or keep his "few thousands" where he can get at them when he wants them, or the interest from them. Any one who would, or could, answer "Half Pay's" questions in the wholesale way he asks him, must be a generalist—and he pardon me for saying so?—as he himself is, and as I was. His own aptitude, the character of his and the neighbourhood, the soil, and a hundred other matters must be known and considered before any of his questions can be answered satisfactorily to himself. And after all, perhaps, instead of the selection of which will bring the largest income, he may be told that his "waggon" will go best on four wheels. Now I am an old man and a busy man, and have no time to waste for among other occupations I hold 250 acres in my own hands. But if "Half Pay" would read like from this taste of me, to hear more of what I could tell him you are at liberty to supply him with my private address. I do not say that I hope to dissuade him from his enterprise because his energy, his capital, and his enthusiasm may make him both a happy and a successful farmer. But all that I know, that if he begins in his present state of knowledge and experience he will have to pay, and show-pay for it. *Write*—Under this head a correspondent, "Half Pay," asks guidance. After 40 years' experience, I can assert that he must not rely on books, nor can he trust to the private experience of others, except he meets with that so hard to find, a really good manager, to direct all the details of farming. If he wishes for occupation, and really likes farming, he may perhaps succeed, but if he seeks an investment to lay out his money elsewhere. As to the soil, he takes a farm of it be of a mixed character—arable and pasture—let him keep all the stock he can, not of one sort only, but believe that no two men agree as to the profits of one first-class sow. There is nothing that varies so much as the price of pigs. It has, I think, been said truly, that if a sow brings eight pigs and keeps her time at each farrow and the pigs bring 1s per head per week, they leave the sow, it pays. If not sold then, they should be kept tight to put up to fatten. The dairy requires, I on a large scale, special good management. I do not think the noble personages make both ends meet, but it is a significant fact that the dairies are mostly in London, except those which send their milk from a distance by railway. If "Half Pay" thinks that Mr. Mechi can answer his question, I would advise him to seek an interview, which will be readily granted. I am sure Mr. Mechi will be able to tell him what to avoid, as well as what to do, and I feel doubly sure that Mr. Mechi will not advise "Half Pay" to begin with experiments. J. C. C.

Concentrated Root Food.—I have written so much on the analytical or feeding value of this food that I have no wish to dilate on the subject. Indeed I have nothing to add. It is on the contrary a variety of food I would wish to say a few words with a view of turning farmers' attention to it. The year 1889 was a year of unusual dearth of roots. The price of roots was high, and the supply was low. The profit of the farmer who grows roots is into their hands instead of into his who grows wheat. What is the remedy? I use one-half of the crop in the old-fashioned way, if you like, raw and convert the other half into concentrated root food. It will keep good for years. A late spring, a dry summer, burning up our pastures, or a less abundant crop of roots next year, give you the command of the market. There is always a time when a store stock is to be bought cheap by storing up an abundance of food you may bite your tongue, and put the profit of feeding into your own pocket instead of letting it slip through your fingers into the pockets of the breeder and dealer. *Hugh Smith, 21, Westbourne Terrace, London, W.*

Foreign Correspondence.

ILLINOIS AND WISCONSIN DAIRY ASSOCIATION.
Cheese-making in the United States. The following is an abridgement of a paper lately read before this Society by V. A. WILLARD of Little Falls—
 The cheese production of 1887 in America amounted to \$1,000,000,000 lb. and in Great Britain to 179,000,000 lb.—total, \$1,179,000,000 lb. for the two nations. The English consumption that year was 200,000,000 lb., and the United States consumed 600,000,000 lb. thus we have the consumption of 800,000,000 lb. by the two nations, which is 75,000,000 lb. more than the production. In other words, to supply the demand of the two countries we must import from some other part of the world 75,000,000 lb. England supplies this deficiency from Holland, but France now comes in as a competitor for their surplus. Hence America must turn north to the main source from which England supplies her requirements, especially as we produce a superior article to the Dutch.
 Another point generally overlooked is that England increases her population every 40 years, and English cheese consumption more than keeps pace with the increase of population. This will make an annual increase in consumption of 4,000,000 or 10,000,000 lb., and in the States the increase of consumption from increase of population is about 4,000,000 lb., thus giving an increase of 18,000,000 lb., to be supplied by increased dairy business. Therefore it is very doubtful if we shall ever reach the limit of over-production, and the consumption of butter goes on in more rapid proportion and a considerable number of dairies must be devoted to that object.
 In the matter of securing fine flavour in both butter and cheese some points have been entirely overlooked in previous discussions. It is only recently that the two causes influencing the flavour of dairy products have attracted our attention. And among these the question of clean, pure water for stock has not been sufficiently appreciated. Milk contains 87 per cent. of

water, and it would hardly seem reasonable to expect that the animal could overstep the laws of nature, and manufacture good milk from stagnant water, yet such has been the case, and because manufacturers have not been able to make a good product out of such milk they have been blamed. With our knowledge and experience in New York we have not been able the past year to locate having some of the best cheese during the hot weather, especially the July cheese. I took some pains to study the question and I found by examining farms and dairies in instances that stagnant putrid water was one of the chief causes. There were other causes but this one was invariable. In one instance the cause was attributed to the milk of one of the patrons whose cows had been drinking from frog ponds. This man changed his fences so as to get good water and so the trouble ceased. In the private dairies of New York and England, particular attention is paid to this matter. On farms where springs are deficient the effort is to be overcome by digging a well and applying wind power for pumping, which can be inexpensively erected and is durable. It is the best plan to have the water pumped up into a tank, and so arranged that it can run back into the well after it has stood a short time, as this will prevent its becoming contaminated by foul gases.

At the present time the old dairy farmers are in error, which is the cause of great impurities in milk, is that they are not taking care to have their cows drink from clean water. I have seen many a farmer's cow drinking from a pond or a stream, and the milk which comes from these places to the factory after having been confined in the can under a close fitting cover will give a most offensive odour and putrid. If there is any manufacturer present who can make clean flavoured goods from such milk, I should like to see him and hear his process. In this respect the English farms are ahead of ours.

For 40 years New York dairymen have been under the impression that the quality of butter and cheese depended entirely upon the manipulations of the milk, wholly overlooking the conditions ensuing from the manner of its production. Of course, much depends upon the manufacture, but good wares cannot be made from bad material. In many points we have advanced to the highest English standard. Our best manufacturers are able, at certain seasons of the year, to make as firm articles as are to be found in the world, but they are not uniform during the season. What is the matter, and what is the remedy? I was the first to direct attention to bad milk, milk spoiled before reaching the factory arising from many causes. You cannot get the butter or cheese which may be tried to by any other means, from the English. America has the cause at her command, and she can produce the best articles. Dairy and other wares, and at certain seasons is very offensive. These causes are chargeable to the farmers and not to the manufacturers. Dairymen can never expect success if their goods are quoted at less than the cost of production. We can make it a great success. We can become the controllers of this great staple throughout the world, but in order to do it, we must show the world we can produce the best articles.

The next subject discussed upon was the proper cooling of milk. It was found that the milk should be cooled to 40° F. before it is put into the butter-tub.

To insure the delivery of pure, sweet milk he urged the Convention to adopt the following rules, to be posted on the door of every factory and addressed to the patrons, saying—

1. That the milk is good when it comes from the stock.
2. That the milk is good when it comes from a cow which has been kept in a clean and healthy condition.
3. That the milk is good when it comes from a cow which has been kept in a clean and healthy condition.
4. That the milk is good when it comes from a cow which has been kept in a clean and healthy condition.

The speaker was interrupted after reading these rules, and a motion for their adoption was most enthusiastically adopted. The question of butter-making was then discussed.

The cheese factories have been of many years to butter-making by the same old-fashioned process. We had ready a very good butter, but the butter He thought really first-class, but it was worth, perhaps a pound, while he did not care how little poor butter sold for. One quart of good cream will produce on an average 13 ounces of butter. Cleanliness, and a temperature of about 60°, never less than 55°, are the most important conditions in churning. The churn should be cleaned with great care. When butter forms the churning should cease, the butter be taken from the churn and all buttermilk worked out, using the ladle instead of the hands.

Good white Oak wood is best for butter-tubs. He approved of the establishment of butter factories, thereby getting better butter and greater profits. Cheese from skim-milk would be much used. China would consume much of it. We make about 20,000,000 lb. of butter each year in this country.

Referring to cheese-making he gave the views of Governor Seymour, favored by that gentleman in a speech to the American Dairymen's Convention at the recent annual session in Utica, N. Y. The market demands a cheese of good texture that is mellow under the finger, but yet of sufficient firmness to be safely handled, and will not fall to pieces

while in the hands of the dealer, is of a clean, nutty flavour, melting in the mouth, and having that delicious aroma that forces itself upon the attention of the customer. A bad or poor flavoured cheese does infinite mischief by closing the appetite and disgusting those who try to eat it—just as a bad oyster taken by chance in the mouth will make one sick of oysters for a lifetime. In cheese-making the work must not be hurried, what heat is required must be slow and gradual, giving the curd time to do their own work, the cheese maker watching all the conditions and standing ready at any time to check the curds when the proper changes are developed.

The interest which we represent to-day is perhaps the most progressive branch of farm industry. It embraces the widest range of topics and the most diversified employment of skill and intellect. First the management of milk in all its relations, and its manufacture into dairy products, and back of this, the great arts of breeding and management of stock, the production of food, &c. These it is important to understand to ensure the largest success. The inauguration of the factory system and these conventions have stimulated inquiry and a desire for improvement which marks a new era in agriculture. The discussions and experiments of dairymen have so sharpened the intellect that there is now no class of men so critical, exacting, or who can weigh a speaker's words with more precision, than those who gather at these conventions.

Societies.

SOUTH DURHAM.

Agricultural Statistics. Mr. MAXWELL said the national benefits to be derived from complete and correct returns of the annual agricultural produce and quantity of stock in a country, have been universally admitted by all classes. Acting under the conviction of the advantages that would accrue to the whole community, nearly all the several Governments of the continent of Europe, as well as the United States of America, have collected agricultural statistics for some time. Our own Government have had statistics or returns collected in Ireland for some years, but it was not till 1846 that returns were begun to be collected for the United Kingdom. Though last to collect agricultural returns, the British nation, and especially the British farmer, were not less aware than other nations and agriculturists of their value, but the jealousy of agriculturists, who, not without some justice viewed such an investigation into their business affairs as placing a dangerous power in the hands of any unscrupulous Chancellor of the Exchequer, against their collection. This standing block was shown to be easily disposed of by the efficient, practical and comprehensive statistics collected in Scotland by Mr. Hall Maxwell in 1846, and in 1847, 1848, 1849, and 1850. Viewed from the agricultural point of view, agricultural statistics would be of immense value were they reasonably accurate, and published in such a tabulated form and at such periods as to be available for practical use. The present returns are valueless to agriculturists, and it need excite no surprise to find them unwilling to place in the hands of any Government details that might really be of great general utility, but which, from the lack of practical knowledge in the arrangement and publication of such statistics, and the objectionable channel through which they are sought to be collected, exhibit on their surface all the worst possible surroundings with the fewest practical advantages. I venture to assert that the success of the effort made by Mr. Hall Maxwell conclusively proves that no objections exist on the part of agriculturists to furnish statistics, when simply required for the honest purpose for which only such statistics should be asked for by any Government. The estimated yield of crops as well as the acreage and number of stock was freely given to Mr. Maxwell, through his judiciously-chosen collectors, on the sole ground that the agriculturists had confidence that their returns would not be applied to any improper use. A good machinery in collecting returns is only therefore required to utilise this confidence. Agricultural statistics, with acreage of crops and number of stock, without an estimate of the yield of the crops, is work half finished and makes us long for the completion of the whole work. There is little good arises from knowing we have so many people and stock to feed if we do not know what we have to feed them with. The acreage of the crops must be taken as a criterion, the yield of the produce as there are such great variations of the yield per acre of all crops in different years. It is for this very fact of our having such great variations in our annual produce per acre from the effects of our varying climate and seasons—and not that there is any material change in the acreage of a particular crop in one year—that agricultural statistics are of such great value. We know by comparison and estimate the amount of food we require between one harvest and another. It is only, therefore, by knowing the produce of the harvest as soon, or even before it is reaped, we can know our deficiency and position in time to go into the markets of the world and make provision economically. The substantial question is—Can the returns be obtained accurately, promptly, and published so as to be alike valuable for national and agricultural purposes, and at a reasonable cost? Certainly the present cost for incomplete returns and the abuses of Mr. Hall Maxwell fully answer the question and even our members of Agriculture may easily arrange a machinery for their collection, publication and publication. The subject is not yet left for any special date, and many agricultural associations and farmers clubs have carefully discussed the practicability of their collection for agricultural purposes only. The following mode of collection and dissemination

manure. The figures given are as follows — 1 328 kilogrammes of chemical manures gave 51,948 kilogrammes of Beet-root per hectare, while 50,650 kilogrammes of farm manure yielded only 41,811 kilogrammes, hence there is a balance of 10,137 kilogrammes in favour of the chemical manures. Similar results were arrived at in the case of the Potato. M. VILLE considers that the excessive use of nitrogenous manures, and the consequent exhaustion of phosphate of lime and of potash from the soil, predispose the plant to ill-health, attacks of parasites, and the like. For the Potato he recommends as most suitable a manure containing a relatively small quantity of nitrogen and a large quantity of potash. M. VILLE does not enter into the question of the relative cost of the two systems of manuring. As to root crops, although it may be possible to grow large crops from artificial manures alone, either from favourable seasons, or because previous dressings of farmyard manure are not yet exhausted, nevertheless the experiments of Messrs. LAWS and GILBERT go to show that such a course cannot be persevered in a long time.

— Mr FISH lately called attention in our columns to an EXTRAORDINARY SWARM OF APHIDES. From other quarters similar reports were sent, and now we have the complement in an equally vast incursion of LADY-BIRDS (*Coccinella*). Kentish Hop growers generally welcome the lady birds, as they destroy the aphides. The town of Ramsgate was on Sunday last visited by a vast swarm of lady birds. They filled the air and covered the earth at every conceivable point. Their number was greatest about noon, when they were to be seen upon projecting corners of houses, collected so as to form one red patch. Later in the day the air got somewhat thinned of them, owing to the traffic of the streets and the destruction which they met with. The streets then presented a peculiar appearance. The number of these bodies strewn about caused the roads to look as though newly gravelled. In the neighbourhood of Chesham, also, lady-birds were seen in enormous quantities at the latter end of last week.

New Plants.

MORMODES UNCIA, sp. n.

Sepala triangulis acuminatis petala ovata acuminata multo latioribus, lobis angulatis antice rhomboidatis apiculatis, fimbriato, callo didymo angulato in disco partibus antice, toto labello involuta.

A very unexpected novelty from Mexico, introduced by Messrs. Veitch. Its flowers are larger than those of *M. aromatum*, and are whitish, with many violet blotches. It is much superior to the last-mentioned species. *H. G. R.*

ONCIDIUM EXASPERATUM, Lind. Rehb. fl.

Affine *Oncidio coccifero*, sepalis petalisque extus valde muricatis, operculis sepalis cuneato ovatis apiculatis petalis paulo latioribus, labello triangulo basi utriusque obtusigulo, callo depresso a basi in disco apice exserto, utriusque lobato, extus utriusque tridentato (undecima de *St. Ignit*) columna sub fovea contracta.

A new species, and quite distinct in the properties of the outer side of the sepals and petals. The flowers are chestnut-colored, the lip yellowish, with brown bars, the callosity orange. It is probably a native of Ecuador, and was introduced by M. Linden. *H. G. R.*

GONJORA PORTENTOSA, Lind. Rehb. fl.

Racemo elongato purifloro, floribus longipedunculatis, sepalo dorsali ligulato-acuto, sepalis lateralibus oblongis, apiculatis, petalis carinatis linearibus lobis carnosissimis compresso, medio superne angulato armis geminis retrorsis in basi laminarum dilatiformium antice acutis, antice aditum in antrum labelli aperientium; epichilo tabuliformi accipiti parvo ligula lineari bicurva anteposita.

This is a very singular novelty, with numerous large yellowish flowers, having fleshy violet petals with purplish dots, the column is similarly coloured, and the upper part of the shining lip is also violet. We are indebted for it to M. Linden. *H. G. R.*

TRICHOCENTRUM TIGRINUM, Lind. Rehb. fl.

Sepalis petalisque ligulato-lanceolatis acutis, labello cuneato lobulato, in medio emarginato, carinis nervis, lobis geminis in basi, carinis elongatis in disco excavatis tenuis tomentosis antepositis, callo excavato-furcata, columna crassiuscula arrecta, alba parvis acutis erectis.

Trichocentrum princeps. A most extraordinary novelty, with the shining leaves of *Trichocentrum atropurpureum*, and the flowers of *Miltonia spectabilis*, but coloured like those of *Cattleya Adolandi*, except that the lip has a white apex, and the calli are orange. We obtained this splendid plant from M. Linden. It is much more like *Miltonia* than a *Trichocentrum*. *H. G. R. Rehb. fl.*

COVERING WALLS WITH GLASS FOR THE PROTECTION OF FRUIT TREES.

[Read at the Manchester Congress, July 22, 1869.]

THE uncertainty of securing good crops of our finer fruits, such as Peaches, Nectarines, and Apricots, owing to the injuries from spring frosts, makes some kind of protection almost a necessity in our climate. Lately orchard-houses have been prominently advocated by Mr. Rivers and others, and when properly managed they have been a source of interest and profit to amateurs and gardeners with limited means of growing fruit on walls or in hothouses. Where there are walls with a southern aspect in gardens, a covering of glass will, however, be found the cheapest and most certain way of securing crops of our finer fruits. When Peaches, Nectarines, and Apricots are only required to come to maturity by the natural heat of the season, the expense of heating such structures artificially is not required. The spring frosts likely to occur in March and April will not injure the blossoms, for I have proved this on an Apricot wall which was apparently covered with glass. Last year, on the 22nd April, 8° of frost were

registered, yet the fruit trees in bloom, and young Apricots as large as Filberts were uninjured under the glass covering, but on the open walls the crop was quite destroyed, even where protected by branches and nets.

For the last seven years the crop has never failed on this wall until this spring, when some varieties of Apricots were only thinly set with fruit, the season may, therefore, be called an exceptional one, and the failure in the crop may be accounted for by the excessive warmth in February, followed by a dull and cold March. The trees showed plenty of healthy blossoms, but the pollen seemed glued together and did not disperse and even the fruit, where set, dropped off from the sudden cessation of the flow of sap. Some varieties of Apricots on this wall, however, have set a good crop, such as the *Kaisha*, *Breda*, and *Musch-Musch*. In the midland districts all unheated orchard houses have very thin crops this year, showing that artificial heating is requisite in such structures in seasons like the past.

When the new kitchen garden was planned at Welbeck, a range of south wall nearly 800 feet long was covered with glass on a novel principle. As the framework is of iron, and the roof made on the ridge-

and-furrow mode, and glazed with strong plate glass, cast on purpose to suit the curve in the roof. The openings for top ventilation are made in the back wall, and every alternate light in front is opened and shut by machinery worked from the inside. The height of the back wall inside is 13 feet, in the front 7 feet 6 inches, and the inside width 7 feet 4 inches. This structure is heated by hot-water

pipes, and these were found very useful this spring, for good crops of Peaches and Nectarines have been secured, as well as plenty of Cherries, Plums, and Pears grown in pots. Fire-heat is only used at the time they are blooming, or in the autumn, to ripen the wood, as the object of this structure is to get a succession of Peaches and Nectarines after the hot-house ones are over. In such structures, if unheated, it is advisable not to exceed 5 or 6 feet of inside width, so that the absorbed heat in the back wall may have sufficient power to expel any frost when the trees are in bloom. In March and April the sun-heat in clear

frosty weather is often very strong, and when the house is shut up early in the afternoon there is quite heat enough reflected from the back wall to make the blossoms safe.

The long range of glass-covered wall here has a very light and imposing appearance, from the absence of any timber in its construction, and from the ornamental iron bays placed every 22 feet in the inside. These bays are for growing hardy Grapes on, and some varieties have this spring shown plenty of bunches to festoon the top of the bays. All the ironwork in the interior is painted of a light sky blue tint, and the effect is very pleasing. The walk inside is a stone pavement laid on walls of bricks on edge, so that the roots of the fruit trees may run between them. Besides the advantage of furnishing a promenade in bad weather, this immensely long range is useful for so many purposes that I must state them *seriatim*. On the front, where the two rows of 4-inch pipes are placed, there is an iron grating covering them. Its width—2 feet—is sufficient for a long row of 300 fruit trees in pots to stand on. In April and May bedding plants in immense quantities can be placed between the pots, or purpose to harden them off for planting them out in June.

The fruit trees grown in pots consist principally of Cherries and Plums, and a few of the best varieties of Pears and Apples. No Apricots are required here for pot culture, as a sufficient supply is obtained every year from a wall protected by glass lights. The Cherries grown in pots come in about two weeks before those grown on the walls, and consist of the following kinds, according to their time of ripening — *Helle d'Orléans*, *Early Purple Guigne*, *Werder's Early Black*, *May Duke*, *Waterloo*, *Black Tartarian*, *Cleveland Bazarreau*, and for the latest *Florence* and *Late Duke*. The following kinds of Plums are grown in pots in quantities — *Early Favourite* and *Mirabelle*, *Brady's Green Gage*, *Jefferson*, *Cox's Emperor*, *Kerke's*, *Oallin's Golden Gage*, *Magnum Bonum*, and *Golden Drop*. The Pears and Apples grown in pots are confined to a few varieties which are esteemed for their earliness, fine flavour, or colour. Pears — *Citron des Carmes*, *Doyenne*

d'Ete, *Yat*, *Jargonelle*, double-grafted on the *Quince*, which bears freely; *Williams' Bon Chrétien*, *Marie Louise*, and *Bourré d'Amanhis Panachée*, a variety beautifully stripped with red; *Doyenne du Comice*, and *Bourré Clairgeau*. Apples — *Cox's Pomona*, beautifully coloured when grown in pots, *Cox's Orange Pippin*, *Melou*, and *Northern Spy*, both American Apples, and a beautiful Russian sort named the *Red Transparent*.

The selection of Peaches and Nectarines planted against the back wall comprises some of the new kinds raised by Mr. Rivers, and the best of the old varieties. The Peaches, according to their time of ripening are *Early Beatrice*, *Early York*, *Early Alfred*, *Dr. Hogg's Early Mignonne*, *Grosse Mignonne*, *Noblesse*, *Malta*, a deliciously flavoured and medium-sized Peach of the *Noblesse* section, *Stamp the World*, *Barrington*, *Late Admirable*, *Walburton Admirable*, *Gregory's Late Teton de Venus*, and *Salway*. Nectarines, in the order of ripening — *Fairchild's Early*, a very old small red kind, *Hunt's Tawny*, *Rivers' P. orange*, *Violette Hative*, *Eruge*, *Murrey*, *Downton*, *Rivers' Albert Victor*, and *Victoria*.

Another great use of this glass covered wall is for producing salads in the winter months, for without much trouble a succession of fine succulent Lettuces and Endive can be had every day when wanted. The Endive is lifted with balls of earth, and put into covered boxes in the Mushroom-house, where it becomes sufficiently blanched in three or four days. The Lettuces are planted in the border in the autumn, and a slight covering of hay preserves them from severe frosts, should the hot-water pipes not be used. A good supply of blanched Chicory is likewise had by sowing it in July on a north border, and lifting it when wanted to plant in large covered pots, where it soon blanches. This forms the *Barbe de Capucin* of the French salads. *William Tillery, Welbeck*

VARIOUS METHODS OF GRAFTING:

WITH AN ATTEMPT TO INQUIRE INTO THE INFLUENCE WHICH THE STOCK EXERCISES UPON THE SCION, AND VICE VERSA.

[Read at the Manchester Congress, July 22, 1869.]

You see, sweet maid, we marry
A gentler scion to the wildest stock,
And make conceive a bark of baser kind
By bud of nobler race: this is an art
Which does mend Nature, change it rather, but
The art is Nature.

By the above quotation from "The Winter's Tale" it would appear that Shakespeare, whose profound knowledge of human life in all its phases has been, and will long continue to be, the wonder and admiration of mankind, was by no means ignorant as regards the art of grafting. It is reasonable to suppose that he would hardly have written the above lines had he not practised this art himself, or at least been thoroughly aware of the objects for which it is usually performed. This art would indeed appear to be of the greatest antiquity, and the date of its discovery, like the case of its earliest practitioner, is hidden in the mists of countless ages.

The practice is alluded to in Holy Writ and Pliny, and other ancient writers, have also alluded to the subject. In some of the r writings fabulous descriptions are given of extraordinary fruit-trees, so grafted as to produce sundry and very dissimilar kinds of fruit, such as Apples, Plums, Figs, Grapes, &c., upon the same tree. But it will be readily supposed that if any such trees ever existed they must have been produced by similar means to that said to be sometimes resorted to on the Continent at the present day, where trees are occasionally produced, and offered for sale, on which appear to be growing the Orange, the Myrtle, the Pomegranate, &c., all upon one stem. All this, however, as may be supposed, is merely a deception, accomplished by having cut out the centre of the stem of the largest variety used, and drawing the smaller stems of the other sorts through the hollow thus formed, each individual plant retaining its roots and thus for a time maintaining a struggling existence. By the adoption of similar means the Strawberry plant has been represented as growing from the stem of a Rose tree. This, too, is accomplished by taking the runner on which the Strawberry plant is produced through the Rose stem, which had previously been hollowed out for the purpose, while its roots occupy the same soil as that in which the Rose tree is growing.

It may, I think, be reasonable to suppose it possible that Nature, or accident, may have first suggested the practice of Grafting, as instances are frequently to be met with in woods and thickets, where branches of trees happen to cross and to press upon each other and the friction caused by the action of the wind in time disposes the bark, and as the branches increase in strength the friction is resisted and the pressure increased, until the result is a permanent and organic union. This may be considered as grafting by approach, a practice which cultivators have imitated in the method known as *Inarching*. Various modes of grafting are practised, all of which, under certain circumstances, have their respective advantages, but of these methods the limits of this paper will only allow me to glance at those which are found to be the most applicable to general purposes, and many other so-called methods may be considered as merely modifications of the same. In all methods of grafting it is of the greatest importance that similar parts should be placed as much as possible in contact with each other, and on this account the method known as *saddle-grafting* may be considered amongst the best, as presenting the largest possible surface to receive the ascending ducts or sap. This method, however, does not appear to be so generally practised as might be expected — possibly on account of more time being required to perform the

keeping up a supply according to the nature and quality of the plants employed for general decoration.

one of Ker's trellises, the lights only recently removed. Plums have shown strange vagaries; the Early Prolific, found here from a stone some 30 odd years since, seems...

Plums grown largely for market, only one has this season fully succeeded. The Early Prolific Plum trees are all pyramids, about 15 years old, and in number; they are planted in rows, 24 feet row from row, and 12 feet apart in the rows; the 24 feet space has been constantly cropped in a recent plantation...

Owing to the warm summer of 1866 we never had so fine a prospect of a fine crop. Our Apricots in particular, the end of February, were one mass of bloom, but the severe weather we had in March cut them all off.

We had very windy weather, with north and east winds, which the Peaches and Nectarines were in flower and setting the fruit, owing to which, as I believe, many of the fruit which appeared to have set had no vital power, and dropped off, although our walls were protected at night by canvas covers.

Potatoes are very fine and clean here; second earlies are beginning to tuber same as last season. I hear that some diseased ones are to be found in places.

I may mention that the garden here is well protected by high walls all round. The park, in old timber, so that we have perhaps a better chance than most of our neighbours, from whom I hear great complaints. Strawberries I am quite disappointed with. Having planted half an acre last July, which I find is the best time they showed their flower stems a ring and line, but alas the coldest winds which prevailed here over them in the appeared to shrive them up.

On Apricots, Peaches, Nectarines, and cherries I never saw a finer bloom than we had here last spring. We had no frost soon enough to kill, but the bitter east winds completely dried up the bloom.

From a small Peach-house I took up four trees--two Peaches and two Nectarines. Their fruit was all gathered early in 1866. Early in September they were planted in my Peach-house. I have had a full, fine crop from them. The other trees did not average a dozen each.

Potatoes of all kinds are very good crops, and as yet free from the disease. I think the general failure of the Peach and Nectarine crop is attributable to the scorching they had to endure last year, and not altogether to the cold spring we have had, as at this place all the trees were well protected, and yet we must have about 50 fruit.

The cold easterly winds in the spring carried off the fruit before it was set. I had Apricots large enough for tarts in the first week in April, when one morning, to my great surprise, I found most of them turned yellow and dropping from the trees in great numbers.

We must look farther back than their time of flowering for a solution of the unsatisfactory state of the fruit. The trees under which the wood and fruit buds were grown and matured last year. First, the excessive heat and drought of May, June, and July, then in the five following months we had here a fall of 29 inches of rain, being 11 inches more than fell during the same time in 1867--a state of things at that time of the year not conducive to their maturation; and then an open winter (so...

undering the trees much more susceptible to the effects of the frost and continuous cold of March, at the beginning of which vegetation was unusually forward. On the 16th standard Violet Plums were in flower, Gooseberries, &c.; on the 27th, flowers of Horse Chestnuts were frosted, and strewed the ground below the trees.

We have often to deplore the sad effects of late spring frosts, and I have often, in the course of 24 years spent in gardening pursuits, seen the hopes of a fine crop of stone fruit, such as Peaches, Nectarines, Apricots and Plums, destroyed by late frosts. I am sorry to say that this season is not an exception, for we had frost in the North Riding of Yorkshire until the 10th of May. I have a scarcity of fruit. I must add, never in my time do I remember seeing such a quantity of blossom on standard trees, particularly Apples and Plums; and at the present time one requires four eyes to see any fruit of either.

On the 7th of last May I had the Peach trees on the walls at this place uncovered, by having the double covering of netting removed altogether, when I never beheld the trees more promising to be productive of a good crop of fruit, which they have never failed to be for the last 40 years, during which period I have always personally attended to their general management, as I have done in the current season. But, to my mortification, in no sooner did the frost set, than they commenced dropping. At this time there are not two Peaches or Nectarines on the open walls--Linnæus dear bought wit--by premature exposure entirely of the trees to the then fluctuating atmosphere that followed. Of course Peaches and Nectarines under glass are an exception to the above fatality. I am more fortunate by having abundant crops of all other stone fruits that are grown at this place. I find that the variability of our climate during last spring and early summer...

crop ever known, this year we have none. Plums the same, except Victoria. The small fruited were very plentiful and fine last year, this year they are poor and very few of them, except Raspberries which bore well. Several kinds of Apples that in ordinary seasons are very poor, were last year well coloured and well ripened. Peaches and Nectarines were well ripened and very sweet this year they do not swell very kindly, but the trees are very healthy. Apricots scarcely bear a crop, and the same may be said of Figs. The beautiful bright green water we had last year was very beneficial for garden purposes in this dainty climate. The quantity of rain that fell at Carmarthen was a fraction over 30 inches. *J. T. Richard, the Currier, Dynevor Castle, August 2.*

The crops of Peaches in late houses with no fire heat have failed miserably. The frost has been more injurious to shrubs and trees here this year than last year. We have had a little rain up to this date, but it has not been sufficient to do any good. Apples of all sorts are in a very poor state, trees and shrubs are covered with mildew. *J. T. Richard, Dynevor Castle, Park, near Carmarthen.*

The early spring frosts killed the first set blooms, and the sharp frosts at the end of May and beginning of June considerably thinned the remainder. Apples are first-rate on Pippins and those kinds that rejoice in the heat of last year; late frosts and cold west winds, however, were the main causes of the reduced number. If the weather proves favourable, the fruit will be fine in quality. Apples injured the leaves of Plum trees very much, and spoilt many fruit. *H. Knight, Fl. and Hort. Cult. Kew.*

Fruit trees never looked more promising than they do this season, as there was a perfect season of bloom, but unfortunately a week of frost has done much to injure them. The gardens here are in a very poor state, a ring frost has done much to injure them. *J. T. Richard, Dynevor Castle, Park, near Carmarthen.*

The present season in this part has been one of the most favourable to fruit crops. From the first summer I can recollect, there has not been a week covered with such a quantity of rain as we have had in bloom and set in May, and in which the thermometer fell 20 degrees below the freezing point, sometimes as many as 30 degrees below. All the early fruit. The early part of May was a most rainy, with an east wind, the sun was not seen for 10 days. Frost on the 12th of May frost for 10 days, and left many of the trees in a bad state. The garden here lying low and damp spring frost takes great effect, but most gardens in this locality have suffered much from the severe spring. *J. A. Carraghmore, Waterford.*

All early kinds of Potatoes are excellent, late kinds looking well, vegetables in general are good. Peas in particular. Our lowest temperature this year was 11° of frost on March 3, our highest temperature (so far) about 40°. *A. Ingram, Alnwick Castle Gardens, Northumberland, August 3.*

Vegetables in the gardens here are over

runners, and the "killers of the soil" to agree upon the merits of deep cultivation; true, all lands cannot be treated alike, but there is sufficient breath and open to the soil, and it would be well to have a special Act of Parliament to make compulsory to cultivate deeply those lands; and if we are to have a succession of hot and cold summers as we have been having lately, it will be quite as necessary to cultivate deeply as it is to use the use of lime or other substances when a piece of the human or brute creation appears. Our trees and other trees have made a great deal of water, and the leaves are very healthy. *H. Knight, Fl. and Hort. Cult. Kew.*

The crops generally are looking well in this neighbourhood. Peas, Turnips, Cauliflowers, and late Potatoes are beginning to feel the want of rain, not having had much rain since the 1st of July. *George B. Tillyard, Brookley Park, Lincolnshire, August 4.*

Orchard-houses with a view to the production of fruit waxes, immediately under my superintendance about 25 miles distant from the other the soil are on the secondary formation, the one having a substratum of sandstone over the coal beds, the other a substratum of mountain limestone. The latter has the best crops in every instance. There was a fine show of fruit up till the heavy rainfall and cold north-east winds of May. The low geothermal temperature during the spring months was, I believe, the principal cause of failure of the stone fruit crops. Quinces are a failure. There is a fine crop of *Fragaria Ugent* against a wall in Merionethshire. The following is an account of the result for Wynnstay.

1860 shows 54 inches rainfall, and 1861 40 inches. *P. Matthews, Wynnstay, Rhoslan, Denbighshire.*

Home Correspondence.

Golden Champion Vine. We learn as much from our failures as from our successes, hence I am induced to record the following case. A plant of Golden Champion Vine was bought during last winter, from Messrs. Osborn & Sons, and being one of their strongest varieties it bore, and bore a high price. It was planted along with about 20 others in a house properly attached with bellows power and properly made up of the best material. As the vines were allowed to start

a cautious and natural manner, as the season advanced. The Golden Champion was the first to break buds, and pushed vigorously into growth of about 4 in height, which in a short time became shriveled up, and have remained in a half-dead condition ever since. Now the Vine was placed under the same conditions received the same treatment as the others that were planted in the same house at the same time, and they have all, except this one, reached the top of the house. The point settled, "failure not from my treatment." The question arises, where is the cause of failure? Is it the Vine's natural weakness, or is it that it was over-rushed in its young state and badly ripened? Perhaps those who have made purchases from the same batch of plants would be kind enough to state how they have managed. It will enable us to arrive at some conclusion regarding this case. *C. J. B. J.*

Hawk-moth. Your correspondent, *Verulam*, says Boyle is wrong in supposing the insect he has captured to be a variety of the humming-bird Hawk-moth. It is, without doubt, one of the larger Sphingidae or Hawk-moths, but from the description given it is difficult to speak with certainty of the exact species. Several of that family are extremely rare, while others are more frequently observed hovering over flowers at dusk. Your correspondent would seem to wish to deprive the humming-bird Hawk-moth, *M. stellatarum*, of its proper rank and place among the British moths, owing to its more sober colouring. It is true its flight is diurnal yet this is the case with several other species of moths the colouring of which is even more brilliant than some species of butterflies. I distinctly recollect Mr. Boyle has secured a fine, possibly rare specimen of the Hawk-moth *S. H. J.*

Mushroom Culture in India. The common Mushroom grows spontaneously on a grazed and in Bengal. In 1842-3, I occupied part of a building converted from a bullock shed. In the cold seasons, Mushrooms in large quantities forced up the house, which standing in a roomy state. As I gathered many a potato for breakfast, I can testify to the excellence of their quality. That Mushrooms may be very simply cultivated, the following example, the result of an accident will show. A friend of mine here thought he would utilise an old greenhouse in the garden by growing some Cucumbers. In the early spring he had a bed made of his stable litter, with a thin covering of soil. This done, the place was left to itself. Passing one morning, he noticed that the bed was thickly studded with Fungi, which, to his delight, he found

day. I may explain that the greenhouse gets but little sun; that the litter was sawdust and horse droppings, fresh; but, having been stored in an open shed, it was probably well saturated with water. The spring was wet and the greenhouse was well covered, but some of the glass broken. I have had to deal with vast numbers of white ants in my time. From what I know of the soil of their nests, I should think it valueless for growing Mushrooms. I should regard it as a waste of money to send spawn to India. It can be produced there anywhere under the usual conditions. A proper bed in an old greenhouse would soon give 100 lbs. down are general. *Mark A. Wood, based at the Indian stable, as a rule, is not of much value. The droppings are generally kept separate, and the urine during the day is commonly caught in the syce in an earthen vessel, and thrown away. It is necessary to have a good arrangement for producing good litter. By the way, what are the elements or constituents that go to produce Mushrooms—urine, excreta, fermentation, or what? Cattle dung is cold. In the case of the bullock shed, production must have been from urine, the dung being a waste of matter as dropped and reserved for fuel. My friend's sawdust had been well used, and thoroughly saturated afterwards with rain. *W. Clifford, Warwick.**

Iron Pipes Blocked.—I live 20 miles from London, and last year I put up a water-wheel to pump the water into my house. The water-power was brought from a pond, distant about 150 yards from the wheel, through a 3-inch socket iron pipe, with a galvanised coupler at the end to prevent weeds or other material from getting in. I had a spring, and the water is hard. Latterly I found the flow from the pond very much diminished in volume, and upon examination the pipe was believed with a sort of Fungus, or a vegetable matter. I have had it cleaned out at both ends, evidently the living runs through the pipe, as we cannot get an increase of volume. It would not seem to be of any use to break up the pipe, and to have it cleaned out, as the Fungus will grow again. Is it a common occurrence for a vegetable substance to grow in an iron pipe through which water is constantly running? Would the same substance in all probability grow if the iron piping had been galvanised? Would the same substance grow if galvanized rather were piping had been used? Is there any plan or use where a free circulation of water could be obtained at all, and can be had to the pipe? I can't get it by a system of wells at stated intervals. *Wynnstay, Rhoslan, Denbighshire.* The production which is your pipe is apparently *Blasphorophora nymphaea*,

Party (or a very closely allied Polype), referred to Alge by the author of the genus, but belonging rather to the *Hydrozoa*. The smell is almost intolerable, and you must certainly take some measures to clear the pipe. You had better consult some chemist, to ascertain what you may use, which would at the same time kill the animal, not injure the pipe, and not be likely to be poisonous to the water. If you could cut off the supply of water for a time the animal might die, but to that end the supply must be completely cut off; and perhaps, after all, the resting-gorms, which are very abundant, might bear a considerable degree of drought. Chemical treatment is the most promising but the exact nature of the difficulty. *M. J. B. J.*

The Vapourer Caterpillar.—Thanks for your reply about this caterpillar. It has been most interesting to me, and I have been very much surprised to remark that it was not at all particular as to food it was looking. At the base of the Rose trees running ribbon border planted thus—Back row, *Pelargonium Cybister*; 3, *Calceolaria aurea floribunda*, 3, *Polygonum Flower of Spring*, 1, *Coleus Verschaffeltii*, 1, *Pelargonium Lady Cullum*, 6, *Labellia speciosa*, 7, *Corastium tomentosum*, 8, *Oxalis black-leaved*. The Vapourers had got as far as the fourth row, and were picked off the *Pelargoniums* and *Calceolarias* by the post. As I thought we had cleared them from the Roses, but for your prompt answer I should not have examined the ribbon border until their jaw-marks had marred its beauty. As it is, I hope by frequent pickings to save it from being sawn up into food for the horrid Vapourers. I found them gnawing away at the *Calceolarias* and cutting into the *Pelargoniums* in the most wholesale manner. They eat both leaf and leaf-stalk, and doubtless stem likewise, of soft, succulent things. *J. T. R.*

Lilium auratum.—I possess a plant of *Lilium auratum*, which has thrown up two spikes of bloom, one of which has nine blooms on it, the other 45. Is not that an unusual number? *C. Wood, Gr. to A. Drace, Ed. Dulwich.* (See report of Royal Horticultural Society meeting, p. 393. Eps.)

Cedar of Lebanon.—There is a fine Cedar of Lebanon standing in the kitchen garden here, of the following dimensions:—Height, 65 feet; circumference of base 2 feet from the ground, below the first branches, 18 feet 9 inches, above the first branches, at 7 feet from the ground, 19 feet 4 inches; circumference of opposite lower branches, 6 feet 6 inches, 8 feet 6 inches, respectively. The diameter of the tree at 10 feet (allowing 8 feet for the diameter of the base) is 125 feet 6 inches. *Thomas Fowles, Gr. to J. T. R. Warrington, Bart., Stamford Court, Warrington.*

Potatoes.—It was a fine specimen of the American Rose Potato, which were taken at 100 lbs. weight. I had an idea at once, and got as enclosures of the Potatoes were. Had it been offered at that price, I would scarcely have met with any other all the "peas" that have been sung its wondrous merits, to what, on a fair trial, does amount? Why, simply that whilst it is no more productive than many of our own standard varieties by no means of such good quality. There are some extraordinary statements made as to its production, but these results have only been obtained under cultural conditions, such as if applied to some known kinds would assuredly produce a similar result. I gave a pound of it to a friend, who had a very large good-sized tubers were cut into small pieces, and I obtained 10 pecks of fair sized potatoes. I got 10 pecks of very fine ones, the same number of Waterbury's, Warrington's, King's, Duke's, and the King's, I think I have never seen any other potatoes that were so good as these. I had to assist me in the trial, and I had an American rival. Besides, it was the first year that it was previously offered at that price, and the consequence, the first year, was a very high price. In such circumstances it is a fair trial, and it is to be a late second early, producing tubers, of a reddish pink colour, and a very white and mealy on the outside. We have not as good Potatoes here in England as we have in any other country, and perhaps a nationalism, but (for his own country), and I am sure that seems to have existed in the time of the same and other Potatoes, whether a good speculation for some enterprising export to New York a cargo of some of our I think he might make no end of "almighty" it. Another American novelty was raised upon the public last spring—a round American Red. This I find to be very good, and with our own Red Regent in the market, it is a very good one. I may mention that in the winter I purchased a quarter of a peck of imported French Potatoes, much of the colour but of rather a darker shade of red, and proved also to be one of the red Regent type, very handsome tubers of such a present quality that I will prove, after keeping, quite as good as the French. Such is the multiplicity of sorts now, that I would be a great boon both to the trade and the consumer if some central authority would undertake to give, for two or three years in succession, a fair trial of all existing kinds, to synonymise all that have really good, and give them certificates of merit, and let the public take their chance; such a trial as this would be a

bottom and the small ones on the top, and the depth of the drain would be about 3 feet. The bottom of this drain got stopped from the accumulation of sand at the mouth, and we had to open it up for several yards, and as we did so, it being the depth of winter, we were surprised to find nearly a hundred frogs, all of a bright yellow colour, and quite lively, nestled there for the winter in the pure spring water, which never froze, all tightly packed between the large stones in the rubble drain. A Frenchman would have looked upon this as a treasure, and would have dressed and cooked the legs of every one of them, but as we had no such longings, they were all allowed to go down the stream in peace to seek for some other hiding-place.

We are all well aware that a wet frog in frosty weather would be frozen to an icicle unless some such provision had been made for it, but as the winter rains generally keep the ponds and ditches well supplied with water during the frosty season, the frog finds no difficulty to get lodgings in the deep water, or in drains out of the way of frost. At the time I speak of there was a brook of clear water and several pools on the common within a stone's-throw of our house, and from what I have above stated, I need scarcely remark that frogs abounded; they spawned in the pools, and plenty of frogs were to be found in the trout streams, so that when I had groped under the stones for trout, I have been annoyed to find that frogs were there. Whether we kept ducks to keep the frogs in check, or for the sake of the ducks' eggs and ducks' flesh, I know not, but certainly our ducks were quartered upon the frogs, and that for half the year at least they would come waddling home every night with their craws well crammed with this dainty. I have often been in at the death and seen the duck turn the full-grown frog about until she had got it headforemost, when it had to go down alive and kicking into the craw. Now if toads (*Bana bufo*), young or old, had been presented to the ducks, they would not have touched one of them, and this discrimination goes far to prove that the toad is at some time of the year not without venom, as many credible witnesses have testified. Without going further into the history of the toad can at present be balanced against its unsightliness, their numbers might be very much thinned (where they are a nuisance) during the approaching spawning time; the spawn of the toad will be found in lines, whilst the frog spawn is in clusters. One year I had the garden infested with millions of young toads after they had left the water and could crawl, and the following season I gave a boy a score for all the full-grown toads he could collect in the spawning season, and so well did he secure the end in view that very few were seen about the pleasure-ground after what he had netted. But to return to the frog, and first of all let me assure your readers that I am no advocate for the eating of frog legs (for that is not only part that is eaten), but, although we are not to eat them ourselves, that is no reason why our ducks should not eat them, and have such cheap and natural food provided for them. The frog is wonderfully prolific, and the swarms of young frogs that annually leave the spawning pools is such an army that one wonders where and on what they will all be fed. It is a very easy matter to accommodate a colony of frogs if they can only get an old quarry-hole, a marl pit, or even a deep ditch to breed in in spring; and before the tadpoles have legs, let the pool be enclosed with a low wall or close palings, and the frogs and their progeny will be at the service of the master of the pond; it will be a frog preserve. Young pheasants are fed with ants' eggs, young turkeys and chickens get maggots, grubs and worms provided for them; it would be idle to argue the matter with the gamekeeper or the henwife, for they have learnt from experience that nothing will do better for chicks than this fresh live food, and few things have been found to do so well. In Devon, near Torquay, such were the number of snails that in spring you could not walk in the Clover ley without crushing four or five small snails at every step, and when the young ducks were let out in the morning they ran away to the feast of snails, and the game fowls and prize birds kept were always ready for a few crushed snails whenever they could get them. I mention this to show that crawling insects and seeds besmeared with mud and sand are the natural and even the necessary food of poultry, from the handsome peacock and pheasant down to the barn door fowl, for the stones in the craw of the bird tell the plain truth, and you may see them eat stones and sand with avidity. They are all foul feeders, and the duck is particularly so, and has a gluttonous appetite, and should only be kept where it could be fed after its own fashion. Cobbett said ducks should not get to the water as it unfitted them for the table, but I need not quote from this author any further beyond the single word "Quack." Many persons have thought to make money by buying food to rear ducks, but they have generally failed, as the food was all too costly, and generally too dry for this aquatic bird. Had the frog been a true fish, instead of belonging to "Reptilia," I should have had an easy task, as the science of pisciculture is just now in the ascendant, people are beginning to see that if they are to have full-grown fish they must first take care of the spawn and the young fry, and make fish ladders in the weirs for the fish to get to the spawning ground and back again to the sea. With the Frenchman stew or preserves of frogs is a feat already accomplished, whilst we are only feeling our way and borrowing or calling in the aid of the duck to help us to get any good of the frog at all in our domestic economy. The frog eats no man's grain, or other manna, like the thievish mouse, and is of a retiring habit, and always clean washed, and gives a dainty morsel to birds of prey as well as to snakes, &c. One thing, however, is quite certain, that when our ducks get plenty of frogs, and the run of the common, they

land eggs and required little or no feeding, but in winter, when the frogs were protected by ice and deep water, the ducks had to be fed at the barn door. Notwithstanding the dirty habits of the duck, and its frog-eating propensities, ducks, wild and tame, are likely enough to hold their ground, and at present fetch quite an unreasonable price in the market, for they are a luxury at the table of the greatest in the land, and it is high time that a step should be taken in the right direction to get such a want supplied. There is no novelty in this mode of feeding ducks, for who has not read or heard drummed in their ears of the "Frog that would a wooing go" and of the "Lily-white duck that gobbled him up," with the chorus of

"Rokey polky, gammon and spinage,
Heigh-ho! said Anthony Rokey"

Alex. Forsyth.

FLAX CULTIVATION IN IRELAND.

THE accompanying interesting Table, which has just emanated from the Agricultural and Statistical Office, Ireland, is well worth the attention of our readers. It shows in statute acres the extent under Flax in each county and province in 1868 and the present year; also the number of scutching mills —

Counties and Provinces.	Extent of Land under Flax.		Difference between 1868 and 1869.		Number of Scutching Mills in 1868.
	1868.	1869.	Increase.	Decrease.	
ULSTER.					
Antrim	20,147	20,071			78
Armagh	21,723	22,730	1,018		133
Cavan	18,118	14,860	1,53		35
Donegal	22,265	27,973	3,708		280
Down	36,887	37,550	663		267
Fermanagh	6,654	8,981	2,307		30
Londonderry	22,008	24,121	2,015		206
Monaghan	20,302	23,178	1,976		69
Tyrone	29,143	34,505	5,452		208
Total of Ulster	192,230	211,044	Increase, 18,814 acres.		1,420
MUNSTER.					
Clare	683	803	120		3
Cork	1,095	2,020	925		29
Kerry	552	538	14		3
Limerick	127	107	20		1
Tipperary	297	349	52		6
Waterford	87	80	7		4
Total of Munster	2,837	3,796	Increase, 959 acres.		44
LEINSTER.					
Carlow	24	10	14		1

Wicklow	6	2	4		
Total of Leinster	5,169	5,258	Increase, 89 acres.		47
CONNAUGHT.					
Galway	254	274	20		4
Leitrim	14	10	4		
Mayo	2,482	2,077	405		5
Roscommon	1,478	2,408	930		7
Sligo	54	47	7		8
Total of Connaught	4,257	5,035	Increase, 778 acres.		34

Total acreage under Flax in Ireland in 1868 and 1869:— 1868, 206,483 acres. 1869, 225,178 acres. Total increase in 1869, 18,695 acres.

Total number of scutching mills in Ireland in 1868, 1,542.

Year	Acres.	Year	Acres.
1851	140,586	1861	147,957
1852	137,008	1862	150,070
1853	174,079	1863	214,090
1854	151,403	1864	301,693
1855	97,076	1865	251,433
1856	106,311	1866	263,507
1857	97,721	1867	253,257
1858	91,846	1868	206,483
1859	130,222	1869	225,178
1860	129,505		

The total area under Flax fluctuates considerably from year to year, as may be seen from the Table subjoined to the one alluded to, in which the aggregate extent of Flax grown in the years from 1851 to 1869 is given. The smallest amount of land under this crop appears to have been in 1858, when only 91,846 acres were reported. Since then the area has increased, although hardly with satisfactory steadiness. In 1864 301,693 acres were under this cultivation, the largest area yet registered, this was decreased to 251,000 acres the succeeding year, and since then the extent has varied from 206,483 to 263,507 acres. The smaller area represents the extent in 1868, and during the present year we are glad to notice an increase of 22,695 acres, making a total area in 1869 of 225,178 acres. This increase is almost entirely due to the province of Ulster, which alone has 18,814 more acres under this crop at present than in 1868. Connaught contributes 3823 acres to the total increase, and Munster 959 acres. The province of Leinster only shows an increase of 89 acres. The great bulk of the Flax crop is therefore seen to be grown in the north of the island, where the people have earned the character of greater thrift than their brethren in the South. Would that the growth of this valuable plant could be more extended in south Ireland the employment it would give to holders of small occupations would be an immense advantage.

AGRICULTURAL GLEANINGS FROM BRITISH CONSULS' REPORTS.

France.—The crops of the last harvest turned out very good, and those of the present year indicate favourable results. The British Consul says this part of France suffers incalculable damage every year from the cockchafer grub (*Melolontha vulgaris*), nothing being safe from its ravages. Considerable sums are paid by the local authorities for the capture and destruction of the cockchasers, and many tons weight of these insects are yearly thrown into the sea. Their great numbers are principally owing to the wanton destruction of small birds which has been allowed to take place.

Lombardy.—The rent of land in Lower Lombardy varies at present from 120 and 200 to over 500 lire per hectare (1/18s 6d. and 3/15s. to over 8/1s. 6d. per acre), this last price being given for meadows and market gardens near towns, especially in the neighbourhood of Milan. Land in Central Lombardy is cultivated on the "metayer" system. The conditions of the contract, which is generally a verbal agreement, vary in different localities, but payments to the landlord are always made in kind, with the exception of a very small rent for a cottage, or rooms, &c. The expenses of cultivation are borne by the peasant, the taxes and certain repairs by the landlord. In Lower Lombardy the land is held on lease by farmers, generally for a period of nine years, and in some few instances for a term of 12, and sometimes 15 years. Any additional building erected, or improvement made, by the tenant is estimated when his lease expires, for which he receives adequate compensation. The position of the agricultural labourer varies in different districts. In Central Lombardy the prevalence of the "metayer" system excludes the question of wages. In Lower Lombardy, however, the system of wages generally prevails, although when rice is harvested payment in kind is very frequently adopted, i.e., so many bags of rice per quantity brought in.

The actual wages of the agricultural labourer seldom exceed one and half lire per diem, but during harvest time he not unfrequently receives from two to three lire. The peasantry of Lower Lombardy are generally in a most miserable condition, badly fed and badly lodged, their hamlets are hotbeds of fever, and from their prevailing want of cleanliness they are especially liable to the ravages of epidemic diseases. In Upper Lombardy, owing to the "metayer" system, the condition of the peasantry is somewhat better, they are at least saved from utter destitution, for should the crop of Indian Corn fail, the landlord provides them with sufficient of that produce for their own sustenance and that of their families. The yield of hay, which is often good both in quality and quantity, is a material of great importance, owing to the large number of cows kept on the dairy farms of Lower Lombardy.

Rye is very little grown in Lombardy, where the soil is better suited for the cultivation of Wheat and Indian Corn. Moreover, as this product does not enter into the ordinary consumption of the country, it meets with no demand. Flax is an important product of the province of Cremona; it is also extensively cultivated in the provinces of Brescia and Bergamo, and in part of the territory of Lodi. Some years ago there was a large export of Flax from the province of Cremona, but there now being in Lombardy several "filatures" for Flax and Hemp, a less quantity is exported.

Georgia, United States.—Of the present state of agriculture in Georgia, it is my opinion, both from a practical knowledge of the same, and from the best information to be obtained, that since the abolition of slavery throughout the State, taken on an average, perhaps one-third less of the number of acres of land may be under cultivation than were planted before that period, and that that portion, now but indifferently worked by free negroes, is not nearly so productive as formerly. When the negro was made free, Georgia lost her agricultural population almost entirely, the negro being the only labourer capable of cultivating the fields, and contending with the climate at the same time. No other population has as yet appeared to take the place of the negro. However abhorrent slavery is, and averse to the feelings of every Englishman, still Georgia had no other resource; that knocked from under her feet, she lies prostrate, unable to recover herself. The freedman, suddenly released from his bonds, entirely unfitted for freedom, looks upon its definition as exemption from labour. He comes to his former owners for assistance when in distress, but forgets them the moment the cause is removed. He, in fact, wishes to revel in all the license of his present freedom and enjoy at the same time all the advantages attached to his former state of slavery. Georgia, never celebrated as a grazing country, raises now but very little stock; her pastures, however fertile, being open to the marauding propensities of the free negroes, are almost useless, and the impoverished state of the Southern farmer has prevented the country being restocked since the war with cattle, sheep, or swine.

San Francisco.—Farming has to be conducted very differently here to what it has in England, or the eastern states of the Union, consequent upon the long drought from May to November, and the intense heat of summer baking the ground to the plough until the rains commence, when work is actively begun, first on the light lands, so as to enable them to hold all the water possible in case of a dry winter, afterwards the low and moist lands are ploughed and prepared for the seed. A quantity of land passed over as worthless, or nearly so, by immigrants in search of farms, is now found to be admirably adapted for the growing of grain under a system very aptly described as follows—The system of summer fallowing prevails to a small extent;

* A Lire is worth about two pence.

to say that the failure took place in the class of agricultural stallions. Of these there were three entries in one section, while the other was a blank, and the three which did come forward were all rejected by the judges. Nor was this state of things from any lack of encouragement. Besides the prizes given by the Royal Dublin Society, a splendid challenge cup was presented by the Royal Agricultural Society of Ireland for the purpose of being awarded "for such pure bred agricultural stallions as may be considered most desirable for improving the breed of draught horses in this country." Owing to the rejection of the horses entered for competition, the cup remains with the Society until next year, when we trust a better claim will be put in for it. The section of agricultural fillies and mares contained, however, some very fair animals, to which awards were made as given in the prize list. The Society, we observe, still continues to offer a prize for the best Spanish sire ass, although it is rarely claimed, and on this occasion the section was blank.

BIRMINGHAM HORSE SHOW

THE fourth annual meeting of this Society has been held this week, and the success which attended it has been even greater than the previous shows. The entries of animals on this occasion were 204, an increase of 54 over last year, and of 71 over 1867. The character of the animals, too, indicated a considerable improvement in the appreciation of these shows by exhibitors; for it was evidently understood that it was useless to send anything that was not really good, or passably so. There were no really bad and "half-middling" animals present on this occasion.

Of thoroughbred stallions for getting hunters there were 10 entries, and 3 present. These were "The Hady," sent by Mr Naylor, of Keltmarsh Hall, Northamptonshire; "Ivanhoff" by Mr Griffiths, Maria Hill, Cheltenham; "Stock nger," by Mr Stephens, Bucknall, Salop; "Amusement," by Mr Westley Richards, of Birmingham; "Dalesman," the most admired horse of the year, by Major Barlow, of Hasketon, Suffolk; "Redoubt," by Mr H Brown, of Monkton, Wiltshire; Mr Manning's "John Russell," Mr Gregory Watson's "Disto," and "The Czar," the property of Fowler Boyd Prime, Esq., Newton Lodge, Monmouth. The 1st prize was awarded to "Dalesman," the strong and elegant chestnut, which was 1st in the recent Lincolnshire meeting, and 2d to the American bred trotter, "Shepherd T Knapp," in Yorkshire, the week after. The 2d was given for "Amusement," a weedy animal, "Ivanhoff," which was 1st two years ago, and 2d to "Motley" last year, being passed over for 3d, "Redoubt" being favoured with that honour.

The hunting classes were a most excellent collection. The grand old bay, "Sprig of Nobility," a horse renowned for taking prizes, was awarded the 1st in the aged class. He is now the property of Major Stapylton, of Helperby, York. Mr McIntosh's "St. Clare," also a well known horse, was 2d, and "Griffin" Mr Berridge, of Barnary was placed 3d. Last year "Mountain Dew" was 1st of this show, the best horse here, however, was undoubtedly Major Barlow's "Topstall." A more accomplished style of minding could not well be possessed, and greater strength in closer compass seldom seen. In regard to his physique "Topstall" may be taken as a model horse. It is not to be wondered at, therefore, that he has carried all before him at the several shows where he has been. Here he of course took the 1st in his class, and he was also awarded Mr Westley Richards' 10 gu. cup for the best hunter. In London he took the 1st in his class, the value of the prize being 50l., in Essex he took 20l., in Suffolk 20l., in Norfolk 30l., and at the Royal the 1st, also 30l. Thus, during this, his first season of appearing in public, "Topstall" has been awarded prizes to the value of 190l. 10s. In the class for hunters under 15½ hands, Mr Westley Richards was awarded the 1st for anything but a taking chestnut, particularly when the good horses by his side are taken into consideration. The 2d prize, Mr Corbet's, of Jumbleton, Mr Humphrey's "Acrobat," a fine old chestnut, and Mr McIntosh's dark brown perfect moving "Voltegeur," were all far before the 1st prize in quality, style, and appearances.

The 4-year-old hunters were an exceedingly good class. Mr Richards was, however, again 1st with a high-bred but far from promising bay. Major Stapylton's strong and staid well-moving chestnut, stood, walked, and galloped like a hunter in every respect. "Chieftain," the property of Mr Jennings, and Mr Berridge's "Shamrock" likewise appeared in most promising form.

The two and 3-year-old colts and fillies were few, and they did not attract much attention.

The hacks, roadsters, and cobs, were a capital collection. In the former Mr Bromley Devonport, M.P., sent a remarkably handsome yearling bay, "Extravagance" by name. Mr Barker's "Bed" the "Wing," a hack 6-year-old and 1½ hands, reaches high, was placed 1st. Mr Cook's "Beauty," a brown mare, is worthy her name, as well as the 2d prize. In the class between 11 and 13 hands, Mr James Hornsby's celebrated animals stepped in to compete. These are "Sambo" and "Beda," a beautiful grey mare to look at and ride. The Yorkshire men the week before last gave the prize against "Sambo," and to the grey mare. This shows how the tastes of men differ, for here are a pair of animals which have always been shown together, and one set of judges have preferred the high-stepping showy action of "Sambo," while other judges have admired the quick but easy and elegant style of the thoroughly-good "Beda." Here the Yorkshire judgment has been confirmed, and the first honour is conferred on the grey mare "Beda."

In the harness horses, Mr Hornsby's "Sambo" and "Beda" were shown as a pair. The prize, however,

was awarded to a fine pair of bright bays, sent by Mr Holmes, of Beverley. Several capital hackneys were sent from the town and neighbourhood of Birmingham. A very elegant chestnut was sent by Messrs. Burbridge & Taylor, of Bradford Street, Birmingham. Mr Joseph Gillman, of Lancaster Street, sent a very good looking white brown hackney. Mr Sanders, of Leamington sent "Peggy," a very clever brown, and Mr Kent, of Spenser Street, Birmingham, sent "Polly," a remarkably elegant dark brown aged mare. Major Stapylton had a splendid 8-year old grey, both as regards appearance and free and fast action.

The ponies were divided into three classes, and a more excellent collection of the various sizes which come under this head we never saw.

The stock cobs and ponies had among them two pure grey Arabs, sent by Mr Clayworth, of Spilsby, Lincolnshire. One of these was very beautiful, and the 1st prize was awarded for him. His reserve price is 300l., and the charge for his sale 2 gu. When we say "King Arthur," the perfect pony which won the 1st prize at Leicester last year, was 2d to the Arab, it will be concluded that the judges had a deservedly high opinion of the Arabian animal.

The dray-horses were but few, and some of the older ones were ridiculously over-fed.

"Honest Tom," the best horse in England, was among the agricultural stallions, and he, of course, took the 1st prize. Mr Manning, of Orlingbury, Wellesborough, Northamptonshire, took the 2d and 3d prizes with "Hercules" and "Black Prince."

The arrangement and management of the show was very creditable to the secretary, Mr Lythall, and all the authorities of the Bingley Hall establishment. The adoption of a card and elastic band for showing the number of each horse on the hat or arm of the rider or leader, was a great convenience, and we hope other societies will follow so cheap and effective a practice. For it often happens that the figures are so small or put so close together, that even if a card be on each side of a horse, it is next to impossible to distinguish the number unless the horse is standing still, and can be closely approached.

Reviews.

Occasional Papers on Veterinary Subjects By William Dick, Founder and Principal of the Edinburgh Veterinary College, &c. With a Memoir by R. O. Pringle, Editor of the "Irish Farmers' Gazette." W. Blackwood & Son, Edinburgh and London.

In his day and generation the late Professor Dick was a name, and in the future his name will be remembered in association with the establishment of the Edinburgh Veterinary College, of which he was the founder and the obtaining of a Charter of Incorporation in which he was prominently concerned.

As an author Mr Dick was but little known, beyond writing occasional articles in agricultural and veterinary journals, he did nothing to add to the literature of his profession, what he did produce, however, was always characterised by that keen appreciation of the practical and disregard of the theoretical which eminently distinguished the writer. From his early associations perhaps he was only safe in the region of facts when he reasoned speculatively he usually arrived at a conclusion directly opposed to one which had been previously deduced from the same premises. His most ardent admirers concentrated their praises in the assertion of his pre-eminence as a practical, never as a scientific man.

Accordingly in the book before us we find a collection of articles which are principally records of the author's observations rather than of his opinions, and as exact and well-defined descriptions of diseases of horses and other animals which came under the writer's notice they are valuable. Mr. Dick's strong bias in favour of the real led him to oppose the idea of a mysterious origin of disease. We see this tendency exemplified in several of his papers, especially in those upon "Foot-rot in Sheep," and "Non-contagious Nature of Epizootic Diseases." Writing of the causes of foot-rot, the author remarks, at p. 95—"The hoofs of sheep, being intended to receive a degree of friction from hard surfaces, are not acted upon when the animal is placed under such circumstances, and the necessary consequence is an overgrowth of the hoof. The crust—the part naturally intended to support the weight of the animal and to endure the greatest share of fatigue—is here allowed to grow out of all due bounds, because the softness of the pasturage upon which it is allowed to present itself, prevents it from being subjected to the friction which the feet of the animal are naturally intended to be exposed to. The crust, therefore, grows unrestrained until it either laps over the sole, like the loose sole of an old shoe, and serves to retain an accumulative earth and filth, or is broken off in detached parts, in some cases exposing the quick, or opening new pores, into which particles of earth or sand force their way, until, reaching the quick, an inflammation is set up, which, in its progress alters or destroys the whole foot."

Again, at page 105, he alludes to the prevalent idea of the infectious character of the disease in the following ironical terms—

"The plague is now known not to be so infectious as it was once thought to be, but the foot-rot will still infect the most extensive downs. The Upas tree may annihilate the existence of all that comes within its pestiferous shade, but what is that to the infection of the foot-rot, when a single sheep will contaminate a

mountain? Nay, it will act even upon parts devoid of vitality, and such, too, as the eccentricity of its action, that it will allow its neighbouring toes to escape, and still infect the whole group."

In the paper upon the "Non-contagious Nature of Epizootic Disease" the same instance is given to illustrate the "infection theory" is uppermost, but, in order to secure adequate evidence, the writer is obliged to state that his choice of illustrations—

At page 200, in reference to the most infectious of an unsound horse, foot and mouth complaint, he writes—

"Its sudden appearance and rapid progress soon proved that it was not propagated by contagion, for when a flock of sheep or a herd of swine, or a large fall of cattle, was attacked, it generally affected the whole of the animals in a night's time, all seemed to be affected, the disease being similar to the eruption of our lips from exposure to cold, or ed herpes. It occurs, however, attacked on the side of a byre, and in some cases almost every alternate cow in the byre being affected, while the other escaped. The disease spread over a great part of the country, but afterwards gradually disappeared, as each variety of the disease being back to a condition of health, and in the case of sheep producing a species of foot-rot, gradually detaching their hoofs."

Pleuro-pneumonia is next alluded to—

"When pleuro-pneumonia followed it was confidently declared by some that it was the result of the previous murrin, and that it also was very contagious, very few, however, who have any knowledge of the disease practically, now believe in its contagious character. It has, however, prevailed to a very great extent, and for a number of years, as an epizootic, and I have no doubt will continue for a considerable time, unless proper means are adopted for its prevention. But what, it will be asked, are these means? Will not a careful separation of the diseased from the healthy do this? Will not a strict quarantine prevent its being communicated to healthy animals? I think not, because it is not, and has not been proved to be, contagious, as I shall endeavour to show."

Lastly, that nothing might be wanting to crown the argument, our author endeavours, in a criticism of Professor Hammond's report on the cattle plague in Galicia, to counteract the belief of the infectious nature of this malady. In reference to the origin of the rinderpest, he writes, at page 225—

"What were the circumstances? I say the want of proper food! Remove the cause and the effects will cease. Had the authorities ordered and enforced the importation of proper food, and given it to the animals, I have no doubt the disease would have subsided. No attempts, however, are made to effect a cure, it is considered so highly contagious, that it is thought that the only way to prevent the spread of the disease is to kill all the cattle that come in contact with a diseased one, and hence the number of victims are enormously increased."

Further at page 230—

"I think it is a pity, that the rinderpest and other diseases have not been more thoroughly investigated in this country, and as nothing can be said in its favour that it is so produced on the Continent, and I believe that it will ultimately be found to arise from causes similar to those prevailing here, and that we have a much safer guarantee against its being brought to this country than either the wholesale slaughter of the cattle, or the carcasses drawn round localities where the disease may have appeared."

The Professor never lived long enough to see, in the progress of the plague in his own country a practical commentary on his argument.

A considerable portion of the volume is filled with the "Proceedings in the Edinburgh Veterinary College," and a memoir of the author of the Veterinary Papers, followed by a list of graduates of his college. By these additions the size of the work is increased, while its interest, except for the Professor's personal friends, is not enhanced.

The Veterinary Papers will well repay the time spent in their perusal, and they will lose nothing in a second edition if they should be associated from their present connection with a record of private and professional feuds belonging to a past period.

Farm Memoranda.

YORKSHIRE. The pleasant prospect of the early part of July is far from being borne out. Around Driffield it is reported that the Wheat ears are very imperfectly filled. In the neighbourhood of Thirsk the same deficiency is prevalent, and the crops are mixed with smut. Tidings from various districts of the county confirm the above statements, and point to the conclusion that a poor yield is inevitable.

HAMPSHIRE AND BERKSHIRE.—A fair estimate may be made of the probable yield, which, from the present state of the crop, and the present and prospect of a drier, is not what a year's production on the ten hills and cold vale land, a partial blight is also prevalent on the heavier crops of the deep leams, but not to any serious extent. Barley is about an average, but blighted where it has been late sown on the downs. Oats are an average crop. Beans, above an average. Peas and Vetches, infested with maggot, but still an average, hay crop, above an average, Swedes, Mangels, and Turnips are safe for a large yield.

EASTERN COUNTIES.—The weather has been unfavourable for harvest operations. A report from Bungay, in Suffolk, states Wheat to be below an average. The weather has also been very unpropitious about Debenham, in the same county. Farmers complain both of quantity and quality in Crowland, Lincolnshire, in the case of Wheat, but Oats and Barley are reported good. Around Kettering, North-

SHANKS'S PATENT LAWN MOWERS FOR 1869.

UNDER THE PATRONAGE
OF
HER MOST GRACIOUS MAJESTY
THE QUEEN,

AND MOST OF THE
PRINCIPAL NOBILITY
OF
GREAT BRITAIN.

SHANKS'S PATENT LAWN MOWERS

ARE ALL FITTED WITH
PATENT DOUBLE-EDGED SOLE PLATES, WIND GUARDS, AND
SELF-SHARPENING REVOLVING CUTTERS.

Advantages possessed by no other Lawn Mowers.

The unprecedented Sale of SHANKS'S LAWN MOWERS for 1868 forms the most convincing testimony of the value and success of the Improvements introduced last Season.

HAND MACHINE.

PRICES—INCLUDING CARRIAGE TO ANY RAILWAY STATION OR SHIPPING PORT IN THE KINGDOM.

SHANKS'S NEW PATENT HAND MACHINE.

10-inch Machine	£3 10 0	Easily Worked By a Lady By a Boy	16-inch Machine	£5 10 0	Easily Worked By a Man By a Man and a Boy By Two Men
12-inch Machine	4 10 0		19-inch Machine	7 15 0	
14-inch Machine	5 10 0		22-inch Machine	8 10 0	
				24-inch Machine	9 0 0	

The Hand Machines are all with Silent Movement

SHANKS'S NEW PATENT PONY and DONKEY MACHINE.

Width of Cutter		If with Patent Delivering Apparatus	
25-inch Machine	£12 10 0	25s extra.	
28-inch Machine	14 10 0	30s "	
30-inch Machine	15 15 0	30s "	

Silent Movement, 12s. 6d. extra.

Boots for Pony, 22s. per set., Ditto for Donkey, 18s. per set.

Every Machine warranted to give ample satisfaction, and, if not approved of, can be at once returned without any expense to the buyer

SHANKS'S NEW PATENT HORSE MACHINE.

Width of Cutter		If with Patent Delivering Apparatus	
30-inch Machine	£19 0 0	30s extra.

ALEXANDER SHANKS AND SON, DENS IRON WORKS, ARBROATH; and
27, LEADENHALL STREET, LONDON, E.C.

27, Leadenhall Street is the only place in London where intending purchasers of Lawn Mowers can choose from a Stock of from 150 to 200 Machines. All sizes kept there, whether for Horse, Pony, or Hand Power.

GREEN'S PATENT SILENS MESSOR,

OR NOISELESS LAWN MOWING, ROLLING, and COLLECTING MACHINES.

BY SPECIAL APPOINTMENT,
MANUFACTURER

TO HER MOST GRACIOUS
MAJESTY THE QUEEN.

The Extraordinary Success of GREEN'S PATENT LAWN MOWERS is an established fact. During the last five years the demand has been unprecedented, which alone is a proof of their superiority over all others. The following are their characteristic features—

- 1st. Simplicity of Construction, every part being free of access.
- 2d. They are worked with far greater ease than any other Lawn Mower.
- 3d. They are the least liable to get out of order.

T GREEN AND SON warrant every Machine to give entire satisfaction, and if not approved of can be returned unconditionally

HAND MACHINES.

To Cut 10 inches	£3 10 0	Suitable for a Lady

to be heard on this subject, not only on account of its importance, but because of the uncertainty of science. Dr. Huxley then proceeded to assert his position, which was that the affirmations of consciousness were unquestionable, and anything that contradicted an affirmation of consciousness was false. Evolutionism did contradict many of these affirmations, and was therefore false. Evolutionism also assumed responsibility and morality. It argued further that the continuance of the selected forms, with the total extinction of the selected forms if they had ever existed, was an objection to the hypothesis which was, moreover, open to all progress.

A very animated discussion then took place. The President asked of the last paper that he was at a loss to see what it had to do with Darwinism. He had some doubts as to the question of the second paper with the subject—Professor Huxley had appeared to have been engaged in a perpetual struggle since he had been in Exeter. The three papers were of different characters. The second was one of which he proposed to take any view whatever. With regard to the third paper, he thought that they should have the most complete connection between science and philosophy, and in the name of philosophy he protested against such a shallow nature of it as that of Dr. McManu. How could the latter give opinions which were essentially the same as those of Bishop Berkeley's conclusions which he did? Let him read Bishop Berkeley's writings which were short. As to the third paper, he said that the affirmations of consciousness being really true did he not know that the foundations of the modern philosophy had been sapped long ago? It was one thing to say that an affirmation of consciousness was absolutely true, and another that any consciousness therefrom was a so-called consciousness. Dr. McManu had carried out because a man must understand before he could believe, but he did complain that he had been misrepresented. He had written in a recent article that the freedom of the human will was the great question of the present day, but he believed it would never be solved, because it lay in the hands of the latest mind. It was not right, he said, to put in a priori a necessitarian. Professor Huxley highly praised Archbishop Freeman for his candour, but he objected to his conclusions. He agreed with the Archbishop in believing that the Bible was intended to teach a moral lesson. The Archbishop's ideas were not new, but he thought the philosophy of biology of Owen and Agassiz were in error. He thought that the uniformity of type and the order to be seen in the lower and was absent from the higher. Dr. Huxley, who had also been criticised by Dr. McManu, said he had no course to defend himself but to read the papers of his adversaries to which reference had been made, and to answer them if they were the constructions put upon them. That was all that he could do, and he therefore retired. Mr. Darwin was a great observer, but by his own admission, he was not a great reasoner. Mr. Huxley pointed out that the papers had been reviewed, and proceeded to give a few statements with regard to Kent's Cavern. He said that the fossil remains and religious men differed in degree and not in kind. There was no possibility of stopping short of the origin of man, a temporary with the fossil animals, and in the origin of man. He had always believed that Moses had written a cosmogony, and he did not yet doubt that it would be some way reconciled with science. There had been a new way of interchange of species, and when they admitted that they must have a number of separate acts of creation, of which there was no evidence. Mr. Wilson said that he considered that any one of the papers ought to have been read that day. If the papers were read, he would be glad to hear of them.

inquiries lately, especially from amateurs, on the subject, I have taken the favourable opportunity afforded by the meeting of Congress to explain my views. I contend, and have no doubt that really practical men will bear me out in this, that there are no fixed rules for gardeners they have to depend so much upon the soil and subsoil of the particular locality in which they have to labour, as well as to obey the laws of Nature, to which they are subject equally with the mariner, who must study his chart otherwise he may find himself amongst the rocks.

As each individual class of plants is governed by natural laws of its own, it practically follows that these furnish our starting point and guide. As we have to grow the Vine in an unnatural climate, and in outside borders, we are bound to bring science and practice to assist us, for I hold that while we consider science all important, still it must not contravene the experience of practice. As regards the Vine, there is no doubt that in several places in England the subsoil suits it completely, and in such cases, of course, it bids defiance to both rule and artifice. I have seen instances where the roots of the Vine have rambed for a considerable distance, permeated through old brick walls and rubble, and become a complete mass of fibres where roots were never thought of.

In the accompanying plan I do not attempt to define the elevation of borders—that must be left to circumstances, being ruled by the general state of the ground, high or low, wet or dry, north or south. Here, in M.D. Cheshire, I should prefer the top of the drainage to be very little below the ground level, and to get as much of

Fig. 1.

Fig. 2.

the border inside the house as possible. The annexed plan (Fig. 2) shows a house 26 feet long and 12 feet wide outside. The front wall of house A should be built on arches, B is the inside border, C are ventilators. These ventilators I would have fitted with trap doors, either of wood or iron, and they are intended first to act as air passages, and secondly to give access to the pipes. By these means you will at any time be able to ascertain the heat of the pipes, amount of moisture, &c., and by providing the pipes with evaporating troughs they can be supplied with water at pleasure. D (in Fig. 1) is the brick rubble for drainage, E soil of border, F concrete.

The outside border is 12 feet wide and is provided with two 3-inch pipes, flow and return, the pipes to be laid on the concrete and in brick flues formed of two bricks set on edge, and a left pigeon hole, the flow pipes to be nearest the house, on account of the pipes in the border, which will be 12 ft. 2 in. thus bringing the return-pipe sufficiently low for free circulation. I propose covering the flues and pipes with flooring tiles set in cement, so as to prevent the heat rising perpendicularly, and compel it to permeate the border horizontally. I am of opinion this is the one great evil in chambered borders. One can just imagine, after the pipes are at rest, if the subsoil and border are at all moist, there must necessarily accumulate a certain amount of moisture in the lower part of border and chamber, and should the surface of the border become dry, the roots will naturally work downwards in search of moisture. Just picture to yourselves a quantity of nice little white tender rootlets hanging through the cavities advised to be left in chambered borders—you start the bottom-heat, and you have no means of ascertaining the heat of your pipes. What must become of those rootlets exposed to you do not know what heat, before there is any circulation in the sap of your Vines? It would be something like sticking one's toes in the fire. This is one reason why I advocate the ventilation at the end, so that we may know exactly the heat of the pipes, &c., there is no necessity for the pipes to be so hot as to kill or injure the roots of the Vines, but they should secure a nice gentle humid general atmosphere.

These disciples of bottom-heating, who would make their chamber of this the border with four rows of pipes, perhaps adopt a surer method, but it seems to me like putting a kettle on top of a chimney to boil it. I think we should get more heat from the two pipes placed under the border, and they would not require to be so hot, at the same time the heat would be much more evenly diffused than by putting four rows of pipes at one side. I should concrete all borders, unless the roots can be prevented from getting down into any unctuous clayey subsoil. It would be out of place here for me to attempt to deal with any other, for it is the kind of subsoil, with the borders outside, in the north of England, that I consider pre-eminently demands bottom-heat, if the Grapes are required to be ripe in April and May. Air-drains from inside of house, crossing the pipe flues, are shown at G. Now, here is another point I must leave to the option of the constructor, whether he chooses to carry these through to the top or front side, but, under any circumstances, I would construct all air drains so that I could stop them at will. Sometimes you may have occasion to stop them to shut out cold winds, sometimes quite the reverse—to stop dry hot winds. I am of opinion that if the border becomes too dry, and you cannot check aeration, this is not only injurious to the roots, but will have a great tendency to infect the Vine with thrips and red spider.

I will not occupy time further than to state, that I have been frequently told by gentlemen amateurs of the inconsistent, unorthodox, and contradictory writings of gardeners. It is very certain that there are men who prefer running the ribs of their pens unmercifully into each other rather than to depart one iota from them—as, for instance, when they hold to their opinion against turf which has had sheep folded upon it, and assert that caired bones and oyster-shells are dangerous nostrums to be avoided, or when they pass a wholesale condemnation upon such Grapes as Lady Downe's, Black Alicante, &c. I should imagine that most practical men would not object to the former, and as to the latter they are indispensable in most establishments, more especially for the market. Few persons will dispute that when new Grapes can be obtained say through the month of April, &c., they are far preferable to late ones, for a nice dish of new Grapes, with their beautiful bloom, and with the foliage in all its freshness, has much the more tempting appearance, but still I consider that late Black Grapes are invaluable to fill up the previous gap. C. A. Pearse, Arley Hall Gardens, Northwich, Cheshire.

SMOKE & VEGETABLE LIFE.

Read at the Manchester Congress, July 1, 1869.

HAVING been employed for more than 20 years in the midst of a manufacturing district during which period trade has very much increased, and living, therefore, for that length of time had to contend against a gradual increase of smoke and other vapours, which are very injurious to vegetable life, I will venture to lay before you a few plain remarks how that offensive and polluted atmosphere has to a certain extent injured, and in some instances destroyed, some of the trees, &c., in this locality.

When I first came to live in Warrington the air was not so full of smoke and other injurious gases as it is at the present time. Some species of plants which then flourished have now disappeared. I have noticed that as manufactures have increased, one species of plant after another has gradually declined in health, and in some instances has become a mere skeleton of what it formerly was, giving a desolate appearance to that county which it once beautified.

Some plants are much more sensitive than others of the effects of an injurious chemically-poisoned atmosphere. When I came to my present situation the Fir and Larch were healthy—these were the first to give way, and the first which had to be cut down. The Cotoneaster macrophylla next died, the Arbor-vita, Juniper, Erica, and common Rosemary followed. What few now exist of these are in a wretched condition, so is Berberis discifolia the Yew, once very vigorous, is all but destroyed, the Rose struggles hard for existence, the Holly is giving way, and none of the Conifers, if planted on these grounds, will live more than two or three years.

Many of the forest trees that flourished 20 years ago are gradually becoming weaker every year, as the air becomes more and more filled with noxious vapours, and some of them are affected sooner than others. The Sycamore, more particularly the variegated variety, is very tender, and is fast decaying, the Horse Chestnut grows vigorously, but is often severely cut waste the foliage is young, and never worse than at present. The Beech and the Lime trees are somewhat stronger than the above, though very far from being healthy. The Ash seems to stand best, and the Elm the next, but all of these are dirty, and are to a considerable extent injured.

Amongst fruit trees the Pear appears to stand best, but is not up to the mark, and the Plum and Damson moderately well, but they are giving way. The Apple is suffering very much, only young trees are at all vigorous, and these not satisfactory, the full-grown trees are very bad, and the fruit very inferior. Both Red and White Currants have suffered severely, being very subject to the attacks of a mite, the leaves then become covered with an adhesive substance, the soot coats them over and kills the leaves, and the leaves falling off in the summer the wood cannot get matured, and the plant ultimately dies. Our Currant trees, that a few years ago were healthy, and produced very fine fruit, are now quite ruined. The Raspberry stands pretty well in more favoured sites, that is, when the air is moderately free from smoke. The Gooseberry is inferior. The fruit of all these plants would soon be

WINE BORDERS THEIR CONSTRUCTION, HEATING, &c.
Read at the Manchester Congress, July 1, 1869.]
My plan I herewith submit to your notice relates especially to the construction, heating, and elevation of wine-borders. There have been so many contradictory and opposite opinions expressed of late upon this subject that it seems a rather hazardous one to venture on, but my plan is simple and economical, and I consider it; and as I have had many

detected in the market as having been grown in a smoky atmosphere.

Many vegetables which grow strongly do well in summer, but when the autumn sets in the heavy air is so filled with poisonous gases that they soon decay. Kidney Beans sometimes drop off as early as October. Cauliflowers do not stand any frost here like they do a short distance from town; even common winter Greens are injured to a considerable degree, and it is only in very mild winters that the Broccoli keeps alive.

Many half-hardy flowering plants do not prosper. The Pelargonium, which grows the best here, has the flowers often discoloured during the night if the atmosphere is of low temperature and charged with chemical vapours. A few plants stand pretty well. The Rhododendron, Aucuba japonica, and the Hawthorn flourish. Some species of plants suffer in all parts of the garden, while others only suffer in some parts. Where the Hawthorn, Rhododendron, and the Yew are planted side by side the two first are healthy, the Yew almost dead. Where some of the delicate plants are considerably sheltered from the passing vapours, they are somewhat healthier than those more exposed to smoke.

The above remarks have reference only to the grounds on which I am employed, and which are peculiarly situated. Some time ago the town lay to the east and north of the Hall and gardens, but now we are surrounded on all sides except directly to the south. Trade has gradually increased, and during the last three or four years the smoke has progressed too. Some of the works are of a very disagreeable kind, dispersing very noxious smells throughout the town, and unquestionably doing a great deal of harm to vegetable life. I have been on the grounds at all hours of the morning and night, and have felt the disagreeable vapours pass in a body when the wind is from the east.

It is on occasions like this that the flowers are found to be discoloured in the morning. Sometimes we find the foliage while in a young state cut in a straight line, and the leaves are found to be withered.

Before those in the surrounding districts, where there are no manufactories. When the wind is from the east we do not suffer so much as when it is from the west. The smoke, which is carried away by the wind, carries away the smoke, and the air is heavy and moist, and the smoke falls quickly to the ground, hanging among the trees, and passing away very slowly; therefore the plants suffer more.

That some works are more deleterious than others we have sufficient proof. On the east side of the town a firm of long standing has lately introduced a fresh branch into its trade. Close to the works are the factory grounds, which, as well as the land adjoining is wooded in the extreme; forest and fruit trees, shrubs, &c., are dead and dying, and are screened from the works being fit to stand, and even these are looking badly.

The outskirts of Warrington are somewhat better. Conifers that will not live at all with us are found in some of the gardens, but not in a satisfactory state. If we go six miles west we come to one of the most desolate places one ever saw, trees and hedges being killed for a considerable distance. The Thorn and Elder appear to be the hardest; miserable remains of these are nearest to this rising town—Widnes, where chemical works are numerous. If we go another six miles north-west we come to St. Helens, another town spreading desolation, trees are dying for miles away from it. East and southward of Warrington, where no works are, the country is fertile, and the foliage rich.

Warrington is a very unhealthy town, and the bark of the country decaying. The Hawthorn, the Ivy, and the Elder, the Privet grows moderately. All vegetables must be vigorous, others will not stand the smoke. Thirty years ago there were large quantities of ridge Cucumbers in the fields, but now he cannot grow them. The water now grow in the town, unless when the season happens to be favoured by a less amount of smoke than we have on an average.

Under circumstances such as these we can only do our best to grow such plants as will withstand the evil, and ask the manufacturers to assist us by reducing that evil, as far as they are able, by consuming the smoke. Some have done so here to a great extent, we must hope others will follow in their steps. We do not know how much might be done by the aid of a persevering, ingenious man. Many of the plants have been recommended.

usefulness in bringing food, but also for producing things of beauty and adornment, and it is the duty of every man to try to accomplish this end. E. Green, Or to Col. the Right Hon. J. Wilson Patten, M.P., Bird Hill, Warrington.

BRIEF NOTES ON ORCHIDS.

[Read at the Manchester Congress, July 22, 1899.]

THIS is undoubtedly the most interesting of all the three kingdoms around us. The growers most do congregate, and many are the fine and extensive collections to be met with in the neighbourhood. I feel, therefore, that in opening this subject here I have undertaken a heavy task, though I shall be dealing with a very popular subject. When I first began to study the Orchid world a few simple rules for the successful cultivation of Orchids, very few were known, and their habits and modes of growth in a state of nature were even less so, so that as a consequence the

were found very difficult to establish in our plant houses. By steady perseverance, however, the mastery was gained over some few plants, which from time to time opened their curious, beautiful, and, in some instances, delicately-scented flowers, each fresh kind that revealed its beauties only increasing our desire for more, which desire has certainly been gratified in a most extraordinary degree during the last few years, by the immense quantities sent to us from their native habitats by various collectors, until at the present time there can be few short of 3000 species in cultivation in European gardens. Many of these produce flowers of surpassing size and beauty, whilst others, though of small size, and dull in colour, and, though not particularly attractive, are generally most exquisitely marked, and curiously formed, and present a beautiful appearance when viewed with a microscope or pocket lens. These plants, which will naturally enough be regarded by the amateur with limited space, but the whole of the species should be carefully preserved in our large Botanic Gardens, for none are more fully aware of the value of some of these small kinds in determining the limits of genera and species, and none can know the value of living specimens for this purpose, better than the systematic botanist.

It is not my intention, however, to occupy time with the history of the introduction and establishment of tropical Orchids into European gardens, although many curious facts are connected therewith, but to offer a little advice upon their management—to repeat, if I may, some things that many here may have heard me insist upon before, and which therefore will not be new to them, but I will hope my observations may reach many beginners. Orchid growing who may find in them something to assist them in the prosecution of their hobby.

Orchids take first rank amongst the plants cultivated in our gardens on account of their extraordinary size and the peculiar and interesting structure of their flowers. They are found in nearly all parts of the world, and are divided into two large sections, viz., the Epiphytal and Terrestrial. The plants comprised in the Epiphytal are the most showy, and are found in the forks or upon the branches of trees at various elevations, whilst the terrestrial ones are mostly found in the more temperate regions, burying their roots under the surface of the ground, and many of them losing their growth in winter.

The growths of orchidaceous plants are commonly called pseudobulbs, but it has occurred to me very frequently that such distinct forms of growth as those presented by Dendrobium, Odontoglossum, Cattleya, Sobralia, Grammatophyllum, Barkeria, Epidendrum, Catasetum, and others equally dissimilar, require some more discriminative term than this, which is applied indiscriminately to all. In the Eastern world Epiphytal Orchids are mostly represented by such forms as Dendrobium, whilst in the Western hemisphere such usages grow as the rule, true, some few genera in the East, such as Cologlyne, &c., are also Epiphytal, and others, put on this form, but they are exceptional. I do not intend giving in detail the cultivation of this, my favourite class of plants, because my views upon this subject have been for some time prominently before the Orchid world, first in the pages of the "Orchid Grower's Manual," and more recently in the three volumes of my "Orchid Growers' Manual," and in Mr. Warner's illustrated "Select Orchidaceous Plants." The conditions which I laid down at the very first were, moderate heat, an abundance of fresh, sweet air and moisture, with full exposure to the sun, but with shade from the direct rays of the sun; and I have never had any reason to change these rules. I have never seen a plant shriveled, or stunted, or withered, or starved, and perishing through heat, or giving plenty of fresh, sweet air, and keeping it properly charged with moisture, my plants never have the "spot." Spot is the great bummer of Orchid amateurs, and indeed, of many old-established Orchid growers, but it is a disease which, if the previously mentioned rules are followed, and, if in addition, care is taken that no rotten or rotting material is near the roots, either in the shape of sour stagnant Moss, or soil, or decomposed wood.

I am quite aware that some eminent men pronounce this disease infectious, and difficult to cure, and that it is produced by the growth of a minute fungus. That the spot-marks on the leaves are caused by a fungus, I firmly believe, but I also as firmly believe that "spot" is the result of bad health, and not the cause of it, for before the fungus can gain a footing on the plant or plants must have been ruined in health, and have thus become a fitting receptacle for the spores of the parasite. The infectious character, I am sure, is an after-effect of the disease, and if a plant in bad health, and with its roots already becoming spotted, they will become infected with the fungus, and the disease will spread, but if a healthy plant is placed side by side with a spotted one, it will not be harmed. This I have thoroughly tested with my own plants, and have had ample opportunity of watching it in other collections, and I can therefore speak upon the matter with confidence. If a plant infected with spot be by chance introduced into a collection entirely free from the disease, it may readily be cured, but not from the moment it is introduced, but it is better to destroy it, and let the plant be taken out of the material in which it is potted, or if on a block of wood let that be removed; then cut away every particle of decayed or decaying roots, wash the plant and roots thoroughly, and replace it in some good sweet living soil; at the

same time attend carefully to the advice previously given regarding the atmosphere and temperature, and the probability is it will not be long before the plant is again in perfect health.

I have adopted this treatment with perfect success myself for the last three years, and am therefore not propounding a mere theory, but advising a system which I have thoroughly tested. Whilst speaking of theories I cannot help expressing my surprise that many of our leading Orchid growers have been so reckless with their valuable plants, as to have sacrificed them for their whole collection in good health, to test some theory propounded by those who have probably never tried it for themselves. I allude to such cases as those of double-gazons in the houses, exposing the plants to the open air during frost, putting them in draughty situations, and many other whims. Many persons still fight for, and uphold these practices, and are continually persuading their friends to adopt them. Now my advice to all Orchid growers is, if your plants are thriving, be careful not to risk them for the sake of experiment. If you must test a theory, do it with a few common plants, and not risk your collections, as many have done. During the past few years I have seen several fine collections, both private and public, ruined because they were subjected to such theories as these.

It is a fact that many of the older cultivators of these plants seem to have been careless of their charms, and in some instances have relinquished their culture entirely. One reason for this has been the use of fire-heat, which at the same time renders the houses unbearable, hence they have been discarded. Another reason in the case of amateurs, has been the buying of hundreds of newly imported plants of one species, overcrowding their houses, and since as extra ones were taken after they are provided, they become unmanageable, and they are carried in disgust, because a thousand plants do not look so well as a hundred did, in the same space, and with the same care. The cool system, as it is called, has been another source of great annoyance to many, but if carried out in a proper manner it greatly enhances the value of these beautiful plants. Many, however, have launched into extremes, and have, by so doing, young beginners especially, by assuring them that such and such species will grow in an ordinary greenhouse, or even out-of-doors. These assertions, which are not true, the plants have naturally a more precarious existence, and have often perished. Now an ordinary greenhouse is a house with a glass roof, and Ericas, and Fuchsias grow in it, and I beg to say the possibility of any Orchid growing in such a house, or health under the same treatment, and in the same atmosphere that these plants enjoy.

That many kinds will grow in a house, as a temperature I readily admit, but they require less of light, and the sun, they must also have much more moisture, and the walls of the house must be kept damp, and the leaves will soon be spotted, and the plants will be ruined. I would not assert that Fuchsias, or other plants, as a rule, that the species enjoying a temperature do not require a decided period of rest, but that a temperature of 50° in winter, with moderate degrees as little above 65° or 70° in summer, will keep a vast quantity of those denominated "Orchids" in perfect health; and as I am of opinion that greater damage may result from the temperature falling a few degrees below the minimum, than from keeping above it, I never rush to the lowest possible degree. If amateurs would but take some interest in the history of their plants, and have the reason to bear upon the facts, they would soon know where, and under what treatment, they succeed.

But while thus strenuously advocating the cool system of cultivation, I must not forget to mention that East Indian kinds, from the low or hot parts, under the impression that many are doing, are not grown because they think the houses are too hot, and are, therefore, not successful. The need not be the case. Some of the most beautiful known are found among the Vanda, and the Saccolabium, and they will but grow in a house, and in a low temperature, the house being in winter, with the heat ranging from 50° to 60°. They enjoy robust health, and in summer they may be kept at the minimum. A collection of East Indian Orchids, I have recently seen quite astonished me, the house was perfectly unbearable, I can compare it to nothing but a steamed oven, and very little or no air was allowed. The consequence was, no one could remain in the place for even a few minutes with any degree of comfort. Orchids required to be kept in such a house, and I should imagine, would soon learn to correct their habits.

With respect to Terrestrial Orchids, nothing comparatively has been done. As a class they have been much neglected, and for no other reason, I think, than that people imagine they are difficult to grow. This is the opinion of 30 years ago, and I have seen many Duss, Satyrium, Pogonia, Epistephium, Habenaria, Pteris, and others, that many of us have established in our gardens. Cases of failure have been noticed, and that is the complete basking they require in the winter season. In their native habitat, their roots will undoubtedly be deep in the moist soil, although the

is probably of more cultural import than their chemical constituents with certain limits...

in consequence. I doubt they would the growing about maintains the vital current at the flood-tide of its power...

As a result of the above, I think it is probable that the phylogenetic structure will be found to be more or less the same...

Has now ready for the sale... CORN MANURE, for Spring Use... SULPHATE of AMMONIA, FISHBONE... OFFICE, 116, Fenchurch Street, E.C.

Autumn Sowing.

ADAM'S NITRO-PHOSPHATE or BLOOD MANURE... This Manure is a very valuable preparation for Autumn Sowing...

The Agricultural Gazette.

SATURDAY, AUGUST 28, 1869. MEETINGS FOR THE ENSUING WEEK: Sept. 2 - Hamburg International Agricultural at Hamburg; Sept. 12 - Cleveland Agriculture at Middleborough.

THERE are no other countries that derive such enormous wealth from agriculture as Russia and the United States. It seems that farming prospers when the land is fertile, even without the aid of science...

In these days of sound political and commercial economy it is a matter of indifference to us whether we draw our supplies from the greatest Empire and despotism, or from the greatest Republic in the world, but we must see that they do not fail us or fall short.

It was the opinion of Mr. McCULLOUGH, one of the most trustworthy of our statisticians, that the over-growing resources of America had been greatly exaggerated, and that the consumption would not be sustained...

The small Wheat crop of the rich soils of the United States is popularly attributed to the slovenly system of cultivation. But this is an error, the cause of the extremely irregular Wheat harvest lies deeper than in mere defects of tillage...

The northern limit may be tolerably well marked by a line drawn from Kingston through Lake Simcoe to Lake Huron. And it is because the inhospitable soil and rigorous climate north of this boundary line preclude the profitable cultivation of Wheat that Canada has disappointed the original expectation of her exporting capabilities...

The rich alluvial plains of Georgia and Louisiana yield less than half the Maize crops that are grown in northern Kentucky. A narrow strip of Wheat land, however, follows the Alleghenies even into the south. Eastward of that range the older and more populous States, with their capital cities, and the wide seaboard with its flourishing coast towns, have in general a very poor soil...

The great Maize and Wheat region is that vast plateau, 700 feet to 900 feet above the sea level, which includes Ohio, Indiana, Illinois, a large part of Kentucky, Tennessee, Missouri, Iowa, Wisconsin, Michigan, and Upper Canada. The Mississippi, the Ohio, and their numerous tributaries are carriers, connected and linked together by canals and numerous lines of railway...

One pioneer after growing 30 bushels per acre in one year, sowed 800 acres the following season, of which 600 acres were killed by frost. In another instance one week of excessively hot weather, after a wet spring, rendered the Wheat nearly worthless. A settler had his yield estimated shortly before harvest at 18 or 20 bushels, but soon after he chose to burn his crop rather than reap it, finding nothing but shrivelled husk in the ear.

A Kentucky gentleman owning 8000 acres of fine rolling prairie, had a crop of 6 bushels an acre on 800 acres, after which he settled down to stock farming, only growing 1000 acres of Indian Corn each year for fattening cattle. The south is supplied chiefly by the Mississippi and its tributaries, by railways, rivers, and canals, which transport the corn of the north-west States. The States that export to Europe do so through their great emporiums—Chicago, Buffalo, and other lake ports, and by means of the great highway existing in the chain of lakes. Buffalo on Lake Erie, connected with New York by the Erie Canal and Hudson River, is the channel of exportation for the greater part of the grain sent to Europe, both from Canada and the States.

In East Canada, Wheat is only grown in a narrow strip along the river St. Lawrence, where the limestone soil is favourable. In Upper Canada the Wheat district extends farther from the river, and some corn is grown for exportation into the States, and eastward by the St. Lawrence to the districts which are not self-supporting. But the wealth of Canada is derived from the lumber trade, not from agriculture, for which she is naturally un fitted by the extreme rigour of the climate, and the poverty of a great portion of the soil.

Cottam's Iron Hurdles, Fencing, and Gates.

COTTAM'S HURDLES are made in the best manner, of superior wrought iron, by an improved method...

WATER TANKS ON APPLICATION.

As Illustrated Price List of Galvanized Iron, and other of BRADY'S Patent Manure, sent on application.

Choice Seeds for Present Sowing.

B. B. WILLIAMS can with confidence offer the following, as being the finest in cultivation... Per pkt. 2s. 6d., 3s. 6d., and 5 0

To the Trade. MRS. PINCE'S MUSCAT VINE, Planting Canes, 6 feet, 42s. per doz. CLEMATIS STANDISHII, very strong, in pots, 75s. per 100.

Grape, Mrs. Pince's Black Muscat. JOSEPH MEREDITH, The Vineyard, Garston, near Liverpool, beg to inform his Patrons and Friends that he has the above excellent variety of MUSCAT GRAPE hanging in the greatest perfection...

New Strawberry, William James Nicholson. WILLIAM LAWRENSON begs to offer to the public, after August 25, plants of the above excellent Strawberry at 10s. per dozen...

Valuable Stove and Greenhouse Plants. TO be SOLD, by Private Contract, a unique Collection of the above, consisting of Rare and Choice ORNAMENTAL FOLIAGED and FLOWERING PLANTS...

H. CANNELL'S AUTUMN CATALOGUE is now ready, and will be sent free for One Stamp. It contains a full description, with lowest prices consistent with quality and accuracy, of all the best new and most distinct varieties of PLARGONIUMS...

To Raisers of Geraniums. H. CANNELL begs to inform all lovers of GERANIUMS that he has a small quantity of Seed of the best Hybridized Zonal in cultivation...

GOLDEN FEATHER. -As this plant has thoroughly proved itself to be the greatest bedding acquisition that has been sent out for many years, H. CANNELL begs to remind all lovers of the garden that now is the best time to sow...

Must be Sold, for want of room. NEW BICOLOR and ZONAL PELARGONIUMS - Large plants of the following kinds taken up from the beds, being lots of cuttings, are offered cheap, viz.:-

VARIEGATED FOLIAGED VARIETIES, very strong and - John Gibson, Lord Lyon, Lucy, Mutabilis, Penelope, Inca, Rubea, Vanguard, Wonderfu.

ZONAL PELARGONIUMS - Gaiety, F & A Smith's Magnificent, & A S's Scarlet Dwarf, F & A S's Perfection, F & A S's de Moray, Wa them Nosegay and Crystal Palace Gem, great improvement on both of Gold and Gold Chain. All at 6s. per dozen.

JAPANESE CHRYSANTHEMUMS - 12 varieties of these new and beautiful flowers, in pots, to bloom this season. 6s. the lot sent out last year at 7s. 6d. each. See Catalogues.

SWEET WILLIAM, 6 distinct varieties, viz. - Auricula Eyed, Hunt's Perfection, Crimson, mixed, double, and striped, 6s. per dozen.

A liberal number of plants thrown in against carriage. DESCRIPTIVE CATALOGUES free on application. 5s. per cent. sent to the Trade. T. L. MAYOS, Seedman, &c., Lugwardine, Hereford.

SUTTONS' IMPORTED FLOWER ROOTS. SUTTON & SONS, SEEDSMEN TO THE QUEEN, READING, BERKS.

having received their FIRST CONSIGNMENT of CHOICEST DUTCH FLOWER ROOTS, Selected by themselves from the leading Growers in Holland, are now prepared to receive orders for their COMPLETE COLLECTIONS for WINTER and SPRING BLOOMING, either for indoor or outdoor cultivation.

- Suttons' £2 2s. Collection, For open ground, Carriage Free, contains-- 24 fine mixed Border Hyacinths, 12 fine mixed Gladiolus, 25 Polyanthus Narcissus, 25 Dac Van Thol Tulips, 25 Pheasant's Eye Narcissus, 12 mixed Single Early Tulips, 25 Double White Narcissus, 12 fine mixed Double Tulips, 50 Double Daffodils, 12 Parrot Tulips, 12 large Campernelle Jonquils, 12 Gesneriana Tulips, 100 fine mixed Double Ranunculus, 50 fine mixed Tulips, 100 Scarlet Turban Ranunculus, 12 Scar et Turban Ranunculus, 25 fine mixed Double Anemones, 12 " English Iris, 25 " Single Anemones, 6 " Spanish Iris, 300 Crocus, in 6 sorts, 6 Liltes, of sorts, 100 Snowdrops, 6 Ferraria pavonia, 50 Winter Aconites, 12 Dog's Tooth Violets, 6 Crown Imperials

- Suttons' £1 1s. Collection, For open ground, Carriage Free, contains-- 12 fine mixed Border Hyacinths, 6 fine mixed Gladiolus, 6 Polyanthus Narcissus, 12 Duc Van Thol Tulips, 12 Pheasant's Eye Narcissus, 6 mixed Single Early Tulips, 12 Double White Narcissus, 6 fine mixed Double Tulips, 25 Double Daffodils, 6 " Parrot Tulips, 12 large Campernelle Jonquils, 6 Gesneriana Tulips, 50 fine mixed Double Ranunculus, 25 fine mixed Tulips, 60 Scarlet Turban Ranunculus, 4 " English Iris, 12 fine mixed Double Anemones, 6 " Spanish Iris, 12 " Single Anemones, 3 Liltes, of sorts, 150 Crocus, 3 sorts, 3 Ferraria pavonia, 50 Snowdrops, 6 Dog's Tooth Violets, 25 Winter Aconites, 3 Crown Imperials

- Suttons' 10s. 6d. Collection, For open ground, contains a choice assortment for a Small Garden.

- Suttons' £2 2s. Collection, For pots or glasses, Carriage Free, contains-- 24 fine Hyacinths, by name, 6 Persian Iris, 12 fine Miniature Hyacinths, do. 6 Peacock Iris, 12 Polyanthus Narcissus, do. 100 Crocus, by name, 12 large Double Jonquils, 12 choice Iris, by name, 12 Single Sweet-scented Jonquils, 6 choice Sparaxis, by name, 12 Scilla præcox, 1 Cyclamen persicum, 12 Single Duc Van Thol Tulips, 1 Jacobea Lily, 12 Double Tournesol Tulips, 2 Lilium lanceifolium album, 50 Early Tulips, 10 sorts, 2 " " rubrum

- Suttons' £1 1s. Collection, For pots or glasses, Carriage Free, contains-- 12 fine Hyacinths, by name, 3 Persian Iris, 6 Miniature Hyacinths, by name, 3 Peacock Iris, 6 Polyanthus Narcissus, do. 50 fine Crocus, by name, 6 Large Double Jonquils, 6 choice Iris, 6 Single Sweet-scented Jonquils, 3 choice Sparaxis, 6 Scilla præcox, 3 choice Orula, 6 Single Duc Van Thol Tulips, 1 Jacobea Lily, 6 Double Tournesol Tulips, 2 Lilium lanceifolium album, 25 Early Tulips, 5 sorts, 1 " " rubrum

- Suttons' 10s. 6d. Collection, For pots or glasses, contains a choice assortment of most useful and showy kinds.

The best 12 Hyacinths for 12s., Extra fine double and single varieties.

For further particulars, with complete Cultural Instructions, see

SUTTONS' AUTUMN CATALOGUE FOR 1869, Gratis and Post Free on application.

Flower Roots and Seeds Carriage Free, except very small parcels.

Five per cent. allowed for cash payments.

SUTTON AND SONS, ROYAL HERB SEED ESTABLISHMENT, READING.

Dutch Flower Roots.

JOHN AND CHARLES LEE have just received their usual large importation of HYACINTHS and other DUTCH ROOTS, in fine sound condition, for which they hope to be favoured with early orders. CATALOGUES post-free on application. Royal Vineyard Nursery and Seed Establishment, Hammersmith, London, W.

Dutch Roots.

LUCOMBE, PINCE, AND CO. beg respectfully to call attention to their new stock of DUTCH ROOTS, which are this year finer than usual. Their NEW BULB CATALOGUE contains all the choicest and most select varieties of Hyacinths, Tulips, Crocuses, Narcissus, Ranunculus, Amaryllis, Gladiolus, Lilliums, &c., &c.

Alba multiflora, Pink.

J. WADSON is now sending out this excellent large white forcing PINK (which gained a First-Class Certificate at the Royal Horticultural Society, South Kensington, May 4, at the Floral Committee, at 7s. 6d. per pair; 5s. per pair when 12 or more are taken. See Gardeners' Chronicle and Gardeners' Magazine, May 8, 1869. A remittance from unknown correspondents. Post Office Orders payable at Hammersmith. J. WADSON, Florist, Wellesley Avenue, Hammersmith, Middlesex.

The Gardeners' Chronicle. SATURDAY, SEPTEMBER 4, 1869.

MEETINGS FOR THE ENSUING WEEK.

- THURSDAY, Sept. 7: Royal Horticultural (Fruit and Floral Committees), at South Kensington 11 A.M. Ditto (General Meeting) 3 P.M. WEDNESDAY, - 8: Royal Caledonian Horticultural Society THURSDAY, - 8: (International Fruit Show).

THE INTERNATIONAL HORTICULTURAL EXHIBITION OF HAMBURGH opened on the 2d inst. Sufficient time has not elapsed for us to be able to give a full report of this important Show, but we may say that it is varied and good. We believe that the following, among other prizes, have been awarded:--HER MAJESTY'S Cup, for Grapes, to Mr. MEREDITH; a Gold Medal to Mr. W. THOMSON, for Golden Champion Grape; Gold Medals for Orchids, to MM. LINDEN and KRAMER, of Flotbeck; for Conifers, to Messrs. SMITH and BARRON; for New Plants, to Messrs. VEITCH & SONS.

SUBJOINED are the ipsissima verba of the recently passed ACT to prevent the ADULTERATION of SEEDS. To Mr. CHARLES SILARPE, of Sleaford, in particular, the public and the trade owe their thanks for the passing of this measure, while the Royal Horticultural Society did good service in calling general attention to the subject by its reports and experiments.

Some of those who have been opposed to the Bill wish to give an impression that colouring Trefoil and White Clover can be proceeded with as before, and as this is calculated to lead people into trouble, it is as well it should be known that legal opinion has been obtained, which shows that if any person uses any artificial means to give an old seed, by dyeing or colouring, the appearance of a new seed, he commits a fraud within the meaning of the Act by giving such seeds the appearance of seeds of another kind. The word "kind" embraces a large meaning, and must be interpreted in conformity with the intention of the Act, to do away with fraud in the seed trade. Old seed is one kind, and new seed another kind. This is the interpretation of the word in the Act by men of great experience, in full legal practice, both in London and the country.

32 & 33 VICT., chap. 112.-1. This Act may be cited as "The Adulteration of Seeds Act, 1869."-2. In this Act the term "to kill seeds" means to destroy by artificial means the vitality or germinating power of such seeds; the term "to dye seeds" means to give to seeds by any process of colouring, dyeing, sulphur-smoking, or other artificial means, the appearance of seeds of another kind.-3. Every person who, with intent to defraud, or to enable another person to defraud, does any of the following things; that is to say, (1), kills or causes to be killed any seeds; or, (2), dyes or causes to be dyed any seeds, or, (3), sells or causes to be sold any killed or dyed seeds, shall be punished as follows; that is to say, (1), for the first offence he shall be liable to a penalty not exceeding 5l.; (2), for the second and any subsequent offence he shall be liable to pay a penalty not exceeding 50l.; moreover, in every case of a second or any subsequent offence against this Act, it shall be lawful for the court, besides inflicting upon the person guilty of such offence the punishment directed by this Act, to order the offender's name, occupation, place of abode, and place of business, and particulars of his punishment under this Act, to be published, at the expense of such offender, in such newspaper or newspapers, or in such other manner as the court may think fit to prescribe.-4. Any forfeiture or penalty under this Act may be recovered, enforced, and applied as follows: In England, before two justices of the peace in manner directed by the Act of the session of the 11th and 12th years of the reign of her present Majesty, chapter 43, intitled "An Act to facilitate the performance of the duties of justices of the peace out of sessions within England and Wales with respect

to summary convictions and orders," and any Act amending the same: In Scotland, in manner directed by The Summary Procedure Act, 1864, and any Act amending the same, or by any police or other Act for the time being in force in any place, and providing for the recovery of forfeitures and penalties. In Ireland, in manner directed by The Petty Sessions (Ireland) Act, 1851, and any Act amending the same; and in Dublin by the Acts regulating the powers of justices of the peace, or of the police of Dublin metropolis. Any jurisdiction by this section authorised to be exercised by two justices may be exercised by any of the following magistrates within their respective jurisdictions; that is to say, as to England, by any metropolitan police magistrate sitting alone at a police court or other appointed place, or by the Lord Mayor or any alderman of the city of London, sitting alone or with others within the said city; as to Scotland, by the sheriff, or sheriff-substitute, or by any police magistrate of a burgh; as to Ireland, by any one or more divisional magistrates of police in the police district of Dublin, and elsewhere by one or more justice or justices of the peace in petty sessions. The term "court" shall include the justices, magistrate, or other person or persons before whom proceedings may be had for the recovery of any forfeiture or penalty.—5. In any proceeding for any offence against this Act, it shall be sufficient to allege that the party accused did the act charged with intent to defraud, or to enable some other person to defraud without alleging an intent to defraud any particular person, or an intent to enable any particular person to defraud any particular person; and on the trial of any such offence it shall not be necessary to prove an intent to defraud any particular person or an intent to enable any particular person to defraud any particular person, but it shall be sufficient to prove that the party accused did the act charged with an intent to defraud or with intent to enable some other person to defraud, or with the intent that any other person might be enabled to defraud.—6. In England where the person who is convicted under this Act thinks himself aggrieved by the conviction, such person may appeal to the next Court of General or Quarter Sessions held not less than 12 days after the day of such conviction for the county or place where the conviction is had, in manner and upon the conditions in and upon which a person aggrieved by a summary conviction under the Act of the session of the 24th and 25th years of the reign of her present Majesty, chapter 96, may appeal in pursuance of the 110th section of the said Act. In Scotland and Ireland, in like cases as in England, an appeal shall lie in manner in that behalf provided by the law of Scotland and of Ireland respectively. A summary conviction under this Act in England shall not be quashed for want of form, or be removed by certiorari; and a warrant of commitment on any such conviction shall not be held void by reason of any defect therein, if it is therein alleged that the person therein named has been convicted, and there is a good conviction to sustain the same.—7. Every complaint under this Act against any person in respect of selling or causing to be sold any killed or dyed seeds shall be commenced within 21 days from the time of the commission of the offence complained of.—8. Whenever any complaint is preferred against any person under this Act, and the court upon the hearing thereof determines that it is not *bona fide* made upon reasonable or probable cause, it shall be lawful for the court in its discretion to direct and order that the prosecutor or other person by whom or at whose instance such complaint has been preferred shall pay unto the accused person the just and reasonable costs, charges, and expenses, to be settled by the court, of such accused person and his witnesses, occasioned by or consequent upon the preferring of such complaint, and upon nonpayment of such costs, charges, and expenses within 14 days after date of such direction and order, it shall be lawful for the court to enforce payment of the same in the same manner as if such costs were a penalty incurred by the person liable to pay the same.—9. Nothing in this Act contained shall prejudice or affect the power of proceeding by indictment or libel in respect of any offence herein provided for; nor shall any proceeding, conviction, or judgment to be had or taken under the provisions hereof against any person prevent, lessen, or impeach any remedy by civil process at law or in equity which any party aggrieved by any offence against this Act might have had if this Act had not been passed.—10. This Act shall commence and take effect on the 1st May, 1870.

In the last issued volume of the "Bulletin of the Federation of the Horticultural Societies of Belgium" is an interesting notice from the pen of M. WESMAEL, of the *PLANES* cultivated in the Belgian Gardens. We do not propose to follow the author through his historical sketch of the genus, and his condensed account of the views as to the number and names of the species held by different botanists, from SPACH, who considered that there was but one, to WILLDENOW, who made four. We must limit ourselves to stating that, in the opinion of M. WESMAEL, and, indeed, of most botanists of the present time, there are two species—*P. orientalis* and *P. occidentalis*; the former a native of Afghanistan, Persia, and other portions of the East, the latter a native of North America. Of *Platanus orientalis*, M. WESMAEL considers that there are in cultivation five varieties—*acerifolia*, *cuneata*, *nepalensis*, *pyramidata*, and *variegata*; and of *P. occidentalis* one variety, which he calls *hispanica*.

Now let us see what are distinguishing points relied on to separate these varieties and species. First we have the form of the leaves, then the circumstance as to whether the hairs are longer or shorter than the little achenes or seed vessels they surround. The habit also serves to separate some of the varieties one from another. To these points of distinction cited by M. WESMAEL, other authors add the comparatively early or late separation of the style.

In *P. occidentalis* the hooked end of the style falls off early, leaving the ripe fruit smooth on the surface. In *P. orientalis*, on the other hand, the styles remain so long that the globes of ripe seed vessels are studded with spines on all sides. We believe very little dependence can be placed on the form of the leaves. It is quite true that it is easy to pick out certain leaves and to say this belongs to *occidentalis* and that to *orientalis*, but then it is often as easy to pick off one and the same tree leaves which in form so closely resemble those of the two species referred to, as not to be distinguishable from them. For instance, the common park *Plane* is correctly referred to *P. orientalis*, variety *acerifolia*, but from it it is easy to select leaves which are not distinguishable from those of *P. occidentalis*, while the leaves of *P. orientalis* are almost protean in their form. The relative length of the hairs surrounding the seed-vessel is a better character, but then unfortunately it is not available for most of the forms found in gardens. In *occidentalis* the hairs are nearly as long as the achenes or nuts, while in *orientalis* they are considerably shorter. Judged by this test, *acerifolia* belongs to *orientalis*. The comparatively early separation of the styles is very marked in herbarium specimens from native American trees, but is much less conspicuous in trees of that kind grown in this country, if indeed there are any *rightly so called* now in the country. There are some who consider that the true *occidentalis* is not to be found now in these islands; but M. WESMAEL admits its presence in Belgium, and we are disposed to think that the large tree in the gardens of the Royal Horticultural Society at Chiswick, next to the Council room, is rightly labelled *occidentalis*. It has the shallow, ovate or triangular lobes to the leaves, and it has the long fruit-hairs assigned to *occidentalis*. Whether we are correct in our assumption or not, there are other differences presented by that particular tree in the longer more slender nuts and the more slender anthers—points which correspond with the dried specimens of American origin, and which contrast with the shorter stouter form of the corresponding parts in *P. orientalis*, and the variety *acerifolia*. Again, the scales covering the young buds are much less downy than those of *orientalis* or *acerifolia*. We have not seen fruit produced on any of the garden varieties enumerated by M. WESMAEL, with the exception of *acerifolia*.

On the whole we think, so far as English gardens and nurseries are concerned, it is not difficult to recognise *P. occidentalis* (Chiswick), *P. orientalis* and its varieties *acerifolia*, *pyramidata* and *variegata*. As to the other varieties, we can but think it a pity to give them scientific names. They are probably all seedling forms of *acerifolia*; thus we have seen in various nurseries plants labelled *acerifolia palmata*, *palmata superba*, *grandifolia*, and others—differing one from the other in size of leaves, form of lobes, degree of hairiness, colour, and other minor points, and even in hardness. We believe it to be next to impossible to definitely characterise these varieties so as to render their recognition easy to others, and shall not attempt the thankless task.

Equally impossible is it to arrive at any certain conclusion as to the point whether or no there were originally two species, or one only; though, when we consider the great variability of the plants, the fact that *P. acerifolia* is, in many points, intermediate between *occidentalis* and *orientalis*, and that the fossil *Plane* tree, described by HEEB, from the miocene beds of Germany and Italy is considered to have had closer analogy with the existing American than with the Oriental form, we cannot but lean to the idea that there was at one time but one species, from which the forms now known have proceeded. Should a *Plane* tree occur in Japan like either of the present races, we should consider the unity theory well nigh established. Recently we have heard of the discovery in Greenland of fossil leaves referred by geologists to this genus, which would seem

to indicate that America was the original home of the *Planes*.

— THE subjoined letter, headed LADY-BIRDS and their ENEMIES, appeared in the *Standard* of the 28th ult.—

"If it be true that the ant contributes in a great measure to the propagation of the aphids by securing the Larvæ and depositing it in their subterranean home free from the destructive inclemency of winter, is it not a curious coincidence that the *Coccinella*, or Lady-bird, the most relentless enemy to the aphids, should on the other hand become a victim to the ant's voracity? But yesterday afternoon whilst rambling in the neighbourhood of Watley Common, my observation was directed to a countless number of dead Lady birds, which literally covered the ground for some yards, and myriads of black ants, about a quarter of an inch long, busily exerting themselves in carrying off the dead bodies of their prey to a large excavation near the summit of a steep bank. My observation, however, was not confined to one spot. Proceeding on my walk I came on as many as four different colonies of these insects all engaged in a similar work. Entertaining some doubt as to whether the ants could really sustain the Lady birds I went a distance of about 1 yard, where I observed some hundreds of the *Coccinella* alight on the surrounding vegetable productions, which was no sooner done than two or three ants immediately went in pursuit, and securing their object by the legs, brought it to the ground, and turning it on its back, as it appeared to me, sucked it to death, the assailants at once going in pursuit of other victims, while a relay of their confederates carried off the dead bodies to their habitation."—JAMES PHILLIPS.

— Serious complaints have reached us as to the mismanagement at the CALEDONIAN HORTICULTURAL SOCIETY'S FRUIT SHOW some three years since, when some of the exhibitors lost a quantity of their fruit. We should not have alluded to a matter which occurred so long since, were it not for the hope that by so doing we may induce the managers to take precautions against the occurrence of such misfortunes at the ensuing show.

— The total number of visitors to the Royal Horticultural Gardens on the anniversary of the late PRINCE CONSORT'S birthday, viz., August 26, was as follows:—S.E. entrance, 85,500; N.E. do., 15,500; N.W. do., 9870. Total, 60,870. It is to be regretted that some more stringent rules as to admission are not enforced, so as to keep back those who do not know how to value the privilege.

— The following is the result of the ROYAL HORTICULTURAL SOCIETY'S EXAMINATION of GARDENERS, July 13, 1869

— The alleged performances of the CONSERVATIVE BOILER have created, as might have been expected, a great flutter among the boiler-makers. The bewildered public will be as much at a loss to choose between competing makers as poor little Nell when she was assured that "Codlin's the man, not Short, by—Codlin. We think the Royal Horticultural Society might at its next provincial show make arrangements for testing these boilers as fairly and fully as possible, so that we might have an authoritative statement to fall back upon. But even then the circumstances of individual cases—the requirements of locality, the management of stokers—are so different, that it would be difficult to fix upon any arbitrary standard. Meanwhile, here is a challenge from Messrs. JONES & SONS, of King Street, Cheap-side, the makers of MONRO'S Cannon boiler (of "We are willing to fix one of our Cannon boilers (of the original make) in any place that may be agreed upon, side by side with a 'Conservative' boiler, which costs half what a Cannon boiler does, including setting (each party bearing his own expense of fixing), and if the Conservative boiler will heat the same quantity of piping in the same time as the Cannon, with half the quantity of fuel (not an eighth part, mind), we will give the inventor of the Conservative boiler a cheque for 100£, and also send a cheque for the same amount to the 'Gardeners' Benevolent Institution,' or any other charity that may be named. Or, if we are allowed to fix one of our 'Improved' Saddle or Cannon boilers, we will agree that the quantity of fuel shall be equal, instead of one-half, as before named, the other conditions remaining the same. We mention this because we have lately introduced some important improvements in the Saddle and Cannon boilers calculated to materially lessen the consumption of fuel and cost of setting."

— The extreme FLUCTUATIONS of TEMPERATURE from sub-tropical heat to sub-arctic cold, which occurred last week, appear to have been experienced pretty generally throughout the country. Dahlias, Vegetable Marrows, and such-like tender stuff suffered to such an extent as to blacken their leaves. A frost so early is most unusual.

— The murder of MDLLE. TINNE in Tripoli, mentioned in our newspaper columns last week, is peculiarly sad. The adventurous lady has succumbed

* Chiswick students.
† This is the only instance in which the whole number of marks has been obtained by any candidate since the commencement of these examinations.

to a more fearful fate even than did her mother, who lost her life in the White Nile district from fever some few years since. Botanists and horticulturists have cause to remember the fate of these heroic ladies, by reason of the publication of the magnificent work, entitled "Plantæ Tinneanæ," mentioned at p. 1169 of our volume for 1867, and in which are described and figured several of the plants collected by M^{rs}. TINNE and her party.

We extract from the Daily Telegraph the following letter respecting the formation of a Flower-giri Brigade for the metropolis, and the injurious REGULATIONS CONCERNING COVENT GARDEN MARKET:

About a month ago you invited discussion on the flower trade of the metropolis. As I believe no dealer in flowers seconded your efforts, I beg the insertion of a few comments in the absence of able correspondents. It is, perhaps, possible to improve the manner in which the flower trade of this metropolis is conducted without establishing a flower girl brigade. There are two classes of retail dealers in flowers, and both labour under conditions unfavourable to the public. It will, perhaps, surprise your readers to learn that until last Easter, only the shopkeepers in Covent Garden were permitted to enter the sacred precincts of the wholesale market until 5 A.M., in order that the tenants of the Duke of Bedford should have the first pick. This rule prevailed at the opening of the Floral Hall, in 1861, and was the chief means of closing it. At Christmas last, a shopkeeper at Knightsbridge, having entered before 5 A.M., was forcibly expelled. This led to several trade meetings, and a memorial to the Bedford office, signed by upwards of 70 growers and dealers in flowers. A deputation was appointed to present it to the Duke's steward; an interview with him was requested. The application was acknowledged, a copy of the memorial for inspection requested, and a promise made to see the deputation. From that time to this no further notice has been taken, beyond opening the market to the public at 4 A.M., the other grievances remaining the same. It would surprise many of your readers to know the amount in value of the cut flower trade of Covent Garden. The wedding orders alone amount to many thousand pounds, and range from one guinea to 100 guineas. These orders have to be executed before 10 A.M.; and in warm weather the flowers must be fresh cut, when the time is too short for any but the market shopkeepers to execute large orders. As they always have as many as they can execute in the season, they are independent; and although flowers in autumn are of little value, a bride's bouquet still costs from one to three guineas in the Centre Avenue. Last year an attempt was made to reopen the Floral Hall. This failed at the moment, more through the general slackness of trade and consequent unwillingness to embark in new enterprises than anything else; but many promised to take stalls at a future time; and as this will probably be the last year the building will be available, perhaps a more successful effort may be made. Among the many projects for the profitable employment of ladies by birth and education, perhaps there are few more promising than bouquet-making in such a place as the Floral Hall; and as many of the aristocracy are members of floral societies for extending and improving production, it is only natural to suppose they will cheerfully support any well organised means for extending the distribution of flowers, and making it an art and occupation for ladies. The regulations of Covent Garden Market, under the Act of Parliament, are so monstrous as to positively exclude more than half the supplies, if strictly carried out. All foreign produce is forbidden market accommodation, as the stands can only be let to growers bringing their produce in their own waggons. Even goods brought by railway from English counties are not allowed an annual stand. I have had goods for many years from Norfolk, Suffolk, Devon, Cornwall, North and South Wales, the Channel Islands, and many other places; but my goods are forbidden, by the Act of Parliament, to be sold on an annual stand, unless taken by the grower in his own wagon. The stands in the flower market are still worse they are allotted in pairs to florists, who, in many cases, only attend the market two or three months in the year, while others that attend the market every month in the year can get no accommodation, the favoured florists only paying toll when they attend the market, and no rent whatever. As the management of the market is about changing hands, through the illness and resignation of the Duke's steward, perhaps a little public discussion at the present moment may lead to a much-needed reform."

The regulations of Covent Garden Market, under the Act of Parliament, are so monstrous as to positively exclude more than half the supplies, if strictly carried out. As the management of the market is about changing hands, through the illness and resignation of the Duke's steward, perhaps a little public discussion at the present moment may lead to a much-needed reform."

We have received from Watcombe Park, near Torquay, some specimens of CONIFERS and other evergreen trees, which go to prove (if proof, indeed, were needed, with the records of such places as Bicton before us), that Devonshire must be a paradise for the arboriculturist. This park, now the property of Mr. VICARY, was, it appears, planted by the late Mr. BRUNELL, C.E., and much labour and money were expended in ornamenting the grounds with rare trees. Among other Coniferous examples now lying before us, we have noble cone-bearing specimens of Picea nobilis, P. Webbiana; P. Webbiana spectabilis, a grand form, with cones 8 inches long; P. cephalonica, Abies Douglasii, and Pinus muricata, with the cones of four successive years; together with Cryptomeria, Libocedrus, Thuopsis, and various Cypresses. Nor are these beautiful trees confined to the Conifers, for along with the foregoing came examples of some remarkably distinct and beautiful forms of Quercus Ilex, namely, latifolia, heterophylla, and dentata, the

latter with narrow, lanceolate, strongly-serrated leaves; also the beautiful but somewhat tender Quercus glabra, Q. marginata, and the curious small-leaved Q. coccoifera. Who wouldn't live amidst such charms?

New Plants.

ORTHOSIPHON STAMINEUS, Bentham in Wallich Plant. Asiat. Rar. 2, p. 13, et in D. C. Prod. xii. p. 32.

Caule herbaceo erecto subramoso, foliis petiolatis ovatis acuminatis grosse dentatis basi cuneatis retundatis vel supremis sub-cordatis; racemis laxis; corollis calyce triplo longioribus tubo subrecto, labio superiore dilatato; genitalibus longissime exsertis Benth. l. c.

At one of the recent meetings of the Floral Committee, Messrs. Veitch & Son exhibited a flowering example of this very pretty labiate plant. Labiate plant? some one may incredulously ask. It is far more like a Cierodendron; and so it is on a superficial glance at the flower; but a more careful observation will soon show of what lineage it really is.

The plant is herbaceous, with numerous much branched purplish hairy stems. The leaves are ovate or deltoid, tapering at the base into a short petiole, coarsely and irregularly toothed, dark green above, with a purplish midrib, glaucous below, with whitish hairs along the veins. The flowers are very numerous, arranged in verticillasters, and these again in racemes at the ends of the branches. The calyx is leafy, tubular below, two-lipped above, the upper lip roundish, the lower one divided into four linear-lanceolate ciliate purplish teeth. The corolla is nearly an inch long, pale lilac-blue in colour (sometimes

object of acquiring information as to the climate of a place; or, secondly, with the immediate object of extending our knowledge of meteorology, regarded as a physical science. Thus, for instance, a certain kind of reduction might be imagined to be of immediate practical benefit in determining whether a certain place might suit a certain class of persons, or a certain class of plants, but yet it might not materially advance our knowledge of meteorology, regarded as a physical science. But, on the other hand, all observations tending to advance our knowledge of meteorology are of undoubted practical benefit. The amount of vapour present in the air is, without doubt, a very important element of climate, inasmuch as this affects in a marked manner the skin of the human body and the leaves of plants; but I am not aware that it has yet been determined by the joint action of naturalists and meteorologists what is the precise physical function which expresses proportionally the effect of moisture upon animal and vegetable life. Is it simply relative humidity? or does not a given relative humidity at a high temperature have a different effect from that which it has when the temperature is low? There is, in fact, an absence of information as to the precise physical formula which is wished by physiologists as expressing the effect of moisture upon organic life. On the other hand, physicists may be presumed to confine themselves to meteorology regarded as a physical science. It is in this latter aspect that I proceed to discuss the question. Regarding meteorology, therefore, as a physical science, it is one of our objects to ascertain the distribution and laws of motion of the dry and wet components of our atmosphere; and it cannot be denied that we are at the present moment in very great ignorance of these laws. With respect to the motion of air in the atmosphere, it cannot be anticipated that we shall ever possess the same sort of knowledge which astronomy gives us regarding the motions of the heavenly bodies, for in the latter case the identity of the object is not lost sight of, while in the former case it is clearly impossible to ascertain the motions of individual particles of air. Our inquiries into the distribution and motion of the elements of our atmosphere must, therefore, be pursued by that method which enables us to ascertain the distribution and motion of any other substance or product, with the individual components of which we find it impracticable to deal. Suppose, for instance, we wish to ascertain the wealth of our country in grain or in spirits, and the distribution of this commodity over the earth's surface. We should, first of all, begin by taking the stock of the commodity corresponding to a given date; we should next keep a strict account of all the imports and exports of the material, as well as of its home production and home consumption. Now, if we have taken stock properly at first, and if our account of the import, the export, the production, and the consumption of our material is accurate and properly kept, it will obviously be unnecessary to take stock a second time. But if these accounts are not kept with sufficient accuracy, or if we suspect that our material leaves us by some secret channel, which we wish to trace, it will clearly be necessary to take stock frequently, and thus a comparison of our various accounts may enable us to detect the place and circumstances of that secret transfer which has hitherto escaped our observation. Applying these principles to the vapour of our atmosphere, what we wish to know is the amount of the material present at any one station at any moment, and also the laws of its motion. It would appear that the best way of measuring the amount present at any moment is by ascertaining the mass of vapour present in a cubic foot of air, mass and volume being fundamental physical conceptions. Next, with regard to the motion of the vapourous constituent, the method of co-ordinates suggested by Dr Robinson would appear to be the natural way of arriving at this. Let us set up at a station two imaginary apertures, one facing north and south, and the other east and west, and gauge the mass of dry air and the mass of moisture that pass these openings in one hour; we shall by this means get the nearest attainable approach to the elements of motion of the atmospheric constituents from hour to hour. We shall not, however, obtain by this means a complete account of this motion, for we have at present no means of measuring its vertical component. This vertical component corresponds in fact to the secret channel in the illustration given above, which we must endeavour to detect by some indirect method. Another thing that ought to be determined is the production or consumption of the vapourous element of our atmosphere as it passes from place to place. This might be done could we keep an accurate account of the evaporation and the precipitation, the two processes by which this element is recruited and consumed. This would, however, be a very difficult observation. Let us now recapitulate what information regarding moisture we can obtain from such complete meteorological observations as are at present made. We have:—1. The mass of vapour actually present at a station from hour to hour. 2. The mass that passes a station in one hour, going east and west. 3. The mass that passes a station in one hour, going north and south. There is wanting 4. The vertical component of the motion of vapour. 5. Its production or consumption as it passes from place to place. These deficiencies may, however, be to some extent overcome by the following considerations:—First, the atmosphere moves as a whole when it moves, the dry and moist air moving together; secondly, dry air is neither capable of production or consumption, but always remains constant in amount. To illustrate this part of the subject, let it be supposed we wish to investigate the vertical motion of the atmosphere at a certain station. Mass this station the imaginary centre of a circle, the circumference of which may be supposed to be studded with other stations at sufficiently frequent intervals, so that we can tell, hour by hour, how much dry air passes in towards the centre of the circle through its circumference, and also how much passes out. Let us suppose that more is passing in than is passing out, or that the imports into the area of the circle are greater than the exports out of it. Now the dry air that passes in is incapable of production or of consumption, and hence the

white), with a straight tube projecting for some distance beyond the calyx, covered with long whitish hairs, and divided above into a two-lipped ringent limb. The lower lip is concave, oblong acute, the upper one also hollow, and divided into three roundish lobes. Filaments, four, slender, nearly equal in length, attached just below the throat of the corolla, hairy at the base, and projecting for a long distance beyond the corolla. The anthers are purple, sub-globose. The four ovaries are surrounded at the base by a thick whitish fleshy disc, which is raised at the anterior portion into a flat lobe (query, is this lobe an indication of a fifth stamen?). The style is as long or longer than the stamens, and equally thread-like, it is divided at its extremity into two ovate flattened stigmatic lobes.

From the beauty of the flowers and the profusion with which they are produced, there is little doubt that this plant will be a favourite with gardeners. In a wild state the blossoms are usually white, but there are varieties with lilac and blue flowers. The plant is a native of Assam, Siam, and several of the islands of the Malay Archipelago, and extends thence to North Australia, thus affording another illustration of the curious relationship between the flora of certain parts of India and the Archipelago, and that of North Australia. How different the flora in other parts of that vast region! It was introduced by Mr. J. G. Veitch from the neighbourhood of Cape York. M. T. M.

BRITISH ASSOCIATION.

FROM the Proceedings in the Mathematical and Physical Section, we make the following selection:—

"Meteorological Reductions," by Dr. Balfour Stewart, F.R.S., superintendent of Kew Observatory.—It will be desirable to preface the method of reduction herein proposed, by a few remarks on the objects contemplated in such reductions. These objects are twofold—firstly, with the immediate

the atmosphere, including its vapourous constituent, the method of co-ordinates suggested by Dr Robinson would appear to be the natural way of arriving at this. Let us set up at a station two imaginary apertures, one facing north and south, and the other east and west, and gauge the mass of dry air and the mass of moisture that pass these openings in one hour; we shall by this means get the nearest attainable approach to the elements of motion of the atmospheric constituents from hour to hour. We shall not, however, obtain by this means a complete account of this motion, for we have at present no means of measuring its vertical component. This vertical component corresponds in fact to the secret channel in the illustration given above, which we must endeavour to detect by some indirect method. Another thing that ought to be determined is the production or consumption of the vapourous element of our atmosphere as it passes from place to place. This might be done could we keep an accurate account of the evaporation and the precipitation, the two processes by which this element is recruited and consumed. This would, however, be a very difficult observation. Let us now recapitulate what information regarding moisture we can obtain from such complete meteorological observations as are at present made. We have:—1. The mass of vapour actually present at a station from hour to hour. 2. The mass that passes a station in one hour, going east and west. 3. The mass that passes a station in one hour, going north and south. There is wanting 4. The vertical component of the motion of vapour. 5. Its production or consumption as it passes from place to place. These deficiencies may, however, be to some extent overcome by the following considerations:—First, the atmosphere moves as a whole when it moves, the dry and moist air moving together; secondly, dry air is neither capable of production or consumption, but always remains constant in amount. To illustrate this part of the subject, let it be supposed we wish to investigate the vertical motion of the atmosphere at a certain station. Mass this station the imaginary centre of a circle, the circumference of which may be supposed to be studded with other stations at sufficiently frequent intervals, so that we can tell, hour by hour, how much dry air passes in towards the centre of the circle through its circumference, and also how much passes out. Let us suppose that more is passing in than is passing out, or that the imports into the area of the circle are greater than the exports out of it. Now the dry air that passes in is incapable of production or of consumption, and hence the

stock of the material at the central station, and in the area generally, ought to be on the increase, since we have imagined the imports to be greater than the exports. If, however, we ascertain from actual observation that the stock of dry air is diminishing instead of increasing, we may be sure that some is carried off by an upward current, which of course carries the moisture with the dry air. So much for the vertical component; and in the next place, with regard to the production or consumption of aqueous vapour as it passes from place to place. Our consideration has hitherto been confined to quantity; let us now define what is meant by the hygrometric quality of the air. It may be represented by the following quotient:—

$$\frac{\text{mass of vapour in a cubic foot}}{\text{mass of dry air in a cubic foot}}$$

Now this quotient can only alter by evaporation, by precipitation, or by mixture. This hygrometric quality of the air may perhaps be considered as a quality sufficiently constant to aid us in tracing the actual motion of air, just as we may make use of the element of saltness to trace the actual path of an oceanic current. But besides this aid, we may make use of it to enable us to tell the precipitation or evaporation. For instance, a very damp air, in passing over a very dry country, may be supposed to emerge less damp, having its hygrometric quality changed; or a very dry air, in passing over a very damp country, may be supposed to emerge less dry, having its quality changed in the opposite direction. Thus, by actual observation of the quality of the air at the time of its reaching some particular tract of land or ocean, and at the time of its leaving it, we may possibly get much better observations of what goes on in the country, as far as this particular research is concerned, than if it were studied with gauges. I should therefore suggest that meteorological observations should, by a system of relation be made to show—(1.) The mass of dry air and of moisture in one cubic foot actually present at each station from hour to hour. (2.) The mass of dry air and of moisture that passes each station, hour by hour, in two lines of direction at right angles to each other, namely, north and south and east and west. When these hourly elements are obtained, they might for seasonal changes be reduced after the method of five-day means, or for the investigation of abrupt changes of weather, such as storms, they might be utilised in some other way. Retaining the belief that meteorology ought to be treated as much as possible with the view, in the first place, of determining the actual motions of our atmosphere and in the next place, of assigning the cause of these, it is not just the greater movements of the atmosphere that will be indicated by five-day means. It ought, however, to be remarked that the observations at any station are subject to the influence of secondary causes probably more so than those of wind. It would appear that this influence ought to be ascertained, and we can make any trustworthiness of the observations regarding the greater movements of our atmosphere. I should, however, remark that the quality of the air, as herein indicated, may be made of immediate use in the study of storms. It has been suggested by Mr. Meldrum, who expresses his concurrence with the above remarks, that in addition to the five-day means indicated above there might be given a brief epitome of the weather. Thus, for instance, "The wind blew from the N.E. at New from January 1st, 1 A.M., to January 4th, 3 P.M., in all 88 hours, at the average velocity of 16 miles an hour, with an average pressure of 30 inches, a temperature of 40° Fahr., and an average hygrometric quality represented by '075." The same remarks had previously occurred to myself, and Mr. Airy also has recently suggested the study of the meteorological phenomena of those periods during which the wind blows in the same direction.

The following paper was read in the Biological Section—

"On the Relative Value of the Characters employed in the Classification of Plants," by Dr. Maxwell T. Masters. This paper was devoted to the consideration of some of the means employed by botanists in classifying the "natural" systems of classification, and to the estimation of the relative value to be attached to these means. The characters treated of were the following:—1. Characters derived from the relative frequency of occurrence of a particular form, or a particular arrangement of organs; 2. Developmental characters, whether "congenital" or "acquired"; 3. Teratological characters; 4. Rudimentary characters; 5. Special physiological characters; 6. Characters dependent on geographical distribution. Illustrations were given in explanation of these matters and for the purpose of showing their application to particular cases. In estimating the value to be attached to certain characters it is necessary to consider the purpose for which they are required. If the object be synthetic, and the characters are to be used to balance so as to be able to group together a large number of forms into one or two large groups, or to divide the world, in the first instance, into the principal characters, as serving to divide the world into two great numbers, then on those dependent on frequency of occurrence and special physiological office, afterwards such others as may be forthcoming. If the object be analytical and discriminative, the special physiological characters demand the first attention, then those which have the most of frequency and immutability, and then those that are congenital. The systematist can very rarely set up to his own standards. Individual cases have to be treated on their own merits—philosophy has to be sacrificed to expediency, and herein shines the light of genius—the tact and insight of a first class naturalist often lead him to make combinations or to adopt forms, on what seem mere grounds of expedience, but which afterwards prove, when fuller evidence is gained, to be strictly consistent with philosophical views.

ON THE CULTURE OF CHRYSANTHEMUMS.

[Read at the Manchester Congress, July 22, 1869.]

It is well known in the horticultural world that in the dull months of November and December the Chrysanthemum assumes an undoubted sway in the conservatory, and I am confident that all who have once witnessed the gorgeous panoramas of colours which a conservatory full of well-grown Chrysanthemums presents at that dull time of the year, when flowers are so scarce, will agree with me when I assert that there is no decorative plant more worthy of general cultivation.

Since the introduction of the new Japanese varieties, the Chrysanthemum may be divided into three principal classes, viz., Large-flowered, Pompons, and Japanese. From Chrysanthemum sinense, which was introduced into this country from China in 1764, our large-flowered varieties were produced, whilst from the Chusan Daisy, sent home by that famous collector, Mr. Fortune, originated the Pompons; and the new Japanese varieties were raised from seed by Mr. Salter, of Hammersmith, from the variety called roseum punctatum, likewise introduced by Mr. Fortune, from Japan. In this paper I purpose to divide my remarks into two parts—first, that relating to outdoor cultivation, secondly, that relating to cultivation for

the conservatory and for exhibition. I wish it to be distinctly understood that the observations which I am about to advance will be of a purely practical character, or confined to matters which have come under my personal experience.

As to outdoor cultivation, I shall briefly say that after five years' practical experience in Hampshire and the same in Lancashire, I find by careful observation that the Chrysanthemum blooms nearly two weeks earlier in the former than in the latter place, and about ten days later in Perthshire and Forfarshire than in Lancashire. From this it will be seen that the Chrysanthemum will amply repay any labour bestowed on its cultivation out-of-doors from Lancashire to Hampshire, more especially in the southern counties, for by protecting them from frost a good display may be maintained from the beginning of November till Christmas; but much display cannot be expected from this plant when cultivated out-of-doors in latitudes north of Lancashire, while in many parts of Scotland no reliance can be placed on its flowering at all out-of-doors, and in some places there, in late seasons, it requires no small amount of cultural skill to bloom it well under glass.

No grower has attained greater celebrity as an outdoor cultivator of this plant than Mr. Broome, of the Temple Gardens, London, who grows annually thousands of Chrysanthemums, which are the daily admiration of thousands of visitors when no other flowers can be seen out-of-doors. I will speak of propagation, and of the treatment of the young plants, under the second division of my subject.

Presuming that the plants have been kept clear of insects during the winter months, they may be planted out in the open ground in the end of March or beginning of April. Dig the ground deeply, and mix with the soil some rich loam, a little well-decayed manure, and some lime rubbish. They will grow in almost any soil, but in this prepared ground better blooms will be insured. After the plants are fairly started into growth, great attention must be paid to watering, for if they are allowed to flag they will become bare of foliage at the bottom. To prevent this, it is good policy to mulch well. When the plants advance in growth, in order to prevent the wind breaking them, they should be secured with sticks. Two stoppings will be sufficient for them in the south, but none is requisite in the north. They should be syringed with clear water twice a day. They generally show their flower buds in September, at which time liquid manure should be supplied. That produced in the farmyard will be found suitable, if no better is at command; it should be well diluted with clear water, say four or five times as much of the latter, according to the strength of the former. They may have this liquid preparation at every alternate watering, until the blooms begin to open, when it must be discontinued. Every available means should now be employed to preserve the beauty of the plants, and to prolong their blooming period. This may be secured by covering up in frosty weather, with tiffany, calico, &c. By attention to this, as I have before stated, a tolerable display may be kept up out-of-doors in mid-winter till Christmas.

I now come to the second division of the subject, viz., cultivation for the conservatory and for exhibition, and I will submit the substance of my mode of culture in this country. I may say, that old plants cut down and treated the same as Pompons, if they break well, generally make the best specimens, but they are not to be much depended upon, for if frequently happens that when a plant is in full bloom, one or several shoots suddenly die off, thereby spoiling the specimen. As early in November as suckers can be obtained from the old plants, they should be taken off, with a little root, if possible, choosing the strongest, and rubbing off all eyes at the bottom of the sucker, after which they should be inserted singly in thumb-pots, in a compost of one half loam and one half leaf-mould, with a sprinkling of silver sand. After a gentle watering they should be placed in a cold frame, plunging the pots in ashes or any similar light material, keeping them close to the glass, and well syringing for two or three weeks, when they will be found to be rooted. A little air may then be given, gradually increasing the quantity until the young plants are sufficiently hardened, still syringing them frequently in mild weather. By the middle of December the roots will have reached the sides of the pots, when the plants may be shifted into 3-inch pots, using less leaf-mould in the compost than formerly. After this time they must have plenty of air on all favourable occasions. Although they will not grow much in the winter months, yet, if kept close to the glass, and in a sunny situation, with a lining of hot manure round the outside of the frame, and by covering up at night, they will keep gradually moving. The sooner the specimens attain the desired size the earlier the stopping may be discontinued, thus giving the grower more time to thoroughly ripen the wood, which I mention is of the very first importance in Chrysanthemum culture, and without which no grower can produce satisfactory results. As soon as the plants have attained the height of 4 or 5 inches their points should be pinched out, which will cause them to throw out several side shoots. All shoots after this time should have their points nipped out after they have made four joints, until the plants have reached the desired size.

About the middle of January the roots of most of them will again have reached the sides of the pots, when they should have another shift, using oyster shells for crocks, and giving plenty of drainage. At this time I make up the compost, in which I put them at every future shifting. It is made up in the following proportions, three parts turfy loam, and the fourth part one half leaf-mould, and the other half pounded oyster shells, lime rubbish and silver sand in equal proportions. The loam is pulled to pieces by the hand, and any wireworms which are found are destroyed. Where bonedust can be had it is preferable

to oyster shells, using it in the proportion of about 1 to 30. The system most generally adopted is to grow the plants on one stem, and now is a good time to rub off all eyes for two inches above the soil. Towards the middle of February they will require another shift, always watering sparingly after shifting, until the roots begin to work in the new soil. They will then begin to grow rapidly, when pegging down must be had recourse to, continuing the same treatment, and fumigating occasionally to keep them clear of insects. About the middle of March they will be ready for another shift, after which any weak shoots ought to be allowed to grow upright for a time, so as to throw more strength into them, at the same time tying down the strong ones to counteract their inclination to growness, for it is of primary importance to have all the shoots of uniform strength, otherwise there will be a diversity in the size of the blooms.

The grower must now decide in what shape he intends to train his plants. This should not be delayed too long, for as the season advances the shoots become harder and stiffer and more brittle; and frequently the breaking of a shoot at this stage spoils a specimen for the season. There are so many fantastic shapes into which the Chrysanthemum may be trained on account of its extreme adaptability to almost any mode of training, that I refrain from recommending one more than another. I would therefore say, let every grower train according to his requirements, or as his fancy may dictate. After trying the upright, squat, pyramidal, standard, and the convex forms, I will merely say that I have found the latter a very simple and effective mode of training. Round the rim of the pot a wire is fitted, to which the shoots may be tied. In bending the shoots down they may be left a little higher in the centre, one shoot by this method can be tied to another, and the framework of the specimen will with very little trouble be formed, so that any future tying will merely consist in filling in the spaces between the shoots.

By the last week in April the plants will by good management be ready to receive their final shift—the large-flowered ones into 12-inch, and the Pompons into 10-inch pots. The plants should now have plenty of room, and should be syringed regularly morning and evening. In May they should be gradually hardened off, previous to being removed out-of-doors, by taking off the lights during the day. About the end of May or beginning of June a sunny but sheltered piece of ground should be selected, and the pots should be plunged to three-fourths of their depth, placing a small inverted pot under each to secure good drainage and exclude worms, leaving sufficient space between the plants to admit light and air, otherwise they will become drawn and weak, and unripe wood will be the result. The plants will require turning round once a week. After the pots are full of roots great attention must be paid to watering, for neglect in this particular will tell its own tale by throwing off a shower of leaves, which not only rapidly detracts from the beauty of the specimen, but expresses a very detrimental effect on the production of good blooms.

During the months of June, July, and August, but little variation of treatment will be required, only the grower should endeavour to have his plants of sufficient size to enable him to give the large-flowered ones their last stopping in the first or second week in June, and the Pompons in the second or third week. In August earwigs and caterpillars must be looked after, the former may be caught by cutting beanstalks into lengths of 4 or 5 inches, placing them on the plants, and examining them in the mornings, the caterpillars must be sought for among the leaves of the plants. If the pots are lifted nearer the surface in this month, it will facilitate the ripening of the wood; and if any of the plants are inclined to be gross, it will be necessary to withhold water from them to some extent, in order to ripen the wood before they show their buds, when they will do in the first week in September. Now is the time to apply liquid manure, and in my opinion the Chrysanthemum should never have any of it until it shows its buds. There may be a few exceptions to this rule, but many who profess to be good growers, and who like to see their specimens make luxuriant growth, administer liberal doses of liquid manure during the growing season—nothing can be more fatal to the formation of good blooms.

Disbudding should now commence. In the performance of this operation care should be taken, in the selection of the buds to be retained, to choose the fullest and most healthy-looking, and leave only one on each shoot in the large-flowered ones. Some of the Pompons, such as Bob, Matamoras, Martha, &c., do best by disbudding to one and on each shoot, and none of them should have more than three left on a shoot. Some of the shoots will be found to be more forward than others, and apt to blossom before them, but by judicious disbudding this may be avoided. This is effected by tapping out the crown or earliest bud of the earliest shoots, leaving a good side bud, and retaining the crown or earliest bud of the late shoots, this will cause all the buds to be equally forward.

About the second week in October the plants should be taken under glass, that is into houses, or pits, where they can be kept from frost, keeping them cool and close to the glass, with abundance of air. If they are wanted for exhibition, the earlier varieties may be kept outside for a week or 10 days longer, protecting them from severe weather; and again the late varieties may be kept in the warmest end of the greenhouse. The plants should now be watered five times a week with liquid manure, applying it 5° warmer than the temperature of the house; this will concentrate the entire energies of the plants in the buds, which will now be swelling rapidly. Towards the end of the month the large-flowered kinds should be tied to neat green sticks, as the blooms will be too heavy for the shoots to support them. The Pompons will require

side or no staking, but should be neatly tied in, so as to present neat compact specimens.

In the last week in October, or the first week in November, they will begin to show colour, when watering and liquid manure should be discontinued. Any of the blooms that are at this time too late should be nipped off, as it is of importance that all of them should be at the same stage of expansion. I prepare my liquid manure in the following manner—I take a tub, which will contain about 80 gallons of water, into which I put a peck of pigeon dung, over which I pour some boiling water to kill insects, and add a peck of soot and one of lime rubbish. I then fill the tub with liquid manure from the farmyard, stir the contents, and skim the scum off previous to using it. I employ it in the proportion of 1 to 6 of clear water in the autumn milder season to make its appearance, to prevent which the leaves should be dusted with flowers of sulphur. About the 20th of November the plants will be in full bloom.

By following the foregoing treatment the cultivator will be enabled to produce large flowering specimens that will carry 150 good blooms, and which will require no dressing, and Pompons with from 150 to 200 blooms, according as they are disbudded, but it is operative that the grower be to a certain extent an enthusiast, a quality without which nothing great has ever been achieved. If specimen blooms are wanted the plants should not be stopped at all, but the side shoots should be allowed to grow upright, disbanding a limited number on each plant, the fewer there are the larger the blooms will be. Treat the plants in every other respect as recommended for specimen plants. Incurved varieties are best for this purpose, as are also in more request now for specimen plants. Some of the sorts, such as Golden Trilby, Princess of Wales, &c., are subject to climatic influences, and do not bear better in some years than in others. Anemone-petalled varieties, although more tender than the others, are very beautiful and well worth growing.

I will not occupy time by giving a list of what I consider the best varieties, as the various catalogues sufficiently describe the most desirable. In conclusion, consider the new Japanese varieties a great acquisition to the conservatory, for although they do not come up to the standard of what is called a florist's flower, they possess the much desired quality of being late bloomers. This, then, is already a point gained, for it is a greater desideratum to have late blooming Chrysanthemums than early ones, flowers are not so scarce in the autumn months as they are in January and February; and as the natural blooming time of the Chrysanthemum is November or December, something is wanted that will bloom naturally for two or three months after Christmas. I think, I think, will soon be accomplished by improving the Japanese varieties. It is true that by growing them in the early and late kind with the assistance of forcing and retarding, the blooming season of the Chrysanthemum may at the present time be extended from September till February; but as they are forced or retarded the blooms will be proportionately inferior, the plant despises the forcing-pit as much as it dislikes the retarding-house.

I trust, therefore, that not only a greater stimulus will henceforth be given to the cultivation of the Chrysanthemum than has hitherto been accorded it, but that encouragement will be held out to raisers of late blooming kinds by offering premiums for late varieties of the Japanese race, whose natural blooming time will be from Christmas onwards, and I have no doubt that we shall have the Chrysanthemum, with its many beautiful and diversified colours, furnishing in brilliant array the most distinguished places on the stages of the conservatory for at least four or five of the most genial months of the year. *R. Fleming, Sandheys.*

HORTICULTURE FOR THE PEOPLE.

(Read at the Manchester Congress, July 22, 1869.)

THIS paper, a rather long and discursive one, was devoted to the consideration of sundry of the obstacles to horticultural progress, and to the means of overcoming them. The following abstract comprises the main points. Alluding to the ill-effects produced by the custom, in some places, of holding flower shows in connection with public-houses, the writer asks—

What tide is it that flows so noiselessly onwards? It is the tide of copper kettles, and Britannia metal teapots, which may be seen dangling from alcohous windows over the doors of hundreds of public-houses in our towns, as incentives for the artisan florist, the cottage gardener to bring his Pansies, his Pinks, his Gooseberries, his Celery to the habitation of the publican. Why, for one exhibition held on right principles, there are hundreds held by the publican; and the good which ought to flow from horticulture—that good which gives a heightening influence to the soul, is wholly dwarfed by its associations with the tide which has already drowned part of the good of horticulture, and annually we see more of it submerged. And if this tide be not stemmed, the time will come when the whole concern will be under the shade of Banias. And can we find fault with him who has the part he acts? Should we not rather blame our people, who show our apathy in allowing so much to be wasted?

The fruits of the system of public-house shows may be seen in many places, and that system will be found to have increased in a greater ratio where our exhibitions have ceased to exist. In proof, I will take one town, whose population is nearly 300,000 souls, and where our own exhibitions have long ceased to be normal. Go through some localities in this town in the autumn months, and you will be convinced from the number that public-house shows must be in a very flourishing condition. And when it is said that a

great many of these shows do not confine the exhibitors to their own produce, it is easy to conjecture the depredations committed amongst the fraternity. Here the land allotments are cultivated by a pack of wolves, who are as ready to prey on their own tribe as on the unwary stranger who may settle amongst them. For rights previous to their little shows, the best disposed have to tend their gardens against the nefarious attacks of their brethren. And many are the bitter curses that have been uttered on fishing, after all their watchfulness, their best stocks of Celery gone from the trench, or their largest Gooseberries no longer potent. And as long as these shows are conducted on the same principle or held under the same auspices, we may as certainly look for the occurrence of these evil results. Therefore, the essayist who would be the champion of horticulture, would be forced to chalk out a new line for exhibitions, such as would not only counteract their present influence, but be calculated to draw votaries by the thousand to the court of Flora who have never yet tasted of her pleasures, before it could be said that he had carried his banner successfully. In accomplishing this, various paths are open to him. He might boldly endeavour to make those public-house shows, legal, or he might humbly ask our great shows to stop and conquer, or again, he might act independently, and start something similar to those latter shows, but on a different footing.

When land societies and horticultural exhibitions were set on motion, we should not have drawn in our ears and trusted to any breeze which might happen to rise to fill the sails. With land societies and exhibitions the good but sprung into life, but how woefully have we failed to nourish its existence. The once healthy plant has become almost leafless. From numerous towns the spirit has completely fled, and in others it drags on but a feeble existence. While we have set these movements afloat to give the people a greater interest in horticulture, what have we done publicly to give them a greater knowledge of its rudiments? Nothing. The one has been fed full to satiety, while the other has been neglected—which would almost warrant me in saying that horticulture has no rudiments, that it requires no teaching: put the seed in the ground, and it will grow and flourish. I might as well say, leave the babe in the cradle, and the child will arise a man. It may truly be urged that literature plays the part of tutor in this respect, that it is the well from which knowledge may be drawn how to cultivate the fruits of the soil; and that it is a tutor within the reach of all. We may have it bound in calf, we have it continually before our eyes in the Press, and we see it gilding the pages of every penny almanack. But on the other hand, can it not be as truly said, that to thousands this well is as a fountain sealed?—no matter how often or how long they may gaze, they remain mere barren spectators. To them literature is worthless, even if it were not so, that would not justify us in withholding other instruction from them. And there is but one way of applying that instruction effectually, and that is, by pouring it into their ears. Thousands higher up in the scale of knowledge require oral help to make them digest their intellectual food; how much more necessary is it, then, to give such help to those who are placed at the lowest part of the scale?

It has been already shown that many of our great horticultural exhibitions have failed to be interesting to the people; and it may be further stated that they are now only patronised by the select few. Year after year our exhibitions have grown in size, and seemed to have concentrated all their energies in pleasing the eye with immense specimens, to the detriment of lesser objects. They were almost bound to pursue this course to see what the skill of the country could do, but at the same time it is to be deplored that they have weighed anchor and sailed away from amongst the people. And if it could be ascertained that they have now exhausted that skill, which it would be most ridiculous to suppose, their order of working might be changed; as it is, their exclusiveness might be altered to the benefit of the profession and the public.

Although horticultural exhibitions have in a measure deserted the more humble exhibitor, yet that is not the sole cause of their decline; for societies have been known to give every encouragement to all classes, and still they have crumbled into nothingness. External influence weighs heavily upon the matter. How often have we seen on the morning of an exhibition the brightest prospects turned into the most gloomy results through unpropitious weather? And the greater our efforts have been, if we are overtaken by that misfortune, the greater will be the effects of the blow. It is to this cause that we may trace the melancholy fact that many of our horticultural exhibitions are dropping off, one by one, from the scene of action. Therefore I cannot attach much importance to our present exhibitions as affording ready means for giving the people a greater knowledge of horticulture. The requirements of the case demand a far wider field for operations than they can give. Their greatness and scantiness in number are their greatest drawback, though at a subsequent period they may render material aid, and receive no little assistance in return.

It is a most significant fact that while our exhibitions have decreased in number, those of the publicans have greatly increased. Therefore I must go to the publican for lessons on Exhibitions for the People. I must go to him who rears an edifice on the ruins of our own undertakings—I must go and see how he manages to make them stand firm while ours are as if they rested on sand. And if I found him working after a very simple manner, I should also find him working none the less effectually. For his own interest he allows as little time as possible to elapse between the payment of wages and his little show, which is generally held on a Saturday evening, and often extends over the Sunday. He gives from 2*l.* to 3*l.*, which, added to the sum subscribed by the exhibitors, constitutes the prize fund.

Admission is very often free, but not more than 2*d.* or 3*d.* is charged at any time. From 5*l.* to 15*l.* are divided in prizes, reaching down to a very small amount; and these exhibitions very seldom fail in a money point of view or yet in attractiveness. In some cases the exhibitors after stazing sit down together to supper, with a view to lay a good foundation for the quantity of drink they may afterwards swallow. Not an intellectual takes place and the following morning those that are sober enough to count their money generally come to the conclusion that they must have borrowed their prize money from Banias, at the rate of 50 per cent.

Much good would be done by setting up similar exhibitions away from the demoralising influence of the public-house. We might not in the first instance be able to win the publican's votaries to our side, but horticulture, long-headed as it is, has still all the vigour of youth, and thousands would join the movement with delight. And why not have similar exhibitions in our schools? Why not have a window-plant show, a Tulip show, a Rose show, a Gooseberry show, a Celery show, or a Potato show in our schools? I have no desire to hurt any person's trade, but I would have all schools, of whatever denomination, wage war against the publican in this respect—not a war of words, but a war of deeds. It is not to name a Britannia metal teapot as a lure for the artisan florist I would hang out a silver one from the school, if he were alive to his own interest, I would be true to the interest of the community. Ministers of nearly every denomination have been found willing to assist in promoting penny readings. Would they not be found willing to embrace the cause of these little shows? Could not one or two individuals in connection with any school be found who have as much knowledge of horticulture as the publican? Until I am fully persuaded that the one class is unwilling, and the other not to be found, but not until then, shall I consider the case to be hopeless. And it would be a happy day for the community, and a bright one for horticulture, when every school had its window-plant show, its Tulip show, its Rose show, its Gooseberry show, and its Potato show to celebrate. I say again that great good would come from the movement, and it is easy to bring it to the test of practical experience. Schools are ready to our hands, the artisan florist impatiently waiting at the door, and England, mother England, has never yet been slow in putting her hand in her pocket for the purpose of blessing her children.

Although strongly advocating the formation of these little shows in our schools, I do not deem them all that is necessary for the well-being of horticulture. However admirably they act as a stimulant, they give little insight into the practice of horticulture. These little shows should embrace a greater number of Flora's beauties—say, beginning in the early spring with Hyacinths, and terminating by the beautiful Narcissus and Foxglove, then Primroses, Violets, and the Cowslip, not forgetting the cottagers' early Sealing.

In prescribing for the knowledge-giving department, something more must be done for it than can be done by mere voluntary effort. I am aware that great good has been achieved by voluntarism, and that great good still remains for it to accomplish. I am also aware that voluntarism has been, and ever will be, capricious, and that its sides are never free from the marks of the spur. Not that I wish to damp its good spirit, but only to place its knowledge-giving department for safety sake, out of reach of its playfulness. But, first of all, let me explain what I mean by this knowledge-giving department, whose duty would be to take up the task where literature leaves off, and labour for its further accomplishments. And what could do this? What could do it effectually? What but a staff of horticultural lecturers—men well qualified for that labour, and men who must be paid for that labour.

I would attach to all our great municipalities one or more of those lecturers, whose title might be that of Horticultural Directors, and whose duty (besides being a consulting authority for the Town Council) would be to give, throughout the season, lectures on horticulture to the people, free of charge, and for which duty such lecturers should receive any sum of money agreed upon by the Council, but not less than, say, 15*0* per annum. Such individuals would soon be surrounded by a host of kindred spirits. Broused to the work by his efforts, they would carry away his utterances to remote corners, and try to emulate him in their schools. And it is just here where voluntarism would come into play, and be of service. This lecturer would, as it were, set the part of the pulpit, which has continually to remind the pen of its duties, without that go-de, that luxury, that soar voluntarism would give the life of a laggard. Many of our mechanics' institutions are sad monuments to its fame. No greater error could be committed than launching measures for the public weal without giving them some fixity. Newfangledness may make them flourish for a season, but in time that wears off, and, like children's toys, one after another is cast aside, until benevolence is ready to cry out in mortification of spirit, See what I have done for them, and mark how they requite me! *Andrew Meikle, Reed Hall, Whalley.*

ON THE APPLICATION OF WATER TO THE ROOTS OF PLANTS GROWING UNDER GLASS.

(Read at the Manchester Congress, July 22, 1869.)

PLANTS, like human beings, breathe, digest, and perspire. These important functions being partially performed by the leaves, it is a common and wise conclusion that whatever kind of treatment best promotes the healthy and free action of these organs, does a proportionate amount of good to the plant. Cleanliness, a pure atmosphere, and a regular and suitable temperature, with a proper amount of light, may be regarded as the leading points favourable to the above

conditions. But notwithstanding that perfection in plant growth depends so much upon the due performance and regulation of these offices, there is another set of organs which plant growing forces upon our attention, and which should have a prior consideration, viz., the roots of the plant, since they may be described as the foundation of it, because according to Nature's laws they are the soonest developed, and are the first substantial agents at work towards forming and building up a plant.

A plant will not sustain life long without its roots, but many instances are known in which roots have lived without branches or leaves for a great length of time, and they have the power of throwing out fresh ones. However, the more a person dives into the vast subject of vegetable life the more complicated and marvellous does it appear, especially the whole machinery of root action and growth, penetrating the earth in every direction in search of food, while confined to the limits of a pot or other vessel they envelop the earth in their mighty network, so tightly, as though they were jealous of the treasures stored up in the soil.

Heat and water are as essential to root formation and growth as they are to wood and leaf development; they must both be present in the atmosphere as well as in the soil, but it is on the artificial application of water to the roots of plants that I purpose offering a few remarks. I have confined my notes to plant growing under glass for the obvious reason that everything growing under these conditions is influenced more or less by the proper application of water. It has long since been a recognised fact that plants search after and obtain food by the agency of their roots, and that the food so obtained is taken up by them in a liquid state and conveyed to the plant for its digestion. No plainer proof of this fact need be sought than the fact that when a plant becomes sufficiently dry at the roots to cause it to flag it soon recovers itself when water is applied to them. Without entering on a discussion of the various other modes by which plants obtain their support, the above facts will convince the most sceptical that water not only affords food to the plant itself, but it has also the power of rendering the chemical parts of a soil soluble, and fit to be taken up by the roots as required. It is therefore very necessary for all those who have charge of plants to use every means in their power towards gaining a thorough knowledge of their wants as regards water at the roots, for it is as easy to give a plant too much water as not to give enough—either extreme being injurious and most disappointing to the cultivator. Let me impress upon beginners, for whom these remarks are principally intended, that such knowledge is not to be gained without considerable experience, and close observation. It will, however, not be very difficult to put my remarks to a practical test, for I am not prepared to lay before you the results of a series of puzzling scientific experiments with water, but simply to lay down a few rules, and to impart some information on watering.

In order that water may be applied to plants under glass in the most beneficial way, it is absolutely necessary to know what relation the temperature of the soil bears to that of the atmosphere of the house. I have tried it many times, and have found that from a 16-size (9-inch) pot downwards, the temperature of the soil is about the same as that of the air, and subject to the same variations, but above that size, and including the largest tubs and other vessels used for plants, the average temperature by day is a degree or two lower, but subject to less variation. In large beds and borders from 2 to 4 feet in depth, and with the surface exposed to the atmosphere of the house, the temperature, on an average, is several degrees lower, with but a trifling variation. From these facts it appears that the larger the bulk of soil the more uniform is the temperature, and this goes far to prove why plants thrive so well when planted-out in borders.

In coming to the next subject, viz., the influence of water on the temperature of the soil, I may remark that during my four years' experiments I have tried all sorts of soils in which house plants are usually grown, and I find that water has the effect of lowering as well as of increasing the temperature of the soil. For instance, water at a temperature of 60° applied to a pot of soil standing at 75° reduces the heat to 67°, but by reversing the experiment, and applying water at 75° to soil at 60°, the temperature rises to 65°, or about one-third of the difference between the two original temperatures. According to another experiment, on applying water of the same temperature as that of the soil, the heat of the latter is increased 2° or 3°, but if the water be 2° colder than the soil, it has no apparent effect on the temperature. From these experiments we may conclude that the nearer the temperature of the water is to that of the soil, all other conditions being favourable, the more progress the plant will make; for although the variations of temperature caused by water, when it is applied either too cold or too warm, are but of temporary duration, yet repeated applications of water, in one or other of these conditions, cause a permanent derangement of the functions of the plants, which no after treatment can thoroughly remedy. Three years ago I selected a batch of two dozen even-sized Cinerarias, and placed them under one structure. One-half were watered with cold water at a chance temperature, while the remainder always had water of the same temperature as that of the house. In three weeks any one might easily have picked out the former, their foliage being of a lighter green, thinner in texture, and not so large as that of the others, their roots were more wiry and less numerous, and the plants were many days later in coming into bloom. I have been in the habit of growing Vines in pots in 12 months, from the eye to the ripening of the fruit, and when the above experiments were tried with them the results were similar, with, in addition, a deal of shanking in the bunches of those Vines which had had cold water applied to them. The

pot Vines which I exhibited at the International Horticultural Exhibition in 1866 were selected from amongst those which were best treated.

The above facts with regard to the application of water to plants will be sufficient to teach the gardener the importance of comparing the temperature of the water with that of the house he enters, before applying it to plants, and then, if proper judgment be exercised, the results cannot fail to be satisfactory.

Before concluding, I feel anxious to call attention to a few irregularities in the system of watering practised in many places, the principal being periodical watering, and not choosing the proper time for it. The former is bad in principle, because it induces the operator to anticipate the dryness of many of his plants, while others will have become so dry as to baffle all efforts to soak the ball of soil by means of the watering-pot. As a natural consequence, many plants are over-watered, while the dryness of others renders it necessary to immerse the whole ball in water, which I should say is as great an evil as the former, because the roots are inactive from drought, and an excess of water suddenly sets them to work, forming a number of irregular and deformed growths, and in some cases decomposition and death follows. As regards the proper time for watering, I am of opinion that the best time is before the house is opened in the morning, or at shutting-up time in the after part of the day; because, as the house is closed to external air, evaporation is not going on so strongly, consequently the action of the roots is steady and progressive, and at all times equal to the demand made upon them by the branches. Excessive dryness or excessive moisture at the root are the great enemies to plant cultivation. *T. Record, Gr. to Col. E. Loyd, Lillesden, Hawkhurst.*

Home Correspondence.

The Royal Horticultural Society.—I have read an article, quoted from the *Notts Guardian*, respecting the Royal Horticultural Society, the writer of which seems to have overlooked a fact seriously affecting the question therein mooted. In the paper where I read it, some previous notices have appeared, written in somewhat the same tone of condemnation of the course which has been pursued by the Royal Horticultural Society since it shifted its garden to Kensington. Let me state at the outset that I am in no way connected with gardening or with the societies, and that I merely ask you to allow me, as "A Looker-on," to notice one or two facts. In the first place, inasmuch as the diminished receipts from exhibitions are attributed to bad management, and it is insinuated that it is the fault of the aristocratical element predominating in the Council at South Kensington, I inquire whether the same cause obtains at the Regent's Park and Crystal Palace? Is it not rather the natural result of three competitors coming into the field? To me it would have appeared a wonderful proof of a growing love for flowers if, when every other kind of trade has been depressed, so wholly a luxury as flowers had not felt it. If, therefore, blame is to be laid on any management, it must certainly be on the score of extravagance in giving prizes larger than could be afforded during such bad times. It will, moreover, probably strike every business man that the usual law of supply and demand will influence the commercial circumstances of societies, and that as an item of "expense" the sum devoted to prizes must vary, unless they choose to sink money. Supposing, then, that the two causes for diminished revenue are—firstly, the springing up of competitors; and secondly, that people will not pay three times over to see the same plants: there are two remedies which may be applied. The managers must set their wits to work to devise continually, not amusing accessories, but novel arrangements of a legitimate character. I well remember Mr. Ewen's first exhibition of foliage plants at Chiswick; and, although with a limited class of subjects, novelties cannot be presented so frequently as at Sydenham, for instance, I think the gardeners will not deserve so large a number of prizes, if they cannot devise some such attractions to give interest to their shows. They must either do this, or the managers of the three exhibitions must resort to the alternative. What this is, is already suggested by other bodies depending for funds on the interest they create in the public mind. Triennial exhibitions in turns must be concocted by the three competing societies, or, like other trades, they will continue to exhaust their strength and weary the public. This course will no doubt be objected to by the select number who year by year receive the prizes, but they must go with the times in one of the two courses indicated. I repeat that I am in no way interested in either of the concerns, and merely have the same superficial acquaintance with the system of floricultural shows which any one else reading your paper may have; but I think the vague and injurious insinuations against the Council of the Royal Horticultural Society which occasionally appear in newspapers are not warranted in the opinion of impartial persons. The Council, we are informed, labours under debt, a considerable source of revenue has fallen off, and as a measure of common prudence they propose an alteration, to save money. This is decried as an injury to the nurserymen, and a failure of the Society's duty. They are sneered at for having years past spent money specially subscribed to form an Italian garden—an ornament without which the money would never have been contributed; they are blamed for neglecting Chiswick because the public forsook it; and all this is attributed to the predominance of the aristocratical element in the management. I have no means of judging whether the trade has not its due influence in this particular Council, I only say that the grounds for blaming it have not yet been made evident to *A Looker-on*.

The Barnes' Testimonial.—Whatever spirit this was

conceived in, it is quite certain that, so far, it has not been very successfully promoted; so much so, that were I in Mr. Barnes' place, I should feel very much inclined to exclaim, 'Save me from my friends!' I am not one who is much prepossessed in favour of testimonials, except in cases of actual need, for it must be confessed that in too many cases the "hat is sent round" as much from dire necessity as from the honour of the thing. Happily for Mr. Barnes he is independent of such eleemosynary aid, and therefore I have no doubt that as a recognition of high moral and professional ability and standing, a shilling or even a penny from a few hundreds or a thousand gardeners would be more grateful to Mr. Barnes' feelings than scores of pounds subscribed by mere personal friends and acquaintances. If this kind of thing is to be encouraged, then I think there are few gardeners in the country more entitled to acknowledgment, for he has opened up a wide store of knowledge to his brethren, so wide that I should say there are few gardeners who can say "I am not indebted to James Barnes for an idea." For my own part, I confess to being indebted to his writings for many useful hints, and I am certain the young gardener cannot read his essays, with which the columns of the *Gardeners' Chronicle* from its first publication to the present time are so well furnished, without rising from their perusal a wiser and a better man. Therefore I say to young gardeners, crowd up your pence, and show, by a few well-filled columns of the *Gardeners' Chronicle*, that you wish to honour the man who has instructed you. *W. P. Ayres, Nottingham, August 25.*

Tritoma Kniphofia Uvaria.—I beg to forward the dimensions of two plants which were planted here three years ago, being then very small specimens.—No. 1, 3½ to 4 feet through, with 100 spikes; No. 2, 2½ to 3 feet through, with 50 spikes. The above are now in full bloom, and can be seen by anyone. *A. Ingram, Gr. to Mrs. Whittaker, Mariners, Westerham.*

Lilium auratum.—Mr. Goode, of Melchet Court, deserves great praise for his pluck in sending his magnificent *Lilium auratum* so long a journey by rail as it is from Romsey to London, but the credit of its growth, from the first purchase of the bulb, through all its successive stages down to within a few months since, is entirely due to Lady Ashburton's late talented gardener, Mr. Cross, to whose industry, perseverance, and great professional capacity, is owing the fact that Melchet Court now possesses one of the finest private collections of show plants in the South of England. I have no doubt but that if Mr. Cross would inform your numerous readers as to the *modus operandi* which he has adopted to produce what must be admitted to be the finest *Lilium auratum* in the kingdom, he would perform a great professional service. It will interest many gardening friends to hear that he has recently engaged himself as gardener to the Rev. T. Philpotts, of Cornwall, a gentleman well known in that county as an enthusiastic horticulturist; and also for many years as the steward of the horticultural department of the Bath and West of England Society's Exhibitions. *A. D.*

Trellised Walls.—Peaches, Nectarines, and Apricots do not succeed on trellised walls, as they do not like draughts behind them. The nearer the fruit is to the wall the better. Wired walls succeed admirably when the wire is strained, so as to sit close to the wall. Mr. Williams, of Woodland House, near here, has a wired wall, and grows most successful crops. Last year I saw them, two trees of the Late Admirable (erroneously called Millet's Miznonne, which is the same as the Royal George) bore magnificent crops, and the largest Peaches I ever saw. I pointed out to Mr. Williams that no other Peaches except the late Admirable and Téton de Venus have that hideous turgid nipple at the apex. To strain the wires tight to the walls, blocks of wood should be let into the wall at both ends; the wires should be placed 6 inches apart horizontally. Had I seen it before I built my walls (about 170 yards) of brick, I should have certainly had mine done in the same way. *W. F. Radcliffe.*

Weather Fluctuations.—The season through which we are passing has been one of the most fluctuating in my experience. Alternations of heat and cold—the latter predominating, have been the rule throughout the west of Scotland. The drought of last summer was very trying, accompanied as it was with intense heat, but the drought of this season has been more long continued, although it has not told with such a withering effect upon the crops, &c., owing to the generally lower temperature that has prevailed. Wells and springs of water, however, have been dried up to a degree in some places, necessitating the interference of authorities to prevent undue waste, even for domestic purposes; and in the town of Greenock, for example, several sugar manufactories are about to be stopped in order to economise the limited supply for the inhabitants. Garden crops are parched up, and bedding plants generally, with the exception of *Pelargoniums*, are in no better plight. Rain has been anxiously looked for, but instead of rain we have had a severe incursion of frost, blackening up *Pelargoniums*, from Mrs. Pollock and Golden Chain to Stella and Treatham Rose. At Meadow Bank, where the situation is on the banks of the freshwater Clyde, the devastation of bedding plants is complete. *Perillas*, *Dahlias*, *Zinnias*, *Chrysanthemums*, and similar plants of a tender nature, have succumbed to a minimum temperature of 27°. There has been such a wave of cold, traversing all low-lying districts in the west and north-west of Scotland, that nothing of a tender nature has escaped, and even the fresh leaves of *Docks* and *Plantains* are totally destroyed. Fields and fields of *Potatoes* that were in beautiful foliage are flattened and blackened to a degree I should say unprecedented. Late crops may be subject to supertuberation from a totally different cause than that of last year, but the general crop is pretty far advanced, although the check will probably have a reaction upon the keeping of the tubers

It is very annoying, after all the labour incident to the propagation, conservation, and moving from place to place of an army of bedding plants, and then the final planting out, to have the pleasure of looking at them thus suddenly and summarily cut off. We have only had 85 consecutive days this season entirely clear of frost. On the 2d of June the thermometer indicated a minimum of 30°, and now on the 30th of August we have a minimum of 27°. To show the fluctuation I append maxima and minima for the last eight days.

	Max	Min		Max	Min
July 23	86	48	July 27	69	56
" 24	86	52	" 28	72	46
" 25	68	45	" 29	54	44
" 26	66	46	" 30	51	27

—and this morning we have the minimum of 31°, with apparently a change looming. Last year flower gardens were in tolerably good condition up to the 19th of October, the thermometer indicating then a maximum of 26°. We therefore had seven weeks' longer duration of the bedding system, which was some remuneration for labour involved, and, moreover, we had no cold to interfere with planting out after the 19th of May. Should weather fluctuations of this kind prevail in subsequent seasons, those so visited will "bottle up" their bedding-out notions and recur to the mixed system. Choice hardy plants are capable of more endurance even in the matter of inflorescence than most of the favourites selected for parterre decoration, and to them eventually our attention must be directed if we wish to prolong the gay season. *Jas. Anderson.*

On Saturday last, the 28th August, we had the hottest day of this season—thermometer at 84° in shade and 100° in the sun; barometer fell rapidly, about 3-10ths of an inch. Sunday we had a stiff gale from north-east, the thermometer barely reaching 56° at noon. Monday bright and cool, with an east wind. This morning (Tuesday) my gardener's salutation was, "Things sadly mauled, sir." On inquiring further I found the minimum thermometer (Negretti's) had registered 27° (5° below freezing). I send you a leaf of Vegetable Marrow, which tells its own tale. French Beans, New Zealand Spinach, Dahlias, and other delicate plants much blackened; Heliotrope in sheltered situations escaped. Has such a frost ever been recorded in the midland counties in the month of August? *W. B., Aug 31*

—This morning (Aug. 31) we had 4° of frost, the wind, which was cutting, was south-east. In the kitchen garden it has destroyed our Vegetable Marrows, Gourds, Kidney Beans, and Potatos; and in the flower garden, Perilla nankinensis, Coleus Verschaffeltii, Heliotropium, Dahlias, and Salvias, are very much disfigured. The Cloth of Gold and Zonal Pelargoniums (except Maid of Kent and Excellent), the Golden Feather Pyrethrum, and other bedding plants appear to have withstood the frost without being much injured. *Quintin Read, Pleasley Vale Gardens, Mansfield.*—The following was the temperature in the shade, at 2 feet from the ground, as observed by me at 6 P.M. on August 25 (9) Fahr. I sent again at nightfall, when there was only just light enough to see the mercury, and it stood then at 85°. This is the highest temperature noted in my experience. The temperature in the sun at 1 o'clock on the same day is given by a neighbour at 136°, but so many items have to be taken into account with thermometers in the sun, that errors are easily made. It is not so with instruments in the shade, and it may be many years before we witness such a temperature attained in the last week of August as 90° at 6 o'clock in the evening. Our climate is truly a variable one, for the same night the wind veered round to the north, and blew a gale, and the morrow, at 2.30 P.M., rain began to fall, and the temperature had dropped to 50° in the shade. *Alex. Forsyth, 9, Islington Square, Salford.*

—On the nights of August 30 and 31 we were visited by frosts, which in exposed situations destroyed the under-named things in the grounds here:—Dahlias, *Amaranthus melancholicus*, Perilla, *Tropaeolums*, Heliotropes, Ageratum, Salvias, Pelargoniums—Mrs. Pollock, Golden Chain, Countess of Warwick, Pink Stella (not first-rate at any time), Christine, Bijou, Crystal Palace Gem, in the same situation, was not so much cut up. Ribbon borders under walls were not so much caught. Vegetable Marrows and Potatos were quite blackened. We are never safe in this neighbourhood to bed-out before June 1, but now it is a question whether we shall be safe to bed-out before September 1. Is the frost of August 30 and 31 to be considered an early or a late frost (early after midsummer)? We have now had our swarms of green-fly, our Lady-birds, and our frost: what have our learned entomologists and meteorologists to say about these visitations?—and will they tell what we are to expect next, so that we may prepare for it; or are we still to accept, as we have to do in most similar cases, that if so and so was not the cause of it, it must be something else? The result we generally find out for ourselves. Gardeners are often twitted on their diversity of opinion, and this both in respect to their arguments and practice. Will any one say how much on this point gardeners differ compared to any other class of men who consider themselves more learned? In July we had the Congress of gardeners at Manchester, and in August there was the Congress of the British Association at Exeter. I read some of the papers and some of the discussions of both meetings. Will any one say how much more unity of opinion on subjects there was amongst our more learned men at Exeter, than in the case of the subjects read at the Congress of gardeners at Manchester? *Wm. Miller, Combe Abbey Gardens.* [Frost (28° Fahr.) was observed at Ashridge, Herts, on the morning of the 1st inst. *EDS*]

Effects of Hot Weather.—There must have been something very unusual in the temperature of August 27 and 28. The extreme heat might be sufficient to account for the firing of several haystacks, and for turning brown the leaves of Lime and Birch trees,

but not for killing plants of Mignonette, and curling up all the blooms upon Hollyhocks in certain parts of my garden, while others a few feet off are uninjured. The most remarkable instance of partiality in burning occurs on a tall blue and white Aconitum, where the top branch has all the flowers scorched, while the other flowers are quite uninjured. *W. T.*

The Wonderful Plant.—In quoting from the "Gardeners' Magazine" a description of a so-called "wonderful plant," you omit the editorial note which I appended, the object of which was to caution the public against a possible deception. Not having seen the wonder, I could not give a critical opinion upon it; but my note concluded with a hint that it was probably not worth seeing. Your mode of dealing with the subject makes me appear the swallower of a cock-and-bull story. *Editor of "Gardeners' Magazine."* [We quoted at secondhand from our contemporary. We give him full credit for penetration, and are quite sure he is too acute to be taken in by such a sham. *EDS.*]

Roses.—Climbing Devonensis has flowered very finely this season, and the bloom fully equals, if it does not surpass, in beauty its parent. It has bloomed here in immense corymbs, and for extraordinary vigour of growth surpasses even that old favourite, Gloire de Dijon. It will shortly supersede every other climbing light Rose. Lamarque and Solfaterre will be cast entirely in the shade by it. The cottagers in this neighbourhood have the fronts of their houses covered with Gloire de Dijon and General Jacqueminot, thanks to local and other floral and horticultural societies for bringing about this very desirable taste for the cultivation of the queen of flowers. Maréchal Niel blooms finely against a south or west wall, but seems very shy at opening its flowers freely when grown as a standard in this locality. *A Godwin, Ashbourne*

Lady-birds.—Southampton and its neighbourhood has had its visitation of these pretty little insects. There was quite a shower of them on the 28th ult. On examining some small Apple trees I found many of the shoots were greatly infested with green-fly. Here I also found the Lady-birds in considerable numbers, and seemingly busy devouring the pests. Wishing, however, to ascertain, if possible, more closely, whether the aphides were really destroyed, or only sucked, as the ants are said to suck them, I gathered a few leaves, upon which there might have been 100 insects, and these, together with a Lady-bird, I placed upon a plate and covered all with a glass; after 48 hours, upon examining it, I could not detect that any of the aphides were touched, as all seemed to be alive. Had I accepted the result of this experiment as a correct one I should, however, have committed a mistake, as upon examining the Apple trees I found the whole of the green-fly had been devoured. Not a live one was to be seen. Singularly, also, those of the trees that had been free from blight were entirely free from Lady-birds. *A D*—I find these insects are not particular as regards diet—they appear to be equally as fond of vegetables as of insect food, they attack Pears and Plums here at an equal ratio with the wasps and flies, which have appeared in overwhelming numbers the last few days. *J. Edlington.*

—In reply to Mr. Fish's inquiry as to Lady-birds eating green-fly, I beg to say that I have often seen them in their grasp, and therefore conclude that they eat them. One of my boys brought me one a short time ago, and said, "Look, father, here is a Lady-bird with a green-fly in its mouth," and turning it over I saw such was the case. I have often fed them and the larvæ by giving them flies from the point of a knife or stick, and I value them so highly that I set my children on fine days in winter to search for them to put in my forcing-house among Dahlias, and I have no doubt but that they keep them clean. Early this season my Roses swarmed with fly, so that I had to wash the blooms with a brush and water before using them, but a few Lady-birds made their appearance; then I noticed some patches of eggs under the leaves, and I soon had a swarm of Lady-birds at work, which cleared my Roses from their enemies. About 15 years ago I noticed under the leaves of a Dahlia that was infested badly with black-fly, some patches of yellowish-looking eggs, which I believe were those of Lady-birds; these hatched, and in three days the larvæ cleaned the plant. There is also a small red spider, whose body is about the size of a hemp-seed, which I have no doubt whatever feeds on green-fly; I have often fed them from the point of a knife, and have seen them suddenly stop and seize the fly. These are also collected by my children on sunny days in winter for the purposes above mentioned. *George Rawlings, Romford, Aug. 30*—The following remarks by "F. R. S.," printed in the *Times*, are worth adding to the information you have already given respecting the swarm of Lady-birds with which we have been visited, and which it has been assumed have been developed in the places where they have been observed. This, "F. R. S.," says, was certainly not the case, and here is his proof:—"During the 14th, 15th, and 16th of August countless multitudes of the little red beetles appeared upon the coasts of Kent and Sussex. They were most numerous close to the shore—tens of thousands perished in the sea near the land. They extended far inland, and on Sunday, the 15th, myriads were seen in London and its neighbourhood. But the largest assemblages by far were on the east coast, especially at the points nearest to the Continent—this at a time when there was a continuous east wind. On the Sunday in question a scientific friend of mine well qualified to observe and record facts of natural history, was fortunate to witness the actual arrival of one of these swarms. When walking on Dover Pier, after morning service, he observed an enormous multitude of these insects, like a cloud, coming over the sea, as if from Calais. They were flying from east to west. Large numbers fell into the water, others covered the pier-head as with a red carpet, but the great mass flew on

westward, and, as they passed overhead, looked to those who gazed upwards like the interminable flakes of a thick snow-storm as seen from below. A similar occurrence had been seen the same morning. It would be preposterous to imagine that these swarms of Lady-birds had flown to sea in the teeth of an east wind, simply to be blown back again. When we remember the smallness and feebleness of some of our migratory birds, that cross the seas to this country during the stormy weather of early spring, the advent of the swarms of Lady-birds is robbed of much of its wonder. But the interesting question remains—Whence came they? Where did they collect in such prodigious numbers? What was the home that fed the larvæ from which the beetles sprang? Or if, as seems probable, that they had many homes, what impulse brought together these millions for a common emigration?" *Z.*

Lettuces.—I find Hicks' Hardy White Cos a most distinct and valuable Cos Lettuce. If it proves as good a winter Lettuce as it has turned out here this season, its good properties will be considerably enhanced. I am now cutting huge fellows from plants spring sown, and notwithstanding the excessive drought there is no tendency in this variety to "bolt." Where Cabbage Lettuces are at all in demand, the new French Spotted is undoubtedly one of the best to grow for summer purposes. It grows to a large size when well cultivated, and stands well, without the least tendency to run to seed. I consider it a most useful kind, especially for small gardens and cottagers, where a Lettuce, whether Cos or Cabbage, is an object. *J. Edlington.*

Unheated Orchard-Houses.—I fully endorse Mr. Thomson's remarks regarding a deficient crop in these structures this season. I have a house here unheated, and it is as fruitless as his. Mine is not the only one, for I have seen several in the same category. Our trees are healthy, blight is out of the question; like Peaches and Apricots out-of-doors, they failed to set their fruit in spring, through the extraordinary early warm season, then the extraordinary cold just at the time the warm and genial weather was required. *John Edlington.*

Wellingtonia gigantea.—Some years ago a very laudable emulation existed amongst those who possessed specimens of the first batch of this tree, and the length, circumference of bole, and diameter of branches were duly recorded. Of late years, however, this practice has been discontinued; is it in consequence of some of the best specimens dying off? or has the interest in the tree abated? I am unwilling to believe either of these cases, although, from some specimens I have seen, the "going off" of the tree in more than one place creates uneasiness as to its attaining even the size of ordinary native trees; at all events, inquiry is wanted, and I hope those who have lost fine specimens from causes which they cannot account for will publish their losses, which are as important portions of knowledge as the successes of others whose trees still exhibit all the signs of undiminished vigour. It would also be well to inquire how the tree fared in the severe winter of 1855-57, and how it got through the dry summer of last year, and whether the present dry summer has told in any way upon it. All these matters are well worth inquiry, as it would be equally unjust to withhold the good character the tree once had as to give it a better one than it deserves. If, therefore, it threatens to "go off" from some constitutional debility not easily remedied, then let it take its place amongst trees whose usefulness ranks in the second class; if, on the other hand, the cases where it has succumbed be traced to local or special causes, not likely to affect its ultimate usefulness, then let its merits be fully known by those having the best specimens reporting to the world their size, and the number of years they have taken to attain their dimensions, with other information on the matter. *Conifer.*

Hardy Herbaceous Plants.—Allow me to remind amateurs that early in the autumn is the best of all seasons for transplanting most kinds of perennials; and that the finest display of flowers next year will come from those plants which have been moved immediately after the first heavy showers that fall during this month. *W. T.*

Althæa frutex.—Will some of your correspondents well versed in the varieties of this shrub give us a list of the most showy, and any other hint as to their culture, for the plant certainly deserves more attention than it often receives? Its fine Geranium-like blooms present themselves at a time when but few shrub flowers are to be had, and the habit of the plant is far from being objectionable. I should much like to see it more patronised, and cannot but think its present neglect arises from its beauties not being sufficiently known; but as it is now just coming into bloom, I hope those having good collections of it will duly report them. *C.* [There is a fine series at Battersea Park. *EDS.*]

Cedar of Lebanon.—In the grounds of Upper Gattou, near Redhill, there are some very fine specimens of this Cedar. One tree in particular is worthy of notice for its large size. The circumference at 1 foot 6 inches from the ground is 23 feet 6 inches; at this point there are three large limbs stretching out almost horizontally, whose circumference is respectively 7 feet 6 inches, 6 feet 9 inches, and 6 feet 7 inches; at 5 feet from the ground the measurement is the same as at 18 inches. At 6 feet it divides into four principal limbs, each a tree in itself, their circumference being 12 feet 4 inches, 11 feet 7 inches, 8 feet 9 inches, and 8 feet 9 inches. The diameter of the spread of branches is 95 feet, height, 60 feet. The snow-storm of January, 1866, injured this tree very much, which has marred its symmetry, several fine limbs on the north-east side being broken off. *J. Creer, Shabden Park.*

Gnat's Bane.—Being much troubled with gnats, and not having any Rosemary, which, they say, will drive them away, I put some bruised Southern-wood (called here Boy's-love) on my children's pillow, and have not

found them bitten since; but as we had a frost in the night sufficient to blacken the leaves of a Vegetable Marrow in a pit which was exposed, I cannot be quite sure it was owing to this plant that they escaped, but it is well worth trying, as few things irritate the blood so much as severe frost bites.

Oak Tree in a Bottle—In reply to your invitation (p. 931) for suggestions respecting the cause of diseased growths of acorns, both in a corked bottle and in an open Hyacinth glass, I submit the following experiments for consideration. Having twisted a fine piece of stiff wire round an inch of candle-end, or taper lower it when lighted to the bottom of a decanter, and put in the stopper; of course it goes out—any child can tell you why. Light it and lower it again, but do not put in any cork this time, and it still will not burn. How is this? Next, cut out of a stiff piece of cardboard a large letter T, of such a size that the upright part of it will just drop easily into the neck of the decanter; now light and lower the taper again, and put in this T-shaped card, the flame at first may show symptoms of going out, as if not quite at home in its new sphere, but quickly reconciles itself to circumstances under which it has no control, and burns brightly. In order to understand fully the influence which the card-board has in keeping the candle alight, you have only to turn the letter T in the bottle, so that one of its arms shall be towards you, and to hold near the opposite arm a piece of brown paper that has been lighted and blown out; you will at once see the smoke drawn down one-half of the neck of the decanter, while the other half remains clear. This indicates that a circulation of air has been established, and while the heated impure air is ascending one side of the card, fresh air is descending on the other side of the partition, and supplying the oxygen necessary for keeping the flame alive. Now I apprehend that, prior to the formation of leaves on the young Oak tree, the fresh air requirements of the plant are not great; and that, while there would be no more circulation in an open Hyacinth glass than there is in an old well with foul air in it, the fact of a cork not fitting tightly, or the mere influence of the thread between the cork and the bottle, might give opportunity for sufficient circulation. W. T. Ingenious, but inapplicable to the case of the Hyacinth glasses, from the neck of which the acorn was suspended by a thread attached to a piece of wood, nearly half an inch in depth, which would play the part of the T-shaped card. In other words, the cellular outgrowths were formed not only where the air was stagnant, but also in the open glass, where there was more or less circulation of air. Eds.]

Iron Pipe Blocked—I have no doubt but that the "spongy material" which has blocked up "A Very Old Subscriber's" pipes (p. 896), is the same pest which gave me so much trouble here in the lead pipes for several years. It grew much faster in the summer that it did in the winter. My remedy was common salt, which destroyed it, but it had to be repeated generally three times during the summer, and as nearly eight days was required each time in its removal, and it passed through the pipe, it was used in great quantity, and very much later, and with the arrangement of the garden. Last winter I had 200 yards of the lead pipe taken up, and 2-inch gas socket pipes put in its place, in the hope that the substance (animal or vegetable) might not like the cast-iron, but, I confess, your correspondent's statement makes me feel very uneasy. The lead pipe had been down about 25 years when the Polype first made its appearance. I have often searched in the pond, but never could find the slightest trace of it there, although the holes of the "cullender" were often quite choked. D. Buchanan, Dyrham Park.

Golden Champion Grape—Having bought a plant of this fine new sort in the autumn of 1868, I was in some measure disappointed with its condition, as it bore evidence of some peculiar temperament or treatment. The plant was about 2 feet in length, a bit of which was brown, the rest was possessed of tattered, ill-developed, meagre-looking leaves, and although it seemed a doubtful representative of so great a name, I resolved to treat it kindly, and immediately placed it in gentle bottom-heat, keeping it on the dry side, and cut it down to two eyes the following winter. I started it into growth by means of bottom-heat at the middle of March, as soon as it made 15 inches growth, which was at the 25th of April. It was then inarched on a two-year-old Hamburgh Vine. It took hold well, and was severed from its own roots after the lapse of four weeks; its leaves became flaccid pro tem., but soon revived, and it is now a strong rod 25 feet in length, with several lateral shoots of 3 feet. With this ocular demonstration of its exuberance, I feel hopeful that its other important and signal qualities will follow in their turn. John Reid, Haugh Hall Gardens, Aug. 31.—I bought a medium sized plant of this new Vine late last autumn. After cutting it down, and resting it in the usual manner until February, it was put into a pit, and was potted in leaves until it commenced to grow. I then potted it into an 11 inch pot, and grew it among as many more for fruiting in pots. It is now 10 feet long, and is a very fine cane. Permit me to add, that your correspondent's case is not the first that I have heard where Vines planted in a dormant state have refused to grow. E. Gilbert, Gr. to the Right Hon. the Marquis of Exeter, Burghley. [The Golden Champion is doing very well indeed at Ashridge, where Mr. Sage has inarched his plant twice. We have also some other communications to the effect that the Vine is doing well. Eds.]

What is a Kitchen Garden?—Mr. Meikle's argument, based as it is on his own assumption, must go for what it is worth. He, however, admits that the evil complained of exists in the present system of kitchen gardening, and recommends as a cure

"judicious" management. This consists, by his own showing, in allowing wall trees 4 feet root-room. Then he would have vegetables occupying some 6 feet, then again standard fruit trees outside, which take the other 3 feet. Why, this is making matters much worse on a border next a wall than, I venture to say, was ever practised. Is this to ensure the practice of root-pruning? Maturation of the roots of fruit trees would be going on on both sides in the act of vegetable planting, and they in turn crying out more then ever against shade and drought. Mr. M. may dispense with his root-pruning if he keeps away the spade, and allows his roots to come nearer to the surface; I should be sorry to try the experiment of a 4 feet border on the trees I have the care of. They have more than double that run, and have not been "crippled" upon for many years, and this with the best results. I cannot, therefore, accept Mr. M.'s arrangement, but still advocate separate establishments. I think these borders, too, would be found no more adapted than some other parts of the garden with the advantage of a bank for "the early batch." The variegation of that situation which Mr. M. can prove for himself by registering the heat and cold for a year in comparison with other parts of the garden would prove this. The other evils alluded to by your correspondent I know prevail, and ought to be remedied; but that is a matter distinct from that under discussion. Agitator.

Hothouse Boilers—I am surprised that some one of greater length has not replied to Mr. Milne's remarks about boilers, or rather, perhaps, he ought to be congratulated on his great discovery. A saving of 500 or 800 per cent of fuel! Talk about reforming our coal bills, why this discovery will well nigh abolish them; they will be virtually reformed off the face of the earth. Winter will soon be upon us. Do contrive to have this boiler tested before it comes. What is the London Horticultural Society about? Mr. Milne's boiler ought to be instantly applied to their large conservatory. The saving of coal would pay for two or three boilers the first winter. And then, only imagine how popular such a service would render the Society. Estimate, if you can, the money it would put into the pockets of its constituents and patrons. No greater service could well be rendered to horticulture than such an extraordinary saving of fuel. Mr. Milne says a man's abilities are not measured by his experience, and in this I beg respectfully to differ from him. If he can enable us to experience this saving of fuel, he will be acknowledged at once as the ablest gardener within the four seas. He will be decorated with medals, laden with money, and all of us, from the least to the greatest, will hasten to do him honour. Do urge on, and out, the Conservative boiler, and oblige An Old Gardener with a Heavy Coal Bill.

Hydrangeas—We have here three very fine specimens, as full of bloom as they possibly can be. On measuring one of them, I found it 36 feet in circumference, 11 feet in diameter, and 6 feet 7 inches in height, with about 1270 blooms upon it; the other two are nearly as large, but not so high. They might have been cut away long ago, as they have to be cut back very considerably every year to keep them off the walk. They are growing against the wall, at the west side of the house, in a very hot place; and in consequence of the very dry weather we have had to keep them constantly watered. The flower, when fully expanded, is of a light blue colour. Thomas Whetton, Gr. to H. Maudslayi, Esq., Bystock.—It is not at all unusual in the Island of Guernsey to see flowers of different colours on the same shrub. I have frequently seen them with blue and lilac flowers. In the same garden I have often observed plants bearing blue flowers within a few feet of others bearing pink or lilac blossoms. Sometimes there will be a couple of blue, then a pink Hydrangea, and so on. C. M. F.—We have a Hydrangea hortensis now in bloom, with some of the trusses pink and some blue. It grows below a Weymouth Pine (Pinus Strobus). The soil of our garden usually makes the Hydrangea bloom pink. We have now a large group of about 20 plants in bloom, and only one truss among these is not pink. A plant of Hydrangea japonica growing near these has pinky flowers. Another plant of the same species, propagated from a cutting of this pinky-flowered one, has flowers of an intense blue. This latter plant grows near the spot where a large Weymouth Pine was felled a few years ago. S. M. O.

Foreign Correspondence.

BOTANIC GARDEN, ADELAIDE, SOUTH AUSTRALIA.—Trying as the frosts of a European winter undoubtedly are, gardeners here have yet to contend with even greater difficulties than with you; and it requires all their skill and attention to preserve, during the severe and long-lasting frosts, frequently accompanied by scouring hot winds, even many hardy plants. But, notwithstanding, we have in Australia horticultural establishments which, by making due allowance for the short period during which they have been in existence, will bear favourable comparison with others in the mother country, and the one I am about to describe ranks high amongst them.

Less favoured by natural position than any of the other public gardens in Australia, the skill of the gardener had to make up in Adelaide what Nature had denied, and under the direction of Dr. R. Schomburgk much has been done to render these gardens amongst the best in Australia. An almost level piece of ground, containing 105 acres, 13 of which are now under cultivation, intersected by an irregularly running creek, which in winter is frequently filled bank high by a rapid torrent of water, and situated on the north-west end of the town, has been set apart for the garden. The soil, a tolerably fertile friable loam, resting at a depth of about 12-15 inches on limestone, is for the

most part sufficiently good, not only for the cultivation of shrubs and trees, but also for the finer herbaceous plants, bulbs, &c., care having been taken whilst trenching to preserve near the surface the more fertile strata of soil. Artificial means have been employed to make it adapted for this purpose where this precaution had been neglected.

A sheet of water containing about two acres, decorated by one or two tastefully planted islands, and some smaller ponds provided with fountains, statues, or specimen plants in the centre, are included in the above area. The portion under cultivation is laid out according to the best principles of landscape gardening, the general effect being heightened by a small rise of the ground towards the north side, the slopes of which are planted with young specimens of conifers, whilst its top, from whence some charming views of the garden can be obtained, is crowned by a beautiful statue of Niobe. The banks of the creek referred to before, planted with the Buffalo-grass (Stenotaphrum), are, near the top, adorned by a selection of specimen plants. Numerous walks, carried out in gentle curves, and leading through well-kept shrubberies, past parts of grass-land, on which some fine specimen trees may be found, or along the lakes and ponds mentioned above, near which even some of the old favourite European trees thrive admirably, intersect the garden, which is divided into two almost equal halves by a broad straight walk leading from south to north. The walks are all well formed and gravelled, mostly edged with ornamental tiles, and provided with shallow brick drains on the sides, so that even after severe rains a perfectly dry path is obtained. The collection of plants distributed over the ground is large and varied, of most kinds good specimens may be found, sufficient space being allowed for the proper development of each.

Without attempting to enumerate all worthy of notice, I may mention the following as specially deserving of attention—Bauhinia purpurea, 15 feet high; Ficus indica, 19 feet; Ficus Sycomorus, 15 feet; Brexia madagascariensis, Gulandina Bonduc, Wigandia urous, 20 feet; Cupressus obliqua, a beautiful specimen, about 20 feet high; Solanum laevis, Cerbera Thevetia, Cassia Caudoleana, Tessoma velutina, &c., all growing luxuriantly in the open air. Statues, some of them of real artistic value, are placed in suitable localities, whilst an obelisk, sacred to the memory of the late, and first director of the gardens, G. Francis, Esq., stands in a prominent position near the main entrance. Water-plants, such as various Nymphaea, the freely-blooming and graceful Apogoneton distachyum, Cyperus Papyrus, &c., adorn the lakes and tanks, the banks of which are decorated by the beautiful Cyperium argentatum. Great difficulty is experienced in finding a Grass capable of withstanding the severe droughts of summer, the native Couch, Cynodon Dactylon, having proved as yet best for forming lawns. A rich collection of succulents, such as Opuntias, &c., planted out in separate groups, the finer varieties being kept in pots in Wardian cases, are scattered over the ground, most of the latter being found near the main central walk. Annuals and biennials plants, bulbs, &c., in great variety are either planted on the borders throughout the gardens, or in special beds, which are kept gay by a succession of bedding-out plants reared for this purpose in the nursery. By these means an almost endless display of flowers is maintained.

Before proceeding to the inspection of the houses we visit the rosary, containing upwards of 300 varieties of Roses, mostly grown as standards. They are planted on a level piece of ground, laid out in the oriental style. The beds are neatly edged with tiles, and covered with small bedding plants, Verbenas, Lobelias, Dianthus Hedderwigii, Phlox Drummondii, and a charming collection of Portulacas, amongst which there are many with double flowers of all colours. The centre of the rosary is occupied by a statue of the Amazon, by Kiss, and which has been presented by the ladies of Adelaide. A piece of ground on the north-west end of the garden has been set apart for experimental purposes. Collections of Grasses, and of medical or otherwise useful plants, may be found here. An important addition to these has recently been made by the introduction of the Gamea grass (Panicum giganteum), which, should it succeed, will prove one of the most useful fodder plants. Another plot close by, but not yet taken up for regular gardening, is intended for the formation of a natural chess ground.

We now proceed to the Victoria-house, a span-roofed building, 57 by 40 feet, with an oval tank 86 by 26 feet, and a depth of 6 feet. A broad walk surrounds the tank, the sides of the house being occupied with stages, whilst rockeries fill the corners. A collection of about 130 species of Orchids, numerous Aroids, Begonias, &c., are here brought together. The following may be mentioned as being particularly noteworthy—Alocasia metallica, Sphaerostema marmoratum, Sanchezia nobilis, Anthurium augustum, A. leuconeurum, Paratropia longitosa, Anacochilus, collections of Caladiums and Dracaenas, Cratons, &c., as well as several good Ferns, Onocidium Papilio, many Phalanopsis, Cattleyas, Epidendrums, &c., having flowered during the current year, whilst other, in Australia at least, rare kinds promise to do so shortly. Some good-sized Tree Ferns, spreading their feathery fronds, and supporting on their trunks Tillandsias, Orchids, Ferns, &c., make up the fairy-like appearance of the house, the tout ensemble of which can scarcely be rivalled, and much less be surpassed, in Australia. The gigantic leaves of the Victoria (the largest of which measures 6 feet 4 inches in diameter), which still continues to flower, almost fill the spacious tank, scarcely allowing room for the cultivation of some other water plants.

Parterres of flowers and ornamental fountains, for which a great variety of different jets is provided, surround the house. A series of older and smaller glasshouses, containing ferneries and a collection of

pot plants, of less intrinsic value, cultivated more for the purposes of decoration, is situated near the southern boundary of the garden, in close proximity to the nursery and to the museum, a small building containing specimens of Australian and foreign timber, seeds, models of fruits, &c. Whilst here we cannot but admire a splendid specimen of *Strelitzia auzusta*, 25 feet high, and constantly in flower, which adorns the central part of the houses referred to. A group of *Yuccas* and other plants of similar habit, amongst which *Boonapartea juncea*, now in full flower, with a stem about 18 feet high, claims also our attention.

The nurseries contain, besides several shelter sheds, two propagating pits, heated by hot-water apparatus, which also serves the ferneries, &c., mentioned before. Combined with the horticultural establishment is a fine menagerie, containing a collection of 19 species of mammals and 10 species of birds. The animals are kept in a series of cells, forming together an ornamental building. All possible credit is due to Dr. R. Schomburgk for the excellent order in which the gardens are kept and their tasteful arrangement. Whilst he is daily striving to still further beautify this already very charming spot, he also gratefully acknowledges the merit due to his predecessor in office, Mr. G. Francis, the late and first director, under whose superintendence the gardens were commenced in 1856. *E. B. Heyne, Rundle Street, Adelaide*

MELBOURNE: Fruits.—At the meeting of the Horticultural Society of Victoria, held at the beginning of last June, Mr. Carson produced a bunch of Grapes from the original imported Muscat Hamburg Vine, just gathered, in excellent condition, and shown with the view of illustrating its excellent keeping qualities. Mr. J. C. Cole exhibited a seedling Apple, grown by Mr. Piper, of Benalla, a very excellent keeper, and named "Piper's Pippin," and from Messrs. B. and S. Johnson came a very handsome, large seedling Apple, grown by Mr. South, of South Preston, which was named "Henry Wilson."

Societies.

ROYAL PARK FLOWER AND FRUIT SHOW, LEEDS.—This exhibition took place on Friday and Saturday last, and is considered to have been the very best autumn show ever held in the North of England. Birds lent the charm of their song to the exhibition. Dahlias were also shown in great force. The show, which seems to have been carried out with great spirit, owed much to the zeal and energy of Mr. Councillor Clapham.

The Apiary.

BEE-KEEPING IN SOUTH WALES.—I send you an account of my doings this season with Ayrshire and other hives, and shall be obliged by your opinion of this part of the country for bee-keeping as compared with other localities, judging by the results. I had this winter four stocks, by depriving hives, of these one was an Ayrshire, or Stewarton, and the three others ordinary depriving hives, two of which were of 14 cubic inches internal capacity, and the third of considerably less.

May, and a great part of June, were unfavourable for bees; supers could be given to the three last-mentioned hives only from the 22d to the 25th of May, and, though entered into then, for three weeks or more but little progress was made; while two swarms united in a fifth hive, a Stewarton, on the 1st and 2nd June, which is early for this locality, did but little during the same period. On the 15th of May a nadir, with comb, had been supplied to the Stewarton stock, according to the orthodox Scotch practice. By the end of July the three ordinary depriving hives yielded 13 lb., 27½ lb., and 35 lb. respectively, and the super of the Stewarton gave 10 lb., along with 29 lb. of comb, perfectly filled, from its top body box, which came off. This made 144½ lb. in all, or a little over an average of 36 lb. nett from each of the four hives. The double swarm in the new Stewarton quite filled their two boxes, but no more, which is to be partly accounted for by one of the swarms being a weak one, the other, however, being decidedly strong.

Another point, besides the general result that was obtained, and to which I wish to draw attention, is the less favourable results from the Stewarton stock than from the others. This stock was strong, and a nadir nearly filled with comb was given to it on May 15, which was at once taken to by the bees; but on account, as it appears, of the additional room afforded beneath, they did not take to the super till July 15—two months after; and I am certain they would not have taken to it at all but for two or three very sultry days which came in the middle of that month, as communication had been opened for the previous fortnight without their having availed themselves of the additional room. Then they half filled a 20 lb. super, no nadir being supplied when they entered it, as I knew from former experience that giving that at such an advanced period of the season would have deprived me of all chance of getting a super finished. In the present case it appears perfectly natural that the super should have been entered later by far than those of the ordinary hives were, as the top body box, holding about 80 lb., had to be filled before there were any indications that additional room was required, or would be made use of if supplied. Now, let it be granted that in a more favourable season that super would have been taken to sooner, and filled, which I believe would have been the case, so that 19 lb. of honey would have been available, as the greater part would have been in the old combs of the stock hive the value would have been less than that of the average of what was taken from the other three hives; besides, that average would in a more favourable season have been correspondingly greater. As to the milder method of

Scotch management, supplying a super first, and a nadir only after that had been taken to, three seasons' experience of it have shown me that even that invariably prevents the super being finished.

July is our great honey month here, as the fields are then carpeted with white Clover, and the honey made from its blossoms is peculiarly rich.

A bee-keeping clergyman in this neighbourhood, who had seen a little of my driving of bees, hit on a curious plan of imitating me. He had two stocks, which delayed swarming, one of these he took up the beginning of July, floor-board and all, and carried into a coach-house, putting an empty hive on the old stand. After having shut the door, and so nearly darkened the place, he turned the hive up, and commenced driving in the usual manner by beating, but without any live over to receive the bees, which swarmed out and made to the light, while others crawled over the floor. Contrary to what I should have supposed, this succeeded so far as that the swarm became well enough provided to stand over the winter and spring. Very little honey, however, was obtained from the old hive, as the combs were greatly filled with brood. The other hive was similarly treated the end of the third week of the same month. This furnished a fair quantity of honey, but the swarm from it was only able to provide itself with sufficient stores to last over the winter, and it died in spring. Heath being within reach, was probably the reason why they succeeded thus far. It is evident the queen must have found the old locality in both cases; but the swarm was lost in one case, and the honey in the other. From what I heard of the temper of the bees during the operation, it appears to have been a desperate business. *A. B., Narberth.*

Florists' Flowers.

NOT only has Mr. John Mann, of Brentwood, as residing in the East of England, furnished an illustration that the raising of new ZONAL PELARGONIUMS is by no means confined to the district of London, but further East even, another aspirant to honours has successfully put in his plea to be ranked among the best producers of the day. Mr. William Groom, of Ipswich, represents the enterprise of the amateur class, and has succeeded in raising some capital bedding Pelargoniums, well worthy of being better known. Of these a fine white variety appears in Mrs. Sach, a greatly improved White Perfection, flowers almost pure white, large, circular and smooth, a variety wonderfully profuse of flower, habit excellent, and dark zonate foliage. Mr. Groom, who takes a very moderate view of the qualities of his own productions, speaks of this variety as a very fine bedder. He has now in one of his convenient little houses a large mass of this variety, for conservatory work it is highly effective. Another white flower, named Maiden's Blush, gives a very fine white variety for exhibition purposes, the flowers are of great size, and massive and smooth in proportion; white in colour, slightly varied with pink; and forming a large and circular fruss; good foliage and habit. John Hopper is one of those brilliant orange-red flowers in the way of William Underwood, and a glorious bedder. There is a good batch of it in Mr. Groom's garden, presenting a brilliant mass of colour, with quality of individual flowers to match. Another is Surpass Miss Martin, scarcely a good name, yet a truthful one, the flowers of a lively salmon-pink hue, fine, stout, and circular, dark zonate foliage, and excellent habit. A large and massive deep salmon-pink flower, not without some novelty of character, has been named E. S. Dodwell, in compliment to the Pictorial-raiser of that name; the individual pips are large and very fine, and form noble trusses of bloom; the foliage darkly zonate, and the habit excellent. To two of these, viz., Mrs. Sach and Maiden's Blush, First-class Certificates were recently awarded at the meeting of the Ipswich Horticultural Society. In the way of Variegated Zonal Pelargoniums, Mr. Groom is now testing, by bedding-out, the worth of several promising seedlings. At the recent Special Prize and Pelargonium Show at South Kensington, Mr. Groom exhibited some young plants that promised well, both in regard to their leaf-marking and colouring, and shape of leaf. Brillancy of leaf-colouring is one of the chief good points in Mr. Groom's strain, the width and regularity of the golden leaf margin is another. Mr. Groom also has a capital pale lilac-coloured Ivy-leaved Pelargonium, of the type of Bull's strain, which he has named Ipswich Gem. Of compact habit and remarkably free of bloom, it will be very useful for basket work, or in any other mode of conservatory decoration. In one of the tents at the Ipswich Horticultural Show, Mr. Groom had suspended in a line lengthwise, and immediately over the table on which the fruit was placed, some 20 wire baskets of this variety, which formed one of the prettiest features of the show.

After a quiet and unpretending fashion, raising and rearing a few seedling plants, from the sheer and pure love of the thing, and because he is rarely happier than when among his floral offspring, Mr. Groom may be said to pursue the "even tenour of his way," and probably no one will be so much surprised as himself to see this record of his successful work. *R. D.*

Garden Memoranda.

MESSRS SUTTONS' ROYAL BERKSHIRE SEED ESTABLISHMENT, READING.—This establishment is one of the largest in the English wholesale and retail seed trade. The establishment is divided into various departments, over each of which intelligent foremen preside. The comfort of the employes—who number during the busy season considerably over 100—is not forgotten, for there is a large reading room adjoining the warehouses, which is open, after business hours, and

in which there is a good library and a liberal supply of daily papers, &c. Other great boons afforded to them are the Saturday half-holiday, and by early closing, during the summer months.

The principal order room, which is solely used for the execution of garden seed orders, is nearly 100 feet in length, and over 30 feet in width. It is elaborately and conveniently fitted up with long rows of counters, and some thousands of drawers, bins, and shelves, which are all labelled in the simplest and most convenient manner. The number of orders executed in a single day is very large, the system of labelling and checking every article, as carried out here, greatly assisting in the quick and correct despatch of all parcels. On leaving this room, we passed through a large paper-room, in which paper-bags of all sizes were being made in large quantities for next season's use. In connection with this department it may be mentioned that a regular staff of printers is employed on the premises, for the purpose of printing the many thousands of labels which are annually required. Proceeding through many large, well-ventilated warehouses, in which are stored the bulk of all kinds of seeds required in the garden and on farms, we arrived at the agricultural seed order department, which is conducted on the same principle as the other order room mentioned above every division and subdivision, and indeed every bag, being properly labelled. Another system carried out here is also worthy of notice as showing the care and precaution that is taken in executing orders. A warehouse book is kept in which a memorandum is made, mentioning the particular parcel of seed from which a customer is served, for future reference, and a small quantity from each such parcel is sown on the farm for comparison and to furnish evidence, if necessary, against any attempt at fraud. Another large three-storied warehouse is situated in the King's Road, which is used for storing Grass seeds, Mangel Wurzel, and Turnip seeds. In the height of the season these are filled with the several varieties of the seeds above-named. At the time of our visit the first arrivals of Turnip seeds had just come in, and were undergoing the process of cleansing and arrangement, preparatory to the general distribution during the forthcoming sowing season.

Adjoining the seed warehouses, &c. is the nursery, which is merely kept by the Messrs. Sutton to furnish a sufficient supply for a good local trade. In this nursery there is a house heated with hot water, for the purpose of testing the germinating powers of the many stocks of seeds received from their own growers. There are altogether nine good-sized houses in this nursery, the whole of which are heated by two boilers. The houses were filled with the usual description of bedding and general decorative stuff. At Portland Place, near the town, there is also a branch establishment of considerable size in which there is a good stock of young and thrifty fruit trees of all kinds, Roses, and a very choice assortment of Conifers, comprising some very pretty specimens of *Araucarias*, *Picea Pinsapo*, *Cryptomeria japonica*, *Thuja*, &c. There was also a good collection of Hollyhocks, and some very fine flowers of the double Zinnias, and double flowered Stocks, &c.

The trial ground proper is situated a short distance out of Reading, on the London road, and occupies about 3½ acres. The first thing that attracts attention is a large and remarkably fine collection of Grasses, that runs on each side of the drive from the entrance gate to the seed cleaning and drying sheds. It must not be supposed that the Messrs. Sutton grow seeds on this farm to any great extent, their system is to save a desirable quantity of choice selected seed of any particular kind: this is grown here, and the seed saved from this extra selected stock is sent to their growers in Essex and elsewhere, to raise the necessary stock for sale. Thus the process of selection, by being carried out regularly, materially improves the quality of the article, instead of suffering it to become deteriorated, as would be the case if the seed were saved annually without selection.

Of Peas, there has this season been an extensive trial, consisting of about 110 different samples, of which about 60 sorts were the subjects of more particular experiment. Laxton's Prolific and Forty-fold had done very well. Laxton's Supreme, of which there was 1½ acre growing here, was rather small in the pod, a circumstance that has been noticed before this season. There were also two new kinds, not yet sent out, and which have not yet been named. One of these, having bright green foliage and pods, was considered as being much superior to Rangler, the other is a late wrinkled marrow, with good sized, well-filled pods. Potatoes were also growing here in large numbers, so far as varieties are concerned, there being representatives of no less than 126 different parcels. Sutton's Early Racehorse was quite ripe before any of the others, and fully maintained its character in that respect. The much-vaunted Early Rose was here, very small in produce, and not at all coming up to expectation. Another American variety, the Early Goodrich, was growing alongside the former, it is a round, smooth, and clean skinned variety, and that is about all that could be said in its favour. There was also a very prolific red Potato having foliage strongly resembling Raspberry leaves. Cabbage, Broccoli, and Kale are largely grown; in fact, a sample from every parcel of seed sent out. Turnips, Mangel Wurzel, and Kohl Rabbi, of which there are large quarters, looked remarkably well, and gave an abundance of promise of a fine crop of roots this season. Sutton's Champion Swede appears to be in great demand, no less than 2000 bushels of seed being sold last season. Of Kohl Rabbi, Sutton's Improved Green seemed to be a good stock. The Improved Reading Onion was also favoured with a large quarter to itself. There were besides several varieties, principally foreign kinds. Near to

these was a batch of a new Lettuce, named Holme Park Green Cos, a large serviceable-looking variety, not yet sent out; a kind, called Duckett's Perfection, also promised to be a good useful sort. Annuals are not grown very largely here, and these for the most part were over at the time of our visit.

Garden Operations.

(For the ensuing week.)

PLANT HOUSES.

THE genus Lachenalia, which comprises some of the most beautiful dwarf bulbous plants, now requires especial attention in regard to potting, &c. There are several species, many of which are much better than the old and well-known L. tricolor, and are consequently well worthy of cultivation. They delight in a free open compost of fibrous loam and sandy peat: being almost all natives of the Cape of Good Hope, a low temperature of from 38° to 45° is best suited for them through the winter months. In potting up store pots the bulbs contained in old balls should be divided, and are better if kept separate when placed in the fresh pots, though many may be placed in at equal distances apart in each. Slight fires will now be generally necessary in stoves at night, just sufficient only to cause a gentle heat to pervade the pipes, and to keep the temperature at a safe point. Less air will also be required as we merge into the cooler autumn months, and this should be afforded rather later in the day than was the case a few weeks past. Seedling Cyclamens sown this spring should be pricked off into small pots, and be pushed along freely as soon as they show the second or third leaf. This is the real secret by which the fortunate few grow these lovely plants to perfection. There must be no rest—no check, until they are produced in full and abundant bloom. They like a nice brisk and moist growing temperature. Above all, they must be kept entirely free from scale, red spider, and especially thrip. When the latter attacks them, or gets a lodgment, they invariably become safely en-cased upon the crown, amongst the tender young leaves as they form, and these they oftentimes eat entirely away before they are observed by the naked eye. Thoroughly good drainage is an essential point in the successful cultivation of these plants. There are some few subjects which, if they are to be kept much longer in flower, will again need to be removed back into warmer houses, such as Tydeas, Achimenes, and the like. Though these and some few other similar subjects will do moderately well in cool greenhouses during the warmer period, they will not last when cooler nights arrive. Examine late grown Italian Tuberoses, and if the plants show any signs of throwing up a flower spike let them be placed in a high temperature, and have abundance of root moisture, giving them alternate waterings with moderately strong liquid manure. Saucers may advantageously be placed under each pot, the better to support the plant in its effort to form good spikes. Lantanas, of which we have now some very fine varieties, may be induced to prolong their blossoming farther into autumn, if placed in a warmer and lighter position than that afforded by a cool, shady greenhouse or conservatory. A little manure-water will benefit pot-bound specimens of these also; it should be weak and clear, and should not be given to them too frequently.

FORCING HOUSES.

Let late Vineries which are now finally swelling off their crops, and Muscat houses in particular, be carefully attended to. Bear in mind the fact, that all Muscats, however well they may look, even up to the final process, are not good Grapes, in the right meaning of the word, until the golden amber we appreciate so much, the thin-skinned berry, and the flavour are assured facts. Do not let present appearances, however encouraging they may be, lull into such false security. Take advantage of every ray of sunshine, and every passing waft of balmy air, and by free admission of the latter, and by judiciously taking off the air betimes, still further aid these favourable circumstances. Where shanking occurs—and it will do so at times, in spite of most persistent remedial efforts—let every berry so affected, even to the gangrenous attachments on the stalks, be immediately removed. Furthermore, supposing (and I say "supposing" for even doctors disagree hereon) that shanking is caused in consequence of a too meagre supply of nourishment from the root, then the leaving on infected berries, which are shanking, to say the least, tends more to impoverish those which are entirely free from the malady by the very quantity of support which they exact for their partial or imperfect support. All Vineries which are now finally colouring their fruit, should have no more water distributed withindoors after this date. And this I have stated before. I hold it to be a matter of some importance, however, hence I freely refer to the subject again. It is the province of the good cultivator to prepare, in so far as may be possible, for eventualities. We may soon have a dull wet time of it, then it will be seen how very detrimental to the well-being of the crop are borders in a wet sloppy state. The inner atmosphere becomes dense and reeks with impurities, which are much at variance with that dry buoyancy which is so essential for the production of flavour. In regard to Pines, I can add little to the past few Calendars. Push forward the potting of all those which it is desirable to pot at this period. Strong successionalists intended for fruiting next season should be placed at the earliest opportunity into the fruiting pots. This, where the quick fruiting process is carried out. Make every preparation for the attainment and maintenance of a proper amount of bottom-heat in all Pine-pits during the incoming winter. To this end the necessary amount of tan must be procured, and when not wanted for immediate use it must be protected against rains. The lovely weather

we experienced at the end of August was all that could have been wished for the late "shows." Those just expanding into flower will swell away kindly and become far finer fruits than would have been the case had dull weather continued. Where economy is practised, and it is seldom otherwise in gardening matters, it will be well to get in at this time the necessary stock of fuel for forcing, &c.

HARDY FLOWER GARDEN.

Mignonette which was sown in pots a week or two since, and which is intended for winter blooming withindoors, should now be thinned out nicely, so that each plant may have ample room to grow and extend itself freely. Water freely with a rosed water-pot, and still keep in a fully exposed place out-of-doors. Hardy Annuals, which are intended to flower where sown, may now be got in. They comprise such as the following—Linnanthes, Collinsia, Silene, Myosotis, Nemophila, Oxyura, Calandrinia, &c. If the weather continues dry, of course each will need watering, and should be effectually shaded from the sun until such time as germination takes place. The cuttings of various sorts of bedding stuff must now be got in with all dispatch. Where room exists to grow them separately, each cutting properly made may be potted singly into large 60-sized pots in a free, open, loamy soil, intermixed with leaf-mould and sand. When this is done place them out-of-doors on to cinder-ashes, or some similar material, in a fully exposed situation, where sun and air can have full play on to them. It will be necessary, should there be no rain, to give later plantations of Gladiolus good waterings. Those who have afforded this aid to Tritomas, as I have previously advised, will have seen the great benefit which accrues therefrom. It will be advisable to continue watering these, that the late flower-spikes may be brought up with equal vigour. The Gynenium argenteum (Pampas-grass), though an inhabitant of the prairie deserts, delights also in root moisture, and if frequently watered with liquid-manure so much the better. No further delay should take place in regard to making plantings of Pansies which are to stand the winter out and bloom next season. Where the Hollyhock seed sown a few weeks since has not shown above ground, it should be well watered, and induced to do so quickly, otherwise the seedling plants will not be sufficiently large to bloom efficiently next year.

KITCHEN GARDEN.

Little can be added in this department to what has been suggested in the past two or three Calendars. All Celery plantations will require frequent copious waterings. Sowings should be made of Cauliflowers for the purposes of a spring crop. There is little to choose between the many varieties offered. The old London, or improved Hertfordshire, are perhaps the best. I have previously suggested that material should be obtained for the purpose of making early autumn Mushroom-beds. The Mushroom-house itself should be emptied, and receive a thorough cleansing with the aid of the whitewash brush, &c. Where there are dices, let the soil and other dices deposited within be cleaned out, and the exterior well washed over with fresh lime. Immediately a wet period arrives make a sowing of Radishes, and set to work transplanting the earlier autumn-sown Lettuces and Endive into the most sheltered positions, there to withstand the frosts of early winter, &c. Other and successful sowings and "pickings out" must be made periodically, hence a portion only of the border to be occupied should be planted yet. W. E.

TOWN GARDENING.

CONTINUE to put in cuttings of Pelargoniums, Centaureas, Stachys, Ageratum, and the Golden Pyrethrum. The last named I consider one of the best foliage plants for towns, as it shows up well next an edging of Ivy. Annuals have done flowering, and should be cleared away, and the stems of such perennials as have also done flowering cut down. Fill the vacant places with Pompon Chrysanthemums. Intermediate Stocks sown last month will now be fit to pot, they should be taken up carefully, with as much root as possible, and planted three in a pot, close to the edge, in a compost consisting of four parts loam and one part rotten dung, well mixed together, and pressed down firm, watered, and put in the shade for a few days, after which they should be removed to a more open position till October, when they should be removed to a cold frame. Double Rockets do well in town if wintered in a cold frame; these should now be taken up, parted to increase the stock, and potted. I find from experience that though they do well during the summer months they will not stand the winter except in a cold frame. Dahlias will now be coming into flower, and should not be allowed to have too much top, which will impoverish the flower and make them small. therefore thin out the crowded shoots, and where the flower-buds come two or three together take them all out but one. Mignonette should now be sown for early spring use in 48-sized pots, and placed in a frame, and as soon as it is up give plenty of air and a gentle watering, and at all times protect it from wet and frost. J. D.

STATE OF THE WEATHER AT CHISWICK, During the last 41 years, for the ensuing Week, ending Sept. 11, 1869

Table with columns: Day, Average Highest Temp., Average Lowest Temp., Mean Temp., No. of Years in which it Rained, Greatest Quantity of Rain, Prevailing Winds.

The highest temperature during the above period occurred on the 7th, 1868—therm. 91 deg., and the lowest on the 7th, 1856—therm. 28 deg.

STATE OF THE WEATHER AT CHISWICK, NEAR LONDON, For the Week ending Sept. 1, 1869, as observed at the Horticultural Gardens.

Table with columns: Day, Moon's Age, Barometer (Max, Min), Of the Air (Max, Min, Mean), Of the Earth (1 foot deep, 2 feet deep), Wind, Rain.

Notices to Correspondents.

ARRANGEMENTS. A R. E. ... Presuming that the first are as you state them we can only say that the proprietor has not kept faith with you, that such practices are not usual, and that they are very reprehensible. We should suppose there is some misunderstanding. APPLE TREE BORER. T. Z. Your tree has no doubt been attacked by one of the wood-boring moths, probably the Goat Moth referred to at p. 924. If you run a cane or wire up the hole, and so crush the larva, no further injury will be done. The trunk will be weakened, if it is not a large tree, and may need some support against wind. BARNES TESTIMONIAL. Mr. John Pearson, Kinket, Bantley, wishes his name to be entered as a subscriber of 11. BOOKS: Constant Subscriber. "Paxton's Botanical Dictionary" (Bradbury, Evans & Co.); "Gardeners' Dictionary" (Bell & Daldy). Both new editions.—G. Mann. "Kemp's How to Lay Out a Garden," and Loudon's edition of "Repton's Landscape Gardening." CALIFORNIAN RESURRECTION PLANT. Nevada. "The hard, dry, brown lump, looking more like a dead Lycopodium than anything else, but which, upon being immersed in a soup-plate full of water, gradually opened its fronds, assumed a green colour, and, in short, 'rose from the dead,'"—is no doubt the Selaginella lepidophylla, a species of Lycopod or Club Moss, the hygroscopic character of which is well known. You will find a description of it in Spring's "Lycopodiaceae," part ii p. 72. CUCUMBERS. C. The proportions and form are all that need be desired, and the flesh solid, with little inclination of seed, but the specimens as sent are much too old and coarse in flavour, probably they were good at an earlier stage. It is very like a Winter Prolific which we have seen.—W. R. A thickness of border over the pipes of about 18 inches, with proper drainage, will be sufficient in the first instance, and to this surface dressing may be added as the plants need more food, or the roots may require to be encouraged to run into fresh material. There should be means provided to prevent the pipes lying the soil too much below. A less thickness of earth would suffice if the moisture is perfectly under control. DESFONTAINIA. J. W. W. The Desfontainia is generally rather a shy blooming plant. It is, we believe, sufficiently hardy to withstand our winters in favourable, that is, sheltered spots, but won't bear excessive cold. We should recommend a mixed loamy, rather than a pure peaty soil, to mulch the surface in winter, and the use of Mr. Barnes' wicker-work protectors through the winter, and spring, in order to keep the foliage dry. Do not plant at now, but wait till spring, keeping the plants meanwhile sheltered in a cold house. DRY ROT. E. H. C. Your Fungus is the perfect condition of dry rot (Merulius lacrymans), and as it is just now producing its countless spores, immediate steps should be taken for its destruction. To get rid of it perfect ventilation is necessary, and all the parts infected should be treated to a wash of strong solution of corrosive sublimate. It is not at all uncommon, as in your case, to find it spreading over gypsum, brick, &c., as well as woodwork, but as you have had dry rot before, it is not probable that the spores came in the gypsum, but from the former plants. W. G. S. EDITOR. J. Red, Hugh Had. The Rev. M. J. Berkeley is not one of the Editors of this Journal, though a most highly-valued contributor. EARLY ROSE POTATO. J. G. Opinions, as usual, are conflicting. We believe the balance to be rather adverse than otherwise to the claims of this new comer. Our own opinion has been already given at p. 699. EQUISETUM. An Amateur Gardener. Drain your garden more thoroughly. GALVANISED WIRE. W. E. We have not heard that this kind of wire is objectionable to train permanent plants upon. GRAPE. D. M. In a "collection of 16 sorts of fruits," it is quite clear you cannot show two sorts of Muscats as one sort—at least we have no doubt "the judges would object" to such an arrangement. Each "sort" is intended to consist of one variety of fruit only, whether the whole are grouped on one stand as a collection, or are put up in separate dishes. Whether you may advantageously introduce two dishes of different kinds of Muscats in such a collection, is another matter, and the answer would depend partly on the quality of the fruit, and partly on the variety afforded by the other sorts in the group. The more varied group, all other points being equal, should win. INSECTS. E. H. C. The ants you sent are males of Myrmica ruginodis. LIGHTNING. From. We believe the Oak tree may be fairly set down as more liable to be struck by lightning than the Ash or the Beech—at least our own observation and that of others of whom we have made inquiry points in this direction. We are not aware that a covering of Ivy on the trunk of the tree has any influence in this matter. NAMES OF PLANTS: Swanea. Mellanthus major, and Spirea sorbifolia.—C. F. Negundo aceroides.—T. E. Probably some of the many kinds of when wild grow for a time in the manner indicated. Most are natives of the Cape, but have been introduced elsewhere. It is not aquatic. It does bloom. Some kinds furnish the drug called aloes.—G. T. 1. Cestria alnifolia, 2. Neillia (Spirea) opulifolia, 3. Elymus arenarius.—Subscriber. 1. Tecoma jasminifolia, 2. Nepeta Mussini, 3. Helianthemum vulgare, 4. Hypericum perforatum.—J. Green, Maudsloti. The specimens sent were too incomplete to name properly. Probably they are—1. Jasminum Sambac, 2. Sipanea officinalis, 3. Spirea Fortunei. NET TREES. K. G. We can see no trace of weevil, we suppose the marauder may have been a squirrel. ORANGE ORANGE. F. F. For information respecting this plant see pp. 182, 211, and 259 of our last year's volume. The Carya, or Hickory tree, succeeds admirably in England, and makes a fine handsome timber tree. COMMUNICATIONS RECEIVED.—T. W.—R. R.—J. H. Y.—J. J.—J. A. C.—T. L.—R. S.—W. A. W.—J. R.—T. S. T.—D. L.—A. C. Constant Reader.—D. J.—T. W. C.—C. McD.—G.—Indian Forest.—W. T., Ipswich.

THE LONDON MANURE COMPANY

(ESTABLISHED 1840) Have now ready for delivery, in fine condition, CORN MANURE, for Spring Use DISSOLVED BONES, for Dressing Pasture Lands SUPERPHOSPHATES of LIME PREPARED GUANO MANGEL and POTATO MANURES. Also Genuine PERUVIAN GUANO, and NITRATE of SODA in Bulk Warehouse; SULPHATE of AMMONIA, FISHERY E. PURSER, Secretary. Offices, 116, Fenchurch Street, E.C.

Autumn Sowing.

ADAMS'S NITRO-PHOSPHATE or BLOOD MANURE for WHEAT.—This Manure, specially prepared for Autumn Sowing, is rich in Ammonia, Phosphates, and other ingredients required for the healthy growth of Grain Crops. Analysis of Blood and the grain of Wheat show that they are nearly identical in composition, hence the value of Blood as an ingredient in Manure. It may be applied at the rate of from 3 to 4 cwt. per acre, according to the condition of the soil, either drilled with the seed or sown broadcast; if the latter, it should be well harrowed in. Prepared by the Patent Nitro-Phosphate or Tenant-Farmer's Manure Company, whose Members are Cultivators of upwards of 60,000 acres of land, which has been for years under management with Manures of their own manufacture; consequently the Consumer has the best guarantee for the genuineness and efficacy of the Manures manufactured by this Company. Particulars will be forwarded upon application to the Secretary, or may be had of the Local Agents. C. T. MACADAM, Sec. Chief Offices, 109, Fenchurch Street, London, E.C.; Western Counties Branch, County Chambers, Exeter; Irish Branch, Westmoreland Street, Dublin.

THE "GOODENOUGH" PATENT HORSE SHOE

The "Goodenough" System is a complete success. Over Thirty Thousand Horses are Shod on it. Three Hundred Farriers have already adopted it. Sample Cases, with full instructions, £1 1s., containing Model, Patent Rasp, Sixteen Shoes, any size, Nails, &c. For particulars, Lists of Farriers, prices, &c., apply to E. J. HARRISON, Secretary, 114, Cannon Street, London, E.C.

Established 1833.

HANCOCK'S INDIA-RUBBER ROSE and TUBING.

CARRIAGE, GIG, & DOG-CART APRONS. HORSE SINGEING APPARATUS, with GAS BURNERS, and INDIA-RUBBER TUBING. Improved INDIA-RUBBER DOORSTOPS. WATERPROOF CART and WAGGON COVERS made any size. HORSE-LOIN COVERS (Waterproof, with Straps complete. BELTING for SAWMILLS, THRESHING MACHINES, and FLOUR MILLS. IMPROVED INDIA-RUBBER WEDGE-SHAPED GAS BAGS for Microscopes and Dissolving Views; any size to order. FLANGE TUBING, for excluding Draught and Dust, and preventing the Slamming of Glass Doors. VULCANISED INDIA-RUBBER BILLIARD CUSHIONS. WATERPROOF BILLIARD TABLE COVERS. Illustrated Price Lists on application. JAMES LYNE HANCOCK, Vulcanised India-Rubber Works, 26, Goswell Road, London, E.C.

"Every Cottage should be provided with a Water Tank." Direct, Iron Cisterns.

F. BRABY AND CO. having laid down more extensive Works, and Improved Machinery on their Deptford premises (10a Wharf), are prepared to supply WROUGHT-IRON TANKS, GALVANISED or PAINTED, of superior quality, at reduced prices, and at very short notice.

An Illustrated Price List of Galvanised Iron, and other of BRABY'S special Manufactures, sent on application. F. BRABY AND CO., Limited, Fitzroy Works, Euston Road, London; or through all respectable Ironmongers. N.B. Open Tanks of different sizes packed one in another to save carriage.

Cottam's Iron Hurdles, Fencing, and Gates.

COTTAM'S HURDLES are made in the best manner, of superior Wrought Iron, by an improved method. Illustrated Price Lists on application to COTTAM AND CO., Iron Works, 2, Winsley Street, Oxford Street, London, W.

COTTAM'S PATENT PORTABLE UNITED COW FITTINGS.

Their advantages are—Portability, not Fixtures, removable at pleasure, no Woodwork or Partitions to impede Ventilation or breed Vermin, Hay Ricks dispensed with as unnecessary, increased width and depth of Feeding Troughs, Water Cistern, and Patent Drop Cover to prevent over-gorging. Cleanly, durable, and impervious to infection, being all of iron. Prices of Fittings per Cow, 6s. Prospectuses free of COTTAM AND CO., Iron Works, 2, Winsley Street (opposite the Pantheon), Oxford Street, London, W. where the above are exhibited, together with several important improvements in Stable Fittings just secured by Patent.

THE LANDS IMPROVEMENT COMPANY.—

(Incorporated by Special Acts of Parliament.) DIRECTORS. John Clutton, Esq., 9, Whitehall Place, S.W. Frederick L. Dashwood, Esq., Kirtlington Park, Oxford. Henry Farquhar, Esq. (Messrs. Herries, Farquhar & Co.), 16, St. James Street, S.W. Lord Garlies, M.P., 86, Eaton Square, S.W., and Galloway House, Wiltshire, N.B. John Horatio Lloyd, Esq., 1, King's Bench Walk, Temple, E.C. Granville R. Ryder, Esq. (Managing Director), 2, Princess Terrace, Hyde Park, S.W. Granville R. H. Somerset, Esq., Q.C., 6, Park Street, Westminster. Henry W. West, Esq., Q.C., M.P., 10, King's Bench Walk, Temple, E.C. Charles Watkin Williams Wynn, Esq., M.P. (Chairman), 2, Lower Berkeley Street, Portman Square, W., and Coed-y-Maer, Welshpool.

The Company advance money, unlimited in amount, for all purposes of Agricultural Improvement, including the erection of Cottages and Farm Buildings, to the Owners of settled and other Estates, and to the Clergy in respect of their Glebe Lands.

The whole outlay and expenses are liquidated by a rent-charge upon the land, redeeming principal and interest, over 25 years. No investigation of title is required.

For Forms and further information apply to GRANVILLE R. RYDER, Esq., Managing Director, 3, Parliament Street, London.

THE GENERAL LAND DRAINAGE and IMPROVEMENT COMPANY.

DIRECTORS. Thomas Chapman, Esq., F.R.S. The Right Hon. Viscount Combermere. Geo. Thomas Clark, Esq. Edward John Huchings, Esq. John C. Cobbold, Esq. William Tate, Esq., M.P. Henry W. Currie, Esq. J. BAILEY DENTON, Principal Engineer.

Agricultural Improvements of any kind are executed by the Company, or the outlay thereon repaid to Landowners who prefer executing the work by their own Agents.

Tenants may also, by arrangement with their Landlords, procure the execution of such Improvements.

The outlay, with all official expenses, may be charged on the Estate, and paid off by a rent-charge in 31 years, or at the option of the Landowners in a shorter term.

No investigation of title necessary, and no legal expenses incurred. Application to be made to HORACE BROKE, the Secretary, at the Offices of the Company, 22, Whitehall Place, London, S.W.

LAND DRAINAGE.—PLANS MADE, LOANS OBTAINED, and CONTRACTS UNDERTAKEN by THOS. C. SCOTT, Land Agent, 19, King's Arms Yard, Moorgate St., London, E.C.

This is the best time to make arrangements and secure Pipes.

FARMING.—A Scotch Farmer has an OPENING for a PUPIL on a large Farm, where the old Arable Land is being improved, and a great extent of Natural Pasture reclaimed. The System pursued is combined Sheep, Cattle, and Arable Farming. Draining, Liming, and other extensive Improvements going on. Can either work or not, as Friends desire. Good Hunting, Shooting, and Fishing. One hour from Edinburgh. Terms £100 per annum.—Address, in first instance, W. S., at C. H. May's, General Advertising Office, 78, Gracechurch Street, London, E.C.

Early Feed for Sheep and Cattle, BY SOWING IMMEDIATELY

SUTTONS' SPECIAL MIXTURE of rapid-growing GRASSES and CLOVERS. 2 bushels per acre; price 10s. per bushel. SUTTON AND SONS, Seedsmen to the Queen, Reading.

Look to your Grass Lands.

JAMES CARTER AND CO.'S RENOVATING MIXTURE of GRASSES and CLOVERS SHOULD NOW BE SOWN. This Mixture is specially prepared to suit the various soils, and consists of the most desirable kinds to produce a Permanent Pasture of first-class quality on old decayed Pastures and other lands that have suffered through the extreme dryness of the past season.

CARTER'S "PRIZE MEDAL" PASTURE GRASSES for FORMING NEW MEADOWS, mixed to suit all Soils, from 2s. to 3s. per acre. Special low quotations for quantities on application to JAMES CARTER AND CO., Seed Farmers, 237 and 238, High Holborn, London, W.C.

The Agricultural Gazette.

SATURDAY, SEPTEMBER 4, 1869.

MEETINGS FOR THE ENSUING WEEK.

- Sept 6 to 12—Hamburgh, &c. 7—Bicester Agricultural Society. 8 to 10—Royal Dublin Sheep Show 9—Thames Agricultural Society. 10—North Shropshire Agricultural, at Market Drayton

VIRGIN soils in America have been known to yield 60 crops without manure. We learn from the accounts of competent travellers that for 8, 12, or even 20 years this new land requires no manure; on the contrary, manure makes the grain or Grass crops at first too rank. Gradually the virgin soils are exhausted of their first freshness. "The first settler," says Mr. JOHNSTON, in his "Notes on North America," "is a robber and exhauster of the land; and he who farms land from which six or more crops have been taken, must farm more generously if he expects satisfactory crops." Skill and industry must bring back the fertility which disappeared under the treatment of the pioneers. Our costly system of agriculture is quite inapplicable to new countries. A rotation of crops, as we understand it—that is, a mixture of forage with cereal crops—is never followed. Our object is to make manure in order that we may grow corn. But the settler raises his live stock on the waste land; meat with him is only 2d. or 3d. a lb., and his crop must be such as can be easily exported. It is easier to clear and cultivate the fresh land than to improve the old. In Maryland the exhaustion of the soil by the Cotton crops has forced planters to retire westward. The land has been "worn out" by a system of farming which is justly called the "robber system." And the pioneer can follow no other plan. Like the English farmer, his business is to make the best of the circumstances by which he is surrounded; to farm, not to philosophise. The new States in America are "filling up" fast, and the new soils are being as fast exhausted. In fact the process described has been exceedingly rapid in the past 30 years, owing to the

unexampled progress of nations in both worlds. A comparison of the census reports for the United States and this country discloses some remarkable facts relating to the distribution of population and the source of wealth in the two countries. Here the population of our agricultural districts diminishes, there it increases rapidly. Between 1850 and 1860 the population of the seven North-western States, where soil and climate especially adapt them to corn-growing, nearly doubled; in 1860, it was 5,543,382. The war checked the progress of population in America, and it postponed the fulfilment of Mr. McCULLOCH's prediction that America would cease to export Wheat. He estimated that the population of the United States in 1834 would reach 60,000,000; according to the latest return in 1860 it was 31,445,080. The progress of the older and the manufacturing States has been greatly interrupted. The increase in the mileage of railways in the United States reads us an instructive lesson. In 1850 the total mileage was 9021; in 1860 it was 30,634; this astonishing progress was then interrupted; it was, in fact, arrested in the Southern States, and greatly checked in the Atlantic and New England States; but in the interior, or agricultural States, it still went on. We find that in 1864 the total increase in the four years was 4274 miles, and more than one-half of this was in the interior corn-growing States. But it is important to note the details of the increase just referred to of more than 21,000 miles between 1850 and 1860.

That of the interior corn-growing States was nearly 12,000 miles, and that of the Southern States was 5400 miles. This wonderful opening up of the agricultural districts was followed by a war, which left them untouched by comparison, but which destroyed industry and population in the other States. It might have been expected that other countries would have been deluged with American corn, especially when the Southern market was closed, but this was not the case; the average surplus of Wheat, for exportation, has been only slightly increased.

In a country where the usual breadth of Wheat is 12 or 13 millions of acres, and the crop is extremely various, there is a large surplus in favourable years; hence America was fortunately able to supply our deficiency in 1861 and 1862. The usual exports of Wheat and flour to this country for the six previous and six subsequent years, were about 1,100,000 and 1,400,000 quarters a-year. Part of this increase was due to the Wheat grown in Upper Canada, which is sent to New York or into the New England States by the Grand Trunk Railway, which now brings the best part of the country into connection with lake and river navigation.

Considering the great increase of the means of communication, the actual addition to the amount of corn exported has been so small that it is evident the country is not "opened up" by the stimulus of the export trade, but by the increase of the home demand.

It is only the surplus of abundant years that is exported from America. At present prices it does not pay to grow Wheat specially for exportation. This is a very important feature of the American Wheat trade; it is illustrated by the scarcity of Maize in the country during the past year or two, notwithstanding that Maize can be grown for one-third the price of Wheat; English consumers, for a long period, had to pay 40s. per quarter for it. It is only the surplus which is exported, and any circumstance which reduces the amount of the surplus, or increases the demand for it, must raise the price. In the case of Wheat, when other countries compete with us, as Ireland has done of late years for Maize, the surplus will be more diffused. Under the stimulus of high prices during the Crimean war, Wheat was grown for exportation; but at the present price, 50s. a quarter, the area of Wheat will not increase.

Settlers in Minnesota (a Wheat, not a Maize country) assure us that it does not pay to grow Wheat for exportation. In all probability the competition of other countries will oblige us to pay dearer for Wheat in future years, in order to secure continued, or rather, increasing supplies, and this may occasion a reaction against the constant increase in this country in the area of pasture land—an increase which the country regards with complacency, because it is supposed to increase the number of live stock; but the conversion of arable to pasture has not prevented the rise, for many years past, in the price of meat. If, as we anticipate, the competition of other

countries occasions a gradual rise in the price of Wheat also, the "food question" will become an urgent public question; and the discussion which will then take place will, no doubt, add greatly to the very meagre stock of knowledge possessed at present by the public at large on certain agricultural and economic questions.

PHOSPHORIC acid in Court! Calcium, iron, and aluminium phosphates before Mr. Justice HANNEN at Liverpool, and reduced phosphates before Mr. Baron PIGOTT at Gloucester!

The chemistry of the agricultural phosphates has become an extensive, complicated, and important subject. New raw materials are everywhere sought for, and the varied supplies of apatite, coprolites and phospho-guanos, which have been the rewards of the inquiry, have been pressed into the service of the manure manufacturer and farmer. Now, if we recollect that the chemistry of the action of sulphuric acid on bone earth itself is not thoroughly understood, it will not be difficult to believe that fresh complications are introduced into the question when phosphates other than those of lime are employed. Some of the so-called phosphatic guanos, Sombrero, Navassa, Redonda, for example, contain much iron and aluminium phosphates. Not only does the presence of these compounds demand the use of very much larger quantities of oil of vitriol in order that the raw material may be converted into a superphosphate containing a good percentage of soluble phosphate, but they introduce a new source of trouble. Use as much sulphuric acid as you will, a portion of the phosphate which it makes soluble in water becomes in time insoluble in water—reprecipitated, as it were, in the substance of the superphosphate itself, or, in other words, it is again reduced. The reduction, or going back, here referred to is becoming a matter of notoriety and of serious importance both to the manufacturer of superphosphate and to the farmer. The manufacturer spends extra time, labour, and money in producing soluble phosphates from materials such as ferruginous coprolites and guanos, only to find that, owing to this reducing action, the manure sinks in value when it has been made a few weeks—a fifth part, say, of its soluble phosphate becoming by that time reprecipitated. The farmer, on the other hand, purchases a superphosphate by analysis. This analysis shows 24 per cent. of phosphate rendered soluble: he sends a sample to an analyst for examination, and the report is 18 per cent. of soluble phosphate only. What has become of the difference—6 per cent.? Owing to the nature of the materials employed it has relapsed into an insoluble or less soluble condition. The only question for the farmer here seems to be this—is the reduced phosphate of equal value with that which remains soluble? Most agricultural chemists believe that it is only inferior to the true soluble phosphate in one particular. The soluble phosphate of a manure diffuses itself through a considerable mass of soil, and becomes therein precipitated. In this state it is redissolved by the carbonated water of the soil, and helps to nourish the plant. Now reduced phosphates have been reprecipitated before they came in contact with the soil; they are pretty much in the same condition as the precipitated phosphates just mentioned, but they have very little or no power of diffusion, and in this particular are manifestly inferior to soluble phosphate. This, then, is the farmer's side of the present question—soluble and reduced phosphate should be separately estimated, and so returned in the analysis furnished to him. But the analyst here has a difficulty, for no method of estimating reduced phosphates has met with general acceptance among the chemists, and so even those chemists who do not doubt their existence, or their value in certain superphosphates, are often obliged to ignore both. But the matter cannot be left in this unsatisfactory position. A suitable and trustworthy process must be found. The experiments of a large number of analytical chemists point to two promising methods of estimating reduced phosphates. In one of these a weak standard cold solution of oxalate of ammonia is employed; in the other, a definite quantity of a boiling solution of bicarbonate of soda. Both of these reagents scarcely affect the original raw material (finely ground) from which a superphosphate is made, extracting from them less than a 1/2 per cent. of phosphate, which they are capable of detecting, in a superphosphate which has had all its soluble phosphate washed out by water, a considerable

amount of reduced phosphate. Both the actions which we noticed at the commencement of these remarks arose from questions concerning the true meaning of the analyses of phosphates. In the Liverpool case, DOBELL v. EARLE, a warranty with respect to some Redonda guano described it as "76.66," which was stated to mean 76.66 per cent. of phosphate of lime. On the other hand, it was affirmed that it contained no phosphate of lime, only phosphates of iron and aluminium. Of course, had it been converted into superphosphate, both the drawbacks of a ferruginous material would have been experienced in a high degree.

In the second case, BRADBURN v. STEPHENS, tried at Gloucester, the warranty contained the words "guaranteed to contain 24 per cent. of soluble phosphate, including the reduced precipitated phosphate." A number of chemists were called on both sides, and the main point of difference between them was as to the practicability of estimating reduced phosphates, the value of which was not denied. In other points the scientific testimony was fairly accordant. One of the plaintiff's witnesses, Professor CHURCH, of Cirencester, found, for example, 18.57 per cent. of soluble phosphate in the sample of superphosphate in dispute, while Dr. VOELCKER, for the defendant, estimated the soluble phosphate in the same sample at 18.66. But Professor CHURCH determined the proportion of reduced phosphates in the same sample to be about 6 per cent., while Dr. VOELCKER was of opinion that it could not be estimated.

We shall probably recur to this subject on another occasion.

— THE Wheat trade has been unsettled during the week, and it now remains about the same as it left off at Mark Lane on Friday, August 27. Other kinds of grain are slightly cheaper.—The beef trade has improved with the cooler weather. Mutton has also been more freely bought. The quotations now are 5s. 6d. for prime British beef, and 5s. 8d. for the same kind of mutton.—The trade in agricultural seeds has been of a merely nominal character.—Wool is of about the same value.

— The Assessed Rates Act is creating serious misunderstandings in various parts of the country. Mr. C. S. READ, M.P., who watched, with his usual assiduity, the progress of the Bill through the Legislature, and who therefore is a trustworthy authority on the subject, has favoured us with the following references to it, with suggestions in regard to the difficulties which are likely to arise—

But few magistrates and hardly any parish officers to whom I have mentioned the subject, seem aware that the operations of "The Poor Rate Assessment and Collection Act, 1869," extends to the whole of England and Wales.—As the Bill was introduced to remedy a defect which existed only in parliamentary boroughs, I ventured to suggest that it ought to be confined to those towns, but that anyhow we should not in the country have two Acts in operation for one purpose. The Government preferred repealing so much of the Small Tenements Act as relates to poor rate, but I suppose what remains will still be in force for the highway rate. The Assessed Rates Act comes into operation on the 20th of this month, and it authorises three distinct modes of compounding. These may extend to any hereditament (which however must contain a dwelling-house) whose rateable value does not exceed 8l.—If the parish in vestry assembled should adopt the Act, then the overseers shall rate all the owners of small tenements, and shall allow a deduction of 15 per cent. from the amount of the rate.—If the owner will also agree to pay for empty as well as occupied houses, then a further deduction of 15 per cent. is to be allowed, so he will get off 30 per cent. In the case of parishes not adopting the Act, the owners of any such small tenements may enter into an agreement in writing with the overseers to pay the poor-rates upon all his cottages, &c., "whether occupied or not," and he shall thereupon be allowed 25 per cent. off his rates, "subject nevertheless to the control of the vestry." All parishes in which the Small Tenements Act is now in force, should, therefore, hold a vestry meeting before the end of this month, to agree about adopting the new Act, and the Michaelmas poor rate should be made in conformity with the deductions sanctioned by the Act. There is a great amount of complication in this new measure, and, like all Voluntary Acts, the effects will be uncertain in extent, and in duration, also, as a vestry may alter its decision every six months. In some unions the poor-rates of small tenements will be levied upon four different assessments, and the highway rates upon two others with a 5l. limit. It is not my desire or intention to criticise the Act, but as it is the law of the land, I simply wish to draw the attention of all parish authorities to its main provisions. The greater portion of the Act relates to securing the franchise to the tenants in parliamentary boroughs, which has nothing to do with us who live in the country, and the first clause allows tenants of three months and under to deduct the rates from their rent.

— Harvesting Wheat by machinery is thus considered by a "Durham Farmer":—

"A correspondent of Mr J. J. MERRI, writing from Yorkshire, says, in a letter which appeared in the Times of the 21st Aug. 'I have cut, tied, stooked, and stubble raked 12 acres of White Wheat (about 34 bushels to the acre) for 11s. Reaper back delivery. This statement struck me at the time as being somewhat inconsistent with my own experience in the neighbouring county of Durham, and this year I find by actual experiment that I have cut, tied, stooked, and stubble raked 12 acres of Red Wheat (about 40 bushels to the acre) for 10l. 4s. Reaper back delivery.'

If the readers of daily papers need any information on the subject of the cost of agricultural operations, it is certainly advisable, as the "Durham Farmer" intimates, that they should be so addressed as not to be left in doubt as to whether the expense is 4s. or 17s. per acre.

— As the "Land Question" is now receiving much attention at the hands of certain public men

and in certain quarters, we give the programme of a "Land Tenure Reform Association" as a matter of news—

- 1 To promote the free transfer of land 2 To secure the passing of Mr Locke King's Real Estate Intestacy Bill 3 To restrict within the narrowest limits the power of tying up land 4 To preserve the rights of the public over commons, and generally over all lands which require an Act of Parliament to authorise their enclosure 5 To promote the practice of annexing such lands to the estates of the neighbouring landholders 6 To promote measures by which, without unjust interference with private rights, facilities may be afforded to the workmen and tillers of the soil for acquiring an interest in the land of the country 7 As one means to the object last proposed—to endeavour to promote such an administration of landed property owned by public bodies, or held for any public purposes, as shall help to carry out such object.

— The President of the British Association, in reviewing the progress of science during the past year noticed an interesting investigation recently conducted by Professor CHURCH of the Royal Agricultural College, Cirencester. The researches of the Professor revealed the presence of copper, in considerable quantity, as forming an important constituent in the red colouring matter of the wings of the Turaco or Plantain eater of the Cape of Good Hope. Traces of copper had previously been found in animals, for example in oysters, but in these cases the presence of the metal might be looked upon as accidental. But in the Turaco the very existence of the red colouring matter of their plumage is dependant upon copper, which exists in it at the rate of nearly 6 per cent. It is curious that in the same feather, partly red and partly black, copper was found in abundance in the red parts, but none, or only the merest trace, in the black.

OUR LIVE STOCK.

THE Rev. C. W. Holbeach has instructed Mr. Strafford to sell by auction 33 cows and heifers and 14 bulls, on the 21st inst., at Farnborough, near Banbury. Mr Strafford informs us that the foundation of this herd was laid in 1813, by the purchase of some pure bred cattle in Yorkshire. For many years no great effort was made to compete with the principal herds of the county, but a good stock, often successful at local shows, was kept up. Since 1853 many animals from the best known herds have been introduced. Sixteen of the lots offered are by H.H. DUKE OF OXFORD, and the cows and heifers are mostly in calf to the same bull LORD RED EYES 2D, or 2D EARL OF CLEVELAND.

— We have not space to notice separately the many important sales just about to take place. The advertisement sheets of our agricultural papers are full of important announcements. Mr. Strafford "is favoured to sell" 25 head of excellent cattle for Mr F. H. Fawkes at Farnley Hall, Ottery, on the 14th of October; and Mr. Thornton will sell a large and well-bred stock of Shorthorns, grazing cattle, and South-downs, the property of Mr. Loughbourn, Petersfield, Hants, on the 15th inst. The same auctioneer is also intrusted with the sale of some very first-class Shorthorns and Leicester sheep, the property of G. R. Barclay, of Keavil, Dunfermline, on the 21st inst. These are all important sales, and we hope to treat of them at greater length on a subsequent occasion. It is a matter of regret that the Farnborough and Keavil sales take place on the same day, as many persons would doubtless like to have attended both.

— We are informed that Mr. LACE, of Grenaby, Isle of Man, has purchased Mr Carr's Lady Rosabel due to calve to PEER OF THE REALM in October. The price was 400 gs. This is the second purchase from Mr. Carr's stock made this year by Mr. LACE, as it may be remembered that he secured Mirabel from the same herd in the spring.

— The following changes have recently taken place in the Kingscote herd. Honour Pride by Captain Gunter's GRAND DUKE OF OXFORD (16,184), dam Helen, by OREGON (8371), and her full sister Honeybell, left on Friday, the 20th ult., for Castle town, Ireland, where their relative Honey 15th, and the bull AERONAUT, preceded them some weeks before. All these are good animals, by Wetherby sires, and sold for good prices. On the following Monday the undennamed nine heifers and two cows were sent to Mr. Angerstone, Weetley Hall, Brandon, Norfolk.—Ada and Cerito 14th, by 2D EARL OF WALTON; Chaff 14th, by 2D DUKE OF WETHERBY; General, by ANTHONY (17,307); Honeys 28th, 29th, and 31st; Lady Lilac 14th, Marchioness of Oxford, Merelina, and Baroness Oxford 3d. These cattle were accompanied by 70 Sussex-down ewes and three very good rams, which are let at high prices. The Kingscote herd has also received the following additions.—Cucumber, of Booth and Bates extraction, from Council, and Paul of Fashion, and her heifer calf, by EARL OF GLOUCESTER; Georgina, and her heifer calf, by PRINCE OF BELL'S, of Brocton House. This is the second lot of the Peach and Georgina tribes which Colonel Kingscote has bought from Mr. Bell. They are nearly pure Bates blood and good milkers, a point much looked after at Kingscote.

— The Coleshill sheep on the 20th ult. made good, but by no means high prices. Most of the full-mouthed ewes went off at from 50s. to 60s. each. Colonel Kingscote gave 73s. for a very good pen, and Mr. Clayden bought another for 72s. The six-toothed ewes ranged no higher than 60s. Mr. Fulcher, for Lord Sondes, gave 82s. for a first-rate pen of four-tooth, and Mr. Lucas secured another good pen of 10 for 78s. each. The shearing rams brought from 5 to 10 gs. with four exceptions, in which 23, 20, 15, and 15 gs. were respectively given. Only one ram lamb was sold for more than 10 gs. The description of the sale of the Coleshill cattle and pigs appeared in our impression of last week.

A correspondent requests us to insert the following query. He asks "if there are any means of preventing calves from going mad from a week to two months old?" "I have," he says, "no hope of finding a cure, as they die in most cases within half an hour after taking it; it is very rare for a calf to die here unless from that cause; this year two have died, and for some seasons past one or two have died each year in the spring, and from one herd in this neighbourhood (Gloucestershire) nine have died this season." When we add that this query is asked by the manager of one of the finest herds of Shorthorns in England it becomes important. In a conversation with the gentleman alluded to, he persisted in defining the disease as mad-rage, and would not allow that it was merely the result of violent pain caused by some internal malady.

RECENT RAM SALES AND LETTINGS.

Lincolnshires.—The rams of Mr. Chaplin, of Tathwell, near Louth, were let by auction, by Messrs. Briggs, on Tuesday of last week. Fifty-one rams were penned, 48 of which were shearlings. For size, substance, and fleece, says the Lincolnshire Chronicle, some of them were truly remarkable, and before a more numerous company would have inevitably caused a very keen competition. Of the 51, 38 were let, the remainder being passed. The gross amount made by these let was 384. 10s., being an average of 10l. 2s. 6d.—The Biscathorpe rams were let on the following Thursday, when Mr. Kirkham had around him his usually large assembly of friends from far and near to partake of his hospitality, and otherwise enjoy the objects of agricultural interest—apart from the sheep to be let—which are to be seen at Biscathorpe. The prices which the rams let for on this occasion were not equal to past seasons. The average price of the 120 rams, 60 of which were shearlings, was 12l. 2s.—On Monday last, Mr. Davey, of Owersby, near Market Rasen, had his rams let by Mr. Tateson. Mr. Harrison hired one of the shearlings at 21l., Mr. J. Clarke one at 30l., Mr. J. Byron one at 40l., Mr. T. Dalton one at 17l., Mr. Toder one at 28l., Mr. Minta one at 26l., Mr. Allwood one at 21l., and Mr. R. Howard one at 20l. Of the 2-shears, Mr. E. Davy hired one at 30l., Mr. Markby one at 18l., and Mr. R. Wilmson one at 26l. And of the 1-er sheep Mr. Minta took one at 21l., and Mr. Havercroft one at 40l. Of the 140 sheep offered 135 were let, the sum realised amounting to 1430. 10s., giving an average of a little over 10l. 13s.—Mr. Marshall, of Branstons, who, as our readers know, has been very successful at the Royal and other agricultural society's shows, offered his sheep to be let on the following day (Tuesday last). The prices realised, however, were not equal to the show of prize cards by the 2-shear and aged sheep. Mr. T. Peohell hired one of the shearlings at 21l., Mr. Cartmoo one at 25l., Mr. Middleton, of Water Newton, Huntingdonshire, one at 35l., Mr. Richardson one at 17l., and Mr. Kemp one at 15l. The 2-shear and aged sheep made good prices. Mr. Harrison hired one at 26l., and Mr. Locker, of Winton, Huntingdon, took one at 31l. The 10 shearlings made 375l. 10s., being an average of 9l. 7s. 9d., and the eight older sheep made 121l., or an average of 15l. 2s. 6d. each. The average of the whole was 10l. 6s. 10d.—The Huttoft letting took place on Mr. Robinson's farm yesterday week. The two-shear sheep were in greater favour, and Captain Catlin, of Elne, Wisbeach, gave 20l. and 29l. respectively for two of them. There were 23 shearlings and 24 two-shear. The average of the 52 was 9l. 19s.—Mr. C. Clarke, of Ashby-de-la-Launde, Lincoln Heath, let his annual produce of rams for the first time on Thursday last. He has hitherto—except in the cattle plague year, when they were sold at home—divided his rams between Newark, Nottingham, and Peterborough fairs. On Thursday there were 100 shearlings offered, and we must say they were the best lot of 100 rams we ever saw together as the property of one man. Mr. Pell hired the first at 14 gs.; Mr. Toynbee took one at 30 gs.; Mr. Mayfield, of Dogdyke, one at 23 gs.; Mr. Dudding one at 24 gs.; Mr. E. Paddison one at 35 gs.; Mr. Sampey one at 17 gs.; Mr. Wildgoose one at 19 gs.; Mr. Holland, of Deeping, three at 17 1/2 gs., 18 gs., and 30 gs. respectively; Mr. Garner took one at 30 gs.; and the remainder, as far as they were let, made the good average for the season of nearly 11l. A few were passed at the upset price of 5 gs., but several of Mr. Clarke's regular customers were unavoidably absent after harvest-work, and the surplus will be readily disposed of at from 8 to 10 gs., as the sheep for which there was no bid were, as a rule, quite as good for store breeding as any that were disposed of.

Southdowns.—The annual sale of sheep, and the sale and letting of rams, the property of Mr. William Ridden, of Hove, near Brighton, took place on Friday. There were 18 splendid rams for letting and 16 for sale. Nine pens of ewes were first disposed of, at prices ranging from 8l. to 2l. 10s. Then followed the rams for letting. The highest price, 69l. 6s., was given by Count Bouille; Mr. Barclay, of Headley, gave 40l. 19s. for one. The others ranged from 37l. 16s. to 10l. 10s. The rams for sale went as follows:—Two-year-old, by a son of Reserve, 27l. 6s., Colonel Bowyer; 1-year-old, by a son of Young Plenipo, 13l. 13s., Mr. Henry Webb, Cambridgeshire; 1-year-old, by ditto, dam a Beddingham ewe, bought in at 10 gs.; 1-year-old, by ditto, dam ditto, 10l. 10s., Mr. Page, Bradwell-on-Sea, Healdon, Essex; 1-year-old, by ditto, dam a Goodwood ewe, 10l. 10l., Mr. Page; 1-year-old, by ditto, dam ditto, 17l. 17s., Mr. Page; 1-year-old, by ditto, 11l. 0s. 6d., Mr. Fox, West Hoathly; 1-year-old, by a son of Webb's 21, 10l. 10s., Mr. Wobb, Cambridgeshire; 1-year-old, by a grandson of Archbishop, 12l. 12s., Mr. Wood, Essex; 1-year-old, by ditto, 10l. 10s., Mr. Page, Maldon, Essex; 1-year-old, by 2d prize ram at Battersea, 10l. 10s., Mr. Fox, West Hoathly.

THE WHEAT CROP OF 1869.

(The following important letter on this subject has been written by Mr. J. B. Lawes.)

It would be difficult to select two successive seasons in which the Wheat crop in this country has differed more than in the years 1867 and 1868. To meet the deficient yield of the former crop above nine million quarters of Wheat were imported into the United Kingdom during the twelve months succeeding September 1, 1867. This large foreign supply would have been still larger had not the splendid crop of 1868 been harvested and brought into consumption at an unusually early period, thus reducing the consumption of the crop to a period of little more than 11 months. The range of prices during these two years has been very great, the average price of the harvest year commencing September 1, 1867, having been 68s. 4d. per quarter, while the average price of the year, from September 1, 1868, up to the time I am writing, being a trifle below 50s. per quarter. It is rather singular that the Gazette of May 8, 1867, which gives 74s. 7d., being the maximum price of the year, also gives in the same week of the following year 44s. 4d., being the minimum price of the harvest year—a difference within 12 months of above 30s. per qr. The crop of 1869 presents none of the marked properties of the two preceding crops; it is certainly not a very bad crop, like that of 1866, nor a very good crop, like that of 1868. Its peculiar feature is the remarkable contrast which is to be seen in crops growing side by side, and to all appearance cultivated alike. Some fields present a magnificent appearance, with height of straw and bulk of produce rarely surpassed, while others are thin and root-fallen. These circumstances make it rather difficult to arrive at a definite figure which shall most nearly represent the crop of the country.

In the "Journal of the Royal Agricultural Society" for 1868, I published a paper on the "Home Produce, Imports, and Consumption of Wheat." A portion of the paper was devoted to a comparison between the produce of the field in which I grow Wheat every year with the general crop of the country, in order to ascertain how far the yield of certain selected experiments could be taken as a guide to the yield of the Wheat crop throughout the country. The figures are given in this paper for a period of 17 years, from 1852 to 1868, and can be referred to by any one who is anxious to know what reliance can be placed on the estimates I am about to give.

The following Table gives the produce of selected experiments in a field which has grown Wheat for 26 years in succession. The produce of the five previous crops is given, as well as the crop of this year, and also the average of the last 17 years, no change of any sort having been made during this period in the manures employed, nor have we reason to suppose there would be any fluctuation in the produce except such as is due to the influence of climate.

BUSHEL OF DRESS'D CORN PER ACRE.

Table with 7 columns: Plot, How Manured each Year, Harvests (1864, 1865, 1866, 1867, 1868, 1869), and Average of 17 Years 1852-1868. Rows include Unmanured, Farmyard manure, and Artificial manure (Nos. 7, 8, 9).

WEIGHT PER BUSHEL OF DRESSED CORN, POUNDS.

Table with 7 columns: Plot, Harvests (1864, 1865, 1866, 1867, 1868, 1869), and Average of 17 Years 1852-1868. Rows include Unmanured, Farmyard manure, and Artificial manure (Nos. 7, 8, 9).

We have in this Table an exact illustration of what appears to be the character of the Wheat crop throughout the country; in one case a produce above the average, and in another greatly below it. Comparing the produce of 1869 with the average of the 17 previous years, we find the unmanured space slightly below the average, while the land receiving farmyard dung every year is nearly 3 bushels above it. The crop with artificial manure (No. 7) gives 28 1/2 bushels against an average of 36 1/2, or nearly 1 quarter of Wheat below the average. No. 8 is 4 bushels below the average, and No. 9 is nearly 3 bushels above it. Nos. 8 and 9, which receive equal manuring elements—the first receiving its nitrogen in the form of salts of ammonia in the autumn, and the latter as nitrate of soda in the spring—generally give nearly equal amounts of produce, No. 8 being rather the best. This year the nitrate of soda gives a produce 4 bushels higher than the salts of ammonia, due probably to the long-continued rain during the winter, combined with a high temperature, having removed the ammonia from the soil. If the different experiments are compared with the products of the two previous years, it will be seen that in no instance is it so low as in 1867, or so high as in 1868. Taking the mean produce of the unmanured and dunged land and the three artificially manured lands (these latter being considered as one), we get a product which, over an average of 17 years, very closely agrees with what is considered by our best authorities to be the yield of an average crop in this country. We have in the present crop a product which is almost identical with the average, the one being 28 1/2 bushels per acre, and the other 29 1/2. Refer-

ring to the lower part of the Table, which gives the weight per bushel, it will be seen that in every case the weight is very low, being 2 lb. per bushel below the average of 17 years; it is even below that of the very bad crop of 1867.

In the following Table will be found the produce obtained by threshing 1 acre from several fields under regular cultivation:—

Table with 5 columns: Field No., Bushels of dressed Corn per acre (1867, 1868, 1869), and Lb. per bushel (1869). Rows 1-5 and Mean.

The yield in these fields is very variable, but in every instance the weight of the bushel is very low. This is the more remarkable after the splendid ripening weather we have had, and in crops which were not in any way laid at the time of cutting. The conclusion I draw from these figures is, that the Wheat crop of 1869 is slightly below the average in quantity, and that it will be also deficient in quality, as estimated by the weight per bushel. Assuming that an average crop is represented by a produce of 28 1/2 bushels, weighing 61 lb per bushel, I am disposed to fix the present crop as equal to 27 bushels of the same weight.

I will now endeavour to ascertain how much food such a crop will supply, and what quantity of foreign Wheat must be imported to supply bread to the nation for the next 12 months. It is said that the area of Wheat grown this year is less than that of last year; how far this is correct I do not know. The statistical return for last year gives an area under Wheat of 3,750,000 acres. In the absence of returns for the present year I will take as a basis for calculation 3,700,000 acres, which at 27 bushels per acre, gives 12,487,500 quarters. From this should be deducted the seed for the succeeding crop, which, at 2 1/2 bushels per acre, amounts to a little over 1,000,000 quarters, leaving in round numbers 11 1/2 million quarters for food. The mean population of the United Kingdom to be fed during the next 12 months will be little short of 31 millions. In the paper I have referred to will be found some calculations relating to the consumption of bread by the population of the United Kingdom. I have estimated this at equal to 5 1/2 bushels of Wheat per head per annum, or upon a population of 31 millions, of 21 1/2 million quarters. As I estimated the home supply at 11 1/2 million quarters, this would leave about 9 1/2 million quarters to be supplied from other soils. This quantity may appear very large, and may be somewhat reduced by the stock of old Wheat of the crop of 1868 still in the hands of farmers. Quite irrespective of season, it should be borne in mind that, while our own produce of Wheat does not materially increase, our population is increasing rapidly, and consequently a larger percentage is fed with foreign corn every year. The quantity of Wheat imported into the United Kingdom during the 12 months ending the 31st of August next will be little short of 7 1/2 million quarters, and this with a harvest far exceeding the average and corn at a low price. Our deficiencies, whatever they may amount to, will doubtless be fully supplied, and in the absence of disturbing causes I should not expect to see the price of Wheat very much below or above the present price for the next nine months. Rothamsted, Herts, Aug. 26.

ABORTION IN COWS.

(The following is a summary of conclusions arrived at by a commission upon the prevalence of abortion in the north-east of the State of New York.)

THE north-eastern portion of the State of New York abounds in factories for the fabrication of the magnificent cheeses which are extensively imported into this country, and many of which may compete with our best qualities. This extensive district has of late suffered so much from the abortion in cows that a commission was appointed to investigate the matter, the admirable and exhaustive report of which, by Dr. W. H. Carmalt, has just been kindly forwarded to us. The report, we may observe, is quite a model for such productions; the investigation was carried out with singular zeal, no expense within the limits of prudence was spared to arrive at the truth, and the result is far more conclusive than is often the case with such commissions. The report, indeed, is so good in itself, that we should be glad to possess it even if we took no interest in the subject, which is far from being the case.

We ourselves frequently suffer very much both amongst sheep and cattle, but especially the former, from the same affliction, and there is little doubt that the prevalence in autumn of ergot in our pastures is the cause of the malady. It was natural, therefore, from the well-known influence of ergot on the uterus, that especial attention should be paid by the commission to the parasitic Fungi occurring in the pastures. This, however, was necessarily modified, from the American habit of housing the cattle during the winter months. The hay then was the object of search rather than the pastures. Every phenogamous plant was thoroughly examined, specimens of the less common species secured, and the whole flora of the infected district carefully registered, but the result showed nothing at all likely to be deleterious, and ergot existed in too small quantities in the hay to be of the slightest consequence.

Attention was, however, turned to the habits of the herd masters as regarded their cattle. The object being to obtain as large and as early a supply of milk as possible, and at the same time to get as much profit from the herd itself, the bulls were killed when quite

young; and the bull-calves kept only so long as was necessary to obtain the stomach in the best condition for the production of rennet, and the heifers were put to the bull at the earliest possible period. In consequence, not only was there the prospect of a feeble fetus from the use of such young bulls, but the cows being forced to yield far more than an average quantity of milk, and that long after they were pregnant, it was not surprising that the race should gradually become weak, and that, the proper supply of nutriment to the young calf being too greatly restricted, there should be frequent abortion. Where bulls, cows, or heifers were introduced from an aborting dairy, the disastrous effects were soon felt, and where 1-year-old bulls were employed the average of losses was proportionately greater. The tables show, moreover, that an average excess of 18.5 lb. more milk per cow than the statistics of the whole State determine should be the yield.

The conclusions of the commission are stated as follows:—

1st. That cows, which have first calved at under three years of age, are more liable to abort during their subsequent pregnancies than those who first calved at three years of age or over, in the proportion of five to three; and that 83 per cent. of the cows raised on the farms reporting them do first calve at under three years of age.

2d. That cows subjected to removal at any time are liable to abort, over those raised on the farms, in the proportion of 7 to 4, and that 63 per cent. are thus removed.

3d. That cows subjected to removals during pregnancy are liable to abort, over those moved while not pregnant, in the proportion of 9 to 2, and that 70 per cent. of those moved yearly are pregnant, and 17 per cent. are moved yearly.

4th. That arrest of development is the condition immediately preceding the abortion; that an excessive drain upon the secretion of milk during pregnancy has a tendency to produce arrest of development in the fetus from inanition, and that an excess of 70 per cent. of milk is demanded from cows in this district, where abortion prevails.

The whole expense of the commission was 4610 dollars, about 1000/ sterling, an example of liberality which is worthy of imitation nearer home. *M. J. B.*

AGRICULTURAL GLEANINGS FROM BRITISH CONSULS' REPORTS.

(Continued from p. 906.)

Tonnay-Charente (France).—The past year has been remarkable for the high price of provisions and the deficiency which prevailed, the more to be noted in a largely productive agricultural district, which has had ordinarily a considerable surplus to dispose of by exportation. On the contrary, Wheat and Oats were in great quantities imported in 1868, but with a scarcely perceptible effect upon prices. This arose principally from want of success in the harvest of the preceding year, but it is also probable that the actual production of provisions, properly so called, is diminishing in this district, whilst their consumption is somewhat increasing. There are two main causes tending to this result. First, the large tracts which, having formerly produced corn, are now devoted to the cultivation of the Vine; and, secondly, the absence of sufficient labour-power duly to cultivate the ground. Incidentally to the latter, it is to be observed that much of the richest producing land has been able to furnish grain crops, &c., for many years, without manure, but under this trial it is becoming less fertile every year, and now requires thorough renewing by fertilising applications and deep cultivation. The farmers are injudicious in placing similar crops, or crops with similar exhausting properties, on the same land year after year; and their system of fallowing, by leaving the so-called fallow ground to become the prey of weeds for one year in every five or seven, far from strengthening the land, is likely to injure it.

Leipsic.—The harvest in Saxony (1868) was somewhat below an average. Pasture failed most universally; and as straw was thin and short, cattle and sheep suffered. The noticeable features of the year are the gradual decline of corn prices to the level of former years, and a heavy fall in the value of cattle and sheep. It is scarcely necessary to say that here, as elsewhere, the seasons were abnormal. Winter was severe, intermittent sharp frost and much snow being alternated with mild weather, thaw, and damp. In spring, dry winds and hoar frosts. At Easter snow fell in large quantities, saturating the ground to a considerable depth, and impeding cultivation for several weeks; thus snow was the last moisture on the land for months, for when rain came, it fell usually over a very small area, and not in sufficient quantity. In summer the drought and heat were so serious, that forest fires frequently occurred. Large sums were spent in clearing railway embankments, and in making ditches to arrest the progress of fire; but in spite of all these precautions, some accidents occurred. The great heat, however, was advantageous in some respects—it brought up the Wheat and Rye crops quickly, destroyed all disease in the ears, and produced a crop deficient in amount of straw, but full of weight in grain. Barley, Oats, and Peas, yielded in proportion to the amount of moisture which they got in the summer months. Patches favoured by moisture produced abundantly; others were dried up. The highlands of Saxony were more favoured by showers and dew than the plains; Beet was greatly injured by drought; Potatoes yielded well, and furnished a large proportion of starch.

Amsterdam.—The harvest here gave general satisfaction, a great deal of Wheat was sown and harvested in fine condition. Rye suffered considerably through the long-continued drought, and though there was not much sown the crop has proved to be better than was

expected. Barley succeeded perfectly well, both quality and quantity turning out satisfactory. Buckwheat was a failure. Oats, like Rye, suffered from the exceedingly dry summer; Beans and Peas were successful; the Rape and Canary seed crops were splendid. Linseed and Flax would have been better had there been more rain. The Potato crop was an abundant and excellent one.

Turkey.—The spring set in very late; not a leaf or a blade of Grass was visible in the beginning of April, and consequently in many parts of the province of Bosnia considerable mortality occurred among the cattle through starvation, the small supply of fodder remaining from the scanty crops of the preceding year having been exhausted. Much rain succeeded the cold and inclement months of March and April, and people rejoiced at the prospect of an abundant crop of hay. The cereals also presented a promising appearance, and very heavy crops were expected. In Bosnia, however, it appears that rain is often either too abundant or seriously required, and the incessant wet weather which prevailed until the month of September damaged the greater part of the hay crop, and injured more or less all the cereals, with the exception of the Indian Corn, which was plentiful and of good quality. Rather more than a fair average crop of tolerable hay was stacked, a great part of which will be available this year, as the past winter was so mild and open that the cattle were able to find sustenance in the fields and copses. The crop of cereals was probably below the usual average. The state and condition of the crops appear to have been identical in many parts of Turkey. *J. R. Jackson Kew.*

ON THE DEVELOPMENT OF CEREALS.

(Mr. Hallett read before the British Association at Exeter the following paper upon "The Law of the Development of Cereals.")

FROM continued observations and experiments, extended over nearly 20 years, I have arrived at the following conclusions, that where room has been afforded to the plant for its natural development—

1st. Every fully developed plant, whether of Wheat, Oats, or Barley, presents an ear superior in productive power to any of the rest on that plant. 2d. Every such plant contains one grain which, upon trial, proves more productive than any other. 3d. The best grain in a given plant is found in its best ear. 4th. The superior vigour of this grain is transmissible in different degrees to its progeny. 5th. By repeated careful selection the superiority is accumulated. 6th. The improvement, which is at first rapid, gradually, after a long series of years, is diminished in amount, and eventually so far arrested that, practically speaking, a limit to improvement in the desired quality is reached. 7th. By still continuing to select, the improvement is maintained and practically a fixed type is the result. I have throughout the whole of my records found only three instances in which there were two ears on a plant containing an equal number of grains, and one of these related to the Belle Vue Talavera Wheat, which, as I shall presently show, may be considered quite exceptional as to variation. In both the other instances there was only a low stage of development, the equally finest two ears of each plant containing but 59 grains and 49 grains respectively. In every case where the plant presented an ear of 60 grains and upwards the next best ear was of less contents than the finest one. In 20 instances taken consecutively and without omission from my journal the average difference between the contents of the first and second ears was $7\frac{1}{2}$ grains. These include seven varieties of Wheat. The difference in four of these instances was only one grain, but in another four it amounted to from 17 to 19 grains. For the simplicity of illustration I have here taken merely the number of grains in the respective ears, but the "best" plant, ear, or grain is that presenting in the most eminent degree a variation towards the quality or characteristic in which the improvement is chiefly sought. This may be the property of producing the finest quality of food, as indicated by weight per bushel, the lengthening, shortening, or stiffening of the straw, the increasing or diminishing, in the case of Wheat, the distances between the ranks of corn, &c. In reference to this question of the different powers of grain in the same ear, it seems that in former times an idea was entertained that those from about the middle of the ear were most vigorous. It has also been recently suggested to me that those grains nearest the "centre of growth" might on that account prove to be the best. This investigation as to the place of the best grain I made in 1858. I planted 10 ears of Wheat in the form of an opened book, having upon the right page the grains arranged as they grow in their respective ranks on the point of the stem, and similarly upon the opposite page those growing upon the back of the stem, a vertical line up the centre of each page representing the stem itself, and the grains nearest to this line on both sides of it representing those which grow nearest to the stem. The only general result, among most conflicting ones, at which I could arrive was, that the smallest corns, those most remote from the centre of growth, exhibited throughout, most unexpectedly to me, a vigour equal to that of the largest, and that the remarked worst grains in one or two instances did not by any means fall so far short of the good ones as I had expected they would do. I have since then repeatedly made trials of the comparative power of large and small, good and bad grains—and in the case of Oats, which produce a small grain attached to a large one, trials as to their respective powers with uniformly the same result, viz., that in good grains of the same pedigree neither mere size nor situation in the ear supplies any indication of the superior grain. Theoretically I believe that the power of vegetable growth in a grain is identical with its power of supporting animal life, and

dependent mainly upon the proportion of gluten which it contains, which is also proportionate to its specific gravity.

THE AMERICAN GRAIN CROPS.

THE crop reports from various parts of the United States are more conflicting and doubtful than is usual at this season of the year. The extreme fluctuations in the weather, and the variations of rain and heat, have produced opposite results in different places.

To come to particulars, we find that the crops are very favourable in the New England States, New Jersey, and New York; the hay crops in all these States will be immense, and the cereals are in a prosperous condition. In Virginia and Tennessee there is nothing to be desired. From the North-Western States the accounts are more conflicting; but it appears that damages by the recent tremendous rain-storms are confined to a comparatively limited breadth of country. Wheat, in some parts of Illinois, Iowa, and a few of the North-Western States, has suffered considerably. But even in the most unfavourable States the harvests—except in the unlooked-for event of continued bad weather—may reach last year's average. In Minnesota, which is now the chief Wheat-producing State in the Union, the supply will be immense. A harvest of full 20,000,000 bushels of Wheat is expected. In Ohio, Wisconsin, Indiana, and Nebraska, the Wheat harvest seems superb. Take it altogether, there can be little doubt that the Upper Valley of the Mississippi, and nearly the entire North-West, will advance considerably upon last year's supply. It will be remembered that this will be partly the result of the increased quantity of land placed under Wheat. If it were not for the drawbacks in various localities on account of the weather, the yield would be unparalleled.

In California the wheat has been already harvested, and the yield, in spite of the drawbacks on account of rust, will be in excess of last year's supply. A greater breadth of land has been sown, much of it on new soil, and the aggregate is unprecedented. Every effort is made to push the grain to market, or to *entrepôts* where it may be available for transportation. From Oregon, Washington Territory, and the Pacific slope generally, the accounts are favourable.

The drawback to this favourable view is the indication that corn (Maize) will not much exceed half a crop. The cold spring and the heavy rains have produced injurious results. Nearly all the Western States have something to complain of on this account. A larger portion than usual has been planted in the Eastern and Southern States, which may neutralize the bad results of the short crop elsewhere. Unusually fine weather for the balance of the season may produce better results. But at the present time corn is in an unusually damaged condition, a fact which is sufficiently attested by the advancing market rates.

The South will, undoubtedly, produce more food than last year. In the Valley of the Colorado, Texas, and in portions of the lower Mississippi Valley, immense damages have resulted from the usual inundations. Vast tracts of country have been devastated. But the supply of food from all the Southern States may be safely estimated as being in excess of last year's products. From all parts of Canada the wheat and corn accounts are highly satisfactory. *Abridged from "New York Economist."*

A VISIT TO TIPTREE.

THERE are few farms in the Tendring Hundred, or even in any other Hundred, or, in fact, in any other county except Essex, of so small an extent as 170 acres, that ever created so large an amount of interest or so much notoriety or celebrity as the farm of Tiptree Hall. For the last 27 or 28 years, during the time it has been in the possession of Mr. Mechi, it has been an exhibition farm, and in the present day it has acquired so much fame that it has actually become one of the things worth seeing in this country. Foreigners who come over to England to see all that is to be seen are sure to include Tiptree in their catalogue of sights; one day of their visit must necessarily be spent in viewing the Wheats, Mangels, and agricultural machinery on Tiptree Heath. Even Garibaldi, who, by-the-by is half a farmer at Caprera, paid Mr. Mechi a visit when he was in England last, and expressed himself exceedingly gratified with all he saw.

Most of your readers are aware that Tiptree is about four miles or so from the Kelvedon Station, and although the road is somewhat winding, with several four-cross-ways, which, in a sparsely-populated neighbourhood, are exceedingly baffling to a stranger, the road is made exceedingly easy by the judicious erection of iron finger-posts directing the traveller to Tiptree Hall Farm. When once the visitor has passed the well-known white gate and entered the avenue leading up to the house, he feels as it were upon an enchanted spot of land, and some visitors of a very lively imagination may probably conceive the idea that Mr. Mechi is some Eastern Magi, who by the use of his divining rod and the usual hocus-pocus of legerdemain, transforms wet earth into dry soil, barren land into fertile fields, and produces six quarters of Wheat from two pecks of seed. They may also expect to see him clothed in a mysterious mantle covered with symbols of the cabalistic art, a long white beard, a pair of tortoise-shell spectacles, and a black cat on his shoulder. But how different is Mr. Mechi in the flesh! A portly, genial, kind-hearted English gentleman, who comes out of his house as you drive up, and gives to all his visitors a hearty welcome, so that the greatest stranger feels at home before he has been in his society ten minutes. Farmers from Scotland, from Cornwall, from Yorkshire, or any other county or country are to be met at Tiptree—three gentleman came all the way

from the extreme north of Scotland to see Tiptree, and were pleased with what they saw, on the day we paid our visit. There was also one gentleman from Bristol, who was a large buyer of corn, and who suggested that farmers should grow a certain description of Wheat instead of Rough Chaff, as he would always give 2s. a quarter more for it. The rest of the party consisted of gentlemen from the Tending Hundred.

After Mr. Mechi had introduced everybody to everybody else, a walk was proposed round the farm, his intelligent bailiff, Mr. Drane, leading the way, Mr. Mechi explaining in his very pleasing manner, the different results of his operations and experiments on the farm. "Look here," said Mr. Mechi, "at this hot haystack, and what a simple process does away with all danger;" it was simply an iron pipe pointed at one end, and perforated, driven in the stack, and a long piece of iron piping, with an elbow attached, outside the stack. All the vapour or steam in the stack was drawn into the pipe and let out, giving convincing proof that at the cost of a few shillings many fires might be prevented. Samuelson's reaper was doing its duty remarkably well. The Wheat was not laid at all, consequently the reaping was easy work, and the result was explained by Mr. Mechi to be due to thin sowing. "For," said he, "give a plant room to stand up, and it won't lie down." On entering one field of Wheat he said, "Now, gentlemen, 4 pecks of seed were sown in part of this field, but in some places there are 2 pecks only—as you are practical farmers, see if you can find out the difference." They could not tell the difference; but when pointed out all pronounced the 2-pecks-an-acre crop to be the best. Taking the Wheat crop over the farm there will certainly be 5, 6, and, with the Rivetts, about 8 quarters an acre. Tiptree is not Barley land, and Rivetts are generally grown instead.

It would be worth while for any farmer to go and look at a piece of Winter Beans on that farm—take up one stalk and 54 pods can be counted; the land was certainly foul, but it had been twice hoed, at an expense of 18s. per acre, and winter bean-land is generally foul this year. Passing from the Beans to the Mangels, it was evident that a very heavy crop may be reckoned on. They were principally Yellow Globe and Long Red, three rows only on a stretch, except that here and there four rows were planted, but only for an experiment, for Mr. Drane said they had the heaviest crop of roots from three rows. The thick leaf Mangel with its fibrous roots was found to keep longer than the fine leaf with one tap root. There was a good crop of Kohl Rabi, all of which was transplanted from a nursery bed of about an acre.

Oats were light, and not at all a good crop.

Although Wheats are considered to be generally up to the average, yet Mr. Mechi is satisfied that his farm will pay a good percentage on his capital for this year. Consequently one might anticipate the result by calculation—if 16l. per acre is employed as capital, 2720l. would be the sum employed on 170 acres, and at 17½ per cent. profit, 476l. would be the result. May such be the case, for his energy and enterprise ought to be rewarded. The buildings next claim attention: the bullock houses, the covered yards, the barn, engine-house, &c.

Certainly the bullocks do not look so comfortable on the rails as they do on clean, good straw; but Mr. Drane assured us that they did better, got on faster, and fetched more money from the butcher. If so, that is all to be desired in fattening stock. The covered yards must be good for cattle, as they keep stock warm in the winter, and cool and free from flies in the summer; every farmer would be glad of such yards on his farm. A number of works are carried on in the barn: corn is threshed or ground, cake crushed, and straw cut for food, all by the little engine which Mr. Mechi considers to be his best servant on the farm. As he says, "steam power never tires; feed it well with coal and water and it will never give up." It is surprising how much work that small engine does—pumping the water into the cattle sheds, then sending the liquid manure into the tank, and again sending it out on to every field on the farm, and for 23 years has never been out of repair.

The cart stables and horses are nothing to speak about; they appear to be overlooked in the general management of Tiptree.

Whoever has an opportunity of spending a day at Tiptree should avail himself of it; there is something to be learnt, and Mr. Mechi is so frank and candid, and so willing to impart any information, that a day is most agreeably and profitably spent in his society. No matter whether any one differs from him or any of his theories, it only produces argument, which must be profitable. It is almost impossible to put him out of temper, and for that reason he often gets the best of it. Essex Standard.

HARVESTING IN WET WEATHER.

THE following letter to the Times well deserves a place in an agricultural Paper. The writer describes a method which might well be used in uncertain or bad weather as a means of enabling the farmer to put his corn together earlier than when it is left in the field until thoroughly dry:—

Sir,—I am gratified to observe by your article of Wednesday last that you are giving your powerful influence in directing the attention of agriculturists to the practicability of means for effecting this object, which is of so much public importance for our variable climate, and I will ask you to afford me space in your columns to give a brief detail of my experience in this matter, which will be found to have anticipated to some extent the recent trials on this subject on a farm of under 300 acres, which I have held for some years as a tenant of the Earl of Derby.

During the wet summer of 1863 my friend and brother magistrate for this county, Mr. Gossage, of the well-known chemical and soap manufactory at Widnes, in this neighbour-

hood, paid me a visit to explain and impress upon me some ideas he had long entertained as to harvesting crops so as to be independent of weather. Mr. Gossage's notions were that if corn (however wet it might be) were placed in ricks in such manner that a current of dry or heated air could be forced through it, the superfluous moisture would be speedily driven off and the corn become thoroughly cured. He proposed to do this by means of a centrifugal fan driven by horse or steam power, and if the latter were employed, to use the gases which were produced by combustion of fuel under the boiler to yield heated air to be applied to accelerate the drying.

After mature consideration, I was convinced the plan was a practicable one, and, to prove it, I set up a rick of Beans in so damp a state that all my servants thought it could not fail of being utterly spoiled. The rick was 20 feet by 10 feet, by 20 feet high, being twice as large as the usual size. Before forming the rick, I placed a wooden trough or pipe 9 inches square inside, extending from one end to the centre, and terminating in an aperture on the upper side 9 inches square. In stacking the Beans, I placed a sack (filled with straw) vertically over the aperture above-mentioned, and gradually, as the rick was formed, I kept raising the sack, and forming a chimney of the same diameter, till within about 6 feet of the top. I then connected a centrifugal fan with the end of the air-trough, and had it driven by two men acting on a large pulley from which the motion was connected, by means of a strap, with a small pulley on the fan shaft. I soon perceived evidence of moisture proceeding from the rick, and in a few days, employing cold air, and with these insufficient means of application, the rick of Beans (which it had been predicted would be utterly spoiled) became thoroughly dried, and was threshed out and consumed on the premises. I was thus convinced that the use of artificial currents of air, either cold or, by preference, heated, would, in the latter case particularly, render the agriculturist nearly independent of weather in harvesting his crops; and I have acted upon this conviction when needful in my operations ever since the wet harvest of 1863.

This year I formed four ricks of hay, under wooden covers (called Dutch barns), each 24 feet by 16 feet by 20 feet high, with a wooden air trough running the whole length under them, provided with slides to let on and out off the passage of air, and each rick having a vertical channel formed as before described. One rick of this hay was mown, tedded, and rolled together by horse labour, put by hand into large cocks, and on the third day from mowing, without being previously spread, was carted and stacked. This rick was so out of condition, that my bailiff begged me not to let it be stacked, as it must, in his opinion, inevitably take fire. I put up the three other stacks in different stages of condition, but none thoroughly cured. I then applied currents of cold air to the whole by means of a fan driven by a steam-engine of 1 horse power, and the hay in each stack (including the one above specially noticed) became so thoroughly cured that it has sold at the full market price of the day. By these means the four ricks of hay were harvested with less than one-fourth the expenditure for manual labour usually required.

With regard to Wheat, it has been customary with me to thresh it by steam-power immediately on carting it from the field, without putting it in ricks. On considering the advantages of this mode of drying I erected an apparatus consisting of a double cylinder 8 feet high, closed at top and bottom, formed of perforated zinc plates, the outer cylinder being 8 feet in diameter, and the inner one 2 feet, leaving an annular space of 3 feet, which contained when filled upwards of 200 bushels of Wheat. I applied, by means of a fan, a current of air warmed by passing over the steam boiler, to the inner cylinder, and the air, after passing through the perforations, filtered through the Wheat, causing it to be brought quickly into a fit condition for grinding.

I have stated that I commenced these operations by the advice of my friend Mr. Gossage, in 1863, and have continually pursued them since that period. I consider that I have now so thoroughly proved the practicability and advantage of these operations, that I can recommend their universal adoption by my brother agriculturists, in the full conviction that, by these means, we can render ourselves, to a great extent, independent of weather in harvesting our crops. Robert Neilson, Halewood, Liverpool, Aug. 29.

FOREIGN SUPPLIES OF MEAT.

THE announcement last week that cattle had actually arrived from Montevideo was somewhat startling to graziers, and could not be received by landlords without causing some little reflection as to the consequences. There is every probability that ere long we shall be supplied with larger amounts of animal food from abroad. No one who appreciates the vast improvement made of late years in our means of transit can feel safe from foreign competition, in even that peculiarly British commodity "roast beef."

If this is true, how far is it a cause for alarm? The subject is difficult, but we do not think that even if the dream is fully realised, a large importation would be followed by a serious reduction in price. First, we should bear in mind that if the speculation proves remunerative, not only England, but every civilised and over-peopled country will avail itself of the cheaper source of food. Hence the supply will be diverted to many markets, and this will tend to preserve the balance of prices. Another fact to be taken into account is that the consumption of animal food will be much increased, and this not only in England, but in other countries. A large portion of our people scarcely taste animal food, but as soon as the price is brought down to their level, the rush which will be made will be a considerable check upon further reduction. Thirdly, owing to the inevitable changes of season, we cannot look for a regular supply of live animals from long distances throughout the year. We subjoin some additional information, from a reliable source, on this subject:—

"An experiment of importance towards solving the question as to the possibility of obtaining supplies of fresh meat from the practically boundless plains of the River Plate has been successfully completed. It was stated in April last that the Government of the Argentine Republic, and also the Government of Uruguay, had granted to an English house the exclusive privilege of snipping live cattle from those States for a period of years, with entire exemption from all port charges and customs' duties, and that in the first instance a small trial would be made of the effect of the passage. It now appears that the steamer City of Rio, which arrived on the 20th inst., brought 19 oxen which had been shipped at Montevideo, and had been 31 days at sea, with, it is said, a short supply of water and scarcely any food but the commonest hay. No casualty had occurred among them, although from exposure and insufficient treatment they had become

extremely thin. They were hurriedly shipped, without selection, on its being found that the vessel could take them, and the price paid at Montevideo was 5l. per head, but a contractor at that port offers to supply any quantity at 4l. per head, free on board, well prepared, and weighing not less than 800 lb. each."

Home Correspondence.

Thick and Thin Seeding.—Last summer a letter was written to the Times, giving an experience in this matter. The writer drilled 1 bushel of Wheat to the acre, and found his crop better than when he drilled 2 bushels of seed per acre. On his recommendation I last autumn adopted the plan myself of sowing parts of fields with 1 bushel and other parts with 2 bushels, which had been my previous practice. The Wheat is just cut. No. 1 was grubbed out of Hops, and contained 6½ acres. The whole of this field was drilled with 5½ bushels of seed, which is less than 1 bushel to the acre. The crop is a fair average crop, and nothing more; indeed, my bailiff seems to think if there had been a little more seed there would have been more corn. This field was free from Couch and weeds, not in good heart, but fresh for Wheat. This was drilled the first week in October. No 2 is a field of 7 acres of excellent land and in good condition, and the crop is excellent, the straw for the most part being 6 feet high. We drilled about an acre of the centre of this field with 1 bushel, the rest of the field with 2 bushels, as usual. I have inquired of my bailiff and of the reapers which part of the field they consider the best. The replies I got are contradictory, and I cannot decide myself. No. 3 is a field of poor sandy land, of 37 acres, but free from Couch and in high condition this was drilled on the 8th and 9th of October. One acre is drilled with 1, and all the rest 2 bushels. Here, again, we are in difficulty about which is best, but the preponderance of opinion is in favour of the 2 bushels. My object is to invite discussion. Nos. 2 and 3 were subsoiled three years ago. B. N. F. [When practical men find it difficult to decide as to which crop is best, we cannot be far wrong in saying that there is not much choice between the two. If one crop is much better than another, a good judge would not find much difficulty in deciding as to which is most advantageous. At the same time communications such as the above are unsatisfactory, and by no means convincing to those who have adopted an opposite opinion regarding the question under discussion. Thin-seeded Wheat may appear poor, and yet yield wonderfully well; and the bulkier thicker sown, may, on the other hand, measure up badly. For this reason we would recommend the only test in such matters to be used, viz., scales and weights, both for straw and grain.]

Societies.

ROYAL AGRICULTURAL OF IRELAND.

Tralee.—The great interest now taken in the agriculture of the sister kingdom will be gathered from the numerous and varied list of prizes awarded by this Society, by the wide range whence exhibitors are drawn, and particularly by the speeches made at the banquet by gentlemen high in authority and of great influence in the country. Englishmen and Scotchmen send specimens of almost every kind of the numerous breeds of cattle, sheep, horses, and pigs now established in Great Britain; while Irishmen, although they for some time lagged behind in the agricultural race, now frequently surpass in open competition their more experienced brother breeders on this side the Irish Channel. Our space will not allow us to give more than the principal prizes in the leading classes. The number of animals exhibited we recorded last week. Besides the classes for these productions there were prizes for small occupiers, for dairy produce, for flax, and for poultry. The following is an abridged list of awards:—

CATTLE.—SHORTHORNS.

For the best Bull, calved on or after January 1, 1864, and previous to January 1, 1867.—1st and Purdon Challenge Cup, R. Chaloner, Kingsfort, Kells, Co. Meath, Sovereign, by Royal Sovereign (22,802); 2d, Edward J. Smith, Islanmore, Croom, Co. Limerick, Lictor (24,333), by Master Harbinger (19,352).

For the best Bull, calved in 1867.—1st, H. Lyons, Croom House, Croom, Lord Francis, bred by Joseph Meadows, Thornville, Wexford, by First Fiddle (19,749); 2d, T. Sandes, Sallow Glen, Tarbert, Royal Tudor, bred by W. Talbot Crosbie, Ardferd Abbey, Tralee, by Royal Sovereign (22,802).

For the best Bull, calved in 1868.—1st, E. J. Smith, The Earl, bred by Richard Challoner, by Ravenspur (20,628); 2d, R. G. Cosby, Stradbally Hall, Queen's County, Colonel Frank, bred by Mr. Meadows, by Agamemnon (23,278).

For the best Bull Calf, calved in 1869.—1st, R. Welsted, Ballywater, Castletownroche, Coronet, bred by exhibitor, by Uncle Ned (19,026); 2d, R. Welsted, Lucky Lad, bred by exhibitor, by Uncle Ned (19,026).

For the best Cow, in Calf or in Milk, calved previous to January 1, 1866.—1st, W. Hutchinson Massey, Mount Massey, Macroom, Janet, bred by exhibitor, by Gwynne of Lothian (21,889); 2d, R. Smith, Blossomfort, Mallow, Venus, bred by William Copinger, Barryscourt, County Cork, by Westrom Wonder, (17,225).

For the best Heifer, in-Calf or in-Milk, calved in 1866.—1st, W. Bolton, The Island, Kilmuckridge, County Wexford, Gamo Hen 3d, bred by the late J. Anderson, Grace Dieu, Waterford, by Mercury (22,342); 2d, R. Welsted, Princess Primrose, bred by exhibitor, by Uncle Ned (19,026).

For the best Heifer, in-Calf or in-Milk, calved in 1867.—1st, Sir R. Paul, Bart., Ballyglan, Waterford, Bonnie Lass, bred by exhibitor, by Patriarch (24,497); 2d, R. Welsted, Rossanna, by Sir James (16,980).

For the best Heifer, calved in 1868.—1st, J. Mealy, Fanny 25th, bred by exhibitor, by Agamemnon (23,278); 2d, William Bolton, Ally Gwynne, bred by exhibitor, by Gray Gwintlet, (10,908).

For the best Heifer Calf, calved in 1869.—1st, F. J. Smith, Islanmore, Croom, Co. Limerick, Gertrude, bred by exhibitor, by Lictor (24,333); 2d, Sir Robert Paul, Bart., Mantle, bred by F. G. Bloomfield, Newpark, Waterford, by Glory (24,048).

HEREFORDS, DEVONS, AND POLLED ANGUS.

Best Hereford Bull, calved on or after January 1, 1864.—1st, R. S. Featherstonhaugh, Rockview, Killucan, for Grateful. Best Devon Bull, calved on or after January 1, 1864.—1st, C. Boyle, Tanagh, Dartry, Monaghan, for Blood Royal. Best Devon Cow, in-Calf or in-Milk, calved previous to January 1, 1866.—1st, C. Boyle, for Pride of Braunton. Best Devon Heifer, calved in 1867 or 1868.—1st, C. Boyle, for Pride of Braunton &c. Best Polled Angus or Galloway Bull, calved on or after January 1, 1864.—1st, W. Owen, Blessinton, for Orathie Jock 2d. Best Polled Angus or Galloway Cow, in-Calf or in-Milk, calved previous to January 1, 1866.—1st, William Owen, for Maggie.

KERRIS.

Best Kerry Bull, calved on or after January 1, 1864.—1st, James Brady, Raheny, Co. Dublin, for The Knight of the Glens; 2d, Madame M'Gillicuddy, The Reeks, Killarney, for Lord Glencar. Best Kerry Cow, in-Calf or in-Milk, calved previous to Jan. 1, 1866.—1st, Thomas M'D. Mahony, Cullenagh, Killarney; 2d, George Massy, The Spa, Tralee.

OTHER BREEDS.

Best West Highland Cow, in-Calf or in-Milk, calved previous to January 1, 1866.—1st, Thomas Butler, Prieststown House, County Meath, for West Highland cow Beauty. Best Ayrshire Bull, calved on or after January 1, 1864.—1st, N. M. O'Donnell, Coolemore, Mill Street, County Cork, for red and white Ayrshire bull Bonnie Dundee. Best Ayrshire Cow, in-Calf or in-Milk, calved previous to January 1, 1866.—1st, J. Buchanan, Sackville, Tralee. Best Ayrshire Heifer, in-Calf or in-Milk, calved in 1866.—1st, David Patton, for Maggie. Best Ayrshire Heifer, calved in 1867 or 1868.—1st, Henry Jones, for Boarding School Miss.

SHEEP.—LEICESTERS.

Best Shearling Ram.—1st and Cork Challenge Cup, T. Marris, Uleoby, Lincolnshire; 2d, W. R. Meade; 3d, W. Owen, Blessinton. Best Ram of any other age.—1st, Seymour Mowbray, Killeany, Mountrath; 2d, W. R. Meade, Ballymartle, Ballinlaseig; 3d, T. Marris. Best Pen of 5 Shearling Ewes.—1st, T. Marris; 2d, Seymour Mowbray. Best Pen of 5 Ewe Lambs.—1st, Seymour Mowbray.

BORDER LEICESTERS.

Best Shearling Ram.—1st, R. G. Cosby, Stradbally Hall, Queen's County; 2d, R. Briscoe, Fermoy; 3d, ditto. Best Ram of any other Age.—1st, R. G. Cosby, Stradbally Hall, Queen's County; 2d, R. Briscoe; 3d, ditto.

OTHER LONG WOOLLED SHEEP.

Best Shearling Ram. 1st, T. B. de Brosno, 2d, ditto, 3d, Captain J. B. Smyth, Fedamore, County Limerick. Best Ram of any other age. 1st, Captain J. B. Smyth. Best pen of 5 Shearling Ewes.—3d, Thomas Butler, Prieststown House, Prieststown, County Meath.

SHROPSHIRE DOWNS.

Best Shearling Ram.—1st, Thomas Marris. Best Ram of any other age.—1st, Thomas Marris. Best pen of 5 Ewe Rams.—1st, Thomas Butler.

HORSES.

The Croker Challenge Cup, value 50 sovs., with 20 sovs. added, for the best weight carrying thorough bred Stallion.—1st, F. H. Power, Roskeean, Mallow, thorough bred stallion in hand.

STALLIONS.

Best Stallion of any breed for general purposes bred on or after January 1, 1862, and previous to January 1, 1866.—1st, J. Fleming, Glasgow, bay Clydesdale stallion Star of the West; 2d, J. Magrath, Knockbrack. Best Stallion for agricultural purposes, foaled on or after January 1, 1866.—1st, P. Cahill, Anna, Tralee, County Kerry, agricultural stallion Young Favourite.

SWINE.—COLOURED BREED.

Best Boar under 18 months old.—1st, F. Trevor, Beech Hill, Donnybrook; 2d, ditto. Best Boar over 18 months and under 36 months old.—1st, P. Murnane, Ballyryan, Tipperary; 2d, W. Hutchinson Massy, Macroom, Berkshire boar Pymalion. Best Breeding Sow under 18 months old. 1st, his Excellency Earl Spencer, K.G.; 2d, T. Sanda, Sallow Glen, Tarbert. Best Breeding Sow, over 18 months old.—1st, W. Hutchinson Massy, Berkshire sow Fatima; 2d, R. W. Reynell, Killynora, Killarney. Best lot of 3 Breeding Pigs of the same litter, above four and not exceeding eight months old.—1st, J. Molloy, Dublin; 2d, F. Trevor. Best Sow and Litter of 6 Pigs.—1st, F. Trevor. Best Breeding Sow, over 18 months old.—1st, J. C. Cooper. Best Sow and Litter of 6 Pigs.—1st, J. Molloy, Dublin.

JUNOS.—SHORTHORNS.

H. Thurnell and H. Smith. Other breeds: R. S. Skirving, — Campion, A Bogie Horse H. Briscoe, H. Thurnell, R. S. Skirving. Sheep—Leicesters, &c.: T. C. Booth, J. Hutchinson, A. Warburton Swine A. Warburton, J. Borthwick, A. Darker. Poultry H. Jones, Flax and Butter: Rev. M. Bradshaw, J. Borthwick Implements: B. C. Wade, D.L.; J. Borthwick.

The following are the practical portions of the speech of Earl SPENCER, the Lord-Lieutenant. After some highly complimentary and generous remarks towards the Chairman and officials of the Society, his Excellency came to the showyard and its contents:—

During my visit to the showyard I was enabled to learn the opinions of those better able than myself to form an opinion, and their opinion was that the show was very excellent in quality. The number is, perhaps, not very great in the different classes; but the quality of the animals exhibited is very good. I do not think I ever saw a finer specimen of a Shorthorn bull than the animal called Sovereign, the property of Mr. Challoner. There were many excellent specimens of quality and shape, and no one who ever saw them could fail to admire the symmetry and beauty of some of those animals. The sheep show was a good one, and I can speak myself in reference to the pigs, inasmuch as I was an exhibitor in that particular department. With the view of testing the excellence of the breed of pigs in Ireland, I thought I could not do better, when I formed the intention of being an exhibitor here, than to go to the Royal Agricultural Society in England, and endeavour to get as good a specimen as England could produce. I brought two excellent animals over, one of which, a sow, had an increase in her family. They had obtained a second prize in England, whereas they were only highly commended here. Such was the decision of the judges, to which I must freely bow. I shall be

most happy if the animals I brought over will be of any use in improving the breed in this country. Passing from this, I would say there was another important branch of the show which was well represented. I allude to the machinery. I saw some improved specimens of implements—ploughs, threshing machines, and others—well calculated to assist in agricultural labour. I feel impressed with the idea that reference to improvement in such articles is a very important part of the work which the Royal Agricultural Society performs, introducing in every part of the country the most recent improvement in agricultural machinery. I may here observe that when going round the showyard I saw one machine which I thought rather calculated to cast a reflection on good agriculture. It is a machine which I hope is not much required in this country; but I must confess that on my journey from Killarney to Tralee I saw a good many fields where that machine should be in operation. I allude to a machine for cutting down thistles. I sincerely trust that the energy of the Irish farmers will soon render the sale of that machine almost impossible in this country; that they will eradicate that noxious weed, the seeds of which frequently blow upon neighbouring farms.

Material Prosperity and Progress.—Now, gentlemen, I should wish to refer to some more general matters, and glance at the general condition of the country. In doing so I would refer to two points which are indicative of that condition—namely, the class of houses in which the agricultural portion of the population live, and the amount of their savings. I believe that there is a considerable increase in the better class of houses. During the terrible ordeal through which the country passed at the time of the famine, and the large exodus of the population which then occurred, it was a remarkable fact that there was no diminution in the better class of habitations, but rather an increase. I sincerely hope that the diminution in the class of mud cabins referred to in the report of the Census Commissioners will continue, and that they will ultimately disappear. The reports of the Commissioners of Public Works give some small indications of the change that is going on in that respect. In 1859 an Act was passed to enable proprietors and farmers to borrow money from the Board of Public Works for building cottages. In 1866 it was amended, when a short Act was passed which enabled the Commissioners to lend money, not only for the building of cottages, but for alterations and improvements. The amount so advanced was not very large, but it had been increasing. Since the passing of the Act there had been expended for cottages over 50,000*l.* I confess I should like to see that greatly increased, for nothing is so important for the country. When referring to these improvements, it is satisfactory to find that there has been an increase in loans for general improvements. In 1866 it was little over 26,200*l.*, whereas in 1867 it amounted to 29,357*l.*, and in 1868 to 42,707*l.* The increase for the present year is considerable, and it is likely to amount to 80,000*l.*, making a total already borrowed for the improvement of agriculture in this country of over 2,000,000*l.* That is due partly to the idea which Parliament rightly entertains that they may lend money to advance so useful a purpose on good security. It is also indicative of a considerable amount of public spirit on the part of proprietors in this country. I see in this country an active proprietor, who has his name down for a loan of over 8,000*l.*; and in the county of Longford a proprietor is going in for a loan of 15,000*l.* for the improvement of his estate; whereas, in the North of Ireland, two proprietors have applied for a sum of 10,000*l.* for the same object. I think that is a very satisfactory sign with regard to improvement in the general condition of the country. I would touch on another point—namely, the amount of savings in the banks: I am happy to find that the amounts of deposits have largely increased this year, and close on 20 millions sterling has been deposited in the joint-stock banks in this country, and this year a considerable increase is likely to be made. Such deposits largely represent the savings of the agricultural classes in the community. I would now refer to one or two more distinctly agricultural statistics which I have been enabled to procure, owing to the excellent arrangements which are made in Ireland in respect to agricultural returns. With respect to live stock, I see that this year there is a considerable increase, with one exception, for I find there is a diminution in the number of sheep—over 250,000—as compared with last year. I do not think that is indicative of any great decrease in the wealth of the country as regards sheep, for the last year there was an increase of over a million and a half, but that increase was preparing for a larger export. We find this year that from the port of Dublin alone there was an increased export of nearly 81,000 sheep. I think, therefore, we may consider that the wealth of the country in sheep this year has not very much diminished. The increase of sheep in this country is a significant fact, for since 1841, the first year of the Royal Agricultural Society, the number of sheep in the country would seem to have doubled. In 1841 there were 2,106,189, and in the present year there are 4,648,158. With regard to cattle, I do not think there is anything that calls for particular remark. The number of cattle remains the same. There has been a slight increase as well as a slight diminution in the exports.

Contagious Diseases (Animals) and the Legislature.—While on this subject I cannot help alluding to an important measure which has passed into law in England and Scotland—I allude to the Bill providing against contagion. On a former occasion I spoke at some length on this subject, but the importance of it is so great that I cannot help again alluding to it. That Bill simplifies the various Acts on the subject, and introduces special laws with regard to pleuro-

pneumonia. That is a very important matter, and well worthy your attention. You will consider whether some similar provision should not be applied to cattle in this country. Nothing could be more important than legislation with the view to the prevention of such diseases, and the farmers of England and Scotland forced Government to introduce a measure of this sort. It must be the interest of the farmers in Ireland to do likewise, for in this country, where there are so many small farmers, the loss that would result from contagious diseases would be almost ruinous. The tenant-farmers of Ireland have not the same means of separating their cattle as the large farmers in England and Scotland have. I earnestly hope that on the introduction of such a measure next session it will receive the support of the Irish farmers.

Pigs, Grass-land, and Arable Crops.—With regard to pigs, it is satisfactory to find there is a very considerable increase in Ireland. That is a sign of the growing prosperity of the labouring classes. A pig very early comes to maturity. It is easily kept, and is the best kind of stock for a poor man. It is therefore satisfactory to find that there is an increase in pigs of 210,215, and if the increase goes on we shall very soon arrive at the highest figure which the stock of pigs ever attained in this country. I will now pass from these statistics to other figures, which are also furnished by the Registrar-General. I allude to statistics which refer more particularly to arable land. It is sometimes thought that those who hold prize cattle are in favour of increasing the Grass in this country, and diminishing the arable. I, for one, consider it important that cattle should be increased in this country, but I do not believe it need be done at the sacrifice of tillage land. In this country, which is dependent on agriculture, it is of great importance that the amount of tillage land should be kept up to the highest point which is essential to agricultural progress. I have noticed in England that you will seldom find 200 or 300 acres of the best grazing land without finding some against it equally inferior in quality, which is far more profitable to the farmer. I know it is the case in Warwickshire and Leicestershire, and the modern improvements in farming have converted estates which were entirely grazing into mixed arable and grazing land. Now, I believe that is the case in Ireland as well as in England, and anyone who travels about the country will see a large quantity of grass-land which could with great advantage be turned into tillage land.

Irish Produce. To prove what I say, I would allude to remarks made not long ago by a gentleman well known to you I mean Mr. Monell, M.P. for Limerick. In a statement he made before the Statistical Society in Dublin, he compared the agriculture of Scotland and Ireland in this respect, and the results are very remarkable. He showed that in 11 years, between 1857 and 1868, in Scotland, though Wheat had diminished by 118,657 acres, Barley, Oats, Potatoes, and Turnips increased by 163,610 acres. At the same time stock increased by 1,447,000 head. In the same 11 years Wheat and other crops decreased in Ireland 700,000 acres, or, deducting Flax increase, 579,740, and there was an increase in live stock of 1,040,745 head. But at the same time the increase of stock does not bear anything like the same proportion as the increase of stock in Scotland. That proves what I say. It is not necessary to have a decrease of tillage. If you can increase green crops and artificial grasses you will find immense benefit from it. If I am right, the returns this year are, on the whole, quite in the right direction. There is an increase in Flax and other arable crops—an increase of 5000 acres. With regard to Wheat it is remarkable what free trade has done in Ireland. There is no doubt that Wheat is better grown in other countries. In 1847 there were 743,871 acres under Wheat, and in 1869 there were 281,117, showing a considerable loss. It does not follow that it is necessary all arable crops should increase, but in Scotland, notwithstanding the decrease in Wheat, there is a large increase in other crops. In this country there is a considerable increase in Barley, which is a crop well suited to this country, and there is a small decrease with regard to Oats.

Irish Fences.—There is one point which I think every stranger is struck with, and that is the peculiar character of the fences in Ireland. Such large fences are hardly necessary for agriculture. Every person who had the pleasure of hunting near Dublin looked with horror at the gigantic fences. There is a wide dyke separating the field from the bank which is large enough to engulf both man and horse. There are gentlemen here who tremble in the saddle when approaching some of these large fences, covered by men who are ready to drag out the unfortunate man who falls on the other side, and they go by the name of "wreckers." As a farmer, I cannot see the necessity for such large fences, or why so much land should be taken up with them. I made some inquiry from Mr. Baldwin regarding the excellent institution known as the Model Farm, near Glasgow, which I frequently visit. I was told the amount of land which a fence occupies on that farm, which is 108 acres in extent. The Education Commissioners levelled 13 acres of fences and it was found that 2 acres of fences would be necessary to divide the fields, and they thus gained 6 per cent. of land on their small area. On a neighbouring farm of 81 acres in extent 7 acres were occupied by fences, and 8 per cent. instead of 2 lost to farming. If fences, and 8 per cent. instead of 2 lost to farming. If those large fences. I have now traced over the different points to which I wish to refer. I have shown that the Agricultural Society has had a large share in improvements in the country, but I have also shown there is still great room for the operation of its skill and energy.

Landlord and Tenant.—My lords and gentlemen,—I have carefully followed the rule which is invariably observed at these meetings—not to allude to any subject of political moment; but I cannot help feeling, when

talking of improvements in agriculture in this country, there comes up to the mind of everybody present a subject now occupying the attention of politicians. I shall not enter on that subject. I feel now the importance of encouraging confidence between landlord and tenant. I will not enter into that difficult subject now, but I think I may be allowed to implore all those who have influence in the country to come forward to meet this difficult subject with fairness, impartiality, and justice. There will be much discussion on what should be done for the settlement of this question, which has been so long agitated in this country. I would implore all who have an interest in it to approach it with impartiality and fairness, and, above all means, to discuss only what is really practicable. If that is done, I look forward to see this difficult question satisfactorily settled. After congratulating those present on the excellence of the harvest, which was about being gathered in, his Excellency resumed his seat amid loud applause.

ROYAL NORTH LANCASHIRE.

THE annual exhibition of the Royal North Lancashire Agricultural Society was held at Burnley last week, in a field belonging to Lieut-General Yorke Scarlett, near the Bank Top Railway Station. The show was held last year at Ulverston, and the total entries this year were, including implements, 2062, against 2063 last year. The stock showed a great improvement on previous years. The entries in cattle were 175, against 162 last year; horses, 173, against 174; sheep, 299, against 285; pigs, 25, against 17; poultry, 53, against 223; roots and seeds, 123, against 101; cheese, 22, against 6; dogs, 306, against 272. At Ulverston, last year, there were 861 entries of implements, against 686 at Burnley this year. The show of cattle was of a first-class character, and many of the animals shown were of far-spread reputation. In the class of aged bulls there were 15 entries.

Mr. Brierley's Bolivar was again successful in this class, closely followed by Lady Pigot's Charles le Beau as 2d, which, although not a prize getter, was highly recommended at the Royal. Messrs. Crawshaw and Blackley's roan bull Prince Leopold, which was at the Royal but got no prize, obtained the 1st prize in the 2-year-old bulls. The class of bull calves produced some good specimens, but the judges had not much difficulty in deciding upon the merits of the prize animals belonging to Colonel Towneley and Mr. William Slye. Perhaps the class which attracted most attention, and in which the competition was very strong, was aged cows. The 1st prize animal at the Royal was not present, but the 2d, Lady Pigot's Queen of Rosales, obtained the 1st here. There was a very close run between Lord Skelmersdale's red and white Cherry and Mr. Adam Dugdale's roan Kent Cherry, but the judges awarded the prize to the last. In this class also was Colonel Towneley's famous cow Duchess of Lancaster.

The agricultural horses were distinguished by very high merit, and the pair of greys shown by Mr. C. W. Brierley were models of symmetry. In the class of brood mares, a fine roan mare, 10 years old, shown by the Rev. J. Pennington, of Whalley, was a finely formed animal, and obtained the 1st prize. The same gentleman also obtained the 2d prize in this class. The class of mares for breeding hunters included some very fine animals, the first honour being awarded to Mr. William Roberts, of Burnley. The class of thorough-bred stallions, although not of average merit, yet produced several first-class specimens. Mr. Roberts, of Burnley, obtained the first honours in the class of yearling colts, but the class of young horses for harness purposes were not of a first-class character. The prizes for yearling colts were not awarded, for want of merit. The young horses for agricultural purposes, as indeed the class of agricultural horses generally, were of high merit.

Sheep were a very meritorious class, and some very fine specimens were exhibited. The Leicesters, although not a numerous class, contained some animals of very high merit. There were some fair specimens of Shropshire Downs, but, generally speaking, the class was not strong. Lonsks showed remarkably well. The silver cup, value 10 gs., given by Mr. R. Shaw, M.P. for Burnley, for the best collection of Lonsk sheep, not less than 20 in number, embracing both sexes, was taken by Mr. Joseph W. Green, Keighley. This gentleman also carried off the silver medal for the best yearling ram of the same breed. There was only a small show of pigs, Mr. Eden, of Salford, being as usual a large and successful exhibitor.

A special prize of 100l., offered by the Earl of Derby, to the town or village in North Lancashire, of 2000 and upwards of population, that shall adopt a similar system of sewerage to that carried on at Wellington College, Sandhurst, found no competitors.

It does.—Implements Messrs. Forrester, Hartley, and Barrows. Cattle—Messrs. Jefferson and Wilson. Horses: Messrs. Angus, Fliswick, and Smith. Sheep, Pigs, Roots, Seeds, &c. Messrs. Baxter, Torr, and Riley. Poultry: Messrs. Hewitt and Teobay. Dogs: Messrs. Fisher and Waller.

The above remarks and the following principal prizes are taken from the *Manchester Examiner*—

CATTLE.—SHORTHORNS.

Best Bull, two years old or upwards.—1st prize and Special Medal.—C. W. Brierley, Rhodes House, Middleton, Manchester, roan, "Bolivar."
 One year old Bull—Crawshaw & Blackley, Headfield Farm, Dewsbury, roan, "Prince Leopold."
 Bull Calf—Colonel Towneley, red, "Baron Collinge."
 Cow or Heifer, above three years old.—Lady Pigot, "Queen of Rosales."
 Two year old Heifer—Rev. L. C. Wood, Singleton Lodge, Wharfedale, white, "Miranda 10th."
 Heifer, not exceeding two years old.—1st prize and Special Medal.—Colonel Towneley, roan, "Oxford Beauty."
 Heifer Calf.—Lady Pigot, white, "Mantelina 2d."

CATTLE OF ANY BREED.

Bull, two years old and upwards.—G. Butler, Preese Hall, Weston, near Kirkham, white, sire "Grand Duke of Lancaster."

Bull, above one and under two years old.—1st prize and Special Medal, R. Thompson, Mythop Lodge, Blackpool, roan, "Prince Thorn," sire "Thornale Grand Duke."
 Bull Calf.—J. Walten, Horncliffe, Rawtenstall.
 Cow in Calf or milk, having had a Calf, and above three years old.—G. Hunt, Frenchwood, Preston, red, "Peereas III."
 Heifer not exceeding three years old.—1st prize and Special Medal, Rev. L. C. Wood, white, "Miranda X." Not exceeding two years old.—J. Milner, Myerscough, near Preston, white, "Princess of Wales."
 Heifer Calf.—J. Farrer, Thorneyholme, Burnley, "Lady Kent."
 New prize—Silver Cup, or 10l., for the best Bill Cow, and Calf, the latter to be the progeny of the two former.—T. Strater, jun., Stand Hall, Whitefield, near Manchester.
 Cup, presented by the secretary, for the best three Short-horns of any age or sex.—Tenant Farmers' prize B. Baxter, Skipton.

HORSES.

Agricultural Stallion.—J. Edmondson, Houghton, Eatwistle, near Burnley, brown, "Young Sampson."
 Brood Mare for Agricultural Purposes.—Rev. J. Pennington, Stonyhurst College, Whalley, roan.
 Pair of Draught or Agricultural Horses, above three years old.—C. W. Brierley, Rhodes House, Middleton.
 Dry or Agricultural Mare or Gelding.—J. and T. Barcroft, Gaghills, Waterfoot, near Manchester, "Smiler," 9 years old.
 Three year-old Gelding or Filly for Agricultural Purposes.—J. Pearson, St. Michael's, Garstang, grey.
 Two year-old Gelding or Filly for Agricultural Purposes.—C. W. Brierley.
 Ditto for Hunting Purposes.—R. Fielden, Walsden, near Todmorden, brown gelding.
 Yearling Colt or Filly for Agricultural Purposes.—R. Harrison, Yorkshire, Burnley, bay.

SHEEP.

Leicester Shearling Ram.—T. H. Hutchison, Manor House, Catterick, Yorkshire.
 Leicester Ram.—T. H. Hutchison.
 White-faced, long woolled, Shearling Ram.—William Norman, Hall Bank, Aspatria, Cumberland.
 Run of the white-faced long-woolled not being of the Leicester breed.—John Pinder, Waddington, near Clitheroe.
 Shearling Ram, Shropshire Down.—J. H. Kearne, Holleth, Lancaster.
 Ram, Shropshire Down.—John Coulthurst, Gargrave House, Skipton, Yorkshire.
 Shearling Ram Wm. Midgeley, Birkett, Newton, near Clitheroe.
 Ram, Lonsk—Wm Midgeley.
 Ram of any other breed, adapted to a mountain district.—George Brown, Windermere, Herdwick.

PIGS.

Best Boar of the large breed, any age.—Peter Eden, Cross Lane, Salford, Manchester, "Gullivar," about three years old.
 Best Boar of the small breed, any age.—Peter Eden, Cross Lane, Salford, Manchester, "Young King."

SCARBOROUGH HAKKNES, AND NORTH AND EAST RIDINGS AGRICULTURAL SHOW.

THIS show was held last week in three fields belonging to Mr. Milhouse, Queen's Hotel, in front of that hotel in North Marine Road, Scarborough. The show was in most respects in advance upon any of the successful exhibitions which have preceded it. The entries were about 150 in excess of those of last year. The total number of entries was 825, including the implement stands. Of this number 50 were of cattle, 51 of sheep (in pens), 47 of pigs, 242 of horses, ponies, and donkeys; and 436 of poultry and miscellaneous entries. Of poultry and pigeons the show was varied, and included some splendid specimens.

The show of cattle embraced some remarkably fine specimens of Durham's famous breed—the Shorthorn. In the catalogue the names of well-known breeders showed themselves, prominent amongst whom was that of the noble owner of Duncombe Park. Singularly enough there was not a single animal shown in the name of the celebrated Booths, though no doubt representatives of the Waraby and Killerby herds were amongst the ranks of competitors. The 1st prize for a bull of any age was awarded to the victor at the Royal show of this year—a splendid roan, the Earl of Derby, belonging to Mr. Wiley, Brand-by, York. The 2d prize winner in the same class is also an animal of unusually fine proportions, belonging to Major Stapylton, of Myton Hall, and bears the appropriate name of Lord Wetherby. In the class of bulls under two years of age Mr. John S. Jordan, Elmsall, Driffield, was successful in carrying off the chief honour with Nestor, whose symmetrical proportions were much admired. This was the second success of the year, the animal having carried off a prize at Bridlington. The bull calf under 12 months which carried off the prize is a beautifully-proportioned animal, such an one as Landseer might love to place on canvass, and belonged to the Earl of Feversham, who also took a 1st for Colonna, a pretty heifer, not exceeding two years old. The prize cow, Lady Valentine—in the class for cows or heifers, above three years, in calf or milk—has been a most successful animal, having taken prizes at Selby, Bridlington, Ripon, and Otley—at the latter place got a silver cup as the best animal on the show ground. She is the property of Mr. Wm. Linton, Sheriff Hutton, York. In the other classes some very fine animals were shown.

The first prize for agricultural stallions was won by Mr. Rd Cole, Gembling, Lowthorpe; and for brood mares with foal at foot, by Mr. C. Leadley, Cloughton, Scarborough. In the special prizes given for the best hunting gelding or mare of any age, Brian Boru, a splendid chestnut horse belonging to Mr. J. B. Booth of Killerby, carried off the silver cup given by the president, Sir Charles Legard, Bart. The silver cup given by Mr. J. Dent Dent, M.P., for the best 5-year-old hunting mare or gelding, was won by Mr. Jas. Darrell, Ayton, Sherburn; that given by Sir Harcourt Johnstone, Bart., M.P., for the best 4-year-old hunting gelding or mare, was carried off by Mr. H. Jewison, of Raisthorpe, York, that given by the vice-presidents of the society, for harness geldings or mares, by Mr. G. Holmes, Bar House, Beverley, and that given by Mr. F. A.

Milbank, M.P., for the best ladies' hackney gelding or mare, by Mr. John Crompton, Thorneholme, Burton Agnes, Hull.

The show of sheep was not large; some very fair animals were amongst those shown. Pigs also were a small but good show. There was a very large show of poultry.

The following is a return of the principal awards:—

CATTLE.—SHORTHORNS.

Bull, any age.—1st, Mr. Wiley, York; 2d, Major Stapylton, Myton Hall.
 Bull, above one and under two years old.—1st, J. S. Jordan, Driffield; 2d, C. Smith, Yarm.
 Bull Calf, under 12 months old.—1st, Earl Feversham, Duncombe Park; 2d, W. Linton, Sheriff Hutton.

SHEEP.—LEICESTERS.

Two-Shear or Aged Rams.—E. Riley, Beverley.
 Shearling Ram.—1st, E. Riley, Beverley; 2d, T. Stampor, Oswaldkirk.
 Pen of 3 Shearling Rams.—1st, E. Riley, Beverley; 2d, J. J. Simpson, Hunmanby.

PIGS.

Boar of large breed.—G. Chapman, Scarborough.
 Sow of large breed, in Milk or Pig.—1st, D. Berryman, Shorburn; 2d, G. Chapman, Scarborough.
 Boar of small breed.—1st, G. Mangles, Ripon; 2d, J. Thompson, Scarborough.
 Sow of small breed, in Pig or Milk.—1st and 2d, G. Chapman, Scarborough.
 Boar of large breed, not exceeding 12 months old.—1st, W. Rudsdale, Yarm; 2d, G. Chapman, Scarborough.
 Sow of large breed, not exceeding 12 months old.—1st and 2d, G. Chapman, Scarborough.
 Boar of small breed, not exceeding 12 months old.—1st, G. Earle, York; 2d, W. Rudsdale, Yarm.
 Sow of small breed, not exceeding 12 months old.—1st and 2d, G. Earle, York.
 Cottager's prize (store pig), the property of a cottager or working man.—1st, G. G. Bilton, Scarborough; 2d, D. Berryman, Shorburn.

HORSES.—AGRICULTURAL.

Stallion.—1st, R. Cole, Lowerthorpe; 2d, W. Simpkin, Burton Agnes.
 Brood Mare, with Foal at her foot.—1st, C. Leadley, Scarborough; 2d, J. Petch, Scarborough.
 Yearling Gelding or Filly.—1st, J. Kirk, York.
 Two year-old Gelding or Filly.—1st, E. Smith, Bridlington; 2d, E. Coltas, Scarborough.
 Three year-old Gelding or Filly.—1st, J. Crompton, Burton Agnes; 2d, Barnett & Robertson, Lowthorpe.
 Pair of Horses.—1st and 2d, J. Simpson, Hunmanby.

JUDGES.—Cattle: Mr. T. P. Outhwaite, Knaresborough; Mr. W. Jobson, Hexham; Mr. P. Knowles, Wetherby; Hunting and Nag Horses: Mr. E. Abraham, Ulceby; Mr. A. Maynard, Saltburn-by-the-Sea; Mr. G. Bolam, Morpeth. Coaching and Agricultural Horses: Mr. W. Wood, Ulceby; Mr. T. Brown, Malton; Mr. R. Robson, York. Implements: Mr. R. Ellerby, Oswaldkirk; Mr. G. Smart, Milford Junction. Poultry, roots, &c.: Mr. J. O. Jolly, York Batter. Mrs. W. Hall, Ganton; Miss Auburn, Scarborough.

MANCHESTER AND LIVERPOOL AGRICULTURAL.

THE CHAIRMAN, in calling attention to the outbreak of pleuro-pneumonia and foot-and-mouth disease, said that the magistrates of Cheshire had determined upon issuing a form of notice for circulation throughout the county, in conformity with the Orders in Council. In the cases of pleuro-pneumonia, the inspector had the power of declaring the farms on which the disease had broken out as infected places; and in cases of foot-and-mouth disease, there was a prohibition against the removal of cattle from the farm on which it occurred. The foot-and-mouth disease had broken out in Tatton Park amongst cattle which had not been in contact with other animals, and he was told that it had also occurred at Lyme, but he had not the slightest idea how it had originated. He had not heard of any case of pleuro in his neighbourhood, but he was told that there was a great number of cases in Broxton Hundred and that part of the county.

The Cultivation of Farms.—Messrs. W. Rothwell and T. Ryby, the inspectors of the farms which had been entered for the Society's premiums and prizes, reported as follows—

"We have pleasure in saying that all the claims submitted to our inspection have been of a very deserving character, but we have had little difficulty in awarding the prizes claimed, as there has been some direction, either as to quality or proportion of work done, specified in the offer of premium which has aided us in arriving at a decision conformably to its intention. Only in one instance have we found much perplexity. Two claimants in the high-lying portion of the district, with farms of a totally different natural character and position, ask for the same premium. Both are large farms, and both are managed with great skill and enterprise, and it has required minute and comprehensive criticism to decide which was best. In awarding the prize as we have done we placed before our minds the standard of excellence to which we conceived it possible for both to attain, and then compared them with this standard. The winner came nearly up to it in all his crops save one, while the other was deficient as we considered, in two points of management, and also in that complete neatness and finish of the whole which should characterize a prize farm. We regret that so few of the prizes for laying down land to Grass have been claimed, as we consider this to be one of the most important points of good husbandry in such a district as that embraced by our society; and we respectfully suggest for your consideration before the annual meeting that it might enlarge the number of claims in future years if a rule were made similar to that applied to farms, prohibiting the winner from competition with the same occupation for three years. A reference to the journal reveals the same names as winners or competitors almost every year in succession, but, while this is creditable to them, it may, and we think does, prevent other farmers outside their circle engaging in the same competition. We regret even more that none of the silver medals offered to owners or occupiers have been claimed; and we would respectfully suggest to such gentlemen that this omission amounts to the neglect of a fine opportunity for stimulating their tenants to better practice in farming. Farmers have a right to their, or in the teachings of such a farmer they may be permitted with the practical appeals to their minds by results they can understand and appreciate; and a farm well tilled and heavily cropped, with good stock upon it, neat, well-kept fences, and good occupation roads, is an argument which speaks, quietly it may be, but constantly and as efficiently as to induce some imitation in almost every neighbour. The best farming in the two counties is found upon our prize farms and in their immediate neighbourhood. Example pro-

vokes emulation. A good farmer and a prize farm are most influential in the district in which they exist; and we think that the agents or bailiffs of landed estates could not better serve their employers than by joining in competition, as we believe that the best stimulus to enterprise and perseverance among the tenantry around. As respects the farming and the crops this year in the district of the Society, we notice a decided improvement annually in the former. Arable land is now kept cleaner when in green crop than formerly. Manure is applied with a more liberal hand and in a more systematic manner. The succession of crops planted is more studied and better known. Improved implements and machinery are pressed into service. Labour is higher, but it is more economical. The push and energy of the business man is being copied by the farmer, and the tenancy of events seems to be bringing successful agricultural practice more and more within the range of thoughtful calculation, liberal outlay, careful living, and persevering application. As regards our farm crops this year in the districts we have visited, we report them a full average generally. Grass has been plentiful, hay crops abundant, Wheat, Oats, Beans, and Barley variable, but an average. Potatoes, Turnips, and Mangels very promising. The best and healthiest crops of all kinds are on the best farmed lands invariably. Dairy stock has milked well, and notwithstanding the prevalence of much unseasonably cold weather, we look forward especially to the ingathering of the harvest of the year.

The following is a list of the principal awards made by the inspectors.—

BEST CULTIVATED FARMS SITUATE IN THE LOW LYING PORTION OF THE SOCIETY'S DISTRICT.

- To the tenant and occupier of not less than 150 acres.—10^l, Mr. W. Johnson, Halebank.
- To the tenant and occupier of not less than 100 acres, and under 150.—8^l, Mr. T. Williamson, Linacre
- To the tenant and occupier of not less than 50 acres, and under 100 acres.—6^l, Mr. J. Clayton, Kirkby.
- To the tenant and occupier for the best managed dairy or grazing farm, of not less than 200 acres.—10^l, Mr. Thomas Kerr, Knotty Ash.
- To the tenant and occupier for the best managed dairy or grazing farm of not less than 100 acres, and under 200.—8^l, Mr. J. Cornes, Hurleston

BEST CULTIVATED FARMS IN THE HIGH LYING PORTION OF THE SOCIETY'S DISTRICT.

- To the tenant and occupier of not less than 150 acres.—10^l, Mr. H. Higson, Pendleton, Manchester. Mr. Lawton, of Culcheth Hill Farm, Warrington, was a claimant for the same premium, and was awarded the Society's medal, and allowed the privilege of competing next year.
- To the tenant and occupier of not less than 100 and under 150 acres.—8^l, Mr. Shuttleworth, Prestwich.

DRAINING, OPEN TO THE WHOLE OF THE SOCIETY'S DISTRICT.

- To the tenant and occupier of not less than 150 acres, who shall drain the greatest quantity.—8^l, Mr. T. Warburton, Bewsey.
- To the tenant and occupier of not less than 100 acres and under 150, who shall drain the greatest quantity.—6^l, Mr. J. Hornby.
- To the tenant and occupier of not less than 70 acres and under 100, who shall drain the greatest quantity.—4^l, Mr. J. Garner, Tattenhall

LAYING DOWN LAND TO GRASS (LOW LYING DISTRICT).

- To the tenant and occupier of a farm of not less than 150 acres, capable of arable cultivation, who shall lay down in the best manner for mowing not less than 15 acres.—5^l, the executors of the late Mr. R. Bond, Stand Farm, Althwaite.
- To the tenant and occupier of not less than 100 acres, and under 150, who shall lay down in the best manner not less than 10 acres for mowing.—4^l, Mr. Gilbert Halsall, Hildon.
- Not less than 7 acres laid down for mowing on a farm of not less than 50 acres and under 100.—3^l, Mr. H. Williamson.

LAYING DOWN LAND TO GRASS (HIGH LYING DISTRICT).

- To the tenant and occupier of a farm of not less than 150 acres, who shall lay down in the best manner for mowing or pasturage not less than 10 acres.—4^l, Mr. H. Nield, the Graze, Worsley.
- Not less than 7 acres, on a farm of not less than 50 acres.—3^l, Mr. W. Carver, Kenyon.

Farm Memoranda.

THE HARVEST IN KENT.—Reports from Boughton Monchelsea state Wheat to be below an average, but secured in fine condition. Where threshing has already taken place, the yield is not up to the estimate. Oats are short; not more than two-thirds of an average. Beans above an average. Peas about an average. Not much Barley grown. The hay crop was very heavy, and got up in good condition, excepting a few stacks of early cutting. The few roots grown are very fair. Hops: some tolerably good, some very bad. According to present appearances, the quality on the clean bine will be very good. Fruit: Apples short, Nuts a pretty good crop.

In the neighbourhood of Dartford the crops generally not very good. Threshing having commenced, it is found that the yield is below the average, and Wheat fully 1 quarter per acre short of previous expectations according to the quantity of straw, in some places not yielding more than 1 quarter of Wheat to one load of straw. Oats and Barley but middling. Peas and Beans a short crop. Tares almost a failure. Swedes and Turnips a fair plant, but now suffering for want of rain. The Hops are a bad crop; there will be some good bright Hops grown, but the average cannot be more than 3 or 4 cwt per acre.

A correspondent from West Farleigh says—From what I have seen and been enabled to collect, I believe the following to be a fair statement of the crops in this neighbourhood:—Hops: very plabby, many grounds severely blighted, others partially so; some a fair crop, but none a full one. As regards the washing of Hops, planters differ much; some have found no benefit, others a little; some, however, speak well of it, as I do. Wheat: the straw mildewed to some extent, and both quality and quantity short of last year, though that was an exceptional one; this year will fall below an average. Oats and Beans partial; not a full crop. Of Barley we have little. Hay an extraordinary crop. Clover a short, poor crop. Apples seem, from the dry weather, small. Filberts a pretty good crop. Potatoes not blighted, and yield well. We have had no trial this year, as blight has ever followed heavy rains when the Potato was ripening. With regard to Turnips, I fear if the dry weather continues they will be a failure; they grew well at first, but are sadly

suffering for want of rain. Mangel is going on pretty well.

THE HARVEST IN SOUTH DURHAM.—The weather continues to be beautifully fine in South Durham and North Yorkshire, and the harvest is becoming very general. A large area of Wheat is ready for cutting, and within the next five days a great amount of work will be done in harvesting. The crops are very excellent, and Wheat seems to be a good average. The Turnip crop is very good.

HOP PROSPECTS.—The following most favourable reports of the Hop prospects appeared in the *Maidstone Journal* of the 30th ult., and are confirmatory of others, which we have not space to give at length. The recent hot weather has exercised a beneficial action upon this crop—

Maidstone and adjoining Parishes, Aug. 30—Since our last report, the Hops have made great progress. The principal gardens will commence picking within a week or 10 days, while those that are slight and bad will not be picked till a month's time.

Aylesford—During the last few days the Hops have come out fast, and are now looking tolerably well. Picking is expected to commence in a fortnight.

Bearsted—Since our last report, the Hops have done exceedingly well, even where not much was expected of them. In this neighbourhood there are some very good pieces, which will produce from 10 cwt. to a ton per acre, but the gross average will be much smaller.

Brasted and Sundridge—The warm weather has caused a few grounds to improve, and these will grow a moderate crop. There is but little mould.

Cranbrook—The weather has been forcing this week, and a general improvement is observable in the Hop grounds, many of which are now in full flower, and look extremely handsome. Our crop will be larger than was at one time thought possible.

Farningham, August 28—In some grounds there is a prospect of a moderate crop. No appearance of mould yet.

Orlestone, Warehorne, and Kennardington—The Hops in these places have done well the last part of the week; average, 3 cwt. per acre. Picking will begin in a fortnight.

Sutton—Since the warm weather set in, the hops are doing better all round. The average growth is expected to be about 4 or 5 cwt. per acre.

Westerham and the Vale of Holmesdale—Since our last report the weather has been more favourable, and in a large number of plantations the burr is turned into Hop, but in others it is at a standstill.

The Poultry Yard.

POULTRY FEEDING.—One of the principal arguments urged against poultry-keeping in general is the expense of keep. It is true where everything has to be purchased for the consumption of the fowls the account-book does, for certain months in the year, show a balance on the wrong side; but then must be remembered the months during which, at the same cost, the birds were valued producers, and eggs and chickens were plentiful. Poultry food has had a very fair trial from the early days of the Cochins China fancy until now. It will be remembered by many that, when in these birds size was fighting against symmetry for the approval of the judges, anything, unwholesome or not, was given to stimulate their growth. Ridiculous, in some cases, were the means employed to induce the already large birds to eat more and grow bigger. We knew of one ardent fancier who hung a bell on to one of the perches on which his Cochins roosted, and was in the habit of going into the poultry-house the last thing at night with a dish of hot food in one hand, and a bull's-eye lantern in the other. Placing the dish on the ground, he used to turn the light on to it and ring the bell. The birds soon got accustomed to it, and without waiting for the bell soon got to know the gleams of the lantern, and when the door was opened one would see all the heads at once stretched out awaiting the dish. By this, and many other contrivances, size was attained, but at the expense of quality, and at the cost of many valuable birds. Dissection told in many a case, where a positive or promising prize-winner had seemed dull for a day, and then died, that meat feeding and spiced stimulants must tell. The gizzard had worked as long as it could, and when the ordinary grit would no longer triturate the unnatural food, the poor bird, in its extremity, had picked up pieces of crockery, iron, glass, &c., to assist. The fanciers and amateurs in that day took the lesson to heart; and if our Cochins are not now as large, they are smarter, more symmetrical, certainly harder, and consequently more useful. There appears now again a tendency towards meat feeding for our poultry. The experience with the Cochins should teach us. Let all poultry food be as good as can be procured, the diet as varied as possible, but varied only in grain, meal, and green-meal. More birds suffer from excessive and irregular feeding than from short rations; and where, from confined space, or other reason, it is necessary or convenient that the fowls be fed from a pan, never let the food stand by them, but as soon as they have tolerably well fed, take the pan away, that they may move, and encourage a healthy and easy digestion, preparatory to the next feeding time. The French, while perfecting the cramming system for their fattening poultry, feed their stock birds very differently, and any one who has attended the principal *concours agricoles* where the best birds meet, may have noticed the attention they receive at the hands of their owner or *bonne*. Differing from our poultry show arrangements, the owners and feeders have constant access to their birds during the shows. Early in the morning they may be seen giving

them a hearty feed of sopped bread or slaked meal; in the course of the forenoon a lettuce, or bunch of cresses, or handful of grass or clover finds its way into the pen. During the afternoon a handful of maize, bran or barley, and possibly a little hempseed is thrown in, and at the close of the day, if there be a little more bread or a little more meal offered, it is daintily picked over by a satisfied bird, who may say with the epicure who feasted on potato salad—

“Fate cannot harm me,
I have dined to-day.”

THE FIRST OF SEPTEMBER.—On Wednesday last, all the topics of the day paled before one—and that one was partridge shooting. With the first day of September comes a very enjoyable season to a great many of us directly, and to many more indirectly. Thousands to whom the moors are as inaccessible as the Antipodes, arrange, and work hard for months, to obtain a few days or sometimes even only a day's partridge shooting. Sons in business in London bring down friends. Men invite down friends of their youth. Some let their shootings and make friends of their lessees. The invalid to whom mutton, chicken and sole, have become distasteful, brightens up at the thought of a partridge for a change; and we wish him a friend to kill one for him, and a good appetite for it when he gets it.

The following answer to “Coney's” inquiry has been received:—Is it not possible your correspondent's rabbits have access to poisonous food? I have known rabbits thrive well when fed on bran, mixed with about one-sixth part of Oats; this was given in the morning, and a meal of sound waste Cabbage leaves in the afternoon. The food was little varied, excepting letting the old rabbits have a little milk to drink occasionally, and they all kept in perfect health, but would gnaw at anything, including painted wood. E. O.

Miscellaneous.

Food of Horses.—Four horses in the south pit at South Hetton Colliery had placed in their respective mangers, 9½ lb of Oats, and 1 lb. of long hay in the cribs by the side of the mangers. Four other horses in the same stable had the same weight of bruised Oats placed in their mangers, mixed with 4 lb. of cut hay. This was done before the horses came into the stables from work, so that each horse commenced eating his food at the same time. The four horses, with the Oats and long hay separate, ate up their food in the following period:—1st horse finished his Oats and long hay in 52 minutes; 2d in 46 minutes, 3d in 61 minutes; 4th in 46 minutes—total 205 minutes. The four horses with bruised Oats and cut hay mixed:—1st horse finished his food in 61 minutes; 2nd in 51 minutes; 3d in 71 minutes; 4th in 59 minutes—total, 245 minutes. In the above experiments, which may be taken as a general average, care being taken to get the animals all under eight years old, all within an inch of the same height, and all with a common average appetite, we see that the difference in the time occupied by four horses eating the same weight of provender is 40 minutes in favour of mixed food. A horse 15 hands 3 inches high secretes from the parotid glands alone, during active mastication, about one gallon of saliva per hour; and from the experiments of physiologists, the other three pairs of salivary glands, and the mucus glands of the mouth, are supposed to secrete nearly four times the quantity, making in all about four gallons of saliva to be mixed with the food of each horse during one hour's active mastication. In 1844, an aged bay horse, 15 hands 3 inches high, had the tubes leading from the parotid glands divided on either side, and so fixed as to throw their contents into vessels held for that purpose; the animal was then fed upon oats. After fasting six hours, the amount of secretion from the two tubes was half a gallon in thirty minutes, the whole of which time the animal was masticating. This physiological fact proves that, by mixing cut hay with the Oats, each animal had, in the before-mentioned experiment, 3½ pints of saliva mixed with the same weight of food more than those which had their oats and hay separated. We consider this to be one of the most important advantages obtained by cutting, bruising, and mixing the provender; for not only is the food threefold more easily digested when so masticated and mixed with saliva, but we think the animal receives a far greater amount of nutriment from the same weight of food. The animal's stomach would labour in vain to digest the food as perfectly, if it were not so well masticated and mixed with the fluids of the mouth, and all provender not thoroughly digested imparts but little of its nutriment to the body. The importance of giving horses a variety of kinds of provender mixed together, cannot be too strongly recommended. I have no doubt that pit horses can be kept in as good a working condition, doing the same amount of labour upon ½ boll (a Newcastle boll = 2 bushels) of Oats, two stones of Beans, one stone of bran, seven stones of hay, and one stone of straw per week, if bruised, cut, and mixed together, as they could be upon 1½ boll of Oats and 10 stones of hay, if given unbruised, uncut, and unmixed, which would stand thus—

2 boll of Oats, at 8s. per boll of 2 bushels	£0 6 0
2 stones of Beans, at 1s. 8s. per stone of 14 lb	0 3 4
1 stone of bran, at 1s. per stone	0 0 9
7 stones of hay, at 9s. per stone	0 4 6
1 stone of straw, at 1s. per stone	0 0 11
	£0 14 10½
Unbruised and Uncut Food	£0 12 6
1½ bolls of Oats, at 8s. per boll	0 6 0
10 stones of hay, at 9s. per stone	0 6 0
	£0 12 6

Supposing the above table to be correct, it would make a difference in favour of the mixed food system at South Hetton and Murton, with the present number of horses, of upwards of 1500*l.* per year. I shall briefly recapitulate some of the principal advantages derived from the plan of feeding, as adopted at South Hetton and Murton Collieries. 1. The animals' provender is better masticated and mixed with the fluids of the mouth, consequently easier and better digested, and more nutriment obtained than when the Oats are given whole, the hay uncut and unmixed; therefore, a less quantity of food is required. 2. The state of the digestive organs of animals so fed is better than when the provender is otherwise given. In an average number of 220 animals, during nearly four years, diseases of the digestive organs were very seldom seen, having only averaged 0.45 per cent., which is nearly twenty times less than what occurred at East Hetton under the old plan of feeding, and which is more than twenty times less than that which takes place in agricultural horses. 3. No hay is spoiled in going down the pits, in the workings, or under the animals' feet at night. 4. Horses do not eat less hay by its being cut; where the advantage is gained is, that the animal is compelled to masticate his other provender much better by being mixed with cut hay than he otherwise would do. The only saving of hay effected by cutting it into chaff is, that which would be wasted in going down the shafts, in the workings, and in the stables under the horses' feet, which we believe would average at least 2 lb. for each horse per day. This waste, in an establishment like South Hetton, would amount to 473 lb. per day, or, taking hay at 6*l.* per ton, to the very large sum of 462*l.* per year. 5. It is of the utmost importance for the general good health of horses in a large establishment to use a variety of kinds of provender. We use at South Hetton Oats, Beans, Peas, bran, Barley, Tares, Luseed, old and new land hay, green Clover and Tares, Turnips, and straw. 6. In an economical point of view, it is very important to regulate the quantity of each kind of provender according to the amount of labour the animals have to undergo. Thus, if the pits are working eleven days per pay, with occasional overtime, leguminous seeds and bran should be largely given, and less Oats and straw; and, *vice versa*, when the pits are working only seven or eight days per pay, the Beans, Peas, Barley, &c. should be decreased, and the Oats, straw, &c. increased; and in all cases where horses and ponies are worked extremely hard, nothing would be more economical than to employ a person to give every animal a feed of corn about the time that the foreshift men are leaving their work.—*Mr. Huntley before the Newcastle Farmers' Club.*

Tenants and Game Preservers.—Recently, at the Leeds Assizes, Mr. Thomas Dickons, a tenant under the Duke of Portland, obtained a verdict for 500*l.* damages on account of a libellous statement which certain parties who rented the game under the Duke had made against him. The game lessees accused Mr. Dickons of disturbing the game by dogs and other means, also of instigating other tenants on the property to do the same. The consequence was a discharge from the Duke's steward, whereupon Mr. Dickons brought an action, and was successful in obtaining a verdict. The libel was in the form of a letter from the associated gentlemen who leased the game to the agent, in which was represented at some length the injury inflicted on the game by Mr. Dickons and his dogs. The defence was principally based on the assumption that the letter was a privileged communication, and the learned judge appeared to lean to the same view. The jury, after two hours' deliberation, came, after some difficulty, to a unanimous decision in favour of the plaintiff.

Maize as Food for Horses.—It appears from the report of the half-yearly meeting of the London General Omnibus Company, that Maize has been used by the company during the last half-year exclusively, instead of Oats. The report states: "The very encouraging results which attended the use of Maize as provender in the previous half-year induced the directors to adopt it still more extensively during the past half-year, and at length to substitute it entirely for Oats. During the summer no other corn had been used for the working studs. The substitution of Maize for Oats effected a saving of 14,172*l.* in the half-year."

Calendar of Operations.

SEPTEMBER.—In our northern counties this is generally counted harvest month. In early seasons much of the crop is cut down in August, but in late ones the work of ingathering extends into October. Harvest operations begin in Sussex about a month or six weeks before they commence in Caithness, there being a difference of rather more than a month between early and late seasons. Hence the bands of Irish reapers, and what make their appearance in the south of England, return home from Scotland. The harvest is also later in elevated districts than in low ones, and the difference in many places is greater than that due to latitude. Thus harvest is earlier along the shores of the Cromarty, Beaulieu, and Moray Friths than in Banff, Aberdeen, Kincardine, and Fife shires, and the more elevated counties of the North of England. Drainage and improved cultivation, including manuring and seeding, have advanced the harvest fully a month in almost every county of the kingdom. The weather, too, although generally good in England, often begins to break and become fickle about this time, so that September is more particularly characterised by the above differences than its predecessor, more especially in late districts where Oats is the principal crop grown, and which in bad seasons is often prematurely ripened by frost. In the late districts of the North the farmer's weather-glass is consulted with an interest not known in the early ones of the South. In the South, again, wet weather in the early

part of the month is sometimes attended with a high temperature, so that the corn is liable to sprout in the stook and heat in the stack. Small sheaves loosely bound is the best protection, being less liable to vegetate, while they are more easily dried for stacking; and the stacks, whether long, on the English plan, or round, on the Scotch, should be built on elevated stands, with open framing, to keep up the centre of the stack and let in air.

Buckwheat, in fine seasons, will be ready for harvesting in the early part of the month, and in late ones towards its close. As the plant flowers and ripens its seed at the same time, the crop should be cut before the first ripened seeds begin to shed. When cut it is left in loose bundles till the green portion is dry, and should be turned gently once or twice, according to the weather, taking care not to shed the seed. The bundles may be bound up and stacked as Turnip seed; but it is more common to thresh out the seed, and stack the straw for litter.

Hop-picking is due this month. When grown on poles, the general practice, the lines are cut about 2 or 3 feet from the ground, which allows the loaded poles to fall over upon a table or "bin." If equally ripened, the Hops may be bagged as one quality; but, if otherwise, they may be divided into three qualities in the picking,—the dark, or over-ripe; the brown, or ripe; and the green. The Hops are next taken to the oast, kiln-dried, and put in pockets when cool. Fine dry weather in picking is essential to success, and any dew in the morning must be off, as the slightest damp injures the flavour or bitter principle, thereby reducing the market value of the crop.

Aftermath-hay, or meadow-hay farms, is made during the month. The practice is similar to that of harvesting the first crop, with two exceptions—the weather and greater succulency of the Grass—and the softness of the hay and increased liability to overheating in the stack. If, however, the weather is fine, the mowing and haymaking machines now in use soon bring the crop into the stackyard. As the Grass may be allowed to grow for a short time without sustaining comparatively any harm from running to seed, the mowing machine should never be yoked in wet or unsettled weather. However, the crop should not be allowed to grow so rank as to become blanched at the bottom. When cut short and green it makes fine forage for soiling milch cows and stock generally; and as much of the aftermath should be consumed this way as practicable, the crop being worth more when green than when made into hay.

Seed Clover is very generally harvested, in early seasons, about the beginning of the month, and the later ones towards its close; the crop having been mown or fed in May or June, insures a greater uniformity of flowering and ripening. The crop may be cut with the mowing machine in preference to the scythe, the former, if sharp and cutting well, effecting less tearing and shedding of the seed than the latter; but the after operations are better done by manual labour than by horse machines. If the mower leaves the Clover in a swathe, then the swathe, when the upper side is dry, should be gently turned as directed in making Clover-hay. In fine dry weather the crop is soon ready for the stack or hay-barn; but in wet unsettled weather the harvesting of seed Clover requires no end of patience, to avoid heating and mouldiness.

Permanent Grass.—Lay down land as soon as crops are removed. This plan is to be preferred to sowing the Grass seeds with the corn crop, as a much closer and better plant of young Grass can be obtained before winter.

Autumn fallows.—The application of steam-power to the cultivation of land in autumn, as soon as the different crops are removed from the ground, is one of the most important of modern improvements in agriculture. The advantage of breaking up stubble-lands early has been known to farmers from time immemorial, but until less or more rain falls horse implements could not be successfully worked on heavy soils. These, too, stand most in need of deep thorough tillage at this season; and it often happens that, when once the weather breaks, too much rain falls before the work can be done by teams. It is otherwise with the steam-plough and cultivator, which can be worked as soon as the crops are off, and the drier the land the better.

Milch Cows, unless on the richest pastures, require a daily supply of green forage of some kind. The produce of irrigated meadows is the best. Tares, Lucerne, and Sainfoin, are grown purposely to afford the daily supply required; but in too many instances cows are hard put to this month. Old cows may be allowed to go dry for fattening.

Farm Horses.—Autumn fallowing, and the practice of taking stolen crops of Turnips have greatly increased the labours of the teams, as compared with the old practice of a short breathing time after the work of ingathering; consequently, they now require to have a full allowance of corn.

Swine.—As last month, keep the piggeries as cool and clean as possible, and avoid food of a heating character. *W. B.*

Notices to Correspondents.

FARM PROFITS: "Half Pay, and his Cows," *G. A. H.* Too late for this week. Why leave a short communication on a current subject till it cannot reach us before Friday?
RAPE CAKE, ITS CHEMICAL COMPOSITION, &c.: *Horticulturalist* writes as follows:—"Having for many years used rape-cake, crushed fine, for top-dressing Wheat, and drilling with Turnip seed with the greatest success (in fine, I consider it the best of artificial manures), I shall be greatly obliged by any of your numerous readers informing me, through the medium of your columns, its constituents, the proportion of phosphates, and ammonia; and also if, for garden purposes, it will answer to use as liquid manure—if so, the quantity, in weight, to 36 gallons of water."

E. T. ARCHER'S "FRIGI DOMO."—Patronised by Her Majesty the Queen, the Duke of Northumberland for Syon House, His Grace the Duke of Devonshire for Chiswick Gardens, Professor Lindley for the Horticultural Society, and Sir Joseph Paxton for the Crystal Palace, Royal Zoological Society, Royal Gardens, Kew, &c.
The best Shading is "Frigi Domo" Netting.
 White or Brown, made of prepared Hair and Wool, a perfect non-conductor of heat or cold, keeping a fixed temperature where it is applied. It is adapted for all Horticultural and Floricultural purposes, for

PROTECTION from the SCORCHING RAYS of the SUN.

JAMES PHILLIPS AND CO.

beg to submit their prices as follows:—
GLASS for ORCHARD HOUSES.
 As supplied by them to Mr. Rivers, to the Royal Horticultural Society, and to most of the Nobility, Clergy, and Gentlemen of the United Kingdom.

Each Box contains 100 feet. The prices only apply to the sizes stated.
 Squares 20 by 12, 20 by 13, 20 by 14, 20 by 15.
 16 oz. to the foot. 21 oz.
 Fourth quality 15s. 6d. 19s. 6d.
 Third ditto 16s. 6d. 20s. 6d.
 Seconds 18s. 6d. 22s. 6d.
 English 20s. 6d. 24s. 6d.
 The above prices include the boxes, which are not returnable.
HORTICULTURAL GLASS.
 Stock sizes, 16-oz., in 100 feet boxes, boxes included.
 These prices only apply to the sizes stated.

SHEET GLASS is made only in the following substances, 15 oz. 21 oz., 26 oz., 32 oz., 36 oz., and 42 oz.
HARTLEY'S IMPROVED ROLLED ROUGH PLATE in 1-8th in., 3-16th in., 1-4th in., and 3-8th in. substances.
BRITISH PLATE GLASS for Windows and Silvered for Looking Glasses, Coloured Glass, Glass Shades, Striking Glasses, &c., &c.

PAINTS, COLOURS, VARNISHES, &c.
STUCCO PAINT, 2s. per cwt. This Paint adheres firmly to the wall, resists the weather, and is free from the glossy appearance of Oil Paint, resembling a stone surface, and can be made any required shade. It is mixed with rain or pure river water.

WHITE ZINC PAINT, 3s. per cwt. One hundredweight of pure Zinc Paint, with three gallons of Linseed Oil, will cover as much as one hundredweight and a-half of White Lead and six gallons of Linseed Oil. Special Dryers for this Paint.

IMPROVED ANTI-CORROSION PAINT, 2s. to 3s. per cwt. Anti-corrosion Paint is extensively used for all kinds of work in exposed situations, on Brick, Stone, Compo, Iron, Iron Bridges, Conservatories, Greenhouses, &c., and is easily laid on by any ordinary workman. Prepared Oil for ditto, 4s. per gallon.

HOTHOUSES FOR THE MILLION.

AWARDED A PRIZE MEDAL, INTERNATIONAL EXHIBITION, 1862.

ON THE PRINCIPLE INVENTED AND PATENTED BY SIR JOSEPH PAXTON, M.P.

Combining Simplicity, Cheapness, Excellence, and Durability. Being capable of fulfilling in the most perfect manner all the requirements of Horticulture.

"Nothing can be more easy than to build them, nothing more simple than to remove them."—*Daily News, May 22, 1862.*

MANUFACTORIES:—LONDON, GLOUCESTER, COVENTRY, ULVERSTONE, PAISLEY, and ABERDEEN only.

ESTIMATES given for ORNAMENTAL CONSERVATORIES, GREENHOUSES, &c., to Designs, Sketches, or Specifications; also for HEATING APPARATUS fixed complete anywhere in the United Kingdom. REFERENCES can be given to works executed in every County of England, and to many in Scotland and Ireland ILLUSTRATED CIRCULARS with LISTS of PRICES of the PATENT ROOFS, with Views of Conservatories, can be had on application to

MESSRS. HEREMAN AND MORTON, 7, PALL MALL EAST, LONDON, S.W.

The THIRD EDITION of a HANDBOOK of VINE and FRUIT TREE CULTIVATION, as adapted to the above Patent Hothouses, containing Illustrations, Hints for Heating Houses, and General Directions for Cultivation, &c., by S. HEREMAN, Chatsworth, price 1s.; post free, 1s. 1d.

"The instructions given for the cultivation of the Vine and other crops are essentially practical, and are evidently written by one who has himself performed all the operations before he attempted to instruct others."—*Cottage Gardener, October 6, 1863.*

"None who take an interest in the construction of Hothouses, or in the management of their contents, should fail in adding this to their collection, however complete that may already be."—*The Farmer, Nov. 13, 1867.*

"The cultural directions have the great merit of being concise and clear."—*Gardeners' Chronicle, Nov. 30, 1867.*

GREEN'S PATENT SILENS MESSOR,

OR

NOISELESS LAWN MOWING, ROLLING, and COLLECTING MACHINES.

BY SPECIAL APPOINTMENT,
MANUFACTURER

TO HER MOST GRACIOUS
MAJESTY THE QUEEN.

THE Extraordinary Success of GREEN'S PATENT LAWN MOWERS is an established fact. During the last five years the demand has been unprecedented, which alone is a proof of their superiority over all others. The following are their characteristic features:—

- 1st. Simplicity of Construction, every part being free of access.
- 2d. They are worked with far greater ease than any other Lawn Mower.
- 3d. They are the least liable to get out of order.

T. GREEN AND SON warrant every Machine to give entire satisfaction, and if not approved of can be returned unconditionally.

HAND MACHINES.

The above MACHINES are made from the best materials, and of superior workmanship; are delivered Carriage Free to all the principal Railway Stations and Shipping Ports in England, Ireland, and Scotland. HORTICULTURAL and AGRICULTURAL IMPLEMENTS, GARDEN SEATS and CHAIRS, FOUNTAINS, VASES, PLAIN and GALVANISED WIRE NETTING, and ORNAMENTAL WIRE WORK of every description. Having very extensive Premises in London, we are in a position to do all kinds of Repairs there, as well as at our Leeds Establishment.

THOMAS GREEN AND SON, SMITHFIELD IRON WORKS, LEEDS;
and 54 & 55, BLACKFRIARS ROAD, LONDON, S.

Then a minority only of our best cultivators, both North and South, took part, while now, instead of having four or five entries in some of the more important classes, we had from 15 to 24. Then it was only nominally, so to speak, that English growers competed; now the competition was more purely national, for most of the counties had representatives in the various classes of fruit and flowers. In the matter of Pine-apples there is no advance. In Peaches, Apicots, Plums, Apples, and Pears there was a decided falling off in general good quality, which may be attributed to the exceptional season. But the tables of the magnificent hall groaned with a load of the most luscious of fruits—Grapes. The collections of themselves were, taken in the aggregate, worthy of the highest commendation. No less than 12 persons competed for the "16 sorts," and six for "20 sorts." The battle for position was confined to three dukeries and an earldom, represented by the names of STEVENS, of Trentham, JOHNSTONE, of Glamis Castle, THOMSON, of Dalkeith, and INGRAM, of Alnwick; while in the smaller section, MATHIESON, of Tulliallan, LEES, of Tynninghame, and TEMPLE, of Balbirnie, took precedence, being placed in the order in which they are named. The post of honour must, however, be assigned to Mr. GEORGE JOHNSTONE, who won easily the principal Grape prize of the day, and who was 1st in 10 other of the Grape classes, amidst such a host of competitors! Never in the palmiest days of our greatest champions has such a success been achieved! It goes to show what young Vines and well made borders can do under skilful management. In this case they are all aerated on Mr. FOWLER'S principles.

What heightened the effect of the show as a whole, was the admirable manner in which the flowering and decorative plants were arranged in the adjacent hall. Usually in Edinburgh this has been open to hostile criticism, but what with the effective and beautiful plants sent for competition from a variety of districts, and agreeable vistas arranged for and opened up, from the entrance to the orchestra, the *coup d'œil* was picturesque and interesting. Then the new and rare plants sent by the Messrs. VEITCH formed quite a treat of themselves, while the Orchids and Heaths, the one from Dalkeith and the other from Tynninghame, far excelled what is usually seen exhibited north of the Tweed.

SOME time since, when an appointment was made in the BOTANICAL DEPARTMENT of the BRITISH MUSEUM, we were not a little surprised, not to say disgusted, to find that one of the conditions imposed upon the candidate for the office was that he should be subjected to an examination by the Civil Service Commissioners. If this examination had had reference to botanical subjects or museum duties, there would have been no reason for surprise; but to subject a well educated gentleman, a graduate of the University of London, whose examinations are known to be the most searching of all similar ordeals, to a test such as is properly enough imposed on unknown men, or on those whose qualifications have not been tested, was to degrade the candidate, and offer an insult to the University. We are glad to find that Mr. JAMES BRITTON, who has recently been appointed to an office in the Royal Herbarium at Kew, has not had to undergo such a degradation.

A correspondent points out that the CYRTANTHUS M'KENII, referred to at p. 641, is not specifically distinct from the CYRTANTHUS LUTESCENS, figured in the "Botanical Magazine" (t. 5374). However this may be, and there certainly is a very close resemblance in structure between them, the two may be regarded as distinct for all garden purposes, the one being white-flowered, and the other yellow. Both are South African plants.

We have received from Mr. SCOTT, of Merriott, several varieties of Apples, grown on (SCOTT'S)

POMMIER DE PARADIS STOCK, to show how healthy and prolific Apples are, worked on this stock, even in a season like this, in which, we are informed, not a quarter of an inch of rain has fallen at Merriott since May. Amongst them were very fine examples of the Gravenstein, richly flavoured. Another variety, called Lady Derby, which Mr. SCOTT had from Leicester (but little of its history is known), is fine in size, and very firm in texture. Along with them came fruit of the Pommier de Paradis, as grown in his nursery, and which is small, of a yellowish lemon colour; the flesh is tender, brisk, and juicy, with a slight acidity, and bears considerable resemblance to Christie's Pippin.

New Plants.

—DAVALLIA MOOREANA, *Masters, sp. n.**

Fronde ample, quadripartite or decompose, triangular, pale green, chartaceo-membranaceo, or subcoriaceo; pinnae pyramidatè triangulari acuminatè, the lower ones a foot or more in length; primary pinnules much acuminatè; secondary ones ovate or obliquely oblong-ovate blunt, divided into blunt oblong or ovate segments, the larger of which are cut down to the costa into cuneate unequal sided lobes; veins forked, free, club-shaped at the apex, terminating within the margin; sori solitary on and occupying the anterior side of the ultimate segments, very prominent on the upper surface; indusia oblong sub-truncate, scarcely convex, the mouth expanded in age; rhizome stout, creeping, producing fronds at short intervals, and clothed with dark brown lanceolate slightly-toothed scales; stipes and rachides smooth, pallid.

This is one of the most beautiful stove Ferns which have yet been introduced to our gardens, and is

remarkable in its family for its graceful habit, its large size, combined with its small sub-divisions, its pale green colour, its smooth surface, and its bullate sori; the latter are remarkably prominent on the upper surface, very much in the way of those of *Leucostegia immersa*, which species indeed the whole aspect of the plant recalls, though it is totally distinct therefrom in its evergreen habit, its much more ample development, and its differently-formed sori. The plant is a native of Borneo, whence it was introduced by Mr. Lobb to the collection of Messrs. Veitch & Sons, by whom it has been exhibited during the past season, and who have received for it the award of a First-class Certificate. We have specimens of what appears to be the same Fern gathered in the New Hebrides by McGillivray.

The rhizome, which is as stout as one's little finger, is of a less rapidly elongating habit than in many other *Davallias*, and appears to prefer to grow half embedded in the soil; it is clothed with narrow lanceolate dark-brown scales, which are somewhat toothed at the margin. The stipes is about the thickness of a stout straw, from a foot to a foot and a half long, quite smooth and pale-coloured, as are also the somewhat slender rachides. The fronds, independently of the stipites, are from 2 to 3 feet long, and from 1 to 2 feet wide at the base, triangular and pointed, of a graceful arching habit of growth, and most elegantly cut into a multitude of small blunt oblique soriferous segments. Their colour is a pale green, and they are very remarkable for the dotted appearance presented by the upper surface from the prominence of the sori. The obliquely ovate pinnules (secondary) are about an inch long or rather more, the pinnulets (tertiary pin-

nules) from a quarter to half an inch long. The form of these latter is shown in the enlarged separate figure of our cut, while the principal figure gives as good an idea of the general character of the frond as is possible on so limited a scale. The sori have the elongate cup-shaped form of those of the true *Davallias*, but, apparently on account of the bulging in the upper surface, the indusium is almost flat. It should be added, that the plant is quite different from the *D. Moorei* of Hooker. T. M.

THE LATE FREDERICK SCHEER.

ON December 30 last, died at Northfleet, Mr. Frederick Scheer, 76 years of age, a City merchant, whose name is honourably associated with botany and horticulture, and who might have enjoyed a world-wide reputation if his modest and retiring habits would have permitted him to do so, or allowed others to give him due and public credit for what he had done, or caused to be done. Mr. Scheer was the exact antitype of those who judge of the value of every publication by the number of times their names are mentioned, and compliments paid to them. Never mind how great the share which he had in advancing a project or publication, it gave him pain to see his name made public in connection with it.

Mr. Scheer was born in the island of Rügen, where his father was a clergyman; and the first part of his life was spent in Russia in mercantile pursuits. But when still a young man, he took up his residence in England as a City merchant, and for many years lived on Kew Green, where his neat cottage and well-kept garden and greenhouse (the latter full of new plants imported by him) was well known to botanists. The last years of his life he lived at Northfleet, Kent, where he indulged in his favourite pursuits of botany and gardening to the full extent his business occupations would allow.

Mr. Scheer had advanced liberal views on religion, politics, and political economy, and spoke and wrote several languages with force and ease. Nevertheless, he was extremely guarded in what he put on paper (in that respect taking Robert Brown for his pattern); moreover, most of his writings were anonymous. Intimate as I was with him, I often urged him to make a list of at least his pamphlets, or allow me to do so; but to this I could never get him to agree. It was quite satisfactory to him that his ideas should have been promulgated, he caring little for the honour of having conceived them, as perhaps the next minute he would have already originated new ones, which one was welcome to use. *** When, in 1839, the Government thought of doing away with Kew Gardens, he did all he could, through newspapers, and in getting up petitions to Parliament, to avert the calamity, and also came forward with a small, but well-written book, "Kew and its Gardens" (London, 1840, 8vo.).

About this time, Mr. Scheer had one of the largest collections of Cacti in Europe, and was in frequent communication with Pfeiffer, Fred. Otto, and Prince Salm-Dyck, the leading authorities on that subject. His collection was extremely rich in Mexican species, chiefly obtained from Mr. J. Potts. Only a small portion of these were ever described, either by Prince Salm-Dyck or (very reluctantly) by Mr. Scheer himself in Seemann's "Botany of H.M.S. Herald." The greater number, however, were subsequently described during Mr. Scheer's removal from Kew. Several new plants, received from his numerous correspondents abroad, were described and figured by Sir William Hooker, Dr. Lindley and myself. Amongst the Mexican Gesneraceæ I found a new genus (*Scheeria*), which I dedicated to him in the "Botanical Magazine," and of which at present two species, both cultivated as ornamental hothouse plants, are known. After losing the bulk of his Cactea, Mr. Scheer took up Ferns, which he studied attentively, and it was he who suggested to me the plan of the "British Ferns as One View" (Van Voorst). His great power of combination, coupled with his varied and profound knowledge, gave him an almost prophetic insight into the future, and this was much appreciated by great City firms, who frequently asked his advice on momentous questions of the day. In look he much resembled Beethoven, whose compositions he could play exquisitely. He was a man of remarkable energy, who never had any serious illness during the

* I believe I am correct in stating, in parenthesis, that the first note of alarm that Kew Gardens were about to be broken up was given by Mr. John Smith (late Curator of Kew) and Mr. Robert Heward, F.L.S., who concocted a letter which appeared in the *Times*, and led to questions being asked in Parliament.

whole of his life. On the day he died he had been all day in the City, came home, and instead of going after dinner, as usual, to his greenhouse, to look at his plants, he went to bed. An hour afterwards he expired, evidently without pain or suffering. His only son died a few years ago; his wife survives him. He was a high-principled, unselfish man, a warm friend, ardently devoted to science, and an uncompromising opponent of all sham, whether it appeared in a religious, political, or scientific garb. B. Seemann, in "Journal of Botany."

HORTICULTURAL EXHIBITIONS: THEIR INFLUENCE ON GARDENING.

[Abstract of a paper read at the Manchester Congress by Mr. Baines, Summerfield, Bowdon, July 22, 1869.]

THE object of this paper was to note the progress that has been made of late years in horticulture. The progress shows itself in the improvement of flowers and vegetables by selection, cross-breeding, and hybridisation, and in the continuous introduction of new plants from all parts of the world. The causes of this progress were attributed by the author to various sources, such as peace, general prosperity, cheap glass, improvements in hot-water apparatus, discoveries in chemistry, the influence of the press, and specially to horticultural exhibitions. To the Royal Horticultural Society Mr. Baines gives the credit of first placing these exhibitions on a proper footing. He considers such exhibitions as of the utmost importance to horticulture by stimulating and fostering a love of plants, and by affording to gardeners and others opportunities such as could not otherwise be had, to see, observe, and compare. Mr. Baines points out the danger of restricting these exhibitions, so as to make them mere displays of a few specialties—they should, in order to retain their attractiveness, be so comprehensive as to include everything worthy of cultivation.

NATURE'S SCAVENGERS.

[Abstract of a paper read at the Manchester Horticultural Congress, July 21, 1869, by Mr. D. T. Fish, Hardwicke House, Bay St. Edward's.]

OF this lengthy paper, marked by all Mr. Fish's fertility and copiousness of illustration, we can give only a very condensed resumé.

The author sets out by stating that the main sources of pollution are five, viz., death, decomposition, combustion, labour, and life. The agents appointed by Almighty wisdom to remove, and disperse and utilise the effete or noxious matter thus caused, are—the sun, the atmosphere, the sea, rivers, and plants. The mode of action of each of these agents is pointed out by Mr. Fish, and the marvellous interdependence of animal and vegetable life is also adverted to. "Dirt" itself is indestructible, it may be carried away or altered in character but not destroyed. While some things merely transport "dirt" to other localities, others transform it.

The concentration of dirt in a limited space is a great source of danger, but one which is obviated by the transporting agents. Among the transforming agents plants are most important; they rush in between the dead, effete matter and the living organisms, even as the high priests, censers in hand, rushed in between the living and the dead, and the pestilence was stayed. * * * Two cries make themselves heard nowadays, the cry for more coal, and for sweeter air. Plants can furnish the latter now, as they have supplied the former in bygone times. Plants alone restore the disturbed balance, and while converting the carbon of primeval times into modern bread, set free oxygen gas to sweeten, purify, and sustain mankind.

From these considerations Mr. Fish is led, in an eloquent peroration, to advocate strongly the establishment of open spaces, and the planting of trees and shrubs wherever practicable in and around our towns. The author further urges the desirability of extending the home culture of plants.

"None too poor to have a plant, none too rich to enjoy the simple beauty of Buttercup or Daisy. We cannot do without plants. In and by them we live, and move, and have our being. They distil for us the breath of life, they make our food, they provide our clothing, they are our medicine in sickness, our strength in health, our transfigurators at death. They are all ministering spirits, * * * springs of labour and sources of power; they bind together the two great natural divisions of life in bonds closer than those of matrimony, and make all things in earth or in heaven, or in the waters under the earth, subservient to the great purposes of the sustentation and increase of life."

In conclusion, Mr. Fish finds in the reciprocal relations of the three kingdoms of Nature, and their beneficial results, the clearest manifestations of Almighty power, Divine purpose, and Supreme beneficence.

BRITISH ASSOCIATION.

(Continued from p. 942.)

THE following notes are abstracted from the proceedings of the Biological Section:—

The Successful Dredging of H.M.S. 'Porcupine' in from 2435 fathoms, a letter from Professor Wyville Thomson, read by the Rev. A. M. Norman. Mr. Norman preface the letter by a statement of what had been done recently in deep-sea dredging, observing that the work of prosecuting deep-sea researches must be carried on by Government in a very large vessel, armed by the highest skill in navigation on the part of the officers, and very costly apparatus. The late Government had taken up the matter, and dredging expeditions were organised in the Atlantic Ocean, which had been attended with the most important results. The remarkable extension of knowledge in this direction had removed the idea started by the late Professor Forbes, that marine life did not exist at depths beyond 300 fathoms. Some interesting results had been obtained by Professor Purcell Wright off the coast of Spain, and at the instance of the Royal Society H.M.S.

'Lightning' had been sent out to dredge in the sea between the Hebrides and Feroe Islands, and one result was to find that there were two distinct sets of fauna within 500 miles the difference of temperature was probably caused by the return of the waters of the Gulf stream after being cooled at the Pole. The investigations of the 'Lightning' had only been carried to the depth of 65 fathoms, a life being found at that depth. Professor Thomson had, however, dredged in the Bay of Biscay to the depth of 2500 fathoms, and the letter gave an interesting account of the existing of the dredge at that depth. Above 1½ cwt to 2 cwt of ooze was the general result of the cast of the dredge, and the thermometric instruments employed showed the temperature to be about 36.4, and life was distributed over the whole area which had been examined, though the specimens were of a dwarfed character, owing, probably, to the low temperature.—Professor Huxley said he hoped it would not be at once assumed that naturalists had adopted Professor Forbes' inference as to the depth at which life might be expected to exist. No revolution had taken place in science on account of the recent dredgings. Men of science were too well aware of the unsatisfactory nature of mere negative evidence, of which they were always distrustful. The fact was that such statements as that referred to concerning Professor Forbes' theory got into the text-books of science, and were spoken of as scientific conclusions, when, in fact, nine-tenths of the writers of text-books were a sort of chifferons who picked up any kind of rag which they found lying about, and who often stated as the conclusions of men of science what men of science had not, perhaps, ever thought of adopting. He had recently had the opportunity of examining a quantity of soundings sent in by the 'Anatoly', which had been dredged in all parts of the world, and it appeared from these that there was a gigantic band of life encircling the globe at the bottom of the sea. It was extremely interesting to reflect that the sea bottom in which these creatures were found was of the same geological formation as that which was millions of years old, and the forms of life found there also resembled those found in the geological formations called the cretaceous period. It was almost impossible to realise the wonderful antiquity of the forms of life found at these great depths of the sea.—Dr. Hooker also pointed out that Professor Forbes' theory had never been accepted as a scientific deduction, and alluded to the dredgings of Sir James Ross in 1842 at 400 fathoms deep.—The Rev. A. M. Norman, in reply, disclaimed all intention of putting forward the supposition of Professor Forbes as a scientific deduction, and called the attention of the Associate Members at least to the necessity for observing the distinction between soundings and dredgings, as it was the latter which had been of the greatest importance, as they had furnished the materials which had illustrated so many interesting facts of modern science.

"On certain specimens of Fossil Gum, obtained from Zanzibar, Madagascar, Senegal, and other parts of Africa," by A. Brady, Esq. The best gum was, he observed, brought from Zanzibar, where it was found in lumps in the sand. The pieces of gum were dug out of the sand, or found in the beds of rivers. He produced a piece which contained a spider in the act of killing a fly. This showed the common operations of Nature going on at the time the gum was formed, just as we saw them now. The question here suggested was as to the antiquity of the gum. He was informed that in the part of the country where the gum was found there were now no trees existing from which the gum could be derived, from this fact he thought that the gum must have been formed at a time far past. The place from which the gum was taken at Zanzibar was a very fertile one, and the soil was very rich, and the specimens showed that the spider was upon them, from which he inferred it had been at the bottom of the sea, and had been up raised since into dry land. Another piece of gum which he exhibited contained a very beautiful lizard, and he was told by some gentleman of the Section that it was of a modern type; another piece contained a common beetle; another specimen contained hundreds of ants. These specimens were from Zanzibar. Inferior gum was brought from Madagascar, and still more inferior from Senegal, and other places in Western Africa. The inferior sorts were not so hard as that of Zanzibar—in his opinion, from not being so old, or, in other words, not so far advanced towards amber.—Mr. Tristram remarked that if the Zanzibar coast had been depressed, submerged, and elevated, like the Sahara, he was not aware of it. But if so, and if the depression and elevation should have been synchronous it would tend to show that the mountain chain of Africa was from east to west, instead of north to south, as at present considered.—Dr. Sclater doubted if the specimens produced had been under water at all, for trees like those from which the gum was produced, were common still in Senegal.

On the Genus *Beswellia*, with Descriptions and Drawings of three New Species, by Dr. Birdwood. This paper, by some accident, was not in the hands of the Secretary, but Mr. Tristram informed the section that it was an interesting history of the Frankincense Tree. These three species of this tree had been discovered in and near Arabia. Consul Playfair, of Zanzibar, had sent cuttings of the tree to the Botanical Garden at Bombay, where these young trees were thriving, though they had not flowered. This tree had been noticed in Niebuhr's "Arabia," of the last century.

"Initial Life," by Mr. C. S. Wake. This paper related to Infusoria.—M. C. Rabibsch offered some remarks on certain facts which had come under his notice. Pure water having been boiled in a vase of gypsum, the vessel was closed, an iron rod passed through it, and after a time there appeared four specimens of Infusoria. They were all different. The same water was again boiled, and again left to rest for a period as before, when three other species of Infusoria, different from the first, appeared. Another fact he stated as follows.—A lemon was divided, one half was wetted with human saliva, and the other with the saliva of a horse. After a little time the two halves produced creatures, the one different from the other.

From the proceedings in the Mathematical Section, we further select the following:—

"On a New Self-registering Hygrometer," by Mr. F. Vivian, of Turquay. At a former meeting Mr. Vivian exhibited a self-registering instrument on the cumulative principle of recording mean values of the differences between wet and dry bulb thermometers, and a self-registering maximum and minimum hygrometer. He now produced an improved form of the former instrument, with a series of curves showing the comparative results of Leslie's hygrometer, his maximum and minimum differential, and his mean self-registering, which he now offered as the standard. He had used it in recording the aggregated differences of solar heat in the sun and shade, the duration of sun, and the amount of nocturnal radiations, and for many other similar purposes. He now proposed to apply it to recording the actual mean temperature, which would be an important feature, if it could be worked out, as he believed it could, and also to the anemometer. He gave a full description of the instrument and its mode of working.—Mr. Strimes thought the instrument valuable, and said he should like to see such a one at every watering place. He referred to the differences in the meteorological instruments used, and their position in different parts of the country, and said he should like to see every town furnished with a good set of instruments, placed in suitable and open positions.—Mr. Vivian said he should be happy to present one of his instruments to any watering place that would like to possess it. Mr. C. J. Woodward then called attention to a rough model

of a new Anemometer, a machine for recording the velocity of the wind, and printing it with type in figures. A working machine on the principle suggested had not yet been constructed. There appeared to be no doubt that the machine would do its work, and was calculated to be, though not to supplant, the present self-registering anemometers.

Mr. Martin exhibited a Self-registering Aneroid Barometer, and read a paper thereon.—Mr. Strimes called attention to the fact that similar instruments had long been in use by Admiral Fitzroy and others, with the exception that a mercurial column was used instead of the aneroid, the former giving by far the most accurate results. It was, however, pointed out that the new instrument was more portable than the other.

THE BEST OF THE CULTIVATED ANEMONES.

(Continued from p. 920.)

Anemone Pulsatilla (Pasque-flower, or Dane's Blood).—Though sparsely distributed, this fine old border plant is a true native, and when it does occur on a bleak chalk down it is generally freely dotted over it. The position is usually such as to suggest the aptness of the name Wind-flower for the family generally; and there are few sights more interesting to the lover of spring flowers than to see its purple blooms just showing through the hard Grass of the blast-swept down on an early spring day. The plant is much smaller in a wild than in a cultivated state, usually devoting itself to the production of a solitary flower which, while showing through the Grass, seems careful not to rise above it. In the garden it forms rich healthy tufts, and flowers more abundantly and vigorously, the contrasts between the wild and cultivated states of the plants being very marked. There are several varieties, including red, lilac, and white kinds, but these are now rare. There is also a double variety. The plant forms a very appropriate ornament for rockwork and border, and is by no means difficult to grow. It prefers well-drained and light but deep soil. Flowers March, April, May; purplish. Height, 3 to 12 inches. Propagated by division or by seeds.

Anemone ranunculoides (yellow Wood Anemone).—Not unlike the Apennine and the common Wood Anemone in habit, this species is so very distinct in its clear golden flowers, that it is well worthy of cultivation even by the side of the most admired kinds. Indeed, we may consider it an Apennine or a Wood Anemone done in gold. It is a South European species, and apparently is not so free on the generality of our soils as the blue Anemone, but when grown into well-established tufts on a light or warm and well-drained soil, it displays qualities of which those who have merely seen isolated plants or figures of the plant can have no idea. I have not found it do well on clay soil, but on chalky soil it seems to grow as freely as the common Crowfoot. It is quite charming for associating with tufts of the Apennine or the Wood Anemones, the Pasque-flower, any of the varieties of *Anemone Hepatica*, the *Anemone pulsatilla*, and like plants. It will grow well in partial shade, but flourishes to perfection when fully exposed. It comes in among the naturalised group of British plants, and grows in a semi-wild condition at Abbot's Langley in Herts, near Worsop in Notts, and it is also reported to occur in several other counties. It is one of the many beautiful hardy plants that may be freely naturalised in our woods and shrubberies. Flowers the end of March and beginning of April. Height, 4 to 6 inches. Propagated readily by division, and also by seeds.

Anemone stellata (*hortensis*) (starry Wind-flower).—This native of Southern Germany, France, Italy, and Greece, if not so showy, is quite as beautiful as the common garden Anemone. The star-like flowers springing from the much dissected leaves, ruby, rosy purple, rose or whitish, vary in a very charming way, and usually have a large white eye at the base, which contrasts agreeably with the gay or delicate coloration of the rest of the petals, and with the rich brownish violet of the stamens and styles that occupy the centre of the flower. It is not so vigorous in constitution as the common Anemone, and requires a little more care than that, but this will only make it the more interesting to all who love variety in their collections of hardy plants. It likes a sheltered yet warm position, a light sandy well-drained soil, and seems to make little or no progress on heavy clay soils. It is suitable for association with the choicer kinds of Anemone on the rockwork, for the mixed border and the choice spring garden, and should be grown in every garden where choice spring flowers are appreciated. Flowers in May. Height, 10 inches. Propagated by division or by seed.

Anemone sylvestris (Snowdrop Anemone).—This is a free-growing and handsome species, partaking somewhat of the size and vigour of the alpine or Japanese Anemone, and the neatness of habit and dense blooming qualities of the dwarfier kinds. It seems to grow freely on almost any soil, the handsome pure white flowers, as large as a crown piece, being freely produced over a mass of fresh green leaves. A native of Siberia, North Italy, Germany, and France, it is perfectly at home in this country; should be grown everywhere that first-rate border flowers are appreciated: will associate well with the alpine Anemone, and plants of like size, about the lower and flatter parts of the rockwork, and being naturally a native of the grove, will be found perfectly at home along our wood walks and half wild spots, in shrubberies, &c. The aspect of the drooping unopened buds has suggested its English name—the Snowdrop Anemone. Flowers in April and May, pure white. Height, 1 foot, sometimes more. Propagated readily by division of root.

Anemone trifolia (three leaved Anemone).—This is an interesting little species, much like the Wood Anemone, but not so widely distributed. Although found in a wild state in pleasant groves on the woody

hillsides of Piedmont or the Tyrol, it does perfectly well in our climate, and should be everywhere grown for variety sake. It may be readily known from its relative, the Wood Anemone, by its neatly toothed trifoliate leaves, and it seems to be a little smaller and dwarfer in habit. I have, however, never seen them under exactly like conditions. It is well suited for naturalisation along with *A. apennina* and others of the family, and is of course suitable for rockwork or borders. Flowers in April and May; white. Height, 4 to 6 inches. Propagated by division and by seeds.

Anemone vernalis (Shaggy Pasque-flower).—One of the Pasque-flower division of the Anemone family, but very dwarf. The flowers are very large and shaggy, with brownish silky hairs. It is a rare plant, and should be grown on in some select spot on the rockwork, giving it good drainage and deep soil. A native of Norway, Sweden, and extreme northern countries, and also of very elevated positions on the Alps and Pyrenees. This species inhabits very elevated regions, and is rarely seen in good condition, at least not in our day, though Miller speaks of it as sending up a stalk near a foot high, and "naked almost to the top, where comes out a neat hairy involucre, and above that one yellow flower shaped like the perennial yellow Adonis, standing erect." It should as a rule be grown on a level spot on rockwork, in deep free soil, and be abundantly supplied with water in summer. Flowers early in spring; whitish inside. Height, 4 to 8 inches. Propagated by division and by seeds. *W. Robinson.*

DISEASE IN THE SUGAR-CANE IN BAHIA.*

THE Sugar-cane has for some years been affected in Brazil with a disease for which the most contradictory causes have been assigned, and without leading to the discovery of any remedy. Loud complaints have also been made in Cuba on the same subject, and in the province of S. Catharina the cultivation has been abandoned in several places. Von Tschudi advised the colonists in South Brazil to the same effect, and in truth considered the climate as adverse; for, according to observations made from August, 1867, to July, 1868, the mean temperature was 70.7° Fahr.; whereas the Sugar-cane requires a mean temperature of 75.2° Fahr. It could scarcely be expected that so succulent a plant could be subjected, without injury to its organic activity, to so low a temperature as 39.2° Fahr., which occurred on the 23d day of August, 1868, in the province of Blumenau, and which indeed is often registered in the rainy season. The cultivation of sugar, however, is still carried on in that province, and is esteemed profitable; whereas, on the contrary, in the more northerly and hot province of Rio Janeiro and the neighbouring departments, coffee is preferred. In Bahia, the most important part of Brazil as regards sugar, where the occupiers of the coast devote themselves almost exclusively to the cultivation of the Sugar-cane, the disease has appeared for the last six years in the most threatening form. At Nazareth, near the town of Bahia, the harvest for three years has been almost annihilated by the malady, and it has since spread to the northern parts of the province. Repeated inquiries, under the direction of the Government, have at present led to no result. New varieties have indeed been introduced, and amongst them one from Salangore, very rich in juice, which has, however, been by no means entirely exempt from the malady; which, notwithstanding the extraordinary drought (from September, 1833, to the end of January, 1839), begins already to be established.

My observations of this malady were directed especially to the investigation of the insects which live on the Sugar-cane, since certain commissions, and even men of science, have given it as their opinion that it is due to their agency. It was recorded as the result of a commission of inquiry in S. Catharina, that a caterpillar, known under the name of "Borer," was the cause of the disease. I have occasionally found it, as well as its pupa, in the stem of the Cane. The caterpillar eats its way from without into the stem, and forms bores. Large holes also are found in the uppermost joints, by which the vegetation is impeded, which is equally the case when the young Cane is perforated by the insect. The last mentioned cavities are, however, far more rare; and the bores, from about one-eighth to one-sixth of an inch in diameter in nearly mature strong Canes, though frequent enough, do not impede the vegetation; though, through the admission of air, and the consequent oxydation, the surrounding layers of cells become red, and the quality of the sugar-sap is somewhat impaired. In spite of all, the Sugar-cane thus affected yields good sugar, and intelligent cultivators have discovered a very different indication of the disease.

Another insect, which is sometimes found abundantly between the sheaths and the stem, is a female Coccus, whose habits, as far as my observations go, agree with those of its allies. Allowing that it robs both leaves and stem of a quantity of juice, it yet appears that the injury is too slight to prevent the development of sugar; added to which the presence of the Coccus is not the necessary cause of the above-mentioned indications of disease which have been generally recognised for the last three years. I have had occasion to observe plantations much affected with scale, which have yielded good sugar, and in which not a single Cane exhibited the disease in question. No other insect, in spite of repeated investigations, has been discovered to which the malady could be attributed.

A ruddy tint in the woody and cambium tissue in the neighbourhood of the joints is an infallible sign of the malady. As the disease advances this colouring permeates these vessels through the whole of the stem,

whereas the parenchyma at first retains its natural transparency. When the disease is fully established, a thick yellow substance flows from these vessels, which hardens when exposed to air, but dissolves in water, and under high powers of the microscope merely exhibits a granular structure. Minute cells appear, either collected in irregular heaps or disposed in moniliform rows, which, when placed in a solution of sugar, are developed in the course of from six to eight days into a beautiful filiform Alga.* To assure myself that this did not arise from spores derived from the air, I placed repeatedly, and in different places, a solution of sugar under a bellglass, but never obtained the same Alga, while it always occurred in the yellow substance placed in a similar solution. In confirmation of its deleterious influence I have found the Alga itself in diseased Canes; I have observed also its infusoroid spores, and their fermentative action in the manufacture of sugar. Sporangia sown on the sheaths of the Cane generate the Alga in tissues in from one to two days. Hydrogen and carbonic acid are generated with such energy and speed in the juice of the Cane when placed in the cauldron, and acted on by the fermentation produced by the sporangia, especially at the commencement of the development of heat, that the scum runs over the lips of the cauldron in great quantities. The organic acids developed by fermentation in the further process of boiling effect a change into uncrystallisable sugar. The extremely small quantity of crystallisable sugar—it being premised that the disease has not advanced too far—is very dark, and of a very indifferent quality. In the moulds from which the molasses have run, where, as is the custom here, a mixture of clay is used for refinery, the fermentation recommences so energetically that the melted sugar flows over the margin of the mould.

The spore-cells of the Alga are about 1-700th of a millimetre in diameter, while the partly simple, partly branched threads of different lengths vary from 1-200th to 1-500th. I distinguish two forms, which appear almost contemporaneously. In the young state we find mother-cells arranged in a row, filled with a quantity of daughter-cells. These last are elongated into threads, but are still surrounded by the mother-cells. I have not been able to observe the formation of the spore-cells at present, but I think it probable that the distinctly visible cells in the membrane of the mother-cells, after its disappearance, form these masses of spores, which I once found on the walls of a perfectly closed cavity in the stem of a Sugar-cane more than one-third of an inch in diameter. Even in a very small glass tube, closed with a cork, in which I kept the yellow mass of spores, there was in moist weather a coating of white powder, in which I recognised the same spore-cells as in the watery solution. This white powder can be easily dispersed in the air, and can penetrate the pores of insects, or through the root into the body of the Cane. The latter way is so much the easier, as from the practice here of planting eyes (the tips of the stem with the terminal bud) being for a time uncovered or only slightly covered, they remain exposed to air and moisture. That moisture is active in the diffusion of the Alga appears not only from the foregoing observations, but from the fact that the years in which the disease was most prevalent have been remarkably rainy, while in the late abnormally hot year it has almost disappeared. We have, then, every reason to regard this cellular plant as the cause of the disease, especially as at its commencement the Cane vegetates strongly, and decays only at a late period, when the Alga decomposes the sugary juice, and the masses of spores in the vessels hinder the flow of sap, the leaves turn yellow, and the terminal bud rots. As the best remedy I regard a mode of culture in future more consonant with the investigations of science than prevails at present in Brazil—repeated manuring with quicklime, as also the washing with liquid lime (lime-wash) the eyes or truncheons before planting *M. J. B.*

Home Correspondence.

Origanum vulgare.—Three varieties of this plant have been brought to me from near Mertham, in Surrey, one with pink, one with blush, and the third with white flowers. The friend who collected them put a handful of each variety together into one basin of water, and observed on the following day that the leaves of the white-bloomed kind had all, without exception, shrivelled and turned black, while the leaves of the other kinds remained fresh and green for some days. What can be the explanation of this? *W. T.*

Potatoes.—Upon the recommendation of my seedman I was induced to order some Golden Blossom Kidney, Ashtop Flukes, and American Early Rose Potatoes, and having just taken them up I can speak most highly as to the produce and quality, the latter far surpassing in yield anything I ever saw, being over 50 lb from little more than 1 lb. of sets. All equal if not surpass Haigh's or Lapstone Kidneys, which are the same, and free from disease, whereas a tuft of Haigh's growing in the middle of the Early Rose was all bad. The manure used was stable and pig dung, dusted over with Lawes' phosphate of lime. *T. W. Chaloner, Newton Kyme.*

Cutting Down Strawberries.—I was looking out of my window, which commands a view of numerous small gardens above the town of Boulogne, some three or four weeks ago, when the weather was hot and dry, when I perceived a man some distance off vigorously mowing something with a scythe. I mentioned the circumstance to my landlord, who also has a garden, and asked him what his neighbour was about. "Oh! Monsieur, he is cutting down his Strawberry plants." Remembering my friend, the late Dr. Lindley's, stern

* Or rather Fungus; no Alga is ever developed under such circumstances. *Eds.*

denunciation of such an ignorant practice, in which he had, I believe, the support of the leading gardeners. I remarked to my informant, "That it was quite contrary to Nature, that the plant was being deprived of its breathing and feeding apparatus, &c." "Mais, monsieur," replied my landlord, "my neighbour is celebrated for the quantity and goodness of his Strawberries." This was rather a hard thrust, and I had some vague sort of recollection of having severely scolded a rough sort of gardener I once had for having done the same, and being myself punished for it by an unusual supply of good fruit. My landlord said he should treat his the same way, but I begged him to leave some, so he has cut some of his down, and merely removed the runners from others, and now awaits the result. Those that had been mown since the rain we have had are now looking fresh and green and have put out runners. I should say that until the plants began to push, they were covered with the leaves that had been cut off. One of the leading horticulturists here has been condemning the plan, and I reopen the question whether a partial trimming, leaving the crown of the plant intact (even this my neighbour does not do) may not be beneficial? *Querist, Boulogne-sur-Mer, August 23.*

Smoke v. Vegetable Life.—In a recent number of the *Warrington Guardian* a writer, who signs himself "Fair-play," tells us that "the gardener of Warrington Hall (about 10 miles distant) says he considers that his fruit never gets spoiled by the smoke;" and that "the smoke is doing good instead of evil, as it tends greatly to the destruction of insects." I am sorry to say the case is quite opposite in Warrington. "Fair-play" adds "fruit is everywhere cleaned before sent to table, therefore the argument of the gardener of Bank Hall, Warrington, is groundless as to dirty fruit." There is some mistake about this. Gardeners are cautious how they handle fruit, lest they leave finger marks upon it, or wipe off that beautiful substance called "bloom," which gives such an elegant finish to good fruit. We have had red and white Currants so covered with dirt that they could not be cleansed—it would not wash off, nor would the birds eat them. They rotted on the tree, while we purchased what was wanted from the market. No fruit that has to be washed, or even sponged, is fit to compare with that with the bloom upon it. If "Fair-play" or the gardener at Warrington will pay me a visit, I will undertake to show them more gardens in Warrington than that at Bank Hall in which the trees are suffering instead of the insects, and no doubt both will return convinced that I have not stated the worst. One word more. Some manufacturers say smoke cannot be consumed, others not only say that it can, but that they are consuming it to a considerable extent. Surely, then, those who are exerting themselves to remedy this great evil are doing a wrong to no man, but good to us all. *Edward Green, The Gardens, Bank Hall, Warrington.*

Mr. E. Green, in his paper on this subject, read at Manchester, and given at p. 917, states: "When the wind is from the east we do not suffer so much as when it is from the west, for in the former case it is often sharp, and carries away the smoke; but in the latter it is soft, the air heavy and moist, the smoke falls quickly to the ground, hanging among the trees and passing away very slowly, and, therefore, the plants suffer more." In an action against a large coke burner for the destruction of a Larch plantation, the trees of which were about 30 to 40 years of age, and which had only appeared to suffer for the five preceding years, although the manufactory of coke had been in as active progress for about 20 years, it came out that a short period prior to the trees being observed to be affected, a new seam of coal had been employed, although only mixed to the extent of one-half with the seam first used. This latter coal was remarkably free from sulphur, containing about 3 per cent., whilst the new seam had as much as 3 to 3½ per cent.; but the primary point of interest was that, while to the north-east vegetation suffered and was killed, in all other directions the injury was little or none. This the plaintiff's witnesses sought to account for by stating that the south-west winds were the most prevalent ones, and so inhaled much greater and more frequent doses of coke-oven smoke and fumes; and although it was proved that the timber when cut down was greatly deteriorated by the effects of the products issuing from the cooking of the coal, it was not seen how unsustainable that induction was, for obviously to produce such a disparity of results between the south-west and other winds, the amount and duration of south-west winds should have been vastly more. I was led to examine the matter, and from the deterioration of the timber it was evident that the gases or their compounds must have been imbibed. Now, we all know that in southerly winds we have dampness with warmth—two of the greatest incentives to vegetable growth, inducing the stomata to active duty—and probably the moisture in the atmosphere had combined with the sulphuric acid, and thus the trees were under the most favourable conditions to imbibe and be injured and killed; yet, be it remembered, south-west winds are generally brisk, and would not permit the smoke to fall quickly, or to hang among the trees. *W. A. Wooller.*

Primula cortusoides amena.—May I ask through your columns, whether cultivators of this fine plant are quite content to receive it as a mere variety of the old *P. cortusoides*? For my own part I have strong doubts on the subject. That there is a general resemblance between the two plants cannot be denied, but there are far closer resemblances between many other plants which all botanists have agreed to keep apart. The size of flowers and the breadth of foliage I am aware count for nothing, but I think the creeping root, the exclusively vernal habit of the plant, the pseudo-lobed or grooved seed-vessel, and the roundish flattened form of the seed, more especially the two latter features, warrant the belief in its distinctness.

* Translated from a memoir, by F. M. Dänert, in the "Zeitschrift für Parasitenkunde."

I should be glad to learn what the "lumpers" can urge on the other side. For the present, at least so far as this *Primula* is concerned, I must range myself on the side of the "splitters." *W. T. Ipswich.*

Weather Fluctuations.—On Saturday, August 29, the thermometer (in the shade) stood at 90° at 1 P.M., barometer 30.200. On Sunday morning, the 29th, about 1 A.M., we had a sudden change, the wind blowing a gale from north-east by east, which continued throughout the day, and the weather was very cold. The barometer fell to 30.000, the thermometer to 58—a difference of 32. Monday, the 30th, cloudy and cold, with east winds, barometer rose to 30.100, thermometer to 59, evening clear and frosty. Tuesday, the 31st, clear and sharp, barometer up to 30.200, and the thermometer indicated 2° of frost, which has greatly injured the crops. French Beans on open squares are very much blackened, and will not recover. Vegetable Marrows, Gourds, and ridge Cucumbers are nearly all destroyed. Heliotropes and Dahlias are scorched a little, but may yet recover. French Beans growing on south borders do not appear to be injured at all, which says much in favour of cropping borders, where early and late produce are required. *David Lumsden, Bloholm Hall, Sleaford, South Lincolnshire.*

Prunella grandiflora.—In a recent number one of your correspondents made some remarks on *Prunella grandiflora*, recommending it as suitable for some descriptions of edging or ribbon borders, and inviting hints from others. I have long known the plant, and certainly the rich purple tints of its clustered labiate flowers make one wonder that it is not oftener seen in our flower garden. Like all the genus, however, its habit is somewhat too rigid and bare to make it useful where more elegant plants are grown. After flowering the brown scaly calyces are not ornamental, resembling the cones of some Pine, and if these were removed the stems would be too much exposed. It is possible, however, that some mode of cultivation might be adopted to obviate these defects. My experience leads me to think that it will not be very easily propagated, as it produces mature seeds but sparingly, and gives but few offsets. *R. S.*

Testimonial to Mr. James Barnes.—The promoters of the testimonial to Mr. Barnes, in Devonshire, are greatly obliged to Mr. Ayres for his timely letter in your columns last week. The object aimed at is not to obtain a large sum of money, but to elicit from the practical gardeners and horticulturists of the United Kingdom (as well as from Mr. Barnes' personal friends) some genuine mark of their appreciation of one whose labours and writings have been of so much value to many of the fraternity. With this view subscriptions, however small in amount, are solicited, and may be forwarded to the Editors of the *Gardeners' Chronicle*, or to me, at the office of the *Devon Weekly Times*, Exeter. *Elias Tazer.*

The Pine Beetle.—The economy of *Hylurgus picipeda* is well known. In April and May, earlier or later according to climate and season, the beetle which have passed the winter in the perfect state make their galleries of oviposition in the bark of Pine trees of more than 10 years old. In six weeks the young brood is fed up, and the perfect beetles emerge. In England, at any rate, there is only one brood in the year, and these beetles, emerging in June and July, pass the following winter in the crevices of the bark of trees and other suitable localities, but until the period of hibernating arrives, they employ themselves in eating out the interior of the young shoots of living trees, doing great damage even to old trees, but especially to younger ones, by destroying their leading shoots; they do this more for food, and no eggs are ever laid in these shoots. The period to attack the insect, in order to destroy it, is in the spring, whilst ovipositing, and whilst the young brood is feeding up. There is no doubt whatever that the bark preferred by the beetle for oviposition is that of large trunks felled during the preceding winter; and the explanation of the ravages committed by the beetle, in the instances of your correspondents (p. 921), may perhaps be found in such logs, perhaps in quantity, having been left lying about, when, of course, they each sent forth a swarm of beetles in the early summer. While, however, the preference of the beetles for ovipositing is for felled timber, they will also attack growing trees, if they be at all unhealthy, and there is unfortunately sufficient reason to believe that the destruction of the shoots during the previous or several previous summers is a sufficient disease to induce the beetles to form their galleries and deposit their eggs in the bark the following spring. The only remedy that is really useful and practicable is to remove the bark of all dying trees, in which the beetles are ovipositing, and of all logs of felled timber, this should be done about the end of May; and if the bark be burnt, or simply placed under water for a week or two, the beetle larva it contains are effectually destroyed. In any Pine-growing region, this plan, to be effectual, should be carried out throughout the whole district. Any trees that seem likely to die, may be felled during the winter and used as traps for the beetles in spring, as it is difficult, until the mischief is done, and the young brood escaped, to detect their presence in the bark of a standing tree, as the parent beetles make a very inconspicuous entry at the bottom of a crack in the bark, the exit holes of the young brood being obvious enough. To save a valued tree from their attack, several logs laid near it would be useful. When the beetles are engaged in making their galleries of oviposition, they may be detected by the little heap of reddish sawdust they eject. I know of no way of attacking them at this period of the year. *M. D.*

Potatoes.—In the first week of March, 1868, I planted some Potatoes, called Veitch's Prolific, which I think is a first-rate kind, and a large cropper. From one root I gathered 188 tubers and supertubers, large and small, and the weight was 10 lb. I saved them all, and again

planted them in March, 1869, and I have this day (September 1) taken them up, and the produce is 113 lb. weight, all good and sound. *J. Wilson, Gr. to Lord Calthorpe, Elvetham Park, Hants.*

Wellingtonia.—Reading the letter in your number of the 1th September on the Wellingtonia, I beg to state, for the information of your correspondent, that mine are still going on in splendid style. They did not mind the frost two years ago. The only thing about them is that they shed more of their foliage this year, but the new foliage is coming in as fine style as ever. *John Hollingworth, Maidstone.*

What is a Kitchen Garden?—If "Agitator" will be good enough to look over my argument once more he will see that he has sadly perverted my statements. "Let your walls be clothed with choice fruit trees, or covered with glass; if the former, allow the space of a yard to be sacred to the roots, also an alley 18 inches wide. The further extension of the border should be at least 3 yards, which might be devoted to the production of early vegetables without any detriment to the trees on the wall." I thought that it was unnecessary to mention, that, beyond the 4½-yard border, a 6-foot walk should intervene, as I go on to say that, on the side next the main quarters, a row of standard fruit trees might be planted, and an alley should run round behind them, and come out to the main walks at convenient distances. How "Agitator" came to imagine that I meant to plant the standard fruit trees on the border next the wall I know not, because I expressly state the portion which the fruit trees and early vegetables occupy. But suppose for a moment that I had intended to plant a row of standards on that border, they should at least be planted 3 feet from the walk, and there should be the same distance from the alley behind. How much of the border would, under such circumstances, be left for the production of early vegetables? *Andrew Meikle, Read Hall, Whalley, Lancashire.*

The Lady-bird.—Much as I am prepossessed in favour of the bright and cheerful-looking Lady-birds, I have nevertheless a decided complaint to make concerning them. They swarmed upon the Apricots here, consuming the soft pulp with avidity, and so tenaciously did they adhere, that a good filip was necessary to dislodge them. Plums and Pears are alike food for them at this time. Independently of what has already been said regarding their choice of food, so constantly are they aggregated upon the pendent tubes of the flowers of *Tritoma* (*Kniphofia*) *Uvaria*, that I have no doubt but that they feed upon pure nectar itself when within their reach. It would seem that they are provisioned by Nature to undergo long flights, so extended and powerful are their wings, comparatively speaking. *William Eirley, Dyswell.*

Pampas Grass.—"The *Gynerium argenteum* (Pampas Grass) though an inhabitant of the prairie deserts, delights also in root moisture," p. 948. I humbly submit that is a slight error. The *Parana* Reed, commonly called Pampas Grass, grows on the mud banks of the river Parana, which separates Paraguay from Rio Grandé and Paulo above Corrientes—none can possibly grow on a desert. *F. D.*

Hot-house Boilers.—In answer to Mr. Munro's offer of terms, I am authorised to state that the inventor of the Conservative boiler has no intention of giving boilers away for experimental purposes; and while on the subject of boilers I may probably be allowed space for a few lines suggestive of a plan whereby the capabilities of different boilers might be tested on a less expensive scale than that suggested by Mr. Ayres, and quoted by Mr. Fish (p. 922). The plan I suggest is as follows. Let the different inventors put their boilers into competition, all containing an equal quantity of water; let them be set with reverberatory bricks, or in any way peculiar to the taste or fancy of the owners; stop up the return-pipe and leave the flow-pipe open. Let a fire be made under them, and, at the end of a given time, note the quantity of fuel consumed, and also that of the water evaporated; this I merely suggest as being a more simple and less expensive plan than that hitherto proposed. Now, with regard to the reverberatory bricks so much hammered at by your talented correspondent. I am not aware of having said anything of an inventor of such material, but that the Conservative boiler is set in brickwork in such a way as "that the bricks act, not only as non-conductors, but as reverberators of heat; and that they do this in a highly satisfactory manner, I feel sure Mr. Fish will admit when he knows more about the matter. He asks, Are not all bricks enclosing fire reverberatory? To this I answer, they are not; for, by reason of their sunken position, and the usual mode of setting them, in nine cases out of ten they are surrounded by a damp substratum, which acts as a perpetual absorbent of heat. In all such cases, to give and take is the law of their position. Not so with the Conservative boiler, which is furnished all over and on every side with confined air-spaces, repelling with intense force the heat against and under the water space, and, if I may be allowed to use the expression peculiar to Mr. Fish, it enwraps the boiler with a thick greatcoat of dry air, refusing a passage outward for the heat. Hence the caloric becomes conserved to that end, for which combustion has been set up; and by the extent of surface provided and exposed to the action of the fire-stream, this boiler combines all the essentials necessary in the most powerful medium for the communication of heat by hot water, namely, rapid and complete absorption with slow combustion at the will of the stoker. Mr. Fish seems to have a peculiar gift for suiting himself to the requirements of his case, as may be seen by his condemning in one boiler what he extolls and eulogises in another. He condemns my "pet" for having long passages, and praises another for taking the products of combustion a long journey. How to reconcile this I am at a loss. He complains of torturing the products

of combustion. Why not torture or rather starve them to death, if it be possible, as the object aimed at is to get all the heat out that is in them before passing up the chimney? *R. Milne, Vale Royal, September 6.*

—I see that the vexed question as to which is the best hot-house boiler for economy in heating is again undergoing notice in your columns. So many different forms and absurd combinations in boilers have been lately introduced for the patronage of the gardening community, that it is impossible to prophecy when the mania will end. "Punch's" artist, Mr. Du Maurier, might be prevailed upon to give a sketch of a specimen not yet exhibited at South Kensington, or at any of the Royal Horticultural Society's shows. Mr. Milne's new boiler is certainly a move in the right direction, and the saving of from 600 to 800 per cent. in our coal bills is something astounding. If this Conservative boiler had been discovered last year, I have no doubt but that the party which bears that name would have been still in power. They would have kept their opponents in hot-water at such a cheap rate, on all the public questions of the day, that they would have effectually taken the wind out of their sails. I, for one, cordially join with "An Old Gardener with a Heavy Coal Bill," in urging the Horticultural Society to organise means for having one of these boilers at work in their gardens at Chiswick or Kensington, and to report upon it as soon as possible. The coming winter is almost certain to be a severe one, with probably the thermometer at zero; the saving, therefore, in fuel with Mr. Milne's boiler would be something considerable in all large forcing gardens. Mr. Pearson, of Clulwell, in describing the boiler which he has stood godfather for, said "that a hatfull of coals was sufficient to keep the heat up." I should think, however, Mr. Milne's would do with a considerably less quantity—perhaps a gardener could carry as much fuel in his waistcoat pocket, if in a concentrated state, and the boiler a small one, as would answer the same purpose. *Thoth.*

Foliage Bedding Plants.—*Centaurea ragusina* has done remarkably well here this season; it has grown most freely, and the colour of its foliage is as white as driven snow. This is an indispensable plant for flower-garden purposes, but is not available for the million, owing to its difficulty of propagation. *C. gymnocarpa* is easier to manage in all respects, and strikes tolerably freely under the usual treatment required by our ordinary bedding plants, and, when kept dwarf (a poor soil will conduce to this), is equally as beautiful and more graceful than *ragusina*. *Iresine Herbsta* has done well in our flower garden. I am therefore compelled to retract what I stated some three years ago regarding the many bad properties this plant, as a bedder, possessed; though, notwithstanding, I still consider it to be a plant not to be depended upon to a large extent in a precarious season. *Annanthus melancholicus ruber* is better here than I ever saw, if anything mars its beauty, it is its rampant growth, and there is evidently a darker-leaved variety creeping in amongst the original introduction, stronger and coarser growing, but apparently a free seeder. *John Edlington, Wrotham Park.*

Phormium tenax.—Should Mr. J. Hill Dickson's attempt to naturalise *Phormium tenax* prove a failure, or meet with imperfect success, I beg to offer the following suggestions for the improvement of the vigour of the growth of the plant. In Mr. Darwin's work on the "Variation of Animals and Plants under Domestication," it is mentioned that the Orange could not grow to perfection in Italy without much care was taken of it, till after it had been propagated by seed, it having up to that time been propagated only by grafting. If, therefore, *Phormium tenax* were raised from seed to the extent of five or six generations, a more vigorous plant might be expected. Another acknowledged principle for the improvement of vigour of growth is cross-fertilisation, using the flowers of two different plants, and in addition to this, the upper part (to the extent of about one-half) of the spikes of flowers and their branches, all young leafy shoots, should be cut off, so as to produce larger seeds.—an experiment which I have practised on the Hemp plant, and obtained seeds with tricotyledonous embryos. It is stated in the "Treasury of Botany" that one of the varieties of *Phormium tenax* has its leaves only 3 feet in length, and its flower-spikes only 6 feet high, so that the plant in the College Gardens at Galway, which has leaves 6 feet in length, has quite outdone one of the varieties in its native habitat. Would not the tall variety, mentioned by Mr. J. R. Jackson in this Journal, July 3, which will conceal a man on horseback, if acclimatised, serve as a hedge-row plant in some situations? The same remarks will, for the most part, apply to the *Bohmeria*, which, being so near *Urtica*, there may be some hope of acclimatising. It is not the acclimatisation of some introduced plants has too soon relinquished, as suggested by Mr. J. E. Jackson in his remarks on substitutes for the Potato, which appeared in this Journal for August 14? This last spring I raised 36 plants of Six-weeks Indian Corn received from the Continent, some of which are very variable in their appearance and time of flowering; but one of the plants flowered earlier than any of the others, and its seeds are, notwithstanding this very cold summer, now ripened, although not yet entirely hardened. The first cob was produced in the axil of the fourth leaf above the cotyledon, so that it began to form its flowers almost as soon as it was out of the ground. The seed was planted in April, and the indoor protection afforded it was scarcely more than it would receive on the south side of a garden wall in such a locality as Fulham. By annually selecting seed from the earliest flowering plants, I hope in three or four years to obtain a variety which, sown in an open field, will ripen its seeds in our coldest summers. May not the

failure of the attempts to introduce a variety which will ripen its seeds every year be owing to selection not having been practised? It may deserve notice that Indian Corn appears improved by crossing even in the first year, one of my plants being larger, with deep chocolate-coloured petioles, instead of a palish green. *B. Clarke, F.L.S., Mount Vernon, Hampstead, August 28.*

Orchid Diseases.—I have read Mr. Williams' Congress paper, on the cultivation of Orchids, with much interest. It is as suggestive as it is practical, and cannot fail to be useful to all who read and digest it. On cultural topics and on management generally, I would not hesitate to endorse it. What I do take exception to, is that portion of the paper which treats upon spot, its cause and cure. It has long been a difficult subject—difficult for scientific authorities to pronounce with any certainty upon, and equally difficult for practical men to bar the door against, yet Mr. Williams, with a few masterly strokes of his pen, would stamp out the disease with a certain corrective treatment which he propounds. Furthermore, he looks upon spot as the consequence, not the cause of bad health, and does not consider it infectious unless when fellow plants are in a bad plight. To cope with a subject such as this, with any idea of placing it satisfactorily before your readers, would require a somewhat lengthened paper. In the meantime a few words by way of rejoinder will be sufficient to establish a case for continued observation and deduction. In the first place, spot appears in plants generally, and in Orchids particularly, in a variety of forms. The diseases are as diverse in their character as they are destructive in their operation, as witness cases that have been recorded time after time. Therefore a panacea is not likely to be found in adopting a uniform course in the annual calendar of operations. Vegetable pathology does not admit of so easy a solution as all this. Plants, like animals, have varied constitutions, and one bill of fare may predispose certain plants to one kind of disease, and certain others to another, while some may luxuriate in the best style treated to the same articles of diet. Consequently the healing prescriptions will require to be written and applied by discriminative talent. Then as to the so-called disease being entirely due to the inroads and agency of a parasitical Fungus, we have the recorded testimony of the highest authority in that branch of Cryptogamic botany which treats upon mycology (see *Gardeners' Chronicle*, p. 147, 1865) that in many of the forms no fungal cysts can be detected. True, parasitic Fungi do a lot of devastating work in Orchid collections, but there appear to be other causes which our ablest investigators in physiology have been unable to elucidate; and looking to the variety of influences at work in an artificial atmosphere, I very much sympathise with them. I think the question of infection must also remain an open one. The physiological condition of the plant may predispose it to some of the kinds of disease that are hovering about in the atmosphere, but certain varieties of the same species often escape "spot free" when their neighbours become infected—all being similarly situated as to health and growing conditions. Certainly, at all events, spot is not always the result of bad health, as Mr. Williams puts it, for many of the rudest grown plants are visited with the malady. By attending to Mr. Williams' cultural directions, growers may minimise the inroads of several of the forms which attack collections, but to get rid of them altogether is quite another question. *James Anderson, Meadow Bank.* [Several visits have been paid by members of the Scientific Committee to various Orchid-growing establishments, but we do not think at present any information on this subject beyond that already published by "M. J. B." and Mr. Anderson has been gained. Eds.]

The Seed Bill.—I am glad that you have published the *ipsissima verba* of the Act for the prevention of the adulteration of seeds, for a very different version of it appeared in the pages of one of your contemporaries (the *Farmer*, Aug. 11). True, your contemporary guarded his publication by saying, that while he wrote the Bill which he published was not passed, but only awaited the Royal assent to become the law of the land. I am glad that you have published the actual text, because it is always desirable to know the true state of a case; but I grieve to see therefrom that all the principal amendments introduced by the Select Committee of the House of Commons have been struck out at the last moment, and that the Bill has been passed almost in the terms in which it was introduced. In particular, the clause against the fraudulent use of naturally dead seed has been struck out, which was recommended by the Council of the Royal Horticultural Society, whose support of which, and objection to the Bill unless fenced by some such protection, gave rise to hostile comments (in which you are not wholly free from having joined) on their obstructiveness, in opposing a Bill which they themselves had been among the first to call for. As given in the *Farmer* it was in these terms:—"5. Whosoever shall, with intent to defraud, or to enable another to defraud, any person, sell or offer for sale, or cause to be sold or offered for sale, or for the purpose of sale, buy, import, or receive, any seeds with which any killed seeds, or dyed or old seeds, shall have been mixed, shall be guilty," and so on. Now, I should like to know at whose instance and by whose influence this was struck out? I do not think it is difficult to understand. Now, any man intending to act honestly should object to the condemnation of an intention to defraud. I believe that the Bill thus mutilated will be an utter failure, although I do not go the length of some who say that it was never intended to be otherwise. The Bill, as amended by the Select Committee, would have done real good, and if it were not too great an encroachment on your space it would be instructive for the public, although not perhaps agreeable to the mutilators, to see a reprint of the amended Bill, or at

all events of the suppressed passages. C. [We do not know who the "mutilators," as our correspondent calls them, were, but we believe that had the words to which he refers been inserted, the Bill would indeed have been an utter failure, from the impossibility of carrying out its provisions. No Act of Parliament will make men honest, but it will prevent many from being dishonest, and the relief to the would-be respectable trader from the present measure will be great, even though the Bill be defective from a Utopian point of view. Eds.]

Wellingtonia gigantea.—I send you a report, with dimensions of two plants I have under my charge. One, planted in 1860, height when planted 2 feet, is now 16 feet; circumference of branches at the base, 30 feet; diameter of ditto at ditto, 11 feet; circumference of bole, 2 feet 9 inches; growth of leader this season, 1 foot 6 inches. The second plant, planted in March, 1865, height when planted 2 feet, is now 11 feet 6 inches; circumference of branches, 23 feet; diameter at the base, 8 feet 6 inches; circumference of bole, 2 feet 3 inches; the growth of the leader this season was 1 foot 6 inches. It is a beautifully furnished plant. I find it perfectly hardy. The winter of 1866 and 1867, I consider a good test, and I hope we shall not experience such a winter again. The glass here on the 2d and 3d of January, 1867, indicated a temperature of 4° and 9° below zero, which killed our *Deodars*, *Taxodiums*, *Cupresses macrocarpa*, and scarcely left a vestige of life in the *Pampas Grass*. The *Wellingtonia* appears to enjoy the other extreme, for it is growing with undiminished vigour. Give it a good situation and treat it well at the root, and I feel confident it will not lose its popularity. *J. Woodward, The Gardens, Garbrand Hall, Ewell, Surrey.*

Frost in Ireland.—I enclose you a portion of haulm of Potato I gathered between Lisburn and Hillborough two days ago, that you may see the effect the severe frost produced upon the crop of Potatoes in certain spots; some have the tops just cut off, in other fields all the leaves killed, and some killed to the ground with the exception of the little stalk which you will see green. Other fields again are not touched at all; but the great bulk of the fields are injured more or less, and I am afraid in many places the produce will be curtailed; although I do not wish to give a desponding view of the crops generally, as they never looked better, and there is little or no disease that I have seen or heard of either in Antrim, Armagh, or Co. Down. Wheat crops are above the average, and Oats, unless on the light sandy lands, a good crop. *Erin, Sept. 3.*

Truss Pipes and Flexible Joints.—Can you give me any information respecting these, which I have been recommended to use in fitting up a new hot-water apparatus? *W.* [These joints, which are now pretty well known, are extensively used, and, as we believe, with every satisfaction. They have the merits of being neat, of fitting perfectly, and of being easily fixed, or removed and replaced; the latter being no slight recommendation in the case of alterations or repairs. We understand that pipes on this principle are now made up to 4 feet bore. Eds.]

Oxalis corniculata atropurpurea.—Can any of your readers give me any information as to the origin of the above-named plant, which is sometimes termed *O. tropaeoloides*, though I do not know on what authority? I believe nothing is known on that point at Kew, no wild specimen existing in the Herbarium. On the other hand, it is difficult to suppose that it can be a mere seedling from the typical species, for, as far as my observation has gone, it exhibits under cultivation no variation whatever. I have an impression that the plant has been either figured or described in "*Flore des Serres*," but, not having access to that periodical, I venture to ask if I am correct? and, if so, perhaps you will kindly quote M. Van Houtte's history of this little Oxalid. *East Anglian.* [The Oxalis in question is figured in the "*Flore*," vol. xii., t. 1205, under the name of *O. corniculata atropurpurea*, and is stated to have been received, under the provisional name of *O. tropaeoloides*, from M. Schlachter, of Loos, near Lille. No further history is given. Eds.]

Iron Pipes Blocked. (p. 948).—It is one of the peculiarities of the Polyzoa that they only live in dark places. The British species are found either under stones or attached to various materials under bridges and other places where there is little or no light. It therefore occurs to me that if strong glass pipes were laid at the bottom of an open trench we should hear no more of this serious inconvenience. *W. T.*

Foreign Correspondence.

LORD HOWE'S ISLAND.—I have lately had an opportunity of visiting Lord Howe's Island, which lies off our coast (Sydney) some 300 miles. It is small in extent and scarcely known to any but navigators. A few observations relative to the botany of the place, may therefore be interesting to your readers. The island is situated in lat. 31° 35' S., and long. 159° 3' E. It is somewhat semicircular in form, about 4½ miles in length, and 1½ miles at its widest part. On its southern extremity there are two mountains, over 2500 feet high; from the base of these to the northern end, where the ground again rises to an elevation of about 1200 feet, the intervening space is of a low, undulating character. The whole of the island is densely covered with a vegetation mainly consisting of trees, shrubs, and Palms, there being no barren spots upon it, excepting the precipitous cliffs of the mountains and coast. From this description of its size and breadth it will be apparent that the greater part of the island is subject to the effects of the sea breeze, yet, on the southern and most exposed side, Palms and exogenous trees grow down to high-water mark, and, except in being dwarfed, seem to be otherwise entirely unaffected by exposure.

After passing the first belt of trees, a species of Fig (*Ficus*) abounds, and occupies much of the low-lying

grounds. In general appearance it greatly resembles *F. macrophylla* of our eastern coast. It differs, however, from that plant by its smaller fruit and foliage, by the under-part of the leaves being more ferruginous, and by its great tendency to produce adventitious roots from its branches, which, after reaching the ground, become stem-like, so that in many instances it is difficult to determine the original trunk. In this respect it is the most remarkable species of *Ficus* I have met with in this part of the world. The largest tree of the kind which I noticed was, as nearly as possible, about 100 yards from the extremity of the branches on one side to that on the other, and had very numerous root-stems. It was a glorious sight, and one long to be remembered. In two or three instances these trees were found forming, as it were, a circle round an open space. This, it was plain, was caused by the original tree dying off entirely in the centre, and its branches in consequence becoming so many separate individuals. It is called *Banyan* by the settlers, after its great prototype of Indian notoriety. No other species of *Ficus* was observed.

Among these Figs, and in every situation upon the island, whether high or low, to the extent of my investigations, two similar, but very distinct species of *Areca Palm* abound, one of which is called by the settlers the *Cabbage*, or *Thatching Palm*, from the fact of its fronds being the only material used for thatching upon the island. This is managed by the base of the foot-stalk of the frond doubling just below the pinnæ, at which point it is worked on a batten, secured in the roof for this purpose. The stalks are brought rather close together on the inside, forming a row of ribs, which has a somewhat neat appearance, and the feathery spray, or pinnæ, on the outside, become an outer covering, of from 7 to 8 inches in thickness, rendering the interior impervious to wet, and cool and comfortable to the inhabitants; it will last from eight to ten years. The other Palm, equally abundant, and intermixed with the one just noticed, is not used for any special purpose. It is of a more slender habit, having shorter and more arching fronds, with the pinnæ rising from the rachis instead of falling as in the former, giving it a rather peculiar appearance, from which it is called by the settlers the *Curly Palm*. Both of these produce very large quantities of fruit, the drupe being of an ovate form, about 1 inch in length, and both have simple spatules (the latter having the longest), produced from among and below the lower fronds. The seeds of both kinds are eaten with the greatest avidity, and are, indeed, the principal support of the large bodies of settlers' pigs, running in most parts of the island.

At an elevation of about 1500 feet, nearly the limit of the preceding species, another and very beautiful Palm occurs, called the *Umbrella Palm* by the settlers. It has large pinnate fronds, with a branching spadix, bearing a large plum-like fruit, which is of a reddish colour when ripe. This tree is comparatively rare, and is strictly confined to the sides of the high mountains, on the tops of which another and smaller species of Palm than any of the preceding kinds is said to grow in very great abundance, the fruit yielding the chief food of the wild pigs running about in that part. I speak of this Palm only from hearsay, as neither I, nor any of the party who visited the island with me, succeeded in reaching either of the mountains' tops. The settlers, who frequently go there to hunt wild pigs, describe it as comparatively low in stature, and bearing a profusion of roundish-shaped fruit. This island, therefore, though very small in extent, produces four distinct species of Palms, none of which, I think, are described.

Among other endogenous plants, those chiefly remarkable are two species of *Pandanus*; one, found principally near the coast, with a stout, straight stem, bearing from its sides a small number of the usual root-like supports; the other having a much more slender stem, and, from an early stage, supported by other very numerous, slender, stem-like roots, which are borne to a very considerable height, up to a point where the stem branches off. The general appearance of this tree, which frequently attains a height of from 40 to 50 feet, is very singular indeed: the whitish coloured root-like bodies, or forked, adventitious stems, occupying as much space below as the branches do above, and thus making the tree resemble an hour-glass. This is a more inland plant than the former, and grows up to a very considerable elevation.

The next and only plant of this class of any particular interest belongs to *Iridaceæ*, and is found only in two or three parts of the island, and that sparingly. One is puzzled to think how such a plant could be indigenous to this quarter of the world, so far distant as it is from most of its congeners. Seed vessels only were obtained, which resembled those of the genus *Moraea*; the flowers were not seen, but from the description given of them by the settlers, who call them the "wedding flowers," they would be referable to the genus named; the leaves of the highest plant obtained were about 6 feet in length, and 3 inches wide at the broadest part.

Crinum pedunculatum was abundant in many parts of the moist sandy shores; it was the only *Amaryllid* noticed. Orchids were rare, only two kinds being seen, one, a species of *Dendrobium*, grew sparingly upon Figs, and in rocky, shady places; another, a species of *Sarcophilus*, was observed attached to trees high upon the hill sides. The Grasses were equally scarce, only three indigenous kinds being gathered, viz. *Spinifex*, running along the sands of the coast; a *Chloris*, and a *Polypogon*, the two last only in one or two places in the interior. In all the clearances made by the settlers not now in cultivation, our *Couch-grass*, *Cynodon Dactylon*, and our *Tufted Grass*, *Sporobolus elongatus*, both evidently introduced, have taken possession of the ground. A single species of *Carex*, a *Cyperus*, and a *Lamprocarya* are all that represent the

Cyperaceae, while *Juncus maritimus*, *Smilax folia*, and a *Commelynaceae* plant are the only endogenous plants observed.

would occupy too much space, and would be out of place in this sketchy description of the botany of the island, to enumerate all the exogenous plants collected, I shall, therefore, confine myself to those which grow with the greatest abundance and which mainly characterize the vegetation, namely, *Lagunaria Patersoni*, an Australian as well as Norfolk Island plant; an *Chrosia*, remarkable for the abundance of its deep red-colored fruit and bright green foliage; two species of *Crotonia*, *Olea paniculata*, a *Pironia*, allied to *Pironia*, a *Tetrathera*, a *Maba*, a *Myoporium*, *Alphitonia lucida*, and an unknown *Myrsinaceae* tree, bearing large quantities of a small oval, reddish fruit, singular as being the only tree on which was found a very curious parasite *Viscum distichum* (Bauer, lustr.). This grew only on the extremities of the top branches, and had the effect of apparently destroying together some of the trees on which it had fastened itself. These plants, with the *Ficus* referred to in the latter part of this paper, constitute at least three-fourths of the trees and shrubs in the island. The *Myrtaceae*, which might naturally be expected to have been largely represented upon an island so contiguous to the Australian coast, were confined to a small species of *aleuca*, called by the settlers "Kilmoquo," and by them as a substitute for tea; and an arborescent species of *Leptospermum*, very rare indeed, as only one of the kind was found, which was dead, and had its vessels only upon it. *Proteaceae* were altogether wanting, and not a type of the Australian *Leguminosae* found, this order being here confined to *Edwardia*, *Andina*, and *Canavalia*. A single *Epaerid* was noted, and this at a high elevation, being a tree of 10 to 50 feet in height, with a stem 2 feet in diameter at the base, and described to me by my companion, who found it, as very branching in habit, and of a lustrous green, except at its extremities, where the leaves became closely imbricated and bunchy in appearance, surrounding terminal panicles of flowers, giving a resemblance, as he observed, of so many small apple plants. Some of the uncultivated ground, many other waste places, were entirely taken possession of by *Verbena bonariensis*, the *Castor-oil*, the *Gooseberry*, and *Solanum laciniatum*, the garoo-apple of our colonists, all of which may be considered the troublesome weeds of the settlers.

have now only to notice the Ferns, which are confined to the following genera, viz., *Polypodium*, *Pteris*, *Holopis*, *Asplenium*, *Platycerium*, *Litobrochia*, *Chlopteris*, *Diplazium*, *Davallia*, *Trichomanes*, *Sonia*, *Alsophila*, and *Marattia*. Of these, the strictly arborescent kinds were two species of *Phila*—one the well-known *A. excelsa*, the other a slender-stemmed species, which, I think, will be as yet undescribed. The genera *Adiantum*, *Aspidium*, both so general in Australia, Norfolk Island, and New Zealand, were not observed; but *Sipteris*, so nearly allied to Ferns, and common to these countries, was found here in many places. Other branches of Cryptogamic botany I had no time to investigate, but the Mosses and *Jungmannia* comparatively scarce. Lichens, particularly the r kinds, such as *Parmelia* and *Stictis* were very abundant, on both rocks and trees on the higher grounds. Along the coast, and washed ashore, were numerous kinds of Sea-weed, but they appeared to be principally small fucoid forms, intermixed with a few entous kinds.

those acquainted with the botany of Australia adjoining islands, it will be apparent, from the sketch here given, that the plants at this island more nearly resemble those of Norfolk Island, from which it is distant some 500 miles, than those of any other country. The *Leptospermum* and *Melaleuca* are almost the only plants which link its flora with that of Australia, all the other kinds being chiefly types of flora found on Norfolk Island. This resemblance will be more clearly indicated, when, at some future time, I shall give a detailed account of all the plants observed and collected during my three days' sojourn on this interesting little island. C. M., *Botanic Garden, Sydney, June 16, 1869.* [We thank our correspondent most heartily for this communication, one which interests us as regards botanical geography. Eds.]

ALLA LUCIA, VOMERO, NAPLES.—On the 24th, 25th, and 26th of January last we had a frost here, such as is not at respectable authority, "the oldest inhabitant," said never to have experienced in Naples. The thermometer fell to 3° below zero, and we had snow on the ground and ice on the ponds for nearly the whole of the three days. I have a large collection of tropical and sub-tropical trees and plants, some of which were killed terribly, and a few have died in consequence. Two splendid plants of *Furcraea gigantea*, which had just come up, died down at once; also the *Cryptomeria japonica*, *Aralia dactylifolia*, *A. papyrifera*, and *A. solidii* died off to the ground, but have since come up again; *Phyllocladus asplenifolia*, dead; *Melanthus*, *be*, *Dammar Pine*, all suffered greatly, but recovered with care. I will not, however, trouble you more with my losses, but come to the points upon which I wish to ask your opinion. I must tell you, however, that about a month after the frost we had very hot weather, and in the intermediate period very strong northerly winds.

Well, I have here a large and fine collection of *Araucarias*—several *excelsa*, *Cunninghamii*, *Cunninghamii glauca*, *Bidwillii*, *gracilis*, *brasilensis*, and last of all, the *Araucaria Cookii*, which of course you know well. Of these last I had three trees, each about 10 feet high—the most beautiful trees, perhaps, in the Villa. The *Araucarias* suffered, but all have come round again except the *A. Cookii*. One of these died at once, a second within three months, and the third, though

still alive, is in a very miserable state. Is there anything peculiar in this *Araucaria* which has made it suffer so much more than the others? Should a similar case occur this year, how should such trees be treated?—should they be watered, or manured, or the dead branches cut off, or what should be done? A friend of mine here, who has himself a large collection of valuable trees of the same sort, and who suffered in the same way, and who is besides a botanist of some reputation, told me that nothing was to be done, but this is very unsatisfactory. J. H. Y. [We fear nothing can be done with any certainty of good results: watering, manuring, &c., will do no good certainly. If there is remaining vitality, rather take care of this, especially through next winter, by covering the roots and the base of the stem; and then next spring, at the season for vigorous spring growth, bend down the stem, with the view of inducing a strong shoot from the base, as is done sometimes to get a leader from allied plants—e. g., *Cunninghamia sinensis*—when raised from cuttings. Eds.]

Societies.

ROYAL HORTICULTURAL: September 7.—W. W. Saunders, Esq., F.R.S., in the chair. The usual preliminary business of the meeting having been concluded, the Rev. J. Dix announced the awards of the Floral Committee, and afterwards directed attention to some specimens of *Looker's Patent Earthenware Propagating Boxes* (see p. 811), and said that the Committee had expressed a favourable opinion respecting their usefulness for amateurs and others having only small gardens, and had suggested some alterations to be made in them, so as to make them more serviceable to propagators having houses at their command. An example of *Green's Patent Pot-cleaner* was also sent by Mr. W. Green, of Garforth, and, with respect to this invention, the Committee was of opinion that it would demand more labour in washing pots than was incurred under the present simple mode. G. F. Wilson, Esq., having announced the awards of the Fruit Committee, alluded to the fruit of the Mulberry, and stated that the stain left on the fingers, after gathering ripe Mulberries, might be entirely removed by rubbing the stained parts with the juice of the unripe fruit on the same tree. The Chairman then directed attention to a new hybrid Ivy-leaved Pelargonium, raised by Mr. Eckford, which was considered as likely to do good service to the hybridist, as affording a means through which a good purple-flowered hanging variety could be obtained, which would be a great gain to horticulture, as a highly effective decorative plant. Mr. B. S. Williams' fine specimen of *Eucharis* was then commented upon, the Chairman remarking that it was a plant which, if kept in an ordinary warm moist greenhouse, was a continual bloomer through the summer months; and he knew of no plant that better repaid the cultivator for any trouble taken with it than this. Attention was then called to a nicely-flowered specimen of the old purple Cape Lily, *Vallota purpurea*, which was grown by G. E. Blenkins, Esq., in a small greenhouse in Warwick Square, Pimlico, and as the plant was in every way adapted for the decoration of such small structures in towns, the Chairman requested Mr. Blenkins to give some particulars respecting his mode of treatment. In reply to his invitation, Mr. Blenkins stated that the culture was of a very simple nature. He grew the plant from a small bulb, and it was three years before it flowered, when it was freshly potted in a mixture of peat, loam, and silver sand. It had continued to increase in size every year till the present time, though the soil had not since been changed. Mr. Blenkins considered it a very desirable plant for growing in London houses. The Chairman then remarked that this class of plants was very impatient of having their roots interfered with. Messrs. Lee's new Rose, *Clemence Raoux*, was then noticed as being very highly scented, a character which was not considered of any importance by a florist, but which was gradually coming into favour; and he (Mr. Saunders) was glad to see this, as he could not imagine why the sense of smell should not be gratified, as well as that of sight. A collection of South African plants, sent by Mr. Cooper of Reigate (who had been a collector in South Africa for three years), was then alluded to as affording a good illustration of the succulent nature of the flora of that country. In conclusion, it was mentioned that at the next meeting, or the one following, they would try to get together a collection of Funguses, some of which would be cooked for those present to taste.

Floral Committee.—Rev. J. Dix in the chair. This was a small meeting, though for the season it was of average interest. From G. F. Wilson, Esq., East Hill, Wandsworth, came some cut flowers of the true *Lilium speciosum*, a fine old species, which for some time was thought to be lost from our gardens. To Mr. B. S. Williams, a Special Certificate was awarded for an admirably grown example of *Eucharis amazonica*, which had about 3 spikes of blooms in various stages of development. A similar award was also made to a collection of Orchids from the same exhibitor, consisting of *Aerides suavisimum*, a distinct white-flowered species with a blotch of yellow in the centre of the lip; and a pretty variety of this named *delicata*; the handsome *Burlingtonia candida*; the somewhat scarce and beautiful *Miltonia candida* grandiflora, and the white-flowered *Lycaste virginialis*. To Mr. Green, gr. to W. W. Saunders, Esq., a Special Certificate was awarded for a collection of plants, consisting of *Nagellia Lindleyana*, a tall growing variety, with rosy flowers and spotted throat; *N. Madame Van Houtte*, dwarfier, with lighter coloured flowers; *Mandrolia lanata*, light violet blue; *Eucoloropsis negehibides*, rose, with darker spotted throat; *Restrepia antennifera*, a curious little brown-lipped flowered Orchid, with long thread-like petaline segments; *Onchium Linninghoffii*, a small species, with creamy yellow flowers, barred with brown; *Promenaea stapelioides pallida*, with flowers of a light green colour, larkly spotted; the greenish yellow flowered *Hoys campanulata*, and *Rhytidophyllum floribundum*, a free-blooming scarlet-flowered Gesneriad. From Messrs. James Backhouse & Son, York, came a plant shown as *Odontoglossum Bluntii*, with two fine spikes, to which a Special Certificate was awarded; it had, however, though white-

flowered, many of the peculiarities of *O. luteo-purpureum*. A choice collection of Orchids was also furnished from the Society's garden. From Mr. Parsons, Danesbury, came two very curious varieties of *Lactrea Felix-mus* named *ramosissima* and *purpura* to which First-class Certificates were awarded. To Mr. Wm. Bull a Special Certificate was awarded for a flowering specimen of *Lasiandra macrantha*, which was the best specimen that has yet been shown of this handsome new introduction. From Mr. S. Cooper, Holmsdale Road, Wray Park, Reigate, came a collection of small South African Euphorbiaceae plants, many of which were new species. A Special Certificate was awarded for the collection. Messrs. Standish & Co., of Ascot, sent a very good specimen of *Ixora Dixiana*, a good free-blooming variety, with large cymes of deep salmony orange-colored flowers, &c. Amongst florists' flowers the *Dahlia* took the lead. Mr. Turner furnished some grand flowers of old sorts and a few new varieties, among which *Tolson-d'Or*, a very fine flower, of a bright yellow colour, and *Hurford*, of a kind of a lilac rosy hue, a very pleasing colour, and of good form were honoured with First-class Certificates, as also were *Aristidea*, rich dark-shaded crimson-purple, from Mr. G. Rawlings, Romford; *Queen of Yellows*, a large, bright orange-yellow flower, of good substance, from Mr. G. Parker, Maiden Green, Winkfield; and *William Lund*, a dark maroon-colored flower, from Mr. Burgess, Chelsea. To Mr. C. J. Barker, Littlehampton, a Special Certificate was awarded, for a collection of cut flowers of single and double *Petunias*, many of them being of great beauty. From Mr. Eckford, gr. to the Earl of Radnor, Coleshill, came a further collection of *Verbenas*, amongst which *Countess of Radnor*, blue lilac, well marked in the centre with violet, and with lemon eye, was singled out for a First-class Certificate. The same award was also made to a new Ivy-leaved Pelargonium named *Lady Edith*, dark crimson tinged with purple, from the same exhibitor. To Messrs. J. & C. Lee First-class Certificates were awarded, for *Clemence Raoux*, a new autumn flowering Rose, of a pale flesh colour and powerfully scented, and for a very fine new variety of the *Africanum* *Capillus Veneris*, named *magnificum*. From Messrs. Downie, Lurd & Luig came a new Nosegay Pelargonium, named *Lady Kirkland*, rich crimson, and a scarlet flowering zonal variety, named *Sunshine*. Some drawings of various flowers were shown by Mr. J. I. Macfarlane, 17, Spencer Road, Upper Holloway; they were carefully and faithfully executed, but in some measure defective so far as perspective is concerned.

Fruit Committee.—G. F. Wilson, Esq., F.R.S., in the chair. On this occasion there was a fair display of fruit. A grand collection of orchard-house fruit, grown in pots, came from Mr. Lockie, gr. to F. H. Berger, Esq., Court Gardens, Great Marlow, consisting of admirable examples of *Magnum Bonum*, *Pond's Seedling*, *Transparent Gage*, and *Che's Golden Drop* Plums; *Bergamotte d'Esperen*, *Gansel's Bergamot*, *Williams' Bon Chrétien*, *Beurré Superfin Forelle*, &c. *Pears Ribston Pippin*, *Reinette du Canada*, and *Empereur Alexander Apples* and a fine bush of *Barrington Peaches*, all of good size, and in fine condition. A Special Certificate was awarded. The same award was also made to a named collection of autumn and mid-season Apples, grown on small pyramidal trees, sent by Mr. Wm. Paul, of Waltham Cross, and to a choice collection of six varieties of Nuts from Messrs. H. Lane & Sons, Berkhamstead, amongst which was the rather rare purple fruited variety. The Chairman brought richly flavoured examples of *Louise Bonne* of Jersey Pear, grown in pots and turned out-of-doors to ripen. From Mr. Dancer, Little Sutton, Parnham Green, came splendid specimens of *Cox's Pomona* and *Warner's King Apples*, to show their free-bearing qualities. To Messrs. Rivers & Son a Special Certificate was awarded for a collection of six varieties of *Fruitigian Grapes*, consisting of *Early Avernac*, *Early Golden*, *Eugenian*, *Primavia*, *Early Saumur*, and *Tokay*, most of them being of good size. Several Means were shown by Mr. Renbald, gr. to F. H. Berger, Esq., Pimlico, Mr. Frost, Dropmore, Mr. Beach, Kingswood Warren, and Mr. Lockie; but, with one exception, they were over-ripe, and could not be fairly judged. Mr. Walton, gr. to E. Potter, Esq., Camfield Place, Essendon, sent a collection of Potatoes; Messrs. Carter & Co. also sent 50 lb. of the *American Early Rose*, the produce of 1 lb. of sets, grown at Forest Hill; these, with samples of a new *Kidney Bean*, shown by Mr. Turner, were requested to be sent to Chiswick for the Committee to compare with other varieties, at the meeting to be held there on Thursday last.

INTERNATIONAL HORTICULTURAL EXHIBITION AT HAMBURG.—The Congress at Hamburg has, we believe, been a great success in a financial point of view. More than 60,000 persons were in the grounds on Sunday, and about a third of that number at least every other day. The whole disposition of the several parts, and the beauty of the situation itself, could not fail to have its proper effect on every one, but if it were asked, as was indeed the case, What is to be learnt from it? we must confess very little. After the collections of *Linden*, *Verschaffelt*, *Veitch*, and one or two more who constantly contribute the most interesting and novel articles on such occasions, and with the exception of the Museum, which comprised several matters of interest, and one or two objects in the fruit houses, there was little really to command attention. We ought not, however, to omit the specimens of pruning, especially those from France, from which certainly something might be learnt.

Unfortunately, with the exception of the Grapes and Pelargonium, there were no means of comparing the state of cultivation with that of other countries. The Grapes exhibited by Meredith and Thomson were incomparably better than any others, though a great push was made to secure the prize for three very inferior Prussian bunches. We were sorry to hear that the same sharp practices which have been so much complained of at home were revived here, and that cuttings were taken from every one of the beautiful *Tricolor-leaved Pelargoniums*. The *Dahlias*, *Hollyhocks*, *Fuchsias*, &c., among the flowers, and the *Cucumbers* amongst the fruit, would absolutely not be looked at by the Committees at South Kensington. The *Asters* alone seemed superior to those which are seen in England, where they are rarely objects of exhibition in London. In *Cucumbers* especially the sorts seemed very inferior; and, where any size was attained, the specimens were ripe, a state in which a great many *Cucumbers* appear in the market.

Amongst the garden machines there were a few minor things which were interesting. A new system of heating obtained the 1st prize, but we in vain strove to ascertain on what grounds. A clumsy apparatus for lifting and transporting plants, from Peter Smith & Son, of Hamburg, had the 1st prize assigned it, after a very cursory examination, a 2d only being given to Mr. Barron's, of Borrowash, which certainly

surpassed it in every good quality. We cannot help regarding this as a case of gross partiality.

The Congress for the discussion of questions of interest to horticulturists sat for three days, but we cannot find a single point on which any new light was thrown out.

[FROM ANOTHER CORRESPONDENT.]

This great exhibition of Horticulture, which opened on Thursday, September 2, and will continue to be held open until this day, is in many ways a remarkable one. No expense has been spared by the committee to render it attractive, and every inducement has been held out to render it interesting in its character, not only by inviting contributions from our country, but by embracing in its scope every class of plant cultivated in gardens, every variety of produce, and every article or implement used in connection with gardening in any way. That the whole has been accomplished would be, perhaps, saying too much. There is, however, one of the most extensive and varied horticultural exhibitions we have ever seen. Finer shows of plants we have frequently in this country, it is, indeed, difficult to pick out any special features of excellence anywhere, so far as cultivation goes, but having said this, we must admit that the tout ensemble is beautiful and instructive.

The show-ground, which covers between 20 and 30 acres, is beautifully chosen, and splendidly situated on the north bank of the Elbe, in a sort of ravine or valley, in which there is a fine piece of water at the bottom. The ground on both sides is occupied by the show, and the two portions are connected by a light suspension bridge, erected for the occasion. The whole of this pretty valley has been very tastefully laid out with beautiful winding walks, and groups of trees, shrubs, flower-beds, &c., by Herren Jürgens, of Ottensen, with great taste and skill. On this portion are exhibited most of the cultivated plants, and ornamental plants—large houses being erected for the accommodation of those that require it, and others, Conifers, Fuchsias, Pelargoniums, skilfully dispersed and grouped in beds in the open ground; thus giving the appearance of a beautiful garden, rather than of a stiff and formal exhibition. Connected with this ground by a substantial temporary bridge, on the opposite side of the road, is another portion of 4 or 5 acres, devoted to machinery, garden implements, fruits and forest trees, &c., the first part not having been found large enough for the display.

The prize offered by her Majesty the Queen, for the three best bunches of Grapes, in need of some of our champion Grape growers to compete for the purpose of securing it—to wit, Thomson of Dukeith, and Meredith of Garston. The prize, as advertised and announced by the Hamburg committee, was to be given for the three best bunches of Grapes, and on this understanding the fruit was sent to Hamburg and staged; when, to every one's astonishment, it was announced that a telegram had been received from General Grey, from the Queen, to the effect that it was to be given, not for the best specimen of Grapes, but for the best assortment of Grapes. Thus the English exhibitors, who brought their fruit in accordance with the schedule, were placed at a discount by this new arrangement. We are of opinion that however important it may have been to consult the wishes of her Majesty, it should have been done at an earlier date, and that if the matter had been clearly explained to her Majesty no such alteration would have been attempted. We maintain that the committee, having offered the prize for the three best specimens of Grapes, were bound to abide by that decision. Mr. Meredith had the good fortune to bring a splendid collection with him, and so became able to compete in other way, and thus triumphantly secured the great honour; otherwise, there cannot be the slightest doubt about it, the Cup was intended to be awarded to M. Wesselhöft, the German opponent. We cannot too severely censure the authorities for their behaviour in this affair. The more it is inquired into the uglier the matter looks, and the more plainly are the intentions seen. We are pleased to congratulate Mr. Meredith on his success, which adds one more wreath of victory to his already numerous honours as a Grape grower. Mr. Meredith's collection consists of three very large, although not particularly handsome, bunches of Mrs. Pince's Black Muscat, a beautiful set of three bunches of Black Hamburg, perfect in every respect, Muscat of Alexandria, Lady Downe's, Trenton Black Muscat Hamburg, &c., all very excellent examples. Mr. Thomson competed with a very perfect bunch of Chasselas Napoleon, weighing 4 lb.; a very large bunch of Muscat of Alexandria, 5½ lb., somewhat green in appearance; and a Black Hamburg, 3½ lb., not quite up in colour, and with the double misfortune of having been bruised and broken. To these the jury awarded a Gold Medal. M. Wesselhöft exhibits a stand of 12 sorts, of very fair and ordinary quality, to which the jury, for some unknown reason, awarded the Cup of the Duke of Mecklenburg, thus placing them before Mr. Thomson's, which were vastly superior. A Gold Medal was awarded to Mr. Thomson for his new and magnificent Grape, Golden Champion, which by its noble appearance excited the unqualified approbation of everybody. For White Grapes Mr. Meredith was placed 1st with Muscats, and for Black Grapes he was disqualified, on account of having obtained the Queen's Cup—the jury evidently forgetting that the objection was equally valid in the one case as in the other. The 1st prize was given to M. Helmen Huger, a fruiterer in Hamburg, for very poor scribbly stuff, so that it is not necessary here for the exhibitor to be the cultivator. A great quantity of Grapes is exhibited, principally however, from vineyards in the south.

Pink Apples make a very excellent display, the fruit in every instance being large and fine. The varieties are the Ripley Queen, and Prickly Cayenne. One peculiarity which we observed as belonging to all these fruits was their round, full, and plump character, not nearly so tapering as is usual with us. Some exceedingly good examples of fruit trees in pots—Apples and Pears chiefly—are exhibited by the president, Dr. Marek, M. Wesselhöft, and others. These are in small pots. The Apple trees about 2 feet in height, and bearing without exception the finest fruit we have ever seen grown in pots—some of the examples of Calville Blanc and Reine des Canals Apples, and Louise Bonné of Jersey Pears being perfect pictures. The show of Peaches is a very poor one, the best collection coming from M. Lepère of Montreuil; the Peach crop, as with us, having been almost an entire failure. Apples and Pears are contributed largely by the nurserymen—M. Jamin et Duran, of Paris, of Sceaux, Demouilles, Toulouse; Martin Müller of Strasbourg, whose collection, it may be noticed, which contains many English sorts, is very incorrectly named, and many other exhibitors show minor collections. There does not, however, seem to have been any regular competition in the way of specimen fruit, and the great majority of the fruits are of a very inferior description, with numbers of decayed specimens giving the whole a very untidy appearance. Quantity altogether exceeds quality in this section; by reducing the number to one-half, the exhibition would have been much improved.

The trained Faux Treas, which occupy a considerable portion of ground near this, are capitally displayed, and formed a somewhat novel and interesting feature. All the trees having their leaves stripped off them, this quarter had rather a wintry aspect. Samples of all sorts of nursery fruit trees are shown in this department—cordons of all sizes, espaliers of all forms, pyramids, candelabra, goblet, as well as common orchard standards, and that to a great extent. It is impos-

sible to avoid falling in love with some of these pretty trees. The principal exhibitors are Messrs. André and Louis Leroy, of Angers; Croux et Fils, of Sceaux; Jürgens, Nicustadter, Holstein; Müller, Strasbourg; and C. Millien, of Lübeck. The only regret we experience is, that so many pretty trees should have been nearly ruined through having been transplanted at such a season.

In the COPPEROUS classes the competition was pretty keen. It was a good idea of the managers to offer these prizes, as by their means the garden was at once beautifully embellished. We cannot say, however, that we approve of the exhibition in a general sense, excepting it might be in the case of new varieties. Some interesting groups are here contrived, as well as good examples in the classes for single specimens; the chief exhibitors and prizetakers being Messrs. Peter Smith & Co., Hamburg; Barron & Sons, Borrowash, Derby; Jürgens, Nicustadter, Holstein, &c. We cannot here enter into detail as to the merits of the various collections. We must observe, however, that the awards of the jury in many instances seem to us unaccountably strange. In the case of the specimen Abies nobilis, the 1st prize is given to a plant from Peter Smith & Co. not one-half the size of, nor one-half so good as, the one exhibited by Messrs. Barron & Sons. The prize plant, however, is honoured through bearing half a dozen cones, a result arrived at through ill-health; this precocity must have embarrassed the jury very much. The plant is truly a most miserable scrub without a leader, and in the last stage of disease. Again, with the specimen Cedrus Deodara, the 1st prize is awarded to the larger, but very inferior plant, without a leader, which at the time we write is almost dead. Messrs. Barron's pretty, compact, healthy plant being placed 2d. Peter Smith & Co. carry off the great prize for a group of 100 sorts with some large specimens, many of which, we are sorry to see, are now dying. Messrs. Barron & Sons carry off 1st honours for 25 Abies and Picea, 6 varieties of Retinospora, and 3 Thujae—all very excellent specimens. The 1st prize Araucaria imbricata came from J. Verschaffelt, Ghent, a perfect model of a plant, some 12 feet in height. The same, however, cannot be said of the prize Wellingtonia, which is truly a wretched object—now quite dead—and ought to have been disqualified with much greater show of reason than in the case of Messrs. Barron's lot of new varieties of Abies Douglasii, which, although they have obtained numerous 1st class certificates in England, were here entirely passed over as altogether unworthy. We have made these remarks, which we think are in justice due to Messrs. Barron, who have contributed largely to this exhibition, and whose plants have received anything but justice at the hands of the jury.

Very beautiful groups of Roses, standard and others of the free blooming hybrid perpetual and hybrid Tea classes, are shown by Fried. Harms, Hamburg; these, being now in full bloom, have a pretty appearance; one group of about 30 Gloire de Dijon is particularly noticeable. The standard Fuchsia, which comes also from M. Harms, presents one of the best examples of cultivation in the grounds. The prize offered for the best and most effective group of one-forged plants in the open air, brought together a lot of very good plants in themselves. Variety, however, seems to have been more studied than effect, and the whole is a mass of confusion. The same remark will apply to all the attempts in the arrangement of flower beds throughout the entire show—too many varieties of flowers used in one bed, without the slightest harmony of colour or effect.

Messrs. F. & A. Smith, Dulwich, exhibit a fine lot of their tricolor and tricolor variegated Pelargoniums, which are the admiration of every one. There are some good specimens of the double varieties, exhibited from some other growers. The best lot of NEW PLANTS undoubtedly comes from Messrs. Veitch & Sons, Chelsea; these, however, were not entered for competition, and so failed to receive the Gold Medal, which otherwise they would have obtained. They comprise eight beautiful Nepenthes, six new Dracaenas, several Crotons, the new Japanese Amaranthus, a fine new Dieffenbachia Bowmanni, one of the best of its class; some new hybrid Alocasias, &c.

M. Linden, of Brussels, also exhibits a large collection of foreign plants in pots, a fine part of the curious Cacta steala Jacobina, Ficus Lindeni, Cissus Linnæi, the singular-looking Trichostema ferax, Odontoglossum Alexandrinum, Cattleya eldorado, &c. M. Linden's lot is not at all an effective one, the plants being arranged in such a slovenly manner, and the dark and dismal lighting not being calculated to show the plants to much advantage. Indeed, the structures for the display of plants, which must have been erected at an enormous expense, were by no means suitable; they were very dark, rough, and untidy, and the arrangement of the plants in the different classes past understanding. Orchids figured very poorly, only two collections of 12 being staged, the 1st prize going to M. Linden, and the 2d to M. Kramer, gr., Flobeck Park, Holstein. The great prize of 500 thalers, for 50 plants in the highest state of cultivation, of which at least one-half must be in flower, is awarded to M. Kramer, Flobeck. The great majority of the plants in this group are very ordinary material, if we except some pieces of Disa grandiflora, which were truly splendid, and one or two others, there was scarcely a plant which at a London show would have been staged for such a prize. Palms were contributed in careless array, and some very fine examples. Messrs. Linden, J. Verschaffelt, and Laurentius, Leipzig, all contribute large and fine groups, the best, however, comes from Herr Wenzling, The Royal Gardens, Herrnhau, amongst which are some splendid plants of the different Geonoma Warronii, Martiana, sarajewensis, &c., Phormium tenax, and Arca Verschaffeltii. M. J. Verschaffelt exhibits a very fine plant of that beautiful tree Fern, Dicksonia antarctica, over 10 feet in height, which, to bring so far, must have been a work of no little trouble.

In a separate building are exhibited collections of market plants, such as Asclepias, Camellias, Heaths, Ficus, Dracaena, which are uncommonly well done; Primulas, Cyclamens, &c., all very good, but ordinary stuff, such as is to be found in any nursery. An immense collection of cut flowers is exhibited by Messrs. Ernst & Van Spreckelssch. A very great variety of Asters from the different German cultivators, the best examples coming from Dupré Brothers, seedgrowers, Quedlinburg. Finer Asters than these we have never seen. Anemones are also well shown here. Hyacinths and Pansies in large flowers, from Messrs. Downie, Laird & Laing, Stanstead Park; and Colours, Tricolor and Bronze Pelargoniums, from Carter & Co., F. & A. Smith & Co., which latter carry off the 1st prize, and very worthy so.

Bouquets and other flower decorations it was expected would have produced a fine display. On the contrary, however, they were all of the most common description. Here, again, the charm of colour was in most cases overlooked, and a variety of flowers was attempted, which gave them all a very confused and untidy appearance. Better arranged bouquets by far were being sold in the grounds by those strangely-attired Victorian girls; the prettiest bouquet amongst them was of the simplest construction, being entirely composed of sprigs of Green Myrtle dotted over the surface with the pretty White Myrtle flowers. Bridal wreaths, and little white bouquets of the same construction are also very pleasing; so that the more simple they are the more pleasing they become. In contrast to this quiet beauty, some wreaths and bouquets made altogether with the double Pelargonium Gloire de Nancy flowers, mixed with a little Fern, were extremely

pleasing. A little stand with pedestal of the same flowers, drooping racemes at the edges, also attracted our attention. The patience and the perseverance displayed in fixing these flowers singly must have been very considerable. Bouquets of Cycas revoluta were also here shown with a bouquet of white flowers tied up with white satin ribbons. It is a custom peculiar to some parts of Germany, on festival occasions, for the mourners each to carry some of these flowers, and for the lid of the coffin to be similarly arrayed. Hence the reasons for the abundance of these plants in Germany, and the favour they are held in.

From vegetables, which came next, and of which there is great display, but of which we need say nothing here, we pass on to the machinery, tools, and implements. Prizes for the things have been offered in like manner as for produce, but we are unable to say how they have been awarded, excepting one or two cases—the great majority of the articles come from England. W. S. Boutton, of Norwich, exhibits the greatest quantity, such as garden engines, which we can highly recommend, being very powerful, of simple construction, and of easy action. Mr. Boutton also exhibits a rather ingenious garden watering pot engine. Several mowing machines, scythes—Messrs. Ransomes & Sims, Green's, Bolton, and Wild's new patent Archimedeon, which is no doubt a good article. Here, however, there was no one to show off its capabilities, so that its working was not understood. The prize, we believe, went to Messrs. Ransomes & Sims. Messrs. Veitch & Sons exhibit a good assortment of garden tools, lery, seeds, &c.; and a great quantity of American hatchets, hoes, &c., are exhibited by Messrs. Schmidt, Franckes, of Osnabruck and New York.

Messrs. C. Behring & Co., of Hamburg, and Silver Street, London, exhibit samples of their new charcoal flower, which they are attempting to introduce. Charcoal, we believe, is very much liked by the roots of plants; so that we believe if this material can be used and made at a reasonable price will be a great acquisition. There are also slates of the same material, which are intended to be used as a substitute instead of slates, also for lining for walls of houses where Ferns, Orbits, &c., may be grown. A little experience, however, will better test the value of the material.

There are many other interesting articles exhibited, but we are unable to notice here. We cannot, however, omit to refer to the awards made for the best transplanting machines for large trees. Messrs. Barron & Sons, of Borrowash, whom we all know as having more practical knowledge of sort of work than almost any one, entered one of their machines, and came over here to contest the prize in a practical manner with that of Messrs. Peter Smith & Co., of Hamburg, and others. Viewing the machines as they each with its tree one is struck at once with the peculiar clumsy character of that of Messrs. Smith, that, with the other, the tree being somewhat bigger on the one than on the other, must have gained for Messrs. Smith the 1st prize; the award is monstrously unjust no one who has had practical experience of such work would for a moment doubt it. It is a most curious apparatus, that we have ever seen, we feel grave doubts as to whether it can ever be worked at all, we believe it broke down twice in the way which had the plant here. The objections against this machine are that the ball has to be enclosed in a large square wheel about 3 feet in depth, so that for all its roots have to be clean off to the required size, and big and little trees must have the same sized ball; 2d, the ball of earth takes 3 feet deep, is a great deal more than necessary, and the Messrs. Smith's machine, when lifted to its utmost height, cleared the ground by about 3 inches, so that the least unevenness of the roads, even a stone, would impede its progress, the wheels are too high, and too narrow in their girth, that they would very readily sink into the earth, &c. We think that Messrs. Barron have just cause of complaint against the judgment, and that their request for a trial of their respective machines should have been allowed, instead of their having been judged in a hurried manner, as they were, by a jury who in all probability never saw a tree moved in a practical manner.

Of the show on the whole it may be said that it is a splendid success, and a most beautiful sight. We wish, however, that we could with equal satisfaction speak of the merits, and the treatment received by the exhibitors.

ROYAL CALEDONIAN HORTICULTURAL: Sept. 8-9. The general features of the great International Fruit Show in this Society are noticed in another column. Here we propose to give a few of its details. In the collection of 20 sorts, Mr. Stevens, gr. to the Duke of Sutherland, was 1st prize. In this group were good Providence and Pines, very fine Black Hamburg Grapes, excellent Muscat and some others of less note; a beautiful cluster of Bland matured condition, Brown Turkey and Lee's Perpetual, the usual varieties of Peaches and Nectarines, good Pines and Trenton Hybrid Melons, Coe's Golden Drop Plums, park Apricot, Raspberries, Strawberries, and Cherries small fruit was shown in dishes, the large in boxes, and whole was well arranged. The 1st prize was awarded Mr. J. Easton, gr. to the Earl of Strathmore, who had the finest Grapes. Mr. Thomson, Dukeith, was placed 2d, for his very fine arrangement of 12 sorts in a splendid stand, divided into several compartments. It consisted of Queen and P. Cayenne Pines, a pair of Dukeith Park Melons, fruited Golden Champion, in grand order, set from an excellent Alicante, Muscat of Alexandria, Mrs. Pince's, Buckland's water, and Black Hamburg, all very good. In fruit of again were good Victoria and Prince of Wales Plums, garde Peaches in fine style, Pittmaston Oranges Nectarine several of the small fruits, which latter weakened the collection considerably. Mr. Ingram, gr. to the Duke of Northland, Alnwick Castle, was placed 3d, a specimen which rise to some dissent, the general opinion being that the 4th ought to have changed positions, he put up events, a most creditable assortment.

In the collection of 16 sorts, Mr. Mathieson, gr. to the Mrs. Vulliam, Tulliallan, had a very fine assortment, arranged, and shown in chip baskets, suitably grouped, comprised excellent Black Hamburg, Muscat, and Morocco Grapes, set of Green Mosaic, extraordinarily large, and very fine coloured Early Crawford and Peaches; Violet Hâtive and Tawny Nectarines, the last grand colour; Moorpark Apricot, Kirkcaldy Seedling, and Mr. Bonnum Plums. Mr. J. Easton, gr. to the Earl of Strathmore, was placed 2d, for his very fine arrangement of 12 sorts in a splendid stand, divided into several compartments. It consisted of Queen and P. Cayenne Pines, a pair of Dukeith Park Melons, fruited Golden Champion, in grand order, set from an excellent Alicante, Muscat of Alexandria, Mrs. Pince's, Buckland's water, and Black Hamburg, all very good. In fruit of again were good Victoria and Prince of Wales Plums, garde Peaches in fine style, Pittmaston Oranges Nectarine several of the small fruits, which latter weakened the collection considerably. Mr. Ingram, gr. to the Duke of Northland, Alnwick Castle, was placed 3d, a specimen which rise to some dissent, the general opinion being that the 4th ought to have changed positions, he put up events, a most creditable assortment.

Coming now to the collections of Grapes, Mr. J. Easton, gr. to the Earl of Strathmore, was placed 1st with the following sorts—Black Morocco, in full bloom and colour than is generally seen, and, as grows, most desirable-looking Grape; Raisin de Calabre, in fine fruit and of full size; Lady Downe's Seedling, in fine fruit

Duchess of Buccleuch, much smaller than was shown by Mr Fowler some years ago. Black Hamburg, Muscat of Alexandria, Muscat Hamburg and Alicante, in quite marvellous form and beauty of finish, considered by all an advance on former years. Mr Bannerman, gr. to Lord Bagot, was placed 2d, with fair Alicante, Gros Guillaume, Muscat of Alexandria, Lady Downe's, Black Tenerife, a smallish bunch, with medium berries in good finish, very good Mrs Pince's, West's St. Peter's, and Hamburg. Mr Thomas, Dalkeith, had a good mixed assortment comprising Black Hamburg, highly finished Muscat of Alexandria, Mrs. Pince's, imperfectly coloured; Trebbiano, good; Golden Champion, very good indeed; Lady Downe's, White Lady Downe's, and Alicante. Messrs. Lane & Son had also a collection in this class.

In the four-bunch class Mr Wm Bryden gr to Sir William Wallace, Lochrym House, Wigtownshire, had an excellent lot, well in size both of bunch and berry. His Gros Guillaume bunch was quite first-rate, and so was Alicante, with very good Black Muscat and Muscat Hamburg. Mr. M'Connell gr to A. Snellett, Esq., Cameron House, Linlithgowshire, had Black Muscat, Muscat of Alexandria, Black Prince, and Hamburg, very good and uniform. Mr. Wm. Meade, gr. to Messrs. Clark, Esq., Minley Manor, had Muscat Hamburg very good in his group. Mr. Bannerman had Gros Guillaume in 1st order, Mr. Meredith, who was not placed, had Hamburg and Lady Downe's, good, and Mr. Lees, Tynninghame, had also a fair collection. In the two bunch Black Hamburg, two Muscat of Alexandria, one bunch of each of the above named, one Alicante, one Lady Downe's, one flavoured white, one flavoured black, one finest bloom, and a collection of Grapes not included in other classes—in these 14 different classes, wonderful to relate, Mr. Johnstone was 1st. All his Grapes were in the best condition, and he brought them off without destroying the bloom. If there was one bunch more than another that created almost a sensation, it was the Alicante, so finely grown in the first instance as to assume model proportions, and then so densely covered with bloom as if it had been under the influence of a "heavy dew" out-of-doors. In these classes, keeping out the collection of Grapes and the bloom, there were from 17 to 24 entries, showing how well the prizes were contested. Mr. Bryden took 2d prize with good Muscat of Alexandria. Mr. Loudon, gr. to T. Barnes, Esq., Salop, had the best ripened bunches, but the berries were small. Mr. Kirkpatrick, gr. to Lord Abercromby, Airthley Castle, had fine bunches, and so had Mr. Ingram, Alnwick, and Mr. Lees. Mr. Meade and Mr. Ingram had good single bunches of Muscat of Alexandria. Mr. Bannerman had a good 2d lot of Lady Downe's; Mr. Brunton, gr. to Sir D. Kinloch, Gilmerton; Mr. Fraser, Biggar; and Mr. Meredith, also had good dishes. In Black Hamburg Mr. M'Connell had a nicely-formed bunch, which took 2d place; Mr. Jas. Hannah, gr. to John Duncan, Esq., Burnhead; Mr. J. Anderson, gr. to J. F. Webb, Esq., Newstead Abbey, Nottingham, and others, had fine fruit. Mr. Wm. Melville, gr. Glenec, New Galloway, had the 2d prize for Alicante; Mr. George Greig, gr. to Wm. Christie, Esq., Greenbank, Liberton; and Mr. McMillan also showing well. For Hamburgs in pairs there were 23 entries, Mr. Walker Basset, gr. to J. C. Phillips, Esq., Cheadle, running the winner very hard for position, backed up well by Mr. Stevens, Trentham. The finest flavoured Grapes in white and black, out of respectively 19 and 17 entries, were declared to be Duchess of Buccleuch and Muscat Hamburg; Mr. John Brunton taking position after Mr. Johnstone.

The heaviest black Grape came from Mr. Jas. Douglas, gr. to F. Whitbourne, Esq., Loxford Hall, Essex, and Mr. Laing—both Hamburgs; and the heaviest white was a Broddingnagian Syrian, weighing 16½ lb., and in good general order. This came from Mr. Jas. Dickson, gr. to John Jardine, Esq., Askleton. The Messrs. Lane had a wonderfully large bunch of Muscat of Alexandria. Muscat Hamburg was well shown by Mr. David Morrison, Mr. Bryden, and by Mr. Jas. Turner, gr. to Mark Spott, Esq., Riddle. For the best pair of Mrs. Pince's Muscat, Mr. Meredith had extra fine samples, large in size, fine in formation of bunch, and well finished, much better than any exhibited by his competitors. It looks valuable as a variety. Mr. Jas. Douglas and Mr. John M'Donald, gr. to Mrs. Sharp Erskine, Dunmarle Castle, had the other lots.

Mr. Thomson had the best assortment of varieties of Black Hamburgs, comprising the small Vitis, a small but finely hammered berry, and Black a little larger and redder in the tinge, a seedling black, much inclined to shoulder, fine bloom. Champion, smaller than we have seen it, and Dutch. Mr. Johnstone, who had the 3d collection, had the Mild Hill variety, fine in colour, in addition to some of those named above. In the collection of Muscats Mr. Ingram had the largest bunches, and Mr. Thomson the smallest in the ripest condition. The lots comprised Escholata, loosely arranged in bunch; Tottenham Park, Bowood, Candia, Tynninghame, the least ripe of the group, and Canon Hall. Mr. Thomson also exhibited the White Lady Downe's in very promising condition, but unripe. Vines in pots were numerous, some of them layered and taken up for show purposes, Mr. Tinsall, Broomlands, and Mr. McLeod, Newbattle, being most successful.

In Pine-apples there were two superb fruits, especially the Charlotte Rothschild, from Mr. Miles, gr. to Lord Carrington, Wycombe Abbey. Very good Queens came from Mr. Fooks, Fordel, Inverkeithing, and an excellent lot was sent for exhibition, and specially rewarded, from Mr. Carmichael, gr. to H. R. H. the Prince of Wales, Sandringham. Mr. John Fortune, gr. to R. Jardine, Esq., M.P., Castlebank, showed good fruit of Smooth Cayenne, but a little too ripe. There were no fewer than 48 Melons placed out of 80 entries, Mr. Douglas winning in both Scarlet and Green-flesh with Scarlet Gem and Bousie's. Incomparable, Mr. Phillips, Stapleton Park, and Mr. Potble, Woodbridge, Suffolk, having also fine fruit. The best Figs were shown by Mr. Cowe, and the largest and best variety among them was named Luffness, a variety bearing a marked resemblance to Castle Kennedy. Mr. Laing and Mr. Fowler, gr. to the Earl of Harewood, had the 1st prize of fruit. Out of 16 dishes of 12 Peaches, Mr. Campbell, Alva, and Mr. Mathieson had the best, with the usual varieties, and out of 31 dishes of 6, Mr. Loudon, Salop, and Mr. Browe, Kilmarin, were the winners. Nectarines appeared to be scarce, there being but few entries, Mr. Hardie, Springfield House, being 1st. Mr. Ross, gr. St. Martin's, Perth, had the best Apricots, Mr. McIndoe, York, taking 2d place. Mr. Kirkpatrick, Airthley, and Mr. Scrymgeour, Holme Park, Reading, were placed for Plums with such sorts as Golden Drop, Washington, and Victoria.

Both Apples and Pears were only sparingly shown. By far the most attractive were the following kitchen sorts of Apples, from Mr. Scrymgeour, gr. to R. Palmer, Esq., Holme Park, Reading—Rehette de Canada, Emperor Alexander, Dutch Collin, Kentish Filbasket, Yorkshire Greening, and grand Olden. In the matter of both Apples and Pears this exhibitor distanced other competitors. Mr. McKay, gr. to Chas. Tennant, Esq., of The Glen, Peebles, had immense fruit of Pashiera quadrangularis, and some of the lesser sized Passion flowers. Mr. Barron sent a collection of Apples and Pears from the orchards of Middlesex, which were not without interest.

In the adjacent hall there were some extra fine plants, particularly of Tree Ferns and Crotons, from Mr. Sutherland, gr. to Peter Denny, Esq., of Helenslee; and these, with the Dalkeith and Tynninghame flowering plants, had an imposing effect. The orchestra and the tables surrounding the room

were filled with the produce of the various nursery firms in and about the city; and what with the glowing hues of the multicoloured Gladioli, and the splendid spikes of Hollyhocks, in the various classes, the interest of the promenade was kept up to a much more marked degree than heretofore. It is impossible, with the limited space at our disposal, to touch upon the many interesting things, far less to dwell upon the numerous stands of florists' flowers. It was pleasant to see so many well cultivated Heaths; Mr. Thomson's Austiniana, retorta major, and Jackson were large, fresh, and full of bloom; and so were those from Mr. Lees, who had Marnockiana in brighter colour than it is generally seen so brought about by standing the plant out-of-doors. By far the best novelty however, was a seedling, named after the raiser, Turnbull. It is a long tubed, waxy expanded variety, of a good red hue, and some day must take position as a leading autumn-flowering Heath. Mr. Thomson's Vandas, comprising tricolor and suavis, were particularly well done. One of the most striking plants in the hall was a Lapageria rosea, from Andrew James, Esq., Alva. It was grown and trained in seven circular tiers, arranged so that the pendent flowers could be well seen, and it was studded with them. The Messrs. Veitch's table was a great centre of attraction. The Orchids and Nepenthes, a portion of them seedlings of Mr. Dominy, were shown in grand style; and, although they had travelled over 400 miles, looked as fresh as seen in the Victorian stoves. Vanda insignis is a grand acquisition, flowering, as it does, in so dwarf a state, and so full of bloom. The new Cypripedium Harrisonianum is about the most perfect representation of a varnished flower known—superior to the best of the shaggy or hairy Lady Slippers (villosum). Cattleya Mangosii is a fine-tinted mauve, with a labellum beautifully frilled; Miltonia Warscewiczii is a particular little gem, with yellow and bronze sepals and petals, and a broad, almost quadrangular lip of dark and shaded purple, with a broad belt of white at extremity. In Cattleyas there were labata, speciosissima, maxima, and devoniana, all noble varieties; and the charming Dendrobium McArthur and Bensons, looked beautiful among the newer Crotons and Davallias, and the choice and chaste Lapageria alba. The whole was rendered enchanting by the addition of a bevy of Pittier Plants, with their curious appendages suspended in a variety of forms.

We were much struck with the perfection of the Hollyhock spikes of the Messrs. Dawnie & Co., as well as their Dahlia blooms, both showing fancy; and so were we with the collection of Gladioli of Stuart & Meis, Kelso—they were really grand. The cut blooms of Hollyhocks of the Rev. Edward Hawke and Mr. McIndoe were all but faultless; the blooms of Willingham Model and Phyrne, the one a saffron and the other a soft pink, were quite a treat.

The collection of vegetables from Dalkeith, from Tullialan, and from Balfour, were good, especially the lots of Peas, Potatoes, Parsnips, and Onions. Great credit is due to the Secretary and all concerned for the efficient manner in which the whole thing was arranged and perfected; everything was put right for the judges to commence their labours at 6 A.M., thus allowing gardeners, at a nominal fee, to visit the show between 9 and 12, and then a high fee for entrance was charged, to allow patrons and visitors to see the exhibition a little more pleasantly than when gardeners are bustling about inspecting the awards. [This is a capital arrangement. Eds.]

A very large party dined in the evening under the presidency of the Earl of Dalkeith—noblemen and gentlemen, and their gardeners, for once joining in social festivity on the same terms. These things are better managed about the "Modern Athens" than almost anywhere else.

Florists' Flowers.

NEW PICOTEES, &c.—The following new varieties are particularly good, and should be in every collection, as they are adapted for decoration either in pots or in the garden border:—

Picotee: Admiration (Turner), a fine large purple-edged variety; gives a quantity of flowers, and is of very strong compact habit.

Carnation: Prince of Orange (Perkins), the finest orange-yellow tree Carnation that has ever been brought before the public; a free flowerer, and of good constitution. It may be had in flower all the year round.

Olive: Bride (Hodge), pure white, with occasionally a little tint of flesh-colour in it, a large bold flower, particularly free and good; a strong grower, clove-scented, and will force well. W. Howard, Bedford Hill, Balfour, S.W.

The Apiary.

BEE-KEEPING IN SOUTH WALES.—The account I have received of the doings of bees in supers during the past season from various parts of Devon, have not been particularly favourable. One beautiful super, or rather two supers from the same stock, weighing nearly 60 lb. net, of exquisitely fine honey-comb, was brought from North Devon to be shown at our Exeter Horticultural Exhibition on August 20. One or two good supers are reported from Kinsbridge. With these exceptions, I have not heard of anything much worth speaking about. On the whole, therefore, I do not think "A B," of Narberth, has much to complain of in his harvest of 14½ lb. from four stocks. As regards my own apiary, and those of some others who were anxious to obtain honey in supers, I have to report that early in the season the hives showed a strong disposition to swarm, leaving their supers more or less filled with combs and honey, and, in some cases, having been largely bred in by the queen. I have frequently noticed that when a super is made the receptacle of a considerable quantity of brood, a swarm is almost invariably thrown off, although the internal capacity of the combined boxes may be very large, and not fully occupied with combs or bees. I should like to know from some of our Ayrshire friends what is the best treatment to be adopted with such stocks. Probably with their system of hive the proper management would be easily understood, but in the matter of ordinary box-hives with glass supers, it does not seem to be at all easy. Nadirs added to the stock hives do not answer; the brood remains in the super, is hatched out, and the honeycomb spoiled. To place a second super between the first and the stock is also, in such cases, bad practice, though succeeding well when honey only is being stored. To place a super above the one which contains the brood, thus making the first super a part of the stock or breeding

hive, would doubtless be correct, but can rarely be done except with hives worked on the same principle as the Stewarton.

With regard to the driving operations of the clergyman mentioned by "A B," wherein the two hives were conveyed into a darkened coach-house, and the bees drummed or frightened out, and allowed to fly back to their respective stands as best they might, it may at first sight appear strange that the queens should have returned with their subjects to their old localities. But it is not so if we consider that both the queens had most probably been born and reared, and had taken their virgin flights from, where they were located. They were both, to a certain extent, acquainted with the situation of their homes. If the hives had been at some previous time transferred to the stands from a distance, having the same old queens at their head, they would in all probability have failed in reaching their proper stands. A friend of mine had in his apiary a similar instance, in which, after driving a swarm of bees, and failing to discover the queen, which he was desirous of capturing, he at length found that she had, during the operation, taken wing, and had got back to the old stand, uniting with the stragglers, and entering the decoy hive placed there for the purpose of amusing them. She was a young Ligurian, which had only a very short time previously taken her wedding flights from the same spot. However, the plan of driving adopted by the clergyman is by no means to be recommended. Thousands of bees must have been unable to fly, or to reach their companions. The sacrifice of brood also in this case must have been very great. S. Bevan Fox.

Miscellaneous.

Coal Plants.—The substance of the coal, although entirely composed of vegetable matter, seldom contains fragments that can be recognised. These abound in the beds above and below the coal itself. The coal always rests on a bed of fine mud changed into stone, and called shale. This is generally much lighter in colour than the other shales of the series, and it abounds in a fossil named Stigmaria, from the number of dots or pits all over its surface. This very common fossil was long believed to have been a water plant, which, when it died sank down to the mud and was there buried and preserved. It is now known to be the roots of the great trees whose remains have chiefly formed the coal which rests on the shale, in which these roots are still embedded. They were large, fleshy roots, and gave off numerous long cellular rootlets from the pits, with which they are completely covered. The soft structure of the rootlets, and their great number, would enable the trees to withdraw a large amount of moisture from the wet soil in which they grew. The trees to which the Stigmaria belonged had a very singular aspect. They were straight, simple, or branched stems, growing to a height of from 50 to 80 feet, entirely bare throughout the greatest portion of their length, but densely covered on the upper part with very long and slender leaves. The bare portion of the stem was marked with parallel flutings, and the elevated flattened ridges were ornamented with the impressions of the fallen leaves, which, as they were very regular, both in their form and arrangement in each species, gave rise to the name Sigillaria, by which the fossils are known. The trees had an appearance similar to that of the immense leafless Cactuses of America, except that, instead of spines or hairs, the fossil bore true leaves. From this resemblance some naturalists have believed them to have been ancient Cactuses, but the structure of the stem, and especially of the fruit, proves most conclusively that they occupy a much humbler place in the vegetable kingdom, and are true Cryptogams. The fruits which are preserved in the coal measures are very rarely found so connected with plants as to indicate the particular species to which each kind belonged. Only one observer has hitherto detected the fruit of Sigillaria connected with the foliage and stem. He found it to consist of several small roundish cases, borne on the somewhat enlarged bases of the leaves. These cases did not contain seeds, but spores, and the structure and arrangement of the spores show that these remarkable trees are very nearly related to the small creeping plants called Club Mosses, found on our mountains. The Sigillaria lived not only in the clay below the coal, but found also a suitable soil in the increasing mass of decaying vegetable matter which subsequently formed the coal. When, from a change in the level of the surface of the land or other cause, the coal was submerged, and gradually covered with mud or sand, these trees stood erect, and were surrounded by the mud or sand. They withstood decomposition until several feet of the deposit was formed. These short trunks in the roof shale of a coal-mine are a source of serious danger to the miner, for when the coal is removed from below, the bed containing them dries to some extent, and the trunks, sometimes two yards in diameter and several feet high, easily separate from the rock because of the layer of coal which surrounds them, and often fall on the workmen. World of Wonders.

Brier versus Manetti.—Esop told the gardener of his master, Xanthus, that "the earth was a step-mother to those plants which were incorporated into her soil, but a mother to those which are her own free production;" and wherever the Dog Rose flourishes in our hedgerows—now delighting our eyes with its flowers, and now scratching them out with its thorns, should we follow the partridge or the fox too wildly—there the Brier is the stock for the Rose. I know that, despite the dictum of Esop, our soil has been no injurious nurse to that foreign Rose which took the name of Manetti from him who raised it from seed, and which was sent to Mr. Rivers, more than 30 years since, by Signor Orivelli, from Como. I know that the Italian refugee is acclimatised, and that in hundreds of

our gardens he is a welcome and honoured guest. I know that the Manetti will grow luxuriantly where the Brier will not grow at all; that in a toward season it will produce some varieties of the Rose in perfection; that in many cases it causes a larger quantity of wood and bloom; and that it seems to be more enduring than the Brier, because the Brier, being used as a standard, is more exposed to hardships, and because the Rose being budded beneath the soil on the Manetti, establishes itself in most cases upon roots of its own. I know, in fine, that the importation of this stock has been a very gracious boon to those who love the Rose, but I am equally sure that nine-tenths of the most perfect Roses which have been grown and shown have been cut from the British Brier. I have proved this not only from my own experience, having grown the two stocks side by side, in a variety of seasons and soils, and also from inspection and inquiry. Latterly I have made a point of asking at our exhibitions the parentage of Roses which have been admired the most, and the answers have been, 90 per cent. of them, as I foreknew they would be, "The Brier." In Dorsetshire, last summer, two of our best Rosarians "discoursed as they sat on the green," and when they had discoursed, it was written by one of them ("Journal of Horticulture," August 13, 1868), "For general use the Brier is doomed; it is time to think seriously of discarding it." But then he adds, and I pray you to mark the reservation. "Exhibitors will not do so, I believe, for the maiden blooms from a Brier are superior to those from the Manetti." But no earnest lover of the Rose will be satisfied with inferior blooms, having the hope of better; and it should have been stated, accordingly, not that the Brier is doomed for general use, but only with regard to those unhappy localities where it cannot be grown. If your lot is cast therein, my amateur (but do not think so without a trial), you may grow Roses for your own delectation in pots on their own roots, and on the Manetti, but I do not urge you to compete. If the Brier flourishes in your district, order 500. *Rev. S. R. Hole, in "Gardener."*

Garden Operations.

(For the ensuing week.)
PLANT HOUSES

PLANT growers have not had a very favourable season for the cultivation of those subjects which require sunny weather and natural heat to produce well-developed wood. For many weeks after the full summer term had commenced, dull and cold weather prevailed, hence the young growth upon many hard-wooded plants was somewhat drawn. The late few weeks of bright hot weather will have afforded some compensation for this, if, as I suggested should be done, various subjects were introduced into cooler temperatures, viz., greenhouse plants placed in sheltered positions out-of-doors, and stove or exotic plants removed into cool houses, or cool vinerias, and other similar structures. What I wish more particularly to call the cultivator's attention to in connection with the above remarks is, that considering the vicissitudes already experienced, we must carefully guard our plants against any further fluctuations of temperature, by housing them at the earliest possible moment when it appears at all likely that a cold period has arrived, and which may be anticipated during the early autumn. Already we have experienced a few cold nights, especially on the 29th ult., when the thermometer fell very low. Scarlet and other zonal *Pelargoniums*, which are being grown in pots for the decoration of conservatories and greenhouses in the early winter should receive copious waterings with liquid manure now that they are in their flowering pots. With a view to perfect a good growth, let the flowers be pinched off constantly. They will ripen their wood and flower better if it be possible to stage them in a fully exposed, open, airy situation under glass. Other subjects, such as *Heliotropes*, *Ageratums*, *Salvias*, and "tree" or other *Violets*, &c., would also be much benefited if they were treated in a similar manner. *Pinks* and *Carnations* should also be potted into their flowering pots without further delay. These should be placed in a cool, shady aspect for a week or two, where, if occasionally damped overhead, they will not fail to take hold in most instances. Pot off seedling *Primulas* as soon as the late successions are fit to handle, pushing them along in a frame or pit, which can be kept rather close and moist. *Gloxinias* which have done blooming should be placed in a rather exposed and dry situation, so that the bulbs may become thoroughly ripened before storing them away for the winter. The same remarks apply equally to such early grown *Caladiums* as are now showing signs of exhaustion by the production of yellow leaves. Do not, however, permit either to become too dry at the root, or by this or any other means cause them to ripen off too quickly, but secure by means of waterings, which may be gradually decreased in quantity and frequency, a gentle transition into the dormant state.

FORCING HOUSES.

I again suggest the desirability of pruning the earliest *Vines* as soon as the wood is thoroughly matured. After this operation has been performed, immediately remove all decayed leaves and other loose or untidy litter, and give the house a thorough good cleansing. Any alterations or improvements which have been planned, should be thoroughly entered upon and brought to a finish. In late *Vinerias*, which are now ripening their fruit, let a dry atmosphere be maintained; the sooner the colouring process is finished the better. Where shanking occurs the berries should be removed as quickly as they are observed. The only other particular attention requisite, apart from the ordinary routine, is to protect effectually the fruit against

the inroads of wasps and other similar pests, which have suddenly become very numerous. Let the temperature in all *Pine-pits* containing sucker successions which are rooted, and others a stage or two in advance, be slightly lowered now that the days shorten, and less solar heat is obtainable. Those "fruiters" which are likely to show in from one to three months' time, will be better prepared to withstand the adverse weather we may then experience, if the night temperature be also gradually lowered during the first dull period which ensues. This may be reduced with safety down to some 8° to 10° above temperate; or say a mean of 61°. Actual fruiters should have a good brisk heat, both top and bottom, and the other necessary conditions of moisture, and, when practicable, fresh air. It will not be necessary to shade any after this date. I would again draw the reader's attention to the great benefit which accrues to all *Peach* and *Nectarine trees* at this season, by being well washed with a mixture of Gishurst compound (see p. 900). I attach great importance to this operation.

HARDY FLOWER GARDEN.

Those who have given copious waterings to *Trilomas*, will have been amply repaid with abundant spikes of fine bloom. It will be advisable now, however, to withhold water, so as to afford the stools the opportunity to perfect what foliage they have made, and go somewhat to rest before winter becomes too severe. Late growth has more to do with the injury these and similar plants receive from frosts than any other cause. Finish planting all *Pinks* and *Carnations* without further delay. Make the necessary preparations for housing *Auriculas* when needful. Prepare the beds for the reception of *Tulips*; they delight in a good rich fibrous loam of good depth, and with a liberal quantity of thoroughly decomposed manure well incorporated therewith. Attend to the taking up, &c., of all spring-flowering bulbs which still remain in the ground, where necessary, before they commence growing freely.

HARDY FRUIT GARDEN

Remove all lateral and fore shoots which push upon *Peach* or *Nectarine trees*, after this date it will prove beneficial to them if the points of the moderate and weakly-grown shoots are pinched off. Many pests, such as wasps, blue-flies, and indeed, the Lady-bird, are now to be guarded against, for they make sad havoc with the wall-fruit. There are few better preventives in regard to Peaches and the like than cotton-wool, and it may be the more readily used now that such small crops exist. A small portion carefully wrapped round each fruit proves a good preventive, as the pests do not care to come in too close contact therewith. Hasten the removal of all old canes from *Raspberry plantations* which have fruited; they not only impoverish the young growing rods, but also contend for their part share of all light and air besides, to the detriment of the rods. Remove now all overhanging foliage or growth of any kind which shades the fruit upon *Tomatos* from the direct rays of the sun, and so aid the ripening process by every possible means. Should the weather continue as dry and fine as it is at present, a good watering with strong liquid manure will be likely to invite them to this end more quickly. Some few early *Pears* will now need gathering. These should be examined periodically until it is seen that they are fit. To have them remain upon the trees until they become thoroughly so, is to submit them to be punctured and otherwise injured by the many pests already referred to.

KITCHEN GARDEN.

Two or three successional sowings are still necessary in this department. These comprise *Lettuces* for the last time, and *Australian Cress* to stand the winter, and which should be sown upon a warm, sunny aspect. *Onions* should now be drawn; and after being permitted to remain for a few days to dry or ripen off, should be stored for winter. Make the main plantation of *Cabbages*. If these are planted out upon the old Onion-bed aforesaid, with no further preparation than the necessary hoeing and clearing off of weeds from the late crop, they will do much better than when planted into loose, freshly-dug soil. Make the final ingathering of *Camomile flowers*, and immediately the crop has been secured cut away all the blooming branches before winter down to the ground line, that the stools may re-establish themselves. *W. E.*

TOWN GARDENING

Hyacinths and other bulbs are now appearing in the seed shops; therefore purchases should be made at once before all the well matured roots are sold. In selecting the *Hyacinth* see that the bulbs are firm and of good form; and if the skin is split at the base of the root so much the better. It will be as well to put a few in glasses at once for early flowering. The glasses should be filled up to the root with soft water, and placed away in a dark cupboard till the fibrous roots have half-filled the glass, when they should be brought forward to the light; or they may be grown in 48-size pots, filled with two-thirds loam and one rotten dung, with a little sand. The roots should be pressed in till they are about half covered, and placed on slates to keep out the worms, and in some convenient position where they can be buried about 2 inches deep in cocoa-nut fibre or fine ashes till they have grown about 2 inches, when they should be uncovered and brought into the house or frame sheltered from the frost. Where there is room in the Fern-case a few roots may be planted therein; they will flower freely, and do no injury if removed after flowering. The stems of the *Pompon Chrysanthemums* in the front rows of the beds and borders should now be untied, and some of the shoots should be pegged down close to the edge, so that the borders may form a full sloping bank of flower, with foliage to the ground. A good watering of liquid manure, given about twice a week, will be of great service to all *Chrysanthemums*. *J. D.*

STATE OF THE WEATHER AT CHRISWICK, NEAR LONDON, For the Week ending Sept. 8, 1869, as observed at the Horticultural Gardens.

Sept.	Moon's Age	BAROMETER		TEMPERATURE			Wind	Mails.	
		Max	Min	Of the Air		1 foot			2 feet
Thurs	2	29.30	28.25	54	37	50.5	58	N. E.	.00

Satur.	68.2	46.5	57.4	19	0.81	3	10	3	3	11	6

The highest temperature during the above period occurred on the 13th, 1865—therm. 88 deg., and the lowest on the 12th, 1863—therm. 28 deg.

Notices to Correspondents.

BOILERS *Messrs. Jones & Sons*. We have referred to your letter, and find that we have not altered a word in it. It was not necessary to express your doubt as to the performance of the Conservative boiler, that was sufficiently expressed by the fact of your challenge.

BOOKS *A Young Gardener* "Kenp's How to Lay Out a Garden," "Louden's edition of Repton's Landscape Gardening," and "Thomson's Flower Garden."

CEPHALOTAXIS *T. W.* The *Cephalotaxis* is closely allied to the *Yew*, and comports itself in every respect like the *Yew*. The habit of all the *Cephalotaxis* is exactly that of the *Yew*. Sometimes a young *Yew* will send up a strong leader, as if it intended to grow into a handsome upright tree, but it ends in sooner or later taking the characteristic *Yew* form. So with the *Cephalotaxis*.

DOUBLE PELARGONIUMS *H. C.* They are fine flowers, but, like too many other English seedlings, wanting in distinctness from the Continental sorts.

FUCHSIAS *H. C.* A good double white, but, as far as the individual flowers go, (and we have not seen the plant), we believe there is a better one in existence.

GARDEN PLANS *Un-Jane J. etc.* We are not aware that any are on view, except in the artists' offices.

GREENHOUSE *G.* A medium sized boiler will suffice for the work you mention. The forcing house should have four rows of 4 inch pipes carried round it, while for the greenhouse, two rows will suffice. Make the stages of slate, and close, so as to hold a layer of gritty sand, or fine spar, which will act as a drainage to the pots in the one case, and will serve to retain moisture for evaporation in the other. A pit for bedding plants might be formed outside these houses if convenient, or you might erect near to them a separate low lean to or span roofed pit, according to the space required. In either case a single pipe, carried round inside, will serve to keep out frost and dry up damp.

INSECTS *J. H. M.* The Fern eating caterpillars escaped in *Arctia*.—*T. S. P.* Your insect, figured, seems to be the female of *Loxota Rosella*.—*D. J.* The larvae which attack your roots of *Lettuce*, *Endive*, and *Violets*, are those of a species of *Agrotis*, a genus of *Noctuid*. They are so subterranean in their habits, even at night rarely coming quite above the surface of the ground, that we know of no remedy better than that you suggest, of "catching them and killing them," if only you can succeed in getting them.

MUSHROOMS *An Old and Constant Sub. Kent.* Mushrooms grown indoors during the summer months are not unfrequently attacked by a very objectionable kind of grub, or maggot, of which our correspondent complains, and which even cause the destruction of "buttons" of moderate size. The only remedy we can suggest is—1st, do not depend upon winter made beds for a summer supply, however slightly they may have been exhausted by bearing previously; 2d, they may be fresh beds made periodically should, however antagonistic to Nature it may seem, be scrupulously excluded from the outer air and, 3d, independently of the occasional soakings which the beds require, the surfaces should be slightly damped over at least two or three times daily whilst in full bearing. Could our correspondent forward examples of the maggot complained of for examination, as we are not certain as to its origin? *W. E.*

NAMES OF PLANTS *A. Witham* *Blitum virgatum*, the Strawberry Blite.—*M. J. A.* *Nicotiana suaveolens*.—*W. F.* Both plants undeterminable.

PASSIFLORAS *R. Carr.* Received with thanks flowers of *Buonapartea Raddiana*, also *kermosina*, and *racemosa*, also *princeps*. The *Stanhopce* we will name shortly.

PELARGONIUM *Lyngbton*. We cannot name these from the leaves. Those sent are remarkable for size only. It is possibly a seedling.

RATS *An Old Subscriber, Co. Meath*. In our volume for 1868, p. 1270, you will find a paragraph relating to the best trap for rats, from which we extract the following—"Place within the reach of the rats some coarse oatmeal mixed with the consistency of thick green m. d. about 2 feet deep. The oatmeal to be 2 inches in depth. The rat ventures to eat his prepared repast, and then endeavours to return, when, to his great surprise, he finds his feet fettered and clogged by his newly-found treasure, and so is unable to take the necessary leap. His fate is sealed. His shrieks bring his friends and relatives, who share the same fate. In this manner I captured nine in one night."

ROSES *New Sub.* The Manetti stock should be budded on the current year's wood, and the young wood shortened the following spring. The Manetti is not a good stock for standard Roses; the Brier or Dog Rose is better. All Roses may be budded from July to September inclusive.

WELLINGTONIA *J. H. C.* The tree is very liable to die off at the tips, as in your specimen. The cause may, perhaps, be Fungus at the roots, as it certainly has been in some similar instances.

COMMUNICATIONS RECEIVED.—A. G.—J. E.—W. S. (Thanks)—C. L.—A. C.—T. W.—R. W.—E. B.—B. & S.—H. Lane & Son.—S. P. H.—E. R. G.—E. G. M.—W. B. P.—C. B.—C. D. & Son.

Look to your Grass Lands

JAMES CARTER AND CO.'S RENOVATING MIXTURE OF GRASSES AND CLOVERS SHOULD NOW BE SOWN. This Mixture is specially prepared to suit the various soils, and consists of the most desirable kinds to produce a Permanent Pasture of the highest quality on old decayed Pastures and other lands that have suffered through the extreme dryness of the past season.

CARTER'S "PRIZE MEDAL" PASTURE GRASSES for FORMING NEW MEADOWS, mixed to suit all soils, from 21s to 32s per acre. Special low quotations for quantities on application to JAMES CARTER AND CO., Seed Farmers, 237 and 238, High Holborn, London, W.C.

Early Feed for Sheep and Cattle.

SUTTONS' SPECIAL MIXTURE of rapid-growing GRASSES and CLOVERS. 2 bushels per acre; price 10s per bushel. SUTTON AND SONS, Seedsmen to the Queen, Reading.

1869. - GREEN FOOD SEEDS. - Welsh Winter Vetches, Winter Rye, Italian Ryegrass, Winter Oats, Winter Rape. Together with all other Seeds, for present sowing, of best new quality, and at moderate prices. JAMES DICKSON AND SONS, 102, Eastgate Street, Chester.

RAYNBIRD, CALDECOTT, BAWTREE, DOWLING, AND COMPANY (Limited). CORN, SEED, MANURE, and OILSEED MERCHANTS. Address, 28, Seed Market, Mark Lane, E.C.; or Basingstoke. Samples and prices sent free on application. Prize Medal, 1861, for Wheat, 1862, for "Excellent Seed Corn and Seeds."

LAWES' WHEAT MANURE, for AUTUMN SOWING, now ready for delivery. All other Manures at 1 cask as per Price List, supplied on the lowest terms. Apply for prices, &c., to JOHN HENNETT LAWES, 1, Adelaide Place, London, E.C.; Dublin, and Shrewsbury.

THE LONDON MANURE COMPANY (Established 1840). Have now ready for delivery, in fine condition, CORN MANURE, for Spring Use; DISSOLVED BONES, for Dressing Pasture Lands; SUPERPHOSPHATES of LIME; PREPARED GUANO; MANURE and POTATO MANURES. Also Genuine PERUVIAN GUANO, and NITRATE of SODA ex Dock Warehouse; SULPHATE of AMMONIA, FISHERY SALT, &c. Offices, 116, Fenchurch Street, E.C.

Autumn Sowing. DAMS' NITRO-PHOSPHATE or BLOOD MANURE for WHEAT. This Manure, specially prepared for Autumn Sowing, is rich in Ammonia, Phosphates, and other ingredients required for the healthy growth of Grain Crops. Analysis of Blood and the grain of Wheat show that they are nearly identical in composition, hence the value of Blood as an ingredient in Manure. It may be applied at the rate of from 3 to 4 cwt per acre, according to the condition of the soil, either dried with the seed or sown broadcast, if the latter, it should be well harrowed in. Prepared by the Patent Nitro-Phosphate or Tenant Farmer's Manure Company, whose Members are Cultivators of upwards of 5000 acres of land, which has been for years under management with Manures of their own manufacture; consequently the Consumer has the best guarantee for the genuineness and efficacy of the Manures manufactured by this Company. Particulars will be forwarded upon application to the Secretary, or may be had of the Local Agents, C. T. MACADAM, Sec. Chief Offices, 102, Fenchurch Street, London, E.C.; Western Counties Branch, County Chambers, Exeter; Irish Branch, 40, Westmoreland Street, Dublin.

GISHURST COMPOUND. Used by many of the leading Gardeners since 1859, against Red Spider, Mildew, Thrips, Green Fly, and other Blights, in solutions of from 1 to 2 ounces to the gallon of soft water, and of from 4 to 16 ounces as a Winter Dressing for Vines and Fruit Trees. Has outlived many preparations intended to supersede it. Sold Retail by Seedsmen, in boxes, 1s., 3s., and 10s. 6d. Wholesale by PRICES PATENT CANDLE COMPANY (Limited), Battersea, London, S.W. The Cheapest and Best Insecticide. DUTY-FREE TOBACCO. By HER MAJESTY'S ROYAL LETTERS PATENT, AND BY PERMISSION OF THE HON. BOARD OF CUSTOMS.

POOLEY'S TOBACCO POWDER, for the Prevention and Destruction of Blight and other Diseases in Plants. Sold by Nurserymen, Seedsmen, and Florists, in Tins at 1s., 2s. 6d., and 5s. Powder Distributors, 2s. 6d. and 3s. 6d. each. "I find it exceedingly useful for killing the Aphides on Roses and other Plants." - Geo. Evelyn, Superintendent, Royal Horticultural Gardens, South Kensington, May 7, 1868. Sole Manufacturer, T. A. POOLEY, Bonded Warehouse, Sussex Wharf, Wapping, E.

FARMING - A Scotch Farmer has an OPENING for a PUPIL on a large Farm, where the old Arable Land is being improved, and a great extent of Natural Pasture reclaimed. The System pursued is combined Sheep, Cattle, and Arable Farming. Draining, Laming, and other extensive improvements going on. Can either work or not, as Friends desire. Good Hunting, Shooting, and Fishing. One hour from Edinburgh. Terms £100 per annum. Address, in first instance, W. S., at C. H. May's, General Advertising Office, 78, Gracechurch Street, London, E.C.

LAND DRAINAGE - PLANS MADE, LOANS OBTAINED, and CONTRACTS UNDERTAKEN by THOS. C. SCOTT, Land Agent, 10, King's Arms Yard, Moorgate St., London, E.C. This is the best time to make arrangements and secure Pipes.

THE GENERAL LAND DRAINAGE and IMPROVEMENT COMPANY. Directors: The Right Hon. Viscount Compton, The Right Hon. Viscount Palmerston, John C. Lubbock, Esq., Henry W. Curtis, Esq., Edward John Hutchings, Esq., William Tate, Esq., M.P. J. BAILEY DENTON, Principal Engineer. Agricultural Improvements of any kind are executed by the Company, or the outlay thereon repaid to Landowners who prefer executing the work by their own Agents. Tenants may also, by arrangement with their Landlords, procure the execution of such improvements. The outlay, with all official expenses, may be charged on the Estate, and paid off by a rent-charge in 31 years, or at the option of the Landowners in a shorter term. No investigation of title necessary, and no legal expenses incurred. Application to be made to HORACE BROKE, the Secretary, at the Offices of the Company, 22, Whitehall Place, London, S.W.

THE LANDS IMPROVEMENT COMPANY. - (Incorporated by Special Acts of Parliament.)

John Clutton, Esq., 9, Whitehall Place, S.W. Frederick L. Dashiwood, Esq., Kirtlington Park, Ox. rd. Henry Farquhar, Esq., Messrs. Horrios, Farquhar & Co.), 10, St. James Street, S.W. Lord Gifford, M.P., 25, Eaton Square, S.W., and Galloway House, Wigtonshire, N.B. John Horatio Lloyd, Esq., 1, King's Bench Walk, Temple, E.C. Granville R. Ryder, Esq. (Managing Director), 2, Princes Terrace, Hyde Park, S.W. Granville R. H. Somerset, Esq., Q.C., 6, Park Street, Westminster, Henry W. West, Esq., Q.C., M.P., 10, King's Bench Walk, Temple, E.C. Charles Watkin Williams Wynn, Esq., M.P. (Chairman), 2, Lower Berkeley Street, Portman Square, W., and Coed-y-Maen, Welshpool. The Company advance money, unlimited in amount, for all purposes of Agricultural Improvement, including the erection of Cottages and Farm Buildings, to the Owners of settled and other Estates, and to the Clergy in respect of their (Glebe Lands). The whole outlay and expenses are liquidated by a rent-charge upon the land, redeeming principal and interest, over 25 years. No investigation of title is required. For Forms and further information apply to GRANVILLE R. RYDER, Esq., Managing Director, 2, Parliament Street, London.

THE NATIONAL DOG SHOW. - THE TENTH ANNUAL EXHIBITION will be held in CURZON HALL, BIRMINGHAM, on NOVEMBER 29 and 30, and DECEMBER 1 and 2 next. Prize Lists, &c., may be obtained from the Secretary, Mr. G. BEECH, Athenaeum Buildings, 9, Temple Row, Birmingham. A Special Prize (Cup, value £5, given by a Gentleman), will be awarded to the best Fox Terrier, over 6 and under 12 months' old on December 1, that has not been exhibited before. The ENTRIES CLOSE on NOVEMBER 1.

SMITHFIELD CLUB FAT CATTLE SHOW. - THE ANNUAL SHOW of FAT CATTLE, SHEEP, and PIGS, will be held at the AGRICULTURAL HALL, ISLINGTON, on MONDAY afternoon, December 6, at 4 P.M. Intending Exhibitors are requested to apply for Certificate Forms by the reference letters as under: CATTLE. - Form A. For an OX or STEER (in any Class). " B. For a COW or HEIFER (in any Class). " C. For a BEAST in Extra Stock. SHEEP. " D. For a PEN of three WETHERS (in any Class). " E. For a SINGLE SHEEP in Extra Stock. PIGS. " F. For a PEN of three PIGS (in any Class). " G. For a SINGLE PIG in Extra Stock. ENTRIES FOR LIVE STOCK CLOSE NOVEMBER 1. Prize Lists, Forms of Certificates, and all information may be obtained on application to Mr. DAVID PULLEN, Assistant Secretary, at the Office of the Honorary Secretary, corner of Half-Moon Street, Piccadilly, London, W. N.B. All communications respecting the Show must be addressed to the Assistant Secretary, as above, and should bear outside the words "Smithfield Club Show."

SMITHFIELD CLUB IMPLEMENT SHOW. AGRICULTURAL HALL, ISLINGTON, DECEMBER 6 to 10. THE LAST DAY for receiving APPLICATIONS for SPACE for IMPLEMENTS and MACHINERY, &c., is OCTOBER 1. Printed Forms of Application, with Rules and Regulations, may be obtained of Mr. DAVID PULLEN, Assistant Secretary, corner of Half-Moon Street, Piccadilly, London, W. All communications should bear outside the words "Smithfield Club."

The Agricultural Gazette. SATURDAY, SEPTEMBER 11, 1869.

MEETINGS FOR THE ENSUING WEEK. Sept. 14-15 - Warwickshire Agricultural, at Coventry. Huntingdon Agricultural, at Huntingdon. Carmarthenshire Agricultural, at Carmarthen. Derbyshire Agricultural, at Derby.

THE readers of a lately-published pamphlet, on the tenure of land in this and other countries, will recognise much of it as having already appeared in leading articles of this Journal. One of the most valued of our contributors, from the very first year of the Agricultural Gazette till the present time, Mr. HOSKYNs has fought nobly during the past quarter of a century for freedom, large-heartedness, and liberality in all that concerns the relations of those engaged upon the land, whether to one another, or to the subject of their common interest. And in these pages, bristling and blossoming all over with the brightest, aptest illustrations, he has once more returned to his favourite study, presenting to his constituents the argument which circumstances had prevented him from laying before the House of Commons.

MOUTh-AND-FOOT complaint has, during the last four months, extended half over England, and reports from the Continent prove that it exists to an unusual extent among cattle and sheep in various parts of Prussia, Holstein, Schleswig, and also in Switzerland. Several times during the last 30 years cattle, sheep, and pigs in this country have suffered from the ravages of the disease, and the present outbreak promises to take rank with those of 1810, 1845, 1852, 1861, and 1862 - periods which are well remembered, among owners of dairy stock particularly. It is not intended to enter into a scientific disquisition upon the pathology of the disease, nor is it required that we should attempt a minute description of its symptoms, which are sufficiently familiar to most farmers of experience to prevent the possibility of any mistake being made respecting the nature of the illness. The management of the sick animals is to the stock-owner more important than a correct knowledge of the specialities of the malady; and it is this division of the subject which seems to be in the least satisfactory state. Very extraordinary proceedings are sanctioned by custom under the head of remedies, and not one of the alleged specifics which have recently

been made public for the cure of the malady will bear the test of experiment.

Before it can be consistently asserted that any given remedy is a specific for a disease, it must be ascertained what is the ordinary course and termination of the disease when left without remedies, and we cannot help thinking that if farmers had trusted to their own observation in this emergency, rather than blindly adopt the recommendations of ignorant quacks, their animals, if not themselves, would be the better. How often have cattle attacked with foot-and-mouth disease been observed to recover rapidly, without any treatment beyond good nursing? The affection appears among a herd of cows; the animals are at first much dispirited, cease to ruminate, lose their appetites, the supply of milk is diminished, and condition is rapidly lost. In a few days, if they have been well tended, supplied with soft food, and properly sheltered, some improvement is perceptible; in a week the signs of recovery are more decided, and from this time the sick animals gradually regain their wonted health. During the whole time the average loss of milk has perhaps amounted to a third or a little over, sometimes, in the middle period of the disease, very little milk is given; but from first to last, among a number of cows, the estimate which we have given will be found correct. What should be done with the milk which is secreted during the progress of the disease, is a grave question, into which we do not now purpose to enter, beyond stating that from the investigations which have been recently made, it cannot be doubted that its consumption is highly deleterious.

Observation of the natural progress of the disease in animals which are well tended, proves that spontaneous recovery is almost invariable; the affection passes through its stages of incubation, fever, and vesication; and soon after the formation of vesicles convalescence begins.

That a very different result attends the neglect of the early signs of the disease, or the ill-treatment of the animal during its course, no practical man needs to be told; but we are describing the progress and results of the malady under favourable management, irrespective of medicines. Our experience has taught us that the ordinary termination of the disease under a system which may be properly termed hygienic, is a restoration to health in a comparatively short period - which is not, so far as we have observed, rendered shorter by the adoption of medical treatment of an active kind.

Hygienic treatment includes scrupulous cleanliness, daily washing the feet, by simple affusion, with an antiseptic fluid (for example, one part of carbolic acid or chloride of zinc to 50 parts of water), removal of manure, frequent supply of dry litter, proper ventilation, and regulation of diet to suit the condition of the animal: in some instances, from the state of the mouth, nothing but gruel will be taken.

All applications to the mouth are, in the early stage of the disease, more likely to do harm than good, and the administration of medicine by means of the usual horn or bottle is often attended with injury. When the vesicles burst and do not heal afterwards, a little astringent lotion of alum or sulphate of zinc (two drachms of either to a quart of water) may be poured into the mouth and allowed to escape again, but it is only in bad cases that even this is required.

Medical treatment is only called for when the disease takes an unfavourable course, and then it may be accepted as a fact that depletive remedies, bleeding and purgatives, will make matters worse. If the animal suffers from high fever, half a pound of salts may be given in water or gruel; or half an ounce of nitre may be dissolved in half a bucket of water, and placed within the animal's reach; the dose being repeated daily. The feet should be kept clean, and if any signs of separation of the hoof appear, the parts should be dressed with carbolic acid or chloride of zinc.

Tonics and stimulants are required in some few instances when debility of an extreme kind supervenes; but in common cases the animals recover their condition upon liberal diet, without medicine. Our advice to agriculturists is to refrain from "doctoring" their animals when affected with the prevailing epizootic; nurse as carefully as possible, and if the disease does not proceed satisfactorily to its ordinary termination, call in the aid of a competent veterinarian instead of the cow-leech with his "cures." Foot-and-mouth disease, like smallpox, has a

definite course to run, and any attempt to arrest it may be attended with serious consequences; at any rate, experience proves that no advantage is ever gained by the effort.

THE thick and thin seeding question appears to have lost but little, if any, of its interest. Mr. MECHI is literally overflowing with facts to prove his side of the case, while a communication from "B. N. F.," which appeared last week, informs us of a comparative trial between thick and thin sowing carried out by him during the present season. The result, so far as our correspondent and his bailiff can "judge," is not decisive one way or the other, and he cannot come to a conclusion as to which is best. In one case the thin sown (1 bushel to the acre) is as good, and in a second case not quite so good, as where 2 bushels have been used. Such is the so-called result, and we would add that unless this subject is approached in a more scientific spirit, little light can be thrown upon it. Referring once more to an urgent advocate of thin sowing—who is going to believe that because Mr. MECHI finds thin sowing to succeed on his piece of land that therefore we are losing "1 to 3 quarters per acre" all over England by acting contrary to his advice? The letter from Mr. SMITH of Woolston in the Times shows clearly that the best quantity of seed to be sown depends upon a variety of circumstances, and also that Mr. MECHI's explanation of the root-fallen condition of much Wheat this season is unsatisfactory. We happen at present to be interested in experiments, definite, clear, and to the point, upon the subject of thick and thin seeding—not on one farm, but on several in one locality. A few days since two reports reached us, diametrically opposed, regarding the prospects of the thinly planted portions. One gentleman said, "I am afraid the thin sown is going to be by far the worst—it is very blighty;" the other, on the same day, said, "I think that the thin seeding is going to be a good experiment; the corn is cut, and there is more straw, with every prospect of its yielding better than the neighbouring thicker sown corn." What are we to conclude from this and similar contradictions? First, that it is most absurd to lay down a general rule without a sufficient groundwork of facts; second, that as it is evident that thin seeding is beneficial in some cases, and that some soils, on the other hand, require a greater amount of seed, it is extremely unwise to begin a controversy as to whether thick or thin sowing in general is right or wrong. It is something like arguing for or against a certain course of action, which course must be governed by circumstances. Are we to suppose for a moment that Mr. WILSON, of Edington Mains, adopts idly an opposite view to that propounded by the "thin seeders;" or rather that his recommendation of "not less than 2 bushels per acre" is based upon practical experience? We believe Mr. WILSON, and Mr. MECHI also, each in his own sphere of observation, but we blame any agricultural teacher who endeavours to dogmatise and to force his opinion on those who reside in a different part of the country, without making allowance for alterations in climate, soil, and variety of Wheat cultivated. But when we see men, who are in earnest about agricultural progress, writing almost bitterly upon two sides of a subject which argument can never settle, but which readily yields to the test of trial, we can only come to one conclusion, namely, that there is a great difference in the amount of seed which ought to be sown under varying circumstances. If a farmer has not undertaken to find out the right quantity for his own farm, he ought to lose no time in doing so. We would, however, suggest that in attempting to solve this question, he should approach it with the care it deserves. For instance, let him measure off a series of 1-acre plots, or equal areas of less dimension, and apportion to each a certain amount of seed,—to the first 5 pecks, the second 7, and so on down to 3 or 4 pecks to the acre. It would be advisable to repeat each plot at least twice, and at harvest the measured areas should be carefully reaped and threshed. By such careful experiment the best quantity of seed per acre would, after two or three years' repetition of the experiment, be obtained, and the farmer would know for himself the truth in regard to the vexed question of thick versus thin seeding. How different is this to the course usually adopted, of merely judging by the eye. No method could be more open to objec-

tion, because thin sown corn may appear scant on the ground, and yet yield well. No test but that of measure and weight can be accepted in deciding as to the merits of the two systems.

— At Mark Lane the Wheat trade has been influenced by the short yield and light quality of the crop, and a rise of 2s. on Monday has been sustained throughout the week. The Barley trade has scarcely begun, and other grain and pulse were unaltered in value.—A large supply of prime beasts and sheep has caused prices in London to be lower, except for very choice qualities.—The agricultural seed trade is almost at a standstill.

— Last Friday's Gazette publishes an Order in Council declaring that Article 5 of the Contagious Diseases (Animals) Order of August, 1869, shall not apply to any milch cow brought from a port of any of the countries comprised in the schedule to that Order, provided the Commissioners of her Majesty's Customs are, on each occasion of the same being so brought, satisfied that the same has been taken from Great Britain to that port, and has not been landed at that port, or at any other port of any of those countries, and in relation to the landing, on any occasion, of any such milch cow in Great Britain elsewhere than at a port of a port defined as a landing-place for slaughter, the condition secondly stated in Article 6 of the said Order, to the effect that the vessel has not, since taking on board the cattle imported, entered any port of any of the countries aforesaid, shall not operate, provided the Commissioners of her Majesty's Customs are, on each occasion, satisfied as aforesaid, but, subject to the foregoing exception, all the provisions of Articles 6 and 7 of the said Order shall, on each occasion, apply to every such cow and the landing thereof and the vessel bringing the same.

— The second part of the year's volume of the English Agricultural Society's Journal has already appeared, and we shall call attention to its contents next week. Meanwhile we may congratulate Mr. JENKINS, the Secretary and Editor, on the promptitude with which he has managed to place reports of the Society's meeting at Manchester before its members, and on the energy and industry which the editorship of the just-issued part evidently displays.

— A correspondent calls attention to the evil of abortion in dairy stock, which inflicts a frightful loss on localities, and proprietors, and herds, often apparently without explanation. It remains an enigma in many of its occurrences, notwithstanding the great premium which awaits the solution of the problem. Mr. BERKELEY, whose contribution upon this subject appeared last week accidentally in a less prominent part of the Agricultural Gazette than it deserved, has pointed out how in the United States an official commission was appointed for its investigation; and the results of the American inquiry deserve attention in this country. We give our correspondent's letter, however, and gladly join him in the wish that readers who are breeders of Sporthorns may be induced to give him any information that would be useful to him under the following circumstances:—"I keep a herd of about 25 cows, which are all apparently, and have always been, in perfect health. In the spring of this year a favourite cow slipped her calf when about seven and a-half months gone in pregnancy; since then I have had 14 cows and heifers follow suit, and always within two or three days of that period. They do not appear to suffer in health. I have one now which slipped her calf last night, which is lying down, chewing the cud, just as if nothing had happened. I am sure that any remarks of experienced breeders will be thankfully received by many others besides your unfortunate correspondent, 'P.'" Our correspondent adds that since writing the above he has read with much interest the communication signed "M. J. B.," to which we have referred above.

— The following statements from an American paper at least show the importance of accurate observation, and the benefit of giving food in the best state for assimilation:—

"My first experiment was with old Indian Corn, in three forms, viz., shelled and fed whole, ground and made into slop with cold water, and ground and thoroughly cooked—the pigs, five in number, were from the same litter, and were the produce of a good common sow crossed with a Berkshire boar. In each case the food was given them as fast as they could eat, and all possible care taken to avoid any waste or irregularity of feeding. In every case of a change of food three days were allowed before the weighing for the experiment, in order that the effect of a sudden and entire change of diet might not affect the result. I found that 5 bushels, at 60 lb. = 300 lb., of whole corn, made 47½ lb. of pork. Five bushels (less miller's toll) of corn, ground and made into thick slop with cold water, made 54½ lb. of pork. The same amount of meal, well boiled and fed cold, made 84½ lb. of pork. The second experiment was exclusively with new corn, in two forms, viz., in the shelled and ground and fed before boiling, and all each case was varied with a 'redhead' or soft corn. The best of the best of corn was reserved for the pigs and the best fed, in the shelled and fed whole, on the cob, made 29½ lb. of pork, fed in the usual way, in the ground. The same amount shelled, ground by horse power, and well boiled, made 84½ lb. of pork. Of course a portion of that fed on the ear was wasted, but it was the common plan, and forms but a fair test of the comparative merits of cooked food. I have made no experiment with sound new corn, but have a favourable opportunity before the season is past, but would suppose that my experiment with old corn would furnish a good criterion to judge by. You ask for any interesting points which may have been noticed during the experiments. I have found that there is even any in allowing the food to become thoroughly cold before it is fed, that in this state a larger amount will be eaten, with more apparent good appetite, than while scalding is beneficial, though an prolonged cooking under pressure is more economical. In more than one case I fastened the lids of the barrel down until the pressure was as high as 5 lb. per square inch in the barrel and steamer, and an examination into the condition of the food convinced me that its globules were thoroughly burst, and it was all or nearly all rendered available. During a given time, the same pigs will consume

rather more corn cooked than uncooked. Having made various portions of one of the above pigs, fed almost entirely on cooked food (fed cold), and having assisted in killing all of them, I must say that the prevalent idea that the meat of a pig is not as firm as if fed upon cooked food has proven my case erroneous—though I am not prepared to say of the result would have been had the best used whole or hot." Another correspondent of the same paper, in speaking of the value of potatoes which are fed to pigs, says—"I have done a great deal of work with the use of boiled wash (brandy potatoes) with meadow hay, 3 bushels of meal and 7 of potatoes will make 100 lb. of pork. I do not wish to be understood that the best of 1 bushel of corn, 1 extra 22s. lb., but merely to state that under similar circumstances the two combined produced the above result."

Mr. LAWES found farinaceous foods to be more productive as pork producers; also that pigs of about nine months old, consuming from 29 to 30 lb. of meal per head per week, increase in weight at the rate of 21 lb. for every 100 lb. of food consumed. In the above American experiments and estimates, the corn at 60 lb. the bushel, 100 lb. of whole corn produced only 16 lb. of increase; 100 lb. of corn, ground, produced 18 lb. while the same amount ground, boiled, and fed cold made 28 lb. of pork.

— At the annual dinner of the Badminton Farmers' Club on Wednesday, the Duke of Beaufort, who had been announced to preside, was called away on important business, and her Grace the Duchess undertook to supply his place, and when she entered the tent in which the dinner took place she was received with loud and ringing cheers. At the conclusion of the report the Duchess rose to propose the first toast, and she was loudly cheered. She said:—"Ladies and gentlemen, you must not expect from me speeches such as you have been accustomed to hear from this chair, or ably filled as it has been in former years; but I think any one can feel a pride and pleasure in giving the QUEEN'S health, and I give it now—'The QUEEN, God bless her.'" After the other usual toasts the Duchess rose and said "I have one more toast to propose, and then I think the arduous duties of chairman—or shall I say charwoman?—will cease. It is 'Success to the Badminton Farmers' Club.' May it go on and prosper, and be for many years to come a happy gathering of friends and neighbours, a day to be remembered with pleasure and to be looked back upon with satisfaction." Mr. KILMINSTER gave the health of the Duchess, which was drunk with the greatest enthusiasm. Her Grace, in responding, said:—"Again and again I thank you for the kind manner in which you have received the toast which has been proposed by Mr. KILMINSTER. I wish I had the power to say all I feel; but accept my most imperfectly expressed gratitude, and believe that I have never greater pleasure than in being at Badminton, and finding myself surrounded by so many kind and friendly faces." For "the MARQUIS OF WORCESTER and the younger branches of the BEAUFORT family" Lady BLANCHE SOMERSET responded.

— Mr. THOMAS DUCKHAM of Bayham Court, Ross, well known as the Editor of the Hereford Herald-Book, and as the energetic spokesman wherever the interests of the breed, of the county, or of agriculture generally are at all at stake, has announced his intention to publish a "Quarterly Record of Hereford Transactions." Mr. DUCKHAM will also hereafter conduct periodical live stock sales by auction. Mr. DUCKHAM has long been a contributor to our columns, and we cannot doubt that one so well known in the agricultural world will soon have his lands full of the engagements he is about to undertake.

— A correspondent, "T. H.," has described in the Times the miseries of 100 sheep and 100 pigs during a fine-weather passage from Rotterdam to London; and Mr. ODAMS has borne further witness to the fact that their miseries did not cease on disembarking, for that the whole were forwarded, without quarantine, immediately to market. Now, no one will defend the brutality of individuals, or say a word to screen the cruel sailor to whom "T. H." refers from any punishment that he deserves, but it is plain that the miseries of 12 hours at sea are to a great extent unavoidable, and that the criticism in this case has been in great part undeserved. The ladies' cabin is, on shorter passages than that from Rotterdam to London, often in a more frightful plight than the fold on deck—and quadrupeds inevitably suffer just as bipeds do. The authorised treatment has to be arranged for the average circumstances of a voyage, and it is in the interests of the stock themselves that they are somewhat closely packed within their pens. The only thing, excepting individual cruelty, to which "T. H.'s" criticism does with justice indignantly refer, is the cruel roughness of the work of landing the cargo, which certainly might, with a little more patience and consideration, be accomplished much more easily and quickly.

OUR LIVE STOCK.

THE sale of Sir N. W. Throckmorton's Sussex sheep and Berkshire pigs, at Buckland, near Farmington, on Tuesday week, was not remarkably successful. Mr. Colsey, on behalf of Lord Sudeley, purchased some good pens of ewes at from 50s. to 58s. per head, and one pen for 85s. Mr. Neville Grenville also bought a good pen of ewes for 84s. each. The rams met with a slow market, many remaining unsold. Mr. Emery hired a very excellent 1-tooth sheep for 23gs., and Colonel Kingscote gave 30gs. for the loan of the 1st prize sheep at Manchester, and 2d at the Bath and West of England Show at Southampton. The same sum was given by Mr. Colsey for the hire of a shearing ram. Messrs. Waller, Hanbury, and Chapman were also purchasers. The above high prices were exceptional, many rams fetching from 5 to 9 and 10gs., while others remained unsold. The Buckland pigs, although they have a

wide reputation, scarcely met with such a demand as might have been expected. Sows made from 3½ to 6 gs., and exceptionally good ones realised as much as 9 and 10 gs. boars were bought at similar prices.

Great interest will be excited in the Cotswold district on Wednesday next, by the sale of Mr. Wm. Hewer's famous stock of Cotswold sheep at North Leach. A flock bred for upwards of 12 years under the eye of such a master as Mr. Hewer can hardly fail to have arrived at great perfection. We are informed by the sale card that one ram (nameless, which is, we think, to be regretted) was sold in 1854 for 230 gs., an unprecedented price. The stock comprises 500 ewes and theives, all of which will be put up by Mr. Villar in lots of five; there are 50 ram lambs, and a few lots of shearing and older sheep. North Leach is 10 miles from Cirencester, 6 from Bourton-on-the-Water, and 12 from Cheltenham. The sale commences at 2 o'clock.

Mr. Barclay's sale takes place at Keavil, on Tuesday, the 21st inst. The herd is small, comprising only 19 cows and heifers, and eight bulls, most of which are young calves. These represent many excellent strains of blood, mostly of Booth origin, among which may be mentioned the Seraphina, Farewell, and the Lenton Lancaster tribes. An authority, in describing some of the best animals of this herd, says:—"Fan-fan (lot 5) is the daughter of *Ruth*, sold in 1861 at Mr. Sunday's sale for 275 gs. *Anne of Lancaster* (lot 6) is the daughter of the 15 gs. *Lancaster 25th*; and lot 2, *Seraphina 13th* a noble cow per se, and the mother of the prize bull HEIR OF ENGLISHMAN, was a 210 gs. purchase and a lucky one. The bull in most frequent use among Mr. Barclay's Shorthorns is BARON BOOTH (21,212), bred by Mr. Bruere, a member of that gentleman's Vesper tribe, and the son of Mr. Booth's PRINCE GEORGE (13,510), and *Vesper*, by KING ARTHUR. Mr. Barclay gave 200 gs. for him, he is a fine stock-getter, as his heifers will show; he has won several prizes, and is the sire of many prize animals. Among others of note *Star of Brathwaite*, now Mr. Cochran's property, was got by him, and no fewer than 12 of the Keavil herd are his offspring. Six of the cows and heifers are in calf to him; three are breeding to HEIR OF ENGLISHMAN, renowned in many showyards. *Seraphina's* heifers are all good ones. *Booth's Seraphina*, the winner of the 1st prize in a large class of yearling heifers at the Highland Society's meeting at Edinburgh, specially so."

RECENT RAM SALES AND LETTINGS.

Lincolnshires.—The aged and last year's male produce of the old Panton flock were disposed of on Tuesday last, when Messrs. Dudding had the pleasure of entertaining a large company, which included the principal ram breeders in Lincolnshire, and also of receiving prices which up to this time are by far the highest of the year. The first 10 shearlings and four aged sheep were let at the total sum of 267 10s., or an average of 137 2s. There were 80 sheep altogether, and the remaining 68 sold for 1149 10s., or an average of 171 8s. 4d. The 80 sheep thus made 1417 10s., or an average on the whole of 171 14s. Mr. Marshall took two at 30l. and 40l. respectively; Mr. Edward Howard, of Nocton, also took two at 18l. and 25l.; Mr. Gilliat also took two at 22l. and 10l.; Mr. Abraham took one at 36l. Mr. Needham one at 31l., Mr. Fieldsend one at 27l. Mr. Boynton one at 26l., Mr. Hles one at 25l., Mr. Wright one at 21l., Mr. Frankish one at 25l., Mr. Child two at 20l. and 25l., Mr. Cartwright two at 20l. 10s., Mr. Trotter one at 24l., Mr. Bramley four at 18l. 10s., 14l., 21l. and 24l. respectively; Mr. Collingwood one at 21l., and Mr. Bieber one at 26l. As the Messrs. Dudding have withstood the temptation of "going in for wool" during the late high price of that article, we are very glad to see that the fine form of their sheep, which they have made the first consideration, is now appreciated for the purpose of bringing together the flocks of time-serving breeders.

Shropshires.—Mr. W. Baker, of Moor Barns, near Atherstone, held his first annual auction sale of rams and ewes last week. The highest price obtained was 20 gs., for a 3-shear, which Mr. Baker reserved the right to exhibit at several shows in September. The same reservation was made in the case of seven other rams, whereby the average was reduced to 11l. 19s. for 83; four being let at from 9 gs. to 17 gs. each; 45 ewes sold at 68s. 10d. each.—The late Mrs. Baker's Shropshire flock was sold at Grendon, near Atherstone, on Tuesday of last week, when the whole of the rams and the entire flock of ewes were unreservedly sold. No. 2, a 2-shear, was sold to Mr. C. Eaton, of Stamford, at 20 gs.; No. 3 to Mr. Dester, at 16gs.; No. 4 to Mr. J. Bennett, of Leigby, at 18 gs. The shearlings were then brought forward, and No. 5 made 56 gs. to Mr. Keeling, No. 6, 18 gs. to Mr. Hopkins, No. 7, 27 gs. to Mr. Kittow, Cornwall, No. 16, 18 gs. to Lord Combermere; and the remainder 15 gs., 14 gs., 12 gs., down to 6 gs., the average being 14l. 5s. 9d. The prices made for aged ewes were 120s. per head for No. 1 pen to Mr. German; 110s. for No. 3 to Mr. Winterton; 100s. for No. 4 to Mr. Walker, who also took No. 5 at 90s., No. 2 at 77s. 6d., No. 8 at 110s. Mr. Kittow bought two pens at 70s., Mr. Dester and Mr. Lumber one each at 70s. The yearling ewes were of good size, colour, and quality, and sold at from 70s. to 120s. Mr. May gave the highest price for No. 1 pen, and took two other lots at 82s. 6d. and 72s. 6d. Two pens were bought for Mrs. Beach at 110s. and 70s. respectively; average 3l. 16s. 8d. Mr. Masfen's 18th annual sale took place at Pendeford on Tuesday last; No. 1 was sold at 15 gs., Mr. Allsopp, Hindlipp Hall, Worcester, bought one at 46 gs.; Mr. Rogers, of The Holme, one at 40 gs.; Mr. Turner, one at 28 gs.; Mr. Minton, one at 35 gs. Others were sold at 20 gs.,

19 gs., 15 gs., and so on down to 8½ gs. A 3-shear ram was bought by Mr. J. Pritchard, at 15 gs.; a 2-shear, by Mr. J. Evans, at 39 gs., another, by Mr. Hands, at 28 gs. The average price obtained for the stock of rams was 16l. The prices realised for the ewes ranged from 4l. 5s. to 2l. 10s. each.

Hampshire Downs.—On Thursday, Messrs. Ewer & Winstanley, of Salisbury, submitted to public competition the flock of Hampshire Down sheep belonging to Mr. R. Dear, of Durnford, who is about to quit his farm. The sheep numbered altogether 700. The 2-teeth lambs realised from 40s. down to 30s. per head, the 2-teeth ewes from 47s. to 40s., the 4-teeth ewes from 50s. to 41s., the full-mouth ewes from 45s. to 37s. per head, the ram-lambs from 14 gs. to 4 gs., some realising 10½ gs., 9½ gs., 7 gs., and 5 gs.; the four 2-teeth rams, 11 gs., 10½ gs., 8½ gs., and 5 gs.

STORY OF A REAPING MACHINE:

OR THE AUTOBIOGRAPHY OF AN "OLD SCREW."

I WAS born 11 years ago, in Essex. I can just remember being painted "extra smart" and packed off to an agricultural show. I think they called it a Royal meeting, though I saw no Royalty there, but I can well recollect my present master saying that "he had bought me, and he hoped I was worth the very long price he had paid for me."

I was sent down to Norfolk, and set to work at once to cut Wheat. There was a great assemblage of country folk to see me make my start in life. All sorts of unkind things were said of me, but I did not so well, and lay the swathe so evenly, that even the labourers admitted that I might manage a small upstanding crop of Wheat. I did not like to hear these poor fellows say I was come to take their harvest bread out of their mouths. One thin, sallow faced man alone stood up for me, and his praise was not over flattering, for he declared "it would be wus for the hosses than for we." So they tried to make the horses afraid of me, and twisted me round so sharply that they actually wrenched off my land-wheel. And, oh! how they did swear when they had to leave me through the gateways!

I cut a good bit of Wheat that year, and next harvest I had my first trial with Barley. It was soft woolly straw, and I got sadly muddled and bunged up; but my sallow-faced friend had taken quite a fancy to me, and when my master put some thing wrong into his hand (he told the boy it was 6l., as he spit upon it for luck, and put it in his pocket, but I somehow found it looked like gold)—well, no matter what it was—he seemed to like me all the better, for he exclaimed in the vulgar tongue of East Anglia—"Durn your old mawther; I'll make yer go now." I ground and struggled on, and all my driving-bands flew off, till at last they sent for another horse, and then I went off right merrily, and have had three horses yoked to me ever since.

The following season I tried my hand, or rather fingers, upon Beans and Oats, and I thought I cut them fairly well. I did not like the narrow ridges and deep furrows I had to cross. Beyond being terribly shaken no harm happened to me, but the driver complained of the lower part of his back being very sore, and I heard my master say that I was too lumbering a thing to be jostled over rough ground like that.

We had finished harvest a day or two, and I was left to sun myself in the field which I had last cut, when I was startled by a loud snorting noise, and two great steam-engines came rushing past me, pulling a more ungainly-looking implement than I am between them. A saucy lad who drove the first engine lallooed out to me, "We'll cure the furrows for thee, old girl!" and certainly since then I have had nice level ground to work upon. I looked at the new-fangled machine, and wondered if ever I should go by steam. If I were stronger and bigger I should, I think, like it. It must be jollier to run to and fro than to be lugged slowly round and round by horses.

I have worked upon four different farms since I came into Norfolk, but I stick to my old master, and have now completed my eleventh harvest. I have had 14 days of sharp work, and have cut nearly 200 acres of Wheat, Barley, Beans, and Oats. The Wheat was, some of it, 6 feet high, and the winter Beans over my master's head, and although I say it who shouldn't say it, it is all fairly well done. It is no use for my master to blow up for leaving too high a "maue" in a field or two of Barley. If he will set me to work in the dew, and grow so much Clover and crab-grass among his corn, I can't cut it clean, and don't believe any other machine can. I don't wish to boast what I have done in my time, but I have cut upwards of 2000 acres of corn, and I think that is a better testimonial than a whole string of medals and prizes. But I can't do everything, and I don't mean to try.

We have a new hand upon the farm this year. I was charmed to hear him say last night, "that he would never harvest again upon a farm where there was no reaper." He thought "close upon 7l. for 18 sweating days' work was fair pay, and that he shouldn't wonder if he was drunk all next week." "You should marry, and join a club, my boy," said our careful driver; but he simply answered, "Clubs and women be—" I couldn't catch what they were to be done with, but, by his manner, he did not seem to think favourably of either of them.

There are ever so many new reapers close by our farm this year. There is the Excelsior, the Eclipse, and I don't know how many others, and all seem to give good satisfaction. But it was very gratifying to hear my master say—and of course he's seen them all at work, for he is always looking at new things—"that, taking all sorts of crops and all kinds of corn, none of them can do better than my old screw."

I don't know how old anyone should be who attempts to write an autobiography, because I have now penned mine, no one must suppose that I am used up,

or that I at all feel the ill effects of age. It is true I am old, but why should I not live to double my age? My shoe and my fingers are sadly worn, but I can, happily, be renewed, and much cheaper than Madame Baobel would have done it, for I have had ever so many new joints, besides two fresh sets of teeth—knives I think you call them. I gratefully acknowledge the care that has been taken of me, and am proud to say that my body and bolts are as sound as on the day they left Brentwood. After every harvest I am nicely cleaned, oiled, and packed away. Twice I have been painted, and I hear that I am going to have another coat this year. I shall then be stowed aloft in the cart-shed, where I may sleep for 11 months. I don't mind the rats and sparrows, but I do wish the hens would roost somewhere else. I should then look ever so much smarter and younger next August!

I hope, in September, 1860, to finish my story.

THIN SEEDING.

[The following amusing discussion of this subject has appeared in the Times.]

I. WOOLSTON UPON TIPTREE.

MR. MECCHI has recently been talking to us in the weekly papers, as well as in your paper, about thin seeding. Let us look the question fairly in the face.

Mr. Mecchi says that he drills 4 pecks of Wheat per acre, but in some of his fields this season it is far too crowded a crop, consequently some of it is stem-rotten or root-fallen, whereas, where he drilled only 1 peck and 2 pecks per acre, the crops are much better, entirely free from stem-rot or root-falling.

This is good data as far as it goes, but let us look a little further.

I have not seen Mr. Mecchi's farm, but from what he tells us and what I have heard through persons who have seen it, I have every reason to believe that it is a lot of poor land very highly manured; but as he is frequently telling us about picking Docks in the spring and burning Twitch in the autumn, I cannot believe that it is over clean. Hereafter I will show what this has to do upon the seeding question.

In this neighbourhood there is a large quantity of poor land running through this parish on to Bletchley and away on through the county into Oxfordshire. It is generally occupied by tenant-farmers, who pay rent and all other taxes, as well as the labour on their several farms. Therefore they seed and manage their land in a way to enable them to do all this as well as keep themselves. The quantity of seed Wheat generally used on this poor land is about 8 pecks per acre. Under horse culture that was the quantity I used. Our best farmers use that quantity now, and some of our worst farmers use a little more. Before and in harvest, I drove through a considerable part of this poor land without finding a single bit of Wheat too thick. Those on our best farmed land were good full crops, free from root-falling, and ripened well, while on the middlingly-farmed land they were thin on the ground, with a good deal of root-falling among them. This shows plainly that there are more causes than one for root-falling.

After working my farm by steam-power a few years, I found that a less quantity of seed Wheat than 8 pecks to the acre was enough, and for some years past I have seeded it with 4 pecks an acre (that was the quantity used for the crop just harvested, which was a most excellent one). This shows that varying circumstances necessitate a varying quantity of seed on the same character of soil.

Will it answer the purpose of the best farmers in this neighbourhood to adopt Mr. Mecchi's plan of high feeding to enable them to reduce their quantity of seed Wheat to four, or less, pecks per acre?

Mr. Mecchi's balance-sheet, published in the agricultural papers last January, showed that he made a profit of 9½ per cent upon a tenant's capital of 16l. per acre, from which he had to pay rent, interest of money, and pay for himself. After looking this balance-sheet carefully over, I found that he drew 150l. from his tenant's capital, with which he helped to make this 9½ per cent. up, and I also found that he entered his Wheat as sold at 63s. per quarter, whereas the imperial averages from August to December (the period during which he sold his Wheat) showed that the general farmer made only 53s. per quarter. This looked strange to me, so I set to and deducted 10s. a quarter from the price of his Wheat (which I was fully justified in doing, for it was shown that a large percentage of it was Rivetts, the very worst quality of Wheat that is grown, and in a subsequent letter he showed that he did not make so much as 63s. of any of his Wheat), and added it to the 150l. drawn from the tenant's capital, and deducted the lot from his 9½ per cent. This fixed him in a mess, for he had not a penny for his own labour or for interest of his money, and not enough to pay his rent at 34s. per acre. I explained all this (signing myself "A Farmer") in the Agricultural Gazette at the time, without his giving me a word in reply. Thus it is quite clear that it will not do for our best farmers to adopt his plan of high feeding to enable them to reduce their quantity of seed Wheat, for they must pay their rent, &c. Will it answer the farmer's purpose to adopt my plan of reducing the quantity of seed Wheat needed?

In two letters recently published I show that by the aid of steam-power I am now keeping my land clean and making an average seed-bed for 7s. an acre a-year, working the land for Beans 10 inches deep; whereas the cost to our best horse farmers is quite 20s. an acre a-year to work the same kind of land 5 to 6 inches deep; and I also showed that my produce on my heavy land this year would average 40 bushels per acre against a trifle over 23 bushels an acre on our best farmed land on like soil. The only assistance that my land has had beyond the working it deeply by steam-power, is the straw grown upon it converted into manure (without the aid of either cake or corn), assisted by a little super-

phosphate for the last two years only; last year with 2½ cwt. per acre, and the year before with not so much. Now, let us go into the calculation, fixing the price of corn, Wheat, and Beans at 5s. per bushel:—

Horse Farming.			
Produce, 23 bushels at 5s.	£ s. d.	Seed-bed	£ s. d.
	5 15 0	Seed Wheat, 2 bush.	1 0 0
		Gain for rent, &c.	0 10 0
			4 5 0
	£5 15 0		£5 15 0
Steam-power Farming.			
Produce, 40 bushels at 5s.	£ s. d.	Superphosphate	£ s. d.
	10 0 0	Seed bed	0 16 0
		Seed Wheat, 1 bush.	0 7 0
		Gain for rent, &c.	0 5 0
			8 12 0
	£10 0 0		£10 0 0

This shows plainly that a farmer can reduce his seed Wheat better by deeply working his land than he can by deeply manuring the top 5 or 6 inches of it, for in the former case he can live and get well paid for his labour, while in the latter case 4l. 5s. an acre cannot do much for him after paying rent and labour, &c. *William Smith, Woolston, Bletchley Station, Bucks, August 30.*

2. TIPTREE UPON WOOLSTON.

I am a great admirer of Mr. William Smith, of Woolston, for his untiring exertions in behalf of steam culture and deeper cultivation. I am a firm believer in both, and 25 years ago I broke up most of my land with nine horses, three in the first plough, the Deanston subsoil plough following in the same track, drawn by six strong horses. This operation followed thorough draining; the two operations forming a durable base for subsequent profits. No doubt steam ploughing, had it then existed, would have done the work much cheaper.

I am sorry that Mr. Smith has descended to misrepresentation of facts in the rather odd jumble of matters that constitute his letter. When my statements cease to be truthful I shall bid adieu to any influence I have in agriculture.

My published balance sheets are contained in the small volume I send herewith, page 45, and they show the following results:—1865, net profit on tenant's capital, 18 per cent.; 1866, ditto, 10½ per cent.; 1867, ditto, 18 per cent.; 1868, ditto, 9½ per cent., average of four years, 12½ per cent., or 33s. 4d. per acre net profit, after paying every charge and providing 40s. an acre for improved rental. These balance-sheets are not "cooked," but are exact transcripts of the moneys paid and received, and the annual valuation on stock-taking. I treat myself as an outgoing tenant on the 31st of December, and as an incoming tenant on the 1st of January.

As Mr. Smith has never seen my farm (it has always been open to public inspection), his charge of weediness must be at second-hand. Against this imputation I must place the evidence of your two able special commissioners (Mr. James Caird and Mr. J. C. M'Donald), who said, in your columns, in 1850:—

"Having walked over every field on Mr. Mechi's farm, we have no hesitation in saying that for clean cultivation and healthy appearance of Wheat and other crops, it is equal to any, and superior to most farms we have met with in this county (Essex)."

This opinion has been endorsed during the subsequent 19 years by thousands who have recorded their approbation in the bailiff's visitor's book.

Personally, it is of very little importance whether I had failed or succeeded; but on public grounds it is of the highest importance that we should know whether drainage, deep cultivation, steam-power, and other agricultural changes are or are not profitable investments.

I am glad to find that Mr. Smith has at last followed my steps in thin sowing, although he admits it with a bad grace.

As to Mr. Smith's recommendation to avoid high feeding and to depend upon deep cultivation and artificial manures, I would say to young farmers—"Don't be misled by Mr. Smith; cultivate deeply, but manure heavily with that cheapest and best of all manures made by animals fattening on cake and other rich food, such manure being made under cover." Science and practice have proved that dependence on guano and some other artificial manures will ultimately greatly exhaust many soils, while rich cattle manure never fails to maintain fertility.

After the imputation so unjustly cast upon me by Mr. Smith, I must decline any further correspondence with him.

For the information of your correspondent, "A Durham Farmer," I annex the details of my experience in reaping with the machine (back delivery) this harvest. It has cut 65 acres of strong Wheat, besides Barley and Oats, the breakage not exceeding a few shillings. The 12 acres at 6s. 9d. amount to 4l. 1s. Twelve acres of Wheat, cut, tied, stooked, and stubble raked:—

Horse labour, per acre	1s. 0d.
Beer for driver, 6 pints	0 9
Binding, stooking, and stubble raking	5 0
		6 9

Twelve acres a day's work for two pairs of horses and one man, at 6s. 9d., 4l. 1s.

The men find the driver out of the 5s. at about 6d. per acre. Our men earn 5s. per day during the harvest month, besides beer, 9d. per day.

Perhaps your correspondent will give us details of his enormous outlay of 10l. 4s., or 17s. per acre.

My Wheat crops will probably average 44 bushels per acre. My first threshing has yielded within a fraction of 48 bushels per acre of white Wheat, sold at 51s. per qr. *J. J. Mechi, Tiptree Hall, Kelvedon, Essex, Sept. 3.*

THE AGRICULTURAL LABOURER.

The condition of the labourer was the subject of several papers and much discussion before the last meeting of the British Association. The following, in the meantime, is a report of Professor Leone Levi's paper on the subject.

PROFESSOR LEONE LEVI commenced by reading the report of the committee on the "Economic Condition of the Agricultural Labourer in England." The committee reported that they had been obliged to confine their inquiry to such matters concerning the condition of the agricultural labourer as were to be found in existing documents, and their first report embraced only the counties of Norfolk, Suffolk, Essex, Surrey, Gloucester, Northumberland, Durham, Lincoln, Nottingham, Leicester, Cambridge, York, Northampton, Bedford, and Buckinghamshire. In these counties wages were represented to range from 18s. a week in Northumberland and Durham, 17s. in Lincoln and Nottingham, and 11s. in Gloucester, to 11s. or even 10s. in parts of Cambridgeshire. Where the wages were higher the diet was better. Diet and conditions were best in Northumberland and Durham. Except in those two counties the employment of women and children in agriculture was represented as morally bad, and was dying out, in consequence of the growing aversion of the women to the employment. The committee were desirous that the General Committee of the Association should be moved to memorialise Government to make a thorough inquiry into the condition of the agricultural labourer.

It is the rule of the Association that the reports of committees should be received without debate; and therefore, at the request of the President (Sir Stafford Northcote), Professor Levi proceeded to read portions of his own report of facts and observations on Agricultural Economics and Wages. The acreage of the United Kingdom under cultivation was 54 per cent. of the whole area, while 14½ per cent. of the entire population were employed in agriculture. There was an enormous increase in the use of machinery in 20 years. The average wages were about 12s. per week. The number of men engaged in agriculture was far in excess of the requirements. The adult labour needed was about 50 persons per 1000 acres of arable land, and 20 per 1000 acres of pasture, and the actual number according to the last census was nearly double that. Wages varied as much as 6s. per week in different localities. With regard to relative productiveness of different soils, Professor Levi spoke as follows:—

"No data is furnished in the agricultural statistics of the degrees of productiveness of the soil of different counties; but if the presence of Wheat, apart from climate and elevation, be a safe indication of a good soil, we find that the south-western counties have double the quantity of acreage sown in Wheat than the northern counties have. Who, indeed, that has seen both Devonshire and Northumberland can fail to perceive the great advantage of the former over the latter? Yet who at all acquainted with northern and southern farming is not convinced that the northern farmer has made more of his land than the southern? Compare, for instance, Lincoln with Devon. The soil of Devon is new and red sandstone, always productive. Lincoln's soil is nearly all drift, generally considered light and poor, yet what is their relative productiveness? The following is given by the *Farmer* as the result of the harvest of 1867:—

	Estimated Number of Bushels Yielded per Acre				
	Wheat.	Barley.	Oats.	Beans.	Peas.
Devon, Axminster	20	32	38	28	22
Lincoln, Alford	32	40	64	40	40

And what is the reason? In Lincoln everything has been done to remedy the defects of the soil. In Devon Nature has been left unaided. Should we calculate the return of the soil from Grass in both counties the result, perhaps, would be different; but my object is to show what has been achieved in Lincoln, no doubt by the larger investment of capital in land." On the subject of the taxes on land, the Professor expressed a doubt as to whether any undue share of burden is put upon real property; but if such an inequality should be found to exist, it was all important that it should be removed. Professor Levi made a special report upon Devonshire as follows:—"In Devon my first visit was to Halberton, a parish of 7600 acres, half arable and half pasture land. The population of 1861 was about 1600 persons. The cottages have generally thatched roofs, and they are constructed with cob-walls, which is a concrete of mud, straw, and pebble. In many cases, where they are in good repair, they may be warm and comfortable, especially if kept dry at top and bottom. Indeed, a local aphorism says, 'Good cob, a good hat, shoes, and heart, last for ever.' But many cottages were in great want of repair, and with their open roofs they seemed somewhat cheerless. Those I visited generally contained a sitting-room and a small back room on the ground floor, and two bedrooms above. None of them had one bedroom only. In one cottage, the family, consisting of a man and wife and his wife's mother, had two lodgers, who paid 8d. per week each. In another there were a man and his wife and four children. In another a man and his wife, two grown-up sons, and a grandfather. On an average the inmates numbered less than five per cottage. The rent of the cottages was 1s. 4d. to 1s. 6d., but each had a small garden attached, which supplies a good deal of vegetables, and allows facilities for the keeping of pigs. The weekly wages at Halberton were 9s. per week for common labourers, with three pints of cider per day. A carter gets 1s. more, or is allowed his cottage rent free, but he works longer time per day. Sometimes a certain quantity of grist is allowed by the farmer, at 5s. per bushel, but though that makes a better bread, it is not cheaper than what is bought. The ordinary diet appears to be tea or kettle-broth (being bread in water and milk) in the morning, bread and cheese for luncheon and dinner, and a supper consisting of

Potatoes and a piece of bacon. The general appearance of the people seemed healthy. At church on Sunday all were comfortably dressed; the children at the Sunday school seemed as tidy as those in any ordinary school in town, and they looked healthy. There is one day school with 130 or 150 children, which, from the report of the inspector of schools, appears to be in a good state of efficiency.

"From Halberton I went to South Molton. Filleigh, the parish where Castle Hill is situated, has 2000 acres, one-third arable and two-thirds pasture land, and has about 700 inhabitants. The cottages are fair, with larger gardens than at Halberton, and the rent is uniformly 1s. per week. There, too, the wages are 9s. per week; but the forester supplies fire-wood at only 10s. per annum. On Lord Portescue's estate there are on an average, only four persons per cottage. The diet of the people did not differ much from that of Halberton, except that the dinner is the chief meal instead of the supper, and fish comes more in use. There, too, I visited the school, which was well attended. There seems, however, less difficulty in obtaining the children of the labourers than those of small farmers: the latter having to pay 6d. to 7d. per child per week, instead of 1d., as the labourers are too ready to find excuses for keeping the children from school. On my way to Exeter I visited Lord Portsmouth's estate at Eggesford. There also the rent of cottages is 1s. per week, and I understand that the landowner does not allow the farmer to charge higher rent for his cottages. The wages are 9s., but a good deal is given out by piecework. I had also the pleasure of visiting Sir John Kennaway, at E-scot, near Ottery St. Mary. In the adjoining parish of Whimple I found the cottages dearer and not so good; but on the Escot estate, as at other places, I saw how much the condition of the labourers is bettered by the presence of a good landlord. The wages were 9s. and 9s. 6d. per week. An allotment of garden land is also given at a nominal rent, and the information received on the state of education was more cheering. The schoolmaster knew few in the parish who could not read and write. In calculating the income of the agricultural labourers in Devon, it is not sufficient to take the standard weekly wages. Where piecework is given a good deal more is earned, by which the income is often increased to 12s. or 15s. a-week. Extra pay is also given at harvest time and at haymaking, for which some give a sovereign, some 30s., and some other extra allowances. Including piecework and extra earnings at harvest time, the wages cannot be less than 10s. or 12s. per week. A portion of these extras doubtless goes to replace the loss of wages for the days when there is no work; but good labourers do not lose much from that source. To the wages of the men we must add the value of the labour of women and children. Not many women are to be found working in the field in Devonshire, yet they earn a little from other occupations, and thus add to the resources of the family. Isolated cases of extreme penury or comparative comfort are fallacious in such calculations. I saw a case where the husband was the only earner of 9s. per week, and with his 7s. 6d. net (rent deducted), he had to support himself and his wife and five children, or seven persons. But there are cases where the husband and wife, or the father and one or two boys, were all earners. To an agricultural labourer a family of little children is a burden, but a number of boys, up to a certain age, before they leave home, is a mine of wealth. The evil is, that often a youth, earning almost as much as a man, gives only a small weekly sum to his mother for his keep, and wastes great part of the remainder. Taking one with another, I would imagine that we should be safe in estimating the total earnings of a man and boy, or one full wage and a third, as the earnings of a family of five. If that be correct, we have probably 13s. or 14s. per week in money as the average income of a family. I will not say that the whole of this amount is practically devoted to the necessaries of life, but, unfortunately, even if it were, it is hardly sufficient to cover the cost of living."

On the whole he found the condition of the labourer in the parts of Devonshire he visited far from satisfactory, but it was by no means so despairing a character as described by some. In conclusion the Professor said the causes of low wages in agriculture were the prevalence of physical labour and excess of labourers. For the welfare and improvement of the condition of the labourer he recommended elementary education, to enable him to take the position of a skilled labourer, technical education among farmers, liberal remuneration for skill, extension of piecework, greater adoption of machinery, assistance to enable the labourer to remove freely from county to county, emigration, extension of the cultivation of the land, an increase of the commerce and manufactures of the country. He also recommended long leases to occupiers, removal of any inequalities of the burdens of taxation, extension of railway accommodation in agricultural districts, yearly hiring of labourers by means of registry offices, the general discontinuance of payment of wages in kind (especially cider, &c.), better cottage accommodation, cottage gardens or allotments, promotion of savings banks, friendly societies, &c., limiting of public-houses, facilities for the purchase of plots of land, &c. He thought it desirable that to the annual agricultural statistics should be added the number and extent of land proprietors, number and acreage of farm holdings, the wages of agricultural labour, and the produce of the soil. As to the character and habits of agricultural labourers, there were among them fewer births, deaths, and marriages, better education among adults (especially women), less drunkenness, less crime, but more pauperism, and more illegitimacy, than among the rest of the industrial population, while the proportions of children sent to school were nearly equal.

Canon GRADLESTONE said he held an official document in his hand proving beyond dispute that in 1861 the wages of

agricultural labour were lower in Devon than in any other county in England. To give cider was worse than giving nothing. The introduction of machinery tended at present to reduce the amount of harvest wages, and the excess of earnings at that season was neutralised by the seasons when the men were out of work. It was of very doubtful financial advantage to the labourer to keep a pig. Employers professed to give fuel, but it was generally roots, which the labourer had to grub out before he had it. The Rev. Canon protested that he had nothing to gain by the part he took in this movement, but he had gained the sympathy of the country, as well as that of most of the Press and the British Association.

Mr. Neville Grenville, Mr. Webster, Q.C., and Mr. J. H. Kennaway took part in the subsequent discussion, which terminated in a vote of thanks to Professor Levi, and a recommendation that his paper should be printed. Some other contributions bearing on the subject were brought before the section. The President suggested that they should be read in succession, and that in the debate on them Professor Levi's report should be included.

AGRICULTURAL STATISTICS, IRELAND, 1869.

[The following report by Mr. Donnelly to the Lord-Lieutenant, has just been published.]

THE collection of the agricultural statistics was carried out this year as heretofore by about 4000 enumerators, selected from the Royal Irish Constabulary and Metropolitan Police Force, and they have furnished returns of tillage and live stock on nearly 600,000 separate holdings. The inquiries were, as usual, efficiently conducted by the officers and men employed on this duty, which extended over a period of six weeks from its commencement on the 1st of June.

The abstracts are compiled from the summaries of the several districts as made up by the enumerators, and may differ slightly from the revised figures hereafter to be published; but I do not anticipate that any important change will be required.

The total area under all crops in 1869 is **5,575,843** Acres.
The total area under all crops in 1868 was (revised numbers) **5,547,971**

Showing an increase in extent under crops in 1869 of **27,872**

The crops which increased in extent this year are—

Crops.	1865.	1866.	1867.	1868.	1869.
Wheat	266,989	299,190	261,034	235,150	281,117
Oats	1,747,228	1,699,695	1,680,511	1,701,645	1,684,788
Barley	177,102	150,291	171,001	186,318	220,999
Bere and Rye	10,091	10,011	9,602	9,998	11,199
Beans and Peas	16,899	14,834	13,552	9,960	9,057
Potatoes	1,066,260	1,050,353	1,001,781	1,034,681	1,041,837
Turnips	334,212	317,198	335,728	320,094	321,880
Mangel and Beet Root	14,418	20,162	18,797	19,109	21,127
Cabbage	31,622	26,531	24,018	32,875	32,139
Carrots, Parsnips, and other green crops	24,130	26,736	25,516	26,622	26,564
Vetches and Rape	2,466	30,623	26,589	22,943	25,348
Flax	251,433	263,507	253,257	206,483	229,178
Meadow and Clover	1,678,493	1,601,423	1,658,335	1,602,135	1,669,800

Total increase on the foregoing crops **71,801**

The crops which diminished in extent in 1869 are—

Crops.	1865.	1866.	1867.	1868.	1869.
Wheat	266,989	299,190	261,034	235,150	281,117
Oats	1,747,228	1,699,695	1,680,511	1,701,645	1,684,788
Barley	177,102	150,291	171,001	186,318	220,999
Bere and Rye	10,091	10,011	9,602	9,998	11,199
Beans and Peas	16,899	14,834	13,552	9,960	9,057
Potatoes	1,066,260	1,050,353	1,001,781	1,034,681	1,041,837
Turnips	334,212	317,198	335,728	320,094	321,880
Mangel and Beetroot	14,418	20,162	18,797	19,109	21,127
Cabbage	31,622	26,531	24,018	32,875	32,139
Carrots, Parsnips, and other green crops	24,130	26,736	25,516	26,622	26,564
Vetches and Rape	2,466	30,623	26,589	22,943	25,348
Flax	251,433	263,507	253,257	206,483	229,178
Meadow and Clover	1,678,493	1,601,423	1,658,335	1,602,135	1,669,800

Total decrease on the foregoing crops **44,922**

Making a net increase in the area under all crops of **27,872**

From the foregoing summaries it will be seen that Wheat decreased by 4,033 acres, Oats by 16,857 acres, and Beans and Peas by 3 acres. Barley increased by 34,591 acres, and Bere and Rye by 1,293 acres. Potatoes increased by 7,156 acres. Turnips by 1,786, Mangel and Beetroot by 2,018, and Vetches and Rape by 2,355 acres. Cabbage decreased by 736 acres, Carrots, Parsnips, and other green crops by 58 acres, and Meadow and Clover by 22,335 acres. Flax increased by 22,695 acres.

ABSTRACT OF CEREAL CROPS.

	1868.	1869.	Increase in 1869.	Decrease in 1869.
Wheat	285,150	281,117	4,033	—
Oats	1,701,645	1,684,788	16,857	—
Barley	186,318	220,999	34,591	—
Bere and Rye	9,998	11,199	1,293	—
Beans and Peas	9,960	9,057	—	3
Total	2,192,079	2,207,970	35,884	20,893

Increase in cereal crops in 1869, **14,991** acres.

ABSTRACT OF GREEN CROPS.

	1868.	1869.	Increase in 1869.	Decrease in 1869.
Potatoes	1,034,681	1,041,837	7,156	—
Turnips	320,094	321,880	1,786	—
Mangel Wurzel and Beetroot	19,109	21,127	2,018	—
Cabbage	32,875	32,139	—	736
Carrots, Parsnips, and other green crops	26,622	26,564	—	58
Vetches and Rape	22,943	25,348	2,355	—
Total	1,466,374	1,468,895	13,315	794

Increase in green crops in 1869, **12,521** acres.

GENERAL SUMMARY OF CEREAL AND GREEN CROPS, &c.

	Acres.	Acres.
Increase in cereal crops in 1869	14,991	50,207
Increase in green crops in 1869	12,521	
Increase in Flax, in 1869	22,695	
Decrease in meadow and Clover in 1869	22,335	23,335
Total increase in extent of land under crops in 1869	27,872	

THE EXTENT UNDER CROPS, GRASS, FALLOW, WOODS AND PLANTATIONS, AND BOG AND WASTE UNOCCUPIED, IN 1865 AND 1869, IS GIVEN BY PROVINCES IN THE FOLLOWING TABLE.

Provinces	Extent under Crops.	Grass.	Fallow	Woods and Plantations.	Bog and Waste Unoccupied.	Total.
Leinster	1868 1,593,477 1869 1,594,794	1868 2,496,415 1869 2,437,072	1868 10,253 1869 9,973	1868 99,522 1869 102,479	1868 638,009 1869 612,758	1868 4,837,676 1869 4,837,676
Munster	1868 1,352,254 1869 1,347,516	1868 3,276,207 1869 3,302,896	1868 3,694 1869 2,713	1868 119,816 1869 167,735	1868 1,191,826 1869 1,173,907	1868 5,934,797 1869 5,934,797
Ulster	1868 1,870,812 1869 1,880,270	1868 2,165,154 1869 2,194,057	1868 5,936 1869 6,572	1868 60,753 1869 58,604	1868 1,211,612 1869 1,165,764	1868 5,314,267 1869 5,314,267
Connaught	1868 731,428 1869 744,263	1868 2,061,617 1869 2,062,252	1868 2,237 1869 1,723	1868 51,167 1869 50,529	1868 1,386,745 1869 1,374,434	1868 4,233,191 1869 4,233,191
Total	1868 5,547,971 1869 5,575,843	1868 9,999,393 1869 10,046,877	1868 22,110 1869 20,981	1868 322,258 1869 319,360	1868 4,428,192 1869 4,356,863	1868 20,319,924 1869 20,319,924

* Exclusive of the larger rivers, lakes, and tideways.

The acreage under the head of "bog and waste unoccupied," had not any live stock on it at the period of the enumeration.

THE AREA UNDER THE SEVERAL CROPS IN EACH YEAR FROM 1865 TO 1869, INCLUSIVE, WAS AS UNDER:—

Crops.	1865.	1866.	1867.	1868.	1869.
Wheat	266,989	299,190	261,034	235,150	281,117
Oats	1,747,228	1,699,695	1,680,511	1,701,645	1,684,788
Barley	177,102	150,291	171,001	186,318	220,999
Bere and Rye	10,091	10,011	9,602	9,998	11,199
Beans and Peas	16,899	14,834	13,552	9,960	9,057
Potatoes	1,066,260	1,050,353	1,001,781	1,034,681	1,041,837
Turnips	334,212	317,198	335,728	320,094	321,880
Mangel and Beet Root	14,418	20,162	18,797	19,109	21,127
Cabbage	31,622	26,531	24,018	32,875	32,139
Carrots, Parsnips, and other green crops	24,130	26,736	25,516	26,622	26,564
Vetches and Rape	2,466	30,623	26,589	22,943	25,348
Flax	251,433	263,507	253,257	206,483	229,178
Meadow and Clover	1,678,493	1,601,423	1,658,335	1,602,135	1,669,800

RETURNS OF LIVE STOCK.

It appears from the following Table that the returns of live stock for 1869 when compared with 1868 show an increase in the number of horses of 2,545; of cattle 80,998; and of pigs 210,215. Sheep exhibit a decrease of 253,338.

THE FOLLOWING ARE THE NUMBERS OF LIVE STOCK FOR EACH YEAR FROM 1865 TO 1869, INCLUSIVE.—

Years.	Number of Horses.	Number of Cattle.	Number of Sheep.	Number of Pigs.
1865	556,287	3,504,490	3,602,342	1,177,605
1866	573,408	3,587,858	3,694,294	918,525
1867	590,782	3,620,554	3,452,252	1,255,186
1868	611,421	3,607,494	3,494,893	1,409,883

2,545	80,998	253,338	210,215

The total estimated value of horses, cattle, sheep, and pigs, this year, is **34,911,360** £; being an increase of **580,944** £ compared with 1868, as appears by the following Table:—

ESTIMATED VALUE OF LIVE STOCK IN IRELAND IN EACH YEAR FROM 1865 TO 1869, calculated according to the rates assumed by the Census Commissioners of 1841, viz.—
For horses, 84. each; cattle, 61. 10s.; sheep, 22s.; and pigs, 25s. each. (These rates have been retained since 1841, in order to facilitate a comparison of the value—one year with another. A percentage may be added on account of the increased value of stock since that period.)

Years.	Horses	Cattle	Sheep.	Pigs.	Total Value.
1865	4,450,296	23,169,000	3,062,576	1,472,006	33,053,478

Scutching Mills.—The number of mills for scutching Flax in each province in 1868 was—in Ulster, 1420; Leinster, 47; Munster, 41; Connaught, 34. Making in all, 1542.

Emigration.—In the first seven months of 1869 the returns of emigrants from the several ports of Ireland show that 45,246 persons left this country. In 1868 the number for the same period was 42,607, being in this year an increase of 2639 persons.

Weeds.—On several occasions I have ventured to call attention to the great injury arising from the unchecked growth of weeds, which is unhappily, so apparent throughout the country. On this subject the late Sir John Sinclair has given the following experiments, which prove the almost incredible advantage of carefully weeding cereal crops:—

1. "Seven acres of light gravelly land were fallowed, and sown broadcast with Wheat; 1 acre was measured off, and not

a weed was pulled out of it; the other six were carefully weeded. The unweeded acre produced 18 bushels; the 6 weeded acres 135 bushels, or 22½ per acre, which is 4½ bushels, or a quarter more produce in favour of weeding. 2. A 6-acre field was sown with Barley, in fine tilth, and well manured. The weeding, owing to a great abundance of Charlock, cost 12s. per acre. The produce of an unweeded acre was only 13 bushels; of the weeded, 28. Difference in favour of weeding, 15 bushels per acre, besides the land being so much cleaner for succeeding crops.—6 acres sown with Oats, 1 acre ploughed but once, and unmanured, produced only 17 bushels. Another 6 acres ploughed three times, manured, and weeded, produced 37 bushels. This experiment proves that Oats require good management, and will pay

contributions of their stock, and who are above mere prize temptations. We have observed many animals taking prizes at several successive shows. In the agricultural horse classes we notice Honest Tom, Black Prince, and Prince; in thorough-breds and hunters we have Carbineer, Motley, Dalesman, Laughing Stock, Angelus, Lady Derwent, Don Juan, Premier, Topstall, and others. In the cattle classes it is very similar. In Shorthorns we have, in bulls, Earl of Derby, Edgar, Charles le Beau, Bohvar, Mandarin, Charlie, Commander-in-Chief, Monk, James I., &c.; in cows and heifers, Lady Fragrant, Queen of Rosales, Miss Farewell, Patricia, &c. In Hereford bulls and cows, Sir Hungerford, Stowa, Prince Leopold; Queen of the Lilies, Lady Adforton, &c. In Devons, Master Ellie, Master Arthur, &c.; Actress, Duchess, &c. In sheep the same; animals are frequently victorious show after show. In the list of exhibitors we have the names of Lord Walsingham, Rigden, Heasman, Throokmorton, &c., in South Downs; in Leicesters we have Sanday, Borton, Inge, &c.; in Long-wools, Dudding, Marshall, Cartwright, &c.; in Shropshires, Lord Chesham, Beach, &c. The like in other classes. In pigs we have Duckering, Eden, Howard, &c.

Without in the slightest degree objecting to the prizes being awarded to gentlemen who for years have appeared as our most successful breeders of any class of stock, there is reason to wish for a larger class of competitors and a wider distribution of the prize money of our agricultural societies.

One more question appears to require ventilation: What have velocipedes, and especially what have velocipede races, to do with agriculture? The intrusion of such objects and amusements into exhibitions of farm stock and agricultural machinery is surely to be condemned as inappropriate. We well know that articles of general utility, or interesting to the public, have been introduced into the Royal and other showyards although not directly connected with farming, but the line must be drawn somewhere, and we certainly think if the bicycle is admitted with other carriages the race should most certainly be avoided. If, as we fear, it is a mere subterfuge for drawing shillings, it cannot be too severely deprecated. It would be an easy matter to contrive amusements of even a more exciting kind. We have indeed very recently seen dancing and "kiss in the ring" tolerated within the precincts of a county showyard. Such practices ought to be discouraged by the leaders of agricultural societies, on the ground that the object of the meeting is not trivial amusement, but mutual improvement. We consider that some check upon this growing laxity is requisite. One society copies another, and if the public are taught to look for exciting amusements at one showyard, they will be disappointed at the more business-like sobriety of a second. Hence the evil once admitted is not likely to decrease, and, whether for good or for evil, it is not unlikely that we may yet see the acrobat surrounded by an admiring crowd in the centre of the area devoted to the products of agricultural and mechanical skill. F. Z.

THICK AND THIN SOWING OF GRAIN.

To determine the proper mode of sowing, and the right quantity of seed-grain to be used per acre under the numerous variations we have of situation, climate, and soil, so as to bring about in every individual case the greatest possible results at harvest, is an annually recurring and important matter of discussion for our agriculturists.

There is probably no branch of agricultural practice wherein greater diversity of opinion exists than upon these two points. The advocates of thin seeding recommend as small a quantity as "2 pecks of Wheat per acre, drilled," while in other quarters the employment of less than 3 to 5 bushels per acre would be considered a dangerous experiment. It is possible that neither practice may be far wrong, if all the circumstances are taken into account, but there cannot be a doubt that, all over the country, by the wasteful system of broadcast sowing, and the excess of seed employed in certain districts, there is an annual loss sustained which, if told in the aggregate, would scarcely be credible.

As some correspondence has already taken place in your columns bearing on the mode of sowing, and quantity of seed-grain to be used, I take the liberty of sending you a few suggestions and observations I addressed some time ago to the members of the Fettercairn (Kincardineshire) Farmers' Club, as illustrative of a system of seed distribution and deposition in growing favour with many farmers in the north of Scotland. *George Reid, Burnieboosle, Aberdeenshire.* We have to apologise for the delay of this publication.

ON DRILL-SOWING GRAIN.

A method of seed distribution that will prevent waste, and secure to each grain or pickle a necessary area of ground in which to germinate and thrive, and which will also secure the deposition of such seed or grain in this form at its proper depth, might be termed the nearest approach to the most perfect method of seed sowing. The advocates of broadcast distribution claim that they sow the pickles of seed without crowding, and that their results at harvest are always superior to any method of drill or row sowing. It is true that they disperse or distribute the grain, but it is equally true that no method of broadcasting can be considered as perfect, when it fails to secure uniform deposition of the seed—an essential element in any perfect method. However carefully the land may be ploughed and harrowed under the broadcast system, it is not possible by any method of after sowing to secure deposition at a uniform and proper depth, while it is well known in a general way, that a large percentage of the broadcasted sown grain is wasted both below the furrow sheet and on the surface of the soil.

As there is yet no method known, economical as to time, of dibbling individual pickles of grain to secure the thickness of plants required in our northern climate to bring about early harvesting, but which is to some extent obtained by broadcast sowing at great waste and loss of seed, the nearest approach

in the right direction is probably that of sowing by the 4-inch row drill, now for several years known as the "Aberdeen Corn Drill." In any system of drill sowing one important advantage is gained by the previous preparation of the seed-bed. In broadcast sowing this matter is frequently not attended to, and the result is a still greater waste in the dispersion of the seed. When the land is friable, light, or dry it may be prepared without evil effect some time before sowing, but such, or even heavy land, should be sown if possible with the same attention and alacrity as Turnip seeds are committed to the ground when the drills are formed; and in the case of light land, not subject to drifting by the wind, should be quickly followed by rolling or consolidation, to secure the retention of moisture in the soil in the event of subsequent drought, and for the more rapid germination of the seed.

Now, sowing by the drill secures uniform deposition and equal distribution in lines or rows, but, on the other hand, it fails to give to each pickle of seed a distinct and separate area of soil in which to come to maturity, as every perfect method should do. Still, it must be admitted that by its use the waste and loss by broadcast distribution is prevented. This economy has been computed fairly as 25 per cent. on the value of the seed sown, or in practice, 75 quarters will go as far in drill sowing as 100 quarters sown broadcast. On this ground alone, therefore, drill sowing ought to be preferred, as it secures against the wasteful system of broadcasting. But what to a large extent prevents the system being generally appreciated is, the diversity of opinion that exists about the quantity of seed-grain to be used per acre, and the distances apart to be fixed for the lines or rows. Some enthusiasts, having a fertile soil and propitious climate, contend that the lines should be 8 or 9 inches apart, and others, when weeds are not damaging, claim that the 6 inch distance is the right one. But putting the matter of weeds out of sight, as no good modern farmer would long tolerate even a legacy of them, the two questions, and very important ones they are, for every practical agriculturist to settle for himself are, first—the quantity of seed per acre he should use, under different conditions or circumstances; and second, the true method of its correct distribution and deposition. It is quite possible to judge of these questions relatively, and without experiment. If it be admitted that giving to every separate grain of seed the requisite area of ground capable of carrying its individual stems forward to the fullest stage of maturity is likely to produce the highest results at harvest, then, the nearest approach to a uniform broadcast distribution, on this principle, coupled with accurate deposition, both of which we hold to be given by the 4 inch drill system, is the most desirable method to be employed. And, then, rows of 4 inches to be preferred to rows of 6 inches apart? and are the 6 inch rows to be preferred to those of four? Certainly not. And as this conclusion can be proved to be true relatively, it has also been proved to be true practically. But the further question arises,—why stop at 4 inches? The Aberdeen Corn Drill is presently constructed, is made to dislodge the soil for the falling in and covering of the seed by coulters that penetrate the ground. If these coulters were all fixed in one line, 4 inches apart, the machine would be unworkable on the average of soils, from stones, earth clods, or weeds chalking up the way. Even coulters placed 6 inches apart have been found liable to this objection, and if made in two rows alternating, giving a 3 inch distance on the average, have been found to be impracticable. Besides, two horses on some stiff lands would be unable to draw a drill 8 feet wide to sow 18 to 18 acres per day, if constructed to sow an average distance in rows of 3 inches. This is not the case, however, when the coulters are placed 8 inches apart, in double lines alternating, giving the sowing distance at 4 inches, because it is altogether free from the objection of dragging or clogging, and two horses can with ordinary ease, on almost any kind of soil, sow with it 18 acres per day. By this arrangement of the coulters in the 4 inch drill we get a less crowded

4 inch row system, the same quantity of seed being employed, and certainly with increased beneficial results. If, for example, trials are made of Oats sown, by thinning at the rate of 4 bushels per acre, under similar conditions as to time, situation, soil, climate, seed, &c., at the respective distances apart of 8, 6, and 4 inches, it will not be denied that as the rows 8 inches apart will contain double the number of seeds or grains in the line than what the 4 inch row does, the probability is that when the crop arrives at maturity the crop in the rows 8 inches apart will be found inferior, the circumstances arising from its crowded condition, impoverished nutrition, and stunted growth. Why is it that in many districts of the south of Scotland, early celebrated for its advanced agriculture and the employment of the once-famed Suffolk and Bedford Corn Drills, farmers have now generally disused them, and returned to the broadcast system of sowing grain? The answer exists no doubt in this, that a heavier crop is invariably reaped from broadcasting, notwithstanding its waste of seed, than from 6 or 8 inch drilling, by the seed not being crowded, hence securing more numerous and stronger stems, as well as richer produce in the ear. If in practising the sowing of grain in rows 4 inches apart, the seed bed is suitably prepared beforehand by harrowing and rolling the soil to a fine tilth, then sowing the seed the requisite depth, and afterwards crossing the lines or rows with a deep stroke of the harrows, it will be found that the seed will not only be rightly deposited for its perfect vegetation, but will be distributed to a considerable extent in the interspaces, giving all the advantages claimed for a distribution that will secure a certain space of ground for every individual pickle of seed, with a saving to the sower of fully 25 per cent. over the wasteful system of broadcasting.

In 4 inch drill sowing, the employment of too much seed is strongly to be deprecated, and many beginners injure the system from want of confidence in making their testing experiments complete and exhaustive as between the quantity of seed to be used, and the distance to be employed between the rows. If the advocate of sowing 8 inches apart will sow either 2, 3, or 4 bushels of seed grain per acre, and will carry out a corresponding experiment with similar quantities of grain at the 4 inch distance, we feel assured he will give the preference to the latter mode at harvest time, and will afterwards readily admit that the best returns are only obtained when there is an actual practical approach to the principle of giving to every individual grain of seed its own space of ground to thrive upon.

In judging of the results of drill sowing when experiments may have been conducted under a variety of circumstances, it will be found of importance to take into consideration—

1. *The Time of Sowing*.—Less seed may be used when the land is sown early in the season than when it is sown late in a prospectively late looking season.
2. *Season as Aspect of Soil*.—The exposure of the ground in particular seasons, irrespective of the mode of sowing, will be found to affect the crop when perhaps under the circumstances the mode of sowing may be blamed. And here again the particular climate of a season will differently affect crops under variable situations, and therefore experiments on hilly lands cannot fairly be pitted against experiments on high lying lands, nor between lands at widely differing latitudes.

3. *Condition of Soil*.—It may be good or bad, early or late, and here the question as to quantity of seed to be employed is involved, as good land needs less seed than bad land, and the crop would be affected in results by the different application of manures.

4. *Quality of Soil*.—This has largely to do with the character of crops. If the soil is weak and inferior no proper start is at first made, nor is the after growth properly sustained. Mixed or impure grain as to sort or variety produces irregular growth, and frequently irregular ripening and inferior results.

5. In conducting experiments to bring about conclusions that are to be relied on for future practice, farmers will find great advantage for future comparison in detailing and registering the nature of preparation of the land, mode and time of sowing and reaping, weight and quality of straw per acre, quantity and quality of grain per acre and weight per bushel, and, if by the adoption of the system offered in the foregoing suggestions, the country is saved an annual waste of seed equal to 25 per cent. on the broadcasted outlay, and obtains an increase also on the produce of the cereal crops, it will be a source of gratification to every one concerned.

Home Correspondence.

Farm Profits: "Half Pay" and his Cows.—"Half Pay" is right in thinking that milk cows are the most profitable branch of farming if well managed, but the difficulty is in managing the details, and preventing both waste and robbery. If "Half Pay" were to take a farm and work as he says, he would no doubt make it pay in the end; but I venture to predict he would be at least five years before he could get any ordinary farm into the state he speaks of. If he wants to try dairy farming, he should try on the plan adopted in Dorsetshire, where the farmer very often lets out his dairy at so much per cow, undertaking to supply the cow with plenty of good food. In this way "Half Pay" could begin his dairy at once, without having to get a farm into order to keep it, and he would, moreover, run very little risk of loss. If he be in earnest and really wishes to try it, I make him the following proposal, viz.: To give him a large, new, well-ventilated cow-house for 18 cows, a large dairy with washing-house, butter-room, cheese-room, and dairy maid's house of four rooms, all new and *en suite*, and to keep his 18 cows well supplied with good food, for the sum of 12*l.* per cow per annum. I will also give him a good house to live in, such an one as any half-pay officer need not be ashamed of as country quarters. I do not think "Half Pay" is right in thinking one of the southern counties the place for a dairy. Ayrshire is celebrated everywhere, yet it is far north, and stands cold and wet. Cheshire is also celebrated, and it, too, is cold and wet. In fact, a considerable amount of moisture is wanted for a dairy farm. If "Half Pay" thinks anything of my proposal, will you kindly give him my address? and if he finds it pay, I can give him double the accommodation for cows if wanted, that is, for 36 cows, instead of 18. G. A. H. [Will "Half Pay" forward his address, that we may do as our correspondent desires?]

Misrepresentation by Mr Mechi.—Mr. Mechi says, "A Farmer" says in your columns, that last year I showed by my balance-sheet that I made no profit, and could not pay all my rent. When will people cease to misrepresent?" Mr. Mechi is fully entitled to ask this question, for it was not he who showed, by his balance-sheet, that he could not pay all his rent, &c., but it was I myself, by relying upon his balance-sheet, and showing up its "misrepresentations." This 9*l.* per cent. on his tenant's capital, that he is now talking about, was a misrepresentation, for he had a pull of 150*l.* upon his tenant's capital to help to make it up, and he misrepresented his case when he told us that he made over 63*s.* a qr. of his Wheat, whereby he over-estimated his profit by over 200*l.* as another help to make it up, and afterwards coolly told us that his prices ranged from 48*s.* to 62*s.* a qr. only; and then he talked of his "improved rent," as he does not pay "40*s.* per acre," for when the chapel land is added—5*s.* acres, at 1*l.* an acre—his rent stands at only 3*l.* an acre. It is of no use for you, Mr. Mechi, to try to escape by charging others with misrepresentation, for the facts are dead against you. You need not charge me with "anger," for I only audited your accounts and remarked upon them. You may be "angry" with yourself for putting in print such a sadly incorrect statement (your balance-sheet), to which you have again referred, and called me to a review of it. A Farmer. [This letter has been lost a fortnight.]

Three and Four Feet Drainage.—A "Bewdley Forester" attempted, some time since, in the "Gardener," to prove that it is a mistake to cut 3-foot drains. He states "I had not the remotest idea that, 35 years after date, I should have to describe my experience as an illustration of the uselessness of draining the fourth foot in dense clays, as drains 3 feet deep take away a really superabundant water. The fourth foot of dense clay, as a rule, holds but a small percentage of water even in the winter (its superincumbent load prevents it from holding more); and if it could retain more, this would be of service to vegetation in dry seasons by being drawn up to the surface by the combined force of radiation and capillary attraction." I fancy that those who once considered 3-foot drains deep enough, may be regarded as having been advocates of a great depth. Mr. Bewdley's test of thorough drainage may be repeated in dense or plastic homogeneous clays. "As water should be drawn away at once, not from the surface only, but from the bottom of the active soil, whether that be at the depth of one, two, or more feet; and this must be done in stiff soils by causing it to sink still deeper, not by allowing it to flow through the active soil towards the drains * * *. Some, however, do not hesitate to assert that their draining is perfect, although it falls far short of fulfilling this condition.—Does draining—the basis of all other improvement—does not accomplish this perfectly, it may nearly as well be left undone. * * *. The test of perfection in clay is the ready filtration of all rain-water to a depth of at least 18 inches midway between the drains, and its speedy conveyance from thence." The "Bewdley Forester" stated, "In support of your dogma, so to call it, I may

say that I have done damage by draining grass-land 2 feet 6 inches deep in the furrows, called 3 feet deep from a line across the ridges." It ought to be well known that the aeration of land to the requisite depth by drainage is only a preliminary process, and subsoiling ought to follow the draining. It is generally acknowledged that subsoiling wet land does it a positive injury. Mr. Morton stated, in a paper before the Society of Arts—"It is no part of good agriculture that the produce of the land is to be made out of a particular layer called the soil, which has to be cultivated, turned to and fro, and stirred and mixed upon an impervious floor hardened by a perpetual trampling, below which lies the subsoil. All recent improvements of the soil have proceeded upon the idea that there is no essential or necessary distinction between it and the subsoil. Thorough drainage and deep cultivation both increase fertility, and that existence of anything like a pan within 30 inches of the surface is injurious." A few quotations ought to convince even the "Bewdley Forester" that 48 inches ought to be the minimum depth in dense clays. The *Agricultural Gazette* has repeatedly quoted—"If the land be of very finely-divided material, and very clayey, it will lift or hold the water higher than if it be sandy, so that the water will stand 6 or 12 or 18 inches above the level of the drains when the subsoil below is wet, according to the stiffness of the subsoil." T. W. R.

Tiptree Hall, Sept. 7.—Finished harvest on Saturday, the 4th. All got up in dry order, after four weeks of splendid weather, without even a shower. Twenty-one good hay and corn stacks, besides the great barn full, although when I commenced building the barn, 26 years ago, I was warned by my practical friends that I should never grow enough on this poor farm to fill it. Now for the crops. Beans abundant, and fit to grind. Wheat very dry, and fit for the miller; quality various. White Club-headed Wheat more or less blighted, and shrunk by stem-rotting. On light land sample will be thin. I threshed 7 acres of my best white—yield, a fraction under 6 quarters per acre; weight, nett, 60 lb. per bushel. Last year it weighed 68 lb. It sold for 5s. per quarter before the fall and rise. I hear of one of our extensive millers who will only buy by weight, 63 lb. to the bushel. One farmer who sold to him on these terms had to supply 4½ bushels for each sack, or 9 bushels to the quarter!—at this rate present prices are, as compared with those of last year, nearly equal. I hear of 7 quarters of tail Wheat out of a threshing of 50 quarters. In my case, the tail was 6 per cent. Red Wheats have the best of it, and ours, sown late, promises to be a fine sample. My Rivetts are particularly good, both in sample and quantity. Two fields, after 7 and 8 quarters of white Wheat last year, have been estimated at 7 and 8 quarters per acre, but I shall be satisfied with a quarter less. Our Barley, on light land, after 6 quarters of white Wheat, is very heavy in grain, though rather coarse in quality—estimated at 7 quarters per acre. I have only 6 acres of black Oats (produced by a heavy Tartan crop, followed by Cabbage in the same year). They are heavy in quality, and well corned, but not a good crop; we reckon on 8 quarters per acre. We always sow black Oats. Quantity of seed: Oats, 2 bushels; Wheat, 1 bushel; Barley, 6 pecks per acre. On comparing the 2 pecks per acre with the 4 pecks per acre of white Wheat on the 7-acre field, the result shows a quarter per acre against the 2 pecks. This was contrary to expectation, the general opinion having been in favour of the 2 pecks; and after cutting the thin stubble looked much the strongest, but there were less heads. The sample was finer, weighing 3 lb. more per bushel, and worth 2s. more per quarter, than the thicker sown. We have not yet tried the peck an acre. White Wheat is evidently a more tender Wheat than our red or Rivett. Owing to its having yielded so abundantly in the dry genial season of 1868, rather too great a breadth of it has been sown this year. My 27 acres of Mangel, Kohl Rabi, Cabbage, and white Turnips all promise abundantly, so that we shall be well supplied with cattle food. Hay and straw buyers tell me that although straw is so bulky there will be no more weight of it than last year. Taking weight and quality of Wheat as a standard, it can scarcely, I think, reach an average. Although our first cut of red Clover was thin and overgrown by Oats, the second growth was a very fine even crop, folded off by sheep eating cake and corn. We gave it 10 loads of manure after the cutting for hay. This field will now have to carry a white Wheat crop, a Rivett crop, and then Mangel. That is my course after red Clover, on the heavy land, the Rivett Wheat getting 2 owt. of guano and some salt, the Mangel a heavy dressing of manure, and guano and salt. We are sowing Mustard and Rape on our light land Wheat stubbles, after these fine rains. Our harvest occupied four weeks. One man, with Samuelson's side delivery reaper, cut 65 acres of Wheat, 6 acres of Oats, 6 acres of Barley. Our men earned 5s. per day, or 6l. per four weeks—4s. per acre was allowed by the men for the use of the reaper—so that it earned by the aid of horses 15l. 8s., minus a few shillings for breakages. It economised time, and rendered unnecessary the employment of strangers. J. J. Mechi.

A Scotch Farmer.—[The following letter has been addressed to Mr. Mechi by a Scotch farmer]:—"Ever since the time that I visited Tiptree Hall, in 1864, and experienced so much unalloyed kindness at your hands, we have had a warm corner in our heart towards you, and, consequently, read with much pleasure and profit your several articles as they appear, from time to time, in the *North British Agriculturist* newspaper. So much so, indeed, that often I have intended to write to you to thank you for displaying so much courage in stating facts, however unpalatable, that by-and-by will be recognised as such, notwithstanding the snarling of a few ours. I can truly sympathise, and heartily join you in denouncing the

short-sighted policy of but too many landlords and farmers both in England and Scotland who seem so well content to let matters 'rest' as they are 'and be thankful.' With such a redundancy of capital in our country seeking a profitable outlet, and to see so many of our fields and homesteads so far behind in good cultivation and tidiness, is positively a sin, and well fitted to arouse the honest indignation of anyone having less enthusiasm than yourself, here, in Scotland at least. Hypotheses, and similar antiquated laws, 'block up the way,' and until these are removed such a thing as progress and thorough improvement is out of the question. The landlord's hypothec, covering the rent for two years at least, enables him to accept (as he often does) the one most servile as tenant, caring little whether he possesses sufficient capital or not; and hence men of capital and enterprise have become soured and disgusted, thus causing many such to look around for a more congenial field; such in fact is my own experience for the last 16 years. I have cultivated my small farm with some measure of success, and now that my lease draws to a close, and before it is known whether I intend to offer for it again or not, several parties have been applying for it, and offers made of a rise of 80 per cent. Bear in mind that the offerers are merely men of straw; the landlord, however, as I have stated, being safe as regards the rent, will, unless I bid a sum approximating to them, let me go. I remember well that the first question you asked of me was as follows:—'How many acres do you cultivate? and how many head of cattle do you keep?' In answer, let me again say that my farm consists of less than 120 imperial acres, one half of which is good sharp land, the other half is very poor and thin; the stock comprises the following—viz., three farm horses and one pony, 35 to 40 cattle of all ages, and 90 to 100 high-bred Leicester sheep, and worth, on an average, 5l. to 6l. a head; these animals are all kept on the farm, unless during the summer, when we rent some 30l. of a grass field; and here it is fair to add that the way I manage to keep such a heavy cover is by following some of your own rules, at least in the matter of cake, and from experience I can testify that you are right. Cramped and confined as we are here, by absurd cropping conditions, one positively has no heart to do anything, not overlooking the fact that the better you farm your land the more rent you will have to pay, should you wish a renewal at the end of your lease; the longer I live the more I am convinced of the utility of manuring your land through the stomachs and bowels of your stock, but, as you know, to carry this method out properly capital is needed, and as those would-be successors of my own see only the fruits, without knowing the cost, they may come to find that the 80 per cent. additional rent may be somewhat ill to raise. Let me brush this aside, and conclude by asking if you think it might be possible for me to get a farm in England, under some landlord who would encourage a tenant who truly wished to do well? It strikes me that amongst the many acquaintances you have got one may be found of the sort indicated, and who might feel disposed to give a trial, as tenant, to *A somewhat Enthusiastic Scotoman*."

Essex Crop.—Your circular was sent after me to Liverpool; unfortunately I lost it, but I now report, that, in this neighbourhood, all the crops in the aggregate are a full average. The Barley crops are above an average, and especially where not injured by over-seeding. The Oat crops an average. Farmers had fault with the Wheat crops, and doubtless, where greatly injured by over-seeding some Wheat crops are light, but others are very fine, full eared, and heavy, which I think will bring the whole to a full average. The Mangels and Swede root crops are very fine. I never saw them more promising. The Potatos in this neighbourhood are retubercating in many places, which, of course, will very seriously injure them; but still there are some very excellent crops. Mine are of both kinds. I have several plots, and some are very good; but the greater number are what are called growing again, and consequently such are nearly worthless, but on the whole, comparing one with another, the crops of grain and roots are a full average in this neighbourhood. I have not been able to examine many Bean crops, but where the land was deeply cultivated, or tolerably so, and not over-seeded, I should say these crops are a fair average. Peas with farmers are always a hazardous crop; shallow and imperfect cultivation for them, and ruinously over-seeding, must always be causes to make them so. But this is seldom the case with gardeners, who cultivate deeply and seed sparingly, and, as an example of this, I add that some years since I saw a market gardener putting in his Peas in rows 30 inches apart, and thinly in the rows, whilst farmers put in theirs only 6 or 8 in. asunder, and three times as thickly in those rows that the market gardener did in his; and on my asking the latter why he cultivated so deeply and sowed so thinly, he replied, "Because he gave 4l. an acre for his land, whilst the farmers gave but 30s. or 35s.; and hence," he added, "they could afford to grow little else than light puffy straw, whilst he was obliged to grow corn regardless of the straw; in fact, the less straw he had the better, so that all the seed he put into the ground grew, and which was generally the case." To add to the force of this, to me, sensible reasoning, I inform my readers that I have grown Peas for upwards of half a century, and never had lice upon any of them, which is the malady that the farmers so much complain of; and as this year, from its dryness, has been very favourable for their production and multiplying, I should say that many farmers' crops of Peas this year have been destroyed by them; not that lice have been the cause of the failure, but the effect only, as I have stated, of shallow and imperfect cultivation, and—what shall I say?—insane over-seeding, as the intelligent market-gardener also added. But being on this subject, I will just add further, that the farmers

add, that this year many Wheat crops are full of what they call bladders or smut, and yet they always boast that they have a specific as a preventive of this malady, and which is by steeping the seed Wheat in a poisonous mixture composed of a mineral and water. Now, this year, and every year—for there are bladders more or less every year—the farmers who use this quackery nostrum have just as many bladders as those who use it not, and some of them more than those who use it not; for the latter rely more on cultivation and the *probata* they gave to their plants, than upon this or any other kind of quackery, and hence, as I have often seen, their Wheat crops are comparatively free from bladder or smut, whilst those of the others are often full of them; but still they go on wetting and drying, and still have bladders. But would it not be better and cheaper to employ some venerable gipsy sybil to charm their seed? G. Wilkins, Wis.

Foreign Correspondence.

CHAMOUNI, August 31: *Swiss Agriculture*.—The best crops I have seen anywhere this year are just now being harvested at and below Liddes, in the valley leading up to the Great St. Bernard Pass, at an elevation of between 5000 and 6000 feet above the sea. Nowhere is the Barley of a richer colour or more full of grain—nowhere are the Potatos sounder, healthier, or more productive—nowhere is the Bean crop so full of pod and seed. The valley, which, in its lower range above Martigny, is just a big deep ditch with sides too steep for cultivation, widens out above Orsières, and is a comparatively flat-bottomed groove near Liddes, where for probably a mile or more in width, and up to the very edge of the steep Fir slopes with overhanging rocks, it is fully cultivated—in a patchwork of little plots, each kept up by its retaining terrace wall. These plots are cultivated with a little one-handed pair-mule plough, and with a big hoe for use both in digging the land and in digging up the Potato crop. They are manured by cattle carrying panniers of dung from the stances beneath barns and byres, and dwelling-houses, where it is stored. The whole process is going on just now, and autumn manuring seems to be as well understood and practised in the highest agriculture of the Continent as it is in English lowlands. The Barley is stoked in sheaves, and being carried home to barns. The Potatos are being hoed out and stored in cellars. The Beans, cut green, are being carried tied in sheaves, and hung astride a set of horizontal rods underneath the wide overhanging eaves of the houses, where a perfect wall of grain is gradually drying. I have seen more Beans hanging and drying in this way under the eaves of Swiss cottages than are to be seen all the way through Belgium and Germany on the way hither.

There certainly is a great variety of agricultural experience and management in Switzerland, as, indeed, was to be expected from its varying circumstances. The wonderfully rich and perfect vineyard cultivation of the northern and north-eastern shores of the Lake of Geneva—the smiling English-looking landscapes one has passed through to Lausanne from Berne—the poorer undrained upland pastures between Zurich and Lucerne—the sandy flats on the way from Lake Lemane eastwards up the valley of the Rhone and southwards up the Arve—the hard-won but abundant crops in hillside patches everywhere, all these present as many types of style and management as much larger countries show—types much wider apart than our own exhibits. The first and last of the series named excite one's admiration most, and having mentioned the patchwork culture of the hill sides about Liddes and Orsières with praise, it is impossible to pass, without expressing admiration, the glorious vine-clad slopes between Vevay and Lausanne: nothing can be finer.

Perhaps the leading feature, more especially of the small-farm cultivation of the country, is the value set on liquid manure. The tanks, over which the dung is neatly piled—built up squarely in successive layers—receives the drainage of the house and heap, and its contents are carried out in the universal carrier of the country, on men's backs, and either lifted down and afterwards ladled out, or, as we saw it in wet weather, when the tank fills rapidly, and has to be emptied quickly, swung abroad (without being lifted down) by clever shoulder movements, calculated, in unskilful cases, one would fear, to drench the unlucky carrier himself with the unsavoury load. The work of distribution is, however, fairly done, and the Grass and other crops thus treated are the better for it. The Grass, however, is everywhere a very coarse and leafy mass of weed, containing quantities of Crowfoot and Hawkbit, and comparatively little Grass. The second crop of hay has been industriously harvested during the past week of fine weather. Women mow as commonly as men, and the scanty crop is rapidly got together, and tied up in bundles within nets, to be taken down to the fodder-house or barn. The uplands are scattered with these chalet-like barns. You see them scattered about the hill-side as you look down on Grindelwald from the little Schiedegg Pass; and again, with quite a large population in scattered villages, you see them all over the lower uplands of the Hasli mountain range from the heights over Reichenbach. These alps, or upland pastures, carry a large quantity of the small dairy stock of the country; and the one cheap food of the country is milk.

The low, flat, and often unhealthy valleys, especially those running into the Lake of Geneva, are in every respect miserable, the population are unhealthy, the land appears liable to inundation, the crops are poor, and mixed up with enormous growths of natural Reed and Rush. A good deal of land is perpetually burned in preparation for a Rye crop, and the process is going on now all about Bonville, on the way up to Sallenches from Geneva. Buckwheat is a common crop. This

and Rye, and Potatoes, seem the chief produce of the district. Patches of Hemp are almost universal, and Oats, still green, are common. Here, in a Roman Catholic canton, everyone was at work last Sunday afternoon; men were ploughing, women mowing, and labour going on as usual, in the listless fashion of the place; and a Protestant, in the coupé of the diligence, taking his pleasure on the day of rest, was passing through their midst, and felt that he had no right to cast a stone at them. J. C. M.

Societies.

BATH AND WEST OF ENGLAND.

August 21.—At the meeting of Council reports were brought up from Messrs. Badcock, the Society's treasurers, announcing that the required sum of 900*l.* had been paid to the credit of the Society by the Taunton local authorities; from the stewards of plant, announcing that all the plant of the Society had been removed from Southampton within the specified time, and was now safely stored at Taunton; and from Mr. Knollys, who had been deputed to conclude arrangements with the Taunton authorities, announcing that all matters left in abeyance were now satisfactorily arranged.

A committee having been appointed "to take into consideration the duties and salaries of the Editor and secretary, and the routine of the secretary's office, and to recommend such alterations generally as in their opinion may be desirable," the report was now brought up and ordered to be taken into consideration at the October meeting of Council, after due notice given on the Agenda paper.

PLACE OF MEETING IN 1871.—As the Society's annual meetings are now held alternately in the eastern and western districts, and as the meeting of 1871 would in due course be held in the eastern district (including the counties of Berks, Surrey, &c.), a committee was appointed to consider the subject, to take such steps as they think necessary, and to report to the Council at the October meeting.

Mr. MARGARY, of Plymouth, suggested to the Council the desirability of offering prizes for donkeys, which he considered would be a great boon to the industrious poor. The subject was referred to the Stock Prize Sheet Committee.

Mr. LE CORNI, of Jersey, having expressed a desire to convert the money prizes which he obtained at the Southampton meeting into a piece of plate, asked the sanction of the Council to his engraving the badge of the Society thereon, and the desired permission was granted.

AYRSHIRE

Breeding of Ayrshire Stock.—Mr. Lindsey's remarks on this subject at a recent meeting are as follows.—I would say, take a bull from a stock not connected with your cows—a stock that has been good for generations back. Be sure that the bull's mother is a good strong profitable cow—such a cow, in fact, as you could face a distant market with. Don't at all be guided by the prizes that she may have taken, unless she have a good appearance of milk, and seems likely to be a good fat beast at the end. I have been thus minute about the bull's mother, because I expect from what I have seen that his progeny will probably be more like his mother than himself. I would like both the cows and the bull which judges at a show would perhaps pass when awarding the prize to the animal showing the most breeding. Now, we admit that enough of attention has perhaps not been paid to this matter, but the reason of that is not because the object is not a desirable one, but because breeders generally have hitherto been a little careless of the fact. There are at the same time a great many breeders whose sole desire and aim is to produce animals having their touch and form worthy of as much praise as the quality and purity of their milk.

In the month of May they should be sent to the moors or shut up in a field of the coarsest Grass on the farm for the summer months, but they should be brought home by September 1, and have plenty of Grass down to Martinmas. They should by no means be kept on bare Grass in autumn. They are now six quarters, and this is the best age to bring them to the size you want. They ought to have sliced Turnip or cut hay or straw steamed in the morning, and be turned out to water through the day. If you have not Turnip, the cut hay, with a very little meal, will pay better at this than any other age of the beast. The plan of sending them to the moors is good, but it is quite wrong to allow them to remain on the moors for more than four months. There should be a field cleared a month or six weeks for them, and bring them home to plenty of Grass in the autumn. By no means allow them to be falling off before you take them in. Feed them at once, and keep the flesh on them till February, when they must have a little meal to supply the drain of nourishment that will be caused by the growth of the calf. But it is wrong to feed heavy at this age, as it is apt to bring on too great a flow of milk. It is better to feed moderately till once they are calved, and the swelling has begun to subside, then feed and bring them to their milk. One could scarcely expect that a farmer having good pasture would advocate the following rule of policy. In the district where he lived it was naturally good pasture, and they had no difficulty, if they attended to the cattle in winter, in rearing cows of a fair size. The size that he reckoned best in a good dairy cows was one that when fed would weigh from 26 to 28 stones. Many studied chiefly the bringing out of fine points; but his opinion of a good profitable cow was one that would stand the wear well in a dairy, and then pass off advantageously as beef. In the breeding of young cattle his experience was that the progeny followed the mother's side more than the father's. Of course it

was perfectly right to have the best bull they could get; but if they put the best bull to inferior cows, they would not produce an improved breed that would fill the lugs.

[On this the *Farmer* remarks: This, in our opinion, is quite contrary to facts. The male animal exerts an unmistakable influence upon the form of the progeny; and if the bull is bred from a good milking stock, there is assuredly every chance that the milking qualities will be influenced by him as well. Experience proves this to be the case; and although the mother may have a great deal to do with the quality of the progeny, still a good bull put to an inferior cow has as good a chance to have offspring of fine quality as if the case was otherwise. Upon this subject we are so certain that we would say—make it a point to provide a well-formed animal always.]

We hear a good deal of discussion now-a-days upon some other points in the breeding of stock. For instance, many farmers are at a loss to know whether it is better to have a cow in calf when it is two and rising three years old, or whether it should be left till it is a year older. Both ways have been tried, but generally it has been found better to allow cows to calve as early as possible. They give the most milk, and continue to be the best milkers. The reason of this is thought to be because they become in calf at a time more in accordance with the promptings of Nature, and the milk, therefore, comes sooner, and continues to flow more copiously all their life. Many, it is true, are very averse to this procedure, and a general feeling exists that it is a most hurtful practice to bring cows thus early to milk, but if they are properly grassed on till that time, and properly wintered, the animal's will be as good at that age as they are when sent off to the moors, to get Grass there, besides, calves are more likely to come to a good size when calved early. Many farmers run into a very common mistake with reference to this, with a view to taking prizes at some neighbouring show, or perhaps a leading one. They have their cows too late with calf; the effect of this upon the calves as well as the cow is very bad.]

Reviews.

Notes on the Distribution of Sewage, addressed to the Chairman and Directors of the Metropolis Sewage and Essex Reclamation Company. By H. J. Morgan Metchim & Son, 20, Parliament Street.

"Town sewage is the most fertilising of manures—producing enormous crops of all kinds of succulent growth—bulkier and heavier crops per acre than ordinary agriculture knows anything about"—"Town sewage is the poorest 'tackle' as manure any of us know—not worth 2*d.* a ton."—Both these statements are quite true. We have known much heavier crops produced by dressings of town sewage than Mr. Mechi quoted from Mr. Morton in a paragraph the other day. Sixty tons per acre of Italian Rye-grass in a single summer have been often grown in this way. Incredible crops are actually grown in this way. We were present on the introduction of Farmer A, who uses sewage, to Farmer B, of Colchester, who knows nothing of it, at the Bury Station, when the Agricultural Society met two years ago at that pleasant little Suffolk town. "Oh!" said A, after five minutes' hearty talk as cordial as could be, "I too am an Essex farmer;" and he began to speak of four crops of Grass already cut that season—it was towards the end of July—averaging 9 tons per acre each. The cordiality ceased at once, and B. turned upon his heel, evidently considering A. either knave or fool.—The results of sewage application as related are incredible—excepting always to those who have reaped them, mown them, seen them, weighed them; and now that almost everywhere towns are being driven to the consideration of the sewage nuisance, and sending agents up and down the country in search of sewage farm experience, the number of these is rapidly increasing. Nevertheless, it is quite true, as just said—town-sewage is a very poor manure. If, indeed, it be worth 1*d.* per ton, the Metropolis Sewage Company, to whom Mr. Morgan addresses these notes, have a very handsome property.

The way in which so poor a manure as sewage produces crops unknown to ordinary agriculture is simply by means of the enormous quantities of it which are applied. If 50 tons of Grass per acre are produced by it, it is because 3000 and 4000 tons, perhaps more, are put on every acre of the land; and hence it is that the question of "distribution," which is here discussed by Mr. Morgan, is of the very essence of the question—what is sewage worth? It costs a farmer 1*s.* a ton per mile to load and carry farmyard dung. But here is a manure worth not much more than 1*d.* per ton to begin with, and we want to carry it 15 or 20 or more miles away—at least, London does, which has 300,000 tons daily of it to dispose of, or enough for 300,000 acres of land.

We strongly recommend Mr. Morgan's notes on distribution to all who have sewage to dispose of, and want to make the most of it. It is plain that if they have to carry it, they will make no money of it. It must carry itself—it must distribute itself. And this is the great merit of the manure in question. It is at once fertiliser and carrier of fertilising matter. The matter which it contains is loaded already on a self-acting carriage, and it only needs that the land be laid out properly, and that channels which will not waste the goods committed to them shall be provided, and the manure will take itself not only to the firm—not only to the field—but to every plant upon that field which wants to feed upon it. Mr. Morgan, fully alive to the necessity of economy and care in dealing with so bulky, so dilute a substance—a manure so poor per ton but so valuable per dressing of 300 tons—has here elaborately discussed the various

plans of enabling it to spread itself evenly and satisfactorily, especially over arable land. His experience has now lasted over several years, upon a farm where it has been the aim rather to make the most per ton of the manure than the most per acre of the land. And this experience is here laid before the reader with all the help that well-drawn illustrations can afford. We strongly recommend the book to the attention of sewage farmers, and especially to the notice of town surveyors and of town ratepayers, who want to realise the value of what creates so great a nuisance now by waste.

It is satisfactory to find that the literature of this subject has at length overtaken its early task of proving the value of sewage as manure, and is now engaged in discussing the methods of its most economical distribution. Mr. Morgan has already done good service as a promoter of sound public opinion on what is one of the leading agricultural questions; and the publication of these lessons of his experience upon the Barking farm is a timely and valuable contribution in the same direction.

Farm Memoranda.

WEST GLOUCESTERSHIRE.—The harvest may be said to be general, and the weather all that can be desired for the drying of the grain. A large breadth of Wheat, Barley, and Peas has already been cut and carried; Beans, too, are fast drying off, and will soon be ready for rickling. Should the weather continue fine another week the bulk of the corn in the vale will be pretty well secured. The corn on the hills is later, and much of it is still very green, and will not be ripe for a fortnight or three weeks. Much anxiety is felt as to the probable yield of the Wheat crop; that it is below an average there is no doubt, but the amount of the deficiency we cannot learn at present, as we are all too busy to pay any attention to threshing. The cause of the present deficiency is no doubt attributable to the excessive rain in winter, and the absence of sufficient heat in May and June; the plant lost its vigorous appearance, and became very spindly and rotten at the root just at the time when it most needed strength to withstand any rough winds which might happen to pass, consequently the gale about the middle of July broke down most of the Wheat crops upon the light soils, and thus prevented the grain filling, as it otherwise would have done; fortunately we have not had much rain, so that the laid corn will not be so much damaged in quality as it must have been had it been very wet. The crops upon deep, well farmed clay soils present a promising appearance, but there are many faulty grains in the ears, there will also be a deficiency in the weight per bushel by at least 2*lb.* compared with last year. Barley is very various. The early sown is generally very good, and much better than last year; the late sown is very middling. Oats cannot be said to be an average crop. Peas about an average upon good soils. Winter Beans present more straw than usual, but have not podded so well in consequence. Spring Beans are very promising. The root crop looks about as very good, and the prospect of an abundant supply of winter food for stock most encouraging. Grass keep is getting rather short, as the latter part has not grown so rapidly this year, owing probably to the immense crops of hay which has been cut throughout this district. J. W. [This was dated August 17.]

The Poultry Yard.

THE LEICESTERSHIRE AGRICULTURAL SOCIETY'S POULTRY SHOW.—Ashby de la Zouch will recall to every one Sir Walter Scott and his tournament, but it will also recall now to many good Leicestershire and other shire people the memory of a very pleasant and successful agricultural gathering. The show was held in the grounds belonging to the Royal Hotel. The attendance was excellent.

Dorkings were well represented by Messrs. Warner and Wood, who took the prizes both for adults and chickens. The hens in the 1st prize pen may be looked for again later in the season in a similarly high position, if their owner does them well. Mr. Sharpe, of Kettering, was 1st for old Spanish, and Mr. Stephens, of Walsall, for chickens. The Cochins, as might be expected, were very good. Those who, in the early days of the fancy, remember the birds exhibited and bred by the late Rev. G. Calvert, of Beby, will find them still worthily represented. The birds shown by Mr. Woodcock, of Bearys, and Mrs. Williamson, as also those of Mr. Worthington, were very beautiful. The white chickens shown by Mrs. Williamson were universally admired, and deservedly so.

The quality of the game fowls was good, but hardly as even as we should have expected for Leicestershire. Mr. Warner took 1st for black-breasted and other reds followed by Mr. Clare. This exhibitor swept the board for the chicken prizes. In the other class for game Mr. Everard won both for adults and chickens. In spangled Hamburgs, Mr. Stephens, of Walsall, was 1st for golden, and Lord Ferrers 2d. Mr. E. Warner 1st for silver, and Mr. Faulkner, of Bretby, &c. All who know his birds will be prepared to hear that Mr. Draycott took all the prizes for Bantams, except both 1st and 2d, Lord Mauchline taking the prize for the single cock.

Mr. J. Choyce won 1st and 2d for Aylesbury ducks and 1st for geese. Mr. Worthington for Rouens, and Mr. J. N. Beasley for turkeys.

The pigeons were excellent, and, for a county show, numerous. The arrangements were good, and well carried out. Mr. Hewitt, of Birmingham, was poultry judge.

PARTBIDGE SHOOTING.—The result of the first week's partridge shooting must be a feeling of disappointment, and at the same time it will impress

many who would not accept the fact that nothing is more injurious to the coming season than too heavy a stock of old birds at the end of the present one. Taking the average of the bags, as they have come to hand in the London market up to the present time, we have had as many old as young birds. The latter are small, thin, and weakly. The best birds we have seen were Cornish; they appeared to have been really covies of first hatch, while two-thirds of the birds generally are now but squeakers. The neighbourhood of Thetford has furnished a few good, well grown lots, but the ordinary supply from the eastern counties generally has been woefully bad. The breechloaders tell terrible tales of driving and impatient shooting, and little birds not bigger than thrushes, drilled through and through, with legs and wings broken, lay about on the salesmen's boards until condemned by the inspectors. It would, we think, have been a good plan to have put off shooting until the middle or end of the month, for we have now reached nearly the middle, and many have worked fairly with gun and dog, and have not yet found a young bird as big as it ought to be at this time. Hants and Dorset, both counties from which the birds are generally very good, are badly off, and in Hertfordshire the covies are small and backward. In the lower part of Essex we have some few of good size, but also many barren birds.

DUCKS.—The suggestion of "G. E. O." of Chepstow (*vide p. 933, Aug. 28*), is an excellent one for those who keep ducks in parts of the country where wild ducks abound. We have there known the cross-bred bird very successful, and it stands to reason that the introduction of fresh blood in such a manner does good in every way. You get harder ducklings and quicker growth, and if your young birds be not so large, you have one brood out of the way before the next is ready, and that is a great help. If you had common country ducks, and turned down among them some drakes of the Buenos Ayrean breed, you would find yourself a gainer in every way. The writer once sent a drake and three ducks to a villager's, to "walk them," as they call it in the country. The man lived on a village green, with lots of water ditches and a good pond at hand. The ducks certainly laid, but, as we thought, badly, and the result was, as far as we were concerned, very nearly a barren one; but somehow or other nearly all the villagers whose ducks used the same pond obtained black and black and white ducks, to the great improvement of their stock, to which result we had the satisfaction of knowing that we had unwittingly contributed.

The rabbits whose illness and death "Coney" wrote about are some destined for export to China (we should say were). They are in new hutches, well constructed, and in a well ventilated stable. Their food clean and sweet, not too dry. They are well looked after, and yet the mortality continues. "E. O." is thanked for his information.

Calendar of Operations.

SEPTEMBER: *Bean and Pea stubbles*, if not broken up last month, should be so early in the present. Under proper management, the land will be clean and free from weeds. If so, or but a few annuals be present, it is better to pull and gather these off light land without breaking the surface before the seed-furrow is made, just previous to sowing time. Heavy clay land, however, may be smashed up and left in large clods, so as to be exposed to the sun, night dews, or rains. If ploughed, we have always found it best to plough narrow and deep, which better mixes the previous winter-made staple with the fresh soil brought up, while it breaks down the land sufficiently fine for Wheat, thereby avoiding crossing with the cultivator. There is, however, less objection to crossing with steam than to the tramping of horses in autumn. Much depends upon the state of the land as to moisture; for if rain falls before it is broken up, one operation, whether by the plough or cultivator, will make it sufficiently fine for "weathering" during the remainder of the month. If, on the contrary, the land is full of Couch and surface weeds (mostly annuals), it should be scuffled or broadshared sufficiently deep to bring them to the surface. Some harrow-gather and burn the weeds in small heaps on the land, with the view of getting rid of the seed of weeds. But the practice is questionable, for the harrows and gathering often shed out most of the seed. The more advisable plan is to collect and cart off the weeds, and to convert the hill formed into compost, by mixing lime, or farmyard and liquid manure, or fish, or guano, by this plan the caustic character of the lime, or the fermentation which thus takes place by adding the ammoniacal substances, destroys the vitality of the seeds. There are, no doubt, exceptional cases where, under wretched management, the land is so full of Couch and other weeds that scuffling and stife-burning the sods in large heaps would be preferable to carting off the whole. It must be borne in mind, however, that stife-burning after harvest is only applicable to our southern counties in the generality of seasons.

Clover-leas intended for Wheat should now be got ready for seeding. Some rib or rafter-plough very tenacious clay soils with the view of getting an aerated and mellow seed-bed. If this was done in August, the land may be coup-ribbed by the second week of September, or cross-ploughed or scarified according to the state of the land and weather. And when ploughed the last time an inch of fresh soil is brought up from the bottom to the surface, which forms a clean seed-bed. Others turn the greensward into the bottom of the furrow, under the furrow slice, by means of a skim coulter, thereby leaving the ploughed land ready for the seed drill at one operation.

When Rye-grass and Clover-lea lies one or two years in pasture before it is broken up, the practice is the same, but the greensward is thicker and closer, and more liable to be infested with insects. The best plan of getting rid of these is to adopt means for rotting effectually the greensward in the bottom of the furrow under the furrow slice, so as to deprive the young insects of food in the spring time, when they first make their appearance in the grub form. Insects seldom deposit their ova in healthy pastures, but the presence of much effete matter is to be suspected; and to rot such sufficiently for the safety of Wheat, a top-dressing of lime, liquid manure, or guano, well bush or chain harrowed in just before ploughing, may be useful in setting up the rotting process. Ploughing early and rolling heavily at once, and then harrowing and rolling at intervals of a fortnight, and sowing the Wheat of a field requiring this treatment last of all, is the sure way of securing a plant and getting the Wheat to stand without being "root-fallen" before harvest, as much Wheat was this year.

Wheat and Oat stubbles are autumn fallowed either for Rye or root crops. In either case there is a close similarity of the practice during the month. Broad-sharing is only needed under bad management and the growth of weeds, and the practice required is the same as noted above under Bean and Pea stubble. In addition to what was there directed, if much seed of weeds has been shed, the land should be chain-harrowed, with the view of encouraging germination, so as to get rid of a crop of weeds next year; and, in the absence of a sufficiency of moisture, it may be advisable to allow the land to lie until rain falls before it is ploughed or smashed up. Great caution, no doubt, is necessary in ploughing deeper than usual; the safer plan being to use the cultivator in all cases where the subsoil is unsoond. But if the land has been deeply cultivated hitherto with horses, it may be ploughed to the same depth with steam, and in such cases ploughing down the stubble for the winter furrow, as for Swedes, Turnips, &c., for spring manuring, is preferable to the use of the cultivator. But when the land is to be manured during this and the following month for winter Beans or for Potatos, Carrots, Parsnips, and Mangels, the cultivator may in many cases be preferable to the plough. The practice, therefore, of preparing the land for manure, and of applying the manures, is very diversified, more so perhaps under steam culture than it was under horse culture. In those districts where the harvest is seldom completed before the end of the month, very little manure has hitherto been applied in autumn. But the rapidity with which steam gets over the ground is fast extending the practice northwards of autumn manuring for Potatos, winter Beans, &c., when such crops are largely grown. Some spread farmyard manure on the stubbles, and then plough in on the flat, or smash up with the cultivator, leaving most of the manure roughly on the surface to be washed in by the rain. This latter plan is not to be commended. A third plan is to spread the manure as above, and cover it by forming the land into ridges by ridge-ploughs. A fourth practice is similar to that of spring, the land being ploughed or smashed up deeply, then crossed with the cultivator, set up in drills or ridges, which are split to cover the manure spread between. The land thus lies high and dry throughout the winter months; rough and somewhat cloddy ridges being preferable for autumn, that the frosts may take deep hold and produce a fine mould and seed-bed by the spring.

Breeding Ewes are commonly bought in about this time, either for a single crop of lambs, both ewes and lambs being intended for the shambles next season, or for augmenting the permanent breeding stock. For the latter shearing ewes are generally preferred, as one year given at the beginning puts on two years of strength at the end of their breeding career. Both ewes and rams, young and old, are now got into condition; and the rams are now turned into the pastures with the draft, cast, or crop-ewes intended to lamb about the latter end of January or beginning of February, and with the stock ewes next month. Togs are put up to fatten on Rape, Vetches, Clover, Cabbages, Collards, or Turnips, or rich aftermath—a pound of oilcake or a pint of peas being given per head to force them forward for Christmas. The crop-ewes are usually crossed with a heavier breed, as the Cheviot or blackfaced ewe with the Border Leicester ram, the Southdown with the Cotswold, &c. W. B.

Notices to Correspondents.

ATTENTION.—Will "Half Pay" kindly forward his address: also Mr. H. Grafton, C.E.?

HARVEST MOON: Cor. Harvest moon is the full moon nearest the autumnal Equinox this year, and it occurs about September 13. At this period the moon rises for several evenings at near sunset, and does not, as on other occasions, rise 20 min. after each evening than the last. Refer to "Chambers Cyclopaedia" and Almanacs.

FILARIA. John Fryer writes as follows—"I have 26 beasts, 14 year old, suffering from a sort of short cough, I believe commonly called 'Hoose.' One died to-day, and on opening it we found the trachea and windpipe covered with bunches of thread worms, finer than sewing cotton. The lungs were also full of them. Will any of your correspondents, or can you, suggest a quick remedy? Several more look to be all but in the 'last stage.' Our cow doctor calls it Filaria, [Filaria in the bronchial tubes of cattle, sheep, and pigs exist to a much greater extent than they formerly did, owing to causes which we cannot now consider. The treatment of this disease is generally unsatisfactory, but the most direct remedy is inhalation of the vapour of carbolic acid. Drive the animals into a shed which can be shut up tolerably close, and then pour some carbolic acid on pieces of tile or brick, made sufficiently hot to vapourise the acid, and keep the animals in the vapour for an hour or two, if they do not manifest distress; repeat the inhalation daily for a few times. Liberal feeding is absolutely necessary to enable the beasts to withstand the debilitating effects of the parasites in the lungs. Animals in poor condition should have a drachm of sulphate of iron and half an ounce of gontian put into the food every day.]

The New Forage Grass, Bromus Schröderi, SHOULD BE SOWN IN SEPTEMBER.
SUTTON AND SONS can supply fresh SEED of the above, to produce several cuttings next year. 40lb. required per acre. Lowest prices per cwt. on application.
SUTTON AND SONS, Seedsmen to the Queen, Reading, Berks.

Buttons' Permanent Grass Seeds for All Soils.
SUTTON AND SONS are now prepared to execute orders for their MIXTURES OF PERMANENT PASTURE GRASSES and CLOVERS for AUTUMN SOWING. For prices and particulars apply, stating the nature of the soil to be laid down to **SUTTON AND SONS**, Seedsmen to the Queen, Reading.

E. G. HENDERSON AND SON respectfully announce their DESCRIPTIVE and PRICED CATALOGUE of DUTCH BULBS and FLOWER ROOTS, including the following novelties, now ready for distribution:—

AZALEA INDICA.—The following new Azaleas are offered by E. G. Henderson & Son, as varieties of first-class excellence, and it is with great confidence that they are named as the productions of Mr. Todman, who has originated several of the finest kinds now in cultivation. Many of the Continental varieties are well known as attractive in colour, but greatly defective in the higher properties of outline and substance, therefore but of secondary value for permanent specimens. As English varieties, those now noticed are highly commended as possessing the finest features of interest required for sowing, and also for competition. (A Coloured Illustration of four varieties is published, 1s. 6d.) Plants, 21s. each, the set 54s.

Queen of Scarlets | Queen of Roses | Queen of Double Salmon Queen | Queen of Double Stripes | Whites.

COBEA PENDULIFLORA.—This new and singularly elegant plant is the most graceful and distinct species in its group. The flowers are bell-shaped at the base, and formed upwards into long narrow, drooping, wavy, strap-shaped lobes, from 3 to 4 inches in length, and from the centre of each lobe in the long spreading dark vinous-red filaments, with terminal yellow anthers, present a remarkably rich and unique contrast to the livorse green hue of the plant. 10s. 6d. Smaller, 5s. each.

SPERMATOPHYTES.—*LADY BOVILL*, 21s. each.
VERBENAS.—The following excellent bedding varieties are proposed to be sent out early in autumn, with a view to enable cultivators to prepare a supply for next season's decoration. 6s. each.
 Lady Cowley | Marquis of Bute. | Lord Charles Percy.

NEW EDIBLE FRUIT, MACADAMIA TERNIFOLIA.—This handsome species forms a beautiful evergreen shrub, the leaves are oblong, lanceolate, spinulose margined, evenly expanded, and of a rich green glossy surface, from 3 to 12 inches in length, by 2 to 3 inches in width. In the younger growth the leaves appear opposite and in pairs, but in a more advanced growth they assume a ternate character. The fruit is about the size of a walnut, which at maturity contains a kernel of a remarkably rich and agreeable flavour, resembling, but much superior to, the Filbert. Judging from its native locality, it is fully expected, with slight protection on our walls, to produce its desirable fruit in an English climate; and as an evergreen of fine habit and distinct feature, it will form a valuable and interesting addition to the orchard-house, and also for the cool conservatory border or wall. As a shrub or small tree, it is stated to be an abundant bearer in mature growth. Young Plants, 21s. and 31s. 6d. each; Strong Plants, 63s. each.

CENTAUREA RAGUSINA COMPACTA.—The finest of all varieties for bedding, true from seeds, the present month being the most favourable time to sow for next year's groups. 100 seeds, 6s.

LAFAGERIA ROSEA.—Fresh seed, being just gathered, will grow immediately. 3s. per dozen.

GOLDEN FEATHER PYRETHRUM.—Seed, 6d. and 1s. packet.
CATALOGUES sent post free on application.
 Wellington Nursery, St. John's Wood, London, N.W.

"Every Cottage should be provided with a Water Tank." *Diarist.*

Iron Cisterns.
F. BRABY AND CO. having laid down more extensive and improved Machinery on their Deptford premises (14a Wharf), are prepared to supply WROUGHT-IRON TANKS, GALVANISED or PAINTED, of superior quality, at reduced prices, and at very short notice.

LISTS ON APPLICATION.

An Illustrated Price List of Galvanised Iron, and other of BRABY'S special Manufactures, sent on application.
F. BRABY AND CO., Limited, Fitzroy Works, Euston Road, London; or through all respectable Ironmongers.
 N.B. Open Tanks of different sizes packed one in another to save carriage.

Cottam's Iron Hurdles, Fencing, and Gates.

COTTAM'S HURDLES are made in the best manner, of superior Wrought Iron, by an improved method. Illustrated Price Lists on application to **COTTAM AND CO., Iron Works,** 2, Winsley Street, Oxford Street, London, W.

COTTAM'S PATENT PORTABLE UNIED COW FITTINGS.

Their advantages are—Portability, not Fixtures, removable at pleasure, no Woodwork or Partitions to impede Ventilation or breed Vermin, Hay Rick dispensed with as unnecessary, increased width and depth of Feeding Troughs, Water-Cistern, and Patent Trap Cover to prevent any working. Cleanly, durable, and impervious to infection, being all of Iron. Prices of Fittings per Cow, 5s. Prospectuses free of **COTTAM AND CO., Iron Works,** 2 Winsley Street (opposite the Pantheon), Oxford Street, London, W., where the above are exhibited, together with several important improvements in Stable Fittings, just secured by Patent.

SIR J. PAXTON'S PATENT HOTHOUSES for the MILLION, are cheap, substantial, and easily fixed. Illustrated Price Lists, with sizes, &c., free on application. ESTIMATES given for CONSERVATORIES, HEATING APPARATUS, &c. A HANDBOOK of VINE and FRUIT-TREE CULTIVATION, post free, 13d. HEREMAN and MORTON, 7, Pall Mall East, London, E.W. Works in London, Gloucester, Coventry, and Scotland.

HOT-WATER APPARATUS of every description, fixed complete in any part of the country, for Warming Greenhouses, Conservatories, Forcing Pits, &c. Plans and Estimates on application. J. JONES and SONS, 35, King Street, Cheapside, London, E.C. Manufactory, 6, Bankside, Southwark.

CRANSTON'S PATENT GLASS BUILDINGS for HORTICULTURE. Plans and Estimates free. Just Published, free for 30 stamps, Third Edition, DESCRIPTIVE BOOK, splendidly illustrated from existing Buildings. By the Author and Patentee, JAMES CRANSTON, Architect, Temple Row West, Birmingham. H. J. GROWTAGE, Manager.

JAMES WATTS AND CO., HOTHOUSE BUILDERS and HOT-WATER APPARATUS MANUFACTURERS, 353, Old Kent Road, London, S.E.

200 CUCUMBER and MELON BOXES and LIGHTS, all sizes, Glazed and Painted complete, read for immediate use, packed and sent to all parts of the Kingdom. Strong ZINC HAND-GLASSES, all sizes. References to the Nobility, Gentry, and Trade in most of the Counties in England.

National Flower Show, Manchester, June, 1867.

FIRST-CLASS CERTIFICATE AWARDED TO THE PATENT TERMINAL SADDLE BOILER, with the following note:—"The Judges consider this one of the most powerful and useful Boilers for general purposes." See *Gardeners' Chronicle*, December 7, 1867. See *Gardeners' Chronicle*, January 23, 1868. See *Gardeners' Chronicle*, February 1, 1868. See *Gardeners' Chronicle*, February 8, 1868. See *Gardeners' Chronicle*, March 14, 1868. See *Gardeners' Magazine*, June 15, 1867. See *Gardeners' Magazine*, August 24, 1867. J. IRELAND, Edward Street, Broughton Lane, Manchester.

HOT-WATER APPARATUS Erected Complete, or the Materials Supplied for Heating Pell's Conical, GREENHOUSES, Tubular Boiler, HOTHOUSES, CONSERVATORIES, CHURCHES, PUBLIC BUILDINGS, &c. HOT-WATER PIPES at who scale prices, Elbows, T Pieces, Siphons, and every other connection kept in stock. WROUGHT and CAST IRON CONICAL, SADDLE, and IMPROVED PELL'S and ELLIPTIC BOILERS, from 24s. each. IMPROVED and EXTRA STRONG CAST IRON TUBULAR BOILERS, with or without Water Bars, from 52s. 6d. each. CAST and WROUGHT IRON PORTABLE BOILERS on STAND, for use without brickwork, from 60s. each. PATENT and IMPROVED THROTTLE and other VALVES, FURNACE DOORS, BARS, and FURNACE WORK of every description and size.

LYNCH WHITE, Old Barge Iron Works, Upper Ground Street, London, S.E. (Surrey side Blackfriars Bridge). Price List on application.

Heating by Hot-water.

SHANKS' IMPROVED WROUGHT-IRON BOILER.—This Boiler is made on the principle of the Saddle and Tubular combined. The Pipe, Fire-box, and Shell plates are all of Wrought-iron, and consequently are not liable to break from expansion and contraction of the metal, as Cast-iron Boilers are. The Tubes are placed in the Fire-box, and so arranged as to expose a very large effective heating surface to the direct action of the fire, the advantage of which is obvious. A. S. and SON will be glad to furnish their IMPROVED BOILERS separately, or to furnish Plans and Estimates for Erecting Hot-water Apparatus complete in any part of the country. HORTICULTURAL BUILDINGS in IRON or WOOD. Catalogues, containing Designs of Houses, &c., will be forwarded on application. Special Plans and Estimates for Ranges of Houses to be erected in any part of the country will also be furnished. A. SHANKS and SON, Dens Iron Works, Arbroath, N.B.; and 27, Leadenhall Street, London, E.C.

PORTABLE ENGINES, FROM 4 TO 25-HORSE POWER, THRESHING MACHINES, SINGLE, DOUBLE and TREBLE BLAST, WITH PATENT ROLLED STEEL BEATER PLATES, AND ALL OTHER RECENT IMPROVEMENTS. PATENT ROLLED STEEL BEATER PLATES

CLAYTON and SHUTTLEWORTH, Sole Licensees and Manufacturers. These Plates have been thoroughly tested, and are found to wear more than three times as long as the Malleable Iron Plates hitherto in use. C. & S. are prepared to supply Threshing Machine Owners and the Trade in any quantity.

CLAYTON and SHUTTLEWORTH, STAMP END WORKS, LINCOLN, and 78, LOMBARD STREET, LONDON, E.C. Catalogues on application, Free by Post.

CUMMING & EDMONDS, HORTICULTURAL BUILDERS and HOT-WATER ENGINEERS, LILLIE BRIDGE, FULHAM, LONDON, S.W.

CONSERVATORIES and HORTICULTURAL STRUCTURES of every description designed and erected (in Wood or Iron), and Heated on the most approved principles with the

PATENT TUBULAR SADDLE BOILER,

the cheapest and best Boiler constructed.

No. 1 size, to heat 400 feet, 4-inch pipe	£5 10 0	} Including Furnace Doors, Bars, Dead Plates, Damper, Soot Door, and Draw-off Tap.
No. 2 size, to heat 900 feet, 4-inch pipe	10 0 0	
No. 3 size, to heat 1600 feet, 4-inch pipe	16 0 0	
No. 4 size, to heat 3600 feet, 4-inch pipe	30 0 0	
No. 5 size, to heat 6000 feet, 4-inch pipe	50 0 0	

Plans and Estimates free of charge.

GRAY'S OVAL TUBULAR BOILER.

INTERNATIONAL EXHIBITION, CLASS IX., No. 2119.

Mr. GRAY begs to call the attention of the Nobility, Gentry, Nurserymen, Gardeners, &c., to his

NEW OVAL TUBULAR BOILER,

Acknowledged by practical judges to be a great improvement on every form of Tubular Boiler yet introduced. It has proved itself superior to all other Boilers for quickness of action and economy of Fuel, doing its work with one-third less the amount required by any other.

Extract from Report in GARDENERS' CHRONICLE of International Exhibition, May 24, 1882, page 476.

"The upright form of Boiler is usually made on a circular plan, rather than a square, it seems feasible that the Boilers on the oval plan should bring the tubes more completely within range of the burning fuel; and this being so, the change, though a slight one with the fire. The usual form of a furnace being a parallelogram is no doubt an improvement."

They are made of all sizes, which, with prices, may be had on application.

JAMES GRAY, HORTICULTURAL WORKS, DANVERS STREET, PAULTON'S SQUARE, KING'S ROAD, CHELSEA, S.W.

PORTABLE AND FIXED HOT-WATER APPARATUS,

FOR HEATING CONSERVATORIES, HOTHOUSES, CHURCHES, PUBLIC BUILDINGS, PRIVATE RESIDENCES, ETC., WITH

TRUSS'S PATENT UNIVERSAL FLEXIBLE AND LEAKLESS PIPE-JOINTS.

T. S. TRUSS

Begs to state that the immense number of APPARATUS annually Designed and Erected by him in all parts of the kingdom, and for the ROYAL HORTICULTURAL SOCIETY at SOUTH KENSINGTON and CHISWICK, with unrivalled satisfaction, is a guarantee for skill of design, superior materials, and good workmanship; while the great advantages obtained by his IMPROVED SYSTEM cannot be over-estimated, consisting of perfectly tight joints with neatness of appearance, EFFECTS A SAVING OF 25 PER CENT. on cost of Apparatus erected compared with other systems; facility for extensions, alterations or removals without injury to Pipes or Joints; can be erected by any Gardener; an ordinary size Apparatus erected in one day; and PERFECTNESS of DESIGN SUPPLIED, INSURING NO EXTRAS. Complete Apparatus, of the best materials, delivered to any Railway Station in England, and Erected at the following prices. Erection beyond 25 miles of London, railway fare for one man additional. Considerable reduction on large works.

TWO FOUR-INCH PIPES ALONG ONE SIDE AND ONE END OF HOUSE.

ECONOMY IN THE GARDEN.

CARTER'S

COLLECTIONS OF

HYACINTHS, CROCUS, TULIPS, &c.,

TO PRODUCE A PRETTY AND PERMANENT DISPLAY DURING THE WINTER,

IN DRAWING-ROOM, CONSERVATORY, AND GARDEN.

JAMES CARTER AND CO. strongly recommend the following COLLECTIONS, assorted from the most popular varieties --

No. 1.—COMPLETE COLLECTION for WINDOW or CONSERVATORY DECORATION £4 4 0

CONTAINING

- Hyacinths, 50 in 12 extra fine named sorts
Polyanthus Narcissus, 30 in 12 named varieties
Jonquils, Sweet-scented, 50
Crocus, finest, named, 200
Tulips, extra fine, named, Double, 50
Single, 50
Crocus, pers. chin, 4
D. extra spectabilis, 4
Lilium maculatum, in variety, 4
Scilla sibirica, 30
Snowdrops, extra large, selected, 100

No. 2.—COMPLETE COLLECTION, reduced quantities £3 3 0

No. 3.—COMPLETE COLLECTION, reduced quantities £2 2 0

No. 4.—COMPLETE COLLECTION, reduced quantities £1 1 0

No. 5.—COMPLETE COLLECTION for CONSERVATORY and OUTDOOR PLANTING £4 4 0

CONTAINING

- Hyacinths, 36 in 18 extra fine named sorts, for pots or glasses
Narcissus, Double, White, 50
Pocicous or Pheasant-eye, 50
Double Daffodils, 50
Tulips, very fine, named, 50
extra fine mixed Double, 20
Single, 50
Crocus, Blue, 200
Striped, 200
Large Yellow, 200
White, 200
Anemones, extra fine mixed, 100
Gladolus Branchioides, 21
Lilium extra fine mixed Spanish, 50
extra fine mixed Spanish, 50
Jonquils, Campernel, 50
Ranunculus, extra fine mixed, 100
Snowdrops, 120

No. 6.—COMPLETE COLLECTION, reduced quantities £3 3 0

No. 7.—COMPLETE COLLECTION, reduced quantities £2 2 0

No. 8.—COMPLETE COLLECTION, reduced quantities £1 10 0

No. 9.—COMPLETE COLLECTION, reduced quantities £0 15 0

No. 10.—COMPLETE COLLECTION for OUTDOOR PLANTING £4 4 0

CONTAINING

- Hyacinths, 75 in 3 colours
Narcissus, Double, White, 50
Pocicous or Pheasant-eye, 50
Double Daffodils, 50
Tulips, extra fine mixed, Double, 75
Single, 75
Crocus, Blue, 200
Striped, 200
Large Yellow, 200
White, 200
Anemones, extra fine mixed, 100
Gladolus Branchioides, 21
Iris, extra choice mixed English, 50
extra fine mixed Spanish, 50
Lilium candidum, 5
aurantiacum, 5
martagon rubrum, 5
tigrinum, 5
Ranunculus, extra fine mixed, 100
Snowdrops, 200
Winter Aconites, 100

No. 11.—COMPLETE COLLECTION, reduced quantities £3 3 0

No. 12.—COMPLETE COLLECTION, reduced quantities £2 2 0

No. 13.—COMPLETE COLLECTION, reduced quantities £1 1 0

No charge for packing any of above Collections.

For the fullest information to ensure successful cultivation and particulars of the above Assortments, send for

JAMES CARTER AND CO.,

THE ROYAL SEEDSMEN,

237 AND 238, HIGH HOLBORN, LONDON, W.O.

SUTTONS'

IMPORTED FLOWER ROOTS

SUTTON & SONS,

SEEDSMEN TO THE QUEEN,

READING, BERKS,

having received their FIRST CONSIGNMENT of

CHOICEST DUTCH FLOWER ROOTS,

Selected by themselves from the leading Growers in Holland, are now prepared to receive orders for their COMPLETE COLLECTIONS for WINTER and SPRING BLOOMING, either for indoor or outdoor cultivation.

Suttons' £2 2s. Collection of Flower Roots,

For OPEN GROUND, Carriage Free, contains--

- 74 fine mixed Border Hyacinths
12 fine mixed Gladiolus
12 Polyanthus Narcissus
25 Duc Van Thol Tulips
25 Pheasant's Eye Narcissus
12 mixed Single Early Tulips
25 Double White Narcissus
12 fine mixed Double Tulips
50 Double Daffodils
12 Parrot Tulips
12 large Campernelle Jonquils
12 Gazeriana Tulips
100 fine mixed Double Ranunculuses
50 fine mixed Tulips
100 Scarlet Turban Ranunculuses
12 English Iris
25 fine mixed Double Anemones
12 Spanish Iris
25 Single Anemones
6 Lilies, of sorts
300 Crocus, in 6 sorts
6 Ferraria pavonia
100 Snowdrops
12 Dog's Tooth Violets
50 Winter Aconites
6 Crown Imperials

Suttons' £1 1s. Collection of Flower Roots,

For OPEN GROUND, Carriage Free, contains--

- 42 fine mixed Border Hyacinths
6 fine mixed Gladiolus
12 Polyanthus Narcissus
12 Duc Van Thol Tulips
12 Pheasant's Eye Narcissus
6 mixed Single Early Tulips
12 Double White Narcissus
6 fine mixed Double Tulips
25 Double Daffodils
6 Parrot Tulips
6 large Campernelle Jonquils
6 Gazeriana Tulips
50 fine mixed Double Ranunculuses
25 fine mixed Tulips
50 Scarlet Turban Ranunculuses
6 English Iris
12 fine mixed Double Anemones
6 Spanish Iris
12 Single Anemones
3 Lilies, of sorts
150 Crocus, 3 sorts
3 Ferraria pavonia
50 Snowdrops
6 Dog's Tooth Violets
25 Winter Aconites
3 Crown Imperials

Suttons' 10s. 6d. Collection of Flower Roots,

For OPEN GROUND, contains a choice assortment for a Small Garden.

Suttons' £2 2s. Collection of Flower Roots,

For POTS or GLASSES, Carriage Free, contains--

- 24 fine Hyacinths, by name
6 Persian Iris
12 fine Miniature Hyacinths, do.
6 Peacock Iris
12 Polyanthus Narcissus, do.
100 Crocus, by name
12 large Double Jonquils
12 choice Ixias, by name
12 Single Sweet-scented Jonquils
6 choice Sparaxis, by name
12 Scilla precox
1 Cyclamen persicum
12 Single Duc Van Thol Tulips
1 Jacobea Lily
12 Double Tournesol Tulips
2 Lilium lancifolium album
60 Early Tulips, 10 sorts
2 " " rubrum

Suttons' £1 1s. Collection of Flower Roots,

For POTS or GLASSES, Carriage Free, contains--

- 12 fine Hyacinths, by name
3 Persian Iris
6 Miniature Hyacinths, by name
6 Peacock Iris
6 Polyanthus Narcissus, do.
50 fine Crocus, by name
6 large Double Jonquils
6 choice Ixias
6 Single Sweet-scented Jonquils
3 choice Sparaxis
6 Scilla precox
3 choice Ogals
6 Single Duc Van Thol Tulips
1 Jacobea Lily
6 Double Tournesol Tulips
1 Lilium lancifolium album
25 Early Tulips, 5 sorts
1 " " rubrum

Suttons' 10s. 6d. Collection of Flower Roots,

For POTS or GLASSES, contains a choice assortment of most useful and showy kinds.

The best 12 Hyacinths, by Name, for 12s., Extra fine Double and Single varieties.

To the Trade. MRS. PINCE'S MUSCAT VINE, Planting Canes, 6 feet, 42s. per doz. CLEMATIS STANDISHII, very strong, in pots, 75s. per 100. H. P. ROSES, in pots, good sorts, our own selection, 60s. per 100. ROSES, New, of this season, in pots, 18s. per doz. HEDERA MACULATA and H. MACULATA LATIFOLIA, extra strong, in pots, 60s. per 100. CATALOGUES of General Nursery Staff on application to G. BAKER and SON, American Nursery, Epsom, Surrey. Grape, Mrs Pince's Black Muscat. JOSEPH MERDITH, having exhibited the above species 1 variety, &c., &c., successfully in Hamburg and Edinburgh, &c., &c., since that he has distinguished bunches hanging in great perfection, also the finest stock in the kingdom of the above in Fruiting and Planting Cases, as well as every other variety worthy of cultivation. The Vineyard, Garst A., near Liverpool.

CHOICE NEW PLANTS,

in single pots, well established. NEW FUCHSIAS of 1869, 12 of the best and most distinct, 9s & 12s. per dozen. NEW CHRYSANTHEMUMS of 1869, 12 of the best and most distinct, 9s. per dozen; 24 do. do. do. 7s. 6d. per dozen. NEW COLEUS of 1869, 12 of the best and most distinct, 6s. per doz. Beauty of Wilmore, 1s. 6d. each. NEW GERANIUMS, 6 of the most beautiful of the season, all received Certificates, 1s. 6d. each. DOUBLE GERANIUM, Madame Lemoine, 3s. per dozen. NEW DOUBLE GERANIUM, Victor, 30s. per dozen. NEW HELIOTROPES of 1869, 6 of the most distinct, 1s. each. NEW LOBELIAS of 1869, 6 of the most distinct, 1s. each. NEW VERBENAS of 1869, 12 of the best and most distinct, 4s. p. doz. NEW ALTERNANTHERA MAGNIFICA, most beautiful, 1s. each. NEW GOLDEN GRASS, A. speciosus, pinnatus, aereo-variegatus, 6s. 6d. each. NEW HOLIDAY, L. 1s. 6d. each. NEW KESING, 1s. 6d. each. NEW MYOSOTIS DISSEMINATA, true, 6s. per dozen. Post office orders on Cashew Heddingham. For above and CATALOGUES of Fruit, Roses, Primroses, Violets, Polyanthus, and other Hardy Herbaceous and Alpine Plants, &c., apply to WILLIAM DILLISTONE, Nurseryman, Bible Heddingham, Essex.

The Gardeners' Chronicle. SATURDAY, SEPTEMBER 18, 1869.

MEETINGS FOR THE ENSUING WEEK. TUESDAY, Sept. 21. Royal Horticultural (Fruit and Floral Committees), at South Kensington .. 11 A.M. Ditto (General Meeting) 3 P.M.

THE records that we have from time to time published of the proceedings of the SCIENTIFIC COMMITTEE of the Royal Horticultural Society have sufficiently shown that the Committee was not idle during its last session. Of its experiments at Chiswick we have still to get an account, and the results of some of them will no doubt appear in due time in the Society's Journal, but for others we must wait a longer time, inasmuch as they are continued on into another season. Physiological experiments that are to be worth anything cannot be rattled off in a few weeks. They are of the kind that requires long-continued and laborious attention.

We cannot say, therefore, that we are surprised or disappointed at no results having been yet obtained in some of the most interesting of the Society's experiments. We shall have them in good time, and they will be all the more valuable and trustworthy that the Committee are cautious in their proceedings, and insist on eliminating every known source of error before they come to their conclusions. We are led to these remarks by the postponement of the report of the Sub-Committee on the effect of different manures on the growth of plants. We have watched the experiments of this Committee with interest, and anticipate some very interesting conclusions from their labours, but we quite agree with the Committee that the experiment requires to be repeated in another manner before any satisfactory report can be made. The soil in which the experiments were tried appears to have been naturally too rich, the seeds too thickly sown, and the result, in those plots which have thriven, a matted mass of luxuriant vegetation, too crowded to allow any minute discrimination of differences in amount of produce. In another year this will be remedied by using poorer soil, only sowing a definite counted number of seeds, and leaving them plenty of space in which to grow.

Of course the above remark does not apply to those plants which have not thriven. We have the information plain enough there that the manure that has been applied to them has been either inoperative or injurious; and we believe we can draw one very important inference from these, which we may note without anticipating the results of the operations of the Committee--at any rate, more than we are entitled to do, having seen similar results arrived at elsewhere. It is, that the mineral manures alone are apparently wholly inert, and exercise no perceptible influence upon vegetation. The experiments made by Mr. LAWES and Dr. GILBERT at Rothamsted have, we believe, induced those gentlemen to come to the same conclusion--at all events, as regards the direct effect of these manures. We understand, indeed, that it is an open question with them whether, although mineral manures have no direct effect,

they may not have some indirect effect when mixed with other manures by stimulating their action. This is one of the points under the consideration of the Scientific Committee, and we have no wish to prejudge it, but we think it is a most important step to have gained, to have ascertained by actual experiment that purely mineral manures are incapable of being assimilated by organic bodies.

This is quite in accordance with everything else we know of the relations between organic and inorganic bodies. Our readers, although beyond the radius of the hurricane, must have heard the sough of the tempest that has been going on in the Academy of Sciences of Paris, on the subject of spontaneous generation, between Messrs. POUCHET and PASTEUR and their respective partisans. Many people regard that question as the battle-ground of materialism and immaterialism—of secondary laws and direct creative interference; but it does not strike us in that light. The experiments of the advocates of spontaneous generation all go to prove that their kind of spontaneous generation can only be got out of organic substances. Some one, we forget who, maintains that he did on some rare occasion succeed in obtaining some animalcules out of a silicious solution, but this is not generally accepted. It is believed to have been due to insufficient precautions to keep out all organic germs from the materials experimented with, and, like Mr. Cross's *Acarus horridus*, to have been a blunder. As far as reliable facts and experiments have hitherto gone, no animalcule has ever yet been produced from anything absolutely free from organic matter. Therefore, with the advocates of that kind of spontaneous generation, if all their propositions were conceded to them, it would still not be a question of materialism but of mode of development. We do not know enough of development to say that "Omne vivum ex ovo" is an axiom suffering no exception. What the materialist wants is something different; he can trace the course of our earth from the time it was still a gaseous homogeneous part of the sun, when its dimensions stretched beyond the orbit of Neptune, down to the time when life first appeared upon its surface, and requires no other but the known and recognised laws of Nature to account for everything; and he can take it up at the present date and trace the progress of life and all other terrestrial phenomena backwards until he comes again to the origin of life, and account for all in the same way; but at the first appearance of life he is stopped on both routes by a gap. The whole course of the history of our globe from its origin until now is an unbroken easy sequence of events flowing from the natural operation of secondary laws, except alone the origin of life; and his plea is that it is not natural that this should be an exception, but that life, too, must have flowed from the operation of these very laws, probably under conditions of the earth (with regard to temperature, for example) which no longer exist. That these conditions no longer exist—if they ever did exist—seems alike proved by the experiments both of panspermists and heterogenists (as the opponents and advocates of spontaneous generation are respectively called), and by the experiments of Messrs. LAWES and GILBERT, and the Scientific Committee.

The logical deductions from these carry us much further than the mere fact that it is probably a useless expense for the agriculturist to manure his land with mineral manures. The fact rebounds from the vegetable kingdom to the animal kingdom. If vegetable organisms cannot assimilate mineral products, neither probably can animal. Here is scope for a revision of many of the most accepted medical remedies, or at least for a reconsideration of the rationale of their action upon the system. Why should we take iron to strengthen our system if it refuses to enter it? Is arsenic no alterative, and do it and mercury never pass into the blood? How do they get to the liver, where they unquestionably have been found, if they do not? Are all these remedies merely irritant poisons, which only cure on the principle of counter-irritation? These, and many other curious collateral inquiries are involved in the very suggestive experiments of the Scientific Committee, and we look forward with interest to their future evolution.

WE have always been the staunch advocates of INTERNATIONAL HORTICULTURAL EXHIBITIONS. Every argument that can be applied in support of exhibitions of a more restricted character

applies with increased force to these international displays. We have at all times cordially and gratefully acknowledged the courtesy and hospitality which have been paid to our countrymen who, as jurors, exhibitors, or visitors, have attended these réunions; and when, in 1866, the opportunity occurred to us to do somewhat to reciprocate the kindness and good feeling manifested towards us by our Continental brethren, we did all that lay in our power to make our "International" pleasant in all ways to our foreign guests. We advert to these matters now to show that we are not influenced by any unworthy feeling, or by any petty jealousy of our neighbours, when we draw the attention of the managers to the system of judging, and to the occasional grossly unfair character of the awards made at Continental flower shows. Britons in general are notorious for grumbling, and British exhibitors, when they do not get the prize they think themselves entitled to, are sometimes wont to murmur. Nevertheless, however much wounded vanity may smart, we seldom, if ever, hear of any well-founded complaint of want of fairness or competency on the part of the judges in this country. In by far the majority of cases the verdict is accepted as correct, and even where doubts are expressed as to this point, the integrity and competency of the judges are never seriously questioned.

But in the case of the large Continental exhibitions, where our countrymen enter the lists, the case is very different. From Paris, from St. Petersburg, from Hamburg, we have heard the same story of incompetent judging. In the case of the last-mentioned display the complaints have been especially noticeable. They have been made, too, not by exhibitors, but by bystanders, and by persons not in any way commercially interested in the matter. Some of the cases are so gross, that we think it will be the duty of the authorities on any future occasion to say precisely upon what principles the judging is to be done. Can it be that the jurors are directed to award the prize to the worst objects in competition? Can it be that it is all arranged beforehand who is to get certain prizes, and that the jurors act accordingly? Can it be that the jurors surrender their individual judgments to that of one of their number who acts as fag-man for the rest? Can it be that they have no knowledge of what they are called on to judge? Can the different results be the consequences of the different social system under which we and they live? Here we dispense so far as possible with Government aid and supervision; there private enterprise is as nothing compared with bureaucratic supervision.

Whatever be the cause, there is an evil which needs a remedy, and we trust that whenever another International Exhibition may be held, the principles on which the judging is to be effected will be made public beforehand, so that exhibitors from this country, not conversant with Continental customs, may know what to expect. If our friends like to call black white well and good, we have no objection, but let them give us notice beforehand, and by all means let us have a fair field: we want no favour.

— ONCE more the NATURE of the FEMALE FLOWERS of Conifers is the subject of discussion. M. GUSTAV SPEER, in the "Memoirs of the Imperial Academy of Sciences of St. Petersburg," vol. xiii., 1869, has recently published a paper on the theory of Gymnospermy in plants, in which, after an historical introduction and copious references to the labours of his predecessors, he gives the results of his own investigations into the development of the flowers in Conifers and their allies. From these data he draws the following conclusions:—

"From the corroborative results of the researches of several able observers, as well as my own investigations, it appears that the so-called ovule of Gymnosperms is not a true ovule, but an ovary. The development of the ovule of the so-called Gymnosperms corresponds entirely with the growth of the ovary, and not with that of other Phanerogams. The supposed coat of the ovule is formed, contrary to what is the case with a true ovule-coat before the embryo [nucleus], consequently, it proceeds from the receptacle of the flower, and not from the nucleus, which is the case with all true ovule-coats. It is formed of separate carpellary leaves, which sooner or later grow out, an occurrence unknown amongst ovule or seed-coats. The so-called ovule-coat of Gymnosperms develops itself independently of the embryo [nucleus], remains long separated from it, does not closely encircle it, and sometimes there is even a considerable empty space between them all of which is opposed to the ordinary development of an ovule-coat, but is normal for an ovary-wall. The simple structure of the ovary in Gymnosperms (which, however, is not so simple as some believe) is no reason for considering it an ovule-coat, but rather an ovary, because this structure is amply explained by the economy of Nature, and because it harmonises better with the more simple organisation of the other parts of Gymnosperms. The anatomical structure of the presumed testa is too complicated for such an organ; and if we call the ovary of Gymnosperms an ovule, and consequently the fruit a seed, and the pericarp a testa, we admit an exception in Gymnosperms without

parallel in the vegetable kingdom; for so high an organisation does not occur even amongst the most highly developed Phanerogams. The formation of a style and stigma, which are seen in some Conifers, can only arise from an ovary, never from an ovule. Different abnormal formations indicate the leaf-structure of the ovary. Thus, when two ovaries grow together, there is a suture on one side and two ovules at the base. The structure, formation, and development of Gymnosperms are repeated in the Loranthaceae, Arceutaceae, and other families. R. Brown's opinion that the scale surrounding the flower of Gymnosperms must be considered as a carpellary leaf, is refuted by all my observations and comparative investigations."

— Every botanist knows that some thin-walled cells become thick in course of time by deposition of new matter, but it is a novelty to hear of THICK-WALLED CELLS becoming THIN according to the season. Nevertheless, such is stated to be the case in *Panicum vaginatum*, by M. DUVAL JOUVE. We cannot dispute M. DUVAL JOUVE's assertions, but we should suppose that the thickening is due, in this case, to a swelling of the inner lining of the cell, and subsequent contraction, not to the formation of new matter and to its subsequent disappearance.

— It is pretty generally believed in this country that the pulpy portion of the FRUIT of the Yew (*Taxus*) is harmless, while the kernel or seed is poisonous. This is a point on which, strange to say, there has been much diversity of opinion. M. CLOS, the learned Professor of Toulouse, has recently gone into the subject, and has given the results of his labours in the Bulletin of the Botanical Society of France. M. CLOS decides that the Yew berries (including the kernels) are perfectly harmless.

— In the grounds of the Crystal Palace, a flag SPAR of *ABIES DOUGLASSII* (135 feet above the ground) has been erected as a flagstaff adjoining the Tropical Department on the road-front of the Palace; a flag was hoisted upon it for the first time on Wednesday the 8th inst., the "stars and stripes" being appropriately so honoured. The mast was presented to the Company by the late Governor of British Columbia, Frederick Seymour, Esq., through W. H. Grace, Esq., representative of the British Columbia Spar Company.

— We learn with pleasure that Mr. M. C. COOKE is engaged in the preparation of a HANDBOOK of BRITISH FUNGI, which will contain figures illustrating the principal genera, and references to those of the species. Intending subscribers should communicate with Mr. M. C. COOKE, 2, Junction Villas, Upper Holloway, London. The subscription price is half-a-guinea.

— At the meeting of the ROYAL HORTICULTURAL SOCIETY on Tuesday next (Sept. 21), two prizes are offered for competition by H. G. BOHN, Esq., F.R.S., for "Peaches grown on standards out-of-doors not less than eight fruits." We are also informed that Mr. ROBERT FENN, of Woodstock, intends to exhibit his graft hybrid, seedling, and other Potatoes at the same meeting; so that those who are interested in the grafting experiment with the noble tuber will have the opportunity of judging for themselves of its practicability.

New Plants.

— *ORNITHOCERPHALUS OBERONIA*, sp. n. Folia ensatis acutis, racemo elongato densifloro, rhabdo bipila, bracteis triangulis ciliato denticulatis, 3-5 nervis floribus parvis; ovario pedicellatis hispidis, sepalis orbis dorso carinatis, ovatis, extus hispidis aurantiaceis; petalis obovatis apice minute crenulatis, labello basi tumido quadrato, cornu utrinque exserto obovato, apice inflexo semilunato, lamina linearis complicata acuta; columna moldea, rostellis sigmoides.

A very pretty, small-flowered species, with yellow and white flowers. One of the numerous introductions of W. Wilson Saunders, Esq., and grown by the gardener, Mr. Green, at Hillfield House, Reigate. It comes from Trinidad. *H. G. Rehb. fl.*

— *ZYGOSTATES GREENIANA*, sp. n. Pseudobulbis minutissimis subpyriformibus monophyllis folio stipitato stipposito, basi vaginato, folio superposito cuneato ligulato trigono carnosissimo, pedunculo angulato basilari bifloro racemoso; bracteis triangulis brevissimis carinatis; ovario longissimo pedicellato; sepalis oblongis obtusis extus carinatis. petalis majoribus oblongis denticulatis, labello oblongo excavato, margine line denticulato basi infra impresso auleato, calvari compresso clavato ancipiti, ovarium pedicellatum subangulate, calvari supra ostium calcaris ligulato antice bidentato columna protra, androclindo in rostellum lineare extenso, fovea tenui limbo, brachio ligulatis semilunatis carnosis. antheris antice rostrata, pollinibus quaternis in caudicula a basi dilatatis linearis.

This is a very curious plant. It is the first *Zygostates* we have seen with a spur, but still no doubt a genuine *Zygostates*. The minute pseudobulbs bear trigonous ligulate, glaucous leaves, nearly an inch long and one line wide. The small, short peduncles have two remarkably large flowers. The small, very short ovary is white, streaked with green. The sepals are ovate, tooth-like obtuse, keeled outside; the petals are ovate, tooth-like and white; the foveate, rounded up is white, with green streaks before and behind the opening of the clavate ancipitous spur. The roots are very long and woolly. This is, perhaps, the most interesting discovery of the late Mr. Bowman, near Rio. We have dedicated it to Mr. Green, the skilful gardener to W. W. Saunders, Esq., who takes extraordinary care of the small but lovely Saundersian gems. *H. G. Rehb. fl.*

— *MEIRACYLLIUM GEMMA*, sp. n. Folia oblonga elliptica carnosissimo margine cartilagineo, umbroso, racemo unifloro axillari, mento obtusato, sepalis triangulis acuminatis, petalis linearibus acuminatis serratis acuminatis, labello basi columna adnato, gibboso saepe ovato, antice angustato acuminato crispo; androclindo postice non cornuto, rostellis elongato concavo apice bidentato.

A little vegetable gem, with a creeping rhizome.

erect leaves, like those of a *Sophronis cernua*, and beautifully amethyst-coloured flowers, standing singly. It comes from Mexico, and has lately flowered in the Saundersian collection, under the care of Mr. Green. *H. G. Rehb fil.*

PLEUROTHALLIS BOWMANI, sp. n.

(*Apode caspasiae*) caulis tenuissimus abbreviatus, folio oblongo lanceo apice minuto tridentato, pedunculato unguis, mento obtuso, sepalo dorsali triangulo trinervi, sepalo inferiori oblongo lanceolato apice bidentato, connatis, petalis spatulatis untrinervi, apice rotundato, callosis, labello ligulato antice rotundato ampliato calloso, columna utrinque membranaceo dilatata, postice ligulata serrata.

A small-flowered species, discovered in Brazil by Mr. Bowman, and lately developed under Mr. Green's skilful management in Mr. W. Wilson Saunders' garden. *H. G. Rehb fil.*

EPIDENDRUM MELIOSMUM, sp. n.

Pseudobulbo sphaerico, foliis ligulatis acutis; pedunculo ramoso, sepalis lanceis acutis; topalis cuneato spatulatis acutis; labello cuneato trifido, lacinia lateralibus ligulatis obtusis abbreviatis, lacinia media oblonga acuminata crispula, callo in disco rhombeo sulcato; columna clavata paucurata aptera, anthera emarginata.

Introduced from Mexico by W. Wilson Saunders, Esq., and recently flowered by Mr. Green. *H. G. Rehb fil.*

BRITISH ASSOCIATION.

(Continued from p. 965.)

In the Chemical Section the subjects mentioned below were brought forward—

"On some New Substances Extracted from the Walnut," by Dr. T. L. Phipson. Between the shell and the kernel of the Walnut there exists a thin membrane called the epispem, which closely envelopes the cotyledons, and is composed here, as in most other fruits, of a double membrane, the inner one being very thin, quite white, translucent, and perfectly devoid of taste, whilst the external one is much coarser in texture, more or less coloured, has a very bitter, disagreeable taste, and contains certain substances which form the subject of this paper. From this membrane Dr. Phipson had extracted a substance which he called Nuectaminic acid, the most remarkable property of which is that when boiled with dilute hydrochloric acid it splits up into glucose and another new substance called Retic acid.

"On the Amount of Soluble and Insoluble Phosphates in Seeds," by Professor Smith. The results of various experiments he had made was that 100 parts of cotton seed yield, when repeatedly washed with water, a quantity of acid phosphate of magnesia, both bases and seeds also yield certain proportions. The results showed that the phosphates exist in a larger quantity in the seed than in the other parts of the pod. Experiments upon Wheat flour of various kinds showed that whilst the flour contains only a trace of the phosphates, especially soluble ones, the bran contains a large quantity. These facts tend to prove that the phosphates and the mineral matters contained in Wheat are not combined with the organic matter, but are in a free condition. Other investigations go to prove that although habit and price have gradually led us to prefer white bread to brown, yet this is an error when we consider the nutritious properties of Wheat, especially as food for children, phosphates being essential for the formation of bone and blood.

"On the Supposed Action of Light on Combustion," by C. Tomkinson, F.R.S. The popular idea that "light puts out the fire" is so fixed that probably no conclusions drawn even from actual experiment are likely to disturb it, especially if they be adverse to the notion. It is a matter of daily experience, as people say that if a fire is nearly out in a well-lighted room, you have only to draw down the blinds in order to revive the fire. Experiments on the subject are not easily made, in consequence of the many distorting causes; but from some experiments found in an old volume of the "Annals of Philosophy," made upon coloured tapers, the conclusion arrived at was that the solar rays, in proportion to their intensity, have the power of retarding to a considerable extent the process of combustion, but this conclusion is open to objection. From a series of experiments upon candles of different sizes and weights, in dark chambers, and in day and sun light, it was found that the increase of temperature led to increased consumption of material, and vice versa, the whole result being that in any case the difference is so small that it may be referred to accidental circumstances, such as temperature and material—the final conclusion being that the direct light of the sun, or the diffused light of day, has no action on the rate of burning, or in retarding the combustion of an ordinary candle.

In the Geological Section the following subject was brought forward—

"Report of the Committee for the purpose of Investigating the Veins containing Organic Remains which occur in the Mountain Limestone of the Mendips and elsewhere," by C. Moore, F.G.S. This gentleman has for a long time made the organic remains found in mineral veins his particular study. In his report he referred to the various forms extending to the length of veins. They could not have been formed by sublimation, or the fossils would not be found in them, and he was specially opposed to the doctrine of segregation. Referring to Mr. Wallace's theory, that many of the veins had been filled up by superficial action since the glacial period, he pointed to the age of the fossils as decidedly against it. Mr. Moore's idea was that open fissures communicated with submarine floors, and dwindled down below. The mollusca, &c., of these seas were deposited in the fissures. Three or four things were necessary to the formation of mineral veins—open crevices, the presence of certain minerals in the water of the sea, and

electrical action. The Mendip Hills are intersected with veins, and on their tops some of these are worked. One of them extends for 270 feet downwards, and contains abundant thin fossils, although no massive rocks are nearer than several miles away. This proves how great must have been the denuding force. Mr. Moore has also discovered both land and fresh-water shells in these veins, as well as entomozoa, and seeds of old carboniferous plants. In the mines of North Wales he had found molluscan and fish remains, the latter belonging to no fewer than ten genera intermixed with the contents of some of the mineral veins, the author had found innumerable teeth of fishes, conodonts, nearly all of which were so small that they required optical power to see them. In the lead veins he had met with great quantities of foraminifera, of secondary age. These veins also developed the existence of a fresh-water fauna, of great measure age, having no fewer than nine genera and 127 species. Mr. H. Brady said three well-known genera of foraminifera had been mentioned by Mr. Moore, all of which still existed. One of the most abundant of the foraminifera, *Involutina*, was remarkable for its variety of form. Professor Phillips said Mr. Moore had produced so many new facts that he was entitled to speculate. When he first heard of the discoveries, he was perfectly astonished. What had to be considered in the origin of mineral veins was the altered power of heated water as a solvent, to take up and precipitate mineral matter. Mr. Brady's remarks on the alterations in the type of a certain foraminifer were valuable, for if wide differences could occur in them, why not in animals of a higher organisation, such as lions and tigers? He referred to similar changes in the cephalopoda, and expressed his opinion that the understanding of lower types would make us better acquainted with higher forms.

MUSHROOM CULTURE IN PARIS.

We take the opportunity of displaying to our readers one of the "sensation scenes" in Mr. W. Robinson's recently-published work, "Parks, Promenades, and Gardens of Paris,"* to which we have previously alluded (see pp. 588, 696). The cut represents a Mushroom cave at Montrouge, some 70 or 80 feet

below the earth's surface, and described by Mr. Robinson in our own columns (1868, p. 744). Access to the cave is obtained by means of a rickety apology for a ladder, placed in a well-like shaft. The beds are formed in parallel lines, as shown in the cut. The spawn is introduced in the form of flakes, taken from an old bed, or from a heap of stable manure, which is considered preferable. The beds have a run of 6 or 7 miles in all; each bed is about 20 inches high, and as much wide at the base. The average produce of this particular cave is 300 lb. a day, and this is only one of several similar establishments. The excavations are made originally by the removal of blocks of white stone for building purposes. As we have suitable caverns in various parts of this country, it is to be hoped that some enterprising cultivator will take the hint, and render us independent of France for preserved Mushrooms, of which, according to Mr. Robinson, no less than 11,000 boxes are annually exported by one house alone to this country.

THE LATE ROBERT THOMPSON.

THE late Mr. Thompson, upon whose lamented, though not unexpected, decease we made a few brief remarks last week, was born early in September, 1798, at Echt, in Aberdeenshire, where his father was a small farmer. He received the solid education of his native parochial school, and was afterwards placed under his uncle, who was gardener to Mr. Skene, of Skene, and by whom he was employed in the garden and plantations. From thence he removed for improvement to the gardens of Haddo House, the seat of the Earl of Aberdeen, where he remained till 1820, and then left for the garden at Dunottar Castle, the residence of Lord Kennedy. After remaining there for one year, he removed to the gardens of Robert Ferguson, Esq., of Raith, in Fifeshire, where he was occupied for nearly three years.

In 1824 Mr. Thompson came to London, and went directly to the garden of the Horticultural Society at Chiswick, to which he had been recommended by his late employer's brother, Sir E. Ferguson. The garden

was then nearly completed. The collection of fruit trees had just been planted, and some of them, which were worked on Paradise stocks, were coming into fruit; and the walls which enclose the orchard and kitchen garden had also just been finished. Mr. Thompson was at once placed in the fruit department, then under the superintendence of Mr. Christie, and no time could have been more opportune for his entering on his duties, as from the first he had under his observation the immense collection of fruits which then and subsequently has existed in the gardens. Early initiated by Mr. Knight and Mr. Sabine into a knowledge of the characters and merits of the then existing varieties, Mr. Thompson acquired a taste for the study of fruits and fruit trees which increased with his years, and which he retained to the last. Indeed, during the whole of the 44 years of his active life at Chiswick, he made pomology his special and passionate study, not only as it was exhibited in the immense collection of all kinds of fruit which was by degrees brought together in the garden, and of which for many years he had the superintendence, but also in the literature of the subject, and in the practice thereof as it existed on the Continent. It was this deeply grounded and thorough knowledge of the subject which so well enabled Mr. Thompson to produce that laborious work, the "Catalogue of Fruits cultivated in the garden of the Horticultural Society of London," which has formed the foundation of modern pomological synonymy. No one, except such a person as Mr. Thompson—whose proverbial patience and painstaking, and excessive care and caution, admirably fitted him for such a task, and stamped his labours with an authority which has never been assailed—could have done this work so well. It was not, however, in pomology alone that Mr. Thompson excelled. Every

department of horticulture received from him its due share of attention, and his love of physical science was equalled only by his love of gardening. No better evidence of the combination of these qualities can be given than that which is furnished by that admirable compendium of modern horticulture, "The Gardener's Assistant." Meteorological science is also much indebted to him for the constancy and correctness of the observations he conducted at Chiswick, for a period of 30 years—from 1830 till within a few months of his death. It is a striking fact that, on an average of 30 years' observations—from 1826 to 1855—the difference in the records of mean temperature between Chiswick and Greenwich amounts only to 0.06°—a lasting tribute to the care with which the Chiswick meteorological observations were made.

Mr. Thompson was a voluminous writer, though he does not appear as the author of many works. To the "Transactions of the Horticultural Society," besides the bulky meteorological tables, many valuable papers on horticultural subjects were contributed by him, while, to Loudon's "Gardener's Magazine," the "Gardener's Chronicle," "Edinburgh Philosophical Magazine," and other periodical publications, he was a frequent contributor. In the preparation of most of his great works, Mr. Loudon acknowledges the aid rendered by Mr. Thompson, and especially in the "Encyclopedia of Gardening" and the "Suburban Horticulturist." He contributed also to the "Penny Cyclopædia," to Morton's "Cyclopædia of Agriculture," and to Lindley and Moore's "Treasury of Botany," and, we are told, he was the sole author of the letterpress of the "Pomological Magazine."

From 1824 to the day of his death Mr. Thompson may be said to have been connected with the Horticultural Society, for although his active duties ceased about 18 months ago, when affliction had incapacitated him from further service, the Society, in recognition of his worth, allowed him to retire on full pay. Now, after a life of great activity, this kind-hearted, amiable old man has gone to his rest. There are many who will deeply regret him, both of those, and they are now few, who began life with him, and who shared with him as young men in those early days of Chiswick garden, the pleasures and privileges attendant on the impetus then given to gardening, such as it had never before or since received; and also of that younger and far more numerous class who have sat at his feet, and have drunk in instruction from his words and his writings.

Towards the close of his career a tribute to the services he had rendered to horticulture was paid to Mr. Thompson, by the presentation of a testimonial, amounting to the sum of 100*l.*, raised by public subscription.

[For most of the facts in this short notice of our deceased friend we are indebted to the memoir in the "Journal of Horticulture," written, we have reason to believe, by Mr. Thompson's son. Some of the particulars of his early life have been taken from an account

* London: Murray.

written by Mr. Thompson himself, upon his admission to Chiswick in 1824. It was the custom formerly for young aspirants to write a short account of their lives up to the date of entry. Several autobiographical records of this kind are still preserved at Chiswick, including those of Paxton, Thompson, and many others. It would be well that the practice should be kept up. EDs.]

THE BEST OF THE CULTIVATED ANEMONES.

(Concluded from p. 986.)

Anemone angulosa (large Hepatica).—Everyone who knows the bright flowers of the variously coloured varieties of the common Hepatica, the very bravest of our early spring flowers, will welcome this species, fully twice the size of the common Hepatica in all its parts, with flowers of a fine sky-blue, as large as a crown piece, and distinguished from the common kind by its five lobed and toothed leaves. It is a native of Transylvania, and is hardy everywhere throughout these islands. Obviously, the only thing to determine about such a valuable addition is how to best grow and enjoy it. It is naturally more an inhabitant of the elevated copse than of the crest of the Alps; it is not able to flourish thoroughly exposed to the fiercest blasts like the little alpine plants that cushion down their stout if diminutive leaves, shorter than the very Moss, so that injury from the fiercest gale is out of the question. I have seen it in sandy soil in a thin shrubbery attain a height of more than a foot when not in flower, and the shelter and slight shade received from surrounding objects is decidedly favourable to its development. On all properly formed rockworks, or in their immediate vicinity, it will be possible to give it a suitable position, while in spaces between American plants and choice dwarf shrubs in beds it will succeed to perfection. When plentiful enough it may be used as an edging to beds of choice spring flowering shrubs and for naturalisation in open spots in shrubberies, or in open rather bare and unmown spots along the margins of wood walks.

Anemone Hepatica (Hepatica triloba; common Hepatica).—To add perfume to the Violet, paint the Lily, or tild the yellow Crocus, would seem to be no more wasteful excess than to praise this exquisite little flower. Let Philip Miller speak, and tell us how much esteemed it was in his day—"These plants are some of the greatest beauties of the spring, the flowers are produced in February and March in great plenty before the green leaves appear, and make a very beautiful figure in the borders of the pleasure-garden, especially the double sorts, which commonly continue a fortnight longer than the single kinds, and the flowers are much fairer." And these plants have half disappeared with many others since that time. There is a cheerfulness and a courage about them on warm sunny borders in spring which no other flowers possess, they are hardy everywhere, are not fastidious as to soil, though they love a deep loam and present a charming diversity. The principal varieties are the single blue, double blue, single white, single red, double red, single pink (carnea), single mauve purple (Barlowi), crimson (splendens), and lilacina. Every variety of the common Hepatica is worthy of care and culture. Is it possible to imagine a more beautiful feature than we may produce by planting a mixed edging of the various colours round, say a bed of dwarf American plants, occupying space that perhaps would otherwise be naked? It is but one of many ways in which we may tastefully use them. The plant is a native of many hilly parts of Europe, usually frequenting half shady positions, which will be found to suit it best in a cultivated state also. It is readily increased by division or by seeds, the double kinds by division only.

Anemone thalictroides (Meadow Rue-like Wind-flower).—A delicate, diminutive, and interesting species, with the "habit and frondescence of Isopyrum, the inflorescence of Anemone, and the fruit of Thalicttrum." These qualities, in addition to its dwarf habit, usually only a few inches high, make it worthy of cultivation. The flowers are white, nearly an inch in diameter, open in April and May, the flower stem bearing a few leaves near the summit, so as to form a sort of whorl round the flowers. It is a native of many parts of North America, and is increased by seed or by the division of its tuberous roots. There is a pretty double variety, *A. thalictroides fl.-pl.*, with the flowers somewhat smaller than the single ones, and very neat. Being small and fragile in its parts it requires a little more care than most of its brethren, should have a light peaty and moist soil, in association with other delicate growers or be placed in a position where it is not liable to be overrun by coarse neighbours. It is, perhaps, more correctly known as *Thalicttrum anemoneoides*.

Anemone narcissiflora (Narcissus-flowered Wind-flower).—I did not intend including this species, not thinking it sufficiently ornamental, but Mr. J. Duncan, of the Royal Gardens at Kew, has favoured me with the following note respecting it:—"This is a very striking and handsome sort, and distinct from any of its relatives. In cultivation its average height is about 1 foot. The petals are pure white above, and purple below, but they vary somewhat as regards colour. Proceeding inward, next in order are the yellow anthers which, contrasting with the corolla, justify the specific name. The scape is about twice the length of the foliage, and bears at its summit a considerable tuft of flowers, each of which is about an inch across. The leaves are stalked, and the blades have a soft feel. All the green parts of the plant are hairy. I notice this kind is mentioned in only a single English nurseryman's catalogue, although it deserves more prominence, and is adapted for the rockery, the border, or for pot treatment. It can be increased by division or by seed sown when ripe. It blooms in spring,

and is a native of Germany, and does well in sandy soil."

Apart from the fine *Anemone japonica* and its varieties, there are a few dwarf *Anemones* in the country unworthy of cultivation, insufficiently distinct, difficult to obtain, and of the last probably *Anemone Halleri* is the best. But it is believed that the cream of the known, or obtainable species of the genus, is included in these papers. They may also have served to show how many varied attractions are derivable from one but little grown family of dwarf hardy plants. Wm. Robinson.

THE LATE JAMES VEITCH.

IN the person of Mr. Veitch, whose sudden death it was last week our melancholy duty briefly to announce, we have lost another of the horticultural notabilities of the last two decades; and though placed in a somewhat different sphere of action from such men as Lindley, Paxton, or Thompson, for example, it will be found that James Veitch the younger, as he was till quite recently best known, has left his mark upon the garden history of our time.

James Veitch was born on May the 24th, 1815, in the neighbourhood of Exeter, where his grandfather (of Scotch extraction) and his father were at that time carrying on the business of nurserymen. When about 18 years of age he was sent to London for two years, for the purpose of acquiring that experience which in those days could only be gained in a London establishment. One year of this period was passed in the nursery of Mr. Chandler of Vauxhall, and the other in that of Messrs. Rolliason of Tooting. Returning again to Exeter, and resuming his routine of duties there, he at the same time, impelled by the new ideas and impulses acquired in London, devoted his energies to the gradual extension and improvement of the establishment at Mount Radford, making it eventually one of the first nurseries of the day. All this time he was acquiring the mastery over the mysteries of the nursery trade, in which, first (since 1838) as a partner in the firm of James Veitch & Son, and subsequently on the death of his father, as the head of that of James Veitch & Sons, he was destined to raise himself to one of the very foremost positions. This prominent place amongst his compeers was won not less by his untiring zeal and energy, his keen perception, his clear-headed business habits, and his great personal influence, than by his thorough practical acquaintance with all professional details. It was on his return to Exeter from Tooting that, taking with him a collection of the Orchid gems of those days, he first started in the cultivation of these favourite plants; a taste which he always cultivated with the greatest possible zest, and which came in time to be ministered to by the introductions of his own collectors, and by his intimate personal friendship with men like Mr. G. U. Skinner and Col. Benson, who had made acquaintance with Orchids in their native homes. It should here be stated that Messrs. Rolliason, with whom young Veitch had been placed for the purpose of acquiring a knowledge of his business, declined to receive any adequate remuneration for the benefits conferred by them on their pupil; and the only method of acknowledgment open to the father of the subject of our notice was to commission the son to purchase Orchids from the Messrs. Rolliason. These Orchids became the nucleus of the collection for which Messrs. Veitch are now and have for so long been renowned. It may be interesting to mention, as an instance of versatility, that about the year 1839 Mr. Veitch entered with great spirit upon the growth of Dahlias for competition, the Exeter Dahlia shows, open to all England, furnishing at that period one of the most tempting arenas for the display of horticultural prowess.

In 1853, while still a partner in the nursery business at Exeter, which had then become famous as the first English home of multitudes of new plants, introduced directly by the agency of Messrs. Veitch's collectors—the brothers Lobb, Mr. James Veitch removed to London, and took possession of the once famous establishment of Messrs. Knight & Perry, at Chelsea. Here he was more directly brought into contact with all the leading horticulturists; and his estimable personal qualities, his sound sense, and his energetic manner, soon lifted him into a very influential position in the gardening world, which he maintained for many years, until, as we may suppose, the fore-shadowings of his fatal malady induced him gradually to withdraw from active participation in what may be called public life. All this time, however, the establishment at Chelsea, which still bore the name of the Royal Exotic Nursery, was being remodelled and improved, and a gigantic business, one of the most prominent in England, perhaps in Europe, was being worked up, sufficient of itself to form a striking monument of successful commercial skill and enterprise.

Were we to attempt to show how far our gardens are indebted to the herculean and unflagging labours of Mr. Veitch, we should have to write a history of most of the new plants introduced during the last 30 years; for it was to his active superintendence of their importation, and to his discriminative choice of collectors, that we may largely attribute the success which was realised in this department. The later explorations of Pearce, Hutton, and others, by which also many fine novelties have been acquired, were even more directly under his control; while in order to form some notion of all the services rendered to horticulture by Mr. Veitch in this direction, we must add to the foregoing the results of the two journeys of his eldest son, Mr. John Gould Veitch, to Japan and the South Pacific, which have proved so prolific of first-class novelties. The pages of the garden periodicals bear witness to these facts, in the number of first-class

plants introduced through his intervention, such as *Wellingtonia gigantea*, *Lapageria rosea* and *Alseodaphne*, *Lilium auratum*, *Maranta Veitchii*, *Vandas sumatrana*, *tricolor*, *corulea*, and *insignis*; *Phalænopsis grandiflora*, *Cypripedium caudatum*, *Rhododendron jasmminiflorum*, *Pteroma elegans*, *Nepenthes* (numerous species), *Drosera*, *fontainea spinosa*, *Thuja Lobbi*, *Abies bracteata*, *Begonia Veitchii*, *Masdevallia Veitchiana*, *Tropaeolum azureum* and *speciosum*, *Calanthe vestita*, *Medinilla magnifica*, *Dipladenia splendens*, *Berberis Darwinii*, *cum multis aliis*.

It is, however, not only as an introducer and a dispenser of plants that Mr. Veitch's name must be boldly inscribed in the annals of horticulture, for he occupied a no less worthy position as a cultivator and exhibitor. Indeed Mr. Veitch was a thorough cultivator, as those who have seen the fine specimens sent from Exeter to the Chiswick Shows will acknowledge, when we say that many of them—Heaths and Orchids to wit—were the fruits of his own cultural manipulation, aided by his devoted and faithful servant and friend Domingo. Thus, when he desisted from the laborious task of potting his own plants, few knew better how to direct the action of others. Then, as an exhibitor, Mr. Veitch has had a large share in making our shows the glorious monuments of cultural skill which they really are, despite all the grumbling concerning them. For many years he has been in the constant habit of bringing forward materials, the most excellent in quality, and these have been so abundant in quantity, and arranged with so much skill and taste, that it has been rare indeed to see the name of Veitch either absent from or occupying a secondary place in the award sheets. In all this, as well as in business transactions, he has for the last few years been ably assisted by his sons, Mr. J. G. Veitch, and Mr. H. J. Veitch, who were admitted to partnership in 1865, and by whom the business will now be continued.

We should not omit to state, that Mr. Veitch was one of the best and most hard-working friends of the Royal Gardeners' Benevolent Institution, of which he was also a trustee.

For several years—from 1856 to 1864—Mr. Veitch was a member of the Council of the Royal Horticultural Society, and took a very active part in the administration of its affairs. At his own hospitable house the interests of horticulture were often the subjects of a very free commentary; and many schemes which had been discussed or concocted there, were in due time realised. In particular it may be stated that the idea of the Fruit and Floral Committees of the Royal Horticultural Society had its origin in a happy thought of Mr. Veitch's, which was first broached and talked over even into the small hours, in the parlour at the Royal Exotic Nursery, and at a subsequent gathering of a few kindred spirits was so thoroughly discussed as to smooth away the difficulties which at first seemed to stand in the way of its being realised. On the basis thus obtained a scheme was drawn up, and virtually that adopted by the Council, which has not only worked well, but proved the horticultural mainstay of the Society. In Mr. Veitch's parlour, too, the particular mode in which the Great International Show of 1866 should be presented to the public was agreed to, and action taken thereupon. There had at that period sprung up amongst a small section of horticulturists a most unaccountable feeling antagonistic to the gentleman who afterwards so efficiently filled the office of chairman, and whose loss we have since had to deplore, and this feeling was battled with and overcome chiefly by the influence of Mr. Veitch, and of a few others who supported him. In all movements for the advancement of horticulture he was ready to take the foremost part. Latterly, however, owing to his failing health, he has been less active in matters of this kind, but even so late as the occasion of the organisation of the English Committee of the Hamburg International Show, those who attended the preliminary meetings were assisted by his advice.

Some two years ago, owing to premonitory symptoms of heart disease, which have proved but too well founded, Mr. Veitch ceased to take so active a part as he had been wont, either in horticultural affairs or in matters of business, but latterly he had been in better health and spirits than usual, and even on the day before his decease had greatly enjoyed a visit from his old friend and collector, Thomas Lobb, so that his death on the morning of the 10th inst., at Stanley House, Chelsea, at the age of 51, came suddenly on his family and friends, although, under the circumstances, it can scarcely be said to have been wholly unexpected. His mortal remains have been deposited in the Brompton Cemetery, and there lie peacefully, in the immediate vicinity of the scenes of the most active portion of his life. That he himself was not unprepared for the change that was to befall him is shown by the fact, that only a few days before his death he selected, without the knowledge of any member of his family, a site for a family grave, and in its selection and attendant negotiations manifested those business habits so characteristic of him. Little remains for us to add. We have said enough to show that this was no ordinary man. Zeal and energy pervaded his every action. A quick temper and impatience of opposition were natural adjuncts to such a character, but at the same time it must be added there was thorough commonsensicalness and straightforwardness, a disgust to all semblance even, of meanness or underhandedness, and a warmth of friendly feeling that can be adequately gauged only by those who knew him. T. M.

Home Correspondence.

Grape Soils.—Whatever may be advanced in the future, none of my opponents have as yet produced any substantial objections to the statements contained in my paper read at the Manchester Congress. Not

single conclusion of theirs has been proved; not a point of mine has been shaken. I trust it will be understood that I have not made this assertion in a spirit of mere opposition. A due regard should always be given to the experience of others. Any other mode of action would stifle truth, and check the course of free inquiry. But still, none of us submissively allow ourselves to be deprived of what we have proved to be facts by the mere expressions of those who choose to advance an adverse opinion. I was not unprepared to find that my statements on the subject of Grape soils would meet with opposition, and I possibly by the majority of cultivators, but truth is not the exclusive property of the multitude on all occasions. I have investigated and thought for myself, and fearlessly give publicity to my conclusions, quite regardless of how they may be received. We need hardly be reminded that the Grape Vine grows freely on the limestone in the Continental vineyards. I have never once said that it refuses to do so on that formation. What I did say, and have proved to be the case, is that it grows stronger, is longer lived, and produces a heavier crop of much superior fruit, when planted on the red sandstone. So convinced of that fact was a gentleman in this neighbourhood, whose garden was situated on the limestone, that he had red sandstone soil brought from a long distance to make his Vine borders, but under no persuasion of mine, as we were not then acquainted. The red sandstone soil, which I employ, does not contain more than from 2 to 3 per cent. of lime, a quantity so small as scarcely to be appreciable. We know that excellent Grapes are grown on the Rhine, and also on the banks of the Moselle river, in soil that rests on sandstone rocks, of the same age and composition as that at Tortworth. Some years ago, when on a horticultural tour in the midland counties, I visited several gardens situated on the same formation, and in every case found the Grapes of a first-class character, whether we refer to colour, or the size of the bunches or berries. The subject of soil was then with me an absorbing question, and I took the opportunity of acquiring as much information as I possibly could. All calcareous soil is not carbonaceous to the same extent, so that success or failure will just be in proportion to the amount of carbonates it may contain. Should it reach 40 per cent., cultivators will find themselves in a dilemma; they may exert every contrivance to excel, but every effort made will only multiply their sorrow. Recently I visited a garden situated on the oolite, which contains as much as 80 per cent. of carbonate of lime, little or no siliceous matter, and only a small quantity of alumina. Had those who embrace calcareous soil so strongly, only witnessed the miserable state of the crop, the Vines struggling for little more than mere existence, they must have been induced to alter their opinion. It must not be assumed that these Vines were worn out by age, or that the soil had become effete. Nothing of the kind; the borders had been made on the most approved principles within the last few years; young canes were planted, and these were superintended by an excellent gardener. The soil was chargeable, which proves what I have repeated elsewhere. It is that which equalises ability, and not the application of a few stringent practical rules, as some would have us to believe. Dr. Masters endeavours to solve the problem, by contending that the physical arrangement of the soil is the most active agent, putting aside almost, if not entirely, the office performed by the mineral constituents. On this point I differ as much from him now as during the discussion at Manchester. Would he allow me to ask, Do not these very ingredients give to soil its physical properties? the principal being silica and alumina; and they alone are the substances in varied proportions which produce light and stiff soils, modified to a greater or less extent by the presence of organic matter. No one denies the necessity of physical arrangement in whatever way it may be brought about, but of itself it cannot support life. Particular inorganic substances are necessary for the roots to feed upon, and unless these are present, whether as elements or compounds, the plant cannot long survive; it will either live a languid life or perish altogether. But however complete the physical arrangement may be, we have not the least security that the soil does not contain deleterious substances, some possibly of so poisonous a nature as to destroy life, and yet so subtle as to escape ordinary observation. If such is not the case, how does it happen that the common Brake in one part of our park never extends beyond a certain limit, although it has perfect freedom to do so. The question cannot be answered by saying that it is owing to imperfect physical arrangement, a reply that certainly does not hold water, as within and without the line of growth it is exactly of the same character in that respect. We have, then, no other resource left by which we can detect those substances which are injurious to some plants and beneficial to others, than by an analytical test. However lightly some may undervalue such a mode of searching out truth, they will have a difficulty in substituting another so trustworthy. This is a subject of great breadth, and to treat it fully would carry us through the entire vegetable kingdom, but I have said enough; and if there are those who prefer to assume that my statements are incorrect, well and good, but they must not expect their assumptions to have any force with those who know that the facts of the case are contrary to such opinions. *Alexander Cramb, Tortworth.*

There is abundant evidence to show that the Grape Vine is a most accommodating plant, so far as the chemical nature of the soil is concerned. The facts narrated by Mr Cramb exemplify this. It is then a perfectly legitimate inference to conclude, that the physical properties of the soil its compactness or friability, its power of retaining or transmitting water, of absorbing, retaining, or radiating heat, and so forth, have, under ordinary circumstances, as much or more to do with the well-doing of the plant than the merely

mineral ingredients of the soil have. By all means let us have analyses such as Mr. Cramb advocates, but let them not be confined to the chemical ingredients of the soil only. *Eds.*

Orchid Culture.—Your correspondent "G. H." at p. 640, expressed his surprise at the speed at which Orchids are killed, but I think it cannot be wondered at, when the injudicious treatment which these plants receive, especially in winter, is taken into consideration. In many cases, instead of the maturity of the wood being made the first consideration, every care is taken to keep the plants continually growing. Thus treated, the majority of species cannot possibly ripen their wood thoroughly, and consequently do not flower so freely as they would if treated more naturally, while the more delicate species must soon succumb under this perpetual growing treatment. I have paid a good deal of attention to the habits of Orchids on the Himalayas, and my idea of how such species as *Dendrobium Falconeri* should be treated may not be unacceptable to "G. H." and others. From November to the end of February I would recommend the plants, as well as the atmosphere of the house in which they are placed, to be kept dry. In mild weather the plants should be syringed occasionally, but never watered at the roots. Shading should be entirely dispensed with, and the plants should be as freely exposed to the sun as possible. The minimum temperature should range at night from 42° to 50°, and in the day from 50° to 65°, and allowed to rise with sun-heat to 70° or 75°. In March or April the temperature should be gradually increased, and the plant should be freely syringed overhead, but watered sparingly at the roots. For the following four months the syringe and watering-pot must be freely used, but in September and October gradually withheld. Rain-water, raised to the temperature of the house, should always be used, and, during the growing season, the evaporating pans, as recommended by Mr. Lorimer at page 581, must not be forgotten; the more there are of those the better, where available. I would recommend a long shallow tank under the stage, with the hot-water pipes running through it. From May to the end of August the minimum temperature should not be lower than 65° at night, and in the day not under 70° to 75°, and might be allowed to rise with sun-heat to 85° or 90°, or even higher. For pottings such species as *Dendrobium*, I would recommend Moss that has been growing for years undisturbed on rocks, and got well filled up with decayed vegetable matter; the Moss should be roughly torn up, and particular care taken to retain all the vegetable matter. The pots should be at least three-fourths filled with potsherds and charcoal, and only as much Moss used as is absolutely necessary to cover the roots and hold the plants secure. For most species, I consider February and March to be the best months for this operation. The remarks made by "G. H." at page 530, about "Pine-house treatment," "stimulants," and "tan pits," appear to me to be so sensible and to the point, that I strongly advise all Orchid growers to read them over again, and act by them. I would also advise "G. H." not to be advised into the cool treatment of *Dendrobium Falconeri*, for, with all due deference to the experience of Mr. Anderson, it is a mistake. As a rule Orchids under cultivation get far too much shade. By far the best flowered plants I have ever seen on the Himalayas have been growing on rocks or bare branches of trees where they were fully exposed to the sun and rain; and those plants had such foliage as would satisfy the most fastidious. Mr. Spruce, the botanist, who lived so long in South America, also observed there that Orchids affect light and open situations, for in his "Report on the expedition to procure seeds and plants of *Cinchona succirubra*," to the under Secretary of State for India, dated January 3, 1862, he mentions, in reference to the order Orchidaceae, that "most epiphytal Orchids love light, and in the dense forest they are rarely seen, and often inaccessible, for they grow on the upper branches of large trees, and descend to the lower branches only on the margin of wide streams, where the whole of one side is exposed to the light." No doubt excess of moisture in winter and heavy shading have to answer for the deaths of many Orchids. In your leading article of June 26, you mention that "the season of rest of most of the Orchidæ begins with the wane of the inflorescence." As far as the Himalayan Orchids are concerned this remark does not hold good, for most of them flower before the end of June, and the principal growing season is from June 15 to September 15. In the same article you remark that when the Orchids were in flower they could be moved to another house and relieved by an admixture of suitable Ferns; but why not go further? for, either as regards appearance or the health of the plants, the devoting a house entirely to specimen plants of Orchids, in any stage, appears to me to be a mistake. A house well filled with such plants as *Caladiums*, Ferns, &c., seems to me most suitable for Orchids. The Orchids should be placed so that the surface of their pots may be nearly level with the tops of the other plants. When there is a table between the passage and front of the house soil should be put on and planted with *Selaginellas* before placing the Orchids on it. In houses thus filled, the atmosphere could be kept much moister than in those filled exclusively with Orchids, besides improving the appearance and economising space. Your remark, in the same article, that during the dark days all the light at command is wanted, cannot be too strictly attended to. *J. A. Gamble, Government Cinchona Cultivator, Darjeeling.*

Cedar of Lebanon.—The following are the dimensions of a specimen growing in the garden of F. B. Johns, Esq., at Bishop Stortford.—Height, 70 feet; circumference at 12 inches from the ground, 11 feet 6 inches; and diameter of the spread of its branches,

81 feet. At 12 feet from the ground it breaks out into numerous branches of immense size. It lost its leader some years ago, which has made a great difference to its height. When a boy, I assisted at the planting of it and for a long time after that I used to amuse myself by jumping over it when passing that way. Are there many specimens which, for its age exceeds this in size? *J. Nichol, Bishop Stortford.*—The Cedar of Lebanon flourishes here. One planted by my father in 1816, on the marriage of Prince Leopold with our Princess Charlotte, measured, in 1851, 58 inches in circumference at 3 feet from the ground, in 1859, 93 inches. It has a single stem, branching to the ground in every direction. It is a magnificent young tree, and promises to be of surpassing beauty and size in 100 years to come. *Thos. C. Brown, Further Barton, Cirencester.*

Dwarf Surface-clothing or Edging Plants.—Two plants I have been cultivating this season seem to me likely to prove useful as dwarf edging or border plants. I refer to *Pyrethrum Tchihatchewi* and *Veronica pectinata*. The former is a native of Asia Minor, named after M. Tchihatchewi, author of the "Flora of Asia Minor." Its finely cut leaves, pale green in a young state, spread flatly over the ground, and rapidly cover it. The *Veronica* has numerous branches spreading in a similar manner. Its leaves are somewhat rounded and hairy, crenate at the edges. The shade of colour it presents is that of a hoary grey, such as is presented by some *Salvias*, and is not usually found in the genus. The use of both, however, is the flat spreading habit of the branches. *R. S.*

Yet another Swarm of Insects.—At Beccles last week, for several days, the common was literally swarming with gnats. The air was full, the earth was covered, and the tents of the Rifle corps was filled with them. There was no escape from them anywhere in the neighbourhood. A reporter who uses ink told me he had the greatest difficulty in writing the proceedings, as they crowded into his ink-bottle, a very small pocket one, and spoiled his ink. On the tables, in the beds, over the bodies of men, women, and children, they crawled or alighted. Nothing like such an infliction had ever been seen by the "oldest inhabitant." Since then we have had violent thunderstorms, and torrents of rain, which have, doubtless, dispersed the gnats, and yesterday (Sunday) and to-day we have had hurricanes of wind enough to sweep every flying insect into the sea. It has pretty well swept or torn my fruit off, not only from orchard, but likewise from pyramidal trees, and scattered branches and green leaves over gardens and pleasure grounds by the cartload, torn up my flowers by the root, broken down Hollyhocks and Dahlias, turned vases topsy-turvy, and left a ruined wreck where a few days since all was smiling beauty. I fear we shall not recover this season the beauty we have lost, nor out-grow in any sense the terrible devastation of these torrents of rain and hurricanes of wind. *Observer, East Anglia, Sept 13.*

Trellised Walls.—At p. 941, the Rev. W. F. Radcliffe says, "Peaches, Nectarines and Apricots do not succeed on trellised walls." This statement I can fully confirm. When I once went to see a gentleman in Surrey about a situation, he showed me through the kitchen garden, which was about 4 acres inside the walls, and said "We have had galvanized wires fixed to train the trees to." I said I did not like the plan; of course he asked why; my answer was, I thought there would be a great deal too much draught behind the trees, which very soon proved to be the case. I entered on my new situation in the autumn of 1860. The following summer the young shoots of the Peaches and Nectarines were almost white with mildew, they were very unhealthy, and did not ripen their wood in the autumn. In 1862 there was very little fruit, so that something had to be done. The object of the wires in this case was, that the walls were so rotten, and the mortar was torn out so much from the joints, that the nails would not hold, consequently the whole had to be refaced. Stout galvanized wire pegs, with holes in the ends, were driven in the wall, about 7 inches apart. These stood out from the wall about 5 inches, which was a great deal too much. Smaller wires were then stretched horizontally from end to end. We then wanted to put the wires closer to the wall, for to do without them altogether was almost impossible. To effect this was not so easy, as the pegs would not drive well. I suggested that the pegs should be bent, which was done by bending all the pegs upwards until the wire was within about three-fourths of an inch from the wall. The trees succeeded much better after that, for the remainder of the time I was there. This leads me to mention a different sort of trellis on which we have Vegetable Marrows growing. The roof of a large cart-shed, which covers an area of 1570 square feet, has been trellised over, and on this Vegetable Marrows have been trained. The shoots have already grown about 28 feet in length, and are bearing a large quantity of fruit. I have been told that they are good for crows, but I have never tried them, as my employer would rather give such surplus vegetables to the people in the neighbourhood, who have not gardens of their own. Many a rough and unsightly shed might be advantageously covered in this manner during the summer months, especially in towns, where land is scarce. *T. Whaddon, Bystock.*

The Blood Pine-apple.—This old variety has been condemned by several growers as flavourless and for this reason not worth cultivation. My opinion on this point is quite the reverse—at least when the fruit is well grown and ripened under the treatment usually given to high-flavoured fruit. I eat a fruit the other day and I thought the flavour was most exquisite, it has not that peculiar mucousness which is possessed by a good Queen, but it has a fine sparkling flavour of its own which I consider to be unequalled amongst the varieties of the king of fruits. No collection should be without a few plants of this kind, if for nothing more than for the sake of variety and appearance on the table. Like the *Cayenne*, it is some-

what shy in producing suckers, but frequently forms a tier of gills as large as ordinary crowns: these soon make good plants; its crown is also available. Its fall habit, indeed, renders it necessary for it to be grown where there is plenty of head-room, consequently it is not a very suitable kind for low structures. *John Edlington, Wrotham Park, Barnet.*

The Assessment of Nurseries, &c.—At p. 919 your correspondent states that nurserymen and market gardeners shall be assessed under Schedule B. This I do not read in the Act 5 & 6 Victoria, which says the profits shall be estimated according to the rule contained in Schedule D, and the duty shall be charged at the rate contained in the said schedule (amount of profit), and where the said duty shall be so ascertained it shall be charged under Schedule B, as profits arising from the occupation of lands (2*d*). Your correspondent does not say this, but he says they are assessable under Schedule B, instead of paying under that schedule *H. Lane & Son, The Nurseries, Great Berkhamstead.*

Condition of Fruit in the North—Returning from a short tour I inspected the state of my garden, situated, say 50 miles south of the Border, and 600 feet above sea level, where of course the finer fruit must be grown under glass; thus Apples, Pears, and Plums have the south wall. I was suddenly at fault with the appearance of some Ribston Apples, having upon them brown patches the size of a 5s. piece. The first idea, that it was rot, immediately gave place to the fact that (to the extent named) the Apples were baked, and this was curiously illustrated by the Apples on branches of the same tree not attached to the wall being quite green. Some Pears on the next tree are affected in the same way; this may be not uncommon in the south of England, but in 40 years' experience I have not seen it in the north. The heat on that wall on the 24th ult. was over 130. My Currants are much blighted—the red have lost most of their leaves, and the black are an ugly blotched brown. Can any of your readers advise the best treatment to obtain healthy buds for next year? Is severe pruning desirable? *S. P. H.*

Restio subverticillatus.—Is there any just cause or impediment why this very elegant plant should not take up a position in the subtropical garden? Its cheerful green colour, its Equisetum-like form, and its graceful curves, induce me to think that it would be much appreciated, either in place of, or alternately with, *Humea elegans*. I understand that it may be increased from seed. It is dioecious, it is the male plant which is so elegant, as well as by division of the root. There is a nice plant of it now in the Cactus-house at Kew Gardens *W. T.* [This is the plant grown in some gardens as *Willdenovia teres*. Eds.]

Roses.—I should be glad to see your valued correspondent, the Rev. W. F. Radclyffe, favour us with his further opinion upon the merits of the batch of new Roses sent out this year. I have been given to understand from a reliable source that they are exceptionally good. A really good white hybrid perpetual Rose is still a desideratum; it is sincerely to be hoped one of this class may be forthcoming. A yellow Moss is still in the background, and can only be anticipated in due perspective. We have had already enough and to spare of every shade of crimson-scarlet, crimson-red, and carmine, &c., and it appears impossible to improve upon several of the real gems we possess in this overdone class. The new English-raised Rose, Miss Ingram, is a colour in the right direction, and a really good Rose, but what improvement it is upon a well-grown Madame Rivers or Madame Vidot we are unable to discover, except it may be in its free habit of growth. I hope our great English Rose-growers will persevere in this direction, and by-and-by rival our indefatigable friends across the Channel, who send us over every season hosts of good, bad, and indifferent, the latter generally preponderating over the former. In reply, however, the knowing ones may say—"Ah! but our climate and weeping sky." Well we were pretty nearly roasted lately, even in this locality—the thermometer some 120° in full sun and 80° in the shade. I think a temperature like this, with a further fine autumn, is amply sufficient to ripen the seeds, when the previous operation of crossing has been duly attended to. About six weeks ago the shoots on a Climbing Devonian Rose (grown as a standard on the Dog Rose) were cut back to from 9 to 15 inches. Each shoot thus treated has sent out laterals about 5 inches long, on the extremities of which I this day counted 27 beautifully-developed buds, which in due course will undoubtedly open before the season closes. How far this severe mutilation may react upon the roots it is at present difficult to say, but it has now the appearance of a nice compact standard Rose of moderate growth, so different from its usual straggling habit when budded as a standard. *A. Godwin, The Rosarium, Ashbourne.*

Substitutes for Maiden-hair Fern.—It is not long ago that the claims of *Thalictrum minus* were very strongly urged in this respect, and I have no desire to say a word in its disparagement; but I wish to call attention to a formidable rival in *Bossea cordifolia*, a small, hard-wooded, Australian greenhouse shrub, with reddish stems, and nice little sprays of heart-shaped leaves, reminding me most of that very small-folaged variety of *Adiantum cuneatum*, which is so much grown in the Crystal Palace. *W. T.*

Wellingtonia gigantea.—It may interest some of your readers to know how a seedling planted by my father (the late J. T. Brooks) in these grounds in the year 1857, has fared. The site chosen was a piece of rich sward, near a watercourse. The growth of the tree in symmetry and extent has been uniform to the present time, and neither the dry summers nor cold winters, since it has been left to shift for itself, seem to have in any way affected it. The dimensions of this tree are as follows—Height, 23 feet, circumference of stem, at 1 foot from the ground, 4 feet 8 inches, ditto of branches, 45 feet. *John H. Brooks, Major, Flitwick*

House, Amptill.—The Wellingtonia here was noticed in the Transactions of the Scottish Arboricultural Society in 1865, and afterwards in the magnificent work now publishing by Messrs. Lawson. In 1865 its height was given as 12 feet, and probable age 11 years. This tree is now 25 feet high—diameter of branches, 15 feet 4 inches; circumference of stem, 1 foot from the ground, 4 feet 8 inches; length of leader this season, 1 foot 8 inches. It is perfectly healthy, and of beautiful symmetry; it suffered no injury from the severe winter 1866-1867, or the drought of the two last summers. Of all the new Conifers planted here not one appears to like both soil and climate better than the Wellingtonia. The soil is a deep heavy loam on a limestone gravel. *Robert Moulton, Gr. to Lord Athlumney, Somerville, Navan.*

—A specimen of this tree was obtained from the Royal Nurseries, Slough, and planted on March 10, 1863, the wedding-day of the Prince of Wales. It measured, 2 feet from the ground, in the spring of 1865, 3½ inches in circumference; in 1866, 6 inches; in 1867, 9 inches; in 1868, 12 inches; in 1869, 13 inches; and it has grown in height about 9 feet, being now about 13 feet high. It is perfectly feathered with lateral shoots, forming a pyramid of extreme beauty. It will be seen that its growth was checked by the dry summer of 1868, and probably of this year also, for both months of July were dry, and we believe it will be found that the warm and copious thunder storms so common in that month, and absent last year and this, greatly favoured the growth of many trees. The four-year-old branchlets are dropping off the lateral shoots; whether this is another effect of the drought of 1868, I cannot say, but it does not at all injure the appearance. Two other specimens flourish here, but not equally with this, which had the advantage of being planted in ground trenched for a garden 30 years since, and used as a fruit garden. The soil is oolite, chemically lime and clay, and the elevation about 100 feet above the sea. *Thos. C. Brown, Further Barton, Cirencester.*

Potato Grafting, &c.—I have been waiting to see some results of this practice published in your journal. Being a new idea, many are anxious to hear something more about it. Many doubts have been expressed as to any good coming of it. That is very natural, but too common, with respect to anything new. The results of my experiments of the past season will perhaps enable those interested (and who is not?) to form some conclusion with regard to it. Doubtless it will require considerable practice before any rule can be laid down to gain a certain end. How interesting, for instance, would an account be from one who has "gone into" the practice so far as to see his way clear to "work up" a Potato, to please the eye or the palate of one who is considered a "little" fastidious! I have just dug up a crop from a kidney called the Uxbridge, which I grafted into a Rock Potato. Its tubers are strung together in so very curious a manner, and so different from anything I have before seen, that I am induced to send you a sketch of them. An excessive degree of a common occurrence. The Rock has the peculiarity of having its tubers strung together in some instances, so this is convincing evidence that the characters of the various sorts of Potato can be altered by this operation. The crop consists of 27 tubers, the largest 5 inches long, but not at all improved in shape, and warty. Johnson's Kidney grafted into a Rock has not taken the above peculiarity in so striking a manner, with much better shaped tubers. An Uxbridge in a Dunbar, which is a round Potato, produced a crop also strung together, but with improved tubers in shape; one or two have a young tuber attached to them. A Rock in a Fluke is but very little different; I fancy, however, the eye is not so deep as in the original Potato. But a Fluke in a Dunbar has a crop of the most distorted worthless tubers imaginable. These were all grown in the same soil (good loam, with some washings of a roadway, together with sand), and side by side. Nothing rough could be found to cause any distortion of the above Potato more than the others. There are various opinions as to the mode of planting the Potato, more particularly as to when and how the manure should be applied. The practice of sowing guano on the sets at planting time explains many failures. If the tuber has started into growth, or has a cut or a new bruise, so as to let in the salt, it is almost sure to kill it. Yet this is often done. Some use half-decayed stable manure, putting it on the Potato some inches thick, and then a sprinkle of guano over that. The Potatoes grown in this way are often warty and soapy. There are others, who to my mind are more wise, who manure their ground in the autumn, and otherwise prepare it, and in the spring put in their Potatoes without dung or guano. Others use guano after the plant is above-ground, which no doubt helps the plant if not sufficiently manured at the bottom. I know of small bits of ground on which for a generation the ash-pit has supplied all the manure it has received, and year after year the Potato has been planted without change, and always with good crops. This proves that ashes are suitable for the Potato. Although the natural soil in various places requires different treatment, still it would be interesting and profitable to know the results of the practice of various manures in connection with various soils. There are few plants in which so general an interest is felt as the Potato. *H. M.*

Protection from Frost.—While reading an account of a tribe of northern American Indians, called Crees, I made a note of two materials which they use to keep out the cold of their inclement winters. They make their tents of poles arranged in a conical form, cover them with skins, and line them with sprays of the Balsam Fir, which are from time to time renewed. It is fair to assume that they have some better reason than the smell of *Picea balsamifera* for giving a preference to this species for keeping themselves warm; and as I believe it is easily grown in England, and is not

expensive, it may be worth while to give it a trial in place of matting, for half hardy plants which are to be left out-of-doors during the winter. The other material to which I allude is Sphagnum, in which they wrap the lower extremities of their infants when travelling in the bag-shaped cradles which are suspended on the backs of the Cree mothers. The Sphagnum is said to form "a soft elastic bed, which absorbs moisture very readily, and affords such a protection from the winter cold that its place would be ill supplied by any other material." Possibly a layer of Sphagnum tacked between two sheets of tiffany might form a better protection than matting for covering plants going to flower shows, or for laying over frames in frosty weather. *W. T.*

Hylurgus piniperda.—Your correspondent, "M. D." at p. 967, says that the economy of this insect is well known. I am of the opinion, which Sir John Lubbock well expressed some years since, that "in entomology we have had but two Hubers, nor can we be said yet to understand thoroughly the habits of a single insect." The most patent facts are noticed and repeated by one author after another, and taken on trust by the rest of the world. Let therefore no one be discouraged from observing everything he can regarding the habits of *Hylurgus piniperda* or any other hurtful insect, by the fear that he has nothing new to find out. Your correspondent has obviously himself something to learn upon the subject. Most people are very well aware, although he appears not, that young Pine trees are often attacked by it, although no old Pine trees, either growing or felled, are in the immediate neighbourhood. But I chiefly wish to protest against two of his recommendations—one, that to save a valued tree several logs laid near it would be useful, i.e., to keep away robbers expose a plate chest, trusting to catching the thief afterwards; the other that the proper mode of destroying the insect is to remove the bark of the tree attacked, or to fell the tree—the two modes being, of course, synonymous, i.e., to kill the tree. I remember in my youth being led by the dictum of a great authority to doing something of this kind. I had some large Silver Firs badly attacked by *Adelges Piceæ*; I was told that the only way to save those not attacked was to cut down all the rest. I began to do so, but after I had sacrificed three-fourths of them, I found that if I went on I should soon not have a single one left. I therefore stopped, and in a few years the trees began to recover and the *Adelges* to diminish, and now they are finer than ever, although sadly fewer. It is the same with the *Hylurgus*; I have nowhere seen its ravages so severe as to threaten anything like the death of a tree. It is the attacks on the young shoots which give alarm, but although these destroy many of the shoots, there are plenty left, and another year may be less favourable to the breeding of the insect. Observations as to the character of the seasons in which it flourishes most, the extent of its depredations; the effect which locality, age of tree, exposure to wind, have upon it, when the larva is found in the young shoots, and why; and many other points of inquiry, are not to be found in Rützelburg and the stereotyped textbooks which follow him. I observe that it comparatively rarely attacks the leader. Why? That of two rows of trees planted, one east and west, and the other north and south, one suffers more than the other; that a few years difference in the age of the trees seems to make a difference in the attack. Let us by all means extend our observations, and not rest satisfied with the assurance of any one that everything is known, and that our labour will be cast away. *A. M.*

Fern-eating Caterpillar.—Some years ago there was a question raised in the *Gardeners' Chronicle*, as to whether any kind of caterpillar fed on Ferns. I wrote to say that I had just destroyed one which in a single night had all but eaten up the only Fern I then had. One of your correspondents asked of what species it was, but being no entomologist I could not tell anything more than that it was very active in its habits and of a bright green colour. I have now a greenhouse fitted up with rockwork as a fernery, and am a good deal troubled with slugs, but they seem to confine their depredations to the tender *Adiantums*. During the last few days I have observed that a strong plant of *Pteris longifolia* has been terribly mutilated by some strong-jawed enemy. On turning up the fronds to look for slugs down fell the caterpillar which I now send you, one of the very same species as the one I saw years ago. Since writing the above I have found the leaflets of a *Pteris hastata* hanging in tatters. Having learned what to look for I soon found the enemy most ingeniously concealed by embracing the under side of the stalk of a frond with all his feet, and in a state of wire-drawn attenuation. That is where and how these pests are to be found in the daytime. *T. H. Maw, Brossley.* [The Fern-devouring caterpillar is that of one of our commonest Noctua, *Mamestra brassicae*. It is well-nigh omnivorous, for though occurring on nearly every Cabbage and Cauliflower in the country, it is equally at home on the Pelargoniums of our borders, and I from your experience has also a taste for Ferns. Eds.]

Cutting Down Strawberry Plants.—It is an ignorant and dangerous practice. The leaves are lunge, and unless the new leaves have fairly started, it is injurious. No doubt the Boulogne gardener cut his down after the leaves had started, and in showery weather. In 1860 I mowed off my leaves, as soon as the crops were gathered the severe winter (never to be forgotten) succeeded the summer without an intervening autumn, the plants were ruined for ever, and I had no Strawberries in 1861. My plants are very strong and thickly foliaged to let in light and air to the new comers I have just removed all the drooping leaves round the plants, but none of the crown leaves. The new leaves will soon be at full height then "Stephen" with a pair of scissors will carefully cut out the old leaves to admit light and air to harden the new

crowns and new leaves. The new plantations (planted July 1) and the worked plantations look like beautiful clumps of green Firs. After cropping remove your strings and runners, and copiously and constantly water the plants in torrid weather. For omitting to do this last season, people have had no Strawberries this year. After cropping, an inch or two of loam—I use calcareous clay—spread over the whole surface, is better for the formation of new crowns than rich manures, which will drive the plant into leaves rather than crowns. Put on the stimulating manures, liquid or sold, about February. After cropping, the plants make new roots from their base: the old ones die away wholly or partially; hence it is necessary to coax out new roots, to re-establish the plants before winter sets in. If this is omitted till March—usually the case—the plants have not horizontal and perpendicular roots sufficient to bring the crop of berries to perfection. Hence people exclaim, "I cannot think how it is. I never saw my plants flower so well or set their fruits so well, but they never got bigger than a pea, and came to nothing." *W. F. Radleyffe.*

The Royal Horticultural Society and its intended Shows for 1870.—No one, however conservative his principles in the main, will deny the fact that some change for the better is absolutely needed in regard to the "home shows" of the Royal Horticultural Society. That the Council has, therefore, acted wisely in taking the initiative in regard to its programme for the ensuing year, all must concede. The subject is one beset with no little anxiety, and many difficulties. Some consideration will therefore be accorded to the Council when it is taken into account how many and variable are the interests it has to cater for. To most superficial observers horticulture in its general and broadest sense has but one voice in common. That this is not really so, I need not assert. Individually we have "our hobbies." Hobbyriders become split up into coteries, and each "fancy" thus based upon the surest of all foundations—identity of interests and feelings, has its panacea. Presuming then, that the Council has to contend against an unhealthy state of revenue and expenditure on the one hand, and that it wishes to encourage the legitimate wishes of the florist, the trade, the growers of large specimen plants, the Orchid growers, fruit and vegetable growers, and others, how it is to do this successfully, and to release itself from those embarrassments which stand in its way? Now it seems to me if the Council sees its way to give ample prizes it could not do much better. But the question that will then arise is this—Can such a society as this, by means of small fortnightly shows, do an amount of national good commensurate with what is expected from it? In a word, will the Society be able by such means to uphold its prestige among the leading societies? This is the broad view which we must take of the subject, if we would see the Society prosper and increase in wealth for the future. I am one of those who attach great importance to a healthy state of trade in regard to accessories of the garden. When good or new plants or things are purchased periodically, it is a sure sign that the employer appreciates his gardener's efforts, and enjoys the fruits besides. Now, very frequently a large show—a show which, from the known prestige of a society, is likely to be worth attending—will induce many employers to go, that otherwise would not do so, and this proves a very great incentive to trade. Written reports, however ably given, seldom loosen the purse-strings in the way that the actual "feast of the eyes" does. Now, the question whether these minor fortnightly shows are likely to prove beneficial or otherwise in this sense is well worthy of consideration. If they decrease the interest which the general community takes in exhibitions of this kind, then very much will be lost. The Editors, in referring to this matter a short time ago, spoke of doing away with the "incubus" of the large shows. If our best large exhibitions, our great and glorious International, in fact, were an incubus, I would that such a nightmare had me in frequent possession. But, seriously, the question why large shows do not pay is open to explanation. In a great measure it is due to the want of a more extended system of advertising. Who amongst the millions in the great metropolis, save and except horticulturists or others associated with them, ever knows when there is a show at those gardens? [Hear! hear!] Mr. Fraser at a late meeting of exhibitors, in stating this much, threw out an excellent suggestion, to the effect that clergymen and doctors should be induced to lend a hand in view of disseminating the knowledge that good horticultural exhibitions were held within such easy reach. Could not the metropolitan railway companies, and others with whom they are in direct communication, be induced to lend a hand too? Now that the "Metropolitan" has a station in the immediate vicinity of the gardens, and thus affords direct and constant communication with densely inhabited Westminster itself, the public need but to be informed that such treats, with reasonable charges, a fair attendance would be assured. If you cannot extend the number of days upon which to hold an exhibition, divide the days or the charges therein into two or more parts. Instead of admitting early visitors at 1 o'clock, let it be 12 o'clock. Then 7s 6d or 5s ticket holders may be admitted from 12 or 1 o'clock till 4 o'clock, after which time reduce the price of admission by half or a third of this price; this, whilst it would not clash with any one's interests, might aid the exchequer materially. I cannot leave the subject without a reference to one other fact. If the Council definitively determine upon the whole programme as partly set forth, and determine that such only shall be their campaign, we may hope that what has been asserted again and again, concerning the unfitness of "the arcades" for the display of plants and flowers, may be taken seriously into consideration.

It matters not what skill Mr. Eyles may bring to bear upon their arrangement, it will be perfectly beyond his power to make "an effect" in such a place. The large enclosure, within which stands the council-room has been frequently used. It is fit only for a dry dock however, and for the carrying on of piscatorial operations with immunity from the outer elements! How far superior is a small tent, such as is used at the Botanic, for such displays; and might it not be placed at the back of the wall between the large tent and the arcade, with an entrance near Mr. Fox's office, and from the doorway at the top of the Exhibition Road? A discussion on these matters cannot decrease the popularity of the Royal Horticultural Society; hence I have not hesitated to speak freely. *William Earley, Digswell, Welwyn.* [Our correspondent is not the only one who has jumped to the conclusion that the shows are all to be "minor" fortnightly ones. We are not so informed, and have seen no such announcement. The shows are to be both of a "larger and smaller" type, very much, we presume, as they are now, except that the spring shows will be more distributed over the early meetings, and all will take place on meeting days. There will be a "great" Rhododendron show, a "great" Rose show, and a "great" miscellaneous show, but the principle of restriction rather than of extension will be adopted. That is practically all the change that is to be made, so far as we understand the proposition of the Council. The exact amount of change can only be known when the subject is discussed in detail. Moreover, we cannot allow our correspondent to twist our words into any such statement as that the Great International Show was an "incubus," or that "great shows" are necessarily so. We did not say this; but what we have written we have written. Eds.]

The Early Rose Potato.—I bought 1 lb. of seed of this variety from a London seedsman in February last, and they have produced 142 lb. [Wonderful! Is there no mistake?] They are a fine sample, and when cooked are white and mealy. The following is the manner in which they were treated:—The pound consisted of five tubers of equal size. I put them into a vinery, to enable them to push the eyes, and afterwards cut them up into 62 sets. I manured the ground 2 inches thick with the dung from an old Melon pit, and planted them as I dug the ground, 16 inches apart between the sets, and 30 inches between the rows. *N. Castle, Gr. to the Provost of King's College, Cambridge.*

Our Old Timber.—There lately stood, in St. Peter's Road, Croydon, a fine specimen Beech tree, measuring 11 feet in girth. On Wednesday last, at 2.15 P.M., it was caught by the gale and blown across the road on to the roof of a gentleman's house, carrying slates, glass, iron, bricks before it. On examining this relic of the past, as it was being sawn up, I found it decayed in the centre. In one of the main branches I counted 130 rings, and to outward appearance it was perfectly sound, on looking at the butt, which was 14 feet in diameter, as it laid. My object in writing is that attention may be called to our old trees, especially near roads or houses; and that they may be examined; and if in the state this one was, let them be taken down before some one is killed as they are walking along the road. *D. J. N., Croydon, Sept. 15.*

Pot Vines at the Royal Caledonian Horticultural Society.—Your reporter, in his account of the late Exhibition of the above Society remarks, in reference to pot Vines, "that some of them were layered for show purposes." It was clear to the most inexperienced eye that the pot Vine to which was awarded the 1st prize in its class was nothing but a clumsy subterfuge, such as ought not to be encouraged. I need not say it did not belong to me. My friends North and South know me better than to think that the remark referred to my productions. My Vine, which was placed 2d, was *bona fide* a pot Vine, as also were my others which took the 1st prize. I would add that I was disposed to look charitably on this attempt to put half a vinery in a pot and then into a box, when I learned that my opponent was an amateur, who stood in need of a little practical experience, and a hint as to what is uniformly understood among gardeners as a "pot Vine." I cast no reflection on the judges; evidently they took the same view as I have done, and seemed anxious to reward toil. But is it not desirable that committees, when arranging schedules, should be guarded as to the wording, so as keep the over logical competitor within due bounds? There may not appear to some the same wide difference between a pot Vine and a Vine in a pot, as there is between a Horse Chestnut and a chestnut horse; and most practical gardeners who saw the plants agree that such must have been the case in this instance. *A. M. Leod, Gr. to the Marquis of Lothian, Newbattle Abbey, Dukesburgh.* Such practices as those hinted at by our reporter, and also by Mr. M'Leod, cannot legitimately be called the "pot culture" of Vines. Eds.]

Foreign Correspondence.

A RUN TO MAHABLESHWAR.—It was evening when the buggy was brought to the door; we stepped in, and drove off towards Poonah. The road leads through gently undulating country, with here a temple surrounded by its Banyan trees and *Plumiera acuminata*, and there a well with its sacred *Pepul* trees. Here a garden redolent with the perfume of the Jasmine and the Rose, cultivated for offerings to the Hindoo gods, and there a field of Bajee, offering its golden harvest. We now cross the Moola Moola, a beautiful river, about the size of the Thames at Kew; the Mango (*Mangifera indica*), the Asok (*Jonesia Asoca*), and *Casuarina muricata* fringe its banks. Here is another temple, and as we pass the delicious perfume of the flowers of *Carica Papaya* salutes us. We reached the Post Office, and getting down, we sent the buggy home,

and proceeded to look round the establishment, which is a commonplace looking bungalow with a verandah all round, and a large clock in the centre, which says, with gravity enough, if not wisely, "it is 10 o'clock!" Two mail gigs are in front, a little stronger built perhaps, but on the whole the same two-wheeled, red-painted mail gigs so common at home.

The fellow in the turban has given the order, "Bring forth the horse;" "Horse" we repeat, as four skittish-looking ponies are led up. What are we going to drive tandem? They are only one-horse gigs, but one is put in the shafts, and another on one side. So we say, "O! we are to have three ponies;" but no, we are requested to get up, and on inquiry find we have got our complement of cattle, and that this is the usual way of buckling-to. While wondering what the Post Office authorities meant by such a fancy arrangement, Jehu advises us to look out, the ponies' heads are let go; when the wheeler, rising on his hind legs, springs off, but his outside brother considers there is something wrong, and putting down his head, declines to proceed. After much pushing, coaxing, and whacking, the poor brute starts off. "The post's shrill horn re-echoes through the air," and on we go; the Christians' church, the Hindoos' temple, and Islams' house of prayer, are soon looming in the distance. Again the driver winds his horn, and we pull up at a changing station, after a run of six miles; here fresh ponies are put to.

It is now September, and the native grains may be seen ready for cutting, together with Wheat and gram just coming through the soil. Just as the sun's light tinges the East we stop, and the driver, saying, "Yea kowta hie, sahib," warns us we have reached the foot of the Mahableswhar hills, the principal hill station of the Bombay Presidency, and henceforth we must find some other conveyance. As we had been working all the previous day, and riding all night, we determined to have some rest, and turned towards the travellers' bungalow, an institution of which your stay-at-home readers can have but at least a far-fetched idea. Well, the Government of India, for the benefit of all who require to travel, has built, at a distance of about 20 miles along all the post roads in India, bungalows in which the weary traveller may rest and find protection from the sun's rays. In all the more important ones a messman may be found, who can provide at least the necessaries of life, and sometimes a few of its luxuries, all of which he is obliged to sell according to a list on the wall signed by the magistrate of the district—an arrangement which, I dare say, would find favour with some in more countries than India. We entered the bungalow, and having divested ourselves of our outer garments, and told the messman to inquire after a pony that should be waiting, and to have breakfast ready at 8 o'clock, we went to rest. Rising at the appointed hour, we made a breakfast on tea and fried eggs. By this time a pony was at the door, and we made another start.

As we enter the village of Wye, a few noble Tamarind and soraggy Cocoa-nut trees greet us. Who has ever seen good Cocoa-nut trees away from the sea-coast? At the road-side *Bryophyllum calycinum*, in company with an *Adiantum* and a silvery *Cheilanthes*, give a foretaste of the botanical treasures beyond. We now reached another travellers' bungalow, where we obtained a draught of brandy and soda-water, and a fresh pony. For the last few miles the road has been rising gradually, but now we have reached the hills, and the road winds upwards. Soon we leave the Babul trees (*Acacia arabica*) behind. For a few miles the road winds up the bare hill-side, now and then affording beautiful glimpses of the valley of the Wye. At 10 miles from the foot of the hills we reach Panohgunny. Here Peaches and Strawberries flourish, and we begin to see a few Brackens; soon they become more numerous, and these, with a yellow *Crotalaria* here and there, carry one's mind back to the

"Land of the mountain and the flood,
Land of my sires."

We then passed plantations of Bamboo and *Casuarina muricata*, while a *Curcuma* appeared to enliven the scene with its beautiful white spathes. We are now nearly 1000 feet above the sea, and here is Lingmalla, with the Government Cinchona plantation. It is beautifully situated at the head of a valley down which the small stream flows, and the quinine trees are planted out on small terraces on the hill-sides. Four years ago the plantation was started with 60 plants, and now the number has been increased by propagation to nearly 1000. They are from 12 feet high downwards, and the luxuriant health shown in their fine foliage is delightful to look at, the whole plantation reflects the highest credit on its superintendent, Mr. Gillingwater. The Yeana was then crossed. Its banks are clothed with Bracken, and at the edge of the water beautiful clumps of *Osmunda cinnamomea*, and on the Moss-grown rocks *Cheilanthes tenuifolia* and a small *Asplenium* are seen. We then passed through market gardens, managed by Chinese. Here one fellow has dammed up a small stream and is watering his Potato plot with it. The Potatoes grown here are the finest in India, and are not surpassed by any grown in Europe. Another is planting Strawberries, which yield heavily from February to June; while here is a plot of green Peas in every stage of growth.

These Chinese have been convicts, and are capital garden men—worth two Hindoos. The principal garden tools are a pick, a hoe, and a small weeder, like a miniature reaping-hook if the tool happens to be not quite handy the Chinaman will soon make it so; not so the Hindoo it is a matter of the most profound indifference to him what sort of tool he works with, the oftener the handle of his hoe comes out the better for him, as he can then squat down to replace it. Now we are nearing Mahableswhar, and the scrub, which has lately consisted of a Willow, and stunted *Eugenia*

de Vrij then found that this essence, obtained by distilling the petals of the Shaddock flowers, is identical with the essence of Orange flowers, called Nérol. This conclusion was amply confirmed, when he returned to Europe, by the principal manufacturers of perfumes whom he consulted on this subject, and who declared the essence of Shaddock flowers prepared by him to be identical with the first-rate quality of Nérol. The next question to be solved was, whether the manufacture of Nérol on a large scale in the tropics would be profitable, and he was soon convinced that in Java, where he made his experiments, the local circumstances are such that this manufacture would certainly prove advantageous. Hence it is almost as certain that it could be profitably undertaken in the English colonies where Shaddock trees abound. But besides the essence obtained by distillation of the flowers, there remains in the retort a substance which deserves attention, both from a scientific and practical point of view, especially if Dr. de Vrij's plan of preparing Nérol on a large scale in the tropical colonies should be carried out. If the residue in the still is thrown, while yet boiling, upon a cloth, the clear yellowish liquid which passes through deposits, in the course of a few days, a large amount of yellow crystals. These, on being submitted to various experiments, have turned out to be identical with the substance discovered in 1828, by Lebraton, in unripe bitter Oranges, and called by him hesperidine, the composition of which remains yet unknown. This hesperidine, which Dr. de Vrij has found to be very widely spread in the genus Citrus, is the pure bitter substance contained also in Oranges and Lemons. It can be obtained easily, and in tolerably large quantities, from Shaddock flowers, and appears to be a completely innocent bitter substance, very different from cocculus indicus, picric acid, &c., so that it deserves, perhaps, some attention as a substitute for Hops. In these days, when organic chemistry progresses with such rapid strides, it is not impossible that the substance in question may have been already produced artificially; but this, of course, cannot be ascertained with certainty until its properties and composition shall have been more completely studied. *Scientific Review*

Garden Operations.

(For the ensuing week.)

PLANT HOUSES.

STOVES and all similar structures will now require particular attention in regard to giving air and to keeping off damp; for if the former be not judiciously admitted at this season, both delicate flowers and foliage will damp off in consequence. I have before remarked, that a little heat should always be kept in the pipes during dull periods, more for the purpose of giving greater buoyancy to the air than to afford any additional amount of heat, which will not be required while the average temperature without is not below temperate. The same remarks apply equally to conservatories and greenhouses, &c. Overcrowding of plants should not by any means be permitted, but the air should be allowed free play amongst and throughout all. Those who have hitherto afforded occasional applications of manure-water to *Chrysanthemums* will now do well to withhold it altogether until the flower-buds show prominently, when it may be again be given to them with great advantage. The tying-in of the young shoots of these plants should be proceeded with as frequently as they may require it. The young growths will now become much stiffer, hence a greater amount of caution in tying them will be necessary. Do not crowd specimen plants too closely together, or let them suffer in the least from drought at the roots, otherwise a great portion of the lower leaves will fall off; which not only makes the plants look unsightly, but greatly injures the flowers themselves. Expose such free winter-flowering plants as *Lobelia floribunda* fully to the sun, and give them all the air possible, now that they have made their summer's growth. With the wood thus well ripened they will flower much better a few months hence. Do not pot any after this date. The bright and beautiful Guernsey Lily (*Merine sarniensis*) will now be forming flowers, as also will some few plants at least of *Fallota purpurea*; although its usual flowering period is in May, these will be found very useful for decorative purposes at this season. The former should occasionally receive a slight root watering, so as to somewhat moisten the balls, in which condition the flowers will last much longer. Water should now be partially withheld from such plants of *Gloriosa* as have finished growing and have ceased to flower, with a view to ripening their tubers.

FORCING HOUSES.

Late Fineries, in which Grapes are finally ripening, should have as much air as possible whenever the external atmosphere is dryer than that within the house. A still further reduction of temperature will be advisable in connection with young successional Pines; during cold nights from 65° to 68° will be quite heat enough for them. Continue occasionally to syringe those plants which are swelling fruits in a primary stage with tepid water some 8° or 10° warmer than the temperature of the house itself. Also afford a little air daily if possible. The quantity, which must be moderate at this season, should be judged by the state of the weather without. A mean temperature of about 71° will amply suffice for these by night at this season, the advance by day should be influenced by the warmth of the sun. During moderately warm days it will be possible to admit just a little air, without materially lowering the temperature. This should be given in the front of the house, so as not to create a draught, which would be the case if the back ventilation were opened. By so doing the humidity in the atmosphere and the temperature of the house will be maintained, much to the benefit of

the inmates. Those who depend upon frames or pits, heated by means of fermenting materials, for their supply of Cucumbers, as long as possible into the autumn and early winter months, should now attend strictly to the linings, which will require thoroughly renovating and making up. The plants may be much assisted by giving the soil within the frames a nice surfacing over with finely sifted leaf-mould. Cut away all old and useless stems, and, if needful, give the insides of the frames, and the inner sides of the lights, a thorough good washing, to cleanse them of any filth which may have collected. This will tend to afford the plants more light, which is very essential now that the days decrease so materially. Do not afford air so abundantly; close the lights early in the forenoon, and do not sprinkle the plants so frequently as heretofore. The materials which are collected for Mushroom growing should be placed in a dry open shed, and be made moderately dry by means of fermentation. The beds, which are already made, should be well beaten down, and spawned as soon as a moderate temperature, averaging not more than 75°, can be assured without any danger from fluctuations which are likely to raise it above this. Do not be in too great a hurry to soil the beds over, for if they then fluctuate antagonistically to the well-being of the spawn, there will be less chance for the excessive heat to be given off.

HARDY FLOWER GARDEN.

The seeds of *Ten-week Stocks*, which I recommended to be sown some time since, will now be sufficiently above-ground to be potted off; they might be placed four or five in large 60-sized pots, or pricked off into pans or boxes, as may be convenient. Except during the first few days after transplanting them, when a little shading will be necessary, they are best fully exposed to the outer air and full sun, where they will be imbued with greater hardihood preparatory to withstanding the cold of winter. *Auriculas*, as I have before urged, should be placed under cover of some sort, but even in rainy weather all the air possible should be afforded them. Pot off late struck layers or cuttings of choice *Picotees*, &c.; they will still have time to take root, ready for storing away for winter. Sow seeds of *Lobelia speciosa*, in pans or boxes, to produce young seedling plants, which, being kept through the winter, will afford a better supply of cuttings in the spring than any autumn-struck cuttings are capable of producing. The seeds germinate best when placed out-of-doors beside a north wall, or other similar shady aspect. Sow seeds also of *Intermediate Stocks*, they will then come into flower succeeding those already alluded to.

HARDY FRUIT GARDEN

Strawberry Plantations will still need to be gone over occasionally, with a view of removing all runners which continue to form periodically. This will be found a good time in which to give all established beds of Strawberries a good mulching over with well-decomposed manure. Remove all runners which have become established in pots from off the beds, and in those instances where it is intended to winter them in the pots they are now in, let them, where convenient to do so, be placed forthwith into the frames, pits, or other protection, plunged in some sort of material, the better to protect the roots during sharp weather.

KITCHEN GARDEN.

In hopes that the beautiful showers of rain we have experienced here (in Herts) may have reached far and near, I advise all to proceed with the necessary transplanting of *Lettuces*, *Endive*, *Cauliflower*, and other plants intended to stand the winter. Finally, draw the earth to all plantations of *Broccoli* and *Winter Greens* where not previously done. *Collards* for early winter use would be benefitted by a like operation. Take up and house the main crop of Potatoes where they have become sufficiently ripe for the purpose, choosing a dry, windy day for the process. *Globe Artichokes* should have all old flower-stalks, &c., removed. Where this has not been done, all old stalks should now be cut away at the ground line. This will induce the somewhat exhausted stools or roots to form young growths, which, being perfected before the colds of winter set in, will be able the better to withstand their influence, in fact, entirely dormant stools will not exist through the winter, but will certainly rot away. *H. E.*

TOWN GARDENING.

The *Shrubby Calceolaria* is one of the best bedding plants for towns. It can be easily kept through the winter, and should therefore be propagated at once by means of cuttings. These should be selected from the healthiest plants; only those shoots that now appear without showing flower-buds should be taken. In preparing the cuttings they should be cut off clean at a joint, and be left about 2 inches in length. When thus made they should be dibbled about 1 inch apart in a cold frame, in a compost, consisting of four parts of sandy loam and one of rotten dung. Here they may remain until spring. They should receive as much air as possible consistently with due avoidance of the ill effects of frosts, and have as little water afforded them as is consistent with their requirements. The varieties that have done best with me this summer are *Aurea floribunda*, *Prince of Orange*, and *Compactum*. In the absence of a substantial garden frame they may be kept very well in boxes, about 9 inches in depth and 1 foot in width, filled and planted in a similar manner to the above, as these can be lifted in and out of doors according to the state of the weather. By these means nice little bushy plants may be obtained for next season's planting. It is the wish of most persons who have not a greenhouse or frame, to preserve through the winter those plants which they have grown during the summer. To obtain this various methods are adopted, such as hanging them up by the heels in a dry cellar, keeping them in a dark room, and burying them in sand. All of these methods

I have tried; but the one I have found to succeed best in keeping *Fuchsias* and *Pelargoniums* is to take them up at once out of the borders, and lay them in by the heels in mould in an outhouse. Then leave them until November to gradually dry off. This being done, I cut off all the young shoots and leaves, and bury them in a large wooden chest, in fine ashes that have never been wetted. By these means I find that they retain their vitality much longer, and break into growth quicker when taken out in spring. *J. D.*

STATE OF THE WEATHER AT CHISWICK, NEAR LONDON, For the Week ending Sept. 15, 1869, as observed at the Horticultural Gardens

Notices to Correspondents.

BOOKS: *Novice*, Thompson's "Gardeners' Assistant," CARNATION *C D & Son*. Quite spoiled.
 CONSERVATORY. *T F* We do not recommend corrugated glass. Light shading blinds will be necessary. It is desirable to plant creepers, and train them beneath the roof. It is also generally preferable to have a central bed planted out, which might consist of *Camellias* or *Rhododendrons*, if designed for a cool house, or *Palms* if for a hot-house. Williams' "Select Stove and Greenhouse Plants" is one of the best books to consult.
 CURRANT TOMATO: *H & C*. There are no grounds for supposing that the new Tomato, *Groselle à Grappe* (*Solanum racemigerum*) is poisonous.
 IMPHEE *W M*. A name given to *Sorghum saccharatum*.
 MALFORMED PEAR: *W Smythe*. Such cases are not uncommon, they show that the edible portion of a Pear is a swollen branch. The true fruit, or core, is here absent. Many cases have been figured in previous volumes, and a full account of such growths is given in Dr. Masters' "Vegetable Teratology."
 NAMES OF FRUITS: *Thomas Webb* *Grappa*: Black Morocco.—*D A* Apples: 1, Duchess of Oldenburg, 2, Sturmer Pippin, 3, Robinson's Pippin, 4, Reinette du Canada; 5, not known. Pears: 1, not known, 2, Urbaniste, 3, Bourré Hardy, 4, Summer Franc Real.—*Charles Lawrence*. Pears: 1, could not be recognised, from the small specimens. 2, *Napoléon*; 3, *Beurré Rance*; 4, *Beurré Rance*; 5, *Louise Bonne* of Jersey; 6, *Gloire Morocco*; 7, *Beurré Diel*.—*M. Lemaitre*: Pear: *Ester Beurré*.—*Lingfield* Apple: *Hawthornden*.
 NAMES OF PLANTS: *B & S* A species of *Loasa*, but undeterminable from specimen sent.—*C G M*. *Tradescantia erecta*. *A Watkins*. *Artemisia vulgaris*.—*W M*. *Phyllis cespitosa*. *W D*. *Ecermocarpos scaber*.—*W B Page*. *Fraxinus heterophylla* and *Quercus Mirbeckii*.—*C B*. *Anomatheca cruenta* *Stanhopea*.
 PANSY: *J C & Co*. *Rosy Gem* appears likely to be a showy bedding variety, of a deep reddish violet colour, but the blooms were much damaged before we received them.
 PASSIFLORAS: *B* *Tiscania mollissima*, *P Baonapricea*.
 PEACHES: *J W Waterhouse*. It is really impossible to say what may be the cause of your Peaches dropping at this season in an unripe state, your trees are evidently much out of health. It seems most probable that they have had an insufficiency of water and nourishment. Peaches ripen very well in the natural temperature of August in the open air. You should keep your houses open.
 PINES AND FIRS: *A Young Gardener*. These may be dried in the ordinary manner; those that are likely to shed their leaves (*Abies*) may be dipped into boiling water before drying. *Thuja* will not require this.
 ROOTS IN PIPES: *H*. Probably roots of a tree, but we are unable to say what tree. Iron pipes are preferable to lead pipes.
 SEEDLING APPLES: *T Burnard & Sons*. Your seedling Apple, which in appearance somewhat resembles a small Golden Russet, is of very inferior quality, the flesh being dry, soft, and with little flavour. It tastes more like fruit kept late in the spring than fresh autumn fruit. We do not consider it, either for its size, appearance, or quality, at all worthy of cultivation.
 VINES: *John J*. It will be perfectly practicable for you to take up your vines in October (which is the best month) and form a new border for them. If the roots are, however, so near the surface as you say, why not apply a liberal top-dressing of good soil, and mulch them and water them well during the summer? The roots of the vines will soon come after the good material, and perhaps receive more benefit therefrom than they would in your new border. If the conditions of your border and the drainage are, however, altogether in a bad condition, by all means renew it. We would also recommend more leaf development and attention to their wants.—*John Waterhouse*. We should not recommend you to water your vines when the fruit is ripe. Keep a dry, cool atmosphere in the house, with plenty of air night and day. A little fire may be applied in damp weather, to maintain a dry atmosphere.
 ERRATA.—In the Report of the Royal Caledonian Horticultural Society, p 96, for "Earl of Strathmore" read "Earl of Strathmore."

THE LANDS IMPROVEMENT COMPANY.

Directors. John C. Allen, Esq., 9, Whitehall Place, S.W. Frederick B. Parsons, Esq., 1, Karlsgate, Park, Oxford. Henry Parshar, Esq., Messrs. Herries, Parshar & Co., 16, St. James Street, S.W.

The Company advance money, unlimited in amount, for all purposes of Agricultural Improvement... The whole outlay and expenses are liquidated by a rent-charge upon the land, redeeming principal and interest, over 25 years.

Autumn Sowing.

ODAM'S NITRO-PHOSPHATE or BLOOD MANURE for WHEAT—This Manure, specially prepared for Autumn Sowing, is rich in Ammonia, Phosphates, and other ingredients required for the healthy growth of Grain Crops.

THE LONDON MANURE COMPANY

Have now ready for delivery, in fine condition, CORN MANURE, for Spring Use. DISSOLVED BONES, for Dressing Pasture Lands. SUPERPHOSPHATES of LIME. PREPARED GUANO. MANGEL and POTATO MANURES.

LAWES' WHEAT MANURE, for AUTUMN SOWING, now ready for delivery.

SCRIM CANVAS, 72 inches wide, from 7 1/2d. per yard, and HESSIAN, 74 inches wide, at 7 1/2d. per yard.

SEED BAGS and SACKS, and BAGS of every description in use, supplied at the lowest possible prices.

Cottam's Iron Hurdles, Fencing, and Gates.

COTTAM'S PATENT PORTABLE UNITED COW FITTING.

THE AGRICULTURAL GAZETTE.

1869.—GREEN FOOD SEEDS.—

Wolsh Winter Vetches, Trifolium incarnatum, Italian Rye-grass, Winter Rye, Winter Oats, Winter Rape.

Sutton's Permanent Grass Seeds for All Soils.

Look to your Grass Lands.

JAMES CARTER AND CO.'S RENOVATING MIXTURE OF GRASSES and CLOVERS SHOULD NOW BE SOWN.

THE NATIONAL DOG SHOW.—The TENTH ANNUAL EXHIBITION will be held in CURZON HALL, BIRMINGHAM, on NOVEMBER 29 and 30, and DECEMBER 1 and 2 next.

THE BIRMINGHAM CATTLE and POULTRY SHOW.—The TWENTY-FIRST GREAT ANNUAL EXHIBITION OF FAT CATTLE, SHEEP, PIGS, DOMESTIC POULTRY, CORN, ROOTS, and IMPLEMENTS, will be held in BINGLEY HALL, on SATURDAY, MONDAY, TUESDAY, WEDNESDAY, and THURSDAY, November 27, 29, and 30, and December 1 and 2, 1869.

SMITHFIELD CLUB FAT CATTLE SHOW.—The ANNUAL SHOW OF FAT CATTLE, SHEEP, and PIGS, will be held at the AGRICULTURAL HALL, ISLINGTON, on MONDAY afternoon, December 6, and Four following Days.

SMITHFIELD CLUB IMPLEMENT SHOW.—The LAST DAY for receiving APPLICATIONS for SPARE IMPLEMENTS and MACHINERY, &c., is OCTOBER 1.

THE AGRICULTURAL GAZETTE.

SATURDAY, SEPTEMBER 18, 1869.

MEETINGS FOR THE ENSUING WEEK.

Sept 22 Bucks Agricultural, at Aylesbury. Staffordshire Agricultural, at March. Wetherby Agricultural.

ANIMALS during transit by sea and land are of necessity subjected to much suffering.

How far the hardships which they endure are preventable is the question which the "Animals' Transit Committee" will shortly have to consider, and, if possible, determine.

Public attention has been suddenly aroused by a letter from "T. H.," published in the Times, recounting the sufferings of sheep and pigs in the voyage from Rotterdam to London, and the additional unnecessary pains which were inflicted during the process of landing them at Blackwall.

We can understand that the writer, witnessing for the first time the scene which he describes, would feel too indignant at the ill-treatment which the unfortunate dumb creatures were compelled to undergo to examine all the circumstances very closely; if he had done so, it might have occurred to him that most of the cruelties of which he justly complains it is quite within the scope of existing laws to punish, although beyond the power of any Government to avert. Over-crowding and privation from food and water can be remedied; but, short of teaching uneducated men compassion, what can prevent the "ferocious brutality" to which he refers?

All that legislation can do has been done already, and "T. H." or any other passenger, if he had been so minded, might have set the law in action with good effect against the young sailor and his companions in cruelty.

But after all, what avail single efforts directed against the offshoots of a bad system? There is no lack of cases of individual savageness in the treatment of animals, and any benevolent individual might spend his whole life in offering up daily victims to the provisions of "MARTIN'S

Act." We would undertake that he should never want offenders at all hours of the day—in the open streets, on the wharves, and in the London market—to say nothing of the secret horrors which are, with some sense of fitness, enacted in darkness.

If any good might be gained by making the hair of the people stand on end, we could outvie the Ghost in "Hamlet" with an unfolded tale of animal sufferings; it is enough, however, to assert in plain phrase that from the time the beast leaves the pasture or the stall on his road to the shambles, he is called upon to suffer scarcely remittent pain from the cruelty, or the indifference hardly less culpable, of his human persecutors, whom it is his sad fate to requite by furnishing them with their daily food.

Under the clauses 64 and 75 of the Contagious Diseases (Animals) Act, the Privy Council has power to deal with the subject; and it is satisfactory to observe in the circular, which has been forwarded to us by Mr. TENNANT, the secretary to the committee, that it is proposed to consider—how a sufficient supply of food and water may be provided for all animals brought by sea to British ports, and for all animals carried by railway in Great Britain how animals may be protected from unnecessary suffering, whether in consequence of overcrowding, or from other causes, during their sea-passage from ports abroad to ports in Great Britain, from ports in the United Kingdom to ports in Great Britain: also during their landing, and throughout their inland transit.

The committee, consisting of the Clerk of the Council, the Deputy Chairman of the Board of Customs, the Permanent Secretary of the Board of Trade, and the Secretary of the Veterinary Department (with Mr. TENNANT as Secretary), invite the aid of all persons who have special knowledge of the subject; and there is no doubt that a mass of evidence will be obtained, which will be of the greatest assistance to the committee in framing the report, which is promised on or before the 1st November next.

We have no desire to anticipate the conclusions at which the committee may arrive from the evidence submitted to them, but we may be permitted to suggest that no half measures will effect what is desired; to carry out the propositions which are implied in the questions referred to the committee, will necessitate entirely new arrangements for sea transit and considerable modifications in these for conveyance by railway.

Proper accommodation for animals on board ship and in railway trucks, is the first point to be settled; when animals are huddled together in a heap, or tied close to the vessel's side, feeding and watering are impossibilities. There is no very great difficulty in the way of penning sheep, and tying cattle in a truck, or on board a boat, so as to allow them free use of their heads; but the expense will be no trifling matter, because the adoption of such a system means neither more nor less than providing a stall for every two oxen and a pen for every dozen sheep, with appliances for the reception of food and water. This, we apprehend, is an outline of the plan which will have to be carried into effect. The details are of minor consequence. How and when food and water are to be given, are questions which may be definitely answered after a few experiments; but we contend that all such experiments are out of place until means have been devised for placing animals in a position in which they shall be enabled to keep their feet and breathe freely, and shall neither be stewed in their own steam nor alternately scorched in the sun's rays and drenched with the waves. Having provided for the comfortable location of animals during transit, the easiest method of supplying food and water need not require much consideration. In cattle ships, troughs and portable racks of net or wood might readily be arranged round the pens, and at a convenient part of the stalls; in reference to railway trucks the plan of hanging on troughs when the train is stationary at a siding seems to be more convenient than the employment of troughs attached to the trucks; food on railway journeys is of less consequence than water, but there would be no difficulty in supplying hay to those animals which might require it at the same time.

Infliction of unnecessary pain, in wantonness or ignorance, cannot, we repeat, be provided against by Privy Council Orders, and if their lordships succeed in providing comfortable quarters for animals in transit by sea and land,

COTTAM'S HURDLES are made in the best manner, of superior wrought iron, by an improved method. Illustrated Price Lists on application to COTTAM and CO., Iron Works, 2, Winsley Street, Oxford Street, London, W.

Their advantages are—Portability, net fixtures, removable at pleasure, no Woodwork or Partitions to impede Ventilation or breed Vermin, Hay Rack dispersed with an unnecessary, increased width and depth of feeding Troughs, Water Cistern, and Patent Drop Cover to prevent over-gorging. Cleanly, durable, and impervious to infection, being all of Iron. Prices of Fittings per Cow, 6s. Prospectuses free of COTTAM and CO., Iron Works, 2, Winsley Street (opposite the Pantheon), Oxford Street, London, W., where the above are exhibited, together with several important improvements in Stable Fittings just secured by Patent.

we must be content to leave the rest to the advance of that liberal education which we are told "softens manners and suffers them not to be fierce."

THE great advantage arising from REAPING CORN by MACHINERY appears now to be universally admitted. The rather light crop of straw of the present year has been favourable to cutting by applied horse-power, and the practice has been nearly universal. In every field, on large farms and on small, where harvest was progressing, the familiar "rattle and ring" of the back or side-delivery machines has been heard. "Where on earth have all the machines come from?" is a question that at once springs to the lips.

We are old enough to have seen many changes. We have lived through the several ages of the sickle, the scythe, and the reaper. Our earliest memories are associated with tales of shearing contests—stories of "land and band" struggles between man and man, when master and dame, man and maid, son and daughter, went out cheerily every morning to face the "stubborn glebe;" yet with every exertion it took a month to get at the "mell sheaf"—to cut the last white corn. Then came the scythe, with which the top-men did their 2 acres each per day; and by its aid we were enabled to finish cutting in three weeks in favourable seasons. And to "disestablish" this implement has taken years of labour and mountains of capital, which have been required to produce the modern reaper—light, durable, and effective. It has been done, however; and there is scarcely a farm in the best farmed districts of England and Scotland without a reaper, although ten years ago our own simple and efficient Cuthbert was the first to invade the territory in which our own farming interests lie.

Although, however, practice has accepted and fully endorsed the doctrine of the supremacy of reaping by machinery, and the question may be fairly said to be removed from the debatable ground of experiment into that of general experience, still we find it very difficult to get at correct figures as to the actual cost of the operation, much less at the comparative cost of different modes.

The farmer knows that the reaper secures to him many advantages—despatch in the operation, shorter period of harvest, less waste in the tail and the sheaf, less waste on the ground, less rakings, a sheaf straight in the straw, but capable of drying sooner than if strewn, and not so liable to sprout in the tail in wet weather as mown corn; and he has also no doubt—he is, in fact, pretty well certain—that it costs less; but how much he can't exactly tell.

This statement of cost depends so much upon circumstances, exceptional and peculiar to localities and individuals, that he will seldom try to disentangle the account, and ascertain the real cost of his harvest operations by machinery.

As Miss MARTINEAU's model farmer's wife—manager irreproachable, and pattern in most things as she was—could never be coaxed into giving her town catechist a precise statement as to the *modus operandi* of butter making, and the "reason why," because, said she, "it depends"—depends truly upon the 101 incidental circumstances and contingencies which affected the result, and which she knew must be met and dealt with by the hand of experience as they arose—so, in the case of reaping, weather may be uncertain, and time thus lost; the hands may on some days be partially employed at other work; there may be servant boys, servant men, servant maids belonging to the house, who are fed there, and have no harvest wages; there may be also work done by members of the family; there may be men hired into the house and men hired out of the house, and some with rations and some without; there are also in some instances bread and cheese and beer allowed, and in others none, and in some beer without bread: so that the question of actual cost becomes, in most instances, one of calculation rather than of fact; and, therefore, the practical farmer seldom ventures, either in print or conversation, to state the positive cost of reaping by machinery.

Now, it fortunately happens that none of these exceptional circumstances occur in our experience this year. Our whole harvest has been cut by the reaper, and every man, woman, and child has been paid money wages weekly. There have been no men hired with rations, and no yearly servants employed; and no extras have

been given but one pint of beer, and beer only, to each person twice a-day. We are, therefore, in a position to answer the question, What is the actual cost of reaping by machinery? precisely and positively; and that, not for one field, or plot of work, but for the whole crops of an extensive farm, the reaping of which was carried on consecutively through the whole period of harvest. This statement of cost and experience we purpose giving in full detail next week; and we shall be very glad if any of our numerous readers will be good enough to furnish us with their practical experience also. What we want are "facts" illustrative of the subject, and not opinions. Opinion, as we have shown, has given its verdict; and by facts and figures we hope to be able to show that the opinion is correct, and to what extent in the £ s. d. point of view it is so. Our correspondents, therefore, will please to state precisely all the following particulars:—1, The kind of reaper used; 2, Number of days at work; 3, Acreage of crops cut, and what sort; 4, Character of crops, whether light, average, or heavy; 5, Number of men, women, and children employed; 6, Rates per day, and wages paid to each; 7, Total amount paid in wages; 8, Amount paid for ale, repairs, and other incidental matters; 9, Total amount paid for reaping, tying, stooking, and raking the gross acreage; 10, The average cost per acre of the same.

The correspondence which has taken place on this subject between Mr. MECHI and a "Durham Farmer" points clearly to the necessity which exists for ventilating this subject. A friend of Mr. MECHI, writing from Yorkshire, states that he has cut, tied, and stoked, and stubble raked, 12 acres of white Wheat, about 34 bushels per acre, for 51s. The "Durham Farmer" says that it has cost him 107. 4s. to cut, tie, and stook, and stubble rake 12 acres of Wheat, about 40 bushels per acre; and Mr. MECHI, in rejoinder, fixes the cost of reaping the acreage of Wheat upon his farm at 6s. 9d. per acre!

That three practical men should gravely state the cost of a simple operation in the art which they profess to practise, at 4s. 4d., 17s., and 6s. 9d. per acre respectively, seems extraordinary. To adopt these figures as facts, to say that the varying surrounding circumstances produced the difference in result, would be to accept a glaring paradox; one, or other, or all of these figures, are erroneous. The real cost and the operation of reaping, measured by the amount of physical power expended in the operation, and not by the money paid by contract, which may vary greatly, is pretty nearly alike in all districts. It may, owing to the co-existent influencing circumstances, as we have already shown, be difficult in many instances to arrive at the correct figure absolutely, but still it may be done actually in some cases, and approximately in others.

Anyhow, though we do not hope to be able to reconcile the anomalous results alleged above, we trust to be able to state such facts regarding the actual cost of reaping by machinery that it shall no longer be left in doubt.

— THE Corn trade throughout the country has been in a state of inactivity during the week, at no appreciable alteration in previous prices.—Over 5000 beasts on Monday lowered prices, except for very choice qualities; and all other kinds of animals, and the supplies at the meat market, participated in the reduction. A slight recovery took place on Thursday.

— Mr. W. BRIDGES ADAMS has published a suggestive and instructive letter on cattle sea transit. His remedy for all the evils connected with it, which are not absolutely wilful, is to get rid of sea-sickness; and the following is his plan:—

"There is a process for getting rid of sea-sickness, and only one that we as yet know of—namely, overpowering great waves by a larger structure. The Great Eastern does not pitch in consequence of her great length, but she does so in virtue of her unsustained centre, and this, which we may call 'thwartship pitching,' is the cause of sea-sickness. We want, then, for Channel transit, a vessel, with considerably more breadth of beam, and a keel, with a larger displacement and a reduced draught of water, and high enough out of the water to allow the waves to roll along her sides without breaking in board. Her great breadth preserving vertical steadiness, her sides parallel throughout, and the bottom rising at the ends to skid the water; and her mode of propulsion, whether fast or slow, must be different from anything that has yet obtained. To the water level, her sides and bottom should be cellular in a triple thickness like a beehive, the outer cells packed solidly with tenacious cement, and the whole structure up to the water line a closed air case similar to a life-boat, rendering her perfectly unsinkable, as she would be incombustible by reason of her metallic structure. Above the enclosed water line she would be divided vertically into four decks with open space throughout, giving perfect ventilation from end to end. The lower deck would belong wholly to the engineer and his assistants at 1 fuel, with a strong current of air keeping it perfectly cool and carrying off the waste gases, making it as comfortable as wholesome as a wide city street. The two next decks would serve for sheep and cattle, and the upper decks for passengers, fruit, and

vegetables. The whole of the decks would be accessible from either end without ladders, stairs, or ladders, by floating landing stages corresponding to the decks. There is no difficulty in the matter. It is simply the Bermuda Dock enlarged into a more convenient form, and made self-moving, and capable of bringing 10,000 head of cattle, or a London weekly supply, in a single trip, walking out at one end from the Continent, and walking out at the other end at Thames Haven, on a moving bridge or ferry.

"With such an arrangement," he adds, "a new class of commerce would grow up. Farmers and gardeners and small traders would ship and receive by their own commodities, giving no trouble to the shipowner, and with out in any way interfering with the comfort of the pleasure passengers, and at a minimum rate of cost in transit. Cattle would come in any quantity, and with as little fatigue or deterioration as walking about a farmstead, with no loading or unloading save that supplied by their own limbs, and with water and food, keeping them in the condition fit for slaughter on the landing. If it can pay to bring live cattle from Buenos Ayres in sea-sickness vessels, with risk of loss by storms, the saving must be enormous in bringing them without sea-sickness and with no risk from storms. Passengers are, after all, a limited quantity, but cattle, to these islands of limited space and constantly increasing population, are an unlimited quantity, and they seem to be producible in the north of Europe in unlimited quantities. Bringing them hither without sea-sickness solves the problem of their transport. I want distances this steam transport may extend to is a pretty speculation we do not yet know. It is a great, and a difficult storage, a problem we have not yet solved, and the size of the vessel gives a multiplied capacity for fuel. The large vessel can carry a multiplied proportion as compared with the smaller one. A cattle trade in non-sea-sickness vessels from the Elbe to the Thames, the Severn, and the Mersey, would put an end to our meat famine and it is quite possible, as certain as in the case of human beings—that the cattle would improve and get into better condition on the voyage, by better shelter, perfect ventilation, and regular food and water, even though in smaller quantities than their appetites. The vessel would easily carry 1,000 head of cattle. Our possible consumption of beef would exceed two millions of tons per annum, if we could get it, equal to some five millions of oxen. Ten vessels constantly occupied would bring us the whole supply from a distance of 500 to 1000 miles of sea transit. Supposing the cost of each vessel half a million, 20 per cent. interest would be 50,000 per annum. Half a million cattle at 6s. per head freight would give us this three times over, or 75 per cent. from which to deduct working expenses and profits. What, then, are the risks? Not of fire, for the whole is iron-plated, not of rot, for it is to be punched in the bottom of such a vessel, not of sinking, for she would be under command, and be raised by discharging her water ballast, not of breaking up, as vessels of inferior construction do in Dandrum Bay, not of increasing her capacity by taking on she would be absolutely tight, or of shifting her cargo for she would be absolutely steady; and, as to wear, she would probably last 10 years, or till set aside by new improvements and raised again as a donation. There would be no Act of Parliament needed for her construction, and she would not be confined to specific termini like a railway. Her cargoes she could procure from several river ports on the Continent, and she would bring them notably to the Thames. London alone would consume upwards of 500,000 oxen per annum, 1370 per diem."

— Cruelty to animals is just now a prominent public question. For several days the subject has been well ventilated in the newspapers, and many suggestions have been made both in regard to prevention and remedy. Miss BENTLEY COTTIS among others, has not overlooked the objections which have been made, and the discussion, which has ensued, nor has she turned her thoughts idly away; but this noble-hearted lady has added another to the noble efforts which she has made to do good both to mankind and the dumb creatures which are his servants. Miss COTTIS inclines to the advantages of early training in the right way, and she accordingly writes to the *Times* as follows:—"The hideous revelations of your correspondents as to the extent and depth of depravity practised in the foreign cattle trade require something more than superficial remedies. I therefore feel it a duty to entreat public attention to a systematic training among all classes both in principles of humanity towards animals, and in a knowledge of the proper treatment of creatures that we are dependent upon for sustenance and other comforts of life." Miss COTTIS then discusses the importance and interest it is to us to treat the gifts of the Creator with a merciful consideration for their feelings, and concludes with the following suggestions, as being the more likely to lead to a remedy for the evils now so common:—"Such considerations suggest whether a systematic teaching of the absolute duty of man towards the lower animals should not enter into the practical education of all classes. An American gentleman, Mr. Angell, who has done much in this direction in his own country, earnestly pressed upon me to try to form a society somewhat similar to one established in Massachusetts under the name of the 'Ladies' Humane Society.' I promised to do all I could to promote a good object through the only public channel I could hope to influence—that of national school education. But as the present exposure of a serious evil has arisen in your pages, I think I best redeem my promise to Mr. Angell by suggesting through you to all persons engaged in teaching, in whatever rank of life, the President of the Committee of Council for Education, and to the National Society's Board of Education, that some plan should be adopted for inculcating, in a definite manner, principles of humanity towards animals, and a knowledge of their structure, treatment, and value to man. I cannot conclude this, I fear, feebly expressed advocacy of an important object without expressing my surprise that the Society for the Prevention of Cruelty to Animals does not prosecute the offenders on the evidence of the shocking state which foreign cattle present on landing. These must be touching our soil be under the protection of English law, and those who maltreat them fully amenable to the penalties." These views will be endorsed by every well-regulated mind. And now we are on this subject we are pleased at being able to add that notice to receiving the attention which is suggested by Miss COTTIS. Steps have been taken at Leicester by the secretary to the above-mentioned Society, the result of which is, the proper mode of showing fowls in baskets

has been adopted. This is so far satisfactory, and we trust that the barbarous practice now in vogue in bringing fowls from Ireland and Holland will be dealt with as its cruelty deserves and the law already directs.

OUR LIVE STOCK.

Mr. STRAFFORD announces that the Farnley Hall sale is postponed from October 11 until next spring.

A few well-bred Shorthorns, of the Craggs and Lizzy Kirklevington families, will be sold by Mr. Thornton on the 29th inst., at Brockley Farm, Lewis-ham, Kent.

Our readers will scarcely need reminding that the Farnborough sale takes place on Tuesday, when Mr. Stratford will dispose of a large and excellent assortment of Bates' Shorthorns by 11TH DUKE OF OXFORD and other noted sires. The name of the Rev. C. W. Holbech is sufficient guarantee of the excellence of the stock. Farnborough is six miles from Banbury and two miles from Fenny Compton stations.

Last week we gave a brief notice of the Keavil herd. Annie Laurie, by KALAFAT (13,101), a 10-year-old cow, and standing first on the list, was purchased by Mr. Bury from Messrs. Dadding, of Panton, the breeder of her mother, Athess by LAMBERTON (927). She is the ancestress of four heifers and two bulls, by the well-bred Booth sires, BARON BOOTH, HEIR OF ENGLISHMAN, and ENGLISHMAN. Lot 2, Seraphim 13th, by JOHN O'GAUNT, the mother of HEIR OF ENGLISHMAN, was a 240 gs. purchase from Mr. Lawford, of Southcott, and is the mother of two very excellent heifers and a bull calf, PRINCE GEORGE, all by BARON BOOTH HEIR OF ENGLISHMAN is also included in the catalogue. Fan-fan (lot 5) we mentioned last week as a daughter of Faith, sold at Mr. Sanday's sale in 1861 for 255 gs., a yearling bull from this cow, and by BARON BOOTH, will be offered for sale. Anne of Lancaster, a member of the well-known Lenton tribe, is the mother of Booth's Lancaster, by BARON BOOTH and KNIGHT OF LANCASTER, by the same bull. Miss Matchless, by ENGLISHMAN, is a grand-daughter of Mr. Cruikshanks' Matchless 2d, by MATADORE, and the mother of two promising heifers. The last tribe to be noticed is represented by White Nuptial, by ENGLISHMAN, English Heiress, and Booth's Nuptial, all descended from Sittytton stock. The Keavil herd will be sold next Tuesday.

Mr. Thornton has advertised an interesting sale for October 1. The stock will comprise about 30 head of Shorthorns, the property of E. J. Scholuck, Esq. The herd consists of representatives of the Rev. J. Benson's Winifred tribe and the Ulverstone Cressida family. CAMBRIDGE BARRINGTON 1ST (1123) was used for five seasons, and afterwards CROFT (1115), bred by Mr. Peel, of Knowlton were Bulls of the Cressida tribe have lately been in service.

Mr. W. J. October 8, is fixed for the sale of the late Mr. Benjamin Wilson's stock at Brawith. The catalogue includes a list of 20 cows and heifers and four bulls, all of which will be brought to the hammer by Mr. Wetherell at 1 o'clock on the day specified. After a few prefatory remarks upon the high character of the herd, follows the usual list of names and pedigrees, the whole of which may be referred to four families as follows—Vesta 2d, by YOUNG EMPEROR, comes of a tribe long bred at Brawith. She is the ancestress of four well-bred and good heifers. Lot 2, Miss Milward, by FRANK MILWARD (16,079), was bred by Earl Cathcart, and is the mother of three heifers, Blooming Rose and White Rose, both by GLACU, come of stock bred by Sir S. Crompton, Wood End, and have added several females to the herd. Lastly, we find several representatives of Mr. Wilson's Certainty family, descended from a cow by Mr. Crofton's SIR WALTER (2039). After the sale of the Brawith stock, three well-bred Booth bulls, belonging to Mr. Alfred Stable, will be disposed of. These animals are respectively by RAVENSHORN, WINDSOR-FITZ-WINDSOR, and ROSOLIO, and from cows of good pedigrees.

The catalogue of the Shouldham Thorp herd is before us. Mr. Gamble has bred his stock carefully for many years, and has adhered to three or four excellent strains of blood. On looking over the list of animals to be disposed of upon October 6 by the Messrs. Wetherell, we notice Charmer by GOLDFINDER (14,630), and from Certainty 4th, bred by Mr. Wilson, of Brawith. This cow, now 11 years old, is the mother or grandmother of seven females, whose names appear in the list. Next we have a famous old tribe, descended from ORONTES (4623), ROMAN (2561), TRUNNEL (55), and FAVOURITE 252, represented by no less than 11 females and 4 bulls. The Tetura by ORONTES tribe, are also present, boasting a splendid pedigree, beginning with 2D DUKE OF THORNDALE, and extending back to ORONTES, ST. ALBAN'S, SIR OLIVER, TRUNNEL, and previously to two crosses of FAVOURITE (252). This family is represented by Fame by 2D DUKE OF THORNDALE, and her daughters Faintail by FELIX (19,734), bred by Mr. Gamble, and Fairstar by ZEALOT, also bred at Shouldham Thorp. FRAMMALE is his brother to the last named heifer, and is now about seven months old.

We notice, as an addenda to the weekly SHORTHORN INTELLIGENCE in the current week's Bell's Weekly Messenger, a heading entitled HEREFORD NEWS, in which a favourable report is given of the Adforton herd. Why Shorthorns should enjoy such a monopoly of attention has always appeared strange to us, and it is a matter for congratulation that the Hereford men are showing symptoms of greater activity in this particular. It appears that the Earl of Southesk is establishing a herd of the "white faces"

at Kinnaird Castle, and among the animals there assembled will be found Mr. Judge's Diadem, the 1st prize heifer among the 2-year-olds at Manchester.

An exceedingly well got up catalogue has recently been issued by Mr. Thornton, in which the history and pedigrees of Mr. Cochrane's unrivalled stock at Compton, Montreal, Canada, are very concisely given. When we remember the English origin of the stock, and are informed that the 22 Shorthorns have cost Mr. Cochrane on an average 200 gs. each, including expenses, we doubt not that much interest will be excited among the lovers of both Bates and Booth blood. We have duly reported in this column the exportation of the various animals now collected at Hillhurst, Compton, and more than our allotted space would be occupied in attempting to give half the interesting information contained in the 15 pages of the publication before us. Our readers should at once procure for themselves the entire account of Mr. Cochrane's famous herd, by obtaining a copy of this most excellent Shorthorn catalogue. The cattle were selected from Aylesby Manor, Wetherby Grange, Walton-on-the-Hill, Braithwaite Hall, Branches Park, Keavil, Beeston, West Deerham, Butley Abbey, Mr. Barnes' herd at Westland, and Mr. Chaloner's herd at King's Fort, Ireland, and are all singularly well bred and perfect in form. Mr. Cochrane has patronised both the leading strains of Shorthorn blood, and in his herd are to be seen representatives of the Danness, Wild Eyes, Moss Rose, Anna (by Peter), Waterloo, Medora, Frail, Gatter, Silence, and Vesper tribes, &c. We could have wished for a preface, however short, informing us of the general features of the locality, the established breeds of cattle in the surrounding district, and some points regarding Mr. Cochrane's career as an agriculturist, which, we are sure, would have been most interesting. Mr. Thornton has, however, contented himself by sending out, without introduction, his valuable contribution to Shorthorn literature, trusting to it to win its way by its intrinsic merit.

RECENT RAM SALES AND LETTINGS.

Lincolnshires. — Messrs. Salter's annual sale and letting of long-woolled rams and ram lambs took place on Thursday, at Attleborough Hall Farm, Norfolk. The great improvement which had taken place in the flock, and more particularly in the lambs, was a matter of general remark, and was alluded to in pointed terms by several speakers at the luncheon. The shearlings made from 6d. 10s. to 35s., which sum was given for lot 18 by H. Webb, Esq., Cambridgeshire. The average price was 5l. 5s. The lambs realised 5l. 10s., the highest price given being 15l.—The Peterborough New Ram Fair for the sale of Lincolnshire sheep took place on Saturday last. The rams sent numbered, altogether, 474, or upwards of 200 less than last year, and but few more than half the supply two or three years ago. The result was, all the sheep were sold, which was not the case on previous seasons. Mr. H. Cartwright, of Dunstan Pillar, sent 42 rams, the average price of which was the highest on the ground—viz., 16l. 15s. Mr. Looker, of Whitton Manor, Huntingdon, bought a useful sheep for 29l., the highest price given; Mr. Gilbert, of Blankney, one at 26l.; Mr. Willingham two, one at 20l. and the other at 21l.; Mr. Smith, one at 22l. 10s.; Mr. Giles, one at 23l.; Mr. Edward Howard bought a compact good sheep at 22l.; Mr. Wincup, one at 21l.; Mr. Bearcroft, one at 16l.; and Mr. Leeds, two for breeding stores, one at 13l. and the other at 15l. Mr. John Henry Casswell, of Laughton, sent 50, as usual. His sheep, however, were not equal to the weight in a compact form, and the fine condition in which we have previously seen the Laughton sheep. This arose principally from the fact of Mr. Casswell's heavy land and ten farms having suffered extremely from the long drought and succession of heavy rains which have occurred periodically during the last 15 months. The fine quality and form of the Laughton sheep were, however, conspicuous, but this the public will not believe in, unless these conditions are accompanied with upstanding appearance and well-grown greasy fleeces. Last year Mr. Casswell's average for the same number was 17l. 12s. 6d.; the loss which the late extraordinary seasons have caused will therefore be partly understood when we say his average this year was only 11l. 10s. One was let for 21l. to Mr. March, another for 19l. to Mr. Burdett; Mr. W. Wright bought one for 21l. 10s., Mr. T. Wright and Mr. Wyman one each for 15l. 10s., Mr. Wisman one for 17l., Mr. Silverworth one for 17l., Mr. Cooper two, one at 16l. and the other at 17l., and Mr. Rankin bought two for Australia, one at 16l. 10s., and the other at 20l.—Mr. T. Casswell, of Penton, which is in the same district as Laughton, also suffered considerably from the past seasons, and his sheep did not come in their usual size and commanding appearance. Last year the Penton flock averaged upwards of 17l. This year the average is only 13l. 8s. There were the usual number of 50 rams. Mr. Tyrrell, of Eglinton, bought one at 23 gs.; Mr. Rooke, of Wilbourne, one at 31 gs.; Sir Thomas Wichote, of Aswarby, one at 18 1/2 gs.; Mr. Everington, of East Dereham, one at 17 gs.; Mr. Walesby, of Ranby, one at 18 gs.; Mr. Willingham, Norfolk, one at 20 gs.; and Mr. C. Clarke, of Ashby, one at 23 gs.—Mr. J. R. Kirkham, of Audley Villa, had 40 rams, one of which Mr. Griffin bought at 29l.; Mr. Bradfield one at 27l.; Mr. Needham, of Huttoft, one at 34l.; Mr. Nidd one at 15l., and Mr. Vergette one at 13l.—Mr. S. E. Dean, of Dowsby, here made his first appearance in public, the number he brought being 33. One of these was let for 10l. The remainder were sold at prices ranging between 17l. 5s., at which price Mr. Swingle bought a good sheep, and 7l. 15s., the average being the respectable one for a beginning of about 9 gs. The remaining exhibitors sold their lots at prices running up from 5l., the upset price, to 9l. each, for common store purposes.

THE AGRICULTURAL LABOURER.

The following is an abstract of Mr. Botley's paper, read before the British Association at its Exeter meeting.

He said, Whether we take the statistics of Mr. Bailey Denton, Mr. Corrance, or Canon Gardlestone, the conclusion forces itself upon us that the status of the agricultural labourer needs and calls for amendment. Mr. Botley then proceeded to give, from personal observation, his ideas as to remedies, both direct and indirect. Speaking of education, he said that where so many prejudices and conflicting interests unite in opposing education, the State should step in and assert its right of guardianship. He was continually reminded of the necessity of compulsory education. In the matter of education, Scotland was better off than England; and while only one-third in the English army could read and write—99 in Prussia could do so, 100 in 200 in Saxony, and all in Switzerland. The three days per week system appeared to him, by rest, which he had witnessed in the North Surrey and other industrial schools, to possess considerable merit. America, Switzerland, and Prussia, were, he said, examples of the advantages of the compulsory system, and that without those drawbacks which opponents urge against it. He thought it would not be going a step too far were the Legislature to compel landed proprietors in rural districts to build or provide the requisite number of decent cottages and garden ground for the labourers required to work the farm. His advice to landed proprietors was, if they had not the means to build, to raise the money in the same way as, under Act of Parliament, they did for drainage and farm buildings. Coming to the earnings of labourers, Mr. Botley said, "The average of day labourers throughout England is said to be 12s. 6d. per week. To this must be added, in the case of carters and shepherds, the cottage and garden free; but piece-work, such as Wheat hoeing, Grass mowing, sheep shearing, &c., taking the mean at 15s., and add 20 per cent. as the earnings of his wife and children, the gross will be 18s. per week for a man, wife, and three children, to pay rent, buy fuel, food, and clothing. We who know what daily expenses are, may well wonder how, with the most rigid economy, they subsist at all."

Piece-work (continued Mr. Botley) is adopted by the most advanced agriculturists when practicable, stimulating the men to exertion, and inducing a better class of labour; the mind must be brought to bear upon the work—the head going before the hand. Education will tend thereto if it is what it invariably should be—industrial. Speaking of emigration, he said, had the present liberal system in grants of land been adopted years ago, tens of thousands who emigrated to the United States would have gone to Canada instead, and would thus have enriched the territory under the British crown some hundreds of millions. Although not a warm advocate of emigration, he considered it a great boon to many who might suffer here before landed proprietors were convinced of the profitable investment of reclamation, draining, and improving their lands by the well-directed application of labour.

Provident societies and cottage garden exhibitions were advocated by Mr. Botley. With regard to co-operative societies, he thought, if the agricultural labourer could be educated up to provident habits and economy, there would be no lack of respectable tradesmen to ensure the ready-money customer good value for his money. Coming to the second part of his subject, drainage, reclamation of waste lands, higher cultivation, game laws and leases, Mr. Botley pointed out the advantage of drainage, both on account of its sanitary benefit and increased production. The tenant should stipulate as to the game, hedgerows, &c., also as to the lease. As regards the game laws, he said—"So demoralising has their operation been on the agricultural labourer, that they are all but universally condemned, to say nothing of the thousands of acres of corn devastated, and whereon the mower filleteth not his hand, neither he that bindeth up his sheaves his bosom." He had seen a 20-acre field of Wheat so eaten up and poisoned by rabbits and hares, that the yield was scarcely 8 bushels per acre, when, from the excellent cultivation, it ought to have yielded 40. What farmer could stand against such results as these? he asked. With respect to leases, he had never yet heard or read any argument to alter or qualify his opinion in favour of a lease. The law should compel proprietors who objected to let on lease to do what equity and political economy require, and recoup the outgoing tenant for all unexhausted improvements, to be arranged by valuation. In conclusion he said he believed there was an abundance of facts to warrant the conclusion that the agricultural labourer's condition is to be advanced by the more liberal management of landed property. Mr. Botley thus summarised his ideas of improving the condition of the agricultural labourer.—1st. By an industrial education producing temperance, prudent forethought, and economy. 2d. By every estate having a sufficient number of substantial cottages thereon, with land adjoining, to grow plenty of vegetables for a family. 3d. Farms to let on long leases with very few restrictions, and containing a compensation clause for all unexhausted improvements. 4th. All wet strong land to be thoroughly drained. 5th. The immoderate preservation of game to be discontinued, and cumbersome hedgerows grubbed. 6th. Tenants to be selected, not on account of their politics, but as men of skill, capital, and enterprise. 7th. Piece-work, where possible, instead of day-work, the utmost employment given by the farmer, who knows that judicious outlay in labour brings a sure return, realising the desired ultimate—a fair day's pay for a good day's work.

Amongst the remarks made in the debate which follows, Mr. James Bellie rebutted the statement of Canon Gardlestone that the labourers received only 9s. a week, and pointed out that there were extras which raised the sum to more than

15s. He also took exception to some statements made by Professor Levi.

Professor THOROLD ROGERS said that to doubt that the wages of the agricultural labourer had fallen within the last 20 or 30 years would be to fly in the face of facts. In considering this question of wages it was important to take into account the power possessed by the agricultural labourer of purchasing the secondary necessities of life—such as butter, bacon, and cheese. This power had, he held, considerably diminished within the last 20 years. He would put this question, Why is butter 1s. 6d. per pound? Twenty years ago butter in summer was 9d. or 10d. per pound. In towns the prices for these secondary necessities were more uniform than in the country, and in this respect the agricultural labourers suffered. Coming to the question of improving the condition of the agricultural labourer, he touched first on the proposal to encourage emigration. He must confess that he had looked with regret on the fact that an exodus had been going on in England, not amongst the poorer classes, but amongst the most enterprising. Long ago he ventured to predict that the emigration system prevalent in Ireland would be extended to England; but he did not think that the remedy of emigration was likely to meet the case. He thought that farmers would find it advantageous to give their labourers better wages—the latter would then have better food and grow stronger, and consequently be able to do more work.

The Rev. Prebendary SAUNDERS confined his attention to the state of education in the county as shown by the reports of the Diocesan Inspectors. These reports showed that there were 49 parishes and districts in this county, and that out of these 49 there were only 2 which had no schools. There were less than 100 inhabitants each, 25 less than 200 each, and 4 just over 200 each. There were 29 parishes with 11,144 inhabitants which had no schools, or had Sunday schools only, and that represented the neglected districts in this county. He would leave them to draw what inference they liked from that. There was no account of Nonconformist schools. The Rev. Prebendary believed the agricultural labourers were, as a rule, anxious to avail themselves of the means of education placed within their reach. He also dwelt on the importance of diffusing knowledge in order to raise the labourer from his present condition.

Mr. JOHN DAW submitted that agricultural labourers received in the present day wages much higher than those given formerly. He denied Professor Rogers' statement that the wages had fallen. He also questioned the accuracy of the Professor's assertion that there was a decrease in the purchasing power of those necessities—why, the average price of butter was 1s. 6d., and in summer it was 1s. Tea could now be had for 3s. 6d. per pound, and lump sugar, formerly 1s. 6d. per pound, was now sold at 5d. In the price of clothes there had been a similar reduction. Mr. Daw had heard some most astounding statements in this section. For instance, a Professor had stated that there were too many labourers, whereas the real fact was that you could not get sufficient labour. The other day a labourer died in his parish, and he could not supply his place. Then as to yearly hiring, that was quite unnecessary—a good labourer never left if treated properly. Canon Girdlestone lived in an unfortunate part of the county. As to teaching, it was no use shouting above the heads of the people—if the labourers were taught at all, let them be taught "the three Rs," and the fact that there was a parish out of their own division. As to making landowners build cottages, give higher wages, and so on, compulsion would not answer—it must be shown that it was their interest to do so. As for game, he thought it would be well to get Parliament to interfere; the simple remedy would be to make a law that no lease should contain the restriction of not killing rabbits. He certainly did not assent to all that Canon Girdlestone had said, nor yet to all that Professor Levi had said.

The PRESIDENT offered a few observations in closing the debate. He pointed out that it did not follow that because labour was low-priced therefore it was cheap. He advised agriculturists generally to be self-dependent, and not trust too much to legislation. He hoped that inquiry into the question which had been so ably debated would be continued.

SOME REMARKS ON THE ADULTERATION OF SEEDS ACT, 1869.

THE Adulteration of Seeds Act is a short statute of ten clauses, enacted as an auxiliary to existing laws which have failed to control certain evil tendencies of the seed trade.

The following is a summary of the ten clauses referred to:—(1.) The designation by which the Act may be cited, viz., The Adulteration of Seeds Act, 1869. (2.) The interpretation of the terms "to kill seeds," i.e., "destroy by artificial means the vitality or germinating power of seeds;" and "to dye seeds," i.e., "to give to seeds, by any process of colouring, dyeing, sulphur-smoking, or other artificial means, the appearances of seeds of another kind." (3.) "Offences in relation to seeds," viz., "Every person, who with intent to defraud or to enable another person to defraud, does any of the following things—that is to say, kills, or causes to be killed any seeds, or dyes or causes to be dyed any seeds, or sells, or causes to be sold, any killed or dyed seeds, shall for the first offence be liable to a penalty not exceeding 5l., and for the second or any subsequent offence, he shall be liable to pay a penalty not exceeding 50l., and to have his name and residence published in the newspapers." (4.) Any forfeiture or penalty under the Act may be recovered, enforced, and applied in certain ways fully described. (5.) Intent to defraud particular persons need not be alleged, so long as the general intent to defraud is maintained. (6.) Appeal from summary conviction in the English, Scotch, and Irish courts is allowed. (7.) Limits time for proceedings under this Act to 21 days from the time of the commission of the offence. (8.) Court may order prosecutor to pay costs of unreasonable prosecution. (9.) Other remedies not to be affected, i.e., under existing statutes. (10.) Act begins to take effect on the first day of May next.

We are somewhat apprehensive that the lion's share of the good promised will be consumed in the law courts, although the contrary is contemplated by the statute. No doubt under clauses 4, 6, and 8 farmers ought to be able to take care of themselves; but there will be some difficulty experienced in practically complying with the provisions of the 2d, 3d, 7th, and 9th clauses, relative to killing and dyeing seeds, and the commerce of killed and dyed seeds, while the limited time for summary proceedings, and the ambiguous character of existing statutes which the ninth clause enact, shall remain in force.

To destroy by artificial means the vitality and germinating power of seeds is an indefinite expression,

although it obviously refers to the practice of purposely killing, to prevent seed of another kind brairding, such as Charlock seed for mixing with Turnip seed. All the Brassica and Trefoil seeds are liable to be thus adulterated, and the extremes to which the notorious practice of purposely killing is carried has for a long time imperatively demanded the interference of the Legislature. But farmers are familiar with other artificial means by which the germinating powers of seeds are partially or wholly destroyed than those used in this modern practice, such as heating in the stack or granary, kiln-drying, destruction by minute and obscure animals and vegetables; and such seeds may be scoured by mechanical, and dyed by chemical means, and then "be mixed with sound seed, so as to give rise to very great difficulty in carrying into effect the Adulteration of Seeds Act; the seeds so killed, scoured, and dyed being of the same kind, and not "seed of another kind" as designated by the second clause. No doubt the third clause enacts that to sell artificially killed or dyed seeds is a punishable offence, subject to the penalty of 5l. or 50l., but practically such, we are apprehensive, will make the matter rather worse than better. In short, this notorious modern practice of killing and dyeing seeds should have been technically designated by the statute, and an example quoted for practical illustration.

The above remarks apply chiefly to small seeds, such as Clover and Turnip; but it is a well-known fact that the larger seeds, as Wheat, Barley, and Oats, are killed, dyed, and "doctored," in various ways, not only by corn merchants, but by farmers themselves. Kiln-drying, scouring, sulphur smoking and chimney smoking, may be quoted as familiar examples. Now, it is only when these processes are carried to too great a length that harm is done. On the contrary, when kept within proper bounds they often do good; hence the practice is advocated by many. Some kiln-dry only, others scour, a third sulphur-smokes and kiln-dries at one operation; while a fourth smokes in the kitchen chimney, &c.

But this is not all that requires to be said under doctoring. The vitality of both the larger and smaller seeds of the farm may be injured or destroyed by bad weather at the time of flowering; or rather, seeds may never have possessed germinating powers, or vitality may be so weak as easily to be destroyed in the stack, granary, or by the artificial modes of drying now coming into use; or the seed may be perfect, but stacked or threshed out and put into granary too damp, or even into a damp granary or store, and when heating sets in, or moulding, it may then be put through a drying or scouring machine and brightened in the colour by sulphuring, or by some other means, not objectionable, and yet discovered, and sold and bought, not for seed or malting, but for grinding, and yet ultimately fall into the hands of some farmer or seed-merchant who will have seed for little money; or too much heat may be accidentally used in the drying, not intentionally to defraud, and so on. In this way adulteration may be carried on to a very large extent without coming within the provisions of the statute.

It will be found equally difficult to reconcile with the requirements of farm practice as at present carried out in most English, Irish, and Scotch counties, the seventh clause, relative to the limited time allowed for summary proceedings. The clause runs thus:—"Every complaint under this Act, against any person in respect of selling, or causing to be sold, any killed or dyed seeds, shall be commenced within 21 days from the time of the commission of the offence complained of." That something of this sort is needed for the protection of trade may be taken for granted, both as regards the seller and buyer—but selling, or causing to be sold, is one thing, and the delivery and receipt of the seed sold and purchased another, and a very different thing, good seed being often sold, but bad delivered and received. We are somewhat apprehensive, the statute does not make suitable provision for the difference. Those farmers, for example, who are in the habit of buying their seeds, often do so long before the time of sowing, when they are delivered, and if there are more than 21 days between sale and delivery, how is the farmer to know in time to lodge his complaint in court for redress? In this respect the position of the small retail trader is perhaps worse than that of the farmer. Many wholesale seedsmen clear off remainders annually at any price they will bring, in preference to mixing them with the new stocks of the ensuing season. These are purchased by retailers. A portion may be sold that season, but the bulk goes on to the next for mixing or adulteration. It is sometimes smoked and dyed, not by sulphur, but in the kitchen chimney, from whence it comes out brighter and of a richer colour than the new seed with which it is mixed. Hence, instead of stacking the new Turnip seed in August, it is threshed out, mixed with the remainders of the last crop, or two or three crops, as the case may be, and the whole stock well smoked and dyed, in small bags, in the chimney. But much of the old seed, although it looks equally fresh with the new, is killed as well as dyed, and therefore this old practice, which has been followed by farmers and small traders from time immemorial, has become a modern offence, punishable with 5l. or 50l., as the case may be. Must it therefore be given up? Many will answer, "Impossible." True, the seed thus killed and dyed has not the appearance of that of another kind, as meant by the second clause of the statute, but it nevertheless is the seed of one season sold for that of another, and obviously falls under the third clause. Hence a difficulty may arise, more especially should it turn out that the retail trader has unintentionally purchased killed and dyed seed of another kind. We repeat, to meet such practical complications in the seed trade, the second and third clauses ought to have been much more cautiously worded.

There is another kind of adulteration, often worse

than any of the above, that requires notice, viz., the sale and delivery of seed full of the seeds of weeds, so much so, that numerically the latter greatly predominate. It follows that good seed is sold and purchased, but weeds are delivered and sown—alas for the land!—neither killed nor dyed, although in their growth they kill the crop with which they grow. Cases of this kind, we presume, fall under the ninth clause—the law of the past. There are, however, exceptions to the general rule, for many samples of this kind are sulphur-smoked and artificially dyed, &c., so as to bring them within the second and third clauses, and the summary proceedings under the fourth and other clauses of the Act. The sequel need not be told, for the amount of litigation to which such cases may give rise is incalculable.

The conclusion of the whole matter is manifestly this. The above Act to prevent the adulteration of seeds is an important instalment in the right direction, and therefore we accept it thankfully. Good seed is no secondary question in successful farm practice, and the best advice we can give our readers is to grow their own seed—if the land will produce it of the proper quality—and when otherwise situated, to make their purchases subject to common sense and the microscope, in preference to Statute Law—The Adulteration of Seeds Act, 1869, not excepted W. B.

RECENT FOOD ANALYSES.

It has been suggested to us that it would be of considerable service to publish the results continuously being made by our analytical chemist, Dr. Benjamin H. Paul, of 1, Victoria Street, Westminster. These analyses, being made for our own guidance in contracting and purchasing on behalf of our members, are very carefully and scrupulously performed. How far the information they contain is likely to be of public utility, you will be able to judge by this week's report.

No. 1 sample (sent to you herewith) is an article known as decorticated ground-nut cake. It is London made, and the entire production is at present taken by oil crushers for "mixing" (i.e. adulterating) linseed-cakes. The selling price is 7l. to 8l. per ton, so that farmers by buying the article and mixing it themselves can evidently effect a considerable saving over the present plan of buying it as an ingredient in oilcake, sold at 11l. 10s. to 12l. per ton.

It will be seen by the analysis that the cake is very rich in flesh-forming constituents, being one per cent. higher in nitrogen than the best pure Linseed. It is also tolerably rich in starch, and is very clean, containing only 5.30 parts of ash (mineral matter).

On the other hand it is low in oil (fatty matter), and like all nut cakes and nut meals, heavy in woody (indigestible) fibre. The following is the analysis:—

Table with 2 columns: Component and Value. Series B.—No. 2. Fat 7.84, Albuminous material 38.95, Starch, gum, &c. 25.24, Moisture 9.07, Ash 5.30, Woody fibre and husk 13.99. Total of feeding constituents 72.03, Total of other constituents 25.97. Nitrogen per cent. 5.9.

The second sample sent you is a new make of decorticated cotton-cake, just now being introduced from the United States. You will see that it is of an unusually bright yellow colour, and remarkably clean. It is selling at 7s. 6d. to 10s. per ton more than the best makes hitherto known here, and the following analysis would seem to show that the actual value is even greater than the market price (at present 8l. 5s. to 8l. 15s. per ton):—

Table with 2 columns: Component and Value. Analysis of a sample of Decorticated Cotton-cake. Series A.—No. 6. Fat 16.48, Albuminous material 46.80, Starch, gum, &c. 18.12, Moisture 8.47, Ash 8.13, Woody fibre and husk 2.11. Proportion of feeding constituents 81.40, Total of other constituents 18.60. Nitrogen per cent. 7.20.

For purposes of comparison we add Professor Voelcker's analyses for us, last season, of the best decorticated cotton-cakes we could then obtain, and also his analysis of the best pure linseed-cake. We understand that the American farmer eagerly buy up decorticated cotton-cake in preference to the best linseed-cake, and that that is the reason why we receive from the United States so short a supply of the former as compared with the abundant supplies we receive of the latter.

Table with 4 columns: Component, Thick, Thin, and Best pure Linseed-cake. Professor Voelcker's Analyses of year of Decorticated Cotton-cake. Moisture 7.8, Oil 16.26, Albuminous compounds 38.87, Mucilage, sugar, and indigestible fibre 2.81, Woody fibre (cellulose) 9.03, Mineral matter (ash) 7.90. Best pure Linseed-cake 14.4, 11.7, 33.8, 2.8, 8.5, 8.16, 100.00, 100.00, 7.09.

The third sample sent you is a pure American linseed-cake, imported into Liverpool. It is a large thin, flat cake, packed in bags—one of the kind known in America as a "special make" of "city bags." It seems to be almost the only American city-cake now coming into the Liverpool market, and none of the same make comes into the London market. Except that it is pressed too hard, and therefore deficient in oil, it is of rare excellence, being evidently made of the very best Linseed, and so carefully screened before manufactured as to leave less than 5 per cent. of

mineral matter in the cake. The present market value in Liverpool is 11l. to 11. 5s. per ton. I annex analysis:—

Analysis of a sample of American Linseed cake. Series A.—No. 5 (Linseed). Fat .. 10.00, Albuminous material .. 38.93, Starch, gum, &c. .. 26.87, Moisture .. 9.93, Ash .. 4.77, Woody fibre and husk .. 10.00. Nitrogen per cent. .. 6.00

The fourth sample I send you is a London made Palm-nut cake. It will be seen that it is not comparable to Smith's Palm-nut meal in fatty matter; but the latter can only be bought in London at a cost of 4l. per ton (less trade allowance), and as this London made Palm-nut cake can be sold at from 5l. 15s. to 6l. per ton here, it ought in all fairness to be allowed to find its way to the agricultural public instead of the rashy foreign meals, which are the only ones usually in our market.

For purposes of comparison, I annex Professor Voelcker's analysis of Smith's Palm-nut meal.

Analysis.—Series A.—No. 7. Fat .. 9.00, Albuminous material .. 14.70, Starch, gum, &c. .. 36.03, Moisture .. 9.40, Ash .. 3.37, Woody fibre and husk .. 17.00. Nitrogen per cent. .. 3.8

Should you consider these inquiries of public value, I will continue to send them to you from time to time. Edward Owen Greening, Managing Director, Agricultural and Horticultural Co-operative Association, 29, Parliament Street, Westminster.

RELATIONS OF LANDLORD AND TENANT (TIPPERARY).

I HAVE to present a picture of varied outline, complicated in its lights and shadows, difficult to comprehend and interpret. Materially, I have reason to believe the condition of the mass of the tenant-farmers corresponds with that of the country around, which, though not cultivated or improved to anything like a high point, wears, on the whole, a look of prosperity. In this, as in other parts of Ireland, the land 25 years ago was engrossed to a great extent by masses of cottiers, whose intense competition caused rents in many cases to be extravagantly high, and also considerably diminished the proper area of legitimate and remunerative husbandry.

As for the rate of rent, I do not think it high, considering the admirable quality of the land, and its proximity to several excellent markets; and though I have heard some complaints of rack-rents, these instances, I am convinced, are exceptional, and rents are generally paid without difficulty. From a comparison, moreover, of different periods, I am satisfied that the burden of rent on the tenant has been steadily diminishing; and though rents have been gradually rising, I do not think, as a general rule, they are as high as might have been expected.

barrier is raised between the classes connected with the soil, and the natural relations between landlord and tenant are occasionally marred by hardship and wrong. With some not inconsiderable exceptions, and those chiefly of modern date, all that has been done here for the improvement of the land, the draining, enclosing, and building of farmsteads, has been the work of the occupiers, not of the owners; and though the occupiers, during their tenancies, have, of course, received the accruing benefit, they complain that, as a general rule, they have obtained no allowance or compensation. They say, moreover, that in some instances their rents have been actually enhanced in consequence of what they have thus done, and that they are discouraged from improving by a general apprehension of such a result; and though I have not been able to find out well-authenticated cases of such injustice, I have little doubt that some might be discovered.

Home Correspondence.

Steam Cultivation.—In the Agricultural Gazette of December 19, 1868, p. 1326, I made some observations on the above subject, and concluded as follows:—"There is so much that I may be allowed to call a step in the right direction in a traction-engine, that the following questions may not be out of place:—Can a traction-engine be made available for draft purposes? Is it possible to have our waggons or trucks made so as to be drawn by the traction-engine, now picking up the corn sheaves, now carrying out the real 'muck,' made under properly protected yards? Indeed, why should I not be able to call on my friend Hodge, and offer him a lift, both for himself and his 10 quarters of corn?"

"HARVEST CARTING BY STEAM.—During this week a novel use has been made of steam-power on the farms of Messrs. Howard, at Bedford. A steam ploughing engine, which is also used for traction purposes, is now employed in drawing waggon trains of corn. Many farmers who use steam-power for cultivating the land, have thought that if the dormant power in the engine could be used during harvest to facilitate the operations in fine weather, they would be able to reduce the stud of horses at the year round, and thus save their keep, amounting to from 20 to 25 a horse per annum, besides their first cost. It has now been proved satisfactorily that not only the breaking up of the land, but the seeding or drilling can be done most expeditiously and economically by steam.

Is this the first instance in which a traction-engine has been used for harvesting corn? Are you able to tell me? West Indian.

Woolston v. Tiptree.—"A Farmer" in last week's Agricultural Gazette, which nom de plume Mr. Smith of Woolston acknowledges in the Times of the 2d inst., has again brought forward his charge of misrepresentation against Mr. Mechi, in his published accounts, regarding the average price of his W heats sold in the year 1868. Perhaps it is Mr. Smith's impulsiveness of character that prevents his looking calmly and correctly at Mr. Mechi's balance-sheets. Mr. Mechi gives the average price of his Wheat for the year, that is, from January 1, 1868, to December 31, 1868. Now, is it at all surprising that the W heats averaged 63s. 9d. ?—when I find in the London markets quoted in the Field of January 4, that the highest price was 75s., March 28, Essex, Kent, and Suffolk, 66s. to 78s. new, 70s. to 81s. old, June 27, 66s. to 73s. new, 72s. to 74s. old, and the highest on December 19 was 58s. Now, how much of this corn that was on the farm on January 1, 1868, valued at 55s. 6d., fetched these prices?—that it was not all Wheat I am aware, for the balance-sheet says, hay, corn, &c., unsold. Let Mr. Smith again read Mr. Mechi's communication as it appeared in the Agricultural Gazette of February 20, p. 202; he will observe that the W heats there spoken of as selling from 48s. to 62s. were W heats of harvest 1868, and sold between the close of the harvest and the date of his communication in February, 1869. Whatever W heats were sold after January 1, 1869, will be accounted for, in the usual yearly balance-sheet, in,

let us hope, the Agricultural Gazette of 1870. Perhaps Mr. Smith may have found out his error before he showed it, but waited patiently for correction. Another Farmer.

Misrepresentation of Mr. Mechi.—Mr. Mechi says "that Mr. Smith has descended to misrepresentation of facts in the rather odd jumble of matters that constitute his letter." Now, if you will refer to your Paper of Feb. 20, 1869, p. 204, you will find that I supplied to you (under the signature of "A Farmer") the data taken from his balance-sheet, proving that he drew 150l. 6s. 8d. from his tenants' capital, and that the sum of 201l. 16s. represented the sum at which he entered his Wheat as sold at, over the imperial averages at the same period, and that when these two sums were deducted from his gross profit there only remained 218l. 10s. 10d., not enough to pay his rent on the 177 acres, the total of his occupation, at 34s. an acre, by 82l. 9s. 2d. Therefore there cannot be any misrepresentation on my side. Mr. Mechi's 63s. 9d. a quarter for Wheat would not have been the road to the big loaf. The general farmers' 53s. 4d., according to the imperial average from August to December, 1868, is a much nearer approach to it. William Smith, Woolston, Bletchley Station, Bucks, Sept. 13.

Reduced Superphosphates.—As one of the principal chemists in the case referred to in your last, viz., "Bradburn v. Stevens," and the one commissioned by the plaintiff to attend at his place of business to open and divide the noted sample in the presence of his solicitor, I trust you will allow me to append to your able article the following notes:—1st. The distinction you mention between soluble and precipitated phosphates—viz., that the latter is inferior to the former by having lost its power of diffusibility in the soil, but is in other respects equally available as plant food—was pointed out by me at the time in my explanation of the nature of the reduced phosphates, and had not been previously dwelt on. 2d. That for more than 12 months past I have adopted the oxalate of ammonia process in a large number of analyses, as a means of separately stating the precipitated part from the ordinary undecomposed phosphate, and have found the process perfectly satisfactory when employed in the manner fully explained by me in the current number of the Chemical News, Alfred Sibson, 11, Eaton Terrace, St. John's Wood, N.W.

The Farmers' Capital must ever Vary.—I am led to this remark by an unjust charge, that I take from my capital to make up my profits. If this were true, I ought, when my capital is in excess, to add the increase to my profit. But the fact is, that in taking stock (which is the farmer's capital) it must be valued at the then market price for which it could be bought or sold, and this price may vary 100 per cent. or more from the preceding annual valuation. I remember selling my first stack of Wheat after harvest at 44s. per qr., and my last stack (both within the 12 months) at 104s. per qr. At other times the difference has been almost as great. So it is, in degree, with live stock. Lambs and cattle during the drought of 1866 were a drug sacrificed at wretched prices, owing to the absence of food on the 22½ millions of acres of permanent pasture and the deficiency on 10 millions of acres of root and green crops. Therefore the stock-taking is a question affecting capital, and not annual profits. I have heard observing farmers say, Note the various prices at which you sell your Wheat for seven years, and in another column put 50s. annually, and you will find the totals agree. The history of agricultural produce has been, for ages, variability, and so it will continue to the end of time. A farmer is lucky who goes out of his farm when everything is dear, and can afford to wait for another when everything is cheap. He must, however, in the intermediate time live upon his capital, or employ it in some other business, or invest it in funded or other securities. The amount of tillages is also affected by the price of labour and the vicissitudes of weather. J. J. Mechi, Sept. 14.

Game Laws in Scotland.—Any change in the law which should authorise and induce tenant-farmers, generally, to become, in their own persons, killers of rabbits, hares, and other game, as a necessary occupation for their own protection on the farms they occupy, would lead to a very undesirable change in their habits and pursuits, most disadvantageous to themselves. In the same way, any change in the law which should authorise them to appoint other persons to do this duty for them, would lead to unpleasant feelings and differences, and misunderstandings with their landlord without end. It would be easy to enlarge on, explain, and illustrate this part of the subject, especially as regards the innumerable evils certain to be engendered by servants killing game on the land rented by their masters. A landlord would naturally and inevitably dislike to see men with guns and dogs roaming over his estate, while he himself might have abstained from doing so; and even if doing no wrong act, such persons would inevitably raise a belief that they were doing what they ought not to do, and this it would be most difficult to disprove. Such would be the evil effects of any of the changes in the law which were proposed in the last session of Parliament. It is conceived that a different system and scheme would be much preferable, as an abatement of the intolerable nuisance and grievance to which very many, but by no means all, tenant-farmers are now subjected, of which they most justly complain, and for which a remedy must be found. Let the Sheriff in each county in Scotland be ordained by law to select within his county a sufficient small number of discreet and sensible persons, whom he shall denominate game inspectors, or by some better name. Let him be directed and required by law, whenever a case of injury from excess of game and consequent complaint shall be brought before him, to call upon any two of such persons to inspect any farm on which it shall be alleged that an excessive and injurious quantity of game (or rabbits and hares, alone)

For the best Cart Gelding, above 4 years old, that has been regularly worked.—St. R. Robbins, Stoneleigh.

For the best Cart Mare, above 4 years old, that has been regularly worked.—St. J. Tysoe, Rumer Hall.

For the best Stallion best adapted for hunting purposes.—1st, R. C. Naylor, Redmarsh Hall, Northamptonshire, for The Hawk, by Faugh-a-Ballagh, Jam Alhoi Brose, by Orlan to.

For the best Hunter that has been ridden in the past season with the Warwickshire, North Warwickshire, Atherstone, Pychley, Bicester, South Staffordshire, and Quorn Hunts.—1st, J. E. Bennett, H. Bosworth Grange, 2d, St. E. Knott, Fenny Compton.

For the best Hunter, 4 years old and upwards (to be jumped on the ground).—1st, 1st, J. King, Quarry Farm, Rowington, 2d, 5d, S. Cattermole, Buley.

For the best 4 years old Gelding or Filly adapted for hunting purposes, the property of a tenant farmer, farming not less than 100 acres of land, and residing within the limits of the Warwickshire and North Warwickshire Hunts, and to have been in his possession not less than 12 months.—Two entries, on 1st, 2d, prize 10l., withheld.

To the Owner of the best half bred 2 years-old Colt or Filly, the property of, and bred by, a member.—St. J. G. Ledsam, Griffins Brook.

For Mare with Foal at her foot, the property of a tenant-farmer (a member of the Society), best calculated to breed Hunters, the foal to be got by a thorough-bred horse.—St. J. G. Ledsam, Griffins Brook.

For the best Hackney, exceeding 15 hands high.—1st, J. H. Griffin, Barcha Bassett.

For the best Hackney not exceeding 15 hands high.—1st, John Robbins, Warwick.

For the best Pony, above 13 and not exceeding 14 hands high.—St. Edward Petre, Wootton Bassett.

For the best Pony, above 12 and not exceeding 13 hands high.—St. J. Beale, Wolvey Grange.

For the best Bar Pig, of the large breed (except Berk hire), under 18 months' old.—1st, 3l., John Wheeler, Long Compton. Only one shown.

For the best Boar Pig, of the large breed (except Berkshire), above 18 months old.—1st, 3l., A. Umbers, Weston Hall. Only one shown.

For the best Boar Pig, of the small breed, under 18 months' old.—1st, 3l., J. Wheeler, Long Compton, 2d, 2l., R. K. Bassett, Whitley Abbey Farm.

For the best Boar Pig, of the small breed, above 18 months old.—1st, 3l., John Wheeler, Long Compton. Only one shown.

For the best Boar Pig, of the Berkshire breed, under 18 months old.—1st, 3l., J. Spencer, Viller's Hill, 2d, 2s., ditto.

For the best Boar Pig, of the Berkshire breed, above 18 months old.—1st, 3l., John Stanley, Leamington, 2d, 2s., Joseph Smith, Henley in Arden.

For the best Breeding Sow, suckling pigs of her own farrow, and in milk at the time of show, of the large breed (except Berkshire). The pigs to be exhibited with the Sow.—1st, 3l., F. Spencer, Wootton, 2d, 2s., John Wheeler, Long Compton.

For the best Breeding Sow, of the small breed, suckling pigs of her own farrow, and in milk at the time of show. The pigs to be exhibited with the Sow.—1st, 3l., R. K. Bassett, Whitley Abbey Farm; 2d, 2s., Sir J. W. C. Hartopp, Bart., Sutton Coldfield.

For the best Berkshire Sow, suckling pigs of her own farrow, and in milk at the time of show. The pigs to be exhibited with the Sow.—1st, 3l., Sir J. W. C. Hartopp, Bart., Sutton Coldfield.

For the three best Breeding Pigs, of one farrow of 1869, of large breed.—2l., John Wheeler, Long Compton.

For the three best Breeding Pigs, of one farrow of 1869, of small breed.—2l., R. K. Bassett, Whitley Abbey Farm.

For the three best Breeding Pigs, of one farrow of 1869, of Berkshire breed.—2l., Joseph Smith, Henley in Arden.

For the best Sow, of any breed, suckling pigs of her own farrow, and in milk at the time of show.—1st, 2l., John Spencer, Viller's Hill. One entry.

For the best Agricultural Horses.—Mr. J. W. Larkin, Lutter with, Mr. R. J. Newton, Campfield, Woodstock, Huntingdonshire, Mr. H. J. Thurnall, Royston, Mr. L. Percival, Walsingham, Mr. Matthew Savidge, Sarsden, Mr. I. D. Kirkham, Bayswater Court, Ross, Sheep and Pigs Mr. G. A. May, Eford Park, Tamworth; Mr. C. Howard, Bedford, Implements.—Mr. J. Hickon, Dunchurch, Mr. Thos. Johnson, Leicester.

There were several classes of extra stock, cheese, &c., but these were only of local interest.

ROYAL DUBLIN SHEEP SHOW.

AGRICULTURAL meetings of different kinds appear to be becoming as frequent in Ireland as they now are in this country. Their importance, too, is also increasing, for not only do Irish breeders bring larger numbers of improved home-bred stock to compete with each other, but old-established English and Scotch breeders respond to the demand in Ireland for improved animals by taking over specimens of their flocks to exhibit side by side with Irish-bred ones. This rivalry, and the intercommunication which takes place between the authorities and members of societies there and the exhibitors and judges who go from this side the Irish Channel, cannot fail to produce a desirable extension of good-fellowship, as well as increase the business profits and material prosperity of every one concerned. The Dublin Society's Sheep Show, which was held with great success last week, is one of the meetings which is helping to do the good work to which we have briefly referred. The following list of prize-takers will show how honours are now divided between previous purchasers of British stock and the present owners of the flocks from which they sprung:—

LONG WOOLLED SHEEP.

CLASS I.—LEICESTERS. One shear Ram.—1st, Thomas Marris, The Chase, Uxoby, Leicestershire, 3d, same 4th, Wm. Owen, Blisnton. Rams of any other age.—1st, T. Marris, 3d, Seymour Mowbray, Mountrath, 3d, W. R. Meade, Killymarino, Ballinhasang. Three 1-shear Rams, not competing in the foregoing sections.—1st, J. and A. E. Gould, 2d, T. Marris, 3d, W. R. Meade. Five 1-shear Ewes.—1st, J. and A. E. Gould, Poltimore, Devonshire, 2d, T. Marris, 3d, S. Mowbray. Five Ewes, any other age, having reared lambs in 1869.—1st, S. Mowbray, 2d, D. Hewatson, 3d, T. Marris.

CLASS II.—BORDER LEICESTER SHEEP.

One shear Ram.—1st, Robert G. Cosby, Strathally Hall, Queen's County, 2d, L. H. Bland, Q.C., Blandford, Queens County, 3d, same. Rams of any other age.—1st, L. H. Bland, Q.C.; 2d, same, 3d, R. G. Cosby. Three 1-shear Rams, not competing in the foregoing section.—1st, L. H. Bland, Q.C.; 2d, J. & G. Laing, Cornhill, Northumberland; 3d, same.

Five 1-shear Ewes.—1st, L. H. Bland, Q.C.; 2d, J. T. Riddell. Five Ewes, any other age, having reared lambs in 1869.—1st, L. H. Bland, Q.C.

CLASS III.—LINCOLN SHEEP.

One shear Ram.—Caleb Goug, Traverston, Nenagh, 2d, same; 3d, same. Rams of any other age.—C. Goug; 2d, same; 3d, same. Three 1-shear Rams, not competing in the foregoing section.—C. Goug. Five 1-shear Ewes.—C. Goug. Five Ewes, any other age, having reared lambs in 1869.—C. Goug.

CLASS IV.—LONG WOOLLED SHEEP.

(Not qualified to compete in the foregoing classes). One shear Ram.—1st, Thos. Roberts, Barn, Strakestown, 2d, R. Coffy, Newcastle, Killiam, 3d, T. Roberts. Rams of any other age.—1st, T. Roberts, 2d, same, 3d, same. Three 1-shear Rams, not competing in foregoing section.—1st, W. Cotton, 2d, R. Coffy, 3d, T. Roberts. Five 1-shear Ewes.—1st, W. Cotton; 2d, C. Cotton. Five Ewes, any other age, having reared lambs in 1869.—1st, R. Flynn, Tuisk; 2d, W. Cotton; 3d, R. Flynn.

SHORT WOOLLED SHEEP.

CLASS V.—SHROPSHIRE SHEEP.

One-shear Ram.—1st, C. W. Hamilton, Hamwood, County Meath, 2d, same; 3d, T. Marris. Rams of any other age.—1st, T. Marris, 2d, C. W. Hamilton. Silver Medal to the Executors of the late J. Richardson, Silverdale, Leicestershire. Three 1-shear Rams, not competing in the foregoing section.—1st, C. W. Hamilton; 2d, same; 3d, the Executors of the late J. Richardson. Five 1-shear Ewes.—1st, the Executors of the late J. Richardson, 2d, same. Five Ewes, any other age, having reared lambs in 1869. The Executors of the late J. Richardson.

INVERURIE.

Breeding and Rearing of Sheep.—A practical and seasonable paper was recently read on the above subject by Mr. BRUCE of Lightfoot, before the Inverurie Agricultural Association. Owing to the great length of the paper we can only give the following extracts, which will no doubt be interesting to English and Irish as well as Scotch farmers:—

Although my experience has been confined to the pure Leicester, I believe that, whatever may be applicable to this breed will hold good in the case of all the others. Blackfaced Highlanders are altogether out of place on our enclosed farms. Accustomed to seek their food over a wide range of country, their instincts lead them to be always on the move; and whenever cribbed and confined they waste nearly as much Grass with their feet as they eat, especially in wet weather, to say nothing of the difficulty of keeping them from breaking the fences. These I would discard, as being unprofitable to the farmers in this district, unless when eating Turnips on the land, enclosed in nets. In this case, you all know, they are first-rate fertilisers on their soils. Although unwilling to give an opinion, still if the question was directly put, "Which of the several breeds do you consider best adapted for our purpose?" my answer would be, a well-bred animal. Considering the value and beauty of well-kept fences, the annoyance and loss that fence-breakers are to the farmer of tidy habits, the well-bred animal will be found the most profitable in every respect. Being of milder disposition, they are seldom fence-leapers; if properly trained, they don't consume any more food, if even so much, nor do they trample the Grass one-half so bad as their more restless brethren, while you have a larger carcass, earlier maturity, more and finer wool, the most prolific, and, in general, the best of mothers.

Preparation of Ewes.—The condition in which the ewe ought to be before and while going with the ram, is of much importance, for let me say that you have the matter pretty much in your own hand, whether your succeeding crop of lambs are to be many or few. Bear in mind, however, that the best treatment for the ewe is not the most suitable for the gimmer; for instance, a ewe, if very fat, if she breed at all, will seldom produce more than one lamb, and often proves a sorry nurse besides, whereas a gimmer in first-rate condition will not only breed more readily, but, in general, will be more prolific, and a good nurse as well, while a gimmer in low condition and badly wintered, in most cases, will produce but one sickly lamb, and that seldom will be found a paying animal. The ewe at this season should neither be fat nor too lean, but simply in a thriving condition, and nothing conduces so much to this as a run of nice sweet Grass, in a field where no sheep have been during the season. When this is not available, a few Turnips or Cabbages, or even Turnip-tops, scattered daily over the field, will have a similarly good effect.

On Rams.—Here let me say that now-a-days one does not so often come across the mongrel that was but too commonly met with some time ago—the brute with the big, ugly head, long slender neck, narrow chest and loins, flat ribs, hard bare back, with the twist culminating at the tail, standing on long, bare, bent legs, and carrying a light fleece of inferior wool. The produce of such an animal will invariably prove a nondescript, and but rarely a first-class butcher lamb. The male in every case ought to be superior to the female. What, then, are some of the leading points needed to constitute a good ram? The following, in my opinion, are a few of them. First, purity of blood, fine head, clean jaws, large bright eye, and thin ears, well set on muscular neck, not too long or too short; broad shoulders, and placed so as to allow the head to be carried as it ought to be, and to walk properly; wide, capacious chest, with a breast like a swan, ribs round as a barrel, broad loins, straight and mellow-handling back, square, and plenty of mutton above the tail, twist down to the hock, long carcase, and clad in a mantle of pearly, lustrous wool, reaching down to the knees. The progeny of a ram having these characteristics, and a well-bred equal lot of ewes, ought, with proper management, to turn out what (in shepherd

phraseology) is called a lot of tops. During the time that the ram is amongst the ewes they should be looked through once at least every day, by this means you are enabled to note the several ewes as they run.

Before Lambing.—After the ram has been removed, the ewes, unless there are too many of them on the land (and it is always more profitable to have ten too few than five too many), will require nothing in open weather but what they pick up, farther than being shifted from one field to another now and then, until within two or three weeks of lambing. Should, however, bare hard frost or snow intervene at any time, in that case hand-feeding of some sort must be resorted to, else dire results will follow. Now, I have observed that the custom, too much in vogue at a season of this kind, is somewhat after this fashion: a wisp of straw is laid on the ground, or else stuck in a heck, and a lot of Turnips spread on the field. Now, gentlemen, I consider this both a wasteful and cruel practice. The straw on the ground, or in the heck, very often with a ricketty covering, gets soaked through with the very first shower of sleet or snow, and in this state they positively will not eat it, unless compelled through sheer hunger. Again, when Turnips are spread on the ground when it is covered with frost or snow, they soon become, if not so before, like lumps of ice; so hard, indeed, that young sheep shedding their teeth, or old ones with few or any, can no more penetrate them than they could a stone. Now, if this be a true picture, let me ask what effects a two or three weeks' dietary of this kind would likely have on the two classes mentioned? There can be but one answer, and that a most unsatisfactory one.

Economical Feeding.—Our practice hitherto has been (and we don't mean to change it), whenever hard frost sets in, or a fall of snow, to have a lot of short wide troughs looked out, and these are placed one here and one there in a small well-sheltered field near to the steading, in which stands a roomy well-aired shed, and here the ewes are brought at once, whenever a change in the weather takes place. I have said that our troughs are short and broad, and that they are placed pretty wide apart from each other. You will have noticed that, whenever a lot of ewes are feeding out of a long trough together, they press and push against each other, so that any one heavy in lamb is very apt to be injured. A short trough entirely prevents this. By having to feed standing as it were in a circle, they cannot press one another unless it may be at the shoulders, while the wideness at the trough prevents the food being pushed over the side and wasted. The troughs being set pretty wide apart, there is less crowding, and by being shifted every second day poaching is prevented, and droppings spread more equally over the land. Having experienced long ago that Turnips, more especially if given *ad libitum*, is the worst food possible for pregnant ewes, we have used the following mixture instead, viz., Oat chaff and cut hay or straw, adding a few light Oats at the rate of 1/2 lb. to each, or, better still, a similar quantity of cotton or rape-cake dust, and slightly damping the whole. This mixture, given without stint, straw in a heck under cover, a lump or two of rock salt to lick, and access to water, will keep ewes in first-rate condition without any Turnips up to within two or three weeks of lambing. The chaff ought to be damped for the following reasons—If dry, it tickles the nose and throat, and causes coughing, and when cake dust is used, it falls to the bottom of the trough, and the mixture on that account is not so readily eaten, while the cut hay, by acting on the muscles of the stomach, enables the oily chaff to be more easily cudded. The following is a very good method for preparing the mixture for those who have not a cake-bruiser.—Get a water-tight barrel, of a size suited to the number of your ewes. Suppose that there are 50 ewes, and that each is to get 1 lb. of cake a-day, in that case weigh 50 lb. of cake, and break it as small as possible with a hammer; put it into the barrel, and then pour over it four or five pailsful of water, if hot so much the better; then stir it up with a stick, and let it stand until next day, by which time it will form into a nice sweet gruel; put your cut hay and chaff on a wooden floor, and pour the gruel over it, mixing it thoroughly with a fork, giving one-half of the mixture in the morning, and the balance at night. Should any one remark, however, that this would be an expensive and troublesome process, such will please bear in mind that this mixture is only given at a time when the ground is covered with frost or snow. With rape and cotton cakes, at 7l. per ton, 1 lb. a-day to each ewe amounts to 5s. a head per week—no great outlay surely, to say nothing about the land being enriched at the same time, as it always is when sheep are fed on cake. A week or two before the first lambs are expected to drop, those ewes marked to lamb first are withdrawn from the others, and placed in a small field beside the bught, and into which they are put every night. To these we give a few out Turnips, gradually increasing the quantity, along with cut hay and a little cake, until the lambs are dropt. By this means they become accustomed to the change of food, which increases the flow of milk, and get familiar with the person going amongst them; and as the average time that the ewe carries the lamb is 145 days, counting on this, and noting other indications, coupled with the payment of a 6d. to the attendant for every living lamb, such a thing as a dead one is rare indeed. When the ewe is lambing, pray don't hurry matters.

After Lambing.—I would strongly recommend keeping the whole of the ewes that may be lambing in a roomy place by themselves for some time, as, when they are allowed to mix with the flock, the lambs are very apt to be trod upon, and seriously injured. Be very careful, however, not to nuzzle too many together, as they get overheated, causing the wool to shed, besides disposing the ewe to catch cold, or inflammation of the udder. Those who breed butcher lambs,

and who may wish to dispose of them early, should give them a little oilcake. If finely ground down, they will begin to eat it when only a few weeks old. To prevent the ewes eating the cake, put up four or more flakes in the field, forming a square, leaving one or more openings of sufficient size to admit the lambs only inside the flakes. Place whatever troughs you may require, these, however, must be covered so as to keep out wet. As the lambs won't eat the cake if it be the least damp, give them very little at first, increasing the quantity to $\frac{1}{2}$ lb a day each—with this little extra, good Grass, and clean skins, they will thrive amazingly. Should it be intended, however, to keep the lambs on through the winter, and sell them fat after being clipped in the spring, the little cake given through the summer will be of immense advantage; in the first place, it will enable them to tide over the weaning period nicely, and, by giving them a good start, will facilitate the fattening process very much afterwards; and here allow me to make a few remarks as to what I consider is the best method of carrying on the feeding operation during the autumn and winter. Say your lambs have been getting a $\frac{1}{2}$ lb. of cake a-day each from 1st of May to 1st of August, at which date they ought to be weaned, this gives 13 weeks exactly; during this time each will have consumed 21 lb. of cake, which, at 11 $\frac{1}{2}$ 10s. per ton, will amount to 2s. 6d. a head. Speaking from experience, I would debit the land with one-fifth of this sum, so that the net outlay per head for three months would amount to 2s. The lambs being weaned they should get a bite of nice Grass, and, if possible, in a field where no old sheep have been during the season, and the cake continued; and once the fields are cleared, let them get a run of the stubbles. Whenever the Grass is gone and the weather breaks, have them put under cover, so as not to allow them to retrograde in the least. By putting them under cover, I don't mean that they should be closed up like cattle; all that is needed is simply a wooden erection in the most sheltered corner of some grass-field; and provided the roof be kept water-tight, anything will answer for lining up the sides.

(To be Continued.)

Reviews.

The Journal of the Royal Agricultural Society of England. 2d Series, Vol. V., Part II. John Murray.

The Part just issued by Mr. Jenkins has for its leading feature a considerable number of very well-written reports of noteworthy farms. Agricultural readers are best taught, and most likely to be satisfied, when the practical farmer is their teacher; and a fairly drawn picture of successful farm practice is the best sort of agricultural lesson. There are a number of capital lessons of this kind in the present volume. Some of the most energetic and best-known agriculturists of the day are thus pressed into the service of the Society, and their practice and experience plainly and simply described by Mr. Dixon and Mr. Jenkins with no doubt pique many a student into rivalry and effort. Some of these pictures of English farm practice we may from time to time transfer to our columns. Dr. Voelcker presents us with an exhaustive treatise on Beet-sugar and the cultivation of the Sugar-Beet. Mr. Evershed writes a report on the agriculture of Staffordshire. Papers on the improvement of grass-lands—on the retention of moisture in arable land, and on the production of successive green crops, are contributed by three practical men—Mr. Cadle, of Gloucester; Mr. Vallentine, of Leighton; and Mr. Chambers, of Derbyshire. There is a portion of the annual report to the Veterinary College by Prof. Simonds, and there are reports of the Implement and Cattle Show at Manchester. The whole makes a capital volume, containing more than the usual proportion of good practical information.

Of the Manchester reports it must be said that the account given of the live-stock is, as usual, very meagre, and that of the different classes of implements exhibited and tried is, as usual, very detailed and explicit. Mr. Wells has done his best to supplement the account given by the judges in the former department, and Sir E. C. Kerrison introduces to the reader the elaborate reports of the implement judges. We are glad to see that Mr. Wells condemns the exhibition of horse-jumping, as proper to the work rather of a circus than of an agricultural society. We observe, in the report of the judges on systems and machines for drying hay and corn in wet weather, that the prize given by the Society of Arts was not awarded for the machine described in Mr. Gibbs' essay, but for the principle on which it was founded. This is a mistake. The prize was given to Mr. Gibbs simply as the author of the best essay on Harvest Work. No doubt the judges were influenced by the fact that the essay contained a very detailed account of his own efforts to bring artificial heat to bear economically on harvest work—but the prize which they awarded certainly was not won by Mr. Gibbs' machine either for its practical efficiency, or, as the report in the volume before us suggests, for its principle. It may be good in either or both of these respects, but on this the judges of the Society of Arts never expressed an opinion. The statistics of the recent meetings of the Society, with which the volume concludes, are an instructive commentary on the policy of holding meetings in populous localities. Upwards of 18,000 were received by the Society at Manchester.

On the Nature and Treatment of Milk Fever in Cows. By Day, Sons, and Hewitt. London: 22, Dorset Street, Baker Street.

This pamphlet has one merit, and as it is a solitary one it may as well be brought prominently forward at once—it is short; but for all the information which the 15 pages of clear type contain, they might have

been indefinitely condensed without any loss being thereby inflicted upon veterinary literature. It will not be denied that any one has the absolute right to publish a book upon any subject under the sun, or for that matter above it, but in common fairness the writer should make sure that he knows something of the subject on which he intends to expatiate.

The authors of the pamphlet inform us, on page 2, that their attention has been directed to a discussion on "milk fever in cows, which has recently appeared in *Bell's Weekly Messenger*," and then they confess their "inadequacy to grapple with a question so subtle and perplexing." This they need not have done, because it is all through the book apparent. Then they plunge into a chaos of speculations about blood poisoning and puerperal fever in ewes spreading through the flock; and specific ferments in the blood producing decomposition or change in its constituents. And then at p. 6, emerging for a moment, they thus state their views of the pathology of milk-fever, by which we presume is meant the common disease, "dropping after calving":—

"This brings us to the more immediate subject of our paper, that of milk fever. From all that is known of this terrible disease, we have it on the authority of the best observers that milk fever is a blood disease, caused by the entrance into the circulation of a specific and destructive poison, in the same way that glanders, hydrophobia, rinderpest, and small-pox are produced."

This is the philosophical view of a fatal congestive disease which occurs only under the one essential condition—parturition; and is no more frequent in the dirtiest and most crowded of cowsheds than it is in the healthiest localities; but our authors' love of the mysterious is not satiated by the mere acceptance of the idea of a specific poison; at p. 8 we have a more explicit doctrine propounded:—

"There may be—indeed there probably are—germs of disease constantly floating in the atmosphere, ready to seize on any animal which is lowered in health by accidental or natural causes. What so likely, then, that a cow which has recently calved should fall a victim to the disease? It is well-known that parturition renders every animal liable to be assailed by any disease that may be epidemic or prevailing at the time. Who would expose a cow that has recently calved to the infection of murrain or the cattle plague? There may be no actual communication between the two animals, and yet the healthy animal is attacked. How then can this possibly be, except through the medium of the atmosphere, or by contact or communication, or in some other way not capable of demonstration?"

Fancy the germs of milk fever floating about in the air ready to pounce upon an unhappy cow as soon as she becomes a mother! But we presume we have quoted enough to show the character of the logic which distinguishes the authors' reasoning upon the nature and causes of disease; and to indicate how far they are competent to deal with the subject of milk fever in cows—a misnomer, by-the-by, as the disease is essentially congestive, and totally distinct from milk fever of the human subject.

Letts' Game Book is a convenient form of memorandum book for the sportsman, containing in each folio ample space on one page for remarks, and on the other a series of columns in which can be entered the head of game of various kinds shot during the day.

Farm Memoranda.

NORTH RIDING OF YORKSHIRE.—On Sunday the 4th inst. the weather broke, and we had on that day nearly 1 inch of rainfall. On the 5th and 6th we had moderately fine weather, and on the latter day some corn was secured. Since then we have had rain, more or less, almost every day, putting a complete stop to harvest operations. As we write the rain falls in torrents, and all the corn remaining in the fields is perfectly saturated. About half of the grain, or perhaps more, is yet unsecured in this district, so that a lengthened continuance of such weather will prove disastrous. So far the temperature has been low, and the dry intervals, accompanied with strong winds, which, while partially drying the grain, have also prevented germination.

With the better opportunity afforded by cutting, we see no reason to materially modify the opinion given last month as to the probable bulk and yield of the crops. Wheat we yet consider to be nearly, if not quite, an average, in bulk, and although many reports from other districts of this county concur in stating the ears as badly filled, yet all we have seen in this district justify us in hesitating to endorse a similar report, and we believe the yield will prove little under an average. The bulk of the crop, even if now secured in good order, cannot, however, be fit to use until spring. Oats are a very short crop, and much under an average. Barley is very good, and a full average. Beans are short, thin, and poorly podded, and decidedly under an average crop.

The rain came opportunely for the Turnips and pastures, both being at a standstill. Turnips as a whole show a small bulb for the time of year, though with warm weather and an open autumn we may fairly expect them to increase much. Swedes promise better than white Turnips. The latter in many places are going off with grub.

Potatoes are reported an indifferent crop, but as yet healthy. *W. J. M., September 15.*

HALE GATE, IN THE TOWNSHIP OF HALE. The farm contains 245 acres. In pasture, 32 acres; Clover seeds, and meadow mown, 124 acres; Wheat after Potatoes, 21 acres, Oats, 37 acres; Beans, 12 acres, Vetches and Oats for soiling, 1 acre, Potatoes, 13 acres, Swedes, 1 acre; Mangel, 1 acre; orchards, gardens, homestead, rick-yard, roads, &c., 3 acres. Customary

rotation—1st, Oats; 2d, Potatoes; 3d, Wheat, with 10 or 12 seven horses, four dairy cows, four heifers, and many pigs; total 23. I have drained 65 acres with pipe in the ditches with large tiles on soles, and drawn Mr. Johnson's finding tiles and soles. I have filled up six pits at my own expense, and planted 3,200 yards of new fence on the roadsides. I have made 1,000 yards of new fields through the farm for convenience of approach to the fields. Laid the foundation with slag, and put on the implement shed of 15 feet by 15 feet. *Willie B. Johnson, July 30.*

Inspector's Remarks.—This farm lies on the banks of the estuary of the Mersey, and not many feet above high water, in short, 32 acres are under the influence of high tides. The surface of the high land is nearly level. Has a little inclination to the south. The soil is stiff clay loam, on a stiff clay subsoil. The corn crops are all the Clover and seeds are sown on land without furrows or grips, so that all the mowing and reaping can be done by machinery without any impediment, except what arises from the weight of the crops. The absence of furrows and grips, and the nature of the soil and subsoil, and the weight and equality of the crop is a proof that the drainage of this farm is perfect far as the upland. The Wheat was in two fields, but heavy clean crops, equal in weight over the whole healthy, and well fed. Oats the same, in three fields, 29 acres sown with Clover and Grass seeds which come well. The Beans were sown in drills, 30 inches apart, affording room for perfect tilage and early growth of the crop, which was perfectly clean and promising for heavy produce. Potatoes in drills, perfect clean and healthy. Mangel and Swedes not promising but sufficient plants, so that the late rains will bring them up, as they were quite rent, and the land well followed. Head-ricks and cops ad right, seven very long haystacks, some of them being 20 yards and upwards in length and 6 broad, with height corresponding, proving a weight of the hay crops. The weather had been dry for the aftermath or second crops to come forward. The quality of the herbage very good. Hay stacks well and neatly thatched. The new wire fence through the farm in proper condition, as well as all the fine wire protection had to be put up to prevent rascally rabbits destroying them, as these vermin have an antipathy to new fences, for they afford them a shelter. Mr. Johnson has a good assortment of implements, and has everything in good order about his house, yard, and homestead. No great quantity of stork is kept on this farm. Most of the produce goes to Liverpool, and manure is brought back in return, and the weight of produce on the farm is a proof that there is a sufficient supply of this necessary article. Inspected July 29th, 1859.

Mr. Johnson had one very powerful opponent. The farm is a large one, and under his management but the corn crops not quite so equal in weight as Swedes and Mangel superior, Potatoes and Beans so vigorous, but equally clean. Soil and subsoil the same in texture, but at a rather higher elevation though nearer to Liverpool. This claimant had another profitable business besides farming. *From Report of Manchester and Liverpool Society's Inspectors of Farms.*

The Poultry Yard.

The poultry shows now come on us thick and fast and the question we have many times asked is now again mooted—Why have we no poultry show in London? We should be very glad to hear that there was any chance of one.

The Birmingham prize sheet is anxiously looked for. A very good poultry show was held on the 8th inst. at Whitby, in conjunction with the Whitby Agricultural Society's thirty-fifth annual meeting. Messrs. Dixon and Adams were the judges. Mr. H. Smith took first prize, and Mr. Bearpark second for adult Dorkings; Mr. Wormald first, and the Rev. G. Husker second for chickens. The quality of the birds was hardly up to the average. Exhibitors cannot be too careful in selecting their chickens for exhibition. The one which is looked on as a mere trifle, which the bird will grow out of in the yard at home, becomes a fatal defect in the showyard. This was the case with a pen of Dorking chickens at Whitby. In Spanish, the prizes for old birds were taken by Messrs. Holmes and Pjard, and in chickens by Messrs. Burn and Stephenson. The first prize game fowls, belonging to Mr. Julian, were deservedly much noticed. The chickens of Mr. Pounder were very good. The second prizes were taken by Messrs. Walker and Blackburn. The district does not stand high for buff Cochins or indeed Cochins of any kind. Mr. Readman took three out of the four prizes with birds of average quality. The dark variety of Brahma held their own against the light variety in Yorkshire and here Mr. Leech won the first prize. Messrs. Walker and Layland taking second and third. Houdans were preferred to Crevecoeurs. As might be expected, the Hamburgs were among the principal attractions of the show. A Yorkshireman has an innate fancy for the breed, which is strong within him. Certainly the birds justify it, for there are few prettier or more blood-like birds. Mr. Holmes took the first prizes for all the adults except for golden pencilled where he ran second to Mr. Walker.

The hardy little favourites, the game bantams, were good. The first prize was taken by a well-known breeder of them, Mr. Eatwistle. Mr. Burn, of Whitby, took a first and second prize for black East Indian ducks, Mr. Leech first, and Mr. Stonehouse second, and a commendation for Aylesburys. The principal competition in the duck classes was among the Rouens.

where Mr. Garbrett may be really proud of his first in the class for any other variety of duck, Mr Walker won with a pair of Carolinas. The Rev. G. Hustler and Mr O A Young won the first prizes for geese: the latter gentleman taking also one first for turkeys—Mr Prews the other.

The pigeons were very good, and the greater number of the prizes remained in the county.

The arrangements were very good, and the attendance larger than usual.

Calendar of Operations.

SEPTEMBER Lining the land in autumn for winter Beans and Vetches is preferable to liming it after these crops are harvested for winter Wheat next season. But to be successfully applied it must be thoroughly incorporated with the surface soil, and kept as near the surface as practicable, as it has a natural tendency to sink to the subsoil. The practice of autumn manuring the soil, therefore, that best adapted for liming, the lime being applied and well harrowed into the land before it is set up into ridges, as directed under the practice of liming for Turnips in spring time. Lime may also be applied before setting up the ridges for Potatoes, Carrots, Mangels, &c.; or to these crops it may be applied, and horse and hand hoed in during spring. We have also thus applied lime in the spring time successfully to Beans, a slight dusting doing comparatively little or no harm in dry weather to the young plants, as it is soon shaken off or washed off by a shower of rain. Land deficient of lime is not adapted for successful Bean husbandry. If applied on any of the other three plans, the lime should be spread upon the stubbles, and well harrowed in before the manure is applied, or if the land requires broadsharing, or scuffling, it should be applied after the weeds have been removed. Lime may likewise be successfully applied to grass-land, either by itself or in the form of lime compost. The Clovers are all great consumers of lime, and in laying down land at this season to permanent pasture, it should be well limed before the seeds are sown. The quantity depends upon the nature of the land and the length of time between the applications, some preferring frequent limings, as once every four years, so that one-fourth of the land has to be limed annually; others every alternate rotation, or every third one.

Permanent Grass.—Land may be laid down more profitably during the whole of this month than in spring in most counties. Grass-land, whether for meadow or pasture, cannot be too rich, and therefore, whatever crop it follows, the land should be liberally manured on the flat, lightly ploughed in. If the land is deficient of lime, then lime on the surface, and at the rate of from 100 to 200 bushels of shells per acre. Some sow the seeds on the lime, but it is better to harrow in the latter, taking care to tear up as little of the manure as possible. This makes a fine seed-bed for the seeds, which may be covered with a chain-harrow. A very fine mould is not desirable at this season—a small cloddy roughness standing the winter frosts better than a smooth surface.

Rye-grass for early spring feeding is sown from the middle of August to the latter end of the current month on all sorts of land. But it grows freely on poor sandy soils, on which Vetches and Trifolium will not pay the seed. Wheat and Oat stubbles are scarified and any weeds gathered off. Farmyard manure is then applied and ploughed in on the flat, and the land sown with about 3 bushels of seed per acre. Or, instead of farmyard manure, the seed may be drilled in with about 3 cwt. of guano. If there is a command of town sewage, and the land is light, fill the newly scarified land with it, or with farm sewage, or the 3 cwt. of guano may be applied with water.

Winter Vetches are sown for spring feed during August, September, and October. The crop, like other spring forage crops, follows Wheat and Oats, and, in our southern counties, it is off the land in time for sowing Turnips. The cultivation should generally be a single thin furrow, as Tares require a firm seed-bed, about 3 bushels of seed being sown per acre. Vetches will grow on all comparatively rich and fertile soils, but this crop is better adapted for the heavier clays, which can be worked advantageously at this season, while the crop next May can either be eaten off by sheep or mown for soiling other stock. Some mix a bushel of Oats or Rye with 2½ bushels of Tares for sowing, per acre, purposely to prevent the Tares kneeing and rotting in the ground, which they are liable to do when the crop is luxuriant, as it generally is under ordinary good management.

Trifolium incarnatum is commonly sown during August and the first half of September, for soiling or hay next May and June. It prefers a rich but rather firm soil, so that the land should neither be ploughed nor smashed up. It may therefore follow Wheat, Barley, or Oats, or any of the root crops that were richly manured. It is sown by chain-harrowing in about 20 lb. of clean seed, or 4 bushels of the rough seed in the huck, per acre; or, if the land requires manure, top-dressing or artificial manure may be applied with a broadcast distributing-machine, and bush-harrowed in along with the seed. The cultivation of the crop is exceedingly simple.

Winter Beans may be grown on lands of a lighter texture than that which is usually termed a Bean-soil. But, whatever be the nature of the soil, light or heavy, the land is ploughed or smashed up, crossed and manured, as already directed, and about 2 bushels of the small winter Beans drilled in per acre, the coulter being set from 18 inches to 2 feet apart, with a sufficient lever pressure to put in the seed to the proper depth. A stroke of the seed harrows completes the operation. The land should be drilled due south and north, or, as is sometimes technically termed, "12 o'clock" (A.M.). Some think the morning sun

more powerful than the afternoon sun, but the difference, if any, on an average, is not great. More perhaps depends upon the exposure of the lands. But for all differences of this kind, due provision should always be made in the cultivation of Beans.

Renovating Grass-lands should be done about this time. Tussock and other inferior Grasses should be dug out, and when weeds and everything of this sort are removed, a heavy top-dressing should be applied and well harrowed in before the seed is sown, and the seed may, lastly, be covered by bush or light chain harrows. The carting and other operations are much more easily done at this season than in early spring, and with infinitely less harm to the land, and the young Grasses will be well established before the winter frosts set in. Stock should not be admitted, but in growing seasons the young Grasses may require to be either eaten off or mown by the middle of November, so as to prevent rotting during winter. Sheep are prone to pull up the finer Grasses, and black cattle to do harm both with their feet and mouths. If mown the Grass should not be cut too close, and a mowing machine and horse rake will go over a large breadth in a day, the rake teeth being set high; and the green cuttings may be given to stock, as sheep in the adjoining pastures, or to cattle of all sorts at the home-stead. In renovating grass-lands at this season, and indeed in spring also, the common mistake fallen into is an insufficient supply of manure to rot the effete vegetable matter of the old Grasses, and to force up a rapid growth of fresh Grass, the renovating work being thereby only half done. But as the young Grasses can be utilised as above, the richer and more abundant the top-dressing the better; and, therefore, it is more advantageous to do half the land well, so much annually, than to half do the whole field in a hurry this year and nothing next.

Milch Cows closely resemble fattening bullocks as to dietary, but it is seldom advisable to house them permanently so early as this, unless there is a plentiful supply of green forage for soiling. On such food, however, they will now do better indoors than in the pastures during the day, and over-night they should be permanently housed, by the beginning of the month in the southern counties, and a full month earlier in the north. The Clovers, including Lucerne, Sanfoin, Vetches, Cabbages, and sewage Grasses make the best forage for cows at this season. Rape and Turnips produce inferior milk for the dairy. Cows will do well soiled on any of the above forage plants after they have become accustomed to them. But it is a well-authenticated fact that a mixed dietary is preferable, so that when this cannot be complied with, an allowance of rough oatmeal, barley meal, or pea or bean meal should be given daily; and mixtures of this kind are more needed for soil now than earlier in the season. From time immemorial dairymen have been familiar with the beneficial effects produced by shifting their milch cows two or three times daily at this season, so as to give them a mixed dietary, hence the practical conclusion.

The Dairy.—September is a good dairy month, both for butter and cheese, if the milch cows are properly attended to, the natural temperature of the atmosphere being that suited to the throwing up of cream and the drying of cheese in southern counties. Northwards it is, on the winter side, too cold and moist. But to both there are many exceptions, while early calved cows are liable to fall off in the quantity of milk, and to give more cheese than butter in what they yield, as compared with the early part of the season. Practically, therefore, the work of the dairy will readily be anticipated. There is not much to be dreaded from solar heat, either in the milk-room or cheese-room, in fine dry open weather in the south, but it is otherwise in close muggy days, everything becoming more and more artificial heat may be needed to keep things dry, whatever may be the temperature of the atmosphere; and it is a wise maxim to kindle the fire in time, as very little heat will then keep everything "sweet," whereas, on the contrary, the extra heat needed one way may do harm another.

Calves, if neglected in their proper food and shelter, are liable to be infected with worms in the windpipe "hoose" or "hask"), and lice on the skin. Our improved breeds are more liable to be thus affected than the old hardier races. The lice are easily seen behind the ears, and along the neck and back. Harsh, frequent, dry husky coughing indicates worms in the air passages—and derangement of the bowels the state of the intestines. The newly weaned calves "have got a set," as it is termed in some districts. About the middle of August they were growing rapidly, but the milk being taken from them without any adequate supply being made in its place in the dietary, they cease to grow for a time, and so on. Prevention is simple, thus,—attend to food and shelter, and as to cure, apply to your veterinary surgeon. *W. B.*

Notices to Correspondents.

BEARDED WHEAT B.C. Too late for this week.

HALF-PAY T.S.P. Thanks for your note. We asked for the address of a correspondent who had written under the signature "Half Pay."

RAINS—WATER BY A WAT—WHEEL An Old Subscriber. Your questions would take quite half a day to work out, and as you cannot do this for yourself, the probability is that your figures, as regards the force of the stream, and so on, are not accurate. The whole of this great labour would, therefore, be useless, letting alone the probability that you might be induced to incur an expense that would end in being too great or too little. Preliminary calculations of the kind you name, to be of any value, should be based on measurements of the greatest engineering accuracy. Your more judicious plan is, to begin the undertaking you are contemplating by consulting in the first instance a trustworthy practical engineer. As you omitted to add your address, we cannot further advise you.

Horticultural Glass Warehouse.
THOMAS MILLINGTON AND CO.,
 87, Bishopsgate Street Without, London, E.C.
 NEW LIST for ORCHARD-HOUSE GLASS as supplied to Her Majesty, the Nobility, Gentry, Mr Rivers, and the leading Horticulturists of the United Kingdom.

F. ARCHER'S "FRIGI DOMO."
 Patronised by Her Majesty the Queen, the Duke of Northumberland for Syon House, His Grace the Duke of Devonshire for Chiswick Gardens, Professor Lindley for the Horticultural Society, and Sir Joseph Paxton for the Crystal Palace, Royal Zoological Society, Royal Gardens, Kew, &c.

The best Shading is "Frigi Domo" Netting.

White or Brown, made of prepared Hair and Wool, a perfect non-conductor of heat or cold, keeping a fixed temperature where it is applied. It is adapted for all Horticultural and Floricultural purposes, for

PROTECTION from the SCORCHING RAYS of the SUN.
"FRIGI DOMO" NETTING, 2 yards wide, 1s. 6d. per yard run.
"FRIGI DOMO" CANVAS

Two yards wide	1s. 9d. per yard run.
Four yards wide	3s. 6d. per yard.
An improved make, 2 yards wide	1s. 9d. per yard.
An improved make, 3 yards wide	2s. 6d. per yard run.

"Sir,—Will you be good enough to send me 50 yards of Frigi Domo 2 yards wide, of your improved make, 1s. 6d. per yard run. You can forward it per London, Tilbury, and Southport Railway. I had some of you several years since, but have not found it substitute so good for Greenhouse and Stove Shadings.—I am, Sir, yours respectfully,
GROVER WOOD (Solicitor, Rochford).
Mr E. T. ARCHER, 7, Great Trinity Lane, Cannon Street, E.C.
ELISHA THOMAS ARCHER, White and Sole Manufacturer, 7, Great Trinity Lane, Cannon Street, City, E.C., and of all Nurserymen and Seedsmen throughout the Kingdom.

RENDLE'S PATENT GROUND VINERIES AND PLANT PROTECTORS.

PATENT GROUND VINERY, 10 FEET LONG, COMPLETE WITH GLASS, FOR ONE GUINEA.

The same size as now in operation at Mr. Rivers' of Sawbridgeworth.

Extract from the "JOURNAL OF HORTICULTURE AND COTTAGE GARDENER," August 19, 1868:—

"We have seen at Mr. Rivers' an experiment with these tiles erected after this fashion, and it succeeds admirably. The Vine is the picture of health and vigour and under the glass there is the needful amount of humidity to secure health and keep down red spider."

In consequence of the large demand for these Protectors, it will be necessary TO GIVE ORDERS AT ONCE, in order to ensure a supply for the Autumn. All Orders will be executed in strict rotation.

These Protectors have been exhibited at the Exhibitions of the Royal Horticultural Society at Leicester and Manchester; at the Royal Botanic Society, Regent's Park; the Royal Horticultural Society, South Kensington, the Bath and West of England Horticultural Society, at Southampton; and at various Provincial Horticultural Exhibitions. Specimens will also be exhibited by the regularly appointed Agents throughout the country,—a List of whom will be shortly published.

AGENTS are IMMEDIATELY REQUIRED—Only one will be appointed in each City or Town. Applications should at once be made to the Patentee.

Mr. Rivers has kindly consented to allow the Patent Ground Vineries to be seen at Sawbridgeworth.

SPECIMENS can be seen any day at the Gardens of the Royal Horticultural Society, South Kensington, on application to Mr. J. G. Fox.

FOR PRICES AND FURTHER PARTICULARS, APPLY TO THE PATENTEE,

MR. W. E. RENDLE, 68, WELBECK STREET, CAVENDISH SQUARE, LONDON, W.

GREEN'S PATENT SILENS MESSOR,

OR

NOISELESS LAWN MOWING, ROLLING, and COLLECTING MACHINES.

BY SPECIAL APPOINTMENT,
MANUFACTURER

TO HER MOST GRACIOUS
MAJESTY THE QUEEN.

The Extraordinary Success of GREEN'S PATENT LAWN MOWERS is an established fact. During the last five years the demand has been unprecedented, which alone is a proof of their superiority over all others. The following are their characteristic features:—

- 1st. Simplicity of Construction, every part being free of access.
- 2d. They are worked with far greater ease than any other Lawn Mower.
- 3d. They are the least liable to get out of order.

T. GREEN AND SON warrant every Machine to give entire satisfaction, and if not approved of can be returned unconditionally.

HAND MACHINES.

To Cut 10 inches	..	£3 10 0	Suitable for a Lady
" 12 "	..	4 10 0	" "
" 14 "	..	5 10 0	Suitable for One Person

SUTTONS'

IMPORTED FLOWER ROOTS

SUTTON & SONS, SEEDSMEN TO THE QUEEN, READING, BERKS,

having received their FIRST CONSIGNMENT of CHOICEST DUTCH FLOWER ROOTS,

Selected by themselves from the leading Growers in Holland, are now prepared to receive orders for their COMPLETE COLLECTIONS for WINTER and SPRING BLOOMING, either for indoor or outdoor cultivation.

Suttons' £2 2s. Collection of Flower Roots, For OPEN GROUND, Carriage Free, contains—

- 24 fine mixed Border Hyacinths
12 Polyanthus Narcissus
25 Pheasant's Eye Narcissus
25 Double White Narcissus
60 Double Daffodils
12 large Campernelle Jonquils
100 fine mixed Double Ranunculus
100 Scarlet Turban Ranunculus
25 fine mixed Double Anemones
25 Single Anemones
300 Crocus, in 6 sorts
100 Snowdrops
50 Winter Aconites

Suttons' £1 1s. Collection of Flower Roots, For OPEN GROUND, Carriage Free, contains—

- 12 fine mixed Border Hyacinths
6 Polyanthus Narcissus
12 Pheasant's Eye Narcissus
12 Double White Narcissus
25 Double Daffodils
6 large Campernelle Jonquils
50 fine mixed Double Ranunculus
60 Scarlet Turban Ranunculus
12 fine mixed Double Anemones
12 Single Anemones
150 Crocus, 3 sorts
50 Snowdrops
25 Winter Aconites

Suttons' 10s. 6d. Collection of Flower Roots, For OPEN GROUND, contains a choice assortment for a Small Garden.

Suttons' £2 2s. Collection of Flower Roots, For POTS or GLASSES, Carriage Free, contains—

- 24 fine Hyacinths, by name
12 fine Miniature Hyacinths, do
12 Polyanthus Narcissus, do
12 large Double Jonquils
12 single Sweet-scented Jonquils
12 Scilla precox
12 Single Duc Van Thol Tulips
12 Double Tournesol Tulips
50 Early Tulips, 10 sorts

Suttons' £1 1s. Collection of Flower Roots, For POTS or GLASSES, Carriage Free, contains—

- 13 fine Hyacinths, by name
8 Miniature Hyacinths, by name
6 Polyanthus Narcissus, do
6 Large Double Jonquils
6 Single Sweet Jonquils
6 Scilla precox
6 Single Duc Van Thol Tulips
6 Double Tournesol Tulips
25 Early Tulips, 5 sorts

Suttons' 10s. 6d. Collection of Flower Roots, For POTS or GLASSES, contains a choice assortment of most useful and showy kinds.

The best 12 Hyacinths, by Name, for 12s., Extra fine Double and Single varieties.

For further particulars, with complete Cultural Instructions, see

SUTTONS'

AUTUMN CATALOGUE FOR 1869, Gratis and Post Free on application.

FLOWER ROOTS and SEEDS CARRIAGE FREE, except very small parcels.

Five per cent. allowed for cash payments.

PRETTY AND PERMANENT DISPLAY

DURING WINTER AND SPRING.

JAMES CARTER AND CO. strongly recommend the following COLLECTIONS, assorted from the most popular varieties:—

No. 1.—CARTER'S COLLECTION for WINDOW or CONSERVATORY DECORATION £4 4 0

CONTAINING:

- Hyacinths, 60 in 25 extra fine named sorts
Polyanthus Narcissus, 36 in 12 named varieties
Jonquilla, Sweet-scented, 50
Crocus, finest, named, 200
Cyclamen persicum, 4

No. 2.—CARTER'S COLLECTION, reduced quantities £3 3 0

No. 3.—CARTER'S COLLECTION, reduced quantities £2 2 0

No. 4.—CARTER'S COLLECTION, reduced quantities £1 1 0

No. 5.—CARTER'S COLLECTION for CONSERVATORY and OUTDOOR PLANTING £4 4 0

McLAREN'S PROLIFIC RASPBERRY.

For full description, see Page 95b,

in 1st week's Gardeners' Chronicle.

AWARDED A FIRST-CLASS CERTIFICATE.

JAMES CARTER AND CO. are now booking orders for the above valuable fruit, to be supplied this autumn at the following prices:—

- 6 Strong Canes, 7s. 6d.
12 Strong Canes, 12s.
25 Strong Canes, 20s.
100 Strong Canes, 60s.

No. 6.—CARTER'S COLLECTION of BULBS for CONSERVATORY and OUTDOOR PLANTING £3 3 0

No. 7.—CARTER'S COLLECTION, reduced quantities £3 2 0

No. 8.—CARTER'S COLLECTION, reduced quantities £1 10 0

No. 9.—CARTER'S COLLECTION, reduced quantities £0 15 0

No. 10.—CARTER'S COLLECTION for OUTDOOR PLANTING £4 4 0

CONTAINING:

- Hyacinths, 75 in 3 colours
Narcissus, Double, White, 50
Poeticus or Pheasant-eye, 50
Double Daffodils, 50
Tulips, extra fine mixed, Double, 75
Crocus, Blue, 200
Striped, 200
Large Yellow, 200
White, 200

No. 11.—CARTER'S COLLECTION, reduced quantities £3 3 0

No. 12.—CARTER'S COLLECTION, reduced quantities £2 2 0

No. 13.—CARTER'S COLLECTION, reduced quantities £1 1 0

No charge for packing any of above Collections.

For the fullest information to ensure successful cultivation and particulars of the above Assortments, send for

CARTER'S

ILLUSTRATED LIST of BULBS, &c., Forwarded Gratis and Post Free.

JAMES CARTER AND CO., THE ROYAL SEEDSMEN, 237 AND 238, HIGH HOLBORN, LONDON, W.C.

DOBSON'S PRIZE CALCEOLARIA SEED, the finest strain in existence, 1s. 6d., 2s. 6d., 3s. 6d., and 6s. DOBSON AND SON, Woodlands Nursery, Isleworth, W.

PELARGONIUMS, Show and Fancy.—Fourteen First Prizes have been awarded to our Collections this season. Any 12 varieties may be selected for 21s. See CATALOGUE, gratis and post free. Woodlands Nursery, Isleworth, W.

DOBSON AND SONS' BULB CATALOGUE, post free. Woodlands Nursery, Isleworth, W.

Splendid New Rhododendron, BARONESS LIONEL ROTHSCHILD.

JOHN WATERER AND SONS are now prepared to execute orders for the above new SEEDLING RHODODENDRON, in colour it is a clear bright crimson, the margin of the bloom of a fiery scarlet, of fine handsome form, and remains a great length of time in bloom. Price 21s. each. The usual Trade allowance. The American Nursery, Bagshot, Surrey.

New Seed, 1869. F. AND A SMITH beg to offer the following, saved from their rival collections, and just harvested in fine condition.—CALCEOLARIA, CINERARIA, PANSY, GERANIUM (Variegated), &c.; PRIMULA FIMBRIATA (Crimson and White), INTERMEDIATE STOCK, &c. Special offer to the Trade forwarded on application. The Nurseries, West Dulwich, S.E.

Primula sinensis. WINDEBANK AND KINGSBURY'S STRAIN. "By far the most varied and interesting set which has come under our notice."—Edinb. Gardeners' Chronicle, Jan 30, 1869. "Our best lot are from W. WINDEBANK & KINGSBURY'S strain."—Edinb. Gardeners' Magazine. Strong plants now ready. Bevois Valley Nursery, Southampton.

Primulas, Fuchsias, Vines. PRIMULA.—New SEED, from the choicest strains in cultivation, Red, Purple, White, and Striped, now offered to the Trade, in liberal Trade packets, mixed, 7s. 6d. and 10s. 6d. Retail, 2s. 6d. and 3s. 6d. per packet. FINE PLANTS, 6s. per dozen. Strong Plants of our four New FUCHSIAS, with plenty of Cuttings on, 2s. 6d. each. These are four of the best yet sent out for Market or Exhibition. A large collection of choice VINES for fruiting and planting. DESCRIPTIVE LISTS and prices on application to FELTON AND SONS, Birmingham Nursery, Harborne Road, Birmingham.

Roses, New Roses, Gladioli. LEVÉQUE ET FILS, NURSERYMEN, 132 and 134, Boulevard de l'Hôpital, Paris, have a very large stock of strong ROSES, Standards, Half-Standards, Dwarf, and on their own roots, including all the best new varieties. NEW ROSES for the YEAR to be sent out for the first time next November.—They can supply a tree, with a large discount. GLADIOLI SEEDLINGS (first race), put through, and all the best sorts by name. LISTS and prices sent free on prepaid application.

Dwarf and Standard Roses. FRANCIS & ARTHUR DICKSON & SONS have an immense stock (many thousands) of very strong well-grown plants of all the best ROSES, including all the new varieties, for Autumn planting; also a large quantity of Strong Plants, in pots, of the best sorts, which can be planted out at once. PRICED DESCRIPTIVE CATALOGUE sent free by post. Inspection respectfully invited. The "Upton" Nurseries, Chester

The Gardeners' Chronicle. SATURDAY, SEPTEMBER 25, 1869.

BEYOND all descriptions, to say nothing of Hibernians, feel an intense interest in all that concerns the culture or the improvement of the POTATO. We are, therefore, sorry that comparatively few had the opportunity of witnessing the results of Mr. FENN's experiments, as displayed at the Royal Horticultural Society's rooms on Tuesday last. The object of Mr. FENN's display was threefold: to show the effect of grafting an "eye" of one form into the tuber of another; to exhibit the produce derived from cross fertilisation of different varieties carried out in the ordinary manner; and to exhibit a series of those varieties which had proved, in Mr. FENN's experience, to be the best adapted for garden or field culture. Referring our readers to another column for the details of this interesting exhibition, we venture in this place to make a few comments of a general character on the results of Mr. FENN's experiments. And first, as to the results of grafting. When this matter was first broached it was received with incredulity and ridicule. The incredulity was natural, the ridicule was not wholly undeserved, owing to the manifest want of caution on the part of some of the experimenters, and the very high jumps they made to their conclusions. Then came the remarkable evidence published in our columns some time ago (p. 270)—evidence given, not by enthusiastic amateurs, or as the result of crude and untrustworthy scientific experiments, but testimony furnished by hard-headed, observant men, with no theory to bolster up, and no physiological problem to solve, no scientific assertion to prove or disprove; but given by men whose aim and objects were wholly and solely practical. Our readers had that evidence before them, and drew their own conclusions.

Now we have got a stage further; a well-known Potato-grower exhibits publicly the results of his experiments in the matter of Potato grafting; and here we may add, that we had the opportunity of satisfying ourselves that there was boni fide adhesion of scion to stock in some of the samples submitted for our inspection by Mr. FENN, some months since. Now what are the results? Where are the graft-hybrids? Of the illustrations furnished by Mr. FENN, on Tuesday, all save two were purely negative; no change was visible in the new tubers. But

the two in which a change had been effected are amply worth notice.

In the one case, where "Fenn's Onwards" had been grafted into "Yorkshire Hero," there was, according to Mr. FENN, some difference in the appearance of the shoots and haulm. As we had no opportunity of forming our own conclusions on that matter we pass that by without further comment. In the other case an eye of "Wheeler's Milky White" had been grafted into the old Fluke as a stock, all the eyes save those of the scion having been carefully removed. The result was a crop of tubers from the scion possessing, obviously enough, the characteristics of the Fluke and of Milky White. Samples of both parents were placed side by side with the hybrid, so that every one might have the opportunity of testing the matter for himself. Mr. FENN's label, attached to his graft-hybrid, said, in one sense truly enough, "character of Potato quite spoilt." In another sense Mr. FENN might fairly have written "great success," for he has demonstrated the practicability of the process, and has exhibited the results in a form, as it appears, almost beyond doubt. The *cui bono* man will probably sneer when he sees the unpromising looking progeny raised by Mr. FENN, and learns that the majority of that gentleman's experiments have been without results. On *cui bono* principles, however, we should have remained stationary, we should have had few or no improved races of plants or animals; as every experimenter knows he achieves success, in most cases, after numberless failures. Again, our *cui bono* friend may console himself with the remembrance of the fact that some very excellent Potatoes are asserted, on good evidence, to have been raised in this manner.

In ordinary grafting, in which the tissue of the scion adheres to that of the stock, when growth takes place, in by far the majority of cases no alteration in the character either of the stock or of the scion takes place. Reservoir is added to reservoir, conduit to conduit, or, to speak more precisely, cell is developed from cell; and as the cells of the stock repeat themselves so also those of the scion develop new ones. In both cases the new cells are uninfluenced in form and appearance by the contact of stock and scion, even though the nutriment of the latter is pumped up through the tissues of the former. Growth, whether of scion or stock, thus appears to be mere augmentation of old material, so far at least as the framework is concerned. But inasmuch as the scion has to get its nourishment through the stock, we are not surprised to see the changes that are produced in habit, vigour, flavour, and the like, as a result of grafting. The little alteration that takes place in appearance may, perhaps, be accounted for on the supposition that the stock, rooted as it is in the ground, and producing no leaves of its own, acts merely as a channel of communication between the soil and the scion. This would open up that other question as to whether stems can grow without leaves, and if they cannot do so, how it is that the stock is not affected by the scion more often than we know it to be. But these questions we cannot now enter upon. *Reverens a nos pennis de terre.* The Potato stock, deprived of its eyes or buds, emits no roots, but becomes decomposed; its insoluble matters are changed into soluble ones, which serve to feed the growing shoot, so that when the old tuber or stock is dug up it is found by Mr. FENN to be, as it were, an empty bag. Where no union takes place the Potato stock remains as plump as it was on the day it was operated on; hence the Potato stock supplies nutriment from its own resources to the graft, and if so, there is little room for wonder at the production of graft-hybrids: but, on the contrary, there is reason for surprise that they do not occur more frequently.

Here we leave the subject for the present, with the intention of shortly reverting to it and to the other experiments on cross fertilisation carried out by Mr. FENN, and which have resulted, *inter alia*, in the production of a tuber said to be identical with wild tubers obtained direct from Peru. In the interim, we tender to Mr. FENN on behalf of all Potato lovers—and that love has many phases—cordial thanks for the opportunity of inspecting his productions; and we earnestly beg him to stick perseveringly to his motto, "Onwards;" and to prove that there may be "Heroes" in Oxfordshire as well as in Yorkshire.

At the recent meeting of the British Association, Miss BECKER is reported to have read a

paper on a PECULIAR FORM of the common LYCHNIS DIOICA, in which stamens and pistil were present in the same flower, contrary to what happens usually in that particular species. Furthermore it is stated that the anthers were filled with spores of a smut-like Fungus, no doubt of the same description as that brought under the notice of the Scientific Committee during the past session (see p. 503). Miss BECKER, it is said, brought forward two modes of accounting for the peculiarity, viz., that it was due to a reversion to the primitive form wholly independent of the Fungus, the other that the change in question was really due to the presence of the Fungus. We have only seen a condensed report of what Miss BECKER really did say, and hence we may possibly be misrepresenting her views; if so, we are open to correction. Such cases as that recorded by this lady are not without their interest for horticulturists, who sometimes find a difficulty in getting Cucumbers or certain varieties of Vine to "set" properly, and therefore a few remarks may not be out of place. Let us look at the facts:—This particular Lychnis is commonly found with flowers of one sex only—stamens on one plant, pistils on another. In Miss BECKER's instance the flowers were hermaphrodite, and were further affected with a parasitic Fungus. Now, most of the allies of Lychnis are hermaphrodite, but a very considerable number are unisexual. In the ordinary Lychnis dioica there is usually a trace at least of the missing organs; hence it is allowable to surmise that their absence in a perfect condition is due to an arrest of development. What the cause of that arrest may be we cannot undertake to decide. It may be due to existing external causes, though this seems hardly likely; it may be due to that tendency to a subdivision of labour, which we see as fully exemplified in Nature's workshops as in man's factories; or it may be, and probably is, associated with that increased fecundity which results from crossed fertilisation.

And then as to Miss BECKER's plant, where the flower was structurally perfect, who can say what were the causes of the change? The authoress herself discards the reversion theory, on the grounds, we suppose, that no one knows what the primitive state of things was, and that there is no distinct evidence of any such reversion having taken place. We suppose it might be said that the flower was originally hermaphrodite, but by natural selection became unisexual, because, from causes previously stated, it was to the advantage of the flower to be so; and if so, Miss BECKER's instance may be one of reversion, but, as before stated, there is no evidence to show what the original state of things was. At the same time as a theory this view of the matter seems to us more plausible than the notion which Miss BECKER upheld, that the Fungus was the cause of the change. We are at a loss to see how the parasite could have brought about the change from an unisexual to a bisexual condition. It would, in our opinion, be more likely to induce an arrest rather than an excess of development.

— THE French correspondent of the *Lancet* sends to that Journal the following account of AN ANTIDOTE TO NICOTINE.—"A bit of news which will be welcome to hygienists and smokers! M. ARMAND, a French savant, has stated to the Academy of Sciences that he has discovered a sure antidote to nicotine. Success has thus crowned the efforts which he has been making for the last few years. The antidote is nothing less than common Watercress. It destroys the poisonous effects of nicotine, and yet does not alter the aroma of tobacco. A solution of Watercress may, therefore, be employed for steeping the leaves of tobacco, and would thus effectually divest them of their noxious properties; moreover, a draught of the same will act as a sure antidote to nicotine."

— While referring to POTATOS, we may cite an interesting fact, recorded in a letter addressed to Mr. PATERSON, a well-known raiser of new POTATOS, and by him obligingly forwarded to us. "A circumstance has come under my notice to-day, from an old Potato grower, respecting your Victoria. You are aware that it blooms and fruits heavily. This person pinched out the bloom of one portion of his crop as soon as fully formed. The other he allowed to bloom and fruit, and the crop he allowed to bloom was not more than half the crop. The other was not only a double crop, but the Potatos were much finer and cleaner skinned."

— We are informed that the widow of Mr. HENRY C. OGLE, who for many years filled the position of head gardener at Eridge Castle, and whose contributions to horticultural literature are well known, is, from causes entirely beyond her own control, in greatly reduced circumstances; and, unless a sum of 100*l.* can be almost immediately forthcoming,

she will be compelled to part with her only means of obtaining a living for the future. Mr. COX, of Red-leaf, has permitted his name to be used as a guarantee of these facts; and for the relief of Mrs. OGLE contributions are solicited from the affluent and the generous. Remittances may be made to Messrs. WHITFIELD & CO, Bankers, Tunbridge Wells; or to Mr. THOMAS READ, Parade, Tunbridge Wells.

— Londoners with botanical proclivities will be glad to learn that the long promised FLORA OF MIDDLESEX,* by Dr. TRIMEN and Mr. THISELTON DYER, is at length issued. We shall advert to this exhaustive work on a future occasion.

New Plants.

PASSIFLORA (SQRANADILLA) MACROCARPA, Masl., sp. n.

P. ramis quadrangularibus ad angulos profunde alatis; foliis late ovatis vel sub-orbicularibus abrupte acuminatis, petiolo perunquo 6 glandulis; stipulis vestimentosis pollicaribus et ultra basi late ovato lanceolatis; pedunculis teretibus, bracteis sub-orbicularibus acutis serrulatis flava tubum amplexantibus, tubo basi intruso, sepalis corollatis petalis superantibus, corolla faucibus seriebus 5 quarum duas exteriores filamentose filis distinctis patentibus crasse violaceo-fasciatis petalis superantibus, duabus intermediis filamentose, filis quam precedentes 5-6 plo brevioribus, distinctis, vel plus minus connatis, intimis vel supra medianam filis coherentibus inflexis sistente; corona media e medio tubi emergente membranacea horizontali ad marginem ciliata gynandrophorum reflexa ibique leviter bifurcata, coronam internam annulosa carnosa; gynandrophoro crasso brevibus basin versus processu crasso trochleariformi notato orbem oblongo obtuso, stylis majusculis clavatis stigmatibus maximis trilobis, fructu maximo oblongo obtuso basi apiceque umbilicato longitudinaliter sulcato.—*Passiflora macrocarpa*, Hort. Linden.

Critics recommend would-be poets to keep the effusions of their muse under lock and key for a lengthened period, at the expiration of which time, if the production appear satisfactory, it may be permitted to undergo the test of public criticism. Artists are, for similar reasons, recommended occasionally to lay aside their paintings and also to turn their pictures upside down, the more readily to detect any error of drawing. We have followed these directions in spirit, nay almost in letter, with regard to the big-fruited Passion-flower above described; and at length, after repeated comparative examination of living and dried specimens, native and cultivated, have satisfied ourselves that the plant in question is deserving of specific honours; that is to say, it is at least as much so as the majority of so-called species, even in a purely botanical sense; while for garden purposes, as we shall presently endeavour to show, there are ample reasons for keeping it distinct from its allies. While thus expressing our belief in the expediency of keeping the present form distinct from its near ally, *P. quadrangularis*, we may nevertheless express as confident an opinion as can be pronounced on matters where there is no direct evidence, that both forms, as well as *P. alata*, sprung originally from a common source. Before, however, treating of these matters, and before giving the history of the Pumpkin-fruited Passion-flower, we must give the description of the main features of the plant in the vulgar tongue.

In habit and general appearance the plant is almost identical with *P. quadrangularis*; so much so, in fact, that in the early stages of growth it is impossible to distinguish the two plants, even when grown side by side as they are in the Palm-stove at Kew. In the adult state of the plant, however, the leaves of *P. macrocarpa* are of a more rounded outline, and are usually somewhat smaller than those of *P. quadrangularis*; the stipules, too, on the fully developed plant are much larger than those of *P. quadrangularis*, and taper at the base into a broad stalk. No reliance can be placed on the number of glands on the leaf-stalk: the petiole is cylindrical above the bracts and somewhat above. The bracts are very large in comparison with those in the nearly allied kinds, cordate to reniform acute serrulate. The tube of the flower is concealed by the bracts, and is shallow, fleshy, smooth, and intruded at the insertion of the flower-stalk. The sepals are four or five times longer than the tube, leathery, greenish externally, whitish within, oblong obtuse, somewhat concave towards the apex, destitute of nerve. The petals are fleshy, broad at the base, oblong obtuse, about the same length as the sepals, and of a violet colour. The corolla consists of seven series of rays, four (facial rays) inserte at the mouth of the tube, one (supra median) immediately below it, one (median) emerging from the centre of the tube, and one (infra median) midway between the latter and the base. Of the four facial rows the two outermost consist of separate, spreading, thick violet-spotted threads, exceeding the petals in length; the two succeeding rows also consist of threads, but very much shorter than the preceding, and bent inwards; the supra-median corona (or fifth facial row) is membranous, bent horizontally inward, and evidently consists of a number of threads imperfectly separated from each other (i. e., partially coherent). The median corona, corresponding to what by some authors is called the operculum, is also membranous, it emerges from the centre of the tube in a horizontal direction, reaches the column, and is then bent upwards, its free edge showing a tendency to split into two lamelle. The infra-median corona is a thick fleshy rim enclosing the interior of the tube (a ring) between the preceding and the base. The column (gynandrophore) is short and very thick, protruding at the base with a very large pulley-shaped process, the upper portion of which is divided into five or six lobes. The filaments are broad and spotted with red, the anthers oblong. The ovary is oblong obtuse, obscurely three-lobed, and surmounted by three thick, club-shaped whitish styles. The stigmas are very large, 3-lobed, brownish. The fruit is large, oblong obtuse, depressed at both ends and longitudinaliter sulcato.

Contrasted with *P. quadrangularis*, in addition to what has been previously stated as to the foliage and stipules, *P. macrocarpa* has rounder, larger, more serrated bracts; a shorter, shallower calyx tube, the petals, which are violet (not pink), do not exceed the sepals in length; the outer rays of the corona exceed the petals considerably in *P. macrocarpa*, and but little or not at all in *P. quadrangularis*. The succeeding coronal rays are filamentous in *macrocarpa*, while they

* London: Hardwicke.

are shorter and tooth-like in quadrangularis. There is only one supra-median corona in *P. macrocarpa*, but there are two in *P. quadrangularis*. The column of *P. macrocarpa* is relatively shorter and stouter, and the pulley-like process is thicker and larger than in *P. quadrangularis*. The ovary in *P. macrocarpa* is oblong or obovoid, not ovoid; the styles very thick, and the stigmas much larger than in any other species of Passion-flower with which we are acquainted. Lastly, the fruit of *P. macrocarpa* is much larger than that of *P. quadrangularis*, and of a different shape, the true *P. quadrangularis* having an ovoid fruit of the size of a swan's egg, and it is ordinarily not depressed at the apex at least, nor furrowed.

P. alata can hardly be confounded with *P. macrocarpa*, as its stems are much less deeply winged, its bracts are much smaller, its coronal rays fewer and simpler, its fruit pyriform, &c.

Almost the first notice which we got of this Pumpkin-fruited Passion-flower, was from the Munchausen-like epistles of the notorious Hullett; and when specimens of the Hullettian plant, obtained direct from the Museum Hullettianum, were seen to be in stem and foliage indistinguishable from the old *P. quadrangularis*, was it not pardonable to suppose that the plant in question was nothing more than a Hullettian form of that well-known species? There was the more reason for this, as Jacquin, many years ago, described a large-fruited form of *P. quadrangularis* as common to the West Indian islands and to the mainland of South America. However, a more trustworthy account was given in the catalogue of M. Linden, and by-and-by specimens of the fruit made their appearance on our exhibition tables.

Still there was the doubt as to whether this fruit was the produce of a variety of *P. quadrangularis* or of a new species. There was this point in favour of its being only a variety of *P. quadrangularis*, viz., that Jacquin, in his original description of the last-named species, mentions also a variety with large fruit "transversely" sulcated. In order to ascertain the true state of the case we put ourselves in communication with M. Linden, Mr. Spruce, and with other gentlemen who grew the plant, or who were presumed to be acquainted with it in its native habitats. To these gentlemen our best thanks are due for their kindness in forwarding information and specimens. The information received from them is so valuable in clearing up the history of the plant that no apology will be needed for introducing the substance of their remarks here. M. Linden, to whom we owe the introduction of this Passion-flower to European gardens, thus speaks of it in a letter dated January, 1867:—

"This Passion-flower was discovered by my collector, M. Wallis, on the banks of the Rio Negro, between Manaus and San Bartolome, about three, or it may be, four years ago. At that time M. Wallis wrote that the species acquired unusual dimensions, and that the fruits, which were highly esteemed in the country, attained a weight of 8 lb."

M. Linden adds, and the testimony is all the more valuable as coming from one who knows the old *P. quadrangularis* in its tropical home, that the species is evidently allied to *P. quadrangularis*, but is quite distinct from it, in flower, fruit, and leaf. So much for the testimony of MM. Linden and Wallis.

Finding in the Kew Herbarium specimens of our plant gathered in Peru by the famous traveller Dr. Spruce, we next applied to that gentleman for information. Dr. Spruce, in reply, expressed some doubt as to whether *P. macrocarpa* was really wild in the locality indicated by M. Wallis.

"If," says Dr. Spruce, "M. Linden's collector sent from the Rio Negro a large-fruited Passiflora, I should say it had certainly been raised there from seeds brought from Peru. No such Passiflora either wild or cultivated, was known in that region at my time. But since steamers have run up to the very roots of the Andes, I learn that the Brazilians have got from Peru the Bamboosage, or Puna-mat Plant (Cordia alliodora), and many others. In the lower eastern Andes a large-fruited Passiflora is commonly cultivated under the name of 'Pambo,' and the same species is still more largely grown on the western side of the Andes, in what is called the 'coast region' of Peru. At Guayaquil, what seems the same kind is called 'Badesa,' but it may be distinct from the 'Pambo.' These Passifloras have a fruit 9, or even 12, inches long, very like that of the common Papaw, but blunter at each end, and very much heavier, bulk for bulk. There is a variety with very unusually sulcated fruit. I suppose it may be the same as the Peruvian *P. quadrangularis*, var. *sulcata*, fructu transversim sulcato, wherein the 'transversim' is to be taken *sensu* *synonymo*, as M. Linden, who calls the longest diameter of an ellipse the transverse, for the fruit of this Passiflora is somewhat elliptical. Not only are the seeds, enveloped in sweet mucilage, eaten, as they are in the common Granadilla, but the thick fleshy part, after the manner of Melons and Papaws, to both of which its flavour slightly resembles it, although it used to remind me more of a soft sweet Apple. In Peru the 'Pambo' is commonly trained over a horizontal trellis-work, raised high enough to allow of a man walking under it erect, but sometimes much higher, and only accessible by means of a ladder. The finest plants and the best tasted fruits I have seen, were grown on the river Chira, in lat. 5° south. The priest of Amotape—a small village on that river—had a plant that must have covered 50 square yards. I have several times reposed in my hammock under its shade, and regaled on its fruit. That was in 1853, when I was invalided, and had given up collecting. Even had I been still vigorous, I should, perhaps, not have preserved specimens of it, under the impression that it must already be well known in Europe. Its cultivation in Peru has existed probably for many centuries, there is no tradition of its introduction, and it is nowhere known wild."

Hence, then, we have evidence that the *P. macrocarpa* of our gardens is distinct from *P. quadrangularis* in many points, that it is cultivated in Peru, and has probably been introduced thence into the Amazon district. We have seen imperfect specimens from Venezuela, and from Central America, that we refer with some hesitation to this form.

The question remains, is this the big-fruited Granadilla of the West Indies, with transversely sulcated fruit, of which Jacquin speaks? This question we cannot answer positively. All the West Indian specimens we have seen belong to quadrangularis. Among them we

have seen some with fruit larger than usual, but yet not much more than half the size of that of *P. macrocarpa*, and truly egg-shaped.

As to the value of the fruit for the table we have the testimony of Messrs. Spruce and Wallis that it is highly esteemed in tropical South America. The fruit grown in this country is, to our thinking, more watery and less richly perfumed than that of the old quadrangularis. On a trial made of some conserve, prepared from the fruits of the two species for comparison, decided preference was given to that made from the *P. quadrangularis*. And here we may be allowed to express our surprise that, commonly as *P. quadrangularis* is grown, its fruit is so seldom seen on the dessert table in the form of jam. We know of few confections of that nature of a richer flavour, and warmly recommend growers of *P. quadrangularis* or *P. macrocarpa*, to avail themselves of the fruit. For this purpose the following directions to the cook may be serviceable:—Cut the ripe fruit into slices, crush the pulp surrounding the seeds with a spoon, so as to extract the juice, remove the seeds, boil the slices till tender, and pass them through a sieve, mix the juice with the pulp, and add white sugar in the proportion of half a pound to a pound of pulp or thereabouts, and boil down to a proper consistence. * M. T. M.

"ABOUT TOWN."

ON September 2 I took a run through two of the London parks—Hyde Park and Battersea, the gardens of the Royal Horticultural Society, South Kensington, and the Crystal Palace. Upon entering Hyde Park at the Marble Arch, "too late" dropped instinctively from my lips. The plants exhibited signals of frost-distress, and showed unmistakable signs of autumnal exhaustion. They looked as if it were the latter end of October instead of the day after St. Partridge's Day. The beds were nearly flowerless, the leaves weather-beaten and autumn-stained, and the general effect was wintry and bleak. It needed not the presence of a band of men snatching cuttings by the donkey load to remind one that danger seemed near. It seemed as if the August frost had expended all its power to destroy this floral fringe of Park Lane, and had succeeded in almost wholly stripping these beds, which had evidently been very beautiful earlier in the season, and its force seemed to have been felt all the way down alike. I was glad to observe that a suggestion made in your columns last year had been attended to all the plants were legibly and correctly named. Had it not been so, no one could have recognised many of the varieties of Pelargonium. Such grand trussers as Amy Hogg especially were reduced to the puniest dimensions. And here, in most cases, misfortune did not come single-handed. Preceding, or on the heels of the frost, caterpillars had been riddling the leaves, and the very Grass between the beds looked languid and killed.

It will be remembered that towards the corner of Hyde Park there is a piece of private ground belonging to the houses in Piccadilly. The angular portion between Park Lane and the park is well furnished with shrubs. Near the centre of the angle there is a circular group of beds. These were flowering away in the utmost profusion, and in the heyday of health and strength. There are also some beds near the park rails within this enclosure. These were intermediate in beauty between the round groups, and those extending all the way down from the Marble Arch to Stanhope Gate and Cumberland Gate. They were well protected by the shrubs from the Park Lane side and pretty freely exposed to the park, hence their intermediate condition. It is impossible to see within a comparatively short distance in the same locality the effects of shelter upon half hardy plants more vividly illustrated.

The same lesson is taught in the subtropical department of Hyde Park. This is confined to comparatively narrow strips on the Knightsbridge side. On the highest ground round the open park the subtropical portion is shut in as it were by a thick mass of shrubbery. Broadly stated, then, this shrubbery forms one wind-break, Knightsbridge and the trees inside the park another; the angular shrubbery, though at some distance, closes up one end, and the artificial mounds, rockwork, trees, &c., the other: thus at all points the force of the wind is broken, and as a rule it might be observed, that where the shelter was most complete, the subtropical subjects seemed most at home.

Proceeding from Hyde Park to Kensington the same truth was further enforced; though here the question of shelter became further complicated by the relative merits of trees or shrubs or dead walls as sheltering agents. A living screen that sifts the air through it, thus breaking its force into fragments, is much more effective as a protector than a dead wall that simply turns it aside. The chances are that in the latter case the wind will vault over the barrier, and form a fresh eddy or current inside of it, and prove perhaps as destructive afterwards as it would have been had it not been interrupted. On the contrary, the living screen disintegrates the force of air in motion, and scatters it utterly, like water spout on the ground that cannot be gathered up again. The subtropical department at South Kensington has the benefit of both kinds of protection. It nestles beneath the high walls of the picture gallery on one side, and is sheltered on the other with a double line of white Poplars. With the double protection the plants were doing well, although hardly so strong as they were last year. The other portions of this garden are pretty well protected by lines of trees, masses of shrubs, and inequalities of surface, while a good deal of heat must be radiated at night from the walls, corridors, &c., and the broad expanses of gravel. The consequences are, that the flowers here suffered but little from the cold. Another circumstance

* Our chef says a compôte would be still better.

doubtless helped to ward off the frost. On the late Prince Consort's birthday free admission is given to the gardens, and this year over 60 000 persons availed themselves of the privilege. Such vast numbers stamped off most of the Grass, and thus checked the loss of heat. The central panel, and nearly the whole of the bedding, was fresh and green, just as if there had been no frost.

From Kensington I proceeded to Battersea. Here is seen a most effective illustration of the protective power of shelter, skilfully disposed. The locality is by no means favourable. The contiguity of the Thames might rather tend to draw than ward off frost; though a body of water is often a useful preventive against extreme and sudden cold early in the autumn, it does not part with its heat so suddenly as the plant-clothed earth. In this way the river might assist the park beside it to resist the cold. It would act as a moderator of the severity of sudden change. But doubtless the form and planting of the ground have more to do with it. The change from Hyde Park to Battersea was like leaping back from the end of October into the middle of July. The subtropicals seemed to be all thoroughly at home in their cosy nooks and warm corners, with massive banks of richly clothed earth behind them, and glowing beds of richest colouring keeping their feet warm. No proof of weakness, no sign of decay, no strain of trying endurance, were visible. Health, strength, freshness and beauty, were inscribed on every group.

I believe the difference between the two parks is mostly, if not wholly, one of shelter. The bedding plants in Hyde Park are set, as it were, in the teeth of the wind. They have a wide road on each side of them, a walk running down between them, and a broad park beyond. And the beds, as well as their windy surroundings are straight, hence the air sweeps along without let or hindrance; the dividing Holly fence even has been removed; there is no wind-break anywhere. At every yard of its progress the breeze gains fresh momentum: it sweeps the whole line of the narrow beds like a hurricane. Were it broken here and there, or turned out of its course by living screens, its force would be weakened, its momentum lessened, as it is, the flower-beds are exposed to its full energy.

In Battersea Park all these unfavourable conditions are reversed. Every expedient has been adopted to shut out the wind from the plants, to turn it aside, or send it scampering off into the air high over their heads. The massive mounds of earth likewise absorb much heat during the day, and give it up again to temper the cold of the night. The energy of radiation is checked by the discharge of this high-level heat, and the plants in the thus sheltered valley preserved in safety. Whether this explanation be accepted or not, the fact remains that while the bedding plants seemed paralysed with cold in Hyde Park they were fresh and beautiful at Battersea.

Proceeding from thence to the Crystal Palace, the bedding plants were found in equal perfection. At the Palace this can hardly be the result of shelter, for the grounds are somewhat bleak and freely exposed. Possibly the plants owe their immunity from early frosts at the Palace to the site and soil: the former is somewhat elevated, the latter dry and apparently poor. The growth of the plants seems sturdy and short, their texture firm, and they thus offer but little frost-hold for the cold. But subtropical gardening is not attempted here, and would possibly prove a failure if it were.

These different states of vegetation within such a limited area appear to illustrate the importance of altitude and shelter as means of combating frost. The latter especially is of the utmost importance.

Dr. Bennet has very clearly shown in his instructive letters on the vegetation of southern Europe that a very slight amount of shelter may often prove of greater value to tender vegetation than several degrees of latitude. The same lesson may also be learned nearer home. The writer has seen the British Queen Strawberry in high perfection on the sunny side of a snow-clad mountain pass in Inverness-shire, while it was perishing from cold in the east and north of England.

In forming gardens for tender plants situations should as much as possible be chosen where it has been observed that common things, such as Potatoes, French Beans, or Dablias, escape the frost till late in the season. If greater care were exercised in the choice of a site, and moderate shelter provided, no one would have to lament the loss of their flower garden in the latter end of August, or dread stern winter treading upon the flowery toes of summer, as it has done in Hyde Park this year. *A Country Chiel takin' Notes about London.*

GRAPE GROWING AT BISHOP STORTFORD.

FOR a full quarter of a century this little town has been famous for Grapes. In the year 1843 (see *Gardeners' Chronicle*, 1847, p. 683) Jones Nash, Esq., planted a large vineyard, for the time, with Hamburgh Vines, and another with Muscat of Alexandria. For many years these Vines and their produce were famed throughout the land; they were well nigh perfect. Pilgrimages were made to the Bishop Stortford vineyards to learn the great art of Grape growing. Berry, bunch, colour, and flavour were all that could be desired. The plants grew like Willows in softness, like gnarled Oaks in robust strength. The produce of each year eclipsed that of the preceding, and hands were uplifted and eyes opened in wondering admiration. But the zenith seems to have been reached years ago, and now the glory has departed from them. A few weeks since I stood in sadness beneath these grand old Vines, gazing upon the wreck of their greatness. Shanking had done its work, and left the crop reduced to the mere shadowy ghost of the olden times. And yet it can hardly be that either age or weakness had

opened up the citadel of life to the cruel havoc of the shank fiend. Twenty-nine years are but a day to the longevity of the Grape Vine, and these grand old rods, measuring from 8 to 12 inches in girth, are still strong, and put forth fine leaves and fair sized wood. The border is likewise wide—about 2½ feet, and well raised above the surrounding surface. And yet on the spot the cause of failure was attributed to the probability of the roots having run clean through and out of the border, and got (as the old gardener who had planted them expressed it) "no one knows where." Their whereabouts, however, will probably be discovered this autumn, as it is in contemplation to clear out those mammoth rods and make another start with new borders and fresh plants. It seems almost like sacrilege to destroy such Vines, and it is to be hoped that a few of them may be lifted into a new root medium, and have one more chance; and that the remainder may be sent up to the arcades at Kensington, to show young and old that the Grape Vine may be grown into a respectable timber tree in the course of a century or so.

But from the setting we turn to the rising sun—from the old Vines of Jones Nash, Esq., to the new ones of Thomas N. Miller, Esq. Five years ago the site occupied by these was a meadow. It is now converted into a kitchen garden, and furnished with some of the largest and best vinerias in the kingdom. One house is 130 feet long and 16 feet wide, in two divisions, one being devoted to Muscats, and the other to Hamburgs. Another is 100 feet by 13 feet, in three divisions—one with an inside border devoted to early Grapes of several varieties, and the other two, one to Muscats, and the other to Hamburgs. The length of rafter in the first house is about 19 feet, and in the second of these houses about 15 feet. But the grandest vinery is a noble span-roofed house, 200 feet long, and 30 feet wide; the side walls are about 2 feet 6 inches high, surmounted by a 2 feet sash leading up to the roof, and the centre of the house is about 15 feet high, which is likewise about the length of rafter on each side. This house is divided into three divisions, one devoted almost wholly to Lady Downe's Seedling, another to Hamburgs, and a third to Muscat of Alexandria. These Vines were planted about 4 feet apart, within about 1 foot of the side walls, only four years ago, and this is the first season that they had been permitted to bear a full crop, right up to the top of the house.

Along the middle of these vinerias a 4-foot pathway, formed of wooden splints, which are about to be replaced by a neat iron grating, is laid, on the top of the border. On each side of this path, at a distance from it of 2 feet on each side, standard or pyramidal Vines 6 feet high are placed, 8 feet asunder; they thus stand 8 feet by 8 feet, and being laden with fruit from top to bottom, have a fine effect. With these exceptions, the entire floor of these houses is clear, and the effect is magnificent. The whole of the Vines, from wallplate to apex, are laden with Grapes, of excellent quality, colour, and size, while both foliage and wood may be said to be as perfect as possible.

The chief feature of the whole of the Vines to be seen at Mr. Miller's is their uniform and general excellence. Mr. Ward, his talented gardener, does not affect sensation bubbles, neither masters nor piecemeal have place within either of these vinerias; each bunch throughout the houses is as like every other bunch as may be; and the same may be said of the produce of each Vine. This uniform and unerring excellence, while it reflects the highest credit upon Mr. Ward, tells against him as an exhibitor. Many, whose Grapes are far below his high average quality, might cut two or three heavier bunches, but with the exception of a small house of Muscats, grown by an amateur under Mr. Wm. Thomson's instructions at Dulwich, I have never seen any Muscats to equal Mr. Miller's. The Hamburgs are also very fine—good in bunch and berry, and as black as sloes. The first two vinerias are bearing their third crop, the span-roofed house, which was only planted four years ago, its first full crop. The bunches on each rod average about 20, and the weight in the different houses will range from 30 to 50 lb. per rafter. The outside borders have asphalted bottoms, are well drained with rubble, and the water is discharged into a passage that skirts their front. The depth of the borders is 30 inches against the vinerias, 2 feet at the walks; their width is 20 feet. They are formed of turfy loam, with a liberal addition of crushed bones and lime rubbish. They have been watered twice this season. Before winter a layer of stubble, about a foot thick, is put on to exclude frost; this is again covered over with tarpauling, to throw off the water. The early Vine border is formed, piecemeal, of turfy loam and broken bones, inside the house, and it was found to be a tangled mass of thick spongioles, ramifying in all directions towards the surface. No drainage was provided nor special preparation made for the borders in the span-roofed vinery. A little loam mixed with crushed bones was placed upon the surface of the original earth—so I understood it—and the Vines were inserted in the usual manner. No Vines could have done better, they are the perfection of robust health, and models of fertility.

Next to the health or excellence of all the Vines, and the uniform quality of their produce, was the spotless cleanliness, size, and gradual and late ripening of the foliage. On the early Vines, with the wood as hard as buckhorn, the leaves were still treasuring up more power for next season's exigencies. The chief peculiarity of culture observed was, that the houses were wholly devoted to the Vines. Neither pot nor plant was seen throughout the whole of the vinerias. This adds immensely to their dignity and grandeur, and probably contributes considerably to the high degree of success realized. Another peculiarity, that of allowing the leading shoots to run on without stopping, has been already adverted to in your columns. Mr. Ward attributes great importance to this, as

likewise to allowing a second shoot to run out from the base of the Vine near the wallplate. With these two growths acting as root stimulators or sap pullers, he practises pretty close stopping of the laterals, so as to allow the sun to develop that golden tint on Muscats which is alike proof and cause of the highest excellence. This theory of open mains is, however, not generally applied to Hamburgs. Each side shoot in their case is left to cater for itself. The advocates of bottom-heat for Vines may fairly claim Mr. Ward as with them. True, he does not heat his main borders from below, but then with his stubble and tarpauling he stores up as much heat as possible. If he directly puts no heat in, he is very careful to let but little out. The borders, again, of his large span-roof house are heated by the surface air from above, while the early vinery border is placed so close to the hot-water pipes, as to be heated, I should suppose, considerably beyond the surface temperature. Be this as it may, all plants that have their roots placed in the same temperature as their tops are grown in bottom-heat.

Further, Mr. Ward raises a good many young Vines annually, and these are grown to great perfection directly over his linen pipes that warm a large span-roofed Pinery. An open grating is placed as a shelf within a few inches of these pipes, where the young Vines remain from early spring until they finish their growth in autumn. At the time of my visit this house had been shut up for the night with a sun-heat of 100°, and of course the pots, brimful of roots, were enjoying the same temperature. During cold nights these pot Vines must have often endured a much higher degree of heat, and yet no plants could have looked better. Even the early Vines are subjected to a high temperature to finish their growth, Mr. Ward remarking that he does not believe in cold as a wood ripener.

Mr. Ward is equally and perhaps more famous as a Pine than a Grape grower. This season he has taken six or eight prizes, last year as many as a dozen; and it will be recollected that he created quite a sensation at the Regent's Park by showing a first-rate Queen over 7 lb. in weight, and 12 others weighing together 63 lb. At the present time he has some fine Charlotte Rothschilds, Queens, Smooth-leaved Cayennes, &c., swelling off, from 6 lb. to 10 lb. in weight. The Pines, like the Grapes, may be said to be all good alike; they are the most regular and sturdy robust lot of plants that can be imagined. About 150 plants are grown, and 70 fruited annually. In from 10 to 18 months the fruit is generally cut. The sorts grown are mostly Queen, Charlotte Rothschild, Smooth-leaved Cayenne—a good many, Prickly Cayenne, Black Jamaica, Black Prince, and the Blood Pine, of which I saw a splendid fruit nearly 6 lb. in weight. They are grown in two houses, one a lean-to, over 100 feet long, and 12 feet wide, in three divisions—one of them being mostly used for fruiting plants, and the other two for successional ones. Three pipes are used for bottom-heat, and the pots are plunged in tan, the plants being kept up close to the glass. The other house is span-roofed, 75 feet long, 25 feet wide, 11 feet high at the sides, 2½ being of brick wall, in which the ventilators are placed, and 2 feet of glass,—and about 10 feet high in the centre. Six hot-water pipes, three deep, in double tile, are carried all around by the side of the wall. Then follows a path all round, and a wide flat bed for the Pines in the centre of the house. Five pipes are carried through this bed for bottom-heat; then a layer of brickbats, followed by the tan as a plunging material. Five rows of plants are fruited in this house. The greater portion of them had been cut, but enough remained to show the high standard of Pine growing at Bishop Stortford. In a few weeks the succession plants will be moved into this house, and a fresh start made. The top of the centre bed is about level with the shelf over the pipes. The plants are therefore a long way from the glass, but the house is light, and the foundations of a sturdy habit have been so well and surely laid in the lean-to house, that the plants retain it to the end of their lives; in fact, this central force, concentrating itself into fruit many pips deep, the spotless cleanliness of the plants, without scale, or bug, or any such thing, and the shortness of the time between the start into growth and the husked fruit, are the chief characteristics of Mr. Ward's Pine growing.

I observed a good many Cucumber cuttings striking in this Pine-house, and I learned that it was a long sort, a yard in length, which refuses to seed, and is grown in quantities from cuttings every winter, and fruited in pots placed on the coping of the retaining wall of the plunging bed, the branches being trained to the roof over the path. In winter and early spring the shelf over the pipes, occupied by the Vines in pots in summer, is devoted to the forcing of Kidney Beans—Fulmer's Early Forcing being found the best for providing a daily supply. Everything seen here betokens attention and skill, and at all points we see proofs of their legitimate reward—success. *David Tallant*

INDIAN FORESTS.

I wish to make a few remarks on the present condition of the Indian forests—as every one who knows anything at all on that subject knows that the condition of a very large portion of them is already so wretched that further neglect could not possibly make them worse—but, on the chief causes that have so ruinously wrought together in making them what they now are. First in order comes the contract system of cutting and selling timber, next clearing, with the view of extending cultivation, and then cattle grazing and its inevitable attendant forest-destroying first, the contract system as I understand it, for a stipulated sum on some particular tract, and within a certain number of months, or as much timber as he liked, besides having unlimited liberty to kill as many young and old trees as he pleased to any extent that either caprice or avarice might dictate. The latter most generally was his regulating motive. If within easy distance of a market where the demand for small poles for roofing and other purposes was great, on the expiry of the lease there might hardly be a

Sal sapling left standing that would make a respectable broom-handle. The only things left were a few stumps that would not repay the labour of cutting; perhaps, also, a few hollow or gnarled specimens of Terminalia, Bigonia, Somercarpus, Ficus, &c., the wood of which is worthless even for the purpose of burning. After clearing away the heavy timber, those rank growing grasses that don't flourish where there is much shade, begin to grow most vigorously; also patches of scrub, for instance, *Ruellia P. sequaria*, *Carissa*, *Zizyphus*, &c., which were carefully preserved for the reason that the market for such species of forest produce is generally very dull, about ahead much more vigorously than before; and seedlings by millions—the legitimate descendants of the fallen great—wield from their vigorous appearance it might be fairly expected would soon become fine healthy trees. But in accordance with the usual custom, the tract must get burnt to improve the pasture for the village cattle; and very few of the seedlings, now apparently so vigorous and healthy, will survive that ordeal. Perhaps the year following, the process may be repeated, and so on every second or third year at the longest, so long as there are cattle and herdsmen in the neighbourhood. After the second or third burning at the most the seedlings will have been completely destroyed and with them a good many of the unsound and worthless trees left at the general clearing. Some of the more vigorous stumps may for many years continue to throw out a few sickly shoots, which can never come to anything, as every successive fire destroys exactly what they have grown upon the preceding one. In time they assume precisely the appearance of worn-out Willow stools; then, disgusted with such treatment, and tired of life, they depart one by one, and the only mementos left of what was once a magnificent piece of forest are a few charred rotten stumps.

Could burning have been prevented, in the course of a short time the tract would again have been covered with healthy saplings, the thinnings of which would have been worth a good sum annually, not to speak of advantages both official and commercial that would have resulted from such a state of things, whereas, as this tract now lies they are entirely unproductive, at least they produce nothing so valuable as the Spear grass, *Carissa*, and *Zizyphus* bushes, about which the best that can be said is, that they are intolerable pests to man and beast. Repeated burning of the jungle seems to impoverish the land so much, that even these pests in the look stunted and sickly, and seem as if they might ultimately die from sheer starvation.

If instead of annually reducing the grass to ashes it is been left to decay where it grew, in the course of time there would have accumulated a fine layer of vegetable mould—a much ready-made food for roots to draw from. But, if the view be objected to, still it would have been of great value keeping the soil moist, as drought perhaps even more the poverty may be the cause of the sterility that follows in the wake of these clearings, which unfits them for the production of one thing or other that can be of much use to either man or beast. A camel or even a goat would in many places find difficulty in picking up a living off an area as large as a good sized farm.

The Indian Government seems always to have been ready recognising, and liberal in rewarding, merit in its servants whether military or civil—in many instances as reward (jagheers) large tracts of land, either virgin forest or partially cleared, of an extent such as few of the little German monarchs could afford to give. Private individuals also often applied for and received extensive tracts at a merely nominal price—a few shillings per acre, with the view of clearing and cultivating. The clearing of these tracts was a very difficult matter but not so the cultivating of parts of them. In many places where that has been tried, after raising two or three crops the land is again thrown out of cultivation. In some cases because of the want of water for irrigating purposes, and in others, because of the excessively dry, gravelly soil. In some districts extensive tracts of that description have been cleared—while through avarice or ignorance matters little, as there has been an injury done to the country at large, and the district particular, that will cost money and time to repair. In clearing and partial cultivating improve the land for grazing purposes, but little could be said against the practice, as such a plea cannot be urged in defence of the system as the very opposite of that is the case. Neither can it be said with truth that the clearing was permitted or sanctioned with a view of improving the health of some sickly district, as such tracts as these have spoken of do not supply the requisite conditions for the production of miasma.

The present system of allowing cattle, for a very trifling sum per head, to graze in reserved forest tracts, has been an still is another fertile source of injury. That arrangement does not expressly stipulate that these tracts are to be burnt every year or second year at the longest, still it is perfectly well understood that such will be the case—that it seems to be implied—unless the grass be so thin that it would occasion the poor wallah (herdsman) a good deal of trouble to burn it. If that were the case portions might escape for more than a period of two years, but on no other condition. When seedlings and saplings perish by the million from that cause, the system that not only tolerates but fosters it for a paltry sum that might perhaps barely supply stationary—red tape included—for the year's consumption in the district office, can hardly be characterised as anything else than blindly ignorant or avariciously greedy. Until that system be entirely done away with, it matters little what other reforms be recommended or sanctioned; at best they can be only palliatives—only another instance of a Mrs. Partington keeping out the sea with a besom.

The Supreme Government must all along have been cognizant of the existence of such a state of things, as well as the results that it would ultimately lead to; but the least this-to-my-successor policy, or absolute indifference to the requirements of the future, seems to have been consistent sufficient excuse for the then present neglect. Report after report was written, pointing out the ruinous tendency of the system, or systems in operation, but only to be glanced at, docketed, and shoved into a pigeon hole with the view of further reference, when time and inclination permitted accidents which have been long in the air. An article after article has also appeared in the newspapers on the same subject, but the result of the current literature on the present day, though not more abundant after they were read. On in particular, in the *Times*, probably about 1846 or 1847, bearing on the contract system of wholesale denudation, after briefly reviewing that, with a foregone conclusion prophetic sketches in a short but most laudable manner the present state of the Indian forests, and the present scarcity of timber, an accurate in its general bearings as it had been written only six months ago. Still one and all of these reported articles have met with the same treatment—short contempt or scornful indifference to the warnings given by such and in different must have made the position of the forests of the forest department a peculiar and in many respects a most anomalous one—consulted on subjects and their opinions treated with the utmost indifference—superintendents of a system that was steadily yet rapidly bringing the forests to ruin. Their case was only another good illustration of the old story of a brick without straw, with this difference, that I have heard of an instance in which their taskmasters treated them with severity for the nonperformance of impossibilities.

Now that stern necessity, the hardest of masters, has succeeded in arousing the Indian Government out of that state

of torpor in which it has lain so long, brought it to recognise the utility of a better system of forest conservancy than has hitherto prevailed, will it rest satisfied with merely an attempt at improving what is already partially wooded? Or, will it take a broader and more liberal view of the question, not rest satisfied until an effort has been made to again cover these now useless and unproductive wastes with sal and other useful trees? Then arises the question, What are to be the means employed in bringing about this great reform? Looked at from this point of view, there seems to be but two modes by which that can be accomplished. Regarding the advantages or disadvantages, as well as the difficulties that may attend the working out of either, it is unnecessary to make any remarks, as my object is merely to show what may be the character of some of the duties that Indian forest officers will be called on to perform, from whom we may be better able to judge of the education that will best fit them for the performance of these duties. Whatever the plan be that is adopted for the filling up of these wastes, the difficulties that will attend the carrying it out are neither few nor insignificant, and will certainly test severely the skill, patience, and perseverance of those to whom the work is intrusted. As workmen they will have a lot of scheming, lazy, careless scoundrels, an excessively dry and poverty-stricken soil, a burning sun, and hot winds that will make even a Mammillaria shrivel, and periodical fires which may at any instant destroy the most promising of experiments. These are a few of the difficulties that the forest officer will have to encounter and overcome in the discharge of his duties. And how far a knowledge of the habits of Indian trees compared with English ones, and the various methods of raising, &c., will assist him in overcoming these, and others of a similar kind that may from time to time crop up, perhaps your learned correspondence can tell us.

It seems to be thought by some that a reverse of study in Germany is all but indispensable for those intending to become forest officers. If for the efficient management of a natural forest it required talent of an altogether different and of a far higher kind than for the management of plantations formed by art, it would be easy to see wherein lay the advantages of a German training. Or, if British foresters did not understand how to turn grass, brushwood, &c., to account when there existed a ready market for such like articles, it would certainly be an advantage both to them and their employers to have them taught. But in India, as in Britain and everywhere else where no market exists for such chips and straws upon which such a high value has been set by some, they must either be left to rot where they lie, or if it be resolved to turn them to some account, it is not possible that it may cost twopence for collecting and bringing into market an article that may barely realise a penny when there? In a district where the population is both scanty and poor, of course the demand for such articles as "minor forest products" cannot be very brisk—in short, where the distance from a good market is really so great the receipts would not cover the expenses incurred for transit alone. It is not to me clear that a German training, or even a German himself, could make much more out of these chips and straws than a man with only a British training could. Further, neither is it very flattering to the dignity or self-respect of the man who, after months or years of hard grinding to qualify himself for becoming a forest officer, finds that, when the desired goal has been reached, the most laborious and tiring part of his duties is not the superintendence of forest operations proper, but to superintend the cutting of a little grass for stumps, the thinning, &c., or the collecting of a few rotten branches for cooking chupatties for the inhabitants of a few wretched villages in the immediate vicinity—miserable trifles that in many instances might barely pay for the postage, far less the labor of the collector.

Not having traveled so far as Germany, I cannot from personal knowledge offer an opinion on the system of foresting practised there. Still to me it seems that the very grounds on which its advocates praise it are exactly those on which some would condemn it. It is said that there is no planting out done there—they trust entirely to self-sowing, in other words, assistant, to fill up any vacancies that may occur. Where land is of so little value that they can afford to wait for that, clearly in that respect there is contrast; but no comparison can be made between that and the British system. British land proprietors cannot afford to wait till accidents fill up vacancies in their plantations. The fact of the Germans being able to afford to wait on such a precarious mode of filling up vacancies merely shows that the value of land there is much less than it is in this country. Still I fail to see in that any proof of superior management; the generality of British foresters would feel inclined to characterise the system as lazy and slovenly. The mere fact of their being able to collect straws and chips simply shows that labor is cheap and coal and iron dear while the very reverse of that is true of this country—another indubitable proof of the superiority of the German system over the British one. On that subject a great deal more might be said, but I will not enlarge further on it.

Now that the Indian Government recognises the necessity for filling up those wastes already spoken of with something more valuable than Spear-grass and Zizyphus bushes, will it trust to accident, birds, and the wind, or to science and intelligence? If to the latter, which seems the most feasible, whether will the man who has been accustomed to seed sowing and transplanting young forest trees, or the one who has had a German training, make the most intelligent and efficient forest officer? It seems to be somewhat gratifying, I think, to find that the British system, with its system of planting out, is not only shown to be really the superior one, but that a few here and there but in the same breath, they really say that they are capable of doing more. If it were only ten nations would be more efficient, given equal circumstances, than the British forester is supposed not to do. If by the German system a greater amount of timber of better quality can be grown on a given area in a shorter time, and at a less cost than by any other, by all means let British foresters take a lesson from them, but if it shows them nothing more valuable than how to collect and prepare grass and brushwood for the market, that is hardly worth taking notice of. It seems that the market there for such like articles is consider-

ably better—from whatever cause—than it is in either Britain or India.

Seeing that the German system has been paraded on so many occasions lately, and in so conspicuous a manner, I shall take the liberty of mentioning a fact which has some indirect connection with that, that its promoters seem never to have heard of, or else have entirely forgotten Numbers of German horticulturalists at one time used to come here, with the view of studying the system practised in British gardens, perhaps because they considered it inferior to their own, and the fact of their coming here at all was merely to get a comparative knowledge of the two systems. A few still come, but with what object I cannot guess, if it be not with the view of making themselves better acquainted with some important principle or practice than they have the means of doing at home. *Scopolia japonica*.

(To be Continued.)

REVIEW OF THE GENUS NARCISSUS—IV.

(Continued from p. 87.)

Group III.—PARVICORNATÆ: crown less than half as long as the divisions of the perianth.

Of this group we may define 11 leading types, as follows:—

- Limb of the flower horizontal, or nearly so, when expanded; anthers sessile, or very nearly so.
- Flowering in spring.
- Crown cup-shaped, 2-4 lines deep.
- Leaves glaucous, flatish, 1-2 lines broad.
- Leaves striate, green.
- Flowers 1-2, usually white, with a tube 12-14 lines long.
- Flowers 3-6, yellow, with a tube 8-9 lines long.
- Crown obconical, uniform, not more than a line deep.
- Flowers white, leaves flatish, glaucous, 3-4 lines broad.
- Flowers bright yellow, leaves terete, bright green.
- Crown obconical, 1-1½ line deep, the edge different in texture to the rest, and much crisped and crenulate.
- Flowers in pairs; crown with a yellow rim.
- Flowers solitary; crown with a scarlet rim.
- Flowering in autumn.
- Leaves contortaneous with the flowers.
- Divisions of the flowers greenish.
- Divisions of the flower white.
- Leaves produced after the flower.
- Form of the flower campanulate.
- Crown nearly obsolete; anthers shorter than their filaments.

11. TAZETTA. 12. GRACILIS. 13. INTERMEDIUS. 14. PACHYBOLUS. 15. JONQUILLA. 16. BIFLORUS. 17. POETICUS. 18. VIRIDIFLORUS. 19. KLEBANS. 20. SEROTINUS. 21. BRODSKONETH.

The above description applies to a plant which is very common in cultivation, and extends in a wild state from the south of Europe, through Syria, Cashmere, and the north of India, to China and Japan. There is a very large number of forms wild in the South of Europe, and known in cultivation, which do not differ from it in any important characters, and which appear to slide into one another so gradually, that it is impossible to individualise them, or characterise them in any definite manner. Of those known in our gardens 30 years ago, 45 are briefly described in Haworth's Monograph under specific names, and recently 26 of the wild ones have been fully described by Professor Parlatores ("Flora Italica," vol. 3, p. 125-156), and 14 of them have been beautifully figured in Jordan and Fourreau's "Icones Floræ Europæ." To these works we refer any of our readers who wish to study out the subject in full detail. All that we propose to attempt here is to characterise a few of the most striking of these various forms, and to enumerate under each of them the most important or best known figures and synonyms.

Var. 1, *lacticolor*.—The typical plant, as just described, of which good figures will be found in Sibthorp and Smith's "Flora Græca," t. 358, and Moggridge's "Montone," t. 23. *Hermione brevistylis* and *H. tazetta*, ex parte, Herbert and Kunth; *H. formosa*, Jordan, t. 189, *discolor*, Jordan, t. 183, and *pratensis*, Jordan, t. 187; *H. freyana*, Sweet, ser. 2, t. 118, *Jord. Ic. t. 189* (a large form, common in cultivation, with flowers nearly 2 inches across), *H. formosa*, Haw. Mon. p. 11, *Jord. Ic. t. 181* (large), *N. Cypri*, Sweet, ser. 2, t. 2; *H. Cypri*, Haw. Mon. p. 11, *Jord. Ic. t. 190* (a large flowered form, with adpressed, crisped corona, 1½ line broad at the mouth), *H. Cypri* and *andriana*, Haw. Mon. p. 11, and *N. Cypri*, Bot. Mag. t. 94 (nearly of the same size as the last), *N. Cypri*, Journ. Bot. Soc. Lond. t. 2, p. 27, the same as *H. Cypri*, Haw. Mon. p. 11, *Kunth, 5, p. 77* (a small form, with the expanded lower petal 4 lines across, tube 2 lines long, leaves 3-4 lines broad).

Var. 2, *intermedius*.—Differs from the last by the narrower divisions of the flower which are not more than a quarter of an inch broad, but it is well imbricated, in the same length and out at the point. *H. intermedius*, Jord. t. 185, *H. intermedius*, Haw. Mon. p. 11, *Kunth, 5, p. 77* (a small form, with the expanded lower petal 4 lines across, tube 2 lines long, leaves 3-4 lines broad).

Var. 3, *polyanthus*.—Flowers 8-20, 12-15 lines across when fully expanded. Divisions pure white, 4-5 lines broad,

imbricated, bluish or cuspidate, equalling or shorter than the tube. Corona about a third as long as the divisions, at first a very pale yellow, finally becoming nearly the same color as the divisions, slightly pleated, the edge serrate. *N. polyanthus*, Lois. Fl. Gall. 1, p. 236, DC. Fl. Franc. p. 23, *Reich. Ic. t. 377, H. Cypri*, Haw. Mon. p. 11, *Kunth, 5, p. 77*.

Var. 4, *intermedius*.—Leaves glaucous, 1-2 lines broad; stem upright, expanded lower petal 12-14 lines across, the divisions pure white, 4-5 lines broad, generally narrowed gradually to a point, and minutely imbricated. Crown 2-3 lines deep, with a crenulate edge, just the same colour as the divisions. *N. papyraceus*, Gawl. Bot. Mag. t. 947 (1806), *Moggridge, Cont. Ment. t. 70, Parl. Fl. Ital. 3, p. 126; Hermione papyracea*, Haworth, Herb. Kunth, *N. unicolor*, Vent. Hort. Malm. t. 26; *N. unicolor*, Tinore, Fl. Neap. 1, p. 144, t. 26, *N. niveus*, Lois. Narciss. p. 37 (1810), *Gren. and Godr. Fl. Franc. 3, p. 280, Reich. Ic. t. 815*.

Var. 5, *intermedius*.—Leaves glaucous, 1-2 lines broad; stem upright, expanded lower petal 12-14 lines across, the divisions pure white, 4-5 lines broad, generally narrowed gradually to a point, and minutely imbricated. Crown 2-3 lines deep, with a crenulate edge, just the same colour as the divisions. *N. papyraceus*, Gawl. Bot. Mag. t. 947 (1806), *Moggridge, Cont. Ment. t. 70, Parl. Fl. Ital. 3, p. 126; Hermione papyracea*, Haworth, Herb. Kunth, *N. unicolor*, Vent. Hort. Malm. t. 26; *N. unicolor*, Tinore, Fl. Neap. 1, p. 144, t. 26, *N. niveus*, Lois. Narciss. p. 37 (1810), *Gren. and Godr. Fl. Franc. 3, p. 280, Reich. Ic. t. 815*.

Var. 6, *intermedius*.—Leaves glaucous, 1-2 lines broad; stem upright, expanded lower petal 12-14 lines across, the divisions pure white, 4-5 lines broad, generally narrowed gradually to a point, and minutely imbricated. Crown 2-3 lines deep, with a crenulate edge, just the same colour as the divisions. *N. papyraceus*, Gawl. Bot. Mag. t. 947 (1806), *Moggridge, Cont. Ment. t. 70, Parl. Fl. Ital. 3, p. 126; Hermione papyracea*, Haworth, Herb. Kunth, *N. unicolor*, Vent. Hort. Malm. t. 26; *N. unicolor*, Tinore, Fl. Neap. 1, p. 144, t. 26, *N. niveus*, Lois. Narciss. p. 37 (1810), *Gren. and Godr. Fl. Franc. 3, p. 280, Reich. Ic. t. 815*.

Var. 7, *intermedius*.—Leaves glaucous, 1-2 lines broad; stem upright, expanded lower petal 12-14 lines across, the divisions pure white, 4-5 lines broad, generally narrowed gradually to a point, and minutely imbricated. Crown 2-3 lines deep, with a crenulate edge, just the same colour as the divisions. *N. papyraceus*, Gawl. Bot. Mag. t. 947 (1806), *Moggridge, Cont. Ment. t. 70, Parl. Fl. Ital. 3, p. 126; Hermione papyracea*, Haworth, Herb. Kunth, *N. unicolor*, Vent. Hort. Malm. t. 26; *N. unicolor*, Tinore, Fl. Neap. 1, p. 144, t. 26, *N. niveus*, Lois. Narciss. p. 37 (1810), *Gren. and Godr. Fl. Franc. 3, p. 280, Reich. Ic. t. 815*.

Parlatores's two other species of this series, *N. Barla* and *N. Gennari*, we have not seen.

Var. 8, *intermedius*.—Leaves glaucous, 1-2 lines broad; stem upright, expanded lower petal 12-14 lines across, the divisions pure white, 4-5 lines broad, generally narrowed gradually to a point, and minutely imbricated. Crown 2-3 lines deep, with a crenulate edge, just the same colour as the divisions. *N. papyraceus*, Gawl. Bot. Mag. t. 947 (1806), *Moggridge, Cont. Ment. t. 70, Parl. Fl. Ital. 3, p. 126; Hermione papyracea*, Haworth, Herb. Kunth, *N. unicolor*, Vent. Hort. Malm. t. 26; *N. unicolor*, Tinore, Fl. Neap. 1, p. 144, t. 26, *N. niveus*, Lois. Narciss. p. 37 (1810), *Gren. and Godr. Fl. Franc. 3, p. 280, Reich. Ic. t. 815*.

Var. 9, *intermedius*.—Leaves glaucous, 1-2 lines broad; stem upright, expanded lower petal 12-14 lines across, the divisions pure white, 4-5 lines broad, generally narrowed gradually to a point, and minutely imbricated. Crown 2-3 lines deep, with a crenulate edge, just the same colour as the divisions. *N. papyraceus*, Gawl. Bot. Mag. t. 947 (1806), *Moggridge, Cont. Ment. t. 70, Parl. Fl. Ital. 3, p. 126; Hermione papyracea*, Haworth, Herb. Kunth, *N. unicolor*, Vent. Hort. Malm. t. 26; *N. unicolor*, Tinore, Fl. Neap. 1, p. 144, t. 26, *N. niveus*, Lois. Narciss. p. 37 (1810), *Gren. and Godr. Fl. Franc. 3, p. 280, Reich. Ic. t. 815*.

Var. 10, *intermedius*.—Leaves glaucous, 1-2 lines broad; stem upright, expanded lower petal 12-14 lines across, the divisions pure white, 4-5 lines broad, generally narrowed gradually to a point, and minutely imbricated. Crown 2-3 lines deep, with a crenulate edge, just the same colour as the divisions. *N. papyraceus*, Gawl. Bot. Mag. t. 947 (1806), *Moggridge, Cont. Ment. t. 70, Parl. Fl. Ital. 3, p. 126; Hermione papyracea*, Haworth, Herb. Kunth, *N. unicolor*, Vent. Hort. Malm. t. 26; *N. unicolor*, Tinore, Fl. Neap. 1, p. 144, t. 26, *N. niveus*, Lois. Narciss. p. 37 (1810), *Gren. and Godr. Fl. Franc. 3, p. 280, Reich. Ic. t. 815*.

Var. 11, *intermedius*.—Leaves glaucous, 1-2 lines broad; stem upright, expanded lower petal 12-14 lines across, the divisions pure white, 4-5 lines broad, generally narrowed gradually to a point, and minutely imbricated. Crown 2-3 lines deep, with a crenulate edge, just the same colour as the divisions. *N. papyraceus*, Gawl. Bot. Mag. t. 947 (1806), *Moggridge, Cont. Ment. t. 70, Parl. Fl. Ital. 3, p. 126; Hermione papyracea*, Haworth, Herb. Kunth, *N. unicolor*, Vent. Hort. Malm. t. 26; *N. unicolor*, Tinore, Fl. Neap. 1, p. 144, t. 26, *N. niveus*, Lois. Narciss. p. 37 (1810), *Gren. and Godr. Fl. Franc. 3, p. 280, Reich. Ic. t. 815*.

A crowd of Haworth's species (as *H. subulnea*, *perlutea*, *flaveola*, *dellexcaus*, and *triloba*) appear from the descriptions to range between our varieties 8 and 9. *N. tazetta*, then, in the broad sense of the term, as here defined, includes all the Narcissi with broad glaucous leaves, and a cup-shaped crown, from a quarter to half as long as the divisions of the perianth.

Well-known in cultivation but never matched with any wild plant. Probably a hybrid between some of the varieties of *Tazetta* and *poeticus*. It has the leaves and general habit of *N. poeticus* var. *radiflorus*, but the flower is different. It may be the *N. angustifolius* of Willdenow, and if so that is its oldest name, but it is not the plant figured under that name by Curtis.

Var. 12, *intermedius*.—Leaves glaucous, 1-2 lines broad; stem upright, expanded lower petal 12-14 lines across, the divisions pure white, 4-5 lines broad, generally narrowed gradually to a point, and minutely imbricated. Crown 2-3 lines deep, with a crenulate edge, just the same colour as the divisions. *N. papyraceus*, Gawl. Bot. Mag. t. 947 (1806), *Moggridge, Cont. Ment. t. 70, Parl. Fl. Ital. 3, p. 126; Hermione papyracea*, Haworth, Herb. Kunth, *N. unicolor*, Vent. Hort. Malm. t. 26; *N. unicolor*, Tinore, Fl. Neap. 1, p. 144, t. 26, *N. niveus*, Lois. Narciss. p. 37 (1810), *Gren. and Godr. Fl. Franc. 3, p. 280, Reich. Ic. t. 815*.

A native of Spain, the South of France, and the Balearic Islands. Intermediate between *Tazetta* and the *Jonquilla*, but both this and the last, though easy to know, when living by their leaves and general habit, are scarcely to be distinguished from *Tazetta* in dried specimens. The three taken together may be known from all other Narcissi by the cup-shaped crowns, from a quarter to a third, or in extreme cases nearly half, as long as the divisions of the limb of the flower. *J. G. Baker*.

Home Correspondence.

The Hamburg International Exhibition. — It is gratifying to me, as one of the victims of those who projected the above exhibition, to observe that their conduct has come under the lash of the Gardeners' Chronicle in last Saturday's publication, and in corroboration of what is there hinted at, allow me to give as an instance of the unfair treatment foreign exhibitors received, some account of my own case, which will perhaps be better explained by the publication of the copy of a letter I addressed to them through their Secretary, but of which, up to this date, they have taken no notice:—

"The Gardens, Dalkeith Park, September 2, 1866. Sir,—I sent my son to your exhibition with the three bunches of Grapes I entered for the cup offered by the Queen of England, and I have just received the following telegram from him:—'Meredith 1st; been disqualified; prize altered from three bunches to a collection.' Now, if I understand this right, it means that you have given the cup to a large collection of Grapes instead of to three bunches, and in the name of all that is fair and honest, I protest against such a change, and claim the cup, if my three bunches were the best that were exhibited, and properly entered as three bunches for the cup in question. The Gardeners' Chronicle has been the English organ of the exhibition, and on July 17 the following paragraph appeared in it:—'We learn officially from Hamburg that the Queen's Silver Cup is to be given to the best three bunches of Grapes.' On the faith of this announcement I wrote, and entered three bunches for the cup, and added, that if I were wrong in supposing it was to be given for three bunches, I begged to be corrected. The only reply I got was a certificate that I had entered them, and a card to place on them, which was an acknowledgment that I was right, and I sent three bunches of Grapes, weighing over 13 lb., at great expense to myself, and I now demand an explanation of what appears to me to be a bit of none, except that of keeping faith with me, or any one else more deserving, and who may have complied with your terms. In conclusion, I beg to say that I will accept of no other prize for my Grapes from you, except that for which they were entered. Waiting your reply. I am, &c.,

"Dr. Gotze, Secy." "W. THOMSON." I may as well state here, that in the printed schedule of the prizes, the cup was offered for three bunches of Grapes in three varieties; and of the whole exhibitors I alone complied with this rule, which would have been binding on any set of judges in Britain, where men have respect for truth and honour—matters that are at a discount amongst those who conduct such exhibitions as that under consideration. For the information of all who may venture across the Channel as exhibitors on any future occasion, I may state that my son left his box of Grapes, on the evening before the first day of the exhibition, locked in in a building on the exhibition ground, along with those of other exhibitors; and when he returned to set them up next morning he found the other exhibitors arranging their Grapes, and his removed from the place where he left them to another part of the building. He looked at the fruit on the evening of their arrival, and found them as sound as when packed, but when he opened them on the morning, a limb was broken off one bunch, and more than a score of berries torn out of the others, the box bearing evidence that it had been repeatedly lifted and dashed on the ground to destroy the Grapes—a proceeding too contemptible to be characterised in the English language. Wm. Thomson, Dalkeith Park, Sept. 20. [Mr. Thomson writes under a feeling of great irritation, as well he may, for, whatever answer may be made to some of his allegations, it is abundantly evident that he has been badly treated. We understand that a deputation of the British exhibitors waited on the President of the exhibition to solicit an explanation of the alteration from "the best specimen" to "the best assortment." The answer given, as we learn, was this, that the cup was to have been for the best specimen, but on the receipt of the cup from England it was found to have engraved upon it, "for the best assortment." The Queen was communicated with by telegraph, and is stated to have replied that she decided for an "assortment." Now, it is clear that the matter was never properly represented to her Majesty. Her name and character have been most improperly traded upon. She would, we are convinced, never have consented to any alteration in the schedule made at the last moment. Moreover, as we further learn, the statement that the cup bore the inscription "for the best assortment" is a—well—a mistake; the words on the cup, as seen after the awards had been made, were "for the best specimen." We do not go so far as some of the exhibitors do, and make a charge of intentional unfairness on the part of Continental judges at these international exhibitions; we simply say, that they sometimes manifest a perfectly childish view of the nature and objects of a free open competition, more nearly akin to the absurd farce enacted at some infant schools in this country, where every little dear gets a prize, and the next stupid one gets the "good conduct" prize! If by some accident, impecuniosity of the mistress, or what not, some Young Hopeful fails to get a prize, he or she is encouraged with the promise of one next time if he or she be good. We believe, odd as it may seem, that the freedom of our political system, as compared with the more despotic bureaucratic Government under which our foreign friends live, has much to do with the complaints that have reached us from almost all the international exhibitors. We ought to add that our former remarks were written before we had any direct communication with any exhibitor, and were suggested by the reports of our correspondents Eds.]

Cedars of Lebanon.—There is a good number of very fine specimens of this Cedar growing in the park and grounds here, although none with a bole so large as some already described in your columns. There are several that girth from 12 to 17 feet, with branches extending over an area of 250 feet, and from 70 to 85 feet in height; most of them are of a beautiful symmetrical growth. One specimen that measures

14 feet at 1 foot from the ground, has a clean stock to 20 feet high, and at 35 feet it girths 6 feet 6 inches. Many who have seen it consider it to be the finest piece of Cedar wood in this country. Fourteen, however, of the largest and handsomest ever grown on this place were laid low by the fearful gales that swept over the west of England and did so much damage on January 10—11, 1866. Most of the above specimens, as nearly as I can ascertain, were planted from 90 to 100 years ago. Will you allow me to ask to what age the Cedar of Lebanon is likely to maintain its health and vigour in this country? From the appearance of many of the majestic specimens growing here, I fear they will soon pass away. Many of them have assumed a sickly appearance during the last four seasons; how long they had previously worn that garb I cannot say. I have particularly noticed this unhealthy look on a specimen at the back part of the kitchen garden. With a bole 12 feet 9 inches in circumference, at 10 feet from the ground it threw up several branches almost perpendicularly, each, comparatively speaking, a good sized tree in itself. Last April the wind broke off two of these monster branches, at the axils of which a large number of rootlets had formed and descended far into the stock of the tree, where there is not the slightest trace of decay; the remaining part has since been thrown, and the same rooting process prevails throughout the whole stock. The young rootlets appear as if they were feeding greedily on the parent stem. Have any of your numerous correspondents noticed similar instances elsewhere? The soil in which they are growing is a good, rich, moderately stiff, loam, resting on a light gravelly subsoil, which, I am inclined to think, contains a large percentage of iron. The locality is considerably elevated above the sea level, the bracing air of which the Cedar of Lebanon appears thoroughly to enjoy in the young stages of its growth. T. Foote, Gr., Haldon House, near Exeter.

Iris (Viennensis) Pavonia.—Can any of your correspondents give me any information as to the cultivation of Iris Pavonia? I have grown it both out-of-doors and in pots in a cold greenhouse, but cannot get it to flower; it throws up its leaves only. A. W. [A beautiful old neglected flower. Eds.]

The Holme Park Lettuce.—In your remarks, p. 947, on Messrs. Sutton & Sons' seed establishment, it is therein stated that "a new Lettuce, named Holme Park Green Cos, is a large serviceable-looking variety, not yet sent out." We think it but justice to ourselves to state that we had the pleasure of distributing seed of this valuable Lettuce for the first time in the spring of 1866, and advertised it largely, so that it cannot now be called a "new variety," or that it is "not yet sent out." It is now pretty well known, although the seed has never been plentiful, owing to the difficulty of getting it to run to seed. We have had it very fine in our trial grounds for some weeks past. Before we sent this Lettuce out we sent it to Mr. Fairbairn, of Lion House, to Mr. Rose, now of Frogmore, and to Mr. Thomson, of Archerfield, for their opinion of its merits. Mr. Thomson described the Holme Park in the "Scottish Gardener" as follows:—"Last summer amongst other varieties, such as the Alma, Moore Park, Neapolitan, and several others, I grew the Holme Park, and found it the very best for a hot season, as it stood far longer than any of the others before it ran to seed; and in other respects it is first-rate, being large, crisp, and sweet, and does not require tying up, but forms itself into a compact-hearted Lettuce, something in shape like the Barrack Cabbage. I can strongly recommend this variety to all who esteem fine Lettuces in the heat of summer." It is, like Rowden's (not Bowden's) Brown Cos, black seeded, and not white seeded, as described in last week's Gardeners' Chronicle, see p. 995. Stuart & Mein, Kelso, N.B.

Black Currant Mite.—I perceive that Mr. Andrew Murray (p. 921) has suggested that this little insect should have a scientific name attached to it, and has proposed for it the name of Acarus Ribes. It is quite true that, as our knowledge of the creature is at present very incomplete, especially with reference to its supposed perfect condition, I hesitated to give it a name; but as a specific one would certainly be convenient, and as it is usual to form the specific names of insects attached to special plants by the genitive case of the latter, the name of Acarus (?) Ribis-nigri may be given to the insect in question, the generic name being provisional. I. O. W.

The Lady-birds.—So much has been written of late respecting these beautiful little insects, that it is quite natural that the rising generation should be inquisitive, and require to know something of their mission, business, and habits, and where they and their friends the aphides really spring from. There are many people who go up and down the world in their several ways without greatly troubling themselves as to how it is made up or inhabited, or without observing for themselves Nature's various, curious, and wonderful ways, until they are tickled all at once by something wonderful in vegetable, insect, or animal life. The habits and mission of the Lady-bird have possibly been quite as well known to some, for ages past, as they are now. When a boy I have heard my father, as well as older men with whom I worked, talk about the good they did in destroying the greenfly, and was always desired not to kill them. The beetle has been accused by some of eating fruit; that, too, was observed in olden times. When their insect mission was over, at the end of the season, they have been observed creeping into holes that had previously been made by birds, wasps, flies, or earwigs, in soft, ripe fruit, both on the trees and on the ground. This does not really constitute them fruit-devouring insects, any more than it does the bold and enterprising sparrow. This bird has lately been accused by the Secretary of the Australian Naturalisation Society of devouring the fruit. I have no doubt

but that this bird occasionally likes the taste of fruit when insects are scarce. I have seen sparrows eat ripe cherries near towns; they will also eat corn, and green Peas, and will nip off any kind of green stuff that may spring out of the soil in spring, but that does not constitute them wholly vegetarians. The immense amount of good they do in destroying insects, in the season, is well known. James Barnes.

Blackberries and Barberries, if mixed in a similar manner to Currants and Raspberries for pies, puddings, tarts, &c., will be found to be quite as good as the latter. The Barberry entirely rectifies the faint mawkish taste of the Blackberry, and imparts to it a very rich flavour, much resembling Cherries. Whoever tries it will never more neglect the Blackberry and the Barberry. They may be considered the most abundant native fruits we have, and if used in this manner there is no reason why the dish should not become more popular. C. S. W., Alton. [A capital suggestion. Eds.]

Sambucus racemosa.—How is it that this beautiful shrub, the scarlet-berried Elder, is not cultivated in England to a great extent? Its appearance at this time of the year is most brilliant, and although described as a native of the middle and south of Europe we have lately seen it growing in the greatest luxuriance in Denmark, Sweden, Finland, and Russia, in plantations and gardens, the most beautiful specimens having been noticed at Abo, on the Gulf of Finland, (growing to the height of 10 or 12 feet, and forming a thick bush. In its leaves and general habit it is quite like the common Elder, but its panicles of fruit, resembling miniature bunches of Grapes, of intense scarlet, render it the most beautiful wild fruit we have ever seen. I. O. W.

Alicante Grapes.—At the cottagers' show held at Latimer on the 14th inst., two bunches of Alicante Grapes were exhibited by Mr. Clements, gr. to G. G. Hill, Esq., Blackwell Hall, Chesham, that weighed a little over 11 lb. They were the finest bunches of the sort that I have ever seen. A. Donaldson, Latimer, Chesham, Bucks.

Chocolate Cake.—Will any of your correspondents be good enough to inform us what is the amount of nutriment in the constituents of chocolate, in comparison, say, with cheese, and whether it is pronounced to be less digestible or otherwise? Pater. [Chocolate, according to "Watt's Dictionary of Chemistry" contains large quantities of fatty matter and vegetable albumen, and about 2 per cent. of theobromine, which resembles caffeine. The ash is very rich in phosphoric acid; Payen's analysis of cocoa beans gives 52 per cent. fatty matter, 20 albumen and fibrine, 2 of theobromine, 10 starch, and other matters. The same author's analysis of Cheshire cheese gives 25—36 per cent. of fatty matter and 5—8 per cent. of nitrogen. Weight for weight, we suspect cheese would contain more nutriment than cocoa, but with the majority of people it is not so easy of digestion. Eds.]

Cinchonas at St. Helena.—The following extract from a letter from Mr. Chalmers, the Government gardener at St. Helena, on the present state and future prospects of the Cinchonas in that island, may not be without interest to the readers of the Gardeners' Chronicle as a continuation of notes on the same subject, published in this Journal a few weeks back. The letter is under date of the 11th of August last, and Mr. Chalmers states that by the end of last month he expected to have 500 plants permanently planted out which would conclude the planting out for the present season. The weather after September till about April, being drier, is less suitable for the operation and therefore that time will be taken up in propagating and preparing nurseries, and in getting the ground in order for future planting when the rainy season sets in again. The plants are all in excellent health and have a fine green vigorous appearance. The tallest, a Cinchona officinalis, which was raised from seed, is nearly 3 feet high, and promises to do well. A plant of C. succirubra growing in the propagation house measures 20 inches in height, with a circumference of 2 inches round the stem, at a foot from the ground; its largest leaf is 16 inches long by 12 inches broad. This plant was raised from seed, and is not more than nine months old. A plant of C. officinalis of the same age, and growing in the same house, is 24 inches high, and is much branched and very healthy, but it has smaller leaves. The other young plants not yet planted out are chiefly in boxes, and will be transferred to the nursery beds as soon as they are large enough to bear exposure to the open air. They number about 4000. Mr. Chalmers states that he has not thought it necessary to increase the stock to a greater number than it is likely will be wanted for planting out in the island; but should it be found necessary at any time so to increase it, he believes that in a short time sufficient quantity might be raised to meet all reasonable demands. In the introduction of other plants such as fruit and timber trees, much has been done from seeds sent from Kew. Mr. Chalmers says as many as 15 new species of Coniferous timber trees will be added to the island. It seems, however, difficult to make the people appreciate such things, their aim being the introduction of edibles or such plants as will yield a quick return. J. R. Jackson, Kew.

Variogated-leaved Orchid.—On looking over collection of Orchids imported from Guatemala in the spring, and now growing strongly, I noticed one small plant with very prettily striped leaves, in the colouring of which yellow predominated over the usual green, and the green was in longitudinal stripes. Is this common amongst Orchids? W. T.

Wellingtonia gigantea.—A beautiful specimen of this ornamental tree is thriving amazingly on the estate; the situation is moist and rather shady, at the bottom of a high sloping hill, and close to a Water-cress bed, which is supplied with water from numerous springs gushing out of the hill-side. The dimensions of this gem, which is unrivalled for beauty and un-

passed for hardness, is as follows:—Height, 28 feet, circumference of stem, 1 foot from base, 3 feet 1 inch; ditto, 4 feet from the base, 3 feet; ditto of branches, 4 feet. It was planted about eight years ago, and was then about 4 feet high. *George Berry, Loneleaf, Wilts.*
 —Al the specimens of Wellingtonia gigantea in this quarter, by which I mean within a circuit of ten miles or more of Dublin, are progressing in the most satisfactory manner, and as a consequence the interest in the tree remains unabated. I have quite recently had opportunities of seeing many, and from inquiries on the spot learned that neither the cold of winters nor the drought of the two last summers has at all affected them, the trees themselves bear evidence to this, although planted in various soils and positions. It is very gratifying to have to record these facts. Our oldest specimen here was planted in the spring of 1856, and its height, when measured in the month of March last, just previous to its commencing growth for the present year, was 26 feet 4 inches, and I cannot add that either soil or situation are particularly favourable. It may interest some, in the future, to record here that this plant is one of the original batch raised and distributed by the Messrs. Veitch, of Chelsea. Permit me also to record that a cutting taken off this plant in 1857 is now a well-formed specimen, 12 or 14 feet high, and growing in the grounds of the Viceregal gardens. There is a slight difference of character amongst them—some grow tall and tapering, and keep very pyramidal, others are dense and extend laterally more in proportion to the height. I may also add that, in the adjoining county of Wicklow, Viscount Powerscourt has had considerable numbers planted, with a view to test their value as forest trees; and I have heard that they are all thriving well. *D. Pressley, Knockmaroon, near Dublin.*

Mushroom Culture.—How much we are indebted to Mr. Robinson for the information which he has brought to light from the deep Mushroom caves of France, time alone will tell. But this much may be said, that the battle of the cordon can be scarcely fought over in the Mushroom, unless it be to bury Monsieur in his own cave by joining with him in the enterprise. That one house out of the many should export to this country no less than 14,000 boxes of these *bonnes bouches*, is sufficient of itself to lead us on to battle. And when it is true that various branches of English industry have sailed away from us in all directions, it is but reasonable that we should look out for and probe the vulnerable parts of the commerce of other nations, and help ourselves, that the balance may be properly adjusted. The enterprise would have to be entered into largely before one could fully ascertain how far the culture of the Mushroom might become subservient to that purpose, entailing considerable foresight on the parties who would make the venture. The question is not one of cultural ability, but more of capability. We can grow the Mushroom as well as our neighbours across the Channel, but we cannot grow it like them. Down in their capacious caves they grow them by the hundredweight daily; whilst here, if the beds produce a basketful of pottles in the same time, the cultivator is in mighty strength. Therefore the gist of the question would lie in the suitability of sites for operations, not only for the culture of the Mushroom, but also as affording ready means for the transportation of material. There are plenty of caverns and other waste places in which Mushrooms might be grown with advantage, but the object of this paper is not so much to examine their capabilities as it is to bring before the notice of intending operators a material which would be found as good, if not more so, for the production of Mushrooms, than that which is at present employed, and that is no less than the accumulated street sweepings of our large towns. Thousands of tons of this material must be swept up weekly, and if it be examined in the aggregate, it will be found admirably adapted for the culture of Mushrooms. The particles being composed of the very essence of the substance most desired by horticulturists, and fit for immediate use, do not constitute its chief merits; it also would be found cheaper than the material at present used, which, according to Mr. Robinson's account, takes several weeks in preparation before the beds can be formed. Now, street-sweepings can be bought for a third of the price which has to be given for horse-manure, and at the same time goes further, retains a sweeter heat longer, and is less liable to decay than the manure brought from the mews; important advantages, which must not be lost sight of by the cultivator. Of course it must be strictly understood, that what is meant by street sweepings is not the heavy, wet clots of the roads, or the mud out of the sewers, but simply the dry sweepings of the traffic of the streets, stored up in the depots of nearly all our towns. Seeing what a great quantity of sweepings are changed into Napoleons over those delicate morsels, the enterprise whereby we could make that quantity less by putting them in our own pockets is certainly worthy of a trial. And if our caverns and exhausted mines have never produced gold nor silver in the nugget, we might be able to make them continue to produce that which has value in the coin. The silver mines in the cold regions of Siberia are the great depots for receiving Russian law-breakers, and it is questionable whether it would not repay the Government of this country to transport some of our finely-nursed convicts to the caves under the bleak hills of Derbyshire and elsewhere, to prepare the way for the future development of *Agaricus campestris*. Forced to keep our convicts at home, prisons, which have no terror for offenders, and which soon will be inadequate, have been erected at great cost to the country. And why build more prisons while those caverns remain unoccupied. Parliament can possess itself of nearly anything; and why not possess itself of caverns for the lodgment of offenders? And if more offenders could be made to add to the wealth of the

country by growing Mushrooms for the million, so much the better. It would take nothing away from the flavour of the Mushroom, and probably it would give the poor as well as the rich the satisfaction of knowing that they were consuming something produced by those who were paying the just penalty of their crimes. *Andrew Meikle, Road Hill, Whalley.*

Pot Vines at the Royal Caledonian Horticultural Society.—In your issue of last week, Mr. M'Leod says "that it was clear to the most inexperienced that the pot Vine to which was awarded the 1st prize in its class, was nothing but a clumsy subterfuge, such as ought not to be encouraged, &c." As I happen to be the winner of the prize alluded to, I must say that, had Mr. M'Leod taken a little trouble to inquire into the case before rushing into print with his supposed grievances, it would have saved him a vast amount of trouble. With your permission, I will briefly state how my Vine was grown.—It was planted in 1867, and grown in the same pot till the day it was exhibited at the International Flower Show in Edinburgh. It stood in a flat at the top of the hot-water pipes the whole of the time, and derived no nourishment whatever from any source but what was supplied in the pot and the saucer or flat. Now this I consider a pot Vine in every sense of the word, but if I am mistaken, Mr. M'Leod will perhaps kindly undertake to give "a hint as to what is uniformly understood amongst gardeners as a pot Vine." I may mention that I had not the slightest intention of exhibiting my Vine at any horticultural meeting till August 5, when Mr. P. S. Robertson, nurseryman, Edinburgh, called, and, on going through the vineries, told me if I took it to Edinburgh it would take 1st prize. I took it there, gained the 1st prize, and I leave it to the public if it was not honestly won. If this statement of facts does not satisfy Mr. M'Leod, I shall be most happy to refer him to different gardeners who have seen the Vine in its different stages of growth. *Andrew Turnbull, Gr. to James Brunton, Esq., Broomlands, Kelso, N.B.* [We have received other letters in corroboration of the above. *EDS.*]

Foreign Correspondence.

CENTRAL PARK, NEW YORK.—When the late Mr. Downing visited England nearly 20 years ago, he was struck with the size and dignity, so to speak, of our public parks, more especially Hyde Park, and said that they had nothing like them in America. On his return, therefore, his first object was to impress upon his countrymen the importance of having parks for public recreation in all respects worthy of his native land, to the improvement of which he was so much devoted, and owing to his acknowledged good taste in all matters connected with rural embellishment, his pleadings in behalf of having parks comparable with those of what is termed "the old country" were listened to with attention. The result has been the possession by nearly every town in America of a public park commensurate with its individual requirements. Until a comparatively recent period New York itself could boast of no park worthy of such an appellation, but now it has its Central Park, which may be safely said to equal anything of the kind in any other country.

Some 10 or 12 years ago a prize of 2000 dollars was offered for the best plan for this park, the lucky recipients of which were F. L. Olmsted, Vaux & Co., a firm which, it must be owned, has done ample justice to the confidence reposed in it. The Central Park is about two and a-half miles long and half a mile wide, bounded on the sides by straight parallel avenues, and at the ends by streets crossing these at right angles. It is enclosed by a rough dry stone wall 4½ feet high, in which there are to be park gates at convenient intervals. There are also several stiles for the admission of visitors on foot. The area enclosed is about 768 acres, of which 136 acres are occupied by reservoirs, from which the city of New York is supplied with water; of these reservoirs one is square, the other irregular in outline, the latter covering about 106 acres. Unfortunately these reservoirs are not under the control of the garden architect, but under that of the park commissioners. Owing to this cause, they are too much elevated for the water within them to give the best effect in the landscape. They, however, practically divide the park into two portions, the northern, or upper park, containing 160 acres, and the lower park containing 331 acres, while the connecting grounds, lying on both sides of the reservoirs, comprise 135 acres.

It is then subdivided by four thoroughfares, one crossing it between the reservoirs, one at each end of them, and the remaining one near the middle of the lower park. These are so constructed, by means of tunnels and other contrivances, as not to obstruct the view, or practically effect any division of the park; and they furnish the means of direct transit across the park for business purposes, without causing any inconvenience to its visitors. In the lower park large tracts formerly covered with stagnant water have been drained; and 10,000 loads of stones have been conveyed to the borders of the park, furnishing materials for the construction of the present enclosing wall. The site for this portion of the park was very rocky, there being, with few exceptions, scarcely an acre in which the great underlying ledge of gneiss did not thrust itself above the surface.

Some might be apt to think the selection of the site just described an unfortunate one; and it was so as far as heavy expenditure is concerned; but the artistic effect is much finer than could possibly have been obtained upon a tract of the richest and most easily worked land, the natural outlines of which are tame and without character. Grass and shrubbery can be formed anywhere, but great rocks and those forms of earth's surface which are only found in Nature where rock exists, can seldom be imitated on a large scale

with perfect success. By taking advantage of the features just indicated this portion of the park has been made to resemble a charming bit of rural landscape, such as is seldom if ever found within the limits of a large town.

Breadth was, however, wanted, and to obtain this, three considerable pieces of ground have been cleared of all obstructions, and brought to a comparatively level surface. One of these, near the centre of the lower park, presents about 30 acres of level surface or slightly undulated ground, forming a reach of turf, about a quarter of a mile across, unbroken by a single road or footpath. This, upon special occasions, is used for military displays; ordinarily, however, it is like a large country green or open common, a place where children may run about and play until they are tired and without danger of being run over or injured if they fall. This green is bounded on the north-east by a rocky ridge, which has been reduced by blasting 16 feet, thus throwing open from opposite points the two finest views in the park.

The rock and earth removed from the ridge, together with that taken from a low hill some distance to the southward, have been used to fill a swamp lying east of the green, and this being further covered with earth to the depth of 4 feet, an additional level space has been obtained of about 80 rods in length and 12 in breadth, only separated from the green by a slight depression of the surface, through which passes a carriage road. This spot is planted with four rows of American Elms, forming a broad promenade or mall, with a fountain at either end, seats for visitors, and accommodation for an orchestra. At its southern extremity gentle slopes of turf, and little broken rocks and planted banks, conduct to a lawn-like surface, called the eastern plateau. Views of an open and pastoral character are thus obtained for a quarter of a mile in either direction, terminating in a forest-like background, having from its ruggedness a peculiar picturesqueness of effect.

Valleys occur in the southern portion of the park, and in its centre the middle portion of the western part of the central valley has been made more spacious by the removal of the smaller rocks and the earth that surrounded the larger ones, so as to form a shallow basin of irregular outline. This basin is almost entirely occupied by a lake nearly 20 acres in extent. The view across this from the most favourable point is of considerable breadth, and is entirely unbroken for upwards of a quarter of a mile. This lake is used as a skating lake in the winter, and for which purpose it has been specially prepared—a small portion at the upper end being separately dammed, in order that water may be kept in it some 12 feet higher than the intended winter level of the remainder of the pond, to be used for flooding the ice when rendered unsuitable for skating by snow and other causes.

The whole breadth of the park is brought into this landscape the foreground of which is enriched with architectural decorations and a fountain, the middle distance composed of rocks, with evergreens and masses of dark shrubs interspersed among them, reflected in the lake; and the distance extended into intricate obscurity by carefully planted shrubs of lighter and more indistinct foliage disposed among and above the grey rock of the background. This hill-side, being isolated in position, is crossed by no road, but is entirely laid out with secluded walks bordered by shrubberies. The bell-tower at the summit offers the best position from which to obtain a bird's-eye view of the whole park, and which at the same time serves as a means for the overseers to transmit by signal orders to the workmen at a distance. Thus much for the lower park. The natural surface of the upper one is much more homogeneous, and it has been treated in a correspondingly simple manner. About midway between the east and west boundaries are two connecting plateaux of turf, amounting to about 18 acres, and these take up nearly all the space for ornamental purposes which the rocky ledges leave available. As regards roads and walks the sunken and tunneled thoroughfares across the park render pedestrians safe from all danger of being injured by horsemen or carriages. Several miles of broad gravel walks have also been carried under arched passages beneath the drives, by means of which all parts of the park may be traversed on foot without encountering a single carriage or horseman. The rides are everywhere distinct from the drives, but horsemen can enter the carriageway if they choose. Footpaths also generally accompany the drives on one or both sides, within convenient conversing distance. An arboretum of about 40 acres has been planted in as natural a manner as possible, consistently with convenience for study, it is intended to contain specimens of every tree and shrub native to the North American continent that will live in the park in the open air. Scattered throughout the park are also some good examples of trees and shrubs introduced from other countries; but some account of these and other matters of special interest connected with this park must form the subject of another letter. *Joseph Newton.*

SOUTH AMBOY, NEW JERSEY, UNITED STATES: Sept. 5.—The fruit crop, with the exception of small fruits, seems to be a general failure in Europe. It is, however, fully balanced by the abundance here. The small fruit crop has been extra good. On one day there were 100,000 quarts of Strawberries sent to New York. Now the Peach crop is in; it commenced, in quantity, about six weeks ago, and will probably last five or six weeks longer. The Peach is everybody's fruit here. I saw it hawked about the streets by waggonloads at 5 cents, or 2/ a quart, and the fruit was quite equal to the best outside Peaches in England; very fine fruit sold for about 2s. 6d. the half bushel basket. One railway brought into New York 110 cars of Peaches one morning each car brings 500 baskets—and some of the Delaware growers have their own steamboats for conveying, so that you may imagine

the extent of the trade, when other cities are supplied after the same rate. Tomatoes are plentiful, and worth about 30 cents a bushel; in some places they are feeding cows with them, for which they are said to be good. Potatoes are a good crop, as you may judge when I state that it is difficult to obtain 3s. per barrel for prime samples. A large grower told me a few days ago that he only received, in New York, 17 cents per barrel, or not quite 7d. English, for a lot, after deducting expenses of barrels, freight, &c. They are now bringing over fruit from California, and wonderfully fine it is; but the Grapes, so far, have been knocked about too much on the road. The Lemons are as large as good Shaddocks, and the Pears much like the Channel Islands fruit, but of better flavour.

We have had long-continued dry weather here, although in some parts it has been quite a wet summer. The season has, however, been cold for this country; on many nights the temperature has been below 75°, and rarely up to 80°. It was very cold for several nights, and days too, last week, the thermometer being down to 12° on the morning of September 1. At New York there was a slight sleet shower; near Boston 4° of frost, ice 2 inches thick on the telegraph wires, and ice on the ponds, but it is warmer now, 86° in the shade to-day. James Taplin.

Societies.

ROYAL HORTICULTURAL: Sept. 21.—J. Russell Reeves, Esq., F.R.S., in the chair. The usual preliminary business of the meeting being concluded, the Rev. J. Dix announced the awards of the Floral Committee, and took occasion to allude to the great loss which Horticulture had sustained in the death of Mr. James Veitch, whose name, he said, had seldom been missed, until that day, from these exhibitions; and of Mr. Robert Thompson, of Chiswick, whose valuable services to Horticulture, and in particular to the sciences of pomology and meteorology, could not be too highly appreciated. G. F. Wilson, Esq., after announcing the awards of the Fruit Committee, said that a dish of Nuts had been exhibited, with a view of creating a discussion as to the cause of the holes bored in them. They were generally supposed to have been made by a small bird (the cole tit), but Mr. Earley mentioned that he had seen the small field mice hanging from the branches of Nut trees; which he, Mr. Wilson, thought to be the most likely explanation of the two as to how the holes in question were produced.

The Rev. M. J. Berkeley then alluded to some cone-bearing specimens of Conifers exhibited by Mr. Cox, and said that he was doubtful if the one marked *Picea cephalonica* was rightly so named, as it was rarely seen in fruit. The reason why many of the choicer Conifers flowered this summer was, no doubt, dependent on the fact that the wood was well ripened by the hot weather of last season. A Fungus, of extraordinary form, obtained from a sewer, was next shown to the meeting. He (Mr. Berkeley) had tested it, and had no doubt that it was merely an abnormal form of *Agaricus ostreatus*. With regard to the show of Fungi which had been announced, Mr. Berkeley said that October 5 was the day now appointed, and he trusted that as the weather was favourable to the production of Fungi, there would be a good display. In conclusion Mr. Berkeley briefly alluded to the samples of Potatoes from Mr. Fenn, whose experiments, he said, were of great importance, and then read the following paper on the subject from Mr. Fenn.

I grafted this year Red Ashleaf on Dickson's Premier, Paterson's Scotch Blue on Royal Albert, and vice versa. I have been unfortunate this season in regard to the "taking" of the grafts. I planted and kept the grafted sets in 6-inch pots, contrary to my later practice of planting them in the open ground when the shoots in the pots have pushed 5 or 6 inches out of the soil. This may have tended to cause non-success as regards the cicatrization of the skins; nevertheless, sufficient results have been arrived at to afford conclusive evidence as to the possibility of grafting the Potato with the eye of another. On July 14 I examined two sets, an eye of Royal Albert on a hardy tuber, white Potato, grafted on Paterson's Scotch Blue. The eye had held perfectly fast to the tuber, thereby giving the impression of being grafted between the stock and the graft. I had the graft set as perfectly as possible into the white tuber, placed it vertically in the tuber, but at the base of the graft and swelled out of its first position, though not sufficiently so to disintegrate itself from the cicatrix of its union with the stock in any case. I gave several sets of this graft, but all failed to hold fast, and I sent it to Dr. Masters to verify this result. Dr. Masters wrote me in answer, "in one case the cohesion was evident, but I do not see that the new tuber or haulm is at all affected by the grafting process. We must have more conclusive evidence than that. I see the union is not merely along the rind, but in the cellular mass of the Potato as well. I have forwarded the tubers to Chiswick. The whole subject is very interesting."

The other sort sent to Dr. Masters was the eye of a Paterson's Scotch Blue grafted on Royal Albert; no cicatrix, or union of the skins, had formed, but some of the young tubers were half-coloured, others less coloured, and one was perfectly white, none of them showing blue all over, like the grafted sort. I asked Dr. Masters to forward them to Mr. Barron, and request him to plant them, and note whether the colouring was permanent.

Now for "more conclusive evidence." I wrote on July 14 that I durst not then meddle with the roots of my last year's grafted Potatoes. Their appearance I noted thus:—Fenn's Onwards on Almond's Yorkshire Hero: an Onwards plant, but earlier, and very diminutive in comparison. Hero on Onwards: I can perceive no difference in the haulm as to part with the Onwards, except perhaps that the foliage of the grafted sets is of a more glazed green. Yorkshire Hero on Fluke: haulm looking like that of the true Yorkshire Hero, with not a symptom of the dark green tinge of the Fluke foliage. Milky White on Yorkshire Hero: haulm like that of a diminutive Milky White, quite ripening off, whilst its namesake by its side was in full vigour of leaf. Milky White grafted on Fluke: (as I did by mistake; I intended to have grafted the Milky White on itself, to try what would be the effect, if any) haulm showing quite a different character from that of Milky White, being not so branching, and of a darker, more upright, and more robust habit. All the above examples in 1888 united at the rinds more or less completely soon after they were planted out—a fact which I proved by inspection. I planted the above named Potatoes on April 15th, when the

graft of Onwards on Hero showed sprouts decidedly greener than those of the true Onwards; and when I dug them up, on August 9, their haulm was not nearly so ripe as that of the latter, and their produce generally, for form, proved rounder than Onwards. The Milky White grafted on the Fluke is the only other decided "conclusive evidence," and that is conclusive enough in the wrong direction; the character, as well as the Potato, being quite spoilt. In short, I may have gained (but I must wait another year to prove it) an improvement by grafting the Onwards on Yorkshire Hero, and that I fear will prove at the most but a mere pennyworth of Potato to a sack of trouble, though I shall be well content if, by the experiment, I have added my mite to the science of horticulture.

Floral Committee.—Rev. J. Dix in the chair. This was a small and comparatively unimportant meeting. From Messrs. Cripps & Son, Tunbridge Wells, came examples of *Codrus atantica*, *Luzula cornuta*, *Deodarea verticillata*, *glaucia*, a silvery-foliaged variety, and a hardy Japanese Hydrangea, named *pauciflora graciliora*, a dwarf free-flowering plant, with large panicles of greenish white flowers. To the latter a First-class Certificate was awarded. The same award was also made to a new Seedling Veronica, named Blue Gem, from Mr. H. W. Warren, nurseryman, Salisbury. This is a fine acquisition, in habit it is dwarf and compact, and it produces an abundance of rich blue flowers. To Mr. J. Salter, Versailles Nursery, Hammersmith, a Special Certificate was awarded for a fine collection of ornamental plants, and to Mr. J. Salter a class Certificate for a fine collection of silver-veined bedding plants. From Mr. J. W. Wainwright, Ashburnham Park Nursery, came flowering examples of the new hybrid Ivy-leave Pelargoniums *Willson* and *Willson*, to the former of which a First-class Certificate was awarded. The same award was also made to *Agave pectinata*, a curious Mexican species, with dark green fleshy leaves beset with whitish spines on the margins. The plant was exhibited by Mr. Green, gr. to W. W. Saunders, Esq. Along with this came a scarlet-flowered Gesnera from Jamaica, and three flowers of *Hemanthus coccineus*. From Messrs. W. Cutbush & Son, Highgate, came two remarkably large and handsome specimens of *Cockscombs*; they were quite 2 feet over the head, and received a Special Certificate for their good cultivation. A very fine collection of Orchids came from the Society's own garden, and to these a similar award was made. From Mr. J. Jobson, Rotherfield Park Gardens, Alton, Hants, came a good new deep blue, free-flowering bedding Pansy, named *Viola Perfection*, to which a First-class Certificate was given. A Special Certificate was awarded to Mr. Cox, gr. to W. W. Saunders, Esq., for a choice collection of cone-bearing sprays of Conifers, comprising branches of *Picea cephalonica*, *P. Webbiana*, *P. Nordmanniana*, *P. Pinsapo*, *Abies Morinda*, and the common Silver Fir. From Messrs. J. & C. Lee, Hammersmith, came small specimens of a dwarf compact-growing Thuja named *Tom Thumb*, and *Cupressus alba-apica*, a fine silvery-foliaged plant, which was regarded as a variegated form of *Thujaopsis borealis*, and to which a First-class Certificate was given. Dahlias were again shown in full force by Mr. Turner, who received a Special Certificate for a fine collection of cut blooms; a First-class Certificate for a new variety named *Provost*, rich crimson; and one of the Second-class to *Alice Gair*, pale bluish, with crimson edges. From Mr. G. Rawlings, Romford, came blooms of *Royalty*, orange-yellow, with faintly tinted crimson edges. This is one of the most beautifully formed flowers that has probably ever been shown at these meetings. A First-class Certificate was awarded. From Mr. G. Wheeler, of Warminster, came a new variety named *Lord Weymouth*, lemon ground, with crimson tinted edges; a showy flower, though in form not quite up to the florists' standard; it was, however, thought to be a good border-flower, and received a Second-class Certificate on that account. A fine box of beautifully coloured Petunias, and some new varieties of Pelargoniums, came from Messrs. Bell & Thorpe, Stratford-on-Avon, and from Mr. J. George, Putney Heath, came a collection of the latter, including a seedling double-flowered variety named *Miss Evelyn*, with dark pinkish flowers.

Fruit Committee.—G. F. Wilson, Esq., in the chair. In consequence of the unfavourable nature of the season, the prizes offered on this occasion by H. G. Bohn, Esq., for Peaches grown in open situations, were not competed for. The meeting, however, was above the average in point of interest, partly on account of Mr. Fenn's very suggestive and instructive exhibition of Potatoes. Some of these consisted of the produce of cross-fertilisation, which in one case was remarkably curious. Early Emperor, a large red kind, was the male, and Fenn's Onwards, white, the female parent. A cross between these produced two distinct varieties of the most diverse description, the most curious of which was described as being very late, the top not appearing till June, and the tubers of which had degenerated to a small round mottled form, and were not distinguishable from those of a wild sort received by the Society from Peru. The produce of another cross between *Hager's Early Goldstream*, male, and *Shedford Seedling Kidney*, female, consisted of 24 varieties of *mandarins* and *kiwano's*. The most curious illustration of the effects of grafting one kind into another was a case in which Milky White had been grafted into the Fluke, and the Fluke had been grafted into the Milky White, and that the Fluke had the appearance of the skin that is peculiar to the old Fluke. The other illustrations of grafting were of *Onwards* into *Hero*, of which it was noted that the colour of the young shoots showed a difference from that of either parent. In the following cases the results had been stated to be grafting, or rather the produce showed a difference:—Royal Albert into Scotch Blue, Premier into Red Ashleaf, Hero into Onwards, Milky White into Hero. Some remarks on these Potatoes are given elsewhere. A Special Certificate was awarded to the collection. A new variety was also shown by Mr. Fenn, named *Hector of Woodstock*. This when cooked was found to be a very finely flavoured kind, and was honoured with a First-class Certificate. From the same exhibitor also came an example of a very neat breakfast honey-glass, by which the honey can be removed from the hive direct to the table. Several samples of three kinds of home-made wines from Grapes ripened in this country. One sample, made from the Royal Muscadine, was especially fine in flavour, and was duly favoured with a First-class Certificate. A large collection of Onions was exhibited by Messrs. Barr & Sugden, of King Street, Covent Garden, who were requested to show them again at the next meeting, when the subject will be more fully gone into. Several examples from Chiswick, and from Mr. William Paul, of Waltham Cross, were also requested to be sent again at the same time. From Messrs. Holloway, 7, Jeffrey Square, came a very large example of the "Nero-midion" (*Pumpkin Vegetable Marrow*); from Mr. Fryer, gr. to F. Fryer, Esq., Digswell, fruit of a hybrid Tomato between Orange-flesh and the old large red variety; and from Messrs. Carter & Co. examples of their Champion Runner Beans. Messrs. J. & C. Lee, Hammersmith, exhibited the purple *Pedicularis*, *Harriet*, *Harriet*, *Harriet*, and Mr. W. Wainwright, Ashburnham Park Nursery, exhibited a new variety of green *Peas*, which was requested to be sent again to the next meeting, when they will be compared with other varieties from this week. Mr. Gilbert, gr. to the Marquis of Exeter, sent a new seedling green fleshed Melon, a cross between *Pink Beauty* and *Victory of Bath*, which was very fine in flavour. A First-class Certificate was awarded, and the variety was named by the Committee the *Burghley Green Flesh*. From Mr. O. Goldsmith, Polesden Lacy, came the scarlet-fleshed Windsor

Prize Melon. The same kind, sent as a seedling, was also shown by Mr. Stacey, South Bank, Egbaston, Birmingham, neither sample being particularly good. The Chairman showed a fine dish of Transparent Greengage Plums, grown in an orchard house; and Mr. R. Fairbairn, gr. to W. Death, Esq., South Lodge, Bishop Stortford, a good example of the Blood Pine, about 6 lb. in weight, to which a Special Certificate was awarded.

GLASGOW AND WEST OF SCOTLAND HORTICULTURAL: Sept. 18.—This was the concluding exhibition of the season, and was held in the City Hall and adjacent rooms. The principal hall looked exceedingly well. What with the ornamental leaved Pelargoniums in beautiful pyramids, the array of Tree Ferns, Palms, and Japanese Lilies, and some good specimens of *Ixoras* and *Heaths*, there was a very striking general aspect. The fine batches of golden and silver-leaved Pelargoniums from Mr. Campbell, Castlemilk; Mr. Ingram, Aitkenhead; and Mr. Boyd, Easterhill, formed quite an exhibition of themselves; but many others came from Messrs. Dreghorn & Aitken, Mr. Paul, Mr. P. McKenzie, and Messrs. Smith & Simons, Messrs. J. & R. Thyne's collection of stove and greenhouse rarities may be noted for its general excellence, it comprised *Crotons*, with their beautiful green and golden foliage, mixed with orange-scarlet *Ixoras*, metallic *Echeverias*, noble-looking *Screw Pines*, and light and airy Ferns. The rare and dwarf Palms, put up by Mr. McKay, gr. to Mr. Reid, Woodburn, and the flowering specimens of *Ixoras* and *Heaths* from Mr. T. Hagg, gr. to Mr. D. Tod, Partick; and from Mr. Boyd, gr. to Mr. Finlay, Easterhill, were remarkably effective. That fine dwarf Fan Palm *Livistona altissima*, the equally interesting *Cladium Getah*, with its stems bristling with spines, and the *Thief Palm*, all plants of very decided character for conservatory decoration, came in well among the miscellaneous flowering plants, as they do at all shows. The variegated *Viola cornuta* from Mr. Lewin, Drumpellier, was an acquisition; and the *Coleus*, named *Sir Peter Coats*, shown by Mr. McKenzie, a good seedling after the order of Queen Victoria, both plants being quite noteworthy as novelties. The saloon, however, was the great centre of attraction, for here the collection that took front-rank position at the International Show in Edinburgh was exhibited, having been secured by Messrs. J. & R. Thyne, who well merited the special award given to them. The collection included grand *Hamburgs*, *Alcanta*, and *Muscat Grapes*. Mr. Smith, gr. to the Duchesse de Coigny, Bargany; Mr. Campbell, gr. to Mr. Geo. Aitken, Craighead; Mr. Crosbie, gr. to Sir Jas. Colquhoun, Luss, and Mr. Paterson, Balgray, all had good Grapes. The Apples from *Rothesay* and *Combs Esq.* were particularly good. What interested the display of fruit were the *tableaux* and *tableaux* of table bouquets. The market gallery was devoted to Dahlias and other outflowers, and to a large display of first-rate vegetables, among which Peas, Leeks, Carrots, and Onions were particularly fine. The extraordinary quantity of vegetables that have in recent years been shown in the West of Scotland, have been matters of general observation throughout the country.

Notices of Books.

The Polar World: a Popular Description of Man and Nature in the Arctic and Antarctic Regions of the Globe. By Dr. G. Hartwig. 8vo, pp. 548. London: Longmans, 1889.

If the natural history of our planet be divided into three great groups, according to temperature, it will readily be allowed that we know most about the objects that occur in the temperate zones, that we have much less still to discover in the tropics, and that our knowledge of the fauna and flora of the polar regions is, in proportion to the limited extent of its species, in many respects deficient. The number of travellers who venture amongst icebergs and snow-clad mountains forms but a small proportion of those who risk their lives in "parts unknown," and the only wonder is that in such inclement climates and in such almost uninhabitable regions every particle of scientific energy is not frozen to the core.

When we regard the relative disposition of land and water upon the surface of our globe, and see how greatly the former preponderates in the northern hemisphere, it is not surprising that our acquaintance with the natural history of the arctic world is more extensive than with that of the antarctic regions.

The Cape of Good Hope, Sydney, and Buenos Ayres all lie about 35° south of the equator; and we know that, with the trifling exceptions of Tasmania, New Zealand, and Patagonia, there is no land at all until we come to the antarctic circle. Compare this with what occurs at the opposite pole; 35° north latitude runs through the Mediterranean Sea, Persia, Thibet, China, California, and the United States; and from thence to the arctic circle there must be at least four times as much land as sea. Spitzbergen is about 13° only from the North Pole, which has been approached both from that island and from Baffin's Bay, until a very few degrees intervened between the hardy travellers and the goal they tried to reach. But it is far otherwise with our knowledge of the South Pole. Land has been discovered below Cape Horn, and opposite the whole of the south coast of Australia, at about 25° from the South Pole; and in one place, opposite New Zealand, ships have penetrated to within 12°, and have seen an active volcano; but in all other directions the ice has prevented any nearer approach to this pole.

It is not therefore surprising that in the work now before us 460 pages are devoted to a description of the northern polar world, while 60 pages suffice for an account of all that is known of the antarctic regions.

We have, on a previous occasion, had reason to speak in high terms of Dr. Hartwig's ability in popularising subjects connected with the natural sciences, and the present volume is in no respect inferior to his earlier compilations. While he makes no allusion to having visited any of the frozen regions, his writings present that natural and easy flow of language which make one imagine that he must be describing scenery with which he has been personally acquainted.

After giving a general account of arctic lands, with their climate, their zoology, their botany, their paleontology, he treats similarly of the arctic seas; and, having thus introduced the subject, he commences at Iceland, and takes the reader eastward with him along the northern parts of Europe, Asia, and America, calling on the road at Spitzbergen and Novaya Zemlya, and leaving him finally on the shores of Greenland. The journey is a

most interesting one. The discovery of each part is carefully recorded, together with the history of the people where the region is inhabited. Thus the habits, customs, and peculiarities of the Icelanders, the Lapps, the Samojedes, the Ostjaks, the Tungusi, the Kampt-schatkans, the Tchutchi, the Aleuts, the northern American Indians, the Esquimaux, and the Greenlanders are in turn fully described. So also is the early conquest by the Russians of the vast extent of Siberia, its gold diggings, its most important fur trade, and its gradual development, to which the extension of its railways is still slowly contributing. The fur trade of the Hindon's Bay territories is explained at some length, together with the habits and mode of capture of all the animals whose skins are of value; of these the principal are the black, brown, and grisly bears; the red, black, and silver foxes; the raccoon, glutton, marten, skunk, mink, beaver, and musk rat.

The accounts of the early attempts to find a north-east passage by sea to India, first through the Baltic, and subsequently round the North Cape, are very amusing to us, with our present geographical knowledge. But perhaps the most interesting part of the work is the able *resumé* of all the attempts which have been made to discover a north-west passage from the Atlantic to the Pacific Ocean.

Our limited space prevents reference to many other subjects to which we would have wished to allude as being admirably described in this book, and we therefore content ourselves with the cordial recommendation of it to our readers.

Florists' Flowers.

It can scarcely be said that seedling DAHLIAS have been produced so plentifully this season as during the few past seasons; and it is a somewhat singular fact that Mr Keynes, of Salisbury, has not produced even one new flower at any of the meetings of the Floral Committee during the present month. No doubt the late and inclement spring had its influence on the blooming of the seedling flowers, and there is reason to believe that, not only are they late in blooming, but imperfect in development. Notwithstanding the paucity with which new varieties have been produced, yet some very fine flowers have come to the fore, combining with the fine properties of the florist much novelty of colour. Five of these flowers stand out prominently, and each has received the highest award it is in the power of the Floral Committee to bestow, namely, a First-class Certificate of Merit. The premier flower is unquestionably Royalty, from that well-known raiser, Mr. George Rawlings, Romford. It was well described by the chairman of the Floral Committee as one of the most beautiful and perfect flowers ever brought before that body: it has a bright golden ground colour, the centre tipped with brown, and some of the surrounding petals slightly *shaded*, the petals open boldly, and form uniformly laid circular *rows* giving the flower a grand outline of perfect shape, the centre is full, close, and high, it looks like a variety that will want some close shading to bring it to perfection, and then it will be as near perfection as any Dahlia that has yet been obtained. Aristides (Rawlings) is another first-class flower, of fine shape and substance, and of a crimson-purple hue, shaded on the tips of the petals at centre with glossy dark. Toison d'Or (C. Turner) is a glorious yellow self, of a deep bright golden hue, and exquisite shape, medium sized, and very pure; if it should prove constant it must be a telling exhibition flower. Harvard (Fellowes), exhibited by Mr. Turner, is a most pleasing flower, of a soft and yet bright hue of lilac-rose, the petals finely formed and regular, giving a fine outline, medium size, and close high centre. Queen of Yellows, the last of the five above referred to, appears to have been exhibited by a new raiser or exhibitor, Mr. G. Parker, Maidens' Green, Winkfield. This is a fine bold bright orange-yellow self, of full substance, and looking as if it would be a constant and reliable flower.

All these, except Aristides and Queen of Yellows, were represented at the meeting of the Floral Committee on September 21. In addition there were Alice Gair (Turner), blush, heavily tipped and dashed with bright rosy purple, and yet, though belonging to a numerous type of flowers, with much novelty of character, of medium size, and very promising, though not shown on this occasion in the best condition. Lord Weymouth (Wheeler), half golden ground, heavily tipped with lake, a pretty and pleasing flower, rather coarse and quilled as shown and somewhat flat, but with good outline, and promising to be finer when well grown. Both these were awarded Second-class Certificates. A First-class Certificate was also awarded to Mr. C. Turner, for Provost, an orange-red flower, the base of the petals paler, distinct in colour, and of good substance and outline, though as shown requiring more finish. In addition there were Sarah Maris (Wheeler), in colour a pale lilac self, the base of the petals flaked with deep rose, but inferior in outline and finish to Harvard, which it somewhat resembles. Edith (Turner), pale ground, tipped with a paler bright purple than Alice Gair, was represented by three blooms all more or less distinct in character: it must be seen in a much improved state to receive an award. Enchantress (Parker), pale ground, slightly suffused and tipped with purple, small, but promising; and Mr. Parker (Parker), pale fleshy buff tipped with purple, not so good as the last named, must also be considerably improved ere they can compare with some flowers already in cultivation.

Mr. Turner staged a collection of 72 blooms of show and fancy Dahlias; of the former the following were very good:—Memorial, Miss Henshaw, Purple King, Edward Spary, Vice-President, Charles Turner, Chairman, Buttercup, Valentine, Miss Roberts, Cynet, Lord Derby, Leah, The Hon. Mrs. G. Wellesley,

High Sheriff (very dark), Mrs. Dorling, Paradise Williams, and James Hunter. Of fancies, the following were well worthy notice.—Queen Mab, Viceroy, Fairy Sturt, Annie, Attraction, Fair Imogene, Sparkler, and Pauline. B. D.

The Apiary.

QUALITY OF HONEY.—Those who have partaken of the honey from my supers have invariably asked me, "What is the reason your honeycomb is so superior to that carried about by the peasantry for sale?"—Theirs is strongly flavoured, while yours is the reverse." The peasantry are in the habit of taking, whenever possible, the swarms of the year, and offering for sale in a neighbouring watering place, all the comb filled with honey, which is of a good colour, i. e., that has not been bred in. I at first answered the question by saying that my honey was made chiefly from white Clover, which gives the honey with the most delicate flavour, while most of the cottagers near the watering place in question were in the neighbourhood of heath, which does just the reverse. Having, however, taken one or two straw vats of my own since my attention was drawn to the subject, I have come to a different conclusion. The honeycomb from these vats was strongly flavoured, and different from that in the supers of the depriving hives beside them. Upon examination it appeared that all the comb in the neighbourhood of the part used for breeding was of a deep yellow colour; that a little further removed was a lighter yellow, and only a comparatively small portion, at the very top of the hives, was of the same colour as the comb in supers. Now, just as the colour deepened so did the flavour; and that, when strong, was so like pollen, that it appeared to me that it was the carrying of this food to the young bees that imparted it. All the comb in the immediate neighbourhood of the place where breeding was carried on would have had pollen carried over it, while the honey was in a warm state, and therefore easily flavoured; and for the same reason it appears probable that the aromatic bitter of pollen would impregnate honey with which it did not come into actual contact. The odour of Oranges has been known to flavour and spoil tea kept in the same warehouse. The warmer the atmosphere the more likely such transmissions of flavour to take place, and the heat of the interior of a hive is well known. Whether this explanation of the cause may be correct or not, it appears to be the case that breeding in a hive injures the flavour of all the comb in its neighbourhood. A. B., *Narberth*.

Garden Memoranda.

GOOD SAMPLES OF BEDDING-OUT.—The garden and pleasure-grounds of Provost Russel, Mayfield, Falkirk, are always objects of attraction to horticulturists from all parts of the country, and a cordial welcome is extended to all by the generous proprietor. The collection of *Cornus* is a mark-a feature in the place, from the extent and variety of the various species, and the excellent condition that characterises the whole. When we add to that, some fine samples of bedding-out flower-gardening, with the suitable adjuncts of lawn and gravel in seemly proportions, the reader will be all the better prepared for appreciating the details of the following picture of quiet loveliness.

Given a straight gravel walk, running about 300 yards first down an incline of about 1 in 8, and then along a level, with parallel borders about 7 feet wide on either side, the borders planted thus—back line of Gladiolus and Christine Pelargoniums, then ovals slightly raised of Pelargoniums Flower of Spring, Golden Chain, and Cloth of Gold alternately, tied together as it were with mass plants of Centaurea ragusina, the ovals edged or garnished with Perlas, and set in a groundwork of the grey coloured and rapid growing Artemisia Stelleriana, with a broad front line or band of Golden Feverfew.

There was a charm about the arrangement peculiarly captivating; the harshness of contrasting primary colours was avoided, and the skill of the gardening artist was tacitly proclaimed. What with the grey decided groundwork, the golden and silver ovals set in purple embroidery, and relieved at intervals with the hoary coloured and runcinate leaves of the Centaurea, and then the golden individual tree-like masses of the Pyrethrum next to a 12-inch margin of Grass—the whole thing was so simple and so effective as to be worthy of imitation. Of course place and position rendered the effect more striking, for on the one hand there is a screen of deciduous trees and shrubs and evergreens of the Irish Yew and Coniferous sections, and on the other is a portion of the Pincium, and an artificial lake which produces a portion of the picture in its waters like a mirror.

Example No. 2 stands at right angles with the borders described, running along the foot of a grass terraced bank in front of the mansion, and is of a more elaborate character in its details, but wrought out with the same masterly hand. The border is about 10 feet wide, backed up with several fine plants of the Lawson Cypress, the Irish Yew, and Thujaopsis borealis. Confronting these are grafted Yews, forming heads like golden balls on sombre green stems, intermixed with neat portable plants of the variegated Acer Negundo, the groundwork among these is Pelargonium Stella. Confronting the back arrangement is a broad line of P. Bijou, then a grey hoary groundwork is provided in Gnaphalium lunatum, with very decided diamonds of P. Mrs. Pollock, garnished with the dark crimson purple hue of Iresine Herbstein, relieved at the junctions with the beautiful Centaurea; and the whole is finished up with three narrow lines of Arabis lucida variegata, Alternanthera spathulata, and Sedum alzoideum variegatum—the dark-leaved plant blending in evident harmony with two of the

most beautiful and striking variegated plants in cultivation.

With the exception of the flowers of Pelargonium Stella there was nothing but foliage to provide the colour here, and the effect was significant, and above all things suggestive to all who have an uncertain climate as to drought and moisture to war against. The fine sweeping bend towards the extremity heightened the effect and led the promenade into a seclusion where the rarities of the garden were under trial. Prominent among these were some of the succulents, such as, for instance, E. beveria metallica in both its forms of dark and greyish dark leaves; E. secunda glauca, with fine *filices*, in autumn having additional beauty in its tinging orange-scarlet inflorescence; Alternanthera amabilis and Iresine Lindeni, both a shade more hardy than their more common fellows, as proved by the weather of the early part of September.

A capital wrinkle is in store for your experimental readers, and one that can be put into form next season, viz., encircling the base of such things, for instance, as Dracena australis, Aralia papyrifera, and such-like gallant growing things, with circles of about 2 feet diameter of the densely-tufted Sedum lividum (?). Here it was quite first-rate, beating, for colour and density, the best attempts of Spergula pilifera that have been ever tried. There are many other succulents of a hardy nature which may be turned to good account in planting the flower-garden. Quietly take the hint, gentle readers, for to many of you at least it will be invaluable information. To Mr. Sorley, the gardener, no small praise is due for making "tracks" for himself, as the Americans call it, in the carrying out of parterre flower-gardening. A.

Miscellaneous.

Limits of Pines.—The road passed Las Tablas, where for the first time we found ourselves in a most delightfully cool temperature, and in a forest of Fir trees (Pinus tenuifolia, Benth., known by the name of "Ocoté," a corruption of the Aztec (Mexican) "Ocotl"). I may, however, add that this is not the most southern limit of the Pines on the Pacific side of America, but that it is, as far as at present ascertained, in latitude 12° 40' north, on the Volcan Viejo, near Chinandega, at an elevation of 5000 feet above the sea-level, whilst the most northern limit, as I have shown in my Flora of Eskimoland, is on the banks of the river Noatak, in latitude 66° 44' north, where Captain Bedford Pim found a regular forest composed of a species (Abies arctica, A. Murr.) closely allied to the white Pine. We did not long remain in this delightfully cool atmosphere, but were compelled again to descend into the hot valleys, passing the village of San Juan de la Maya. Dr. Seemann's "Dottings in Nicaragua."

Coal Plants.—Stigmaria or Sigillaria, together with Lepidodendron and Calamites, formed the principal trees of the coal period. The dense damp forests in which they flourished had a very different aspect from anything to be seen on the earth at the present day. But the plants themselves have very near allies, from which they differ chiefly in the great size to which they attained, and the necessarily more highly organised stems they possessed. Ferns are the only Cryptogams which reach the size of trees at the present day; but it is remarkable that the Ferns which abounded in the coal period were generally humble plants, only in one or two cases having a stem of any length, while on the other hand the small Club-Mosses and Horsetails of our day attained at that early period a size that equals or even surpasses the trees of our forests. World of Wonders.

How to Grow Gooseberries for Cooking.—Many years ago my father planted a hedge of Gooseberry bushes to prevent a neighbour from encroaching, and he put in a lot of spare bushes and a great many cuttings of full length, just as they were pruned from the Gooseberry bushes, and a matted thicket was the consequence, very prolific indeed of spines; but a very unlooked-for result was obtained, for after all other Gooseberries had got large and sweet, these were small and sour, and made excellent tarts. Any quantity of Gooseberry cuttings can be got in winter, and, if they are carefully put in the ground they will all strike root, and make good plants in the course of a short time. If any one possessed of a stock of plants will keep the pruning knife away from them, and get them into hedgerow fashion, he will soon get a weight of small fruit off them, for the plant is a sure cropper, and its forte lies in the multitude of spines and small sour berries that it can produce. It seems quite at home at this kind of work, and can act untraced by high cultivation. The price of green Gooseberries is extravagantly high, yet it is quite astonishing to see the quantities sold, and the large size they are. A tart Gooseberry should not be larger than a Hazel nut, but these I allude to are as big as Walnuts, and need to be sliced like Cucumbers before going into the pie-dish. As the fruit is only grown to half its natural size for tarts, and only occupies about half the time upon the bush that the ripe fruit does, it does not exhaust the plant; and if the caterpillar can be kept down the plants will go on fruiting for a great many years, for the Gooseberry plant is long-lived, and remains a stunted shrub, although never pruned. It is less than the Currant in size, and considerably longer lived. It seems as if it could not aspire like the smooth-barked Currant, having to guard itself with pointed armour, which it has to manufacture as it goes on. The subject only wants to be named, and the line of distinction drawn between the culture for ripe fruit and the culture for green, and the work will get forward in due time. It is sound practical advice, and no one will be disappointed that gives the thing a fair and honest trial. A. Forsyth, in "Florist and Pomologist."

Garden Operations.

(For the ensuing week.)

PLANT HOUSES.

MANY climbing plants, such as Dipladenias, Clerodendrons, Stephanotis, Combretums, Jasminum ligustrifolium, &c., among stove plants, and Rhynchospermums, Solanum jasminoides, Sollyas, and the like, amongst greenhouse plants, will now need very little root moisture when grown in pots, sufficient only, in fact, to keep them from showing any symptoms of flagging.

FORCING HOUSES.

The outdoor borders of those Vineries which are intended for early forcing should now, if not already done, be covered over without further delay, for the purpose of warding off superficial rains.

HARDY FRUIT GARDEN.

The ingathering of all choice varieties of Apples and Pears should now be commenced, and carefully conducted. Perhaps the best or safest test is to gather them at the time when they will part from the trees readily.

HARDY FLOWER GARDEN.

Finish pricking out all seedling Garden Primroses, Polyanthus, &c., at the earliest possible moment, otherwise these will not have time to become established before winter.

young shoots to establish themselves before winter sets in. These may likewise now be propagated by means of some of the younger shoots, which have eyes at the base of the leaves, where, in fact, no flower has been formed.

KITCHEN GARDEN.

Continue tying up Endive and Lettuces upon dry favourable occasions, a few at a time, and often. These blanch more slowly at this time, and are more likely to rot during the process, hence the need of proceeding as above.

TOWN GARDENING.

THE Chrysanthemums should now be attended to, if it be wished that they should make a pleasing feature when in flower. The plants can now be trained to almost any required shape, and will right themselves in time for flowering.

STATE OF THE WEATHER AT CHISWICK, NEAR LONDON, For the Week ending Sept. 22, 1869, as observed at the Horticultural Gardens.

Table with columns for Sept., Moon's Age, BAROMETER (Max, Min), TEMPERATURE (Of the Air: Max, Min, Mean; Of the Earth: 1 foot, 2 feet, deep), Wind, Rain.

Sept 16 - Cloudy, but fine, cloudy, densely overcast, rain. 17 - Showery, a ght rain, showerly at night.

STATE OF THE WEATHER AT CHISWICK. During the last 43 years, for the ensuing Week, ending Oct. 2, 1869. Table with columns for Sept and Oct, Average Highest Temp, Average Lowest Temp, Mean Temp, No of Years in which it Rained, Greatest Quantity of Rain, Prevailing Winds.

The highest temperature during the above period occurred on the 27th and 29th, 1832—therm 79 deg, and the lowest on the 25th and 30th, 1833, and 29th, 1843—therm 23 deg.

Notices to Correspondents.

** The Editors request those who forward fruit to be named to select specimens that fairly represent their average character—not exceptionally fine fruit, nor miserable scribbles, as is frequently the case, for these it is impossible to recognise.

GARDENER'S EXAMINATIONS: M L. Dalziel. Apply to James Richards, Esq., Assistant Secretary, Royal Horticultural Society, South Kensington, W.

INSECTS: W A W. Your very young caterpillar arrived so smashed and shrivelled as to be unrecognisable. We believe it, however, to be that of the Golden-tail Moth, W.

MUSHROOMS: A Constant Subscriber. We could wish for no better material than that you refer to for the formation of a bed, and the certainty of a crop.

NAMES OF PLANTS: P Jenkins. Apples 1, Marks Codlin, 2, Keswick Codlin; 5, Hawthornden; 6, Cox's Orange; 7, Sturmer Pippin, 8, Nonsuch, 10, Blenheim Orange, 11, Tower's Glory; 12, Bridgewater Pippin. Pears 13 and 14, Passo Colmar, 20, Winter Nellis, 21, Marie Louise. Plums 16, Dunmore; 22, apparently the same; 17, Yellow Imperatrice. The others could not be determined with any degree of certainty, many of the specimens being so very small, and out of all character.

NAMES OF PLANTS: Steukler. Clematis Flammula, Jasminum officinale, Rhododendron ferrugineum—S E A Metrosideros floribunda.—H F B R. The Lucerne Dodder, Cuscuta haasiaca, Koch. Please say where found—W M. Pylagellus capensis, Vx. 12 and Vx. 7; Cephalotaxus Fortunei, Vx. 11, 1, 2, 5, and 6; Cephalotaxus drupacea; Torreyia japonica; 4, probably the same, a stunted specimen.—K Carr. The Stanhopca appears to be an intermediate form between S. oculata and S. Warlit. Twenty years ago, it might have been accounted a distinct species.—An old Subscriber.

PASSION FLOWERS: W Earley, and H M. S. Penna. P hybrida floribunda, of gardens, probably a hybrid between P. curulea and P. haidiana alias Kerresina, a very desirable variety for cultivation.

PEAR INSECTS: Anon. The insects on your Pear leaves are the slimy larvae of a black-winged sawfly, Selantria Ethiops, which is produced in the perfect state during the summer. The grubs are easily destroyed with lime water, or by sprinkling the leaves with powdered lime, W.

PREPARING HOME-GROWN TOBACCO FOR FUMIGATING: A Learner. Gather the full grown leaves on a fine day, lay them on each other in a dry, sunny place, about 1 foot thick, constantly turning them every day, and as they get dry, keep putting them a little thicker until quite dry; then put them in a basket or box, pressed quite tight, pick off the best leaves and hang up the stalks. Let them gradually dry, and then chop them up and make use of them. In drying, pick out the leaves as they get brown, and put them by themselves, i.e., after the sap is exhausted, keeping them packed away.

SEEDLING MELON: R Gilbert. The fruit sent was cut too soon, and was, consequently, not quite ripe; it is, no doubt, a good variety. The fruit sent to the Fruit Committee on Tuesday last, was first rate.

THE PINE BEETLE: S W. The Pine destroying beetle, Hylurgus piniperda, see pp. 967 and 992. The following cut we reproduce from p. 740 of our volume for 1846. Fig. 1 shows a round hole through the bark and wood. Fig. 2 shows where

the beetle has eaten the pith upwards, and made its exit at the extremity (b). Fig. 3 represents the natural size of the insect, and Fig. 4 shows the beetle greatly magnified. The mouth is well adapted for gouging out wood, as may be seen at c, which exhibit the two strong jaws, g represent the hairy maxilla, and stout feelers, j being the chain, with similar palpi.

THE LATE MR. THOMPSON. Mr C N. Thompson writes to say that he was not the writer of the notices to which we alluded last week.

COMMUNICATIONS RECEIVED.—Sub.—J. N.—Constant Subscriber.—W. J.—W. C.—W. C. T.—R. A. P.—H. M.—J. R.—A. H.—D. J. N. (next week).—W. S. B.—C. D.—H. M., Enys (we will try it).—R. F.—W. T. (Dalkeith)—A.—C. McD.

PREPARING HOME-GROWN TOBACCO FOR FUMIGATING: A Learner. Gather the full grown leaves on a fine day, lay them on each other in a dry, sunny place, about 1 foot thick, constantly turning them every day, and as they get dry, keep putting them a little thicker until quite dry; then put them in a basket or box, pressed quite tight, pick off the best leaves and hang up the stalks. Let them gradually dry, and then chop them up and make use of them. In drying, pick out the leaves as they get brown, and put them by themselves, i.e., after the sap is exhausted, keeping them packed away.

SEEDLING MELON: R Gilbert. The fruit sent was cut too soon, and was, consequently, not quite ripe; it is, no doubt, a good variety. The fruit sent to the Fruit Committee on Tuesday last, was first rate.

THE PINE BEETLE: S W. The Pine destroying beetle, Hylurgus piniperda, see pp. 967 and 992. The following cut we reproduce from p. 740 of our volume for 1846. Fig. 1 shows a round hole through the bark and wood. Fig. 2 shows where

the beetle has eaten the pith upwards, and made its exit at the extremity (b). Fig. 3 represents the natural size of the insect, and Fig. 4 shows the beetle greatly magnified. The mouth is well adapted for gouging out wood, as may be seen at c, which exhibit the two strong jaws, g represent the hairy maxilla, and stout feelers, j being the chain, with similar palpi.

THE LATE MR. THOMPSON. Mr C N. Thompson writes to say that he was not the writer of the notices to which we alluded last week.

COMMUNICATIONS RECEIVED.—Sub.—J. N.—Constant Subscriber.—W. J.—W. C.—W. C. T.—R. A. P.—H. M.—J. R.—A. H.—D. J. N. (next week).—W. S. B.—C. D.—H. M., Enys (we will try it).—R. F.—W. T. (Dalkeith)—A.—C. McD.

PEAR INSECTS: Anon. The insects on your Pear leaves are the slimy larvae of a black-winged sawfly, Selantria Ethiops, which is produced in the perfect state during the summer. The grubs are easily destroyed with lime water, or by sprinkling the leaves with powdered lime, W.

RAYNBIRD, CALDECOTT, BAWTREE, DOWLING, AND COMPANY (Limited), CORN, SEED, MANURE, and OILCAKE MERCHANTS.

Suttons' Permanent Grass Seeds for All Soils. SUTTON AND SONS are now prepared to execute orders for their MIXTURES OF PERMANENT PASTURE GRASSES and CLOVERS for AUTUMN SOWING.

Look to your Grass Lands. JAMES CARTER AND CO.'S RENOVATING MIXTURE OF GRASSES and CLOVERS SHOULD NOW BE OWNED. This Mixture is specially prepared to suit the various soils.

CARTER'S "PRIZE MEDAL" PASTURE GRASSES for ORNING NEW MEADOWS, mixed to suit all Soils, from 21s. to 2 per acre. Special quotations for quantities on application to JAMES CARTER AND CO., Seed Farmers, 237 and 238, High Street, London, W.C.

869. GREEN FOOD SEEDS. Welsh Winter Vetches, Trifolium incarnatum, Italian Rye-grass, Winter Rye, Winter Oats, Winter Rape. Together with all other Seeds, for present sowing, of best new quality, and at moderate prices.

THE LONDON MANURE COMPANY (ESTABLISHED 1840). Have now ready for delivery, in fine condition, CORN MANURE, for Spring Use, DISSOLVED BONES, for Dressing Pasture Lands, SUPERPHOSPHATES of LIME, PREPARED GUANO, MANGEL and POTATO MANURES.

LAWES' WHEAT MANURE, for AUTUMN SOWING, now ready for delivery. All other Manures and Cakes as per Price List, supplied on the best terms. Apply for prices, &c., to JOHN BENNETT LAWES, 1, Mark Lane, London, E.C.; Dublin, and Shrewsbury.

DAMS'S NITRO-PHOSPHATE or BLOOD MANURE for WHEAT. This Manure, specially prepared for autumn sowing, is rich in Ammonia, Phosphates, and other ingredients required for the healthy growth of Grain Crops. Analysis of Blood and the grain of Wheat show that they are nearly identical in composition.

Wheat Sowing. Smut in Wheat, and the Ravages of the Slug, Grub, and Wireworm. A 6d packet is sufficient for Six Bushels of Seed Wheat.

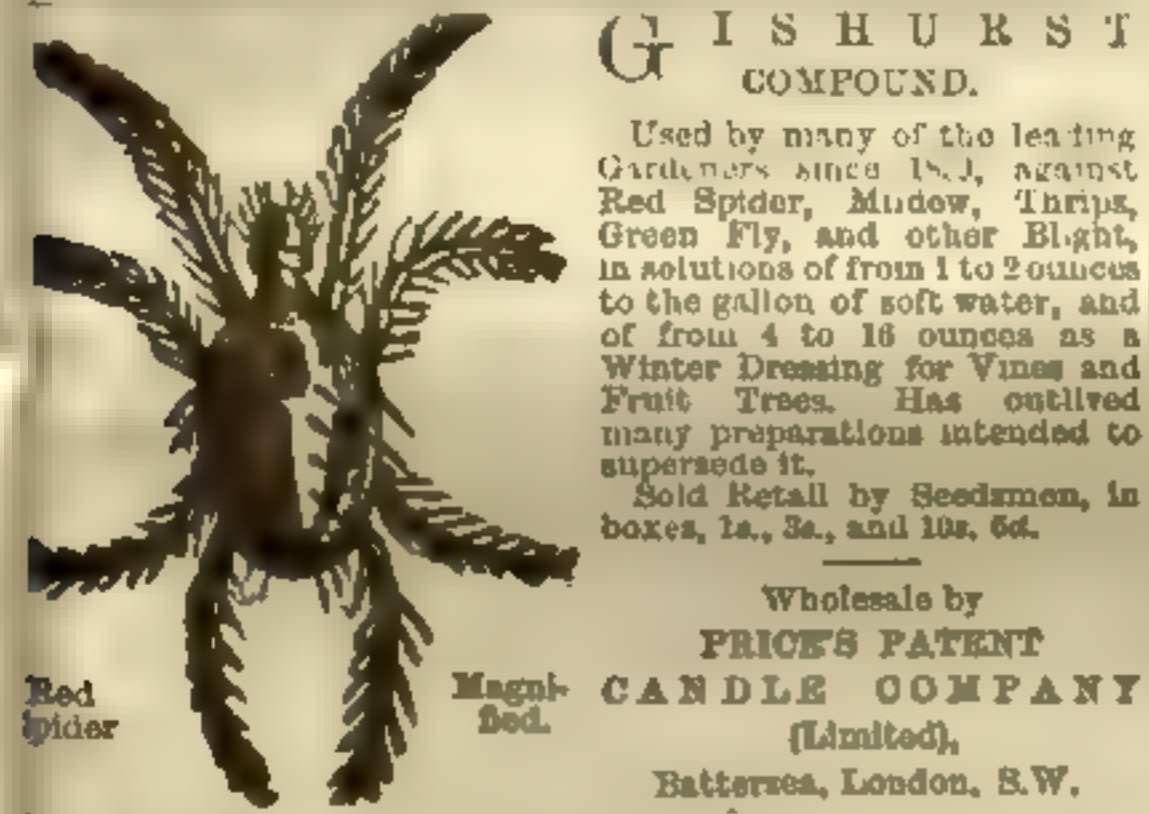

DOWN'S FARMER'S FRIEND for Preventing the Smut in Wheat, and the Ravages of the Slug, Grub, and Wireworm. A 6d packet is sufficient for Six Bushels of Seed Wheat.

The Cheapest and Best Insecticide. DUTY-FREE TOBACCO. HER MAJESTY'S ROYAL LETTERS PATENT, AND BY PERMISSION OF THE HON. BOARD OF CUSTOMS.

DOOLEY'S TOBACCO POWDER, for the Prevention and Destruction of Blight and other Diseases in Plants. Sold by Nurserymen, Seedsmen, and Florists.

GENUINE TOBACCO PAPER, of the finest quality, 10d. per lb., or 8d. per cwt. WILLIAM RUSHFORTH, Nurseryman and Seed Merchant, Leeds.

GISHURST COMPOUND. Used by many of the leading Gardeners since 1833, against Red Spider, Midge, Thrips, Green Fly, and other Blight, in solutions of from 1 to 2 ounces to the gallon of soft water.

FOWLER'S PATENT STEAM PLOUGH and CULTIVATOR may be SEEN at WORK in every agricultural County in England. For particulars apply to JOHN FOWLER AND CO., 71, Cornhill, London, E.C.; and Steam Plough Works, Leeds.

WARNER'S SILICATE of IRON PAINT. A certain PREVENTION against DAMP WALLS, Effectually PRESERVES IRON and WOOD, Is unaffected by extreme HEAT and AMMONIA.

THE LANDS IMPROVEMENT COMPANY. (Incorporated by Special Acts of Parliament.)

Directors: John Clutton, Esq., 9, Whitehall Place, S.W.; Frederick L. Dashwood, Esq., Kirlington Park, Oxford; Henry Farquhar, Esq., (Messrs. Herries, Farquhar & Co.), 16, St. James Street, S.W.

The Company advance money, unlimited in amount, for all purposes of Agricultural Improvement, including the erection of Cottages and Farm Buildings, to the Owners of settled and other Estates, and to the Clergy in respect of their Globe Lands.

THE GENERAL LAND DRAINAGE and IMPROVEMENT COMPANY.

Directors: Thomas Chapman, Esq., F.R.S.; Geo. Thomas Clark, Esq.; John C. Cobbold, Esq.; Henry W. Currie, Esq.

Agricultural Improvements of any kind are executed by the Company, or the outlay thereon repaid to Landowners who prefer executing the work by their own Agents. Tenants may also, by arrangement with their Landlords, procure the execution of such improvements.

THE BIRMINGHAM CATTLE and POULTRY SHOW.

The TWENTY-FIRST GREAT ANNUAL EXHIBITION OF FAT CATTLE, SHEEP, PIGS, DOMESTIC POULTRY, CORN, ROOTS, and IMPLEMENTS, will be held in BINGLEY HALL, on SATURDAY, MONDAY, TUESDAY, WEDNESDAY, and THURSDAY, November 27, 28, 29, and 30, and December 1 and 2, 1869.

SMITHFIELD CLUB FAT CATTLE SHOW. The ANNUAL SHOW of FAT CATTLE, SHEEP, and PIGS, will be held at the AGRICULTURAL HALL, ISLINGTON, on MONDAY afternoon, December 6, and Four following Days.

SMITHFIELD CLUB IMPLEMENT SHOW. AGRICULTURAL HALL, ISLINGTON, DECEMBER 6 to 10. The LAST DAY for receiving APPLICATIONS for SPACE for IMPLEMENTS and MACHINERY, &c., is OCTOBER 1.

MEETINGS FOR THE ENSUING WEEK. Sept. 29: Trial of Steam Ploughs and Cultivators at Peterborough; 30: Northampton Agricultural Show; October 1: Bedfordshire Agricultural Show.

The Agricultural Gazette.

SATURDAY, SEPTEMBER 25, 1869.

MEETINGS FOR THE ENSUING WEEK. Sept. 29: Trial of Steam Ploughs and Cultivators at Peterborough; 30: Northampton Agricultural Show; October 1: Bedfordshire Agricultural Show.

FOOT-AND-MOUTH complaint has not yet exhausted its virulence; on the contrary, it seems to gather fresh force as it advances; the ratio of fatal cases has increased, and the number of severe attacks is enormously in excess of those which occur in the ordinary course of the disease in this country.

There is something yet to be discovered respecting the mode of propagation of epizootic affections. With the cattle plague it was all plain sailing, wherever infected animals or materials which had been in contact with them entered, there the malady appeared, and absolute security was always attained when complete isolation was enforced.

Ten days ago foot-and-mouth disease was reported to exist in nearly 800 places; last week the number was over 1000, and this week it has reached nearly 2000. The following list of infected counties will serve to convey an idea of the extent of surface over which the affection has spread:—

ENGLAND.—Metropolis, Berks, Bucks, Cambridge, Cheshire, Cumberland, Derby, Durham, Essex, Hants, Herts, Kent, Lancashire, Lincoln (Lindsey), Middlesex, Norfolk, Northampton, Northumberland, Nottingham, Oxford, Salop, Stafford, Suffolk, Surrey,

Sussex, Warwick, Worcester, and the East, West, and North Ridings of Yorkshire, SCOTLAND.—Argyll, Berwick, Clackmannan, Edinburgh, Haddington, Lanark.

On the Continent the state of affairs is not more satisfactory; from the Black Sea to the Atlantic foot-and-mouth disease prevails among cattle, sheep, and pigs, and cargoes of infected animals are day by day landed in this country.

Sheep suffering from the disease have been detained at Newcastle and other outports, and on Tuesday last a cargo of nearly 100 sheep arrived in London from Hamburg, and on inspection it was found that 45 of the animals were affected with foot-and-mouth disease; they were accordingly detained; the remainder of the cargo, however, being apparently healthy, was sent to the metropolitan market to be distributed over the country, and add to the already numerous centres of infection.

The same course has been adopted at other ports, with the natural result of spreading the disease; but for the future the danger will be effectually met by the detention of the entire cargo of sheep in every instance when any of them are affected with oozema.

This arrangement is imperatively called for under the present circumstances, and its adoption at all the ports may be expected to produce good results. Under the provisions of the Contagious Diseases (Animals) Act, and the General Order of August 10, cargoes of cattle must be dealt with in an equally summary manner in the event of any of them being affected with a contagious disease; it may, therefore, be presumed that no more infected foreign animals will be allowed to pass inland.

More stringent measures are, in the next place, required in this country before we shall succeed in arresting the disease which has advanced up to the present moment almost without let or hindrance. We do not advocate a recourse to the severity of the cattle plague orders; but strict isolation, and a free use of disinfectants, are essential parts of an effective system of prevention.

It cannot be assumed with any show of reason that the restrictions at present in force are sufficient to meet the emergency; with hundreds of diseased cattle grazing in commons, and in practically open pastures, it is impossible to arrest the spread of infection, and even when the disease is known to exist among cattle on a farm, there is no provision which empowers the local authority to prevent the removal of the apparently healthy animals from the premises to a neighbouring fair or market.

The disease, both in reference to its severity and extent exists in an exceptional form, and special provisions are needed for its eradication. Authorities charged with the carrying out of the Act, working in earnest, will find that they have no light labour to perform, and when they manifest an intention to act vigorously it is beyond everything desirable that they should not be crippled by want of power to meet every difficulty as it arises.

THERE is a peculiar district on the mountain limestone formation, in Staffordshire and Derbyshire, which is too elevated for corn or arable cultivation in general. The smooth outline of the hills, with their grass-covered surface, gives them a strong resemblance to the downs in the south of England. But the limestone soil is much richer than the thin covering of the chalk downs, the climate is cooler, and the rainfall is 50 per cent. greater. We have been much struck with the comparative character and quality of the herbage on the two sites. The natural poverty of the one and richness of the other are not more remarkable than the fact that the Grass of the latter, under exhaustive treatment, assumes the same character as that which covers the former. Most of our readers are familiar with the look of the herbage common to the tract referred to—the Epsom and Brighton Downs, and to the North and South Downs generally. It is sweet herbage for sheep, and is as unproductive as it looks, nor can it be made otherwise by any system of cultivation ever yet attempted. But the better soils of the limestone are clothed with rich Grass, that feeds heavy Shorthorned cattle, whose bulky frames, seen on the horizon, have a singular appearance when the animals stand on the topmost edge of the great round hills to catch the air in hot weather. The few sheep which accompany the cattle in this rich but elevated district are, like them, natives of the plain. The condition of this pasturage is easily

maintained by restoring to the soil the elements removed in the cheese, butter, bone and flesh which are yearly sold to the more populous districts which require them: but, as we said before, the condition is lost when this restoration is neglected,—the pasturage then becomes poor, the best Grasses disappear, and the land, instead of retaining the succulent early and cultivated varieties which had been sown, is taken possession of by plants peculiar to the chalk and limestone, several of which are not Grasses, and are a month later in spring than those commonly cultivated.

It is observed that pastures from which hay is sold lose their herbage first; the process is much slower on the cheese farms, because pigs are kept to eat the whey, and a partial restoration takes place in the corn purchased to fatten them. The hill farms are occasionally farmed, or *spoiled*, by those who occupy land elsewhere, and hire for their convenience several "gates" of hill pasturage,—a "gate," being summer grazing for one ox, or for six sheep. There are, in short, many examples of farms where no proper or complete system is carried out, and the exhaustion of the soil, as shown by the injury done to the herbage, is found to be in exact relation to the management. Exhaustion, sooner or later, is inevitable, except under very high farming, which includes generally cattle feeding with cake and corn, and large purchases of manures. But the period is, of course, dependent also on the original quality of the land and subsoil.

We have often been struck by the appearance of two adjoining pastures, presenting the greatest possible contrast, though on land of similar original quality. Yet it seems that the Clovers, &c., are not banished from the exhausted soil, nor are they destroyed; they exist, though without vigour, and are present, though in portions too minute to be observed; and they can be made to appear suddenly (that is, in a single season), by sowing bones. Seed alone would be thrown away, because the conditions of growth are wanting, but the constituents contained in bones supply those conditions; and the plant, which had never been quite destroyed, immediately becomes luxuriant.

Bones have been systematically used in English farming for half a century, and the singular phenomenon described is familiar to agriculturists, but the lesson taught by it has yet to be made familiar, for the practice of modern farming has perhaps led us astray from simple truths; we are apt to overlook the fact that modern farming takes from the soil more rapidly than farming did of old, and that it only restores to the soil, clumsily and inadequately, by force of purchase.

Our great crops are obtained at great cost; we work the land harder than we once did; we plough it deeper and crop it faster—and we feed it better. Unless it be so fed, our deep cultivation and other operations do not pay. Even the richest land does not long bear our rotations of crops, without being fed by manures obtained directly or indirectly, outside the farm. The German Professor was not far wrong when he said to his pupils "manure is the soul of agriculture." It is almost the one thing needful to the English farmer: all his other processes would fail without it.

Some persons have declared that the earth is inexhaustible. Let them attempt to farm without manures; meaning thereby all the fertilisers. The truth is, plants appropriate the substance of the soil, which is removed with them. The land has no power of continual self-restoration, and therefore, farm it as we will, by plough or by spade, we must constantly manure it. The expenditure for manures is an enormous and apparently an increasing item in English farming. Their cost controls the cost of food. If guano, superphosphates, and cakes were one-half their present price, there would shortly be more English and less foreign Wheat at market. For whether our fields may be properly called exhausted or not, there is no question of the effect of the extra feeding they would get. Need we point out that manures are more wanted because the land is less idle, and they get scarce because they are wasted? Plants are grown for man and stock; man is the great appropriator. Where does that portion of the substance of the earth which is consumed by man go to?

How to rouse the farmers of England to a sense of their wants, their privileges, and their true position, is a problem of no small difficulty. Isolated as they of necessity must be, it is by no

means easy for them to assemble for mutual counsel: and it has been hitherto impossible to reach them through books or the Press. The great body of farmers know and care little for those questions which are discussed by its leaders, although these topics have a vital interest to every occupier of land. This inertness is being gradually broken down by education and the extension of agricultural associations, but it is still to be regarded as one of the greatest impediments to their progress. It is in fostering brotherly feeling or the sense of professional kinship that Chambers of Agriculture should find their greatest work. In this the usefulness of professional associations in a great measure lies, the body caring for, and, if necessary, protecting its members. This element of usefulness should be kept steadily in view by our Chambers of Agriculture, and as the season for their meetings advances it is advisable to call attention to the value of *united action*. When an important subject is discussed, agriculturists should endeavour to be present, on the principle that the larger the meeting the more influential will it prove. Too often have we heard a farmer say that he could read all about the meeting afterwards in the newspapers, forgetting that his personal influence in backing up the opinions of the Chamber was thereby sacrificed. To say that as much is learnt by perusing the report of the speeches at home as by hearing them delivered, indicates a want of appreciation of the main object of a public meeting. Why, we would ask, is so little progress made in the direction of secure tenure for the occupier of land? How is it that the question of game preserving continues in so unsatisfactory a condition, and why is not the necessity of better cottage accommodation more prominently brought before landowners? Free discussion, and the expression of definite opinions, supported by weighty arguments, would do much towards the settlement of these and other important topics, and we long for the day when tenant-farmers will interest themselves in the endeavours which are being made in other localities besides their own, for the advancement of a common interest. Agriculture has advanced, but until more attention is bestowed by farmers themselves on such subjects as have been named, our present knowledge cannot be fully developed.

With reference to the first question—the tenure of land—how is it possible that the resources of the soil can be fully brought out by yearly tenancies? It is not in the nature of things that it should. Further, when we remember the monopoly of land which exists it is at once clear that the landlord has the advantage in what is so often incorrectly stated to be "an equal contract between man and man." Let the tenant-farmers of England, however, awake from their stupor, and demand a better, a more secure, tenure; a tenure which will enable them to do justice to themselves and their country by raising produce under the most favourable circumstances. Then they will be backed by a strong public opinion, and the landlords will give way in a matter which can be shown to be for their own advantage. Our system of large estates becomes absolutely vicious when it acts as a drag upon the production of food for the people, and the only means of making it consistent with modern notions is to secure the tenant in quiet possession. It is positively sad to find the yearly tenancy and "good feeling" theory maintained by men of agricultural position; and we hold that it is simply absurd to talk of improving land as it ought to be improved, without the inducement of a long lease and security for capital invested. When will the majority of farmers see this question in the same liberal light in which it has been regarded and presented by, let us say, JOHN GREY and WREN HOSKYN'S?—to choose our representative men from at once the living and the dead. It may be long before the views of such men are generally adopted, but they are the growing opinions of the day. The goal of the many, not the pleasure of the few—this is the invincible weapon to be used. In conclusion, we once more lament the want of that lively interest in these matters on the part of farmers themselves. Their contentment, instead of being looked upon as indicative of a low state of vitality, is used as evidence that no reform is required. Farming associations are yet young, and if their active members can succeed in showing their less enlightened and worse educated brethren the importance of personal attendance at, if not of

actual participation in, agricultural discussions, much good will be effected.

—The price of Wheat has declined at Market and generally throughout the country, from 1s. 6d. per quarter during the week. Barley, excepting malting qualities, and other spring grain and pulses, also slightly lower. Maize, however, on which horses are now largely fed, is 1s per quarter dearer. 51s. per quarter is the highest price quoted for new English Wheat, and 56s. per quarter for foreign. —The beef trade has not recovered recent small decline in price, except for very choice English qualities; but prime mutton is now at 5s. 10d. per 8lb. —The agricultural seed trade has been almost limited to Trifolium, Rye-grass, and Tares, for which there has been a somewhat demand. —The English wool trade has changed little, and inferior foreign is no dearer; but qualities of Australian and New Zealand grown Merino have advanced 1d. to 1½d. per lb., in consequence Messrs. BRADBURY & COOK say, of the manufacturers becoming "keen competitors."

—The returns of acreage of our various crops, sent in to the statistical department of Board of Trade, have just been published. It has been practicable to obtain from all parts of England and Wales the information necessary for their completion for this year until the present date. With a view of making known as early as possible the results exhibited by the returns, the following particulars are furnished in anticipation of the return in detail:—

EXTENT (IN ACRES) OF LAND IN GREAT BRITAIN USED FOR THE CULTIVATION OF THE FOLLOWING CROPS IN 1867, COMPARED WITH THE EXTENT IN 1866 AND 1865.				
Year	Wheat	Barley	Oats	Per cent.
1867	3,357,876	2,251,164	1,100,487	80
1866	3,652,125	2,151,114	2,757,673	80
1865	3,696,030	2,256,177	2,785,054	80
INCREASE (+) OR DECREASE (-).				
1867 over 1866	+42,905	+104,853	+23,001	+1
1866 over 1865	-12 per cent.	-10 per cent.	-10 per cent.	-10
1867 over 1865	+327,144	-205,013	+31,527	+1
1867 over 1866	-97 per cent.	-01 per cent.	-13 per cent.	-19
TOTAL NUMBER OF LIVE STOCK IN GREAT BRITAIN ON JUNE 25, 1867, COMPARED WITH THE NUMBER ON JUNE 25, 1866 AND JUNE 25, 1865.				
Year	Cattle	Sheep	Pigs	Per cent.
1867	4,913,934	23,911,111	2,000,000	20
1866	5,123,981	23,711,316	2,000,000	20
1865	5,313,788	23,589,954	2,000,000	20
INCREASE (+) OR DECREASE (-).				
1867 over 1866	-107,047	-1,137,412	-	-3
1866 over 1865	-200,000	-370,000	-	-10
1867 over 1865	+323,554	+601,853	-	+10
1867 over 1866	6.5 per cent.	2.9 per cent.	-	34

The acreage of land in Great Britain under the various crops in 1867, against 64,433 in 1866, and 65,187 in 1865. There is this year a considerable increase in the acreage of all the corn crops over 1866; but a considerable and surprising decrease in the number of live stock—107,047 cattle, 1,130,412 sheep, and 2,000,000 pigs fewer, in 1867, than in the previous year.

—The Leeds Mercury publishes the reports of a large number of its Yorkshire correspondents on the character of the past harvest, and comes to the conclusion that notwithstanding the variety of soil and cultivation, all accounts agree, not only that the crop is not equal to an average of the last four or five years, but that it is likely to be much below an unusually favourable yield of last year. Whilst it is an average crop, Oats are a deficient yield. The weather has been favourable for the root crops, there is every reason to anticipate an abundant food and fodder for cattle.

—The Contagious Diseases (Animals) Act is perfectly understood, at present, by many persons owners of stock throughout the country. One of the provisions in the Act requires that any farmer or owner of stock shall give notice of the existence of any contagious disease in his flock or herd to the officers appointed by the proper local authorities. A case was brought before the magistrates at Oldham, on Monday, when a farmer was convicted for not giving notice of an outbreak of foot-and-mouth disease among his cows. The magistrates, however, only inflicted a nominal fine, as this was the first case which had been brought before them. The full penalty is 20l.

—A passenger by the boat from Bremen to London via the Thames on Tuesday afternoon, after a most uncomfortable and stormy passage, lasting more than four days, was that of over 30 or 40 beasts and 100 sheep. Bremen 8 or 10 oxen and 30 sheep died during the passage, and were thrown overboard. The water, food, and shelter killed so many, that probably 30 to 50 per cent. of the value of the animals was lost. The steamer had left in a storm, and the officers were as malignant as the passengers in their inevitable cruelty to which the shipping of such animals thus consigned them.

—The Bingley Hall Company have issued a prize list for the next Birmingham show of live stock, and roots, from Nov. 27 to Dec. 2, 1867. The prizes are: The Earl of Coventry, 25l. cup; the Earl of Aylesford, 15l. cup; the Mayor of Birmingham, 10l. cup; the Hotel and Innkeepers, 25 guineas. There are, besides, four extra prizes and two gold medals for the best male, the other for the best female, in the cattle classes. The money prizes consist of 120l. for each of the three English breeds of cattle, viz., Herefords, Shorthorns, and Devons. Longhorns are honoured with 30l. in four prizes; Scots, seven prizes; Welsh, 20l. in two prizes; other breeds and cross-bred animals, 60l. in six prizes, extra classes, 10l. in two prizes. For sheep the Linen and Woollen Drapers' four extra prizes

107. each—10 gs. by Mr. Bromley-Davenport, M.P.; 10 gs. by Mr. Newdegate, M.P.; and 10 gs. by Messrs. Mapplebeck and Lowe. The money prizes are 30l., in three prizes, for each of the six recognised breeds, viz., Leicesters, Lincolns, Cotswolds, Southdowns, Shropshire, and Oxfordshires. Fat pigs and breeding pigs have also several appropriate prizes besides silver medals. Full particulars, however, may be had by applying to the Secretary, Mr. Lytball, New Street. The entries for stock close Nov. 1, and for implements, &c., before Nov. 11.

The Staffordshire Agricultural Society held its annual meeting at Burton-on-Trent on Thursday last, and, under the good management of its secretary and active authorities, the show was in every way successful. There has been some discussion of late about the desirability of a county show having two days for stock. When, however, the expense of shedding and horse-boxes is considered, it is doubtful whether it is advisable to incur it. This matter is just a question of the cost being recouped by the attendance of visitors. So far as agricultural instruction goes, one day is just as good for farmers to make comparisons as 20 days would be. Staffordshire has only one day for stock, while Warwickshire has two days, yet the Staffordshire show is by far the more instructive exhibition of the two. The question, however, now is, whether both of them, and several others in the midland counties, are now required. Would it not be better for them to amalgamate, and form an influential Midland Counties Association, and hold a week's show at each principal town once in ten years? If provincial agricultural shows are now required, it is obvious that this plan would be more in accordance with the spirit of the present time. Why not form a Midland Counties Agricultural Association, in imitation of the Bath and West of England and Southern Counties Society? Staffordshire, Warwickshire, Worcestershire, Leicestershire, Derbyshire, Shropshire, and Cheshire, would form a field for working in that would be able to yield an exhibition worthy of the Midland Counties, with Birmingham as its centre, as well as one worth going to see by any agriculturist in the county. At present, however, these shows are too numerous to do much good to their own county, and there is nothing for strangers to see when they go. There have been about a dozen of these shows this week and last, the prize animals at many of which have been the same. The Staffordshire meeting, however, has been successful, as county shows now go. The cattle, we learn, from a report in the *Lirmingham Gazette*, were good.

The Shorthorn bulls include some well bred and useful animals, the 1st prize being awarded to a roan, 2 years and 9 months old, bred by Mr. E. Lytball. The 2d prize animal, "Theodore," the property of Mr. Speed, although seven months younger than his more successful rival, possesses great frame, and all the attributes of a Shorthorn male. The Duke of Devonshire obtains a high commendation for a fine roan, of immense substance, which is scarcely inferior to his two successful rivals. In this class, Mr. Hardy, of Dunstall Hall, Burton, exhibited a well-grown animal, of great size, but somewhat unshapely. A roan bull, the property of the Marquis of Annesley, although passed over by the judges, excited the attention of the practical farmers. The yearling bulls were of a serviceable character—Mr. Willoughby Wood's roan, which took the 1st prize, showing good breeding; Mr. Hill, of Wilm Hall, deservedly received a high commendation for a rich roan of great promise. The bull calves were of a variable character. Mr. Willoughby Wood's 1st prize animal being closely run by Mr. Hildon's "Nimrod," but as there was four months' difference in the age, it must remain for next year to decide which is the better of the two. In this class there are two fine roans, one the property of Lady Des Vaux, and the other of Mr. Wakefield, which are promising animals, and will doubtless be heard of on some future occasion. The ewe classes were good; indeed, it would be almost impossible to get together a collection of every stock in any county in England which could be shown at Burton. They were all in store condition, the ewe classes were of the highest quality, and the Shorthorn element was the predominant feature. There were only five entries in the class for fat cattle. There was but a single show of sheep, but, as usual, the Shropshires pre-eminently. Mr. Keeling, although coming off with a second award, showing some fine animals. In the long-wooled class, Mr. J. Busnack took the 1st prize with an improved Lincoln, in the old and shagging classes, and his pen of shagging ewes, of the same breed, were very fine. Indeed, all the 1st prizes in the long-wooled classes were taken by Mr. Johnson. As to the pigs, all that can be said is that they were of the porcine race, and the 1st and 2d prizes for pigs of a small breed were awarded to two of the largest animals in the yard. In contrast to this objectionable practice, a diminutive little bear, 10 months old, was exhibited in the class for boars of a large breed by Mr. Bantock, of Wolverhampton. The majority of the pigs were white, and Tamworth, only two or three were of Berkshire, and these of inferior quality. The ewes were of not more than 100 lbs. weight, and the weighing was anything but satisfactory.

Stearns ploughs and cultivators are to have an important trial at Peterborough, on Wednesday and Thursday next. We are informed that large and small sets will be put in competition, and also that Messrs. AMES & BARFORD will exhibit a new self-moving anchor, which is described as a great advantage in working the well-known round-about system of Mr. SMITH, Woolston.

The Canbridgeshire Society held its annual meeting on Wednesday and Thursday, this being the first time of its show extending beyond one day. In a brief report the *Stamford Mercury* says:—"All the classes of the horse show were well supported, and whether for agricultural, hunting, or road purposes, the animals exhibited were, on the whole, of a high character. Cattle were a good display, although numerically we have seen better shows in the Eastern Counties. Sheep were not very numerous, and pigs were decidedly, as regards numbers, at a discount." The first prize for Shorthorn bulls over two years was awarded to Mr. Pawlett, 2nd to Lady Pigot; under two years old—1st, ditto; 2nd, Mr. J. How. In heifers Lady Pigot took the first prize.

OUR LIVE STOCK.

MR. THORNTON has given notice that the sale of Mr. E. J. Schollick's Shorthorns will take place on October 5, instead of the 1st, as previously advertised.

An important sale is announced by Mr. Stafford to take place on October 19, at the Prebendal Farms, Aylesbury. Mr. J. K. Fowler has long been known as a breeder of excellent stock, and we have every hope that his coming sale will be well attended, and that the quality of the 40 Shorthorns offered for sale will be appreciated by the public. Catalogues are not yet issued. We may, however, state that the stock is of Fawsley origin, with Kirklevington crosses, and that amongst them will be found some very good ones descended from *Catalpa, Chamer, Cold Cream, Walnut, Fantail, Seraphina*, and other favourite sorts. The sire now in use is *MARDICANTE*, bred by Mr. Adkins, of Milcote.

Mr. Duckham will hold his first sale of purchased Hereford cattle on October 21, the day after the show of the Herefordshire Agricultural Society and Great October Fair. The event is looked forward to with interest, and we are glad to learn that the entry is already exceedingly satisfactory. One eminent breeder has pledged 10 head of cattle at Mr. Duckham's disposal for his first periodical sale.

The herd of Mr. G. R. Barclay was sold at Keavil, Dunfermline, on Tuesday last, by Mr. Thornton. The result was, on the whole, satisfactory, although on account of the advanced age of some of the cows they brought less money than was originally given for them. Thus, *Seraphina 13th*, purchased at one time for 240 gs., only realised 110 gs., and *Anne of Lancaster*, once sold for 150 gs., was bought for 54 gs. *Fan-fan*, a daughter of *Kath* and *SIR JAMES*, became the property of Mr. Whyte, of Clinterty, for 166 gs. Lord Sudeley was the purchaser of *Seraphina 13th*, and her two daughters, *Seraphina Carissima*, and *Booth's Seraphina*. Nineteen cows and heifers realised an average of 59l. 6s., and eight bulls made 57l. 15s. each. The average of the 27 head disposed of was 58l. 10s. 9d. A large number of cattle breeders and farmers were present from all parts of the kingdom, and the whole of the stock was disposed of without reserve, Mr. Barclay having sold his estate. The following is a list of the names of the animals sold, of the purchasers, and the prices made:—

Table with columns: Name of Animal, Price, Name of Purchaser. Includes entries for Cows and Heifers (e.g., Annie Laurie, Seraphina 13th) and Bulls (e.g., Baron Booth, Heifer of Englefield).

Sheep.—At Derby, in the Shropshire Sheep Class, Mr. Willoughby Wood secured the 1st place for rams, in competition with Mr. Baker's 2-shear sheep, which has been so frequently victorious this season. In the shearing class Mr. Baker was 1st, and Mr. Wood was 2d. In the ewe class Mr. Rose took the 1st prize, with a pen of very fat sheep, thought by some judges deficient in "character," and not quite so good as Mr. Baker's sheep, which were placed 2d. Mr. Wood's ewes were scarcely fat enough to attract the judge's eye, and this partiality for fat in judging a class of animals intended for breeding purposes gave rise to some little discontent. Everyone speaks or writes against this tendency to award prizes for obesity, and yet the evil does not decrease, and hence many of our best breeders will not exhibit. A well-known sheep-breeder writes to us as follows:—"I consider it buying a prize too dear to spoil one's best breeding animals to obtain it."

While speaking of Shropshire successes, we may mention that Lord Chesham took the 1st prize for yearling rams and for yearling ewes at the International Exhibition at Altona, Königstrasse. His lordship sold one ram for 40 gs., and three ewes for 10 gs. each during the show. This is very satisfactory, especially when it is remembered that the Latimer flock has been established but a comparatively short time.

RECENT RAM SALES AND LETTINGS.

Leicesters.—Mr. W. Torr, of Aylesby Manor, held his annual meeting on September 1, according to custom. This has usually been a private letting, but on this occasion some of Mr. Torr's views and the prices he made have been promulgated. We accordingly learn that—"Mr. Torr had reduced the number of his rams to accommodate the lessening demand for pure blood, but out of the 60 shown 25 or 30 finer specimens of Leicester sheep were never exhibited, and

these were let at remunerative prices. Some of those shown were the progenitors of successful competitors at various exhibitions of agricultural societies, and one of them, Quid, was the sire of the winner at Manchester. Major Taylor took one sheep at 20 gs. and another at 10 gs. One was let by auction (by Mr. Thornton) to Mr. Maw at 20 gs., the opponent being Mr. Harrison, who then hired one at 12 gs. The highest price made was 35 gs., and the lowest letting was at 10 gs. The average [of seven was 20 gs., and the general average was about 14 gs. The total number let on the day was 29, and there were also applications by letter."—The large sales in Scotland took place last week. At Edinburgh on Thursday week there was a good show. The highest price obtained during the day was 33l., for the animal belonging to Mr. Simson, Blainslie, which was commended at the show on Wednesday. The purchase was made for Mr. Balfour, of Whittingham. The ram, also belonging to Mr. Simson, placed 1st on Wednesday, and 1st at the Highland Society's show as a Border Leicester shearing tup, was purchased by Mr. Hunter, Dipple, for 36l.; 35l. was given for a ram belonging to Mr. Smith, Castlemains. The Glasgow prize ram of Mr. Smith, Stevenson Mains, was sold for 20l. Mr. Watson, Asperton, sent 50 the highest price made was 19l., and the average 7l. 16s. The Duke of Buccleuch sent 30 the highest price was 22l., and the average 7l. 10s. Mr. Smith, Castlemains, sent 38, and, with the price above named, his average was 8l. 15s. Mr. Smith, of Stevenson Mains, sent 70, and averaged 6l. 8s. 3d.—Mr. Sanson sent 38, and averaged 8l. 3s. 6d.—At Kelso last week the great annual sale of Leicester and half-bred rams, under the auspices of the Border Union Society, commenced in the Inch Park. There was a large attendance, including proprietors and flockmasters from distant parts of the United Kingdom, and also from Canada and Australia. There were four rings placed at various points in the park, three being for the sale of Leicester sheep, and one for the sale of half-bred rams. There were in all 51 lots entered for sale—54 of Leicesters, and 10 of half-breds—representing a grand total of 1735, last year the number was 1813, so that there has been a decrease this year of 48. The following are the principal prices made:—The lot belonging to Mr. Foster, Ellingham, sold well. One was sold at 50l. to Mr. Calder, Oxenrig; one at 40l. to Mr. Simson, Blainslie; one at 37l. to Mr. Smith, Stephouse; and one at 26l. to Mr. Angus, Whitefield. Mr. Robertson sold the ram that was highly commended at the show at Coldstream on the previous day at 24l., while the tup that got the 2d prize, which belonged to another party, only brought 11l. The highest-priced ram in the lot of Mr. Bell, Linton, was purchased by Mr. Bell, Fans, at 20l. Mr. Dunlop, Nilston Ridge, sold his highest-priced ram to Mr. Lumsden, Northumberland, at 31l.; and another to Mr. Foster, Curradon, at 24l. In the Rev. Mr. Bosanquet's lot, the ram which brought the highest price was sold to Lord Penrhyn at 30l.; another was sold to Mr. Robeson, Springwell, at 26l. Mr. Wood, Thornborough, bought the highest-priced animal in the lot of Messrs. Black, Coldstream, at 22l. Mr. Torrance, Sisterpath, sold his highest to Mr. Inglis, Logan Bank, at 41l.; and one to the Marquis of Tweeddale at 30l. The Mellenden sheep, which have long held a leading place at this sale, came on for auction about six o'clock, when the ring was surrounded by a large company. The highest price obtained was 109l., one of the highest figures ever obtained at this sale. It was purchased by Mr. Collingwood, Lincolnshire. Mr. Bruce, Aberdeen, purchased one at 40l.; Mr. Robertson, Harperton, one at 36l.; Mr. Torrance, Sisterpath, one at 31l.; Mr. Foster, Ellingham, one at 26l., and one at 21l. The average was the highest obtained at this sale. Lord Polworth's are generally regarded with great interest by flockmasters, and the ring is generally crowded when the sale is going on. On this occasion, however, they were about the last on the list, when a great number of farmers had left, and hence the average and highest price were not so high as last year. The top price was 42l., purchased by Mr. Elliot, Hollybush; Mr. Borthwick, Gowbog, purchased one at 33l.; Mr. Scott, Buckholm, one at 31l.; and Mr. Thomson, Rutherford, one at 20l. The following is a list of some of the highest and average prices obtained:—

Table with columns: Lots, Owners, Highest, Average. Lists various lots and owners such as Messrs. Dinning, Nilston Ridge; Mr. Hunter, Ellingham; Mr. Bosanquet, Rock, etc.

Border Leicesters.—At Mr. Barclay's sale, at Keavil, on Tuesday, some of his sheep were disposed of. The tups and tup lambs met with a ready sale, at from 53s. to 80s. each, and two were sold to Mr. Featherington for 52 10s. each. The females made, the ewes, from 63s. to 78s., and 17 gimmers (theaves) became the property of the Hon. D. B. Ogilvy, at from 52. to 82 5s. each. Southdowns.—Lord Sondes' fourth annual sale took

place on Wednesday, September 8, at Elmham Park, Norfolk. 16 shearing rams averaged 15*l.* 1*s.* 3*d.*, six 2-shear ditto averaged 16*l.* 9*s.* The highest shearing ram was let to J. J. Colman, Esq., for 36*g.*s.; highest 2 shear to Colonel Tomline, M.P., 33*g.*s. Some ewes and wether lambs were also let, 110 shearing ewes, 37*l.* 7*s.* 7*d.*, average 16*s.* 6*d.*, 50 full-mouthed ewes, 113*l.*, average 57*s.* 3*d.*; 90 ewe lambs, 116*l.* 15*s.*, average 32*s.* 7*d.*, 150 wether lambs, 257*l.* 5*s.*, average 34*s.* 3*d.* The highest pen of shearing ewes realised 6*l.* 16*s.* 6*d.*; ditto, full-mouthed ewes, 3*l.* 12*s.*; ditto, ditto, ewe lambs, 1*l.* 13*s.* 6*d.*; ditto, wether lambs, 1*l.* 18*s.*

Shropshires—Mr. Charles Byrd, of Littlewood, near Stafford, head, on Monday (Sept. 6), a sale of the produce of his flock, which was started from good stock about 15 years ago. Amongst the prices given for rams were the following:—No. 1, Mr. Branburne, 60*g.*s.; No. 2, Mr. Henry Smith, 44*g.*s.; No. 3, Mr. Matthews, 35*g.*s.; No. 6, Mr. Fetherstone, 42*g.*s.; No. 7 (to let), Mr. Ford, 20*g.*s.; the others ranged from 7 to 12*g.*s. each. The ewes were low in condition, and realised from 16*s.* to 51*s.* each.—Mr. Walker, of Odstone, Leicestershire, has been working up a flock of this breed for about 20 years, and he recently held his first annual sale. Young Duke, a 4-shear, by Duke of Kent, which was let till November 1, with the right of sending 10 ewes, for Earl Howe, at 18*l.* 10*s.* Then followed 16 shearlings, all by Young Duke, with many good strains on the dam's side. Mr. Swann, Odstone, gave 17*g.*s. for one; Earl Howe, 16*g.*s.; Mr. T. Drackley, 15*g.*s.; Mr. J. Bonnett, Ratby, 14*g.*s.; Mr. M. Drufford, 17*g.*s.; Mr. T. Earrp, 12*g.*s.; Mr. Neal, Bilston, 10*g.*s.; the lowest price being 8*g.*s.; the average of the 16 shearlings was within a fraction of 12*l.* each.—At Shrewsbury, on Thursday week, Mr. Preece held his second large sale. Amongst the lots were 40 belonging to Messrs. Crane, one of which was let at 51*g.*s., another at 30*g.*s., three others at 20*g.*s. each, and several sold at 15*g.*s.—Mrs. P. W. Bowen's rams ranged from 9 to 23*g.*s. each.—A shearing of Mr. Mansell's was sold to Lord Penrhyn for 30*g.*s.; and several of Lord W. de Bruce's ran from 9 to 16*g.*s. each.—Mr. Henry Smith showed 20 sheep, some of which were let at 20*g.*s.—Mr. T. Horton exhibited very successfully, No. 1 being let at 20*g.*s., No. 3 at 19*g.*s., No. 4 at 24*g.*s., No. 5 at 24*g.*s., and the others making from 17 down to 12*g.*s. each.—Mr. Joseph Crane's 14 rams made an average of about 13*g.*s. each.

Coltsvolds—Mr. W. Hower had a sale last week, in consequence of his retiring from business. There were 1 aged rams which sold as follows—24*g.*s., purchased by Mr. Smith; 25*g.*s., purchased by Mr. Swanneck; 12*g.*s., by Mr. Holt; and 11*g.*s., by Mr. B. Browne, being an average of 17*l.* 4*s.* 7*d.* The ram lambs were next offered, and prices ranging from 25*g.*s. down to 4*l.* 10*s.* were realised, Mr. Timms purchasing the highest priced animal. The average was 5*l.* 10*s.* 5*d.* Mr. Canning, of the firm of Canning & Russell, attended, and purchased 10 of the highest priced theaves, at 6*l.* 10*s.* each, for exportation to New Zealand; and Mr. Guerrier, of London, purchased 15 ewes for Prussia. Some ewes were also sold at high prices. They were in lots of five each. The first lot produced 6*l.* per head, and other lots realised from 5*l.* 15*s.* to 2*l.* 12*s.* 6*d.*, which was the lowest. The first pen of theaves brought 6*l.* 10*s.* each, and some ranging down to 2*l.* 10*s.* The average price for ewes was 3*l.* 12*s.* 6*d.*, and for theaves 3*l.* 16*s.* 9*d.*

Lincolns—Mr. J. W. Kirkham held his annual sale at Cadsby Hall on Thursday week. The rams are descended from the Biscathorpe and old Hagnaby flocks. The 31 rams realised 115*l.* 5*s.* 6*d.*, being an average of 13*l.* 8*s.* each. Nos. 1, 2, 4, and 8 fetched the highest prices, and were bought as follows—No. 1, by Mr. Wright, of Wold Newton, 21*l.*; No. 2, Mr. Williams, of Ashby, 22*l.* 1*s.*; No. 4, Mr. Kirkham, Hundleby, 21*l.*; No. 8, Mr. Kirby, Marsh Chaysal, 19*l.* 19*s.*—Mr. Hles, of Wold Newton, had 24 sold at Causton last week. No. 4 was bought by Mr. C. Nainby at 13*l.*; No. 5 by Mr. Empson at 20*l.* Mr. C. Wood bought No. 6 at 10*l.* 10*s.*, and No. 12 at 11*l.* 10*s.* Mr. W. Hudson bought No. 14 at 15*l.*, and No. 19 at 17*l.* 10*s.* No. 15 was bought by Mr. Gooseman at 15*l.*; No. 18 by Mr. Rannard at 12*l.* 10*s.*, and No. 13 by Mr. Dixon at 10*l.* 10*s.* The average of the 24 rams was 10*l.* 12*s.* 6*d.*—At Partney Fair on Saturday the usual important sales of rams took place. There were sheep from seven different flocks, comprising about 200 very superior rams, nearly all shearlings. The Langton Grange rams, the property of Mr. Harwood Mackinder, were offered by Messrs. Briggs. The 31 rams realised an average of about 11*l.* 15*s.* The Huttoft rams, consisting of 33 shearlings, the property of Mr. J. L. Needham, averaged 10*l.* 7*s.* 6*d.* The Thurlby rams, belonging to Mr. Kemp, were 37 in number, the average for which was 11*l.* 12*s.* The Caventhorpe rams were disposed of by Mr. Law. There were 55. Mr. Palethorpe bought one at 16*g.*s., Mr. Pilkington one at 34*l.* 2*s.* 6*d.*, Mr. Marriot one at 19*g.*s., Mr. Downing one at 15*l.* 1*s.* 6*d.*, and Mr. Sanderson another at the same price. The 55 rams realised 559*l.* 2*s.* 6*d.*, being an average of 10*l.* 3*s.*

AGRICULTURAL MEMORANDA.

1. *The Harvest.*—I have been absent for two months in Hungary, and was therefore too late to reply to your circular as to the crops. From what I now learn, the deficiency in Wheat will be very great. Well-farmed lands of good quality and thoroughly drained may produce 4 quarters to the acre instead of 5½ quarters of average years; but many acres, where 4 quarters are usually reaped, will not this year exceed 2 quarters, and when cold and wet, the yield will be still smaller. Winter Beans and Oats are a good crop, and early sown spring Beans are fair, the later sown Peas have suffered from smother-fly.

The extreme heat and drought of August have

checked the Mangel and Cabbage, which in July were most promising. This injury is much smaller where the subsoil plough has prepared the arable land to retain its moisture; and there, too, the Swede Turnips have escaped mildew, and may yet make a fair average crop.

Dairy produce was good to the end of July, but the dry weather since has checked the supply of milk.

All other stock, whether feeding or store, has done well.

2. *Drainage.*—In a paper read by Mr. John Shuker, which in your leader you deservedly praised, the author recommends 4-foot drains under almost all circumstances, when laid in an open measure, and 3 feet with an impervious subsoil. I believe that the Enclosure Commissioners are influenced by a preference for drains 4 feet deep in all cases, in their consideration of applications for loans for the improvement of land. I was quite familiar with deep as well as shallow draining 50 years ago, and I am satisfied that in most cases in which the drains are required to be as near as 20 feet from each other, the subsoil is so impervious to water that a drain of 3 feet is as effective as one of 4 feet, and much less costly. I have watched drains made in 1824, of 4 feet and 2 feet 6 inches, in the same field, and I have never seen any advantage there in the deeper drain.

Then as to drains deeper than 4 feet, I was aware that drains of 5 or 6 feet drew the water from greater distances than 4 feet drains in case the measure into which they were laid was open, but for some years I thought that 4 feet drains, with 40 feet intervals, were sufficient and the cheapest. Having 200 acres of meadow to drain and irrigate at a time when I was unable to superintend it myself, I engaged an engineer to undertake the work. He obtained a depth of from 6 to 8 feet on a considerable area, and on this part he placed his drains 240 feet apart. The cost was at least 200*l.* less than the 4-foot drain would have required, and the work is so effectual that the land is perfectly dry in 24 hours after a flood has run off it.

I have also only one-sixth of the length of drain to keep in order, and I think at that depth, having a stream of water through them for more than 40 weeks in the year, they are less liable to be injured by animals getting into them.

The paper to which I allude speaks also of necessary air holes for drains, now, wherever water can go air can penetrate, at least 100 times as fast, so that no air holes can be necessary and may be mischievous, as encouraging the use of the drain by vermin.

3. *Lucerne.*—The best crop of Wheat I have seen this year is grown upon land which was occupied by Lucerne for 11 years previous to 1858. In the tenth year it was as productive as in any preceding year, but the extreme wet of 1857 decayed the roots, and I was obliged to plough it up. It gave me 5½ quarters of winter Beans to the acre last year, and a very heavy crop of Wheat this. The Lucerne was drilled at 18-inch intervals. The soil was ploughed between the rows twice in the winter each year, and kept clean by the horse-hoe between the rows after each mowing. We mow usually three times, a hot year gives four mowings. I am about to try it upon clayey land, where Grass does not grow very readily. I may here manage to keep a plant with 18-inch intervals, but I have failed to do this upon a free Turnip soil, and had given up Lucerne-growing until I learned that they succeeded well in Lincolnshire with 18-inch intervals. I followed these examples in 1852, and have never been without a good piece of Lucerne since. I find the best manure is nightsoil and ashes, of which I give 12 tons per acre, and it leaves the land in splendid condition. *Charles Paget, Ruddington Grange, Nottingham.*

AGRICULTURAL PROGRESS.

OUR text naturally turns attention to the cultivation of land by steam-power—the mowing and reaping machine in our hay and corn harvest—sewage farming, with the other leading and great advances of the day. But there are little things that should not be overlooked, and it is these latter which we propose for discussion at this time, i.e. the little improvements that follow in the wake of the big ones. For example, will steam culture and the sowing of sound seed, free from weeds, render the hand-hoeing of corn crops unnecessary, thereby effecting a saving of from 3*s.* 6*d.* to 5*s.* per acre? In this county (Surrey) we went early last June over three Wheat fields, two of which were not hoed; the other was, and the former were by far the best crops. They belong to three different farmers. The two unhoed fields exemplified the benefits arising from deep tillage and pure seed in a very striking manner, while the other illustrated the old plan of shallow tillage, weeds, and hoeing, and we quote the three examples for several reasons—1st, because all were horse-tilled, and on what is here termed light land, in contrast with the heavy clay soils of the district; 2d, not one of the fields was rolled for the reaping-machine—the practice in harvest being to cut low with the bugging-hook, the straw being sold in the metropolis. And, 3d, when we remarked that this practice was exceptional, and did not apply generally, and the practical question arose as to the propriety of rolling such land in springs like the past, we were met with the reply:—“Put my teams in this ’ore field in April? Not for the life of me,” which is plain English, and yet something must be done. As for rolling the other after hoeing, that was thrown aside as hopeless, even by steam, in the majority of seasons. On a similar quality of land, cultivated by steam, the secondary or resultant improvements, as they may be termed, are still more favourable, but not so great as on clay soils whose tenacious and binding character is gradually becoming changed by the improved drainage, aeration, and action of manures, and also by the greater diversity of crops grown, so that in cases of this kind the resultants which we have got to consider, are not one, but many.

Mowing and reaping-machines are changing greatly

the details of practice in hay and corn harvest, which sewage farming is also producing fruits far beyond the limits of town sewage application.

“A penny saved is twopence gained,” says the proverb, and if farmers can save the expense of horse and hand-hoeing their corn crops by steam tillage and the sowing of clean seed, they will doubtless realize the truth of the proverb in harvest. To sow weed and then hoe them at an expense of 5*s.* per acre is an old practice, which bespeaks its own short-sighted economy, and that land can be cultivated by steam as to meet all the requirements of cultivated crop when grown without weeds, is a proposition which may safely be granted. When land is only cultivated to the depth of 6 inches—4 inches being no uncommon depth of plough furrow on some unadorned old clay under the old practice—the roots of the crops were obliged to search for their food laterally, on the surface, consequently hoeing the land between the drills became essentially necessary to promote the lateral ramification of the roots. But naturally of corn crops, as Wheat, Barley, and Oats, with Peas and Beans, strike their roots downwards to a great depth, as may be seen exemplified in all deep rich soils in which their rootlets can safely penetrate in search of food; and this is just what they do when land is deep cultivated by steam, for the broken-up subsoil purified by drainage and aeration, and fertilised by application of manure and the decomposition of roots, when they have fulfilled their function to the growing plants. By such means the roots penetrate and obtain food far below the share of the steam-drawn implement, as may be seen by carefully digging down with a spade. The advantages thus gained will be more readily appreciated if contrasted with what was formerly experienced when the roots were confined to a few inches on the surface over what may be termed a poisoned subsoil. The seeds of weeds must of course be sown before they can vegetate on such land; but there is no difficulty in explaining how the weeds are propagated. It is not quite so easy to account satisfactorily in every part for the rapid manner deep steam tillage is now getting rid of them on soils where they previously grew in great abundance. The fact itself however, is acknowledged by all who have reported the experience of steam culture, and the fact is all that we have to deal with on the present occasion.

The improvement of land by steam tillage is a work of progress, and as it advances many weeds gradually disappear, so that if weeds are not sown they cease to grow, and the fact is an all-important one to the steam tillage farmer.

In Scotland there is hardly such a thing as a hoed cornfield, weeds being kept under by deep tillage and hand-weeding, and the proper manuring and seeding of the land. There are no doubt exceptions to this general conclusion, many cornfields being still overgrown with Thistles, Twitch, Knot-grass, and Charlock; but the area of land thus infested is annually becoming less with the progress of drainage, deep tillage, manuring, and seeding. So long as the land was improperly drained, the practice of deep ploughing in autumn was not attended with that success in getting rid of weeds which has been experienced since thorough drainage and subsoil ploughing has become general; and there is yet much clay land, in the north as in the south, very imperfectly drained, but, relieved from the trampling of the horses' feet by the substitution of steam drainage, is being greatly improved.

The next question is the rolling of corn crops for the reaping-machine. In the north, where hoed crops never stands in the way, and when the hoed crop is vest, and hence the time for rolling, is considerably later, little or no difficulty is experienced. At the same time, the trampling of the horses' feet and the “pitting,” or footprints of their feet in the land in dry weather, and on clay land in wet, has long furnished matter for loud complaint, so that the advantages of a steam-hauled roller call for consideration even in the north. In the southern counties of England, where the reaping-machine is not unfrequently in the field before the roller is out of the way, in some parts of Scotland, things are widely different. Where hoeing is the practice, as it must continue to be so long as weeds grow and the land is not ploughed some 5 or 6 inches deep, the work, if practicable, should be done earlier than it generally is. Some farmers, who mowed short with the scythe for the sake of the straw, before the reaping-machine was introduced (we ourselves did so), always studied to get through with their hoeing in time for rolling. When spring-sown corn there was seldom much difficulty attending the work, as such farmers grew comparatively no weeds; but with autumn-sown Wheat it was often otherwise in seasons like the past, the horses' feet and roller both do less or more harm to the land and young plants at the time. But were hoeing wholly done away, the period of rolling would be extended over a longer time, so that the work could then be done as soon as the land is sufficiently dry to carry the horses' feet. Under the old practice the roller was put over “crusty clays” to make them hoed. But steam culture is doing away with this crusty state of winter Wheat lands, by changing their tenacious and binding character to that of friable loams by the admixture of vegetable matter and oxidation of mineral; so that the passing of the roller over the land leaves it in a sufficiently pulverised state to meet the requirements of the young plants.

Let no one run away with the untimely notion that one year's successful steam culture, or even half-a-dozen years, will effect such changes in stubborn clay soils which carry the horses' feet like a barn floor often in the month of March, for every successive year goes adding to the change until it is completely effected. It may be one rotation in some soils, two in others, and three may be required to subdue the more tenacious

and binding clays of our southern counties; but change the land must when continuously stirred up by steam-power to the weather, the water being removed from below by efficient drainage.

The greater efficacy of manures is perhaps not wholly a resultant of steam culture, but the difference in the quality of the manure required is; and both merit special attention. So long as the land was only cultivated a few inches in depth, the manure, from its being so near the surface, and a noxious bottom to which it was liable to sink may not inaptly be said to have been situated as the poet describes, with

"Death 't the front, damnation in the rear,"

the waste from both causes being great; but the greater depth of cultivation and the purification of the soil to nearly the depth of the drains, not only obviate waste but affords a wider field for action. And besides this there are chemical changes otherwise effected by deep tillage and drainage in favour of economy: something like half the advantages as to efficacy of manure resulting from proper steam tillage will in theory remain a secret, although in practice it is realised.

Steam tillage produces from one to two quarters more corn per acre, with a finer quality of corn and straw. Roots and forage plants are being successfully grown on land which did not produce them profitably before the adoption of steam, so that what our forefathers termed "corn farms" are now stock farms also. It would take more space than we have at disposal to enumerate all the advantages under this head, owing to the common belief that stock do not pay for their keep, but whether we adopt the hypothesis that the farmer loses or gains by keeping stock, the balance nevertheless turns in favour of steam tillage with the other improvements at issue, owing to the richer manure produced by the growth of roots and forage plants. But, exclusive of the manure, we have always made money by stock, i.e., procured the full market value of the produce the cattle consumed. Many others do so, and therefore we disclaim the old theory that bullocks and sheep are only at the best "muck-making machines to the farmer." At the present time, at all events, they are more than this (so say butchers and the consumers of beef and mutton), and the general conclusion to which attention requires to be called is that steam culture is sending more beef and mutton to market than was done under horse culture, other things being the same. Other things, however, are not exactly the same—on many farms, at least, owing to the effects produced by the late murrain in black cattle; but such does not lessen the force of the argument one iota, but the contrary, for the improvements in tillage and produce are greatly in favour of the health of live stock, and hence in warding off contagious disease by, in some measure, removing or reducing the action of the predisposing cause.

We now come to notice the change in the details of hay-making produced by the mowing machine, hay-tedder, and horse-rake, where a considerable saving of manual labour is effected, besides securing a better quality of hay in less time. In this case the advantages arising from the control which the farmer has over his crop is greater than the mere saving of money in making from 2 to 3 acres of hay instead of one, with the old number of hands. In fine haymaking weather more than this can be done by the hands, so that in a heavy crop of meadow grass the carrying, if care is not taken, is liable to fall behind the mowing. The tedding-machines and horse-rakes are also liable to fall behind the mower. To time the several machines to each other and to the weather is often no easy task, so as to produce the finest possible quality of hay, and effect at the same time the greatest economy in labour of hands and horses. In making Rye-grass and Clover-hay, or Clover-hay alone, the tedding machine is not used while the hay, as it is made, is put up into small cocks, where it can remain until the whole field is secured. It is more easy, in this case, to proportion the different branches of the work to each other, but in scorching weather both the Clover and Rye-grass are liable to "roast" or "burn," as it is variously termed, so that a greater proportion of the hands are required to turn over, or half over, the broad, flat swathes left behind the mowing-machine. As a 'prentice fee has to be paid in learning any branch of farming, so at the present time not a few farmers are serving an apprenticeship in the hay field. But as practice is the best teacher, so progress is fast being made, and a higher degree of perfection being attained every successive year. Farmers, therefore, require to be closely present all day long in the hay harvest field, for the best of servants are not likely to arrive too soon at perfection in the working of new machines, more especially as to the economy of time and labour which should be effected.

The reaping-machine is also giving farmers the power of cutting down their crops in time in corn harvest. But two things require to be attended to in order to reap the greatest success; viz., 1st, a little fore-thought in seed time, so that all the fields shall not be ripe at one and the same time; and, 2d, the necessary means for carrying as fast as the corn is ready for stacking. On both these points of modern harvest practice the schoolmaster is unquestionably abroad. In point of fact, the latter may be said to be a corollary to the former, for as the fields ripen they must be cut, and are cut down in rapid succession with the reaping-machine, and when once cut stacking follows. No doubt, in fine weather the sheaves will not suffer much harm from being an extra day or two in the stook, but such is a very unwise expedient, and should never be trusted. Nor is it necessary that it should be so as a rule, for in seed-time it is easy to make the necessary provision for harvest in the different kinds of corn and times of sowing. In point of fact, it has long been done by those who do the whole work of harvest with the regular staff of hands on the farm, and it is

done without sustaining any loss whatever, the balance in every case being in favour of the increased value of the crop as compared with the opposite practice, where corn that ripens generally a week later than another sort is actually sown a week earlier, in order, as it were, that both should ripen together H. B.

THE TRANSIT OF STOCK BY SEA.

THE evils which afflict the various classes of stock during transit by sea are manifold. To begin with the deck, the first serious evil that presents itself is the almost total want of shelter. During two or three months in summer, when the weather is warm and fine, the want of this may not be much felt; but let anyone observe the appearance of animals as they are taken into the vessel, and watch the progress of the effects of exposure (intensified undoubtedly by the want of food and water); see how they first begin to look cold, and their coats stare; gradually their backs begin to arch, and continue to rise, while their bellies are tucked up until their natural shape is almost lost; their feet and legs become numbed; and, after two days of it perhaps, a more complete picture of misery it would be difficult to find; while the discharge of mucus from the nose tells of mischief within which may, an hour or two later, lead to fatal consequences. Be it remembered that these animals are exposed to all kinds of weather, wind, and rain, frost and snow, and what is often worse than all, the lash of the spray in stormy weather. I have stood on the bridge of a steamer and watched how, even in a small storm, each wave as it was met sent a shower of spray over the vessel from stem to stern, and with a force which only those who have experienced it can fully appreciate; and the condition of the stock exposed to it was pitiable indeed. This state of things may not occur in every voyage, but it does occur sufficiently often to call for application of everything that can be done to increase shelter; and the following suggestions would perhaps help somewhat towards so desirable an end. 1st. Let the pens have light corrugated iron (galvanised) roofs thrown over them, slightly arched in the middle. The standards at present used for the boarding would be quite sufficient to carry them, if made of a suitable height, and a top-rail added to receive it. 2d. In windy or cold weather it is essential to protect the animals from the sweep of the blast, and this might readily be done by tying a tarpaulin along the side of the pen exposed to the wind.

Along the bulwarks a light roof, as suggested for the pens, might be erected by increasing the height of the standards into which the planks already alluded to are fixed, keeping the inside higher considerably than the top-rail of the bulwarks, to allow water to run off. Then, instead of a division plank, a light close-boarded partition might be inserted. These would break the force of the wind to the animals and also keep them tolerably dry, and thereby greatly increase their comfort, and as they might be constructed to be readily erected and taken down, there does not appear to be any very serious objection to their use.

In the hold, the first, and perhaps the greatest, evil to the stock is exactly the reverse of what occurs on deck; fresh air is the great desideratum. The want of ventilation in the hold, and consequent foul air, heat, and stench, produce results more disastrous than even the exposure of the deck, rapidly producing low typhoid fever, which it is to be feared more frequently ends in pleuro-pneumonia than is generally supposed.

The condition of a hold filled with cattle or sheep, a few hours after they have been put in, must be actually examined to be fully appreciated; and the visitor must not be content with going merely down to the foot of the ladder, or even taking two or three steps towards the interior of the hold, as the stifling sensation experienced naturally suggests, but let him grope his way to the back corners, where nothing can be seen, but where the ventilation is worst, and where the quick breathing and constant moaning of the unhappy beasts only too truly indicate their sufferings, and we believe he will turn away sick at heart, and astonished that the animals can endure it. Then when a storm comes, and the hatches have occasionally to be closed, for however short a time, these evils are a thousandfold intensified.

The hatchway, and the sheet for increasing its ventilating power, have already been noticed; and, while these must be used to their utmost capacity, some other arrangements must be devised to bring these holds up to even a moderate state of ventilation, the absolute necessity of which is now recognised on all hands. The following method is suggested—Holds sufficiently raised above the water-line to be fitted with windows similar to those used in ordinary passenger cabins. These might be made sufficiently numerous to thoroughly ventilate a hold, with the help of one or two openings through the deck, for the escape of foul air. Such an arrangement, in smooth water, would be very effectual; but, of course, the windows could only be used in comparatively smooth water, and therefore some arrangement to effect ventilation in all weathers, in these upper holds as well as in the holds which are below the water-line, must also be found; and for this purpose there appears nothing so good as the multiplication of air-pipes, similar to those now used to ventilate the engine-room of a steamer. These pipes are about 12 inches in diameter, are raised about 10 feet high from the deck and have bell-shaped mouths, which are curved forward so as to face the direction in which the vessel is sailing, thus meeting the current caused by its passage through the air, intercepting it, and conveying it downwards. A row of these might be placed along the sides of the vessel, a sufficient number of which could be carried down to the lower holds by means of light wooden movable tubes, or gutta-percha ones, which, when not in use, would occupy very little space; then, along the centre line of the hold, another row of

similar pipes would be required to carry off the foul air; these would be in shape precisely the same as the others, but the bell-shaped mouth would be curved in the reverse direction, so that the action of the external air on them would be to quicken the discharge of air from them. Movable connecting tubes might be used to carry the foul air from the lower holds through the upper ones, without any risk of increasing the contamination of the air in the latter. The effect of this arrangement would be, that a current of pure air would enter at the sides, and as the temperature of the air in the hold would nearly always be higher than that of the external air, this current would naturally sink to the lowest parts, and would pass from the sides to the centre, from which it would be discharged by the foul-air pipes. This circulation would be established, and all that would remain to be ascertained would be the capacity of the tubes required for a given number of cattle or sheep, to effect thorough ventilation. This latter question would soon be settled by practical experience; but, in the meantime, we suggest the down-pipe of 12 inches in diameter, and one up-pipe of similar capacity, for every five cattle or fifteen sheep; and we further suggest that the mouths of both sets of pipes be made movable, so that they can be faced to, or from, the direction in which the current of external air is moving most strongly. By this means, and with ample capacity of tubes, the ventilation of the holds could at all times be completely regulated. The next evils to be noticed affect both the stock on deck and in the hold—viz., the want of food and water. For stock that are only to be on board the steamer for not more than eight or 10 hours, the want of food is not of very much consequence, unless accompanied with severe exposure to cold or wet, and therefore the following remarks are intended to apply rather to stock which are to be a longer time on shipboard; water, however, we are inclined to insist on for all stock on board a steamer at least once in every six hours. The consideration of how these are best to be supplied brings up again what has been already alluded to—the usual method of securing the animals, cattle and horses, by tying their heads as closely as possible to a ring in the side of the vessel, and by placing them so closely together that access to their heads is almost impossible. If such is to continue to be the arrangement of these animals on board a steamer, the supply of the necessaries of life to them will continue, as it hitherto has been, practically impossible; but we believe the absolute necessity of supplying these will compel a change of arrangement, and therefore, as a preliminary to the main question, we suggest a method of effecting this. For the cattle on deck, let the standards and planks now placed along the buttocks of the animals be made a little stronger, and more securely fixed than they are at present, and the animal's position may be reversed, and its head tied to a ring in the plank, instead of to one in the bulwarks. For the cattle in the hold a similar erection might be used—such, indeed, as is at present used—to accommodate more animals than are now tied to the sides of the vessel. This arrangement would bring every animal's head within the most convenient reach of the cattleman that is possible, so that both food and water could be supplied with ease.

As to the kind of food to be supplied, there may be differences of opinion, but for general stock nothing appears to be better than hay, the natural food (dried) of horses, cattle, and sheep, and which, to the recommendations of being cheap and easily obtained in most places, adds this property—that its nature fits it for being supplied to the animals by an extremely simple means, viz., a net made of tarred cord, and for cattle and horses in the form of a bag containing 5 lb. or 6 lb. of hay. For ponies or sheep in a pen or hold, the net would require to be made oblong, of sufficient length to stretch across, secured at the ends to the sides of the pen or hold, and supported by light stakes when necessary. For horses and cattle, a bag-net should be suspended alongside of each animal's head; or, if made a little larger, one between each pair of animals might be found sufficient. The use of nets in the feeding of animals with hay is, perhaps, less known on the north side of the Tweed than on the south side; but from personal observation and experience every confidence is felt that the net, in one form or other, is capable of being adapted for the purpose in view, and that it offers greater facilities, when the requirements of a steamer are considered, than any other apparatus yet tried. Its chief advantages are these—it is portable and very cheap; the hay, once in it, is secure from the effects of wind, so that it forms the best vehicle for conveying hay in a steamer from the store to the stock (hay might be put into the nets before shipment), and for preserving it when placed before them, it occupies the least possible room when not in use, it won't become sour or injuriously dirty, and it will allow the animals to consume the food with less waste than an ordinary rack, while its use, as suggested, would place the supplies within the reach of each animal; and we therefore, without hesitation, suggest it as the best apparatus for supplying food to stock on board steamers.

The supply of water, fortunately, presents much greater facilities than food, and, bearing in mind the reversal of the animal's position, already suggested as a *sine qua non*, we offer the following arrangement—Let a small service-tank be erected on some elevated portion of the steamer (such as the small portion of deck usually built over the bowsprit), if possible, sufficiently high to send water by gravitation along the deck, the supply of which alone requires the elevation of this tank above the main deck. This service-tank may be supplied from the general tanks (probably themselves requiring enlargement, by help of the engine at any time, and from it let pipes be laid along the deck, near to the line of the heads of the animals arranged along the bulwarks and sides of the holds, having taps at intervals of 20 feet or so, to which a

gutta-percha pipe can be screwed. One set of pipes would supply both the deck and upper hold, the lower hold being supplied by a set of pipes laid in the floor above it. With such an arrangement as this, the watering of the stock would be made comparatively easy. To effect it, the cattlemen, keeping up the service-tank supplies, and having screwed on the gutta-percha pipe 10 or 15 feet long, would take it in one hand, and with a pail in the other (light movable wooden troughs being used for sheep), would pass from beast to beast, supplying each in turn in probably not more, on an average, than one minute each, and this would be quick enough for all practical purposes.

The only objection to this system that occurs as likely to be made is on the score of expense; but even although it entailed increased storage tank-room, the whole apparatus for a large steamer could not cost a larger sum than would be repaid tenfold by the benefit to the stock; and when it is further considered that water might thus be supplied without interfering with almost any of the existing arrangements of a steamer, and that quickly and conveniently too, the matter of expense becomes very small, and does not appear as a very great objection to such a mode of supply, and we therefore suggest it as the best arrangement possible in the circumstances.

The only other evil of this mode of transit to which we can allude here, is the knocking about, the falls, and consequent trampling, suffocation, and strangulation, to which cattle and sheep are especially liable during rough weather, and which appears to be simply, as to the last-named results, the effect of over-crowding. The animals are packed together as closely as they will stand, and when an ox falls, through its feet slipping on the slimy boards, the chances are very great that the animals next to it on both sides will be thrown down on the top of it. This is easily understood, when it is remembered that the animals standing together in a row press mutually against each other, the moment, however, a vacancy is made by the fall of one, this pressure tends to fill up the space left, by pushing the adjoining beasts until they meet over the fallen one, which then has scarcely a chance to regain its feet, even when these don't fall over it, but when this happens, and in a storm, the confusion becomes inextricable, and the lives of three or four animals are lost through such a small accident as the slipping down of one beast. So much is this felt, that almost the whole vigilance of the cattleman is directed, during the voyage, to the one object of keeping the beasts on their feet, and the difficulties of achieving it can only be fully realised by those who have witnessed the effects of a storm on the occupants of the hold. As a remedy for this great evil, we suggest that, instead of a division plank to every tenth beast as is now usually allowed, a similar plank shall be fixed between each animal. The advantages of this would be very considerable; if a beast did get down it would prevent its being either trampled or strangled to death by its neighbours before it had a chance to get up again, while the support these planks would give to all would relieve the individuals from the swaying and crushing effect now experienced in the rolling of the vessel, and which is productive of much mischief to all except the strongest animals. It may be thought a disadvantage to the introduction of these planks, that such a system would fix the limits of the space allowed to each beast, and that a large animal and a small one would have precisely the same accommodation, further, that these animals would occupy space which might be better employed. To the first of these it may be replied, that as nearly all steamers are built with a view to the requirements of the particular station on which they are to be employed, the descriptions and average sizes of the stock usually conveyed could be known, and suitable grades of space provided accordingly, and that as the fixing of the spaces would prevent overcrowding and all its attendant evils, a great advantage would thereby be gained; while the greater comfort and security of the animals would more than repay for the extra space occupied, and which, after all, would be comparatively trifling, only an addition of 3 inches (the thickness of the plank) for each beast, while its cost would be very trifling. Mr George Menzies, in the "Transactions of the Highland and Agricultural Society of Scotland."

Home Correspondence.

Dairy Farming.—1. If a farmer gets 12l. per annum, besides the whey and manure, for the keep of a cow, it will pay him well enough to provide good food—say in winter, Oat straw cut into chaff, with plenty of roots; in spring, green Rye, Oats, and Vetches; and in summer good Grass. Such food will keep a dairy in full profit, if the cows are managed so as to calve in March and April. 2. A good ordinary cow will give 3000 quarts of milk during nine months, and will be dry for three months. Now, 12 quarts of milk will produce 1 lb. of butter and the skim-milk will produce 3 lb. of cheese. Therefore, 3000 quarts of milk will give 250 lb. of butter and 750 lb. of cheese. If we value the butter at 1s. per lb., and the cheese at 5d. per lb., then a single cow would produce in a year,

Table with 2 columns: Item, Value. 250 lb. of butter at 1s. = £12 10 0, 750 lb. of cheese at 5d. = 17 12 6

yearly from each cow. 3. A dairy of 100 cows could be managed by three men and three women, and, supposing the men to be paid 13s. per week, and the women 9s. per week, they would cost in a year as follows:—

Table with 2 columns: Item, Value. Three men, 52 weeks, at 39s. = £111 9 0, Three women, 52 weeks, at 27s. = 76 12 0, Total wages = £187 12 0

4. In a dairy of 100 cows we must reckon two cows

dying in the year, worth say 15l. each, or 30l. the pair. 5. There will be no loss on selling the cows when worn out, for as every cow is dry for three months she can be fattened off and sold to the butcher without loss. 6. There will be 100 calves, but these ought to be sold off at three days old, and will not do much more than pay for the bull. 7. The capital requisite to carry on a dairy of 100 cows may be put down at 1600l., the interest on which, at 5 per cent., will be 80l. per annum. 8. Supposing, then, that any one with 1600l. and a taste for dairy farming could arrange with a farmer to keep 100 cows for 12l. per head per annum, the farmer getting the manure and the whey, then his dairy would cost him as follows:—

Table with 2 columns: Item, Value. 100 cows kept, at 12l. each = £1200 0 0, Wages, three men and three women = 171 12 0, Deaths of two cows = 30 0 0, Interest on 1600l. at 5 per cent. = 80 0 0, Allow for petty expenses = 30 18 0

9. But each cow ought to produce 28l. 2s. 6d., therefore the annual produce would be:—

Table with 2 columns: Item, Value. 100 cows, at 28l. 2s. 6d. = £2812 11 0, Deduct expenditure = 1112 10 0

Net profit = £1700 0 0

to pay for careful supervision, or 13l. per cow per annum. These figures, no doubt, are a little surprising, nevertheless all the data I have assumed are well founded, and can be proved in many ways. The real fact is, that the success of a dairy depends wholly on careful attention to details, and it is the want of that care which makes many persons fail in carrying them on. If cows are not thoroughly milked, if milk is allowed to go sour, if butter is allowed to get bad, if curds are allowed to spoil, or if cheese is injured by bad making, all these things tend to bring down the profit at the year's end; but, if a dairy is properly superintended, there is no doubt of its being the most profitable branch of farming. G. A. H. Your figures are wrong under No. 2. It is only an extraordinary cow that yields 3000 quarts of milk per annum, and no man ever yet owned 100 extraordinary cows.

Filaria.—I have now 57 cattle suffering from "filaria" in the throat and lungs. The application of fumes of carbolic acid on hot bricks I find is a very difficult operation. In the first place, my medical man tells me, pure carbolic acid is rather costly, and then I fail to find a suitable hovel or barn in which to apply the remedy to 57 head of cattle. If all the needful requirements were obtained, I learn that the application needs the nicest management to prevent suffocation of the cattle. The medicine we are now using is 1 pint turpentine and 1 pint linseed oil mixed in 1 pint of water, and given to each bullock every morning. The cough is becoming less husky, and the skins are beginning to shine a little. I therefore decide to continue the dose until I hear of a better remedy. John Fryer, Manor House, Chatteris, Isle of Ely, Sept. 16.

Period of Cutting Corn.—I never before observed such a striking difference as in the year in the practice of farmers as to the time of cutting their corn crops, especially Wheat. Could you lay down some rules for guidance on this matter or refer to some reliable work on the subject? A tenant farmer, whose land is, of course, his own reaping just twelve days after me. Who is right? This is only an example of the wide difference which prevails in practice. As to Oats, the same diversity is observable; but not so much in Barley. It seems to be generally admitted that Barley ought to be quite ripe before it is cut, and that this ripeness is indicated by its becoming "goose necked." B. N. P. You will find Mr Hannan's observations and experiments on the best period of ripening quoted in most works of agriculture. Wheat may be cut when you cannot squeeze any milk out of the grain. Oats should be cut while still greenish. Barley should be cut when all of one ripeness, and therefore not till all dead ripe.

Harvesting Corn by Machinery.—In reply to your inquiry as to the cost of cutting, stooking, and raking, I beg to furnish an account of the expense incurred on the Earl of Zetland's farm at Aske during the late harvest. The reaper has been used on the farm for several years, has back-delivery action, and was manufactured by a local implement maker. The whole quantity cut was 80 acres—25 Wheat, average crop; 9 Barley, full average; and the rest Oats, light, with the exception of 10 acres, fair average crop. The whole was cut in nine days. The cost per day was 2l. 12s., as under:—

Table with 2 columns: Item, Value. Nine women binding, at 2s. per day = £18 0 0, Two men binding, at 2s. 6d. per day = 0 5 0, Three men stooking, at 2s. 6d. per day = 0 7 6, One man raking by hand, at 2s. 6d. per day = 0 2 6, Two men with machine, at 2s. 6d. per day = 0 5 0, Allowance of 8 men instead of beer, at 6d. do. = 0 4 0, Two horses, at 3s. 6d. per day = 0 7 0, Wear and tear, &c. = 1 1 0

Nine days, at 52s. per day, 23l. 8s., the cost of the 80 acres, averages 5s. 10d. per acre. Four horses were employed for the reaper, each pair working half a day, and being employed in other work the remaining half. The hours of labour on this farm are—for men, from 7 A.M. to 5 P.M., with one hour for dinner; for women, from 8 A.M. to 5 P.M., with one hour for dinner. The three men were not actually stooking all day, but were engaged in removing the corn in front of the reaper before the arrival of the women in the morning, all of which corn had to be bound as well as stooked afterwards. R. H. King, Oliver, Richmond, York, Sept. 21.

The Yield of Tiptree Hall Crops.—A correspondent, "Inquirer," in the Times, recently asked Mr. Mechi "to corroborate the statement as to this large yield of Wheat by giving the name of the field and its acreage on which the crop was grown, with a certificate from the corn merchant, who purchased the grain, of the quantity delivered, the bailiff attesting to the amount

being the produce of the field specified. To this request "Inquirer" added,—"A confirmation would disarm multitude of sceptics, and be an answer to the deposition who on visiting the Tiptree farm on the eve harvest reported their estimate of the Wheat crop irrespective of the Rivett's Wheat, at 31 bushels per acre." To this letter Mr. Mechi replied as follows:—

I thank your correspondent "Inquirer" for his desire to convince certain agricultural writers that I do not mean to decline to employ myself, my bailiff, and the people who buy my corn, in making all sorts of declarations as to the truth of my statements, in order to convince those who do not desire to be convinced, and who will not believe anything but what they see. For 25 years my farm has been open to public inspection, and men who understand their business as farmers can see well the produce of the field of the crops as they are my bailiff; and, although I was assured (when I began improvements) by practical men that I should never get enough on this poor farm to fill the great barn I had completed, yet the barn was filled this harvest, and, addition, 21 good corn and haystacks show their proportions. Such facts as these are worth more than the most elaborate and elaborate. No doubt these untruthful farmers who are still shut up in their houses with their heads in the clouds, their feet on the ground, and their hands in their pockets, and who will not believe anything but what they see, can hardly reduce the advantages arising from totally different state of things. Am I to be blamed for raising for and practically advocating such improvements as benefit both landlord and tenant and increase and cheapen the food of the people? I know that I have the sympathy, support, and approbation of those whose good opinion is worth having, and I therefore can afford to pass by good humouredly the attacks of either ignorances or prejudice. J. J. Mechi, Tiptree Hall, Kelvedon, Essex, Sept. 16.

Corn Reports, 1869.—In an article under the heading in your last issue, and signed John Fox, Merton Hall, Warwick, I am represented as having stated in my harvest report, "that the Wheat crop 1869 would prove very little inferior to that of 1868." I have made no such statement. Indeed, what I did state was as different from the above as possibly can be, viz, that the Wheat crop of this year would produce 10 bushels per acre, or 28 per cent, under last year's crop. The other assertions—I cannot say criticisms respecting my harvest reports, coming as they do from so unscrupulous a writer, are not worthy of notice. James Sanderson, 11, Pall Mall East, Sept. 23.

Foreign Correspondence.

NEW ZEALAND.—Mr. Nairn's Bearded Wheat.—I have further examined the specimen of bearded Wheat sent from Pourere, Hawke's Bay, New Zealand, by Mr Henry Nairn—a notice of which appeared in your journal for June 26, p. 698,—and find that it is a Wheat, and as perfectly smooth as red Wheat is, rather lighter in colour than red Wheat usually, and differs only in having a beard about one-third the length of Rivett's, which is, however, considerably stouter, and so gives the ear a somewhat prickly appearance. In the lowermost spikelets the beard is very short, and it then scarcely differs from red Wheat, which is not infrequently slightly bearded in its uppermost spikelets. Although this Wheat was raised from a single plant in New Zealand, which had varied in some or nearly the same kind, as far as regards the beard, appears to have originated elsewhere, as Mr. Clarke informs us that "some of the spring Wheat grown in Devonshire have a beard somewhat like Rivett's," and that when he resided in America 30 years since, "nearly all the Wheat grown in Westchester county, New York, was bearded red Wheat, the beard being two-thirds the length of Rivett's, but it was not a Rivett, and I considered it to be the same kind as our spring Wheat." This Wheat, however, he informs us, was not very remarkable for its productiveness, 5 quarters per acre being considered a good yield. I therefore consider that the most remarkable character of this Wheat is the increased number of spikelets, one of the ears sent having 32, which is the most part are four-set, 24 being a high number for red Wheat, although I have seen 26 and even 30; the latter instance a few of the uppermost being barren, which is not the case in this Wheat. But although the ear contains so many spikelets, it is not elongated as ear of red or white Wheat with four or five spikelets less would be; for it is only 4 inches long, and in form of a square dense mass. On this account it appears the more likely to be a really new variety, its grain it is decidedly a red Wheat, the colour being deep as any red Wheat we have seen. Mr. Nairn states that "it is a very heavy cropping kind, for with a bad farming it has produced 75 bushels of 62 lb. weight from 1 acre." It may be hoped therefore that it is an increased vigour of growth, and would stand against mildew and red rust better than ordinary kinds, the latter being the cause of the extensive destruction of the Wheat crop in South Australia, and also that it would be less subject to "root falling" or "rotting," which is said to have destroyed the crops to the extent of 2 qrs. per acre.

It is stated in a letter to Dr. Hooker from a New Zealand correspondent in the "Proc. Linn. Soc." (about three years since) that certain British plants being introduced into that country grow with more vigour than in England. Watercress, for instance, nearly covers some of the streams, so as to become a serious impediment, and a Compositae (Daisy tribe) has become so prolific as to prove destructive to a great extent to the Grasses of some pastures. It is not thus the case with Wheat—and, if so, the extraordinary produce of this bearded Wheat would be accounted for. Not improbably it was grown on fresh broken-up ground, or land recently in cultivation for the first time, but even then the yield would be extraordinary. I hope Mr. N. will supply us with further information, and it would be interesting to know whether this Wheat is less liable to mildew than other kinds. A.

LEICESTERSHIRE

The Agricultural Labourer.—Mr. PELL, M.P., said:—As regarded the condition of the agricultural labourer a variety of broad assertions had been made, rather loose in character; among others he noticed the other day the absurd statement that when winter came round the labourers who were employed on farms in a certain county as a rule retired into the workhouse. With regard to education, Professor Leon Levi, in a remarkable paper he read at a recent meeting of the British Association, pointed out that the condition of the agricultural labourers in this respect was not so bad as some of our manufacturing districts. They did not lag in the rear in point of education as was generally supposed. This extraordinary paper of Professor Leon Levi, which was shortly to be published, stated that out of every hundred women married in the county of Rutland, which was altogether an agricultural county, no less than 84 were able to write their names, whilst in Lancashire—the manufacturing county—only 51 signed the register: an advantage of 30 in favour of the county where old and primitive institutions in rural districts were maintained in a rough and antiquated way, but they secured advantages to the people, specially the women, in education, which were lost to the working people of Lancashire. He did not wish to say this as a reproach to Lancashire it was their misfortune. He could go further, and say—having carried out the figures beyond those of Professor Levi—he found, making use of the same basis (the Registrar General's return) that the advance was now more rapid in Lancashire than in Rutland. He was quite aware, no man more so, of the enormous difficulty there existed in keeping up the old relationship between employer and employed, where thousands were engaged, as compared with that where they had to deal with scores; but still agriculturists might rest contented that when the comparison was made, the condition of those they employed showed to their advantage. One word more. It would be a great blessing if our people were better educated, but they must bear this in mind, they, in the House of Commons, as well as those in the Upper House, must be practical as well as theoretical, and consequently could only attempt what they knew they could carry out to some practical end. He denied that landlords and farmers were the opponents of education, and pointed to Professor Levi's figures as irresistably proving the contrary. What was it that the farmers wanted now? They were not so far advanced in the application of machinery to agricultural pursuits as the manufacturers were to the goods they made, but there was a great difference between the circumstances of the two. On land they had to pass the implement over the surface of the ground, which might be irregular; they had also the condition of the atmosphere to contend with, difficulties which the manufacturer had not to combat. His machinery was steady and fixed, its condition of working less variable. He could introduce an artificial atmosphere, if it was necessary, into his factory. What the agriculturist still had to rely on to a great extent, was the physical strength of his men. There was an amount of hard work to be done in connection with farming that could not be better done by the book; there was an immense amount of work, which if they put a highly-educated man, and a fine strong physical man to do, there was no question which of the two would do the work the better. The times, no doubt, would change. There was a tendency to employ machinery wherever it could possibly be brought into use; the employment of it was intended to relieve mankind of the drudgery of work, and many a piece of machinery had been invented with that object. Now, when this machinery came to be further—as he hoped it would be—applied to agriculture, then the men of sheer animal strength will be less wanted, and better educated men, able to take charge of machinery and to attend to minor details, will find employment. Then the educated labourer will be more needed than he now was.

INVERURIE

[The following are Mr. BRUCE's concluding remarks, continued from p. 1003, on "The Breeding and Rearing of Sheep."]

Sheep are profitable.—In proof that sheep stock will pay if properly cared for, allow me to read the following extract from a letter I received from a friend who sold 200 fat wethers this spring. Two hundred wethers, bred and fed on the farm until 1 year and 9 months old. Breed—Cheviot ewe and Leicester tup. Keep when weaned—kept on Grass on cultivated land until March 10, Turnips until middle of April, link pasture until middle of October, Grass on cultivated land until 20th November, yellow Turnips eaten on the land until middle of February, when they were finished off on Swedish Turnips on a grass-field, with 1 lb. mixture of Peas and bruised Oats for about a month, when the whole were sent to London. Average price netted, 55s; weight, about 70 lb. The clip at one year old averaged 6½ lb., and sold at 1s 6d per lb. On making a calculation, I find between wool and mutton 175s. 10d. to be the average, and realising on the gross 65d. 8d., not taking into account the enriching of the land when eating the yellow Turnips, and the superior top-dressing the Grass must have got when consuming the Swedes, Oats, and Peas.

Diseases of Sheep.—Inflammation of the womb is but too well known. A day or two after lambing the ewe will be found straining very much, the parts swollen and of a livid colour, showing that severe inflammation has taken place. Now I am almost certain that this dangerous complaint arises from one of two causes. Either the ewe has had access to too

many Turnips, with little or any dry food during winter, thereby causing the fetas to become overgrown, and thus injuring the ewe; or else rough handling at the time of lambing. When we commenced keeping sheep, we gave little else than Grass and Turnips in winter, and suffered accordingly; but from the time we discarded the Turnips and adopted the dry food, we have not had a single case. When a ewe is down in this complaint, I would recommend the following treatment—Give 2 table-spoonfuls of treacle, 1½ oz. of common salt and 1½ oz. of salts, 2 tea-spoonfuls of sweet spirits of nitre, 2 tea-spoonfuls of laudanum, and as much ground ginger as will lay on a halfpenny, bathe the eye frequently with warm water, and use, as injections, a plentiful supply of Driffield oil, mixed with an ounce of laudanum, keeping her raised a little behind, perfectly quiet, and drawing the teats often.

Garget, or inflammation of the udder, I have always found a most unmanageable complaint, owing, no doubt, to the fact that it had generally proceeded too far before being observed. Having, unfortunately, lost several valuable ewes, one time or another, by this trouble, and aware that it must have arisen from mismanagement of some sort, made me anxious to find out where the error existed. After pondering over the matter, I have arrived at the conclusion that these ewes were lost, not from want of, but by having got too much attention, through our anxiety about the comfort of the new-born lamb. I fear we had coddled the ewe too much up. I mean, that we had kept her too warm, and when sent out to the field, the cold frosty winds, common in spring, by chilling the udder, had caused the mischief. I am the more convinced that this had been the exciting cause, from the fact that, formerly, when allowing our ewes to rough it more than we do now, while then we had ailments of which the udders going wrong. While it is right that every attention should be paid to the comfort of the lamb (and it is astonishing how much cold a lamb will stand, provided it is getting plenty of milk, and the weather dry) my experience is against overdoing the thing by too much kindness, "prevention being always better than cure." I would recommend that the ewes should be looked carefully through every day for some time, see if the lambs be all sucking, and none of the udders too full. Owing to the tits being kept continually wet with the lamb sucking, they are very apt to get chapped with the cold winds, and being very sore, the ewe will refuse to let the lamb suck, consequently the udder soon becomes overgrown with milk, and unless promptly attended to, serious mischief will follow. The only plan in a case of this sort is to take the ewe home and confine her for some days, and rub the sore tits as often as possible with an ointment composed of equal parts fresh butter and bee's-wax melted together, and before applying the ointment hold the ewe until the lamb suck, and bathe with a weak solution of sugar of lead and zinc, and very soon all will be right. Garget or inflammation is quite another thing. In this case the udder becomes very much swollen on one or both sides, showing a sharp, well-defined edge where it connects with the rim of the belly, has a dead, dull feel, and if pressed with the finger leaves a mark like putty, the udder is discoloured, and covered with a clammy sort of perspiration. In every case of this nature I lost the ewe, arising, no doubt, from having proceeded too far before being observed. If taken in time, I would recommend the following treatment—Turn the ewe and bleed from the vein that runs along the belly immediately before the udder, closing the wound with a pin and a little lint, giving the same purge prescribed for inflammation of the womb, with the addition of 3 or 4 drops of the "tincture of acetate," to allay the fever. Should the fever continue, give at the end of every two or three hours, for some time, say 3 drops of the acetate amongst a little water. Be careful, however, not to exceed 3 or 4 drops at a time, as acetate is a most deadly poison, and keep the udder constantly covered up with cloths wrung out of cold water, piled above to induce heat, and emptying the udder of any milk as often as possible.

Stomach Stagers, or founder, is caused by giving too much food, especially of an uncuttable nature, when newly lambed, or else by the Grass becoming too dry and little or any water in the field. I remember being advised at one time to give my ewes at the time of lambing some boiled Barley. I did so to two of them, and next morning neither of them could rise, and even when lifted up they couldn't stand. We gave a smart dose of medicine, but it was two days before either of them could rise; the boiled Barley, being of too short and sloppy a nature, had prevented the muscles of the stomach from throwing it up to be cuded, and thereby had become paralysed. Stagers, however, is most common on the Grass at the time when it becomes too dry, and when the Rye-grass is running to seed, and, as I said before, when water is deficient, a sheep suffering from stagers will be found very dull, and generally standing by itself at the dykeside, and showing a good many of the symptoms of sturdy. If sought to be driven about, it will often appear as if blind in one or both eyes, and should the stomach be very much impacted, it will at all times become quite wild and furious, and throw itself into the most fantastic attitudes. Some years ago we had a very bad case of this nature, and not knowing at that time the exact whereabouts of the eye-vein, I bled from the ears severely, gave a smart purge, along with injections, and as the animal was quite wild, two strong men had to keep it from hurting itself for an hour or so, by which time it became quieter, and by morning it was all right. It was brought on by being turned the same day into a field of rich rank Grass. Several jumps of rock-salt, placed in the field along with an abundant supply of pure water, is the best preventive in this case.

Sturdy.—The only cure in this complaint (the flesh being perfectly wholesome) is the knife. I tried the Ettrick Shepherd's cure on one or two occasions, but in no case could I ever get the wire far enough up; and, suppose I had, how could I have been sure of the exact spot? It proceeds, I think there can be no doubt, from a small worm of some sort getting up the nostril, and by this means reaching the brain.

Foot-rot, although not a deadly ailment, is often a very troublesome one if allowed to spread, and being extremely infectious the wise course is to always check it in good time, as the longer it is allowed to continue among a flock the more virulent it becomes, and ending, as I have known it to do, in the mouth becoming affected as well. Sheep wandering on mountains, or those feeding on dry, sharp soils, and having to travel for their food, are seldom troubled with sore feet. Foot-rot chiefly attacks those grazing on rich old pastures, the Grass on which being soft and spongy, the hoof is not worn down nearly so fast as it grows. Another fruitful source of foot-rot is in allowing the bught to get damp and dirty, and by folding too many together. The following lotion will be found a specific if used in time.—1 oz. of nitric acid, mixed with 3 oz. of rain-water; the hoof to be carefully pared, and every vestige of the dark stringy roots that will be seen cut away, and then apply the lotion with a feather, holding the animal on a dry place for a little. Should the disease have run on for a time, and become festered above the hoof, in that case it should be poulticed for a day or two, and then washed with some weak caustic solution—such, for instance, as a little bluestone melted in warm water, inserting the foot amongst it while hot. There is another kind of sore feet that sheep are often bothered with, and which appears to pain them very much. The skin between the hoof becomes cracked and festered, and when not attended to the foot soon gets very much inflamed and swollen, causing the hoofs to stand widely apart. When the crack is not very deep, nor the foot much swollen, a very good plan is to get some one to hold the foot, while another rubs a bit of an old guano bag gently backward and forward between the hoofs, and then apply a little of the foot-rot lotion. Should the crack be very deep, however, and the foot much swelled and inflamed, in that case the foot should be poulticed for a day or two, until the swelling and inflammation be removed, and then bathe with a weak solution of sugar of lead and zinc.

Reviews.

The Cornell University Register. Ithaca, U.S. 1869.

The Cornell University has perhaps excited the interest of English people more than any other of the remarkable institutions for education which have been lately established in different parts of the United States. The novelty of the system by which students are directly possessed of technical knowledge in the shape of a trade have been able to support themselves while following other kinds of study—a system so liberally cutting away the class restrictions which limit the usefulness of many of our own places of education—has no doubt been one cause of this interest; another has certainly been the attachment to the new university of so notable a man as Mr. Goldwin Smith, formerly Professor of Modern History at Oxford.

The older universities of America were founded more or less completely after the pattern of those in England. The new foundations are to be directed more distinctly to the material development of the country, without, however, neglecting the benefits derivable from the widest kinds of general education. In 1862 Congress passed an Act granting public lands to these States and territories which would provide colleges "for the benefit of agriculture and the mechanic arts." The share of the State of New York amounted to 200,000 acres, and the revenue arising from this or from its sale was the fund available for educational purposes. This fund was eventually appropriated to the university founded by Ezra Cornell, at Ithaca, on certain conditions, the most important being his endowing it with 500,000 dollars, and the free education of a certain number of students, one from each district of the State. The object of the university was defined to be the teaching of such branches of learning as would promote the liberal and practical education of the industrial classes. Other branches of knowledge might, however, be included in the plan, and this has since been done. Special provisions were also made to prevent any religious body obtaining the management of the university, and no religious disqualification can interfere either with students or teachers.

The university was formally opened on October 7, 1868, nearly 500 students applying for admission. The number at present on the books is 112; the difference is no doubt to be attributed to failure in the entrance examination, which, however, only consists in English grammar, geography, arithmetic, and elementary algebra. Three of the students apparently come from England, and there is no restriction as to nationality.

The course of study is somewhat complicated in its arrangements, but probably works simply in practice. There are three general courses, extending each over four years, in science, philosophy, and art. The encyclopaedic character of these is rather overpowering. The arts or classical course, for example, includes English, Latin, Greek, physiology, botany, chemistry, physics, philosophy, political and rural economy, two modern languages, and a good many other subjects too numerous to mention. It is intimated, however, that if this is not enough students may take extra subjects as well.

There are also optional courses, in which, subject to certain restrictions, the student is allowed to choose his own lectures, and special courses for students

taking up only a single branch of science; each of these is carried out by a separate faculty or college. First on the list is the College of Agriculture, which has a farm of 200 acres. "Laboratory and field practice are combined with the usual lecture-room work to the utmost extent possible; to this end laboratories, live stock, tools, models, and apparatus are supplied." The subjects taught are agricultural chemistry and geology, mechanics, botany, zoology, and the economics of agriculture, or as we should say, agriculture proper. But the complete course leading to the degree of Bachelor of Science includes all these subjects, and a good many others, and requires four years. There are, however, abridged courses of three and two years. Students are also allowed by special permission to attend some only of the courses, and to spend the rest of their time in farm or garden work.

The other special faculties are equally elaborate in their arrangements, some of them being even divided into subsidiary "schools," each with its prescribed course of study. The advantage of this system is that the waste of power which attaches to isolated places of special education is avoided. Besides teaching its own special pupils, each faculty is available for giving a general knowledge of its subjects to students with less restricted studies. All these departments, moreover, do not seem to be in any sense merely paper schemes. The museums and collections belonging to them are already extensive, and there is a library of 25,000 volumes common to the whole university.

Considering the short space of time in which all this has been initiated, it is not a little astonishing how much progress has been made. The dependence of future material prosperity upon the capacity in the industrial classes to apply and utilise knowledge has been thoroughly recognised and acted upon. The work to be done, says the Register, "is to aid earnest, determined, manly young men in obtaining the best education which their talents allow." This language is, perhaps, a little more gushing than is usual with us in such books, but the very simplicity of purpose from which it arises is in itself characteristic. The university is definitely meant for work, and is incompatible with idleness, and hence "whenever a young man is pursuing such a course as to render his stay not conducive to his own interests," he is at once removed as a discordant element.

"Professors," again, "have been sought whose methods of teaching are such as to awaken enthusiasm." There is, therefore, no marking system. The whole account of these arrangements reads, to those who are acquainted with education in this country, like a Utopian dream. However that may be, they already seem in the first year of their existence to have gone a long way towards realising the wish of the founder to "found an institution where any person can find instruction in any study."

The fees are very moderate. About 300 students can live in the university buildings. Their total expense of maintenance is 232.40 dollars a year, the university fees are 30 dollars more, making a total of 262.40 dollars, or less than 5*l.* a year. Other students have to live in the university town, which is probably rather more costly.

The programme of the studies for the four years' agricultural course is worth quoting. The range and variety of the kinds of learning which enter into it would probably surprise even those who are devoted amongst us to the cause of agricultural education.

"THE FOUR COURSES OF 12 THIRTY-TWO, OR FOUR YEARS."

"*First Year*—Fall Trimester: Algebra, English language and vocal culture, French, and human and comparative physiology. Winter Trimester: English language and vocal culture, French, geometry, history, and zoology. Spring Trimester: Botany, embryology, English language and vocal culture, French, and rhetoric.

"*Second Year*—Fall Trimester: Chemistry, English literature and rhetoric, experimental physics, German, psychology, and vegetable physiology. Winter Trimester: Chemistry, elementary geology, English literature and rhetoric, German, public speaking, and physics. Spring Trimester: Acoustics and optics, chemistry, book-keeping (for laboratory practice), German, and physics.

"*Third Year*—Fall Trimester: Agricultural and economic botany, agricultural chemistry, English literature and rhetoric, and veterinary anatomy and physiology. Winter Trimester: Agricultural chemistry, agricultural and economic botany, English literature and rhetoric, horticulture, and veterinary medicine and surgery. Spring Trimester: Agricultural chemistry, arboriculture, English literature and rhetoric, landscape gardening, and veterinary medicine and surgery.

"*Fourth Year*—Fall Trimester: Agricultural chemistry, agricultural geology, astronomy (or comparative anatomy and history), practical agriculture, and rhetoric and oratory. Winter Trimester: Agricultural architecture, agricultural technology, practical agriculture, moral philosophy and political economy, and rhetoric and oratory. Spring Trimester: Agricultural mechanics, architecture and rural economy, practical agriculture, international and constitutional law, and meteorology."

The Farm Well Managed, or a Treatise on Green-feeding and Wheat-growing. Showing how double the quantity of Wheat can be grown per Acre, and as many Cows of the largest breed well fed the whole year round as there are Acres on the Farm. By a Man of Forty Years' Experience. With a useful Appendix. J. Heywood, H. Deansgate, Manchester.

Here is a whimsical bit of authorship. In the first place, what is the writer's "acre?" But, indeed, one need not trouble himself much with the inquiry. It is quite possible for the tenant of ordinarily good land to keep a cow even on the imperial acre, and there are a good many hints in this little tract which will assist him. It is, however, out of the odd individuality of the writer, which is displayed obtrusively, that the reader of this little publication will extract his chief amusement. From the introduction, where it is grotesquely enough exhibited, we extract the following passage:—

"The writer has done business for his parent, a gentleman once holding 1900 acres of land, about

300 acres of which he cultivated; and used to have, in one season, 50 acres of Turnips and upwards of 200 acres of Wheat. It would require 120 sheep-shearers to shear his sheep, as he had 3000. He fattened 100 oxen annually; he had in Smithfield every market day (Thursday), from the 1st November till the 1st of May following, fat stock on sale. He kept a small dairy of 10 milch cows; none of the milk was sold, being used in rearing calves, lambs, and pigs, and also in the larder, and any remaining was given to tenants and the poor. It generally took six men daily to prepare corn for the market; he employed daily 30 or 60 men, besides lads and women; he kept 25 horses and beasts at work. I have seen in his stackyard Wheat three years old. I never saw his desk without money in it, and he had also much money out at interest, beside having landed property for ever. He had a nice Swiss carriage, and on the sideboard, in the parlour, was paraded a quantity of silver plate. He kept a splendid table (mostly from the produce of his own farms), at which the best crusted old port wine and several other liquors daily appeared. He brewed every month for family use, and made his own cider. There were fat hocks killed occasionally, as required, and a sheep every Monday morning, besides, at other times, lamb, veal, kid, and lots of poultry. The roasting-jack was daily in requisition; he never allowed a goose to be killed singly, there should be three at one time, as he said the giblets of one goose made but a poor dish. When our hung-beef and bacon was put in chaff, during hot weather, to preserve it, every crook in the kitchen loft, where it had been suspended, was re-occupied by a loaf of sugar, to be kept dry, so that the kitchen resembled a grocer's shop. He had a stand, with 12 moulds, and he borrowed two more stands from his neighbours, Captain Berry, of Eghish Castle, and Captain Drought, of Whigsboro, with whom he was on visiting terms many years. With these 36 moulds, by wicking and filling one by one, the first was fit to draw by the time the last was filled. By this means the housekeeper was enabled to make as many candles in two October days as was sufficient for the household consumption for 12 months; they were then hung up in the larder, in bunches, to bleach. A large number was required, as there were never less than two lights in the parlour and four in the drawing-room at one time without taking into account the number required for the six bed-chambers, the other apartments were well supplied with dips, as were also the stables for the hunters and cart-horses, and the coach-house. In the larder stood a large deep crock filled with sweetmeat, consisting of stoned raisins, currants, suet, sugar, whisky, and lemon-peel, always ready whenever a plum-pudding or a mince pie was ordered. The minister of the parish, if unmarried, boarded and lodged with us, and a single old gentleman, the father of Sir John Kingston James, Lord Mayor of Dublin, not liking the din and noise of a city, likewise boarded and lodged with us many years. Those gentlemen knew well they would have a well-supplied sumptuous table, and the opportunity of intermingling with genteel society. My parent was a sheer industrious man, and understood his business well, having a set day for beginning and finishing all farm operations, and deferred nothing. He made an usel servant man by the breakfast table in the parlour every night before he retired to bed, and for 20 successive winters all the members of his own household ate their breakfast by candle-light. There was a horse saddled, ready for his own use, from an early hour in the morning till late in the evening, and a land steward assisted him and his two sons to conduct the business, besides righthand men residing on his distant farms, which were visited daily in turn, by his sons, mounted on horseback, to see if all was right; still it did not debar his sons or himself of taking their share of recreation in the way of fox hunting, they being well experienced and courageous horsemen, and well mounted, having often returned with three fox-brushes in the bridle head-stall as trophies. He had his business on all his farms well executed and timely, without any tyranny, and died prosperous, wealthy and respected. He made a fair will, dividing his property among 22 legatees. His funeral was numerously attended by relatives and acquaintances, out of the latter were taken 12 bearers, all gentlemen of respectability, some of whom were magistrates and grand jurors. A hearse and horses carried, in an oak and deal coffin, his remains, now entombed."

Farm Memoranda.

WEST SUSSEX.—Harvest is all over, and everything has been secured in good order, except where some were rather too quick from having been frightened at the commencement, as the weather then was rather unsettled, and weather prophets told us sad things about Saturday moons and such like. Though we pretend not to believe these forecasts, yet they sometimes make us feel a little timid. But we don't intend to trust to anybody's prognostications any more. We shall take the weather as it comes, and make the best of it; that is, if our faith don't give way again. However, we have got together a fair crop, but we are now getting the thatch blown off at a rapid rate. There is hardly a whole roof on any rick in the parish, and in many cases they are nearly stripped and the sheaves blowing off. The wind has been terrific since Saturday night, and at present no signs of abating, but we have had some nice showers which have got to ploughing depth. They were much wanted, for pastures are very bare, and stock are on short allowance. The Turnip crop will not be so good as we expected, especially the latter sown. Manure has not done so well, the summer, on the whole, having been too cold, though for three weeks of harvest it was excessively hot. There has not been quite so much threshing as is usually done up to this time—the price being on the whole low,

and having fluctuated so much, and in such unexpected ways. Upon the whole the crop appears to be about an average, and the sample of Wheat is not far behind that of last year, Barley is a good crop, and of good quality, Oats are of good quality, but can hardly be a full crop, Peas are good, and have been well secured. Our markets are well supplied with both fat and lean stock, but the sale is rather slow; stock sheep will rather drop in value, on account of the root crops. There has been a little of the Potato disease, but not to a great extent, and the crop upon the whole is good. Getting ready for the sowing will now be our chief work, and as the weather will work up easily, should the weather be favourable we may get well forward. Cattle will soon have to some indoor food, as the nights will get cold, and pasture bare. They have been more annoyed by flies this summer than usual, and we have been obliged to put them in the sheds by day to protect them; still they have done very well, and there is likely to be a fair supply of beef during the early part of winter, but it is likely to fall off at a later period. Foot-and-mouth disease is reported to be not far off us—around Arundel; and unless timely precautions are taken it will soon spread. People will be rather cautious in sending stock to market for a fortnight. G. S., Sept. 13.

The Poultry Yard.

THE BIRMINGHAM PRIZE LIST.—"Long look for come at last." Heartily welcome, but rather with an alloy of grumbling caused by the line of print that says, "The entries close on Monday, the 1st of November."

Everyone expects great things from Bingley Hill, and he will be hard to please who is not satisfied with the prize-list for 1890. A show that runs into hundreds of classes, with some of them six prizes to a class, is of magnitude to command entries, and that it does so is proved by the numbers that are rejected year after year by the committee because they are one or two posts late, ostensibly, but equally for want of colour. Coloured Dorkings head the list, and have four classes allotted to them, including in their prizes an extra amount of 2*l.* from a railway fund, and two cups, each of the value of 5*l.*—one for the best cockerel, and the other for the two best pullets. We have already this year seen wonderful Dorking chickens, pullets especially, but, with such incentives, breeders will spare no pains, and we may expect to record a great advance on the Silver-greys are allotted two classes, and we think over-liberal allowance of prizes (time in number). White Dorkings are fighting hard to improve their position, and to make a reputation, they are making way, although but slowly. Their admirers will thank the encouragement held out to them a slight one, but they find they have but two classes, and that the best compete irrespective of age. It is a breed the value of which do not supplement the ordinary prize-money, and we suppose the amount allotted is proportionate to the number of entries hitherto received. Four classes for half Cochins, each one headed by a silver cup, value 5*l.*; two of them are offered by Mr. Mapplebeck, a supporter of the Birmingham show from its commencement. The brown and partridge-feathered, and white Cochins are well provided for by eight classes between them.

We may fairly expect the Brahma Poutras this year to be among the most prominent features of the show, and many and close will the comparisons be between the pencilled and the light varieties. There are people who say that the value of the prize has no weight with the real amateur, but what brought out the best Brahmans but the judicious distribution of a few handsome and heavy prizes at the principal shows? I wish well to the light birds, but think they are to be pencilled ones what the Harvard crew was to that of Oxford, they may, and we hope they will, get better each year, but the position, we think, will remain unchanged. The pencilled Brahmans this year have a stimulus of two silver cups in addition to the money prizes.

We do not say that every one will be surprised, but we think, nine amateurs out of ten will be when they see that the breeders of Malays are awaking from years of lethargy, and that the prize-sheet contains an announcement, under the head of the Malay class, that, "by the donations of a few amateurs the committee are enabled to increase the prizes for Malay." The committee and the amateurs are equally to be congratulated, and we hope the entries will spring in proportion. The Malay fowl has not nearly earned credit for its many good qualities, and deserves a much better character than is generally given to it. We may fairly hope that this is a fresh start for the breed, and that we may see it take the position it held in poultry shows, as we understand them, were tried of The Crevecours, Houdans, and La Flotte, in two classes each, and a very close rivalry and competition may be looked for therein. Spanish, in three classes, with a silver cup for the best cockerel. We can readily endorse the allotment of two classes, black Hamburgs, and think they will make a fine way. Golden and silver pencilled and spangled are as heretofore, in the prize-sheet, and may be expected in great force in the pens. If Polish fowls make progress, they try hard to hold their ground, and in three classes.

The inducement to introduce new varieties is so extravagant, the class allotted to them being one of the poorest, if not the poorest, of the whole list.

Sixteen classes, with three prizes of plate and a railway prize, are allotted to the game fowls. Those who know the Birmingham show, know what the game fowls are there; those who don't know it, should go and see them.

The Bantams are wisely to be shown in pens of a

and two hens. The black-breasted reds are to have a silver cup, value 5*l.*, for their 1st prize. The principal varieties of ducks have a class each; the Rouens and the Bucnos Ayrean, or black East Indian, have each an extra prize. We think the geese of all ages might compete together, but cordially approve the separation of the turkeys. The pigeon list must be reserved for next week.

Miscellaneous.

Foot-and-Mouth Disease is a light matter among turks and lean cattle—they will be little, if any, the worse of it; but it is very serious amongst heavy-feeding cattle and milch cows. If fat cattle are attacked, they should have their Turnips sliced, with crushed oilcake and meal. There is no treatment of any avail in the fever stages. When the fever is gone, there will be a beast or two out of a lot whose feet will require attention. The horn of the hoof gets loosened from the flesh. The animals may require to be thrown, and the dead horn cut away. It must be remembered that it will never attach itself again. The veterinary surgeon should generally perform the operation, unless the owner is skilful himself. Cows require great attention. The disease seats itself in their udders, and unless they are most carefully milked out they may be rendered useless as milkers—losing one, two, or even all the quarters of the udder. The foot-and-mouth disease is very infectious. I recollect having carried it home from a neighbouring farm, by merely handling a bull which was down with the disease. I came straight home, and handled the first beast opposite the door in one of my own byres; in three days he was seized with the complaint; and in two or three days thereafter nearly every beast through the steading was down in it. Out of 40 fat cattle, 38 had it, only two escaping. Upon inquiry I found that one of them had had it before. I lost from 1*l.* to 5*l.* of condition on an average off every one of the 38. From the same farm, and at the same time, a veterinary surgeon had been called in. He went straight to another farm, six miles distant, and in a few days every animal there was seized with the same complaint. It is the general belief that an animal will not take the foot-and-mouth disease twice. This is a mistake. I have a cow that took it twice, but there were seven years between the attacks. *Cattle and Cattle Breeders, by W. M'Combie, M.P.*

Calendar of Operations.

SEPTEMBER: Wheat Seed-time.—The sowing of Wheat commences about the close of the month. It used to be the busiest season of the year on what were termed Wheat and Bean farms, but the increased breadth of root crops grown on soils of this kind has extended the period of sowing over the next three months. Still, during the current month and early in October, everything is got ready for preparing and sowing the land intended for winter Wheat.

Seed Wheat newly threshed is to be preferred, provided the crop has been stacked in thorough good order, and care is generally taken that this shall be the case. Nothing pays better than the selection during harvest time of the best Wheat for seed. Clean flinty straw, and crisp plump corn only should be stacked for this purpose. Great improvements have recently been made in the scouring of Wheat, so as to remove by mechanical means the germs of animal and vegetable life, and all such improvements are highly to be commended. But they should not be wholly trusted to, and it is just as imprudent to trust alone to the process of pickling. Both processes should be carried out with equal care. Besides, those who cannot grow good sound seed Wheat for themselves, should purchase of others who can. Some soils and climates are defective some way or other in the growth of Wheat, so that annually losses of quality and vigour occur, according to the season. We need hardly add that for such farms seed Wheat should always be bought, for the simple reasons that it is worth more money than the home-grown, and that the difference of value in favour of the change of seed is greater than generally credited. Some only change every second or third year, but unless under exceptionally fine years, when there is no falling off in the quality, the practice is wrong. The more advisable rule is to change your seed when you do not grow it up to the proper standard, and this is easily known in good time to purchase.

Pickling Wheat.—Some use blue vitriol (sulphate of copper) dissolved in warm water, half a pound or so to a sack of Wheat, using no more water than will wet the surface of the grains when rapidly turned over on the barn floor. For clean fine white Wheats, which have few spines for holding the germ of smut, a quarter of a pound of this mineral to a bucket (two gallons) of water is enough, as for this thin-skinned Wheat a stronger solution is dangerous to the vitality of many of its grains. With Rivetts and other coarse Wheats, with their long spines or hairy end, the half pound per bucket of water may be used, while the Wheat should be immersed in a tub, well stirred for a few minutes, and all floating grains, whether wrapped in chaff or not, skimmed off. The moisture is soon absorbed, so that in a few hours the Wheat is ready for the drill. No more should be dressed at a time than is required for immediate sowing. Others wash the Wheat in brine of a sufficient strength to carry an egg or Potato, and then dry it by sifting hot lime over it on the floor, mixing the two rapidly together until the surface of the grains is covered. No more should be washed than is required for sowing at the time, and any remainder left in the drill or sack should be spread out thin upon a dry floor, otherwise its vitality will be injured, and it may be wholly destroyed, thereby rendering it unfit for seed. The washing over-night should therefore be sown the next day, or, if wet

prevent, the spreading out thinly should be adopted for the whole batch.

Kind of Seed.—Soil, climate, and the like must be considered before it can be determined which is the best sort of seed to sow. The different varieties are very generally known under local names, derived from the persons who selected them as Hallett's Pedigree Wheats; or the district in which they were first grown, as Essex Wheat. Red and White Wheats form another distinction. Some are more hardy than others, and better adapted for this or that kind of soil, climate, and management; so that small trials should be carefully made before extensive changes are carried out.

Thick and thin sowing is a controversy of long standing; much depends upon the weather and state of the land. Some soils tiller abundantly, others sparingly and unequally, when sown thin, the result being more green ears than ripe ones in harvest. The latter soils, however, are capable of much improvement. In the one case from 2 pecks to a bushel per acre is considered more profitable than a thicker seeding. According to other opinions, from 2 to 3 bushels per acre are not found too thick a seeding; but the 3 bushels are generally sown broadcast upon a rough seed furrow, so that much of it is buried too deep and rots. The probability, therefore, is that, on an average, not much over 2 bushels braird and tiller under the thick broadcasting plan.

Wheat sowing is now chiefly done by seed-drills, the coulters being from 8 to 12 inches asunder, and each coulters kept down to a regulated depth by a weighted leverage. The seed is thus put in to a uniform depth, comparatively speaking, so that if sown the whole of it brairds and tillers. The latter, however, only follows when the land is in good condition, and no harm is done by the frosts of winter and spring or from other causes. On some soils, and in some exposed places, less or more loss is generally sustained during winter, so that due provision must be made for such thinnings in the plants. It is hardly possible to estimate, without local experience, the difference between soils and places in this respect.

Potato harvesting commences about the end of the month. The digging is done by hand, by the common plough, or double-mouldboard plough, and by the Potato digger. When dug with a three-pronged fork one man will keep two women or boys gathering with baskets. When turned up by the common, or double-mouldboard plough, one man will shake out to six or eight gatherers. The Potato digger turns up and shakes out at the same time, thus dispensing with hands to shake out. A cart follows the gatherers, into which the potato-baskets are emptied, and the loaded carts are backed into the pit-bottom, generally made about the breadth between the wheels out to the Potatoes being raised as high as possible. They are first covered with straw, and a slight covering of earth, not quite up to the top, and ultimately with a foot to 1½ inches of earth, with straw vents at short intervals along the ridge. Some extensive growers sort their Potatoes in the gathering into three lots—the large for marketing immediately, the next for seed, and the remainder for pigs; the latter two sorts only being stored. But the more common practice is to pit the whole sound crop as above, and, when sold, to sort them by means of potato-riddles, or sieves, the width of the mesh being a matter of agreement.

Housing stock at night takes place about the latter end of the month. The working horses, milch cows, and fattening bullocks are taken up earlier, as previously noticed. Foals, young colts, and idle horses should either have a dry bed in a hovel to go to, or else be taken home to the stable or strawyard; young cattle suffer much from lying over-night on a wet cold bed, and the finer the breed and the higher the condition the greater the loss. Even the hardy Highland cattle in their native glens look out for shelter over-night, or, if the weather is open, they choose a thick comparatively dry bed of long heath. But our lowland herds have no such choice.

Stock sheep require to be provided for in various ways. On some Highland sheep walks, in bad seasons, the shepherds and their flocks have to begin by the end of September, moving towards the lowlands for their winter quarters. In other walks further south, in the border counties of England and Scotland, while lowland farmers are finishing corn harvests, the shepherds are finishing theirs, by the stacking of hay for the winter months beside the stalls or sheep-pens, some of it having to be carted from the tramp-cocks, where it grew, several miles distant, over rough mountain roads. About 2 stones per month or so is provided for every sheep, assuming that something can be scraped from under the snow; and those who do not grow hay themselves purchase. *W. B.*

Notices to Correspondents.

GRASSES: Briton. For permanent Pasture on heavy soils, to be sown without a crop, put in about 50 lb of seeds per acre, including 2 or 3 lb. of each of the usual Fescues except *F. rubra*, a large quantity of *F. lolacea*, 3 lb. each of Timothy, Cockstoot and Foxtail Grass, 5 lb. each of Perennial and Italian Ryegrass, 3 lb. each of *Poa trivialis* and *P. nemoralis*, and 5 lb. each of red and white Clovers. Sow them, without a crop.

RAISING WATER, &c., BY WHEEL: J. B. M. says:—If the "Old Subscriber" who wanted information on this subject can come to me at Reading, I can show him a wheel I put up nearly 20 years ago which has threshed and cut chaff, ground, and pumped for me ever since, without stopping the floods or interfering with the rights of the millers. [We can give an "Old Subscriber" our correspondent's address.]

TO LAY DOWN SANDY WASTE TO GRASS: T. S. B. You are right in getting rid of root and brush by burning. The ashes, however, are not a sufficient manuring. You had better put in a dressing of bones early in spring, before you sow Grass seeds. The better plan indeed would be to burn, and then bone heavily; then grow Turnips; then feed them off with cake-fed sheep; and then sow your Grass seeds.

Seeds Direct from the Growers, the most Effectual Means of Preventing Disappointment.

SUTTON AND SONS, SEED GROWERS, deliver their Home-grown Seeds, Genuine as Harvested, to all parts of the kingdom. Carriage free (except very small parcels).—Prices and full particulars on application. **SUTTON AND SONS, Seed Growers, Reading.**

To Market Gardeners.

TWO HUNDRED THOUSAND extra strong plants (now ready for planting out) of **JENKINSON'S DEFIANCE FARLY CABBAGE**, which is unquestionably the finest early Cabbage in cultivation, being very early, hard, and suitable to run. The stock is specially selected. Price, put out here, 5*s.* per 1000, or 10,000 for 40*s.* Also, about 30 lb of SEED of the above superior Cabbage, of this year's growth; price 6*s.* per lb. **GEORGE T. FOX, The Nurseries, Wexley Rocks, near Leek, Staffordshire** (Post office orders payable at Leek).

SPECIMEN ORCHIDS,

to be sold a bargain, viz.—
AERIDES ODORATUM, extra fine, 3 by 2 feet, 2*l.*
CATLEYA CRISPA, extra fine, 60 pseudobulbs, 4*l.*
MOSSIAE, extra fine, 60 pseudobulbs, 43 10*s.*
ZYGOPETALUM MACKAYI, extra fine, 30 pseudobulbs, 43 10 pseudobulbs, 4*l.*
MILTONIA CANDIDA, extra fine, 18 pseudobulbs, 43 10*s.*
LALIA ANCEPS, 10 pseudobulbs, 41 10*s.*
DENDROBIUM KINGIANUM, 50 pseudobulbs, 42
STANHOPEA INSIGNIS, 30 pseudobulbs, 41 10*s.*
TIGRINA, 20 pseudobulbs, 41 10*s.*
 Or the 10 fine specimens for 40*l.*
 W. R. J. also offers, in good small plants, 5*s.* to 10*s.* each, or the following:—*Maxillaria granulifolia*, *Cypripedium insigne*, *C. barbatum*, *Isotria medeolae*, *V. lutea*.
W. B. DERRICHS, Nurseryman, Ipswich.

First Prizes for Pomology and Arboriculture

At the INTERNATIONAL EXHIBITION, 1867
F. MOREL, Rue du Souvenir, Vaise, Lyons, France, offers the following:—
New SEEDLING PEAR, PROFESSOR HORTOLES, vigorous growth on Quince or Pear, very abundant bearer. Fruit average size, and first quality. Ripens in October. Obtained First Prize. Price, 6 francs each, or 12 for 60 francs.
New PEAR, SOUVENIR DU CONGRES, 2 francs.
DE PONTRIANT PLUM, the best of large Plums, very juicy. It bears August 10 to 20. Dwarf, 1 franc each; standard, 2 francs each.
 Choice Collections, as adopted by the Pomological Congress of France, of PEACHES, NECTARINES, PEARS, APPLES, CHERRIES, and APRICOTS.
 Fifty varieties of TREE PEONY, 2 50 francs each.

TO THE TRADE.—The Undergnod solicits orders for the following:

- | | |
|---------------------------------|----------------------------------|
| Dwarf Maiden Peaches | Arbutus, twice and thrice trans- |
| " Nectarines | 1 and 2 |
| " Cherries | Sweet Bays, 1 <i>s.</i> |
| " Pears and Apples | Isotria medeolae, do. |
| " Plums | Laurea, C. minor, do. |
| " trained of all the above | Portulaca, do. |
| Standards and Pyramids do.— | Pinus austriaca, 2 feet |
| strong clean stuff, and of the | Arbor-vitae, American |
| most approved kinds | Chinese |
| Fruit Tree Stocks, of all sorts | Berberis Darwini |
| Roses, Standards, strong | " aquifolia |
| " Dwarf, worked, do. | Acacia, 1 foot |
| " own roots, do. | Cupressus Lawsoniana |
| Manetti Rose Stocks, do. | Cedrus atlantica |
| | Phillyrea, sizes |
- Most of these articles can be supplied by the 1000, at very reasonable prices, on application to
G. H. AY AND SON, Nurserymen, Brox, Chertsey, Surrey.

Must be Sold, for want of room.

NEW GOLD and BRONZE ZONAL PELAR-

GERANIUMS.—Large plants of the following kinds taken up from the beds, affording lots of cuttings, are offered cheap, viz.—
BICOLORS.—Amber Witch, Anroum, Beauty of Oulton, Bronze Belt, Bronze Shield, Crocus, Eclipse, Jason, Mrs. C. Barry, Pet of the Parterre, Richelleu and Sol.
MARBLE-SHADED FOLIAGED VARIETIES, very strong plants—John Gibson, Lord Lyon, Lucy, Mutabilis, Penelope, Rosette, Rustic, Vanguard, Wonderful.
ZONAL PELARGONIUMS.—Gaiety, F & A Smith's Mon. Acant, F & A S's Scarlet Dwarf, F & A S's Perfection, F & A S's Comte de Moray, Waltham, Zebra, &c. Crystals Palace Gem, great improvement on Cloth of Gold and Gold Chain. A lot of per dozen.
JAPANESE CHRYSANTHEMUMS.—12 varieties of these new novel and beautiful flowers, in pots, to bloom this season. 6*s.* the set; sent out last year at 7*s.* 6*d.* each. See Catalogues.
SWEET WILLIAM, 6 distinct varieties, viz.—Auricula Eyed, Scarlet, Hunt's Perfection, Crimson, mixed, double, and striped, at 6*s.* per dozen.
 A liberal number of plants thrown in against carriage.
DESCRIPTIVE CATALOGUES free on application. 6*s.* per cent. allowed to the Trade.
 Apply to **T. L. MAYOS, Seedman, &c., Lugwardine, Hereford.**

CHOICE NEW PLANTS,

in single pots, well established.
NEW FUCHSIAS of 1869, 12 of the best and most distinct, 9*s.* & 12*s.* per dozen.
NEW CHRYSANTHEMUMS of 1869, 12 of the best and most distinct, 9*s.* per dozen; 24 do. do. do., 7*s.* 6*d.* per dozen.
NEW COLEUS of 1869, 12 of the best and most distinct, 6*s.* per doz. Beauty of Widmore, 1*s.* 6*d.* each.
NEW GERANIUMS, 6 of the most beautiful of the season, all received Certificates, 1*s.* 6*d.* each.
DOUBLE GERANIUM, Madame Lemoine, 9*s.* per dozen.
NEW DOUBLE GERANIUM, Victor, 30*s.* per dozen.
NEW HELIOTROPES of 1869, 6 of the most distinct, 1*s.* each.
NEW LOBELIAS of 1869, 6 of the most distinct, 1*s.* each.
NEW VERBENAS of 1869, 12 of the best and most distinct, 4*s.* p. doz.
NEW ALTERNANTHERA MAGNIFICA, most beautiful, 1*s.* each.
NEW GOLDEN GRASS, *Alopecurus pratensis aureo-variegatus*, 2*s.* 6*d.* each.
NEW HOLCUS, *Lanatus albo-variegatus*, 2*s.* 6*d.* each.
NEW IRESINE, *Acuminata*, 1*s.* 6*d.* each.
NEW MYOSOTIS (SUN-FLOWER), 6*s.* per dozen.
 Post free orders to T. L. MAYOS, Seedman, &c., Lugwardine, Hereford.
 For above and CATALOGUE of Nurbs, Roses, Primroses, Violets, Po santus, and other Hardy Herbaceous and Alpine Plants, &c., apply to
WILLIAM DILLISTONE, Nurseryman, Sibbald Hedingham, Essex.

Fine New Hardy Clematises.

GEORGE JACKMAN AND SON are now sending out their two following NEW CLEMATISES, that they can warrant as distinct, vigorous, and abundant flowering as those varieties which have already obtained such general approbation.
CLEMATIS LADY BOVILL (First-class Certificate Royal Horticultural Society).—"Width of the petal is greater than its length, which causes it to be very slightly cupped, resembling a somewhat expanded Tulip, while its colour (a greyish blue) marks its distinctness."—*Floral Magazine*.
 "The more novel tints of light mauve and greyish blue."—*Gardener's Chronicle*.
CLEMATIS MAGNIFICA (First-class Certificate Royal Botanic Society).—"This is one of the most hardy and vigorous growing varieties of the Working Hybrid. The colour is purple, suffused with a strong crimson shading over the whole surface of the flower, making it very attractive."
 "The petals of which are barred with Turkey red."—*Gardener's Chronicle*.
 2*s.* each, or three plants, viz., one C. Lady Bovill and two C. magnifica, for 4*s.* A few extra strong plants, 5*s.* 6*d.* each.
 A Coloured Drawing (by Andrews) of C. Lady Bovill can be had by enclosing 12 stamps, or Circular, giving "Opinions of the Press," with engraving, for one stamp.
 The usual allowance to the Trade.
Woking Nursery, Surrey.

HOT-WATER APPARATUS of every description, fixed complete in any part of the country, for Warming Greenhouses, Conservatories, Forcing Pits, &c.

Plans and Estimates on application.
J. JONES AND SONS, 35, King Street, Cheapside, London, E.C. Manufactory, 6, Bankside, Southwark

JAMES WATTS AND CO., HOTHOUSE BUILDERS and Hot-Water Apparatus Manufacturers, 353, Old Kent Road, London, S.E.

200 CUCUMBER and MELON BOXES and **LIGHTS**, all sizes, Glazed and Painted complete, read for immediate use, packed and sent to all parts of the Kingdom. Strong **ZINC HAND-GLASSES**, all sizes. References to the Nobility, Gentry, and Trade in most of the Counties in England.

HOT-WATER APPARATUS Erected Complete, or the Materials Supplied for Heating Peill's Conical, **GREENHOUSES, HOTHOUSES, CONSERVATORIES, CHURCHES, PUBLIC BUILDINGS, &c.** Tubular Boiler.

HOT-WATER APPARATUS Erected Complete, or the Materials Supplied for Heating Peill's Conical, **GREENHOUSES, HOTHOUSES, CONSERVATORIES, CHURCHES, PUBLIC BUILDINGS, &c.** Tubular Boiler.

IMPROVED PEILL'S and ELLIPTIC BOILERS, from 24s each. **IMPROVED and EXTRA STRONG CAST IRON TUBULAR BOILERS**, with or without Water Bars, from 52s 6d each. **CAST and WROUGHT IRON PORTABLE BOILERS** on STAND, for use without brickwork, from 60s each. **PATENT and IMPROVED THROTTLE** and other VALVES, **FURNACE DOORS, BARS, and FURNACE WORK** of every description and size.

LYNCH WHITE, Old Barge Iron Wharf, Upper Ground Street, London, S.E. (Surrey side Blackfriars Bridge). Price List on application.

RICHARDSON'S PATENT HORTICULTURAL BUILDINGS.

PLAIN LANTERN-ROOFED CONSERVATORY, and LEANTO VINERY or PEACH-HOUSE on adjoining wall.

Illustrated Price Lists of Sir J. Paxton's Patent Roofs on application.

Designs prepared and Estimates given for Conservatories to suit any style of Mansion, on receipt of particular of size required with rough sketch or description; also for Heating Apparatus to any extent, fixed complete in any part of the United Kingdom.

HEREMAN AND MORTON, 7, PALL MALL EAST, LONDON, S.W., HORTICULTURAL BUILDERS AND HOT-WATER ENGINEERS.

A HANDBOOK of VINE and FRUIT TREE CULTIVATION, with full particulars of Patent Roofs, of Conservatories, Hints for Heating, &c. By S. HEREMAN, Chatsworth. Post Free, 13d.

PORTABLE AND FIXED HOT-WATER APPARATUS,

FOR HEATING CONSERVATORIES, HOTHOUSES, CHURCHES, PUBLIC BUILDINGS, PRIVATE RESIDENCES, ETC., WITH

TRUSS'S PATENT UNIVERSAL FLEXIBLE AND LEAKLESS PIPE-JOINT

T. S. TRUSS

Begs to state that the immense number of APPARATUS annually Designed and Erected by him in all parts of the Kingdom, and for the ROYAL HORTICULTURAL SOCIETY at SOUTH KENSINGTON and CHISWICK, with unrivalled satisfaction, is a guarantee for skill of design, superior materials, and good workmanship; while the great advantage obtained by his IMPROVED SYSTEM cannot be over-estimated, consisting of perfectly tight joints neatness of appearance, EFFECTS A SAVING OF 25 PER CENT on cost of Apparatus erected complete with other systems; facility for extensions, alterations or removals without injury to Pipes or Joints; and erected by any Gardener; an ordinary size Apparatus erected in one day; and PERFECTNESS of DESIGN SUPPLIED, INSURING NO EXTRAS. Complete Apparatus, of the best materials, delivered to any Railway Station in England, and Erected at the following prices. Erection beyond 25 miles of London, railway fare for man additional. Considerable reduction on large works.

TWO FOUR-INCH PIPES ALONG ONE SIDE AND ONE END OF HOUSE.

Size of House.	Apparatus Complete.	Erection	Size of House.	Apparatus Complete.	Erection

Bath and Gas Work erected in town or country. The Trade Supplied.

Price Lists, Plans, and Estimates forwarded on application to

T. S. TRUSS, C.E., CONSULTING HORTICULTURAL ENGINEER, &c., SOLE MANUFACTURER, IRON MERCHANT, HOT-WATER APPARATUS MANUFACTURER, AND HORTICULTURAL BUILDER, FRIAR STREET, BLACKFRIARS ROAD, LONDON, S.E.

SHANKS' IMPROVED WROUGHT-IRON BOILER.

This Boiler is made on the principle of the Saddle and Tubular boiler, and is fixed complete in any part of the country. It is made of Wrought-iron, and is not liable to break from expansion and contraction. The Tubes are placed in the Fire-box, and so arranged as to expose a very large effective heating surface to the direct action of the fire, the advantage of which is obvious.

A. S. AND SON will be glad to furnish their IMPROVED BOILERS separately, or to furnish Plans and Estimates for Erecting Hot-water Apparatus complete in any part of the country.

Catalogues, containing Designs of Houses, &c., will be forwarded on application. Special Plans and Estimates for Ranges of Houses to be erected in any part of the country will also be furnished. A. SHANKS AND SON, Deans Iron Works, Arbroath, N.B.; and 27, Leadenhall Street, London, E.C.

ECONOMY IN THE GARDEN.

James Carter & Co. Seed Growers

COLLECTIONS OF HYACINTHS, CROCUS, TULIPS, &c.,

TO PRODUCE A PRETTY AND PERMANENT DISPLAY DURING WINTER AND SPRING.

JAMES CARTER AND CO. strongly recommend the following COLLECTIONS, assorted from the most popular varieties -

No. 1.-CARTER'S COLLECTION for WINDOW or CONSERVATORY DECORATION £4 4 0

CONTAINING:

- Hyacinths, 50 in 25 extra fine named sorts
Tulips, extra fine, named, Double, 60
Polyanthus Narcissus, 36 in 12 Do. do. do. Single, 50
Double White Narcissus, 4
Diostrya spectabilis, 4
Jonquils, Sweet-scented, 60
Lilium speciosum, in variety, 4
Crocus, finest, named, 200
Scilla sibirica, 36
Cyclamen persicum, 4
Snowdrops, extra large, selected.

No. 2.-CARTER'S COLLECTION, reduced quantities £3 3 0

No. 3.-CARTER'S COLLECTION, reduced quantities £2 2 0

No. 4.-CARTER'S COLLECTION, reduced quantities £1 1 0

No. 5.-CARTER'S COLLECTION for CONSERVATORY and OUTDOOR PLANTING £4 4 0

McLAREN'S PROLIFIC RASPBERRY.

For full description, see page 956, in

Gardener's Chronicle Sept. 13.

AWARDED A FIRST-CLASS CERTIFICATE

JAMES CARTER AND CO. are now booking orders for the above valuable fruit, to be supplied this autumn at the following prices -

- 6 Strong Canes, 7s. 6d. | 25 Strong Canes, 20s.
12 Strong Canes, 12s. | 100 Strong Canes, 60s.

No. 6.-CARTER'S COLLECTION of BULBS for CONSERVATORY and OUTDOOR PLANTING £3 3 0

No. 7.-CARTER'S COLLECTION, reduced quantities £2 2 0

No. 8.-CARTER'S COLLECTION, reduced quantities £1 10 0

No. 9.-CARTER'S COLLECTION, reduced quantities £0 15 0

No. 10.-CARTER'S COLLECTION for OUTDOOR PLANTING £4 4 0

CONTAINING:

- Hyacinths, 75 in 3 colours
Narcissus, Double, White, 50
Poeticus or Pheasant-eye, 50
Double Daffodils, 50
Tulips, extra fine mixed, Double, 75
Crocus, B. n. c. 200
Striped, 200
Large Yellow, 200
White, 200
Anemones, extra fine mixed, 100
Gladolus Brenchleyensis, 24
Iris, ex choice mixed English, 50
Lilium candidum, 6
aurantiacum, 6
margarita rubrum, 6
Lilium, 6
Ranunculus, extra fine mixed, 100
Snowdrops, 400
Winter Aconites, 100

No. 11.-CARTER'S COLLECTION, reduced quantities £3 3 0

No. 12.-CARTER'S COLLECTION, reduced quantities £2 2 0

No. 13.-CARTER'S COLLECTION, reduced quantities £1 1 0

No charge for packing any of above Collections.

For the fullest information to ensure successful cultivation and particulars of the above Assortments, send for

JAMES CARTER AND CO., THE ROYAL SEEDSMEN, 237 AND 238, HIGH HOLBORN, LONDON, W.C.

SUTTONS'

IMPORTED FLOWER ROOTS

SUTTON & SONS, SEEDSMEN TO THE QUEEN, READING, BERKS,

having received their FIRST CONSIGNMENT OF CHOICEST DUTCH FLOWER ROOTS.

Selected by themselves from the leading Growers in Holland, are now prepared to receive orders for their COMPLETE COLLECTIONS for WINTER and SPRING BLOOMING, either for indoor or outdoor cultivation.

Suttons' £2 2s. Collection of Flower Roots,

For OPEN GROUND, Carriage Free, contains-

- 24 fine mixed Border Hyacinths
12 fine mixed Gladioli
12 Duc Van Thol Tulips
25 Pheasant's Eye Narcissus
12 mixed Single Early Tulips
25 Double White Narcissus
12 fine mixed Double Tulips
50 Double Daffodils
12 Parrot Tulips
12 large Campernelle Jonquils
12 Gesneriana Tulips
100 fine mixed Double Ranunculus
60 fine mixed Tulips
100 Scarlet Turban Ranunculus
12 English Iris
25 fine mixed Double Anemones
12 Spanish Iris
25 Single Anemones
6 Lilica, of sorts
300 Crocus, in 6 sorts
6 Ferraria pavonia
100 Snowdrops
12 Dog's Tooth Violets
50 Winter Aconites
6 Crown Imperials

Suttons' £1 1s. Collection of Flower Roots,

For OPEN GROUND, Carriage Free, contains-

- 12 fine mixed Border Hyacinths
6 Polyanthus Narcissus
12 Pheasant's Eye Narcissus
6 mixed Single Early Tulips
12 Double White Narcissus
6 fine mixed Double Tulips
25 Double Daffodils
6 Parrot Tulips
6 large Campernelle Jonquils
6 Gesneriana Tulips
60 fine mixed Double Ranunculus
25 fine mixed Tulips
50 Scarlet Turban Ranunculus
6 English Iris
12 fine mixed Double Anemones
6 Spanish Iris
12 Single Anemones
3 Lilica, of sorts
50 Crocus, 3 sorts
3 Ferraria pavonia
50 Snowdrops
6 Dog's-Tooth Violets
25 Winter Aconites
3 Crown Imperials

Suttons' 10s. 6d. Collection of Flower Roots,

For OPEN GROUND, contains a choice assortment for a Small Garden.

Suttons' £2 2s. Collection of Flower Roots,

For POTS or GLASSES, Carriage Free, contains-

- 24 fine Hyacinths, by name
6 Persian Iris
12 fine Miniature Hyacinths, do.
6 Peacock Iris
12 Polyanthus Narcissus, do.
100 Crocus, by name
12 large Double Jonquils
12 choice Lilies, by name
12 Single Sweet-scented Jonquils
6 choice Sparaxis, by name
12 Single Duc Van Thol Tulips
1 Cyclamen persicum
12 Double Tournesol Tulips
1 Jacobea Lily
60 Early Tulips, 10 sorts
2 Lilium lanceifolium album
2 " " rubrum

Suttons' £1 1s. Collection of Flower Roots,

For POTS or GLASSES, Carriage Free, contains-

- 12 fine Hyacinths, by name
3 Persian Iris
6 Miniature Hyacinths, by name
3 Peacock Iris
6 Polyanthus Narcissus, do.
50 fine Crocus, by name
6 Large Double Jonquils
6 choice Lilies
6 Single Sweet-scented Jonquils
3 choice Sparaxis
6 Scilla picea
3 choice Oxalis
6 Single Duc Van Thol Tulips
1 Jacobea Lily
6 Double Tournesol Tulips
1 Lilium lanceifolium album
25 Early Tulips, 5 sorts
1 " " rubrum

Suttons' 10s. 6d. Collection of Flower Roots,

For POTS or GLASSES, contains a choice assortment of most useful and showy kinds.

The best 12 Hyacinths, by Name, for 12s., Extra fine Double and Single varieties.

For further particulars, with complete Cultural Instructions, see

SUTTONS'

AUTUMN CATALOGUE FOR 1869,

Gratis and Post Free on application.

FLOWER ROOTS and SEEDS CARRIAGE FREE, except very small parcels.

Five per cent. allowed for cash payments.

SUTTON AND SONS,

ROYAL BERKS SEED ESTABLISHMENT,

READING.

Primulas, Fuchsias, Vines.

PRIMULA.—New SEED from the choicest strains in cultivation, Red, Purple, White, and Striped, now offered to the Trade, in liberal Trade packets, mixed, 7s. 6d. and 10s. 6d. Retail, 2s. 6d. and 3s. 6d. per packet. FINE PLANTS, 6s. per dozen. Strong Plants of our four New FUCHSIAS, with plenty of Cuttings on 2s. 6d. each. These are four of the best yet sent out for Market or Exhibition.

A large collection of choice VINES for fruiting and planting. DESCRIPTIVE LISTS and prices on application to FELTON AND SONS, Birmingham Nursery, Harborne Road, Birmingham.

To the Trade.

MRS. PINCE'S MUSCAT VINE, Planting Cane, 6 feet, 42s. per doz. CLEMATIS STANDISHII, very strong, in pots, 75s. per 100. H. P. ROSES, in pots, good sorts, our own selection, 60s. per 100. ROSES, New, of this season, in pots, 18s. per doz. HEDERA MACULATA and H. MACULATA LATIFOLIA, extra strong, in pots, 60s. per 100. CATALOGUES of General Nursery Stuff on application to G. BAKER AND SON, American Nursery, Bagshot, Surrey.

To Market Gardeners and Planters.

THE SUBSCRIBERS beg to offer the afternamed, in fine healthy well-ripened Standard and Pyramid Trees, by the dozen, hundred, or thousand, of a sort, at low prices, which may be had on application. The Standard Trees are on stems, 5 to 6 1/2 feet high; the Pyramids average from 3 1/2 to 5 feet.

PEARS—Beurré de Capiaumont | PLUMS—Belle de Louvain
Fray's Seedling | Diamond
Hessel | Mitchellson
Welbeck Bergamot | Prince Englebert
&c. &c. | Victoria, &c., &c.

RICHARD BRADLEY AND SONS, Halam, near Southwell, Notts.

Fruits and Fruit Trees

J. SCOTT, The Nurseries, Merritt, Somerset, has now in his fruit room about 500 sorts of PEARS, which he offers, in named collections, at 1s. per dozen sorts. Cash with order; small sums in stamps. Orders for FRUIT TREES will be carefully attended to. 1000 sorts of Pears, 700 of Apples, 170 of Plums, 150 of Cherries, and other kinds in proportion. These are grown as Standards, 6 to 7 feet, Pyramids, 6 to 7 feet; and Bushes, 3 to 4 feet high; also Dwarf-trained fine healthy plants, and are described in the "Orchardist," the best work on Fruits in England, price 1s. 6d. A printed List or Index sent gratis.

Spring Flowers, Roses, Fruits, &c.

THOS. S. WARE'S new AUTUMN CATALOGUE of ROSES, EVERGREEN and ORNAMENTAL TREES, SHRUBS, FRUITS, &c., is now ready, and will be forwarded free on application. To which will be added a select List of SPRING-FLOWERING PLANTS, especially requiring to be planted in the Autumn, in order that they should be thoroughly established for flowering well and early in the Spring. Hale Farm Nurseries, Tottenham, Middlesex, N.E., adjoining the Railway Station.

Roses, New Roses, Gladioli.

LÉVÊQUE ET FILS, NURSERYMEN, 132 and 134, Boulevard de l'Hôpital, Paris, have a very large stock of strong ROSES, Standards, Half-Standards, Dwarfs, and on their own roots, including a large selection of novelties. NEW ROSES for this YEAR (to be sent out for the first time next November)—They can supply all these, with a large discount. GLADIOLI SEEDLINGS (first-rate) per thousand, and all the best sorts by name. LISTS and prices sent free on pre-paid application.

Ranunculuses, Anemones, Tulips, &c.

C. TYSO, Florist, &c., Wallingford, Berks, is offering these beautiful hardy flowers, in great variety of colour, at reduced prices, as under. They can be forwarded safely by post. RANUNCULUSES, fine mixed, Double, 10 to 5s. per dozen. ANEMONES, fine mixed, Single, 10 to 5s. per dozen. TULIPS, fine mixed, Single, 10 to 5s. per dozen. good Double do., named, 3s. to 4s. per dozen. RANUNCULUS and ANEMONE SEED, 2s. 6d. per packet. Treatise on Ranunculus, 7 stamps; Treatise on Anemone, 4 stamps. CATALOGUES free for one stamp.

The Gardeners' Chronicle.

SATURDAY, OCTOBER 2, 1869.

MEETINGS FOR THE ENSUING WEEK.

Royal Horticultural (Fruit and Floral Committees), at South Kensington .. 11 A.M.
Tuesday, October 5
Ditto (General Meeting) 3 P.M.

WHAT decision the ROYAL HORTICULTURAL SOCIETY may have come to as to its future operations in the matter of PROVINCIAL SHOWS we know not indeed we are ignorant whether any decision at all has yet been arrived at. In any case we imagine that there is still ample time for outside discussion, and we believe it would be very much to the interests of the Society and of horticulture generally, did such discussion take place. We take it for granted that the balance of evidence would be in favour of continuing these provincial trysts. Assuming that this postulate is granted, these questions then arise—Is it desirable that the Society's exhibition be held, as heretofore, at the same time and place as that of the Royal Agricultural Society, or is it not preferable, with last year's experience in view, that the two exhibitions should be dissociated? In the latter case, where should the place of meeting be? We do not wish to obtrude any opinion of our own—we merely invite discussion, and in so doing we may state one or two facts which must be duly considered, in order to arrive at a satisfactory solution. Fact number one is, that the meeting of the Royal Agricultural Society for the ensuing year is to be held at Oxford, than which few towns can be better placed in regard to accessibility and convenience of visitors, while certainly no city can surpass it in interest. On the other hand, Oxford is not a horticultural centre in the same sense as Manchester or Glasgow are, and whether, with the manifold attractions of the old university town, superadded to the "bovine furor," poor Flora would not pine neglected in "Port Meadow," "Jericho," "Paradise," or some other locality known to old

Oxonians but little likely to be explored by visitors, is one of the questions we should like to see discussed.

Fact number two is, that Dublin holds out the hand of fellowship. From across St. George's Channel a suggestion is wafted which assuredly merits attention. It is this, that the Royal Horticultural Societies of London and Dublin respectively should unite their forces, and hold a grand horticultural meeting in the Irish metropolis. The proposal is made in the current number of the *Gardeners' Record*, and the project, if carried out in the same spirited manner as that in which it is conceived, must of necessity prove successful. The success or failure of such gatherings depends in great measure, we may say almost entirely, upon the efficiency and completeness of the local arrangements. Exhibitors may fill the allotted space to overflowing with the products of their skill and industry—prize lists may be ample, crowds of visitors even may be forthcoming, but if the local arrangements be badly planned or imperfectly carried out, and specially if there be not harmonious co-operation between the local and the central authorities, the result is sure to be unsatisfactory, and in all probability will be discredit to all concerned. It is very significant that in the very same number of the *Record* is a report of a meeting held in Dublin for the purpose of considering the propriety of establishing a horticultural club. This proposal, it appears, was well received, and is likely to be carried into effect. We infer from this that the prospects in Dublin of united action in matters horticultural are favourable. Every one knows the *expressément* with which our Irish brethren take up a cause dear to them, and hence if it should be decided to listen to the persuasive tones of Erin, and hold a grand show in her metropolis, we shall have no cause to dread any lukewarmness in the matter. We shall revert to these subjects on a future occasion, and in the meanwhile we should be glad, in the interests of horticulture, to see the subject discussed in a manner commensurate with its importance.

WE are informed that at the MEETING of the ROYAL HORTICULTURAL SOCIETY to be held on October 5 the following prizes will be offered, viz.:

- By W. WILSON SAUNDERS, Esq., V.P.R.H.S.—Collection of Edible and Poisonous Fungi, 2l., 3l., 2l. These should be tastefully set up, and, as far as possible, correctly described and named.
- By Messrs. J. A. J. & Co., FRUITERS—Best three bunches of Madresfield Court Black Muscat Grapes, 5s.
- By the same—(Grapes) three bunches of Chasselas Muscat (open), 1l., 10s.; three bunches of Muscat Hambourg (open), 1l., 10s.; three bunches of Frankenthal or Hambourg (open), 1l., 10s.; three bunches of White Muscat of Alexandria (open), 1l., 10s.; three bunches of Alicante (open), 1l., 10s.; three bunches of any new or recent variety (open), 1l., 10s.; the best collection, named (open), 2l., 10s.

At the meeting of the Royal Horticultural Society on Tuesday next we are informed that Mr. HOOLEY, of Wollaton, near Nottingham, intends to exhibit some specimens of his CONQUEROR PRIZE CELERY, a variety which is said to be superior to all others. As the seed was not sown until the first week in April, and as the specimens to be exhibited are expected to weigh from 6 lb. to 7 lb. each, it may be fairly inferred that the variety is of quick growth as well as large size. After the exhibition at Kensington the specimens may be seen at the establishment of Messrs. BARR & SUGDEN.

A paragraph appeared at p. 993 relating to the fall of a large BEECH TREE, in which accidentally nothing was said as to the condition of the roots. We have now examined them carefully, and we find on the larger fragments abundant white spawn which undoubtedly belongs to some Polyporus, and possibly to *P. adustus*, though that is not the only species which affects the Beech. On the smaller portions there is a granular brownish mass, the nature of which is very uncertain; it is also doubtful whether this is due to the exusion of sap from the decaying roots, or whether it is wholly extraneous. The question before us at present is, how shall we ascertain or even suspect that the roots are in an unsound condition, and so prevent the possibility of accident by timely removal? In general something wrong may be anticipated if the foliage assumes an unhealthy appearance, or if some of the branches perish, or if the trees become stag-headed. But this is not always an indication of total decay, and in the latter case it is the primary root which is the only one which is in general affected. We have seen many trees which have fallen in high winds from the roots being decayed either from the natural effects of old age or from the attack of Fungi, of which there was a remarkable instance a short time since in a fine Elm in the pleasure-ground at Kew. A few years since specimens, according very closely with those now before us, were forwarded by the late Sir W. MIDDLETON, who was anxious, if possible, to save some fine Beech trees which had assumed an unhealthy condition. We recommended then a close examination of the roots, and the removal of every one which was attacked by Fungus. We never heard what was the result of the examination and the supply of fresh compost, but if there were any sound superficial roots of sufficient size

we have little doubt that the treatment would have been effectual.* M. J. B.

The LUCERNE DODDER, *Cuscuta lassica*, seems to be spreading here. We have heard of it in Cambridgeshire and elsewhere, and recently a correspondent forwarded us specimens from Adwell, in Oxfordshire. No doubt it has been introduced with foreign seed. Its clear orange stems, abundant pure white and exquisitely-scented flowers, make us, from our point of view, regard it as anything but a weed, though the farmer would no doubt join issue with us in this matter.

The following letters appeared in the *Standard* of the 18th ult. The EFFECTS OF THE STORM described in the latter one are singularly similar to the effects of heat mentioned by a correspondent, writing from Penge, three weeks previously (p. 915).—"In reply to the correspondent in your journal of to-day, the Elm, Chestnut, Apple, Filbert, and many other trees and bushes in this neighbourhood, are all in the same state, the leaves on the western side of the trees are shrivelled, and quite brown and black speckled; on the other parts quite fresh and green. This is 30 miles from the nearest point of the sea. JOHN HILL, Westbury, Wilts, Sept. 16.—"The same extraordinary effects of the late gale as reported by your correspondent from Winterbourne, near Bristol, were very strongly marked here; though, as we are situated quite 45 miles from the nearest seashore, I cannot suppose the phenomena to be caused by the sea water, as he imagines. In my garden, on the W.S.W., or weather side, the trees and tall shrubs, particularly the Horse Chestnut and Damsons, are scorched and withered, exactly as though fire had passed over them, whilst on the opposite side they are still as green as ever. But the most remarkable feature in the matter is that though these trees and shrubs are standing on very high ground in my garden, and were fully and completely exposed to the fury of the gale, they are only thus withered and seared in the upper branches, and in no case are they injured within 9 or 10 feet of the ground; the lower branches of the Damsons and shrubs being still as green as ever. A. SHIRLEY, Chisleton, near Swindon, Wilts, Sept. 17."

A correspondent sends us the following interesting communication relating to the production of COLOUR IN LEAVES of the IVY-LEAVED PELARGONIUM, by simply bending the leaf stalk:—"L'Éléante, the Ivy-leaved Pelargonium, makes a very nice cover for a pillar, or for a trellis. If, when it is 4 or 5 feet high, a leaf-stalk here and there be bent, so as not to impede the circulation entirely, the effect, after a few days, will be very good. The leaves on the injured footstalks become beautifully coloured with shades from pink to purple, and afford a fine contrast to the clear creamy white colour of the natural leaf. A. B." No doubt some of our readers will try this simple experiment, and if so they will be doing good service by communicating the results.

In addition to the British exhibitors at the INTERNATIONAL HORTICULTURAL EXHIBITION at HAMBURG, to whom we have before referred, we may state that Mr. W. S. BOLLTON, of Norwich, succeeded in carrying off no less than four prizes for garden implements and furniture, such as lawnmowing machines, water barrows, engines, and chairs. Mr. BOLLTON has also taken a Silver Medal for the best collection of horticultural implements, &c., shown by him at the International Industrial and Agricultural Exhibition now being held at Altona, in Sleswig-Holstein.

Intending visitors to Chiswick will be glad to learn that the LARGE VINERY is now in fine condition. The Vines are in excellent health, and have produced this season about 4000 bunches, of a good average description. We understand that a photograph of the interior has recently been taken.

Our funny friend, that is to say "FUN," has been perpetrating a piece of mischief at our expense. He has administered a playful whack with his staff and bladder on our shoulders—all for fun of course, and so we will not be such ill-conditioned curmudgeons as to grumble at him, particularly as his assertions, like idle dreams, should be taken *contrarywise*; and we are far too fond of fun to grumble at it, even when it is Puckish. Here is what "FUN" says:—

"The 'Gardeners Magazine' holds too high a position to be suspected of ulterior motives, when it condones the Horticultural Society for making the *Gardeners' Chronicle* its exclusive and favoured organ. If the Society possessed a Journal of its own no one would complain, but that it should thus favour—if [oh! the power of 'if'] such questionable practice does favour—the *Chronicle* is disgraceful to the Society and the periodical alike. It is as if the Agricultural Society, for instance, compelled its members to take in the *Daily Telegraph* by giving its reports to that journal. The Horticultural Society ought to be re-named. It is a *club* for the management. It is a *Dike* and *Sea* tural Society, and solely intended to promote the interests of agriculture, and periodically of members of the *hip*, on 'er another somebody to relieve the other poor of London—poor science, poor agriculture." If he would buy up 5000 Kensington, the garden, and the Museum, and convert them into a wilderness, he would not only avert disgrace from England, but give some chance of a regeneration in horticulture, science, and art."

Well, certainly this is about as funny a tissue of misunderstandings and misstatements as could well be woven, even by ATROLYCUS or MR. PARINGTON. We leave the Society, the *Telegraph*, the Museum to take care of themselves, but as to our not over courteous garden contemporary, we are not disposed, at his bidding, to take part in the revival of the Pickwickian farce of the "rival editors;" we would simply, in all good fellowship, ask him to make sure of his facts

* We suppose that our correspondent in stating the butt was 14 feet in diameter, included the soil which was torn up with it. We conclude that this must have been the case, as the tree is described as 11 feet in girth.

before he launches a diatribe against us. As it entirely deny his allegation, and we do him a hourly turn—at least, we hope so—by telling him that the same sources of information are open him as to us, that is, provided he be a Fellow of Society, and avail himself of the privileges of Fellowship by obtaining as we did, the sheets of supposed defunct Journal in the manner provided the regulations of the Society for that purpose enact. For the sake of "Fun," who does not appear to over well posted in matters horticultural, we append the following:—

Three journals, in three different ages born,
The spacious world of gardening to adorn.
Its even way the *Chronicle* pursues,
Promptly the "Journal" doth record the news;
The "Magazine"—the others doth abuse.
Add Ireland's "Gardeners' Record" for a fourth;
A "Farmer" and a "Gardener" in the north
And in the south, besides the "Florist,"
The "Field" for garden, farm, or forest.
Good luck to all the eight! Should there be more,
Here's to them all! an' a "Gard'ning to the fore!"

New Plants.

MORMODES VARIABILIS, sp. n.

Sepals late ligulatis acutis, petalis striatis, albis; lobis brevi unguiculato hastato triangulo apiculato revolutis, ciliolato velde piloso; flore aurantiaco (= aurantiacum) atropurpureo (= atropurpureum).

A many-flowered species, like *Mormodes Carlina* introduced first by Messrs. Backhouse, no doubt from Western South America, and afterwards by W. Saunders, Esq. (= atropurpureum), and Director (= aurantiacum). The purplish variety is nicely spotted with darker spots on the lip.

CYPRIPEDIUM NIVEUM, sp. n.

Aff. *Cypripedium concolor*: sepalis dorsali transverso ovato apiculato, sepalis inferiori ovato triangulo orbello bene breviter petalis ovatis apice lobis emarginatis; labello orbato saccato lobis imbricatis obtusangulis, staminibus oblongis basi breviter articulis trilobis, foliis obscure viridibus, albis striatulis.—*Cypripedium* (L.) Sw., var. *noveboracense*, Hook. & Arn. in litt.

This is quite a little gem, having flowers like those of *Scelopodium Schlimii*, white, with delicate violet spots and a deep yellow blotch on the staminal. The question, whether it is a variety of *Cypripedium concolor* cannot now well be decided. The leaves are mottled in a very different way, there being distant white stripes, on the dark green surface. The shape of the sepals is very different—and I remember how constant it is in *Cypripedium purpuratum*. The petals are much broader, shorter, and emarginate; the lip is rounder and shorter. We believe that ochre-coloured Orchids have little tendency to be white flowers. Whatever may be the final decision to the position of the plant, it is no doubt total distinct for amateurs, who will certainly like it. It comes from India, having been the last Orchid to puzzle our much-lamented correspondent, Jam. Veitch.

POLYCYCNIS LEPIDA, Lindl. et Rehb. fl.

Racemis nutante pluribus; rachis velutina. Bracteis lanceolatis acuminatis, lobis scaberrimis, ovata velutina, non attingentibus; sepalis ligulatis acutis, lobis linearibus lanceolatis, lobis acutis in basi linearibus acutis callo interposito, lacinis posticis triangulis obtusis, acutis non angulatis, callo linearis acutis angulatis, acuminatis in disco, lacinis anterioribus obtusangulis delatatis triangulo extensa, apiculata puberula, coloris filiformis apice dilatato, in trochilo postico obtusangulo.

A very interesting addition to the genus *Polycynis*. For a long time we knew it only from the inspection of some shrivelled flowers, and we hesitated to judge it fully. Having, however, lately had the opportunity of seeing the plant at the Hamburg show, as having seen in an adjacent room the true *P. barbata* (all represented in Bot. Mag. as to the base of the lip from Frau Senatorin Jenisch's garden, where it was grown by M. Kramer, we were able to see the scientific distinction of what the amateur sees immediately is different, without understanding what peculiarities of the flower are to be looked at in order to get characters. The flowers are very much like those of *Polycynis muscifera* in colour and shape, but a little larger and nearly as numerous. The auricles at the base of the lip are far more developed than in *P. barbata*, but straight, not curved, as in *muscifera*. The lip itself, however, is more like that of *P. barbata*, since there are no anterior angles to the side lacinae. The sepals of the old *barbata* are hairy outside, here they are glabrous. One might say it is *Polycynis* with the nodding raceme of *barbata*, but with the flowers of *muscifera*. Yet it should be added that if much like these in the less elegant colours, they are a little larger, and have the side lacinae of the lip as in *P. barbata*. It is one of the interesting of the Granadan discoveries, for which M. Linden has to thank M. Gustav Wallis. H. G. R.

HYPOCAUST HEATING.

SOME years ago an article appeared in the *Gardeners' Chronicle*, describing at some length a new mode of applying heat to glass structures, as well as to open spaces not always covered with glass. The plan in question is the invention of Mr. C. W. MARTIN, M.P., of Leeds Castle, Kent, and has been by him applied to the heating a range of houses in the gardens there, as well as to give warmth to a large piece of ground devoted to the growth of early vegetables, and such other things as will bear exposure to the open air, when the coldness of mid-winter is past. Mr. Martin, who is an ardent antiquarian, acknowledges taking the hint he has so successfully carried out from works of a

* We must apologise if, from the exigencies of our meter, we have omitted to specify any other of our friends. Perhaps "Fun" will oblige us with the loan of a poet.

somewhat similar kind which the Romans adopted in domestic matters; in other words, from researches he has made, he has discovered that the mode the Romans adopted in warming their dwellings in winter, was by so constructing the lower floor as to have a fire underneath it, warming it and the enclosed space above. The ascent of heated air was thus known to that enterprising people, who availed themselves of this property in their "hypocausts," a term by which Mr. Martin also designates the mode he has adopted of heating horticultural buildings. The simplicity and non-liability to get out of order of such an arrangement would seem to recommend it for more extensive use than it has yet been put to.

The glasshouses so heated were ordinary lean-to's, resting against a brick wall, as is usually the case, but instead of the floor being of earth, it has the appearance of being covered with York pavings, which, however, are not of stone; in fact the whole floor of one of the houses was composed in the same way that, I believe, large breadths of the floors of London houses are made—that is to say, by three or more flat tiles being cemented together to form a sort of slab about 3 inches thick, 9 inches wide; piers a yard apart support this floor; the chamber below might be about 2 feet high, and it is simply in this that a fire is kept, with whatever rubbish comes to hand. A proper fireplace is formed, large enough to receive anything that one or two men can lift, and an outer door encloses the whole, while a chimney at one corner allows of the escape of smoke; but this is checked by a damper, so as not to allow the escape of heat in any way if possible; by attention to this, combustion is retarded, and nothing is lost—and as the whole of the floor of each house is so acted upon, the area of heated space exceeds that of any other known mode of heating. In one of the houses even more than this was accomplished, for the front wall was on pillars, or arches, and the border in front, to the width of 6 feet or more, was also heated in a similar way; and early vegetables, and such-like things, seemed to succeed admirably. The heat imparted to the houses and their contents being akin to that furnished by the flues of old, the plants were healthy and in good condition, and as a proof that sufficient heat was at command for most ordinary purposes, I may mention that on the floor of one of the houses, a bed of soil was formed by an artificial stone kerbing, upwards of a foot high. Pines were planted out in this, and had made stout, stubby, healthy growth, which indicated that they relished their quarters, although they would not have objected to some additional heat, as the cubic area to be heated occasioned great waste of heating power, but they were then furnishing suckers in abundance, and very fair fruit had been cut at times. In the other houses, where Grapes and plants were grown, the heat at command seemed ample.

The success attending the heating of the houses above described induced Mr. Martin, a few years ago, to try its effects in another place and on a piece of ground adjoining the kitchen garden a slight excavation was made, and a series of brick piers, 9 inches square, and about 2 feet high, were made, enclosed by a 9-inch brick wall. A flooring of the same description as that of the house above alluded to was made, resting on those brick piers, which were about a yard apart, and the side walls were carried up about a foot higher all round, forming a sort of edging to keep in the soil by which the whole was covered after the flooring became sufficiently dry and hard to bear it, which was not long, as it was made of Portland cement between three layers of flat tiles, scarcely 3 inches in all. At one corner, where the fire was, the excavation was a trifle deeper, to allow head room, and a capacious fireplace, large enough to receive the stump of a tolerably sized tree, was formed; the whole was closed in by an outer door, shutting in the whole of the heat created by the combustion. A chimney at one corner formed an exit for what little smoke was allowed to escape, but the interposition of a damper reduced this to the smallest possible quantity, Mr. Martin's intention being as far as possible to economise all the heat he could command. The flooring above the fireplace was, I believe, somewhat thicker than the remaining portion, but in other respects it was all alike, and the heat had the means of playing through the whole chamber. A trap-door or two around the sides, more for the purpose of showing its action than for any other purpose, proved how well it worked. The space so heated was a square of some 50 feet or thereabouts, and I am told early vegetables of sundry kinds have been raised every year, and a cheap description of protection afforded them, by wooden shutters resting on a sort of framework of simple construction, but the heating had been so satisfactory that Mr. Martin had built an ordinary lean-to pit, covered with glass lights. Upon one side of this heated bed, at the time of my visit, Pines were planted out in one of the compartments, and appeared to be doing well, a portion of the flooring in the front of this pit not being covered, so as to command top-heat. I forget what the other compartments contained, but the main bed was thickly cropped with French Beans, Salads, young Onions, and other things useful for late autumn supplies, the whole being in a healthy and promising condition. I was told that a succession of useful crops had preceded the one I then saw. Its uses being most important in late autumn and early spring, in summer the fires are not kept on, and I believe in future some means will be taken to confine the heat in a great measure to heating the pits the Pines are growing in, excepting when the state of the weather or other circumstances renders it advisable to heat the other also, but at all times the waste heat will pass under it, after having expended much of its warmth in supporting the more tropical vegetation it is called on to assist; but early Potatoes, Radishes, and the like will not be forgotten, and they

will receive the advantage of this new mode of applying bottom-heat at the time it is most wanted.

Leeds Castle is one of the few feudal residences that have passed down to the present day in a habitable condition, without having been spoiled by the ravages of turbulent times or the equally mischievous effects of architectural alterations, which during the last century destroyed so many other places of interest. A bold Norman tower, surrounded by water many feet deep, and to which there is access only by one bridge, formerly a drawbridge, it must have presented an impregnable appearance during the middle ages, when the modes of attack were less formidable than now. To make its defence more sure, a series of outworks seem to have flanked the gateway, while the inner citadel was divided into two parts, which would have to be won, one after the other,—a narrow passage now uniting the two where a second drawbridge once existed, while the stern solidity of the whole gives it a charm which the most careless observer cannot but admire. J. R. [The hypocaust system of heating, as carried out by Mr. Martin, has been frequently alluded to in our columns and elsewhere. It is very satisfactory to find its success so well assured. Eds.]

INDIAN FORESTS.

(Concluded from p. 1015.)

It is thought by some—and they seem to have at least plausible reasons for so thinking—that horticulture and arboriculture are not two different arts, but that the latter is merely a minor branch of the former, although not by any means an unimportant one. Still I think few will deny that it does not require the same lengthened experience, nice tact, and scientific knowledge to make an accomplished arboriculturist that it does to make an accomplished horticulturist; no principles are adopted by the former that are not greatly amplified and extended by the latter. Is British horticultural skill on the wane, or has that of Germany quite outstripped it? Men from Germany come over here to study the higher branches of an art, and, by way of mutual compliment, I suppose, others from this country must go there to study the minor. "Oh! but in Germany they learn organization, which they have not the means of doing in Britain." To finally dispose of that objection, those who in the Indian Forest Department must organise a working system for themselves, as the climate they have got to work in, and the men—shall I call them?—they have got to work with, will make that a necessity. "Oh! but why is it, if there be so much rare talent in this country, that it is not forthcoming at the India House?" or how is it that much of what does come is rejected, simply because it does not come up to our standard of ability? The tests are simply no tests whatever of a man's ability as a forester, although they may be of his ability as a surveyor and a chemist, or a mathematician, and a great many other things besides these. Those who could overstep the barrier that this standard has created across the entrance into the Indian Forest Department will hardly try it, as the prospects held out on the other side are not sufficient to induce them to make the attempt, while some of those who do try it fail—not in forestry, but in other subjects that have nothing whatever to do with it. By that standard they no doubt get men, whom if tried by another, a little more utilitarian, might be found wanting. As the term educated may have more than one meaning, to prevent misconception I shall give the sense in which I use it. The training, whether limited or extended, that best qualifies a man for the performance of the duties and responsibilities of that particular station that he may be called on to fill, is certainly superior to that which, so far as regards the proper performance of a certain class of duties, if a novice before, leaves him not less one still. The education that best fits a man for the profession of a gentleman, and that which would best fit him for the profession of a forester, are widely different in character; of necessity, they must be, as the ends to be attained are in themselves widely different. This leads one to ask the question, is there not a little too much of the genteel and pseudo-scientific, and a very great deal too little of the practical and thoroughly scientific, in the training that the present class of forest officers have to undergo? It strikes me that it fits them equally as well for a dozen other professions, as it does for that of a forester. If I am not greatly mistaken, it seems well calculated to make a man a smatterer—teaches him a little about everything, and nothing particular about anything. Men are not all heaven-born geniuses, as those who had the fixing of that standard would seem to suppose; some men are, but a great many more are not, and unless they can thoroughly digest and assimilate that strong stimulating food that they are compelled to cram themselves with, they would certainly thrive better on something plainer. Indeed, unless they can do so, such a heterogeneous mass of things, all valuable in their way, leaves their intellects as disorderly as a broker's shop, the contents of which have no value to the owner whatever, beyond their money value to others. Neither was the great mass of what they are required to cram themselves with—to the individual—beyond its utility in procuring for him an appointment that brings him a definite sum monthly, or annually.

If they are still determined on keeping up this high educational standard, about which so much has been said, in addition to the subjects already included, I would suggest, in hopes of their being found useful, that astrology, mediæval theology, music and dancing, French, and particularly German waltzes, ought to be allowed a high number of marks. In including so many other studies highly valuable because of their greater utility to the drawing-room forester, such omissions as I have attempted to supply were most serious. If rumour is to be credited—which I leave an open question—some of these model foresters have already been weighed in the balance and found wanting in what, above all other accomplishments, was the most needful for them to have; that is, a thorough practical knowledge of the duties of a forest officer. Instead of cramming the men they now propose sending out with a variety of subjects that have no direct bearing whatever on the art of forestry—in addition to the education that a man intending to fill such a situation may be supposed to have had—they should insist upon his being well grounded in systematic botany, morphology, physiology, and something of terminology and geology, some thing more than a mere smattering would be extremely useful; and though last mentioned, not the least useful, would be a good knowledge of the theory and practice of horticulture. And if the examiners would be at some pains to ascertain that the candidates had in them as much of what vulgar folks call common sense as would enable them to apply the teachings of these subjects to the art of forestry—or, what would perhaps be a more correct way of putting it, out of the teachings of those construct a system suited to the surrounding circumstances, which, call it what you please, no matter whether British, Indian, or German, would be a successful one. It would also be needful, on the part of the examiners, to ascertain that the candidates knew something more about the uses of the implements employed in forestry than can be learned from any handbook of popular knowledge,

as they will be expected to teach the natives how to use them properly; if deficient in that themselves, then success in imparting to them instruction will not be so great as it otherwise would. To be able, not only to tell a Hindu how a piece of work ought to be done, but to be able to show him how to do it, is by far the best plan of instructing him that you are not to be done by any of his careless, lazy, roquish practices so easily as he may feel disposed to think, and that you know the difference between a piece of work that ought to occupy him a day, and that which might scarcely occupy him an hour.

The foregoing remarks apply only to the class of men which I suppose may occupy the lower ranks of the Indian forest ladder. Regarding the education of those that are to occupy the upper, I shall not presume to speak, farther than that it is not with minor details regarding seed-sowing, transplanting, or thinning, that they can be expected to occupy themselves, but with general questions of far greater importance; indeed, they who would venture to do so are unfit for such a position. Such trifling details may be safely left to subordinates to work out; if they fail in doing so to the satisfaction of their superior and to their own credit, the inevitable conclusion is that they are unfit for such a position, because of their ignorance, or else because they are not conscientious workmen.

An article in the *Pall Mall Gazette* of August 14 reminds me, that in speaking of the different causes that have wrought so energetically and steadily, hand in hand, in ruining the Indian forests, there are yet one or two others that I have omitted to mention. Some may, however, look upon those now to be alluded to as too insignificant and trivial for particular notice. But on that point, as well as on others connected with the same subject, opinions may differ. The subjects omitted are, 1st, wounding, as a means of making the trees produce gum (an article for which there is considerable demand all over India), next, destroying the bark for drugs, dyes, &c. I have also heard that decortication and charring the decorticated surface for the purpose of making it exude resin, is extensively practised in the hill districts.

The excessive exudation of gum from the stems and branches of some kinds of fruit trees is often spoken of as being the cause of bad health and untimely death, but perhaps oftener only an evidence of bad health rather than the cause. Any explanation that satisfactorily answers that question might, perhaps, do something towards clearing up some others that naturally arise out of the subjects above introduced. These are, will systematic wounding—hacking and hacking—with the view to induce gumming (with the practice undoubtedly does), ultimately lead to bad health and unsoundness in the timber? or will decortication lead to the same result, viz., bad health and unsoundness? That decortication and charring certainly will, there cannot be a doubt. Whether these practices be mere, or less, injurious to the forests than others that have been spoken about, is nothing to the purpose. Are such practices beneficial, or are they injurious to the production of clean grown sound timber? No doubt, enormous numbers of those gnarled stumps that rank as trees in some portions of the Indian forests are fit for little else, decortication, scoring, and notching the stems, to facilitate the ascent and descent of the gum ducts, when following their lawful calling, can scarcely make them more worthless than they are. Still, it might be highly interesting on the part of those who give their sanction to these practices to ascertain whether their further extension or restriction would, in the end, prove the most profitable. Resin-collecting evidently has not improved the condition of some of the French forests, neither has it improved the condition of some of the hill ones in India, if report speaks the truth. Yet resin-collecting, and the mode of producing it, will, I have no doubt, be one of the arts taught the British ignoramus in the schools of France and Germany. Scots Bengalee

Home Correspondence.

Grafted Potatoes.—The experiments on Potato grafting, so ably advocated by your correspondent, Mr. Fenn, I fear will hardly be worth the trouble and time he has bestowed upon this valuable root. My experience with regard to procuring new varieties is decidedly against the practice. It is true my experiments have been very limited, for want of faith in the method. I have been a very successful exhibitor and grower of the Potato for several years, and during the time I lived with the late Sir Osley Wakeman, Bart., Pridiswell Hall, Worcester, I grew a great many varieties—indeed, all I could meet with, as the back volumes of the *Gardeners' Chronicle* testify. Indeed, I was at one time quite as enthusiastic in the culture of the Potato and its different varieties as your correspondent, Mr. Fenn. During the time I grew so many varieties, I had many curious sports or freaks; such as round Potatoes turning to kidneys, and *vice versa*, red Potatoes turning to white, and so forth; the same thing occurred in the gardens of Mr. Berkeley, Cotheridge, near Worcester, where Mr. Marshall, gr., planted a row of Potatoes that entirely changed colour (see also p. 602 of the *Gardeners' Chronicle*, 1857). Now, had these been grafted sets, I should have concluded I had worked a wonderful change, and that it was the result of grafting; but at that time I believe that method was not in practice; but if grafting the Potato should change its shape, size, and colour, why should not the colour change in other root-grafted plants, and other things. We all know that a white Grape grafted on a black stock will not alter in colour from white to black, but such things have been known as for a black variety occasionally to produce a white bunch. The same with other fruits and flowers, and it is frequently the case with the Potato. This, it may be said, has nothing to do with Potato grafting. True; but I will come nearer to the point, and unfold a little secret that perhaps was only known to the late eminent florist, Mr. Gaines, and myself. Many of your readers will no doubt remember a Dahlia, named Princess Radziwill, raised in 1844 by me, at the time I had charge of the florists' department under Mr. Gaines. It being one of the very best light Dahlias of that time, it will no doubt easily be called to mind. The seedling plant, when taken up, was put in a pot to be kept during the winter. When starting time came, the root was turned out of the pot, and examined by myself and my employer, and we discovered that it fortunately had a double crown. My employer at once spoke of dividing it, but I objected for fear of losing it. But he said a "faint heart never won a fair lady;" and accordingly divided the root into two parts before it was set to work. It so happened that in dividing the root two pieces were cut off with eyes attached to

them; and as I had orders to make all the stock I could, I grafted them, in order to keep them plump, into another root, without the least idea of their uniting, but singular to say they both grew. All the eyes of the other variety, Burnham Hero, were carefully rubbed off, and finally the root was divided. I need hardly state that this, being a novel experiment, was watched with much eagerness, but not one bit of difference was visible, either in colour or shape. The varieties were very different in shape and in colour, Princess Radziwill being a light flower with a reflexed petal, the other a large dark maroon with cupped petals. Surely if Potatoes change colour and shape in grafting, we might reasonably expect the same change in the Dahlia. That Potatoes grow from grafted sets I fully acknowledge, but the change from rounds to kidneys, and *vice versa*, and from red to white, I am at present not able to comprehend. I can quite understand that a red Potato grafted into a white one will produce red Potatoes, and a white grafted into a red will produce white Potatoes; that is, if all the other eyes are destroyed (not otherwise), or that there will be a mixture of colours. It may not be generally known that Potatoes will even grow without eyes. One square inch of the substance of the inside of a tuber will grow—this becomes the difficulty of experimental grafting—and further, the young tubers will vary in shape. *Edward Bennett, Gr. to G. S. Foljambe, Esq., Osberton Hall, Worksop.*

Special Pelargonium Show.—It has this season been very generally remarked by lovers of the flower-garden, that their Pelargoniums have flowered particularly well; indeed, I never remember to have seen them look better. The only drawback has been the frequent slight frosts which have from time to time caused the flowers to appear variegated by turning the petals whitish. The Pelargonium is doubtless the most effective and important plant that we possess for the flower-garden, taking all its various classes into consideration. I think therefore that too much encouragement can hardly be given to it by the Royal Horticultural Society, the more particularly as regards the introduction of new and improved varieties. I have heard of a double white one; I have also seen a nice striped flower, others nearly purple, some approaching to yellow. When we look back at the extraordinary changes that have been wrought in this family during the last few years, one cannot help thinking that the popularity of the plant must be very great; and I think I may venture to say with safety that quite 75 per cent. of gardeners and amateurs have a batch of seedlings, many of them, I know, feeling convinced that if they only had the opportunity to compete with their neighbours, they could achieve an easy victory. Again, as to the double varieties—many of our best florists declared only two or three years ago, that they would neither take the florists' taste nor the public fancy, but even the staunch and veteran florist, Mr. Banks, of Deal, on seeing a fine plant of Marie Lemoine the other day, exclaimed "This is a grand object! I have been well satisfied with Madame Lemoine this season, and I intend going extensively into this class." I think all who have seen a good and well-grown collection of the doubles, will admit that a wonderful improvement has been made in a very short time. In fact, in every class a rapid progress is being made, and I much question if ever there was a more bountiful season than the present for really good varieties, whether tri-colors or bicolors. Therefore the importance of holding a special Pelargonium show every season can scarcely be over-estimated either by societies or the public. I, for one, should be glad to continue my subscription towards such a show, and to learn the views of others on this subject. If the show is to be continued, the time should be announced, and the schedule prepared speedily. Every class of Pelargonium should be encouraged, and, moreover, the voice of the smaller growers should be allowed to be heard, so that all may have an equal chance of success, for nothing can be more glaringly wrong than to see the first prize in almost every class carried off by large plants of new varieties, some of which have only a few days before been distributed to the public at a high price. I am also disposed, from the knowledge I gained from the last essays, to continue my subscription towards a prize for another next season, on the condition that the same person is not allowed to win twice. *H. Cannell, Woolwich.* [The above suggestion, which has emanated from a grower, is one which the growers must decide on for themselves. If the general feeling should be to repeat the exhibition, our services may be commanded, as on previous occasions. But the expression of opinion should be prompt. Eds.]

Iris (Vioussenzia) Pavonia.—Your correspondent "A. W." complains in last week's number of your *Journal* (p. 1016), of his want of success in the cultivation of this very pretty bulbous-rooted plant. Mons. Van Houtte was so charmed with it, that he described it, by saying "s'il y a une plante celeste, c'est elle;" and I quite concur with the opinion so well expressed. It is most easy of culture, either in pots or the open air, when protection can be afforded it from severe frost during the period of growth. Perhaps pot culture would suit "A. W." best, and I will describe it for his benefit and that of your readers generally. Select good sound roots, plant six in a 18-size pot, one-fourth filled with potsherds, over which place a little moss or similar material to perfect the drainage; fill the pots with well prepared loam, i.e., loam which has been turned over two or three times and well aired previous to using. Press the roots in the mould half an inch deep, and smooth over the surface. Plunge these pots in coal ashes, in a cold pit or frame; water very sparingly until the growth is an inch or two high, and carefully afterwards. Give abundance of air in fine weather, by drawing the lights off; the more air in light the better. The bulbs will fill the pots with roots, and a second potting in March will cause them

to throw up their pretty spathes of bloom freely. I generally use a little decomposed manure over the potsherds at this potting, and 32-sized pots, replunging them. Should it be desirable to have the flowering out-of-doors, the pots may be plunged in the open borders as soon as the spathes are 6 or 8 inches high. I am confident success will attend "A. W.'s" operations if he follows these instructions. Leaves only are produced, when the roots are weak or the planting is neglected until spring. *Charles B. Saunders, Cesarean Nurseries, St. Saviour's, Jersey.*

Packing Fruit for Transmission Abroad.—I am about to send to Jamaica a quantity of Pears and Apples, in an unripe state of course, and they will be about 22 days on the way. The time is not long, but the heat will be great, and the knocking about greater still, in fact, this is the principal danger. Damp, though, may perhaps be also a danger to be guarded against. It has been suggested that chopped straw would be a good thing, or perhaps bran, as neither of these would impart a taste to the fruit. I should like to elicit the opinions of some of your readers, as there may be some who have had experience in this matter, and by publishing their experience they will be doing others a service as well as myself. *John Kirby* [Cork dust, Cocoa-nut fibre, or charcoal, have been recommended. Eds.]

Hothouse Boilers.—Much has been written and said about the various boilers now before the public. Can anything be done to have a just trial of their powers in a fair field, and no favour? Suppose, for instance, that, say 2000 feet of piping be put together, and a fire-hole got ready, say 7 feet deep, in a field near to some central railway station, some time next summer; then let there be an opportunity given for any one who chooses to try a boiler of a fixed price, and with a certain weight of fuel. Let the test be—which boiler heats the whole of the piping soonest to the highest degree of heat, and retains the heat the longest with the allowed fuel. This trial might continue as long as comers brought their boilers, and a fee of 10s. might be paid to cover the expenses of fixing, piping, &c.; each competitor to fix his own boiler, at his own expense, and remove it the day after his trial. Three days—one for setting, one for trial, and one for removal—will be quite enough for each competition. I think we shall find, if such a trial takes place, it will bring out a boiler better than any at present in use, and I, for one, shall try one of my own invention, or, rather, an improvement on one already in use, which, set on my principle, will take a deal of beating. *A Nurseryman.*

The Lady-bird.—I was somewhat surprised to observe, in last week's *Gardeners' Chronicle*, that such an acute observer as our worthy friend, Mr. James Barnes, expressed a doubt about the fruit-consuming propensities of the Lady-bird. There is no doubt that they not only hide in, but rapidly devour fruit. They likewise go to it for the express purpose of eating it. There is but little hiding place in a Peach or Apricot, an Apple, or Pear, or a Plum half eaten by birds; and I have seen such raw, tender, and fully exposed surfaces again and again covered with nibbling Lady-birds hard at work, making a hearty meal of such matters. This very day I observed a Bergamot Pear with half of it picked off by birds; what was somewhat unusual, the birds had carried off the peel somewhat beyond the level of the mellow pulp, and on this projecting mass of sweetness, fully exposed, without a cavity that would have hidden a midge, I counted 12 Lady-birds hard at work, filling themselves. I moved them several times, but they were most tenacious over their dinner. They shifted unwillingly, as a dog does from a bone, and seized the fruit with greater intensity from being moved. They seemed even to look up angrily at being disturbed, and could one have heard it, doubtless they either buzzed defiance at or expressed hatred of the intruder upon their feast. On another Pear a score of ants were feeding quietly beside and among eight Lady-birds. On another six Lady-birds were employed in enlarging a cavity which looked as if it had been entirely made by themselves. I saw some of them bite off bits of the rind, while those who were in took good care to keep the others out. The law seemed to be that each must dig through its own crust before being permitted to luxuriate on the soft crumb. The quarrying in through the rind seemed a slow process, but when it was accomplished, how their mandibles did flutter, and their greedy delight seemed unbounded. Doubtless, like woodlice and earwigs, the Lady-birds do creep into holes in fruit for shelter; but, like them also, the more they like the sheltering material the shorter is its duration. Their house of to-day fills their stomach to-morrow; and though they are unable, like some other insects, to carry their houses on their backs, they have a more convenient mode of imparting to it rapid locomotion, by giving to it wings, and flying away with it. I have at times suffered so much from the ravages of Lady-birds among Apricots, that their golden coat of mail has often reminded me of my lost fruit, and though I have never mustered courage enough to kill them in any quantity, I cannot pretend to any compunction when I see them drowned in wasps' bottles, or hear that ants can tickle them to death. *D. T. Fish.*

A Monster Melon.—Mr. Paterson, head gardener at Pontypool Park, Monmouthshire, has succeeded in producing a monster Melon, of the superb Rock variety. Its weight was 21 lb., and it measured 12 inches in circumference by 8 inches deep. A photograph of it has been taken. *Reporter.*

The Royal Vineyard Grape.—Will any of your readers, who have grown or are growing this Grape, say how it does with them? I have had one for several years, but the bunches have only produced a few large berries with a great many little ones about the size of Peas. Is it considered a good variety? *M. Greenock.* [The Royal Vineyard Grape is not a first-

class sort as regards flavour. Its remarkably keeping properties render it valuable, however. I have never experienced any difficulty in its cultivation. Mr. Stevens, of Trentham, grows it remarkably well along with Black Hamburgs, and recommends it highly as one of the best late white Grapes in cultivation. It looks well. *B.*]

Orchid Culture.—The two following anhorisms, favourite stock phrases—"In the multitude of counsellors there is wisdom," and "Too many cooks spoil the broth." Every partisan holding a brief on either, and use it as an axiom against the opposite party. As it is with some things bearing more weight upon the comforts and well-being of mankind, so it has always been with the treatment of the poor Orchid that has been forced from its proper home, and compelled to live under a variety of cultural treatments. It is pronounced either to be too hot or too cold, too dry or too wet, too far from or too near to the sun, its artificial home, too copiously or too sparingly supplied with root *pabulum*, placed under the influence of too much light or too much darkness. The more discussion we have the more puzzling and perplexing must it be for all who read with the view of profiting, and little is it to be wondered at that not a few, from an attempt to digest the pith of opposing opinions, with disgust if not contempt. I have been led to this sort of reverie by the utterances of Mr. G. (see p. 991) concerning the amount of light Himalayan Orchids should be exposed to. The growers are at all times exceedingly indebted to gentlemen who give information concerning their habits. As affording data for founding a list of cultural treatment upon, such information is of the highest consequence, but to imitate these conditions would be attendant with the worst possible effects. Gamble in substance says now what has been said before by "R. H." at p. 1061, 1864, and by Mr. G. both very careful observers of the native habits of Orchids—the latter gentleman in a valuable issue (see p. 1109, 1864). Speaking of *Dendrobium* generally, and of Falconeri in particular, after detailing the proper season of rest, Mr. Gamble says "shading should be entirely dispensed with, and that the plants should be as freely exposed to the sun as possible." Inconsiderate advice, indeed, if compared with that gentleman's recommendation of a growing temperature, sufficient to maintain, if not to heat all the tender *Dendrobiums* ever imported and grown under the best sheet-glass that was ever made. But the partial shade of the trees on the wrong side of the sun has its influence in mitigating the severity of its burning rays, and then the dispersion of the rays and the moisture with which air, earth, and trees are loaded, give of their abundance to keep these epiphytes in a state of life and health. I say, with the exception of trials in a variety of ways with most of the *Orchidaceae* that have been imported from all countries, beware of imitating to a nicety all natural conditions in an artificial home. I endeavoured to reply at the time to the observations of both your able correspondents "R. H." and Mr. Gosse; and as since then my opinions in that particular remain unchanged, I reproduce a portion of the remarks bearing most directly upon the points at issue. Readers will find them in *extenso* at p. 76, 1865:—"All exotic *Orchids*, whether epiphytal or terrestrial, when caged up in an artificial structure, and subject to an atmosphere somewhat foreign to their nature, even when best imitated, require more or less shade from a scorching sun. The very plants that will thrive under a variety of circumstances in the countries where they are indigenous, might succumb to similar treatment here. It is well enough to know—indeed, such information is most valuable—the range of temperature, the degree of moisture, the exposure, whether shady or open, of the plants under cultivation, but it is not so desirable to have growers to imitate to the very letter the peculiar habitat. . . . There are some epiphytes which, doubtless, are growing in their native country pretty much exposed to sun-heat, as witness, for example, 'R. H.'s allusion (1864, p. 1061) to *Broussonetia sanguinea*, and some other species not named, which grow in 'Jamaica, exposed to the light and heat of the sun.' Bring these home, however, tie them upon blocks, get them as well established as possible, before you suspend them close to the glass in the face of a full meridian sun in the months of June, July, and August, and what is the consequence? Evaporation goes on so rapidly from the leaves and pseudobulbs that your artificial climate fails to provide the necessary food for assimilation, the leaves get scorched, and if not the chlorophyll is all but burned out of them, the plant sickens, and, unless remedial measures be resorted to, may die. Most epiphytal *Orchids* do require light, and light in abundance; but some slight shade must intervene between the sun and the plants that are grown under a glass covering; the reason for which must be obvious to the merest tyro in horticultural art." Just so; the intense light and heat of a meridian sun must be obviated in every glasshouse, but so soon as it begins to wane, and when a number of the species are ripening off their pseudobulbs, dispense with your canvas, and clear away all obstruction to the action of diminished light. I have said before, and now reiterate, that more *Orchids* are killed with burning summer treatment in a stifling atmosphere, accompanied with painful aridity, than have ever been killed by any stupid winter treatment to which they may have been subjected. I have seen evidences of that times without number, and I am exceedingly unwilling that the error should be aggravated by the *Orchid grower* dispensing with his blinds. *James Anderson.*

Cedar of Lebanon.—In the letter I sent respecting the specimen of this tree in the grounds of F. B. Johns, Esq., at Bishop Stortford (p. 991), the age of the tree is omitted. It was planted in 1821.

being then about 2 feet in height, and having been grown in a small pot. *J. Nicholls, Windhill, Bishop Stortford.*

Tenure of Nursery Grounds.—I have had a nursery for 22 years, and have paid my rent quarterly. Now, my landlord has given me notice to quit next March, or else to pay double rent. I am told he cannot get me out under three years except by paying me for stock, will you please inform me if this is so. *Constant Reader.* We think it clear that the tenancy referred to in the above letter is a yearly tenancy, and, in the absence of any special agreement (which, so far as the letter shows, does not exist in the present case), we believe the law in such cases is that the tenancy is determinable by six months' notice, expiring at the expiration of any current year of the tenancy. If, therefore, the tenant in the present case commenced holding at Lady-day, the notice given is good, but if he commenced holding (say) at Christmas, the notice would not be good, and he could not in that case be removed until Christmas, 1870, it being too late now to give notice for Christmas next. We think it clear that he cannot claim to be paid for his stock. There are sometimes local customs which have the effect of laws, and which would be known to local land-agents; but there cannot, we think, be any local custom such as he mentions. Our correspondent should consult his solicitor in the matter. *Ebs.*

Picea cephalonica.—I see the Rev M. J. Berkeley observes that the cones of *Picea cephalonica* are very rarely to be seen (see p. 1018). The tree here has produced cones for several years in succession, and I have raised plants from them, this year there are a great quantity. *Picea Pinsapo* has produced a cone this season for the first time; it is quite distinct from *cephalonica*, as the scales are smooth, like the Norway Spruce, but the cones of *cephalonica*, from the base to the apex, have loose ovate acuminate scales, and which spread nearly horizontally, very differently from any cones I have seen. *Abies Smithiana* and *Picea Nordmanniana* have many cones this year, and, if desirable, I will take some specimens to the meeting at South Kensington ere long. *Philip Frost, Dropmore, Pray do Ebs.*

The Royal Horticultural Society's Floral Committee.—From the remarks of your correspondent "R. D." I learn that it is a matter of surprise that I have not exhibited seedlings at the Horticultural Society this year. It is not because I could not have done so. The fact is I do not approve of the way in which the Horticultural Society dismisses members of the committee. For more than 30 years I have never, until this season, ceased to be a member of the Floral Committee in London. My dismissal was very trite, merely stating that my name had been erased from the list, and thanking me for my services. I have since found that the reason assigned is that I had not attended a sufficient number of times to admit my retention on the list. Had I been aware that it required any given number of attendances to continue a member, I should not have transgressed now. I do not write this so much in regard to myself as others. I live about 100 miles from London, and many others, who live a long distance off, are first-rate judges in the department they are constituted to judge, and generally attend when the flowers or plants they cultivate are before the committee; but if this rule is to be carried out, all the judges will soon come from the vicinity of London alone. Now this should not be, and I feel persuaded that the efficiency of the Horticultural Society will be best secured by selecting the best men from any distance that will attend, and that will allow no influence to interfere with their judgment. I write this without prejudice. I shall never again sit on this committee, but I should not like to see other old friends dismissed, like myself, without warning. *John Keynes, Salisbury.* There is much force in what Mr. Keynes urges, and it is well worth consideration, whether the rule adopted should not be relaxed in certain cases. As an old member of the committee, however, Mr. Keynes must surely know that it has been customary—and we think it is a proper custom—to make a slight change annually, and so as to admit some three or four new members, and in order that this may be done without injustice or invidiousness, we believe the plan of selection has been adopted to strike off those whose attendances have been fewest during the year. We suppose that at the last revision Mr. Keynes came under the operation of this law. Next year some one else will doubtless have to be made way for Mr. Keynes. *Ebs.*

Foreign Correspondence.

TIFLIS, PERSIA.—Whilst the north and south of Europe as well as the empire of Russia have suffered from an unexampled hot and dry summer, the south, and particularly the trans-Caucasian provinces, have, contrary to the usual course of Nature, enjoyed such an uninterrupted temperate heat and such a degree of moisture, as may be reckoned amongst the things of extraordinary occurrence.

This year might do much for the enrichment of meteorological science, were it possible to determine the boundary line through Europe at which this strikingly remarkable depression of atmosphere ceased, and by a comparison of the prevalent winds to find a means of explaining this remarkable phenomenon. It is perfectly clear that the abnormal weather would also occasion irregular appearances in the vegetable kingdom. Before proceeding to an enumeration of them, a *resumé* of the state of the weather of winter and spring may not be out of place, especially as many appearances in the growth of plants in summer will be the easier of explanation. The dry autumn of the previous year was succeeded by a very dry winter, which awakened the most lively fears for the condition of the corn crops. It was only at the end of the winter,

in February, when usually the first buds of spring appear, that rain and snow fell in the mountains, and still more at Tiflis. It is worthy of remark that the high mountains, the principal chain of the Caucasus, as well as the higher of the less important ones, and the mountains on the Turkish boundaries were covered with unusual, and towards spring time with extraordinarily heaped, masses of snow, so that postal traffic met with constant interruptions, and had to contend with the greatest difficulties. Whilst, then, in the mountains almost uninterrupted evaporation threw itself off in fabulous masses of snow, the flat country was almost dried up. March and part of April again were dry, though not so warm as usual. In April followed a kind of rupture of the clouds—the first continuous refreshing of the earth in this year, to which a few heavy showers in May and June, though weaker, bore most resemblance. Between times, however, it was again hot, and during the whole year prevailing weak east winds only increased the effect of the sun. In the low country, as well as upon the slopes of the mountains, both the hay and corn harvests were under the average in quantity; and, as the farmer says, nothing will grow this year. In spite of the moderate heat, and the though rare yet plentiful rain, we scarcely remember to have seen such a miserable crop either of hay or corn. But as if to spite the rapidly passing season, which is here usually distinguished for its excessive droughts, the east and south winds continued, and brought such a thick mass of clouds, that from the middle of July until the end of August clear sunny days were rare, and frequent heavy showers of rain caused continuous moisture of the atmosphere, to which the neighbourhood of Tiflis is otherwise quite unaccustomed. From August 19 until about September 10 there was a pause in which the whole fierceness of the Asiatic sun again raised the temperature considerably; then it rained again almost every day, and after a few clear warm days, on the evening of September 21, a perfectly tropical thunderstorm broke forth, and for three hours one did not know which to admire most, the never-ceasing glitter of the lightning, or the unceasing roar of the thunder, or the rushing masses of water, which threatened to destroy everything. Since that day we have again the healthy refreshing north-west wind, which, like a true angel of heaven, purifies the stagnant oppressive atmosphere, the result of the damp east and south-east winds, and makes it enjoyable. The cool of the evening only made itself felt in contrast to the temperature during the day about September 10, on the 16th there was a slight hoar frost, but otherwise only a heavy fall of dew.

It has already been said that the cereals, as a rule, were not favoured by the weather, their harvest and the setting in of the rain coming in at the same, in consequence of which the harvest was not only hindered, but much grain was left growing in the fields, owing to the want of storage, and the threshed corn was kept in underground cellars, into which the floods of rain often forced their way, and the saved provision was lost. The Vine promised a harvest rich beyond all precedent; whole rows of Vines were to be seen in the vineyards, each bearing not under 10 bunches of Grapes, and many having above 20. During the blossom, however, rain fell, mildew followed irregularly, in the month of July, *Oidium* succeeded, and though arrested by violent rains, it afterwards spread in a way never before observed. Until then the Muscatelles, Isabellas, Labruscas, or some similar kinds had been quite, or at any rate in a great degree, free from the disease: now there is no difference to be seen, the most tender Grapes, whose place of origin is popularly believed to be the East Indies, as well as the strongest, are all and equally ill. Here, too, it is to be noticed that the stagnant, almost windless, atmosphere favoured the disease, particularly in those districts which were open to the south and south-east winds, whilst other places only 60 versts from Tiflis were spared, and without any artificial protection bore a good harvest. Only those who have regularly smoked their Grapes with brimstone can show good ones. It is asserted that in and near Erivan, &c, where, on account of the winter cold, the Vine is kept covered with earth, and where for want of wooden supports it is made to creep along the ground, the Vine disease is an unknown thing. I, myself, have tried this method in a garden where the Vine had suffered from the disease for six years, and, with the assistance of sulphur, have had a good result. An old white, small-berried Vine, called *Portala*, which had remained unclipped as an experiment, as well as a black one, which had trailed itself up a tree, and was also unclipped, were quite passed over by the disease. I emphasize these observations particularly, and add that another experiment of clipping a Vine short, after the French fashion, was quite a failure, in the same way that a French gardener in the neighbourhood has destroyed a Peach and Apricot plantation in two years, through the short French cut, as he himself confesses, and says that the trees have died from the loss of sap.

The abnormal activity of the atmosphere has shown itself not only in the cultivated plants, but also in the forest trees. I give a few proofs, which will speak for themselves. It has been much noticed that the second shoots, or so-called August shoots, were much stronger than the early shoots; for instance, in the Oak (*Quercus*) they were very remarkable. Others, like many *Robinia Pseud-Acacia*, *Tilia*, *Acer obtusatum*, *Rosa hybrida bifera* of various kinds, &c, lost their leaves in the beginning of August, suddenly threw out new leaves, and immediately after short, weak side shoots, others remained quite bare, and mostly the totally yellow foliage dried up on the tree. Most of the evergreens have an exuberant green, such as one very seldom sees in Tiflis, and more particularly all *Coniferæ* distinguish themselves by their enor-

mous growth; and I have never seen a single example out of many hundreds which in the least degree showed signs of disturbed growth. As far as I know, the following trees have blossomed twice—*Cereis Siliqua-trium* and *Syringa persiana* full foliage, *Corylus Avelana*, male and female catkins shortly before opening, this usually blossoms in January, *Glycine sinensis*, *Cytisus Laburnum*, *Spartothamnus junceus*. The sameness in number of these species is remarkable, as usually after a dry summer and moist autumn this appearance occurs much more frequently. Apparently, this year was missed the period of repose occasioned by the drought of the summer, so that the growth was not interrupted. As a sign that the moisture of the spring and even winter has more influence upon the flowering of the perennial plants, especially upon trees, the following observations may find a place. Such newly-bedded plants as were not well watered in the spring gave unsatisfactory results, and also in the well-watered plantings the growth of wood, &c, was very unequal, weak, and unfavourable. It was only in the second shoots in August that a stronger growth was noticeable. In most cases, too, the second hay harvest was better than the first. The green of the steppes has only given place to the withered yellow of winter towards the end of September, instead of, as usual, in May. The perennial Grasses have also bloomed in September, and the stalks of hay are very tall. An ornamental and ornamental plants in gardens have a striking richness in growth. Up to now, the end of October 1868, most frosts have not been noticed, and the garden flowers still in the full beauty of foliage and flowers. A few flowers have suffered through the depression of the atmosphere—*Balsams* and *Petunias* have decayed at once, *Verbenas* flowered late, *Heliotropes* turned yellow and died off, *Remontante* Roses have run extraordinarily to wood, without giving a single flower, *Fuchsias*, as usual in July, leafless. All so-called foreign plants—*Aroids*, *Musci*, *Draenas*, *Bezonias*, &c, have thriven excellently.

The quality of fruits, the Vine included, is under the average. The best winter fruit, carefully plucked, does not keep, but decays in masses in the store-rooms. Even the trees, particularly the Apples and Piums, are clothed in the same ugly grey garment, as the sick Vines, the fruits fall off before they are ripe, and are uneatable. The Peaches lost their foliage as early as August, and with it their fruits, which were excessively watery and tasteless. It might be worth while to find out whether these appearances were caused by a Fungus allied to the *Oidium*, as even forest trees suffered in numbers from Fungus-like formations, lost their leaves, and produced but stinky after-shoots.

In gardens in the town of Elisabethpol 200 versts distant the Vine disease made great ravages, but I noticed that, contrary to the state of things in Tiflis, the driest vineyards suffered most, whilst those in marshy ground were but slightly affected or, indeed, quite healthy. *M. Scharrer, in Bulletin of the Imperial Society of Naturalists of Moscow.*

Notices of Books.

The Malay Archipelago. By A. R. Wallace. 2 vols. 8vo, Cuts. London: Macmillan. 1869.

It is well known to the scientific world that Mr. Wallace, almost simultaneously with Mr. Darwin, arrived at similar conclusions respecting the origin of species, and that from the distant shores of the Malay Archipelago he communicated these conclusions to Mr. Darwin, at the very time when the latter was about to give to the world what is now known as the Darwinian theory.

Wandering amongst semi-civilised nations, closely noting their types, manners, and languages, making large collections of the hitherto almost unknown birds and insects of these regions, and recording their habits and geographical distribution, he accumulated during the space of eight years a vast number of observations bearing especially on the latter question, and, as such, of enormous value towards the elucidation of the difficult question of the former distribution of land and water over the surface of the globe. To obtain evidence bearing on this point, and on that of the origin of species, was Mr. Wallace's great aim, to which even the collecting of birds and insects was secondary: and while the "125,000 specimens of natural history," recorded in his preface, show his energy and industry in the latter department, the almost as numerous facts and observations gathered by him on physical subjects, and the correctness and accuracy with which he has arranged and named them, equally testify to a mind capable not only of seeing and accumulating the various points which bear upon his subject, but of so placing them before his readers as to bring irresistible conviction to their minds.

Knowing Mr. Wallace's high standing as a scientific collector and observer, and occasionally receiving instalments of his results in the shape of short papers in various periodicals, naturalists waited impatiently for a fuller account of his expedition; but unlike those travellers who rush into print immediately on their return home, simply publishing their journals as written, and consequently issuing bulky and but partially interesting volumes, Mr. Wallace waited six years before giving us, in two small volumes, the desired book of travels. The consequence is that he has digested and arranged his materials in such a way as to produce, not only a highly interesting, but a most valuable addition to our knowledge of that portion of the world in which he lived and worked so long.

He has followed a somewhat peculiar plan in his book; the best idea of which may perhaps be given by calling it a physico-geographical arrangement. Each group of islands, closely connected by its fauna and human inhabitants, is taken separately; his differ-

journeys and collections in each island are first described, and a chapter is then devoted to the natural history of the group in general. The book thus naturally divides itself into five portions. Of course Mr. Wallace's various expeditions did not correspond with this division; but he has wisely thought that it is less instructive to his readers to ascertain the precise order in which he visited the different islands, than to obtain a clear and connected idea of each.

The first chapter is devoted to the physical geography of the entire region, which Mr. Wallace divides into two portions, easily traceable on his physical map by the shallow sea which on the one hand connects Sumatra, Java, and Borneo with the Asiatic continent, and a similar shallow sea which connects New Guinea and some of the adjacent islands with Australia. "We have here a clue to the most radical contrast in the Archipelago, and by following it out in detail I have arrived at the conclusion that we can draw a line among the islands, which shall so divide them that one-half shall truly belong to Asia, while the other shall no less certainly be allied to Australia. I term these respectively the Indo-Malayan and the Austro-Malayan divisions of the Archipelago." (I, 13.)

This division is completely supported by an examination of the animal productions of the various islands (though not to the same extent by the plants), and

"The general result therefore at which we arrive is, that the great islands of Java, Sumatra, and Borneo resemble in their natural productions the adjacent parts of the continent, almost as much as such widely separated districts could be expected to do even if they still formed a part of Asia, and this close resemblance, joined with the fact of the wide extent of sea which separates them being so uniformly and remarkably shallow, and lastly, the existence of the extensive range of volcanoes in Sumatra and Java, which have poured out vast quantities of subterranean matter and have built up extensive plateaux and lofty mountain ranges, thus furnishing a barrier for a parallel line of subsidence, all lead irresistibly to the conclusion that at a very recent geological epoch the continent of Asia extended far beyond its present limits in a south-easterly direction, including the islands of Java, Sumatra, and Borneo, and probably reaching as far as the present 100 fathom line of soundings." (I, 19.)

And further—
"The whole of the islands eastward beyond Java and Borneo are essentially fragments of a former Australian or Pacific continent, although some of them may never have been actually joined to it. This continent must have been broken up not only before the Western Islands were separated from Asia, but probably before the extreme south-eastern portion of Asia was raised above the waters of the ocean, for a great part of the land of Borneo and Java is known to be geologically of quite recent formation, while the very great difference of species, and in many cases of genera also, between the productions of the Eastern Malay Islands and Australia, as well as the great length of the sea now separating them, all point to a comparatively long period of isolation." (I, 22.)

These two main divisions are then subdivided into the five districts already mentioned; comprising the Indo-Malay, Timor, Celebes, Moluccan and Papuan groups; and in his account of each, Mr. Wallace not only gives a vivid picture of the ways and customs of its inhabitants, and describes the gorgeous birds and butterflies he was fortunate enough to discover, but keeping his natural object in view, he shows throughout how the differences in the various natives, the mammals, the birds and the insects, all bear evidence in favour of his theory, and in short, how the singular and unexpected facts of their distribution can be accounted for in no other way. Well may he conclude his sketch of the physical geography by saying—

"From this outline of the subject it will be evident how important an adjunct natural history is to geology, not only in interpreting the fragments of extinct animals found in the earth's crust, but in determining past changes in the surface, which have left no geological record. It is certainly a wonderful and unexpected fact that an accurate knowledge of the distribution of birds and insects should enable us to map out lands and continents which disappeared beneath the ocean long before the first traditions of the human race. When the geologist explores the earth's surface, he can readily interpret the past by observing the approximate position of ancient continents and seas, and the sea level, but when he explores the sea, he can determine the past position of the land, and the land level, by the light of the waters. Hence the naturalist's pen and pencil can fill up this great gap in the past history of the earth." (I, 23.)

In forming his collection, Mr. Wallace mainly devoted himself to birds and insects, he did not, however, neglect the curious mammalia, &c., which came in his way, but preserved skins and skeletons whenever it was practicable. For instance, while in Borneo he took some pains to procure specimens of the large Orang-utan, or Mias, as it is called by the natives, and also as much information as possible respecting its habits. He also obtained a young one, which he kept for three months; and the account of this little creature forms an amusing episode, which is, however, too long to extract. Altogether he killed 16 of these animals, for which he was looked upon by the Dyaks as a benefactor, these animals being great nuisances from the havoc they committed on the Durian trees, especially as they waste and destroy a great deal more of the fruit than they eat.

Of the difficulties to be encountered we have many graphic instances, and it seems perfectly marvellous how well he succeeded, considering the means at his disposal. His plan on arriving at a fresh locality was to search for a place where insects were likely to abound, namely, a clearing in a forest, and to establish himself for some weeks as near to this as he could; hiring a house when one was to be had, and building one when there was none. And what houses they were! Here is the description of one—

"From what I have seen of a large house built on a plot of Yams and Plantains, and a small hut, which the natives might have the use of, if it would suit me. It was quite a dwarf's house, just 8 feet square, raised on posts, so that the floor was 4 feet above the ground, and the highest part of the ridge only 6 feet above the floor. As I am 6 feet tall, and an inch high in my stockings, I looked at this with some dismay, but finding that the other houses were much further from water, were immediately dirty, and were crowded with people, I at

once accepted the little one, and determined to make the best of it. At first I thought of taking out the floor, which would leave it high enough to walk in and out without stooping, but then there would not be room enough, so I left it just as it was, had it thoroughly cleaned out, and brought up my baggage. The upper storey I used for sleeping in, and for a store-room; in the lower part (which was quite open all round) I fixed up a small table, arranged my boxes, put up hanging shelves, had a mat on the ground, with my wicker chair upon it, hung up another mat on the windward side, and then fastened that, by being holed and carefully creeping in, I could sit on my chair with my head just clear of the ceiling. Here I lived pretty comfortably for six weeks, taking all my meals and doing all my work at my little table, to and from which I had to creep in a semi-horizontal position a dozen times a day, and after a few severe knocks on the head by suddenly rising from my chair, I learnt to accommodate myself to circumstances. We put up a little sloping cooking hut outside, a bench on which my lads could skin their birds. At night I went up to my little loft; they spread their mats on the floor below, and we none of us grumbled at our lodgings." (II, 359.)

Amongst the miseries incident to collecting in a tropical country, insect plagues must certainly stand foremost. More than once Mr. Wallace was confined to his house for weeks by ulcerated feet, brought on by the attacks of mosquitos, sandflies, &c., and he speaks very piteously of the interruption thus caused to his work—

"The stings and bites and ceaseless irritation caused by these pests of the tropical forests, would be borne uncomplainingly; but to be kept prisoner by them in so rich and unexplored a country, where rare and beautiful creatures are to be met with in every forest ramble—a country reached by such a long and tedious voyage, and which might not in the present century be again visited for the same purpose—is a punishment too severe for a naturalist to pass over in silence." (II, 251.)

Moreover, his birds and insects, when once caught, prepared, and added to his collection, still required the utmost watchfulness and care to prevent their being destroyed by ravenous creatures.—

"The lean and hungry dogs before mentioned were my greatest enemies, and kept me constantly on the watch. If my boys left the bird they were skinning for an instant, it was sure to be carried off. Everything outside had to be hung up to the roof, to be out of their reach. At last just finished skinning a fine King Bird of Paradise one day, when he dropped the skin. Before he could stoop to pick it up, one of this famished race had seized upon it, and he only succeeded in rescuing it from its fangs after it was torn to tatters. Two skins of the large Paradise, which were quite dry and ready to pack away, were on the table in my tent for the night, wrapped up in paper. The next morning they were gone, and only a few scattered feathers indicated their fate. My baggage-stuff was out of their reach, but having stupidly left a box which served as a step, a full-plumaged Paradise bird was next morning missing and long below the house was to be seen still uttering over the fence, with the two golden plumes all tremble in the air. Every night, in so soon as I was in bed, I could hear them searching about for what they could devour under my table, and all about my boxes and baskets, keeping me in a state of suspense till morning, lest something of value might incautiously have been left within their reach. They would drink the oil of my floating lamp and eat the wick, and upset and break my crockery if my lazy boys had neglected to wash away even the smell of anything eatable. Bed, I say, as they are here they were worse in a Dyak's house. In Borneo where I was staying, I had a large piece of a Dyak's house, and besides wearing a pattern of my aspect certain." (II, 359.)

Ants, of course, were ubiquitous, and it must have been a work of no small difficulty to circumvent them.—"They swarmed on my table as I was at work, setting out my insects, carrying them off from under my very nose, and even tearing them from the very cards on which they were gummed, if I left them for an instant." (II, 328.)

In spite of all these troubles, in spite of occasional fevers, bad food, voyages in native boats against contrary winds, when he seems to have been invariably sea-sick—difficulties thrown in his way by the indolence or suspicion of the natives, Mr. Wallace worked steadily on, collecting, observing, and noting, and apparently on the whole thoroughly enjoying his nomadic existence.

"It sometimes amuses me to observe how, a few days after I have taken possession of it, a native hut seems quite a comfortable home. My house at Wuyopi was a bare mat, with a large bamboo platform at one side. At one end of this platform, which was elevated about 3 feet from the ground, I placed a mat, and partly enclosed it with large Scotch plaid, making a comfortable little sleeping apartment. I put up a rude table on legs buried in the earthen floor, and had my mat and the plaid clear for a seat. A line across one corner carried my daily wash, cotton clothing, and on a bamboo shelf was arranged my small stock of crockery and hardware. Boxes were ranged against the thatch walls, and hanging shelves, to preserve my collection from ants while drying, were suspended both without and within the house. On my table lay books, penknives, scissors, pliers, and pins, with insect and bird labels, all of which were unsolved mysteries to the native mind." (II, 133.)

"Then what delightful hours I passed wandering up and down the dry river courses, full of water-holes and rocks and fallen trees and overgrown by magnificent vegetation. I soon got to know every creek and rock and fern and insect up to the water's edge, and better yet to see what treasures they would yield. At one place I walked for a long way, following the banks of a river, and saw many things which I had never seen before. I might expect to find a small dragonfly, a damselfly, and an easy prey. At certain rotten trunks I was sure to get the curious little tiger beetle, *Diaperis divinatoris*. In the denser thickets I would capture the small antlion, the water bug (*Amphipoda*) sitting on the leaves, as well as some rare and beautiful leaf beetles of the families *Hispidae* and *Cyberomelidae*." (I, 265.)

Occasionally Mr. Wallace notices a beautiful flower, but it is not often. The reason for this is not, however, that he was so engrossed by his own special pursuits as to overlook them, but that in tropical forests bright coloured flowers really play a subordinate part in the aspect of Nature. The following extract may serve to dispel illusions on this subject, which may be entertained by those who have never visited the tropics:—

"The reader, who is familiar with tropical nature only through the medium of books and botanical gardens, will

picture to himself in such a spot many other natural beauties. He will think that I have unaccountably forgotten to mention the brilliant flowers, which, in gorgeous masses of crimson, gold, or azure, most sparingly these verdant precipices, hang over the cascade and form the margin of the mountain stream. But what is the reality? In vain did I gaze over these vast wilds and verdure among the pendant creepers and heavy masses, all around the ascent, on the river's bank, or in the deep caverns and gullies, and see not one single spot of bright colour, which I saw not in a single tree, or bush, or crevice, bore a flower so brightly except in a few ferns, or objects in the landscape. In every direction the eye rested on green foliage and mottled rock. There was infinite variety in the colour and aspect of the foliage, there was grandeur in the rocky masses, and in the exuberant luxuriance of the vegetation, but there was no brilliancy of colour, none of the bright flowers and gorgeous masses of blossom, so generally considered to be everywhere present in the tropics. During 12 years spent amid the grandest tropical vegetation I have seen nothing comparable to the effect produced on a landscape by Gorse, Broom, Heather, and wild Hyacinth, Hawthorn, purple Orchises, and Buttercups." (I, 371.)

The number and variety of the topics discussed in these two volumes cannot be even touched on within the limits of a review, all bears evidence of careful observation and thought, and deserve study and consideration. Mr. Wallace's work is by no means to be classed merely as an interesting book of travels; it will take its place on our library shelves, and will be referred to, as a standard authority regarding the countries it has so carefully studied, and so ably described.

Florists' Flowers.

ANY notice of the new show PELARGONIUMS of the present year would be incomplete without mention of the honoured name of Beck. That name—so high up in the annals of floriculture—has been so long and so honourably and successfully associated with the production of new Pelargoniums, that were it to be struck out of our modern records, it would be like the snapping of one of the strongest bonds binding together much of pleasant reminiscence of the past with much of success in the present, and hope in the future of floriculture. When, a few years ago, Mr. E. Beck "shuffled off this mortal coil," the work of Pelargonium raising was continued by his son, Mr. Wiggins, who for the past 25 years has borne an important part in all that has been so worthily achieved at Worton Cottage.

The fact that Mr. Wiggins has not published his seedling Pelargoniums this season is least not owing to the fact that he has none to show, as it will be remembered that, both at the June and July meetings of the Royal Botanic Society in 1878, Mr. Wiggins exhibited some very promising yearling flowers. In the improvement of the large-flowered Pelargonium, Mr. Beck had his particular line of procedure. Those who were readers of the early volumes of the "Florist" will remember the lofty ideal Mr. Beck had before him, and to the attainment of which he unceasingly laboured. One of his requisites was a habit moderately dwarf, with stiff foliage, and short stalks to the leaves, so as to form a compact bushy plant. Perhaps it may be said that a large degree Mr. Beck associated this habit with new varieties, and one has only to inspect the varieties of the past three years at Worton Cottage to see how much this has been fulfilled in the later form of the new kinds. Form was another leading feature of Mr. Beck's ideal; and though it was always his firm opinion that what was necessary to form a first-rate flower was to a great extent attained by high cultivation, and that alone, he yet firmly believed that the coveted breadth of petals, and consequent roundness and fullness of flower, were obtained by the judicious cultivating and crossing of different flowers. It is also true that form is a less characteristic of the Isleworth flowers, down to the present time. In further working out his improvements, it would seem that Mr. Beck placed form of very much higher elevation in the category of desired improvements than size; while some of our raisers endeavoured to get size, with a view of attaining form at a later date, Mr. Beck, it would appear, inverted this process—a process still continued at Worton Cottage. I think every impartial observer must have been driven to admit, that during the six or eight years at least the new flowers raised by Mr. Wiggins have been inferior in point of size to those shown by Messrs. Foster and Hoyle; but that they had qualities of form and habit commensurate with their size will perhaps be as freely admitted. Still, in point of size, Mr. Wiggins shows a marked advance in his flowers he intends to distribute in the coming autumn. I had an opportunity to inspect these a few weeks ago, under circumstances favourable to arriving at a just conclusion as to their merits; they were removed from the taint of dressing or the wrappings of "floricultural mythology," sometimes pretty thick, spread about new things on particular occasions. Of these flowers seemed to stand out boldly as acquisitions, viz. *Bacchus*, rose ground lower petals, heavily painted with dark maroon top petals, with regular pink margin, and white throat; flowers large, bold, of fine shape. *Dove*, a large pure white flower, of fine shape and substance; large dark blotch on petals, lit up with fine carmine, and edged with pink. *Firefly*, bright red, having a dark spot in each petal, dark top petals, fine shape, and remarkably early blooming. *Hebe*, lower petals pink, spotted with chocolate, dark top petals, margined with pink, flowers large and bold. *Rosea floribunda*, rose lower petals with large white throat, large dark blotch on top petals, margined with lively rose, flower large in size, and good shape; and *Victoria*, a fine and striking flower, salmon-rose lower petals, large white throat, dark petals, lit up with vermilion, and edged with deep red.

The others forming Mr. Wiggins' batch of flowers for this year are—*Bouquet*, pure salmon lower petals with slight pink spots, white throat, dark top petals.

margined with rosy salmon, flowers large and free-blooming Cardinal, bright maroon lower petals, painted with dark, dark top petals; a flower of good shape. Corporal, a bright crimson-scarlet flower, with dark top petals lit up with vermilion, and margined with deep rose. Flora, a large white flower, with dark top petals; an abundant bloomer. Florence, lilac lower petals, pencilled with rose, dark maroon top petals. Garland, a rich-looking flower, in the way of Diadem; large white throat, dark top petals, a bold and showy flower. Modesty, a pretty lilac flower, with dark top petals, margined with pale pink. Multiflora, lower petals pale rose, white throat dark maroon top petals, with broad margin of rose. Pluto, another large dark painted flower, with rich shaded dark top petals margined with lively crimson. Prince of Wales, lower petals pure white, dark maroon top petals, with broad pale margin. Rosy Circle, warm rose lower petals, pure white throat, dark blotch on top petals, and broad margin of rose; flowers large and stout. Sultana, rich rosy salmon lower petals, fine dark maroon top petals, margined with rosy salmon; free, and of fine shape. Salamander, lower petals warm orange-rose, with large dark maroon top petals, and broad rosy margin; and Snowflake, pure white lower petals, the upper petals having large purple blotches and edging of white.

There is therefore no lack of new large-flowering Pelargoniums for the present autumn, as the foregoing, combined with what Mr. Turner has to distribute of Messrs. Foster and Hoyle's flowers, will give Pelargonium fanciers abundant material to select from.

As a general rule the exhibitors of large-flowering and fancy Pelargoniums both, the former especially, should, and really ought to raise a little the standard of quality in the flowers they exhibit at provincial shows. Both at the Whitsun exhibition of the Manchester Horticultural Society, and at the great show of the Royal Horticultural Society, the large-flowering Pelargoniums were not of so high an order as might be looked for in such a plant-growing district. Leeds and York, and Oxford, are no doubt exceptions, but the exceptions are very few comparatively. Very often different varieties are seen well grown—cultivated in a manner worthy of better sorts to operate upon; and while it is the continuous aim of raisers to produce new and improved varieties, it should also be the endeavour of exhibitors to keep pace to some extent with the raisers, and so strengthen their hands and crown with success their praiseworthy efforts. R. D.

Mr. Wimsitt has issued coloured illustrations of Mr. Willis' new Ivy-leaved Hybrid Pelargoniums, named Willis and Willis roses, both of which were shown nicely in bloom at the last Floral meeting. They are evident crosses between the lateripes and scarlet or inquinans sections, have the flowers of two pretty and distinct shades of rose colour. We have also a plant of Variegated and Variegated Zonal varieties issued by Mr. B. Baker, of A. A. very, which, if correct as to colouring, is a most lovely, the zone in the case of one, named Frans de Beucker, being well defined and of a pale orange-buff tint. Another, named Silverwitje, seems to be a good silver-edged sort, with broad, well-defined white margins.

We have just received from Mr. Cannell a series of blossoms of some of Mr. Banks' new FUCHSIAS, which are of remarkable size and beauty. One is quite a monster in size, the corolla being fully 3 inches in expansion, the individual petals an inch and a-half long, and an inch and five-eighths broad. Another more refined flower of the expanded class measures fully 2½ inches across the corolla. Both the foregoing are of a reddish violet; while another of the same form, and nearly equal in size, has the colour of a rosy lilac hue. There are besides many fine acquisitions of other types amongst them; but as the blooms are not named, we cannot refer to them more particularly.

The Apiary.

THE "LONG ECONOMIC BEE HIVE."—We extract the following from "The American Bee Journal" for September.

"I wish for the benefit, if it may be, of all the readers of the Journal, to speak again of the convenience of something like the 'long economic hive' described in the May number, for keeping up a supply of celled queens. It will be remembered that, in this hive, the frames are inserted crosswise, with two entrances on the sunny side, one near either end. Let such a hive, full and in good order, contain the choicest queen. Then, at the proper season of the year, or when it is desired to raise queens, lift out a frame near the middle, and insert a closely fitting division board at its place, thus making for the time two hives of the same size, with a separate honey-board for each part. The queen being in one part of the hive, the bees in the other part will, from her eggs, proceed to construct queen cells, which, after nine days, may be carefully cut off and removed to other hives, or to queen-rearing boxes, and the queen, with due precaution, changed to that end of the hive, when the unqueened part will, in turn, proceed to construct queen cells, and so on alternately. The advantages of this method are—

- 1. Its convenience in having steadily, through the season, a supply of maturing cells.
- 2. Its safety. The bees in both parts having the same mother smell alike, and like her, on which account she is not likely to be injured.
- 3. Its utility. The bees not being much disturbed in the change, nor removed from their stand, are not in so much haste, and consequently commence with younger grubs, or with eggs; and the stock being stronger than a small nucleus, keeps up a more equable temperature and a better supply of food, producing more perfect queens for future mothers.
- 4. Its certainty. By this process one is sure of cells

at the time, and as there is supposed to be nothing impure about the hive, there can be no mistake about the queen as raised, unless spoiled or injured in the process of fertilisation afterwards. I continually use three of my best queens in this way, and so have every three or four days a fresh supply of cells, to be made use of according to circumstances, in the yard, or otherwise, to mature for market. I have as yet lost no queen by the frequent change, and like the method much better than any that I have seen described. J. W. Truesdell.

The Editor of the "Bee Journal" remarks on the foregoing paper, that the hive alluded to and described by the Rev. Mr. Truesdell in a former number, seems to be substantially a more convenient form of the Dzierzon twin hive—that is, a hive that may be used, at pleasure, for the multiplication of stocks and the storage of honey; or with due alternation, as a nucleus hive for rearing queens, or supplying queen cells continuously."

Garden Memoranda.

LEA BRIDGE ROAD NURSERIES, LETTON, ESSEX. —This old establishment has been long and favourably known for its Heaths, Azaleas, and Camellias, which are grown in large quantities. The cultivation of this class of plants may be said to be the leading feature of the place, but other subjects are also done well here, as a visit in the months of August and September will prove to any one who has the slightest fancy for the many kinds of the ever popular "florists' flowers."

The principal attractions at so advanced a period are, of course, the plants grown outside, nevertheless we may notice a few things in the houses. In the show-house, which had contained a fine display of Lilium auratum, were some small nicely-furnished plants, in 18-sized pots, of that elegant scarlet-flowered succulent the *Rochea falcata*—this, when well grown, makes one of the handsomest autumn-blooming plants for indoor decoration. The *Campanula fragilis*, a free-growing trailing variety, with grey-blue flowers, and admirably adapted for hanging in baskets, was also very effective. Another plant that has flowered well this summer, and is remarkable for the sweetness and delicacy of its flowers, is *Nerium album*, sometimes called the White Oleander. This plant belongs to a beautiful though very much neglected class of evergreen shrubs, which are easily grown, and flower freely in a stove for the greater portion of the year. In a small stove were some dwarf bushy plants of *Ixoras*, which Mr. Fraser informed us were seedlings, about one year old; they seem to flower very freely, and produce many quite new tints of colour. Another remarkable character in them is that no two flowers come exactly alike in colour. This method of growing dwarf bushy free-flowering examples of the lovely *Ixora* must be something new in cultivation, and is at any rate worthy of adoption in establishments where plants of this kind are always in demand or for growing largely for market purposes. Some specimens of the rather new and magnificent *Atamandea nobilis* were flowering very freely; this is a fine yellow-flowered robust growing kind, worthy of a place in every stove. *Lapageria rosea* was growing in great luxuriance, trained to the roof of a cool house. In this position it flowers well up to Christmas: it is a fine flower for a lady's head-dress. The beautiful *Gnaphalium eximium* is one of the old favourites that used to appear at exhibitions in years gone by, but is now seldom seen. Its flowers, which are produced in clusters, are of a beautiful coral-red colour, and have a considerable resemblance to a Strawberry. A more useful class of plants there cannot be, as when they have done growing the flowers can be cut, and in most cases they retain their colour, and are well suited for filling vases in winter. Of Clematises, two varieties were growing out-of-doors which deserve a word of commendation, *C. candida*, white, one of the best and freest bloomers; and *lanuginosa nivea*, pale blue, a good flower and a continuous bloomer.

A bed of Verbenas here was very showy, all the varieties contained in it being in fine condition, notwithstanding the unfavourable season for this class of plants. On remarking the fine appearance of the bed, we were told by Mr. Fraser that it contained only those kinds which had been tried by time, and had proved to his satisfaction to be first-rate for general bedding-out. As it may be of some service to know what are really good, we give the following list of varieties, which are so highly esteemed by Mr. Fraser, and are honoured with a place in the "extra selected" bed—*Reine des Roses*, rose, lemon eye. Moonlight, white. *Amelvement*, deep rose. *Exhilarer*, scarlet. *Amber*, pink and white striped. *Blue King*, light purplish blue. *Princess of Wales*, white. *Eden*, pale pink. *King* (garning), bright orange-rose, with lemon eye; *Grand Duchess*, white, with lilac-crimson centre; *Crimson King*, crimson-scarlet, with lemon eye; *Snowball*, white; *Mademoiselle Marie Rendatler*, purple, lemon eye; *Delicata*, rosy crimson, pale lemon eye; *Dante*, scarlet; *Ariosto Improved*, rich purplish maroon; *Mrs. Holford*, white, and last, though not least, *Purple King*. These are all first-rate, and can be depended upon for a display of bloom. Amongst new kinds sent out this season, *Lady Folkestone*, rosy crimson. *Caroline Smith*, rosy pink, very free bloomer. *Fanny Martin*, of a lighter shade than the former, and equally as free a bloomer, and *Coleridge*, a rich dark scarlet, of good substance, all appear to be very promising varieties.

The Zonal Pelargonium receives great attention here. Mr. Fraser being one of our most able cultivators of this class of plants, as is evinced by the fact of his specimens nearly always taking first honours at the various metropolitan exhibitions. Amongst nosegays, *Monseigneur Dupanloup*, creamy white, an immense trusser, is a fine bedder; *Cham*, very fine, deep scarlet,

with large white centre, is first-rate; *Mlle. Nilsson*, pink, a large trusser and free bloomer, is one of the best of the pink bedding nosegays, and a great acquisition. *Docteur Legrand*, carmine-purple, large and compact truss, and free flowering, is a good variety for pot culture as well as bedding; *Lucas*, cerise-scarlet, is very fine for the latter purpose. In the variegated section, *Princess Alexandra*, bright green foliage, with a broad margin of pure white, is an excellent bedding kind. Amongst the double-flowered varieties, the best for bedding purposes appeared to be *Madame Lemoine*, very fine pink, and dwarf in habit, and *Imperatrice Eugenie*, with fine flowers, of a brighter shade of colour than the former, and with little or no zone in the leaf. These, however, always appears to greater advantage grown in pots under glass, under which treatment they are very handsome.

Of herbaceous Phloxes Mr. Fraser has a fine collection; indeed the cultivation of this flower is one of the specialties of the establishment, and the collection when in flower offers a very pretty sight. The later blooming kinds, which are derived from *Phlox decussata*, are the most grown here, Mr. Fraser decidedly preferring them to the *P. suffruticosa*, or the early flowering section. Amongst the newer Continental varieties are several very desirable acquisitions, inasmuch as they are of fine form, and in various colours, approaching to scarlet, from which we hope to see a good scarlet flowering variety raised. Of the recent introductions of this character, the following are specially fine—*Monsieur Paulmier*, rich salmon-rose; *Gloire de Neuilly*, deep rosy scarlet with crimson centre, very fine; *Roi des Roses*, rose suffused with salmon, afterwards becoming more rosy; *Aurantiaca superba*, rich orange-red with fine crimson centre, a fine flower; *L'Aveur*, fine bright crimson, of good form; *Monsieur de Lannay*, brilliant rosy red; *Professor Koch*, brilliant rose suffused with salmon; and *Dr. Parrot*, pale orange-rose. These are all very fine flowers, and worthy of recommendation. Amongst whites,—*Czarina*, dwarf and good; *Boule de Neige*, a little taller grower, *Madame la Comtesse de Turenne*, very clear, with pale violet eye, *Madame Domage*, splendid white with large violet-crimson eye; and *Comtesse de Malart*, suffused white with large rich crimson centre, first rate, are first-class kinds. *Monsieur Malet*, delicate lilac, is quite distinct, blooms freely, and very dwarf, not growing much more than 12 inches in height; *Madame Lemort*, bright rose with large crimson centre; *Madame Godefroy*, rosy purple, very fine; *Souvenir de M. Pirole*, brilliant reddish crimson, very distinct, *Soulouque*, purplish lilac, and *Comte Lambertye*, rich glowing crimson, are all very fine flowers, bloom freely, and are very distinct.

Another plant that is grown here as an article of trade is the Pentstemon, a flower that has lately undergone considerable improvement at the hands of the florist. Amongst a lot of fine new sorts the following appear to be the best—*Richard Linnour*, lilac-purple, beautifully pencilled throat; *George Brant*, white, suffused with lilac; *Surpasse Victor Hugo*, scarlet, with conspicuous white throat; *Pauline Dumont*, pale rosy lilac throat, beautifully pencilled; *Indispensable*, rose, rich crimson pencilled throat; *Bons Villageys*, dark red, throat white, faintly pencilled; *Grinchu*, purplish lilac, white pencilled throat, large, and very distinct; *Leon la Prevoste*, crimson; *Grande Conde*, deep crimson, conspicuous white throat; *Josephine Dumont*, a lighter shaded crimson, with a richly marked throat; and *Richard Gutterman*, scarlet, very showy, and one of the best. In addition to the above, there are several varieties that are remarkable for their dwarfness of growth, and compact free-flowering habit. The following may be mentioned as being the best amongst this very pretty and useful class:—*Emile Chate*, crimson, pencilled throat; *Mohere*, of a pale lilac tint, with deeper marked throat; *Apollon*, scarlet, white throat, large and fine; *Duo Job*, rosy red, deep crimson throat; *Maria Heed*, pale lilac, pure white throat, and *Henry Berson*, rosy scarlet, with white, faintly-lined throat.

Amongst other kinds of bedding plants were several varieties of Lobelias, of which *L. pumila grandiflora*, blue, was the best of the compact-growing section. Most of the new hybrid Coleuses have been tried here, *Princess Royal*, in Mr. Fraser's estimation, being the best for general cultivation. This nursery is one of the principal emporiums for Heaths, and a healthier lot of dwarf bushy plants, which consist of over 30,000, principally winter-blooming kinds, is seldom seen. The other parts of the grounds, which are about 100 acres in extent, are well stocked with the usual description of shrubs, Roses, fruit trees, &c. This brief notice of the place would be incomplete if we did not refer to a specimen of the original *Martiney Rose*, growing against the end of Mr. Fraser's residence. The flowers are large, white, with bold yellow centre, and are produced up to the end of November in favourable seasons. The plant is evergreen, and is a fine subject for similar positions.

Obituary.

ARBOICULTURE has lost one of its most enthusiastic supporters in the person of GEORGE PATTON, Esq., Lord Justice Clerk of Scotland, whose melancholy and for a while mysterious, fate, has lately created so much sympathetic interest. Mr. Patton, who was born in 1803, was called to the bar in 1823, was appointed Solicitor-General in 1852, and Lord Advocate in 1856, and, in March, 1857, succeeded to the Lord Justice Clerkship. He took a great interest in gardening, and especially in arboriculture, the Conifers being his favourite study. Much of his vacation was spent in planting and beautifying his estate of the Carnies, and his brother's estate of Glenalmond, to which latter he succeeded only three weeks ago. As the originator and

Chairman of the Oregon Botanical Association, he was instrumental in introducing many valuable new hardy trees to our collections, Cupressus Lawsoniana amongst the number, and one of the novelties thus introduced was named after him, Abies Pattoniana. It appears that his lordship, in a fit of temporary insanity, left his house on the morning of September 20, and proceeded to the bank of a deep pool in the river Almond, in Perthshire, where he committed suicide—a tragic end, which has excited in the community a deep feeling of sorrow, and awakened much sympathy for his surviving relatives.

Miscellaneous.

To Render Timber Incombustible.—Herr Reinsch concludes, as the result of his experiments as to the best means of preventing timber bursting into flame, that impregnating timber with a concentrated solution of rock-salt is as good, if not better, preservative against its bursting into flame as water-glass (silicate of soda), while the price of the former salt is, of course, only a mere trifle; moreover, rock-salt thus applied to timber is a preservative against dry rot and noxious insects. He recommends the use of salt water, that is to say, a solution of rock-salt of moderate strength for the use of fire-engines during a fire, as by far more effective than water; but in order that the salt should not injure the working parts of the engines, they will immediately afterwards have to be played with fresh water. Builder.

Garden Operations.

(For the ensuing week.)

PLANT HOUSES.

THE lovely Eucharis amazonica, with liberal treatment, may be induced to form flowering spikes at this time, which will come into bloom and prove very useful at or about Christmas. A nice amount of bottom-heat, and full exposure to the sun, from this time onwards, will materially influence them in this direction. Few plants delight more in a plentiful supply of moisture than do these. When the leaves are frequently sponged over, they thrive much better than when a quantity of dirty particles are permitted to accumulate on them. The free-flowering and useful Tritonia aurea will now, in most instances, have done flowering, and the leaves will have become more or less yellow. At such a time it is customary with most cultivators to lay the pots upon their sides, so as to dry both the soil and bulbs. This treatment, however, is antagonistic to the real requirements of the plant; for immediately they cease to flower, and the surface-growth begins to ripen off, certain offsets, which spring from the old bulbs, at the base of the current season's growth, will commence to grow fast, winding their roots around the inner sides of the pots in dense masses. Therefore, to dry the bulbs off at such a juncture, is neither more nor less than to starve these new roots to death; a very injurious procedure when it is remembered that they alone produce really fine flower-spikes, and, indeed, are often double the size of those produced by old bulbs, which have been prematurely forced to rest. To grow this plant successfully it is necessary to treat it precisely in the same way as evergreens; in fact, never to let it be entirely at rest. Those varieties of British Ferns which have been grown in pots for conservatory or similar decorative purposes, and especially those which are deciduous in their nature, should now be somewhat dried off, preparatory to resting them for the winter, after which they may, if not unduly pushed on at this time, be plunged into a sheltered position out-of-doors until the ensuing spring. The beautiful Ipomoea Bona nox, which is now becoming somewhat exhausted by flowering, may be greatly assisted by the application of a little weak manure water. The richly barred white flowers of this plant, the Midnight Lily or Moon-flower of the native Indians, open only in the evening, diffusing perfume all around. It should be grown more generally, as it does well in a cool stove, and is an annual, or at least does best with me treated as such.

FORCING HOUSES.

The weather whilst I write is all that can be desired for the final ripening of Late Grapes. Where any do not ripen properly, have a tolerably free resort to artificial heat in the early part of the day, with as plentiful a supply of fresh air as is convenient at all times. Without the latter, artificial warmth is of but questionable utility. The present fine weather will in like manner assist Pines which are flowering to set their fruit well, a fact of no little importance when it is taken into consideration what unfavourable weather is often experienced during some part of this month. Let all good varieties which are now pushing up their flowering spikes be removed into as light and warm a structure as it is possible to afford them, where they may receive a routine of treatment peculiarly adapted to themselves, irrespectively of what other plants in the same house may require, as no makeshift practices will suffice for them at this time. I scarcely need say that these remarks do not apply to those varieties which adapt themselves to the exigencies of such a period, such as the Black Jamaica, the St. Vincent, &c. In regard to Vineries, of course it will be necessary to expose fully to the outer air all those which have become denuded of their crop of fruit as quickly as possible after the last bunch has been removed. This applies equally to the small vinery of the amateur. No artificial means will ripen off the wood so well as a nice dry air of moderate warmth. Afford a nightly covering, as by throwing a mat over all late frame Cucumbers or Melons, so as to maintain a moderate warmth by night to the last. The nights are now beginning to be much cooler; hence the need of attention in this respect. The early Mushroom-beds, which were soiled

over some two or three weeks since, and the surface of which show symptoms of cracking, should be occasionally sprinkled over with clear tepid water from a fine-rosed watering-pot. Continue to collect materials for other successional beds, now that the weather is dry, and the droppings may be obtained in the best possible condition.

HARDY FRUIT GARDEN.

The crop of Peaches or Nectarines not having been heavy this season, it may be well to remove entirely those shoots which have borne fruit. This will allow the air to pass more freely around those which remain, and tend to ripen the young wood better. It has been demonstrated beyond doubt that cutting the large leaves in two, across the midrib, conduces greatly to the formation of flower-buds; hence, as much gross wood exists this season, it may be well to resort to this system of restricting the cruder sap. Persist in pinching back all young growths which form after this date, and by these means endeavour to force the trees to rest as early as possible.

HARDY FLOWER GARDEN.

Those cuttings of Pelargoniums and other tender subjects which are used for summer decorative purposes, such as Maurandias, Heliotropes, Iresines, Coleus, &c., and which have already been struck and become well-established, should now be removed under the shelter of a frame. We may now anticipate a slight frost at any moment, this caution is therefore the more necessary. Dahlias often suffer greatly from early frosts: I have, doubtless in common with some of your readers, known the earlier autumnal frosts to be so severe as to injure the tubers which are in the soil. I do not hesitate therefore to advise all who place a value upon their stock, to draw a little additional soil up around the base of each forthwith. Verbena cuttings must now be got in where the operation has been delayed. They strike best placed into a cold frame, kept rather close, and shaded during bright sunshine. A general survey should now be made of all choice Perennials, Biennials, &c., and any which it is intended to increase or secure, by means of cuttings, such as Antirrhinums, Pentstemons, &c., the latter, against the severity of the winter, had better be placed into pots or boxes in the form of cuttings; they can then be properly cared for. Secure the necessary seeds of Phlox Drummondii; when choice is made from amongst those grown at home, save only the very choicest. Sow a pan of Nemophila insignis: these will come in for blooming in pots or baskets in the early spring months.

KITCHEN GARDEN.

Choose now a dry day for the purpose of clearing the late Celery of all useless leaves, minor side-shoots, &c., and so aid it in establishing a robust framework, preliminary to the first earthing-up. The early-sown crop of Carrots may be taken up and properly stored away in some convenient place for first use. Remove the larger, finer Endive and Lettuces, which have been grown on for planting, into cold frames, orchard-houses, or other similar make-shift places, giving all a good watering immediately they are transplanted, first treading in the soil firmly around each. Keep a watchful eye upon the weather, and should symptoms of coming frost occur, remove the whole stock of Tomatos into a warm, dry place, to forward the ripening process. W. E.

TOWN GARDENING.

Grass Plots and verges should now be well rolled, preparatory to the last mowing. The edgings should also be trimmed with the edging-iron before digging the borders, which will give them a neat appearance. The beds intended for Hyacinths and other bulbs should now be cleared. A good dressing of leaf-mould and sand should be dug in, and left rough to sweeten till the latter end of the month, when they should be levelled down, and the bulbs planted. Pits and Frames should now be got ready for the reception of plants, putting in 3 inches of fine ashes to stand the pots on, and to keep down the worms. The plants should be moved into them as soon as possible, so that they can be protected from excessive rains. Early Tulips which are suitable for window culture, should be at once planted, three in a 48-size pot, about an inch below the surface, in two-thirds of sandy loam, and one of leaf-mould. I believe there are no better varieties for this purpose than the red, white, scarlet, and yellow Duo Van Thol. Crocuses should also be potted, putting five in a pot, four round the edge, and one in the centre; also Narcissi, putting only one bulb in a pot, about an inch below the surface. The pots should be placed out-of-doors on fine ashes, and be covered with Cocoa-nut fibre, till they have made plenty of roots, when they should be removed into the house at different times, so as to keep up a succession. Aucubas, Lilacs, Box, Bladder Senna, Viburnum Lantana, &c., may now be transplanted. In planting them, see that the holes are made large enough for the roots to be spread out. The earth should be well shaken in among the roots, and be trodden in firmly all round the balls. If the surface is afterwards covered with short litter, it will be of great benefit to them. J. D.

STATE OF THE WEATHER AT CHISWICK.

During the last 43 years, for the ensuing Week, ending Oct. 9, 1889.

Table with columns: Date, Average Highest Temp., Average Lowest Temp., Mean Temp., No of Years in which it Rained, Greatest Quantity of Rain, Prevailing Winds.

The highest temperature during the above period occurred on the 5th, 1831—therm. 80 deg.; and the lowest on the 5th, 1853—therm. 23 deg.

STATE OF THE WEATHER AT CHISWICK, NEAR LONDON, For the Week ending Sept. 29, 1889, as observed at the Horticultural Gardens.

Table with columns: Date, Moon's Age, Barometer (Max, Min), Temperature (Of the Air: Max, Min, Mean; Of the Earth: 1 foot deep, 2 feet deep), Wind.

Sept. 27—Overcast, cold wind; fine, densely overcast. 28—Slight rain, cloudy, but fine, densely overcast. 29—Very fine, exceedingly fine, clear and fine. 30—Very fine, fine and warm, clear, starlight. 1—Cloudy, but fine, densely overcast, cloudy. 2—Very fine, cloudy, but fine, clear and fine. 3—Fine, very mild, very fine, densely overcast. Mean temperature of the week, 53.5 deg. above the average.

Notices to Correspondents.

BOOKS: I. K. The "Gardeners' Dictionary" (Bell & Daldy) will suit you. True Bacc. Bradbury, Evans & Co. Bouverie Street, E.C., price 25s.—D. K. A new French work on the Rose is advertised as about to be published by the "Librairie de la Maison Rustique, Rue Jacob, Paris." The author is M. Lacharme, and the price little more than a shilling. This will probably meet your requirement of a "little French book on Roses." Should you wish an English work we advise you to get O. Fisher's "Notes on Rose Growing," price 6d (Bradbury, Evans & Co.), or Rev. S. R. Hole's forthcoming work on the Rose Lemaire's work, to which you allude, can be had from the Maison Rustique above cited, or through Messrs. W. & Norgate, Henrietta Street, Covent Garden.

GRAPE SOIL: Constant Subscriber. In reply to your inquiry, Mr. Cramb kindly answers that the red sandstone employed by him is that kind which overlies rocks of a particular geological formation, and is not derived from "Subscriber" impurities, from pounds of pulverised rock. The colouring matter that gives the designation "red" has no doubt been furnished by the decomposition of hematite, or mica, which contain larger or smaller portions of oxide of iron. Its porosity or tenacity will just be in proportion to the amount of silica or alumina it may contain, and its fertility is according to the quantity of organic matter. Mr. Cramb uses it without any mixture whatever, and feeds with liquid manure. As to the failures in the growth of one Vine, and the success of the others, several causes could be adduced, but without fuller particulars we could not advise you.

GRAVELLING PATHS: T Floyd. We cannot say the probable cost of regravelling your paths, all depends upon the prices of gravel, and labour, in your district.

MISTLE: B. D. This will not do out-of-doors without protection in your locality.

NAMES OF FRUITS: T. A. S., Tenby. Pear Sanguinole.—W. D. G. N., and J. Innes, as soon as possible.

NAMES OF PLANTS: W. J., Graham's Town, South Africa. You don't tell us what the habit of your plant is, but from the flowers we should suppose it to be Lissocilus (Eulophia streptopetalus, or it may be Eulophia platyptala, but as the specimen sent was so much crushed we cannot fully determine. Send a better one.—T. S. S., Thrusk. Your plant is Phytolacca decandra: the fruit is not poisonous. The others were badly packed, we will name shortly.—W. C. Lagerströmia indica.—C. D. 1, Hypolepis tenuifolia; 2, Pleopeltis Blandfordii. We cannot name Begonias from crushed and withered leaves—probably yours is B. Griffithii.—R. A. P. 1, not recognised; 2, Asplenium obtusolobum, a pretty little basket fern.—H. Moore. 1, Hypolepis tenuifolia; 2, Lastrea teneroides, often known as Polypodium trichodes.—An Old Subscriber, Gannera scabra.—C. Quaint. Pardonius chinensis.—W. T. Aster cyneus.—Constant Reader. 1, 2, 3, and 4, Athyrium Filix femina, the two first tasselled forms; 5, Lastrea Fulx-mas.—A. B. 1, Aster Novae Belgii; 2, may probably be a leaf of the Longan (Nephelium Longan); 3, Phymatodes lineare.—K. A. P. Alstromera (or Bonmaria) edulis.—T. Rescaen. The common Hornbeam, Carpinus Betulus.—B. Anthemisia tinctoria.—B. Dujill. 1, Platycladus rotundifolium; 2, Gasteria verrucosa; 3, A Sedum, past recognition; 4, Cotoneaster microphylla.—Anon. 1, Carica Papaya, the Papaw; 2, 3, 4, We cannot undertake to name plants from leaves only.

PINE APPLE POTATO.—Can any of our readers say where this curious variety of Potato may be obtained?

STENOGRAPHY: Inquirer. Pitman's.

STRAWBERRY CULTURE: Deoniensis. The Strawberry will grow in any good garden soil. A rich loam, not too light in texture, that will retain moisture, but not too much, suits it well. The ground should be prepared at once, by giving it a good coating of well decomposed manure, such as that of exhausted cucumber beds, &c., with rotten leaves and leaf mould, if either of the latter be obtainable. The ground should then be trenched, mixing the manure well with the soil when digging it in. If your beds are old, or the surface consist of old garden soil, this will be essentially necessary. The best time for planting is early this month, whilst the ground is warm enough to encourage the plants to make a healthy root growth before winter. The sorts best adapted for cultivation greatly depend upon your requirements. Say what you wish in this respect, and we will endeavour to furnish you with the desired information.

THE LATE JAMES VEITCH: A. B. As you rightly say, the Arca caria avenue at Bilton forms a living monument to this lamented gentleman. The glories of Bilton have recently been amply portrayed in our columns.

THOMPSON TESTAMENT: Subscriber. In answer to several subscribers, we may state on authority that Mr. Thompson received the greater part of the money subscribed for his benefit during his lifetime, in periodical instalments. The balance of the fund will be applied in accordance with the directions made in his will. The Royal Horticultural Society continued to give Mr. Thompson his full salary up to the time of his decease.

VINES: A. B. Narberth. The statement in "Pearson's Vine Culture," respecting the Trentham Black Grape, is quite correct, and the other statement you mention is wrong. It must be cut as soon as ripe, in fact before the Black Hamburgh, if both grow in the same house. We will look up the other information you require.—B. Dujill. The cause of your Vine leaves dropping off is attributable to damp. Give more air. This accident was very prevalent in the early part of the season.

ERRATUM.—The double-flowered Pelargonium Mrs Evelyn, noticed at p. 1018, was shown by Messrs. Bell & Thorpe, and not by Mr. George, as there stated.

COMMUNICATIONS RECEIVED.—G. E. L.—R. W.—H. V.—H. B. (next week).—R. B. (with thanks).—C. W.—J. E.—T. L.—G. T. (with thanks).—A. B.—J. S.—C. P.—A Subscriber.—W. E.—G. E. L. (insects not arrived).—R. W.—C. Moll.—H. C.

LAWES' WHEAT MANURE, for AUTUMN SOWING, now ready for delivery
All other Manures and Cakes as per Price List, supplied on the lowest terms. Apply for prices, &c., to JOHN BENNETT LAWES, 40, Mark Lane, London, E.C.; Dublin, and Shrewsbury.

Autumn Sowing.
ODAM'S NITRO-PHOSPHATE or BLOOD MANURE for WHEAT—This Manure, specially prepared for Autumn Sowing, is rich in Ammonia, Phosphates, and other ingredients required for the healthy growth of Grain Crops. Analyses of Blood and the grain of Wheat show that they are nearly identical in composition, hence the value of Blood as an ingredient in Manure. It may be applied at the rate of from 3 to 4 cwt. per acre, according to the condition of the soil, either drilled with the seed or sown broadcast, if the latter, it should be well harrowed in. Prepared by the Patent Nitro-Phosphate or Tenant-Farmer's Manure Company, whose Members are Cultivators of upwards of 50,000 acres of land, which has been for years under management with Manures of their own manufacture, consequently the Consumer has the best guaranteed for the genuineness and efficacy of the Manure manufactured by this Company.
Particulars will be forwarded upon application to the Secretary, or may be had of the Local Agents.
C. T. MACADAM, Secy
Office, 109, Fenchurch Street, London, E.C.; Western County Branch, County Chambers, Exeter, Irish Branch, 20, Westmoreland Street, Dublin.

THE LONDON MANURE COMPANY
(ESTABLISHED 1840)
Have now ready for delivery, in fine condition,
CORN MANURE, for Spring Use
DISSOLVED BONES, for Dressing Pasture Lands
SUPERPHOSPHATES of LIME
PREPARED GUANO
MANGEL and POTATO MANURES
Also Genuine PERUVIAN GUANO, and NITRATE of SODA
Wholesale and Retail, 116, Fenchurch Street, E.C.

Wheat Sowing.

DOWN'S FARMER'S FRIEND for Preventing the Rust in Wheat, and the Ravages of the Slug, Grub, and Wire-worm. A 6d. packet is sufficient for Six Bushels of Seed Wheat, which can be dressed and fit to sow in a quarter of an hour. Testimonials from the largest Wheat Growers in the Kingdom, bearing testimony to its great power and efficacy, may be had of Agents, who are appointed for every district.
Full directions for use are given with each packet.
Prepared at the Manufactory, Woburn, Beds.
CAUTION To guard against fraudulent imitation and consequent disappointment, see that the signature of HENRY DOWN is on the label.
Agents in every Town throughout England, Scotland, and Ireland.
"Every Cottage should be provided with a Water Tank." District Iron Cisterns.

BRABY AND CO. having laid down more extensive and improved Machinery on their Deptford premises (104 Years), are prepared to supply WROUGHT-IRON TANKS, GALVANISED or PAINTED, of superior quality, at reduced prices, and at very short notice.

An Illustrated Price List of Galvanized Iron, and other of Braby's special Manufactures, sent on application.
P. BRABY AND CO., Limited, Fitzroy Works, Euston Road, London; or through all respectable Ironmongers.
W. B. Open Tanks of different sizes packed one in another to save space.

Cottam's Iron Hurdles, Fencing, and Gates.

COTTAM'S HURDLES are made in the best manner, of superior Wrought Iron, by an improved method. Illustrated Price Lists on application to COTTAM AND CO., Iron Works, Winsley Street, Oxford Street, London, W.

COTTAM'S PATENT PORTABLE UNITED COW FITTINGS.

Their advantages are—Portability, not fixtures, removable at pleasure, no Wood-work or Partitions to impede Ventilation or breed disease. May be dispensed with an unnecessary, increased width of depth of Feeding Troughs, Water Cistern, and Patent Drop-pan, for the purpose of saving space. Clearly, durable, and in previous to the present, the best of Iron. Prices of Fittings per Cow, 5s.
Particulars free of COTTAM AND CO., Iron Works, 2, Winsley Street opposite the Pantons, Oxford Street, London, W., where the above are exhibited, together with several important improvements in the fittings last secured by Patent.

Caution to Gardeners.—When you ask for **LAYNOR AND COOKE'S WARRANTED PRIZE PRUNING and BEDDING KNIVES**, see that you get them with the name LAYNOR, and the Corporate Mark, Ours are arranged without which are not genuine.
B. & C. ought to have to caution Gardeners and others, but are impelled to do so, in consequence of an imitation, of common metal, having been sold for the genuine one, and which has caused many complaints to be made to them of Knives which were not of our make, all of which are warranted both by Sellers and Makers.
B. & C.'S PRUNING and BEDDING KNIVES are the best and cheapest in the market.
Patton Works, Sheffield. Established upwards of 125 years.

THE GENERAL LAND DRAINAGE and IMPROVEMENT COMPANY.

Thomas Chapman, Esq., F.R.S. The Right Hon. Viscount Compton.
Geo. Thomas Clark, Esq. Secretary.
John C. Cobbold, Esq. Edward John Hatchings, Esq.
Henry W. Currie, Esq. William Tate, Esq., M.P.
J. BAILEY DENTON, Principal Engineer
Agricultural Improvements of any kind are executed by the Company, or the outlay thereon repaid to Landowners who prefer executing the work by their own Agents.
Tenants may also, by arrangement with their Landlords, procure the execution of such improvements.
The outlay, with all official expenses, may be charged on the Estate, and paid off by a rent-charge in 31 years, or at the option of the Landowners in a shorter term.
No investigation of title necessary, and no legal expenses incurred.
Application to be made to HORACE BROKE, the Secretary, at the Offices of the Company, 22, Whitehall Place, London, S.W.

THE LANDS IMPROVEMENT COMPANY.

John Clutton, Esq., 9, Whitehall Place, S.W.
Frederick L. Dashwood, Esq., Karlington Park, Oxford.
Henry Farquhar, Esq. (Messrs. Harries, Farquhar & Co.), 16, St. James Street, S.W.
Lord Garies, M.P., 25, Eaton Square, S.W., and Galloway House, Wiltshire, N.B.
John Horatio Lloyd, Esq., 1, King's Bench Walk, Temple, E.C.
Granville R. Ryder, Esq. (Managing Director), 4, Princess Terrace, Hyde Park, S.W.
Granville R. H. Somerset, Esq., Q.C., 4, Park Street, Westminster, S.W.
Henry W. West, Esq., Q.C., M.P., 10, King's Bench Walk, Temple, E.C.
Charles Watkin Williams Wynn, Esq., M.P. (Chairman), 2, Lower Berkeley Street, Portman Square, W., and Coely Mason, Walspool.
The Company advance money, unsecured in amount, for all purposes of Agriculture. Improvement, including the erection of Cottages and Farm Buildings, to the owners of estates and other Estates, and to the Clergy in respect of their Glebe Lands.
The whole outlay and expenses are liquidated by a rent-charge upon the land, redeeming principal and interest, over 25 years.
No investigation of title is required.
For Forms and further information apply to GRANVILLE R. RYDER, Esq., Managing Director, No. 1, Great George Street, Storey's Gate, Westminster, S.W.

THE BIRMINGHAM CATTLE and POULTRY SHOW.

—THE TWENTY-FIRST GREAT ANNUAL EXHIBITION OF FAT CATTLE, SHEEP, PIGS, DOMESTIC FOWL, CORN, ROOTS, and IMPLEMENTS, will be held in BINGLEY HALL, on SATURDAY, MONDAY, TUESDAY, WEDNESDAY, and THURSDAY, November 27, 29, and 30, and December 1 and 2, 1869, when PRIZES to the amount of nearly £2100 will be awarded on the following Divisions, viz—
FAT CATTLE .. £507 13 0 BREEDING PIGS .. £77 2 0
FAT SHEEP .. 310 8 0 ROYSTERS and CORN .. 7 16 0
FAT PIGS .. 59 11 0 POULTRY and IMPLEMENTS .. 747 14 0
Prize Lists, Certificates of Entry, and every information may be obtained from the Secretary.
The ENTRIES CLOSE on MONDAY, November 1
JOHN B. LYTHALL, Secretary.
Offices, 39, New Street, Birmingham.

SMITHFIELD CLUB FAT CATTLE SHOW.

The ANNUAL SHOW OF FAT CATTLE, SHEEP, and PIGS, will be held at the AGRICULTURAL HALL, ISLINGTON, on MONDAY afternoon, December 6, and 1 Four following Days.
Intending Exhibitors are requested to apply for Certificates of Entry by the reference letters as under—
CATTLE.—Form A. For an OX or STEER (any Class)
" B. For a COW or HEIFER (any Class)
" C. For a BEAST in Extra Class
SHEEP .. D. For a PEN of four CATTLE (any Class)
" E. For a SINGLE SHEEP (any Class)
PIGS .. F. For a PEN of four PIGS (any Class)
" G. For a SINGLE PIG in Extra Class
ENTRIES for LIVE STOCK CLOSE NOVEMBER 1
Prize Lists, Forms of Certificates, and all that may be obtained on application to Mr. DAVID L. ELLEN, Assistant Secretary, at the Office of the Honorary Secretary, corner of Beef-Moon Street, Finsbury, London, E.
N.B. All communications respecting the Show must be addressed to the Assistant Secretary, as above, and should bear outside the words "Smithfield Club Show."

The Agricultural Gazette.
SATURDAY, OCTOBER 2, 1869.

MEETINGS FOR THE ENSUING WEEK.
October 4 Committee of Central Farmers' Club (Special), at the Salisbury Hotel.
5 Central Chamber of Agriculture, ditto.
6 East Bucks Agricultural, at Henley.
7 South Bucks Agricultural, at Stoke Poges.
8 Devon Chamber of Agriculture, at Exeter.

WE recur to the subject of the actual cost of REAPING by MACHINERY, as illustrated by our practical experience during the past season.

The extent to which we shall refer comprised 54½ acres of Wheat, 54½ acres of Barley, 18½ acres of Oats, and 18½ acres of Beans, being a total of 146 acres. The Wheat was a fair average crop of straw, and not at all broken down or twisted. One half the Barley was a light crop—about 4 quarters per acre, and the other a full heavy crop of 5½ quarters per acre. The Oats and Beans were an average. On the whole, the crops must be considered to have been favourable for the use of the reaper. There were no patches of corn prematurely down, and grown through; the Clover in the seeds was not too high, and there were no weeds. The weight of straw, too, was such as to be quite within the power of the man upon the machine.

For the sake of an actual standard of comparison, 9 acres of Wheat were let off by contract to a scytheman to mow, bind, stook, and rake at 10s. per acre, leaving 137 acres to be cut by machinery.

The machine we used was a combined mower and reaper, back manual delivery, with tilting rails in the place of board; and our experience of it may be fairly put alongside the story of "an old screw," given so cleverly in our columns the other day. The reaper in question we have found to work where the ground was soft and wet. In the wet harvest of 1867 we cut all our corn with it when no other machine in the district was worked at all. And on many occasions it acted efficiently even where the ground was so soft and

sticky that the wheels gathered dirt, so that the whole machine ultimately became one solid mass of clay and soil, from which it took several hours to clean it before further progress could be made. With wet corn, and wet soil, it did its work when no reaper proper could get on, owing to its single wheel sinking into the ground. In this experiment on a large scale we deemed it best to adopt the combined machine, which, with its two wheels, we could depend upon to complete the harvest, should wet weather occur.

The labourers engaged for the work and reaping with the machine were, a foreman at 5s. per day; a boy to ride on the reaper and drive, at 2s. per day; five men, averaging 1s. 3d. each per day, to make bands and tie the sheaves; four women, at 2s. per day each, and one man at 3s. 6d., to "make up" or gather the sheaves, and put them into the bands. One or two of the binders were higher priced than the others, as they were wanted for superior work when stacking came on. These constituted the full personal staff of the machine, their gross wages amounting to 39s. 9d. per day. To complete the force, we also put on two good men to open out the fields at the corners with the scythe, and to stook the sheaves, and a boy to drive the horse-rake, and heap the rakings, &c. These men were paid 4s. 6d. per day each, and the boy 2s. The amount of 11s. per day, added to 39s. 9d., the cost already stated of the hands engaged directly with the reaper, made a gross expenditure in manual labour of 50s. 9d. per day. To this we may add the cost of 16 pints of beer twice a day, at 1s. per gallon, 1s., making a total of 54s. 9d., as the total daily cost of "manning" the machine. This beer was supplied to the men direct from the brewery, so that the cost is exact. Incidental expenses must also be added, after the work is done, as it is only then that they can be ascertained; as the term implies, they fall as a charge upon the work at irregular periods, and in variable amounts.

On August 16 we began harvest work, and at noon on the 19th we had completed 36 acres 2 roods of Wheat. On the same day the Oats were begun, and finished on the following day. A delay of three hours occurred during the time this was under the process of cutting, or the work would have been completed a little sooner. The Barley was begun on Saturday, August 21, and finished on Thursday, August 26, 5½ acres being completed in five days. The Beans (18½ acres), and the spring Wheat (9 acres), were completed in two and a half days, and the whole of the crops were down at noon on Monday, August 30—the entire period which the reaper was at work was 12½ days, from Monday, August 16, to Monday the 30th. During this time there was only one compulsory stoppage from an accident, and this only for a few hours: not a single shower or damp morning intervened to delay the progress of the work. We would observe that no attempt was made to hurry the work, or even to push it. It would have been easy to have done at least 2 acres per day more than was done. We may also note here that one of the two good men at 4s. 6d. per day, engaged to stook the corn and open out fields, was taken away to cart and stack Wheat, after the reaper had been at work six days, three additional men and two boys being engaged at this time to make up a set for carting and stacking. We were enabled thus to remove one of the stokers, as it was necessary that the Barley should lie in sheaf unstooked for a day or two, to kill the Clover tied up in the sheaf: so that, when the stoker required help, the men attached to the machine were able to assist in the evening, and early in the morning, before the dew or moisture was out of the Clover, and the Barley fit for cutting. This was an important point to attend to, and it can be as easily attended to with a reaper as with a scythe. To cut Barley with Clover in it, before it is dry, and to tie up and stook immediately, causes much delay in the crop being fit for carting; and should rain occur, before the sheaves are quite dry after cutting, the Barley is very liable to sprout. It may be asked why we have four women and a lad as "takers-up" after the machine? Why not have five women? Our reason was, that when the crop happened to be light of straw, eight hands were able to follow the reaper instead of ten. The two men forming one set were then taken to stooking, &c. Had we employed five men and five women to follow the reaper, when it was necessary to call off two men, there would have been left three men and five women; so that one woman would have

been compelled to bind the sheaves work which women most properly object to, and which is unsuitable for them.

The actual cost of reaping will, therefore, stand thus:—

Table with 2 columns: Item and Price. Items include Manual labour as follows, per day, 1 foreman, at 5s per day, 1 boy to drive, at 2s ditto, etc.

Amounting, for 12½ days, for the gross cost and manual labour in reaping 137 acres, to £34 4 4½

To this we have to add for incidentals paid by foreman—Repairs, 3s. 6d.; oil, 1s. 6d.; and files, 2s.; and to deduct for wages of the man who was taken off after six days' work, viz., 6½ days at 4s. 6d. = 1l. 9s. 3d. So that the total amount will stand as follows:—

Table with 2 columns: Item and Price. Items include Cost of 12½ days' manual labour, Less for 6½ days as above.

Incidentals as above £32 5 1½

Total £32 12 1½

—being the actual cost of reaping 137 acres of corn by machinery, or 4s. 9d. per acre, exclusive of horse and machine power. If to this, then, we add 1s. per acre for the horses, and 6d. per acre for the wear and tear of machine (a liberal allowance), we have the result of 6s. 3d. per acre for the actual cost of manual labour, machine, and horse-power, as nearly as it can be ascertained by actual experience.

The sum of 4s. 9d. per acre represents the actual payment for the manual labour and incidentals in harvesting in this manner, and it represents to a fraction our payments for the 12½ days that it took us to cut, tie, stook, and rake 137 acres of an average crop of corn.

Into this account no element of mere estimate enters; the figures represent the amount of physical power employed absolutely in the work accomplished—in days' work; these days' work being paid for at the full prices of the district. They fully substantiate the assertions of Mr. MECHI and his correspondents as to the cost of this new common operation. Mr. MECHI's Yorkshire correspondent, in his estimate of 1s. 4d. per acre, most probably took no account of horse-power or depreciation of machinery; if so, nothing can be much nearer than his payment to ours. And in reference to our own experience as now detailed, we have only to say that, though in recording it we give a leaf out of the ordinary farm practice, it is no less an experiment, designed to ask a question and to obtain a correct answer, and its results are as trustworthy as they could possibly have been had they arisen from a trial on an experimental plot however carefully conducted.

Experience, indeed, is at all times an experiment; but it is only when all the attendant circumstances can be fully ascertained, as in this instance, that the information obtained therefrom is precise enough to be valuable.

We are in possession of the figures and facts connected with the cost of reaping by machinery as practised upon two other large farms with which we are connected, and where the work is conducted in a manner totally distinct and different from each other and from that which we have now detailed. We reserve these particulars for another occasion.

— At Mark Lane yesterday, the decline of 1s. to 2s. per quarter, which has been general since Monday, was more than acquiesced in, and something lower was obliged to be taken to effect sales. The meat trade is very dull, and top quotations for beef have again touched 5s., while prime mutton has fallen to 5s. 4d. per stone. Common beasts are 2s. 8d. to 3s. 1d. per stone, and sheep, 1s. to 1s. 6d.

— The Contagious Diseases (Animals) Act is now attracting much attention and discussion in most of the cities and boroughs in the kingdom. At the Michaelmas Quarter Sessions the Act will be a prominent subject for consideration, it is therefore advisable that any information and decisions that may transpire should be disseminated. At Norwich last week a committee for carrying out the Act was proposed and agreed to unanimously by the Town Council. In proposing the committee Mr Taylor said—

One thing he would mention, and that was that the appointment of this committee would not entail any serious expense on the Council; the only thing that would have to be provided was a proper place to which to send infected animals, and they must look out for a proper spot for that purpose. He would remind gentlemen that it had been necessary to take proceedings before the magistrates in the case of some animals suffering from the foot-and-mouth disease. The

owner was proceeded against, and a penalty, altogether with costs, amounting to 25l., was recovered. But he (Mr. TAYLOR) wished he could say the matter ended there, but unfortunately they had two bullocks sent to their market at 2 o'clock one morning, which animals had been seized, and the matter would again come before the magistrates on Thursday.

The case to which Mr. TAYLOR referred was sufficiently complex to show that much consideration must be given to it before the provisions and working of the Act can be thoroughly understood even by magistrates and their legal advisers. The case in question was as follows:—

THOMAS FISHER, of Ber Street, Litcher, was summoned for wilfully knowing and allowing to be driven, on the 17th, on a certain highway called Magdalen Road, two steers which were infected with a contagious and infectious disease called pleuro-pneumonia. Mr. I. O. H. TAYLOR supported the information, and Mr. LINAY appeared for the defendant. Mr. TAYLOR asked the permission of the Bench to withdraw the case against the driver, THOMAS HALL, as they had now the right person before them. Mr. SMITH described the disease as so positively manifest that no person could fail to see it. The cattle, it appeared, have been slaughtered under the joint consent of defendant and Mr. BENJAMIN LEE, of whom he bought them. Mr. SMITH said the lungs of one weighed 19 lb., and of the other 10 lb. In answer to Mr. LINAY, Mr. SMITH said that he could not tell what had become of the carcasses. He knew that under the 54th section of the Act, a declaration ought to be sent to the Privy Council. He had not done that yet, but it would be done by next Saturday. He (Mr. SMITH) was appointed inspector by the Corporation of Norwich. Mr. LINAY, on behalf of the defendant, raised as a point of law that the case must fall through on the ground that the Act of Parliament had not been properly published or made public. The real charge against the defendant was that he did knowingly and wilfully allow these cattle to be driven on the highway suffering from a contagious disease. The defendant did not, nor did Mr. LEE, the cattle dealer, of whom he bought the two steers, know that anything was the matter with the beasts, with the exception of one of them, which had a slight sore throat. Mr. LEE was a man through whose hands thousands of cattle were going, and he would tell the Bench that he did not know that these animals were diseased. Mr. LEE was called, and gave evidence to that effect. He said that one of the animals was quite sound, and the other had a tumour inside its throat. The cattle had been slaughtered, and the carcasses had been sent up to London and passed as good meat. The defendant was fined 10l., and the costs 5l. 10s. 6d. Mr. LINAY applied for a case, on the ground that the regulations of the Act had not been properly applied to the city. The Bench granted him a case.

The appointment of Mr. SMITH, "at so much per annum for his services," was carried unanimously by the Town Council. Some other cities and boroughs have adopted the same means. At the petty sessions at Bearstead, in Kent, Mr. GOULD did not see the necessity of appointing a professional inspector, and therefore moved that the superintendent of police be appointed, at a remuneration to be fixed by the committee in accordance with the amount of service performed. This was seconded by Mr. TAYLOR, and carried unanimously. Upon the suggestion of the Clerk, it was also moved by Mr. JEWELL, seconded by Mr. WARD, and carried nem. dis., "That every police constable shall be an officer for putting in force the provisions of the Act."

An account of the first series of experiments made on the banks of the Seine in the direct application and decomposition of the sewage of Paris was given in the Agricultural Gazette of July 17 in the present year, and mention was then made of the experiments commenced on an increased scale in another place, the second series has now been carried on for several months, and a general statement respecting them is now before us. The plot of ground selected for the experiments is on the plain of Genevilliers, adjoining Asnières, and opposite to the hamlet of Clichy, where the former trials took place. At the mouth of the great collector-sewer at Clichy are established steam pumps which convey about one-tenth of the whole sewage of Paris across the river through cast iron pipes 18 inches in diameter; these pipes are placed along a new bridge which crosses two islands and connects the two banks of the river. The pipes end in large reservoirs on the Genevilliers side, placed on the highest point of the plain, and thence the sewage is conveyed by means of a brick conduit 2 feet in diameter, which embraces a piece of land about 25 acres in extent, and returns to the Seine at some distance down stream. This canal is above the level of the surrounding soil, and at various places the sewage runs off into lateral canals and trenches, so as to feed all the lands under the experiment, the supply is shut off from the small trenches, when necessary, by simply damming their mouths with turf or mould. Near the spot where the sewage re-enters the Seine are three large basins about 6 feet deep, in which the surplus liquid is received and purified by means of sulphate of alumina, in the proportion of 6½ oz. to a ton of the liquid sewage; after purification the water is turned into the Seine, and the precipitate is collected to be used as manure. The soil of the plain of Genevilliers is anything but promising—it is sandy, and at no part many inches deep, and beneath this is a thick stratum of flints. In consequence of its unproductiveness it has not, like the other outskirts of Paris, been converted into market gardens, and a more wretched plain could scarcely be found. The city of Paris rented 25 acres of this land, which was parcelled out amongst a number of farmers and gardeners, and this, as well as the surrounding lands, are supplied with sewage without any charge. It is now eight months since this experimental ground was inaugurated, and almost every variety of crop has been raised— forage plants, cereals, vegetables and flowers, and all exhibit remarkable vigour, especially when compared with like crops produced in the immediate vicinity without the aid of sewage—the Maize, Beetroot and Cabbages, are magnificent. Of course there is nothing remarkable in such a result, it has been produced in 20, perhaps 100 places in England, but the arrangements are excellent, and, above all, economic, and the experimental ground attracts great attention, the Emperor having been amongst the visitors. The

main, or rather the direct object, is to show to tourists and market gardeners the actual value of sewage, and thus to create a demand for it, if it succeeds in that object it will have done a service. Those who may visit Paris this autumn only to take the Clichy omnibus, cross the new bridge and study the matter for themselves.

— The old controversy on the relative merits of large and small farms has broken out again, and Mark Lane Express pours out its sarcasm in advocates of petite culture. We fear but little can be done by advocating either view. The events will not be affected in the slightest degree by any such discussion. Farms inevitably increase in size as successive generations of their tenants pass on, and that is the very satisfactory explanation of the of the largest holdings in this country. We indeed quote Mr. HOSKINS himself, whose letter the Times has excited this discussion, in most of illustration of its powerlessness to do either good. In the course of an argument representing views of the whole subject of land tenure, in a strongly held position is most ably defended, with trace of that ill-conditioned personality which times disfigures controversy, Mr. HOSKINS exclaims:—

"Never do folks talk wisely, and in the street, vein of more presumptuous folly on landed topics, they argue preferentially for 'large' or 'small' 'grande culture' or 'peasant proprietorship'—the simple rule is—Free the Land, let it grow its own natural equilibrium of ownership, and tenants, holdings, and small. Must we have King Canute, and reverse his chair, and his lesson, in order to the land is governed by its own eternal and irrevocable law as well as the sea? and that nothing but the courtier skulls, and the narrowness of eye that would essay or propose to wield with human hands the sceptre—'So far shalt thou go, and no farther!'"

— Corn Averages and Michaelmas Rentals with in a concise and intelligible manner by MONTGUE MARRIOFF, editor of "WILKIE'S Commutation Tables," who forwards the communication on these subjects, in connection the quantity and value of Wheat and Barley reported:—

"At the close of the agricultural year I beg to inform of your readers, and especially those who have adopted the system of corn rents, a statement of average prices of British corn, furnished on the return sheet weekly in the Journal of the Royal Agricultural Society, 1860—Wheat, 40s. 8d. per imperial bushel, 41s. 6d. do. Oats, 27s. 2d. do. The figures in price during the same time are as follows—

Table with 4 columns: Highest price, Lowest price, Difference, and Date. Rows include Wheat 1868 Oct 3, 54 4, 1869 May 8, 44 4, Barley 1869 Jan 25, 49 7, Oats 1868 Dec 5, 29 8.

The net imports during the year (the exports have been subtracted) have been—

Table with 2 columns: Wheat and Wheat Flour. Values are given in £ and s.

The net imports for the year ending Michaelmas, 1868, were, Wheat, 5,190,422 qrs. Wheat flour, 3,046,654 cwts. value, 3,700,000.

— Foreign competition in Hop growing presents a vexed question among Kentish and Sussex planters. The following pertinent letter to Standard is therefore too good to be hid and bushel. If it be not exceptional, it is conclusive, if it be exceptional, an equally pertinent reply to be provoked:—

"Seeing a correspondence in your paper respecting duty, and being one of those foolish planters, as your correspondents would have the public believe, who cut their throats by clamouring for a repeal of the duty, I herewith a statement of the prices at which I have sold Hops for the last 14 years. I think you will then see that Hop planters have not much cause to complain of freedom of trade."

Table with 4 columns: Year, Price, and Average. Rows include 1877, 1876, 1875, 1874, 1873, 1872, 1871, and Average.

Showing that we get a better price without the duty with it on, besides saving nearly 1l. per cwt., or 15% on the value."

Does "A Hop Planter" give an ordinary quality Hops? Or, does he grow the fine pale ale for which there is a greater demand than supply, which therefore do not come into competition with the common Continental produce?

OUR LIVE STOCK.

A LARGE company met at Brailes House, 17th ult. to witness the sale of a selection of Shorthorns from Mr. Sheldon's admirable herd. Cattle were brought out in good order, but the competition was not brisk, although the result was whole, satisfactory. The fair average of 16l. for 37 head was obtained, and good prices were for several animals. Surmise 2d, by MAY DUNFORD from Mr. Tanqueray's Surmise by DUKE OF CESTER (11,382), although nine years old, attracted some attention, and was purchased by Mr. Charles 67 gs. Johanna Southcott, by JOHN O'GAUGHAN bought for 73 gs. by Mr. Cheney, and her Jaughton of Arc, by DUKE OF BRAILES, went into the same lot at 41 gs. Fenelia, by Duke of Brailes' dam, Hope by ESOP, and previously descended from the OF DUBLIN, JANIZARY, SNOWBALL, LITTLE CALIPH, and finally from the Fawsley cow, the yearling heifer, plain in colour, but of great substance, She, after some competition, was sold to the

Leney for 130 gs., but has since, we hear, been resold at a profit, to Mr. Dangar, for Australia. The highest price was given for *Lady Ellen Barrington*, of the Bates Barrington tribe, who was bought by Mr. Drewry, or the Duke of Devonshire at 157 gs. DUCE OF BRATTLE (23,724), a capital sire, got by 1TH DUKE OF THORNDALE, and of the *Acorn* family on the maternal side, was reserved at 200 gs., and the highest price for bulls was given by Mr. Ladds, who purchased EARL OF BARRINGTON 2D, a two months' old calf, for 55 gs.

No great prices were realised at Farnborough on Tuesday, the 21st ult. Unfortunately, the Kewill and Farnborough sales were fixed for the same day, and most Shorthorn breeders were drawn away by the greater attraction in Fifehire. The 33 cows and heifers were sold for an average of 26*l.* 15*s.* 10*d.*, while the 14 bulls only made 23*l.* 15*s.* 9*d.* each.

Our readers are reminded of two important sales which will be held during the coming week. The first is that of Mr. Gamble, of Shouldham Thorp, on Wednesday, when some good cattle, of Brawith extraction, will be offered. The second, on Friday, when the late Mr. Benjamin Wilson's stock will be disposed of. In our impression of the 18th ult. we gave some particulars regarding the origin and condition of these herds.

Mr. Thornton has issued a catalogue of the Aldingham Hall Shorthorns, the property of E. J. Schofield, Esq. The sale takes place next Tuesday, when 27 very well bred cattle will be offered to the public. The herd consists of three families, two of which were obtained from the late Mr. W. F. D. Dickinson about 12 years ago. Of these, one traces to the Rev. J. Benson's noted Winifred tribe, and the other is full of Colling blood. The third tribe was bought at the Ulverston sale, on the death of Mr. Dickinson in 1836; this was the celebrated Cressida family, of which there are several representatives in the catalogue. The first bull used was CAMBRIDGE BARRINGTON 1ST (14,233), of Bates blood, bred by the Duke of Devonshire; he was succeeded by Mr. Peel's CERDIC (19,115), of the Warlaby Blass or Broughton tribe. Of late years sires of the Cressida family have been used. A contemporary, looked upon as an oracle in matters relating to Shorthorns, speaks very decidedly to the merits of the Cressida tribe. The four lots, *Andromache*, *Cressida 6th*, *Macco*, and *Maia*, "are worthy, as regards the composition of their lineage, to go into any herd; and we shall be surprised if they do not provoke the competition of men who know the value of the blood they inherit." The stock is reported to be in good condition, and will be sold without reserve. Aldingham Hall is 5½ miles from Ulverston, on the Lancaster, Furness, and Whitehaven Railway.

The same auctioneer has published a catalogue of Mr. P. J. Kearney's entire herd of Shorthorns, which will be brought to the hammer on Wednesday, the 13th inst. This is an Irish herd, situated at Miltown House, Clonmellon, county Meath, and is principally of Booth and Mason blood. Two-thirds of the number trace directly to animals purchased at the great Chilton Sale, county Durham, in 1829. KEARNEY'S BULL (1141), although without a pedigree, was well known to be of this stock, and his fame brought purchasers to Chilton across the Channel. Mr. Latouche gave 270 gs. for MONARCH (2324), and Mr. Robert Holmes, of county Meath, raised his best tribes from lots 1 and 8. Sixteen cows and heifers, and two bulls trace back to *Brianna*, by MONARCH, daughter of lot 8, 13 cows and heifers are descended from lot 2, *Portia* by CATO (119), whose portrait may be seen in the third volume of the Herd Book. There are also four members of the Bates Waterloo family, and the pedigrees of the remaining animals are very excellent, as for instance that of *Victoria Alba*, bred by Lady Pigot, by PRINCE ALFRED (11,394), and from a daughter of Mr. Barnes' *Victoria*, sold in 1840 for 500 gs. Booth bulls have been recently used. MONA (11,824) and RAVENSPUR (20,628), were hired from Warlaby; DR. McHALE (15,887), DUKE OF CORNWALL (21,578), and DUKE OF YORK, were all bred by Mr. Barnes, of Westland, from his Mantalini family; and PRINCE BERTRAM, the sire of all the young calves, was bred by Lady Pigot, and is of the Broughton tribe, to which the famous cow, *Lady Fragrant*, also belongs. There is a railway to Kells, from Dublin, and cars can be obtained at Kells for Miltown House, which is five miles distant.

STEAM PLOUGHING AND CULTIVATING TRIALS.

ONE of the most successful meetings of this character that we have ever attended was carried out on Wednesday and Thursday last, on the farm of Mr. Becroft, at Eye, about three miles north-east from Peterborough. This display of steam-power and its accompanying machinery was organised by Mr. Barford, of the firm of Messrs. Amies & Barford. The leading motive for calling together the public, and that part of the business people of this country who are more directly interested in cultivating the soil at the cheapest possible cost, was to introduce a new self-acting anchor, which was invented by Mr. Campion, a practical farmer, near Spalding, the patent of which Messrs. Amies & Barford have purchased. To make the performance more attractive and instructive, however, the makers of other systems were invited to join in displaying their engines and tackle, according as they may think their system is more practicable and economical. Messrs. Fowler & Co., of Leeds, under the energetic direction of Mr. Greig, made a strong response to Mr. Barford's suggestion or invitation. The performances of the two firms we will take separately.

Messrs. Amies & Barford advocate the round-about

system, as originally supplied by Mr. Smith, of Woolston, but with modern improvements, and particularly with the use of their new self-acting anchor. This anchor is like every other valuable application, it is of the most simple character. It is an addition to, and a self-evident improvement of, the original disc anchor, to recall the form of which we need only say that steel or iron discs revolve on an axis and cut their way along the headland, the "stay" or the implement depending on the depth to which the said discs cut into the soil. In many cases these discs were not found to be sufficient to accomplish the resistance required when a plough or cultivator was being drawn up to this form of anchor. This would be the case even when the draught of the engine was direct abroadside or at a right angle with the line in which the discs were cutting. To increase the "staying" capacity something therefore was required beyond merely loading the frame with earth or anything heavy that might be at hand. This fact every one saw, and Mr. Campion has cleverly overcome the difficulty.

The manner of accomplishing this object is simply to put a strong revolving bar of iron where the cross or end bar of the old frame was fixed. On this bar there are eight or 12 tines fixed, according as the soil may be soft or hard, and the length for grappling is also regulated according to the hardness or softness of the soil. There are two or three tines clasped to each side of this iron bar. The object of these several sets of two or three tines is that the anchor may advance when required, by setting free the tumbling apparatus, and a fresh set of tines act as grappels when the anchor has moved as far as the work done, or to be done, requires. This performance is accomplished by the simple possible means. On one end of the bar which carries the tines is a ratchet with four catches, into which falls a notched lever. When this lever is left to itself, or is in position, the grappel tines are held in a rigid position, and they then hold fast to the soil. And when it is necessary for the anchor to advance, the lever is raised from one catch, which allows the tumbler to revolve, and the next set of tines to work down or forward, and so come in contact with the soil as to enter it, and again bring the anchor to a dead stop.

The efficiency of this anchor, according to its apparent strength and weight, is something extraordinary at first sight. The resisting power acquired by its use is, however, easily apprehended; for by the use of it with the round-about system, the draught is equally divided between the grappling tines described and the discs. This will be understood by recollecting that there is a forward motion, which acts on the grappels, and a side motion, which acts on the discs. As the rope runs round a block in the centre of the anchor-frame, the draught is equally divided, the one part being towards the scratch-block, to which the anchor is working, and the other to the implement which is being drawn through the soil.

Into the work done we need not enter. For it is the same with steam ploughs and cultivators as it is with reaping and mowing machines. The operation is, for all practical purposes, sufficiently perfected. And the only question left in either case is, how can the operation be executed at the least cost of power and wear and tear of machinery. For the small farm and fields, where the round-about system is more suitable, we believe this self-acting anchor is destined to net as the finishing touch to the economy of the system. In saying this we are not disparaging the large sets, to which we have shortly to refer as being adapted for large occupations and fields, and for letting out, for there is ample room for both systems in this country, and, while one is suitable in its own particular way, so is the other. In connection with the round-about system, however, Messrs. Amies & Barford are now sending out complete sets for using with an 8 or 10-horse engine, at the small cost of 25*l.* This set includes windlass to be driven with tumble shaft or band, snatch-blocks and anchors as ordinarily sent out, and 1600 yards of ¾-inch steel rope. The patent self-acting anchors are an additional cost of 50*l.* the pair. But as these anchors save the labour of two men, and three men and two boys can now do the work as easily and efficiently as seven pairs of hands could do it with the original claw anchors for drawing the implement to, it is a fair conclusion that this 50*l.* is well spent. Messrs. Amies & Barford are evidently of this opinion, for they would not have invested in purchasing this invention of a practical farmer unless they had taken every means to assure themselves of its value. And as Mr. Campion has worked 500 acres of land with one which he had made in his own blacksmith's shop, there is strong evidence that its character is not over-rated. Its performance was seen at various times by the Peterborough firm, and in some cases it had a strain upon it of 20-horse power without once turning over or giving way, while in no case were there more than the three men and two boys mentioned employed in doing the work in connection with which this self-acting anchor was so conspicuous a figure.

Messrs. Fowler & Co.'s engines and machines, and the work they did, need but little description. They worked two 10-horse traction engines, one at each end of the field, the draught thereby being direct. The implement they used was a cultivator, which was turned at the ends in the most perfect manner that we have ever seen anything done in connection with so important an agricultural operation. When the cultivator has advanced close up to the engine the slack rope is brought into play, in doing which an arm is caught, and the rope is conducted to a lever, which is fixed just above the frame of the cultivator. Thus, while the machine is being turned—or, rather, as a preliminary process to its being turned round—the pressure by the tightening rope raises the tines of the implement well clear of the ground, whereby that great resistance, which would otherwise necessarily happen, is simply reduced to the mere weight of the implement

riding on its three wheels. In short, it is the principle which has been practised by hand of raising the tines of horse-cultivators clear of the soil at the ends; but in this case the action is entirely mechanical.

As we have said, the work done need not be discussed. But we may mention that 18 acres were thus cultivated 10 inches deep between 7 o'clock A.M. on Wednesday morning and 2.30 P.M.

In connection with this steam cultivation, we cannot, however, omit saying that some astounding facts are accumulating under another order of practice. The two 30-horse power engines, which we saw at the Royal meeting at Manchester, have been worked since harvest by Mr. Campbell, of Buscote Park, Berks, for whom they were specially made. Between two and 3000 acres have been done during the last two months at the rate of 36 acres average per day, the depth being 10 inches, and the soil "the strongest in England." The actual cost of this work is 2*s.* 6*d.* per acre. And so satisfied are Mr. Campbell and the Messrs. Fowler with the performance of these heavy engines, that they intend to try what a pair of 50-horse power engines will do; and from the lesser coal and oil per acre required with this greater power of the 30-horse engines, and the reduction of wear and tear, they are assured, from the calculations they have made, that the work can be even more efficiently done at 1*s.* 0*d.*, or even 1*s.* per acre. We adopt the term "more efficiently," since it is clear that the more rapidly a cultivator is drawn through the soil, the more it becomes shattered or disintegrated for the action upon it of air and water.

The cost of these 30-horse engines is 1100*l.* each; of the implements and 800 yards of rope, 400*l.*; or, in all, 2600*l.* The cultivator used with these carries 21 tines, 9 inches apart. But the first time, if the soil be very crude, only 13 tines are used. Last year Mr. Campbell used two 20-horse engines, and did from 20 to 25 acres a day. The rate at which the present implement is now driven is three and a-half to four miles an hour. The greater effect this pace has on the soil, with the increased amount of 10 to 15 acres per day of work done, not forgetting the lesser coal, and oil, and wear and tear, make this performance a stride in steam cultivation which no one has hitherto mastered at one venture.

Mr. Prie's two-furrow and three-wheel plough, which is carried bodily, and without sliding on any part while at work, was used close by, and doing some of the best work we ever saw. This plough is growing rapidly into public favour for preparing land for sowing with grain. Several farmers on the ground ordered one, two, or three of them, as they were readily convinced that the three horses and one man could do more and better work with it than four horses and two men could with the ordinary plough. Messrs. Fowler & Co., who are the makers of these ploughs, have increased their plant for this purpose, till they can turn out 50 per week, when they have done during the last six months. But their orders are accumulating so rapidly that they will have to double and triple their force in this department, if they would respond to the demands of their customers.

THE CONTAGIOUS DISEASES (ANIMALS) ACT, 1869.

(32 AND 33 VICT. CHAP. 70.)

QUOTING the long title, this is "An Act to consolidate, amend, and make perpetual the Acts for preventing the introduction or spreading of contagious or infectious diseases among cattle and other animals in Great Britain." It consists of 126 sections or clauses, and nine schedules, the whole being the reverse of *multum in parvo*. The Act is framed, as the preamble declares, "to confer on her Majesty's Most Honourable Privy Council power to take such measures as may appear from time to time necessary," and so on. We may conclude, but solely on the grounds that one less defective statute is better than the eight more defective ones which it repeals, that the Act may be received as an improvement and step in advance. As to its working, we need hardly tell our readers that this will depend mainly upon the practical judgment and fidelity of local authorities, committees, inspectors, and other officers. The orders of the Privy Council of August 10 are rather ominous than promising, and will soon require to be supplemented; but it will be high time to pass sentence on practical merits when good or bad work, as the case may be, is done. In this paper I confine my observations to the statute itself.

The Act makes provisions both for the commerce of home and foreign live stock, and also for the management of live stock at home in times of contagious disease with a view to prevent its spread. It extends to England and Scotland, but not to Ireland; and it is not very clearly defined whether Irish stock are to be considered foreign or home. The Act is subdivided into ten parts.

Part I. Preliminary, gives the definition of terms, titles, old Acts repealed, &c. It includes what is meant by contagious or infectious disease, as cattle plague, pleuro-pneumonia, foot-and-mouth disease, sheep pox, scab, glanders, and any other disease the Privy Council may declare infectious or contagious. Part II. is on local authorities in England, and provides how they are to be appointed. Part III. Foreign animals, provides chiefly for the foreign trade, and includes the new market about to be erected by the Corporation of London. Part IV. Discovery and prevention of disease, sec. 31-64, charts out rather dimly how the Privy Council are to carry out the more important division of the work within the districts of the different local authorities and inspectors. It extends to the home and foreign trade, and to live stock generally when infected, and to carriers of disease. Part V. Slaughter in cattle plague and compensation. Part VI.

Orders of Council and local authorities—points out how the Privy Council and local authorities are to frame their orders—publications, and how the expenses of the same are to be covered. Part VII. Land-grants powers to local authorities to rent or purchase land for the purposes of the Act, as for wharves, lair-sheds, and markets. Part VIII. Expenses of local authorities, such as compensation for slaughtered cattle, general expenses, and borrowing powers—as to how the money is to be raised. Part IX. Offences and legal proceedings. Part X. Scotland—how the Act is to be applied by providing for the difference of the laws and execution from those of England. Such is a cursory notice of the sections. The first schedule names the Acts repealed; the 2d, the local authorities of England; 3d, regulations respecting committees and sub-committees; 4th, regulations that may be applied to landing, movement, and disposal of foreign animals; 5th, maximum tolls, dues, and payments in the metropolitan market after opening of foreign cattle market; 6th, rules with respect to infected places, including cattle and sheep-pox; 7th, pleuro-pneumonia rules; 8th, forms for use of inspector; 9th, local authorities in Scotland. The schedules form part of the Act. They contain some 40 sections, and form perhaps the best half, so to speak, of the statute.

We shall now proceed to discuss the application of the Act under the three heads—of (1) foreign trade, (2) home trade, and (3) home management of live stock. And before entering upon each separately we may observe that the practical question is not so much what the Act provides as what the Privy Council and local authorities are empowered to do—not only by this statute but others relating to the subject. This is obviously the view the Privy Council take in their recent Order, when they say—"In exercise of the powers in them vested under the Act of 1869, and of every other power enabling them in this behalf." It follows that farmers and the public generally will require to look sharply after their respective interests, otherwise they may be taken advantage of by municipal corporations, as the Corporation of London, who may acquire an adverse monopolising interest, with the view of keeping up the consumer's price to a maximum, but the farmer's or producer's price down to a minimum, the difference being of course their profit. In short, the bearing of the Act is too much in favour of monopolies of this kind, hence its working will require to be watched, more especially by the agricultural interest, home and foreign.

The Foreign Trade Abroad.—A healthy state of this trade is evidently the grand object of the statute, and foreign farmers and the consumers of foreign meat in this country are more deeply interested in preserving the health of foreign stock in the different countries where they are produced than the English farmer, however great may be his loss when cattle plague and other diseases are introduced from abroad. This arises from three causes—1st, the rapid manner disease abroad thins the herds and flocks from which England has her supplies of foreign meat; 2d, the impetus which this and the improvement of agricultural implements and machinery is giving to the growth of corn in those countries of the Continent from which we used to get our chief supplies of foreign stock; and 3d, the rapid increase of the manufacturing population on the Continent, and hence the greater consumption of farm produce which naturally follows. The effects of the last outbreak of cattle plague in those countries were such that they find it more profitable to increase the breadth of corn and reduce the weight of stock in proportion thereto, than to produce animal food exclusively for England in the present unhealthy state of the trade. The decreasing supplies from those countries are facts which speak for themselves. What else could be expected from the existing unhealthy state of trade? For, ever since railway communication was extended to Russia, almost to her steppes, when some consider the birthplace and natural breeding ground of rinderpest, the farmers of countries which used to supply us have been compelled by the losses sustained to shape their practice to the exigencies of the case, and at the present time are holding fair to outlive us in manufacturing and commercial industry, and the consumption of animal food. Prior to the last outbreak of cattle plague they were good customers at our annual sales of improved breeding stock, but since then they look upon upon England just with as much suspicion as upon Russia. What surplus stock they have they continue to send us so long as we are free from disease, but the less they have to do with us the better, so long as we import increased supplies from Russia, Hungary, and the other places seldom free from cattle plague. To overlook such facts is to lose sight of the foundation upon which the Contagious Diseases Act is based, and upon which it must be worked; for our foreign supplies now come from a foul stable naturally, and the British farmer and consumer must trace their action accordingly.

The foreign trade includes, according to the Act of 1869, and powers vested in the Privy Council and local authorities by virtue of it and other statutes, and the freedom of trade generally, not only the exporting of sheep, beasts, calves and pigs to Britain, but also horses, dogs, dead meat, including rabbits, poultry, game, raw hides, wool, and all products, dead or alive, which may be termed "carriers of disease." At present the Order of the Privy Council applies the regulations of the fourth schedule of the Act to—1, The dominions of the Emperor of Russia; 2, The Austro-Hungarian Empire; 3, The States of the North German Confederation; 4, The dominions of the Sultan; 5, The dominions of the King of Italy; 6, The Papal States; 7, Belgium; 8, The Netherlands; 9, The dominions of the King of the Hellenes. This is rather a sweeping territory to begin with, but not an inch more than the present state of trade on the Continent demands. And the duty of the local autho-

rities, &c., in this country, is to see that disease is not imported with any of the above products or carriers of disease from any of the above States. Some of them can send us large supplies for a long time to come, double and quadruple what they now do, if rinderpest &c. could be stamped out. A healthy state of the trade abroad, therefore, is just as much in favour of their producers as it is in favour of the British farmer and consumer. In point of fact it is more in favour of the foreign producer and home consumer than the home farmer, although too many of our large towns view the facts of the case in a different but distorted light.

The trade in foreign stock, and products termed carriers of disease, in the metropolis and other places, has acquired a magnitude sufficient to require statute law and an executive exclusively for itself. At the present time it can neither be said to be in a healthy nor stationary state, more especially in the capital. For the former (health) the Act of 1869 provides, but it makes no satisfactory provision for the rapid manner the trade in foreign live stock is being converted into that of dead meat, and the way the trade in foreign live stock is leaving the capital for other places to supply the capital with dead meat. Foreign beasts and sheep yield a better quality of meat than outward appearances indicate. This has given an increased stimulus to the intermediate jobbing between the live and dead meat markets so much complained of—a pernicious system, which has been slowly working its own ruin, not only in the foreign trade, but home trade also. Hence the increasing supplies of dead meat from the country. On August 13 we left London per Great Northern Railway for the Highlands of Scotland. In the same carriage a Sussex auctioneer, well acquainted with stock sales, and a gentleman from Berwick, were fellow-travellers, and during the conversation we were informed by the latter that one butcher in Berwick now slaughtered upwards of a thousand sheep weekly for London, &c. At Leith and Aberdeen we were informed that the prime dead meat that comes up from the North is not all the produce of Scotland. In short, the objectionable manner the trade in foreign live stock has hitherto been carried on is fast rectifying itself by the natural laws of commerce, so that ultimately the demand for foreign beasts and sheep would, there is every reason to believe, give rise to markets and abattoirs exclusively for foreign stock to supply this demand.

We now come to the practical question—What provision does the Act of 1869 make for the renovation and improvement in the trade in foreign live stock and dead meat? And the obvious answer will readily be anticipated. The monopoly conferred on the Corporation of London is against the freedom of trade thus to rectify itself. True, there is nothing in the statute to prevent the foreign trader from erecting abattoirs in more favourable situations than the polluted atmosphere of the capital, and from these consign his hind-quarters and forequarters to the best markets in a much more superior way than is now done, provided the Privy Council and the local authorities do their duty. But as we said before, the foreign trader and his customers will require to look sharply after their respective interests, otherwise the freedom of trade will be thwarted by monopolising corporations and others, to whom the Act gives too much encouragement.

There remains for consideration the importation and spread of disease. However carefully the foreign trade is conducted abroad, in compliance with the spirit of the Act and powers vested in the Privy Council, it may be taken for granted that disease will be imported to Britain either in live stock or the carriers of disease. If it breaks out in live stock on their passage across the Channel it may be stamped out by the inspectors, so as to prevent its spread, if they are vigilant, but if landed in the incubatory state in live stock, or a live form in the carriers of disease, an exclusive foreign market, as provided for the capital, and the immediate slaughtering of stock, form together but a very poor safeguard against contagion and infection, as the seeds of disease may be spread by the dead meat and hides, by drovers and their dogs, butchers' horses and dogs, by coming in contact with those of farmers and dairymen, and by cattle salesmen who live and farm in the provinces, and by none more readily than the "between jobbers" in the market, who do not shift their dirty clothes before they return home. And in large towns like the metropolis disease is more liable to be spread than in isolated places in a purer atmosphere and under a separate jurisdiction of its own, where live stock, dead meat, carriers of disease, and traders themselves could be disinfected before leaving the market, or abattoir. In short, it is possible to erect establishments, public and private, in certain places under the Act and powers vested in the Privy Council, in which foreign trade can be carried on to any extent with comparative safety as to the spread of disease. And although we do not deny the application of this to the capital, yet it is manifest the Corporation of London will have to act differently from what they have hitherto done, or it will be otherwise, &c., the metropolis will continue to prove itself not only the "plague spot" of Britain, but also of Western Europe, as it has hitherto done.

Of the trade in home stock, dead meat, &c., little requires to be said, as much of the foregoing on foreign applies to it. Improved railway conveyance is much needed, the present practice being barbarous in the extreme and out of all date. The idea of cattle being 30 consecutive hours, or even 12 hours, according to the 6th section of the Act, without food and water, is not easily reconciled with the successful conveyance of fat stock either by road or rail. Live stock when travelling drink more frequently than when at home, and a railway cattle truck that does not provide food and water for stock when they like to eat and drink ought not to be. The quantity of water at starting need not be

large, and the supply required on the way will be when the troughs are empty, which, from our experience, might be about once in five hours. The Act, however, provides that stock shall be watered as agreed upon by farmers and graziers with railway and steamboat companies. It is only when they do so that railway companies can water stock at the farmer's expense, and if they also fail to do so for 12 hours, if so ordered by the Privy Council, I am well borne guilty of an offence against the Act. For, as who send their stock by railway will therefore bear this in mind, for the penalty due to the offence will be greater than the expense of food and water. The Act makes 20s., or 5s. per head, or three months imprisonment with hard labour, the maximum, born in the Privy Council and the local authorities determine the law on such points, so that farmers and graziers will have to make themselves acquainted with what is law in their own localities, which they may obtain free of charge. As to how stock are watered and fed no provision, of course, is made, but it is likely to be made, by the Privy Council, &c. To be returned, with suggestions how it may be done, &c. As to the cleaning and disinfecting of cattle pens, &c., the 21st section of the Order of the Privy Council, August 10, provides how this is to be done by railway and steamboat companies; so that all farmers and inspectors have to do is to see that trucks, &c., are disinfected before stock are put on them. Any attempt to put a diseased animal on a truck or on board a steamboat is punishable with imprisonment, in addition to the loss of the animal, which will be slaughtered and buried or sent to a knacker's, at the owner's expense, without question. Diseased animals on board ship will be thrown into the deep sea.

When stock at the homestead or in the pastime of the farmer are seized with any complaint of a suspicious character, it is the duty of the owner, according to the Act, to call in either the inspector of the district or his own veterinary surgeon; otherwise should foot-and-mouth disease, cattle plague, &c., break out, the consequences may be serious, within the limits of the statute, in the absence of the laws of the local authorities, are sweeping, consequently, in the spirit of the statute, are vested with powers to enforce laws sufficiently stringent either to check the spread of disease, or ruin the unprincipled grazer or drover who attempts to override the law. To this indirect antiquated mode of statute law for farmers we have already objected, on the twofold grounds—first, that the Act leans too much in favour of municipal authorities, and second, that powers are vested in the Privy Council, &c., which, although once vested in the sovereign, now exclusively belong to Parliament. Nevertheless, if the local authorities and committees are selected, the liberal working of details may compensate in a great measure for the sacrifice of constitutional principle. But we aver that farmers will find it an easy matter to maintain their rights in this respect with municipal corporations, owing to the short-sighted notions so generally entertained by consumers, viz., the stringent laws required by farmers to prevent the spread of disease, unjustly interfere with trade. If consumers would only make themselves practically acquainted with the fact, how fast the foot-and-mouth disease, &c., eat the meat off the bones, and that foot-and-mouth disease at the time we write is actually consuming more meat daily, at home and abroad, all the foreign meat imported into England, they would see the propriety of joining farmers in the enactment of stringent laws possible for preventing the introduction and spread of contagious and infectious diseases. This is not all that consumers have to weigh in the balance for when herds and flocks at home and abroad are decimated by disease, they experience two losses—first, easily estimated; but the price of meat rises far above its normal level, at which it remains for a length of time; and second, a vast amount of diseased and wholesome meat is sent into the market. If there were consumers cannot view with an impartial eye the losses of producers, they ought, at least, to be able, by the time, to calculate their own losses since 1866, and on, for the future. W. B.

Home Correspondence.

Harvesting Corn in Wet Weather.—I must take exception to the statement of your reviewer in the last *Agricultural Gazette*, that the award of the Society of Arts is not to be considered as an approving recognition of the principle upon which the Gibbs' system of drying wet corn in sheaves and stacks was based. If the Society's prize was not given in that sense, for what was it given? Surely not for reiterating the advantages of saving corn and weeds at wet harvests, which the Society itself had so substantially asserted to be an important national object, offering the extraordinary prize of a £1000 Medal, or 50 guineas, nor for a mere exposition of methods, had been practised in other countries, without being deemed worthy of adoption here, nor for any general treatment of an object which every farmer admitted was desirable, but which no one had been able to satisfactorily (profitably) accomplish at large. As I was on the Council of the Society of Arts at the time the prize was given, I was one of the special committee appointed to deal with the matter (though I did not act as a judge). I say that my own impression and that of others whom I spoke was that the intention of the Society was to elicit, by a distinctive and valuable prize, means of carrying into practice an object so generally admitted to be desirable. Anything short of accomplishing this purpose would, in my experience, have been simply throwing the medal and money away. Had I thought that Mr. Gibbs would have received the

Farmers' Clubs.

KILKENNY.

Hints on Horse-breeding.—In a paper by Mr. J. PALLIN on this subject, lately read before this club, are the following passages:—The first object of every horse-breeder should be profit, with the view of producing a saleable, marketable article, exactly the same as you do your crops. To do so requires a fair knowledge of the subject, and a sufficient amount of care, patience, and intelligence. We have two kinds of breeders—namely, those who breed by chance, and those who go systematically about it. Of the former we have the most frequent instances. A gentleman or farmer happens to have a mare which has carried him safely and comfortably for years on the road or in the hunting-field, or has been his trusty slave in harness; and for either a kindness for past services, or some other cause, he wishes to have a foal from his favourite, feeling quite happy to have so good an animal to breed from. No further consideration is bestowed; her shape, temper, constitution, and action may be all good for a hunter or roadster; still she may not be suited at all for a brood mare.

Again, a person may have a mare which he intends to make a brood mare, which has not any of the qualities possessed by the other. She may be old, badly shaped, bad tempered, broken down, or of a washy constitution, blind, spavined, or curdy hocked; still she is used as a brood mare, simply because she is on the farm. Now, can anything be more foolish than to expect success in breeding in such a way? And as it is by far the most common practice, can it be wondered at that so many farmers complain that horse-breeding is unprofitable? Disappointment and pecuniary loss must accrue to the breeder, and a great injury is done to the country at large. I am willing to allow that a good foal may be produced from such a mare as described, but in 99 cases out of every hundred a useless brute is the result.

Choice of Sire.—Again, how does the chance breeder proceed in the choice of his sire? Does he look for one which has all the points and parts of perfection in which his mare is defective?—one which resembles her in size and form, but superior in breeding? If he did, half the evils might be avoided; but chance is again trusted to, and all the anxiety he evinces in the matter is the cost of his horse's services; while, in other cases, it is the one which passes the gate, or is close at hand, or perhaps the property of a neighbour or a friend, who is glad to give the service for other compliments. He may have every defect to which horse-flesh is liable; but this is no matter to the chance breeder: a foal is all he seems to desire. He never pictures to himself the cost of rearing it up to three or four years old, and bringing it to a fair, when, if he is sold, and comes under the eye of a veterinary surgeon, he has the unpleasant task of informing him that his horse is a roarer, or has a pair of diseased hocks; he is taken home, sold for a trifle, or put to work on his master's farm, which, in a short time, reduces him, by more fully developing the diseases, to a cripple, and he drags out his weary existence in misery. The systematic breeder never allows any chance work to creep into his concerns. Whether he breeds racers, hunters, carriage, saddle, or cart-horses, he selects with deep anxiety his breeding mares, and those which he can trace back to blood of unquestionable family in their class. They select the best sires, and scrutinise their performance, pedigree, and shapes, and, in all probability, breed from those which have been already tried and found to produce animals of the right stamp. Any defects in his mares he endeavours to correct in his foals by having the sire super-excellent in those points, so that, by close attention to those matters, he can almost calculate with certainty what sort of animal he will have to dispose of at a certain age, the market for him, and what in all probability he will be worth. Breeders of this description are yet not numerous in those counties. There is, however, nothing to prevent them becoming so, and they will generally succeed best by confining themselves to breeding the one class of horses. I will boldly assert that horse-breeding will pay the Irish tenant-farmer who breeds systematically and knows its management. We know how difficult it is to succeed in any undertaking when we do not understand it; and the same difficulty exists in horse-breeding. The demand for some years has rapidly increased, from the fact of foreign dealers purchasing a large number of our best colts and fillies.

The fame of our Irish horses has extended far and wide; and the further we go away from home, the more are prized our "Irish nags." I can only account for it by the fact that they must have that great recommendation, which is an inheritance, not alone of Irishmen, but Irish horses—namely, pluck, stamina, and hardihood. The French and Austrian soldiers are now carried by Irish horses; and if it were not that some striking peculiarity existed, they would certainly find remounts in their own country.

Choice of Dams.—In selecting the second part of my subject, I take the mare, as on her, I consider, depends three-fourths of the importance in, I may say, any breeding, but especially in horses. I have scarcely ever seen a bad horse of any class out of a good mare; and there is scarcely an instance of extraordinary horses but the prevailing point of excellence could be traced in some way to the dam. At the same time, we must not throw over the consideration of the stallion's properties. In racing, I could give you several instances where the same mare, with different sires, produced almost every year a horse of character, such as the dam of Stockwell, which has been justly styled the Emperor of Stallions, from the number of winners he has produced. Pocahontas, his dam, almost to her last foal, transmitted to each that peculiar gift of speed which makes a race-horse; and at present there are no less than six of her sons at the stud, and each of these has, to a greater or less extent, the same peculiar power. Rataplan, although an own brother to Stockwell, and said to have been a gamer race-horse, has not been so successful, but still was above the average with several sons at the stud—good horses, from their power and stoutness—one, I may add, in this county, which will, I am confident, be of service to the country in getting good half-bred stock. Amongst our home-blood we have the great Birdcatcher, whose dam, old Guiccioli, with almost any sire, produced running horses, she being also the dam of Faugh-a-ballagh, which went to France, and whose progeny are now the cream of the French studs. I only bring forward these few instances to illustrate the fact I have found must be first looked to—namely, the dams. In breeding hunters, carriage, or farm horses, you will find it equally marked, and at present I know of a farmer who has a mare up to last year which produced nine or ten foals, and he never got less than from 70*l.* to 100*l.* for them at four years old; while every year she got different horses. Temper, power, endurance, spirit, I think, generally follow the dam; form, action, &c., the sire. In selecting your mares, the following particulars should be inquired into:—True blood, soundness, shape, action, age, height, and temper. As I do not intend to particularise any class of horse, the remarks I offer are applicable to all. Of course, each has its peculiarities. For instance, a thorough-bred shoulder is a bad one to put to a collar, and thorough-bred action would not answer in a four-horse plough. General rules I can only give you, and you can apply them to all classes of horses. It is not my intention to enter into the due observance of the crossing of different and peculiar strains of blood to produce a first-class racer, nor shall I dwell on the breeding of thorough-bred stock. The horses bred by us are of a lower class, and to those I will direct your attention. The pedigree of a hunter does not require that nicety of selection as in blood stock; still, I consider it almost indispensable to have at least a couple of crosses of the thorough-bred. There are certain breeds which are peculiar for the natural qualities of jumping, and mares from such strains should have a preference. Wexford has long been famous for its hunters, and I think it has been due principally to that famous sire Elvas, who I may say stocked the country with his progeny for many years. They were all peculiarly made, long, low, strong horses, with shapes eminently suited for the hunting field, besides being natural fencers. Some of the sons and daughters of the famous Irish Birdcatcher have given us splendid natural hunters. In Carlow we had two of his sons—The Trapper and The Bird—which have produced nice stock, while in Kilkenny, Doctor O'Toole has not disgraced his sire's name. In Kilkenny and Tipperary, the Welcomes and Greathearts were well-known hunting blood, and some of the mares from them in the country still are breeding well.

Hunters, Hacks, and Ponies.—Without losing sight of size and power, for they are often called on to perform extraordinary acts of gameness, and from the thorough-bred blood comes all the pluck and courage to stay a distance, and by their blood-like action to give their riders a comfortable seat in their saddles. In a hunting-field the blood will always tell, and although I have sometimes seen true-made hunters to look at got by a cart-horse, I have scarcely ever seen one of them reach the end of a run with a moderate pack of foxhounds. It is not necessary for a brood mare to produce hunters to have been a performer herself, but there are a few points indispensable, namely, a fine, well-laid shoulder, depth of girth, short cannon bones, with size, a good back, plenty of rib, big quarters, thighs, and hocks, with her hind-legs in the proper position under her. In the breeding of carriage horses, pedigree is not of great importance; but without a dash of thorough-bred blood in her veins, it is impossible to have them step well.

Mares to breed a carriage horse may be of a plainer kind than hunting brood mares, but they must bend the knee, and have plenty of quality about their head, neck, and shoulders. Some years ago there was a class of clean-legged Irish draught horses in the country that could pull their 30 cwt. in a cart, or trot their master to market 10 miles an hour. They were bays, blacks, or chestnuts, of no particular breed. They stood on short sinewy legs, with long bodies, flat off their ribs, and generally high-hipped; long thin heads, with hairy rough muzzles, but with a good prominent eye, which denoted determination. Such a class of

horses has now nearly vanished from our country, those which are still left are producing the best and harness horses I meet. At present I know of a mare of the kind, 25 years of age, which has produced 15 or 16 live foals, with a small loss in the county Carlow. She has been almost his principal support, and with different sires, her colts all brought a uniform price of from 70*l.* to 60*l.* at 2 years old in the halter, and, as the old man told me, a veterinary surgeon has never had the fortune to put his hand over one of her progeny. Fortunately for his profession to which I belong, such a breed has disappeared for disease was almost unknown amongst them in form; but unfortunate to the tenant-farmers of the country at large, for we shall never see their like again, besides being a class of animals well suited to what wants, they were easily kept in condition, and at maturity at an early age. Some of the best I have seen have been the produce of our Connemara pony and a good thorough-bred horse, when they be had large enough; besides, they generally wonderful durability, and a snare of quality. Shoulders and legs should be the principal parts to in the mare, as without they are well formed, an animal cannot be a good hack. Thick shoulders are almost worse in this class of horse than any other, as they seldom can exist in any horse out his having a tendency to stumble and trip up less. Good legs and feet are indispensable to a road, and to produce which the dams should have them well shaped, and in the proper position.

Draught-horses.—There are, perhaps, no equine species which will bear so much of the Connemara pony, and they were well suited to the wants of the small tenant-farmer of half a county. There is no part of my subject which will interest as a body of advanced practical farmers, as remarks on what we want to constitute a good brood mare—a breed which, I have come to the conclusion, even with the the number of horses of the kind which have been imported into the country of late years, has not improved proportionally. Clydesdales have, for years past, been looked upon as the most desirable breed to introduce into the country, but I must say, in my short experience, I do not think so, as I do not consider them, in general, to the wants of our ordinary tenant-farmers. I no doubt that they are fine, powerful animals, and draw enormous burthens; but in our land, as we have here in this county, such an amount of horse power is seldom required, besides, where is the farmer who has 20 or 30 acres of land could feed a pair of them year, to keep them in proper condition (which amount to fat)? Their action is slow, and until they are aged, they are generally what may be termed "soft" with clean legs, compact make, that can bend the knee, and don't dish in their trotting action, well with a thorough-bred horse; but for such the breeder should always select a sire who will give well laid back shoulder, and light head and neck. It is in those points that Clydesdale mares are rully at fault. For draught purposes, the straight-shouldered, wide-chested horses are best with such a conformation they must have a corresponding want of pace, which invariably, if not acted in the opposite sex, will come out in the form of a good draught mare should stand from 15 to 16 hands high, and need only exert in walking, she should do light and freely, placing her feet on a flat on the ground. Her head should be round, but well-shaped, with round, plump, and new shoulders, strong, muscular, and fully developed. I have said, standing upright more than oblique, being strong and thick, as from this formation the weight is thrown into the collar than if the neck were light, with oblique shoulder; leg should not be too short for the weight of the body, and should be lengthy; pasterns strong and short, well rounded, well-formed feet, which should be furnished with dark-coloured hoofs, loins and haunches inter-fused, with plenty of breadth, which assist also in carrying weight into the collar. Any one who has had a steady puller under a heavy load must have kept how the animal lowers the head, bends the knee, and digs the hind toe into the ground. Some of the best and Cleveland bays which have been imported into this country, and crossed with our Irish mares, produced the most useful class of draught horses I met; they have all the spirit and quickness of our Irish horse, and, at the same time, the weight of the Suffolk. Some of the best of the dale bred in the same way are good farm-horses when not too tall suit our wants admirably. I have seen some animals got by a Norfolk horse, which in this county some time since, which were perfectly serviceable animals. I would strongly recommend such a class of horses to you; but it is difficult to get a sire of the actual stamp, much looked for both for the country and for exportation.

Soundness.—The all-important point of soundness now to be considered. It is the essential element in brood mare for all purposes. It is a notorious fact there are certain diseases of which the parents are subjects, and which will descend to the progeny, prevent such results, which I think cause much pointment, we should be particular in the examination of our mares required for the stud. In many cases, a mare is never put to the stud until she is fit for anything else, but let me impress on you that when you have a mare fit for nothing else, consign her to the stud rather than encumber yourself with her useless progeny for such they must be. It is often difficult to draw a line between hereditary diseases and those of accident. In general, those which are hereditary defective conformation, such as spavin, splint, ringbones, sandcrack—all diseases affecting

Blindness and navicular disease come under the former class, although they may be the result at any time of the latter also. Spavin and curbs, although distinct diseases, and depending on different causes, are found in the produce of horses which have badly-formed hocks, although both diseases may be the result of accident. With curbs, if I found a mare with what is termed round or bent hocks, with a small os calcis or point I would not breed from her, as it is almost certain to come out in her progeny. On the contrary, if you had a straight, well-formed hock, and only a curb on one leg, I would not consider it of any consequence. Spasm, ringbones, and sidebones, I consider, are hereditary in almost any form. Indeed, ringbones will come out in generations, and I consider these hereditary dispositions depend on peculiar weak formation of the large and small pastern bones; or at other times, where the legs are so shaped as the centre of gravity comes over the top of the hoof, Nature throws out an ossification as a strengthener to the parts. Another hereditary disease I consider of much importance is blindness dependent on disease of the eyes—specific ophthalmia, a special disease of horses, which is certain to follow breeds, and on no account would I recommend breeding from either sex affected with it. A mare may lose an eye or become blind of both from an accident, but in any case it renders them more or less unfit as a brood mare to fill that office which Nature has destined her to protect and shield from injury her offspring. Diseases of the respiratory organs, as roaring, whistling, broken wind, thick wind, &c., I consider hereditary diseases. Roaring, dependent on imperfect formation of the throat,—horses with thick, hairy jaws, thick at their angles, and badly set on, large heads, all have a tendency to this disease, while I have sometimes found it in horses with long thin necks. Diseases in the feet in most cases are hereditary, navicular disease particularly so. Mares with narrow, mulish-looking hoofs, contracted at their heels, are invariably bad to breed roadsters, especially if this be accompanied by short pasterns, which make them more liable to the result of concussion. Sandcracks I have seen follow in families, and as it depends on a certain want of the connecting materials between the fibres of the hoof, and will often render a horse useless, it is certainly imprudent to use animals so affected for breeding, particularly if it is accompanied by flat feet, which is generally the case. In concluding my remarks on soundness, I may add that it is most important to have both horse and mare in a healthy condition, as the progeny of sickly or emaciated parents must inherit some of the debilities, besides having a tendency in any case to materially retard and interfere with the healthy development of the foal during gestation. Perfect conformation and soundness in both male and female is of the greatest importance, and he who breeds from either in an unhealthy or diseased state must feel assured that he cannot expect his progeny to be otherwise; as the old adage says, "like produces like."

Farm Memoranda.

LODGE FARM, CASTLE ACRE, NORFOLK.—This farm consists of 997 acres of land, and was taken by Mr. Hudson in the year 1822, together with an adjoining farm of 500 acres, which now forms part of the occupation of his son, Mr. Thomas Moore Hudson. The two farms had been refused by three persons before Mr. Hudson took them. They were both poor and foul, and the outgoing crop, which was carried by the new occupier, amounted to 20 bushels of Wheat and 21 bushels of Barley per acre, while the roots did not enable him to winter more than 10 bullocks. After being cleaned and fertilised by the liberal use of rape-cake, the land gradually improved, and now, after the expenditure for the last 30 years of between 2500*l.* and 3000*l.* per annum in oilcakes and other feeding stuffs, shows well as from 800*l.* to 1100*l.* per annum in artificial manures, according to their price, the 1000 acres will now winter from 100 to 140 steers, according to the root crop.

Grass Land.—The grass-land consists of about 200 acres, all of which is pasture, and fed principally by hay. From 10 to 50 acres of it are irrigated, but even the hay, although very good as feeding land, is useless for mowing. Irrigating is begun in November, after the Grass has been eaten off, and the water is shifted in succession from one part to another, after having remained a few days on each, until the beginning of March. The cost of cleaning out drains, the river, and so forth, is about 10*s.* per acre annually. Sheep are put on the irrigated pastures by day as soon as there is good feed for them—generally about the end of March or the beginning of April.

Arable Land.—Five-and-twenty years ago, when the Society offered a prize for the best essay on the Agriculture of Norfolk, Mr. Hudson farmed on the digenous four-field system, and his *modus operandi* is described in some detail by Mr. Barugh Almack in his commended essay, published in the fifth volume of the Journal. For some years past Mr. Hudson has farmed on the five-course system, getting some catch crops in addition, as follows:—1, Wheat; 2, Barley, followed by (a) Tares and winter Oats, (b) early Peas, or Rye for feeding; 3, Turnips, 4, Barley; and, 5, seeds. At present, however, Mr. Hudson is gradually getting shift back to the ordinary four-course system, as, on the whole, he considers it better adapted to the West Norfolk land. This is particularly worthy of mention, because about 11 or 12 years ago the five-course system—taking, however, Oats after Wheat instead of Barley, and no "catch crops"—appeared to be undervalued in the eyes of the Norfolk farmers.

Wheat.—The Clover ley is manured with 10 loads of farmyard manure as soon as possible after the Cow-

grass has been mown, or the Trefoil and white Dutch have been fed off. The manuring is generally done in July, August, and September. The land is then ploughed to a depth of 5 inches, heavily rolled, sometimes with a Cambridge roller, and harrowed four times; and afterwards drilled with from 8 pecks of Spalding Wheat at the commencement of the season, to 10 pecks at the end of the year, the drills being 7 inches apart. It is then harrowed twice, and rolled with a Cambridge roller. In either February or March the Wheat is hoed either by horse or by hand, and is top-dressed with 2 cwt. of guano per acre.

Wheat is cut with a Burgess & Key's reaping machine just before it is ripe, it is headed by men and women at 3*s.* per acre, and is shocked by odd hands, the fields being gone over afterwards with wood-tined horse-rakes. The sheaves stand about a week on the shock, and are then put into long stacks on the field where the crop has been grown. This system of stacking is pursued with every kind of crop, and thus the necessity of stackyards is entirely done away with. The stacks are generally 13 yards long and 7 yards wide, and the distance from the eaves to the ridge is about 15 feet. The thatching is done at 5*d.* per yard run at the eaves, which is equal to about 1*d.* per square yard. Round stacks of 9 feet diameter at the base were formerly very much in vogue, but they are, comparatively speaking, rarely made now—certainly by no means so frequently as in former years. Threshing is done partly by fixed and partly by portable steam-threshing machines, and the corn is dressed by hand finishing and winnowing machines. Previous to sowing the Wheat is dressed with Down's Farmer's Friend.

2. Barley.—After the Wheat is harvested the stubbles are forked over by hand, at a cost of from 6*d.* to 1*s.* per acre, so as to thoroughly clean it and get rid of Twitch. The land remains thus until February, when it is ploughed to a depth of about 4½ inches, and dressed with 2 cwt. of guano per acre, by means of Chambers' manure distributor, drawn by two horses. It is then immediately harrowed again, and drilled with 3 bushels per acre of Golden Melon Barley. Sowing commences about the middle of February, and is finished as soon as possible. After sowing, the land is harrowed twice over, but seeds are not sown on the Barley in this course. Barley is weeded in June by women at from 4*d.* to 5*d.* per acre.

The crop is mowed with a Burgess & Key's machine; it is collected with gathering forks, the land being raked between the heaps, and the corn is afterwards pitched, loaded, and stacked, Barley being neither sheafed nor shocked.

Harvesting white crops is generally done by gangs of men, who engage for the harvest. Mr. Hudson hires 27 men annually to harvest the white crops, on a farm comprising about 800 acres of arable land. These men are divided into three companies of nine men each, namely, two loaders, two rakes, and five at the stacks. These men get about 6*l.* 10*s.* each for about three weeks' harvest work, including trimming the stacks, putting up the implements, and clearing up generally.

Oats are seldom or never grown as a white crop, but their place in the rotation would be instead of Barley in the course just described.

3. Roots.—The 100 acres devoted to this course are generally subdivided as follows.—15 acres white Tankard Turnips, 10 acres Swedes, 15 acres green round Turnips, and 20 acres Mangels.

(a) **Turnips and Swedes.**—The Barley stubble is forked over in the same manner as already described in the case of Wheat stubble. After Wheat sowing is finished it is ploughed 6 inches deep, it lies all the winter, and as soon as Barley sowing is finished it is again ploughed—across the previous furrows. Subsequently it is scarified and harrowed, as may be required. In May the land is ploughed again, and ridged in the beginning of June, eight loads of farmyard manure per acre being put in the ridges. Just before sowing, a dressing of 3½ cwt. of superphosphate, and 1½ cwt. of ground rape-cake, mixed together, is drilled on the ridges, and immediately upon this 1 lb. per acre of Turnip seed is drilled with a small seed drill. All the Turnip seed is sown on the ridge, except a small quantity in the autumn, which is sown on the flat.

White Tankard Turnips are sown for September and October feeding, Hudson's Swede (a kind of Purple-top) for winter use, and green round Turnips are sown in autumn after Tares (which are sown on Barley stubble after Wheat) for use in the spring.

As the Turnips come up they are first horse-hoed, then cut out to 11 inches apart, at a cost of 2*s.* per acre, being singled by a gang of women at 1*s.* 6*d.* per acre. After singling, they are horse-hoed again, and finally each plant is hoed round—an operation which is locally termed "scouring."

The Swedes are pulled when ready, and six drills of them are placed together in a row; a furrow is then ploughed on each side, so as nearly to cover the roots with earth, and thus protect them from frost, &c. The white Tankards are first fed off, being generally consumed before the hard weather commences. They are pulled and sliced for the sheep, to which they are given in troughs, with an allowance of cut hay, and about half a pound of linseed-cake each per diem. After these are finished the Swedes are topped and tailed, and thrown into heaps, from which they are sliced and given to the sheep. The green round Turnips are fed off by ewes and lambs in March and the beginning of April, and the land is immediately afterwards sown with Barley.

(b) **Catch Crops.**—The 15 acres intended for green round Turnips perform another duty previous to being devoted to that crop, being sown with either Tares and winter Oats, or early Peas. Rye for feeding is also grown as a catch crop before green round Turnips.

In the first case, after the Barley stubble has been forked over to get out Twitch, it is manured with ten three-horse loads of farmyard manure per acre, which

is ploughed in 5 inches deep, and the land is immediately drilled with 2½ bushels of Tares and half a bushel of winter Oats per acre. This crop is generally fit to mow for the horses about the middle of May, and the land is immediately afterwards ploughed and cleaned, and soon after the middle of July sown with green round Turnips.

Early Peas are sometimes sown on Barley stubble instead of Tares. The land having been forked as before, it is manured with eight three-horse loads per acre; this is ploughed in 5 inches deep, and 3½ bushels of early Peas per acre are drilled in about the end of November or early in December, the rows being 9 inches apart. When well up, they are hand-hoed at 2*s.* per acre. Harvesting is done the third week in July, the whole strength of the farm being employed in cutting and carrying as quickly as possible. The Peas are cut with hooks, and are immediately carted on to a piece of seeds or hay stubble to ripen. They are laid out in beds with paths between them, so that they may be easily and frequently turned until ripe.

As soon as the Peas are carted away the land is cleaned, ploughed, and drilled with green round Turnips, and a dressing of 3½ cwt. of superphosphate and 1½ cwt. of rape-cake per acre.

For Rye the land receives the same preparation, except that no manure is applied, and it is sown in September or October, with 3 bushels of Giant Rye per acre. This crop comes in for spring food for the ewes and lambs in April. After the Rye is fed off, the land is ploughed 6 inches deep, rolled with a three-horse roller, and then harrowed. After this treatment it lies for three weeks, when it is again ploughed, and afterwards sown with green round Turnips, and treated as ordinary Turnip land.

(c) **Mangels.**—The 30 or 40 acres of Mangels usually grown are sown on the strongest and best land available in the shift. The land is ploughed and otherwise prepared in the winter, and ridged about the middle of April, when ten three-horse loads of manure per acre are put in the ridges, and covered with from 2 to 3 cwt. per acre of guano; the ridges are afterwards closed up by a double-breast plough, and drilled with 7 lb. per acre, generally of Long Yellow and Long Red, Globe Mangels being grown only on the very best land. Since steam cultivation has been adopted the land for Mangels has been tilled in the autumn to the depth of 8 or 9 inches, and the seed has generally been got in earlier than formerly, from which great benefit has been derived.

The plants are first horse-hoed, then cut out with a 14-inch hoe, at a cost of 2*s.* per acre, and singled, in the same manner as Turnips, for 1*s.* 6*d.* per acre, after which they are horse-hoed again.

The Mangels are taken up the last week of October or the first week in November, topped, but not tailed, and put into "clamps" 6 feet wide at the bottom, and coming to a ridge at a height of 4 feet from the base. They are covered with a thick gavel of straw, and afterwards with about 4 inches of mould; the ridge is left open for about a fortnight, after which it is entirely closed. Pulling, topping, loading, and stacking cost altogether from 6*s.* 6*d.* to 7*s.* per acre, according to the crop. Mangels are chiefly given to the feeding beasts in the foldyards, commencing in January or February, these also getting from 10 to 12 lb. of cake per day, with cut hay or straw, and a few are also used in the spring for fat sheep after the Swedes are finished. Mangels are always sliced with the Turnip-cutter.

4. Barley.—After the Turnips are fed off, the land is ploughed, and then allowed to remain untouched until the middle of February, when it is harrowed, ploughed again, and drilled with 3 bushels per acre of Golden Melon Barley; it is then laid down with 20 lb. per acre of small seeds. The harvesting and other operations connected with Barley have already been described in treating of Barley after Wheat.

5. Seeds.—Half the Barley of the above course is laid down with 14 lb. of Trefoil and 6 lb. of white Dutch per acre for summer feeding, and the other half with 20 lb. of Cow-grass per acre for mowing. After sowing, the land is harrowed, and as soon as the Barley is sufficiently strong it is gone over with a one-horse roller.

The Cow-grass, of which there would be about 80 acres, is mown with a Burgess & Key's Grass-mowing machine, and the labour is paid for as day-work. The stacks are about 5 yards wide, and as long as necessity requires. As soon as the hay is off, the land is manured for Wheat, as already described. The remaining half of this course is fed off by sheep during the summer, and then manured as soon as possible. Mr. H. M. Jenkins, in "Royal Agricultural Society's Journal."

The Poultry Yard.

THE COMING BIRMINGHAM SHOW (Continued from last week).—The pigeon classes at Bingley Hall are always well worthy of notice, and although the classification does not always meet the approval of those who are disposed to make one breed of birds their especial favourites, to the prejudice of others, yet we think that the committee shows its anxiety to make progress by constantly adding new classes, and extending its already lengthy list.

Pigeon fanciers, while spirited in carrying out and developing the birds to which they are most attached, regard the other classes with an apathy that is discouraging. Some go so far as to count only carriers, pouters, and tumblers as worthy of classification, and dismiss the other varieties as "toys." We think that the progress made in the last few years in some other breeds will lead to a more general acknowledgment of the merits and beauties of other kinds of pigeons. Almond tumblers head the Birmingham list, with a class giving them three prizes. Carriers follow, with half a dozen classes, each furnishing two prizes.

See Mr. Clara Sowell Read's Essay on "Recent Improvements in Norfolk," in the 19th volume of this Journal, 284 and 285.

more greedy are the pouters, monopolising ten classes. We think they might be curtailed with advantage. It is true the birds are very handsome, but why should not the tried birds compete one against the other?

The favourites of London fanciers of past generations, the little baldheads and beards, come next; we hope they may muster well. Tamblers follow, with two classes, which we suppose are intended to take all varieties except almonds. The improvement that has been noticeable in the runts exhibited during the last few years, is this year to be still further encouraged by a five-guinea cup, offered as first prize by Messrs. Baily & Son, of London. The birds now exhibited are heavier by more than a pound per pair than were the winners a few years since; and when it is considered that a pair of ordinary young pigeons weigh about 20 ounces, while we now see runts that pull down four and a half pounds per pair, it is worth while to try to what extent this growth can be developed. We are aware that the comparison of the runt with the almond tumbler or carrier is not to the advantage of the former as regards appearance; but we may recall the Dorkings of years ago with those we now see, and see the beauty and symmetry to which careful breeding has brought a breed formerly called "dunghill" and "barndoor." The same result might be looked for to a certain extent with pigeons; and that which seems a great weight to us now for a pair may be only an average in a few years' time.

Jacobins come next on the list, and few prettier pigeons are seen in the pens. Fantails have two classes—we should like to have seen a third for, so-called, Indian fantails. We get from them a perfection in points hardly ever attained by the larger and coarser English birds. Trumpeters are rising in importance as a class, and are now showing what may be done by the introduction of fresh blood. Two classes are allotted for owls—one for the foreign and one for the English variety, one class of three prizes for nuns of all colours. Owls and nuns rank among the first favourites in small pigeons, followed in estimation, as in position, at Birmingham, by the turbits.

Barbes, a very important breed of pigeons, and one that takes a high standing with amateurs in all parts of the world, have two classes; one for blacks, and one for birds of any other colour. That three classes should be allotted to dragons will excite surprise everywhere but in the town where the show is held. No one will grudge the class apportioned to the pretty little magpies; and we hope that the two classes following, which are to be filled with Antwerps, may bring both judges and breeders to one opinion as to what the real Antwerp should be. Archangels and swallows close the list of classes for single varieties. Following them comes the class which is the nursery of all new varieties, in which six prizes are given. We omitted to notice earlier that Mr. W. R. Rose offers a cup, value three guineas, for the best pouter in the show. There are 12 classes for pigeons, and as in some cases the competition is so close as to involve the close handling and examination of many birds, we would suggest an increase in the number of the pigeon judges.

WE are afraid that goose-eating at Michaelmas is going out of fashion. Certain it is that seldom has the demand been so small and the supply so indifferent as this year; and we think hardly ever has the weather been so much against the feeders. On Saturday last there was a good demand for geese, and but very few at market. On Monday—the first real Michaelmas market—very few geese, and nearly all of those spoiled by the closeness of the weather, and from having been killed when full of food in order to increase their weight. On Tuesday the supply was good as regards number, but the geese generally were very small. There were one or two lots which showed the cross of the large Toulouse birds, and they sold well; others again showed the head and stripped neck of the Chinese, and were avoided. The Essex geese were many of them small geese, that had been imported from Holland and Ireland when goslings and turned down to fatten at the feeders' in England. They hardly ever attain any size, and are seldom good eating. The best geese that come are those fed by the Norfolk and Cambridgeshire farmers. They make up full of meat, of good quality; and where attention is paid to the breed, so that good size is coupled with quality, they sell very well. The Irish and French geese were below the average, both in number and quality; and those from southern England had, as a rule, been but poorly fed.

— We are of course unable to report any general result of the bags made yesterday; but we think it will be found that in the west and southern parts of the country the first hatch of pheasants was not so bad as has been imagined. The reports from the eastern counties up to the present are not encouraging.

Calendar of Operations.

OCTOBER. Harvest in late districts of the North is seldom finished before the beginning of the month, and in late seasons much corn is often abroad in the North towards its close. But unless the wet is accompanied with a high temperature, there is not that tendency to sprouting which exists in the early and wet harvests of the South. In cold weather small loosely bound sheaves and well set stocks stand a good deal of water without sustaining much harm, the straw often suffering more than the corn. This is especially the case with Oats, the straw of which is chiefly consumed as fodder by cattle. Fine Oat straw is highly prized as feeding material, and hence to get a good crop of Oats, and that crop safely harvested, is no secondary question in the North.

Michaelmas Entries to Farms.—New servants, where changes take place, and the balancing of the books, &c., engross attention in our southern counties at the commencement of the month, as the

farmer's year very generally commences with October. In the olden time it was common for the incoming tenant to purchase out his predecessor for a "lump" sum, as agreed upon, the former taking everything on the farm, including hired servants. But owing to the great improvements which have recently taken place in live and dead stock, old-fashioned farmers who have fallen behind in the march of improvement cannot thus be purchased out when they give up their farms. For, at the present time, very great circumspection and skill are required by the incoming tenant in the selection of live stock and implements at his entry. No doubt cheap entries suit men with limited capital at the present day, as they always have done hitherto. But tenants who enter with limited capital will find it better to hire steam ploughs, cultivators, and other implements of tillage, threshing machines, &c., than to start on the old plan with an extra strength of inferior working horses and ineffective implements; and the same principle applies to live stock, i.e., if the incoming tenant cannot consume the whole of the root crops, hay, &c., with a paying stock, it is better to let part to some other person, than to attempt to consume the whole with a worthless stock that will not pay. It is not necessary that the live stock should be expensive thorough-breeds. Indeed, this should rather be avoided; but the live stock should be a paying stock; and for a similar reason it is not necessary that the working cattle and implements should be all new, and of the most expensive sort. Such are the contracts which, in the case of limited capital, should be carefully avoided. But the teams should be fit for their work, and the implements, &c., although not new, should be of the best make, and thus capable of making good work. It is by attention to such practical data that some intelligent farmers start successfully with about half the capital which others find a losing concern, or else experience very great difficulty in keeping their own.

Wheat Seed-time extends over a greater portion of the autumn months than formerly. This arises from the reduced breadth of naked fallows, and the greater area of land under root and green crops now followed by Wheat. When to have summer following of what was then termed Wheat soils was the common practice. Wheat-sowing about the beginning or first week of October was the general rule, South and North; and so closely was this rule adhered to, that many farmers were of opinion that later seeding of the land was attended with less promise, and no doubt it was on undrained tenacious clay soils. But improvements in drainage, cultivation, and manuring, enable farmers to get a fine seed-bed for Wheat after mangels and Swedes are removed from the land in November, the young Wheat plants, too, having time to be thoroughly established before the winter sets in. Indeed, in our southern counties some degree of caution is necessary in mild seasons in sowing early, otherwise the Wheat will be "winter proud." To obviate this "sow thin," say the advocates of thin seeding. In the North, where winter sets in earlier, there is less liability to harm, but even in our northern counties, as Fister Ross, early sown Wheat in mild seasons is liable to be "winter proud," more especially when sown thick. But when the autumn is cold, the winter early, and the spring late, thin sowing in the North is attended with a deficiency of plant, but not to the extent formerly experienced before the land was thorough drained. More seed is thus required in the North than in the South, generally speaking; and in each case less seed is required in mild seasons than in cold ones, and with early sowing than late sowing.

Live Stock.—The comparative question resulting from improved agriculture in the management of our herds and flocks is the reverse of that of Wheat, given above. Thus the stock that used to be starving at our hedge sides in November and December under the old practice, is now improved and put up to fatten in September and October of the previous season, so to speak, as we now have an abundance of feeding materials outdoors and indoors with which to force them forward to early maturity and the shambles. Thus in our southern counties, as Surrey, Hants, Dorset, and Devon, the horned Dorset ewes begin to lamb and are put upon the young Clover seeds and Italian Rye-grass and Turnips, whereby both are sometimes ripe together for the shambles by Christmas, without either cake or corn. In other cases cake, corn, &c., are needed. Over the greater breadth of the southern and midland counties the rams are put to the breeding ewes with a view to lambing the last week in February or first week in March. The fattening sheep are put upon Rape or Coleseed, or Turnips; sometimes the wether hogs are treated in the same way, or the latter may be folded during the day and turned back into the pastures over-night. The practice is very diversified, much depending upon the weather, the state of the pastures, and the crop that is to succeed the Rape and Turnips. If Wheat, and the land be heavy clay, it may be advisable to feed off as early as possible, or before the weather breaks, with the view of getting in the Wheat in a proper seed-bed.

Notices to Correspondents.

FARM ACCOUNTS. Bath. You might adopt Mr Jemmett's system as developed in his books for the farmer's use. His address is Muswell Hill Farm, near Reading. WHEELS. M. W. In pastures weeds are discouraged by drainage, close pasturage, and artificial top dressings, and by perseverance in spudding or pulling large plants at all seasons of the year, especially in the spring and summer, and before their seed time. If these means will not avail, the land must be ploughed up, well fallowed, and laid down again. COMMUNICATIONS RECEIVED (Too late for this week).—"The Crops of 1869" (J. B. Lawes and Henry Watkins); "How much Milk and Butter will a Cow give" (G. A. H.); "Recent Analyses" (E. O. Greening); "The Potato Crop of 1869" (W. Paterson); "Half-inch Bones for Meadow-land" (T. B. E. T. ARCHER'S "FRIGI DOMO" Patent. Patented by Her Majesty the Queen, the Duke of Devonshire for Chiswick Gardens, Professor Lindley for Horticultural Society, and Sir Joseph Paxton for the Palace, Royal Zoological Society, Royal Gardens, &c. The best Shading is "Frigi Domo" Netting. White or Brown, made of prepared Hair and Wool, a perfect conductor of heat or cold, keeping a fixed temperature when applied. It is adapted for all Horticultural and Florist purposes, for PROTECTION from the COLD WINDS and MORNING FROST. "FRIGI DOMO" NETTING, 2 yards wide, 1s. 6d. per yard. "FRIGI DOMO" CANVAS. Two yards wide ... 1s. 9d. per yard. Four yards wide ... 3s. 6d. per yard. An improved make, 2 yards wide ... 1s. 6d. per yard. An improved make, 3 yards wide ... 2s. 8d. per yard. "Sir,—Will you be good enough to send me 60 yards of Frigi Domo, 2 yards wide, of your improved make, 1s. 6d. per yard. You can forward it per London, Tilbury, and Southend Railway had some of you several years since, but have not found a substitute so good for Greenhouse and Stove Shadings.—I am, Sir, respectfully, "Glenwood Wood (Solicitor, Reading)." Mr. E. T. Archer, 7, Great Trinity Lane, Cannon Street, E.LISHA THOMAS ARCHER, Wholesale and Sole Manufacturer, 7, Great Trinity Lane, Cannon Street, City, E.C., and of all Men and Seedsmen throughout the Kingdom.

- 100 HYACINTHS in 100 very choice sorts £4 4 0
100 " 50 very choice sorts 2 10 0
50 " 25 very choice sorts 1 15 0
50 " 25 very choice sorts 1 15 0
25 " 12 extra fine sorts 0 12 0
12 " 12 choice sorts 0 9 0
12 " 12 good sorts 0 6 0

The order should specify whether they are intended to be grown in water or earth, as all kinds are not equally suited to both purposes. It should also be stated whether single or double blossomed kinds are preferred, otherwise we usually supply about two-thirds double and one-third single. The single varieties generally thrive best in water, but their merits are never apparent until the flowers are fully expanded.

SUTTONS' MIXED HYACINTHS for Beds or Open Borders.—Double, Single, and various colours, 2s. 6d. per doz., 17s. 6d. per 100. SUTTONS' HYACINTHS in DISTINCT COLOURS for Massing, Bedding, Ribbon Gardening, &c.—Double and Single, various shades, separate, 4s. per dozen, 30s. per 100.

Suttons' Complete £1 1s. Collection For OPEN GROUND CULTIVATION, Carriage Free.

Crocus, finest, named, 200
Cyclamen persicum, 4
Tulips, extra fine, named, Double, 50
Do. do. do. Single, 50
Dielysia spectabilis, 4
Lilium speciosum, in variety, 4
Scilla sibirica, 36
Snowdrops, extra large, selected, 100

No. 2.—CARTER'S COLLECTION, reduced quantities £3 3 0

No. 3.—CARTER'S COLLECTION, reduced quantities £2 2 0

No. 4.—CARTER'S COLLECTION, reduced quantities £1 1 0

No. 5.—CARTER'S COLLECTION for CONSERVATORY and OUTDOOR PLANTING £4 4 0

McLAREN'S PROLIFIC RASPBERRY.

For full description, see page 98, 111

Gardener's Chronicle Sept. 18

AWARDED A FIRST-CLASS CERTIFICATE.

JAMES CARTER AND CO. are now booking orders for the above valuable fruit, to be supplied this autumn at the following prices:—

- 6 Strong Canes, 7s. 6d. | 25 Strong Canes, 20s.
12 Strong Canes, 12s. | 100 Strong Canes, 60s.

No. 6.—CARTER'S COLLECTION of BULBS for CONSERVATORY and OUTDOOR PLANTING £3 3 0

No. 7.—CARTER'S COLLECTION, reduced quantities £2 2 0

No. 8.—CARTER'S COLLECTION, reduced quantities £1 10 0

No. 9.—CARTER'S COLLECTION, reduced quantities £0 15 0

No. 10.—CARTER'S COLLECTION for OUTDOOR PLANTING £4 4 0

- CONTAINING: Hyacinths, 75 in 3 colours
Narcissus, Double, White, 50
Poeticus or Pheasant-eye, 50
Double Daffodils, 50
Tulips, extra fine mixed, Double, 75
Single, 75
Crocus, Blue, 200
Striped, 200
Large Yellow, 200
White, 200
Anemones, extra fine mixed, 100
Gladious Brechtleyer, 4
Iris, ex. choice mixed English, 50
extra fine mixed Spanish, 50
Lilium candidum, 5
" aurantiacum, 6
" martagon rubrum, 6
" tigrinum, 6
Ranunculus, extra fine mixed, 100
Snowdrops, 400
Winter Aconites, 100

No. 11.—CARTER'S COLLECTION, reduced quantities £3 3 0

No. 12.—CARTER'S COLLECTION, reduced quantities £2 2 0

No. 13.—CARTER'S COLLECTION, reduced quantities £1 1 0

No charge for packing any of above Collections.

For the fullest information to ensure successful cultivation and particulars of the above Assortments, send for

CARTER'S ILLUSTRATED LIST of BULBS, &c., Forwarded Gratis and Post Free.

JAMES CARTER AND CO., THE ROYAL SEEDSMEN, 287 AND 238, HIGH HOLBORN, LONDON, W.C.

Rhododendrons, As EXHIBITED in the ROYAL HORTICULTURAL SOCIETY'S GARDENS, SOUTH KENSINGTON. ANTHONY WATERER has a pleasure in announcing that his PRICED and DESCRIPTIVE CATALOGUE for the present season is now ready, and will be forwarded on application. It fully describes the kinds most worthy of cultivation, as well as a general summary of his extensive general stock. Knap Hill Nursery, Woking, Surrey.

Rhododendrons.—To the Trade. J. MATTHEWS has a collection of 4-yr RHODODENDRONS, 6s. per 100, 12s. per 50, 18s. per 30, 24s. per 20, 30s. per 15, 36s. per 10, 42s. per 8, 48s. per 6, 54s. per 5, 60s. per 4, 66s. per 3, 72s. per 2, 78s. per 1. SPRUCE FIR, 1 1/2 to 2 feet, 20s. per 100, and 2 1/2 to 3 feet, 30s. per 100. PRIVET EVERGREEN, 2 1/2 to 3 feet, 12s. per 100, 3 to 4 feet, 16s. OAKS, 3-yr. budded, 1 to 1 1/2 feet, 12s. per 100. Milton Nursery, St. Leonards-on-Sea, East Sussex.

Splendid New Rhododendron, BARONESS LIONEL ROTHSCHILD. JOHN WATERER AND SONS are now prepared to execute orders for the above new SEEDLING RHODODENDRON; in colour it is a clear bright crimson, the margin of the bloom of a fiery scarlet, of fine handsome form, and remains a great length of time in bloom. Price 21s. each. The usual Trade Allowance. The American Nursery, Bagshot, Surrey.

THE GARDENERS' ROYAL BENEVOLENT INSTITUTION. Notice is hereby given that an ADDITION to the LIST of PERSONS who will be made in January next. All Persons desirous of becoming CANDIDATES are required to send in their Papers and Testimonials to the Committee on or before MONDAY, November 8 next, after which day they will not be received. Preference will be given to those Persons who may have been subscribers for 15 Years and upwards. Should there not be sufficient number of that class, then the claims of those who have not subscribed so long, or not at all, will be considered. By order, EDWARD R. CUTLER, Secretary, October 6, 14, Tavistock Row, Covent Garden, W.C. P.S.—Printed Forms may be had upon application to the Secretary.

The Gardeners' Chronicle. SATURDAY, OCTOBER 9, 1869.

THE FUNGUS MEETING at the Royal Horticultural Society passed off successfully on Tuesday last. There was a decided improvement in the mode of displaying these productions as compared with that adopted last year, though there is still room for further improvement in this respect. The edible Fungi also require to be distinctly set apart from those which are known to produce injurious effects, and from those which are not worth cooking. In an educational point of view, too much stress can hardly be laid upon this point, the more so as, to the unpractised eye, the difference between noxious and harmless varieties is sometimes very slight, especially in the case of the Boleti. Mr. WORTHINGTON SMITH's excellent charts might well have been suspended in the room, to have facilitated the recognition of Apician dainties from others only fit for MEDEA'S cauldron. The species exhibited were naturally pretty much the same as those shown last year, and the comments made on them contained little novelty, if we except the interesting communication from Dr. CURTIS to Mr. BERKELEY, and for permission to make use of which we have to thank the latter gentleman. For figures and descriptions of the principal edible and noxious varieties, we may refer our readers to our last year's volume, pp. 1064, 1091. The Council of the Society very properly caused some of the species exhibited on this occasion to be cooked, and equally properly set a good example by themselves partaking of the dainty fare. We may, however, suggest to the cook that moderation in the use of butter would be a virtue, and the heating of plates a still greater one.

The species most relished were the Fairy-ring Champignon, Marasmius Oreades, broiled; the Vegetable Sweetbread, Agaricus prunulus, stewed in white sauce; the Parasol Agaric, A. procerus, broiled; the Giant Puff-ball, cut in slices, dipped in the white of egg, and fried; and the maned Agaric, Coprinus comatus, broiled. The only fungus exhibited that was new to our lists was the true Cantharellus carbonarius, of Albertini and Schweinitz, sent by the Rev. W. HOUGHTON, from charcoal heaps in the woods round the Wrekin, in Shropshire. The same species was found on burnt earth by Mr. W. G. SMITH and others, on Saturday, Sept. 25 last, during the excursion of the Reigate Natural History Society, under the presidency of Mr. W. WILSON SAUNDERS. It here occurred in some plenty on burnt earth and charcoal near the Fir woods about Gomshall. Mr. HOUGHTON also sent fine specimens of Lactarius controversus, Pers., and Geaster rufescens, P.: the former species appears to be now cropping up in various places, but invariably under Poplars. The specimens exhibited by Mr. SMITH, together with Boletus cyanescens, Bull. came from Staplehurst, Kent. Mr. ENGLISH had some grand plants of Agaricus Cœclæ, Berk. and Br., from Epping Forest, where it is common. Many of the edible varieties are undoubtedly

excellent, and it is a matter for regret that, while so many thousands of our poorer countrymen hardly taste fresh meat from one year's end to the other, vast quantities of wholesome and nutritious Fungi are allowed to rot ungathered. A good deal may be done to promote a knowledge of the good sorts, and a taste for them by such exhibitions as that at Kensington, and by the local naturalist clubs, of which that at Woolhope (to whose volume of "Proceedings" we shall have shortly to allude) may be mentioned as in the van of progress in this matter. Nevertheless, we can scarcely believe that edible Fungi will ever take any important place among articles of food for general consumption till they can be cultivated, and a regular supply in due season counted on with something like certainty. We would then urge those who have this matter at heart to try what they can do in the way of culture. Already, we suspect, some trials are being made in this direction, for we notice that Messrs. CARTER pretty frequently exhibit specimens of the Giant Puff-ball, one of the very best of the sorts for culinary purposes. When we hear of armies being fed for months on Fungi, it is surely time to begin to utilise our resources.

— WE have received from Mr. McDONALD, of Woodstock Park, Ireland, as well as from several other gardeners, letters advocating the propriety of taking some steps to perpetuate the memory of the late Mr JAMES VEITCH. The suggestion has been spontaneously and independently made, and has met with approval in various quarters, and we gladly give publicity to it, believing that Mr. VEITCH has done more than almost any other man in modern times for the advancement of gardeners and gardening, not only by his direct example in regard to cultivation and the introduction of novelties, but by the tact and ability displayed in placing intelligent men in positions calculated to develop their capabilities. We would suggest that a committee should be at once formed, with a view to give effect to this proposal; and we shall ourselves be happy to receive the names of persons willing to act on the committee, and also to take steps to convene an early meeting.

— Connected with the subject of GRAPE-GROWING IN POTS, which is now exciting some little discussion, we have been favoured with a photograph of a house of pot Vines now growing at Newstead Abbey, near Nottingham; and if the crop is not the finest we ever saw, it is certainly such an one as is rarely seen, and is well worthy of description. There are two houses filled with pot Vines, both of the same size, and both containing the same number of plants. That of which the photograph is taken is filled with the Black Hamburg exclusively, the other containing a variety of kinds, with a good sprinkling of the Mrs. Pince's and Alexandrian Muscats. The houses are span-roofed, and each is about 30 feet long by 14 feet wide. A walk runs through the centre, and on either side there is a bed, with a bottom of strong slate slabs, the latter resting upon pillars of dry brickwork, so that they may be raised or lowered, as no bed of soil, or a deep one, may be required by the exigencies of cultivation. The whole of the heating pipes are placed under the bed, and the heat is admitted to the atmosphere of the house through valves in the side walls, thus securing a constant circulation, as the cold air from its natural gravity sinks into the path, passes under the bed among the heated pipes, and forward up the valves to the atmosphere of the house. Into this bed, which last year was used for the growth of Melons and Cucumbers, pots containing strong, well-ripened Vines, were partly plunged about the time in the spring the buds began to break naturally, the object being to have the crop ripe at the commencement of the shooting season. Each house contained 34 Vines, 17 in either bed. The Hamburg house was the most uniform in the crop, and contained upwards of 300 bunches, many of them being more than 2 lb. in weight, few less than half a pound; indeed a fruiterer from a neighbouring town said he would purchase the crop at 250 lb., which would be nearly 8 lb. to each Vine. The berries were of good size and well coloured, and the roof of the house looked a mass of Grapes. The mixed house was not quite so well filled; the Muscats, both Mrs. Pince's and White, not being so well set or swelled as the other varieties. Mrs. Pince's Grape, as seen here, is certainly not a suitable Vine for pot cultivation, whatever it may be for other purposes, the bunches being thin and the leaves wanting in vigour. The crop of the two houses, taken altogether, was such as is rarely seen in any place; and as we have given the weight, say 500 lb., in the two houses, it will be easy for any person to calculate what such a crop would be worth in June or July, when Grapes such as these are worth from 5s. to 15s. per lb.; and when they have done so they will find that pot Grapes would be found a very remunerative crop. It is, however, only fair to say that these Vines were allowed to root into the border of plunging material, and that they there received every assistance in the way of liquid manure and other aids to good growth. The crop, and the style in which it was finished, reflected the greatest credit upon Mr JOHN ANDERSON, the intelligent gardener at Newstead, whose permanent Vines, now carrying their first crop, can scarcely be surpassed by any Vines of the same age in the country.

— We are glad to hear that next year it is proposed to bring out a new illustrated work on British Hymenopterous Insecta, from the pens of

W. WILSON SAUNDERS, F.R.S., and WORTHINGTON G. SMITH, F.L.S. It will consist of descriptions and figures of some 200 or 300 species of such Fungi as are new, rare, or such as have been unsatisfactorily figured before. One hundred coloured plates (super-royal) are being drawn on stone by Mr. SMITH, partly from drawings by Mr. SAUNDERS, and partly from his own sketches. The book will appear in four parts, each part containing 25 plates, price 10s., the parts to appear on the 1st of January, April, July, and October. Any rare species our subscribers may meet with in their walks will be thankfully received by Mr. W. G. SMITH, 12, North Grove West, Mildmay Park. Subscribers can send their names to Mr. VAN VOORST, Paternoster Row.

— We have received for publication the following circular relating to SCIENCE INSTRUCTION for WOMEN:—An important experiment is about to be tried at the South Kensington Museum, to promote the instruction of women in science. By permission of the Lord President, Professors HUXLEY, GUTHRIE, and OLIVER are about to commence a course of lectures on Natural Science, beginning in November. The fees will not exceed a shilling a lecture, with voluntary examinations, and the terms will even be lower to schools and governesses. The Duchess of ST. ALBAN'S, MARY, Marchioness of SALISBURY, the Countesses of TANKERVILLE, DE GREY, and GRANVILLE, Lady NORTHCOTE, and many other ladies, have expressed their willingness to assist in carrying out this experiment. The Hon. and Rev. F. BYNG, of Onslow Gardens, London, S.W., is the Treasurer and Secretary.

— Messrs. MOSES & Sons, and similar firms, are no longer to monopolise the services of the Muses in the ADVERTISEMENT of their wares. Most fitting is it that they wait on Flora; so thinks the writer of the subjoined advertisement, taken from the columns of a suburban journal *verbatim et literatim*:—

A GARDENER, of his employment bereft,
When death's early hand removed,
Experienced great loss when so painfully left,
For he has for many years been approved,
Now seeks a new service, and where there is wanted
Skill, diligence, merit's best face,
Assured when he finds himself fairly transplanted,
He's the right Gardener in the right place.

— We are informed by Messrs. BARR & SUGDEN that any one desirous of trying the FRENCH MUSHROOM SPAWN can have a few flakes gratis for that purpose. Since this article was noticed in the *Field*, inquiries have been very numerous, and as Messrs. BARR & SUGDEN know nothing of it practically, they have thought it best to make the above offer.

— We learn that we were mistaken in our statement that Mr. BRITTON was appointed to an ASSISTANTSHIP in the Kew Herbarium without an examination, inasmuch as that gentleman had to submit to the ordeal prescribed by the Civil Service Commissioners, although he had already satisfactorily passed an Arts examination. Our statement was copied from the *Pall Mall Gazette*.

FERN CULTURE.

FERNS are the plants of the million. They are not confined to any particular country: they have a wide geographical distribution. Indigenous Ferns provide a treat of no common character to all who choose to collect them, and tend them with care afterwards, a much greater one than any other tribe of native plants, barring, of course, a few of the choicer alpine. Beautiful as the majority of our native plants are, and particularly suited for artificial cairns of rock-work, collectors and growers generally who have means at their disposal cannot rest contented with the possession of them alone. The love of plants and flowers in some natures is true and deep. Once the affection is grounded, its extension laterally follows intuitively, and the Fern collector, after he has explored and secured all that are good in the British Islands, longs to accommodate the more beautiful and interesting of the exotic species. The mason, the carpenter, the glazier, and the engineer are all consulted, and the upshot is that the house is reared—probably the beginning of a collection hereafter to be famous, possibly the whole thing ending in defeat. Unfortunately some people are defeated by having or allowing things of first importance to be done upon a wrong principle; and it is because of this, and because we occasionally see a good principle carried out, and corresponding success following it, that I beg to trouble your readers, as a matter of interest to them, with the following line of success in a remarkably short period of time.

A very enthusiastic admirer of trees and plants, and one holding a fine collection of Coniferae, of Roses, of Rhododendrons, of Hollies, and of border florist-flower plants generally, latterly took to Ferns. He had, after battling a little with indigenous plants—having, with the aid of an excellent wife and growing-up family, collected much with his own hands—indulged in the very praiseworthy idea of having a house, not of the princely Mendelian character, which can only be imitated by the few, but of such a kind as thousands can well afford to rear. It was a simple span-roof, so erected as that the plants could never be more than a yard from the glass. This could not be filled at once with fine species, for it would be a too extravagant entrenchment upon the nice little sums that are apportioned out of a year's income for detached projects outside the household concerns altogether. It was made to do duty, therefore, for a collection of Coleuses, some Dracenas, and such-like plants, that put in a respectable appearance, and are come-at-able at a small figure. The one side was reserved for Ferns, and by extraordinary attention they have grown up wonder-

fully fine, getting up in the space of 18 months from the common nursery stock to be nice half specimens of plants.

The house is 40 feet long, and about 12 feet wide with a path up the centre. It is heated by water-pipe. On either side the path is a brick partition about 1 foot high. Within this enclosure is a bed of Cocoa-nut fibre, which forms capital groundwork for the plants to rest upon, the finer particles at the top being especially fitted for rearing the thousands of spores that are shed indiscriminately over the surface. The heating is effected by hot water, a flow and return pipe round the house being sufficient to provide heat at all times. The atmosphere, nicely modulated in point of heat and moisture, is striking to the senses at the entrance; and the health of the collection amply testifies to the good and simple mode planned and carried out for the successful cultivation of a tribe that is wondrously beautiful at all times.

Prominent among the lot stood out *Adiantum farleyense*, than which a more beautiful species does not exist, especially seen under the influence of the light which might be called the semi-Wardian case culture, as described by Mr. Gair and his gardener, Mr. Crombie, in the suburbs of Falkirk. It evidently delights at being bathed in a profusion of atmospheric moisture, the quadripinnate fronds, that are handsome in themselves, seem to grow with exuberance in a climate of the kind. The grand pendulous fronds in particular, varying shades of green, and the elegant pinnate habit with which they are invested, single them out as a plant suitable to be placed in company with the most choice of Flora's subjects. Without the case, in the atmosphere of the house, the following kinds were particularly noteworthy:—The superb forms of *Gramma Laucheana*, and the more beautiful *Parsonsii*, as if dipped in gold, contrast well with the tassel-like silvery *G. Wattenhalliana*; that *Pearcei* has very fine pinnae, so multitudinous and nicely cut as to look more beautiful in its relation to work of Nature, than the finest piece of lace as a work of art.

Then the Maiden-hairs (*Adiantum*) are quite a variety, and have probably more admirers than any other races put together. Their fitness for mixing with a variety of flowering plants is beyond question, and the wonder is why this sort of finishing is not more common. *A. concinnum* grown on cleverly, is a grand form, and well adapted for liberal treatment. *A. curvatum*, a plant not often in good condition, is unusually promising, and decidedly beautiful, from the form and curvature of its pinnae and generally good looking fronds. *glaucophyllum* is an acquisition to the dwarfed species of the family. *A. pubescens* is another fine species, the fronds growing closely together, the pinnules and pinnae being invested with white from the distinct pink tinge that adorns the normal green. *A. cardiochilana* is a noble-looking plant among some of its tiny compeers, and stands here in fine style; the pinnae lie very flat, and look very lustrous. *A. cristatum* and *A. velutinum* were both noticeable species in the collection, and well done.

Among other genera are *Phegopteris* (*Polypodium sancta*), like a dwarf *Trichomanes*, elegant among ferns and well adapted for a choice position. *Polypodium appendiculatum* had long and depending fronds of a brown and crimson tinge and rachis, and contrasted well with the dark green pinnae, being a capital plant for *Acrophorus chærophyllus*, at all events as seen in the collection in question, the light green fronds reaching to a good size, and the colour fine toned in portion. *Davallia aculeata* is one of the most interesting Ferns for contrasting with its fellows, the rachis adorned with prickles, and the pinnae of a brilliant green. *Pteris ternifolia* has fine fronds with a superficial observer. Others too numerous to particularise are doing equally well in the low house at an intermediate temperature. The beauty of the ferns is very much enhanced by a proper system of culture at work, and they all provide a treat to every one, no matter what his plant proclivities may be. After this the no very great cost incurred from beamstays, and the wonder is why their cultivation is not more general. A real enjoyable hour could be spent daily amongst them, and the writer is indebted to Mr. Gair for giving him an opportunity of seeing so many upon so small and economical a scale. After all, it is some virtue yet in Cocoa-nut refuse, all other conditions being equal. The field of seedlings was recently a fruitful one, for it yielded enough for forcing "our own collection," and supplying some to friends and acquaintances to try their "product" upon. A.

OUR FRUIT FAILURE AND ITS LESSON.

It has often been said, with much truth, that we learn as much or more from our failures as from our successes. Be this as it may, I take it that the lesson taught us by the loss of our superior stone this year is the necessity or desirability of having a Glass. No skill in culture, no training, no other means of protection will enable us to baffle such frosts as we have had this season. They went into some tender fruit, and become like the kernel of a lancet. Like that bright morsel of steel, they make light of such flimsy thatches as mere mats, or feathery boughs. The frost passes right through such weak lines of so-called defence, and the fruit beyond them withers, dead, and rotting. The risk of such catastrophes is seen yearly, though it is only now and then that such ruin and havoc are wrought. But the uncertainty of our autumnal desserts will suggest an inquiry into the wisdom of running such annual risks.

of failure, which may end any season, as they have done this, in sweeping the whole of our superior stone fruits off our walls. The loss in actual pleasure is great; in the artistic setting-out of dinner tables it is perhaps greater still. What fruit can equal in beauty the luscious Nectarine? or in soft, downy charms, the handsome Peach? Why should these be sacrificed? and at what shrine are they offered up? Is our loss inevitable? or who or what is responsible for it? It arises chiefly from three mistaken notions: that our climate may be trusted; that the ordinary means of protection can master it; and that the natural constitutions of trees can be hardened by skilful cultivation.

It is unnecessary to discuss the question of the trustworthiness of our climate. It is fickleness, caprice, and hypocrisy, in their most subtle and destructive forms. It cannot be relied on for a single hour, far less a night, a week, a month, or the whole danger period of flowering trees and embryo fruit. *Woe, woe* be to the British gardener that puts faith in the climate! But, then, may we not fall back on the ordinary means of protection? We might possibly, if these were again protected from the rain and the dew. Dry protectors have a great power of resisting the ingress of heat or the ingress of cold; but when saturated with water they become active coolers in themselves, and draw away heat from the trees when they need it most. And then, what does the biting Nor'-easter reck of porous canvas, overhanging branches, rough-spun strawbands, or flapping mats? Why, it laughs their opposition to scorn, and even uses them as so many flappers, to impart greater subtlety and force to its scathing wings.

But what have we left to oppose to these two terrible foes—the frost and the wind—that so far have haughtily worked their destructive will among our fruits? How is skill to meet these enemies? It cannot change the climate, at least not to any great extent. It cannot alter the natural forces of hoar or back frost, far less can it chain, though it may to some extent shut out, the terrible east wind. It can, but it is only expected to operate upon the subjects exposed to the climate, and materials employed to protect them. Doubtless, within this narrow range, skill may accomplish much. The trees may be planted on well-drained land, they may be preserved from overgrowing, overfruiting, and other debilitating influences, and their growth may be kept clean and early matured. They may be kept dormant as late as possible in the spring, and the protection may be skilfully regulated in regard to time, quality, and quantity. But beyond this we can scarcely go, once the floodgates of a new and tender life are opened by the gentle touch of spring, and flowers, and leaves, and young fruit spring forth joyously at her bidding. What amount of skill can, under such circumstances, and with such appliances, protect these children of the following summer from the ravenous mouth of devouring winter when he angrily returns to us amid all this splendour, beauty, and glory, and mows it all down with his ten-pounders—ten-degree-of-frost artillery! The skill of the cultivator, however great, is no match for such an antagonist, armed with such piercing projectiles as these. Are we then to give up the contest? Far from it. Let us try other means of defence, and especially glass, for glass never wears nor rusts out, while canvas and all such material is always on the road to rot and ruin.

But doubtless I shall be told that the testimony of this season is against the efficacy of glass. Alone and itself it seems to have failed. There is almost as can be seen in unheated orchard-houses as on open walls. But this state of things is exceptional. It is the first season in their history that unheated orchard-houses have failed. And they have not wholly failed this year. Further, the fact of their failing does not prove the inefficacy of glass protection under the best conditions; it only shows that sometimes, and under extraordinary pressure, it may give way. Neither in an orchard-house, especially if span-roofed, be cited the good examples of the resistance offered by glass to the roads of cold. Many of such houses are openly constructed and glazed. They permit a tolerably free interchange of air between the outside and the in. In most of them, too, a maximum amount of radiating surface is associated with a minimum of heat-absorbing power. The earth is covered over with trees, and there but little brick or other solid work to act as absorbents and husbanders of heat. Supposing we reverse the conditions by providing a maximum area of radiators, and covering these with a minimum of glass, be more felt and the results obtained more satisfactory. The chief fault of most unheated glass structures is that they are too large in proportion to their heat-storing capacity. The great superiority of one over all other protectors, is that it is water-proof and air-tight. It prevents the heat from being swept or washed out with a rush; but it does not hinder its passage through. Heat is too subtle to be thus shut in. The transparency of glass shields becomes in one sense their weakness. They radiate heat from within to without with much greater energy than more porous but opaque barriers. Unlike the latter, also, the anti-radiating power of glass can hardly be affirmed to be in the direct ratio of its thickness. It is, in fact, rather doubtful to what extent the thickening of glass affects its radiating force, though doubtless, upon other grounds, thick glass proves a more efficient protector than thin. The thick barrier is a greater obstacle to the direct loss of heat by conduction. For this reason no lighter glass should be used for screens than from 20 to 30 oz. to the foot.

But the efficiency of all glass protectors depends greatly upon the absorbent properties of the enclosed area. We must make hay—that is, lay up caloric—when the sun shines; and this heat will battle and triumph over the climate, while the frost comes unbidden and stalks with silent and nimble feet over our glass pro-

teectors while we sleep. To derive the maximum amount of protection from glass covering, then, I think the glass should somewhat closely hug the walls rather than be spread out into wide-bottomed houses. We want portable glass screens more than lofty, wide, or expensive permanent structures.

The glass coverings at Welbeck, so admirably described at the Manchester Congress by Mr. Tillery (see p. 597), partake of the latter character. No one can question their usefulness for all the purposes named—in fact, they constitute a magnificent range of fruit houses. They are just too good to be generally come-at-able. What is needed for universal use is a simple, portable, efficient glass screen that any one with a head on his shoulders can put up for himself, and as readily take down and devote to other purposes when it is no longer needed to screen the heat in or the cold out. By the employment of such screens the wall trees will continue to be in the open air unless at the critical and dangerous orises of flowering and setting. In the North, again, where the autumn is cold and sunless, the screens might be called into

requisition to finish the fruit. When not in use for these purposes they could be converted into coverings for pits or frames used as ground vinerias, or to finish choice Pears; placed over Strawberries or early Peas in the open ground—converted into late vinerias, Melon, Cucumber, or plant houses, either as lean-to's or narrow spans, by being placed back to back. To give the easiest possible portability to, and endow with the utmost range of convertibility, such screens, they must be readily dis-integrated into their primary elements and re-formed.

The best screens for protective purposes that I have seen are those that have been designed by Mr. Beard, of Bury St. Edmund's, during this summer. It will be remembered that this gentleman is the patentee of a new mode of glazing, that dispenses with the use of putty or other adhesive substance, and that he uses a remarkably light T-shaped metallic sash-bar, a padding of felt forming the buffer at all points between the iron and glass; and the whole being firmly knit together by a few bolts and nuts. By withdrawing these the entire screen or house can be instantly

resolved into a package of glass, a bundle of iron, and a roll of felt. Hence the screen of to-day may be a Melon, Cucumber, or plant-house to-morrow. Another great advantage of these malleable iron bars is that they can be bent out from the wall at the top, thus giving more space where it is most needed, and yet be brought closer to the wall at the bottom than any other description of rafter. Most protecting screens are made too wide, owing to the non-pliability of ordinary bars, unless a short span is formed at the top, which adds immensely to the expense, or a dangerously acute angle is formed at the upper portion of the wall. Width at bottom is a structural necessity with most glass screens; but unless such screens are to be used as at Welbeck, and orchard-house trees are grown in front,—a practice which can hardly fail to injure the bottom of the wall trees,—it is much better to keep the screens as close as possible to the wall from top to bottom. The whole wall is then equally exposed to light and air, and can hardly fail to exhibit that great charm so rarely met with, equality of vigour and of fruitfulness from topping copstone to nethermost base. The pliability of these rafters affords every facility for such furnishing of walls. The above sketches will give greater force to these remarks, and reveal the merits of Beard's bar for screening purposes better than any mere description. The upper cut shows the screen in use, and reveals the merits of

the bent bar, which enables the screen to be placed close to the wall without either sprawling out at the bottom or forming a dangerously acute angle at the top. Mr. Tillery prevents this by raising the front of the structure, which adds greatly to the expense, and in fact converts it into a house, to the endangering of the trees on the bottom of the wall. The ready convertibility of the screens into houses may be seen in the middle and lower cuts, the former shows a useful house for a late Vinery, formed by simply placing two bars top to top. In the lower cut the bars are reversed and are made to form a span-roofed house with front lights. A capping to make the whole water-tight, and a few bolts, are all that are needed to effect the conversion. Ventilation can be provided for at the top by leaving a small space between the two screens and covering it with wool or glass.

The position of the screen made with two bent bars seems also the best possible for reducing the radiation of heat from its surface. The open sky is the most powerful radiator. The bent bar turns the larger portion of its face away from this greedy devourer of heat, and looks toward surrounding objects to get back from them possibly as much warmth as it gives. The limited direct sky line may readily receive light and covering, or it may be occupied wholly with an anti-radiator, such as a shutter of wood, in all localities where severe frosts are anticipated. This would probably increase fourfold the protective power of the screen.

Again, this bending of the bar affords rare facilities for ventilation. In Mr. Beard's glass screens the entire upper portion is converted into ventilators, to be opened or shut to any extent at pleasure. The mode of erecting the screens is extremely simple. An iron-plate is laid down on the ground, or placed upon bricks or wooden posts at any desired distance from the wall, say at 4 feet, the distance of course determining the bottom width of the screen. Cast on this plate are raised lugs at intervals of 20 inches, for the reception of the rafter or bar. The ground end of the rafter is dropped into these double lugs and made fast with an iron pin, the upper and bent end being placed against the wall just under the coping. The under side of the rafter is pierced at the upper end, and likewise in the middle of the space between the ground line and the bond. Through these holes iron bars of convenient length are passed. These rods are connected with coupling screws, which bind them tight, and make the rods continuous bars with out break for any distance. Between each rafter and upon these rods pipes, in length the exact width of the glass, are placed. These butt up against each bar and keep them in exact position, acting as immovable side braces. The upper rod that runs along the wall under the coping is kept in its place by a few staples or eyes, driven into or passed through the wall. These arrangements make the entire framework quite fast to the wall, rendering the slim rafters stiff as pokers and as tight as drums. The felt is then rolled on, followed by the glass, and another layer of felt, succeeded by the covering bars in convenient lengths, with their fixing screws, and the screen is completed in less time than is needed to describe the operation. Every extension of it is but a repetition of the preceding. The ends are made to fit anywhere. The glass may run on for a mile, or be cut off at any point, at the end of a 20-inch square, with the same facility, as every two rafters are complete in themselves. The glass is laid end to end, or butted, and the square that fills the upper or ventilating portion is carried beyond the end, to throw the drip clean over on to the glass below. The glass used is 30 inches by 30. The bent portion of the bar may run in width from 12 inches to 24, or even more if desired, and for walls 10 feet high, screens 4 feet wide at the bottom would be sufficient, though of course they are made to any width and any height of wall. With such ample ventilation at the top, it would seldom be necessary to provide bottom ventilation, and on excessively hot days one or both ends might be thrown open.

One great means of increasing the efficiency of such protectors is to shut up a good houseful of heat early in the afternoon. This reserve of heat, supplemented by the liberation during the night of that hidden away in the brickwork, &c., in the day, would generally prove sufficient to resist the frost. Another caution is needful: glass protectors should not be used until the flower is ready to expand. If erected too early, they would prematurely force the flowers into blossom, at a time when the frost would prove more than a match for the screens. This late application of the needed shelter is a strong point in favour of their portability. Our chances of success in mastering the severities of the climate are largely determined by the time we begin the contest. These portable glass screens will, to a considerable extent, give us our own choice of time. They also enable us to choose our ground and position, and put under us efficient agents. With a skilful handling of these strong, elegant, efficient glass screens for walls, we may reasonably expect to see them in the far North or in the sunny South, covered with luscious wall fruit. *D. T. Fish.*

Home Correspondence.

Duke of Cornwall and other Melons. — This Melon deserves to be extensively grown. I saw it exhibited last year, and being much struck with its large and handsome appearance I determined to give it a trial this season, to see if its flavour was equal to its other good qualities. The result has been very satisfactory. All the fruits have been of an unusual size, the last one but weighed 9 lb., and was of a delicious flavour. The fruit is oval-shaped, of a rich yellow colour, flesh green, and very deep. I have tried Queen Emma, Golden Queen, and others that have recently been sent out with high characters, but have found none of them equal to the Duke and another variety which I have grown here,

almost exclusively, for the last five years, under the name of Austin's Incomparable, — a green-fleshed variety, fruit large, round, yellow skinned, and finely netted. I got it originally from Dalkeith, where, I believe, it is still grown by Mr. Thomson, and is a favourite of his. The Duke of Cornwall is a very late variety, and a good keeper, but requires a high temperature to ripen it properly. J. Simpson, Wortley Hall Gardens.

Wellingtonia gigantea.—There are two specimens of this noble tree growing in the grounds at Lamorbey Park, near Bexley, Kent, the seat of R. Bousfield, Esq., of which the following are the dimensions:—No. 1 was planted in 1854, and has attained the height of 29 feet 10 inches; circumference of bole, one foot from the ground, 6 feet 9 inches; and the diameter of the branches 19 feet. No. 2 was planted in 1856, and is now 25 feet 2 inches in height; circumference of bole, at the same height as the former, 5 feet 8 inches; and the diameter of branches 14 feet 8 inches. They were not injured during the severe winter of 1866-7, nor have the dry summers of 1868 and 1869 interfered with their growth. Alex. Baxter, Gr.

Roses.—I was very much gratified to read Mr. A. Godwin's letter on Roses, and as a grower of this justly called queen of flowers, have been anxiously looking out for the Rev. W. F. Badclyffe's annual comments on the Roses of 1868. Florists in this part of Ireland have few opportunities of seeing the novelties yearly introduced, so that we are principally guided in ordering by the notes of such men as the "Rose-grower of Okeford Fitzpaine." I can cordially endorse all that "A. G." says, with reference to the way we are fleeced by our Continental friends, who yearly send us such quantities of worthless varieties. For years past I have bought all the new Roses as they were offered, and of course "paid for my whistle." Last year I had about 40, and of this lot I only intend growing the following, which have done very well with me, and which will be found in list No. 1. These are all good growers, and I believe improvements on existing sorts:—Abbe Verniere, Baron Haussmann, Baroness Rothschild, Boule de Neige, Duke of Edinburgh, Elie Morell, François Fontaine, Impératrice Charlotte, La France, Madame Christine Nilsson, President Villermoz, Vicomtesse des Vezins. The following are varieties which I purpose growing a second season before discarding:—Baron de Beauverger, Coquette des Alpes, Curé de Charentay, Duchesse d'Aoste, Enfant d'Ancugny, Madame Alice Dureau, Madame Noman, Madame Grondier, *Madame Rolland, *Merveille d'Anjou, Reine du Midi, Souvenir du François Ponsard, Tournefort, Charles Turner, Pitord, Prince Humbert, *Miss Ingram, *General Barral. The following is a list of varieties which have flowered here, and which I consider positively worthless:—Barillet-Deschamps, Ernest Boncenne, Jean Brosse, Lisette de Beranger, Souvenir de Madame de Corval, Souvenir du Ponsard, Jules Bourgeois, Comtesse de Palloux, Comte de Raimond. Now has I had a rather hard matter, that as the case stands at present I could only recommend, "if referred to," about 12 varieties out of my 40. I will conclude by saying, that in the second list there are some varieties which have not flowered with me; these I have marked with an asterisk, and trust, if I am spared to see them flower, that I may be able to add them to list No. 1. *Hibernicus.*

The Royal Horticultural Society's Floral Committee.—As Mr. Keynes has detailed his experience of the Floral Committee, I will add mine. I should have done this before, but I understood that "the clique" had been broken up, and that better things might be expected. As it does not seem to be so, my experience may be useful to those who, like myself (once) may think it a pleasure to belong to it; but to these one's advice must be that of "Punch" "to young gentlemen about to marry, 'don't.'" I am one of the earliest members of the Committee, and although attendance on it involved every time a journey of upwards of 200 miles, and an expenditure of between 2*l.* and 3*l.*, I managed to attend pretty often. After, I think, two or three years of office, the annual displacement and election of three members took place; three names were struck out, and we were requested to name three, which we did. What was my surprise, then, to receive a curt note, a week or two after, saying my name had been struck out by the Council. This was bad enough, but worse followed. I have many friends—personal friends—on the Floral Committee, and the following year they replaced my name, and sent it in to the Council, with two others; mine was again cut out, and some stranger substituted. Without vanity, I suppose I may say I do know something of florists' flowers, and am pretty well known in the horticultural world. Since then I have, of course, not attempted, nor encouraged my friends to attempt, to have my name restored. One kind and influential friend offered to do so this year, but as Mr. Keynes' letter shows that the same leaven is at work, I decline the honour (?). I know perfectly well how all this was brought about, but there is one fatal error at the bottom of the Council's proceedings—they imagine that they are conferring an honour and favour on all whom they admit to have anything to do with them. Go ahead of the clique, and ask anyone who has had anything to do with the Society, "Have you any confidence in it?" and, a "guinea to a ducat," I know what the reply will be. It is a thousand pities; the Royal Horticultural Society has missed a grand opportunity. It might have been a noble institution, it is now the greatest *fiasco* I know. *D. Deal.*

The Royal Horticultural Society's Provincial Show.—You state truly that no town is more accessible or more interesting to visitors than Oxford. It is also true to a certain extent that Oxford is not, in the strict sense of the term, a horticultural centre; but in my opinion that matter should have but little weight with the Council in their decision, as the great desideratum

seems to me to be the convenience of bringing exhibitors and their products together, and the general public to view them. Setting aside minor considerations, there can scarcely be a doubt of the successful issue of the affair, if the Society succeed in obtaining a good locality for the show; and in my opinion the best place, if obtainable, would be either the Parks or Christchurch Meadows. The Parks doubtless would be preferable, as that is a fine open space, and near to the centre of the town, besides being a very favourite resort; but, if neither of the above-named places can be obtained, I say emphatically to the Royal Horticultural Society, do not go to Oxford; for if they are compelled to go to any such out-of-the-way place as Port Meadow, I am sadly afraid the result in a pecuniary sense would be a failure. The general attractions of Oxford must bring great numbers of visitors to the town. There are also some well-kept gardens in the neighbourhood, such as Blenheim and Nuneham, which would doubtless be thrown open on such an occasion, and which would add to the pleasure of all lovers of gardening. *H. B.*

Vine Roots.—Do Vines make roots without the action of leaves and branches? I have made some observations as to this point for myself, and will give your readers the result of my experience. In May last I planted a Vine—the Muscat of Alexandria—in a good border; I then inarched it on the Royal Vineyard (that being, in my opinion, a worthless variety). It grew well, and made a fine cane. But what about the roots? I examined them at different times, and to my surprise the newly-planted Vine has not made a single root that I can find. I have also tried the application of bottom-heat to the Vine roots for two years past, beginning the first day of the new year. I put good stable-dung on one-half of the border, and kept up a nice gentle warmth until April, the other half remaining cold through the winter. I could see no difference in either part of the house throughout the seasons of both years. We have had fine Grapes ripe in May in both parts alike. *F. Gill, Plymouth Nursery.*

Packing Fruit for Transmission Abroad.—The following communication from R. Halburton, Esq., Halifax, in *Gardeners' Chronicle*, 1863, p. 100, describing the packing of the Nova Scotia Apples sent to the Great Exhibition of 1862, may not have been noticed by Mr. Kirby, and may prove useful to him:—"A wooden box filled with trays, each 2 feet long, 18 inches wide, and 5 inches deep, divided by partitions into spaces 4 inches wide. These trays had a layer of dry ground plaster of Paris strewed over the bottom, on this a layer of Apples was placed in a single row; more plaster was carefully filled in between the Apples, and the whole was covered with about an inch of plaster, well shaken down, so that the fruit became immovable. Packed in Halifax on January 9, the box arrived on January 25." *S. M. O.*

Cedar of Lebanon.—A fine specimen of this tree at Mount Elzeumbe Park, near Plymouth, was roughly measured by me the other day, with the following results—Trunk (1 foot above soil), 12 feet round; from trunk to the tip of branches on one side, 18 feet; the man who showed me it said it was 423 years old. There were also many other smaller but still fine trees. A Cork tree measured 9 feet. There are also some fine Orange trees here, some 20 feet high, pictures of health; one Mandarin Orange had 1513 ripe Oranges upon it, besides hundreds of green ones. A fine Citron was noticed, with fine fruit, growing against a wall without any protection. The Oranges referred to are taken into a house in winter. *H. M., Hartley, Oct. 4.*

Liliums.—I differ from "J. D." (p. 1020) in the advice he gives with regard to the bulbs of these plants. Experience has taught me to newly pot them, if they require it, as soon as the stem is dead; then keep them dry through the winter, they will begin to make roots before spring. To take away all the small bulbs and to shift the larger ones without disturbing them is still better; to thin out the bulbs, letting those left remain in the pots without disturbance for three seasons at least, and giving nutriment in the water when growing, is the best plan of all. This practice will be found to answer in respect to all Lilies. *M.*

Pelargonium Show.—You remark, in your foot-note to Mr. Cannell's letter upon the subject of the continuance of the Special Pelargonium Show by the Royal Horticultural Society, that the speedy expression of public opinion would be desirable. It appears to me that the numerous attendance at last year's show was sufficient evidence to the Society of its popularity. The Pelargonium, too, has been the adopted child of the Society; it would never do to cast it adrift now that it is showing itself worthy of the attention and care bestowed upon it, by the wonderful progress it is making both as regards foliage and flower. I anticipate that next year's exhibitions will display some startling improvements upon the tricolors of last. In the flower, also, the progress is wonderful, both as regards form and colour. I do not despair of seeing, ere long, every colour that our Flora possesses produced on the Pelargonium of the scarlet section, not even blue and yellow excepted. The bare idea of the Horticultural Society abandoning such a promising child seems to me impossible. I would rather suggest the setting apart two days for its exhibition than giving up the one. I agree with Mr. Cannell that greater encouragement should be offered to the small growers and amateurs. Let not our great growers and florists be too greedy in wishing to usurp to themselves the credit for the production of new varieties, or appropriate to one another the award of all the prizes. I am certain they would find it far more to their interest as well as credit to encourage in every possible way the amateur, which means the general public, or, in other words, the million, to grow, to produce, and to compete at our floricultural exhibitions, especially in new varieties. By so doing an amount of enthusiasm would result, more telling upon our horti-

cultural societies' and florists' annual balance than has yet been dreamt of. Let us have free trade in the production of all florists' flowers—free trade and fair play in judging of their merits in the award of some mark of distinction to the producer—and I maintain that such a state of things would enlist the interest of the million; that where there are now 50 buyers and visitors to our florists' establishments there would be thousands. It is the great mistake to imagine (as I know some florists do) that it is to the interest of the florist to keep the public ignorant of the cultivation and the production of florists' flowers; it is the old and exploded principle of monopoly, which in the long run does not pay. Pelargonium offers an enticing field for the amateur because it is easy of management, easily hybridized, but there are many other florists' flowers equally capable of improvement, and their beauty, would equally repay for time and attention. For instance, what can be more beautiful than the Cyclamen? I know of no flower more beautiful and I believe it to be capable of immense improvement. What more lovely sight could be imagined than a special exhibition of Cyclamens? One might imagine upon the subject of the number and beauty of florists' flowers that I would encourage the amateur until I occupied the entire space of your paper; therefore I must conclude by saying, that I think will be found appealing to you for space to the Horticultural Society the desirableness of having its special Pelargonium show. *An Amateur.*

International Exhibitions.—I am glad to have at last given expression to what are the feelings of many correspondents and exhibitors as to the state of these affairs on the Continent. I am still pleased to think that you have done so in a way which should not offend our friends across the Channel, have made from time to time the acquaintance of those for whom I have great respect, and I am sorry if any of them felt hurt at a little plain speaking on our side of the water. You have stated the cause of their not seeing as we see, viz, that they are under different forms of political government to we do. But how shall we account for the managers of the St. Petersburg show issuing printed papers, and that any one sending plants by rail should have passes given them for the return journey, and when application was made, and the railway company refused, these same managers admitted they could compel them? Were not the exhibitors at St. Petersburg by—well, if not a fraud, by some very much like deception? This show, more was held (so it was stated in print) under the highest patronage. I have attended the St. Petersburg Internationals, and in all, save London judging, in my opinion, has been altogether an-archical principle; the wonder, therefore, is that the complaints are not more numerous. The system is one that causes numerous errors, even supposing that no change is taken of the great facilities for packing, and reversing their decisions afterwards, in a way no one can understand. *Robert Warner, Bromley.*

Lilium auratum.—The following are the particulars of a plant of this grand Lily, which has been growing in the conservatory of James Bland, Esq., Quarry Hill, Allerton, near Liverpool, and of which a photograph was exhibited at South Kensington, at the meeting of the Floral Committee, on September 7. The plant is the produce of a single bulb from the year 1850, at present time. On August 25 it had 140 blooms expanded; eight had fallen from the lower stem in addition there remained 53 blooms nearly expanded, making a total of 193 blooms. On August 164 blooms had expanded, out of which 153 remained perfect, which was the greatest number borne at any one time. The first flower opened on August 10, and on September 4 one flower remained open. My experience with the auratum varieties leads me to conclude that their average duration is nine days, but in this instance I have kept some flowers in perfection for 13, which is the longest I have ever known them to keep. I invariably find blooms to expand during the night. Having great interest in this class of plants, and tried various ways of growing them, I will give the history of the progress of the plant in question from the year 1850 to the present time. The soil I find most suitable for the growth of this Lily, and which I have used for the above referred to, consists of good turfy loam, decayed cow manure, a little peat, and silver sand incorporated, care being taken to secure good drainage and to water freely during the growing season. In 1855 a single bulb was potted in a 7-inch pot, placed in a cool greenhouse, where it remained until it flowered and produced three flowers. In 1856 the plant was repotted in a 9-inch pot, and received the same treatment, the produce being 17 flowers. In 1857 the bulb was repotted in an 11-inch pot, and produced three strong flowering stems and three small ones producing in the whole 53 blooms. In 1858 the plant was transferred to a 16-inch pot, and placed in a temperature of 45° to 50° in the month of June, where it remained until the stems were about 18 inches length; it was then taken to a cool greenhouse, where it remained till it flowered. The bulb then produced strong flowering stems and seven smaller ones producing in the whole 100 flowers. In 1859 the plant was turned out of the pot, and a small portion of the soil was taken away from the ball, it was then repotted in a 17-inch pot, and treated as before. The plant produced up 39 flowering stems, ranging from 2 to 9 feet in height from the top of the pot, and producing in the whole 193 blooms, many of which measured from 12 inches across. After the plants have done flowering I set them out on a sunny border to ripen them, when they are out down, and stored away until the season arrives to start them into growth. *J. Smith.*

to James Bland, Esq., Quarry Bank, Allerton, near Liverpool. [This was a splendid specimen, very similar in its general aspect to the plant from Melchet Court, but having a larger number of blossoms. Eds.]

Potato Grafting.—Mr. Bennett, of Osberton, my valued friend, and indeed principal tutor, is a well-known practical gardener, and a particularly good Potato grower; and I should not have the slightest hesitation in accepting his teaching on any subject connected with the Potato, excepting the question at issue: but on this little matter I must beg to differ slightly with him. About a fortnight ago I was down at Osberton, and was talking the matter over with him, but he could not recognise that the stock had any influence on the scion. Now, it is a well-known fact that the Potato is self-supporting, therefore if the stock and scion have no influence on each other, then Potato grafting must fall to the ground. Mr. Bennett, too (see p. 1079), in endeavouring to substantiate his argument, adduces some striking illustrations of the liability of the Potato to sport, and, indeed, to entirely change colour; and probably this circumstance may be attributed to a great change of soil, as from limestone to clay soils, or vice versa. Now, in the face of all this, it is not surprising that Mr. Bennett should be incredulous in the matter of Potato grafting; and it would be well if other growers would record their experience in this matter, that the world may know what the Potato is capable of doing of itself, without any interference beyond planting. In continuation of stock and scion, Mr. Taylor, of Bedale, has done good service in this matter (see p. 220, 221), as also has Mr. Fenn; indeed the latter gentleman has done more service in this cause than any other man, by publicly exhibiting the results of his practice, and I, for one, most heartily endorse the sentiments expressed by the Editors of this paper in commendation of Mr. Fenn's practice. This, together with my own experience, which I hereunder adduce, is, I think, sufficient to prove the fact that the stock influences the scion. This year I had the misfortune to get all my grafted Potatoes cut off by frost; some of them were entirely killed, and what did survive are very small indeed. It may be remembered that in my letter to the *Gardeners' Chronicle* on this subject (see p. 250) I signified my intention of grafting the Potato into the Jerusalem Artichoke, and vice versa, which statement created a little "wit" and ridicule at my expense. However, as an experimentalist, I did not allow that to daunt me, and thinking the Editors might possibly know no more about the matter than myself, I resolved at all hazards to gratify my inclination, and accordingly put my idea into practice; and I am now happy to be able to state that the Artichoke grafted into the Potato has produced the most wonderful cross of any of my experiments! The Potatoes grafted into the Artichokes were each killed by frost. Now, if need be, I am prepared to make oath and say, that the following is a correct statement of facts, viz.—No. 1, Artichoke grafted on Fluke, produced a round pinkish tuber; No. 2, Ashleaf grafted on Daintree's Seedling, produced both round and kidney-shaped tubers, resembling both stocks; No. 3, Ashleaf grafted on Red Regent, produced a light pink round Potato, much the same as No. 1; No. 4, Daintree's Seedling grafted on Fluke, produced tubers much the same as the stock. No. 5, Artichoke grafted on Daintree's Seedling, result similar to No. 4; No. 6, Ashleaf grafted on Fluke, produced a coarse skinned kidney Potato, rather pink; Nos. 7, 8, 9, 10, 11, and 12 killed by frost. Certain of the men in the garden can testify to the above statement, and any person may see for himself on paying me a visit, and presenting me with his name and address. More I cannot say. Now in connection with this subject, the question that occurs to me is, "Is it possible to effect any improvement in the Potato by grafting?" My answer is, "I am doubtful;" for after three years' experience and careful observation, I cannot truthfully state that I have effected the slightest improvement by the grafting process, on the contrary the produce has invariably been most ugly—some of the tubers real "mongrels," which has almost killed my interest, for I am a poor fisherman if without luck. I shall however continue to watch with much interest my Artichoke produce, and shall hope to again communicate to you the result, after another year's trial with it on its own roots. Thomas Simpson, The Gardens, Bromfield Lodge, near Chelmsford. [Our correspondent must excuse us if we put a very different interpretation upon his Jerusalem Artichoke experiment from what he does. He has not yet got his sunbeams from Cucumbers. Eds.]

Sambucus racemosa.—The reason why that beautiful shrub, the scarlet-berried Elder, is not cultivated to a greater extent in England, may be that it does not succeed in the vast majority of English gardens, in which the few plants I have seen were not worth looking at. The plant seems to require for its development, perhaps for its continued existence in a locality, either a considerable elevation above the sea level, or a north latitude higher than that of England. The luxuriant specimens seen by "I. O. W." in Sweden, Finland, &c., were under the latter favourable condition. In the middle and the south of Europe, it is only met with under the former. The first time I saw it in its beauty, it was straggling over a garden wall in Pontarlier, one of the most elevated, if not the most elevated town in France (2716 above the sea-level) close to the Swiss frontier, just before the railway takes the grand plunge down to the lake of Neuchâtel. Both the Jura range and the Alps are adorned by the scarlet-berried Elder. At my first visit to the Pyrenees I looked out for it in the valleys about Eauz Chaudes. Not finding it, I hastily guessed that it might not be a Pyrenean plant; but taking a walk into higher regions, in the direction of the Pic du Midi d'Ossau, I reached the level above which it becomes abundant, but below which it is not to be found. In my own garden, a few

yards above the sea level, not far from the Channel coast, a *Sambucus racemosa* grew rapidly to a considerable size. Every year it flowered abundantly, but as soon as the berries were as big as a half-grown currant, they dropped off till the ground was covered with them. A very few remained a little longer and grew a little bigger; but during the whole period of its existence the tree never gave me a single scarlet berry. A year or two ago it died, whether from a lingering consumption caught in the winter of '60, or from a summer sunstroke, I cannot say. I hesitate to plant another, unless some of your correspondents will give me hopes of obtaining, down on the plain, not only its vigorous branches but its panicles of fruit, which, as "I. O. W." truly states, "resembling miniature bunches of Grapes, of intense scarlet, render it the most beautiful wild fruit we have ever seen." I should be more sanguine as to the result of a trial of its aptitude for Highland shrubberies. E. S. D.

New Method of Fruit-growing.—Finding your columns so liberally open to the gardening fraternity of all denominations, to enable them to lay before the public the result of their labours, I hope to be allowed to make a few remarks on my new method of growing fruit, being especially desirous of calling the attention of the public to the new house erected for the purpose in Chiswick Gardens. Seeing this will enable any whose attention may have been called to the subject, to judge of the process by its own merits, and save me much trouble in explanation. You invited the public last week to take a peep at the magnificent vinery at Chiswick; to see which is alone worth a pilgrimage to any lover of fruit-growing under glass. If any one can condescend to look at my humble house, after viewing such a noble structure as the large vinery certainly is, I will try and raise my head, and say something about it. Though in a small way, I have great pretensions, and profess to grow Grapes, and stone-fruit, and what not besides, in this same house. And it certainly can be done to the greatest perfection, both as to the size and flavour of the fruit. I venture to think (*en passant*) that this latter quality of flavour is not sufficiently considered in the general way. It is satisfactory, however, to see that the judges at our fruit shows are beginning to appreciate it more and more in their estimate of the different fruits that are submitted to their approval. I ordered the fruit here to be retarded as much as possible, in order to keep it for show on the trees. The result is, that I have still a few Peaches and Nectarines left. Some of the latter, gathered yesterday, were as delicious in flavour as I ever tasted them in August, in spite of having been kept back so long, and the weather during the last fortnight having, moreover, been sunless, and otherwise unfavourable for the ripening process. The Plums left are Transparent Gage, which is now softening, very large in size, as are also Jodogne and Brahy's Plums. The crop of Peaches and Nectarines was below an average in quantity; Plums very good; Pears small, and below average. But this has been a sad year for fruit everywhere; and when we hear of such men as Mr. Rivers, of Sawbridgeworth, and Mr. Pearson, of Chilwell, failing, who are never in the habit of disappointing their visitors, I may, on the whole, congratulate myself upon having made a pretty good fight of it. John Fountaine, Southacre Rectory, Brandon, Oct. 5.

The Troubles of the English Exhibitor.—A good deal of justifiable grumbling has lately been manifested in your columns concerning the strange ways of foreign committees, and the extraordinary decisions of foreign jurors; and we have plumed ourselves that their ways were not our ways, and that, moreover, our ways were so much better than theirs. Well, certainly; and yet there are exceptions, as the following tale will tell:—About three weeks ago there was a great fruit tournament northwards. Growers from all nations were invited. The names of the jurors were exhibited beforehand, and displayed to the full in broad-sheets to inspire confidence; and everything that the experience of the learned and the wisdom of the wise could do to ensure success, and to give satisfaction was done. And yet here is the experience of a southern exhibitor. The great tilt of fruits took place on September 8 and 9. Our exhibitor entered in good time in class 3, for two Pines of any variety. On September 6 the fruits were sent off by mail, correctly addressed, to the secretary. A letter was posted at the same time, giving notice of the fact, and it was further notified that a Royal gardener would call for the Pines, pay the carriage, and stage the fruit. Another letter was despatched by the same post to the latter, who received it all right on the following morning at 7 A.M. This sent the Royal gardener Pine hunting on that day, and the two next, without finding them, however. Nothing more was heard of them until Saturday the 11th, when the *Gardeners' Chronicle* was eagerly opened as the Book of Fate. No notice, however, of the Pines. The exhibitor concluded that he had been beaten, and philosophically chewed the cud of disappointment by reflecting that they must have been good specimens to beat them. He then waited patiently, hoping that his Pines would appear; but no Pines came home. On the 11th, the secretary as custodian of all fruit, beaten or not, was written to. Another silence of four days. No answer. On the 18th the exhibitor's temper became somewhat like a Pine-leaf rubbed against the grain, and he wrote again, stating that he had heard through his friend, the Royal gardener, that his fruit had not arrived during the show, and begging an answer, stating the time of their arrival, as he was only waiting for this information before making a claim on the Great Northern Railway for non-delivery. The secretary broke silence—a silence of over 13 days' duration he it noted by all fervent exhibitors—on the 20th, telling our exhibitor, for his soothement, that his Pines had arrived all right, that they were seized on by a third party, and exhibited

as grown by a gardener to a noble lord, and awarded the 1st prize (see p. 971, first sentence of fourth paragraph from the top, col. a). After the show, one of the fruit had been sold, and the other was returned to the secretary as soon as the mistake was discovered; sorrow was also expressed for the mishap. Two days more passed: our exhibitor's impatience reached a white heat, that found expression in a telegram on the 23d. A reply is written on the same day, stating that the prize Pine had rotted on their hands, that it was not delivered to them till 10 days after the show, and regretting that it had not been eaten for dinner rather than spoiled. On the 25th another letter arrived, enclosing the prize-money and price of Pine, minus the cost of the post-office order—a piece of sharpness, under the circumstances, worthy of the canniest Scot in a' that braw country. The northern worthies have also promised to have the name altered in the "*Gardener*;" but, to an appeal to alter it officially in the *Gardeners' Chronicle*, they have remained dumb. To add to the zest of the disappointment, the proprietor of the Pines had the satisfaction of hearing of them being praised by a duke as wonderful examples of high cultivation, most creditable to the gardener of the noble lord in whose name they were exhibited. On reading this "over true tale" one hardly knows what most to wonder at—the long silence of the secretary for more than a week, his carelessness in allowing fruit addressed to himself to be removed by any one besides the gentleman specified in the letter of advice, the dumbness of the nobleman's gardener under honours which he must have known for many days to be undeserved, and what has become of his Pines, as also that the officers of such an old society as the Royal Caledonian Horticultural and its experienced secretary, Mr. Stewart, should have made such a blunder. This fact ought to make us charitable to our bungling friends over the water. "Let him that is without sin (fault) throw the first stone." Possibly, however, our northern friends will think they have had pelting enough. So, requesting your readers to turn to the page and paragraph already adverted to, instead of "In Pine-apples there were two superb fruits, especially the Charlotte Rothschild from Mr. Miles, gr. to Lord Carrington, Wycombe Abbey," read "from Mr. Ward, gr. to Thomas N. Miller, Esq., Bishop Stortford, Herts." *Observer*.

Conifers.—We have a number of very handsome trees of *Picea cephalonica*, varying from 30 to 40 feet high, that are this year bearing cones freely. With this I send you some specimens gathered from two separate trees, and you will observe that they are very dissimilar, leading me to suppose that we have two varieties of this most beautiful Conifer. Please say if it is so. I may just add that the finest specimens of the above are growing on a well sheltered westerly slope, quite out of reach of the early morning sun. The soil is a loose grey sandy loam, in which they appear to revel. *Picea Pissapo*, growing in a similar soil, has over 200 cones, specimens of which I send you. This tree is about 50 feet high, and the whole of the cones are on about 10 feet of the top. *Picea Webbiana* has six of its dark singular-looking cones. This, I fear, is too tender to be of value for extensive planting; it grows too early, and suffers much from frosts, and the soft fleshy buds got destroyed in the winter. *Abies Douglasii*, *Morinda*, and most of the Conifers are coming very freely this season, probably owing to the tropical heat of last summer. *Abies Douglasii* grows here almost as freely as the Larch, and as the timber is likely to be of great value it should be planted extensively. The inflorescence of the *Althea frutex* is very great this year. Several plants here are literally loaded with bloom. This lovely shrub is deserving of more extended cultivation. J. Sheppard, Gr. to J. Berners, Esq., Woolverstone Park. [The varieties of *P. cephalonica* are different, the one has shorter, blunter leaves, smaller and more deeply coloured cones than the other, and more prominent bracts. Eds.]

Societies.

ROYAL HORTICULTURAL: Oct. 5.—James Bateman, Esq., F.R.S., in the chair. The preliminary business of the meeting being concluded, the Rev. J. Dix and G. F. Wilson, Esq., announced the awards, and commented upon the products brought before the Fruit and Floral Committees. The Rev. M. J. Berkeley then addressed the meeting, first stating that the pretty Epidendrum, shown at the last meeting by Dr. Rogers, was found to be *E. glumaceum*. With respect to the doubt respecting the correctness of the name of Mr. Cox's specimen of *Picea cephalonica*, expressed at the last meeting, Mr Berkeley said that on examining some specimens sent by Mr. Frost, he found that the cones of *P. Pissapo* were quite different from those of *P. cephalonica*, the latter having projecting and pointed bracts, which was not the case with the cones of *P. Pissapo*. Mr Berkeley then proceeded to notice the Fungi, and referred to the interesting lecture delivered by Dr. Bull at the exhibition last year. Shortly afterwards Mr Berkeley received a letter from Dr. Curtis, stating that during the latter part of the American war, Fungi formed the principal food of the Southern army. The speaker then announced the names of the winners of the prizes offered, and referring to Mr. English's collection, called attention to the excellence of the preserved specimens, which looked like models, but which were in reality the Fungi themselves, prepared by a process the nature of which had not yet been made known. *Boletus edulis* was then alluded to, as one of the best of the edible Fungi, though not well known. It was a species of which Dr. Badham, a great authority on such matters, had said that it was good when cooked in any way. It was recognisable from other *Boleti* by a fine whitish network on the stipes, and occurred in abundance in the pleasure grounds at Kew. Mr.

Berkeley, whilst in Hanover a few weeks back, went into the markets there, and saw bags full of slices of this species, which was greatly appreciated on the Continent. He also saw in the same market another species which he had not seen before, *Clavaria rufescens*. The genus *Boletus*, said Mr. Berkeley, had been often described as gall tasting, but this remark did not apply to all the species, as he exhibited a specimen of *B. castaneus*, which was no doubt eatable. *B. luridus* possesses the singular property of being, when first broken, quite yellow, and then immediately turning blue. *Agaricus orcella*, a species not often found in this country, was then said to be one of the best, as also was *A. nebularis*. *A. Oreades*, the Champignon, of which there were several specimens, was then alluded to, as being one of the very best. In reply to a question often asked, Mr. Berkeley stated that there was no absolute distinction between harmless and noxious Fungi. Observation and experience furnished the only safe guide. This applied equally to other plants, as the Wild Celery might be mistaken for Water-cress. Illustrations were given of the noxious effects of some species, and the intoxicating powers of others; and in conclusion Mr. Berkeley read the following communication from Dr. Curtis, of South Carolina:—

"You have asked me to give you my experience with the eatable Mushrooms of America. This will be most satisfactorily done, I presume, in pretty much the same style in which I would narrate it to you at your own fireside. My experience runs back only about 12 or 15 years. You may remember that, previous to this period, I expressed a fear of these edibles, as I had grown up with the common prejudices against them, entertained by most people in this country. Having occasionally read of fearful accidents from their use, and there being abundance of other and wholesome food obtainable, I felt no inclination to run any risks in needlessly enlarging my bill of fare. Thus I had passed middle life without having once even tasted a Mushroom.

"But as under your guidance and assistance my knowledge of Fungi increased, a confidence in my ability to discriminate species grew up with it, and a curiosity to test the qualities of these much lauded articles got the better of timidity; and now, I suppose, I can safely say that I have eaten a greater variety of Mushrooms than anyone on the American continent. I have even introduced several species before untried and unknown. From the beginning of my experiments, however, I have exercised great caution, even with species long recognised as safe and wholesome. In every case I began with only a single mouthful. No ill effect following, I made a second essay upon two or three mouthfuls, and so on gradually until I made a full meal of them. Fortunately, I have never blundered upon any kind that was mischievous, although I have eaten freely of forty species. This is due, perhaps, to my general acquaintance with species which have been long used in Europe, and hence I have made no experiments upon new species which had not some affinity or analogy with them.

"For instance, *A. campestris* and *arvensis* being wholesome, I did not doubt but that *A. amygdalinus* (a new species closely allied to *A. arvensis*), might be safely attempted, as it has proved equally safe and palatable. Indeed, this may be regarded as the safest of all species for gathering, as it can be discriminated from all others, even by a child or a blind person. Its taste and odour are so very like those of Peach kernels or Bitter Almonds, that almost invariably the resemblance is immediately mentioned by those who taste it crude for the first time. This flavour is lost by cooking, unless the Mushroom be untried. When thoroughly cooked I cannot myself distinguish it from *A. campestris*. One or two persons have expressed the opinion that they can distinguish it, and that it is not quite so good. Others, again, are equally positive that it is better. In the crude state I deem it the most palatable of all Mushrooms, as it leaves a very grateful after-taste upon the palate, fully equal to that of Almonds. This is the thing I sent you some years ago for cultivation, but which failed to grow. I very much wish it might be propagated in England, so that we might ascertain whether it would undergo any change of qualities in a different soil and climate. I have for some time been entertaining the suspicion that such is the case with many of our species. Thus, in European books the Morel is described as possessing a peculiar flavour, that has given its name to the Morello Cherry. I can detect nothing of the sort in our Morel. You speak of *A. caesareus* (in *Introd. Crypt. Bot.*) as being 'perhaps the most delicious of all Fungi.' This grows in great quantities in our thick forests, and may be obtained by the cartload in its season, but to my taste, and that of all my family, it is the most unpalatable of all our Fungi. I can find many of our most passionate mycophagists who will avow that they like it. I have tried it in almost every possible mode of cookery, but without success. There is a disagreeable saline flavour that we cannot remove nor over-ride.

"In the *Tricholoma* section, in which are several species long known as edible, I did not hesitate to experiment upon any that had the odour and taste of fresh flour. I began with *A. frumentaceum* not learning from books whether it had been eaten in Europe. To this I subsequently added three new American species belonging to the same group. All are excellent when stewed, and are especially valuable for their appearance in late autumn, even during hard frosts, when other *Agarics* are mostly out of season.

"Again, there seemed such a similarity of texture and habit between *A. caespitosus* (*lentiginus*, Berk.) and *A. melleus*, although the former belongs to *Clitocybe*, that the temptation to a trial of it was irresistible. As it is found here in enormous quantities, and a single cluster often contains 50 to 100 stems, it might well be deemed a valuable species in a time of scarcity. It would not be highly esteemed where other and better sorts can be had; but it is generally preferred to *A. melleus*. I have found this species very suitable for drying for winter use.

"Among *Boletii* I ventured, in ignorance if it had ever been eaten, to try *B. Collinitus*, on account of its close relationship with *B. flavus*. I am not particularly fond of *Boletes*, but this species has been pronounced delicious by some to whom I have sent it.

"So among the *Polypores*, I had no fear of harm from the use of a new American species (*P. poripes*, Fr.), on account of its relation to *P. ovinus*, of its texture and its flavour. The taste of the crude specimen is like that of the best Chestnuts or Filberts. It has been compared even with the Cocoa nut, and is certainly of very agreeable flavour. It does not, however, make a superior dish for the table, being rather too dry, but it is innocent and probably nutritious.

"Of the *Merisma* group of *Polypores*, having already tried *P. frondosus*, *confluens*, and *sulphureus*, I ventured, after some hesitation, and with more than usual caution, to test the virtues of a new American species (*P. Berkeleyi*, Fr.), notwithstanding the intense pungency of the raw material, which bites as fiercely as *Lactarius piperatus*. When young, and before the pores are visible, the substance is quite crisp and brittle, and in this state I have eaten it with impunity and with satisfaction, its pungency being all dissipated by stewing. I do not, however, deem it comparable

with *P. confluens*, which is rather a favourite with me, as it is with some others to whom I have introduced it. *P. sulphureus* is just tolerable; safe, but not to be coveted when one can get better. When I say safe, I mean not poisonous. I cannot recommend it as a diet for weak stomachs, which should be said of some other Fungi of similar texture. I am here reminded of an experience I had three or four years ago with this species, which would have greatly alarmed me had it happened at an early date in my experiments, and which would, probably, have deterred any one unused to this kind of diet from ever indulging in it again. I had a sumptuous dish of it on my supper table, of which most of my family, as well as a guest staying with us, partook very freely. During the night I became exceedingly sick, and was not relieved until relieved of my supper. My first thought on the accession of the illness was of *Polyporus sulphureus*; but as I remembered that inflammation was one of the symptoms of Fungus-poisoning, and I could detect no indications of this in my case, I soon dismissed the rising fear, did not send for the doctor, nor take any remedy. Others, who had partaken of the Fungus more freely than myself, were not at all affected; and I presume my sickness was no more induced by the *Polyporus* than by the bread and butter I had eaten. And yet, had I alone partaken of the dish, or had one or two others been affected in like manner, doubtless the night attack would have been very confidently attributed by some to the Mushroom, or had this been my first trial of that article, possibly I might ever after have regarded it with suspicion. I learned a few days afterwards, from one of our physicians, that this kind of sickness was then somewhat prevalent in the community, and could be attributed to no known cause. For the credit of this species, therefore, we were fortunately able to distinguish the *post hoc* from the *propter hoc*.

"There are families in America that for generations have freely and annually eaten Mushrooms, preserving a habit brought from Europe by their ancestors. In no case have I heard of an accident among them. I have known no instance of Mushroom-poisoning in this country, except where the victims rashly ventured upon the experiment without knowing one species from another. Among the families above mentioned, I have not met with any whose knowledge of Mushrooms extended beyond the common species (*A. campestris*) called Pink Gill in this country. Several such families live near me, but not one of them was aware, until I informed them, that there are other edible kinds. Everything but the Pink Gill, which had the form of a Mushroom, was to them a Toadstool, and poisonous. When I first sent my son with a fine basket of Imperials (*A. caesareus*), to an intelligent physician, who was extravagantly fond of the common Mushroom, the lad was greeted with the indignant exclamation, 'Boy, I wouldn't eat one of those things to save your father's head!' When told that they were eaten at my table, he accepted them, ate them, and has eaten many a one since, with all safety and with no little relish. Since that time our mycophagists eat whatever I send them, without fear or suspicion.

"I have interested myself to extend the knowledge of these things among the lovers of Mushrooms, and also their use among those who have not before tried them. In the latter work I am not always successful, on account of a strong prejudice against vegetables with such contemptible names, and an unconquerable fear of accidents. Yet, as in my own case, curiosity often conquers these errors. When away from home I have frequently obtained ready permission from a kind hostess to have cooked a dish of Mushrooms that I have found on her premises. It has rarely occurred in such cases that the dish, then tasted for the first time, was not declared to be delicious, or the best thing ever put in the mouth. This latter phrase was once used in reference to so indifferent an article as *A. salignus*. Indeed, I have found several persons who class this among the most palatable species. To such persons a dish of fresh Mushrooms need seldom be wanting, as this one can be had every month of the year in this latitude. I am inclined to believe that the quality of this species varies with the kind of wood it grows from, and that it is better flavoured when gathered from the Mulberry, and especially from the Hickory, than when taken from most other trees. Its fitness for the table seems also to depend much upon the rapidity of its growth; those which grow slowly, as is the case with some of our garden vegetables, being of tougher texture and of less delicate flavour. A warm sun after heavy rains brings them out in greatest perfection.

"I have several times been asked by persons eating Mushrooms for the first time, whether these things belong to the vegetable or animal kingdom. There is certainly a very noticeable resemblance in the flavour of some of them to that of flesh, fish, or mollusc, so that the question, as founded merely on taste, is not an unnatural one. But I was much struck with its propriety when reading an article in *Priser's Magazine*, a few years since, written by the late Mr. Broderick, wherein it says that Mushrooms contain osmazone. If this be so, it accounts both for their flavour and for their value as food. Of this latter quality I had become so well convinced that, during our late war, I sometimes averred, and I doubt if there was much, if any, exaggeration in the assertion, that in some parts of the country I could maintain a regiment of soldiers five months of the year upon Mushrooms alone.

"This leads to a remark which should not be overlooked, upon the great abundance of eatable Mushrooms in the United States. I think it is Dr. Bidham who boasts of their unusual number in Great Britain, stating that there are 20 edible species in that kingdom. I cannot help thinking that this is an under estimate. But if the doctor is correct, there is no comparison between the number in your country and this. I have collected and eaten 40 species found within 2 miles of my house. There are some others within this limit which I have not yet eaten. In the catalogue of the plants of North Carolina, you will notice that I have indicated one hundred and eleven species of edible Fungi known to inhabit this State. I have no doubt there are 40 or 50 more, as the alpine portion of the State, which is very extensive and varied, has been very little explored in search of Fungi.

"In October, 1836, while on the Cumberland Mountains in Tennessee, a plateau less than 1000 feet above the valleys below, although with little leisure for examination during the two days spent there, I counted 18 species of edible Fungi. Of the four or five species which I collected there for the table, all who partook of them, none of whom had ever eaten Mushrooms, declared them most emphatically delicious. On my return homeward, while stopping for a few hours at a station in Virginia, I gathered eight good species within a few hundred yards of the depot. And so it seems to be throughout the country. Hill and plain, mountain and valley, woods, fields, and pastures, swarm with a profusion of good nutritious Fungi, which are allowed to decay where they spring up, because people do not know how or are afraid to use them. By those of us who know their use their value was appreciated as never before during our late war, when other food, especially meat, was scarce and dear. Then such persons as I have heard express a preference for Mushrooms over meat had generally no need to lack grateful food, as it was easily had for the gathering, and within easy distance of their homes if living in the country. Such was not always the case, however. I remember on one occasion during the gloomy period, when there had been a protracted drought, and fleshy Fungi few to be found only in damp shaded woods, and but few even there, I was unable to find enough of any one species for a meal; so, gathering of every kind, I brought home 18 different kinds, had them all cooked together in one

grand *pot-pourri*, and made an excellent supper. Among them was the *Chantarelle*, upon which I would say a few words in confirmation of what I have already said upon the various qualities of Mushrooms in different regions and localities. I found some where written of this Mushroom as being so deliciously esteemed a delicacy, that it is much sought for when a dish of state is given in London. Can this be the same as that (for nothing common and easily obtained is so delicate, I believe), or because you have it of finer flavour in England? Here, where it abounds, no one seems to care at all for it. The same would I regard Mushrooms entirely rather than eat them. It certainly varies much in quality, as I have occasion to find it quite palatable, and again, though cooked in the same mode, very indifferent. I have been unable to ascertain whether this difference is due to locality, exposure, soil, moisture, or temperature. That soil has much to do with the flavour of some species of Mushrooms I am well convinced. In a parcel of Pink Gills I have sometimes found one or two specimens, though perfectly sound, of such unpleasant taste and taste as would spoil a whole dish. So also with the *Spizella* (*A. arvensis*), of which I annually find a few beautiful specimens growing near my residence, upon a grassy turf that covers a pile of trash made up of decomposed sticks, and scrapings from the adjoining soil. Their taste and odour is perfectly detestable. I had one specimen cooked, and an amount of seasoning could abate the offensiveness of this odious thing; yet within 100 yards of these I gathered specimens of the same identical species, which are of fine quality equal to that of the best Mushrooms. As I have before mentioned the varying flavour of Mushrooms growing on different kinds of wood, so here I suppose the unpleasant quality of some specimens of these two well-known and common species may be owing to something in the soil which they grow which they cannot assimilate, and so render a palatable and wholesome species totally unfit for the table. Such specimens, if eaten, would be poisonous or unwholesome. I do not feel any temptation to prove. It is not probable that they will ever do any mischief, for it is more than probable that a human being should so pervert his instincts as to swallow a villainous concoction.

"Experience and observations like these would seem to justify the inference that an innocent species may become deleterious, on account of its taking up some bad qualities from the soil. But as I have never known a case of poisoning in families that are well acquainted with the common Mushroom or Pink Gill, that gather the specimens for themselves, and have used this article of food annually for many years, I cannot agree with a suggestion somewhere made, that you, that perhaps all Mushrooms contain a poisonous element, but some of them in such small quantity as to have no perceptible effect. Now, had you seen the quantities of collected Mushrooms swallowed at a single meal which I have seen several destroyed, and with no more harm than from the same amount of oyster or turtle soup, I think you would be forced to the conclusion that such an amount, even of poisonous Indian meals, must have had some very unpleasant manifestations. It also be a very innocent diet.

"It is said that the sale of the Pink Gill (*A. campestris*) is forbidden in the Italian markets, because that species is often proved to be poisonous. May not this have been done by ignorant and careless collectors or by worthless inspectors? To us in America, who use this species so freely and fearlessly, the Italian's curse, 'May he die of a Prick' would have no more terror than 'May he die of a rotten toe.'

"Our best and standard Mushrooms are the Pink Gill (*A. campestris*), Snowball (*A. arvensis*), Peach Kernel (*A. amygdalinus*), Nut (*A. procerus*), French (*A. prunulus*), *M. (M. oculata)*; Coral (*Clavaria*); and *Omelette* (*Lycopodium giganteum*). These are almost universally in high esteem. Yet tastes differ on these things as on fruits and vegetables, some putting one, some another, at the head of the list, though fond of all and ever ready to use either of them. I have known a person prefer a Peach to a fresh Apple. There are some among us who regard *A. procerus* as fully equal to the *Tricholoma*, and I am almost of the same opinion. Whether broiled or fried it truly makes a luscious morsel. I mention in this connection, that this species has been named of Nut Mushroom, from a quality that I do not mention in the books which describe it. The stem of the fresh and young has a sweet nutty flavour, very similar to that of the Hazel Nut. Is this the case with you? Its flavour is agreeable that I am fond of chewing the fresh stems. This peculiarity in connection with its agreeable ring and colours, I deem it a perfectly safe species to recommend for collecting. We have no species likely to be mistaken for it, except *A. rachodes*, and I fully tested the innocence of the latter before commending the first to others. This has been expected by some, but I have found it harmless. Though well flavoured, it is not comparable with *A. procerus*, and its flesh is so thin and spongy that it is not worth the trouble of those of more compact texture are to be had. A specimen of the same group, is a much preferable species.

"The Morel is one of my greatest favourites, but this I find in quantity except in calcareous districts. A few since (April 21) I had a dozen for supper, the largest number ever had at one time.

"The *Lyoperion giganteum* is also a great favourite with me, as it is, indeed, with all my acquaintances who have known it. It has not the high aroma of some others, but the delicacy of flavour that makes it superior to any other that I have ever eaten. It seems, furthermore, to be so digestible that it adapts it to the most delicate stomachs. This is the habit of Down of Mushrooms.

"In this latitude (about 36°) we can find good Mushrooms for the table during nine or ten months of the year. *A. salignus*, which some are quite fond of, we can have in every month, as this species comes out during any part of the year. *A. campestris* makes its appearance in the early part of March, but is not in full crop until September. An excellent species of the *Tricholoma* group do not appear until after frost sets in, and continue into December, the case too with *Boletus Collinitus*, which sometimes comes from the earth frozen solid.

"These observations and experiences are confined to the Carolinas; though, I presume, from casual observation elsewhere, and from information derived from other parts of the country, that, making some allowance for difference of climate and length of seasons, what I have said is applicable to the whole country. M. A. Curtis

Mr. Saunders then stated his intention of offering a prize again next season, and suggested that to the edible species better known, they should be separated from the poisonous ones, and be labelled so as to direct more attention to those which were useful to man.

The Chairman having adverted to a few subjects, said that many years ago the late Sir John Banks had predicted that the fruit of the Mangosteen would be exposed for sale in Covent Garden Market, though he might not live to see it; and he (Mr. Bateman) was happy to see that that prophecy had been partly fulfilled, a few days previously he had bought fruit from the Mango in Covent Garden, which were obtained from Madeira. The Mango had fruited at Chelsea

constant communication from one side to the other, and in spite of identity of soil.

The botany of railway banks and railway stations indeed is a subject well worth the attention of botanists, and in these days of junction stations and consequent delays, not the most unpleasant mode of whiling away the time is to note the "aliens" and "strangers" that make their appearance in such localities.

Our notice has extended to such length that we can only mention without further comment the sketch of the progress of botany in Middlesex from the time of Mr. Turner, the first part of whose "Herball" was printed in 1551, to that of Mr. Melville, whose "Harrow Flora" bears date 1864.

So many tastes and interests are catered for in this volume that our authors are sure to get full meed of praise and thanks from all sorts and descriptions of plant-lovers, and we too are happy to aid in the general chorus.

The Aptary.

BEE NOTES: SUPERS.—I have seen two very beautifully worked boxes of honeycombs lately, and was induced to take notice of the manner in which the bars were arranged. The boxes were perhaps 13 inches square, by 7 inches in depth below the bars.

I have hitherto been particular in constructing my supers of the proper dimensions for taking the same bars as are in use in the frames of my stock-boxes, only placing them rather further apart. Though this method possesses many undoubted advantages, yet, as my bars are very narrow, being only 1/2 inch in width, I have found that they were hardly capable of supporting very wide and heavy combs, and have, therefore, refrained from placing them so widely asunder as I otherwise should have done.

Garden Operations.

(For the ensuing week.)

PLANT HOUSES

THE species of Eranthemum, considering their usefulness and the variety in their forms, are not met with in collections of stove plants nearly so frequently as they should be.

minimum to be arrived at during the middle of winter should be from 48° to 50°. Place them after this date into as light and airy a position as is practicable. The above remarks apply equally to Sonerilas, regarding which I may state that even greater care is necessary not to have the balls containing the roots at all sodden after this time, otherwise the loss of the plants will assuredly be the consequence.

FORCING HOUSES.

Where Vines are forced early no further delay should take place in pruning them, if this be not already done. If the least symptom of bleeding occurs let white lead be immediately placed over the wounds, or use other methods, of which there are several, to prevent it.

HARDY FRUIT GARDEN.

The advent of foggy or drizzling weather, some of which we have already experienced, will make the ingathering of all fruits a matter of more care should bright clear days not ensue. Boverly particular not to pick any until it has become thoroughly dried.

HARDY FLOWER GARDEN.

Well-kept walks, without which a garden at this season loses that nice neat tone which is so desirable, will now need all our attention to keep them in thorough order. They must be constantly swept and rolled over—as often, in fact, as leaves and other litter accumulate.

KITCHEN GARDEN.

In this department the chief work will be to manure all vacant ground at the earliest possible moment, after the removal of the crop which may have been upon it, and to well dig or trench it over.

good coating of coarsely sifted leaf-mould and loam placed amongst the stools or crowns of the sorts. This, whilst it tends to ward off the winter, aids the roots besides by affording additional nutriment to the soil and to themselves when the growing period arrives.

TOWN GARDENING.

THE Ivy is a most valuable plant for town walls, and the present is a good time to plant it, so as to be ready to twine round wirework to form beds, which make a pretty feature, and are very good for growing early bulbs in.

STATE OF THE WEATHER AT CHISWICK, NEAR LONDON. For the Week ending Oct. 6, 1869, as observed at the Horticultural Gardens.

Table with columns: Day, Moon's Age, Barometer (Max, Min), Temperature of the Air (Max, Min, Mean), and Temperature of the Earth (1 foot, 2 feet deep).

Sept. 30—Overcast, cloudy, very close, heavy showers at night. Oct. 1—Showery, cloudy, but fine, clear and fine. 2—Overcast, slight rain, densely overcast; showery.

STATE OF THE WEATHER AT CHISWICK, DURING THE LAST 43 YEARS, FOR THE CORRESPONDING WEEK ENDING OCT. 9, 1869.

Table with columns: Day, Average Highest Temp., Average Lowest Temp., Mean Temp., No. of Years in which it Rained, Greatest Quantity of Rain, and Prevailing Wind.

The highest temperature during the above period occurred on the 14th, 1881—therm 90 deg., and the lowest on the 13th, 1880—24 deg.

Notices to Correspondents.

GRASS DISEASE. We never before heard of any such Grass diseases. INDIAN FORESTS: A Young Gardener. Apply at the Office, Westminster. MEDLARS: An Amateur. These should be allowed to the trees as long as they will, or until they begin to of themselves: a slight frost will do them little harm, however, in no way beneficial.

THE LANDS IMPROVEMENT COMPANY.— (Incorporated by Special Acts of Parliament.)

John Cotton, Esq., Whitehall Place, S.W.
Frederick L. ... Kirtlington Park, Oxford.
Messrs. ... (Messrs. Harris, Farquhar & Co.), 18, St. James Street, S.W.
Messrs. ... Eaton Square, S.W., and Galloway House, Westchester, N.B.
John ... Esq., 1, King's Bench Walk, Temple, E.C.
Messrs. ... (Managing Director), 2, Princes Terrace, Hyde Park, S.W.
Messrs. ... Esq., 4, Park Street, Westminster, Hyde Park, S.W.
Messrs. ... Esq., 1, King's Bench Walk, Temple, E.C.
Messrs. ... Esq., M.P. (Chairman), 2, Lower Berkeley Street, Portman Square, W., and Coed-y-Maen, Welshpool.

This Company advance money, unlimited in amount, for all purposes of Agricultural Improvement, including the erection of ...
For Forms and further information apply to GRANVILLE R. ...

THE GENERAL LAND DRAINAGE and IMPROVEMENT COMPANY.

Thomas Chapman, Esq., F.R.S. The Right Hon. Viscount Combermere.
George Thomas Clark, Esq. Edward John Hitchcock, Esq.
Messrs. ... Esq. William Tate, Esq., M.P.
J. BAILEY DENTON, Principal Engineer.
Apprenticeship of title necessary, and no legal expenses incurred.
Apply to H. ... Secretary, at the Offices of the Company, 22, Whitehall Place, London, S.W.

H A L L E T T ' S

PEDIGREE HUNTERS WHITE WHEAT.

Also the ORIGINAL RED.

Price, including bags, Five Guineas per Quarter, by the Quarter or Half-Quarter, One Guinea per Bushel for less than a Half-Quarter.

Delivered at the Brighton Station, in bags sewed up, sealed, and containing printed directions for planting, upon receipt of Cheque or Post Office Order, without which it will not be sent to unknown Correspondents. Less than a bushel not supplied.

Apply to Captain HALLETT, F.R.S., The Manor House, Brighton.

Autumn Sowing.

ADAMS'S NITRO-PHOSPHATE or BLOOD MANURE for WHEAT.—This Manure, specially prepared for Autumn Sowing, is rich in Ammonia, Phosphate, and other ingredients required for the healthy growth of Grain Crops.
Particulars will be forwarded upon application to the Secretary, or may be had of the Local Agents. C. T. MACALDAM, Secy. Chief Offices, 115, Fenchurch Street, London, E.C. Western Counties Branch, County Chambers, Exeter, Irish Branch, 45, Westmoreland Street, Dublin.

THE LONDON MANURE COMPANY

Have now ready for delivery, in fine condition, COGNAC MANURE, for Spring Use. DISSOLVED BONES, for Dressing Pasture Lands. SUPERPHOSPHATES OF LIME. PREPARED GUANO. MANGEL and POTATO MANURES. Also Genuine PERUVIAN GUANO, and NITRATE of SODA. ex Dock Warehouse, SULPHATE of AMMONIA, FISHERY SALT, &c.
Offices, 116, Fenchurch Street, E.C.

LAWES' WHEAT MANURE, for AUTUMN SOWING, now ready for delivery.

All other Manures and Cakes as per Price List, supplied on the most liberal terms. Apply to JOHN BENNETT LAWES, Esq., Mark Lane, London, E.C. Dublin, and Shrewsbury.

ROSE and CO'S BIPHOSPHATED PERUVIAN GUANO

(Registered Trade Mark) ...
Agents for the North of England—Messrs. Keighley, Maxstead & Co., Hull.
Agents for Scotland—Messrs. Richard Connor & Co., Glasgow and Aberdeen.
Agents for Ireland—Messrs. R. F. Gladstone & Co., Dublin.
ROSE and CO'S Biphosphated Peruvian Guano Company (Limited), 1, King's Bench Walk, London, E.C.

Wheat Sowing

DOWN'S FARMER'S FRIEND for Preventing the Smut in Wheat, and the Ravages of the Bug, Grub, and Wire-worm.

A 9d packet is sufficient for Six Bushels of Seed Wheat, which can be dressed and sown in a quarter of an hour.
Testimonials from the largest Wheat Growers in the Kingdom, bearing testimony to its great power and efficacy, may be had of Agents, who are appointed for every district.
Full directions for use are given with each packet.
Prepared at the Manufactory, Woburn, Beds.
CAUTION.—To guard against fraudulent imitation and consequent disappointment, see that the signature of HENRY DOWN is on the label.
Agents in every Town throughout England, Scotland, and Ireland.

FOWLER'S PATENT STEAM PLOUGH and CULTIVATOR may be SEEN at WORK in every Agricultural County in England.

For particulars apply to JOHN FOWLER and CO., 71, Cornhill, London, E.C. (or to the Agents, Messrs. ...)

THE TANNED LEATHER COMPANY.

Armit Works, Greenfield, near Manchester.
TANNERS, CURRIERS, and MANUFACTURERS of IMPROVED TANNED LEATHER DRIVING STRAPS and MACHINERY.
PRIME STRAP and SOLE BUTTS.
Price Lists sent free by post.
Warehouse: 81, Mark Lane, London, E.C.

Cottam's Iron Hurdles, Fencing, and Gates.

COTTAM'S HURDLES are made in the best manner, of superior Wrought Iron, by an improved method. Illustrated Price List on application to COTTAM and CO., Iron Works, 2, Wincor Street, Dalby Street, London, W.

COTTAM'S PATENT PORTABLE UNITED COW FITTINGS

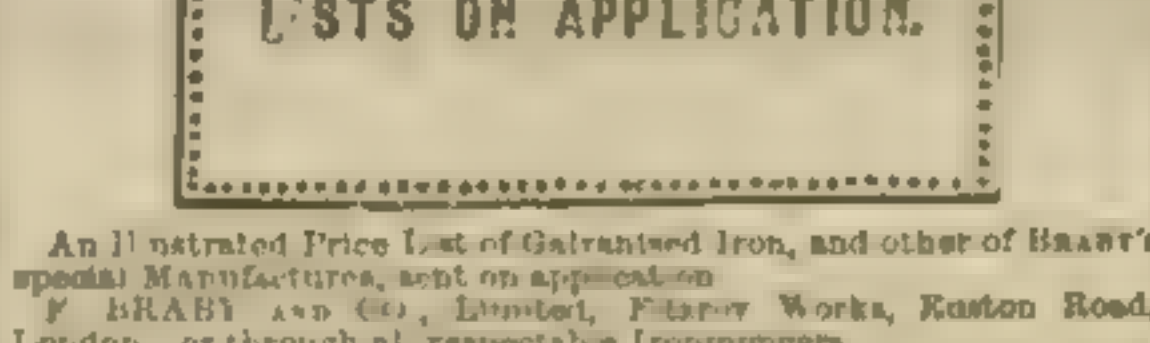

Their advantages are: Portability, not fixed; removable at pleasure; ...
Prospectuses free from COTTAM and CO., Iron Works, 2, Wincor Street (opposite the Post Office), Oxford Street, London, W., where the above are exhibited, together with several important improvements in Stable Fittings just secured by Patent.

Health of Horses, Stables, and Dog Kennels. MASTERS OF HOUNDS.

Will find the greatest advantage in Paving the Floors of Stables and Kennels with PYRIMONT SEYSEL ASPHALTE.

Thirty years' experience of the durability of this material, for the above and many other purposes, testifies to its value. A List of all such and other works can be had on application to J. FARRELL, Secretary, 5, Parliament Street, S.W.

Rosher's Garden Edging Tiles.

THE above and many other PATTERNS are made in the most durable manner, and of great durability. The pattern sorts are ...
F. & G. ROSHER, Manufacturers, Upper Ground Street, Blackfriars, S.E. Queen's Road West, Chelsea, S.W.; Kingsland Road, Kingsland, N.E. Illustrated Price Lists free by post. The Trade supplied.

ORNAMENTAL PAVING TILES for Conservatories, Halls, Corridors, Balconies, &c.

as cheap and durable as Stone, in blue, red, and buff colours, and capable of forming a variety of designs. Likewise more elaborate designs. Pattern Sheets of Pavements with prices, forwarded free on application.
WHITE GLAZED TILES, for Lining Walls of Dishes, Larders, Kitchen Ranges, Bains, &c. (Imitation and other Stone) Paving Beliefs of great durability, Dutch and Amsterdam Chinkers, Wall Copings, Bell and Stoneware Drain Pipes, Slates, Cements, &c. To be obtained of F. & G. ROSHER, at the addresses as above.

SILVER SAND (REIGATE), at the above addresses—

14s. per Ton, 1s. 2d. per Bushel; 2s. per Ton extra for delivery within three miles, and to any London Railway. What Quantities of 4 Tons, 1s. per Ton less. A coarser grained sand 4s. per ton more. Samples of Sand by post on receipt of stamp.
FLINTS and BRICK BURLS for Hotbeds or Ferneries. KENT PEAT and LOAM supplied at lowest rates.
F. & G. ROSHER.—Addresses see above.
N.B. Orders promptly executed by Railway or Vessel. A liberal discount to the Trade.

SMITHFIELD CLUB FAT CATTLE SHOW.—

The ANNUAL SHOW of FAT CATTLE, SHEEP, and PIGS, will be held at the AGRICULTURAL HALL, ISLINGTON, on MONDAY afternoon, December 6, and Four following Days.
Interested Exhibitors are requested to apply for Certificates of Form to the reference letters as follows:—
CATTLE: Fat Cattle, Fat Oxen, Fat Steers (in any Class); Fat Bulls, Fat Heifers (in any Class); Fat Sheep: Fat Rams, Fat Wethers (in any Class); Fat Pigs: Fat Single Pigs, Fat Pairs (in any Class); Fat Triplets (in any Class); Fat Sows (in any Class); Fat Piglets (in any Class).
ENTRIES FOR THE SHOW CLOSE ON NOVEMBER 1.
Price Lists, Forms of Certificates, and all information may be obtained on application to Messrs. J. ALLEN, Assistant Secretary, at the Office of the Secretary, corner of Half Moon Street, Piccadilly, London, W.
N.B. All communications respecting the Show must be addressed to the Assistant Secretary, as above, and must first state to the Secretary, Smithfield Club, S.W.

THE BIRMINGHAM CAT, PIGEON, and POULTRY SHOW.

The TWENTY-FIRST GREAT ANNUAL EXHIBITION of FAT CATS, SHEEP, PIGS, DOMESTIC POULTRY, CORN, ROOTS, and IMPLEMENTS, will be held at BINGLEY HALL, on SATURDAY, MONDAY, TUESDAY, WEDNESDAY, and THURSDAY, November 27, 28, 29, and 30, and December 1 and 2, 1869, when PRIZES to the amount of nearly £2000 will be awarded in the following Divisions, viz.:—
FAT CATTLE £200 10 0, SHEEP 100 0 0, PIGS 50 0 0, FAT SHEEP 200 0 0, ROOTS and CORN 70 0 0, FAT PIGS 50 0 0, POULTRY and PIGEONS 747 10 0.
Price Lists, Certificates of Entry, and every information may be obtained from the Secretary.
THE EXHIBITION CLOSES on MONDAY, November 1.
JOHN A. LYTHALL, Secretary.
Office, 20, New Street, Birmingham.

The Agricultural Gazette. SATURDAY, OCTOBER 9, 1869.

MEETING FOR THE ENSUING WEEK. October 12—Bisford Agricultural Society, at Bisford.

STEAM-POWER is, no doubt, the parent of modern enterprise, and the life and source of our industrial system. It has reformed—or, rather, transformed—every branch of industry in turn. Whatever new kinds of labour it may have created—and some of them are hard enough—it has in general lightened toil and superseded brute drudgery. It is said that steam is to effect equal changes in agriculture—that it is to lessen its labour and expedite its processes. As the shuttle passes through the warp in the power-loom, so the plough and the drill and the instruments of husbandry are to pass through the soil, steam-driven. The whistle of the plough-boy is to be replaced by that of steam, and "Gee-wo!" or "Come hither!" are to be heard no more in our arable fields. Agriculture has always been a handicraft; it is to be enabled, and to become a manufacture.

We hardly know with what feelings to anticipate these changes; and, whether they shall be ultimately realised or not, we must confess we do not think them imminent. It is said that the mode of culture affects flavour in certain vegetables, but we cannot yet detect a smack of steam in agricultural produce. There are no factory flavours in our bread at present, on the contrary we fancy it has a beyond-sea taste; at least a third of the Wheat consumed has a character of rude foreign farming about it. And if bullocks were as portable as corn, there is no doubt that Bison beef would soon compete with the joints of our domestic breeds. Much as we should like to see this foreign help supplanted by self-help, it seems to us a mistake to rely solely upon steam.

The largest cotton mill in England has six immense floors, which we ascended by a steam hoist. An engine of 300-horse power drives the vast and complicated machinery of the establishment. The representative busts of great mechanics and economists adorn the handsome engine-room. In one immense apartment 1200 power-looms weave threads into fabrics. In this mill we heard more noise, and smelt more oil, than in all our showyard practice combined. Steam is here supreme, for without the concentrated power that drives them, those myriad wheels and spindles would stop at once, and the industry of Lancashire, and all kindred labours, would come to an end. Steam is essential to our railways, to the rapid ocean-traffic, and to many of our grandest undertakings; but there is no indispensable relation between steam and progress in agriculture. English farming might be deprived of steam, and nevertheless be made much more productive than it is now. Our trade and manufactures are sustained by steam, and would collapse without it, but it is not even the foster-parent of our agriculture. While we talk of its mighty power and of the revolution it will accomplish in farming, we become daily less dependent on it. We will not say as the satirist said of virtue—laudatur et aliquid—but at any rate this country depends more and more for its food-supply on the ruder farming of distant countries, where

labour is cheap and the soil unexhausted. And it must be so while we continue to rely on mechanics, and neglect to repair those broken links in the chain of natural causes. We cannot expel "Nature" by steam-power.

No doubt clay soils will yield a certain crop of Wheat, year after year, without manure. Mr. LAWES still gets about one-third of a crop on his strong land. We quote that single fact in his valuable experiments to illustrate what mechanics alone can do for agriculture; they can enable us to farm with economy as to labour, but they will never supply us with a system of agriculture. It used to be thought otherwise. JETHRO TULL maintained that minute subdivision would obviate the use of manure, believing that the plant fed on the finely divided particles of earth. When the true theory of the nutrition of plants was little understood, there was a current saying, "mechanics for the clays, chemistry for the light lands"—we have learned that chemistry is necessary for clays also; in fact, we apply more chemistry to clays than to light land, in the removal of the stagnant water by draining, and in the liberation of the locked-up "inorganics" by burning. We must not, however, be too critical on a mere saying which, like many common sayings, has a foundation in only partial truth. But let the cost of tillage be reduced to the standard of that gallant pioneer—Mr. SMITH, of Woolston—and allow for a considerable saving to be effected in some unforeseen way in the cost of harvesting and preparing for market, still the main items—including that heavy one, manure—must remain untouched.

Agriculture is too big to be moved much by any number of steam tugs. We must rely on the laws of Nature, not on any mistaken expectations of the power of mechanics.

We are glad to observe that one leading question, in which the continued prosperity of agriculture is involved, was handled before the British Association at Exeter, where two papers were read on the liquid and dry earth schemes of dealing with house waste.

At Mark Lane and throughout the country Wheat has declined in price 1s. to 2s. per quarter. Fine malting Barley has been actively inquired after, and made full prices. Old and new Oats are both cheaper, the former 1s., and the latter 2s. per quarter. The live stock and meat trades have been brisk for all good qualities, beef having risen to 5s. 6d. per stone, and mutton to 5s. 8d.—The seed trade is nearly confined to winter Tares—English wool more freely inquired after, but there has been no advance in prices.

The Peterborough Ploughing and Draining Matches took place on Wednesday last, when the interest displayed in reference to them was even greater than has been shown for several years past. There were 50 entries, and 48 teams came to the fields, which were provided by Mr. Wagstaff, on his Woodstone Farm, a mile or so from the town. The teams were divided into seven classes. The champion class included eleven competitors, whose work was extraordinary for straightness and uniformity. But the 1st prize was won under protest, as STEPHEN BLUNT, to whom it was awarded, and who was recommended by Mr. LOVELL, secretary to the Northamptonshire Society, had for some months been occupied as a butcher, and therefore had departed from, or risen above, the character of a labourer. This prize is therefore left to the consideration of the committee. The competition among farmers' sons or pupils under 21 years of age, and over that time of life, is a very interesting part of the contest. By the interest taken in these trials, too, it is clear the farmers of the Peterborough district do not reckon that horse-ploughing will be entirely superseded by steam-power during the next generation. In the older class Mr. JAMES NEALE not only beat Mr. GOODYEAR, who had been a successful ploughman for years, but the judges awarded him Messrs. HOWARDS' plough, offered as a special prize for the "best work in any of the classes (implement makers excepted)." The younger hands also did excellent work, the 5th cup going to Mr. TEMPLEMAN, jun. The work in the class of men who had not taken a 1st prize was but little inferior to the champion's performance, which foreshadows the keenness of the trials in this class in future years. The boys under 18 years of age did work that was highly creditable both to them and their masters. Three men were recommended by implement makers to compete for the 5th cup offered. The well-known JAMES BARKER, and the equally well-known GEORGE BROWN, here came together—the former for Messrs. RANSOME, SIMS & HEAD, and the latter for Messrs. COOKE & CO. JAMES BARKER won the prize. Messrs. FOWLER & Co.'s Pirie's Plough was used by one of Mr. WAGSTAFF'S men, who had never held one before that day, and although he had not got quite into the way of steering its wheels as straight as a line, it did some efficient work; the stubble being well buried, and the soil left in an admirable condition for aeration. The drainers did some wonderful work. There were three classes, including 19 competitors. The young hands did their work well,

but the drains out by the experienced men were, in several instances, only 6 to 8 inches wide at the top, although they were 4 feet deep. JOHN NICKERSON, sent by Mr. WHITTON; and WILLIAM WOODS, sent by Mr. CHENEY—each of whom took 1st prize in his class—were worthy of particular praise, for the drains were almost as straight and smooth as if they had been sawn out. It ought to be said, however, that these men were fortunate in their ground; the soil was not uniform enough to give each man the same chance, for when gravel and water were come upon, there being no outlet for the water, the sides dropped in, and the work, however skilled, was spoiled in appearance.

At a special meeting of the committee of the Central Farmers' Club, held last Monday, the circular letter from the Privy Council Office on the transit of animals came under consideration, and the following answer was agreed to:—The committee of the Club would in the outset impress the great importance of the more speedy transit and delivery of animals carried by railway; while it would further recommend:—That all trucks for the conveyance of animals upon railways should be fitted with spring buffers. That, in order to prevent the injurious effects upon the animals by the shunting of the trains and from other causes, the trucks should be divisible into compartments. That it is undesirable to unload animals during transit by railway. That animals should not be upon a railway for more than 12 hours without water; and that railway companies should be compelled to provide means for the proper watering of cattle before loading.—That any appliances for the watering of animals should be attached either to the carriages, or troughs should be so placed at the stations that animals travelling for more than 12 consecutive hours can drink from such troughs without being removed from the trucks.—With respect to the feeding of cattle, the committee is of opinion that there are great difficulties in the adoption of any plan, and is not sure that the feeding is necessary or desirable.—That all vessels for the conveyance of cattle should be licensed for the purpose, and that the number of animals such vessels should be laden with be defined, on the same principle as is adopted with emigrant ships.—That the vessels should be divided or divisible into compartments in the same way the committee has recommended for railway trucks.—That pleuro-pneumonia and other diseases are no doubt engendered by the exposure to which animals are subjected on landing, and that shelter and accommodation should be provided on their disembarking.—The reply of the committee concludes with a reference to the fact that the course of circumstances has amply justified their memorial presented to the Lords of the Privy Council from the Club in March, 1868, and wherein the chief point dwelt upon was the establishment of a foreign market, as the only means by which the stock of this country can be defended from the importation of cattle plague and other foreign diseases.

At the Council Meeting of the Central Chamber of Agriculture held last Tuesday, the questions for discussion related to the Privy Council inquiry about the transit of animals. Professor BROWN attended the meeting for the Committee of Privy Council, and stated that the Committee was most anxious to have from that Chamber suggestions of a practical character, not only as to what was the best thing to do, but also the best way in which to do it. The Privy Council had nearly absolute power in making regulations. It was absolutely necessary that the suggestions made for its guidance should be such as could without very serious expense be carried into effect, but if there was a large increase in the cost of transit it would not be liked either by the farmers or the importers. A good deal of discussion ensued upon Professor BROWN'S address, and ultimately the following resolutions were unanimously agreed to:—

- 1. That, in the opinion of this Council, animals travelling by railway ought to have the opportunity of drinking at intervals of time not exceeding 12 hours. 2. That a supply of water should be accessible to animals at all loading places of railway stations. 3. That railway companies should publish time-tables of their trains carrying live stock, and that each lot of animals travelling by railway should be accompanied by a waybill, showing the times of arrival and departure, and the causes of detention, if any. 4. That railway wagons for the conveyance of cattle should be constructed with spring buffers and spring couplings, roofed over, and divisible into compartments, and that freedom from overcrowding, and a proper cleanliness of wagons and loading places, should be enforced. 5. That ships and steam-vessels carrying animals should be licensed, and placed under a thorough system of inspection.

In his monthly report to the vestry of Marylebone, Dr. Whitmore, the medical officer of health, refers to the extent to which the foot-and-mouth disease among cattle is prevailing, and its effect upon the food of the people. He finds the number of cows now kept in Marylebone to be 461, and of these 310 have been attacked by the disease, to which may be added some 35 or 40 others that were removed either on the first appearance of symptoms or soon after recovery. It causes serious loss, owing to the great diminution of milk. Cows which, before the disease, gave 15 and 20 quarts of milk per day, give only 8 or 12 quarts two months after apparent recovery. The secretion of milk does not stop altogether, except in the most severe cases during the disease, and most cowkeepers frankly admit that this milk is mixed with that from healthy cows and sold to their customers; the probability, therefore, is that the inhabitants not only of Marylebone, but of all other districts of London, have been drinking milk from infected animals for some time past, but as the weekly return of sickness from charitable institutions shows no appearance of disease among children, such as the drinking of milk from animals suffering from an eruption of vesicles on the feet and in the mouth would be likely to produce, the doctor comes to the conclusion that the risk or

danger of drinking such milk is very small, although it is impossible for him to say that there is not a taint of disease. The cowkeepers are of opinion that milk is not deteriorated by the disease, and freely to their own children, who are healthy. However, states it as his duty to urge the wisdom of policy of always throwing away the milk of infected animals, and that the cowkeepers have fully promised to do in future.

OUR LIVE STOCK.

The catalogue of the entire herd of pure-bred Aylesbury, the property of Mr. Fowler, Prebendary of Aylesbury, is now before us. The high character of this stock is sure to attract a large number of horns breeders on Monday the 19th inst., the day for the sale, and we fully expect to see a very keen competition. Fawsley, Tortworth, and Kirklevington all sound well, especially to the lovers of Bates' stock, and the 37 cattle all trace to one or other of these stockers. Mr Fowler will place a moderate reserve on one cow, and with this exception the lots will be sold at the highest bidder. First on the catalogue we find *cess Royal*, by DUKE OF BOLTON, a 12-year-old from Sir Charles Knightley's *London Pride*, by Bolden's JANIZARY (8175), and previously tracing to *Alone* by that excellent sire SNOWBALL, by CALIPH, Walnut by WHITEBOY (1540), and to Mr. Charge's stock. Of this good old strain is *White Princess*, by 3D GRAND DUKE, and *Princess*, by HARDICANUTE (22,537), (lot 1), daughters of the first-named cow; *Lady* by HARDICANUTE, and two bulls both by 2D CLARO, named respectively GRAND DUKE OF and ROYAL CLARO. Occupying the next in the list is *Sunrise*, by Sir Charles Knightley's LUKE, and from *Sweetheart 3d*, of Milcombe traction. The name of *Charmer*, by LITTLE and *Sylph*, by SIR WALTER, will remove a doubt as to the excellence of this pedigree. The same well known family belong *Seraph*, by DONPERRY (13,169); *Sunbeam*, by HARDICANUTE and from *Sunrise*, and among the bulls, *Fawn Royal*, by PRINCE CHRISTIAN (22,532), *Fanta 3d*, by VICEROY (17,181), was purchased for at the last Didmarton sale; her mother was *Flea*, Mr. Sunbury's CUPID, and her great-grandmother was *Flourish*, by the 100 G. USURER, the cow in which Mr. Rich raised his celebrated *L'orient*. When to this excellent history is added the fact that she is due to calve in November to 2D DUKE OF LINGHAM, she may be expected to bring a high price. We may as well mention at this point *Ursula 28th*, 13TH GRAND DUKE, another Didmarton heifer, bought as a calf at the first sale for 61 gs. *Verbena*, by M. QUITO (11,964), was bred by Captain Blathway, and also her dam, *Victory 2d* by 4TH DUKE OF OXFORD and her grandmother *Victory*, by 1 SUREE, was bred the late Earl Ducie. She is full of York and Oxford blood. *Seraphina 18th* (lot 7) by IMPERIAL OXFORD was bred by Mr. Lawford, of Southcott, and is sprung from a well-known Seraphina tribe. Immediate descendants from her we find *Princess Seraph* and *Imperial Seraphina*, both by PRINCE CHRISTIAN, two young heifer calves by HARDICANUTE, and a yearling bull by 8TH BARON WETHERBY, who is son of the 7TH DUKE OF YORK *Naiphala*, by BULL RUN, is the oldest representative of a very pure Knightley family. *Sue* was bred at Fawsley, as was also her sire, who traces back to JANIZARY, LITTLE JOHN and CALIPH. Her mother *Sylphide*, was another Fawsley cow, by SARAH, also bred by Sir Charles Knightley, this most excellent pedigree finds its limit in FAVORITE (252), and STUBBLE BULL (627). *Pipalee*, by BULLS, possesses an identical pedigree with *Naiphala*, *Edith of Fawsley*, and *Knightley Princess*, by PRINCE CHRISTIAN, *Knightley Grand Duchess*, by 4TH GRAND DUKE, *Fawsley Queen*, by HARDICANUTE, and 1ST BARON FAWSELEY, by 8TH BARON WETHERBY, all immediate descendants of these two cows. *Tail 2d*, by Mr. Graham's COSTA (21,487), and *Fantail* by BARRYCORN, sold at the last Killohore is a well-bred Shorthorn. Her sire was of good known stock, and on the mother's side she is thorough Bates, as the three consecutive sires, 5TH DUKE OF YORK, 4TH DUKE OF NORTHUMBERLAND, and SHEPHERD TAIL satisfactorily show. One heifer calf of this and a young bull, MARQUIS OF AYLESBURY, will be offered. To trace the pedigree of every animal in the catalogue would occupy too much space, and we will close this sketch by a reference to the bulls lately in the herd. These are PRINCE CHRISTIAN (22,537) bred by Mr. Graham, of Yardley; 8TH BARON WETHERBY, bred by Mr. Bowley, of Siddington, thorough well-bred Bates bull, full of York and Oxford blood; and HARDICANUTE, by POTENTATE CHAMBER (19,423), dam *Harmony*, by CHERRY GRAND DUKE 3D (15,764).

Two bulls of first rate descent, bred by and property of Lord Braybrooke, will be sold with Fowler's stock. Both are by 4TH DUKE OF GENEVA a bull by DUKE OF GENEVA (19,614), and of the Cherry Duchess tribe. The first, GENEVA DUKER out of *Haydon Rose*, a daughter of ENGLISH (19,701), and *The Beauty*, by PURITAN (9523); and second, CHERRY DUKE, is from *Christina Rose*, daughter of 4TH DUKE OF THORNDIKE, and of the Cambridge Rose tribe, so long bred by Mr. Bates of Kirklevington. We are reminded in the catalogue that 10 animals of this family sold at the Preston sale in 1867 for an average of 214l. 18s. 8d.

Bride of the Vale, the 1000 guineas heifer, purchased of Mr. Booth, of Wariaby, a few months ago by Mr. Gibson for Messrs. Walcott & Campbell, *State of*

New York, has unfortunately cast her calf during her upward passage. She was heavy in calf to COMMANDER-IN-CHIEF, the 1st prize bull at Leicester last year.

A large and carefully bred stock, comprising swarms of 17 head of Shorthorns and a flock of Leicester sheep, were dispersed at Cotham, near Newark, on Monday, the 27th ult. Mr. Booth has long been known as a breeder of stock, and a considerable company assembled to witness the sale. The cattle are of nice colour, full of hair, somewhat deficient in character, and low in condition. It was also the opinion many who attended the sale that the contagious disease now so prevalent exerted a depressing effect on buyers. The 12 Shorthorns realised 957*l.*, or an average of 1*l.* 12*s.* 9*d.* No high prices were given, but among the highest may be noticed 17*g.* for a bull calf scarcely six months old, and 32*g.* for a cow.

PETERBOROUGH GREAT FAIR.

THIS meeting for the sale of cattle, horses, wool, and other articles, took place on Saturday. It seems to be general opinion that the last day of the week is a very inconvenient one for so large and important a meeting, and particularly as Peterborough market is on a Saturday. In connection with this opinion has been suggested that the first Wednesday, or Thursday, or Friday in October would be a far more convenient arrangement for all parties than for it to be regulated by the day of the month, and it is probable that steps will be taken to effect this alteration. It happens that great fear and difficulty now exist respect to the foot-and-mouth disease, an increased amount of inconvenience, and expense too, occurred Saturday; for every distant purchaser was anxious to get the 10, 20, 30 or more beasts which he had bought, off by railway at once, lest they should, after enduring a public fair, fall down with the disease before they got home, and be stopped on the way by the authorities. How this was managed we cannot say; but from the crush at the stations on Saturday evening, we should say that the leading of cattle ran into Sunday, or many lots had to be kept in the town or neighbourhood over Sunday, which might naturally increase their own danger, and probable injury to others. For these several reasons, it seems clear that so great a meeting as this might be advantageously diverted from falling on a Saturday.

Of the animals there is but little to say. As there is no regular tolls paid for exposing them in the fairs, no comparative statistics of the number "putched" from year to year can be ascertained. But, far as we could estimate them, there was a far greater number of cattle on Saturday than we have met at any previous fair during the several years we have been present. The condition of the stock, too, have never been better. As regards the trade there were far more beasts, both large and small, than we were accustomed to see, and that many were in better hands for tramping the country to stand other fairs or markets. Prices were also considerably lower, may be judged. From this, however, an exception must be taken, for the high price of meat would insure for the oxen in forward condition a brisk demand at high figures. This was the case. The drovers were early in the field for the good beasts put in their yards for the great Metropolitan Christmas market-day. The animals made from 24*l.* 30*s.* a head, according to their size, quantity, and condition.

The Irish beasts were the most numerous, and the best in quality and condition, that we have ever seen. The present the Irish herds at home are said to be free from disease; and as this is attributable to the isolation of Ireland, and to its being an exporting country, a strong case is here made out for the benevolence of the present disease in England existing in the landing and circulating foreign cargoes of animals. Many of these Irish beasts were four years old, some of them were as well-bred as any one need look at, and the whole of them were in either a forward or sleek growing condition. Now, therefore, that the Irish herds have attained this character, surely the best thing which Irishmen could be engaged in at this time would be to improve their traffic in animals, and thereby redeem the character they bear for sort-righted barbarous treatment of their stock, whereby the value of them in this country is lowered a times more than it would cost to treat them in a civilized way.

There were only a few hundred Devons, and they were apparently but little sought after. Of Herefords there were but two or three small lots. All, however, were in fair condition. As regards disease, we are pleased to be able to say there was not the slightest sign of the foot-and-mouth complaint to be seen. We trust, that the mixture of many together, some of which may have had the disease in an incipient form, will not result in making general in the districts over which they will be distributed.

Some few of the remnants of recent long-woolled rams were offered by Mr. Law and Mr. Briggs, jun., and the price—these inferior sheep made were equal to one of the averages of the best of flocks. The averages were 10*l.* and 11*l.* a-head.

The horse fair was confined principally to the trade in young Irish horses and Welsh ponies. The barter which the men commit who "snow off" these animals are as great as ever. Many a young animal was no doubt named for life by the manner in which it was rashed and pulled about. Good colts and cart-horses were scarce and dear. A cart foal, we were informed, was sold for 24*l.* In the nag and saddle-horse department there was nothing but screws, or shapeless animals at are of but little use; for the trade in sound and

stout animals is now so good that dealers and their agents look them up at home, and it is an exception if they ever appear in a market or a fair at all.

AGRICULTURAL COUNTY SHOWS.

THE suggestion in your last number (p. 1023) with regard to amalgamating the shows of the separate midland counties into one association, with Birmingham for its centre, deserves serious consideration. At present I am scarcely prepared to assent to the proposal without further inquiry. The reasons you have adduced in its favour are weighty, but something may be said on the other side. A too limited area is certainly to be deprecated, and the tendency of such associations has of late been to amalgamation. Thus our society, which was once confined to North Staffordshire, now embraces the entire county. In like manner the Sparkenhoe Club has expanded into the Leicestershire Society. No one can deny that in both these instances the amalgamated societies have gained in influence and prestige. But if you make the area of a Society embrace something like the third or fourth of England, you totally change its character. We have already, in addition to the Royal Agricultural Society, our great meetings, such as the Yorkshire, the Bath and West of England, &c., and with gatherings they are. But the bulk of the exhibitors at county shows would never venture to meet the competitors when they would have to encounter in such an arena. Virtually its shows would be open to the kingdom, and heading the prize lists would be found the old familiar names of Booth, Fawkes, Foljambé, Laly Pigot, &c. The emulation of ordinary breeders, which it is so difficult yet so desirable to excite, would run much risk of being completely extinguished by encountering antagonists like these. We want to rouse ordinary farmers to emulation among themselves, instead of gazing passively at high-bred stock as they might at the beasts in a menagerie. Local shows have materially assisted in the diffusion of superior animals, and nowhere are they more numerous than in Yorkshire, where, during the summer months, there appears to be a show once a week. Men may have extremely well-bred stock, the diffusion of which would much conduce to the general improvement of dairy or grazing herds, who would not care to meet the picked animals of the kingdom. It is well that farmers should have an opportunity of inspecting these, and thus form an idea where, for example, they may best supply themselves with a bull, without going to the price expected by Captain Gunter or Mr. Booth.

With regard to the duration of the show, I agree with you that one day is sufficient for those carried on on the present plan. For one on a larger scale a week might be requisite, but there ought to be some great benefit to compensate for the risk and suffering involved in confining animals so long under unnatural conditions. For my own part I would, if it were possible, rather shorten the show of the Royal Society than lengthen any others. The real benefit of such exhibitions is to farmers, to whom they afford an important means of instruction. It is very well for the inhabitants of towns to amuse themselves by inspecting the stock, but I see no adequate good to be derived from detaining the poor creatures longer than necessary from home for the mere amusement of factory operatives and children.

If, however, agricultural exhibitions are to fulfil their highest purpose, as means of educating the public mind, there must be more confidence felt in the decisions of the judges than is the case at present. As one means of attaining this, might it not be possible at the larger meetings to allow the judges an opportunity of revising first impressions, by going a second time over their work? One of the most eminent judges of poultry mentioned to me that he had on one occasion reversed his first decision, by being accidentally allowed a second glance at two pens of birds, and that he had thus escaped committing a serious error. Again, there is a tendency on all such occasions, unconscious it may be, to give the preference to size, fat, and flourishing condition, over those less showy indications of high breeding which at home could not fail to press themselves on the private observer. On this ground I sympathise with Mr. Ellman in his protest on the decision in the Southdown classes, and that quite independently of the merit of the pens in question. Mr. Ellman deserves the thanks of breeders for his moral courage in upholding the true character of a breed against more showy claims. There is another point worthy of consideration. At present the judges have only the appearance of the animal to guide them. Who would buy a Shorthorn or a race-horse in this manner? Is breeding worth more or is it not, than the mere appearance which happens to impress on the individual animal? Of course it is worth money, or else we should not see one colt knocked down for 50*l.*, while the next, which is no better looking, fetches 1000*l.* The judges therefore ought, in common fairness, to be allowed to possess this necessary element in arriving at a correct decision. Men who were fit to hold that responsible office, would allow it due weight and no more. If it be objected that such information might induce partisanship, I reply that in numerous cases the judges employed at the Royal and other great shows, not only know the blood, but are perfectly familiar with the animals themselves. So far from any party feeling influencing the awards, they are, as a rule, far more satisfactory than at smaller meetings. Of course I allude to the preference which may be entertained for one strain of blood over another, for no one would for a moment impute the suspicion of personal partiality to any gentleman filling such an office. As an illustration of the confidence placed in them, Mr. Wilson mentions that at the great Hamburg International exhibition, the judges were furnished with the name of each exhibitor, a piece of information

which is perfectly useless. On the other hand, it is a matter of everyday observation, that at provincial shows, animals win prizes, as Shorthorns, which are not only less well-bred than others in the same class, but which are not even qualified to be in the Herd Book. Nay, on one occasion I remember seeing a cow take a 1st prize, of which the pedigree and the breeder were alike unknown. With fat stock the best animal ought to have the prize with breeding stock the pedigree cannot with safety be left out of the account. It may even be that a reference to pedigree would in many cases assist the judges at provincial shows, in placing the best animal in his rightful position. For instance, a person not accustomed to first-class Shorthorns, might easily, among a lot of young bulls, prefer one shape like a prize bullock to another having the proper type of a male animal not yet arrived at maturity. A reference to the respective parentage of the two might possibly induce a doubt as to the correctness of the standard which the judge had hitherto held. As a first step in the right direction, I would press on local societies to adopt the rule carried out in the catalogue of the Royal Society, where the name and Herd Book number of the sire, and that of the dam with her sire and number, are appended to every animal exhibited. If it is thought by any one that I lay too much stress on pedigree, I advise his careful study of Mr. Darwin's great work on the "Variations of Animals and Plants under Domestication," a work which ought to be in the hands of every breeder who desires to possess more than an artificial knowledge of his art. For patient research, extensive reading, and generalisation alike cautious and profound, it is not approached by any book on the subject. Willoughby Wood, Burton-on-Trent.

THE WHEAT CROP OF 1869.

IN the *Agricultural Gazette* of September 18, your correspondent, Mr. Ford, of Merton Hall, Warwickshire, gives it as his opinion that the statements which I have put forward with regard to the yield of the Wheat crop of 1869 are "most erroneous," and, indeed, that my estimate of the smallness of the deficiency compared with the average, is "perfectly ridiculous." Mr. Ford says, that on July 17 he reported his belief that the Wheat crop of this year would fall short of that of 1868 by at least 2 quarters per acre, that since that time there occurred some fine hot foreign weather, which materially improved the Wheat crop; that still he is of opinion that the yield will be nearly 2 quarters per acre less than last year. The material improvement which he admits thus only reduced his estimate of the deficiency compared with last year from "at least" to "nearly" 2 quarters per acre. I freely grant that, in the early part of July, the Wheat crop was in a very critical condition, but I am disposed to attribute a far more improving effect to the splendid weather which followed than that which your correspondent assigns to it.

The following facts in addition to those I have before adduced in reference to the Wheat crop of the harvest just passed, have a considerable independent value; but they will, perhaps, also aid your readers in forming their own conclusions among the conflicting opinions which have been published on the subject. In a field of 30 acres which has now yielded 9 grain crops during the last 14 years, Clover was grown in 1858, and this was followed by Wheat of various descriptions, the land being equally dressed with artificial manure for all when the seed was sown. The results were as follows:—

Table with 3 columns: Description of Wheat, Bushels per acre, Weight per bush. Rows include Burwell, Bristol Red, Red Langham, Red Wonder, White Chaffin, Woolly Ear, Nursery, Rostock, Niagara, Golden Drop, and Mean.

Thus the average yield in these 10 experiments with as many different descriptions of Wheat, is over 30 bushels per acre; and I have probably 60 acres on my farm which will yield an average of 6 quarters per acre. It will not be doubted that an equally large produce has been obtained by many others; whilst, on the other hand, on my farm, as on many others, some of the Wheat was thin and root-fallen. I cannot, however, suppose that, in a season which, side by side with failures, is capable of affording such large produce, the crop of the country generally can be so deficient as it is represented by some. Your correspondent does not say what he estimates the average produce of the country to have been last year; so that his estimate that the yield is 2 quarters per acre less this year does not clearly indicate his figure for the present year.

I estimate the produce of 1868 to average, over the United Kingdom, 31 bushels per acre. This, at the time, was considered to be rather high; and the imports of Wheat during the succeeding 12 months would seem to indicate that it was at any rate not too low. If, however, we take 31 bushels per acre as the yield of 1868, and deduct from this 2 quarters per acre, we should have only 18 bushels as the average yield for 1869. The price of Wheat at the present time certainly affords no indication of any such deficient yield, and I leave your readers to judge of the validity of such an estimate. J. B. Lawes, Rothamsted, Sept. 23.

P.S. Since writing the above, I have seen Mr. Kains-Jackson's letter, quoted in the Money Article of the

Times of Sept. 25. He there sums up the various estimates of the Wheat crop of 1869, as under:—

ON THE TECHNICAL EDUCATION OF THE AGRICULTURAL LABOURER.

By J. BAILEY DENTON, C.E., F.G.S.

[The following paper was read at the meeting of the British Association at Exeter.]

WITH the general interest felt in the condition of the agricultural labourer, and the promise held out by the Government of measures for the education of the people during the next session of Parliament, it may not be inopportune to address a few observations to the Association on those points, by attention to which it is hoped the promised mode of education may take a form which, at no distant period, may have the effect of instructing rural labourers of coming generations how to earn higher wages, and thereby obtain more and better food, and increased social comforts.

It is not to be doubted that the prevailing absence of education is the cause of the depressed and inferior condition of rural compared with urban labourers, which renders them the worst paid class of the community, and that the first step to be taken is the establishment of a system of primary education, which can only be successfully carried out at school. The object of the writer is not in any way to interfere with this elementary school teaching; it is rather to show, while the subject is under public consideration, that it should be associated with technical information, whereby the labourer may make his work more valuable and better appreciated by his employer, and thus secure more money in return.

Up to the present time the country at large has laboured under the mistaken opinion that the operations of the farm require no initiation, that physical health and strength alone are required to make the farming labourer all that he need be. Gradually, however, the business of the farm in its several branches is becoming more like other businesses, and elementary education and technical knowledge are admitted to be as essential to the full return from agricultural as from manufacturing labour, with this difference only, that, the work of the farm being dependent on more subtle influence than those of trade, the technical knowledge required to bring each operation to the most profitable bearing is wider than that which is required in perhaps any other calling in which manual labour is the chief active power. Yet no special learning in any branch of farming is imparted to the young agricultural labourer, although there is not a trade which does not require its working members to undergo apprenticeship before they can take part in a trades' union, showing distinctly how the more intelligent appreciate apprenticeship as a means of becoming skilled workmen. Any mechanic, following a trade involving only a monotonous repetition of the same work, is not considered qualified for the privileges of combination, unless he has gone through the form of apprenticeship. It is upon this ground, and this ground only, that in all the better trade societies the first rule is, that no one shall be admitted "unless he possesses good abilities as a workman," in which case "he shall not work for less than the average rate of wages paid to members in the same branch of trade in which he is employed." The act of apprenticeship is, in fact, the very basis of trades unions. It is very different with the farm labourer, though if, for instance, he would thoroughly succeed as a horse-keeper, a herdsman, or a shepherd, and obtain full wages, he must not only do his routine work with industry and care, but, to do it perfectly, must understand the nature of the animal with which he has to deal, and how best to maintain its health and productiveness, knowledge which is not to be gained in the ordinary course of the farm labourer's life, though it may be quickly acquired by special servitude and technical teaching. So with the ploughman, the drillman, the hedger and the ditcher, if either would do his work thoroughly he must not only understand the nature of the seed he may have to sow, and the plants he may have to raise, but he must be conversant with the influence of seasons upon their growth, and upon the soil in which they grow. This quality of knowledge is now gained by a few only, who are observant, and teach themselves. Speaking generally, it is the imperfect way in which the manual work of the farm is done, which for the most part keeps down the price of agricultural labour; yet there is not a farmer of any intelligence in the country who will not readily pay 2s. to 3s. a-week more for an adept in any branch of duty than for a casual hand who, being put to every kind of work, is master of none.

It has been advanced that the simple payment of higher weekly wages to agricultural labourers, without seeking to make them more skilful in their duties, would be generally beneficial. This, however, is opposed to the first principles of economy, as such a system could only be maintained by impoverishing the farmer without increasing the produce of the soil. If, on the contrary, the work of the labourer is made more productive, not only will the farmer be rendered better able to pay higher wages, but the soil, by yielding more, will better support increasing population, and so add to the wealth of the nation. The first proposition is advanced on the ground that, by raising the wages of agricultural labourers, they will be immediately enabled, by the purchase and consumption of more food, to put forth greater strength, and be able to endure more. To prove that this is well founded reference has

been made to their casual employment in railway, draining, and other public works, and the better wages they then get. It has been further supported by the statement that when farm labourers from Dorsetshire, Somersetshire and Cornwall, earning from 7s. to 12s. a week, have migrated into the higher priced counties of the North, they have directly received the prevailing higher wages of the district, and have become as valuable to their new employer as native men. The experience and observations of the writer—who, for the last 20 years, has had the conduct of works of land improvements in nearly every county in England and Wales, and generally has under his control from 1500 to 2000 agricultural labourers—do not confirm this view of the question. He has found that the quality of labour varies in different counties or districts, distinguishing one from another as distinctly as any other characteristic feature, and that the value of the work performed in the low-waged districts is very much less than that of districts where wages are higher, although there are some special works which are even better performed on the low-waged than in the high-waged districts. If every instance of migrated labour which has afforded satisfaction could be investigated, it would be found that although the want of hands may have raised the wages given beyond what immigrant labourers may have received at home, it has only been when they have become skilful in their new duties by practice that they have risen to the level of superior native men.

In spite of the fact that the agricultural labouring population has decreased, it is not to be denied that in some rural districts there is still an excess which has the effect of keeping down the price of labour below what it ought to be, while there is a scarcity in other districts which has necessarily the contrary effect of raising local wages above the average amount, though the scarcity may not extend to the whole of the year. Neither can it be denied that where this seasonal scarcity of hands exists it has been caused in most instances by the same species of migration as that by which it is very properly desired to counteract this unequal state of things.

In 30 out of the 42 counties in England, reckoning the ridings of Yorkshire as counties, Mr. Thornhill Harrison shows (see "Fraser's Magazine" of April last), that there has been a gradual decrease in the number of persons employed in agriculture, the reduction being traceable to the migration of the young and active men from the country to towns, and from agricultural to manufacturing pursuits. He says—"Not only was the number of agricultural labourers fewer in 1861 than in 1851, but the quality of the labour was seriously deteriorated. No doubt fewer women were employed in the fields, but the proportion of boys and old men to full-grown men in the prime of life was much increased, as appears from the following table:—

LABOURERS EMPLOYED IN AGRICULTURE.

	1851.	1861.
Under 15	105,700	119,000
Above 40	393,500	427,500
	499,200	546,500
Able-bodied	78,400	60,000
	1,280,000	1,260,000

Thus, if we compare 1861 with 1851, we find that the total number employed in agriculture in the former year included 73,700 fewer who were able-bodied, and 47,300 more who were either lads under 15 or men over 40."

The progress of agriculture, nevertheless, has been so remarkable and rapid within the last 30 years, that, notwithstanding the increasing application of steam machinery and horse labour to objects in which manual labour alone a few years back was the only means of production, the actual demand for men has increased, and is still increasing, particularly in those parts of the country where arable prevails over pasture culture. But as long as the fallacious opinion rules, that physical power without the exercise of mental ability is the measure of the value of manual labour, so long will the farmer treat his labourers with the same consideration as he does a threshing-machine, or a steam-plough, which is only set in motion when circumstances call for its use, to be put away again when its work has been performed, whereas, if the head more frequently directed the hands of the farm labourer, this casual description of employment would give place to constant engagement. The farmer would, in fact, find that the return on his capital would be in proportion to the intelligence of his workmen and the extent to which he employed them.

At the present moment, no sooner is the boy sent by his parents to earn a shilling or two a-week on the farm, than he commences a career of empty thought; the little exercise of the child's mind, which had been exerted in reading, or in writing, or in doing a sum of addition or subtraction when at school, ceases. He is made a bird-keeper, or a crow-clapper, or a ploughboy, or a pig-driver, or anything else which can be performed without mental effort. No one takes the least trouble to teach him his duty. If he does contrary to what he has been told to do, he may receive a blow from his master or from the man he is working with, and if he is considered to be doing too little for the 2d. or 3d. a day which is paid him, he is sent home to his mother to find another master, from whom he will receive similar treatment.

The age usually devoted in all trades and occupations of life to apprenticeship is thus wasted, and the time when the human mind is most susceptible of beneficial impressions lost. At the same time the worst habits incident to agricultural life are imbibed, and the pernicious influences of beer and cider take effect. The wretched compounds sold as beer and cider, which create thirst when taken to allay it, soon tell their tale in habitual drunkenness and enfeebled health.

It is striking to observe how closely the habit of

drinking is associated with low wages and early in the age of the agricultural labourer the influence of beer and cider take effect and prevent improvement in labour. There are not any statistics we can ascertain the quantity of beer sold in England, but we find by the returns of Dorsetshire—a county famous for the wages, and in which much cider is privately supplied by the farmers to their labourers—a number of agricultural labourers in 1861 while the number of beer and cider sellers showing a proportion of 33 labourers to one. In Lincolnshire—where the average wages are cent. higher than in the south-western counties no cider is made, and where beer only is a number of agricultural labourers in 1861 and the number of publicans 1317, which proportion of 40 labourers to one publican, acquainted with the value of labour in any specimen districts will confirm the statement of higher wages of the Lincolnshire labourer profit to the employer than those of the southern counties.

Having laid so much stress upon technical education as a means, when associated with practical, of improving the condition of the labourer, I would point out the means by which it should be gained. At school the child should be read, if only in monosyllables, of the common the farm, and children's books might be prepared for this use. Children of rural districts known to take great interest in the animals and crops of the farm, and they would retain further details conveyed in an instructive and pleasing form. Thus, primary and technical education might proceed together. These books would be useful to the children of the labourer and children of the farmer too, and, if prepared at different ages, would command a very large sale. The teacher at the school, too, should be qualified to lead the children to think on matters connected with their future occupations.

As soon as a child is considered old enough to school and take part in farming duties, he should be placed under a leading man of a particular department on the farm,—not treated as he now is by being sent one day to one thing and the next another,—to gain under the shepherd, or the housekeeper, the cowkeeper, or the engineer, or the hedger and ditcher, or the thatcher, or the drainer, that special knowledge which would qualify him to earn higher wages than otherwise could. There could not be any difficulty in carrying out this plan, particularly if farmers generally would take an interest in seeing the sons of their labourers were placed where they would obtain the most useful information. By this means, a boy employed on the farm would be apprenticed in one department until he had acquired a thorough knowledge of it, and then might pass to another. In order to encourage master-labourers to impart such information as they possess a small prize should be given to those who produce the best work while competition for prizes might be organized amongst the scholars themselves.

THE PETERBOROUGH TRIALS.

Messrs. AMES & BARFORD, the enterprising Peterborough, have this week given to steam ploughmen, and all farmers who take an interest in the great treat. They did on their own account believe, hitherto was supposed to be only the province of the agriculturists in their locality to judge for themselves which might be the best tackle for their own circumstances, and certainly a better opportunity was offered for that object. You have, no doubt, here expatiate upon the fine weather for the very numerous company, the magnificent welcome lunch, and the discussion after luncheon intention is, by argument, to examine which is the best way of making steam cultivation more and in what way the implements at the Peterborough exhibition contribute to that end.

First of all, I will analyse Campaign's invention, movable anchor, which, according to the programme is to dispense with the anchor-men. There is least doubt that when I saw the apparatus there were no anchor-men required, and the boys, who have nothing to do but raise the alloy the anchor to travel forward, were such perform that duty. As regards the novel invention, I am quite certain it exists only in ingenious arrangement of the revolving chain and end of the travelling anchor. But the anchors were made by John Fowler & Co. to 1862; they had not the revolving claw, travel was regulated by a chain and in my soils such as we saw at Peterborough, still light sands and upon rocky soils the chain is p. But John Fowler & Co. abandoned the revolving system, and with it the travelling anchor; I believe, because it did not admit of steam-plough on a large scale, which means, saving in labour time, and saving in all working expenses. Travelling anchor of Mr. Campaign might, I do not easily meet with situations in which it would be at all. In irregularly-shaped fields it would be more than 90°, even 150° and 160°. In that case much question whether the anchor would "move" without help. Then there is this further disadvantage in Mr. Campaign's, as in any other, travelling anchor that when the work in a field has been completed, to be fixed upon travelling wheels to remove it; the

earth-box, carrying the dead-weight, has to be emptied, horse is wanted to transport it into another field; when arrived there, the travelling wheels must be taken off again, and the earth-box refilled. All this means labour, means time, and requires skill. It is a matter of calculation whether the two half-crowns saved daily in the wages of two anchor-men will pay for the extra outlay over the snatchblock, for the labour and time expended in removing and refixing the travelling-anchor.

Mr. Campan's anchor, although highly ingenious, only adds to the complication of the system without adequate saving. In my opinion, Buistrode's patent snatch-block-sling is a much more serviceable addition to a roundabout tackle. There was nothing new in any other part of the roundabout tackle exhibited. The whole apparatus was manufactured by Fowler & Co., and their windlass, with its compensating brake, and their blocks, as well as the portable engine, were constructed with that due regard for strength which characterises all the machinery made at their works.

The other tackle exhibited was one of Fowler's double-engine tackle, of 12-horse power, working a turning cultivator with nine tines, each 10 inches apart. The work it performed was well done the circumstances were very favourable, and from 7 o'clock in the morning until 2 P.M. 18 acres were "got over," at a depth of about 8 inches. There was a novelty in the gear of the engines: the horizontal shaft, which communicates the power to the winding-drum and all its bearings and bevil-wheels, have been entirely dispensed with, so that the whole design now is a model of simplicity. During the discussion, it was clear, a great interest was evinced in the question—Which is the best tackle to suit the men who farm from 200 to 400 acres? The custom of small fields, crooked hedges and hedgerow timber, was again denounced as one of the elementary hindrances to successful steam culture.

Although Mr. Smith, of Woolston, came in for a large share of sentimental eulogium, every whit of which he deserves, still it was evident that the practical agriculturists then present did not consider the roundabout tackle, even with Mr. Campan's anchor, as sufficiently meeting their wants. The roundabout system has, since it was originated, remained the same. Most of the attempts to improve it have only added to its complication. I have upon former occasions expressed my belief in the hiring system being the best mode of making steam cultivation more general, and bringing it within the reach of every farmer; and, in my opinion, the latest and most improvements of Messrs. John Fowler & Co. in their hiring-out tackle are unquestionably confirming my opinion. I am alluding to their new 20 and 30-horse power tackle. I consider the best steam-plough to be the one which can do the greatest number of acres per day. At one time the outcry against the double-engine tackle was, that "the engines were too heavy." We now have practical proof that heavier engines than formerly in existence can be moved about with the greatest facility. We (the North Lincolnshire Steam Cultivating Company) have two 20-horse power engines, which we purchased at the Manchester Show. The whole of the gear and the fittings of the engines are of steel. The weight of the engine is about 4 tons in excess of our old 14-horse power engines, but the power is almost doubled, so that, when travelling, the power they exert "beats" their weight, and these heavier engines move with facility upon ground where our old engines would be in difficulties.

Now for the economy of working a large power tackle in preference to one of small power. One man is necessary to drive even the smallest engine, and one man suits to drive a 20 or 30-horse power engine. One man is necessary to steer Mr. Smith's 3-tined cultivator, taking one yard in width, and one man, with the same ease, steers Fowler's widest cultivator, 18 feet wide. Clearly there must be economy in the large power tackle, at least as regards labour. But, I believe, there is a great economy, in every respect, with the more powerful and simple tackle. I am under the mark when I state that, on an average, one 20-horse double tackle can do as much work as four sets of the roundabout tackle. The cost of four roundabout tackle is considerably above 2000*l.*, which is the cost of a 20-horse power Fowler tackle. Non-steam ploughmen might say, why not put a 20 or 30-horse power engine to the roundabout tackle? Practical steam ploughmen will agree with me, that more than 10-horse power are not suitable for a roundabout tackle.

The hiring-out tackle will, I believe, always have a great share of public patronage. It is so convenient to farmers. Without one farthing in outlay, nay at a saving of working capital to them, for they are enabled to dispense with some of their horses and implements, and it necessitates no knowledge of the management of a steam-plough to the employer, the hiring tackle does its work, even when farmers pay dearly for this convenience, at a cost less than that of their own horse-labour. Of course the hiring system, in its present stage, is most unsatisfactory. Disappointment to customers is of daily occurrence now in our business. Few are fortunate enough to get the use of an apparatus during this season; but then surely that is not the fault of the hiring system; on the contrary, it is an argument in favour of it, for it shows a great demand, which will in time be met by a proportionate supply. Precisely as there are now steam threshing machines enough let out for hire for the demand, so there will be steam ploughs enough for the work to be done. My advice to the agriculturists desiring to obtain each on their farms cheap steam cultivation, is this, that two, three, or four neighbours, according to the size of their farms, should join and buy a steam cultivating tackle of at least 20-horse power, with double engine (the less number of partners the better), or to encourage and assist some industrious working man in their parish, who has a knowledge of machinery, in

purchasing a tackle of the most powerful description to let it out on hire in their locality. *Richard Toepfer, North Lincolnshire Steam Cultivating Company.*

Home Correspondence.

How much Milk and Butter will a Cow give?—In the *Agricultural Gazette* for Feb. 8, 1868, p. 134, you will find one of your correspondents gives his experience of dairy farming. He says, "I consider 720 gallons (2880 quarts) a fair return in a year for a cow, and this quantity of milk, if the food do not contain more than 80 per cent. of moisture, will produce from 230 to 290 lb of butter." This same writer says that 25½ lb. of milk, or about 10 quarts, will make 1 lb. of butter. He also states that 5 gallons, or 20 quarts, was the highest daily yield of one cow. He was evidently a practical man, for he actually kept 48 cows. He states that 17 cows actually gave throughout the year an average of 84 gallons daily, or 84 x 365 = 30,660 gallons, or 122,640 quarts in one year, from 47 cows, or 2610 quarts from each cow, and if 10 quarts produced 1 lb. of butter, that would be 261 lb. of butter yearly from each cow, as the average from 47 cows in one year. Again, in the "Farmers' Almanac" for 1868, I find it stated that a Holderness cow gave 20 quarts daily, yielding a pound of butter from each 12 quarts. An Ayrshire cow gave 20 quarts daily, yielding a pound of butter from 9½ quarts; an Alderney cow gave 19 quarts, yielding a pound of butter from 12 quarts; and a Devon cow gave 17 quarts, yielding a pound of butter from 9½ quarts. Of course these last are exceptional cases, but your own correspondent gave his actual experience of one year of a dairy of 47 cows. Now I reckoned on 3000 quarts, but I allowed 12 quarts to produce a pound of butter, which gave 250 lb. in a year instead of 261. I do not think that I have greatly over-estimated the produce of a cow. Moreover, in Dorsetshire, it is by no means uncommon for a farmer to let out his dairy to a dairyman at 15*l.* and even 18*l.* per cow per annum, and that dairyman makes a profit out of it. *G. A. H.*

Poultry and Pasture—I have always found my best corn within 30 feet of the fowl-house, although the poultry have free access to the field. Many of my brother farmers come to a different conclusion, and say that their fowls eat off the young Wheat, and Mangel, and other plants. On inquiring as to the cause of this discrepancy I soon discovered it. Poultry are as fond of grazing as either sheep or cattle. Near my hen-house I have a small pasture, not so those who suffer by poultry, and as they cannot get Grass they eat the young Wheat and other plants. There should always be pasture land near the hen-house. I am more and more convinced that poultry are profitable and pay better than either sheep or bullocks. Compare the live weight of both, and you will find that while you sell the former at 1*d.* per lb. live weight (5*s.* per stone of 8 lb. net dead weight) you get from 9*d.* to 14*d.* per lb. live weight for your poultry. I speak, of course, of well-bred poultry properly fattened. Experience has convinced me that birds, poultry, and winged game are the farmer's best friends, and that without them his crops would suffer great damage. *J. J. Mechi, Tiptree, October 4.*

The Crops of 1869.—I was very glad to see that Mr Ford, of Morton Hall, had exposed the fallacies of such writers as Mr Saunderson, who are always writing and praising up the crops every year, in order, I suppose, to please the landlord, for what other purpose can it be? He says he has been in this county and in that, and then hazards a conjecture as to the yield. How is it possible for him to arrive at that while rushing along in a train? No wonder, then, his predictions are always falsified. Everywhere he is set down as a false prophet, on whom no one can place any reliance. He appears somewhat nettled at Mr. Ford's remarks, but Mr. Ford is quite right—"No practical man believes what Mr. Saunderson says, or credits his opinions." But there is no doubt the yield of the Wheat crop is very indifferent, and is at least 15 bushels per acre short of last year; indeed, the crop is very much under an average. It is of no use, besides, for Mr. Lawes to say the contrary. *Henry Watkins, Whilam, near Birmingham.*

The Potato Crop of 1869 at different periods was almost threatened with a total failure in the early part of the year. In west Devonshire and in several other counties it was so much affected with disease, that growers sent their crops to market and sold them for what they would make. The very dry weather followed the disease, and the crop of early Potatoes was very poor nearly all over Britain. The cold weather and frosts in Scotland did much harm in the month of August, but the weather in September has been all that could be desired for maturing the later kinds of Potato for winter consumption, and it is the opinion of practical men that the crop of 1869 will be the heaviest crop and best quality that we have had for years. The London market was never better supplied at this season, and the price has seldom been so low. The Potato crop on the Continent is very heavy, and in an advanced state of maturity. *Wm. Paterson, 1, Union Street, Dundee.*

Emigration to the Southern States.—May I request a small space in your columns for an extract from a letter received from a friend residing in the North of England. It bears upon a subject of very considerable importance in the present day, and will probably be read with much interest by your agricultural readers.—

"A friend of mine, a farmer in this neighbourhood (Durham), has been to South Carolina with a view of buying land. He has returned, having purchased an estate of 4000 acres, 2000 of which are as fine land as can be bought, and capable, with capital and good cultivation, of producing a bale of cotton (50 lb) per acre, the present value of which is from 1*l.* to 2*l.* per bale. The cost price of the land (freehold) is considerably under 1*l.* per acre. What say you to this? It beats even Norfolk farming. The other 2000 acres

are virgin forests of Oak, Maple, Walnut, &c.—I imagine, worth but little, but capable of feeding cattle from the undergrowth of Grass, and pigs from the Peaches, Walnuts, and other fruits which fall from the trees. The estate is near to Sumpterville, within three miles of a railway station, and 60 miles from Charlestown (the great Cotton market), and the river which runs through the estate is navigated considerably above that town by steamers. Negro labour is plentiful, but not very cheap; the negroes get 1*s.* 6*d.* per day, nearly as much as our labourers. This contrasts with the slow, uphill work of English farming. To tell the truth, if I were a farmer I would go at once, but am not satisfied that it would be prudent without some knowledge of the business. I ought to tell you that the Southern planters (the old slave-owners) have been utterly ruined by the war, and have nothing left to work their farms, hence the great depreciation of land, and the opportunity for English farmers with capital. The hatred against the Northerners is so intense, that they dare not buy land. Nor will the Southerners sell to them. This is one reason for its being so cheap. I think this emigration of capital and skill in the hands of Englishmen to the very centre of the old slave trade is one of the most remarkable and hopeful signs of the times. My friend met with an English gentleman—a young man who had been nearly all round the world—in America, for several months looking for a place to settle down upon. He had gone into most of the Northern and Western States, and said he saw no such chance as in the Southern States, and thus have gone into the matter as joint spec."

The foregoing would seem highly coloured, but it comes from a reliable source. The subject is one, as I before stated, of deep interest to the younger farmers of the present day, believing, as I do, that ere this generation passes, such will be the competition for land in this country as to render farming a most unsatisfactory and unremunerative business. I almost feel as my friend, and wish that I were a younger man, and had such an opportunity before me. Surely it would be wise for young men (who have sufficient spirit of enterprise) before entering upon poor and dear farms in this country, with the certain prospect of losing their capital, to take a trip to the Southern States of America, and judge for themselves. It has long been my opinion, that since the war a good opportunity was there offered to English farmers. This letter seems to conform to that impression. Nor is the social and political state of the question, to which my friend alludes, of less interest; it plainly shows how, under the hands of an all-wise Providence, events are working for the general good of this great human family. *William Cubitt, Bacton Abbey, Norfolk.* [The above letter of our correspondent Mr. Cubitt is taken from the *Norwich Mercury*.]

Thin Seeding.—I send you the results of the comparative quantities of Wheat sown in 1868. In both cases the 1 pecks per acre beat the 2 pecks and 1 peck per acre by about 1 quarter per acre. The yield of each field was 47 bushels and 48 bushels per acre of White Club-headed Rough Chaff. Only half an acre in each field was sown with the 1 and 2 pecks. The general seeding of my 65 acres of Wheat was with 1 pecks per acre (my usual quantity). The thin sown Wheats were finer in sample and 3 lb. heavier per bushel, and worth 2*s.* per quarter more than the thicker sown. The general opinion was in favour of the thinner sown before harvest, but the 4 pecks carried the day. In two former years the 1 peck per acre produced my largest crop, 57 and 58 bushels per acre, but on the heavy land I look upon 4 pecks per acre as the safe quantity, and on the light land, when sown late in the season, 5 pecks to 5½ pecks per acre. Each farmer should judge for himself by comparative trials, for soils and climates vary; the crop is also influenced by season, and especially by high or low farming. Eight pecks per acre I have always found diminished the yield by nearly 6 bushels per acre. I generally sow from the middle of October to Christmas. The following statement may probably remove many doubts and dispel many quibbles. It is copied from my book (*Routledge & Sons*), pp. 43 and 45.—

TIPTREE HALL FARM (WITH CHAPEL LAND), 178 ACRES.—NET SURPLUS IN HARD CASH AVAILABLE FOR RENT AND PROFIT AFTER PAYING EVERY EXPENSE.

I must decline any further correspondence on the subject. *J. J. Mechi, Tiptree Hall, Essex, Oct. 4.*

Milk of Diseased Animals.—When we had the cattle plague in our herd, a scientific gentleman wished to have some milk from a cow suffering from the disease. We had at that time three animals in our hospital suffering intensely. Our bailiff managed to get out of the three cows about a pint of milk, which he put down on the ground whilst readjusting their clothing. A greyhound dog, a great favourite, followed me unobserved to the shed, and whilst our attention was concentrated on the poor sufferers, I suddenly observed the dog had lapped up all the milk. We all thought the dog had mischief to the dog must follow, but we never could discover any difference in him whatever, and, if I remember rightly, he ran two or three courses the next day. I mention this to allay the fears some persons seem to have of being injuriously affected by the milk of cows affected with foot-and-mouth disease. As a fact, too, the milk ceases, or nearly so, when the animal is attacked. *B. M. F.*

Foreign Correspondence.

PARIS: The Periods of Assimilation of the Principal Elements of Plants.—M Isidore Pierre, Professor of Chemistry in the Faculty of Sciences of Caen, has given much time and labour to the very important question, At what period of their growth do plants assimilate the various elements of their composition? and he has recently given the results to the world. The determination of this question has an obvious

and very important practical result, namely, that of enabling the cultivator to supply those elements which are under his control, with nearly the same regularity that the farmer deals out food to his cattle and poultry.

The Professor confines his remarks at first to Wheat, and afterwards proceeds to the consideration of other plants. His plan consists in noting the variations which a plant undergoes at different periods of its development in its weight and chemical composition, thus ascertaining the periodic increase of its organic matter and of each of its mineral elements, when it is at its height, and when it begins to decline.

The first experiments were made in 1862: on April 19 the stems of the Wheat began to elongate; on May 16, on unrolling carefully the upper leaves, it was difficult to find and remove the ear; on June 13 the ear began to show itself; on the 29th of the same month the flowering was entirely completed; on July 13 the greater portion of the ears had commenced to turn yellow; and, lastly, on the 30th of the same month the Wheat was out. The results obtained from the experiments made at the dates above given were, per hectare, as follows:—

Table with 7 columns: April 19, May 16, June 13, June 29, July 13, July 30. Rows include Organic matter, Nitrogen, Silica, Oxide of iron, Phosphoric acid, Lime, Magnesia, Potash, Soda, and Totals.

The second series of experiments was made in 1861. On May 11, before the ears were formed, the Wheat was a little more forward than that of May 16, 1862; on June 3 the formation of the ears was rather more advanced than on June 13, 1862; on June 22, when the flowering was over, the Wheat was in about the same state as on June 29, 1862, if anything rather behind than otherwise; on July 6 the grains were still easily crushed; on July 25 the corn was reaped. The plants not containing always the same amount of moisture, the Professor reduced all the samples experimented on to complete dryness.

The results of the second series of experiments were as follow:—

Table with 5 columns: May 11, June 3, June 22, July 6, July 25. Rows include Organic matter, Nitrogen, Silica, Oxide of iron, Phosphoric acid, Lime, Magnesia, Potash, Soda, and Totals.

The two crops were grown upon different fields. The last dressing of the former crop consisted of what is called terreau, earth mixed with manure; that of the second crop consisted of street refuse, containing a great deal more salt. These facts explain, no doubt, in a certain measure, the great difference which exists in the relative proportions of soda which is always found in the slightly salted soil in the neighbourhood of Caen.

The two Tables of results show that when the flowering is over the plants have acquired nearly all their weight, but, especially, that they have taken up all the mineral substances which enter into their composition. It has been found also, by other experiments, that the most rapid daily increase takes place a little previous to that period, and that not only as regards the whole plant, but also with respect to each of the most important constituents—nitrogen, phosphoric acid, potash, magnesia, and lime. One of two things, then, is certain, either that the plant, by a continual interchange between the elements absorbed and those expelled, remains in a state of equilibrium, or that it ceases to borrow from the soil, and to absorb new elements, and digests as it were those which it had previously taken up, causing them to take that form which fits their special nature and destination. If, as everything tends to prove, the second hypothesis is the least distant from the truth, the active intervention of manures and of the elements of the soil is reduced to a minimum if it does not cease entirely. From this period, then, any new addition of manure can have little effect upon the crop. In other words, after the flowering is completed, from the moment when the grain is formed, all addition of manure is either superfluous or injurious. Experience has in fact taught the farmer that it is of no use adding manure after this period, with the hope of improving the existing crop.

The next question is, whether these facts are equally true of other crops besides Wheat. We possess few data respecting the composition of plants at various stages of their life and development. M. Pierre then gives a series of observations made on a crop of Colza.

The first experiment was made on March 22, when

the plants were 20 inches high, and nearly on the point of flowering; the second on April 2, the plants being 36 to 37 inches high, and in flower; the third on May 6, the plants having attained an average height of 4 feet, and the flowering completely over; the fourth on June 6, the plants being full 6 feet high, and the seed far advanced; and the fifth on June 20,—at the time the crop was out—all the leaves having fallen and the stems turning yellow.

The results obtained from the whole plant, roots excepted, after being thoroughly dried, were, per hectare, as follow:—

Table with 5 columns: Mar. 22, April 2, May 6, June 6, June 20. Rows include Crop entire, Mineral matters, Nitrogen, Phosphoric acid, Lime, Magnesia and alkaline salts.

Thus, as in the case of Wheat, we find that when the flowering is completely finished, nearly the whole of the organic matter and the whole of the nitrogenous and mineral substances had been taken up by the plant. If we consider that these two plants not only belong to different species, but to botanic families wide apart from each other (Graminacea and Crucifera), it is fair to assume that the facts indicated have a certain generality.

The inferences, therefore, are, that up to the moment of the formation of the head, and even until the flowering, the influence of manure may still make itself felt in an energetic manner, but that after that period, when the seed is formed, the effect of manure, whether old or new, has little or no influence on the plant. These experiments and inferences are derived from large crops; it remains to be seen whether plants grown under glass or in pots yield the same result.

The Professor concludes with the following observations:—Amongst the practical consequences arising out of the above results is, that a plant has exercised its exhaustive action in the soil long before it has come to maturity; but it results also from the same data, that the organic matter properly so called, the carbonaceous matter, has not acquired its full limit when the provision of mineral matter is already, apparently, complete.

As regards the ulterior accumulation of carbon, two distinct sources may contribute. 1. The soil, furnishing free carbonic acid in solution in the sap, or humid matter soluble in the sap; 2. The atmosphere, bringing carbonic acid to be decomposed by the leaves of the plants. The assimilation of carbon by the roots, during the last period in the life of plants, seems to be improbable in any form, for in the state of carbonic acid in aqueous solution it would take up with it a certain quantity of mineral substances, and the weight of the latter would be increased in the plant, whereas we find it is actually diminished. The same remark will apply to the absorption of humid matter in whatever state of solution, because they always contain a notable proportion of mineral substances.

It remains, then, only to consider the carbonic acid of the atmosphere, of which a portion may be given out of the soil in which the plants are vegetating. Supposing that the active portion of the crop averages at the period in question 20 inches in height, corresponding to a layer of air amounting to 5 tons, that the said air contains only the average proportion of 1/1000 of its volume of carbonic acid, and that only half the latter be taken up for the benefit of the crop,—the carbonic acid decomposed would represent about 5 lb. in weight, and, supposing the air to be renewed only 20 times a day, there would be a fixation of the carbon contained in about 100 lb. of carbonic acid, or in round numbers about 29 lb. of carbon.

If it be remembered that the carbon does not equal half the weight of the organic matter, there would, according to the above hypothesis, be a daily production of at least 58 lb. of organic matter, or for the 15 days following the flowering of the Wheat about 870 kilogs. per hectare, which is in fact the actual increase at that period. As regards the Colza, by the same calculation, the production of organic matter during the month following the flowering would reach about 800 kilogs., which is rather more than is found to be the actual increase. G. W. Y.

Farmers' Clubs.

WEST CUMBERLAND.

Are not our Root Crops and Cereals Cultivated beyond their Natural Powers of Production?—At a recent meeting of this club, Mr. Ross, of Ravensglass, read the following paper:—I ask your attention to this preliminary question,—Has Nature set limits to the productions of animal and vegetable life? In other words, in the case of animals, does Nature supply a certain and limited force to all and every organ of the body, enabling each to perform its proper function, necessary to healthy existence and the generation of its species? and in the case of plants—is there a limit to the force which Nature supplies for their perfect health, enabling them to yield sound fruit to the cultivator, and leave in his hands sound and healthy seed to reproduce their kind? I presume to say that so it is, and I think none present will question it. These remarks lead me to the subject for to-day—Are not our root crops and cereals cultivated beyond their natural powers of production?

Turnips—And, first, let me notice the latest crop put in—Turnips. Is it not a mistake, too often committed by the grower, to have all his thoughts and efforts directed exclusively to the capability of the soil,

and none towards the nature and powers of those which he has planted? It is with him, however, weight per acre can I raise, and not how I can stimulate the plant, consistent with a moderate healthy crop—a portion to be used as food for cattle and sheep; and a portion to be transplanted in order to supply seed for future crops. Considers he tries to grow 20 or 30 tons per acre; if he only 10 or even 50 tons that would be still better. Any one for a moment at his operations. He procures manure probably from some cottager who grows stems in quantity regularly, and who has the good sense of selecting his seed roots to take only the best. Turnips of about 9 to 12 inches in circumference of farmer plants this seed in well prepared manure, applies the most approved and most powerful stimulants. He gives rather an extra space between the drills, weeds out his plants, and the result is a very heavy crop of very large Turnips. He may win a prize from some enclosure; and it may be either for the field as a whole, or for roots selected. Out of this prize lot either one or one else must secure some roots for seed. The crop is removed to store. As an extra crop, he can afford to give an extra supply to his stock this way the winter passes over and a cold winter succeeds; at such a time you all know that crops are invaluable; but what does the farmer do now? Even this, that what remains of the Turnips are either rotten or rotting fast. The skin (that is, the skin) seems whole, but when it is broken he finds contents already pulped to his hand. About a neighbour may hear him remark, that this is a bad year for keeping Turnips. But the farmer yet. Some time about Michaelmas he may again remarking that the young cattle, which so largely with his fine large Turnips, had not well at Grass as others which he knew to be smaller Turnips and much less in quantity.

Seed Turnips—Now let us look after the seed for seed. They have been planted in some corner, and anon they grow, showing fine and fat stems; but long ere this the bulbs have become shells, the seed stalks are solely supported by the skin, with a thin coating of the heart adhered to them. They do come to maturity, and the seeds are prepared for use in the following year. Then what they go? He who rears them probably needs them, and he who grew the parent bulbs must have a supply so they fall into new hands. Their new owners admit them to land well prepared as he thinks, turning up the soil in drills to facilitate evaporation, again splitting these drills with the dried manure inwards, including a due allowance of stimulant before. Some of the seeds sprout in due course, others are very lazy about it, and some never do it at all. Hence the field is blank, but having some modern healthy-looking Turnips and a great many fine roots; and some tiny worm holes with some which weather gets the whole blime of the matter.

Cause of Degeneration.—How or why we have so soon from a crop of giants to one of dwarfs we admit to the fullest extent the influence of weather upon crops, both as to quantity and quality. It is often seen results whose causes must be something as I think in this case I think that the first crop is the result of forcing the plant beyond its natural limits, and the second is the result of the waste of that forcing. Much as was overdrawn by the first. Suppose that you get a post horse whose natural force is equal to 20 lbs. per day, and if I urge him on to 60, which may be, and if one of you get the same horse next day, not knowing what was done with him the day before, to do the same, I think you will not succeed. In most, a sixth of the distance; and why? because I overdraw by two days his natural power. Of course if you had known what I did you would not have had him. Ay, there's the rub! paid as much and lost as much time over your horse as I did over my 60. I think that this may be illustrated by the practice of some at the present time. We have a few fast farmers, in the north, and really they do get on wonderfully, always having the best of the horse, leaving others to fight with Nature as best they can. The only pity is that other fast men are not compelled to use seed from their overforced crops; then their race would not be so fast and long.

I have one word more to say about Turnips. I do not think, as many do, that a farmer is so very dependent upon them for wintering his cattle. Few of good quality would serve his purpose better. You will find that the crop which yields the largest quantity of skin in proportion to heart are the best feeders, and give the whole of the skin and a part of the heart to one, and only heart to the other, and with progress, you will seek no further proof. There would single a crop of Turnips, so that the largest would measure from 15 to 17 inches round. To get a Turnip, whose diameter is 4 inches, to have about 50 superficial inches of skin to the heart is 8 inches; on it the skin will be only four times as much as that of the former, but you will get nine times the quantity of heart; that is, assuming that the Turnips are of the same shape, but they are often more conical than globular. Therefore I think that growing very large Turnips is unprofitable.

Potatoes—What I have said of Turnips applies to Potatoes. By undue forcing beyond their natural powers they have been reduced to the condition of a very sickly family whose members can only go on a very fine season. They are constitutionally predisposed to disease, and any sudden change of atmosphere may develop it. Various theories, and as many

do anything else that may be required for the 300 sheep. These cost, therefore, for attendance, a little more than 1s. per score per week.

When the ewes and lambs are together these arrangements are supplemented by a wooden "lift-hurdle" or lamb-gate, which enables the lambs to run out of the pens and get the best of the feed on the next day's fold before the ewes are put on it, as well as their rations of cake and lentils. This lift-hurdle is about 7 feet long, and the usual height; it is divided into two portions by a horizontal bar midway between the ground and the top rail, and the lower half is subdivided by rolling upright bars 10 inches apart, just wide enough to allow the lambs to get through. The upper half has a sufficient number of uprights to give the whole the requisite strength.

Horses—From 26 to 28 horses, of the Norfolk and Suffolk breeds, are kept to work 800 acres of tillage, being considerably more than three horses to every 100 acres of arable land.

Fourteen of these horses are kept in boxes; the remainder are fed in stalls and turned into the horse-yards at night. From the beginning of harvest through the winter they get a peck and a quarter of crushed oats, and a quarter of a peck of crushed beans; also 1 bushel of hay, wheat or barley-straw, both cut into chaff. This food is continued until the middle of May; they then get as much Tares and winter Oats as they can eat, leaving off the corn and chaff after they have had green food about a week. In this way they are kept as long as the Tares last, generally until the middle of July, when the Cow-grass is mown, after which they are turned into the pastures and remain there until harvest begins, when corn and chaff are given to them, and their winter treatment recommences.

Horses are occasionally bred to replace some of those that go off, but not otherwise; and as a general rule they are bought as 2-year-old colts, in preference to breeding for home use. Hitherto the number of horses employed has not been reduced by steam cultivation.

The delivery waggons are drawn by four horses in two pairs, and take 25 sacks of Wheat or 30 of Barley. With this exception all the yoking is in a line, the carts being three-horse tumbrils, and the harvest waggons drawn in the same manner by three horses in a line.

Labour.—After the elaborate and, we may almost say, paternal methods pursued in the north, the Norfolk system of labour is not very attractive. There is no such thing as a yearly labourer, no boarding paid for by the farmer, and, in short, no connection between master and man except work on the one hand and payment on the other. The bailiff gets a guinea per week, the yardman 14s. 6d., the engine-driver 3s. per day, and the ordinary farm labourers from 10s. to 12s. per week. Lads are paid from 8s. to 9s. per week, and boys from 4s. 6d. to 5s., while women get from 10d. to 1s. per day. All the payments are made in money, there being no privileges in addition to the wages. Cottages, with gardens, are paid for by the men at the rate of from 1s. 3d. to 1s. 6d. per week; they are tolerably good, and the labourers do not often take lodgers.

A considerable amount of field work is paid for by the piece, as has already been described; but much of it is done under a system of "gangs," one or more of which can usually be got at short notice. These gangs are composed either of men or women, according to the nature of the work. Women generally do the weeding and other light work.

A wheelwright, a carpenter, and a blacksmith, are kept on the farm, and all the carts and waggons, as well as the harrows, are home made.

The labour account, including the wages of the bailiff, blacksmith, carpenter, amounted last year (1863) to nearly 2000l., or very nearly 2l. per acre on 1000 acres of land, about 200 of which are in Grass.

Steam Cultivation.—For the last three years Mr. Hudson has had steam cultivating machinery on Fowler's single-engine direct anchor system; the engine is a double cylinder of 10-horse power, and is also used for the threshing machine and other purposes. The chief benefit hitherto derived from steam cultivating is in the root crops, and more particularly in the crop of Mangels, as previously mentioned. The use of steam has also tended to the substitution of cultivating under certain circumstances; for instance, Wheat stubbles are now cultivated twice and ploughed once, instead of being ploughed three times.

Before Mr. Hudson bought this set he was in the habit of hiring steam tackle, and paid 8s. per acre for cultivating from 9 to 10 inches deep, besides the cost of coal and of carting water, ploughing was done under the same arrangement as to coal and water, at 7s. 6d. per acre. Mr. H. M. Jenkins, in the "Royal Agricultural Society's Journal."

WEST GLOUCESTERSHIRE: Oct. 1, 1869.—Although the stormy weather of the last three weeks has somewhat hindered us from getting on with our autumn sowing, it has nevertheless been more favourable than otherwise for ploughing up the land for Wheat. This, by the way, had got rather behindhand, owing to the harvest being later than usual, and the continuance of the drought; but now that the horse-power of the farm has been more concentrated, the ploughing has been got well forward, and Wheat sowing has begun on the hills, and will soon be begun hereabouts.

As there is now so much talk about thick and thin seeding, and as the opinions of many practical farmers are so conflicting and unsatisfactory, it would, perhaps, be as well to let the matter drop for the present, and let those who feel inclined to differ from Mr. Mechi's views upon the subject try a few plots of ground in the same field, with different quantities of seed; and then bring the whole produce, straw and grain, to the

weights and scales, for there is no other means whereby the question can be correctly tested. So far as we are concerned we agree with neither too thick nor too thin seeding; our practice for years has been to drill from 5 to 6 pecks per acre, according to the time of year and the condition of the soil. We think that every farmer should be able to judge for himself what quantity of seed his land requires; but sometimes custom gets the upper hand of his judgment, and he sows 2 bushels, or sometimes 2½, where 1½ bushel would do, simply because it is his wont. No doubt 2 or 3 pecks of seed would be sufficient upon some rich or maiden soils, but upon our old arables, and these not of the best quality, we must draw a line, and seed according to our experience. It is reasonable enough to argue, that if the land cannot support one plant, it certainly cannot support two, but upon our cold clays some allowance must be made for loss of plant. In a wet winter, wherever there should happen to be a low place in the land, or horses' footmarks, they fill full of water, and there it remains till the sun and wind dry it up; the consequence is that the plant perishes. This often happens upon well farmed and thoroughly drained land. In this neighbourhood the harvest was secured in the best possible condition, and in most cases thatched before the rain set in. The deficiency in the yield is greater than was at one time anticipated, and the quality very middling, especially when the Wheat was badly laid. A considerable amount of threshing has been done in the neighbourhood, and the results are from 5 to 6 sacks per acre, and the weight 58 to 60 lb. per bushel. Very little Barley or Oats have yet been threshed. The Mangel and Swedes sustained a severe check during the drought, but have somewhat recovered since the rain. Late Turnips are growing rapidly; there is every prospect of an average crop. The early sown are being fed off, in order to get the land sown with Wheat. The Potato crop is good hereabouts; no disease has appeared here at present, growers are busily engaged digging them up. The sowing of Rye, Vetches, and Winter Oats for spring feed is now pretty well completed.

Stock of every description is healthy, good stores are selling better since the rain set in, there being a prospect of autumn Grass, sheep are also rather dearer, stock ewes selling from 10s., and good lambs from 24s. to 30s. per head. Pigs are still very dear. J. W.

The Poultry Yard.

"THE Poultry" in the City is quoted as an obstruction; although why Temple Bar should stand and the Poultry be pulled down, few who dwell *extra muros* and the privileges thereof would be able to say. The only way in which the poultry of which we treat can be an obstruction is, when the supply exceeds the demand, and such is our present case.

Much has been written and said about the superiority of the French poultry and its cheapness, compared with our own. We think the only point on which we suffer is our cookery and management of the bird after the purchase of it. It is very difficult to say at what price a couple of fowls is really cheap to a middle-class man, when purchased by his good-wife to form the staple of the mid-day meal for his growing, numerous, and thriving family. With the decision arrived at, when breakfast is finished, commence the troubles. Mama, when she goes out, orders the fowls. She knows her maid can't or won't truss them, and therefore they are sent home ready for cooking, by which arrangement a very valuable addition to the family stock-pot is lost. The importance of the giblets or *abattis* would be so great in a Frenchwoman's eyes that she would carry home, pick, singe, and draw the fowls herself, rather than lose the smallest portion of them. Were the same thing attempted in English town homes, we should be inclined to ask at what time the dinner might be expected? Not that our English maid-servants would not do more for their employers than perhaps those of any other nation; but that, in the present instance, they don't know how.

The temptation to run into a discursive, roundabout story as to the proper education for girls intended for the kitchen is here very great, more especially when one has just read the telling and home-hitting addresses of such men as Professors Kingsley and Maurice at the Social Science Congress. It would be delightful to train a batch of really good cook-maids. The difficulty is in doing it. It has been, and is, we think, fairly tried in nearly all parts. In "Tom Brown's School-days" Mr. Hughes gives Mrs. Brown the credit of doing much for the rising generation; but when Tom is at Oxford the nursing the old villagers get (as described) at the hands of their dames is not of the first order. Kitchens have been established by pun-taking ladies, model markets started by sanguine traders, all to tempt our mechanics, artisans, and lower middle-class to improve, or at least change, their mode of providing for their daily meals; but while we know of more than one failure, we doubt if the successful cases are numerous. It may be that our natural taste leads to the rejection of those dishes which our forbears called "kickshaws," but we think the old saying that "Heaven sent the food and the Devil the cook" would be leading to the root of our objection as a nation to make dishes (as we make them) They manage those things better abroad. We constantly say so; but except that their trams keep better time than ours, we confess those things are hard to find. On one other point we think, however, we must yield,—they cook their poultry better. From the time the unlucky chicken draws his last breath he is the object of constant attention. To begin with: All his feathers are carefully saved. We will suppose he is killed in the summer, and therefore, like the featherless bipeds in the same country (France) he is not left long. His comb, feet, head, and trimmings furnish the principal part of a *ragout*, which figures at breakfast,

and gives the intending diners an inkling of the store for them later. Two medium-sized *pensionnat* in France serve for the *roûti* for more people. They are skilfully carved into smaller pieces than we should cut, and can come be much more equally divided. Handed over to crosses, they are appreciated, but we serve the one or more vegetables, bread sauce, gravy, &c. two fowls are nearly always deemed unpalatable unless flanked by a ham or piece of pork. We say we know that our poultry is inferior, but we add all sorts of things to it, and eat all sorts with it to conceal its real flavour. Restoring starting point, we repeat with sadness that the supply of poultry exceeds the demand, but we must not be misunderstood. The chicken retains its price, the supply and demand being balanced. But it is the common kinds, the chickens, and farmyard ducks which fail in sale at any price. The Emerald Isle—although not at present in her good graces—overwhelms mongrel brood geese, chickens, and ducks, and dying. Many of them never find a market, the greatest wonder is, how the producer can get when the chicken passes through the hands of the railway agent, salesman, and eating-house figures on the placard in the window of the "Chicken, with gravy and bread sauce, &c."

Roup in Fowls.—Roup is a somewhat general for most diseases, but is most properly applied to cold. The fowl becomes drooping, food running from the nostrils, swollen eyes, and derided excrement. The symptoms most peculiar to roup are difficult and noisy breathing, or of rattling in the throat, beginning with generally termed grapes. The head becomes and much swollen, and the eyelids livid, with slight, and even total blindness. There is an discharge from the nostrils, and even from the of foetid matter, at the commencement thin, but afterwards becoming thick and purulent, offensive. As secondary symptoms, the appetite but gone, except for drink; the crop feels hot to touch, and the feathers are staring, ruffled, and a healthy gloss. The fowl sits moping and in corners, always apparently in great pain. In the of the disease it is supposed to be infectious whether so or not it is certainly proper, for the sake, if nothing else, to separate the diseased from healthy ones, to prevent the disease from spreading. They should, above all, be kept warm and have of pure water. **Treatment**: In general we would the killing of a rousy fowl at once, unless it be as the risk of its contaminating the whole flock. At all events, let it be removed from the yard as discovered. Warm, dry bedding and nutritious are the first essentials to recovery; in addition frequent removal of the dried discharge from the eyes and nose by warm bathing the nostrils with Castile soap-suds as often as necessary, and the eyes with warm milk and water. In the way of remedies, we find that nearly equal numbers under various modes of treatment. "For grouse affected by the roup," says Mowbray, "warm is necessary, and even the indulgence of the fire or the bake-house. Wash the nostrils with soap-suds as often as is necessary, and the swab with warm milk and water." We have the following remedies, viz. a peppercorn in a pill the three following days the patient being much Afterwards bathe the swollen parts with camphor spirits or alcohol and water. As a finish to give sulphur in the drink, or a small pinch of roup and all putrid affections, I confidently the following, and consider it the only true remedy. Take finely pulverised fresh-burnt charcoal yeast, of each three parts; flour of sulphur, 10 flour, one part, water, quantity sufficient, and make into boluses of the size of a hazel give one three times a day. Cleanliness is necessary than warmth, and it will seem desirable to bathe the eyes and nostrils with milk and water, or suds, as convenient." Giles says, "As soon as the disease is discovered in warm weather, remove the infected ones to a place; then give a dessert spoonful of castor their heads with warm Castile soap-suds, and remain until the next morning fasting; scald Indian meal, adding 2½ ounces Epsom salt hens, or in proportion for a less or greater give it warm, and repeat the dose in a day they do not recover." *Albany Cultivator*.

Calendar of Operations

Threshing seed Wheat is generally best at the stook; but in early seasons in our southern it may often be stacked without harm. On the other hand, nothing is more ruinous to seed than the stacking of it in a damp state, or in a state such cases it is better to thresh out of the stook, then spread the grain thin upon the ground required for sowing. Newly threshed Wheat is always to be preferred to that which has been the granary for only a month or six weeks. north of Ireland some of the small farmers call their Wheat, "as they term it, handful and over a barrel or tub, and when lashed seed, they sometimes only lash out the of the grain for this purpose, by turning round lashing out the inferior into a different the best quality being the more easily separated from the straw. They also pick the smutty ears out of the handfuls before they begin to lash, in way very fine seed is obtained, which is the

ECONOMY IN THE GARDEN.

James Carter & Co. Seed Growers AND NURSEYMEN,

237 AND 238, HIGH HOLBORN, LONDON, W.C.

CARTER'S COLLECTIONS OF HYACINTHS, CROCUS, TULIPS, &c., TO PRODUCE A PRETTY AND PERMANENT DISPLAY DURING WINTER AND SPRING.

JAMES CARTER AND CO. STUDDY TO OBTAIN THE FOLLOWING COLLECTIONS SELECTED FROM THE MOST POPULAR VARIETIES.

Carter's Collection for Window or Conservatory Decoration, £1 1s.

- 12 fine named Hyacinths, 12 Jonquil sweet-scented, 50 double Crocus, 1 Oxycodon persicum, 1 I. um spectatum, 30 extra selected snowdrops, 3 La Camille Tulips, 3 Royal Standard Tulips, 9 fine named Poly. Narcissus, 1 Dielytra spectabilis, 1 Scilla sibirica, 3 Tournesol Tulips, 3 Rex Rubrum Tulips, 1 Yellow Rose Tulips, 6 Red and White Van Thol Tulips, 3 Rose Van Thol Tulips, 100 fine mixed Double Ranunculus, 100 Scarlet Turban Ranunculus, 25 fine mixed Double Anemones, 25 Single Anemones, 50 Crocus, in 6 sorts, 100 Snowdrops, 50 Winter Aconites.

subject to variation as the season advances. CARTER'S COLLECTIONS, with increased quantities of the above varieties, 4s., 6s., and 8s., packing included in all cases.

McLAREN'S PROLIFIC RASPBERRY. SPECIAL VARIETY.

For full description, see page 986, in

Gardener's Chronicle, Sept. 18.

JAMES CARTER AND CO. beg to state that in consequence of the rapid demand for this valuable novelty their stock of strong Canes is now exhausted.

The entire stock will be held next season by J. C. & Co., and Orders are now booked to be supplied in rotation next autumn at the following Prices.

- 6 Strong Canes, 7s. 6d. 50 Strong Canes, 20s. 12 Strong Canes, 12s. 100 Strong Canes, 60s.

Carter's Collection of Bulbs for Conservatory and Outdoor Planting, price 15s.

- 6 Hyacinths, extra fine named, 6 fine bouquet, 3 Tulips, Tournesol, 7 Tulips, Rex Rubrum, 12 Tulips, extra fine mixed, 50 Crocus, fine White, 18 Anemones, extra fine mixed, 6 Iris, choice English, 9 Jonquils, Camporela, 1 Narcissus, double White, 12 Pousant's Eye, 3 Tulips, Yellow Prince, 3 Tulips, White Pall-baker, 50 Crocus, fine Blue, 40 Crocus, fine Yellow, 4 Gladiolus Brenchleyensis, 12 Iris, choice Spanish, 18 Ranunculus, extra fine, 24 fine selected snowdrops.

subject to variation as the season advances. CARTER'S COLLECTIONS, with increased quantities of the above varieties, 30s., 42s., and 63s. No charge for packing.

Decoration of the Drawing-room. JAMES CARTER AND CO. offer for this purpose their choice Selections of HYACINTHS as below, including glasses.

- 12 choice Hyacinths and 12 new-shaped Glasses .. 21s. 6d. 12 fine .. and 12 new-shaped Glasses .. 19s. 6d. 12 good .. and 12 new-shaped Glasses .. 18s. 6d.

Carter's Collection of Bulbs, for Outdoor Planting only, price 21s.

- 18 Hyacinths, choice in 3 colours, 12 Narcissus, double white, 12 Pousant's Eye, 12 Double Daffodils, 30 Tulips, extra fine mixed, 50 Crocus, blue, 50 .. striped, 50 .. large yellow, 50 .. white, 24 Anemones, extra fine mixed, 6 Gladiolus Brenchleyensis, 12 Iris, extra choice mixed, English, 12 Iris, extra fine mixed, Spanish, 3 Lilium candidum, 3 .. tigrinum, 24 Ranunculus, extra fine mixed, 100 Snowdrops, selected, 24 Winter Aconites.

subject to variation as the season advances. CARTER'S COLLECTIONS, with increased quantities of the above varieties, 42s., 63s., and 84s. No charge for packing.

For full instructions for cultivation, and particulars of the above Assortments, see

CARTER'S ILLUSTRATED BULB CATALOGUE For 1869, Gratis and Post Free. JAMES CARTER AND CO., THE ROYAL SEEDSMEN, 237 AND 238, HIGH HOLBORN, LONDON, W.C.

SUTTONS'

IMPORTED FLOWER ROOTS

SUTTON & SONS, SEEDSMEN TO THE QUEEN,

READING, BERKS,

having received their FIRST CONSIGNMENT of CHOICEST DUTCH FLOWER ROOTS,

Selected by themselves from the leading Growers in Holland, are now prepared to receive orders for their COMPLETE COLLECTIONS for WINTER and SPRING BLOOMING, either for indoor or outdoor cultivation.

Suttons' £2 2s. Collection of Flower Roots,

- For OPEN GROUND, Carriage Free, contains: 12 fine named Hyacinths, 12 Jonquil sweet-scented, 50 double Crocus, 1 Oxycodon persicum, 1 I. um spectatum, 30 extra selected snowdrops, 3 La Camille Tulips, 3 Royal Standard Tulips, 9 fine named Poly. Narcissus, 1 Dielytra spectabilis, 1 Scilla sibirica, 3 Tournesol Tulips, 3 Rex Rubrum Tulips, 1 Yellow Rose Tulips, 6 Red and White Van Thol Tulips, 3 Rose Van Thol Tulips, 100 fine mixed Double Ranunculus, 100 Scarlet Turban Ranunculus, 25 fine mixed Double Anemones, 25 Single Anemones, 50 Crocus, in 6 sorts, 100 Snowdrops, 50 Winter Aconites.

Suttons' £1 1s. Collection of Flower Roots,

- For OPEN GROUND, Carriage Free, contains: 12 fine mixed Border Hyacinths, 12 Polyanthus Narcissus, 12 Pousant's Eye Narcissus, 12 Double White Narcissus, 2 Double Daffodils, 5 large Camporela Jonquils, 50 fine mixed Double Ranunculus, 50 Scarlet Turban Ranunculus, 12 fine mixed Double Anemones, 12 Single Anemones, 50 Crocus, 3 sorts, 50 Snowdrops, 25 Winter Aconites, 6 fine mixed Gladiolus, 12 Duc Van Thol Tulips, 6 fine mixed Double Tulips, 6 fine mixed Double Tulips, 6 Gesneriana Tulips, 6 mixed Tulips, 6 English Iris, 6 Spanish Iris, 3 Lilias, of sorts, 3 Ferraria pavonis, 3 Dog's-Tooth Violets, 3 Crown Imperials.

Suttons' 10s. 6d. Collection of Flower Roots,

For OPEN GROUND, contains a choice assortment for a Small Garden

Suttons' £2 2s. Collection of Flower Roots,

- For POTS or GLASSES, Carriage Free, contains: 24 fine Hyacinths, by name, 18 fine Miniature Hyacinths, do., 18 Polyanthus Narcissus, do., 12 large Double Jonquils, 12 Single Sweet-scented Jonquils, 12 Scilla proceox, 12 Scilla Dub. Van Thol Tulips, 12 Double Tournesol Tulips, 50 Early Tulips, 18 sorts, 6 Persian Iris, 6 Peacock Iris, 100 Crocus, by name, 12 choice Lisias, by name, 6 choice Sparaxis, by name, 1 Oxycodon persicum, 1 Jonquil, do., 2 Lilium lancifolium album, 2 rubrum.

Suttons' £1 1s. Collection of Flower Roots,

- For POTS or GLASSES, Carriage Free, contains: 12 fine Hyacinths, by name, 6 Miniature Hyacinths, by name, 6 Polyanthus Narcissus, do., 6 Large Double Jonquils, 6 Single Sweet Jonquils, 6 Scilla proceox, 6 Duc Van Thol Tulips, 6 Double Tournesol Tulips, 25 Early Tulips, 6 sorts, 3 Persian Iris, 3 Peacock Iris, 60 fine Crocus, by name, 6 choice Lisias, 6 choice Sparaxis, 3 choice Gladii, 1 Jacinthe Lily, 1 Lilium lancifolium album, 1 rubrum.

Suttons' 10s. 6d. Collection of Flower Roots,

For POTS or GLASSES, contains a choice assortment of most useful and showy kinds.

The best 12 Hyacinths, by Name, for 12s., Extra fine Double and Single varieties.

For further particulars, with complete Cultural Instructions, see

SUTTONS' AUTUMN CATALOGUE FOR 1869, Gratis and Post Free on application.

FLOWER ROOTS and SEEDS CARRIAGE FREE, except very small parcels.

Five per cent. allowed for cash payments. SUTTON AND SONS, ROYAL BERKS SEED ESTABLISHMENT, READING.

Choice Belgian Pansy. THE ONLY GENUINE SHELLEY STRAIN. GEORGE JOHN CHILDS, SEEDSMAN TO WM. DEAN. Apply the above, just harvested, at 1s. 6d. and 2s. 6d. the pack, post free; also choice ENGLISH SHOW PANSY at 1s. 6d. and 2s. 6d. the pack. Darley Street, Bradford, and Bradford Nurseries, Shipley. NEW CATALOGUE. VALERAS, Italian and French Camellias, Azaleas, and Lilies, offered by LOUIS VAN HOUTTE. Copies of the above may be had direct from Ghent, or from L.V.H.'s Agents, R. SILBERRAD and SON, 6, Harp Lane, Great Tower Street, London, E.C. Royal Nursery, Ghent, Belgium.

Splendid New Rhododendron, BEAUFESS LIONEL ROTHSCHILD. JOHN WATERER AND SONS are now prepared to execute orders for the above new SEEDLING RHODODENDRON, an excellent specimen, the margin of the bloom of a fiery scarlet, of the handsome form and retaining a great length of time in bloom. Price 10s. each. Trade and Wholesale The Amsterdam Nursery, England.

Rhododendrons To the Trade. J. MATTHEWS has a large stock of 4-yr. RHODODENDRONS, 4s. per 1000; 3-yr. (1-yr. transplanted), 10s. per 1000; 1 to 1 1/2 foot, bushy, 15s. per 100; 1 1/2 to 2 feet, 40s. per 100. Granddium, white Rhododendron, budded, 1 1/2 foot, 10s. per dozen. Cornelia picta, 1 1/2 foot, 12s. per dozen. SPRUCE FIR, 1 1/2 to 2 feet, 20s. per 1000; and 2 to 3 feet, 30s. per 1000. PRIVET EVERGREEN, 2 to 3 feet, 16s. per 1000; 3 to 4 feet, 20s. OAKS, 3-yr. budded, 1 to 1 1/2 foot, 5s. per 1000. Milton Nursery, Stoke-on-Trent, Staffordshire Potteries.

RHODODENDRON MULTIFLORUM. A most beautiful and desirable variety, which has never been seen in this country. It is a new and beautiful variety, which has never been seen in this country. It is a new and beautiful variety, which has never been seen in this country.

Camellias, Azaleas, and Lpaeris. HENRY WALTON, having a large stock of the above, finest plants possible, will sell with care, being a home worker, and with confidence recommend them. AZALEAS, 4s. 6d. per doz. CAMELLIAS, 4s. 6d. per doz. LPAERIS, 4s. 6d. per doz. Have several hundred of the above, from 2 to 4 feet, fine for exhibition purposes, also the best and finest and specimen came in, and for use each - this is a favourable opportunity for getting them for your houses or improving your grounds. The above are now dealt with. CATALOGUE, sent free on application. Edge Field, Milton, and the Lancashire.

Echeverias. H. CANNELL has the finest and largest blooming lot of Echeverias in the Kingdom, varying in size from seedlings to plants 4 feet high; and H. C. has at hand no other expense for putting together a large quantity of seed to perfect a fine lot of Echeverias, and if sown at once, will make splendid little plants for next season. One pod, just ripe, sent free for 18 stamps. H. C. has also a fine lot of the three Echeverias, including kinds: SPONDA, SPONDA GLAZIA, and JEMMA. A packet of either of these sent free for 18 stamps. Plants of all the above from 6s. per dozen to 20s. per plant. New Floral Flower and Flower Seed Merchant, Woolwich.

New Plant. WILLIAM BULL is now sending out the beautiful LANSIANDRA MACRANTHA, which can be easily cultivated in an ordinary Garden. Price, 7s. 6d. and 10s. 6d. each. The flowers of this plant are truly marvellous, 14 feet in circumference; are produced nearly throughout the year, and on plants when only an inch or two high. Some blooms of it were sent last Christmas to the Editor of the Gardener's Chronicle, and the following remarks were made in the columns of that Journal, January 2, 1869: "We have before us a fine specimen of the noble Lansiaandra macrantha, sent us by Mr. B. Bull, which we will be glad to see in the garden of any of our readers, which we will be glad to see in the garden of any of our readers, which we will be glad to see in the garden of any of our readers." A DESCRIPTIVE CATALOGUE of other NEW PLANTS, just published, may be had on application. Establishment for New and Rare Plants, Kings Road, Chelsea, London, S.W.

The Gardeners' Chronicle. SATURDAY, OCTOBER 16, 1869.

MEETINGS FOR THE ENSUING WEEK. (Royal Horticultural) Fruit and Floral Tuesday, Oct. 19. Committee at South Kensington .. 11 A.M. Ditto General Meeting 3 P.M.

A GREAT deal has been said and written on the subject of SEWAGE, both as to its qualities as a manure, and as to the most effectual mode of disposing of it in cases where it has been collected by drainage. As any facts bearing upon these important subjects are valuable, we need make no excuse for citing the experience of one of our veteran horticulturists, Mr. MASTERS, of Canterbury, as to the application of sewage to ordinary nursery stock. We may premise that the Vauxhall Nurseries, where the experiments we are about to call attention to have been carried on, have been used for the growth of trees for upwards of a century; consequently, without the application of manure many crops would be so weakened, from the impoverishment of the soil, as to be unfit for market. The subsoil of the establishment in question consists of brick-earth and valley drift, over which lies a few spades' depth of a stiffer clay, which is the part requiring manure, and for which purpose heaps of town rubbish and various animal manures were employed till, remembering how the Chinese utilised their fecal matters, Mr. MASTERS caused a large tank to be constructed for the reception of the manure from the

adjacent barrack-yards. This is conveyed into the tank by pipes, and yields a large supply, which is rendered available by first filtering the watery particles through a filtering screen, and returning the semi-fluid to the mass in the tank. Preparations of zinc and charcoal were at one time applied as deodorants, but latterly an easier and better process has been adopted. In a nursery of large extent there must be great accumulations of weeds and refuse; these, instead of being dug in, are collected together, and with the clay are burnt in large heaps. The dry earth and vegetable ash act at once as a deodorant and as a manure. Then the tanks are emptied into an area of 2 feet depth; the surface is covered with the burnt earth, which destroys bad odours, and is in time incorporated into a compost fitting a nurseryman's purposes. It seems applicable to all sorts of evergreens and shrubs, which attest, by the rapid growth they make, and the colour of their foliage, how congenial the manure is to their natures. Fruit trees seem especially to relish it, as the growth of Apples, Pears, Cherries, Plums, of Peaches and Nectarines, is beyond average, and the trees show unusual vigour of constitution. That these good effects are brought about by this manure is shown by the striking difference in the growth of the trees and shrubs on a portion of the ground which has not been so treated. Roses, either upon the Manetti or the Dog Rose stocks, thrive remarkably, and produce flowers in abundance and for long continuance.

But it is not to nursery plants alone that this matter is valuable, for it is equally beneficial to all the Brassica family in the kitchen garden. Potatoes thrive with an application of it amazingly, though unfortunately it does not prevent the prevailing disease.

It appears to us that the above system is as nearly perfect in theory, as it is excellent in practice. We have here a manure rich in all the elements that plants require, applied in a way that enables them to avail themselves of it readily, and which must materially improve the mechanical texture of the soil to which it is added.

When we remember how many nurseries there are in the country to which the application of sewage manure in a similar manner would be an easy matter, we can but recommend the extensive adoption of the practice. It seems to us, in its degree, to solve the two questions we alluded to at the outset, as to the value of the sewage matter, as a manure, and as to the mode of dealing with it without annoyance to others. The plan is doubtless not so applicable in all instances as in the case of large towns, and even for smaller ones it would be an expensive matter to get a series of such tanks as above described into working order, but the money would not be thrown away, as they would become the means of enriching the respective neighbourhoods by affording a continual supply of what is equally essential to purposes of horticulture and of agriculture.

— We have received numerous letters from gardeners in all parts of the country, expressing, in the warmest manner, approval of the proposal made in our last number, that the memory of the late Mr. JAMES VEITCH should be perpetuated amongst horticulturists, for whom he did so much, by some fitting MEMORIAL. It is proposed to form an unlimited General Committee, of which the London members would form a central or managing body, and the country members would act as collectors in their several districts. There should also be a committee for Scotland, and another for Ireland. Those who are desirous or willing to render aid are requested to send in their names, in order that early action may be taken. As to the nature of the memorial, which must be a matter for the determination of the General Committee, and in which determination the wishes of Mr. VEITCH's family must be consulted, we may quote the following passage from a letter addressed to us by Mr. W. THOMSON, of Dalkeith, which contains a suggestion well worthy of consideration—"One gardener of first-class position and judgment suggests a monument. To my own mind the choice lies between that, and the institution of a fund, the interest of which should be given as a 'Veitch Prize' or 'Veitch Medal,' to be awarded in all time coming, to the man who during the year shall make the most important additions to our garden productions, whether by importation or hybridisation." For the present we merely add, that as Mr. VEITCH was a man who never did things by halves, so neither should this memorial question be left half worked out, either by those—gardeners—whose interests he has in so many ways advanced, or by those—employers—to whose pleasures and gratifications, in a gardening point of view, he has in so many ways, and in so large a degree, contributed.

— Mr. MARTIN MÜLLER, of Strasbourgh, issues with his catalogue a coloured drawing of three NEW

GRAPES which were sent from the Crimea by MARÉCHAL PELLISSIER, Duc de Malakoff, to his friend M. RUDLER, from whom M. MÜLLER has obtained them. One, named Ribier du Maroc, has large roundish black berries, not unlike a Hamburg, and is said to be good. Another, called Malakoff usum, has large clusters and remarkably long and large rose-coloured berries (four weighed 54 grammes: 1 gramme = 15½ grs. nearly). This must at least be a very handsome Grape, with something the colour of the Ahbee, but of a deeper tint. The third is the Tschalousch sofa usum, a large oblong yellowish white sort, described as being of very good quality and magnificent. This, from its appearance, may possibly be the Chaouch or Chavoush, already known amongst us. A Chasselas de Husseren, also announced as new, is described as having the quality of the Chasselas de Fontainebleau, but with berries twice as large, and ripening earlier.

— Visitors to the late INTERNATIONAL EXHIBITION AT ST. PETERSBURG will be glad to know that the Federation of the Belgian Horticultural Societies has just issued a report of the proceedings on that memorable occasion, illustrated with portraits of General GREIG, Dr. REGEL, and others who worked so hard to ensure the pleasure of their guests. The report in question will form an acceptable souvenir.

— The following inscription to the memory of the late Professor DAUBENY has been placed in the chapel of Magdalen College, Oxford:—

VINE GROWING AT TRENTHAM.

VINES, Grapes—Grapes and Vines—one or other of the words are hardly ever absent from your columns, their praises are ever being sung, and their glories ever chronicled. To some no doubt, perhaps to many, of your readers, there may be just a little too much of this Vine or wine glorification; and to tell the truth, I think there is, so that I owe your readers an apology for meddling with the subject. I would just beg to remind them, however, that a great deal of the matter brought before them is unfermented, so that although they may partake pretty freely, it can do them little harm—or good. Haven't we during the past 12 months or so been treated to all the extremes of opinion in regard to the necessity or absurdity of bottom-heat, and the merits and demerits of early forced and late kept Grapes?—each party maintaining that, except by the adoption of their particular practice, nothing satisfactory could be attained; and have we not more recently been told by one who ought to know, from his lengthened experience, that by the admixture of calcareous matter in the soil of our Vine borders, we do a very foolish thing? Calcareous matter forsooth! the very thing which we nearly all have been so anxious to obtain for our Vines, and in which we believed they loved to dwell—but which Mr. Cramb tells us is the most injurious matter we can use. Facts, however, will hardly bear out Mr. Cramb's assumptions, and his protest falls unheeded. The plain truth is, that all these extreme doctrines, opinions, and practices, require a good deal of the fermentation of common sense. Major Clarke very aptly observed at the Manchester Congress, that tact or ability to take advantage of, and turn to the best account, existing materials or conditions was the main thing wanted to ensure success; that he believed it was possible to produce good Grapes with bottom-heat, though another person could produce equally as good without it; and that good Grapes can be grown in land charged with calcareous matter, as well as in soils from which it is totally absent. All or nearly all depends upon the skill of the cultivator and his adaptation, of his means to the end.

That some soils and situations are much more favourable for Vine cultivation and gardening operations generally than others, there is little doubt, and when these exist naturally the skill of the cultivator is but little tried. There is, in my opinion, a great deal of nonsense written about the composition of soils for our Vine borders. The Vine, after all, is not so very hard to please in that respect. There is more to contend with as regards locality and situations. In low, damp localities, with cold watery sub-soils, such as at Trentham and some other places I could name, it is a ten times more difficult matter to produce Grapes than on some high-lying, warm-subsoiled situations. The treatment required in the two instances is as opposite as the two poles, and when success equal or superior to that in the favourable situation is achieved in the adverse the credit due is all the greater.

Given, one of the coldest and most unfavourable localities in this country for Grapes, Trentham—the noble but badly situated seat of one of our noblest Dukes—the Duke of Sutherland,—I say that the condition of the Grapes there, as well as that of every other department, reflects the very highest credit on Mr. Stevens, the Duke's able gardener. Sensation houses may for a time be here and there found to outvie anything at Trentham, and this may sound rather paradoxical, Trentham having been so long under the great Mr.

Fleming, the seat of sensational gardening. Now or ever, under the régime of practical Stevens, has changed; and we find instead good sound practical gardening carried on in every part of this extensive establishment, and that too, in a modest and unpretentious manner. Not to do one whit from the credit due to the great originator of this place, I can without the slightest hesitation say that the Trentham of to-day exhibits more good practical gardening than ever did Trentham in the past. But, lest I be taunted with these assertions no proof, I simply say, go and see.

To give a lengthened and detailed account of what Mr. Stevens has done since his transshipment to Mr. Veitch's big Azaleas at Chelsea, to Trentham six years ago, is not within the meaning of this article. But when it is told that every fruit tree, Apples, Plums, Cherries, &c., and nearly every Vine, in "almost miles" of houses and "Trentham" have been removed, and new soil, new borders for each, some idea may be gained of the work involved. Those who can cast their eyes back to the fine fruit exhibited by Mr. Stevens when in the zenith of his glory, and the poor produce of the same a little later on, and can compare that now produced by Mr. Stevens, as shown by him at the Manchester show, will know that the resuscitation has been; and all practical gardeners are also well aware how much more difficult it is to resuscitate an old place, keeping up at the same time the regular supply to the family, than to start an entirely new affair, when nothing is expected of it, actually there.

To the Vines, however; and in the first place I am afraid to say how many houses of Vines there are. All of the Vines, old and young, when I saw them, not long since, looking remarkably well, and making strong, robust wood, ripening gloriously. The shoots are kept thin on the Vine, that all the leaves have abundance of space to do themselves. And such leaves!—of a deep healthy green, large, and in substance like Laurel, clean and perfectly clear of insects. And here one word as to the importance of the proper leaf cultivation of the Vine. Just according to the amount of foliage properly developed, will be, not only the root action, but the quality of the crop affected, as every particle of sap drawn up by the roots must be elaborated through the agency of the leaves. It would be a very important matter for our learned physiologists to determine how much leaf surface, or what amount of respiratory or other organs, is required by a Vine to produce a certain amount of Grapes. I hope some day that some one may be able to grapple with a question like this. We assume certain proportions in our own rough way, and practically we may not be far wrong. It is, however, all a matter of guesswork, but Mr. Stevens appears to guess pretty near the mark, for although the bunches were not enormously large—some 5 or 6 lb., nor the crop extraordinarily heavy, the berries were of the largest size, and the most beautifully coloured I ever saw. I was so captivated with some *Black Hamburgs* in one house that I must needs taste them, when my intense astonishment they were only half ripe then Mr. Stevens assured me they had been in the house within little more than a fortnight, and every one knows it takes generally a month to do this part of the business.

The soil at Mr. Stevens' command is naturally a red one. It is of the new red sandstone, somewhat close and adhesive for Vines, so to improve it in this respect and to render it more porous, Mr. Stevens has it cleaned, i. e., half burnt, and so it becomes all that can be desired. Very little organic matter, or other material, if I understood Mr. Stevens properly, is added to the soil, and certainly no Vines could seem to be happier. The gardens at Trentham lie low, very nearly on a level with that sluggish river the Trent, and many of the Vine-borders are close on the water stratum, and are therefore naturally extremely low in temperature. To prove this, registers were kept last March, and it was found that while the average temperature of the outside borders in the garden was 33°, that half a mile distant on the side of the neighbouring hill was 42° difference of 9° in the two instances. Can it then be wondered at that Mr. Stevens, in his low, cold, and damp locality, is a great believer in the beneficial effect of bottom-heat for his Vine roots? No; with him it is almost a matter of necessity. It was from Trentham a long time ago, that I heard the first of the concrete of the Vine border, and at Trentham it is still practised and with advantage. The surface of the concrete is 5 feet below the level of the border, then there is a lot of rubble, through which are placed, at every 2 yards or so, open drain tiles across the border, communicating with an open chamber in front, in which are situated the hot-water pipes. The plan is simple, easy of application, and satisfactory. One capital instance of its effectiveness is thus afforded. A large house Muscats with full-grown rods some eight years old, in its turn to be supplied with a new border, last autumn so to make short work of it, instead of tracing out the roots, they were more than the half of them chopped clean off, &c. Then in spring the Vines were started as usual, with the advantage of the application of bottom-heat, and the result is a really splendid crop of fruit, equally good as if their roots had never been disturbed. The wood for next season is also in splendid condition. Now this is a very unusual success, and is entirely attributed to the fact of the roots having been in such a comfortable medium, and their action having begun so early by the assistance of the bottom-heat applied.

Vines in pots are only cultivated at Trentham to fill up an occasional gap—their fitting purpose. At Trentham, as in all well conducted places, houses are devoted to the cultivation of one sort or another—Muscats by themselves, Hamburgs and late sorts by

5. Red Onions.—These were exhibited under their various names of Blood-red, Dark Blood-red, Very Dark Blood-red, and Very Deep Blood-red. Blood-red was the largest and Very Dark Blood-red the finest coloured.

6. White or silver-skinned Onions.—These were exhibited under a great many names, such as Very Early Silver-skinned, Early Silver-skinned, Very Early Paris Silver-skinned, Early Paris Silver-skinned, Large Early Paris Silver-skinned, Early Nocera Silver-skinned, Extra Early Nocera Silver-skinned, White Tripoli, White Valontia, Silver Keeping, and White Lisbon. The differences seemed but trifling. White Lisbon appeared the coarsest, and White Tripoli from imported seed were the finest.

7. Two-bladed Onion.—This is a pretty little variety, much prized for pickling.

8. Potato, or Underground Onion.—This is a large and mild-flavoured variety, not usually produced from seed. There were, however, specimens from Mr Gilbert, of Bursley Park Gardens, the produce of roots, and Messrs. Barr & Sugden showed specimens from seed.

The Tree or Bulb-bearing Onion, sometimes called the Rocambole Onion.—This variety produces small bulbs on the stalk instead of flowers, and these are considered the most valuable of all Onions for pickling.

The collection, as exhibited before the Fruit Committee, is on view at Messrs. Barr and Sugden's warehouse, King Street, Covent Garden.

Home Correspondence.

Potato Grafting.—Our good cousins over the water would probably observe "A pretty considerable f—l you are for your pains." Well, be it so. I speak personally as to this observation, for I know that, whether by grafting or by any other means, the raising of new varieties of Potatoes can never, in a monetary point of view, compensate me for "the trouble and time I have bestowed upon this valuable root." But what of that? It has been to me a wonderful study during a period of 30 years, whilst laying hands upon every variety which crossed my path; and what by selection, then by crossing the best sorts, and of late years by practising the grafting process, an insight into Nature's workings has been gained sufficient to convince me that a Potato is a Potato, that it always was and ever will remain a Potato. In my most recent crosses with the Potato this season I can distinguish in the 60 specimens I took to South Kensington, blended in colours, and in form and flavour, every sort that I have operated upon, from the two first parents of my original cross, and more—even retrograding—by the production of one which, in habit of growth and appearance of tuber, is like the wild esculent as it was received this season by the Royal Horticultural Society from Peru, when I saw growing in the gardens of Caswick. I will defy anyone to prove the Potato capable of retaining its name, or to add to the species any other form or colour further than those exhibited by me, because I have produced them from black, and going through intermediate colours and spottings to white, and of every intervening shape from round to kidney. I own it is a most difficult matter to improve upon the species, as in all my previous workings, excepting my last early and late batches of crosses, out of hundreds of new seedlings I have not been able to succeed in raising a new variety coming up to the standard of what I consider a Potato should be in quality, coupled with good bearing properties and habit of growth. It is yet capable of great improvement even on my last essays, and is the race of man at a standstill, when by striving to improve our lowly, though important esculent, as being a part of our means of subsistence, I have been taught by the simple yet wonderful workings of Nature, to consider about the origin of existence? I trust your old and most worthy correspondent, Mr. Edward Bennett, will allow me to warn him never to prostrate his abilities entirely to a consideration of profit. I have been compelled to know the importance of monetary matters as much as any man—carking cares have caused "the grey sorrow to flow o'er my head" before its time—but it is not good always to allow "enthusiasm" to become cooled by placing the idea of £ s. d. before our eyes. "Want of faith" in the practice of grafting the Potato may fairly be excused, still I have succeeded in gaining a hybrid cross; and if the result is in a wrong direction, let us hope for better luck next time. Personally, I do not consider the subject sufficiently exhausted, either in a practical or scientific point of view, to induce me to give it up; so along with cross-breeding I propose to "drag my weary staff, though slow," in the matter of grafting. Mr. Bennett may thank himself for the notice, as it was, I believe, the very experiment of his in the grafting of the Dahlia (p. 1039) which gave me confidence to stand out, and confront the disbelief in the possibility of gaining a cross through grafting the eye of one variety of Potato into the tuber of another. I have never been able to gain an infusion of colour through grafting the eye of a white sort on a coloured kind, though that has been stated to have been achieved. In the instance of Paterson's Scotch Blue, grafted on to the Royal Albert (white), which I sent to Dr. Masters, the divergence of colour seen in the immature tuber could not have been caused by the grafting process, because the skins of the graft and the stock had never united, or the tissue either; therefore that instance of variegation of colour must be attributed either to the immaturity of the tubers or to a changing in the colour, similar to that which Mr. Bennett speaks of as having occurred both with himself and in the garden of Mr Berkeley, near Worcester. The case of the bunch of white grapes on a black Vine is not quite so familiar for analogy as is that of

the blue racemes of flowers occurring on the yellow Laburnum, &c. I cannot quite understand the two last paragraphs of Mr. Bennett's paper. All the eyes, from the tuber to be grafted on, are, or should be, scooped or quite cut out, otherwise, of whatever colour they may be, they would produce their kind from the eyes left in, and if the uniting of either skins or pulp does not take place in the graft stock, the eye or graft will independently and simultaneously produce Potatoes of its kind, though in the cases of perfect or partial cicatrization, resulting in my practice, as above stated, I have never yet been able to achieve a "mixture of colours" in the hybrid. The circumstance of "one square inch of the substance of the inside of a tuber" being able to "grow," viz, I suppose, to produce shoots, foliage, and tubers, without a pang or symptom of an eye in its composition, is something quite beyond my experience, the mere mention of which has caused Mr. Bennett to send me on another tack. I fear I shall have more difficulty to "weather that point" than I had in making "port grafting." If a square inch of the inside of a tuber will grow, why will not a whole tuber do so when deprived of all its eyes? In the latter case I almost invariably find my tubers, when the grafts do not "take," to remain plump and inert in the soil, unless they become devoured by ground grubs, they are generally highly approved of by that family as the choicest of victuals. Robt. Fenn, Woodstock.—Upon what principle a Potato can be called a stock I am utterly at a loss to conceive. It may be sheer ignorance on my part, but I cannot understand how the simple insertion of a piece of one tuber into another can in any way affect its character or change its constitution. In days gone by, when all sorts of unavailing remedies were propounded for extinguishing the Potato disease, one was not only recommended but put to the test that has some similarity to the idea of grafting. This was to scoop out a small hole in the tuber when being planted, and insert therein a Pea, which said Pea was to grow, and in its growth absorb from the tuber all its tenacity to disease. Of course when planted the Pea grew, but the expected result did not follow, neither did I ever hear that on any occasion the experimental cultivator was astounded by shelling out from the produce young Potatoes instead of green Peas. I may be told that this incident is utterly beside the question at issue, but I think it is not, although the two vegetables mentioned are so widely divergent in character. I should just as soon expect, were I to scoop out a hole in a cricket ball, and insert the eye of a Potato, and then plant it, that its produce would be "leathery," as I expect to find that the same experiment, carried out with Potato tubers only, can be productive of change. The fact is (and here is the fallacy that runs through the whole of these experiments), a Potato tuber is not—cannot be—a stock at all. What is a stock in the sense in which the word is here used? A rooted tuber. Is there any known stock in the horticultural vocabulary that is not a rooted or rooting medium? But who ever saw a rooted Potato? Let there be no misapprehension of my meaning when I say this. A Potato is so utterly dissimilar to other tuberous or bulbous roots in this respect, that it has no capacity to emit roots from itself in any way. [There are exceptions, Eds.] In this respect how much does it differ from the Jerusalem Artichoke, or the Dahlia, or such roots as the Parsnip, Carrot, or Turnip. If anyone were to scoop out the head of a Parsnip, and insert therein the crown of a Carrot, that would be grafting in reality, as, in the event of growth, all root action must come from the former, and the flow of sap would be through it into the latter. But how different with the Potato, for here it may be said its tail comes out of its head; instead of roots, a shoot is first emitted, and this puts forth the rootlets that are its feeders, consequently, there is no passage or flow of sap through the tuber into the haulm, but from the roots into the haulm direct, and thus as a result the so-called stock can have no active connection with the graft or its produce. It is rather a nice point to determine as to how long a period during growth the original set continues to influence the haulm. If some of those enthusiastic gentlemen who have devoted their energies to the grafting mania would try by experiment to elucidate this idea, they may possibly perform for horticultural science some service. Is it possible to plant a small number of equal sized Potatoes of the same variety, and then without disturbing the roots, and at various stages of growth, sever the connection between the old and new? We are told by Vine growers that if the roots that are so often emitted from the branches of a Vine are supplied with the elements of nutrition, the action of the ordinary roots will be checked, does this fact apply to the Potato to this extent that when roots are formed at the base of the shoot and furnish food to it, its connection with the tuber ceases? If so, it but furnishes another proof that the practice of grafting Potatoes, so-called, is just so much labour lost. To work out this suggestion may after all be productive of but little gain, but I may venture to assert that its result will not be a crop of mongrels. Alex. Dean. The above remarks are suggestive of grafting together the young sprouts of such varieties of Potatoes as it may be thought desirable to intermix. As to the "stock" we refer our correspondent to our last issue p. 1012. We shall have more to say by and by. Eds.]

Roses.—"Hibernicus" is a bold man. Forty new Roses at 3s. each amount to £12. For a trade more I can buy 200 plants of C. Leschvre, which will take half a century to beat. I used to buy "whistles," but I have got more prudent. I know but little of the Roses of 1868-9, but, as far as I can read and learn, I think he would be right to buy the Tea Roses Adrienne Christophe and Marie Sisley, and the H. P.'s

Charles Lee, Marquise de Montemart, Duke of... burch, Madame Creyton Milane Jacquier, Souvenir de Poiteau. M. Eugene Verdier has his list of new Roses for 1869-70. As he has not the raisers' names, I shall only refer to those sent by himself. Of his seedlings these are the best: "Auguste Neumann (E. V.), vigorous, large, full form, good habit, magnificent colour, brilliant shaded fiery red and violet, often mottled white, a remarkable variety." "Ferdinand de Lesseps" very vigorous, large, full, fine form, purple violet, very fine." I have bought in dormancy which I prefer to plants ready made, plants of the Edinburgh and Charles Lee, &c. each. Mr. Bedford's foreman told me C. Lee was very good. I shall buy Marquise de Montemart, Souvenir de Poitou, Marie Sisley, and Mons. E. Verdier. He hopes the "whistle" will be cheap. Madame Dureau is first-rate, and Reine du Midi blooming freely. Neither bloomed freely during the fore part of the season. W. F. Radcliffe.

Destroying Wasps' Nests.—I have succeeded in taking wasps' nest and two hornets' nests with chloroform, that I think it a public duty to give the information in your journal. Dr. Owen in his dear little book, advises the covering the face and head with crape, and tying the hands and ankles, &c., but I go to work, without of failure, without any change of usual attire. I wait till two hours after dark, when pretty well the wasps are in their nest for the night; no stars are about, as is the case with hornets. I take a bundle of straw, some matches, a lantern, tow, and a pint of chloroform about 6 oz. I may say that wasps prefer taking a rat's hole for breeding, and generally in some bank (I found only one in flat ground). Having ascertained the direction of the passage, I then would some tow be sewed round the stick, pouring half the chloroform over it, thrust the hole in the direction of the nest. To make perfectly sure of success this may be with drawn, and the stick with tow and chloroform inserted, the first, ever, always served my purpose. The fall effect obtained in five minutes if the operation is well formed, and the nest may be dug out, even had with naked hands, and if perfect may be placed on a wire cover, or, if mutilated, burnt at once on lighted straw. There are many females in each, and these are the founders of future nests, so it is most desirable to destroy them. The taking hornets' nests is a more formidable undertaking, the hornet does not sleep in good hours as the wasp; he comes home all hours of the night and sometimes don't come home till morning. Let them three hours after dark to gettle down, and then proceeded to take the first nest. It must be remembered that I had already taken a wasps' nest, and I would recommend others to try their hand on wasps, and gain some experience in the way of managing the operation before they attempt hornets. Seeing that I could take a wasp's nest easily, and with perfect safety, I went to work with more self-possession on this terrible insect, the hornet. The nest was built above an opening in the side of a wood barn where a board had come off and it was necessary to fill up the space between the hanging board and outer boards with some cloths tucked in behind where the hornets entered; this was done on a previous night. On the night we took the nest my man and myself laid tow on this ledge, poured a quarter of a pint of chloroform on it, nailed a sack over the opening then going into the barn, we made holes with a stick on either side of the nest, and I squirted chloroform into it, in five minutes the sack was removed, and the hornets—about 200—lay quite motionless. Stragglers kept coming home; some were caught in a net on which the light of a bull's eye lantern was thrown and some would settle on the barn, and when light was fully cast upon them they were easily caught by a stick. I clothed my man with netting, shoes, head and gloves on his hands, but I made no difference in my ordinary dress, and we escaped being stung. I may state that my man afterwards took another hornet's nest in the thatched roof of a cottage in the neighbourhood, described for taking a wasp's nest with chloroform. On examining what might perhaps be called the "cell," i.e., the aggregation of cells, there were five tiers of boards what I take to be the commencement of a series; it was in an oval form on one side, the other on the oval side were cells deep in the middle, shallower by degrees as the edges were approached they were very beautifully formed hexagonal cells, at first sight appeared empty, but a close inspection revealed white grubs attached to the bottom of a cell, from the eighth of the size of a full grown fly down to the size of the smallest pin's head, showing the progress from the egg to the pupae. On examining the pupae in the large pieces of comb I found of four or rather maggots, in different stages and sizes; I found when the maggot began to change into the insect, a very tough membrane, resembling parchment, sealed the cell until the fully perfect insect was strong enough to burst its way through. There was lying in the wood yard a tree with a hole in it; this tree was decayed in the centre, hornet's passage in and out this tree gave rise to the belief that there was a second nest, but when they continued their visits, it was evident they went only for material to make paper. The cells and corners of the parts not wedged by the sides of the board were so regularly marked in deep and light fawn-coloured striae, that one might imagine they had worked concert for artistic effect. I placed masses of tow under a wire meat cover, and extracted the whole

papillæ of resin around the entries of their burrows, and yet the beetles persevered, and the young broods emerged abundantly, the tree being quite dead next season. *M. D.*

Boilers.—Your space has been a good deal occupied with the question of hothouse boilers and stoves for the generation of steam, a question of no small importance to the nurseryman. A dweller in town, I have not much right to ask you to let me obtrude my views into the discussion, but I should like to point out how I believe more economy might be obtained than has yet occurred to those professionals concerned in this question, and what means I should take to obtain the greatest amount of heating power with the smallest cost. From a commercial point of view I should ask, if something might not be done to utilise the waste steam generated in the kitchen of the nurseryman? I believe a great deal might be accomplished in this direction, and which would at the same time tend to economise the domestic arrangements of his household. In my kitchen I have a stove which, with a small amount of fuel, is capable of generating any quantity of steam. This stove, the invention of Capt. Warren, is manufactured by Messrs. Adams & Son, of Marshall Street, in an hour after the fire is lighted, the steam is up, and goes on generating with a small fire throughout the day. The whole of my work is done by the action of steam, but for domestic purposes this steam is only required for a few hours, and then comes the time when it might at a very small cost be conveyed to the hothouse, and it would not be difficult to keep the fire going throughout the greater part of a long night at any time it may be required. In this way the air of the dwelling-house would also be rendered more healthy and constantly warm. The stove offers a very economical and superior mode of cooking, this being accomplished entirely by using hot-air, which, while it in nowise deprives the meat of its juices, retains the greatest amount of phosphates in both animal and vegetable food. Ignorance of the great importance of this cooking, constitutes one of the main causes of the great national deficiencies in respect of food, and the bad uses which our working classes make of such elements of food as lie within their grasp. *W. C.*

Packing Fruit for Transmission Abroad.—Your correspondent, Mr. John Kirby (p. 1049), may possibly find the following plan worthy of consideration. When I lived at Stanton Lacey, near Ludlow, 30 years ago, in default of a proper fruit room I used to adopt the following plan, viz., collect some ripe Fern, allow it to become thoroughly dry, strip off the fronds from the stalks, and place each fruit singly in a handful of these leaves, packing them away in hampers, boxes, or any other convenient receptacle. Those fruits which may become rotten, will not easily contaminate their neighbours; and a surprising quantity can thus be stored away in a small space, by allowing one hamper to stand upon the top of another, and so on. I should continue this practice in preference to any other that I know, but there is a difficulty here in procuring the Fern. Let me advise your correspondent not to use "chopped straw," or straw in any shape, as the fruit would be almost certainly ruined, and an unpleasant odour from it. I really do think that for his purpose thoroughly dried Fern fronds would be "the thing." *Robert Fenn, Woodstock.*

Flight of Greenflies and Lady-birds.—In the morning of July 21 I observed my young Peas covered with innumerable greenflies, and slight observation led me to consider them as a new enemy. They had large brownish wings, well adapted for flight. Since then I learned that the same kind of aphid appeared about the same time in various parts in this quarter, as Bury St. Edmund's, Thetford, and Norwich. The flies were somewhat like those of their family which attack Plum trees, except their mealy powder that resists water. In my haste to destroy the green pests I regret not having preserved some of them, so that their history might be better known, but I trust others have done so. I syringed them with lime-water, and though they were easily washed down they were as soon up again, and the Pea stalks were green during their ascent. Afterwards I shook them into watering-pots amongst greasy lime-water, and destroyed those on the ground with a spade. Repeating the operation I stopped the plague, but not before the crops were destroyed, for the insects had sucked the juice from the tender tops, which soon withered in the hot sunshine. I have said that the aphides came suddenly, meaning that they were not bred near or upon the plants, on which they alight like others of the family. Besides, the insects seemed to disappear as mysteriously as they came, at least, from other plants where they were not disturbed. Now, if these greenflies left eggs as other aphides do, they may reappear in such numbers that no amount of Lady-birds can keep them down. I mention this because the latter insects were so abundant this season that some were led to consider that they followed the greenflies to devour them. However this may be, Lady-birds are also fond of soft fruit, on which I have seen them in twos and threes, in company with wasps, where no common fly would dare venture. Perhaps their shell-like covering is too hard for wasps. The Lady-bird is called also Lady-cow. The Linnæan name is *Coccinella septempunctata*. By the children in Norfolk it is called Bishy Bar-na-bee. It may be seen nearly at all seasons, and early in the spring during a glimpse of sunshine, when other insects are torpid, or inclosed in chrysalids. The above was written before I had seen T. Southwell's remarks on this subject in "Science Gossip." He mentions that on July 21 a "yacht belonging to Mr. Creswell, of Lynn, sailing off Hunstanton, passed through a mass of dead Lady-birds, accumulated on the surface of the water, about 10 feet broad, and extending for 2 or 3 miles." The same writer also notices Mr. Cordeaux's note on greenflies in the "Zoologist," and who says, "On July 21,

the same day above referred to, about 13 miles from the Lincolnshire coast, his cutter ran through numerous belts of water, from a few yards to some hundreds in breadth, and extending both to port and starboard as far as the eye could reach, so full of myriads of green winged aphides as to present a thick pea-soup-like appearance." It is rather remarkable for the insects to have been seen in so many different parts on the same day; they were noticed in Norwich on the 23d or previous day. *J. Wighton, Cossey Park.*

Cockchafer.—I herewith send you some grubs which have been a source of great annoyance to me during the present season. About the middle of June they attacked a bed of dwarf Roses, eating the roots to such an extent that the leaves soon became yellow. I tried lime and soot, which seemed to check them for a time, but never fairly routed them, and I have this day taken up some of the plants which have not sufficient roots left to keep them alive, the fibrous ones being all gone, and the larger ones have the bark peeled off entirely. Could you inform me of a remedy for getting rid of them without transplanting the Roses, as some of them have only been budded this summer. *T. V., October 6.* [The grubs sent with the preceding note proved to be nearly full-grown larvae of the cockchafer—*Melolontha vulgaris*. They must have been very short of more succulent food to have attacked the rootlets of the Roses. We know of no application which would drive them away from the roots, but they might be attracted from them by burying slices of Turnips or Potatoes about the roots, which might be examined once a week. Cockchafer would not be so numerous, and their larva so injurious, if the rooks were not so unmercifully shot. *I. O. W.*]

Yellow Bedding Pansies.—Of late years the Calceolaria has proved very uncertain in many localities, and the question is, What shall we get for a substitute? The yellow-leaved Pelargoniums have in some measure come to the rescue, the golden Pyrethrum has also proved very useful, but, although these give us colour through the foliage, a plant with yellow flowers is more attractive and more appreciated. During a late tour in Yorkshire and Nottinghamshire I saw the yellow Pansy used with very good effect; indeed it has quite superseded the Calceolaria in one or two large establishments which I visited. At Sandbeck, the seat of the Earl of Scarborough, about 6000 plants of it are in use, scarcely a plant of the Calceolaria being grown. This Pansy is certainly one of the best-formed yellow bedding varieties I have seen. The flower is stiff and well-formed, with a neat eye, which makes it additionally attractive, and it is moreover a very free bloomer. I have forwarded you a few flowers so that you may see that it is distinct from the Cliveden variety, which is so extensively used at Thoresby, where it graces the matchless panel borders in the kitchen garden. But for profusion of blossoms the kind in use at Rufford, the residence of Captain Saville, carries off the palm; it is called the Pride of Rufford, and I can assure your readers it was with joy that I beheld it. It is used in lines, in diamonds, and in panel works, indeed, Mr. Holah, the gardener, uses it by the thousand as freely as some people use the *Christum Vult lutea* is also very extensively used, and is here well grown. But enough of yellows, for after all there is nothing like a true blue, and here it is to be found in a blue seedling Pansy with a velvety texture and a dark eye: a small bed of this was very telling, and promises to be quite an acquisition amongst bedding Pansies. I cannot conclude these few remarks without referring to the ribbon border (112 feet long) which I saw at Rufford, and which was exceedingly well done, beautifully arranged, and kept as even as though it had been cut with a scythe. It was composed as follows—1st row *Cerastium*, 2d *Lobelia speciosa*, 3d *Pelargonium Harry Hieover*, 4th *Yellow Pansy*, 5th *Pelargonium Brillant*, 6th *Centaurea candidissima*, 7th *Perilla*, 8th *Centaurea candidissima*, 9th *Pelargonium Stella*, 10th *Zelinda Dahlia*, 11th mixed Dahlias. I also saw some grand beds of *Verbena venosa*, but not a single Calceolaria was visible in the principal flower garden. *Edward Bennett, Osberton, Worksop.* [See note at p. 1092 *Eds.*]

A Monster Potato.—During my recent visit to Scotland, on the occasion of the International Fruit Show in Edinburgh, I called at Dunnikeir, the seat of Captain Oswald, near Kirkcaldy, Fifeshire. Mr. Dewar, the gardener there, showed me a "pet Potato" he had growing in a cosy corner, the tuber of which he selected from a crop grown on the home farm there last year. He could give me no name for it, but he described it as "a long red Potato, with deep-set eyes." This tuber being planted, sent up some 10 or 12 shoots, these formed laterals, which, as they grew, Mr. Dewar kept staked and trained; the whole forming what one would call a beautifully furnished plant, which when I saw it (September 10) measured 7 feet in height and 24 feet in circumference. I think this is something out of the common in Potato culture. What the produce of this enormous top may be remains yet to be seen, but Mr. Dewar promised to let me know the weight of tubers when taken up, which might be interesting to the readers of the *Gardeners' Chronicle*. Have any of your correspondents ever seen a Potato plant grown to such gigantic dimensions? *George Grievie, Mount Stewart, Newtownards, Co. Down, Ireland.*

Wellingtonia gigantea.—The following is a description of a fine specimen which is under my charge, and which I believe to be one of the first batch that was sent out. The plant in question was purchased from Messrs. Rollison, and was planted out early in the spring of 1859, in unprepared ground, the subsoil being a very strong clay. The height when planted was about 15 inches, the present dimensions are as follows:—height, 27 feet; circumference of bole, 1 foot from the ground, 4 feet 10 inches; ditto at 3 feet, 3 feet 6 inches; circumference of branches, 11 feet. It has withstood

the extremes of temperature that we have experienced during the last few years without any check to the growth. *James Wood, Gr. to E. R. Northey, Esq., Epsom House, Epsom.*

The Weather on the West Coast of Scotland.—The weather, which had been exceedingly dry, suddenly on Sept. 5th to be very wet. Since that time rain has fallen every day during the month, the amount of 7.73 inches, being 3.11 inches in excess of the average of the last 10 years. The barometer was very unsteady, and fell to 28.96 on the 23d, and had 1.39 inch of rain in 16 hours, accompanied by a strong gale, which suddenly changed the appearance of many beds in the flower garden, and some of the plants in the borders. Still we congratulated ourselves as we (on the banks of the salt-water Clyde) were parched up for months, and were visited with the or Lady-bird, as in the south-east and midland counties (p. 945). We began planting out Calceolarias, Pott & Co., on May 11, and finished with Mrs. Pollock's Calceolaria, Perilla, Amaranthus, and *Coleus* &c. We had several frosty nights in May, the thermometer indicated 28° after the Calceolaria was put out, and 30° in June, after several hundred Pelargoniums were bedded out, without being hurt. Pelargoniums are struck in the open border in June and August, and kept in a dry airy pit during the winter so that they are strong and hardy when planted out. We for many years put in cuttings of Calceolaria in cold pits; they are kept there through the winter and we have never experienced a deficiency for a year out. The monthly fall of rain here during the last 10 years was—May, 9.49 inch; June, 2.71 inch; July, 4.01 inches; August, 1.18 inch, which suits us; more than the average fall. We never had bedding plants so gay before. Pelargoniums in particular flowered very profusely. Vegetables were everywhere abundant and good. We have still plenty about Laxton's Prolific and Prizetaker are fine; Chancrow England did well in summer, but has failed in the 10th; also plenty of Kidney Beans and Cambridge Hollyhocks and Gladiolus were fine, but are all done. Dahlias, being well set with buds during the dry sunny weather, are now covered with large flowers, and seem to be enjoying the wet; *Hesperis*, *Heliotropes*, and *Ageratum* also stand it well. As for the more hardy plants that have stood the wet value, *Pentstemons*, and a dwarf scarlet seedling *Calceolaria* in the way of Lang's Ambassador, but which stands it better. The latter continued in flower until the last winter after the new year. *J. McIntosh, Gey Toward, Sept. 30.*

Our Fruit Failure and its Lessons.—There can be no doubt of the season of 1890 being well and long remembered. After the hot season of 1888, so much adapted for the full ripening of the wood of all fruit trees, much fruit was naturally expected this year. In the spring the shoots literally teemed with fruit buds. We had hopes were entertained and joy experienced at such an abundant show of bloom! But the trying ordeal of a drifting sheet and piercing cold, damp and dreary days, had to be endured, and in the end the fruit shown in every garden by the scanty supply of access to the fruits, whilst in some it has proved a total failure. This is an exceptional season, we know. Still, I doubt if it will prove a serviceable one, by inducing all gardeners to calculate their resources should another such season be experienced by them. So many plans have been tried, and all having failed, one and all are brouched to the same inquiry—Which is the most efficient method of our obtaining superior stone fruit in all seasons? Mr. Fish has done well to call attention to this subject, as it requires the immediate attention of all concerned. Hitherto, whilst ordinary means of protection have secured in many places an abundant supply of fruit, others the results have not always been so satisfactory. This has given rise to the more extensive use of glass coverings, their superior advantages over ordinary methods being so decidedly apparent. Then again, the successful career of glass coverings for many years instilled in the minds of many the idea of their being vulnerable. At length, however, we find their capacity of resistance is limited, and this year's experience "shows that sometimes, and under extraordinary pressure, they may give way." This is an admission Mr. Fish is constrained to admit by the almost unanimous testimony of this year's failure. But to prevent this defeat, Mr. Fish complains of "many houses being openly constructed and glazed." With such an argument so far stands good. But what of the failure of closely glazed and properly constructed houses? We have an unheated Peach-house here, covering 10 feet length of wall; height at back, 10 feet, width at front 2 feet high; each of these lights, as well as top lights, open for ventilation. Figs in pots are grown along the front. This house is flanked at each end by walls, running north and south, so that it may be perceived this house is greatly sheltered from east or west gales. Notwithstanding which, I have secured only three dozen fruits, Peaches and Nectarines from this house. The trees are very healthy, and the wood was studded with bloom buds, very few of which, however, did fully expand. They did not want to water, neither were they saturated with wet. But the continued damp, dark, and bitter weather lapped up the heat from within, and left the bloom equally parched with those on trees out-of-doors, merely covered with Spruce boughs, and their results are about equal. I maintain, therefore, that to ensure the crops we may insure the houses, by having sufficient amount of piping to defy the ingress of paralyzing weather, and keep the enclosed air constantly in motion. Mr. Fish gives some excellent designs of glass screens, which I think are all that can be wished for; but I know of a house almost identical in design to the lean-to shown in the wall being 18 feet or 20 feet high; the front railing

in the development of gardening resources of what might yet become, under happier auspices, truly the "Emerald Isle." I believe, however, it would be a mistake were the Royal Horticultural Society of England to quit its legitimate field of operations and try its fortunes across the Channel, while it has so much comparatively unexplored territory at home in which to ruralise, and, it is to be hoped, reap some tangible results. The best way to meet the suggestion of our friends in Dublin would be to hold in that capital next year a duplicate of the great International Fruit Show so recently held in Edinburgh; and that it might become truly international, another should be held the succeeding year in London, so that each of the capitals of the three kingdoms might have in perpetuity its great triennial fruit show. Can the Irish Society undertake to get up a great fruit show next autumn, and to do it as well as the Caledonian Society does it. Let them try. If they will submit a liberal schedule of prizes, and get first-class judges, there will be no lack of competitors; and having done it well, the credit will be all their own. As far as London is concerned, that can give a good account of itself when the time comes to need it. A. D. [Not a bad suggestion. Eds.]

Foreign Correspondence.

THE BOTANIC GARDEN, PADUA.—The Botanic Garden at Padua possesses unusual interest from being the oldest in Europe, having been founded in 1545. Here is one of the finest collections of trees on the Continent. In a large conservatory raised on a terrace there is a splendid Norfolk Island Pine, some 35 feet high, and very thickly clothed with branches; a large specimen of the *Todea africana*, from the Cape of Good Hope; and a very fine *Ficus stipulata*, covering the walls of the house. In various parts of the garden are some unusually large plants of rare trees; among these may be specially noticed the *Magnolia grandiflora*, which were raised from seed by Farsetti, the director of the garden in 1742. Some of these trees have trunks 4 feet in diameter, and over 60 feet in height, and are thickly clothed with leaves and branches. When in flower they must be a magnificent sight. The *Acacias* are also very fine plants. The *A. Farnesiana* is between 60 and 70 feet high, and *A. Julibrissin* about the same height. Of other large trees there are *Gymnocladus canadensis*, *Diospyros virginiana*; *Vitex Agnus-Castus*, 160 years planted, 40 feet high; *Chamerops humilis*, 25 feet; *Sterculia platanifolia*, 30 feet; *Lycium japonicum*, 80 feet. *Araba sp. nosa*, nearly 30 feet; *Smlax Sarsaparilla*, from 60 to 70 feet; and many others of a size and growth only to be met with in such a favourable climate. There is also a wonderful *Platanus orientalis*, planted the year the garden was formed, with a remarkably knotted stem which is quite hollow in the lower part. The shape of this tree is very singular, having a long trunk without any branches, and forming a spreading and umbrella-like head.*

The garden is divided in one part by a lofty ornamental wall, in which are two gateways with high and bold pillars at the sides. These pillars in April were covered with glorious masses of the *Wistaria* in full bloom, and were a lovely sight. The plan of training the *Wistaria* as a standard, with a broad-spreading head, was also most successfully carried out, there being a very fine specimen in a prominent position, with a stem of some 10 feet in height. Dr. Visiani, the resident director of these gardens, has evidently taken great care and pains to bring them into their present condition, everything being in the most perfect order; and a visit to the gardens at any time of the year would be a source of the greatest pleasure to the horticulturist or lover of nature.

The library and herbarium are both extensive. The latter contains about 6000 specimens. The collection of fossils (comprising some magnificent examples of Palms and Ferns) is of rather recent formation, and is one of the finest in existence. Most of the specimens were brought from Monte Berico, in the neighbourhood of Vicenza.

In the library are some very beautifully executed water-colour drawings by a Venetian artist, taken from different points in the garden. One is a general view of the garden, in which the remarkable church of St. Antonio, with its seven domes, is introduced. A second shows one of the principal fountains in the garden, with the church of S. Giustina in the background, and the last is a most careful and correct portrait of the remarkable old Plane tree previously alluded to. J. W. C.

Notices of Books.

A Book about Roses: How to Grow and Show them. By S. Reynolds Hole. Blackwood & Sons. Square 8vo, pp. 277.

If there be still on this earth a lineal descendant of the flowers that bloomed in Eden, that one is assuredly the Rose. Other flowers are as beautiful; some, like the Lily, are as chaste; the Camellia more nearly realises the ideal of the florist; Orchids are more surprising; many plants exhibit grander foliage or greater range of colour in their flowers; but, taken for all in all, the Rose shows a more perfect harmony, both in form and colour—a more refined perfume, a more fitting association of leaf and flower, than any other plant; and hence it has long held, and long will hold, undisputed sway as *regina florum*—the queen of flowers.

Volumes have been written, replete with lore and legends, concerning the history and origin of the Rose. Poets major and poets minor, in all ages and in all tongues, have hymned her praises; and yet more remains to be sung. No one has done full justice to the theme, and as the "new Roses" make their appearance "new poets" must invent new "conceits" to account for their origin; for instance, it is very pretty to read that the rosy tint is due to transfusion, as

* The fine tree in the Chelsea garden is of much the same form. Eds.

doctors would say, from the veins of the queen of beauty herself.

"Alba fui quondam rubri qua causa coloris
Me proprio tinxit sanguine pulchra Venus."

But how about Maréchal Niel or Gloire de Dijon? Could Venus have had the jaundice? The thought is too dreadful. It must have been jealous Juno in one of her wrathful moods, who gave origin to the yellow Rose; or was it Minerva, "sicklied o'er with the pale cast of thought"? We leave the question for Mr. Hole's decision, and in the meantime commend his book to general attention. It is not at all necessary that the reader should be a rosarian to appreciate this volume; should he be one, he will like it all the more; should he be contemplating entering the ranks of the floral sybarites, he will, from a study of Mr. Hole's pages, learn how to do it, and how not to do it;—how, when, and where the Rose should be planted, and budded, and pruned; what it should eat, drink, and avoid—as the title says, how it should be grown, and how shown. Should our imaginary reader, however, be reading for reading's sake, he will enjoy the genial fun and playfulness, the wit, the easy flow of language, and the pleasant spice of scholarship that pervades "A Book about Roses." From this point of view—and the same remark applies in a cultural sense—the chief defect of the book is, that it is written too much "de l'abondance du cœur," as the author has it; it is too cloying. It is like a feast where sparkling wines are served with every dish, and where *entrées* of sweetmeats and crackers are handed round between each course. Such diet is likely enough to engender a fit of indigestion, and the reader of Mr. Hole's pages is likely to throw down the book after a short time—assuredly, however, to take it up again after no long interval. In the monthly instalments in which it was first issued through the pages of the "Gardener," this mental indigestion was not felt, as the conditions of the publication provided wholesome seasons of rest between the courses. But the rosarian—he who has graduated and gone out in honours—well, it would be a matter of inexorable necessity for him to procure the volume, were it written in the dullest, prosiest vein that ever sickened a reader, for it is the production of a man who boasts of thirty "all England" cups, whose Roses are always looked for anxiously at flower shows, who took the lion's share in originating the first Rose Show *par et simple*, whose assistance as judge or *amicus curiæ* is always courted at such exhibitions. Such a man "ought to have something to say worth hearing to those who love the Rose," and he has said it. Having written so much, we may well conclude our notice by bidding our readers "go and hear;" in other words, read the book, not forgetting the two appendices, which are about the most useful chapters in the volume.

Florists' Flowers.

It was stated not long since, in one of the monthly gardening publications, that "the day for named POLYANTHUSES has passed away." To that remark exception was taken by one of those fine old amateur cultivators of the Auricula and Polyanthus who helped to make the annals of floriculture illustrious 20 years ago, and who still lives to link that renowned past with the less glorious (in a certain sense) but not less active present, in these words—"I am loth to admit this, as I cannot see why it should be, any more than with the Pink, the Auricula, or any other florists' flowers. Types of these may be and are raised from seed, and if superior in any point to the original are deserving of a name. But these types are the result of self-fertilisation; and if florists would only take the Polyanthus into their especial care, as is the case with the Auricula, the effect of careful crossing would soon be manifest by the appearance of different and improved varieties. For example, take Buck's George IV., give it the tube of Tantarara and the refinement of Saunders' Cheshire Favourite, and you have a model flower to work upon for further operations." Alas! that's the floricultural rub. With rueful face and sinking heart the desponding florist inquires, "Where are these three flowers to be obtained for purposes of comparison?" and the light-hearted mocking Echo replies "Where?" Probably from no single grower for sale can a set or any of the named Polyanthuses that figured at exhibitions and in lists 10 or 15 years ago be obtained. Of recent years, and dating back to 1856-7, a kind of disease ravaged the beds of many a cultivator of the Polyanthus. Some subtle influence, never satisfactorily accounted for (unless it was a kind of inevitable deterioration, resulting from high breeding), committed sad havoc, and the "rude slayer, death," seized "the flowerets gay." The late Mr. James Woods, of Harwich, a noted Polyanthus grower in his day, once complained of all his best show varieties having been attacked and almost annihilated, and one variety he was just on the point of sending out was reduced from 60 to six plants. Singularly enough, the losses Mr. Woods sustained were but the counterpart of those of others, and in all cases the common border varieties were untouched. Two years later Mr. Woods had to record the same baleful experience, and with similar aggravating results, for on this occasion he lost the whole of the stock of two new varieties, one of which, named Star of the West, must indeed have been a star of some magnitude, for it is recorded of this flower that it was exhibited at Ipswich with "nearly 90 perfect pips, and rounded like a ball." The restoration of such a magnificent variety as that is an aim well worthy the enterprising florist, and he who succeeds in producing it will deserve well of floriculture.

The ordinary type of the garden Polyanthus is still very popular with many. It is one of those charming spring-flowering plants no lover of flowers would willingly let die. It is pleasant to know it is still

popular, and it deserves to be well regarded, valued more as a decorative plant for the garden than as a pot-plant, and the nearer the florist's ideal of perfection the more they esteemed; and this is proper, for it is the achievements of floriculture that the highest can attain to becomes gradually translated into an index of the popular taste, though, at best, the outcome of approximate perfection is but a shadow of what can yet be reached.

As far as the London district is concerned, the improvement of the Polyanthus appears to be almost wholly in the hands of Mr. Wiggins, of Cottage, Isleworth. Not but what other growers are similarly engaged, but the type of Mr. Wiggins' flowers mark an advance nearer towards the ideal than those of his contemporaries. It is that Mr. Turner has a lot of fine things, but which something will no doubt be done to improve. There is an arbitrariness about the shape of the sharply defined, and hedged round by the variations. In the improvement of most of the variation of colour is held to be a desideratum. The points being in a properly adjusted position. It is laid down that the centre of the Polyanthus shall be yellow, the edge the colour exactly as the centre, and the ground rich dark crimson. This appears very good, and some raisers, craving for novelty, have we should not have scarlet as well as crimson, and the bright and brilliant intermediate each colour, with a blue ground for the white edges; and so with black and gold, gold, or even blue and silver, black and gold. But the answer has come back, distinct andatory:—"That the eye and lacing should be shade of yellow is a property not to be given the vagaries of any mottled or spotted spots of seedlings;" and so a rapid collapse of "novelty" ensued. Strange as it may appear—but it is nevertheless true—old-fashioned laws was, perhaps is still, the flower should die well." Some have pronounced as "perfectly contemptible," and yet it has illustrated some time since by Mr. Read, of Rasen, in "Gossip of the Garden," who follows:—"I have this season had outdoor real practical knowledge of the framers of the in two seedling Polyanthuses, the one an example of their existence. In its decline, one colour and marking until fairly decayed, the other, the eye of which assumed a deeper shade, seemed to drain the colour from the leaves, bleached to a dirty white; and here at the their existence all comparison ceased, and I never struck with the force of perhaps similar to that which guide the framers of the code of

Coming now to matters relating to the culture of the Polyanthus, it may be said that as named (of any pretensions to quality at least) can be obtained the grower must depend on seed, and of getting something that will repay the expense. Seed can be sown at any time during the summer, the seed pan or pot should be drained with "corks" or coal-cinders, and can be placed a layer of Moss. Good watering is very essential, as it is often found that the watering of the seed pan for the length of time before the seed begins to germinate causes an immoderate amount of moss on the surface through which will not penetrate. After filling the pan, and seed, plunge the pot up to the rim in a shallow tub, through the top soil; then let it stand and cover the surface lightly with a few sprays of Moss, over this place a square of glass, and pan in a cold frame in ashes or sawdust, only get the morning sun. It will suffice to pan under a wall or in the shade, but so many are possible that it would be well to provide a frame. Here it can remain, and will require attention for a fortnight; after that time may be given, and in four or five weeks will be making their appearance. After the may be removed by degrees, the glass tilted, air, and finally removed altogether; but must be well shaded from a southern sun. seedlings use a soil composed of sand, loam, and mould in about equal proportions. When are large enough to handle, they can be into boxes, or to an intermediate bed to can be given, placing the plants pretty close. When sufficiently established, the next be to transfer the plants to their permanent Here an important consideration presents of aspect. "The north or east of a wall is temporary shade, where they will get only sun, is the aspect most favourable for the Second, suitable soil. Good loam from will grow good. Wheat, well sweetened by frost, sun, and air, or good turfy loam one-third of either two-year-old well- horse-dung, well sweetened by exposure, turning over about 9 inches deep of soil, the Polyanthus healthy and well. opinion of one of the foremost amateur the Polyanthus in the present day. The rarity is emphatic in a degree rising to a point that should never be overlooked. "But the great secret of success lies in In making the hole ready for the reception (which ought to have its roots washed and to see that they are all healthy and vigorous, decaying parts removed), raise it up in the form of a cone. Spread out the roots, gather the foliage erect, and fill up to above the collar of the plant. The advantage

deep planting is, that the best rootlets growing from the top part of the tap-root derive more nourishment from the soil, and are more secure from drought in summer and frosts in winter. It is also necessary that they should have regular attention by frequent stirring, top-dressing with fresh soil, and watering when necessary, and as soon as the truss makes its appearance, cover it over with a square of glass firmly fixed on a short stake: this will be a sufficient protection to keep off wet and insects which injure the bloom. These simple attentions will insure a bloom which might prove a what gratification to the most fastidious florist. Shallow planting is a prolific cause of destruction among Polyanthus, especially when dry weather sets in. In cases where it is sometimes difficult to get a shady spot for them, the plants are so much the more open to the injurious influences of drought. To screen them from the drying effects of the hot sun, it is well to shake some fine soil about the plants, and then give the bed thorough watering through a coarse rose watering pot. Then some dry stable manure, or any short litter can be shaken over the plants, so as to almost entirely hide them from view. As a matter of course, when wet weather sets in, the litter should be removed. Generally, growers recommend that the plants capable of being divided should have that operation performed on them soon after blooming time. Perhaps it would be best, however, to defer this till the young growth that invariably follows the period of bloom has fully developed itself. Plants cultivated in pots can be divided earlier than those growing in the open ground. When dividing the roots, take away only those pieces that have rootlets attaching to them. There is always some trouble in inducing unrooted pieces to throw out the fibres, unless very carefully tended to. The plants obtained by division would succeed best planted out in an open border on the north-north-east side of a wall or hedge, but not too near where they can get plenty of air, little sun, and no drip, and beware of snails and slugs.

Those growers who cultivate for exhibition purposes, and those who make a leading speciality of the Polyanthus, generally cultivate all their best flowers in pots. The cultivators of the Polyanthus in the northern districts always recommended an inch of pebbles for drainage, and over these the same thickness of dried rushes. In regard to soil, one grower of the note always recommended a soil composed of two parts decayed Potato haulm, not above one year old, and one part rotten horse-dung and cow-dung (about equal parts of each), and a little river sand. The plants should be potted in August, and during this operation it is of the first importance to see that the tap-root is sound at the bottom, otherwise the plant will never do well. When potted, the plants should be placed in a shady situation for about two or three weeks, and if dry weather sets in they should be gently watered once or twice a week, but never be allowed to receive any splashing rain. The latter part of September they should be moved into their winter quarters (a common garden or a facing the south), and, when needed, well protected from frost, by covering the lights with mats, yet so as to allow of a run on all favourable occasions to prevent the possibility of their drawing. In February about the middle of the old surface soil may be removed, but in doing this be careful not to disturb the roots. Then fill with a richer compost than the preceding—say, half marden loam, and half well decomposed horse and cow-dung. Finally, to ensure a good bloom, keep the plants in a sheltered position, and, to possess none of the richness of the Polyanthus, but will be small and of a dull red colour. Old times Hogg, in his treatise of nearly 50 years ago, thus writes regarding the Polyanthus—"Let it be remembered, that these flowers, if planted in the grounds, and which indeed is the only successful way of growing them, will be in a situation exposed to the morning rays of the sun, and excluded from them the rest of the day. It is a waste both of time and plants, to keep them all the year round in pots, especially in the neighbourhood of London: I have found it so: others may be successful. I admit it is convenient to have them in pots in the spring, both for exhibition and sale; in this case, the moment the pips begin to turn them into the ground, and let them remain there till near Michaelmas, when they may be placed in their pots. Keep slugs and snails off them. The Polyanthus, in coming into flower, should be set under a hand-glass raised upon bricks, shaded constant exposure to the air soon tans the eye and lacerates the eye and lacerates the eye." Hogg also enumerates the named varieties of the Polyanthus. It is to be seen from the foregoing how little we have modified the routine of cultivation laid down by this old florist, even after an interval of 50 years. There is no lack of named Polyanthus at the present time, but there is a great want of worthiness about them. Early this last spring I received five named plants from a grower; on their reaching me I inspected their quality from the names they bore, and their blooming I found them to be much inferior to flowers in my seedling bed. Intending purchasers should therefore proceed with caution. From a bed of fine seedling plants, Mr. Wiggins has this season selected and named about 20 kinds. I had an opportunity to inspect these on two or three occasions, and the following appeared to be the very cream of them: Princess Alice, the Premier and Prince of Wales, a very fine, President, Golden Cluster, a finely flowered Vanguard, the facing very dark. Bracelet, Golden Champion, rather small, but promising seedling well; Nonsuch, Beadsman, Florence, and the Acre. Even should these prove to be inferior to the named flowers of 15 years ago—now, it is to be said, almost wholly lost to us—we have here something good to work with; and, combined with so much

quality, there appears to be much vigour of constitution. The Isleworth flowers were, no doubt, seen at a disadvantage, as they were all blooming in the open ground, affected by cold winds, occasionally alternated by hot sunny days.

Mr. John Read, of Market Rasen, has left on record some capital suggestions for fertilising, or, as he terms it, hybridising the Polyanthus, with a view of obtaining finer kinds, that are well worthy of being reproduced here. He starts by stating that if size be wanted a large flower should be selected as the seed-bearing parent, suppressing other good qualities within a commensurate degree, if refinement be wanted, then select as the seed-bearing parent a flower having this in the largest degree likewise, and impregnate them with the pollen from a flower containing such properties, in colour or marking, as it may be sought to impart. The *modus operandi* is as follows—Take a strong truss of the variety selected for the purpose, remove the small pips, leaving five or six to be operated upon, take out the anthers with a pair of small forceps or tweezers as each pip opens. When fully expanded, collect the pollen from the best pips of the variety selected as the pollen parent with a camel's-hair pencil, that will not scatter it; introduce it into the tube, and forcibly turn it round upon the stamens of the removed anthers. Repeat this process several times, and afterwards cover over the truss with a piece of glass, to keep wet or insects from injuring the fertile pips, and Nature will work her own way. When the seed-pods are turned brown, and just about to open, gather them, and store them in a dry place till sowing time—the best time for this is probably in February. Fill some boxes, pans, or shallow pots to within 1 inch of the top with rich garden mould, then sift or rub half an inch of very fine soil, and sow the seed; only just cover it with fine sifted soil, water with a small-rose pot, and take care never to let the seeds get dry after they begin to germinate. When the seedlings are large enough to handle, transplant them on a shady border, free from drip, about 8 inches apart; attend to watering and top-dressing, and in due time this labour will be rewarded by the appearance of some "gems of purest ray serene." R. D.

Garden Memoranda.

MOUNT MERRION, the seat of the Earl of Pembroke, from its fine position and the lovely scenery which it commands, has always been considered attractive. Lately, however, through the able management of Mr. Welsh, his lordship's gardener and steward, the establishment has become famous for the perfection to which bedding-out gardening has been brought, a condition which has caused a visit to Mount Merrion to be considered a great treat by the thousands who are favoured with permission to enjoy it. The principal entrance is at the top of Merrion Avenue, which is situated about one mile from the Blackrock station of the Dublin and Kingstown Railway. This noble avenue, which is about 500 yards long, leads in a straight line to the mansion, and is bordered on each side with forest trees from 50 to 60 feet high. Between the trees and the walk is a broad margin of grass, which is kept mown. The walk is of ample width, and the effect of the view from the entrance gate is very fine.

Entering the bedding-out garden from the lower gate, a splendid mass of colouring is seen on the right and left borders. The one to the left is about 100 yards long and 4 yards broad, with beds of circular form alternating with oblong squares. The front and back of the borders is beautifully margined with *Cerastium*, very pure in colour, the angles defining the beds are filled with *Lobelia speciosa* (from cuttings). The beds are principally filled with zonal Pelargoniums, the centre of each circular bed has a pyramidal plant of *Acer Negundo variegatum*, which gives a graceful appearance to the border and relieves it from flatness. Two beds next the entrance-gate at once claim attention—a circular one of *Cybister*, literally loaded with its immense scarlet trusses, the square bed next it being a complete contrast in its chaste colouring, viz., a square centre of *Perilla* (four lines), surrounded with *Centaurea candidissima*. This bed, which is placed between one of *Christine* on one side, and one of *Cybister* on the other, and set off with blue *Lobelia* in the spaces, is a gem in its way. Of the other beds the most noticeable are those filled with *Amy Hogg*, *Rival Nosegay*, *Cirelet* (very distinct), *Madame Rudersdorf*, *Pauline*, and *Stella*. Facing the entrance-gate and filling the end view, is a raised mound, with a clump of *Centaurea zymosarpha* in the centre, the remainder is filled with *Scarlet Pelargonium*, which surround very large single plants of *Centaurea*, about a yard apart, this is very effective in the distance.

The right-hand border (from the entrance-gate) is 200 yards long, and is a very effective piece of bedding, being remarkable for its beautifully-toned colouring, and the clever manner in which the flatness of the border is relieved by raised beds or clumps about 20 feet apart, which are filled with the quiet colours of *Acer Negundo variegatum* and *Centaurea candidissima*. About 100 yards of this border is planted with seven lines, running parallel with the walk—the centre line is *Pelargonium Christine*, pink; those on each side are planted with *Miss Kingsbury*, very pure silver edge; then two lines of *Iresine Herbstii*, the line next the walk is composed of *Lady Cullum*, and the back row strong plants of *Mrs. Pollock*. The effect of the variegated Pelargoniums is greatly enhanced by Mr. Welsh's practice of keeping one-half the flowers pulled off, thus allowing the foliage to come out distinctly in the design. This border is broken by a second entrance-gate, and the remainder of the border is planted with circles and squares of bedding, much in the style of the first-mentioned border, except that it
