INDEX OF CONTENTS

OF THE

GARDENERS' CHRONICLE AND AGRICULTURAL GAZETTE

FOR 1869.

HORTICULTURE.

A.

Bes Douglasii, 939; *Morinda*, 713; *pectinata*, curious anomaly in the stem of, 814
Bout town, 1013
Buses in horticulture, 554
Buttlin, tendency to produce variegation in, 508
Buttlin Thompsoni, 276
Byes nian mixture, Stevenson's, 1306
Cacia Ricana, 306
Calypha tricolor, 1111, 1137, 1158; *Wilkesiana*, 1158
Cer rufinerve albo-limbatum, 1158
Cincta from New Grenada, 561
Corn, grown in water, 969
Crocodylus sclerocarpa, 306
Erophylum venosum, 9
Experiments, novel, 1062
Solide Botanic Garden, 946
Plantum Capillus-Veneris, var. *macrifolium*, 669; *Capillus-Veneris* undulatum, 742; *decorum*, 583; *excelsum* Leyl, 600
Fides Lobbi, 1158
Ficus ostreata, abnormal form of, 1018
Fave Bossieriana hystrix, 83; *dasyliroides*, 135; *De Smetiana*, 392; *pectinata*, 1018; *Verschaffeltii*, 561
Flourensia Mannii, 1182
Agricultural Congress at Copenhagen, 360
Ge, marine, range in depth of, 689
Geria, the spring in, 814, 841, 864, 689, 713
Geria, Vine cultivation in, 39
Lamanda nobilis, 305
Geasia Jenningsii, 136, 1278; *metallica*, 926; *Sedeni*, 615
Ge, culture of the, 1208
Pine plants, culture of, 664
Gnaphalium sessilis amena, 842
Gnaphalium frutescens, 945; *Ludwigii*, 1157
Garyalis Johnsoni, 1233; new seedlings of, 847
Nature gardening, 613
Naxon Palms, 995
Nerica, N.W., vegetable products of, 232, 149
Nomum sceptrum, 1182
Norphophallus picturatus, 553
Opelops trifurcata, 833
Oreochilus Dawsonianus, 1158; *Dawsonianus* pictus, 1097; *Lowii*, 790; *Ordianus*, 1067
Pearson, Mr., presentation to, 447
Pisonia blanda, 252
Pisonia, the best of the cultivated, 920, 365, 900
Platanus ficum, 136; *lancoletum*, 1278; *albanum*, 733
Platanus, M. Thuret's garden at, 1255
Platanus about trees, 449
Platanus acutifolia, 1278; *nitens*, 126
Platanus, extraordinary swarms of, 892
Platanus on the wing, 842
Platanus, Calville Blanc, 7, 81, 138, 193; *Courtpendu* Plat, 335; *Golden Russet* Pearmain, 134; the *Paradise*, 443; the *Stubbard*, 1256
Platanus blossoms, 418
Platanus stocks, 6, 51, 110, 140; *Burr* Knot, 6; *Jocin*, 6; *English* Paradise, 6; *French* Paradise, 6, 79; *Scott's* Pommier du Paradis, 964
Platanus, as single lateral cordons, 394; as wall pieces, 505; ringing, 8; speckled, 1068, 1309
Platanus trees, flowering of maiden French cordon, 556
Platanus, buds dropping off, 226; canker or mummifying in, 333; diseased, 278; protecting, 18, 531
Platanus peltata, 83
Platanus Cuninghamsii, 475
Platanus, 28
Platanus education, 222, 259
Platanus aurea, 305; *Baueri*, 305
Platanus, Dr. Seemann's, 220, 713, 895, 1205
Platanus Stelleriana, 1212
Platanus cirrhatum, 447
Platanus, gigantic, from Nicaragua, 220, 713, 895, 905
Platanus conspicua, 166, 362
Platanus locust, the, 1182
Platanus scandens, 1278
Platanus, 1092; preserving, 750; how to keep fresh, 710
Platanus of nursery gardens, 276, 916, 992
Platanus illuminator, 1187
Platanus Filix-femina var. *Elizabetha*, 1114; *Platanus* Filix-femina var. *kalothrix*, 842
Platanus spheric pressure, 55
Platanus of roses, 252
Platanus japonica, obtaining the fruit of, 111; drying of, 163
Platanus leaves, 1157
Platanus Pear, fruiting of the, 1114

B.

Azalea, hardy, 794
Azalea La Superbe, 306; *Madame* Van der Cruyssen, 503; *sinensis* alba, 136
Bachelor's Button, 531, 556
Backhouse, Mr. James, death of, 136
Baines, Mr. T., presentation to, 1157
Bangalore, horticulture at, 392
Barbe de Capucin, 1258
Barberries and *Blackberries*, 1016
Barnes v. *Lady* Rolle, action for libel, 1305
Barnes' testimonial, the, 838, 891, 944, 967, 1157
Barnes, Mr. W., death of, 1334
Barr & *Sugden*'s (Messrs.) trial grounds, 995
Basket, a flower, 417
Battersea Park, subtropical gardening at, 915
Beans, improvement, 817
Bedding, winter, 249; winter and spring, 82; winter v. spring, 137
Bedding-out, good examples of, 1010
Bedding plants, 615, 842; grown at Chiswick, 588, 443, 499, 555; notes on, 529; spring, 1307, 1254; winter, exhibition of, 1210; yellow, 1136, 1160, 1184, 1233, 1283, 1310; yellow and blue, 897
Beech tree, roots of a, attacked by *Polyporus*, 1038
Bee, leaf-cutting, 841
Bees, American Bee Journal, 9, 31; *Alsike* and *McKillop* Clover for, 477; artificial queens, 225; bee-keeping in South Devon, 947, 971; best aspect for, 561; *Boscawen's* hive, or self-filling money-box, 793; *Clovers* for, 589, 617; comparative fertility of queens, 141; death from the sting of, 393; disease in, 197; driving, 899; foul brood, 994; decomposed pollen the cause of, 844; its cure, 113; glass hives, 1187; hives, 1115; honeydew, 767; the long economic hive, 1042; meeting of German apiarians, 309; 365, 667, 717; non-swarming hives, 393; notes for March, 258; notes on South Devon, 691; *Pagden's* How I make 796 a-year by my Bees, 819; quality of honey, 1019; removal of supers, 873; returning bees, 899; *Sir* T. Tancred, Bart., on bees, 421; starvation in the midst of plenty, 1259; supers, 1088, 1162; thickness and wateriness in honey, 225; transferring bees, 231; wintering, 31, 57; the *Woodbury* hive, 533
Beet, Chilian, 1310
Beet-root, experiments with manures on, 891
Begonia Duchartrei, 561; *falcifolia*, 136; *glan-dulifera*, 738; *Sedeni*, 1306
Belvoir, spring gardening at, 501; *Tulips* at, 502; winter gardening at, 441
Berberis, evergreen, 612, 710, 738; *Wallichiana*, 395
Bertemboise grafting, 195
Betula alba pendula elegans, 1278
Bieton, *Camellias* at, 81; the gardens at, 303, 421, 477, 589, 593
Blatta melanocephala, 392
Bletia Sherrattiana, 253
Blight, American, 618
Blue Viola, 1234
Boilers, hothouse, 841, 872, 897, 922, 946, 1040, 1088, 1113; the conservative, 940, 967; *Green's* patent, 79, 166, 223, 336; *Orson's* convoluted, 922; *Pearson's* new, 922; upright, 377; water syphon for, 29; proposed trial of, in France, 1230
Bolbophyllum rotundifolium, 1189
Books Noticed:—*Alphand's* Les Promenades de Paris, 716; *American Horticultural Annual*, 337; *American Pomological Society's Proceedings*, 504; *Washington on the British Rubi*, 898; *Bailion's* History of Plants, 30; *Balfour's* Lessons in Botany, 140; *Barillet's* History and Culture of Pastes, 364; *Bennet's* Winter and Spring on the Shores of the Mediterranean, 1311; *Bickmore's* Travels in the Indian Archipelago, 448; *Blackmore* on Colorado, 994; *Bowden's* Naturalist in Norway, 365; *Bronghart* on the Progress of Descriptive Botany, 30; *Duke's* Greater Britain, 84; *Dottings* on the Roadside in Panama, Nicaragua, and Mosquito, 1294; *Duchartre* on the Progress of Physiological Botany, 30; *Earley* on the Culture of Mushroom, 364; *Fisher* on Growing Roses, 364; *Fries*' Figures of Hymenomycetous Fungi, 1115; *Glenny's* Garden Almanac, 1211; *Gray's* Introduction to the Common Wild and Cultivated Plants of the United States, 1102; *Grieve's* History of Ornamental-foliaged Pelargoniums, 2d ed., 843; *Grindon's* Echoes in Plant and Flower Life, 843; *Gwyn* Jeffrey's British Conchology, 843;

Hallier and *Zürn's* Journal for the Investigation of Parasites, 818; *Hartwig's* Polar World, 1018; *Harvey* (Dr.), *Memoir* of, 504; *Hogelmaier's* Die Lemnaceen, 448; *Henderson's* Practical Floriculture, 337; *Hogg's* Gardeners' Year-Book, 1311; *Hole's* Book about Roses, 1090; *Johnson's* Gardeners' Dictionary, 448; *Johnston's* Atlases of Physical Geography, 1162; *Karl* Koch's Dendrologie, 225, 253; *Kirwan* on Conifers, 280; *Lemaire's* Les Cactées, 140; *Lemaire's* Succulent Plants, 994; *Lord* St. Leonard's Handy-book on Property Law, 1259; *Lowe's* Manual Flora of Madeira, 140; *Mackintosh* on the Scenery of England and Wales; its Character and Origin, 1187; *Masters' Vegetable Teratology*, 690; *Nichie* on the General Management of Plantations, 616; *Microscopical Journal*, 337; *Milde's* Index Botrychiorum, 197; *Milde's* Monographia Generis Osmunda, 107; *Morrison* on the Pruning of Forest Trees, 616; *Müller's* Facts and Arguments for Darwin, 716; *Newman's* Illustrated Natural History of British Moths, 894; *Oliver's* First Book of Indian Botany, 1235; *Pago's* Chips and Chapters for Young Geologists, 796; *Petit* Laëtte, the Vine in the Bordeaux Country, 420; *Rennie's* Insect Architecture, 393; *Rbind's* Vegetable Kingdom, 332; *Robinson's* Parks, Promenades, and Gardens of Paris, 583, 696; *Smith's* Birds of Somersetshire, 1259; *Somerville's* Molecular and Microscopic Science, 141; *Stewart's* Punjab Plants, 1211; *Thomson's* Practical Treatise on the Grape Vine, 742; *Trimen* and *Dyer's* Flora of Middlesex, 1067; *Wallace's* Malay Archipelago, 1041; *Warner's* Select Orchidaceous Plants, 923; *Whittaker's* Almanac, 1311; *Williams' Choice* Stove and Greenhouse Flowering Plants, 743; *Woolhope* Naturalists' Field Club Transactions, 1129; *Wood's* Gardening for the Cottage, 716
Borecole, hybrid variegated, 390
Borecole drawing, 7, 110, 111, 165, 221, 305, 389, 499; sketching, 51
Botanical nomenclature, 1123
Botanic Gardens, Adelaide, 246; Calcutta, 53, 108; *Glasnevin*, 1329
Botanic Society of London, Royal, 872
Botany, Fossil, Mr. Carruthers on, 304
Bottom-heat, 1297
Bougainvillea speciosa, 506
Bouquet, original meaning of the word, 112
Bouquets, button-hole, 109, 249; at the Crystal Palace, 557; at Manchester, Mr. Yates', 815
Brassica lincata, 742
Brassica arcuifera, 358; *Lawrenceana* longissima, 503, 1182
Brazilian plants from Campinas, 1186
Briar verus *Manotti*, 969
British Association, 891, 916, 941, 965, 950
Brooklyn, Prospect Park, 1234; *Washington* Park, 1235
Broom, common, for forcing, 335
Broomfield, *Orchids* in flower at, 169
Broccoli, hardy, 278, 307, 335, 391; *Backhouse's* Winter White Protecting, 307; *Knight's* Protecting, 307; *Veitch's* Early Spring White, 307; *Waterloo*, 593
Budding evergreens, 2256; *Roses*, 139; *Vines*, 1291
Bulls, vitality of, 335; ulcers in, cure for, 223
Bull's (Mr.) nursery, Chelsea, 1235
Butterflies at Pau, 55; the *Peacock*, 8
Button-hole bouquets, 109, 249

C.

Caladium Meyerbeer, 742
Caladium ciliaria, 666; *intermedium*, 843
Calanthe Vestibul, 593
Calceolaria Henrioti, 1278
Calceolaria, herbaceous, 688
Calcutta Botanic Garden, 53, 108
Californian Conifers, 167, 1185; *Pine* cones, 141
Calochortus uniflorus, 1306
Camellia Duke of Lancaster, 9; *Bonomiana*, 196; *Kelvingtoniana*, 83; *La* Maestosa, 106; *quecofolia*, 196; *Tharasa* negri, 196
Camellias, 166; double, 190; outdoors, 81, 336; at *Bieton*, 81; buds, dropping off, 52, 112, 189, 194, 1332
Campanula isophylla, 136; *turbinata*, 136
Camptopus Mannii, 1182
Canadian emigration, 80
Canadian icehouse, 137
Cannes, horticulture at, 1299
Cantharellus carbonarius, 1112, 1186
Carnations, tree, or perpetual, 1233, 1285
Carter & Co., Messrs., seed farms, 890
Caryota Cumingii, 305
Catasetum, new Mexican, 742; *sacatum* var. *pliciferum*, 1182
Caterpillar, the *Vapourer*, 596, 622
Cattleya Eldorado, 115; *labiata* lacera, 738; *Trianae*, 83; *Wallisi*, form of, 196
Cedar of Lebanon, the, 278, 896, 945, 951, 1016, 1040, 1054; seeds of the, 335
Cedrus Deodara (for timber, 1155, 1205, 1233, 1279, 1283
Celery rotting, 226; show of at *Carlton*, 1110
Centaurea candidissima, to propagate, 924; *hybrida*, 1018
Central Park, New York, 1017, 1138, 1186
Centrinus Epidendri, 1279
Centropogon Lucyanus, 738
Cereal, new hybrid, prize for, 276
Cecus lividus, 1278
Cestrum elegans, 83
Chamaesyphus spheroides andelyensis, 1153
Cherries as single vertical cordons, 692
Chimonanthus grandiflorus, 1283; *peocox*, 1231
Child's Menagerie, the, 332
Chinese Primulas, 111, 281
Chlorophyll, Prof. Lawson on, 1320
Chocolate cake, 1016
Cholera ternata, 1306
Christmas Rose, the, 9
Chrysanthomum, new, 197; *Japanese*, 1310; at Messrs. *Salter's*, 1187, 1235; at Mr. *Forsyth's*, 1187; at the *Temple* Gardens, 1187; the culture of, 942
Church decoration, 1296; artificial flowers for, 1307; drawing and making designs for, 1255, 1307
Cibotium regale, 130
Cichorium Intybus, 842
Cinchona at St. Helena, 612, 1016; cultivation of in Bengal, 447; cultivation of in India, 497
Cissus Davidiana, 136
Citrus japonica, 252; stock for, 232
Clematis actualifolia, 1158; *excelsior*, 666; *indivisa* lobata, 198
Cloche, the, 55, 82, 111, 1351; illustration of, 1111
Coal plants, 969, 1019, 1164, 1212
Cobaea pseudiflora, 305
Cockchafer, 1088
Cockroaches, trap for, 478, 924
Cocksfoot-grass seeds, maggots on, 873
Coccoloba Palm, cultivation of the, 1116; fruiting of the, 108
Coco de Mer, 742
Coleogyne Goweri, 445; *Reichenbachiana*, 395
Coffee plant Fungus, 1157
Coleus, the, 474; *Sansonii*, 616
Coloration of leaves, 1138, 1184, 1232, 1253
Commelina deflexa variegata, 558, 1158; *prostrata*, 1158
Committee, scientific, of Royal Horticultural Society, meetings of the, 83, 195, 252, 308, 392, 447, 503, 615, 696, 1210, 1332; subjects brought before the:—*Abutilon* Thompsoni, effect of grafting, 193, 208; acclimatization of *Truffles* in Australia, 252; *Alce*, cultivation of the, 1210; *Apple* stocks, 83, 198; experiments on grafting various ditto, 1210; *Cyclamen* europaeum and *hederifolium*, 308; experiments on growth of seeds, 551, 1210; fertilization of Grasses, 1332; *Holly*, variation in the, 83; *Hyacinth*, abnormal form of, 196, 447; manure for *Vines*, 615; *Myosotis* dissitiflora, two forms of, 615; variegated *Pelargoniums*, experiments with variegated manures on, 1210; *Potato* grafting, 195; *Primulaceae*, experiments on the hybridizing of, 503; *Sugar*-*Boat*, 352; *Sugar*-*cane*, disease in the, 447, 503; *Sycamore*, fasciated branches of, 63; *Walnuts*, blackened by frost, 1210
Condy's fluid, 253
Congress, horticultural, 85, 304, 335; and the congress papers, 897; and its critics, 920
Congress at Manchester, the, 872; papers read at, 735, 814, 839, 865, 892, 917, 942, 965, 1207
Conifers, 1003; adnation in, 539; *Californian*, 167, 1185; from *Watcombe* Park, 941; *Fungus* spaw on the roots of, 1181; in bloom, 398; in South Devon, 1283; leaves of, 190; nature of the female flowers of, 988; planting, 57
Conservatory plants, 25
Continuity of growth, 1279, 1310
Cordon, the, 506, 1111; diagonal single, 442; the horizontal, 223; the unilateral, as an edging for fruit gardens, 1134; and *Calvilles*, 1233; *Cherries* as single vertical, 692; *Plum* trees as, 617; v. other modes of fruit growing, 7
Cordylone Guffoyli, 1278
Cornwall, climate of, 816

Carex aristosa, 1273
 Cossus ligniperda, 224
 Cotoneaster congesta, 1306; prostrata, 1306; Simonsii, 1306
 Cotton, foreign seeds found mixed with, 840, 865
 Courcelles, près Amiens, the gardens at, 807
 Covent Garden Market regulations, 941; notes, 84, 169, 225, 338, 449
 Crickets, 8, 55
 Crimea, proposed international exhibition of fruit in the, 1110
 Crocus Orphanidis, 1278
 Crops, permanent, surface cropping, 688
 Croton elegans, 1185
 Cucumber, Blue Gown, 393; Telegraph, 55, 140; Sutton's Berkshire Champion, 82
 Cucumbers, 55; judging, 740, 765; diseased roots of, 78, 190; destruction of plants of, 391; without bottom-heat, 138
 Cucumis prophetarum, 842, 865
 Cypripedium fragrans, 252; Lawsoniana, 252; beetle attacking ditto, 1022; Lawsoniana pendula alba, 1067; macrocarpa variegata, 1306
 Curcuma purgans, 440
 Currant, Lee's Prolific Black, 843; Red, anomaly of, 278; woolly-leaved Red, 230
 Currant shoots, Black, disease in, 276, 332; disease, 254, 769; bud disease, 841
 Currant tofts, the, 921, 1010
 Cuscuta hamulosa, 1088
 Cutting stealing, 702
 Cuttings, plants raised from, duration of life in, 1257
 Cyclamen africanum, 1182; Atkinsii, 56; europaeum, 308, 361; variation in the leaves of, 196; hederifolium, 308, 361; hederifolium var. gracium, 1331
 Cyclamens, Mr. Atkins' paper on, 308
 Cymbidium Dayanae, 710; tigrinum, 392
 Cyrtopodium Hurrianum, 108, 190; niveum, 1088; pardinum, 554; Parishii, 742
 Cyrtanthus McKenii, 641, 964

D.

Dahlia imperialis, 1182, 1210; grafting the, 1182
 Dahlias, list of, 394
 Dalechampia Roeziana rosea, 601
 Dasylylion Hartwegianum, 789, 817
 Daubigny, the late Professor, inscription to the memory of, 1084
 Davallia Mooreana, 964
 Deckeria nobilis, 1067
 Delostoma dentatum, 305
 Dendrobium barbatum, 556; barbatulum, 556; binoculare, 785; cariniferum, 611; crassinode, 164, 196, 1306; densiflorum albo-luteum, 733; Devonianum rhodoneurum, 196; Falconeri, 501, 530, 534, 640; hexadesmia, 710; Huttoni, 686; Jamesianum, 554; lamellosum, 277; luteolum, 252; miserum, 388; superbum Huttoni, 1208; superbum valutinum, 1208; Veitchianum v. macrophyllum, 684; Williamsianum, 78
 Dendrochilum filiforme, 849; glumaceum, 785
 Deodar, planting for timber, 1185, 1206, 1288, 1270, 1283
 Designing of new works by gardeners, 804
 Devonshire, spring in, 502
 Deyach Dhooz to Jumnotri, journey from, 270
 Dianthus hybridus striatiflorus, 139; neglectus, 1306
 Dichorisandra undata, 83
 Dickson & Co.'s nurseries, Edinburgh, 83
 Dieffenbachia nebulosa, 503
 Dilke, Sir C. W. Wentworth, death of, 527, 533
 Dipladenia boliviensis, 738
 Disa grandiflora, 449
 Disengagement, how I got over my, 1159
 Dodder, the Lucerne, 1028
 Drimba Cooperi, 1158
 Dry-rot, cure for, 1310
 Duration of life in plants raised from cuttings, 1257

E.

Ecklon, Dr., the late, 780
 Edinburgh, Royal Botanic Gardens, 365; international show at, 1087, 1111
 Education, arboricultural, 222, 250; forest, on the Continent and in England, 1205
 Egypt, cultivation of Strawberries in, 689
 Edersalle House, Manchester, the Orchids at, 798
 Elms, 54; covered with gnara, 252; variegated, 641; weeping, 840
 Elm timber, 166; method of preserving, 194; seasoning, 224

 Piano, the occidental, 1114
 Planos, grown in Belgian gardens, 940
 Plant life and its teachings, 994
 Plants, new or rare, described:—Adiantum
 decorum, 582; Ampelopsis tricuspidata
 (Vitchii), 838; Bolbophyllum (Cirrhopetalum)
 rotundiusculum, 1182; Brassia arcuigera, 388;
 Catasetum escatum var. pliciferum, 1182;
 Cattleya labiata (Trianea) lacera, 738;
 Cologyn Goweri, 443; Cymbidium Day-
 nium, 710; Cyrtopodium Harrisianum, 108;
 C. niveum, 1038; C. pardatum, 554; C. Par-
 labii, 814, 1158; Davallia Mooreana, 964; Den-
 drobium bicolorale, 785; D. cariniferum,
 611; D. brassinode, 164; D. hexadensia, 710;
 D. Huttoni, 680; D. Jamesianum, 554; D.
 lasioglossum, 277; D. miscrum, 388; D.
 superbum (macrophyllum) velutinum, 1206;
 D. superbum (macrophyllum) Huttoni, 1206;
 D. Williamsoni, 78; Epidendrum caligarium,
 1110; E. Karwinakii, 710; E. moliosum, 989;
 Eranthemum Andersoni, 134; Godwinia gigas,
 1330; Gongora portortosa, 893; Houllotia
 Wallisii, 611; Lailia elegans var. lobata,
 1158; Lailia macrotia, 1110; Macadama
 ternifolia, 1231; Melastachyum gemma, 988;
 Mesospindium Bowmanii, 1182; Miltonia
 Warscewiczii, 277; Mormodes Sclimieri, 50;
 M. unca, 692, 1205; M. variabile, 1038;
 Odontoglossum anthoxanthum, 398; On-
 cidium andigenum, 416; O. euxanthium,
 1158; O. exasperatum, 892; O. gyrobolbon,
 838; O. hypophanatum, 814; O. Phala-
 enopsis, 416; Ornithocephalus Oberonia, 988;
 Orthosiphon stamineus, 941; Passiflora
 macrocarpa, 1012; P. organensis, 1168;
 Pescatorea Wallisii, 710; Pinus sylvestris
 haynensis, 473; P. Taurac, 191; Pleuro-
 thallis Bowmanii, 989; Polycygnis lepida,
 1038; Restrepla antennifera, 1254; Sar-
 canthus arifolius, 416; S. chrysomelas,
 682; Selenipedium longifolium, 1205;
 Stanhopea gibbosa, 1254; Struthiopteris
 orientalis, 498; Tacsonia quitensis, 388;
 Trichocentrum tigrinum, 892; Trichoceros
 parviflorus, 1254; Vanda cœrulescens, 498;
 V. Dentoniana, 528; Zygostates Greeniana,
 988
 Plants, action of ether on, 793; effect of frost
 on, 107, 167, 194; effect of green light on, 277;
 dwarf surface clothing, 991; exhibition,
 sizes of pots for, 407; for bedding, notes on,
 528; for conservatory, 55; foliage bedding,
 967; greening of etiolated, 1308; hardy
 herbaceous, 389, 945; in bloom in Feb-
 ruary, 278; decomposition of carbonic
 acid by, 1157; local names of, 8; old
 English names of, 799; on the improvement
 of, 814, 839; rare and interesting, award for,
 837, 1205; showing in small pots, 471; steal-
 ing, 762; subtropical, experiments with,
 at Battersea Park, 566; transportation of,
 845; in vinerias, 81; the wonderful, 916,
 945; wild, local names of, 80; winter flower-
 ing, self-fertilisation in, 1205
 Plant portraits, 136, 334, 738, 1158, 1182, 1278,
 1306
 Plectocoma elongata, 1067
 Pleione Wallichiana, 1114
 Pleurothallis Bowmanii, 989
 Plum, Dry's seedling, 898
 Plum, bladder, 664; French, 1330
 Plum trees as cordons, 617
 Podocarpus coriacea, hardy, 1210; Maki
 variegata, 503
 Polyanthus pin-eye v. thrum-eye, 445
 Polycygnis lepida, 1038
 Polygonum capitatum, 1182
 Pomological Congress of France, 249
 Pomological Society of America, 1110

DOBSON'S PRIZE FLOWER SEEDS.—

Excelsed by none.
DOBSON'S PRIZE CALCEOLARIA SEED.—Our collection embraces the most magnificent varieties, whether for compactness of habit, variety, richness or distinctness of colour, abundance of bloom, &c., and brought to that state of perfection as does not admit of any improvement. Our collection this season has been more than usually rich and brilliant in colour, and we feel quite satisfied that we have never before offered Seed with so much confidence as we can do this season. Our collections invariably take prizes at the London Exhibitions, viz.—International Exhibition, Royal Horticultural and Royal Botanic Societies, and Crystal Palace. Seed in sealed packets, 1s. 6d., 2s. 6d., 3s. 6d., and 5s. each.

JAMES'S PRIZE DITTO, in sealed packets, 1s. 6d., 2s. 6d., 3s. 6d., and 5s. per packet.

DOBSON'S PRIZE HALSAMS are rich and varied in colour, very double, and of large size, and worthy the attention of Exhibitors. Eight varieties, separate, 2s.; mixed, 1s.

DOBSON'S PRIZE CINERARIA SEED.—Our collection, from which we have Seed, consists of all the best varieties of all raisers, and produce a first-rate assortment of Seedlings, which are remarkable for their good quality. Our collections have invariably received the 1st Prizes at the Shows the last 5 years. Seed in sealed packets, 1s., 2s. 6d., and 5s.

DOBSON'S PRIZE PRIMULA SINENSIS FIMBRIATA RUBRA.—The produce of this Strain have fine large and richly-coloured flowers, with fine fringe, so essential in this class of plants, and we can warrant them as unsurpassed. Sealed packets, 2s. 6d. and 5s.

DOBSON'S PRIZE PRIMULA SINENSIS FIMBRIATA ALBA.—A splendid large variety, of pure white, finely fringed, and throwing the flower-spikes nicely out of the foliage; the habit good; 2s. 6d. and 5s. The above varieties in mixture, 1s., 2s. 6d., and 5s. per packet.

PRIZE POLYANTHUS, took 1st Prize at Kensington Spring Show, 1868, 1s. and 2s. 6d. per packet.

SCARLET INTERMEDIATE STOCK, fine rich colour, good habit, 6d. and 1s. per packet.

ANTIRRHINUM, extra fine, mixed, 6d. and 1s. per packet.

HOLLYHOCK, Dobson's superb, mixed, fine double, 1s. and 2s. 6d. per packet.

LOBELIA SPECIOSA, true Crystal Palace variety, 6d. and 1s. per packet.

PANSY, finest, mixed, from Show flowers, 1s. and 2s. per packet.

SWEET WILLIAM, a beautiful strain, 6d. and 1s. per packet.

John Dobson and Sons' SEED LIST for 1869 is now ready, and will be forwarded post free on application.

John Dobson & Sons, Woodlands Nursery, Isleworth, and Hounslow.

Genuine Seeds.—Carriage Paid.

GOLDEN CHAMPION GRAPE.

"THE WHITE GRAPE, ABOVE ALL OTHERS, FOR GENERAL CULTIVATION."

SEE THE FOLLOWING EXTRACTS:—

"This is indeed a noble Grape, and one which will take the highest rank amongst White varieties. It supplies a desideratum which has long been felt, viz. the possession of a White Grape of easy culture like the Black Hamburg."—*H. in Gardeners' Chronicle.*

"We look upon this Grape as decidedly the finest White Grape we have ever seen, and destined to take its place by side with the Black Hamburg."—*Gardeners' Magazine.*

"In size and appearance it far surpasses any White Grape, and in flavour it is excelled by none except Muscats."—*Journal of Horticulture.*

"Robust in constitution and free bearing as a Black Grape, this is certainly the best White Grape (always excepting the one of Alexandria), the world—so far as we know of it—has ever seen."—*Nottingham Guardian.*

Plants are now being sent out, price 21s. and 42s. each.
 Strong Fruiting Canes, 63s. each.

OSBORN AND SONS, FULHAM NURSERY, LONDON, S.W.

IMPORTANT.—To prevent confusion, all Letters should be addressed WILLIAM PAUL—the Christian name full, as above.

NOTICE IS HEREBY GIVEN, that the PARTNERSHIP heretofore subsisting between us, the undersigned, ANTHONY WATERER and ROBERT GODFREY, carrying on business as Nurserymen and Farmers at Enap Hill Nursery, near Woking, in the County of Surrey, under the style or Firm of WATERER & GODFREY, was DISSOLVED on the 24th day of JUNE last...

STEPHEN BROWN begs most respectfully to tender his best thanks to the Nobility, Gentry, and his Customers generally for the very liberal patronage he has received during the number of years he has been in Business, and has much pleasure in recommending as his successor MR. DAVID GOLD MCKAY, who has purchased the BUSINESS and STOCK in TRADE carried on at 11, Market Hill, Sudbury, and he is sure the Business will be conducted with satisfaction to those who may favour him with their patronage.

DAVID GOLD MCKAY, who has Purchased and Succeeded to the above Business, begs respectfully to solicit from the Nobility, Gentry, and the Public generally, a continuance of the support so long and so liberally bestowed upon his predecessor, and assure them it is his full determination, combined with his long experience in the Trade, to send out Seeds True to Name, Genuine, and Unadulterated, at strictly moderate prices (see Catalogue), and from those who have not hitherto favoured his predecessor with Orders he respectfully solicits a trial, believing it would lead to increased confidence. All orders (however small) shall receive his careful and personal attention, and be executed with the greatest possible dispatch.

STEPHEN BROWN offers the following at the annexed low prices:—
CONIFERAE, 25 choice sorts, 2 to 3 feet high, in fine condition 40 0
18 choice do. 35 0
25 choice do., larger size 70 0
18 choice do. do. 50 0

STANDARD TREES, as Scarlet Chestnut, Scarlet Thorn, Weeping Ash, &c. 12 fine sorts 16 0
FLOWERING SHRUBS, 25 fine sorts 14 0
PYRAMIDAL APPLES and PEARS, finest vars. per doz. 12 0
do., extra splendid, large fruiting trees, each 3s. to 5 0
GRAPES, from eyes, strong canes in pots each 2s. 6d. to 3 0
STRAWBERRIES, Bradley's Dr Hogg per 100 10 0
Underwood's Lady 10 0
other fine and popular sorts—per 100, 3s. to 5 0
RHUBARB, Salt's Crimson Perfection per doz 10 0
Royal Albert 8 0
POLYANTHUS, Gold Chain 8 0
choice named vars. each 1s. to 2 0
PINKS, in eight fine vars., 1-2 per doz. 6s., 9s. and 12 0
PAMPAS GRASS, very strong per doz. 6s. to 15 0
GYNERIUM ARGENTEUM ROSEUM PENDULA, an elegant Pampas Grass, with drooping spikes of a purple-rose tinge, each 2s. 6d. to 3 0
DWARF ROCK CISTUS, 20 beautiful varieties for 10 0
DOUBLE POTENTILLA, very beautiful, 6 varieties for 10 0
VIOLETS, the finest varieties, per dozen 3s. to 5 0
HERBACEOUS PLANTS, in 800 best sorts. Catalogues free.
LILIES, in 80 superb varieties, per dozen 6s., 9s., 12s., 15s., and 24 0
GLADIOLI GANDAVENSIS hybrids, in 160 finest varieties, per dozen 3s., 6s., 9s., 12s., and 15 0
PEONY, CHINESE, 12 finest varieties 9 0
PEONY, CHINESE, FRAGRANT ALBA, fine large showy white flowers 0 0
CYCLAMEN, 12 beautiful varieties 12s. to 21 0
CYCLAMEN 6 beautiful varieties 6s. to 10 0
NURSERY, HERBACEOUS, and BULB CATALOGUES free on application.

STEPHEN BROWN, Sudbury Nursery, Sudbury, Suffolk.

Choice New Seeds.

THE FOLLOWING have been either saved at the ROYAL NURSERIES, or from stocks selected by CHARLES TURNER.
BALSAM, from a prize collection, 1s. per packet
CENTAUREA CANDIDISSIMA, 1s. per packet
GYMNOCARPA, 1s. per packet
CARNATION, from exhibition kinds, 2s. 6d. per packet
OLIVADEN FORGET-ME-NOT (Flaxweed), 1s. per packet
FOXGLOVE, from Ivory's varieties, 1s. per packet
HOLLYHOCK, from all the new kinds, 1s. per packet
Collection of 24 named varieties, 5s.
LOBELIA SPECIOSA, 1s. per packet
PHLOX, Herbaceous, from own collection, 1s. per packet
PINK } from named varieties, 2s. 6d. per packet
PICOTEE }
FELARGONIUM, SHOW, 2s. 6d. per packet
" FANCY, 2s. 6d. per packet
" TRICOLOR, 2s. 6d. per packet
" VARIEGATED, 2s. 6d. per packet
" ZONAL, 1s. per packet
PETUNIA, very choice, 1s. per packet
PYRETHRUM GOLDEN FEATHER, 2s. 6d. per packet
VERBENA, from finest named kinds, 1s. per packet
VIOLA CORNUTA, 1s. per packet
" LUTEA, 2s. 6d. per packet

VEGETABLE SEEDS.

BRET, PINE-APPLE, 1s. per oz.
BROCCOLI, SNOW'S TREE, 2s. 6d. per packet
CABBAGE, BAILEY'S SUPERB, 1s. per packet
CELERY, TURNER'S INCOMPARABLE, 1s. per packet
CUCUMBER, BERKSHIRE CHALLENGE, 1s. 6d. per packet
HEDSOR PROLIFIC, 1s. 6d. per packet
MELON, BAILEY'S ECLIPSE, 2s. 6d. per packet
" GOLDEN QUEEN, 2s. 6d. per packet
" BEECHWOOD, True, 1s. per packet
PEAS, LITTLE GEM, First Crop, 2s. per quart
" ADVANCER, Second Crop, 2s. per quart
" PREMIER Third Crop, 2s. per quart
SAVOY, NEW FRENCH, 1s. per packet
CHARLES TURNER'S NEW SEED CATALOGUE, containing all the newest and best varieties, can now be had post free on application.

THE ROYAL NURSERIES, SLOUGH.

FOSTER'S 'X' FINE LONG RIDGE CUCUMBER.—This is a variety of a remarkably fine hardy long dark green cucumber and one that can be recommended with the greatest confidence. It is very prolific and keeps its colour to the last. All who have seen it or sown are satisfied that it cannot be surpassed, and those who have tried it favour are convinced of its excellent quality, and such that the small quantity of seed raised is a ready nearly exhausted. Length 1s. to 18 inches. Price per packet of 12 seeds 6s. 1s.
EXTRA FINE NEW HYBRIDIZED PETUNIA.—Saved from the best large crimson, blotched, striped, and pointed varieties. Price 1s. and 2s. 6d. per packet.
DIXON'S MAMMOTH WHITE CELERY, per packet 1s.
DIXON'S YORKSHIRE NEW PEA, per quart 1s.
FOSTER'S EMPEROR, fine frame CUCUMBER, per packet 2s.
KARL DIXON, 87, Queen Street, Hall.

The Gardeners' Chronicle.

SATURDAY, JANUARY 2, 1869.

In reviewing the events of the PAST YEAR in its horticultural aspect, we can no more help calling to mind the political doings of the same period than, according to SHAKESPEARE, the gardeners of RICHARD THE SECOND'S time did under similar circumstances.

"Superfluous branches Lop away, that bearing boughs may live;"

while, on the other hand, there are others whose policy is to

"Give some supportance to the bending twigs."

Fortunately for us in regard to these matters

"All must be even in our government"

while in matters purely pertaining to our craft, and wherein our neutrality is not enforced, there is happily, in spite of minor differences, a unanimity of purpose and a singleness of aim directing all our efforts to

"Keep law and form and due proportion Within the compass of our pale."

True, the means of doing this are very varied. While some

"Cut off the heads of too fast growing sprays,"

others -

"Root away The noisome weeds, that without profit suck The soil's fertility from wholesome flowers."

And so in gardening matters—using the phrase in its widest sense—while the aim of all is the general advancement of the craft and of the craftsmen, the means of effecting this end are not a little different. Speaking broadly, there are those whose anxious forethought and watchful care are made manifest by the brilliant and solid results they lavish on our exhibition tables, while there are others equally hard working, with the self-same ultimate object in view, joying in their work, though with a sense that the "results" may not so speedily be realised or presented in so attractive a form.

Among the Horticultural Exhibitions of the year the two most noticeable were those of Ghent and Leicester. The former, which was of an international character, was again strongly suggestive, as most of the foreign shows are, of the desirableness of a more picturesque arrangement of the plants brought together—a feature which to some extent regulates the prize schedule, inasmuch as such bold objects as large Palms, Ferns, and Cycads, are more freely used than with ourselves. This picturesque disposition is obtained mainly by the economical abandonment of staging, the dwarfier plants being set en masse on the surface, and the taller ones used either as "starers" to break the view at particular points, or to hide the retaining walls. Single graceful plants set up thus on slender pedestals, here and there, produce far more effect than when all are staged alike in formal phalanx. The Leicester show confirmed the experiment of the preceding year at Bury, and though not so successful in a pecuniary sense, showed conclusively that the provincial visits of the leading horticultural body must to a greater or less extent stir up the horticultural

talent of the country, and thus be productive of benefit both to gardening and gardeners

Another feature, which we may certainly note with pleasure, is the steady progress of the taste for Spring Gardening. It is not every one who could hope to compete with Chiveden, Belvoir, or Nuneham in these matters. It is not every one who is endowed with the taste or the enthusiasm of the proprietress of Wardie Lodge, but there is not a suburban fore-court a red square in extent, but might be brightened at a trifling cost by the tender children of the spring.

Turning to other departments—the establishment of a Scientific Committee by the Royal Horticultural Society to co-operate with the other committees, is a real matter for congratulation. Discussion by men competent in their several departments—free, open, unbiassed discussion—will be most serviceable in many matters connected with horticulture. Again, the sub-committees told off to investigate and report on such subjects as spot in Orchards, the relation of manures to the growth of particular plants, the best modes of pruning, and the like, cannot fail to do good service, even if they do not entirely settle the points in dispute. One thing we may remark with reference to this committee. If it is to become one of the chief means, as we hope it is, of educating the horticultural talent of the country—if it is to be the focus through which the rays of chemistry, of botany, of geology, and what not, are to be converged on horticulture—it must have some more efficient means of bringing its work before the public than it now has. Up to the present time our own columns have, as we believe, formed almost the only channel through which the doings of the committee have been made known to those most concerned. It is our duty, no less than our pleasure, to act as chroniclers in this matter, but we can but feel that the communications that are made to the committee are deserving more full publicity than the abstract that our space permits us to give.

The publication of Mr. DARWIN'S work on the Variation of animals and plants under domestication is another of the features of the year. We do not hesitate for a moment in saying that this work will exercise a powerful influence on practical gardening and agriculture in the future, none the less powerful in that its effects will be made manifest by practitioners to whom the very name of the author may be unknown. Looked on merely as a repertory of facts, we do not know where else the student could find, collected together in one book, such a mass of details relating to the history of our domesticated animals and plants, and of their manifold varieties, as is collected together in these volumes, while the chapters on inheritance, hybridisation, selection and variation teem with lessons and suggestions which the thoughtful practitioner will not fail to turn to good account. The work in question may well encourage observers to record the results of their experience, when they see the use made of them. In this sense it is with peculiar pleasure that we find our own columns, and those of our contemporaries, have furnished so many facts and illustrations to the author.

The Obituary of the year—always a painful list to look on—is perhaps not so full of great names as has unfortunately been the case of late years. Still we have had to lament the loss, within the cycle, of persons so intimately connected with horticulture as HENRI VILMORIN and NATHANIEL BAGSHAW WARD, both of whom seem to have had the faculty of securing the esteem of all with whom they came in contact. Among botanical collectors—that enterprising band to whom we owe so much—the losses have been severe, how severe the names of PEACOCK, HOWMAN, HURTON suffice to indicate. Among botanists and travellers we have had recently to record the death of WALKER-ARNOTT, VON MARTIUS, SCHNIZLEIN, and POPPIG, the two latter better known in Germany than here, the two former of world-wide repute. Sadly it is a violation of propriety to speak in the same breath of the loss of these great men, and of the destruction of the dragon tree of Teneriffe, to which so much interest attached. To us all the idea of being the first to record the overthrow of this famous tree, which had an interest for the general public almost as great as for professed plant-lovers.

Of our own share in the work of the year we must of course say but little. We have endeavoured to keep our readers conversant with what has been doing in the horticultural world, and to afford them a free stage for the discussion of all matters of interest to them.

Thanks to our correspondents, we have been enabled to give illustrations of gardening and cognate matters, not only in this country but from China to Peru—at any rate, in Tuscany and in Australia, in the Riviera and in New Zealand, in Russia and in India, in Switzerland and in Spain. The year before us is one that promises to be full of interest for plant-lovers of all descriptions. With the assistance of our correspondents we hope to do our part as faithful chroniclers of its events.

THE recently published triple number of M. VAN HOUTTE'S "Flora des Serres" contains pictures of some remarkably beautiful NOVEL GLOXINIAS (*Lageria speciosa*). One of these in particular, called *Fleur de Flandre*, is the most charming we have yet seen. It is one of the drooping flowered race, the corolla being white, with an internal belt of crimson halfway down the tube, which, beyond this to the base, is minutely dotted, as in the new French sorts, while the throat and inner portion of the limb is pure white, the extreme margin being also a narrow line of pure white, just within which is a bold and pretty feathered band of red-lilac-violet. This combination of colours has a most charming effect. Another, called *Rose et Hermine*, is erect-flowered, white, with the limb almost wholly of a mottled carmine tint. *Centure d'Hebe* is semi-drooping, with a white tube and narrow even white border, while the limb segments are of a carmine rose dashed with lilac. *Cordon lavande* is erect-flowered white, with a narrow belt or edging of pale lilac. *Violette neigeeuse*, a drooping-flowered sort, is of an entirely novel and curious mottled tint of dark heavy purple. Finally, *Leon Van Jer Wee* is a very richly coloured drooping-flowered variety, with the lower part of the tube pale and spotted, the upper part and the throat of a deep rich purple-crimson, coloured equally all round the tube, this passing off into bright carmine over the centre of each limb segment, and surrounded with a broad edging of white. These lovely flowers have wonderfully improved of late, and M. VAN HOUTTE'S establishment has long been famous for the successful hybridisation of these and other Gesneriads witness the splendid *Plectopomas*, recently alluded to in our list of Plant Portraits.

— We have before us fine blooming specimens of the noble *LASIANDEA MACRANTHA*, sent us by Mr. BILL, which shows that the flowers of this grand plant may be had in winter as well as in summer, which is an additional recommendation. Notwithstanding what may seem to be an unfavourable season, the blossoms are even now nearly five inches across, and are of the richest violet hue, a tint which has not been reproduced in any of the illustrations which have yet appeared.

— We are requested to state that the pamphlet advertised as "THE IMPROVED METHOD OF GROWING FRUIT," is by the Rev. JNO. FOUNTAINE, and is merely a slight variation on orchard-house culture. The subject was mentioned in our columns, 1867, p. 1193.

— For the benefit of a rapidly increasing class, we this week commence a series of notes on TOWN GARDENING, by one of the most successful practitioners of gardening under difficulties.

APPLE STOCKS.

1. *The English Paradise*—This was introduced from Holland early in the last century, and is called by Miller in his Dictionary the "Dutch Paradise." It is quite distinct from the stock called the *Dauvin* in France. A very near relative of this kind of stock is to be found among the stock-growers in Surrey. To quote Miller, "This sort will not decay or canker as the other—the French Paradise, nor does it stunt the grafts so much, so is generally preferred for planting espaliers or dwarfs, being easily kept within the compass usually allotted to these trees."

Since the time of Miller there have been doubtless, other surface-rooting seedling Apples raised having the same effect on the graft as the above, and here we called English Paradise stocks. I can testify to two kinds raised here from seed some 40 years since, and now found so eligible for cordons, bushes, or pyramids, as to supersede all other kinds of dwarfing Apple stocks, and to lead to the planting here alone of from 60,000 to 70,000 annually. One of these stocks, the *Nonsuch* gives such a prolific habit to Apple trees, that small bushes only 1 foot high are crowded with blossom buds, and some trees exhibited at South Kensington in October last were equally crowded with fruit, although but 18 inches in height. Besides these kinds of Paradise stocks, Mr. Scott, of Crewkerne, has, I believe, raised one or two kinds of Paradise Apple stocks equally eligible. Hence I am enabled to contradict decidedly Mr. Robinson's assertion in a contemporary, that the term "English Paradise" is a misnomer, if by that he implies that no such stock exists.

2. *The Doucin*.—This is used in France for pyramidal Apples in gardens. There are several varieties under this name in the different departments of France, some of them very inferior, with small leaves, and a stunted, storky habit; the best kind approaches the habit of the English Paradise in having broad, shining leaves, but on the whole, is not equal to it, as the stock does not swish so regularly with the graft in our climate. It is, as Mr. Robinson says, an inferior stock for cordons, and not at all equal to our English Paradise stocks for that, and all other garden purposes.

3. *The Barr Knot*—Some years since, when making a call on Mr. Fleming at Trentham, he mentioned this stock as being an excellent one for garden Apple trees,

inasmuch as it seemed to suit the soil and climate. This turned my attention to it, and I found it was well known in this county, as a Mr. Byde, a magistrate or then living at Ware Park, had planted it extensively, calling it his "walking-stick Apple," because he used to cut off a truncheon from an old tree, and after sawing it as a walking-stick, plant it in his garden, where it planted itself by its 18 inches, it would root and bear fruit the second year. Independently of its bearing a really good kitchen Apple, it forms a good stock, being at the surface, and inducing fruitfulness, a more difficult of propagation than the English Paradise stock, its young shoots not rooting so freely. Near North, South Wales, there is a race of the so-called Knot Apples, all the varieties of which root freely at the surface, and make good stocks for garden Apple trees.

4. *The French Paradise*, or *Pommier du Paradis* of our French neighbours. My knowledge of this stock dates from 1827, that of Mr. Robinson's being so long a date—and if the old saw-sawyer's verb, *experientia docet* means anything, I can know something about it. There is no doubt that being one of the dwarf Apples—*Armenia*, as I had had them both under cultivation and the early Paradise cultivators most probably names, under the name it came thence. In those old times, however, the stock was entertained that the site of Paradise was in the highlands of Armenia, considering the text, Genesis points to a position near the sources of the rivers the Pison, the Tigris, the Gihon, and the Araxes. *Armenia* being an old Apple-growing country would give such a habit of root—as dwarf Apples—after the manner that Japan and China give various and other strange varieties of trees and shrubs, are the effects of domestication. England is now being old in Apple cultivation, hence it is that if any of our old varieties of Apples are sown, they displace dwarf-surface varieties, sorts fit for stocks for garden trees. One variety raised from seed here is so small that I call it my pigmy stock, it is the same habit as *Armenian* or *French Paradise*, but is smaller in all parts, so that an Apple tree grafted on it will grow in a breakfast cup. The unmeaning given to this stock probably had its origin in the middle of the 17th century there was a deeper Christian, or perhaps superstitious, feeling the Continent than in these times, and the little Apple trees brought from Armenia would be looked upon with great interest, and some of the natured priest would perhaps suggest that, as it was sown in Armenia, that it be the *Apple of Paradise*, and hence the name. In Evelyn's time, even before then, this stock seems to have been in gardens, for in noticing double grafting I shall on occasion to mention a very old writer on fruit trees seems never to have made much progress, however, fashion for a few years having to some writer to be seen the little trees in France, and then come home and talking and writing of the marvels he had seen, and then going out, as has been the case in ladies fashions, for doubtless chignons were not before the Flood! In Miller's time (the middle of the last century) the French Paradise seems to have been in common cultivation in England, for he says "Paradise Apple hath of late years greatly obtained stocks to graft a bud upon, but these are of no duration unless they are planted so low that the graft take root, when it is equal to a stock. These trees have been much more esteemed in France but being so curious are not esteemed in England." May it be so, before we hear again about this stock, a special correspondent seems to have lived and collected praises. The truth, I believe, is, that fruit gardening was confined to the orchard of the farmer, and all perfect walled-in gardens of the wealthy, and all Paradise stocks and other stocks were of no use to me for I remember, in 1825 to 1830 buying several Paradise stocks of Messrs. Buchanan, of Cambridge, they were grafted here, and but few were seen, gardeners would not believe that any stock would grow on a tree dwarf and prolific. I believe I was inclined to go with them, but I soon found that the path led lead forwards. I planted some of these stocks, and grafted them with Sturmer Pippins. They are still here.

I have in a preceding paragraph disputed Mr. Robinson's assertion, that the English Paradise was a misnomer. I must, in the case of truth, be equally peremptory with respect to Apple trees grafted on the French Paradise, being fit for horizontal single cordons, trained on wire. I simply and decidedly assert that in England they are the most unfit of all for that purpose, the question why? I answer because the tree is bent down to be fastened to the wire, and the clusters of blossom spurs at the bend, that there is enough of vital force in the stock to throw out a young shoot to be tied to the wire, and thus continue edging; thus, if trees are planted only 4 or 6 feet high they are long before they touch each other, and instead of cordons they become stumps. It would be pleasant to take one's friend into the fruit garden to be compelled to say *Voici mes chignons* (look at my stumps) instead of cordons. The English Paradise stock, on the contrary, forms a nice continuation of the young shoot being more vigorous, so that it may be grafted on to its brother in front.

Again, I am compelled to be decisive. Mr. Robinson's cold clayey soils than in those that are more fertile. This, as regards the soil, is a complete mistake it is the exact converse of the truth. In France, as to the heat and dryness of the climate, the French Paradise stock requires a cool, moist, retentive soil. England a light, generous loam, and a warm summer. It is not tender as regards frost, and the well known, *Armenia* is very cold. It is quite

real advantages, which cannot be claimed for any other kind of tree whatever, we trust your readers will allow that the contents have advanced good reasons for clearing them...

Ascertaining how healthy what the French stock is not, we are entitled to an equally lucid explanation of what it is. It is the more needful to have this matter of the stocks cleared up, from the fact of the importance given to it in connection with the importation by your correspondent of over 1000 Apple trees from France...

LIME APPLE PESTS

I HAVE lately corrected your columns some remarks on the pests culture, &c. of this noble fruit and wish to state a few facts, and make a few remarks in reference thereto. One correspondent tells us that by some mischance or oversight he once got on to his fruiting plants in bloom and out of bloom that troubled me and others...

As a result I will venture to relate what I once witnessed at a thriving little manufacturing town. A company of mountebanks had pitched their tent, and commenced their various and other tricks for the amusement of the yokels...

May I be allowed to inquire of Mr Hamilton how to reach and exterminate those heavy-bugs with their legs and young broods, which are always nested in the soil, the cracks of the paths the drainage the porous materials the fissures in the walls or rafters...

Home Correspondence.

Names of Plants. Some time since the meaning of the word 'Applering' was asked by one of your correspondents and various explanations were given. I lately met with a copy of Dr. James's Scottish Dictionary, and found the word was, as one of your correspondents thought it, of French origin.

under Boyd, who is said to have been an extraordinary genius, was born in 1562. Among his many works there is one called 'Hymni,' the subject of which is, not hymns as might be supposed, but a description of different plants. The titles of his poems are: 1. Rosa, 2. Vicia, 3. Lilium, 4. Hyacinthus, 5. Primula, 6. Petrus, 7. Narcissus, 8. Phlox, 9. Lavandula, 10. Camerula, 11. Iris, 12. Crocus.

Water Tanks.—A "Subscriber," at p. 1817, 1868, asks for information relative to a water-tank. Having had three of them in the course of 30 years, I will give him my experience. In the first place, I think if he requires a large tank it should be underground, and might be covered with a mound sown with Grass...

Orchard-house Lettuces.—I forward samples of some Lettuces grown in my Cherry-house. The rows of trees plunged in pots are 3 feet apart, and one foot space in the centre between each row, is devoted to winter Lettuces. Part of the crop of those sent has been in use all the month the seed was sown early in September, those sown in October will come into use in February and March.

Earliness of the Season.—The season is much earlier than usual this year. The fruit-buds begin to swell, and very soon the hail-flicks will attack the young tender ones. In this neighbourhood there are great numbers which at present content themselves with the seeds on Brambles and Heath, and also the young buds of Larch, to shoot them all is impossible.

Snakes. I beg to suggest to "Enquirer" a simple method of keeping the snakes which trouble him so much in moderate bounds without killing them. If at the proper season he will have the leaves of better preparation for kitchen garden use, or deposits of similar material, where mowings of Grass, peats, or garden rubbish of any kind are thrown in addition, well searched he will most likely find large masses of the eggs of the ringed snake, and destroying these will do him much good.

Adulteration of Seeds.—I have seen with some surprise that one of your correspondents considers the inquiry which the Council of the Royal Horticultural Society has been making into the adulteration of seeds

a far-ol one. I can assure him the public do anything comical or farcical in it, and I trust the time is far distant when an inquiry into the conduct of the British tradesman will be so unbecomingly large has been made to an appearance most certainly the principal seed dealers not only anonymous but by a subscription of the Royal Horticultural Society...

Pines and Mealy-Bug.—I beg to thank Mr. Cott and Mr. Hamilton for their very touching fruiting Pines. We have here four houses now for the growth of Pines. The fruiting house is the only one infested with the bug, and was brought about by placing in it a few stoves of these infested, which were sent as a present to a neighbor.

Peacock Butterflies.—I have this day, Dec. 22, in the open field, a beautiful peacock butterfly, which was very common, but I had never seen it before. I had a good view of its wings, but it was in the act of flying, and I was unable to get a better view than my sketch at this date.

Autumn Fruiting Raspberries. In the garden at Netcham Park, near Aylesbury, can be seen, October some red and yellow variegated Raspberries, loaded with fruit of fine quality. Was the aspect presented on the 4th of October when a visit was paid to the garden. They bear fruit about the second week in August, and before Christmas if the weather be not favourable, frost does the fruit but little harm, but if wet and stormy weather be followed by frost, the gets destroyed.

Crickets. If your correspondent R. W. Pines will procure and send me a small quantity of the same, I will send you a small quantity of the same, I will send you a small quantity of the same, I will send you a small quantity of the same.

Princess of Wales Peach.—Mr. Rivers states that the Peach ripens just before Late Admirable. Dr. Hogg, in his "Fruit Manual," says it does not ripen till the end of November. Which is correct? Each of the Princess of Wales Peach ripens, as Mr. Hogg states, just before Late Admirable. The discrepancy in the two reports may be accounted for by the fact that when the work referred to was issued, the Peach, being almost new, ripened its fruits later than now.

Keeping Grapes in Water.—I was much interested in reading an article in the Gardeners' Chronicle, published by Mr. Rivers on keeping Grapes in water. Having kept them myself as late as May, it may be interesting to know my treatment. Grapes were grown in a cold vinery, and I were of November 1867, and put in water in a tub of water with a tea-spoonful of a fine salt-water solution. I then inserted from 2 to 3 inches of the stem of the bunch in the neck of the bottle, if the stem

Garden Operations.

(For the ensuing week).

PLANT HOUSES

AMONGST Orchids, there are some varieties of Zygopetalum which have lately flowered, and which in a general way will have formed young shoots, or growths. These should receive every encouragement, by placing them in the lightest and warmest corner of any structure adapted to their wants. Oidium flexuosum will also be making fresh growth, and will need a like share of care and attention. I have frequently found that the few Orchids which thus stand against our best efforts to check them, upon forming fresh growths at this dull season, are very much exposed to the attacks of nocturnal and other pests, their young and tender roots being instinctively sought after by wood lice, cockroaches, slugs and snails; the latter to protect them, it is at all times advisable to place them over pans that are constantly filled with water. This has its usefulness in other ways, where it may not be convenient to syringe the plants, or to afford a general body of atmospheric moisture around them, the slight amount of evaporation constantly going on will prove a valuable assistance to the young growing roots. I have found that the pretty Cypripedium-like Labium floribundum adapts itself to almost any form of treatment. It may be grown with ordinary care in any cool greenhouse. Whilst in the stove or intermediate house it quickly forms compact, neat, bush-like plants. Large plants, when attainable, will prove at this season invaluable for conservatory decoration. They form a most delicate and a good succession may be kept up constantly, if needed. Except to push forward a few very early ones, such forcing is not necessary, as they were last month in full bloom. I have a plant at the present time some three feet high, and as much in circumference, which is very gay. Old plants of Tydaea, which have just ceased flowering, should be cut down, if good strong young growths exist at the base. Give the young shoots every encouragement to grow, and any that are sufficiently large and are easily raised from the mother plants, may be at once separated, and potted in separate pots. They delight in an admixture of peat, leaf-mould, and silver sand. As the days wear on, and the light and the sun gains more power, give attention to the stems and similar structures. Give early attention to draining and close the gutters, and water every day by one check. By stopping it is possible to secure a few degrees of heat from the sun's warmth.

FORCING HOUSES

Take advantage of every ray of sunlight in this department to afford more air, with which a larger outlay of moisture will be possible. Light and air, it should be understood, are the two prime movers in all cases pertaining to the growth of vegetation; and moisture is the valuable and necessary ally, and can only be made use of, and turned to successful account, according to the amount of heat and air. It is well to try and check the tendency to over-watering, by means of moisture or rain, that may be supplied by the leaves in the process of elaboration, which goes on but slowly at this season even with the best of glass. Excess of water at the root deranges the delicate spongy cells, which are forced on to, and in contact with, the leaf surface, even should it not cause damping or decay, does cause injury to the delicate organism, however minute or inappreciable it may be. Be particular, in increasing the amount of moisture with that of the light, not to give a too great proportion of the former. The whole surface foliage of forced plants should be perfectly dry once at least in every twenty-four hours. Should we be favoured with more sun, it will be observed that many of the forced plants will flag. This in the majority of instances will not be caused by exhaustion brought on by want of water, as many would surmise, but rather from inability to withstand the sun's increasing influence. Afford in all such instances a slight shading for about half an hour at a time, when the better to surmount such trying periods. Figs in pots intended for an early supply of fruit should now be plunged into a good bottom-heat of from 70° to 75°. Do not water them too freely at this season, and be particularly careful to make. But these and all other subjects similarly treated, and more especially deciduous plants, are benefited at this early stage by being constantly syringed previous to the actual formation of leaves. One of French Beans, which have been sown a week or two back, will have assumed the rough leaf by this time, and will therefore require shifting into 16 or 21-in. pots. They should be sown in rows, and sown with properly decayed manure. They should be potted rather early, taking care to give them to bury some part of the roots in the soil, and rather drawn footstake in the front, so as to gradually afford them as much light and air as possible.

HEAVY FLOWER GARDEN

Tulips planted out in open borders and beds have already the tips of their leaves peeping through the ground. Where vacant plantings exist, no delay should occur in placing the necessary materials beside them, or to land, ready for their protection should frosts arrive. The fancy only know how much the after-beauty is destroyed by attention to these matters. The old, but very beautiful, Grape Hyacinths, are already some inches above ground, which is very early for them, and which is an excellent opportunity to transplant them where necessary. An dried roots of such bulbs as Crocus, Anemone, &c. should now be planted if they are required to flower this season. These and other similar bulbous plants, which are now showing through the ground, may also be taken up, and safely replanted, by all who contemplate any re-arrangement.

HARDY FRUIT GARDEN

Proceed with the pruning and nailing of Morello and other Cherries upon north walls during mild weather. The young wood, especially of Morello, with flower-buds attached, should all be retained, if not too thick. Remove with a sharp knife all old fruiting portions which do not seem likely to bear again, or which may be replaced by younger and more healthy shoots. I have observed black-fly still alive upon some Cherry wood, so that without rather severe weather ensues, resort must be had to the winter dressing of these amongst other things. Plums should be pruned but sparingly when the trees are established and have filled the necessary vacancies. It should be borne in mind that the fruit is formed upon the short spurs which emanate from branches a few years older than themselves, these old branches must, therefore, be retained, if fruitfulness is intended; should the formation of fresh and younger wood be required, the removal of these in part, or wholly, will of course be necessary.

KITCHEN GARDEN.

Where Rhubarb and Seakale are forced in Mushroom-houses, or other similar places, it is advisable to take up a good seasonal supply of crowns or stools to store away in some protected place, preliminary to their being wanted on an early day. This will tend to advance them a stage, in the event of frosty weather setting in. It is not advisable to take them up when the ground is more or less frozen, as then the sudden extreme from cold to heat will prove injurious in its general effects upon them. A seasonal light or two of Asparagus will also be needed with the necessary roots, to succeed those now showing. Attend to any draining operations in contemplation, water the soil, holds too much stagnant water, and embrace the opportunity to burn up a bit of brush or heaps of waste. H. E.

TOWN GARDENING

The principal operation to be performed now in the town garden is the preparation of the soil. I shall therefore in the first place, call attention to this subject, for without a good soil, the best and most careful culture will be less a success. It is quite certain that all the parts of plants are enlarged during summer by the nutriment taken up by the roots. Not only is the soil in the course of time exhausted, by the plants withdrawing all the essentials of vegetation, but it is often naturally poisoned by soil and cats and dog with the accumulated rubbish of years. In our large towns, therefore, as much of the old soil as is unfit for vegetation must be removed, and its place supplied with fresh loam—the stiffer the better, so that it is not actually clay, with a mixture of rotten dung. I prefer good stiff loam for town gardening for this reason—the neighbourhood is so limited by sewers, pipes, &c., that the percolation of water goes on at too great a rate. I therefore recommend the use of stiff loam and mulch, and over the roots. The dry atmosphere and influence of the sun is very prejudicial to vegetation, we miss these sadly by day so essential, but so seldom experienced, in towns, and to compensate for this as much as possible, syringing over the tops every fine evening should be had recourse to, and this, with a removal of the soil, will have a tendency to purify the atmosphere. By mulching the roots and syringing the tops, and making a suitable selection of plants, every lover of gardening may succeed in growing and keeping plants even in the most confined spots where it has hitherto been thought difficult to keep them barely alive. This is also the time to attend to the Irish Ivy which is one of the most useful plants for covering walls. Now it close and take off all superfluous stems of old plants and press down close to use used for coverings. Hyacinths which were put in the autumn, and set in a dark place, should now be brought to the light, and the glasses filled up with soft water. Plants in frames should be kept dry and clean, and have plenty of air; they must also be well protected from frost. J. D.

STATE OF THE WEATHER AT CHISWICK NEAR LONDON

Table with columns for Date, Barometer, Wind, and other weather metrics. Includes a summary of the week's weather and a note about the temperature during the week.

STATE OF THE WEATHER AT CHISWICK

Table showing the state of the weather at Chiswick during the last 41 years, for the ensuing week ending Jan 7, 1891. Columns include Date, Average, and other weather-related data.

Large vertical table on the right side of the page, likely a continuation of the weather or agricultural data, with many columns and rows of numbers and text.

CARTER'S PRIZE MEDAL PERMANENT GRASS SEEDS,

MIXED TO SUIT ALL SOILS.

28s. to 32s. per acre; cheaper quality, 24s. to 26s. per acre.

See Carter's "Gardener's and Farmer's Vade Mecum for 1869." Post Free, 1s.; Gratis to Purchasers.

Testimonial from J. Bromwich, Esq., Rugby.

"The Grass Seeds I had from you last year were very good, indeed, a more beautiful crop could not be found."

CARTER'S PRIZE MEDAL LAWN GRASS,

1s. per lb.; 20s. per bushel, as supplied to

H I M THE EMPEROR OF THE FRENCH, H R H THE CROWN PRINCESS OF PRUSSIA, THE GOVERNMENT OF THE UNITED STATES, THE IMPERIAL COMMISSIONERS, PARIS EXHIBITION, &c. &c.

THE NEW FORAGE PLANT, BROMUS SCHRADERI.

See Gardeners' Chronicle, page 1345, Dec 26, 1868, from which the following is extracted - "The crop (of Bromus) was perfectly satisfactory as regards both the quantity and quality of its produce. The Horsekeepers buying it preferred it to Italian Ryegrass, and the Farmer - being it was very much inclined to agree with them"

F. DAVIS, Esq., Pubright, Guildford, writes -

"I beg to offer my thanks to Messrs. CARTER & Co for calling attention to the valuable plant, Bromus Schraderi.

"I purchased some seed to test its value, and it occurred to me that a report of my experience might prove of interest.

"The seed was sown in July on ground as dry as dust, but it vegetated freely, the first shower causing it to grow with amazing rapidity. The first cutting was made October 20, the plant being 2 feet high, and I found my cattle preferred it to any food I could offer them. I now have (Nov 20) a luxuriant second growth, in spite of the cold weather.

"I may mention that I was first induced to cut the Grass on account of my Pony refusing its ordinary food, and was gratified to find the Bromus greedily consumed."

Sow 35 lb. per acre in drills.

Price 1s per lb., cheaper per cwt. See

To Landowners, whether Tenants in Fee or for Life, Estate Agents, the Clergy, &c. THE LANDS IMPROVEMENT COMPANY (Incorporated by Special Act of Parliament in 1853), advance Money and lend in amount for all purposes of Agricultural Improvement - the whole outlay and expenses being liquidated by a rentcharge over 25 years. For information and Forms of Application, apply to GOSWELL R. RYDER, Esq., Managing Director, 5, Parliament Street, Westminster, S.W.

THE GENERAL LAND DRAINAGE and IMPROVEMENT COMPANY.

Disincorporated. Thos. Chapman, Esq., F.R.S. Geo. Theobald Clark, Esq. John C. Cobbold, Esq., M.P. The Rt. Hon. Viscount Combermere

Works of Drainage of any extent, Irrigation, Enclosing, Wood Grounds, Kitchens, Farm Houses, Large Buildings, and other improvements, are executed on a design of the Property, whether Freehold, Entailed, Mortgaged, Trust, Ecclesiastical, or corporate, or Co-legate, or Lands granted for the purpose to Landowners who desire to execute the works by their own agents. Tenant farmers may also, by arrangement with their landlords, procure the execution of the above improvements on their farms at an annual cost to themselves of between 5 and 7 per cent. on the outlay and local expenses. The whole of the outlay on the works, with all official expenses, may be charged on the Estate for a term of years, to be fixed by the Landowners to meet the circumstances of tenants. No investigation of title being required, no legal expenses are incurred. Applications to be made to Mr. HENRY CURRIE, the Secretary, at the Office of the Company, 22, Whitehall Place, S.W.

The Agricultural Gazette. SATURDAY, JANUARY 2, 1869.

Is anybody satisfied, or ought any person to be satisfied, with the existing CONDITION of AGRICULTURE and of agriculturists in this country?

Rents, indeed, are gradually rising, and the value of land for sale is increasing even faster than its value to the tilling tenant. The landlord, therefore, probably least of all has reason to complain. His social supremacy remains unchallenged, his wealth increases with every agricultural improvement, and, as just suggested, it is still more influenced by every addition to the wealth of all other classes. For the advantages of his position - whether its political influence, its personal endowments, or the enjoyments of life within its reach - he is envied even more than ever hitherto, and on all these grounds he is quite as much as ever to be congratulated. And though even he is often shackled and disabled by conditions very much of his own creation, which interfere with the immediate serviceableness of his property, and which damage his power to deal with the responsibilities he has to bear, yet we cannot suppose that he has much reason for the complaint suggested in our opening sentence.

Come now, however, to the tenant of his land. No doubt country homes are as comfortable as ever, rents are paid with promptitude enough, and wages are paid at least as easily as they used to be, and we do not suppose that any one will say the condition of things as regards the farmer has suffered upon the whole during the past quarter of a century. On the contrary, there has been improvement, but it has been improvement of a kind which only indicates the character and quality of the progress which is still required. In all the materials of his occupation he is no doubt better off than five-and-twenty years ago. Drainage Companies, created by Lands' Improvement legislation, have been at work for him. Many hundred thousands of acres have had their fertility immensely increased, and many hundreds of farms have been equipped with buildings properly adapted for an increased and more valuable stock and crop. The manure importers and manufacturers have been at work for him. Millions of tons have been added to the staple of English soil, during all these years, of just those ingredients on which its fertility depends, and in which it is naturally deficient. Implement makers have been at work for him. His land is cultivated, and its products are dealt with, more effectively and economically than was formerly the case. The ordinary plough is an implement of easier draught, and of increased efficiency. The steam-plough is now our willing and efficient servant, and hundreds of farms are testifying to its powers. The flock-master and the cattle-breeder have been at work for him. The means of economically consuming the green produce of his land are, if not cheaper than they used to be, at least better and more abundant, and this great division of his business - the meat manufacture - has been improved by the supply of imported cattle foods, as well as by the power of using better stock. Certainly in all the material details of his occupation the farmer is better furnished and more capable than he used to be. But as to his position socially, while that of

advancement of our other green crops I may mention that I was first induced to eat the Grass on account of my pony showing symptoms of illness, and having his ordinary food, and I was gratified to find Bromus greedily consumed." James Carter & Co., H. H. ... B. C.

Societies.

COVENTRY.—At the 25th anniversary of this Society, which was celebrated last week, there was some useful agricultural discussion, which we extract from the columns of the Coventry Chronicle. SUTTON WESTERN, who presided, referred, among other subjects, to that of game. He felt as strongly as any man that no one had any right to keep up an estate with a large number of hares or rabbits, he might call it a sporting estate, but it was not only of no use to the land, but it was a great expense to the landowner. He said he was very glad to see something done to remedy the abuses under which the tenants were labouring, and he thought the landowner would be in a better position if there was not such a multiplicity of hares and rabbits as seemed to run about in parts of the country. There were no new doctrines of his, or much of any kind, always entertained, and anybody who knew anything about their family estate knew how to manage it. The great desire of the owner of the estate was, that no rabbits to any extent should be preserved, and that many tenants on the estate should have a right to the land. If any excess of four-footed animals, he had no objection to make his complaint, and it would be remedied at once.

Mr. MERRITT, who was the answer to a personal toast, said as this was an agricultural meeting it might not be amiss if he said something about agriculture. His object in improving his farm was to increase its profit, and he laid it down as an axiom that he thought should always be accepted as a rule, that anything done in agriculture that did not pay for itself was not worth doing. There were several things which were left undone in agriculture that could be done, but they were neglected, because they would be profitable. He knew there was there among some of the very best farmers in England he meant as far as regards the cultivation and cultivation of the soil, but if he asked whether they had studied their own profit and the greatest amount of money they could get out of the land, he would find a good deal to learn with regard to the management of the soil. He said that very recently, and he named one point on which he thought they were short-sighted. Every farmer of 800 acres or less should have a little fixed steam engine for the purpose of preparing the food for his stock, or for grinding corn, and doing things of that sort. He said that he had six or seven hundred acres of land, sent to him, and he had a profit of £1,000 a year, and he had a fixed steam engine of 6-horse power for 150l. and with it he could work his chaff-cutter, his pump-outter, cake-breaker, grinding-mill, threshing-machine, &c., if he chose, and pump all his water in what was his annual cost? In his own case, he had a fixed steam engine of 6-horse power, and it cost him £1,000 a year. Those who have sent him to be ground were therefore foolish, and he was speaking of a great mistake, he was speaking on the subject of a fixed engine as he had a portable one. He told him he always cut his own chaff and employed two horses constantly at chaff-cutting. He immediately pointed out to him that the cost of it would be at the least 50l. per year, besides the cost of a larger expense than he (Mr. Mechi) for the work of his farm. That was clearly a mistake, he was speaking of every man with the large quantity of a fixed engine. Generally speaking, agriculture was progressing tolerably rapidly. He looked at the cultivation of the soil, and he believed as they did more and more accustomed to it, its progress would be very considerably extended. He was gratified at seeing from his dining-room window that his neighbours using steam cultivators, and he was glad to know that one of them was ready to come to his (Mr. Mechi's) land when he required it, for it was hardly answer to purpose to have another engine on the farm. As regarded the preparation of food for the cattle, he had received from Glasgow a sample of some of the best Beans, Peas, Italian Corn, and so on, and this was sent very largely from Glasgow to Aberdeen for sale by those fine fat bullocks with which the Aberdeenshire farmers supplied the London market. His own experience was greatly in favour of feeding food for cattle, and this year, with some bullocks and 300 or 400 sheep, he had no difficulty

in finding food, in spite of the small supply of roots, and he still had enough roots to last three or four months. If they wanted confirmation of what he said, he could show it to them. This was not the time for detail, but on taking up a Scotch paper he found that one very intelligent farmer had put up a fixed engine and cooked all his cattle food; and this was a very important point for undoubtedly stock must be the sheet-anchor of the farmer—not for its direct profit, for he did not believe there was any direct profit in feeding stock, but he was sure from 25 years' experience that the more stock they kept and the more stock they fed with something that did not grow on the farm, the larger would be their crops of corn and other produce. One weak point in agriculture was that there was not meat enough made on their farms to produce a large quantity of manure. He thought they could not complain of the price of their meat, for at this very moment they were selling it at 8d a pound in the carcass, and if it were true that 7 lb. or 8 lb. of cake would make a pound of meat they might lose a little by cattle feeding directly, but indirectly it was the cheapest way of obtaining manure he knew of, and far superior to guano and artificial manure generally. As a rule, farmers do not keep half stock enough. Then came the question, whether their landlords would not help them a little in the improvement of their buildings for the increased quantity of their stock. He believed the old open farmyard mast, as a source of profit, be given up. Their bullocks should not go out into the open, neither should they be in an open yard, and if anybody doubted this let him read Professor Voelcker's analysis of farmyard manure, in which he states that the best parts of the manure are rendered comparatively worthless by allowing the water of heaven to fall on it, and wash out the solutions down the brooks. These were improvements that ought to be adopted on every farm in the kingdom, and if they doubted it let them try them on a small scale. For instance, a man might rent a shed for 20 bullocks for 15l. Let him pay his landlord 6l. for it, and keep his bullocks and his manure under cover, and he would soon see the advantage of it, and would find his crops considerably better than when he used manure from an open farmyard, or artificial manure. He begged to thank them for the patience with which they had listened to him, and for the honour they had done him in drinking his health on that occasion.

Mr. HILLS, the secretary, said—As regarded the remarks of his friend Mr. Mechi, he had not a fixed engine himself because he held two or three farms, which though in the same parish, were a little distance from each other, and therefore he had a portable engine. He must say that as yet he had not found engineering cheap work, though he did not know how it would be in the end. He had no doubt that a portable engine could be bought as cheaply as a fixed one.

Mr. MERRITT—No.

Mr. HILLS said that was matter of opinion. A portable engine could be sent round to their neighbours, and his (Mr. Hill's) engine could be had by anybody when he did not want it himself.

Mr. MECHE.—Do you grind your corn for your cattle?

Mr. HILLS said yes, of course he did, but he sent it to the millers, where it was properly ground. He had a friend in his neighbourhood who had a fixed engine, and had attempted to grind his corn, but he had been obliged to give it up and go back to the miller. What did farmers know about grinding? They knew a good deal more about grinding. If they let the farmer and miller be one they would rub on together very comfortably, but for any man to monopolise three or four trades he didn't think was right at all.

The CHAIRMAN proposed "The health of Mr. Catchpool," with thanks to him for placing his land at the disposal of the Society.

Mr. E. CATCHPOOL said, considering the state of the land, he had never seen the ploughing done better. The boys' work was remarkably well done, and one little boy, hardly higher than the ploughstaff, was almost equal to some of the men, showing what a lad might do by application and attention. As to the digging he was sure every one present must have felt proud of the way in which the men went to their work, they dug pretty nearly 14 inches deep, and he had no doubt he should have the benefit of it in his crops. The vegetables were very good for the season, the Potatoes particularly so, and he thought he might say that their poorer neighbours understood the cultivation of things of that kind as well as any labourers in the kingdom. This Society was not established for the benefit of the farmers. It did not give prizes for fat bullocks or big Mangels, but was intended to benefit their poorer neighbours. Farmers did not come there to praise each other, and, indeed, he had sometimes thought that they rather came to abuse each other. He was not yet convinced that a fixed engine was cheaper than a hired portable one. He once had an engine of his own, but he found the repairs were so enormous that he thought it was better for somebody else to pay for the repairs and bring the engine to him to do his work. He happened to drive through Mr. Mechi's farm about the beginning of harvest, and there he saw a hired portable engine knocking out the sacks of Wheat by wholesale. "Halloa," he said, "here is Mahomet come to the mountain;" and he asked the man about it, and was told that he had persuaded his master to hire it as he thought it was cheaper. When he got to Mr. Mechi's house his friend told him they had just stocked 600 quarters, but he (Mr. Catchpool) certainly could not understand why he had done it in that way if a fixed engine was cheaper than a portable one.

Mr. MECHE said what his friend had stated was quite true. He hired the engine for two or three days, but, as he afterwards explained to his man, the cost was taking a very moderate figure, 3l. a day, and he had

to fuel coals, and as they worked their engine 160 days in the year, that would come in a year to 190l., whereas it only cost him 32l. a year for coals for his own fixed engine.

Reviews.

First Report of the Commissioners on the Employment of Children, Young Persons, and Women, in Agriculture. Her Majesty's Stationery Office.

In this Blue Book we have first, the report of Messrs. Fremantle and Palfreer, Her Majesty's Commissioners, in which they recapitulate the topics of the inquiry, discuss in detail the reports of the Assistant Commissioners, and refer in particular to the allotment system, the effect of inclosures upon the condition of the labourer, and the condition of the cottages in which, for the most part, agricultural labourers live. The second part of the book includes all the district reports received from the assistant inspectors, and to a few extracts from the first of them, that of the Rev. J. Fraser, who visited the counties of Norfolk, Essex, Sussex, and Gloucester, we shall now direct the attention of our readers.

The Education of Country Children.—Instead, therefore, of appearing, with very doubtful prospects of success, the regulations of the Factory Acts to agriculture, I should like to see, as the Commissioners of 1861 wished to see, the Factory Acts themselves revised. I am satisfied that the age of 8 is too early, on physical grounds, for children to go to constant work, I am satisfied that the age of 8 is too early, on educational grounds, for them to commence half-time or periodic attendance at school. But whether the Factory Acts are thought to require revision or not, it will be seen by any one who cares to peruse the evidence that I have collected, that it is the almost unanimous opinion of every person and body of persons who have expressed opinions upon the subject, that the best mode of promoting the education of children in agricultural districts would be (1) to prohibit their employment on the land under the age of 10, (2) to make provision for securing their regular attendance at school for the five years preceding that age, and in several cases the suggestion was added that (3) to prevent the possible loss, by disease, of what they had attained, the children, when emancipated from entire restriction, should still be required to fulfil a certain amount of winter attendance—say 150 hours—either at day or night school, for two years more. I should add that not only do farmers think that this mode of dealing with the subject would be the mode least embarrassing to them in the cultivation of their land, but that managers and teachers of schools declare that they could do more for the children's education in this way, than they could hope to do if regular attendance ceased at 8, and intermittent attendance took its place till 13. My own opinion, formed upon an experience of 20 years as manager and (to a considerable extent) teacher of a rural school, entirely coincides with theirs. It is the opinion of the teachers particularly, that irregularity of attendance is the most formidable difficulty with which they have at present to contend,—children kept at home for all sorts of frivolous purposes by the parents, or withdrawn for all sorts of varying lengths of time by the farmer, and that a child kept constantly at school till 10 ought to be able to pass in the Government's Fourth Standard, indicating an amount of attainment which, though something of its completeness may be detracted by the friction of life, is likely, in its main elements, to stick to him to the end. I found a perfect agreement amongst the farmers that, whether his education makes him a better labourer or not, every English labouring man ought to have placed within his reach the opportunity of education, and that his education ought, at least, to extend as far as the power to read, to write, and to cipher, and the admission was very frankly made that the present general standard of attainment is far below this. I entirely go along, also, with the opinion very frequently expressed, that the ability to write and to cipher are of secondary importance compared with the ability to read. They can be easily and quickly secured, if the desire exists, at almost any period of life, and there will always be abundant motives for securing them; but the power to read, if not acquired in youth, is rarely acquired with any facility at all, while it is, emphatically, the key of all subsequent knowledge and self-improvement. And there is a certain analogy between the capacity to read and the capacity to swim. A man whose mastery of this useful accomplishment, when a boy, was limited to the power of sustaining himself in the water for half-a-dozen strokes, and whose practice stopped there, if he should unhappily fall into deep water 20 years afterwards, even within easy distance of the bank, would infamously be drowned; but he who has once accomplished the feat of swimming across the Thames will find that he has endowed himself with a power that he will never lose. So too with reading.

Agricultural Cottages.—"I am happy to say that at all my meetings the farmers were quite as loud and outspoken as the clergy in denouncing the mischievous results of the present condition of too many English cottages. It was unanimously agreed to, again and again, that every cottage inhabited by a labourer with a mixed family ought to have three bedrooms. It was more than once suggested that something in the shape of a Building Act should be introduced which should require a certain proportion of the cottages of every proprietor to have this amount of accommodation. Inspection of cottages by an independent officer like the ex-justice, who should have power to limit the number of the inmates in some proportion to the number and cubical capacity of their rooms, was in many cases urgently advised. While still stronger, perhaps, and, under the circumstances, even more natural, was the feeling of the farmers about "close"

fishes. Indeed anything more selfish, and, I will venture to say, wicked, than the motive which led to the creation of such parishes, it is difficult to conceive. They arose from a desire to rid one self of a just share of a burden which is only tolerable when borne by all equally. Mixed with this was a desire to get rid of an eyesore and of a nuisance, of people intruding upon the squire's privacy or disturbing his game. Added to which was an utter abolition of all moral and social responsibility in respect of those whose labour was producing our wealth, and whose strength and muscle was being worn out in our service. By the change in the law of settlement, it is true, *non est tunc change fuit causa*. At least we have changed the principle, though it will be long before we have undone all the effects of the practice. Just now a righteous Nemesis has fallen upon the creators of these parishes. They find their rates increased three and four-fold. They sometimes experience a difficulty in letting their farms. I am informed that a farmer's question when he comes to look at a farm no longer is, 'What are the rates?' because he knows they will be equal throughout the union, but 'How many cottages, and what supply of labour can I command?' Tenants are beginning to fight shy of farms without cottages, and of a labour supply that has to be fetched three or four miles. It would be almost a less loss and a less inconvenience to a farmer to go that distance after his water. The proper proportion of cottages to each 100 acres of land depends very much on the nature of the soil, whether heavy or light, the mode of cultivation, whether arable or in grass, and the kind of labour employed, whether chiefly adult male, or that of women and children too. In the dairy district of the Vale of Berkeley one or at the most two cottages to the 100 acres is considered a sufficient supply. In Essex and Sussex where female labour is less used four cottages is the proportion desired. In Norfolk and on the Cotswolds, from two and a half to three. Heavy land requires more labour than light arable land than pasture, a district that produces corn than a district that produces butter and cheese, while the labour of women and children, of course, to a certain extent displaces the labour of men. I consider, however, that in an average district, where the farming is of a mixed description and the labour employed mixed, three cottages to 100 acres would be an adequate, perhaps almost an excessive, proportion.

The Statute Law.—The system of monthly hiring, which is the rule of domestic service as applied in farm labour whenever workmen are engaged for the purpose by time at all to the ordinary instance of the harvest. Those who are emphatically called farm servants are hired mostly by the year. This applies chiefly to the labourers without whose services the farm could not be carried on for a single day, and whom, therefore, the farmer considers himself obliged to secure by bonds not easily broken—the shepherd, the carter, the stockman, the ploughboys, the dairymaid. The usual periods of such hirings are in the spring, or, more commonly, in the autumn; and, where those abominations exist, the transaction generally takes place at the 'mop' or statute fair. I believe that in law a verbal agreement, if it can be proved, is as valid as a written one, and as a matter of fact, the terms of the contract are seldom put upon paper, what weighs most on the mind of the young farm recruit, and impresses him with the strongest sense of obligation, is the mystical shilling which passes from the palm of his new master into his own, and which may be regarded as the agricultural sacramentum. These yearly hirings appear to me to operate ill in many ways. The statute law, which is one of their accompaniments in many counties, in Gloucestershire to wit, is one of those ancient customs which, however out of keeping with our present state of civilization, however tending in their modern abuse, still hold their ground in this conservative country, simply because they are ancient. A contract entered into between two parties, each probably previously a stranger to the other, and in which small account is made of character on either side, cannot but too often issue in a result unwelcome to both, the servant and he has got an unsatisfactory master the master that he has hired an unprofitable servant. The boys often run away, and the master does not thank them worth the cost and trouble of a pursuit.

Mr Fraser's report is full of information and suggestions on education, cottage accommodation, modes of hiring servants, the multiplication of beer-houses, the system of larceny and harvest frolics, the preservation of game, and the co-operative system applied to agriculture, and to those, and the topics of the other reports in this valuable Blue Book, we shall draw attention from week to week.

Farm Memoranda.

ESTATES IN GALWAY AND IN MAYO.—I will select four estates, two in the county of Galway and two in the less favoured county of Mayo. The two in Galway are Creggs and Glynck, now the property of Adlan Pollock, Esq., a resident proprietor, and in Mayo, the two extensive estates of Lord Dillon and the Earl of Arran, both generally absentees. I select these, not alone because I have been long and intimately acquainted with them, but also because the late management of the Galway estates has been the greatest possible contrast to the management of the Mayo estates.

I will begin with the Galway estates, where I was professionally engaged to value and report upon about 15 years ago, pending a sale in the Encumbered Estates' Court, just prior to Mr Pollock's purchase of both. The state of the people on the lands of Creggs I found to be bad enough, but certainly not worse than I had seen on other properties. But when I came to the Glynck division—the arable land of which is natural good, and the reclaimed land equally so—the condition, both of

the people and of the land, was indescribably wretched. Seeing this I lingered longer than might under other circumstances be necessary for my general inspection to ascertain the fundamental causes of such a wretched state of things, and I learned from both clergyman and parishioners that such industrial improvements would be carried out, and such an increase of rent would be undertaken, as I would advise. Notwithstanding, however, my successful experience in such matters previously, I, on mature consideration, advised my principal to have nothing whatever to do with the property, and Mr Pollock coming in soon after, purchased the two estates of Glynck and Creggs, and the agricultural world has since heard much of both. On the latter he effected such improvements as Ireland at least had never before witnessed but with what pecuniary results to himself the public are not now, I fear, likely to be made acquainted, whilst many political economists believe that the same or even a far less expenditure of capital on smaller farms would have contributed far more to the wealth and strength of the nation. Some even go so far as to say privately, what they would not do publicly in proving publicly, that Mr Pollock's speculative improvements have been to him personally a losing game.

Mr Pollock's large farms and expensively large homesteads can hardly be productive of such gains as if the manufacturing capabilities of the district had been also utilized. Nor should we now in all probability be hearing as we do, that Mr Pollock is advertising to be let four townlands varying in extent, of farms from 100 to 1000 acres splendidly supplied with farm buildings, and 4000 acres on the Glynck estate less expensively equipped. Let me now take a turn into Mayo, and give a short notice of the two estates already named there with which I am more intimately acquainted. Lord Dillon's property in Mayo contains nearly 100,000 acres and on the whole of this vast range there were not, when I was professionally engaged on it, nor have I any reason to think there are yet, 12 farms that would average 50 acres each, nor 12 ploughs, 12 carts, or 12 horses that an English or intelligent Scotch farmer would call worthy of their names. At that time the only farms that could not be profitably let were a few of the very best parts of the estate. In fact there was not an estate in England, or perhaps I might add, Great Britain, on which the rents in all cases fair ones, were more unjustly paid. This happy state of things arose from the simple fact of having the estate managed by an agent and his subalterns who knew their respective duties and had them executed with strict justice to both land and tenants. Instead of clearing off the small holders, though in some cases previously all but pauperized by middlemen, till then so common in Ireland, each of them had his farm well tilled and revalued, and for approved improvements by themselves ready money was paid by the agent. Beyond this, although the re-adjusted rents were fully 50 per cent less than they were under the middlemen yet each townland was raised from 25 to 50 per cent higher on the landlord's rent-roll than they used to stand.

I have now but to add a few words in regard to the Earl of Arran's estate Mayo. I am led to understand that when his lordship came into the management of this estate both it and its occupants were in a condition socially as bad as those on the Glynck estate when I inspected it. When I last saw Lord Arran's property, in adjudicating on the merits of his tenants for prizes offered by his lordship, those tenants were in a state which might well be copied anywhere. How did his lordship in a few years—some of which were the worst for such purposes, effect these extraordinary reformations? Was it by ejecting tenantry and expelling thousands of pounds in clearing and enlarging farms, and building partial homesteads? Was it by paying the tenants for leaving their little holdings, as on Lord Dillon's property? No, it was first in getting rid of harpers that lured them and robbed them secondly, in having their farms and rents re-adjusted and finally by giving them practical instruction in the reclamation and culture of their lands, without expending one penny in such improvements beyond the salaries of the two instructors engaged, and the prizes for merit already alluded to.

Now as Ireland is believed to be on the eve of a social revolution, would it not be well to have the foregoing crudely-expressed facts well studied by your great English capitalists? They are seeking for certainly less profitable investments in other countries. Let them first consider how far such investment could be made in Ireland, and thereby help to strengthen the United Kingdom while benefiting themselves. *Finis.*

NORTH RIDING OF YORKSHIRE. Dec. 20. Two months, now near the close has been unparalleled for the amount of rainfall and unseasonably mild weather. A sudden change has, however, now taken place, and as we write the snow flakes are flying, and we have a cover of snow about an inch in depth.

The weather in one respect has been favourable for stock, inasmuch as on dry porous soils the warmth has induced a growth of grass, and tended to eke out the short crops of roots; but on the other hand, owing to so much rain sheep stock have done very indifferently during the month, and this more especially on high-lying situations. Should the storm be a lengthened one, all sorts of fodder will run high, and the question will be—not how to fatten either sheep or cattle, for few are attempting that, but how to find food to keep them alive.

Catch crops of Rape, &c., of which so much was expected, have, in this district at least, proved a failure. In our own case we had the oats stocked at wide intervals, and immediately the corn was cut had the stubbles cultivated and sown with Rape, applying 2 cwt. of guano as manure, and although the seed was sown before the 12th of August, the crops have proved

meagre in the extreme, and we are of opinion that some money spent in cake would have proved a better investment. Some of the Turnip fields on the plants had failed were resown with Golden Wonder Turnips about the same time, but with no success.

Fat cattle and sheep are now in few hands, the carcasses of another month will be very scarce. Christmas beef has made from 8s 6d to 10s 11d, and mutton 8d per lb.

At our low lands have been laid under water on some of the non-drained and badly drained soils the excessive wet has damaged the Wheat, but on dry porous soils it looks well. My own experience proves the last Wheat crop to be an average yield. *H. J. M.*

The Poultry Yard.

THE MANCHESTER POULTRY SHOW

We have to report progress, and that progress, on a show that, in the face of many difficulties, holds its own right manfully. The imposing list of patrons and vice patrons, and the imposing committee, are alike wanting from the list of the Manchester show. George Jenkinson, Esq., *et cetera*.

The eighth Christmas meeting, which closed on the 28th Dec., was characterized by the competition of birds of unusual merit. Judging from catalogue one would imagine that the best birds from Birmingham and Liverpool combined their forces at Manchester. In the 1st class for Dorking cocks Admiral Hornby took the first prize, followed by Messrs. Longwell and Martin. The exhibitors at Manchester and Mr. Statter's contented themselves with consolation, every one knew that competition was more than keen. In the class for hens, the same exhibitor won first, Mr. Gibson second, and the Duke of Newcastle third. The prizes were distributed among exhibitors who assisted to better fare. Mr. Statter, of Stratford took first in the class for Dorking cockerels with a grand bird, one that is likely to be heard of some day. Ryder took the second prize, and Mrs. Arkwright 3d. The competition in Dorking pullets was very keen indeed, the quality of the hens very high, Mr. Wright, Admiral Hornby and the Hon. H. W. Williams took the prizes in the order in which we passed them. An examination of the birds will give evidence of the great amount of merit in the Dorking fowl in production to its breed.

Mr. John Martin and his wife the Duke of Newcastle took 1st and 2d for the rose-combed Dorking. The class for silver grey Dorking cocks brought out one adult bird—at least no bird was in the catalogue as over one year. This colour of Dorkings is not a satisfactory one to those who see these birds with agriculturists' eyes. Uniform feather is very pretty, and in some breeds, such as the Dorking it is nearly always obtained in quantities of some quantity more valuable. Mr. Wright was the winner for cocks, and Mr. Kames for the silver grey classes at Manchester.

The class for white Dorkings was a failure, winner Mr. Longwell, a breaker, to whom at poultry shows is a very heavy or erroneous result would very possibly have been the same. Competition here great.

We have no flock of fowls in which the success of certain strains is so fully exemplified as in the Spanish. We see exhibition of eminence, achieve success, and the strain becomes standard after as one from which to show or sale. There were 20 pens of these birds at Manchester and among the principal exhibitors were the Hon. Messrs. De la Penne, Lady Tessa, Comber Hall, &c.

In the class for red Game cocks, Mr. Wright was successful with a very fine specimen of Mapplebeck and White taking 1st and 2d. Mr. Julius Schmet took 1st, Mr. Mapplebeck 2d and 3d, and also 1st for pullets.

No one will be surprised to read that Mr. Wright was 1st both with cock and hen in the class for dark-coloured birds; Mr. J. A. Taylor was 2d with pullets. The show of white Cochins was very poor in number, but here, as at Birmingham the quality of the birds was very fine. The bird of Mr. Smalley placed 1st, and to the exhibitor went both 1st and 2d in the class for cock and pullets.

Mr. Julius Schmet may be well proud of winning such a class of Brahma cocks with Mr. Wright Greaves and the Rev. E. Alder 2d and 3d. Mr. Lingwood, Messrs. Pamfret and Hargreaves were the winners for hens and pullets.

The light Brahmas are working hard for exhibition, and find many supporters, but we do not see they can distance the pens of titos. Mr. Lucy took both firsts, Mr. John Pares 2d and 3d. Mr. Dawsett also two prizes.

The Polish fowls were not exhibited in two pens, and, we think, wisely. No doubt the exhibitor complains, but the breed loses rather than makes, and ready has but little to recommend it. It has been hard for Mr. Atkins' birds to find themselves anywhere but first—but so was it. Mr. Wright was 1st with a cock and 1st Mr. Senior for hen.

The Crows were an excellent, the prize names were known at an early date. The exhibitors of French produce Messrs. Cooper, Fitzwilliam and Co. and Worsley were successful.

Mr. Julius Schmet took 1st for Houdan, and J. C. Cooper for La Faisle. Mr. W. C. Brinley won 1st with a black-bone game cock, that was much admired. Mr. Board

RICHARD SMITH'S FRUIT LIST

Contains a sketch of the various forms of Trees, with directions for Cultivation, Soil, Drainage, Manure, Pruning, Lifting, Cropping, Treatment under Glass, and the synonyms, quality, size, form, skin, colour, flesh, flavour, use, growth, duration, season, price, &c. Free by post for three stamps.

RICHARD SMITH'S LIST OF THE EVERGREENS... Contains a list of various evergreen plants with their characteristics and prices.

DWARF-TAINED TREES By the Thousand... Lists various dwarf trees like Apples, Peaches, and Cherries.

ORCHARD-HOUSE TREES Fruiting in Pots... Lists trees suitable for growing in pots, such as Apples and Peaches.

EVERGREEN HEDGES... Lists various types of evergreen hedges and their prices.

SURPLUS STOCK.—VERY CHEAP.

SPECIMEN CONIFERS and EVERGREENS... Lists surplus stock of conifers and evergreens.

At 12s. per dozen... Lists prices for various tree specimens.

At 15s. per dozen... Lists prices for another set of tree specimens.

At 2s. per dozen... Lists prices for smaller tree specimens.

At 3s. per dozen... Lists prices for another set of smaller tree specimens.

At 4s. per dozen... Lists prices for yet another set of smaller tree specimens.

At 5s. per dozen... Lists prices for the final set of smaller tree specimens.

At 6s. per dozen... Lists prices for another set of smaller tree specimens.

At 7s. per dozen... Lists prices for another set of smaller tree specimens.

At 8s. per dozen... Lists prices for another set of smaller tree specimens.

At 9s. per dozen... Lists prices for another set of smaller tree specimens.

At 10s. per dozen... Lists prices for another set of smaller tree specimens.

At 11s. per dozen... Lists prices for another set of smaller tree specimens.

At 12s. per dozen... Lists prices for another set of smaller tree specimens.

At 13s. per dozen... Lists prices for another set of smaller tree specimens.

At 14s. per dozen... Lists prices for another set of smaller tree specimens.

At 15s. per dozen... Lists prices for another set of smaller tree specimens.

At 16s. per dozen... Lists prices for another set of smaller tree specimens.

At 17s. per dozen... Lists prices for another set of smaller tree specimens.

At 18s. per dozen... Lists prices for another set of smaller tree specimens.

At 19s. per dozen... Lists prices for another set of smaller tree specimens.

At 20s. per dozen... Lists prices for another set of smaller tree specimens.

RICHARD SMITH, NURSERYMAN AND SEED MERCHANT, WORCESTER.

Forest Trees, Evergreens, &c. CHIVAS AND WEAVER have much pleasure in drawing the attention of Planters during the ensuing season to their very large stock of the above, grown with the greatest care, and regularly transplanted.

To the Trade. WANTED, LARCH, 1 to 3 feet; SPANISH CHESTNUT, 3 to 4 feet.

Autumn Planting. PETER LAWSON AND SON have an immense stock extending over many acres of the leading varieties of HARDY ORNAMENTAL TREES and SHRUBS.

For Lawn and Cover Planting. BERBERIS DARWENI.—Too much cannot be said of this fine Evergreen species.

COTONFASTER SIMMONS.—This is a beautiful Hardy Evergreen Shrub with a very dark green leaves and bearing a large quantity of scarlet berries.

Wandsworth Common Nursery. Ten minutes' walk from Clapham Junction. MR ROBERT NEAL begs to invite the attention of the Nobility, Gentry, and the Trade in general to his very extensive and healthy stock of FRUIT TREES.

The American Nursery, Bagshot, Surrey. JOHN WATERER respectfully invites the attention of Gentlemen and others engaged in planting to the numerous selections from his extensive stock.

RHODODENDRONS (Standards).—Of all the leading choices, scarlet, and other varieties of 3 to 4 feet stems, consisting of such as Alexander Adie, Major Waterer, The Warrior, Princess Mary of Cambridge, Madroona, Mrs. Lou Penn, Joseph Wainwright, and all such others as have been exhibited annually at the Royal Botanic Garden, Regent's Park.

RHODODENDRONS (Half standards).—Of all the approved kinds; 2 to 3 feet stems. RHODODENDRONS. Hardy scarlet, crimson rose, white, for garden corners or borders fine weeping plants.

RHODODENDRONS (Dwarf growing kinds).—These are very choice growing varieties, and are recommended for filling winter beds, Daphnoides, Myrtifolium, and Heliconium are the best suited for such purposes.

RHODODENDRONS (PUNTLUM).—This kind is the most common, and now generally admitted to form the best permanent cover for game. In the most severe weather it is never injured by bare or rabbit ground plants.

AZALEA, HARDY. Of the most popular kinds, of all colours, and in fine plants, covered with a profusion of blooming buds. These are much used for forcing.

ANDROMEDA FLORIBUNDA. One of the most hardy plants used for decorating winter temples. Of these we are large holders, and can supply beautiful specimens at 30s. per dozen, covered with blooming buds.

KALMIA LATIFOLIA and MYRTIFOLIA.—Fine grown plants, of all sizes. HARDY HEATHS.—A very fine collection in 30 kinds, 30s. per 100.

ARIES NORDMANNIANA. Of this fine kind we are very large holders, all of which are seedlings, and of all heights, from 2 to 4 to 6 to 8 and 10 feet.

ARIES MAGNIFICA.—Fine specimens, 2 to 3 feet. ARIES NORDMANNIANA. A seedling, 1 to 2 feet. ALIBIS LACINIOSA.—From 2 to 3 to 4 to 5 feet.

ARIES GRANDIS (Lindleyana).—Fine specimens, 2 to 3 feet. ARIES BOULEAU.—3 to 4 to 5 to 6 feet. ALIBIS LACINIOSA.—2 to 3 to 4 to 5 feet.

ALIBIS LACINIOSA.—2 to 3 to 4 to 5 feet. THYJA BORNEALIS.—2 to 3 to 4 to 5 feet. THYJA ALBA.—1 to 2 to 3 to 4 to 5 feet, perfect globes.

WELLINGTONIA GIGANTEA.—Of all sizes from 2 to 12 feet. IRISH YEW.—Selected specimens, 2 to 3 to 4 to 5 feet. HOLLIES (Green and Silver).—In the most approved kinds of all sizes.

STANDARD GOLDEN HOLLY (Weymouth's).—The best for standards, fine plants.

Mr. R. Parson 1st, Mr. Aykroyd 2d, for adult cocks. Mr. Chamber 1st for cockerels, Mr. Pool for pullets.

Everyone will be prepared to read that Mr. James was successful with brown-red game cocks. Mr. Aykroyd 1st for hens, and 1st for a young cock, and 1st for pullets.

For ducking game, Mr. Aykroyd for cocks, and Mr. Riggs for hens, Miss Sadler and Mr. John Halsall for cockerel and pullet.

Mr. Hensley was again a winner in the last class for game cocks.

The classes of Rouen drakes and ducks were well worth seeing and gave great satisfaction as well as much hard work to the judges, as nearly every pen was contested. Mr. Scatter was first with a giant drake, and Mr. Hensley with two ducks of unusual merit.

The Aylesburys were few, but the quality of them was the parent when we say that Mrs. Seaman's was the best.

A large and interesting class of waterfowl was very attractive to all visitors. Mr. Ley winning first for Mallards, Mr. John Jenkinson, 2nd and 3rd for Pintails and Canada geese.

The turkeys, geese, and pigeons must receive notice next week.

Miscellaneous.

The Royal Agricultural College, Cirencester. My own habits of thought and action induced me to give the fullest consideration I was able to the internal discipline and general arrangements of the college. After a long and careful examination of the college arrangements, I was naturally of opinion that the college arrangements were not only for its own sake, but for the benefit of the country. I was anxious to see the system of agriculture, not only for its own sake, but for the benefit of the country. I was anxious to see the system of agriculture, not only for its own sake, but for the benefit of the country.

Notices to Correspondents.

Experiment has proved that 100 lbs. of water will take up and hold 2 1/2 lbs. of water before it will set. It is found that 100 lbs. of water will take up and hold 2 1/2 lbs. of water before it will set. It is found that 100 lbs. of water will take up and hold 2 1/2 lbs. of water before it will set.

ARTHUR HENDERSON & CO.'S

CATALOGUE of choice VEGETABLE and FLOWER SEED NOVELTIES

Is now Published, and can be forwarded Post Free on application.

The VEGETABLE SEED SECTION contains-

Selected LISTS of the best varieties of each kind most worthy of cultivation, also some excellent new sorts of both VEGETABLE and FLOWER SEEDS of sterling merit, attention is also directed to the Pine-apple Compact-top BEET (the finest and richest flavoured variety extant), carefully saved, true from the original stock. Also the new DWARF WATERLOO BEET, top leaves rich metallic crimson; growth true, even, and regular. This beautiful foliaged variety may with advantage be cultivated in the flower garden as a border, ribbon, or edging plant; its root is a trifle larger than the Pine-apple Compact-top, flavour excellent, full of sweet saccharine juice, colour crimson, texture tender and uniform throughout.

The FLOWER SEED SECTION contains-

Imported GERMAN FLOWER SEEDS in Collections, Choice Strains of FLORISTS' FLOWER SEEDS, a careful LIST of FLOWER SEED NOVELTIES of the season, HORTICULTURAL REQUISITES of every kind, KNIVES, PROTECTING MATERIALS, HORTICULTURAL MANURES, &c., &c.

89. Cut Roses, distinct, 1 truss of each (Amateurs), £3, £2, £1, 10s.
90. Cut Roses, distinct, 1 truss of each (Amateurs), £3, £2, £1, 10s.
91. Cut Roses, distinct, 1 truss of each (Amateurs), £3, £2, £1, 10s.
92. Cut Roses, distinct, 1 truss of each (Amateurs), £3, £2, £1, 10s.
93. Cut Roses, distinct, 1 truss of each (Amateurs), £3, £2, £1, 10s.
94. Cut Roses, distinct, 1 truss of each (Amateurs), £3, £2, £1, 10s.
95. Cut Roses, distinct, 1 truss of each (Amateurs), £3, £2, £1, 10s.
96. Cut Roses, distinct, 1 truss of each (Amateurs), £3, £2, £1, 10s.
97. Cut Roses, distinct, 1 truss of each (Amateurs), £3, £2, £1, 10s.
98. Cut Roses, distinct, 1 truss of each (Amateurs), £3, £2, £1, 10s.
99. Cut Roses, distinct, 1 truss of each (Amateurs), £3, £2, £1, 10s.
100. Cut Roses, distinct, 1 truss of each (Amateurs), £3, £2, £1, 10s.

Nov.—Each bouquet to be shown separately, in a hyacinth glass, or some similar kind of stand.

GREAT ROSE SHOW (Continued).

- 19. 6 Moss Roses, distinct kinds (Open), £1, 10s., 10s.
20. 24 Roses in pots, not fewer than 15 distinct kinds, the pots to exceed 8 inches in diameter (Open), £3, £2, £1.
21. 20 New Roses of 1866, 1867, or 1868, in pots, not fewer than 15 distinct kinds, the pots not to exceed 8 inches in diameter (Open), £3, £2, £1.

Nov.—Exhibitors can only show in two of the classes 5, 6, 7, 8. New Roses are to date from the time when put in commerce, either in this country or abroad.

TUESDAY SCIENTIFIC, FRUIT AND FLORAL MEETINGS.

Jan. 10.—Fruit and Floral Committees at 11 a.m., Scientific meeting at 1.30 p.m., General Meeting at 3 p.m.
Feb. 16.—Fruit and Floral Committees at 11 a.m., Scientific meeting at 1.30 p.m.; General Meeting at 3 p.m.

PRIZES OFFERED.

- 1. Dessert Apples, single dish (Open), £1, 10s., 10s.
2. Dessert Pears, single dish (Open), £1, 10s., 10s.
3. Dessert Apples, three dishes (Open), £1, 10s., 10s.
4. Apples, 6 dishes of the best kept fruits (Open), £1, 10s., 10s.
March 2.—Fruit and Floral Committees at 11 a.m., Scientific meeting at 1.30 p.m., General Meeting at 3 p.m.
March 16.—Fruit and Floral Committees at 11 a.m., Scientific meeting at 1.30 p.m., General Meeting at 3 p.m.
April 6.—Fruit and Floral Committees at 11 a.m., Scientific meeting at 1.30 p.m., General Meeting at 3 p.m.

PRIZES OFFERED.

- 1. White-spined Cucumber, 1 brace, of 1 sort only (Open), £1, 10s., 10s.
2. Black-spined Cucumber, 1 brace, of 1 sort only (Open), £1, 10s., 10s.
3. Smooth Cucumber, 1 brace, of 1 sort only (Open), £1, 10s., 10s.
4. Cucumbers, not confined to one sort (Open), £2, £1.
April 20.—Fruit and Floral Committees at 11 a.m., Scientific meeting at 1.30 p.m., General Meeting at 3 p.m.
May 4.—Fruit and Floral Committees at 11 a.m., Scientific meeting at 1.30 p.m., General Meeting at 3 p.m.
May 18.—Fruit and Floral Committees at 11 a.m., Scientific meeting at 1.30 p.m., General Meeting at 3 p.m.
June 1.—Fruit and Floral Committees at 11 a.m., Scientific meeting at 1.30 p.m., General Meeting at 3 p.m.
June 15.—Fruit and Floral Committees at 11 a.m., Scientific meeting at 1.30 p.m., General Meeting at 3 p.m.

PRIZES OFFERED BY W. WILSON SAUNDERS, Esq., F.R.H.S.

- 1. 12 Herbaceous Plants, in flower, distinct, to be exhibited in boxes, £1 10s., £1, 10s.

PRIZES OFFERED.

- 2. 24 Pinks, cut blooms, distinct (Nurserymen), £1 5s., £1, 5s.
3. 12 Pinks, cut blooms, distinct (Amateurs), 15s., 10s., 7s.
4. 6 Carnations, distinct, in bloom (Open), £2, £1 10s., £1.
5. 6 Double-flowered Zonal Pelargoniums, 3 sorts, in bloom (Open), £2, £1 10s., £1.
6. 1 Double-flowered Zonal Pelargonium, in bloom (Open), £1, 10s., 10s.

PRIZES OFFERED.

- 1. 24 Carnations, cut blooms, distinct (Nurserymen), £1 5s., £1, 5s.
2. 12 Carnations, cut blooms, distinct (Amateurs), 15s., 10s., 7s.
3. 6 Carnations, cut blooms, distinct (Amateurs), 10s., 7s., 5s.
4. 24 Picotees, cut blooms, distinct (Nurserymen), £1 5s., £1, 5s.
5. 12 Picotees, cut blooms, distinct (Amateurs), 15s., 10s., 7s.
6. 6 Picotees, cut blooms, distinct (Amateurs), 10s., 7s., 5s.
7. 36 Carnations, Picotees, and Cloves, mixed, cut blooms (Nurserymen), £1 10s., £1.
8. 12 Carnations, Picotees, and Cloves, mixed, cut blooms (Amateurs), 15s., 10s., 7s.

PRIZES OFFERED.

- 1. Peaches, single dish, from pot plants (Open), £1, 10s.
2. Peaches, single dish, grown on planted-out trees, under glass (Open), £1, 10s.
3. Nectarines, single dish, from pot plants (Open), £1, 10s.
4. Nectarines, single dish, grown on planted-out trees, under glass (Open), £1, 10s.
5. Peaches and Nectarines, best collection, named (Open), £1, 10s.

PRIZES OFFERED.

- 1. 24 Gladioli, cut spikes, distinct (Open), £2, £1 10s., £1.
2. 12 Gladioli, cut spikes, distinct (Nurserymen), £1, 10s., 10s.
3. 12 Gladioli, cut spikes, distinct (Amateurs), £1, 10s., 10s.
4. 6 Gladioli, cut spikes, distinct (Amateurs), 10s., 7s., 5s.
5. 6 Hollyhocks, cut spikes, distinct (Open), £1, 10s., 10s.
6. 24 Hollyhocks, cut blooms, distinct (Nurserymen), 15s., 10s., 7s.
7. 12 Hollyhocks, cut blooms, distinct (Amateurs), 10s., 7s., 5s.

PRIZES OFFERED.

- 1. 24 Gladioli, cut spikes, distinct (Open), £2, £1 10s., £1.
2. 12 Gladioli, cut spikes, distinct (Nurserymen), £1, 10s., 10s.
3. 12 Gladioli, cut spikes, distinct (Amateurs), £1, 10s., 10s.
4. 6 Gladioli, cut spikes, distinct (Amateurs), 10s., 7s., 5s.
5. 6 Hollyhocks, cut spikes, distinct (Open), £1, 10s., 10s.
6. 24 Hollyhocks, cut blooms, distinct (Nurserymen), 15s., 10s., 7s.
7. 12 Hollyhocks, cut blooms, distinct (Amateurs), 10s., 7s., 5s.

PRIZES OFFERED.

- 1. Peaches grown on standards out-of-doors, not less than 18 inches high, £2, £1.

PRIZES OFFERED BY H. G. BOHN, Esq., F.R.H.S.

- 1. Peaches grown on standards out-of-doors, not less than 18 inches high, £2, £1.

PRIZES OFFERED BY W. WILSON SAUNDERS, Esq., F.R.H.S.

- 1. Collection of Edible and Poisonous Fungi, £3, £3, £3.
* These should be tastefully set up, and, as far as possible, correctly and conspicuously named.

PRIZES OFFERED.

- 2. Grapes, 3 bunches of Chasselas Musqué (Open), £1, 10s.
3. Grapes, 3 bunches of Muscat Hamburg (Open), £1, 10s.
4. Grapes, 3 bunches of Frankenthal, or Hamburg (Open), £1, 10s.
5. Grapes, 3 bunches of White Muscat of Alexandria (Open), £1, 10s.
6. Grapes, 3 bunches of Al canto (Open), £1, 10s.
7. Grapes, 3 bunches of any new or recent variety (Open), £1, 10s.
8. Grapes, the best collection named (Open), £2 10s.

PRIZES OFFERED BY THE REV. GEO. KEMP, F.R.H.S.

- 1. For the best dish of Grapes, consisting of 6 bunches of variety, grown in the open air against a wall, without protection whatever, £3, £2.

PRIZES OFFERED BY W. WILSON SAUNDERS, Esq., F.R.H.S.

- 1. Collection of Winter Bedding Plants, to be exhibited in boxes, £3, £1.

PRIZES OFFERED.

- 2. 4 Chrysanthemums, large-flowered, in pots, distinct (Open), £1, 10s., 10s.
3. 4 Chrysanthemums, Pompones, in pots, distinct (Open), £1, 10s., 10s.
4. 12 Chrysanthemums, cut blooms, distinct (Nurserymen), 15s., 10s., 7s.
5. 6 Chrysanthemums, cut blooms, distinct (Amateurs), 10s., 7s., 5s.

PRIZES OFFERED BY THE REV. GEO. KEMP, F.R.H.S.

- 1. For the best winter dessert of Apples and Pears, 3 dishes each, £3, £2.

SUTTONS' HOME-GROWN SEEDS, NEW AND UNADULTERATED, CARRIAGE FREE.

SEEDS DIRECT FROM THE GROWERS THE BEST MEANS OF PREVENTING DISAPPOINTMENT

SUTTON AND SONS, ROYAL BERKS SEED ESTABLISHMENT, READING. WERE AWARDED A FIRST PRIZE SILVER MEDAL.

PARIS, 1867, for their HOME-GROWN SEEDS.

SUTTONS' COMPLETE COLLECTIONS of VEGETABLE and FLOWER SEEDS, for One Year's Supply, Carriage Free.

Table with 2 columns: Collection name and Price. Includes 'Collections of Vegetable Seeds' and 'Collections of Flower Seeds'.

Particulars of the above Collections may be had on application, and any articles not required will be excluded, and others included according to the wish of the purchaser.

SUTTONS' PRIMA COLLECTION of CHOICE VEGETABLE SEEDS, containing the following excellent varieties, forwarded, Carriage Free, to any Station in England.

- List of vegetable seeds including: CUCUMBER, ONION, MELON, CARROT, PARSNIP, ENDIVE, SWEET BASIL, THYME, SAVORY, WINTER LETTUCE, etc.

Suttons' Priced Descriptive Catalogues.

VEGETABLE SEEDS and FLOWER SEEDS. Includes logo for Suttons' Home-Grown Seeds and Paris 1867 Silver Medal.

SUTTONS' RINGLEADER PEA, The earliest in cultivation, price 2s per quart

SUTTONS' CHOICE POTATOS FOR PLANTING.

- List of potato varieties: EARLY RACEHORSE, BERRSHIRE KIDNEY, GOLDEN BLOSSOM KIDNEY, etc.

SUTTON AND SONS, SEEDSMEN TO THE QUEEN, LEADING.

Lansdowne & Co. Seed Growers

237, 238, and 261, HIGH HOLBORN, LONDON, W.C.

PRIZE MEDALLISTS

LONDON.

PARIS.

1862.

1867.

CARTER'S GENUINE GARDEN SEEDS, in assorted Collections, to suit large or small Gardens.

- No. 1. For Cottage Gardens .. 12s 6d. No. 2 For Small Gardens .. 21s. No. 3 For Medium Gardens .. 40s. No. 4. For Large Gardens .. 63s.

No charge for packing

CARTER'S PRIZE MEDAL FLOWER SEEDS, in assorted Collections, to produce the most effective display.

- Collection A, 10s. 6d.; Free by Post, 11s. B, 16s.; Free by Post, 15s. 6d. C, 21s.; Free by Post, 21s. 6d. D, 42s.; Free by Post, 42s. 6d. E, 63s.; Free by Post, 63s.

JAMES CARTER & Co. are prepared to supply on the 15th of January next the following Four handsome

New Varieties of Coleus,

Raised at the Gardens of the Royal Horticultural Society, and purchased by them at the Public Auction on the 10th of December, 1868.

- COLEUS HER MAJESTY. This variety is of very free habit, and the broad leaves are of a deep bronzy red, with the narrow banding edged somewhat gold. Price 6s. each. COLEUS PRINCE OF WALES. A free growing variety, with leaves of a deep purplish red, marked with deeper coloured blotches, and having scarcely any golden markings at the edge. Price 6s. each. COLEUS PRINCESS OF WALES. This has still less yellow than either Queen Victoria or Princess Royal, but has instead a much more decided and deeper glow of purple. Price 6s. each. COLEUS PRINCE ARTHUR. The leaves of this variety have a yellowish ground colour, while the veins, the costa, and the principal veins are heavily marked with deep purplish red, the margin also being red. Price 6s. each.

New Double Zonal Geranium for 1869,

WILHELM FEITZER (Lansdowne). A novelty without a rival, possessing all the desirable qualities to make it a valuable addition to every collection; dwarf, free-blooming habit, and brilliancy of colour. Plants not higher than 6 inches had two and three trusses fully expanded each measuring rather more than 5 inches across, the individual flowers are large, very double, of the most perfect shape, and dazzling orange-scarlet colour.

Lilium auratum (Golden-rayed Lily). Fresh imported Bulbs, 2s. 6d. each, and upwards.

For full descriptions, see

CARTER'S GARDENER'S AND FARMER'S VADE MECUM FOR 1869

(Illustrated), 34th year of publication. Post Free for 12 Stamps; Gratis to Customers.

CARTER'S PRIZE MEDAL LAWN GRASS will produce a Permanent Turf of finest quality. 1s. per lb.; 20s. per bushel.

CARTER'S FERTILIZER, the best Manure for the Garden. In Tins, 1s 9d and 4s 6d each. In Bags, 16s. and 26s. each.

See CARTER'S "Gardener's and Farmer's Vade Mecum for 1869" (Illustrated), 34th year of publication. Post Free for 12 Stamps; Gratis to Customers.

JAMES CARTER AND CO., SEED GROWERS, 237 and 238, and 261, High Holborn, London, W.C.

Superb New Plant, Gesnera Exoniensis.

LUCOMBE, PINCE AND CO. beg to call attention to this magnificent new Winter-blooming Plant. For Table or other Decoration it surpasses anything ever before seen.

HENRY GODFREY, NURSERYMAN, Stourbridge, has to offer a large quantity of HERBACEOUS CALCULARIAS, raised from seed saved from a particularly fine strain, established in small pots from 1s. to 3s. per dozen, basket and package included.

SUTTONS' HOME-GROWN SEEDS, Carriage Free

Seeds direct from the growers the best. Includes logo for Suttons' Home-Grown Seeds and Paris 1867 Silver Medal.

The Gardeners' Chronicle. SATURDAY, JANUARY 9, 1869.

ONE of the most pleasant of our editorial tasks is that of taking a retrospective glance, at the end of each recurring year, over the many valuable NOVELTIES which in the course of the season have been brought specially under notice.

Let us look into the stove department, and inspect the company of recruits stationed there. Of the flowering series, the plant of the year is certainly the noble Lasiandra macrantha, whose gigantic flowers, as we mentioned last week, are borne in winter as well as in summer.

Great and grand have been the additions made to the group of handsome-leaved stove plants, among which the first place must be assigned to the numerous, varied, and beautiful forms of Codium variegatum, which we have already described at length.

efforts in her own garden have beyond question been successful, for her kale beds would add both grace and beauty to the most imposing flower garden. Gardens at this time of year are generally remarkable for baldness, and for the want of diverse tints to brighten up what are looked upon as the choicest spots out-of-doors. Miss Hope's garden, after being divested of its summer furniture, is equally well and comfortably dressed with material so table for winter clothing, and forsooth, it wears by no means sordid habiliments. The gaiety and diversity of the colours greatly astonished me.

Let me cite two or three examples for illustration, beginning first with the centre piece of the design. It is a circle divided into eight segments, the partitions being variegated. At intervals, the centre is a portable specimen of the Irish Yew, and the sections filled or rather packed in with divers-coloured Kales. Now, those who never saw such an arrangement might suppose that the bed was a tall, gaunt, hideous looking thing, with a goodly portion of bare-legged kale stocks staring you in the face, but it is no such thing. The labour incurred in sowing the hundreds of them required for the bed in question, so as to have the leaves resting flat upon the soil, must be something considerable, but the effect is such as to repay the labour. That bed has a fine bizarre appearance, and is all the more conspicuous from being elevated above its fellows. By far the most chaste beds are, however, some curved parallelograms surrounding the central or key bed, and they are of ample size to afford scope for design. Laying across the beds are four diamonds, equidistant, and forming raised panels, filled with red, yellow, and whitish Kales, while in the centre of the diamonds are standards about the size of an umbrella, upon which variegated and choice Ivies are climbing. These beds are quite as effective, and more quiet and chaste than some summer beds I have seen. The groundwork is planted with Rue, which has a good effect

against the variegated Hollies which form the boundaries of the diamonds, and the belting of variegated Ivy that marks the outline of the beds. No hardy shrubs, even of the rarest and most commanding character, could at all cope with this for effect. Moreover, the groups are easily surveyed by the eye, and would be generally acceptable to admirers of effort.

Again, the subsidiary and detached beds that team upon the grass-plot are each of them beds worthy of inspection, and have something individually to recommend them. Nothing could be less objectionable than beds of *Stonacropa*, with the most finely out-leaved and highest coloured Kales set amongst them, and the whole enclosed within the variegated *Periwinkle*. The more select Flages are inserted at intervals in some of the arrangements, and then there are both ground-work and broad beltings of the fine-leaved *Tymium*, and edgings of the *Gnaphalium lanatum*, which very much relieve the sameness of the Kales. The whole forms an example of accomplished gardening art. An effect can positively be given, which those who have never seen it little dream of, and the undulating style which Miss Hope patronises—now raising, now flattening the beds, and duly balancing size and colour—is such as evinces correct taste, and makes her winter garden quite as worthy of a critical examination as a fine landscape from an artist's pencil.

Careful selection and a determined elimination is evidently required to procure such an admirable breed, whose quality is combined with desirable variations in colour. The question that escaped my lips, and which must present itself to most readers, is, "How do they stand the frost?" "They have stood every season," replied Miss Hope, "with impunity, when even the hardest of the curly greens have been injured." This is most important evidence, and is the best certificate possible for maintaining the Kales in their prominent position throughout four of the coldest months of the season.

As regards preparation, there must be growing space

afforded during summer proportionate to the demand, and this is what most people will be ready to do. You may talk of stunts and their stability for a sort of work but the kale can be used quite effectively, and at one time of the season. So says Miss Hope, and I need hardly point by way of comparison, the accommodation provided for the most valuable of the summer bedders, to the cost of spring bedding to the labour incident on the setting up of the beautiful articles used in spring garden work, the labour involved in the making of these beds, and the various beds must however be by no means inconsiderable. If feet of their stems are buried in the ground, and they offer no opposition to the frost. Then they are packed together as if one were packed for economy of space. With Miss Hope they are inserted in beds on a grassy green-work, and seems to be the better way of exhibiting them to advantage. Order of the highest character is maintained, and litter scrupulously looked after, and lawn rolled and kept firm as a bowling-green.

One word as to the different phases of decorative gardening. It seems to be an unsatisfactory mode of summer bedding in the same parterre, if it be instruction that each is to be of representative character. Beds are beautiful in flower but when the green foliage springs up or shows symptoms of decay. It is true winter gardening and summer bedding can be managed thoroughly. Spring bedding does not come a bit too soon for the anxious admirer of flowers, but it has a tendency to tread too upon the heels of bedding out proper, and many lots of bulb foliage have to be prematurely sacrificed or otherwise the whole removed to auxiliary quarters. All the phases may be had respectably, but one ambitious now-a-days that something near irreproachable decorative gardening at all the seasons is the aim of both the sightseer and the grower. J. A.

METEOROLOGICAL TABLE FOR THE QUARTER ENDING DECEMBER 31, 1887.

Observed at Weybridge Heath, Surrey. Lat 51° 21' 18" N.; long. 0h. 1m. 46s. W. 150 feet above mean sea level, on the Lower Bagshot sand. Soil and subsoil fine sand.—By W. F. Harrison, Esq., F.M.S.

Mean pressure of dry air in inches at sea level.	Highest temperature of the air in the shade.			Mean of all highest.	Mean of all lowest.	Mean monthly range of temperature.	Mean daily range of temperature.	Mean temperature of the air.	Mean temperature of the dew point.	Mean reading of thermometer in sun's rays.	Mean ditto on grass.	Mean temperature of the earth.		Mean elastic force of vapour.	Mean weight of vapour in a cubic foot of air.	Mean altitudinal weight reduced for subnormality.	Mean density of humidity (complete saturation = 100).	Mean weight of a cubic foot of air.	Mean estimated strength (—0).	WIND.				Mean amount of rain.	Mean amount of snow.
	One foot deep.	Two feet deep.	N.									E.	S.							W.

Home Correspondence.

Arboriculture.—It is really astonishing how few landed proprietors take the least interest in the management of their woodlands. The few who do so are well paid for the time spent in studying "arboriculture," not only in the pleasure they must derive from such study, but from the handsome profits realized out of their woods. It is true that timber does not now give such returns as it formerly did, which circumstance may to a certain extent account for so many proprietors feeling indifferent on the subject. About sixteen years ago the writer could readily obtain 2s. 6d. per foot, cubic, for large oak wood, 1s. 8d. is now about the highest it will realise, larch which sold for 1s. 6d., now sells for 1s. and 1s. 2d.; Scotch fir sold for 10d. and 1s., present value 8d. or so. Notwithstanding these low prices, it is probable that three times the quantity then used is now consumed, and if it be so, it might reasonably be expected that the value of timber ought to be proportionately higher, but such is not the case. The reason of the inquiry, why has the value of timber not fallen so much? There may be many causes at work tending to produce this result, but the main one I believe, is the quantity of foreign timber imported into the country, and however disagreeable the fact, to those who are interested in the culture of home-grown wood, it is undeniable that free trade in timber has reduced the value to a minimum. And so long as we are not able to supply the increased consumption from our home woods, it is certain we must depend on foreign timber, for the payment of which money must be sent out of the country which should be spent in improving our own. Next to our food and clothing, wood holds the third place, sheltering us from the storm, and supplying fuel for our fires, which it would do, even though our coal mines, as some fear will be the case, were exhausted. Hence, not only are landed proprietors interested in the proper management of woods, but the public is more or less so, and this raises the question, whether, if the immense tracts of waste lands throughout the country were converted into woodlands, and afterwards managed as they ought to be, it would not be possible to grow such a supply of timber from our home woods as to present, or at all events prevent their being glutted as at present, to the almost total exclusion of our own produce? It must not be supposed that it is possible to do without foreign timber for house building and other like purposes. I am firmly convinced, however, that home-grown wood of good quality is vastly superior to foreign for outdoor uses, such as fences and other erections exposed to our variable climate, as also for the cheapest house-grown wood will be of less value than

it has been. The preference given to foreign for outdoor use, because of its cheapness, appears to me to be, in common language, "penny wise and pound foolish," as has been proved by our railways purchasing foreign sleepers, which are said to last about one-third the time that larch or good Scotch fir sleepers do, they are of course much cheaper, but if they require to be renewed in the proportion of three to one, entailing the same expense in felling and relaying as the others, there cannot be much saving. *A Forester*.—I am glad to observe in your impression of December 19 that you take this subject up. Arboriculture has been too long looked upon as a name more than anything else. It very frequently occurs that from the poor encouragement given, parties are appointed to the charge of plantations who, by reason of a limited education, and a want of professional skill, do not reflect credit on the profession, or tend to advance the science. The remedy for this lies in a higher quarter than with the foresters a one. No doubt foresters can do much, and ought to take the initiative, but their endeavours can never be fully successful unless they are seconded by the real parties who will be benefited, viz., proprietors. Books have been written on the subject, and many other efforts have been made in Scotland to improve the status of forestry. Among other endeavours, the Scottish Arboricultural Society was instituted about 14 years ago, and since that time it has been plodding away, by dint of sheer perseverance, as the part of two or three indomitable foresters, with varied success, but it has now assumed a position higher and more influential than it ever did before, because the good effects of its efforts are now beginning to speak for themselves on the sylvan appearance of the country, and also on the incomes of the landlords. This Society has done much, but it still has a great deal to do, and it is to be desired that all parties interested will see it to be their duty to give their support to the advancement of a cause which will do material good to the country, and improve the value of lands which are at the present time utterly worthless. Mr Brown, factor, Invercauld, read a paper before the British Association two years ago on "The Claims of Arboriculture as a Science," this paper was very favourably received, and it may be hoped will have some effect. A deputation of the Scottish Arboricultural Society also attended the meeting of the same Association last year at Norwich, and pressed similar claims, and I entertain the hope, from the encouragement then accorded by that learned body, that on a future occasion they will see it their interest to recognise arboriculture as a science calculated to improve the internal and commercial interests of Great Britain. The admission contained in your valuable article, "that we are obliged to send a poor young man

to France and Germany to acquire a knowledge of forestry for the Indian forest appointments," is certainly very humbling to us, and ought to make us bestir ourselves in that direction, so as at least to equal our continental neighbours. Great difficulties lie in the way of establishing forest schools upon the same basis as forests here are quite different to what they are on the Continent, but by establishing societies similar to those in Scotland, and having these societies resided over and managed by a staff of thoroughly practical men with scientific knowledge, I think much may be done towards improving the cultivation of forests and filling up the blanks which at present exist. *Shoulder to Shoulder*.

Winter Temperature for Variegated Zonal Pelargoniums.—If "Requarer" will turn to Mr Griev's handy little book upon the propagation and culture of these plants a book which ought to be in the hands of every grower—he will find at page 102 the following useful practical information on the matter in a temperature not under 50°, kept near them to the glass, and watered them very sparingly. These three points comprehend all that is needed to carry them safely through the winter. These plants suffer most in the fall season from being left in the open being placed far from the glass, and they are not to be watered. Mr Griev says not under 50° they may safely have a temperature of 50° if placed near to the glass, and kept rather short of water. In such a position the author assures us that the plants will be filled with roots, and the plants may be shifted into 10 or 12-inch pots. The pots must be clean and the drainage so perfect as to occupy at least one-fourth of the entire depth of the pot. Over this layer of earth a covering of 1 inch of moss is to be spread to keep the soil from mixing with it, and choking up its interstices in various ways. Mr Griev recommends a rather soft mould potting enriched with a portion of rotted manure well rotted, the finer parts being rejected through a ½ inch sieve. The roughest soil is then placed in a layer of Moss, and a small portion of the finest soil used to smooth off the surface. Pot firmly, return to the same quarters, water sparingly at first and keep close and moist with surface syringes for a fortnight or so after potting. Early in June, the winter and spring treatment comes to an end, and the plants are removed to their summer quarters in a cold pit, or upon ashes, the glass only being used as a protection against heavy rain and frost. Such a treatment Mr Griev's winter, spring, and summer treatment is not exactly in his own words, and it would be presumptuous, as it is wholly unnecessary, to say anything to them. I can most heartily commend

covering of the hive, believing that it is better to have the hive of a single thickness of board, say seven eighths of an inch, in order that the heat of the sun may easily penetrate it, and warm up the hive almost fully, thus giving the bees an opportunity to bring to the central part of the hive fresh supplies of food from the outer combs. This may lead to a somewhat greater consumption of honey, but if a swarm of bees will give its owner from 50 to 100 lbs of surplus honey in a season, as mine have done the past summer, he ought to be entirely willing to have them eat all they need during the winter. I have removed all the honey-beards, placed two half or three quarter inch strips across the frames and covered the whole top of the frames with any old wooden elements that could be found about the house. Push them in as you would pack a truck, two, three or half-an-inch thicknesses will make no difference. The moisture will pass through as readily as the insensible perspiration of our bodies will pass through our best clothing. The hives will remain dry and the bees warm.
S. Bevan Fox.

(To be Continued.)

Miscellaneous.

Early Peas in Pots.—Having the advantage of a great length of glass walls covering I made a trial of all the earliest Peas in cultivation, and took means to have them true from the raisers. They were all sown on the same day early in February, in the same sized pots, soil, and situation. The varieties were Carter's First Crop, Sutton's Ringleader, Dickson's First and Best, Taber's Perfection, Dickson's Profits, and Sangster's No. 1. The First Crop and Ringleader showed flower at the same time. Taber's Perfection and Dickson's First and Best were two days later. Dickson's Profits was equal with the sprouts early for it was a week later than any other in flowering, and Sangster's No. 1 the last. The first dish was gathered off Carter's First Crop and Ringleader as they are identical in growth and earliness, on the 15th of May. Dickson's First and Best and Taber's Perfection were only two days later in furnishing their first dish. Sangster's No. 1 and Dickson's Profits were two days later. The rows were sown as follows:—First Crop and Dickson's First and Best were only three and four Peas in a pot, and came in nearly a fortnight. By far the best potter and for or was Taber's Perfection, for I average four and five Peas in a pot of good size and was well favoured. The sort I had for Dickson's Profits was similar to Sangster's No. 1, for they were both really at nearly the same time, and resemble each other in the size of the pods and in growth. I had a long low pot filled with Marlean's Little Gem, which produced by far the finest and earliest Peas I have ever grown in May. The first batch of pots was sown in November, and came in in the end of April, and two other sowings made in December produced some good dishes in the beginning of May. In fact the pots and Peas were as large as those produced in summer, and quite of the Marrow flavour. For the future I intend discarding all the tall early Peas for forcing, and only using Little Gem and Tom Thumb, with Advancer for the tallest variety.
W. Tillery, in "Florist and Pomologist."

Garden Operations.

(For the ensuing week).

PLANT HOUSES.

Caladiums, which are now at rest, require a more than ordinary amount of care during this their dormant period, to enable them to retain such an amount of vitality as will insure a good vigorous growth at a future date. More of these valuable tuberous-rooted plants are lost at this time of the year than during the whole period of their growth, simply through the want of a little closer study of their characteristic peculiarities. I believe that dry-rot destroys more of them than any form of dampness or latent moisture is capable of doing. This is invariably brought on by great fluctuations of temperature and dryness in excess. Their succulent roots become scorched in either case, that they are incapable of retaining a sufficient quantity of nourishment to maintain a proper vitality, and hence rot is induced, even in form which permeates the whole. To insure the plants against this state of things, endeavour at all times to keep the pots as far as possible from any source of heat, whether pipes or flues, but in a temperature never less than 55°. If any condensation exists in the atmosphere, a sufficient quantity will attach itself to the pots and soil. I would, however, recommend that the pots, which should lay upon their sides, be occasionally sprinkled over with tepid water. A good deal might no doubt be learnt in regard to these plants by a reference to the native Arum of our woods and hedges. These are generally found in dry situations, not always, it is true, the wet of our long winter months with entire immunity from injuries of this sort. *Caladiums* will now be expanding a few of the first blooms, or some among them will have the buds forming very prominently. Where the least symptoms of green-fly or other pests exist a good fumigation should be given, as when once these gain a lodgment at this season or at the next flowering period, they generally succeed in destroying some of the younger buds, and damaging the beauty of the plant. Good waterings with liquid manure should be given them from now onwards. Continue putting successive batches of *Herbaceous Caladiums* as quickly as their roots advance to the sides of the pots, until they are finally shifted into the flowering ones. Early *Cybe Telarjuniensis* should have gentle and artificial them by a slight amount of heat being kept in the pipes daily. Those however, which are intended for the ordinary blooming season should be kept as

cool as possible, not to unduly expose them. Give more water to *Heaths* and *Epimediums* who have spent their flower buds, and thus promise an early display. I have lately sown similar plants in regard to *Campanulas*, which I might in a good supply at this period. Those who have ordinary bedding stuff, or semi-hardy plants of any other sort, stored away in unheated or other makeshift houses or frames, will do well to withhold water from them for the next three or four weeks. Such a course will assist to insure them from any injury through the want of water at the roots.

FRUITING HOUSES.

A plentiful supply of fresh air should be given to *Peaches* as soon as the buds have pushed, should the weather prove favourable. Upon bright sunny days (or at any time when the external thermometer rises up to about 50°), let it be admitted with judgment at the front, especially in instances where the air-holes are placed continuously to the heating media, and the air blows free upon and between them, so becoming warmed on its way into the structure, at the same time giving more atmospheric moisture with the increase of air. The bottom heat at the roots of fruiting *Peaches* should now be kept up to a mean of from 79° to 81°. Strong successions may be kept some 10° or 12° lower than this. Where symptoms of a decrease exist, steps should be taken to stir up the material, and if required to add more fresh tan or other substances which may be needed. Be cautious in the use of the water pot for some little time to come, unless where the plants are plunged in the vicinity of pipes or flues, and are the more likely to be affected thereby. If the *Peaches* or *Nectarines* in the earliest house are commencing to expand their blossoms, increase the temperature by some 2° at night, and 3° or 4° by day. Do not syringe them during the early stages of flowering, but rather keep the air as dry and buoyant as possible, the more to aid this delicate process. Permit the warmth caused by sunshine only to run up to from 72° to 75°, without at all times for a like purpose.

HARDY FLOWER GARDEN.

Where alterations and improvements are contemplated in this department, this will be found a good season to push forward such operations with vigour. *Crucifers* should now receive every attention at our hands, the season, being a wet dripping one, has not been very propitious to them. Carefully attend to all the younger stuff likely to have been influenced by the late wind-storms, and secure them by every possible means against any further bad weather. Composts, which are heaped up for the purposes of decomposition or protection, may be turned over with much benefit after the late frost. This will not only tend somewhat to destroy insect life, but also aid by its resuscitating influence to make the same more valuable. All trees intended to be transplanted should now be removed as quickly as possible, that the soil may become well settled about the roots, and fresh rootlets be formed, preliminary to their forming early spring buds.

HARDY FRUIT GARDEN.

Where delay has occurred in the planting of *Fruit Trees* (against which I protested some months since), I would again urge the desirability of planting at once. Do not cut away any of the branches for a little time to come, as so doing causes an undue and unnecessary expenditure of sap, which would be already taxed in the process of removal. The excessive rain of the past few months has caused the ground to become unusually moist, this will give to all a good idea concerning the sort of substrata their fruit-tree borders, and the soil conditions to them are possessed of, and may suggest the desirability of a more efficient system of drainage. A soil containing stagnant moisture is farthest removed from that which is likely to produce good fruit, and with moderate constancy of supply. Hence, by drawing attention to the question, I may induce greater scrutiny into such matters by possessors of soil of this description. The sooner all draining operations are concluded, the better. Any who, being in the possession of old walls, contemplate having them pointed over, or wired for fruit-tree training will do well to push such work forward during mild weather, as the early spring operations in connection with these will now quickly need attention.

KITCHEN GARDEN.

The earlier sowing of *Peas* and *Broad Beans* should again be earthed up a little upon a dry day. Some sort of protection should be afforded them from the attacks of sparrows and the feathered tribe generally. One or more rows of wadded, which has been previously dipped in naphtha, strung along the tops of their young growths, I believe to be an excellent remedy. Do not omit any opportunity to dig well, or to trench over, every vacant or spare place, that frosts and snow may have full play upon the ground. Many growers I observe remove for present use the crowns, or terminal growths, of *Beaufoils* sprouts, but excepting in instances where they are slow to button, or are wanted early off the ground, this practice is bad. It exposes the whole stalk to the bearing influence of frosts, and causes them to cease growing, however favourable the weather between now and spring may be for the production of more sprouts. A few *Potato Onions* may now be planted in a favourable situation in rich and well prepared ground. Press them firmly into the soil, and bury all excepting the tip of the crown in the operation. Onions are likely to be very scarce ere the season is far advanced, so that every opportunity should be embraced to increase the stock.
W. E.

TOWN GARDENING.

Should the weather continue open, now is a good time to attend to grass-plots. Take out all Daisy and other weeds that are visible, and give a good dressing of

mould, rake it well about and roll well in fine weather, this being of the utmost importance to town grass. Where it is intended to lay turf or Grass seeds the ground should now be turned, levelled, and all rough rubbish, packed out Hyacinths, Narcissus, Crocuses, and Tulips that yet remain on ground should be planted as soon as possible, so as to succeed those planted in autumn. If not previously taken up all *Crysanthemums* large flowered and single, and lay them in close together, so that they are protected, for, though they are tolerably hardy, it is known a lasting frost kill a great many, and by moving the plants the beds and borders can be manured and properly dug. Lilacs and other deciduous shrubs should now be looked over, and all dead or ill straggling branches and suckers from the back cut out, and the ground turned up with Parker's fork. As all British Ferns do well in towns, a new work should now be formed. A bank of any good earth should be thrown up, of an irregular outline on this an artificial rockwork can be formed of clinkers, burnt bricks, and old roots, and as there is no class of plants differing so much in their natural habits as Ferns—some thriving in swamps, some on rocks, some on rains, and some on trees—we endeavour, in forming the rockery, to supply the individual wants by imitating Nature as far as possible. The vacancies between the rockwork should be filled up with such soils as are likely to suit each individual variety—planting, for instance the Royal Fern, *Andropogon regalis*, in a mixture of bog and sand, in position where it can be kept moist, the *Blechnum boreale*, or *Hard Fern*, higher and drier, in a soil of loam and peat, the *Hart's tongue* in a mixture of leaf-mould and old brick rubbish, on the darkest of the rock, and the various other kinds in accordance with their natural habits. J. D.

Testimonial from J. EDWARDS, Esq., Her Majesty's Defences, Hilsa Lines.

"The whole of the Grass and other Seeds gave great satisfaction."

CARTER'S PRIZE MEDAL LAWN GRASS,

1s. per lb., 20s per bushel, as supplied to

H.M. THE EMPEROR OF THE FRENCH,
H.R.H. THE CROWN PRINCESS OF PRUSSIA,
THE GOVERNMENT OF THE UNITED STATES,
THE IMPERIAL COMMISSIONERS, PARIS EXHIBITION,
Ac &c

Testimonial from M. BARELLET, Chief Superintendent of the Gardens of H.M. Napoleon III.

"The Grass which we have laid down with your Seed has come up well, and is magnificent." [Translation.]

THE NEW FORAGE PLANT,
BROMUS SCHROEDERI.

See *Gardener's Chronicle*, page 1345, Dec. 26, 1868, from which the following is extracted—"The crop of Bromus was perfectly satisfactory as regards both the quantity and quality of its produce. The Horsekeepers having preferred it to Italian Rye-grass, and the Farmer saying it was very much inclined to agree with them."

F. DAWES, Esq., *Pebrigt, Guildford*, writes—

"I beg to offer my thanks to Messrs. CARTER & Co. for calling attention to the valuable plant, Bromus Schroederi."

"I purchased some seed to test its value, and it occurred to me that a report of my experience might be of interest."

"The seed was sown in July on ground as dry as dust, but it vegetated freely, the first showing causing it to grow with amazing rapidity. The first cutting was made October 20, the plant being 2 feet high, and I found my cattle preferred it to any food I could offer them. I now have (Dec. 20) a luxuriant second growth, in spite of the cold weather."

"I may mention that I was first induced to cut the Grass on a small farm by refusing its ordinary food, and was gratified to find the Bromus greedily consumed."

Sow 35 lb. per acre in drills.

Price 1s per lb., cheaper per cwt. See

ROYAL AGRICULTURAL SOCIETY OF ENGLAND

AGRICULTURAL EDUCATION

The EXAMINATION of CANDIDATES for the SOCIETY'S EDUCATIONAL PRIZES will take place in the week commencing MONDAY, April 12, 1869. Copies of the Form, required to be sent in by March 18, may be obtained on application to

H. M. JENKINS, Secretary
12, Hanover Square, London, W

The Agricultural Gazette.
SATURDAY, JANUARY 9, 1869.

THE cattle plague, obeying the law which seems to regulate the progress of contagious diseases generally, is advancing westward from its reputed home in the Steppes. Hungary has been suffering from its effects for some time past. It also prevails in Lower Austria in at least three districts. In Transylvania nearly 60 places are infected. Bukovina is not free from the pestilence, and Galicia is reported to have several infected districts. Altogether, in Hungary, Lower Austria, Bukovina, Transylvania, and Galicia there appear to exist between 60 and 70 centres of infection. Saxony, we learn, has prohibited the passage of Steppe cattle over the Sax-Bohemian frontier, but permits the entrance of Bohemian cattle with certificates of health.

The contemplation of these facts is not likely to produce a very cheerful state of mind among those who are especially interested in home-bred stock. We have felt ourselves tolerably secure from invasion up to this time, because we have been principally supplied with foreign cattle from healthy districts; but now the Grass season is over, and we are about to import cattle bred in the districts which are now being ravaged by the cattle plague, or in very decided proximity to them, Galician, Hungarian, and white Austrian cattle will now be sent to our markets; and, although all those cattle are presumed to have been feeding for many months in Austrian and Prussian distilleries, and growing fat upon the refuse products, there is at least a possibility of other animals of the same breed being smuggled over the Prussian frontier. Indeed the probability of such an occurrence was distinctly admitted by the Veterinary Congress, held in Vienna in 1865. Our own experience is strongly in favour of the presumption, that such violation of frontier rules is neither so difficult of execution nor so infrequent as many persons would lead us to believe.

In the spring of 1867 an outbreak of cattle plague in the East of London was, with good reason, charged upon white Austrian cattle, which, according to the system pursued on the Continent, ought not to have been capable of introducing the disease. Regulations, however, are not always carried out as they should be; and there is nothing to justify the assertion that foreigners have stronger scruples about "running the blockade" than Englishmen have. We found it here exceedingly easy to pass Orders of Council, and to issue directions from all sorts of authorities, but the task of enforcing the laws was by no means trifling, particularly when people quietly ignored their existence, and acted in accordance with their own ideas of right or convenience. Providing that all the regulations respecting the passage of animals through Prussia are carried out stringently, we may perhaps rest in tolerable security, but any evidence of the fallibility of the precautions which are adopted by that Power will necessarily disturb our repose, and such evidence we undoubtedly have had. Under ordinary circumstances the system of feeding Bohemian and other "white cattle" in the large distilleries works well, and no foreign beasts imported to this country "die better," in butchers' phrase,

than the cattle so treated; but this is small compensation for an occasional outbreak of cattle plague in the metropolis, or elsewhere. So long as all the conditions of security are maintained, no danger need be apprehended. Capitalists on the Continent may buy hundreds of cattle in Bohemia, Moravia, and Hungary, feed them upon the waste products of their distilleries, and having brought them to a condition fit for the English market send them to England; the time required to fatten them will in itself be a guarantee of their freedom from infection, and if there is no disease in the locality where they are fed, they may safely be treated as though they had been bred there. The travel of these cattle through Prussia to the coast is permitted only under restrictions; evidence of their having come from a healthy locality is required; and, in short, every care is taken by the Prussian authorities, as might be expected, to prevent the entrance of infected animals into their country—not always with success, as their records will show.

The transit of cattle through Prussia to this country occupies some days. Cattle coming from Bohemia are usually on the road about six or seven days before they reach the London market; and it may be said in reference to the "white cattle" of Austria, that their passage occupies something like a week. This fact is often quoted in support of the theory that infected animals—that is, cattle infected in any part of Austria (in Bohemia or Moravia, for instance)—cannot be sent to London, because by the time they arrive the disease will be sufficiently advanced to be at once detected by the inspectors. The argument rests entirely upon the assumed fact that the cattle which first became infected in their own country are as a matter of course brought on to London, altogether ignoring the probability of such animals falling sick before they are shipped, and being disposed of, while the remainder of the herd—a certain number of them having received the infection from those originally diseased—will be shipped for England, and thus arrive in our ports two days, instead of six or seven, after infection. In this way the Silesian cattle, which are said to have imported the disease in 1867, may not, and most likely did not, show any symptoms of ill-health on their arrival in this country, although some of them died here so shortly afterwards that there was no possibility of their having been infected after landing in London, where, indeed, cattle plague did not then exist.

It is to be hoped, in view of the steady progress of the plague in the Austrian provinces, that every care will be taken to prevent its introduction here, but it is quite impossible to doubt the extent of the risk which we must continue to incur, so long as the malady exists in countries adjacent to those from which we now obtain large supplies of foreign cattle.

TURNIPS and Swedes are not generally approved on heavy land as a preparation for corn. Their removal is costly; and though they are useful for stock feeding, the moderate crop yielded by heavy land does not always pay the cost of production. There is manure to put to the credit of the account; but this is all wanted, the heavy-land farmer declares, to restore the condition of his land. If the Turnips be folded off in the winter, the Barley crop suffers from the effect of treading the land, which even frost does not obliterate; and even if eaten off before winter, either Wheat or Barley will probably be a worse crop than after bare fallow. Good heavy land will yield a full crop of Barley after bare fallow, and it may fairly be asked—what more can it do under any circumstances? If injury be done by treading, a light crop is certain to follow, and if the folding takes place in early autumn, and the land is enriched, the succeeding crop may prove stout in straw and light in corn. It must be remembered that crops do not always behave as theory predicates, they obey their own habit of growth.

Even on poor heavy land that requires dressing we have seen a spirited and very successful attempt to introduce root cultivation attended by very doubtful results as regards the corn that followed. Next to the farm we refer to is a similar holding, under the old routine of fallow for corn. The bare, pale earth on one side of the hedge, was a sorry sight compared to the luxuriant green of a capital crop of early white Turnips on the other. Sheep fed with oilcake soon came on the scene, and it was delightful to

NEW GOLDEN QUEEN MELON.

THE FINEST MELON IN CULTIVATION.

Owner of this valuable Melon having saved his entire Stock for S & M, and having been grown in a
Garden by himself with no other variety near, it may be relied on as GENUINE.

Price per packet, 2s.

STUART AND MEIN, SEEDSMEN, KELSO, N.B.

List of Firms who have received a supply of the above from S & M. will be published shortly.

B. S. WILLIAMS'

NEW GENERAL PRICED SEED CATALOGUE for 1869,

Is now ready, and will be forwarded Post Free to all customers and applicants.

It contains Lists of all New Flower Seeds of merit, Choice Strains of Florists' Flowers, imported Flower Seeds in
collections, the most useful Annuals, Biennials, and Perennials for Spring and Summer Flowering, carefully selected
Descriptive Lists of improved Varieties of each kind of Vegetable Seed, with a few Practical Hints as to Culture, also
an Appendix containing Gladioli and other Summer and Autumn-flowering Bulbs, Knives, Horticultural Imple-
ments, Horticultural Manures, Insect-destroying Composition, and every article likely to be required in the Garden.

A personal inspection solicited, every article is priced, and purchasers may depend on the Seeds being true to
name, and everything of the best quality. Exaggerated descriptions are carefully avoided.

All Orders of more than £1 in value sent Carriage Free.

VICTORIA and PARADISE NURSERY, UPPER HOLLOWAY, LONDON, N.

CAREFULLY SAVED GARDEN SEEDS.

ARTHUR HENDERSON & CO.'S

CATALOGUE of choice VEGETABLE and FLOWER SEED NOVELTIES

Is now Published, and can be forwarded Post Free on application.

The VEGETABLE SEED SECTION contains—

Selected LISTS of the best varieties of each kind most worthy of cultivation, also some excellent new sorts
of both VEGETABLE and FLOWER SEEDS of sterling merit, attention is also directed to the Pine-apple Compact-
top BEET (the finest and richest flavoured variety extant), carefully saved, true from the original stock. Also the
new L'WAVE WATERLOO BEET—top leaves rich metallic crimson, growth true, even, and regular. This
beautiful foliaged variety may with advantage be cultivated in the flower garden as a border, ribbon, or edging
plant, its root is a true larger than the Pine-apple Compact-top, flavour excellent, full of sweet saccharine juice,
colour crimson, texture tender and uniform throughout.

The FLOWER SEED SECTION contains—

Imported GERMAN FLOWER SEEDS in Collections, Choice Strains of FLORISTS' FLOWER SEEDS,
a Descriptive LIST of FLOWER SEED NOVELTIES of the season, HORTICULTURAL REQUISITES of every
kind, KNIVES, PROTECTING MATERIALS, HORTICULTURAL MANURES, &c., &c.

N.B. Everything in this CATALOGUE is Priced.

PINE APPLE PLACE, MAIDA VALE, LONDON, W.

BARR & SUGDEN'S

(12, KING STREET, COVENT GARDEN, LONDON, W.C.)

NEW SEEDS READY TO SEND OUT.

NEW DESCRIPTIVE SPRING CATALOGUE of CHOICE SEEDS ready, and may be had free by intending
purchasers. The Catalogue embraces every Novelty and Speciality in Flower and Vegetable Seeds worthy of notice,
with a Special List of nearly 400 sorts of ALPINE and HERBACEOUS PERENNIALS, which have been saved from
one of the most extensive Collections in Europe, and the most extensive LIST of GLADIOLI offered, embracing all the
New kinds. Also offered for the first time in this country a SPECIAL LIST of NEW TABLE MAIZE, the most
improved varieties of those cultivated by our American Cousins, who use the green cobs as one of their most
popular Vegetables, and as, in this country, they will come into use when the supply of Green Peas is becoming
short they will be found an agreeable substitute for these. The late Judge Haliburton (Sam Slick), when residing
at New York, used this Vegetable when in season daily. The Rev T C Bréhat, of Guernsey (Her Majesty's
Commissioner at the Paris Exhibition of 1867 to report on the present state of Fruit Culture on the Continent),
through the American Commissioners received the varieties of Maize referred to and enumerated in our Catalogue, and
has placed the entire stock at raised last year in our hands for distribution, feeling confident that the success which has
attended their cultivation in the Island of Guernsey warranted him in introducing them into England for domestic use.

SUTTONS' RINGLEADER PEA, THE EARLIEST IN CULTIVATION.

The ROYAL HORTICULTURAL SOCIETY last year tested carefully the merits of the leading kinds of EARLY PEAS, and it is gratifying for us to observe the Report of their Trials, which appeared in the *Gardeners' Chronicle*, June 27, 1863, contains the following brief but emphatic statement.—
"The earliest form of all was Ringleader. Several of the Peas blossomed at the same time, but Ringleader was fit to gather first"

In thus referring to the result of this important Trial, we may mention that it strictly coincides with Trials made by our Customers, and also in our own Experimental Grounds. The first sowing last year of the Ringleader Pea at our Seed Farm was made on February 12, and harvested fully ripe for threshing on June 16, coming off in time for Turnips. Retail price, 2s per quart. SUTTONS' Ringleader Pea is included in all Messrs. Suttons' Collections of Vegetable Seeds.

SUTTONS' CHOICE POTATOS FOR PLANTING.

- SUTTONS' EARLY RACEHORSE, the forwardest known, 5s per peck.
- SUTTONS' BERKSHIRE KIDNEY, the best and most prolific in cultivation, 5s. per peck.
- SUTTONS' GOLDEN BLOSSOM KIDNEY, a very distinct second early variety, 5s per peck.
- SUTTONS' KING OF POTATOS, a splendid variety, took First Prize at Birmingham, 3s. per peck.

And numerous other sorts, moderate in price, true to name, and free from disease For prices see SUTTONS' SPECIAL POTATO LIST, Gratis on application

SUTTONS' SPRING CATALOGUE AND AMATEUR'S GUIDE,

Price 1s. Gratis to Customers.

SUTTONS' ABRIDGED LIST Gratis on application.

All Goods Carriage Free, (except very small parcels). Five per Cent. allowed for cash payments.

SUTTON AND SONS, SEEDSMEN TO THE QUEEN, READING, BERKS.

PRIZE MEDALLISTS

LONDON.

PARIS.

1862.

1867.

JAMES CARTER & Co. are prepared to supply on the 15th of January next the following four handsome New Varieties of Coleus.

Raised at the Gardens of the Royal Horticultural Society, and purchased by them at the Public Auction on the 10th of December, 1868.

COLEUS HER MAJESTY.—This variety is of very free habit and the broad leaves are of a deep orange red with a narrow border of green which gives a beautiful contrast.

COLEUS PRINCE OF WALES.—A free-growing variety, with leaves of a deep purple red, marked with deeper coloured blotches, and having scarcely any green markings at the edge, so that it resembles Albert Victor, minus the golden margin. Price 3s 6d each.

COLEUS PRINCESS OF WALES.—This has still less yellow than either Queen Victoria or Princess Rosa, but has instead a much more acid and deeper glow of purple. Price 3s each.

COLEUS PRINCE ARTHUR.—The leaves of this variety have a yellowish ground color, while the base, the veins, and the principal veins are heavily marked with deep purple red, the margin also being red. These markings give the plant rather a grotesque appearance. It has the erect habit and general peculiarities of Coleus Godeolii. Price 3s 6d each.

The set of four for 14s.

New Double Zonal Geranium for 1869.

WILHELM FITZGER (Linnæus). A novelty without a rival, possessing all the desirable qualities to make it a valuable addition to every collection, dwarf, free-blooming habit, and brilliancy of colour.

Plants not higher than 5 inches had two and three trusses fully expanded, each measuring rather more than 5 inches across, the individual flowers are large, very double, of the most perfect shape, and dazzling orange-scarlet colour.

We have purchased the entire stock for distribution in England, of the raiser, M. Lemoine, of Nancy. Plants to be ready by February 15, 1869. Price 7s 6d each.

Lilium auratum (Golden-rayed Lily).

Fresh imported Bulbs, 2s 6d each, and upwards.

CARTER'S SEEDS FOR THE FARM.

See page 59, of this day's Gardeners' Chronicle

CARTER'S PRIZE MEDAL LAWN GRASS will produce a Permanent Turf of finest quality. 1s per lb., 20s per bushel.

CARTER'S FERTILIZER, the best Manure for the Garden. In Tins, 1s 9d, and 4s 6d each. In Bags, 15s. and 25s. each.

See CARTER'S Gardener's and Farmer's Vade Mecum for 1869 (Illustrated), 34th Year of publication. Post Free for 12 Stamps, gratis to Customers.

JAMES CARTER AND CO., SEED GROWERS, 237 and 238, and 261, High Holborn, London, W.C.

GARDENERS' ROYAL FAVORITE... CANDIDATES.

Table with columns: Name, A, Votings. Includes names like GEORGE ANABALL, THOMAS WILLMER, etc.

The Meeting on Monday, George Anaball, of North Craven, and Thomas Willmer, of South Craven, by the joint invitation of the Society of Gardeners, on the 11th inst.

By Order, EDWARD R. CUTLER, Secretary, 14, Tavistock Row, W.C., Jan 14.

THE ROYAL HORTICULTURAL SOCIETY'S GRAND EXHIBITION at MANCHESTER.

Show of the ROYAL AGRICULTURAL SOCIETY. Amongst various Special Prizes, A SILVER CUP...

will be offered by the Proprietors of the GARDENERS' CHRONICLE and AGRICULTURAL GAZETTE for the best COLLECTION of 6 FRUITS and 6 VEGETABLES, to be made up as follows:

Good, Medium, Inferior. Grapes, 0 marks, 3 marks, 1 mark.

Strawberries, 3 marks, 2 marks, 1 mark.

Gooseberries, 3 marks, 2 marks, 1 mark.

Cherries, 3 marks, 2 marks, 1 mark.

Raspberries, 3 marks, 2 marks, 1 mark.

Apples, 6 marks, 3 marks, 1 mark.

Plums, 3 marks, 2 marks, 1 mark.

Peaches, 3 marks, 2 marks, 1 mark.

Apricots, 3 marks, 2 marks, 1 mark.

Oranges, 3 marks, 2 marks, 1 mark.

Lemons, 3 marks, 2 marks, 1 mark.

Small Fruits, 3 marks, 2 marks, 1 mark.

Vegetables, 3 marks, 2 marks, 1 mark.

quality, and constitution, so that those who would aid and assist her have a more difficult though more straightforward work before them than their fellow-labourers in the floral world.

In Grapes alone, the noblest and most prized of all our fruits, if there were nothing else, we have sufficient of note to write down the year 1865 in red letters. Mr. W. TOWNSON, whose efforts as a hybridiser of the Vine have in previous years been rewarded with success, is again entitled to our especial thanks for the production of the Col de Signora, the most magnificent grape I ever saw, and one of which I boast. This splendid acquisition is a hybrid between the Champion Hamburgh and the Bowood Muscat twice removed. The berries are of enormous size, somewhat resembling huge Canon Hall Muscats. It is every inch a champion, golden in colour as the Muscat itself, with a flavour equalling its rival for richness, and which partaking more of the Hamburgh character, and with a vigorous constitution. We have here a Grape which will take the highest rank, and worthily fill up the blank which has long been left—that of a white companion to the Black Hamburgh. Some curious crosses of Mr. PEARSON'S from the Strawberry Grape, and which have performed although in other respects worthless variety, are deserving of especial mention, combining as they do, in a powerful degree, the Strawberry scent with the Muscat flavour, the latter too rich too musky in fact to be pleasant, and the flesh being of the peculiar shiny texture belonging to all the American, or Fox Grapes as they are called. It is however an important break, a result which could scarcely have been anticipated, and one from which we may hope in future years to obtain scented Grapes of the finest quality—who knows? We would here suggest that some of our hybridisers should turn their attention to the raising of a race of hardy Grapes—Grapes of large size and good quality, that will ripen their fruit early and well, in the open air of England.

Amongst Peaches and Nectarines we are again indebted to Mr. RIVERS for some splendid acquisitions. The improvements which are being effected in this class of fruits are truly marvellous, so numerous are the seedlings raised and fruited every season. Many of those of the past season we have tasted, and have found them excellent, all being possessed of a peculiarly rich and tender flesh. The gem of the season is Margate, raised from Rivers' Orange Nectarine, a Peach of medium size, ripening in August, with very tender melting flesh, and a flavour quite original and exquisite. Another variety, a seedling from Cooledge's Favourite, is also one of very great promise. A new yellow-fleshed Peach of Mr. PEARSON'S may be mentioned as an acquisition to that class, although the yellow-fleshed sorts are not generally looked upon with much favour in this country—why, we cannot tell, for there is something peculiarly pleasing and warm-looking about them, though in flavour they are as a rule inferior.

Figs have come in for a more than usual share of attention during the past season. They have been strangely neglected in this country, yet there is no fruit so really delicious. The Negro Largo, introduced by Mr. FLEMING, of Chyeden, from Spain, is a great gain, a noble-looking fruit, of large size, prolific, and of excellent quality. The Bourjassetto Grise, figured at p. 1260 of our last volume, though not new, is but little known, and may be thus prominently noticed as being without exception the richest of all the Figs we have tasted. The Col de Signora Blanca panachée is also an extremely good, and a particularly beautiful sort, the fruits being handsomely striped with broad bands of green and yellow.

Amongst Apples we have the fall well worthy of notice—Anna Elizabeth, a large culinary winter variety, Beauty of Waltham, in autumn, dessert sort, and Golden Seckling, another dessert sort of really good quality. Amongst Pears we have one sterling acquisition, the Summer Beurre d'Arenberg, which ripens in August, and which was raised by Mr. RIVERS from the old Beurre d'Arenberg. Beurre d'Automne, a large October Pear, is an introduction from the Continent, and has flesh resembling that of the Marie Louise and Glou Morceau, and which may not only be pointed out as one of the most beautiful Pears in existence, but also as one of most excellent quality.

Though several Cherries and Plums have been brought forward, we have no decided acquisitions

to record amongst these fruits. Strawberries would doubtless have furnished us with abundant materials to chronicle had the weather been more favourable; but, being so hot and dry at their season of ripening, they were in a great measure spoiled. Some seedlings raised by Mr. STANDISH and Mr. WILLIAM PAUL, not yet named, are of wonderful promise; also the following of Dr. RODEN'S raising—Duke of Edinburgh, Lord Napier, and the Sultan. Mr. PAUL furnish us with two good varieties, the Golden Queen, a beautifully netted, bright golden-skinned and green-fleshed variety, and Queen Emma, a white-fleshed variety. New Melons are always plentiful enough, and the difficulty of their raising is principally a matter of good cultivation.

The progress made in the VEGETABLE department has not been so great as amongst fruits, the past season having, in consequence of the excessive drought, been perhaps the worst that has ever been experienced for the proper prosecution of this, the least attractive, but by far the most important of a gardener's pursuits. We do not here look so much for novelty as we do amongst flowers or fruits. The improvements amongst vegetables are effected by careful selection of particular forms, and by the husbanding of seed from these, rather than by the exertions of the hybridiser. Thus, when a new vegetable is announced, it will in most cases be found that it is only a particular form carefully selected from some variety already in cultivation. In Peas, however, we have one or two grand exceptions to this rule, and to Mr. LAXTON, of Stamford, our thanks are again especially due for his successful exertions in this field of labour. By his efforts in hybridising the Pea, we are gradually becoming possessed of a race of early green Marrows of wonderful excellence. We last season recorded the introduction of Laxton's Supreme, and Alpha, which have quite maintained their high character; now we have to record a still greater acquisition, which has been named William I., a wrinkled blue marrow, as early as Sangster's No. 1, and producing very large pods—a grand acquisition truly. Multum-in-Parvo, a larger form of Little Gem, is in some respects an improvement on that variety.

Amongst Kidney Beans, the Salmon-coloured Kidney, proves to be very good amongst dwarfs, while amongst Runners Premier is a decided acquisition—a true Kidney Bean with a running haulm, and consequently a continuous bearer. The new Purple-podded, has proved to be more curious than useful, the dark colour of the pods militating against it. Of Colonies we have Sandringham White, a selected and somewhat taller form of the Incomparable White, and Carter's Incomparable Red, an excellent dwarf kind. Of Endives we have Fraser's Broad-leaved Batavian; and of Lettuces, All the Year Round and many fine forms of Paris White Cos. Mr. MELVILLE has been working assiduously for some years past in hybridising the old perennial Woburn Kale with the variegated Borecole, the object being to secure a perennial variegated Kale for the decoration of our shrubberies in winter, and in this he seems now to have succeeded, the new form being an important acquisition, although not yet quite so perfectly coloured as we may expect to have it.

Amongst Cucumbers there are always numerous so-called novelties bearing at least new names, yet there is nothing particularly new amongst them, the Telegraph of Rollisson and Paul, Pearson's Long Gun, and Masters' Prolific, may be cited as perhaps the best forms of the year. Winter Favourite, a hybrid from the Lardy ridge sort, promises to be an excellent winter variety, as does the Early Winter Prolific. To these may be added the magnificent varieties raised and sent out by Mr. HAMILTON.

In Potatoes—one of the most important of all Mother Earth's productions—we have abundance of new material. The past season was, however, one of the strangest and most trying that has ever been experienced for this particular crop, and although disease was happily almost absent, the excessive drought affected them greatly. Almond's Yorkshire Hero of our great Potato King, Mr. FENN, is a fine sort. Carter's Main Crop, of the Red Regent class, will prove a most useful variety, being excellent in quality, like the Regent itself. There are also Giant King, Veitch's Improved Ash-leaf, and many others too numerous to mention. Thus throughout the entire vegetable kingdom, in almost all its various departments we have something new to write down, some improvement to be thankful

for, all tending to show that our gardeners are ever watchful, and ever ready to aid and assist Nature in her steady onward march. B.

— We have just had a very curious communication from one of our best producers of ZONAL PELLARGONIUMS. It is well known to most of plants from cuttings, especially in the case of the scented Roses, that a large callus is often formed at the base of the cutting, which keeps increasing in size without throwing out a single root, and eventually cutting the cutting off. The case before us is somewhat, though not entirely, similar. A quantity of cuttings of Zonal Pellargonium were observed to die off at the base, and when examined, with a view to ascertaining the cause, it was found that from the base of the internode a spongy mass was thrown out, which ultimately branched and assumed the appearance of some Clavaria. In the specimen before us not a root was thrown out, and this appears to have been generally the case, and indeed the fungoid mass, on close examination, to belong, not to any root, but to an unnatural development of the axillary where the lowest leaf was torn off. This appeared to be the case from an abnormal development of the foliaceous appendages being at length produced in many cases on the tuberiform body. The appearance, in fact, is similar, though in a modified degree, to which occurs occasionally on different parts of the Pteris, of which an illustration was given some time ago in this Journal. The body was too much decomposed, in consequence of transmission by the post, to admit of microscopic examination, but we have no doubt about its being a transformed bud, whether normal or adventitious. The cause of these curious freaks, no one is, we believe, in our present state of knowledge, able to explain. M. J. B.

— MR. H. C. BAILDON, of Edinburgh, has issued a specimen of his new patented process of NATURE-PRINTING, in the form of four sheets containing figures of 12 species and varieties of ferns and British Ferns. The plants are for the most part very nicely and truthfully represented, though in their being printed in colours, one can scarcely judge the perfect accuracy of first-class hand-colouring. The process adopted seems to be that of taking impressions direct from the specimen, after carefully drawing with prepared ink, on transfer paper, where the figure is conveyed to a lithographic stone, the colours being then obtained by successively printing compared with what is more usually called Nature-Printing, the Naturdruck of the Germans. The process presents both advantages and disadvantages. On the one hand it avoids all undue extension of the parts and joints, of more accurate printing, especially as regards the thicker parts, as the ink and rachs, on the other hand, the structure of the venation especially, are less distinctly brought out. To remedy this latter deficiency in the present enlarged woodcut figures, drawn by Mr. FITZ, have been given in the letterpress. The work is published by REEVE & Co.

Below we give the results of the Royal Horticultural Society's December EXAMINATION OF GARDENERS. We understand that the Examiners, stating that the papers worked on this occasion were below the average, specially point out that in respect to orthography, both in the case of ordinary language and of the names of plants, the result is not satisfactory, words and names being too often carelessly spelt, as may be illustrated by such as "Lordizabella" for Lardizabala, and "Amaroc" for Hemerocallis. The schoolmaster has some occupation still, amongst the rising generation of gardeners. Surely with the high-grove profession and high estimate of the value of their services, it is part of the young men of the period, we ought at least to look for a better display of the rudiments of learning. It may be necessary to indicate the total of marks for the questions set was, in Floriculture 1200, and in Fruit and Vegetable Culture 1000. The awards are as follow—

Name.	Floriculture		Fruit and Vegetable Culture	
	Cert.	Marks.	Cert.	Marks.
R. J. Lynch, Kew	1	104	2	100
J. M. Auld, (Liswick Student)	2	870	3	100
W. J. Stone, Eridge Castle Garden	3	860	3	100
R. Inglis, Kew	2	810	3	100

J. Morrison, Chiswick Student	3	330	3	100

New Plants.
— MORMODES SKINNEBI, sp. n.
Sepals pedicels linear-lanceolate with the reflexed lobes, the innermost lobes being the largest, the outermost being the smallest. The petals are linear-lanceolate, the innermost being the largest, the outermost being the smallest. The fruit is a globose capsule, the lobes being linear-lanceolate, the innermost being the largest, the outermost being the smallest. The column is whitish.

Messrs. Veitch obtained the plant through the late G. L. Skinner, Esq., from Central America. We have dedicated it to the memory of that gentleman, whose death was a severe loss for Orchidology. H. G. Rehb. 31

BOTANICAL DRAWING.—No. II.

For a flower drawing smooth paper is best suited, as it shows off finer touches and lines, and smoother washes of colour.

The best pencil to use is an H. for delicate subjects, such as white flowers, and an F. for leaves, and any part which is to receive dark colours, so that the lines may not be entirely obliterated.

In botanical subjects it is sometimes desirable to represent the roots, bulbs, &c., but they are so easily drawn that I think no special directions are necessary.

In the straight stem there is always some degree of curve, therefore the ruler should never be used; it is the last resort of those unable to make "straight strokes" and only worthy of schoolboys. It is more difficult to draw parallel lines, and the best practice is to sketch grasses or long-leaved plants.

Leafy stems or branches should be first faintly outlined their true length, of their proper thickness, so that the drawing may occupy a well-balanced position on the paper. Then mark whence the leaves spring. It is also desirable to note the shape of the stem, whether square, round, winged, &c.

The slight sketch below will show the advantage of proceeding thus cautiously, and will enable every leaf petiole to have its proper point of attachment, whether visible or not.

In serrated leaves it is safer to put in the serrated outline before doing the veins; and, in cases where the latter terminate in the points of the serratures, commence the veins at the points, and they are sure to terminate properly.

In lobed leaves, after faintly indicating the lobes, put in the ribs and veins first, and the outline of the lobes particularly if they be toothed, will be found much easier. In digitate leaves indicate the petiole and midrib first, the relative position of the leaflets can be kept with greater certainty. In pinnate leaves, when large, after faintly sketching the rachis and

the points whence the leaflets spring, put in the mid-ribs first, and define the leaflets last; if the pinnate leaf is small, this is unnecessary. W. H. Fitch.

APPLE STOCKS AND FRUIT GROWING.

It is impossible to exaggerate the importance of the question of Stocks, and of a correct knowledge of them. No single variety of a fruit, however good, is at all so important as a stock which exercises a good effect on all the varieties of a species grafted upon it, and therefore exact knowledge is of tenfold greater importance in the case of a stock than of any of the varieties grafted upon it. The pith and marrow of this discussion lies in the answer to the question: What is the true French Paradise stock, and what is its value?

The French Paradise Stock (Pommier du Paradis).—Mr. Rivers (and also the Rev. T. C. Bréhaud, the author of the Government Report on Fruit Trees at the Paris Exhibition) states that it "seems identical with the dwarf Apple of Armenia, referred to in the Journal of the Horticultural Society, Part 2, Vol. III, page 15." Any person with the slightest knowledge of the Paradise stock of Continental gardens, and who refers to this account, will rise from it with a feeling of surprise that any intelligent person could suppose the dwarf Apple, tacitly mentioned to be the French Paradise, for it is described as never exceeding in thickness of stem, even at 40 or 50 years of age, "that of your fore-finger." To test the fact that the diminutiveness was not owing to its being always kept in pots or boxes, the writer put out three plants, and, after keeping them three years in the open ground, found they had made no perceptible progress. Young plants of the Paradise, in which the buds have missed, may be seen larger than the tiny trees above described in many French nurseries. Apples worked on the Paradise are not delicate, tiny shoots, but strong, clean, handsome plants, 4, 5, and even 6 feet high, at little more than a year from the bud; and in numerous gardens in northern France the very fruiting branchlets of the trees on the Paradise are stouter than the dwarf Apple of Armenia at any period of its life. Any person who steps into the Imperial gardens at Versailles will find therein some 5 miles of cordons Apple trees, chiefly of the Blane and d'Armenie du Paradis, trained near the ground, worked on the Paradise. The soil is rich, deep, cold, and clayey, and the trees, instead of being too weak, grow stronger than is desired, the very smallest spray displaying more vigour than this Armenian Liliputian, of which not a word is said as to the fruit, flowers, or other characteristics, that would enable anyone to say what it is or what it is related to; and yet Mr. Rivers, without offering any evidence in support of his opinion, declares it to be identical with this unhappy little Eastern Apple, of which nobody knows anything or possesses any means of learning anything.

Having now seen what the Paradise is not, we will next learn what it is, according to the learned Professor Karl Koch, of Berlin, who is known to have devoted more attention to the origin of our cultivated fruit trees than anybody else.—"The name Malus paradisiaca appears to have been first used by Ruellius, in the year 1537, and does not refer to the Apple of which our first parents partook in Paradise, but to a fruit which is supposed to have been sent from heaven. It is a native of south-east Russia, the Caucasus, Tartary, and the Altai mountains. I have often seen this plant in the Caucasus, where it forms dwarf trees, often accompanied with suckers, near the Don

at the Volga. It gives forth strong branches near the root, rather from the under part of the trunk, and grows more quickly than the smooth-leaved Apple tree. On this account it is very much used by fruit-growers for stocks for trees; it keeps the trees dwarf, and it bears fruit earlier. It always remains dwarfier than the varieties of the smooth-leaved Apple, and is of shorter duration. It is sometimes met with in gardens as Malus tatarica." I have much more from Prof. Koch, but this is enough for my present purpose. There is nothing in what he says about it or its relatives, from a botanical point of view, that does not coincide with the practical experience of Continental fruit growers. In addition to the origin of the Paradise it is desirable that we should know something definite about its personal appearance. The following description of it is from the pen of M. Carrière, of the Jardin des Plantes, and Editor of the "Revue Horticole":—"Roots much ramified and tidy, short, remaining near the surface, and never tap-rooted. Shrub, bush-like, much branched, the branchlets rather long, and with a lateral tendency, the stems covered with a smooth bark of a reddish colour; lightly pubescent in the case of the young shoots. Leaves lanceolate, elliptical, of a light green above and velvety beneath, finely denticulated, acuminate at the ends, but principally at the base. Petiole broadish and channeled. Calyx, with divisions acuminate and recurved, often contorted, as long as the peduncle. Petals straightly elongated, the inner ones being a little longer than the outer. The fruit is a small apple, white, pubescent. Fruit ripens in the month of July." It flowers more abundantly and earlier than the Paradise.

Let us next approach the subject from a more practical and important point of view, clearly understanding that the Paradise stock is considered of the highest value in France, in Belgium, Switzerland, and the neighbouring countries. When I state that I have seen many gardens without a single Apple tree that was not growing upon it and trained as a low horizontal cordon to walk and borders and these gardens in possession of a number of the finest Apples, I shall have conveyed a fuller idea of its importance than by quoting any number of opinions from authors, cultivators, or nurserymen. We can breakfast in London in the morning, and dine in Paris conveniently the same evening. In the gardens of M. Bac at Ivery, M. Chardon at Fontenay aux Roses, M. Mallot at Brunoy, M. Cochet at Suisnes, Baron Rothschild at Ferrières, and in the Imperial Gardens, not to mention hundreds of other places, it is grown, and preferred above all other ways of Apple growing, so that ascertainable evidence of its value is abundant. Of this stock, so appreciated across the Channel, Mr. Rivers writes:—"1st, it is too tender for this climate; 2d, I decidedly assert that it is the most unfit of all for forming single horizontal cordons; 3d, the tree, when bent down to be fastened to the wire, puts forth such a cluster of blossom-buds at the bend, that there is not enough of vital force in the stock to throw out a leading shoot to be tied to the wire; 4th, trees on it, instead of cordons, become stumps; 5th, it is exactly the converse of the truth that the French Paradise stock flourishes better in stiff, cold, clayey soils, than in those that are light and fertile." I could fill a column with proofs from England as well as France that each and every one of these statements is exactly the reverse of the truth, but I shall simply quote a few opinions of weight. Professor Decaisne, who is probably the first pomologist in Europe, says "it is absolutely certain that the Paradise cannot be killed by frost." M. F. Jamin, the part-owner of the large nurseries at Bourg-la-Reine, says, "The Paradise does best on bad, clayey soils, and if thrown on the surface of the ground, with its roots exposed all the winter, cannot be killed by our hardest frosts." Prof. Morren, of Liège, says, "The Apple on the Paradise has been tried extensively in the Flemish part of the country, and has succeeded remarkably well." Any person who casts his eye on the map of Europe and sees that southern England and the Flemish part of Belgium are merely divided by a few miles of sea, will surely have to ask himself, is there magic in the air, that a plant which is pronounced a marvellous success on one side of the Channel should be such a worthless thing on the other? The reader will probably have made up his mind about the matter by this time, and said, "It is now a matter of simple experiment; let us try it, and, if convenient, in competition with the English Paradise." Knowing that eye-proof is better than any other, I have recently placed 400 Apples on the Paradise, on clay soil, to the north of London, and in a position where they can be seen by everybody, and by and by, if this plantation does not prove every one of Mr. Rivers' five propositions to be untrue, I shall be the first to proclaim it. I appeal to the gardeners of England to test the matter. Many of my friends have already taken it in hand, and in a year or two we shall know the result. One word to those about to test it: always allow the apex of the young cordon to grow a little upwards, which will prevent the tree from using all its vital force at the bend. This is indispensable to the quick and successful formation of a line of cordons. Repress the point, or tie it closely down on a level with the other parts of the tree, and assuredly the sap will make an effort to ascend somewhere nearer to the base, but keep the growing point a little higher than any other part of the tree, and the sap will course through the whole length of the stem, and escape most at the apex, which may be fastened to the wire from time to time.

Mr. Rivers states that the Paradise was common in England in Miller's time, and quotes his opinion against it, but does not say that at present we require the Paradise for quite a different purpose. Miller says that "the dwarf Apple, which is rather a shrub than a tree, commonly called Paradise Apple, is undoubtedly a distinct species from all the others," and that the difference is "permanent when raised from seed." He says the stocks are not of long duration, nor will the trees grafted on them ever grow to any size, in both of which statements he is perfectly right. The cordon was unknown in his time, and if the Paradise grew bigger than it does, it would be useless for this purpose, but the Paradise was known and spoken of long before then. In the "Complete Gardener" of the "famous M. De La Quintinie, made English by John Evelyn, Esq.," London, 1693, at p. 112, I find these words:—"Moreover, Apple wildings, whatever they be and however grafted, are fit to make high standards, but not in the least fit for dwarfs, and the quite contrary with Paradise stocks, inasmuch that Apple trees must never be planted to grow as dwarfs, and take up little room unless they be grafted upon Paradise stocks, these quickly bear fruit and shoot little wood, the others are a long while producing nothing but a vast quantity of wood, which make excessive large trees, and live long before they bear fruit." But we find allusions, and distinct ones, to the "Paradise" long before this date. I can trace interesting notices of the Paradise in books that appeared 112 years before 1768, the date of my edition of Miller, but space forbids giving them here. They are all much to the same effect as Miller's account, and indeed he appears to have adopted their statements. Since their day many generations of men and Apple stocks have been resolved into their original dust and water, and fruit culture has increased tenfold with us, and in a much greater degree in the adjacent.

Early in last June I visited Mr. J. Wood, an English nurseryman, many years settled at Bosen, and in discourse with him on the subject of the Paradise, he said, with much emphasis, "For every fruit tree planted in England there are one thousand planted in France." In France there are regular professors of fruit culture, who frequently lectured to numbers of gardeners, and the subject of the Paradise has been published books at Paris, and in

Leaves If the leaves are more or less erect in relation to the stem, sketch the lower ones first, as a guide for those above, as in the left-hand out in the following sketch.

If reflexed, commence with the upper leaves, for the same reason. If done thus systematically, there will be a great saving of time and india-rubber.

Opposite leaves are best shown slightly askew, but if the stem is branched, the leaves on some of the branches should be more or less foreshortened, for the sake of variety.

Outline large leaves faintly before sketching them decidedly, and that should be done with one stroke of the pencil, and not with repeated touches, unless the leaves are woolly, when an indefinite outline is admissible. It is better to put in the midrib first, and the secondary veins afterwards, and to leave the leaflets to be added afterwards. The leaves may be—leaves are very seldom so rigid as to have none—then mark whence the veins spring.

winds prevailed The barometer continued tolerably steady during the month

February - The thermometer stood a little more the month, the mean temperature being a little more than 1 above the average

March - There were no great extremes in this month. The mean temperature was 1.7 above the average

April - This was on the whole a warm month, the mean temperature was nearly 1 above the average

TABLE SHOWING THE HEIGHT OF THE BAROMETER AND THERMOMETER, AND DEPTH OF RAIN AT CHISWICK, IN THE MONTH OF 1868, COMPARED WITH THE AVERAGE OF THE PREVIOUS YEARS

The Mean Temperature was 1.7 above the average. The Mean Maximum Temperature was 3.7 above the average.

mean minimum was 2.37 above the average. The highest temperature was 89 on the 5th, and the lowest 39 on the 25th...

September - In the early part of this month the day temperature was again very high, the mean maximum being more than 3 above the average

October - The day temperature in this month was fully maintained, being rather more than half a degree above the average

November - The day and night temperatures in this

May - In this month the day temperature remarkably high, the highest was 87 on the 20th, the lowest at night was 27 on the 24th

June - This month was especially remarkable on account of the high temperature being remarkably high, that of the nights unusually low

July - This month was remarkable for its hot days and comparatively cool nights. The temperature was 43 on the 21st and 22nd

August - In this month the thermometer steady as regards the day and night temperature

TABLE SHOWING THE HEIGHT OF THE BAROMETER AND THERMOMETER, AND DEPTH OF RAIN AT CHISWICK, IN THE MONTH OF 1868, COMPARED WITH THE AVERAGE OF THE PREVIOUS YEARS

The Mean Temperature was 0.4 above the average. The Mean Maximum Temperature was 1.2 above the average.

month were 1.01 below the average, the highest temperature was 57 on the 1st and 5th, and the lowest 18 on the 19th...

December - This month was remarkable for its day and night temperature, the former being above the average, and the latter 1.37 above the average

THE DROPPING OF CAMELLIA BUDS.

FOR years past I have observed complaints in the Gardeners' Chronicle respecting Camellias casting their blossom buds, and much seemingly reasonable advice has been given thereupon

Indoors in a span-roofed house, 18 feet high and 125 feet long, with a middle bed up the centre from end to end, and of course all planted out, the trees have for many years reached the summit...

plants, while in front, in each space between the walks and roof, covered with buds and blossoms base to summit, and yielding thousands of flowers of all colours every day from September till the end of April or May...

It is a much greater pleasure to see such perfection. The whole mystery, as to this dropping of buds, I send a sample of foliage and buds, thick, fleshy, crisp, and of a luxuriant colour. They are exposed to wind and dash of storms of hail, sleet, and snow...

I had had a class, but finding the plants were not doing well, I had to re-water them. I had a class, but finding the plants were not doing well, I had to re-water them. I had a class, but finding the plants were not doing well, I had to re-water them.

the pots are new, and seem to have absorbed as much moisture as if they had been steeped in water. I had a class, but finding the plants were not doing well, I had to re-water them. I had a class, but finding the plants were not doing well, I had to re-water them.

Horticultural Congress—I am in a way that has been said respecting a meeting of this kind, and as it is to be under the auspices of the Royal Horticultural Society, I beg of the craft generally to prepare papers to be read before that august meeting. The subject of heating Vine-borders could be discussed on its merits, as well as hosts of real or supposed grievances and such subjects as seeds and the seasons, cultivation and decoration, and other matters too numerous to mention. It would also be a desirable to establish sub-congresses in local districts, to consider subjects, and send delegates to report progress annually to the congress proper. A great error in the past has been to mix with the Royal Agr. Natural Society, as both societies will work cordially together for the benefit of the country. Particulars can be discussed of the various branches of horticulture, as well as of other matters of success or disappointment, as exhibitors or visitors. It is to be hoped that every one will take his best precautions, so that we shall not hear any more of the old tale of having left better at home. Much pleasure will also be experienced in witnessing the great collections of implements, and the large gathering of the animal as well as the vegetable kingdom. Finally, as these meetings are for the benefit of the employer as well as the employed, let there be a clear understanding between both parties that the expenses to such meetings be duly entered on the debit side of the garden cash-book. *J. Miller, Workshop Manor.*

Atmospheric Pressure—As it may be interesting to some of your readers to compare the remarkable depression of atmospheric pressure during the past month with that which occurred towards the close of December, 1821, I copy the movements of the barometer (reduced to sea level) on that occasion from the "Proceedings of the Meteorological Society," vol. i., p. 200.

9 A.M.			2 P.M.			6 P.M.		
Dec. 11	Dec. 12	Dec. 13	Dec. 11	Dec. 12	Dec. 13	Dec. 11	Dec. 12	Dec. 13
29.18	29.56	29.15	29.18	29.56	29.15	29.18	29.56	29.15

And on Jan. 19, 1822, the barometer rose to 30.58 inches. *R. C. Cann Lippincott, F.M.S., Overcourt, near Bristol.*

Rainfall, &c. The rainfall of last month was remarkable, and an account of it may be interesting. My instruments are placed on the side, and near the bottom of a hill, in a sheltered situation, free from walls and trees.

DECEMBER, 1865			
Day	Ins.	Days	Ins.
1	0.8	10	0.2
2	1.1	11	0.7
3	1.2	12	0.8
4	1.3	13	0.2
5	1.4	14	0.2
6	1.7	15	1.0
7	1.6	16	2.3
8	1.7	17	1.5
9	1.5	18	1.1
		Total	11.4

The highest observed (uncorrected) reading of the barometer at 9 A.M. was 30.126° on the 9th, the lowest, 29.642° on the 21st. The highest self-registered temperature occurred on the 7th, 59°, the lowest on the 30th, 33.5°. The highest observed temperature of the dew-point at 9 A.M. was 52° on the 11th; the lowest, 31.5, on the 12th. The highest humidity at 9 A.M. was 100 on the 1st and 29th, the lowest, 78°, on the 13th. The greatest horizontal movement of the air in 24 hours occurred on the 28th. The direction of the wind was south-westerly on 15 days, south-easterly on four days, southerly on three days, westerly on five days, and easterly on four days. Ozone was very abundant throughout the month, the only day showing deficiency being the 21. *R. C. Cann Lippincott, F.M.S., Overcourt near Bristol, Jan. 2.*

Butterflies at Pau on New Year's Day—One of your correspondents mentions the fact of his having seen a Peacock butterfly on the wing in the open fields on the 22d of December last. This is, I believe, "for this realm of England," quite an unparalleled case, but on New Year's Day I noticed three species with a few miles of Pau, France, viz, the common Atalanta, a species of Fritillary, and the sulphur-coloured. Whether there was anything unusual in their being seen in mid-winter in that locality I do not know. *J. B.*

Tubers of Oxalis crenata—At Paris, on my return from Pau, having a little time to spare between the trains, I strolled into the Palais Royal, where in a "depot" of "comestibles," I noticed, among other good things, the tubers of an Oxalis, which I have no doubt was my old friend *O. crenata*, that I had not seen for 30 years. The hour being early, and the shop only just opened, there was no one there but an ignorant woman, and all that she could tell me was, that the tubers were grown in the open air, and in the neighbourhood of Paris. I brought away a number of them, which I hope to exhibit and comment upon at the next meeting of the Royal Horticultural Society at South Kensington, and in the meantime I should be particularly obliged to any of your correspondents who might kindly send me information on the subject. *J. B., 9, Hyde Park Gate, South, W.*

Tanks—Can you or any of your readers tell me of a plan to get water out of a tank. It is of brick, cemented, and is 12 feet long, 6 feet wide, and 3 feet deep. It is 3 feet below the surface, 1 foot above it, and has no step down to it. We find a moderate-sized can feels heavy

when we have to dip low for it and bend down our backs to get up the sides of the tank, and this requires some one to make them look on. *A. W. D. C.*

Cricket—I have a very large quantity of crickets, and I have been thinking of getting rid of some of them. I have been thinking of getting rid of some of them. I have been thinking of getting rid of some of them. I have been thinking of getting rid of some of them.

Cucumbers—Doubtless there are many amateurs who are equally perfect as I am myself in regard to the choice of one or more good Cucumbers. Every seedman or grower recommends his own variety. I find nearly all of them improved or very old-fashioned names are to be had. I have a constant heat by hot water of not less than 75°. I shall be obliged if you can give me the names, and where seed is procurable, of a good trucky, or favoured handsome sort of about 18 to 20 inches in length well covered with bloom to be raised on a hotbed of dung, in a brick pit, with outer linings that stand hardy, and will not damage, should the heat occasionally fall to 60°, when it loses the sun's influence. Years gone by, such as I am anxious to procure used to be grown by the then unscientific and a fine specimen (not early) in March. Is there a Cucumber known as the Racehorse? and where obtainable? *Q.*

Rats—I have made a garden joining a meadow, with a brook running through, and am greatly troubled with rats. Your correspondents would greatly oblige by informing me of the best method of getting rid of them. *A. Heaton at Green Hill, Bury St. Edmunds.*

Phalaenopsis Schilleriana—A fine specimen of this magnificent Orchid will shortly be in bloom at Messrs. Carter & Co's nursery, Perry Hill, Sydenham. The plant is not over large, but in the condition having four very handsome marked leaves, and it has thrown up a flower-spike about 10 inches in length, and in addition to the terminal shoot of the spike there are eight lateral shoots, the aggregate of flower buds being 57. It promises to be an exhibition in itself, and it is to be hoped that when in bloom it will appear at one of the meetings of the Floral Committee at South Kensington. *R. Dean, Ealing.*

Sedum acre variegatum—I have some small circular beds carpeted with this showy little Sedum, that are each in the way a miniature field of the Cloth of Gold. Growing close to the ground it presents the appearance of masses of minute golden blossoms, most striking at this season of the year. It is one of the prettiest and most useful foliage plants for spring work that I have ever employed, and I marvel that our spring gardeners do not use it extensively. The mild, moist weather suits it uncommonly well, though amid the hardest frost it never loses its cheerful and bright appearance. *R. Dean, Ealing.*

Telegraph Cucumber—I forward you a brace of Rollison's Telegraph Cucumbers—they are not quite equal to what I have been cutting, in consequence of having cropped them rather heavily. My reason for sending them, is to show that my brother gardeners need not be under any fear in growing this variety in winter or early spring. Several spurious varieties have been sold for Rollison's Telegraph, and were complained of by some correspondents in the *Gardeners' Chronicle* last season. I have heard of two or three instances in which Cucumbers could not be produced of this variety in winter; they certainly cannot have been the true kind, for I find it an extraordinarily free setter and cropper. I do not think there is anything to equal it, especially for winter use. I sowed some seed on the 21st August, and began to cut on the 20th October, and have been cutting ever since (from eight plants) an average of 12 Cucumbers a week. From my previous knowledge of its cropping quantities, I feel certain the plants would continue bearing until next autumn, if required to do so. I had it a very shy seeder if kept true, but it fertilized with any other free seeding kind it will produce seeds freely, but it then becomes almost worthless in comparison with the pure stock. In one list of seeds I have seen this variety offered at a very low rate, lower than some popular and common kinds, the seedsman may perhaps, have had the true stock, but it is very doubtful if he has kept it true, as I am convinced that he could not grow the seed for the low price he asks. One of the principal things that is required of seedsmen is, to send out articles true to name. Suppose a gardener like myself is depending upon a crop of winter Cucumbers, either for his employer's table, or for market purposes, and after growing them several months he finds that he has not got the true kind, but an almost worthless variety, that will not bear fruit longer than a Gherkin, and will only now and then produce one of the miserable-looking fruit. Sending out articles true to name does not apply to Cucumbers alone, but to the general articles sold in the trade. I think this is of equal, if not more importance, than the mixing of seed, which is being discussed in the columns of the *Gardeners' Chronicle*. *J. D.* Considering the season, the samples sent were very good. *E. W.*

Pruning Forest Trees—Mr. W. P. Ayres objects to the principles I laid down in the paper on forest pruning, which I read at the last meeting of the Scientific Committee of the Horticultural Society. I need not trouble you with a reply to his criticisms, because having said my say, it is open to every one else to say theirs in their turn, and to confute my conclusions if they can. But I trouble you with a few lines to present Mr. Ayres' statement of my position being

Hyacinths—I potted my Hyacinths the second week in November some in old pots and others in new ones. The water had been near them before use. Now, the old pots are doing well, making some good roots, but those in the new ones are not doing well. They have rooted well into the compost, but as the roots reach the sides of the pots they turn brown and rot off. What can be the cause of this rotting? They were all potted the same day, in the same kind of compost, plunged to the rim of the pot in sand and watered, then covered to the depth of 3 inches in rough sand and ashes. I constantly examined them, and the pots seemed to have absorbed the moisture as though they had been steeped in water before the roots came in contact with them. *F. H.* Mr. William Paul kindly furnishes the following reply to the above query—"I can only account for the rotting of the roots of the Hyacinths immediately that they come in contact with the sides of the pots on the following supposition. 'F. H.' says

JANUARY 14, 1888

but they are very abundant. The great supply of grapes comes from the Crimea. In general they are large and well flavoured, and sell here (Moscow) at about 10 roubles a pound.

Societies.

ENGLISH BOTANICAL. Dec. 17, 1887.—Charles Jenner, President, in the chair. After the election of five new members for 1888-89, Dr. Cleghorn, the new elected President, gave the chair. Donations to the library and museum at the Royal Botanic Gardens were announced. The following communications were read:—I. Notes on the Dying and Ageing of Plants. Dr. Cleghorn. The author described the changes which take place in the tissues of plants during the last months of their life. The mode of cultivation of the various species, and the value of the Carob Bean as a food for the young of the insect, were dealt upon, and the value of the various vegetables as seen in the markets was discussed. II. Notes on the remarkable plant, Cynomorium, a parasitic plant, was given and the present position of the plant in the Antioch Gardens described. III. The largest trees in these gardens were mentioned, and the results of the recent introduction of a new species, The importance of extended arboriculture was discussed. The paper will appear in full in the Society's Transactions. IV. Reports on Botanical Specimens in the Herbarium, 1886, by Professor Dickson. The specimens of the various plants collected in the various parts of the world were exhibited. V. The importance of Fungi. By Mr. James English. Fungi, considered by Prof. Dickson. The author described the various forms of fungi, and the importance of their study in the history of the world. A series of Fungi were exhibited by Mr. English, and now in the Museum at the Royal Botanic Gardens, were exhibited to the meeting. VI. Report on the number and distribution of plants in the Government plantations at Durban, on September 1, 1887. The total number in the various plantations that date was 2,073—viz., 1,000 in the Government plantations, 900 in the official and 173 in the private. VII. The importance of the study of the life of a botanical tree, in which he had made a study through some parts of South-east and West Africa, and the results of his study were exhibited. VIII. Professor Dickson gave a description of the peculiar microscopic structure of the cells of the Brazil nut. Preparations were exhibited under the microscope. IX. Mr. Stark exhibited growing plants of Asparagus azoricus and Sodia Maximowiczii.

Florists' Flowers.

THAT in the face of such a trying season as the past summer has proved for bedding plants generally, and for the Verbena in particular, the Floral Committee should have awarded three First-class Certificates to Verbenas, as fine and useful bedding kinds, out of a somewhat limited number of plants bedded out for trial, is a fact enough to rouse to a high pitch of enthusiasm the loyalty of those advocates of the VERBENA as a BEDDING PLANT who, sustained by a faith no calamity that has happened to their favourite can darken, were still found prophesying that "the new-fangled bedding plants, in which dingy and uncertain aspects of self-coloured foliage, or leaf-variegation, supply but indifferently well the place of gay and varicoloured flowers, will last but for a season, and ere long be supplanted by the old and more reliable plants whose legitimate possession of the flower garden they have for a brief time usurped." True it is, that in the flower garden the neglected Verbena has just come to the foreground, and taken high honour at that kind of competitive examination a season's trial affords. With other bedding plants, Mr. Barron this season planted out a few Verbenas, and to the following varieties First-class Certificates were awarded, as recorded above.—James Burbeck (Perry), shaded pink, dashed with violet, a fine and many free blooming, bedding kind, trusses of good shape keeps its colour well under a burning sun, and of excellent habit and style of growth. John Wilson (Perry), scarlet, dashed with violet, with all the admirable qualities of the foregoing, but yet distinct in colour. Miss Wimsitt (Wills), deep purplish violet, with conspicuous white eye, which, however, becomes a little pale with age but without presenting a very appearance very free blooming, and excellent dwarf habit. For cultivation in pots this latter variety appears to be eminently adapted, and should be noted by cultivators who so grow the Verbena. Hercules (Perry) was also very good, yet having to a certain extent the fault that attaches to most rose-coloured Verbenas when used for bedding purposes—a tendency to become pale and washy, this variety has deep rose flowers with white eye, with a crimson ring surrounding it, it has also free-blooming properties, and an excellent habit for bedding purposes. While on the subject of rose-coloured Verbenas it may be stated that there has been seen growing in the neighbourhood of Halifax during the past summer a rose-coloured sport from the well-known Purple King, identical with it in every respect save in the colour of the flowers. In the somewhat monster atmosphere of the West Riding of Yorkshire (though it appears somewhat difficult of proof to assert that the atmosphere has been moist anywhere during such an almost unprecedented summer), this sport has done very well indeed; and if

getting pale as the flowers age, it is to some extent compensated for by the wondrous profusion of bloom it yields. It did not appear to have been named, but was simply known as a rose-coloured sport from Purple King. A variety known as Crimson King, sent out by Mr. Mathew, of Edinburgh, was seen remarkably fine at Mr. Kinghorn's nursery, Richmond, in August last. It has bright deep crimson flowers, with a pale lemon eye, and a good bedding habit. Mr. D. Thomson, lately of Archers' Road, strongly recommends this variety for bedding purposes—a pretty sure guarantee that it is well adapted for the purpose. The dry season has had a beneficial effect on a somewhat rampant grower like the old Lord Raglan, as it has tempered its growth and increased its tendency to bloom freely and continuously. It was largely used this past summer at the Promenade Gardens, Great Malvern, by Mr. R. H. Vertezans, and on some sloping banks, with a north-west aspect, it was gloriously fine. It is an excellent kind also to cut from, having a long stiff flower stalk, while in regard to constitution it is so hardy a way in habit that it blooms as usually late in the season. It is somewhat late in the career of this variety to write thus much in praise of it, but these are the very qualities that have kept it so long in cultivation. Blanc de Castille is another capital bedding kind, having pure white flowers with a slight lemon eye, and a good habit. This was also very attractive at Mr. Kinghorn's nursery.

At the Royal Nursery, Slough, Mr. Turner planted out this summer a number of kinds, to test their value for bedding purposes. It afforded a very good opportunity to get something like reliable impressions of their apparent usefulness in this respect. The best thus employed were—Apollo (Sarkey) pale flesh with bright crimson centre, and suffused with the same, a wonderfully free blooming kind, of excellent habit, and which kept its colour well. Madame Herman Steeger (Beucharat), very showy indeed, and useful as a bedder; something in the way of Apollo, but white, bright rose and cherry centre. Blue Queen (Perry), bluish purple, with white eye, keeping its colour better than flowers of this hue of colour generally do, nice dwarf compact habit. Modesty (Perry), another good light-coloured bedder, bluish, with bright crimson centre, and capital habit. King of Bedders (Henderson), bright crimson-flowering variety, in the way of Admiral Dundas, habit dwarf and compact. Spark, brightscarlet, a variety that does not burn, and has a fine glow of colour. L'Avenir de Balant, a very good bedder, opening bright rose, with small centre of bright rosy crimson, the flower pale a little with age, but without becoming washy. Black Prince (Sawth), red plum purple with white eye, a good bedder. James Burbeck (Perry), and John Wilson (Perry), both very fine and effective here as at Chiswick, the predominant hue of the former is scarlet, of the latter ruby. Miss Turner (Perry), habit very good, but comes much suffused with pink out-of-doors, yet a very pretty variety. Hercules (Perry), a good bedder, and of a deep rose hue, approaching to ruby, in its effect it has more of rose in the flower than is found in the case of John Wilson, and out-of-doors the two kinds approximate much more closely to the same hue of colour than when grown under glass, the colour of Hercules fades a little as the flowers age. Lilac King (Perry), pale lilac, free blooming, and good habit. Harry Law (Perry), shaded purple, with white eye, a good bedder, and free blooming. Starley Hibberd (Perry), a splendid bedding kind, of a close, compact habit, and most profuse in blooming, colour bright plum purple, with small white eye, a kind that retains its colour remarkably well, and also promises to be a good variety for pot culture; and J. C. Ward (Perry), bright purple, good bedding habit, and free blooming, but with a tendency to come pale round the small white eye soon after it opens.

Of pure white flowers, the old Snowflake has done most admirable duty as a white bedder during the past summer. In a few instances where it has been seen (and they represented somewhat diverse localities) it, too, had lost something of the strong growth it will frequently manifest, and had produced many more blossoms than usual. It would thus appear that the dry weather has beneficially affected strong and rampant growers, a fact that may be of use to cultivators in the future. No doubt the great bane of the Verbena, as affecting its attractiveness, is wet weather, as a heavy rain will soon impair the beauty of a bed, but it should be borne in mind that all flowering plants grown in the open air are more or less injured by the same cause, and a too sweeping condemnation of the Verbena should be modified by such a consideration. R. D.

The Aptary.

WINTERING BEES (continued from p. 31).—In my last communication on this subject I gave the ideas of some writers in the "American Bee Journal" who are in favour of wintering bees on their summer stands, providing for them proper protection and ventilation suitable to such a condition. I now, from the same number of the Journal, give the views of some advocates of the dark cellar or separate house system of wintering, leaving it to my readers in this country to judge for themselves whether the adoption of either method is desirable, and if so, which plan would best suit their purpose.

"Novice" says:—"We are going to put all our bees into the cellar. Does any one care to know why? Well, you remember the one weak swarm (or rather quart of bees) that we kept in the cellar last winter, which consumed less than one frame of honey, and of which so many were lost, after being set out a day or two? Though they did become very weak, yet, without any assistance in the spring, except the rye and oatmeal, they became a strong colony, and have yielded us more than 50 lb. of honey. Now, had they been left

out with the others, they would assuredly have died, as well three or four much stronger ones, and we should have had nothing but empty combs. By the way, Mr. Little, we will pay 25 cents each for frames of empty worker combs, so that a Langstroth hive from which the bees have died is worth 2 dollars 50 cents for combs alone. I extract this last paragraph, though not relating to the subject under consideration, for the purpose of showing our readers the value which, by some bee-keepers, is placed upon empty combs, which, in truth, should always be carefully preserved for your assistance to weak stocks, or for making artificial swarms. Now, if we can save 10 lb. of honey from each stock, by carrying them in the cellar (which we do not doubt), we shall have 350 lb. more ready for our honey machine next spring. We shall place a thermometer there, so as to keep the temperature as near 35 or 40° as we can. A great deal is said about keeping bees quiet, yet the weak swarm first mentioned was struck every day for three months with hardly an occasion, to see if they were alive, and we are going to 'look at 'ard punch' our bees this winter whenever we feel inclined to do so. We cannot help thinking Mr. Langstroth's new plan for wintering is an awful sight of trouble, and that it will not answer the same purpose as keeping them in a cellar at a temperature of about 40°. Will not the same objection come in that was made to double hives—that the sun cannot warm them through as quick as a thin hive? This writer is a warm advocate for the use of rye and oatmeal. He thinks that his large harvest of honey the last poor season was mainly owing to the large amount of rye and oatmeal fed last spring. "We think," he remarks to the Editor, "you should advise, at the proper season, in large letters, the use of rye and oatmeal, but then how few would take the trouble to provide it?"

Another correspondent, B. S. Hoxie, says—"I gave my method of wintering bees in the Journal some time since, and will now say that I have tried most of the plans recommended, and think any temporary arrangement too expensive with too much time too much after with hives, loose boards, &c. I say, make a suitable permanent house. It need not be expensive, and will last for years. I set my bees into their winter quarters as soon as severe cold sets in, remove the caps entirely, and put on the straw mats, which are made of soft oat-straw, and so constructed that they fit tightly on the top of the hive, with a space of 1/4 inch between the straw and the frames. This allows a free passage for the bees to all the combs, and a warm place for them to cluster. Perhaps ashes, woolen rags, or something of this kind may answer, but nothing is so cheap and clean to handle as the mat made in a frame with strips of lath.

A. Salisbury, says—"In November, 1887, I put 163 stocks of bees in the basement of my double-walled, brick, sweet potato house, the walls of which were 16 inches thick, with a 4-inch deal air space between, and the floors filled up 1 foot with dry sand, to prevent moisture arising from the earth. The larger proportion of the hives were well filled with honey, but some eight or ten that came off late in August (some swarms having issued as late as the 25th) were only half supplied. All these were inverted, and flat pieces of sugar-candy laid on the combs, to save the honey for spring consumption when first set out of the house, that being the most dangerous time to feed, from the interference of robbers. I removed them from the house about the middle of March—all being in very fine condition. On the 15th May they commenced sending out natural swarms (they were Italians, of course). I did not lose a swarm after setting them out in March. During the winter the mercury did not fall below 40° (F.) in my room, when it was 10° below zero out-of-doors. I do not admit a ray of light in the room. I shall put 130 stocks in the same room this winter."

This writer hails from Illinois. There seems to be a great deal to be said on both sides of the question as to which place is the best, but evidently the climate of his district has the most influence on the decision to which each bee-owner must arrive. S. Bevan Fox.

Obituary.

We regret to have to record the death of Mr EDWARD PARKE FRANCIS, on the 11th inst., at his residence, North Road Cottage, Hertford, in his 67th year. Mr. Francis had been in business for nearly 40 years.

Miscellaneous.

Planting Conifers.—The two great evils that Conifers suffer from are, an excess of moisture at the roots, and planting in low confined situations. Unfortunately Conifers do not always show the effects of these evils. In dry seasons and mild winters the plants do pretty well. It is only when there is a heavy rainfall in the autumn and this is followed by a severe winter, that Conifers planted in badly drained land and confined situations suffer to any extent, but the results then are often disastrous. Plants that are perfectly hardy are thus set down as tender. Hardy Conifers when planted in badly drained land, or in confined places, will suffer seriously from a few degrees of frost, while the very same kinds will, when planted in thoroughly well-drained land and open airy situations, stand many degrees of frost without sustaining the slightest injury. When Conifers are planted in badly drained land and in confined places, the wood very rarely gets properly matured, and in consequence it suffers from a few degrees of frost. Excess of moisture at the roots in winter causes the spongellets to perish, and the plant is in consequence weakened and less able to stand frost. From long practical observation I have very little

doubt that excess of moisture at the roots is one of the chief causes why so many hardy Conifers suffer so much injury in severe winters. Of the several thousands of Conifers planted here in the park, the pleasure ground, and woods, not one of those in exposed situations, and where the subsoil is of a dry porous nature, suffer in the slightest degree from frost. A few only, in low places, or where from the nature of the ground the surface water could not pass off freely, suffer slightly. I am perfectly convinced of more attention was paid to the drainage of the land, and to planting in open airy situations, where the wood would get ripened, we should not hear so often of wholesale destruction of Conifers in severe winters. In our moist climate the land for Conifers cannot be too dry in winter, if we wish to save the fine roots from perishing, nor can the situation be too open and airy provided it is sheltered from the fury of the destructive west winds. *M. Saul*, in "Florist and Pomologist"

Incombustible Wood.—According to M. Schattenmann's experiments, there is an easy and cheap way of rendering wood incombustible, it consists of coating it with chloride of lime. It is true, writes the "English Mechanic," this will only protect the surface, but it will prevent the flames from spreading. Chloride of lime, or more properly chloride of calcium, is obtained on a large scale by decomposing bones with hydrochloric acid, which dissolves the calcareous part without attacking the gelatine they contain. This neutral and liquid chloride marks 11° by Baume's aerometer, and contains 15 per cent. of anhydrous chloride. To this liquid an equal weight of slaked lime should be added, and it may then be applied to the woodwork to be preserved. The operation should be repeated twice with a common whitewashing brush. The cost is at the rate of about 5 francs per 100 square metres, the liquid costing 1 franc, and the rest being the men's wages. The Bouxwiller Mining Company, which extracts gelatine from bones, can afford to sell liquid chloride of lime at 2 francs per 100 kilogrammes, not including the price of the cask. Where chloride of lime cannot be had, it may be made by treating chalk with hydrochloric acid. To test the incombustibility of wood prepared in this way, take a few bricks and inclose a square with them, fill up the space with a kilogramme of straw, place three wooden laths across, coated as above, then put another row of bricks upon the first, and place the three uncoated laths across. Having well secured them, set fire to the straw, when the upper or uncoated laths will catch fire immediately and be consumed in five or six minutes, while the lower ones, protected by their coating, will only glimmer and be carbonized where the flames touch them, but will everywhere else be safe from combustion. Fir-wood should be selected for the experiment.

Garden Operations.

(For the ensuing week)

PLANT HOUSES.

THE past season having been favourable to *Heaths*, the stock in the Heath-house should in consequence be healthy and vigorous. A cold temperature approaching closely to frost will not injure this class of plants so much as a few degrees too much artificial heat. On the other hand, a close, damp atmosphere must always be guarded against, as this tends to cause a weakened and drawn growth. With an abundance of air upon all favourable occasions, and a temperature averaging at this season a mean of about 35°, a good sound growth may be insured without in any way injuring the constitution of any particular variety. *Conservatories* should now be looking neat and gay, and to insure a continuance of bloom it will be necessary to constantly look forward in regard to introducing a necessary quantity of plants into forcing pits, &c., to keep up the supply. Every semblance of decay, whether of leaves or flowers, should be removed daily, as nothing in this way should be permitted to remain to destroy the freshness of the plants. Afford, on all favourable occasions, a plentiful supply of air, taking care not to give any more artificial heat than may be necessary to keep out frosts, or occasionally, to prevent the ill effects of damp. The former has a tendency to hasten the decay of forced flowers, weakly as they are, by its harsh dryness, and the latter to cause decay, which may or may not be outwardly perceptible, before its natural time. Attend to and search all hard-wooded plants for mildew, as this destructive agent oftentimes causes considerable injury before it is detected. Take advantage of "bad weather" to wash all pots, pans, or tubs, requiring such attention, and by this means aid in forwarding all such small jobs, so as to have the same well under hand when the busy months, which are now fast approaching, arrive.

FORCING HOUSES.

Fines which are now in flower should have a temperature of about 70° by day, with a decrease of 10° by night, and with a dry atmosphere. It is well at this early period to aid the process of fertilisation artificially by slightly jerking the whole bunch with the hand, the better to distribute the pollen. In certain instances, one variety of Grape, or plants of separate identity, may have a larger supply of pollen than others, in all such instances it will be practicable to cross-fertilise them with any others which show a scarcity. The process of disbudding must be carried on gradually, removing all laterals in like manner as soon as a healthy leaf or two has been secured upon all where required. Other Vines which are now swelling their buds should have an increase of 3° or 4° more heat, and with rather more air, when the first symptom of actual leaf-formation exhibits itself. Tan-pits in *Piseries* should now have careful attention. Should the heat be on the decline, let the pots be taken out, and the tan be well stirred up from the bottom, as previously advised. This operation will be the more necessary to secure a good uniform

heat by the end of the month, at which time some of the most forward successional may be induced to show fruit, at which juncture great attention in this and other matters must be given if fine fruit are to be secured. *Early Kidney Beans* may now be grown with very little trouble, they should be sown five in a 60-sized pot, and be potted on into 16's, so soon as the rough leaves show. Afford to young *Seedling Cucumbers* as much heat and air as possible without risk of injury by the latter. Where convenience exists, sow *Meloa* seeds for an early crop, treating them in every respect similarly to the former. Introduce a successional stock of *Strawberries* into any cool structure, such as a Peach or Cherry house, to make a primary start preliminary to being removed into a higher temperature. Be very gentle in regard to forcing *Cherries*; these have a great dislike to excess of heat, artificial heat more especially. A mean of about 44° to 46° will be ample until the buds have pushed.

HARDY FRUIT GARDEN.

Hardy outdoor Vines should now be pruned without further delay. It is not advisable to prune them so closely as is often practised. I would always advise that one or more good firm buds be retained upon each properly ripened shoot of the last year's growth. Those should, however, be chosen which are properly placed for tacking neatly to the wall. Remove any very old wood, and replace it at once with younger, or wait until shoots of the current season's formation become sufficiently long to fill up the vacancy. I would advise every one who has any spare space on walls having a southern aspect to plant a Vine at once, they amply repay the necessary outlay in a season or two. Finish pruning espalier *Pears*, and remove all young wood, excepting where needed to refill a vacancy, or to extend the area of the tree's usefulness, &c., and take all care of the smaller compact fruit-buds at their base. In most instances it is advisable to leave a few buds at the base of each young shoot so cut back, for the purpose of forming fruit-spurs.

HARDY FLOWER GARDEN.

This has hitherto been, so far as damp is concerned, a rather trying period for rare sorts of *Auriculas*; they should be kept thoroughly clean, and in such a position that the fresh air may keep the atmosphere as dry as possible. Much good is done to all such plants, where it is necessary to keep them in a cold pit or frame, by shifting the whole round, and removing each it stood upon, by placing it a few inches further to one side or the other. *Paeonies*, whether of the herbaceous or tree section, should now be transplanted or otherwise, as may be contemplated, they delight in a good stiff yellow loam, with plenty of well-decomposed leaf-mould intermixed. A good deep soil should always be afforded them, as they often root perpendicularly to the depth of 3 or 4 feet. *Box edgings* may be planted at this season during mild weather. The sward upon lawns should now be well rolled, for the double purpose of removing worm-casts, and to keep up a neat and tidy appearance. Roll gravel walks as frequently as is convenient after rains, &c., the better this operation is performed at this time of the year, the firmer and superior will the walks be in the drier summer months. Plant where necessary deciduous or *Privet hedges*, and perfect any arrangement in contemplation for the removal or transplanting of evergreen shrubs of whatever sorts. This will be found a good time to purchase any further quantity of *Ranunculuses* which may be required, in readiness for planting at an early date, to which I hope again to refer at the proper season. Some choice evergreen and other shrubs I have noticed have become unusually forward. The buds upon such as *Kalmias*, *Syringas*, *Persian Lilacs*, and the like, having pushed already, it will be advisable to check them somewhat by a process of transplanting. Take them carefully up by the root and replant immediately in the same position if necessary, and the object in view will be attained. In some instances it will be advisable, should sharp frosts visit us, to afford all choicer varieties which have been forced to push thus prematurely the protection of a mat. *Roses* of all sorts are also making growth at the apex of the shoots of the past season's formation; it will be well, therefore, to defer all pruning operations in regard to them for a time. To prune them closely under such a state of things will be to induce those very buds to shoot which we are desirous of saving, and from which we anticipate a future display of flowers. I reiterate past advice transplant *Roses* at the earliest possible moment.

KITCHEN GARDEN.

It is an old practice to plant about this date a few early Ashleaf *Potatoes*, and one well worthy of following now. With weather at all favourable, these early sets often gain such a march on later planted ones, as to precede them by some two or three weeks in the production of early tubers. They should be planted deep, so that no injury may befall them by frost. Seven inches will generally be found a tolerably secure depth. I advise all with only limited means who desire to have a few as early as can be produced without the aid of frames, &c., to plant their sets in a drill row properly drawn out, and to cover them with two parts of moderately rotten dung, and one of the natural soil. Mix it well together in the operation, and do not trample it down more than is necessary. Thus, not only will they enjoy greater immunity from frost, but finer tubers will be formed than when contact with the cold soil alone is afforded. *W. E.*

TOWN GARDENING.

A CLEAN neat path is an important requisite in a garden at all seasons, both for its appearance and use, and as this is a good time to commence walk making, a few practical hints on the same will perhaps interest as well as instruct those who are about commencing this

operation. There are many different opinions as to the choice of gravel, but that which I prefer in the neighbourhood of Tooting or Kensington, is a fine, it requires a little binding loam to be mixed with it, which causes it to adhere well together when and in wet weather it is not liable to stick to the feet. It is of a good colour, which is a great desideratum. The depth of the gravel should be about 6 inches, not less than 3 inches of coarse rubble underneath. In making new walks great attention is necessary regard to the level of the ground on which they are intended to be made, so that when they are laid they will slope gradually towards the lowest part of the wet may be drained off easily, for if it is not done the water will remain upon the walks a considerable time after heavy rain, and leave a deposit of soot and dirt which will render them unfit for use. When the ground is level and there are no declivities to carry off the wet, it will be advisable to raise the walks about 2 inches in the centre, and by the sides at convenient distances, to let off the water into cesspools, from which it will soak away in a short time. The month of March is the best time for finally completing walks, but as that is a busy time in the garden, it is advisable, in order to forward much work as possible, to complete them now with exception of the final layer of 3 inches, over finishing touch in March, so that they may be neat and fresh for the summer. Old walks should be edged and swept, and well rolled two or three times a week. This operation should be particularly attended to, as a clean hard walk is the principal feature of an enjoyable garden at this dull period. *J. D.*

STATE OF THE WEATHER AT CHISWICK, NEAR LONDON.

For the Week ending Jan. 13, 1889, as observed at the Horticultural Gardens, Chiswick.

January	Mean Air	BAROMETER		Of the Air		Of the Earth	
		Max	Min	Max	Min	Mean	1 foot deep
Thurs. 7	24	30.273	30.225	50	41	45.5	46
Friday 8	25	30.409	30.316	54	48	52.0	47
Satur. 9	26	30.437	30.398	51	39	45.9	48
Sunday 10	27	30.270	30.165	44	39	41.0	47
Monday 11	29	30.126	30.106	41	37	38.0	46

Wed. 13	31	29.957	29.879	41	34	37.5	45
Average		30.223	30.154	46.4	39.3	42.8	46.1

- Jan. 7—Dense fog overcast, cloudy and overcast, foggy.
- 8—Overcast, densely overcast, fine, but overcast.
- 9—Densely overcast and foggy, very dull, fine and warm.
- 10—Fine, overcast, fine, cold wind, overcast at night.
- 11—Densely overcast throughout, cold wind.
- 12—Overcast, densely overcast, cloudy and overcast.
- 13—Densely overcast, fine, very dull, overcast.

Mean temperature of the week, 8-10 deg. above the average.

STATE OF THE WEATHER AT CHISWICK

During the last 43 years, for the ensuing Week, ending Jan. 13, 1889.

January	Average	Highest	Lowest	Mean	No. of Years in which it has occurred	Greatest Quantity of Rain.	Prevailing Wind	
							W	S
Sunday 17	42.6	29.7	35.6	14	0.68 in.	4	3	
Mon. 18	42.6	31.3	36.9	18	0.36	2	2	
Tues. 19	43.1	31.6	36.9	20	0.68	4	2	
Wed. 20	42.4	31.6	34.3	19	0.25	1	5	
Thurs. 21	42.9	32.1	34.7	20	0.48	3	6	
Friday 22	43.1	32.3	37.7	8	0.8	3	6	
Satur. 23	42.8	32.4	37.3	14	0.57	2	4	

The highest temperature during the above period occurred on 19th 1928—therms. 58 deg., and the lowest on the 19th, 1880—44 deg. below zero.

Notices to Correspondents.

Books: C. D. We can only advise you to apply to one of the foreign booksellers, who may be able to procure it for you. **Coleus Biquifidus.** The plant which is popularly called "Nettle leaved Geranium," and is so commonly seen in the windows of living-rooms, is the *Coleus frutescens*, a native of South Africa. It has also borne the name of *Platanus frutescens*. It was introduced nearly a century ago. **Blumel** came from Java about 1850, *C. Verschaffeltii* from Java about 1860, *C. scaberrimus* from the Eastern Archipelago about 1863, and *C. Gibbertii* from the South Sea Islands about 1866. The name comes from *Koleos*, a sheath.

NAMES OF PLANTS: S. E. T. *Libonia floribunda*.—*Sesquipedalis* *arvensis*, var. *balearica*.—*A. B. 2*, *Veronica perfoliata*; 2, *Anglopteris hypoleuca*; 3, *Asplenium obtusatum*.

PINE-APPLES. P. A. It is not usual nor desirable that suckers on Pine-apple plants, sweating their fruit, should show fruit. Yours is probably the result of some accident, perhaps of too dry a regime, nor are three crowns to a pot at all desirable, as they spoil the beauty and symmetry of the fruit. The superfluous ones should have been removed, destroyed at a very early stage.

FRIMULAS W. C. & Son. The flowers were too much injured by pressure to enable us to judge if the strain is permanent. They are certainly very fine, averaging fully two inches in diameter.

REMOVAL OF PLANTS: Cheltenham. The answer to your question, we suppose, depends entirely on the agreement which was made when the plants were put in.

SILENTNESS: Constant Reader. This plant requires to be grown on freely in a strong, moist heat with plenty of water, and should have a good, porous, well drained soil of peat, lumpy peat and sand. The leaves of your plant are probably becoming yellow from want of sufficient heat. Old plants are seldom so effective as young ones, which require to be grown on as freely and vigorously as possible, and to be cut so well as when from 1 to 2 feet high, with all the leaves perfect. It would be best to strike the top in a cucumber frame, and grow on afresh.

TAN FOR HEATING: C. Cavale. There will be no danger in using the tan in your vinery for the purpose of raising a little heat to start the Vines. We have never used it before, as we much prefer good stable manure mixed with earth for that purpose. If you use tan try a depth of 6 inches at first, which can easily be increased if necessary. It must be turned over every other morning, so as to let the hot fumes penetrate among the leaves.

COMMUNICATIONS RECEIVED.—*W. C.*—*T. H.*—*W. J.*—*T. D.*—*J. F.*—*W. E.*—*W. T.*—*G. A. H.*—*A. S. H.*—*W. D.*—*P. M.*—*R. P. D.*—*A. M.*—*G. S.*—*Somerset.*—*T. F.*—*E. S.*—*W. H.*—*J. Walls.*

ERRATUM.—In our notice of Florists' Flowers last week, *Dahlia King of Prussia* was mentioned. It should have been *King of Primroses* (*Rawlings*).

First Crop or Ringleader Pea.
CHARLES SHARPE AND CO., having grown largely
 the **BEST EARLY PEA**, with great care, have much
 to offer to the Trade. Price on application.

Farm Seeds Direct from the Grower.
CHARLES SHARPE AND CO. will be glad to send
 the carefully selected **TURNIP**,
BEANS, and other **GARDEN SEEDS** can
 be had on application.

Garden Seeds
CHARLES SHARPE AND CO'S PRICED TRADE
SEEDS are sent to all parts of the Kingdom.

Seed Potatoes.
CHARLES SHARPE AND CO. are now prepared to
 make special offers of all the leading sorts of **POTATOS**.
 The following are the most desirable:
Early Peas for Market. The best variety is
IMPROVED EARLY CHAMPION
 a week earlier than Daniel O'Rourke and more prolific.
 A week earlier than Daniel O'Rourke and more prolific.
 A week earlier than Daniel O'Rourke and more prolific.
 A week earlier than Daniel O'Rourke and more prolific.
 A week earlier than Daniel O'Rourke and more prolific.

THE ALPHEIANER has a quantity of **SUTTONS'**
EARLY PEAS to offer, at 1s. per bushel; also seed
 of **BLACK COLLIS**, **Cattell's Eclipse**, **Horticultural**
Water Wate, and the early **Purpin Sprouting**. The Trade
 will be glad to hear of them. Seed Grower, **Toddington, Beds.**
Seedsmen to the Queen.

FRANCIS & ARTHUR DICKSON & SONS, the
 "old-established" Seed Warehouse, 106, Rastgate Street,
 London, E.C. The best **EARLY PEA** in Cultivation is **DICKSONS' "FIRST**
PEA". Price 1s. 6d. per quart.
 The best **NEW SEEDS** for the **GARDEN** and **FARM**, of the most
 distinct character, each Variety being saved from the best Stock
 of the kind. **DESCRIPTIVE Priced CATALOGUES** on
 application. A list of 22 var. delivered Carriage Free to any Station.

PRIZE MEDALLISTS

1862. 1867.

CARTER'S PRIZE MEDAL GRASS SEEDS
for PERMANENT PASTURES.

For **LIGHT SOILS**, } 28s. to 32s. per acre.
 For **MEDIUM SOILS**, }
 For **HEAVY SOILS**, }
 Second Quality, 24s. to 26s. per acre.

See Article on the best Mixtures of Grass Seeds as
 adapted to particular localities, commencing page 75 in
 Carter's "Gardener's and Farmer's Vade Mecum
 for 1869" Post Free, 1s.; Gratis to Purchasers.

Testimonial from **H. BLISSETT, Esq., Letton Court.**
 "Please send me 37 acres of Grass Seed as last year.
 I am glad to say that what you then sent has done well."

THE NEW FORAGE PLANT,
BROMUS SCHRÖEDERI.

See *Gardener's Chronicle*, page 1345, Dec. 26, 1868,
 from which the following is extracted—"The crop (of
 Bromus) was perfectly satisfactory as regards both the
 quantity and quality of its produce. The Horsekeepers
 buying it preferred it to Italian Rye-grass, and the
 Farmer selling it was very much inclined to agree with
 them."

E. DAWES, Esq., Pirbright, Guildford, writes—
 "I beg to offer my thanks to Messrs **CARTER & Co.** for
 calling attention to the valuable plant, **Bromus Schröderi**.
 I purchased some seed to test its value, and it
 occurred to me that a report of my experience might
 prove of interest.

"The seed was sown in July on ground as dry as dust,
 but it vegetated freely, the first shower causing it to
 grow with amazing rapidity. The first cutting was made
 October 20, the plant being 2 feet high, and I found my
 cattle preferred it to any food I could offer them, I now
 have (Nov. 20) a luxuriant second growth, in spite of the
 cold weather.

"I may mention that I was first induced to cut the
 Grass on account of my Pony refusing its ordinary food,
 and was gratified to find the **Bromus** greedily consumed."
 Sow 25 lb. per acre in drills.
 Price 1s. per lb.; cheaper per cwt.

CARTER'S PRIZE MEDAL LAWN
GRASS,

AS SUPPLIED TO
H.H.M. THE EMPEROR OF THE FRENCH,
H.R.H. THE CROWN PRINCESS OF PRUSSIA,
THE GOVERNMENT OF THE UNITED STATES,
THE IMPERIAL COMMISSIONERS, PARIS EXHIBITION,
 &c. &c.
 1s. per lb.; 20s. per bushel.

Testimonial from **M. BARILLET**, Chief Superintendent of
 the Gardens of **H.H.M. Napoleon III.**
 "The Grass which we have laid down with your Seed
 has come up well, and is magnificent." [Translation.]

Agricultural Improvements.
MR. BAILEY DENTON undertakes the **UNDER-**
DRAINAGE of **LAND** at a charge of 6s. an acre: and will
 supply **PLANS** and **SPECIFICATIONS** for Farm-houses, Farm-
 buildings, and Labourers' Cottages with or without Superintendence
 during Construction, on terms to be ascertained of him at
 22, Whitehall Place, London, S.W.

To Landowners, whether Tenants in Fee or for
 Life, Estate Agents, the Clergy, &c.
THE LANDS IMPROVEMENT COMPANY
 (Incorporated by Special Act of Parliament in 1853) advances
 Money, unlimited in amount, for all purposes of Agricultural
 Improvement—the whole outlay and expenses being repaid by a
 rent-charge over 25 years.
 For information and Forms of Application, apply to **GRANT AND**
R. ROSS, Esq., Managing Director, 2, Parliament Street,
 Westminster, S.W.

THE GENERAL LAND DRAINAGE and
IMPROVEMENT COMPANY
 Directors:
Thos. Chapman, Esq., F.R.S. The Rt. Hon. Viscount Combermere
Genl. Theobald Ark, Esq., M.P. Henry Collyer Esq.
John C. Cobbold, Esq., M.P. Edward John Aitchison, Esq.
 W. and T. F. Esq., M.I.

J. BAILEY DENTON, Principal Engineer
 Works of every kind of any extent, Irrigation, Enclosing Wood
 Grubbing, Road-making, Farm Houses, Farm Buildings, and
 Labourers' Cottages, are executed on all descriptions of property,
 whether Freehold, Leased, Mortgaged, Trust, Ecclesiastical,
 Corporate, or Collegiate, or Loans granted for the purpose to Land-
 owners who desire to execute the works by their own agents.
 Tenant farmers may also, by arrangement with their landlords,
 procure the execution of the above improvements on their farms at
 an annual cost to them of between 6 and 7 per cent on the
 outlay and official expenses.
 The whole of the outlay in the works, with an official estimate,
 may be charged on the Estate for a term of years, to be fixed by the
 landowners to meet the circumstances of tenants.
 No investigation of title being required, no legal expenses are
 incurred.
 Applications to be made to **MR. HORACE BROKE**, the Secretary,
 at the office of the Company, 22, Whitehall Place, S.W.

ROYAL AGRICULTURAL
SOCIETY OF ENGLAND.
 AGRICULTURAL EDUCATION
 The EXAMINATION of CANDI-
 DATES for the SOCIETY'S EDU-
 CATIONAL PRIZES will take place in
 the week commencing **MONDAY, April**
12, 1869. Copies of the Form, required to
 be sent in by **March 18**, may be obtained
 on application to
H. M. JENKINS, Secretary.
 12, Hanover Square, London, W.

The Agricultural Gazette.
 SATURDAY, JANUARY 16, 1869.

The agricultural statistics of the country for
 the past year have just been issued in detail.
 Any one desiring to know whether, and how
 many acres, more Wheat or Barley, Potatoes, &c.,
 were grown in 1868 than in 1867, in England,
 Scotland, Ireland, &c., can read the figures in
 the **Blue-Book**. There also he can see what
 stock, both in total numbers and per 100 acres,
 there was each year in every county in the
 kingdom. And there is an immense mass of
 useful information in its pages—for which we
 have to thank the statist of the Board of Trade
 —connected with population, stock, and crop of
 every county, and of every division of the
 country, and of every other civilised country in
 the world, which cannot but be interesting to the
 agriculturist. The substance of the introductory
 report, signed by **MR. A. W. FONBLANQUE**, is given
 in another page. Besides the extract there given, a
 preliminary statement must be adverted to here,
 in which the history and progress of the inquiry
 is described. The figures given are not yet in
 any case an exact statement of fact. Wherever
 such a statement has been refused, as it still is
 in some few instances, the best available means
 are employed to return a careful estimate. But
 this, though vitiating the totals as strictly
 accurate records, does not much spoil the
 trustworthiness of the inferences which may be
 drawn from a comparison of one year with
 another. The character and quantity of error on
 this account can hardly be supposed to differ very
 much from year to year; and while, therefore,
 we can hardly affirm that the total acreage or
 total numbers here alleged of every crop or kind
 of stock is absolutely true, we may nevertheless
 entirely believe the statement that so many more
 acres of any crop, so many more or fewer of
 a particular kind of stock, have been cultivated
 in 1868 than in 1867. It is as indicating the
 tendency and growth of agriculture in particular
 directions that these Tables are essentially valu-
 able, and we shall, therefore, during the next
 few weeks transfer them to our pages entire.

It is much to be hoped that the gradually
 dying jealousy on the part of the farmers of some
 districts, which leads them to refuse all informa-
 tion to Government officials, and thus to some
 extent to spoil or make imperfect the informa-
 tion readily given by others, will soon altogether
 cease. We believe it will. It will soon appear
 that the information asked for can have no per-
 sonal or immediate interest whatever. Every
 item is lost in the mass to which it is contri-

ding, the obvious conclusion is against allowing storm-water to be mixed with sewage. In the second place, where the sewage is thus diluted to an excess with storm-water, it prevents its being stored up in cisterns, as in the Flemish practice, at seasons when it cannot be applied to the land as when the ground is frozen and covered with snow. The objection is a valid one, but like the others preceding it, is only applicable to the mismanagement of sewage by towns, for were it obviated it would be greatly in favour of sewage farming.

The fourth plan of sewage farming is simply to do away with the objections to the third plan, and to add artificial manure of a specific character to the sewage, so as to make it more efficacious in producing certain crops, as roots, cereals, Flax, &c. It is therefore in principle similar to the practice now pursued by farmers, who thus improve the efficacy of their farmyard manures.

Such is the position of the sewage question at the commencement of the new year (1869). The liquid manure system, as illustrated by the practice of the Barking farm, with such differences of detail as differences of soil and climate may indicate, is that which meets with the approval of the agricultural public. But before the practice can be adopted generally, the objections raised against it must be obviated, and this requires to be done by towns. "Send the sewage to the land" is now a public mandate, endorsed by Parliament in a special statute, and its soundness meets with universal approbation in town and country. But when the practical question is raised—are towns sending their sewage to the land? the above four objections return a negative answer. Thus towns are wasting the fertilising elements of the sewage which the land so much needs, only sending what the land seldom requires, and yet during the whole of the year 1868, which has just expired, the general complaint has been that farmers will not receive their sewage on any terms!

Experience is a wise master-teacher, and no doubt towns will eventually get the practical tuition they now so much stand in need of at this school. Sewage *per se* will cover the expense of sending it to the land, and something over. And thus, to send it to the land without waste of fertilising matter is the grand problem of problems of the present day. That night-soil will stand a sufficient dilution with water for its conveyance to the country in close pipes has long ago been proved in Flanders, China, and other places where manure is used and even preferred by farmers in a liquid form, and before the close of 1869 we hope to see it tested by experiment how far sewage can be conveyed in pipes flowing full bore, without undergoing deterioration of its manurial value. And when this is done, there is not a town in the kingdom which will not have itself to blame if it does not get rid of its sewage *per se*, on remunerating terms. There may be many difficulties in the way of obviating the wasting of the sewage and the other three objections raised, but these only exemplify the magnitude and importance of the general question involved in the practice of sewage economy, for the objections, one after the other, will disappear the moment towns begin at the beginning of the great work, by sending their sewage in its normal state to the land, free from waste; for, this done, the several propositions involved in the second and third objections would be carried out by farmers. There only remains the fourth objection, and the chief difficulty in the way of separating the storm-water from the sewage is the disposal of horse droppings in the streets, and the manner they are got rid of in dry weather suggests the remedy. There are, however, many plans of purifying storm-water in towns, so as to render it fit for being turned into rivers. In deed, almost every town would have something special in the solution of this question. Into the details of a practice so widely diversified we cannot go. But the conclusion is manifest, that were towns to go this length in the economy of their sewage, storm-water would soon be got rid of satisfactorily, one way or another. W. B.

PARING AND BURNING.

I HAVE lived all the days of my life in the neighbourhood of extensive "paring and burning." Moreover, although I am now a Rosarian and Fragararian, I have been all my days a practical farmer. Mr. Mechi's system is, was, and always will be right—to

Make horn
Drive corn.

Horn is, of course, a generic term for cattle. It means feed high; and instead of sending out all corn from the farm, to send out fatted cattle and corn. That is Mr. Ford's plan at Rushton. The above is what doctors call a foreign substance, and I only mention it as it gives me an opportunity of expressing my great admiration of Mr. Mechi. I will now say a word on the above heading.

1. *Paring and Burning of Light Thin Land.*—I have seen lots of this, and my impression is, that though by this process you can without further expense (about 30s per acre, it used to be), by the stimulation of the ashes, get a most remunerative crop, either of Wheat or Oats, at once, yet is it objectionable. We do not in common life argue against the use of a thing from its abuse. How often have I seen persons who break up this thin down land give the land a greasing, which means a crop of Wheat followed by a crop of Oats! This of course is the abuse of paring and burning thin down land. It might still be done, and so great a mischief as I have seen might not occur if the land was highly farmed from the first. These lands are too light already—they won't "seal," and the ashes make them unsealable for ever. Moreover, these lands are generally at a great distance from the homestead; the consequence of which is, they get little or none of the best of manures—farmyard manure. When these thin

wards, and a layer of fresh stable manure put on, and then another layer of sods, till the pile assumes the appearance of a rick. Lord Rivers allowed me to break up a bit of this soil here. I have a rick of it now no stable manure at all in it, and I have carried out on a bit of the same land a clod-rick, thoroughly dissolved, made about a year ago. It was only turned once and Branning would not hurt this fine sandy loam land, but the other, in the end, I knew would be the best plan. However, I am now talking of paring and burning thin light land. It is a thing that should not be done. Were I a landlord, I would insist upon the top clod, which is the richest part of the land, being dissolved, and I would insist upon the first crop being Rape raised by bones or superphosphate. The latter acts more quickly, but half-inch bones are the most lasting. For cold lands I think Peruvian Guano (the cheapest of all manures) is best. Mr. Burgess, of Launceston Farm (my oldest agricultural friend), in the parish of Tarrant Moreton, tenant of Mr. Farquharson, passed by, some years ago, a piece of broken up land. I said—"Here is a pretty mess." "Ah," said he, "that land, if laid down to Grass, will not be as good in 40 years as it was when broken up." The land was too light before, now the ashes have made it lighter, to say nothing of the exhaustion occasioned by the stimulation of the ashes." He is a renter of 1500 acres—one of the finest farms in Dorset. His corn-fields are about 60 acres each, square, with nice thorn hedges round them. Each ridge ploughed would be about 4 acres. The house is in the centre, with nice water meadows, and at either end of the farm are capacious downs. The arable land is about 900 acres. The testimony of such an experienced and excellent farmer is worth a thought. If a person pares and burns his land he must begin, not with taking the grease out, but by putting it in, as Mr. Mechi would do.

2. *Paring and Burning the Sward of Staple Land.*—You may sum up this in one word—it is folly. Simply rick the swards, turning the green part downwards. Turn the rick once, and in a year or less it will be dissolved, and fit to cart out. But why break up good staple land at all—I mean grass-land that pays? When I read the queries of "J. B. S., Cirencester," in a later impression, I laughed, and came to the conclusion (he won't be offended) that to break up such land as he spoke of would be the act of a lunatic. On reading it a second time I came to the conclusion it was only playful sarcasm!

There is a class of deep, heavy, poor, foxy clay that would be benefited if it was stife-burnt an inch deep every time it came to Wheat. That is the sort of land to pare and burn, whether grassed or under tillage. Burn it as often as you like, the ashes will stimulate, sweeten, and keep the land open. If the land is wet it must be drained 3 feet 6 inches deep.

As regards Couch-grass, there ought to be none; but if there is any, mix it with stable manure in the field, and turn it; it will soon dissolve. If there is little Couch-grass the ashes will be *nil*; if there is much Couch the shame will be in the ratio of the ashes. W. F. Radclyffe

ESTATE MANAGEMENT IN IRELAND.

I do not think your correspondent "Fingal" is happy in his illustrations of modes of managing property in Ireland, given in your Paper of the 2d inst. Mr. Pollock's system is as much in excess on the one side as the other instances are deficient on the other.

Mr. Pollock spent money on his estate with a most lavish hand, and without any regard to economy. He bought out the occupiers, land, stock, crop and that they had, even the pig—at prices far above their value, often four times above it—a course which, anywhere but in Ireland, with its impractical sentimentalities, would be thought uncommonly satisfactory to the sellers. No doubt Mr. Pollock overdid the whole thing in a way no practical man of moderate means could have done, no one but himself, of course, knows his accounts; still, the best opinion is, that after all he makes a fair interest for his money.

I happen to have tried both the other two systems recommended, viz. —1. Making allowances to tenants for such permanent improvements as they effect, and 2. Employing an agriculturist to teach them better plans of farming. The vice of making allowances is, that the tenants very seldom do the improvements thoroughly. A cat watching a mouse is nothing at all to the vigilance needed to get an Irish tenant to do work well for which his landlord is to make him an allowance. It soon comes, too, that no one on the estate will do anything at all that he is not allowed for. Common-place repairs are neglected till a case can be made for a job to be allowed for. I soon found I was paying substantially as much in allowances for work badly done, as I could have it done well for myself. The employment of agriculturists answered very well at first, when men who had never grown a Turnip before had to be taught how to do so, but I found when this early, rough stage was past, little more good could be done by him. I think the reason was, that the influence of the landlord or agent could make the tenant grow some Turnips, but it is very hard to bring such influence to bear on the better or worse preparation of the land, better or worse manuring and thinning of the crop, earlier or later sowing, and so, in spite of the agriculturist, with most tenants an excuse did duty for good management in these respects.

I believe there is no substitute in Ireland, any more than in England, for the outlay of the landlord's capital on proper landlord's improvements. There is plenty of room and need for both landlord's and tenant's capital on nearly every farm in Ireland. Few farms are all wet, and the tenant's capital spent in manuring the dry part of his farm will pay him much better than in doing landlord's improvements. If a landlord's improvements pay him 5 per cent. permanently, he is well

paid, but a tenant's capital laid out at that rate to him. Money spent judiciously in manure, is always, on and in such condition repaid a few times over in one and with a large profit for a few years. The tenant continues to hold the farm. Ten or 20 per cent. of the landlord's rental is paid out in permanent improvements will in 20 years change the face of the land and add as much to the rental, with good profits to the tenants. And whereas in Ireland the money borrowed from the Government, under the Improvement Acts, repayable principal and interest at 6 per cent. in 22 years, or at 5 per cent. in 25 years, there is no excuse on earth for landlords not to make permanent improvements themselves in a judicious manner, employing the labourers on their estates, who are at least as deserving a class as the tenants, leaving the tenant's capital to its proper use on the land that grievously wants it.

It is, therefore, that I say that the system of "Fingal" errs as much in defect as Mr. Pollock's in excess. I do not wish, however, to imply that the estates he mentions are not much improved. The truth is, any orderly system carried out on a business-like way is sure to improve an Irish estate, more or less; if it is only a business-like enforcement of rent, even a high rent, the estate will improve. Neglect is a far greater evil than any other in Ireland. An easy-going, indulgent, careless landlord, will in 10 years ruin any estate, (the rent never so moderate. Once an Irish tenant gets into debt he is a lost man; no one gets in arrears without in debt besides. If good years come the arrears swallow up all the gains, and the man is rather less in debt, and with greater liberty to pay more, and with no more spirit to farm better than out arrears, though he may have hard work to do to pay his way, yet when good years come, the tenant's own, and better farming is the consequence.

I believe there is no point relating to Ireland, which so much ignorance prevails, as the management of estates on which the landlord's capital is being spent in permanent improvements. What a waste of capital is made of every abuse, great or small, accidental or arising from mere personal caprice, that tends the other way is little heard of by the Landlord.

AGRICULTURAL STATISTICS.

(The following is the report by Mr. F. P. F. Statistical Department of the Board of Trade, of the tabular results of this year's statistical inquiries published, are prepared.)

THE first two tables show abstracts of the agricultural returns for each division of the United Kingdom, the figures for Ireland being taken from the returns issued by the Registrar-General in Dublin. The number of acres returned as under all kinds of bare fallow, and Grass in the United Kingdom was 45,652,000, which is 265,000 in excess of the acreage in 1867, and 1,307,000 in excess of the total acreage returned in 1868 as compared with 1867, however, chiefly owing to the increased acreage of permanent pasture returned in Great Britain and Ireland under a more comprehensive heading than was used for collecting the returns. Of the number of 45,652,000 acres returned for the Kingdom in 1868, 11,659,000 were under crops, 4,865,000 under green crops, 981,000 were under fallow, 5,690,000 under Clover and other Grasses, and 23,161,000, or nearly one-half of the acreage returned, were under permanent pasture. The proportion of permanent pasture varies considerably in the different divisions of the Kingdom. The Tables show that the proportion of permanent pasture to the total acreage returned was 45 in every 100 in the United Kingdom, 42 in England, and 23 in Scotland, and 61 in Ireland. The average acreage in 1868 as under bare fallow or uncropped arable amounts to 958,000 acres for Great Britain and 24,000 acres for Ireland. In Great Britain the proportion of bare fallow to the total acreage returned is every 100 acres, but it is 53 to every 100 acres of corn, green, and rotation Grass crops, and 75 to every 100 acres of corn and green crops only. There is a large amount of land, capable of cultivation, but lying waste or under an erroneously returned under the heading of fallow or uncropped arable land.

The aggregate acreage under corn and grass in the United Kingdom in 1868, as compared with 1867, shows the following results—Corn, an increase of 227,000 acres, and green crops, an increase of 170,000 acres. The acreage under Potatoes, a decrease of 170,000 acres. The acreage under Potatoes is larger in 1868 than in 1867, in 31,000 acres, of which 50,000 acres were in Great Britain, and 3,000 in Ireland. The acreage under Wheat is larger in 1868 than in 1867, in 1,000,000 acres of the Kingdom, the total increase amounting to 310,000 acres. The acreage under Barley in 1868, compared with 1867, shows a falling off of 112,000 acres, but as there were an increase of 4000 acres under Barley in Wales and Scotland, of 16,000 acres in Ireland, the actual decrease in the United Kingdom in 1868, compared with 1867, is 92,000 acres. In the acreage under Oats, there was an increase in the United Kingdom of 45,000 acres, 1868 over 1867, the chief part of the increase being in Ireland, England showing an increase of 18,000, and Wales and Scotland an increase of 10,000 acres. The acreage under other crops (excepting Potatoes) is generally lower in 1868 than in 1867, the decrease in the Kingdom in 1868 is 24,000 acres. Turnips, 9000 acres under Mangels, 12,000 acres under Cabbages, Kohl-rabi, and Rape, and as much as 100,000 acres under Vetches, Lucern, &c. The acreage under Flax in Great Britain is distinguished for its increase in the returns for 1868. There were under

Grape Vines.

B. S. WILLIAMS' STOCK... and in good condition for sending out. Kinds and prices can be had on application.

Superb New Late Grapes.

"MRS PINCE'S BLACK MUSCAT" may now be seen in perfect perfection. This is a knowledge to be the most grape extant.

PINES and VINES... PINES, of the best sorts, fruiting and stocks, very strong and fine.

ARTHUR HENDERSON AND CO... fruiting canes, capable of carrying a crop of 100 lbs of fine grapes.

BLACK HAMBURG, 3s. WHITE FRONTONAC, BUCKLAND SWEETWATER, LADY DOWNES.

Also these fine sorts, GOLDEN CHAMPION, MRS. PINCE'S BLACK MUSCAT, and MAIR RESEFIELD COURT.

WANTED, BRAMBLION and PEAR-PLUM STOCKS... with 2 and 4 extra and upright canes.

Standard Roses, and Dwarf Maiden Peaches and Nectarines.

STANDARD ROSES, best cutting sorts, 70s per 100. DWARF MAIDEN PEACHES and NECTARINES, leading sorts.

WANTON APPLE TREES... on the true French Paradise Stock, as recommended by Mr. Jackson in his 'Gleanings in France.'

FINE ORANGE TREES for SALE... Ten very handsome trees, in robust health, loaded with fruit.

STRONG STANDARD DWARF TRAINED APPLES and PEARS... with 7 to 8 feet of lady laurel and laurel.

WOODLAND NURSERY, MARKET GARDENS, SURREY.

W. WOOD AND SON... to their enormous stock of FRUIT TREES in a fruit-bearing state.

FRUIT TREES, NURSERY STOCK, ROSES.

L. PAULIER, NURSERYMAN, CHATEAU DE SERRAUX... of Nursery Stock, and especially FRUIT TREES and ROSES.

Table listing various fruit trees and roses with prices. Includes items like PEARS, QUINCE, APPLES, DOG ROSE, PEARL, CHERRY, and ST. L.

ROSES... Our own best selection. Standards, 3 feet to 3 feet 7 inches, per 100 £3 15.

CATALPA... Discount of 5 per cent. will be given on prepaid orders.

STEPHEN BROWN... the following at the annexed low prices.

Table listing various plants and trees with prices. Includes items like CONIFER, STANDARD TREES, PEARL, POLYANTHUS, PINK, HOLYHOCK, PAMPAS GRASS, GYNERIUM, DWARF ROCK, DOUBLE POTENTILLA, VIOLETS, HIBISCUS, LILIES, GLADIOLI, PEONY, CYCLAMEN, and NURSERY.

KNAP HILL NURSERY, WOKING, SURREY.

ANTHONY WATERER

PLANTS TO BE SUBMITTED TO

FOLLOWING LIST to the NOTICE of INTENDING PLANTERS

EVERYTHING IS WELL-GROWN AND FINELY ROOTED.

In proof of which he gives the date of their last removal

- ABIES ORIENTALIS, 5, 6, 7, and 8 feet, 10s. 6d. to 21s. each.
ALBERTA, 5 to 6 feet 3/4 to 10/4 per doz., moved April, 1888.
ALBERTA, 5, 6, 7, and 8 feet, 10s. 6d. each, moved April, 1888.
CANADENSIS, 4, 5, 6, 7 feet high, 14s. to 21s. per dozen.
PIUMBA, 1000s of these dwarf variety of the common Spruce Fir, many are 6 years old.
GREGORII, 30 years old.
F. N. ELISA - The Common Spruce, 5, 6, and 7 feet high.
PICEA N. MILLS, 4, 5, 6, 7, 8, 9, 10, 11 feet high, 8 and 10 feet in circumference, 42s. to 147s. each.
NORMANNIANA, best of all seedling plants, 1 1/2 to 2 feet, 20s. and 42s. per dozen.
MAGNIFICA or NOBILIS ROBUSTA, 2 feet, 15s. each.
LASIOCARENA, 2 to 2 1/2 feet, 60s. per dozen.
JUNIPERUS SIBIRICA, 4 to 5 feet, 10s. 6d. each.
CEDRUS ATLANTICA, 5 to 6 feet, 42s. to 60s. per doz., moved in 1888.
DEODARA, 4 to 6 feet, 42s. and 60s. per dozen.
JUNIPERUS CHINENSIS, 4 to 5 feet, 10s. 6d. each.
JUNIPERUS SIBIRICA, 4 to 5 feet, 10s. 6d. each.

CHIVAS AND WEAVER have much pleasure in drawing the attention of the public to the fact that they have selected the most valuable and the most useful plants to the very best of the above group with the greatest care, and that they have selected the most valuable and the most useful plants to the very best of the above group with the greatest care, and that they have selected the most valuable and the most useful plants to the very best of the above group with the greatest care.

Forest Trees, Evergreens, &c. JOHN KENNEDY AND CO. have as usual a very large and superior stock of FOLIAGE and ORNAMENTAL TREES and SHRUBS which they are selling at moderate prices. The Trees and Shrubs are of all kinds and sizes, and are particularly well suited for the purpose of planting in pleasure grounds, and for the purpose of planting in pleasure grounds, and for the purpose of planting in pleasure grounds.

The American Nursery, Bagshot, Surrey. JOHN WATERER has the pleasure of calling the attention of the public to the fact that he has much satisfaction in recommending to the public a very fine and useful plant, the first-rate excellence and from the fact that it remains in an excellent state for transplanting. Having a very large stock, he is determined to treat on most liberal terms. He would however, earnestly invite Purchasers to make a visit and choose for themselves, which is easily accomplished by South-Western Railway (Reading Branch) to Sunningdale Station, which is near the Nursery.

RHODODENDRONS (Standards) - Of all the leading choice, scarlet, and other varieties, 3 to 4 feet stems, consisting of such as Alexander Ayle, Michael Waterer, The Warrior, Princess Mary of Cambridge, Quadroona, Mrs. Ingleton, Joseph Whitworth, and a great number of others as have been exhibited annually at the Royal Botanic Gardens, Regent's Park.

RHODODENDRONS (Dwarf-growing kinds) - These are very close growing varieties, and are recommended for filling winter beds, Daphnoides, Myrsinoides, and Hybridum are the best suited for such purposes. Odoratum is delightfully scented, and much used for potting and forcing.

AZALEAS, HARDY - Of the most beautiful kinds, of all colours, and in fine plants covered with a profusion of coming buds. These are much used for forcing. 18s. to 20s. per dozen.

ANDROMEDA FLORIBUNDA - One of the most hardy plants used for decorating water-works. Of these we are large holders, and can supply beautiful specimens at 30s. per dozen, covered with blooming buds.

KALMIA LATIFOLIA and MYRTIFOLIA - Fine grown plants, of all sizes. HARDY HEATHS - A very fine collection, in 20 kinds, 30s. p. 100.

ABIES NORDMANIANA - Of this fine kind we are very large holders, all of which are seedlings, and of an average height from 2 to 5 to 6 to 8 and 10 feet.

ABIES MAGNIFICA - Fine specimens, 2 to 5 feet. ABIES NOBILIS - All seedlings, 1 to 3 to 5 feet. ABIES LASIOCARPA - From 2 to 3 to 5 to 7 feet.

ABIES GRANDIS (of Douglas) - Fine specimens, 2 to 5 feet. ABIES DOUGLASSII - 3 to 4 to 6 to 10 feet. ABIES PINSAPO - 2 to 3 to 5 to 10 feet.

ARAUCARIA IMBRICATA - Fine specimens, 2 to 4 to 6 to 12 feet. THUJA SINENSIS - All sizes, 2 to 4 to 6 feet. THUJA AUSTRALIS - All sizes, 2 to 4 to 6 feet.

THUJA GJANTRA - In dense quantities, from 3 to 4 to 6 feet. WELINGTONIA GIBBERNA - All sizes, from 2 to 12 feet. IRISH YEW - Selected specimens, 1 to 12 feet. HOLLIES (various) - Fine, 2 to 3 to 4 to 6 feet.

HOLLIES (Gold and Silver) - In the most approved kinds, of all sizes. STANDARD GOLDEN HOLLY WATERER'S - The best for standards, fine plants. STANDARD WEEPING HOLLIES (Green and Variegated).

We have likewise immense quantities of the leading kinds of EVERGREENS, of all sizes, such as Yew, Box, Bays, Aucubas, Arbutus, Phillyreas, Common and Portugal Laurels, &c., as well as fine strong transplanted FOLIAGE TREES, 2 to 3 and 4 feet, consisting of Ash, Beech, Alder, Spanish Chestnut, Hazel, Withy, Larch, Spruce, Pinus austriaca, &c.

The Planting Season.

WOODLANDS NURSERY, MAREFIELD, NEAR UCKFIELD, SUSSEX. W.M. WOOD AND SON respectfully invite especial attention to the very large stock of STANDARD ORNAMENTAL TREES, of large size, suitable for planting as single specimens in Lawns or in Parks where immediate effect is desired.

Plants for Hedges TWO HUNDRED THOUSAND COMMON LAURELS, of all sizes, from 1 to 3 feet. Wm. Wood & Son

AMERICAN ARBOR-VITAE, especially recommended for Hedges:—2 to 3 feet, 6s. per dozen, 40s. per 100; 3 to 4 feet, 9s. per dozen, 60s. per 100; 4 to 6 feet, 12s. per dozen (extra fine), 100s. per 100.

SPECIAL OFFER to GENTLEMEN.—See CATALOGUE 53, p. 11, for quantities of 5,000, and above 20,000, carriage paid.

ORNAMENTAL TREES AND SHRUBS. PETER LAWSON AND SON have an immense stock (extending over many acres) of the leading varieties of HARDY ORNAMENTAL TREES and SHRUBS, of such sizes as are most suitable for immediate effect, which they offer at moderate prices; and purchasers of large quantities will be very liberally dealt with.

For Lawn and Cover Planting. BERBERIS DARWENI.—Too much cannot be said of this fine Evergreen species. It is hardy, and the profusion of its orange-red berries, in some clusters with the maturity of berries which a bear and wild pheasants are very fond of, render it one of the most attractive and desirable plants for Lawns as well as Cover Planting ever introduced.

COTONEASTER SIMMONSII.—This is a beautiful Hardy Evergreen Shrub, with glossy dark green leaves, and bearing a large quantity of scarlet berries, which ripen later than the Berberis Darweni, and will hang all winter.

Wandsworth Common Nursery. Ten minutes' walk from Clapham Junction.

MR ROBERT NEAL begs to invite the attention of the Nobility, Gentry, and the Trade in general to his very extensive and healthy stock of PLANTS, consisting of a large collection of Standard, Pyramidal, and Dwarf-trained FRUIT TREES, of all sizes, Standard and Dwarf ROSES, Coniferous and other Evergreens, Forest and Ornamental Trees and Shrubs; also a large collection of Rhododendrons, all the very best in cultivation, and are of the most various forms, sizes, and colors, and are shaded up to white, and in some instances, and in the leading kinds of scarlet, both standard and dwarf, set with buds, which he can supply in large quantities at a very low price.

1863.—Mangel Wurzel Seed. H. AND F. SHARPLEY, of Wandsworth, have the honor to announce that they have the above-named Seed, grown on their own Farm this season from picked Balbs. The quality is very fine, and prices are low. Samples may be obtained on application.

SURPLUS STOCK.—Special offer to the Trade. PEAS, SANDSTON'S NO. 1. EARLY EMPEROR. BISHOP'S LONG AND DWARF. PARADISE EARLY MARROW. WATERLAD or VICTORIA. SEEDLING for effect of a. THE GEM or TOM THUMB. VEGETABLE PERFECTION. MAIR'S DWARF MAMMOTH. BEANS, GREEN WINGS. GREEN LONGPOD. BROCCOLI, CHAPPEL'S CREAM. ELLETSON'S MAMMOTH. IMPERIAL WINTER WHITE. WILLOW LATE WHITE. KNIGHT'S PROTECTING. BRIMSTONE. ADAM'S EARLY WHITE. PURPLE SPOOTING. CABBAGE, EARLY YORK. LARGE YORK. NONPAREIL (green). CARROT, ALTRINGHAM (good). JAMES' INTERMEDIATE. WHITE BELGIAN. ONION, WHITE GLOBE. BROWN GLOBE. RADISH, WOODS' EARLY FRAME. AND TURNIP. SPINACH, EARLY KITE. TURNIP, EARLY GLOBE. POMERANIAN WHITE GLOBE. SWEET PEAS mixed colors.

East Lothian, White, and Purple Intermediate Stock. THOMSON'S SUPERB HERBACEOUS CALCROLARIA, saved from the Dalkeith Collection, in packets at 1s., 2s., 6d., and 5s.

ROLLISSON'S TELEGRAPH CUCUMBER (Trade)

THERE ARE MANY VARIETIES IN CULTIVATION. From the universal satisfaction that their Telegraph Cucumber has given, WILLIAM ROLLISSON & SONS are much encouraged in again offering good and well ripened Seed of this most extraordinary variety. Its wonderful cropping qualities have this year been witnessed at their Establishment by many experienced judges, all of whom have agreed that it is the best in cultivation for that purpose, in fact it has been acknowledged to be, by the best authorities of the day, the most productive yet introduced for Winter and Early Spring use, in proof of which See Gardeners' Chronicle, January 17, 1863. See Gardeners' Chronicle, August. See Gardeners' Chronicle, March. See Gardeners' Chronicle, Oct. See Gardeners' Chronicle, Jan. See Gardeners' Magazine, Jan. See Journal of Horticulture, &c.

PAUL'S NURSERIES AND SEED WAREHOUSE, WALTHAM CROSS, LONDON, N.

GENUINE AND FIRST-CLASS SEEDS.

WILLIAM PAUL

BEGS TO ANNOUNCE THAT HIS

CATALOGUE OF SELECT VEGETABLE AND FLOWER SEEDS,

Including many Novelties, is now ready, and may be had Free by Post on application.

In proof of QUALITY he need only refer to the numerous Prizes awarded at various Horticultural Shows throughout the country, for both Vegetables and Flowers grown from his Seeds, and in regard to prices these are in all cases affixed on the lowest possible scale to be remunerative. The following Gardens in Hertfordshire, justly renowned for their Vegetables and Flowers, have long been supplied from his Seed Warehouse—Brockett Hall, Panshanger, Danesbury, Polos, Digswell, Wyduval Hall, Woodhall, Youngebury, Bedwell Park, Essendon Place, Campfield Place, Bayfordbury, Knebworth, Frogmore Hall, Childwickbury, Codicote Lodge, and many others of equal celebrity throughout the country.

To purchasers who are unacquainted with the best varieties of Vegetables and Flowers, or who wish to save the trouble of writing a List, the following Collections are made up on equally liberal terms with any other House in the Kingdom. All are of the best quality, and cannot fail to give the fullest satisfaction.

VEGETABLE SEEDS.

No. 1. The WALTHAM COLLECTION of VEGETABLE SEEDS, FOR A LARGE GARDEN, Price £3 3s.

LONDON and CONTINENTAL SEED COMPANY. Purchasers of a large quantity of seeds are strongly recommended to obtain the CATALOGUE now published by this Company.

Address. LONDON and CONTINENTAL SEED COMPANY, 25, WELBECK STREET, CAVENDISH SQUARE, LONDON, W.

NOTICE is HEREBY GIVEN, that the Partnership of JOHN SHIP and EDWARD HOBAY, carried on at the Nursery, 8, 10, 12, & 14, St. Andrew's Street, London, is dissolved. All debts due to the said Partnership, or by the said Partnership, are to be paid or received, as the case may be, by JOHN SHIP, or EDWARD HOBAY, or by their respective Attorneys, before the 1st day of January, 1882. Dated this 1st day of January, 1882.

HENRY BALBY, President, begs to inform the Trade, that he has been appointed to the Country Nursery of Waltham Cross, and has the honor to acknowledge the interest and trusts by street notices, and performances, and the assistance of past favours, afforded by the late customers, and to express his sincere appreciation of the same. It will be his endeavor to meet the requirements of a real good article at a reasonable price. Being a cultivator for several years, Flower Market, he has an opportunity of securing from some of the best growers in the country, and is enabled to carry on a first-class business. New Plants, &c., may be ordered at advertisement prices. Royal Nursery, Waltham Cross, January 1, 1882.

Editorial Communications should be addressed to the Editor, at the Office, 41, Wellington Street, London, E.C. The Editor's Office is open from 10 o'clock to 4 o'clock, on all days except Sundays and Public Holidays. Printed by JAMES MARRIOTT, at the Office of Messrs. W. & A. G. & Co., Limited, 41, Wellington Street, London, E.C. Office No. 4, Wellington Street, London, E.C. January 20, 1882.

B. S. WILLIAMS

HAS MUCH PLEASURE IN OFFERING CAREFULLY SELECTED

SEED OF THE SUPERB EAST LOTHIAN INTERMEDIATE STOCK

Feeling sure, from personal observations of several years, that it is without question the finest strain of Intermediate Stock extant.

The colours are Purple, Scarlet and White. The two first are remarkably brilliant, and the latter very general bedding purposes, indeed, the effect which can be produced by these three varieties in both spring and autumn gardening is not surpassed by any of the now popular plants.

An assortment of three colours (Scarlet, Purple, and White), 2s. 6d.

James Dickson & Sons

OLD ESTABLISHED SEED & NURSERY BUSINESS, 102, EASTGATE STREET, AND "NEWTON" NURSERIES, CHESTER.

LONDON AND CONTINENTAL SEED COMPANY,

68, WELBECK STREET, CAVENDISH SQUARE, LONDON, W.

THE LONDON and CONTINENTAL SEED COMPANY has purchased the old and important business of Rendle & Co., of Plymouth, which has been established for nearly 100 years. THE LONDON and CONTINENTAL SEED COMPANY. — Mr. RENDLE, the head of the old Firm, consented to be the Managing Director of this Company. DISCOUNT of TWOPENCE in the SHILLING will be taken off the published prices of any London or Provincial Seed Merchant. DISCOUNT of TWOPENCE in the SHILLING will be taken off the published prices of Seeds for the Family Kitchen Garden, and the Flower Garden. DISCOUNT of TWOPENCE in the SHILLING — This new system of supplying Seeds for cash payment is the most plan so successfully introduced by Mr. Rendle, the Managing Director of the Town and Country Book Society. DISCOUNT of TWOPENCE in the SHILLING — The Bookselling system, of taking off a large Discount to the purchaser, is now introduced into the Seed Trade by the LONDON and CONTINENTAL SEED COMPANY. SEEDS, the NEWEST and FRESHEST, all the growth of 1868. — Another new system introduced by the London and Continental Seed Company, is to dispose of all surplus stock at the end of each season, so that the season is commenced without an ounce of old or imperfect seed. SEEDS, all the growth of 1868, can be obtained from the LONDON and CONTINENTAL SEED COMPANY. THE LONDON and CONTINENTAL SEED COMPANY have made arrangements with the most experienced Continental Growers for the quick delivery of all New Seed Express Parcels every week in the season to the leading Continental Cities. THE NEW GARDEN SEED LIST is now ready, and can be had on application, Gratis. A Discount of Twopence in the Shilling off all Garden Seeds. THE NEW FARM SEED LIST is now ready, and can be had on application, Gratis. A Discount of Twopence in the Shilling off all Farm Seeds. THE ILLUSTRATED NEW FLOWER SEED LIST is now ready, and can be had on application, Gratis. Copy A Discount of Twopence in the Shilling off the price of all Flower Seeds. LONDON and CONTINENTAL SEED COMPANY — Purchasers of all kinds of Seeds are strongly recommended to obtain the CATALOGUE now published by this Company.

LONDON AND CONTINENTAL SEED COMPANY, 68, WELBECK STREET, CAVENDISH SQUARE, LONDON, W.

GOLDEN COLETS, QUEEN VICTORIA—This is the brightest in colour of the whole series, having the centre of the ear of a rich bronzy bright crimson, delicate shot with pale violet, with a bright yellow edge, somewhat broken with crimson veining, so as to appear as if the borders were formed of a double row of golden beads. (See Catalogue.)
Messrs. JONES & CHARLES JONES were the fortunate purchasers of this, the most splendid of all Colets, at the recent sale by Mr. Stevens of the Royal Horticultural Society's new Collection. A pair of Queen Victoria will shortly appear in the "Florist" under a name being looked for de very early in Spring. Price 3s. 6d. Special offer to the Trade on application.
Royal Vineyard Nursery and Seed Establishment, Hammaramth, London, W.

HENRY GODFREY, NURSEMAN, Sloughbridge has to offer a large quantity of **HEAVY ESCALOPED EARLIAN**, raised from seed saved from a particularly fine strain, established in small pots, from 2s. 6d. to 3s. per dozen, basket and package included. When three or more baskets are taken, Post Office orders or postage stamps will be accepted.

Choice Seeds, Gladioli, &c.
W.M. CUTRUSH AND SON'S CATALOGUE of the above contains description and price of many very superior home-grown VEGETABLES, and FLOWER SEEDS, and choice varieties of GLADIOLI, &c., all of which are highly recommended. Post free on application.

CATALOGUES of NEW SOFT WOODEN PLANTS, with special Priced Lists forwarded free on application.
Munro Nursery, Sible Hedingham, Essex.

Seeds.
AVERSE as **MR. WILLIAM BULL** is to publishing Testimonials, and for the reason that all good Houses must constantly receive them in some shape or other, still, so much has recently been written and said about inferior Seeds, and Mr. W. B. knowing that Seeds of such excellence as are supplied from his Establishment can scarcely be procured elsewhere, quotes in corroboration the following extract from a letter just received from Lieut. Col. E. Bodian, Honorary Secretary of the Agricultural Society of Mysore, Bangalore.
"We have been sorely tried with Seeds, sent us as Novelties and best kinds. I have found the sealed packets sent us, bearing your name, are out and out the best we get."
CATALOGUE of SEEDS, just published, with everything priced, can be obtained by enclosing 12 stamps.
Establishment for New and Rare Plants, King's Road, Chelsea, London, S.W.

HOOPER AND CO'S GENERAL CATALOGUE is now published. It INCLUDES PROBABLY MORE BONA FIDE MATTER, and a larger variety of genuine subjects, than any other published in Great Britain.
It ENUMERATES NATIVE SEEDS from various parts of the world, several from hitherto unexplored districts, and therefore not yet described in Botanical Works.
The SEEDS OFFERED are UNADULTERATED, and as cheap as those of any House which sends out good articles.
The KITCHEN GARDEN SEEDS are of the very finest quality, and sent carriage free to any part of the Kingdom.
All FLOWER SEEDS are sent free.
Hooper & Co.'s GENERAL CATALOGUE for 1869 (referred to above) is published at 6d., and gratis to all Customers.
Hooper & Co. have no connection whatever with any other Seedsmen of the same name, and the only place where their genuine Seeds can be obtained, is at their Retail Seed Warehouse in Covent Garden Market, London, W.C.

WITH LIST OF IMPLEMENTS AND OTHER GARDEN REQUISITES,

Is now published, and will be forwarded Post Free on application.

ROYAL EXOTIC NURSERY, CHELSEA, LONDON, S.W.

NEW HYBRID PASSION FLOWERS.

PASSIFLORA MUNROI, and PASSIFLORA LAWSONIANA

(Fully noticed and described in the Gardeners' Chronicle of December 12, 1868, p. 1233).

PETER LAWSON & SON

Intend to send out the above-named charming Climbers, for the first time, early next May, and are prepared to book orders for

Plants at 21s. each, with the usual discount to the Trade.

EDINBURGH AND LONDON.—January, 1869.

TACSONIA ERIANTHA (WOOLLY-FLOWERED TACSONIA).

A noble plant, resembling in habit and colour of flower the well-known T. mollissima, from which, however, it differs conspicuously in the white under-surface of the foliage and long bracts. As a Greenhouse or Conservatory Climber, it rivals the T. mollissima, and is as free a flowerer. (Vide "Curtis's Botanical Magazine" for January, Tab. 5750.)

PETER LAWSON AND SON have been fortunate in acquiring the Stock of this splendid Climber from James Anderson Henry, Esq., F.L.H., and intend to send it out simultaneously with their new Passifloras

Orders for Plants will now be booked at 21s. each. Trade allowance as usual.

EDINBURGH AND LONDON —January, 1869.

CAREFULLY SAVED GARDEN SEEDS.

ARTHUR HENDERSON & CO.'S

CATALOGUE of choice VEGETABLE and FLOWER SEED NOVELTIES

Is now Published, and can be forwarded Post Free on application.

The VEGETABLE SEED SECTION contains—

Selected LISTS of the best varieties of each kind most worthy of cultivation, also some excellent new ones of both VEGETABLE and FLOWER SEEDS of sterling merit; attention is also directed to the Pine-apple Compact-top BEET (the finest and richest flavoured variety extant), carefully saved, true from the original stock. Also the new DWARF WATERLOO BEET top leaves rich metallic crimson; growth true, even, and regular. The beautiful foliaged variety may with advantage be cultivated in the flower garden as a border, ribbon, or edging plant, its root is a true larger than the Pine-apple Compact-top, flavour excellent, full of sweet saccharine juice, colour crimson, texture tender and uniform throughout.

The FLOWER SEED SECTION contains—

Imported GERMAN FLOWER SEEDS in Collections, Choice Strains of FLORISTS' FLOWER SEEDS, a careful LIST of FLOWER SEED NOVELTIES of the season; HORTICULTURAL REQUISITES of every kind, KNIVES, PROTECTING MATERIALS, HORTICULTURAL MANURES, &c., &c.

N.B. Everything in this CATALOGUE is Priced.

PINE APPLE PLACE, MAIDA VALE, LONDON, W.

July 19th to 24th, 1869.

THE ROYAL HORTICULTURAL SOCIETY'S GRAND EXHIBITION at MANCHESTER.

in connection with the SHOW of the ROYAL AGRICULTURAL SOCIETY Amongst various Special Prizes.

A SILVER CUP copy of the famous Colima Cup, VALUE £21 will be offered by the Proprietors of the

GARDENERS' CHRONICLE AND AGRICULTURAL GAZETTE for the best COLLECTION of 6 FRUITS and 8 VEGETABLES, to be made up as follows:

Table with 4 columns: Good, Medium, Inferior. Lists various fruits and vegetables like Grapes, Apples, Peas, etc., with corresponding marks.

This Prize is open for Competition amongst Amateurs and Gardeners of private gardens. The Fruit and Vegetables produced must be of the Exhibitor's own growing, and any article otherwise obtained will disqualify the Collection. It is expected that the several articles will be neatly and effectively displayed. In awarding the Prize, Marks will be adjudged according to the above scale, for the several subjects produced.

The Gardeners' Chronicle.

SATURDAY, JANUARY 23, 1869.

MEETING FOR THE ENSUING WEEK. Monday, Jan. 25—Entomological Anniversary.

THE second "interim Report" on the ADULTERATION OF SEEDS issued by the Sub-Committee of the Royal Horticultural Society, and published in our columns at p. 27, after dealing generally with the question of the vitality of seeds in its relation to their adulteration, goes on to exhibit in a more elaborated form the alleged evil practices its aim is to expose, it shows the injurious influences incident thereto, and closes with some practical suggestions in the way of doing away with these malpractices, and thus obviating their unjust consequences.

The Sub-Committee appear to be fully justified in asserting that in "so far as they have heard, no exception has been taken by any one to the statements in their former Report. They understand they are admitted to be a fair and moderate statement of facts, so far as they go." Anything approaching hostile criticism of the Report, has not been directed either to a denial, or to a justification of the practices alleged, and admitted to prevail in the seed trade, the tendency has rather been to evade the main question by eulogising the high character of the dealers in general. The seed trade has had ample time and opportunity to rebut (if possible) the charge made against it in the Report, but it has not done so, though at the same time its silence should not be arbitrarily construed into an admission of guilt. Certain it is, however, that those of its members who have taken a part in the discussion clearly admit the prevalence of culpable practices. Still it must not be forgotten that there are, according to the Report, a few houses who do not adulterate their seeds, "and which are struggling (almost) single-handed against the overwhelming preponderance of those who do."

Before proceeding to criticise the details of the second Report, it would seem to be necessary to caution the Sub-Committee not to hazard statements except they are fully convinced they are in the main correct. It is not too much to assert that from the very constitution of the Sub-Committee its members cannot have had any very great personal knowledge of the subject

before the frosts of spring, when the vessels are

possible to or

Beech and Oak... May frost... thousand in a common winter... was in position the worst possible to resist frost.

I also send... a few trees worked on the Pommier... and you will see, that although they were transplanted last April...

I shall conclude my defence of a very useful tree... saying that when I was asked whether I considered the said stock hardy, his answer was: "Certainly!"

It therefore is not often that Apples grafted upon the Pommier... I never find mine do so, neither do Pears grafted on Quinces...

GREEN'S PATENT HOT-WATER BOILER

Among the many new forms of boiler, that invented by Messrs. Green, of Leeds, seems to me to be one of the most promising.

The following are some of the advantages which this new boiler possesses... 1. It requires no brick-work...

during this short time little or no harm to the most tender plants, even during frosty weather

Mr. Green has thus, I believe, conferred a great boon on amateurs, and those whose means are limited, by affording a means of heating at a large or small pace with a very small quantity of fuel...

The boiler at Kensington is 4 ft. high, and 2 ft 4 in. in diameter, and has upwards of 1000 ft. of 4 in. pipe attached to it.

doors almost continual... it is quite fair to assume... more than double the work it has to do if required. Mr. Eyles reports that he cannot tell what its capabilities really are...

PINE-APPLE CULTURE. CUTTING DOWN

I HAVE latterly observed some correspondence in the Gardeners' Chronicle respecting the so-called "cutting down" or "cutting over" system of inducing the fruiting of Pine plants.

It would appear, from the explanation your correspondents give of this system, that their practice is not yet quite up to the mark as to fruiting Pines to a certainty with, according to the season of the year from 10 to 16 months' growth...

I will endeavour, for the information of your readers, and as an old Pine-apple cultivator of above 30 years' standing, to relate some facts in illustration of the subject, leaving them to draw their own conclusions. Fifty years ago Pine-cultivators were few and far between, and very different were the conditions we had to contend with, compared with what we have had for the last 30 or 40 years.

one of the numerous trees... Mr Day's nephew... and to science, by the gentleman

APPLE STOCKS.

COX, alias P. M. paradisica, or Paradis of the French, and the Paradise of the English cultivators, for our little hardy tree, I think it has had its origin in the mountains, on which it is found at elevations, and mostly in damp or wet spots, getting a continual supply of moisture melting above it.

Gerard, in his "History of Plants," mentions "a great kind of sweet Apple, called the Paradise Apple, which bears the Apples very early in the year. Can there be much doubt that this was the Pommier de Paradis to London, but before the Pommier de Paradis to London, but before the Pommier de Paradis to London...

When living in Paris I have seen thousands of trees worked upon it as a stock... I had never heard any one complain that the trees were tender or that the trees refused to grow when they were got up a year or two ago by two or three...

spontaneously, or rather by accident; nevertheless, from all appearances, there is a strong presumption that my spores must have germinated, and may possibly have been physiological or horticultural fruit. Would it not be possible, by the process I have described, to get some mushrooms freely in our fields and meadows in any soil? We can procure the spores, in any quantity, at any season, in the peculiar condition in which they take root and grow in the fields; and there, I think, they would be more likely to be preserved, than if they were artificially prepared, and sent through the Winter, should not have a chance of growing when sown in the garden. I have seen several of my mushrooms, which have been preserved for all the dangers of six months of unwholesome weather. With a handful of the prepared spores, one might inoculate a whole pasture with the same.

Waterford newly carried out on this system. I agree with my friend Mr. McDonald, that the plan in clumps through the woods is by far the best; besides, it tends greatly to curtail the expense, at the same time giving equal, if not better, results. I have seldom known hares or rabbits to do any material injury to the Rhododendron ponticum, but sheep, should they break through, will turn up their noses at them, and look for something more palatable to their taste. The simplest and cheapest plan is to have the ways and means of raising seedlings is to buy a quantity every year, say at from 1s. to 2s. per 1000; plant them in nursery ground for a year or two till they get strong, planting in the woods the same quantity of stronger plants that have been bought. I have been adopting for several years a very simple and cheap plan of getting up underwood with common Laurel, viz. when cutting down overgrown wood, which I do in quantities every year, in place of sending them to the fire or rot-heap, I have them planted in the woods, and in the same way I have planted the pruned branches of the laurel in the holes with the soil, tramp, and chip the tops to the ground. This process succeeds best when done before Christmas. I seldom have a failure. Your readers will no doubt have tried the same plan; it is not new, but is certainly worth adopting. *A. R. Castleboro, Enniscorthy.*

Garrya elliptica.—I am surprised at seeing so few of this beautiful and curious shrub in gardens. I have seen it in several soils or sites, or are too crowded in general, otherwise any one seeing it in this mild season, would assuredly have more. Here (40 feet above sea) the plant is like a fountain; its catkins are 5 to 6 inches long, appearing like falling water; it is not more tender than the Myrtle, and stands wind-storms that will not, but it cannot endure the drip of rain.

Grape-growing and Ivy on Trees. Will any of your readers have tested the "sentry-box" system of growing Grapes be kind enough to state what is the success of the system? Also, what varieties of Grapes are best suited to it? I should also be glad to hear any opinion as to the injurious effect (if any) of the growing closely round the trunks of trees. I have a very large Pine tree, with Ivy nearly up to the top 40 feet high. This autumn the foliage is turning brown and I fear the tree is dying. May it be attributed to the Ivy, and if so, is it too late to save it by cutting the Ivy off? *John Fryer, Manor House, Chertsey.*

Camellias Outdoors.—I have this day, January 11, counted 49 blooms on one plant of the Saccol nova Camellia. It is planted in a south-eastern aspect. There are also some Rhododendrons here in full bloom. *Hamilton, Cr., Tweed House, Symington.*

The Calville Blanc Apple (White Calville).—Mr. Rivers has written from France, and has had some of the Apples in the present time to send me. I have seen them, and they are very good, and without any redundancy. Various remarks have been made on the elegant degree, I saw a specimen, and find the following statement in the *Gardener's Chronicle*, p. 140. It occurs in an article, specially relating to the Calville Blanc, by Mr. Rivers. In it he relates how he used to hear its merits extolled by French cooks, and "but like most of us English I felt that a French Apple could not be compared to ours, and told them so. It is only within the past few years that I have been compelled to think as they do, that the Calville Blanc is the finest of all Apples for kitchen use." Then he tells us to grow and how to cook it, and declares that they "give out plenty of juice, are most delicious, and become a perfect pudding." These passages need no comment. I can assure you, that I particularly, finding that its fruit was so good, and that many people were under the impression that it came from some paradisaical climate, I showed how it may be grown to perfection in our gardens, not only in a flat, but in a really good (Calville Blanc) soil, and also of the American ones will be found high and improved by the same mode of culture. Indeed for none of the finer American Apples is the system worth adopting, if the splendid Calvilles and Renettes that

we may see in London are to be considered worth less. *R. R.*

Double Grafting.—I find that Mr. Rivers states, in his last edition, how that double grafting had been introduced into use long ago, and that it had been carried out by the Rev. T. C. Bréhaut states in his Report, printed separately "by special permission of her Majesty's Commissioners, that double grafting is a well-known practice abroad, though its advantages are obvious and great." Seeing that this was unjust to the nations who, however far behind us as horticulturists in some respects, are certainly expert in all matters of fruit-tree multiplication, training, and culture, I simply told the truth about it. When in the last of youthful enthusiasm about British horticulture, I told several experienced French fruit-growers and nurserymen about the double grafting of Pears, they were all surprised, and one was cruel enough to point to a wall of old Pears double grafted beside the spot where we were standing. From the *Gardener's Chronicle* (p. 7), I now learn that Mr. Rivers' knowledge of double grafting is now common in France with a few of the intelligent nurserymen, though the observation as to its not occurring there occurs in his book issued a few weeks ago. *W. R.*

Mealy-Bug on Pines. Mr. Barnes says in his book of mealy-bugs, and young brood of the mealy-bug, and that it is to be destroyed. Mr. Barnes says in his book, that he was once tricked with a mountebank's powder, which he says he used to be cured by applying in that shape a second time; and he is so zealous to run rough-shod over all such ideas as powder recipes, misquotes my paragraph by stating my remedy was to dredge the dust into the eyes and throats of the insects. It would appear that Mr. Barnes repudiates all idea of effluvia or gases being detrimental to animal life, although I have no doubt he frequently uses gases himself for the destruction of insects. I remember once reading in the *Gardener's Chronicle* an account of the destruction of insects by brushing Laurel leaves and scattering the dust about the house. This success was attributed to the dust, and not to the gas contained in the Laurel. Mr. Barnes says, how those bugs, snugly nestled in various fissures, and out of sight, are to be reached? I presume that every fissure, however small, is permeable to gases, consequently the atmosphere in the house is charged with vapours poisonous to the insect. Goldsmith, who was no mountebank, in his "Animated Nature" states that the seeds of Staphisagria Larkspur, and Tobacco, reduced to powder, will destroy certain disgusting insects, although no mention is made of dredging the eyes or throats of the vermin. But have we nothing to relate concerning the efficacy of the Walnut in the destruction and dispersion of insects? Goldsmith says, the bed-bug will not live in the Walnut tree. In America, where insects, such as the mosquitos, horse-flies, &c. are very numerous, and other insects are much annoyed and injured with flies, that some farmers, until a recent period, have suffered much for the want of a remedy, and this remedy has been discovered in the use of Walnut leaves boiled in water. It was first published in the *Rural New Yorker*, an agricultural paper, published in Rochester, New York. The water in which the leaves are boiled is sprinkled over the horses and the cattle, and all insects, I am told, are either destroyed or dispersed. My friend lost an excellent horse a short time before he heard of the recipe, from what is called the bed-fly. It is possible, as I have mentioned above, that frequently in the house the horse is troubled by having the affected parts, receive the dew on its legs, and this frequently produces the insect, which is sent down to the stomach, where it may cause some inconvenience. I have now stated all I know about Walnut leaves, and in conclusion, I do know that I was unfortunate as to have a numerous brood of the cotton bug on my Pine plants at Chertsey, and I can prove by the evidence of Mr. Bréhaut, son of the late Mr. Bréhaut, of the Park, who had the honour of recommending me as a gardener to my late employer, that no such insect as the cotton-bug was about the place when I left. If the Walnut leaves did not destroy or disperse the insect, then they must have left their own seed. I will leave this question for Mr. Barnes to solve. *Joseph Hamilton.*

Plants in Vinerias.—"Signa" is neither the Alpha nor the Omega that will have to labour under the difficulty of growing grapes and plants together. No great difficulty either. But, to bring them both up to a standard of excellence, when thousands of plants have to be sheltered during winter, and not a few grown along with the Vines in the same, is a good many heads' Signa. If Signa is a gardener whose employer wishes him to concentrate all his energies in producing sensational Grapes, he ought to allow him the privilege of giving the plants, to a great extent, their own space in the vinery. Otherwise he may expect to be disappointed in the results. Certainly exceptional cases may occur, and it will be chiefly found where the Vines are in the full glow of youthful vigour and able to hold their own for a year or two, but to continue to grow and to huddle together a lot of miscellaneous plants, year after year, in a vinery, however expedient is a course adapted for the full perfection of either. There are two vinerias here, each 50 feet long by 17, and for the last 25 years they have more or less been also occupied with plants. At the present moment they are both crammed as full as possible. I shall soon start the early house, and everything that is in it, with a few exceptions, must come out, and be stowed

away, goodness knows where. At the same time, the late one has a goodly number of bunches waiting, but from the crowded state of the house, and the water that is required, the scissors have often to be applied, so that the bunches are becoming scanty and every day I have to see some bunches that have been extended two months longer. As it is, I am sick of seeing the remnants hanging, and care not how soon the work of destruction is ended. The houses are heated with hot water. The Vines are planted in an outside border, which is covered with long litter and a few old lights on the top. The early house contains Black Hamburghs, Black Prince, and Muscat of Alexandria, and for the last three years they have done very well. I generally recommend a little about the latter end of May, with Azaleas, Camellias, from the 10th to the 15th, and a lot of other hardy plants have to be sown by the Vines under the Vines. From the foregoing it may be inferred that I have too many plants and too little room, not an objection that with which I am not prepared to contend, and from the great number of plants housed in the late vinery the season is very much shortened, and greater attention is required in keeping the Vines in healthful vigour, with so many insect-hot-beds are in the close proximity, and, as it would be next to an impossibility to produce sensational bunches from those Vines. But as a balance, my employer is quite as well pleased to see bunches from 1 lb. to 3 lb. in weight and plenty of them, as he is those of heavier calibre. Nevertheless, I look to go to a great show now and then, and feast my eyes on the productions of my more favoured neighbours. *Brassica, Read Hall, Whalley, Lancashire.*

Potatoes.—I commenced Potato-planting Jan 1, and I shall keep on till I have finished. I do not hold with "chumping" Potatoes, especially Kidney sorts, and therefore, as they are growing out fast, I plant. I am planting mostly with a stick, and I am induced to do so for two reasons—firstly, because they come up more regularly so planted; and secondly, because the stick leaves an artificial drainage under the roots, which, in case of heavy falls of rain this next season, may be serviceable. As regards the quality of last year's Potatoes I may say I never ate better. I am not yet "an old donkey." By letting the Potatoes stay in the ground till the super-tubers were ripe I gained quality, and lost in numbers. I would, however, rather have 12 good eating Potatoes than 24 bad ones—squashy, waxy, and tasteless. I have just finished the super-tubers of the Lapstone, the York, and the Kidney, which I have planted in the York, and the York, which I gave to Mr. Fenn, who won a special certificate with it in London as a cooked Potato, is a hybrid, by grafting, of the Lapstone and old Ashleaf. With such parentage, it is no wonder that it is so good. I have had it ever since it came out, and it has always acquitted itself nobly. I spoke of it in the *Chronicle* as I believed, never ever its raiser, Mr. Almond, blew a "tugue." I cannot get up a stock of it, because it is so great a favourite that all comers fill their jackets for seed, eat them up, and then write, "They are stunners; send me some more, there's a good fellow!" "D." of Deal, went off with Hero, Gryffe Castle seedling—the best of the Regents—and the Early Uprights, a most first-class Potato, apparently an early and superior Fluke, and then, having eaten them up, wrote for more, but I am not "an old donkey," he must wait till next planting time. I have sent one tuber each of the Early Uprights—a fine specimen—and of the Peach Potato—a first-class round (I think the American raised) to Mr. Fenn, and I am sure that he will be pleased with them. I have also sent to Mr. Farmer 24 Heroes, and 12 of Taylor's Yorkshire Hybrid, and unless he grows the Lapstones he may not get better. Next year he must have the Early Uprights, the York, and the Peach Potato, and then we will have my best, and good enough for anybody. I am sure that you will get from Mr. Fenn (King of Potatoes) that he has succeeded after 30 years' persevering labours, in winning a First-class Certificate for a collection—some of them his own seedlings—at Kensington. He says in his letter: "I selected Taylor's Yorkshire Hybrid, Yorkshire Hero, and Fenn's Orleans as the cooking test. Hero won by several nocks. The Committee awarded it a First-class Certificate, and right honourably so. It certainly is the Potato of Potatoes, and the country must thank you for bringing it out." Taylor's Hybrid is a saviour Potato, with longer stalks and more flowers. Hero has short bushy stalks and white flowers, but is quite equal to it as regards quality and flavour. I wish I hope Mr. Fenn and other Potato raisers will turn their attention to late-keeping Potatoes. There are several of good "second earlies," but with the exception of the deep-eyed Gramma and Salmon Kidney—formed like a Jerusalem Artichoke—I have none that keep good till the Royal Ashleaf comes in. Whether the Potato be round, or kidney, or lantern shaped, I want, be its colour white, purple, pink, red, or mixed, a late first-rate Potato with uniform shape, good surface, prominent eyes and a good cropper. Here is a nut for Mr. Fenn to crack. *W. F. R. R. R.*

The Camellias at Bicton. Having had the privilege of seeing the beauties of Bicton last autumn, my impressions of which, I trust you will soon be able to give to your readers, permit me to inform all that Mr. Barnes says (p. 62) about the marvellous health, luxuriance, and inflorescence of these splendid plants, indoors and out. Nothing could exceed the freshness of their dark glossy leaves, nor the abundance and beauty of their blossom-buds. I felt then as I do now, that it was worth the journey from Hardwicke to Bicton—and it is a long one—to see those splendid plants alone. And in the recent dark days I have often con-

as the ubiquitous and excellent *Cupressus Lawsoniana*, Chinese and Siberian Arbor-vitæ, Hemlock Spruce in high health, and *Cryptomeria japonica* and Lobbii, which both do far better than *Taxodium sempervirens*, and there were plenty of them to take observations from. In fine, it was a pleasure to see the whole grounds under systematic management, the extent and variety of the articles under cultivation and the good order which was everywhere manifest. J. A.

Obituary.

WE regret to announce the death of Mr. JAMES BACKHOUSE on the 20th inst. at his residence, Hillside House, near York, in the 74th year of his age. Mr. Backhouse was the senior partner of the eminent firm of James Backhouse & Son, nurserymen and seedsmen, York.

Miscellaneous.

Covent Garden Notes.—During the past fortnight there has been a good supply of Broccoli sent to Covent Garden Market from the neighbourhood of Penzance, Cornwall. This comes packed in large open hampers, and when not delayed in transit, arrives in good condition. The principal flowers produced in quantity during the above period were Primulas and Hyacinths, which are chiefly obtained from the localities of Isleworth, Barnet, and other places near London.

To Make Paint Adhere to Zinc.—It is difficult to get a coat of paint to adhere well to zinc, which rapidly oxidizes when exposed to air and moisture, and as most engineers know galvanised iron goes very quickly when once the covering of zinc has decayed. Many means have been tried to obtain the firm and close adherence of paint to zinc. The last we have met with is due to Dr. Böttger, who professes to have completely succeeded. He makes a solution of one part of chloride of copper, one part of nitrate of copper, and one part of chloride of ammonium in 64 parts of water and one part of commercial hydrochloric acid. This solution acts as a sort of mordant. It is put with a wide brush over the zinc which is immediately beset with a deep black colour forming according to the Doctor a basic chloride of zinc, and what he calls an amorphous brass. The black colour changes in the course of 12 or 24 hours to a grey, and upon this grey surface any oil paint will dry, and give a firmly-adhering coat. Summer heat and winter rain will have no effect in disturbing this covering which affords complete protection to the zinc. *Boulder*

Garden Operations.

(For the ensuing week.)

PLANT HOUSES.

Gardenias are plants which will endure much hard forcing, and, by treating two or three batches differently may be had in bloom almost every month in the year, as almost every matured shoot will produce flower-buds. Those who wish to have flowers early may have them by placing the necessary quantity of plants into a warm moist temperature. Few plants even evergreens, will endure so much strong, unwholesome steam as these. A bottom-heat of from 50° to 90° may be freely afforded them, using for this purpose strong steaming horse or stable manure, with an upper temperature some 10° less produced by properly studied gradation than that in which they have previously been standing. *Cape Pelargonium* intended to make the finest specimens, should now have their final shift, within a week or two. Particular study should therefore, be given to the preparation of soils to form a compost for them. Like all other plants grown in pots, they do not succeed thoroughly unless the pots have become well crammed with roots, previous to the formation of flower-buds. Hence, as they are not very great rooters, small pots are essentially necessary. And the best possible compost should be obtained for filling them good hearted yellow, friable, fibrous loam, with one part of thoroughly decomposed manure, not too moist, and a good sprinkling of silver sand, well suit them well. The whole should be well incorporated, and after a good drainage has been insured, they should be potted firmly. It often happens, when giving such small shifts to plants, that the whole space between the ball and the inner sides of the pot are not uniformly and evenly filled. To obviate this evil, and to be certain that no vacuum exists, it will at all times be necessary to use a thin with about half the thickness of the fingers, and with which the soil should be forced well home. Besides the loss of valuable space, caused by carelessly performing this operation, at watering the ball is not uniformly moistened, as the water will flow more freely through the lightly pressed portions, leaving that which is properly finished off hard and dry. The temperature in such Pelargonium houses should now be raised about 5°. Insure a maximum of 55 by night. Place them constantly as near the glass as possible, and keep them perfectly free from green fly and all similar pests. The continued damp, unwholesome weather will have taxed the efforts of growers of specimen soft-wooded plants. Increasing attention is still needed in the removal of every particle of decay. My previous advice regarding the occasional use of slight fires has greater force the longer this sort of weather lasts. It should be thoroughly understood, however, that it will do more harm than good to make the pipes or flues so hot as to dry the house and plants that are contained therein by sheer force of heat alone, for, were it possible to do so, immediately the heat declined the dense moisture contained in the external air would find its way through every aperture and be condensed, thus making the matter worse instead of better, and unnecessarily putting the plants to undue excitement. When slight fires are necessary, let them

be such as will insure to the air a greater buoyancy only such, in fact, as will cause it to rush out at the apex by its own force carrying with it a fair proportion of the moisture from within.

FRUIT HOUSES.

Pines which may have fruit set, and which are beginning to swell, should now have a uniform temperature of 50° to 55° by night, with an increase of 10° to 12° by day which will bring it up to 70° or 75°. A more moist growing atmosphere should be insured and a moderate amount of air only be afforded for a time. Shut up these soon after noon and secure a little sun-heat if possible. Be very careful not to permit draughts in any form on to the delicate Pined berries. Though no injury may be perceived from such carelessness at the time, a certain amount of mischief is certain to follow. In regard to *Pines* little can be added to past advice, given in former Calendars. As the potting season of some successions will soon arrive, it may be well to remind the reader of the necessity of procuring the necessary soil, and placing it to dry in proper positions, chopping it up, &c. Continue disbudding the earliest *Peach* and *Nectarine Trees* as soon as the fruit begins to swell, and young wood shoots are forming, increase the temperature by some three or four degrees by day in light weather, but with due caution not to have recourse to any excess which is likely to cause undue excitement, or to make forced growths beyond the capability of each plant to mature at such a period.

HARDY FLOWER GARDEN.

The present season with its extreme mildness and much moisture, greatly favours the formation and growth of every variety of parasitical Moss or Fungus. I notice that *Gibberula Arborescens*, and many other deciduous shrubs owing to the evergreen *Rhododendrons*, are in some situations over-run with such growths. That these are very injurious I scarcely need add. It will be well to give all that are attacked therewith a good dressing with wood-ashes, properly prepared by sifting, &c. Scatter it well into and amongst the branches at a time when they are wet, and the ashes are likely to adhere. Where wood-ashes are not readily procurable, a slight dusting with dry lime, which has been slaked a few days previously, will also prove destructive, but must be used with greater caution, especially upon evergreens. In cold, moist, tenacious soils, it will be advisable to stop all digging operations until such time as the beds, borders, &c., become drier. This is excellent weather to re-lay and to level irregular lawns, and any work of this kind in contemplation should be pushed forward with vigour.

HARDY FRUIT GARDEN.

The present weather is all that can be desired for all newly planted trees, so thoroughly have the contused rains washed down and settled the earth around the roots. Should a moderately dry period ensue, it will be advisable to level the soil in instances where it may have settled down irregularly, thus causing water to stand after heavy showers, which would quickly be absorbed and carried off if the surface were level. Keep a sharp look-out at this particular time after winged pests. So tender have the buds become upon bush fruit, and in many instances so prominent, that the birds are already mutilating them. Besides the many ordinary ways of keeping them away, resort may be had to dipping worsted-thread in spirits of naphtha and tying it in short lengths equally distributed upon each bush.

KITCHEN GARDEN.

Relishes may, if the weather continues mild, be sown in very warm southern situations with a fair prospect of success. Sowings should also be repeated upon slight beds of fermenting material, and under lights placed upon a south border. Continue to turn over and to sweeten the necessary heap of material upon which *Cucumbers* and *Melons* are shortly to be planted. It must be perfectly sweet and free from any impurities, which are readily detected. Everything in the way of *Cauliflowers*, *Talluces*, and the like, under frames or hand glasses, whilst they may be protected from excessive superficial rains, must however be afforded plenty of fresh air by day and night, by tilting the lights, &c. Even with the slight protection thus afforded, and with plenty of air allowed, they begin to look very weakly. If any amount of confidence could be placed in the weather it would do them much good to remove all frames or glass quite away from them for a week or so, allowing the air to blow freely amongst them on all sides, and so harden them a little. *W. E.*

TOWN GARDENING.

FROM some cause, possibly from the want of a knowledge of what will grow successfully in confined places, no trees are to be seen in many of the squares and gardens of London, with very few exceptions, but the common *Lime* and *Poplar*, and these in a very starved and miserable condition. The managers of our public parks have of late set a good example by planting many beautiful and rare trees and shrubs, which thrive well, though they are not entirely out of the reach of smoke. Of course they are better situated than those in squares and gardens in the heart of the town. As fresh soil in sufficient quantity to plant in may be obtained, it is quite certain that, with due care and attention, many trees and shrubs may be grown in all the squares, and not a few in the most confined localities of large towns. In the first place, it is of the utmost importance that the trees to be planted in such places should be young, and if they have been previously transplanted once or twice in the nursery so much the better, as they will then remove with more fibrous roots. When they are removed from the nursery they should be lifted with as much mould around their roots as possible, at the same time, as much fresh soil should be obtained as will be sufficient to plant them in. In planting, the

soil should be carefully distributed amongst the fibrous roots, and be trodden firmly down. They should be firmly secured with stakes, to prevent the mud from disturbing their roots. A good water or shower should be given, repeating the same on a second day, as the plants have well started into growth. I consider the end of February the best time for planting, inasmuch as they start better than when planted early, for they get coated with soot. These precautions should be carefully attended to, for on them depends the success of most trees in towns. Rotten leaves and long weeds of great service to shrubs planted in towns, if desired, as shallow as possible, so as not to disturb their roots. In my next I will give a list of some of those trees which are best calculated to answer the purpose in view.

STATE OF THE WEATHER AT CHISWICK NEAR LONDON For the Week ending Jan 20 1891 as observed at the Hort. Station.

January	TEMPERATURE							
	Max	Min	Max	Min	Mean	Lowest	Highest	
There 14	3	29.90	29.57	49	34	41.5	44	51.1

GREENHOUSE MANAGEMENT.—F. V. T. writes: "I have a greenhouse in which I grow a variety of plants. It is very warm in winter, and I have a fire in the house to keep it warm. The most fertile plants are those raised in cuttings. For outdoor culture these are best propagated in January grown in a genial temperature and having off for planting out as soon as the weather permits. I put a few against the back wall of an interim house, which probably keep up a continuous supply. You had better sow your seeds at once."

GLAZING PLANT STRUCTURES.—H. W. N. who sent us a paper on this subject in October last, will greatly oblige us by forwarding us his address.

J. C. Wheeler & Son, beg to caution the Trade against inferior and spurious varieties.

J. C. Wheeler & Son, Seed Growers, Gloucester, and 65, Mark Lane, London, E.C.

Wheeler's Little Book for 1869. Price 6d., post free.

"Wheeler's 'Little Book' is an agreeable and instructive companion."

"Wheeler's 'Little Book' is now a household word in many establishments, and is regularly looked for as the Almanac."

"Wheeler's 'Little Book' will do something to satisfy their cravings."

J. C. Wheeler & Son, Seed Growers, Gloucester, and 65, Mark Lane, London, E.C.

FOSTER'S "K.L." FINE LONG RIDGE CUCUMBER.—This new variety is a remarkably fine hardy and dark green cucumber, and one that can be recommended with the greatest confidence. It is very prolific, and keeps its colour to the end. All who have seen it growing are satisfied that it cannot be surpassed, and those who have tried its flavour are convinced of its excellent quality, inasmuch that the small quantity of seed per packet of 1/2 seeds, is

EXTRA FINE NEW HYBRIDIZED PETUNIA.—Saved from the best large crimson, blotched, striped, and pencilled varieties. Price 1s. and 2s. 6d. per packet.

DIXON'S MAMMOTH WHITE CELERY, per packet 1s. **DIXON'S YORKSHIRE HERO PEA,** per quart 2s. **FOSTER'S EMPEROR, fine frame CUCUMBER,** per packet 2s. **LONG'S FINE DIXON,** 67, Queen Street, Hull.

THE NEW FORAGE PLANT, BROMUS SCHROEDERI.

See *Gardeners' Chronicle*, page 1345, Dec. 26, 1868, from which the following is extracted:—"The crop (of Bromus) was perfectly satisfactory as regards both the quantity and quality of its produce. *The Horsekeepers buying it preferred it to Italian Rye-grass, and the Farmer selling it was very much inclined to agree with them.*"

E. DAWES, Esq., *Parbright, Guildford*, writes:—

"I beg to offer my thanks to Messrs. CARTER & Co. for calling attention to the valuable plant, *Bromus Schroederi*. I purchased some seed to test its value, and it occurred to me that a report of my experience might prove of interest.

"The seed was sown in July on ground as dry as dust, but it vegetated freely, the first shower causing it to grow with amazing rapidity. *The first cutting was made October 20, the plant being 2 feet high, and I found my cattle preferred it to any food I could offer them, I now have (Nov 20) a luxuriant second growth, in spite of the cold weather.*"

"I may mention that I was first induced to cut the Grass on account of my Pony refusing its ordinary food, and was gratified to find the *Bromus* greedily consumed."

Sow 35 lb. per acre in drills.

Price 1s. per lb.; cheaper per cwt.

To Landowners, whether Tenants in Fee or for Life, Estate Agents, the Clergy, &c.
THE LANDS IMPROVEMENT COMPANY
(Incorporated by Special Act of Parliament in 1853, advance Money, unlimited in amount, for all purposes of Agricultural Improvement, the whole outlay and expenses being liquidated by a re-charge over 25 years.)
For information and Forms of Application, apply to GRANT LEE R. HYDER, Esq., Managing Director, 3, Parliament Street, Westminster, S.W.

THE GENERAL LAND DRAINAGE and IMPROVEMENT COMPANY.

Directors: The Rt. Hon. Viscount Combermere, Geo. Thomas Clark, Esq., Henry Currie, Esq., John C. Cobbold, Esq., M.P., Edward John Hutchins, Esq., William Tite, Esq., M.P.

J. BAILEY DENTON, Principal Engineer
Works of Drainage of any extent, Irrigation, Enclosing, Wood Grabbing, Road-making, Farm Houses, Farm Buildings, and Labourers' Cottages, are executed on all descriptions of Property, whether Freehold, Entailed, Mortgaged, Trust, Ecclesiastical, Corporate, or Collegiate, or Leases granted for the purpose to Landowners who desire to execute the works by their own agents. Tenant-farmers may also, by arrangement with their landlords, procure the execution of the above improvements on their farms at an annual cost to themselves of between 6 and 7 per cent. on the outlay and official expenses. The whole of the outlay in the works, with all official expenses, may be charged on the Estate for a term of years, to be fixed by the landowners to meet the circumstances of tenants. No investigation of title being required, no legal expenses are incurred. Applications to be made to MR. HORACE BROKE, the Secretary, at the office of the Company, 22, Whitehall Place, S.W.

Agricultural Improvements.
MR. BAILEY DENTON undertakes the UNDER-DRAINAGE of LAND at a charge of 6s. an acre, and will supply PLANS and SPECIFICATIONS for Farm houses, Farm-buildings, and Labourers' Cottages with or without Superintendence during Construction, on terms to be ascertained of him at 22, Whitehall Place, London, S.W.

ROYAL AGRICULTURAL COLLEGE, CIRENCESTER.

President—His Grace the Duke of Marlborough, D.C.L., F.R.S.G.S.

Council: Right Hon. The Earl of Ducie, Right Hon. T. H. Sotheron F.R.S., F.G.S., Esq., Edward Bowly, Esq.

Right Hon. Earl Bathurst, Edward Holland, Esq., M.P.

Principal—The Rev. John Constable, M.A., Trinity College, Cambridge.

Resident Professors: AGRICULTURE—John Wrightson, F.C.S., M.B.A.C.

CHEMISTRY—Arthur H. Church, M.A., Lincoln College, Oxon, F.C.S.

ASSISTANT TO CHEMICAL PROFESSOR—Beaumont J. Grosjean.

NATURAL HISTORY—William T. Thiselton Dyer, B.A., late Junior Student, Christ Church, Oxon.

LECTURES ON ANATOMY, PHYSIOLOGY, AND HYGIENE—J. A. M'Brice, Ph.D., M.R.C.V.S.

MATHEMATICS AND SURVEYING—The Principal.

DRAWING—James Miller.

AGRICULTURAL EDUCATION.

The EXAMINATION of CANDIDATES for the SOCIETY'S EDUCATIONAL PRIZES will take place in the week commencing MONDAY, April 12, 1869. Copies of the Form, required to be sent in by March 18, may be obtained on application to

H. M. JENKINS, Secretary, 12, Hanover Square, London, W.

The Agricultural Gazette. SATURDAY, JANUARY 23, 1869.

SPECTATORS have a better idea of the contest, and can better see the field on which it is being waged, than those who are actually engaged in the fight. Whether that be the true explanation or not we cannot say, but there is a marvellous contrast between Lord GRANVILLE'S survey of the subject-matter with which agricultural progress is just now concerned, which is reported in another page, and that which one gathers from a report of the last general meeting of the Royal Agricultural Society of England. The fact that, let the skill of the agriculturist and the artificial fertility of the soil (which, after all, are the two great divisions of the subject with which agricultural societies have to deal)—let these be what they may, their produce from the land is being in some districts eaten up by rabbits and hares—the other almost equally important fact that the manure from at least one quarter of the live stock of this country is being absolutely wasted, and never reaches the land at all—those relations of the land to the great natural fertilizer which are involved in the words land drainage and deep tillage—the business and social relations sustained by the farmer with the landowner on the one side, and with the labourer on the other—his own appropriate education and that of the people he employs—these were properly displayed and urgently represented last Saturday at Shrewsbury as the topics on which Chambers of Agriculture ought to bring their influence to bear. At the last agricultural meeting in Hanover Square, on the other hand, one of the two annual meetings held there by the Royal Agricultural Society of England, after the discussion of a purely domestic subject had concluded, the topics to which the meeting directed their attention were, the proper shoeing of horses

been a good farmer's year, Barley, spring Beans, and Oats having been light crops. My profit as a tenant-farmer (after paying my improved rent of 40s per acre) will this year be only 17 12s per acre, or 43 per cent, while last year it was 37 0s per acre or 93 per cent. Let us hope for better times.

It will be seen by the annexed balance-sheet that the average profit of the four years is 12 1/2 per cent on tenant's capital, or 32s 11 per acre, this of course, after providing 10s per acre, the improved rent J. J. Mechi, Jan., 1869.

A DISCUSSION ON FAT CATTLE.

THE conditions under which breeding cattle should be fed for show is a subject which regularly crops up from time to time, the intervals being long or short according as the genius or humour of practical men is spurred into activity by glaring cases of deterioration from the abuse of fattening resources. After this question has, however, been taken up and discussed in earnest, there it ends. This is often the result of deliberations which can only end in putting definite conclusions on paper. There is here no line that can be drawn and defined as the certain limit beyond which no one shall go. It is a question which must be left open to the judgment of a minority who are accorded with responsibility at the time when stocks are brought before them to deliberate over in the judging ring or show shed. It is not a question that can be answered by rule, nor with mathematical or geometrical nicety, nor by any form of weights and measures, but it must be determined by that phase of human judgment which is established by established individual experience being disseminated by tedious repetition till the principle becomes general enough to be what is termed "fashionable." As fashions are ever changing, however, we take courage under this view. It is not long since that so many feet of crinoline were considered to be a heaving form of ladies' attire, both indoors and abroad. The exact reverse of distension is now considered to be the pink of perfection or fashion. Stalwart men are, in a mental sense, and in their business, scarcely less credulous or impressible than are the "softer sex," that is, when they are addressed in a manner and by means which they respect, or, as the case may be, in a way which they fear.

These reflections were induced by the revival of the subject of "cattle feeding" at the annual meeting last week of the Royal Northern Agricultural Society (Mr. McCombie in the chair), and the recollection we have of what kind or condition of animal was "fashionable" at our great stock shows 10, 15, and 20 years ago. Mr. Marr condemned the present system. He urged the propriety of drawing a line of demarcation in the feeding of cattle for shows. He thought no animal, above a year old should be allowed to compete that had received anything but common fodder—that is, had been fed on Grass in the summer, and straw and Turnips in the winter. Certain animals might even get too fat for breeding on this, but this would, more than anything else, show their quality. He thought a resolution carrying out this would have a good effect, inasmuch as many animals were destroyed by over-feeding. By the present system they must either give up showing the animals, or must feed them with artificial food, and he thought that such a resolution as he had hinted at would do much good. Of course he would allow any food to bullocks, as they were intended to be fed.

Mr. Leslie pointed out the difficulty of the question, and while he agreed with Mr. Marr's views in regard to the injury done to stock animals, he would not advise the meeting to enter on a resolution. Mr. Campbell fully supported Mr. Marr, adding that the line of demarcation was easily drawn, and he could see no difficulty in confining animals to be shown to the ordinary food of the farm—Turnips, straw and Grass. Mr. Copeman and the Chairman differed with Mr. Marr in regard to the expediency of drawing the line and the effect which would be produced if the line was drawn. Other members expressed their views for and against the line of demarcation, and, as usual, as we have intimated, "the subject then dropped," and in this case apparently without having so much even as any "moral" influence.

Here, then, is the great question raised once more, and brought by discussion to its true bearing and then dismissed as one with which practical men cannot effectively deal. Scotchmen generally take unto themselves the notion that they are essentially men of practice—that they are not only ready to learn but that they can carry out any subject or idea which they have mentally mastered. If this be so, how is it that the leading members of the Royal Northern Agricultural Society, after having agreed upon a question which in their opinion is a very important one, do not embody their sentiments in a resolution which would convey their judgment to the absent members of their own Society, and, "on the wings of the Press," to the members of all other societies? This is clearly an admission of the "moral" weakness of a society composed of practical men that ought to have been studiously avoided. The evil is pointed out, understood, and openly acknowledged, and the conclusion is subsequently declared and promulgated that it is irremediable.

All this we could have understood, if it had occurred in connection with the Royal Agricultural Society of England about the management of which there has of late been so many and just complaints. But let us take the views of this Society, and gather up our recollections in regard to the character of animals which were fashionable there only a few years ago, and compare them with those which are looked upon as the first style of fashion now. It is not long since that blubbery and hairless rumps and flabby backs were the only ones that stood any fair chance of being awarded honours by the Society's judges. Miking qualities were thought

nothing of whatever, but a wet nurse establishment was provided by the Society's stewards, as it was considered to be a necessary institution. We are not aware of any prevalence of this present fashion as set by the Royal Society, is based on the intelligent or reasonable grounds which are commonly supposed to be the basis of a society which takes for its motto "Science with Practice." But we should be doing both the Society itself and our subject an injustice if we did not freely and candidly admit that the improvement in the fashion which has guided judges of late years, has been great, and that its importance has been quite equal to its extent.

Let us not stop at the point. How has this improvement been effected? Simply by the outward pressure which has been brought to bear on the Council and their stewards and judges by practical men—a few fussy, but faithful breeders, and their amateur friends, merged into a current that became compact and nearly all-powerful, and they set the fashion which, even to this day, has inflicted considerable injury on many of our flocks and herds. Their fancies androtchets, however, might at any time have been likened to a house of cards, for no sooner were they blown upon by the breath of more intelligent men, than they were driven out of form never to be again raised to prominence. It is the remedy, however, which has to be applied to a course of evil that becomes expensive, and proves the losses inflicted. To this day this expensiveness and these losses are felt in some cases they have not in the slightest degree decreased. The issue of many animals, both as members of flocks and herds whose parents have a long pedigree, have to be fed on milk and sugar and every delicacy of the pasture field and granary to make them grow to less weight in a given time than more reasonably and naturally bred ones will grow on common and comparatively inexpensive food. This result of judging and awarding prizes at shows is so far the exact reverse of common wisdom. Both the farmer and the consumer wants an increase of lean meat, while nearly the whole tendency of awarding prizes at our principal shows has generally been simply an encouragement to produce a greater disproportion of fat to lean. Hence many flocks and herds have been going the way which the once fashionable Leicesters have gone—to a state of degeneracy which will only produce puny and weak frames that are predisposed to grow much grease and but little muscle. Pigs have gone the same way and many porcine herds which were once fashionable are now used as or seldom heard of.

These data are too well known to need further exposition at our hands, and if the Council of our national society had not been what was at the time aptly termed a "house of cards" they would have been acknowledged in Hanover Square, and practically asserted in the showyard.

Let the Royal Northern Agricultural Society, and similar practical societies, take courage, therefore, and when they have found the evil and dragged it to the surface, by all means let us have the said evil, and the best possible remedy for it that can be devised, embodied in a resolution. Had the Royal Northern Agricultural Society done justice to itself on the occasion in question, other societies would undoubtedly have followed its example, when an incalculable amount of good would speedily have been effected. If this British privilege the proposing, seconding, and "carrying" resolutions—was more frequently done by local agricultural societies, when commonly acknowledged errors are made practically conspicuous, glaring faults of judgment and management would soon disappear. Many of the best practical men in the country hold themselves aloof from Royal and country shows. If these men be right, agricultural prizes, as now awarded, must be wrong. These awards are too often a gratification of vanity, and too seldom an award of commercial merit. Let, therefore, real practical societies go on condemning the faults on which we have touched, and let these condemnations be put into a tangible form. If this be done we shall see as great a change for the better in the character of animals shown in the next 10 years as there has been in the last 10. Even the Royal Agricultural Society may by this time, if it be reformed within, begin to have some appreciation of profit and loss in breeding and feeding animals. Should this much to be desired result ensue, we may then be able to praise its examples as worthy of being followed by local societies, instead of urging local societies to bring their practical knowledge to bear on false and profitless fashions wherever these are to be found. H. W. G.

THE WARM, WET WEATHER.

THAT Christmas is the best time for frost and snow is an old song, the truth of which need not be questioned; but farmers could do well without either frost or snow if they could only make up their minds to thank it, for the too common belief that the former kills insects and permeates the land, and that the latter clothes and fertilises it, is based upon a very doubtful foundation. No doubt many insects perish when taken by surprise, but Nature is no less careful of these than she is of other families, and generally insects are gifted with an instinct, and the means of carrying it into effect, which leads them to penetrate the soil to a depth beyond the reach of frost, or to find some other retreat equally out of the way of harm. As to the drying and integration of the surface soil, the benefits thus produced are greatly magnified, and those which in reality do exist are more than counterbalanced by the injury done by frost to the manure in the land, and the crops which have to stand the winter, as Grass, Wheat &c., and to live stock. That snow covers the ground, and thus protects it, is manifest, but the truth of the argument is its own death

Table with columns: Price of Wheat, Capital, Profit on Tenant's Capital at Tiptree Farm. Rows include various agricultural items and their respective values.

Table with columns: 1865, 1866, 1867, 1868, 1869. Rows include various agricultural items and their respective values over the years.

Table with columns: 1865, 1866. Rows include various agricultural items and their respective values over the years.

REMARKS ON THE BALANCE-SHEET OF 1868. I have received the following notes from Mr Mechi in relation of the above tables. Abundant and extensive Wheat crops, of fine quality and at remunerative prices, had led me to expect a very profitable year, but my expectations were disappointed when I made up my live stock account so that the net surplus of income over expenses is only 53s 12s 6d instead of the 100s 0s 0d of 1867. The failure of the root and green crops, the high prices of purchased food, and the loss of stock account to show a much greater loss than the value of purchased food was probably the cause of the failure of the live stock account. A very large amount of stock was lost, and the loss was not covered by the great increase in the value of the farm. No stock was sold except in prime fat condition, and the loss would have been much greater had not our stock been housed and fed on prepared mangel, and mangel and warm food. In any case it does not appear that the raising of lean stock are opposed to the carrying of fat stock on poor soils like mine. The ordinary season was very unfavourable to light crops, and I have reason to believe that flock and stock breeders on our 22 millions of acres of pasture have suffered severe losses by force of the weather, and by dearly-purchased food being much more expensive than usual, wages have been high and the hard, dry ground has brought down the value of farm implements and vehicles, and thus increased the amount of tradesmen's bills. Although the Wheat crop was good, this has not

tous of dead meat, the whole, with inconsiderable exceptions, going direct to the London market. The year the steamers carried 4553 fat cattle from Aberdeen to London. Let us take the live cattle at 13,000 net, and the value of the wool at 100,000, the benefit of the provincial towns by the way.

It is far of the greatest importance for the farmer to have a good market for his produce. The principal Aberdeen dealers frequently forward as many as 100 to 120 cars, all well packed, and the inferior beef to the London market. The value of the wool is also a great consideration. The average value of the wool is about 100,000, and the value of the live cattle is about 13,000 net. The value of the wool is also a great consideration. The average value of the wool is about 100,000, and the value of the live cattle is about 13,000 net.

The value of the wool is also a great consideration. The average value of the wool is about 100,000, and the value of the live cattle is about 13,000 net. The value of the wool is also a great consideration. The average value of the wool is about 100,000, and the value of the live cattle is about 13,000 net.

number of Agriculture," Earl GRANVILLE said—As far as he had been able to learn, there were only two objections urged against Chambers of Agriculture—it being said on the one hand that the landlords were not interested in the improvement of the soil, and on the other that the farmers were not interested in the improvement of the soil.

The value of the wool is also a great consideration. The average value of the wool is about 100,000, and the value of the live cattle is about 13,000 net. The value of the wool is also a great consideration. The average value of the wool is about 100,000, and the value of the live cattle is about 13,000 net.

The value of the wool is also a great consideration. The average value of the wool is about 100,000, and the value of the live cattle is about 13,000 net. bought than he bargained for. Unfortunately for himself he finds it too late; for, if purchased for a stock bird, he has in all probability begun to breed from it, and will find ugly proof in the development of his chickens. To guard against such frauds is the duty and interest of both committees and exhibitors.

The hatching season of 1869, as far as we yet hear, is a very favourable one, and we hear of better broods than usual.

Obituary.

The late Mr. Hall, of West Firaby Hall, Lincolnshire—The deceased was (the Doncaster Gazette records) for many years well known and universally respected as the land agent of the Wiseton estates, during the lifetime of the Earl Spencer, who was more generally known as Lord Althorp. Under Mr. Hall's able management the whole of those extensive estates were remarkable for their high state of cultivation. At the day of his death, Mr. Hall had some months entered on his 86th year, retaining his intellectual powers unclouded to the last hours of his prolonged existence. He was probably the oldest living life member of the Royal Agricultural Society of England, and there is a very striking portrait of him in the well-known picture (since engraved of the members of that Society. For many years Mr. Hall acted as one of the judges, and not only at the shows of the Royal Agricultural Society, but at all the principal agricultural exhibitions of the kingdom. Mr. Hall's extensive experience, great knowledge of stock, and strict impartiality, caused his services to be frequently sought by the committees of such associations. It was, however, in connection with the establishing and perfecting of the world-famed Wiseton herd of Shorthorns that Mr. Hall's name became more generally known to the agricultural world. Earl Spencer proved his high appreciation of the way which his agent had carried out his wishes and instructions by bequeathing that large and valuable herd to Mr. Hall at his death. After the death of Earl Spencer, Mr. Hall, leaving Wiseton, became the purchaser of the Hesley Hall estate, and resided at Hesley Hall for more than 20 years. Full of years—respected and esteemed by all who knew him, from the peer to the peasant—Mr. Hall has passed away at an age to which few men attain.

Notices to Correspondents.

Asphalt. *Miserable Lard*. Some of our readers may give you further information, meanwhile we beg to say, that asphalt is more slippery than stone or concrete, and while slippery when hard, it softens in hot weather, and wears into holes, which are very difficult to patch up.

Cow-rop. *Cor*. One bushel of distiller's grains, with 40 lb of pulped Mangel, mixed with chaff of hay and sweet straw, and 3 lb of good linseed cake a day, and access to clean water, is a good ration for a cow, as you can have. If you cannot have grains, add 10 lb of Mangel Wurzel, then you must have a bucket of water, and take well to it.

Food for Pigs. *Cor*. There is a saving in pulping roots, and mixing them with chaff of straw and hay. The hard dry food is softened and not wasted, cooked and rendered more digestible, and more voraciously taken in the least the power of picking and wasting its food. That is the only one of your questions that can be answered confidently. We reprint the others, hoping that they may raise discussion.—Is bran a good feeding stuff? and what is its worth per ton? What quantity of oats might a feeding horse get per day? and what are the best ingredients of a good horse ration? What is the best feed for a stallion at the present season?

Soot and Lime. *Mr. S.* asks about the application of soot or lime to the soil. Soot is a finely divided material, containing a small percentage of ammonia. It is a good fertilizer, according to the processes carried on by means of the fire which generated the soot. It is possible that the atmosphere of a kitchen wherein a large amount of cooking, in the shape of roasting or baking meats, is carried on may contain a greater percentage of ammonia, but this variation can be hardly worth consideration. For starting young turnips, sweeties, or Mangels, it is a useful fertilizer for wheat or spring corn, which has a weak blue and a yellow sickly tinge, it will act almost like a charm in giving the plants a start. But it cannot be depended on for supporting a large crop of roots, nor a heavy crop of corn. Superphosphate of lime (dissolved bones) is necessary in addition, if a heavy and sound crop of either roots or grain is the object. On land which produces too much "top," or blades, neither roots or cereals, soil would be superfluous, and might be injurious. This, however, is a practical question, which any farmer may, in connection with the above remarks, easily judge of for himself. Lime, as a rule, would be a correct application where soot is not required. If lime be applied to back land it will bring into use much of that vegetable matter which imparts to it this blackness—such substances as partially decomposed vegetation, which grew and fell, or decayed as roots, at some previous period of the history of the soil which contains them. These are in a crude form, and they become soluble slowly by the action of atmospheric solvents, helped probably by the roots of plants, whose exudations may have the power of producing a slow chemical action in their neighbourhood. This process is, however, too slow for farmers to rely upon. Hence the use of lime. These black substances require to be reduced to very much the same condition as soot, and thereafter to be made soluble. But to burn the surface containing them would be to drive off these deposited substances, and they would be driven away before the wind. Lime is the best application to produce solubility in crude vegetation. Its caustic qualities induce a process of slow burning, which does not result in being driven away like smoke. These, then, are the leading data relating to soot and lime. When it is correct to use one or the other, no one can decide without a knowledge of the soils which require to have their fertility increased. Lime, however, we may remark, is an application which has been very exhaustively used, and therefore it will not do to depend upon it for a permanency, although it may be used once in every three or five years, as a deep deposit as the Lincolnshire or other fen lands, as these deposits are practically inexhaustible.

Spraying. *W. W. C.* Frequent borings before the plant is in seed, during both corn and green crop cultivation, must ultimately destroy it. It is the plague of poor sandy soils.

KNAP HILL NURSERY, WOKING, SURREY.

ANTHONY WATERER

BEGS TO SUBMIT THE

FOLLOWING LIST to the NOTICE of INTENDING PLANTERS

EVERYTHING IS WELL GROWN AND FINELY ROOTED.

In proof of which he gives the date of their last removal

- APHIS ORIENTALIS, 4, 7, and 9 feet, 1 s 6d to 1s each.
ALBIFLORA, 5 to 9 feet, 20s to 60s per doz., moved April 1868.
DOUGLASS, 1, 2, 3, 4, 5, 6, 7, and 8 feet, 5s to 10s 6d each, moved August 1868.
CANADENSIS, 4, 5, 6, 7 feet high, 1s to 3s per dozen.
P. MILA, P. M. F. A., P. ANTI-FLAMMANTIA, P. GREGGII, P. EXCELSA, The Common Spruce, 5, 6, and 7 feet high.
PICEA NOBILIS, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 35, 36, 37, 38, 39, 40, 41, 42, 43, 44, 45, 46, 47, 48, 49, 50, 51, 52, 53, 54, 55, 56, 57, 58, 59, 60, 61, 62, 63, 64, 65, 66, 67, 68, 69, 70, 71, 72, 73, 74, 75, 76, 77, 78, 79, 80, 81, 82, 83, 84, 85, 86, 87, 88, 89, 90, 91, 92, 93, 94, 95, 96, 97, 98, 99, 100.
NORDMANNIANA, beautiful snowing plants, 1 1/2 to 2 feet, 2s and 3s per dozen.
MAGNIFICA or NIBELIS ROBUSTA, 2 feet, 15s each.
LABIOPARPA, 2 to 2 1/2 feet, 6s per dozen.
CEDRUS ATLANTICA, 5 to 6 feet, 4s to 6s per doz., moved 1868.
DEODARA, 4 1/2 to 6 feet, 4s to 6s per dozen.
LIBANI, moved April 1867, 5, 6, 7, and 10 feet, 1s to 1 1/2 each.
CUPRESSUS LAWSONIANA, 4 to 5 feet, 3s per dozen.
JUNIPERUS CHINENSIS, 4 to 5 feet, 3s and 4s per dozen.
JUNIPERUS VIRGINIANA (Red Cedars), 4, 5, 6, and 7 feet, moved August, 1868, 12s to 42s per dozen.
YEW, ENGLISH—Many thousands, 4, 5, 6, 7, 8, 10, 12 and 15 feet high, nearly all of which have been raised within 12 months.
IRIS—Hannoverian plants, 7 to 8 and 10 feet, 7s 6d to 10s 6d each, and upwards.
GOLDEN and ELEGANTISSIMA Hundreds of fine plants, on their own bottoms and worked, from 3 to 6 and 8 feet high.
MANY of these plants are 30 years old, all have been recently removed.
THUJA AUSTRALIS—This plant originated at this Nursery. We have large numbers of fine specimens, 3, 4, 5, and 6 feet high, 8, 1, and 1 1/2 feet round.
GIGANTEA—Splendid plants, moved August, 1868, 10 to 15 feet high, 21s to 42s and upwards each.
LOBBII 6 to 7 feet, and as much round, 3s to 7s 6d each, 10 to 14 feet, do. do., 21s to 63s each.
Ad. moved in 1868.
THUJOPSIS BOREALIS, 5 to 6 feet, 60s per doz., moved August 1868.
WELLINGTONIA GIGANTEA, 10 to 12 feet, 21s to 63s each, moved August 1868.
HOLLIES, GREEN COMMON Stout, fine rooted plants, 18s per dozen, 5s per doz.
MANY thousands 4, 5, 6, and 7 feet high, 3s to 14s per doz.
A new lot of splendid plants, 1 1/2 to 1 3/4 feet high, 1s to 2s each. Ad. moved April, 1868.
SCOTTIA, Thousands of the finest plants, known. Thousands of trees, 7 to 10 feet high, 1s to 1 1/2 each.
MAY-LEAF, 7 to 10 feet high, 1s to 1 1/2 each.
HODGINS HOLLY, 4, 6, and 7 feet.
GOLDEN QUEEN, 11 months of growth, 3 to 4 feet high, 1s to 1 1/2 each.
WATERBURY'S This variety is raised by the late Mr. Waterbury, and is a fine specimen, 10 feet high, 20 inches circumference, straight, with a single stem, covered with the most beautiful foliage. There are many fine specimens, and constantly and recently raised.
SILVER QUEEN, 3 1/2 to 4 feet high.
STANDARD WATERBURY'S HOLLY, 5 to 6 feet high, with heads 6 to 8 inches in diameter.
STANDARD WEEPING HOLLY, Some of the finest specimens, 10 to 12 feet high, 20 inches circumference, straight, with a single stem, covered with the most beautiful foliage. There are many fine specimens, and constantly and recently raised.
VARIETIES of the ordinary kinds—A good assortment, from 4 to 10 feet high, 1s to 1 1/2 each. The price cannot be desired. The proceeds of the sale will be used for the benefit of the poor.
JOHN GREEN'S VAUGHANII 4, 5, 6, 7, and 10 feet, 1s to 1 1/2 each and upwards.
PYRAMIDAL, 1 1/2 to 2 feet, very fine.
BAY'S SPANISH (DUN) from 3 to 10 guineas a pair.
PYRAMIDS.
LAURUSTINUS STANDARDS, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 35, 36, 37, 38, 39, 40, 41, 42, 43, 44, 45, 46, 47, 48, 49, 50, 51, 52, 53, 54, 55, 56, 57, 58, 59, 60, 61, 62, 63, 64, 65, 66, 67, 68, 69, 70, 71, 72, 73, 74, 75, 76, 77, 78, 79, 80, 81, 82, 83, 84, 85, 86, 87, 88, 89, 90, 91, 92, 93, 94, 95, 96, 97, 98, 99, 100.
LAURELS, PORTUGAL, 3 and 4 feet high, 7s and 10s per dozen.
RHODODENDRONS, One of the finest specimens, 10 to 12 feet high, 20 inches circumference, straight, with a single stem, covered with the most beautiful foliage. There are many fine specimens, and constantly and recently raised.
STANDARDS—A large number of the older trees, to be sold with or without roots, many of them 20 and 40 years of age, with many measuring in circumference, and which are in the best of health.
SEEDLING varieties, various kinds, and of all sizes, from 1 1/2 to 2 feet high, 1s to 1 1/2 each.
DWARF varieties, various kinds, and of all sizes, from 1 1/2 to 2 feet high, 1s to 1 1/2 each.
ODORATUM, 1 1/2 to 2 feet high, 1s to 1 1/2 each.
GOVERNANUM, 1 1/2 to 2 feet high, 1s to 1 1/2 each.
PONTIUM, for cover, good plants, 2 1/2 to 3 feet high, 1s to 1 1/2 each.
The Exhibitions of Rhododendrons in the Horticultural Gardens are supplied from Knap Hill.
AZALEAS—A fine stock of the most beautiful, good blooming plants, early, late, and of all colors, 18s to 30s per dozen. Large plants, 3, 4, 5, and 6 feet high, 21s to 63s each.
KALMIA LATIFOLIA—Nice blooming plants, 18s to 30s per dozen, larger of a 18s each.
ERICA HERBACEA CARNEA—The prettiest flowering Heath, fine plants, by the 10s or 15s each. The best varieties of Hardy Heaths at 15s per doz.
DAPHNE CNEORUM MAJUS—A grand specimen, fine plants, 18s per dozen.
AUCUBA JAPONICA, up to 3 feet, thousands.

THE FOLLOWING ORNAMENTAL TREES, OF LARGE SIZE.

Are well grown and well rooted, and stout.

- PLANES, ORIENTAL and OCCIDENTAL, 10 to 15 feet high.
SYCAMORE, 10 to 14 feet.
WEEPING BIRCH, 8 to 12 feet.
MOUNTAIN ASH, 8 to 10 feet.
HORSE-CHESTNUTS, COMMON, 10 to 12 feet.
SCARLET HORSE-CHESTNUTS, very fine flowering Trees, 1 year, worked.
BEECH, WEEPING, 7 to 15 years, worked.
BEECH, PURPLE, 8 to 15 feet high.
DECIDUOUS CYPRESS, 8 to 12 feet.
NORWAY MAPLES, 8 to 12 feet.
LOMBARDY POPLARS, 10 to 12 feet.
THORNs, fine Standards, of the most ornamental kind.
ASH, Gold barked, Flowering, and other varieties, 8 to 10 feet.
LIMES, 10 to 12 feet.

As well as the above-mentioned articles, at Knap Hill will be found one or perhaps the best Stock of all the better kinds of HARDY EVERGREENS, DECIDUOUS and FLOWERING TREES and SHRUBS.

A PRICED AND DESCRIPTIVE CATALOGUE

Will be forwarded on application.

Purchasers are respectfully invited to inspect the Plants growing in the Nursery. No Catalogue can adequately represent such a Stock.

The Nursery is readily reached by Train from Waterloo to Woking Station, where conveyance all times be depended on.

The Railways now take Goods at through rates to almost any Station, thus doing away with the expense of packages.

MOLLE'S PATENT EARTH SYSTEM.

THIS INVENTION EFFECTUALLY REMEDIES EVILS ARISING FROM COMMON CESSPOOL

AND WATER-CLOSETS, AND EQUALLY PREVENTS THE OFFENSIVE SMELL CONSEQUENT ON THE USE OF THE ORDINARY COMMUNE IN BED-ROOMS, HOSPITAL WARDS, PRISON CELLS, &c.

It may be applied in two ways—First, the COMMUNE. This is movable and self-contained, and is adapted for use in bath-rooms, Hospitals, Nurseries, &c. Secondly, the APPARATUS. This is sold separately, and may be applied to an existing closet, or fitted to a new building, in or out of doors; and may be placed over a dry cesspool, or a portable iron tank if more convenient.

THE EARTH SYSTEM is economical, both in the first cost and its after working; there is no expensive cistern required from frost, and the product is a Manure of great value to Farmers and Gardeners. The supply of water, its removal, are attended with no more inconvenience than the supply of coal and the removal of ash. The value of the manure amply pays the cost. Added to which, the savings of the ashes, instead of being a nuisance, may be mixed with the earth, and thus lessen the quantity of earth required. Under certain conditions, ashes alone may be used—on board steamships, for instance, where they are not only a nuisance, but where the use of the Earth Closet would not only be a saving of cost but the removal of an annoyance.

On view at the Office, No. 29, BEDFORD STREET, STRAND, W.C.; and at the Dublin Depot, MESSRS. EDMUNDSON AND CO., 9, UPPER ABBEY STREET

THOMAS M. EVANS, General Manager and Secretary. MESSRS. H. J. AND J. W. GIRDLESTON, 37, Norfolk Street, Strand, W.C., where they may be consulted with reference to MOLLE'S PATENT SYSTEM FOR WARMING CHURCHES, SCHOOLS, &c.

PORTABLE AND FIXED HOT-WATER APPARATUS, FOR HEATING CONSERVATORIES, HOATHOUSES, CHURCHES, PUBLIC BUILDINGS, PRIVATE RESIDENCES, ETC., WITH

TRUSS'S PATENT UNIVERSAL FLEXIBLE AND LEAKLESS PIPE-JOINTS.

T. S. TRUSS

Begs to state that the immense number of APPARATUS annually Designed and Erected by him in all parts of the Kingdom, and for the ROYAL HORTICULTURAL SOCIETY at SOUTH KENSINGTON and CHISWICK, with unrivalled satisfaction, is a guarantee for skill of design, superior materials, and good workmanship; while the great advantages of his IMPROVED SYSTEM cannot be over-estimated, consisting of perfectly tight joints with facility for extensions, alterations or removals without injury to Pipes or Joints; can be erected in an ordinary size Apparatus erected in one day, and PERFECTNESS OF DESIGN INSURING NO EXTRAS. Complete Apparatus, of the best materials, with Saddle Boiler, delivered by Railway Station in England, and Erected at the following prices. Erection beyond 25 miles of London, at one-third additional. Considerable reduction on large works.

Table with 4 columns: Size of House, Apparatus Complete, Erection, and Price. Includes rows for 50 feet by 15 feet, 75 feet by 15 feet, and 100 feet by 15 feet.

Bath and Gas Work erected in town or country. The Trade Supplied. Horticultural Buildings of every description from 1s. 6d. per foot superficial, inclusive of Brickwork.

Price Lists, Plans, and Estimates forwarded on application to T. S. TRUSS, C.E., CONSULTING HORTICULTURAL ENGINEER, &c., SOLE MANUFACTURER, IRON MERCHANT and HORTICULTURAL BUILDER, FRIAR STREET, BLACKFRIARS ROAD, LONDON, S.E.

To those who prefer making their own Selections, full particulars of the best varieties, including

CHOICE NOVELTIES FOR THE FLOWER AND KITCHEN GARDEN,

will be found in SUTTONS' PRICED CATALOGUE, Gratis and Post Free.

SUTTONS' RINGLEADER PEA, THE EARLIEST IN CULTIVATION.

The ROYAL HORTICULTURAL SOCIETY last year tested carefully the merits of the leading kinds of EARLY PEAS, and it is gratifying for us to observe the Report of their Trials, which appeared in the *Gardeners' Chronicle*, June 27, 1868, contains the following brief but emphatic statement.

"The earliest form of all was Ringleader Several of the Peas blossomed at the same time, but Ringleader was fit to gather first"

In thus referring to the result of this important Trial, we may mention that it strictly coincides with Trials made by our Customers, and also in our own Experimental Grounds. The first sowing last year of the Ringleader Pea at our Seed Farm was made on February 12, and harvested fully ripe for threshing on June 16, coming in time for Turnips. Retail price, 2s per quart. SUTTONS' Ringleader Pea is included in all Messrs. SUTTONS' Collections of Vegetable Seeds.

SUTTONS' CHOICE POTATOS FOR PLANTING.

- SUTTONS' EARLY RACEHORSE, the forwardest known, 5s per peck.
- SUTTONS' BERKSHIRE KIDNEY, the best and most prolific in cultivation, 5s. per peck.
- SUTTONS' GOLDEN BLOSSOM KIDNEY, a very distinct second early variety, 5s. per peck.
- SUTTONS' KING OF POTATOS, a splendid variety, took First Prize at Birmingham, 3s per peck.

And numerous other sorts, moderate in price, true to name, and free from disease. For prices see SUTTONS' SPECIAL POTATO LIST, Gratis on application.

Culinary and Floricultural Seeds.

WILLIAM ROLLISON AND SONS beg respectfully to announce that their GENERAL and PRICED SEED CATALOGUE for 1869 is now published, which comprises many novelties, in the way of VEGETABLE and FLOWER SEEDS, and so numerous valuable additions to their extensive List of SUB-TROPICAL PLANTS which can be raised from Seed, in which is also included the following choice Flower Seeds:—

CENTAUREA RAGUSINA COMPACTA.—The foliage of this new variety has the most silvery-white gloss, while its very dwarf and compact habit makes it much more useful and effective in Ribbon-borders than any of the oldest varieties. Price, per packet, 1s. and 2s. 6d.

KENNEDYA FREDWOODII.—This extremely ornamental Green-house Creeper blooms in great profusion during the months of December and January. The flowers, which are as large as those of a good-sized Sweet Pea, are of a gorgeous scarlet-crimson, delicately striped in places with white and marked with green. Very young plants in 3-inch pots will bloom abundantly. Seed, price 1s. per packet. Blooming plants from 2s. 6d. to 6s. each.

PRIMULA SINENSIS FIMBRIATA.—Seed saved from the finest prize strains in cultivation. Price per packet, 2s. 6d.

PRIMULA SINENSIS KERMESINA SPLENDENS.—Seed saved from the brightest coloured variety. Price per packet, 2s. 6d.

CINERARIA.—Seed saved from named varieties, the flowers of which combined endow shades of brilliant colours with perfection of form. Price per packet, 2s. 6d.

N.B.—W. K. & SONS' GENERAL CATALOGUE of SEEDS may be had gratis, and post free, on application to

The Nurseries, Tooting, London, S.W.

PAUL'S NURSERIES AND SEED WAREHOUSE, WALTHAM CROSS, LONDON, N.

Including many Novelties, is now ready, and may be had Free by Post on application.

In proof of QUALITY he need only refer to the numerous Prizes awarded at various Horticultural Shows throughout the country, for both Vegetables and Flowers grown from his Seeds, and in regard to prices throughout all cases affixed on the lowest possible scale to be remunerative. The following Gardens in Hertfordshire, renowned for their Vegetables and Flowers, have long been supplied from his Seed Warehouse.—Brooklands, Panshanger, Danesbury, Poles, Digawell, Wyddial Hall, Woodhall, Youngsbury, Bedwell Park, Essex—Campfield Place, Bayfordbury, Knebworth, Frogmore Hall, Childwickbury, Codicote Lodge, and many of equal celebrity throughout the country.

To purchasers who are unacquainted with the best varieties of Vegetables and Flowers, or who wish to avoid trouble of writing a List, the following Collections are made up on equally liberal terms with any other House in the Kingdom. All are of the best quality, and cannot fail to give the fullest satisfaction.

VEGETABLE SEEDS.

No. 1. The WALTHAM COLLECTION of VEGETABLE SEEDS, FOR A LARGE GARDEN, Price £3 3s.

No. 2. The WALTHAM COLLECTION of VEGETABLE SEEDS, FOR A MEDIUM-SIZED GARDEN, Price £2 2s.

No. 3. The WALTHAM COLLECTION of VEGETABLE SEEDS, FOR A SMALL GARDEN, Price £1 1s.

Smaller Collections for Small Gardens or Cottagers, 15s., 10s. 6d., or 5s. each.

FLOWER SEEDS.

No. 1. The WALTHAM COLLECTION of FLOWER SEEDS, INCLUDING THE FINEST IMPORTED ASTERS, STOCKS, &c., Price £2 2s.

No. 2. The WALTHAM COLLECTION of FLOWER SEEDS, INCLUDING CHOICE IMPORTED ASTERS, STOCKS, &c., Price £1 1s.

No. 3. The WALTHAM COLLECTION of FLOWER SEEDS, INCLUDING THE MOST EFFECTIVE FOR A SMALL GARDEN, Price 10s. 6d.

No. 4. PAUL'S CHOICE COLLECTION of HOLLYHOCKS, IN TWELVE DISTINCT NAMED SORTS, Price 5s.

NOVELTIES, OR VARIETIES OF SUPERIOR MERIT.

BEST, Paul's Superb Crimson, 1s. per packet. BROCCOLI, Lander's Superb Protecting Late White, 2s. 6d. per pkt. BROCCOLI, Snow's Winter White, very select stock, 1s. per packet. BRUSSELS SPROUTS, Paul's Waltham, 1s. per packet. CAULIFLOWER, Hill's Dwarf, 1s. 6d. per packet. CAULIFLOWER, Superb Dwarf Hertfordshire, 1s. per packet.

CUCUMBER, Paul's Improved Telegraph (true), 2s. per packet. * This Variety was first sent out by me in 1841, and has since that time been the most prolific and best flavoured of all Cucumbers. ENDIVE, Waltham Green Curled, 1s. per packet. LETTUCE, Brockett Hall Brown Cos, 1s. per packet. LETTUCE, Hill's Compact Brown Cos, 1s. 6d. per packet. PARSLEY, Paul's Selected Extra Curled, 6d. per packet.

FOR MORE PARTICULAR INFORMATION, SEE SEED CATALOGUE.

All Seeds, except very small parcels, Carriage or Post Free.

LILJUM AURATUM.—Flowering bulbs, 2s. to 7s. 6d. each; 18s. to 72s. per dozen.

GLADIOLI.—A very fine assortment to name, 6s. to 24s. per dozen.

ROSES.—A fine stock still on hand, Standards, Dwarf-standards, Dwarfs, and in pots for forcing.

FRUIT TREES.—Standards, Pyramids, and Dwarf-trained, and a large general Nursery Stock in excellent condition.

PRICED CATALOGUES, FREE BY POST.

CHOICE NOVELTIES FOR THE FLOWER AND KITCHEN GARDEN,

will be found in **SUTTONS' PRICED CATALOGUE**, Gratis and Post Free.

SPLENDID NEW POTATO FOR SEASON 1869.

SUTTONS' BERKSHIRE KIDNEY,
5s. per peck; cheaper by the bushel.

SUTTONS' BERKSHIRE KIDNEY, price 5s. per peck; cheaper by the bushel.

This splendid Potato is a seedling from the Duke. Having several plants of that class, we have found it to be by far the best and quite a fortnight earlier. The tubers are of large size, smooth, and have a remarkably fine flavour. It is not affected by disease as other varieties. It is exceedingly prolific. It is by far the best variety for the main crop.

From Mr. A. WEAVER, Oxford.

"You may imagine how well the Berkshire Kidney Potato has done, when I tell you that the 1 peck you sent me has produced 16 pecks of good Potatoes. I had the pleasure of showing them to the Public at the Oxford Horticultural Society's Meeting, and they were highly praised."

SUTTONS' GOLDEN BLOSSOM KIDNEY POTATO, price 5s. per peck; cheaper by the bushel.

A distinct and very excellent variety. The skin is very smooth, eyes shallow, flesh white, and of very fine flavour. It is exceedingly prolific.

For particulars of other choice sorts of POTATOS, see SUTTONS' SPECIAL POTATO LIST, Gratis and Post Free.

SUTTONS' RINGLEADER PEA, THE EARLIEST IN CULTIVATION,

As per Royal Horticultural Society's Report in Gardeners Chronicle, June 27, 1868

Price 2s. per quart.

SUTTON AND SONS, SEEDSMEN TO THE QUEEN, READING, BERKS.

forests and humid ravines of these mountain regions orchidaceous plants of surpassing beauty abound. They have for 20 or 35 years past been imported into Europe in very limited quantities, but, as a rule, they were at once subjected to a cold and stifling heat. Because they were from the tropics, whether in reality from the chilly slopes of a snowy sierra, or from a hot jungle, it was all the same—Nature rebelled, and the plants died.

They had been dragged down from their cool mountain homes, and cooped up in a box for six or eight weeks in the hot and humid climate of the tropics which they must pass to reach us, and therefore few, comparatively, survived—some of these being the very finest, and hence both rare and expensive. Others, scarcely less charming, travel well, and are now to be had at far lower prices than formerly. Some of the finest of the New Grenada *Odontoglossums* and *Oncidiums* occur in districts that are liable to extreme cold, and may yet be found hardy enough to stand the winter in some parts of England. We learn from the late Mr. H. M. Archer's work, that he met with an Orchid 800 feet above a village where the snow was lying 6 inches thick, and the thermometer indicated 8° of frost, and that *Cattleya labiata* and *Sophranitis grandiflora* have been found not unfrequently with the hoar-frost upon them, and the grand *Laela majalis*, in Mexico, is said to bear several degrees of frost. I myself have seen icicles hanging abundantly within a few inches of *Epidendrum vitellinum*, which was placed in a nook of rockwork during the frost of the winter before last. The plant was in no way injured, and grew finely the following summer.

There is every reason to believe that many, and perhaps most, of the Orchids from Brazil, Mexico, Peru, New Grenada, Nepal, Khasya, China, and Australia, will bear a temperature close upon the freezing point without injury, not that I recommend this to be tried any more than I should with a *Cineraria*, but I am satisfied that a greenhouse temperature, which is never allowed to fall much below 40°, is not only abundantly sufficient for them but likely to induce a far more vigorous growth and abundant bloom, than the usual warmth of Orchid-houses in winter. I have consequently placed a large portion of my collection in houses where the winter temperature falls to from 35° to 45° associating them, in fact, with greenhouse plants. That they will bear this, and in many instances even more, is certain. *Cattleya Mossiae* and *Laela purpurata* continued growing out-of-doors in a deep shady recess for six weeks after the frost had cut off many things in adjacent grounds, and they were only taken in after the thermometer had registered 29½°. This temperature severely injured one of the young growths of *Cattleya Mossiae*, but did not hurt three others which had been formed almost entirely out-of-doors. Seven degrees of frost the winter before last killed *Odontoglossum grande*; while 3½° of frost but very slightly spotted its leaves. It destroyed the leaves only of *Lycaste Skinneri*, and did not hurt in the slightest degree the glorious *Laela superbiens*, all of which were side by side out-of-doors, and I consider if *Cattleya Mossiae* will bear this, all *Cattleyas* will, except *Cattleya superba*, as with this exception they come from cooler districts than *Cattleya Mossiae*. It must however be borne in mind that an Orchid wintered in a warm house (60° to 70°) will scarcely stir, if placed out-of-doors or in a greenhouse the following summer, even if the temperature be 80° in the shade during the day, they will have a second rest—the coolness of the night temperature and free circulation of air more than neutralise the high day temperature. Plants so treated will rest for months with the thermometer at 60° to 80°, and begin to grow in autumn when their sleep is over, even with the thermometer at 40° to 50°. This, I think, clearly proves that to get a free and vigorous summer growth in a greenhouse, or out-of-doors, the plants must be wintered at a proportionately lower temperature—40° to 50°. It is not easy to accommodate recently imported ones to this wholesome discipline, because the great heat of the voyage, &c., often stimulates an untimely growth, which cannot be checked severely without endangering the plant. It must, however, be aimed at as far as possible; and not till this is done shall we see on many of our finest species the short stiff leathery leaves, and rich purple-tinted stems, &c., which we find in the imported specimens, healthily developed in their fine mountain climate. We have yet to learn that mere size is not the standard of excellence in an Orchid's stem or bulb, any more than in cattle.

There are many Orchids which will bear greenhouse treatment when the growths have been well matured during the summer in a cool and airy situation, which would rot directly if placed in a greenhouse when they have been grown in a moist and close house, with a temperature of 70° to 80°. We may be able to see no difference before the two are tried, but we shall soon find that they have very different constitutions. As a rule, while these plants are growing freely, they should have abundant supplies of water. *Odontoglossums* should never have the soil dry, but they like air in constant motion, and a bright sunny position in winter. In summer they should be carefully shaded from direct sunshine, and a very humid atmosphere should be maintained, combined with free ventilation day and night. At that season the night temperature should be 15° to 20° lower than the day temperature, so as to cover the plants with dew. In winter, and especially when the temperature is very low, little or no water should be given, and the atmosphere should be kept as dry as possible. The pseudobulbs are the natural reservoirs for moisture, so that, if plump and well-matured, the plants will require no water for weeks, or even months, while at rest during the winter, air will be dangerous with the thermometer outside at 40°, but will be advantageous, when the sun

shines and there is little wind, for an hour or so at mid-day, the thermometer being at 45° or more outside in the shade.

Where Orchids are grown on blocks of wood, the roots should be covered lightly with Sphagnum or any fresh green Moss free from insects, behind which a little fibrous peat should be sprinkled, the whole being firmly secured with zinc or copper wire. When grown in pots, the pots should be filled to two-thirds of their depth with broken crocks, above which a mixture of chopped Sphagnum and fibrous peat should be placed, with a little white sand. This compost should be firmly pressed, and raised in the form of a cone above the rim of the pot, placing the plant on the top, the roots only being buried in the Moss. *Isaac Archer, Holt, Worcester.*

BOTANICAL DRAWING.—No. III.

Leaves in Perspective—Leaves have been subjected to more bad treatment by the draughtsman than perhaps any other portion of the vegetable kingdom, they have been represented, or rather misrepresented,

in all kinds of impossible positions. Numerous are the tortures to which they have been subjected—dislocated or broken ribs, curious twists, painful to behold—even their wretched veins have not escaped; and all these errors in perspective arise from inattention to

the simple fact, that in a curved leaf, showing the under side, the midrib should be continuous, and the veins should spring from the midrib. The simple way to avoid perpetrating such vagaries, is to treat a leaf as if it were skeletonised, and I would recommend skeletonised leaves as admirable subjects to illustrate their own perspective. A little study of them in this state would be beneficial to those who are wont to take unwarrantable liberties with them when rejoicing in their summer garment of green, which veils their curious anatomy.

In representing leaves in perspective, then, the first faint outline will be found of the greatest service, and in making it, the leaves should be treated as if they were skeletonised, i.e., continue the outline through the curved portion of the leaf. Here I may impress

upon the reader the importance of being formed by the veins with the midrib, they are also useful in drawing for a scientific purpose, sent a leaf cut across, to show the thickness. The cuts in the preceding column will illustrate remarks.

Little more need be said about sketching them than there are no errors in perspective.

PINE-APPLE CULTURE CUTTING DOWN.

As the remarks of Mr Barnes, of Bickton, related to create wrong impressions, of Bickton, point out the fact that he himself is showing false impressions when he attempts to allow been in the habit of growing Pine plants became "old, long-shanked" objects, worse the days of yore; and then, and not till then, them down in order to make them fruit. It is presumption in me, or perhaps in any other, to presume to teach Mr Barnes how to manage, but I can state that the practice I have retained, guidance of others is not exactly the "cutting over" "old long-stemmed Pine plants" supposes. What I have sometimes done in has been in the case of Pines that had been potted suckers, say, for illustration in September, started into fruit in January, 1869, and in to even younger plants. In the case of these, sometimes found that a few plants moved into fruit along with the rest, and instead of and allowing these to grow on, I have cut at the surface of the soil and repotted them often as I have done so, have found them fruit almost immediately, and swell very in time to form a rear-guard to the general

I can heartily sympathise with Mr Barnes' tion of the difficulty of growing Pines in old, drippy pits, for those in which I grew the Archerfield for 10½ years, up to last November erected long before Mr Barnes was born, on flat in the roof, drippy, several of them heating power, and behind a wall which screened them from the sun for three months year. In the spring of 1867 one of them constructed with every modern appliance, and was that suckers potted in August, 1867 were ripe fruit last September. So that Mr Barnes' invidious supposition that "old, long-shanked" were the order of things in my case, may be wrong, and I am certain the same may be said of those Simpson, of Wortley Hall, who has recently on the matter in the pages of the *Gardener's*. I think every one who attempts to guide others duty bound to defend himself from misrepresentation, and I am sure that when Mr Barnes charges old-world growers he neither intended this, nor make it good. The cutting-down and destruction long-stemmed plants is of old enough date. Pine grower knows, but it may be said, cutting-down of young plants should not be should be reckoned as work fit only to fall to the incompetent. But those who have to grow spare plants for fruiting in dull pits, further from Land's End than Mr Barnes' lot is, will find that now and then plants that have stood in corner of the pit have a will of their own when time comes round, especially if that time be the prompt remedy of cutting-down these fellows, and brings them into fruit before they are "old or long-shanked," and hardened in the of the time of Mr Barnes' boyhood.

I am much obliged to Mr Barnes for the opportunity of representing the practice I have adopted its proper light, especially as few can lay claim to assume the place of a Gamaliel in *Pinegardens*, he has a right to do. *David Thomson, Pinegardens.*

Home Correspondence.

Apple Stocks.—After the platitudes that appeared under this title, the two words may give your readers a fit of brain sickness, mental nausea often brought on by reading a novel. The subject in dispute has been whether we in England possessed dwarfing Apple stocks to those used in France, and so overruled the Robuson. The Scientific Committee on the decided that the Apple trees on English stocks placed before them were robust, healthy, fertile. To those who looked over the trees, it was more apparent than the hardy robust one-year-old grafts on the Nonsuch English stocks. They were studded with fine plump buds ready to burst with exuberance of health, in contrast to these trees, Oak-like in their growth, were little fellows on the same stock, who had been removed once, and hence their sterility. I confess to a feeling of satisfaction in seeing a portion of the labour of a long life spent in your number for January 2, under "Apple Stocks." I have given my knowledge of the stocks of present day. From my close observation and experience I am aware that I have a greater number of fruit-tree stocks than any man in Europe (I am "Oh"), and can therefore afford to state at length of "A," "B," and "C," reminding one of a (itmouse) trying to make a small hole in a Beurre Diel pear. The Scientific Committee, however, settled the question. (Not quite.) The subject "was alive, and is dead." So there is to be said. I may, however, allude to some points

SUTTONS' GRASS SEEDS

FOR ALL SOILS,
ARRIAGE FREE.

A SILVER MEDAL for EXCELLENCE of QUALITY,

PARIS, 1867.

SUTTONS'

MIXTURES of PERMANENT PASTURE GRASS and CLOVER SEEDS,

Producing abundant Crops of Hay and superior Pasture, for the following descriptions of Soils —

STIFF CLAY SOILS, to be met with in the London, Kimmeridge, Oxford, and Lias Clays.
BEST MIXTURES for these Soils, 28s. to 32s. per acre.
GOOD MIXTURES for these Soils, 20s. to 26s. per acre.
 Carriage free.

HEAVY LOAMS, of the same Formations, when they have been subjected to surface admixtures and subsoiling.
BEST MIXTURES for these Soils, 28s. to 32s. per acre.
GOOD MIXTURES for these Soils, 20s. to 26s. per acre.
 Carriage free.

GOOD MEDIUM LOAMS, on the Marls of the Old and New Red Sandstone, the Gault, and the Greensands.
BEST MIXTURES for these Soils, 28s. to 32s. per acre.
GOOD MIXTURES for these Soils, 20s. to 26s. per acre.
 Carriage free.

LIGHT SANDY SOILS, on New Red Sandstone, and the inferior Oolite. Soils visited by Sand Drifts, as in Oxford and Gloucester, also those covering up the Staffs and the Tertiary sands of the Dorset Heaths.
BEST MIXTURES for these Soils, 28s. to 32s. per acre.
GOOD MIXTURES for these Soils, 20s. to 26s. per acre.
 Carriage free.

SHARP GRAVELLY SOILS, such as the Flint Sand Drift which overspreads so much of the Southern part of England.
BEST MIXTURES for these Soils, 28s. to 32s. per acre.
GOOD MIXTURES for these Soils, 20s. to 26s. per acre.
 Carriage free.

CHALKY SOILS, as the Mountain Limestone, the Oolite, and the Chalks Proper, where not too elevated.
BEST MIXTURES for these Soils, 28s. to 32s. per acre.
GOOD MIXTURES for these Soils, 20s. to 26s. per acre.
 Carriage free.

SHEEP DOWNS.—The Elevated and more Exposed parts of the Oolite, such as the Wolds of Gloucestershire, the Cotswold Hills, and the Fens of Wiltshire.
BEST MIXTURES for the above, 28s. to 32s. per acre.
GOOD MIXTURES for the above, 20s. to 26s. per acre.
 Carriage free.

WATER MEADOWS, and all Land under Irrigation.
BEST MIXTURES for the above, 28s. to 32s. per acre.
GOOD MIXTURES for the above, 20s. per acre.
 Carriage free.

SUTTONS' "CRYSTAL PALACE" MIXTURE, for Park Grounds, as supplied to the Crystal Palace Company to produce a beautiful evergreen sward, 18s. per bushel. Sow 2½ bushels per acre.

SUTTONS' MIXTURES of GRASS and CLOVER SEEDS for
 1-year Lay, best quality, 13s. 6d. per acre.
 2-year Lay " " 17s. 6d. per acre.
 3-4-year Lay " " 22s. to 24s. per acre.
 Second qualities cheaper.

SUTTONS' RENOVATING MIXTURE for the above law should be sown early in the spring to produce a great increase in the quantity and quality of Grass. 6s. 6d. to 12 lb. per acre. Price 9d. per lb.
 Special Contracts made for large quantities.

Five per cent. allowed for cash payments.

CARTER'S GRASS SEEDS

FOR PERMANENT PASTURES,

SPECIALY PREPARED FOR

HEAVY SOILS | MEDIUM SOILS
and LIGHT SOILS,

Including the following valuable Hay-producing and Feeding Grasses and Clovers, in proportionate quantities to suit particular descriptions of Soils, &c.

PERMANENT PASTURE GRASSES AND CLOVERS.

SWEET VERNAL GRASS	FACEY'S PERENNIAL RYE GRASS
MEADOW FOXTAIL	TIMOTHY
LARGE OAT GRASS	WOOD MEADOW GRASS
CRESTED DOGSTALL	ROUGH-STALKED MEADOW GRASS
COCKSFOOT	PERENNIAL RED CLOVER
HARD FESCUE	PERENNIAL WHITE CLOVER
VARIOUS-LEAVED FESCUE	ALSIEK CLOVER
TALL FESCUE	YELLOW TREFOIL CLOVER
DARNEL-LEAVED FESCUE	
MEADOW FESCUE	
CARTER'S SUPERFINE ITALIAN RYE-GRASS	

Per Imperial Acre, 26s. to 32s.

Second Quality, 20s. to 28s.

For full cultural directions, see page 75 of "CARTER'S GARDENER'S and FARMER'S VADE MECUM for 1869." Post free 1s, gratis to customers.

J. C. & Co. hold one of the largest stocks of Grasses in the country, and append below a List of distinguished purchasers of Carter's Grass Seeds.

H.M. THE EMPEROR OF THE FRENCH,
 H.R.H. THE CROWN PRINCESS OF PRUSSIA,

Peterborough (Local Rating)	Mr. John Little.
Waldstone.	
Midland (Steam Cultivation)	Mr. James Howard, M.P.

OUR correspondents have once more brought THE SEWAGE QUESTION prominently before our readers. The season of growth is approaching, and the manure of the farm is again the leading agricultural subject. Is it not strange that one of the most abundant sources of fertilising matter should have been so long neglected—that the house-waste of London, which used to be imperfectly removed, with immense labour, by horse and cart a few miles outwards to the market gardens, should not, now that it is in a form to carry itself, be greedily appropriated?

Travellers by rail continually see long trains of stable-dung leaving London. It has been collected in yards, carted to the terminus, trans-loaded into trucks, it has yet to be steam-drawn to a distant station, transferred to the farmers' carts, horse-drawn to a distant field, thrown out in heaps, scattered with the fork and covered by the plough. Moreover, it cost a good deal to begin with. This is the waste derived from feeding merely upon hay, and straw, and Oats, and Beans, and Clover; and notwithstanding all its cost, the process pays. Look now at what becomes of the waste—more valuable, one cannot help supposing—of feeding upon beef and bread and vegetables. It is got for nothing, it carries itself, it distributes itself, it buries itself. From every house it drains through sewers, gradually collecting into one, and the labourer on the farm just lifts a shide or hutch and forthwith it spreads itself over the surface of the soil, where the hungry plants are waiting for it, and through the substance of the soil, where their roots are ready to absorb it. Of course there are costs between the outfall sewer of the town and the receiving gutter on the farm, but the tenant knows nothing of them. He merely pays a sum which in relation to the value of what he gets is pretty much the same as the two shillings or half-a-crown which he pays at the town stable for the load of dung which he collects at such expense; and the sum he is called upon to pay is quite enough to replace the costs of delivery to his land.

What does he get for his money? He gets the whole growth-waste of the best fed animals in the world. What is the principal advantage of the sheepfold as compared with ordinary farmyard dung?—simply this, that the liquid and solid excrement are put upon the land, whereas the manure of the ox or horse is wasted in yards and heaps, and drained of its liquid part before it leaves the building. Town sewage contains the whole of the liquid and the solid parts of what we call growth-waste—the growth-waste, too, of an animal that is better fed, and that is more wasteful of its food than any

harvest or the dung to the land must go up hill, and that I am not making a needless case against the locomotive, indeed I am not, for if I could make use of it I would have it. I like to be busy in September. "West Indian" has never heard me grumble about that; on the other hand, he knows that I press on everybody the necessity of driving on as much as possible all that month and October. Ploughing can be done by steam, but I say that so long as we are obliged to keep some horses to cart the corn as well as drill it, and I do the job work on the farm, let them do the little that is needed, for they can do it better than steam can, but if we can do all this cheaper by a locomotive let us do without horses altogether, but a review of what I have written will show that I cannot, whatever other people may do, for, according to "West Indian's" suggestions, I must keep or hire two horses, besides keeping my pony; and I do not see my way clear enough to sell my windlass and buy another larger to do a less daily work, to pull

down my barn and shed for the sake of pulling my corn down hill when my dung must be pulled up hill, to say nothing about wasting my land by cutting a new road along the bottom, while I have got a public road along the top. Taking it all in all, I dare not have anything to do with it. Let others try if they like. There are plenty who have got their land better situated for the task than I have. On a flat farm it can be done, but whether it can be made to pay I know not; to my mind it is very doubtful.

Mr. Mechi does not understand land drainage at all, for as to when a drain shall run depends upon circumstances. On my flat land drains have been running four months, on my hill lands only two months, and Mr. Mechi tells us of drains that only commenced running on the 8th of January. On my flat land ad through last dry summer the water was within about four feet of the surface, on my hill land we had not a drop of water, and if I had dug a well 70 feet deep I should not have

found any at that depth, for the thing to be tried. How near the water was to the surface of the land to which Mr. Mechi refers, on what drains did not run until the 8th of January, I do not know, but there is a good reason why my drains on flat land should run before those did on the hill, although they are all put in at the same depth, and this. As soon as the land on the flat is well saturated with rain it is full to the depth of the water table, the drains begin to run, but on the hill the water will go down 70 or more feet, and that part of a bushel must be full before the drain can run, besides that, the top 4 feet must be saturated before 70 feet at bottom can fill at all. What the chances could be, that the under-soil could hold water until the 8th of January in Mr. Mechi's drains, or they would have run before the 1st of January. *William Smith, Woolston, Bleckley Bucks, Jan. 18.*

THE ROYAL AGRICULTURAL SOCIETY.

THE improvements in practical farming since 1837 have been unparalleled. No doubt during the war period, in the first 20 years of the century, the wealth of the country was greatly increased by the inclosures. We have not been able to emulate our predecessors in that respect, for the simple reason that they anticipated us, and left us only Bagshot Heath and some other very unpromising tracts that we certainly have not had the courage to attack as yet. But in all the details of husbandry we have made great progress; we have invested capital in many spirited undertakings, by means of which the revenue of the landed interest has been largely increased; and the agricultural production of the country, and the national wealth, have received a great addition. The Royal Agricultural Society, we are glad to say, has had an honourable share in these transactions. It has been closely identified with the history of farming progress. The literature that it has diffused by its Journal has, we hope, been as the seed sown upon the waters, that will bear fruit after many days. Fruition is very slow in some cases, and some seeds are wrapped in so hard a husk that germination only takes place after the lapse of several years! But the Society sagaciously adopted other means of disseminating knowledge. The meetings it has held in all parts of the country have done more in the way of practical instruction than the Journal could possibly have effected, even if its Editor for the last 30 years had been a second Arthur Young. Our conviction of the ultimate and permanent good accomplished by well-directed literary labours is not disturbed by the rapid effects of the Society's meetings, in spreading information and intelligence of a special kind. The ablest pen, though it can do much, and its influence may endure and may even increase, cannot rouse the spirit of emulation and excite the observation and interest, so vividly, as the practical instruction which is received in the visit to the showyard. Those high psies that every year surround the scene of competition enclose the muster-ground of the agricultural forces; most English farmers, and many foreign ones, have been repeatedly present at the grand tournament. It is needless to enlarge on the advantages they must

have derived from witnessing this competitive struggle, peculiar to our own times, in which the victor's prize is a reward for excellence in the results of agricultural industry. But we are writing of the past rather than of the present and future. These exhibitions will not cease to be popular, but while equally amusing they have already become less instructive. They have, to some extent, served their purpose; they have rewarded everything that ingenuity has devised, and that enterprise and skill have produced, both in the farmyard and in the factory, they have bestowed a prize, or commendation, on all sorts of improvements, and on many novelties that were not improvements, but were regarded as such by sanguine judges and purchasers, whose ruling idea seemed to be that what was most modern must be best. We do not deny that some fingers have been burnt at shows through incaution and being "greedy of new things," but on the whole their practical utility has been very great. Some people may have bought experience of new implements and improved stock at a dear rate, but many more have made their selections with profit to themselves, especially when they have used their own judgment, without being too much biassed by the award of those who have sometimes measured excellence by what may be called a paint-pot standard, selecting implements not adapted to the rough work of an English farm, though very suitable, perhaps, for Arcadia, or "for exportation." The field of invention is not exhausted, though it has been well cropped, but it is no longer a virgin soil; it will produce less in future, and the public requirements will be less. The farmer may be said to have "supped full" of agricultural shows; at any rate, his first hunger is appeased. The Royal Agricultural Society, therefore, must not rest its claims to favour on a sight, however attractive, and however useful, within certain rather narrow limits, it may be. Its teaching must not be confined to that of exhibiting and placarding good models. You may look at a pig, fixedly, and in a proper frame of mind, with great advantage, but after you have distinctly made out his

opposite extremities, and decided why his tail fell off—as it always does from a prize pig—you cannot learn much more by staring at him. There is soon an end of the knowledge which only goes in at the eye, and even that which is mentally acquired by discussion, when people are together from all parts of the kingdom, is not the end and aim of what an instructed mind would desire. The Royal Agricultural Society has no work to do but should devote itself more earnestly than to the supplying the higher wants of intelligent agriculturists, and, if possible, of attracting others, and excite in them the same desires. It has many opportunities of usefulness, but none half so important as the none in which it shows itself, at present, so much to excel or to succeed. We have shown that we owe much to the Society; it supplied a pressing, and might almost add, a passing need. Farmers compare notes and to try conclusions in many ways. The Society gave them the opportunity of doing so. The work of the past thirty years cannot be over-estimated. The engineer who now constructs the machinery of agriculture, aptly represents in his own person the progress we have made, he is an educated man, a Member of Parliament. His predecessor was a village forger. Such rapid transmutation is not to be expected. At that rate of development we might expect one day to see wise men ruling at Hansard's. But by that time other people will, perhaps, be doing so, and instruction in general will, perhaps, be more for. It is unfortunate that now, while it is so, cannot be forthcoming. The recent nomination of a post of Editor of the Journal, of a gentleman acknowledged to be ignorant of the art he was unable to teach, must, we fear, give members a very favourable impression. No doubt the members who have made this unhappy mistake, and the guarantee of their good intentions, but the power to do good are not always accompanied by unaccountable proceeding can only be attributed to want of true earnestness among those who

they are, no doubt, quite in accordance with his taste, and possibly they take an interest in chemistry, agricultural statistics, in general, in all sorts of directions each according to his own bent, but they have no real sympathy with the farmer, and they have no real sympathy with the farmer.

But without this real sympathy, true sympathy, which is the only sympathy that can be of any use, the work of others cannot be of any use. The work of others depends so greatly on what we do and think about them. Agriculture is a very old and venerable pursuit, and it is a very old and venerable pursuit, and it is a very old and venerable pursuit, and it is a very old and venerable pursuit.

The Royal Agricultural Society of England, as we observed, was established at a period when the wants of the agricultural body never dormant in our land were being raised. Its object was the improvement of husbandry, and as this is a permanent and a steady work, the institution would necessarily grow in stability and harmony as it grew older if it fulfilled its purpose with success. But if it fail to be useful, or if it ceases to be useful, from any cause, it ought to be dissolved. We use this term in a sense that cannot be contradicted, since the Society is less flourishing than it has been as regards its finances and the number of its members. We do not see in the present management of the Society either the elasticity or strength of a wise government that knows how to adapt itself to changing circumstances, or the firmness that ignores all changes. We have innovation with a vengeance, but what we want is steady and consistent progress, anything that any sensible and unprejudiced person would not condemn.

THE TIPTREE BALANCE-SHEET.

Our old friend, Alderman Mechi, has again favoured the public with his annual balance-sheet. As the worthy owner of Tiptree arrogates to himself the position of teacher of agriculture, and in addition to his household proceedings there furnishes us with an array of figures intended to back his assertions, he becomes a fair object for criticism. The effect of these figures on persons practically acquainted with the subject, or at least provoke a smile. Were it not for the substance which his speculations are calculated to have on the minds of others not well versed in agricultural lore, but who are interested in farming, being made to appear more profitable than they are in reality, I should allow the good man to blow his trumpet in peace.

As it is I will make an attempt to analyse his farmed balance sheet—

LIVE STOCK.	
Dec. 31—1885	
Dec. 31—1884	£1068 18 0
Dec. 31—1885	450 1 0
Dec. 31—1884	181 17 0
Dec. 31—1885	696 19 4
Dec. 31—1884	24 0 0
Dec. 31—1885	1 17 6
Dec. 31—1884	£2415 12 10
Dec. 31—1885	£1054 17 6
Dec. 31—1884	1284 10 11 1/2
Dec. 31—1885	29 10 0
Dec. 31—1884	68 14 4 1/2
Dec. 31—1885	£2415 12 10

It will be seen that there is a direct money loss on the stock account of 66l. 14s. 4d. If to this be added one-fourth of the labour and beer bills for attendance, the deficiency will be increased to 192l. 13s. 4d. This is exactly opposed to the advice farmers are constantly receiving from other quarters that they must not go to the barn door for all, but look to their stock as a help to their rents.

If we look a little closer at the balance-sheet we shall find that the Tiptree system combines with the business of farming proper those of milling and market gardening as well as a little haggling carting. Under the following heads we find—

Dec. 31—1885	£272 12 9
Dec. 31—1884	£272 12 9

Every farmer followed Mr. Mechi's advice and got a fixed engine, there would not be such a great demand for him to do for his neighbours. If we grew green Peas for the London market, I apprehend the thing would be overdone. Job-cart is not a very attainable, and most of us find enough to do without it. The sale of hay and straw is forbidden to the greater portion of the tenant-farmers of England, but it is the four items I have just enumerated that have the credit of the balance-sheet, and which are the only ones that show a profit. If he were to let his farm he would charge a rent for ditches, fences, roads, and the like. A common honesty he should charge the landlord's measure. Apart from his live stock which his own figures show, involves an absolute loss of something like 200l., his chief receipts are

Wheat, or the production of which his farmland is naturally well calculated.

The last two or three years on well drained land Wheat has yielded well, and the price has been remunerative. It is this, and this alone, which has enabled him to present the balance-sheet to the public. Wheat remained at 4s. 6d. or 5s. a bushel, which he has had no detailed account of the profits of Tiptree.

Mr. Mechi is by no means the only man who thinks that because he does something different to other people it must be more clever. It often happens that a thing which is done as an exception which would not answer at all as a rule. He tells that he raises great crops of Wheat through feeding bullocks at a loss. It has at all events the merit of being a showy system, and the wheat some persons grow a great way. He tells us moreover that he should have had a great increase.

If we all turned feeders, and there were no breeders, will Mr. Mechi inform us whence we are to obtain our stores. If the farmers of England were all competitors for the few bred on the Welsh mountains, or which reach us from Ireland, we should get but few apices, and what sort of margin would be left for profit when the beef was laid on?

It would be well for Mr. Mechi, to reflect, that common sense and business knowledge are not monopolised at Tiptree. There are farms in this country adapted to feeding others to breeding purposes. When a farmer takes possession of a new occupation it is for him to consider for which purpose his land is best calculated, and adopt a system most in consonance with its natural capabilities. That man is the best farmer who manages his business on the commercial principle of obtaining the largest return he can for himself with the least expenditure of capital consistent with keeping the land in good heart and condition; and not the man who, with an overflowing purse, adopts a showy system, involving a great outlay, and then swaggers about his gain of 10 per cent. eked out by millering, market gardening, &c.

Mr. Mechi tells us that many tradesmen would be well satisfied with 10 per cent. profit on their returns; he does not tell us, though, that the capital invested in trade, aided by the credit the trader receives, is in many cases turned over perhaps 10 times in a year; thus, 10 per cent. becomes cent. per cent. I have had some insight into both trading and farming, and I am not talking without book. For several years I was in the habit of passing, almost daily, Mr. Mechi's establishment in Leadenhall Street, and I would back that against Tiptree at ten to one.

Mr. Mechi is, doubtless, an amiable enthusiast. He has made farming his hobby-horse, and he rides him very hard. It amuses him to hear himself talk, and I dare say he believes all he says. Different people hold different opinions, and some, no doubt, put faith in his dogmatic teachings. I will frankly say that I do not. Had I a son whom I wished to apprentice to the business of a farmer, with a view to his getting a livelihood, Tiptree Hall would certainly not be his destination. F. W. Bignell.

Home Correspondence.

Will the Liberal Government Establish a Board of Agriculture, or an Agricultural Department in the Board of Trade?—I answer, yes, if it can be shown to be sufficiently necessary or advantageous. The Board of Trade now professedly undertakes the management and regulation of every department, both of trade and agriculture, and all public matters connected with either trade or agriculture go through the office of the Board of Trade. This may be all right as far as it goes, but the great bulk of agriculturists cannot rest satisfied with such a secondary order of things. They consider their interests paramount, and to be subordinate to a Board of Trade is humiliating, if not altogether wrong. It might put agriculturists in better humour, and would look more definite and trustworthy, if this Board of Trade adopted the additional words, "and Agriculture,"—i. e., "the Board of Trade and Agriculture,"—with the understanding that trade was represented in one office and agriculture in another. This would suffice so long as agriculture was fully recognised, and every effort put forth to promote its security and prosperity. This in fact is what we want, and what we certainly don't get. Now this being the case, what can a separate department in the Board of Trade, or a really new Board of Agriculture, do for it? Well, this board or office would have all matters connected exclusively with agriculture brought before it, and not being encumbered with the trade department, everything would be more promptly dealt with and action immediately taken wherever required. If well conducted it would prove a great safeguard, and be a trustworthy guide to all engaged in agricultural pursuits. It would be the very place for agriculturists, generally or individually, to apply for information, or to address their complaints upon any emergency, i. e., suppose an outbreak of cattle plague, small-pox in sheep, or any of the evils to which we are subject, occurs, the information is sent to the office, and without delay it is at once seen to. What a safeguard this. No awaiting the circumlocution of Privy Council meetings and Orders in Council. But what are to be the special duties, and the business to be attached to this office? The collection of agricultural statistics would be one of its most important duties. To this would be attached much business. The appointment of officers to collect the statistics, the times of collection, the mode of collection and frequency, the reception of the returns, the making them promptly up, so as to prove most beneficial to agriculturists as their future guide, and the regulation of the foreign cattle trade the importation of sheep and other foreign farm stock would be another very important department in this office. This of all

things would be the most onerous—the exercise of unwearying watchfulness against imported diseases. It would be the duty of the office to seek the earliest and most authentic information from all parts of the world relative to danger from these imported diseases, and to take energetic and decisive measures to prevent their introduction. If for no other purpose, as a most important safeguard it would be right to establish an office for this special service. Far better than to trust to the veterinary office the regulation of home supplies, of modes of transit by rail or otherwise, of stock markets to prevent local infections, of infringement of orders from abroad, of prevention from dangerous stock diseases by injurious contact, and the thousand and one minor matters over which this office has to exercise its jurisdiction by the exercise of a military veto. Then, without a stoppage or seeking class legislation, the office might, in fact ought, to take an oversight of all matters connected with or pressing exclusively upon agriculture, with a view to their alteration, improvement or removal—i. e., the pressure of the Mat tax, the pressure of local taxation, the hardships from game laws or game preserves, also the consideration of the laws between landlord and tenant, the law of hypothec, the land question of Ireland, the averages of grain as they affect the tithes, the importations of grain, of feeding stuffs, of manures, of wool, of vegetables, fruits, &c. in fact every production of the soil should be subject to inspection or oversight and regulations from this office. Besides these matters there are many others of which a board of agriculture (designed as I take it to be to promote the best interests and prosperity of agriculture) ought to take especial cognisance. I mean such as county expenditure (i. e., for drainage, for roads, for expenditure in highways, turnpike roads, river works, or arterial drainage, sewage of towns, collection, enclosures of commons and wastes, Government advances upon subsoil drainage of incumbered or life estates, and all other subjects and matters arising connected with the soil. Unquestionably there would be plenty of work found for a good and efficient office. O. F.

Farmer Mechi's Balance-Sheet fixes him thus:—

House, buildings, machinery, and 177 acres of land, gross profit thereon	£1054 17 6
Rent, exclusive of tithes	£1054 17 6
or an average of 34s. an acre	£1054 17 6
Interest on £5000 at 5 per cent.	250 0 0
The balance of the year's work	£1054 17 6

34s. an acre does not appear an over high rent when we see a fixed steam-engine, irrigation pumps, in-livestones, and threshing-machine included, and draining all done. The balance of 81l. 15s. 6d. for the farmer's year's work is by no means a great one for his care and trouble of looking after 177 acres of land, as well as his 2000 of tenant's capital. My carter gets better paid, and so does many an agricultural labourer, who has little or no care about anything. Here is the position of my carter. He has at home with him a wife, three sons, and a daughter. He has a house and garden free of rent. Here is his income—

Last year I paid to the father and two boys (one 17, and the other 14 years of age)	£15 16 0
The earnings of wife and daughter are put well under the mark at	£ 10 0
The younger son earns nothing.	£105 5 0

Now, compare a farmer's position, with a balance of 81l. 15s. 6d. for his year's work (with say a wife and four children) with this man. The farmer must be up and doing from day to day, from week to week, and from year's end to year's end. His children must be educated and clothed by the interest of his money, not by his earnings, for that will not do it, for his earnings will all be wanted for bread and cheese and one expense or another. Yet he must not turn his back upon charity, much as he needs it himself, for the parson will frown at him if he does, and look upon him as one of the rascally idle class. The labourer now-a-days gets vast advantages here over him, for he gets his children educated for nothing, and he comes in for gifts at Christmas and other seasons of coals, beef, tea, as well as clothing, and he will not only frown at the parson if he gets none, but will keep away from his church. All this I know to be true, but then Farmer Mechi may tell me that his average income is 12 1/2 per cent. which gives to him for his year's work on an average 160l. (or 6d.). That looks better, yet for all that it is nothing like so good pay as my carter's is for when the farmer's bread and cheese, the school bills and clothing, &c. are all in and paid for I cannot see much of a balance left, and besides that, it is not every farmer who has got a Mr. Mechi's head upon his shoulders to assist him in making cheap pork and beef; and besides that we cannot all go upon his plan of buying store cattle and feeding them, for there must be some breeders, even if their losses are much greater in a year like the last. Taking it all in all, assisted by Mr. Mechi's evidence, I take it that the farmers of England are paid the worst for their labour of any class of men in the country, and get frowned upon the most. Mr. Mechi's average price of Wheat in 1883 stands at 63s. 6d. per quarter. I should like to know how much of that Wheat grew in 1867, and how much in 1888.

A Farmer
Steam Cultivation.—A copy of the *Agricultural Gazette* has just reached me, in which "Agricola" refers to my letters in the *Messenger* of November 30, and December 21, upon steam cultivation, and expresses his regret that I have closed the correspondence, but at the same time pays me the compliment of asking me to "lend him a hand," as "he is thinking of purchasing a steam apparatus for the cultivation of his farm." "Agricola's" farm of 200 acres is too small to

employ any steam cultivating apparatus, and unless he can get some neighbour or neighbours to join him who have land to cultivate, he had better content himself with good horse-power, or take more land himself. He states that "his average root crop is 35 to 45 acres." I therefore presume that his is comparatively light land, if so, he will not find steam cultivation nearly so profitable as on heavy land. Besides, "Agricola's" fields of "from 6 to 14 acres" are, like his farm, much too small for profitable steam culture, and as he would seem to entertain a sort of religious veneration for the hedges and trees which were "planted by his grandfather," he appears disinclined to interfere with them, or the "nice country appearance about the farm," hence his present idea would seem to be to allow things to remain as they are. If so, he had better leave steam cultivation alone. It will not pay him, and if he has some surplus cash, for which his bankers probably only allow him a very small interest, let it remain there until a more profitable investment can be found than that of steam cultivating machinery on a small farm of light land. Some years ago, I gave a very intimate friend similar advice, but he, being of a sanguine temperament, backed his own opinion, bought a set of cultivating tackle, worked it for years, and I have no hesitation in saying, both from my own observation and the testimony of his neighbours, that if the money expended upon it had been invested in Three per Cent Consols, his family would now be many hundreds, and probably thousands, in pocket. Do not let me be understood as being opposed to steam cultivation; on the contrary, I am a decided advocate for it, and hope to see it extend year by year until that millennial period when, if possible, the soil of England may be made to support the population of England.

Ploughboy, Jan. 16, 1869.

Steam Cultivation.—[The above letter on this subject appeared in last Monday's *Bell's Messenger*; and the following is "Agricola's" reply.]—"Ploughboy," in *Bell's Weekly Messenger*, has certainly "begun with the beginning and ended with the ending" of my letter; but he has not answered it. The "hope" I expressed, that he would lend me a hand must, I see, be "deferred," as he passes over the real portion of my letter without even a note of encouragement to the Editor, that the space so kindly placed at the disposal of men of such wide-spread experience will shortly be filled up. "Ploughboy" may rest assured I am really a farmer, farming 200 acres, or thereabouts, and, I may add, working for my rent, or, other words, livelihood. The question at issue, as I read it, is, not the implement that can do most work per diem, but that exhibits most economy in its application and adaptability to the farm-work generally. If I piece out my work—ploughing and cultivating to one contractor, threshing to another—my next door neighbour, a sort of "Jack of all trades," will drill and harvest for me, "West Indian" will be sending circulars to say he will take me and my 10 qr. to market for a "song"—each of these industrious individuals informing me that farming is a gentlemanly employment. Certainly, with contractors—such "Over Twist" contractors as your correspondent Mr. Harry Rivington (p. 1349, 1868), mentions—it would be gentlemanly employment with a vengeance. Where the employment, except as paymaster? He refers to my grandfather's hedges, assuming I had a religious veneration for an inanimate thing! but the implement can be fashioned to the farm. Now, let us hear his reasons—"Light land," to begin with, detracts from profitability of cultivation,—my fields, like my farm, too small for steam cultivation. But the land is not too light, or fields too small, to pay at the rate of 10s. to 16s. per acre for ploughing, when it appears it can be done for six, or even less. If it can, as it does, bear the higher sum, it certainly can the latter or smaller. I attended Mr. Smith's field lecture, and he pointed out a five-acre field, on the right-hand side of the road going from the homestead, which was cultivated from the green lane, the size being not at all an inconvenience. I must not encroach on your kindness, but allow me once more to ask "Ploughboy" if the statement quoted by Mr. Smith, of Woolston, taken from the *Agricultural Gazette* of 20th January, 1866, is correct or not? Will he add me?—will he aid "Smithsonian" in finding the whereabouts of this cheaper working tackle?—and, on behalf of myself and seven more of my farming friends, will he fill up the gap in the *Messenger*? And will he also follow Mr. Mechi's example, and send a copy to each of the agricultural papers? *Agricola*.

Irish Land Management.—There is a great deal of truth in the letters of both your correspondents, "Fingal" and an "Irish Landlord." Irish land, like land in other countries, varies in different situations, and must be managed as the conditions under which it lies point out. In some cases an English arrangement is possible, in others it must be dealt with according to the peculiar habits of the people by which it is occupied. It is generally wise to give a tenant who has some capital, more industry, and a farm not under 50 statute acres, a lease. There are many judicious outlays a landlord may make, but in some counties, as Meath and Tipperary, it requires considerable tact to improve without incurring the hostility of the Ribbon society, which acts with perfect success and security. The question, however, of the Irish land has become rather political than economic. The demand for "improvements" was never perfectly honest. It meant a good deal more. Perpetuity of tenure, it does not matter how obtained, is what the Irish tenant wants, that which he demands as a right. He looks upon the connection between himself and his landlord as a copartnership. The one has a right to the head rent, the other to whatever his own industry, outlay, or the increase of value may bring. It is, therefore, useless to consider under what conditions the utmost produce can be taken from the soil, what terms are best, and what number of persons the agricultural area of Ireland can maintain,

until it is understood whether or not this claim to copartnership will be granted. A settlement of this question is essential to agriculture. The tenure of land, the principles on which land should be held, require to be fully discussed, but I deny their consideration should be confined to Ireland. If the tenant in one place ought to have a share in the soil, why should it be refused to him in another? If perpetuity of tenure ought to be granted to an Irishman, why is it to be denied to a Scotchman? Are great concessions to be yielded to one class because it is poor, ignorant, and discontented, and refused to the same class elsewhere because it is, in comparison, wealthy, energetic, and respects the law? A "political remedy" is never successful unless it is founded on some principle. To concede to agitation, to satisfy one set of men at the expense of another, may suit party purposes, but will eventually ruin what it was intended to promote. The objection which will be alleged is, that in England the landlord has invested a large capital in his property, while in Ireland it is the tenant who has so done. But in Ireland, also, a considerable capital has been invested in the soil by the landlord, though over a limited extent, believing in the security of his property. The tenant does more in Ireland than in England, but, as far as my experience goes, his improvements are seldom permanent, or of much money value. The capital laid out in Ireland on the land is not one-half of that laid out in England. The social habits, tastes, and wants of the greater part of Irish farmers require much less than do those of an English farmer. The farm buildings with which the Irishman is satisfied, the house in which he lives, the condition of the land, are generally very different from that with which an Englishman or Scotchman would be content. The anxiety to possess land is so great, that every disadvantage is overlooked, and a price above its value offered. There is yet another consideration which largely influences in Ireland the national feeling, not that that system of cultivation should be employed, nor that character of agriculture adopted, which is most profitable, but that which can maintain the largest population. If the farmers are less rich, they will be in larger numbers, and the produce of the soil more equally divided. These are some of the problems which agitate Ireland, and in whatever way they are answered in that country, there will be a corresponding echo in Great Britain. They are not easy of solution, they require careful thought. If they are discussed with calmness and impartiality, it is to be hoped that the relations of landlord and tenant may be improved at least, they will be understood. But no statement of the question fair to all will be attained if it is used by professional statesmen and political agitators for the purposes of party, and none will ensure the prosperity of the country in which the interests of agriculture, practical and scientific, are not fully considered. *Brinsley Marlay, Jan. 26.*

Over-fattened Breeding Stock.—With reference to an article in your last paper on the subject of breeding stock being shown in an over-fed state, I have to inform you that the Highland and Agricultural Society of Scotland adopted the following rule some time ago—"Breeding stock must not be shown in an improper state of fatness, and the judges will be prohibited from awarding premiums to overfed animals." *F. N. Menzies, 3, George IV. Bridge, Edinburgh, Jan. 25, 1869.*

Scab.—I bought in the autumn some sheep infected with the scab. They were put into a field of 60 acres, and their condition was not discovered for two months, during which time they had rubbed themselves against many trees and fences. Towards the end of November they were dressed effectually with mercurial ointment, and are apparently quite cured by the first dressing. I cannot disinfect all the surfaces against which the sheep might rub in so large a pasture, and I want to know at what period I may safely put other sheep into the same field. In common with my neighbours, I have very little experience of this pest, and I shall feel much obliged to any of your correspondents who can give through the *Agricultural Gazette* the information I require. *C. Paget, Ruddington Grange, Nottingham [An answer is given under Notices to Correspondents.]*

Moule's Earth Closets.—Nothing is now said about them. Can you obtain the experience of your correspondents who have tried them? It appears to me one of the most important questions, especially in a manufacturing district, where most of the night soil is worse than wasted. *J. Carter, Nursery, Keighley, Yorkshire*—I have read with great interest the article by "W. B." on Sewage, and the reply to it by Mr. Hope, Parsloes, Barking. With regard to Moule's dry-earth system, could you give an idea of the market value per cwt. of the mixture furnished (for agricultural purposes) by Moule's plan? Have gardeners ever bought it, and what have they given? I think his plan was tried at Wimbledon lately, were the deposits bought by farmers in the neighbourhood? *Amateur.* Will any reader state his experience?

Sewage Farming Prospects.—Thanks to Mr Hope for his reply. The sewage practice he so ably advocates evidently requires a more thorough investigation at the hands of practical farmers like myself than it has yet received, and it affords me much pleasure to find that his paper runs parallel to mine in the main. The objections in my paper are those which have been raised during the past year in the discussion of the sewage question. He answers them one way, I another, so that the two put together give double force to the argument in favour of the Barking practice. As to apparent differences, they belong chiefly to the march of improvement, I being in the vanguard of progress, while he comes up slowly in the rear. Many of my readers, if not the majority, are familiar with the fact that I am no amateur of the Mechi school, but a practical farmer of upwards of 20 years successful experience, during which I doctored farmyard manure and sewage, and grew heavier crops than have yet been

grown at Barking. But in doctoring I did not use guano and superphosphates, &c., either in the hill, liquid manure tank, or flowing sewage. At the same time I have always found farmyard manure sewage subject to improvement, both by preventing waste and adding fertilising matter. And instead of finding fault with my neighbours' doings in the field or dairy, my maxim has been to improve my own practice. In plain English, consider the Barking practice farther behind the march of improvement than it should be. With regard to "facts" and "deductions" it is very unfortunate in the disposal of them. It is only one party in the agreement at Barking, the other party, the sellers of the sewage, being equally interested, and if the sewage is worth three times the money the latter now receive, the time may come when they will be more than more deeply interested financially than the same holds good of other towns. As to the flowing sewage in sewers and open mans, I look at granted (see my paper) that my readers were with the oxidation, and consequent waste of matter in flowing water—the limited space of command preventing me from going into details on this head, so as to refute erroneous argument to the contrary. Thus, the comparison made between musk, a natural product, and a volatile and of sewage, the product of decomposition, is sound practical one, and on that account falls to ground. The argument of liberated ammonia in a room containing stagnant water is a basin devoid of practical force. The analysis of a gallon of sewage at one place and of a gallon at another down the sewer, as at Barking and at the Sands, does not furnish any exact or trustworthy evidence—i.e., facts—as to the waste of the sewers they are the manifest exponents of, and when once liberated they cannot be confined within cast-iron pipes, much less brick sewers. If facts are established, and therefore cannot be thrown by the theoretical deductions of chemists. The replies to the third and fourth objections have not a foot to stand upon, for profits increased and expenses reduced in the usual progressive chemical and mechanical appliances, storm-water can be removed without the expense of desiccation. Sewage tanks are only where farmers cannot get a direct supply from mains when they require it, or but half the quantity they need, and they differ from cesspools in many respects, and as to the application of sewage of any kind, to the land in the frosty weather, it is out of date, and when Essex farmers use sewage then it will be a fact. The question of fresh towns with country milk has just now received stimulus from the Society of Arts, and will afford us greater gratification than to see farmers doubling the number of their much coveted being the practical way of proving an increased for the milk. *W. B.*

Societies.

HIGHLAND AND AGRICULTURAL Jan. 20.—The general meeting of this Society, the Duke of Buccleugh, K.G., President of the Society, occupied the evening. The most noble the Marquis Tweeddale, E.L., elected President, and 73 new members were elected.

THE ABERDEEN SHOW—1868.

Mr KINLOCH, yr., of Gilmerton, said he had been for the information of the meeting, that the last show of the Society, held at Aberdeen in August, was a successful one, although it cost them some £1500. He could not say that the exhibition of classes was equally successful. For instance, the exhibition of thoroughbred horses was a complete wretched failure. The exhibition of the class of at Kelso was bad enough, but at Aberdeen it was worse. He hoped that hereafter the prizes for stock which they themselves did not of. The exhibition of Clydesdale horses and cattle was not such as they were accustomed to the shows of the Society, but there were reasons for that in the refusal of the railway companies to make certain concessions in their regulations for conveyance of stock. He then alluded to the exhibition held in Glasgow by those gentlemen who not send their stock, owing to the failure to suitable arrangement with the railway companies. These gentlemen would have met with the approval of the members of the Society, but what did they do? At the last moment, they organised an opposition in Glasgow, to be held on the same day as the show. He could only wish that these exhibitors heard the remarks that were made in the Aberdeen in regard to their conduct. When seen in the newspapers of the following day that "the Tuesday in Glasgow was the most successful kind that had been held," they knew that the exhibitors were the animals that should have standing in the empty stalls at Aberdeen. He thought, however, that bygones must be bygones. He stated that, owing to the kind services of Mr Hope of Kippendavie, he had good hopes that the companies would make some concessions in regard to the Edinburgh show. He trusted that they would to announce that horses and bulls would be free on their return journey in horse-boxes, and that all stock might be conveyed to and from the special cattle trains. That, he knew, did not meet the demands of the requisitionists in the western districts, but he hoped they would direct their credit for having gone carefully into the matter. He might say that it was the

land. He wished to bring the matter under the attention of the directors, so that they might take it into consideration, and also that possibly it might be connected with the Chair of Agriculture, so that the young farmers might be able to analyse these things for themselves. He made this proposal in sincerity for the use of his brother farmers well knowing the very large sum that was annually paid for special manures and feeding stuff.

Professor ANDERSON said he would be glad to join in any additional precautions so as to enable the Society better to detect adulteration. He did not say that the question of adulteration was in so satisfactory a state as they could wish it to be, but he thought there was less adulteration than there was some years ago. He was quite sure that the number of inferior manures in the market was smaller than formerly.

PREMIUMS FOR REPORTS ON THE SCIENCE AND PRACTICE OF AGRICULTURE.

Professor BALFOUR reported that the following premiums had been awarded for reports since the general meeting in June—

- 1. The Gold Medal of £50 to James Black, Esq., for a report on the Agriculture of Aberdeenshire and Banffshire.
2. The Gold Medal of £25 to George Armatage M.B.C.V.S. (late Professor of Anatomy and Physiology, Glasgow), Leighton Buzzard Beds, for a report on Planting in Scotland.
3. The Gold Medal of £25 to William Brown, junior, F.R.S.E., Stone, Peebles, for a report on the Best Methods for the Arrangement of Byres, Stacks, and Courts for Cattle, with a view to Sanitary Arrangements.
4. The Gold Medal of £25 to George Menzies, Trentham Stoke upon Trent, Staffordshire, for a report on the Commissions which should Regulate the Carriage of Stock by Railway or by Sea, as well as its Transit by Road.
5. The Gold Medal of £25 to Robert Hutchison of Carlisle, Kirkcubbin, for a report on the Profitable Extension of the Poultry Department in a Mixed Farm in Scotland.
6. The Silver Medal of £10 to the author of a report on Experiments and Improvements on Wire Fencing bearing the motto—'Good Fences are Good Neighbours.'

Dr. BALFOUR also stated that the following premiums would be offered in 1869—

Table with 2 columns: Subject and Premium Amount. Includes categories like Agriculture of East Lothian (£30), Farming customs and covenants of leases (£20), Improved varieties of agricultural plants (£10), and Rural economy abroad (£10).

The report was adopted by the meeting.

PREMIUMS FOR REPORTS ON WOODS AND PLANTATIONS.

Dr BALFOUR then stated that since last general meeting the following premiums have been awarded for reports lodged in competition under this department—

- 1. The Gold Medal, or £25, to C. Y. Mickle, forester, Cullen House, Galloway, Banffshire, for a report on the formation and management of young plantations.
2. The Medium Gold Medal, or £10, to John E. Brown, Warr, Oswaldkirk, Yorkshire, for a report on the American and Canadian forest trees adapted for cultivation in Great Britain.
3. The Silver Medal to Robert Hutchison, of Carlisle, Kirkcubbin, for a report on forest trees of recent introduction into Scotland.
4. The Silver Medal to the author of a report on planting on exposed or barren tracts, marked 'Onward.'

Professor BALFOUR further reported that the following subjects have been proposed for the current year—

- 1. Extensive planting by proprietors.
2. General management of plantations.
3. Planting on exposed or barren tracts.
4. Use of economic purposes of Corsican Fir.
5. Forest trees of recent introduction.
6. Advantages of using home-grown timber as compared with foreign.
7. Effects of the very dry season of 1868 on trees and shrubs.
8. Results of seedlings of conifers, the practice of trees grown in Britain, as compared with plants from foreign seed.

TRANSACTIONS FOR FEBRUARY, 1869.

Mr. IRVINE, of Drum, said the next number of the 'Transactions,' being No. 4 of the Fourth Series, would be published in February.

Farmers' Clubs.

EDINBURGH CHAMBER OF AGRICULTURE Jan. 14. —Transit of Cattle by Railway. Mr. REID, of Granton, read a paper on this subject. He said—Railway officials are alive to the fact that sheep and

cattle are taken to the markets from the railway grounds, and are packed in trucks, and are sent to London, but from London, particularly interest, have turned a great ear to the inconveniences and lamentations of their innocent passengers. No better experience could be got of their sufferings than the melancholy description of the recent wreck of the Hibernia. As most of you know, I have for many years been doing all in my power to draw public attention to the grievous and cruel wrong the country has been perpetrating ever since the transport of live stock has been principally accomplished by means of rail and steamboat. In providing the animals with neither water, food, nor shelter, during a period of, it may be, 20, 30, 40, or any other number of hours when on the journey they are made to perform and carried through the air at the rate of from 5 to 10 miles an hour, at other times crowded together for hours together, in a state of hunger, thirst, and general misery, and that, in a cramped space, the laws of both God and man. If the watering, feeding, and ventilating waggon, which I have invented were to be introduced as the only vehicle for the transit of stock, pleuro-pneumonia, and many other diseases which afflict our stock, would be rarely if ever heard of—the population and agricultural community would be saved from serious losses, and our butchers would be able to offer us more wholesome food, and at lower price.

It is a wonder that the present mode of conveying cattle should ever at first have been commenced, without means being provided whereby they could be watered and fed. Of course, it is well known to every one that the entire business of all animals intended for human food is to eat, drink, rest, and sleep, without intermission. The first thing they do when rising from their lair, even in the most weather when feeding on rich sweet grasses, is to go to a watering-place and drink before beginning to eat. And this, on the authority of ancient and modern agricultural writers, they do 12 times during 24 hours. No wonder such lamentable results follow, when these animals are suddenly deprived of all the comforts of their existence, and sent away on a journey of 60 or 70 hours' duration, confined in a close box, which, no doubt, under present circumstances, has this good property, that, when the cattle become mad through thirst, they cannot by any means leave their place of confinement. While the poor beasts are at home it is the constant study of the farmer to see not only that all their wants are supplied, but also the greatest care is practised that they should be kept in perfect health till they are fit for market. What follows then? They are taken out of the fields, or the warm, well-ventilated house, and driven to the first railway station, panting from unusual exertion, reeking with perspiration. They are in this state packed into open-sided trucks, shunted and knocked about. Whoever has travelled at all must have witnessed with horror such scenes, and every human being must feel for such needless sufferings. Eventually, they reach their journey's end in anything but a fit state for market. And apart from the question of cruelty, there is the question of the health not only of the animals themselves, but also of those for whose food they are intended. Cattle or sheep arriving from a long journey, when taken from the fetid hold or truck, will drink of the filthiest pool with relish. This is the sort of preparation for the blood of animals that will shortly after be conveyed as food to the stomachs of human beings. From my knowledge of the natural habits of animals in a healthy state, I am perfectly satisfied that a liberal supply of water should be given to them while confined in a steamboat or truck, once, at least, in every five hours. A draft Bill has been proposed by the Chamber of Agriculture, whereby they propose to give water to animals when on a journey by rail or sea every 10 hours. Now, no thought is required to tell our judgment that this would be a grave error. When I have already shown that cattle when pasturing on rich grass require to drink at least every two hours, how can they be satisfied or kept in health if they only receive a drink every 10 hours? If we would in this matter judge them more by ourselves, we would find that in our requirements on a journey to London, even while sitting at our ease in a first-class carriage, we are almost certain to partake of liquid refreshment two or three times during the journey.

But not only in a humane point of view has the subject of transit of stock great interest and importance to a commercial country such as ours. Leaving altogether out of sight the barbarous inhumanity practised in the present mode of conducting our extensive cattle traffic, and taking a purely economical view, we arrive very nearly at a true conclusion of its evils to our prosperity and trade, and also to the well-being of the entire population. This has been proved from facts which are clear and undeniable when the matter is investigated. The statistics of the Norfolk Insurance Company, as given by Mr. Finlay Dunn lately to the Scottish Chamber of Agriculture, show that the death-rate of cattle from pleuro-pneumonia alone ranged from 13 to 63 per cent. in 1863, and in 1864 to 35 per cent., under the restrictions of 1866 it fell down to 1 per cent., and never rose above that point until the unrestricted traffic was resumed about the end of 1867, when, during the first seven-and-a-half months of 1868, under the old system of cattle-transit, the death-rate reached 30 per cent. From this it is shown clearly where the loss to the country lies. Besides, we must take into consideration the large quantities of beef and mutton which are damaged from the knocking about the cattle receive while in trucks of the present construction, from the pressure of one animal upon another while being shunted, or going up and down inclines, when too many animals are packed together, so that really much meat is rendered unfit for human food from bruises received in this manner. And to meet this great loss which I have endeavoured to point

land. He wished to bring the matter under the attention of the directors, so that they might take it into consideration, and also that possibly it might be connected with the Chair of Agriculture, so that the young farmers might be able to analyse these things for themselves. He made this proposal in sincerity for the use of his brother farmers well knowing the very large sum that was annually paid for special manures and feeding stuff.

Professor ANDERSON said he would be glad to join in any additional precautions so as to enable the Society better to detect adulteration. He did not say that the question of adulteration was in so satisfactory a state as they could wish it to be, but he thought there was less adulteration than there was some years ago. He was quite sure that the number of inferior manures in the market was smaller than formerly.

THE DUMFRIES SHOW IN 1870

Mr. K. VLOCH reported, in reference to the show of Dumfries—consisting of Dumfriesshire, the counties of Kirkcubright, and Wigtonshire—asking the directors to hold the show at Dumfries. That the show had been favourably entertained, and he had been instructed to submit the following resolution to the directors:—That this meeting be requested to submit the following resolution to the directors of the Society being held at Dumfries in 1870 and authorise the directors to make the necessary arrangements. The resolution was adopted.

CHAIR OF AGRICULTURE

Mr. LAWSON, of Bortwick Hall, reported that the directors had agreed to by the general meeting in 1868, in regard to the endowment of the Chair of Agriculture in the Edinburgh University, had been agreed to. He stated that the agreement was that the sum of £100 per annum should be given by the Government for ten years, on condition that Government should pay an equal or a greater sum; and that it had been agreed that the directors should submit to the Treasury Commissioners of the Treasury the estimates. The vote was carried and the first half year's advance had been paid by the Government and by the Society. The report was approved of.

VETERINARY DEPARTMENT.

Mr. GILCHRIST, of Walsby, convener of the Veterinary Department, reported that up to the present time the directors had not yet got an independent Royal charter for a Veterinary College. It would be renewed on the 1st of January. They must have a Royal charter before the summer they could get it. He proceeded to report that the Society had a very great interest in all that concerned the Veterinary College. On the 1st of November last he attended the opening of the Veterinary College, with pleasure to a most excellent dinner given by Dr. Dalzell to the students. He reported that the very numerous attendance, and the very high standard of the College was now in a very promising condition, and he thought it would be well to be under the able direction of Principal Dalzell and those who laboured with him.

CHEMICAL DEPARTMENT.

Professor ANDERSON reported the proceedings connected with the Chemical Department. In the course of his remarks he said that he had arranged for the present season, which were likely to be of a very important kind. They were but on a small scale, but such as would go over the whole rotation. He had been afraid that, owing to the drought, the experiments would have been a failure, but he was glad to say that they had turned out well up to this time. In the course of the work of the laboratory, he believed that a number of analyses had exceeded that of any other year. He had been successful in detecting many cases of adulteration, so that farmers were enabled to recover from the sellers a considerable sum of money. He thought it was connected with the most important part of the Highland Society. It was particularly important in a year like this, when the weather had been so very meagre. He had been very much interested in the chemical department of the Highland Society, in which that gentleman had this year been very successful. An instance was given of a cake of soap, having been fed on cakes containing arsenic, and the result was that the arsenic was found in the press stamp. The cake had been analysed in the chemical department of the Highland Society, and it was found to be more useful by perhaps appointing a person to take steps to stop, as far as was in his power, that abominable system of adulteration. He thought that few of them knew what their food was, and what fertilizers to put into the

out, we require to fall back for a supply from abroad thereby causing large sums of money to be paid out of the country for a perishable article that could with careful management be obtained at home, as this country is perfectly capable of rearing and feeding as many animals as would supply the whole population, if all the departments of the business were carefully managed. Not that I object in the least to bring foreign stock into this country from any fear of infection, if the animals are healthy when put on board, and properly and carefully attended to during the journey. To meet any expense that railway or steamboat companies would necessarily incur in effecting a change so greatly required, more money would require to be paid by the feeder than is paid at present. And thus, by the slaying of an experienced London salesman, would be paid back to them a hundredfold. He says cattle worth from 30/ to 40/ are depreciated to the extent of 2/ per head during the journey from the north of Scotland to London. And there can now be no doubt that the stoppage of the cattle traffic was a very serious loss to all railway companies.

As I do not wish to exhaust your patience, I will now draw to a conclusion with a short extract from the "Story of the Truck." "For my own part, though I am no philosopher, yet I hold to this, that whatever our reason proves to be wrong or defective, it at the same time enforces the duty of change and reform; that no palpable evil is to be passively submitted to as incurable. In such spectacles as dumb beasts imprisoned for days at a stretch in steamboat holds or railway trucks, no matter whether the season be scorching from a strong sun overhead, glaring like a ball of fire, or the keen-outting frosty wind blowing strong, accompanied with hail, sleet, or rain, intensified in bitterness from the speed of the train, enough to freeze up the very marrow—all who dispassionately look at this matter must behold an enormous wrong, a terrific evil, and in their heart of hearts cry out for a remedy to get such a wrong redressed. If railway companies were to be held responsible by law for the proper delivery of live stock in the same condition and value that they received them, a change in transit would soon be adopted; but there is little prospect of such a boon till Government comes forward with its strong arm to settle the matter. Every one remembers the erection of drinking fountains in our streets, and what an immense benefit has resulted from them to men, horses, cattle, and dogs; and no doubt they have been the means of protecting great numbers of the canine race from hydrophobia."

Reviews.

Revue des Deux Mondes, November 15, 1868. An article by L. de Lavergne on "l'Enquête Agricole" in France.

In an article at p. 370 of the Agricultural Gazette, 1866, we gave a statistical account of the agriculture of France. Low prices for corn had been the rule for several years. In 1865 the average price of Wheat was 38s. 6d. per qr. English farmers were not then very flourishing, but the French were actually distressed. The general complaints gave rise to a discussion in the Chambers, followed by the appointment of a Government inquiry into the condition of agriculture. This investigation has now been completed, and we are able to lay the results before our readers. We ventured to predict that the cause of complaint was beyond the reach of an "inquiry," that it arose from the great abundance of corn, followed, in accordance with a well-known economic law, by such a disproportionate depression of price as left the farmer a loser by his increased crop. Forty shillings a quarter is not a satisfactory price for Wheat, but the English farmer can produce it at a lower price than his next neighbour, and has nothing to fear from his competition.

The central system in France gave the Government a very efficient machinery for undertaking the investigation referred to. The country was first divided into 28 districts, under presidents chosen from among the members of the Chambers, or from Government officers. These were each assisted by a Government official, and were placed in communication with the prefects. Thus about 200 Commissions, of 10 or 12 members each, were formed, and they held their sittings in all the chief towns. The numerous agricultural societies and farming clubs in France were catechised by means of printed lists of questions. This elaborate inquiry has been conducted in this way in the most systematic manner, and the result must necessarily be the collection of an immense amount of information on everything relating to farming and to rural economy generally.

The enormous mass of documents, containing all that could possibly be known on agricultural matters, or imagined by the lively French mind, had first to be condensed by official pens, as after a census or annual return of crops here. The solid and substantial matter contained in these rivers of information has been separated by a process which may perhaps afford a wrinkle to the Metropolitan Sewage Company, who have not yet succeeded in eliminating the good from the bad at Barking. There are 28 district reports in all, of which 12 have been "elaborated" and printed at the Imperial Printing Press, in a style worthy of Napoleon III. The final result is a quarto volume of 550 pages.

Of course it is the one of the Minister of Agriculture to show that everything prospers under the Empire, or to find a good excuse for any awkward fact, but in M. Lavergne we have a critic who cannot be deceived. Our readers will recognise him as the author of works on the rural economy of England and of France, and as a very eminent agricultural statistician.

The following facts relating to agricultural affairs have been culled from the minister's quarto volume.

The value of landed property has decreased in the past 20 years. The official and most plausible explanation is that the country being more prosperous, capital which formerly overlaid now finds new outlets, and is diverted from the land. Probably the true explanation is the diminution in the rural population and consequent decrease in the number of purchasers of land. The moderate-sized properties have suffered most.

There is no jealousy between the large and petty farmers. The little holders are famous for their laborious habits and their economy. They are considered a benefit and a necessity to the community, and a great stay to political security. It is the excess of division that is to be deplored, as when 2 acres are divided into ten or a dozen scattered plots. It is a state of things as found in the West especially, where in one commune 2080 acres are divided among 270 proprietors, whose little estates are split up into 388 plots. Lawsuits between neighbours are the consequence, and great loss of time and labour in cropping and cultivating. This evil, centuries old, and arising from the law of succession, is increasing.

The general opinion of the law of succession, as gathered by the "inquiry," is in favour of its distribution amongst the members of the family, but is opposed to the existing article in the civil code which allows any one of them to insist on his share being paid both in personal and landed property, when both are left behind. A division of the property is recommended, which will admit of as little splitting up of landed property as possible. A law is also alluded to enable neighbours to make exchanges on payment of a duty of one franc.

The insufficient amount of capital invested in farming is ascribed to the following causes:—The temptation of more remunerative investments, the scarcity of manual labour, the existing system of mortgages; the delays and formalities connected with d. straits and forced sales, and the general inclination of owners to buy land, instead of putting more capital in their present occupations. The investments which have drawn off capital have been, foreign securities, lotteries, which are a very attractive mode of gambling, and above all, the state loans. The sum required in the past 15 years to meet the expenses of the army and of enormous public works, has amounted to between 200,000,000 and 240,000,000.

The agricultural loan and credit companies have at present been of little use, in consequence of their charging a high rate of interest. It is proposed to abolish that article in the civil code which only allows an owner to give as security for a loan such property as can be actually placed in possession of the lender, or of a third person agreed upon.

The decrease in the rural population in the past 20 years, owing to the general movement of the work-people towards the towns, where they are better paid, has occasioned great alarm to farmers and an inconvenient rise in wages. The enormous standing army weighs most heavily on the resources of the country. It draws off the labourers, checks population, and increases mortality, even in time of peace, in consequence of the unhealthy conditions of barrack and garrison life. The increase of the population has always been in inverse ratio to the strength of the army. Here is the great drawback to agricultural prosperity. There is but one opinion on the subject of the annual levy of 100,000 men, it is more than the country can support. Three-fourths at least of the men are drawn from the country. The proprietor class is divided into large, moderate, and small owners, of these the last suffer most. A peasant farmer who loses his son is almost a ruined man. It shows the attractive force of towns, that in the department of the Seine their population has increased by 700,000, while the adjacent country districts are half deserted.

M. Lavergne is of opinion that the two most effective reforms for the restoration of rural prosperity and population are a reduction in the army and in the scale of public works. He recommends machinery to supply as far as possible the deficiency in labourers; and is in favour of savings banks and mutual aid societies, and of special instruction on subjects connected with horticulture and agriculture.

Farm Memoranda.

HAISBOROUGH, NORFOLK.—The following remarkable history has probably never been paralleled, and may, therefore, be recorded as a genuine agricultural maximum. It relates to a period of 15 years ago, but is authenticated by trustworthy eye-witnesses. Mr. William Cubitt, of Bacton Abbey, North Walsham, well known in Norfolk as an energetic practical agriculturist, writes as follows:—

"I now send you a short history of the extraordinary field of Wheat to which I previously alluded, as also a communication on the subject from the owner and occupier of the land, George Wilkinson, Esq., whose veracity may be relied on.

"This field, situated in the parish of Haisborough, about 1 furlongs from the sea, contains 5 a 1 r 38 p, and is of average fertility with the lands adjoining, being a good loamy soil resting upon a strong subsoil, but sufficiently porous not to require draining, and suitable to every kind of cropping.

"In 1813 it was sown with Peas, probably preceded by Wheat. In the autumn of that year it was again sown with 'Spalding' Wheat—about 3 bushels of seed per acre. It came up thickly, and in the following spring, and during the summer it presented an unusually luxuriant appearance, particularly when fully shot into ear, so much so as to attract the attention of all passers-by. Many bets were made by practical men as to its probable yield, some estimating the produce at 9 quarters per acre. The field was harvested separately, and on threshing yielded 11 quarters 2 bushels per acre. In the same season and upon land almost

adjoining, but occupied by another, 10 quarters were produced. In the parish from which I received the above information, the average yield of Wheat per acre, near the sea, is 7 1/2 to 9 quarters of Wheat per acre, and an equal quantity of Barley. There are the largest crops on this neighbourhood—5 quarters of Wheat per acre from 5 to 6 quarters of Barley, being a full crop. These heavy crops to which I have alluded, are not in any degree owing to high or extra-fertile soil, although 1844 is of a very recent date, yet it was not the custom upon the good land of this district, as now, to use artificial manure for the purpose to consume them with so great an advantage as cake and other artificial food as during the last 20 years; and yet, for all this, the produce does not perceptibly increase; on the contrary, with regard to inferior grain, especially Barley, it has been in general complaint through this part of the country, it has of late years deteriorated both in quantity and quality; therefore I cannot but arrive at the conclusion that extra prolific crops are not so necessary consequences of high farming as is generally supposed. Now, 1844 being the most prolific ever known in this neighbourhood, the question arises, What were the peculiarities of that season? I am only in a position to assert that the summer of that year was the most genial I ever remember. The drought was not equal to the two just past, from the month of March till the end of August, had an unusual number of sunny days, and was free from storms and atmospheric changes."

"Since writing the above I have been informed by Mr. Wilkinson that the field had not been treated differently from other fields on the farm. The usual four-course system was pursued to lessen the acreage of the root crop, and the custom on such lands to take a crop of Peas after Wheat, and then Wheat again, as was the case in the instance referred to. With regard to the crop of 10 quarters per acre, it was grown by a man (Mr. Howes) who had occupied land in the parish for a period of 50 years, and who had been heard to affirm that he never before grew a crop approaching to such a crop; 7 quarters per acre was the largest crop his land ever produced prior to 1844.

"It may also be interesting to state that Mr. Wilkinson again planted Wheat on the field in 1845, and the yield was something less than 4 quarters per acre. He farms 400 acres, and the land is of the finest quality. His statistics, given below, are of 4 imperial bushels.

"The land I occupy is very similar to that of Mr. Wilkinson, and I come to the conclusion that to farm it as he does, and stick to the usual four-course system, is attended with great loss and disappointment. A plan of late years has been to pursue a four-course, but to crop close and extend the rotation, for instance, thus:—1, Turnips or Mangold; 2, Wheat or Oats; 3, Barley; 4, Clover or Beans; 5, Wheat, which is a kind of five-course, care being taken not to lay down more manure than is required for the use of my horses. And therefore, I usually grow a field or two of Wheat, which always grow as large a shift of roots as possible, and are generally well paid by the water grazed upon by the cattle, and also by the means thus afforded of the straw made into good manure."

Mr. Wilkinson, the owner of the field, writes thus to Mr. Cubitt:—

Dear Sir, — I am unable to find the produce of the crop grown in 1844 in the stable case containing the produce exceeded 22 coombs an acre, and I think it amounted to 22 coombs 2 bushels and 1 pint. I attribute this extraordinary crop to Peas, and not to any particular course of husbandry, but to my average for seven years, including 1844, being 10 quarters and Barley; and am yours truly,

Table with 2 columns: Year, Harvest. Rows for 1841, 1842, 1846, 1847, 1848, 1849, 1850. Values range from 10 to 11 quarters and bushels.

Average produce per acre for the last 7 years 10 1 3 or 5 qrs. 1 bush. 3 pecks.

[We give this history from a collection of rural maxims, published eight years ago by Mr. Morton, in the Journal of the English Agricultural Society, hoping that some of our correspondents will be induced to report to us instances of agricultural maxima which the harvest of 1844 has doubt presented.]

The Poultry Yard.

THOSE who aspire to honours at the poultry show of 1869 should now be very busy with their chickens. We hope the exhibitors will be so lucky that at present the chickens are so plentiful that we need not count them. A proverb tells us not to count the chickens until they are hatched, but we offer a few remarks on the subject of the ones from which they are expected, so doing we may increase their number. The time of year, and for the next two or three months, for setting are now by the practical and dealers. Many a lady whose only pleasure is to see a man to whom she has great pleasure, in his half hour's reference to her or shop, make the pleasure profitable by the purchase of a pen of prize or common poultry.

CHOICE FLOWER SEEDS.

MESSRS. VEITCH & SONS,

ROYAL EXOTIC NURSERY, CHELSEA, LONDON, S.W.

DESIRE TO DIRECT PARTICULAR ATTENTION TO

THE FOLLOWING SEEDS OF STERLING MERIT

NOVELTIES OF THEIR OWN INTRODUCTION,

Offered for the first time.

ASPERULA AZUREA SETOSA

A most profuse-blooming hardy annual, a native of the Caucasian mountains. It is of a dense habit, attaining an average growth of 1 foot, and covering itself with bunches of beautiful light blue flowers, which are very sweet scented, lasting a long while in perfection. We recommend this beautiful annual on account of its striking colour, delightful perfume, and the profusion with which it blooms, one plant having open at the same time hundreds of heads of flowers, which are produced as well from the axil of every leaf as from the ends of the shoots.

Per Packet, 1s. and 2s. 6d.

OXALIS VALDIVIANA.

A showy hardy Oxalis, for the introduction of which we are indebted to our collector, the late Mr. R. Pearce. It is quite hardy, the plants having already passed several winters in the open ground unharmed. Its habit is compact and good, and it throws its bloom spikes well above the foliage. The flowers are of a bright yellow colour, sweet scented, and produced in bunches of large size. For mixing with bedding plants of all kinds in flower gardens this

plant will be found valuable, as it will form an admirable contrast with other colours. Per Packet, 1s. and 2s. 6d.

PALAVA FLEXUOSA.

A most beautiful annual, received from Bolivia through our collector, the late Mr. R. Pearce. In growth it attains an average height of 15 to 25 inches, and produces in the greatest profusion its charming flowers, which measure an inch in diameter, and are thrown out in great profusion. Its leaves are very neat and graceful. In colour the greater portion of the flower is of a bright rose, fading slightly towards the centre, whilst the base of the petals is almost black, producing a dark eye, which contrasts beautifully with the other portions of the flower, rendering it once most striking and effect. It succeeds admirably either in the open air or as a greenhouse and greenhouse decorative plant. At the Great International Horticultural Exhibition in London were awarded the 1st Prize for the best three new plants, the Palava being one of the winning set.

Per Packet, 1s. and 2s. 6d.

OTHER NOVELTIES,

Highly recommended by the raisers, from whom supplies have been obtained.

Abronia arenaria.

Per packet, 1s.

Amaranthus elegantissimus.

Per packet, 1s. 6d.

Amaranthus speciosus aureus.

New Golden Prince's Feather. Per packet, 1s.

Aster, Giant Pæony-flowered Perfection.

Per packet, 1s. 6d.

Nasturtium Golden King of Tom Thumbs.

Per packet, 1s.

Primula sinensis fimbriata punctata elegantissima.

Per packet, 2s. 6d.

Zinnia elegans pumila fl.-pl.

IMPORTED COLLECTIONS OF FLOWER SEEDS,

Obtained direct from the most celebrated Continental Growers, sent out in the original papers, and strongly recommended as being of the very best quality.

Asters.

Dwarf Chrysanthemum-flowered, 12 distinct colours, separate	s. d. 2 6
Tall Chrysanthemum-flowered, 12 do. do., do.	2 6
Truffaut's Perfection Pæony-flowered, 12 do. do., do.	3 0
Globe Pæony-flowered, 10 do. do., do.	2 0
Pompones imbricated, 12 do. do., do.	2 6
Crown or Cocardeau, 6 do. do., do.	1 6
Raid's Improved Quilled, 10 do. do., do.	1 0
Victoria, very fine, 8 do. do., do.	2 6
Ranunculus-flowered, 6 do. do., do.	2 0
Empereur or Giant, 6 do. do., do.	1 0

For packets of the above, in finest mixed colours, see Catalogue, page 37. Messrs. V & S were awarded a Special Certificate for the excellence of their Asters, of which they exhibited a large collection at the Royal Horticultural Society's Meeting, Sept. 4, 1868.

Stocks.

Dwarf German Ten Week in 12 distinct colours, separate	s. d. 2 6
Large-flowering German Ten Week, in 12 do. do., do.	2 6
Pyramidal Large-flowering Ten Week, in 12 do. do., do.	2 6
Earliest-flowering Autumn, in 6 do. do., do.	1 0
Empereur Large-flowering, in 8 do. do., do.	2 0
Brompton, in 12 do. do., do.	2 0
Cocardeau or Giant Cape, in 8 do. do., do.	2 0

For packets of the above, in finest mixed colours, see Catalogue, page 47. From Mr. Cox's splendid collection, see *Gardener's Chronicle* of 1868, page 820.

Antirrhinums.

Assortment of 13 finest varieties, separate, 2s.

Balsams.

Smith's Camellia-flowered, in 9 distinct colours, separate, 2s. 6d.	2s. 6d.
Camellia-flowered or Blotched, in 8 do. do., do., 2s. 6d.	2s. 6d.
Rose-flowered, in 8 do. do., do., 2s.	2s.

Cannas.

Assortment of 13 finest varieties, separate, 7s. 6d.

Carnations and Picotees.

Self or One-coloured, in 12 vars.	Perpetual Flake, in 12 varieties
Flake, in 12 varieties	Perpetual Bizarre, in 12 varieties
Bizarre, in 12 varieties	Perpetual Fancy, in 12 varieties
Fancy, in 12 varieties	Picotees, white ground, in 12 varieties
Yellow Flake, in 12 varieties	Picotees, yellow ground, in 12 varieties
Yellow Bizarre and Self, in 12 varieties	Picotees, Perpetual or Tree, in 12 varieties
Yellow Fancy, in 12 varieties	
Perpetual or Tree, Self, in 12 varieties	

The above superb Collections, 3s. 6d. each.

Cockscombs.

Dwarf Varieties, in 12 distinct colours, separate, 2s. 6d.

Delphiniums.

Assortment of 12 choice varieties, separate, from our own splendid collection, 2s. 6d.

Double Helichrysums.

Assortment of 10 splendid varieties, separate, 1s. 6d.

Everlastings.

Assortment of 25 best varieties, separate, 4s.

Assortment of 12 best varieties, separate, 2s.

Hollyhocks.

Saved from a choice Collection, in 12 named varieties, 1s. 6d.

Ipomceas.

Assortment of 12 finest varieties, separate, 2s.

Larkspurs.

Double Dwarf Hyacinth-flowered, in 10 distinct varieties, 2s. 6d.

Double Dwarf Rocket, in 10 distinct varieties, 2s. 6d.

Double Tall Stock flowered, in 5 distinct varieties, 2s.

Marvel of Peru.

Assortment of 10 finest varieties, separate, 1s. 6d.

Ornamental Grasses.

Collections of 50 finest varieties, 6s.

Collections of 25 finest varieties, 3s. 6d.

Collections of 12 finest varieties, 2s.

Ornamental Gourds.

Collections of 24 finest varieties, 2s. 6d.

Collections of 12 finest varieties, 2s.

Giant Gourds.

Collections of 12 finest varieties, separate, 2s. 6d.

Petunias.

Assortment of 12 varieties, separate, 1s.

Phlox Drummondii.

Assortment of 12 finest varieties, separate, 1s. 6d.

Poppy.

Pæony-flowered, in 10 distinct colours, separate, 1s.

Carnation, in 12 distinct colours, separate, 1s.

Portulacas.

Double-flowered, in 6 finest varieties, separate, 1s.

Single-flowered, in 8 finest varieties, separate, 1s.

Salpiglossis.

Assortment of 10 finest varieties, separate, 2s.

Scabious.

Large-flowered, in 8 distinct colours, separate, 1s. 6d.

New Dwarf, in 6 distinct colours, separate, 1s. 6d.

Wallflower.

German, Double, in 10 splendid varieties, 1s.

Zinnia elegans.

Double-flowered, in 4 distinct colours, separate, 1s.

Single-flowered, in 6 distinct colours, separate, 1s.

SUBTROPICAL AND ORNAMENTAL FOLIAGE PLANTS.

MESSRS. VEITCH AND SONS have secured supplies of Seeds of the best and most admired Plants in an important section, full descriptions of which will be found in their "VEGETABLE and FLOWER CATALOGUE for 1869," which will be forwarded Post Free on application.

Assortment of 12 best varieties of the above, 5s.
 Assortment of 24 do. do. 10s.

AGRICULTURAL SEEDS OF THE CHOICEST AND MOST GENUINE DESCRIPTION

60, BUCHANAN STREET, AND NORTH WOODSIDE NURSERIES, GLASGOW.

LONDON AND CONTINENTAL SEED COMPANY,

68, WELBECK STREET, CAVENDISH SQUARE, LONDON, W.

THE LONDON and CONTINENTAL SEED COMPANY has purchased the old and important Business of Rendle & Co., of Plymouth, which has been established for nearly 100 years.

THE LONDON and CONTINENTAL SEED COMPANY. - MR. RENDLE, the head of the Firm, has consented to be the Managing Director of this Company.

DISCOUNT of TWOPENCE in the SHILLING will be taken off the published prices of any London or Provincial Seed Merchant.

DISCOUNT of TWOPENCE in the SHILLING will be taken off the published prices of Seeds for the Farm, the Kitchen Garden, and the Flower Garden.

DISCOUNT of TWOPENCE in the SHILLING. - This new system of supplying Seeds for each purpose is the same plan so successfully introduced by Mr. Rendle, the Managing Director of the Town and Country Book Society.

DISCOUNT of TWOPENCE in the SHILLING. - The Bookselling system, of taking off a large Discount to all cash purchasers, is now introduced into the Seed Trade by the LONDON and CONTINENTAL SEED COMPANY.

SEEDS, the NEWEST and FRESHEST, all the growth of 1868. - Another new system introduced by the London and Continental Seed Company, is to dispose of all surplus stock at the end of each season, so that the new season is commenced without an ounce of old or imperfect seed.

SEEDS, all the growth of 1868, can be obtained from the LONDON and CONTINENTAL SEED COMPANY.

THE LONDON and CONTINENTAL SEED COMPANY have made arrangements with the most important Continental Growers for the quick delivery of all New Seed. Express Parcels every week in season from the leading Continental Cities.

THE NEW GARDEN SEED LIST is now ready, and can be had on application, Gratis. A Discount of Twopence in the Shilling off all Garden Seeds.

THE NEW FARM SEED LIST is now ready, and can be had on application, Gratis. A Discount of Twopence in the Shilling off all Farm Seeds.

THE ILLUSTRATED NEW FLOWER SEED LIST is now ready, and can be had on application, Gratis. It contains numerous Illustrations of the Choicest Novelties. Everyone who has a Flower Garden should have a Copy. A Discount of Twopence in the Shilling off the price of all Flower Seeds.

LONDON and CONTINENTAL SEED COMPANY. - Purchasers of all kinds of Seeds are strongly recommended to obtain the CATALOGUE now published by this Company.

ADDRESS, LONDON AND CONTINENTAL SEED COMPANY, 68, WELBECK STREET, CAVENDISH SQUARE, LONDON, W.

Among other seedlings of Mr. Donne's, some of which are not yet sufficiently tested, I may mention a fine cider Apple, equal to the best I have seen, which is our best fruit hereabouts for the Jersey. Mr. Donne's fruit, which I have named the *Champagne*, is rich in all those qualities that are requisite for producing the finest cider its liquor, when properly treated, will vie with the wine of which it bears the name, and Mr. Donne's cellar contains a quantity of this kind that would puzzle a connoisseur, for Mr. Donne is as much famed for his wine-making as he is for his ardent pursuit of fruit raising and fruit culture. *John Scott, Merritt, Taunton, Somerset*.
The Apple sent by Mr. Scott is of medium size, strongly Pearmain-shaped. It has a smooth even surface, skin pale yellow, considerably suffused with

russet, and slightly shaded with scarlet on the sunny side. Flesh firm, moderately juicy, with a sweetly acid flavour, tolerably pleasant, but not rich. In appearance, as well as in the texture of its flesh, this Apple, with the exception of its acidity, is very similar to Adams' Pearmain. White Cackle Pippin seems much too acid for that variety. We have our doubts as to the correctness of the name given by Mr. Scott, as it is generally exceeding sweet and pleasant. Eds.]

GLAZING AND GREENHOUSE BUILDING.

I SEND you a rough sketch of my new system of glazing and greenhouse building, by which putty is entirely dispensed with. Instead of putty, India-rubber rollers are fixed by the carpenter, with galvanised

screws, to the side of the glass, and the work of the workmen is done easily and quickly. A groove is cut in the bar, just sufficient space being left to obtain a slight pressure from the roller. A groove in the ridge receives the upper end of the square, and the lower end is fixed with a galvanised screw at bottom, just leaving a small space wherein to insert a thin ash wedge between the glass and the screw. If the rollers are fixed by gauge, there will be no difficulty in glazing a house 100 feet long by 12 feet wide, in three days, by a man and a boy, and it requires no painting after it is done, the saving of labour is very obvious. And, when the house requires painting, the glass may be stripped off very quickly, and placed in position each space against the outer wall, when the painting can be

more readily, quickly, and efficiently performed, as there is no glass in the way. The squares butt against each other, consequently the glass must be cut true, and none inferior to 20 oz. should be used. There

should be a little play allowed between the bars and glass, for inequality in size and imperfection in cutting square. There is also by this mode of glazing less risk of breakage, and when a square is broken it

can be mended in one minute, by simply taking out the screw and pushing the new square into the hole of the broken one. This advantage is not to be obtained of any workman who glazes in the

and cost but a trifle; the screws may be had of most iron merchants.
We have now used this system for three years, and are so satisfied with it that we shall never more run in the old groove. I was looking at our glazier the other day chipping out the putty of a broken square, and getting in a new one, and am certain I could have put 20 squares on the new system in the same time which he took to put in one on the old. The bars being channelled, any wet that drives against them is carried down and discharged at the bottom. No drip occurs at the joints, and when from defective cutting the squares do not meet quite close, any water that enters runs down the inside and escapes over the plate, which slopes outwardly, and has two channels of slight depth run out in each space. I use glass 12 by 26 inches, and find no difficulty in securing panes of this size.
The plan of ventilation is very effective and simple, being composed of two folding shutters the whole length of each side, and as the ridge is double, a space of say 9 inches dividing it, there is an opening for a vertical lift of a board 11 inches wide the whole length of the house. This system affords an effective aeration of the structure even, to excess, and must be modified

according to the weather by the partial opening of the vents. The inner supports consist of iron arches, 2-inch bar, and the interior view is exceedingly light, airy, and graceful.
The cost of these structures, compared with those constructed on the old system, is very economical. If desirable, I will furnish you with statistics. *F. T. Smith, The Nurseries, Dulwich, Nov. 10. [Pray do. Eds.]*

THE ESPIRAN GRAPE.

THIS is a very popular out-of-door Grape, better known as the Esperione. Espiran is, however, the true name (see Hogg's "Fruit Manual"). I am often astonished at the very high character which this Grape receives in your columns. I can only fancy that somehow or other your correspondents must be cultivating some other variety in its stead. I know that the Black Hamburgh and Frankenthal have been by some confounded with it, indeed, we have here in these gardens received cuttings of the Esperione (so called) several times, and they have almost always proved to be the Black Hamburgh. Although I have been present at nearly all the fruit shows for some years

past, I can only remember one instance of the true Espiran having been exhibited, excepting those from the Society's Garden, Chiswick. I think we have the late Mr. D. Beaton to thank more especially for a great deal of the confusion existing in respect to this Grape. He it was who wrote and praised it up so much in his characteristically energetic style, and gave it a character for excellence to which it can lay no claim whatever. The Vine which poor Donald lavished all his high-sounding praises upon, proved to be nothing more nor less than the true Black Hamburgh. There is little doubt, from Mr. Beaton's position, and the respect in which his writings were held, that cuttings from the false Espiran Vine were distributed pretty freely throughout the country. I only, of course, advance this as an opinion; but as it coincides with what I have so often proved, I do so the more readily.
The Espiran, in my opinion, is quite a third-class Grape, judging of it by the standard of flavour. The only recommendable qualities to which, in my opinion, it can at all lay claim, are its fertility, and hardy constitution. It may also very probably be a good wine-making variety, but I cannot answer for that. I have cultivated the true Espiran Grape in heat and on the open wall, and I must say that I am disappointed with it. Grown in heat it produces good sized bunches, and the berries colour beautifully, but they are very leathery and frequently of an astringent flavour. Grown in the open air it also bears and colours well, but I have never tasted a berry much better than a Sloe—at all events it is decidedly unpleasant to eat; while on the same wall Royal Muscadines and Black Front gnaws have been of excellent flavour. I tasted some berries from a bunch that was exhibited (I think) by Mr. Dewdney, of Dorking, at the meeting of the Fruit Committee on October 23, grown in the open air. They were abominably bad, judging them in comparison with others from the same place.
The Espiran is a very distinct Grape, easily distinguished by its wood, leaves, and fruit. The wood is very hard, and growing in staves very highly coloured—a deep reddish-brown, when in a ripe state (i.e., the young shoots) it has a beautiful and very distinctly striped appearance, dark brown and

FEBRUARY 6, 1868.

of soft soap, sulphur, &c.; also dusting over with sulphur in summer, but without effect. It appears to be very similar to the Potato disease. An old gardener, who has done the nailing here for nearly 30 years, tells me the trees were similarly attacked some years ago, when, after a few years, the disease disappeared. It was then, after rather more than 12 years, the first time it has been here, and this year they are again attacked. It attacks Peaches and Nectarines, and I have sent specimens of all stages of its development, from the first spot to the killing of the wood. The specimens Mr. Berkeley had were forwarded from me through the kindness of the Rev. H. Dombrain, who has seen the trees, but to whom the disease is quite new. The Peach shoots above mentioned were submitted to the most experienced horticulturists in England, and they give it as their opinion that such an effect must be produced by the causes mentioned by Mr. Berkeley at the general meeting. It must be recollected that without an opportunity of examining a particular locality it is impossible always to speak with perfect certainty; all that can be done is to state the probable cause, and even should that fail to be borne out by facts, the cultivator will at least be able to eliminate one possible element in his judgment. As the disease is not confined to the late peculiar season, but has existed for years, we cannot help thinking that the fault is to be found in the roots. We believe that the Peach trees which had suffered so much at Chatsworth were restored by removal of the old sodden soil about the roots, replacing it with a congenial compost. On examination of the specimens just received it is quite clear that the constitutional condition of the plants was somewhat fresh stimulus. The disease often, though not always, commences at the bud, which dies and communicates the subjacent tissue, there not being strength enough below to throw off the young diseased wood. We have little doubt that if the roots are inspected, and proper compost supplied, that the health of the trees will rapidly improve. At any rate, it is worth the trial. Send the leaves when first attacked and in subsequent stages. Eps.]

Rose Budding.—I shall be very much obliged to any of your readers who will tell me the simplest and easiest way of fixing Rose buddings. I have been accustomed to use them with wax, but it is very troublesome to me in a crowd of Briars, from catching so frequently in the thorns. I have heard of some adhesive substance that is used, but I have never seen it, and anyone who has tried it will much oblige me, and probably others also, by a description of it and the mode of using it, with information of the success that has attended its use, and the place where it can be procured. To this inquiry "S. E. H." obligingly answers—"If 'F' will favour me with his address, I shall have pleasure in sending a specimen of the cotton which I have used for many years in budding to my entire satisfaction, which is much less liable to be entangled among the thorny branches of the Briar, and which he can procure at any 'small-ware' shop. I should prefer wax to worsted. It is easier for manipulation, and, soon succumbing to the influence of the weather, gives no trouble as to the removal of ligatures, but the cotton is, in my opinion, the most pleasant and safe material to use. I have made no experiments, except in grafting, with any 'adhesive substances.' S. E. H.]

Mistletoe.—Would you inform me in your Answers to Correspondents whether the Mistletoe growing on a Mountain Ash is an uncommon circumstance. [Yes.] There are quantities of it here on Thorn, Lime, and Apple trees, and one very fine specimen on the Oak, which have been recorded in your columns; but though there are plenty of Mountain Ash trees about here, I have failed to discover the Mistletoe on but one, and that a close to some large Lime trees, with some trees 3 to 4 feet in diameter growing on them, which are now covered with berries; owing to the late and weather the mistle thrushes have not taken them this winter, as they generally do ere this. E. J. C. Havts

Garrya elliptica.—This plant is worthy of all the praise bestowed upon it by "Somerset," and for the south and west of England it is admirably adapted. We have scarcely anything so beautiful among plants in its drooping catkins, while its leaves resemble the evergreen Oak, and its habit is compact and bushy. But intending planters must carefully note, that "Somerset" adds—"That it is not more tender than the Myrtle." It is not quite so tender in fact, for it lives and grows out-of-doors tolerably well in East Anglia, but in the course of 20 years I have only once seen its fountain-like catkins uninjured by frost. In sheltered nooks in the south and west it is, however, among the most graceful and distinct of all shrubs, and is eminently deserving of more general cultivation. D. T. P. January 28.

Ivy on Trees.—Mr Fryer, at p. 81, inquires whether Ivy injures the trunks of trees. Certainly it does, when they are growing fast, and the Ivy is allowed to wind round the stem. In such case it presents a strong mechanical barrier to the growth of the trunk, and seriously impedes the passage of the sap. But on large trees, and trained parallel along the trunks, I do not think the Ivy injurious. The Pine tree referred to is possibly suffering from the heat and drought of the past summer. It would be well to try the effect of several thorough soakings of water before destroying the Ivy, presuming that the latter is valued as an ornament. It is a good plan in the case of Pines to remove the Ivy wholly from the trunk; when it gets to run among the branches of Pines it often injures them, and fortunately it is not needed there as an ornament. D. T. P. January 28.

Camellia Buds Dropping.—I can fully endorse all that Mr Barnes has said respecting the casting of buds, although it is not in a general way so much complained

of amongst specimens planted out, as in those under pot-culture, the latter being more subjected to sudden changes, or conditions of heat and cold at the root, a greater or less degree of moisture, &c. These conditions being carefully guarded against, the great secret is to maintain, at the same time, a cool and comparatively moist and healthy condition of the atmosphere. I have for several years past made many and various experiments on the cultivation of the Camellia, such as potting at different seasons, in various kinds of soil, watering with various manures in a liquid state, in the various stages of growth and bud, and also by exposure to various temperatures, &c., but am not thoroughly satisfied respecting the requisite amount of light best suited to bring the flowers of this plant to the greatest perfection, but, as far as my experience has gone, I am inclined to believe that the light admitted by a modern span roof house, glazed with sheet glass, in the autumn season, has a tendency to diminish the size of the blossoms, if not positively to cause the casting of buds, especially with pot-plants. I should be glad to know if Mr. Barnes' house is glazed with sheet glass, and what shading is used, particularly in the autumn season. By far the best and finest flowers I ever saw expand under my own management were matured in a house glazed with sheet glass, in a northern aspect. I may here add that part of the same collection, for want of space, when housed (about the middle of September) was placed in a cool house with a southern aspect. This house contained at the time a number of miscellaneous New Holland plants, was paved with fancy tiles, and kept very clean. The greatest care and attention was bestowed on the Camellias, but they cast many of their buds, and the flowers that came to maturity were small compared with those in the house with the northern aspect. I have also seen many good collections of Camellias in various parts of Great Britain grown in houses with a southern aspect, but where such is the case, I have invariably found them in old-fashioned, dark structures, where drip and small glass, not over clean, is the order of day. In compliment to Mr. Barnes, I know such is not the case at Bicton. It is 14 years ago since I was there, and I shall never forget the cleanliness and order everything was in under his able management. Anonymous.

Pines: Cutting Down.—I am glad that Mr. Barnes has enlightened the rising generation of gardeners upon this subject, for many have already clutched at the operation as a novelty. I am not able to look through the vista of the past, for half so many years as Mr. Barnes, but I know that the cutting down was performed 20 years ago by a noted Pine grower, but this was accidental. The roots of his would-be fruiting plants were injured by excess of heat in the plunging material before he was aware of it, and the plants were taken and thrown on the rubbish heap, and remained there for some days. Such was his grievance that he went frequently, as it were, to weep over the objects of his admiration. He at last came to the conclusion to reinstate them in some form or other, finding that they would fruit sooner than the suckers, and some, after being "chopped," were placed amongst the fruiting ones, the others were arranged amongst the successions as their size demanded; and to his astonishment he found the most of them fruited, as he termed it, prematurely. Nothing short of necessity, I should say, would ever induce any one to overthrow, in such a way, the equilibrium of root and branch in such a plant as the Pine. I will relate another instance, which came under my own observation, of the effect of this cutting. At Wortley Hall, before Mr. Simpson went there, a quantity of Pines had been planted out, their age being about two years. They showed no symptoms of fruiting, and it was decided that they should be taken up and replanted, but such was the mechanical texture of the soil that scarcely a handful would adhere to the plant, and the roots were in anything but a good state. However, the best were replanted, and the others were cut down and set amongst them. One part of the old soil was used (it was only common garden soil with some lime rubbish), and this was mixed with about three parts peat. This may seem a strange compost to some, but necessity has no choice—not a sod was allowed to be cut for garden use. However, they rooted in it well, and they showed fruit in a short time, those cut-down as well as the others. Where Pines are planted out, the mere lifting of them and placing them back will induce them to fruit. I fear Mr. Barnes has misunderstood the object the gentlemen he names had in view when they wrote. I presume that they came forward to maintain the operation as being an expedient course to pursue in an emergency, such as requiring a few Pines at a certain time, and not under the assumption that they were introducing a new system of culture. If the latter was their aim, he is quite right, as a veteran, to take them in tow. W. P. R., Holwood.

Iron for Garden Walls.—The ideas which I now publish may have in them nothing that is really new or original, but they may be worth the attention of those who may be making new gardens or alterations in existing ones. The large outlay required if a kitchen garden is to be walled in, often deters the proprietor from having his garden so large as is desirable, or such a space for training tender fruits as he would wish. When brick is used the wall becomes in the course of time full of innumerable nail-holes, unless wire be used on which to train the trees), and the pointing also falling away, capital hiding places are formed for destructive insects, to the endless trouble and annoyance of the gardener. I would therefore substitute iron for brick. The first cost would be less and the ultimate saving large. The walls would be made of iron plate galvanised, $\frac{1}{2}$ inch in thickness for 3 feet from the base, above that height $\frac{3}{4}$ inch would be found sufficiently strong. The plates might be all made 3 feet in width and of any length into which they could

be rolled. The horizontal joints should be flanged, the flange being about an inch in width. This would admit of its being pierced at 7-inch intervals for the insertion of wire, running vertically as tree trunks. The width of the wall at the base should be 3 feet, for one 14 feet high, decreasing to 1 foot at the apex. The earth where the wall is to stand should be removed till a quite solid stratum was reached, or at any rate 3 feet in depth and 1 foot in width must be removed. This trench should then have 1 foot of concrete spread evenly over it, blocks of stone of a good size being buried in it, to which the bottom flange must be bolted. The top of the wall would be covered by a plate, sloping from its centre, and projecting but little, for the wall, having a sloping face, could not be protected by a coping, except of an extravagant width. I think that, as a rule, trees sheltered by wide copings are not so healthy or so generally free from red spider in summer as those that receive all the dew and rain that fall. Now, it will be seen that we have an air-tight structure, with a surface upturned to the sun, and which will therefore both receive and retain a great amount of heat. As I have no reliable data, I am not prepared to say that it will retain heat longer than a brick wall. If its retaining power be greater, so much the better for our trees on clear frosty nights during our treacherous springs, for the radiation may possibly be greater than from a perpendicular wall. In the case of walls intended to carry our tender fruits in the south of England and Ireland, and in the north and in Scotland our better kinds of Pines, Pears, and Apples, hot-water pipes could be used, then the temperature of the wall, whilst the trees run any risk from frost, would be under control, and after wet summers the hot-water apparatus would be of immense use in ripening the wood. A 3-inch flow-and-return should be ample for the heating of a high wall, and say 100 yards in length. These might be placed near the ground level. F. Moore.

Cheap Vineries.—Would a vinery 14 feet wide, span-roofed, with a slope of 7 inches to the foot, with Vine plants on the S.W. side, trained up that side and down the opposite one, be suitable, or could one of 16 feet be made without supporting columns under the rafters? Would 20 inches be too wide between the astragals, or would it be better to use narrower glass, say 15 inches in width, or what size of squares if none of the above are suitable? What quality of 16 ounce glass as advertised by dealers? May I ask if the Golden Champion Grape suits a cool vinery as well as the Black Hamburg? D. [Roofs are always the better for being steadied by supports of some kind 12 inches in width enough for the glass, which should be 20 oz. The Golden Champion Grape is stated, on Mr. Thomson's authority, to ripen perfectly with the Black Hamburg. Eps.]

Phalanopsis Schilleriana.—As comparing of notes in my opinion is next in value to open competition, a few words about a plant of this fine Orchid under my care here may be interesting to some of your readers. The plant has eight leaves, and now bears a panicle of 78 flower-buds, its length is 5 feet $\frac{1}{2}$ inches, and its greatest breadth is 4 feet, and a much more valuable stem still is bearing a fine young plant, about 15 inches from the pot, the largest leaf of which measures 13 inches long; and about a foot higher is another smaller plant, but which promises to become a very nice one in a few months. Another plant, taken from the same parent about 3 $\frac{1}{2}$ years ago, is now bearing 90 flowers, and is nearly as large as its mother William Cross, Gr. to the Right Hon. Louisa Lady Ashburton, Melchet Court, Romsey.

Dianthus hybridus striatiflorus.—I have just seen this very pretty double mule Pink blooming freely out-of-doors under the north wall of a greenhouse, at Mr. McDonald's nursery at Chichester, not any the worse for the frost of the three preceding nights. It deserves to be oftener seen in collections than it is. W. T., Jan. 23.

The Rainfall of 1868, and its Effects on Fruits, Vegetables and Plants.—The fall of rain during the year 1868 was about equal to the average amount for this district, but it was so irregularly distributed that the extremes of drought and humidity were experienced during the year. From February to July there was a constant deficiency of rain, and the whole amount registered for that period was 6.23 inches. So great a deficit in the supply of rain during the period of greatest activity in vegetable growth, proved injurious to some of our cereals, and generally and unfavourably affected hay and root crops. The same peculiarity of the season exhibited in a marked degree the imperfect character of our system of supplying that most essential element, pure water, to our towns and villages. The autumn months were wet. The rainfalls which occurred in August, September, and October assisted to make up the average. This was finally accomplished in December by a fall amounting to 6.07 inches, which about equalled the quantity that fell during six months in the spring and summer seasons. Owing to the drought, Potatoes ripened in July. The crop was too light to take up, and as the haulm in most cases remained green and vigorous, hopes were entertained that with rain an improvement in the crop would take place. After the copious showers which fell in August a rapid growth and development of young Potatoes from the first crop of tubers ensued, and a tolerably large second crop was the result. The declining heat, consequent on the season, and the increasing humidity, while it assisted the growth, tended little to give maturity to Potatoes, and the second crop was in consequence inferior in that respect. White Turnips sown on the 19th August grew rapidly, and afforded a crop of medium size, quite large enough for table purposes. The Onion crop ripened early, and the tops dried, so that rain could afford no benefit to this useful crop, which is in consequence scarce. Carrots are small and somewhat hard; failures were frequent in this

abstracted, in the way we have mentioned, by some faithful pupil who had forgotten that vegetable physiology had made some progress since the publication of the works before alluded to. The book is a worthy and the author's well-earned reput.

The Rev. H. T. Lowe has published the fourth and fifth parts (making the first volume) of his excellent *Manual Flora of Madeira and the Azores Islands* (Van Voorst). The descriptions are admirably drawn up, and the dry technicalities are enlivened by the insertion of interesting remarks. The author raises his voice loudly against certain "inexcusable, intolerable, anagrammatic transformations," such as of *Phagnalon* into *Phagnalon*. The list of *corrigenda* is long. Let us hope that in succeeding parts more careful revision will take place, or a separate part will be needed to contain the *corrigenda*.

who has already earned great repute for her *Science*, 2 vols. 8vo (Murray). After a well-managed summary of the present state of our knowledge on the elementary constitution of matter, including the revelations of spectrum analysis, the author passes in review the most representative groups of plants and animals, and describes their peculiarities. The book is beautifully illustrated, and though necessarily to a large extent a compilation of the best that has been undertaken by one thoroughly competent for the task she has undertaken.

CATALOGUES RECEIVED.—The following Seed Lists have been before us: Barr & Sugden's Catalogue.—J. Coe & Co.'s Vase Mecum.—Sutton & Son's Amalgamated Catalogue.—Wheeler & Son's Little Book.—W. Paul's Select List.—E. P. Dixon's Catalogue.—Charles & Cummins' List.—W. Bull's Retail List.—London and Continental Seed Co.'s Catalogue.—E. H. & A. Dickson & Son's Vegetable and Flower Seeds.—T. Kennedy & Co.'s Catalogue.—T. Sampson's Catalogue.—W. Drummond's Vegetable and Flower Seeds (accompanied by pamphlets entitled *Directions for Sowing Seeds*, and *Directions for the Culture of Various Seeds*).—S. Glendinning & Son's List.—E. J. & Co.'s General Catalogue.—W. Thompson's Descriptive Catalogue.—Ch. Huber et Cie's (Paris) Catalogue.—J. Veitch & Son's Catalogue.—W. & A. Carter's Catalogue.—J. & R. Thynes' Catalogue.—R. Parker's Catalogue.—T. Lang & Co.'s (Melbourne) List.—B. S. Williams' Catalogue.—E. Dean's Catalogue.—W. Wood & Son's Catalogue.—C. Turner's Catalogue.—F. G. Henderson & Son's Catalogue.—F. & Co.'s Catalogue.—Stuart & Main's Catalogue.—A. D. & Co.'s Select List.—Vilmorin-Andrieux's Catalogue Général de Graines, etc., and Supplementary Catalogues. Many of these contain very good lists of both of vegetables and flowers, and some are well illustrated.

Plant Lists we have:—J. Stanish & Co.'s Catalogue of New and Rare Plants (illustrated with several colored illustrations).—J. & C. Lee's Trade List (containing an extensive selection of hardy trees).—W. B. & Co.'s Catalogue of Ornamental Plants (with list of names).—T. Kennedy & Co.'s Forest and Ornamental Trees.—J. Veitch & Son's Descriptive Fruit Catalogue and Select Roses.—E. H. Krelage et Fils' Catalogue Systema et Descriptif des Prairies.—R. & S. Marks' Select List of Hardy Plants.—Société des Éleveurs de Brest (M. Robert, Rosiers Nouveaux).—Lang & Co.'s (Melbourne) Catalogue of Plants.—Ch. Huber et Cie's Catalogue de Végétaux.—A. Stolze's *Prä-Courant des Plantes Nouvelles*.—L. Van Hulle's (Gand) Catalogue of Hardy Plants (contains a very extensive and varied list of hardy trees and shrubs).—H. Gannell's *Floral Guide for 1900*.—J. Seemann's *Preis-Verzeichniss neuer und neuester Gärten*.—Dallas.

Florists' Flowers.

There are few flowers that can boast a greater variety and extent of admirers than the STOCK, it is everybody's flower, but it is none the less a "rich" if we wish to see this flower in its highest perfection, we must more often look for it amongst the poor than the rich. There are thousands of humble cottages where the Stock enjoys a fixity of habit, and its character, but which can only be appreciated by noting the care and attention bestowed upon it. The favourites of the humble housewife. The cottage garden has hitherto been limited to the common Stock and often being a plant it has been the case that the former has been less account for this. The probability is that it was to be found in cottages and not in the hands of outside observers but to the general public a matter of course. In selecting a Stock to save seed, it is the practice to choose those that have five or six petals, these produce the largest pods, and invariably the greatest proportion of double flowers. It is careful to select that variety that produces these desirable results.

The Hampton Stock is found in three distinct forms—scarlet (the most common), white, and purple; the latter is less often met with, the white is somewhat more frequently though by no means common whilst there are few cottage gardens in this neighbourhood that do not boast a few of the former. In the summer, certainly not so tall and robust as the scarlet but still very handsome and double. The proportion of doubles to singles in this colour was

small; the strain of scarlet grown about here is the Giant, reaching from 30 to 36 inches in height, branching in habit, and often producing spikes of bloom, open at once, from 9 to 10 inches in length. These are positively grand, and would excite the admiration of the greatest bedding-out epicure. The Queen Stock has special charms for many, because of its small branching habit and its adaptability for cut flowers, for which it is available. Scarlets are of the purple that is so common in the Hampton Stock, the common and most plentiful colour in the Queen. The white and scarlet are, however, frequently met with. Another characteristic of this Stock is its tendency to produce variegated flowers, thus plants bearing blooms that are white and scarlet and white and purple are very common, where the different colours have been grown adjacent to each other, but I have never met with one that has the purple and purple together. The purple Queen will make very effective beds for spring work, and also produce a colour that is by no means common for that purpose.

The summer varieties known as the Ten-weeks are great favourites with cottagers, but the variety that exists in this case of procuring imported seed fresh every year to produce good double kinds, renders the chance of their growth among the poor less possible, but they are none the less fitted to adorn the gardens of the poor. The improvement that has been made in these Stocks of late years, especially those that take the pyramidal form, would astonish many who have neglected their culture. Last spring I was supplied with seed of the following kinds: Violet Pyramidal, Azure Blue Pyramidal, Large-flowering Pyramidal, Giant Pyramidal, Giant Ten-week Purple and Scarlet, and German Ten-week of eight colours. These were raised in a class at Hampton, and planted into the open field as soon as the ground was fit. They commenced blooming about the middle of July, and continued without intermission up to the end of November, many of the pyramidal kinds holding on to Christmas, and seemingly the more so the more they were cut. Beyond the soil being fresh and moderately manured, they had no other assistance, never having had a drop of water from the first, in spite of the excessive drought; their vigour of growth astonished me.

I exhibited at two of our local exhibitions—on each occasion a large box filled with a collection of these flowers, and it is not too much to say that they produced quite a sensation there, especially as the flowers were the best I have ever seen. The most remarkable variety of colouring, all helped to make them especial objects of attraction. In the one case I obtained a 1st prize, and in the other a First-class Certificate. Early in August I took some notes of them, which I will now give for the benefit of your readers. First of the Pyramidal in this class the Azure-blue deserve first mention, although purplish white would more correctly convey the true nature of its colour. This has a very dwarf robust habit, averaging 10 inches in height, 60 per cent double, has a glossy dark green foliage and would make a good variety for a front row. Another fine stock is the Violet Pyramidal, this is of a rich dark colour, strong robust habit very free bloomer from 10 to 12 inches in height, 60 per cent double flowers. The Large-flowering Pyramidal, having a variety of colours, of very robust habit, about 12 inches in height, giving 60 per cent double, but the singles are also very fine and attractive. The Giant Scarlet Pyramidal Stocks resemble the previous ones in character and habit, and are very fine. Distinct from these are the Giant Ten-weeks, a somewhat taller strain, of branching habit, and which would be best in the centre of a bed; their height averaged 16 to 18 inches. These are first-rate for cutting from, and can be strongly recommended for that purpose. The two colours of these were scarlet and purple; but singularly enough, as the flowers reached the extremities of the branches, in either case they assumed a variegated form, thus adding considerably to their beauty. Last but not least in attractiveness were the German Ten-weeks, these possessed a variety of colours, among which pure white, salmon, and black brown were particularly prominent; these averaged about 12 inches in height, all of them having a robust branching habit. The proportion of doubles was very large; moreover these Stocks continued to bloom most wonderfully right into the winter. I believe the notes as given above to be truthful and not exaggerated. Horticultural Societies would do well to schedule collections of these flowers along with Dahlias, Asters, &c., at their autumn shows. Gardeners of all classes should grow them for decoration, and where possible cottagers should have them to help to maintain that suggestion of beauty which they so much prize. I have met with few annuals that I can recommend so highly as these. *Alexander Dean.*

The Apiary.

COMPARATIVE FERTILITY OF QUEENS.—It is the opinion of some practical aparians that artificially-raised queens are not generally so prolific as those reared in the normal manner by bees in preparation for sending out natural swarms. It is also thought to be tolerably well proved that artificial queens vary in this respect, according to the period of their larval state at which the change from the ordinary to the royal nurture commenced. It seems rational to suppose that a queen raised from a grub which had arrived at the fourth day of its existence in the larva condition before any change had been made in its nursery or in its food, could not be turned out so perfectly and fully developed, consequently so fertile or prolific, as she would be if the change in her nurture had commenced from the time of her emerging from the egg. It is

also asserted that queens which have been subjected to this late process of transformation are very short-lived—that at the end of the first, or at most the second season, they are utterly worthless as breeders, and are usually deposed and exchanged by the bees if the time of the year be suitable for that purpose; if not, and they are allowed to remain, the hive gradually dwindles away.

I confess that some of my artificially raised queens have after a brief and brilliant career, which was usually attended by a very high rate of increase, and some have disappeared altogether, after a very short existence. But I am not prepared to say that it was owing to their having been raised in the manner above alluded to, but I can remember instances of queens which were apparently raised under precisely similar circumstances, and which have lived for several seasons, with fertility and longevity.

I cannot for one moment believe that a queen artificially nurtured is necessarily less prolific or more fertile than her sister reared in a perfectly natural manner. The most prolific, and longest enduring queen in my apiary, that I have ever been able to trace the career of, was an artificial Ligurian queen raised by my friend Mr. Woodbury, from one of the two queens originally imported by him, and presented by him to me. I placed her at the head of a very small artificial swarm, gradually building up the stock until it was sufficiently strong to stand the winter. I do not know at what period of her larva state the change in her treatment may have commenced. I have had many other artificial queens, which have been almost equally remarkable for these good qualities of fertility and longevity, but as my attention had not then been drawn to the consideration of the arguments advanced by aparians on these subjects I had paid no attention to the exact conditions which attended their formation. It is an interesting subject, and one of being experimented upon, with a view to the discovery of the course of procedure most likely to ensure satisfactory results. *S. Bevan Fox.*

Miscellaneous.

Vegetable Products of N.W. America.—One of the *Vacciniums* (*ovalifolium*, Sm.) is well known to all north-western travellers (at least those who have been much among the northern Indians) as the *le-bean* plant, being used to make a dainty of that name. The berries are gathered in the autumn, before they are quite ripe and after being pressed into a firm cake it is lined and wrapped in bark and laid by. When it is to be used a quantity is put into a vessel among cold water and then stirred rapidly round with the hand, when it must be free from grease and it assumes a paste-like form. More water is then added, and more stirring applied, until it assumes a firm, not unlike soap-balls. In this frothy state it is supped with long wooden spoons, made of Pinus monticola. It is pleasant to the taste, with a slightly bitter flavour, and is often prepared in Hudson's Bay forts as an Indian dish, which no traveler ought to leave the North-west without tasting. At their high feasts the Indians will sup of this until they are ready to burst, and then wade in the water, drinking which seems to allay the thirst occasioned by the thirst. The Indians and grizzly bears of Southern Oregon and California eat the berries of the *Manzanilla* (*Arctostaphylos glauca*, Dougl.), but I have never seen the northern tribes make the same use of the berries of the allied species (*Arctostaphylos tomentosa*, Pursh). The tender shoots of various plants are eaten in the spring, such as the shoots of *Rubus nutkanus* (carrot loads of which can be seen, in the season, on the way to Indian villages), *Rosa fraxinifolia*, Bork., the green stem of *Ligusticum sibiricum*, L., and *Pseudoanemum leucocarpum*, Nutt.; which are peeled and eaten, as well as the stem of *Erodium cicutarium*, L'Her.—the alfalfa, or "pin-grass," of the Californians, and some other plants of that sort. They seem to make use of no species of Lichen for food, but make compressed cakes of a *Rhodymenia* for winter use. Captain Mayne, R.N. ("British Columbia," p. 272) however, says that they boil and compress into cakes *L. jubatus*, I never saw them do so though the statement is not at all improbable (see also *Lauder Lindsay, Journ. Linn. Soc. Botany*, vol. ix., p. 313-14). Grass and Clover the Digger Indian (the elevated in his history above the lower animals) looks upon as great blessings, and eagerly eats them, and grows fat on them. The Californian White Clover is however, very sweet and I dare say to these poor people forms, either raw or boiled, a very agreeable salad to their grasshoppers. Beyond the Potatoes they have no cultivated plant. Some of the Indians in Oregon used to grow a little wild Tobacco, but they now buy the ordinary *Nicotiana* from the whites. I have seen some of them, when Tobacco was scarce, in order, as they thought, to get the full benefit of it, inhale the smoke, gulping it down until it came out at the nostrils and ears. They would repeat this once or twice, then lay the pipe to another, and lie down, almost senseless, to sleep of the stupor. *B. Brown, in "Pharmaceutical Journal."*

Californian Pine Cones.—Some time since Mr. J. Q. A. Warren, of California, arrived in England with a magnificent collection of Pine cones. They were exhibited at his private rooms, where we had the pleasure of inspecting them. We are glad to learn that these Californian Conifers have been secured by Mr. Bennett, of the British Museum for the Botanical Department. The collection comprised fourteen species—viz., *Pinus Coulteri*, twin cones, with the young cone of the first year's growth, also a specimen of the same variety over a foot and a half long, and an open cone, very large and beautiful, showing this species in all its perfection, *Pinus Sabiniana*, *Pinus muricata*, this

SUTTONS' GRASS SEEDS

FOR ALL SOILS,

CARRIAGE FREE

SILVER MEDAL for EXCELLENCE of QUALITY,

PARIS, 1867.

SUTTONS'

MIXTURES of PERMANENT PASTURE GRASS and CLOVER SEEDS,

Producing abundant Crops of Hay and superior forage, for the following descriptions of Soils —

STIFF CLAY SOILS, to be met with in the Loam, Kimmeridge, Oxford, and Lias Clays. **BEST MIXTURES** for these Soils, 2s. to 3s. per acre. **GOOD MIXTURES** for these Soils, 20s. to 25s. per acre. Carriage free.

HEAVY LOAMS, of the same Formations, when they have been subjected to surface admixtures and **BEST MIXTURES** for these Soils, 2s. to 3s. per acre. **GOOD MIXTURES** for these Soils, 20s. to 25s. per acre. Carriage free.

GOOD MEDIUM LOAMS, on the Marls of the Old and New Red Sandstone, the Gault, and the Greensands. **BEST MIXTURES** for these Soils, 2s. to 3s. per acre. **GOOD MIXTURES** for these Soils, 20s. to 25s. per acre. Carriage free.

LIGHT SANDY SOILS, on New Red Sandstone, the Sands of the Inferior Oolite, Soils visited by Sand Drifts, as the Cotswold and Gloucester, also those covering up the Staff and the Tertiary Sands of the Dorset Heath. **BEST MIXTURES** for these Soils, 2s. to 3s. per acre. **GOOD MIXTURES** for these Soils, 20s. to 25s. per acre. Carriage free.

SHARP GRAVELLY SOILS, such as the Flint and the Chalks Proper, where not too elevated. **BEST MIXTURES** for these Soils, 2s. to 3s. per acre. **GOOD MIXTURES** for these Soils, 20s. to 25s. per acre. Carriage free.

WALKY SOILS, as the Mountain Limestone, the Marls, and the Chalks Proper, where not too elevated. **BEST MIXTURES** for these Soils, 2s. to 3s. per acre. **GOOD MIXTURES** for these Soils, 20s. to 25s. per acre. Carriage free.

SHEPP DOWNS—The Elevated and more Exposed parts of the Oolite, such as the Wolds of Gloucestershire, the Hils, and the Plains of Wiltshire. **BEST MIXTURES** for the above, 2s. to 3s. per acre. **GOOD MIXTURES** for the above, 20s. to 25s. per acre. Carriage free.

WATER MEADOWS, and all Land under Irrigation. **BEST MIXTURES** for the above, 2s. to 3s. per acre. **GOOD MIXTURES** for the above, 20s. to 25s. per acre. Carriage free.

SUTTONS' "CRYSTAL PALACE" MIXTURE, for Park Grounds, as supplied to the Crystal Palace Company to produce a beautiful evergreen sward, 18s. per bushel. Sow 2½ bushels per acre.

SUTTONS' MIXTURES of GRASS and CLOVER SEEDS for
1-year Lay, best quality, 13s. 6d. per acre.
2-year Lay " " 17s. 6d. per acre.
3 or 4-year Lay " " 22s. to 24s. per acre.
Second qualities cheaper.

SUTTONS' RENOVATING MIXTURE for the above Soils should be sown early in the spring to produce a great increase in the quantity and quality of Grass Sow 6 to 12½ per acre. Price 9d. per lb.

Special Contracts made for large quantities.
Five per cent allowed for cash payments.

SUTTON AND SONS,
BREDSMEN TO THE QUEEN, READING, BERKS.

The advantages of procuring Seeds direct from the Growers cannot be over-estimated.

GODS HOUSE FARM, ARDIEGH, ESSEX

CARTER'S GRASS SEEDS.

CAREFULLY ARRANGED TO SUIT THE VARIOUS CONDITIONS OF SOILS.

The following Table gives the sorts and proportions of Grasses and Clovers comprising Messrs. CARTER'S Mixtures for the various soils:—

FOR HEAVY SOILS.	No. 1	No. 2	No. 3
	Fertile Clays.	Poor Clays.	High Lying Clay Soils.
SWEET VERNAL ..	1	1	1
MEADOW FOXTAIL ..	2½	2	2
LARGE OAT GRASS ..	1	1	2
CRESTED DOGSTAIL ..	1	2	3
COCKSFOOT ..	4	3	3
HARD FESCUE ..	2	3	3
VARIOUS LEAVED FESCUE ..	2	2	3
TALL FESCUE ..	2	2	2
DARNEL-LEAVED FESCUE ..	1	2½	1
MEADOW FESCUE ..	3	3	2
Best imported Italian RYE-GRASS ..	4	4	4
Pacey's Perennial RYE-GRASS ..	4	4	8
TIMOTHY ..	2½	2½	2
WOOD MEADOW GRASS ..	3	3	4
Rough-stalked MEADOW GRASS ..	1	2	3
PERENNIAL RED CLOVER ..	4	5	3
PERENNIAL WHITE CLOVER ..	4	4	4
ALSIKE CLOVER ..	1	1	1
YELLOW TREFOIL CLOVER ..	2	3	4

Per Imperial Acre, best quality, 27s. to 32s.
Second Quality, 25s.

TESTIMONIAL from The Right Hon. Lady CARBERY, Castle Fife, Glenalady, Feb. 1, 1869.
"Lady Carbery wishes to tell Messrs. CARTER that nothing can be better than the Meadow Land laid down with their Grass and Clover Seeds last season."

CARTER'S GRASS SEEDS FOR MEDIUM SOILS.	No. 4	No. 5	No. 6
	Alluvial Soils.	Limestone or Calcareous Soils.	Loams derived from Old or New Red Sandstone.
SWEET VERNAL ..	1	1	1
MEADOW FOXTAIL ..	2	2½	2
LARGE OAT GRASS ..	1	2	2
GOLDEN BRISTLE GRASS ..	1	2	2
COCKSFOOT ..	4	3	4
HARD FESCUE ..	2	3	3
SHEEP'S FESCUE ..	2	3	3
DARNEL-LEAVED FESCUE ..	1	1	1
MEADOW FESCUE ..	3	3	2
Best imported Italian RYE-GRASS ..	4	4	4
Pacey's Perennial RYE-GRASS ..	4	4	8
TIMOTHY ..	2½	2½	2
WOOD MEADOW GRASS ..	3	3	4
Rough-stalked MEADOW GRASS ..	1	2	3
PERENNIAL RED CLOVER ..	4	5	3
PERENNIAL WHITE CLOVER ..	4	4	4
ALSIKE CLOVER ..	1	1	1
TREFOIL CLOVER ..	2	3	3

Per Imperial Acre, best quality, 27s. to 32s.
Second Quality, 26s.

TESTIMONIAL from H. BERRY, Esq., Letton Court, Hereford.
"Please send me 37 Acres Grass Seeds as last year I am glad to say that what you then sent has done well."

CARTER'S GRASS SEEDS FOR LIGHT SOILS.	No. 7	No. 8	No. 9
	Light Chalk Soils.	Brashy Limestone Soils.	Sandy Soils.
SWEET VERNAL ..	1	1	1
MEADOW FOXTAIL ..	2	2	2
GOLDEN BRISTLE GRASS ..	2	2	2
COCKSFOOT ..	2	2	2
HARD FESCUE ..	1	1	1

YELLOW TREFOIL ..	3	4	4
PERENNIAL RED CLOVER ..	6	4	4
PERENNIAL WHITE CLOVER ..	2	3	2
ALSIKE CLOVER ..	1	1	1
BURNET ..	1	1	1
SALINFON ..	1	1	1

Per Imperial Acre, finest quality, 27s. to 32s.
Second Quality, 26s.

TESTIMONIAL from J. BROWNE, Esq., Rugby.
"The Grass Seeds I had from you were very good indeed. A more beautiful crop could not be found."

CARTER'S PRIZE MEDAL LAWN GRASS,

As supplied for the grounds of the late Paris Exhibition, will specially produce a carpet-like turf of the finest quality.
1s. per lb.; 20s. per bushel (sow 3 bushels per acre).

JAMES CARTER AND CO.,
237 and 238, and 261, High Holborn, London, W.C.

Agricultural Improvements.
MR PAULY LINTON undertakes the UNDER-DRAINAGE of LAND at a charge of 5s. an acre, and will also execute all SPECIFICATIONS for Farm-houses, Farm-buildings and Labourers Cottages with or without Superintendence during Construction, and generally be acquainted of him at 2, Waterloo Place, London, S.W.

To Landowners, whether Tenants in Fee or for Life, Estate Agents, the Clergy, &c.
THE LANDS IMPROVEMENT COMPANY
(Incorporated by Special Act of Parliament in 1853), advance Money, unlimited in amount, for all purposes of Agricultural Improvement, the whole outlay and expenses being liquidated by a rentcharge over 25 years.
For information and Forms of Application, apply to GRAY & CO. R. HYDER, Esq., Managing Director, 3, Parliament Street, Westminster, S.W.

ROYAL AGRICULTURAL COLLEGE, GIRENCESTER.

President—His Grace the Duke of Manchester, D.C.L., F.R.S.
Council:
Right Hon. The Earl of Ducie, Right Hon. T. H. Sotheron, Esq., F.R.S., Metcalf.

LECTURER ON ANATOMY, PHYSIOLOGY, AND HYGIENE—J. A. M. Brides, Ph.D., M.R.C.V.S.
MATHEMATICS AND SURVEYING—The Principal.
DRAWING—James Miller.
The NEXT SESSION commences FEBRUARY 6. For Forms of Admission apply to the Principals.

ROYAL AGRICULTURAL SOCIETY of ENGLAND.

AGRICULTURAL EDUCATION.
The EXAMINATION of CANDIDATES for the SOCIETY'S EDUCATIONAL PRIZES will take place in the week commencing MONDAY, April 12, 1869. Copies of the Form, required to be sent in by March 15, may be obtained on application to
H. M. JENKINS, Secretary,
12, Hanover Square, London, W.

ROYAL AGRICULTURAL SOCIETY of ENGLAND.

MANCHESTER MEETING, 1869.
STOCK and IMPLEMENT PRIZE SHEETS are Now Ready, and will be forwarded on application to
H. M. JENKINS, Secretary,
12, Hanover Square, London, W.

The Agricultural Gazette.
SATURDAY, FEBRUARY 6, 1869.

MEETINGS FOR THE ENSUING WEEK.
Feb. 8—Gloucester at the Ram Hotel (County Financial Boards).
10—County of Devon at the Town Hall, Newton Abbot (the Chemistry of Agriculture).
Staffordshire at Swan Hotel, Stafford 11 o'clock (Employment of Young Persons and Women in Agriculture).
North Riding at Malton.

One word more upon THE SEWAGE QUESTION. The *Mark Lane Express* laughs at our last week's "transformation scene" and, to tell the truth, its satire is as clever as can be. The "characteristic aroma," in particular, is what it cannot stand. But the transformation here, though the most striking feature in the picture, is not at all a distinctive characteristic of "the sewage question." One is taken by the nose in the best farmyards, and never more offensively than in the market gardens around London, which have yet to learn their sewage lesson. Heaps of rotten grains and putrid distillery wash, of offal cabbage leaves, and filthy garbage of all sorts, give out the most awful stench that ever fouled the air; and you perpetually come across a whiff of something of this kind amid the Barking Cabbage gardens. But at length the stuff is spread about and covered by the plough; and the Onion seed or Kidney Beans are sown, and the Cabbages are pricked out; and the rains fall, preparing food for them, and distributing it throughout the soil, and the very same extraordinary transformation then takes place, which, when enacted in the case of sewage, tickles our contemporary. What, indeed, is agriculture throughout but a transformation scene, most wonderful and beautiful. That which, in sewage, especially justifies the epithet, is the rapidity, the immediateness of the process. The manure is poured on one week, next week the Grass is cut, and on the following day the milk is carried up to town. The changes which in ordinary farming take place during a rotation, or require at least a year, are in sewage farming crowded into a month or week; and we defy any one, even the writer in the *Mark Lane Express*, to look on without astonishment at the quickness

of the agricultural transformations on a well-managed sewage farm.

How did it use to be?—There is a district where, within living memory, agriculture owed almost as little to artificial aid as the manured moorland along which it did. The plough, indeed, turned up the soil once in a term of years, and a crop of Oats was taken, but thereafter it was left to unassisted Nature. "Natural Grasses, including Thrifts, Catfoot, Crowsfoot, Couch-grass, Docks, and every perennial weed the farmer knows, would what they would for years to the starvings grazed upon the stubble, drawing no doubt some what from the soil, and somewhat from the air, and thus at length replenishing the surface soil after a fashion, until there was stuff enough to make a decent coat of ash, and this with whatever rotten straw, road scrapings, &c., had been gathered into a heap, was ploughed under, and another crop of Oats achieved.—The step from this, through Clover for a year or two, and a Turnip crop after the second crop of corn, was a very great one, but even here the manuring came once only in the rotation. By-and-by the artificial-manure manufacture enabled the farmer to put his farmyard-dung almost wholly on the Clover, and to get his Turnips by the aid of superphosphate, so that the land received a dressing every other year. The dung-cart went and the harvest cart returned, but the interval was still so great that there was nothing startling in the contrast.—At length an Agricultural Commissioner, quoting Mr. HUBSON, of Castle Acre, published through the Times—"It is the custom on this farm to manure for every crop," and the practice spread, and thus of course was a great stride onward. But even so, it is nothing to the practice of the sewage farms, where 300 or 500 tons per acre are put on after every cutting of the Grass, and, ready made, and self applied, and spreading it out among the heavy roots, the food of plants, which sewage holds dissolved, is sucked up the very day and hour of its arrival, shows itself almost immediately in rapid growth, and in a week or two may be seen converted into the purest and completest human food. This, we repeat, is a true transformation scene—so much so, that we are certain a well-managed sewage farm, during the season of growth, will give its agricultural visitor as truly new a sensation as a child receives at its first pantomime.

The Lodge Farm, in the hands of the Sewage Company, is, we are told, fast becoming a bore in agricultural journals. It is, nevertheless, we confidently believe, at this moment, for the light it throws on a most important social and agricultural problem, the best worth seeing of all the farms within her Majesty's dominions. And our contemporary, instead of laughing at the statements which are made about it, would have done better to send some one down in whom its readers are not true. Moreover, in the interests of agriculture, which it professes to serve, we submit that it should have quoted our figures as well as laughed at our rhetoric. Why was the history of all those autumn crops, sold for 10L. to 20L. an acre, so carefully excluded from its record, when the very point to which its argument was directed lay in the question—Will it pay?

The fact no doubt is, that the temptation to make a thousand readers laugh was too great for it, and so an hour's enjoyment has been purchased by its witticisms, at the cost of confirming all those prejudices and that usury by which alone the solution of the sewage problem is now delayed, and a column of good writing has been wasted in a clever exposition of the old rule, "How not to do it."

But what is the alternative? Surely a leading organ of the agricultural world is not content to let the whole refuse of 5,000,000 well-fed animals run to utter waste. To whomsoever the statement should be properly addressed, we do not hesitate to say once more, that to do this is immense stupidity. The maxim, "Let well alone," however safe and often wise, does not apply. It may have been "well," agriculturally, in the old days of the privy and the cesspool, when immense quantities of fertilising matter now washed into the Thames were carted to the land. But "well," if so it could be called, was not let alone, and it is impossible for any agriculturist to defend the enormous loss which now takes place.

Meanwhile we would rather be of those who are seeking anxiously for the remedy, which one

day must be found or even bear the laugh which ever awaits the enthusiast who sometimes exacts the example of the winter in the "Wentworth" press, who sits giggling while both land and city suffer.

— AT Mark Lane, on Monday, another effort was made to lower the price of Wheat, and buyers were the more successful. Some of the trade has been without alteration.—The stock and wheat markets now begin to show the effect of the action taken in the form of the anxiety to which we have frequently alluded in the last six months. Open market prices are generally lower than in the last few months, and the wheat trade is generally more active than at previous high rates.

— Pauperism and Poor-rates was the subject discussed on Monday last before the London Farmers' Club. An abstract of the paper read by Mr. TRASK will be found on another page. It was not long, and the points which seemed to have had more particular attention given to them were effects rather than causes. The discussion which followed was taken part in by several members. The Rev. W. CONWAY took up the question of legislation against drunkenness, waste lands, &c., through all the "rot-holes," as he termed them, which are urged by individual members of society. Mr. FAY argued that a National Rate would be attended with no good. In London it might do but if it were extended to the whole country it would be attended with national waste. The system of giving relief cannot be better administered than by the guardians. Mr. SMITHIES said industrial teaching should be extended. In his opinion, tailoring and shoemaking are taught to boys, and cooking and sewing to girls. The result is that boys and girls over 14 years of age are in demand, and readily go off the hands of the guardians. Mr. CORBETT, a Poor-law Board Inspector for the metropolitan districts and home counties, said the schools ought to be separated from the workhouse, and the children kept from their parents, who as paupers are the worst class of the town. Mr. CROSSKILL said that the Government should take steps on this important subject, and must be backed by public opinion. Mr. RAY has expressed the same view from the chair many times. In proportion to the increase of population, there is a large increase of pauperism. To say that Trades Unions in reared pauperism is an overstatement, very little can be attributed to Trades Unions as regards pauperism. He advocated sick-rates, so that the men could support themselves in illness, and save themselves from pauperism. He condemned indiscriminate charity—in his own town there were many "gifts" the proceeds were doled out once a year and the recipients got drunk with the money. Mr. CHARLES HOWARD said Mr. CROSSKILL knew nothing about it, but he lived in hopes of catching a little more of the profits of such townsmen as he before long. Mr. THORNTON, of Oxfordshire, was of opinion that the Law of Settlement and the Removability question ought both to be altered. The vagrant ought to be admitted to the workhouse on condition that he stops not less than 14 days. He might then take his wages of labour in clothes or money and go. If he stopped another 14 days he would become a resident pauper, and might be dealt with by the board of guardians, as might be expedient. A man with a "ticket-of-way," that is, an honest man in search of work, would have his food given him, and be passed on. Mr. READ, Mr. CADDLE, Mr. SAM SIDNEY, the Chairman and other members having addressed the Club the process was terminated in the usual manner.

— It is proposed shortly to hold a public meeting, including landowners, labour paying authorities, and philanthropists, probably under the auspices of the Society of Arts, to consider the question of establishing a Society for the Improvement of the Condition of Agricultural Labourers by the promotion of the following objects:—(1.) The raising of the wages of farm labourers, where excessively low, by the removal of proper seasons of surplus labour from over-populated districts to places where it is in greater demand. (2.) To encourage the more extensive building and improvement of cottages in accordance with the demands of health, decency, and comfort. (3.) The elementary and technical education of the children of agricultural labourers. (4.) The more extensive adoption of the system of allotment of garden grounds, and the protection of the rights of agricultural labourers under the Inclosure Act. (5.) The prosecution of sanitary reforms in villages, small communities, and dwellings of agricultural labourers. (6.) The separation of labourers' provident societies from public houses, and their establishment on safe and economical principles, and under proper management, so as to secure to those able and willing to save some means of support in times of sickness and disablement from work. (7.) The discontinuance of state tax farming.—There are also the questions of co-operative farming, tried by Mr. GIBSON'S Association, and the co-operative Agricultural Society, labourer's co-operative stores and brewers adopted with success in some localities, the limitation of children's and women's labour, the truck system, &c., but about some of which questions there may be too much difference of opinion existing to render their adoption desirable by a society wishing to secure general support.

— The Central Chamber of Agriculture held its first Council meeting for the year 1902 on Tuesday last, when there were present ten M.P.'s, viz., Mr. C. S. Read, Lord George Hamilton, Sir Massey Lopes, the Hon. T. Cadogan, Mr. A. Pell, Mr. J. W. Knight, Mr. James Howard, Mr. W. W. Beach, Mr. Wheelhouse, and Mr. S. W. Clowes. Several members of pro-

vincial Chambers were also present. The meeting was held in the Library by the Council, and was presided over by Mr. H. GREGG ANDREWS. A proposal for a national poor-rates notice had been given apparently from an independent Chamber, and the other members of the Council were present. The meeting was held in the Library by the Council, and was presided over by Mr. H. GREGG ANDREWS. A proposal for a national poor-rates notice had been given apparently from an independent Chamber, and the other members of the Council were present.

— The meeting was held in the Library by the Council, and was presided over by Mr. H. GREGG ANDREWS. A proposal for a national poor-rates notice had been given apparently from an independent Chamber, and the other members of the Council were present.

— This was proposed at the annual meeting of the Chamber, and was carried by Mr. ANDREWS. Mr. ANDREWS stated that they began to see the result of the charges upon real property, and that they were not satisfied that ever since the principle had been passed, and the result was that the principle involved in the charges carried out to the end. He proposed that the Board should be empowered to make the law, and that the law should be carried out to the end. He proposed that the Board should be empowered to make the law, and that the law should be carried out to the end.

...because she has just produced a red and white... of promising appearance... to be served by Mr Hayward's Duke of CLARE.

We hear from Farnham that Miss Evans has produced a very good red and white bull calf, by 13TH DUKE OF CLARE. The mother is of King'sley descent and was bred by Mr Sturton of Levesley Abbey. She was afterwards sold to Mr Roberts who parted with her to some private Mr Alcock. At that time it was not thought likely that she would add to breed. Miss Roberts's by DUKE OF BATHON 1273rd dam *Rosebud* by GARRICK 11, 7, and is 13 years old.

We are sorry to announce that on the 25th ult. *Winterbon* 324 produced a dead heifer calf to 2D DUKE OF COLLINGHAM. This is a great loss to Mr Rich. It is, however, satisfactory to learn that the mother will not be injuriously affected.

The Duke of Buccleuch's *Princess Flower* the dam of Royal Errant, dropped a heifer calf to Mr Barclay's *HANON BOOTH* on the 9th ult., at Dalkeith Park.

THIRD LORD OXFORD (22,300), the property of Mr C. W. Harvey, of Wotton on the Hill, has been slaughtered within the last few days. He had just completed his sixth year, and for some time previous to his death was useless for breeding purposes. This bull was bred by Mr Thorne, of T. riddle U.S., and was imported into this country by Mr Harvey. He was by Mr. S. E. Bolden's 2D GRAND DUKE (12,961), a sire whose portrait figures in the 11th volume of the "Herd Book." He was sold to Mr Thorne for 1000g. His dam was *Oxford* 1304 by 3D DUKE OF YORK 10,163, bred by the executors of Mr Bates of K. Alvington, and the property of Mr Thorne. The possessed bull was an brother to Mr McIntosh's IMPERIAL OXFORD, and his half brother to the Duke of Devonshire's LORD OXFORD and Mr Levey's LORD OXFORD 2d.

The subject of "breeding in-and-in" has often been discussed, and instances both of good and evil effects resulting from it have been adduced as reasons for and against the practice. Doubtless the existing variety of opinion springs in a great measure from viewing the subject from too general a point of view. That in-and-in breeding may be carried in all cases to too great a length few will deny, but we should remember that the effects of such close alliances vary according to the kind of animal experimented upon, and the stage of refinement or high breeding which the artificial race may have attained under the care of the breeder. If we confine in-and-in breeding generally, whether in the case of sheep, cattle, pigs, or fowls, we shall most probably find a strong and well-supported opposition to our views. To come to a truthful conclusion each must be considered separately, for while we would not deny that a general law is obeyed by all, we believe that each of the above-named animals is affected in a different degree, and that while in one case close breeding will soon prove injurious, in another it may be carried much further with benefit. In the case of cattle and sheep we see illustrations of the latter effects, and in Shorthorns and Lancasters there is no doubt that this plan of breeding has been rather beneficial than otherwise. Size and constitution may suffer if the system is too rigorously pursued, but with moderation both are preserved, while quality, fertility of type, and aptitude to fatten, are promoted. In-and-in breeding has produced some of the best of Shorthorns, as, for instance, COMER and many splendid animals boasting descent from FAVORITE. A well-known writer has recently calculated the amount of FAVORITE blood in some of his immediate descendants, and has shown that after he had been matched with his own produce to the third generation, the calf thus bred contained 15 10ths, or 93.75 per cent. of the blood of FAVORITE in his veins. This cow was matched with the bull WELLSINGTON having 67.5 per cent. of FAVORITE blood in his veins, and produced *Clarina*. *Clarina* was matched with the bull LANCASTER, having 67.5 per cent. of the same blood, and she yielded valuable offspring. Such facts show the extent to which in-and-in breeding may be carried with Shorthorns without apparently injuring the progeny. There is, however, reason to suppose that sterility is in a measure produced, and may not the inferior making properties observable in many high-bred Shorthorns be a direct effect of the same cause, intimately connected as the secretion of milk must be with the breeding condition of the mother? In the case of sheep, the system of breeding continuously from the same flock without the introduction of blood from extraneous sources, has often been persevered in for many years by eminent breeders. In the case of pigs we believe the same defective close breeding shows themselves in partial sterility, manifested in and-in breeding much sooner than in the case of cattle and sheep.

THE AREA OF LAND REQUIRED TO UTILISE SEWAGE.

THE area of land required to utilise the sewage of a town containing so many inhabitants is a question which can only be solved by considering the quality of the sewage, and the nature of the land, climate, and crops grown. No specific rule can be laid down for guidance. Were it farmyard manure, Peruvian guano, or any of the artificial manures now in use, experience could return a ready answer to the question. But so many cartloads of farmyard dung, or so many hundredweights of artificial manure, are facts which leave many things understood by practical farmers, as the quality of the manure, the nature of the soil, &c., such being taken for granted, consequently, were an uninitiated person to adopt such a rule in the manuring of his

land the chances are that disappointment would attend his practice.

It is a town sewage of a much worse quality than even farmyard manure, which experience is yet waiting from which to deduce the dose to start approximately to a general rule. No doubt the quantity of sewage applied to the acre at Edinburgh, Barking and other places might be gauged, but not as a rule of guidance to any other place, for many improvements have to be made by the sewerage of the collection and conveyance of sewage, before the question as to the area of land can be satisfactorily solved, so as to supply the necessary data for a standard rule. In addition, the rule, like the question itself, must be considered one of progress, for if towns were to devalue their sewage of twice and thrice the fertilising powers, more and more land would be required to utilise it economically.

Practically considered as a work of progress, the improvement of the quality of the sewage as now supplied by towns is the first step required to be taken, in order that the area of land necessary to utilise it. At present, therefore, the solution of the question lies between two extremes, wide application of the waste and storm-diluted sewage now applied to the land, on the one hand, and the application of sewage in its normal state, or as nearly in its normal state as practicable, on the other. It may never be within the reach of the highest advance made to collect and apply all the fertilising properties of normal sewage to the land, for in Flanders, where the nightsoil is carefully collected and removed every day, farmers are familiar with the fact that a very great loss of fertilising matter is sustained, but infinitely little as compared with the sewage systems of this country.

If we assume for the sake of argument, that town sewage can be collected and applied to the land, as now proposed in this country, with a little loss of fertilising matter as in the more common practice of the Flemish farmer, then if we divide the inhabitants of a town by 10, the quotient may be taken as a distant approximation of the area of land required to utilise the sewage of that town, the land being under arable husbandry, as at the Working Farm, Essex. Thus, if the inhabitants of a town number 50,000, then 5,000 acres will be required to utilise its sewage. And if we further assume that a five-course shift of cropping is pursued, the sewage being applied two years in succession to Grass, there will be 50,000 acres in each shift, and hence a total of 250,000 acres under sewage farming. If, however, we assume that with greatly improved sewage, one year in Grass is found sufficient to enrich the soil for a four-course shift of cropping, then 125,000 acres would be under sewage farming, and so on for any other hypothesis that may be assumed. Thus, according to the Flemish practice, sewage may be successfully applied to Potatoes when about eight or ten inches aboveground, or just before they are "canted up." It may also be applied to the land before the Potatoes are planted. Mangel may be manured in a similar way, the sewage being applied to the land before the seed is sown, and to the drills after the leaves of the plants rise off the ground, so as to get it to the roots. Any crop, in short, requiring manure may be sewage, if the sewage can be applied to the roots without touching the leaves, provided always that the sewage is of a quality to suit the peculiar requirements of the crop.

An American authority recommends sewage Mangel as soon as the young plants appear above-ground. "A sprinkling of liquid manure along the rows, about the time that the plants first appear above-ground, will in general secure an abundance of them; and this may be done with much less trouble than would be imagined by those who have never practised it. It requires only a water-cart, with a large cask, and two leathern hose, kept at a proper distance from each other by a stick between them, so that they may pour the liquid manure over two rows at once. If the field be not above a mile from the tank, a man and horse will water 2 acres in a day; and if the distance is half a mile, 4 acres. The expense will be amply repaid by the crop." (Dr. Gardner's "Farmer's Dictionary," New York, 1846.)

In the dry climate of the United States, it is generally more difficult to secure a sufficiency of young plants than with us, and if the manure in the tank has been properly fermented and diluted, so as to deprive it of the caustic character it possesses when in a fresh state, it can be then applied to young plants in the above way. And with regard to the construction of the water-cart for watering two drills at a time, Mr James, of Cheltenham, exhibited one at the summer meeting of the Royal Agricultural Society of England, held at Leicester last year. Carts can be made to water two, four, or six drills at a time as required.

With sewage laid on to the land by means of iron pipes and hydrants, a man with a water-cart and boy could the horse, along two drills at a time, would go over a greater area of land than stated in the American practice. As the cart could be filled by means of a hose in passing the hydrants, the same hydrant and hose could supply two or more carts, the one being in advance of the other—the water-cart never having to leave the drills, save in shifting at the headlands, and when halfway across to a second hydrant, the hose would be screwed on to it. In this manner field after field could be sewage, as fast as the plants required. If we assume that the seed was sown by a machine doing two drills at a time, and that in seeding the horse walked twice as fast as in manuring, or three times as fast when giving a heavy dose of sewage—then the young plants under ordinary circumstances would require in the former case two liquid manure carts, and in the latter three carts. In a wet season the young plants would require the sewage to be less diluted with water than in ordinary ones. And to meet such demands the water-cart would require to

water four or six drills at a time. In extreme years of drought the plants may require a watering of river or pond water, or, if such cannot be supplied, the soluble salts in the sewage may be precipitated, and the comparatively pure water filtered off to supply the wants of the growing crops, the solid matter thus obtained by precipitation being mixed with fresh sewage and applied to stubble land or crops which could receive it. All this can be done as the crops and land require by one and the same arrangement of sewage machinery and apparatus, and therefore at no great expense.

With regard to the proper time for applying the sewage to the land and to growing crops—the four quarters of the compass, viz., south, north, east, and west, would, no doubt, each return a different answer to the question. Few farmers require to be told when their land requires manure. The crops answer that question, and the rule will be found no exception in sewage farming. In spring the sewage may be applied, in any degree of dilution required, to Grass and Wheat, crops by means of the hydrant and hose, the liquid being evenly distributed over the surface by means of a slanting board nearly close to the ground, as in Flanders, the liquid thus falling softly upon the young plants, and about their roots, without earthing up the opening expanding leaf, or closing the pores of the soil so necessary to be kept open at this season. The sewage should flow freely from the hose, and not be discharged in the form of a jet upwards, so as to fall in a heavy shower, as by such means it is wasted, the young plants are injured, the soil is consolidated, much harm being done in these various ways. It may be applied to land before seeding if sufficiently dry to receive it. And the rule may be laid down as a general one, that when the seed is sown there should be a sufficiency of sewage sap in the ground to force up the young plants with vigour, such as Turnips into rough leaf, so as to be out of danger from fly. The small coleopterous insects that play such havoc belowground do not like sewage—ammonia kills them. In exceptionally dry seasons it may not be easy to retain sewage sap in the soil, so that the American practice of watering the young brail may be advisable. After plants are up and beginning to cover the ground they will stand a good dressing of sewage, and if mildew is not wholly averted in Swedes, &c., and aphides in Peas and Beans, the extent of harm in both cases may be greatly reduced. To stubble lands after harvest, including Grass crops, sewage may be applied by the hose in any quantity, so as to place the land in the highest state of fertility required by subsequent crops, and to such ploughed land it may be applied during open weather in winter. But when the sewage is sent to the country as the land requires it, the probability is that much of it will be stored up in tanks during winter, as in Flanders and other places, for spring and summer use, the sewage being turned off from the mains into this farmer's tank to-day, his neighbour's to-morrow, and so on, according to the demand.

The reader must bear in mind that were the sewage sent to the country in its normal state, or as the

country requires it, the supply would be short of the demand, so that unless farmers got their tanks filled during winter there would be short allowance, or perhaps none at all, when the spring and summer came with their demands upon the mains. To lose sight of this is to shut the eyes to one of the most important and promising manurial resources of the country. No doubt the supply of towns is increasing with the increase of population, but placed in the balance with the manurial requirements of the soil under improved systems of culture and cropping, it amounts to nothing, comparatively speaking. For, judging from the present state of progress, the increase of population is not keeping pace with the increased demands of the land, due to improved cultivation, manuring, and cropping—hence the practical conclusion.

It will thus be seen that the area of land required to utilise the sewage of towns is influenced by so many causes, that the preceding hypothesis can only be received as a very distant approximation. Had the question been put to the agricultural public in A. D. 1800, How many acres of land will be manured with guano and other artificial fertilisers in the year 1869? there was not at that date one farmer in a hundred who would have ventured to open his mouth in reply. But at the present day the general answer to the question would be, "Tell us the price and quality of the manure with the supply," and everybody's area would be forthcoming. And if the supply is both cheap and good it will be found short of the demand. Will it be otherwise with town sewage? If town sewage proves its value, as guano and bone-manure have proved their value, and if it is brought within reach of farmers, whose lands require it, will they not use it? So long as it is sent to the country so wasted as not to be worth the expense of application, it will be viewed as quack imitation guanos are viewed, and treated accordingly. Good guanos find a ready market, but the bad, if known, are unsaleable. Indeed, such is the difference intrinsically, that intelligent successful farmers would not use the latter were they to receive it gratis, with a premium for its application.

That towns are now beginning to see the force of the old maxim, "A penny saved is two pence gained" in the case of the sewage, is manifesting itself in every province of the kingdom. The Barking farm practice in Essex has thrown a flood of new light upon economy of sewage, and also upon the means of obviating two objections to the old practice—the one relative to the health of towns, and the other to the health of the country. Thus, in the first place, they see if the fertilising properties of the sewage are economised it will find a ready market sooner or later. In the second place they see that the pestilential gases now issuing from sewers—more especially in large towns where the sewage has to flow through miles of sewers in densely populated districts, as in the metropolis—will be preserved in the sewage during its course. And, in the third place, they see that the noxious malaria arising from grass-land to which sewage is continuously applied at all seasons of the year will also be got rid of, the health of the country being thus secured.

These are great advances, and although not necessary to realise them to their full extent, they may be advantageously engrafted upon that practice upon all the other sewage practices now in vogue. Compared with the grass-meadow system of Edinburgh and other places, the arable system requires a larger area of land to produce a greater amount of produce than the former, a greater difference between these two systems manurial economy of sewage than is generally supposed. It is now a well authenticated fact, in agriculture, that sewage is not a specific manure, or grown by it—the food which it supplies bears no kind, proportion, nor quantity, suitable to the consequence, there must either be an emanation going on in the soil or else it must undergo a gaseous form, or partly both. The latter is what takes place, but the emanation of manure arising from the process of decomposition is than as generally credited. Hence the practice of applied sewage under this system, and why, against this system, the more the sewage is lying matter the greater the waste and the malaria given off into the atmosphere. On the other hand, when the land is broken up for arable crops by different plants, each plant has a specific difference in its requirements and utilization of food, the manurial elements are better utilised. In this respect the greater manure is similar to what takes place under the dung. With the economy of this latter farmers are familiar, and the principles apply with even greater force to sewage farming. It is not all, for when the land is under arable is admitted, so that the greater proportion of oxygen used up in the process of decomposition obtained from the atmosphere and not from the sewage. In the latter process, hydrogen with sulphur or carbon (i. e., sulphuretted gas or carburetted hydrogen gas) is given off, the former process nitrogen is given off, there is strong reasons for believing that of the nitrogen of the atmosphere that unites with the hydrogen of the water, in the present, so as to form ammonia. From experiments made in this country, and on the continent, ammonia has been thus made by art, and practical farmers have long looked to the decomposition of organic matter in the soil properly aerated, as a natural source of ammonia, the liberated hydrogen and nitrogen present being the case, the ammonia thus formed in the land to utilise a greater proportion of the elements of the sewage than would otherwise be the case. Adding these differences together, in favour of the arable system of sewage, compared with the Grass system, is generally imagined. W. B.

AGRICULTURAL STATISTICS.

[We continue the publication of the official tables.]

STATEMENT OF THE POPULATION, AREA, AND ACREAGE UNDER CROPS AND GRASS, IN THE UNITED KINGDOM AND IN VARIOUS FOREIGN COUNTRIES, ACCORDING TO RETURNS BY THE STATISTICAL DEPARTMENTS OF THE RESPECTIVE COUNTRIES.—The Area and Acreage are stated in English Statute Acres.

Description of Crops, &c.	United Kingdom, 1868.			Sweden* (in 1866).	Norway (in 1865).	Denmark Proper (in 1866).	Prussia* (in 1867).	Wurtemberg (in 1867).	Bavaria (in 1863).	Holland (in 1860).	Belgium† (in 1856).	France (in 1867).	Spain‡ (in 1867).
	Great Britain.	Ireland.	Total**

* Estimate Returns. † The results of the Return taken in 1866 have not yet been published. ‡ In the year 1862. § Chiefly Spain. †† Including lakes and rivers. ‡‡ Including 500,000 of forest. **** Including Isle of Man and Channel Islands.

NOTE.—For Russia, Switzerland, and Italy — For Russia there are no Returns of Acreage under Crops, &c. For Switzerland there are no Returns of the Acreage under each kind of Crop. In 1855, the aggregate Acreage under Corn and Green Crops was 1,435,565 acres, and 3,627,431 acres under grass, meadows, and pasture.

For Italy there are no Returns of the Acreage under each description of total area under cultivation is thus divided:—Arable Land (including Pastures), 13,493,626 acres; Rice fields, 362,257 acres; Olive Gardens and Chestnut Plantations, 1,462,830 acres.

THE HEREFORD BREED OF CATTLE

by Mr Duckham, of Baysham Court, near Ross... The Hereford breed of cattle... The Hereford breed of cattle... The Hereford breed of cattle...

THE HEREFORD BREED.

The Herefords have been severely tried in competition with all other breeds of this kingdom... The Hereford breed of cattle... The Hereford breed of cattle...

Having made the selection of both male and female, the next thing to be considered is their management... the next point for consideration is, at what period of the year should they be brought into existence?

The next point for consideration is, at what period of the year should they be brought into existence? And here I think we must look to Nature's laws to guide us in our decision... I will now endeavour to demonstrate the evils of the first two systems, and the advantages attending the latter.

1. First, then, as regards summer or early autumn calving which has been practically forced upon breeders who aspire to Royal and other distinguished showyard honours... I will now endeavour to demonstrate the evils of the first two systems, and the advantages attending the latter.

2. This brings me to the second system, and upon the principal of getting a little time annually I will suppose the heifer intended to calve in autumn... I will now endeavour to demonstrate the evils of the first two systems, and the advantages attending the latter.

laws are... I believe abortion in high bred stock to be the result of many errors, all of which, however, are summed up in the words, 'too much stimulating food—too little exercise—too much warmth, and too great a disregard to the natural functions and all it entails.'

3. I will now proceed to consider the advantages attending the period which is more in accordance with Nature's laws... I will now endeavour to demonstrate the evils of the first two systems, and the advantages attending the latter.

(To be Continued.)

Home Correspondence.

Sewage Farming Prospects.—Your correspondent, "W. B.," in your paper of the 16th inst., having made frequent reference to this farm, I am induced to notice some of the points where his statement is calculated to mislead the inexperienced... "W. B." seems to think that there is a special difficulty in selling at a profit the milk produced at this farm, in some way connected with the expense of the sewage system of cultivation.

farmers, the experience of this farm before and after the introduction of the use of sewage provides a very decided instance of the contrary. There are many more points of a general nature in 'W. B.'s' letter, that I should have wished to notice, but I am unwilling to trespass on your space beyond an endeavour to draw attention to the valuable results obtained at this farm, a better acquaintance with which would I am sure, induce 'W. B.' to notice them more favourably than he has done. *Henry W. Pease, Little Farm, Barking, Jan. 28.* This letter was unfortunately detained in the post, or else would reach you with it was too late for our issue of the 20th.

Tiptree Hall Live-stock Account for 1866. I ask myself the question, Does it pay to feed 300 acres of cake, corn, &c., besides and with the produce of 30 acres of green and root crops? I have long since said "Yes" and proved it by the fact. But how do I prove it? By taking Mr. Lawes' estimate of the manurial value of each ton of food consumed, after it has been consumed, and by finding all my crops of a maximum instead of an ordinary yield.

	Food consumed.	Tons	Manurial value per ton.	Total value of Manure.
172	Best American linseed cake	14	4 12 0	64 8 0
55	Mixed cotton cake	4	5 0 0	31 0 0
86	Best rapeseed	1	4 18 0	24 18 0
24	Beans (20 stones per sack)	2	3 13 6	9 1 0
35	Maize cobs	3	4 5 0	21 5 0
69	Straw	14	3 0 0	39 0 0
47	on. timonial food	1	0 0 0	0 0 0
44	Wheat and Barley	1	1 14 0	6 6 0
9	Unseed	1	0 13 0	5 13 0
66	Wheat and Grass hay	17	1 17 6	21 12 6
67		26		42 13 0

Manure compared with guano when it was 10/ per ton, equal to 31 tons of guano, which at 13/ per ton, its present price, would amount to 412/. Deduct 100/ for extra attendance, grinding, &c., of this extra quantity of food, and there appears a gain of 312/ as compared with the purchase of guano. As a general estimate, I consider this a fair and just comparison. No accounts taken of the manure resulting from the 30 acres of root and green crops consumed. It appears from the foregoing that I get 412/ of guano for about 100/. Is not that a saving and a gain? Take away that amount of manure, and see how much my general crops would be diminished. I am no believer in the over-manuring of crops, especially Mangel, Beans, Clover, Grasses, and particularly Italian Rye grass. Besides, with every extra inch of subsoil moved there are 100 tons of poor soil to be enriched. The great curse of English agriculture is, after want of drainage, deficiency of manure. My experience has taught me that land can never be too rich, even for Wheat or other cereals, provided the manure has been applied for a previous crop. It is the sowing of too much seed that causes crops to be prematurely laid in well fertilised soils. *J. J. Mechi, Feb. 2.* [It is difficult to understand the above valuation, but we suppose it is assumed that Mr. Lawes' valuations were based upon the price of guano at the time when it was sold at 10/ a ton.]

Carbolic Acid for Scab in Sheep.—I see in your Notices to Correspondents it is mentioned that sheep dipped in, or washed with, soap and water, containing one part of carbolic acid to 100 of water, will resist the infection of scab. In your next impression will you kindly inform me if thus washing or dipping sheep already infected, will cure them of scab, and whether there would be any risk in allowing ewes which have been washed, to return at once to their lambs? By complying with this request you will greatly oblige. *A Tenant-Farmer.* [Respecting the employment of carbolic acid as a remedy for scab in sheep it is necessary for a "Tenant-Farmer" to be informed that, although the agent, if properly used, is certain to cure the disease (at least in our experiments upon several thousand scabby sheep it has never failed), there are several practical difficulties in the way of its successful application. First, the stuff which is commonly sold as carbolic acid is merely tar oil containing a small percentage of the acid, and utterly useless for any purpose to which carbolic acid is applied. Secondly, the solution for dipping the diseased sheep must contain at least one part of acid in 50 of water, and the mixture must be perfectly uniform, or it will do mischief. A quantity of the acid rises to the surface of badly made compounds, in the form of a brown film, and the first few sheep which are dipped really get the principal part of the active ingredient on their skins, and sometimes die in a few minutes. The weak solution, which we recommended last week as a disinfectant, is quite free from this source of danger, but it is not strong enough to cure scab. Thirdly, the cure of scab, by means of carbolic acid dressings, requires that the animals be dipped twice, the second time ten days after the first, in order to destroy any young scabs which may have been hatched since the first dipping; and which, if not exterminated, would soon increase and multiply. We could give directions for making a carbolic acid dip, but we doubt if a "Tenant-Farmer" would care to take the necessary trouble to make it, and there is a great probability of his failing if he did. The preparation which is advertised as "McDougall's Cure for Scab," and also the "Glycerine Dip," owe what efficacy they possess to the presence of a certain proportion of carbolic acid, and it would be better to use one of these in the way we have suggested, than to attempt the manufacture of a mixture, the preparation of which requires considerable pharmaceutical tact. There would be no danger in allowing ewes to return to their lambs after "dipping," as soon as the superfluous fluid has drained off them.]

Earth for Closets. From the time that, in order to

the development of the dry earth system the manufacture of earth closets and first a firm and then a company for that manufacture became a matter of necessity I ceased to write to you on the subject, lest my desire to publish the benefits of the system should be misinterpreted as that of pushing a business. Now, however, that the discovery in its varied applications has been recognized from a mere manufacture into a system and as such is not only widely acknowledged but has spread at home, and is spreading throughout the Canada and other countries I may perhaps be permitted occasionally, and without suspicion of selfish activity, to say a few words about the successful results that have been obtained with earth and water. In this connection I would reply as freely as I can to your correspondence. *Amateur.* Two or three years ago Mr. H. Taylor, a farmer and manure dealer in Dorchester who has for longer than that period supplied and removed the earth from the Dorset County School of 75 or 80 boys, pronounced the manure to be worth when dry, from 2/ to 3/ per ton. Shortly after this two tenants of Baron Rothschild's at Hutton, whose names you will find in the Earth Closet Company's circular, gave their testimony of the experiment—that the minimum value of earth once used in a closet is 3/ per ton. Previous to this testimony, I had disposed of the manure from my parish school, of about 30 boys, in this way: a farmer supplied the earth and removed it, giving me 10s a month for the produce. This I gave to the schoolmaster, to induce him more readily to keep the place in proper order. But on receiving the testimony as above mentioned I proposed to two of the farmers of the parish to take a ton each give me 3s a ton for it, which should go to the schoolmaster, and carefully try an experiment. One was quite satisfied with the power of the manure, but he used it extravagantly, applying the entire ton to a single acre of Sweden. The other, R. Hayne Esq., of Fordington, wrote thus to the manager of the Earth Closet Company—"I used some earth that had passed twice through the earth closets in the day-school of this parish on a piece of Rape of about three acres and a half. The land had the previous season borne a crop of Mangel the whole of which was drawn and consumed by the cattle. The Rape was sown on the 15th of April and one ton of the earth (entirely) was drilled with the seed. In June 2 cwt of Bell's guano was sown broadcast over the whole piece which was harvested in the drills. The reason for my applying the guano was because the land had not been dugged. The crop was a good one although the season was so dry and hot and therefore unfavourable for Rape. If I had not used the earth I should have drilled six sacks of bones in the piece, costing 72s." *Henry Moule, Fordington Vicarage, Feb. 2.*

Mr. Mechi.—I decidedly disclaim to be an agricultural teacher. On the contrary, I am always a learner, seeking for the most profitable and therefore the best, modes of agricultural practice. It is true that I make public my facts and practice, and sometimes venture an opinion but I hold that it is good for agricultural progress that we should make known and compare and thus derive profitable information from each other. Of course such a system is unpalatable to those who wish to make farming a hole-and-corner business and shade it from the light of observation but the time for that is gone by, now that we have good roads, railways, penny post, and a rapidly growing agricultural Press, in which we may all meet, discuss, and compare. As I have already said, I am always a learner, and I respect those agriculturalists who profess to be dispassionate when they practice that if they will point out how I can improve the gains on my farm I shall not only feel much obliged to them but will at once adopt the practice they recommend, and so increase the money in my pockets. Finding fault without suggesting a remedy is both unkind and childish, and savours strongly of a conviction that our present mode of agriculture is perfect and incapable of improvement. So long as the average yield of each acre in the United Kingdom is only a trifle over 3/ annually I shall be no participator in such a conviction. I am a good deal amused by the various styles of admonition or censure bestowed upon me and my balance sheets. May I ask these parties to produce their own balance sheets, and thus improve and enlighten me. One calls me a market gardener because the railway enables me to send my Peas green in the pod to the London market instead of harvesting them and sending them dry. Another grumbles because at a leisure time I aid my neighbour with horse work and he in return aids me when I am over busy each party charging the other according to the work done. A third censures me for grinding my own and my neighbour's corn, and innocently asks what is to be done if we all become millers? He might as well suggest our all becoming cotton spinners, or tanners or butchers and bakers. Another infers that because I don't sell lean animals I do not breed any. I do breed 100 lambs annually, and sell them as fat mutton at a year old. I always used to rear 30 calves annually until the cattle plague made it dangerous. I stand fast to my axiom that selling lean stock off the farm impoverishes it, and is inconsistent with large produce of corn and roots. It is only very rich land or dairy districts that will stand such treatment. Plenty of fat stock and plenty of corn must be our future motto. *J. J. Mechi, Tiptree Hall, Feb. 1.*

Malt for Beer.—In the *Standard*, a day or two ago I saw an extract from the *Chamber of Agriculture Gazette* containing mention of a brewing of three parts of barley meal to one of malt. This proportion of meal is I fancy, unusual, but surely the use of meal in brewing could never have been spoken of in that Gazette as being of itself a novelty. In Johnston's "Chemistry of Common Life" this use of meal is described and the reason of its success given. But this is a "modern instance." In a much older book of

we saw you have not the London book of 1751, gives "The quantity of wheat required to make 100 quarters of beer," the "wheat" and "oats" must be reduced to meal, and the rest of the plan is the same in principle as in the *Standard*. It may be worth your notice that of "hoppys" and "hops" I think I had then the me when...

H. J. M. Gatchell, Suffolk, Jan. 29.
 Lume as a Fertilising Agent.—The reason in reply to R. Smith relative to the application to crops in which there exists much matter I can fully endorse from my own experience. I took a piece of land five year since exhausted, and badly farmed when I received it, having a poor crop of Oats. I had used lime and the vegetation it produced was utterly worthless. In the first place I thoroughly drained and summer fallowed, and then I was bound to the Irish acre; then I had it sown in February sowed it with Red-cliffed Wheat which proved a splendid crop both as regards quantity and quality yielding more than Wheat. I should remark that a small part of the land which had been earlier mazed. The following year I sowed down with Grass seeds and Clover of which crops were remarkably good but the lay was extraordinary for such a dry summer—nothing less than eight tons of grass and it was mowed a second time to feed the stock during the heat of summer. The Potatoes on part of the ground which had not been although otherwise well manured, yet they were worthless but it was quite otherwise. I had had been a mill for they were both for the table. As previous to my occupying the land it never had been either deep or ploughed since it had been a wood, I attribute the improvement in fertility to the action of the manure mulch for ages of vegetable matter lying as it were and literal use as in the soil has been at once utilised by the lime and suitable for the purposes of domesticated vegetation. Change in its surface where it has been in Grass is almost inured to. *J. M. E.*

Tiptree Hall Farming.—It was not my intention to have written again on Tiptree Hall, but for two reasons I am induced to write a few lines. In the first place I thank the gentleman who wrote the article which was inserted last week in the *W. B. Z.* This article I take to be an analysis of the hollowness of Mr. Mechi's managing his cattle and cultivating his soil. Other reason for again writing is the consideration of it I call the attention of myself as well as that of other readers. I have been in Suffolk and on the borders of Norfolk had thought Mr. Mechi was well known, farming doings appreciated as I had often his having been there at agricultural meetings. I saw several farmers and a class of them but to my surprise did not had read Mr. Mechi's balance sheet and why they had not read it since Mr. Mechi much pains to enable them to do so, the was that they did not think it worth indeed they all spoke of it with confidence. On finding such to be the case I made to take my fare on my return home to Tiptree of which I knew Tiptree Hall was within my object being to ascertain from some of the most with there, what was the opinion of neighbours farmers of Essex had or had not here has farming and balance sheet were spoken against if possible than I had had been in Suffolk and Norfolk and of the the respectable looking farmer whom I thought the man what he thought of Mr. Mechi's sheet he spoke of it with cheer confidence he did not believe a word of it as Mr. Mechi could write down what figures he pleased out what profits he pleased but even if he crops of Wheat he said he kept fat cows at expense on purpose to make manure for the of these crops, and that such a system followed by a tenant farmer who had been for making money, would soon have him in a house, and as three or four times in the same room, he appealed to the if such were not the case and the terms as possible contained in Mr. Mechi's the opinion of thoughtful farmers in the neighbourhood as well as that of other counties in which he resides. I was thought by them of the balance sheet of others in other parts of the country and these in the neighbourhood from whom whom I have had the opportunity of the subject. The balance sheet is for January 1—Valuation, and 1866 shows crops at that date of each of those years then goes down to December 31 of each year, showing the stock and crops exhibiting a profit for each of those years for the first 52s 11s 6d for the second for the third, and 25/ 13s 6d for the last year. Now I thank Mr. Mechi for spirit to him, who made these valuations the valuer or valuers came to the

year, and their exact value to a penny... all, or only a part of his crops—that is, passed them through the bushel, or could have known at what price they... These are but simple questions, and as Mr Mechi has and taken extraordinary... year on the 31st of December of the... a single penny for each year, before parts of those crops, could have been before the market price of them, by any could have been known? The same might be put, and with still greater force, as... but I forbear putting them for the... to do with the task I have above set

Societies.

AGRICULTURAL OF ENGLAND.

COUNCIL. Wednesday, February 3, 1869. Mr. H. S. Thompson, trustee, in the chair, Lord Chesham, Lord Tredegar, Messrs Lopes, Bart., M.P.; Sir T. Bart.; Mr Baldwin, Mr Bramston, Mr. Colonel Challoner, Mr. Clive, M.P.; Mr. Mr. Mr. Brandreth Gibbs, Mr. Hornaby, Colonel Kingscote, M.P.; Mr Milward, Mr. Randell, Mr. Bigden, Mr. Shuttleworth, Mr. Webb, Major Wilson, Mr. Jacob Wilson, and Mr. Voelker.

Dunmore, Stirling, N.B., was... of the Society. ... were greeted... H.P. ... Arts... Fairfield... Showsbury.

It was announced ... awarded the prize of 20L, in ... of Grass-land," to the ... "Give liberally, so that you ... which was written by Mr.

Clement Cadle, of Gloucester; and the prize of 25L. in Class IX., "On the Rise and Progress of the Devon Breed of Cattle," to the essay bearing the motto "Spero," which was written by Mr. John Tanner Davy, of Rose Ash, South Molton, Devon. It was recommended that the publication of the essays should be accompanied by that of the award of the prize of 30L. in Class I., "On the Farming of Middlesex," by the Rev. J. C. Clutterbuck, for his essay bearing the motto "Rus in urbe," of which decision no report has yet been published.—This report was adopted.

HOUSE.—Viscount Bridport, Chairman, reported that the Committee recommended the consideration of the question of obtaining additional committee-rooms on the north side of the house, as they can be provided at a moderate cost; and that the Committee empowered to lay before the Council a plan and estimate to be furnished by Mr. Fowler.—This report was adopted.

GENERAL MANAGER COMMITTEE.—Mr. D. R. Davies reported that the Secretary of the Manchester Local Committee having called the attention of the Committee to the subject, it had been agreed to recommend the Council to appoint a Special Committee to consider whether any and what privileges at the Society's shows shall be placed at the disposal of Local Committees. A discussion then ensued, in which Mr. Torr, Major Wilson, Colonel Challoner, Mr. Randell, Lord Chesham, Colonel Kingscote, Mr. Thompson, Mr. Brandreth Gibbs, Mr. Cantrell, Mr. Milward, Mr. Jacob Wilson, and Mr. Davies took part. Ultimately the recommendation was withdrawn, Mr. Davies adopting the suggestion of several members of Council, and giving notice of his intention to bring forward a resolution on the subject at the next Council meeting.

SHOWYARD CONTRACT COMMITTEE.—Mr. Randell, chairman, presented the following report—

In your meeting with reference to the Showyard meeting, your Committee have to lay before the Council a statement of the cost of showyard works at Leicester. This is all that is asked for, but as your Committee believe that the object of the proposition was to enable the Council to compare the cost of the showyard works now with the amount formerly paid, we give also the amount for the Worcester show—Worcester, from its situation, appearing more fitly to bear comparison with Leicester than any other meeting. The cost of the Leicester showyard was £4378 18 11

The cost of the Worcester showyard was £4378 18 11
Add to this the works at Leicester which were in excess of those at Worcester, after deducting those which at Worcester were in excess of Leicester.. .. 118

Cost of Leicester as above £4496 18 11

That is, the Leicester showyard cost £1088 15 5 less than it would have been under the arrangement in other words, if the showyard works at Worcester had been of the same extent as Leicester, the cost of the former would have been 1088L 15s. 5d. more than was expended upon the latter, and this without crediting anything to Leicester for the improved character of the buildings and works there, the additional measurements only being charged. Of the amount thus saved 321L 18s. 1d. is upon the permanent buildings, and we think it right that the Council should be informed as to the effect of purchasing, instead of hiring, as formerly, these buildings.

The amount paid at Worcester for the hire of these buildings was £4378 18 11
And that, on the same scale of charge, the additional buildings would have cost .. 116 0 0

Whereas at Leicester the whole cost was £4496 18 11
Showing a difference in favour of the present arrangement of .. 321 18 1

after paying the cost of railway transit, repairs, erecting, and insurance, and charging 10 per cent. upon capital employed.

The surveyors' report had been considered, and certain suggestions were recommended to the Council.—This report was adopted.

COMMITTEE OF SELECTION.—Mr. Thompson, chairman, reported the following recommendations of the Committee—1. That Sir T. Hesketh, Bart., M.P., of Rufford Hall, Lancashire, be proposed to the Council, in accordance with the resolution of the last meeting of the Committee, to fill the vacancy caused by the election of the Duke of Richmond, K.G., as Vice-President, and (2). That Thomas Statter, Esq., of Stand Hall, Whitefield, Manchester, be elected to fill the vacancy caused by the resignation of Mr. Caro Sewell Read, M.P. Sir T. Hesketh having been proposed by Mr. Thompson, and seconded by Lord Bridport, was then unanimously elected a member of Council; and Mr. T. Statter having been proposed by Mr. Torr and seconded by Mr. Milward, was also unanimously elected a member of Council.

It was resolved, on the motion of Mr. Torr, to repeat the advertisement announcing the intention of the Council to hold the country meeting of 1870 at some place in the counties of Berks, Bucks, Hants, Kent, Oxfordshire, Surrey, or Sussex.

A letter from Mr. Walter Parthing, of Stowey Court, Bridgwater, was read; and it was resolved that his heifer, born July 1, 1866, is eligible to compete for the Society's prizes in Class G1 of Devon heifers not exceeding three years old.

Farmers' Clubs. LONDON

Pauperism and Vagrancy.—On Monday last Mr. Trask's promised paper on this subject was read before the members of this Club in their assembly room at the Salisbury Hotel. After the customary introductory remarks had been made, Mr. TRASK came to the main ground of his paper—

Number and Increase of Paupers.—I find that the total number of paupers of all classes in England and

Wales on the 1st of January, 1868, was 1,040,103; and at Michaelmas, 1868, was 67 per cent. more than at Michaelmas, 1867, and 10 per cent. more than at Michaelmas, 1866, and the increase has been general throughout the kingdom. It is difficult to fully comprehend the state of things which these figures indicate, for instance, the borough of Tamworth, which sends two members to the House of Commons, and has a population of 10,100, and in the last census— it will take 102 such boroughs to furnish men, women, and children enough to equal the number of our paupers south of the Tweed, or if we take another parliamentary borough—that of Richmond—we shall require the total number of its inhabitants to be multiplied just 203 times before we arrive at a number equal to the paupers of England and Wales! I think, then, that no one need be surprised, when we are told by an eminent Cabinet Minister that "This is the great problem which is now before us. It is not for statesmen only, it is not one for preachers of the Gospel, only—it is one for every man in the nation to attempt to solve.

Remedies Considered and Suggested.—What I understand by solving this problem, is to apply such remedies as will, as far as possible, lead to a permanent mitigation of the evil; for no one supposes that pauperism can be entirely eradicated—it will always exist, more or less, in a great community. In proceeding then to consider the best means of permanently mitigating this great evil, it should be borne in mind that we have to deal with different classes of paupers, that require totally different treatment, and in order to discuss the question with any practical advantage, it is absolutely necessary to treat of each class separately. I shall therefore take that course, and point out where I consider the existing system has failed, and what steps should be taken to remedy it. I shall also show in what way I think the general interests of the working-classes might be improved. The class of paupers that I shall first refer to are those within the workhouse. Dr. Sturges has recently stated that "Almost the only persons found in workhouses are the aged and infirm." This, however, is not the case, for by far the largest class of inmates are children under the age of 16, and I have long since felt, after several years close observation, that no part of our poor-law system has failed nearly as much as in the case of these children. As a rule they are taught to read, write, and cipher very fairly; but as for a knowledge of any industrial occupations to enable them to get a living to make themselves useful members of society, they are woefully deficient. When we consider that we have nearly 60,000 children in the workhouses, and of these probably more than two-thirds are orphans or deserted by their parents, it will at once be seen how important it is that these children should be brought up in such a manner as will enable them to get an honest living in the world, and not to look upon a state of pauperism and a home in the workhouse to be naturally theirs, as I fear many of them do now. At the Sherborne agricultural meeting, a short time since, Professor Buckman is reported to have spoken on this subject as follows. "As a member of a board of guardians, he had been very much struck lately with a very important question. He found that the children in our workhouses were being brought up for nothing else but paupers. He hoped that something would be done to take them out of that category. He was not prepared to suggest any scheme. But they had been told lately that foreigners were supplying their navy, and that they were enlisting foreigners for the army. He did not see why their pauper children should not be sent to some central school, to be supported by all the unions in the country, where they might be educated so as to enable them to follow some useful occupation. He had been thinking of the matter for a considerable time. To bring up children merely as paupers was highly creditable to the nation. That was an agricultural question, and one which they would do well to consider." The first step that I think it is necessary to take, in order to bring up these children satisfactorily, is to remove them from all workhouse contamination; no doubt an improvement might be made where they are, but the expense of bringing them up in a proper manner in workhouses would be enormous, and the result almost certain to be unsatisfactory. Even in salaries alone, in small workhouse schools the cost is now from 2L to 3L for each child, while at Birmingham, where there are nearly 600 children taught, the total salaries of the teachers and industrial instructors amount to about 7s per head. But the greater saving, in having the children brought up in institutions expressly adapted for them, apart from the workhouse, would be felt through their being taught the means of permanently keeping themselves after leaving the institution, and not to become a source of further increasing the pauperism of the country. After arguing that the cost of educating children should be borne by the national exchequer, and their maintenance only thrown upon the poor-rates, Mr. Trask described the—

Present Inefficient System of Industrial Training.—I have noticed that one of her Majesty's Inspectors of Union Schools, in his last report to the Poor-law Board, states that, "As the result of 20 years' experience the great difficulty in the education of pauper children it is the imperfect education of many of those above them, and on whom they must depend. The consequence is, that although education is seldom openly opposed it is often thwarted and impeded indirectly, and great inefficiency is constantly manifested to the whole subject." I am bound to say that my own experience entirely bears out this statement; as a rule, the guardians have utterly failed in the management of workhouse children. I have received a large number of letters from different workhouses in reference to this subject, but I shall only give the substance of two or three of them. From one union the master states, "That the boys of this

encouraged. Those who have traveled between Hamburg and Berlin must have noticed the immense flights of pigeons circling round those large red brick homesteads that are dotted about the country.

The pigeons of which we have been speaking are generally of mixed plumage of all shades, from dark slaty blue to white. They are reared, as a rule, mixed together with the ordinary French pouter.

In answering a correspondent, "Colchicus," in a recent Number, we said that tame pheasants might be made to pay by the sale of their eggs. We have a great many letters, inquiring all sorts of particulars as to the birds and mode of keeping them.

We have to chronicle the close of the game season, of which it may be said that white pheasants and partridges have been unusually plentiful.

Calendar of Operations.

Spring Wheat not sown last month is now got in without needless delay. The propriety of increasing the breadth of the crop will no doubt give rise to some diversity of opinion.

Now Beans and Peas as soon as the weather and land will permit, is also a current rule. Of late years we have become more and more impressed with the propriety of increased attention being paid to the growth of both these crops.

The Oat, although the hardest of our cereals, requires a dry seed-bed, with properly cultivated land, to secure a favourable return. The latest varieties are sown as early in February as the weather will permit.

Notices to Correspondents.

Mr. Hope. Mr. Hope is informed that fertilizing material by using it as litter in the stable and after wards rolling in a dung heap.

VICTORIA and PARADISE NURSERY, UPPER HOLLOWAY, LONDON, N.

STOCKS, STOCKS, STOCKS.

B. S. WILLIAMS

HAS MUCH PLEASURE IN OFFERING CAREFULLY SELECTED

SEED OF THE SUPERB EAST LOTHIAN INTERMEDIATE STOCK,

Feeling sure, from personal observations of several years, that it is without question the finest strain of Intermediate Stock extant.

The colours are Purple, Scarlet, and White. The two first are remarkably brilliant, and the latter very pure. They produce immense branched spikes of large double flowers, and are admirably adapted for ribbon borders and general bedding purposes. Indeed, the effect which can be produced by these three varieties in both spring and autumn gardening is not surpassed by any of the now popular plants. If sown early in March, and transplanted in May to their blooming places, the amount of double flowers produced, and the grand display they make, is truly surprising. For either flower gardening or pot culture they are unapproachable, and cannot be too strongly recommended.

An assortment of three colours (Scarlet, Purple, and White), 2s. 6d.

B. S. WILLIAMS, VICTORIA and PARADISE NURSERY, UPPER HOLLOWAY, N.

NEW HYBRID PASSION FLOWERS.

PASSIFLORA MUNROI, and PASSIFLORA LAWSONIANA

(Fully noticed and described in the Gardeners' Chronicle of December 12, 1868, p. 1288).

PETER LAWSON & SON

Intend to send out the above-named charming Climbers, for the first time, early next May; and are now prepared to book orders for

Plants at 21s. each, with the usual discount to the Trade.

EDINBURGH and LONDON.—January, 1869.

TACSONIA ERIANTHA

(WOOLLY-FLOWERED TACSONIA).

A noble plant, resembling in habit and colour of flower the well-known T. mollissima, from which, however, it differs conspicuously in the white under-surface of the foliage and long bracts. As a Greenhouse or Conservatory Climber, it rivals the T. mollissima, and is as free a flowerer. (Vide "Curtis's Botanical Magazine" for January, Tab. 5760.)

PETER LAWSON AND SON have been fortunate in acquiring the Stock of this splendid Climber from Isaac Anderson Henry, Esq., F.L.H., and intend to send it out simultaneously with their new Passifloras.

Orders for Plants will now be booked at 21s. each. Trade allowance as usual.

EDINBURGH and LONDON.—January, 1869.

CAREFULLY SAVED GARDEN SEEDS.

ARTHUR HENDERSON & CO.'S

CATALOGUE of choice VEGETABLE and FLOWER SEED NOVELTIES

Is now Published, and can be forwarded Post Free on application.

The VEGETABLE SEED SECTION contains—

Selected LISTS of the best varieties of each kind most worthy of cultivation, also some excellent new sorts of both VEGETABLE and FLOWER SEEDS of sterling merit. Attention is also directed to the Pine-apple Compact-top BEET (the finest and richest flavoured variety extant), carefully saved, true from the original stock. Also the new DWARF WATERLOO BEET—top leaves rich metallic crimson—growth true, even, and regular. This beautiful foliaged variety may with advantage be cultivated in the flower garden as a border, ribbon, or edging plant, its root is a trifle larger than the Pine-apple Compact-top, flavour excellent, full of sweet saccharine juice, colour crimson, texture tender and uniform throughout.

The FLOWER SEED SECTION contains—

Imported GERMAN FLOWER SEEDS in Collections, Choice Strains of FLORISTS' FLOWER SEEDS; a careful LIST of FLOWER SEED NOVELTIES of the season, HORTICULTURAL REQUISITES of every kind, KNIVES, PROTECTING MATERIALS, HORTICULTURAL MANURES, &c., &c.

N.B. Everything in this CATALOGUE is Priced.

PINE APPLE PLACE, MAIDA VALE, LONDON, W.

All Seeds Carriage Free.

PAUL'S NURSERIES AND SEED WAREHOUSE, WALTHAM CROSS, LONDON, N

GENUINE AND FIRST-CLASS SEEDS.

WILLIAM PAUL

DEGS TO ANNOUNCE THAT HIS

CATALOGUE OF SELECT VEGETABLE AND FLOWER SEEDS,

Including many Novelties, is now ready, and may be had Free by Post on application.

In proof of QUALITY he need only refer to the numerous Prizes awarded at various Horticultural Shows throughout the country, for both Vegetables and Flowers grown from his Seeds, and in regard to prices these are in every way fixed on the lowest possible scale to be remunerative. The following Gardens in Hertfordshire, justly celebrated for their Vegetables and Flowers, have long been supplied from his Seed Warehouse—Brockett Hall, Dancsbury, Poles, Digswell, Wyddial Hall, Woodhall, Youngsbury, Bedwell Park, Essendon Place, Bayfordbury, Knebworth, Frogmore Hill, Childwickbury, Codicote Lodge, and many others of similar celebrity throughout the country.

To purchasers who are unacquainted with the best varieties of Vegetables and Flowers, or who wish to save the trouble of writing a List, the following Collections are made up on equally liberal terms with any other House in the Kingdom. All are of the best quality, and cannot fail to give the fullest satisfaction.

VEGETABLE SEEDS.

No. 1. The WALTHAM COLLECTION of VEGETABLE SEEDS, FOR A LARGE GARDEN, Price £3 3s.

No. 2. The WALTHAM COLLECTION of VEGETABLE SEEDS, FOR A MEDIUM-SIZED GARDEN, Price £2 2s.

No. 3. The WALTHAM COLLECTION of VEGETABLE SEEDS, FOR A SMALL GARDEN, Price £1 1s.

Smaller Collections for Small Gardens or Cottagers, 15s., 10s. 6d., or 5s. each.

FLOWER SEEDS.

No. 1. The WALTHAM COLLECTION of FLOWER SEEDS, INCLUDING THE FINEST IMPORTED ASTERS, STOCKS, &c., Price £2 2s.

No. 2. The WALTHAM COLLECTION of FLOWER SEEDS, INCLUDING CHOICE IMPORTED ASTERS, STOCKS, &c., Price £1 1s.

No. 3. The WALTHAM COLLECTION of FLOWER SEEDS, INCLUDING THE MOST EFFECTIVE FOR A SMALL GARDEN, Price 10s. 6d.

No. 4. PAUL'S CHOICE COLLECTION of HOLLYHOCKS, IN TWELVE DISTINCT NAMED SORTS, Price 5s.

NOVELTIES, OR VARIETIES OF SUPERIOR MERIT.

- PAUL'S Superb Crimson, 1s. per packet.
BECK'S Leader's Superb Protecting Late White, 3s. 6d. per pkt.
BECK'S, Snow's Winter White, very select stock, 1s. per packet.
BECK'S SPROUTS, Paul's Waltham, 1s. per packet.
BECK'S FLOWER, Hill's Dwarf, 1s. 6d. per packet.
BECK'S FLOWER, Superb Dwarf Hertfordshire, 1s. per packet.

- CUCUMBER, Paul's Improved Telegraph (true), 2s. per packet.
* * * This Variety was first sent out by me in 1861, and is distinct from many varieties of Telegraph, and acknowledged to be the most prolific and best flavoured of all Cucumbers.
ENDIVE, Waltham Green Curled, 1s. per packet.
LETTUCE, Brockett Hall Brown Cos, 1s. per packet.
LETTUCE, Hill's Compact Brown Cos, 1s. 6d. per packet.
PARSLEY, Paul's Selected Extra Curled, 6d. per packet.

FOR MORE PARTICULAR INFORMATION, SEE SEED CATALOGUE.

All Seeds, except very small parcels, Carriage or Post Free.

- ARM ARBATUM.—Flowering bulbs, 2s. to 7s. 6d. each; 18s. to 72s. per dozen.

NEW VARIETIES of COLEUS,

NOW BEING DISTRIBUTED.

At the Gardens of the Royal Horticultural Society, and purchased by JAMES CARTER & Co. at the Auction on December 10

HER MAJESTY - This variety is of very free habit, and its broad leaves are of a deep bronzy red, with the narrow veins somewhat less golden tinted than Princess of Wales. It is however very effective. Price 5s. each.

PRINCESS OF WALES - A free-growing variety, with leaves of a deep purplish red, marked with deeper coloured veins, and having scarcely any gold markings at the base, that it resembles Albert Victor, minus the golden spots. Price 5s. each.

PRINCESS OF WALES - This has still less yellow than the Victoria or Princess Royal, but has instead a decided and deeper glow of purple. Price 5s. each.

PRINCE ARTHUR - The leaves of this variety have a very ground colour, with a too base, the veins, and the veins are heavily marked with deep purple red, the base being red. These markings give the plant rather a peculiar appearance. It has the close habit and general character of Coleus Gibson. Price 5s. 6d. each.

The Set of Four for 14s.

LILIUM AURATUM (Golden-rayed Lily).

Imported Bulbs, 2s. 6d. each, and upwards

POTATOS (Best kinds to Cultivate).

- CHAMPION KIDNEY (for foreign), 5s. per peck, 4s. 6d. per bushel.
EARLY OXFORD (choice quality), 3s. p. pk., 2s. p. bush.
ROYAL ASHLEAF & DUNKY 4s. per peck, 14s. p. bush.
ASHTON BLUKE KIDNEY, the best second early variety, 4s. per peck, 14s. per bushel.
IMPERIAL KIDNEY (very prolific), 2s. per peck, 14s. per bushel.
WILLIF (well known), 4s. per peck, 14s. per bushel.
DALMAY (Round), 2s. 6d. per peck, 8s. per bushel.
FLORIP (Kidney), 2s. 6d. per peck, 8s. per bushel.
IMPROVED REGENT, 2s. 6d. per peck, 8s. per bushel.
Co. a stocks of the above are very choice and true.

CARTER'S PRIZE MEDAL LAWN GRASS

will produce a Permanent Turf of finest quality. 1s. per lb., 90s. per bushel

CARTER'S FERTILISER,

THE BEST MANURE FOR THE GARDEN.

In Tins, 1s. 9d. and 4s. 6d. each. In Bags, 15s. and 25s. each.

HOOPER AND CO.'S GENERAL CATALOGUE, which contains 250 distinct Species and Varieties of Flower Seeds, and every valuable sort in Kitchen Garden seeds. Liberal profit allowed.

HENRY GODFREY, NURSERYMAN, Stonebridge has to offer a large quantity of HERBACEOUS CALICOLARIAS, raised from seed saved from a particularly fine strain, established in sun, pots, from 2s. 6d. to 3s. per dozen, basket and package included. When three or more dozens are taken, Post office orders or postage stamps will accompany orders.

HENRY GODFREY, NURSERYMAN, Stonebridge has a large stock of FERNS and SPERMATOPHYTES, offers them in 12 fine varieties, at from 8s., 12s., to 18s. per dozen. These are fine healthy plants, full of fronds, grown in a cool greenhouse. Post-office orders or postage stamps must accompany all orders.

GLOXINIAS, erect and drooping, 2 yr. in bloom. Free by post, in 12 choice named sorts, 8s., 24 sorts for 15s. ACHIMENES, good tubers, free by post, two of a sort, in 12 choice named varieties, 6s., 19 varieties, 9s.

WERB'S NEW GIANT POLYANTHUS Florist Flower, and GIANT COWSLIP SEEDS; also plants of all the varieties, with double PRIMROSES of different colours, AURICULAS, both Single and Double with every sort of early Spring Flowers. List on application - Mr Wm. Clibbet, Reading.

SUTTONS' COLLECTIONS of CHOICE

Table with columns for variety names and prices. Includes GLADIOLI, 100 in 50 choice varieties, 24 0 0, 12 choice varieties, 20 12 0, etc.

Choice Seeds, Gladioli, &c.

Wm. CUPRUSH AND SON'S CATALOGUE of the above contains description and prices of many very superior home grown VEGETABLE and FLOWER SEEDS, and choice varieties of GLADIOLI, &c., all of which are highly recommended. Post free on application. Highgate Nurseries, London, N.

GLADIOLI SEEDLINGS (Mixed). - Beautiful Flowers equal to any collection, of all colours. Strong Flowering Bulbs, 7s. per 100; 31. 4s. per 1000. Apply to Levesque et Fils, Nurseryman, 132 and 134, Boulevard de l'Hopital, Paris.

Gladioli, the most Extensive Collection.

BARR AND SUGDEN, 12, King Street, Covent Garden, W.C. have the best and largest collection of GLADIOLI ever offered, prices varying from 2s. to 5s. per root. For particulars see pp. 68, 69, 70, and 71 of B. & S.'S SIKING SEED CATALOGUE. BARR & SUGDEN, 12, King Street, Covent Garden, W.C.

The Gardeners' Chronicle.

SATURDAY, FEBRUARY 13, 1869.

Table of meetings for the ensuing week. Monday, Feb. 15 - Entomological 7 1/2 x; Tuesday, 16 - Royal Horticultural Fruit and Floral Committee at South Kensington 2 1/2 x; Wednesday, 17 - Ditto Scientific Committee 1 3/4 x; Thursday, 18 - Ditto General Meeting 3 1/2 x.

THE report of the ROYAL HORTICULTURAL SOCIETY, an abstract of which we publish in another place, contains little that has not been at various times commented on in these columns during the past year. The establishment of the Scientific Committee we have ever held to be a judicious step, serving to give increased weight and authority to the Society, and bringing it, as the acknowledged centre of horticultural skill and horticultural knowledge, into closer connection with those collateral branches of science which have so important a bearing on gardening pursuits. As this Committee and its deeds have often formed the subject of comment, we need not dwell on them now further than to hail with pleasure the announcement vaguely made in the report, and afterwards more fully explained by Mr. WILSON SAUNDERS, that arrangements are being made to amend and accelerate the issue of the publications of the Society. At present these documents are a laughing-stock and a reproach to the Society. Even the Journal, the contents of which are satisfactory so far as they go, loses all its value from the excessively long intervals between its appearances, a circumstance which must be even more annoying to the learned and deservedly respected Editor than to the other Fellows of the Society. For our own part, we think that the beneficial operations of all the Committees, and especially of the Scientific Committee, are very materially impaired by the irregular and imperfect way in which their proceedings are recorded. In the case of the Scientific Committee, or of the Journal which should serve as the "Transactions" of that Committee, what hope is there of inducing either practical horticulturists who have information to communicate, or scientific men who have experiments to record, explanations to offer or suggestions to make, to come forward and contribute of their abundance? How different would it be were it once known that the Society afforded means for the diffusion of rigidly selected horticultural lore of a high-class character, not mere reports of exhibitions which

have little to say... certificates and... the duty might well be exacted for... greater honour to pertain to those not mentioned in the Society's records, but information of a character not of ephemeral interest only, but likely to be useful to coming generations of horticulturists. The objection hitherto raised on the score of deficient funds strikes us as of no great weight, because the money spent on the present numerous but most unsatisfactory and fragmentary publications must be almost as large as would be necessary to cover the expenses of a quarterly or monthly digest, so prepared as to be of value to the Fellows, and a credit to the Society. Such a publication, for which the Society has already a most efficient editorial staff, would, in our opinion, find, if not directly, at least indirectly, replenish its coffers. It is a fair question to put in reference to the not very favourable balance-sheet laid before the general meeting, whether the comparatively small sum required for putting the publications of the Society on an improved footing would not be much more profitably spent, both as regards the advancement of horticulture and the prosperity of the Society, by so doing, than is the relatively large sum now disbursed in prizes and medals. It is admitted that Exhibitions do not pay—and when we look at the medals expended in prizes this statement is not at all a marvel. Of course a good deal may be said in favour of giving prizes of substantial value, either money or otherwise to gardeners, but to well-to-do amateurs the "crown of wild flowers" would be ample recognition, while in the case of nurserymen it certainly seems entirely unnecessary to subsidise them, and at the same time give them the best possible means of advertising and displaying their productions. Surely with this class of exhibitors a less costly form of prize would answer all the purpose, or they might extend the system already carried out on a small scale with reference to certain specialities, and subscribe for prizes among themselves, and so liberate funds, to our thinking, now urgently needed in other departments of the Society's work.

How well laid out are the sums disbursed at Chiswick, the report of the board of directors shows. To horticulturists this document will be the most satisfactory portion of the Society's annual report, and now that facilities of access by railway to Chiswick from most parts of the metropolis are afforded, we may hope that the Society's most useful work carried on in the now time-honoured garden, will be appreciated by a larger number of visitors than heretofore.

At the recent Annual Meeting of the ROYAL HORTICULTURAL SOCIETY, in the discussion which ensued as to the PUBLICATIONS issued by the Society, Mr. BATEMAN took occasion to compliment the Gardeners' Chronicle, and he might have added, the Horticultural Press in general, on the manner in which matters of interest to the horticultural public were reported, and he urged that this circumstance rendered it of the less importance to amend the official publications of the Society. While we appreciate the compliment, we cannot assent to Mr. BATEMAN'S reasoning, because the official publications alluded to would necessarily be of a different character and the subjects treated of would be differently handled than they are in the columns of a newspaper. Besides, we are not sure after Mr. BATEMAN'S statement, that it would not be to the advantage of the Society if its proceedings were less efficiently reported.

We have just received specimens of two LICHENS which are said to be spreading with extraordinary rapidity in some parts of IRELAND. They are the common Evera Prunastri and Rabaulna farinacea, which abound in woods and orchards where the ground is badly drained. On a small scale it is easy to get rid of them by scraping, but they will soon grow again, and the most effectual remedy is to drain the land thoroughly. We have seen the most extraordinary effects produced in Apple trees by removing the Lichens, new vigorous adventitious shoots being developed, the growth of which was before once arrested by the choking of the Lichens, which prevented the access both of air and light, and the same evil effect was produced on the fruitful spurs. Our correspondent remarks that he cannot conceive why this plague should occur now and not in former years. It is of course impossible for us to answer this without inspecting the locality. Drains may have been stopped, particular local circumstances may have made a change in the distribution of moisture, or the matter after all may not have been before called into especial notice. Nothing can be more common than the profusion of these Lichens, especially on Larch and Hawthorn, in damp situations, and when they are once established they do not very readily disappear. M. J. B.

short time previously, while yet in Erlangen, he obtained the academical degree of doctor, for his dissertation "Plantarum Horti Academici Erlangenensis Enumeratio." This very important dissertation, consisting of 20 pages 8vo, was arranged strictly according to the Linnean method...

the men besides Schrank, who at this time exercised an important influence on the development of Martius' faculties, was General Conservator Schlichtegroll, who, although no botanical scholar, possessed an extensive knowledge of the kingdom and then there were the Academies Schlichtegroll and Sommering. And it was in these early years that Martius first attracted the attention of King Maximilian Joseph I, who was an ardent lover of plants and in his frequent visits to the garden was usually escorted round by Von Esenbeck. In the sequel, we shall see what important influences in Martius' career are traceable to this...

the traveller Baron Von Kurwinski, the Emperor of Bavaria favoured, as early as 1815, the idea of a scientific expedition to America. True, the plan discussed by the Academy of Sciences was never carried out. When, however, at the Congress of Vienna in 1816, a matrimonial alliance was effected between the Austrian Archduchess Leopoldina and the Crown Prince, subsequently Don Pedro I of Brazil, and Austria set about equipping a scientific expedition in the retinue of the bride, it was resolved in King Maximilian Joseph's Imperial Court, to depute two Bavarian naturalists to accompany the Austrians. The choice fell upon the geologist, as zoologist, and Martius, as naturalist, the latter having been selected by the king...

the petals or divisions may be made to radiate correctly beyond a doubt. Another common fault is to represent them all pointing in one direction sometimes this may occur in Nature, but it is not artistic to copy it in every case.

For scientific purposes it is desirable that positions should be as varied as possible, so that at least a front side and back of a flower be exhibited. A third error I may also allude to, and it is one very common in drawings made from dried specimens for scientific purposes—I have often seen otherwise correct and beautiful plates marred by it—viz, the representing all or most of the flowers in a particle or mass, with one particular division of the corolla directed towards the spectator, such uniformity is too mechanical to be natural. As good a flower as any to commence with is a Primrose, and for a mass of flowers the Polyanthus or Oxlip, as in these cases they are presented to the eye in various positions.

For the front view a faint pencil should be pencilled, the centre and the divisions of the corolla indicated, and then sketched in as firmly as is desirable. If the drawing is to be coloured, the outline and veins, if any, should be strong enough not to be quite obliterated by dark colour.

In a side view the tube should be properly adjusted to correspond with the throat or eye; the simplest way to do so is to carry the outline of the tube faintly through to the centre of the flower, as in the foregoing cut. In a position showing the tube foreshortened, or in a back view, the same method should be adopted as shown in the following illustrations. Tubular flowers

are often sadly treated by draughtsmen; take, for instance, the common Daffodil, in which, if lines were drawn round each centre, they ought to be in the same plane. The next sketch will better explain my meaning.

It is one of the most difficult flowers to sketch correctly in its natural position, and the best way to test correctness is to turn the paper, so that the flower be erect, when the bad drawing, if any, will be obvious. W. H. Fitch.

Home Correspondence.

Vine Roots Diseased.—Can you inform me what is the cause of the roots of my young Vines being destroyed? They were planted at the beginning of April, 1867 in an rustic border, composed of three-fourths of soil as per samples, in equal quantities, the other one part being composed of lime rubble, stable manure, and bones. Last season they made a tolerable growth. Vines of my own growing, although much the weakest when planted, made by far the best cases, but on examining them I found the roots in a very unsatisfactory condition. I top-dressed the border with turfy loam and lime, and they have made a quantity of young roots in it, but the old ones are quite destroyed. The strongest of the two Vines sent is of my own growing, the other is one of a quantity I purchased from one of our best cultivators, and I am afraid the mischief came with them. I have three vinerias that are doing well; one of these has been planted 50 years, and the other two seven years. The house in which these diseased Vines are planted is 60 feet long, and is intended for a late house. I shall be glad to know what remedy there is, if any, or if I must clear all out, and make a fresh border. J. S. R. [From the specimens of roots and soil sent we are of opinion that the mischief is due to Fungi at the roots. This is very apparent on those of the stronger Vines; apparently it has been introduced in planting the Vines—leaf-mould, or some such material, having been used in growing the young plants in the pots. There is no remedy for the evil, but a complete removal of the soil and plants. B.]

Pine-apple Culture: Cutting Down.—Had Mr. Barnes confined himself simply to an account of his own early experience of the cutting-down system, I should not have felt called upon to notice his remarks, seeing that I never either claimed to be the originator of the system, or said that anybody else was. But since he has brought my name forward, with remarks on my practice, I cannot pass over his statements in silence, so far as they refer to me. Whatever half a century of experience may have done for Mr. Barnes, it has evidently not taught him charity towards his unoffending, though younger brethren. Although he is at great pains to make it appear that the cutting-down process is not creditable to the cultivator, it is evident from the way he brings up recollections of 50 years back, that he is terribly concerned lest he should lose repute in the matter. When I first recorded my experience on the subject, I was careful not to claim priority in that respect, but accorded that to Mr. Thomson, who at least was the first to recommend the plan under certain circumstances, and but for his doing so, and the discussion which has taken place recently, it seems we should never have heard of Mr. Barnes' claims to the honour of carrying the bell—as he puts it—as the originator of the system. Mr. Barnes magnifies the difficulties he had to contend with in his youth to the utmost, taking care always that his own success does not suffer by the contrast. I beg to inform him, however, that some of the Pine stoves here remain nearly as they were about 50 years ago. Some of them have been heated with hot water, but they are by no means modern structures, and our early fruiting house still retains the flues. Yet we manage to supply fruit in quantity, and of good quality, without having to cut-over the plants, unless on an exceptional occasion—though I would not hesitate to adopt the plan if necessary, nor think there was aught discreditable about it, knowing well that not even the best cultivators can reckon upon every plant showing when wanted. On occasions when I have made the experiment with a few plants which had missed fruiting at the proper time, they showed fruit directly, and swelled off in close succession to the others, and were out of the way before the young plants required the room. Mr. Barnes is quite wrong in supposing that plants so treated have to be kept till the following year, thereby losing a season, nor could he draw such an inference from any former statements of mine, though he says as much. I do not make these remarks in order to justify my own practice. I am only a beginner, and cannot claim a quarter of the experience of Mr. Barnes, nevertheless I am willing to be judged by my success, and I think I may say that the Pines here will bear comparison with anything at Bioton. Cutting-over Pines with the object of making them fruit as has been recommended, and chopping off their stumps, as used to be done in Mr Barnes' young days, are two different things. In the former case it is done with good healthy plants, to hurry maturity; in the latter it was a necessity entailed by bad cultivation, according to Mr. Barnes' own showing, and was done, not to induce fruitfulness, but to encourage fresh roots in place of those which had been destroyed, as any one may find who will take the trouble to look into some of the old authors on gardening. It is a well-known fact that the gardener is not always successful in his undertakings, it is not in the nature of things for him to be so, and it would be well if we were a little more willing to acknowledge this. You have at different times invited your readers to relate their failures as well as their successes, but the remarks of your correspondent at p. 79 is an example of how they may expect their statements to be taken, by those whose experience might be supposed to have taught them toleration—if they state anything which savours in the most remote degree of failure or mistake. J. Simpson.—Give honour to whom honour is due. I am very much pleased with Mr Barnes' entertaining article on the Pine-apple, made up from the "scraps of the system." As a 50-year-old cultivator, and a jubilant Pine grower, he appears to have had his full share of difficulties to contend with in order to bring that noble fruit to early maturation. As I am set down for one

(To be continued)

BOTANICAL DRAWING—No. IV.

Flowers are often considered the most difficult part of a plant to sketch, but such, I think, is not the case, the reverse being more evident than that of leaves whose positions are more definite. The most common error perpetrated is that of not showing the flower correctly on its stalk or peduncle, but to sketch it detached as it were, thus imparting to the drawing an air of conscious comicality. To avoid this error, in making the first faint sketch prolong the stalk through the flower to the centre, whence

quality during the latter half of the period. The results given below will show this so far as...

SEWAGE FARMING PROSPECTS

I was, I confess, somewhat surprised to learn from "W. B.'s" remarks lately that I was coming up "slowly in the rear in the search of improvement," but still I am always open to correction on every subject, and if "W. B." can satisfy me that he has any experience whatever in the use of town sewage, I shall be quite willing to be taught by him, as although not perhaps so old a hand as "W. B." I have nevertheless enough to appreciate the goodness of even the most learned men, and the constant errors which that green-eyed devil from the West, the confident assertions of "W. B." in regard to the sewage-farming prospects of the country whose sewage he has used for upwards of 20 years, successful experiments. This I do not wish to dispute, and all his assertions show an intimate acquaintance with the practice and results of ordinary farming, but when he asks us to believe that during those 20 years he has "doctored" farmyard manure and sewage, and has grown "heavier crops than have yet been grown at Barking, I confess that with all possible respect for his own belief and honesty of intention in making the statement, I cannot and do not believe it. The sewage of no town has been used in the careful and scientific way which he talks of for upwards of 20 years. I challenge him, not only to name the town whose sewage he has thus used, but to name any town in the country whose liquid sewage has been carefully and economically utilized for "upwards of 20 years." I fear he has tumbled into the same mistake as another gentleman, with whom I had a controversy some four or five years ago, but for whom, nevertheless, I entertain a very great and...

sincere respect, namely, Mr. Alderman Mechi. This gentleman hazarded a great number of positive statements with regard to town sewage, and he honestly admitted that he had had a "four-mile" experience of sewage, whereas it turned out on examination before a committee of the House of Commons that "four miles" was the distance of the sewage of his town from the sewage of his own town, which was mixed with, and put to the liquid sewage, or as he improperly called it, "sewage" of his farmyard, mixed with an occasional dead horse. What the precise manurial or pecuniary value of this brew was, of course no human being can pretend to say, for it was probably never the same on any two occasions. Sometimes it may have been stronger, sometimes weaker than town sewage, but in no case probably was it at all as multi-farious and therefore complex, as the sewage of a large town.

I fear it is pretty evident that "W. B." has fallen out of his own error notwithstanding the fact that he is not an "amateur" as the "M.S." says. I do so fear that like the vast majority of writers, and the still greater majority of human beings in general, "W. B." is not always strictly logical for he says "instead of taking fault with my neighbours' doings either in the field or farm, my main has been to improve my own practice." And then he goes on to translate this excellent maxim into similar language for the benefit of his more obtuse readers, and he states "in plain English, I consider the Barking practice further benighted in the march of improvement that it should be." How this latter sentence can be a translation into plain English of the former, I confess I beg and my capacity to understand, but then as I said before, I have lived long enough to appreciate my own ignorance.

But "W. B." says that the sewage of Barking, not only of my own town, which is a sewage of London, but also of the sewage of Barking, is not only its theoretical value, for instance, "but he Mr Hope is only one party in the agreement at Barking, the other party, the sellers of the sewage, being at least equally interested, and if the sewage is worth say three times the money the latter now receive for it, the time may come when they will tell him that they are more deeply interested financially than he."

I do not know what this means. I buy the sewage that I consume myself from the Metropolitan Sewage Company, but the Metropolitan Sewage Company is a creature of my own creation. It was incorporated by a special Act of Parliament for which I applied to the Legislature for the purpose of the sewage of London for the next 15 years, to supply and purify the Metropolitan Board of Works. Therefore I am not only deeply interested in the sale as it is a purchase of the sewage, but infinitely more so. The standard price of the Company for the sewage is 1d. per ton, the theoretical price fixed by careful analysis is 22d. per ton, that is to say, fractionally more than twice the price asked by the Company, and not three times as "W. B." imagines. But if its value were 30 times as much as it is now sold for, the total quantity that I am ever likely to purchase would be a nothing in comparison with my interest in that which is sold.

With regard to "W. B.'s" chemical remarks, I will simply state that I have not pretended to base any arguments in favour of the utilization of the London sewage by surface irrigation in the county of Essex upon any superficial chemical knowledge of my own, but have preferred to rely on the opinions of the best professional men of the day, and perhaps when I enumerate them, not only my readers, but even "W. B." himself, may think that I am as likely to be right in my views on the question of a possible waste of manure by the system I advocate as he is. Among the gentlemen who supported my Bill before Parliament were Professors Way, Voelker and Miller, and Dr. Gilbert Olling O'Brien and Abel, and for direct very good reasons, which perhaps "W. B." does not see, I am of opinion that Prof. Way's comparison between the grains of manure and sewage was a "sound practical one" and does not "fall to the ground." And with all possible deference to the opinion of "W. B." I should imagine that the "empty" of a gallon of sewage at one pace and of a gallon of another farther down the sewer at Barking or at the Maplin Sands, would furnish very "exact and trustworthy evidence," although the sewer is not yet flushed, as "W. B." supposes, down to the Maplin Sands.

Why "W. B." should state that my replies to his third and fourth objections to the utilization of town sewage by surface irrigation, "have not a foot to stand upon," because "profits can be increased and expenses reduced in the usual way by progressive chemistry and modern appliances," I confess I do not understand. He seems to argue against his own objections and not against my replies. However, as I began so I will end. If "W. B." will quote the name of the town whose sewage he has successfully doctored for "upwards of 20 years," I shall be most happy to learn my business as a sewage-farmer from him, and if, as I believe, it turns out that he never used a drop of genuine town sewage in all his life, I will venture a few further remarks on a future occasion as to the use of town sewage in connection with market gardening. W. Hope, Parsloes, Barking, February 3.

P.S. Since writing the above, which was perhaps fortunately delayed in transmission, "W. B." has practically answered the question that I have put for it, a gentleman has written me headed "The Area of Land required to Utilise Sewage," that his personal experience relates wholly and exclusively to liquid manure carried about in carts. Now, I think any practical farmer will support me when I say that it is impossible to put anything, whether liquid or not, into a cart, and take it any distance, and empty its contents...

- Additional names will be inserted as they are received.
ESSAYE PHILIP DIXON, The Yorkshire Seed Establishment, St. Queen Street, Hull.

ROLLISSONS' TELEGRAPH CUCUMBER (True).

THESE ARE MANY SPECIMENS VARIETIES IN CULTIVATION

From the universal satisfaction that their Telegraph Cucumber has given, **WILLIAM ROLLISSON & SONS** are much encouraged in again offering good and well ripened Seed of this most extraordinary variety. Its wonderful cropping qualities have this year been witnessed at their Establishment by many experienced judges, all of whom have agreed that it is the best in cultivation for that purpose. In fact it has been acknowledged to be, by the best authorities of the day, the most productive yet introduced for Winter and Early Spring use, in proof of which

TANNERS, CURRIERS, and MANUFACTURERS of IMPROVED TANNED LEATHER DRIVING STRAPS for MACHINERY PRIME STRAP and SOLE BUTTS.
 Price Lists sent free by post.
 Warehouse 21, Mark Lane, London, E.C.

COTTAM'S PATENT PORTABLE UNITED COW FITTINGS.

Their advantages are—Portability, not fixtured, removable at pleasure, no Woodwork or Part to rust, made of Ventilation or broad Vermin, Hay Rich dispensed with as unnecessary, increased width and depth of Feeding Troughs, Water Cistern, and Patent Drop Cover to prevent over-gorging. Cleanly, durable, and impervious to infection, being all of Iron. Prices of Fittings per Cow, 5s.
 Prospectuses free of **COTTAM & Co.**, Iron Works, 2, Winsley Street (opposite the Free School), Oxford Street, London, W., where the above are exhibited, together with several important improvements in Stable Fittings as secured by Patent.

GARDEN BORDER EDGING TILES, in great variety of patterns and materials, the plainest sorts being especially suited for KITCHEN GARDENS, as they harbour no Slugs and Insects, take up little room, and ones put down incur no further labour and expense, as do "grown" Edgings, consequently being much cheaper.
GARDEN VASES, FOUNTAINS, &c. in Artistic Stone, of great durability, and in great variety of design.
F. & G. ROSSER, Manufacturers, Upper Ground Street, Backframes 8, Queen's Road West, Chelsea, S.W. Kingsland Road, Kingsland, N.E.
 Sole London Agents for **POOLEY'S PATENT GARDEN WALL BRICKS**. Illustrated Price List free by post. The Trade supplied.

ORNAMENTAL PAVING TILES for Conservatories, Halls, Corridors, Balconies, &c., as cheap and durable as Stone, in blue, red, and buff colours, and capable of forming a variety of designs.
 Also **TESSELATED PAVEMENTS** of more enriched designs than the above.
WHITE GLAZED TILES, for Lining Walls of Dairies, Larders, Kitchen Ranges, Baths, &c. Grooved and other Stable Paving Bricks of great durability, Dutch and Adamantine Chalkers, Wall Copings, Red and Stoneware Drain Pipes, Slates, Cement, &c.
 To be obtained of **F. & G. ROSSER**, at their premises as above.

SILVER SAND (REIGATE, best quality), at the above addresses—1s. per Ton, or 1s. 2d. per Bushel; 1s. per Ton extra for delivery within three miles, and to any London Railway or Wharf. Quantities of 4 Tons, 1s. per Ton less.
FLINTS, BRICK BURES or CLINKERS for Hackeries or Grotto Work.
F. & G. ROSSER.—Addresses see above.
 N.B. Orders promptly executed by Railway.

Caution to Gardeners.—When you ask for **SAYNOR AND COOK'S WARRANTED PRUNING AND BUDDING KNIVES**, observe the mark SAYNOR, also the Companies name WARRANTED, without which none are genuine.
 S. & C. regret having to caution Gardeners and others who have been misled by cheap imitations of our quality, having been sold for the genuine one, and who have many complaints to be made to them of Knives which are not their make, all of which are warranted both by Saynor & Cook and S. & C.'s PRUNING and BUDDING KNIVES are the cheapest in the market.
Faxton Works, Sheffield. Established upwards of 100 years.

THE ORIGINAL INTRODUCERS, PATENTEES, and SOLE MANUFACTURERS of "FRANCIS MORTON'S" SYSTEM of CABLE WIRE FENCING,

which during the past few years has come into use over

"SEVERAL THOUSAND MILES OF FENCING,"

And has received a large and distinguished preference over every other description of Park and Farm Fencing. The great success attending the introduction of our Patented Improvements has led to numerous worthless imitations being offered for sale by dealers and others. It is necessary for us therefore to note that this Fencing is EXCLUSIVELY MANUFACTURED at our Liverpool Works.

AUSTIN'S ARTIFICIAL STONE, INVENTED 1826.

THE superiority of this material to all others for damp situations and its durability under the most intense frost being now indisputable, and attested by its extensive use in Scotland and Ireland, as well as the principal country seats of England, attention is invited to the following summary of the work manufactured with it, a variety unprecedented in any other establishment of past or present times —

VASES, about 300 different kinds, at from 10s. to £50. FOUNTAINS, more than 200 designs, from £10 to £400.

PORTEFLEURS, or low FLOWER BASINS, in various styles, antique and modern, SMALL FIGURES, adapted to all styles, &c., FIGURES of ANIMALS and BIRDS, about 70 kinds; SUN-DIAL PEDESTALS, about 20 designs, BASKEIS, from 1 to 17 feet diameter, GARDEN SEATS, of substantial architectural character, for the ends of terraces, SHELLS for water or rock plants, from 1 to 14 feet wide; FLOWER BOXES, for windows or pavements, BAPTISMAL FONTS, from 2 to 15 guineas, CRESTS and other TERMINALS, for gate-piers, BALUSTADING, to suit all styles of architecture, a great variety of ORNAMENTAL PEDESTALS, GOTHIC CROSSES, PINNACLES, and NICHES; EDGING for flower-beds.

AUSTIN AND SEELEY, Nos. 369-375, EUSTON ROAD, REGENT'S PARK. N.B. No sand is used in "Austin's Stone," which is waterproof.

MOULE'S PATENT EARTH SYSTEM.

VALUE OF THE MANURE.

Mr. James, of Hutton, has furnished the following particulars. He says — "Mr J Gadson, who holds upwards of 600 acres of land in this and an adjoining parish, has applied earth passed once through the closet to a Turnip crop, and has produced some of the finest roots I ever saw, although it was sown broadcast, and not, as it should have been, by drill. He has no hesitation at all in estimating its minimum value at £3 per ton. Mr Gamble, who holds land here to the same extent, has arrived, by an independent trial and calculation, at the same conclusion.

Mr HAYNE, of Fordington, Dorchester, writes — "I used one ton of earth that had passed twice through the earth closets in the day school of this parish on a piece of about 3 1/2 acres. The land had, the previous season, borne a crop of Mangolds, the whole of which was drawn and consumed at home. The Rape was sown on the 30th April, and 1 ton of the earth, costing 6s., was drilled with the seed. In June, 2 cwt. of Bad's guano was sown

broadcast over the whole piece, which was horse-hoed in the drills. The reason for my applying the guano was because the land had not been dunged. The crop was a good one, although the season was so dry and hot, and therefore unfavourable for Rape. If I had not used the earth I should have ordered six sacks of bones in the piece, costing 72s."

"Mr. HENRY TAYLOR, Manufacturer of Agricultural Implements, at Dorchester, who is also a manure dealer, and holds a small farm, supplies the earth for the closets and urinals of the Dorset County School. The contents of the vault are removed by him once in three months. He has tried the manure so manufactured on various crops, and he has informed us that he considers the deposit of three months, after one use of the earth, to be worth, when dry, from £2 to £3 per ton. He has tried the repeated use of the same earth, and he considers the value of the manure to increase in proportion to the number of uses."

For Prospectuses and Testimonials apply at the Office, 29, BEDFORD STREET, COVENT GARDEN, W.C., where the Closets are on view and in operation. T. M. EVANS, Manager Engineers, MESSRS H. J. AND J. W. GIRDLESTONE, 37, Norfolk Street, Strand, W.C., where they may be consulted with reference to MOULE'S PATENT SYSTEM for WARMING CHURCHES, SCHOOLS, &c.

Dublin Depot, 9, UPPER ABBEY STREET, DUBLIN.

AS A PROOF OF THE SUPERIORITY OF THE THRESHING MACHINERY

MANUFACTURED BY

CLAYTON, SHUTTLEWORTH & CO.,

They beg to call attention to the following statement.

	ENGINES.	MACHINES.
Engines and Machines sent out in the year 1868	812	644
Total Number sent out up to December 31, 1868	8,921	7,982

The Gold Medal was awarded them at the Paris Exhibition, 1867, for Portable Engines and Threshing Machines, and at the last trial of the Royal Agricultural Society they gained every First Prize offered for Steam Engines, also the Prize of £15 for Finishing Threshing Machines, and Silver Medal for special improvements on which occasion the following Firms, amongst others, competed — Messrs. Ransomes & Sims, Tuxford & Sons, Reading Ironworks Company (Limited); Brown & May, Alchin & Son, Barrows & Carmichael, Humphries, Marshall, Sons & Co (Limited), Burrell, Ruston, Proctor & Co; Roby & Co. (Limited), Holmes & Sons, E. R. & P. Turner, P & H Gibbons, Tasker & Sons, Nalder & Nalder, Riches & Watts, Wallace & Haslem, Catchpole & Thompson, &c, &c

NOTE.—The Royal Agricultural Society will not hold another trial of Portable Steam Engines and Threshing Machines until the year 1872

This was necessary for a separate work, which appeared contemporaneously in a magnificent series of volumes. In the first place, Martius undertook only the botanical section, and Spix the zoological; but, on account of the death of the latter in 1820, when he had only worked up the mammals, the birds, and a part of the amphibia, the continuation of the work fell upon Martius. He acquitted himself of the obligation in the most satisfactory manner, having secured the assistance of Agassiz, Andreas Wagner, and Pertz for the actual work, whilst he conducted the editing of it. It is true, however, was no small labour, involving, as it did, the superintendence of the publication of four large folio volumes. The collaboration of the botanical treasures was effected similarly to the collections of Humboldt and Bonpland by Kunth, in the form of a selection of the most interesting novelties. The *Platantheras*, or flowering plants, were illustrated in the "Nova Genera et Species Plantarum Brasiliensium" 3 vols. fol. Martii, 1823-32 and Cryptogamia in the "Icones Selectae Plantarum Cryptogamicarum Brasiliensium" 1 vol. fol. 1827.

The first volume of the former work was prepared by Martius's colleague, Agassiz, the remainder entirely by Martius, except the chapter in the "Icones Selectae" on the internal structure of Tree Fern stems, from the pen of Hugo von Mohl, a chapter that served to enhance the value of the work in the highest degree. In both works not only were many new and highly remarkable plants made known, more than 400 species and 100 genera, but they were also very and very carefully described, and they received an essential character. For every new plant is a new fact, which is not without importance, and at all events it is a fact as important that each plant should be published and referred to its proper place in the system, as that any new observation in the province of histology should be recorded. And the art of correctly describing a plant and ascertaining its affinities so that nothing shall have to be changed in future researches, is a much more difficult task than those will admit who affect to despise it. A practised and quick sight for natural affinities, a happy gut of combination—in short, an essentially "systematic tact"—which is by no means a "skill in guessing," but the result of an exact and extensive knowledge of the vegetable kingdom; this, and a comprehensive acquaintance with forms, placed Martius in the rank of the first botanists of his time.

Indeed, so great was the esteem in which his works were held that he received the highest scientific distinction that can be conferred upon a botanist, namely, election as a member of the Institute of France.

It may be mentioned here, in passing, that the above-named works were subsidised so long as Maximilian Joseph I. lived, after whose death they were left and remained entirely dependent on their own resources.

(To be Continued)

FRUIT PROTECTION

FRUITS, I believe, are the gardeners who do not think some protection necessary for the blossoms of Peaches, Apricots, Peaches and Nectarines. The protection usually afforded, if not altogether vain, is often defective. The dew falls perpendicularly, unless, therefore, the protection is over the blossoms, and sufficient to keep off the dew, which give the frost power, the protection is more or less useless. You may wrap a Pear tree, whether pyramid or bush, with covering like a "mummy," but if you do not put the covering over the head of the tree, you will probably lose all your fruit. I will now say about the mode of the protection of winter fruit, and explain how it is done here. The S.W. wind here blows furiously into the trees, hence a great and expensive covering than the one used would be of no use. In protected situations lighter materials would do very well. To give an idea of the fury of the wind, I must inform the reader that the S.W. wind tumbled one branch of a tree before the birds were set, into the next garden, and moved another 2 inches out of the perpendicular, so that I was obliged to take it down and put it up again. Add to this 11 miles or more of N. wind at the back of the wall with nothing to stop it, the reader will see with what liberties I have to contend. Yet a thing which is difficult is not necessarily "impossible"—a word that ought to be rubbed out of our dictionaries. The following is the way the trees are protected, and I may observe that they have been thus protected since November. In my opinion it is as necessary to shield these Persians (Peaches and Nectarines) from the vibrations of winter as from the attacks of spring frosts on the blossoms and expanding leaves, which are more tender than the blossoms. For lack of this you see the leaves withered all over, and looking as if a mole had been heaving between the outer and inner outside—a disgrace to science. Unless the foliage can be kept heavy and free from frost and red spider and other pests, the gardener's curses will be the order of the day. I used the following, and the skin of the second lung; if the first suffers the second must suffer. But to proceed with the description of the protection. Battens, 3½ inches every way, are let into the ground at 1½ feet apart. One foot is tarred and planted, and the upper part is painted white. Iron rods ½ inch of an inch diameter, reach from batten to batten, and run into iron staples. Under the coping a rod of similar length is fixed with iron loops, with a supporting iron lip in the centre, which is necessary here on account of the violence of the winds, which else would tear the rods down and also draw the loops. The curtains are No. 2 muslin at 12½d per yard bought of Mr. Brown, of Ipswich, they are 22 inches wide, and run top and bottom, with rings affixed to the sheets, at present with tar twine, but after the season is

over they will be affixed to the rings and sheets with strong copper wire. In ordinary situations the tar twine would suffice, but here the rings saw them off in a gale of wind. These curtains have not been undrawn all the winter but when the blossoms are in bud they will be undrawn after bud-fall. This then is the way it is done here, and it has been approved by many of my friends and acquaintances, and as several of them have already promised me the pleasure of their visit in the Rose season, I doubt not I shall be able to show them as fine—perhaps a finer—display of Peaches and Nectarines grown out-of-doors without glass as could be seen at Frogmore or Llanthomas. It is ridiculous to think of covering the above fruits with a glass protection, and you will not get a fair crop in seven years, and your foliage will be miserably withered. The excuses generally made are worthless, they are mainly "It is impossible," and "The soil don't suit 'em." N.B.—Tart. hum away. Insist upon having them, and you will have them, but then you must allow materials and a free access to water than is generally to be found even in our great gardens. After the fruit is secured the next thing to be done—two or three times a week—is to syringe the foliage the under side, or red-spider, scale, thrip, and green fly will spoil your wood and foliage. Scale destroys the tender skin of the next year's bearing wood. In order to stop them I am about to dissolve some aloe in water, and sponge my trees. No creature likes aloe. A gentleman had a monkey that gnawed his tail. Every remedy was tried in vain. At last he rubbed his tail with aloe after the first taste punged him more. It is worth a trial. When red spiders have made your leaves look yellow spotted on the outer side and wiry on the under side, the mischief is done, and the leaves will not recover. Defective foliage produces defective flavour and unhealthy wood for the next year. Peaches in strong soil do best on the Plum stock but in very light soil they flourish best on the almond stock. I want some fruits, as the Peach and Nectarine blossoms are beginning to expand. W. F. Radclyffe.

VEGETABLE GROWING: NORTH & SOUTH.

THIS discussion, which owes its origin to some remarks on a few late Peas at Bothwell (see 10th 1886), like a snowball, increases in dimensions as it is rolled along. I had intended, after my remarks at p. 1234, 1886, to have withdrawn from the contest, and to have left an open field to other and abler hands for the discussion of this important question, but fate and Mr. Fish have decreed otherwise. For here am I repeating my assertion, which has formed the backbone of the discussion, that "as a rule Scotch gardeners pay more attention to, and take a greater pride in cultivating vegetables than their English brethren." While making this statement, I wish all those whom it may concern, distinctly to understand, that I have no feeling in the matter—I mean, in the way of holding up the gardeners of one country, at the expense of the other. Such is far, very far from my intention. My feelings are entirely with the vegetables. My desires are for their improvement, and having found the vegetables in Scotland not only last year, but in many other years, more plentiful, and of better quality, and having seen that a deeper interest is taken in their cultivation by the professional gardeners, than I have found in the same class of gardens (gentlemen's gardens) in the South of England, I have fearlessly stated the case, and again call the attention of our Southern cultivator to the fact, hoping that discussion may cause a little more attention to be bestowed on this, the most important branch of a gardener's duties.

It is no answer to my argument for one or two writers to blow the trumpet of their own success, which is not the least called in question, or to lavish any amount of praise on the general excellence of English gardeners. No one is more ready to acknowledge their merits as a body than myself. Neither will it do to vilify the climate by way of justification for our own shortcomings. The simple facts remain the same, and cannot be slurred over in that manner. The subject is worthy of a deeper consideration.

I am certainly obliged to Mr. Fish for his generous contribution on p. 1236, 1886, although he ranges himself on the opposition, he has, *volens volens*, advanced a good deal in support of my argument, and much besides which I can by no means endorse, to wit, in giving it as his opinion that English gardeners display greater skill in the management of their kitchen gardens than do those of Scotland, in as far as they produce early salads and forced vegetables, while those of Scotland do not. Mr. Fish proceeds on the assumption that horticulture in Scotland has made no advance since he was an apprentice in the neighbourhood of Perth 30 years ago, than which there can be no greater fallacy. Ample evidence of this may be seen by anyone paying a visit to either the Edinburgh or Glasgow March and April spring shows where as good if not better vegetables may be seen as have ever been exhibited at any show of the same season in England. There collections of vegetables are exhibited by the dozen, containing Sea-kale, Asparagus, Mushrooms, French Beans, Potatoes, Carrots, Cucumbers, Rhubarb of gigantic size, besides the ordinary hardy vegetables of the season, including fine Celery, Leeks 3 inches in diameter and 9 inches blanched, and always an ample display of small saladings. This does not imply want of skill, or show a scarcity of vegetables in spring. The same may be said of their June shows; and the autumnal displays are simply grand. I think it would be a good thing for me here to invite Mr. Fish and those who think with him that vegetable culture is not what I have represented it to be in the North, to take note of the collections of vegetables they will see at the great International Exhibition in Edinburgh next September, or perhaps

some of them, including Mr. Fish, may come with them in a friendly way on that point. I am forgetting however, for how long, any good vegetables, and I am forgetting about the "scorching summers" and "the dry heating air" which "bleed" of every green thing in the garden. The past summer I merit such a description, but to the whole country North at least, nears the general character of an English Mr. Fish tries to make out about the quality of the land with that of Scotland, and to such exaggeration from a purpose in writing as an apology in East Anglia, but what are the 1868 an exceptional, let us take Symonds' British Review, subject I find that the average of the Chiswick, Kent, and the last nearly as possible equal to that of Bury St. Edmunds, B. to which Perth, the fall was equal to about 25 more rain in 1867 than the three first-named places, but as at Bothwell, and Soons, Perth, a little further North at Aberdeen, 24 inches but this is a way as Mr. Fish states, and it must further as exist there, require more in state. Further, the South-west of England than any part of Scotland, the Hebrides. Last year, Aberdeen, and Banff, as any part, and much more so than in Lancashire, Derbyshire, and Cumberland, not to speak of south-western counties. I might have said enough to convince Mr. Fish, and that climate (moisture) has but very with it.

I have already stated that the atmosphere may exert a little influence on things as the autumn Peas, but what little difference there may be, advantage of the South of the North, somebody must be whipped for it, something must be made to excite the gardeners, and so forth, and guilty, and pictured so very that we were in Arabia, or some other land. Who that believes in Mr. Fish will be of the soft, balmy breezes of our Fog about which our poets have so much to say, our poor climate has a deal to answer for the charge of our Southern friends in the culture of many kinds. The Frenchman shrugs his shoulders, and recommends instead of taking at the vegetables in Covent Garden, growing in the market gardens, if he will thus find any evidences of defects. I think not. There are finer cultivated by the London market gardeners of the year, than by any other part of the country. The climate suits them, and study it, and study it as well as they can, why should professional men like Mr. Fish, much fault with it? Good crops can be one class, why not by the other, who, as more & B.

(To be)

NOTES ON FRUIT

Pear, Doyenne du Commerce—This is the greatest excellence. It has, further, the advantage of being always good, which is a great recommendation. The old Pomological Society was the first to put Pear into prominent notice, and the Committee has in three successive years the 1st prize as the finest flavoured Pear at the November meetings. It is of a somewhat resembling that of the *Glen Moreau*. It is of a somewhat round shape, and somewhat flattened at the top, in which it succeeds best the fruit is beautiful, russet, and when ripe, the fruits are nearly as large as the *streaked and shaded with red* rate-bearer, *Saint Nectaire*. *Pear, Winter Pear*—A very fine variety and one that is always good, and for it is very rare, indeed that it can be found of indifferent quality. It is of a somewhat round shape, and of a yellow colour, sometimes entirely covered by a frequently easily distinguished by its naturally small, being entirely wanting in *Beurre d'Arenberg*. The flesh is of a melting. The tree forms a handsome fruit most abundantly and frequently a very shy bearer. By planting in different aspects and situations, a success

Societies.

ROYAL HORTICULTURAL: Feb. 16.—W. W. Saunders, Esq., F.R.S., in the chair. The routine business having been transacted, the Rev J. D. J. after reading the awards of the Floral Committee, called the attention of those present to a new form of garden label, that was made of the same material as that of which the face

of which I was once opposed... Mr. Wilson, Esq., and stated that the awards of the Floral Committee and that the exhibition before them was a very interesting one.

SUTTONS' GRASS SEEDS

FOR ALL SOILS,

NEAT CROPS OF HAY AND SUPERIOR PASTURE. CARRIAGE FREE.

THE MEDAL FOR EXCELLENCE OF QUALITY,

PARIS, 1867

MESSRS. SUTTONS'

MIXTURES FOR PERMANENT PASTURE

CONTAINS THE FOLLOWING

FINEST CLEANED GRASSES AND CLOVERS.

Table listing various grass and clover species such as Meadow Foxtail, Sweet Vernal, Creeping Bent, etc.

SUTTONS' BEST MIXTURES

FOR THE FOLLOWING SOILS -

- STIFF CLAY SOILS, to be met with in the London, Kimmeridge, Oxford, and Lias Clays.
HEAVY LOAMS, of the same Formations, when they have been subjected to surface admixtures and...
GOOD MEDIUM LOAMS, on the Marls of the Old Red Sandstone, the Gault, and the Greensands...

SUTTONS' CHEAPER MIXTURES,

20s to 26s. per acre. Carriage Free.

SUTTONS' "CRYSTAL PALACE" MIXTURE, for Park Grounds, as supplied to the Crystal Palace Company, to produce a beautiful evergreen sward, 18s. per bushel. Sow 2 1/2 bushels per acre.

SUTTONS MIXTURES OF GRASS AND CLOVER SEEDS for

Table showing prices for different types of grass and clover seeds, e.g., 1-year Lay, best quality, 13s. 6d. per acre.

SUTTONS RENOVATING MIXTURE for the above Seeds should be sown early in the spring to produce a great increase in the quantity and quality of Grass. Sow 6 to 12 lb. per acre. Price 9d. per lb.

Five per cent. allowed for cash payments.

SUTTON AND SONS, CHICKEN TO THE QUEEN, READING, BERKS.

The advantages of procuring Seeds direct from the Growers cannot be over-estimated.

Lainsparter & Co Seed Growers

237, 238, AND 261, HIGH HOLBORN, LONDON, W.C.

A SPECIAL PRIZE MEDAL AWARDED PARIS 1867

FOR SUPERIOR EXCELLENCE OF GRASS SEEDS.

CARTER'S GRASS SEEDS,

SPECIALLY PREPARED FOR ANY DESCRIPTION OF SOIL.

- No. 1. For FERTILE CLAY SOILS.
No. 2. For POOR CLAY SOILS.
No. 3. For HIGH-LYING CLAY SOILS
No. 4. For ALLUVIAL SOILS.
No. 5. For LIMESTONE SOILS.
No. 6. For NEW or OLD SANDSTONE SOILS
No. 7. For LIGHT CHALK SOILS.
No. 8. For BRASHY LIMESTONE SOILS.
No. 9. For SANDY SOILS.

J. C. & Co. hold one of the largest and best stocks of Grasses and Clovers in the country, and are now prepared to supply their Mixtures as above, for the formation of first-rate Permanent Pastures.

Finest Quality, per acre, 28s. to 32s. Second Quality, per acre, 20s. to 26s.

THE ONLY PRIZE MEDAL AWARDED LONDON 1862

FOR SUPERIOR EXCELLENCE OF FARM & GARDEN SEEDS.

LOOK TO YOUR GRASS LANDS.

CARTER'S RENOVATING MIXTURE should be sown on Meadows that have suffered from the past dry summer. The Mixture includes the most desirable Grasses and Clovers for hay crop, and succeeding green feeding, and will soon restore a first-rate permanent pasture.

Sow 8 to 12 lb. per acre.

Price 9d. per lb., 80s. per cwt.

CARTER'S PRIZE MEDAL LAWN GRASS,

As supplied for the grounds of the late Paris Exhibition, will speedily produce a carpet-like turf of the finest quality.

1s. per lb. 20s. per bushel (sow 3 bushels per acre).

For full information on the Laying Down and after-treatment of Grass Lands, see

CARTER'S FARMER'S CALENDAR FOR 1869

(ILLUSTRATED),

Post Free 6d.; Gratis to Customers.

JAMES CARTER AND CO., 237 and 238, and 261, High Holborn, London, W.C.

First Crop or Ringleader Pea. CHARLES SHARPE AND CO., having grown largely this EXCELLENT EARLY PEA, with great care, have much confidence in offering it to the Trade. Price on application.

Farm Seeds Direct from the Grower. CHARLES SHARPE AND CO. will be glad to send special offers of their carefully selected TURNIP, MANGEL, and other FARM SEEDS on application.

Garden Seeds. CHARLES SHARPE AND CO'S PRICED TRADE LIST OF PEAS, BEANS, and other GARDEN SEEDS can be had on application.

Seed Potatoes. CHARLES SHARPE AND CO are now prepared to make special offers of all the leading sorts of POTATOS at Stamford.

RAYNBIRD, CALDECOTT, BAWTREE, DOWLING, AND COMPANY (Limited), COAL, SEED, MANURE, and OILCARE MERCHANTS. A Address: 59, Seed Market, Mark Lane, E.C.; or Basingstoke. Sample and prices post free on application. Prices Monthly, 1851, for Wheat 18s., for Barley 12s., and for Oats 10s.

1868.-Mangel Wurzel Seed. H. AND F. SHARPE can offer the Trade some splendid H. STOCKS of the above-named Seed, grown on their own Farm this season from picked Bulbs. The quality is very fine, and prices low. Samples may be obtained on application. Seed Growing Establishment, Wisbech.

SUTTONS' PRIZE MANGEL SEED, 1869. SUTTONS' BERKS PRIZE YELLOW GLOBE, SUTTONS' NEW YELLOW INTERMEDIATE, SUTTONS' MAMMOTH LONG RED. SUTTONS & SONS are now prepared to quote the lowest price per cwt. for the above superior varieties of Mangel Wurzel, which have given such great satisfaction during the past year. SUTTONS & SONS, Seed Growers, Reading, Berks.

Early Feed for Sheep and Cattle. SUTTONS' IMPROVED ITALIAN RYE-GRASS, the earliest and most productive in cultivation. Should be sown in February and March to produce a succession of valuable cuttings during the year. If sown alone, 3 bushels are required per acre. Price 7s. per bushel, cheaper by the quarter. Carriage free. SUTTONS & SONS, See Notice to the Queen, London, B. 1868.

HALLETT'S PEDIGREE CHEVALIER BARLEY produced in 1868 a Crop of 42 bushels per acre, a Sample of which was awarded the First Prize at the Birmingham Show of 1868. Took the First Prize also at the same Show of 1867. Produced to 18 1/2 tons of 9 quarters per acre. 16 HORSE BLACK TARTARIAN OATS produced, 1868, 12 quarters per acre. For particulars apply to Captain HALLETT, F. L. S., Brighton.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND

AGRICULTURAL EDUCATION.

The EXAMINATION of CANDIDATES for the SOCIETY'S EDUCATIONAL PRIZES will take place in the week commencing MONDAY, April 13, 1869. Copies of the Form, required to be sent in by March 18, may be obtained on application to

H. M. JENKINS, Secretary, 12, Hanover Square, London, W.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

MANCHESTER MEETING, 1869.

STOCK and IMPLEMENT PRIZE SHEETS are Now Ready, and will be forwarded on application to HENRY WHITWORTH, Esq., Local Secretary, 46, King Street, Manchester, or

MEETINGS FOR THE ENSUING WEEK.

- Feb. 23 - Farnith (Local Taxation).
24 - Highland Society (Mr Melvin on New Zealand).
27 - Canterbury (The Present System of Licensing Beer Houses).

A SYSTEM of traffic which allows of the free movement of sound animals all over the kingdom does not necessarily exclude foreign stock from the privileged classes, but it admits them only on the guarantee being given of their sanitary condition; and this can only be asserted after the animals have undergone a period of detention, or quarantine, equivalent in duration to the longest time of incubation of any infectious disease to which they are liable. With the remembrance of cattle plague and sheep pox, not to speak of other infectious maladies of foreign stock fresh in our minds, we cannot conceive that this condition will be deemed harsh or unnecessary; and yet it is evident that under its operation foreign stock would be virtually excluded, from the circumstances of their position. Quarantine, except in the case of a few valuable animals, does not, to accept the importers' estimate of the system, answer in a pecuniary point of view. Equally, from our point of view, it would not be judicious, using the mildest term, to allow imported animals, the previous history of which is quite unknown, to come in contact with home stock, we being, at the same time, per-

fectly aware of the fact, that in their apparently healthy bodies there may lurk the germs of a disease which will become manifest only when it is too late to prevent disastrous consequences. Hence, failing to give the necessary evidence of freedom from infectious maladies, imported animals which may possibly introduce disease which we already have, more often, perhaps, than we are aware of, proved to demonstrate, some have forecast among our herds and flocks must not be admitted into a class composed only of those which are essentially free from a suspicion of infection.

The first point of all this is what shall be done with animals which fail to furnish the required evidence of perfect health. And the answer involves the consideration of the whole system of regulations applicable to the cattle trade. According to the view which the breeders of home stock adopt, the most ready and simple way out of the difficulty is to slaughter all imported animals by the water side, in fact, to irrevocably establish the system which now obtains at all the ports except the port of London. It is quite worth careful consideration whether those cattle only which come from infected countries, or countries of transit like Austria and Prussia, should all be slaughtered at one depot, or at several, and also whether the exemptions in favour of cattle from France and Spain should be extended to animals from other countries which are not countries of transit, and where cattle plague is not naturally existent. We are met here, however, by the awkward possibility of other infectious diseases than cattle plague being introduced. Foot-and-mouth complaint, lung disease, and some of the contagiousness which farmers wish to avoid; and hence it can hardly be expected that they will abandon the idea of slaughter of all imported fat stock at the landing places, or the plan of quarantine, which practically means exclusion of store stock. There are many objections to the system of slaughter on the wharves. Temporarily at least it would lessen importation and drainage trade, it would not absolutely prevent communication of infection by indirect means, and if cattle plague should break out in so limited and populous an area as a crowded foreign cattle market, with daily arrivals of fresh stock taking place, a very pretty mess the business would amount to.

The plan, however, has the merit of being free from complexity, and it is besides the only one which will satisfy the demands of the home breeder. Any other arrangement, presumably, must involve complicated machinery, which is always liable to get out of order.

In some way which shall be decided upon, as open to the least objection, contact between imported and home-bred stock is, we will assume, to be effectually prevented. This consideration, then, presents itself viz., the unrestricted movement of all stock which can be certified to be free from infectious disease. At this point the essential difference in the position of home-bred stock, as compared with that of imported animals, becomes apparent. Foreign cattle reach our shores tainted with a suspicion which can only be removed by their residence here for a time, while cattle bred and fed in the country are constantly under observation. In respect of every homestead in the country it is, or can be, easily known whether or no the animals on the farm are free from infectious disease, and this being the case, no danger can possibly arise from the unrestricted movement of all healthy stock being permitted. No distinction beyond what is absolutely demanded by difference of circumstances need therefore be established between foreign and English animals. In both cases let those which are infected or even suspected be safely restrained. While we take means to prevent contact between home-bred cattle and newly imported foreign stock on the legitimate plea of danger let us consistently put a veto upon the admixture of cattle infected or infected with pleuro-pneumonia or foot-and-mouth disease with healthy animals in fairs, markets, or on the public roads. And to do this effectually the removal of live cattle from farms and premises where these diseases exist must be unconditionally prohibited, so long as there remains a risk of propagating the infection.

Such an arrangement would do what is demanded—place imported and home-bred animals on precisely the same level, by according to each the privilege of freedom when they are ascer-

tained to be capable of exercising it without injury to the sanitary condition of their fellows, and by shutting up either or both within some limits, when they are known to be dangerous or when their condition prevents the owner from giving the necessary guarantee of their exemption from infection. A vast number of circumstances will have to be considered in arranging the details of a measure which shall embody the principle for which we contend, but the difficulties, so far as we can understand them are not insuperable, and the object might be of sufficient importance to justify the expenditure of time and trouble in view even of its possible attainment.

THE great and increasing dependence of this country on foreign supplies of corn makes the equality of other countries more than a mere matter of curiosity. The narrative of foreign travel is interesting to most people. It may gain additional zest from the fact that we are constantly going farther and farther abroad for our "daily food." And we must look to new countries, since the old ones, sooner or later cease to contribute to our wants, and indeed become our competitors in the markets of the world.

Nearer to us than New York is a country of great average capability, of almost unparalleled fertility in some parts, and with a splendid climate. Turkey in Asia is four times as large as Great Britain and Ireland, is very thickly peopled, and produces a more abundant crop than what its soil would produce, if it were well cultivated. It is, therefore, a new country in the sense of being undeveloped and of being capable of producing an immense quantity of corn for foreign consumption. It was once the seat of ancient empires; a great population was supported on its soil. Josephus tells us that many of the villages of Syria contained 15,000 inhabitants. The account is probably exaggerated, or it is a difference of designation. We should call them towns. The present population, however, of 12,000,000 or 13,000,000, does not approach what it once was in the famous countries now under Turkish rule, in Asia. This dominion, unhappily, is fatal to industry of every kind. The agricultural productions of the country are, or would be, too varied and rich ever to include corn for exportation, but at present the land lies absolutely waste. All around the modern town of Hillah, which stands on the site of ancient Babylon, the marks of the ancient channels and canals of irrigation may still be seen. The waters of the Euphrates and Tigris were led over the rich alluvial plains, and they were thus made to produce the grain that fed a population that is unknown, and which has been variously estimated at from one to five millions for the capital alone. The waters of the Jordan and Orontes, and other rivers of Syria, were utilized by similar means, and much of the country that is now called "desert," because it is uninhabited, was, by irrigation and by industry, made productive.

All these countries are within the region of summer droughts, and water is there the "soul of agriculture," as manure is here. Much, however, may be grown without it over a wide extent—just as much corn is grown in the old corn countries of Europe, though the yield is small, but with it the production is enormous. All the grains of our temperate region are produced in perfection, besides a rich variety of subtropical fruits and produce. Sugar, not now sent to the English market on account of careless management, has been a Syrian product from remote antiquity. Cotton fields in many parts of the empire, the climate and soil that suit it best, yet much of the homespun worn by the country people comes from Persia. The Vine grows abundantly everywhere; it yields wines for local consumption, and the Sultanas of Smyrna and other mountain districts in the sheltered valleys that are fertile and so productive. Other plants, used in medicine and the arts, grow in various parts of Turkey; opium is produced, the Palm is indigenous; and Dates are exported in considerable quantities, because they grow wild and need no care or labour. Peaches and Nectarines, Persian fruits, find a home in the adjoining countries of Kurdistan and Armenia. Here, too, and throughout the dry uplands of the north and east, the sheep finds his native habitat, and at Erzeroum, the emporium for the trade of that part of Turkey, great numbers are assembled every year for exportation to Egypt, Persia, and

the Russian territories. The price of the animal is 11 such. This is further worth the attention of those who are the masters of flocks, and where the flocks are and herds of oxen, and the country is snow-covered, and the sheep are shorn, and the wool is sent to the great markets of Turkey. The sheep of Asia are not so numerous as those of the possession compared with the water of Mesopotamia and the hill country.

This splendid country, which our eyes not allow us to describe more fully, is becoming decrepit. The Government which shears the sheep and half-subsidized, wagers the whole country with their flocks, and prevents its cultivation. They levy taxes on the inhabitants, and off-take restriction to the neighbourhood of the villages, where the security is to be had. But the eastern of land there would progress even without these "desert." Much of the land belongs to the State, it is every year let in large blocks for only, including the farming of the land, the title, the farmer subjects to the State or cultivators. It is the order of the day to practice the farming by the State on the latter by the Government of the district.

In some respects the Eastern question is a farmer's question. When foreigners and their way into these rich and fertile countries, Spain is in the same category with their increased production affect the soil and its corn, or intercept our supply. What will be the future balance of the world, and what the character of our culture? The answers to our questions comprise the future history of the world, the Mediterranean. Possibly these rich countries may supply the world with the valuable products of agriculture—wheat, fruits, silk, &c.—and may themselves be buyers rather than sellers of corn.

At Mark Lane on Monday the corn was in a state of stagnation, and a few sales were in progress had to be suspended. Throughout the week little or no rain has taken place, and demand, but Monday's prices have been raised. At the cattle market there has been a change of state of things, for the supply of business has been small, the number of the foreign orders having been 140 as of the latter, and on Monday a reduction of prices are still made. 3s 6d to 3s 8d for sheep and from 1s 6d to 1s 8d for sheep. These high rates are stimulating dealers, and a declaration is apparent, for the want of the President of the Board of Trade, that the present high price of mutton is a result of the Privy Council restrictions. Meadows being coming from the country, and buying the sheep at the wharves in Essex and taking the sheep to the manufacturing districts. On Thursday a shire but her interest 12s as many as the which he took direct to Walsall. Boxes of Prussian sheep have gone to Paris for the past but as prices in London now exceed the values, the stream of sheep is diverted across the Channel and the North Sea. Cakes of fine quality can be had at 1s 6d and 1s 8d. The seed trade has had a return of interest, and that the superior quality of wheat is coming, and any attempt at sowing. Tares are scarce and Rye grass and Clovers are held for the anticipation of the demand next month.

In the House of Commons on Wednesday ROBERT MONTAGU introduced his Bill, to amend the Acts relating to the prevention of infectious diseases in cattle. On the previous day Sir Robert Peel gave notice of his intention to move on a Bill for a Committee on the subject of local taxation in Scotland. Mr. Cairnes introduced a Bill to amend the Acts relating to the prevention of infectious diseases in Scotland.

The following letter from Messrs. Reading, needs no introduction. In numerous gardens, banks, and other situations through your paper we were called your attention to the enclosed. The result under the assumption of being known to us as leading houses, requires persons want to place him stamps on the introduction to a place in Windsor. We know a man of the name, but the many in your way have had, that it is successful in taking money from many a person, but if we may mention the name, it is to be a 'magisterial' agent, as he dates from a address in almost every letter, probably a detection.

The delusion that agricultural labourers everywhere the worst paid class of Her Majesty's

further object of considering the whole matter, and making a recommendation to Parliament. I am correctly in possession of your views. Yes. I can only assure you that the matter shall have the most careful consideration. A portion of the subject, relating to the poor, especially interesting to my right hon friend Mr. Crossin, who is with me as well as to my friend Mr. Keble, Mr. H. G. G. And when the matter is particularly interesting to all other members of that Government, whether they have special interests in the matter or not. They have a great interest in it, and as it is of their general duties to the public, and a question of so much national importance. I can only say that at all times in the progress of this matter I shall be very happy to confer with you. I shall be glad to be put in possession of the information you have. I fully agree with Mr. Read that it is a question which is entitled to the gravest consideration, apart from political parties.

Mr. Read, M.P., thanked the right hon gentleman for his courtesy in granting the interview.

FARMING AT TIPTRIE HALL.

Look to your Drains and Watercourses.—This ought to form a prominent cause in every lease. After a 24 hours rain, such as we have just had, it is interesting to examine every outlet and, reflecting on the pump-like stream from every drain, wonder what is to be the fate of those numerous but unfortunate individuals who farm heavy or wet undrained lands, where the water is retained as in a plugged flower pot, and from which the only escape for it is upwards by evaporation, robbing the earth and plants of the sun's invigorating rays, and employing them to convert the unescaped water into steam, which, full of latent heat, rises into and is wasted on the air. As a rule, water-courses and outlets of drains require frequent watching, bunches of rushes and water plants increase so rapidly during the growing season that they soon choke the channel and hinder or stop the flow of water, and conceal the outlets of the drains—bushes, broken sticks, and other matters get blown or thrown into the ditches, and cause injurious obstruction. I make a point of having a periodical examination of the watercourses and outlets, and the removal of all obstructions in preparation for the winter floods. This is a task too often neglected, and requires the best resolve of the principal. I am sorry to see it stated in the *Standard* and elsewhere, that on some large estates it has become necessary to appoint a regular examiner of drains, owing to the suicidal neglect of some of the tenants. Roads, drains, and fences are, to my certain knowledge, very much too often neglected. This is decidedly a most unprofitable omission, to say nothing of neatness.

I fear that these frequent over-supplies of rain, combined with the rapid growth of weeds as well as of Wheat, owing to the unusual mildness of the winter, will, on the undrained soil, act most injuriously, especially when we get our usual supply of cold spring nights and cutting easterly winds. The night on at Christmas may after a while be so richly and so wrong as some of our friends suppose, although I wish it may be. A great many people believe in the moon's influence, and even Shakespeare himself was not free from this weakness. If weakness it be, a farmer with drained lands will be able to hoe his Wheat and drill his spring corn 10 days earlier than his undrained neighbour.

My Preparation for a Crop of Mangel Wurzel.—The previous crops were—1866, Red Clover, 1867, White Wheat, 1868, Rye and Wheat. Soon after harvest the land is broadsowed, and the rubbish and stubble burned. In November manure is put in at the rate of 20 or more loads per acre, and ploughed in by two ploughs, the first drawn by three horses, the second plough following in the same track, drawn by four horses. The second plough is with a mould-board, or breast, we thus get very deep cultivation, the upper and under soil, and the manure being all intermixed. The lands are 7 feet 2 inches wide, so as to allow of three rows of Mangel on each land or stretch. The land remains in this condition until April, when 3 cwt of Peruvian guano and 2 cwt of common salt are mixed together, and sown broadcast. The land is then broadsowed once or twice according to circumstances, the seed drilled, having been first kept in wet sand some days, and the land harrowed. It is important never to plough this heavy land in spring, for by so doing it loses its moisture and the plant fails. I never miss a plant or crop of Mangel. With friable soil a different treatment may be necessary, but I only speak of our stiff clays suited for Mangel. To give some idea of the quality of our manure, which is all made under cover, on paved floors, or on spars, free from any rain—there is this year on each of the acres the consumption of 25 lb worth of cake, corn bran, malt combs, hay, and other feeding stuffs, a plentiful crop of roots and straw. We only give a small portion of roots to each bullock, especially in a dry season, but the rest is stored up for use from 10 fattening weeks for a year. Three months is ploughed on 9 acres, we had 120 tons of manure in the spring 3 cwt of Peruvian guano per acre and 2 cwt of salt. This we have proved by cutting the guano on one acre, and could see the answer, not only in the Mangel crop, but in the Oat or Wheat crop that followed. In fact, the land can never be too richly manured or too deeply autumn cultivated for Mangel. It is more profitable to grow 40 tons per acre on one acre than on two, for there is thus only half the rent, rates, tithes, seed, labour, &c. Three years ago, in a good season, we averaged 10 tons per acre on 18 acres, and we have grown 7 quarters of Wheat per acre after Mangel. We always put on 2 cwt of Peruvian guano with common salt for the summer crop following Mangel or other crops drawn off the land. Our

Mangel crop of 1868 is scarcely less than 30 tons per acre. I need hardly say that the Mangel are kept free from weeds by two or three horse hoes, by Garrett's horse hoe and several hand hoes, bringing the soil up to the surface. Of course in order to farm this system for Mangel, plenty of fattening stock must be kept. By this system the Mangel costs the farmer much less per ton than by spreading the crop over a larger area of half-manured soil. A long experience has confirmed my original opinion that high farming, producing maximum crops, is the true way of obtaining a good profit. Maximum crops depend mainly on plenty of good manure, and the latter can be much more cheaply obtained by judicious stock fattening than by artificial manures. There may be exceptions, but I speak particularly of my own farm, which consists of both light and heavy land.

3 hand-hoesings	2 17 0
Pulling and filling into carts	0 11 0
Carting Mangel from field	0 7 0
Carting, carting and thatching	1 1 0
Tithes, rates, and taxes	4 0 0
	£138 2 4

These are the regular charges that would be allowed in a transfer valuation. To these must be added the cost of carting to the homestead, cleaning, cutting up or pulping, 2s. per ton.

ON THE CROP—the usual average crop—177. 11s. } £166 12 4

My Best Crop for 1868.—I have just threshed the remaining portion of my last field of Wheat, and find that the whole field has produced a fraction over 64 bushels (8 quarters) per acre, of fine marketable (120-headed) Rough Chaff White Wheat, weighing 64 lb. per bushel. Thirty quarters of it were sold on the 12th inst. at Chelmsford market, at 50s per quarter. The other portions, sold much earlier, brought 61s. and 62s., making the average of the field 67s. 6d. per quarter—thus producing a money return of 237 per acre, besides the straw, which, at present price here, is worth about 31 1/2 per acre, in fact we are selling our surplus straw at that rate. The field was of 1/2 acres, actual measure, and the quantity of seed drilled a fraction over 4 pecks per acre put in on the 20th November, 1867, after cover, cut for hay, and then fed. I mention actual acres because what are called "farmer's" acres are sometimes 1/2 rods, and many labourers are well aware that what the field "goes for" is often a good percentage more than its actual measure. By piecework the labourer would in such cases, be a loser, unless he took that matter into his account.

My men had always an opinion that my Oak field, which produced 7 or 2 bush. per acre (sold at 60s.), would yield more than this Willow field near the pond, but I, Mr. Hallett, and others thought differently. It turns out that I was right. My 23 acres of Wheat have thus yielded an average of over 64 per acre. 20 acres, which were of Rye and Wheat after White Wheat, did not yield so well as the White Wheat, nor did the Red Wheat. The fine, warm, dry season was evidently more suited to the fine White Wheat than to those of coarser quality. Most of our Wheat was of fine white quality. The Rye sold at 4s and 6s per quarter when the White was sold at 5s to 6s. Beans and Barley were a very light crop. When I purchased this farm in 1841 I gave 23/ per acre for it—now some of my Wheat crops realize that amount per acre, and exceed it by the value of the straw 3/ per acre. This is an encouraging to agricultural improvers. A good deal has been said about my land being good Wheat land. I know of two large farms not far from mine, of very much better natural quality than mine that let for about 10s per acre one of them having superior buildings and a good house. There would be plenty more good Wheat lands if landlords drained them and if the tenants consumed plenty of purchased food, and made, as I do, 6/ worth of meat per acre. I do not expect everybody to believe my statement of growth, especially those who farm unimproved land, make little manure put in too much seed, and trust too much to Nature. J. J. Mechi, February, 1869.

THE PURE SHORTHORN BREED

This was the subject of the following Paper read by Mr. Bates at a recent meeting of the Kingsgate Association, held at Kingsgate, U. M. P., the President of the Association in the hall.

In introducing this subject, I think it will simplify the matter and facilitate discussion if we consider the advantages derived from pure-bred herds under the following heads, viz.—1st, the advantages to the breeder, 2d, the advantages to the grazier, 3d, the advantages to the dairy farm 4th, the advantages to the country at large.

1. **The Advantages of a pure bred Herd of Short-horns to the Breeder.**—Before we can properly discuss this question, it seems to me to be necessary that we should arrive at some intelligible guide as to what con-

stitutes a pure bred herd. The great want of attention paid in former times to the breeding and rearing of stock by many of our farmers, was one of the principal causes of our inferiority in these respects to the farmers from our own country and from other countries. Whether the Short-horns were imported from Scotland, as some were, or whether they were bred from some of our native stock, I do not know. We have however Short-horns then, and others too. The water breed in the country of York principally consisted of those which were considered superior cattle at that time, as regards size, appearance, general symmetry, the cows being considered suckers in the highest degree, but as regards the breed called Durham, or improved Short-horn, cannot go back with any degree of certainty to a sire and dam of HUBBARD, the famous bull, 1777, which first brought Mr. C. Colling's name to the public as a breeder of improved Short-horns. It is meeting with the bull was an arrangement which authorities agree. As to his pedigree, HUBBARD is very interesting. Mr. J. H. Hunter, a breeder, seems to have been the first to do business, having a number of males of the bull and his dam, were frequently noticed by Waistell, who, seeing the good possessed in his kindly feeding character of the dam, fed in him; but the price being 8l., which he thought high for a calf not a year old, he consulted Colling about it, and thought he detected a feeling of approval in Mr. Colling's language expressed. On the next morning he made the bargain, and had scarcely done so before he arrived for the same purpose; and as the two rode home together they agreed that it should be speculation. This arrangement, however, was to have lasted long for we find that the property of Mr. C. Colling, only a few months after, are different opinions, some maintaining that a true specimen of the Teeswater breed, alleging that she was a cross (not the first events not far removed between the Teeswater and the West Highland Kybe breed. The testimony we have against the latter assumption, statement made by Mr. J. H. Hunter, a well known breeder of Short-horns, who says, "I never saw the cow with my father's breed, and I saw a lot of HUBBARD, there was no bull for me to have any stake in her blood, and I have lately said that she resembled my own cow, I have no reason to believe that I believe in having a mixture of blood in her." This statement having been written 10 years after the HUBBARD, we must not rely too implicitly on the retentiveness of Mr. Hunter's memory as evidence against the Kybe element and the doubt may exist at that point there is no doubt about the cross which Mr. Charles Colling made some years afterwards, with the Pure bred.

Having been fortunate, whether by accident or in profane and unskillful, very superior quality of character, he had the good sense to make the good thing what he had, for we find that he exclusively from the same tribe and breed, with any of the females for breeding purposes, at the time of his sale in 1840. It seems quite remarkable that the same man who bought the calf which was the nucleus of the Teeswater breed, should have purchased a herd of animals which resembled the Teeswater breed in 1840, at a price of 1000 guineas for 7117 1/2 lb, being an average of 1000 lb. Mr. Colling had many very good specimens, yet there is no doubt it was a cross, and the grand advertisement of the bull, Teeswater, had the effect of calling the attention of the gentlemen in all parts of the country to the breed, and its adoption for we find that Colling's sale and other sales afterwards the Teeswater was not only sold extensively, as at his sale, to the counties of Durham and York, but purchasers from many other parts of the country. A great deal might be said of several other breeders, who were not only competitors with Mr. Colling, but I have thought it better to refer to their names from their own remarks, in so exclusive a form, and more so, as it is not the present day to be able to trace the pedigree of animals back to Messrs. Colling's blood, he is a fortunate man who can do so.

broken link in the descent.

Having thus briefly reviewed the progress of the Teeswater pure Short-horns, we now have an important era in their history—the establishment of Messrs. H. B. Back, who, on the basis of the Teeswater, and some other pure bred animals, first appeared in the country, which showed how much the improved breed at that date spread over the country, having entered the Teeswater during the 11 years only two more years ago, and in a proper standard of quality, and for entry in a true register of the pure Short-horns, only three or four crosses of the blood were admitted, whilst, on the other hand, it was understood that a fixed number of crosses should be so that the breed, if it is to be pure, should be diffused more rapidly throughout the country, manifest that had the descent been

Still, there was no more important member of the family than the wife of the happy husband, and his home comfortable and cheerful. Such a witness of a happy home is a rare sight in the world.

Some would have had more of the very wheat flour, which cost more than a dollar, and was not so nutritious. Others thought too much nourishing thing was better than which there was no greater mistake for beer or stout. They gave a trial to the system. They started a small brewery for the strength for a time, and it was a success. They had a good deal of business, and they were well off. They had a good deal of business, and they were well off.

ANTHONY WATERER

DESS TO SUBMIT THE

FOLLOWING LIST to the NOTICE of INTENDING PLANTERS EVERYTHING IS WELL GROWN AND FINELY ROOTED.

In proof of which he gives the date of their last removal

- ABIES ORIENTALIS, 5, 6, 7, and 8 feet, 10s. 6d. to 21s. each.
ALBERTUS, 5 to 9 feet, 30s. to 60s. per dozen, moved April, 1868.
DOUGLASSII, 5, 6, 7, and 8 feet, 5s. to 10s. 6d. each, moved August, 1868.
CANADENSIS, 4, 5, 6, 7 feet high, 1s. to 31s. per dozen.
PUMILA } Hundreds of these dwarf varieties of the
PYGMAEA } common Spruce Fir, many are 30 and
CLANBRASSILIANA } 30 years old
GREGORII }
EXCELSA.—The Common Spruce, 5, 6, and 7 feet high
7 to 10 feet round, moved April, 1868, 21s. to 30s. per dozen.
PICEA NOBILIS, 4, 5, 7, 8, and 10 feet high, 8 and 15 feet in circumference, 4s. to 11s. each. Hundreds of magnificent plants of the best quality variety. None are grafted, and all moved since March, 1868.
NORDMANNIANA, beautiful seedling plants, 1 1/2 to 2 feet, 3s. and 4s. per dozen.
3, 4, 5, 6, and 8 feet, 10s. 6d. to 105s. each.
Splendid trees, moved August, 1868, 10 and 15 feet high, 15 to 20 feet in circumference, 7 guineas each and upwards.
MAGNIFICA or NOBILIS ROBUSTA, 2 feet, 15s. each.
3 1/2 to 3 feet, 6 feet in circumference, 21s. to 31s. 6d. each.
3, 4, and 6 feet, 3 s 6d to 10s. each and upwards. Mr. Waterer has hundreds of this handsome Fir, all seedlings.
LASIOCARPA, 3 to 2 1/2 feet, 9s. per dozen.
3 to 4 feet high, 8 and 9 feet in circumference, 9s. and 11s. 6d. each.
5, 6, 7, and 8 feet high, 10 and 12 feet in circumference, 4s. and 5s. each.
PANSY, 3, 4, and 5 feet high, 10 to 11 feet, 7s. to 10s. each.
7, 8, and 10 feet high, 10 to 12 feet, 10s. to 12s. each.
FINSA NITIDA, moved April, 1868, 1 1/2 to 2 feet, 3s. per dozen.
ARIZONICA, moved April, 1868, 2 1/2 to 3 feet, 3s. per dozen.
CEMBRA, 8 to 10 feet, 10 and 12 feet round, moved 1865, 10s. 6d. to 21s. each.
CEDRUS ATLANTICA, 6 to 6 feet, 4s. to 6s. per dozen, moved 1868.
2 to 6 feet, 4s. per dozen, moved 1868.
5 to 10 feet, 7s. 6d. to 11s. 6d. each, moved 1868.
DEODARA, 4 to 6 feet, 4s. to 6s. per dozen.
7 to 8 feet, 8s. per dozen.
9 to 12 feet, 12s. per dozen and upwards. Some thousands of these large Cedars, the majority moved since Jan., 1865.
LIBANI, moved April, 1868, 5, 6, 7, and 10 feet, 5s. to 21s. each.
CUPRESSUS LAWSONIANA, 4 to 6 feet, 3s. per dozen.
6 to 6 feet, 4s. to 7 to 8 feet, 6s.
9 to 10 feet, 7s. 6d. to 10s. 6d. each.
12 to 15 feet high, and as much round, 11s. to 61s. each.
We have thousands of these large Lawsoniana, from 5 to 15 feet high, the majority moved in 1865.
JUNIPERUS CHINENSIS, 4 to 5 feet, 3s. and 4s. per dozen, 6 to 7 feet, 6s. to 8s. per dozen, 8 and 9 feet, and as much round, 2 s each, 10 to 12 feet, 3s. to 10s. 15 to 20 feet in circumference, 4s. to 10s. each and upwards. We have several thousands of this fine Juniper, 4 feet and upwards, the majority moved in 1865.
JUNIPERUS VIRGINIANA (Red Cedar), 4, 5, 6, and 7 feet, moved August, 1868, 1s.4 to 4s. per dozen.
YEW, ENGLISH.—Many thousands, 4, 5, 6, 7, 8, 10, 12 and 15 feet high, nearly all of which have been moved within 12 months.
IRISH.—Handsome plants, 7 to 8 and 10 feet, 7s. 6d. to 10s. 6d. each, and upwards.
GOLDEN and ELEGANTISSIMA. Hundreds of fine plants, on their own bottoms and worked, from 3 to 6 and 8 feet high. Many of these plants are 30 years old; all have been recently removed.
TILIA AUREA.—This plant originated at this Nursery. We have large numbers of fine specimens, 3, 4, 5, and 6 feet high, 8, 10, and 15 feet round.
G. ANTEA.—Splendid plants, moved August, 1868, 10 to 11 feet high, 4s. to 6s. and upwards each.
LOBBII, 6 to 7 feet, and as much round, 5s. to 7s. 6d. each. 10 to 14 feet, do. do., 21s. to 52s. each. All moved in 1868.

- THUJOPSIS BOREALIS, 6 to 8 feet, 81s. per dozen. Do. do., 7 to 9 feet, 10 and 12 feet in circumference, 10s. 6d. and upwards. Moved in 1868.
WELLINGTONIA GIGANTEA, 4 to 5 feet, 7s. 6d. to 10s. 6d. Do. do., 6, 7, 8, and 9 feet, 11s. to 61s. each. All moved August, 1868.
HOLLIES, GREEN, COMMON.—Stout, finely rooted plants, 18s. per dozen, 4s. per 1. Many thousands, 4, 5, 6, and 7 feet high, 30s. to 51s. per dozen and upwards. A number of splendid plants, 10 to 15 feet high, 1 and 2 feet round. All moved April, 1868.
SCOTTICA, } Trees of the finest hardy English
LAURIFOLIA, } known. Thousands of beautiful plants,
MYRTIFOLIA, } 3, 4, and 5 feet high, 7s. 6d. to 10s. 6d. each.
HODGINS HOLLY, 4, 5, and 6 feet.
GOLDEN QUEEN.—Thousands of large plants, 10 to 15 feet high, and as much round.
WATERER'S.—This variety originated here as a result of them by hundreds, 3, 4, and 5 feet high, 8 to 15 feet in circumference—the admiration of everybody who has seen them. There are many of them 20 and 30 years old, and are constantly and recently renewed.
SILVER QUEEN, 3, 4, and 5 feet high.
STANDARD, WATERER'S.—A large number of fine plants, 10 to 15 feet high, 1 and 2 feet round.
HOLLIES, 6 to 8 feet stems, with heads 8 to 12 feet high, very handsome.
STANDARD WEEPING HOLLIES.—Some of the best plants in the Kingdom, with a fine, and on their own roots. One, probably the finest of the kind in any Nursery, is 15 feet high, 20 inches in circumference, perfectly straight, with a magnificent head covered with berries. The plant was moved August, 1868.
VARIEGATED, of the ordinary kinds. A stock of one thousand, from 3 to 5 feet high, 1 and 2 feet round, in condition to be desired. The prices are 1s. 6d. and 2s. 6d.
BOX (GREEN and VARIEGATED), 4 to 7, and 8 feet high, 1 to 6s. each, and upwards.
PYRAMIDS, 1 to 5 feet, 1s. to 5s. each.
BAYS, STANDARDS, } from 3 to 15 feet high, and
PYRAMIDS, }
LAURUSTICUM STANDARDS, 4 to 6 feet, 1s. to 5s. each.
LAURELS, PORTUGAL, 4 and 5 feet high, 1s. to 5s. each.
RHODODENDRONS.—A large number of the finest kinds, 10 to 15 feet high, 1 and 2 feet round, in condition to be desired. The prices are 1s. 6d. and 2s. 6d.
STANDARDS.—A large number of the finest kinds, 10 to 15 feet high, 1 and 2 feet round, in condition to be desired. The prices are 1s. 6d. and 2s. 6d.
SEEDLING varieties, varying in height from 1 to 15 feet, and in diameter from 1 to 2 inches.
DWARF varieties, several kinds, 2 to 2 1/2 feet high.
ODORATUM, } Nice bloom.
GOVERNANCE, } 12s. and 15s. per dozen.
PONTICUM, for cover, good plants, 27 s per dozen.
The Exhibitions of Rhododendrons in the last year, and that they are supplied from Knapp Hill.
AZALEAS.—A large number of the finest kinds, 10 to 15 feet high, 1 and 2 feet round, in condition to be desired. The prices are 1s. 6d. and 2s. 6d.
KALMIA LATIFOLIA.—Nice blooming plants, 12 and 15 feet high, 1 and 2 feet round, in condition to be desired. The prices are 1s. 6d. and 2s. 6d.
ERICA HERBACEA CARNEA.—The prettiest of the flowering Heaths; fine plants, 12 to 15 feet high, 1 and 2 feet round, in condition to be desired. The prices are 1s. 6d. and 2s. 6d.
DAPHNE CNEORUM MAJUS.—A grand specimen of the variety; fine plants, 12s. per dozen.
AUCUBA JAPONICA, up to 3 feet; thousands.

THE FOLLOWING ORNAMENTAL TREES, OF LARGE SIZE,

Are well grown and well rooted, and stout.

- PLANES, ORIENTAL and OCCIDENTAL, 10 to 15 feet high.
SYCAMORE, 10 to 14 feet.
WEEPING BIRCH, 6 to 12 feet.
MOUNTAIN ASH, 8 to 10 feet.
HORSE-CHESTNUTS, COMMON, 10 to 12 feet.
SCARLET HORSE-CHESTNUTS, very fine flowering Trees, 10 years, worked.
BEECH, WEEPING, 7 to 15 years, worked.

- BEECH, PURPLE, 8 to 15 feet high.
DECIDUOUS CYPRESS, 8 to 12 feet.
NORWAY MAPLES, 8 to 12 feet.
LOMBARDY POPLARS, 10 to 12 feet.
THORNS, fine Standards, of the most ornamental kind.
ASH, Gold-barked, Flowering and other varieties, fine Standards, 8 to 10 feet.
LINES, 10 to 12 feet.

As well as the above-mentioned articles, at Knapp Hill will be found one or perhaps the most extensive Stock of all the better kinds of HARDY EVERGREENS, DECIDUOUS and FLOWERING ORNAMENTAL TREES and SHRUBS.

A PRICED AND DESCRIPTIVE CATALOGUE

Will be forwarded on application.

Purchasers are respectfully invited to inspect the Plants growing in the Nursery.

No Catalogue can adequately represent such a Stock.

The Nursery is readily reached by Train from Waterloo to Woking Station, where conveyances may at all times be depended on.

The Railways now take Goods at through rates to almost any Station, thus doing away with the expense of packages.

ANTHONY WATERER, KNAP HILL NURSERY, WOKING, SURREY.

put thus—How much higher would this or that embankment (as the case may be) require to be made to prevent flooding? And as rivers have generally an embankment on each side, the raising of one involves the raising of the other, and so on. Again, there are narrow places where both embankments may require to be set back; so that every individual case needs to be seen in its own light in order to determine what should be done. Now, we repeat, the present time is highly favourable for landowners, tenants, and all interested investigating this important branch of drainage.

Vegetation continues to be more than usually interesting. Thus the land and the weather are in favour of filling up blanks in Wheat, either by transplanting or dibbling in seed, and where such works have not been concluded, as will be the case in late districts, they should now be prosecuted. Extremely mild as the season has been, the work of checking vegetation, and the problem how best to do it, is not engrossing more than an average attention, generally speaking. As to young Grasses, water meadows, sewage meadows, and early forage crops of every kind, it may not inaptly be said the season is a month ahead of the average. At all events the progress of vegetation merits special notice, for in several places the scythe is in active operation, and in early seasons like this it is better to begin in time, as the Grass and forced forage plants of every kind are liable to etiolate and suffer injury at the root. "Mow early and often" is the safe rule to avoid harm, and at the same time to secure the greatest amount of produce. W. B.

Notices to Correspondents.

ASSIZE OF BREAD, 1739: Mr J Richards, of Exeter, in a second part or Supplement to his "Gentleman's Steward," instructed, published in London, 1739, in a note speaking of 200 years before that time, says "A penny loaf formerly bread for a week, is now scarce sufficient for a day." In London, in 1739, by the assize of bread, the price of a quarter peck loaf of 4 lb 5 oz, was fixed at 6d; vide "Middleton's Survey of Middlesex." But will some of our West country correspondents kindly tell us what were, at Exeter, in 1739, the price of the quarter peck loaf, and the weight of bread off as fixed by the magistrates there?

W. B. GARDNER, Amateur. We do not know of any book of the kind in the British Museum. Extracts from the "Gentleman's Steward" might be used for your purpose. Apply to Mr. Abbott, Agricultural Library, 20, Fleet Street.

Soot 1/5 Year analysis is certainly a mistake. The line, "salts of ammonia, 425," should probably be read, "organic matter containing salts of ammonia." Dr. Voelcker's analysis gives 471 of organic matter in 1000, containing, however, only 13 of ammonia.

TORNADO FOR BECK POULTRY: J. N. Colchester. Next week.

TURNIP FIELD. Querist says—"We have a Turnip field which we expect would have been cleared of roots before the end of the present month, so as to admit of seeding the land with spring Wheat. The ground will not, however, be entirely cleared of its present crop before the end of March. Will it then be too late to sow Wheat?" [Not too late for "April" Wheat.] He adds—"We have a field ploughed from Grass in the beginning of January from which we had intended to take a crop of Oats. Should the Turnip field be cleared for Wheat, would you advise to crop the latter with Wheat instead of Oats, taking Oats after the Turnip crop?" [It is a very good plan, and in low condition. We intend to advise you for sowing for both Oats and Wheat. You will find a note of it in our issue of 10th inst. We would rather advise Potatoes, which will probably answer very well under the circumstances you describe.]

WATFORD SEWAGE FARM. Amateur. Thanks; we believe that the statement truly represents the fact, but it ignores the other fact, that it is only by the application of large quantities of sewage quantities too large to be squirted through pipe and hose by steam power, as at Watford—that the great results of sewage in soil can be obtained.

YARD AND BARN MANURE. F. T. says, "We have a large quantity of yard manure made in boxes, should you advise throwing it out into a heap to be trodden down, or carting it as it is into a heap in the field, leaving the sides with a bank in order to keep the winds out, and turning it about a fortnight before using? It seems to me that this last would be the wiser plan, as in the former case the rains in the uncovered yards would wash away a great many of the good properties of the manure." [When questions of this kind are asked, the crop for which the manure is intended, and the time when it will be used, should be mentioned, also the quality of the soil to which it will be applied. As regards the manure itself, it would decidedly be better to heap the manure than to spread it in a yard. As it was made in boxes, we conclude it contains a large portion of droppings to the quantity of straw used in heaping it, therefore, the more it is trodden down by horses and wheels, by its being drawn up load upon load, the better. For manure so charged with ammoniacal salts will ferment quite rapidly enough for rotting when so compressed, and there will be very little loss by the dissipation of gases from over-heating. It may happen, however, that a stirring will be desirable, as the crop to which it may be applied may require nursing when young and the manure therefore ought to be as short, or as nearly in a soluble condition, as possible. More direct loss would necessarily accrue from this plan, but then if the crop to which it is applied be Turnips, Mangel, Beet, or other green crop, it might be far more benefited by having its young leaves forced for collecting food, than would be the value of the additional loss of quantity and weight by the greater fermentation and the longer or more rapid process of decomposition. The plan in Norfolk and other Turnip counties, where much of their manure is now applied for Beans, Peas, or Wheat or to Clover, is to empty their yards and sheds in April, May, and June, heap and tread the manure down, as above advised, cover top and sides with soil or ashes, and turn it merely for the purpose of mixing a few days before its application. But then it is used some months before the crop which will have it to feed on begins to grow fast enough to require much food. It will also have to lie in the soil through the winter, therefore does not need to be at once in a soluble condition. It may be right to apply manures to clay or loamy soils four or six months before the next crop requires its influence, but it is not right to do this on light soils. The Norfolk men find that Turnips fed off light land before Christmas are less fertilizing to the soil for the next crop of Barley by quite two cwt. of Peruvian guano. Our correspondent will probably be able to apply these data to his own case.]

COMMUNICATIONS RECEIVED.—T. B. S.—E. West.—An Irish Landlord.

February 20, 1869

Full-grown Evergreens. HENRY GONFREY, Nurseryman, Stourbridge, has the following Evergreens to offer...

- Large Evergreens and Forest Trees. JAMES AND SON have a large quantity of the following trees...

Fruit Trees, Nursery Stock, Roses. JAMES AND SON, Nurseryman, Clenny lez Seca, x. offers for the present season a very large quantity...

The American Nursery, Bagshot, Surrey. WALTER WATERER respectfully invites the attention of gardeners and others engaged in planting...

FIFTY THOUSAND ASH to be SOLD, 2 to 3 feet, transplanted, and well rooted. Apply to Mr G. C. WHEELER, M. D.hurst, Sussex.

WANTED to PURCHASE, one or two PLANTS, from 4 to 8 feet high. Address with particulars and price, to J. C. WHEELER & SON, Old Broad Street, E.C.

THEOS CRIPPS AND SON beg to announce they still hold a good stock of the following plants...

J. C. WHEELER AND SON.

WHEELER'S GUINEA COLLECTION OF GARDEN SEEDS comprises the finest varieties in cultivation... WHEELER'S TOM THUMB LETTUCE is a wonderful favourite with my family and friends...

New and Choice Vegetable and Flower Seeds.

STUART AND MEIN, NURSERYMEN AND SEEDSMEN, Kelso, N.B. beg to offer the following selected from their GENERAL SEED CATALOGUE for 1869...

BOX EDGING and COMMON LAURELS. 2000 yards of DWARF BOX EDGING, and 6000 LAURELS, of various sizes, in capital condition for removal...

JOHNSON'S PROLIFIC WHITE KIDNEY POTATO. A few tons of this excellent sort grown in Cornwall are offered at 10s per cwt...

Dublin Depot, 9, UPPER ABBEY STREET, DUBLIN.

MOULE'S PATENT EARTH SYSTEM.

VALUE OF THE MANURE.

Mr. James, of Hatton, has furnished the following particulars. He says: "Mr. J. had a garden, who had 3 1/2 acres of land to which an adjoining path, has a good earth passed once through the soil to a Turnip crop, and has produced some of the finest roots I ever saw, although it was very dry, and not as it should have been, by drill. He has no hesitation in stating its value at 23 per ton. Mr. Gampel, who holds land to the same extent, has arrived, by an independent trial, and in conclusion, at the same conclusion."

Mr. HAYES, of Fordington, Dorchester, writes:—"I used some earth that had passed twice through the earth-closets in the day school of this parish on a piece of Rape of about 3 1/2 acres. The land had, the previous season, borne a crop of Mangolds, the whole of which was drawn and consumed at home. The Rape was sown on the 8th April, and 1 ton of the earth, costing 80s., was drilled with the seed. In June, 2 owt. of Bell's guano was sown broadcast over the whole piece, which was harvested in the autumn. The reason for my applying the guano was, because the soil had been changed. The Rape was a good one, and the soil was dry and hot. In the autumn, the Rape was cut and the soil used, the earth should have drilled with the guano, and cost 12s."

Mr. HENRY TAYLOR, Manufacturer of Agricultural Implements at Lechlade, who is a manure dealer, writes:—"I have supplied the earth for the closets and for use of the Lechlade School. The contents of the tanks are removed by 120 gallons monthly. He has tried the manure so manufactured on his crops, and he has informed us that he considers the best crops, after one use of the earth, to be worth 20s. to 22s. to 23s. per ton. He has tried the repeated use of the earth, and he considers the value of the manure to be 20s. to 22s. to 23s. per ton."

For Prospectuses and Testimonials apply at the Office, 20, BEDFORD STREET, COVENT GARDEN, where the Cows are on view and in operation. T. M. EVANS, Manager Engineering Works, MESSRS. J. W. GIRDLESTONE, 37, Norfolk Street, Strand, W.C., where they may be consulted with reference to the MOULE'S PATENT SYSTEM for WARMING CHURCHES, SCHOOLS, &c.

It is with great gratification that we announce our permission to refer upon any occasion to the various Heating Apparatuses at the above-named "ONE BOILER SYSTEM" has for years been subjected to the most critical tests with every satisfactory result. It is matchless for efficiency, and is the largest Apparatus on record. These are no theoretical statements, but positive facts, and it is not too much to add, that no boiler can boast a parallel.

For List of Details, see "ILLUSTRATED BOOK OF DESIGNS" (12th Edition), which can be obtained by addressing a note to JOHN WEEKS AND COMPANY, HORTICULTURAL ENGINEERS, &c., KING'S ROAD, CHELSEA.

John Weeks & Co.

MASTIC L'HOMME LEFORT, OR COLD GRAFTING WAX.

THIS PREPARATION IS KNOWN AS THE BEST WHICH CAN BE USED IN THE OPERATION OF GRAFTING TREES, SHRUBS, AND PLANTS OF ANY DESCRIPTION, BUDDING ROSES, &c.

It requires no previous melting; it is always ready for use, it grows hard in the open air as well as in water and once hardened is not liquified under a high temperature.

IT RAPIDLY HEALS ALL WOUNDS IN TREES, &c., ARISING FROM ACCIDENT OR DISEASE IT IS THE BEST STYPTIC TO PREVENT THE BLEEDING OF VINES AFTER PRUNING

For the above and other purposes, which can best be illustrated in its use, it is indispensable MASTIC L'HOMME LEFORT is strongly recommended by the illustrious Professors of Horticulture and Arboriculture in Paris, such as MM. DU BREUIL, DECAISNE, CARRIERE, RIVIERRE, CAPPE, ALEXIS LEPERE, FROILLET, and many others.

Sold in Tin Boxes of various sizes, bearing the Signature of the Inventor, L'HOMME LEFORT, Price, 6d., 1s., 2s., 4s., and 6s. per box.

Retail of most Seedsmen in the Kingdom; Wholesale only of

CHOICE PRIMULA SEEDS.

B. S. WILLIAMS

BEGS TO CALL SPECIAL ATTENTION TO HIS SUPERB STRAIN OF THIS

UNIVERSALLY ADMIRER WINTER AND SPRING FLOWERING PLANT

He can with confidence offer it as being unequalled in cultivation.

Plants from this Seed have always been awarded First Prizes wherever exhibited. B. S. W.'s strain of Primula is so well known to all the principal gardeners in the three kingdoms that testimonials are unnecessary.

In sealed packets, Red, White, or Mixed, 2s. 6d., 3s. 6d., and 5s. each.

VICTORIA and PARADISE NURSERIES, UPPER HOLLOWAY, LONDON, N.

CYCLAMEN PERSICUM (HYBRIDS).

B. S. WILLIAMS

HAS GREAT PLEASURE IN OFFERING

SEEDS OF HIS SUPERB VARIETIES OF CYCLAMENS,

Which are much superior to those sent out by him last season, being saved from the plants exhibited by Mr Wiggins, at the Meeting of the Royal Horticultural Society, at Kensington, on Tuesday last, Feb. 20...

B. S. W., having made arrangements for the supply of all Mr. Wiggins' Seed, it can only be had in sealed packets bearing his name and address.

In Sealed Packets, 1s. 6d., 2s. 6d., and 3s. 6d. each.

B. S. WILLIAMS, VICTORIA and PARADISE NURSERIES, UPPER HOLLOWAY, LONDON, N.

B. S. WILLIAMS,

NURSERYMAN AND SEEDSMAN,

VICTORIA and PARADISE NURSERIES, UPPER HOLLOWAY, LONDON, N.

Respectfully invites the Nobility and Gentry about to furnish their Conservatories, Greenhouses, Stoves, and Orchid-houses, to an inspection of his

STOCK OF MAGNIFICENT SPECIMEN PLANTS,

MANY OF WHICH ARE UNEQUALLED IN THIS COUNTRY.

THEY CONSIST OF—

The Choicest and rarest Exotics, such as TREE-FERNS, PALMS, BEAUCARNEAS, AGAVES, ITCA CYCADS, ARALIAS, CAMELLIAS, AZALEAS, and all other kinds of STOVE and GREENHOUSE FLOWERING and ORNAMENTAL FOLIAGE PLANTS, proved to be worthy of cultivation.

The Large CONSERVATORY, at all times of the year well worth a visit, is now unusually gay with Camellias, Azaleas, Ericas, Epacris, the magnificent varieties of Cyclamen persicum, obtained from Williams' seed; Williams' superb Chinese Primulas; the beautiful improved Hybrid Solanums, now laden with their large and highly ornamental berries, Hyacinths, and many other Spring Flowering Plants, also helping to make a fine floral display.

The STOVES and ORCHID-HOUSES are also very attractive and interesting just now, with Odontoglossums, Cypripediums, Caloglyphes, Lycaste Skinneri, Phalaenopsis, and many other kinds.

The COLLECTION of MEXICAN PLANTS is surpassed only by that of Kew Gardens.

ALL NEW PLANTS of sterling merit are added to the Collection as soon as procurable, and may be seen by the inspection of which would alone repay a visit.

In May will be published,

A CATALOGUE OF NEW AND RARE PLANTS FOR 1869,

FOR FREE TO ALL APPLICANTS.

The "Favourite" Omnibuses leave Victoria Nursery every seven minutes for the City and London Bridge to Strand and Victoria Station, and for Regent Street, the West End, and Brompton.

VICTORIA and PARADISE NURSERIES, UPPER HOLLOWAY, LONDON, N.

Or may be had by the dozen, 100, or 1000, at 1/6 prices. A LIST, with prices, of all the best and very variegated and other Geraniums may be had on application to

Wm. Forster, Basinghurst, Staplehurst, Kent.
The Trade supplied.

HENRY CANNELL'S AMATEUR'S and NURSERYMEN'S FLORAL GUIDE gives every particular of all the newest and best Zonal, Tricolor, Bicolor, Variegated, and Double Pelargoniums, Fuchsias, Verbenas, Petunias, Chrysanthemums, Dahlias, Calceolarias, Pentstemons, Antirrhinums, Lobelias, Phloxes, and Bedding Plants, &c. in cultivation, their improved qualities being correctly described, and a great deal of other valuable information given, including the Second Chapter on the "Art of Gardening" and the Natural Requirements of Plants, and how to grow them in the best manner. Price for six stamps.

First Prize at the Pelargonium Show at Kensington, last June, for the best six Bicolors.

H. CANNELL is now sending out SEED from the above in 2s. packets. It is particularly fine this season, and cannot fail in producing some valuable new kinds, for it is sown with great care from seed of the very best in cultivation; both Tricolors, Bicolors, Zonals, &c., mixed, including some picked from this year's kinds, such as Lord Derby, Richard Heady, Duke of Edinburgh, &c. Now is the best time to sow it. **GOLDEN FEATHER PYRETHRUM**, the best yellow bedding plant ever sent out, 1s. per packet. The following seeds are purchased from enthusiastic amateurs, who are quite as particular as those that wish to purchase the same. For further particulars as to purity of quality, price, &c., see H. C.'s Floral Guide, free for six stamps.

UNRESOLVED TESTIMONIAL.
"Bute House, Hammersmith, London.
"DEAR SIR.—I have 27 Pelargoniums up from your packet of seed, and one of them is as red as a garden Beet. Only fancy, if it keeps to its colour, it will be very odd. I will let you know how I get on with it, if I am spared to do so.—Yours truly,
"D. LEECH."

DESCRIPTIVE CATALOGUE of NEW and CHOICE PLANTS free. Messrs. Nursery, Sibthorp's, Upper Holloway, Essex.

Stocks, Stocks, Stocks.
B. S. WILLIAMS has much pleasure in offering carefully selected SEED of the SUPERB EAST LOTHIAN INTERMEDIATE STOCK, feeling sure, from personal observations of several years, that it is without question the finest strain of Intermediate Stock extant. The colours are Purple, Scarlet, and White. The two first are remarkably brilliant, and the latter very pure. They produce immense branched spikes of large double flowers, and are admirably adapted for ribbon borders and general bedding purposes, indeed, the effect which can be produced by these three varieties in both spring and autumn gardening is not surpassed by any of the now popular plants. If sown early in March, and transplanted in May to their breeding places, the amount of double flowers produced, and the grand display they make, is truly surprising. For either flower gardening or pot culture they are unsurpassable, and cannot be too strongly recommended. An assortment of three colours (Scarlet, Purple, and White) 2s. 6d.
B. S. WILLIAMS, Victoria and Paradise Nursery, Upper Holloway, N.

W. RUSHFORTH, NURSERYMAN, Leeds, offers as under, very fine—
DOUBLE WHITE PRIMROSES, per 100, 25s.
DOUBLE LILAC PRIMROSES, per 100, 30s.
DIELYTRA SPECTABILIS, per 100, 21s.
LAURUSTINUS, in bud, per 100, 20s.
ASPARAGUS, 3-yr., per 1000, 25s.
SPINACH, 4-yr., per 1000, 0/6.

Bedding-out and Hardy Clematises.
JACKMAN'S HARDY HYBRID CLEMATISES.
AWARDED TWENTY FIRST-CLASS CERTIFICATES AND TWO SPECIALS.

GEORGE JACKMAN AND SON are desirous of drawing the attention of those who intend using their Clematises for a permanent bed of plants, &c., to the fact that the present time is most favourable for planting.

OPINIONS OF THE PRESS.
"They have in their several varieties the very colour of which our summer gardeners are in a great measure deficient." J. F. (Champion), *Gardener's Chronicle*, August 31. "They will be of the highest value as purp. bedding plants—our present colours in this way being poor indeed compared to these." *The Field*, September 28. "There is no finer flowering plant for lawn decoration, no more gorgeous subject for garden avenues, not even exceeding *Pi. rosea*, which the glorious mass of rich violet purple furnishes quite a new sensation in bedding out." *The Florist and Pomologist*, November, 1867.
An ENGRAVING from a Catalogue, showing the flowering qualities, and a GENERAL CATALOGUE of PRICES, will be forwarded gratis by enclosing a stamp.

Flora Nursery, Hammersham, Sussex.

New Golden Coleus.
DOWNIE, LAIRD AND LAING, have much pleasure in offering the following beautiful and distinct varieties which they feel assured will give every satisfaction. Lists of received First-class Certificates, and will be sent out on request, at 7s. 6d. each.

ALBERT VICTOR, a very distinct tricolor variety, the centre of the leaves being bronzy red, surrounded with large blotches of deep purplish-carmine, and the golden margin a very distinct, much more so than in any other of the new Golden Coleus, the marginal teeth are also marked off by rich carmine lines. It has a very free habit of growth.

BARONESS ROTHSCHILD, an exquisitely beautiful variety, the centre of the leaves being of a bright bronzy-crimson, with stains or blotches, margin bright golden, and the veins fully marked with light carmine. In habit of growth it resembles Albert Victor.

PRINCESS BEATRICE, a charming variety, of a beautiful golden hue, the main veins being slightly marked, and the margin entire & defined by dark crimson lines, dwarf, and has a very free habit of growth.

PRINCESS ROYAL.—The centre of the leaves are a rich bronzy-crimson, with a narrow bright yellow margin, a handsome and most effective pot plant, and a most desirable variety for bedding, being very bright, and nearly an entire colour, a fine grower.
Stanstead Park, Forest Hill, London, and Enbury.

IBERIS GIBRALTARICA VERA,
NEW HARDY PERENNIAL.

This fine and very distinct Candytuft can now be supplied. It is perfectly distinct from all other species of cultivation (including *I. coriacea*, which is often erroneously sold as "*I. Gibraltarica*."). The true plant, now offered, we believe for the first time in the trade, is more than double the size of *I. coriacea* in all its parts—the heads are 2 to 3 inches across, and the individual flowers nearly three times the size. They are white, or pale shaded lilac. Habit very robust and free.

1s. 6d. each, 15s. per dozen.

JAMES BACKHOUSE AND SON, YORK NURSERIES.

DIPLADENIA AMENA.

J. W. WIMSETT

HAS GREAT PLEASURE IN ANNOUNCING THAT HE HAS PURCHASED

THE WHOLE STOCK OF THE ABOVE BEAUTIFUL PLANT,

Raised by Mr. Tuke, Gardener to E. Nicholls, Esq., of Bramley, near Leeds, who also raised the best *Dipladenia amabilis*. A figure of the beautiful *D. amena* is given in the "Florist" for April, 1868. Plants will be ready for distribution the first week in May.

Price, 1½ Guinea each.

Strong Half Specimens, 5 and 7 Guineas each.

ASHBURNHAM PARK NURSERY, KING'S ROAD, CHELSEA, LONDON, S.W.

WHOLESALE CATALOGUE ON APPLICATION.

THE FOLLOWING SPECIALITIES SUPPLIED AT THE CATALOGUE PRICE OR SPECIAL OFFER FOR LARGE QUANTITIES.

ECHEVERIA METALLICA.—Fresh Seed now ready to send out, in pods containing from 20 to 50 seeds, with full directions as to culture. Few plants equal this grand House-Leek for subtropical or alpine succulent gardening, or for the decoration of the Conservatory; its large massive leaves, shaded with a purplish glaucous hue, are unique.

PYRETHRUM GOLDEN FEATHER.—A valuable plant for ribands, beds, edgings, &c. Raised from seed, it retains its beautiful golden hue longer than if propagated by cuttings or divisions.

CARNATION SEED, from Florists' Flowers, in Mixture or in Collections.
PICOTE SEED, from Florists' Flowers, in Mixture or in Collections. *St. Art & Co.* Carnation and Picotee Seeds have long been noted for their large yield of fine double flowers.

PELAGONIUM SEED.—Large-flowered, Double, Fancy, and Diadematum, in Mixture or in Collections. The Seed we offer produces Flowers of great beauty.
PELAGONIUM (ZONAL) SEED.—Saved from the newest Variegated Tricolor and Bicolor Varieties, and from these crossed with the finest Zonals.

PRIMULA SEED.—Saved from the largest and brightest-coloured Embroidered flowers, from Fern-leaved and Double Varieties.
PINK SEED.—Saved from the choicest English varieties.
HOLLYHOCK.—Saved from English Exhibition varieties.

LOBELIA LITTLE GEM.—The prettiest of last year's novelties, flowers pure white, with clear well-defined blue margin, compact, and blooming throughout the season.
PETUNIA SEED, of exquisite quality.
CINERARIA SEED.—Saved from the choicest Florists' Flowers.
ZINNIA SEED, from magnificent double varieties.
CENTAUREA CANDIDISSIMA (RAGUSANA), warranted true, plump, well-ripened seeds.
CENTAUREA GYMNOCARPA SEED, true.
BALSAM SEED, finest double varieties.
VIOLA CORNUTA SEED, PURPLE QUEEN.—The richest, darkest coloured, and most profuse blooming variety.
MYOSOTIS SYLVATICA SEED, the finest Forget-me-not for spring gardening.
ORNAMENTAL GRASSES.
SUBTROPICAL PLANT SEEDS.
MELONS.—Choice hybrid, fine shape, and beautiful coloring, exquisite in flavour, fine shape, and beautiful coloring.
MELONS. All the usual sorts in cultivation, selected fruits only.
CUCUMBERS. All the finest varieties in cultivation.

STUART AND CO., 5, TAVISTOCK ROW, COVENT GARDEN, W.C.

SUTTONS' HOME-GROWN FARM SEEDS,

NEW AND UNADULTERATED, CARRIAGE FREE.

SEEDS DIRECT FROM THE GROWERS THE BEST MEANS OF PREVENTING DISAPPOINTMENT.

SUTTONS'

YELLOW INTERMEDIATE MANGEL.

This is, without exception, the best Mangel in cultivation, and very free from rootlets. From the symmetrical form of the roots, and the leaves being very small, this variety may be allowed to stand closer in the rows than other Mangels, hence it produces a greater weight per acre. It may be pulled with half the labour of other kinds.

Price 1s. 6d. per lb.; cheaper by the cwt.

1869.

SATURDAY, FEBRUARY 27, 1869.

MEETINGS FOR THE ENSUING WEEK: Monday, Feb. 22, 7 PM; Tuesday, Feb. 23, 11 AM; Wednesday, Feb. 24, 8 PM.

WE, of course, hold that all gardeners should be reading men, reading being one of the great HELPS TO PROGRESS which the present age has brought very near to us all. With the advantages now enjoyed in this respect by almost every one who cares to avail himself thereof, we ought to see an immense improvement in the intellectual condition of the various classes of society, improvement of a far more solid and decided character than is very generally apparent.

To the gardening fraternity the Horticultural Press affords one of the readiest and most useful means of obtaining instruction and improvement, but whilst the mind is often craving, the pocket is as often stubborn.

RICHARD SMITH, SEEDS AND SEED MERCHANT, WORCESTER.

with Martius as co-editor. At first the work progressed slowly, on account of the novelty and costliness of the undertaking, but since the year 1850, in consequence of the increased interest taken in it by the Prussian Government, it has proceeded much faster, and has now reached the 10th part. The completion, which Martius so longed to see, has been entrusted to other hands (those of Dr Eichler). It was one of Martius' last cares to take the necessary steps to ensure its continuance, in pursuance of which we may reasonably hope to see this noble monument of German industry brought to a close. Even now the parts that have appeared form the most comprehensive work in botanical literature yet published. Nearly 10,000 species are described, and these are illustrated by more than 1100 plates. It is evident that the editing and publication alone of so enormous a mass of matter is a performance worthy of the highest acknowledgment, but Martius' share in the work was by no means limited to that portion. True, out of all the monographs published, two only were by Martius, but then he supplemented nearly all the others by valuable explanations on the geographical distribution, the medicinal, technical and economical importance of the several plants. He also contributed a series of characteristic plates representing the vegetation ("Tabula Physiognomica"), accompanied by masterly definitions, and in the most elegant Latin. He also contributed maps of the floral districts, and routes of travel, &c. Several of the monographs in the "Flora Brasiliensis" are esteemed as masterpieces, for in many cases the men who wrote them had previously devoted years of study to the respective groups. The mere enumeration of Martius' other writings would fill several columns, for there are more than 150 separate works, but it is unnecessary to dilate on them, because Martius' scientific eminence does not depend on them.

There are, however, many valuable treatises amongst them. What botanist is not familiar with his researches in the Ericaceae, Amarantaceae, Nyctagynaceae, Erythroxyleae, &c. They afford evidence at once of the extraordinary versatility and observation of the writer, to whom no branch of botany was unknown. Nevertheless many of them have already accomplished their service to science, and are now out of date. But the larger works will endure, and centuries hence will be consulted and esteemed, just as we now keep and use the works of a Sowerby, a Jacquin, or a Rheede, &c.

Martius was not only a botanist in the widest acceptation of the word, he was also a general naturalist. He worked with the industry of the bee, collecting and utilising every fact and scrap of information possible, and remained to the end an ardent lover of classic literature, delivering Latin lectures to the last.

Reverting to the main facts of Martius' life, we left him in 1820, just after his return from Brazil, when he was nominated ordinary member of the Academy, and second conservator of the Botanic Garden. For some years his position remained unchanged. When, however, in 1826, King Ludwig I. ascended the throne, and the University of Landshut was removed to Munich, he was appointed professor of botany in that institution, and six years later, upon the retirement of the aged Schrank, he received the post of first conservator. With the exception of occasional journeys to England, France, Holland, &c., he discharged almost uninterruptedly the duties of both until 1851. When it is considered that interchange of thoughts and ideas formed a prominent feature of Martius' temperament, it will be readily understood that he was eminently qualified for a teacher, especially of science. He, who had seen and investigated the tropical flora, and assiduously cultivated the study of native plants, and had excellent examples from the British garden before his pupils, was equally at home, whether in a purely scientific and systematic botany, or in the diffusion of general principles, by means of illustrative examples.

A ready perception of the beautiful rendered his lectures no less instructive than graceful. Hosts of youths flocked to his lecture room, and as eagerly accompanied the affable and wonder-loving guide through a field and glade.

A real student's feat was the long-observed annual excursion to Linnæus' Oak, at Ebenhausen, on the Isar, about two miles and a half (German) distant from Munich, where are the steep and rapid mountain-falls of the Halden. Undeniably botany was there pursued with enthusiasm and exhilaration of spirit, and certainly without any detriment to science. More than one of Martius' pupils have become ornaments of their profession. Al. Braun, Mohr, K. Schumper, Sendtner, Spring, and others sat under him.

With a budget of only 1500 gulden (not a third of the present sum) Martius succeeded, with the assistance of the highly meritorious gardener Weinkauff, in making the botanic garden a model establishment. The garden had just been remodelled with great care, and partially replanted, when in 1854, through the erection of a glass palace for an industrial exhibition, the beautiful plan was marred. Martius, who had vainly remonstrated against this intrusion, ceased to interest himself in the garden, and his principal occupation thereafter was the publication of the "Flora Brasiliensis."

(To be Continued.)

PEAR PROTECTION

I DID not like to mix this article with the one on the protection of Peach and Nectarine trees. I see that "Pari Passu" has taken up the subject, and I can endorse every word he says. To grow first-class Pears away from walls would be labour in vain, unless they were protected from spring frosts (hoar frosts) from February till the 14th of May. Doyenné d'Alençon, a bush Pear on the Quince stock, and first-class, is now (February 23) coming into full bloom. What would become of it if not protected? I grew great crops of

culinary Pears last year on the Pear stock, on espaliers, in the open, without any protection. Some of the trees had 100, some 150 Pears, but you cannot secure first-class dessert Pears, such as Beurré Superfin, Josephine de Malines, Marie Louise, Doyenné du Commerce, and Dana's Hovey, without strong protection for many weeks. So satisfied am I of its absolute necessity, that I have just bought 80 yards of "forfar," at 1½d per yard, for the purpose. Even when Pears are set, and large as a hazel nut, they are liable to be destroyed by sharp hoar-frosts, though the frosts may not affect the Pear, they will destroy the stems, which turn yellow and then the Pear drops off! I do not doubt the truth of Mr Saul's (Stourton, York-shire) statement, namely, that he can grow Pears, Peaches, Nectarines, and such-like fruits without protection. It can be accounted for by the blooms being kept back by the climate till the danger is over. At Rushton I had a Marie Louise on a north wall, it never needed protection. The espalier towards the south wall never filled my hands till I shected it, and then I grew from 100 to 140 Pears on the tree. The warmer the climate and the warmer the position in the garden are, the greater is the danger by reason of radiation. I lost no Roses under my north wall in 1890, but I lost several under my south wall from the above reason. Some writers on this subject must be either lucky fellows or lunatics! They are not, I imagine, practical and experienced men, but theorists, metaphysicians, or mathematicians (signally deficient in Kepler's three laws, upon which astronomy is founded), who are always mistaking figures for facts!

Shakspeare uses the word metaphysical for supernatural. Well, they are supernatural "chaps," who think it beneath their lofty flights of imagination to study Nature. The French fight for "an idea," but the English go crazy on "an idea," often a French idea. "Corden Pears 1 foot from the ground. Why, the spring frosts will destroy them, and if any are left they will be demolished by the blackbirds, if the season is torrid. The birds nearly demolished my low Quince bush Pears, Beurré Bachelier and Doyenné Gris. Then we are told by these happy theorists that Pears can be grown remuneratively for the million— for the masses. Poo! the masses will expect from three to six a penny. We must not judge by the London market, where Pears sell at a high price— often fabulous, and worthy of a dessert described in the "Arabian Nights"—the dessert, shall I say, of Aladdin, or Sinbad the Sailor? So difficult are first-class Pears to be secured against spring demolitions, that, though I have had Madame Millet six years, I have never yet seen the shape of the fruit, although she blooms annually like Mr. Turner's Medestum.

The Pyramids on the Quince stock, about 5 feet 5 inches high on an average, beat the bush Pears thoroughly. They were as exposed to the south-west wind as the Eddystone Lighthouse, and had only a 14-inch board about 5 inches over their heads as a fixed protection. They cropped nobly, and drew all eyes. They were Doyenné du Commerce the best Pear of the year, and equal to Beurré Superfin, and Josephine de Malines, and Dana's Hovey, the sweetest of all Pears. It is of the Seckel, linc, and honey itself. The others were good, viz., Summer Beurré d'Armenberg, Gratio, La Sœur Gregoire, Bergamotte Hestrick, and Beurre Clairgeau. The last is very handsome. It has, however, though good in flesh and musky, three faults,—it is comma-formed (carvo-pyriform); it lacks juice and sprightliness of flavour, still you must have it. I expect from horticultural writers of the theoretical school a witty or crazy reproof—there is not much difference, for

I set wit to man's nose is so near allied,
That two partitions do their houses divide.
W. F. Rudcliffe.

SURFACE CROPPING VINE-BORDERS AT ARCHERFIELD.

AS Mr. D. T. Fish assumes that I have taught the surface cropping of Vine-borders as a correct theory, I beg to state that I am not aware that I have ever done so. But, setting this aside, Mr F writes very incorrectly of the position, material, and extent of the Vine-borders at Archerfield, and will not be surprised when I presume that, on these points at least, I am more learned than he. I will state the facts of the case, and if they do not prove instructive to any reader who may be placed, at any time, as I was when dealing with the borders in question, they may furnish Mr Fish with another topic for his fertile pen.

As is usual, a walk runs parallel with the main range of glass in which the vineries are situated at Archerfield, but in this instance the walk is much closer to the houses than is consistent with good planning; so close, as in some instances not to afford more room for outside borders than about 8 feet, and in others about 5 feet, while in some cases the Vine roots are entirely excluded from the inside border, and in others the inside borders are not more than 10 feet wide. Between the winter of 1859-60 and that of 1866-7, I made borders to about 200 feet of vineries, and as soon as I found the Vine roots crowding into the walk it was torn up, a border made under it and laid down hard and fast in the same position. When the roots arrived at the extremity of this fresh soil, the border on the south side of the walk was turned upside down, the subsoil removed, the border being made up to the old level, not with "fresh mairlen matter," as Mr Fish states, but with common old kitchen garden soil. This border on the south side of the walk was bounded by an espalier for Pears and Apples, not more in some instances than 24 feet from the front of the vineries, and the greatest width to which I carried any of the borders from the front of the houses did not exceed 22 feet instead of 50 feet as Mr. Fish states. It is quite correct that the borders on each

side of the walk were draped with the common herd of bedding plants." The plan adopted was to probe deeply into the Vine borders, for they were full of Vine roots, but to lay over them from 1 to 1½ inches of well decayed manure, and over this a 1½ inch of light rich soil, and in cases to plant the bedding things. And if ever Mr Fish tried this method, he will find that the roots of bedding plants are wonderfully, though not singularly, fond of being near the commissariat.

The theory of this practice I will leave Mr Fish to deal with, and will be content to set a his feet as a theorist. The results of the practice Mr Fish is already versed in, and I think if he had inspected some season, after a most unparalleled drought, and with no artificial watering, he would have concluded that it would have been a pity to have meddled with either the flower-borders, or the Vines. Vines from which Grapes were cut in June, carried their foliage without a spider-fault in November, while the wood was as green as ever I saw Vine wood before.

I have no idea of establishing either a theory or a precedent by the relation of these facts. Mr Fish and all gardeners who can carry out their ideals may be considered fortunate. In this matter I did the best I could for a display of flowers and a supply of Grapes under the circumstances. What I would have done had I carried out my ideal of Vine-borders is a very different question. As it was, I left a set of Vines at Archerfield of which, I think, even Mr Fish need not to have been ashamed. Vines which were too heavily cropped in their early days, but which, under more favourable circumstances, had improved every year for the last three or four years. D. Thomson, Drummond Gardens.

Home Correspondence.

Indian Forest Appointments. Having become some further consideration on this subject, I beg now again to trouble you, in the hope of pointing out what may be taken as the best course to be followed in the selection and training of young men for these appointments. In these days of free trade and open competition, I think it would be far preferable if the India Board were to allow the candidates to acquire their knowledge where and how they please, and not pursue any special line of education, resting contented with the result of examinations of the candidates in various stages of education. The plan which I would therefore suggest is, that candidates, who are desirous to compete for one of the forest appointments, should, as a preliminary measure, pass the examinations proposed by the India Board to test their general education; after which, for the next two years, they should be placed on a sort of probation, somewhat similar to young men qualifying for staff appointments in the army, and should receive, during that time, the same amount as the India Board at first proposed towards the expense of their maintenance, on the stipulation that the candidates pass another special examination at the end of two years in all the particular branches of knowledge which they will eventually require, with a further stipulation that they must pass a minimum standard before being finally appointed. They should then rank according to the results of their examinations. It might further be suggested that members of the Institute of Surveyors or of the Horticultural Society should, in virtue of their part of the examining Board. In order to facilitate the education of the candidates, and also for the benefit of young men intending to practice in the country as agents on estates, or in woodland districts, and for the benefit of country gentlemen who may wish to attend, the Council of Surveyors and the Council of the Horticultural Society might arrange a course of lectures to be given in some central place, such as the rooms of the Horticultural Society in London, on the special subjects necessary, such as the following:—Trees, the Classification of Plants and Fossils, Botany, Habits of Indian Trees compared with British Trees, Forestry, Land Surveying, Rangeland Levelling, Arterial and Land Drainage, &c. These lectures should be open to all donors on payment of certain moderate fees, which would go to pay those who gave the lectures, and the lecturers might be selected by the Council of the two Societies. I have named the lectures should also be given in some central place in April or May of each year, for the accommodation of those who wished to attend them. The Institute of Surveyors should then ask different surveyors in England, Scotland or Ireland to send in their names to those willing to take young men and especially those who are under their charge for a certain time, specifying their terms, and stating whether as in or outside of their own country, and that they would remain at least six months in each place. After the candidates are finally appointed, arrangements might be made by which the candidates might go for a tour of inspection in order to acquire additional information. I believe that by these means a very superior young men would be trained, not only in England and also for England itself, and they would acquire all the technicalities of their education which were pursued in England (than in this country) facilities would be given to many in this country to study systematically many matters relating to the business of a land agent, and especially the survey of forest management. You will observe that I have made no stipulation about it being compulsory on the young men to go to France or Germany. They may do so if they think proper. All that would be wished is that the competition at all times be fair, and open to all Woodlands.

Arboricultural Education.—I have read the article on the Indian forest question with much interest, and

of, or ignoring the fact, that the stock is entirely different. I have seen a good many espaliers in my time, but never one that bore a crop like those little cordons that I saw at Ferrières, Versailles, and amongst the French fruit growers. The espalier on the Crab stock, no matter how big and ugly was the trellis you put it upon, was always with difficulty kept within bounds, always pushing its vigour to the top branch, whereas the little trees I saw in France growing on very stiff moist loams, were in the sturdiest and neatest condition that could be desired; and everywhere I was told that they were scarcely any trouble, a little pinching now and then, and some attention to see that the spurs were equally distributed along the line, being all that was required. Why, the trouble is worth incurring for the sake of having such a pretty garniture to our walks in spring and autumn, even if the great Apples were of wood, and not of the finest flavour. The pinching and training would be pleasant employment for ladies and young folks, in their few hours garden rambles, affording both profitable and amusing exercise. So many tortured forms of trees have been presented to the public that I do not wonder at those rejecting them who cannot see the undeniable merits which have been claimed for these cordons, but when once they are seen well done, and in working order (we cannot expect they will be in England for a year or two), everybody interested in a garden will be charmed, and the plan will, I venture to say, be adopted in the largest as well as the smallest gardens in the land. Every operation connected with the culture of these trees will be agreeable in consequence of its simplicity; and it will be pleasure to have the little trees under the eye, from the unfolding of the rosy buds in spring, to the gathering of the fine fruit in autumn. It is to me very surprising that none of our great fruit growers, pomologists, and others, who are, I believe, in the habit of travelling in France every year, and some of them for the past 30 years, did not spy out and introduce this system long ago, and more surprising still, that it is but recently that we have learned from Mr. Robinson the real value and nature of the stock (others who have mentioned it have always recommended the Doucin or English Paradise), and no doubt but for his exposition of the matter, we might have gone on for many years without knowing anything of value about it, as we have already lived without such knowledge for many years, notwithstanding the proximity of the fruit gardens of northern France and southern England, and the abundant intercourse between the two countries. We have brick and tile edgings in all sorts of fancy forms, pebble, stone, slate, and wooden edgings, also Grass, Box, Thrift, and many other living edgings, but when once fairly understood, the little edging of choice Apple trees will prove the most popular, profitable, and useful of them all for the fruit or kitchen garden. Apart from edgings, the plan of planting the cordon on the ends, fronts, and low walls of plant pits, and other houses, low walls and fences, small vacancies or spaces between fruit trees on walls of any aspect—indeed, on any kind of blank space on walls is another distinct improvement, and, when we have it in full operation, the specimens of the finer and tenderer fruits grown on this method will be such as we have not yet had the pleasure of producing in this country. I looked in vain in Mr. Rivers' letter in the *Gardeners' Chronicle* of January 30th for any reply to a single statement in Mr. Robinson's article of the 16th. That article conveyed to me the first distinct account of these most interesting stocks that I have ever met with in our language, and I am astonished that Mr. Rivers, who talks of having studied the subject for so many years before Mr. Robinson was born, has not even made an attempt to account for the extraordinary contradiction and confusion so clearly pointed out. If I mistake not, something more than personalities are required to make us take any one's *ipse dixit* for gospel, after this revelation. *James Barnes, Bickon Gardens.*

The *Quercus Ilex*, as an ornamental tree, certainly stands unrivalled, and I have often felt surprised at its not being more extensively planted at places where it is found to thrive well. Here it has been planted largely, and I think I may say my worthy employer has some of the handsomest, if not the largest specimens in this country. A large belt planted here on the north side of the kitchen garden affords excellent shelter, and also forms a grand feature in the place when viewed from almost any point. For blocking out buildings and other objects from view, for giving shelter, and as an ornament withal, the *Ilex Oak*, in my opinion, is unsurpassed. When planted out in groups or singly in the park, it gives the locality during the dull months of winter a clothed and warm appearance. Notwithstanding, it does not receive that amount of attention from arboriculturists to which it is justly entitled. The handsomest specimen growing in the park here stands 49 feet in height, its branches extend over an area of 190 feet. Its stock girths, close to the ground, 14 feet 9 inches, and at 6 feet from the ground, 12 feet. There are many other noble specimens growing here, and of a larger size, but the above is by far the handsomest specimen. One, for instance, girths, close to the ground, 20 feet, another, 12 feet, has attained the height of 70 feet. *Thomas Foote, Gr., Haldon House, near Exeter, February 16.*

Green's Patent Hot-water Boilers.—Mr. Walls having spoken so highly (p. 79) of Green's boilers, I should like to know whether in his opinion, if this boiler were bricked in it would not be even more powerful than he represents. It surely must lose a great amount of heat exposed to the action of atmospheric air. Again, was the boiler at work the whole of the three months, or only a few nights? as the amount of coke used is so trifling compared to the consumption of other boilers. I have one at work, which certainly has four times as much work to do as the one

spoken of at Kensington; but it burns about 7 chaldrons in the fortnight. I hope he will state if the boiler was at work the whole of the 12 weeks, or was only used at nights. We have had such mild weather that it may not have been required much. *E. J. W.*

[I do not consider any very great advantage would be gained by enclosing the boiler in brickwork; if placed in a covered shed or stoke-hole, this is all that is necessary. In this boiler the circulation of the water is very rapid and is easily maintained, for, so long as a moderate amount of fuel is kept in a state of combustion in the fire-box, this quick circulation continues. The great object I consider is to keep the water constantly circulating through the area to be heated. This being accomplished, the quantity of heat lost from the outer surface of the boiler being exposed to the action of the air becomes of little consequence, the object being to cause a quick circulation and not to heat a mass of brickwork. The boiler I referred to was at work the greater part, if not the whole of the period, as stated at p. 79. Since my remarks appeared I have seen two more of the boilers at work. One, about 3 feet 6 inches high and 15 inches diameter, at Harrogate, was heating about 300 feet of 4-inch piping. When I saw it, the fire had been lighted but a little over an hour, yet the whole of the pipes were so hot that it was impossible to keep one's hand on them, thus showing that the boiler was capable of heating three or four times the quantity of pipes attached to it, for no practical man would allow any heating medium to remain for any length of time so hot as these pipes were, if he expected to keep up healthy vegetation near them. In this case I found there was very little fire inside the firebox, and on asking how long the fire would last when made up I was told that it had been banked up at 5 P.M., and found all right at 8 o'clock the following morning. The other boiler I have seen is of the same size as that at the Royal Horticultural Gardens (4 feet 6 inches by 2 feet 8 inches). This is heating 1312 feet of 4-inch piping at the Royal Park, Leeds. I found the pipes in each house at 10 A.M. as hot as any one could wish for horticultural purposes, and Mr. Murray told me that the fire was made up at 6 o'clock the evening before, and that it was simply stirred up the first thing in the morning, a little fuel added, and the damper put in at 8 o'clock. The desired amount of heat can now be obtained at less than one-half of the former cost in fuel. I had, as stated at p. 79, ordered one of Green's boilers, intending it to heat about 3000 feet of 4-inch pipe, but it was sent back to have a slight alteration made, by which I have no doubt it will heat upwards of 7000 feet, and enable us to dispense with two fires, which will be a very considerable saving. The boiler will be fixed in a few days, and I will hereafter give a faithful report of what it really can do, and if I find any faults I will name them. I trust the explanation given above will be deemed sufficient by your correspondent "Z" (see p. 166). Further, I trust that all who are wishful of imparting any information, or asking for particulars respecting this important matter, will give their names in order that the subject may be dealt with in a straightforward and proper manner, and without fear or favour. *J. Walls, FRHS.*—With less commendable patience than your correspondent "Z" (p. 166), and instead of asking as he has for further particulars respecting the operations of this boiler, whose untried capabilities have been pointed in such glowing colours, I, perhaps more anxious than wise, resolved to visit the establishments referred to, in order if possible to witness a genuine economy of heating by hot water adaptable to my own hothouses, but I regret to say I was sorely disappointed, not to mention the loss of time and expense. It is just probable that had not the name of our esteemed friend, Mr. Eyles, figured so prominently, I might have hesitated and been more content to wait, but finding his name so freely handled, and knowing the entire disinterestedness and impartiality he uniformly evinces, I ventured to undertake a tour of inspection, which has enabled me to give a reply to "Z" by stating the facts *seriatim*. Arriving at Kensington I made for the boiler, which, in itself, as stated, measures 4 feet 8 inches high, but I may add that when fixed, including the ashpit and flowpipe connection, it exceeds 6 feet. Now I cannot quite reconcile the idea of a boiler requiring a depth exceeding 6 feet claiming for itself the possibility of being fixed in places "inaccessible to other boilers." Again, it is stated that this said boiler is heating "upwards of 1000 feet of 4-inch piping." Allow me to correct this assertion by stating that the quantity of piping is only 750 feet, a good portion of which is only 2-inch, and the furnace is so reduced that it holds (so I was informed) only sufficient fuel to last three hours or four at the longest. Notwithstanding having here met with the reverse of what I had been led to expect, I wended my way to the Asburnham Park Nurseries, where these boilers were to be seen, but, to my utter astonishment, there was no patent boiler "at work or otherwise;" certainly I was informed that one of the boilers had been upon the premises for the purpose of a trial, but had to be removed, and on examination it was found necessary to return it to the maker. Under the circumstances, therefore, I may be excused from giving any opinion respecting the merits of this said boiler, preferring as I do to remain silent, until every opportunity has been given for a fair trial. I cannot, however, conclude without again referring to the disappointment I experienced at having seen so little after having read so much, it would be well if newspaper correspondents, instead of jumping at pre-nature conclusions, would simply state facts. *Y.*

Air in Vineries.—I have several young Vines in a house with other plants which can be treated well with the Vines, but I am repeatedly told by my employer that although the plants do not require air, yet the Vines, having broken weakly, need it to

whenever you go along with you in holding, that whenever the information required to qualify a candidate for a first appointment can be obtained in this manner, it is absurd to send him abroad to obtain it, while on the other hand, if it can be obtained on the Continent, and is worth anything, it is equally clear that he must then go there to get it. These are generalities which no one will dispute but which at the same time, like all generalities, leave us very much in the dark. Until we have been to those quarters, and learn the actual details, which it is thought cannot be had here, and which we must send our aids to the Continent to learn, we can do no progress in discussing the question. Can you tell us who they are, or if the recommendations by which they must have been guided have also been general? If the latter, the whole question is a matter of obscurity, which nothing will clarify but a personal inquiry and examination into the facts. If, on the other hand, details have been condescended on, we shall be able to know what they are, take them to ourselves, and come to some opinion as to their value. There are undoubtedly some things which cannot be learned here, but so far as we are concerned on the spur of the moment, none of them are of sufficient value to call for special education elsewhere. There are others which cannot be learned on account of our political constitution—such as military restrictions, extreme severity to trespassers, a system of administration, &c., but these again seem to us not to be likely to be of much use to Englishmen anywhere, at any rate not to be of those which it is imperatively necessary for them to acquire. There are other peculiarities in the Continental forest management, which are only not to be learned here because we have no need of them, but which could be taught here as in France, were it considered desirable to teach them—for example, the loppings of trees when they are felled are often left to rot on the ground. The expense of carriage to market would be greater than the price they would bring. Not so in France, for the scarcity of wood makes them valuable, and they have attained at great perfection in the neatness and order with which every scrap is preserved for use. As to our practice will teach the rudest labourer to make a garden, so I incline to think that unless there are other matters to be taught on the Continent than such details, the reason for sending our arboriculturists abroad to learn is somewhat of the weakest. There may be other things which it is desirable that they should learn. I do not say no, but until we know what they are, no one can give an opinion upon them. Perhaps we shall be told it is their organisation which we are anxious to learn. Has it, then, been settled that the French or other organisation is to be adopted in India? or, what is the use of sending men to learn an organisation which they are not to use? Can we get the desiderated information as to the details of the Continental system which it is desirable for our foresters to acquire, the first point to be considered is, whether they cannot be equally well learned at home now? Whether, supposing them not to be equally well in England now, they might not, by some arrangements, be specially taught here in the future? And 3, Whether they are worth acquiring at all? There remains another question which does not seem to have occurred to our Executive or their advisers. What are our students to do with regard to the laws and blunders of the Continental system? The idea seems to have been, that because the Continental system is elaborate, and the machinery carefully regulated and supervised, it must necessarily be perfect. I can only say, that notwithstanding all their boasted, notwithstanding their admirable horticultural attainments, especially in their carrying out to a still more important extent—in fact, in everything that Government do in all which I am willing to admit that they do do well, notwithstanding all this, their system, using the word in its literal sense, of the management and growth of trees, I ask any man in the world who has a particle of arboricultural knowledge, and who would think of a forester who should plant young plants by allowing the young trees, which are about to be felled, to shed their seed, and then let the young plants to grow up together into a thicket, not to be touched by knife or hatchet for 20 years. Is that the forestry that our young men are to learn? I have not the information nor the opportunity to know how far this system prevails all over the Continent, but I can vouch for it being that way in some parts of Germany, and I may add, that it is characteristic of early thimbling dwellers in my opinion, as characteristic of the Crown forests in some parts of France. But there ought to be some attention on this and all other points connected with the young Indian foresters, before their studies abroad, without first ascertaining what was the system followed in the schools they were to attend, and if it turns out that what I have just described is a part of the system, it would be desirable to know whether it is considered an improvement upon that followed in Britain or not, and whether it is intended to be adopted in our own country. As for me, I shall stick by the old plan, because it is old for in that respect I give every preference to that I have described, but because on the whole I think it is better.

The Horizontal Cordon.—As Mr. Robinson's writings lead me to see for myself the horizontal cordons on the Paradise stock, my opinion may be as useful as that of some who have never seen them, or have not got beyond the erroneous idea that they are espaliers with one branch, being ignorant

PLANT HOUSES.

ANY duplicate plants of Stephanotis, Clerodendrons (the variety Thomson's especially), Combretum, Dipladenias, Ipomoea Leoni, Rondeletia, Russelia, rancea - an old and much neglected plant, though a very beautiful one - Torenia and evergreen varieties of Thunbergia not already in flower, with many other similar subjects, may, by the aid of a little extra heat and other favourable circumstances, be induced to flower earlier than the general stock and so, by extending the length of their flowering period, materially enhance their value. Gloxinias should not be repotted, whether they are required to flower early or late, to prevent the separation of the roots, which have made some growth will be at the risk of bringing the delicate roots which emanate from the bulbs when once they commence growing. In process of re-potting, the greater part of the old soil composing the ball should be carefully removed, and they should afterwards be potted with moderate firmness into small pots, of such a size as will admit the ball freely without undue pressure. The compost in which they ought to be potted should be a good fibrous peat open loam, and moderately decayed leaf-mould in about equal parts, to which may be added a good sprinkling of silver sand. They require a good brass heat to start them well, which, with proper humidity in the atmosphere, may average from 75° to 80°. Increase the artificial temperature by some few degrees in stages, so that the sun gains more power. It should not range below a minimum of 65° now. Use the syringe more freely, and induce a further activity of all the inmates by a moderate supply of atmospheric moisture at all times during the early part of the day and forenoon. Fuchsias should also be started into growth, where a display of fine plants is required at the blooming time. Continue to "propagate all plants used for bedding out," and where abundance of room exists commence potting off those that require such help most. Remove the lights entirely from off all pits or frames containing these and similar subjects which are not being pushed on in heat, or have been repotted, and are still in want of shelter and assistance. By doing this at all times on warm sunny days they will be greatly benefited.

FORCING HOUSES.

Now that the sun's warmth has gained such an amount of power as to make itself felt, let a gentle but decided advance of temperature be given in all forcing houses, excepting such as are only now in the first stages, or have but recently been started. It cannot be too frequently urged, in regard to forcing houses, that a steady advance is a sure and safe road to success, in all the early phases of forcing operations. To unduly excite the branches of any plants and so push them on at a quicker rate than it is likely the roots can afford a sufficient supply to keep up, or the roots being active, to force a growth more quickly or more constantly than can be matured by the delicate organisation of the leaves at this season, is certain to result in all-success. A mean of 58° is at all times safe, and this should seldom be exceeded at the earlier stages of forcing by artificial heat alone. Of course, with an advance of natural heat an abundance of air is always desirable. Continue the disbanding of all superfluous and unnecessary shoots, bearing in mind, however, that a good leaf surface is of the first importance, tying the branches as they extend should not be unduly neglected, as they quickly become firm and stiff, and are apt to snap off, if any great gales are permitted in this respect. In thinning the earlier berries, it should be remembered that a good crop does not always mean a heavy one. Thin out the bunches pretty liberally, and before the berries have attained to any great size, and it will be found that the plants will assert their powers by the production of size and weight, with no risk of their not colouring well or shanking, &c., disasters which too frequently arise from over-cropping and like circumstances. Plants will now want active attention, and the necessary spring potting, top-dressing of the pots, &c., should be hurried on during fine and favourable intervals. Successionals which are in their fruiting pots should receive a nice top-dressing with good decaying pieces of rich loamy turf, afterwards giving them a good soaking with strong clear liquid manure. Pot any further batch of successional which have moderately filled the pots with roots in which they are now growing, into their fruiting pots. Shut up the house early at all times, and on bright sunny afternoons especially. At such times the thermometer may with great advantage be forced up to

from 88° to 90° by sun-heat alone. Give at such a time a pretty copious syringing with tepid water, not below the actual temperature of the house itself.

HARDY FLOWER GARDEN.

The lovely varieties of Scilla will now have done flowering. It will be of great advantage to the bulbs if all the old seed-vessels attached to them are picked off.

HARDY FRUIT GARDEN

Of the protecting materials to which I draw especial attention last week, the best form is the Frigi Domo. It is composed of such a thick substantial material, however, that it is absolutely necessary that it should be removed from off the trees daily, otherwise a sickly and overdrawn growth is certain to be the result of fixing it thereto for even a limited period.

KITCHEN GARDEN

Little can be added in this department to what was advised last week. Whilst I write (the 22d inst.) snow is falling freely here in Herts, and all symptoms prognosticate that the operations then alluded to will have to be deferred.

TOWN GARDENING.

If the ground has been prepared as previously directed, this is the proper time to divide and plant out any of the following herbaceous, perennial, and biennial plants, which I have found to do well.

this is a species of perennial Convolvulus, of easy culture, and does well when planted in boxes for training around windows. Evening Primroses are useful plants for town gardens; from 3 to 4 feet high.

STATE OF THE WEATHER AT CHISWICK NEAR LONDON.

Table with columns for Date, Max, Min, Mean, Wind, Rain, and other weather metrics for February.

Feb 18—Rain, showery, clear and fine, frosty. 19—Dense fog, frosty, very fine, cloudy, but fine.

STATE OF THE WEATHER AT CHISWICK

Table with columns for Date, Average High, Average Low, Mean Temp, No. of Years in which it has occurred, and Prevailing Winds.

The highest temperature during the above period occurred on the 4th, 1860—therm 70 deg and the lowest on the 2d 1863—therm 14 deg

Notices to Correspondents.

Messrs. Adams & Adams, 25, Piccadilly, Manchester, wish it to be distinctly understood that they can pay, not only twenty shillings in the pound, but five hundred thousand shillings on all they owe, and are further prepared (sic) to advance any amount up to £1000 on goods consigned for bonded (sic) sale.

fact that the Grapes in question had disappeared before the advent of our reporter. Perhaps our reporter was not in the field at any rate, it was no use asking him to go and learn from "Justitia" that "the bunch had only 25 berries on it, and there were 31 members to divide upon their merits."

CLEMATIS C. P. C. montana may be readily grafted on layers, so may C. Jackmanni. The latter being more if desired, be increased by grafting.

DARI SEED Manchester. Seeds of some Malva species cannot tell which, without a specimen of the plant.

DEFICIENT CROP OF GRAPES W.R.G. We can assure you the reason for the want of Grapes on the north side of the house than that of their being so much shaded by the sun's influence by the others that the wood was not thoroughly ripened, and is in consequence unable to produce the fruits.

DROPPING OF APRICOT BUDS: D. We attribute the cause of the dropping of the flower-buds of your Apricot trees to their expanding to over-excitement—to excitement which the wood was sufficiently ripened or sufficiently rested to bear it.

FORCED STRAWBERRIES: J.C. We can scarcely account for the failure. It may possibly be owing to the runners having been obtained late, and not getting well established in the pots—not sufficiently firm, in fact—so that they have been unable to stand the excitement which you have given them to.

FUNGUS: The Rev. H.D. The specimen you have sent is curious. We presume it came from an oak tree, and it is a state of Desdalea quercina, very like a fungus in "Ray's Synopsis." If not on Oak, be a g. g. on a fine to say on what kind of wood it grows.

HIBISCUS ESCULENTUS: Kilmartin. We are not sure the seeds of this plant can be obtained.

NAMES OF FRUITS: F. Bass Pool.

NAMES OF PLANTS: J.W.F. Abies excelsa, Norway Spruce. C.I.F.S. The seedling appears to be Piptis in an early stage is a common stove plant.—H.M. 1, tree in flower.

OUT-DOOR GRAPES: Ovidor. We give you the names of which we have tasted tolerably good in the garden of London. We are not going to express our doubts as to whether they have all been properly ripened in the house in which we generally speak of.

PRESERVATION OF PEACHES: W.H. Take it in your hand that is on the point of opening and keep it in a box in a little box.

SOIL FOR POTATOES: J.C. Superphosphate of lime is the very best manure that you can use. It is general to guano, although it may not be so stimulant. It is difficult, however, to recommend artificial manures without knowing the condition of the soil.

VERBENA DISEASE: F.Z. A few years ago a disease in Verbenas was new at similar to yours, though not identified. We had then an opportunity of examining stock, and though everything as regarded culture seemed admirable, almost every plant (with the exception of those which were evidently attacked by Thrips, but that has to do with the white spots with which the leaves are sprinkled) these white spots occur in plants in a well as cultivated state and doubtless depend upon peculiar climatic condition which we are unable to state; and if this is the case in the nature of the disease there is little chance of remedying it in the present difference of climatic condition may be the cause.

VERBENAS FOR EXHIBITION: The Rev. H.D. The varieties are good exhibition plants, and are well adapted for being deposited in a house during the winter. Harry Law (Perry), J.C. War Perry, James Perry (Perry), John Wilson (Perry), King of the South (Perry), L'Avenir de Kilmartin, Le Grande B. (Perry), Dubree), Lord Leigh Malva (Perry), Mrs. Perry (Perry), Mrs. H. de Perry, Miss Perry, Starling Perry, The man harris (Perry), and the latter are seen now-a-days. So we will suppose the dependent contemplates exhibiting cuttings of the grown in the open ground cannot be expected to be under control. Use a rich soil, and put the plants from 6 to 8 inches in diameter. Always water in fine weather, so as to prevent the plants from being drawn, as it should be the object of the exhibitor to have a limited number of shoots as strong and stout as possible. Allow but one truss to a shoot, and half-a-dozen to a plant will be enough. When coming into flower the plants in hot weather allowing the sun to act on the plants will become drawn, and the blossoms will be small. Careful not to allow a single drop of water to touch the bloom.

WATER CRESS: H.D. There is a French book, by M. Chabot, "Le Cresson," noticed in our columns in 1866 and also in p. 416.

COMMUNICATIONS RECEIVED.—The Vicar of Wokingham (pated).—Adulteration of Seeds (next week).—J. H. D. O. R.—J. D.—J. H.—J. B.—D. T. F.—H. R.—D. T. L. E.—Somerset.—J. B.—A. R.—B. D.—Shropshire.

green weighed 94 lb., the white Silesian 98 lb. and the red top 80 lb. The number of his roots was green 49 white 52 and red top 47. There were several blanches in all the rows, but the seed of each sort came up about equally, and the general appearance of the rows was alike. They were sown on the 21st May, and had not germinated nearly firm till the 1st June. In fact they were only sown and then sown twice, the object being not to start the crop, but simply to see what they would yield with ordinary care and labour of the soil in a trying season. The tops of the green and white weighed alike, 33 lb., the tops of the red 31 lb. The return from about 10 hills of a plot was 18½ stone, or at the rate of 21 tons an acre without the tops, adding these, it would make about 28 tons per acre. But, from the results of this experiment of the three sorts, he recommends the white Silesian. Its top is equal in bulk to the green; the root weighs as well or better, and it seems a finer quality than the green-top. Both the green and white seemed stronger and more robust than the red. We need not refer at any greater length to the details of cultivation. The Sugar-Beet resembles in this respect the Mangel Wurzel, differing from it mainly in the closer rows—and the closer plants in the rows—and the advantage of growing the crop on the flat, so as to enable an earthing-up in midsummer.

Since last August foreign sheep landed in this country have been slaughtered at the place of landing in consequence of the extensive prevalence of small-pox, or rather sheep-pox, on the Continent, particularly in those countries from which our supplies are obtained.

The Order of Council imposing restrictions upon the importation of foreign sheep is now, however, no longer in operation, and farmers are asking why it was so suddenly suspended while the disease still exists, according to published reports, in Holland, Friesland, and other parts of the Continent. Mr. WALTER, the Secretary of the Home Cattle Defence Association, in a letter to the *Times* on Monday last, remarks upon the prevalence of the sheep-pox in countries whence sheep are imported to England, and suggests that the revocation of the protection order, under such circumstances, could only be excused on the plea of "the falling off in the amount of cattle brought into the metropolis, and in refutation of this imagined justification of the course which has been adopted, he states that for the fortnight ended the 14th inst., the number of sheep imported into London was 7000, as compared with 2500 in the corresponding fortnight of last year. Taking these figures as correct, they prove nothing, as the question of average importation is not to be decided by reference to a particular week or fortnight in one year as compared with the same period in another. There is no doubt that in general the importation of foreign sheep has recently fallen off considerably, as reasonably might be expected under a system of restricted movement. Mr. W. E. FOSTER, in answer to a question in the House on Monday night, referred to a deficiency of between 70,000 and 80,000.

Importers and salesmen have made the most of this deficiency in their representations to the Government, and their perseverance has been rewarded by the obtainment of the concession which they have so persistently demanded. Meanwhile another argument is added to the already long list in favour of permanent legislation upon the whole subject of cattle traffic, and the final abandonment of the elastic system of law making, which, however convenient in some respects, has the essentially serious drawback of perpetual uncertainty attached to it. Respecting the risk of introduction of sheep-pox into this country, we entertain no very grave apprehension. Farmers may take courage, as their safety depends very much upon themselves, it is only necessary to refrain from buying foreign sheep for stores, and the danger is at once reduced to a minimum. The only fear is that some enterprising speculators may buy odd lots of foreign sheep at a low price, and perchance, in their zeal to dispose of them to the best advantage, do a vast amount of mischief unwittingly. This thing has happened in our experience more than once, and it therefore behoves flock-owners to keep a sharp look-out for the present.

At Mark Lane on Monday and throughout the week the corn trade has been a hand-to-mouth business, but prices have not been lowered. The only

gran which has received any particular attention has been fine quality of foreign wheat, which is required for making the "strength" of the loaf, crops grown in the most fertile soil, and the yield is a very high one, and the crops are having an average of 40 per stone for both the red and white, and at the 5d being the present top quotations. As, however, many beasts are still at 10d per stone, the amount of bread made through want of food, are consequently. The Department of the President of the Board of Trade, to whom we referred last week was answered by an order appearing in the *London Gazette* at the time we went to press full particulars of which will be found in another column. The average of the wheat trade is in a state of depression in consequence of the weather. (Continued, however, in short stocks keeps prices firm.

Lord ROBERT MANSFIELD relating to the importation of foreign cattle provides that such animals shall be landed only at ports and according to regulations prescribed by the Privy Council, that they shall be taken to "places" near the point of disembarkation, and not removed thence alive, and in the meantime they shall be kept separate from all other animals. The Privy Council is to have power to suspend this enactment as to separation during the next three years—not longer, also to exempt from the Act certain classes of foreign animals, or animals from specified countries. Moreover, nothing in the Act is to interfere with the powers of the Privy Council to make regulations for subjecting foreign animals to quarantine, and for allowing animals subject to quarantine to be removed alive beyond the limit of the port of landing. The "local authority" may be required to provide the "places" for receiving, selling, slaughtering, and fattening, the Board of Trade shall have all the powers for that purpose vested in the local authority by the Contagious Diseases (Animals) Act.

The desire of the Chambers of Agriculture for the appointment of a Royal Commission to inquire into the incidence of local taxation and suggest remedies for the existing inequality and injustice to be thus discovered, which was laid before the Premier by a petition some days ago, found expression on Thursday evening in the House of Commons. Sir M. LOPES, in moving for such a Commission, declared that local taxation now exceeded £20,000,000 a-year, one-half the whole national expenditure, putting as to the payment of the debt, and this he showed was levied exclusively on 93,000,000, or one-seventh only of the income of the country. He urged the injustice of placing all the charges amounting to this enormous sum on the land, and recommended that a contribution to local expenses should be made from Imperial funds. The effect of a Commission, he expected, would be to prove the grievance and provide a remedy. Mr. C. S. REAP, in seconding the motion, declared that it was by no means a merely agricultural question, but one affecting town and country alike. Although the motion was ultimately withdrawn and no Royal Commission is to be issued yet we have every reason to be satisfied with the result of the efforts of our Chambers of Agriculture to bring their influence to bear on the Government, for Mr. GLADSTONE, while refusing the issue of a Commission, did so expressly because that would have the effect of shelving the question for half-a-dozen years, whereas they felt that the question stood early on the list for settlement, and as soon as the Irish Church question was settled it would be one of the first duties of the Government to deal with it.

In Cheshire, which, during the ravages of the cattle plague, suffered more grievously than any other county in England, the people will pay a heavy rate for 30 years, to balance the losses which were then caused by the "stamping out" process, sanctioned by Parliament. The population of Cheshire, through their representatives in Parliament and their local authorities, on Wednesday brought the matter before the CHANCELLOR of the EXCHEQUER, with the view of obtaining some relief. Mr. LOWE admitted the hardship of the case, and it was intimated that the PRIME MINISTER should be consulted.

The Home Cattle Defence Association unanimously passed the following resolutions at a special meeting held on Monday last:—

1. That this Association has observed with surprise and alarm that the regulations enforced by the Privy Council in order to prevent the introduction of sheep-pox into this country have been rescinded. 2. That this Association is of opinion the experience of the last six months has abundantly proved the necessity for the retention of such precautions, this country, under those regulations, having continued exempt from that disease, notwithstanding its prevalence in those countries upon the Continent of Europe from whence our main supplies are drawn, and the increasing number of sheep which are being imported thence as compared with the quantity brought over in the corresponding period of last year when the trade was free. 3. That this Association, representing as it does the various parties in Great Britain affected by this question, feels imperatively called upon in the interest of consumers as well as producers, to urge upon members of Parliament the necessity either of immediate legislation by the Government upon the subject or of carrying out the Bill now in progress through the House of Commons.

On Monday evening, before the Social Science Association, Mr. P. HOLLAND read a paper conveying an indignant protest against the statement of Dr. RUMSEY at the Birmingham meeting of the Association, condemning on sanitary and utilitarian grounds the invention of the water-closet and the modern system of town sewerage. Mr. CHADWICK and Mr. RAWLINSON protested that any loss was better than that organic filth, the origin of all kinds of disease, should be retained in the neighbourhood of habitations, as in the old days of the cesspool it used to be. To wash the house and town completely out

was better, even though it involved the loss of fertilising matter. This loss was however, as a matter of fact, of little consequence, for the loss of matter was not lost, it was only changed, and would, if permitted, find its way back to the growing plant, which would be the experience of Croydon as to the results of sewer drainage-water, was by the late Mr. BIRMINGHAM, and constituted a Birmingham misrepresentation.

The *Mark Lane Express* has published its annual report of the harvest of 1888, and the results so far as the great crops are concerned, of its elaborate Tables, containing returns from 500 correspondents:—

THE HARVEST OF 1888

Classification	Wheat	Barley	Oats	Beans	Peas
Failure	—	—	—	—	—
24 parts under average	—	—	11	—	—
1 half 14th	—	4	—	—	—
1 1/4	—	29	—	—	—
1 1/2	—	32	—	—	—
1 3/4	—	11	—	—	—
1 5/8	—	4	—	—	—
Under average	—	22	—	—	—
Average	44	—	—	—	—
Over average	—	—	—	—	—
1 1/4 over average	—	4	—	—	—
1 1/2	—	3	—	—	—
1 3/4	—	—	—	—	—
1 5/8	—	3	—	—	—
2 1/8	—	—	—	—	—
Failure	—	—	—	—	—
Total	24	50	42	—	—

Classifying them, as we did our own returns in August last, under the heads "average," "under average," and "over average," we obtain the following figures:—

	Wheat	Barley	Oats	Beans	Peas
Average	44	—	—	—	—
Under average	—	—	—	—	—
Over average	—	—	—	—	—

And now, if we reduce these to their percentage results, and compare them with those of the *Agricultural Gazette*, we find the following very near concurrence:—

PERCENTAGE OF RETURNS HARVEST 1888

	Agricultural Gazette Aug., 1888		Mark Lane Express Feb., 1889	
	Average	Under average	Average	Under average
Wheat	32	61	24	—
Barley	27	77	—	66
Oats	19	80	—	73
Beans	17	83	10	83
Peas	55	80	37	87

The returns given to our contemporary, after the threshing of a large portion of the crop, may be taken to represent the fact; and it must be admitted that our own returns, published during the harvest time, are thus proved to have been wonderfully accurate. Only in the case of the Pea crop is there any considerable difference between the two sets of replies, the threshing of the crop having proved it to have been worse than was anticipated.

OUR LIVE STOCK

We have just received a copy of Mr Chaloner's sale catalogue. The auction, according to Mr Thornton's advertisement, will take place on March 1st (Easter Tuesday). We have before spoken of the excellent origin of this herd, which has been bred chiefly from Aylesby, Farnley, and Babraham stock for the last eight years. Most of the animals are by BARNET FLAG (19,351), RAVENSPUR (20,628), and ROYAL SOVEREIGN (22,802), half-brother to the first named bull. All these animals were bred by Mr R. Booth. The catalogue contains a list of 34 females and 12 males. These may be divided into groups according to the tribes which they represent. Thus, *Lady Pigeon* of CHELTENHAM (12,588) is the eldest member of the well-known family descended from the Hon. Mr C. Arbuthnot's *Sylph*, by SIR WALTER 203. This is somewhat plain cow, but a good breeder. She is now in calf to SOVEREIGN, a very perfect, level, and sized bull by ROYAL SOVEREIGN. Mr Chaloner also offers four heifers, the offspring of *Lady Pigeon* and the bulls above-mentioned. Two of these animals are very good and deep in carcass, a third, *Lady 4*, by RAVENSPUR, is somewhat flat-sided. *Lady 2* (lot 2) is the ancestress of a numerous progeny comprising five heifers and four bulls. This cow was bred by Mr Torr, of Aylesby. She is by BARNET ROYAL (11,180), and from *Lillage Maid* by COLONY PRINCE (10,087). On further tracing we find that *Lillage Rose* is a representative of the "Wharfedale" family, which has recently been successful in the showyard. She has produced three calves, four of whom—*British Maid* and three others—are at present at Kingsford. *Bessie M* is a good-looking animal, now seven years old, the mother of three excellent heifers. Perhaps the best cow in the catalogue is *Bagatelle*, by SULTAN (17,653). She is truly grand in appearance, rich in colour, and splendidly haired. This cow was bred by Mr F. H. Fawkes, of Farnley Hall, and is descended from an only sister to *Isabella*, the ancestress of Mr Booth's well-known family of that name. Her daughter, *Boppe*, is

touch, and only on the spit or in the boiler. Some other matters they knew from practical observation and instruction from father to son. We have a more scientific knowledge of these matters now-a-days. We divide and classify our feeding stuff into nitrogenous, starch and gluten-yielding, and other qualities, which I need not here specify. We are also constantly receiving instruction from the chemist to this or that society on the way in which these particular kinds of foods will form bone, muscle, or fat, or all three, either in due proportion or in a predominating degree. Practical men know too that, however correct this data may be in the laboratory, or when applied to particular animals, general results will not be the same. That which would make a good, hardy, and otherwise serviceable Berkshire or Yorkshire pig, for example, hard and "crumby" in the mouth, would only be suitable for preventing an unwholesome bred Suffolk, Essex, or Dorsetshire hog from running to lard when it was being roasted, boiled, or fried. The same views apply to Leicester or Hants sheep, and to animals of an intermediate quality also to "pure" bred cattle, and the ordinary cattle which farmers keep for profit.

All this, however, proves that the real philosophers in animal and vegetable physiology, or agricultural chemists as they are commonly termed, are quite right in their data. But it must be admitted that more is, at the same time, proved, viz., that however trustworthy the philosophy of the laboratory may be, much must necessarily be left to the skill and judgment of practical men when they have mastered this simple elementary knowledge. More than this even is proved. It is shown in theory, as it is known by many practical men, that the fine touch which first-class butchers think indispensable, may be developed in animals which are unkindly "handlers" when they are taking their chance as growers, and that the finest or "purest" bred animals may be surpassed by a more common or "coarser" tribe, if the former be in the hand of a skilled feeder, and the others be not. These views answer, we think, "S. G.'s" question—"May it, therefore, be hoped that the rule of the Highland Society shall not in every case become imperative?" If I may be permitted to give a direct reply, I should say, in the future pay more attention to the practical knowledge of judges, than to enforcing this or any other similar rule.

A word or two more on fashionable or "pure" breeds. We know where the Leicester sheep have fallen to in the estimation of men who have to look largely or partly to their flock for their rent or balance at their banker's. If we refer, too, to the prize takers of 20 years ago, we can learn how few there are of their

flocks or herds which have not degenerated, or as regards their owner's interest, come even to a worse termination. Where are A's, or B's, or C's bulls, rams, or boars? But we need not ask any more of these common questions.

Looking to the above data, however, for our general answer, I may say these fashionable animals could not be made to prove any one of the conditions embodied in the rules laid down by modern scientific men and animal physiologists. The young of the animals in question had become so degenerated that when born they were only half the size and weight of other animals of the same kind, which had been subjected to more natural treatment. And, although no expense whatever was spared in nourishing their debilitated frames and constitutions, they would not grow to the same size, weight, and specific value that others of the same genus would do when only fairly nursed and fed. The difference in the cost of which would vary from 5 to 10 to 1. While the "pure," or "fashionable," or in-and-in bred animals had a mixture of various cereals, linseed and steamed chaff, dusted too perhaps with a "condiment," in addition to the choicest roots and green crops of the farm, they would seldom exceed the common stature and frame of their genus and tribe, but the animals which have not had their nature weakened, but possessed the vigour of their ancestors in their constitution, would "shoot out and grow," in response to a little extra attention as regards shelter and food, and produce double the weight of meat in half the time at the above less rate of cost. In the one case, too, the nitrogenous, or lean or muscle-forming substance, would have been both digested and assimilated, and the result would have been a full development of eatable and nutritive meat. But in the other, the nitrogenous elements would either not have been taken at all, or cracked heels, scaly legs, and hairless backs would have been the effect of a degenerated nature making an effort to utilise that which should have been to it the most "feeding" of foods. We need not say which kind of animal would have been growing and thriving under this treatment, and which would have been out of sorts and unprofitable.

These data and the arguments I have based on them, will, I trust, further interest "S. G." and the numerous intelligent farmers in this country who are rapidly coming up to the speaking and writing point in regard to this most important subject. Although we have not the freedom of discussion to rely upon, let us not sit idly by and see our flocks and herds degenerate in the next few years, from errors of selection and pampering, in the same way as the noble and once "sound and stout" blood-horse has done within the memory of the present generation. W. W. G.

There is as much danger in keeping we I, as in permitting them to shrink from ing, nor ought they to have any change immediately prior to the lambing season. It is unnecessary, it ought to be made several times the season arrives. The writer of the tolerably successful in the management of ing flock. They are winter grazed in pastures, and as they become heavy with is required by their condition, they are Mangels, at first very sparingly upon and this is increased gradually; fescue Mangel being Oat chaff, and even cake is resorted to out to keep them healthy and fat. When their "tunes are up" they are rather large, contiguous, well sheltered corner of one field are two lambing which they are brought at night for safety. We, however, avoid as much as possible fining them in these paddocks, and avoid foul contact. Mangels and chaff are not food, but as they lamb they are drawn pastures, being still supplied with In the paddocks and the two fields are taken when desirable. In the way of good lambing seasons. I list a word or two Always be provided with a crook, a bottle at hand, a pan of lard, a tin of nitre, a small hook, a short cord, a little lard to catch the ewe, the milk for a haudanum, a tablespoonful for the ewe after labour, the gin to moisten the tongue of lamb, the sweet nitre for a feverish ewe, hook and lard for rare use at year trouble the ewe till requisite to let Nature take its course. O. P.

Malt and Barley for Beer. The from Barley was originally proposed by of near Yeovil, who published a treatise about 16 pages, price 7s., on that subject 1821. The writer was then near Yeovil, and at his request one of them received of the plan, which was made a few days 3 bushels of bruised Barley and 1 bushel malt. By Mr Ham's advice the water was at about 3° lower temperature of water than commonly applied all malt to, but a the brewing was conducted on their usual writer well remembers that the usual sweetness which there is in that and it was about the flavour and as pale as water (possibly 3 or 4 lb. per bushel of have supplied that deficiency), and he was informed that the trial had not been so was expected of it. E. West.

Small Farms.—I observe in the Notices dents, in your Paper of the 20th inst "Small Farms." You do not mention an "Essence of Farms;" by William Blackie, Esq. Dublin, Curry, Jun & Co., Sackville Street. I recommend this as better than any I have very good pamphlet. You advise "April" is not too late. This no doubt but "on very heavy and low conditioned not Oats be safer? and on the broken-up advise Potatos. I would, with all advise Oats, as Potatos on my heavy poor not suit, nor could the cultivator get a proper state for a food crop without a good and pulverising, either by means of the mechanical means. The safest crop is Oats; but why does your correspondent whole of his Turnip crop is cleared off plough and sow as soon as each port of

I see also a paragraph about "Earth by "W. R." Whether he has one of earth closets, or only since the Rev. M. made such a work about h.s. the "W. B." plain, simple, practical view of the case adopted by any cottager, viz., that any for disinfecting quite as well as it saves time, and remunerates as well. That closets are no new thing you will see from I give from a paper of mine, written in two closets on the premises, having boxes out and in beneath the seat. A box of dry has been used a scoopful of the earth box, which prevents any scent from discomfited several people who were in Moulie's closets by telling them that I for 20 years Geo W Hau Derby Feb 22

Mr Meehi's Reply to 'T. B. S.'—Mr Meehi most politely avoids answering put to him, but goes at once to his denouncing all as antiquated do in his dangerous craft has marked Meehi charges me with having written blacken his agricultural character and that in no hostile spirit I demand from and immediate answers to these made h.s. valuations?—and who ascertain of the unthreshed corn? &c. I here farmer's mind and every kind of agricultural profession, to ascertain the however, a sardonic guess, from the balance-sheet, by whose agency the various written down, and the figures placed to give an example or two, viz., "horse from farm" for last year (1868). W. M. chased elsewhere, 13th. 11s. 10d. state that these entries are anything more to say the very best for them? Could Mr Meehi

Home Correspondence.

Steam Cultivation.—Like the general public, I have long ceased to pay any attention to what Mr Smith, of Woolston, thinks proper to write, but as he has gone even beyond himself in asserting that a deliberate statement of mine, made before the Midland Farmers' Club at Birmingham, is not founded in fact, I feel compelled to break silence. If this silly, egotistical, conceited man will refer to page 11 of our catalogue, he will there find an illustration and description of the implement I stated that I had used for ridging and subsoiling, and moreover, he will find that to this implement was awarded a 1st prize at the Newcastle meeting of the Royal Agricultural Society. Again, if he will take the trouble to ask his neighbour, Mr Pike, he will find that Mr Pike does not forget, and perhaps never will forget, walking over some fallows when coursing with me, broken up with this very implement. I know advice would be thrown away upon Mr. Smith, but I submit that the respectability of your Journal ought not to be lowered by admitting into its columns such a libel as Mr Smith penned last week. James Howard, Britannia Ironworks, Bedford, Feb. 24. [Mr. Smith, like many other energetic, useful men, must, no doubt, plead guilty to the possession of a quick, impulsive temper; and if, in this instance, as we suppose, from Mr. Howard's explanation, his temper

has been excited under a mistaken impression of personal injustice, he will probably, like other warm-tempered men, be ready enough to apologise for hasty words. The complimentary adjectives which Mr Howard has clustered around his name are not, however, very likely to mollify an opponent. We could have selected others quite as true, and much less likely to aggravate a dispute. Let us add, that if Mr. Smith is egotistical, it is a great mistake; for we shall always be happy to take up the cudgels for him. We are ready at any time to defend the opinion that there is not now among us any man who has done so much as he for the promotion of the leading agricultural improvements of the present century. Add up all upon the list—manufacturers, inventors, farmers—who have had any hand in the promotion of steam cultivation in this country, he stands clearly at the head of it. No one has done more work with less encouragement and pay. Ed.]

The Lambing Season.—Success now depends upon the prior management of the ewe flock—for which if it has been properly grazed through the winter, no great danger need be apprehended, from abortion, fevers, colds, &c. They cannot be kept too quietly, and they must be regularly fed; not profusely, but just so much as will keep them in fair, ordinary con-

young Wheat is very forward, almost too so in fact, but on the whole, on the increased basis of appearance, it is very well, and the weather is much needed.

Notwithstanding the open winter, the work is by no means forward, and the crops are not so far advanced as they should be, owing to the late sowing and the late start of the season.

Our great loss was the loss of the wheat crop, which was almost entirely destroyed by the late sowing and the late start of the season.

WEST SUSSEX. Feb. 27. We have now to think, passed through one of the mildest winters that any one remembers. Hardly any frost, but growing weather since the last autumn rains. This has been very fortunate for the stock, as they are not so much affected as in a severe winter.

There is still more than the usual quantity of work to do, as the weather has been so good, and the crops are so far advanced. It is a pity that the weather is not so good as it is, as it would be very profitable for the farmer.

There is still more than the usual quantity of work to do, as the weather has been so good, and the crops are so far advanced. It is a pity that the weather is not so good as it is, as it would be very profitable for the farmer.

The lambing season is nearly over among the farmers, and has been a good one. The lambs are well, and the ewes are in good health.

Mangels that we have, and the other crops, are very good, with Vetches, and the young Clovers without a doubt.

A CORNWALL FARM.—The farm I occupy is, as you are aware, like this district, chiefly the light land, or out-land, which characterise the tablelands of the Cornish hills, partly arable and pasture, but some of the best land is in part reserved for the use of the farmer.

As regards the crops, the winter has been a dry one, and the crops are not so far advanced as they should be, owing to the late sowing and the late start of the season.

Steam cultivation has scarcely been adopted at all in this district, the soil being thin, but I think, with care, it could be done, particularly for lightly sowing the stubbles in the autumn as a preparation for next year's crop.

The yield of Wheat per acre was last year above the average, the quality, too, was extremely good, and most of it was harvested in fine condition and fit to thresh.

Barley was generally well harvested, but the yield has been deficient, and partly rather hard and steeley, yet very bright and dry.

Oats very deficient in corn and straw, weight light, Pans fair, Beans middling, not much grown here. On the whole, Wheat was by far the best crop of last season.

Every farmer, more or less, did something to supplement the bad early root crop, sowing turnips, Taro, and Rape, Mustard, Trefoil, Clover, Vetches, &c., and of which to some extent, are now useful for spring food. As many of the early crops failed they were ploughed up, and some were sown in the spring for food, and some were sown in the autumn, with Grass seeds again this year. The early crops of crops has therefore been very good, and the old crops will be very good.

The roots having failed, some of the best has been found to winter the live stock, but as an article of food is dear, many cattle and sheep which should have been so fat in spring have been only treated as stores. The straw being sweet, and the hay good, although a great deal has been cut into hay, that straw, if cut green at harvest, being particularly valuable, and where roots could not be spared, a little cake or ground corn or linseed has been mixed and given, the food in some instances being cooked or steamed, and with such provender and good water, cattle will do fairly. In the case of store sheep, chaff mixed with malt-combs, bran, oats, cake, or maize has been used, the

sheep having water and perhaps the roots of some of the crops. By such means, the live stock has been wintered at least as well as in a severe winter.

The Poultry Yard.

It is a pity that the weather is not so good as it is, as it would be very profitable for the farmer. The crops are not so far advanced as they should be, owing to the late sowing and the late start of the season.

The price of wheat appears by these figures to be about that of wool to have risen on the average 1,100 per cent. in the 200 years, and is all the more remarkable named the greatest rise was from 1700 to 1800. E. T. Clegg's Letter, in the "Economist."

PAUL'S NURSERIES AND SEED WAREHOUSE, WALTHAM CROSS, LONDON, N. GENUINE AND FIRST-CLASS SEEDS. WILLIAM PAUL

NOTES TO ANNOUNCE THAT HIS CATALOGUE OF SELECT VEGETABLE AND FLOWER SEEDS, Including many Novelties, is now ready, and may be had Free by Post on application

In proof of QUALITY he need only refer to the numerous Prizes awarded at various Horticultural Shows throughout the country, for both Vegetables and Flowers grown from his Seeds, and in regard to prices these are in all cases affixed on the lowest possible scale to be remunerative. The following Gardens in Hertfordshire, justly renowned for their Vegetables and Flowers, have long been supplied from his Seed Warehouse - Brockett Hall, Panshanger, Danesbury, Poles, Digawell, Wyddial Hall, Woodhall, Youngsbury, Bedwell Park, Essendon Place, Campfield Place, Bayfordbury, Knabworth, Frogmore Hall, Childwickbury, Codicote Lodge, and many others of equal celebrity throughout the country.

To purchasers who are unacquainted with the best varieties of Vegetables and Flowers, or who wish to save the trouble of writing a List, the following Collections are made up on equally liberal terms with any other House in the Kingdom. All are of the best quality, and cannot fail to give the fullest satisfaction

VEGETABLE SEEDS.

- No. 1. The WALTHAM COLLECTION of VEGETABLE SEEDS, FOR A LARGE GARDEN, Price £3 3s.
No. 2. The WALTHAM COLLECTION of VEGETABLE SEEDS, FOR A MEDIUM-SIZED GARDEN, Price £2 2s.
No. 3. The WALTHAM COLLECTION of VEGETABLE SEEDS, FOR A SMALL GARDEN, Price £1 1s.
Smaller Collections for Small Gardens or Cottagers, 15s., 10s 6d., or 5s. each.

FLOWER SEEDS.

- No. 1. The WALTHAM COLLECTION of FLOWER SEEDS, INCLUDING THE FINEST IMPORTED ASTERS, STOCKS, &c. Price £3 2s.
No. 2. The WALTHAM COLLECTION of FLOWER SEEDS, INCLUDING CHOICE IMPORTED ASTERS, STOCKS, &c. Price £1 1s.
No. 3. The WALTHAM COLLECTION of FLOWER SEEDS, INCLUDING THE MOST EFFECTIVE FOR A SMALL GARDEN, Price 10s. 6d.
No. 4. PAUL'S CHOICE COLLECTION of HOLLYHOCKS, IN TWELVE DISTINCT NAMED SORTS, Price 5s.

NOVELTIES, OR VARIETIES OF SUPERIOR MERIT.

- BEET, Paul's Superb Crimson, 1s. per packet.
BROCCOLI, Paul's Improved Telegraph (true), 2s. per packet.
BROCCOLI, Launder's Superb Protecting Late White, 2s. 6d. per pkt.
BROCCOLI, Snow's Winter White, very select stock, 1s. per packet.
BRUSSELS SPROUTS, Paul's Waltham, 1s. per packet.
CAULIFLOWER, Hill's Dwarf, 1s. 6d. per packet.
CAULIFLOWER, Superb Dwarf Hertfordshire, 1s. per packet.
CUCUMBER, Paul's Improved Telegraph (true), 2s. per packet.
LETTUCE, Brockett Hall Brown Cos, 1s. per packet.
LETTUCE, Hill's Compact Brown Cos, 1s. 6d. per packet.
PARSLEY, Paul's Selected Extra Curled, 6d. per packet.

FOR MORE PARTICULAR INFORMATION, SEE SEED CATALOGUE. All Seeds, except very small parcels, Carriage or Post Free.

- LILIUM AURATUM.—Flowering bulbs, 2s. to 7s. 6d. each; 18s. to 72s. per dozen.
GLADIOLI.—A very fine assortment to name, 6s. to 24s. per dozen.
ROSES.—A fine stock still on hand, Standards, Dwarf-standards, Dwarfs, and in pots for forcing.
FRUIT TREES.—Standards, Pyramids, and Dwarf-trained, and a large general Nursery Stock in excellent condition.

PRICED CATALOGUES, FREE BY POST.

IMPORTANT.—To prevent confusion, all Letters should be addressed WILLIAM PAUL—the Christian name in full, as above.

"KEW GREEN GLASS."

HENRY ORMSON

BEING EMPLOYED BY THE GOVERNMENT

ERECT NEW PLANT HOUSES IN THE ROYAL GARDENS, KEW,
 BEGS TO NOTIFY THAT HE HAS GLAZED THEM WITH GLASS OF AN
 APPROVED GREEN TINT,

of which were made to his order, and submitted to analysis by a scientific gentleman, and found to
 be of requisite component parts for producing the desired tint.

TINTED GREEN GLASS is highly approved of by the Director and Curator of the Royal Gardens,
 as a result of its excellence in subduing the scorching rays of the sun, and thereby producing a luxuriant and
 growth of the plants.

He has made arrangements with an eminent Manufacturer for a supply of this particular description of Glass,
 who may entrust their Orders for New Structures to him, may fully rely on getting the same description
 of Glass as used by him at Kew.

H O. is desirous of cautioning Horticulturists against spurious imitations of this Glass.

ORMSON'S PATENT IMPROVED WELDED WROUGHT-IRON BOILERS,
 USED IN CARRYING OUT THE IMPROVEMENTS IN THE HEATING APPARATUS
 AT THE ROYAL GARDENS, KEW,

are extensively used in preference to Cast-Iron ones, on account of their great security against cracking.

CONSERVATORIES, IN THE HIGHEST STYLE OF ART,

SPECIALLY DESIGNED TO SUIT ANY STYLE OF ARCHITECTURE.

COMPLETE ARRANGEMENTS OF

FIRST-CLASS HORTICULTURAL STRUCTURES

TO SUIT ANY GARDEN, LARGE OR SMALL.

ORMSON'S PARADIGM FRUIT AND PLANT HOUSES,

FOR EVERY PURPOSE, WILL BE FOUND THE BEST CHEAP STRUCTURES OF THE PRESENT TIME.

PLANS, SPECIFICATIONS, AND ESTIMATES ON APPLICATION.

CONSERVATORIES, HOTHOUSES, MANSIONS, CHURCHES,
 PUBLIC BUILDINGS, &c.,

HEATED BY THE MOST APPROVED AND SCIENTIFIC PRINCIPLES.

HENRY ORMSON, HORTICULTURAL BUILDER TO HER MAJESTY,

HEATING APPARATUS MANUFACTURER TO THE COMMISSIONERS OF HER MAJESTY'S ROYAL PALACES
 AND PUBLIC BUILDINGS, AND TO THE ROYAL HORTICULTURAL SOCIETY,

STANLEY BRIDGE, KING'S ROAD, CHELSEA, LONDON, S.W.

MASTIC L'HOMME-LEFORT, or COLD GRAFTING
 WAX, an invaluable preparation, for use in the operation of
 Grafting. It requires no melting, is always ready for use, and
 becomes perfectly hard when exposed to the air. Mastic L'Homme-
 Lefort is the BEST STYPTIC to PREVENT the BLEEDING of
 VINES. In Tins, 6d., 1s., 2s., 3s., and 6s. each. Retail of most
 Seedsmen, wholesale a 100 of
 HOOPER & Co., Covent Garden, London, W.C.

FA HAAGE'S WOOD GARDEN STICKS and
 TALLIES, commended by the Royal Horticultural Society,
 acknowledged to be the neatest, cheapest, and best Training Sticks
 and Tallies made.
 The above can now be had, of all sizes, Wholesale, of BERRAN &
 BLACKBURN, Cox's Quay, Lower Thames Street, London, E.C.; and
 Retail, of the principal Seedsmen and Florists.
 Price Lists on application.

COTTAM'S PATENT PORTABLE UNITED
 COW FITTINGS.

Their advantages are—Portability, not Fixtures, removable at
 pleasure, no Woodwork or Partitions to impede Ventilation or breed
 Vermin, Hay Rack and space with an unnecessary, increased width
 and depth of Feeding Troughs, Water Cistern, and Patent Drop
 Cover to prevent over-gorging. Cleanly, durable, and impervious to
 infection, being all of iron. Prices of Fittings per Cow 15s.
 Prospectuses free of Cottam & Co., Iron Works, 2, Wansley Street
 (opposite the Pantheon), Oxford Street, London, W., where the
 above are exhibited, together with several important improvements
 in Stable Fittings just secured by Patent.

GARDEN BORDER EDGING TILES, in great
 variety of patterns and materials, the former sorts being
 of a superior quality for KITCHEN GARDENS, as
 they harbour no slugs and insects, take up little
 room, and once put down never require labour
 and expense, as do "grown" Edgings, con-
 sequently being much cheaper.

GARDEN VASES, FOUNTAINS, &c. in
 Artificial Stone, of great durability, and in
 great variety of design.
 F & G. ROSSER, Manufacturers, Upper Ground
 Street, Blackfriars, S.; Queen's Road West,

By Royal Appointment
 To HER MAJESTY, by Special Warrant, dated December, 1865.
 To the PRINCE OF WALES, by Special Warrant dated February 10, 1866.

DAY, SON, AND HEWITT,
 Original and Sole Proprietors of the STOCK BREEDERS',
 MEDICINE CHEST for Disorders of Horses, Cattle, Calves, Sheep,
 and Lambs. Patronised by upwards of Seventy Thousand of the
 principal Stock-breeders, Horse Proprietors, and Agriculturists in
 England, Ireland, Scotland, and Wales.

Caution.—The "Great Animal Medicines known to the world as
 "Day's," and in such universal repute under that title, are those
 only manufactured by us, as a Bill in Chancery, we recently filed, has
 established, and no one, as was there shown, knows anything of our
 discovery, or our mode of compounding.

The Chest contains the following matchless preparations—
 Half-a-Dozen CHEMICAL EXTRACT, at 30s. per dozen.
 One Dozen GASKOL'S FLUID, at 20s. per dozen.
 One Dozen RED DRENCHES, at 13s. per dozen.
 One Dozen RED PASTE BALLS, at 7s. 6d. per dozen.

Adapted for all ailments among Stock during the present season.
 Price of Chest complete, with Shilling Book on Farriery, £1 15s. 6d.,
 carriage paid. Either preparation may be had separately in boxes.

TESTIMONIALS.
 "DAY, SON, & HEWITT'S SIX-GUINEA'S 'Stock breeders' Medicine Chest' is the handiest and completest we know of—in fact, it lets a Farmer see a whole Pharmacy—not exactly in a nutshell, but in a neat little box."—*Mark Lane Express*, 16th Dec. 1887.

"The 'Gaseous Fluid' is sufficient for all the ills that Calftlood is liable to."—*T. Bowick, Author of the Prize Essay on Calves.*
 "My Shepherd declares the 'Chemical Extract' to be worth a guinea a bottle."—*H. Woods, Lecture on Breeding and Management of Sheep.*

"The 'Gaseous Fluid' is the best correctivo of Scour in Sheep I have ever tried."—*T. Ripley, Lecture on Summer Grazing of Sheep.*
 "DAY, SON, & HEWITT, supply most excellent remedies for Scour, Gripes, and other diseases, and we have used their Medicines for some years with success."—*Sporting Gazette.*

"We have found the 'Colic Drink' (Gaseous Fluid) prepared by DAY, SON, & HEWITT, act as an invaluable remedy."—*Mark Lane Express.*

Orders sent by Post will be promptly attended to if addressed—
 DAY, SON, & HEWITT, 22, Dorset Street, Baker Street, London, W.
 Branch Depot at Wantage, Berks.

PUBLICATIONS.
 The "Shilling Key to Farriery," free by post for 12 stamps.
 The "Rearing of Calves," free by post for Three stamps.
 The "Breeding and Management of Sheep," by H. Woods (Lord Walsingham's Agent), free by post for Five stamps.

Caution to Gardeners.—When you ask for **SAYNOR AND COOKE'S WARRANTED PRIZE** PRUNING and HOEDING KNIVES, see that you get them. Observe the mark SAYNOR, also the Corporate Mark, OBTAIN WARRANTED, without which none are genuine. H. & C. regret having to call on Gardeners and others, but are compelled to do so, on account of an imitation of common quality, having been sold for the genuine one, and which has caused many complaints to be made to them of knives which were not of their make, all of which are warranted to be the best and the cheapest in the market.

Horticultural Glass Warehouse.

GRAY'S OVAL TUBULAR BOILER.

INTERNATIONAL EXHIBITION, CLASS IX, No. 2119.

Mr. GRAY begs to call the attention of the Nobility, Gentry, Nurserymen, Gardeners, &c., to his **NEW OVAL TUBULAR BOILER,**

As acknowledged by practical judges to be a great improvement on every form of Tubular Boiler. It has proved itself superior to all other Boilers for quickness of action and economy of Fuel, &c., &c., and is one-third less the amount required by any other.

Extract from Report in GARDENERS' CHRONICLE of International Exhibition, May 21, 1862, page 61.
"The upright form of Boiler is usually made on a circular plan, rather than a square, it seems feasible that a boiler of oval form is superior to Mr. Gray's variety of it is said to be plan about 4 times the tubes more can be packed with the fire. The usual form of a furnace being a parallelogram is no doubt an improvement."

They are made of all sizes, which, with prices, may be had on application.

JAMES GRAY, HORTICULTURAL WORKS, DANVERS STREET, PAULTON'S SQUARE, KING'S ROAD, CHELSEA, S.W.

WHOLESALE CATALOGUE ON APPLICATION.

THE FOLLOWING SPECIALITIES SUPPLIED AT THE CATALOGUE PRICE, OR SPECIAL OFFER FOR LARGE QUANTITIES.

- BEVERIA METALLICA—Fresh Seed now ready to send out, in pods containing from 20 to 50 seeds, with full instructions to culture. Few plants equal this grand House-Leek for subtropical or alpine succulent gardening, or for decoration of the Conservatory. Its large massive leaves, shaded with a purplish glaucous hue, are unique.
THERMOPHYLLON GOLDEN FEATHER—A valuable plant for ribbons, beds, edgings, &c. Raised from seed, it has a beautiful golden hue longer than if propagated by cuttings or divisions.
PPTUNIA SEED, of exquisite quality.
CINERARIA SEED.—Saved from the choicest Florists' Flowers.
ZINNIA SEED, from magnificent double varieties.
CENTAUREA CANDIDISSIMA (RAGUSINA), warranted true, pump, well-ripened seeds.
CENTAUREA GYMNOCARPA SEED, true.
BALSAM SEED, finest double varieties.
VIOLA CORNUTA SEED, PURPLE QUEEN—The earliest, the darkest coloured, and most profuse blooming variety.
MYOSOTIS SYLVATICA SEED, the finest Forget-me-Not for spring gardening.
ORNAMENTAL GRASSES
SUBTROPICAL PLANT SEEDS
MELONS.—Choice hybrid, our own raising; unequalled for their exquisite luscious flavour, fine shape, and beautiful lacing.
NETTLES.—All the usual sorts in cultivation, seed saved from selected fruits on 7
CUCUMBERS.—All the finest varieties in cultivation.

STUART AND CO., 5, TAVISTOCK ROW, COVENT GARDEN, W.C.

New Golden Coleus.

DOWNIE, LAIRD, AND LAING can supply the whole series raised at the Royal Horticultural Society's Gardens, Chiswick, at advertised prices, after March 15. CATALOGUES free on application. Stanstead Park, Forest Hill, S.E.; and at Edinburgh.

Beautiful New Coleus.

CHARLES TURNER begs to offer the following: PRINCESS ROYAL—The centre of the leaves of a rich bronzy crimson, with a narrow bright yellow margin, a handsome and most effective pot plant, and a most desirable variety for bedding. It is very bright and nearly an entire colour a free grower. ALBERT VICTOR—Centre of the leaves bronzy red shaded with purplish maroon, red lines and golden margin, very distinct, and strong grower. The above splendid varieties were selected from the large batch of seedlings raised at the Royal Horticultural Gardens, and were considered the best of them. They obtained the highest price at the sale, and each was awarded First and Second Prizes. Will be sent to the Nursery, Stanstead Park, Forest Hill, S.E.

New Golden Coleus.

DOWNIE, LAIRD, AND LAING have much pleasure in offering the following new and distinct new Coleus, which they feel assured will give every satisfaction. Each has received First and Second Prizes, and will be sent out on March 15 next, at 7s. 6d. each.

ALBERT VICTOR—This a very distinct and improved variety, the centre of the leaves being bronzy red, stained with large blotches of deep purplish-carmine, and the golden margin is very broad, much more so than in any other of the new golden sorts, the marginal teeth are also marked out by rich carmine lines. It has a very free habit of growth. BARONESS ROTHSCHILD—An exquisite beautiful variety, the centre of the leaves being of a bright bronzy-crimson, without stains or blotches, margin bright golden and the teeth beautifully marked with light carmine. In habit of growth it resembles Albert Victor. PRINCESS BEATRICE, a charming variety, of a beautiful light golden hue, the margin is very slightly marked, and the margin entirely defined by dark crimson lines, dwarf, and fine. PRINCESS ROYAL—The centre of the leaves are a rich bronzy-crimson, with a narrow bright yellow margin, a handsome and most effective pot plant, and a most desirable variety for bedding being very bright, and nearly an entire colour, a free grower. Stanstead Park, Forest Hill, S.E., and Edinburgh.

New Seeds for the Garden and Farm, 1869

CROYDON. A. HENDERSON'S SEEDS, PRICES, and PRICED CATALOGUE of SEEDS, containing Cultural Remarks on all the most important SEEDS. Scott's New Garden and Farm Seeds. VEGETABLE SEEDS.—J. Scott's stock of Vegetable Seeds is of the purest and best quality. Customers and friends who in years past have been benefited by the appearance of the seeds, are invited to give attention to the appearance of the seeds. The seeds are raised by growers of the highest respectability, who have a world wide reputation, and are received by J. Scott direct from Germany, France, and England, &c., &c. The seeds which took nearly every Prize at the last season at all the neighbouring and many other shows were supplied by J. Scott and large quantities of various kinds of seeds are sent to all parts of the British Isles to correspondents who speak in the most flattering terms of their choice quality. For a full price, and description, see J. Scott's VEGETABLE and FLOWER SEED CATALOGUE.

AGRICULTURAL SEEDS.—For a full description, prices, mode of sowing, and every other particular, J. Scott begs to refer all purchasers of Farm Seeds to his LIST OF AGRICULTURAL SEEDS, MANGEL WURZEL, SWEDE, and TURNIP of Extra Selected Stock, raised by J. Scott from twice-selected, transplanted roots. Large buyers liberally treated with. POTATOES.—J. Scott has for plant on a large stock of Early Kidney of sorts, Early Portland, Early Balmahoney, Milky White, Ashford Flukes, Somerset Red, Paterson's Economist, and that best of all Potatoes, Paterson's Victoria. Special prices per peck, bushel, or sack, on application. See previous Advertisements. J. Scott, The Seed Stores, Yeovil, Somerset.

ARTHUR HENDERSON & CO'S

FLOWER SEED NOVELTIES FOR 1869.

Abronia arenaria.

This very pretty novelty agrees in its general habit of growth with the well-known A. umbellata, having, like that species, trailing stems, etc., entire, and somewhat fleshy foliage, and flowers in stalked umbels from the axils, but differs in the colour of its blossoms, which are of a pure waxy yellow, delicately scented, and produced in long succession. It blooms easily first year from seed, and may therefore be treated as a half-hardy annual, but is perennial in dry soils. Per packet, 1s.

Agrostemma coeli rosea, dwarf-fringed Lilac.

A very beautiful novelty; it produces large, compact bushes 8 to 9 inches high, exceedingly floriferous, bright, violet lilac, very fresh, and so numerous as to resemble a large bouquet. Per packet, 1s.

Agrostemma, dwarf-fringed Rose.

Very pretty hardy annual, showy, and keeping in flower a long time. Per packet, 1s.

Amaranthus bicolor ruber.

Fine vigorous variegated-leaved plant, with abundant foliage, green, striped, and shaded with purplish red at the foot of the stems and branches, bright carmine scarlet, sometimes pointed yellow, and thickly set at the top. We consider this variety as one of the best variegated-leaved plants, very different from, and far more showy than an old Amaranthus bicolor. Per packet, 1s.

Amaranthus speciosus aureus

(NEW GOLDEN PRINCE'S FEATHER).

This is a seedling from the well-known purple Prince's Feather; it agrees in almost every point with the variety hitherto cultivated, but differs in a striking degree in its tint, which is of a rich golden yellow; from its distinct colour, for massing in beds or as a line in a ribbon border, it will be found invaluable. Per packet, 1s.

Arabis arenosa.

This is one of the finest spring flowers; the reason of its being so rarely cultivated is through improper treatment, sown in June, July, and August, and transplanted in September and October, about 18 inches high, it will produce in spring a very dwarf bush, about 18 inches wide, covered with a large number of flower spikes, varying from rosy white to bright rose. Per packet, 6d.

Aster Bouquet Perfection (Schilla Aster).

Exceedingly beautiful, excels all other varieties by the regularity of its habit, a very plant, with its numerous full double deep flowers, forms a perfect bouquet in the shape of a pyramid. Foliage very distinct, height about 15 inches. White variety. Dark carmine with white. Per packet, 1s.

Asperula azurea setosa.

Hardy annual, most profuse blooming. It is of a dense habit, attaining an average growth of 1 foot, and covering itself with bunches of beautiful light blue flowers, which are very sweet scented, lasting a long while in perfection. Per packet, 1s.

Cheiranthus Cheiri albus plenus.

White flowered double Wall flower, very striking and beautiful, in two varieties. I White double branching, 1s. 6d. per packet. II White double branching Rocket, 1s. 6d. per packet.

Datura fastuosa Huberiana.

New varieties, mixed.

These charming novelties comprise the most beautiful variations in colour, such as white and yellow, violet and sulphur. They are most distinct and highly desirable additions. Per packet, 6d.

Delphinium formosum celestinum.

A soft, light sky-blue of this fine hardy variety, very beautiful. Per packet, 6d.

Dianthus barbatus nigricans

(SWEET WILLIAM).

An elegant novelty, which by its very dark character differs widely from all the other varieties yet offered. It has deep violet leaves and dark blood-red velvety flowers. Per packet, 6d.

Heartsease or Pansy.

- KING of the BLUES, per pkt. 1s. 6d.
GOLDEN BELT, " " 1 6
PURE WHITE, " " 1 0
VIOLET, with white edge, " " 1 0
COPPER COLOURED, " " 1 0
SKY-BLUE, " " 1 0

The above splendid varieties are now completely fixed, and reproduced from seed almost without sporting.

Heracleum eminens.

Hardy perennial herbaceous plant. A most beautiful ornamental foliage plant, attaining a large size, of exquisite beauty as a single plant on lawns or in groups in parks. The beautifully delineated foliage is of great substance, densely covered with a greenish white tomentose down, very ornamental throughout the season. The flower-stems bear very umbrellaceous nobly-formed umbels of flowers. A rare and altogether magnificent species. 1s. per packet.

Ipomoea hederacea atrocarmina grandiflora alba marginata.

Handsome variety, with brilliant carmine flowers, edged pure white. Six Seeds, 1s. 6d.

Ipomoea hederacea grandiflora alba picta carminea.

With silver marbled leaves, heart-shaped, largely marbled with silver grey, flowers white, dotted with brilliant carmine. Six Seeds, 1s. 6d.

Ipomoea hederacea alba grandiflora.

Ipomoea hederacea grandiflora alba picta lilacea.

With silver marbled leaves, heart-shaped, largely marbled with silvery grey, white flowers, spotted with clear lilac. Six Seeds, 1s. 6d.

Ipomoea hederacea atrocarmina intus alba.

With silvery marbled leaves, tri-lobed leaves, largely marbled silver grey, flowers dark carmine, with large white throat. Six Seeds, 1s. 6d.

Marigold, Dwarf French New Golden.

A pure golden dwarf French Marigold, very double and compact. Per packet, 6d.

Mimulus repens.

This very distinct species presents a marked contrast in its habit and foliage, as well as in the colour of its flowers, to most of the other members of this popular genus. It produces slender trailing stems, clothed with very small ovate entire foliage, and bears pale lilac-purple colour, the lower lip being prettily spotted with orange on a yellow ground. It is best suited to pot culture, being a cool greenhouse plant, and produces its flowers during the summer months. Per packet, 1s.

Modiola geranioides.

An elegant little tuberous-rooted Malvaceous plant, of a habit, with pretty incised foliage, and light crimson flowers, rather more than an inch in diameter, produced from the base. Though an abundant bloomer, it is unfortunately a shy winter England. It has proved quite hardy in well-drained light soil, as of the easiest culture. Per packet, 1s.

Nierembergia frutescens.

Soft-wooded shrub, from Chili, 2 1/2 feet high, branching habit, with white lilac flowers, abundant bloomer. Per packet, 6d.

Oxalis valdiviana.

It is quite hardy, its habit is compact and good, and it blooms well above the foliage. The flowers are of a bright yellow, sweet scented, and produced in bunches of large size. The plant thus continuing a considerable time in bloom. Per packet, 1s.

Palava flexuosa.

This most beautiful annual is one of the finest introductions of late years, average height 15 to 18 inches, branching freely, producing in the greatest profusion its charming flowers, which are borne above the foliage. Its leaves are very neat and graceful, colour rosy pink, fading towards the centre, while the base of the petals is almost black, producing a fine contrast. Per packet, 1s.

Perilla nankinensis folis variegata.

The dark leaves are beautifully variegated with silver and reproduced well from seed. Per packet, 1s. 6d.

Polafoxia Hookeriana.

A beautiful rose flowering everlasting. Per packet, 6d.

Portulaca grandiflora flore-pleno (DOUBLE PORTULACA)

Mixed seed, consisting of the finest double varieties, of the most brilliant colours, in scarlet, crimson, yellow striped, &c., &c. Double two-thirds double flowers. Per packet, 1s.

Potentilla.

Fine double varieties, mixed, containing rich crimson, red, yellow, and finely mottled varieties of the finest persons. Per packet, 1s.

Pyrethrum (Golden Feather).

This new and beautiful bedding, edging and rockwork plant, true from seed. One of the most effective and beautiful plants of the season. Per packet, 6d.

Solanum capsicastrum Henderson.

A fine seedling between Capsicastrum and Phlox, of a neat and beautiful plant, covered with berries of scarlet, in culture and winter decoration, height 1 1/2 to 2 feet. Per packet, 1s.

Stock, Anderson's Rose Intermediate.

A very dwarf free flowering variety, well adapted for pots, beds, masses, or ribbons, the habit is fine and compact. Per packet, 1s. 6d.

Tacsonia Van Volxemi.

This splendid and beautiful climber we can offer seed of, one of the finest of this tribe, free to flower of many months, since in bloom, colour very brilliant. Per packet, 6d.

Trachelium canescens, flesh-coloured flowers, lilac-coloured flowers.

Two pretty new varieties of this very useful ornamental flowering plant. Per packet, 1s.

Viola lutea.

A neat new bedding and edging plant, quite hardy, of a compact habit, and produces its beautiful canopy of flowers throughout the season (rain or sunshine) in the greatest profusion. This plant has qualities adapted for bedding purposes, which are known will render it as popular and as much sought after as a lovely companion the Viola cornuta. Per packet, 6d.

Viscaria oculata, Dwarf Perfectus.

This is a remarkable fine novelty, very dwarf, 4 to 6 inches high, very bushy and compact, exceedingly floriferous, flowers are of a slightly shaded lilac, with a purplish stain in the centre. Per packet, 1s.

Viscaria elegans picta.

The centre of the flower is dark crimson, gradually passing to bright scarlet, belted with a pure white margin, producing a fine and brilliant appearance. Per packet, 6d.

Waitzia Steetziana.

A very pretty miniature species, suitable for pots, but growing well in the open ground, not apt to die off as some of the other species; about 6 inches high, with comparatively large compact yellow flowers. Per packet, 1s.

Wigandia vigieri.

This is one of our best large ornamental, care being not superior, in size to Wigandia, from which it is distinguished by the silvery tinge of its immense mass. Per packet, 1s.

Zamesia americana.

This is a neat dwarf, deciduous shrub, belonging to the Saxifrage section of the Saxifrage tribe, and attaining a height of about 1 foot. It produces opposite-ovate, serrated foliage, white beneath, and terminal cymes of neat white Saxifrage-like flowers. A very fine plant, being found apparently in only one locality in New Jersey, the vicinity of the Rocky Mountains. It is perfectly hardy, and easy culture in light soil. The seeds are small, like those of some species of Saxifrage. Per packet, 1s.

THE ADVANTAGES OF PROCURING NEW AND UNADULTERATED SEEDS DIRECT FROM THE GROWERS CANNOT BE OVERESTIMATED.

The Gardeners' Chronicle. SATURDAY, MARCH 6, 1869.

MEETING FOR THE ENSUING WEEK... SATURDAY, MARCH 13...

IN the discussion which has taken place in our columns on the ADULTERATION of SEEDS, we have endeavoured, as far as we have been concerned, to hold the balance as evenly as possible...

rotation of seeds has at various times been under the consideration of the Association, and that proposals have been made to check the evils complained of, and they have all fallen through...

It will be gleaned from what we have said that various members of the trade, in London and in the provinces, have from time to time endeavoured to discontinue the practice...

Now, once more, there is a chance of erasing this plague-spot. Parliament is to be invoked to enforce virtuous conduct on the practitioners of easy virtue. We rejoice to hear it...

It has been a matter of great astonishment to us that so little movement has been taken by the foresters, surveyors, and land agents of this country on the subject of the Government plans for the education of youths to serve the higher offices in the INDIAN FORESTS...

SATURDAY, MARCH 6, 1869.

MEETING FOR THE ENSUING WEEK
MARCH 10—County of Devon Chamber of Agriculture, at Newton

A CALENDAR of Farm Operations in March begins thus — "It is of importance that we sow (a) only those seeds which we want to grow, and that (b) they be alive when we sow them." To the other conditions of success in plant growing, viz, the preparation of the bed for these seeds, and their proper position on and under its surface, we do not now refer. It is with their purity and vitality that we have now to do.

No one has done more than Professor RUCKMAN to awaken the attention of farmer to the importance of this subject. He has shown them how they suffer from both carelessness and roguery in the seed trade. How often has he not reported from 10,000 to 50,000 weed seeds in a single pint of Clover—in a pint of Rye-grass seed several thousand seeds of Crowfoot and of Holcus, and in a pint of Luiseed 10,000 to 15,000 seeds of Charlock, Mustard, Cress, &c. He has taught us also, by careful analyses, not only of seeds, but of pasture lands, how this mass of weeds is not only sown, but grown. Ten years ago, in a field of "seeds" at Cirencester, he dug up a square yard of Clover ground, and found 46 plants on it neither Rye-grass nor Clovers, which alone the farmer believed he had sown. There were 7 plants of Plantain, 8 of Crowfoot, 2 Hardheads, 2 Dandelions, 1 Hawkbit, 6 of Ground Ivy, 4 of Selfheal, 1 small Bindweed, 1 Fool's Parsley, 2 Mouse-ear, 6 Field Madder, 2 of Couch, 4 of Creeping Bent. Several of these are flat-growing weeds, occupying the surface—such are Bindweed, Plantains, Crowfoot, Dandelion, &c. Many of them are

or to turn them on a common, and also to prevent an ass being moved, when the power is not used. The power is to be placed solely in the Privy Council, and is to be vested in the Queen in Council. This proposal is intended to prevent delay in cases of sudden danger. In regard to the power which would be reserved to the Privy Council to, in the event of certain defined circumstances, to bring out certain defined arms into which they could not be taken into the ordinary countries will be prohibited. The Government are anxious to have a report of details. The question to be regarded in any way a party to this we may express a hope that the question and would vexed question will soon be settled. Lord ROBERT MONTAGU, the second part of the Bill, which he said the first part. His lordship ultimately proposed that the two Bills should be referred together to the committee of the whole House, and the best of both. This suggestion was not adopted, and leave was subsequently given to the Bill, which was read a first time.

Dr VOELCKER read on Monday last, before the Farmers' Club a dignified paper on the subject of Food and Manures, of which a copy must be postponed till another week. We are glad to mention, however, that Dr VOELCKER's opinion that less than 10 per cent. of the ordinary English are pure art. and that many manures sold at 4s and 7s per ton contain fertilising materials to the value of 2s 6d per ton, and some of these mixtures are so adulterated that they are positively and largely injurious to the crops to which they are applied. Of the adulterations which we give the following summary:—
1. Dr VOELCKER's statement was shown to be true by instances where a quantity was recently sent from the south coast and sold by auction in the southern counties and sold on the ground that there was so much in the soil as to render soluble superphosphates at so high a price. Chemists, however, ascertained, therefore, that in this case it would be a good thing if a test were fixed on a test whereby a uniform estimate guaranteed. Mr COLEMAN said if a man in any way if business made a profit of adulterated article, he could always find one to buy it. It was not an adulterated manure, but the compositions made up by the adulterator, and they were good for nothing. It was stated that where artificial manures were used a large amount was allowed to sell his straw, the straw would be bargained as the best of them only acted as a manure, and left nothing behind. The year was not when there was much diseased cereals, his manure was the cause. This he attributed to the fact that the manure was not pure. Mr HARPER, Loughborough, asked Dr VOELCKER the value of linseed as compared with pure cake. Mr WILLIAMS, Loughborough, asked Dr VOELCKER if a manure was highly successful, and whether the difference arose from the season or from the moulding of cakes was not more owing to the use of bran with the linseed-meal than to the position of the place in which they were stored. Mr HARPER also asked Dr VOELCKER a number of questions on feeding materials and manures, to which Dr VOELCKER explained that he was a large consumer of food for stock and of manures. The speaker regretted that Dr VOELCKER was not to say that only 10 per cent. of cake-makers made pure linseed-cakes. He also spoke of leather being used in his neighbourhood (Woodstock), and the best results, by cottagers and cultivators of the country, who found it better than anything else. He himself had also used it, and found it to be a very good manure. Mr ROBERT LEAMON, of Woodstock, a farmer, said that he had had a quantity of testing the value of leather and that while the tanned parts were perfectly good, the fresh trimmings and the alkaline dust adhered to them were of considerable value as a manure. There was a wide difference, however, between the character of the two substances, and he had no doubt the Chairman had intended Dr VOELCKER's meaning. Dr HARPER said, as to the value of Linseed, the value of cake was too great to admit of its being used as food for stock. As to the difference between the results of applied manures it might be that the manure applied during the season when the soil was not so good as when it met with so much rain. It was very easy for a manufacturer of manure to adulterate the cake, and it was not at all common for the quality to be lowered. The manure cakes kept better, because, after pressing, they were stored in a room or warehouse, the temperature of which was kept tolerably high. This was necessary for the safety of cakes which had to be exported to this country, for the long voyage across the Atlantic would otherwise render them, not only in a large extent, but positively injurious as a manure from the poisonous Fungus which would be generated and appear as a blue mould. Guano with a little ammonia would still be the cheapest auxiliary manure that could be bought, even if the price were the same as it now is. In reply to Mr HARPER, Dr VOELCKER said linseed-oil was generally of more value for commercial purposes than it

was for making meat; therefore it would be futile to enter into elaborate calculations and experiments to determine the value between Linseed, with its natural amount of oil, and the residual meal, as it is sold for agricultural purposes in the form of cake.

At the usual monthly meeting of the Central Chamber of Agriculture on Tuesday last, it was moved by Mr. R. JASPER MOSE and seconded by Sir HERBERT CROFT, M.P., that this Chamber considers it desirable that there should be a separate Government Department for Agriculture, presided over by a permanent officer. Mr NEVILLE-GREVILLE, M.P., Major WILSON, and Mr WHITTAKER spoke in opposition to the appointment of such an officer. Agriculture did not require to be nursed or fostered, all it required was fair play and the opportunity of expanding and developing such agencies as the Chambers of Agriculture opened up to it. It was urged, on the other hand, by Mr AGLAND, M.P., that if agriculture was a subject for the interference and the interest of Parliament, it was a subject of interest to the Administration of the country. The question was whether agricultural interests should be rescued from the accidental and secondary position which they occupied in so many different offices, and be made subordinate to a staff of persons who would bring the advantage of technical skill and experience to their consideration. The Chairman, Mr S. READ, M.P., believed that by a revision of departments the incidence of additional expense might be avoided. The true object of the agriculturists was to have a permanent secretary, and not a party man, who would probably have to go out of office as soon as he had learnt his duties, and who might never again in his whole life return to undertake them. The motion was at length adopted. The proposal (advised from the last meeting) for a deputation to the President of the Board of Trade on the subject of a separate Government Department for Agriculture was postponed for a month. Mr DICKINSON moved, and Mr RIGBY seconded a series of four resolutions, which, after considerable discussion and verbal alterations, assumed form as follows:—

1. This Chamber considers that a complete Act applicable to the United Kingdom for the regulation of the importation and sale of foreign seeds and plants, and of safeguards against the introduction of foreign diseases, is to be responsible for the preventing of enormous losses of live stock by contagious and infectious disorders.
2. This Chamber considers that strict regulations should be imposed as to the accommodation, feeding, watering and security from disease of animals imported by ship, public highway, or any other mode, and that it should be made penal to receive by road railway or water, or to exhibit in any fair market or public sale animals suffering from cattle plague, pleuro-pneumonia, sheep pox, foot and mouth complaint, and other diseases, and that a strict quarantine and public sales, should be subject to strict inspection.
3. This Chamber considers that the introduction of foreign diseases can be prevented only by slaughter, or by quarantine of imported animals at the place of disembarkation, and that, for the accommodation of importers and the interest of the public, licensed markets or lairs and slaughter attached thereto should be provided at the seaports where arrivals from foreign countries are landed.

These resolutions were passed unanimously.

It was stated at the Chamber of Agriculture on Tuesday last, reported in the House of Commons during the discussion on Mr AGLAND'S motion for an agricultural department among the various Government offices, that the agricultural returns, instead of being published soon after harvest, were deferred till they had become useless. Mr CAIRD accordingly wrote to the Times to defend the existing conduct of the agricultural statistical inquiry. He says:—

In justice to the Inland Revenue and the statistical department of the Board of Trade, by which the returns are collected and classified, I think this statement should not remain uncorrected. A summary of the facts was published on the 20th of September and appeared in all the newspapers. Every one interested in agriculture, producers, and consumers, alike, were apprised of the results, and of the causes of the present depression, and of the necessity of the Government to take steps to remedy it. The farmers, warned by the large increase in the price of wheat, and the fall in the price of other crops, if they could not afford themselves of it, of being the first in the market, the consumers soon participated in the consequent general depression in price, and the result was a mutual depression of prices which might otherwise have proved disastrous to themselves and their dependents. The full returns in detail were not ready for publication till the close of the year. But the summary contained all that was necessary for the guidance of those interested in the national supply of bread, and its publication so early as the 20th of September was, in my judgment, most creditable to the department concerned.

A memorial is in course of signature among the breeders of sheep requesting the Council of the Royal Agricultural Society of England to abolish the inspectors of wool and shearing, in consequence of the dissatisfaction which they are alleged to have given at Leicester. Mr HOBSON, on behalf of the breeders of 'Shrops,' Mr ROBERT GARNE, for the Cotswold breeders, Mr BROWN, for the Norfolk, and Mr JOHN TREDWELL, for the Oxford Downs, are taking a leading part in the movement. The memorial begs the Council to invest the judges with full power to decide upon the eligibility of the animals for competition, and asserts that "the practice of inspecting the wool and disqualifying sheep by private parties, whose names are not published as inspectors, is most objectionable, as being at variance with the rules of the Society, subversive of the privileges and power that should alone be exercised by the judges, and a system which fails fairly to prevent the evil it is intended to remedy by its having been known to permit the competition of animals which could not have been fairly shorn, and having disqualified others which could have

been proved to have been shorn in conformity with the rules of the Society."

The Corporation of the City of Lincoln, in response to a deputation, agreed last week to give 1000 towards the expenses of the North Lincolnshire Agricultural Society's Show, to be held in Lincoln on the last three days of July next.

OUR LIVE STOCK.

WE have received a communication from Mr. Thomas Bell, of Brockton House in which he complains of some remarks made by us in reviewing his Catalogue on the 23d of January. It was certainly not our intent on to speak otherwise than handsomely of the Brockton House herd, and reference to the impression above alluded to will show that we mentioned the Catalogue in a friendly spirit. The offending passage comes last, and is as follows:—"Too frequently the pedigree crosses are short, thus, in six cases there are only three crosses, and in 11 on four crosses of pure blood. The period of time thus indicated is too short to ensure true bred stock that may be relied upon to transmit their good qualities to their progeny." We plead guilty at once to the inaccuracy of the statement, and are glad that Mr Bell, by calling our attention to it, has enabled us to correct the error. The six cases above mentioned boast four, and the 11 cases five, crosses of pure blood. Mr Bell proceeds as follows:—"As to the period of time being too short to ensure true-bred stock that may be relied upon to transmit their good qualities to their progeny, that is a question neither you nor I can solve. Speaking from experience, I would rather commence breeding from a cow with only two good crosses, and be sure of success, than upon half-a-dozen miscellaneous ones of which I knew nothing. I can give several instances of this. When I bought the Matchem cow, which I afterwards sold to Mr Bates, she had only two crosses. As to the 'good quantities of her progeny' there can be no dispute, as the tribe is increasing in popularity every day, neither is the period of time too short here. She bred the 'Oxford Premium Cow,' one of the best cows in her day; CLEVELAND LAD, one of the best bulls in his day, and the sire of *Duchess* 2d, which was the dam of the *Grand Duchesses*; CLEVELAND LAD 2d, another first-class bull, and sire of the 1000 gs. *GRAND DUKE*; and last, *Oxford 2d*. From the 'Oxford Premium Cow' came *LOCOMOTIVE*, which was sold to America for 250 gs., and his brothers, *DUKE OF WELINGTON* and *LOCOMOTIVE 2d*, were also sold to America for large prices. The descendants of *OXFORD 2d*, both males and females, were all of a superior cast, and remain so to this moment. I will next allude to the *Kirklevington*. When my father bought the *Northampton white cow*, she had no pedigree, but he was told that she was descended from Mr. Maynard's stock. The prices her progeny are selling for proves more than I can say for them. Then there is the *Waterloo cow*. When she came to *Kirklevington* she had only two crosses by *WATERBLOOD* to begin upon. When my brothers and I bought *Armo* of Mr Bates she had only one cross, by *BEVEDESS*, and one of her descendants, *Annette 2d*, bred by me, was sold last month for 200 gs., while several of the tribe, both male and female, have been sold for 50 and up to 100 gs. *Flower*, the great-grand-dam of *Fuchsia*, when she became ours, had only one cross, by son of *YOUNG WYVARD*, and descended from Mr James Brown's *Old Red Bull*. The last tribe I will name is that which originated in *Price*. She had no pedigree when I got her, yet many a good animal has been descended from her. Among the number was the celebrated cow *Playful*, bought by Mr. Douglas, of Athelstane. Her produce sold as high as 300 gs. each, and *Princess*, another descendant, by *4TH DUKE OF OXFORD*, and other two of the same family, were also all sold last month for 200 gs. each. These instances are sufficient to prove that it is not the length of pedigree that should be our guide when making a purchase, but the goodness of it."

We have given Mr Bell's vindication of the high character of his herd at length, and so far as his remarks apply to the Brockton House stock, we entirely concur with him. The precise time or number of crosses required to give fixity of type to a breed cannot of course be specified, and in some cases it may take much longer than in others. Mr Bell says he had "rather commence breeding from a cow with only two good crosses, than upon half-a-dozen miscellaneous ones," of which he knew nothing. This is a mere truism. The question is, whether he had rather begin breeding from a cow with two good crosses or half-a-dozen good crosses. We confess to a leaning towards the last case.

We should also like to ask whether Mr. Bell would put his cow with two good crosses to a bull with the same number of crosses? Why should such a proposition seem unpractical? It is because we are all convinced of the importance of long and pure lineage. We know that if we do begin with an ordinary cow we must work the ordinary blood out by repeated alliances, and that our best plan is to begin with good blood on both sides. We also believe that the effects of one bad cross—and every animal of unknown pedigree is liable to have sprung from such a cross—may reappear after many generations.

The following record of Shorthorn births has been received from Holy Bank—*Grenadine* by ROY ROY (23,694), produced on the 21st of January a roan cow (*Geneva* by GENEVA'S DUKE (21,630) *Grenadine 2d*, by LORD WILD EYES 2D (22,234), d. *Grenadine* above mentioned, calved a red with little white letter, by EARL OF BARRINGTON, on January 30. *Fidelity 5th* by 10TH DUKE OF OXFORD (17,739), and descended from Mr Bell of Kirklevington's *Fidelity* family, calved a white bull (*FIDELITY 7TH*) to *PRINCE*

STEAM CULTIVATION. COMBINED RIDGE AND SUBSOILER.

A letter to you last week, informing you that ... had referred at Birmingham to my ... and subsoiling plough, and now I ... another letter giving some results from ... of this implement, and I do so to-day ... I finish my Bean seeding for the ... and you know that I always give ... so that all the world may come and ... they like. In October last, in a letter ... I wrote this— ... started on No. 4 heavy land 10 acres, ... It was finished on the ... the tacks half a mile to ... and we finished that fall at 2.15 p.m. ... on the 14th we shifted the tacks ... where a number of people saw it at work, ... on the 14th." ... as the implement left it ... of February, on which day I began ... heavy land, after ... heavy land, and ... These two fields were ... in seven working days the ... The most important ... that we could do this planting ... of a horse on this dirty, sticky land, ... which it has been ever since the ... of that December. Yet the Beans kicked ... from the ridges like ashes, so ... on this dirty land, as I stated in my ... cost me only 7s. 0d. an acre, and ... are gone in well.

Now, let us go to the light land. On October 10, I found this land in a nice dry mellow state, so I set the men to dib in the Beans, and I set my three horses and pony to pull my subsoiler along every ridge, splitting the ridges 15 inches deep, and covering in the Beans at the same time, and it made excellent work—the best I ever saw done. On the 10th and 11th we did 8 acres, the 12th was a regular wet day, which brought a flood down upon us quickly. To-day is the first day that we could get on well again, so we set to and finished the 12 acres.

Now, I will give some other facts upon this point, for I have threshed all my Beans that were planted and grown on land similarly worked a year ago, they were grown upon my heavy land fields, Nos. 2 and 3, and No. 1 light land, and I will talk about the heavy and fields first.

The produce on Nos. 2 and 3, heavy land, was 28 bushels per acre. These fields since harvest (as I have before shown) have been smashed and planted with Wheat, at a cost for seed-bed of 6s 9d per acre, and the plant is a most excellent one, although drilled with but a trifle over 1 bushel of seed per acre. It has thickened vastly, and it looks very strong.

The produce on these poor heavy clay fields under horse culture used to be—a dead fallow, with Wheat after it, from 25 to 30 bushels used to be the average. 30 bushels was always considered a capital crop. The Beans, the third year, would be about the same as to quantity as the Wheat; but the Wheat crop for the fourth crop must not be fixed at over 25 bushels. Taking the dead fallow and the three crops, the average of the four could not be fixed at over 80 bushels.

You see that even in this bad Bean year I have got an average crop of Beans on this poor land when compared with horse culture; and my Wheat was an excellent crop, and although not threshed, I am quite certain that it will give quite 40 bushels per acre. The summing up of all this is—

Table with 2 columns: Crop/Field, Yield. Wheat on No. 1: 40 bushels. Beans on No. 2: 28. Beans on No. 3: 28. Wheat on No. 4: 40. Total: 136.

56 bushels over an average under horse culture, or 14 bushels per acre.

Now to field No. 1, light land. It was by far the best field of Beans in this neighbourhood. A neighbour of mine told me that it was the best field of Beans in England. I did not see one so good anywhere, neither did I read of one so good. I had 37 bushels per acre. The Beans were plump and good, no hollowside ones, and I have sold nearly all of them to my neighbours for seed at a good price. Can Mr Howard produce such facts as these in support of his statement at Birmingham? If he can, let us have them.

You know that I offered to do all my work last autumn before a Commission of the Royal Agricultural Society, if they would send one. Now, as soon as I had completed my autumn work I informed the Council of that Society, by giving all the particulars, and asking them to send a Commission down to inspect and report upon the work. The Secretary wrote to me that my communication would be laid before the Council at its meeting in February. The meeting is over, and neither you nor I have heard a word about the communication. They are quite welcome, as far as I am concerned, to do what they please with my communication, it cannot hurt me, for I have given all my inventions away, and the testimony that I give is given with a good will but Mr Howard, of Bedford, tells them, "I have used a combined ridging and subsoiling plough... that makes capital work,"—and this is the implement that the judges would not look at at Chelmsford, that they would not see at work by the aid of a Commission last autumn, or even its work since offered. "In Autumn," says Mr. Howard, "if we have some farmyard manure made early in the year, it would be put on the stubble before it was broken up. The ridging would be done in favourable weather." But Mr Browick, the manager of the Britannia Farm, said on the 13th of last August, "The plan Mr. Smith recommends of putting on the manure for roots before breaking up the stubble with the ridger and subsoiler is hardly desirable... Take Messrs. Howards' own case. When they entered on the Clapham Park property there was nearly one year's straw in hand, and hardly a load of dung could be scraped up... Mr. Smith's system would not meet a case of this kind... Messrs. Howards' plan I regard as the more generally useful one... the stubbles are up as soon as the crop is removed. In December the land is ridged with the common double-mould plough, each pair of horses managing from 2 1/2 to 3 acres a day. The ridges lie till after Christmas, when the dung is carted from the yard and spread in the furrows, the ridges being split at convenience." Let Mr Howard read this, I can bring other evidence of the inconsistency of his own writing.

One word more, and I have done. The Agricultural Society may try to smother me as long as they like, and Mr Howard may try to swallow me up if he can, but so long as I continue to work out my own plans and give facts to the public, which I mean to do, the former will never get on with their task, and the latter will find me a regular hedgehog to get down. William Smith, Woolston, Bletchley Station, Bucks, Feb 16, 1869

[The above was written and in type before we received Mr. Howard's letter published in last week's Agricultural Gazette. A long communication has been since received from Woolston discussing Mr Howard's letter clause by clause. But we do not publish it, for the public are not interested in a personal discussion of this kind. We may, however, say that it proves, by reference to Mr. Smith's private correspondence, that the public are interested in the Woolston writings on

steam cultivation; and it argues, as indeed is done above, by a reference to Mr. Browick's writings, that the practice of stirring the stubbles deeply, having first spread the manure on them in the autumn, is a practice new to Mr Howard, to which he may have been led by the Woolston practice and the Woolston writings. As to the implement figured on p. 11 of the Bedford catalogue, not having a copy of the catalogue, Mr Smith is unable to refer to it, but a copy has been sent for, and further criticism, we presume, may be expected. Meanwhile we extract one passage from his letter, relating to the power of tillage and manure combined to maintain the constant cropping of the land with Barley.—"I will give you a bit of fact—Mr. James Howard may call it 'silly egotism' if he likes. It is a fact that I had a heavy crop of Wheat on my No. 6 light land field (11 acres, in 1867, instead of a crop of roots, that I had upon this same field a crop of Barley in 1868 that gave me a produce of 54 bushels per acre, and that it is now nearly ready to be planted with Barley for 1869. For the Barley crop in 1869 it was smashed once by steam and horse-cultivator, twice, at a cost of 10s 8d. an acre, and it had a dressing of superphosphate of 8 cwt. per acre. For the Barley to be grown in 1869 it was ridged and subsoiled by steam-power 11 inches deep, last autumn, at a cost of 7s 0 1/2d per acre, and the operation to bring it upon the flat is a subsoiling, splitting the ridges 15 inches deep, at a cost of 3s. per acre, making a total of 10s. 0 1/2d. per acre for the seed-bed; 6 cwt. per acre of superphosphate was thrown upon it last autumn and ridged in. The field is fen land in character, rich in vegetable mould, and very poor in lime. It can stand having all the straw taken from it every year if it is well limed; therefore I have made up my mind to grow Barley upon it, and nothing else, with the aid of superphosphates. Mr. Lawes gave us the fact the other day, that he had grown Barley on the same land for 16 years with the aid of artificial manures, taking all the corn and straw off during the whole period; and I thank him heartily for it, for it cheers me on in the road that I had cut out for myself. He has proved that the thing can be done—and I mean to prove that it can be done—practically, to any extent. 10s. an acre will work my land a foot deep, and keep it clean for ever without the aid of any Twitch burning. I state this openly and fairly, so that people may all come and see what I am at, at any time."

Home Correspondence.

"T. B. S." v Mechi. —Your correspondent "T. B. S." is disposed to despise small things, and taunts Mr. Mechi with having added such insignificant figures to his balance sheet as farthings and halfpence. When asking—"Will Mr. Mechi state that these entries are anything more than guessed, to say the very best for them?" he adduces instances, which he does not seem to observe, that tell very ludicrously against himself. The sum of 1312. 11s. 10 1/2d., amount of horse-food purchased by Mr. Mechi in 1868, is unaccountably minute to "T. B. S." In fact, he says—"The very minuteness—the halfpennies and pennies—show that the balance-sheet is an impossibility." Is it really beyond his comprehension to understand how Mr. Mechi can tell to a "couple of farthings" what he has paid out for a certain item? and, again, as minutely, how much he received for certain items sold? It is very evident that the good old rule, "Take care of the pence, and the pounds will take care of themselves," is not one of "T. B. S.'s" maxims, and that has, doubtless, something to do with his sceptical allusions to Mr Mechi's balance-sheet. The theory which "T. B. S." seeks to propound is really a new feature in business, and it would no doubt be interesting to the general public if he would kindly inform them as to how his theory works in practice. Let us suppose that "T. B. S." is a laud-agent, and that he is conducting transactions on some gentleman's account, in which fractions figure more or less prominently. Were he to produce a voucher for a single item of 1312. 11s. 10 1/2d., would that gentleman tell him that his voucher was necessarily false, since it went to the minuteness of halfpenny? I think not. But then this is the theory of "T. B. S.," and according to it, in order to prevent the gentleman preferring such a charge against him, he must do something to obviate the possibility of such a result. If it is not his practice to observe detailed accuracy in accounts, will he tell us what efficient method he adopts in order to satisfy himself as to the profit or loss per annum on his own farm, since he does not go to the minuteness of pence and halfpence? I can hardly believe that a man like "T. B. S." will be altogether without accuracy on some points. I humbly submit that Mr Mechi and his bailiff are quite as lively, apart from local reasons, to be able to form a correct estimate of farming substances and stock-in-trade as "T. B. S." or, perhaps, any land agent in the kingdom is. Moreover, if 99 out of every 100 farmers here to employ dealers to purchase their stock for them, as "T. B. S." says they "very wisely do," the farming interest and intelligence must be fast losing ground, for it does not require the unfounded assertion of "T. B. S." to prove that. Where a farmer does not possess sufficient judgment to enable him to select his own stock, he cannot by any means be able to turn that stock to the best advantage after it has been purchased for him. We dare say it would appease the wrath of "T. B. S." were Mr Mechi to get that gentleman to make his future valuations for him. We should not then be troubled with the carping of this spiteful individual. Most likely, indeed, that he would be calling upon the farmers of England to follow Mr. Mechi's example in every respect, even to employing "T. B. S." not only

to make their annual valuations, but also to select for them whatever stock they might happen to require. This "post" the superior talents and great experience of "T. B. S." admirably qualify him to fill, and it is to be hoped that the British farmers will not be so slow to avail themselves of the hints, which he has graciously condescended to throw out, as they are to act upon some of Mr. Mechi's theories. I trust that Mr Mechi will be long spared to show to the agricultural world his useful balance-sheets, notwithstanding the conviction of "T. B. S." that "his papers and figures are much impeding agricultural progress, and greatly misleading the public." Let me ask wherein Mr Mechi's papers and figures are likely to impede agricultural progress? I have always entertained the opinion, and ever shall, that both Mr Mechi's writings and speechings are worthy the careful consideration of every practical farmer, and it will doubtless require more substantial arguments than those advanced by "T. B. S." to prove to the world and posterity that Mr. Mechi has not been a true benefactor of his country, and a distinguished agricultural pioneer. I do not say that I agree with all the theories supported by Mr. Mechi, nor yet with the manner in which all these theories are carried out, but this I do say, that the opinions of Mr. Mechi are very far from being untenable, although they seem to have been far, very far, in advance of his own generation. Will not such a fact tend rather to add than detract from his future renown? It may not suit "T. B. S." and a few others, to have Mr. Mechi's farming profit displayed before all and sundry, but that will not conceal the fact that the agricultural resources of this country are but very imperfectly developed, and that one of the best incentives to further exertions are the frequent papers and the annual balance-sheet of Alderman Mechi. *J. Scott, March 1.*

Co-operative Manure Association.—In answer to queries contained in your Paper of February 27, I beg to forward you a copy of the rules of the Lincoln Tillage Association. We supply nothing but 26 per cent. soluble phosphates, made from coprolites and acid. The same article is generally sold in the retail trade from 6*l* to 8*l* per ton, and often more. There is no doubt that on fair land from 3 to 4 cwt. per acre of this manure is quite sufficient for any crop of Turnips where the land is very light some sulphate of potash would do good—say, 2 cwt. per acre, with 3 cwt. of superphosphate. *E. Toyndee, Lincoln, March 1*

The Tiptree Balance-Sheet.—Mr Mechi does vouchsafe to notice me, but at present has not accepted my challenge, and proved that the average yield of each acre in the United Kingdom (calculated on the Tiptree system) is only a trifle over 3*l* annually. Neither does he answer my question as to how he makes the tillages over the whole of his farm worth 3*l* 15*s* 6*d* per acre. Instead of enlightening us on these points, he occupies a couple of columns of your valuable space chiefly in telling us that after a flood we ought to look to our drains, how to grow Mangel &c. We all knew these things before. Knowledge of this kind is possessed by every one at all practically acquainted with agriculture, and is by no means restricted to Tiptree. I again hope that he will be so obliging as to answer the questions I have put, as my poor understanding is incapable of solving the difficulty. It would be far better that he should clear up the old instead of every week breaking fresh ground. Furthermore, in your impression of Feb. 6, Mr Mechi says, "I make public my facts and practice, and sometimes venture an opinion; but I hold that it is good for agricultural progress that we should make known and compare, and thus derive profitable information from each other. Of course such a system is unpalatable to those who wish to make farming a hole-and-corner business, and shade it from the light of observation, but the time for that has gone by now that we have good roads, railways, penny post, and a rapidly growing agricultural Press." After expressing such sentiments, surely he cannot refuse to enlighten me on the points to which I have adverted. By a parity of reasoning I may also say that now when we happily possess all the advantages he enumerates why should trading more than farming be a hole-and-corner business? As he has been so ready to benefit the farming interest by throwing the light of day upon it, how can he refuse a similar advantage to his neighbours, the West-end traders? Will he kindly inform us through your columns what is the profit on a six-guinea bagatelle table, or a ten-guinea dressing case, or will he publish a balance-sheet of his Regent Street concern. I have no doubt but that the trading community generally would applaud such public-spirited conduct, and it might be of service to many of his agricultural friends as affording a clue to an opening for some of their big boys when they are too thick on the ground. *F. W. Bignell.*

As farmers we are glad to hear the thoughts of anyone on subjects in which we are deeply interested; and although we do not all agree with Mr Mechi, at the same time he may rest assured that there are very many who will be sorry to think that he should relay his useful communications on account of such allusions as those of F. W. Bignell in his last letter. I believe that many who not only possess knowledge and experience which would be of great value to the farming community, but are capable of imparting such knowledge, are deterred from doing so, not caring to "cross pens" with angry and unscrupulous assailants. I think of F. W. Bignell as "G. A. H." (p. 174) does of "J. B. S."—that he owes Mr. Mechi an apology. To that portion of the letter, however, which is not merely personal I regret equally with myself that from want of local knowledge he cannot satisfy me as to the value of Tiptree lands, &c., having never seen them, but I concluded he had, for at p. 119 he says,

"his chief crops are for Wheat, for the production of which his farm is well calculated." He says, "I have kindly given him a point, for 'if Mr Mechi has not placed the value high enough, &c.;" but this is the question he cannot, nor can I, answer. I wish to know the general run of land for agricultural purposes in that neighbourhood. Is it "29*s* 10*d*. or 40*s*?" I will now add a word or two to "A Farmer." Let him consider the first portion of this communication as intended for him also, but I must say in a minor degree. Three-fourths of his letter will not require any observation—it speaks for itself. I will only notice his correction as to rent. He says—"Now I will put the case plain—"

Tiptree Hall, buildings, machinery and 177 acres of land, rent	£301 0 0
Gross profit thereon, according to Mr Mechi's balance-sheet	£525 13 6
Correction, "45 acres of chapel land"	45 0 0
	£570 13 6

Here we must part company, each following the bent of his own mind. I now take

Tiptree Hall, and 132 acres of land at 40 <i>s</i>	£264 0 0
Rent of chapel land	45 0 0
	£309 0 0
Interest of tenant's capital of 2638 <i>l</i> . at 5 per cent	142 18 0
Balance for Farmer Mechi for his work	218 15 6
	£570 13 6

I will not take up your space by repeating the latter portion of my last letter, but anyone can add 38*l*. to "Farmer Jones" for his year's work, and sum up interest of capital; or, in other words, he has allowed me 37*l*. for my carter, and I will not even now call him a working bailiff. *Another Farmer, P.S.*—Imperial averages are useless in this matter. I sold Red Wheat, Golden Drop, on September 25, for 60*s*, the third week following for 55*s*. *The Mark Lane Express* of the 15th inst. quotes "Devises" market: Red Wheat from 45*s*. to 57*s*.

Societies.

ROYAL AGRICULTURAL OF ENGLAND.

MONTHLY COUNCIL *Wednesday, March 3, 1863*—Present Mr. H. S. Thompson, *Trustee*, in the chair; Viscount Bridport, Lord Chesham, Lord Kesteven, Lord Walsingham, Hon H. G. Liddell, M.P., Mr. Acland, Mr. Baldwin, Mr. Barnett, Mr. Barthropp, Mr. Booth, Mr. Bowley, Mr. Bramston, Mr. Cantrell, Colonel Challoner, Mr. Clive, M.P., Mr. Davies, Mr. Druce, Mr. Edmonds, Mr. Brandreth Gibbs, Mr. Holland, Mr. Hornsby, Mr. Hoskyns, Mr. Milward, Mr. Pain, Mr. Ransome, Mr. Statter, Mr. Torr, Mr. Turner, Mr. Wells, M.P., Major Wilson, Mr. Jacob Wilson, Professor S.monds, and Dr. Voelcker.

The following new members were elected.—

- Allan, George, Knightley Hall, Eccleshall, Staffordshire.
- Avelard, Lord, Norwinton Park, Oakham.
- Bartoun, William, Harrogate, Yorkshire.
- Bland, Henry Wainwright, Barlow, Chesterfield.
- Brady, W. Hallinshed, Chestergate, Stockport.
- Brierley, C. William, Rhodes House, Middleton.
- Brown, Pereira, Olantworth Hall, Lincoln.
- Cannon, Joseph C., Oxford.
- Dalsell, John, Stainburn Hall, Wokington.
- Dobbs, Samuel P., Huntly, Gloucester.
- Gadsby, Alfred, 10, Crane Court, London, E.C.
- Graham, James, Parcelstown, Westlinton, Carlisle.
- Greenfield, George, Belle Eau Park, Ollerton.
- Groucock, Charles, Stanfield Hall, Wymondham.
- Haig, George E., Goodworth Clatford, Andover.
- Hart, John, Strangeways, Manchester.
- Hill, John, Crookes House, Newent.
- Hunt, George, Evesham.
- Ingledeu, John, Sewborwens, Penrith.
- Jenkinson, Francis Marston, Stafford.
- J. Anson, Daniel J., Kensall Green, Harrow Road, Middlesex.
- Knight, Edward, Smallrise, Sandon, Stone, Staffordshire.
- Laurie, Reginald N., Pax Hill Park, Cuckfield.
- Leech, George, Hunden Great Lodge, Haverhill.
- Loveridge, Charles, Ivstsey Bank, Penkridge.
- Lucas, Rev. Charles H., The Rectory, Edith Weston, Stamford.
- M'Gregor, John, Acton Weaverham, Northwich.
- Mitchell, J. Jackson, Wigton.
- Moulton, Frederick, Hallow Tombridge.
- Nelson, Thomas, Catgill Hall, Egrement, Cumberland.
- Nicks, William, Gravelle House, Gloucester.
- O'Neil, William, Athy, Kildare.
- Purdon, Edward, Bachelor's Walk, Dublin.
- Rogers, Henry, Wolgarstone, Penkridge.
- Rogers, Thomas, Coxall, Brampton Bryan, Staffordshire.
- Rothwell, W. Talbot, Foxholes, Eikel, Lancaster.
- Simpkin, Joseph, Narborough, Leicester.
- Simpson, Samuel, 33 South King Street, Manchester.
- Smith, Henry, Eaton Constantine, Wellington, Salep.
- Spedding, John J., Greta Bank, Keswick.
- Strickland, George, Low Abbey, Kirkby Thora, Penrith.
- Thornton, John, 15, Langham Place, London, W.
- Tomlinson, Bruce, Asgarby, Stamford.
- Valpy Richard, Heathlands, Wimbledon, Surrey.
- Wall, Thomas, The Ford, Droitwich.
- Wartnaby, Mrs., Market Harborough.
- Welchman, Thomas, Malshanger Farm, Basingstoke.
- Wigram, John, Harlow, Essex.
- Wilson, S. W. Apsley Cottage, Stockport.
- Wool, James, Hagga, Wigan.

FINANCES.—Lord Bridport (Chairman) presented the report from which it appeared that the Secretary's receipts during the past month had been examined by the Committee, and by Messrs. Quilter, Ball & Co., the Society's accountants, and were found correct. The balance in the hands of the bankers on Feb. 28 was 1998*l*. 18*s*. 5*d*. The deed of security given by the Secretary and his sureties had been received, duly signed, and ordered to be placed in the custody of the London and Westminster Bank.—This report was adopted.

JOURNAL.—Mr. Thompson (Chairman) reported that Messrs. Clowes & Son having agreed to accept a reduction in the price of printing, paper and other expenses connected with the publication of the Journal, whereby

a saving will be effected, fully as great as the amount anticipated from advertising for public lectures, the Committee recommend the Council to accept the offer. In pursuance of the authority given to the Council, the Committee had ordered the Secretary to pursue in inspecting the selected farms, and to make the requisite arrangements with Mr. H. H. D. for visiting the farms and preparing the report for publication in the Journal. In accordance with the suggestion of Mr. Wilson, of Knappstoft Hall, the Committee recommend that in the first issue of the Journal of every year those members of the Council who retire by rotation in the following year shall be indicated by an asterisk being placed after their names. With regard to Essay papers, as reported that in Class IV, "On the Domestic Economy of the Agricultural Labourer," the judges recommended that the prize be withheld.—This report was adopted.

HOUSE.—Viscount Bridport (Chairman) reported that the Committee had consulted Mr. P. on the architect, with reference to alterations in order to obtain additional rooms for the use of the Council, and that as the cost will not exceed 75*l*, and as the plan submitted, the expenditure of that amount for the purpose was now recommended.—This report was adopted.

CHEMICAL.—Mr. Wells (Chairman) reported that the following papers had been contributed by Dr. Voelcker to Part 2 of the Journal for 1863—

1. On the Composition and Nutritive Value of *Trifolium striatum*—a new kind of Clover.
2. On the Causes of the Benefits of Chemicals in a paratory crop for Wheat.
3. The Annual Chemical Report.

It was also stated that the forthcoming issue of the Journal will contain Dr. Voelcker's report (a type) on field-experiments on cover sowing permanent pasture; and that Dr. Voelcker had reported that experiments on drainage-waters from various states of cultivation as regards manure were in progress.

The Committee recommended that Dr. Voelcker be requested to investigate the subject of the value of night-soil and dried earth, with a view to ascertaining its value to agriculturists. It was also recommended that the usual annual grant for investigation be awarded to Dr. Voelcker. In conclusion the Committee expressed their regret that the lectures in former years had been discontinued.—The report was unanimously adopted after a discussion of the value of which Colonel Challoner regretted that the day had been fixed for the lectures. Mr. Wells said that it had been found that farmers were not attending Mr. Thompson remarked that although the scheme had been tried, the result was a bad attendance. It was then proposed that

Bridport, seconded by Colonel Challoner, moved unanimously, "That Dr. Voelcker be invited to give on the general results of his investigations during the past year, on some day hereafter to be named by the Chemical Committee."

MANCHESTER MEETING.—Lord Bridport presented the report, and stated that the Committee recommended the formation of a sub-committee to take into consideration the question of refreshments, forms of tender and of advertisements, and that the Secretary to issue those advertisements to the tenders—the committee to consist of Mr. Brandreth Gibbs, Mr. Cantrell, Colonel Challoner, Mr. Torr, Mr. Statter, Mr. Torr, and Mr. Whitworth. It was also recommended that the contractor be provided a floored and waterproof market in the showyard for the accommodation of the Highness the Prince of Wales (President) and additional prizes, proposed to be given by the farmers for additional descriptions of produce, which had been laid before this Committee by the Local Committee, it was recommended that the proposal be declined, as being inconsistent with the rules and objects of the Society. It was recommended that the name of Sir Thomas Hesketh Bart. M.P. be added to the list of this Committee. With regard to the question of placing the Local Committee in position to offer some privilege or compensation to its local fund to its subscribers, otherwise, it was recommended that the Local Committee be at the disposal of the Local Committee (1) transferable weekly tickets, and (2) 250 non-transferable tickets for distribution on the second day of the show.—This report was adopted.

SHOWYARD CONTRACT.—Mr. M. reported that the Committee recommended that the contract erected for the general meetings in the showyard be put up at the commencement of the show, and be available for the use of the members of the Society during the week and that it be furnished with chairs, and writing materials. The Committee considered a series of suggestions, made by Mr. Knappstoft Hall, Rugby, recommended that the regulations of the Society be enforced at the entrance, and that wire-netting be provided for the cheese and butter exhibited from 10.30 to 12.30.—This report was adopted.

The question of the supply of chairs for the Council and officers of the Society was discussed, and it was recommended that the chairs be let for hire to the public, having been reported by the Committee, the facts were reported to the Council, and on the motion of Mr. M. it was resolved by Mr. Thompson, it was unanimously agreed that the contractor be the only person allowed to put up chairs in the showyard, on his undertaking to supply more than 1000 chairs, at a charge of 1*d* each time a chair is used, or 6*d* for a day-ticket.

AGRICULTURAL EDUCATION.—Mr. Holland reported that the arrangements for the examinations were proceeding satisfactorily, and the Committee recommended the commencement of

This Company was originally formed by and under the direction of Agriculturists, circumstances that have justly earned for it another title, viz.

THE TENANT FARMERS' MANURE COMPANY
 Its Members are Cultivators of upwards of 200,000 Acres of Land, which has been for years under Management with Manures of their own Manufacture, and the quality of the produce has the best guarantee for the genuineness and efficacy of the Manures manufactured by this Company.

Particulars will be forwarded on application to the Secretary, or may be had of the Local Agents.

Chief Office—109, Fenchurch Street, London, E.C.

SCOVENS' ABYSSINIAN MIXTURE, the most effective remedy for preventing and destroying Plant Lice, etc., yet produced, especially Mealy Bug, Brown and White Scale, etc., on all kinds of Fruit and Plants, without injury to the plants.

FOR DESTROYING RED SPIDER, MEALY-BUG, THIRP GREEN and BLACK FLY, without the aid of a Fumigator—This article having been before the Public for the last three years, and being now used by many of the leading Horticulturists—from several of whom Testimonials have been received as to its efficacy—the Manufacturers beg to recommend those who have not used it to give it a trial, feeling confident when they have done so they will use nothing else, as it is far superior to paper or rag, and will not injure the plants. Sold in 1lb packets and upwards, price 3s. 6d. per lb., carriage free. A reduction in price for large quantities.

To be had of **Messrs. ROBERTS and SONS**, Tobacco Manufacturers, 112, St. John Street, Clerkenwell, E.C. 2, of whom Samples and Testimonials may be obtained, and of all Seedsmen and Nurserymen.

 Two yards wide 1s. 6d. per yard run.
 Four yards wide 2s. 6d. per yard run.
 As prepared make, 2 yards wide 1s. 6d. per yard run.
 As prepared make, 4 yards wide 2s. 6d. per yard run.

See Heligbald's Register, Feb. 13, 1867.
 "See Please send me at once, by Mail and R.R. way, 50 yards of Frige Domo 3 yards wide, same as you sent me about this time last year, at 1/6 which answered its purpose admirably. Yours respectfully,
 "G. H. S. R. R."

"We had 20 dozen Apples last year on walls protected easily by Frige Domo."
 Messrs. Thomas Archer, who are Sole Manufacturer, 7, Great Trinity Lane, Cannon Street, E.C. 2, and of all Nurserymen and Seedsmen throughout the Kingdom.

Caution to Gardeners. When you ask for **PRIZE MEDAL, 1867. PRIZE MEDAL for BEST** **SAYNOR AND CO'S WARRANTED PRIZE** **SPRUNG and BUDDING KNIVES**, see that you get them. Observe the mark SAYNOR, and the Corporate Mark, Ostrich Warranted, without which they are not genuine.

S & Co. regret having to state to Gardeners and others, but are compelled to do so, in consequence of an imitation, of common quality, having been sent to the printing office, and which has caused many complaints to be made to them of knives which were not of the making of which they are warranted. **SAYNOR and MAKERS** **S & CO'S PATENT and BUDDING KNIVES** are the best and the cheapest in the market.

Printed by the Staffs. Established upwards of 120 years.

Iron Cisterns.
F. BRAY AND CO. having laid down more extensive and improved Machinery on their Bedford premises (near WARRING) are prepared to supply **WROUGHT-IRON TANKS, GALVANISED or PAINTED,** of superior quality, at reduced prices, and at very short notice.

LISTS ON APPLICATION.

An Illustrated Price List of Galvanised Iron, and other of Brant's special Manufactures, sent on application.
F. Bray & Co., Limited, Fitzroy Works, Euston Road, London; or through a respectable Ironmonger.
N.B. Open Tanks of different sizes packed one in another to save carriage.

COTTAM'S PATENT PORTABLE UNITED COW FITTINGS.

Four sets of Cow Fittings are shown, with a cow attached to one of them. The machine is used for fitting cow collars and other equipment.

GARDEN BORDER EDGING TILES, in great variety of patterns and materials, the patterns being especially suited for **KITCHEN GARDENS**, as they harbour no Slugs and Beetles, take up little room, and once put down require no further labour and expense, as the "green" edgings, consequently being much cheaper.

GARDEN VASES, FOUNTAINS, &c., in great variety of patterns, and in green variety finish.

FOXLEY'S PATENT GARDEN WALL BRICKS. Illustrated Price List free by post. The Trade supplied.

ORNAMENTAL PAVING TILES for Conservatories, Halls, Corridors, Balconies, &c., as cheap and durable as Stone, in blue, red, and buff colours, and capable of forming a variety of designs.

WHITE GLAZED TILES, for Lining Walls of Dairies, Larders, Kitchens, Ranges, Baths, &c. (covered and other Stable Paving Bricks of great durability, and also Anamorphic Tiles, Wall Copings, and Stoneware of all kinds, &c., &c., &c.)
 To be obtained of **F. & G. ROSSER**, at their premises as above.

SILVER SAND (REIGATE, best quality), at the above address—14s per Ton, or 1s 3d per Bushel, 2s per Ton extra for delivery with three inches, and to any London Railway or Wharf.

PLANTS, BRICK BURNERS, or CLINKERS for Rockeries or Grotto Work.
F. & G. ROSSER.—Addresses see above.
N.B. Orders promptly executed by Rail way.

In addition to other Medals and the highest Commendations of all the principal Agricultural Societies, F. M. & Co. were awarded the Dublin International Exhibition Medal, 1865; the only Medal given solely for Wire Fencing.

THE ORIGINAL INTRODUCERS, PATENTEES, and SOLE MANUFACTURERS OF "FRANCIS MORTON'S" SYSTEM OF CABLE WIRE FENCING.

which during the past few years has come into use over

"SEVERAL THOUSAND MILES OF FENCING,"

And has received a large and distinguished preference over every other description of Park and Farm Fencing. The great success attending the introduction of our patented improvements has led to numerous worthless imitations being offered for sale by dealers and others. It is necessary for us therefore to note that this fencing is EXCLUSIVELY MANUFACTURED at our Liverpool Works.

THE PERFECT SUBSTITUTE

for SILVER—The real NICKEL SILVER, introduced more than 30 years ago by WILLIAM S. BURTON, when Plated by the Patent Process of Messrs. Elkington & Co., is beyond all comparison the very best article next to sterling silver that can be employed as such, either usefully or ornamentally, as by no possible test can it be distinguished from real silver.

A small, useful Set, guaranteed of First Quality for finish and durability, as follows

	Fiddle or Old Silver Pattern	Bead Pattern	Thread Pattern	King's or Shell and Thread
12 Table Forks	1 10 0	2 1 0	2 2 0	2 5 0

WILLIAM ROLLISSON & SONS'

BRILLIANT NEW TRICOLOR GERANIUM, THE MOONSTONE,
 WILL BE SENT OUT ON AND AFTER THE 30TH OF APRIL NEXT.

Of the above most beautiful Tricolor is compact and exceedingly free; the leaves, which are of good moderately large, are almost round, and from the slight convexity of their shape they exhibit to great and varied colourings with which they are adorned, the centre of the leaf is of a bright and lively green, towards the edge of the leaf, to a soft crimson-lake, which entirely encircles the whole zone, edged with a dark chocolate zone, which is much intercepted by the most intense blood-red. This bright crimson-red belt. It is some what in the way of *Lucea Grisea* in its colourings, but is rather brighter, and the habit and slow growth of that variety, "The Moonstone" is almost as free in habit as a *Tem* and it remains constant in character. This, without exception, is the finest Tricolor hitherto offered to

FOLLOWING NINE SPLENDID NEW DOUBLE GERANIUMS FOR 1869,

ADAME BONNET	MIDDLE LOUISE DELESALLE	M FROEBEL
ADAME DEBRAY	M. DE ST JEAN	MARIE LEMOINE

Extra fine Transplanted BEECH and HORNBEAM, 2 to 3 ft. and 3 to 4 feet, also fine EVERGREEN PRIVET, in large quantities. Wm. Wood & Son, Woodlands Nursery, Marshfield, near Uckfield, Sussex.

CHOICE SEEDS. FLESH-COLOURED MEXICAN KIDNEY BEAN. We consider this variety as the earliest in cultivation. It is likewise very prolific, and of excellent quality. 2s per quart. LACED'S SUPERB LATE WHITE BROCCOLI. - Recommended by Mr. Thomson, Dalkeith, as a splendid variety, very large, beautifully white, and heading till the middle of June "Like enormous Cauliflowers." 2s. 6d. per packet. SMITH'S SUPERB PROTECTIVE BRASSICOLI - An excellent early Spring Broccoli, of dwarf growth with very compact head, abundantly protected. Well adapted for cold soils and a good crop. 1s per packet. MICHIEL'S GREEN CURLED KIDNEY BEAN - A very beautiful variety, we consider it as being the best of the early crop, and well adapted for forcing. 1s per packet. LEE'S GIANT BEAN, 2s. 6d. per packet.

SELECT FLOWER SEEDS. AMARANTHUS FLEURANT, 2s. 6d. per packet. ASPERULA AZUREA SETOSA. A profuse blooming hardy Annual, of dense habit, growing about one foot, and covering itself with bunches of light blue flowers. Very sweet-scented, and lasting a long while in perfection. 1s per packet. PEPT. VARIETAT D. High ornamental for border decorations, the stem and main being bright red and scarlet yellow, or white. Each variety per packet 6d. the three colours mixed, 1s. LINA LYALINA. A very early and border plant, blooming in the first week of the month of May, with an abundance of bright yellow orange-centred flowers. 6d per packet. MALVONIA LASSATA. A very early and border plant, blooming in the first week of the month of May, with an abundance of bright yellow orange-centred flowers. 6d per packet. MATTHIOLA BICORNIS. - This night-scented stock has proved itself a worthy addition to the number of our hardy Annuals. 6d per packet. MATTHIOLA TRICOLORATA. - This choice new species is quite distinct from the preceding. It forms branching masses, covered with a profusion of mixed blue flowers. These continue long in bloom, remain expanded during the day as well as in the evening, and constantly exhale a delicate and delicious fragrance. Growth free and easy, producing a fine effect in a bed or mass. 1s. 6d. per packet. ONALIS VALDIVIANA. - Flowers bright yellow, sweet-scented, and produced in bunches of large size, which continue long in bloom. Reported as pure habit and of good habit. 1s per packet. PALAVA FLAVO-GA. - Described as a beautiful new Annual, growing to an average height of 15 or 18 inches, and producing in the greatest profusion flowers of a bright rosy pink, fading slightly towards the centre, with a dark eye. 1s per packet. VILIA CROKOTA, MALVONIA LASSATA. - 6d per packet. A collection of 24 ORNAMENTAL VARIETIES OF FLOWER SEEDS suitable for ROCKERS, &c. DESCRIPTIVE CATALOGUE OF FLOWER SEEDS sent free on application. JAS. BLACKMORE & SON, York.

J. C. WHEELER AND SON. WHEELERS' GUINEA COLLECTION of GARDEN SEEDS - comprises the finest varieties in cultivation. For details see "WHEELERS' LITTLE BOOK" for 1890, price 6d., post free. J. C. Wheeler & Son, Seed Growers, Gloucester, and 59, Mark Lane, London, E.C.

"WHEELERS' TOM THUMB LETTUCE is a wonderful favourite with my family and friends; for a summer Lettuce I have never seen its equal." - G. F. A. Flower, Stanwell Farm. 1s per packet, post free. J. C. Wheeler & Son, Gloucester.

"WHEELERS' MILKY WHITE is the best of all Potatoes, and those who do not grow it may consider themselves rather behind the age." - SMITHY HISSON, F.R.S. 4s. per bush, 15s. per bush. MILKY WHITE. - This I received from the well known firm of Messrs. Wheeler & Son, Gloucester. It is one of the handsomest Potatoes grown, and well deserves its name, for it is most beautifully white, very floury, and one that I do not hesitate to regard as first-rate. It is also a very free bearer. D. Deal. 4s per bush, 15s. p. bush. ONE PECK of WHEELERS' MILKY WHITE and ONE GUINEA COLLECTION of GARDEN SEEDS sent carriage free by rail on receipt of cheque or Post-office order for 25s. J. C. Wheeler & Son, Seed Growers, Gloucester, and 59, Mark Lane, London, E.C. WHEELERS' GRASS SEEDS for CROQUET GROUNDS should now be sown at the rate of 10 lb. per acre, a good dressing of soot applied, and the ground well rolled. Price 1s per lb., 20s per bushel, carriage free. J. C. Wheeler & Son, Seed Growers, Gloucester, and 59, Mark Lane, London, E.C.

THE MOST EXTENSIVE COLLECTION.
BUDDEN, 12, King Street, Covent Garden, W.C.
 The finest and largest collection of
 seeds, plants, and cuttings, from 2d. to 15s. per foot.
 The following are some of the most valuable and highly recommended.
 All of which are highly recommended.

GROWERS AND DISTRIBUTORS OF GENUINE SEEDS,
237 AND 238, HIGH HOLBORN, LONDON, W.C.

Seeds Direct from the Growers the best means of Preventing Disappointment.
NOTICE TO PLANTERS OF LARGE QUANTITIES
 of FARM or GARDEN SEEDS will be supplied liberally by
 Scroes & Sons. For prices apply to the Growers, or to
 Scroes & Sons, Royal Exchange, London, E.C. 4.

Chrysanthemums.
NOTICE.—In answer to numerous applications, ADAM J. FORSTER begs to inform the Trade and the Public that his New CHRYSANTHEMUMS will be ready for the first week in April. For description, see CATALOGUE, now ready. All orders executed in rotation.
 Brunswick Nursery, Stoke Newington, N.

New Chrysanthemums.
JOHN SALTER AND SON beg to announce that their CATALOGUE of NEW JAPANESE and other CHRYSANTHEMUMS is now ready, and may be had on receipt of two stamps.
 Versatiles Nursery, William Street, Vale Place, Hammermith, near Kensington Railway.

British Fern Catalogue.
ROBERT SIM will send, post free for six postage stamps, Part I. (British Ferns and their varieties, 30 pages, including prices of Hardy Exotic Ferns) of his PRICED DESCRIPTIVE CATALOGUE of BRITISH and EXOTIC FERNS, No. 7. Foot of Gray's Alley, Strand, W.C.

LEEDS HORTICULTURAL SOCIETY
 The GREAT EXHIBITION OF PLANTS, FLOWERS, FRUITS, and VEGETABLES, will be held in the LEEDS ROYAL PARK, on WEDNESDAY, THURSDAY, and FRIDAY, June 8, 9, and 11. PRIZES, upwards of £300, will be given, and may be had on application to
JAMES R. BBECK, Secretary.
 Crossgate, near Leeds.
 Note: The North-Eastern, Great Northern, Midland, Lancashire and Yorkshire, and London and North Western Railway Companies will convey Plants, Flowers, Fruits, &c., at ordinary rates to the Show, and return them free if they remain the property of the Exhibitor. The Committee provide Assistants and Horses for exhibition vans coming by rail, and Covered Spring Vans to convey Plants, &c., between the Railway Station and the Exhibition Grounds, at 50 cents per hour.

GRAND NATIONAL HORTICULTURAL EXHIBITION, 1869, to be held in the BOTANIC GARDEN, MANCHESTER, MAY 14 to 22. NEARLY ONE THOUSAND POUNDS IN PRIZES. The following are among the number of First Prizes offered:—

SPECIAL PRIZES, PRESENTED.

The best Group of 50 Plants	£50	Collection of Bedding Plants	£5
10 Cape Heaths	£20	5 Fine-apples	£5
12 Roses	£20	12 Hardy Shrubs	£5
4 Double-flowered Pines	£20	24 Hardy Grasses	£5

THE MANCHESTER BOTANICAL SOCIETY'S PRIZES.

10 Exotic Orchids	£10	10 Fine-foiled Plants	£10
12 Stone and Greenhouse Plants	£10	12 Miscellaneous Plants	£10
10 Agaveas	£10	12 New and Rare Plants	£10
10 Roses	£10	20 Hardy Conifers	£10
10 Show Pelargoniums	£10	12 Hardy Rhododendrons	£10
10 Fancy Pelargoniums	£10	Miscellaneous Collection of Fruit	£5

ENTRIES CLOSE on MAY 1. Schedules, &c., may be obtained on application to the undersigned,
 Botanic Garden, Manchester.

TUESDAY, — 16—(Ditto (Scientific Committee))	11 A.M.
(Ditto (General Meeting))	11 A.M.
THURSDAY, — 19—Linnæan	8 P.M.

The Anglo-Saxon race has been slow to apprehend the value of the forests with which Nature has so liberally clothed the earth; and wherever British rule has been established the existing forests have disappeared, and no care has been bestowed on planting others. In all our colonies there has been the same improvidence, and it is only of late years that attention has been drawn to the importance of CONSERVING THE FORESTS OF INDIA. Advancing civilisation, the progress of agriculture, and the rapid extension of railways, have, however, rendered it imperative that means should be taken to organise a system of forest administration to control the clearing of indigenous forests, and to economise public property for the public good.

About 12 years ago the first attempts at organisation were made. Drs. BRANDIS in Burma, CLEGHORN in Madras, and GIBSON in Bombay, endeavoured to lay the foundation of a system. They started, as it were, single-handed in the different Presidencies, without skilled assistance, and depending on such help as could be found in the local services. The events of the Mutiny quickly followed, and the small establishments which had been formed, were crippled, and in some cases broken up. On the restoration of tranquillity steady progress ensued; a staff of five or six assistants was sanctioned in each of the larger provinces of the empire, and the more valuable forests were mapped out into separate ranges, and exact information was obtained regarding their resources.

In 1862 the Government of India resolved to introduce a general system into all the provinces under their control, and the office of Inspector-General was created. A Forest Act was passed by the Legislative Council in 1864, giving power to local administrations to demarcate the limits of State forests, to reserve certain trees for State purposes, and notifying the mode of procedure in cases of trespass, conflagration, &c.

With these greatly extended operations the want of trained assistants was much felt by the principal forest officers, and during a furlough to

Genuine Seeds.
WITHS CALADOLE of FLOWER and VEGETABLE SEEDS, of first quality, is now ready, including their fine strains of BAESAM, GIBBERIA, PRIMULA, TRICOLOR and PANTUMS, with every novelty of repute.
 The Nurseries, Dulwich, London.

New Catalogue.
WOODTHORPE will be happy to forward, on application, his CATALOGUE (which will be a complete list of NEW and CHOICE PLANTS, FLOWERS, and GENERAL NURSERY STOCK, at a heavy discount to the Trade.
 Nurseries, Hedingham, Essex.

Roses.
WALTON can supply for cash CLOVE and SHALLOT KING DAISIES, 5s. per 100; also the best sorts of Cabbage Plants, 2s. 6d. per 100, extra strong 3s. per 100.
NEW WHITE SPANISH, 2s. 3d. per lb.
 37, Abchurch Lane, London.

Roses.
WALTON will be happy to forward on application his DESCRIPTIVE CATALOGUE of ROSES for 1869, for quality or quantity the stock is unsurpassed, and has been especially acknowledged to be the finest in the Trade.
 Somerset, King's Acre, near Hereford.

New Roses, &c., 1869.
WALTON has to offer the following Plants:
 NEW ROSES, Strong Plants 36s.
 NEW VERBENAS, Strong Plants 12s.
 NEW PRIMULAS, Strong Plants 12s.
 NEW ST. PAUL'S, Strong Plants 12s.
 NEW ST. PAUL'S, Strong Plants 12s.
 NEW ST. PAUL'S, Strong Plants 12s.
 CATALOGUE free.
 Nurseries, Haslemere, Surrey.

Choice Flower Seeds for 1869.
CHOICE CINERARIA,
 and from named flowers, 2s. 6d. per packet.
CHOICE CALCEOLARIA,
 from a choice strain 2s. 6d. per packet.
CHOICE PRIMULA FIMBRIATA,
 beautifully fringed, 2s. 6d. per packet.
CAMELLIA FLOWERED BALSAMS,
 with double flowers in fine choice varieties, 2s. 6d. per packet.
PTERIDUM (GOLDEN FEATHER),
 a bedding plant comes perfectly true from seed. Per packet, 1s. and 2s. 6d.
ANTHUS ELEGANTISSIMUS,
 the best of the Garden per packet, 1s. 6d.
SUPERB HOLLYHOCKS,
 choice varieties, per packet, 2s. 6d.
 Nurseries, Haslemere, Surrey and Seed Establish-
 ment, London, W.

Choice Plant—Echeveria metallica.
WILLIAMS is now enabled to offer for the first time the very Ornamental Bedding Plant, which has been produced such a splendid effect in the Botanic Garden, &c. For sowing, and various other purposes, it is a most valuable and very striking and distinct from any other plant yet used for bedding. It is sold in packets, 2s. 6d. each.
 Nurseries, Haslemere, Surrey, Upper Holloway, N.

by alternation of painting may be made attractive at each of the four seasons. It is only a question of forethought and of means. Eds.

Red Currants—I have this day forwarded you two small portions of Red Currants, both have been taken from one branch. The forward part of the branch has been in flower 10 days with shoots 6 inches long the rest of the branch and tree is only just expanding its buds. There is no outward visible cause why this should be the case, the bush is growing in the open garden, the most exposed to the most forward branch being on the north side of the bush. Several gentlemen and gardeners have seen this, and all say they have never seen anything like it before. *William Cowan, Hill, March 7.* The facts are as stated, but without a knowledge of all the circumstances we cannot explain the anomaly. Eds.

Mildness of the Season. The following plants were found in bloom in the neighbourhood of Taunton, Somersetshire, on the dates given—Feb 15 Ranunculus Ficaria, Capsella bursa-pastoris, Carlina hirsuta, Draba verna, Viola odorata, Viola odorata alba, V. hirta, Stellaria media, S. Holostea, Primula spinosa, Genm urbanum, Potentilla Fraxea, Vesum album, Taraxacum officinale, Senecio vulgaris, Helianthus perennis, Tussilago Farfara, Vinca minor, V. major, Lonicera purpureum, Veronica arvensis, V. agrestis, Primula vulgaris, P. veris, P. elatior, Mercurialis perennis, Ulmus montana, Alnus glutinosa, Saxifraga, Narcissus Pseudo-Narcissus, Scilla maritima, Feb 18 Fumaria officinalis, Lychnis viscaria, Ulex europaeus, Prunella vesca, Chrysanthemum inodorum, Angelica sylvestris, Daphne Laureola, Feb 21 Tussilago Farfara, Adonis vernalis, Feb 22 Scilla maritima, The ranthus (Cherry Bryannum) Hort. cum Sphoryllium, March 4 Taxus baccata, March 5 Primula verna, Anthriscus sylvestris, Veronica pinnatifida. G. W. R.

Paint for Labels—Some time ago I wrote to a leading periodical connected with gardening about the impenetrable and consequently soluble nature of white-lead, and of almost any kind of lead oil-paint. I adduced the instance of an old notice board bearing still perfect black letters on what had once been a white-lead ground. Not only had the white ground entirely departed but the wood itself was so weathered as to leave the black letters in very distinct relief. I was yesterday examining the stove plants of a friend who called my attention to the fact of the white-lead or paint on his plant labels being dissolved by the watering. No amount of material possessing the saponifying property of lead should ever be used on plant labels or on anything where this chemical power of lead compounds is so greatly augmented by the combined aid of heat and moisture as in a plant stove. Indeed, on all surfaces exposed to atmospheric influences, zinc or barytes white will be found far more protective and durable than white-lead. But for durability there is nothing like lamp-black on external work. One coat of it on wood or iron will outlast many coats of white-lead. I do not think water-lead has any material saponifying or solvent power over equal Potash then a weak caustic alkali and a small quantity of white-lead or other white pigment in powder. For use mix the two together on a bit of glass or on an oyster-shell, and apply to the labels, then write at once with a hard black-lead pencil. J. H. M.

Fruit-tree Protection. Diseased Peaches, Apricots, and Nectarines.—The Rev W P Radclyffe, in again calling the attention of fruit-growers to his excellent mode of protecting Peaches and Nectarines, ought to have included Apricots. So far as curtains are concerned I beg to join with him in recommending them for the purpose, having had something like a 15 years' experience in the use of them. I do not seem to have secured the top where the branch was of a satisfactorily healthy character. My object is not to say so much of curtains, as where they are tried they will speak for themselves. I would direct attention to the protection of a more important part of the tree than the young wood, viz, the old wood, not only from the effects of winter but from the burning sun in summer, together with the muzzling of the cedar roots in spring. In 1859 and 1860 it devolved on me to rearrange, and in many respects to plant afresh, the whole of the wall-trees of a large garden, and amongst the number a score of Peach and Nectarine trees in a bearing state, this as a rule was done in the months of September and October, and immediately each tree was insulched with a large barrowful of half rotted hotbed manure, and as the object was fruit the year after removal, the stems of many were covered as far up as the union of scion and stock. Out of the number treated so in 1860, only one refused to grow in 1861, that year succeeding the ever-to-be-remembered Christmas-eve that made such havoc amongst fruit trees on walls in all parts. The failure of that one was easily accounted for, as it had a very long stem, and had moreover been much mutilated by the pruning-knife, and had no protection at the union, which had swelled by repeated being cut back, so that it was as large as a turnip. The tree had carried a fine crop of fruit in the season, and many of the fru it were worn and bent, so that was the situation. The thermometer against the wall, and in the sun, was frequently as high as 120° in the wood. Well, the result was death in 1861, and on making a cross section of a piece of the wood it was found similar to the pieces enclosed. No. 1, Plum tree, dead from pith to bark, side next the sun. No. 2, branch of Nectarine, the same. No. 3, Peach, partially so. In nine cases out of ten this is seen on all kinds of stone fruit, but particularly Apricots, and doubtless it will be seen in 1860, in many places where the thermometer registered as high as 120° in the sun. This will be a great year for observations, and particularly on trees that have been much cut about while in a young state. The shortening in of the shoots of young trees so frequently, is where the mischief lays. There is not a bud

at, even if the most latent character, as have been freed into action hence the bare centres in a most all kinds of stone fruits so often to be seen. These, together with the cedar roots, are the parts that require protection the most, as the young wood on bearing trees, is well ripened, even on such naked stems, will endure a great amount of exposure up to the blooming season. It has been my uniform practice for a number of years to cut away a 1/2 inch from the walls every winter and I rarely find them injured by frost. If Peaches, Nectarines, or Apricots, are planted in light soil resting on a gravelly or sandy surface, and the cedar roots are partially exposed, I would suggest to be considered as imperative, not only as protection from frost, but from the opposite extremes—the parching sun against a south wall, and the cutting east winds of the months of March, April, and May, lapping up at noon-day the very life's blood of the tender leaves, which in less than 10 hours may be still with frost. So in a season like the present, with an early vegetation, in addition to curtains, I would recommend a thin spray of Holly twigs (the leaves wither and hang on), which admit plenty of light and air when the curtains are drawn off. I give the results of an observation made here to-day. March 10 with two trees side by side, the one partially covered with Holly twigs, the other quite exposed—the thermometers hung to the wall 3 feet from the ground, and facing the sun—

1st tree	partially covered tree	60°
	exposed tree	75°
	north aspect	45°
2nd tree	covered tree	35°
	exposed tree	72°
	north aspect	27°

Thus it will be seen, the exposed tree had to endure a declension in temperature of 43°, the partially protected one only 22°. Is it consistent, then, under such circumstances, nay, it is impossible to expect that reciprocity of action between root and branch in the exposed tree that would otherwise take place under the more uniform state of keeping? The action of frost and other extremes of temperature on the old wood, together with that of an inordinate use of the pruning-knife, do not always manifest themselves until after many years, but gradually at last bring about a derangement of the cellular tissue. Then gum, canker, blister, insects, and all manner of diseases are engendered, and premature decay succeeds. W. H. M.

The Cedar of Lebanon. Permit me to direct the attention of all those who are interested in arboriculture to the splendid cones which these trees are now bearing. All Cedars do not bear fruit, but many contain excellent and numerous seeds. The cone of the Cedar is remarkably tough, and will not discharge its seeds by exposure to heat like those of other Firs. I have tried various methods of extracting the seeds, and find the following the most effectual. Fix the cone in a vice and saw off about 1/2 inch top and bottom, then with a mallet and cold chisel divide the cone into quarters, which must be separated into smaller portions. Place these in the kitchen screen for say 24 hours, and they can then be separated with a little industry. If very tough, use a pair of wire-nippers to open them. A good cone contains from 10 to 20 seeds. It is remarkable that though the Cedar is so prolific this year, the Pinus austriaca has no cones, but it bore so heavily the two previous years that I have not only young trees of this species growing from trees of my own planting, but have sent considerable quantities of seed to friends and some nurserymen. Higford Barr, Aldermaston, Feb 25.

Hardy Broccoli.—Permit me to ask your practical readers and correspondents which of the winter white Broccoli has proved the best this fine open winter. My own experience in the growth of this vegetable has hitherto been very limited, and as I intend to grow it in future on a more extensive scale, I am anxious to know which of the recently-introduced sorts—early winter white Broccoli I mean—is most worthy of cultivation. Colo.

Mistletoe.—Your correspondent T J Hope (p 125) says "I am in the habit of smearing a few berries," meaning Mistletoe, "every season, and find they take most readily on the Thorn and Mountain Ash." Would he, or any other of your correspondents, be kind enough to tell me how and when to "smear" them, as my employer is desirous to make a present of a few young trees with Mistletoe growing upon them? Rub the berry against the underside of a young branch, at the present time, they will adhere by their natural viscosity. Afterwards keep the birds off. Eds.

Colour of the Backs of Rose Petals.—The colour of the reverse side of Rose petals is a subject, I think, of some importance, and one to which more attention should be directed, especially in the selection of new Roses from description. How is it that many of our finest shaped Roses are dull and unattractive? Simply because certain forms of the flower exhibit the backs of the petals much more than others of a flat or rosette character, and the finer the shape—that is, the more globular and deeper the cup of the petal—the more is reverse shown. In nearly all red Roses this is of a dull purplish tint, which tones down very sensibly whatever brilliancy of colour the face of the petals may possess. This is evident when we consider that fully one-third of the back is exposed in our finest modes of shape, cupped, bush centred, and globular flowers, such as La Reine, Alfred Colomb, Chabrisland, Pierre Notting, Prince Henri de Pays Bas, &c. Neither the beautiful Jules Margottin with its shell-like petals, nor the brilliant Senateur Vaise, would have held our hearts so long had they not shown us bright backs as well as faces. May I venture to give our Continental neighbours a hint, not to send us any new red Roses less bright in the reverse of their petals than our old favourites, Senateur Vaise, Henry Curtis, Torquay, Pyrethrum Tchihatchewil.—This is very likely to prove a useful turf-plant on dry soils, sloping banks,

and other positions where it is difficult to make it grow. It is one of M Bossier's plants and was first planted in the Botanic Garden at Geneva. It was first introduced into England by M Verlot, of the Jardin des Plantes, Paris, in 1811, and recommended it strongly in the 'Gardeners' Chronicle'. The position in which it was first planted in the Jardin des Plantes was a very exposed one, and it had not withstanding these circumstances, the carpet of this Pyrethrum with the leaves of the species, the leaves are much more green at all seasons. It is perfectly hardy about the surface of the ground in a very hard winter. The flowers are white, rise a little higher than those of the daisy, and may be run over by those of that plant. If left on to decay, they do so with a very little eyesore. It is not like the Sparganium, a really fine turf in flakes, and becomes a very good turf in firm soil of the ground. As in these cases, or turf is generally the most valuable of all for the earth, this plant is more likely to be useful on a large scale in countries where it cannot be kept in good condition without a great deal of trouble. Nevertheless, from the inquiries made from time to time for materials to cover hot and sloping and other surfaces, which people find a difficulty in keeping green, there can be little doubt that it will meet the wants of some, even should it never be honoured with a position on the lawn or the only banks, &c., in the southern counties it may be useful. Till recently it has not been obtainable in the trade, or in botanic gardens, in this country, but see plants of it now offered at a cheap rate. Our correspondent kindly suggest an English name for this plant. Eds.

Fixing Rose Buds.—Your correspondent 'J' in the 'Gardeners' Chronicle' of Feb 6 inquires why the best adhesive material for fixing rose buds is Mastic bladder, not made too soft, the surface wet with oil and passed round like a surgical bandage, which will straighten it, and a little practice make it a very easy process. It will remain fixed long enough to be taken down the end with a thread. I use bladder to prevent my Carnations from bursting. G.

Oranges.—Having seen a notice in the 'Gardeners' Chronicle' of Feb 6, inquiring why the best adhesive material for fixing rose buds is Mastic bladder, not made too soft, the surface wet with oil and passed round like a surgical bandage, which will straighten it, and a little practice make it a very easy process. It will remain fixed long enough to be taken down the end with a thread. I use bladder to prevent my Carnations from bursting. G.

Maltese Blood Oranges exhibited by Mr. Gooding to Sir John Neell Bart., of Grittleton. I took advantage of calling on Mr Gooding, being in the neighbourhood, to see the trees from which they were gathered, and I was highly gratified to observe the successful manner in which not only the Oranges, but Shaddock, Lemons and Limes were raised. The growers of these handsome and delicious fruits are under the disadvantage of having to grow them in tubs, and in many establishments, such as Grittleton Park, Wycombe Abbey, Wilton Abbey, &c., the specimens are planted out in a large arborvitae conservatory, in the centre being a Shaddock and a Lemon with quantities of fruit of very large size, and the time quite ripe or approaching maturity. The trees named (the Shaddock and Lemon) must be 12 to 20 feet in height, and the healthy vigorous growth combined with plentiful foliage, of the largest growth, show that they enjoy the place allotted to them. Where there is sufficient space at command, the appearance of such specimens as these at once induces cultivators, that keeping them in tubs will give any of the genus Citrus the chance of being well to advantage. The trees were all perfectly free from the insects usually found upon them, and must have considerable labour bestowed upon them. This same attention was throughout the establishment, and, as the residence lies on a plain, it is in the summer months a very beautiful country seat. Another conservatory of the same size as the one in which the Oranges, &c., were planted was filled with Azaleas, Roses, Hyacinths and other forced bulbs, &c., usual at this season, presenting a very gay appearance. H. W. H.

Lonicera fragrantissima.—For a many years of a low wall this is a most desirable evergreen shrub, worthy a position in all gardens, whether large or small. A plant here on a south-west wall (perhaps an exceptional one, has been in flower since November, several who have seen it have been led to ask why such a glorious shrub should not meet. Being evergreen this character is one of its cheerfulness, independent of its most fragrant blossoms. Like all the Lonicerae I preserve it readily from cuttings. The plant here was cut pretty freely, finding by such treatment it would profusely. John Edington, Wrotham Park, Bucks.

Root Pruning.—I should be greatly obliged if you would tell us how he avoids the evil of tapping or cutting the roots, from the others just being cut, and the tree by "going half round each tree, and cutting the roots within about 6 or 8 inches of where they were cut at the previous operation." Pear trees in the stock make all their strongest roots perfect, and the Apples will even do so to a large extent, and be cut Crab stock, and it is only when this can be done against that efficient root-pruning is performed. J. B.

Garden Fountains.—English gardens are not cultivated, but rarely show the best taste in laying out. One thing is generally neglected which should be more considered—I allude to water, especially water in motion. All this means that we have not a complete All architectural or formal gardens are made up without them. Any small place may have a fountain very little cost if the proper plan is adopted. It is to have a plain draught pump, with about 10 feet of pipe, on a trellised tower of four larch poles, or other

March 13, 1869.

JAMES CARTER AND CO.,
237 and 238, and 261, High Holborn, London, W.C.

RAYNBIRD, CALDECOTT, BAWTREE, DOWLING, AND COMPANY (Limited),
COAK, BEED, MAXON, and OILCACK MERCHANTS.
Address: 80, Seed Market, Mark Lane, E.C., or Basingstoke.
Samples and prices sent free on application. Prizes Medals, 1851, for Wheat, 1862, for "Excellent Seed Corn and Beans."

HALLETT'S PEDIGREE CHEVALIER BARLEY
Produced in 1858 a Crop of 62 bushels per acre, a Sample of which was awarded the First Prize at the Birmingham Show of 1868. Took the First Prize also at the same Show of 1867. Produced in 1867 nearly 9 quarters per acre.
PEDIGREE BLACK TARTARIAN OATS produced, 1868, 12 quarters per acre.
For particulars apply to Captain HALLETT, F.L.S., Brighton.

1868.—Mangel Wurzel Seed.
H. AND F. SHARPE can offer the Trade some splendid STOCKS of the above-named Seed, grown on their own Farm this season from picked Bulbs. The quality is very fine, and prices low. Samples may be obtained on application.
Seed Growing Establishment, Wisbech.

BATH and WEST of ENGLAND SOCIETY, Established 1777, and SOUTHERN COUNTIES ASSOCIATION for the ENCOURAGEMENT of AGRICULTURE, ARTS, MANUFACTURES, and COMMERCE.

H. R. H. The PRINCE of WALES, K.G. SOUTHAMPTON MEETING, 1869.
President—

The Right Hon. The EARL of CARWATON
The ANNUAL MEETING will be HELD at SOUTHAMPTON on MAY 31, and JUNE 1, 2, 3, and 4.
Prize Sheets and Regulation Papers for Stock, Poultry, Implements, and Horticulture, may now be obtained from the Secretary, Bath.

For Oil Paintings, Water Colour Drawings, and Art Manufacture, from R. R. M. Daw, Exeter.
All Entries must be made and Fees paid on or before April 12.
By order of the Council,
4, Terrace Walk, Bath. Jos. AN GOODWIN, Secretary.

ROYAL AGRICULTURAL SOCIETY of ENGLAND.

AGRICULTURAL EDUCATION

The EXAMINATION of CANDIDATES for the SOCIETY'S EDUCATIONAL PRIZES will COMMENCE on TUESDAY, April 13.

Copies of the Form, required to be sent in by March 15, may be obtained on application to

H. M. JENKINS, Secretary,
12, Hanover Square, London, W.

N.B.—There is no stipulation this year as to the age of Candidates.

MANCHESTER MEETING, 1869.

STOCK and IMPLEMENT PRIZE SHEETS are Now Ready, and will be forwarded on application to HENRY WHITWORTH, Esq., Local Secretary,

28, King Street, Manchester; or

H. M. JENKINS, Secretary,
12, Hanover Square, London, W.

The Agricultural Gazette.
SATURDAY, MARCH 13, 1869.

If from 20 to 30 tons of Sugar-Beet can be grown per acre, and disposed of on the spot at 1l. per ton, there is no question but that sugar farming will prove profitable. Doubtless during the past season as much or more could be got for common Mangel, but then the season was wholly exceptional. The sugar-maker allows a maximum weight of 4 lb. per root. Last season Mr. HAWKINS, of Lavenham, grew 21 tons per acre, with roots averaging 1 1/2 lb. a-piece. Had they reached 3 lb. he would have had 42 tons per acre; at 4 lb. they would have brought his crop up to 56 tons per acre. His roots numbered 32,000 to the acre, or 152 1/2 roots to the ton.

The mode of culture must steer clear of two extremes—gross feeding and starvation. The former is apt to produce water rather than sugar, and yet the root must have weight enough to pay. Apart from the question of sugar growing it is worthy of inquiry, how far farmers are wise in growing those Mangels that are almost wholly aboveground, and whether, even for feeding purposes alone, the Sugar-Beet would not prove the more profitable? The chief feeding value of Mangel is derived from its sugar. The question may be asked with great pertinence—whether more food might not be grown by choosing a low-growing Sugar-Beet than a high-growing Mangel? For it seems that the part aboveground yields scouring salts rather than nourishing and fattening sugar. In looking through the analyses of the Lavenham crop we were much struck with the wide range of the sugar percentage, the lowest being 3 and the highest 12 per cent, while the sewage-fed root from Barking reached over 13 per cent. Mr. FISH pointed out at the meeting of the West Suffolk Chamber the other day that heat

in any great quantity was not needed to develop sugar. He found a strong confirmation of this on looking over a number of analyses by Professor VOKLKER. Two samples from Devonshire yielded 3.46 and 1.02 per cent respectively, while the average yield of the Lavenham roots was 9 1/2 per cent, and roots from the colder climes of Germany and Russia produced from 10 to 12 per cent of pure white sugar.

But how will the new industry affect the feeding of stock and the agricultural interest generally? The stock will suffer much less than is generally supposed. It is difficult to convince many farmers that as much as 10 per cent of their large Mangels is sheer water. This item can at least be readily supplemented from the nearest pump or pond. We lose nothing by allowing the hydraulic presses to disperse the water of our Beet. In addition to this the sugar-maker takes the sugar, that is as much as he can get of it, for it is still a disputed point whether Beetroot pulp or the common Mangel (whole root) contains the largest percentage of sugar. But admitting that we lose a certain amount of saccharine matter, we must remember we get 20s a ton for this loss alone. And there is no other, unless it be the water. The sugar-maker destroys nothing, every particle of the Beet is returned to the farmer, except a certain amount of its sugar and water. A brief outline of the modes employed of production will render this apparent to every intelligent reader. The sugar-maker is intent upon extracting the sugar, not wasting or destroying the roots, hence every part of the root not convertible into sugar is used for cattle food or manure.

The first process consists of the trimming of the Beet. Along the side of an open shed a row of women sit, armed with knives, between two long rows of Sugar-Beet, those on the outside are trimmed, those on the inside being dressed. The dressing consists of scraping the rough soil off, removing the fibres and the part of the top that has been above-ground. These chippings are then sold for stock fuel, at 1d. per bushel. The cleaned roots are then caught up by boys, and emptied into a long cylindrical iron cradle or washer; they are delivered at the further end of the washer clean, seized by active hands lying in wait for them, and delivered to the rasper. These convert the roots into a soft homogeneous mass resembling Potato soup or rotten turnips and deposit it in a small vat. Into this well a scoop or basket constantly dips, hung with a stick neatly that the least touch tips it over and empties its contents. On each side of this spot women are stationed with flannel bags that just hold the contents of this measure, and their business is to empty the measure of Beet soup into these bags, and place each bag flat between two plates of iron; these are piled one above the other until they reach a sufficient height when they are placed under powerful hydraulic presses. The pressure is not completed at once, but they go through a series of six or eight presses in succession, arranged in a semicircular line, around an open gutter that conveys the juice into a large tank. After every separate squeeze the plates and bags are rearranged, made up to the requisite height, and re-pressed. And thus a great many are employed, and a number of presses are at work together.

From the last press the bags are carried back to one end of the cleaning shed, whence the pulp is emptied into the pulp store, and the bags are passed into the washing-house. Here a number of women are engaged constantly cleaning the bags and passing them on again to the fillers. Thus far, then, nothing has been added to the Beet; it has simply been separated, by enormous pressure, into liquid and solid. The liquid has been passed forward one step nearer to sugar, the solid has been sent back ready for conversion into beef. The pulp, as it is called, might with great propriety be called Beet bread. It is the flesh-forming matter of the Beet, not baked, but pressed almost dry. It is greedily eaten by all kinds of stocks, and is doubtless a most wholesome and nutritious food.

From the well near the hydraulic presses the beet-juice is speedily lifted up to the top of the factory. Following it as quickly as possible, we find three large copper vessels full of beet-juice. Here, also, we are confronted with the Excise officers, and are reminded for the first time of a duty of 8s per cwt. on British-grown sugar. Singularly enough the duty is levied on the beet-juice, not before one step farther can be

taken towards converting the raw juice into sugar its temperature and specific gravity must be duly and carefully noted. As soon as this is done the process of conversion into sugar is resumed. This mode of levying the duty is important to agriculturists, as it has been suggested to Mr. DUNN that it might form the basis of the fairest mode of payment for the roots. The samples analysed range from 3 to 13 per cent. in their sugar. The former samples of roots are not worth more than 15s per ton, while the latter would be worth 30s per ton. Now it would be easy to keep the roots of each grower by themselves and test the specific gravity of the respective juices separately. This would afford a powerful stimulus to the discovery of the best means of increasing the percentage of sugar, and it is just possible that the amount will be still further increased.

But beet-juice is readily decomposed. No sooner does it leave the presses than it begins to change colour. From a bright pinkish it at once assumes a dark hue. This chiefly affects the quality of the sugar, and must be prevented as much as possible by hurrying forward the process of manufacture. The instant, therefore, that the Excise is satisfied, a quantity of lime is cast into the juice, which destroys certain impurities, and casts them up to the surface as a dirty froth or scum. After boiling by steam, the clear liquor is drained off in one direction and the scum in another. The juice is then saturated with carbonic acid gas (which throws down the lime, filtered through animal charcoal, and otherwise purified), and another residuum is thrown off. The scum is sent through a filter-press, all that is useful for sugar-making preserved, and the refuse converted into cakes for manure, and offered at the works for 1/ per ton. As nothing more of the Beet comes back to the farmer, it is unnecessary to follow the process of sugar-making farther here. Suffice it to say, that from this stage most of the processes aim at getting rid of the water, and changing the sweet liquid into solid sugar, hence it is evaporated while in vacuum, and after being reduced as much as considered desirable, it is run into barrels and dispatched to London, to be finally converted into sugar. It is hardly needful to observe that the whole of the machinery is driven by steam-power. The entire works are of Belgian manufacture and are under the superintendence of M. VICTOR ORTMAN, civil engineer, from Belgium. Three steam-engines of about 50-horse power (collective) are on the premises, and the works are capable of working up from 1000 to 5000 tons of Sugar-Beet in about three months.

It is one of the necessities of the manufacture that the work should be continuous. Fresh relays of workmen and women therefore succeed each other night and day. Over 100 hands are employed, and the result upon an agricultural community of so much money earned wages spent, and such an active industry excited just at the dead season of the year, can hardly be over-estimated. All around the factory there is an air of bustle and of business. Visitors are flocking to see the sugar-making from far and near, and the Lavenham experiment will doubtless become the birthplace of many others throughout England and other countries. From different countries of Europe, from Canada, and from all parts of Great Britain and Ireland, gentlemen have been to see and judge for themselves, and there seems no reason, in the nature of our climate, circumstances, or laws, why sugar growing should not speedily become almost as important a branch of British agriculture as the production of beef, beer, and corn.

M. GEORGE VILLE, of Paris, has recently directed attention to the enormous quantities of sulphate of ammonia existing in certain of the Tuscan regions. This salt is of such agricultural importance, and the demand for it is so rapidly increasing, that the discovery of any new source whence it may easily and cheaply be derived would be most welcome. But the fact is, that M. VILLE has made no new discovery at all. What credit there is attaching to the detection of sulphate and other salts of ammonia under the circumstances named above, is due, not to M. VILLE, but to a distinguished Italian chemist and mineralogist, Professor BECHI. One of M. BECHI's first discoveries of a native ammonia compound in Tuscany was made, not in 1868, but in 1863. He then found and described a mineral known as *Lavelleite* (named after the proprietor of the

estate), and containing several per cent of ammonia. A large block of this mineral was shown, with sulphate of ammonia, in the International Exhibition of 1862. In this latter year M. BECHI continued his researches, and obtained by one evaporation of the residual salts left in the water from a lagoon at Travale, a sample of sulphate of ammonia, less than 80 per cent of the pure substance. At the same time M. BECHI, both privately and publicly, drew attention to the agricultural importance of his discovery, speaking on the 10th of June, 1862 to the following effect:— "I have come to us, in these lagoons of Travale, to a most abundant source of ammonia and to a from which agriculture ought to derive great benefit. . . . In the working of the lagoon waters we have met with great difficulties in attempting to separate the ammonia acid from the sulphate of ammonia, but these difficulties have at last been overcome and we now obtain both borax acid and sulphate of ammonia in a state of great purity and by means of an economical process." M. BECHI also alluded to the vast stores of ammonia which could be extracted from these lagoons, and made available for the arts. In April of the year 1863, M. BECHI published the results of his researches, giving an account of the various peculiar salts of the lagoons and their probable modes of production. Meanwhile, at his invitation, many distinguished agriculturists were experimenting with the sulphate of ammonia on their farms, and with the most favourable results.

We may add that in the Paris Exhibition of 1867, M. CORPI, the director of the works at the lagoons of Travale, showed several samples of agricultural and pure sulphate of ammonia, the sources pointed out by M. BECHI. The importance of this manufacture is consequently may be gathered from an experiment made by M. BECHI in 1862. He found that four *soffoni* (or jets) in the neighbourhood of Travale yielded in 24 hours more than 5000 lb of sulphate of ammonia. He also observed that the very earth, in some places about the lagoons, is saturated with sulphate of ammonia and that this occurs in combination with sulphate of magnesia in the same neighbourhood.

The above narrative will, we trust, have shown that we are indebted to M. BECHI, not only for the detection, some years ago, of important sources of native ammonia, but for pointing to agricultural bearings and importance of the discovery, and likewise for experimental views towards its practical realisation. A //

— AT Mark Lane the corn trade has had a downward tendency throughout the week, in consequence of intelligence that large shipments of grain from the Baltic, Black Sea, Australia, California, and other parts, were near at hand. — At the Metropolitan live stock market on Monday there was a short and former high prices were fully maintained, a large arrival of foreign animals on Thursday, however, caused the trade in inferior qualities to be active. Fine calves are making 10s to 12s per stone, and choice porkers 3s 4d per stone. — The seed trade is undergoing some novel changes. Messrs. for a return of American Clover seed to New York have been received, and as these orders refer to quantities it is expected that even higher prices than have been anticipated will be asked for our small stocks.

— On Wednesday evening Lord RUSSELL's Motion for a second reading in the House of Commons, and is therefore lost. In moving the second reading, Lord RUSSELL referred to the amount of capital invested in English agriculture, and the small return which it deserved at the hands of legislators. He observed, which that large portion of this capital which is invested in the live stock of the farm can be saved is kept fast in stock from a contact with it. If the necessary steps were taken to prevent the spread of meat throughout the country, he thought it could be done. He stated that the result would not follow. It had not followed at Liverpool, and it would not follow generally, because the business of the country is so restricted, and the number of cattle are so numerous, that it would be impossible to introduce. At present about 200,000 tons of dead meat are sent out of the country, and only 4,000 tons are sent abroad. If the foreign trade were stopped, it would be gained by the absence of contagious diseases more than compensate for any loss. In the years during which the cattle plague existed, the country lost about one-eighth of its cattle, and the number of cattle imported during 25 years was 1,000,000. Mr. HEATON objected to the Bill, and all the existing Acts of Parliament on the subject, and dating from the middle of the reign of George I. — and so that it was antagonistic to the Government.

Committee shall consist of the President and the stewards
 of the stock

It was resolved to recommend to the general meet-
 ing that the date of the Council meeting which has been
 fixed by the bye-laws to be held in March shall be
 altered to February.

The Improvement Committee were re-appointed,
 with the same power as heretofore.

It was ordered that the Club's advertisements be
 inserted in the *Field* and the *Agricultural Magazine*
Journal, as well as the other agricultural papers, as
 before.

The honorary secretary was requested to commu-
 nicate with the Agricultural Hall Company in refer-
 ence to the accommodation in the new pig hall, and
 also as to the sheep and pig pens,—the subject to be
 then referred to the committee appointed at the last
 Council to confer with the Agricultural Company
 thereon.

The thanks of the meeting were voted to his
 Grace the Duke of Marlborough, President, and also
 to the Right Hon. Lord Bridport (who took the chair
 on his Grace having to leave), for their able conduct in
 the chair.

STURLING

Substitutes for Turnips in Wintering Cattle

At a recent meeting to discuss the question, "What are
 the most economical substitutes for Turnips (consequent
 on the scanty crops of that root for 1868), to take out
 provender for cattle during winter?" Mr. ALEXANDER,
 of Taylorton, said—I am old enough to remember
 when Turnips were not cultivated at all on Carse land
 —at least in the neighbourhood of Stirling. I think
 I was amongst the first to try a few rapes. This
 was immediately followed by growing a few from
 that to have the whole fallow-break in green crop,
 and I have not had any raked fallow for upwards of
 20 years. With regard to the deterioration of the Turnip
 crop this year, my practice is to grow what I
 have. This can best be done by grating the whole
 Turnip into a pulp, and then mixing it with cut straw
 or chaff, and when the cattle fattening are intended
 for the butcher, to add a portion of the best quality of
 cake along with a small portion of hashed grain—the
 mixture to be made up at feeding time. I consider it
 a great waste of Turnips to give an animal as many as
 it can eat upon this belief, I have adopted the
 pulping system, which is not only economical for
 feeding and feeding stock, but also very beneficial for
 dairy stock, the milk and butter having a much better
 taste and flavour than when the Turnips are used
 whole. The best substitute for Turnips for win-
 tering cattle is rape-cake, the best of the
 or a mixture of rape-cakes. There is, how-
 ever, some difficulty in getting cattle to eat
 rape-cake: this can be obviated by mixing it
 with chaff, and steaming it with hot water. Last
 year I wintered half a score of cows, and they
 very well by giving them a supply of fresh straw and
 water with an addition of about six or seven
 of cakes. A plentiful supply of fresh water should
 always be in the cattle-yard. One great drawback in
 the purchase of cake is the adulteration which is prac-
 tised when cake rises to its present price. The only
 safeguard is to purchase from respectable traders. In
 my opinion, these farmers, at least with a little
 supply of Turnips, should not fret themselves for the
 butcher. I consider it more profitable to winter cattle
 now. One very important feature in the saving of
 food for cattle is proper shelter. This, in many winter-
 ing yards, is still a very great drawback. I have myself
 experienced for some years very great loss from that
 cause. One of my cattleyards I have covered over
 altogether. This, when properly done, is of very great
 benefit for the saving of food and the comfort of the
 cattle, as well as the rich quality of the manure. The
 other yards I have roofed on all sides of the square,
 thereby securing a comfortable dry bed. This may be
 considered by many as an indirect way of saving food
 for cattle, but my experience has taught me the above
 statement to be the fact. Proper housing and comfort-
 able cattleyards have hitherto in many farms been far
 too little attended to in this locality. Another
 very important feature in the saving of farm
 provender is the proper storing of straw when
 threshed. No farmstead should want a large straw
 barn or shed—this I have found to be of great
 advantage—besides, using straw out of a stack causes
 great loss and waste, and it is often in a very
 injured condition. The cultivation of the Turnip
 crop is one of the most important features of modern
 husbandry. To grow Turnips successfully in clay
 land, the soil must be thoroughly drained, well
 wrought, and well manured. The substance of the
 above few remarks is—first, to economise what Turnip
 is on the farm by pulping and mixing with chaff or cut
 straw, with the addition of a mixture of rape-cake or in
 the want of Turnips altogether to use rape-cake as a
 mixture for wintering purposes; second, housing and
 comfortable cattleyards, and the straw shed, all care
 using not to be exposed to the weather; good attention
 being at all times necessary for the proper cultivation
 of the Turnip crop.

Mr. M'LACHLAN said he could never get his cows to
 take kindly to pulped Turnips. He was in the habit of
 steaming or slightly cooking them first. And by this
 way he found them to be more nutritious, a less quan-
 tity of Turnips when other stuffs were mixed with
 them, were required, and the quality of the milk was
 much better. For dairy cows he advised the use of
 lentil meal and bean meal, along with pulped Turnips;
 for wintering cattle, an extra allowance of oilcake,
 and, for feeding cattle, pulped Turnips and a little
 rape-cake. He also advised the use of spent distillery
 grain.

Mr. BUCHANAN, of Whitehouse—Fortunately, this
 season, those farmers who are worst off for Turnips are

in a great measure better off than their high-land
 farming neighbours for straw. I have no doubt
 that the first impulse will be the consumption of
 cake to supply the deficiency, which is one of
 our best substitutes for Turnips, but the recent
 advance in the price of cake brings me to the
 point whether we have not a cheaper and more
 economical substitute in our circum-
 stances. Before going farther, allow me to compare
 the price of cake with the price of our own good home-
 grown grain, and in particular Beans and Oats.
 Taking linseed-cake as the standard and leading sort of
 its kind, we find the price at 13s. per ton, while we
 have Beans at 11s. 10s. per ton, and Oats at about
 9s. 10s.; and the two mixed in equal quantities will
 cost about 10s. 10s. per ton, being about 2s. 10s. per ton
 cheaper than linseed-cake. Some may consider that
 even at these quotations cake is the best bargain, but
 it must be remembered that we have the grain pure,
 and in the hands of our own agriculturists. With-
 out saying that adulteration takes place we cannot
 say that a large quantity of it is to be
 at the present price of cake. As he observed,
 however, that I do not by any means undervalue the
 use of cake, and for particular and special purposes
 genuine cake is very important, but it allows me to
 read from the report of the Council of the English
 Society. With respect to feeding substances, I would
 observe that the great scarcity of green food and the
 failure of the root crops have compelled farmers to
 purchase substitutes of cakes and corn to a much
 greater extent than in ordinary years. In consequence
 of the increased demand for purchased food, the sophis-
 tication of oilcakes, I regret to say, has received a great
 impetus. I hardly remember any season in which I had
 to examine so many inferior and adulterated linseed-
 cakes than in the past. The subject deserves the
 most serious consideration of the agriculturist, for
 the danger of adulterated cakes is not only
 decreased by using small quantities for feeding
 purposes, but also by mixing with a small quantity of
 genuine cake. The adulteration of my stock by giving them adul-
 terated cakes is a great loss, as those who have seen
 oxen, from want of knowledge and cupidity, occasionally
 incorporate with feeding cakes substances which
 are positively poisonous to animals. Under our
 present circumstances, however, I would prefer using
 for our cattle, in addition to straw, a supply at least
 once or twice a day of mixed chaff, or broken or cut
 straw (which is so generally abundant on Carse farms)
 with a certain proportion of the meal of the grain
 alluded to above spread on any mixed with it, and
 which they consume greedily and without loss as I
 would give a supply of water to the stock with three
 or four times a day. For feeding dairy stock I have
 found that a mixture of rape-cake, steam-steeped or
 boiled in water, with chaff, a few seeds of Rape,
 adding a portion of bean-meal, and finally washing
 the mixture with water, the being taken away the
 cream, and the residue being used with these cakes
 is their best fare. These farmers who are
 fortunate enough to be near a distillery or brewery
 will find the refuse of these added to the above mixture
 to be of great service to this class of stock. In regard
 to the other department of the wintering—viz., fodder
 —I think we need not be at any loss with the present
 price of hay at about five guineas or so, two tons of
 which is I am sure, better than a ton of any oilcake.
 As to the adulteration of Turnip-cake and straw combined
 in a mixture, Mr. CARRICK, of Baad, and I carried
 remarks, I leave the discussion in abler hands than
 mine.

Mr. CARRICK, of Baad, had tried rape-cake, oilcake,
 Indian Corn-meal, and other things, but amongst the
 whole of these things he had found nothing so bene-
 ficial and so economical for feeding cattle as bean-
 meal. He admitted that bean-meal was dangerous
 when too much was given to the cattle, but when it
 was properly and carefully used, there was nothing
 better for them. When mixed with a little chaff it far
 outstripped anything else that had been mentioned.
 For instance, what is cake? It is only refuse; it is
 only the shew of good feeding stuffs, the substance
 gone. Where there was no Turnip, he would advise
 farmers to make a mixture of bean-meal, crushed oats,
 and a little cake and they would find it would
 be an excellent feed. The sum and substance of his
 argument was, that nothing could beat bean-meal when
 judiciously applied.

Mr. LUCAS, of Cornton, referred from several of the
 speakers which had preceded him with regard to the
 pulping of Turnips. He was of opinion there was not
 much profit by it, especially on a moderate-sized farm.
 He had wintered cattle on the rape-cake and straw.
 He thought it was the most profitable for wintering
 purposes to use cattle rape-cake and straw, and,
 for feeding purposes, cake and straw produced a
 nice bloom on cattle, and to raise their value in the
 market. If the country were in good housing for
 cattle, there was a great deal more in good housing
 than people imagine, and it was certainly a
 great advantage to those tenant-farmers whose lands
 had provided them with efficient housing for their
 cattle.

Sir ALEXANDER GIBSON MARRIOTT understood
 from the discussion, one reason in favour of pulping,
 and that was, that the animals feed kindly, so that they
 and that largely. With regard to the scanty Turnip crop
 of last year, he thought the way whereby they might
 augment their stock was by taking more care in fitting
 and housing the stock. If they looked around the neigh-
 bourhood of Stirling they would find that the Turnip
 crop was removed from the field in the most careless
 manner possible. He had seen Turnips lifted, and left
 in the field exposed to all the rains of heaven and all
 the frosts, and then removed after the rain. Now, it
 was well known that Turnips were never so good after
 rain and frost—that they were best fresh

SUTTONS' GRASS SEEDS

FOR ALL SOILS,

ABRIAGE FREE,

PRODUCING ABUNDANT CROPS OF HAY AND SUPERIOR PASTURE

A SHARER MEDAL FOR EXCELLENCE OF QUALITY,

PARIS, 1867

MESSRS. SUTTONS'

Seed Potatoes.

CHARLES SHARPE AND CO. are now prepared to make special offers of a large quantity of SEED POTATOS for sale.

Plants, to be Sold, Cheap.

G. GAINES begs to offer to Nurserymen and Seedsmen the GREEN GLOBE ARTICHOKE plants, which are the best in the country. Also the STRONG TARRAGON plants. For particulars apply to G. GAINES, Herbalist and Seedsmen, 10, Abchurch Lane, London, W.C.

GIANT ASPARAGUS PLANTS, the best that money can procure. 2s. 6d. per 100. These are a Vegetables which do not require a lot of expense in growing. For particulars apply to RICHARD WALKER, Seed and Plant Dealer, 10, Abchurch Lane, London, W.C.

Choice Potatoes for Planting.

SUTTON & SONS can supply the following excellent POTATOS at very moderate prices:
Mylor's Early Aspinall, Sherry Bona, Daubay, Duke of Albany, Flour Blaw, Walker's Regent.
Lowest prices per Sack or Ton on application. Berries & Sons, Seed Growers, Reading.

RICHARD WALKER has to offer the finest sort of ROUNDED POTATO (AMERICAN RED) — 1 lb. tubs as white as snow, and is the best crop in the country. It was imported in 1855. As too block of ground, apply early. Price per cwt. 30s. Special quantities at the same rate. SEAKALE, for planting, 3s. 6d. per 100. FACED PEAS, 2s. per 100. In the case of Market Gardeners.

New and Superior Farm Seeds.

FRANCIS & ARTHUR DICKSON & SONS, The "Old Established" Seed Warehouse, 100, Eastgate Street, and The "Upton" Nurseries, Chester. PRICED DESCRIPTIVE CATALOGUE OF FARM SEEDS post free, on application.

MIXTURES OF GRASS SEEDS for Permanent Turf and Rotation Crops, to suit every description of Soil and Climate, of very superior quality. Finest clean seeds of CLOVERS, RYE GRASSES, and NATURAL GRASSES, at Market rates. See prices and prices on application.

THE DORSET MANURE and other SEEDS are available with the best quality of seed, and are of the highest character. Special Estimates for large quantities. Orders amounting to £2 value (Grain, Potatoes, &c.) excepted will be delivered carriage free, at the principal Railway Stations in the Kingdom.

EDWARDS' FINEST CUCUMBER, recommended by all who have seen it to be the best in cultivation. It is a most prolific bearer, possessing every quality of a first-rate Cucumber, and produces fruit 24 to 30 inches in length at every joint. Orders have been given by all who have seen it growing. A brace of the above was sent to the Editor of the Gardeners' Chronicle. The following was his opinion, on the 19th December — "A handsome white-skin variety, of crisp flavour, and having the recommendation you mention it is a desirable variety." Can be had in packets of 2s. each, or 2s. 6d. each of George Edwards, King Street, Castle Gate, York, and of Messrs. Huxley & Sons, Seedsmen, 6, Leadenhall Street, London, E.C.

ROLLISSONS' TELEGRAPH CUCUMBER (True).

From the general satisfaction with the Telegraph Cucumber has given, Messrs. Rollisson & Sons are much encouraged to again offer good and well ripened seed of this most extraordinary variety. Its wonderful cropping qualities have this year been witnessed at the Establishment by many experienced judges, all of whom have agreed that it is the best in cultivation for that purpose; in fact, it has been acknowledged to be, by the best authorities of the day, the most productive yet introduced for Winter and Early Spring use, in proof of which —

The above may be had in printed and sealed packets, guaranteed true, price 2s. 6d. each from The Nurseries, Tooting, London, S.W.

WILLIAM ROLLISSON AND SONS also beg respectfully to announce that their GENERAL and PRICED SEED CATALOGUE for 1869 is now published, which contains many notes on the way of VEGETABLE and FLOWER SEEDS, also numerous valuable hints as to the best quality of SEEDS. TROPICAL PLANTS which can be raised from Seed, in which it is also included the following choice Flower Seeds:

CENTAUREA LAGASINA COMITATA. The foliage of this new variety has the most striking appearance, which is very dwarf and compact habit, and is much to be desired as a large and brilliant border that will give the most varied varieties. Price per packet 2s. 6d.

KENNEDY'S FINEST WHITE. This extremely ornamental Green-leafed variety forms a great improvement on the months of December and January. The flowers, which are as large as those of a good-sized Red Petal, are of a deep scarlet-crimson, to which a stripe of white runs through the middle. Very young plants of 3 inches will bear an abundance of seed. Price 1s. per packet. See particulars from 1s. 6d. to 1s. each.

PRIMULA SINENSIS FEMINATA. — Seed saved from the finest prize strains in cultivation. Price per packet 2s. 6d.

PRIMULA SINENSIS KERMESINA SPLENDENS. — Seed saved from the lightest colored variety. Price per packet 2s. 6d.

INERATA. — Seed saved from James's variety, the flowers of which combine red and white, and are of the most perfect form. Price per packet 2s. 6d.

CYCLAMEN PERVICUM. — The best which W. R. & Sons possess of this species. It is a great improvement on the months of the finest collections in the country. The flowers being of the brightest crimson, and are of a very large size, and are most beautiful in appearance. Some are most beautiful in appearance and striped with white and light grounds, while many are of a solid color and are of a very large size, and are of a deeper shade. The variety is of the best of the flowers of this strain, many of them being of the best of the season, and were really beautiful. Price, a printed and sealed packets 2s. 6d. to 3s. 6d. per packet.

W. R. & SONS' GENERAL CATALOGUE OF SEEDS may be had gratis, and post free, on application to The Nurseries, Tooting, London, S.W.

weeks after planting. This is done to "let the soil settle down flat, more especially in the case of the potato crop, as manure is not so much broken up as in the case of the other crops. In some cases the manure is not broken up until the autumn, when the manure is not so much broken up as in the case of the other crops. But in the case of the potato crop, the manure is not so much broken up as in the case of the other crops. Some of the most common mistakes in the case of the potato crop, is that the manure is not so much broken up as in the case of the other crops. The general practice is to apply the manure to the potato crop, and to apply the manure to the potato crop, and to apply the manure to the potato crop. The general practice is to apply the manure to the potato crop, and to apply the manure to the potato crop, and to apply the manure to the potato crop.

Notices to Correspondents. Put a bit of sulphur, about two parts of cream, as soon as it is taken from the lay before you churn, put the cream in boiling water for half an hour, and then while it is in the hot water, and afterwards steam it to get rid of the sulphur. The sulphur is not so much broken up as in the case of the other crops. The general practice is to apply the manure to the potato crop, and to apply the manure to the potato crop, and to apply the manure to the potato crop.

NO IMPROVEMENTS OR ALTERATIONS FOR THE PRESENT SEASON, 1869,

GREEN'S PATENT SILENS MESSOR,

OR

NOISELESS LAWN MOWING, ROLLING, and COLLECTING MACHINES.

The Extraordinary Success of GREEN'S PATENT LAWN MOWERS is an established fact. During the last five years the demand has been unprecedented, and alone is a proof of their superiority over all others. The following are their characteristic features —

- 1st. Simplicity of Construction, every part being free of access.
- 2d. They are worked with far greater ease than any other Lawn Mower.
- 3d. They are the least liable to get out of order.

From the fact that these MACHINES are so well known in Great Britain and Ireland, also on the Continent of Europe, T GREEN AND SON do not deem it necessary to trouble the Public with a List of the numerous Testimonials that they have received from time to time, but would simply add,

THEY ARE THE ONLY MACHINES IN CONSTANT USE AT

- | | | |
|---|-----------------------------------|------------------------------|

AND IN MOST OF THE PRINCIPAL PARKS, SQUARES, ETC., IN THE UNITED KINGDOM.

HORSE, PONY, AND DONKEY MACHINE.

GREEN'S PATENT LAWN MOWERS

have proved to be the best, and carried off every Prize that has been given in all cases of competition.

T. GREEN & SON

warrant every Machine to give entire satisfaction, and if not approved of can be returned unconditionally.

PRICES of HORSE, PONY, and DONKEY MACHINES, including Patent Self-delivery Box; Cross Stay complete; suitable for attaching to ordinary Chain Traces or Gig Harness.

PONY AND DONKEY MACHINES.

To Cut 28 inches	£13 0 0	Leather Boots for Donkey, 18s. Leather Boots for Pony, 22s.
" 28 " " " " " "	16 0 0	
" 30 " " " " " "	17 0 0	

HORSE MACHINES.

To Cut 30 inches	£21 0 0	Leather Boots for Horse, 25s.
" 36 " " " " " "	24 0 0	
" 42 " " " " " "	27 0 0	
" 48 " " " " " "	30 0 0	

Both the Horse, Pony, Donkey, and Hand Machines possess (over all other Makers) the advantage of Self-sharpening. The cutters being steel on each side, when they become dull or blunt by running one way round, the cylinder can be reversed again and again, bringing the opposite edge of the cutter against the bottom blade, when the Machine will cut equal to new. Arrangements are made that the cylinder can be reversed, by any inexperienced person, in two or three minutes.

HAND MACHINES.

To Cut 10 inches ..	£3 10 0	Suitable for a Lady
" 12 " " " " "	4 10 0	" " "
" 14 " " " " "	5 10 0	Suitable for One Person
" 16 " " " " "	6 10 0	" " "

To Cut 18 inches ..	£7 10 0	Suitable for One Person
" 20 " " " " "	8 0 0	Suitable for Two Persons
" 22 " " " " "	8 10 0	" " "
" 24 " " " " "	9 0 0	" " "

Packing Cases are charged at the following low rates, viz. — for the 10 and 12-inch Machine, 3s.; 14 and 16-inch, 4s.; 18 and 20-inch, 5s.; 22 and 24-inch, 6s. Persons providing themselves with Lawn Mowers are recommended to purchase the cases in which to stow them away, when not in use, to prevent them from getting damaged. If returned, two-thirds will be allowed for them.

The above MACHINES are made from the best materials, and of superior workmanship; are delivered Carriage Free to all the principal Railway Stations and Shipping Ports in England.

Every Machine is warranted to give entire satisfaction, and if not approved of, can be returned unconditionally.

T GREEN AND SON have a large quantity of LAWN MOWERS in stock at their Leeds and London Establishments; also various other kinds of HORTICULTURAL and AGRICULTURAL IMPLEMENTS, GARDEN SEATS and CHAIRS, FOUNTAINS, VASES, PLAIN and GALVANISED WIRE NETTING, and ORNAMENTAL WORK of every description.

Having very extensive Premises in London, we are in a position to do all kinds of Repairs there, as well as at our Leeds Establishment.

Having a large quantity of MACHINES in stock at our Leeds and London Establishments, we are in a position to execute Orders on the day they are received.

Burton & Sons, Seedmen to the Queen, Reading.

F AND A. SMITH beg to announce that their splendid Collection of CINERARIAS is now in full bloom, and will well repay a visit. They would call the attention of purchasers to the following varieties, which are now being sent out, each of which has obtained Certificates at the Royal Horticultural Society, and pronounced far in advance of anything hitherto offered—

INO. Large white flowers, with tip of light crimson, extra fine.
PANDORA White, with heavy tip of carlet crimson; very large head, and good habit.
ROYAL PURPLE Shaded purple and puce, with ring of rich crimson, and inner circle of pure white, undoubtedly one of the finest habited and the most richly coloured variety yet sent out.
 Lists of other varieties on application.
 The Nurseries, West Dulwich, S.E.

New Seeds for the Garden and Farm, 1869.

A RCHD. HENDERSON'S DESCRIPTIVE and PRICED CATALOGUE of SEEDS, containing Cultural Remarks on all the most important SEEDS, A select list of GLADIOLUS for Spring Planting, GRAPE VINES, in Pots, an unrivalled Collection.
 Also his DESCRIPTIVE CATALOGUE of GENERAL NURSERY STOCK is now ready, and may be had gratis and post free upon application.

Ston Nursery, Thornton Heath, Surrey, and at the East Surrey Seed Warehouse, College Grounds, North End, Croydon.

Vegetable, Agricultural, and Flower Seeds.
 MICKLETHORPE HARDY HERBAGE PLANTS, Sweet Violets, &c.
ROBERT PARKER begs to announce that his CATALOGUE, containing DESCRIPTIVE LISTS of the finest kinds in cultivation of the above-named, is now published, and will be forwarded to applicants. The stocks of Seeds have all been procured from the best possible sources, and are warranted genuine, and are offered at the lowest possible prices.
 Intending purchasers are requested to compare the prices with those of other houses.
 Exotic Nursery, Tooting, Surrey, S.W.

Genuine and First-class Seeds, Carriage Free.
W M. PAUL begs to announce that his NEW CATALOGUE of SELECT VEGETABLE and FLOWER SEEDS is just published, and will be forwarded free by post on application.
 He has made enlarged arrangements, by which he believes he will be able to secure for his Customers, as usual, the best means of VEGETABLE and FLOWER SEEDS, of good germinating quality, free from adulteration. For further particulars, see large Advertisement of last week.
 Important.—All letters should be addressed Wm. Paul, Waltham Cross, London, N.

CHOICE PRIMULA SEEDS.
B. S. WILLIAMS
 SEEDS TO CALL SPECIAL ATTENTION TO HIS SUPERB STRAIN OF THIS
UNIVERSALLY ADMIRER WINTER AND SPRING FLOWERING PLANT.
 He can with confidence offer it as being unequalled in cultivation.
 Plants from this Seed have always been awarded First Prizes wherever exhibited. B. S. W.'s strain of Primula is so well known to all the principal gardeners in the three kingdoms that testimonials are unnecessary.
 In sealed packets, Red, White, or Mixed, 2s. 6d., 3s. 6d., and 5s. each.
VICTORIA and PARADISE NURSERIES, UPPER HOLLOWAY, LONDON, N.

CYCLAMEN PERSICUM (HYBRIDS).
B. S. WILLIAMS
 HAS GREAT PLEASURE IN OFFERING
SEEDS OF HIS SUPERB VARIETIES OF CYCLAMENS,
 Which are much superior to those sent out by him last season, being saved from the plants exhibited by Mr. Wiggins, at the Meeting of the Royal Horticultural Society, at Kensington, on Tuesday last (Feb. 26) when they were pronounced far in advance of any ever before raised, both in point of size of flower and richness of colour, which varies from pure white to mauve and deep red; many of them in addition being beautifully striped and spotted, and deliciously fragrant. Seeds sown in heat from the present time until the end of March, can be proved to produce flowers within 12 months.
 B. S. W. having made arrangements for the supply of all Mr. Wiggins' Seed, it can only be had from sealed packets bearing his name and address.
 In Sealed Packets, 1s. 6d., 2s. 6d., and 3s. 6d. each.
B. S. WILLIAMS, VICTORIA and PARADISE NURSERIES, UPPER HOLLOWAY, N.

WILLIAM ROLLISSON & SONS'
BRILLIANT NEW TRICOLOR GERANIUM, THE MOONSTONE
 WILL BE SENT OUT ON AND AFTER THE 30TH OF APRIL NEXT.

The habit of the above most beautiful Tricolor is compact and exceedingly free; the leaves, which are of substance and moderately large, are almost round, and from the slight convexity of their shape they exhibit to great advantage the rich and varied colourings with which they are adorned; the centre of the leaf is of a bright and green surrounded by a dark chocolate zone, which is much intercepted by the most intense blood-red. This colour shades off, towards the edge of the leaf, to a soft crimson-lake, which entirely encircles the whole zone, with a bright lemon-yellow belt. It is somewhat in the way of *Lucia Grove* in its colourings, but is rather brighter and, unlike the shy habit and slow growth of that variety, "The Moonstone" is almost as free in habit as *Tom Thumb*, while it remains constant in character. Thus, without exception, is the finest Tricolor hitherto offered to the public.

THE FOLLOWING NINE SPLENDID NEW DOUBLE GERANIUMS FOR 1869.

MADAME BONDET	MDLLE. LOUISE DELESALLE	M. PROEBEL
MADAME DEBRAY	M. DE ST. JEAN	MARIE LEMOINE
MARIE CROUSSE	M. DE ST. PAUL	WILHELM PFITZER

Together with many other Novelties of sterling merit, will be distributed on and after the 30th of April next.

For Descriptions and Prices of the above, see SPRING CATALOGUE of NEW and CHOICE SOFT-WOOD PLANTS for 1869, which will be sent Gratis and Post Free on application to
THE NURSERIES, TOOTING, LONDON, S.W.

TO THE TRADE ONLY.
STUART & CO., SEED GROWERS, NICE.

 (Late of 85, Southampton Row.)
WHOLESALE CATALOGUE ON APPLICATION.

THE FOLLOWING SPECIALITIES SUPPLIED AT THE CATALOGUE PRICE OR SPECIAL OFFER FOR LARGE QUANTITIES.

ECHEVERIA METALLICA.—Fresh Seed now ready to send out, in pods containing from 20 to 50 seeds, with full directions as to culture. Few plants equal this grand House-Leek for subtropical or alpine succulent gardening, for the decoration of the Conservatory; its large massive leaves, shaded with a purplish glaucous hue, are unique.

PYRETHRUM GOLDEN FEATHER.—A valuable plant for ribands, beds, edgings, &c. Raised from seed, retains its beautiful golden hue longer than if propagated by cuttings or divisions.

CARNATION SEED, from Florist's Flowers, in Mixture or in Collections.

PICOTESE SEED, from Florist's Flowers, in Mixture or in Collections. Stuart & Co.'s Carnation and Picotee Seeds have long been noted for their large yield of fine double flowers.

PELARGONIUM SEED.—Large-flowered, Spotted, Fancy, and Dissectatum, in Mixture or in Collections. The Seed we offer produces flowers of great beauty.

PELARGONIUM (ZONAL) SEED.—Saved from the newest Variegated Tricolor and Bicolor Varieties, and from those crossed with the finest Zonals.

PRIMULA SEED.—Saved from the largest and brightest-coloured floriated flowers, from Fern-leaved and Double Varieties.

PINK SEED.—Saved from the choicest English varieties.

HOLLYHOCK.—Saved from English Exhibition varieties.

LOBELIA LITTLE GEM.—The prettiest of last year's novelties, flowers pure white, with clear well-defined blue margin, compact, and blooming throughout the season.

PETUNIA SEED, of exquisite quality.

CINERARIA SEED.—Saved from the choicest Florist's Flowers.

ZINNIA SEED, from magnificent double varieties.

CENTAUREA CANDIDISSIMA (RAGUSINA) variegated plump, well-ripened seeds.

CENTAUREA GYMNOCARPA SEED, true.

BALSAM SEED, finest double varieties.

VIOLA CORNUTA SEED, PURPLE QUEEN.—The most darkest coloured, and most profuse blooming variety.

MYOSOTIS SYLVATICA SEED, the finest Forget-me-not for spring gardening.

ORNAMENTAL GRASSES.

SUBTROPICAL PLANT SEEDS.

MELONS.—Choice hybrid, our own raising, unequalled in exquisite luscious flavour, fine shape, and beautiful markings.

MELONS.—All the usual sorts in cultivation, selected fruits only.

CUCUMBERS.—All the finest varieties in cultivation.

STUART AND CO., 5, TAVISTOCK ROW, COVENT GARDEN, W.C.

 Flowers. One mile from Cheshunt Station, Great Eastern Railway.

BARR & SUGDEN,

12, KING STREET, COVENT GARDEN, LONDON, W.C.

ADULTERATION OF SEEDS.

"The law is a terror to evil doers, and a praise to them that do well."

Mr. Webb's proposed Bill imposes a penalty not exceeding £50 for killing Seeds or destroying the germinating power
 of other artificial means, or for giving Seeds a false or deceptive appearance by colouring, dyeing, or other
 means, or for knowingly selling or having for sale any killed or dyed Seed.—*Vide "Times," March 18, 1869*

UNSOLICITED TESTIMONIALS, SUCH AS B. & S. ARE CONSTANTLY RECEIVING.

Mr. J. W. Brown informs Messrs. Barr and Sugden that he cut
 expressed the same. Mr. Brown himself has always found the
 seeds, bulbs, &c., from their establishment to be of first-rate
 quality.—*Much Hadham, Nov. 26, 1868.*

The above will suffice to show that while B. & S. had with satisfaction
 Mr. Webb's proposed measure for the public protection,
 their customers must have always felt satisfied that the Seeds
 received from their house had not been tampered with.

HUNDRED sorts of ALPINE and HERBACEOUS PERENNIAL SEEDS, from one of the most choice
 Collections in Europe, GLADIOLI, embracing the new kinds and all the older varieties worthy of
 Offered for the first time in this country, a SPECIAL LIST of NEW TABLE MAIZE, from the
 Rebut, of Guernsey (Her Majesty's Commissioner at the Paris Exhibition of 1867 to report on the
 state of Fruit Culture on the Continent, and author of "Cordon Training," "The Modern Peach Pruner,"
 &c.) The varieties embrace those most esteemed by our American Cousins, who use the green cobs as one of
 the best Vegetables in this country, they will come into use when the supply of Green Peas is becoming short,
 as we find an agreeable substitute for Green Peas. (See Leading Article on Maize, "Journal of Horticulture,"
 page 155.) For further particulars, see B. & S.'s SPRING SEED CATALOGUE, page 58.

BARR & SUGDEN'S COLLECTIONS of SEEDS and GLADIOLI,
 and Genuine, Home-grown when advisable, and direct from the Growers, &c., &c.

BARR AND SUGDEN, 12, KING STREET, COVENT GARDEN, W.C.

B. S. WILLIAMS,

NURSERYMAN AND SEEDSMAN,

VICTORIA and PARADISE NURSERIES, UPPER HOLLOWAY, LONDON, N.,

essentially writes the Nobility and Gentry about to furnish their Conservatories, Greenhouses, Stoves, or
 Orchid-houses, to an inspection of his

STOCK OF MAGNIFICENT SPECIMEN PLANTS,

MANY OF WHICH ARE UNEQUALLED IN THIS COUNTRY.

THEY CONSIST OF—

The choicest and rarest Exotics, such as TREE-FERNS, PALMS, BEAUCARNEAS, AGAVES, YUCCAS,
 ARALIAS, CAMELIAS, AZALEAS, and all other kinds of STOVE and GREENHOUSE FLOWER-
 PLANTS, and ORNAMENTAL FOLIAGE PLANTS, proved to be worthy of cultivation.
 A Large CONSERVATORY, at all times of the year well worth a visit, is now unusually gay with flowers of
 Azaleas, Ericas, Epacris, the magnificent varieties of Cyclamen persicum, obtained from Wiggins' strain
 of Williams' superb Chinese Primulas, the beautiful improved Hybrid Solanums, now laden with their large
 ornamental berries, Hyacinths, and many other Spring Flowering Plants, also helping to make a grand
 display.
 STOVES and ORCHID-HOUSES are also very attractive and interesting just now, with blooms of
 Cypripediums, Cologynes, Lycaste Skinneri, Phalaenopsis, and many other kinds.
 The COLLECTION of MEXICAN PLANTS is surpassed only by that of Kew Gardens.
 A SEW PLANTS of sterling merit are added to the Collection as soon as procurable, and may be seen here,
 a selection of which would alone repay a visit.

In May will be published,

A CATALOGUE OF NEW AND RARE PLANTS FOR 1869,

POST FREE TO ALL APPLICANTS.

The "Parasite" Omnibuses leave Victoria Nursery every seven minutes for the City and London Bridge, the
 Victoria Station, and for Regent Street, the West End, and Brompton.

VICTORIA and PARADISE NURSERIES, UPPER HOLLOWAY, LONDON, N.

New Bedding Plant—*Echeveria metallica*.
B. S. WILLIAMS is now enabled to offer for the
 first time SEEDS of this very Ornamental Bedding Plant,
 which during the past season produced such a splendid effect in
 the Grounds at Battersea Park. For edging, and various other
 purposes, the broad bronzy leaves afford a very striking and
 beautiful contrast, quite distinct from any other plant yet used for
 Bedding purposes. In sealed Packets, 2s. 6d. each.
 B. S. WILLIAMS' Victoria and Paradise Nurseries, Upper Holloway N
 Gladioli, the most Extensive Collection.
BARR AND SUGDEN, 12, King Street, Covent
 Garden, W.C. have the finest and largest collection of
 GLADIOLI ever offered, prices varying from 2d. to 15s. per root.
 For particulars see pp. 68, 69, 70, and 71 of B. & S.'s SPRING SEED
 CATALOGUE.
 BARR & SUGDEN, 12, King Street, Covent Garden, W.C.

GOLDEN FEATHER PYRETHRUM,
(Pyrethrum parthenifolium aureum), new Golden-leaved
 Bedding Plant—A dwarf, bushy perennial, 6 to 8 inches in height,
 with beautiful golden leaves, of densely compact growth, un-
 equalled for riband-row or belts for the Flower Garden. It is
 perfectly hardy, and simply requires its flower-buds pinching off
 during the summer months, and stands through winter as a
 permanent gold edging plant. Produces its golden foliage true
 from seed. Sold in packets free by post, 1000 seeds, 1s. per packet.
 Any number of packets free by post. Seed our own saving of 1868.
 Trade supplied.
 London Agents Messrs. HEARY & SON, 6, Lendenhall Street, E.C.
 J. SLAYER & SONS, The Nurseries, Malton, Yorkshire.

Golden Coleus, Queen Victoria.
MESSRS. JOHN AND CHARLES LEE are now
 sending out this most beautiful and most brilliant of all
 Coleuses. The centre of the leaves are superb bronzy, light crimson
 edged, with a double row of golden beads richly broken with crimson
 veins. *QUEEN VICTORIA* is of free growth and good habit, and
 has a truly regal appearance. First-class Certificate. Price 7s. 6d.
 Messrs. LEE & CO. for *COLLEGI PRINCESS ROYAL*. Colour and
 habit the same as Queen Victoria, except that the golden margin is
 much narrower. A superb variety. First-class Certificate. Price 7s. 6d.
COLEUS ALBERT VICTOR. Centre of leaves bronzy-red,
 shaded with purplish margin, golden margin very broad. Very
 distinct and effective. A strong grower. First-class Certificate.
 Price 7s. 6d.
 The Set of Three for 20s. Usual allowance to the Trade.
 Royal Vineyard Nursery and Seed Establishment, Hammersmith.

New Golden Coleus.
DOWNIE, LAIRD, AND LAING can supply the whole
 series raised at the Royal Horticultural Society's Gardens,
 Chiswick, at adverted prices, a ter March 16.
 CATALOGUES free on application.
 Stanstead Park, Forest Hill, N. E. and at Edinburgh.

New Golden Coleus.
DOWNIE, LAIRD, AND LAING have much pleasure
 in offering the following beautiful and distinct novelties,
 which they feel assured will give every satisfaction. Each has
 received First-class Certificates, and will be sent out on March 16
 next, at 7s. 6d. each:—
ALBERT VICTOR, a very distinct tricolor variety, the centre
 of the leaves being bronzy red, stained with large blotches of
 deep purplish-crimson, and the golden margin is very broad,
 much more so than in any other of the new golden sorts, the
 marginal teeth are also marked out by rich carmine lines. It
 has a very free habit of growth.
BARONESS ROTHSCHILD, an exquisitely beautiful variety, the
 centre of the leaves being of a bright bronzy-crimson, without
 stains or blotches, margin bright golden, and the teeth beauti-
 fully marked with light carmine. In habit of growth it resembles
 Albert Victor.
PRINCESS BEATRICE, a charming variety, of a beautiful light
 golden hue, the main veins being a richly marked, and the
 margin entirely defined by dark crimson lines, dwarf, an
PRINCESS ROYAL—The centre of the leaves are of a bronzy-
 crimson, with a narrow bright yellow margin, a handsome and
 most effective pot plant, and a most desirable variety for bed-
 ding, being very bright, and nearly an entire colour, a free
 grower.
 Stanstead Park, Forest Hill, London, and Edinburgh.

March 20, 1869.]

A PAPER on the FOOD STATISTICS of the
COUNTRY in 1868 was read on Tuesday evening
before the Statistical Society, by Mr. CAIRD.
The subject in all its bearings includes, of course,
the whole field open to the writers and readers of
the *Agricultural Gazette*, and we have therefore
given the whole of Mr. CAIRD's discussion of it
in the following pages. The tabular statements
issued by the Board of Trade on this and other
departments of British industry need some
annual exposition of the kind which Mr. CAIRD
has given us during the past two years, in order
to the full appreciation of their lessons.

Figures, like pictures, are of course the
terrest of all writings; and nouns substantive
being their only part of speech, the verbs and
adjectives by which their lessons can alone be
told have to be supplied by their expounder. The
story as listened to is thus much longer than the
story seen, and it was therefore to only a few of
the points illustrated by Mr. FONBLANQUE's Blue
Book that Mr. CAIRD could direct our attention.
His paper first referred to the justification which
his previous estimates, founded on the Agricul-
tural Statistics of 1867, have received during
1868. The foreign supply which we needed
that year for the provision of sufficient bread
during the harvest year, had been calculated at
9,600,000 qrs.—the actual receipts were 9,609,000
qrs., if the year were taken from August to
August; 9,293,000 if it were taken from Sep-
tember to September—thus justifying the esti-
mate, not only of the crop, but of another very
important element in all such calculations—the
possible saving in the consumption of the bread
of a country during a period of high prices.
This is much less than has been generally
imagined. Bread is the last item of consump-
tion that yields to the pinch of poverty; and
Mr. CAIRD's opinion, that it can be calculated at
only 1 per cent. for every 10 per cent. in its
increased cost, has been well borne out.

The contrast between the harvests of 1867
and 1868, was another of the facts well

illustrated by these returns. Taking the quality as well as quantity of the Wheat into account, the difference was as 9 to 16. Seven millions of quarters of Wheat, or one-third of our whole bread consumption, was grown in 1868 more than in 1897, and the contrast in price between May of 1868, when the food of the former year was all our stay, and that of December, when the full abundance of the previous harvest had been realised was as great. It was 73s. 6d. in the former month, 50s. 1d. in the latter—a difference here also, of about one-third. Any forecast of prices and of imports during the remainder of the present harvest year must depend on accuracy in estimating, not only home produce but foreign abundance. In France alone a difference of only one bushel per acre in the crop amounts to 2,000,000 qrs. per annum. Her neighbourhood thus affects our markets enormously. And a scarcity in France immensely aggravates any difficulty of our own. The quantity already imported is, however, after a higher rate than that of the average of the past 10 years, and the probability would be that prices will yet fall, were it not that the exceptional character of the past year, as regards the other productions of the farm, complicates the problem.

Mr. CAIRD then proceeded to discuss our food consumption, and it appears that this is gradually increasing and has now risen from 111 lb. to 145 lb. of Wheat per annum individually, while the proportion of it which is imported from abroad has risen from 79 lb. to 134 lb. per head. The naturally falling price of Wheat during the last 20 years in this country has diminished home production. The price was 6s. a quarter less during the past eight years than during the eight years immediately preceding. And Mr. CAIRD'S explanation of the singular fact, that Wheat alone, of all our grain crops, is thus affected by free trade throws a great deal of light upon the subject. The peculiarity is explained by him on the ground that Wheat, of all our cereals, has the largest area of production within our reach.

Passing from the bread part of our food, we come to the meat question, and the relations of home and foreign supply were elaborately discussed in the paper last Tuesday. Of course this, as affecting impending legislation on live stock importation, received full discussion.

The light thrown by the returns on the differences in the agriculture of the three kingdoms, and on certain differences among our own counties, was well exhibited. As regards the former it appears that there is more stock, and a larger proportion of "restorative" cropping, in Ireland, than in any other part of the United Kingdom, and barring the extremely small farms, which really do not constitute so large a part of that island as supposed, it seems to be Mr. CAIRD'S opinion that Irish farmers contribute per acre as largely to the food supply of the country as any others in the United Kingdom.

The question of large or small farms generally received also some illustrative treatment, less, however, with the view of exhibiting any special result attributable to this difference alone, than in order to present a general picture of the differences in the industry of coal and chalk counties, as Mr. CAIRD termed them, respectively—in the former of which small farms, and in the latter larger farms, are found to prevail. The effect is that higher wages and higher rents do as a matter of fact prevail in the districts where the average size of the farms is smallest. Mr. CAIRD concluded with a hopeful reference to the prospects of the new beet-sugar industry.

Of the discussion our report must be brief.

Mr. C. S. READ, M.P., defended the value of agricultural statistics on general grounds, and expressed a desire that their collection and publication should be continued though, as farmers are not speculators they may have no special agricultural serviceableness. He referred to the estimate which Mr. CAIRD had given of our proportional dependence on the foreigner for meat, and expressed his belief that our imported supply did not exceed one-twentieth of our consumption. He defended agriculturists from the charge of indifference to the condition of the agricultural labourer, this having been a subject which had been oftener than any other discussed in Farmers' Clubs and Chambers of Agriculture.—Dr. GILBERT, in a speech which we must give fuller next week, referred to the methods by which his estimate of the annual consumption of Wheat had been arrived at, and

to the conclusions at which he had arrived. The poorer the people, the larger the consumption of Wheat by them. Mr. GLOVER spoke of the very partial degree to which any such estimates as had been discussed could with any safety be used to regulate the proceedings of either importers or commercial men.—The Rev. Canon GARLESTONE spoke at length on the condition of the agricultural labourer, contrasting his plight in the northern counties with what he took to be the state of things in the South.—Mr. CUNNINGHAM supported the rev. gentleman by facts within his own knowledge from observations he had made in the midland counties.—Mr. DUDLEY BAXTER supported Mr. READ in his estimate of the quantity of imported meat as compared with that of home-grown produce.—The Chairman, Mr. NEWMARCH addressed the meeting at considerable length. "It is not our business," he said, "to speculate in corn. Nor are we responsible for inferences that may be drawn from our facts. But what we are responsible for, is the accuracy of our statements." He was sorry to find there was so much difference of opinion on the consumption of Wheat. There ought to be Governmental inquiry into the truth on this subject, and this he hoped, with the advice and assistance of Mr. CAIRD, would yet be undertaken. There were differences, too, on the influence of large and small farms as regards labour and rent and he thought it highly desirable that some one should go through different counties to gather information on the relations of rent, wages, and produce. As regards the condition of the labourer, he thought when the Rev. Canon GARLESTONE entered into generalities, and found fault with classes, he travelled out of the province of this Society. The remedy for the present evils would be found in giving children and youths more of a technical education, and less of a theological and literary one.

Mr. CAIRD, in reply, expressed regret that the discussion had wandered from his subject. He was prepared to maintain the correctness of his last year's figures regarding the proportions of foreign and home meat supplies, and believed that he had rather erred on the side of under statement as to the former. His table of large and small farms was made out without any other consideration than to exhibit the results which followed the respective systems, and to give a full statement of the circumstances which influenced those results. He had endeavoured to open up, and to throw what light he could on, large questions affecting the progress of agriculture and the future supply of food, and he trusted that the labour he had bestowed on the subject might bear useful fruit.

We hope to give a fuller report of the discussion next week.

—The corn trade is in a heavy state at the decline of Monday. A short home supply was counteracted by large foreign stocks, in granaries and afloat.—The meat trade has been over-done this week, from previous high prices having induced excessive consignments.—The seed trade has, generally, become very active.

—It is announced that Mr. WERN HOSKINS is a candidate for one of the Parliamentary seats for the City of Hereford, which have just been declared vacant by the Court. We do not know if there be any farmers or farm-ers among the citizens of Hereford, or any readers of the *Agricultural Gazette* who hold the franchise there, but in case there be, we venture to express to them the hope that they will send up Mr. HOSKINS as their representative. They could hardly do a greater agricultural service. What his politics on party questions may be, we do not know. But on whichever side of the Speaker he may sit, it is certainly desirable that one so intimately acquainted with the influence of the Land Laws of the country throughout the whole structure of society, whether in town or country, should have a seat in Parliament. No one could speak with more authority than Mr. HOSKINS on these and kindred subjects, and it will certainly be a circumstance as fit as it is fortunate if the City of Hereford should return a country gentleman so well qualified to do justice to the interests of both town and country.

—Mr. ALLNATT reports to the *Times* regarding the present cold weather, that during the first 14 days of March the mean temperature has been exceeded thrice only, and that by a very small amount. On the remaining days the deficiency ranged from 1° to 4° below the average. On the 14th the ground was covered deep with snow, and mean temperature sank 4° below the average value. On the 3d, 4th, 7th, 8th, 12th, 13th, 14th, and 15th the range of night temperature was from 33° to 29°, but, notwithstanding this unwonted frigidity, the frost had comparatively little influence upon the earth, and penetrated but superficially. The preceding high rate of temperature, combined with the sun's power during the day, had so heated the ground as to enable it to react to a considerable extent the penetration of cold. Candlemas Day (February 2) fails us this season. The forecast has not been fulfilled.

An equatorial hurricane brought up a succession of heavy mountain masses of cumulus and the result was to 43°. There was nothing to indicate the coming of the present wintry weather.

OUR LIVE STOCK

OUR readers will not be in much danger of tiring the old maxim, "the more you know, the more you want to know." We expect to see a large number of sheep and lambs at the forthcoming sale, and to hear some of the best breeders and quality of the flock, as well as known to a breeder of the breed, and necessary for us therefore, to call attention to the fact that the sheep will witness the dispersion of the race. Rich's Short-horns.

—On the 1st of April an important sale of Short-horn stock will be held at Birmingham, under the auspices of the Birmingham and Midland Counties Society. A silver prize list has been issued, and is offered for the best Short-horn bull under 21 months old. Second and third prizes and 5/ will also be awarded in this class. Handsome prizes for Short-horn bull calves 6 and 12 months old. Pure-bred Short-horn all descriptions may be sent to the stock and cup has been offered by a few owners. A ram as a prize for the best animal of the cattle duly entered must be shown at 9 o'clock on the morning of the sale, and the same day by Mr. Lythall, who is secretary to the Council. The cattle will be shown at the amounts, less the commission, to be given to the owners of stock as soon as possible. The idea is an excellent one, suggested which has been given to the Spring Meeting of the Dublin Society. We trust that the sale will be a mart in England and may be evidence of that there is sufficient promise of the future of Short-horns in Birmingham. A full report with the following results, which we think will be successful, in point of numbers, and the most sanguine expectations of the future.

1st Prize	£100
2nd Prize	£50
3rd Prize	£25
4th Prize	£12 5/
5th Prize	£6 2 1/2
6th Prize	£3 1 1/4
7th Prize	£1 10/
8th Prize	£1 5/
9th Prize	£1 2 1/2
10th Prize	£1 1 1/4
11th Prize	£1 0/
12th Prize	£1 0/
13th Prize	£1 0/
14th Prize	£1 0/
15th Prize	£1 0/
16th Prize	£1 0/
17th Prize	£1 0/
18th Prize	£1 0/
19th Prize	£1 0/
20th Prize	£1 0/

—We hear from Stanton House that a good sheep stock than usual has been kept over the winter on account of the failure of the Turnip crop. Mr. Dunning is a well-known breeder of Improved Leicesters, and annually disposes of 100 rams. The average was nearly 160 each. The present flock comprises a total of 1200 of which 150 breeding ewes have a record. Mr. Dunning's 3-year ram PROGRESSOR, which took the prize in his class at the Peterborough and Northampton shows last season, was so injured on the 1st of Wetherby that it was considered advisable to put him down. His dead weight was 110 lb. per quarter.

—Mr. Wroughtby Wood of Hereford has kindly favoured us with the following account of the present state of his experiment flock of sheep.—"Swedes having been an entire failure, and Mangel barely half a crop, I deemed it better to have my lambing later than usual. Instead of having about the middle of February my arrivals were this year not until the first of March. An auspicious start has been made at the present time (March 15) 50 ewes have produced lambs which are more likely to have arrived while the ground is still wet. Hitherto the produce has averaged over an average. My flock consists of 20 years, and during that time has steadily increased in size, weight, and quality. My last year was so unfavourable for sheep that I first entered upon it I was led to the madness to attempt a breeding flock with the purest ewes that could be obtained. The present flock is almost entirely new. With the exception of some 100 ewes I purchased for 6/ each at the time of Mr. Clarke was broken up, and sold to Forster's last year, no fresh blood has been introduced into the flock. The flock was speedily increased with the arrival of 1000 more of the same breed, which took the 1st prize for quality at the present time. The pedigree of many of my ewes is from the 1st generation. My ram is the NINETEEN, a very compact heavy ram, which won the 1st prize at the present time, and promise to equal in size, weight, and weight of wool, the shearings brought forward my last year's sale. When they were weaned in summer, at an earlier period than usual, they were small that I was afraid they would never attain the usual size. Being put, however, into the usual allowance of Swedes, they grew in a most surprising, nor do they appear to have the usual allowance of Swedes. Fortunately 2

tion. The returns of live stock do not include horses, the most interesting and, dually, the most valuable of all. As every man knows the number of his horses, the return can be given without occasioning any of trouble, and I hope therefore that the statistics for the present year will include a column for horses.

Home Correspondence.

Smithfield Club.—I beg to inform you that in consequence of the storm to which the 1st prize was awarded in the case of the last Smithfield Club Show, having been a quality, the prizes will be paid as follows:—1st, 20*l.*, to Richard Shirley, of Bawtrey, Murslow, Church Streeton Salop; Silver Medal to the breeder, Mr Shirley, 21, 10*l.*, to her Majesty the Queen, R. F. Brandreth, Gibbs, Hon. Secretary.

Farming Profits.—Your last number contained a communication from Wester Ross in which the writer states that he had realised a profit of 12*l.* 10*s.* 6*d.* per acre from the produce of 62 acres of land—more than double the profit shown by Mr. Mechi. He states that he obtains 1*l.* 10*s.* from the farm on which he resides and charges it with the cost of labour. There is no mention made in his balance sheet of manual labour, but simply the labour of horses at 1*s.* per hour per pair working 1000. Admitting that all the crops have been sold off standing I cannot for a moment suppose that no expense had been incurred for manual labour, although no item appears under that head in the accounts. The sowing, hoeing and weeding of the crops and the distribution of the manure, although a man sowed in his own path does 1*s.* the value of 77*l.* 10*s.* 6*d.* over 62 acres, and must have been expensed without some expense for manual labour. On the credit side of the account there appears 8*l.* for Potato ground, was this amount the profit of the crop of Potatoes or was the Potato land sabbet? This balance sheet, which shows such large profits, is to me the most puzzling and perplexing, as well as the most unsatisfactory one which I have ever perused, and I should feel much obliged if the writer would give a full and clear statement of the mode by which he arrives at these figures, so that his profits have been 12*l.* 10*s.* 6*d.* per acre for the past year? I, March 15. What was the value of the crop under the heading of Farm, Mr. Shirley, in your issue of March 13, and how do you account for the profit of 12*l.* 10*s.* 6*d.* per acre over the whole year? When by his own account of the 1000 of Grass, corn and straw are sold off the farm, or was the year a bad one in this respect? Is the manual labour included in the sum of 6*l.* for labour of horses, at 1*s.* per hour per pair? As far as my experience extends, I find that 1*s.* per acre is a very moderate charge for horse labour, even on a light-land farm. With regard to the item "Potato ground" does he let this land for Potato growing, and if so what price per acre does he obtain, and who pays for the manuring, or, if he grows the Potatoes himself, why is there no charge for seed Potatoes? Does he mean that he sells the crops as they stand when he ments in selling them in a "raw state"? I also presume that no Turnips are grown, and no stock kept, as none are mentioned. Am I right in this, and, such is the case, does he find that the Potato farm will keep the land open? A. H.

Co-operative Farming and Technical Education.—Allow me to call the attention of your readers to the following extract from an account in the *Daily News*, describing the ways in which Parisians spend their leisure time, and to find an excellent example in every department of France. The principle is that of co-operation. A landlord takes a farm of his own and gets it farmed by 20 or 30 tenants, between the ages of 20 and 25, under the direction of an able agriculturist—the farm is found to prosper in an extraordinary degree, and in four years to have paid all its expenses, and be worth per acre more than twice its value, before the trial was made. The project is a mere one, and is founded on the quality as well as quantity of the labour furnished. At the end of the year the profits being divided equally, each tenant must possess at least 100*l.* of his own means. But, to carry the project into effect, he must be a good farmer, and must be able to read, write, and count. The experiment has been tried in various parts of France, and it is what I am stating in this paper, and I have even read the account of a farm in the district of Brest, and found that at the end of four years' work of 19 cultivators, not one but had less than 100*l.* of his own means, and had earned 280*l.*, and has been taken as one of the best in the group. The landlord, five years ago, was unable to let his farm at all, because it yielded nothing. He cut it down if he chooses for 50*l.* a year. This institution exists among its patrons the highest names in France, and M. Drouyn de Lhuys is its president, but again it needs funds. It seems to me that this plan might be advantageously followed in England. It would be a means of making good farm servants and improving the condition of our agricultural labourers, by giving them a practical education, and the evenness of respect in learning to read, write, and count. I hope you will kindly insert the above. *Mary, March 15.*

Local Taxation.—Farmers as a class do not give themselves much trouble to inquire into the facts and bearings of public questions: hence their groundless, not to say unreasonable, fears relative to the present agitation upon the subject of local taxation. They say these things only because they are told to make a worse case for farmers, and to give a more favourable position. We shall have to pay in rent what we have to pay in rates, and if farmers will only say longer with us, we shall never know how to farm our land, and we shall be shaken, and we have not a great many more years to spare to stand at our ease. Such remarks are entirely untrue, and there is nothing to be gained by any such prompt them. I do not wish to discuss the local question. Any one who is not satisfied with the present system, and who is not content with the present rates, are entitled to say what they please upon the subject. They are rated upon "real property," i.e., land, or buildings standing thereon, and they pay in rates about 10*l.* 10*s.* 6*d.* annually. The Income-tax is not charged upon the property, and it is valued at a much lower amount than the local tax. Now the local tax is paid by the tenant, and amounts to 10*l.* 10*s.* 6*d.* a year, and the Income-tax is paid by the landlord, and amounts to 10*l.* 10*s.* 6*d.* a year, and the total amount is 20*l.* 10*s.* 6*d.* a year. You are truly a great deal better off than you are if you still submit to bear your load without much murmuring. "Well, but we shall pay in rent, if not in rates," say you. This is in some measure true, probably, and in one sense right. Your farms have been long unjustly rated, to save other's pockets. Should an equitable distribution of local burthens take place throughout the whole community, your farms would be worth more rent, and as your landlord will have more to pay on account of the charge upon his income, and you so much less, he is entitled to an increase, but by no means equal to the whole saving, inasmuch as he divides his payment which now comes chiefly out of the 110,000,000*l.*, with the remaining payers of Income-tax, amounting to 2,000,000, so that in strict justice a tenant cannot be charged a third of what he now pays in rates as rent. Now take the 2,000,000*l.* charged to Income-tax, and capitalise it at an interest of 5 per cent, it makes 40,000,000*l.*, the capital of the country, exclusive of all below and above. Now what is your share of this monstrous sum? You pay on Schedule B, i.e., hat rental, some 5,000,000*l.*, say 10,000,000*l.* capitalise this in the same way, and it only amounts to 200,000,000*l.* or less than one-tenth of the whole. In the equitable distribution, then, of the local taxation the tenant-farmers would be rated upon property represented by 20,000,000*l.* capital, the public and property represented by 40,000,000*l.* capital, and the whole sum into 60,000,000*l.* Now if you have a house worth 1000*l.* and you pay 10*l.* a year for it, you are assessed the rate of 1 per cent, and if you have a house worth 100,000*l.* and you pay 1000*l.* a year, you are assessed the rate of 1 per cent, and if you have a house worth 10,000,000*l.* and you pay 1,000,000*l.* a year, you are assessed the rate of 1 per cent. I think that I have shown enough to set aside these absurd fears, and I trust every farmer will be led to take his best measures for the future till an equitable adjustment is attained. O. J.

bearings of public questions: hence their groundless, not to say unreasonable, fears relative to the present agitation upon the subject of local taxation. They say these things only because they are told to make a worse case for farmers, and to give a more favourable position. We shall have to pay in rent what we have to pay in rates, and if farmers will only say longer with us, we shall never know how to farm our land, and we shall be shaken, and we have not a great many more years to spare to stand at our ease. Such remarks are entirely untrue, and there is nothing to be gained by any such prompt them. I do not wish to discuss the local question. Any one who is not satisfied with the present system, and who is not content with the present rates, are entitled to say what they please upon the subject. They are rated upon "real property," i.e., land, or buildings standing thereon, and they pay in rates about 10*l.* 10*s.* 6*d.* annually. The Income-tax is not charged upon the property, and it is valued at a much lower amount than the local tax. Now the local tax is paid by the tenant, and amounts to 10*l.* 10*s.* 6*d.* a year, and the Income-tax is paid by the landlord, and amounts to 10*l.* 10*s.* 6*d.* a year, and the total amount is 20*l.* 10*s.* 6*d.* a year. You are truly a great deal better off than you are if you still submit to bear your load without much murmuring. "Well, but we shall pay in rent, if not in rates," say you. This is in some measure true, probably, and in one sense right. Your farms have been long unjustly rated, to save other's pockets. Should an equitable distribution of local burthens take place throughout the whole community, your farms would be worth more rent, and as your landlord will have more to pay on account of the charge upon his income, and you so much less, he is entitled to an increase, but by no means equal to the whole saving, inasmuch as he divides his payment which now comes chiefly out of the 110,000,000*l.*, with the remaining payers of Income-tax, amounting to 2,000,000, so that in strict justice a tenant cannot be charged a third of what he now pays in rates as rent. In the equitable distribution, then, of the local taxation the tenant-farmers would be rated upon property represented by 20,000,000*l.* capital, the public and property represented by 40,000,000*l.* capital, and the whole sum into 60,000,000*l.* Now if you have a house worth 1000*l.* and you pay 10*l.* a year for it, you are assessed the rate of 1 per cent, and if you have a house worth 100,000*l.* and you pay 1000*l.* a year, you are assessed the rate of 1 per cent, and if you have a house worth 10,000,000*l.* and you pay 1,000,000*l.* a year, you are assessed the rate of 1 per cent. I think that I have shown enough to set aside these absurd fears, and I trust every farmer will be led to take his best measures for the future till an equitable adjustment is attained. O. J.

Foreign Correspondence.

CANADA. Toronto, Jan. 24.—Butter.—The object of the present communication is to give you the earliest possible notice of a most dangerous agricultural fraud, which has just made its appearance here. It has come from the United States, where it has been making a great stir; it may be known in England, but I have seen no notice of it in any agricultural journal. It is an imitation of butter, and is sold as either a one, or a half a one, as to be taken to seriously affect the trade in exported butter if it cannot be stopped. It is called the "Butter secret," and has been patented. They will patent anything in Canada for the sake of the fees—a most disgraceful state of things—leaving the patentee to make good his patent if he can before the courts of law, and the public quite unprotected against the fraud of sales of such patent "rights," and by this means the merchant at his own suffer. In the present case the parties introducing the so-called "patent" into Canada will shortly realize to the amount of thousands of pounds before the matter was exposed. The plan is to take a pound of good fresh butter, a part of milk new and sweet and the sugar powder several things will have the same effect. These are mixed or kneaded together, the butter takes up the whole of the milk, and the result is a mass weighing over 2*l.* weight of a substance which resembles fresh butter as to pass for it with those who are unacquainted with a fraud. The hotels and boarding-houses in New York where fresh butter is sold cents a pound are using the machinery extensively. The mass of cases requires immediate notice, although in winter it has been kept for three weeks without change, yet American winters are so cold that any butter that is kept for very long periods. The thing is now thoroughly exposed in the papers, and I trust the public may be guarded against it. Whilst on the subject of butter I may mention a few facts with respect to that product, which may be generally known in the dairy districts in England, but which certainly are not generally made known in agricultural journals, and as what I say is the result of actual experience, I may prove useful, at an event may be mentioned. The best is with respect to water-milk butter. We all know what a trouble this is, and how irksome as to labour besides the extra labour of churning when the butter would come. As this may be avoided by properly skimming the milk, and then churning the skimed cream. The way we discovered it was this. We had an English servant, a Devonshire woman, who often asked us why we did not deacid the milk. She had heard of it, but did not know how to do it; but she

said the rule she had heard was that the milk should be set on the stove until the size of the bottom of the pan was seen as a ring on the surface. As we had been greatly troubled with the usual results of winter churning we tried it, but failed a number of times. We finally succeeded, however, and the following is the result after some 50 trials.

Set the milk when fresh milked in a place where the thermometer will stand at from 60° to 62°, let it stand 24 hours, don't have the milk more than 2½ inches deep, the cream will rise well, then move the pans carefully to the stove (we all use stoves in our kitchens in Canada), and let it rest until the thermometer shows 180°, or until the first smell of boiled milk appears. If you can keep it at this heat from half an hour to an hour so much the better, though less time will do, then move the pans back to the place they came from, and let them stand at least 12 hours until the cream is cold and solid, it will then come off in a single cake (so to speak) and leave the milk without adhering to it at all, the result is cream ready to make butter, and it may be made in large or small quantities. If in large quantities no doubt some kind of churn would be necessary, but as we made butter every second day, we used a large wooden bowl; in this bowl the cream is stirred with the hand all one way for a few minutes, generally under 10 minutes, and the butter comes at once. If it is a poor colour, the true Grass tint may be given by grating a Carrot, putting the grated pulp into a muslin, and squeezing it with and amongst the scalded cream, until the right colour is obtained. The colour adheres to the butter, leaving the butter-milk pure and white, this is a most extraordinary fact, and we never could account for it.

The great point to be attained is the right heat. If the milk is not heated hot enough, the butter will be bitter and will have a sort of sting on the palate. If it is too hot it will be very good, but will be full of white flakes, and will be less in quantity than it ought to be, but if the milk is of the right heat, so as just to develop the smell of boiled milk (or at 180°), the result will be a pure hard butter, not of the fine summer flavour, but never bad, or such as can be found fault with by the most fastidious, it keeps well as fresh butter, but it was always too scarce to make salt butter of. Of course a proper quantity of salt was used in the usual way.

We were always very careful that the milk should be good, and that if any of the cows were out of order, their milk was not mixed with the rest. When we sold this butter we always got the very highest price that was going, and customers who once took it always wanted it again. We used tin pans, and would recommend those that are stamped and not soldered.

The resulting butter-milk was very sweet and good, and was used by those who liked that article. The skimmed milk was nearly as pleasant to use as new fresh milk, but of course was poor from the absence of cream, it was in great demand by the poor families in the neighbourhood, and is infinitely superior to ordinary skimmed-milk.

In feeding our cows in winter we give them a proportion of ground peas, also bran, and distillery slop, besides hay; and we always found that the quantity of butter was in proportion to the quantity of grain used—the more grain the more butter.

(To be Continued)

Farmers' Clubs.

LAVENHAM.

Feb. 26: Comparative Profits of Different Crops.—In response to a call from the Chairman, Mr. BIDDELL read the following highly interesting paper—

The subject which I have undertaken to bring forward this evening is one that had I given much thought to beforehand I should not have selected, as I have found it much more difficult to deal with than I anticipated. Both the outgoings and receipts will, to a very great degree, rest on estimate rather than fact, hence not unhelpfully my calculations may contain many errors, and, if so, I hope the practical gentlemen of this Club will correct them. The chief reason I had in selecting it for discussion was the remark made at this Club to the effect that if we obtained from 15% to 20% per acre for Sugar-Beet, still the growing of them would be unprofitable. My ideas being somewhat different, I shall conclude this paper by instituting a comparison between the profits of this crop and others. I am quite aware that in discussing profits I am going into a somewhat delicate question, but being fully impressed that farmers' profits are nearly always much over-rated, the endeavouring to throw light upon the subject can do no harm. As the most simple way of placing the subject before you I shall take the case of a 400-acre farm of good heavy land, farmed on the somewhat old-fashioned and now generally condemned plan, but which, in its balance-sheet, is frequently as successful as the modern and more showy farming, under which there is no doubt a valuable pride in producing large crops of corn and meat, very often at an expense which is not followed by a proportionate return. Large crops in our large outlays. For receipts are large, but the heavy bills for oilcake and other feeding stuffs, with those for the more direct manures, must seriously diminish them. With the present object it will probably matter but little whether our calculations are founded upon high or low farming. As they are most easily made under the latter, I shall adhere to it, assuming that the farm dresses itself, that is, that neither manure nor feeding stuffs are purchased and consumed upon it, and that no extra crops are indulged in.

Of the 400 acres we may assume 80 are pasture, the remaining 320 acres being arable, deducting 20 acres for waste, we have 300 acres net arable land; that is, 75 acres in each shift. The Wheat crop being generally assumed to be the most profitable, I will take that first.

Table titled 'WHEAT CROP.' showing expenses for 75 acres at 8 coombs per acre, including items like Annual charges, Seed, Ploughing, and Threshing, with a total expense of £817 10 0.

Total expense per acre .. £8 17 0
75 acres at 8 17s 6d 668 11 3

Apparent profit .. £150 19 8
We have now one of the most difficult elements to deal with, and that is the depreciation of the land in consequence of the growth of this Wheat. The allowance must be made, not on the basis of its effects the immediate year following, but how far it is depreciated to the farmer who may have the land for the next four or five years, deducting it as equal to 31s. per acre, we have 150l. 18s. 9d., less 116l. 5s., leaving the clear profit of this crop at 34l. 13s. 9d.

Table titled 'BARLEY CROP.' showing expenses for 75 acres nett at 10 coombs per acre, including items like Annual charges, Barley Seed, and Threshing, with a total expense of £750 0 0.

Annual charges as for Wheat .. £5 2 6
Barley Seed—9 pecks .. 0 10 0
1½ ploughing on an average at 9s .. 0 11 3

Apparent profit .. £279 18 3
There can be no doubt that land after being cropped with a white straw crop like Barley, and unmanured for is left in a very depreciated state, and 5s. per acre will not probably be found too much to deduct for this 187 10 0

Leaving a clear profit of .. £85 6 3

Table titled 'LAYER.' showing expenses for 30 acres, including items like Annual charges, 10 acres fad, and 12 acres Red Clover, with a total expense of £222 10 0.

Annual charges as before, 62s., seeding, 14s. (including failures) .. £114 0 0
Manuring 12 acres with 10 loads at 5s. .. 30 0 0
Making 12 acres into stover, thatching, &c., at 1s. .. 6 6 0

Apparent gain .. £4 2 0
Add for improved condition of land 30 acres at 35s. .. 52 10 0

Leaving a profit of .. £56 12 0

Table showing expenses for 45 acres Beans and Peas, 8 coombs per acre, including items like Annual charge, 14s., and Straw, with a total expense of £315 0 0.

Annual charge as before .. £3 2 0
Seed—3 bushels .. 0 13 0
Ploughing 1½ time at 9s. .. 0 11 3

Apparent profit .. £39 19 9
Add for improved condition of land at 25s. .. 76 5 0

Leaving a profit of .. £45 15 9

Table titled 'FALLOW SHIFT.' showing expenses for 20 acres Beet at 7l., 10 acres Swedes at 5l., 15 acres White Turnips, 10 acres Coltsed or Mustard, and 20 acres Tares and green food, with a total expense of £140 0 0.

Annual charge as before at 62s. .. £114 0 0
45 acres ploughed for roots equal to 4 times .. 16 0 0
10 l. tillage .. 0 1 0

Apparent loss .. £292 15 0
Deduct for improved state of land 52s. 6d. per acre, 156l. 1s. 6d. from 292l. 15s., leaves, loss .. £295 17 6

In instituting a comparison between the profits of growing common Mangel and Sugar-Beet I do not mean to assume that we can grow two-thirds the weight of those that we do of the common Beet. Taking the average weight per acre of our Mangel when cropped to be 24 tons, we then should calculate the same to be 16 tons, which at 17 per ton, we give 272 per acre. The consuming value of our Beet I take to be 15 per acre. I do not at all think that in an average year we make more than this—to it must be added something for the benefit in manure-making we derive from consuming them on the farm, this would be met by adding 35s. per acre, and 7s. for value of manure alike in both cases. We have then 97 2s. as their value per acre, their cost as shown being 20s. 10d. leaving a loss of 17 11s. 6d.

The point then we now arrive at is, how much more expensive are the Sugar-Beet to grow and convert into money than the common Beet.

What I have termed the annual charges, and the seeding and manuring, will be the same for both. Additional cost of hoeing and singling, the plants having to be left thicker say 1s. per acre. The additional trouble and cost in taking up and cleaning a crop balanced by the additional labour and cartage of the 8 tons more grown of the common sort than of Beet. Add for additional length of cartage, say two miles at 2s. 9d. per ton on the 16 tons, 27 1s. making a total cost of 187 1s. 6d. Value of the crop, including top, 7s., 16l. 7s., leaving a net profit, 31 1s. 6d. against a cost of 31s. 6d. in growing other Beet, making a total balance of 11 17s. 6d. in favour of growing Sugar-Beet in neither case do I take into consideration the improved state that the land may be left in. If compared the return with that of the Bean crop, the balance would be still more in favour of the Sugar-Beet.

I trust that I may not have been altogether unsuccessful in showing two things, viz. that our corn crops are not so profitable as they appear to be, and that Sugar-Beet growing may not be so bad a speculation. My remarks on them are of course founded upon a very limited experience, but I am very strongly persuaded that if on 100-acre farms, situate within three miles or so of a factory, the farmers were to grow some 10 acres (so in proportion on larger farms) the crop would be found profitable.

Mr Biddell, in concluding his remarks, said in his opinion the percentage which a farmer generally realised upon his crops was 10 per cent. If any of his figures were wrong, he should be happy to be corrected, and as it would be difficult for them to remember all the figures he had quoted, if any gentleman wished he should be happy to refer again to his paper with reference to any particular item.

DISCUSSION

Mr. HAWKINS said he thought, in the whole Mr Biddell had made a very fair and just estimate of the value of the crops; no one could have gone through these figures without very great trouble, and he must say that with the great majority of the remarks he (Mr. Hawkins) entirely agreed. The white straw crop he thought were estimated very correctly, and then they came to Clover. The members were aware that on a great many farms Clover was grown now for hay, but in his opinion it very rarely answered at any rate on heavy lands. They were so influenced by seasons, that his own observation he knew that his Clover crop had not paid him a penny piece. Last year he had a piece of Clover which failed him, and on that he grew Beans and Sugar-Beet. He got four coombs of Beans, and 2½ of Sugar-Beet. Now, if he had grown all Sugar-Beet he should have done right. In a heavy land district like Lavenham all knew the uncertainty of Bean and Pea crops, taking them as a rule. They were the most uncertain crop ever grown on a first-rate soil, and it must not matter whether the crop is on first-rate soil, and it must not matter whether the crop is a crop or not. He grew a field of Peas a few years ago, which was the finest he ever set eyes on. A friend of his, Mr. Nunn, after looking at it, said to him it would stand him in coombs an acre. He went out for a week to the Northamptonshire, and when he came back he happened to look at the field, it was perfectly covered with lice. He to a five-acre straw and 6 bushels of Peas off that field. But now they are able to produce a crop which was almost a certainty. Last year was one of the worst they had ever had for roots, and if they could grow anything like 15 to 20 tons per acre, that would beat four or even ten coombs of Beans or Peas, and that the Beet crop is not taken so well as Beans or Peas. He had seen Beans with a stalk this half a foot above them, and quite upright, and the ground could not be seen for the weeds, while after Beet the land was left in much better condition than after Beans or Peas. As to 1 per cent he was afraid it was a visionary idea. They might make it one year, but another they would tank none at all. At stall Mr. Biddell put things fairly before them, and there was something persistent in the way he had done it. He considered Beet a very paying crop, for every gentleman had the opportunity of growing it. He (Mr. Hawkins) was certain every one could grow 20 tons per acre. Mr. Duncan was ready to them 12 a ton for all they could grow, and where were they getting cheaper and sugar dearer; therefore, let them grow Wheat and grow Sugar-Beet. Mr Biddell had stated that one could grow or half more of the common Mangel than Sugar-Beet, and with reference to that he was sure he had near them a quality famed for growing Beet, but he could tell them that the heavy st was not at Haddenham Farmers' Club this year was not 2 tons. They know what good farmers they were out there. The exhibitors who were different from that, as in the case of Rand and Mr. Kersey, who grew Mangels upon their farm they grew more 11c, as they grew Beet, but he only grew about 19 tons per acre. When he saw that their county court judge had 14 per acre and several first class farmers only 14 per acre, his impression was that he could grow a heavy weight of Beet as he could of any other sort. If Mr. Biddell failed to take them, or had to shut up his works in consequence of their not answering, he should not have the slightest reluctance to consume them on his own farm, as the Beet thrived remarkably well upon them. It was a most profitable Beet for feeding purposes.

Dr WHITE said that when a season came with an amount of moisture, they would find that their

districts. Here we find 13,020 acres sown in Wheat in 1899 increasing up to 15,565 acres in 1902, the average of the five years being 16,424 acres.

The yield commenced with 19.7 bushels in 1899 and gradually dropped to 12.3 bushels in 1902—the average being a little over 1 bushel per acre that is 1.2124 in excess of the average of the old settled countries in the same period.

The second important period covers years with 11.9-9.2 acres under Wheat increased to 47,144 acres in 1901 and drops again to 45,822 acres in 1902, the average being 46,565 acres, an increase of 11 per cent on the average of the previous five years.

The yield ranged from 11.1 bushels per acre in 1893 up to 17.2 in 1895, and fell again to 11.7 in 1902—the average of the five years being rather under 14 bushels that is, about 2 1/2 bushels below the average of the earlier important period, and about 3 1/2 bushels over the average of the old settled countries in the corresponding period.

Looking to the results of the 15 years over the whole colony, we find that in the first five years there was an average annual breadth of land laid down in Wheat for grain of 114,284 acres with an average yield of 11,487,998 bushels, being at the rate of 15 bushels per acre, whilst in the second five years the average annual breadth of land sown in Wheat for grain was 132,564 acres, with an average yield of 1,345,514 bushels, being at the rate of 10 bushels to the acre.

Such are the results of an investigation into the statistics of Wheat growing in New South Wales since the year 1887. They are not encouraging to the prosecution of this branch of agriculture and yet the farmers of South Australia set us an example of industry and perseverance in this very branch of husbandry under circumstances but little, if at all, more encouraging, for I find that in a corresponding period to that which we have been reviewing their average yield has very slightly exceeded 10 bushels per acre. It has been as low as 4 bushels per acre, and as high as 14, and they are glad to sell their Wheat on the ground at 3s. 6d. per bushel.

Elaborate tables of the returns of the above divisions and districts are then given. These are given separately, and divided into quinquennial periods. The following is a summary table. We do not give the details.

Table with columns: Grand Totals, 1888, 1889, 1890, 1891, 1892, Average. Rows: Acres, Bushels, Yield per Acre. Another table below with columns: Grand Totals, 1893, 1894, 1895, 1896, 1897, Average. Rows: Acres, Bushels, Yield per Acre.

Upon the above returns the Sydney Morning Herald makes the following remarks and calculations. "Looking at the average yield and price that has reigned during this period, the following appears to be the money result per acre to the Wheat grower:—

Table with columns: Bushels per acre, Price per acre, Money result per acre. Rows: Southern District, Western, Northern, Midland, Pastoral (5 years).

To these figures the Herald adds.— "Such are the results of an investigation of the statistics of Wheat growing in New South Wales since 1887. And in South Australia the farmers can show little or nothing better. The question is, whether so unprofitable a crop should be continued. This would appear to be the conclusive question on reading these facts, but do not let us run away with the impression that this is the result of good husbandry—these are the bad returns of shiftless, unscientific, reckless husbandry. It may be that good husbandry applied to Wheat growing may prove a bad investment in New South Wales as compared with its application to other crops, but until our Wheat growers have manured freely and ploughed deep, let us not rush to the conclusion that, of necessity, Wheat growing has proved a failure here."

Farm Memoranda.

WEST GLOUCESTER March 6.—As the spring advances one can form something like an accurate opinion as to the prospect of the seed crop. It is anything but satisfactory in this neighbourhood, notwithstanding all the efforts used early in the autumn to patch it up by sowing Rye-grass seed and Trefoil over the land immediately after the corn crops were cleared. Many acres are already ploughed up, and will be sown with Peas, consequently a short cut of seed hay is now but too manifest. Owing to the extreme mildness of the winter, a vast quantity of green food has been produced in the shape of Turnips, Rape, Mustard, &c., sown in the autumn, and this has been pretty well enough for store sheep without much hay, so as regards hay a great saving has thus been effected. There is a quantity of shed corn growing amongst the young seed, which (if we do not get frost to cut it down) will help to make the ricks larger. Our practice for the last few years has been to sow the Giant Sanfoin (milled) with our mixture of seeds instead of broad Clover, and of this we have a useful plant amongst the Rye-grass. Our reason for doing so is that the broad Clover used to die out between November and March—the leaves became covered with black spots, and the plant gradually withered away, but we shall again try the Clover seed after the land has had a rest of eight years, and had time to recover its Clover sickness.

Very little has been done at present to spring sowing, neither can it be proceeded with till the weather becomes more settled. The heavy land in the vale is so soddened with the tremendous rainfall that it has become almost mud under the surface, especially where it only received an ordinary ploughing (where it received deeper ploughing it is more manageable), and as we cannot now expect frost enough to pulverise it, the furrows must be turned back when dry enough to

bear the horses, and dried by the March winds and pulverised by its showers before it can be brought into a state fit for cultivation. Many acres of good Bean land will in consequence have either to be fallow or to be sown with roots, though the latter plan is not very advisable upon very heavy land.

The lambing season has now become general in this neighbourhood, and the ewes appear to be very healthy and to have plenty of milk, a good average of lambs may justly be expected. We have up to the present time 135 ewes which have yealed, and out of these we have had 61 doubles and two trebles, and from other quarters the results are equally satisfactory. Sheep, both fat and store, have greatly advanced in price during the last six weeks. Some fat fags were recently sold at the Kingscote sale at 60s per head out of the wool, not a bad price for February sales in a season when roots have been more plentiful than they have been this year. J. H.

VERSE OF BERWICKSHIRE March 13.—It happens rather awkwardly that winter comes to us at the close of February, and continues to maintain its sway well into the seed month. At no time has the snow exceeded an inch or two in depth, nor has the frost been sufficient to prevent its melting after noon, and if we get out of this without heavy rains, the seed-bed will be the better for what it has got. So wet a "winter" we have not seen since 1851, at least the rain was so frequent as to make the land most unsuitable for any work but lea-ploughing. Even the muck (in very little bulk, no doubt) had to be carted out over wet roads, in despair of frost, and now that it has come, there is little or nothing to do. One advantage there was in having a small root crop—that it took little storing. Cake and corn are easier to carry, but worse to pay for, after losing the manures applied towards growing Turnips, and but little of the high price of meat will find its final resting place in the farmer's pocket. The quality of Swedes is inferior, neither Potatoes nor cake can quite make it up. Yet feeding stock have done pretty well on an allowance of from two-thirds to three-fourths of Swedes, with the addition of rike and meal for cattle, and Peas and Oats for hogs. Winter Grass does little good. Between that and artificial food, we never saw our flock do worse. Lambs are coming now, neither numerous nor strong. Spring corn is well sold out, at capital prices. Waiting for proper weather for threshing Wheat, we have lost the price on part of the crop. It makes good meal for cattle at 1s 4d a stone, used along with an equal weight of cake at 1s 8d.

They say Wheat was extensively sown in autumn on clay lands, where Turnips were an absolute failure. Many of us, however, had a sprinkling of plants over our fields, and were unwilling to destroy them early; and so it came about that we never had less Wheat sown. Turnips sown or braided after the August rains came to naught; Rape and Mustard invisible to the naked eye. J. T.

The Poultry Yard.

"WEST CHESHIRE," who deserves ample apology for delay in reply to queries, relates as follows:—"I shall be very much obliged if your correspondent on poultry management would inform me, through the medium of your columns, which is the best kind of poultry to keep for own use and general profit in a small farm-yard, capable of taking, say, about 30 hens. The range for these is not as good as it might be, as there is a village close by I have thought of Dorking hens and game cocks, or Dorking hens and Brahma cocks."

We think that by answering *in extenso* the letter of "West Cheshire," we may be of some use to others who are similarly situated, and to such we offer our best help. There are many situated as is our correspondent, who, with ample run at their command, fear, as he does, the proximity of a village. We think it a groundless fear, and hope there are few villages in England where a bird, the known property of a resident, straying into the road, would not be driven back home. At all events we like to think so, but to a man who differs from us we would recall the anecdote of the timid sub in a marching regiment years ago, who, dreading an assault from a brother officer, took counsel of the regimental Galen before the fray, rather than after. "Doctor," said he, "Captain S threatens to pull my nose—what would you do?" "Why," said the doctor, looking hard at him, "do" why, grease it." If our correspondent's run for 30 hens be a good one, he may easily wear them from the village road by feeding them home, or by enlisting one of the powers belligerent, in the shape of a small boy, to watch them when they come on to the road, and agreeing with him to drive them back. The present week has been divided in an amicable hostility as to the relative merits of a dark or light blue riband. We think men get more particular and selfish as questions touch themselves individually, for instance, in running their horses for the Derby, they run for what they call the "Blue Riband of the Turf," but when they row their own boat, the difference is so fine, that it is drawn out to Light Blue and Dark Blue. One must admire the pluck and endurance of the crews, and wish that both could win. Some of them have been, are, or may be, poultry fanciers, and may have read in the archives of the poultry world the battles of the Brahmas—how that, on their arrival here, they were looked on as intruders, bastards, interlopers, bringing no credentials whatever, and giving dreadful offence to the holders of the vested interests in Cornish China stock, abused as half-breeds, Yankee notions, and many other *soubriquets*, all of them more or less expressive. The Brahma Poultras have gone steadily on improving in public estimation, until the cry must now be—"Save us from our friends."

Reviews.

Wheat Culture in Australia during the last Ten Years. A comprehensive and otherwise valuable paper on wheat was read in the first week in December at the Royal Agricultural Society of Australia, at Christchurch. After going over the wheat of the southern, western, northern and midland districts, and making some suggestive remarks in regard to the "virgin" soils of "new" wheat lands, Mr. Bollenston, to an examination of the comparatively virgin soils of the pastoral

Market Gardens, Biggleswade, Beds.

RICHARD WALKER can supply for cash CLOVE CARNATIONS, SCARLET KING DAISIES, ss. per 100; EAST HAM, and all the leading sorts of Cabbage Plants, 2s. 6d. per 1000; RED DUTCH, extra fine, 4s. per 1000. Seeds, home-grown ONION, WHITE SPANISH, 2s. 3d. per lb. GIANT ASPARAGUS, 3-yr old, 3s. per 100.

Camellias, Azalea indica, and Rhododendrons

JOSEPH BAUMANN, Nurseryman, Ghent, Belgium, begs to offer the following Plants, without Flower-buds - 100 CAMELLIAS, best sorts, £3, £4, £5, £6, and £8. 100 AZALEA INDICA, best sorts, good plants, £3 10s. 100 RHODODENDRONS, best hardy sorts, 2-yr. grafted, £6. 100 AZALEA INDICA, Stocks, 12s. 100 FORTICA, small Stocks, 5s. 100 THUJA ELLWANGERIANA (or Tom Thumb Arbor-vitae), new, £2. 1 PEONIA MOUTAN GLORIA BELGARUM, £1. 1 " SOUVENIR DE GAND, £1. 3 New AZALEA INDICA, 1st prize at Ghent ALFRED DELMON, COMTE BISMARCK, TRIOMPHE D EVERGEM; the three, with or without flower-buds, 15s.

A GENTLEMAN is desirous of DISPOSING OF his STOVE PLANTS (a small choice collection), and of a Portion of his GREENHOUSE and BEDDING-OUT PLANTS. They are all admirably grown, and in healthy, hardy condition. The plants may be seen at Crowhurst Park, Herts. (South-Eastern Railway), on reference to CHARLES RAY, Head Gardener, and some particulars respecting them obtained by personal application at 4, Stanhope Place, Connaught Square, W.

New Fuchsias-Primulas.

FELTON AND SONS (late Felton & Holiday) will send out their four unrivalled NEW DOUBLE FUCHSIAS in the last week of April, 1869. They have been selected from many thousands, are quite distinct, and cannot fail to give satisfaction.

LORD CALTHORPE - Bright scarlet tube and sepals, very thick and waxy, of great length, and most beautifully reflexed, corolla large and full, deep purple, slightly veined at the base. This is a noble Fuchsia, free grower and profuse bloomer, and makes very fine specimens.

HARRY FELTON - Bright crimson tube and sepals, the latter reflexed with a graceful and remarkably regular curl, corolla bright mauve, very large and full, and being well expanded, makes the flower of great size and remarkably showy; the habit excellent, and bloom abundant.

CONQUEROR - Light crimson tube and sepals, tube short, sepals very long and broad, elegantly recurved; corolla dark purple, flamed crimson - a very pretty variety.

EXQUISITE - Large tube and sepals, elegantly reflexed, colour bright crimson, corolla large and full, purple and rose, flamed and flaked, novel in colour, and very compact.

Price 7s. 6d. each, the set for 25s. If more than one set ordered, 21s., with usual discount to the Trade.

We have also a good stock of our two new White Fuchsias, which we sent out last spring, and of which the following are the descriptions, copied from Gardeners' Chronicle January 30, 1869.

LADY SALE FELTON & SONS - White tube and sepals, the latter nicely reflexed, and of good substance, corolla pink-purple, stout, an abundant bloomer, of good habit. I think it will make a good Fuchsia for any purpose.

JOLLY (FELTON & SONS) - This is a welcome and long wished-for improvement on a good old variety called Fair Oriana, pure white tube and sepals, the latter well reflexed, bright pink-scarlet corolla, a good grower and very free.

Price 2s. 6d. each. Orders booked now, and executed in strict rotation.

PRIMULA, from one of the choicest strains in cultivation, 2s. 6d., 3s. 6d., and 5s. per pkt.

Birmingham Nursery, 60, Harborne Road, Edgbaston, Birmingham.

TO CLEAR the GROUND,

the following Offer is made - BERBERIS DARWINII, 9 to 15 inches, 2s. per 100. DULCIS, 12 to 18 inches, 10s. 6d. per 100. AQUIFOLIA, 9 to 12 inches, 10s. 6d. per 100. LIGUSTRUM OVALIFOLIUM, 19 to 24 inches, 5s. per 100. COTONEASTER SIMMONSII, 36 to 48 inches, 20s. per 100.

To Clear the Ground, The finest varieties of DWARF PEACHES are offered at HALF PRICE.

To Clear the Ground, A large quantity of Hybrid Seedling RHODODENDRONS, from 1 foot to 3 feet high (very bushy), will be sold at HALF PRICE.

To Clear the Ground, Some very fine 7 and 8-yr Dwarf-trained PEACHES and NECTARINES will be sold at HALF PRICE.

To Clear the Ground, Some magnificent HYBRID PERPETUALS, in Pots, will be sold at HALF PRICE.

Apply to CHARLES NOBLE, Ragsbot. Send for a CATALOGUE.

C H O I C E S E E D S.

FLESH-COLOURED MEXICAN KIDNEY BEAN - We consider this variety as the earliest in cultivation. It is likewise very prolific, and of excellent quality. 3s. per quart.

LAUDER'S SUPERB WHITE BROCCOLI - Recommended by Mr. Thomson, Dalkeith, as a splendid variety, very large, beautifully white, and heading till the middle of June "like enormous Cauliflowers." 2s. 6d. per packet.

SMITH'S SUPERB PROTECTING BROCCOLI - An excellent hardy Spring Broccoli, of dwarf growth, with large compact head, abundantly protected. Well adapted for cold soils and exposed situations. 1s. per packet.

MITCHELL'S GREEN-CURLED KOHL RABI - A very beautiful variety, well adapted for garnishing, the edges being crisply curled, and well-formed for dishing fruit, &c. 1s. per packet.

LEE'S GIANT ORACH, or SUMMER SPINACH 1s. per packet.

SELECT FLOWER SEEDS.

AMARANTHUS ELEGANTISSIMUS - A great acquisition for bedding and ribbon borders, being of dwarf compact habit, and producing a brilliant effect with its rich scarlet-tinted bronzy-purple leaves. 1s. per packet.

ASPERULA AZUREA NEVOSA - A profuse-blooming hardy Annual, of dense habit, growing about one foot, and covering itself with bunches of light blue flowers. Very sweet-scented, and lasting a long while in perfection. 1s. per packet.

BEET, VARIEGATED - Highly ornamental for border decorations, the stem and midribs being brightly coloured scarlet, yellow, or white. Each variety, per packet, 6d.; the three colours mixed, 1s.

LINARIA ALPINA - A very pretty rock or border plant, blooming continuously for several months; of dwarf growth, with an abundance of bright purple orange-centred flowers. 6d. per packet.

MALCOMIA INCRASSATA - A distinct species of Virgin Stock, resembling in general appearance the well-known M. maritima, but is of more robust habit, with larger, brighter coloured and more enduring flowers - points of much importance in an Annual so extensively cultivated. 6d. per packet.

MATTHIOLA BICORNIS - This night-scented Stock has proved itself a worthy addition to the number of our hardy Annuals. 6d. per packet.

MATTHIOLA TRICUSPIDATA - This choice new species is quite distinct from the preceding. It forms branching masses, covered with a profusion of mauve-like flowers. These continue long in bloom, remain expanded during the day as well as in the evening, and constantly exhale a delicate and delicious fragrance. Growth free and even, producing a fine effect in a bed or mass. 1s. 6d. per packet.

OKALIS VALDIVIANA - Flowers bright yellow, sweet-scented, and produced in bunches of large size, which continue long in bloom. Reported as quite hardy and of good habit. 1s. per packet.

PALAVA FLEXUOSA - Described as a beautiful new Annual, growing to an average height of 18 or 19 inches, and producing in the greatest profusion flowers of a bright rosy-pink, fading slightly towards the centre, with a dark eye. 1s. per packet.

VIOLA CORNUTA, MAI VE QUEEN - 6d. per packet.

A Collection of 8 x DYNAMENTAL VARIETIES of FLOWER SEEDS suitable for ROCKRIES, 3s. DESCRIPTIVE CATALOGUE of FLOWER SEEDS sent free on application.

OLD ESTABLISHED NURSERY AND SEED BUSINESS, 102, EASTGATE STREET, AND "NEWTON" NURSERIES, CHESTER

HARRISONS'

NORMANTON GLOBE MANGEL WURZEL

IS THE BEST IN CULTIVATION.

None genuine except in Sealed Bags, price 2s. per lb.

From Mr. Gowling, Farm Steward to The Right Hon. Lord Berners, Tisbury, Wiltshire.

"Having grown your Normanton Globe Mangel two seasons in same fields with various other sorts, I can with confidence recommend it as being by far the best quality and heaviest cropper I have ever seen. It is being very small (although quite sufficient to preserve it from frosts), allows it to be grown very closely together, and having but one small root, comes up with half the labour of all ordinary descriptions. It is a new season yielded just 40 good cart loads per acre, of the most magnificent bulk. They were admired by all who saw them. Please save me 200 lb. of Seed for next year. I have recommended it to several Gentlemen in different Counties, and have no doubt you will have a large Sale for it."

Choice Stocks of all the leading kinds of MANGEL WURZEL. TURNIPS, SWEDISH and COMMON, of the most approved varieties. PERMANENT PASTURE GRASSES and CLOVERS to suit all Soils.

CATALOGUE Post Free on application

All Orders value £1 and upwards carriage paid.

Fine Lawns and Croquet Grounds by Sowing SUTTONS' LAWN GRASS MIXTURE, which forms a close, velvet turf in a very short time.

From Mr J. M. K. ... to J. Fisher Esq., 14 Court, ...

January 2, 1892. "The seed you sent me last year turned out most satisfactory well. Several gentlemen who came to Le Court could scarcely credit, from the appearance of the lawn, that it was only sown in May. In August it was as fine and thick as I have seen some lawns that have been laid down for three years."

From Mr H. Reynolds, Gardener to Lady Emily Foley, Stoke Edith, Wilt.

March 9, 1892. "The Snelawn grass seed purchased of you last year has given the greatest satisfaction."

From Mr Henry Fuller, Gardener, St. John's College, Cambridge. October 3, 1892. "The lawn grass seed has given the greatest satisfaction to the Master and Seniors of the College."

Instructions on the Formation and Improvement of Garden Lawns, Croquet Grounds, &c., gratis and post free.

Suttons & Sons, Royal Parks Seed Establishment, Reading.

Caution to Gardeners.—When you ask for SAYNOR and COOKE'S WARRANTED PRIZE PRUNING and BUDDING KNIVES, see that you get them Warranted, without which none are genuine.

S & C regret having to caution Gardeners and others, but are compelled to do so, in consequence of an imitation, of common quality, having been sold for the genuine one, and which has caused many complaints to be made to them of Knives which were not of their make, all of which are warranted both by Sellers and Makers. S & C'S PRUNING and BUDDING KNIVES are the best and the cheapest in the market.

Parson Works, Sheffield. Established upwards of 125 years.

SHANKS'S PATENT LAWN MOWERS FOR 1869.

UNDER THE PATRONAGE
OF
HER MOST GRACIOUS MAJESTY
THE QUEEN,

AND MOST OF THE
PRINCIPAL NOBILITY
OF
GREAT BRITAIN.

The Patent Improvements recently introduced give Shanks's Machine several important advantages possessed by no other Lawn Mower.

PATENT DOUBLE-EDGED SOLE PLATE, WIND GUARD, &c., &c.

THE UNPRECEDENTED SALE FOR 1868 BEARS TESTIMONY HOW MUCH THESE ADVANTAGES HAVE BEEN APPRECIATED.

THE FIRST PRIZE MEDAL
OF THE
INTERNATIONAL EXHIBITION,
LONDON, 1862.

HAND MACHINE.

THE FIRST PRIZE SILVER MEDAL
OF THE
UNIVERSAL EXHIBITION,
PARIS, 1867.

ALEXANDER SHANKS AND SON, in presenting their "PRICE LIST of LAWN MOWERS for 1869," have much satisfaction in intimating that among all Exhibitors of Lawn Mowers at the Universal Exhibition of 1867, they are the only firm to whom the Jury have awarded a Medal.

A. S. AND SON have, in addition to the PATENT DOUBLE-EDGED SOLE PLATE and WIND GUARD, made very great Alterations and Improvements in the Machine. These alterations, which were introduced last Season, have now undergone an effectual trial, and the result has been so successful as to enable A. S. AND SON to offer a Machine which far excels any other that has ever yet been offered, *whether for ease in working, certainty of action, or durability.* It has only to be compared with other Machines, when its superiority will be at once seen and understood.

PRICES—INCLUDING CARRIAGE TO ANY RAILWAY STATION OR SHIPPING PORT IN THE KINGDOM.

SHANKS'S NEW PATENT HAND MACHINE.

Machine Size	Price	Operated By
10-inch Machine	£3 10 0	By a Boy

JOHN CAYSELL, Nursery and Seed Establishment, Westerham, Kent.

Verbenas, Verbenas.

ALL THE LEADING VARIETIES of 1868, also Purple, White, Scarlet, and Pink, with plenty of Cuttings, at 2s. per doz., Small Plants, 6s. per 100, or £3.10 per 1000. Twenty new varieties of ZONAL GERANIUMS of 1868 for 10s. Price of Lanes, Nursery, Boxley Heath, Kent.

F AND A. SMITH beg to announce that their splendid Collection of CINERARIAS is now in full bloom, and will repay a visit. They would call the attention of purchasers to the following varieties, which are now being sent out, each of which has obtained Certificates at the Royal Horticultural Society, and pronounced far in advance of anything hitherto offered.

- 150 Large white flowers, with tip of light crimson extra fine.
150 White, with heavy tip of clear crimson, very large head, a good habit.
ROYAL PURPLE Shaded purple and puce, with ring of rich crimson, and inner circle of pure white, undoubtedly one of the finest that I and the most richly coloured variety yet sent out.
Lots of other varieties on application.
The Nurseries, West Dulwich, S.E.

Cineraria Seed.

NOW IS THE TIME TO SOW FOR AN EARLY CROP.

F AND A. SMITH beg to offer Seed of the above, from their splendid collection. As a proof of its general excellence, they append the following Testimonials, samples of which they are ready to send.

A. A. BARR would here mention that they received last year the only Certificate awarded for Cineraria, and they have already received two during the present season.

March 20, 1869.
I enclose 2s. 6d. in stamps for a packet of your Cineraria Seed. I hope it will be as good as last year, the packet I had then turned out first-rate, and so did the Balsam Seed you applied me with. I obtained 1st Prize with a Collection of eight Waverhampton.
JAMES B. CRAWFORD, Finchfield, Waverhampton.

The Nurseries, Lickenhead, March 20, 1869.
GENTLEMEN,—Please send me per return, 2 dozen packets (or about the same quantity in bulk) of your choicest Cineraria. That you sent me last year gave the greatest satisfaction. Yours truly,
W. HERRINGHAM

The Nurseries, Lickenhead, March 20, 1869.
I enclose 2s. 6d. in stamps for a packet of your best mixed Balsam, and a 2s. 6d. packet of Cineraria for two growth. Last year's were excellent. Yours truly,
J. SAVORIS.

The Nurseries, West Dulwich, S.E.

Genuine Seeds. Carriage Paid.

WILLIAM ROLLISSON & SONS'

BRILLIANT NEW TRICOLOR GERANIUM, THE MOONSTONE

WILL BE SENT OUT ON AND AFTER THE 30TH OF APRIL NEXT.

The habit of the above most beautiful Tricolor is compact and exceedingly free, the leaves, which are of green substance and moderately large, are almost round, and from the slight convexity of their shape they exhibit to great advantage the rich and varied colourings with which they are adorned, the centre of the leaf is of a bright and green surrounded by a dark chocolate zone, which is much intercepted by the most intense blood-red. This bright colour shades off, towards the edge of the leaf, to a soft crimson-lake, which entirely encircles the whole zone, and with a bright lemon-yellow belt. It is somewhat in the way of L'Amo Grieve in its colouring, but is rather brighter and, unlike the shy habit and slow growth of that variety, "The Moonstone" is almost as free in habit as a Thumb, while it remains constant in character. This, without exception, is the finest Tricolor hitherto offered to the public.

THE FOLLOWING NINE SPLENDID NEW DOUBLE GERANIUMS FOR 1869.

- MADAME BONDET | MDLLE. LOUISE DELESALLE | M FROEBEL
MADAME DEBRAY | M DE ST. JEAN | MARIE LEMOINE
MARIE CROUSSE | M. DE ST. PAUL | WILHELM PFITZER

Together with many other Novelties of sterling merit, will be distributed on and after the 30th of April next.

For Descriptions and Prices of the above, see SPRING CATALOGUE of NEW and CHOICE SOFT-WOOD PLANTS for 1869, which will be sent Gratis and Post Free on application to

THE NURSERIES, TOOTING, LONDON, S.W.

B. S. WILLIAMS,

NURSERYMAN AND SEEDSMAN,

VICTORIA and PARADISE NURSERIES, UPPER HOLLOWAY, LONDON, N.

Respectfully invites the Nobility and Gentry about to furnish their Conservatories, Greenhouses, Stoves, and Orchid-houses, to an inspection of his

STOCK OF MAGNIFICENT SPECIMEN PLANTS,

MANY OF WHICH ARE UNEQUALLED IN THIS COUNTRY.

THEY CONSIST OF—

The Choicest and rarest Exotics, such as TREE-FERNS, PALMS, BEAUCARNEAS, AGAVES, TUCKER CYCADS, ARALIAS, CAMELLIAS, AZALEAS, and all other kinds of STOVE and GREENHOUSE FLOWERING and ORNAMENTAL FOLIAGE PLANTS, proved to be worthy of cultivation.
The Large CONSERVATORY, at all times of the year well worth a visit, is now unusually gay with flowers of Camellias, Azaleas, Ericas, Epacris, the magnificent varieties of Cyclamen persicum, obtained from W. Williams' seed, Williams' superb Chinese Primulas, the beautiful improved Hybrid Solanums, now laden with large and highly ornamental berries, Hyacinths, and many other Spring Flowering Plants, also helping to make a floral display.
The STOVES and ORCHID-HOUSES are also very attractive and interesting just now, with a variety of Odontoglossums, Cypripediums, Colognyras, Lycastris Skinneri, Phalenopsis, and many other kinds.
The COLLECTION of MEXICAN PLANTS is surpassed only by that of Kew Gardens.
All NEW PLANTS of sterling merit are added to the Collection as soon as procurable, and may be seen on the inspection of which would alone repay a visit.

In May will be published,

A CATALOGUE OF NEW AND RARE PLANTS FOR 1869,

POST FREE TO ALL APPLICANTS.

July 18th to 24th, 1869.
THE ROYAL SOCIETY'S
GRAND EXHIBITION at MANGHE ER.
In connection with the
SHOW of the ROYAL AGRICULTURAL
Amongst various Special Prizes,
A SILVER CUP (copy of the famous Cellini Cup) VALUE £21
for the best COLLECTION of 5 FRUITS and 5 VEGETABLES.

Table with 4 columns: Good, Medium, Inferior. Lists various fruits and vegetables with their respective grades and prices.

The Gardeners' Chronicle. SATURDAY, MARCH 27, 1869.

MEETING FOR THE ENSUING WEEK
THURSDAY April 1st—London

THE future of FLOWER SHOWS is one of the
difficult questions of our time. As a rule they
do not pay, and the probability is that they
will not. They were for many days a source
of profit to who ever they occurred. What
can make this? Certainly not that
horticulture and floriculture have retrograded,
or even that the skill of cultivators has stood
still. Certainly not, we think, that fewer persons
than formerly take an interest in matters con-

cerned with gardening.
The reasons for this state of things may prob-
ably have had their origin in the very successes
of former days. Thus, one step in advance has led
to another until the shows have actually out-
grown themselves, for by little and little the size
of the objects produced has been increased, till
now everything is carried out on so gigantic a
scale that the prizes have necessarily become
overwhelming. In the next place, the very beauty
of the objects shown may have led the managers
to rest satisfied with the routine arrangements
adopted from the beginning, until they have
become so formal and stereotyped, that the
shows fail to attract outside paying visitors in
numbers sufficient to be remunerative. New
classes of objects of a minor character, have indeed
been, from time to time, introduced here and
there, but, in a general sense, there has been little
change in our shows except as to the gradual
increase of the size of individual plants, and as to
the necessary limitation of numbers which have
led to a most appreciable curtailment of variety.
The large collections of mixed plants, which once
numbered 40 or 50 specimens, have dwindled
down to tens or twelves, many of them easily
grown, and serving for two or three successive
shows. Then the collections of different growers
are mostly more repetitions of each other, seldom
showing any material change, seldom containing
any new and original plants. As to the overgrown plants
themselves, these in many instances might well be replaced
by smaller plants in 12-inch or 15-inch pots. For
16 or 20 plants, such as these, the growers were
formerly proud to get Knightian and Bank-
sian Medals. Now, as much as 20 is given for 12
plants, certainly larger, but not more meritorious
as objects of cultivation. A prize of 20l for 30
or 40 plants, in pots not to exceed 15 inches in
diameter, has been suggested as likely to open up
an entirely new field for competition, and cer-
tainly since we have gone as far as is practicable
with large pots, it might now be wise to try
how far success might be attained in smaller
ones. Besides the more varied character of the
plants exhibited in years gone by, we miss
another feature of interest, namely, the collec-
tions of fruits which, while they excited much
interest at the May meetings, became grand
features in the months of June and July.
The extension of the duration of the shows,
which was the saving feature in the great Inter-

the North—"The finest vegetables in the... around London" This is as much... of us have said "Oh! but these... What of that? Is not this true... The only difference is, that one... is sold for a price in the open... the other is sold for wages at home. But... is not how or where they are sold, but... are produced—North or South? Around... Then we claim them, and debit... that produces them. Possibly... perhaps by English... by the growers of the finest... All honour to the growers of the finest... the kingdom, about the credit in this case... to the South.

essential in every branch of our profession. Without skill we can neither build nor heat nor furnish... the earth grown with plenty nor smile beneath its robe of beauty. The surest way to command wisdom is to use it constantly, and use it worthily. To have and to use skill is the only royal road to get more than... generally lies through the valley of self-employment; and skill is most commonly found and most charmingly illustrated, both in the North and in the South, in many of those quiet nooks and corners of which we seldom hear, and in those characters that shrink from observation. D. T. F. S., F.R.H.S.

THE CHILD'S MENAGERIE.

That economic botany has a wide range of application the varied contents of the museum at Kew clearly illustrates. One of the most peculiar, and at the same time amusing of recent additions to that collection, is a series showing the mode of manufacture of children's toys as carried on in Saxony, and presented by Dr. Reichenbach. Every one knows what a child's Noah's Ark is, and every one is more or less acquainted with the orthodox forms of the representation of the beasts which it contains, and farther than this we believe most of us have at some time asked ourselves the question, "How is it possible for these toys to be made, brought into this

perpetuate themselves, and are in no degree injured, but rather improved by the careful and systematic feeding of such trees as are fit for timber. Planting out seedlings in many places almost impossible, and were possible extremely difficult, to say nothing of the difficulty of establishing nurseries in accessible situations. Again, two trees, if planted out, would never have the same chance of growth as those self-sown in the very spot most suitable to them.

In illustration I would beg to adduce (1) the Sal (Vateria robusta), one of the most valuable timber trees of India. This tree sheds abundance of seed, which germinates freely, the strongest plants of course rising above the others. The trees are most abundant, and when one is cut down hundreds spring up in its place. No planting could be half as effectual, and thinning is not needed for some years. Its habit is on the spurs, running at right angles into the Terai, as also in Terai itself, under the shadow of the hills.

(2) The Fir, Pinus roxburghii, is another instance. If the ground remains unmolested these trees will always spring up abundantly, provided the whole hillside on which they grow be not entirely denuded of the parent trees, and thus rendered dry and barren.

(3) Again, the Sissoo (Dalbergia Sissoo) springs up in amazing profusion in the beds and around many of the torrents which descend from the hills, and run between the ravines. No sowing or planting could do this; although unfortunately the trees are often injured and altogether washed away, by the incessant changing of these beds.

(4) The remarks on the Pines apply also to the stately Deodar, and other trees having affinity to it, but I think that sowing seed might be usefully adopted, due regard being had to the exact spots where such seed was sown. I might expand these illustrations, but I have said enough to show that self-sowing is not to be deprecated in vast tracts of forest land in India.

The great enemies of the Himalayan forests are (1) cattle, and (2) fire.

(1) The pasturing of cattle utterly destroys millions of trees; and, excepting when a forest is well grown, should be utterly prohibited.

(2) Fire is still worse, for when the Grass is at its driest it is fired, and it is needless to point out the destruction which ensues. The most effectual means known and adopted against firing is the clearing of broad roads, over which the fire finds it difficult to pass. This is now generally done, I believe, in the North-west of India.

The reckless cutting of sapling trees—the choicest Sal trees, for instance—was formerly productive of much injury to the forests. The natives used to wattle their sheds with these saplings, but this practice has been in a great measure stopped. I have perused all the reports I could lay hands on for some years, and I have been perfectly astounded at the number of acquisitions pointed out as requisite by Dr. Brand's as necessary for a forester.

Doubtless a little time spent amongst the forests of Britain, and a run about to all the seats of general European management will not be undesirable; whilst, of course, a generally sound education, including surveying, leveling, and ordinary drawing, is indispensable. A fondness for natural history would add an interesting recreation whilst at work; but the requisites are—a sound constitution, good common sense, and indomitable courage. The

forester should be ready to face a wild beast if he met him, as is often the case in the Terai. He should be temperate in his habits, and be a good walker and rider. If he be a good shot so much the better for his fare, whilst a little angling will enable him at times to vary his diet, fish abounding in many forest streams, as yet innocent of the fly.

The rest will come fast enough, for of course the general system of forestry to be adopted in any particular locality, will be clearly laid down at headquarters. In these days of difficulty of providing for the honest, willing sons of middle-class men in England, we do not need one single foreigner in this department, whether for higher or lower appointments, nor do I see that any necessity exists for any lengthened period of study out of the United Kingdom. An Old Rohilla.

PEACHES AND NECTARINES - DISEASED SHOOTS.

I do not know any two things in physiology that have puzzled me more than the Potato disease, and the diseased shoots of Peaches and Nectarines kindly sent at my request (accompanied by an intelligent letter), by Mr Woodford, gr. to the Earl of Winchelsea, Eastwell Park, Ashford, Kent. I cry with Milton, who was blind—

"O dark, dark, dark!"

Before "guessing," I may observe that, in answer to my questions, Mr. Woodford says, "that he disbuds moderately, that the trees are not starved, on the contrary they are most luxuriant [The shoots sent showed this. W. F. R.], that if there is any difference the most luxuriant shoots suffer most; that there is no difference between trees 20 years old and new trees; that some of each will escape, and some of each will suffer, both being treated alike; that the land is the same."

country, and sold at so low a price as they usually are?" but this question is partly solved by a glance at the collection at Kew. The wood used is the common white deal of carpenters, and the mode of manufacture is so ingenious that a description of it cannot fail to be of interest. The wood is first turned in a lathe in circular pieces, which look when entire very like circular picture frames. Cross sections of the proper width required are then cut out of these "frames" in the direction of the grain of the wood, where a horse, a cow, a lamb, or a dog, or whatever animal has been designed in the lathe, presents itself. This will be more clearly understood from the accompanying figures. The section now has to be finished by hand, all it requires, however, is to have the angles rounded and smoothed, and the tail, horns, &c., which are turned in separate pieces, attached, after which the whole is painted, and the animal is complete. In the case of an elephant the ears, tusks, and trunk are all turned in distinct circular pieces, and sections are cut out in a similar manner to those intended for the body. This mode of manufacture is very ingenious, and in some degree explains the possibility of the production and importation of such large quantities of these toys for sale at such cheap rates. Since these specimens have been exhibited at Kew, they have attracted a large share of the attention of the numerous visitors who flock there. John B. Jackson, Kew.

HIMALAYAN FORESTRY.

In the Himalayan forests, and those at the base and on the spurs of the hills, those trees thrive best for which the soil and situation are suitable. This appears a truism, yet it results from it that if not wantonly destroyed the said forests, whether of Sal (Vateria robusta), Sissoo (Dalbergia), Deodar, Fir, or other trees

the most important... Fortunately, arrested by no river, destroyed by no mountain range; it is free as the air, and it is equally

Black Potato a milder flavour, and to render them more prolific, by crossing them with the first week of May, when they were well taken up several sets of each of the above, and disturbing as little as possible the clay in the roots, I joined them by cutting a clean part of the shoots without roots or leaves, placing the cut surfaces made to fit each other as nearly as possible, tying them with strips of linen, and the parts with tenacious clay, in which state each doubled plant having two sets of roots, down again, and carefully about the clay with white; No. 2 Red and white; I put down about half-a-dozen of these double sets, all of which appeared to be as well as the single sets in the rows from they were taken. In the month of August, on the clay from some of the plants, I found I was hybridising, so far as colour was concerned taken up in October the following results—No. 1. All the produce were most coloured, one side being thoroughly black, the other perfectly white, the dividing line ran from the roots to the tops of the tubers, nearly showing them imagined at first sight that I had black and white tubers, the red showing black and crescent-shaped patches, except a few were coloured in nearly equal proportions the being opposite sides. The smaller tubers had been most intermixed. No. 3. Produce irregular and striated, the red colour predominating, the changes produced on the Potato by the described, I determined to attempt to hybridise the Beizao and the Red A.tringham Carrot, and the varieties of the Turnip. The way I proceeded was to plant the bulbs to be operated together, and conjoin the seed stems in the manner as the Potatoes when suddenly high to be together, and before the blossoms would be shown. The depressed state of agriculture at home (now several years since) obliged me to turn attention to other matters, and I had not the time to make further experiments. *Edward Deputy County Surveyor, Tipperary Town.*

It will be seen that our correspondent's method is different from that of Mr Taylor, who is a proponent to herbaceous grafting. The reader will remember the curious case of the adhesion of a white Carrot figured in this Journal, p. 53, &c.

Broccoli.—In reply to "Colo" (see p. 278), I would inform as to the best hardy Broccoli, I would say that I consider Snow's Superb Winter Broccoli to be the earliest and best. It comes in the beginning of January, but was rather late this season than usual. I also cultivate the various varieties, which succeed the above in rotation. Snow's Winter White Protecting, an excellent hardy variety, for use a few days after Snow's; Snow's Early White, a very useful sort about the middle of February. Veitch's fine Spring White is an excellent variety, its beautiful white heads being ready in the beginning of March; Dilcock's is a large and fine sort, fit for use in the middle of April. I have grown Osborn's Early White, but with a tender, and will not stand frost or too much rain, and will grow many of the new varieties, but have not any to surpass in me named, which in my opinion are the best winter Broccoli in cultivation. *London, Bloxholm Hall Gardens, Slieford.*

Broom for Forcing.—Being strongly recommended to our limited stock of hardy shrubs for forcing purposes for conservatory decoration, I selected an ordinary sized plant carefully, and in a suitable sized pot, and at once, without preparation, introduced it into a moderate heat. In a few weeks time I was rewarded with a show of blossoms of this, the commonest of all leguminous plants. Within the reach of all, the colour of its value, yellow flowers being scarce in the winter months. *J. Edlington.*

Cropping Vine-borders.—Were it not that I had seen Mr Fish's remarks on this subject apparently set forth in "A," from which he quotes, and the facts stated, at direct variance, I certainly would not have croached on your columns again to treat of it. I would wish the borders in question could have been attended must have been what "A." referred to, and that such had then taken place. I have not recollection of having stated to him exactly how the borders had then in any case been made up, nor possibly have stated it at 50 feet except by the height of the soil from the rag referred to in the composition of the borders from the soil. I would wish the borders in front—not the borders under or beyond Mr Fish's in error in supposing that the borders were deepened or raised annually to the depth of 6 inches. The old mulching was removed, and the borders in the course of 10 years were raised 12 inches altogether. The natural decay of the soil, and the removal of the mulching, would increase to the depth or height of the borders. I think we are often too apt to lay a great stress on a mere crotchet in cultivation, than on the way with the idea that if the surface of the soil is attended to rigidly by any given rule—Mr Fish's instance, "Sacred to the Vine roots"—they are the most important point right, as they are to be well with their roots under a drapery of bedding, and therefore it is right to "bed-out" on the Vine

borders all this may be imbibed by inexperienced minds. For my own part, I would apprehend a thousand times more danger from one season's severe attack of red spider on the foliage than from 10 years' surface-cropping after the manner I have practised it, and if Mr. Fish would write "Sacred to the roots" on the border, I would write "No quarter to red spider" on the inside of the vinery, as a vastly more important inscription. Mendelssohn once said to his critics, "Stick your claws into me! Don't tell me what you like, but what you don't like;" and so it would be well if gardening writers would tell what they don't like, as well as what they like. Mr Fish has told us that he dislikes cropping Vine-borders with anything; and now I beg to state that there are things in Vine management I like much worse than surface cropping, and worst of all do I like red spider. *D. Thomson, Drumlanrig Gardens.*

Oranges of Home Growth.—Having cultivated the Orange and Citron family to some extent for upwards of 12 years at Hardiston, in Worcestershire, I beg to offer the following remarks for the encouragement of those who may be contemplating the culture of these delicious fruits either for ornament or utility. The collection at Hardiston consisted of Shaddock, Lemons, Limes, Citrons, Maltese, Blood, and other Oranges. These being of easy cultivation, were grown principally for ornament, but in some instances the fruit ripened exceedingly well, more especially the Lemons, which were particularly fine. In 1856 I exhibited a collection of them at one of the meetings of the Horticultural Society, then held at 21, Regent Street, for which I received a Certificate of Merit, the fruit having been found, in point of cultivation, to be of superior excellence. Some little time after the meeting in question, I received a letter from the late Dr. Lindley, asking if I would oblige him with the details of my method of cultivation; which I did at the time, and which he did me the honour of publishing at p. 4, 1857. The following winter I sent another collection to one of the Society's meetings, but unfortunately, through some delay in transit, they arrived too late for exhibition. Dr Lindley immediately informed me of the circumstance, and stated that he had placed them on his side-table, and had shown them to his friends, who greatly admired them. The trees from which the above-mentioned fruit was derived were grown on the planting out system, in the borders of a large conservatory, where they grew with great vigour, and bore an abundance of fruit, which made them very ornamental in summer and winter. In regard to pruning they were merely kept thin, and allowed to grow as naturally as possible. During their growing season the borders were well soaked with liquid manure. *J. Miller, Worksop Manor.*

The Horticultural Congress.—Now that the Royal Horticultural Society has announced the plan for the Congress, some estimate of its value may be formed. The Society has acted wisely in making the proceedings as simple as possible, and so that they can be carried out at little cost. The circumstances attending the experiment may serve as a guide to the Society in giving the Congress a broader basis in future years. Papers and discussions on them should be solicited, and all horticulturists should be invited to send specimens of diseased growths of plants, of soils suitable for the cultivation of different plants, and, in fact, should communicate anything connected with the profession which may be of interest, or which requires general elucidation. [Hear, hear!] All objects should be sent some time previous to the Congress, so that they could be arranged, and descriptive labels affixed, and, when the meeting assembled, discussion upon the most prominent should ensue. More good would result from this than from the mere reading and discussion of papers. Whatever is done, let no spirit of "sturdy independence" hold the profession aloof from acting in concert with the Society in making the experiment successful. I fully endorse your sentiments regarding employers facilitating the attendance of their gardeners at the meeting. I would also add that there are many head gardeners throughout the land, a word from whom to their respective employers would be a great boon, and be required in order to let their subs have a peep at the exhibition. *Brassica, Read Hall, Whalley.*

Flies in Pine Stoves.—I beg to inform your correspondent "Inquirer" (see p. 307), who is troubled with goat-like flies in his Pine pits, that he can get rid of his tormentors by fumigating with tobacco tissue, or by mixing the tissue with ordinary tobacco paper, and using the syringe thoroughly the next morning. We had the pests in our Pine pits last January, and could not get rid of them by smoking in the usual way with tobacco paper, and the syringe seemed to have no effect on them; I therefore tried the tobacco tissue, and have now got quite rid of them for the last three weeks not the slightest vestige of the living insect has been seen, but it required much syringing to free the dead flies from the plants. *D. Cunningham, The Gardens, Moor Park, Rickmansworth, Herts.*

Pear Buds Killed by Frost.—In describing the conditions of the bloom-buds on the Pears after the severe frost of Dec. 25, 1860, I perhaps was not sufficiently clear in stating that the buds when cut open were quite black—I ought to have added, in the centre, still, I cannot see how any one acquainted with the subject under discussion could mistake my meaning, as the fact of their having been cut open implied it was not the outside of the bud that was meant, the colour of which in the depth of winter is sufficiently well known. The greater part of the incipient blossoms in each bud appeared never to have moved afterwards, as was evident at blooming time, each bunch of bloom being composed of a portion only of its original number, the others being visible like dry dust. In the greater part of the blossoms which did expand the pistil was dead, and in some others the anthers also. I cannot agree with "Pari Passu," that

where buds are killed by the action of frost, we may expect to find them burst, inasmuch as the external portion of a bud is composed of a number of parts, that in all probability would admit of a degree of expansion, not possible in the bark or wood of a tree, and in that way bursting would be prevented. The pistil and anthers, from the great difference in their structure, would in all probability burst if frozen, to their certain destruction. But we are now veering on a most abstruse subject—the manner in which frost destroys vegetable life. *T. Barnes, Suamersfield, Boulen, Cheshire.*

Vitality of Bulbs.—Having had occasion to-day (March 15) to consult my herbarium concerning the genus *Narcissus*, I was surprised on finding two bulbs of *Corbularia monophylla* with living leaves about an inch long. One of these bulbs I gathered at Oran (Algeria) in January, 1848, and the other at Tlemcen, on the frontiers of Morocco, on the 23d March, 1857! I immediately planted the bulbs, and put them in my greenhouse, where I have no doubt they will flourish, and in all probability flower next spring, after (for one of them) a rest of 23 years! *Giles Munby, Alice Holt, Farnham.*

Cedar of Lebanon Seeds.—I have read with much pleasure the remarks of your correspondent (p. 278), who kindly explains the manner in which he extracts the seeds from the cones of the Cedar. However good this method may be, it is not quick enough to adopt, where a large quantity of cones have to be opened; and it has the disadvantage of causing a great many of the seeds to be crushed by the operation described. The following is the method which we adopt to remove the scales from the thousands of cones we require annually in raising our nursery seedlings—About the month of February a hole is made in the ground, about 2 feet deep, in which we bury all the cones in sand. In one or two months' time—having taken care that the sand does not become too dry—the cones scale easily without force, the seeds are then picked out and are sown immediately. It might be thought that this plan would injure the quality of the seeds, through moisture, &c., but it does not, as the seeds are taken from the cones, in a fresh condition, and are swelled ready to germinate at once. Formerly the nurserymen in this country (France) used to bore through the apex of the cones with a gimlet, but it was a long and tedious operation. During the last 20 years the above plan has been followed by all our *confreres* with great success. It was found out by one of the nurserymen finding in the ground some cones, which had been buried by rats, and which scaled easily of themselves, and by ascertaining that the seeds of these would grow freely. *Delépine Ainc, Horticulteur-pépiniériste, Angers.*

The Court-pendu Flat Apple.—In reading a notice of this Apple on p. 309 as the Garnons Apple, and Mr. Watson's mention of it at p. 53, I am reminded of years gone by, for in 1834 I happened to be dining at the *table d'hôte* of the *Hôtel de Vienne*—I think that was the name of the hotel—at Ghent. It was in the month of June, when Strawberries and Cherries were ripe. At the dessert I was surprised to see numerous dishes of Apples, plump, bright, and beautiful, as if just gathered; and finding them preferred by the diners, I inquired of my table neighbour how it was that such an early kind of Apple existed in Belgium, unknown in England. He soon enlightened me by telling me that the Apples in question were those of the preceding year, and that they were of the kind called Court-pendu. I had some faint recollection of having seen the same kind of Apple in the gardens of the Horticultural Society at Chiswick, but the fruit under my eye was different in all respects. I therefore thought I had made a grand discovery, and, like all credulous young travellers, was proud enough of having done so, for I anticipated the pleasure of making the English people acquainted with plump, bright, and fairly good Apples in May and June, for those on the table at Ghent were large, flat, with fine bright crimson coats, and sweet, juicy, and nice in flavour. Acting on my impressions I at once set about importing some trees of my newly discovered Apple. When they came into bearing I found the sort well known by my old friend Mr. Pearson, as the Wollaton Pippin, and also at Chiswick, and so my dream ended. The Court-pendu Apple is now largely cultivated in our gardens, and in warm seasons, like the last, its fruit are fair, and they keep well till March, but they are so inferior to those grown under the brighter skies of the Continent as scarcely to be recognised as of the same kind. *T. R.*

Green's Hot water Boiler.—May I take the liberty of asking "Y." (see p. 233) if he is simply in search of truth?—for, if so, it is reasonable to suppose he would have come here openly, and have told some one the nature of the business he had come upon. I should not now care to reply to him, not wishing to waste your valuable space, but that I am anxious the truth should be known respecting this boiler, which I fearlessly assert is all that I have described it to be. I will go further, and say it is the best, most effective, and most economical boiler for horticultural purposes in present use. If "Y." or any one else, doubts this, let him come and judge for himself. Beyond this I do not intend to reply to any one who takes shelter under a *nom de plume*. I will shortly give a description of the boiler now at work here, for the present, suffice it to say that it is doing much more efficiently the work previously performed by two boilers (one of them a very large one), with less than half the fuel and labour. *J. Willis, F.R.H.S., Ashburnham Park Nursery, Chelsea.*

Hardy Spring Flowers.—I saw a few days ago at Mr. R. Parker's Exotic Nursery, Tooting, a very rich deep-coloured herbaceous Anemone, named *dichotoma fulgens*. The hue of colour was of a brilliant deep crimson, and it was nearly as showy as the well-known Vermillion Brilliant early single Tulip. Mr. Parker said it was quite hardy, though occupying a warm and

Mr Morris may be said to hold this in abhorrence, and there is no doubt much truth in his remark, that a little wholesome neglect on the part of some amateur growers would no doubt result in these plants doing better, and being much more satisfactorily cultivated. "Coddling" is no doubt the bane of many amateur growers—hot, ill-ventilated, close houses will not, and cannot be made to grow healthy specimens of these Variegated Pelargoniums. When requisite and during the winter and early spring months, it will be found necessary almost daily,—some artificial heat is given to the house, and a free circulation of the air allowed by plentiful ventilation. There was no evidence of damp, all was healthy, vigorous, and, if the season for being in true character, well coloured.

In regard to soil, Mr Morris uses a fine yellow loam, known as the Dartford loam—sweet, and full of fibry lumps, and of a sandy nature. It is in this alone that Mr Morris grows the plants, and then it is not sifted, but simply broken up into small lumps, and so used for potting purposes. Aeration of the roots is a special feature of Mr Morris's method of cultivation, and accordingly chips of turf, large enough to astonish some growers, are incorporated with the soil, so that it may be thoroughly open and porous, and in addition narrow earthenware pipes are placed in the soil, with the openings just above the surface, and this is done to obtain a free circulation of air through the body of the soil. This process was being applied to a certain number of pots, and it was noticeable that the plants, the roots of which were so aerated, were in a very healthy condition.

There is no doubt much both of truth and force in the remark often made, that of all plants the Variegated Zonal Pelargonium is most likely to suffer from over-propagation. In the general race to get new things distributed, especially at a time when so many new varieties of the tribe are being produced, over-propagation is almost an inevitable result, and debilitated plants succumb to a rigorous mode of treatment, or pine away to a state in which life and death are held, as it were, in a balance. Amateur growers, without proper appliances for growing the plants, have to fight against the effects of debilitation, in addition to other accidents common to plant life. It is the evils incident to the misfortune of over-propagation that Mr. Morris essays to lessen by his somewhat novel mode of cultivation, certainly it is, that as far as the results could be ascertained on this occasion, it appeared to be conclusive in favour of the method of aeration of the roots adopted by that gentleman R. D.

Miscellaneous.

Covent Garden Notes.—The supply of Broccoli (Cornish heads) is now on the decline, as the season for these is nearly over. In consequence of the late mild autumn and mid-winter, the supply sent from Cornwall to the market was very large, the enormous quantity of 10,000 crates (1,000 tons) having arrived between December 20 and February 28. As will be seen from the Market Reports, the Potato trade is somewhat dull, as it has been so for some weeks past, notwithstanding this, we learn that the average weekly quantity brought to King's Cross by the Great Northern Railway alone since December, has been at the rate of 1,000 tons per week, and that a short time back 7,000 tons were delivered at the same place in one week. New Ashleaf Potatoes, grown in frames, have appeared during the last few days, but in very limited quantities. Cucumbers, which are principally of the Syn House breed, are now getting more plentiful, and are sold at from 1s each and upwards. There is a small supply of the highly coloured Lady Apple (the Apt of Hogg's Fruit Manual), in excellent condition, and which are sold at 1s 6d. per dozen.

Lichen-Lessons from Gravestones.—Few botanists have paid any attention to our rock-loving Lichens, consequently the literature of the subject in this country is at a very low ebb. This is greatly to be regretted, for the beautiful part-coloured films and patches of vegetation so common on architectural remains and exposed rocks are well worthy of close study. Lichens are known to be amongst the first objects which disintegrate rocks and stones, but the time required for their germination and growth has long been a vexed point. Recently an English botanist has hit upon the idea of noting the growth of lichens upon the dated monuments and gravestones of country cemeteries, and has found that it requires a period of twenty years for a lichen to acquire a moderate or adult size on a squared stone; the growth of these pretty rosettes of grey and yellow colour, so ornamental to our architectural remains, is, as might have been expected, excessively slow. Builder.

Garden Operations.

(For the ensuing week)

PLANT HOUSES

THE shifting of plants into larger-sized pots, or, as we of the craft term it, fresh potting, should now be proceeded with in the case of stove or other plants requiring such aid, as suggested last week. Space will not allow me to give in detail every particular in regard to the exact consistence, the richness or otherwise, of soils which the several species require, or to state how firmly or otherwise individual plants should be potted, &c. I may, however, point out in general terms a few particulars, which are absolutely necessary to be attended to by those who wish to be successful in the treatment of plants grown in pots. Hard-wooded species of plants invariably require to be solidly and firmly potted. The composts used in potting them should be so composed as to admit of this being done without in any degree diminishing or impairing the needful amount of drainage,

which is so necessary to cause the water given to them to percolate freely throughout the pot and to flow as free away without scouring the soil, or causing the many other evils attendant upon imperfect drainage and an injudiciously prepared and too tenacious substance. Hard-wooded plants, moreover, do not require to be potted so often as those of a more succulent nature, but require a larger amount of really good material of the proper sort, as they receive but little benefit from liquid manures, which are so serviceable in the case of grass feeders. Thus, whilst the best maiden loam is as essentially necessary to the soft-wooded plant as it is to the hard-wooded one, yet a different mode of mixing the materials is requisite in preparing a suitable compost for each. The hard-wooded plant should have as much partly decomposed fibrous matter as possible soft succulent plants, on the contrary, thrive better in thoroughly decomposed substances. Their growth is rapid, hence what is afforded them within the small compass of a pot should be at once fit for their use, for if this is not so, their principal growth will be made before the compost is in a fit state for them to feed upon. Actual manure may be mixed freely with this loam in the case of all plants of quick growth. The grosser the feeding capabilities of a plant, so much the stronger also should the stimulant given be; but others less strong though of rapid development—such, for instance, as Chinese Primulas, will do better with the milder regimen of decomposed leaf-mould. The plants of slower growth should only have a very small portion of manure at any one potting. The manure should be applied with judgment, and only such as is thoroughly decomposed and is certain not to injure the component parts of the compost in admixture. It only remains for me to add, that the longer the intervals which exist between each potting, so much the more permanent and efficient should the drainage be made. Large crocks should be placed over the large outlets at the base of the pot, and over them a layer of potsherds broken so small as to prevent the soil finding its way down into and amongst the crocks, so as to choke up the proper channel. The more succulent in general a plant's roots are, so much the more loosely should it be potted. Give the final shift to any late *Cinerarias* which are needed for a successional display. They should, however, if dwarf and healthy, only receive a small potting at this time. Pinch back the young shoots upon *Fuchsias* started into growth, as previously advised, and continue to propagate any varieties of which a more extensive collection is required. Gradually advance the temperature both in stoves and in Orchid-houses, and with it afford a proportionately larger supply of moisture. Be cautious, however, at this early period, not to cause or permit too much water to lodge in the hearts or crowns of any plants, or it may cause the actual growing parts to become decayed. Above all things, attend to the fumigation of all structures likely to harbour or to produce insect pests. Always endeavour to act upon the preventive system, by smoking all such places periodically.

FORCING HOUSES.

The temperature in all *Piseries* containing forward successional should now, as the season advances, be increased to a mean of about 73° by night, and, with the assistance of sun-heat, an increase of from 12° to 14° by day. Give them tolerably good syringings overhead with tepid water both mornings and afternoons when the days are bright and sunny, but only very early upon afternoons while dull weather prevails. The freshly potted suckers or crowns should have a nice soaking of water a few degrees warmer than the temperature of the house in the morning of fine days, though much of what is necessary may be afforded in process of syringing by experienced hands and those who closely study their wants. *Figs* that are swelling their fruit must be pushed on their way very evenly, as the least check they receive so deranges their organs as to cause them to shed the fruit at this stage. Such *Peach* and *Nectarine* houses as have fruit within swelling freely, should be attended to in the matter of thinning or pinching back the young shoots. The only safe way is to go over them carefully at intervals, and by taking out a few of the thickest and strongest shoots to somewhat ease the parent trees of their burden. Where any are in such an advanced state as to be about to commence stoning a more decided action, as regards pinching the shoots, will of course be needful. I would here throw out a hint regarding red spider, the only preventive of which is to keep the trees in health and cleanliness, for they are sure to follow in the wake of a neglect of one, or ill-success in the other. The next few weeks will be favourable to their formation upon many indoor subjects. If there is one preventive better than another it consists in a tolerably free use of flowers of sulphur, and an abundance of atmospheric humidity.

HARDY FLOWER GARDEN

Those who have delayed to make the necessary sowing of *Sweet Peas* should do so at once. These are far more beautiful when sown thus early, and bloom before the excessive summer heat sets in. It is not necessary to sow them in pots; and with the customary protective measures, *Sweet Peas* are far more hardy than many suppose them to be. Many semi-hardy perennials, such as *Pentstemons*, *Phloxes*, *Pyrethrums*, &c., which, from their rarity, have been kept within the protection of a cold frame, should now be planted out into the open border; press the soil firmly around them after planting, and by any other means secure them against sudden storms and strong winds. Even in places where only limited means exist it will now be full time to bring the stock of *Dabbies* to light, and to start them into growth. Where it is not requisite to increase the stock by cuttings, it will not be necessary,

to force them on by placing them in an even or heat. The more gently they are brought into growth the greater will be their robustness. Propagate by means of cuttings any further stock of *Dabbies* may be required.

KITCHEN GARDEN

Sow a few *Cardoons* for early use. Make the sowing of *Beet* upon good trenched soil, with plenty of manure placed at the bottom of the trench. Finish planting all early *Potatoes* immediately. *Artichokes* Make a successional sowing of *Peas* and *Broad Beans* as soon as those previously sown are aboveground, earthing up all that need it. Make plantations of *Rhubarb* this is generally done by dividing the old stocks and replanting them in manured fresh soil. Sow *Capsicums* and *Cucumbers* as also the herb *Sweet Basil*, for winter purposes. W. E.

TOWN GARDEN

GRASS PLOTS and lawns should now be frequently, as this operation not only makes the grass firm, smooth, and clean, but renders the grass easier to mow. It will be necessary to recommence mowing at once early in the morning while the dew is on the ground, is the best time to do this with the scythe, if with a mowing machine, later in the day when the grass is dry. Grass plots in town gardens should not be cut quite so close as is usually done in the country. The *Virginia Creeper* and other plants covering walls, trellis-work, &c. should now be cut in or otherwise secured. Have all the young shoots of off, and the leading branches secured. *Cyperus* are now growing fast, if dwarf plants are required, they should be pegged down as previously directed. The annuals that were sown in gentle heat will be coming up, and will require a little attention. A flow of air should be afforded them in fine weather and they should receive occasionally slight waterings. *Herbaceous* plants may still be planted, if there is plenty of earth round their roots. *Antirrhyns* and the most useful plants for town gardens, such as *Violas*, be sown, and also the common *Tropaeolum* sown in borders, and makes a pretty display. *Hyacinths* have done flowering in glasses and pots. *Chrysanthemums* turned out into the borders and covered with a little rotten dung in the autumn and allowed to rot, they will flower well next season. *Tulips* are now getting forward, and if slightly protected on cold nights and during stormy weather, they will bloom freely, and give great satisfaction. J. D.

STATE OF THE WEATHER AT CHISWICK, NEAR LONDON. For the Week ending Mar 24 1903 as observed at the METEOROLOGICAL OBSERVATORY.

March	Moon's Age	BAROMETER		TEMPERATURE			W. S. P.		
		Max	Min	Max	Min	Mean			
Thurs. 18	5	29.828	29.710	51	30	40.6	41	60	6

Friday 29	52.8	34	44.2	21	1.9
Satur. 30	52.1	33.7	42.9	20	0.5

The highest temperature during the above period was 78 deg. on the 2d 1879—then 78 deg., and the lowest on the 18th 1889.

NOTICES TO CORRESPONDENTS

Books: S. T. "Ayes on the Cucumber," & M. "The Cucumber," if either is still in print. We have a new edition of the former to be expected, but perhaps not in time for your objection. Refer to our weekly Calendar, and refer to the "Notes on the Cucumber." DISEASED FIR TREES: P. B. You have noted a fungus on a parasitic fungus, *Peridermium*, which I have not known of any remedy. The fungus is a parasite on the wood, as the branches are not affected. I have seen these of the Silver Fir from almost all parts of the world, where the nature of the fungus is the same. I identify the introduction of the parasite, and the means of spreading the parasite. G. S. H. IN A GARDEN: I have seen a very good specimen of the fungus, and I have seen a very good specimen of the fungus. BOARD GENTLY TWO OR THREE LINES at the end of the next issue, and use the syringe from the next issue. Information on this subject, see p. 333. NAME OF INSECT: A. I. responds.—The sketch of the "dove" insect represents one of the *Homoptera*, *Neides tipularis*. It is reputed to be a pest of the *Homoptera*. NAMES OF PLANTS: F. W. J. I have seen a very good specimen of the fungus, and I have seen a very good specimen of the fungus. SCOTT'S WASP DESTROYER MIXTURE.—Those who have used it to dispose of should advertise them, and not lose their money under a bushel. FRESH MINT: I have seen a very good specimen of the fungus, and I have seen a very good specimen of the fungus. COMMENTARY: H. E. V. I have seen a very good specimen of the fungus, and I have seen a very good specimen of the fungus. C. F.—M. I have seen a very good specimen of the fungus, and I have seen a very good specimen of the fungus. —A Constant Reader—J. A.—A. P. I have seen a very good specimen of the fungus, and I have seen a very good specimen of the fungus.

SUTTONS' HOME-GROWN FARM SEEDS,
NEW AND UNADULTERATED,
CARRIAGE FREE.
DIRECT FROM THE GROWERS THE BEST MEANS
OF PREVENTING DISAPPOINTMENT
Special Contracts made for large quantities
Farm Seeds are saved from large and carefully
selected crops from the Carriage Free, but have no Agents.
SUTTONS' PRIZE MANGEL WURZEL,
A NEW AND DISTINCT VARIETY.

SUTTONS' NEW YELLOW INTERMEDIATE.
The peculiar shape of the roots, and the leaves being small,
may be sown to stand closer in the rows than other
varieties, and it produces a greater weight per acre. It may be
sown with half the labour of other kinds.
1s. 6d. per lb., much cheaper by cwt.
THE LARGEST GLOBE VARIETY IN CULTIVATION.

BERKSHIRE PRIZE YELLOW GLOBE.
A new variety of Globe Mangel, yet introduced. It is of
a very neat top. It is mostly of pale yellow
colour, and produces only one tap-root. It grows to a large size, and
produces the enormous weight of 85 tons per acre.
1s. 6d. per lb., much cheaper by cwt.
The following excellent sorts can also be supplied:—
SUTTONS' HAMMOTH LONG RED, 1s. 6d. per lb.
SUTTONS' YELLOW GLOBE, 1s. per lb.
SUTTONS' RED ORANGE GLOBE, 1s. per lb.
SUTTONS' YELLOW GLOBE, 1s. per lb.
SUTTONS' GLOBE, 1s. 6d. per lb.
SUTTONS' LONG RED, 10d. lb.
SUTTONS' RED GLOBE, 1s. per lb.

MEETINGS FOR THE ENSUING WEEK.

- April 1 Yearling Short-horn Bull Show and Sale, at Bingley Hall, Birmingham
- 2 Norfolk Chamber of Agriculture, at Norwich—1 The Contagious Diseases Act, 1869, Lill No. 2 2 The Best Substitute for the Malt-tax

We some weeks ago called attention to the fact that the farmers of England are but scantily represented in the Commons House of Parliament. It was a phenomenon, not to say a scandal, that constituencies consisting almost wholly of those who cultivate the soil should send up soldiers, lawyers, noblemen, and squires, but no one really representing them—so few of these being agriculturists. Thanks partly to the fashion set by the Royal Agricultural Society of England, partly to the real interest, for all educated men, of the problems which agricultural improvement offers, the agriculturist is met with now in many other classes as well as among the actual tenants of the land, but that the latter, who may be said almost exclusively to hold the county franchise, should disregard the special agricultural fitness of any candidate for the county membership, and consider only the nomination of the leading county men, was not only an absurdity—it was a disgrace. This was one of the points enumerated as indicative of the present status of the tenant-farmer in this country. No doubt the necessity for a special or professional representation of his class in Parliament will pass away along with, almost in advance of, that undue subserviency which at present hinders it; for it only needs a general advance in intelligence and resolution among agriculturists to attain, without the aid of legislation, many of those aims which the most advanced among us propose to achieve by direct enactment. Nevertheless, the progress sought will be materially hastened by the presence among our legislators of men who have the confidence of farmers; and if more of the counties cannot send them up, let us hope that some of the borough constituencies may act for them.

The City of Hereford is to elect its representatives next Tuesday, and one of the candidates is Mr. C. WREN HOSKYNs, well known to the readers of the *Agricultural Gazette*—well known, indeed, to agricultural readers everywhere. No one has done more than Mr. HOSKYNs to illustrate the influence of English history, and especially of English legislation, on the condition of English agriculture, no other English writer has done so much to illustrate the charm and extend the interest now generally felt in even the commonest details of land-owning and of farming—no one, we may add, did more than he to revive the steam cultivation problem, whose achievement has been at length such a great and pregnant agricultural success; and as having already often been the exponent of

GENUINE TOBACCO PAPER, of the best quality, 100 per lb. or 50 per cwt. WALTER BAKER & CO., Stationery and Seed Merchants, London.

THE TURAC O CLOTH - The easiest and best for the strength, as 17 per lb. or 19 per lb. at Joseph Baker, 1, Broad Street, Fleet Street, E.C. Post Office Orders payable to Fleet Street.

WILKINSON'S COMPOUND. Used by many of the leading Gardeners since 1850, against Red Spider, Mite, Thrips, Green Fly, and other pests.

Wholesale by PRICE'S PATENT CANDLE COMPANY (Limited), Battersea, London, S.W. By Royal Appointment.

To His Majesty, by Special Warrant, dated December, 1865. To the Prince of Wales, by Special Warrant, dated February 10, 1866.

DAY, SON, AND HEWITT. Sole Proprietors of the STOCKBREEDERS' MEDICINE CHESTS, for HORSES, CATTLE, CALVES, SHEEP, and LAMBS. No. 1 MEDICINE CHEST, Contains 8 strong different kinds of Compounds, admirably arranged, with full directions for use. Parf. Price 2s. 6d., carriage free. No. 2 MEDICINE CHEST, Contains the Extract, Gaseous Fluid, Red Drench, and Red Paste, with Shaming Key to Parf. Price 2s. 6d., carriage free.

H. BROOK AND CO. Sole Manufacturers of the H. CHELTENHAM GARDEN ENGINE, which weighs only 11 lb. 10 oz., throws water in a continuous stream over 35 feet. To be had of all Ironmongers, and Wholesale only at 10, Featherstone Buildings, Holborn, London, W.C.

WARNER'S PATENT OF IRON PAINT. A certain PREVENTION against RUST, and PRESERVES IRON and WOOD. Contains 1 lb. of IRON and AMMONIA. A complete recipe, and may be obtained through any chemist or ironmonger. WARNER & ASHBY, 17, Laurence Pountney Lane, E.C.

FOWLER'S PATENT STEAM PLOUGH and CULTIVATOR may be SEEN at WORK in every Agricultural County in England. For particulars apply to John Fowler & Co., 71, Cornhill, London, E.C. and Steam Plough Works, Leeds.

IRON HURDLES. SHEEP, CATTLE, and ATTLER, 4s. 6d. per 100. List by post. GALVANIZED IRON and WOOD. St. Pancras Iron Works Company, Old St. Pancras Road, London, N.W.

THE TANNED LEATHER COMPANY. Arncliffe Works, Greenfield, near Manchester. TANNERS, CURRIERS, and MANUFACTURERS of IMPROVED TANNED LEATHER DRIVING STRAPS for MACHINERY. PRIME STRAP and SOLE BUTTS. WALRUS LEATHER for COVERING COTTON GIN. PRESSING ROLLERS. Price Lists sent free by post. Warehouse, 41, Mark Lane, London, E.C.

Green's Patent Noiseless Lawn Mowers. GREEN'S PATENT LAWN MOWERS have proved to be the best, and have carried off every prize that has been given in all cases of competition, and in proof of their superiority upwards of 41,000 have been sold since the year 1856. They are the simplest in construction, least liable to get out of order, and can be worked with far greater ease than any other Lawn Mower extant.

They are the only Machines in constant use at: Buckingham Palace Gardens, The Winter Palace Gardens, Marlborough House Gardens, Dublin, Royal Horticultural Society, The Dublin Botanic Gardens, South Kensington, The Liverpool Botanic Gardens, The Royal Botanic Gardens, The Leeds Botanic Park, The Hull Botanic Gardens, The Crystal Palace Gardens, Brussels, The Hyde Park Gardens, The Sunderland Park, The Preston Park. And in most of the principal Parks and Squares in the United Kingdom.

Every Machine is warranted to give entire satisfaction, and if not approved of can be returned at once unconditionally. Illustrated list on application, which includes Free Delivery to all the principal Railway Stations and Shipping Ports in England. Orders executed on the day they are received. T. G. & Co. have always more Lawn Mowers in Stock at their Establishment, 41 and 43, Blackfriars Road, S., than any other firm in London. Having very few agents in London, we are in a position to do all kinds of repairs to our works at the Works at Leeds. THOMAS GREEN & SON, Smithfield Iron Works, Leeds, and 41 and 43, Blackfriars Road, London, S.

Caution to Gardeners.-When you ask for SAYNOR AND COOKE'S WARRANTED PATENT PRUNING and BUILDING KNIVES, see that you observe the mark SAYNOR, as so the Company's name is warranted, without which there are many cheap imitations. Gardeners and others who have been misled by these cheap imitations, and who have bought them, are made to their own loss, as they are not made to their order, and are not so strong and durable as the SAYNOR AND COOKE'S KNIVES, which are the best and the cheapest to be had.

Glass for Garden Purposes. JAMES PHILLIPS AND CO. beg to submit their REDUCED PRICES of Glasses.

Table with columns: PROPAGATING GLASSES, Each - s. d., inches in diameter, inches in diameter. Rows 1-11.

Table with columns: EACH GLASSES, with ventilating hose through back, inches in diameter, inches in diameter. Rows 1-5.

Table with columns: CUMBER GLASSES, inches long, inches in diameter. Rows 1-3.

Table with columns: HAND GLASSES, inches, inches, inches. Rows 1-3.

Table with columns: LONDON AGENTS for HARTLEY'S IMPROVED PATENT GLASS, inches, inches, inches. Rows 1-3.

Horticultural Glass Warehouse. THOMAS MILLINGTON AND CO. 87 Bishopsgate Street Without, London, E.C. NEW LIST for ORCHARD-HOUSE GLASS as supplied to Her Majesty, the Nobles, Gentry, Mr Rivers, and the leading Horticulturists of the United Kingdom.

Table with columns: ORCHARD-HOUSE SIZES, inches, inches, inches. Rows 1-3.

Table with columns: SMALL SHEET SQUARES, 15 oz., per 100 feet, inches, inches, inches. Rows 1-3.

Table with columns: SHEET GLASS, 15 oz., per 100 feet, inches, inches, inches. Rows 1-3.

is scarcely a Vine-border throughout the country which is not more or less warmed in some way or other. Every gardener in this country, while constructing his Vine-borders, takes care, while supplying enough feeding material, to have his border laid warm and dry. All admit the necessity of warming so far, and it is absolutely necessary in some situations to pay extreme attention to this point. Some situations are naturally more cold and damp, and require more warming, &c., than others. This, therefore, should not be lost sight of in speaking generally of heated borders. As to the methods and extent of warming, we have, in the first place, the simple draining of the ground, the concreting of the bottom of the border, and paving it with brickbats, &c., which are almost universally practised; then others may be, as it is termed, aerated, which is simply well drained, and a very excellent method it is, others, more elaborate, may have the addition of hot-water pipes, or hot manure, &c., in various positions, and to a varying extent—amongst the brickbats immediately underneath the roots, or in capacious chambers below them, as in the Kingston Hall example, the allusion to which, and its apparent justification, by Mr. WESTLAND, have been the principle cause of this discussion. There are, besides, many other methods of increasing the natural warmth of a Vine-border, such as elevating it above the surrounding level, protecting it from cold and wet, husbanding the heats of summer, applying heating materials to the surface, or forming it inside the house, &c., all of which may be more or less recommended.

A certain degree of heat for the roots of Vines being thus considered, by all parties, to be beneficial, it seems a simple problem to determine what should be its exact amount, yet it is on this very point that opinions are divided. We know exactly how much to apply to the tops at all seasons, but how much we ought to apply to the roots is not clearly ascertained. For the production of early Grapes—Grapes to ripen in April, Mr. WESTLAND gives it as his opinion, that the temperature of the border "should correspond with the mean temperature of the house," say 60°. Mr. THOMSON, whose experience is great, puts it at the same figure. Now, assuming this to be correct, we have here some data to go by. To attain and maintain that degree of temperature it is absolutely necessary to have recourse to fire-heat in some shape or form the border must, in fact, be warmed by hot-water pipes. We therefore give our vote unhesitatingly in favour of Mr. THOMSON'S practice (see p. 27), as being the simplest and most effectual. Although in unskilled hands heated borders may be said to be "dangerous things," it is shown, in Mr. THOMSON'S letter, that in skilled hands they are exceedingly obedient. The chambered borders at Kingston Hall have been condemned by those most conversant with them, on account of the expense of construction. We are well aware of the many fine crops of Grapes produced by Mr. WESTLAND, but, when we take into consideration the enormous expense attendant on the formation of these borders, and the condition of the Vines during the past season, we must join in their condemnation. It may be said, that a good thing is not dear at any price; yet if the same result can be produced at a less cost, we prefer the cheaper plan. Mr. WESTLAND'S proposed border, as propounded by Mr. AYRES, seems good in principle; nevertheless, it seems to us, that unless considerable heat is continuously kept up—which is objectionable—the border will only become heated to a very slight degree.

We come now to consider the necessity for so high a degree of earth-temperature to start Vines in November, or at any other season. Mr. SAGE, a good practical gardener, says 50° is much preferable. Mr. MILLER, Combe Abbey, and others, say something to the same effect. We have heard the argument used, that if 60° is necessary in November, it is equally so in December, January, February, and March, yet the advocates of the heated borders do not deem it necessary for the three latter months, and why? It may appear rather paradoxical that those Vines which bear the best fruit, the main supply in fact, should require no assistance in the way of bottom-heat, though that is found so beneficial in the case of the others started earlier,—that the Vines which produce the main crop, should, in fact, start into action without bottom-heat at the season when the earth's temperature is at its very lowest, and greatly below that of November, when such heat is

deemed necessary. The average temperature of the earth, as noted at Chiswick, at a depth of 2 feet, is in November 47°, in January 40°, in March 44°, and it is the very end of June before 60° is arrived at. It then rises to 68°, and in September sinks to 61°, October 56°, and at 1 foot the temperature is in summer a little higher, in winter a little lower. Our well-formed Vine-borders are, probably, considerably warmer than this, yet here we have the fluctuations shown, and some idea of the actual temperature realised, and from that and our own practical experience combined, we draw the conclusion that 60° is an extreme temperature, and higher than necessary to start with, even in November. The earlier Vines are forced, the more difficult it is to get them to break. It is unnatural for them to do so in November, and they have to be forced to do it. This is the reason why a higher degree of temperature in the border is necessary to set the roots in action in the one case than in the other; it is sound doctrine, as they will naturally move in spring at a much lower temperature. Roots grow to some extent, in favourable situations, during the winter, while the tops are yet dormant; in their action they are always naturally in advance of the tops, but when forcing is commenced in November their action is anticipated hence the necessity of a stimulant, and the farther out of the natural course, the greater must the stimulant be.

Vines forced early one season require less forcing the following one. They seem to get used to an earlier season, yet, by continued forcing, Vines become exhausted, and require renewal much sooner than those which are allowed a more natural life. We have seen many excellent crops of Grapes produced and ripened in the end of April and May, by the husbanding of the heats of summer in early autumn, and by protection from cold and wet in winter, with the addition of a little fermenting material to the outside borders, as well as by the use of inside borders, of which we much approve for early work. And, again, for very early Grapes, we are greatly in favour of the use of pot Vines. They can be forced at a much less expense. This, in fact, is the only purpose for which pot Grapes can be recommended, viz., to bridge over the gap that may exist between the late and early crops on the permanent Vines. Thus, although we approve of Mr. THOMSON'S method of applying bottom-heat, as being the best brought forward—and look upon it and similar methods as great feats of horticultural skill—yet, seeing that it is apt to be mismanaged, and that equally good Grapes, and a continuous supply, can be procured without incurring that expense, we are inclined to say—Let well alone.

After all comes the final question, is it necessary to force Grapes so early? For those who prefer newly ripened fruits it may be, for those who are content with well-kept Muscats, Lady Downe's, Alicante, Mrs. Pince's, &c., it is not. Mr. MILLER, of Combe Abbey, one of the most successful Grape cultivators in this country, who objects to early forcing, states that by the aid of the fine late Grapes now in existence, he is enabled to belt the year round without it. Remembering what we do of Mr. MILLER'S freshly kept Grapes in March, as well as those of Mr. TILLYARD, at Stanmore Priory, and the examples of Mr. MEREDITH, Mr. STEVENS, and others, as well as the late kept Grapes still to be seen in Covent Garden, we decidedly give them the preference. They are not only not coarse, but rich and luscious in comparison, in our opinion, with the newly ripened fruit, excepting Royal Ascot, in the end of March and beginning of April. As they can be kept so well now, at so much less expense than by forcing, we fail to see the utility of forcing early, and this conclusion does away, to a great extent, with the necessity of having hot-water pipes and heated chambers underneath our Vine-borders.

—A UNIVERSAL AGRICULTURAL CONGRESS is to take place at Copenhagen from the 6th to the 10th of July next, under the presidency of the Comte HOLSTEIN. The scheme is an extensive one, and combines the following features—1. Reports and discussions on agricultural matters, 2. Exhibitions of domestic animals of the bovine, equine, ovine, porcine, and feathered classes; 3. Exhibition of implements, machines, &c., connected with agriculture, forestry, dairy management, the chase, fishing, bee-culture, and gardening, 4. Exhibition of the products of agriculture, forestry, &c., 5. Horticultural exhibition. This latter, which more immediately concerns us, is in charge of a special committee, consisting of the Baron

ZYPHEN ADELER (president and M. ROYER, director of the Public Parks, members of the General Commission; and M. TYGE ROTHE, director of the Garden of Rosenberg, M. C. L. HANSEN, secretary and M. J. O. HOLM, secretary of the Horticultural Society of Copenhagen. It is to embrace vegetables and table fruits, in season, as well as forced, retarded, fruit trees and garden seeds, ornamental plants and cut flowers, ornamental plants, agricultural products, as preserved fruits, &c. Designs for gardens, hothouses, &c. erecting, heating apparatus, and garden notices. Notice of intention to exhibit, to be sent before the 15th of June to the Secretary, M. D. DESSAULT, plads No. 13, Copenhagen.

—What is a SPECIES of NARCISSUS? We find question in reference to the proposed exhibition of species of Narcissus next year (see p. 30). We may ask, Who are to be the judges? What rules of law are to be laid down for their conduct? Are we to go back to the origin of species, and your to discover the handsome but somewhat unprofitable youth who is said to have been the inventor of his race? No, surely, and yet we should trace at the root of the matter (mark), though naturally process would be narcotic in its effects. Suppose we don't suppose any three botanists would be of the same opinion as to what constitutes a species of more than usually variable genus. HERBERT, in his own opinions on the matter so did HAWKINS, BOISSIER, so also M. JORDAN, but assuredly the botanists we have mentioned, and we enumerate many others, has carried entire control to the minds of others. In this dilemma, what judges at the forthcoming exhibition to do? Time enough to consider this matter, and we are to be able to announce that Mr. J. C. BAKER of Royal Herbarium, Kew, has kindly undertaken, on request, to prepare a few notes on this point, which may facilitate their labours. Few persons can be so well suited as Mr. BAKER, both by personal knowledge and favourable circumstances for summarising the state of science as regards the cultivated species of Narcissus. We hope to publish the first portion of Mr. BAKER'S remarks in an early number, and meantime, as it is desirable to know what actually are in cultivation, any of our correspondents who may have specimens in a fit state for description, will be aiding in the good work by sending specimens either to Mr. BAKER, or to ourselves.

—The following extract from the official Gazette, received from her Majesty's Ambassador, Berlin, has been forwarded to us for publication. *Staats Anzeiger* gives us some particulars of the METHOD OF CULTIVATING the POTATO, by GÜLLICH, of Pinnberg, in Holstein, and which, as said, has given surprising results where it is employed. The leading features of this new culture are—1. Turning up the soil to a considerable depth; 2. Choosing as seed large, sound, and uneyed Potatoes; 3. Leaving each seed Potato a space of one square foot; 4. Laying the seed Potato with the side down. By a report laid before the last meeting of the Frankfurt Agricultural Society, we learn the result of experiments in Potato-growing made last year on one morgen (two-thirds of an acre) which was planted with 8 metzen of seed, 1 metze is somewhat less than one-tenth of an English bushel, and where the seed Potato was left 12 square feet the produce was 108 scheffels (German bushels, = 15 English bushels). Another morgen of land, planted with 12 metzen, where each seed Potato had a space of 9 square feet, yielded 88 scheffels. A third morgen was planted with 1 scheffel of seed, each Potato being left a space of 12 square feet, and the produce was 78 scheffels. The average yield of the 3rd morgen was 78 scheffels on the same land, and was obtained from 7-8 scheffels on the same land, and was 108 scheffels. The advantages of GÜLLICH'S system consist of—1. A saving of 6-7 scheffels per morgen of seed, and, 2. An increase of from 25 to 100 per cent of the produce.

—A correspondent expresses his surprise at two portions of a LAYER of a Black Hamburgh Vine either side of the peg which fastened it to the ground producing shoots, as the SAP must move upwards nearest to the parent Vine in a direction contrary to which it took originally, inasmuch as he is aware that this is contrary to "recent discoveries," and it is declared to ascend by ducts and vessels. The fact, however, is, that no such theory prevails. On the contrary, it is now well ascertained, that the change of the fluid or gaseous contents of any contiguous cells through the whole plant, may take place in any direction, though the main current be in one direction rather than in another. As valves, like those of a pump, no such current is though permeable dissepiments are sufficient to prevent it. The old experiment of planting a Gooseberry head downwards is a case exactly analogous to that of a correspondent's Vines, as, indeed, are most cases in which the tips of the shoots take root. A Gooseberry tree will readily take root in any position, the same may be said of many other plants. The course could not be the case if the sap moved in one direction only. M. J. B.

A CHAPTER ON SWEET PEAS.

THE author of your admirably written and exhaustive Calendar adverted last week to the necessity of early sowing of Sweet Peas, and the necessity of early sowing would have them exhibit their full richness of colour, purity of tint, and sweetness. Permit me to endorse this excellent advice, and to add, that the time to sow Sweet Peas for the first grand crop, which is the richest, is in the open ground in the month of March, as hardy as any other Pea, and probably more so, and for some years past I have

with the first crop of Racehorses, &c., and from bloom among the first of them all, and the weather as well or better than the hardest

exceptionally mild winter, this March has been a month for Peas, and none of them have withstood the biting frosts, pelting hailstorms, and withering blasts they have had to contend with: but our Sweet Peas have withstood any of the others. They are short, healthy, and all that the cold has been able to do is to arrest growth,—to keep them close to the ground,—to keep them from being able to injure the growth already begun, and to keep the plants from being able to mount up their stakes

rather peculiar feature of the Peas is that they do not come through the soil in a straight line, but they draw up two ridges of earth about 2 inches on each side of the Peas, leaving a space from 1 to 2 inches wide between. The Peas of course occupy the valley, and these ridges act the part of a rampart to the cold air, while the early breaking up their powers of resistance and by the time they reach the top of the stems they are perfectly formed, having put on their full complement of leaf clothing, and are able to do brave and victorious battle with the cold.

But just at this stage we meet them under shelter and a d to growth—sticks. I saw lately a most interesting illustration of their power in the garden of one of the top quarters of his kitchen. The whole row was in the same condition—

staying at one spot, where it was in full bloom. Now what hastened it there, and caused it to be a fortnight before the other portion? It would be a long while before my readers could find it. Just at that spot two or three young

Carrot bushes sprayed over the Aubrietia, and they either keep the cold off, or they had down upon it, as to advance its flowering a fortnight. Without seeing it one could credit that such a result could have sprung from such a cause. But the fact has confirmed me in my opinion that I have adopted with all early Peas for as soon as they are fairly up, I invite them to afford them the protection and support of

For the first crops the stakes should be placed lower than for later ones. We generally choose small twigs at the bottom, and allow the stems to interlace over the top. Doubtless thus the stakes afford a most efficient shelter, and they stimulate earliness of growth. But I must not mix with the stakes, or your readers will accuse me of mixing with the assertion of the perfect hardiness of Peas, and then proceeding to advocate a distinction for their infantile days. Nevertheless a wide distinction between the shelter of a glass and pot, box, or glass nursing, with

of unnatural tenderness. Peas sown in November, and treated thus, will blossom early in June, and few flowers can be so useful for cutting at that period. For they are most effective, with one stem left on a stem. By this method every stem can be arranged to a nicety of position and an equal height, and they impart a dressiness and grace to a row, reposing on a fringe of green, and many flowers can equal and hardly any excel the standard for the display of Sweet Peas in a wide mouthed vase from 9 to 12 inches high. For this purpose choose those of the most compact form, abundant bloom, and perfect number length, and choose of tender also a branch of the most distinct blossoms. Then, with a correct eye and artistic fingers, arrange and fill in the margin, showing the tendril and the stem depend over the edges of the vase, and spring up slightly beyond the rim in all directions, and you have an offering fit for the Queen of Beauty.

Such a perfect vase once placed in the drawing-room, is not only a pleasure to the eye, but it is welcomed with a pleasure that means must be devised to make permanent institution there. The simplest method is to sow Sweet Peas three or four inches apart, as we do all other Peas. It is just as easy, and it keeps up a succession of Sweet Peas for a long time, and by the same means. Sow in November, for the first crop; in the second, in May, for the third; and if you have a few more in June for the last. The March crop should be in partially shaded places, and the last crop, like the first, on a warm spot. This is an essential for the first crop on account of the want of flowers. I could name ladies who prize Sweet Peas as much or more than the epicure

are used for boundaries of flower beds, forming screens, &c., they are able to flower throughout the season, by preventing the maturation of a single seed, and by the use of liquid manure. The branch method also favours the breaking

back of the haulm, and this tends to continuity of blossoming. The Scarlet Invincible Pea, which, by the way, is not a scarlet, shows what may be done by careful selection, and points the way to greater distinctness and vividness of colouring. A spotless white, a perfect blue, a vivid scarlet are within reach, and would form valuable backgrounds to many ribbon or flower-garden arrangements, where an indiscriminate mixture cannot be used.

With these new varieties, and early and successive sowings, or judicious pickings, no flower garden or drawing-room need be without the sweet adornment of these lovely flowers from May to November. *D. T. Fish, F.R.H.S.*

CYCLAMENS.

C. hederifolium, Aiton. -The tuber of this species is not unfrequently a foot in diameter when full grown; its shape is somewhat spheroidal, depressed on the

Fig 1

upper surface, rounded beneath. It is covered with a brownish rough rind, which cracks irregularly, so as to

Fig 2

form little scales. The root fibres emerge from the whole of the upper surface of the tuber, but princi-

Fig 3

pally, and in greatest numbers, from the rim of the tuber; few or none issue from the lower surface. The leaves and flowers spring direct from the tuber without the intervention of any stem. At first they spread horizontally, but ultimately become erect. The accompanying figure 1 is taken from a small and not very characteristic example. There are not sufficient fibrils shown emerging from the upper surface and margin, the lower side of the tuber is moreover more rounded than is shown in the figure, while it is quite exceptional for the leaves to proceed from a little stem as shown in the cut. They issue in general directly from the tuber. The plant is well figured in Baxter's "British Botany," t. 505.

C. europæum, Linn.—In this species the tuber is of medium size and very irregular form, sometimes roundish or depressed and knotted, at other times elongated. The rind is thin, smooth, yellowish, sometimes "scabby." The tuber is sometimes of considerable length and size, as remarked by Sweet, who says "caudex non raro elongatus." Another author speaks of having seen it a foot and a half in length. The leaves and flowers originate from stalks or branches, which emerge from all parts of the tuber. The root

fibrils spring from the lower surface of the tuber as freely as from the upper, but are never so numerous as in *C. hederifolium*. The drawing 2 shows the tuber too much depressed above. The stem emerging from it is rarely so much branched as is shown in the sketch, and there are usually two or three springing from different parts of the tuber and growing in different directions.

Figure 3 shows a piece broken off from one of the long underground stems just alluded to. Its direction is horizontal or creeping, not erect. It produces stalks or branches at both ends, and from which the leaves and flowers arise. This form is the "radice anemona" or "anemonoides" of some botanists and of the Dutch florists. *J. Atkins, Painwick.*

INDIAN MAIZE.

THE interesting paper on this valuable and too much neglected esculent, by Mr. Clarke (see p. 251), has induced me to add some experiences of my own. The plan recommended by Mr. Clarke is not unknown to me, though I have never actually tried it, it is, however, suggestive. The "Six-weeks' Maize" is a novelty to me. Can the size and weight of the cobs be sufficient to make it a remunerative crop? The common yellow variety known in commerce can be obtained cheaper from America than we can grow it, unless, as at Barking Creek, sewage be used, and this is reported to be a great success. But what I should like to see grown largely as a delicious and nutritive table esculent, and capable of supplying blanks in the rotation of other delicate vegetables, is Indian Maize, used in a green state, as is commonly done in the United States. To do this, however, it is necessary to obtain seed of the right kinds, as the common yellow is only fit for cattle or poultry, at least in a green state.

While reporting for Government, in Paris, my attention was directed to an unequalled collection of varieties of Indian Maize, which was exhibited in the American section. Through the kindness of the Commissioner, a selection of the best of these was sent me, and in the summer of last year they were all planted out in the open ground, as early as April, in my garden, which is exposed to the wind, and the soil of which is unfavourable for Maize.

The plants grew rapidly, and reached to 10 feet in height, and were then secured to short stakes, by which means they weathered, without injury, a gale of 30 lb. pressure to the square foot in August. They presented a magnificent appearance, having cobs of a size which many intelligent visitors pronounced to be finer than any in China or Japan. This might easily be the case, for it is not probable that seed is so carefully selected in those countries as in a selection from the best in the whole of the United States, which embraces such a range of climate. Some idea of the size and consequent value of these new and splendid varieties which have never before been exhibited in such a complete form in Europe may be arrived at when it is stated that the cobs were nearly three times as heavy as some cobs of the best Algerian corn, grown in this island, in a garden, from selected seed, and ripening nearly at the same time. The varieties I grew ranged in height from the 3-foot "pop corn" so well known, and which ripened early in September, to the 10-foot heavy blue corn, which ripened in October. In all there were about 20 varieties, of many sizes and shades of colour, ranging from the large pure white corn of Georgia (which is extremely delicate), through shades of yellow, to tawny; others were of a Mulberry colour, and some dark red; a few were of a fine blue. Of these 20 varieties some will in time be found useless, no doubt, but the larger proportion will supply a succession of

autumnal table esculents, having a flavour much resembling Peas, and very nutritious. In New York it is customary to boil the "sweet corn" for an hour or an hour and a-half (according to the ripeness of the cob) in one thickness of the husks, tying the ends together. Butter and salt is then spread over them. The number of cobs I did not find to exceed two on a plant as an average, and this is considered to be a fair result, considering the size of these cobs. On some of the dwarf varieties (one of which is remarkably beautiful) there were occasionally four cobs.

Having no previous experience, the plants remained unwatered during the dry summer; they were twice earthed up, but the ground was very inadequately prepared from the first. Thus the trial was a fair one, and I look forward with great interest to amateurs and others taking up this matter of selected white Indian Maize, to be eaten green. There is no doubt that such a collection would never have reached Europe but for the occasion of the Paris Exhibition; and the plants having been tried in this island during last season, and having matured their seeds perfectly, this is a good opportunity to test their value once for all. I had at first decided on distributing the spare seed to friends, but being discouraged from so doing as an inadequate method of arriving at any large result, I transferred them to Messrs. Barr & Sugden, who have had a good previous experience in this matter, and are themselves prepared to experiment largely in them this year. For myself, I have prepared a number of seeds in small pots, so as to forward them under glass, as April might prove a treacherous month for open air planting.

I should also suggest to amateurs the Australian plan of sowing three seeds in a triangle, at say a foot of interval, for the sake of putting a stake 3 feet high between each group of three. As subtropical plants

some were extremely showy, and would ornament a garden. In conclusion, I only hope these plants will interest others as much as they have me, and that they will record their experiences for the general benefit. Surely out of 20 varieties we may select one-half being permanently adopted. T. C. Brabant, Richmond House, Guernsey.

MASTIC L'HOMME LEFORT.

THIS is a long unmeaning name for a minor but exceedingly useful art of grafting wax. "pauv' greffer a fruit," as stated in the superscription on the little tin boxes in which it is received. This composition comes from France, where grafting wax is much more generally used than in this country. In grafting, as is well known, after the parts have been properly joined and fixed, it is necessary to apply some substance to exclude the outer air from the wounds, in order to prevent them from drying up; otherwise the parts would not unite. In this country, for the ordinary grafting of fruit trees, &c., a mixture of wax is most generally used, and it answers well, but its utility beyond the labour of mixing and application, is, however, when only one or two grafts are made, is pretty considerable. In France, grafting wax of various composition is generally used, and it is frequently employed in this country, especially for the finer operations. The great objections to its use are, the necessity of having fire near the place of work to melt the stuff, for it must be applied while warm, and if allowed to cool becomes set, and that it is somewhat hard, and apt to injure delicate bark. It thus takes up a good deal of time, even when a very small quantity is required.

The importance and usefulness, then, of the Mastic L'Homme Lefort, which is always in a condition at for use, will be at once seen. It is a substance of about the consistency of common white lead, somewhat resembling half-melted gutta serena, and having a very pleasant and agreeable perfume. It is quite easy of application, being readily spread over the parts with the blade of a knife or a flat piece of wood, like butter on bread. Although in the box, away from the air, it will keep pliable and moist for many years, it very soon hardens on the outside after being exposed to the air, and, as it were, hermetically seals up the point of junction, and thus prevents all access of air to the cuts. It is at the same time quite elastic, and easily removed when required.

This substance was introduced by Mons. Lefort to this country some six or eight years ago, and is now in the hands of Hooper & Co., Covent Garden. It was at the time largely tried in various ways in the Royal Horticultural Gardens, Chiswick, by Mr. Thompson, who reported favourably on its merits. I have myself used it in grafting all sorts of hardy fruit trees, and approve of it very much indeed. In grafting tall standards it is better than clay, which it is difficult to fix at all times. This, on the contrary, can be applied with the greatest ease in any position, and a very little of it suffices to spread fairly round about the junction of the scion with the stock. I was particularly to recommend its use in grafting Vines. For this purpose it is far superior to clay, or any other article that I have used—and I have grafted some hundreds. The objection to the use of clay or moss is that in general when the Vines are growing a moist atmosphere is maintained in the house, in fact, to induce the scion to break strongly it is regularly syringed. The clay, &c. is thus kept continually moist, and roots are emitted into it from the stock, and frequently from the scion also. When this takes place, and I have seen it many times, there is but little chance of the graft succeeding. With the Mastic, on the contrary, no roots are possible, however much the moisture and heat applied externally to the graft and stock, and, as a consequence, success in Vine grafting becomes almost a certainty.

I have also found the Mastic useful in placing over wounds or bruises on plants generally, thereby enabling them to heal quickly. For this purpose, for Vine grafting, and for all the more delicate operations of grafting, I strongly recommend it further, it is very handy, always ready for use, and so easily applied. With a sharp knife, a bit of matting, and a little sixpenny box of Mastic L'Homme Lefort (at which price sufficient for 100 grafts can be purchased), any gentleman or even lady can go grafting trees, at any moment, with the greatest facility, and finish the operation without soiling the fingers. B.

Home Correspondence.

Diseased Pines.—Since January last I have cut ten Pines, three of which were black inside, and quite unfit for table. When the stalk is amputated all seem solid and good, and it is not before they reach my employer's table that the evil is detected, which is the more vexatious to me. As it never occurs in the warmer months I am inclined to think that the extraordinary wet and dull season has something to do with it. The pots in which they grow are well drained, the soil consists of two parts turfy loam, to one part well decomposed horse-dung and sifted charcoal, the plants are potted in a pot 4 leaves (in a store), the depth of which is from 5 1/2 to 7 feet; this is full of good leaves. I rearrange my plants every spring and autumn, trenching the whole depth of leaves first backwards, then forwards, working in fresh leaves each time. When done last week a beautiful pure steam arose from the old leaves. I have stove plants on the front stage, Vines are on the rafters till the fruit is cut (about November), then they are drawn through the front lights to ripen their wood. I plunge the pots over their rims about an inch, but as the leaves are pure and good I do not think that harm arises from this cause, as oftentimes the plants have some strong feeders groping in the leaves. I am

very particular in watering, sometimes the syringe only is used for some six weeks, and then not on dull days. When the fruit is swelling and the plants are dry, I give them a little clear tepid manure water. The lowest bottom-heat has been about 72°, and the temperature of the atmosphere from 67° to 70°. I fear that latterly the bottom-heat has been rather insufficient, is that, in your opinion, the real cause? As my case is somewhat different to that of another correspondent (see p. 195), who is in the same trouble, I may be allowed to say that if some of your able correspondents will point out either the cause, or my errors, I shall feel very grateful. C. L. We submitted this question, as also that given at p. 195, to Mr. David Thomson, who kindly answers:—"There are two causes which are especially calculated to produce decomposition in Pine-apples. The one is excess of moisture at the root after the fruit begins the ripening process, the other is that of leaving the fruit too long before it is cut or used after being quite ripe. There are some varieties more subject to rot than others, such as the Spanish variety of the Smooth-leaved Pine, and the generally (I say not the varieties) in use are not referred to. The plunging of the fruiting Pines over the rims of the pots among leaves, and allowing them to root into them in the dull winter months, must be regarded as unfavourable in this particular case, because the absorption of moisture by the roots can neither be so effectually checked or regulated as when the roots are confined to the pots, or even a bed of soil, allowed to become dry as the Pines ripen. Pines to swell and ripen in the lead of winter should always be carefully drained, and have a bottom-heat of say 80° to 85°. And as it is requisite to maintain a moderately moist atmosphere while the fruit are swelling, comparatively little water at the root is required, in such sunless weather, and immediately the fruit begins to colour no more water should be given to the roots. Managed thus, Pines may be cut or removed to a cooler and drier place, and kept perfectly well for a month after being ripe. More Pines in all stages are ruined by over-watering than from any other cause. We should say that cold and damp at the roots have caused decay in this case. We know of a case on a wholesale scale where, last winter, from no other cause than over-watering, every Pine proved black at the centre when cut."

Marschal Niel Rose.—Will you kindly advise me in the matter of a Marschal Niel Rose? It was planted three years ago. Last year in the early summer it produced an abundance of small buds, only three of which really opened, and these produced very poor flowers. In the autumn of last year three flowers were produced, one of which was magnificent. The plant kept its leaves well through the winter and looked healthy. It is now almost leafless, and is covered with multitudes of small buds just the same as last year, and which will evidently come to nothing. The Rose is against a south wall; my garden is suburban, with a grassy subsoil, but the border has been well made, and manured with rotten stable dung. Last year, for a short time in the spring, on the advice of a nurseryman, I bent the shoots downwards on the wall in an umbrella shape, but doubting the advantage of so doing, I soon trained them horizontally again. The Rose has been very sparingly pruned, only the tips of the shoots having been taken off. Can you suggest anything to make the plant do better for the future, or is it hopeless to grow Marschal Niel out of doors with a severe miles of London Bridge? C. F. We submitted the above to the Rev. S. Reynolds Hole, who obligingly sends us the following reply:—"It is difficult to prescribe without seeing the patient. The symptoms of debility are serious, and the proximity to London and the gravelly subsoil are adverse to recovery, and yet this "one magnificent bloom" encourages both hope and care. The premature development of buds, weakly, and doomed to sure destruction, is common with this beautiful Rose, especially when it is worked on the Manetti stock, and is grown against a wall with a southern aspect. The most successful plan of rearing Marschal Niel in his integrity has been, in my case, to grow it upon the Briar, either upon a wall with an eastern aspect, upon standards, or on arcades. If "C. F." has not tried the Briar, I advise him to do so, renovating, at the same time, and manuring his soil. S. R. H."

Surface Cropping Vine-borders.—There exists a diversity of opinion on this point. In a theoretical point of view the non-croppers have seemingly a plausible case, but what says practice on the point? I well remember that, 20 years ago, in a large garden with an extensive range of vineries, the then gardener annually planted the Vine-borders with bedding plants, the Vines bearing enormous crops of first-class fruit every season without the least indication of distress. The borders were subjected at least once a year to the barbarous practice of digging or forking in a good top-dressing of turfy soil, rotted dung. I have seen the same practice carried out repeatedly both in Ireland and in Scotland, and I must say with no injurious consequences. So soon as it is proved that cropping is injurious to Vine or fruit tree borders, then will arise the undeniable necessity of asking our employers for more ground to grow vegetables, and flowers for eating purposes. Were all our Vine-borders divested of their summer garb, and our fruit tree borders of the useful in the shape of vegetables, I apprehend our employers would not often enter into a garden which would look like a fallow field at midsummer. At this place there is a good range of forcing-houses of large dimensions. In one of them there is a Black Hamburgh Vine, which has been planted between 80 and 90 years. It covers 75 feet of rafter, and is now as healthy and fruitful as in the first few years of its existence. This Vine has 24 feet of border to revel in ere it reaches a 6 foot gravel-walk, which the roots pass under into a

vegetable garden. I have traced the roots a considerable distance in the vegetable break, where I dug heavily at, through the season, and have found them in the most healthy condition. The portion of the border allotted to this fine old Vine, before it reached the path, is always cropped during the summer months. Another house, in the same range is planted with Muscats, we have a 15-foot border ere it reaches the path. The quarter opposite this house is devoted to the growth of Asparagus, and within this plant is a great feeder and a deep feeder. Not far from the front of this house amongst the Asparagus roots, in our kitchen garden borders are heavily cropped every season, and I suppose have been for the last 20 years, yet the wall trees are in a most healthy condition, bearing heavy crops of good fruit every season, as would our visitors can testify. I would rather crop the borders in this manner, than plant them with dwarf fruit trees. A Middlesex Gardener.

Arundo conspicua.—Allow me to call attention to the New Zealand Toe-Toe Grass, or Arundo conspicua. I believe this will prove a valuable material for rope and strong fabrics. The fibre is nearly as tough as that of the New Zealand Flax (Phormium tenax), while the plant is much more prolific, and seems as if it would grow anywhere in this country and yield a heavy crop. The fibre is of a darker green colour, rather broader and more so erect, and from 2 to 4 feet in length. I enclose a blade for you to test its strength. Henry Curtis, Rosary, Torquay.

Soil for Rhododendrons.—We have no hard green the Carnie has alone excepted—that can be compared for beauty with the Rhododendrons, and on account it certainly deserves to be much more extensively cultivated. The idea that this shrub will be unproductive, except when planted in peat soil, is erroneous. Where the ground is naturally composed of peat, they thrive well, but they may be well grown in almost any kind of loamy soil, not too tenacious enough to knead. The soil is a mellow, sandy, hazel loam, but do not succeed when planted in sharp gravel, or in soil of a calcareous nature. The use of peat soil, by those unacquainted with its nature, should be avoided as being as injurious as any other. Rhododendrum is considered by many to be a rather delicate plant, but unfortunately I find it not quite so. F. F. F.

"Caractacus" Pea.—A row 5 feet in length in glass was sown here on the 6th of January from which 3 quarts were gathered to-day, March 23rd, and the picking has been purposely delayed a few days so that the Peas were fit. As this Pea seems to possess capabilities for moderate forcing, and may prove an acquisition on this account, I may state that it is growing in the valley of the Thames from seed sown June last, when it was 2 feet in height and had with medium sized pods. It is less productive than type, perfectly pure and of uniform growth. It was supplied under the name of Caractacus. John E. Hoag, Hall Gardens.

Primula sinensis.—Accompanying this paper are few Primula blooms, sent not for an opinion on their merits, but to show that in addition to the better kinds in the hands of Messrs. Wilebank and Leach (p. 281), there are others of similar form, but that may ultimately produce distinct types. The white bloom is from a plant producing red flowers as deeply coloured as are those of the purple kind. The semi-double flowers come true from seed, and are reproduced from year to year. Unlike the single double ones, these produce flowers having the most productive organs, they are of a less robust growth than the single kinds, but are as easily cultivated, and are very useful for winter work, the bloom remains longer upon the stalk, and consequently better adapted for bouquets. This type of flower is almost exclusively confined to white. Two others, having a white ground suffused with a white red, quite distinct and margined with a white red, very similar in appearance from any I have seen elsewhere. The habit of foliage in this type is strong and the leafstalks light in colour and very erect. The other two blooms have a pure ground colour suffused with white, thus reversing the previous order, and in flaked flowers, which both have been seen on grounds flaked with purple. These four last are small, as the plants have passed their best, and expect to reproduce them as distinct varieties in winter. I have no doubt but that we may produce new shades of colour in the Primula, and certainly there are few flowers that more amply repay the careful hybridiser's labour than the one now the subject of comment. While they are eminently easy of cultivation, they afford the best display of colouring that can be got from any part in the lead of winter. One of our private hybridisers of the Primula race, who I believe was trying to produce a yellow one, has now produced a decided novelty, and it seems not unlikely that the desired colour may ultimately result. I am to do the same, and hope for success. The prospect of getting a blue shade is a so worthy of attention, if obtained, it would indeed be an achievement. I have seen nothing that I think would prove a better work for this purpose than the layer of blue shade sent. As far as I can gather we have had the following colours: Whites, from pale to slightly shaded with pink, purple, from pale to dark mauve; rose, or kermesina type which varies a shade, but the deeper ones are very showy and they are moreover, ultimately develop a scarlet with a green tincture of colour than now exists, flaked flowers, but white grounds and purple or rose flakes are a very distinct flower, having a white ground with a rich salmon tint round the eye, gradually shading

Surface Cropping Vine-borders.—The present dis-... cussion in your columns forcibly reminds me of the... common proverb, that of two evils we should choose... the least. But it should be borne in mind that this... proverb is thoroughly vicious in principle, and ever... gives rise to questionable practices. No man is com-... pelled to choose an evil course. He is never com-... pletely hemmed in by an unbroken barrier of evils—... some outlet for good is constantly provided. To square... the proverb with truth or sound ethics, it should run... —Of two evils choose neither, or spurn both. A similar... principle should guide us in plant-growing. Here, as... in our own conduct, we are not shut up to a choice of... evils, but are free to elect or choose the good. The culti-... vator, for instance, who inscribes "Sacred to the roots" ... on his Vine-border, is not compelled to invite or allow... the attacks of red spider on the leaves or branches of his... Vines. The fact of having done justice to the roots... can never be accepted as a reason for treating the top... with indifference. Instead of there being any antago-... nism between the cases of both, anxiety for the well-... being of the one is almost sure to beget a like zeal for... the well-doing of the other. Hence the illegitimacy... of those who when one good practice is commended, ... extol another in preference, or to its depreciation. The... cropping of Vine-borders is either right or wrong; ... and it is one or the other wholly independent of the... evils wrought by red spider on the leaves of Vines. ... Surface-cropping and red spider are both evils of... sufficient importance to be discussed singly and... alone, and neither are likely to be cured by any... cultivator, however famous, informing us that he... prefers the one to the other. The important ques-... tion is, not which is the worst evil of the two, but why... should we have either. I contend that no cultivator... should surface-crop his border. Mr. Thomson says... no Vine grower should admit red spider, and yet some-... how he sees fit to offer his good advice in apparent... antagonism to my inscription. But the two are in... perfect accord, and both are alike good. It cannot be... intended to convey the idea that there is the most... distant connection between an uncropped border with-... out, and red spider within the house, for it is well... known that there can be no such connection. ... Neither do I yield to any one in attributing the... utmost importance to cleanliness within the house. ... Thrips or spider largely impair or totally destroy the... functions of the leaves, and disorganise the entire... economy of life. It is only needful to look at infected... leaves through a common microscope to be convinced... of this. Freedom from such pests is essential to... success, and ought to be one of the primary objects of

all Vine growers. Upon every Vine should be written... "No spider, thrips, or bug allowed here." Outside and... inside the borders should bear the inscription, "Sacred... to the roots. When we think for a moment of the... expense of building, planting, and heating Vineries, ... it is astounding that anything should be per-... mitted to share the borders with the Vine roots. ... There is risk of impairing or exhausting the... soil, and of preventing or exhausting the... surface cropping. Only think of what these would have to produce in the... course of years, and the difficulty, expense, and risk of... its renewal is enough to make us pause ere we take... a surface crop off it of either beauty or utility, and thus... dissipate its stamina and impair its powers of pro-... duction. The border, from its position and its under-... ground treasures, has become precious as gold, and its... surface crop treats it like so much copper. A Vine-... border is prostituted and degraded when it is used for... growing what any other soil or place would grow... just as well or better. Even if it does not much... injure the Vines—which it does—surface cropping... is a piece of the most reckless extravagance that... can be indulged in. It scatters, as it were, broad-... cast, among common flowers or vegetables, the food... that was prepared for conversion into meat or drink... fit for the gods. It would almost seem an act of... sacrilege to grow Cabbages on a Vine-border, but as... far as the waste of Vine food is concerned, bedding... plants are about as greedy robbers. Even beauty may... be purchased too dear, and it is so bought when it... weaves its robe of glory out of the blood of Grapes—a... compensation, indeed, may be given, but it is difficult... to measure the loss, and impossible in many instances... fully to restore it. Restoratives are needed for the... Vines alone, and they are entitled to the whole benefit...—and need it, too, to keep up their productive stamina... to the highest pitch for many years together. But it... it is not only that these competitive roots exhaust... they likewise injuriously affect the texture of the soil. ... Their multitudinous bearings break and fine down the... earth, and so unduly compact it into a solid dense mass, ... well nigh impervious to air and water. This is a great... evil on many soils, and one means of avoiding it is to... devote the ground solely to the use of the Vines. I... have no more faith in mere panaceas than your corre-... spondent. Attention to no one point, however impor-... tant, can command success. Still I believe a rich, ... sweet, unclothed border for the roots, and spotlessly... clean tops, are the twin sisters of successful Vine grow-... ing, and that where they are present with ordinary skill... as an auxiliary in the application of water, light, heat, ... an air, good Grapes are almost sure to follow as a... matter of course. D T Fish F R S

Potato Improvement.—Having made experiments on... the Hemp plant by a process of pruning or mutilation... as it may be termed, and produced seeds with tricoyle-... donous embryos, and having three leaves in a whorl, ... instead of two opposite, and female plants bearing male... flowers—I would suggest that the following mode of... treatment may very probably give rise to new and per-... haps unusually productive varieties of the Potato, if the... increased number of leaves in the Hemp may be regarded... as from having buds in their axils, as an indication of an... increased number of branches. And as real vigour of... growth is, it appears to me, the best preventive of... diseases connected with the growth of Fungi, it may... be hoped that varieties of the Potato may be raised by... such a process which will stand against the Potato... disease better than any of those hitherto grown. The... Potato selected should be the largest sized one of the... variety that can be procured. All the eyes but two... should be cut out, or, if that is inconvenient, it should... be allowed to sprout before planting, and all the young... stems but two broken off. When it comes up, more than... two stems will, in the first place, appear, and of them all... but the two largest should be pulled up, care being taken... not to injure the plant, to avoid which the knife may... sometimes be necessary. Many small stems will con-... tinue to come up for weeks, which should be removed... soon after their appearance, so that only two stems are... allowed to grow. Some time before the flowers open, ... those parts of the stems which are above the... peduncles should be cut off, and also the branches... from the axils of all the leaves. The places... of these branches will be quickly supplied by... others for weeks, but these should be removed... about once a week, also, before the flowers open, and... as soon as it can well be done, all but the two or three... largest should be removed. It may be expected when... the fruit has ripened that some of the seeds will be... found to be of larger size than usual. Of these the... larger only should be planted, and the most productive... seedling raised from them selected to proceed with the... experiment which I should expect might be advan-... tageously carried on to the third or fourth generation... at least. What would be the consequences I cannot... conjecture, but I believe that varieties of more... vigorous growth would be raised, which might perhaps... prove to be much less liable to disease, and more pro-... ductive. Having made the experiment but once, I am... unable to give complete directions, but the principle... will be sufficiently obvious, it is an extension of that... which Mr. Hallett has so successfully applied to cereals, ... although originating from different data. The Rev. F. ... D. Horner, of Ripon, Yorkshire, who has cultivated... Indian Corn for so many years that he regards his... varieties as acclimated, and who ripened last year 80... plants, one of his varieties being 3 feet high, never... allows a plant to ripen more than two cobs, and to this... I attribute, in some measure at least, his success. Had... he commenced with the six weeks variety, and always... reduced the cobs to one, it may be a question whether... the plant might not by this time have become available... for farm cultivation in the south of England. Not... being able at present to carry out the above experiment

* One plant bore two male flowers, and another one, the... anthers being of the usual size.

Societies.

At the meeting of the Society of Gardeners at the Horticultural Society...

with a good deal of success... The following are the names of the exhibitors...

Notices of Books.

How to Grow Mushrooms of the Best Method... London Brad & Evans & Co.

Notes on the Art of the Garden... By the Rev. O. J. Lee M.A. London Brad & Evans & Co.

As these notes were originally prepared for the use of the members of the Society...

Les Pensées: Histoire, Culture, Multiplication... Par J. Barillet, Jardinier en Chef de la Ville de Paris.

This is an ouvrage de luxe, in which the author has given us a full and complete history of the Pansy...

M. Barillet classifies Pansies as follows: 1. English Pansies...

* An archine is the general measure used in Russia; it is 27 inches long, and is divided into 16 vershoks.

* Bricks in the south of Russia cost from 6 to 7 roubles a thousand (about 90s.), but they cannot be burned very hard...

Garden Operations.

(For the ensuing week.)

PLANT HOUSES.

THE several varieties of the much neglected though beautiful genus *Læva*, will now require attention, such as potting, &c. All these varieties do best in a free open compost of peat, and a good yellow fibry loam, with a plentiful supply of silver sand, small lumps of charcoal, and pot herbs broken very small, in admixture. The application of hot water to the bottom of these and many other similar plants is of great importance, and it will amply repay the cultivator, if he has not a regular supply of bottom-heat at command, to make a suitable temporary place with the aid of fermenting materials, in which to afford them such beneficial assistance. They may be plunged into this as soon as they have been potted. Other kindred subjects, such as *Gardenias*, especially such as *Stantegana*, *atriolata* and *Poronæ* would luxuriate in such a place, even if the flowers are only now about to expand, and these latter will attain double the size in such a situation, to what they would do upon an ordinary level stage or bed. There are also *Franciscana*, *Indica*, *C. rodolensis*, *Immaculata*, *Stephanotis*, *Alamandus*, *Combrétums*, *Rondeletias*, &c., all of which would be "at home" under such favourable circumstances. Even a pot or two of *Eucharis amazonica* may be plunged into the material, which will induce the plants to bloom again, and that somewhat earlier than others which may not receive this kindly aid. In no instance should this artificial bottom-heat exceed a maximum of 60° to 87°, and what is of equal importance, the moisture that may settle upon the foliage of the plants should, if possible, by a judicious admission of air, become moderately dry at least once in 24 hours. *Boronia*, and especially the beautiful and fragrant *B. serrulata* which one seldom sees in perfection now, like a little additional heat in the spring months during their period of growth. When growing they also like a tolerably free supply of moisture, both top and bottom, and more especially if noticed frosty, as they always should be in fibrous soil, with plenty of sand. Undeviating care and attention will now, and for some time to come, be necessary in watering the plants which have only recently been shifted, and until the roots commence to grow vigorously. According as the progress of potting is being pushed forward, so in proportion should the heat be kept up. Plants which have undergone this operation will require the most, because a greater mass of inert soil surrounds the roots, and a slight additional incentive is needful to induce a strong and wholesome activity among them. Be particular in regard to giving the necessary supply of air to plant houses at this season, and to close the lights or ventilators on the approach of a storm or dull period, both which may be expected at this season, the fluctuations of temperature being great, and likely to give the inmates a chill if due care be not taken to prevent the ill effects arising from this cause.

PIVOT HOUSES.

There will now require almost hourly attention in the matter of the wind and shading the vines, fanning out the berries, &c., in addition to constantly keeping up a wholesome amount of moisture and furnishing the many other requisite attentions. *Pines* which have been turned out of the pots into a bed formed within the pit, should now receive a nice fresh surfacing of rich open loam and well rotted manure, if this has not been previously done. Remove carefully any decayed or ripened leaves from around the base of any plant. In surfacing them be particular not to place such a thickness of fresh material thereon as to unduly bury the main stalks. The department which is set apart for those *Pines* which are swelling their fruit, should now be kept up to a good high temperature, and have an abundant supply of atmospheric moisture. To insure this, especially during the prevalence of dull, cold, or boisterous weather, much less air should be given than is essential for younger successions, which are required to be kept dwarf sturdy, and stiff. Even this, however, may be overdone. An unreasonable amount of heat and moisture, without a moderate supply of fresh air at frequent intervals is, I feel convinced, the cause, in the main, of most of the disproportionately large crowns which are to be seen overtopping fruits of moderate size. It will now be safe for amateurs and others having only limited means at command, and who are not thoroughly initiated into the art of forcing very early, to commence *Cucumber* growing. The advice regarding the sweetening of the necessary fermenting materials by successive heatings, caused by turning the materials over two or three times, must be closely followed. As the period has now become moderately advanced, only a tithe of the heat required earlier will now be needed, hence only a smaller quantity of material than was previously required need be brought into play. So soon as the bed is made up and water should be so laid as that the frame can just stand safely upon it, the soil, in the form of a conical shaped mound, may be placed under the centre of each light, after the materials have been well trodden down. A lining some two feet wide should then be placed around the outer sides of the bed, formed of the same heating material as that with which the bed itself is formed, the sides of the box or frame being well landed up, as this causes a dryer warmth than that arising from below. When the heat averages from 60° to 75°, and with a little air to give egress to excessive steam at the back, the plants may be turned out into the mounds; cover them up well at night, leaving a little air on these also. In regard to other forcing houses, such as *Peach*, *Nectarine*, *Fig*, and *Cherry Houses*, I distinctively advise that a moderate temperature only should be maintained by night. I have so frequently urged

the benefit accruing to all forced subjects by a moderate and a judicious supply of fresh night air, that it seems superfluous to repeat such advice. So soon, however as a change from the present ungenial and very bad forcing weather takes place, and more moderate nights, with even a moderate supply of sun-heat by day occur, then let the night air be admitted with moderate freedom. Above all, do not attempt to force against time under such unfavourable circumstances, as at the best an ill-developed and tasteless crop will assuredly be the consequence. Take every possible advantage of natural warmth and sunshine, and the present slowness will prove a greater incentive to quick vegetation and fruit formation in the future than is supposed.

HARDY FRUIT GARDEN.

The present is a very trying period for all tender *Wall Fruits*. Those only who are in possession of a good protective covering can hope to secure a perfect crop this in-coming summer. I have kept my "Frig. Dome" curtains to the walls night and day, during the prevalence of the late chilling winds, and with great advantage. I caution all who may have saved a crop, against allowing the sun to have full power upon it until such time as it has become sufficiently strong to withstand its influences, by the use of partial shadings, &c. The rays of the sun, as we shall find, have gained much power during the past period of cloudy weather, hence the need of such caution.

HARDY FLOWER GARDEN.

Continued by the aid of frames, &c., to propagate any further supply of *Dahlia*s which may be required. Finish planting *Ranunculus* in all instances where any are still above ground. It will be necessary now to seriously think about mowing lawns, &c., for, early as it is, the sward assuming a very forward and an exceedingly coarse appearance, and this is likely to become worse if not soon headed down. Try to select a mild, or at least non-frosty period, for the operation of mowing. As soon as the weather becomes a little more settled sow *Hardy Annuals* in the open quarters where it is intended they should flower. The old way of sowing them in a circle or ring has many advantages not possessed by an indiscriminate scattering of the seed upon any given space. Sow seeds of *Polyanthus* and *Auriculas* of the Alpine sections in pans, and place them on a sunny shelf in a moderate temperature only. Prick off into pans, boxes, or pots, such things as *Seedling Lobelias*, *Pyrethrum* (especially the Golden Everfew), *Chamæpeuce*, *Echeverias*, and other ornamental foliage plants of the more hard-wooded sections, and which require pushing forward. My advice is, never to sow seeds of any kind until you can fully calculate upon giving them all the attention they require. A greater mistake cannot be made than sowing indiscriminately, and with no regard to such circumstances. The result is that 8-10ths of the produce dwindles away, and others which are left have lost their main vigour ere a chance of growing is afforded. Make further sowings of any half-hardy annuals intended to be grown, so soon as the necessary attentions suggested above can be relied on. The ensuing week will be a good one in which to sow a Grass mixture for renovating such lawns as may be wanting in vigour or verdancy.

KITCHEN GARDEN.

Autumn-sown *Cauliflowers* and *Cabbages* may all be finally transplanted on to their summer quarters upon the first favourable opportunity. When either of these are pricked out or transplanted into freshly dug soils, be careful to tread the ground all over first, and to tread the roots of each plant firmly into the soil. If cold winds prevail, drill rows may be drawn, along which they should be planted, as part protection from chilling winds, &c. Sow successional crops of *Spinach*, *Lettuces*, *Celery*, and some of the *New Zealand Perennial Spinach* upon a slight hot-bed, it will come in well, and in good time for transplanting into the open borders in May, W. E.

TOWN GARDENING.

In February last (p. 170) I gave a list of *Chrysanthemums*, and a few hints for their cultivation in open borders. I now propose to furnish the following list of varieties which come to great perfection if grown as flowering specimens under canvas against a wall. — *Amea Ferrère*, silver white, tipped with pink. *Avigena*, amaranth, Antonella, salmon-orange; *Beverley*, white, *Beverley*, golden, *Cherub*, golden amber. *Daught*, rich canary. *Dupont de l'Eure*, salmon-rose. *Lady Stude*, lilac and peach. *Lady Hardinge*, delicate rose. *Jardin des Plantes*, bright golden orange. *Mrs. George Rundle*, white. *Prince of Wales*, purple-violet; *Prince Alfred*, rosy-carmine; *Princess of Wales*, white, tipped rose; *Rev. J. Dix*, orange-red. Splendid blooms can be obtained in the very heart of towns by the following means. In the first place the borders should be well drained, and then be prepared, by using a compost of two-thirds of loam and one part of rotten dung and leaf mould, to the depth of 18 inches. These borders should be not less than two feet in width. Plants should now be obtained that were struck last autumn, and which have been wintered in cold frames. Though I have had fine flowers from spring-struck cuttings, they are not, as a rule, so good as those obtained from plants struck in the autumn. The plants should now be planted, about 6 inches apart and 4 inches from the wall, and lateral shoots should be removed as fast as they grow, until the plant divides into two or more leading shoots, and as many of these latter may be retained as the strength of the plant will admit of. The watering of the plants must be attended to during the summer, both by applying it to the roots, and by syringing the tops every fine evening. Liquid manure should not be given to them until about the second week in August. The mixture which

I use is prepared in the following manner. — In a large tub which holds about 50 gallons, I put 1 peck of soot, 1 bushel of horse-droppings, and 2 bushels of soap-suds, filling the tub up with water, the whole is well stirred up and allowed to settle for 24 hours previously to its being used. If one quart of this mixture, with three-fourths of soft water, be applied, it will be sufficient. About the second week in August the buds will commence to show on the tips of the leading shoots, surrounded by smaller ones, and if the leading buds are plump one, the smaller buds should be removed. The season advances some means should be provided for protecting the flowers, which can be done by placing upright posts four feet from the wall, and these posts fixing others that will lean to the wall. This skeleton framework should be covered with canvas as soon as the buds begin to show. Should the plants grow above the height of the canvas the shoots may be trained down right and set.

STATE OF THE WEATHER AT CHISWICK, NEAR LONDON, For the Week ending Mar. 31 1863, as observed at the Horticultural Garden.

Month	Day	BAROMETER.		TEMPERATURE.					
		Max.	Min.	Of the Air.	Of the Earth.	Wet.			
March	25	30.013	29.909	49	39	34.5	41	4	1
	26	29.913	29.814	49	24	24.5	42	4	1
	27	29.727	29.423	42	23	23.5	42	6	1
	28	29.672	29.468	47	33	36	42	6	1
	29	29.844	29.638	43	27	25.0	42	6	1
	30	29.854	29.7	45	36	40.5	42	4	1
	31	29.97	29.757	51	28	28.5	41	4	1
Average		29.832	29.642	45.5	29.1	37.3	41.9		

March 25—Overcast, cloudy and fine, drizzly showers in evening.
 26—Overcast, densely overcast, drizzle, drizzle, drizzle.
 27—Fine, cloudy, and with a drizzle in the evening.
 28—Overcast, very drizzly, drizzle, very drizzle, drizzle.
 29—Clear and cool, hoar-frost in the morning, drizzle in evening.
 30—Densely overcast, cloudy, by a wind, drizzle.
 31—Drizzle and cool, cloudy, drizzle, drizzle, drizzle.
 Mean temperature of the week 61.0 deg. below zero.

STATE OF THE WEATHER AT CHISWICK, During the last 43 years, for the ensuing Week ending Mar. 31 1863.

April	Average Highest Temp.	Average Lowest Temp.	Mean Temp.	No. of Years in which it has Occurred.	Greatest Quantity of Rain.	Least Quantity of Rain.
Monday	45.6	35.7	40.7	17	0.3 in.	2.1 in.
Tuesday	45.0	35.0	40.0	2	0.30	2.61
Wednesday	45.0	36.9	41.0	11	0.5	3.14
Thursday	45.7	36.8	41.3	21	0.50	3.14
Friday	45.1	35.8	40.0	25	0.45	1.67
Saturday	45.0	35.3	40.2	23	0.73	1.67

The highest temperature during the above period occurred on the 7th, 1859—therm. 59 deg., and the lowest on the 19th, 1850—20 deg.

Notices to Correspondents.

CUCUMBERS. T. L. F. As explained last week, the spines will not be admissible to compete as they are fixed wire netting. F. P. We await further information on this subject.

HORTICULTURAL "C. NORTH." If T. There is no need for even the small matters of grubbing, to refer to. The meeting as an experimental one is planned on a moderate scale. The arena for the same provided, without trouble or expense to gardeners, to have the use of it, with full liberty of action, bounds of order, and as to the destiny of our arrangement adopted in that society, however, the societies and associations, where the papers of the hands of the authorities by whom the meeting is held. We hope it may be found practicable to publish a separate report of the whole proceedings.

INSECTS. W. B. M. The insect sent with the Nectarine blooms from an orchard house is a fly, has no power of gnawing the cortex of the mischief has probably been done by a *Worm* (sp.), which is nocturnal in its habits, and for with a lantern after dark, when it was found on the stems and twigs, causing the complaint of W.

MANAGEMENT OF VINES. J. A. I have inspected our vines regularly two or three times a day, in a moist, warm atmosphere, down them into a river when the syringing of the vines discontinued, and while they are in a moist atmosphere is maintained. When in a moist atmosphere, with a corresponding temperature congenial to them. This is the best way for growers. A dry atmosphere is a very bad one, growing rapidly is exceedingly injurious. It prevents bunches running to tenderness, has no connection with the other. A very dry atmosphere will have this effect, the prevention of the growth of every part of the vines, and from this the bunches being smaller, that they have straggled so much.

NAMES OF FRUITS. T. H. H. Strainer Pippin, Blenheim Orange, not Beauty of Kent.

NAMES OF PLANTS. S. R. *Doodia* means the book you refer to. Messrs. Maule & Co. a carte de visite of Sir W. Hooker. — J. R. Douglas. — *Cape Bononia*. *Antonia* eximia, handsome greenhouse shrub, rather with a little. It should be obtainable at any of the great nurseries.

J. J. We cannot have your treble overcast, as a formator as to the habit and as to the appearance, attempt to do so. — H. P. *pastoris*. — *Drak*, *verna*, *3*, in autumn, *2*, in summer.

REMOVAL OF GREENHOUSES. C. G. G. R. I have seen the expiration of his life, and the houses erected by him for the purpose of such erections are considered trade fixtures, for 1-02, p. 177. An ordinary tenant would be bound to have them erected.

VARIETIES OF PELARGONIUM. K. D. Mr. Morris' statement in his paper on Mr. Morris' *Pelargonium* at p. 33. "Prince of Wales" was by Mr. Morris, but by Messrs. Carter & Co. at Perry Hill.

YANG MAE. *Cine Everlasting*. The Yang mae was some years since by Mr. Fortune to the nursery of Standish & Noble, and doubtless one or other of the gentlemen, whose addresses may be found in the columns, could tell you, where the plant is obtainable.

COMMUNICATIONS RECEIVED. — H. C. — J. B. T. — M. — C. F. — E. A. O. — Hants. — A. — H. Cancell. — J. T.

 H. M. JENKINS, Secretary,
 12, Hanover Square, London, W.

The Agricultural Gazette.
 SATURDAY, APRIL 3, 1869.

MEETINGS FOR THE ENSUING WEEK.
 April 3. London Farmers' Club (Captain Dashwood on the Systems of
 Local Rating in England, Scotland, and Ireland) - 6 p.m.
 - 7 - Royal Agricultural Society of England.

As our readers already know, it is proposed that the ADULTERATION OF SEEDS be declared a crime by Act of Parliament, and that a code of fines be enacted for various forms of the offence. And that the offence is common enough, and injurious enough to demand special legislation of this kind, no agriculturist is likely to deny. Seeing, however, how various the modes of adulteration may be, and how difficult they are of detection, and also taking into consideration the extreme ignorance of too many farmers on this subject, we confess that our hopes of remedying the evil hinge at least as much on the advance of education. Indeed, it is not only the farmer who would want to be educated in the matter—the juries who would have to try such cases would also require to be taught. We speak with some degree of personal experience on this question, having once been engaged upon a trial where it was sought to recover damages for the injury done by a large mixture of Burnet with Sainfoin. Because the two seeds were somewhat alike in colour, neither the judge, the counsel, nor the jury could be made to understand the difference, and the jury sapiently concluded that the seedsman was not to blame in the matter, and accordingly the plaintiff was non-suited.

In another case, where a seedsman was called to account for sending common Turnip seed, instead of Swede seed, the judge ruled that there was not much difference between them, and that the sutor was not entitled to damages. Moreover, as seeds are necessarily very variable in their germinating percentage, it will be exceedingly difficult to bring home cases of mixture of old seeds or killed seeds to the dishonest seedsman, and unless some expert constantly attends the markets, or examines samples before they are sent out, it will be utterly impossible in this way to save the consumer from being often cheated. He may sow a sample of seed, and be disappointed in the crop,

SUTTONS NEW YELLOW INTERMEDIATE.
 The peculiar shape of the roots, and the leaves being small,
 which may be sowed to stand close in the rows than other
 kinds, and it produces a greater weight per acre. It may be
 sown in rows with half the labour of other kinds.
Price 1s. 6d. per lb.; much cheaper by cwt.
BEST GLOBE VARIETY IN CULTIVATION.

SUTTONS BERKSHIRE PRIZE YELLOW GLOBE
 A new variety of Globe Mangel, yet introduced. It is of
 round shape, with very near to it a little of pale yellow
 in the generally only one tap-root. It grows to a large size, and
 is able to produce the enormous weight of 35 tons per acre
 in 24 weeks. It is sent forth also be supplied —
 SUTTONS MAMMOTH LONG RED
 SUTTONS SELECTED YELLOW GLOBE
 SUTTONS SELECTED RANGE GLOBE
 SUTTONS GLOBE COOL LONG RED
 SUTTONS SELECTED LONG YELLOW
 SUTTONS SELECTED RED GLOBE
 Lowest price per cwt. on application.
SUGAR BEET (Sow 8 lb. per acre).
 For particulars on cultivation, see Suttons' "Farmer's Year Book."
 WHITE SILES AN GREEN TOP, 10d. per lb.
 For further particulars of Agricultural Seeds, see Suttons'
 "Farmer's Year Book for 1869" 6d. Post Free, gratis to Customers.
 For seed and allowed for cash or on terms. All goods carriage free.
SUTTONS and BOND SEEDSMEN TO THE QUEEN, READING.

CARTER'S WARDEN
IMPROVED MANGEL.
 NOT TO BE SURPASSED.
1s. 6d. per lb.; cheaper per cwt.
 For FULL INFORMATION on the LAYING DOWN
 and AFTER-TREATMENT OF GRASS LANDS, see

 (ILLUSTRATED),
 Post Free 6d., Gratis to Customers.
JAMES CARTER AND CO.,
 237 and 238, and 261, High Holborn, London, W.C.

fail utterly, but he would fail, though in a less degree, even with ordinary high farming. As for any necessity of pouring sewage over more than one surface of and in order to purify it, such a necessity is entirely visionary, unless in cases where very large quantities are given, by which I mean not only a large total quantity in the 12 months, but also cases where each individual dressing is beyond the capacity of the crop and soil together to purify. But if land is properly laid out there is no necessity whatever for either of these excesses, and I myself produced some very astonishing results on a small scale, not only on a practical working scale last season, but also on a field where not only the sewage never was applied twice to any land at all, but from which there was no outfall of any sort or kind.

And now I will end as "H" began, and say that I trust this little discussion may be of some practical use, not in solving the question, but in convincing "H" and others that the question is already solved. *W. Hipe, Parsloes, Barking, March 31*

A CHAPTER ON POTATOS.

(Concluded from p. 341)

THE Miscellaneous Class at the late show for other named sorts was an interesting collection, 23 lots being entered. The judges had two 1st and two 2d prizes at their disposal in this division. One of the 1st prizes went to Messrs. Sutton & Sons' Berkshire Hero, a Kidney Potato which will, we have no doubt, become a general favourite. It appears to be of vigorous habit (for we have not grown it, being, like many others, too late in applying for seed last year). Its quality and productiveness are highly spoken of, and the two samples sent were remarkably true to the engraving in Suttons' "Amateur's Guide." The other 1st prize was given for a round white seedling, shown by Mr. J. K. Fowler, of the Prebendal Farms, Aylesbury, about which we should be glad to have further information. We should judge it to be a second ear, of good quality, with an appearance it is all that could be desired. One of the 2d prizes went to Mr. George Burckley, Kingsthorpe, Northampton, for Johnson's seedling Kidney, which was also very promising. The other 2d prize was given to a lot named Snackel's Conqueror, very good, but improperly named, they were like the Wellington, but rounder in shape than we ever saw any specimens of that sort.

Increased attention has been given during the last few years to improved modes of cultivating Potatoes, and greater care has been exercised in the selection of seed and of sorts for planting. This is shown in some degree by the many letters from correspondents in all parts of the country which are to be found in the catalogues of our leading seedsmen, and it is a gratifying fact that at most of the cottagers' shows which are now established in so many of the rural districts really good collections of Potatoes are brought together. Still in some quarters more care might be used in planting than is generally observed. As regards garden cultivation, and the nearer the plants are sowed in the fields the better will be the results, we have found that in order to obtain good crops of good quality the land intended for Potatoes in the following year should be ridged up early in the autumn, and some well-made manure thrown on when the soil is dry, say in November, if during a frost it will be all the better. There is a marked difference in the appearance and quality of Potatoes planted on land thus treated as compared with those put in the ground upon comparatively fresh manure. A slight dressing of guano, or of some one of the established special manures prepared for this crop, applied in damp weather before the final hoeing, is of great advantage, especially on light soils. It is also a good plan to pull off some of the outside and weaker shoots; the crop by this means will come much more regular in size, and there is not one of our vegetables which will so well repay a little extra trouble as the Potato.

We have in former numbers of the *Herald* referred to the very interesting experiments so carefully carried out by Mr. G. Maw, of Benthal Hall, Salop, in order to ascertain the size of sets which are most productive. Mr. Maw's report on the results of his last and most complete series of trials was published in the volume of the *Journal of the Royal Agricultural Society of England* for 1857; the general conclusions established by him being that "every increase in the size of the set from 1 oz. up to 8 oz. in weight produces an increase in the crop much greater than the additional weight of the set planted. The net profits over and above the extra weight of the sets in planting 1 oz. sets in heq. of 1 oz. sets, amounted in the whole series of experiments to between 3 and 4 tons per acre, and the further profit on the increase of the size of the set from 4 oz. to 8 oz. averaged about 5 tons an acre, all the intermediate steps partaking proportionately of the increase." Those who desire to profit by the results of Mr. Maw's labours will find whole Potatoes, and, so far as the garden is concerned, it is necessary to cut out from each tuber, with a sharp-pointed knife, some of the eyes which are too thickly placed, thus being another mode of obtaining the largest number of Potatoes of a size fit for cooking. When Potatoes are planted whole, a small piece of the skin at one end should also be cut off; this, we are assured, causes the eyes to start more rapidly and to grow more vigorously.

We should be glad to hear of some careful trials being made where Potatoes are extensively grown, in order to ascertain the comparative productiveness and value of different sorts, as we have seen done with regard to Wheat and other farm produce. The results would be valuable for future guidance; and such, we have no doubt, as would surprise many who stick to a few old and coarse sorts.

The question—Can we have Potatoes in fine condition

all the year round—has often been asked, and we think it may be answered in the affirmative, if proper care is used in the selection of varieties and in cultivation. To ensure this result some one or more of the Kidney Potatoes we have named should be chosen for the first crop; and we have always thought that more kidneys might be grown with advantage than is generally the case, such as Rivers and Gloucestershire, which are large croppers, and keep well for some considerable time. We say nothing about which sorts are the earliest, as the race for very early Potatoes is simply a race for an indigestion, most of the earliest are much more wholesome and much better in quality if gathered when perfectly ripe and kept for a couple of months before cooking. Daintrees' First Early would follow the kidneys, and, as we have said, in the Milky White we have all that could be desired for a second crop. With regard to late Potatoes, there is now no difficulty whatever in making a satisfactory selection, Paterson's Victoria, Dalmanoy, the Fluke Skerry Blue, and some of the other blue varieties affording ample means of doing so. The Victoria and the Fluke are, perhaps, the most

reliable, the latter, if of a good quality, in fine condition the longer it is kept. We believe in the opinion of the medical profession that some exercise should be exercised in the home of Potatoes of different seasons of the year, and that the late crop by no means nutritive or digestible, as they are first gathered as they are after having been some time. A little observation would satisfy us as to the soundness of these opinions.

We may add, in conclusion, that the results of trials of Potatoes in different parts of the country are prepared for publication in our best journals, would be even more useful than they are at present if information were added as to the nature of the soils on which the trials are made, and the mode of cultivation adopted. Is it the character of the soil which, speaking generally, makes the difference in the produce of different varieties, or can this be made to influence, in most cases, by care in cultivation? With regard to the Fluke, we believe it is the almost universal opinion of growers of Potatoes that this sort does not grow on strong soils only, but this we have reason to believe is not an invariable rule. *M. Hand Counties Herald.*

AGRICULTURAL STATISTICS, 1868.

[We continue the publication of the official returns.]

STATEMENT OF THE ESTIMATED QUANTITIES OF THE PRINCIPAL KINDS OF CORN AND OF POTATOS, IN IMPERIAL BUSHELS, AND OF BEETROOT, PRODUCED IN VARIOUS FOREIGN COUNTRIES, ACCORDING TO THE LATEST RETURNS.

Description of Crops.	Russia (average of 1859 to 1863).		Sweden (in 1866).	Norway (in 1865).	Prussia (in 1866).
	In Europe.	In Asia.

Cider Orchards.—A peevish Fellow of a College, being asked to subscribe to an institution for the good of posterity, exclaimed "We are always asked to do something for the good of posterity, but I would fain see posterity do something for us." Perhaps some of those to whom I am about to propose the planting of cider orchards may be of the same mind, still it is to be hoped there may be a good many who do not hold such selfish views. Were I a landholder, one of my improvements would be the planting of an orchard of one or two acres or more, according to the size of the farm, in a grassed paddock close to the homestead. Such would be found to be of great benefit to the farmer. Such an enclosure is also useful for stock purposes during a great part of the year. Strong land well drained makes the strongest and best keeping cider, where the land is chalky or gravelly the cider is milder, and, I think, pleasanter, but it will not keep good longer than a year. If a few Pears are ground up with the Apples they greatly improve the cider. If the orchard is grassed, the Grass should not be allowed, during the minority of the plantation, to approach nearer the stem of the tree than 4 feet. If the soil is thin, it is best to plant the tree on the surface (the clod sod being turned down) and to put earth over the roots, like a semi-molehill. The proper distance for permanence is 24 feet apart every way. This plan will take 33 trees per acre, but for 20 years another plant between each tree in the rows may be planted, and when the branches touch, two intermediate trees may be grubbed up, planted elsewhere, or destroyed. An acre thus planted will take 112 trees. Orchards, even in thin land, would succeed were the trees occasionally manured over the radius of the roots, or were cattle, depastured in the orchard, suffered to lie there. The best cider Apples (according to Mr. John Scott), are Best Bache, Coccagee, Fox Whelp, Kingston Black, Red Must, Red Streak, the Late Jersey the above are described as first-rate. The next are described as fine, esteemed, or excellent, viz., Bringewood, Cowrane, Forest Styre, Foxley, Early Jersey, and Tom Potter, vulgarly called Tom Put. Scott names two Crabs thus.—Haglo, specific gravity,

10.91, and Siberian Bitter Sweet, 10.91. One word about Coccagee. Some 50 years ago my father bought a hoghead of Coccagee cider, made somewhere in the vicinity of Taunton. He gave six guineas for the hoghead, and it was worth it. He valued it more than any wine he possessed. He had it bottled, and took it from our country residence to the more general cellars of Weymouth, where it blew up and destroyed a quantity of the finest old port. Coccagee cider is the finest cider in the world, but beware of very warm cellars. Finally, as it would be very just and wise if landlords were to give their tenants a co-proprietorship in rabbits and hares, so it would be no less kind and beneficial to themselves and their tenants, if they would establish near their farmsteads a nice cider orchard.

W. F. Radcliffe, Okeford Fitzpauc.
Shropshire Sheep. Why do we find that it is easier to sell a fat "black foot" than a pale and long-wool? Simply because the meat of the one is of higher market value than that of the other. We cannot sell fat to be eaten now, say our butchers; and those of us who have to provide meat for large families can speak feelingly of the contrariety of demonstration which is bestowed upon the advent of a fat joint of mutton. Materfamilias asks deprecatingly, "where we could not have had the fat cut off?" and the hero of the trade has pleasant visions of "perquisites" which ever heard of complaints of too much fat from the regions below? But how does all this affect the farmer? what has he got to do with the different ways in which meat is received into Lonses? Well, perhaps, very little, but he might learn a lesson from the fact. Materfamilias or her lord has to pay for the meat, and having to pay for it, she or he expects that a choice might be permitted, and if a choice may be made in, we find that the mutton possesses more meat in proportion to fat, as that usually selected by the good old economic laws of supply and demand, of course raise the price of mutton of good flesh, and in the course of some time—but not until mutton butchers can't prevent it—farmers get to know that mutton with much lean is preferred, and that the

The cows were irregular in character. *Flora*, sent by Mr. Foljambe, was awarded the cup, and she was bought by Mr. Radley, of Furbeck, the buyer of the 1st prize yearling, at 150 gu., Mr. Pawlett's *Young Jewel* was commended, and sold for 12 gu., Mr. Garne's *Beatrice* made 17 gu. to Mr. Harding, of Swansea, and Mr. Butler's highly commended *Badmington Gem* was bought by Mr. F. Lytall of Banbury, at 48 gu.

The older bulls made from 70 gu. to 41 gu., according to their youth and promise, or their form and estimated capacity for work.

The various inferior and the few bad animals sent here, indicate that this trade is being over-done, or that their breeders have not the capacity for judiciously selecting males and females for breeding purposes. These breeders would, therefore, clearly benefit themselves and better judges, if they would turn their attention to feeding instead of breeding. The defective appearance of some of the animals must however be set down to the late trying seasons.

The sum made by the sale was 717 12s.

Farmers' Clubs.
CIRENCESTER.

March 8. — *The Game Laws*—We regret we are unable to give more than an abridged report of the valuable paper on this subject lately read by Mr. W. J. Edwards, of Lechlade, before this Club.

The country is a vast garden, every acre made to produce its quota towards the maintenance of our teeming population, yet not producing enough to meet our wants, for I find that in the year 1867 there were imported 346 million cwt. of Wheat, 3 million cwt. of Wheat flour, 5½ million cwt. of Barley, about 9½ million cwt. of Oats, and 3 million cwt. of Beans and Peas. Now, I wish this fact to be borne in mind whenever the subject now being brought forward is discussed, namely, the subject of the undue preservation of game in this country, and I would speak more particularly of ground game. My proposition is that game is unduly preserved, that is, that it is preserved to so great an extent that such injury is done to the growing crops, whether of corn or of Grass, as materially to interfere with the yield of those crops, thus shortening the supply of home food for the people, both of corn and meat, destroying the profits which ought to accrue to the farmer for his trouble and outlay in cultivation, and also preventing the employment of the number of hands which would otherwise be profitably employed in the cultivation of the soil, which deprives of support, and that to a material extent, many of those who should be supported by agriculture, whilst at the same time it is a bar to the application of the skill and capital which would otherwise be applied, and is now to a great extent applied where game is not over-preserved. Now, what do we mean by game? The definition given is that it is "All wild birds and wild quadrupeds of Britain when the law allows to be captured or killed only at certain seasons and by licensed persons." There game means certain wild birds and animals specially protected, in order that the amusement of sporting may be enjoyed by those who possess the necessary qualifications, and its undue preservation is owing to the fondness of the comparative few for a sport which may, under certain conditions, be enjoyed by them with insignificant loss to any one, but which, carried to excess, becomes an intolerable nuisance to the many. Bearing in our mind, then, what game is, and why alone it is preserved, I will proceed to show that

The Damage which it Causes renders its undue preservation unjustifiable. The Rev J. Fraser, in his report relating to the employment of women and children in agriculture, touches incidentally on the effects of the preservation of game. He says—

"The extent to which the system of game preserving is carried on in many parts of England, and particularly in the county of Norfolk, is assuming a serious significance, both in a moral and an economical point of view. The farmer cannot cultivate his land with the proper measure of profit, and there is a tangible loss thereby sustained in the resources of the country, while the way in which, and the extent to which preserves are stocked to meet the present taste of battle shooting, and to satisfy the notion that you have had no sport unless you have slain leaps upon leaps, act as frezes the incentives with the peasant, who lives his bit of sport as he does the gentleman, and whose best earnings are not sufficient to enable him to overcome the temptation thus thrown in his way to poach and to steal.

In the *Times* of December 14, 1868, under the head of a "Midland Battue," we read "that certain preserves were shot through by nine noblemen and gentlemen, and the quantity of game bagged was 2330 head, of these 1030 were pheasants and 800 hares." In the *Times* of November 30, 1868, we read, "At a Suffolk battue 721 head of game was killed in four days, of which 237 were brought down the second day." In the *Field* of December 1, 1868, we read, in the head of Suffolk "Game killed by seven guns in three days, a total of 2720 head, of which more than 700 were rabbits. In the same paper we find that 11 noblemen and gentlemen killed in five days 834 head, of which 1077 were hares and rabbits. In a neighbouring county more than 2000 head of game were shot in one week in December on one estate, by no means a large one, and more than 1000 being rabbits. But we need not waste time by multiplying instances of this kind, any sporting paper will furnish them week by week through the season (though in fairness I should say that I have noticed the largest numbers I saw), and the publicity given to this kind of sport encourages it, because it stimulates every landowner who has a passion for it to vie with his neighbour in the number of head of game which his preserves may contain, and those householders in such rivalry may be said to have a ganey ambition. I confess that to me and to many others such sport seems very tame. Pleasants numerous as barn-door

fowls in a farmyard, and as easily shot down; rabbits, as thick as in a warren, and hares without end; each sport-man supplied by his servant with ready-loaded guns, to be discharged as soon as loaded, all plain, matter-of-fact work—a continuous bang, bang, for an hour or two together. If otherwise, how could nine gentlemen bag in one day 2330 head, or 250 as the average of each gun or set of guns on a December day? These facts show that game is preserved to a great extent in many parts of the country—I may say more or less in all, and I say so with more confidence, because from observations and inquiries I have made within the last month or two, I have been astonished to find

The Amount of Injury sustained—On this I will bring to your notice the written testimony of a landlord, whose memory is much respected, who was a staunch friend to agriculture, and who was a most able and far-seeing man—I mean the late Mr. Pusey. In the fourth volume of the *Royal Agricultural Journal*, published 25 or 26 years ago, he writes, on speaking of agricultural improvements in Lincolnshire—

"Some years ago a large posse of the best land enclosed with a high fence, and you hope that the owner is about to begin tilling his fresh soil. On the contrary, the object of this improvement is to keep out the only sign of farming, the sheep, and to preserve the best of the land (because where the land is best the covert is highest) an undisturbed realm for the blackcock. Every blackcock killed by the owners of these moors has cost more, I was convinced, than a full ox, though indeed it is nothing new that sporting should impede farming. The New Forest was made for the deer and Henry I. enclosed 70,000 acres of land 'doing as Douglas says 'for the pleasure of having in a farm to the common wealth.' In later times, when it was proposed to lay the forest dry the tenants opposed the scheme obstinately and their objection was I found most curious (I paid a visit) was the objection that would put on the wild ducks and other waterfowl. In the last generation we have seen how rabbits reduced the long woolled sheep, and now blackcock and grouse, I believe, are the main impediments to the extension of cultivation. On the Somersetshire moors the sheep are indeed generally admitted, but the rent of the land is 1s. or 2s. an acre, quite sufficient for such feed as the animals find. Yet there is land so let for which I know that in Berkshire 30s. an acre would be a fair price; and if the landlords in Somersetshire sold some of their moors at a rate sale stated on the present rental, that land I find, on a village over it, we could be as cheap as any that can be obtained in the blackwoods of Canada—not only as cheap, but more easily cultivated, near a much better market, and, above all, at home.

On an estate where the house and shooting were let together, the right of sporting being reserved to the landlord or others, in the tenants' agreements, the damage done to a piece of Barley was estimated by a valuer (a professional man) at 61s. per acre, and to the whole farm at no less than 7s. 6d. per acre. This was corroborated by a very respectable witness, and a fully competent judge in such matters. On two-thirds of the farm Vetches can never be planted with any chance of a fair return, and through the fact of small crops being harvested, and of little farmyard manure being made the labour bill is much lower than it should be, and the loss to the country is not merely the 7s. 6d. per acre, but also the larger portion of the value of the extra corn and meat which would be produced upon the farm if the tenant could cultivate in such a manner as to have a fair chance of securing large crops. In the *Field* of January 9, 1869, we read of an experiment made on a game-preserved farm. One acre of Wheat was fenced in with close hurdles of some kind, and yielded 9 sacks on that acre, the rest of the field yielded 6 bushels to an acre, being a loss of 7 sacks 2 bushels per acre from game. Now the Wheat average of England and Wales, taking the average of the past 16 years, is estimated at 3,300,000 acres, so that the loss to the country on its whole Wheat acreage, besides the interference with labour, the loss of straw, &c., and, as a consequence, of home-made manure, reckoned at the rate of the loss actually sustained on that piece of land, would be 31,500,843s., taking Wheat to be worth 25s. a sack. Surely such a fact should startle the greatest game preserver! Again, another case has been mentioned to me of a similar description, although not so great a loss. A piece of Wheat was enclosed in the middle of a field, and at harvest competent judges—valuers—estimated the difference at 2 sacks to an acre, the larger quantity being grown on the enclosed piece, the quality of which was superior by about 17 per load, and fit to harvest before the other. The fact was that all the field of Wheat, excepting the protected piece, after having been eaten down by hares and rabbits, which were afterwards considerably thinned, again grew, and so luxuriantly as to cause the blight, hence the difference. I venture to assert, without fear of contradiction, that one-fourth of the cultivated land in England and Wales—and I include grass-land, for that sustains great injury—suffers from game to the extent of 2s. per acre under its present management, we must add a further sum of 2s. 6d. per acre for the value of the extra produce which would also be grown on this land if good farming could be pursued. Now taking 314 million acres as the cultivated portion of England and Wales, we get eight million acres nearly as one-fourth of the whole, which at 2s. an acre plus 2s. 6d. an acre, making 4s. 6d. an acre, gives a money value of three millions. But we have still between five and six millions of acres, returned as uncultivable to deal with. When we find that only 25 years ago Mr. Pusey found land in Lincolnshire being enclosed for game, and in Somersetshire let at 1s. or 2s. per acre, the fee simple of which would have been worth 37 an acre in Berkshire, when Mr. Evershed tells us that the best farms in Surrey are surrounded by land growing nothing but Gorse, &c., we cannot but conclude that some portions of the five and a half millions of waste land is kept back from cultivation by the love of sport—not fewer, I estimate, than one million acres—which would produce, after paying all expenses, a net value of 37 an acre at the least, or a total of 3,000,0007, which, added to the former amount gives us the enormous sum of 6,000,0007, being nearly the value of one-

third of our Wheat and flour imports, and may be to the public by the undue preservation of game.

The Gamekeepers—I approach the part of the subject we are now to consider with reluctance, because I fear I shall not be able to do justice to the justness game-preservers with the full of the loss which are occasioned by their preservation of sport. I believe there are very many gentlemen who are ignorant of the extent to which they are causing the unhappiness which they cause in many instances a family. Often is it a fact that a gamekeeper who naturally loves and wants game, has considerable influence with his master, he raises on him and his word without thinking for himself, and is perhaps the more naturally induced to do so when that master coincides with his own wishes. He is told there is much game. He is told that such and such farms are grumblers. He is told that the wren is eating the sheep broke through the hedges and did the damage, or that it was the rook that did the damage, crop, not the pheasant or the hare, so he rests satisfied. There is an excellent letter in the *Field* of November 1868, signed "Land Agent," which is worthy perusal of every landlord, it is fairly and truthfully written, and I cannot do better than extract parts of two or three paragraphs from it. He says—

"I state in a positive way that the game law is causing more feeling between landlords and tenants than all other questions put together. I have seen many landlords as just, kindly, and considerate men as the subjects who were as unjust to the tenants, especially gamekeepers as most men can be, as an instance I know a gamekeeper a landlord desired me to give him compensation for an acre of Wheat utterly destroyed because he was told the game was worth 57 an acre, and he had to say that it had been more than a fair compensation, that the compensation cost the tenant 57, the other 4 being the tenant's profit and interest on his capital. "On another estate, when a shooting was let to a gentleman for a year, and when the tenants were suffering to the amount of at least 6000, I got the landlord to let the shooting to the tenant for a year, reserving the right of shooting to the landlord at a bargain, and you should hear the tenants' joy at the proposal at the rent dinner, although formerly I could scarcely effect a cheer of any sort.

This gentleman then gives an instance where a tenant had been ruined in spite of payment of an acre of damages, and where he himself had 84 wren rabbits killed on an area of 100 acres, and now the tenant being ruined, &c., as Mr. Large, of "Secrets of Farming," where the question of rabbits is well dealt with, every one of them does 10s. worth of damage a year. Then, as an instance of a gamekeeper's view "Land Agent" adds "A keeper assured me that the tenant's complaints were groundless, there was only a breed of stock of rabbits left. I put trappers on and knew, upon 2000." Well, now this keeper did not do "Land Agent," but how many landlords are deceived? And how absurd is the remark, "view to prove no injustice, Game farms are let at game rents." I think the very worst feature connected with this part of the subject is where a landlord rents at a distance and lets his shooting, with or without a house, to any one but the tenants. Such a practice is a wrong one in principle, say more, it is a crime, an unjust one. Talk not of the tenant being free to let a farm or leave it, talk not of his having voluntarily acquiesced in the preservation of game. The tenants of England are too numerous, and broader, to be able to quickly turn their hands to other occupations, to be able as a body to reject farms unless they can control the quantity of game, and so long as this continues so long will the game injustice remain.

Letting Separately the Game—I say that gamekeepers, knowing as they must, even from newspaper reports, how often farmers are injured by game tenants, should never let their shooting until they have first offered it to the tenants themselves. In the case of a landlord keeping the shooting in his own hands, consider that any person owning land who should more convenient to let a portion, or all of it, to a tenant should renounce his right to keep any brambles or ruperds upon it at all except as a means of a tenant understand a lessee spending large sums on a farm cultivating it, and paying rent for its use every year, and I yet be hampered by a stipulation that the tenant is empowered to partially stock it, whether he chooses a so-called compensation or not. Why should I be annoyed, so continually worried, why every day walk or ride round my farm should I be reminded of the gnawed Swedes, the fallow-like appearance of my Wheat and Barley, my short crops of seeds, my destroyed Vetches, my poisoned Grass, my starved heifer and stopped-up watercourse, and my tenant, at either I had made a very foolish bargain, or my landlord was behaving most injurious. I would not risk one's life as a slow poison, and I would not, for the sake of no more, as a rule, than half-a-crown a year's pastime for the lessor. But there is one more thing I should never mind doing—I should never mind having, and indeed I like to have, gamekeepers for pleasant sporting, and if the landlord is willing to parting with his land, would say, "I will give you sport, most willingly, most gladly would I do so myself, but I must come when I like and I will give you sport, most willingly, most gladly would I do so myself. In passing on from this part of the subject I would suggest, and it is this. That it shall be considered unjust and unhandsome conduct on the part of a landlord to let his shooting without first offering it to his tenants at a fair and reasonable price, so that where the landlord retains the shooting for his own use, rabbits and in no case be reserved, tenants have a joint right to kill hares, winged game, &c., reserved to the landlord.

shall fall to the rapid growth of White Mustard, Stubble Turnips, Rape, Italian Rye-grass, Rye, and other useful leaf crops. In the autumn when the matted cultivated stubble has been mowed to receive the seed; 5, the independence (thanks to manufactured fertilisers) alike of the soil and of the weather, as regards the rotation of crops, and the agriculture used formerly to be supposed to hinge; and 6, the use of the various machines which enable us to divide and mix—the chaff-machine, the pulper, and the grinding-mill; and these by a small amount of mechanical power, to render nutritious and palatable a very large quantity of comparatively innutritious but yet useful fodder.

It is unfortunate that among the papers to which Mr. Merdoun in the attempt of his correspondence he omitted to name the value of the roller as a tillage implement for the rough ground. We have lately been over one of the finest pieces of young Clover that were ever seen—a most excellent thing this year, which has been sown singly to extraordinary and excessive forcing in the spring of 1868. The Wheat was put in after a drill presser of a homely, but unusually efficient kind. The field was a light soil on the lower colts, and every plough was followed by a loaded cart, one wheel running in the newly turned up furrow, the other on the top of the soil. As in the spring the soil was again drawn over for ever, it was a very ordinary thing. The Wheat was, after the excessive trampling with a pair of horses and two heavy wheels for every satchel, sown with two harrows and the Clover sown and rolled in. The young plant came at once and survived the drought and now covers the land with magnificent promise of a heavy crop both for fodder and for seed.

Among the other papers of the Part are Dr Voelcker's extensive treatment of the subject of manuring for Clover and pasture lands—Professor Tanner's paper on the influence of climate and hereditary character on sheep—Mr. Davy's history of the Devon breed of cattle—Dr. Voelcker's chemical report, to which we shall refer hereafter—Mr. Hutchinson's reference to the cultivation of new Counties and Mr. Everett's very useful practical essay on the best method of obtaining a continuous succession of green crops, including roots, throughout the year.

Farm Memoranda.

HAMPSHIRE.—The month of February, although very wet and stormy, cannot be said to have been unreasonable, as this month is usually wet, but this year has proved also exceedingly mild, the grass on the lawns being as forward as it often grows in the April month. Very little was done in February in the planting of Beans or Peas, but since the middle of March began the weather has proved dry enough at intervals for planting Beans and sowing Oats, Barley, &c., and on the driest soils, the gravel and chalk lands, a considerable breadth has been sowed in fair average condition. In some cases the Clover and Grass seeds have been sown at the same time as the corn, but until the end of the month it is considered best to defer the seeding until the corn is up, more particularly as the long roller now so generally in use answers admirably in breaking down the surface and covering the small seeds. The different sorts of Clover seeds are rather dear this year, but the Alsike variety is much cheaper and more generally grown than formerly, it being a very capable substitute for other varieties. The seeds of the various grasses and clovers are many of them very scarce this year, owing to the fact that the previous year in other cases they cannot be depended upon for their own or with. They seldom produce a full crop, either in the first or second cutting. All kinds of fodder crops are very forward. Velvet, Trifolium, Rye, Italian Rye-grass, &c. are quite a month earlier than they often are. This is fortunate for on many of the chalked farms Turnips and Swedes the ordinary sowing time for March and April, are nearly gone, and are being supplanted by Mangel, where parties succeed in growing them, and it ought to be considered, to great a risk to run on stock farms, unless a fair proportion of Mangel is provided, as well as other roots. The prejudice at one time existing against the growth and use of Mangel is fast dying out, and no doubt an unusually large acreage will be sown this year. The Sugar-Beet, too, is beginning to attract attention, and in case there was a free sale for them they would be largely grown upon strong and heavy lands which are too cold and flat for feeding sheep upon in the winter months. The Wheat plant looks well, more particularly upon dry soils, but on clay soils strong rains the weather has not been dry enough. There is, however, less loss of plant this year than is often the case. The prices of grain seem to be gradually receding, no doubt arising from the appearance of the crops, the season, and the probability of large importations. All kinds of meat are now very dear to the consumer, and must very soon diminish consumption, which is the only thing likely to keep the price in check, as the number of fat animals are very short in this country compared with the ordinary supplies at this time of year, either of cattle, sheep, or pigs.

In our last report a good fall of lambs on the vale farms was stated, the lambing season also on the hill farms is now far advanced, and this is the third year in succession when the fall of lambs has been over the average, but the present has proved the best of any year reported with our respect on, the ewes producing more twin lambs, for the most part in sound healthy condition. In looking back, however, to years past it has been often remarked that the flocks of Hampshire Down sheep have been subject to very serious losses, both of ewes, lambs, and sheep of

different ages, at certain times of the year, and it cannot be said to be the result of the soil and climate of Hampshire entirely for it is noticed both in Wiltshire and Berkshire likewise but is complained of as applicable to the Hampshire Down breed, and that they are by no means a sheep possessing a good constitution, in consequence of which an experiment has been going on for some years by crossing them with the Shropshire breed, and this cross has been found very good in various ways. We have an excellent record as to the Hants Downs only yielding 89 per cent. of lambs, whereas the Shropshires yield 29 per cent. The latter are said to be more hardy, will bear closer feeding, have more aptitude to fatten, produce more wool, are quieter feeders, being hardly ever known to maven on succulent food like Rape, &c. These advantages are great, and calculated to improve the Hampshire breed immensely if the cross is carried out with judgment and the blood carefully commingled. Lambs of this cross taking the prize at Lloy on the 15th inst. were remarkably fine specimens of early maturity. Joseph Blundell, Southampton, March 20.

The Poultry Yard.

To "A. K." who writes to complain that her fowls eat each others plumage.—In all probability you have read Virgil's *Georgics*, and remember the dreary north therein described as exciting the man who waked his rooms the livelong night, laughing at and enjoying the choros of a Greek play. The case of your birds lies in this untoward season afford to other amateurs that negatve satisfaction that even the best among us feel, on finding others in as bad a plight as ourselves. For what reason we are unable to say, but your letter might be that of many amateurs this year. Many a promising sale, many a Silver Cup reckoned on with certainty has been postponed *sine die*, because, indulging in an untidy and unauthorised appetite, the birds, especially the Spanish and Houdans, have eaten each other, or at least each other's plumage. Before prescribing a remedy we must try and find the cause. Are your fowls kept on a brick or boarded floor, or do you keep them in confinement? If the floor be boarded or bricked we advise its removal, and the substitution of a gravel and chalk mixture. If the birds be kept in confinement, they, at this season, require a very liberal and varied diet, plenty of vegetable; and in all their soft food, such as barley-meal, &c., a quantity of flour-of-sulphur should be mixed. It sometimes happens that one particular bird is the culprit, if such be the case it should be at once withdrawn, and, unless very valuable, it should be at once killed. A bird that is naked or bare in any part, should always at once be removed from the company of the others, and its feathers should be carefully drawn, and the bare place washed with warm water and treated with spermaceti ointment. All fowls and pigeons will peck at bare flesh, and when the skin is broken they will peck it and eat it to the bone. A correspondent, writing to the "Journal of Horticulture," recommends the application of a solution of bitter aloes to the feathers of the birds, and says he has never known it to fail as deterrent. Whatever may be the cause, it is certain that this year the complaints of this feather-stripping are double the average, and the difficulty of the cure is manifest. The ingenuity and experience of all poultry fanciers will be brought to bear on it, and we hope with satisfactory results.

The very rough weather, and the biting east winds to which we have been subject for the last few weeks, render additional care and attention absolutely necessary for the well-doing of the little chickens already hatched. If the coops can be placed under the shelter of a shed so much the better, if not, then an old sack thrown over, and the back of the coop carefully kept to the wind. Every little extra attention, in the way of diet, will be amply repaid by the growth and strength of the chickens.

The Loss of Weight in Cooking, comparing poultry and other meats would, according to Professor Donovan, be as follows. He took a piece of tender ribs of beef weighing 11 lb., this when roasted, lost 2 lb. 6 oz., of which 28 oz. were water, and 10 oz. fat, &c. The meat was then dissected from the bones, and these were found to weigh 10 oz. Consequently, of the original cut when weighed more than 11 lb. there was less than 8 lb. of meat, so that if it was bought at 4 1/2 per pound the roasted beef that could be actually consumed would cost more than 12 a pound. Part of a sirloin of beef that weighed 22 lb. lost by roasting 14 oz., of which 27 were water and 17 fat, &c. The bones weighed 2 lb., and the beef that was actually suitable for eating weighed 7 1/2 lb. Hence, if the cost of the joint were at the rate of 8 1/2 d. per pound, the value of the roasted meat would be 1s. 2 1/2 per pound. A leg of mutton that weighed when bought 9 1/2 lb., lost when roasting 1 lb. of fat, &c. and 13 oz. of water. The bone weighed 16 oz. Only 5 lb. 6 oz. were left, and if the butcher had charged 8d. per pound, the cooked meat would cost more than 11 d. A goose, not stuffed, prepared for roasting, weighed 7 1/2 lb., when roasted it was found to have lost 18 oz., and the bones weighed 12 oz. The edible part that remained, therefore, if the goose sold at 1s a pound, would be worth 1s. 8 1/2 d. per pound. A turkey, properly trussed, weighed, including its liver and gizzard, 6 lb. 11 oz. It lost 20 oz. in roasting, and its skeleton weighed nearly 12 oz., the weight of its edible part being 4 lb. 10 oz. Had the original price of the turkey been 5s., the value of the roasted meat would be 1s. 1d. per pound. According to the same authority, a duck when prepared for roasting weighed 11 lb. 10 oz. In roasting it lost 6 1/2 oz., and the bones weighed 4 oz. The edible portion therefore was only about 1 lb., and if the duck cost 2s. or 1s. 8d., the food it yielded

Meredith's Vine, Pine, and Plant Manure. JOSEPH MEREDITH, The Vineyard, Garston, near Liverpool...

THE MANURES are now ready for delivery for present season, 1899. PATENT TURNIP MANURE. DISSOLVED BONES. SUPERPHOSPHATE OF LIME...

OSBORNS' PURPLE BEDDING VERBENA.

We have grown the above-named VERBENA two summers, and have no hesitation in saying we believe it to be a most desirable variety for bedding purposes. We sent it to Mr Thomson at Dalketh, and to Mr David Thomson at Archerfield, to test its merits. The following are Copies of Letters we have received from those Gentlemen, which will be seen fully sustain the opinion we formed of it, and faithfully describe its leading features:—

- To Messrs. Osborn & Sons. Dalketh Gardens, February, 1899. "I grew your purple bedding Verbena last year on trial, as you requested. In colour of bloom it resembles the King, but its habit is dwarfier and it is much more suitable for small beds than that variety. It will prove a great acquisition amongst bedding Verbenas. (Signed) "W. M. THOMSON."
- To Messrs. Osborn & Sons. Drumlanrigg Gardens, February, 1899. "I grew your purple seedling Verbena extensively last year at Archerfield. And to thoroughly test it against the King I had the groundwork of a long border made up in equal proportions of these two rival sorts. I found the seedling more dwarf and 'twiggy' in habit than Purple King, while it more than equalled P. K. in profusion of bloom, and there is fully more of a blue shade in the seedling. It far surpasses P. King for edgings and small beds, as it has a far better constitution, consequently it strikes more freely and is much easier wintered in a healthy condition. I look upon it as a great acquisition. (Signed) "D. THOMSON."

Plants will be ready for distribution early in May, at the following scale of prices — 1 Plant, 2s. 6d., 12 Plants, 18s.; 50 Plants, 60s.; 100 Plants, 100s. THE USUAL TRADE DISCOUNT. OSBORN AND SONS, FULHAM NURSERY, LONDON, S.W.

MEETINGS FOR THE ENSUING WEEK.

It will be remembered that FIRES OF ORIGINATING FROM RAILWAY LOCOMOTIVES, were rather numerous during the past dry summer, and those who visited Leicester during the great exhibitions of the Royal Agricultural and Horticultural Societies had ample opportunities of perceiving that the Midland Company's route formed no exception to the general rule. The fires were not only numerous but some of them of a very serious character, extending to large areas of corn and grass crops, and in some cases to woods and plantations. Generally the claims for compensation have been settled privately by the railway companies, but there have been some exceptions to this rule, and one occurred on the Midland Great at Nottingham at the recent Assizes, where Mr. HARRIS, the Official Assignee in Bankruptcy, brought an action against the Midland Railway Company for injury done by fire to his property situated at Kegworth, on the Nottingham and Leicester line. The principal fire—for there were many of them—occurred on the 16th of last July, destroying 4 acres of Grass keep, several hundred trees and shrubs of eight to ten years' growth, and some established picket fences. Acting under the direction of one of the subordinate inspectors of the Railway Company, Mr. HARRIS caused the damage to be estimated by a competent horticultural valuer who assessed the loss of crop, and the cost of restoring the plantation and fences with plants of the same size at 118/ 11s., and the damage to the freestone, it being for sale at the time, at 350/. For these amounts a claim was made upon the Railway Company, who, so far from honoring it, at once denied their liability and would not even entertain the question of compensation at all. Feeling that neither in law nor equity could damage so manifest and serious be pushed.

Notices of Books.

Recent Architecture, by James Rennie, Esq., with much enlarged by the Rev. J. G. Wood, M.A., with 18 plates of drawings. London: R. S. D. P. 1859.

The work is a very good one, and contains a great deal of information on the subject of architecture, and is well adapted for the use of the student and the practical architect. The plates are very fine, and the text is well written and easy to read.

The Apiary.

NON-SWARMING HIVES.—In the reply to "P. G.," p. 100, it is stated that "we have worked 1,000 for three or four seasons without their leaving one swarm, excepting a few stragglers from them every year. I have frequently extended this time with the swarming bees, and have kept them in perfect strength up to the sixth and seventh years. I have swarms into the straw hives with the same type for swarming. One of these years, however, at 1 1/2 years, they swarmed, and I was obliged to destroy them. The next year they were nearly all wintered in the straw hives, and I have not had any more swarms since."

The book is a very good one, and contains a great deal of information on the subject of architecture, and is well adapted for the use of the student and the practical architect. The plates are very fine, and the text is well written and easy to read.

APRIL 10, 1869

SUTTONS' HOME-GROWN FARM SEEDS,
 NEW AND UNADULTERATED,
 CARRIAGE FREE
 SEEDS DIRECT FROM THE GROWERS THE BEST MEANS
 OF PREVENTING DISEASE
 Special Contracts made for large quantities
 Best Farm Seeds are sown from the most carefully
 selected seed, and are guaranteed to be pure, but have no Agents.
SUTTONS' PRIZE MANGEL WURZEL,
 THE LARGEST GLOBE VARIETY IN CULTIVATION.

SUTTONS' BERKSHIRE PRIZE YELLOW GLOBE.
 The most variety of Globe Mangel yet introduced. It is of
 heart shape, with very neat top. It is mostly of pale yellow
 color, and generally only one tap root. It grows to a large size, and
 when sown produces the most weight of roots per acre.
 Following are the sorts also available —
 SUTTONS' SELECTED YELLOW GLOBE, 1s. per lb.
 SUTTONS' SELECTED ORANGE GLOBE, 1s. per lb.
 SUTTONS' SELECTED RED GLOBE, 1s. per lb.
 SUTTONS' SELECTED LONG YELLOW, 1s. per lb.
 SUTTONS' SELECTED LONG RED, 1s. per lb.
 SUTTONS' SELECTED COMMON INTERMEDIATE, 1s. per lb.
 Lowest price per cwt. on application

SUGAR BEET (Sow 8 lb. per acre).
 SUTTONS' SELECTED SUGAR BEET, 10s. per lb.
 SUTTONS' SELECTED SUGAR BEET, 10s. per lb.
 THE BEST SWEDE IN CULTIVATION IS
SUTTONS' CHAMPION.

Very heavy cropper, perfectly hardy; stores well, free from mildew
 SUTTONS' PR. M. ATALONIA OF SUTTONS' HOME-GROWN
 MANGEL WURZEL AND TURNIP SEEDS may be had
 carriage and Post Free.
 All Goods Carriage Free, except very small parcels.
 Five per cent. allowed for cash payment.

MEETINGS FOR THE ENSUING WEEK
 April 12 Cirencester Farm Meetings
 13 Royal Dublin Agricultural Society's Show
 17 Norfolk Chamber of Agriculture, at Norwich Valuation
 of Property Bill.

AGRICULTURAL labourers are, we believe, at
 present exciting more compassionate interest in
 the minds of well-meaning men than any other
 class in the country. They are declared to be
 half-fed, ill-housed, helpless. It is no answer
 to such an assertion that other large classes
 living in towns are in an even worse plight, and
 that unskilled labourers in the country are better
 off than the corresponding class elsewhere. The
 honest inquirer has generally to allow for this
 fact, however—that the superiority of country
 lodging, bad as it may often be, and of country
 food, has to be admitted. But it is the compara-
 tive helplessness of the village labourer that
 touches you; the townsman strikes and congregates,
 even riots, and will be heard occasionally
 —the farm labourer is never heard. That is
 probably the reason why clergymen and philan-
 thropists are so urgent on the subject, and why
 Farmers' Clubs and Chambers of Agriculture are
 constantly discussing it. And it is well that this
 interest should exist, notwithstanding that it is
 from the class themselves that help must really
 come. They are not helpless. Over great part
 of England the agricultural labourer of a certain
 age has abundance of pocket-money. From 18
 to 25, when a single man, he is lodged and
 boarded, and receives from 10% to 16% a-year. If
 he could only be induced to abstain from public-
 house resort, he might before he married be a
 man of property—have a houseful of furniture,
 or even both house and furniture of his own.
 There is no one from whom he has anything like
 the chance of help that exists within his own
 unaided reach. And it is on education during
 boyhood, and on considerate and firm manage-
 ment during youth—on personal character, in
 short—that his condition as a man depends.

We are glad, nevertheless, that public-spirited
 men keep the facts regarding the class generally
 prominently before the public, good service is
 done, not only by those who urge self-restraint
 and personal influence as their two great helps,
 but also by those who criticise the more public
 agencies which are at work both against and
 for the class. In particular, all true pictures of
