in Tibet in the manufacture of some of the best
 fabrics. This woolly covering is said to disappear with
 advancing age, or when he is struck from the mountain
 climate for which he appears so well adapted. Some
 was certainly the case in the case of the late
 Duke of Argyll, who died at the age of 70, and was
 General at Chinghai in the year 1848. He was
 used for purposes of the wool, and was found to be
 of good quality. It is said to be of a
 place where the wool is of a
 it is superior to any other. It is said to be a
 substitute for the wool of the mountain, and
 his extreme hard work and care in the mountains
 give him an interest even in the eyes of English
 agriculturists.

Sheep—Messrs Robert and John Russell, long ex-
 tensive and successful farmers in the neighbourhood of
 Hartford, have within the last two years appeared
 before the public as successful breeders of Hampshire
 Down sheep. We have not room to enter into details
 of the present state of their flock, and are content to
 state that they have succeeded in raising a flock of
 never ones have been seen in the neighbourhood.
 The history of the flock is worthy of
 attention, as it was commenced in opposition to the
 farming opinion of the district, where it was generally
 thought that raising lambs would not be a successful
 enterprise. Still, in spite of this discouraging opinion,
 the Russells persevered and succeeded. Mr W.
 roughly Wood informs us of a similar flock with
 regard to breeding lambs, his names are not
 known. My land is so unfavourable for sheep that
 when first I entered upon it I was told that it would
 be madness to keep a fine flock. And yet the
 Honey Bank Shropshire have passed upon our
 Mr Wood's able management. We have then two
 instances, showing that local opinion should be
 subjected to the test of experiment, and not blindly
 accepted as the *dicta* by which a future practice
 must be controlled. Mr Russell, thus speaks of the
 commencement of his flock. "The reason we tried
 to breed our flock was that the stock we purchased
 were not only fit to fatten, but the ewes were
 were numerous progeny from goodness. Our
 flock commenced with Southdown ewes, which
 were crossed with Hampshire rams every season.
 The stock increased in size and earliness of matu-
 rity, enabling us to sell them at one year old.
 Fresh males were purchased every year until at length
 after bringing home some of the best which money
 could procure, Mr Russell found that his own young
 rams were superior to those he had bought. This
 determined him to exhibit at the "Royal, which he
 did at Leicester, and so successfully as to carry off the
 1st prize, and subsequently similar success attended
 his sheep at Islington. Distance from other similar
 flocks is a difficulty at Farningham, especially in the
 important item of finding a market for rams. As the
 Messrs Russell have 100 ram lambs they propose
 either to send them to some western fair or give
 an auction in the west of England."

STEAM CULTIVATION

I HAVE looked upon the "West Indian" steadily
 written article on Steam Cultivation and as he has
 touched upon "E. Peppin Lechallour's" article in the
 "Journal d'Agriculture Pratique," I will give a sum-
 mary of it, with some remarks of my own, in support
 of my own mode of application. Here is the sum-total
 of the article above referred to. The Agricultural
 Societies, both in France and England, are thanked
 for giving trials and reports by which we are told
 that the superiority of steam power over horse power
 is completely settled, although as yet there is a differ-
 ence of opinion as to what is the best application—
 the contest being between a two-engine set, cost-
 ing 1400*l.* and a one-engine set working on the
 roundabout plan said to cost 720*l.* Some statements
 are then made as to where "bare fallows must com-
 pletely cease to exist," fixing the time for working
 from February 15 to May 15, and from August 15
 to November 15, all 180 days, but from these
 we are to deduct 50 days for Sundays, &c., leaving
 130 days as the working days in a year for a set of
 tackle, be it what it may, thus condemning our
 own Royal Agricultural Society's practice of basing
 their estimates on 200 days work. Then come some
 estimates on a 500-acre farm, fixing the days thereon
 at 225 acres on an average of years, leaving 275 acres
 for corn and roots. Then these 275 acres are to be
 reduced by small fields to be done with horses that
 must be kept for carting corn, &c., to 225 acres. Then
 we are told how to operate—"A breaking up of
 the stubbles directly after the corn, crops have
 been carted at the latter end of the summer
 by a light portable engine,
 then a portable engine set on a
 partly for carting, and partly for
 action of frost. In the spring the
 scurrying and one harrow will
 the best condition for sowing, &c., &c., Mar-
 April, and May." &c. &c. are set apart for the winter-
 sown white crop, leaving 175 acres for oats and spring
 corn, and here is the sum total of work to be applied
 on the 225 acres—400 acres of grubbing and sowing
 225 acres of ploughing with a harrowing, showing that
 it would not do to employ a double-engine set on such
 a holding, and that such a set has no chance except in
 the hands of the contractor. We are then shown
 what a roundabout set can do upon such a holding.
 "The work required by 225 acres will occupy Howards
 tackle during 104 days, and a day's working expenses
 are fixed at 2*l.* 3*s.* 6*d.* or 27*l.* an acre for grubbing
 is 4*l.* an acre for sowing, and 1*l.* 3*s.* 6*d.* an acre for
 and. After comparing these figures with horse work
 the Leicester award is approved by justifying the use

of a roundabout set on such a holding, leaving the
 104 days required entirely to the contractor.
 Please to make a few remarks upon these state-
 ments. I don't remember the cost of a set of Howards
 tackle, but I believe the cost of Howards
 does not represent a set of mine. Here is the cost of a
 set of mine.

That all that is needed to work land in England
 What I wanted in France I know nothing about.
 Now let us look at the time fixed for working. In
 England February 15 is too early for we do not need
 it for the planting of our Bees, I have tried the
 matter and have done the work well and have had good
 results from it. I don't know whether it will
 be a day or so later for that purpose than with
 March 15 would be a more seasonable time for
 the work, and these were fixed for
 work on to May 15, but for the life of me I cannot
 see what use it can be all that time on such a
 holding. I can quite agree about the land all being in
 crop during the summer months but I cannot under-
 stand how we can be usefully out upon our stubbles
 after "great crops" are harvested by August 15 for it
 is the stubbles after my pasture crops that I want to be
 at the disposal of the farmer they are not cleared until the end
 of August, September and October are the two months
 to work the land when we are told to work on to
 November 15, we are told to work on to the end of
 the year, one time to a day including meal times
 and stoppages for working without a day's rest. Then I
 must knock off 15 days in November, 15 days in
 August and 8 days from February 15 to March 15—in
 all 38 days from the 130 days already shown as the
 working days for a year less 10 days for Sundays.
 This will reduce the working days of a year to 82,
 therefore Howards' tackle would not be able according
 to my showing to do its 104 days' work a year on such
 a holding.
 Now let us look at the cost of this 104 days' work
 on 225 acres of land, 104 by 27*l.* 6*s.* 6*d.* a day equals
 2877*l.* 10*s.* 6*d.* or 110*l.* 2*s.* 6*d.* an acre for a seed-bed.
 Again compare the cost of these seed-beds with
 mine worked upon my plan, with a like costing 720*l.*
 Here is my mode of calculating. Had the engine to be
 charged to thrashing and grinding, &c., in the same
 way that "E. Peppin Lechallour" did, this reduces the
 cost to cultivation to 372*l.* To do the 225 acres, the
 tackle would be required 11 days at smashing and 27 days
 at ridging and subsoiling. The cost of the men for a
 day's smashing is 16*s.* 6*d.* of coal, 8*s.* of oil, 8*d.* for
 11 days, total, 13*l.* 16*s.* 10*d.* The cost of the men for a
 day's ridging and subsoiling is 14*s.* 6*d.* of coal, 8*s.* of
 oil, for 27 days, equals 37*l.* 6*s.* 6*d.* The cost for
 the 225 acres would then be 170*l.* 2*s.* 6*d.*

Cost of engine and tackle	720
Cost of fuel and oil	100
Cost of labour	100
Cost of seed	100
Total	1020

On an average 6*s.* 1*d.* per acre
 This is a most wonderful support to my own figures,
 worked out last autumn, when I showed that my
 average cost of seed-beds was 10*l.* an acre, yet it
 proves plainly that "E. Peppin Lechallour's" mode of
 application (the Howards) is by no means the best,
 inasmuch as the cost is shown to be 110*l.* 2*s.* 6*d.* an acre,
 against my 6*s.* 1*d.* He may plough and he may
 harrow, and he may also scratch, but these figures speak
 for themselves, and prove him to be a long way behind,
 for there are my lands and seed-beds to look at, yet, and
 there is more than that, for there are now my three
 fields of Wheat to look at, planted with but a mere
 trifle over a bushel of seed per acre 12 inches from row
 to row, seeds at a total cost of 1*l.* 1*s.* 6*d.* per acre, and
 they look much stronger in colour than
 anything of the same culture in the neighbourhood
 or any that I have seen within the last month, so
 where I may, although seeded as thick again. People
 who have visited me within the last 14 days from
 several parts of England tell me that they have seen
 none like them for strength. Then there are my
 Beans up and strong on my ridged and subsoiled land,
 costing only 7*s.* an acre for working up 10 inches deep.
 My crop last bad Bean year, grown upon land similarly
 treated, gave me a produce on my heavy clay land of
 28 bushels per acre, an average of what it used to be
 under horse culture, and on my best land I had
 47 bushels per acre, which I sold to my neighbours for
 seed at 1*l.* 10*s.* per bushel. Then there are my Mangos
 a really perfect crop, and that too, in a year
 when the ground was so dry, and the weather so hot,
 never was seen anything so good, and I had a witness
 to it. And there is my Beans already planted, the
 first white crop in success, and as good as a
 certain that was raised and subsoiled last autumn.
 I was too deep, that had nothing this spring to bring
 it upon the surface but a scratching of the ridge with
 my subsoiler worked with horses. His evidence goes
 against the contract plan with a 1400*l.* set, for he
 shortens up the time for working, yet not enough, as I
 have shown, to say nothing about the April and May
 work, which to my mind is very questionable, for
 September and October are the only months in which
 steam power can be applied with advantage, excepting
 a very little spring work. We all know that the con-
 tractor must give good beds for us, 104 an acre
 from the difference of price may be set at rest for
 there is no doubt but in no that can do it at so low a
 cost per acre, therefore it must be the "best applica-

tion" and the Frenchmen have a
 apply it.
 The Royal Agricultural Society of France
 grand mistake at starting by a contract
 and M. Lechallour's article is a
 sticking to the plan, the contractor
 the fact is that I have seen a
 application in the power of steam and
 to the Frenchman's terms.
 By the way, I have seen a
 P.S. I have seen a
 thus.

Can we not find a 'curing' water
 trive a deal for steam? I have
 works well, yet I find as I have
 practice it is not needed. Look at my
 growing, drilled in with horses, and
 planted by hand above named, I
 tell the world what is good, and I
 for a thing.
 "A want rope made of the best materials
 We have got that.
 Can we not make a traction engine
 harvest? I fancy it can be done—
 it will not pay.
 Now let me ask a question. How many
 we need to assist our railways in carrying
 of the country? When that is done
 hunting into the bargain, we will
 steam.

ADULTERATION OF SEEDS

Mr. CHARLES SHARPESE I will
 grievances which have long been
 columns of the leading agricultural and
 journals. They are these: Large quantities
 or German Rape seed, and inferior samples of
 Rape are killed by a process of steaming
 drying, for the purpose of mixing with
 Turnip seed. Seeds of the former
 are prepared in a like manner for
 of these varieties which have a
 a cheap and inferior kind of Clover
 for mixing with Red Clover and
 old samples of Clover seeds are
 for the adulteration of seeds of a
 value,—this process of steaming
 destroying to a great extent the
 of the seed so treated. There are
 which might be ment and it is
 the principal evils complained of. These
 have frequently been publicly made
 any contradiction, and in the absence
 have a right to assume that in the
 correct. Now to carry out this
 there exist in London and other
 factories for the preparation of
 to a case business being to kill
 Bill proposes to inflict a penalty
 engaged in the business of preparing
 turn, and the promoters of the Bill
 this clause alone will to much
 complained of. Penalties are also
 one knowingly or purposely
 killed or dyed seeds. The Bill
 short, being confined to leaving
 practice in the trade. It has
 does not go far enough, and
 seed, and I will take this opportunity
 such remarks. There would be
 applying the Bill so as to prevent
 for it is impossible to say at what
 considered unfit for use for sowing,
 the season in which they are
 years with a fine harvest the
 when kept over one or two years
 even super or to, the new use of
 seasons. In our harvest, the
 of seed must always be
 therefore it often occurs that
 harvested in fine condition and
 the demand of following years
 or quantity. It was this
 framing the Bill to leave out
 as interfering too much with
 must the seed business. I
 remedy for any injury
 sale of old seed of bad growth
 also in coming to this
 committee of the Council of
 report upon the adulteration
 They say
 If this Bill should become law
 seed be done away with the
 will not be interfered with,
 large stocks in consequence
 accumulating. Old seeds
 or coloured seeds do not, except
 to the trade. It is satisfactory
 offered to the Bill in fact it
 any opposition or any
 any persons who can
 into these
 of seed. As to the former, I do not know

JOURNAL—Mr. Thompson reported (1) That the new number of the Journal was on the table. The delay in its publication on this and several previous occasions, had caused much annoyance to the Committee, and they therefore reported that Mr. Jenkins was prepared to undertake that the Journal shall in future be published at the right time, namely, by the end of the months of February and August, &c. (2) A letter having been received from the Duke of Devonshire, K.G., in relation to the proposed new number for publication at the end of August. (3) A letter having been received from the Duke of Devonshire, K.G., in relation to the proposed new number for publication at the end of August. (4) The Committee recommended that his Grace's offer be accepted with thanks. (5) M. Fleury, French Consul-General in England, having written to request that the "Société des Agriculteurs de France," recently established in Paris, may be admitted to this Society, and exchange publications with it the Committee recommended, without giving at present any opinion on the request for a liaison that an interchange of publications between the two Societies be established. (6) The Committee recommended that a proposal be adopted for the next issue on any article relating to the Society's affairs, to be published in the Journal, to be dated after the conversation Mr. Wells, M.P., asking on this subject whether the Committee were interested in cases that a report is received from Mr. Wells, testifying to the irregularity in the appearance of the Society's publications was a subject to be discussed at a meeting of the Society. Mr. Thompson then stated that the probability of the Society's educational grant being discontinued and in order to encourage young and rising agriculturists and to publish useful and interesting matter for the Journal, he wished to suggest the establishment of two travelling scholarships of £100 each, one for British and the other for foreign agriculture, so that the subject of the grant might be referred to a special committee. Mr. Dent, M.P., who was the only member of the Society who was present, was unwilling to obtain matter for the Journal without having recourse to Prize Essays, more especially reports on the agriculture of different districts, would prefer experienced persons instead of young men. The Hon. Mr. Lubbock, M.P., asked how the qualifications of the candidates would be ascertained, and also whether it would not be possible to combine Mr. Thompson's idea with the award of the prize of 25*l*. already sanctioned, increasing the amount if necessary? Mr. Wells, M.P., objected to the time at which this proposal had been

lecture on his chemical investigations during the past year.—This report was adopted.

MEMORIAL—Mr. Wells, M.P., reported that 21 gentlemen had entered their names as candidates for the Society's educational prizes. He announced that the examination would commence on Tuesday, April 13, and gave a general description of the scheme proposed to be followed. **SELECTION**—Mr. Dent, M.P., presented the report in which the Committee recommended that his Grace of Devonshire, K.G., should be elected a honorary member of the Society. A copy of the Society's Journal up to the present time be forwarded to his Grace. It was proposed by Mr. Dent, M.P., seconded by Mr. Wells, M.P., that his Grace should be elected in the place of the late Sir J. V. J. Stone, Bart., M.P. On the motion of Mr. Dent, M.P., it was unanimously resolved that his Grace the Duke of Devonshire be elected an honorary member of the Society, and that a bound copy of the Society's Journal up to the present time be forwarded to his Grace in recognition of his services and his courtesy to the Society. On the motion of Mr. Thompson, his Excellency M. Drouyn de Lhuys and M. Lecouteux were unanimously elected honorary members of the Society, the mover of the resolution observing that the former gentleman was already very well known to members of the Society, and that the latter was a distinguished agriculturist and a member of the Society.

A memorial was received from the Corporation of Oxford, inviting the Society to hold its country meeting at Oxford. On the motion of Mr. Torr, the Corporation was invited to an inspection committee to be appointed to inspect the Duke of Devonshire's sheep. Mr. Dent, M.P., was appointed to the committee.

A memorial was received on the subject of the shearing of sheep in England.—We, the undersigned, being exhibitors and breeders, and interested in the welfare of Shropshire sheep, beg respectfully to represent to the Council of the Society of Agricultural Sciences, under the means of inspecting the wool of the sheep, by private parties whose names are not to be placed as inspectors, are most objectionable, as being at variance with the rules of the Society, subversive of the privileges and powers which should be exercised by the judges, and a system which falls far short of preventing the evil it is intended to remedy. It is, therefore, respectfully requested that the Council of the Society will be pleased to take the necessary steps to have been

in conformity with the rules of the Society, and to have the names of the inspectors placed on the list of exhibitors, so that they may be known to the breeders of Long-woolled sheep, and that the regulations for the shearing of sheep for exhibition be strictly enforced, and that the Council will be strongly in favour of the proposal.

fully urge that the Council should be pleased to consider the subject of the shearing of sheep in England, and to have the names of the inspectors placed on the list of exhibitors, so that they may be known to the breeders of Long-woolled sheep, and that the regulations for the shearing of sheep for exhibition be strictly enforced, and that the Council will be strongly in favour of the proposal.

A letter on the same subject from Mr. Denis Brown was then read, urging the Council to consider the subject of the shearing of sheep in England, and to have the names of the inspectors placed on the list of exhibitors, so that they may be known to the breeders of Long-woolled sheep, and that the regulations for the shearing of sheep for exhibition be strictly enforced, and that the Council will be strongly in favour of the proposal.

by no means general, and quoted from several communications to that effect which had been received from the Council.

The Council cannot believe that it would be agreeable to the judges to have the additional duty imposed upon them which the memorialists ask for, or that it would be efficiently performed by them as appointed for the purpose. In requiring that all sheep exhibited should have been fairly

deception, and they know that this statement in the memorials, not absolute time is not distant when all exhibitors will be glad to receive and consider any suggestions for their object the making such inspectors disqualifications by inspectors of shearing wool.

Mr. Rigden, as a large breeder and for many years expressed his opinion that sheep being disqualified by the inspectors will do away with unfair shearing, and that the memorialists should share the same fate. Mr. Rigden, as a large breeder and for many years expressed his opinion that sheep being disqualified by the inspectors will do away with unfair shearing, and that the memorialists should share the same fate.

On the motion of Mr. Ranson, the principal county agricultural societies, the Institution of Mechanical Engineers, requested to nominate judges of machinery, and prizes offered by that Society.

BATH AND WEST OF ENGLAND
At the late Council meeting of this Society, a copy of vol. XVI, containing the series commencing with the extension of the operations in 1862; and it was ordered that part of the Journal containing the first united annual meeting of the Bath and West of England Society and Southern Association, at their meeting to-morrow.

purpose of promoting a new or third series of the Journal, and that the committee have no contributions; also that the committee be informed of the latest time at which the local committee should be notified.

Mr. Robert Badcock be requested to be the local committee of the Bath and West of England Society and Southern Association, at their meeting to-morrow.

Mr. Robert Badcock be requested to be the local committee of the Bath and West of England Society and Southern Association, at their meeting to-morrow.

Mr. Robert Badcock be requested to be the local committee of the Bath and West of England Society and Southern Association, at their meeting to-morrow.

Farmers' Clubs.
LONDON.
April 5.—Mr. F. L. DASHWOOD said that a few persons are aware of the exists in the modes of rating in the three our country. I do not enter into the detail of the subject, but what we in England can do with our whole system of rating may be more harmoniously, and to the benefit of the country, as follows:—
In England, now, a church rate and no education rate.
The county rate (which included of the police) is paid by occupiers to the expenditure, which is quarter sessions, but directed to the poor rate (under which he paid by the

have for years watched the system of education... violent and well-attended assistance... clothing coal and...
 Many can well remember the evils of the old system, altered in 1831, and in many cases we can trace its evil effects in families at the present time.

Are we not entitled to demand... superior advantages... present outdoor rating system...
 The current number may be taken as a fair or favourable example of the form which this long-established periodical has at length assumed. It is no longer a strictly agricultural journal or a collection of original articles. On the other hand it is no longer a heavy, and except for professional use, an unreadable book. It is, for the most part, a light, various, amply illustrated re-edition of well-written, cleverly written, smartly written articles which have a ready appearance in the columns of our excellent contemporary, the Farmer, and which, we cordially admit, almost always well deserve the more permanent form they here receive. The present number contains leading articles on the adulteration of seeds, the improvement of pastures, the management of irrigated lands, the making and the use of farmyard manure, the supply of nitrate of soda, the increase of home food production, pictures of foreign cattle, reports on the feeding of cattle, on the plough, and details of farm building construction, reviews of books, gardening papers, poultry papers, travels by tourists, contributions by arboriculturists, by naturalists, by the veterinary surgeon, and by the poultry keeper and the housewife. There

Reviews.

The Country Gentleman's Magazine for April, 1860. Simpkin, Marshall & Co.

The current number may be taken as a fair or favourable example of the form which this long-established periodical has at length assumed. It is no longer a strictly agricultural journal or a collection of original articles. On the other hand it is no longer a heavy, and except for professional use, an unreadable book. It is, for the most part, a light, various, amply illustrated re-edition of well-written, cleverly written, smartly written articles which have a ready appearance in the columns of our excellent contemporary, the Farmer, and which, we cordially admit, almost always well deserve the more permanent form they here receive. The present number contains leading articles on the adulteration of seeds, the improvement of pastures, the management of irrigated lands, the making and the use of farmyard manure, the supply of nitrate of soda, the increase of home food production, pictures of foreign cattle, reports on the feeding of cattle, on the plough, and details of farm building construction, reviews of books, gardening papers, poultry papers, travels by tourists, contributions by arboriculturists, by naturalists, by the veterinary surgeon, and by the poultry keeper and the housewife. There

information for anybody from almost everybody; and we hope that everybody is satisfied. We think everybody—the proprietor included—ought to be for he has certainly provided something for every taste, and the useful is well mingled with the ornamental. We take an extract from the article on "American Dairy Factories":—

The Rockville factory stands near or adjoining a wet and springy piece of ground, covered with fragments of rock from the Saawangank mountains. The buildings were erected a year ago, and have some improvement in construction over the older factories. The main structure is 25 feet by 50 feet—two storeys—which are used for manufacturing and curing cheese. Adjuncting this on one end is the spring-room, and on the side running back in the shape of L is the churn-room, 20 by 30 feet, on the end of the churn-room is the ice-house, which is arranged so as to lead out of the churn-room with a broad hall or alley, which serves as a collar for storing butter.

This building has double sides, packed in with tan-bark, and the ice-house being on one side, with communication by door makes it a cool place for keeping butter of great summer. In this room there are two vats—measuring 14 feet by 14 feet, and the other 12 feet by 12 feet, sunk even with the floor, and arranged so as to be filled from one spring. The temperature of the water is 19°. It is soft water, but less so than those at the other factories to which we have referred. The delivery of the milk is at a window, and on a platform the height of a wagon. As the teams drive up, the cans are slid upon the platform, and emptied into a large square receiving-butt or can. On the side of the window, standing upon platform scales, where it is weighed, and the cream lifted out by two funnels into two long tin pans or coppers. The cost of structure and fixtures was 10000. The number of cows from which milk is levered is 425, and on November 1 the receipts were 1900 quarts—estimating a quart wine measure, to weigh 2 lb. Milk varies in weight, and a wine quart weighs at some seasons of the year, a trifle over 2 lb. During the month of May, when cows are in pasture, Mr. Slaughter finds that 100 quarts, wine measure, will weigh 21 lb. The milk here is kept in the spring from 24 to 36 hours, when the cream is taken off and allowed to sour in a churn. Mr. Ipleague, the superintendent of the factory, informed us that what is called a more butter is obtained from the cream when churned sour than when sweet. At this season of the year November 2, the cream is taken off and deposited in the long tin pans, and immediately carried to the churn-room, which is kept, by means of a coal stove at a temperature of 60 to 65°. Cream two days old when taken off will require from two to three days before it will thicken in the churn-room at the above temperature.

Butter making—The churns are the barrel and half-dash churn, and are filled about half full of cream, which is diluted by putting in cold water in summer, and warm water in cold weather, at the rate of 10 to 30 parts for each mass of creaming. The churns are set about 10, but in cold weather they are started at about 4°. When a mass of cream is to be churned, the churns are first about half full, and a pan of spring water added to dilute the cream, in warm weather cold water is used, and in cold weather warm water, so as to make the mass at a temperature of 60° to 62°. The temperature of the cream while churning should be kept below 65°, for if at the close of the churning the buttermilk should be at a temperature above 61°, the flavour and colour of the butter are injured. When the butter begins to come, the churn is rinsed down with cold water. After the butter is taken from the churn, care is taken not to touch it more than is necessary with the hands. The butter trays are elliptical in shape, and the ladle is used for turning over the butter white it is being washed. In salting and working over, the whole is done by the butter worker heretofore described, and great care is taken not to work it too much, as over-working spoils the grain and makes the butter slabby. A 22 lb batch is laid upon the inclined slab or butter worker, and the lever applied, first beginning at one side until the whole is gone over. Only a few manipulations of this kind are required, and we were surprised at the expedition by which this part of the process was effected. The salting and working of the butter is by the same rule adopted by the other factories, 18 oz of salt being used for 22 lb of butter.

The butter worker is similar to the one alluded to, except that the lever is diamond-shaped, which it is claimed is an improvement. The inclined triangular slab on which the butter is worked stands upon legs, and has beveled sides about 3 inches high. It is 4 feet long and 25 inches wide at the upper end, tapering down to 5 inches at the lower end. At this point there is an opening for the escape of the buttermilk into a pan below. In salting, the butter is washed and then spread out with the ladle upon the worker in pure fine Ashton salt sprinkled over the mass. It is then turned over a little with the ladle, and afterwards worked with the lever.

At this factory there was a little contrivance, consisting of a wheel and lever and weight, for regulating the stroke of the dashers when churning. The trays are elliptical, being 2½ feet long and 1½ foot across, and will hold 25 lb of butter. The butter is packed in Orange county pails or tubs holding 60 lb, or in oak tubs of 40 lb, as at the other factories, and shipped twice a week to New York, bringing 70 cents per tub. The association is composed of 28 farmers, who have dairies ranging from five to ten, and up to 30 cows. Four farmers not belonging to the association deliver milk here, and are charged 1½ dollars per cow extra. The cheese is manufactured out of skimmed milk, by the same process as at the other factories. They are pressed in 16-inch hoops, 8 inches high, and weigh

Standard of Operations.

some sown broadcast, but 1500. 20 to 24 inches apart, from end of the month in the southern white and yellow, yield the heaviest in a deep sandy loam, but peaty soils. The and is generally in autumn, the manure being in, and when practicable the subsoil ploughing, being common. it is common to apply wood and gypsum, at the time of sowing. of guano is sown into the for the seed when sown broad- drilled in, as in the case of with ashes or in a liquid form. of last year's growth, and fresh, it in sawdust, and allowed to lie

for a day or two before sowing, and a peck of Barley or Rape may be added, to show the line of the braird in horse-hoeing the first time. About 7 lb of seed are sown broadcast, and 6 lb drilled in per acre. It should be lightly covered with not more than half-an-inch of soil, and ro. ed.

Mangel Wurzel is generally sown about the latter end of the month or beginning of May. If the land has been previously manured, and is ready for sowing, the latter period is often as promising as the former. The general practice, however, is to manure at the time of sowing, and for such the former period is to be preferred. About 20 cubic yards of farmyard manure, a month or six weeks turned on the dunghill, is spread evenly in the newly-opened drills, from 27 to 30 inches apart. About 2½ cwt. of superphosphate, and an equal quantity of common salt, are sown broadcast on the dung, and the covering of the dung keeps pace with the opening of the drills, so as to have as little exposure to the atmosphere as possible. The sowing follows close after, "yoking after yoking," so as to get in the seed with the moisture; some damp the seed before sowing to make it braird more rapidly. It should be lightly covered with not more than half-an-inch of mould, and about 7 lb. of seed are required per acre. The more the soil is compressed by heavy rolling the better will the seed vegetate and the plants grow. When more or less farmyard manure than the above is applied, less or more artificial manure is used. Some apply the artificial manure in a liquid form, by means of a combined liquid manure and seed drill, either with a continuous or drop motion, as Gillyatt's. The latter, the drop motion, sows both the seed and manure in each row alternately, and at equal distances apart. Not a few prefer the old plan of d.bbling in the seed, but continuous sowing, for many reasons, is becoming more and more general.

Sugar-Beet (the white Silesian) is sown about the same time as Mangel Wurzel and Carrot. Its cultivation, perhaps, more resembles the latter than the former, the deep working of the land being essential both in autumn and spring. Opinion is somewhat divided as to the soil and manure best adapted for it, but there is little question that it resembles very closely Mangel Wurzel in both these respects, rich and rather heavy land being the best. The distance between the rows is very various, but as horse-hoeing is favourable to the growth of sugar, 20 inches apart, growing the roots the closer the other way, will probably become general, more especially as roots over 1 lb decrease in saccharine value. The seed is sown as that of Mangel, not deeper than half an-inch, from 6 to 8 lb. per acre. And it is essential that the seed be fresh, of the last year's growth, and of the proper sort, so as to insure an equal braird, with plenty of plants, equality in the size of the roots being the sure key to success.

Cabbage seed may be sown about the middle of the month for thinning out in the drill, so as to avoid transplanting. The operation is similar to sowing Turnip seed. The land is in some cases manured in autumn, in others at the time of sowing, in drills 50 inches apart. If the former, a stroke of the harrows will generally make the ridglets ready for the Turnip seed-drill, and if the land is clean, and well pulverised with the weather, the harrows may not be required. If manured at the time of sowing, with from 20 to 30 cubic yards of farmyard dung per acre, the practice is similar to that of Mangel and Sugar-Beet. From 3 to 1 lb. of seed are sown per acre, the latter if the weather is dry, the former if moist.

Cabbage plants from the autumn sowing are planted from the middle to the close of the middle. About 5000 Drumhead plants will plant an acre. The land is either manured in autumn or in the spring, about a month before planting. Watering newly-planted Cabbages is generally objected to by farmers, but the practice is successfully carried out in gardens, and may be so in the field but in very dry weather each plant should get a good soaking so as to supply moisture to the roots, for a small drizzle on the surface does harm. If water is near, two water-carts will keep half-a-dozen watering-pans going, doing about 6 acres a-day.

Hop Gardens should be ready for pointing in the early part of the month, as the bines or runners now begin to rise rapidly. The poles are either set vertically, one or more in each hole, or standards are raised, and between these wooden bars or galvanized wires are stretched for training the bines. Throughout the plantations weeds are kept under by means of the hoe and nutget, i. e., hop scurrier. Nursery beds require also to be weeded and kept clean.

Teasel is sown this month, either broadcast or in drills 27 inches apart, from two to three pecks of seed per acre; or it may be sown in seed-beds for transplanting in autumn, the crop being harvested the second year. This latter is the more common practice. The plant requires a clean clayey soil, in a thorough state of cultivation.

Chicory is sown this month, both as a forage plant on poor sandy soils, and also as a root crop on richer land for roasting as a part substitute for coffee. For either purpose about 12 to 15 lb. of seed will drill an acre. For sowing, the drills should not be more than 9 inches apart, or no more than will permit of the crop being hand-hoed, for roots for roasting the drills should permit of horse-hoeing, the plants being set out as Carrots. Chicory may also be sown broadcast in the place of Clover, on many light Clover-sick soils, in laying down land to permanent pasture, with a light crop of Barley or Oats.

Notices to Correspondents.
GIANT *if Beetle*. Supposing guano to contain 14 or 15 per cent of ammonia, you might serviceably add a gallon of sulphuric acid to every cwt. of it, in order to fix the volatile ammonia which it contains.

Rosher's Garden Edging Tiles

THE above and many other PATTERNS are made in Terra-Metallic Ware, Terra Cotta, Stoneware, and Redware, and of great durability. The plainer sorts are especially suited for KITCHEN GARDENS, as they harbour no slugs and insects, take up little room, and once put down incur no further about and expense, as do "grown" Edgings, consequently being much cheaper. GARDEN VASES, FOUNTAINS, &c., in Artificial Stone, of great durability and superior finish, and in much variety of design.

F & C ROSHER, Manufacturers, Upper Ground Street, Blackfriars, S.E. Queen's Road West, Chelsea, S.W., Kingsland Road, Kingsland, N.E. Illustrated Price Lists free by post. The Trade supplied.

ORNAMENTAL PAVING TILES for Conservatories, Balconies, Corridors, &c., as cheap and durable as Stone, in blue, red, and buff colours, and capable of forming a variety of designs. Likewise mosaic enriched designs. Pattern Sheets forwarded for selection.

WHITE GLAZED TILES, for Lining Walls of Dairies, Larders, Kitchens, Bathes, &c. Grooved and other Stable Paving Bricks of great durability, French and a Luminous Chalk or Wall Copings, Red and Stoneware Drain Pipes, Slates, Cement, &c. To be obtained of F. & C. Rosher, at their premises as above.

SILVER SAND (REIGATE), at the above address—14s. per Ton, or 1s. 3d. per Bushel—2s. per Ton extra for delivery within three miles, and to any London wharf or wharf. Quantities of 4 Tons, 1s. per Ton less. A coarser graded Sand is per ton more. Samples of each Sand sent by post.

FLINTS and BRICK BURLS for Rockeries or Grottoes. **KENT PEAT and LOAM** supplied at lowest rates.
F & C Rosher.—Addresses see above.
N.B. Orders promptly executed by Railway or Vessel.
A liberal discount to the Trade.

 and CULTIVATOR may be SEEN at WORK in every
 County in England.
 Particulars apply to JOHN WHEELER & Co., 7, Cornhill, London,
 or Steam Plough Works, Leeds.

Rosher's Garden Edging Tiles

There are many other PATTERNS made in
 Ware, Terra-Cotta, Stone, and Redware, and
 of great durability. The plainest sorts are
 especially suited for KITCHEN GARDENS, as
 they harbour no Slugs and Insects, take up
 little room, and once put down incur no
 further labour and expense, as do "grown"
 Edgings, consequently being much cheaper.
GARDEN VASES, FOUNTAINS, &c., in
 Artificial Stone, of great durability and
 superior finish, and in much variety of design.

Manufacturers, Upper Ground Street, Blackfriars, E.C.
 and West, Chelsea, S.W.; Kingsland Road, Kingsland, N.E.
 Prices Lists free by post. The Trade supplied.

MENTAL PAVING TILES for Conservatories,
 &c. &c. &c. in various colours, and capable of forming a variety
 of designs. Likewise more elaborate designs. Pattern Sheets
 sent, with prices, forwarded for selection.
GLAZED TILES for Living Walls of Dairies, Larders,
 Dress Rooms, Baths, &c. &c. &c. and other Stable Paving
 of great durability, Dutch and Adamantine Cloppers, Wall
 and Stoneware Drain Pipes, Slates, Cement, &c.
 Supplied of F. & G. Rosser, at their premises as above.

SAND (BEIGATE), at the above addresses—
 100 lbs. in 1/2 cwt. per Bushel; 2s. per Ton extra for delivery
 from the wharf, and to any London Railway Wharf. Quantities
 of 100 tons or more. A coarser grained Sand 4s. per Ton more.
 Orders sent by post on receipt of stamp.
NETS and BRICE BURS for Rookeries or Ferneries KENT
 and all other articles supplied at lowest rates.
 F. & G. Rosser.—Addresses see above.
 All Orders promptly executed by Railway or Vessel.
 A liberal discount to the Trade.

DICK RADCLYFFE AND CO'S RUSTIC
 DECORATIONS for the Draw Room, Conservatory, &c.
 Dick Radclyffe & Co., Seedsman, &c., 113, High Holborn, W.C.
Indestructible Terra-Cotta Plant Markers.

 Warehouse: 31, Mark Lane, London, E.C.

LAWN MOWERS, Warranted.—Purchasers may here
 inspect a large Assortment of every improved construction;
 and as R. P. Taylor & Co. are not Makers, they recommend only
 those that are thoroughly efficient. **HORTICULTURAL TOOLS** of
 every description. Lists on Application
 R. P. Taylor & Co., Adelphi Place, London Bridge.

Green's Patent Noiseless Lawn Mowers.
GREEN'S PATENT LAWN MOWERS have proved
 to be the best, and have carried off every prize that has been
 given in all cases of competition, and a proof of their superiority
 upwards of 44,000 have been sold since the year 1856.

They are the simplest in construction, least liable to get out of
 order, and can be worked with far greater ease than any other Lawn
 Mower extant.

They are the only Machines in constant use at
 Buckingham Palace Gardens The Winter Palace Gardens,
 Marlborough House Gardens, Dublin
 Royal Horticultural Society, The Dublin Botanic Gardens
 South Kensington, The Liverpool Botanic Gardens
 The Royal Botanic Gardens, The Leeds Royal Park
 Regent's Park, The Hill Botanic Gardens
 The (Royal) Palace Company, The Botanic Gardens, Brussels
 Gardens, Bydenham, The Sunderland Park
 The Hyde Park Gardens, The Preston Park
 And in most of the principal Parks and Squares in the United
 Kingdom.

Every Machine is warranted to give entire satisfaction, and if not
 approved of can be returned at once unconditionally.
 Illustrated Price Lists on application, which include Free Delivery
 to all the principal Railway Stations and Shipping Ports in England.
 All Orders executed on the day they are received.
 T. G. & Co. have ten times more Lawn Mowers in Stock at their
 Establishment, 64 and 65, Blackfriars Road, S., than any other firm
 in London, that intending Purchasers can select from.
 Having very extensive premises in London, we are in a position to
 do all kinds of repairs there as well as at the Works at Leeds.
THOMAS GREER & SON, Southfield Iron Works, Leeds, and 51 and
65, Blackfriars Road, London, S.

SAMUELSON & CO.'S

NEWLY PATENTED EDGE-CLIPPING SILENT LAWN MOWERS.

THE MOST IMPORTANT IMPROVEMENT EVER INTRODUCED.

MESSRS.
SAMUELSON AND CO.
 DESIRE TO DRAW SPECIAL
 ATTENTION TO THEIR
 NEW
LAWN MOWERS,
 for 1869,

Which are fitted, when re-
 quired, with a new Patent
EDGE-CLIPPING
 arrangement, entirely
 superseding the old and
 tedious operation of Edge-
 Clipping by hand.

All Machines fitted with
 new Silent Gearing, ensur-
 ing perfect freedom from
 noise when at work.

Catalogues, with full
 descriptions and prices of
 the new Patent Edge-
 Clipping Silent Lawn
 Mower, on application to

SAMUELSON AND CO., BRITANNIA WORKS, BANBURY.

J. B. BROWN AND CO'S
NEW PATENT BB LAWN MOWER for 1869
 PRICES REDUCED AND THE MACHINE PERFECTED.

HAND MACHINE.

The **NEW PATENT BB LAWN MOWER** is universally
 allowed to be, by the most competent practical judges, superior to
 any other—being the best designed, also of exceptionally best
 material only, all parts liable to breakage being of malleable iron,
 every part made to standard gauge, and all accurately numbered, and
 the entire Machine fitted and finished in a manner incontrovertibly
 superior to any other Lawn Mower manufactured.

TESTIMONIAL

From **ALEX. MACRAE, Esq.,** Alexandra Park, Morwell Hill—ap-
 pointed by the Metropolitan Board of Works to lay out their new
 Public Parks, and to plant the Thames Embankment July 1st, 1868.
 "Gentlemen,—I have pleasure in informing you that the 42-inch
 Horse Mowing Machine, supplied by your firm 15 months ago, does
 its work remarkably well. The two 42-inch Horse Machines sup-
 plied by you in May last are also most satisfactory.
 "I have recommended your Lawn Mower to many of my friends,
 believing that the machine does its work better than any other, and
 combines strength superior to Shanks' machines, with the lightness
 of Green's. Having now four of your Lawn Mowing Machines in
 constant use on our grounds, and two of these having been in work
 over a year, I have never had cause to alter this opinion of your
 machine, which I now have pleasure in giving to you.—Yours faith-
 fully,
ALEX. MACRAE.
 "Messrs. J. B. Brown & Co., 143, Upper Thames Street."

The **B B LAWN MOWER** was selected at the Paris Exhibition, in
 preference to all others, by the celebrated Engineer, **Mons. Henry**
Schneider, of the well-known Engineering Works at Creusot, and
 President of the French Legislative Assembly. The following is a
 copy of a note received by Messrs. Brown & Co. from **Mons.**
Schneider:—
 "Union de Creusot.—Schneider et Cie.,
 "68, Rue de Provence, Paris, le 24 Fevrier, 1868.
 "Monsieur,—J'ai fait faire l'essai de votre Machine à tondre les
 gazon, et m'empresse de vous faire connaître que les resultats en
 ont été satisfaisants.—Recevez, Monsieur, mes sinceres salutations.
 (Signed) "H. SCHNEIDER."
 "Messrs. J. B. Brown et Cie., 90, Cannon Street, London."

PRICES—NEW PATENT BB HAND MACHINE for 1869.
 10-inch } For a Boy { £3 5 0 } 15-inch A Man and Boy { 7 10 0 }
 12-inch } A Man { 4 5 0 } 20-inch } Two Men { 8 0 0 }
 14-inch } A Man { 5 5 0 } 22-inch } { 9 0 0 }
 16-inch A Man and Boy { 6 0 0 } 24-inch } { 10 0 0 }
 Prices of Horse and Pony Machines on application.
 Every Machine is warranted to give perfect satisfaction in every
 respect, and delivered free to any Railway Station in the Kingdom.
 It is most important, in order to prevent disappointment,
 that orders for delivery during the season 1869 should be given
 without delay.
Messrs. J. B. Brown & Co., Office, 90, Cannon Street, E.C.
Manufactory, 940, New Kent Road, S.E.

PAXTON'S STRAWBERRY CRINOLINE.

The **STRAWBERRY CRINOLINE** is in the form of
 a table, made in halves, so as to be used without disturbing
 the plant. It is 16 inches in diameter, and stands 4 inches
 above the ground, galvanized. Its use is to preserve Straw-
 berries from slugs, contact with the soil, superfluous
 moisture, and other nuisances. They are considered to last
 10 years at least with care.

Price per Gross, £4.

The **STRAWBERRY CRINOLINES** are declared by all
 who use them to be of the greatest use in keeping the Fruit
 clean and assisting its growth—thus in the production of
 large crops. For particulars see Illustrated Catalogues, and
 Testimonials sent to us by our patrons last year.

The contrivance is by the late Sir Joseph Paxton, who,
 after testing them for one season in his own gardens, "Rock
 Cottage," was the first to use them. The right to Manufacture them was transferred to

R. HOLLIDAY, PRACTICAL WIRE WORKER, 2A, PORTOBELLO TERRACE,
NOTTING HILL GATE, W.

Illustrated Catalogues of Horticultural Wire Work free on application
WIRE ARCHES, ARCADES, VERANDAH'S, ORNAMENTAL FENCING, TRELLIS WORK for CREEPERS, FLOWER
STANDS, SUSPENDING BASKETS, AVIARIES, PHEASANTRIES, &c.

NEW, RARE, AND BEAUTIFUL PLANTS.

WILLIAM BULL, F.L.S.,

DEGS TO INTIMATE

THAT HE CAN SUPPLY THE FOLLOWING PLANTS,

MANY OF WHICH ARE QUITE NEW AND OFFERED FOR THE FIRST TIME, SOME EXTREMELY RARE, AND OTHERS UNIQUE

A DESCRIPTIVE CATALOGUE, just published, post free for 12 stamps.

ORCHIDS.

The following are new or extremely rare
ODONTOGLOSSUM PISCATORUM, price 5 gu.
ONCHIDIUM MACRANTHUM HASTIFERUM, price 2 gu.
ONCHIDIUM NIGRUM M. MILLIATUM, price 10 gu.
ONCHIDIUM TRUMMELIANUM, price 10 gu.
VANEA CALHARTI, price 20 gu.
ARGHEUS M. SEMIPEDEALE, price 3 and 5 gu.
CYPRIPEDIUM LAYIQUATUM, price 20 gu.
ANCYLUM KURNELM, price 10 gu.
CYPRIPEDIUM DAYANUM, price 5, 6, and 10 gu.
CYRTOPTERA FLAVA, price 1 gu.
ODONTOGLOSSUM ALEXANDRI, price 3 gu.
" N. FAHUM, price 5 gu.
" PULA HELLUM GRANDIFLORUM, price 2 gu.
ONCHIDIUM AGRICOLA, price 2 gu.
PHAIUS GRANDIFOLIUS FOL. VARIEGATUS, price 3 gu.
PHALANOPSIS SCHILLERIANA, price 5 gu.
ODONTOGLOSSUM ROSEUM, price 4 gu.

LASIANDBA MACRANTHA - This marvellous plant produces its gigantic violet blue flowers (1 1/2 foot in circumference) on plants a few inches high, and throughout the year. Price 3 guineas. For full description, vide Mr. W. B.'s New Catalogue, page 6.
CLEORODENDRON SPECIOSUM - An attractive tree fern of a variety, forming a very fine companion and contrast to C. Balfouri. Price 1 guinea. For full description, vide Mr. W. B.'s New Catalogue, page 4.
ERANTHEMUM ANDERSONI - The flowers are freely produced on small plants, and are as lovely as those of an Orchid. Price 10s. 6d., 15s., and 20s. For full description, vide New Catalogue, page 11.
CYRTOPHYLLUM - The handsome, moss, green leaves of this ornamental plant are 7 to 10 inches long, and 1 to 2 inches wide, with veins and leaflets very whitish. Price 1 guinea. For full description, vide New Catalogue, page 3. This plant received the first award of merit at the last Meeting of the Floral Committee of the Royal Horticultural Society.
CYANOPHYLLUM BOWMANI - This fine plant is considered the best discovery and introduction of the unfortunate collector whose name it bears. Price 1 guinea. For full description, vide New Catalogue, page 4.

NEW PALMS.

WELPIA REGIA - The foliage, when young, of this magnificent form, is of a dark crimson colour. Price 2 and 3 guineas.
DECAISNEA NOBILIS, price 3 guineas.
CALAMUS OSEYANUS, price 3 guineas.
ATTALIA LIMBATA, price 2 guineas.
MARTINIZIA LINDENIANA, price 1 guinea.
GEONOMA ZAMORENSIS, price 3 guineas.
CALAMUS EXCELSUS, price 2 guineas. For full description, vide New Catalogue, page 4.
CALAMUS SPECIOSISSIMUS, price 3 guineas. For full description, vide New Catalogue, page 4.
PINASOA LATSCHOTA, price 3 guineas.
LEPIDOCARYON GRACILE, price 3 guineas.
PYCHOSPERMA ELEGANS, price 1 guinea. For full description, vide New Catalogue, page 7.
PYCHOSPERMA LACINIOSUM, price 1 guinea. For full description, vide New Catalogue, page 7.
GEONOMA SPECTABILIS, price 1 guinea.
DESMONDIUS GIBBERUS, price 1 guinea.
PLECTROCOMIA ELONGATA, price 2 guineas.
GANSIA PRINCIPIS, price 2 guineas.
DENDROBIUM PLUMOSUM - This is one of the most elegant of the Palm family, and, being of small growth, admirably adapted for vases and table decoration. Its leaves are of a rich dark green, and handsomely plumed, hence its name. Price 1 and 2 guineas.

Beautiful crimson-flowered New Hybrid Plant, HUSKINGIA UMINATA, price 7s. 6d. One of the gems of the season.

NEW SILVER VARIEGATED GRASS, HOLCUS LANATUS A. DECAISNE, price 5s. each, 2 gu. each, for full description, vide Mr. W. B.'s New Catalogue.

NEW HERBACEOUS LOBELIAS.

The two following varieties are of a new mode of growth, and the product of a new method of culture, and are admirably adapted for use in pots, or in groups in the flower bed of the border, or in any other place where they have a striking effect. The flowers with which they are adorned are of a most brilliant blue, never fading, and are 1 foot in height, readers being highly recommended.
CHIAEM - Bright blue the flowers are of good size and number. Price 2 guineas per dozen.
MARVELL - Pure, white flowers, and of a most beautiful form. Price 2 guineas per dozen.

This Prize is open for Competition amongst Amateurs and Gardeners of private families. The Fruit and Vegetables produced must be of the Exhibitor's own growing and any article otherwise obtained will disqualify the Contestant. It is expected that the several articles will be neatly and effectively displayed.

MEETING FOR THE ENSUING WEEK.
 TOMORROW, APRIL 20.
 Royal Horticultural Fruit and Flora Comm. trees at South Kensington . . . 11 A.M.
 Ditto (Scientific Committee) 1 P.M.
 Ditto (General Meeting) 3 P.M.

THE chapters in Mr. DARWIN'S "ORIGIN OF SPECIES" relating to the systems of classification adopted among naturalists, have always appeared to us to be among the most remarkable among the many noteworthy features in that now well-known work. Mr. DARWIN'S remarks are not only of very great interest in a purely scientific point of view, but their practical importance is fully as great, and will in the future be even more so. It would be out of place here to enter at length into the consideration of the so-called natural system of classification. Suffice it to say, that according to Mr. DARWIN'S views, such systems must have a genealogical basis. The several forms and groups of plants or animals that we see around us are related one to the other in various degrees, just as human beings are. The hypothesis of a common origin, and a consequent more or less direct relationship, thus affords a rational explanation of the existence and of the affinities of those groups which naturalists term species, genera, &c. To test the correctness or fallacy of such views two courses are open to us. We may proceed deductively, and from a full consideration of the facts already known to us we may arrive at conclusions which will be nearer or farther from the truth in direct proportion to the extent of our knowledge, and the correctness of our reasoning. Or we may proceed inductively, and, without bias one way or the other, laboriously and conscientiously accumulate facts. Each fact throws light upon its fellow, each one, while in itself again, continually unfolds the prospect of further gain, and opens up an illimitable prospect—an ever-shifting horizon which prevents us from ever attaining to a full knowledge of what is probably quite beyond our mental range. Nevertheless we are tempted or compelled to progress from the unceasing stimulus afforded by the continual discovery of hitherto concealed truths, no less than by their intrinsic material importance. Mr. DARWIN has himself followed both modes of investigating the hidden secrets of Nature, and while his deductions are among the most startling of any in the whole history of science, his patience and sagacity as an experimenter have brought to light facts of

which the physiologist already recognises the importance and of which horticulturists and agriculturists will in future years reap the material result. With reference to the Darwinian theory it has always been felt that its soundness must be tested by students of special groups, either of animals or plants, and so we find Mr. MILLER testing the validity of the theory by an investigation of the Crustacea. Then we have Mr. BENTHAM treating the extensive genus Cassia on the same principle, and so with other naturalists—and this brings us to speak more particularly of M. CARRIÈRE'S labours. M. CARRIÈRE is a practical man, and is therefore entitled to a hearing from practical men. M. CARRIÈRE is a theorist, who reasons logically, and takes care that his premises are as sound as they can be made; he is therefore sure to be listened to with attention by others. M. CARRIÈRE, too, has pursued both methods of investigating the truth. Our own columns have from time to time furnished many illustrations of this statement, but we would allude now particularly to his genealogical arrangement of the varieties of Peaches and Nectarines, which is a practical carrying out of Mr. DARWIN'S ideas as to the relationship and filiation of natural groups. The genealogical trees of Mr. DARWIN and M. CARRIÈRE are constructed on the same principle as the "Greek trees" in the Greek grammars, and which, we must confess, have acquired in these Darwinian days an interest for us which we are compelled to admit was wholly unappreciated in our schoolboy days. But, not content with this, M. CARRIÈRE has followed the plan adopted by MM. VILMORIN, BUCKMAN, and others, of ascertaining by direct experiment the probable origin of some of our cultivated plants. Thus, from seeds of the wild Radish, carefully selected through four generations, M. CARRIÈRE states that he has produced a great variety of forms, which he summarises as follows:

Raphanus Raphanistrum, wild form.
 Flowers pale yellow, with purplish veins.
 Leaves relatively small, nodding, not very fleshy.
 Roots filiform, dry, fibrous, always white, hard, somewhat woody, not edible.

Varieties induced by selection, &c.
 Flowers white, violet-rose, or yellow, self-coloured, or usually streaked.
 Pods variable in size, form pendent or erect, sometimes very large, as much so as those of the Madras Radish, and thus succulent and edible.
 Roots large, sometimes excessively so, variable in form and colour, fleshy, flesh white, yellowish, or rosy, sometimes violet, succulent and edible.

Some of the forms thus produced are valuable additions to our culinary vegetables, and may be treated as Turnips. M. CARRIÈRE draws attention to the different results of his experiments as carried out in the light, dry soil of Paris, and the stiffer, more retentive soil of the country. In the latter case, on good Wheat soil, the tendency was to form short thick roots, while in the light calcareous soil of Paris the varieties produced had long white roots, more like a Carrot in shape. M. CARRIÈRE further remarks on the difference in the result as manifested by autumn and spring-sown seeds respectively, and on the necessity for different treatment according as the plants are cultivated for the sake of their pods or their roots, whence as well as from other experiments of a like nature, he concludes that the forms of organised beings are always in harmony with the conditions or circumstances in which they are developed. To us this seems rather too sweeping an assertion. It appears to us to exclude adaptation to function, and to limit the changes too exclusively to the action of external conditions. Perhaps we may have misunderstood M. CARRIÈRE. Our own notion is, that in all adult organised beings there are two sets of characteristics or attributes—the one congenital and common to all the members of large communities, at least in their earliest stages, the other manifesting themselves at a later period, and special to certain individuals or species. These latter characteristics are developed or acquired in conformity either with external conditions, or are manifested for the proper fulfilment of some function or office which has to be fulfilled. Thus the congenital features characterize large sections or groups, while the acquired characters serve to distinguish species or individuals one from the other. The experiments in progress at Chiswick on this important subject will, we hope, not only be of direct practical benefit, but will serve to throw light on the variations of plants as affected by different conditions of soil, &c.

We may remark, in conclusion, that the practical result of M. CARRIÈRE'S experiments has been the production of a new variety

amount of the time occupied in ploughing the... cost me within a small fraction of 9s. per working day...

My horses work on an average 277 days in a year and the average length of day is nine hours the pair therefore...

It is to be noted that the value of the crop of Turnips and last year was a very good crop of Turnips...

It is to be noted that the value of the crop of Turnips and last year was a very good crop of Turnips...

It is to be noted that the value of the crop of Turnips and last year was a very good crop of Turnips...

My horses work on an average 277 days in a year and the average length of day is nine hours the pair therefore, cost me within a small fraction of 9s. per working day, or 1s. per hour. I have been told that this deep ploughing would soon deteriorate my horses, from over exertion and predispose them to disease. This I have not found to be the case or that they were injured by the work in any way. If the horses are properly yoked and driven by a ploughman who understands his work and if the number in the plough is regulated by the nature of the soil to be ploughed, the work is little, if at all more severe than ordinary ploughing.

I have endeavored to bring under your notice the causes which induced me to undertake the different operations which I have described on farms which have been cultivated under my own direction. The means employed in carrying them out have been given in detail, as well as the success which has attended the system I have followed. I trust that they may prove worthy of imitation by my neighbours on such soil and climate as they may think adapted for the undertaking and that the fruit arising from their industry may tend to improve the produce of the land and equally benefit the cultivator and the consumer.

Home Correspondence.

Summer Grazing - The modern system of summer grazing is much on the increase and will ultimately be very general. This is quite right in a country so rich in its resources as Great Britain for the fattening of animals destined for the food of its inhabitants. This island home of ours in comparison with the outer world is a mere speck, but it is wonderful in its enterprise, its influence, and its importance. It is manifestly at the head of the nations of the earth, its hold upon the destinies and advancing civilization of the whole world. Its commerce extends to every country, and every port and harbour known in these countries is made to contribute to the support or comfort of its inhabitants. It is the great mart of the nations. The products of all countries find their way to its shores, and are most beneficially distributed by its people. Thus it becomes in this respect the greatest of nations, and it is by the enterprise, the freedom of trade, and the noble perseverance of its inhabitants that its prestige is upheld and its innumerable blessings secured. The most important is the provision for the sustenance of its population. This mainly depends upon the industry, energy, and persevering efforts of its agriculturists. This class has wonderfully added to the resources of the nation during the past half century, and at the present time is probably doing more to advance its prosperity than any other class is doing or can do. It is the department in the national economy to provide food, &c. for the nation. I am about to show that they eminently do their duty in one especial part of their business, viz. in the summer grazing of their farm stock. I can't, I regret to say, include every grazer, but I speak now of the modern grazer and his doings. He can't extend the area of his fields, but he does the next best thing he makes the fields support the greatest number of stock it is possible to put upon them with a satisfactory prospect of fattening them. The grass pasturage is a most secondary thing with the modern grazer. Take the fattening of cattle upon lands of the highest value. He selects cattle of considerable value and nearly fat to graze as his first run. These are supplied with the most approved artificial food in judicious rations, and are speedily well fattened. By this course he can fat off two, and three or four 'runs' or heads of cattle before the old-fashioned solely grass feeding grazer can prepare one for sale - hence the value of feeding stuffs brought from some quarters of the globe. Take, again, second-run grass and these would probably long ago have been well fattened three sheep per acre. The modern grazer will put on from seven to 12 sheep per acre, give them liberal rations of cake, corn, &c. and thus fatten them speedily. The difference is simply this: every good modern grazer adopts the use of artificial food in his summer grazing. The ordinary grazer depends upon his pasturage alone. The former will rest upon the average fatten three animals on the other an fatten one. The first has land with more than double the quantity of stock and by his advanced and judicious use of the specially prepared food upon his secondary land. The ordinary grazer, depending upon grass alone, can fatten but one animal at all, and is thus beaten to the extent I venture to assert. At the commencement of the present century it was customary to graze our best lands with inferior bred oxen of from four to five years old, and the average of oxen grazed would not exceed three years, their weight nearly equaling that of their clumsy progenitors. The sheep feeding and his were grazed with three shear sheep, and of superior type, now these lands are chiefly grazed by sheep not exceeding 12 months at 'stocking time,' and at 18 months arrive at satisfactory weights, fattened. This is a great advance in a nation's progress, and, as knowledge increases and prejudices die out, modern grazing will be universal.

Prolific Sheep - A farmer in the locality Mr. Benjamin Thomas, Penber, in the parish of Llangan, Carmarthenshire, possesses a ewe of a mongrel breed which in January last brought fourth five lambs at a birth, and again in December produced three, thus making eight lambs within the year. One of the first mentioned lambs died shortly after it came into the world, but the seven others, together with the mother, are at this time in good health and condition. This description of sheep appears to be exceedingly prolific, for another party on the adjoining farm obtained 11 lambs from two ewes of

the same sort within the year, in 1867, and in the majority of cases twins made their appearance. These sheep also produce their progeny much earlier than the higher class race, which makes them very valuable on that account. They are small, but the meat is excellent and strikes me that offering prizes for them at the Smithfield Club shows would not be a bad plan. Another advantage attending them is, they seldom are attacked with disease of any kind, and their yield of wool is considerable. Being hybrid they differ from the native mountain sheep of the country in sundry respects. The butchers about here purchase them readily; indeed, I may say, in preference to the aristocratic breeds which prizes that they are in great demand among their customers. J. A. Lewis, H. H. H. H., Carmarthenshire, April 7.

Foreign Correspondence.

Paris - Agricultural subjects continue to occupy considerable attention, even more than is usual at this period of the year, and there are several reasons why this should be the case, one being the approach of the general election, when agriculturists and agriculturists often have an agricultural topic. The long debate in the Corps Legislatif on the subject of the transformation of Paris and the proposition of the fact that the city is now indebted in that respect according to official reports, in a sum exceeding 1,000,000 sterling, has also had its effect. On the latter discussion, said a writer the other day "there is but one thing that agriculturists need remember, namely, that during the last 17 years about 90 millions sterling have been absorbed by the great public works executed in Paris, this is 20 millions more than would have completed the provincial road work (spanned of the entire empire)." "Nothing," says the same writer (M. J. A. Barral), "can better exemplify how little is done for agriculture than its special budget, out of the 1,650,000,000 f. devoted to the ordinary expenditure, only 8,271,000 f. are devoted to agricultural purposes. The subventions to the theatres amount to 1,887,000 f. and the total of those granted for agricultural societies, shows, exhibitions, prizes, and experiments connected with the diseases of the potato, the vine, and silk worms, is only 1,750,000 f. the portion allotted to the agricultural societies and committees is 1,000,000 f., while the allowance to the Opera amounts to 20,000,000 f."

Of the various articles included in the agricultural budget there is a sum of 600,000 f. only a part defrayed by the State, for the three veterinary schools each pupil, except those belonging to the army pays 15 fr. per annum for his board. There were last year 200 pupils in the Veterinary school of Lyons and 100 at the Veterinary school of Montpellier.

The same is the case for the three agricultural schools of agriculture in Lyons, Montpellier, and the pupils pay each 20 fr. a year. These schools are apparently in a very poor way, last year there were but 131 pupils in all, namely, 48 at Grignon, 46 at Grand Jouan, and 37 at Montpellier; the total cost to the Government was but 12,154 f. In the 18 farm-schools there were 1204 pupils, the Government grant in 1867 was only 25,000 f., but it stands at 27,000 f. for 1870. The three sheep farms belonging to the State, at Chambon and Haut Tugry and Corbon, cost the Government little more than 1000 a year, these establishments are regarded as being most serviceable to agriculture in improving the breed of animals.

The Inspectors-General of Agriculture, even in number with their four assistant inspectors, cost 2,700 f. the traveling lectures on agriculture and arboriculture, 1500 f. and the 13 professors of agriculture in great towns, only 732 in all. There is no increase in the budget this year as compared with 1869, and it is stated by M. Barral that the produce of the schools, sheep and cow farms being deducted from the grants, the cost per annum to the State is only in fact 100,000 a year.

The Superior Commission of Agricultural Inquiry has recommended the necessity of more being done by Government and the following is the purport of its recommendations. The establishment of a superior school of agriculture in Paris with an experimental farm in the environs, the establishment of one or two regional schools in the south of France, formation of free scholarships in favour of the pupils of the latter for the Paris schools, extension and improved organization of farm schools, encouragement of agricultural orphan schools, formation of both sexes, encouragement of agriculture by the development of stations for experiments with the aid of the authorities of the departments and of the agricultural societies.

An amendment signed by 144 deputies, has been presented to the Corps Legislatif, in favour of an addition of 12,000,000 to the budget for the purposes stated above.

The proposed plan of the new superior school of agriculture will shortly be published, and may be regarded as official and decided upon. It will be somewhat on the model of the old Agronomic Institute of Versailles.

In the meantime the local committees are adopting means towards the same end. The central committee of Bourges has opened courses of primary agricultural instruction, and last year distributed 10 gold medals to the successful candidates who had made the greatest efforts to improve their farms, the fundamental notions of gardening and agriculture. Deputies from this committee have visited farms, and made references on various subjects in the spot.

M. G. de la Motte, of Orleans, has earned great popularity by his practical references and received the Cross of the Legion of Honour from the hand of the Emperor last year. Not long since he had a conference at Lamotte-Beuvron, which was well attended, and created considerable interest. Amongst the other proposals now before the Corps

been found by the late Mr. P... of Peru, near to the snow line and to grow well in a cool and shady place. It was then made to several other places, and to the very beautiful Rhododendron, Haddington, one of the parents of which is a regular and beautiful Orchid, the larger, more aristocratic than alluded to. At present, it is the plant was to be sent for

called the attention of the meeting to an elegant Anthropolium cirratum, a new plant, forming a great contrast to the Amaryllis (immaculata) variety. The Chairman then alluded to the various Orchids in his collection, and in allusion to the medal, expressed his regret that the committee had not been able to award it easily by Messrs. Veitch, and almost without a struggle. He had great pleasure in presenting the consideration of the eminently successful in which Mr. Anderson had grown Orchids, and he had baffled the skill of cultivators, and he claimed that Mr. Anderson had on the great Orchid lovers, consisted in the fact that he kept his knowledge to himself, but was always ready to impart it to others less skillful than himself. Mr. Anderson trusted that Mr. Anderson would continue to grow such specimens of and he only could grow. He then said that he experienced very much pleasure in receiving the medal from the hands of Mr. Anderson, who had for so long a period been devoted to Orchid culture, and who had done so much for the Horticultural Society.

that those who had a love for the Horticultural Society could at any time be gratified at the prizes which are annually treasured by himself and his success. His countrymen north of the Tweed would be glad to have such prizes. Such prizes were valuable, and recipient, but stimulated the zeal of the Horticultural Society in the nation of gardeners. Mr. Anderson then acknowledged the compliment paid him, and the chairman for the kind manner in which he had spoken of the Horticultural Society.

SUTTONS' HOME-GROWN FARM SEEDS,
NEW AND UNADULTERATED,
CARRIAGE FREE.

**BEST SWEDE IN CULTIVATION IS
SUTTONS' CHAMPION.**

Price 1s. per lb. or 10s. per bushel. Lowest price per bushel on application. Carriage free to any Railway Station.

SUTTONS' CHAMPION SWEDE.

The most productive, and best shaped Purple-topped Swede in cultivation.

Price 1s. per lb.

Lowest price for large quantities quoted on application.

It maintains its character as the best Swede in cultivation. It is a very large purple-topped yellow variety, perfectly hardy, and grows very well. It is of fine globe or shape, and remarkable for its quick growth, and freedom from coarse roots. It has taken for the Champion Swede at the Royal Horticultural Society's Show of the value of 20 guineas each. These same cups were also awarded to the Champion Swede of the Royal East Berks and South Bucks Agricultural Societies to crops of our Champion Swede, and other approved varieties of Agricultural Roots. Numerous other prizes have been awarded to crops of this Swede, while it has certainly obtained the first prize for pulled roots. Some very fine specimens in Ireland, and exhibited on our stand at the Smith's Club Show in December last, attracted marked attention.

From **W. BAKER, Esq., Poplar House, Sproyngton**
"I had this year 16 acres of your Champion Swede-
the crop was very good, and I am only now
beginning to pull."

From **J. ANKERT, Esq., Manor House, Tingewick**
"I took several prizes last year with crops grown
from your Champion Swede, and I am only now
beginning to pull. There is no better Swede than the Champion
Swede."

From **L. M. WARREN, Esq., Gathorpe Lodge**
"I believe you are aware this is a great seed
for the Turnips, &c., but your unrivalled Champion
Swede is a real gem."

From **J. C. MOORE STEVENS, Esq., Hincott**
"I won a Ten-shilling Silver Cup last year for
your Champion Swede."

From **Messrs. DICK & SON**
"We grow some splendid Champion Swedes from
your Champion Swede."

The Agricultural Gazette.

SATURDAY, APRIL 24, 1869.

MEETING FOR THE ENSUING WEEK
Wednesday, April 29—At Agricultural Spring Show

SOME remarks which were incidentally made at the last monthly meeting of the Council of the Royal Agricultural Society deserve more attention than they are likely to attract. The Society has recently established examinations for testing the knowledge of those who mean to follow agriculture as a profession. As yet only two have been held. The results of the first were unsatisfactory, but this was mainly due to the defective arrangements of the examination itself. The second has only just terminated, and the report of the examiners has not been made. The examinations cannot possibly yet be said to have had a fair trial. It is astonishing, therefore, to read proposals for the appropriation to other purposes of the education grant, as if the whole scheme were

too radically had to deserve even the little forbearance which would have been needed till the result of the second examination had been announced.

Nothing can be more disheartening than the way in which important questions of the greatest interest to the community are often settled without the community having any voice in the matter, or even knowing that they are under consideration. This is especially characteristic of English institutions. We are scandalous not to have enterprise cramped by central authority that we run into the other extreme, and often allow it to be stifled by the meretricious of private associations.

Now, the Royal Agricultural Society of England is such an association, but one of national magnitude. Though independent of Government control it performs work which, in any other country, would be done by a branch of the Government itself. It represents also the great body of farmers, and its leaders should be anxious not only to advance farming as a business, but to elevate it as a profession. To discontinue these examinations would be to fail in both.

Farming in England requires, more than any other subject of equal national importance, to be stimulated and aided by every kind of assistance that human intelligence can provide. Still more obvious is it that the new generation of farmers ought to be men whose training not only fits them to thoroughly understand the present position of their work, but also to extend and improve its methods. Beyond a certain point mere business-like habits do little to increase production, and to increase production is to increase national resources. To decline to test the knowledge of those who are to help hereafter to feed the country is to repudiate agricultural education altogether, in fact to withdraw it from the category of intelligent pursuits, as if it were only a little more complex than the unsophisticated practice of the West Indian negro, who scratches the ground and contentedly sows a few Pumpkin seeds. To give up these examinations, is, in an age like the present, to be guilty of an anachronism.

Still more inconsistent is it with the other proceedings of the Society itself. So anxious was this body when it recently elected a Secretary and Editor to get a man of scientific attainments that it entirely overlooked the desirability of his knowing something about farming as well. Will any arrangement be more perverse—the Editor of the Society's Journal is to know nothing about the practical needs of farming, while the readers of the Journal are not to be encouraged to take advantage of scientific teaching. If the members of the Council really succeed in carrying out their apparently foregone conclusions, they may be congratulated on having done not a little to degrade farming as a profession, and something to impede national progress.

It is now the best season for sowing the Sugar-Beet. No green crop can be easier grown. It will thrive anywhere, and with any regimen under which common Mangel Wurzel will flourish. Those who know how to grow common Mangel need no instruction in the growth of Sugar-Beet. The two may be treated exactly alike unless in the following particulars. The Beet should be sown on the flat surface instead of in ridges, and about as close again together as common Mangel. The roots should not exceed an average weight of 4 lb. each. The amount of sugar produced within the root is largely dependent upon its being wholly excluded from the light: and of course the plants are easier earthed up to the leaves when placed on the flat than when perched upon the crown of ridges. The seed should be drilled in rows about 18 inches apart, and the plants thinned out to an average distance in the rows of from 8 to 10 inches. Sugar Beet will grow upon any soil, but it prefers a mixed soil, of a tilth 12 inches in depth. It succeeds admirably after a crop of Wheat or Barley. The stubble should have been deeply broken up as early as possible in the autumn, and farmyard manure applied at the rate of from 10 to 15 tons per acre; if rank or fresh it is better ploughed in at that time; if well rotted, it may be applied in the spring. Supplementary to this, or to supply any lack of it when it is scarce, from 2 to 3 cwt. of guano or nitrate of soda per acre may be deeply harrowed in previous to sowing the seed.

A fine tilth must be obtained. To ensure the greatest success, perfect pulverisation is needed. It is a dead loss of growing force as well as an act of cruelty to plants to make them perform the drudgery of smoothing down a bed for themselves,

when plough, scarifier, and harrow would do the work better. With a fine seed-bed, and good seed of the white Silesian Beet, drilled in at the rate of 6 or 8 lb. per acre, a good plant is well nigh certain. Regularity of plant is the first step towards a good yield. Sugar-Beet will bear transplanting as well as, or better than, any other green crop. But it is always safer to have to destroy a dozen plants, because they are too thick, than to be obliged to transplant one from the crop being too thin. The Beet requires the usual attention in hand thinning, cleaning, &c. About the middle of August it should be earthed up right to the leaves, unless indeed the roots elect—which they do upon some soils—to bury themselves. By the middle or end of October the Beet crop should be harvested. The best implement for taking up the roots is a three-pronged fork, and care must be exercised not to break them, otherwise a considerable amount of sugar will ooze out with the sap. The yield per acre may be safely reckoned at 20 tons. There is no reason in the nature of the Sugar-Beet why the crop should not be nearly as heavy as that of the common Mangel. Though smaller, its substance seems more firmly compacted together, and, bulk for bulk, it is certainly the heavier of the two. Forty tons of the common Mangel have been grown per acre, and there seems no reason why the same high maximum should not be reached with Sugar Beet.

The sugar maker prefers the roots to average 4 lb. a-piece. Last season's crop only averaged from a pound to a pound and a-half. The heaviest crop, 21 tons per acre, was obtained with roots of the latter weight. They stood apart 22 inches by 9, and there was abundant head room and plenty of root space to have doubled their weight and size as they grew. This would have made the crop 42 tons to the acre. It thus appears that an average of 30 tons per acre in an ordinary season seems reasonable and moderate. The cost of production slightly exceeds that of common Mangel. A few more pounds of seed per acre, an extra allowance for hoeing, the plants being more numerous—and a shilling or two extra for harvesting, the roots being deeper in the ground—exhausts the list of extras. The entire cost of growing Sugar-Beet, including rent of land, cultivation, manure, and harvesting, and allowing no drawback for the unexhausted manure, nor its benefit to the succeeding grain crop, has been carefully calculated by the largest grower at 97. per acre. Another grower makes it amount to 111. Allowing, say 27 more for carting to the factory, we reach a total outlay of 138. per acre.

The price given for the roots is 11. per ton. It follows that very large profits are within reach of the growers of Sugar-Beet. If the crop averages 30 tons per acre, 171. is netted by it; if 25 tons, 127; and so on.

Comment upon these figures would only weaken their force. If farmers can better such returns from other crops of course they will do so: if not, they will doubtless turn their attention to sugar farming. And we may add facts to show that if they do so, we need fear no doubt of roast beef. One Lavenham farmer delivered 100 tons of Sugar-Beet to the factory, and he took back to his farm no less than 70 tons—67 of these were cattle food, the other 3 being Beet manure. The trimmings and pulp are greedily devoured by all kinds of stock except calves. When kept covered up from the air the pulp keeps sweet and good for months, probably years. If left exposed, the upper layer decomposes, or forms a crust that preserves the mass underneath. So little water remains in the pulp that a ton of it measures about 60 bushels. This consists of the entire flesh-forming matter of the Beet, minus the water and a portion of the sugar. It is a sort of Beet bread. A bushel of pulp, with a pound or two of oilcake and a few handfuls of meal per day, have been found to fatten bullocks rapidly and well. There was some fear that the pulp might prove a drug on the hands of the sugar maker. At first the cattle sniffed at it, and turned up their nose, but no sooner did it enter their heads that they were expected to eat it than they did so with a will, and asked for more. Now there is but one regret throughout the district—that the supply was so limited.

The corn trade has been pursued at a further decline in prices. Wheat is 1s. to 2s. per quarter cheaper, and other grain has similarly fallen in value. The live stock and meat trade has on the contrary been in a highly animated condition. A moderate supply on Monday, when all good and fair qualities were rapidly bought up, was followed on Thursday by

only 680 beasts in the market. Quotations are accordingly high, 6s. 10d. being the top price for Irish pork, and veal are also dearer. The season is nearly over for agricultural seeds.

A serious case of importation of sheep on Thursday evening, by a vessel named ROBERT MONTAGU, from Antwerp, had arrived from Mr W. L. F. Government were informed that one or two infected with small pox. According to Professor SYMONDS, the latter cargo of which three were found to be suffering from small pox. This fact was discovered, not on sheep had left the wharf, but before they had left the wharf. Orders were given that the sheep and orders were given that the sheep be used until it was thoroughly diseased. The course was pursued with regard to the sheep, 22 being suspected of infection, and unmistakably diseased. After a full and the prompt and secure measures were adopted for preventing the spread of the disease. FORSTER made the following remarks: "There was reason to believe that both came from the same party at Antwerp, and signed to the same person in this country they had been separated with the sheep could be more easily landed and evaded."

The 1st prize at the Highland Society's Show at Aberdeen was not gone to the owner of the animal, but then awarded. The disqualified heifer was not proved to be in calf. Mr Drummond, who exhibited her, subsequently gave the Earl of Sutherland's heifer, and placed 2d, and has 'qualified' according to the rule of the Highland Society.

The entry of implements for exhibition at the Manchester meeting of the Royal Agricultural Society will close, we may remind our readers, on next, May 1.

An important seed case, of which we have an abstract, was recently tried in the County Court at Haddington. Mr JOHN RYAN, of Hillon, of A. Le. Kinross-shire, sold Messrs. EAD & PARK, seed merchants, Haddington, damages, on the ground that a quantity of rye-grass purchased by him in 1865 as perennials, failed to produce a second year's crop, and must have been infected with a second year's crop, and must have been infected with a second year's crop. A great deal of evidence was led on both sides, witnesses being seedsmen, practical farmers, and growers, and practical botanists. For the pursuer it was contended that there were two distinct kinds of the Rye-grass plant, an annual, and perennial, and that the seed was in poor condition, and well prepared, and that a portion of the seed with different seed produced a second year's crop. On the other hand, the defenders pleaded that the seed was in poor condition, that according to the evidence there was no such thing as an annual rye-grass, that being merely a trade term for two kinds of seed, and that the seed supplied was from a bin from which they had supplied their customers that year to numerous customers, without any case except that of the pursuer. The Substituted has decided in favor of the pursuer, and is awarding the pursuer in expenses.

A metropolitan salesman was accused on Friday last of having "cruelly tortured" a cow, exposing them for sale in a new-york market at the Metropolitan Cattle Market, on the 24th of March. These proceedings were taken by the Society for the Prevention of Cruelty to Animals, against Mr JOHN CONDON, and the police crowded with his brother meat and cattle dealers who were anxious to hear the proceedings. Mr ELLISON, in giving judgment, said that it had been committed, it had been done, and sending of the sheep from the country in the market were, but in the exposing. He should be commuted his decision was to be appealed from, but he now fine the defendant 5s., and 2s. costs, and five days' imprisonment in the House of Correction.

OUR LIVE STOCK.

THE SIDDINGTON HERD—Mr Bowley's herd on Thursday, was eminently successful. A large assembly to witness the proceedings, and among many well-known breeders. Lord Dunmore bidding for the "Siddington" raised the price of the female section of the herd to a figure rarely even in Shorthorn sales. Mr Bowley's herd suffered from the low prices obtained for the year. Thus while the heifers and cows made an average of only 35s. 5s. 9d. The three heifers all became the property of Lord Dunmore, the best fetching 240 gs., Siddington 6th 360 gs., Muswell 2th and 3th respectively 190 gs. and 105 gs., the first being Lord Dunmore, and the second by Lord Dunmore. We hope to give a complete price list next week, average over the entire 39 an average of 39s. 10d. plus, the highest that has been reached since the sale last year, when 18 animals realised 3s. 6d.

On Friday May 7, an important sale of Shorthorns will take place at Wicken Park, Stratford. Thirty-three females and 10 males, including a well-known Penrhyn Cattle and Wicken Park.

looking at this I inquired what was paid for the larger kinds of chickens, and I found that the price was 7s for the larger chickens and half-a-crown for ordinary ones. I think, therefore, that the trade in poultry should be certain and regulated as a means of great wealth to this country. We can afford too much importance to the encouragement of implements in this country. When I have been amusing myself every now and then in different parts of the country I have had opportunities of seeing the manner in which the agriculturists of Meath and Kildare carry out their tillage, and I have been very much struck everywhere I have been by seeing the ploughing conducted on the highest principles of English agriculture. I have seen grass-lands being brought up, and I have seen other lands that have been ploughed up, and I have always noticed that the ploughs which ploughed these lands were of the latest patterns that I always see at the agricultural meetings in England. Now I perhaps, may be allowed to attribute this excellence to the fact that it is a great excellence, if you use the best plough there is no doubt it is a great economy of labour and skill. I may attribute some of that excellence to the work of the Society, and showing in this town the latest improvements among the implements, and encouraging the farmers to get the best "tools for their work." I noticed to-day what I conceive to be an important machine for dealing with Flax, which I see is a very important branch of the agriculture of this country. I noticed the great increase that has been made within the last few years. I think within the last six years the numbers of those employed in dealing with Flax in this country have risen from 20,000 to 60,000, and it is a remarkable thing with regard to that that out of the number of persons employed in manufactures in this country, 60,000 are employed in trades connected with Flax. Anything that encourages a manufacture so important as this, and encourages the labour required in it, must be of very great importance, and it was, therefore, with great interest that I noticed the machine which I refer to in the yard to-day.

ARTIFICIAL WARPING.

The use of water as the carrier of fertilising matter is not confined to sewage farming; every case of warping land common on our tidal river banks, is an example of it.

The artificial practice of warping land, although similar in principle, differs indeed from the natural in many respects. The former has a very general application, whereas the latter is confined to a few localities. According to the artificial method, clay may be mixed in the water and applied to sandy, chalky, or peaty soils. Chalk, or any calcareous earth may be pounded and mixed with the clay, or mixed alone in the water. In a similar way peat, earth, mud, and the various alluvial deposits may be applied by means of water to soils of a different character. There is not, perhaps, a province in the kingdom, and perhaps there are not many farms, where the practice might not be carried out with advantage.

The practice is similar in many of its details to the tempering of clay in brick-kilns in the manufacture of coloured bricks. The clay and chalk are broken down in the water, and by means of a small current are carried into the enclosure, where the mixture is deposited, and whence the clean water is decanted off. This is general, and hence the practice, and in very many places large fields of land might be similarly warped, also by gravitation.

The expense at which the work can be done both ways, or by a combination of them, is less than would perhaps generally be imagined. In the West Riding of Yorkshire, and North Lincolnshire adjoining, although the outlay was greater than would generally be the case, yet the peaty soils artificially warped, we were told, when on the ground, are paying remunerating interest and leaving fair profits to the farmer. This, however, is an exceptional example, the earth dug up for warping being somewhat similar to the salt of the natural system, consequently, on the question of outlay and returns, it is no safe rule. But the practice of claying fenland, and of warping poor moorland and sandy soils, by mixing the earth in the water used in irrigation, affords trustworthy data for determining whether the practice is likely to pay, and the profits in such cases are amply sufficient to warrant a conclusion in favour of artificial warping as proposed, for in a vast number of cases which have come under our own observation the work could be more effectually done at less money by the latter practice than by the former now in use. An immense area of the bogs of Ireland might also be warped with clay. We have gone over large areas of sandy, gravelly, and chalky soils where there was a command of clay and water in the winter time soils in which the water would have sunk, thus leaving the clay mixed in the strata.

The pumping apparatus required would be of the common kind now in use in pumping water out of the fens, &c. The best method of breaking down the clay, and calcareous earth, peat, &c., and the mixing of them with the water, would depend upon the nature of the material. Moist earths soon dissolve in water, and if full of small stones these could readily be screened out and separated from the fluid mass before it entered the pipes to the land. The size of the pipe would depend upon the steam-power, the height the water has to be raised, and the like. In ordinary cases a 6 or 8-inch pipe would suffice, but where large works, as for warping the immense bogs of Ireland, are concerned, and great quantities of water and clay might have to be carried a considerable distance, twice the above size might be used.

Four hypothetical examples might be imagined for practical illustration—(1) warping by gravitation, (2)

warping by steam or water power, to be followed by subsequent use of the same machinery for liquid manuring; (3) warping by steam or water-power, to be followed by liquid manuring by means of a separate machine; (4) warping apparatus to be movable, and warping peat bogs by water or steam-power, the warping apparatus to be movable.

(1) There are thousands of acres of poor moorland steep pasture capable of being warped on the first plan the mountain stream furnishing water and the mountain side the clay or other warping material, so situated that it could be wheeled into the watercourses situated lower than the peat. The only difference, therefore, between this plan and that now in use for irrigating by water only, would be an increase of fall, for breaking and mixing the clay at the clay pit, and for conveying it to the land for application a sufficient length of water-runs for distribution similar in construction to what were and are still used in irrigating meadows, and even warping (for warp has been applied in this way already) would be required for spreading the clay evenly over the Leath or pasture. The length would be determined by the number of lands employed. One active warper would apply a great many tons of clay in a day of 10 hours. At the other end the clay or warping material would be broken down and mixed in the water by the force of the flowing current, and any stones could be screened out by this process. The question of expense therefore, may be put thus: What would it cost to dig and wheel a cubic yard of clay into the stream? And in general the answer would represent a mere fraction of the expense of applying clay by carting, spreading and incorporating with the soil by the weather.

(2) By far the greatest area of land that would be permanently improved by artificial warping would require either water or steam-power. A large extent is naturally rich, but the greater breadth is known as "thirsty and hungry land"—soils that drink up all the rain that falls upon them, and eat all the manure given them, without yielding any adequate return in harvest. They are either natural or artificially drained, and as the grand object in view requires the warp, whatever may be its nature, to be thoroughly incorporated with the staple, it follows that, in the process of warping, the warp should not be applied faster than the water can be filtered through the soil by drainage. In other words, it would not be necessary to raise embankments, so as to retain the water in a stagnant state, for allowing the clay to subside and form a layer of deposit in the surface, as in warping peat-bog. In order, therefore, the better to incorporate the clay with the staple, the latter should be ploughed deep, and smashed up across, so as to leave it as open as possible, and capable of holding a sufficient application effectually to improve its quality. It does not require logic to show that in this way, with a command of water, clay can be applied at a fraction of the expense it is now being done by carting and manual labour, and at the same time more effectually. So that, according to the old proverb, "Lay clay on sand, and you buy land," large estates would thus be bought and added to the superficies of the country for little money.

The chief question is that of expense, and as almost the whole of the plant would afterwards be required for liquid manuring, the practical solution of the double problem resolves itself into the old story of "hitting two ways with one bone." There are in point of fact few projects of the present day that possess half the promise, or which have equal claim upon the attention of the agricultural public.

(3) The third proposition is somewhat similar to the second, the chief difference being that it assumes the work of warping to be of greater magnitude. There are large tracts of land that would pay for claying; but the clay best adapted for warping, and the water required are at too great a distance to pay for application on a small scale. Before the work will pay, landowners and their tenants must join so as to include in one contract what will pay for the laying down and use of pipes of suitable dimensions for finishing the work within a given time at so much per acre, and when one contract is concluded, the plant including engine and pumping apparatus, would be removed to another. But upon each farm there would remain the pipes and hydrants required for liquid manure irrigation. Upon each farm the work of warping or claying would be similar to that of the second example already described, so that the tenant would have no more to do but screw on his hose to the hydrant, as soon as the land was in a fit state to receive liquid manure from the homestead. At the homestead the liquid manure would generally have to be raised from the tank by pumping apparatus, but to lands lying at a lower level it may be taken from the tank by a syphon, and thus save the expense of steam.

The greater extent of our fenland may be included under the second and third propositions, but the immense bogs of Ireland, together with other large tracts of peat in the United Kingdom, cannot be thus reclaimed. In this case a new soil has to be formed over the old, so that the process of artificial warping is similar to the natural one, with the exception of the conveyance and quality of the warp. As a rule, it may be laid down that in examples where the warp can be thoroughly drained, either at the bottom or to a depth of 4 feet, then the practice of warping would fall under either the second or third proposition. But when the drainage cannot be thus effected, so as to remove the water and permit the incorporation of the warp with the staple, then the ground to be warped must be surrounded with a low embankment, over the top of which the warp would be discharged from the conveyance pipes, and when the area thus enclosed is full, the water would be drawn off as soon as the warp had subsided.

The small spots of green sward which here and there

envelop the moor, and the patches of sweet herbage which are scattered about the heath, a joining proves the value which art has in giving work effect. In hill roads when the stones are over the Leath, carrying with it fresh earth, the herbage springs up, which is greedily eaten. In like manner the immense bogs of Ireland, by artificial warping, have their bleak and barren appearance changed into emerald green, and thriving flocks and herds, at no great outlay of money.

ON DEEP CULTIVATION BY STEAM OR HORSE-POWER.

The following is the second paper on this subject read at the meeting of the High and Low Agricultural Society to which the Minutes of Two years' address were reported last week.

MR. GEORGE HOFFE, of Fenton Barns, read a paper on the comparative advantages and cost of steam and horse power with reference to the work of the soil, and still less of comparing the merits of the two systems of steam cultivation now in use. I wish to state to you, as clearly and briefly as I can, my own practical experience in steam cultivation. In 1863, I obtained from the Messrs. Howard of Bedford a set of their steam cultivating apparatus, consisting of a harrow and a 10-horse power engine, and Clayton and Shuttleworth of Lincoln. I can say I have had no reason to regret my purchase, though I have lately changed my horse power for Fowler's grubber, and have sold to my stock a Fowler's 4-square balance-plough. Messrs. Howard's cultivator stirred even the most obdurate soils, and suffered little or no contact of breakages, while the quantity of stones that I have had to remove is immense. I mention that from one single field the stones broken for the road, have measured about 1000 yards. However, Fowler's grubber works more ground, and consequently does more work, being heavier in draught, than Howard's, though only suited for land that has been ploughed or stirred. Again, from the Fowler's being much larger and broader than Howard's, and as they only run on the soil, the depth is more easily regulated, and what marks are left on the stirred earth, which has been ploughed to the depth of Fowler's grubber can easily be made to run two to three inches deeper, without any extra on the engine or rope, while Howard's, at the best, had, on some soils, a strong tendency to run altogether in the land. After some years of cultivation, during which I ploughed nothing but an 11 that was done with horses, and having got out of stones, or nearly so, I began to doubt if I was right in having the soil so often stirred over. I therefore got one of Fowler's balance-ploughs, which, besides ploughing, enables me to plough deep, and break up the Tarnip crop, when I prefer having the soil stirred up the soil and throws it on edge, which is a digging. This plan has certainly several advantages over ordinary ploughing. It does not run over effects of the weather, which stiff and hard when ploughed early. It also exposes the possible surface to the atmosphere and to the frost, but it does not destroy grasses or weeds in an effectual manner as close and compact does. Unless the steam harrow is used on land that has been dug it is found very tiresome horses walking over, but when it has been dug the soil is very popular with my next. This digging is very popular with my next. I have steam-power, but I have found it better when practised early in autumn or before the usual furrow we make on stubble land. The usual furrow we make on stubble land is 10 inches in depth, and on level land the crop 8 inches is the rule. I may state that of land ploughed and grubbed annually, above 500 imperial acres. From accurate measurements since last harvest I find that from that land I ploughed 204 imperial acres in 5 days, and included 53 days for 11 changes from fields. Though it commonly takes only 10 hours for change, fixing the apparatus, cutting ropes and the steam up again, I have done 20 days for change. By dividing the 20 days by 53 days required for ploughing then I get 37 imperial acres as the work done in a day. I felt rather disappointed when I saw the result as on a square field of upwards of 100 acres ploughed immediately after harvest, the work taken was only five days, which gives 200 acres daily. When we came to small fields and to the short winter days of from seven to ten days reduced, the extent of ground done was also reduced. In the general average there is a 26-acre field of very stiff clay, where we have only three ploughshares instead of four, and only required depth of 10 inches. The time taken six and a-half days, which gives only 104 imperial acres. I have also grubbed since harvest a 4-acre field, time taken, including two and a-half days for changes, being altogether 15 days, or at the rate of 7 imperial acres daily. Here a 1-acre field diminished the average amount of work done in a half days were taken for it. We have also

APRIL 24, 1880.

Turnips are sown over 10 acres twice in three days... I am confident it will be done in shorter time.

As regards the cost it is naturally divided into, first—The interest on capital invested, and the tear and wear of machinery and implements, and, secondly, the amount of daily expenditure. In regard to the interest on capital, I must to some extent be satisfied with the results of the amount of interest was satisfied.

Table with 2 columns: Item and Amount. Items include 'Two men and two boys daily wages', 'Fuel for engine and horse labour, for water, &c.', 'Cost of carrying carriage, & fuel', 'Making the engine expenditure', 'Tear and wear and tear daily'.

Thus the cost of each day's work comes to... I have already shown the average daily work in ploughing... It will be observed that the work done is not much more than could be accomplished by two pairs of horses constantly employed throughout the year.

THE FATTENING OF STOCK.

We slaughter annually in Ireland about half a million of beasts and export to Great Britain about a third of a million. A large number of them are sent to market in very good condition by the graziers, large farmers, and landed gentry of Ireland.

difficult to fatten them profitably but it may be safely assumed that the intelligent farmers of England and Scotland, who fatten a great many of our Irish cattle, do not lose by the system. We have seen Irish cattle in the stalls of English farmers who pay a higher rent than is paid for the same class of land in Ireland. Before a farmer embarks in stall-feeding, he should calculate the cost of raising a ton of roots on his farm, and the quantity of meat which that quantity of roots will produce. On land fairly adapted for root crop cultivation, roots can be raised at about 7s 6d a ton. Now, the results of several experiments conducted with great care, show that when cattle are carefully selected and skilfully stall-fed, they pay not less than 6d a cwt for the Swedish Turnips consumed. The fattening of cattle divides itself into two great divisions—grazing and stall-feeding. The former of these is practiced principally upon what, by way of distinction, is called fattening land, and we think that this is a profitable way of managing this class of land. The land is usually stocked at the rate of one beast per acre. About one-third of the number, or one beast to every 3 acres, is put on in October, and the remainder in May, when the Grass is pretty strong. The animals are sent to market as they become ripe. By stocking first-class land less closely, it often fattens two sets in the year. Some graziers give cake in troughs on the Grass, at the rate of 2 lb and upwards per head daily. Cracked Oats are also used for the same purpose, and, considering the present low price of grain and the high price of beef, and the improvement which is effected in the land by the dung of the animals so fed, it pays very well. The average increase in weight of grazed cattle varies very much. Good 2-year-olds and 3-year-olds increase at the rate of 2 lb (live weight) daily from May to October. This is above the average, but we believe it is attainable by skill in breeding and feeding. The grazier shifts his cattle from field to field, so that they may always have a good fresh bite. For this purpose his land may be divided into three or four sections. One is kept free from stock until the most forward beasts need it. The cattle are grazing on section two until section one is ready for them. Section three receives the less forward beasts or dairy stock, and stores cattle and sheep may occupy a fourth section. The animals are regularly shifted from one division to another. Thus, when the stock in No. 1 is transferred to No. 3, the former is cleared and closed up till it is ready for the most forward beasts, and so on of the other divisions. It is worthy of remark that as fattening animals approach ripeness, they require better keep, which in the case of grazing cattle, means more succulent pasture. Grazing cattle also require a plentiful supply of water. It is found beneficial to place rock-salt within their reach, so that they may lick it. The passages leading from field to field should be kept clean, to prevent disease of the feet, which keeps up irritation and wastes food.

Most farmers whose holdings are large and who grow roots, fatten a number of beasts in houses during winter and spring. The system is usually called stall-feeding. The animals to be fattened are withdrawn from Grass and placed under shelter at the approach of winter. Irish tenant-farmers generally do this in stalls, which answer exceedingly well for the purpose. The house should be warm, but not close, there should be good ventilation, but no drafts of air. The animals should be kept as quiet as possible in the stalls, because every movement of the limbs, as well as every excitement and irritation, causes a waste of the animal tissue, which is equivalent to a waste of food. Too much light causes stall-fed animals to be restless, and retards the fattening process. The stalls should, therefore, be dark rather than light. For about 10 days after cattle are put up to fatten they should get soft Turnips, which prepare them for the more nutritive sorts. From the very commencement the strictest regularity should be observed in the hours of feeding, and the beasts should be kept clean and comfortable all through. Some farmers curvy once a day, and we have no doubt this extra trouble pays remarkably well, as it promotes the healthy action of the skin. The house, as already observed, should be warm, but not so close as to cause sweating, which is injurious. The greatest attention should also be paid to the dung, which should be neither too watery nor too hard. At first the soft Turnips generally scour them, but if not allowed to go too far, this brings about a healthier action of the entire system, and by providing dry fodder the excrements are soon restored to their proper consistence. The animals may now receive more fattening food, the kinds and quantities of which vary with the size of the beasts and the views of the farmer. The kind of food most commonly given to stall-fed cattle are roots, straw, and hay, with oilcake or corn. The state in which it is best to give these substances to cattle is a subject on which opinions differ widely. Some (but we believe they are few in number) cook the roots. It is the general opinion, however, that this does not pay. The advocates of the system say the animals can digest their food with less exertion (which means less waste of tissue) when it is cooked for them. Roots are, however, easily digested, and besides the large quantity of saliva secreted during the mastication of the raw roots is required for the proper action of the stomach. To prevent choking, the roots should be cut into slices not exceeding an inch in thickness. Some, again, reduce the roots to shreds by what is called a pulping machine. The pulped food is often allowed to undergo a slight fermentation before it is used. The pulping machine appears to be serviceable when the farmer wants his cattle to consume and assimilate a large quantity of straw. By mixing the pulped roots with straw cut into what is called chaff by a chaff-cutting machine, and allowing the mixture to stand for a short time, cattle eat a great deal of straw. We have found the system exceedingly useful for milch cows, but not equally valuable for fattening beasts. The

secretion of milk appears to be increased by a slight degree of fermentation. The use of the chaff-cutting for cutting up straw and hay has been warmly advocated. Animals can assimilate cut straw with less effect than long straw. It is also said, and with truth, that we can thoroughly mix bad and good straw and bad and good hay after they are cut into chaff, and so induce our farm animals to eat the bad along with the good. But the farmer should have neither bad straw nor bad hay. The chaff-cutter has special advantages, such as enabling to mix roots and straw together in the way just explained, but it remains to be proved whether the feeding value of the straw is really increased by cutting it. When oaten straw is given to fattening beasts it should be broken very fine, and given by itself or strewed upon the Turnips. We have found the latter plan to answer very well. Some people wash the straw or hay into chaff, make the oolake into a mess, and pour it upon the former. For feeding purposes corn should be either ground at the mill or crushed by a machine specially constructed for the purpose. The farmer who feeds horses and cattle on Oats should have an oat-crusher, to be worked by hand or steam power on large holdings. Every cwt. of Oats given to thriving animals (along with roots and good Oat-straw) produces at least 12 lb. of beef and tallow. If given to ill-shaped and badly-reared cattle it would not produce this. Stall-fed cattle should receive three feeds of roots or of roots and cake or corn, in the day—once in the morning, once at noon, and once in the evening. They should also receive some good Oat-straw or hay at night, and after each feed. If fed often they are disturbed more than is desirable. The question, what are the proper quantities of the various kinds of food which ought to be given to stall-fed cattle? has never been fully answered. The usual practice is to give them as much roots and fodder as they can eat. This system often causes waste and loss. From 8 to 10 stones of roots in the day, according to the size and condition of the beasts, may be given, together with good straw or hay, and some ground corn or cake. For the first 10 days or a fortnight—that is, while the animals are on soft Turnips—no artificial food is needed, but when put on Swedish Turnips, 1 lb or 2 lb of corn or cake may be given daily to each, and the allowance may be increased to 4 lb as the period advances. Practical Agriculture, for the Use of Agricultural Classes in Primary Schools.

THE BEET SUGAR MANUFACTURE IN GERMANY.

A VERY elaborate and interesting report on the introduction and present condition of the manufacture of Beetroot sugar in the States of the Zollverein, has been furnished to the Foreign Office by Her Majesty's Secretary of Legation at Munich. The report opens with a history of the introduction of the Beet as a sugar producer, a brief sketch of which we have already given in these columns. So full, however, is the report of interesting details relating to this branch of industry in the Zollverein States, that we again open the question to present to our readers some of the principal points of interest culled from the mass. Until about the year 1835, colonial or cane sugar alone was consumed in the Zollverein, 86 sugar refineries then existed throughout the various States of the Union. When Beetroot sugar was introduced, the use of colonial sugar gradually decreased. While at the present time little else but the former is used, confectioners and distillers of liqueurs being almost the only classes for whom it is imported, Beetroot from the time of its introduction has been subject to various legislative enactments, and such heavy taxes imposed, that at one time threatened to crush the trade—the total number of 218 manufactories, which were in operation in 1843, having been reduced in the course of the two following years to 216, but in the year 1856 the number had again risen to 233, and from that time forward there has been a progressive increase year by year. Simultaneously with this increase further improvements were introduced in the mode of manufacture, and to such a perfection has it now been brought that, while at the period when the duty was first imposed the average yield was only calculated to be at the rate of one Zollverein cwt of raw sugar to every 3 Zollverein cwt of Beetroot, the most successful establishments produce, at the present day that quantity of raw sugar from about 1 or 1 1/2 cwt of the root. The proportionate production of sugar varies, however, considerably in different manufactories, partly in consequence of a difference in the process adopted or the description of the machinery made use of, and partly in consequence of the greater or lesser quantity of superfluous matter contained in the beet grown in different soils and under different conditions as regards climate generally, or the weather which may have prevailed during particular seasons. In some manufactories, especially in Wurtemberg and Baden, the system has been introduced of subjecting the Beetroot to a process of artificial drying, previous to using it in the sugar manufactory. In Bavaria between the years 1842 and 1865, the Beetroot sugar manufacture remained almost stationary and the report says—"From one cause or another it has never fairly taken root in this country, the chief obstacle thereto being, as I am assured, an indisposition on the part of the peasant proprietors (a very numerous class) to depart from the routine system of crops, as generally adopted in Bavaria, and to enter upon the cultivation of Beetroot on an extensive scale, without, perhaps, any very secure guarantee of the success of the sugar manufactories, and, consequently, of the permanency of the change to be made in their system of husbandry." The report goes on to say "In several provinces of

almost unnecessary. With hand labour, things could be moved about from one part to the other with great ease.

Reviews.

Transactions of the Highland and Agricultural Society of Scotland. W. B. Mackenzie & W. Paterson, Glasgow, London.

This annual volume contains, as is proper on this for a country where plantations are not only a most important branch of agriculture proper but a great agent in the reclamation of uncultivated lands a very large number of agricultural articles. These, with descriptions of works of reclamation amounts of Turnip and Grass cultivation, a description of agricultural implements, a description of Manure, and some references to stock, make up the practical part of the volume. In addition to these we have the proceedings of the chemical department, and the official appendices. The number is full of substantial and useful information. We quote from one of the county reports a fact relative to the extension of Ayrshire dairying in the county of Dumfries.

The agricultural statistics have never been collected in such a form as to determine how many Ayrshires were in the county at any particular period. Their number, in comparison with the other breeds, is therefore a matter of conjecture. Five and twenty years ago, Galloways were the universal breed, with the exception of the Ayrshire cows in a few dairies, and a few Shorthorns close upon the Border. Now every arable farmer, almost without exception, in at least one or five of the parishes of upper Nithsdale, has a dairy, and the Ayrshire prevails more or less in the whole of that district. Ayrshire cows are kept on many of the farms in every part of the upper Annandale. The increase of Ayrshires in point of numbers, and how the fact has arisen, in their favour, may be inferred from the fact that, whereas, at the time we specify it was never treated of to offer a prize for the best Ayrshire cow in the number of prizes arranged for them at a contest then shows us for any other breed of cattle. The attention of the public is divided between the prize-takers belonging to the two breeds. A further idea of the extent of that increase may be gathered from the fact, that whereas there were only 11000 Ayrshire cows in the county in 1855, there were, as we have seen, 15800 in 1880, showing an increase in 25 years of 1800, or fully one-eighth. Even more than the above number of Ayrshires would be added in that time, for the Galloways are diminishing almost as much as the Ayrshires are increasing.

Were the writer disposed to give way to sentiment, he might give expression to a sad lament, that the substantial beef-producing Galloways should be supplanted to so large an extent by the less familiar and less imposing Ayrshires; but as his present duty is to act as a reporter, he rests contented with simply recording the fact.

Commercial Reports received at the Legation Office from Her Majesty's Consular Residency in Turkey in April 1880.

The various Consular Reports from Turkey give an interesting account of the agriculture of Turkey, such as it is, and show us the decayed condition of a country that has seen better days. The nomenclature of the localities and places in this country is greatly confused. The province of Bagdad includes ancient Mesopotamia and a good deal besides. North Syria includes the country south of the Taurus chain of mountains, as far as is drawn from the seaport of Beyrout through Palmyra to the Euphrates. South of that line to the confines of Arabia all is burning sand, or nearly so, and requires no agricultural description. Anatolia and Asia Minor, Kurdistan, Armenia, and Trebizond occupy the whole of the northern portion of Turkey, north of Syria, and between the Aegean sea on the west and the Persian dominions on the east.

The mineral wealth of the country is very great, wages are low—6d to 1s a day—and this alone shows the want of employment. Even the common roads are neglected and those famous caravan routes which connected the great towns of the East with the coast are falling to decay. Locusts are often allowed to increase to such an extent as to destroy the crops. They can be kept down by diligently destroying the eggs for a few seasons, but if even an English farmer can seldom be found who will eradicate the last root and joint of "Couch," what can be expected of a lazy Turk? Concerted action and Government help are required, but the measures taken are seldom sufficient. One year the Government piously ordered holy water to be sprinkled, from the mosques, towards the infested districts. Perhaps this was typical of irrigation—the only means by which the maximum can be obtained from Turkish soil in general. In what may be called the highland districts, including the lofty plateaux of Kurdistan, as a centre, and thence southwards to the plains of Mesopotamia, and northwards to the Black Sea, irrigation ceases to be a source of production. The climate is moderate, and agriculture is carried on in the valleys through which run the numerous rivers that afterwards water the southern plains. A spot of unexampled richness in this division of Turkey is the Pal-hak of Kharput, midway between Erzeroum and Aleppo. Four rivers flow through it, two of which unite and form the Euphrates.

The general average of farms in Kharput employ 12 oxen and 20 souls, among whom are eight able-bodied labourers, the rest being boys, women, and young children. All however, excepting infants contribute to the general labour required to till, collect the harvest, and other incidental work. The system of farming pursued is to divide the farm into four equal

parts, of which one is sown every year with Wheat, another with Barley, and the third with various other seeds and Cotton, the fourth portion remaining fallow. The landlord provides the seeds and constructs the rude mud cottages for the farmers at his own expense. The latter finds labour, implements, oxen, and everything else. The proceeds, after deducting the seed and the Government tax, is shared equally between the two. A farm such as we have described is shown in the following balance-sheet of a Kurdistan farm worked with

Table with columns for Receipts and Expenditure. Receipts include Wheat, Barley, Cotton, Castor Oil, Beans, Vetches, Millet, and Mustard. Expenditure includes Seed, Tithe, and other farm expenses. Total Receipts: £159 0 4. Total Expenditure: £15 4 1.

The savings seem small enough, but they are increased by the diligence of the men and women during the long winter months, the former occupying themselves in weaving the cotton and woolthread, spun by the women during the leisure hours in summer, into the coarse cloths in use throughout Kurdistan for shirts and jackets, and the latter in knitting shawls worn by townspeople and Kurds, from the wool they spin and dye at home. In this manner 9/1s 9d are added to the year's savings, making a total of 24/5s 10d. With this they purchase a few trinkets for the women, copper utensils, and sheep, whose produce furnishes them with thread, butter, butter-milk and cheese. They rarely touch fresh meat, contenting themselves with burgous (hulled corn), made into pilau with butter, milk, bread, eggs, fruit, and vegetables. In autumn a couple or three sheep are killed, and their flesh made into "bastorms," which gives a relish to their winter fare. Altogether they are well off, more comfortable than in any other Turkish provinces I have seen, or than the same classes in Europe.

The productions of the Kharput province are very various. We are told that, besides all kinds of grain, cotton and silk are both cultivated; opium is grown at Mahlia, Gall-nuts, gum-tragacanth, and shoemaker's glue (cot) at Paos near Kharput, madder roots and yellow berries at other spots, vineyards abound everywhere, yielding syrup and raisins as usual, as well as a tolerable wine, which is sent in large quantities to Erzeroum, Swass, and Diarbekir. The Mulberry grows luxuriantly in every district, its fruit is either dried in the sun for winter use or distilled into rakki. It furnishes the materials for a paste called pesteeck, a favourite delicacy in the northern provinces.

The neighbourhood of Mosul and between Mosul and Bagdad appears to be an equally fertile tract, a little more tropical in its character. On low levels, near the rivers, Rice is grown. The finest Date groves are south of Bagdad, near the Persian Gulf. The vast and fertile plains through which the Euphrates and Tigris flow, find a natural outlet by the navigation of the former river, which, after uniting in one stream with the Euphrates, falls into the gulf, below the port of Bussorah.

To return to Kharput it is to some extent an exceptional district; the fertility of the soil, and the demand for produce in Diarbekir and other populous towns, has enabled an industrious community to establish itself in security, free from the attacks of the wandering tribes that are the curse of other parts of the country. A considerable Christian colony has sprung up; the labouring classes are nearly all Christian, they have acquired property in the land, in fact they monopolise all employment and occupations requiring talent. The old Turkish landowners, who keep open house with the ostentatious extravagance common to old Moslem families, and live in great apathy and idleness, would in time be all "bought up" by these active competitors if the latter had equal rights and privileges. The bad system of farming the tithe has been abandoned here.

To open up this and the best parts of eastern Turkey, a railway is needed from Alexandretta (the port on the Mediterranean), through Aleppo to Erzeroum; but there is no security for the introduction of foreign capital, and as for native energy, the port just named is exposed to the malaria from a pestilential marsh, which keeps half the people in bed with ague every summer, and yet the sum of 20000/ to drain the marsh is not forthcoming. A Turk leaves all to fate, and dies rather than exert himself or take the least trouble. A characteristic story is told of his apathy. Trebizond, an ancient port on the Black Sea, is the emporium for rhubarb, which grows in that part of Turkey. Hundred of bales are always in store ready for export,

but not a trace of this valuable article in the town, even a case appears to be on the banks of the rich soil has not been turned. The total number of sheep in the north of the province is free from disease, and the mark where an extensive system of sheeping is going on is a practice of Grass and Vetches, which is flooded at will by its waters, streams that flow from the mountains. But this important resource of the wilderness is not being used by the government, and the peasantry have been driven away from it.

Our sketches are done by men of business who are engaged in commerce. Space forbids us to say before us, even in relation to the wealth of Turkey, but the country, once the gates of the East are opened, will lead us into the depths of barbarism. Like a large some pretext for the three Russian century. The nation seems irrevocably the soil may yet be reclaimed, for the races who dwell on it.

Farm Memoranda.

WEST SUSSEX. April 20. We are one of the best winter crops of the year, but the spring has been very dry. Grass, Turnips, and Vetches, as well as winter wheat, have all done well. The weather, and the pastures are all very bleak appearance. For the first time, the sheep have been hard pushed to keep their wool. Sowing is over in most cases, and the whole has been favourable for the opening. The weather has worked freely and Oats and barley have come up well, but at present they are long in the ground. Wheat has never promised better than it does at present, but the blade is broad and the tillers well. There has been a good future, and some have been very good. Other crops, and stock will have to be cautiously next autumn, and it is not more than usual good. The weather is over, and has been a successful one, coming into market plentifully, but the at all active, trade, however may be weather gets warmer. The best maintains its price; of second rate and lower prices have to be taken rather behind yet, as little has been done to overcome it soon. G. S.

CHADBURY, NEAR FIVESHILL. The report by Mr. Hinde in the current Journal of the Royal Agricultural Society, request that I will describe my farm, the questions of your interest as to the drought of the past season and the consequent thereon, seems to require some detail as to the changes which have made up the farm since I entered in 1830, the increase of stock, and how those changes have influenced the consequent extent to which the year has affected me.

The farm consists of 100 acres, about in pasture and meadow, the remainder is thus—100 acres of mixed crops, 150 acres of heavy soil, 120 acres of very poor soil. At the time I entered upon it, the condition. All my endeavours, as to the disastrous consequences of my attempts to improve it, and the old labourers alike assured me that the 120-acre portion, "in seven days growth" would "in fact, nearly all the soil had been entirely unprofitable for some years. Obviously, the first thing to be done of the clay-land, next, the removal of fences and all hedge-row timber from the My excellent landlord Mr. Hall and the former, and give his assistance in the latter. Finding the tone and soil proceeded to drain, and apply it to the second year I came to the conclusion of a deeper and more beneficial system. I commenced the process of draining, and may in large heaps from the old hedge-row described in a letter which appeared in the Journal of the Royal Agricultural Society. The effect of this treatment was that the flock of ewes had increased from 1000 the farm when I entered, to 2000. Wheat from about 120 quarters a year, to 1000 quarters. But, not without the influence of drainage and burning, it is not very easy to produce roots upon the clay, it still remained, and those roots consumed where grown, without any corn crop. I therefore resorted to feeding of sheep, and my practice has been to growing Rape and early Turnips.

October Turnips and Swedes... to serve till Christmas, and then till the end of April. In this soil in the sheds, 18 inches to be sown over by degrees as it becomes worn and dung. This serves a double purpose and dung. This serves a double purpose and dung.

in addition to this farm, all 30 acres, and mainly used for dairy cattle; folding over during the winter, the portion of land which has been grazed by dairy cows during the previous year occupying this additional land my sheep increased to 400, but the food-supply except during the months of January when they are employed as mowers and dairymen on this farm. To show how this usual cropping in detail

half of which is broken up... will be in this way — day-land will be part Vetch, a part to be eaten off by the end of July and prepared for Wheat by steam, either green crop, sown after harvest; steam-ploughed, and sown in the autumn of different kinds, to be ready in May, June, and July, and Swedes, Turnips, and Rape. Vetch and Vetches, eaten off early by ewes and lambs, and planted with Swedes

the fallow quarter provides a succession with the mixed seeds and an occasional frequent change to a grass field (for the little more than provide hay and young cattle), carries the ewe lambs through the summer, and provides roots to winter the lambs. The wether at the end of April or early in May, rams are kept, after finishing the season till September. This process has been followed except 1864—for several years. From the order in which your sheep are put out the subject of cropping, the result of this year has affected me for carrying my sheep through

and for the first time since I have had my Mangels, except about 2 acres, the field intended for them is naturally, subject to an incoming crabby soil. My land farmers know anything of a manuring of 30 loads per acre of 1867, coupled with a rather deep and a very mild winter, brought up the soil that scarifying only, previous to the Mangels, was out of the question. It was moved with Smith's steam cultivator, and ploughed, in order to get the land was thus left rough: it was not rid of that crop of Mangels vegetated. It was subsequently sown with Turnips, but to no purpose, as the Rape which lay in the field early in August. In the same year, Turnips, and Rape also failed; I found myself with upwards of 100 ewes, and nothing for them but 5 acres of Mangels stunted by the dry weather.

The Poultry Yard. Napoleon called us a nation of shopkeepers and the name has stuck to us ever since. He called us a nation of shopkeepers and the name has stuck to us ever since. He called us a nation of shopkeepers and the name has stuck to us ever since.

leader has been devoted to them, jubilant may be our fowls and ducks. The calculation as to the cost of a fowl on its native cabin floor in Ireland, its progress in value until it reaches the consumer's kitchen, cannot fail to recal to mind the prospectus of Mr John Jones Tibbits in "The Cartons," when he proposed to make everybody's fortune with his fruit gardens and orchards. The present Lord Lieutenant deserves every one's thanks for drawing attention to a subject more or less important to us all, and hitherto almost universally neglected. But there are fowls and ducks, and in all probability as much difference between that which his lordship ate at 7s. and the one which was to cost 6d., as between the English horse to be forthcoming at the next show and the Irish pony. The climate of Ireland is very favourable for all kinds of stock, even lions bred in the Zoological Gardens at Dublin, until it becomes a serious question how to dispose of the cubs. Irish chickens may undoubtedly be bought on the ground at certain times of the year at 6d. each, but then they are not in condition of flesh for growth for table use. They have to pass through several hands before they reach the consumer. When killed and sent to market they are subject to freight both by rail and steamer, neither of whom work for nothing. The present must be admitted to be the dullest season ever known in London, and the demand for poultry is not nearly up to its average. The principal consumption of the Irish poultry imported into London is in the metropolis, next comes Liverpool, then Manchester. The Irish fowls, as imported, are thus classed, according to their quality, and we give the average prices they have realised during the last ten days in the London market.

Table with 2 columns: Location and Price. West of Ireland, from 3s. 6d. to 3s. 8d. each. Waterford, do. do. do. to 2s. 6d. Arrivals, do. do. do. do. do.

From the above has to be deducted salesman's commission, market toll, freight, and the higgler's, or dealer's expenses and profit in collecting the birds. Thanks to the enterprise of some of the railway carriers, there is now no difficulty in the transit. Some of the large firms even provide baskets for bringing the fowls over. The prices above quoted show that if the start is good, a good profit to be made in fattening for the London market, not that there is any probability of the Irish fowl reaching the price of 7s. until the breed is very much improved and the feeding very much attended to. At present the birds, especially those from Arrivals, are badly fed, killed, and prepared, those from Waterford are better, while the West of Ireland fowls take more pains than either in fattening, killing, and picking, and consequently reach the top price. That the quality will go on improving we may reasonably expect, but that the price will enable us to buy the Irish fowls of good edible quality at the price mentioned, viz. 1s. or 1s. 6d. each, is doubtful. We cannot say whether or no the retail price of fowls in Dublin reaches 7s. per head, but we know that the wholesale, indeed the feeder's price of the best English fowls does, and even exceeds it at this time of year.

The first dotterel of the season was in Leadenhall Market on Thursday the 23d. A common blue heron was seen flying over Covent Garden Market in a westerly direction on Wednesday morning.

In our last Number we admitted an article on this subject from a foreign correspondent, which we have little doubt will cause some discussion, and many doubts, among poultry fanciers, it was on the hatching of chickens—that is, taking them out of the shell by human hands, instead of leaving that work to the hen. People have an idea that the hen sits on the egg for a certain time, and that when the time comes for hatching the chick bursts the egg and comes forth, there never was a greater mistake—the chick until liberated from the shell "by outside aid," is as incapable of motion as if it formed a solid with the egg, which is nearly done. You might as well enclose a man in an iron boiler, and tell him to get out without tools, as expect a chick to get out of the shell without help. The chick grows and swells in the inside of the shell until at last the exercise on the point of the beak of the bird presses against the inside of the shell, and bursts up a small scale, of course when it does this, it at the same time breaks "in that spot" the inside skin of the egg—this admits the air, in a short time it breathes and gets strength to cry loudly, the hen then sets to work to liberate it, she brings it forward under the feathers of the crop, and supporting it between the breast-bone and the nest, begins the work of setting her progeny free. She hitches the point of her beak into the hole formed by the raising of the scale by the chick's beak, and breaks away the egg skin or shell all round the greatest diameter of the egg, the point efforts of the hen without and the chick within then liberates the prisoner, and he struggles into existence, and gets dry under the feathers, and with the natural heat of the hen.

All female birds who set on their eggs to hatch them have the hook in the beak strongly developed, even the broad-billed duck and the goose have these hooks specially developed, and with them they liberate their young. In Australia where everything seems to be by contraries, it is the cock of the Irish turkey that hatches the eggs, and not the hen. It would be interesting to know whether the hook of the beak is better adapted for this service in the male of that bird than in the female, the hook on the beak of the ordinary cock of the common fowl is quite different from that of the hen—it is adapted for wounding in fight, but not for the hatching of eggs.

Our informant on this subject has all his life paid great attention to the facts as here stated, and has watched the hatching of every kind of domestic bird. They are all very jealous of being seen, and will at

once stop in their operations if disturbed by personal intrusion, but the facts are as stated, and any poultry-keeper can prove it if he is observant enough.

Calendar of Operations.

APRIL. Paring and Burning, if the land is level and free from stones, is generally done by a horse-paring plough, but if it is full of stones, uneven, or covered with ant-hills, the paring must be done by the breast-spade or breast-plough. The depth or thickness of the turf cut depends upon two things—the thickness of the sward, and the quantity of manure required. From an inch to an inch and a half is perhaps an average, but in some peaty soils it is twice this depth, while in some cases a shallow plough (arrow-slice) is barred for the sake of the ashes. This latter, however, is generally termed "staple burning." The horse-plough and breast-plough will both cut the sods into short lengths and reverse them. In dry weather they are soon ready for burning, but otherwise they require to be set up to dry. Sometimes a team with a heavy harrow keeps toiling about the sods until sufficiently dry. They are, when ready, burned in heaps with a smouldering charring fire, so as to produce black ash. A small quantity of straw is generally given for kindling the fire. The work may be done for about 10s. including the carting and the cost of the manure when the breast-plough is required, if done by contract.

Turnip Fallow. After paring and burning, as soon as the ashes are spread the land is ploughed about 3 or 4 inches deep. It is then harrowed, smashed across, hollowed and clod-crushed, so as to break down the sods and incorporate the ashes. It is then ploughed about 3 inches deeper than before that, bringing up a fresh sod from the bottom to the surface. This fresh sod is broken and mixed with the sod below by means of the harrows, cultivator, and clod-crusher. Rape or Colseed may be sown on the flat by the liquid manure and seed drill, or the land lie until next month for Swedes, or Jute for Turnips. If the land is naturally poor, 3 cwt. of soluble manure may be drilled in with 5 lb. of Rape seed.

Turnip Fallow after Stiff Burning and Clay Burning. As soon as the ashes are spread upon peaty soils, they are mixed with fresh staple, similar to the staple produced by paring and burning. Had the work been done in autumn, a shallow staple of fresh soil would have been brought up to the surface by the winter frost, but at this season the soil may be mixed with only 2 or 3 inches of fresh staple, as it is no more than heavy harrows will bring up, or a light scratcher will do. Many farmers, however, on the surface of the peat or staple, will mix the surface of clay lands are staid burned, the land has been previously under the plough, the ashes may be mixed with the shallow staple by means of the cultivator, harrows, and clod-crusher. The old plan was to plough, harrow, and roll, but under this practice it is more difficult to get the ashes thoroughly incorporated with the staple, and the proper mixture of the ashes is the practical rule. The same rule applies to clay ashes burned in large heaps when carted and spread upon the surface of arable land. But if the land has not been previously under the plough, or if it is in a poached and worse state, the ashes require to be cautiously mixed with fresh soil as in the case of peaty soils. It is better to stir the soil in the summer time or autumn.

Drainage and Trenching—Some landowners and farmers prefer breaking up waste lands, and pastures, and exhausted fields from mismanagement by trenching, in preference to paring and burning. The work is best done early in winter, but in some moist climates, and also in dry ones, if there is a command of liquid manure, it may be profitably done after a Lady-day manure, or as late as April, provided the subsoil, brought to the surface is sound and friable. If the land has not been previously drained, the work of draining should precede that of trenching. Examples might be quoted in which the stones dug out in trenching when broken, filled the drains, with the exception of the first four drains opened; when the land between them was trenched, the stones from it were carried across by boys and women to the next four drains, and so on. In the absence of stones, tiles are used in draining. The trenching is generally from 20 to 21 inches deep, the top spit or sod being turned into the bottom of the trench, the bottom spit being thrown over it. When the work can be done without picking, it may cost 17 per acre but if the bottom spit is full of stones and requires picking, 5d. to 6d. The trenching in some cases may be done by horse or steam-power, a trench-plough following a common one. If the subsoil is a stony clay, poaching in, carting or carting off the stones in showery weather should be avoided, but the tramping of gravelly soils in carting off stones will do little harm as the sods below keep the ground sufficiently open. On no account should the sods below be disturbed until they are thoroughly rotten. A sufficient depth of manure for over 12 artificial manure can be raised by the harrows and clod-crusher. If necessary, the harrows may be used to keep them down. If there is a command of liquid manure in a garden, the land should be well soaked with it as soon as it is trenched and then allowed to lie until the effect of the manure and excrementations is rotten, when it will be a time for Turnip sowing. Lime may be applied if the land requires it. In most climates the sods will rot in a month's time sufficiently to grow Turnips with superphosphate—1 cwt. more or less, according to the nature of the land. If the subsoil is calcareous the need of liming should be well harrowed in before the seed is sown. Lime is applied in very varied quantities to Turnip

falls during April and May, the dose running from 50 up to 500 bushels of newly calcined lime from the kiln. Applied to newly trenched land, it powerfully promotes the decomposition of the vegetable and excrementitious matters it contains. In the centre of each perch a heap of the lime shells is placed from the cart in heaps, and then covered with earth. In dry weather the slaking may necessarily take some days, but if the ground is moist, and the air humid, the heaps soon slake. They are then spread and well harrowed into the surface.

Hoeing by hand and horse-hoe is general now among Wheats, Beans, Peas, and early Potatoes. Wheat hoeing should be finished in time for the rolling of the land for the reaping machine before the plants are too far advanced.

Grass seeds may be rolled into hoed Wheat, but if the Wheat has been sown broadcast it may be better to roll heavy land, and sow the seeds and then harrow in with light harrows. In lighter soils the seeds may be rolled in.

Soluble manures are sown broadcast, and are either hoed or harrowed into crops requiring them. In moist weather a shower will wash them into the roots of crops.

The pastures entered upon at Lady-day may yet be renovated by top-dressing and Grass seeds. Before the manure is applied the land should be carefully gone over, and Tussacks and weeds of every kind above-ground removed. The seeds may be bush-harrowed in, and also the top-dressing into the sward, and to effect this properly a bout or two of the bush-harrow may be necessary to work the manure properly into the roots.

Lady-day Entries often leave work to be done in April which had better been done in previous months. A different system of cropping is entered upon, old hedges are stubbed out, the grass-lands which they enclosed are pared and burned preparatory to being sown with Turnips or Rape, and gaps in the hedges which remain are filled up with the freshest and best plants carefully dug out of those which are removed. This latter—the filling of gaps—should be done as early as possible, and the newly planted Thorns copiously watered, to consolidate the earth about their roots. But the cutting of hedges and plashing to fill up gaps seldom do well in April, more especially old sickly hedges in early season. Entries are either to the Grass and fallow lands, the outgoing tenant retaining occupation of the lands under corn, or else (which is common) the incoming tenant purchases the entire interest of his predecessor, and each of these plans has its peculiar effects upon the various operations of farming. W. B.

Notices to Correspondents.

ESTIMATION OF PHOSPHATES. J. W. P. Esq. In reply to your letter we reproduce a portion of the report by Mr. W. Little, of Lincolnshire, from the *Chemical News*—Mr. Barnard, in his ingenious process, recommends 100 grains of the manure to be tested to be added to two pints of water; and this large quantity of water is employed that sufficient of the sulphate of lime may be taken up by the water, to afford lime by its decomposition with soda for combination with the biphosphate, which is also in solution. The following is the exact method I have adopted in working out Mr. Barnard's process.—I have a measure holding 1000 grains of water it is, in fact, a piece of glass tube, about half an inch in diameter, stopped at one end, and divided into 100 equal parts, consequently each division represents 10 grains of water. I then dissolve 10 grains of neutral carbonate of soda in rain water, and make it up to 1000 grains. This constitutes my test solution of soda, every 10 divisions of the measure represents exactly 1 grain of soda. I then take another glass tube, about 1 foot long and one-eighth of an inch diameter, stopped at one end with a plug of gutta percha, which is perforated with a pin; the object of this tube is to add the test solution of soda, drop by drop, at the termination of the operation, when great nicety is requisite; this may be effected by applying the finger at the other end of the tube. I now proceed to test, agreeably to the recommendation of Mr. Barnard, one-half of the solution, or one pint, with my small tube, graduated into four divisions, so that each division represents one-tenth of a grain of soda. It may require soda solution equal to about ten divisions of the small drop tube (or one grain of soda) to neutralise the free sulphuric acid that may be present in the solution operated upon; but this is readily ascertained by adding the test solution gradually, and so long as the liquor remains quite clear when well agitated by stirring; directly the liquor assumes a slight milky appearance, the free sulphuric acid is neutralised, and the conversion of the biphosphate in solution into neutral phosphate is beginning, the milkiness being occasioned by the precipitation of phosphate of lime through the decomposition by the soda of the sulphate of lime in solution. At this time a piece of blue litmus paper, fastened to a piece of cork, must be put into the liquor, when it instantly becomes red. Having noted the exact quantity of soda solution employed to neutralise the free acid, more of it may now be added gradually, until the liquor begins to show an alkaline reaction, constantly stirring the whole time, this will be readily seen by the litmus paper assuming a bluish colour. We will now suppose that 1 grain of soda has been employed in neutralising any free acid that may be present, and 12 grains have been employed in decomposing the sulphate of lime for the precipitation of all the biphosphate as neutral phosphate, it now remains to estimate the quantity of biphosphate in the 100 grains of manure. Now, 1 equivalent of carbonate of soda (53) combines with 1 equivalent of anhydrous sulphuric acid (4) to form sulphate of soda. Consequently we have this proportion—As 53 is to 40 so is the 12 grains of soda to the quantity of anhydrous sulphuric acid employed in the conversion of the neutral phosphate of lime into biphosphate which is 0.05 but as we have only tested half the liquor, the whole will show 14 1/2 grains as the quantity of anhydrous sulphuric acid employed in the 100 grains of manure. Again, 80 parts of anhydrous sulphuric acid are necessary to form 100 parts of biphosphate consequently, we have this further proportion to show the percentage of biphosphate contained in the 100 grains—As 80 : 100 :: 14 1/2 : the percentage of the biphosphate formed by the 14 1/2 grains of anhydrous sulphuric acid, which shows the manure to contain about 22 1/2 per cent. of soluble or biphosphate of lime.

EXHAUSTION OF LAND. Land cannot be exhausted by the application of manure, the idea is altogether a mistake. The exhaustion, if it takes place at all, is due, not to the manuring but the subsequent disposal of the crops grown.

30 inches	72 inches	20 10 0
30 inches	84 inches	22 10 0

These Rollers possess many advantages over all others; they are made in two parts, and are free to revolve on the axis, affording greater facility for turning, and the outer edges are rounded off, or turned inward, thus removing the unsightly marks left by other Rollers. They are manufactured of the best materials, and are got up in a surpassing any ever yet brought out. The Rollers 24 by 26 inches, 20 by 22 inches, and 16 by 17 inches, are made in one part, at a reduced price; and, for Rollers of that size, will be found to answer many requirements. The handle can be reversed to either side of the Roller at pleasure.

PRICES—24 in. by 26 in., £4; 20 in. by 22 in., £3 2s. 6d.; 16 in. by 17 in., £2 10s. Delivered Carriage Free to all the principal Railway Stations and Shipping Ports in England.

WILLIAM ROLLISSON & SONS'

BRILLIANT NEW TRICOLOR GERANIUM, THE MOONSTONE

IS NOW BEING SENT OUT.

The habit of the above most beautiful Tricolor is compact and exceedingly free; the leaves, which are of substance and moderately large, are almost round, and from the slight convexity of their shape they exhibit to advantage the rich and varied colourings with which they are adorned, the centre of the leaf is of a bright green surrounded by a dark chocolate zone, which is much intercepted by the most intense blood-red. The colour shades off, towards the edge of the leaf, to a soft crimson-lake, which entirely encircles the whole with a bright lemon-yellow belt. It is somewhat in the way of *Lion's Griev* in its coverings, but is rather more and, unlike the shy habit and slow growth of that variety, "The Moonstone" is almost as free as *Thumb*, while it remains constant in character. This, without exception, is the finest Tricolor yet offered to the public.

THE FOLLOWING NINE SPLENDID NEW DOUBLE GERANIUMS FOR 1869

- | | | |
|---------------|-------------------------|-------------------|
| MADAME BONDET | MDLLE. LOUISE DELESALLE | M. PROBEL |
| MADAME DEHRAY | M. DE ST. JEAN | MARIE LEMOINE |
| MARIE CROUSSE | M. DE ST. PAUL | WILHELM FRIEDRICH |

Together with many other Novelties of sterling merit, are now being distributed.

For Descriptions and Prices of the above, see **SPRING CATALOGUE OF NEW and CHOICE SOFT-LEAVED PLANTS for 1869**, which will be sent Gratis and Post Free on application to

THE NURSERIES, Tooting, London, S.W.

NEW PLANTS, 1869.

B. S. WILLIAMS,

VICTORIA AND PARADISE NURSERY, UPPER HOLLOWAY, LONDON, N.

HAS MUCH PLEASURE IN OFFERING

THE FOLLOWING CHOICE NEW PLANTS, FOR THE FIRST TIME

Early Orders are solicited. Strong Plants now ready.

Achimenes.

The two varieties now offered are the result of crossing by Mr. Parsons, of Welwyn, who has been so eminently successful with Achimenes. The present kinds are much superior to any ever offered by B. S. W., and cannot fail to give general satisfaction. **ROSE QUEEN** will be found very distinct and desirable, while **Williamsii** is the most brilliant variety yet obtained.

ROSE QUEEN.—This is a beautiful form of this desirable genus. It is compact in habit, and a profuse bloomer. The flowers are large, stout, and of rich rose-lake in colour, shading to deep purple, with an orange centre. Price 10s. 6d. each.

WILLIAMSI.—A charming free-blooming variety of good compact and branching habit, leaves bright green and clothed at the edges, flowers large and of good substance, limbs two inches and upwards across, and vivid scarlet in colour, throat orange-yellow. Price 10s. 6d. each.

Geraniums.

The two following varieties, which have been raised by Mr. Bennett, of Osberton Gardens, who after seven years' trial has found them to possess qualities for bedding purposes superior to many of the

varieties now grown, either new or old, and from his great experience in this branch of the profession, Mr. Bennett is enabled to form an accurate opinion respecting their merits.

MIRIAM OF OSBERTON.—A variety possessing the most compact habit, leaves small, but very dwarf and compact, and very free in habit, flowers large, and of a most brilliant and intense crimson, colour great, shaded with bronze, and a narrow white zone in the "Carillon" of the *Penny*, 1867, and a variety of superior habit, and worthy of extensive culture. Price 5s. each.

MORNING STAR.—A variety possessing the most compact habit, leaves small, but very dwarf and compact, and very free in habit, flowers large, and of a most brilliant and intense crimson, colour great, shaded with bronze, and a narrow white zone in the "Carillon" of the *Penny*, 1867, and a variety of superior habit, and worthy of extensive culture. Price 5s. each.

Petunias.

MODEL OF PERFECTION.—A superb variety of branching habit, leaves small, but very dwarf and compact, and very free in habit, flowers large, and of a most brilliant and intense crimson, colour great, shaded with bronze, and a narrow white zone in the "Carillon" of the *Penny*, 1867, and a variety of superior habit, and worthy of extensive culture. Price 5s. each.

ENGINEERS AND PATENT WIRE FENCING MANUFACTURERS.

THE ONLY MEDAL AWARDED SOLELY FOR WIRE FENCING.

GALVANISED IRON MANUFACTURERS, WIRE DRAWERS, &c.

F. M. & Co. have received the Medals and highest Commendations of all the leading Agricultural Societies.

F. M. & Co. have received the Medals and highest Commendations of all the leading Agricultural Societies.

THE ORIGINAL INTRODUCERS, PATENTEES, and SOLE MANUFACTURERS of "FRANCIS MORTON'S" SYSTEM of CABLE WIRE FENCING,

which during the past few years has come into use over **SEVERAL THOUSAND MILES OF FENCING."**

And has received a large and distinguished preference over every other description of Park and Farm Fencing. The great success attending the introduction of our Patented Improvements has led to numerous worthless imitations being offered for sale by dealers and others. It is necessary for us therefore to state that this Fencing is FACI-SIMILIA MANIAT REB at our Liverpool Works.

OUR PATENT WIRE FENCING IS CHEAPER, STRONGER, MORE DURABLE, MORE EFFICIENT, AND BETTER IN APPEARANCE THAN BAR IRON FENCING, HURDLES, &c., AT TWICE THE COST. Thoroughly efficient Workmen sent to erect in any part of the Kingdom. Special Estimates prepared for considerable quantities.

AS SELECTED FOR THE NEW PUBLIC SEFTON PARK, LIVERPOOL.

CAST AND WROUGHT-IRON PARK, ENTRANCE, AND FIELD GATES, PLAIN OR ORNAMENTAL, OF THE BEST DESIGNS.
ALSO, CONTINUOUS BAR IRON FENCES, HURDLES, AND TREE GUARDS, RABBIT NETTING, WICKETS, POULTRY FENCING, PALISADING, &c.

With all similar Manufactures required for the Embellishment or Improvement of Landed Property.
Solid Wire Drawn and Rolled, of every description, at the lowest prices.
Dear Fences of the most approved Designs.

COGNIAL WIRE FENCING

LARGE CONSUMERS PLACED ON

PAXTON'S STRAWBERRY CRINOLINE.

THE STRAWBERRY CRINOLINE is in the form of a table, made in halves, so as to be used without disturbing the plant. It is 16 inches in diameter, and stands above the ground, Galvanised. Its use is to preserve Strawberries from Slugs, contact with the soil, superfluous moisture, and other nuisances. They are considered permanent at least with care.

Price per Gross, £4.

THE STRAWBERRY CRINOLINES are declared by all who use them to be of the greatest use in keeping the Fruit clean and assisting its growth—thus in the production of early crops. For particulars see Illustrated Catalogues, and Testimonials sent to us by our Patrons last year.

The contrivance is by the late Sir Joseph Paxton, who, after testing them for one season in his own Gardens, "Rock Hill," gave his approval of their usefulness. The design was transferred to

HOLLIDAY, PRACTICAL WIRE WORKER, 2A, PORTOBELLO TERRACE, NOTTING HILL GATE, W.

TESTIMONIALS RECEIVED upon the PRACTICAL USE of PAXTON'S STRAWBERRY CRINOLINE.

"Farnborough, Shipley, near Leeds, Feb. 26, 1868.
In reply to your letter, asking my opinion of your 'Strawberry Crinolines,' I consider them invaluable. They keep the fruit away from the wet and slugs, and materially assist in bringing forward a large proportion of the fruit, which is so generally covered by the leaves that it gets no sun or heat. I expect to send you an order for a lot more in about a week.—Yours, &c.
"EDWARD SALT"

"Mr. Holliday, please forward three gross of Strawberry Crinolines.—Yours, &c.
"EDWARD SALT"

"St. Andrew's House, Hertford, Feb. 14, 1868.
I have used the Strawberry Crinolines with which you supplied me last year, for one year, and consider them extremely useful for the purposes for which they are intended. They keep the fruit from the soil, and expose it more freely to the sun.—Your obedient servant.
"JNO. MARCHANT, Jnr."

"Portobello Road, Notting Hill Gate, W. March 17, 1868.
I have had the Strawberry Crinoline in use during the fruiting season of the past year, and I can confidently state that they are invaluable for all the purposes for which Mr. Holliday, the maker, recommends them.
"JNO. H. McELROY, correspondent of the 'Gardener's Magazine.'"

"Peopleton, Pershore, Feb. 20, 1868.
The Rev. JAMES COLE wishes to express his great satisfaction with Mr. Holliday's Strawberry Crinolines, very neat and efficient.
"The Arboretum, Hecy Road, Ipswich, Feb. 11, 1868.
I am so well pleased with the Strawberry Crinolines you supplied me, that I am anxious to advertise them extensively, and I am persuaded their great price will be very generally adopted. They not only effect a great saving in the cost of the fruit, but the quality is also greatly improved.—I am, Sir, yours truly.
"W. B. JEFFRIES."

"The Fishery, Maidenhead, Feb. 8, 1868.
I found the Strawberry Crinolines I had of you last May very useful, as they kept the strawberries free from dirt and slugs, and are much superior to anything I have used before for that purpose.—Yours obediently,
"FREDK. NORMANSELL."

"Flasby Hall, Gargrave-in-Craven, Feb. 4, 1868.
I am very much pleased with your Strawberry Crinolines, they answer perfectly and keep the fruit clean and free from slugs. The only fault is their price, as, if quantities of Strawberries are wanted, the number of Crinolines required involves a serious expense.—Yours, &c.
"J. W. PRESTON"

"Kington, Radnorshire, Feb. 4, 1868.
The Strawberry Crinolines (one gross) supplied by you last May answered very well (those which were sent)—I am, Sir, yours sincerely,
"E. COOPER."

"Chilham, Canterbury, Feb. 4, 1868.
Your Strawberry Crinolines were very useful to me last season, and more so as I, during the season, worked the earth between the rows of Strawberries very deep and very close, and the fruit was very large and fine, which your Crinolines kept from touching the lower part of the fruit, and palatable.—Yours, in haste,
"WM. MARTIN"

From Mr. JAMES PEARSON, Gardener to H. Bentley, Esq.
"Ebbald House, Woodlesford, near Leeds, Feb. 11, 1868.
I got one gross of your Strawberry Crinolines in the middle of the ripening season, 1867, and I got them all to use without delay, and I have great pleasure to say they were the means of saving a great deal of fruit from perishing, it being a very wet season, likewise in keeping them clean from dirt and slugs, which is a great nuisance to the eater, indeed, they answer all the usefulness I got from them.—Yours respectfully,
"J. PEARSON."

"Longmead, Bishopstoke, Hants, Feb. 4, 1868.
I can speak in the highest terms of your Strawberry Crinolines, which I consider are very useful in preserving the fruit from dirt and slugs. I ordered a gross from you last year, and they fully answered my expectations. You can confidently offer them to the notice of Strawberry growers.—I remain, Sir, yours truly,
"ALFRED BARTON"

"Redwell Lodge, Weymouth, Feb. 4, 1868.
I have no hesitation in saying your Strawberry Crinolines answer admirably. The only drawback to their universal use is the expense, for where many varieties of Strawberries are grown the quantity required would be considerable, and the expense amount to a large item in the garden expenditure. You can use this in any manner you think proper.—Yours truly,
"FREDK. CHAS. STEGGALL"

"Mendlesham, near Ramsgate, Feb. 5, 1868.
The Strawberry Crinolines I had from you last year answered remarkably well, and I have recommended them to my friends.—I am yours obediently,
"A. C. BENTHALL"

"Eaton Hall, Hatfield, Feb. 6, 1868.
I have much pleasure in adding my testimony to the usefulness of your Strawberry Crinolines. I used them last summer with great success.—I am, Sir, yours obediently,
"W. T. TURNER"

"Brokenhurst Park, Lymington, Hants, Feb. 10, 1868.
I have much pleasure in enclosing you the testimonial you ask for. I consider your invention, the Strawberry Crinoline, of great value in keeping Strawberries clean from dirt and slugs, &c.—Yours, &c.,
"JOHN MORGANT"

"Chipping Norton, Feb. 4, 1868.
The Strawberry Crinolines I had from you last year answered my expectations. I recommend them to others in Chipping Norton, who were also much pleased with their usefulness. I am, Sir, yours truly,
"J. H. BENTLEY"

"Moyra Park, Navan, Ireland, Feb. 5, 1868.
I have used your Strawberry Crinolines, and highly approve of them. They answer all the purposes advertised for, and are, I think, an acquisition to the fruit garden.—Yours, &c.,
"J. O. C. POLLOCK"

From Mr. W. ELLIOTT, Gardener to J. Dodson, Esq.

"Littledale Hall, Eaton, Lancashire, Feb. 6, 1868.
At your request I write, and with much pleasure, to state that your Crinolines answered admirably here last year. Our crop of Strawberries was double what it has ever been (many around us failing altogether), and the fruit both ripened well and was unusually fine and clear of soil. Yours obediently,
"W. ELLIOTT"

"The Limes, Thetford, Feb. 10, 1868.
I used the Strawberry Crinolines you sent me last year, and was much pleased with them, they effectually answer the purpose of keeping the fruit clean, and assist the ripening. Last season being very dry, they were not so much required, but I feel sure that in a wet season they will be found most useful.—Yours,
"JOHN HOUGHEN"

"Barnstable Place, near Lewes, Feb. 5, 1868.
In reply to yours, I beg to say that my experience teaches me that it is very desirable to keep the fruit of Strawberries clean away from the ground. The Strawberry Crinolines supplied by you to me last year certainly kept the fruit away from dirt, slugs, and superfluous moisture.—Yours truly,
"G. GRANHAM"

From THOS. WHIDDON, Gr to H MAUDSLAY, Esq.

"Bristol, Exmouth, Feb. 20, 1868.
I think your invention of the Wire Crinoline a great boon to Strawberry growers. We used the wire crinoline we received from you last year, and found them to answer a very good purpose. They keep the fruit clean, and clear from the attacks of slugs and wire-worms. I think in wet seasons they will be very useful.—Yours,
"THOS. WHIDDON"

"The Gardens, Moor Court, near Stroud, Gloucestershire.
In reply to your request, I beg to say the Strawberry Crinolines (one gross) answer the purpose remarkably well for which they are intended. They are the means of saving much fruit from slugs and dirt in wet seasons, and ripen their fruit much better than lying on the ground.—I remain, yours truly,
"WILLIAM BASSETT."

Garden Memoranda.

ROBIN GARDENS, THE SEAT OF THE RIGHT HON. LADY ROLLE, BUCKINGHAM PALACE, LONDON.

From the arboretum we naturally turn into the flower garden. As already observed, the garden as it were cuts its way broad and clean out of the extensive grounds devoted to trees and shrubs or, to write more fully, the arboretum ends in a screen of shrubs that runs up to the flower garden on one side, while on the other, the American ferneries, &c., occupy the space between the flower garden and the public road. The greater portion of its length it has an additional inner boundary of brick wall furnished through out with Magnolia grandiflora. The upper boundary is marked by the noble range of...

Peach-houses and early... In the middle... substantial and imposing ornament of the range. The glass reaches the entire distance between the two walls (about 110 yards), the end houses (Peach-houses) being inclined to the side wall, to take off the sharpness of the corner. In front, the garden and its accompaniment of water, &c., is bounded by a fine new church, built by Lady Rolle about 10 years ago, by high banks crowned with lofty shrubs, a level glade and...

the banks, carrying the eye along to a noble obelisk some way off in the distance, and with portions of the park itself to the left of the church. The ground is probably 50 feet from the range of glass to the side of the church. It is in the form of a long narrow...

ramble, sloping to the south, and is wholly composed of three sides, and almost wholly fronted by the high turf bank, and their shrub-crowned heights the church, &c.

Its most eligible site for a flower garden is divided into three portions, and devoted to three distinct purposes—the upper to flowers, shrubs, and trees, the middle to Grass, and the lower to water. A space of about 100 yards in depth, measuring from the gravel walk in front of the glass, is devoted to the flower garden proper. A gravel walk is then carried across, and the ground is arched down by means of a Grass bank to a level about 14 feet lower, the side walks reaching the lower ground by flights of stone steps. Then follows a piece of perfectly level close-shaven turf, destitute of all ornament, except a row of statues arranged across its

... being considerably larger than...

with a broad margin of turf, on which standard Hays were arranged at regular intervals. This is succeeded by another Grass slope, carrying the ground down about 5 feet lower in fact to the water level. The...

adapted to the highly formal character of the ground. Two-thirds of the space is devoted to a square water, leaving a wide block of turf at each end...

This turf likewise proceeds in a narrower band along the bottom, thus surrounding the square sheet of water with a boundary of green Grass, but, just in the centre of this narrower band, an elliptical reservoir is...

water from the square into a narrow canal, that forms a second water-line at the bottom, and then doubles back along the ends of the block of turf already noted. These end canals are slightly beyond the lines of the enclosing walls that bound the flower garden, and form, as it were, a finishing barrier of silvery water between the flower garden arrangement and the arboretum, on the one side, and the...

on garden on the other. The walls do not reach down to the water, so at this point there is no boundary but that of the water, on one side, and in addition to this a solid mass of vegetation, chiefly...

on a very high Grass slope. A little beyond the water there is another more Grass...

of the huge Grass bank already noticed, probably 13 feet high, carried round far enough to hide the end of the pinetum and the old church and churchyard, and suddenly terminating at the beautiful new church. Beyond this, on the left, is the American rockwork, shell-house, and the overflow...

from the canal, furnished with the Bamboos, Pampas Grasses, &c., already noticed. It will be seen that the ground as a whole is unique, and the effect of these three kinds of beauty, each seen by itself, and in juxtaposition, close enough to contrast, harmonize...

... next green Grass pure and simple, and the water level at rest...

... and arboreal character or spirit pervading the whole. There is the temple at the top, the beautiful church at the bottom, fountains, vase, stone seats, and...

... tower up in the park in front, and high over the wall on each side, and you feel that the temple of Flora is enwreathed with garlands borrowed from other and almost equally beautiful arts. Imbued with this...

one doubts whether Flora's temple is quite worthy of...

I think for Bixton she deserves more...

... I would have more formality in the...

... and one of the best and largest geometrical designs that has ever been laid down would not be too good for this grand position. My meaning will appear more obvious as I proceed to describe the flower garden as it is.

First of all there is a border in front of the glass range, then a fine gravel walk followed by the inclined piece of turf on which the garden is displayed. The upper border at the time of my visit (August) was one of the grandest sights I have ever seen, filled from end to end with the Belladonna Lily in full flower. Why does not everybody grow this lovely Lily in the garden and the drawing room, since scarcely anything can equal it in regal grandeur. The Lily is succeeded in the autumn and winter by the grand expanded Violet, so sweetly described in your...

... that one could almost have smelt them, by Mr. Robinson. On the opposite side of the walk are some well-filled vases of Pelargoniums, &c., then follow two enormous Pampas Grasses, that have each produced 100 or more blossom-spikes at one time. Close to these are two very fine Deciduous of atrain party time, and then on each side, between these plants, massive vases lined with Pelargoniums. These vases are each surrounded by a...

... with the usual bedding plants. In the middle of each fountain on each side...

... four beds at their feet. These were filled with Camosillas, Pelargoniums, Pink, and Hyacinths, and these there is an outer rim, cut into four other beds, with...

They were filled with Iresine Heros, Amaranthus melancholicus, Cineraria maritima, and Lobelia, the four small circles with Pelargoniums. Then a large dial stands in the centre, with two whole circles at equal distance on either side, possibly furnished with the two...

... two very large stone baskets on each side, surrounded with groups of 12 beds each, well filled with the usual occupants. Near here again, specimen Calceas and Mugnias cannot be seen. Then follow border groups of Roses, Ruscus dendrons and common shrubs, and a low wall of vases surrounded with oval heart-shaped beds devoted to Veronias, then a couple more heavy vases, surrounded with mosses and ferns, followed by massive stone seats on each side, completing the flower garden and bringing us to the end of a formal walk...

... small figures representing, I suppose, the virtues, or Virtues, or both.

Through its whole...

SUTTONS' HOME-GROWN FARM SEEDS,
NEW AND UNADULTERATED,
CARRIAGE FREE.
THE BEST SWEDE IN CULTIVATION IS
SUTTONS' CHAMPION.

SUTTONS' CHAMPION SWEDE.
The hardest, the most productive, and best shaped Purple-topped Swede in cultivation.

Price 1s. per lb.
Cheaper by the bushel. Lowest price for large quantities quoted on application. Carriage free to any Railway Station.
This maintains its character as the best Swede in cultivation. It is a very large purple-topped yellow variety, perfectly hardy, and stores exceedingly well. It is of fine globular shape, and remarkable for its small neck and freedom from coarse roots. It has taken for seven successive years His late Royal Highness the Prince Consort a Prize Cup, of the value of 20 guineas each. These silver cups were last year awarded at the meetings of the Royal East, Berks and South Bucks Agricultural Societies to crops of our Champion Swede, and other improved varieties of Agricultural Roots. Numerous other Silver Cups have been awarded to crops of this Swede, while it almost invariably obtains the first prize for purple roots. Some very fine roots, weighing upwards of 16 lbs each, grown by one of our customers in Ireland, and exhibited on our stand at the Smithfield Club Show in December last, attracted marked attention.

From Geo. RANSON, Esq., Poplar House, Sproughton.
April 21, 1868.—"I had this year 15 acres of your Champion Swede, the finest and best grown in my neighbourhood. I am only now finishing them."
From J. ARWAT, Esq., Manor House, Tinagrick.
April 16, 1868.—"I took several prizes last year with crops grown from your seed, and amongst them was a £10 prize for the best general crop. I think there is no better Swede than the Champion grown."
From A. M. WHARFORD, Esq., Gashorpe Lodge.
March 2, 1868.—"I believe you are aware this is a great seed district, particularly for Turnips, &c., but your unrivalled Champion Swede is almost exclusively grown."
From J. C. MOORE STIVERS, Esq., Wincott.
April 2, 1868.—"I won a Ten-Guinea Silver Cup last year for Swedes grown from your Champion Seed."
From Messrs. DICK & SON.
April 14, 1868.—"We grew some splendid Champion Swedes from the seed you sent us last year."

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.
DR. VORLCKER'S RESEARCHES.
A Lecture, "On the RESULTS of CHEMICAL INVESTIGATIONS made during the PAST YEAR," will be delivered by Dr VORLCKER, on MONDAY, May 10, at 2 P.M., at the Society's Rooms, 12, Hanover Square, W.
Members of the Society and their Friends, as well as other Gentlemen interested in the subject, are invited to attend.
H. M. JEVKINS, Secretary,
12, Hanover Square, London, W.

The Agricultural Gazette.
SATURDAY, MAY 1, 1869.

MEETINGS FOR THE ENSUING WEEK
May 2: London Farmers' Club, Mr. Henry Corbet on Foxes v Rabbits at Salisbury Hotel—5 P.M.
— 4—Chamber of Agriculture at Salisbury Hotel
— 6—Royal Agricultural Society of England, at Hanover Square.

English agriculturists are once more concerned for the security of their flocks in respect of the much dreaded small-pox, which has again been introduced into this country by sheep imported into London and Harwich. Three cargoes were detained last week by the veterinary inspectors to the Customs.

More than 3000 sheep have been slaughtered on the wharves of London and Harwich in the last few days, but of that number not more than a dozen were actually affected with small-pox; the others were detained as a measure of precaution, and not on account of their being unsound at the time.

All the consolation which the home producer is offered is conveyed to him in the official statement that the existing arrangements are sufficient for the emergency; and that, as at present informed, the Government does not contemplate the re-enactment of the Order to slaughter at the landing-places all sheep imported from the Continent. Under these circumstances the farmer naturally asks—What are the existing regulations, and how do they act to prevent the spread of infectious diseases?
It is generally understood that considerable discretionary power is vested in the authorities

May 1, 1897

refer the reader to Mr Secretary SIDNEY and the price list.

Town Drainage and Sewage Utilization Com-
pany has been incorporated. Mr J BAILEY-DENTON
 has been appointed. The Company propose to
 have the action of the town in disposing of their
 sewage by act as a medium between the sewer autho-
 rities and farmers, and to apply sewage on the lands
 of farmers, or on any other land which may be
 available for the purpose. They will undertake the
 purchase of land for the reception of sewage by
 any other means, or they will institute the pre-
 paration of plans and specifications, the provision
 of funds, and the execution of works under the immediate
 supervision of their own engineers. They will
 be prepared to advise upon, and to treat for, the
 preparation of plans and the construction of works
 necessary for the supply of water to towns and dis-
 tricts at present insufficiently provided. The company
 has been constituted at a time when works of the
 kind thus contemplated are likely to meet a very
 general want throughout the country.

The following paragraph from the *Pall Mall*
Gazette appears to us to deserve general attention.
 The allegation has been made that if the Game Laws
 were in any degree modified, the farmers will suffer so
 much from trespassers that they will demand a strin-
 gent Trespass Act. The idea is preposterous. Larks
 are not game nor are plovers' eggs, yet both are
 scarce, which bring a high price. But who ever
 heard of a farmer complaining of the damage done by
 persons snaring larks or seeking for plovers' nests?
 The fact is they are not preserved, and therefore they
 are not immediately numerous, and by consequence
 there are no bands of men hunting after them. They
 are afforded an occasional remuneration to a few persons
 not more than a tenth of the damage in a whole year
 than is inflicted in five minutes by a single run with
 a dog over a field of young wheat, or even by the
 trampling of a horse, or by the trampling of a dog
 with his friends, keepers, and cogs, beating a
 field in early autumn. It is not the Game Laws
 which preserve our lands from trespass, they create
 trespass by creating the occasion and temptation
 therefor. Our unreasonable game preservers are happily
 equally even among landlords. They have done
 much mischief by pushing to extravagance the
 extension of the laws which were never intended to
 extend to their most serious trespassers. They have now
 sought to extend the reaction, beginning in Scotland, but
 now to extend to England, which demands the
 abolition of laws they have perverted. We counsel
 them to yield to the first demand. At present the
 Scottish farmers are ready to compromise with them
 for the abandonment of hares and rabbits. But if this
 is resisted the great towns are sure to take the question
 up and ask why we keep in force laws which breed
 poverty as well as pleasure, and fill our gaols as
 certainly as our preserves. The wiser Conservatives
 will stand by the demand to be inevitable, and their
 English brethren will be very foolish if they reject the
 present Sybilian offer.

In a recent case before the Court of Record at
 Edinburgh the plaintiff was formerly in the employ of
 the defendant's servants at Hull, in the capacity of
 warehouseman, and in April, 1897, informed them that
 he had discovered to him that acorns ground into meal
 would make very good "bun" for cake. Bun is
 a cake what "bunkum" is to speech. On that sugges-
 tion the defendants bought at various times 295 tons of
 acorns, and used upwards of 200 tons of it in lieu of
 flour. The price of the latter was about 5s. a ton, and
 of acorns at Smyrna 17s. a ton, the difference in value
 being 10s. 6d. per ton. The plaintiff's case was that defendants had pro-
 mised to remunerate him for imparting this secret, but
 they had done so. He had sent in a bill claiming
 10s. 6d. per ton, which amounted in the aggregate to
 2,950s. 6d. The defendants denied that they had pro-
 mised to remunerate the plaintiff, who was their
 servant, but had said that if the meal turned out well
 they would make him a present. It had not answered as
 "bun," inasmuch as the farmers complained that
 cake made from it was bitter, and they would not buy
 it. Defendants had between 80 and 100 tons of acorn-
 meal on their premises now, and had tried in vain
 to sell it. They had given up using it two or three
 months ago. The jury found a verdict for plaintiff
 for 10s. 6d. per ton.

What are the merits of a public house pig?
 We are induced to ask this question by the
 following extract, which appears to be a communica-
 tion from an authorized correspondent of the *Stamford*
Chronicle.

The first annual meeting of the recently estab-
 lished Stamford Pig Club was held on the 14th inst., at the White Horse
 public house, and was a most successful and interesting affair. The club
 has been formed by Mr. W. S. S. S., the treasurer. The club
 has a capital of 100 guineas, and the monthly contributions are
 1 guinea. The club has a number of members, and the first
 meeting was held on the 14th inst. The club has a number of
 members, and the first meeting was held on the 14th inst. The club
 has a number of members, and the first meeting was held on the 14th inst.
 The club has a number of members, and the first meeting was held on the 14th inst.

pigs are liable; and accordingly that it is a good
 thing for a poor cobbler, husbandman, or other
 labourer, who puts all his pence in one pig, to have
 some neighbourly mode of assuring himself against the
 entire loss of his pig from some unforeseen and un-
 avoidable visitation or casualty. But how prudent
 such a plan is to be maintained by a public-house publican,
 so that, thereby, one of the small-wages class may
 be induced to practically realize 'how important a
 good pig is to the family of a labouring man,' we are
 not able to determine from the above details.

OUR LIVE STOCK

LAST week we briefly noticed the principal points of
 interest of the Didmarton sale. We have since heard
 that Lord Dunmore has purchased another 3000 guineas
 from Mr Bowly at a high price, and that, taking this
 last sale into account, the average of the females has
 been raised to 100l. It may be so interesting to our
 readers to learn that *Kirklevington 12th*, which Lord
 Dunmore obtained from Mr Loney at an advance over
 the 384 gs. she fetched at the Didmarton sale last
 October, produced a heifer calf on the 22d inst. to
 2D DUKE OF COLLINGHAM. Henceforward Dunmore
 will be associated with Kirklevington blood, as Lord
 Dunmore apparently loses no opportunity of securing
 any number of this fashionable family which comes
 into the market.

LOD WILD EYES 5TH, the property of Mr
 Harvey, was put up for sale at Didmarton with
 Mr Bowly's stock, and was purchased by Lord Fitz-
 hardinge for 110 gs., the previous bid of 100 gs. having
 been made by a tenant-farmer of the neighbourhood.
 The following is a complete list of the animals, their
 purchasers, and the prices realised.

Name of animal	When calved	Price	Name of Purchaser
Females.			
<i>Southern</i>	Mar. 1897	42	Capt. De Winton

Two valuable heifer calves have been added to
 the Kingscote herd this week, on the 13th a roan from
 the *Countess of Oxford*, by COUNT BICKERSTAFFE
 2D, and on the 20th, a roan, by 3D DUKE OF
 CLARENCE (23727), and from *Honey 21st* by 2D DUKE
 OF WETHERBY (21818), dam *Honey 15th* by DUKE OF
 CLARENCE (19611). It will be seen by a perusal of
 the pedigrees of this latter calf that it is bred in and
 is very close; it, however, shows no symptom of
 weakness, but is a fine specimen of what a Shorthorn
 calf should be, with all that vigour so characteristic of
 Bales blood. COUNT BICKERSTAFFE 2D is full brother
 to COUNT BICKERSTAFFE (23330), and *Countess of*
Oxford is by 1TH DUKE OF AIRDRIE (2315), dam
Gem of Oxford by 2L GRAND DUKE (12961). Major
 Conolly, M.P. has purchased *Ariel Duchess* by DUKE OF
 WHARFEDALE (19618), of Col. Kingscote, for the
 respectable sum of 200 gs.

Mr Loney, of Wateringbury's, sale will take
 place on Thursday, the 6th inst. Twenty three heifers
 and as many bulls will be offered to the public by
 Mr. Strassford, and from what we have lately seen and
 heard, respecting *Duchess* and *Kirklevington* blood,
 we may expect to witness plenty of competition and
 high bidding. We have so recently called attention to
 Mr Loney's herd, and its high character is so well
 known, that it is hardly necessary on the present
 occasion to enter further into details as to its merits.

The Ridlington Catalogue has at length
 appeared. It contains no fewer than 64 entries, of
 which 50 are females. All these animals, bred by Mr.
 Wortley, will be offered for public auction, by Mr. John
 Thornton, on Thursday, 13th inst., at Ridlington. Mr
 Thornton, in his lucid prefatory remarks, tells us that
 "the tribes from which many of these animals are bred

have been located in the county of Rutland for a great
 number of years, and are of the same stock as that from
 which Mr Baker, of Cottesmore, bred his celebrated
 Shorthorn gold medal heifer in 1837 and his gold
 medal steer in 1840." Six females are descended
 from Mr Bowly's *Kirklevington* cow *Ariel* by
 4TH DUKE OF YORK, and are full of Bales
 blood. The essential character of the herd is,
 however, both in name and pedigree record four
 or five crosses of this blood. The two sires last used,
 were first IMPERIAL COUNT 21,155 by IMPERIAL
 WINSTON, both bred by Mr Carr, of Sta. Kew, and
 from a grand-daughter of Mr John Booth's
Citadel, by HAMLET, and also HIGHLAND CHIEF
 21,111, bred by Mr Wortley, by BRITISH FLAG
 19,311, and from a daughter of *Prince of Southwick*,
 the winner of the 1st prize at the Worcester meeting
 of the Royal Society in 1853. The stock are pronounced to
 be in good healthy condition well haired possessed of
 good feeding qualities, and to be excellent milkers.
 Several of the cows are newly calved, and others have
 been served by IMPERIAL COUNT, HIGHLAND CHIEF,
 GENERAL NAHER (21,023), the property of Mr.
 Cheney, of Gablesby Hall, and PRESIDENT, bred
 by Mr. Adkins, of Milcote, and descended from
 FAVOURITE (252).

From Longford House Murchingshampton, we
 are favoured with the following *Crusula 21st* by
 7TH DUKE OF YORK let at Mr. Rich's sale at Did-
 marton, in October, for Wm Payne, Esq., produced
 on Monday last a very handsome red and white female
 calf to 2D DUKE OF COLLINGHAM (23,730), which it
 is proposed to call *Queen of Didmarton*.

RURAL SCHOOLS.

The President of the Hampshire Farmers Club, the Rev.
 Frederick Breton, recently delivered a lecture before its
 members, of which the following is an abstract.

By way of a peg on which to hang my remarks, I will
 refer to a statement made a few days since by Canon
 Girdlestone in the *Times* of the state of the school in
 the parish of Halberton. The statement which Canon
 Girdlestone had previously conferred on that parish
 relieves me from any hesitation in referring to it,
 while the exact details with regard to his school which
 he has now published furnish me with the best
 possible illustration of the present parochial system.
 Halberton, with its 7000 acres and population of 1000,
 may be taken in these respects as an average rural
 parish. If the boundaries of parishes (as it is to be
 wished) should ever be readjusted, and their popu-
 lation approximated, Halberton would not be a bad
 standard of acreage and population. The number of
 children attending the school are not much below the
 average proportion, which is about one child over
 17 per head, whereas in many rural
 parishes, is not more than one child to 100. It was, how-
 ever, to utter in a recent paper that Canon Girdle-
 stone made his statement in the *Times* and the *Times*
 endorsed his complaint as applicable not only to
 Halberton, but to all England. And I am free to own
 that if his complaint will bear consideration in
 Halberton, it may be accepted as fairly applicable to
 any parish school under the same system.

Canon Girdlestone's complaint has respect to the
 incidence of the cost of the school. He complains that
 much too large a share falls upon himself as the clergy-
 man of the place, and demands a compulsory transfer
 of that share by the process of a rate to the owners and
 occupiers of property. The cost of the school last year
 was 1371s. 6d., and was thus distributed - 561 16s.
 or more than two-fifths, was provided by the general
 tax-payers, and received as a Government grant, 261s.
 or somewhat less than one-fifth, was voluntarily sub-
 scribed by the owners and occupiers; 241 17s. 3d., a
 still smaller one-fifth, was paid by the parents, leaving
 exactly another one-fifth, which was met by an endow-
 ment of 47s., and Canon Girdlestone's own contribution
 of 221 11s. 3d. In other words, of the 11, which the
 schooling of each child has cost, more than 8s. has been
 paid by the Government, 4s. by the endowment and
 vicar, not quite 1s. by the voluntary subscribers, and
 4s. less than 1s. by the parent. Now, what is the true
 in crease to be drawn from this statement? What is
 the real grievance to be complained of? Is it not that
 the public already does far too much, and the parent
 far too little? Ought not Canon Girdlestone, as a true
 friend of the labourer, to call upon him to do his own
 duty before he acquiesces for an extra burden to be com-
 pulsorily laid upon those who already do voluntarily
 for their neighbour's child more than he is willing to
 do himself? What can that education be really worth,
 to whom the parent contributes so little? I might add,
 how unsatisfactory to their minister must be the
 result of his own example and instruction, if it leaves
 them contented to do so little.

Though I may have the misfortune to differ from
 Canon Girdlestone in some of his views, I have been
 disposed to admire sincerely the energy and independ-
 ence of spirit, even if it borders upon stubbornness,
 which he has shown in fighting the cause he has
 undertaken. I feel it, therefore, difficult to understand
 how he, of all men, should fail to perceive the injury
 that is done to the independence of the English
 labourer by thus stepping in between him and his
 child, and encouraging him to cast upon others one of
 the first duties that belong to him as an English and a
 Christian parent. I can only attribute this strange
 unkindness of good and kind men, that will not let us
 look upon the labourer as one of ourselves, and expect
 from him the feelings and the consequent duties of any
 other good man, to these utterly unfounded views of the
 agricultural labourer's ensaved position in England
 which Canon Girdlestone has taken up and so loudly
 proclaimed. What is that position? Why simply
 this. The English agricultural labourer, instead of
 being an owner or occupier of land, is a dealer in those

that are thin, chalky, and too close to the rock to carry... The yield of the crop greatly depends upon... The seed... I say, have the best seed, which, if... The seed... I say, have the best seed, which, if... The seed... I say, have the best seed, which, if...

Calendar of Operations. May.—Barley is sown in some late districts about the end of May, but it is liable to suffer from the early autumn frosts of such districts, much...

earlier the better, if intended for forage cropping. Drill as in last month. Lupine is also sown throughout May, as directed in April, on poor sandy and peaty soils adapted for its growth.

Rape is sown early, for sheep feed in July. The preparation of the land, manuring, and seeding, are similar to Turnip culture. It is generally sown in rows from 12 to 20 inches apart, on the flat. The crop is well adapted for heavy soils, and is very commonly grown after paring and burning, not only for sheep, but for mowing for stall or yard-fed cattle.

Hoening of spring corn is generally finished this month. Thistles now make their appearance in the rows on land that is cultivated too shallow, and require to be spudded out. Beans, Peas, Parsnips, Potatoes, Cabbages, and Carrots require both horse-hoeing and hand-hoeing, and all these crops require the earth to be drawn well up to the plants in hand-hoeing them.

Grass seeds.—Sowing after the last hoeing is preferred by many to the counter practice of laying down land to Grass at the time of sowing the corn without hoeing.

Turnip foliage on a large area of every province in the kingdom, in the latter part of the land ready for sowing is the result of the late sowing of the crop. On some farms and dairy farms, where the soil is light and the four-course system is followed, a shift of cropping, one year, is made, or the land is annually in the hands of the turnip for several years, however, is generally the case.

It is next ploughed lengthways, harrowed, and carefully weeded, and then rolled, when it is generally ready for ridging for the manure, or for spreading the manure and ploughing it in. But the ploughing is generally preceded by the cultivator, who, with a well-drawn up any weeds to the surface, and then, by a heavy roller, expels them from the plough. The cultivator keeps the natural moisture in the ground, if harrowing and raking be kept well up, and the winter-made mould is thus kept upon the surface, both of which are essential in the successful growth of the turnip.

Notices to Correspondents. FOREIGN PALENT MEAL.—R.N.W. Unless the cheaper price be owing to admixture with trash of any kind, and that is to be ascertained only by an examination of the particular lot for sale, you should not be deterred by the price from purchasing. Our manufacturers are as good at squeezing out the oil as any are, and the foreign meal is likely to be the richer of the two.

Highway J.G. Next week. LAMBS H.G.P. The best method of the operation is that to which the shepherds of the district are accustomed. In a matter where there is ample local experience, the local rules are the safest to adopt, and an old shepherd is as good an adviser in such a thing as a veterinary surgeon.

J. B. BROWN AND CO'S NEW PATENT BB LAWN MOWER for 1889. PRICES REDUCED AND THE MACHINE PERFECTED.

The BB LAWN MOWER (London made) is universally allowed to be, by practical judges, superior to any other—being the best designed, also of best material only, all parts liable to breakage being of malleable iron, and made to standard gauge, all accurately numbered, and the entire Machine fitted and finished in a manner inconceivably superior to any other Lawn Mower manufactured.

Alex. Mackenzie, Esq., Alexandra Park, Muswell Hill—appointed by the Metropolitan Board of Works to lay out their New Public Parks, and to plant the Thames Embankment, thus writes— "I have recommended your Lawn Mower to many of my friends, believing that the machine does its work better than any other, and combines strength superior to Shanks' machine, with the lightness of Green's. Having now four of your Lawn Mowing Machines in constant use on our grounds, and two of these having been in work over a year, I have never had cause to alter this opinion of your machine, which I now have pleasure in giving to you."

The BB LAWN MOWER was selected at the Paris Exhibition, in 1875, by the celebrated Engineer, Mous. Henry, and was also selected by the French Legislative Assembly.

PRICES—NEW PATENT BB HAND MACHINE for 1889. 10-inch } For a Boy { £3 5 0 | 15-inch A Man and Boy £7 10 0. 12-inch } A Man { 4 5 0 | 20-inch } £10 0 0. 14-inch } A Man and Boy { 5 10 0 | 24-inch } £12 0 0. 16-inch } A Man and Boy { 6 10 0 | 30-inch } £15 0 0. Prices of Horse and Pony Machines on application.

Prize Medal, 1867. Every Cottage should be provided with a Water Tank. Iron Cisterns. BRABY AND CO. having laid down more extensive and improved Machinery on their Deptford premises (100 Wares), are prepared to supply WROUGHT-IRON TANKS, GALVANISED or PAINTED, of superior quality, at reduced prices, and at very short notice.

Every Cottage should be provided with a Water Tank. Iron Cisterns.

LISTS ON APPLICATION.

An Illustrated Price List of Wrought Iron, and other of Brass & Steel. Max. & Co., Limited, Fitzroy Works, Euston Road, London; through all respectable Ironmongers.

COTTAM'S HURDLES are made in the best manner, of superior Wrought Iron, by a new method. Illustrated Price Lists on application to Cottam & Co., Iron Works, 2, Winsley Street, Oxford Street, London, W.

COTTAM'S PATENT PORTABLE UNITED FITTINGS.

Their advantages are—Portability, not Fixtures, removable at pleasure, no Woodwork or Partitions to impede Ventilation or breed Vermin, H.P. used with as unnecessary, increased width and depth of Feeding Troughs, Water Cistern, and Patent Drop Cover to prevent over-gorging. Cleanly, durable, and of infection, being all of Iron. Prices of Fittings per Cow 5s. Prospectuses free of Cottam & Co., Iron Works, 2, Winsley Street (opposite the Pantheon), Oxford Street, London, W. where the above are exhibited. Improvements in Stable Fittings just received.

NO IMPROVEMENTS OR ALTERATIONS FOR THE PRESENT SEASON, 1869,

IN

GREEN'S PATENT SILENS MESSOR,

OR

NOISELESS LAWN MOWING, ROLLING, and COLLECTING MACHINES.

The Extraordinary Success of GREEN'S PATENT LAWN MOWERS is an established fact. During the last five years the demand has been unprecedented, and alone is a proof of their superiority over all others. The following are their characteristic features:—

- 1st. Simplicity of Construction, every part being free of access.
- 2d. They are worked with far greater ease than any other Lawn Mower.
- 3d. They are the least liable to get out of order.

From the fact that these MACHINES are so well known in Great Britain and Ireland, also on the Continent of Europe, T. GREEN AND SON do not deem it necessary to trouble the Public with a list of the numerous Testimonials that they have received from time to time, but would simply add,

THEY ARE THE ONLY MACHINES IN CONSTANT USE AT

THE ROYAL HORTICULTURAL SOCIETY'S GARDENS, SOUTH KENSINGTON
 THE ROYAL BOTANIC GARDENS, REGENT'S PARK
 THE CRYSTAL PALACE COMPANY'S GARDENS, SYDENHAM
 BUCKINGHAM PALACE GARDENS
 MARLBOROUGH HOUSE

THE HYDE PARK GARDENS
 THE WINTER PALACE GARDENS, DUBLIN
 THE DUBLIN BOTANIC GARDENS
 THE LIVERPOOL BOTANIC GARDENS
 THE LEEDS ROYAL PARK

THE HULL BOTANIC GARDENS
 THE BOTANIC GARDENS, BRISTOL
 THE SUNDERLAND PARK
 THE PRESTON PARK

AND IN MOST OF THE PRINCIPAL PARKS, SQUARES, ETC., IN THE UNITED KINGDOM.

HORSE, PONY, AND DONKEY MACHINE.

GREEN'S PATENT LAWN MOWERS

have proved to be the best, and carried off every Prize that has been given in all cases of competition. Since the first year they were introduced (1836), upwards of 46,000 have been sold, and 25,000 of that number during the last five seasons.

T. GREEN & SON warrant every Machine to the entire satisfaction, and if approved of can be returned unconditionally.

PRICES of HORSE, PONY, and DONKEY MACHINES, including Patent Self-delivery Box; Cross Stay complete, suitable for attaching to ordinary Chain Traces or Gig Harness.

PONY AND DONKEY MACHINES.

To Cut 26 inches	£18 0 0	} Leather Boots for Donkey, 18s. } Leather Boots for Pony, 22s.
" 28 "	15 0 0	
" 30 "	17 0 0	

HORSE MACHINES.

To Cut 30 inches	£21 0 0	} Leather Boots for Horse, 30s.
" 36 "	24 0 0	
" 42 "	27 0 0	
" 48 "	30 0 0	

Both the Horse, Pony, Donkey, and Hand Machines possess (over all other Makers) the advantage of Self-sharpening. The cutters being steel on each side, when become dull or blunt by running one way round, the cylinder can be reversed again and again, bringing the opposite edge of the cutter against the bottom blade, when Machine will cut equal to new. Arrangements are made that the cylinder can be reversed, by any inexperienced person, in two or three minutes.

HAND MACHINES.

" 24 "	..	9 0 0	" "

Packing Cases are charged at the following low rates, viz. —for the 10 and 12-inch Machine, 3s; 14 and 16-inch, 4s; 18 and 20-inch, 5s; 22 and 24-inch, 6s. Persons providing themselves with Lawn Mowers are recommended to purchase the cases in which to stow them away, when not in use, to prevent them from getting damaged, and returned, two-thirds will be allowed for them.

The above MACHINES are made from the best materials, and of superior workmanship; are delivered Carriage Free to all the principal Railway Stations and Shipping Ports in England, Ireland, and Scotland.

HORTICULTURAL and AGRICULTURAL IMPLEMENTS, GARDEN SEATS and CHAIRS, FOUNTAINS, VASES, PLAIN and GALVANISED WIRE NETTING and ORNAMENTAL WIRE WORK of every description.

Having very extensive Premises in London, we are in a position to do all kinds of Repairs there, as well as at our Leeds Establishment.

Having a large quantity of MACHINES in stock at our Leeds and London Establishments, we are in a position to execute Orders on the day they are received.

THOMAS GREEN AND SON, SMITHFIELD IRON WORKS, LEEDS;
 and 54 & 55, BLACKFRIARS ROAD, LONDON, S.

HOTHOUSES FOR THE MILLION.

AWARDED A PRIZE MEDAL, INTERNATIONAL EXHIBITION, 1862.

ON THE PRINCIPLE INVENTED AND PATENTED BY SIR JOSEPH PAXTON, M.P.

Combining Simplicity, Cheapness, Excellence, and Durability. Being capable of fulfilling in the most perfect manner all the requirements of Horticulture.

"Nothing can be more easy than to build them, nothing more simple than to remove them" *Daily News, May 22, 1862.*

MANUFACTORIES:—LONDON, GLoucester, COVENTRY, ULVERSTONE, PAISLEY, and ABERDEEN only.

ESTIMATES given for ORNAMENTAL CONSERVATORIES, GREENHOUSES, &c. to Designs, Sketches, or Specifications; also for HEATING APPARATUS, and complete anywhere in the United Kingdom. REFERENCES can be given to works executed in every County of England, and to many in Scotland and Ireland.

ILLUSTRATED CIRCULARS with LISTS of PRICES of the PATENT ROOFS, with Views of Conservatories, can be had on application to

MESSRS. HEREMAN AND MORTON, 7, PALL MALL EAST, LONDON, S.W.

The THIRD EDITION of a HANDBOOK of VINE and FRUIT TREE CULTIVATION, as adapted to the above Patent Hothouses, containing Illustrations, Hints for Heating Houses, and General Directions for Cultivation, &c., by S. HEREMAN, Chatsworth, price 1s., post free, 1s. 1d.

The instructions given for the cultivation of the Vine and other crops are essentially practical, and are evidently written by one who has himself performed all the operations before he attempted to instruct others.—*Cottage Gardener, October 6, 1863.*

"None who take an interest in the construction of Hothouses, or in the management of their contents, should fail in adding this to their collection, however complete that may already be."—*The Farmer, Nov. 13, 1867.*

"The cultural directions have the great merit of being concise and clear"—*Gardeners' Chronicle, Nov. 30, 1867.*

Crystal Palace, Sydenham, March 2, 1867

Messrs. WARNER & SONS.
"GENTLEMEN,—I feel great pleasure in stating that I was present at a trial of your small Crystal Palace Fire Engine, and was much pleased with its efficiency and simplicity. The Pump throws out a steady jet of water to a height of 50 feet with very little labour. The Pump we have is well made, very simple in its parts, and not likely, I think, to get out of order. The advantage of this pump is its being very portable. Besides being a good Fire Engine, it will make an excellent Garden Engine."
"I remain, gentlemen, yours obediently,
"Edwin Ross, Engineer to the
"Crystal Palace Company"

Drawing and Estimates for Wind Engines, Water Wheels, and Hydraulic Machinery of every description for Steam, Horse, or Hand-power will be forwarded upon application.

SAMUELSON & CO.'S
NEWLY PATENTED EDGE-CLIPPING SILENT LAWN MOWER
 THE MOST IMPORTANT IMPROVEMENT EVER INTRODUCED.

MESRS. SAMUELSON AND CO. REG. TO DRAW SPECIAL ATTENTION TO THEIR NEW LAWN MOWER for 1886. Which are fitted, when required, with a new EDGE-CLIPPING arrangement, superseding the tedious operation of Clipping by hand. All Machines fitted with new Silent Bearing giving perfect freedom of noise when at work. Catalogues, with descriptions and prices of the new Patent Edge-Clipping Silent Lawn Mower, on application.

SAMUELSON AND CO., BRITANNIA WORKS, BANBURY.

GREEN'S IMPROVED PATENT ROLLER,
 FOR LAWNS, DRIVES, BOWLING GREENS, CRICKET FIELDS, and GRAVEL PATHS SUITABLE FOR HAND OR HORSE POWER.

PRICES OF HAND ROLLERS.

Diam.	Length.	£ s. d.
30 inches	32 inches	7 10 0
24 inches	26 inches	4 10 0
20 inches	22 inches	3 10 0
16 inches	17 inches	2 15 0

PRICES OF ROLLERS FITTED WITH SHAFTS, SUITABLE FOR PONY OR HORSE POWER.

Diam.	Length.	£ s. d.
30 inches	32 inches	10 10 0
30 inches	42 inches	11 10 0
30 inches	48 inches	13 10 0
30 inches	60 inches	15 10 0
30 inches	72 inches	17 10 0
30 inches	84 inches	19 10 0

These Rollers possess many advantages over all others; they are made in two parts, and are free to revolve on the axis, affording greater facility for turning, and the outer edges are rounded off, or turned upwards, thus avoiding the unsightly marks left by other Rollers. They are manufactured of the best materials, and are got up in a manner surpassing any ever yet brought out. The rollers 24 by 26 inches, 20 by 22 inches, and 16 by 17 inches, are made in one part, at a reduced price, and, for Rollers of that size, will be found to answer many requirements. The handle can be reversed to either side of the Roller at pleasure.

PRICES—24 in. by 26 in., £4; 20 in. by 22 in., £3 2s. 6d.; 16 in. by 17 in., £2 10s. Delivered Carriage Free to all the principal Railway Stations and Shipping Ports in England.

SHANKS'S PATENT LAWN MOWERS FOR 1869.

UNDER THE PATRONAGE
OF
HER MOST GRACIOUS MAJESTY
THE QUEEN,

AND MOST OF THE
PRINCIPAL NOBILITY
OF
GREAT BRITAIN.

The Patent Improvements recently introduced give Shanks's Machine several important advantages possessed by no other Lawn Mower.

PATENT DOUBLE-EDGED SOLE PLATE, WIND GUARD, &c., &c.

THE UNPRECEDENTED SALE FOR 1868 BEARS TESTIMONY HOW MUCH THESE ADVANTAGES HAVE BEEN APPRECIATED.

THE FIRST PRIZE MEDAL
OF THE
INTERNATIONAL EXHIBITION,
LONDON, 1862.

HAND MACHINE.

THE FIRST PRIZE SILVER MEDAL
OF THE
UNIVERSAL EXHIBITION,
PARIS, 1867.

ALEXANDER SHANKS AND SON, in presenting their "PRICE LIST of LAWN MOWERS for 1869," have much satisfaction in intimating that among all Exhibitors of Lawn Mowers at the Universal Exhibition of 1867, they are the only Firm to whom the Jury have awarded a Medal.

A. S. AND SON have, in addition to the PATENT DOUBLE-EDGED SOLE PLATE and WIND GUARD, made very great Alterations and Improvements in the Machine. These alterations, which were introduced last Season, have now undergone an effectual trial, and the result has been so successful as to enable A. S. AND SON to offer a Machine which far excels any other that has ever yet been offered, *whether for ease in working, certainty of action, or durability.* It has only to be compared with other Machines, when its superiority will be at once seen and understood.

PRICES—INCLUDING CARRIAGE TO ANY RAILWAY STATION OR SHIPPING PORT IN THE KINGDOM

WINDOW GARDENING IN TOWNS.

I was highly gratified with "Lina's" remarks upon this subject. On a recent visit to the commercial metropolis of Glasgow I remarked the prevalence of window gardens almost every window of the town was a window garden. Many are of the most beautiful, others are furnished with many of the grasses and ferns with admirable cultivation. There are numerous large houses which are described as having parterres painted or repainted fitting into the window and with earth unfurnished with flowers of the summiest description or hung as Lina points out, or penny packets of gas Anemones—with Maurandias, Nasturtiums, Canary Crocuses or Convolvuli, hanging down gracefully over the heads of the passers-by, or climbing up the sides of the window, and shaping the sky line with floral arches of beauty. Others again substitute tiles or stoneware, china, or ornamental iron boxes, for wood. Some of these window boxes are highly artistic, better patterned, and give a taste first to the front of the houses.

But the difference in the treatment of these gardens is as nothing to the varieties in structure and form of the upper stories. For the most part one is used that probably a majority of these spaces are not used at all, but green or hothouses to boot. For the purpose of keeping out the blacks and improving the climate, immense numbers of them are converted into green or hothouses. The simplest mode of effecting this transformation is the following—Squares of glass, of the desired height, are pushed firmly down into the soil along the front and ends of the window garden. A large square of glass is then carried across from the window to an arch beyond the glass side of the box. This forms the roof. It is held in position by two or three pieces of hoop iron being carried up from the side of the box to the height of the front of the roof and ends with a bar of iron across the front edge of the glass. A square of wood or a similar bar of iron is also carried across the top of the box with a hook at each end, and the roof is supported about halfway across the box by a similar bar of iron. One of these took the form of a simple arrangement, the greenhouse being supported by a simple arrangement of iron rods and being all tight. Even ruder contrivances than this may be met with. Invention has been severely taxed in the matter of glazing. I believe every known method has been illustrated in these window gardens in Glasgow. And the modes of fixing in the glass can hardly be more varied than the shape of these tiny houses. You may see curves of all forms, lean-to's, spans, half spans, ridge-and-furrows, domes, bells, glass steeples, quadrants—all shapes are pressed into use. The most elegant are perhaps the semicircular roof, sweeping down from the top or middle of the window to the surface of the garden. Very ingenious devices are used for ventilation, and most of the expedients known in gardens, from the removal of a pane of glass by hand, to the

opening of crossing of vent at big spaces, have been applied to these interesting miniature glass houses. The most common height of the glazed sash of the gardens reaches to the top of the bottom sash of the windows. The under sashes are capable of being slid up or doubled back throughout their entire length. Two glass sashes are attached to the top of the upper sash, and is often attached to it. In that case the pure air must either come into the room, or be admitted through the window, or be admitted through the door. The latter is objectionable, as it creates draughts and the plants, and runs the risk of vitiating the air by the outside air. In rooms where each window is furnished with its garden, the glass sash can be attached to the window frame, but to an extra bar, and the upper sash be left free to move at will. It is important that the ventilation of the room should be separate and the window garden should be in danger of being over-heated by the air while their plants will either have too much, or the living room too little air, unless the one is rendered quite independent of the other. This danger guarded against, nothing can add more to the enjoyment of a home than these glazed window gardens. We have heard a good deal lately about window greenhouses, but in these glazed window gardens possess all the merits of the most perfect portable window greenhouse. We can adjust the glass sashes, our gardens, or shut them out of our living rooms or bed rooms at pleasure. And that is the power of shutting out the sun, or entering in a great extent in the enjoyment of a window greenhouse, but it is also of the utmost importance to the health and beauty of the plants. Supposing, for instance, such a garden is furnished with tender plants, it is necessary to close the tropical heat and excess of moisture within the limited area. On the other hand, if it is not heated, and the night is cold, throw up the window, and the heat of the room will preserve the plants from frost. But morning comes and with it the sweep or the house-maid down with the window, and preserves your plants from a dusky and glib breakfast of soot and dust. The window garden, placed ever so closely, must never induce its owner to respire with the window. This inner barrier of glass is needed to separate between the two forms of life. Our object is to keep the plants there is to have a maximum of enjoyment from them with the minimum of injury to the plants or ourselves. As to the plants which are to be grown in these window gardens, almost any known plant may be made to grow in them. Their areas are necessarily limited, but, fortunately, more can be developed in these window gardens, and even size may be had within reasonable limits. It would therefore seem superfluous to enumerate lists of plants suitable for cultivation in such structures. Among tender plants few could be more suitable than the hardier Caladiums, Begonias, Ferns, and Mosses. Amid curious plants there are the Cacti, Melocactus, Echeverias, Mesembryanthemums, Saxifragea, and all the various races of succulents. For the general run of such gardens there are the Pelargoniums of all kinds and colours, forming a host in themselves, sufficient to fill all such gardens with beauty throughout the year. Then there are the Fuchsias, of which almost the same might be said, with Petunias, Balsams, Verbenas, Chinese Primroses, Chrysanthemums, Camellias, Indian Arizans and the easier grown Heaths, Cystisus, and Coronillas, all admirably adapted to enter window gardens at the various seasons of the year. The whole host of bedding plants, whether grown for foliage or flowers, will thrive in such situations with proper care, while in the wall-glazed little house Achimenes, Gloxinias, Begonias, and all such plants will grow well, flower in summer, and give the lower half of the window a tropical richness, even though the upper half reveals the proverbial leaden skies of the northern parts of Britain. Almost every wild or common garden plant may be found in these window gardens, and I confess that I look upon the rough boxes of the poor and the struggling classes with most interest. There was something pathetic in noting the efforts of the poor to bring some fragment of the beauty, purity and freshness of the country to brighten up the dark, close, stifling garrets, and dark, dreary cellars in which so many of them are doomed to dwell. I had the privilege, or pain, for it was both—of visiting some of the worst parts of Glasgow in company with a city missionary, and I found the love of flowers, as proved by their possession, to be almost universal among the lowest classes of society. It would have humbled the pride of many professional call-vaters to have seen the poorest of these wretched creatures, some of the most wretched of the race, to be the only gardeners that I met in the most depths of the city. It was the one ray of hope and the one bright spot in the lives of these poor men to man but birds man to his Maker and who can tell how many may have been drawn back by their gentle saint ministry to duty, virtue, and goodness, after another ministry had failed. But leaving the regions of wretchedness and glacially ascending the social ladder to the ranks of industry, we seem to breathe the fresh air of a new world, and while we gratefully note how much clearer and purer it is, we cannot but be aware that it is now so heavily laden with the fragrance of flowers. There are for these among the working poor of Glasgow seemed universal. Much of their time at home is spent in cultivating, and most of their short holidays in collecting flowers for the window garden. The following sample of flower-hunting, in which I shared, is given as a fair illustration of the means used to

furnish these windows. I was gratified to find them filled at a cheap rate through the day a trip to Stirling was proposed, and Glasgow friend—every window in whose floor had its window box or garden—was particular about providing, before starting, two or three large pocket-handkerchiefs, and a box of soap. No sooner had we cleared the streets than the reason of our carrying these things was made known. The water events it must be known—yes, the water was fished out of the pond. He had had one thing like it, before, and it had had two windows and expanded two or three times. We also hunted for Mosses, Lichens, and ends, to set off the "other tower window." Some fine Daisies, Bachelor's buttons, and Gardeners' Garters, had been seen in the latter's garden, and some of the same flowers to be seen in others, that the garden took more of the old place at home. The mixture looked better than if they were all wild or tame. A week's cause of the day or an expression of respect to—"It's just a grow year ago in the auld house at my order" was generally sufficient to transfer a handkerchief from the cottage gardens to the handkerchief. Oocas was a of something was given in exchange, and the handkerchief seemed to change hands during the garden to the handkerchief. But the sometimes met with the "ready ye're welcome to the bit flowers, bars and handkerchiefs" which were spent at home, but when the handkerchief was given, the wife had to be given to the wife. "Kent him" was a year ago, when the wife and handkerchief were as a handkerchief. A woman's love of make the whole world know. During the whole of a year there had been the collection of out with an energy and enthusiasm as to any other country; and called with a most together of the world. At last enough of better. Well, man, I an array of flowers, and the the station. So I went to town for a day, and I had a new record of an of some with a bearing him. Lack of the collection of flowers their success at the window garden, this passage of the handkerchief compared to the handkerchief when we reached the window with its handkerchief and a toast, sweet cake, and a tea-table and more attraction. My friend seemed to be in a preserve. The flowers were here or there, but they were shed now, but they were pairs of tiny hands with living tenderness, or clapping, while their little feet actually about for very gladness of "Oh you little dainty!" addressed heard from tiny lips, and old ones. Every vase, glass, and even the old less tea-pot were in it, tant ready and no sooner were all the duty overflowing handkerchiefs were made treasures. That room, in the heart of the city of Glasgow, was transformed into a representation of the flora of Scotland. I confess that, amid all these things, I felt a gathering lump in my subdued my cravings for tea; more than any one when all the of the beautiful was at last man lane pleasure of giving and standing that as the handkerchief, which every day I was to renew the window gardens on the morning undertaken with fear and trembling bold face upon it, and began to of the windows with the handkerchief to the ringing in of the new. However, nearly brought me to ground, had lead-looking bits, as I soon had spread, or reverenced as home had been carried from the battle-field that been brought from Burnside Hill, and that little plant of a struggling "wee bit o' the Maiden's Blush" that front of the handkerchief. These things must be done, and the handkerchief had to be inserted, and the window and room must be kept for the window they must be made to grow. The handkerchief was a very good one, and I very much enjoyed over these window gardens. I had done since over far more matters came at last, and it was a little bit never "lookit see pretty at the window." Every window garden is more or less

beautiful, but unfortunately the weather... The Victoria house... the most spacious I have seen, but it is not... contain anything worth particular notice... of the month, or even before June or July... course considered as a sanctum... is admitted without special... however, through the glass... and contains only a limited... of plants.

I am told, 34 houses here, but I do not... however, that a good few of these houses... such plants as in England and other... in winter. They... at least from 40 to 50 pairs... There are two species of houses for tropical... Avocets, Yuccas, Cordylines, &c., but... and many of them are what... called Tree Ferns, having trunks, if... to describe them, from... and fronds about 6 feet long, so that... at least a space of 12 feet.

of a *Blatantium*, which has a... 2 feet thick and from 3 to 4 feet high;... it during the winter it was quite bare, ... about a dozen young fronds are shooting... could think that in the course of a month... be beautiful. What promises to be the... of all the Tree Ferns, is one which is... and about which I have not yet succeeded... any information; the stem is fully 7 feet... inches in diameter. It has been nursed... time, and is at present bound up with a little... but the young fronds are shooting out freely... of them are nearly 3 feet long.

Several remarkably fine specimens of... from Van Diemen's Land, ... similar... 1 foot high, and fronds from... these large and beautifully... there is an extensive collection of small... benches or shelves near the glass all

of the Agaves there are some eight or ten, about as... any I have ever seen. Some of the Yuccas too... plants, from 3 to 7 feet high... other plants remarkable for their handsome... there are several specimens of *Encopha...* and *E. caffer*; the latter has... feet high, and the head is at least 8 feet... Another large and beautiful *Cycad* is called... *Peroffskiana* (Begel), this plant is about... diameter. It was introduced from Mexico... Peroffsky, formerly director of this garden... to be the only one of the kind in Europe... *revoluta* has a stem fully 6 feet high, and... 9 feet in diameter.

You are already acquainted with an Ivy... named *Hedera Helix* var. *dentata*... among the Ferns with several other... leaves are about 6 inches in... with in late prickles, not teeth... Apart from its technical characters, ... the best *Hedera*s in cultivation... and *Hedera Helix* var. *maculata*, ... distinct in outline, and slightly... *H. Helix* var. *Wagneriana* is a fine large... regular at the margin.

I wrote you the other day I have had... the preparations for the Exhibition, ... now better able to form an idea of their... I find that the house, or series of houses, ... before are being arranged as stores for... of plants which it is intended to flower... opening of the Exhibition, which will itself... whole of the riding school adjoining a... and well-lighted hall, about 150 paces long and... 50 paces wide. A large doorway has recently been... in the wall, which will serve as a communica... to the Exhibition and the plant-houses. A... number of workmen are busy arranging... which will be laid out as a garden. At... rockwork and mound are being formed, ... visitor may obtain a general view of... but there is a great deal to be done yet... like design can be seen, for the... alterations have recently been set to... recently. I should say there will be... for the windows are large and nume... would have been a great advantage if the... were 10 or 15 feet higher. However, I... a better place for an exhibition of flowers and... easily be found. The Neva has been... for 8 or 10 days, and the bargemen are... direction. The weather at present is... I think this year the navigation will... sooner than usual, so that those who... from England and other countries with... or plants to the Exhibition, are likely to be... this soon enough if they come by sea. K.

MARTZBURGH, NATAL.—The great want in this... is timber. Along the coast there is a belt of bush, ... in the interior timber in the kloofs or ravines, but... the plains, for miles upon miles, not a tree is to be... Then you come to a thorn district, where the... scattered about, gives the country a park-like... appearance, as it has indeed all along the coast, ... where the scenery is sometimes very beautiful indeed. ... The native woods all grow very well at the same eleva... and with the same shelter as they have at home... they won't do in the open. The Blue Gum and... Wattle and Willows of Australia will do well, but... require much care and cultivation. They will not do... to take care of themselves; they may live, but

they will not thrive, though if taken care of, their growth... is rapid in the extreme. I saw... Gums raised from seeds and plants... last three years, and many of them... 30 feet high. The tops of the... are flat, table mountains being found... The character of the soil is very fertile... of Wattle. The only trees to be seen... in the garden are the Wattle, the... the richness of the soil as some assert—may be... gathered from this. I had to enclose my garden from... the open "held" or common, and to break up and get... the land in order, and have now in the fences and... banks, Oak, Ash, Elm, Furze, Poplar (all English)... Blue Gum, Willow, and Wattle (Australian); also... Aloe and Prickly Pear (American). The Banana is... in good bearing with the Walnut and Hazel close by, ... the Pomegranate and Raspberry alongside each other... The Fig and the Ribston Pear, the Strawberry, and... China, Arrowroot, and Cabbage—the latter the richest... I ever ate. Cotton and Tobacco, the Peach and Pome... granate are grown together for fences, the former so... that I feel my eyes in them, and yet with... and stock of all kinds in the garden... in an almost hopeless state of insolvency.

Societies.

ROYAL HORTICULTURAL May 4.—James Bateman... F.R.S. in the chair. At the conclusion of the... usual preliminary business of the meeting the Rev... J. Dix, in announcing the awards made by the Floral... Committee, directed attention to the various objects of... interest and beauty brought before them, and more... especially to some flowers of *Menyanthes trifurcata*, a... beautiful British plant that is found growing in... marshes and which was said to be the property of Mr... Earley at E. Power, Esq., Dagenham Park.

The Rev. M. J. Berkeley, in addressing the meeting... first referred to the arrangements made regarding... the prize for the best collection of *Narcissus*, and... said that in consequence of it was found impossible... to get a great number of species in flower at... the same time, in consequence of the flowering... periods of the different species extending over a con... siderable time. He then informed the meeting that it... had been decided to open the competition at the next... meeting, May 18, from which time a record would be... kept until the termination of the contest at the first... Tuesday meeting in April, 1870. He further stated, that... when the prize was first offered it was not intended... that garden varieties should be admitted into competi... tion, but only true species; but it was now decided... that all marked varieties should be included, and that... it would be left at the option of the judges to disqualify... false varieties that were exhibited.

(Mr. Berkeley) then exhibited a specimen of what was... called *Narcissus biflorus*, though it was not always two... flowered—as in some instances he had found five flowers, ... and sometimes only a single flower. In all probability... the plant in question was a hybrid, as it appeared never... to produce ovules. He then alluded to the new form of... *Colerix* exhibited at the Floral Committee. Mr... Berkeley then called attention to the new *X Dieffenbachia*... *nebulosa* was a cross between *Wendlandia picta*, raised... by Mr. Haase. In allusion to the one shown by Mr... Standish, Mr. Berkeley stated that some of the Marquis... possessed many fine specimens of *X Dieffenbachia*... *campestris*, and *X Dieffenbachia* var. *platanoides*, were... desirable of it. With reference to the *Narcissus*... shown by Mr. Standish, Mr. Berkeley stated that out of 1000... seedlings raised between *annuncium* and *Muricoides*... only 12 resembled the female parent. Attention... was then called to some sports of *Croton variegatum*... all produced on the same plant. A specimen was also... made to an *Urtica* like plant, called *Urtica*... *spectabilis*, so named on account of its poisonous bark. ... It belongs to the same family as the *Oleander* and the... *crispata* plant of Malabar. A specimen of *Urtica*... *florida*, a common *Urtica*, from Abyssinia was then... exhibited. Mr. Berkeley then repeated the observa... tions made at former meetings, respecting the growth... of Truffles; and with reference to the mildew on *Roses*... stated that it could be cured, as was also the case... with the Hop and Vine Fungus, because the... mould grew on the surface, and not within... the substance of the leaf. Some flowers of the common... *Baccharis Button* (*Lychnis dioica*), in which the... anthers were affected with Fungus (a species of... *Ustilago*) were then shown. In this case Mr. Berkeley... observed that the spores must have travelled from the... plant. Alluding to the advertised nostrums for... destroying smut, mildew, &c., Mr. Berkeley stated... that at these were in some cases fallacious. But Mr... Berkeley said, might be remedied, but mildew and... smut could not be entirely eradicated, but the... large to enter the stomata of the plant, and the spores... in germinating, produced fine threads, capable of... penetrating these apertures. The best remedy in... the case of smut had been found to be a mixture of... Glauber's salts and quicklime. A Tulip was then... shown with numerous excrescences upon its petals, of... the same character as those so often seen on the leaves... of Cabbages.

Mr. Bateman then made some comments upon the... objects exhibited, and, in conclusion, informed the... meeting that the band would play in the garden on... every Tuesday and Saturday afternoon during the... London season.

SCIENTIFIC COMMITTEE May 3.—Dr Thomson, F.R.S.,... in the chair. Mr. Berkeley stated that he had examined... the specimens of Sugar-cane alluded to at the last meet... ing (see p. 447). He had found that the ducts in the... lower portions of the culm were more gored with... upwards to the hearts of the young shoots, which... matters, might have caused the peculiar pink discolora... tion that was observable in the canes. Specimens of diseased Peach shoots and of Vine... roots, similar to those before alluded to, were shown. ... With reference to the latter, Mr. Berkeley stated that... which injures the roots. The leaf-insect is not only... itself larger, but its eggs are larger also. Specimens of... the roots of *Conifers* were exhibited, which had been... attacked by the *Conifer* root-insect. The insect was... killed. Vine roots were shown which were... with mycelium of the common *Muscardin*. Some... specimens of *Conifers* were shown which had been... attacked by the *Conifer* root-insect, and that the birds... were stripped off the... however, nothing to indicate the... hypothesis.

Dr. Masters... Mr. Berkeley stated that he had examined... the specimens of Sugar-cane alluded to at the last meet... ing (see p. 447). He had found that the ducts in the... lower portions of the culm were more gored with... upwards to the hearts of the young shoots, which... matters, might have caused the peculiar pink discolora... tion that was observable in the canes. Specimens of diseased Peach shoots and of Vine... roots, similar to those before alluded to, were shown. ... With reference to the latter, Mr. Berkeley stated that... which injures the roots. The leaf-insect is not only... itself larger, but its eggs are larger also. Specimens of... the roots of *Conifers* were exhibited, which had been... attacked by the *Conifer* root-insect. The insect was... killed. Vine roots were shown which were... with mycelium of the common *Muscardin*. Some... specimens of *Conifers* were shown which had been... attacked by the *Conifer* root-insect, and that the birds... were stripped off the... however, nothing to indicate the... hypothesis.

Bougainvillea speciosa.—This plant is certainly when properly treated, one of the most lovely of all stove climbers. A few days since I visited Sandbeck Hall, the seat of the Earl of Scarborough, and I then had the pleasure of seeing this Bougainvillea in the highest state of perfection.

Garden Operations

(For the ensuing week.)

PLANT HOUSES.

THE temperature of Orchid-houses proper should now be gradually advanced to the full growing maximum, which, during bright sunny weather, may reach to a mean of about 90° in the latter part of the day.

are dug, or forked over, however, a small quantity of manure should be added.

KITCHEN GARDEN.

The remarks which I have offered above, turning up or digging light open soils during hot weather have equal, if not more value, in such grounds, if they are light, should be immediately after the heavy weather and the ground is moist.

TWO GARDENING.

THE following hardy annuals will all succeed well sown now in the manner I have previously directed. They will also produce their flowers in July, August, and September if the patches are frequently watered during the summer.

STATE OF THE WEATHER AT CHISWICK, NEAR LONDON. For the Week ending May 5, 1889, as observed at the Horticultural College.

Table with columns for Day, Max, Min, Mean, Wind, Rain, and other weather metrics for the week ending May 5, 1889.

Apr. 29 Fine, at and overcast, with drizzle. May 1 Very fine, foggy and calm, with drizzle.

STATE OF THE WEATHER AT CHISWICK, NEAR LONDON. During the past 24 hours, for the evening week ending May 1, 1889.

CULTIVATION IS
SUTTONS' CHAMPION.

SUTTONS' CHAMPION SWEDE.
The most productive, and best shaped Purple-topped Swede in cultivation.

Price 1s. per lb.
Lowest price for large quantities quoted on Carriage free to any Railway Station.
It is character as the best Swede in cultivation. It is a large purple-topped yellow variety, perfectly hardy, and of one of the most uniform shapes, and remarkable for its freedom from coarse roots. It has taken for many years the title of the Prince Consort's Swede, and is the variety which the Royal Horticultural Society, the Royal East London Horticultural Society, and the Society of Agriculturalists, and numerous other Societies have awarded prizes to. Some very fine crops of 10 lbs. each, grown by one of our customers, and exhibited on our stand at the Smith's Exhibition, attracted marked attention.
For sale at Poplar House, Spryngton
I had this year 10 acres of your Champion Swede, and they grew in my neighbourhood. I am on your side.
Mr. J. M. Wharton, Esq., Manor House, Tynnington.
I took several prizes last year with crops grown amongst them was a £10 prize for the best and there is no better Swede than the Champion.
Mr. M. Wharton, Esq., Gouthorpe Lodge
I am aware you are aware that in a great seed catalogue you have put in your Champion Swede, but your variety is the best I have ever grown.
Mr. C. Moore Stevens, Esq., Wincott
I won a Ten-Guinea Silver Cup last year for your Champion Swede.
Messrs. Dixon & Son
We grew some splendid Champion Swedes from your seed last year.

SATURDAY, MAY 8, 1869.
MEETINGS FOR THE ENSUING WEEK
May 10 { Royal Agricultural Society (Lecture in the Society's Rooms, 12, Hanover Square, by Dr. Voelcker, on "Results of Chemical Investigation.")

In the course of the recent Election Addresses one candidate, in speaking of the Irish Question, referred to the Land topic as one too lengthy and complicated for the popular treatment necessary on such an occasion, and intimated his purpose of entering into it in fuller detail on some more suitable occasion. We look upon all land subjects as our own; and we shall be glad to see the promise carried into effect.

It would be idle to attempt to hide from ourselves the fact that after the settlement of what is called the 'Irish Church question,'—(not very accurately; for, Establishment and Endowment are not the Church, but its official clothing, and habiliments,) that after this, must come the Land question: and it has already long become the fashion to say that this will prove the more difficult question of the two.

Very likely. But difficult or not, it must be met. For, what alternative is there? If there be evil to be remedied, or error to be amended, it must be done. England cannot afford, year after year, to

"Split itself,
And go to buffets with the other half"
in the person of that close-adjointing country whose relation with it must, like that of a wife, be either a vital element of national strength, or an essential weakness, a 'Thorn in the flesh,' close, constant, and besetting. It is not really a question of Party: be it Whig or Tory, Conservative or Liberal, it is a matter that must be dealt with. It cannot be done in a passion. It can only be dealt with by the most judicial treatment. In the present day, national justice cannot be denied, or deferred: and if it could, the Government of this country is not one that would deny, or delay the remedy of a proved wrong. We should not permit either in our own case; we must not in the case of our fellow subjects.

But there is one great difference between the Church and the Land Questions—and it is this: that whereas in the former case we are satisfied with the institution which we ourselves enjoy, and erred perhaps only in trying to force the cap that fits our head, upon another skull of widely different shape and size—in the latter case, we have a system at home which is condemned by—we might almost go the length of saying—every one who has taken the trouble to understand it. Indeed, if we were asked what one thing is left for an Englishman to complain of, what one

to answer for. Certainly a rabbit... Mr. Robinson, when about to deliver... Mr. Newdegate mourned over... Mr. Newdegate mourned over... Mr. Newdegate mourned over...

barrenness to luxuriance and abundance. One's memory is treacherous, but we find it difficult to remember a year when Grass was so good... The same remark will apply also to the Wheats... The Oats are now well up and with the exception of a few suffering from the ravages of wireworms, are planting well...

them up; but we do not commit the common error of giving our hens a "warm breakfast." Many of our... Assisting Chickens out of the Shell.—I have read with much interest the poultry articles in your Paper for some time past.

Reviews. Plans, dedicated to the Landowners of Carmarthenshire and Pembrokeshire. By John Frederick Vaughan, Earl of Cawdor. W. Ridgway, London, W. 1869.

The fine weather occasioning such a rapid growth of Grass, combined with the present and probable future high price of beef, have made fresh beasts very good to sell, and the demand appears almost to exceed the supply.

Assisting Chickens out of the Shell.—I have read with much interest the poultry articles in your Paper for some time past. Last week's article contains these words—"We have hardly ever known the dry-handed assistance to be successful."

The Poultry Yard.

ECONOMY IN FEEDING CHICKENS. Those who keep chickens know very well that if all the feed that is given to them has to be purchased, the profit arising from keeping them is very small.

The Quid of Tobacco.—Thanks to you and to "J. N." of Colchester, for his letter, appearing in your Journal of February 27, on the efficacy of the "quid of tobacco."

Miscellaneous.

Emigration.—The class of people at home that would most immediately benefit themselves by emigrating to Canada are the agricultural labourers.

Farm Memoranda. ALLEBY HOUSE, CHATERRIS, CAMBRIDGESHIRE. The cold and wintery weather of March was followed by a showery and growing April.

Another strong inducement Canada holds out to this class is in the facilities afforded to boys and girls of getting situated in what they can, from the first, maintain themselves, learn the ways of the country, and by degrees become prepared for commencing something on their own account. How many happy mothers of families have I seen in this fair Province of Ontario sorrowful by all the soul comfort of life, and with equally good prospects for their children, who had they remained in the old country would scarcely have had a chance of rising higher than becoming the wives of farm labourers, who must struggle hard for the barest means of physical existence. I told the people at home that Canada was pre-eminently the country for the poor man, who, possessing the qualifications of health and strength, sobriety and industry, need have no fear of making progress, although he might arrive among us without a penny. The experience of thousands will confirm this statement. But it must never be forgotten that success essentially depends upon the possession and exercise of the qualities before mentioned, and that this is no country for the frivolous, the idle, or the dissipated. People of the sort usually blame the country for their want of success, instead of blaming themselves, as they ought to do. *Professor George Buckland in the "Ontario Farmer"*

Mr Smith, of Woolston, on the Drainage of Grass-land—My farm, containing 112 acres of arable and 60 of grass-land, consists of two distinct qualities of soil. The valley land is mixed gravel and clay. I have generally called it light land, it is, however, by no means light working land for ordinary horse culture, it always needed three horses to plough it. The hill land is very heavy clay—On grass-land hereabouts the drained and un-drained fields were both alike burnt up. I could not see that either of them had any advantage over the other in contending with the dryness of the summer. On arable land, that which was drained had the advantage, and greatly so in all cases in the Wheat crop, to the extent of more than a quarter per acre. As the crops on well drained land were fine and full, whereas all the crops on un-drained land were thin on the ground, and nothing like so bulky when cut, yet they ripened well. The effect of drainage upon the Bean crop was very perceptible, for on the un-drained lands they burnt up very early in the season, whereas on the well drained land they did not burn up so quickly, and on my own well drained and deeply cultivated lands they stood out to the last 10 days before harvest, and I had the honour of having the best Beans in the neighbourhood this dry summer, the result of drainage and deep steam cultivation. I can, however, give you one instance of drainage having done an injury to a good meadow. Forty years ago a mill in the adjoining parish was pulled down. I have a meadow that floods in the winter, and had always been mown. It is situated half a mile above this mill; and as soon as the mill was pulled down, this meadow gave a less produce than it has done before by more than a load a year, and it continued to do so for 10 years, and I a weir was put up holding the water to the height it stood at before the mill was removed, and then the meadow at once returned to its increased productivity, and it has continued so ever since. Side-drains have been put in, so that the uplands are all well drained, although the water in the river stands at its former height. The deep stirring of my land by steam-power has enabled it to withstand the drought better than shallow horse-worked land had done. This was clearly shown in my Bean crop. They were planted at the same time that the neighbouring horse-farmers planted theirs, yet they came up first and kept first. They stood 5 feet high, and were well corned, and kept green longer than those on horse-worked land did, and were much the best crop in the neighbourhood. *Journal of the Royal Agricultural Society*

Calendar of Operations.

MAY.—*Kohl Rabi*, sown in beds or in drills in early spring are now transplanted, but this mode of culture is being superseded by that of sowing as for Swedish Turnips, with the liquid manure-drill, applying about 500 gallons per acre. Some only apply about 200 gallons, but the quantity is too small, as it only wets the surface, for vegetation is only started with nothing to support it below. For many soils in dry seasons 1000 gallons is too small a dose. Much depends upon the state of the land. If comparatively dry, 500 gallons may do, less than 200 gallons when the land is moist. The liquid should sink to the depth of 5 or 6 inches deep into the soil, so as to apply available nourishment to the rootlets, which very soon strike to this depth. If it only sinks an inch, the liquid is too strong, assuming that from 3 to 4 cwt of superphosphate has been dissolved in 200 to 500 gallons of pond water. In judging how much water to apply, put a gallon of clean water into a watering pan, and then with the edge of a hoe open a drill, and ascertain how far it will moisten the soil to a proper depth, bearing in mind that the more widely the liquid spreads itself through the soil, the more economical and successful will the supply of food be, not only to the young plants, but also to the roots when they begin to swell. Having ascertained now far a gallon will go, it is easy to calculate how much will be required per acre. When the liquid-manure drill is at work, it is a poor saving to stunt the land of water.

Rolling spring corn crops is general in this month in ordinary seasons, so as to make a smooth surface for the reaping machine. Before rolling strong ground it should be cleared of large stones brought to the surface, pieces of wood, as the points of hurdie and netting stakes left in the soil, where Turnips have been eaten off by snecp short pieces of hoop iron, and such like, as the roller in passing over them very often lifts up one end, so as to come in

contact with the knife of the reaping-machine. Land infested with Coltsfoot should also be carefully gone over, as the smallest bit left, when pressed in with the roller, will take root and spread. The roller not only smoothes the surface, but breaks crusty clay soils when sown broadcast, thereby supplying mould for tilling, &c. Such soils require a heavy roller, and heavier in some seasons than in others. To effect this difference of pressure, rollers are provided with means for increasing the weight as the land requires, as for instance the weight in the roller, &c. Many pastures are the better to be rolled with a heavy roller at this season so as to crush clods, worm-casts, and break hard soils, so as to induce the tilling of the Grasses and filling of the ground.

Farm-horses are said to be "soft" this month. A little extra corn and grooming is needed with the green food. The latter will sometimes bring away the bots better than drastic purgatives.

Weaning of Calves is a work of degrees. Before they are weaned they should be learned to eat sliced root, cake, corn, and hay; and if this is done, early calves which have been fed by the pail may now have their milk gradually taken from them. If they suck, their dams should be milked nearly dry, and finally dry, before they are put to them.

The Dairy.—As soon as milch cows are grass-fed, cheese-making comes into season as the calves are weaned, but until the cows are fairly taken with the Grass, so that their bowels and the secretion of milk are both in a healthy normal state, good cheese cannot be made. Sour whey (lactic acid) and saltpetre are sometimes dissolved in the milk, to prevent "heaving," but they lower the quality of the cheese; neither can good butter be made. The true plan is to correct the food of the cow, until she has fairly taken with the Grass. This done, good cheese and butter may be made. During this month, however, particular attention requires to be paid to the ventilation and temperature of the dairy. Dairies are generally kept too damp and cold during winter, and this, with the increase of temperature due to the season, accounts for much that is experienced, in the way of turning milk sour, and causing cheese to be variable and at times inferior in quality, when other conditions are the same. The dairy should be kept dry at the proper temperature, and free from stagnant air. In Lutter dairies, there is a diversity of opinion as to the temperature of the milk room, if raising cream the range being from 55° to 60°. The sudden chills which milch cows experience when first turned out to Grass, also injuriously affects the quality of their milk.

Wireworm and Slugs often play sad havoc in corn-fields and grass-lands in May. Some apply lime to Turnip fallows as a remedy, spreading a liberal dose out of the cart, or by broadcast sowing-machines, others sow soot and salt by hand, or broadcast sowing-machines. In each case the application of the lime, soot, and salt is followed by heavy rolling. The clod-crusher and land-presser are also used with less or more effect in crushing the enemy to death, and fixing the roots of the plants in the ground. In case of slugs, the lime, soot, or salt is sown at night, when they are abroad feeding, and when followed by the roller immense numbers are destroyed. But wireworm is not so easily got rid of, as it is defended by a tough, leathery coat, and feeds more below the surface. Lime, soot, and salt, are obnoxious to the insect, so are nitrate and sulphate of ammonia, but unless applied in a soluble form, they do not reach the wireworm, consequently, it is only in moist weather, or when the land is sufficiently moist to dissolve them, that their application is effective. In dry weather, therefore, the water-cart should follow the broadcast sowing-machine, if the two are not combined in the form of a broadcast liquid manure-distributor. Where town sewage or water is laid on to the land for irrigation, a free use of either in time is doubtless the best mode of getting rid of both wireworm and slug as it not only kills them, but promotes the growth of those plants which have been cut through to a single root, and the tilling of others less injured, thereby filling the ground. Blanks may be filled up by transplanting corn of the same kind from a different field, or from patches of the same field which have escaped the ravages of the insects. The work is best done in moist weather. Twelve inches apart each way will tiller and fill the ground, if rich and in good heat, and the expense of transplanting is far less than some may imagine who have never tried it. When grass-land is attacked by wireworm, as it sometimes is, the best time for applying salt, &c., is when the insect first begins its work of destruction, as it is then less strong, and hence more easily destroyed. When nothing is done to arrest its ravages at the commencement, it cuts its way between the roots and soil, so that over large patches of the field the latter becomes separated from the former. In bad cases bushes of wireworms may be collected. A rich compost of lime should then be spread over the bare places, and Grass seeds bush-harrowed and rolled down. When old grass-lands are suspected as they justly may be when cockchafer, click-beetles, and daddy-long-legs abounded on the pastures the previous season—they should frequently be examined during March, April, and May, and, as soon as observed, active measures should be taken to soak the roots of the Grasses, on which they live, with liquid manure such as the land and Grass require, the application to be followed by the clod-crusher and roller when dry. *W. J.*

Notices to Correspondents.

PRESSINGS. *J. T. G. G.* The earthen compost with 10 or 12 bush lbs of bone dust per acre will bring 1-2 tons the same with one cwt of nitrate of soda, and two or three cwt of guano, will promote the luxuriant growth of the Grasses.

Caution to Gardeners.—When you ask for **SAYNOR AND COOK'S WARRANTED PRUNING and BUILDING KNIVES**, observe the mark SAYNOR, also the Corporate Mark WARRANTED, without which no name is genuine. S. & C. regret having to cut out Gardeners and others compelled to do so, in consequence of an imitation of quality, having been so far for the genuine one, and with their many complaints to be made to them of knives which their make, and of which are warranted both by S. & C. and the cheapness of the market. **S. & C.'S PRUNING and BUILDING KNIVES** are at the **Patron Works, Sheffield.** Established upwards of 20 years.

ROYAL EXOTIC NURSERY, KING'S ROAD, CHELSEA, S.W.

NEW PLANTS FOR 1869.

JAMES VEITCH & SONS

BEG TO ANNOUNCE THAT THEY WILL SEND OUT ON AND AFTER MAY 21,

THEIR UNDERMENTIONED SPLENDID NOVELTIES.

Ampelopsis japonica.

A new hardy Virginian Creeper, sent to us from Japan by Mr J G Veitch. It is remarkable for its compact shrubby habit, and for the great beauty of its foliage during the autumn months, the colours surpassing those of the popular Virginian Creeper, A. hederacea. After being exhibited before the Flora Committee of the Royal Horticultural Society in October, 1868, and awarded a First-class Certificate, it is thus described by Mr Moore. — "A bold habit and remarkably beautiful hardy deciduous climbing shrub, with broad ovate oblong leaves, which in autumn assume a rich orange-red tint, and are extremely beautiful. It was much admired." Price 7s. 6d. each.

Begonia rosaeiflora.

This is one of the many beautiful Begonias discovered by the late Mr. Peares, in the Andes of Peru, coming from an elevation of 12,000 feet. It is admirably suited for cool greenhouses, and is very nearly if not quite hardy and may be safely planted in sheltered situations. It is a stoloniferous species, with orbicular reniform but also radical leaves, and scapes supporting from three to five flowers of a bright rosy colour as large as those of Begonia Veitchii. It is figured in the "Botanical Magazine" for December, 1867. Price, good plants, 10s. 6d. each; extra strong plants, 21s. each.

Ocrotan (Codiseum) anoubesfolium.

One of the most distinct of the many fine varieties of Croton, found by our Mr J G Veitch in the South Sea Islands. It forms a handsome compact growing shrub, with oblong acuminate leaves 6 to 8 inches long, by 2 to 3 in width, tapering at the base. The surface of the foliage is of a beautiful dark glossy green, thickly studded with yellow, or somewhat crimson blotches, the midrib and veins being slightly tinged with pink. Bearing a strong resemblance to the well-known Aucuba japonica of gardens, it takes its name from that popular plant. This plant was awarded a First-class Certificate at the Royal Botanic Society's Exhibition, June 6, 1868. Price 21s. each.

Ocrotan (Codiseum) Hillianum.

Amongst the many Crotons introduced by our Mr J G Veitch from the South Sea Islands, none are likely to be more useful and generally appreciated than this fine variety. It is probably the most compact and close growing kind of the whole collection, and this characteristic, added to its beautiful shining variegated foliage, renders it a fine ornamental plant and peculiarly adapted for filling vases or for table decoration. The foliage is oblong sub-ovate acute unto, from 6 to 7 inches in length, by 2 to 3 in width, the upper surface being shining purplish green, the midrib and veins being bright crimson, and the under surface dull purple. It is remarkable for the reddish yellow effect of its foliage. A First-class Certificate was awarded to this plant by the Royal Horticultural Society on July 7, 1868. Price 31s. each.

Ocrotan (Codiseum) maximum.

This magnificent Croton is probably the finest variegated plant of the season, and certainly one of the most striking ever offered. It far surpasses all others hitherto known, and it affords us peculiar satisfaction to have been the means of introducing it through our Mr. J G Veitch, who discovered it during his trip to the South Seas. It is one of the largest yellow leaved varieties, of a strong robust habit, and admirably suited for exhibition or general decorative purposes. The leaves are oblong lanceolate acute, from 12 to 14 inches in length, by 5 to 4 in width, of a rich golden colour, marked on each side the midrib with dark olive-green bands of irregular form. It is one of the showiest stove variegated shrubs, and has only to be seen to be admired. It has been figured in the "Flora Magazine," and awarded First-class Certificates by both the Royal Horticultural and Botanic Societies. Price 42s. each.

Davallia hemiptera.

A beautiful dwarf stove Fern, very similar in appearance to some of the fine filmy Ferns. It is exceedingly dwarf and compact in habit, easily grown, and producing an abundance of the most delicately cut fronds, from 4 to 6 inches in length. This will prove a decided acquisition to all collections of Ferns. It was awarded a First-class Certificate at the Royal Horticultural Society's Exhibition, July 7, 1868. Price 10s. 6d. each.

Dracaena Macleayi.

It affords us great pleasure to be able this season to offer two more of the beautiful Dracaenas brought home by Mr. J G Veitch from the South Sea Islands. This and the following are both very handsome additions to this useful class of plants, which have of late years become so deservedly popular for decorative purposes. It is exceedingly robust and compact, with leaves from 15 to 18 inches long, by 3 to 4 in width, of a dark bronzy brown, with a decided gloss or metallic tint over the whole surface. The peculiar habit and colour of foliage of this fine species renders it perfectly distinct from any other in cultivation. Price 6s. each.

NEW ORCHIDS FOR 1869,

INTRODUCED DIRECT FROM THEIR NATIVE HABITATS BY MESSRS. VEITCH AND SONS

Angraecum falcatum.

A very pretty, neat dwarf growing Orchid, from Japan. In habit it is remarkably dwarf and compact, seldom exceeding 9 to 12 inches in height, producing its charming spikes of white, sweet-scented flowers in great abundance. It remains a long time in bloom, and is of very easy culture, succeeding well in a cool intermediate house. Price 12s. to 12s. each.

Coclogyne (Pleione) Reichenbachiana.

The group of Pleiones has for many years sustained a high position in the estimation of all admirers of Orchids, being of easy culture, and requiring only a medium temperature, it comes within the reach of almost all plant growers. The species now under notice was discovered by our indefatigable correspondent, Colonel Benson, of Rangoon, and is thus described by Dr. Hooker, in the "Botanical Magazine," for February, 1866. — "This is decidedly the finest species of the Pleione group of Coclogyne known; it is very distinct from any other, by the great size, peculiar shape, lobing, and reticulated coloration of the pseudobulbs." The flowers are large, often measuring 2½ inches across, with oblong spreading rose-lilac sepals, recurved petals, and a fringed emarginate lip, white, beautifully marked with deep magenta. This lovely plant bears the name of Professor Reichenbach, the celebrated botanist. Price 12s. each.

Dendrobium crassinoda.

One of the most remarkable Dendrobies hitherto discovered, whether we take the singularly formed stems or its distinct and beautiful flowers. The former are produced from 9 to 12 inches in length, and formed throughout of swollen internodes closely set together, giving them the appearance of rows of large beads. The flowers are 2 to 4 inches in diameter abundantly produced from the upper nodes; white, with broad rose tips to the sepals, petals, and lip, and a large bright yellow disc to the latter. In its native habitat it is described as producing as many as 25 of its charming flowers on one stem, thus rivaling the most beautiful of its genus. It is of very easy culture, and can be highly recommended to all lovers of Orchids. The Floral Committee of the Royal Horticultural Society awarded a First-class Certificate on February 16, 1869. Price from 63s. to 145s. each.

Dendrobium macrophyllum Huttonii.

This beautiful plant is a white variety of the well-known D macrophyllum. It was sent to us direct from the Moluccas, by our late collector, Mr. Hutton, after whom it has been named. It possesses all the good qualities of the original species, being if possible a more profuse bloomer, and its handsome white flowers, which are deliciously scented, last during a long period in bloom. Price, good plants, 105s. each; strong plants, 147s. each.

ORDERS ARE NOW BEING BOOKED, AND WILL BE EXECUTED STRICTLY IN ROTATION.

A NEW ILLUSTRATED DESCRIPTIVE CATALOGUE

Of the above and many novelties sent out by other houses will be forwarded free on application.

ROYAL EXOTIC NURSERY, KING'S ROAD, CHELSEA, S.W.

Dracaena nigro-rubra.

This fine stove variegated plant forms a fitting companion to the foregoing. It is of bold erect growth, with leaves from 18 to 20 inches in length, of a dark brown, with a large rosy-crimson centre, the young foliage being, as a rule, entirely of the latter showy colour. In habit it is very similar to Dracaena ternstroemia, but its striking shades of crimson render it quite distinct from that of any other species. We have no hesitation in recommending it as a desirable acquisition. It has been frequently exhibited, and received similar awards to the preceding. Price 21s. each.

Dipladenia (Echites) Boliviana.

This distinct and beautiful stove plant may be best described as a very free flowering Dipladenia. In habit it is very compact, producing an abundance of flowers in a much smaller size than most any other species. The foliage is medium in size, of a light glossy green colour, the flowers are somewhat smaller than those of D. crassifolia, pure white, with a distinct yellow centre. It forms a pleasing addition to the already popular Dipladenias. It has been frequently exhibited, and was awarded the First Prize (Silver Medal) at the first of plant in flower at the Royal Horticultural Society's Exhibition, June 16, 1868. Price 15s. each.

Eranthemum aspersum.

A beautiful stove flowering shrub, introduced from the Solomon Islands by Mr. J G Veitch. It has glabrous branches, ovate oblong leaves, forming a long leafy inflorescence of very dense long-tubed white flowers. Each flower has an expanded bilabiate limb of five segments, four of which are dotted with purple and the fifth heavily blotched with the same colour, like the lip of an orchid. It is of very low growth, dwarf in habit, and an abundant bloomer. It is figured in the "Botanical Magazine" for May, 1868. Price 7s. 6d. each.

Hedaroma (Darwinia) fimbriata.

This very distinct and beautiful greenhouse plant was introduced from the south-east of Africa. In character it closely resembles the well-known Hedaroma Trappifera, but is dwarfier, and more freely in a small state. The flowers are of medium size, bell-shaped, of a bright rosy colour, and beautifully fringed on the outer edge. It is a decided addition to that useful and popular class of greenhouse or conservatory flowering plants. It was awarded a First-class Certificate by the Royal Horticultural Society on May 1868. Price, good plants, 15s.; a few stronger plants, 21s. 6d.

Maranta (Calathea) tubispatha.

A beautiful stove plant, introduced by ourselves from Western Tropical South America. The following description is taken from the "Botanical Magazine" of November, 1863, in which number it is figured. — "A very graceful species. Its habit and prettily blotched leaves cannot fail to render a valuable addition to our variegated stove plants." The leaves are obovate, elliptical, shortly acuminate, from 8 to 12 inches in length, of a pale green colour, with a row on each side of the midrib of a pair of oblong deep brown blotches—the strong contrast between the lively green groundwork of the leaf and the brown blotches rendering the plant at once distinct and elegant. It has received a First-class Certificate from the Royal Horticultural Society. Price 15s. each.

Rhododendron Henryanum.

A seedling raised by that successful hybridiser, Isaac Anderson-Henry, Esq., of Edinburgh. It crosses between the handsome Rhododendron Dalhousiana, and R. neesii, and is of a pure white and very sweet scented, and in shape a medium betwixt the two parents. It forms another decided addition to the popular class of conservatory sweet-scented Rhododendrons. It has been exhibited before the Flora Committee of the Royal Horticultural Society and received a First-class Certificate. Price 10s. 6d. each.

Thibaudia acuminata.

A beautiful greenhouse shrub, introduced by ourselves from the Andes of Ecuador. It is described by Dr. Hooker in the number of the "Botanical Magazine" for January, 1868, in which it is figured. — "A very distinct, showy, free flowering shrub. Being a native of the lofty regions of the Andes (from 8 to 10,000 feet), it is well suited to a conservatory temperature, where its handsome green foliage, purple tinted young leaves, and brilliant red flowers, which are produced in great quantities, render it a very attractive plant." In its native habitat it is said to be in flower during the whole year, and under cultivation it blooms almost constantly. Price 10s. 6d. each.

Masdevallia Veitchiana.

This most extraordinary and strikingly beautiful Orchid was introduced by ourselves from Cordillera of Peru. It is acknowledged by all who have seen it to be the finest Orchid of recent introduction, and we have no hesitation in saying it is equal if not superior to any hitherto known. Coming from a high elevation, it thrives well under the coolest Orchid treatment, and is a very free growing plant and an abundant bloomer. No description can convey an accurate idea of the striking effect of this plant when in bloom, the form and colour of the flower being entirely unique. It has small oblong pseudobulbs, linear oblong, dark glossy green stems and erect slender racemes from 12 to 16 inches high, each bearing a single flower from 5 to 6 inches in length, by 3 to 4 in diameter. Each flower consists of three broad ovate sepals, extending into long tail-like points at the end, brilliant orange-scarlet colour, delicately shot with purple, added to this there is a vivid blue ground over the whole flower, by the inner surface being studded with minute papillae, of a brilliant orange-yellow. It may be easily imagined from the foregoing description, and considering that each flower remains open from five to six weeks, that for striking beauty this plant is quite unsurpassed. It has been figured in the "Botanical Magazine," and "Flora des Serres," and exhibited at the Exhibitions of the Royal Horticultural and Botanic Societies, and also at the Horticultural Show held at St. Petersburg. In every instance the highest Prizes have been awarded, and Messrs. Veitch & Sons recommend it as one of their finest introductions. Price on application.

Vanda insignis (true).

It affords us great pleasure to be the medium of introducing this splendid species, which for so many years been sought after by European cultivators. The Vanda is perhaps altogether the finest genus of Orchids, and we have no hesitation in saying that the true V insignis is one of the very finest of its genus. It is peculiarly distinct in every way, having the habit and foliage resembling those of the sunia and tricolor, but, unlike these species, young plants only 8 to 12 inches produce spikes with five to seven flowers. The flowers continue open an unusually long time, and measure 2½ inches in diameter, being of sepals and petals of a bright glossy ochraceous brown colour, blotched with chocolate. The labellum forms the most striking feature of the flower, being an inch across, of great substance, and of a beautiful lilac-pink colour. This remarkable plant was sent to us from the Moluccas, by our late lamented collector, Mr. Hutton. It has received the highest awards ever bestowed on a New Plant, and a universally deserved. Price on application.

LADY CREMORNE. Flowers erect, white, with a rich deep rose throat, the perianth rays which give the flower its double appearance...

JOHN GRAY. Flowers erect, rich dark crimson, shaded in the centre, the outside of the prolonged calyx is of a light crimson...

The Royal Horticultural and Royal Botanic Soc. as have awarded Certificates to both these Novelties, and they are figured and fully described in the 'Flora Magazine' for 1885, page 401.

DOBSON'S PRIZE FLOWER SEEDS.

DOBSON'S CELEBRATED PRIZE CALCEOLARIA. This strain is, if possible, finer than we have ever had in this country...

DOBSON'S PRIZE CINERARIA, 1s., 2s. 6d., and 5s. Received 60 First Prizes in 8 years.

DOBSON'S PRIZE PRIMULA. Unsurpassed in the trade for fringe and colour.

CARTER'S PRIMULA, CALCEOLARIA, and CINERARIA.

J. C. & Co.'s strain of Calceolaria is saved from plants that were awarded a 1st Prize at the late International Show.

CALCEOLARIA and CINERARIA.

Per packet - s. d. Calceolaria, finest hybrid 2 6 Calceolaria, Dobson's strain 2 6

PRIMULA.

Per packet - s. d. Primula, choicest mixed 2 6 Primula, choicest white 2 6

CALCEOLARIA INTERNATIONAL PRIZE.

INDIA RUBBER HOSE at Manufacturer's prices, 40 feet (with comp. etc. fit up), 25s.

ROYAL HORTICULTURAL SOCIETY.

SHOW OF POT ROSES and SPRING FLOWERS, May 8. AWARDS OF THE JUDGES.

CLASS 1 - POT ROSES, in pots, distinct. (Nurserymen) 1st, Mr. W. Paul, Paul's Nurseries, Waltham Cross, N., £2

CLASS 2 - 12 NEW ROSES of 1887 or 1888, in pots, distinct. (Open) 1st, Mr. C. Turner, £2

CLASS 3 - 12 NEW ROSES of 1887 or 1888, in pots, distinct. (Open) 1st, Mr. C. Turner, £2

CLASS 4 - 12 NEW ROSES of 1887 or 1888, in pots, distinct. (Open) 1st, Mr. C. Turner, £2

CLASS 5 - 12 NEW ROSES of 1887 or 1888, in pots, distinct. (Open) 1st, Mr. C. Turner, £2

CLASS 6 - 12 NEW ROSES of 1887 or 1888, in pots, distinct. (Open) 1st, Mr. C. Turner, £2

CLASS 7 - COLLECTION OF ALPINE PLANTS, in 8 boxes, each 1 foot square, 1000

CLASS 8 - 6 POLYANTHUSES, distinct. (Open) 1st, Mr. J. James, £1

CLASS 9 - 4 RHODODENDRONS, 2 kinds. (Open) 1st, Mr. A. Wilks, £2

CLASS 10 - RHODODENDRON, single specimen. (Open) 1st, Mr. A. Wilks, 15s.

CLASS 11 - 6 PANSIES, in pots, distinct. (Open) 1st, Mr. J. James, 10s.

CLASS 12 - 6 POTS OF LILY of the VALLEY. (Open) 1st, Messrs. Haxney Brothers, Nurseries, Notting Hill, W., £1 10s.

CLASS 13 - MISCELLANEOUS COLLECTION OF PLANTS in FLOWER. (Open) 1st, Messrs. J. Standish & Co. Royal Nursery, Ascot, £1 10s.

EXTRA PRIZES. Messrs. Paul & Son, Collection of Roses, in pots, £2.

Mr. W. Paul's Collection of Cut Roses, £1 10s.

Mr. C. Turner's Collection of Cut Tulips, £1

Mr. J. James's Collection of Cut Tulips, 1s.

Mr. H. Hooper, Stand of Bedding Pansies, 15s.

Mr. C. Turner's Collection of Alpine Anemones, 10s.

Mr. H. Hooper, Stand of 30 Bedding Pansies, 10s.

Mr. H. Hooper, Stand of 57 Pansies, 7s. 6d.

Mr. H. Hooper, 24 Ranunculus, 7s. 6d.

Mr. J. James, Stand of 24 Pansies, 7s. 6d.

LEEDS HORTICULTURAL SOCIETY THE GREAT EXHIBITION OF PLANTS, FLOWERS, FRUITS, and VEGETABLES will be held at the ROYAL PARK, on WEDNESDAY, THURSDAY, and FRIDAY, June 9, 10, and 11.

THE ROYAL HORTICULTURAL SOCIETY'S GRAND EXHIBITION AT MANCHESTER, in connection with the SHOW of the ROYAL AGRICULTURAL SOCIETY.

A SILVER CUP (copy of the famous Cellini Cup), VALUE £250 will be offered by the Proprietors of the GARDENERS' CHRONICLE and AGRICULTURAL GAZETTE for the best COLLECTION of 6 FRUITS and 6 VEGETABLES.

In awarding the Prize, Marks will be assigned according to the following scale:

Table with 4 columns: Name, 1st Mark, 2nd Mark, 3rd Mark. Includes items like Grapes, Melons, Strawberries, etc.

This Prize is open for Competition amongst Amateurs and Gardeners of private families.

The Gardeners' Chronicle.

SATURDAY, MAY 15, 1885.

MEETINGS FOR THE ENSUING WEEK.

Tuesday, May 13. Royal Horticultural, Fruit and Flora Committee, at South Kensington, 11 A.M.

Wednesday, May 14. Royal Horticultural (First Summer Exhibition of Plants and Flowers), at South Kensington, 2 P.M.

Thursday, May 15. Royal Horticultural (Special Prize and Pelargonium Show), at S. Kensington, 2 P.M.

FEW men not actually engaged in the practice of Horticulture have done more to promote its interests than the late Sir CHARLES WENTWORTH DILKE.

The present is a good time for saying a few words on a fault which too generally characterises our BRITISH FLOWER SHOWS, and one which has often been unadverted on, but which remains uncorrected to the present day.

It is the almost total disregard which is generally paid to producing artistic effect with the materials sent for exhibition. No one can have visited a Continental show without having remarked the contrast exhibited in this respect with an English one.

groups, so that the bright colours of the flowers are brought out by the green of surrounding foliage. Those that are displayed singly are planted in smooth turf provided for the occasion—not a pot is to be seen. The pots of the plants which are staged are concealed by the foliage of other plants arranged in front of them, large masses are thrown together here, interrupted by smaller and lower lines there, until the whole assumes the aspect of a natural scene of beauty. Whether this can be said of our English shows, we leave our readers to say. Long rows of the same kind of plant are regimented, with their pots displayed in all their native hideousness—each individual flower a gem of beauty, perhaps far surpassing anything to be met with on the Continent, but in combination deteriorated in effect by their unvarying uniformity, modest flowers killed by the unrelieved glare of something that is called “a blaze of beauty” in their vicinity, and as to general effect, of course that is impossible where the show is parcelled out in different patches and exhibited in different places. There is nothing to prevent our producing as good an effect in our shows as our neighbours do. There is no mystery or difficulty in it. We did it in the great International Exhibition in 1868. The Rhododendron shows of the Royal Horticultural and Botanical Societies are examples where it is done every year, and now and then a more or less successful effort in the right direction has been made by these societies in their general shows, sufficient to prove that they can do it when they choose, and to remove every apology from them for not doing it always. A great show which was held last week in Berlin, has suggested the above remarks, and which may serve to indicate the way that we should go.

The show was held in a riding school, as is usual on the Continent, and the whole place had to be put into order, covered with soil, gravel, turf, staging, rockeries, waterfall, &c., in the space of three days. In these three days, too, while the work was going on, the plants were received and put in their places, and here is the point of difference between the English and the Continental practice, in which our chief difficulty lies. Our exhibitors send their plants in only on the morning of the day of exhibition, the Continental exhibitors three days before. But our horticulturists have shown themselves willing to part with their plants for two, three, or four days, some of our shows have lasted that time; would they then object to send them (if required) two days, or even only one day, before the show, if the show were not continued beyond two days after opening? We imagine not. Whether or not it would be practicable to fix different days for sending in different kinds of plants we do not know. We can easily imagine that it would be a convenience to some exhibitors who were sending more than one van-load to send some on one day and some on the next, and that others who had something of especial rarity or value would not like to send it until the last moment, and would not be willing to make two journeys for all that they had to show. But all that is a question of detail. If the mass of plants were in the hands of the officials a day before the opening, we venture to think we should inaugurate a new and better state of things. But another thing, not less necessary, is preliminary preparation. The plan of the campaign has to be arranged beforehand—the place of the great masses has to be fixed, and the plants to fill them provided. At the Berlin Show, the Botanic Garden sent all the large, massive, fine-foliated plants. At home, the Horticultural, Botanical, and Crystal Palace establishments have all that within themselves. Each massive group could be prepared days beforehand, with holes left into which to pop the glowing Azaleas or bright flowering plants when they arrived, and thus, as at Berlin, each separate exhibited plant could be displayed with a thick framework of dark green foliage setting it off, and although thus mingled with other plants, the whole of one exhibitor's plants in that class kept by themselves. It would take a good deal more space, and would entail a great deal more trouble on the part of the officers charged with the exhibition. That we do not deny—but as our object is to make the exhibitions more effective, and more attractive to the public, that is surely worth the extra trouble.

One other point to be noted is, that the stages for the smaller plants, would require to be more

nearly vertical than we are accustomed to make them. It is easy to see how these smaller plants may be arranged effectively and without showing the pots, if we once admit the idea that for almost every plant that is sent for exhibition there shall be another green foliated plant to form the setting in which the exhibited plants are to be placed.

—THE NATIONAL HORTICULTURAL EXHIBITION which opened yesterday at MANCHESTER, is probably the finest show which has yet been held in that city. Mr WILLIAMS' prize of 50l. for which there are two competitors, has brought together the finest group of 50 plants ever staged by one exhibitor in a single collection, and when we add that this group comes from the collection of H. MICHOLLS, Esq., those who have witnessed Mr. BAINES' style of growing plants will have little difficulty in realising something of the cultural merits of the subjects produced. Those grand Saracenias, at which horticulturists gazed in sheer amazement a year or two since, are there, looking finer than ever, another conspicuous object in this group is a grand bush of *Genetylis tulipifera*, robed in wondrous beauty. We remark throughout the show that in all cases the plant is more finely coloured than usual, which is probably owing to the thorough ripening of the wood, from the excessive heat of last summer. Mr WILLIAMS himself exhibited something like a hundred specimen plants in the various classes. Orchids and Azaleas from various sources, Roses and Rhododendrons from Messrs. LANE, Ferns and Conifers, and the thousand miscellaneous subjects which go to make up a great flower show, are staged in profusion, and, altogether, this is, as we have said, one of the finest flower shows that Manchester has witnessed. It is to be desired that the weather may continue to be as propitious as it now promises to be, in order that the holiday folk may enjoy to the full the feast of flowers, which Mr. FINDLAY and the Manchester Botanical Society have spread out for their delectation.

—We learn that the BOTANIC GARDEN, MANCHESTER, is not available for the purposes of the ROYAL HORTICULTURAL SOCIETY'S EXHIBITION, in July next. The arrangements between the two Societies have, as it appears, come to naught, owing to the Council of the Manchester Society demanding privileges for their Fellows to an extent beyond what the Horticultural Society can in reason accede to. Under these circumstances the Royal Horticultural Society had no option but to look about for another site, and we believe that a very eligible spot has been secured just beyond the Botanic Garden, and attached to the best portion of the Royal Agricultural Society's Show.

—In accordance with a wish expressed by many exhibitors who intend to be present at the SPECIAL PELARGONIUM SHOW on the 23d inst., we believe that some arrangements are in progress by which they, as well as their friends who may be desirous of attending the discussion meeting, which is to take place in the Council-room during the time the awards are being made, may be served in the garden with a substantial breakfast. Messrs. SPIERS & POND will, we believe, be willing to cater for them, if they will take the trouble to provide themselves with a breakfast ticket (to be had at the refreshment stand) not later than 8 A.M. It is proposed that the breakfast should be served at 10 A.M. precisely, so that the meeting may take place at 11 o'clock, as already intimated (see p. 391).

—Mr. W. ROBINSON'S work on the PARKS, PROMENADES, and GARDENS OF PARIS, has just been issued by Mr. MITCHELL, and forms a handsome volume of more than 600 pages, with 400 woodcuts, plans, &c. It is by no means a mere amplification of his former volume, but while it is in great measure devoted to the subject indicated in the title, it appears to comprise a complete account of the best and most noticeable features of French gardening in all its departments. Further examination will be needed before any opinion can be offered as to the technical merits of the book, but in the meantime we may safely commend it to the notice of all desirous of a richly illustrated souvenir of the French capital.

—The first volume of Mr. WILSON SAUNDERS' useful REFUGIUM BOTANICUM is now completed. The last part is devoted mainly to species of *Cotyledon* (*Echeveria*). Of this we shall take occasion to speak more fully at another time. Meanwhile we tender the hearty thanks of all horticulturists and garden botanists to Mr. SAUNDERS for his public spirit and welcome aid.

—M. ALPHONSE DE CANDOLLE, the President of the Botanical Congress of London, 1868, has been elected one of the foreign members of the Royal Society.

—The Chair of BOTANY in ERLANGEN, vacated by the death of Dr. SCHNITZLEIN, has been filled by the election of Dr. KRAUS, formerly assistant to the Professor at Leipzig.

New Plants.

—*VANDA DENISONIANA*, Benson and Echb. fil.
 Folia ovato-lanceolata apice inequali obtuse bilobis (sine dente medio—semper?), racemo valido plurifloro, sepalis cucullato-oblongis obtuse scutis, petalis magis cucullatis abrupte dilatatis subhastatis, labelli auriculis subquadralis, lamina pandurata, lacina antica angusta basi equali anguste ac obtusangulo subaequilata, antica emarginata, carinis a basi in discurum approximatis quinque obtusis, calice emarginato postposito, calicari conico vix breviori, lobis velutina. Flores lactei, apicibus flavo-viridibus suffusis, calicari fundus ac regio circa ostium aurantiaca, linctis puncturum brunnescentium geminis atrisque.

The white Burmese Vanda was one of the secret treasures of the Royal Exotic Nursery for a while. It has just flowered, and Messrs. Veitch have kindly placed in our hands the beautiful *spolia* of this striking

novelty. The habit of the plant may be compared to that of *Vanda Bensoni*, though, as far as our observation goes, the new one is much stronger. The leaves, Mr. Harry Veitch informs us, are wider than those of *Vanda Bensoni*, late, unequally bilobed at the attenuate apex, and the petals are reflexed as in the majority of *Vanda*. Both sepals and leaves somewhat hastate, milk white with a yellowish-greenish hue on the apex. The upper sepal bilobed, subhastate, anterior part, not broader than the base, not so much like a heath-sock as that of the *Vanda Bensoni*. A peculiar feature is the callous line springing from it. There are five raised ridges on the disc of the lip, and a little callus at its base, the concave spur is very short at the end, deep orange around the mouth of the tube over which stand two parallel oblique rows of papillae around it.

We live in the days of novelty in *Vanda*, as we did years ago in the days of new *Phalenopsis*. One of our plant will create a sensation among amateurs. We can scarcely say that it is one of Colonel Benson's striking discoveries, though we should not be surprised if appointed the modern Paris, to decide which was the loveliest among the Bensonian families just now in hand another extraordinary Bensonian variety. We have dedicated this *Vanda* to Lord Londesborough, naming it *V. Denisoniana*, a great lover for Orchids. Messrs. Veitch, who may be proud of their success, inform us that the new *Vanda* appears to be a free flowerer as the same plant has just produced a new flower spike. H. G. Rees.

NOTES ON BEDDING PLANTS.

“I WRITE down my experiences,” says an author, “that men may see how life looks to one who has plucked its joys and tasted its sorrows, and who lived to be devoutly thankful for the experience both.” In some such way might one speak of the experiences of bedding-out. I write mine, narrating a success here, detailing a failure there, so that others who bed-out may take heart again, or at least lose it altogether over something they have “looked on with longing eyes.”

Bedding plants are numerous and varied, and the most fastidious gardener—what to select for grand desideratum. Here is a *Heliotrope* that bedders-out who use the *Heliotrope* would do well to secure—the name surpasses Guasco—the colour lavender, the trusses simply immense—big enough to be the breast of a drawing-room “jarvis,” the habit bushy, and free-blooming. I saw it last summer at John Fraser's, Lea Bridge Road, and made it as a worthy joy to pluck. Not that *Heliotrope* is much used now a days for bedding purposes, but early frost soon gives them the appearance of being the unlovely thing, yet this variety will make the most effective bed, and furnish plenty of cuttings into the bargain.

Iresine aereo-reticulata has succeeded with me even with what would have been thought to be a dry hot summer. Whether raised in the tropical department, or braving the vicissitudes of a more exposed flower garden it has failed to tempt me to praise it. It is a plant not to be despised, nevertheless, for it has its uses, and here, at this season, a specimen in a warm house, and here, at this season of the year, it makes a good display among bedding plants, the leaves being large and of a lustre of green hue, while the net-like marking of gold is very clear and striking.

Generally, the Golden Feather *Pyrethrum* is to be a decided acquisition for bedding purposes, though some condemn it. Even these, however, object to its proneness to flower too early, the labour incurred in keeping the buds from opening. Particularly is this proneness to flower characteristic of autumn-struck plants, as they commence naturally enough, early in the summer. Seedlings raised in the spring should be used, as they do not till quite late in the season when it is to a great extent a matter of indifference. Raising raising plants from seed, use spring struck cuttings. Is this plan enough to stand the winter and so be made ready for the spring garden? A wet season is more favourable to the golden *Pyrethrum* than a dry hard winter, and if a damp causes it to speedily decay, and if a frost massed for effect is not harmonious with the hue of yellow. The spring garden needs the hue of yellow more than the summer flower garden, as of flowers the yellow *Crocus*, *Alyssum saxatile*, *Oxyria*, *santhemoides* (a most useful early flowering annual, richly deserving to be much more grown than it is), *Limonium Douglasii*, *Limnium californica*, and the invaluable yellow *Pansy*. *Viola* does not bloom early enough to make an effective bed. Of yellow-foliated plants there are *Sedum* now in flower, “draped with gold,” and invaluable for bedding, and rockeries, if only properly appreciated, even the gaged forms of the *Arabis*, &c.

Coming back from this digression it may be asked if any of the new variegated *Pelargonium* those of the golden-leaved and gold and bronze can be recommended for bedding purposes. My experiences of bedding-out during the last season no variegated zonal *Pelargonium* that I saw compare with Mrs. Pollock for effect. *Pelargonium* was good, finely marked, and vigorous. *Pelargonium* considered too moist to grow it in reflection in

leaves playing with the sunbeam," and the "diffusive" of the beautiful "hovered over many a bed of this plant, in its gay beauty so striking as to transcend even the most sanguine hopes of those who had reaped various experiences in using it. Alas! there was no spot 'too moist' to be found anywhere above ground in July and August many a frizzle horticulturist sighed for it, and "sought but never found." Two varieties only of the new kinds of variegated zonal plants that I saw being tried last season came near Mrs. Perkins' for effectiveness, those were Perkins & Sons' Queen Victoria, and Lady Craven, and of the two the last best. They also possess one great quality for bedding purposes.—constitution. In a few instances beds of Lady Craven were to be seen—a capital plant making short stocky growth, but dull in appearance, showing too much of the dark zone.

Of the golden-leaved section, Crystal Palace Gem makes high an effective and durable bedder. The leaves are shaded with a darker colouring, giving them a marked appearance, but not in a manner to detract from its usefulness. It is a decided improvement on the Golden Chain and Cloth of Gold, and stands exposure admirably. It is said to have originated at the Crystal Palace as a sport from the old Lady Margaret or Trenton Rose, and, though dwarf in habit, blooms as profusely. It withstands rain and sun alike, and maintains its character with undeviating constancy right up to the expiration of the bedding season.

Of the somewhat numerous gold and bronze zonal section, Kent's Hero, one of Messrs. Downie, Laird & Lang's new varieties, and the Rev. W. F. Rydley's, one of Messrs. Windbank & Kingsley's seedlings, are worthy the highest praise, while they are not enough for the last named to be used as an edging to the former. In a remarkable degree, Kent's Hero is strong and vigorous constitution, and at autumn it was in one case allowed to remain out-of-doors until the cold rains came, and it nevertheless retained its original brilliancy almost unimpaired. To these can be added Ebor, a really fine and useful bedder, and Beauty, probably raised at Hantroyde, having excellent habit, compact growth, and bright leaves. Of the many new kinds tried at Chawick, some, in spite of an adverse season, were very promising as bedders, but, to speak definitely of their usefulness in this respect, they require to be soon bedded-out in the usual manner. Of the white edged variegated Peltandium, Mrs. C. J. Perry, a variety of dwarf and bushy growth, the leaves deeply tinged with white, cannot be too highly recommended. As an edging to large beds it is invaluable, as the compact and even growth of the plant gives a good surface of white to the leaves "map white as wings," like a snowy mantle. Castelmilk is another capital kind, the leaves edged with a pale cream, the habit good, but for its distinctness, for its peculiar wavy habit, and for the contrast between the dark green of the body of the leaves and its edging of white, I give the palm to Albion's Child. A note should be made of each of these varieties by bedders-out who may be sighing for something new and something good as well. The new variegated ivy-leaved variety L'Elegante makes a capital edging plant, and stands exposure well. In some exposed positions of the north, and till quite late in the season, it was very effective, used as an edging for beds. In such a relation it should be pegged down, to preserve the symmetry of the line.

In the north likewise, Viola lutea was exceedingly common, though in many places the drought and heat were very tested, and in some instances almost destroyed. Its usefulness. It was during a very trying summer that opportunity was given to bed it out on anything but a large scale and altogether opposite experiences have been recorded of this plant. In the north also at the Lpton Nurseries, Chester, I saw a bedding Pansy, bearing a profusion of greyish pale blue flowers, named Beau de Ciel, and which was supposed to be of French extraction. In size of flower it approached the Clveden blue Pansy, in character of habit it came nearest to the bedding Pansy, and I was told that it came into bloom as early as March, and continued to bloom during the summer months till late in the season. It had one advantage over the Clveden blue Pansy, that during the hottest weather it did not become so pale as is to be expected of the latter.

The foregoing are only a portion of the newer bedding plants courtng popular favour. There are yet others, and of these something shall be said. *Qno.*

The following is a list of descriptions of the typical form of each, with its principal varieties and their synonyms.

1. *N. Pseudo-Narcissus* (Linn. Sp. Plant p. 414).—Bulb ovoid, not more than half an inch thick. Leaves generally two to a scape, very slender, green, 1½–2 lines broad, concave on the face, scape 8–12 inches high, very slender, terete, flowers one or two to a stem, on pedicels 2–3 lines long, which equal or exceed the spathe, densely crowded, 14–16 lines long, exserted, the lobes of the corona about half an inch long, the upper three inserted near the mouth of the tube and reaching nearly to the throat of the crown, style filiform, reaching nearly to the base of the tube, corona entire, inflated, style exserted, 2–3 lines long, 3 native of Spain, Portugal, the opposite coast of Africa, and the south-west of France as far north as Bordeaux.

This, the 'harp pettecoat,' was divided into 'species' by Herbert as follows, and we give references to the figures and Haworth's and some other synonyms, but we fear that even taking the plants as slight varieties, they are barely distinguishable—

- 1. *N. Pseudo-Narcissus*, Herb. Amar. p. 207. Size as described above, corona slightly inflated entire and inflated, style shorter than the corona. Redd. Germ. t. 41, p. 30 and 31, and Redd. Germ. t. 1, p. 1—The latter figured Bot. Mag. t. 68, Sweet Fl. W. Gard. ser. 2, t. 164.
- 2. *N. Pseudo-Narcissus*, Herb. Amar. p. 207. A robust form, with slightly repand corona and exserted style. Sweet Fl. W. Gard. ser. 2, t. 326. *N. Pseudo-Narcissus*, Det. in Red. L. vol. 8, p. 100, constant and under Haworth.
- 3. *N. Pseudo-Narcissus*, Herb. Amar. p. 207. A slender form, with erect shining leaves, a distinctly exserted style, and a distinctly lobed corona. *N. Pseudo-Narcissus*, Salisb. Prodr. p. 22, Red. L. t. 476, Sweet Fl. W. Gard. t. 114, constant and under Haworth.
- 4. *N. Pseudo-Narcissus*, Herb. Amar. p. 207. More slender than the type, leaves drooping, corona entire, inflated, style exserted. *N. Pseudo-Narcissus*, Prodr. p. 222. *N. Pseudo-Narcissus*, Haw. Journ. Trans. p. 244.

The following are more striking varieties than any of the above:—

- 5. *N. Pseudo-Narcissus*, India Fl. Nov. p. 9. Leaves 2–3, scape not more than 3–4 inches high, perianth not more than 8–10 lines long above the very slightly stalked ovary, the divisions of the limb as long as the filament, reflexed, corona 2–3 lines long, style exserted, lobes of the corona exserted. *N. Pseudo-Narcissus*, Bourgeois, p. 228. From the island of Java, under the name of *N. Pseudo-Narcissus*, Held in *N. Pseudo-Narcissus*, Webb in Bot. Beech. p. 2, t. 1, p. 82.
- 6. *N. Pseudo-Narcissus*, Webb in Bot. Beech. p. 2, t. 1, p. 82. Scape 4–6 inches long, perianth not more than 8–10 lines long, lobes of the corona exserted, style and longer stamens exserted. *N. Pseudo-Narcissus*, Held in *N. Pseudo-Narcissus*, Webb in Bot. Beech. p. 2, t. 1, p. 82.
- 7. *N. Pseudo-Narcissus*, Webb in Bot. Beech. p. 2, t. 1, p. 82. Scape 4–6 inches long, perianth not more than 8–10 lines long, lobes of the corona exserted, style and longer stamens exserted. *N. Pseudo-Narcissus*, Held in *N. Pseudo-Narcissus*, Webb in Bot. Beech. p. 2, t. 1, p. 82.

II. *N. Pseudo-Narcissus* (Linn. Sp. Plant p. 414).—Bulb ovoid, half an inch or a half thick. Leaves five or six to a scape, glaucous, erect, flattish upwards, equaling, or rather shorter than the scape at the time of flowering, five or six lines broad. Scape about a foot high, with two prominent edges, flowering in the middle of March, before any of the other species. Flowers always solitary, nearly sessile, or with a very short pedicel within the spathe. Flower 18–20 lines long above the ovary, the obconical tube about half an inch deep, the divisions of the limb in one or less seen and superior yellow, paler than the crown, along lanceolate, 9–10 lines long, 5–6 lines broad at the base, the outer ones rather Junier than the others, the crown just equalling the anthers, deeper and more orange-yellow than the divisions, the most about an inch across, slightly plicate and incised-crenate, filaments uniseriate from the base of the tube, 7–8 lines long, flattened downwards, straight, the anthers linear four lines long. Style above an inch long, straight, slightly exceeding the anthers. Extending as a wild plant from Sweden and England, to Portugal, Spain, Italy, and Transylvania.

Of this, the Daffodil, there are five well-marked varieties, which were known to, and described by, Linnaeus; and which keep up their characters well enough under cultivation to stand as species for a garden purposes, as follows:—

- 1. *Pseudo-Narcissus*, Linn. Sp. Plant p. 414. The ordinary average form of which we have described above. Redd. Germ. t. 41, p. 30 and 31, and Redd. Germ. t. 1, p. 1—The latter figured Bot. Mag. t. 68, Sweet Fl. W. Gard. ser. 2, t. 164.
- 2. *Pseudo-Narcissus*, Linn. Sp. Plant p. 414. Larger in all its parts than the last, the leaves 6–8 lines broad, the flower 2–3 inches long above the ovary, the divisions of the limb twice as long as the broadly obovate tube, the same colour as the crown, which slightly exceeds them, and spreads near the throat (in an extreme specimen that lies before us whilst we are writing, an inch and a half broad). Redd. Germ. t. 41, p. 31, and Redd. Germ. t. 1, p. 1—The latter figured Bot. Mag. t. 68, Sweet Fl. W. Gard. ser. 2, t. 164.
- 3. *Pseudo-Narcissus*, Linn. Sp. Plant p. 414. Smaller in all its parts than the type, the whole plant when cultivated not above 6 or 8 inches high, the leaves a quarter of an inch broad, often only 3 or 4 inches long, the flower 12–15 lines long, exclusive of the ovary, the crown the same colour as the divisions, and slightly exceeding them, the divisions 2 lines broad at the base. *N. Pseudo-Narcissus*, Herb. Amar. p. 207, and *N. Pseudo-Narcissus*, Haw. Journ. Trans. p. 244.
- 4. *Pseudo-Narcissus*, Linn. Sp. Plant p. 414. Smaller in all its parts than the type, the whole plant when cultivated not above 6 or 8 inches high, the leaves a quarter of an inch broad, often only 3 or 4 inches long, the flower 12–15 lines long, exclusive of the ovary, the crown the same colour as the divisions, and slightly exceeding them, the divisions 2 lines broad at the base. *N. Pseudo-Narcissus*, Herb. Amar. p. 207, and *N. Pseudo-Narcissus*, Haw. Journ. Trans. p. 244.

5. *Pseudo-Narcissus*, Linn. Sp. Plant p. 414. Flowers large, or middle sized at first a very pale sulphur yellow, finally nearly white, the divisions narrow and more lanceolate than in the type, the same colour as the rest of the flower, equaling or slightly exceeding the divisions. Bot. Mag. t. 68, Sweet Fl. W. Gard. ser. 2, t. 164.

All these five varieties are none of them very rare in cultivation in England at the present time, but 1 and 2 are very much the commonest, both being frequently seen "double" in gardens. *N. Sabini* Lindl. Bot. Beech. t. 762. *Domeles major*, Haworth, is most like No. 1, but the corona is decidedly shorter than the divisions, and the filaments are inserted higher up in the tube, and scarcely exceed the anthers. Doubtless it is a garden hybrid.

III. *Calathinus* (Linn. Sp. Plant p. 415). Bulb ovoid, not more than half an inch thick. Leaves generally two to a scape, very slender, green, 1½–2 lines broad, concave on the face, scape 8–12 inches high, very slender, terete, flowers one or two to a stem, on pedicels 2–3 lines long, which equal or exceed the spathe, densely crowded, 14–16 lines long, exserted, the lobes of the corona about half an inch long, the upper three inserted near the mouth of the tube and reaching nearly to the throat of the crown, style filiform, reaching nearly to the base of the tube, corona entire, inflated, style exserted, 2–3 lines long, 3 native of Spain, Portugal, the opposite coast of Africa, and the south-west of France as far north as Bordeaux.

A very distinctly marked plant, easily known from the Daffodil and from *N. Pseudo-Narcissus* by its slender tube, basinate stamens, long pedicels, and reflexed divisions, and from *N. Triandrus*, which otherwise it very closely resembles, by its longer corona. We have seen wild specimens only from the Isle of Gleanans, in Brittany, gathered by Gay and others, and from Portugal, gathered by Baron Paiva, and are not aware that it is now in cultivation in this country. We follow Redd. and De Candoille in regarding it as the *Calathinus* of Linnaeus, but the plant figured in the "Botanical Magazine" under that name is very different, being a slight form of *N. odoratus*. *J. G. Baker*

Home Correspondence.

Indian Forest Appointments.—The discussion that has lately been going on in the columns of the *Gardeners' Chronicle* on this subject will, doubtless do a great deal of good to both India and our native land. Many proprietors of waste land may be inclined to think that whilst we are training young men for India, a few trained for home service would do no harm. Training young men to manage Indian forests is very meritorious, and a step in the right direction. Let us have a few for home service. I think I may state, without fear of contradiction, that the forests of our English nobility are the worst managed part of their property. The result is a heavy loss of rental to the proprietor, and a general loss to the country. This result is in most cases owing to the ignorance of the person in charge of the forests. I refer to one of the largest estates in Staffordshire, which I give as an example of many more that I know. There have been three agents in about 20 years. No. 1 was an auctioneer, No. 2 a linen-draper, and No. 3 a Catholic priest: all three very nice men in their own line of business, but they knew little more of forest management than "the man in the moon." So long as our landowners leave vast tracts of valuable timber land in the care of such people, so long will our forests be anything but what they ought to be. It is often deplorable to see land being planted with trees entirely unsuited to the soil and situation—trees that delight in damp sheltered places planted on high, dry, exposed places, and vice versa. The idea of sending young men to Germany to learn how to manage forests is simply ridiculous. The Germans are the worst foresters on the Continent, in fact they do not manage them at all, but leave them to Nature. I have lately had several long conversations with the ranger of one of her Majesty's forests. He has lately been over a great part of Germany, and he assures me that nothing can be made worse than the foresting. In France the forests are now much better managed than formerly. When I was last at Chambery in Savoy buying trees, I found the Government agent in the same nursery buying young forest trees by the million. He told me that the Emperor took great interest in the forests, also that thousands of acres were being planted every winter with young trees suitable to the soil and situation. The English send to Germany for Dogwood to make gunpowder, and leave square miles in Ireland, England, and Scotland unplanted, that would produce a better and cheaper wood. I may say the same of many marshes that would, if planted, produce large quantities of Willows for basket making and crate wood. I know one hill in my native county (Aberdeen) that formerly did not produce enough to keep a dozen geese. It was planted with Fir and Larch, about 20 years ago, and now produces a handsome yearly rental to the proprietor, besides giving employment to woodmen, sawyers, and carters. I could also give many instances where large sums have been spent in planting land with trees entirely unsuited to the soil and situation, and the natural result has been, dead loss and disgust to the proprietor. *John A. Watson, Campaign Lammermoor, Geneva, Switzerland.*

Calanthe Veitchii.—I am quite certain every Orchid grower will thank Mr. Anderson for teaching us how to manage the lovely *Dendrobium*.

REVIEW OF THE GENUS NARCISSUS.—II.

Group I. MAGNICOBONATE crown as long or rather longer than the divisions of the perianth.

Of the Narcissus which have the crown in the middle of the flower as long as the divisions of the flower, there are only three well-marked species, each of which corresponds to a genus of Haworth's, two of which are well known in cultivation, but the third, which is very rare in a wild state, is now, we fear, lost from our gardens. They may be distinguished from each other as follows, viz.—

- 1. *BULBOCOLUM* (Genus *Corbularia* Haworth). Filaments and style straight; divisions of the perianth linear-lanceolate, and to an eighth of an inch broad at the base.
- 2. *PSEUDO-NARCISSUS* (Genus *Ajax*, Haworth). Filaments and style curved; divisions of the perianth oblong lanceolate, 5–6 lines broad at the base.
- 3. *CALATHINUS* (Genus *Asarum*, Haworth). The cylindrical rather widened at the top, five or six times as long as broad; divisions of the perianth distinctly reflexed.

could not sell. A Colonel might as well talk of selling his Regiment as a Tenant in chief (or *capite*) selling his *fief* (or feudal estate). It descended from father to son—to the eldest of course, as being the first who could discharge its duties, in regular succession of 'primogeniture' a line never broken except when "some fair mischance," inconveniently occurring in the shape of a Daughter, was as matter of course immediately consigned to the first Favourite of the royal list who wanted—a Pief.

Remember there was no Standing Army, no Navy no Civil List no Parliament to 'vote supplies.' The King had to do it all himself and this network of *subordination* which penetrated the whole body politic, say rather this pyramid, of which the sovereign was the summit, embraced at once his military power, and whole bond of government. The Land was the basis on which it all stood, the pivot on which the whole turned. War being the one occupation of life—the 'natural pursuit' of man,—to follow to the field some warlike lord was the Rent which each vassal paid to his Superior, throughout all the links of the feudal chain.

But there was one class of Society which did not go to war. The Churchmen of those days (for Lawyers, like other national blessings, were of later birth) were the only scholars as well as the only landlords, in the land in *proving* sense of the word, and by degrees, invented modes of *leasing*, and then *leasing* land, which, gradually superseding the old fashion of *enfiefment*, furnished one out of several ingenious and evasive modes of passing the actual *ownership* from one to another *in fee* and in an evil day,) even of conveying it *in trust* to one man for the actual benefit, or use, of another, the latter thus enjoying what was called the *equity*, while the former held the *legal* estate.

But here let us take breath for a moment, and survey the jungle we have got into! Lord Suzerain, Tenants in Capite, Profs, and Profits, Leases and Releases, Leases and Trusts, Legal and Equitable Estates, and Feudal Tenures in general! With such a vocabulary over its head by way of pedigree, will it now be wondered at, that that unhappy bit of land, about which those two citizens were last week complacently negotiating, changed masters, under their simple Cheque-and-Receipt-book operations about as effectively as if they had proposed to buy and sell the old day out of the Week, or one of 'The Twins' out of the zodiac?

To modern eyes the power to Buy and Sell seems almost inseparable from the idea of ownership. That freedom and facility of transfer, which has during the past year enabled three and a half Millions Sterling to change owners at the London 'Clearing House,' is due solely to the growth of Trade, and Commerce, and Manufactures, those 'Younger Children' of national history, which as they rose to wealth and importance, obtained laws for themselves adapted to the stature and intelligence of the periods in which they attained to corporate existence and maturity. Laws are to a nation very like what Habits are to an individual: it is easier to make a new one than to alter an old one, and thus we must not be surprised to find the modern trade Interests of society clothing themselves with the legal habiliments of advancement and intelligence, while Land was still struggling in the fetters, say rather the swaddling-clothes of a system, which while studiously retaining the old appellation of *real* property, deprived it of that which is recognised as the best test of all proprietary right,—the power of disposal, or 'alienation.'

There is nobody to hang, or even to blame for this. It is not the fault of the lawyers. They did not make it. It *grew*. The poor old feudal system was a good one in its day—and suited to its day. It kept society together in a sort of chivalrous interdependence, which was better than independent barbarism. The evil is, when a thing has lost its use and meaning, and become obsolete, when the candle has burnt down into the socket and grown mischievous, that the extinguisher is not put on to prevent its becoming disagreeable.

But why, you will ask, if this obstructive system exist no longer in the other countries of Europe, once as subject to feudal laws as England, and has never existed at all in the American States, since they ceased to be a Colony—why does it still hold its ground in the United Kingdom of Great Britain and Ireland? Why have the efforts of our Legislature, as in

the Act of 1832, which limited Land titles to twenty years been unavailing? Why was Lord WESTBURY'S Bill of 1861 for the registration of indefeasible titles, unavailing? Why was the proposal perhaps the best of all,—to cut the Gordian knot by Insurance, buyers and sellers uniting to insure till the twenty years had run out, and the title run *in*—unavailing?

If you ask the question of a layman, he will answer, smiling, with the aphorism that "No Craft reforms itself." And as the Public think they *can't* do it, and the Conveyancers *won't* do it, landed titles in England and Ireland can only wait patiently for another Deluge, or some terrestrial cataclysm like those which Sir ROBERT MURCHISON and the Geologists tell of, to give us a fresh start altogether, and put us on a par with Holland, Denmark, Norway, Germany, Switzerland, the Tyrol, Italy, and Belgium, where no doubt some such convulsions must have happened, as they have made short work of Feudalism, and demoralised the conveyancers down to the vulgar doctrine of 'small profits and quick returns.'

But if you are not afraid to ask a Conveyancer himself about it, and he should chance to be one of

"those better brothers
Who think of something else beside the pen,

he will probably ask you in return (also smiling, "like any christom child") "How on earth are we to enable you to sell land, like Horses? How would you set about selling a horse whose master had *settled* him in such a posture that his head was in this century, and his tail in the *next*, or *—a year*? If you could see *here*, how would you deliver him? We have to deal in a kind of ware more far-reaching than the Atlantic Cable, more delicate than the electric brain-thread, the nerve that links our mind to matter. We are your only true spirit-'mediums.' They, poor bungling-scholars, only profess to bring the dead back to life, and evening parties, and round games. But our machinery, *our* dealings are with *the Living*. They are our real clients, those antenatal, 'in Remainder;' for they are always 'coming,' and they have got, and for ever and for ever hold the *Fee*, while that poor breathing wretch, the 'life in being,' the 'Tenant for life' in *tail*, whom you ignorantly call the *owner*, and address as 'Esquire,' is a being whom we look upon as autogaster at the wrong end of the Settlement, for any good, or harm he can do, and as in *our* eyes, nobody at all. His life estate—his '*posse*' is daily diminishing, while the Remainder man's '*posse*' is daily dilating, and enlarging on the *view*."

You say that that won't exactly do, for the purpose that the soil was made for, viz, its agricultural use, that it was meant to be cultivated like a garden by *somebody*, not tied up, like a Lettuce, for somebody *else's* future enjoyment, and that the land, if it be 'real property' ought also to have a real *owner* of some sort: that the proprietor ought to have some *Motive*, the Tenant some *Security*, the Labourer some 'place where he may lay his head,' after his hard day's work, and *near* it too, and you say that this long-winded system of entail on an *unborn* generation interferes with *all* of these, and sacrifices the present to a future uncertainty, which the very instant it ceases to be future and uncertain, and comes into possession, is chained down in turn to the despised and despicable 'life estate,' and from that instant begins to

"Lose the name of action."

Well! what can the Conveyancer do to help it? He has only to obey Instructions. 'The Family' asks it, and "the Law allows it." You say that it is written *somewhere*, that "the earth was made for all"—that, *to this day*—and mark that, it is as responsive to the Spade, as to the Steam Plough, *and more*—and that if a live dog is better than a dead lion, a living Nymph should be able to buy, and *sell*, his five acres (and without taking S. NEAD'S 'old man of the sea' on his back, in the shape of a lawyer) as easily as AHAB to inherit his five thousand. It sounds dreadfully 'radical,' but it is the nature of things that *penetrate* the soil to be so. Yet how to 'disestablish' this unborn tyrant, and restore English and Irish earth to "any number of lives *in being*," as in America? Won't it give birth to a Revolution—i. e., amongst the Unborn, whose 'vested interests' it so cruelly disendows? Ay! there's the rub!

But, happily, for every poison there's an antidote, and for "this Nettle danger," there is the Dock to soothe the sting—that the very moment

the unborn rebel comes into life, he drops once his objectionable character, and *comes* within our admitted circle of rights as reasonable entail! Once establish this number of Lives *in being*, but no crawling into the unborn world!" and you get rid of that stifles the free transfer of British and landed absurdity, one chapter of the *unborn* soil. Very terrible advice, no doubt. The wonder is that such a restriction has not occurred earthquakes in the before-named *unborn* begins, but worse remains behind for it was halt a history but "Sir, a whole history of our quotation spoke of.

— THE corn markets throughout the country have been without any important changes. Foreign Wheat in foreign Wheat was at a slight advance. The meat and live-stock markets lower prices have been made, from the short supply at previous times. The number of beasts on Monday was 1,630, of which 3,134 were foreign, and the highest prices made were per 8 lb. Of sheep there were 32,400, nearly all being foreign which sold at much lower prices. The lambs made 7s. per 8 lb.—But little is doing in the seed trade. Some speculative exchange has been made in the Clover seed market at a slight advance in prices.

— The Returns of the CHANCELLOR of the EXCHEQUER on Local Taxation were issued on Thursday, and they appear to be of more importance than anything which has been published on the subject, and, of late, much vexed question. The amount to be levied for the poor-rate, a though it is not an exonerate for the relief of the poor, was, at 11,061,502, as against 10,304,067 in 1867—an increase on the year of 757,435. In England the amount was 10,132,457, and in Wales 599,157. The contributions out of the poor-rate as contributions to the borough, and police rates, amount to the aggregate to 2,325,717 in England, and 127,467 in Wales to Highway Boards, 611,577 and 655,777 respectively. Burial Boards, 107,127 and 339,000 to bath and wash-houses (of which there are none in Wales 11,398), and to fire-brick in England, 127,127. Making these deductions, the exact cost of the poor-rate exclusive of Scotland and Ireland is 8,881,877.

— Mr PENNY, the contractor for the new show-yards of the Long-stay Agricultural Society during the five years which will end with getting on with his work at Manchester. A space of 70 acres, some four times as long as it is broad, between the Manchester and A. Ringham Ballers to the south, and the Manchester and Chester roads on the north, is already enclosed. The architectural elevation which greets the visitor on approach is a ready in its place—the framework of the rows for implements is already planted in long lines of shelving for machinery in motion as seen on either side as you get within the yard—the further end, divided off by a public highway (which will, however, be closed during the week of the show) so much of the shelving for sheep, and pigs as it is safe to put up by the closing of the entry list has declared in much exactly will be wanted, is a ready framed position—the horse-boxes are in progress—of the apartments for judges, stewards, secretaries, &c. a very near completion—and Mr PENNY is congratulated on his obvious resolution to do everything in perfect order long before the time to which his contract ties him. The asphalt, and at its eastern end next Manchester it is clayey, but ample care is being taken frequent large and shallow drains with many openings to the surface, to provide for the rapid drainage of surface water, if the weather should be wet. It can, however, be denied, that the risk of discomfort there should be any considerable rainfall during the snow of this year very much enhanced by the character of the land. Let us hope that what may be pronounced the usual good for one of the Society's this year attend it, and that the multitude of spectators who await its arrival at Manchester may see the advantage of seeing its capital show under fortunate circumstances.

— The Birmingham Horse Show is fixed for June 17—20, inclusive. At a meeting last week presided over by Mr T. B. WRIGHT several alterations were made in the programme. The principal suggestion by Mr WRIGHT was that the carriage class should be struck out of the programme in regard to stallions, setting hunters. This suggestion was adopted. The classes for stallions were also expanded. An extra prize of 5/13, however, added for the best horse and a new class for hunters not exceeding 16 hands was agreed to, the prizes offered being 20/ and 10/ respectively. The prizes altogether are increased by 100/ over last year, and the guarantee amounted last week to 10,000/.

— A Bill for the institution of County Finance Boards has been introduced into the House of Commons by the Government during the past week, which the following summary is given in the Times. It is proposed that in each county a number of representatives of the ratepayers shall be associated with county magistrates. In each county a composite Board is to be formed, consisting of the magistrates. The *ex officio* members are to be the magistrates, while the elective members are to be guardians of the poor chosen by the County Board.

they respectively belong. The number which... to delegate as to vary from one to... gross estimated rental and the... expected, will be to send to each Financial... representative of the rate-... every two magistrates. But, as many of the... do not attend the strength of... would in practice be pretty equal... committees of the Board equal... would be drawn from both classes. The Act... compulsory, so as to secure uniformity of system... the country, and to avoid those disputes... seem to be the inevitable result of a permissive... measure.

Warning to Cattle Dealers is the reading of a singular action in the Sheriff's Court at London. Mr. CHARLES DALLAS, of Haughhead, was sued for personal injury done in St. Andrew Street by an ox which was described in court as being of large and in a furious state, along that street. From the evidence, it appeared that the bullock was, on the day in question, along with other bullocks, being driven, under charge of one man only, and ran off from its companions. It was attempted to be shown in defence that the injury to the plaintiff was the result of a simple accident, occurring through the bullocks having been barked at by a dog, and when barking at the dog, snapping its foot, and coming down with its head on the street. The Sheriff gave judgment against the defendant. He held that the occurrence raised a presumption of fault on the part of the defendant which he must rebut, and that he had failed to do this. In the first place, the alleged fall of the bullock was only spoken to by the man who had charge of the cattle. No bystander—although there must have been many—had been called to substantiate it. Again, the defendant had tendered no evidence as to the previous character of the bullock, and he must assume that had favourable evidence on that point been obtainable, it would have been presented to the court. Besides, it seemed to him that if a person chose to drive a number of bullocks through the streets of a city with only one man in charge, then, if harm happened to the public, the owner must be responsible. It might be that generally one man was found quite sufficient, and it was for the owner's interest to have only one driver in order to save expense, but it was clear that when anything unusual occurred one man was not sufficient to control such a number of cattle, and for his own purposes the owner had only one person in charge, then he, and not the public, must bear the attendant risks.

OUR LIVE STOCK.

Two important sales of Durham cattle have recently attracted attention among admirers of high-bred stock. One held at Watlington, Kent, on Thursday, the 9th inst., in which Mr. F. Leney offered for sale 20 heifers all below two years old, and the same number of young bulls. The other, held at Wicken Park Farm, Bucks, when Lord Penrhyn disposed of 22 females and 18 bulls. Lord Penrhyn's cattle made the very excellent average of 60*l.* 10*s.* all round. Further inspection of the prices realized shows that the 34 cows and heifers averaged 67*l.* 2*s.* 9*d.*, while the bulls brought 47*l.* 19*s.* each. The Wild Eyes tribe were in the greatest demand, eight individuals making 9*l.* 12*s.* each. *Grand Duchess of Wales*, by 11TH GRAND DUKE of this tribe became Lord Danmore's property at 300*g.* *Grand Duchess 3d*, by DUKE OF GREVEL, and of Wild Eyes extraction, was purchased by the Hon. C. W. Fitzwilliam for 105*g.*, and *Grand Duchess 5th*, by the same sire, and from *Grand Duchess 3d* was knocked down to Mr. F. Leney at the same figure. The Darlington also created much competition. *Darlington 12th* was bought by Mr. H. J. Sheldon for 105*g.*, and Lord Kenh's secured the 15th and 17th of the name for 120*g.* each. The 11 members of the family averaged 75*l.* 10*s.* We hope on a future occasion to give a full list of the prices and purchasers.

We beg to remind our readers of the Costerton sale of Northern cattle and Leicester sheep which takes place on Tuesday next, under the superintendence of Mr. Thornton. Mr. David Ainslie's stock is of first-rate quality. The cattle we have noticed on a previous occasion, and we now add that the sheep have signally sold themselves by carrying off a large number of prizes both at the Highland Society and Border Union shows. Costerton, near Edinburgh, is eight miles from Dalkeith, and three from Tynehead Station.

Mr. R. Gibson, New York, has purchased two heifers and a bull from Mr. Booth, of Waraby, for the sum of 2000*g.* It is some months since Captain Gunder disposed of his *Duchess 5th* to Mr. Cochrane, of Canada, for 1000*g.* The Booth blood on the present occasion has asserted its equality with that of Bates, *Bride of the Vale* having realised the same noble figure. The remaining heifer, *Merry Peal*, and the young bull ROYAL BRITON, were sold for 500*g.* each. *Bride of the Vale*, a roan, is rather more than four years old, and is a daughter of *Soldier's Bride*, by W. SUSSEX (1893), and LORD OF THE VALLEY (1890). *Merry Peal*, a roan, is by COMMANDER-IN-CHIEF the 1st prize aged bull at Leicester, and from *Lady North*, of the Bliss family, by S. B. SAMUEL (15,302). ROYAL BRITON is still a calf, he is by LORD BLITH, 22,126, and from *Royal Bridesmaid* by PRINCE ALFRED (13,191), and therefore descended on the male side from the cow *Bliss*, and on both sides from LEONARD, the sire of *Bliss*.

Mr. F. Leney's sale was even more successful than that of Lord Penrhyn, the general average being 64*l.* 1*s.* 6*d.* This figure was, however, greatly due to the sale of the GRAND DUKE OF KENT, calved Dec. 23, 1868; a son of LORD OXFORD 2D (20,215) and *Grand Duchess 9th*, and tracing back to *Grand Duchess* by

GRAND DUKE 10,281, and previously through a long line of Duchesses to *Duchess 1st* by CUMBY. This splendidly bred calf was purchased for 500*g.* by Mr. Moore. Deducting this exceptionally high price from the catalogue, the average is lowered to 53*l.* 2*s.* and the bull average is brought down to 52*l.* 10*s.* The same gentleman also became the owner of *Countess 2d* by KNIGHTLEY of the *Charmier* tribe, for 255*g.*, and of *Duchess* by GRAND DUKE 10TH, also a descendant of *Charmier* by LITTLE JOHN, for 75*g.* The same blood had a so attractions for Mr. J. P. Foster, who bid 200*g.* for *Tien Duchess 3d* by KNIGHTLEY. We append a list of the prices realised, and the names of the purchasers.

Name of animal.	When calved.	Price.	Purchaser.
<i>Females.</i>			
<i>Garland 6th</i>	July 8, 1867	29	The Queen
<i>Tien Duchess 3d</i>	Sept. 19	200	Mr. J. P. Foster

 Average of 26 bulls 56 19 3 = 1139 6 0
 Grand total £2755 4 0
 General average £44 1 6

We hear that the heifer calf dropped by *Kirklevington 12th*, which we recently noticed, has to be known in future as *Marchioness 1st*, and that all the produce of the *Kirklevington* and *Siddington* stock now at Danmore will be designated *Marchionesses* and we presume also *Marquises*.

Old Moss Rose, purchased at Kibbrow for 400*g.* by Mr. D. R. Davies, has produced a rich roan bull calf to GRAND DUKE 10TH *Cleopatra 5th*, of the same herd, has calved a white heifer to GRAND DUKE OF ESSEX 4TH.

THE CIRENCESTER SCHOOL OF ART

[The following very beautiful address was lately spoken, on the occasion of an award of prizes at the School of Art in Cirencester, by Prof. Church, of the Royal Agricultural College.]

I SHOULD be glad to be allowed, in saying a few words to you to-night on the subject of Art, to ramble about a little in this wide domain. Only three days ago did I hear that I might perhaps be of some use here this evening, and since then my ordinary work has not permitted me to prepare such an address as would have satisfied your expectations and my wishes. Excuse then, I beg, my presumption in speaking at all in this place. Let my interest in Art and my desire to help, in any way at all possible to me, on such an occasion as this, be my excuse for standing before you and giving you, for a few minutes, some desultory talk. 1st. I would take up then as they come into my mind a few subjects of artistic moment about which I have often thought.

First among these stands the relation of science to art—its help and its interference more particularly being in my view just now. It has often happened that the period in a nation's history when art has attained its greatest perfection has not been distinguished for special moral excellence, or large literary achievement. Chinese colour is most lovely, its combinations and modes of application afford splendid examples of refinement of taste, yet the stereotyped character of Chinese civilisation is a by-word in Europe. In North Africa, again, we have several rough and half-civilised tribes possessed of a style of ornament which both as to design and colour is worthy, I will not say of imitation merely, but of the deepest study. A bit of Arabic inlay, such as some of the Meymar specimens just added to the South Kensington Museum, or a plate of Persian faience will show us that we must not disdain to learn from peoples far behind us in general civilisation

—who know less, and certainly talk less than we do, but who seem to have felt more, and commonly achieved, in some art directions, greater successes than are usual amongst us. Looking back 300 years, we find in Western Europe the splendid structures of medieval architecture, from A.D. 1100 to 1500, together with the perfect products of many kindred arts, coeval with a state of society, of feeling, and of general knowledge which in some points was absolutely barbaric. Was it then, I want to ask, the growth of science and the spirit of philosophical inquiry which deadened art then, or must we look to our own era before we can trace any great influence of this kind? I ask this question not because I can here answer it competently, but because it gives me the opportunity of mentioning one point of contact between science and art which leads often, in individual cases, to distinct failure. You know that men of science who are always questioning Nature and learning her secrets, can now do at their will, and more perfectly than before, many things which men knew not the reason of formerly, and which came as it were hap-hazard, and now and then to the earlier workers. Take an example. When the great French potter Bernard Palissy was at work (he died in 1590), no knowledge of the real nature and affinities of the material of pottery, of glazes and glazes was to be got. He struggled through years of experiments and years of disappointment, and at last achieved at last a success of the most durable sort. During the last hundred years or more every problem that puzzled Palissy in glazing his ware has been solved by science. Invention and processes and improvements may even have been too abundant. Our manufacturers and those of Europe have done great things, but the ware may be perfect in texture and durability, the colours may be pure and bright as those of flowers, the glaze may have the polish of a jewel, but if there be lacking the artist's spirit to imbue the exquisitely-prepared body with true life, the finest porcelain-paste, and enamels, and glazes are worse than dead. Those old potters whose works are now-a-days preserved as precious, did not invent their materials first, and then begin to think of design and colour, and the idea of the form and the ornament had wrought itself into order, and then were sought by long-continued trials materials which should give it substance and adequately represent it. Now, a chemist, or experimenter, or manufacturer invents a new glaze, and a man needs but to cover everything he makes the vessels to show off the wonderful new glaze, and not to give that it may produce the beauty of the vessels. See, for example, the Beckington. Science has brightened our colours, but lay on bright chemical pigments thick as you can, glaze them with the juiciest of glazes, and if feeling and art be wanting, the result is a dead, artificial, and dull display of hues given you, which, after you have seen it once or twice, will be forgotten. I have seen their so-called harmonies of a day, but never again, you never tire. In Josiah Wedgwood you have an illustrious example of a man who pressed into the service of his manufacture all the resources of science, and yet so used them that they served only to exalt the artistic merit of his productions. For to Wedgwood's ware chemistry gave the right composition, while mechanical skill gave truth and perfection of texture and form. By countless trials under scientific guidance Wedgwood improved his materials, not to display them as such, but in order worthily to represent the lovely designs of Flaxman and to reproduce the beauty of antique art. I have given you illustrations of the way in which science may help or endanger art; hundreds might be cited from painting or from architecture, where, especially, mathematical precision and mechanical hardness are too often quite fatal to beauty of effect; but I must rest content with having directed your thoughts to a question of such great importance as the right attitude of science to art.

I am naturally led to say a few words now on another topic, intimately connected with the last. We have seen, or may infer, that improvements in manufacture arising from increased knowledge of the intimate properties of the materials used may often aid and often damage art. If, for example, you make all your pigments pure and bright, you may have no repose as the result—what we may name temperance of colour may become impossible or difficult. Use but do not lavish the gifts that scientific progress offers. Take a Persian dish as an example. On a white ground is a beautiful arabesque of conventional ornaments from leaves and flowers. The designer used four colours only, a pale greenish-blue like the turquoise, a deep rich blue, a grey-like Indian ink, and lastly, a red, a peculiar tint—very dull and very dirty, not quite unlike that of a halfpenny stick of very bad sealing-wax or a poor sort of red lead. But this colour must not be brightened only let a scientific man come in and suggest and substitute the last new chemical red, let him take the dulness out of the red and the beauty is taken out of the whole combination of colour. And then the Indian ink colour, a smoke colour, is on these Persian plates for a similar reason. Often their borders have, besides ornaments in colour, hundreds of little spiral parts of grey giving at once quietness and solidity to the edge or frame, and thus brightening the central design of the piece. Temperance in colour does not indeed mean dullness and dowdiness of colour—it means proper relief combination, and proportion of colour. Let some of these rarer tints be introduced among your blues and reds and yellows, which you cannot exactly name but which the watchful student of Nature may see trembling on the leaves of the Willow, or paying the autumn palette of the forest, or shining at sundown from the depths of the sky.

I hardly like to take up the third point about which I had wished to speak to-night it would demand for proper treatment many illustrations and examples.

This might have been done at a very small cost... society... but it was not done... such a comparison... spirit which characterizes the whole of the country.

Home Correspondence.

Steam Cultivation. Any farmer who has heard the signature of W. H. ... command attention... however, from the fact that his remarks refer more to the cultivation of the soil only, and not to the more important question of the otherwise... A correspondent... looked upon... interesting... may be a fact that... whatever the nature of the soil may be, is more effective than once over the ground by horses, whether in ploughing, grubbing, or harrowing, but such a rule does not imply that steam culture involves fewer ploughings, &c., for in practice the requirements of the soil, season, &c., may demand the opposite, viz., more frequent ploughings with steam than with horses. We can easily perceive cases where frequent and effective ploughings are better in favour of steam, and very probably this may be the rule in the vast majority of farms, but from some a rule would also have to apply to cases where once over the ground with steam... the ground by horses, which in not a few examples steam can enter the soil more easily, by which the work by one operation when horses have to wait a more advanced season for favourable weather, at a sacrifice which the harvest favouring never fails to estimate at its true value. It is the loss to arrive at practical results that would induce any farmer to bring steam to aid. He has come to the conclusion, and, no doubt, it must be admitted a correct one, that by a better pulverisation, a looser moving of the soil, his crops are largely increased, involving more carriage in every respect. It is in regard to this carriage we must see what can be done. In the *Agricultural Gazette* for Jan. 2, p. 14, Mr. Smith gives us an estimate of work done, and what can be done, which, on the whole, is not altogether discouraging, but an alarm of fire is raised. "Ah! 'tis a good servant, but a bad master," but can we not keep it in bounds?—for you will observe it is "fire" that is put forward as the only drawback. It has been remarked that when a horse is put to work and other... to us... still require... of Wheat... the time to reap... will be heat or to... we wish to bring a... here to the reaping... will start, and will be put forward as an essential reason for retaining horses on the farm in number more than can possibly be required. Mr. Smith shows by his "correct card" that his horses worked on an average of 122 days each in the year—that is three acres on 112 acres arable and 10 acres grass, and but for the average recommended by the R. A. S., 100 acres would be necessary to keep more than four horses. Mr. Howard's bailiff writes (p. 177) that 10 or 12 horses are sufficient for 100 acres under the plough, a fact which steam, but do they not seem too many? Assuming the work on 100 acres to be four times that of Mr. Smith's case, by mere matter of multiplication we certainly would arrive at the conclusion that 12 would be required, but is it so? There are always exceptions to the rule, let us hope that this instance is one, and that the work can be done by four or five horses on 224 acres arable. Allowing there is a pinch at haymaking and harvest, a horse might be purchased and again disposed of if hiring is out of the question, but with a good class of farm-horse, one in which steam has inspired a rival spirit of activity, one horse to every 50 acres of land would be found sufficient. I will not here refer to the great in fact immeasurable, advantage to be derived from the use of steam, thereby enabling deeper and more effective cultivation, in the greater economy of manure of labour, the... of the... engine be made... servant "fire" what other obstacles are present... will point to the small lands or stretches which the undrained and unpulverised state of their ground requires to prevent if possible the crops being "waterlogged," but steam cultivators know such are not requisite. There is certainly a great drawback in the hedging, timber, and small fields, but with a little management this might be overcome. The fact of their being obstructions will in very many instances cause their removal. Another use to which our engine might be put is in irrigating our fields with liquid manure or water. It is well known in farming that the root-producing portion of the farm has thereto failed on the whole to pay its own expenses and has consequently entailed a heavy charge on the corn-producing moiety. But liquid manure and irriga-

tion would render them self-supporting by furnishing at a diminished percentage of cost a greater increase. It may be remarked that this irrigation is a costly affair, but taking into consideration the value of the straw that is now trodden under foot in its conversion into, in many instances, so-called manure, it does not seem wrong that such waste should be avoided. Is it not possible to consume the greater portion of straw, now so wastefully used on the majority of farms, in assisting to produce meat, animals themselves being kept on swarded floors, by using a large quantity of liquid British guano, the appliances requisite for its conveyance to the fields being, I suppose, not so thoroughly considered as they should be? 70s. per acre, varying with the position of the field, it may be, and perhaps has been used. We have seen... There is no possibility of... the strength of... will be... the... even... of applying guano, nitrate of soda, and such like manures in a liquid state. How many farmers of light land or otherwise, would have been thankful in the past season had their farms been laid with a thin grasp of the 3-inch guano or water pipes? And it may be presumed that it had been so the winter months would have been more productive. A fatal failure would in its effect have been written down by these gentlemen who kindly assisted you in doing a trustworthily statement of the... Again, does the fact of a larger amount of manure being applied to the soil, which in the next season would have been written on an average, 10 per cent. on the farm, for the purpose of better... which in many cases, in hardly so named owing to the rainfall from the... getting in return manure, the value of it or... Here we are met with, "Where is the money to come from?" If we will but for a moment consider the large sums that are invested in foreign and other roads by many owners of land here, whose estates would be benefited by an ordinary... it has some... asked as often without getting an answer in any way satisfactory. Risks will be incurred in a "London and Dover," or a "Kent and... rail, or the mere report of the engineers of such undertakings, backed up by the opinion of some one who has had great experience in these matters at the same time that, with some worthy examples for imitation of the immense good that can be done in "foraging for our own people," so little can be noted by way of advancement in the agricultural world. In... Mr. Smith's... wireworm and a glance at Hampshire farming. Having just visited Hampshire I was... so many... destroyed a wireworm. All this might have been easily, cheaply, and certainly prevented by the sowing of about six bushels of salt per acre just as the manure was being brought. I have some land subject to this pest, and for several years, having tried the salt I have prevented the ravages. "Oh, but," say or write without... My reply has been—Do it with any water with the salt? This soon... It would do to wait for a... of larvae before... the withering of the plant... after the stem has been bitten through by the wireworm. In some cases wireworms are the best friends to farmers, that is, when they only destroy one half or two-thirds of the too thickly sown plants, thereby teaching a wholesome lesson on thin seeding. A Hampshire farmer told me the other day, as I looked over his wireworm eaten field, that last year he had despaired of getting any crop, but the few plants left by the wireworm had... grow... have... Hampshire... with a... I was a good... system in the district... from the wheat. This in fact would be considered a culpable and unprofitable... The... in the spring and find it a paying operation. On the part of a Wheat field, where a long heap had been removed the wheat was densely thick and great advanced in growth beyond the rest of the crop. Here was an instructive lesson. It teaches us that with very ordinary quantity of seed would be enough and that the excess in this case would be ruinous to the crop, and hardly save it from premature falling and rotting. There is always maintained, in despite of many opinions to the contrary, that land can never be

too rich for wheat. I should like to see... I am told that we are not... with cake and corn, for we should have... of Barley or Oats." I am... improved condition of the... corn as we do with roots or... between them... J. J. May, ...

From the foregoing experiments we may, I think, safely conclude that the seed steeped in oil was preferable to any others, nor do I think that it is at all a matter of importance as to a few hours' steeping. If the seed becomes well saturated with oil it will achieve two important objects, viz., the destruction of any insects or parasites that may be upon the seed, and also accelerate the growth of the plant out of the reach of its first enemy.

The CHAIRMAN (Mr. Evan Davies, of Patton) said Mr. Roden had not at all entered into the history or habits of the turnip beetle, or attempted to show any connection between the seed, the embryo, and the insect, whereby a steeping of the seed might be beneficial for its destruction.

steeped in oil and the attack of the fly prevented. A Dr. P. ... the microscope by a practical illustration. He sowed part of the seeds with the white spots in the open part of the ground, and part in a flower-pot, which he covered with a bell glass, to prevent the ingress of enemies...

Journal of the Bath and West of England Society 1868. W. Ridgway, 169, Piccadilly

The current volume contains reports on the Falmouth show—papers on the Geology and Physical Geography of Cornwall, Somerset, and Devonshire also one of Mr. Whitley's excellent meteorological essays...

The most laborious and original, and, we hope, fruitful, of these essays is a report by Mr. W. Froude, steward of the implement department of the Falmouth show, in which he discusses at great length, and with great fairness, one or two of the classes of machinery whose exhibition he superintended.

therefore, must be rated at verification of this result I made per minute, the result was 10 foot-pounds per minute. Now the rules accepted by the best authorities rather than falls short of the work a bodied man is able to perform...

"If then each stroke may, as my me, be assumed to clear a space of 5 ft. 10 foot-pounds of each superficial feet, giving 100 foot-pounds per square foot of space cleared, to the square...

Other experiments were made to determine the power required for cutting grass. It was found that the net expenditure of power was 12 foot-pounds per square foot of surface cut...

Mr. Froude's summary comes to the conclusion that the power expended by existing machines is in the proportion of 12 to 100 foot-pounds per square foot of surface cut, whereas the power required for the same work is only 12 foot-pounds per square foot...

Mr. Froude's summary comes to the conclusion that the power expended by existing machines is in the proportion of 12 to 100 foot-pounds per square foot of surface cut, whereas the power required for the same work is only 12 foot-pounds per square foot...

To sum up what has been said:—The existence of some radical improvement in the power of mowing machines is shown—

- (1) By the fact that when 'working dry' nothing is done but to raise the grass when cutting a first swathe.
(2) By the great and unwarranted draught, which different machines as tested by a dynamometer exhibit when performing the same amount of work, and
(3) By the fact that the power expressed in square feet of surface cut is even in the best machines grossly in excess of that which, as a direct consequence, is the utmost required for the same amount of the work.

To account for this I have no doubt that the action imposed on the knife-bar and rollers involves a stress upon the working parts very maximum is nearly forty times as great as that which the performance of useful work alone requires.

(2) I deduce from the above that the stress that an excessive power of mowing and in backlash the loss of power is very great as regards friction, and the pressure is very least almost as much waste as appears in the best machines.

(3) Lastly, I point out a remedy which is admirably adapted to the present state of the art, and which, if adopted, would reduce the abnormal stress by the operation of a counter-balance, which would be a very valuable improvement.

The simple fact that the power of mowing machines is in the proportion of 12 to 100 foot-pounds per square foot of surface cut, is of itself a very striking fact, and somewhere they embody a principle which is not understood by the general public. The power of mowing machines is in the proportion of 12 to 100 foot-pounds per square foot of surface cut, is of itself a very striking fact, and somewhere they embody a principle which is not understood by the general public.

and seed-drill. On inferior soils, with less farmyard-manure, Peruvian guano should be sown over the dung, and the superphosphate applied in a liquid form along with the seed, or the guano and superphosphate may be both sown over the manure and river-water, applied by the drill, to start the seed into braird. In dry weather some farmers put a heavy roller over the drills after the sowing machines, thereby rolling them flat, and leaving the land as if it had actually been sown on the flat. But in moist seasons the drills or ridgelines are left high, as the land when moist supports the rollers of the machine better than when dry. This latter plan, however, is objectionable, for when the dry weather sets in the young plants and manure both suffer. As a general rule, therefore, farmyard-manure should be covered rather deeply—or, as it is sometimes termed, "down below the weather," and the drills rolled nearly flat after sowing—assuming that the land is thoroughly drained. The practice of high drills in wet seasons no doubt took its rise before and was drained, as they would then in some measure protect both manure and plants.

Live stock are said to begin their new year with May, the time for turning out to grass being from the middle of April in the south, to the middle of May in the north. When first turned out from the home-stead they require to be carefully attended to, as the nights are sometimes biting cold. This is more especially necessary with milk cows, brood mares, and all cattle that have shed their coats in warm stalls. It is a good plan to turn stall and box-fed cattle out to open yards for a week or ten days before they are sent to the pastures, and if there is green food, as Tares, or water-meadow Grass, they should be fed on such fodder in the yards, so as to prepare them for the permanent change to Grass. Milk cows and working horses are often taken from the fields at night during May.

Fattening Cattle and Sheep.—The remainders of winter-fed stocks are now disposed of, those ripe for the shambles being sold to butchers, those not fit for slaughtering being sold to graziers, who commence filling their parks or pastures from the middle to the end of the month, according as the weather and the forwardness of the Grass may allow.

Fat Lambs are now abundant north and south. In the north some farmers buy in draft-ewes (4-year-old Cheviots and 5-year-old blackfaced) in autumn, serve them with Leicester rams, and by the end of May many of the lambs are sold off, and the ewes then soon become fit for the shambles. The lambs of the remainder are drafted and sent to market, and their dams follow as soon as they are ready.

Dorset Ewes are served in the home counties from the beginning to the close of the month with Sussex Down or Hampshire Down rams, for early lamb. In many cases the ewes are brought and served purposely to get them and their lambs both ripe for the shambles together. The practice of buying in old ewes for a crop of early lambs is thus similar to that of May lambs in the north. Technically it is termed "lamb and dam fattening." Sussex and Hampshire Down ewes also have early lambs, but the horned Dorset ewe is generally preferred.

Lambing in May is common in the Highlands of Scotland—indeed it seldom terminates before the close of the month in late districts.

Castration of Lambs should be done in mild weather, when they are from 10 to 14 days old. Those fattening for the shambles need not undergo the operation. The whole lamb flock is generally docked and marked at the same time, some only brand or mark the ram lambs and ewe lambs selected for breeding—the marking of the others being left to those who may purchase them in the summer markets.

Weaning of lambs takes place with those dropped in February and March, and continues on to July as they come of a suitable age.

Sheep-washing and Shearing commences generally about the close of the month in our southern provinces, the month of June being more common in the north. Some flock-masters have small washing places built of stone or brick expressly for the purpose, the size allowing one or more sheep to be washed at a time, according to the size of the flock. Water is laid on from a pond or stream by means of a pipe. A few steps lead down to where the shepherd stands, the water being drained off below, others dam a running stream, the shepherd standing in a cask while washing; a third and an older plan is, to swim the sheep through and through a deep pool in a river or dam in a stream until clean. The poet Dyer appears to allude to this latter practice when he says—

"Gay shearing time approaches. First, however,
Dive to the double flid, upon the brim
Of a clear river. Gently drive the flock
And plunge them one by one into the food."

As soon as the wool is dry, shearing commences. In the larger hill flocks of the North the shepherds join or club, shearing first one flock and then another, each flock being thus put through the shears in less time.

Bacon Hogs.—Young pigs intended for bacon are allowed to grow more steadily, and hence are fed on less nourishing food than those forced forward for the shambles as small porkers, but it is short-sighted economy to allow young pigs which are intended for bacon to lose their milk flesh.

Breeding Sows that farrowed in February and early March will be dry, and coming forward to litter in August; they should be well kept, but not too fat, and this applies to those still nursing.

Notices to Correspondents.

NAME OF PLANT J. H. M. Your plant is without flowers. Is it not the dark variety of *Oxalis corniculata*?

H. DOULTON & CO.'S GARDEN EDGING TILES

THESE TILES ARE MANUFACTURED IN VITRIFIED STONE-WARE AND IN TERRA-COTTA OF THE BEST MATERIAL WHICH IS BURNT TO AN EXTRA DEGREE OF HARDNESS AND WARRANTED IMPERISHABLE.

They will be found to be far preferable to Box and other Edgings, as they require no attention when they take up less room, and do not harbour Slugs, &c. PRICE LISTS of the above, and also of TERRA-COTTA GARDEN VASES, FOUNTAINS, FLOWER-POTS, FERN-CASES, &c. &c. may be had on application to DOULTON AND CO., HIGH STREET, LAMBETH, S.E.

DESCRIPTION. THE "AUTOMATON"

THE "AUTOMATONS"

Are guaranteed to perform their work perfectly, and if not approved may be returned within a month. They are easy to work, light in draught, almost noiseless; and being driven by machine-made gearing are not liable to get out of order.

PERFECTION IN GARDEN ENGINES First-class Certificate of Merit, MANCHESTER HORTICULTURAL EXHIBITION, 1867.
BAMFORD'S Registered (No. 1552) "MODEL" GARDEN ENGINE.

The Inventor has great pleasure in offering this GARDEN ENGINE to the Public for the fourth season. Many Improvements, which have been suggested by experience or otherwise have been added, in combination with increased strength and new design in several parts. Although in competition with many new forms and variations, which have been brought out to meet the requirements of the public, none have so thoroughly succeeded as an article of utility in every class of Horticulture.

The "MODEL" GARDEN ENGINE is the only one that will throw a steady, continuous, and powerful stream of water. The simplest and most effective apparatus for throwing water by hand power.

Their style and small amount of friction renders it easy for a Lady to use them, as evinced by numerous Testimonials.

From Mr THOMAS FARMER, Gardener to Lady Cotton Sheppard,
 Crickmarsh Gardens, March 12, 1868.

"Dear Sir,—I am very pleased to bear testimony to the efficiency of your 'Model Garden Engine,' I find it invaluable for damping down Fruit and Peach Houses, also for syringing Peach and other Wall Trees, Roses, &c. I may safely add it beats the Hyacinth and all the Garden Engines and Sprinklers I have before met with.

"I am, dear Sir, yours truly,
 THOMAS FARMER."

GARDEN OR HOT-HOUSE ENGINE,
 With air vessel, capable of throwing from 30 to 50 feet, (improved
 Cast iron, India-rubber Tube, and Brass Spread)

No 10, to hold 10 Gallons £3 5s.
 No 14, to hold 14 Gallons £3 17s

GUARANTEED TO GIVE SATISFACTION IF NOT APPROVED, CAN BE RETURNED.
 Sold by all respectable Ironmongers, and the Manufacturer,
HENRY BAMFORD, MARKET PLACE, UTTONETER.

 1 1/2-in. ditto Delivery Hose, 1s. 4d.

Crystal Palace, Sydenham, March 2, 1867.
 Messrs. WARNER & SONS.
 "GENTLEMEN.—I feel great pleasure in stating that I was present at a trial of your small Crystal Palace Fire Engine, and was much pleased with its efficiency and simplicity. The Pump throws out a steady jet of water to a height of 50 feet with very little labour. The Pump we have is well made, very simple in its parts, and not likely, I think, to get out of order. The advantage of this pump is its being very portable. Besides being a good Fire Engine, it will make an excellent Garden Engine."
 "I remain, gentlemen, yours obediently,
 Lewis Storr, Esq. near to the Crystal Palace Company."

NO IMPROVEMENTS OR ALTERATIONS FOR THE PRESENT SEASON, 1869,

IN

GREEN'S PATENT SILENS MESSOR,

OR

NOISELESS LAWN MOWING, ROLLING, and COLLECTING MACHINES.

The Extraordinary Success of GREEN'S PATENT LAWN MOWERS is an established fact. During the last five years the demand has been unprecedented, and alone is a proof of their superiority over all others. The following are their characteristic features —

- 1st. Simplicity of Construction, every part being free of access.
- 2d. They are worked with far greater ease than any other Lawn Mower.
- 3d. They are the least liable to get out of order.

From the fact that these MACHINES are so well known in Great Britain and Ireland, also on the Continent of Europe, T. GREEN AND SON do not deem it necessary to trouble the Public with a list of the numerous Testimonials that they have received from time to time, but would simply add,

THEY ARE THE ONLY MACHINES IN CONSTANT USE AT

THE ROYAL HORTICULTURAL SOCIETY'S GARDENS, SOUTH KENSINGTON
 THE ROYAL BOTANIC GARDENS, REGENT'S PARK
 THE CRYSTAL PALACE COMPANY'S GARDENS, SYDENHAM
 SUCKINGHAM PALACE GARDENS
 MARLBOROUGH HOUSE

THE HYDE PARK GARDENS
 THE WINTER PALACE GARDENS, DUBLIN
 THE DUBLIN BOTANIC GARDENS
 THE LIVERPOOL BOTANIC GARDENS
 THE LEEDS ROYAL PARK

THE HULL BOTANIC GARDEN
 THE BOTANIC GARDENS, EDINBURGH
 THE SUNDERLAND PARK
 THE PRESTON PARK

AND IN MOST OF THE PRINCIPAL PARKS, SQUARES, ETC, IN THE UNITED KINGDOM.

HORSE, PONY, AND DONKEY MACHINE.

GREEN'S PATENT LAWN MOWERS

have proved to be the best, and carried off every Prize that has been given in all cases of competition. Since the first year they were introduced (1856), upwards of 48,000 have been sold, and 25,000 of that number during the last five seasons.

T. GREEN & SON warrant every Machine to give entire satisfaction, and approved of can be returned unconditionally.

PRICES of HORSE, PONY, and DONKEY MACHINES, including Patent Self-delivery Box, Cross Stay complete; suitable for attaching to ordinary Chain Traces or Gig Harness.

PONY AND DONKEY MACHINES.

To Cut 26 inches £13 0 0	} Leather Boots for Donkey, 18s. } Leather Boots for Pony, 22s.
" 28 " 15 0 0	
" 30 " 17 0 0	

HORSE MACHINES.

To Cut 30 inches £21 0 0	} Leather Boots for Horse, 30s.
" 36 " 24 0 0	
" 42 " 27 0 0	
" 48 " 30 0 0	

Both the Horse, Pony, Donkey, and Hand Machines possess (over all other Makers) the advantage of Self-sharpening. The cutters being steel on each side, when become dull or blunt by running one way round, the cylinder can be reversed again and again, bringing the opposite edge of the cutter against the bottom blade, and the Machine will cut equal to new. Arrangements are made that the cylinder can be reversed, by any inexperienced person, in two or three minutes.

HAND MACHINES.

To Cut 10 inches	.. £3 10 0	Suitable for a Lady
" 12 "	.. 4 10 0	" "
" 14 "	.. 5 10 0	Suitable for One Person
" 16 "	.. 6 10 0	" "

To Cut 18 inches	.. £7 10 0	Suitable for One Person
" 20 "	.. 8 0 0	Suitable for Two Persons
" 22 "	.. 8 10 0	" "
" 24 "	.. 9 0 0	" "

Packing Cases are charged at the following low rates, viz. — for the 10 and 12-inch Machine, 3s., 14 and 16-inch, 4s., 18 and 20-inch, 5s., 22 and 24-inch, 6s. Persons providing themselves with Lawn Mowers are recommended to purchase the cases in which to stow them away, when not in use, to prevent them from getting damaged. When returned, two-thirds will be allowed for them.

The above MACHINES are made from the best materials, and of superior workmanship, are delivered Carriage Free to all the principal Railway Stations and Shipping Offices in England, Ireland, and Scotland.

HORTICULTURAL and AGRICULTURAL IMPLEMENTS, GARDEN SEATS and CHAIRS, FOUNTAINS, VASES, PLAIN and GALVANISED WIRE WORK and ORNAMENTAL WIRE WORK of every description.

Having very extensive Premises in London, we are in a position to do all kinds of Repairs there, as well as at our Leeds Establishment.

Having a large quantity of MACHINES in stock at our Leeds and London Establishments, we are in a position to execute Orders on the day they are received.

SUTTONS'

HOME-GROWN SWEDE AND TURNIP SEEDS,

NEW AND UNADULTERATED.

Saved from carefully selected roots.

EARLY, MEDIUM, AND LATE SOWING.

Lowest price per bushel on application

Goods Carriage Free, except very small parcels.

SWEDES.

CHAMPION.—The best Swede in cultivation. A very heavy cropper, perfectly hardy, stores exceedingly well, and seldom suffers from mallow. 1s. 3d. per lb., much cheaper by the bushel.

PURPLE-TOP.—A useful variety, fine stock. 1s. 3d. per lb., much cheaper by the bushel.

POOL.—A well-known sort. 9d. per lb., much cheaper by the bushel.

GIANT TANKARD.—One of the heaviest croppers, and quite distinct from the Yellow Tankard Turnip. 1s. per lb., much cheaper by the bushel.

HARDY WHITE.—A particularly choice sort; excellent for late spring feed. 1s. 3d. per lb., much cheaper by the bushel.

YELLOW-FLESHED TURNIPS.

GREEN-TOP YELLOW HYBRID, and **PURPLE-TOP YELLOW HYBRID.**—These are very superior varieties. If sown in July and August they will produce a heavy crop, scarcely inferior to Swedes sown in June. 1s. 3d. per lb., much cheaper by the bushel.

SCOTCH or BULLOCK.—Green and Purple. 1s. per lb., much cheaper by the bushel.

TANKARD.—Excellent for early feeding, and a certain cropper; but should not be allowed to stand after December. 1s. per lb., much cheaper by the bushel.

ECLIPSE.—A very fine purple-topped hybrid, of oblong shape. 1s. 3d. per lb., much cheaper by the bushel.

WHITE-FLESHED TURNIPS.

LINCOLNSHIRE RED PARAGON.—Very large, and of excellent feeding properties. Sow in June and July for autumn and winter use. 10d. per lb., much cheaper by the bushel.

POMERANIAN IMPROVED WHITE GLOBE.—The best Turnip for early feeding. Comes off in time for wheat sowing. Sow in May. 10d. per lb., much cheaper by the bushel.

IMPERIAL GREEN GLOBE.—The best Turnip for the main crop. Very heavy and nutritious, and of valuable feeding properties. Sow in May, June and July. 9d. per lb., much cheaper by the bushel.

PURPLE-TOP MAMMOTH.—A new and distinct variety, very free grower. Flesh firm, white, and juicy. Sow in May and June for early feeding, and August to stand the winter. 1s. 6d. per lb., much cheaper by the bushel.

IMPROVED GREEN TANKARD.—The best of the Tankard varieties. Suitable for early feeding on account of its very quick growth. Sow in May and June. 1s. per lb., much cheaper by the bushel.

GLOBE or GREY STONE.—Should be sown the same time, and for the same purposes, as the Red Paragon. 10d. per lb., much cheaper by the bushel.

MEETINGS FOR THE ENSUING WEEK
May 29 { Norfolk Chamber of Agriculture—County Financial Board.
Horse Show, at the Agricultural Hall, Litchington.

To those who have confidence in the Science of political economy it must afford matter of interesting thought to mark the occasional force of Circumstance in compelling obedience to laws which argument, however cogent or reiterated, had failed to demonstrate. When the late Sir ROBERT PEELE was still but half a convert to the long resisted doctrine of free trade, the formidable visitation of the Potato Famine in Ireland—foretold, years before, by COBBETT, and by McCULLOCH—precipitated not only the abandonment of the 'Sliding Scale,' but the wholesale abolition of the Corn-laws. "The stars in their courses fought against Sisera." Events which to the great body of general observers come simply as 'accidents' are often neither less nor more than the practical self-vindication of Natural Laws, which however slow, are as certain in their operation—as certain to reach their culminating point, as the overflow of a dam by the silent accumulation of the stream,—or that retributive course, in the Moral laws, of which it has been so sternly sung,

"raro antecedentem et lectum Deservit Poena pede claudo"

It would be well for mankind, if their rulers believed in this salutary doctrine, better still if they believed in it themselves. But we go contentedly on violating the maxims of a Science which is, after all, but the 'horn-book' of natural law, a sort of grammar of factology "collected and arranged for the use of students"—a class whose limited demand will hardly pay the publication.

Were it otherwise, would the appeal now made to England on the Irish land-difficulty present the all but insuperable problem that it seems to do? Are we sure that in this question "our withers are unwrung"? Are we ourselves in a position have we qualified ourselves to undertake—we will not say the cure—but even to estimate its features, or honestly to look it in the face?

We have said, and we repeat that—apart from every shade of political thought, from every turn of party views—we regard Land questions

as essentially our own. What would be the use or end, of all we write and write on agricultural and landed topics—what would our office as journalists be worth if when a question so vitally consequential as this is harassing the minds not of landowners and legislators only, but of every thinking man, who has his country's good at heart, we stand aloof, watching as mere lookers-on the painful evolution of a problem whose elements touch the very marrow of our weekly task and study, and refusing to contribute our mite towards its solution?

We have spoken in two former articles of 'the law's delay,' and cost and difficulty, in the Transfer of land, amounting almost to a national scandal, but become inevitable under our complicate system of Entails, Executory devises, and the endless legal refinements interwoven with them. So long as these remain, my living dormant claims under all wills and deeds and unexecuted testaments, long Abstracts of title must and will be required, and long delays, and long bills of Costs, must follow. On this point what says the distinguished Economist to whom we are indebted for the best edition of ADAM SMITH'S great work. "By preventing the sale of land," says McCULLOUGH, "or placing it, as the lawyers say *extra commercium*, Entails are obviously adverse to the progress of agricultural improvement, and property is hindered from coming into the hands of those who would turn it to the best account."

But entails are by no means responsible for the whole of the evil, nor is it, as will easily be seen, their use but their extravagance that needs correction. There is another cause, developed into more significance since McCULLOUGH wrote, and far more insidious in its operation upon the freedom of the soil, but so entrenched by public error that it almost baffles the fair assault of argument. Nor will we attempt to storm it, until MENENTIS-like we have shown it its own image, not in his immortal vein of allegory, "once upon a time," but by a simple tale of modern life.

In a certain street, at the extreme West-end of London, there lived, not long ago, a well-known householder, who became notorious for the odd fancy of never allowing his windows to be cleaned. Under the silent influence of the dust, if not of ages yet of years, which answer to some end of our enterprise, what should have been a great and life-giving minutes, became an exposure even to the passers-by. No friend, instance, or relative, of friend or relative had any influence on the obstinate man to abate the nuisance. Every form of appeal, before it had well begun, he stopped and smothered with the same retort of which the burthen was that on the opposite side the street there stood a house, in which nearly every window-pane had been cracked, by the clumsy vehemence of the cleansing process, constantly repeated. The fact was true, unfortunately: for, no effort of discrimination could induce him to admit, or see, that between the extreme evils of fracturing every pane, and allowing them to become useless within, and offensive without, there was a very wide interval indeed,—of which in fact, every other house in the street stood witness.

On the other side of the British Channel there lies a country where an imperial demagogue made a law, which still remains in force, that no man should be able to make a will of landed estate except in such a proportion as permitted each of his children (male and female) to share equally with himself. If he had only one child, he could make a will of half, if two, of one third; if six, of one seventh; and so in the other cases. This pernicious law was intended by its shortsighted framer as a preventive of the growth of aristocracy—what it became was and is, a preventive of *progress*—and this at the hands of one who said that "the greatest woman in France was she who furnished most sons—to the Conscription." But its evil influence does not operate in France alone

"like a midwived ear
Blotting the wholesome brother"

it has had the consequence on this side the Channel of rivetting the shackles of a law of landed intestacy, which has drifted down to us from feudal times, and which errs in the opposite extreme, and of arresting its very discussion with the pious cry—"Heaven defend us from the French *morcellement!*" "Our opposite neighbours' paces have been cracked by the impulse of rude hands; let no finger disturb the dust, or let daylight into ours!"

Yet,—this landed exception apart,—in no

country of the world has the 'daylight' gained, in their respects, a freer admittance. If a foreigner writing of England were describing the mode in which the Law disposes of the effects of an Intestate, he would speak of it as excellent beyond the reach of criticism. "On the death of any person without a will," he would say, "the Law divides his wealth amongst all his children, with an equal proportion to his wife, if living, and to the children of a deceased child, with an impartiality that seems to approach the perfection of justice. But let him have inherited or bequeathed any of his money in *fee*—then all is changed—the whole shall go to the eldest male to the exclusion of all the other children." Thus there are two separate principles of distribution of property, diametrically opposed to each other, and that in the most commercial country in the world, where every kind of property is equally available under the hammer of the auctioneer, land itself included, so far as the act of sale is concerned.

It is, however, urged in reply that this law of 'primogeniture' comes very rarely into operation, that the devolution of land in this country is governed almost entirely by Trust Settlements, and family Deeds of Intail, so that if this exceptional case which feudal habits have lifted down to us, were laid hold of and extinguished tomorrow, the *costs* of limited inheritance by the first born son would suffer no interference; people would only be more careful to make their Wills or Settlements, and landed property would remain unaffected by the change of the law.

'Why then alter it?' it is asked. If its operation is so trifling now, and would probably be still rarer afterwards, why alter it? The question is gravely asked, with all the persuasive emphasis with which men defend a system which they would never have dreamt of creating. As if the proof, or reproach, of the justice of a law were to be measured by the frequency of its operation. Would homicide once a year be more 'justifiable' or less *criminal* than once a month? or a law permitting it less censurable? The question is not of the frequency, or extent, but of the policy and justice of its action. Individuals may divide their property as they please. There is no good reason why any man should not devise, or settle, all his land upon his eldest son, and other sons to his youngest daughter; it is simply a question of private will, and preference, and he must be trusted to make what provision he pleases for his widow, and his other children, and if he omit this duty, it is a matter with which the public and the Legislature, in a free country, cannot meddle: all such restraint would be an impolitic interference with the rights of property.

But it is still more important that THE LAW should not speak in two voices, nor make capricious exceptions, in this kind of property, or in that, to its own even-handed justice. It must be consistent with itself, and a Rule of Right. "No human laws" says the great Judge BLACKSTONE, "are of any validity if contrary to the Law of Nature, and such of them as are valid derive all their force and all their authority, immediately or immediately from this original."

The will, or settlement, of a Parent while ostensibly giving all the landed estate to the eldest son, charges it with, or makes other provision for the widow, and younger children. The *law*, in the case of land, does nothing of the kind so that, as has been humorously said of it by a high living authority, "when it does make a will for a man, it makes one that any man would be ashamed to make for himself." But frequent or infrequent as its private operation may be this is a small part of the mischief of the law in question. Its real evil power is on systems of which it is the root and of which 'Real and Personal' as terms of distinction, applied to different kinds, or rather conditions, of property, is the luxuriant growth. It is hardly possible to convey an idea of the history of Litigation which has grown up in our Courts of Law and Equity out of these two words, and the conflict of two discordant and irreconcilable systems—the Commercial and the Feudal, *several actually operating*, to which they have given the key-note, and remained the fundamental cause. The disputes between the 'Heir-at-law and the 'Personal representative,' as they are called,—the respective champions of the two conflicting codes,—would, if the recountal of the tale of centuries were possible, surpass that of

Through those centuries the dust has gathered and no hand has essayed to lift it, and the daylight in. But it is the darkest dawn that precedes the Dawn.

Mr. W. SMITH, of Woolston, has received for his farm. He can no longer give his labour to the promotion of steam cultivation, and talk with the usual confidence of detailing his experience, and drawing conclusions teaching them, with characteristic urgency, without a return for his attention he was giving the public. The tax upon his farm has become excessive, and the tax upon his five guineas is for the future to be charged on his farm lecture. His reasons for this given in the following letter from him.

"I have shown my farm to thousands from all quarters by walking over it with them, and explaining my system, within the 14 years since we start, without netting a farthing for my trouble. I have now made up my mind that I will no longer walk and talk for nothing any longer, especially as my facts are stronger than ever. There are my Bean crops on Nos. 1 and 4, heavy and seed-beds costing 7s. an acre, the strongest in the neighbourhood, with the land as good as a garden, although it is the 14th crop without a fallow, and yet under horse culture this year, and fallow every fourth year. Then there are my Beans on Nos. 2 and 3, heavy land, costing only 6s. 9d. an acre for seed-bed, beating everything on similar soils in the neighbourhood. No. 1, light land, similarly treated with Wheat, at a like cost, is quite the best in the neighbourhood, and these lands are as good as a garden. Then there are my Barley crops, the third year in succession, on a seed bed, and the soil worked a foot deep, as fine a plant as ever I saw, and my other crops are all as good as any I have seen, besides all that, I have just gained the first prize for my own, the heavy plough, and the first prize for a sowing machine, and I can be assured that I have not only how productive I can make a 14 years' but in the worst soil, I can make a first-rate condition by steam power. So, in the case, and the public must be made to pay more than if they have them. You are all aware, I may, however, come and see for yourself, if you like. The 14th crop—Wheat—costing only 6s. 9d. an acre, and that was cost for ploughing once over at least 10s. 6d. (and I shall have to pay tax for ploughing the fallow land this year on the farm that was just bought) is a fact that must sooner or later mark upon the land and farmers of the country, and not the cost of a set of tackle or low machinery can employ a set, that they need care much about, but their great concern must be how to apply it; and that is what my 14 years' practice has learned me."

We entirely sympathise with Mr. SMITH. He stands, we believe, on an altogether different platform from that which is occupied by any other of the promoters of steam cultivation in this country now remaining to us. Mr. SMITH cannot quote their large expenditure and costly efforts in the same direction, with a view to being placed by outsiders in the same rank as which our Woolston hero stands. That is a misfortune incidental to the nature of their contribution, valuable, efficient and essential as it has been, to the success which we have now to record. No doubt it needed pluck as well as capital to follow as a manufacturer in the track of the farmer's first commission of a steam engine, without a will, and we gladly acknowledge the good spirit which prompted and inspired the efforts of the agricultural machine makers in the promotion of steam cultivation. But the manufacture has long since become a standard profitable. Hardly anyone, unless it is the pioneer who, each for himself, commenced one of the early firms of steam cultivation machines, and lost by it, can say that steam cultivation is not now a profitable business to every one concerned in it. There are no one probably of those who have spent 20 years been working at it, but has made a fortune by it. And a most fit and proper acknowledgment of its every one admits this to be those who are achieving this result, whatever their rightful claim to it, think as we do, not as a matter of fact receive the measure of an hour and of gratitude which is awarded to the inventor and the teacher. Even an inventor, if he be also manufacturer necessarily receives money payment for his labour and his genius, submits to a different valuation of his services from that which we accord to others. And Mr. SMITH, the courageous signaller, the persistent advocate, the confident and unquenchable leader in this particular department of our country's improvement, stands now almost alone in the opinion of his contemporaries among the claimants of the highest rank.

the progress of a great industry. These are considered as indicative of the intention to establish what is asked for by agriculturists and Professors, namely, a complement to the scientific education...

at the expiration of a lease they had frequently made some increase of rent. If it appeared that the number of years a person had held a farm was not enough to compensate him an advance had been made him and the full rent had not been demanded...

landlord or the incoming tenant ought to pay for that. It was a matter easily enough made the subject of agreement at the time. One speaker had seemed in favour of arbitration at any time. He confessed his experience went the other way...

on the Lease.—The following is an abstract of the paper on this subject by the Cirencester Society of Agriculture, reported in these columns...

Mr. SMITH (Bibury) thought arbitration should be carried to a greater extent than it generally was. His opinion was that they would be better without any lease at all than with a short one but was in favour of long leases...

Professor WRIGHTSON in replying, said there appeared to be some difficulty in understanding the nature of the question. He thought the value of the means used in the form of manure and feeding stuffs to produce this abnormal fertility, would meet the difficulties of the case...

Farmers' Clubs.

MORAYSHIRE.

Rees and Wood Pigeons.—At a late meeting of this Club, Mr. GEDDES (Orblston) said: I believe it was the overwhelming increase in the number of crows that induced the committee to adopt this as the question for discussion upon this occasion...

the ownership of the whole of it. Of course, if they were owners of an estate they would deal with it as they pleased, but if they were only owners of a limited interest in it, they must so deal with it as best to make that limited interest serve their purposes for the time they held it...

Mr. WRIGHTSON said the resolution merely affirmed that short tenancies and the insecurity of capital were calculated to act as obstructions in developing modern agriculture. It seemed to him that was only another way of saying what was already well known...

Roses in Pots.

SON have now ready for immediate planting several thousands of ROSES in Pots, new and old. Their List contains the names of 1800 they have seen and recommend, and these are as under:—

NEW CHRYSANTHEMUMS, PYRETHRUMS, &c. JAMES EARLE AND SON beg to announce that they have sent out their NEW JAPANESE and other CHRYSANTHEMUMS, PYRETHRUMS, &c. A DESCRIPTIVE CATALOGUE will be forwarded on receipt of two postage stamps.

NEW CATALOGUE of New Plants for 1869. JAMES EARLE AND CHARLES LEE'S CATALOGUE of NEW WOODED PLANTS is just published, and may be had on application. It contains accurate descriptions and illustrations of the New Double Pearsons for 1869, New Genia, and New Norway, New Gloxinia, New Colusa, New Chrysanthemum, and New Field of Plants.

ROSE. Earle's Nursery, Peterborough, has a large stock of the following, which cannot be surpassed by any nursery in the Kingdom.

PELARGONIUMS. Earle's Nursery, Peterborough, has a large stock of the following, which cannot be surpassed by any nursery in the Kingdom.

Bicolor Pelargoniums. JAMES EARLE invites the special attention of the public and other purchasers to his extensive stock of BRONZE PELARGONIUMS, JAPANESE and CHINESE CHRYSANTHEMUMS, FUCHSIAS, and other plants, at the lowest prices for cash.

Best Gold-leaved Pelargoniums of the Season. JAMES EARLE AND SON are now sending out the above plants, in a strong established plants, at a 25% discount to the Trade.

New Tricolor and Bicolor Geraniums. JAMES EARLE AND SON are now sending out their new plants, amongst them the following sterling varieties:—

Cheap Tricolor Geraniums. JAMES EARLE offers 50,000 fine plants, at the following low prices for cash:—

First Prize Bronze Pelargoniums. JAMES EARLE, LAIRD, and LAIRD have great pleasure in announcing that they are now sending out the following plants, which were awarded the First Prize at the Special Exhibition, May 21, via BLACK KNIGHT, 10s. 6d.

Tricolor Pelargoniums. JAMES EARLE AND SON, St. Alban's, begs to offer his two beautiful TRICOLOR PELARGONIUMS, 'PRINCE' and 'MRS. DIX', awarded for freedom of growth and coloring, in good plants, 5s. each.

M. OLORE DE NANCY (fine double). JAMES EARLE AND SON, St. Alban's, begs to offer his two beautiful TRICOLOR PELARGONIUMS, 'PRINCE' and 'MRS. DIX', awarded for freedom of growth and coloring, in good plants, 5s. each.

New Tricolor Pelargoniums for 1869. JAMES EARLE AND CHARLES LEE intend to send out in the autumn of 1869, the following NEW TRICOLOR PELARGONIUMS, which they can warrant to be of strong constitution, and bright and clear colors.

JOHN CLUTTON is a Silver Tricolor of a very striking and novel character, the broad bright crimson zone being well defined, and the white edge clear and distinct.

ALL MILNER.—A beautiful Golden Tricolor, of robust habit and free growth. The centre of the leaf a bright green, the margin a bright flame colour on black, and the margin clear and well defined.

ROYAL HORTICULTURAL SOCIETY.—SPECIAL PRIZE and PELARGONIUM SHOW, May 21.

AWARDS of the JUDGES. PRIZES OFFERED by HIS GRACE THE PRESIDENT.

CLASS 1.—9 GREENHOUSE AZALEAS in Bloom. (Open.) 1st Prize, Messrs J. & C. Lee, Nurserymen, Chiswick, W. Extra, Messrs J. & C. Lee, Royal Victoria Nursery, Hampton, in Extra, Mr. A. Wilkie, Gr., Addison Road, Kensington, W.

CLASS 2.—9 ROSES in Pots in Bloom. (Open.) 1st, Mr. C. Turner, Royal Nurseries, Slough. Extra, Mr. W. Paul, Pat's Nurseries, Waltham Cross. Extra, Messrs. Paul & Son, Old Nurseries, Chesham.

CLASS 3.—6 Double-flowered Zonal PELARGONIUMS, not fewer than 8 kinds, in Bloom. (Open.) 1st, Messrs. J. Standish & Co., Royal Nursery, Ascot.

CLASS 4.—6 NEW PLANTS sent out in 1867 or 1868. (Open.) 1st, Messrs. J. Veitch & Sons, Royal Exotic Nursery, Chelsea, Silver Flora Medal. 2d, Messrs. J. Veitch & Sons, Bronze Flora Medal.

CLASS 5.—6 NEW PLANTS sent out in 1869. (Open.) 1st, Messrs. J. Veitch & Sons, Silver Flora Medal. 2d, Messrs. J. Veitch & Sons, Bronze Flora Medal.

CLASS 6.—NEW PLANT, shown for the first time in Flower in Great Britain. (Open.) 1st, Messrs. J. Veitch & Sons, for Denrobium Jamesianum, Silver Flora Medal.

CLASS 7.—NEW FOLIAGE PLANT, shown for the first time in Great Britain. (Open.) 1st, Messrs. J. Veitch & Sons, for Croton Hookerianum, Silver Flora Medal. 2d, Messrs. J. Veitch & Sons, for Dracaena magnifica, Bronze Flora Medal.

CLASS 8.—NEW GARDEN SEEDLING, of any kind, in Flower. (Open.) 1st, Messrs. J. Veitch & Sons, for Rhododendron "Lady Rolle," Silver Flora Medal. 2d, Mr. J. W. Wilmott, Ashburnham Park Nursery, King's Road, Chelsea, for Pelargonium (Ivy-leaved) "Willis' rosea," Bronze Flora Medal.

CLASS 9.—GROUP of FOLIAGE and FLOWERING PLANTS, 3 of each. (Open.) 1st, Mr. C. Turner, £5. 2d, Messrs. S. Glendinning & Sons, £3.

CLASS 10.—8 STOVE and GREENHOUSE PLANTS, distinct, in Flower, in 12-inch pots. (Open.) 1st, Mr. G. Wheeler, Or. to Sir F. H. Goldsmid, Bart., M.P., St. John's Lodge, Regent's Park, N.W., £5. 2d, Mr. A. Wilkie, £3.

CLASS 11.—1 Golden Variegated Zonal (Tricolor) PELARGONIUM (Open.) 1st, Messrs. E. G. Henderson & Son, Nurserymen, St. John's Wood, "Peter Griev," 15s. 2d, Messrs. J. Carter & Co., Nurserymen, Forest Hill, "Prince of Wales," 10s. Equal, Mr. C. Turner, Nurseryman, "Mrs. Hewley," 10s. 3d, Mr. C. Turner, Nurseryman, "Achilles," 10s.

CLASS 12.—1 Silver Variegated Zonal (Tricolor) PELARGONIUM (Open.) 1st, Mr. C. Turner, Nurseryman, "Excellent," 15s. 2d, Mr. C. Turner, Nurseryman, "Lady B. Bridget," 10s. 3d, Mr. C. Turner, Or. to Lieut. Col. W. Kinson, Finroy Park, Highgate, "Mrs. Col. Wilkinson," 10s.

CLASS 13.—1 Gold and Bronze Zonal (Bicolor) PELARGONIUM (Open.) 1st, Messrs. Downie, Laird & Laird, Nurserymen, Forest Hill, "J. W. Morris," 15s. 2d, Messrs. Downie, Laird & Laird, Nurserymen, Forest Hill, "Red Ring," 10s. 3d, Messrs. Downie, Laird & Laird, Nurserymen, Forest Hill, "Empress Eugenie," 5s.

CLASS 14.—1 Golden-leaved (Self) PELARGONIUM (Open.) 1st, Mr. C. Turner, "Pillar of Gold," 15s. 2d, Messrs. J. & C. Lee, "Golden Nugget," 10s. 3d, Mr. C. Turner, "Carr's Bowler," 5s.

CLASS 15.—1 Silver-edged PELARGONIUM (Open.) 1st, Mr. C. Turner, "Bright Star," 15s. 2d, Mr. C. Turner, "May Queen," 10s. 3d, Mr. C. Turner, "Mrs. Cutler," 5s.

CLASS 16.—1 Ivy-leaved PELARGONIUM in Bloom. (Open.) 1st, Mr. J. W. Wilmott, "Wish rosea," 15s. 2d, Mr. J. Stevens, "L'Elegante," 10s.

CLASS 17.—1 Nosegay PELARGONIUM in Bloom. (Open.) 1st, Messrs. Downie, Laird & Laird, "Fire King," 15s.

CLASS 18.—1 Zonal PELARGONIUM in Bloom (Open.) 1st, Messrs. F. & A. Smith, "Acme," 15s. 2d, Mr. G. Smith, "Juby," 10s. 3d, Messrs. F. & A. Smith, 5s.

Echeveria metallica (Special Offer). JAMES CARTER AND CO. beg to offer, in quantity, nice Seedling Plants of ECHEVERIA METALLICA, the singular and beautiful Shell Plant, very effective for bedding purposes. Price per dozen, 6s., per 100, 42s., per 1000, £18—well-established plants, in small pots, with four to six leaves each. Larger, at usual Catalogue prices.

Vines for Planting in a Growing State. JOSEPH MEREDITH, The Vineyard, Garston, near Liverpool, has now ready for planting fine extra strong YOUNG VINES, with 3 to 4 feet of extra strong Wood of the season, and 10 to 12 leaves, in a whole year, and prevent disappointment by planting between now and August next. Planting in a Growing State ensures success. Packed to travel any distance with safety.

Exhibition of American Plants. ANTHONY WATERER begs to announce that the AMERICAN PLANTS at Knap Hill are NOW in PERFECTION. The Nursery is readily reached by Train from Waterloo to Woking, where capital conveyances may be obtained. ANTHONY WATERER also invites inspection of his EXHIBITION in the HORTICULTURAL GARDENS, South Kensington, and at the CRYSTAL PALACE.

New Golden Caladium. THE DIRECTORS of the CHISWICK GARDEN of the ROYAL HORTICULTURAL SOCIETY desire to apprise the GROWERS of NEW PLANTS, that they are willing to RECEIVE OFFERS for the PLANTING of the above, and in consideration of the beauty and constancy of which have never been fully proved. The plants are in a well-advanced condition, and may be seen, and further particulars as to price, on application to Mr. BARROW, at the Garden.—May 21.

July 19th to 24th, 1869. THE ROYAL HORTICULTURAL SOCIETY'S GRAND EXHIBITION at MANCHESTER, in connection with the SHOW of the ROYAL AGRICULTURAL SOCIETY.

A SILVER CUP (copy of the famous Collier Cup), VALUE £21 will be offered by the Proprietors of the GARDENERS' CHRONICLE and AGRICULTURAL GAZETTE for the best COLLECTION of 6 FRUITS and 6 VEGETABLES, to be made up as follows:

Table with 4 columns: Good, Med. val., Inferior. Lists various fruits and vegetables like Apples, Peas, French Beans, etc.

This Prize is open for Competition amongst Amateurs and Gardeners of private families. The Fruit and Vegetables produced must be of the Exhibitor's own growing, and any article otherwise obtained will disqualify the Collection. It is expected that the several articles will be neatly and effectively displayed.

The Gardeners' Chronicle. SATURDAY, MAY 29, 1869.

MEETINGS FOR THE FORTHCOMING WEEK. (Royal Horticultural, Fruit and Floral Comm. Meet. at South Kensington, 1st & 2nd June, 1.30 p.m. Ditto (Scientific Committee) 3rd June, 1.30 p.m. Ditto (General Meeting) 4th June, 1.30 p.m. Royal Horticultural Great Show of the Season, at South Kensington, 24th & 25th June, 10 a.m. to 4 p.m.

THE Horticultural Society of London, as is proved by its charter, was established to promote the science of cultivation, and the improvement of our gardens. To that end the periodical EXHIBITIONS of GARDEN PRODUCE were established nearly 40 years ago; and though the shows were small at the beginning, they have now assumed proportions which may truly be described as levithian. True, however, to its charter, the Society has uniformly encouraged the cultivator rather than the collector; and those who, like ourselves, can trace the exhibitions back for the last quarter of a century, will see that the cultivator in the long run has always beaten the collector. We might give names to substantiate that fact, but the sudden manner in which exhibitors of large plants have appeared upon the field, and as suddenly disappeared, will illustrate what we mean. Money may make fine plants go together in a rather mysterious manner, but money never yet, except when backed by practical ability, made such gardening hold together for many years. We therefore consider the Council of the Society is perfectly justified in the course it is taking with regard to the exhibitions of future years. Large plants have certainly had their day as a leading feature, especially as too frequently they lack both novelty and variety. Look to the reports:—A. sends Hedera and Pimelea, B. contributes Pimelea and Hedera, and the same wearisome tautology runs through every class in the exhibition, while through

the best time for syringing to be between 3 and 4 p.m. When the weather is very hot, a disastrous effect on the wet foliage, and he would use a little blower to dry the leaves.

The issue of green-leaved and variegated female parents from the former was generally, but not always, the stronger and those from the latter generally, but not always, the weaker. As regards future progress, he thought we should be able to obtain yellows yellower, higher-coloured zones, and darker feet he did not believe that we should be

MAY 29, 1869.

To the Trade.
TURNIP and MANGEL SEEDS, growing crop of 1869, splendid stocks, various kinds. Seed Catalogue sent on application. Seed Catalogue sent on application. Seed Catalogue sent on application.

To Farmers, Gardeners, and Others.
EXCELLENT strong Spring-sown CABBAGE, BRUSSELS, SAVOY, BRUSSELS, and various other plants on offer price on application.

WHEELERS' IMPROVED TURNIP SEEDS—The subscribers beg to call the special attention of Agriculturists to the extra selected stocks of Turnip Seeds, which for quality and yield cannot be surpassed. Prices furnished on application, and free delivery as formerly.

Wheeler's Imperial Swede.

WHEELERS' IMPERIAL SWEDE—Purple top, very heavy, very nutritious, large, handsome and heavy. Price 1s. per lb. Carriage free excepting single parcels under 10s. For five consecutive orders 10% discount is taken. For the 1st order—order to the Gloucestershire Root and Turnip Society, as the best seed in cultivation. It is a sort especially to be recommended. Price 1s. per lb. J. C. Wheeler & Co., Seed Growers, Gloucester; and 59, Mark Lane, London, E.C.

SUTTONS' CHAMPION PURPLE-TOP SWEDE—Suttons' Champion, price 1s. per lb., much cheaper by the bushel, carriage free. Lowest price per bushel on application. Sutton & Sons, Seedmen to the Queen, Reading, Berks.

Messrs. Suttons' Collection of Grasses.
 SOUTHAMPTON MEETING, 1869, of the BATH and WEST of ENGLAND, and SOUTHERN COUNTIES ASSOCIATION To AGRICULTURISTS AND OTHERS INTERESTED IN LAYING DOWN LAND TO GRASS.

MESSRS SUTTONS' COLLECTION of GROWING SPECIMENS, consisting of 100 sorts (from their Experimental Farm, Reading), presents an opportunity rarely offered for obtaining a personal knowledge of the properties and habits of growth of the various kinds of Grasses suited to the English climate. Attendance will be given during the Show, and further information may be had on application. STAND No. 18. MIXTURES prepared for every description of soil. Sutton & Sons, Seedmen to the Queen, Reading.

The Exhibition of the Bath and West of England Agricultural Society, Southampton.

JAMES CARTER AND CO., THE ROYAL SEEDSMEN, 237 and 238, High Holborn, London, W.C., invite inspection of their extensive and varied Collection of Samples of CARTER'S PRIZE MEDAL MANGEL, SWEDE, TURNIP, and other FARM SEEDS, harvested on their own Seed Farms. On view and sale during the Show at SHEPHERD No. 26, Implement Department. STAND No. 194. JAMES CARTER & Co., Seed Growers, 237 and 238, High Holborn, London, W.C.

The Royal Seedsmen.

 MONDAY, May 31 }
 FRIDAY, June 4 }
 WEDNESDAY, June 2 } Royal Agricultural Society of England—North.
 SATURDAY, — 6 } Norfolk Chamber of Agriculture at Norwich.

On some late occasions we have endeavoured to point out, as familiarly as the subject will admit, the faulty features of our English land laws, features retained in this country, after almost every other European State, with one well-known exception, has got rid of them. Even while we have been writing, this exception has begun to disappear. Austria, the once backward, but now progressive Austria, has actually set about amending her land laws, after the Prussian—we may almost say the European pattern, and has recognised at last the wisdom and policy of freedom for the land,—freedom of Transfer, freedom from prolonged Entail, freedom from exceptional laws of Intestacy.

The opponents of this freedom in England are of two classes, consisting on the one hand of Landowners themselves, and on the other, of Lawyers of the land-agent, and lower conveyancing classes. The opposition of the landowners is rather passive than active, it really consists in a backwardness and indisposition to help themselves, arising out of a kind of timorous individuality that shrinks from allowing its own wound to be probed or known. Unfortunately, too, there is such a thing as the Timidity of Ignorance, a not uncommon complaint, which has the effect of peopling the dark unknown, or the twilight half known, with all sorts of spectres, so brain-born and unsubstantial as to elude all fixity for the purpose of examination, or the detective power of argument. One of the commonest of these, in the present instance, is a visionary theory about subdivision of land and 'peasant proprietors,' which are assumed as being the object of those who ask for Land-Emanicipation, and also assumed as being unfavourable to agriculture. Both assumptions are groundless, and untrue; but they are repeated, from print to print, and from mouth to mouth, with a persever-

and that makes one often wonder... if it is that sets on foot, and underlies... gratuitous, and beside the mark... begun with assertions of the evils of small... evil of small... and a distinct... The answer... instead of... United Kingdom... the aggregation... smaller estates... that is starting... more right to ask... "are you then... than to say... "are you then... a results or..."

The wish that... or even... the good they prevent... Natural Laws whose salutary action they intercept. It ought to be superfluous to say that what is wholesomest for every country and every part of every country, is that there should be both large wealth and small wealth, and wealth of every intermediate size without hindrance from the blinding agency of factitious rules and... The same is true, absolutely and... which takes the form... that small estates are bad things, or that large estates are bad things, but it is true that artificial restrictions, and exceptional laws directed to produce either extreme whether a... or a... country, are bad and far more mischievous than is commonly supposed. They damage not only the immediate subject matter of their operation, but disturb the whole relations of society connected with it. And of nothing is this so true as of the land. Volumes might be written upon that fatal phrase, 'agrarian law' and each chapter might take for its theme a different... on the political and social development of life, as traceable to this original. There is not a class of society unaffected by it, scarcely a destination of life which it does not reach.

Whoever doubts this, or imagines the propo... and call to... earth is... original source of all Wealth and of the whole machinery of human society, or suppose there can be any such thing as a... whether it is likely, that an error in the laws that profess to govern it, should be a trifling matter, a mere mistake, of small moment, or limited action, involving no consequences that interpenetrate the body politic in its vital relations whether, if it be true that there are... laws belonging to, and in the very structure of created things, presiding over their organisation, just as each plant, or tree, though growing in the same soil, develops its own special foliage and individual form, in accordance with the law of its being, — whether, if this be true, it is a safe or prudent responsibility, to go dogmatising on, with man-made theories and conceptions, taking such childish forms of expression as 'being in favour of small estates' or 'large estates' in land, when the trodden experience of daily life ought sufficiently to demonstrate that the mere tendency of a 'law' to produce either extreme is, at once, its condemnation.

It is true that the Napoleonic law, in France, compelling subdivision, is impolitic and injurious. It is true that the triple action of the land-tax, the entail laws, and obstructed Transfer resulting from them, intercepting land-... in England, is impolitic and injurious. Which is the... is simply one of those matters of speculative opinion on which men will take this side and that side, as long as "the sun and the moon endureth." To some lands and to some peoples, one system is better adapted,—for instance, where attachment to the soil is little, and capital for vicarious employment on it, large,—where men look solely to annual profit, and would rather rent of another, than cultivate, or ornament, their own,—there, the 'grande culture' of territorial Estates farmed by large tenants is sufficiently indicated. On the other hand, where the land is loved, like an heirloom for its own sake,—where capitals are small, and adapted to a smaller class of produce,

Is it... that the 'landed interest' must now be in their turn the 'doctrinaires', and set about explaining that the seventy or eighty... of British and Irish acres are not going to... like a half-trained colt, the instant the... and the... are... Can it really be necessary to argue that the sum of land transactions will not be less, nor the quiet... likely to come out in fewer figures when activity and freedom are the...? It is hard, they say, to persuade men against their interest, how often has modern experience shown it quite as hard to guide them in the true path of it... and... not behind the... of the community, will long be regarded, like a... by the... as they rear, when it has at its head the knowledge, the will, and the power to confer on British soil the greatest boon it shall ever have received since the time of its great statutory emancipation in the days of CHARLES the SECOND.

THE ninth anniversary festival in aid of the funds of THE ROYAL AGRICULTURAL BENEFICENT INSTITUTION will take place at the New Hall, Freemasons' Tavern, on Wednesday, June 9—next Wednesday week—the Right Hon. Lord ROBERT MONTAGU, M.P., in the Chair. The annual election of pensioners and children will be held at the same place on the following Wednesday, June 10, at 11.30 A.M. There will then be elected on the list of the society's assistants 12 male pensioners, at 25/- per annum, 6 married pensioners at 30/- per annum, 12 female pensioners at 25/- per annum, and 12 orphan children, to be maintained and educated by the Institution. These numbers will thus be added to a list on which 126 names have been already placed, 18 married couples and 90 single men and women having been elected during the past eight years to the benefits of the charity founded by Mr. M. M. And how large the distress which has in so many instances associated with the... of the... which have each year... and... the... is the...

spend a month or six weeks in Ireland, and looked at matters from an English rather than an Irish point of view, would no doubt be able to contribute most valuable papers to the Society's Journal. One of the best papers he ever remembered seeing in the Journal was a paper on farming in the Lothians. At the present moment he believed steam cultivation was being extensively applied in that part of the world, and he should very much like a good man to be sent down to tell them what steam cultivation was doing for agriculture in that district. These matters had been referred to a select committee of the Council, and he could have wished to provoke a discussion, with a view to obtaining the opinion of members of the Society with regard to them. A few words now with respect to education. There was no doubt that the examination this year had, according to the report of the examiners, been a very satisfactory examination, probably the most satisfactory they had yet had. The worst of it was perhaps, that when they looked at the list, they found that all the first and second class prizemen, with one exception only, had been educated at the same place. He would like to see the field from which their candidates were taken somewhat more extended. He believed one of the prizemen was of the mature age of 29 or 30. Now he scarcely thought that they ought to give educational prizes to young men of that age, men who had gone regularly into the practice of agriculture. It was a question for consideration—first, whether these examinations were to be carried on another year, and if so, next, whether they ought not to put some limit to the age of those who took part in them. Another question was, whether the gold medal of the Society of the first class, and a silver medal of the second class, with a certificate, might not be a sufficient inducement to the gentlemen to come up for examination. This was the day for the election of additional members of the Council, and he had a very strong feeling that they did not introduce anything like enough new blood into the Council. He had frequently urged that one-half the list should retire, and be ineligible for re-election. No doubt they might lose some of the most useful and practical men in the body. Still, there were as good fish in the sea as those which had already been caught, and he thought that if possible they ought to do something to get more new members into the Council.

Reviews.

On the Art of Valuing Agricultural Land, and on the Indications of the various Qualities of Soils. By Philip D. Tuckett

This is another of the papers read before the Institution of Surveyors, and printed in their Transactions for the session 1868-69. It is a detailed and careful examination of a subject which stands in the very front of the agricultural world, and with which Mr. Tuckett's paper on sewage has, we think, enabling the author to tell his tale to our readers as he did to his auditors some eight or nine weeks ago in Great George Street—by frequent extracts from his pages.

The amount of rent claimable from a tenant of land is theoretically to be arrived at only as the late Robert Baker, of Writtle, in his edition of "Baydon on Rents and Tillage," suggests—by estimating the expenses incurred in the production of the whole course of one rotation of crops on the best soils, and he very justly observes, that the valuer must be constantly alive to the changes in the market price of the various articles of produce, and he might now have added, to the supply of agricultural labour in the various localities.

Mr. Tuckett acquiesces in this view only to the extent that the sound plan is to go carefully into these calculations as to the best and worst qualities of both light and heavy arable and pasture land, so as to form and keep a well settled scale of values, to be filled up on going over each estate.

A knowledge of the rents actually given for land by good tenants is also, he admits, a most important practical test of the accuracy of such individual calculations, and is gradually acquired by the negotiations incident to the practice of a land agent; but whatever the method by which the valuer fixes in his mind his scale of rental value, what he has to do in looking at any particular lot or estate, is to obtain such indications of its quality as will enable him unhesitatingly to give it its true place in this scale.

We now proceed with our extracts—

1. On the Indication of Value afforded by Trees and Plants. It is exceedingly dangerous to attempt to judge of the quality of a soil from the crops grown upon it in one particular year only, still many useful indications may be obtained from its more permanent products, especially from the trees and grasses. Most of our ordinary forest trees have special proclivities for the various soils on which they flourish, and a careful observation of their growth, and of the height to which they attain, affords information which will seldom mislead. A young sapling Elm tree or Hazel cannot be found where there is not a good mixed soil, whilst an abundance of Oak and Blackthorn are indications of heavy soil, and the growth of the trees will generally correspond with the quality of the soil. The Alder and the Willow are only found in wet places, chiefly by the water-side, and the Birch grows in wet places. On the other hand, the Scotch Fir prefers the lighter soils, and the Scotch Fir grows in the woods which will produce nothing else except deer and the Beech though it will grow elsewhere on good land is sensibly indicative of a calcareous soil. The hycarium is partial to light or sandy soils, whilst the Walnut and I believe I may say the Maple also, usually grow on good mixed soils. The Ash is scarcely a sign of any particular kind of land, if it is of rapid growth, it indicates good land, in poor soil it is constantly met with, but is of slower growth and often stunted. The Wattle, I believe, grows on a more indistinct soil, and one never sees a strongly grown Quince fence on inferior soils. The various permanent Grasses which make up the swards of an old pasture, and even the weeds found in the land, and

the character of the growth of both, form most valuable indications of the quality of the land. This part of the subject is treated in great detail in a long and admirable essay by Mr. Bravender, published in the fifth volume of the Royal Agricultural Society's Journal, to which I would refer those who desire a greater amount of botanical detail than I can afford space for in this paper. It is estimated that the distinct species of natural Grasses, natives of this country, are in number about 150 or 160, whilst those which are recognised as covering the surface of good old pasture land number, I believe, only about 50. It is said that a square foot of old pasture or meadow land contains about 1160 plants, a square foot of water-meadow about 1500, and a square foot of a crop of Grass seeds on arable land only about 80. The species of the best permanent Grasses being so moderate in number, it is worth while to learn their names, and also to recognise them at sight when in flower.

- Dactylis glomerata Cock's-foot Grass
Alopecurus pratensis Meadow Foxtail
Festuca pratensis Meadow Fescue
Festuca ovina Hard Fescue Grass
Panicum pratense Greater Meadow Cat's-tail
Anthoxanthum odoratum Sweet-scented Vernal Grass (which gives its scent to hay)
Meadow Oat-grass
Avena pratensis Yellow Oat-grass
Avena sativa Crested Dog's-tail Grass
Cynodorus cristatus Tall Oat-like soft Grass
Heliclus avenaceus, or Arrhenatherum avenaceum Meadow Barley-grass
Lolium perenne Rye-grass
Lolium temulentum Annual Meadow Ryegrass
Poa pratensis Meadow Stalk and Meadow
Trifolium pratense Clover
Trifolium repens White Clover
Vicia cracca Creeping Vetch
All really good pastures are composed chiefly or almost entirely of these Grasses, and they take up so much of the surface of the land that they are necessarily well watered, even when the surface is otherwise dry. The proportion of these best Grasses which occupy the surface is a pretty sure indication of quality.

Mr. Bravender, in the paper above mentioned, gives several lists of flowering plants and natural Grasses, with their several indications, but, with a view to condensation, I shall confine myself to selecting only a few specimens—a few of the principal plants indicating cold, wet land, and a few of those found on very dry soils; because, as the valuer visits the land in all sorts of weather, and at different seasons, he may be principally dependent on vegetation to tell him whether a field is injured by excessive wet in its ordinary condition, or, on the other hand, whether light land is excessively dry and likely to burn, whilst of almost everything else he can always judge by other means, and because, if one attempts to extend the list to all the indications intended to be derived from them, the result is a long and simple. It is a very curious fact that the herbage of a wet grass-field almost entirely changes when it is drained. This is the reason why people used to say that grass-land could be easily over-drained, and was often ruined by draining. The fact is, wet grass-land is not ruined by being so for two or three years, the old Grasses dying off, and the better ones not having yet fully taken their place.

- Plants Indicating Cold, Wet Land
Agrostis palustris Marsh Bent Grass
Alra aquatica Water Hair Grass
Alra crispata Tufted Hair Grass
Alopecurus geniculatus Hoating Fox-tail Grass
Carex Carnation Grass
Centaura calcitrapa Blue Bottle or Star Thistle
Ononis palustris Marsh Thyme Thistle
Hippuris vulgaris Mare's Tail
Potentilla anserina Silver Wood
Primula veris Cowslip
Rhinanthus cristifidus Yellow Rattle
Scabiosa succisa Field Bit Scabious, or Field Bitton
Thymus latifolius C. Hebe
Plants Indicating Light Soils
Agrostis tenuis Common Fine Bent Grass
Alopecurus pratensis Wavy Mountain Hair Grass
Festuca ovina Crested Hair Grass
Festuca ovina Canterbury Bells
Heath Bell Flower
Ononis palustris Common Heath, lang, or Heather
Poa pratensis Sheep's Fescue Grass
Poa trivialis Yellow Ladies bed Straw
Poa trivialis Wild Sainfoin
Poa trivialis Wild Tyme

In addition to the species of Grasses, a good deal may be learned by the character of their growth. On good land the blade grows full and broad, on poor wet land it often looks stunted, whilst on thin sandy soils it is apt to be thin and wiry. When pasture land contains a large proportion of the Mooses it is a sure sign of poverty, and more often of poverty caused by constant mowing at the want of manure than of natural barrenness. On common and unimproved land the common Brake or Fern (Pteris aquilina) generally grows on the best land, and Irish Gorse, Heather, &c., on the inferior portions.

The general colour of the surface of pasture land is also some guide to its quality. The colour of all pastures changes with the season, and no land is green all the year round (though the best land looks green the longest), and a fresh green colour is often dependent on recent manuring; but in winter, when the frosts have stopped the growth of the Grass, poor soil turns brown, whilst good sound pastures are never brown, but assume a whitish hue.

On this last point we remember a happy remark of the late Mr. John Morton, when about to complete the purchase of an estate near Thornbury for the late Earl of Ducie. Referring to the quality of its undrained pastures, he told the solicitor who was conducting the sale, "There is an instrument termed the cyanometer—a circular card of varying shades of blue—by which the meteorologist, holding it between him and the sky, determines the depth of colour in the heavens for record in his register. Now, the last time I rode by this land, having on an old brown great-coat, I bethought me of this test, and looking at the pasture fields over the arm held up between me and the Grass, I found the agreement in the colour perfect. Your 'poor cold grass-land' had turned brown. It is not worth the 30s. at which you value it."

Take now another extract, on a subject of which Mr. Morton was an original student and one of the earliest writers. Relations of Geology to the Value of Land.—There is one science which is often spoken of as having an important bearing on the profession of a surveyor, but I have never seen any

...of the strata, their order, thickness, general

...mechanical conditions resulting from the accident of their
particular position. I have been led to think, in the course of
my observations of the soils on the various strata, that this
subject is susceptible of an entirely different treatment; and
the use to which I propose to apply geology in land valuing is
to trace and describe the mechanical conditions of the soil
of the various strata. It is to be observed that the strata
which are the most
principally of alluvial clays
the Tertiary strata of the
...and the
...layers
of the coal measures, and those weak clay soils of
limes, found amongst the Silurian and Cambrian
...strata.

Now clay soils, on each of these formations, comprise a con-
siderable portion of the surface of the country. In the

FOULNESS. Admission of Tidal Water into Drainage.
The Commissioners of Sewers for the Island of
met at Southend, on Wednesday, for the purpose
considering two counter memorials which had been
presented to them on the admission of tidal water
the island for sanitary and other purposes. The
memorial was signed by eight gentlemen, owners and
occupiers of 4,772 out of the 6,304 acres of land
the island contains, and stated that they had
long been deeply sensible of the great in-
sustained through the admission of salt

manuring and seeding of the land being similar to what is described under "paring and burning."

Limeing Turnip follows continues up to the time of sowing, the lime being spread and well harrowed into the land prior to its being set up in drills for the manure. Instead of the shells being laid down in small heaps upon the land, and covered up with earth to slake it is emptied in heaps of several cartloads on the headland, or near where there is water to slake it and the slaked lime then spread with shovels from the tail of the cart. This practice neutralises acid qualities, which destroy the germinating power of small seeds in "sour" soils. Potato land is also limed from the cart, and hoed in with the horse-hoe and hand-hoe in hoeing. When Potatoes are aboveground the lime should be applied in dry weather, as the slight dusting of the lime will then do the stems comparatively no harm, particularly if the hand-hoes follow so as to shake it off. In moist weather, or on dewy mornings, it does harm to the wet leaves, although not to the extent which some farmers imagine.

Worms in great variety now begin to emerge from their winter quarters, where they have lain in a chrysalis state and to enter upon active life, depositing their ova in Parsnips, Carrots, Cabbages, Beans and Turnips. Parsnips and Carrots become cracked, Turnips have anbury, or finger-and-toe, and Cabbages and Beans are club-rooted. The Turnip fly attacks the young brass before it gets into rough leaf, and as the plants become sickly and rot, they form food and breeding ground for other varieties. They are more numerous and destructive in dry seasons than in wet ones, and in land that has become "tired" of growing any of the above crops; in other words, when crops begin to degenerate they are liable to be infested with insects. But the most healthy Cabbages, &c., in virgin soil are attacked. The Curculionides are vegetable feeders but they live chiefly on the decaying remains of plants, while others subsist on animal matter in the soil. Hence they are seldom found in a healthy fertile soil where such matters undergo immediate decomposition. Hence, also, the best plan of getting rid of these insect tribes is the use of active manures, especially in a liquid form, and of a quality such as the crop to be grown requires.

Hot-gardens furnish employment in hoeing, digging, and tying of bins. It is never too late to apply guano and fish manure in a liquid form, much diluted, in dry weather, if the bins require it. In moist or wet weather the manure may be sown dry, when it will be washed in by the rain. Hoeing will bring it to the roots, if the hills are sufficiently moist to dissolve the manure when applied.

"Wheat flagging," when necessary, should be done in time, or before the ear rises to be in the way of the scythe or reaping hook, and while the young plants grow erect. When blanching or etiolation takes place, the stalks become not only weak, bend and "kink" at the bottom, but the broad heavy leaves also become weakly, and bend so as to be below the edge of the scythe; they are also more difficult to cut; but when growing erect they are easily cut. A very small bit from the point of a leaf will effectually check exuberant growth, and let in the light to the bottom. The scythe or reaping-hook requires to be kept sharp and evenly drawn across the tops, but an experienced hand finds no difficulty in doing this. The work is best done in rather moist weather, and in the morning, if the weather is dry, as under the influence of a burning sun the leaves bend and do not stand up to the scythe. W. D.

Notices to Correspondents.

BARLEY FOR SEED: T. S. We fear that, under the circumstances, no jury would give you damages.

CABBAGE COR. Early Yorks, sown in July and August, will be ripe in May. Then pull every fourth Cabbage, and transplant Drumheads sown in February. They will be ready in November, and will keep till January, and if you sow in April again, you may have a crop which will be good food in January and February.

COTTON CAKE. Inquirer writes: "Will any one who has been in the habit of giving cotton cake to cows, say if he has any reason to suppose it has prevented them from being in calf?"

DISEASE IN SHEEP. R. Llanely, Carmarthenshire, writes as follows:—"Can you, or any of your correspondents, inform me what is the disease of which eleven sheep died near here lately, and of which the following are the symptoms. The sheep (part of a flock of about 60) appeared very healthy until a short time before they died. They were feeding upon high land, dry, adjacent to the sea-shore. They appeared heavy and dull, frothing at the mouth and nose; drank water. On being opened it was found that the heart was swollen, the tongue black, teeth, in some, loose. Inner coat of stomach came away when handled, smelt badly internally, swollen under the jaw. The cloven hoof in a few days several more were affected but recovered after being moved to another part of the farm. The lambs of the dead sheep are healthy." (The disease, judging from your description of it, is one of those blood affections of which splenic apoplexy is the type. It occurs generally on undrained and retentive soils, which have been much fed over, or otherwise highly manured. We have met with the disease on all kinds of pastures where the herbage, from any cause, was luxuriant and of rapid growth. Without knowing more of your system of management, and the general condition under which your stock are placed, we cannot advise you beyond suggesting the obvious course of keeping sheep off the dangerous ground while the herbage is springing.)

HIGHWAY PATRONS should apply to a Justice of the Peace, who could, under the General Highway Act, sect. 44, summon the surveyor of the parish before the Justices at some special sessions for the highways, when the said Justices may appoint some competent person to view the road, or may view it themselves, and direct the surveyor to meet them upon the spot; and if it shall appear that the road is not in a state of thorough repair, the Justices may order it to be done within a given time, and if the surveyor neglect their orders, they may fine him 5l.; and if he should be guilty of this, they may fine him again to the extent of the actual cost of the repairs needed. A Surveyor of Thirty Years' Experience. To keep the Law at his Fingers' ends.

FOWLER'S PATENT STEAM PLOUGH and CULTIVATOR may be SEEN at WORK in every part of the County of Essex. For particulars apply to JOHN FOWLER & Co., 71, Cornhill, London, E.C., and Steam Plough Works, Leeds.

IRON HURDLES. (Under Medal of the Royal Agricultural Society) SLEEP for CATTLE 4s. 2d., OX, 5s. 11d. List by post. GATES and FENCING of every description. Patent Iron Work Company, 11, St. Pancras Road, London N.W. Cottam's Iron Hurdles, Fencing, and Gates.

COTTAM'S HURDLES are made in the best manner. Superior Wrought Iron by the improved method. If desired, please apply to COTTAM & Co., Iron Works, 2, Wansley Street, Oxford Street, London, W.

COTTAM'S PATENT PORTABLE UNITED COW FITTINGS.

Their advantages are—Portability, ease of use, removable at pleasure, no woodwork, or parts liable to rot, and vertical motion or broad vertical bar, and a great expense, such as is necessary, increased with the length of Feeding Troughs, Water (supply) Patent Drop Cover to prevent over-gorging. Clean, durable, and impervious to infection, being all of iron. Prices of Fittings per Cow, 5s. 6d.

Prospectuses free of COTTAM & Co., Iron Works, 2, Wansley Street (opposite the Panttheon), Oxford Street, London, W., where the above are exhibited, together with several important improvements to Stable Fittings just secured by Patent.

THE HYDRONETTE. (Robins' Patent) for Gardens, Greenhouses, Conservatories, Bathed, &c. Unrivalled ease of action, simplicity, convenience, and force.

The HYDRONETTE is a more useful, easy working, reliable, and convenient water-throwing machine than any other in use. It is made in three sizes—No. 1 with 4 feet of Suction Hose, Strainer, Jet, and Pump, 1s. 6d.; No. 2, 15s. 6d.; No. 3, 21s. 6d. No. 5, 21s. 6d. Extra Hose and Union Joints furnished on order. Forwarded on receipt of Post Office order. To be obtained through any Ironmonger or Florist, or of the Proprietors, HAYES & SONS, 27, 29, and 31, Edgware Road, Paddington, W.

SHAW'S TIPPERS. For Botany and Prices apply to J. SHAW & Co., 39, Oxford Street, Manchester.

RICK-CLOTHS, NEW and SECOND-HAND. POLES, PULLEYS, &c. An Illustrated Catalogue post free.

Address: BENJAMIN EDINGTON (only), 2, Dole Street, London Bridge, S.E. No other Establishment.

FOR the BEST LIQUID MANURE. IMPROVED ROLLER and CLOD CRUSHER.

Address: JAMES TOWN WORKS, Cheltenham.

J. H. BROWN AND CO. NEW PATENT BB LAWN MOWER for 1881. PRICES REDUCED AND THE MACHINE PERFECTED.

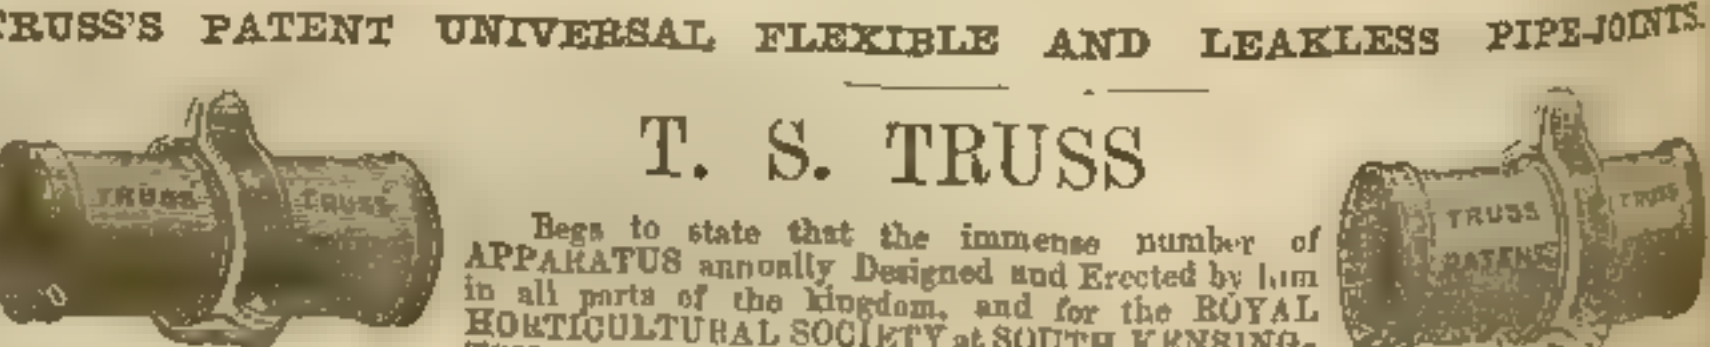

The BB LAWN MOWER (London made) is infinitely adapted to be, by practical judges, superior to any other—being the best designed, also of best material only, all parts liable to breakage being of malleable iron, and made to standard gauge, all accurately bored, and the entire Machine fitted and polished in a most unobtainable superior to any other Lawn Mower manufactured. Alex. Mackenzie, Esq., Alexandra Park, Muswell Hill, was appointed by the Metropolitan Board of Works to lay out their new Park, and to plant the Thames Embankment, these machines. I have recommended your Lawn Mower to many of my friends, believing that the machine does its work better than any other, and combines strength superior to Shanks' machine, with the lightness of Green's. Having now four of your Lawn Mowing Machines in constant use on our grounds, and two of these having been in use over a year, I have never had cause to alter the opinion of your machine, which I now have pleasure in giving to you.

The BB LAWN MOWER was selected at the Paris Exhibition of 1875 in preference to all others, by the celebrated Engineer, M. H. Bessemer, of Creusot, and President of the French Legion of Honour.

PRICES NEW PATENT BB LAWN MOWER. 12-inch for 1 boy £3 5 0 18-inch A Man and Boy £4 5 0 22-inch A Man and Boy £5 5 0 24-inch Two Men £6 5 0 Prices of Horse and Pony Machines on application. Every Machine warranted to give satisfaction, and delivered by J. H. Brown & Co., 90, Cannon Street, E.C., and 1st City, Thomas Street, E.C.

PORTABLE AND FIXED HOT-WATER APPARATUS, FOR HEATING CONSERVATORIES, HOTHOUSES, CHURCHES, PUBLIC BUILDINGS, PRIVATE RESIDENCES, ETC., WITH TRUSS'S PATENT UNIVERSAL FLEXIBLE AND LEAKLESS PIPE-JOINTS.

T. S. TRUSS. Begs to state that the immense number of APPARATUS annually Designed and Erected by him in all parts of the Kingdom, and for the ROYAL HORTICULTURAL SOCIETY at SOUTH KENSINGTON and CHISWICK, with unrivalled satisfaction, is a guarantee for skill of design, superior materials, and good workmanship, while the great advantages obtained by his IMPROVED SYSTEM cannot be over-estimated, consisting of perfectly tight joints, neatness of appearance; EFFECTS A SAVING OF 25 PER CENT. on cost of Apparatus erected compared with other systems; facility for extensions, alterations or removals without injury to Pipes or Joints; erected by any Gardener; an ordinary size Apparatus erected in one day, and PERFECTNESS OF DESIGN SUPPLIED, INSURING NO EXTRAS. Complete Apparatus, of the best materials, delivered to any part of the Station in England, and Erected at the following prices. Erection beyond 25 miles of London, railway fare extra man additional. Considerable reduction on large works.

Table with columns: Size of House, Apparatus Complete, Erection, and Price. Rows include 20 feet by 10 feet, 30 feet by 12 feet, 40 feet by 15 feet, 50 feet by 15 feet, 75 feet by 15 feet, 100 feet by 15 feet.

Bath and Gas Work erected in town or country. The Trade Supplied. Price Lists, Plans, and Estimates forwarded on application to T. S. TRUSS, C.E., CONSULTING HORTICULTURAL ENGINEER, &c., SOLE MANUFACTURER, IRON MERCHANT, HOT-WATER APPARATUS MANUFACTURER, AND HORTICULTURAL BUILDER, FRIAR STREET, BLACKFRIARS ROAD, LONDON, S.E.

THOMSON'S WHITE LADY DOWNE'S GRAPE.
THOMAS METHVEN
HAS SECURED THE STOCK OF THIS GRAPE,
 Which was raised by Mr. Thomson, of Dalkeith, from the Black Lady Downe's. The Vine is of the same vigorous habit of growth as the parent, equally fruitful, sets more freely, requires less heat, and is not liable to scald as the black variety is; keeps as long, if not longer; and has fully as good a flavour. It is guaranteed to be the latest keeping White Grape in cultivation. It received First-class Certificates at the Edinburgh Show on March 20, 1867, and at Glasgow on the 27th of the same month. It will be Exhibited next Spring at all the March and April Shows.
ORDERS ARE NOW BEING LOOKED TO BE SENT OUT NEXT SEPTEMBER
 Strong Planting Canes, 21s. and 42s. each; Extra Strong Fruiting Canes, 63s.
LEITH WALK NURSERIES, and 15, PRINCES STREET, EDINBURGH.

WILLIAM ROLLISSON & SONS

REG RESPECTFULLY TO INFORM THE NOBILITY, GENTRY, AND TRADE THAT THEIR GENERAL CATALOGUE OF PLANTS, SHRUBS, TREES, &c., EXTENDING OVER 150 PAGES OF LETTERPRESS,

Is now Published, and will be forwarded to all applicants on receipt of 8 Postage Stamps, and sent Gratis to Customers.

THE FOLLOWING FORM PART OF THE CONTENTS OF CATALOGUE—

- ACHIMENES, AMARYLLIS, AMERICAN PLANTS, AQUATICS, Scare, Greenhouse, Hardy, ACURIA, CALEAS, Indian, Hardy, CAMELLIAS, CASSIA, CARNATIONS, Tree or Winter Flowering, Summer Flowering, CHRYSANTHEMUMS, CINERARIAS, CLIMBERS, Scare, Greenhouse and Hardy, CONIFERAE, ERICAS, Cape, Hardy, FUCHSIAS, GERANIUMS, GLOXINIAS, GESNERACEOUS PLANTS, GREENHOUSE PLANTS, HARDY HERBACEOUS and ALPINE PLANTS, SHRUBS, TREES, &c., LILIUMS, MISCELLANEOUS SOFT-WOODED PLANTS, NEW, or RARE PLANTS, ORCHIDS, PEONIES, Herbaceous, Tree, PALMS, PELARGONIUMS, PENTSTEMONS, RHODODENDRONS, Hardy, Greenhouse, STOVE PLANTS, SUBTROPICAL PLANTS.

- W R & SONS will also be happy to forward either of the following Catalogues on application: CATALOGUE of FERNS, classified, comprising nearly every known species and variety 70 Pages. CATALOGUE of FRUITS, descriptive and classified, containing the most approved among the old varieties, together with all Novelties of sterling merit. 70 Pages. CATALOGUE (Spring), containing a great number of very choice soft-wooded Novelties for 1869 30 Pages. CATALOGUE of IMPORTED DUTCH and other BULBS, with a very full and Descriptive List of Roses of all kinds raised 56 Pages. CATALOGUE of CULINARY and FLORICULTURAL SEEDS, priced and classified. 60 Pages

THE NURSERIES, TOOTING, LONDON, S.W.

NEW VARIEGATED PLANT FOR THE FLOWER GARDEN, ABUTILON THOMPSONI.

MESSRS. VEITCH & SONS

DESIRE TO CALL PARTICULAR ATTENTION TO THIS

DISTINCT AND BEAUTIFUL VARIEGATED FOLIAGE PLANT.

The ground colour of the leaf is a light green, which is profusely shaded and mottled with bright yellow, giving quite the appearance of mosaic work. It is a most effective ornamental plant, and from its free growth is well adapted for burning purposes. During the summer of last year it proved a most valuable addition to our collection, and when plants from the open ground were exhibited at the Floral Committee Meeting of the Royal Horticultural Society, held September 1, 1868, it was awarded a First-class Certificate as "a charming addition to our decorative plants." It attains a height of about 1 1/2 foot, is of compact habit, and is strongly recommended.

Price 30s. to 36s. per dozen.

CATALOGUES of SUBTROPICAL and other PLANTS are now ready, and will be sent Post Free on application.

ROYAL EXOTIC NURSERY, CHELSEA, S.W.

NEW PLANTS FOR 1869.

JAMES VEITCH & SONS

DESIRE TO ANNOUNCE THAT THEY ARE

NOW SENDING OUT THEIR SPLENDID NOVELTIES.

- AMPELOPSIS JAPONICA, price 7s. 6d. each. BEGONIA BOSEFLORA, price, good plants, 10s. 6d. each; extra strong plants, 21s. each. CROTON (CODLEUM) AUCUBÆFOLIUM, price 21s. each. CROTON (CODLEUM) HILLIANUM, price 21s. each. CROTON (CODLEUM) MAXIMUM, price 42s. each. DAVALLIA HEMIPTERA, price 10s. 6d. each. DRACÆNA MACLEAYI, price 42s. each. DRACÆNA NIGRO-RUBRA, price 21s. each. DIPLADENIA (ECHITES) BOLIVIENSIS, price 15s. each. ERANTHEMUM ASPERSUM, price 7s. 6d. each. HEDAROMA (DARWINIA) FIMBRIATA, price, good plants, 15s.; a few stronger plants, 31s. 6d. each. MARANTA (CALATHEA) TUBISPATHA, price 21s. each. RHODODENDRON HENRYANUM, price 10s. 6d. each. THIBAUDIA ACUMINATA, price 10s. 6d. each.

NEW ORCHIDS FOR 1869,

- INTRODUCED DIRECT FROM THEIR NATIVE HABITATS BY MESSRS VEITCH AND SONS. ANGRECUM FALCIFORME, price 21s. to 42s. each. COELOSYPHE (PLEIONE) REICHENBACHIANA, price 42s. each. DENDROBIUM CRASSINODA, price 63s. to 105s. each. DENDROBIUM MACROPHYLLUM HUTTONI, price, good plants, 105s.; strong plants, 147s. MASDEVALLIA VEITCHIANA, Prices on application. VANDA INSIGNIS (TRUBI), Prices on application.

For full descriptions, see Gardeners' Chronicle, May 15, 1869, page 526.

A NEW ILLUSTRATED DESCRIPTIVE CATALOGUE of the above, and many NOVELTIES sent out by other houses, will be forwarded free on application.

ROYAL EXOTIC NURSERY, KING'S ROAD, CHELSEA, S.W.

HER MAJESTY'S GARDENER USES

FOWLER'S GARDENERS' INSECTICIDE.

Invaluable to Nurserymen, Fruit and Vine Growers.

INSECTS, BLIGHTS, and MILDEWS

easily and effectually destroyed without injury to the most delicate plants.

A GREAT SUCCESS

in FOWLER'S GARDENERS' INSECTICIDE.—See the Testimonials from eminent Gardeners throughout the Kingdom. Sold by all Nurserymen and Seedsmen.

HER MAJESTY'S GARDENER SAYS—

"I am satisfied that the Insecticide will kill any insect that it comes into contact with, without injury to the plant."—Vide Mr George Wynnes' Letter

THE FOLLOWING ARE MOST IMPORTANT.

Mr THOMAS MOORE, Botanic Gardens, Chelsea, says—"We have formed a very favourable opinion of Fowler's Insecticide as a remedy for many of the insect pests of plants. It effectually destroys White and Brown Scale, Thrips, Red Spider, and the Green and Black Fly; at the same time it does not injure the plants."

Mr BARKLEY HINGGINS says—"Fowler's Insecticide is a sure remedy for American Blight, it will clear off the horrid vermin, and do no harm to the bark, or even to the young leaves. The trees are now as clean as polished walking sticks."

Messrs. Wm Wood & Son, Marefield say—"We have tried it on Roses affected with Mildew, Camellias covered with Green-fly, and Aucubas and Oleanders infested with Scale, and we have much pleasure in stating the plants are now perfectly clean and healthy."

Mr F R PRASOR, Chiswick says—"It is by far the most effectual remedy I have tried for our insect enemies. A plant covered with Brown Scale is cured at one dip. Ants, the different kinds of Aphid, and in fact everything Black and White Thrip amongst the number, are settled at once."

NOTICE to the TRADE.—

In consequence of the popularity of FOWLER'S GARDENERS' INSECTICIDE, and to supply the increasing demand, the Manufacturers have been compelled to open a London Depot at 25, Great Dover Street, Borough, to which Address all Orders should be sent.

FOWLER'S GARDENERS' INSECTICIDE,

for Washing, Syringing, and Dipping Plants, Is. 6d., 2s., 3s., 6d., and 10s. Jars.

Sold by all Nurserymen and Seedsmen.

FOWLER'S TOBACCO POWDER

for Dusting Plants, Is., 2s. 6d., and 5s. Canisters.

SOLE MANUFACTURERS G. AND T. FOWLER,

25, Great Dover Street, Borough, London, S.E., and North Street, Brighton.

The Best and Cheapest Vermin Killer.

Vide "The Gardener's Magazine," conducted by Shirley Hibberd, Esq., F.R.H.S., of August 15, 1868.

UNDER PERMISSION OF THE HON BOARD OF CUSTOMS.

THE LONDON GROUND TOBACCO (free of duty), for the Destruction and Prevention of the Grub and Blight in Plants. Sold in Tins Is. and 2s. 6d. each, by Seedsmen and Druggists.

POWDER DISTRIBUTORS, 2s. each.

Manufacturers: C. and S. Serra, at their Bonded Warehouse, Shad Thames, London S.E. AGENTS WANTED.

TOBACCO PAPER ISSUE,

for DESTROYING RED SPIDER, MEALY BUG, THRIP, GREEN and BLACK FLY, without the aid of a Fumigator.—This article having been before the Public for the last three years, and being now used by many of the leading Horticulturists—from several of whom Testimonials have been received as to its efficacy.—The Manufacturers beg to recommend those who have not used it to give it a trial, feeling confident that they have done so they will see nothing else, as it is far superior to paper or rag, and will not injure the plants. Sold in 11b. packets and upwards, price 2s. 6d. per lb. carriage free. A reduction in price for large quantities.

To be had of MESSRS. ROBERTS AND SONS, Tobacco Manufacturers, 112, St. John Street, Clerkenwell, E.C., of whom Samples and Testimonials may be obtained, and of all Seedsmen and Nurserymen.

W. H. LASCELLES' MACHINE-MADE

Table with columns for Melon Lights (6 ft. by 4 ft., 6 ft. by 8 ft., Double Lights, etc.) and Greenhouses (Woodwork only, Prepared and Fitted, etc.).

Finbury Steam Joinery Works, 121, Banbury Row, E.C.

Rosher's Garden Edging Tiles.

THE above and many other PATTERNS are made in Terra-Metana Ware Terra-Cotta, Monocore, and Redware, and of great durability. The plainer sorts are especially suited for KITCHEN GARDENS, as they harbour no Slugs and insects, take up little room, and once put down incur no further labour and expense, as do "grown" Edgings, consequently being much cheaper. GARDEN VASES, FOUNTAINS, &c., in Artificial Stone, of great durability and superior finish, and in much variety of design.

F & G Rosser, Manufacturers, Upper Ground Street, Blackfriars, S.E. Queen's Road West, Chelsea, S.W., Kingsland Road, Hingland, N.E. Illustrated Price Lists free by post. The Trade supplied.

ORNAMENTAL PAVING TILES for Conservatories,

Halls, Corridors, Balconies, &c., as cheap and durable as Stone, in blue, red, and buff colours, and capable of forming a variety of designs. Likewise more elaborate designs. Pattern Sheets of Pavements, with prices, forwarded for selection. WHITE GLAZED TILES, for Lining Walls of Dairies, Larders, Kitchen Ranges, Baths, &c. Grooved and other Stable Paving Bricks of great durability. Dutch and Adamantine Chimneys, Wall Copings, Red and Stoneware Drain Pipes, Slates, Cement, &c. To be obtained of F & G Rosser at their premises as above.

SILVER SAND (REIGATE), at the above addresses—

11s. per Ton, 1s. 2d. per Bushel. 2s. per Ton extra for delivery within three miles, and to any London Railway or Wharf. Quantities of 4 Tons 1s. per Ton less. A coarse grained Sand 1s. per ton more. Samples of Sand by post on receipt of stamp. FLINTS and BALLS of BRICK or ROCKERS or FERRITES. BEST PEAT and LOAM supplied at lowest rates.

F & G Rosser.—Addresses see above. N.B. Orders promptly executed by Railway or Vessel. A liberal discount to the Trade.

New Roses for 1869.

July 19th to 24th, 1869. THE ROYAL HORTICULTURAL SOCIETY'S GRAND EXHIBITION at MANCHESTER.

in connection with the SHOW of the ROYAL AGRICULTURAL SOCIETY Amongst various Special Prizes. A SILVER CUP (copy of the famous Cellini Cup), VALUE £21 will be offered by the Proprietors of the GARDENERS' CHRONICLE and AGRICULTURAL GAZETTE for the best COLLECTION of 5 FRUITS and 8 VEGETABLES, to be made up as follows:

Table with 3 columns: Good, Medium, Inferior. Rows include Grapes, Melons (3 Fruits), Strawberries, Gooseberries, Currants, Cherries, Raspberries, Apples of 1868, Peas, French Beans, Broad Beans, Can't flowers, Cucumbers (brace), Summer Cabbages, Parsnips, Turnips, Globe Artichokes, Onions, Spinach, Rhubarb, Potatoes, Mixed Salad.

This Prize is open for Competition amongst Amateurs and Gardeners of private families. The Fruit and Vegetables produced must be of the Exhibitor's own growing, and any articles otherwise obtained will disqualify the Collection.

The Gardeners' Chronicle. SATURDAY, JUNE 5, 1869.

MEETING FOR THE ENSUING WEEK. Monday June 7 - Entomological. P.M.

THE ST. PETERSBURG EXHIBITION is at an end; the plants which so lately graced its now empty space are being borne by ship and railway to the various quarters in Europe from which they came...

After all the prizes had been determined, the Exhibition was wound up by a grand public ceremonial of distribution of prizes. The Minister of Domains, M. ZELENOW, had, as we should word it, kindly consented to give away the prizes; or, as the Russians prefer to phrase it, had had the great condescension to undertake the distribution of the prizes.

The ceremonial took place in a fine large hall, the Library of the Ministry of Marine. The first step in the proceedings was to invest the delegates or Presidents of Juries with the insignia of certain Russian Orders. The English delegates were alone omitted. This appears to have arisen from some mistaken notion that English subjects cannot accept foreign decorations without the QUEEN'S permission.

may accept a decoration, although he may not wear it in England without special permission. He may wear it abroad, or leave it as a souvenir to his family. It may be thought that it would have been better, seeing that so many men of science from other countries accepted this recognition of their scientific eminence at the hands of the EMPEROR, that our delegates should have done the same without making any demur about it.

The President, Aide-de-Camp General GREIG, next made a suitable address. The President speaks admirably well; all his speeches—and he has had no end of them to make—having been exceedingly clever, appropriate, and spiritual. The presentation of prizes followed, and the 'triumph' flourish of a military band added force and dignity to the loud acclaim of popular applause with which the more successful candidates were successively greeted.

We understand that a pecuniary success has been obtained, and that the EMPEROR, by the munificent donation of 10,000 roubles, secured the undertaking from any chance of actual loss. It is in a horticultural and botanical point of view, however, that its success is most important. It was a bold and daring thought for a country such as Russia, untried as she was in such adventures, to enter the lists with the western nations in an enterprise of such difficulty. That thought emanated from Dr. REEGL and it seemed to be universally admitted by those acquainted with the progress of the scheme, that but for his energy and perseverance it would have been a fiasco in spite of the high protection it received.

We may add, in conclusion, a few remarks on the competition, and the prizes which were awarded.

Among those, of all the foreign exhibitors, M. LINDEN, of Brussels, stood facile princeps. The large gold medal (value 150 roubles) was gained by him for "a collection of six different plants introduced into Europe by the exhibitor himself, and not yet in commerce." In fact he gained this twice. There were only three competitors, and the two lots of plants to which the first and second medals were awarded turned out to be both from M. LINDEN.

The second and third extra gold medals, offered for a collection of three plants introduced into Europe by the exhibitor himself, and not in commerce, were next carried off by M. LINDEN (the 1st prize having fallen to Messrs. VEITCH). He also carried off the first gold medal for the best single plant introduced by the exhibitor, and not in commerce, with Cochlostema Jacobianum. Then the first gold medal for the best collection of 15 plants introduced since January, 1867. A large silver medal (1st prize) for a plant in flower, not in commerce next fell to his Rudaea nymosa (S. Catherine's, 1867). He next gained a large silver medal (1st prize) for a plant "remarkable for the beauty of its foliage, and not in com-

EVERGREEN BERBERRIES.

HAVING paid much attention to the cultivation of this beautiful family of shrubs during the last few years, perhaps the result of my experience may prove interesting to some of the readers of the Gardeners' Chronicle. I shall begin by noticing those species which are best worth cultivating, and which are found to be hardy, or nearly hardy, in this part of the country—the neighbourhood of Canterbury, and end with a few observations on certain valuable species fit for a conservatory or cold greenhouse. With regard to cultivation the majority of the species appear to delight in a rich well-manured soil, but some of them require the addition of a portion of sand. Where botanical descriptions are given at full length, they are generally quoted from Professor Lindley's articles in the Journal of the Horticultural Society.

B. Aquifolium (N. America) — This species requires but little not as it is grown in most shrubberies, and is generally admired for its highly varnished leaves and abundant flowers. It may, however, be observed, that there have sprung up of late years many mongrel varieties that have been honoured with various high-sounding names, but most of which are far inferior to the original species, the leaves of these varieties being characterised by their dull surface. There are, however, two exceptions that may here be noticed, viz., that known by nurserymen as *B. floribunda*, which is very handsome in growth, and another called *B. nitens* first raised at Exeter—remarkable for the extremely glossy appearance of the old leaves, which when young are of a rich bronze, changing to a dark green. This variety is of a dwarf and compact habit, it requires a shallow situation, and a copious of peat, loam, and sand. I am informed by Mr Masters that seeds from the same plant will produce plants, some with nine leaflets, others with five. Again, the surface of some will be like that of others bright.

B. arbutata (Nepal) — A handsome, fast-growing evergreen, with reddish-brown branches, named as above from its leaves being usually fringed with bristle-pointed, fine close serratures. The leaves vary much in this species, both in form and size, on the same plant are found leaves with four or five spiny teeth, some wholly destitute of toothings at the sides, and others with the fine close serratures above noticed. The berries are red and oblong. The species is perfectly hardy, and grows well in ordinary garden soil.

B. Beali (China) — Of the hardy species this is perhaps the finest, being beautiful at all seasons of the year, either as regards foliage or flower, while the fruit in colour and size surpasses that of any other species. The leaflets of *B. Beali* vary in size to an extraordinary extent, even on the same plant, some measuring as much as 5 inches in length, and 3½ in breadth, the average size being about 3 inches in length and 2 in breadth. They also differ considerably in form, some being nearly square, with 5–6 coarse spiny teeth, and others long and rather narrow, with a very stiff triangular point. This species requires very careful cultivation to do full justice to its merits; shade, shelter from gusts of wind, and rich soil, being absolutely necessary. Not only ought the ground to be well manured at the time of planting, but every winter a much of half rotted stable manure should be placed on the surface of the ground, around the plant. The so-called varieties, *B. japonica* and *B. intermedia*, belong to this species, the former rather absurdly so named, as the species is not a native of Japan. *B. Beali* will defy the rigour of any winter like, or to be experienced in this country, a convincing proof of which is, that during the very severe frost of January, 1857, many plants were in full flower in this neighbourhood, and not a blossom was injured. By pruning to a single stem, *B. Beali* may be made to assume a Palm-like character, which is very effective. This species is easily propagated from seed, a single berry frequently producing three plants.

B. Darwinii (S. America) — One of the best known, and one of the most useful and ornamental of the small-leaved species. Nothing can be finer than the sight it presents in spring, with its beautiful orange-coloured flowers and highly varnished leaves, which are not more than ½ inch long, with three large spiny teeth at the end and one or two more on each side near the middle, or without any at the sides. The branches are covered with reddish, weak, straggling hairs. It occasionally makes enormous shoots, and generally suffers from this luxuriance of growth, many of the branches dying off without any other apparent cause. To remedy this, and to keep the plant in good health and vigour, the frequent application of half-rotted manure to the surface of the ground above the roots is strongly recommended. It would make a beautiful and effective fence, being of quick growth and quite hardy. There is a valuable hybrid between *B. Darwinii* and *B. empetrifolia* named *B. stenophylla*, the leaves somewhat resembling those of the latter species and the flowers being in beauty with those of Darwin. This hybrid is handsome as a bush or trained against a wall, is a free grower, but quite hardy and flourishes in a mixture of rich soil, peat, and sand. Cuttings taken in a autumn strike readily under glass.

B. dulcis (Magellan) — A pretty sub-evergreen, and one of the best known of the genus. The leaves are bluish green, small, and generally without any toothings; the flowers very abundant, and of an amber-yellow colour. Some individuals of this species retain their leaves the whole winter, whereas others speedily become bare. Another species, viz., *B. buxifolia*, is sometimes confounded with *B. dulcis*. The latter-named species is quite hardy, and appears to thrive in a mixture of peat and sandy loam.

B. fascicularis (California and Mexico) — Remarkable for its very prickly but not shining leaflets. Very handsome but, unfortunately, not quite hardy, requiring the shelter of a wall during very severe winters. Care should be taken to obtain the true species, as there are

some hybrids closely resembling it. It is easily propagated from layers and cuttings, and thrives in a mixture of leaf-mould and sandy loam. There is a hybrid between this species and *B. Aquifolium*, which, being very handsome and rapid in growth, is a favourite in shrubberies, and known by the name of *fascicularis* hybrida. The leaflets of this hybrid are more regularly toothed than those of *Aquifolium*, but without their lucidity. It is much more hardy than its parent *fascicularis*, and is said to attain the height of from 10 to 12 feet. It is not particular as to soil.

B. Fortunei (China) — This species is figured in vol. i. of the "Journal of the Horticultural Society," and there described as follows:—"This shrub forms a deep green smooth bush, with from three to four pairs of leaflets, and an odd one to each leaf. The leaflets are about 4 inches long, narrowly lanceolate acuminate, with shallow distinct spiny serratures." Mr Shirley Hibberd, in "Floral World," August, 1862, has noticed "the peculiar tone of pure green" to be observed in this plant. This species is handsome when well grown, but rather difficult of cultivation, and liable to injury from very severe frosts. It probably would thrive better in a conservatory or cold greenhouse than out-of-doors. O.

(To be Continued.)

CINCHONAS.

ANOTHER instance of the successful cultivation of the Cinchonas in a foreign soil reaches us from St. Helena. In that small but interesting island, through the recommendation of Dr. Hooker, and the great interest taken in the matter by the Governor, Sir C. Elliott, as much as by Mr J. C. Melliss, the Cinchonas have been introduced, and, under the care of Mr. George Chalmers, the Government gardener, upwards of 5000 plants have already been raised, and these are all strong and healthy, some about 18 inches high, many of which have already been transplanted to a site selected for a Cinchona plantation in the neighbourhood of Diana's Peak.

Mr Chalmers, formerly of Kew only arrived in St. Helena in the month of May last, and the Governor, in a report to the Colonial Secretary, dated November, 1868, says:—"We have already more than 2000 young plants, set out in boxes, and thriving vigorously, raised from seed of several approved descriptions of the tree, for which we are indebted to Dr. Hooker's kind and lively interest in this undertaking. These plants will all be permanently set out in the course of the next four or five months. Beyond this number, at least 4000 more have germinated, and are doing well from seed sent from Kew at more recent dates than the first supply, and planted at different times as it reached St. Helena. Amongst these are plants of *C. succirubra*, *C. Pahudiana*, *C. officinalis*, *C. Calisaya*, *C. Condaminea*, &c." Sir Charles Elliott further asserts as his belief, judging from the result of careful observations as to the time required for the germination of the seed, that if their resources for preparing the ground and fencing in the young plants were increased, they could have in less than a year, 20,000 young plants *in situ*. The portion of ground selected for these plantations on the recommendation of Dr. Hooker, lies along the inclines of the ridge of which Diana's Peak forms the culminating point, the general elevation of which is between 2000 and 2700 feet, the mean annual temperature rather below 60°, and the soil composed, to a depth of several feet, of vegetable mould. At the above elevation this rich deposit is bathed in moisture for at least three days of every week in the year, and thus favoured has become covered with a luxuriant growth of Ferns, and other plants of a similar nature to those usually found in the native seats of the Cinchonas. The very interesting report, from which the foregoing information has been gathered, proceeds to say that it is proposed carefully to test the lowest elevation at which different descriptions of Cinchonas will succeed in St. Helena, so remote from great masses of heated and that the mean temperature is probably cooler at 2000 feet than it would be at 3000 feet in tropical continents. In well-sheltered situations in St. Helena, some of the Ferns thrive at 1700 or 1800 feet, and perhaps that may prove to be the case with the Cinchonas.

Sir C. Elliott draws attention to the importance of introducing these invaluable plants in all soils and climates where there is any possibility of success, and remarks that both Dr. Hooker and the late Sir W. J. Hooker strongly advised the formation of Cinchona plantations in St. Helena. Dr. Hooker especially has pointed to a fact of high interest connected with the subject. It was found, he says, during the late disastrous fever at the Mauritius, that the Cinchona leaf contained a powerful febrifuge principle, so that for distances of no great length as between St. Helena and the coast of Africa, it would be easy to transport large means of abating the dreadful scourge at very moderate prices compared with that of quinine. In five or six years the plantations would be sufficiently advanced and of sufficient value to maintain themselves.

While on the subject of Cinchonas, it may not be without interest to notice how the cultivation of the plants is progressing in other countries where they have been introduced. From Jamaica we learn that about 30,000 plants are by this time ready for planting out, a plantation of 50 acres having been prepared for their reception. Amongst this large number all the most valuable species occur, as *C. succirubra*, *C. Calisaya*, *C. officinalis*, &c. The accelerated formation of this plantation will be most advantageous to the island, as it will enable the authorities there to devote their attention to propagating the plants for sale, so that with the assistance of private enterprise their cultivation will become more widely distributed.

The success of the plants in the East Indian plantations has become such an established fact that it

appears almost needless to refer to the subject, but the receipt at the Kew museum of specimens of the bark of several of the most valuable species from plants grown at Ootacamund, from one of which the unprecedented amount of 7.8 per cent. of sulphate of quinine has been obtained, again arouses our interest. Mr. Broughton, the Government analyst at Ootacamund, says that the plants yielding this valuable bark were raised from seed received from Mr. Cross, who had charge of the first batch of Cinchona plants from their native soil to the first trial ground in India. This plant, Mr. Broughton thinks is peculiarly distinct from its companions. It has markedly lanceolate leaves (almost like those of a Pear tree in shape). In a letter from Mr. Broughton he also draws attention to the fact that among the varieties of Cinchonas there are innumerable gradations between the typical forms, so that among the many thousands of plants on the Ootacamund plantation it requires a search to find specimens which possess all the characters of the variety required by the published descriptions of authorities. Thus, for instance, some of the distinctive peculiarities of var. *Crissia* are combined with those of var. *Bonplandiana*, and Mr. Broughton, as a chemist, says he does not find any essential or constant chemical peculiarity to justify the distinction of so many varieties. With regard to the formation of the alkaloid in the plants, it may be interesting to refer to Mr. Broughton's own remarks. He says:—"I have some reason at present for thinking that the alkaloids are formed in the cells of the tissues in which they are found and are not elaborated elsewhere. The alkaloids are not found to any appreciable extent in the leaves and the very young bark. They are not found, as far as I at present can make out, in the liquid that fills the lactiferous vessels. When bark is removed without injuring the cambium, a liquor is poured out by the latter which coagulates and soon becomes a layer of protecting cells, as these grow they become bitter and contain gumme, although there is no perceptible communication with any part of the plant besides the cambium. The wood I have found to contain alkaloid, but in small quantity, and of this the heartwood is richer. The liquor that the cambium first secretes is not in the least bitter." Mr. Broughton appears also to have made an analysis of the leaves of the Cinchonas, to test their medicinal value, which has been by some high spoken of, as in the case of the fever at the Mauritius before alluded to. He found that they contain a minute quantity of dubious amorphous alkaloid, but that they owe their bitterness mainly to the presence of quinovic; he considers that they are of little or no medicinal value, and that sulphate of quinine cannot be prepared from them. It is probable that, as the plants get more widely distributed and more perfectly naturalised in places where they are now introduced, we shall learn more about the value or uselessness of the leaves as a febrifuge. John R. Jackson, Kew.

Home Correspondence.

The Royal Horticultural Society's Show at Manchester.—I quite agree with your foot-note at the end of Messrs. Shaw and Baines' letters (p. 585). In reply to Mr. Shaw's remarks, I shall feel obliged if you will insert Rules 9 and 16:—

"IX. That persons who desire the privilege of attending the gardens without being proprietors, be admitted by payment of the usual annual subscription, but that such persons take no part in the business meetings of the Society.

"XVI. That, Sunday excepted, every member have free admission to the gardens for himself or herself, and the resident members of his or her family, including resident tutors and governesses, and for persons having no place of abode or business within ten miles from the gardens, except on exhibition days, when the members only and their families shall be admitted on producing their tickets of signing names, when required, in a book to be kept for that purpose at the lodge."

Another point in Mr. Shaw's communication is answered in your issue of last Saturday, for he is remembered, our members and their families have admission when our own exhibitions are held, and yet we have always a large balance in our favour from receipts at the gates; so that I confess I cannot see at a glance how the admission of our subscribers to their own garden would have resulted in a financial loss. I am aware that certain "special meetings" were called some years ago in connection with the Manchester Botanical Society, the result of which was nearly to put an end to the Society, and I would ask whether it would have been wise to upset the constitution of our Society for such an evanescent affair as a flower show, and that in a locality where a great horticultural show is no novelty? Respecting the special prizes, there can be no doubt but that the majority have been promised under the impression that the show was to be held in the Manchester Botanic Gardens. The Royal Horticultural Society has thought it prudent to hold its show elsewhere, and it has a perfect right to do so. I think it has taken a wrong step, but that shall not prevent me from doing what little I can to make the meeting in Manchester an agreeable and prosperous one. I conclude, as Mr. Baines did, by remarking, "I could say much more, but refrain from doing so from the conviction that nothing should be done to widen a breach that ought never to have existed," but, however, let us forget all differences, and do what we can to make the forthcoming meeting successful. Bruce Findlay, Botanical Gardens, Manchester.

Ground Vinerias.—The shoots of strong Vines, which have been planted three or four years, appear to be sometimes difficult to get down to the floor of ground vinerias without their being broken. A Black Hamburgh, whose shoots were easily pegged down, after they had become a little hardened at the base, for the first three years of its growth proved this year quite

1869.]

With all the waiting that was possible, it was impossible to get the shoots down without breaking them off and five accordingly went one after the other—some that started straight upright being snapped in the middle by the frame being lowered. Long wire instead of hair-pins, were tried to catch the shoots, and draw them only a little, but besides that the joints of the slates often did not answer for these, a stone was quite sufficient to prevent them going down, and the wire thrust down, it came up again five or six from the pull of the shoot. The difficulty at first appeared insurmountable, but has been overcome thus—Galvanised wire, as thick as thin whipcord, was cut into convenient lengths, a crook for the end was turned upon one end, and the other for 4 or 5 inches was bent at a right angle for a stone or piece of brick to lie upon. This allowed the shoot to be pulled as much as first as could be done without breaking at the base, and by degrees the lower part of the wire was shortened with ease. What was a tremendous bother now became a pleasure and certainty, and I was even enabled without risk to pull over strong shoots from the opposite side to fill the gaps. Those who have only young Vines have no occasion to resort to this contrivance, as all the while the Black Hamburgh of four years' growth was pulling me, several younger companions beside it presented no difficulty. By waiting till the shoots were well hardened, they were easily and safely laid down on a piece of tile, or a flat stone, with a pebble on the outer side of the shoot for it to rest on. A. B.

Potatoes.—At p. 530 you express a wish to be informed as to the growth of Potatoes this year. In this parish, indeed, in this neighbourhood generally, persons acquainted with their coming up very irregularly. Race-courses Kidney, Ashleaf, Early Oxford, seem alike in this respect. Warminster Frame, a new round Potato, to be as early as the Ashleaf, is hardly showing, and planted more than two months. My man tells me the missing roots are growing underground. This is the country for fruit of all kinds, owing to the mildness and spring frosts—on the 8th June, 1868, a crop of Kidney Beans was killed in a neighbour's garden. I have Pear, Apple, Plum, and Cherry trees of a good standard, there are few walls; they were covered with bloom, but in many cases after apparently once the fruit was dropped, in all cases to some extent, though I have sheltered with elm boards supported on two or three stakes. Pears have suffered most. Out of two dozen, one has 30 Pears, two 8 or 9, and about one apiece, most of them none at all. You only advised me at the end of September, 1866, about apples, which I find are likely to succeed best of any kind. I should feel obliged if some of your correspondents would give me a list of half-a-dozen of the best Plums. I have a Denyer's Victoria grafted on a stock, hardly the size of a Currant bush, with two dozen Pears on *The Shepherd of Salisbury* stock.

Weed Destroyer.—A few days ago I saw on a large parcel at one of the London stations the following advertisement.—“Weeds extirpated from lawns. Watson's lawn sand, or weed destroyer, sprinkled upon lawns rapidly and effectually destroys Dandelions, Daisies, Clover, Ribgrass, and other weeds, at the same time makes the Grass grow, and gives it a most healthy appearance. Price, 28s per cwt., or 4d per lb.” What a wretched discriminating application is this! which has such deep-seated weeds as Dandelions, and at the same time “makes the Grass grow”! W. M. [Marvelous, J. true. Eds.]

Anteater Gardening.—There are many persons who, like myself, are fond of gardening on the small scale practicable by amateurs of moderate means, some of whose flower gardens may contain borders along walls or hedges, and surrounding lawns or croquet grounds, and with shrubs such as Laurels, Bays, Laurustinus, Rhododendrons, &c., and even trees, and which are particularly difficult to bed-out in, or even to keep in a satisfactory condition throughout the summer, on account of the drip and shade of the shrubs they contain. Such persons will be, as I have been, probably unwilling to widen these borders to any great extent, so as to afford room for a high background between the stems of their shrubs and the flowers they wish to see encircling their lawns, for they will not like to encroach upon the Grass, perhaps for fear of impeding croquet, and they will not like a moderately wide border, say four or five feet from the stems of the shrubs, always looks ragged at the back, and is difficult to get on to trim or cut flowers from. It may be worth their while to try the plan of a detached border such as has suggested itself to me. Instead of having an earthen border of 4 or 5 feet wide, I advise them to grow Grass as close to their shrubs as may be, filling up around their roots with Fry, Periwinkle, St. John's Wort, or any other plants that will continue the green right through to the wall, and will also conceal the stems of the shrubs, then to cut their border for flowers out of the turf, so as to leave 1 foot of good sound Grass behind it. The inner edge of this border will be not more than 3 feet from the stems of the shrubs if they be well-grown, and if made 2 or 2½ feet wide, it will give ample space for a very bright display. The Grass edge and Ivy behind the border will improve the brightness of the flowers, and facilitate their culture, and the effect will be far greater than if a plain, uninterrupted border of 5 feet had been employed. I may add that, during the extremely hot summer of last year, I derived great benefit from having turned into my flower-beds plenty of long litter. The ends of the plants peeping out were certainly a dis-sight until the absence of surface-caking due to their affording a free passage for water to the roots, was quite surprising. I found, too, that Mignonette, sown broadcast over beds

and borders, kept them cool and moist, and was especially valuable for Calceolarias, and its quiet tone enhanced the beauty of foliage and flowers, while its sweet fragrance was no mean addition to their scent. R. E.

Rainfall in Nottinghamshire.—On Wednesday night, May 20, in 24 hours my rain gauge registered 1 inch. It rained heavily and steadily from six o'clock on Wednesday morning until the forenoon of Thursday, with the wind north east, the barometer standing at change, the lowest temperature being 39°, and the highest for that day 45°. The soaking has well washed the blight off the Roses, and all life off the fruit trees, and started all our early Peas off in racing style. I generally sow the crack sorts at three seasons, as the weather suits, viz., at the beginning of November, December, or January, and early in February, and often pick the first dish off all three sowings. In 1865 I pulled my first dish on June 22, 1866, I pulled on June 18, 1867, I pulled on June 13, and last year, 1868, I pulled on May 29. Although my Peas are podding now, and looking remarkably well, unless a great change takes place in the weather, I do not expect that I shall be able to pull any before the middle of June. I have scarcely ever seen Peas looking so well. Laxton's Supreme is a strong grower, the other new sorts are strong and vigorous. French Beans and Scarlet Runners are just aboveground, but I don't expect the sowings of them will do any good, sodden as the ground is. With the exception of these, I give my respective seedsmen great credit for supplying me with first-class seeds. The committees and the cooking of the last dry summer have done them more good than harm. Small fruit is with us plentiful. Strawberries are apparently going to flower well, and if proper attention is paid to mulching, the late rain will do them good. J. Miller, *Workshop Manor*.

Bedding Plants.—From my experience I can confirm “Quo's” notes (p. 523) respecting the Pyrethrum Golden Feather as a bedder, and its being not so free-blooming when grown from seed, also respecting Pelargonium Crystal Palace Gem being an “effective and durable bedder.” I would add a word respecting one or two other things which I have found good. Pelargoniums come first, and amongst the golden tricolors Louisa Smith has a first place. Mrs. Pollock is an old favourite, and is cheap, and must be grown either for odd lang syne or its cheapness, which is the powerful consideration with the multitude, but I am confident that when Louisa Smith is seen growing with Mrs. Pollock it will be found quite as good a “doer.” At Reading, where I saw it in one place, it was doing much better, both being planted out together. I also saw it near Weymouth, where it was splendid, having grown into a large plant and, indeed, wherever I have seen it, the opinion seems to be that it is quite as good a grower and it is much brighter in colour than the other sort—the leaf is also a finer shape, being rounder, and the green does not run so much outside the zone. I am informed by those who have seen it—I have not—planted out at its home, the Dulwich Nurseries, that it is very fine there also. Lady Collin is a first-rate grower, and very distinct, but not sufficiently effective for bedding-out; the zone is all, or nearly all, quite black, and the margin is so narrow that it has no effect. Among common zonal varieties, Glorious, rich deep vermilion-scarlet; Rebecca, cherry, and Vesuvius, bright scarlet, with a white eye, are worthy of every praise, habit, flowers, truss, and profuseness of bloom are unsurpassed—perfect balls of bloom all the season. Tropaeolum Mrs. Treadwell is unique as a bedder the flowers such a rich crimson, the leaves such a dark green, and so profuse, moreover, a fine winter bloomer. For the few who can afford it, Achyrocline Saundersoni (E. G. Henderson & Son) will be a valuable acquisition amongst white-foliaged plants, being of a beautiful silvery tint and exquisite in habit, and moreover, useful all the year round. In the same way is Artemisia Stelleriana, first-rate for bedding, and perfectly hardy. From what I have seen of all the above, I am sure they will give every satisfaction as bedders, if they only get a fair field and no favour—favour has given not a few things a bad name, and nearly killed Mrs. Pollock—fair play to all they want. Alexander, 29, Union Road, Cambridge.

Gas-tarring Orchard Trees. Canker—Your correspondent, John Lloyd, p. 556, seems to have injured his fruit-trees by an overdose of gas-tar. I have before now had to resort to the same expedient, and a very useful one it is, but when applied all round the tree, as Mr Lloyd seems to have done, it is almost certain to produce a bad effect. I only daub a little here and there on the stems and about on the ground. This serves to scare away the rabbits and hares, as they do not like to get their faces soiled by such a bad-smelling thing as gas-tar. If Mr Lloyd will carefully pare off most of the tarred bark, hurting the inner bark as little as possible, and then paint his trees with a mixture of cow-dung and clay, I think that they will soon recover their pristine healthiness. He need have no fear to well peel his trees, as no injury will accrue to them by doing so. I have been for some years in the habit of peeling, in spring, to counteract the bad effects in frost-bitten, cankered, or hide-bound fruit-trees. I generally commence at the ground, removing all the outer bark to a considerable height, and then prune back the branches either close to the tree or as far back as there is any blistered or cankered places, then painting the tree with the composition recommended above. It often happens after severe winters, such as 1860 and 1866, that fruit-trees get frozen through—at least a great many do—by which canker is induced, which is certain destruction to the health of the trees so affected. In fact, they often become a mass of canker. In all such cases I resort to peeling, and have never found it fail in restoring my trees to health. When the trees have been very much frozen, it is well to cut all the

branches clean off and head down the tree to about two-thirds of its height, then peel and paint. Many, I may say most, people attribute canker to the roots going too deep into poor cold soil, but for one cankered tree so produced, I think 99 per cent. are cankered by frost, and all that can be said to the charge of the cold soil is its tendency to cause the tree to grow too much, and so produce crude, unripened wood, a great drawback to fertility in all kinds of plants, hence the cold or frost acts with double force upon the watery tissues, and disruption and canker follow. I do not recollect ever hearing any one speak of frozen trees, nor have I ever seen the subject mentioned in books. It is always bad soil that bears the blame if a tree gets cankered. I have had hundreds of fruit-trees killed by frost in my soil but never one by the roots penetrating too deep. The Kingston Black Apples here in 1860 were all rendered so cankered and so injured, that I have abandoned its cultivation. At the time I speak of I had over 5000 trees of this kind, as it is much esteemed in this neighbourhood as a cider fruit, all were more or less injured. There are not many Apple trees so tender as this, but yet there are several others that might be mentioned. Reinette du Canada, for instance, Baltimore, &c. Of Pears the tender ones are far more numerous, such as Forelle, Glou Morceau, Louis Bonne of Jersey, Serkle, Belle Angevine, Duchesse de Mars, and Citron des Carmes, are sorts that occur to me, on the spur of the moment, as being very tender and easily cankered by frost. I have a fine tree of Flemish Beauty, now loaded with fruit, which was very much frozen in 1860 for about 2 to 3 feet up the stem, all the branches were beginning to get cankered; I skinned it all round for about 3 feet above the ground the result was, the branches are become healthy, and it is, as I have said, loaded with fruit. One bad result of frost-bite is, the trees whilst under its influence never produce good fruit, it is generally speckled with Fungus and other marks—in fact, my Forelle trees, where they have not been peeled, do not produce an eatable fruit. Those of them I have peeled are this season perfectly healthy, and were loaded with fruit, but, like all other early-flowering sorts, they dropped it, from being affected by the few frosty nights we had in April, when our glass went down to 25°. I may say that nearly all the kinds that flowered later have fruit upon them, although many of these have been sorely tried by the cold prevailing all through May. I do not know whether this letter will throw any light upon the subject of cankered trees; if it does, it will be a pleasure to me to have contributed in a small degree to turn people's thought in the right direction, and also to have shown that there is a ready and sure cure for so destructive a malady. John Scott.

Spring Gardening.—A few days ago I had the pleasure of calling at Crabwood establishment, near Southampton, the residence of Rolles Driver, Esq., to see my friend Mr Higgs the gardener, there, who has for some years past paid considerable attention to spring gardening, and to selecting the best subjects for that purpose. Mr Higgs has now for several seasons been able to produce very pleasing and harmonious results from simple means, and those, too, of a very inexpensive nature; so much so, that the materials employed by him are within the reach of every person who has a garden, and is able to devote a portion of it to ornamental purposes. The gardens at Crabwood are on a small scale, but in small gardens we often meet with meritorious results. The flower beds here are close to the south side of the mansion, at perhaps a dozen yards or so distant from the windows; a gracefully curved walk intervenes between the beds and the house, which winds along until passing out of sight amongst the shrubs beyond the flower garden. This flower garden has about 14 beds cut out in Grass, having ample space between the beds for promenading with ease, and beyond the beds there is enough space to allow of the modern game of croquet being played, beyond this there is an irregular and diversified outline of shrubbery, which when seen from the mansion seems, as it were, to hold and encase this little gem of spring flower gardening in a living frame of shrubs. There is one great point to be observed in connection with spring gardening, viz., that the plants employed must all be in flower about the same time, and to secure this end, Mr Higgs principally uses the following four—*Silene pendula*, pink; *Myosotis sylvatica*, blue; *Limnanthes Douglasii*, yellow; and *Saxifraga granulata*, white. These four are those principally used in the flower beds. In some of the borders a small yellow *Cheiranthus Marshallii*, and a scarlet Daisy, which yields an abundance of flowers, are used. In the largest beds Mr Higgs uses three colours; for instance, next to the Grass is the yellow *Limnanthes Douglasii*, next is the blue *Myosotis sylvatica*, having the taller-growing and more showy pink *Silene pendula* in the middle of the bed. Some plan the white *Saxifrage* in the middle, but in any bed where the *Silene* is used it grows too high to allow of the *Saxifrage* being seen to good advantage. These plants are all hardy, and when in flower, a shower of rain or a moderate amount of frost does not detract from the beauty of their display. G. Dawson, *Shirley, Southampton*.—I had the pleasure of walking through the gardens at Osberton last week, and I say Mr Bennett may well be proud of his spring bedding, for it is certainly a grand success. As the Osberton gardens are so well known to most of your readers, I may be allowed to offer a few remarks on the spring bedding, &c. In the kitchen garden was a ribbon-border of *Cerastium*, *Primroses*, *Variegated Kate*, and *Wallflower*, which looked well. A design with coloured walks in front of the conservatory was arranged with *Viola cornuta*, *Primroses*, *Tulips*, and *Hyacinths*, some little diamond-shaped beds at each end of the conservatory being planted with a few choice flowers, and edged with that little gem the blue *Gentian*. Leaving the conservatory and Rose garden we entered upon a long walk

Notices of Books.

Reports on the Pruning of Forest Trees and on... row Trees. By John Morrison, Croydon, Surrey. Stirling. Report on the General Management of Forests... By C. Y. Michie, Forester, Culn House. (From the "Transactions of the Highland and Agricultural Society of Scotland," 1868 and 1870.) It is now some two or three years since the Highland Society made an important alteration in the publishing its "Transactions." They used to be published for the Society, but not distributed gratuitously to the Fellows. Both public and private had to pay for them. They are now distributed gratuitously to all those Fellows who indicate their desire to have them. This, we think, is a more effective course for such a Society as the Highland Society, which has a peculiar purpose and aim it is to disseminate practical knowledge among the body of its members. In matters of pruning and forestry we are especially pleased to see that sound views are making progress. The old belief in the efficacy and in the safety of pruning as a "medicine" or "fresh air" is being given up, and in the papers we have placed at the disposal of our readers this notice the principle is acknowledged, and in different degrees, that pruning is only a remedial measure in exceptional cases and for special purposes. At the same time, notwithstanding that both Mr. Morrison and Mr. Michie have obtained prizes from the Highland Society for these Essays, and both within the space of a few months, a very material difference exists in their practice and also in their theory, and we are anxious to see that Mr. Michie's Essay is decidedly in the right respect to what we consider the proper course to be taken of the question. Mr. Morrison's practice is an improvement upon what used to be regarded as the orthodox belief on the subject, and Mr. Morrison's again an advance upon Mr. Morrison's. Mr. Morrison still announces that "one of the most effective means to be employed for promoting the healthy condition and increasing the value of plantations is pruning," and fortifies his opinion by an argument that the necessity of, and advantage of, pruning forest trees may be traced and supported by reference to the beneficial results attending the pruning and training of fruit trees." Mr. Morrison's opponents of pruning as one of the chief arguments against the practice. The purpose for which trees are pruned is totally different, and a different forest trees, and what is good for the one must be good for the other. Mr. Morrison's practice as a necessity be bail for the other. Mr. Morrison adheres, too, to what we cannot but consider an erroneous idea, that it is the forester's business to

JULY 5 1880.]

the tree growing to branches instead of to the trunk. The chief object of pruning is to prevent the energy of the tree being wastefully expended, and to direct it into the proper and natural channels, so that it may become profitable.

It is not possible to put into view any question as to the results of this system, that being a disputed matter of fact which must necessarily take the place of an opinion on one side and counter-assertion on the other, and which would wish those who adopt the views followed by Mr. Morrison to remember, on the point of theory and practice, first, that every branch must *ex necessitate* contribute to the stem before it can contribute to its own growth, and second, that each tree has its own growth, and that if men will only let it alone, it will grow if men will only let it alone.

Pruners are tormented by the fears of what will happen, if the branch is allowed to stand or that bud is not pushed forth. They see a tree in its young state, and branches springing from the ground, and assume that if they allow these to remain they will retain the same relative proportion to the trunk which they have now. But it is a perfect fallacy to suppose that the trunk will grow and the side branches will be thrown out, and they have served their present purpose of bearing the sustenance and life of the plant. The pruner anticipates Nature and removes the twigs before the proper time, depriving the tree of the advantage of temporary presence. Nature has diverse ends to accomplish, for which different means are necessary, and she uses her apparatus when she requires it, and she takes away what she has done with it. The pruner demands the present requirements of the tree and interferes to making the most shapely skeleton out of the materials he has, or expects to have, before he takes upon himself the office of Nature's workman, and makes journeyman's work of it.

The healthy and convincing foresters of the mass of the country are in the fact that it is almost impossible to reduce anything on either side but hypothetical grounds. Thus, Mr. Morrison makes the following statement of what will follow from a particular course of treatment—"In the case of an Oak 40 or 50 years old which has had no kind hand in the course of its life, to check its wild luxuriance, the trunk is found comparatively only a few feet high, with several leaders, a striving for the mastery the trunk its immense head and dwarfish stems being almost useless either for wood or bark."

It is not possible to understand the value of the branches better. In speaking of some particular cases he says "The best skill in future years can never rest re-act, that the tree will be almost entirely a dead weight, and branches will be left to rot, and the trunk will be a mass of decayed wood, and the value of forest trees, more especially of the old, is the age of the tree when the branches have been checked." But Mr. Michie is not in all respects sound. He argues for a certain amount of pruning and gives his reasons for it. If he must go to the rules of Procrustes we should recommend him to shorten the branches on the trunk side, rather than to balance the tree, rather to apply himself to pruning out and cherishing those on the other. It is not his duty and has the merit of taking nothing from the tree. Other reasons chiefly resolve themselves into the cases, as removing second leaders, shortening branches that seem likely to break from snow or wind, or otherwise do mischief—as to which a discretion must always be left to the forester, and in exercising it he should always remember that a discretion is not an option. He has the power to prune, but it is not always well to exercise it. It is excellent to have a giant's strength, but tyrannical to use it like a giant.

Mr. Morrison touches slightly on the pruning of the trunk. He is perfectly aware that he is on dangerous ground and treats the kind of pruning which he recommends as exceptions to the general rule, not to be done with the knife. We cannot agree with him in the view he takes of these exceptions. For the most part he recommends pretty free pruning for Abies, and when young, the side shoots often come very strong, and form themselves into leaders, unless checked at this stage, they take more the part of bushes than trees. But they are easily cut under, and stand the knife well when applied to the young branches, are of very free growth, and when they attain about 6 feet in height, there is less of the side shoots overtaking the leaders." Mr. Morrison's precaution against Douglas becoming a tree is very unnecessary. If anything could make a tree a tree, it is the very course of procedure adopted by the present, but it is a giant that, like Samson, the fetters man would impose. The growth of the side shoots, which has done much to the character of the tree when it has spread, and is one of its great beauties.

Some of the views and some of the differences between the views held by our authors in regard to pruning we think highly of the papers in question, and we subscribe without qualification to much that is recommended by both. Mr. Michie's paper being on the general management of plantations gives him most weight, and he is obviously a sound adviser, whose recommendations may be safely relied on.

strong hue of colour much wanted, the flowers small and somewhat cupped. Next came President A. Verzevaffelt, salmon-red, spotted with purple on the upper segment, a paid but somewhat loose flower. Duke of Buccleuch, was in the same way, but slightly paler. Frederick II, paler still, of a pale salmon-red hue, the upper segments plentifully marked with small blotches of rosy purple, a very free-blooming variety. George Eses, still paler, and of a softer hue, a bold and snowy stem and well-formed flower, awarded a First-class Certificate for its undoubted good qualities. Le Paix, a light rosy-purple flower, something in the way of Charming, and certainly not equal to it. Reine Marie Hericette, pale pink, with narrow margin of white, the upper segments heavily marked in a striking manner with deep violet-rose—in the case of a few flowers, one or more of the segments marked with pale scarlet, a fine and bold flower, though somewhat rough-looking—awarded a Second-class Certificate, and Mrs. Turner, a thin and somewhat flimsy-looking form of Criterion, scarcely so good in colour.

Here, too, was seen the first representatives of the new show Pelargoniums of the season. Mr. Turner had North Star, a flower of the lower petals glowing orange, red, with light dark blotch on each, dark upper petals, with regular margin of very range of colors, small and somewhat rough, a valuable high-coloured decorative variety, of the rose habit. Needle Gun (Hoyle) a showy painted flower, the lower petals violet rose overlaid with orange, and painted dark red, upper petals good, regularly margined with a slight edge of pale rosy-crimson, free blooming and showy. Herald (Foster), lower petals deep orange-rose heavily painted with dark, glossy dark top petals, with regular margin edge of rosy-crimson, free-blooming and good habit. Heroine (Foster), soft rich pink lower petals, large pure white throat, upper petals blotched with dark close to the throat, broad margin of deep pink lit up with orange, good habit. Lady of Lyons (Foster), delicate pink lower petals, with very slight blotches of rose, dark top petals, margined with fiery orange, and slight edge of pink; a large and somewhat rough flower. That grand variety, Troubadour (Foster), was shown in excellent condition by Mr. Turner. Of Fancy Pelargoniums, Mr. Turner had Marston, a very fine dark purple-rose self flower, very slightly edged with white, and white throat, a striking exhibition variety. Ladies or shaded rose, lower petals, with a kind of blotch of white towards the centre of the flower, lower petals rose pink with white, the same white throat. Leontine, a very fine dark pink self flower, with a white throat, and white lower petals, with a white throat. A capital cover-edged Pelargonium named Bright Star was also shown, by Mr. Turner, the leaves are edged with creamy white, and the plant has bright orange-scarlet flowers, larger and much finer in quality than is generally seen in this class. Miss Ingram Rose also received a First-class Certificate, it was shown in fine condition, the flowers rarely expanded, and of a delicate bluish-white, with a tinge of deep blush in the centre. Fancy Pansy Marie from Mr. Hooper, of Bath, represented as a bedding kind, has large flowers of a bright purple ground blotched and margined with pure white, it is certainly novel in character, the flowers large, and of good shape and substance.

The Special Prize and Pelargonium Show at South Kensington, on the 23d inst. was the means of bringing together a goodly number of new florists' flowers, in addition to the new Variegated Pelargoniums. Mr. Mann, of Brentwood, brought a batch of fine Zonal Pelargoniums, which quite maintained his reputation as a raiser of new kinds, and the Flora Committee acted with great discretion in only awarding Certificates to flowers of undoubted superiority. First-class Certificates were awarded to Duchess of Abercorn, of Mr. Mann's batch, a flower of a rosy-salmon hue, shaded with orange on the upper petals, large circular well-shaped flowers nearly 1 1/2 inch in diameter dark zonate foliage, and to Luminator, rich bright orange-scarlet, large, and very showy, and having dark zonate foliage and good habit. Other good flowers in this group were Lady Hope, pale salmon (Charming salmon-rose), Ariosto bright orange-scarlet (Christiana), pale salmon, faded violet (Lord Stanley), bright crimson (Challenger), salmon, Prince Teck, a fine scarlet variety of a brighter hue than Lord Derby. Irona Diana, orange-salmon and rose, large and showy. Princess Leek, pale salmon, with light centre. Beauty of Brentwood, salmon-rose, a fine flower. Pandora, salmon-scarlet, flushed with orange; and Ambition, orange-scarlet, very fine. Mr. Groom showed Mrs. Sach, white, tinted with pink about the centre. Mr. Thomas Laxton, Stamford, had a batch of promising bright flowers, the best being Sophia Clapton, salmon-rose shaded with violet, large and showy. Consequence, deep orange, very bright, Imperial, orange-crimson, showy and striking. Vivid in the way of Sophia Clapton but darker, and Nisi Prius, vivid orange-crimson, with dark zonate foliage. First-class Certificates were awarded to the following double flowering Pelargoniums—Wilhelm Pfizer, with large and full fringed flowers, full and of good shape, and having a dwarf compact habit of growth, and Marie Lemoine, flowers large and full and of a soft pale pink, habit good, a promising variety for pot culture. The same award was made to Mr. Harman Denham for a Variegated Ivy leaf Pelargonium, named Mr. Lambert, a great deal in the way of Duke of Edinburgh but with more yellow in the variegation, habit robust and variegation good. The same award was made to Ivy-leaf Pelargonium Wills rosea, one of the best of Mr. Wills' new hybrids, yielding flowers of a fine hue of rose, smooth, and quite as circular in shape as those

of the ordinary zonal kinds. Mr. Turner contributed some new Pelargoniums similar to those described above, and First-class Certificates were awarded to Heroine (Foster), shown in fine condition, and to fancy Pelargoniums Excalibur and Agrippa, described above. The same award was made to Mr. Wilhelm Paul for a silver-edged Pelargonium named Waltham Bride, the mode of growth somewhat resembling that of Flower of the Day, and producing pure white flowers, habit good.

Some Gold and Bronze and Zonal Pelargoniums were furnished by Mr. J. R. Pearson, Chilwell, a raiser who has distributed some fine things in this way. Two of the latter are very promising, viz., Principal, having a fine shade of magenta-rose, and Margaret Wilson, salmon-scarlet, lit up with orange, both varieties of good habit, and having dark zonate foliage.

Two Roses received First-class Certificates, viz., climbing Rose Duchesse de Mecklenburg, with pale salmon rose-coloured flowers, from J. H. Arkwright, Esq., Hampton Court, Leicester, and to H. P. Mons. Woolfield, bright pink, suffused with rose in the centre of the flowers, which were large and full, a beautiful and delicate flower, this came from Mr. Turner. A much darker coloured flower was shown by Messrs. Paxton & Son under the same name, the flowers appeared to be deeper in the tube and less globular in shape. It was thought that differences in the mode of cultivation might have had caused this difference, though by some it was feared that they were two distinct flowers, one incorrectly named. R. D.

The Apiary.

CLOVERS.—An interesting paper by "B" on Clovers and their relative value to bees as honey plants, which appeared in your last week's number, contained two or three statements to the correctness of which I feel bound to take exception.

1. "B" writes "that the Red Clovers, *Trifolium pratense* var. *perenne*, and *T. medum*, are much visited by bees, as well known." If this applies to the ordinary Red Clover cultivated by farmers, I must beg to differ with him. It is pretty generally understood by apiculturists that the Red Clover is of little or no use to the bees, and, from many years' observation, I am convinced they are correct in their belief. The larger humble bees can and do extract honey from the blossoms, and it is possible that, in unfavourable seasons for the secretion of honey by ordinary bee-plants, the hive bees may follow the wild bees, and attempt to extract honey, chiefly by taking advantage of small holes formed in their masses by the stronger individuals of the latter. This is precisely what is done by the hive bees in respect to the Kidney Bean and *Fuchsia* blossom. I do not assert that this is the case as regards the Red Clover blossoms, in fact, I have never yet, during my many opportunities for observation, seen them visited by more than a small number of bees; and those, after one or two vain attempts, acted very speedily, as if they had made a mistake, by flying away.

2. "B" does not consider the *Trifolium incarnatum* to be much sought after by bees. I am surprised at this statement as I have long believed that a large field or two of this cattle or sheep food grown in the vicinity of an apiary to be an enormous boon to the bee-master. I once visited a field of *Trifolium incarnatum* situated about two hundred yards from my garden. The moment I entered the gate I observed bees busily at work. Going a little further into the field, I measured out with my eye a square yard, on which the foragers were very numerous. I had previously been much surprised at the rapid increase of combs and honey in my supers, and was now satisfied that I had discovered the true source of plenty. In subsequent seasons the hives in that apiary always did well in the short period during which this crop was allowed to be in flower by the farmer. S. Bevan Fox.

Miscellaneous.

Cricket.—On Saturday last the employes of Messrs. Beck, Henderson & Child, 221 and 222, Upper Thames Street, played a cricket-match on Dappas Hill, Croydon, between the married and single members, in which the latter were victorious by seven runs.

Pruning Cottons.—There is a method of cultivating a few kinds of Plums as vertical cordons practised in France which is likely to be popular. It is simply selecting the proper sorts (first cutting your bare), then planting them in ground not too rich,—say a calcareous sandy loam, and then pinching in, during the summer, all the young shoots, and trusting to this to re-train the growth of the trees, without either root-pruning or removal. The varieties adapted to this mode of culture, are as yet but few, viz.—Oullin's Golden Gage, Reine Claude de Bayay, Belgian Purple, Large Black Imperial, Cluster Dawson and Prince Engelbert, of the latter kind upwards of 1000 trees are planted here for fruit bearers, they are now five years old, and are becoming compact, fertile, cylindrical trees. In the course of time, there will doubtless be many kinds of Plums adapted to this mode of culture, for here we have 2000 seedling Plums all raised from three varieties, and likely to give kinds as well adapted to our climate as is the Early Rivers or Early Proffe, well known to be the hardiest Plum known, but yet only the first removed, by seed from one of the most tender French varieties, *Precoce de Tours* Plum. These vertical cordon Plums should be planted from 4 to 5 feet apart, row from row, and the same distance from tree, the former distance will allow of 2700 trees per acre, the latter 1700, and, as far as I can see, many years will elapse before they will require thinning, and they will bear many bushels of fruit per acre. *Spencer's Fruit Garden.*

Florists' Flowers.

The opening of the great exhibition is the occasion for the production of new Florists' Flowers, and at the exhibition of the Royal Botanic Society on the 21st ult. Mr. Turner was strong with new Continental flowers, the majority of them partaking of fiery hues. The darkest was *Eclatante*, deep red, a fine and

THE LONDON MANURE COMPANY

HIGHLAND and AGRICULTURAL SOCIETY.
EDINBURGH SHOW, JULY 28, 29, and 30.
ENTRIES CLOSE JUNE 12.

Premium Lists and Certificates may be obtained on application to the Secretary, **FLESCHESS NORRIS MAXWELL, Esq.**, 3, George IV. Bridge, Edinburgh.

THE LANDS IMPROVEMENT COMPANY.
(Incorporated by Special Acts of Parliament)

DIRECTORS
John Clutton, Esq., 9, Whitehall Place, S.W.
Frederick L. Dashwood, Esq., Kington Park, Oxford.
Henry Farquhar, Esq. (Messrs. Herries, Farquhar & Co.), 10, St. James Street, S.W.
Lord Carlisle, M.P., 85, Eaton Square, S.W., and Galloway House, Wiltshire, N.B.
John Horatio Lloyd, Esq., 1, King's Bench Walk, Temple, E.C.
Granville R. Ryder, Esq. (Managing Director), 2, Princes Terrace, Hyde Park, S.W.
Granville R. H. Somerset, Esq., Q.C., 6, Park Street, Westminster.
Henry W. West, Esq., Q.C., M.P., 10, King's Bench Walk, Temple, E.C.
Charles Watkin Williams Wren, Esq., M.P. (Chairman), 2, Lower Berkeley Street, Portman Square, W., and Coopers' Hall, Whitechapel.

The Company advance money, unlimited in amount, for all purposes of Agricultural Improvement, including the erection of Cottages and Farm Buildings, to the Owners of settled and other Estates, and to the Clergy in respect of their Glebe Lands.
The whole outlay and expenses are liquidated by a rent-charge upon the land, repaying principal and interest, over 25 years.
No investigation of title is required.
For Forms and further information apply to **GRANVILLE R. RYDER, Esq.**, Managing Director, 2, Parliament Street, London.

THE GENERAL LAND DRAINAGE and IMPROVEMENT COMPANY.

DIRECTORS
Thomas Chapman, Esq., F.R.S. The Right Hon. Viscount Compton
Geo. Thomas Clark, Esq. boroare
John C. Cobbold, Esq. Edward John Hutchings, Esq.
Henry W. Curtis, Esq. William T. de. Esq., M.P.
J. BAILEY DENTON, Principal Engineer

Agricultural Improvements of any kind are executed by the Company, or the outlay thereon repaid to Landowners who prefer executing the work by their own Agents.
Tenants may also, by arrangement with their Landlords, procure the execution of such improvements.
The outlay, with all official expenses, may be charged on the Estate, and paid off by a rent-charge in 31 years, or at the option of the Landowners in a shorter term.
No investigation of title is necessary, and no legal expenses incurred.
Application to be made to **HORACE BROKE**, the Secretary, at the Office of the Company, 22, Whitehall Place, London, S.W.

The Improvement of Landed Estates.
THE LAND LOAN and ENFRANCHISEMENT COMPANY (Incorporated by special Act of Parliament), is empowered, subject to the approval of the Inclosure Commissioners for England and Wales, to advance Money to the Owners of Settled and other Estates, for the Erection of Farm Buildings and Cottages, and for the Drainage and general Improvement of Landed Property in any part of the United Kingdom, the amount borrowed being made repayable by annual instalments spread over a period not exceeding 25 years.

The expenses incident to the transaction are paid by the Company, and added to the amount to be charged on the Estate. An investigation of the Landowner's Title is necessary. Terms and further particulars may be obtained of Messrs. GILCHRIST & CO., W. 2, 31a, George Street, Edinburgh. Agents for the Company in Scotland of Messrs. RAWLINS & BOYD, 7, Great George Street, Westminster, S.W., and Salisbury; of Messrs. ASHMAN, Messrs. & Co., Solicitors, 6, Old Jewry, London, E.C., and at the Offices of the Company **EDWIN GARROD**, Secretary.
No. 22, Great George Street, Westminster, S.W.

ROYAL AGRICULTURAL BENEVOLENT INSTITUTION, for the RELIEF of DECAYED FARMERS, their WIDOWS and ORPHANS.

Patron—**HER MAJESTY THE QUEEN**
President—**HIS GRACE THE DUC OF RICHMOND.**
Advocates to Pensioners
Married .. £40 per annum. Male £26 per annum.
Widows and Unmarried Orphan Daughters .. £30 per annum.
Every Information to be had of the Secretary, by whom Subscriptions and Donations will be thankfully received.

ROYAL AGRICULTURAL BENEVOLENT INSTITUTION—The NINTH ANNIVERSARY FESTIVAL in AID of the FUNDS of the INSTITUTION will take place in the New Hall, Freemason's Tavern, on WEDNESDAY, June 9, at 6 o'clock.

The Right Hon. Lord ROSSLYN MORRISON, M.P., in the Chair. Dinner Tickets, 21s.; Ladies Tickets, 6s.; to be had of the Stewards; the Secretary, at the Office of the Institution; and at the Bar of the Tavern.

ROYAL AGRICULTURAL BENEVOLENT INSTITUTION—The ANNUAL MEETING of PENSIONERS and CHILDREN will take place at the Freemason's Tavern, on WEDNESDAY, June 16, at 11.30 a.m.
A Subscriptions shall be received until January 1, 1870, each year, and no Contributor shall vote while the same remain arrears.
No. 55, Charing Cross, London, S.W.
C. LOUNSFIELD SHAW, Secretary

The Agricultural Gazette.
SATURDAY, JUNE 5, 1869.

MEETINGS FOR THE ENSUING WEEK.
June 8. Central Chamber of Agriculture (to consider County Financial Reports, Ground Game, &c.) at Salisbury Hotel—11 a.m.
Oxford and Banbury Agricultural Society's Show at Oxford.
Royal Agricultural Benevolent Institution (Annual Dinner), at Freemason's Tavern.

No one has a better right than Mr. MECHI to speak for THE ROYAL AGRICULTURAL BENEVOLENT ASSOCIATION. But what is the explanation which he offers of its expenditure, to which we last week called attention? "My experience," he says, "has taught me that the stream of charity does not always rise and flow spontaneously, but has to be sought for and pumped up at considerable cost, and it is not always the cheapest management that produces the largest result, but rather on the contrary." But we submit to him that the expenses, whatever they may be, connected with the Royal Agricultural Benevolent Association, are carefully and explicitly published in the accounts of the Society. There is no need whatever, we presume, of referring in general terms to the inevitably heavy costliness of managing benevolent associations; for the amount under every division of the outlay is stated, and may be submitted to analysis and discussion. Last year, for example, when 5259s. 10s. 6d. was received, we are glad to know that the anniversary expenses were only 16l.—a good deal less than they had been in any previous year—an exceptional economy which will, we hope, guide the practice of 1869, and all years to come. We know, too, that the salaries and collector's poundage, commission, &c., together with incidental expenses, amounted in 1868 to 497l. 18s. 3d.—rather more than they had been in any former year. Of this we presume, from previous entries, that 278l. is the amount of salaries and wages; but even here, where a degree of uncertainty exists, there is no justification of Mr. MECHI's hazy indefiniteness of assertion on the general subject of the costs of charity. In printing, stationery, postage, advertisements, again, the cost last year was 362l. 7s.; and in rent and gas and furniture, 94l. 13s. 8d. Each of these items can be carefully investigated, and instead of general and indefinite assertion, tending rather to justify costliness of management, it is the part of every well-wisher to this institution to desire that every department be taken one by one into special examination.

remembering that every 20% saved makes another annuity available. The total cost last year was close on 10000—the amount spent in pensions was close on 20000, and stock to the amount of 20000 purchased. Here, then, is the division of the pound contributed into 200000, 20000, and 20000, of which we complain. Is this an economical method of administering the contributions of the benevolent subscribers to the Agricultural Benevolent Society? We do not think it is.

Another correspondent, whose letter follows Mr. MECHI's, suggests a much simpler and much better way. In place of funding property he would buy annuities from the National Debt Commissioners for those who are elected on the foundation of the Society. The Secretary of the Society would be the recognised attorney for all the annuitants—receiving and transmitting their quarterly allowances on receipt of the necessary proof of life. The interests of the pensioners would thus be absolutely and permanently safe. The property of the Society would be absolutely secured and the whole of it, barring annual expenses, would be available as the contributors contemplated and desired.

And these annual expenses might certainly be very much reduced, by the plan which our correspondent suggests. Annual expenses need not, we presume, be ever more than they were last year. And if postage, printing, advertising, commission, postage, and house rent were brought within reasonable limits by any secretary who should set himself energetically to save the annuities of another dozen pensioners out of the existing cost of maintaining them, we do not suppose that anybody would begrudge him, in that case, well-earned salary. But certainly it is plain upon the face of it that the expenditure is at present excessive.

Will anybody give us, for example, the justification, if any, for a jump made in these costs between 1864 and 1866? The annual charges stood at 8500, or thereabouts, during the three years 1862-3-4; in 1865 they fell to 7847; in 1866-7-8 they have stood at about 9700. What is the reason of this jump of rather more than 100%? It is not explained by any unusual increase in the number of the annuitants who would make very well indeed with the rate of contribution which we have suggested. It is not explained by any increase in the amount of the Society's stock, which was 111100 in 1861-6000 in '62, 18000 in '63, 23000 in '64, and 62000 in '65. What, then, is the explanation to be offered of a clean leap over 100% in the annual expenditure at that time, by which the annuities were swallowed up of five expectant pensioners in just that class which is both most numerous and most helpless?

If, as our correspondent suggests, the cost of management could be reduced one half or to 5000 a-year, we should have about two dozen additional pensions at once available, and surely there is no one knowing the poverty and trouble coming under the notice of the Association who will not welcome the idea that, by a little better organisation or more economical management, so great an addition to the serviceableness of the Institution may be made. Let us hope that Lord ROBERT MONTAGU may be able next Wednesday to assure the annual meeting of members and subscribers that no consideration whatever will hinder the Council, on whom the responsibilities of the Institution rest, from instituting the sharpest possible inquiry into the possibilities of economy.

CONSTITUTIONAL tendencies of a physical kind like qualities of the mind cannot be accounted for; they can only be investigated in respect to their nature and consequences. Now what is called HABIT IN PLANTS is understood except in the same limited sense. Acquaintance with these habits is necessary to the cultivator; it is that special knowledge which enables him to give each plant or crop the treatment it requires. Without this knowledge he is not a duly qualified practitioner. Every successful farmer understands precisely the various little details of management which result in a heavy crop; the method becomes a more exacting routine on bad soils than on good, but the same end is always in view. It is the object of the routine of tillage, and need not be much interrupted even by the exigencies of cleaning the land. It is skilfully kept in view, though not discussed and apparently not recognised by the plain practical farmer. To the agricultural student the habit of plants is worthy of systematic study. The first

stumbling block of an amateur farmer is his ignorance of special knowledge; he departs from the beaten path without the knowledge necessary for his guidance in a new one. He is unacquainted with the ordinary routine; he does not understand its aim and object, and consequently cannot estimate its merits or detect its defects. Ignorance may be professed, but there is no opposition so blind and unreasoning as that of fancied or mistaken knowledge. The scientific education of the amateur does not enlighten him much in practical subjects, and he is frequently led astray by some plausible theory, which further information would have led him to reject. Science interprets natural laws; practice complies with them, and in agriculture, when practice habits, as it does with different farmers, it is often neglected, and seldom from absolute ignorance. In the practice of farming an approved system seldom leads far wrong.

The best period for sowing Wheat, as it depends on the habit of that plant, must be decided by practice. It is found that this crop thrives best when sown in autumn, in a moist, cool seed-bed; a rapid early growth seldom progresses sound and healthy. The theorist may properly watch this practice and put it to the proof, and we have known some practical farmers do so too, by sowing a month earlier than usual, in a warm seed-bed, each grain being deposited with much learning and solemnity, singly and at proper intervals. This was done with the most scientific objects in reference to light air, circulation, space, food, &c. But our Wheat turned out badly; it became blighted and unharvested, and for the future we shall be less prone in measuring the elements of a proper dress for cereals. Space and air are very essential, no doubt, so are milk and butter and butter, but there may be too much of a good thing. Experience is the best nurse. In those purely practical matters, any very wide departure from custom generally proves a mistake. Plants have special habits of growth which experience can alone discover. We are taught this by numerous striking examples in gardens.

A garden is the best field for observation, and the principles of plant culture. It is in fact a large experimental ground. There is no room for fruitless experiments there, and in the hedges and beds, and in the green-houses, hundreds of plants under treatment, more or less artificial, whose cultivation requires great nicety to accommodate their special habit. A course of such gardening would not be thrown away on an intelligent pupil. He would observe much in the active management of a garden which he could usefully apply on the larger scale of a farm, and knowing that the same general laws govern the whole family of vegetables, whether they grow in fields or gardens, he would learn a great deal of what we will call practical physiology, that would have a direct influence on his management as a farmer, and would help to prevent that apparent wandering after error which often marks the course of the unpractised farmer.

We know a highly intelligent agriculturist, living in a dry warm county, who believed he could rival the successful Potato-cultivation of the Lothians, living as he did one-twelfth the distance from the London market. His soil was suitable; but he failed, for want of the cool, moist, Scotch atmosphere. There is no analogy in the cultivation of a farm which could teach him this unexpected effect of climate. In the garden, such observations are forced on the attention by the cultivation of plants in the green-houses and hot-houses. The alternation of heat and drought of the plants of South Africa and Mexico must be reproduced in the cultivation of the African Lilies and the Cactus. The Palm requires its desert heat and dryness, the tropical Ferns and Water Lilies their steaming swamps, and the Vine its alternations of warmth and cold of activity and rest. These are very general characteristics, but there are cultural refinements in horticulture, and fine shades of difference in the treatment of delicate plants, and to learn these thoroughly would make us gardeners, not farmers. The Vine should be only transplanted when the roots are active, as it does if moved in the dead of winter, thus we find our root crops have more vitality, and power to resist frost, when they are rooted in the ground than after their separation. On the same principle any plant transplanted in

autumn, as Turnips for seed, should be allowed time to "get hold" of the ground. Plants in gardens do not blossom freely while their growth is excited by water and space for their roots to extend in a slight check to their growth throws them into flower, and the effect is part of the gardener's art which he constantly practises. The tendency of plants in this respect is of interest to an arable farmer, the most important part of his business is to produce blossom, or rather to grow seed, of one sort or other and that at a low rate. These garden observations explain why the Onion does not seed freely except in very favourable years, why a full plant of carrot does not ripen most equally, why Mangold for certain conditions runs to stalks and not fruit. Some garden plants and even British plants, take kindly to heat and forcing well, the Polargones, on the other hand, requires sufficient heat for production from frost, but the least attempt at forcing is to be avoided. The Onion prefers a hard, firm soil, the Cabbage one that is more porous, some require an abundance of manure and produce their fruit or seed freely, others yield only a few and stems under such circumstances. In potted culture, several plants thrive best when they are potted in with a rougher soil than when they are potted loosely. In short, the habits of plants in the treatment of plants shows that their requirements in cultivation demand close attention to their special habit.

A truly scientific cultivator will not draw conclusions founded on theory. The gardener has other means of a purer observation, which has the nice requirements of plants as to soil and climate. He will know what suits the soil of the country. A Kentish Hop grower produces an acre for his land, in the county of Kent, as well as labour in Essex. But the delicacy of the aroma of the best Kentish Hop gardens only yielded a coarse article. Hop. Custom had fixed in Kent and had in Essex, and the original selection was an accidental one. The analogy of the Vine teaches us how greatly flavour depends on conditions of soil and aspect. The best of the potted plants are grown on adjoining ground, in one place, in the next, the common white-flowered plant. On some soils white Wheat is grown, if sown, it becomes red in a few years. Let us recommend to the practical cultivator to guide him, and to the theorist to practice to carry a lantern in front.

— The rise of 1s to 1s 6d per quarter on Wheat at Mark Lane on Monday has been sustained, and the provinces throughout the week. The market was firm, without any alteration in the wheat and sheep are again on a par as regards price. The highest price for best home-grown per bush is 1s 6d, and the agricultural soil trade is more active. The price of the agricultural soil trade is more active. The price of the agricultural soil trade is more active. The price of the agricultural soil trade is more active.

— On the subject of the breeding of horses, the present demand is said to be for a more compact and powerful form of horse. The quantity and quality of the stock of horses bred in this country. If the nobility and gentry of influence who feel interested in the matter could provide sound powerful, and useful, horses to serve their own needs, and their own small farms, the farmers and those who have an innate love of horsemanship, soon afterwards the opportunity of greatly increasing the number of Englishmen. The great industry now experienced by a farmer wishing to breed from a favourite mare is to find a horse fit to use except a few of the crack stallions of the day who can command any price for their services. The price of the mare would be a great deal more than the price of the horse.

— A general statement was made in the House of Commons on Friday, May 31st, 1890, by the President of the Board of Agriculture, Mr. BRIDGES, in answer to a question put by Mr. BRIDGES, in reference to the annual collection of agricultural statistics for the present year. Mr. BRIDGES has said that the statistics collected by the Government must be of very great advantage to the ordinary weekly and monthly transactions of trade at the same time, taking a wider view of the question, it was desirable that statistics should be given from year to year showing the progress of agriculture, and there was, therefore, no objection on the part of the Government to discontinue the collection.

— Farm servants were discussed in the House of Commons on Friday last. The Chancellor of the Exchequer, Mr. BRIDGES, informed the House that farm servants were exempted from the tax on servants. But if farm servants were employed as under-gardeners, they would be liable to the tax.

Home Correspondence.

The Royal Agricultural Society—Mr. Dent appears to have had the matter in the lead when he suggested that one-half of the retiring Council should not be eligible for re-election. I presume for a limited period in order to introduce fresh blood into the Council, of which it stands in need. The remarkable attendance at the annual meeting, although, no doubt, in some measure due to the... of last year, was... by the members generally. Why should they... Agricultural Education—At the general meeting of the Royal Agricultural Society last Saturday, Mr. Dent, on behalf of the Council, expressed a wish to know more of the opinion of the outer world on the points to be discussed in committee. While your columns are open to contributors, I hope the members of the Society will not withhold the aid of suggestion to those who at considerable expense of time and trouble are seeking to serve their interests, and to advance that which is declared by our charter to be the seventh national object to be prosecuted by the Society. Our opinions are specially invited to two suggestions already referred to a committee—the first made by Mr. Thompson, that travelling scholarships should be instituted for the double purpose of advancing the education of young men who had shown agricultural ability, and of deriving from their report matter for insertion in the Journal; the second offered by Mr. Dent, that older and practised men should be employed to visit and report on the agriculture, not only of England, but also of foreign countries. As a means of promoting agricultural education, each of these schemes is probably inferior to that of periodical examinations, already tried with success by our Society; but, while the national disgrace continues, that in this great country there should be but one good school of agriculture, it may be urged that the prizes might almost as well be given at once to the best men at Cirencester without the cumbersome and expensive process of a separate examination. Not all civilized nations, however, are in the same backward state as ourselves in this matter, and we may perhaps reap some advantage from their superiority in this respect, by a modified combination of the schemes already under discussion. Let competitive scholarships be founded by the Society for certain foreign schools of agriculture giving, say, 40*l.* per annum towards the maintenance of the successful candidate during two years of study at the appointed school. In this way we might every year have one young English farmer trained in one of the excellent and numerous German schools of agriculture, another attending the course of agricultural lectures lately founded by the French Government in the Jardin des

Plantes, and another in one of our best American schools at Yale. The... of the... could be obtained from... always a... of... with the... of other nations. The... for... should require a knowledge of... at the school, and... at the... of the Society... of the two years... a... report on... of... Many of our members would like to have... of... for the... of the... which... as a... of... If we... the... of... those who take either the diploma at Cirencester or that given by the Highland and Agricultural Society of Scotland. By a very slight supplementary examination we might ascertain, if need be, that none of these should fall below the standard of qualification required for the first class in the late examinations held at Hanover Square. This sort of reward has the advantage of being more valuable to the recipient than it is costly to the Society.

Adulteration of Seeds—There has been much writing and talking lately about the adulteration of seeds... I have been... with the trade and those... and if a few sensible remarks from me are... of any value, you are welcome to make use of them. Perhaps they may assist to reassure the public, who have been lately terribly frightened about the adulteration of seeds. The mixing of old and new seeds is not by any means a new thing caused by the excessive competition of modern times. The ancients were not averse to try their hands at it, and perhaps the practice is as old as the trade itself, being a perfectly necessary concomitant of it. The more modern refinement of a thing and dyeing a cheap kind of seed, to make it pass for another sort of much greater intrinsic value, is quite a different matter, and cannot be established on any pretext whatever being simply a fraud. Seed of various years' growth may be mixed with advantage to the public if the merchant is careful thereby to supply the customer with a more vigorous growth, but sellers of seed which has been killed and dyed to represent other kinds for several years' growth, and to be sold as such, is a different matter. It is a... of the law are those who are detected in the very act of preparing the seed for the market, and that... of the... It will take... of the... and an honest seedsman may buy it unwittingly, and believe it to be a genuine article. Seedsmen cannot always estimate their requirements so exactly as to be independent of the open market, and an unexpected increase in the demand for any particular seed may exhaust their own guaranteed stocks, and compel them, especially at the end of the seed season, to seek supplies from other sources. In such a case a small rogues' seed-men may be imposed on, and induced in the press of business to buy a doubtful article for the sake of supplying the urgent demands of impatient customers. A large proportion of the adulteration of seeds is caused by the public themselves, and I can tell them plainly that they are the remedy very much in their own hands. If people will insist on getting their seeds at a lower price than respectable seedsmen offer them, and will risk their crops of Turnips, Clovers, &c., for the sake of a paltry saving of a few shillings, there will always, as long as the world remains as it is, be plenty of unscrupulous seedsmen ready to humour them. Better far to pay a penny more per pound to a well known respectable seedsmen who has fairly earned his right to public confidence by a long course of fair dealing. If the proposed Bill to prevent the adulteration of seeds passes into law, it may with all its imperfections strengthen the hands of honest dealers, but the public can protect themselves very much by avoiding dealers who profess to sell cheap seeds. W. B. S., *Edinburgh, May 17.*

Agricultural Statistics—Mr. Sedgwick has sent a copy of the... addressed by him to the President of the Board of Trade. I trust that the agricultural statistics will be as future as they are now, and be told annually, and not, as Mr. Pell recently proposed in the House of Commons, quinquennially. Mr. Pell's objections to their annual collection are, firstly, "that they are of a speculative character," secondly, "that they had failed because the area was but an imperfect measure of what the fields would yield to the granary," and thirdly, that they were faulty because they "left out all wood, waste, and garden ground." With respect to the speculative character of the returns, it is evident that they tend to lessen speculation, inasmuch as they make known to all the food-producing area of the country. Speculation is based generally not upon what is known, but upon what is uncertain. But I need not dwell on this point, as Mr. Pell has successfully answered himself by stating that "as corn dealers are heedless of statistics, therefore the returns are of no speculative value." The second objection, which virtually means that as the returns only give the area under different crops and not the average yield, therefore they are imperfect. It would doubtless be more satisfactory if returns of the acreage yield, as well as of the different areas under crops, could be obtained, but it by no means follows that because there are difficulties in obtaining the one the other ought to be abandoned. Experienced observers can give an approxi-

Finance Steward informed us that 30,000 had entered. Thursday was the first day as regards the stock and machinery this Society has had, the best meeting this Society has had, the number of the stock was not quite so large as at Bristol, in consequence of there being no classes here. The exact numbers are—Bristol, Southampton, 528 head. The machinery increased greatly, in both the number and value of articles.

The Shorthorns were a collection that did not do credit to this breed of large heavy cattle. The 1st prize was awarded to the Messrs. Garne, for a heavy beast, that had muscle in abundance and was strong for any reasonable connoisseur. The 2nd prize was given to Mr Stratton's, also a heavy animal, with much flesh. In the class for bulls under two years there was much evidence of over-feeding. The 1st prize was awarded to the Babraham bull, which reminded us of First Fruits, the Babraham bull at Battersea in '62. Lord Sudley was the owner here, and his young bull was within a week or two of two years of age. He is a most attractive animal, but when we come to consider his perfect fat-ox ripeness must have on his countenance and that of his issue—if he ever be capable of a sire—it is clear that it is the duty of every influential society to disqualify animals which are unsuitable to the practical judges of this country to make up a bull into the form of the 1st prize at Southampton with a view of securing a prize. It is a degradation to any society to allow a bull to be offered for stock purposes to leave the prize with the highest honour, instead of bearing the stigma which such treatment of any young animal entails. This is what we must come to, and the sooner the Society comes to a determination on the subject, and sticks to it, the greater will be the honour and the advantage of the society will gain. The result is evident—the result of the way in which his bull had been produced and got up for show, for he shows signs of degeneration in the family to which he belongs. He is excellent for his symmetry, no doubt, but he has lost the character for which this breed is famous, or Clipping Norton, is a bull which for his character for his age was undoubtedly the most valuable bull in his class for legitimate profit. His character is immense, and his fair feeding has not been lost. He was only Highly Commended. But in this and the 2d prize animal, there was a young bull of great promise, unnoticed by the judges. His colour is a rich straw, and he has a beautiful long silken coat. These were in the condition in which breeding stock should be kept, and considering the length and form of his body he would certainly have met with success at the hands of the authorities. He was sent by Mr Walter, M.P., of Barewood Park, and we hope to see him in good company next year and go before judges who will take into consideration the views we have urged.

There was no calf class at this show. This may not be a mistake perhaps, for calves after so much of a year or two that we do not see the good of showing them for prizes. Calves may be valued by the parent, but it is next to mere guesswork to say which calf will be the best animal when he comes to maturity. This after all is, or ought to be, the object of public judging and awarding prizes. The judges are supposed to know nothing of pedigree or pedigree, how is it possible they can do so in a class of calves?

Cows and heifers were not numerous. We cannot judge the judging in the class of aged cows. The 1st prize was an animal which retains the true character of a Shorthorn dam, wide hips and expansive rump, and therefore ample width between the points for carrying a full bag of milk, a cow's chine, a long neck, and a long face below the eyes. These are the kind of cows that we now need to have stamped with the approbation of judges. The breed may be adapted for breeding broad-shouldered heavy-backed bulls, but if the race of females must be bred for this purpose, we had better think about the breeding and milk-giving character of our herds. But rather than this should we should be better without excessively broad-shouldered and heavy-necked bulls.

Young heifers were more numerous, and there were a few excellent animals, but here the judges were evidently guided by the prejudice and fashion which has been established of late years, during the time when the country has beset some of the wealthy men of our country who have taken to Shorthorn breeding as a speculation. The difficulties into which many of these are now merging ought to be obviated now that we have ample trustworthy data to guide us in the art of breeding.

The 1st and 2d prize bulls were placed first in the yard, and so the quality goes. They were 22 in number. The 1st prize was more admirable than were the 2d prize sent by Mr Walter Farthing, Mr Buller, and Mr Burton. As we have remarked, however, there is an undersize in the specimens of this breed which are brought to public notice, a great question whether the course pursued by the leading breeders has been a judicious one. The staying or lasting character of their specimens may be considered. The 1st and 2d prize bulls were however, and some of the cows were as good as they could possibly be mated. But if we are to go on decreasing in size as it has done during the last few years, we shall be able to find models for purposes of Kerry and Breton and Jersey cows for Herefords were not strong, and the main

strength of these animals was displayed in a magnificent bull and cow, the former sent by Mr Arkwright, and the latter by Mr. Allen, as set forth in our prize list. The bull is an extraordinary fellow, but beyond him there was nothing worth notice in the aged class, for the 2d prize was a narrow, irregular fore-quartered beast, with a deal of poddiness, which gave him anything but an improved or improving appearance. The cow, however, to which we have referred as being naturally a grand creature, has been greatly over-done with rich or fattening food. The injury of this is clearly shown in the size of the calf a few days old by her side, for it is just one of the diminutive things which look to be too good to knock on the head, but which it is clear would cost twice as much to rear it and feed it for the butcher as it would be worth when full grown.

The Sussex bulls were in bad condition, their coats being full of scurf and dust. This negligence is unaccountable. If it had not been for two or three great and good cows, and a few handsome and well-grown or growing heifers, this breed would have been a discredit to the show as well as to the county of Sussex.

The Channel Islands cattle were upwards of 80 in number, and a finer collection of this peculiar breed of animals we never saw out of their native islands. The prizes of the society brought the whole of the islands into competition, and as there is as much dissimilarity between the Alderney and Jersey and the Guernsey breeds, as there is between North Wales runts and South Wales cattle, it was not possible to give even the usual amount of satisfaction among the somewhat Frenchified and excitable island exhibitors. The Jersey men object so much to the Guernsey breed that they will not allow a single one of them to pass the landing wharf at St. Helier's. We may add, the Guernsey breeders are even more strict than this, for they will not allow a single Jersey animal to be imported into Guernsey. Mr Le Saunier's 1st prize was considered by some of the Jersey breeders to be but a fourth or fifth-rate one, because he was leggy, light in colour, and otherwise favoured the Guernsey type. This decision was more objectionable to most of the Jersey men, because what they considered the best bull was only Highly Commended. This animal is Mr. Elias Nicole's, Trinity, Jersey; the dam, too, of this bull was awarded the 1st prize at the Royal meeting at Plymouth, and 100 guineas were then offered for her to be taken to America. The decisions among the cows and heifers gave even more dissatisfaction, and there certainly was a large amount of inconsistency in class 23, for if the light sandy colour, Guernsey type of heifer, be the right stamp of animal for the 1st prize, the very neat and beautiful fawn-coloured heifer, with black points, was not suited, with so much choice and excellence, to receive the 2d prize. But this may be accounted for from the fact that a Jersey man and a Guernsey man, and an English resident in Guernsey, were the judges. Prejudice in these cases will not give way, so the judging probably proceeded on the principle of "giving and taking."

The following are the awards in the cattle classes:—

- DEVONS.**
 Judges—Devon and Sussex cattle—Messrs. Ford and Tremain, Herefords and Shorthorns—Messrs. Thomson and Baldwin.
 CLASS 1. For the best Bull, exceeding 2 and not exceeding 4 years old on the 1st June, 1869.—1st, Mr Walter Farthing, Stowey Court, Bridgewater, 20; Mr James H. Buller, Lownes, Crediton, Devon.
 CLASS 2. For the best Bull, not exceeding 2 years old on 1st June, 1869.—1st, Mr Walter Farthing, ditto.
 CLASS 3. For the best Cow in calf.—1st, Mr W. G. Nixey, Upton Court Farm, Slough, Bucks, 10; Mr Walter Farthing, ditto.
 CLASS 4. For the best Heifer in calf, not exceeding 3 years old on the 1st June, 1869.—1st, Mr Nixey, 10; Mr J. H. Buller.
 CLASS 5. For the best Heifer not exceeding 2 years old on the 1st June.—1st, Mr R. Burton, Place Barton, Broadcrag, Devon 5; Mr W. Farthing, Commended Mr J. H. Buller.

- SHORTHORNS.**
 CLASS 6. For the best Bull, exceeding 2 and not exceeding 4 years old on 1st June, 1869.—1st, Messrs. Garne & Son, Broadmoor Gloucestershire, 10; Mr R. Stratton, Buryatop, Swindon, Wilts. Highly Commended Lady Pigot, Branches Park, Suffolk.
 CLASS 7. For the best Bull, not exceeding 2 years old on 1st June, 1869.—1st, the Right Hon. Lord Sudley, Toddington House, Winchcombe, 10; Mr R. Stratton, Swindon, Highly Commended Mr G. Garne, Churchill Heath, Clipping Norton, Oxon.
 CLASS 8. For the best Cow in calf.—1st, Lady E. Pigot, 10; Mr J. Atkins, Barton Peverell, Bishops Cleeve.
 CLASS 9. For the best Heifer in calf not exceeding 3 years old on 1st June, 1869.—1st, Mr James How, Broughton, Huntingdon, 10; Mr G. Garne. Highly Commended Mr G. Garne.
 CLASS 10. For the best Heifer, not exceeding 2 years old on 1st June, 1869.—1st, and 5th, Mr R. Stratton. Highly Commended Lady E. Pigot.

- HEREFORDS.**
 CLASS 11. For the best Bull, exceeding 2 and not exceeding 4 years old on the 1st June, 1869.—1st, Mr J. H. Arkwright, Hampton Court, Leominster, 10; Mr W. Rossiter, Stragways, Marnhall, Blandford.
 CLASS 12. For the best Bull, not exceeding 2 years old on the 1st June, 1869.—1st, Mr N. Benjafield, Short's Green Farm, Motcombe, Shaftesbury, 10; Mr W. B. Simonds, M.P., Abbots Barton, Winchester.
 CLASS 13. For the best Cow in calf.—1st, Mr J. D. Allen, Tisbury, 10; Mr W. Tudge, Adforton, Leintwardine, Herefordshire. Highly Commended Mr J. H. Arkwright.
 CLASS 14. For the best Heifer in calf, not exceeding 3 years old on 1st June, 1869.—1st, Mr W. Tudge, 10; Mr J. H. Arkwright, Leominster. Highly Commended and Commended Mr J. W. James, Blandford.
 CLASS 15. For the best Heifer, not exceeding 2 years old on the 1st June, 1869.—1st, Mr W. Tudge, 5; Mr J. W. James, Nappowder, Blandford.

- SUSSEX STOCK.**
 CLASS 16. No entry.
 CLASS 17. For the best Bull, not exceeding 2 years old on the 1st June, 1869.—1st, Mr T. Smith, Beckley, Staplehurst, 10; Messrs. J. and A. Heasman, Angering, Arundel.
 CLASS 18. For the best Cow in calf.—1st, Mr W. Botting,

- Hurstpierrepont 10; Mr T. Smith. Highly Commended: Mr G. Jenner, Rye. Commended Messrs. Heasman.
 CLASS 19. For the best Heifer in calf, not exceeding 3 years old on the 1st June, 1869.—1st, and 10th, Messrs. Heasman.
CHANNEL ISLANDS.
 JUDGES—Mr J. James, Guernsey, Mr M. Gibart, Jersey, and Mr. Midleton, Calverton, Oxford.
 CLASS 21. For the best Bull, not exceeding 4 years old on the 1st June, 1869.—1st, Mr T. Le Sieur, Maufant, St. Saviour's, Jersey 5; Mr P. Pitta, Newport, Isle of Wight. Highly Commended Mr Louis Nicole, La Fontaine, Trinity, Jersey.
 CLASS 22. For the best Cow in calf.—1st, Mr T. Maindonald, St. Peter Port, Guernsey, 5; Mr N. Arlaud, St. Mary's, Jersey. Highly Commended Capt F. A. Maxse, R.N., Holly Hill, Southampton. Commended Mr Arthur.
 CLASS 23. For the best Heifer, not exceeding 2 years old on the 1st June, 1869.—1st, Mr J. Dorey, St. Martin's, Jersey 5; Mr J. D. Sherrington, Bramshaw, Lyndhurst. Highly Commended Mr D. Le Chaminat, Sables, Guernsey. Commended Mr P. Gaudin, St. Helier's, Jersey.

Sheep.—The sheep were a good show as a whole, although there were some very inferior animals present. The Leicesters were placed 1st on the list, and Mr. Sanday, of Holmepierrepont, took the two 1st prizes in the ram classes with sheep that were of an excellent form and of a creditable size as Leicesters now go. These sheep, as we have often remarked, are not thrifty enough in either muscle or wool for this go-a-head age. But we hope the great value of the sheep as a pure breed, and for improving Lincoln and Northamptonshire sheep, and for crossing with Hampshire Down, will long be appreciated, as it would undoubtedly prove to be a great loss to the country if this woolly tribe were merged entirely into other breeds, or become altogether extinct.

Of Cotswolds there were only nine lots, but they were of their usual large, fine, and white character—excepting one, however, for Mr. Rynbird sent as great a brute as was ever consigned early in life to a dog-butcher.

Southdowns for show without Lord Walsingham's name being associated with the exhibition is an oddity, after the success which has attended his lordship's continuous efforts for several years. Mr. Rigden and Mr. Heasman here had it nearly all their own way. The Southdowns were, however, a long list. There were 34 entries of shearing rams, and 16 of any other age. Mr. Rigden, Mr. Heasman, and Sir W. Throckmorton, Bart., took two prizes each in these classes. Mr. Rigden's two-shear ram is excellent for form and substance, and the ewes of both Mr. Heasman and Sir W. Throckmorton were remarkably beautiful for symmetry and fine white wool. The Highly Commended pen sent by Mr. R. Neville-Grenville, M.P. were also excellent, and but little, if any inferior to the prize sheep.

The Hampshire Downs were sure to be in strong force. A more valuable collection of sheep we never saw together, no matter what may have been the breed. The 1st prize ram had a back which was not surpassed for its touch in the yard. The weight of this sheep, too, although he was not excessively fat, was great. This is one of the valuable traits of these sheep: they contain so much lean. Some of them are still coarse in appearance, but this view applies more to their big head and their large hairy legs than anything else. Mr. W. E. Pitt had a fit of weakness when he sent No. 249, for he had the appearance of one of the German Noah's Ark toys magnified a few hundred times; and some one who rejoices in the name of Mr. Frederick Sigmund Schwann, sent an animal similar in outline, but which had a stomach twice as large or doubly distended with wind. The ewes were a capital class, and the large entry and character of ram-lambs, 20 in number, some of which had their mother by their side, did credit to this breed, which is rapidly coming to the front, now that we can get a superabundance of wool from foreign countries. These animals grow meat, and they will increase in popularity when some of the present fine and fashionable flocks are neither seen at Royal shows nor thought anything of in their own district or county.

The Shropshires have found their way all this distance south, but only in small numbers. Lord Chesham, however, had a pen of ewes which, for smartness of appearance and uniformity of character, their legs and face being black, we have seldom seen surpassed. His lordship's 1st prize ram was also of the same character, but neither the ewes nor the ram would be considered large enough for the old-established Shropshire breeders. However, taking them as they are, they are very beautiful sheep. Mr. Horton sent two, and Mr. Wood, of Romsey, Hants, sent four rams and a pen of ewes—three of the rams, however, were bred in Shropshire. This breeder has taken a liking to this breed, and it does not appear that his fancy has been at all misplaced, while his success shows that the supposed suitability of these sheep for almost any soil or climate has some sound foundation.

The Somerset and Dorset breed, with their long white curly horns and white wool, were well represented, and they readily reminded one of the first lamb of the season, for producing which their value is great, and fully appreciated in this neighbourhood and the Isle of Wight. There were, too, some Exmoor sheep, which have a similar form as regards horn and frame, but as they have apparently been on the high hill-sides of the moor after which they are named, they are very small. According to Mr. Tucker, in the Strand, there is no sweeter mutton than they produce, and they live where nothing else except goats would exist. They are, therefore, worthy of the position in which they stood at the Society's show, which embraces their native ground.

- The following is the list of awards
LEICESTERS.
 JUDGES—Leicesters, Cotswolds, and Oxford Downs—Messrs. Payne & Twitche, Southdowns, Hampshire, and Shropshires—Messrs. Canning, Hart, and Cureton.
 CLASS 24. For best yearling Ram.—1st, Mr. Sanday, Holmepierrepont, 5; Messrs. J. & A. H. Gould, Pottimora, Exeter. Commended Mr. Sanday.

PORTABLE AND FIXED HOT-WATER APPARATUS,
 HEATING CONSERVATORIES, HOTHOUSES, CHURCHES, PUBLIC BUILDINGS, PRIVATE
 RESIDENCES, ETC., WITH
TRUSS'S PATENT UNIVERSAL FLEXIBLE AND LEAKLESS PIPE-JOINTS.

T. S. TRUSS

Begs to state that the immense number of APPARATUS annually Designed and Erected by him in all parts of the Kingdom, and for the ROYAL HORTICULTURAL SOCIETY at SOUTH KENSINGTON and CHISWICK, with unrivalled satisfaction,

is a guarantee for skill of design, superior materials, and good workmanship, while the great advantages of his IMPROVED SYSTEM cannot be over-estimated, consisting of perfectly tight joints with appearance, EFFECTS A SAVING OF 25 PER CENT on cost of Apparatus erected compared with other systems, facility for extensions, alterations or removals without injury to Pipes or Joints, can be effected by any Gardener, an ordinary size Apparatus erected in one day; and PERFECTNESS OF DESIGN GUARANTEED, INSURING NO EXTRAS. Complete Apparatus, of the best materials, delivered to any Railway Station in England, and Erected at the following prices. Erection beyond 25 miles of London, railway fare for one person included. Considerable reduction on large works.

GREEN'S PATENT SILENS MESSOR,

OR

NOISELESS LAWN MOWING, ROLLING, and COLLECTING MACHINES.

BY SPECIAL APPOINTMENT,
MANUFACTURER

TO HER MOST GRACIOUS
MAJESTY THE QUEEN.

The Extraordinary Success of GREEN'S PATENT LAWN MOWERS is an established fact. During the last five years the demand has been unprecedented, and alone is a proof of their superiority over all others. The following are their characteristic features—

- 1st. Simplicity of Construction, every part being free of access.
- 2d. They are worked with far greater ease than any other Lawn Mower.
- 3d. They are the least liable to get out of order.

IMPORTANT NOTICE.

Trial at the London Horticultural Society's Gardens, Chiswick, June 5, 1857, four competitors — First Trial on level ground, Second Trial on uneven ground, Third Trial on intricate places, around trees, &c.,—when GREEN'S PATENT was unanimously declared to be the best in each Trial by COLONEL CHALLONER, DR. LITTLE, and G. McEWAN, Esq., the appointed Judges, and on every subsequent Trial to the above have GREEN'S PATENT LAWN MOWERS carried off every Prize that has been given in competition for superiority in every point.

PRIZE MEDALS AWARDED TO GREEN'S PATENT LAWN MOWERS.

FIRST PRIZE MEDAL AT THE INTERNATIONAL EXHIBITION, LONDON, 1862.
FIRST PRIZE MEDAL AT THE INTERNATIONAL EXHIBITION, DUBLIN, 1865.
FIRST PRIZE MEDAL AT THE NAMUR EXHIBITION.
FIRST PRIZE MEDAL AT THE GAND EXHIBITION

FIRST PRIZE MEDAL AT THE LARSEN EXHIBITION.
FIRST PRIZE MEDAL AT THE LINDENE EXHIBITION.
FIRST PRIZE MEDAL AT THE BRUSSELS EXHIBITION, on two occasions.
FIRST PRIZE MEDAL AT THE HAMBURG EXHIBITION.

THEY ARE THE ONLY MACHINES IN CONSTANT USE AT

THE ROYAL HORTICULTURAL SOCIETY'S GARDENS, SOUTH KENSINGTON

HORSE, PONY, AND DONKEY MACHINE.

GREEN'S PATENT LAWN MOWERS

have proved to be the best, and carried off every Prize that has been given in all cases of competition. Since the first year they were introduced (1856), upwards of 46,800 have been sold, and 25,000 of that number during the last five seasons.

T. GREEN & SON
warrant every Machine to
entire satisfaction, and
approved of can be returned
unconditionally.

PRICES of HORSE, PONY, and DONKEY MACHINES, including Patent Self-delivery Box, Cross Stay complete, suitable for attaching to ordinary Chain Traces or Gig Harness.

PONY AND DONKEY MACHINES.

To Cut 26 inches	£13 0 0	} Leather Boots for Donkey, 18s. } Leather Boots for Pony, 22s.
" 28 "	15 0 0	
" 30 "	17 0 0	

HORSE MACHINES.

To Cut 30 inches	£21 0 0	} Leather Boots for Horse, 25s.
" 36 "	24 0 0	
" 42 "	27 0 0	
" 48 "	30 0 0	

Both the Horse, Pony, Donkey, and Hand Machines possess (over all other Makers) the advantage of Self-sharpening. The cutters being steel on each side, when they become dull or blunt by running one way round, the cylinder can be reversed again and again, bringing the opposite edge of the cutter against the bottom blade, when the Machine will cut equal to new. Arrangements are made that the cylinder can be reversed, by any inexperienced person, in two or three minutes.

HAND MACHINES.

To Cut 10 inches	..	£3 10 0	Suitable for a Lady
" 12 "	..	4 10 0	" "
" 14 "	..	5 10 0	Suitable for One Person
" 16 "	..	6 10 0	" "

To Cut 18 inches	..	£7 10 0	Suitable for One Person
" 20 "	..	8 0 0	Suitable for Two Persons
" 22 "	..	8 10 0	" "
" 24 "	..	9 0 0	" "

Packing Cases are charged at the following low rates, viz — for the 10 and 12-inch Machine, 3s., 14 and 16-inch, 4s., 18 and 20-inch, 5s., 22 and 24-inch, 6s. Persons providing themselves with Lawn Mowers are recommended to purchase the cases in which to stow them away, when not in use, to prevent them from getting damaged. Returned, two-thirds will be allowed for them.

The above MACHINES are made from the best materials, and of superior workmanship, and are delivered Carriage Free to all the principal Railway Stations and Shipping Ports in England, Ireland, and Scotland.

HORTICULTURAL and AGRICULTURAL IMPLEMENTS, GARDEN SEATS and CHAIRS, FOUNTAINS, VASES, PLAIN and GALVANISED WIRE NETTING and ORNAMENTAL WIRE WORK of every description

Having very extensive Premises in London, we are in a position to do all kinds of Repairs there, as well as at our Leeds Establishment.

Having a large quantity of MACHINES in stock at our Leeds and London Establishments, we are in a position to execute Orders on the day they are received.

HAND MACHINE.

THE FIRST PRIZE SILVER MEDAL
OF THE
UNIVERSAL EXHIBITION,
PARIS, 1867.

ALEXANDER SHANKS AND SON, in presenting their "PRICE LIST of LAWN MOWERS for 1869," have much satisfaction in intimating that among the Exhibitors of Lawn Mowers at the Universal Exhibition of 1867, they are the only Firm to whom the Jury have awarded a Medal.

A. S. AND SON have, in addition to the PATENT DOUBLE-EDGED SOLE PLATE and WIND GUARD, made very great Alterations and Improvements in their Machine. These alterations, which were introduced last Season, have now undergone an effectual trial, and the result has been so successful as to enable A. S. AND SON to offer a Machine which far excels any other that has ever yet been offered, *whether for ease in working, certainty of action, or durability* It has only to be compared with other Machines, when its superiority will be at once seen and understood

full sized leaf, not a rampant one, and we must have, if possible, perfect colour. The latter for preference in any event. Tulip growers (now alas few and far between) have always had the same difficulty only in a much higher degree, for the colour of the Tulip is still in a much higher degree. They overcome it by using old well-rotted, and decomposed cow manure, and I would do the same. I compost then, and had three parts of very fine sand, obtained if possible from an open pasture, where the grass is the best stacked, just enough to kill the grass, and then pulled to pieces, and one part of cow manure, and a part of a sandy peat and one half of a part of water. This is at a distance in the largest of Mr. Sargleton's plantations of Jersey who has a splendid collection of Tulips, and has obtained the best results during the last five years, and is ordered from thousands of seedlings, and whose reputation is therefore worth listening to. He was led to use it by noticing how the roots seemed to fasten upon the cyster when he sometimes used instead of drainage, and he has found it improve both the growth and colouring. If reasoning from analogy be of any use at such matters, he is right. For Mr. Thos. Rivers has pointed out that calcareous water improves the colouring of Apples and Pears.

2. In Pots.—What is worth doing at all is worth doing well. Do not waste time, labour, or the space of a half pot of soil. Applying these wise considerations to the best of the trial, I have found that the best way is to use a 32-sized pot. Having fixed upon the position of the bed (which if possible should be fully exposed to the sun, and sheltered from the north and east), remove the old soil to the depth of 2 feet, then fill in for about 6 inches with stones, brick-bats, clinkers, &c. (the largest at the bottom), to secure good drainage, cover these with a layer of sods, grass downwards, or, failing these, with a thin layer of brush wood, or short straw &c., next, rough ridings from the potting-shed, or then fill up to some 2 inches higher than the intended level, with the compost recommended above, or imitate it as nearly as convenient—e.g., hot sun, manure (after doing duty, not before, may be used for the purpose), and may be applied in rather larger proportions than in pot culture, for which the compost is used to be specially meant. A large bed here, but smaller plants after the above fashion, was really magnificent. The plants, when put out, soon made vigorous growth, and near the end of the autumn the plants fully had dry summer, affording many dozens of cuttings, while at the same time, in the aspect, and within 10 feet of the same spot, plants of the same size and varieties, but planted in the ordinary unprepared garden soil, made no progress at all, and were taken up in autumn no longer than when planted out, without having yielded a single cutting. The cuttings alone from the large bed repaid the cost of labour and materials.

3. In Pots.—From the cutting to the exhibition table—I will begin by taking off a good, mature cutting, the best time for doing so for our purpose being about the middle of April—by all means avoid the 1st. Put it into a thumb-pot, in equal parts of loam, peat, and silver sand, then place it in a cold frame, and shade from sun till rooted. When the roots reach the sides of the pot, re-pot into a 50 in the compost given under the head "soil" and return it to the cold frame. Shade it for a day or two, till re-established, and then give plenty of air. When the plant has six mature leaves, pinch out the growing point, and when the roots again reach the sides, re-pot into a 32-sized pot, and return the plant to the cold frame. Continue to stop it when needful—having in view the future finished plant—and above all things avoid the knife. If any shoot threaten to grow too rampant, it may be brought to reason by bending it gently down for a time, and a weakly one may be encouraged by placing it more upright. When the weather will permit, take the lights off all night. This and the nearness to the glass will give colour to the leaves. In the hot season, a little water may be given, but not more than is needed to keep the soil moist. The water should be put on a high shelf close to the glass, at the back of the greenhouse, and from a reservoir run the plant out of its pot, trim the outside roots, run the fingers gently through the ball, and place it in the same sized pot. Now, put it into a close frame, having a gentle bottom-heat, and shade from sun till again established, when it may be returned to its place in the greenhouse. Continue the stopping and trailing as the growth advances; and, as soon as the roots have again filled the pot, shift into its exhibition home, a "No. 24." Place it in a close frame, slightly heated, for not more than a week, and then return it to its old shelf in the greenhouse, when it must be carefully tended, stopped, trained, and regularly turned round, to avoid its growing out of shape. By no means drive sticks through the best roots, but train with matting to a wire round the pot, or some such contrivance. At least a month before exhibition, cease stopping, and remove the plant to a cold frame. Diffuse the sun's rays by means of stretched tiffany, or something equally transparent give plenty of air, and at night remove the lights whenever the weather will allow. During this finishing month clear weak soot water, or sulphate of ammonia (1 or 2 gal. lons of water), may be given twice a week.

The plant will now be ready for the exhibition table, to conquer or be conquered, its exhibitor being "equal to either fate." And now my labour of love is completed. Jonathan Smith, Jersey National School, Don Street, Jersey.

Home Correspondence.

Dendrobium Falconeri.—I must needs ask you for a small space to answer Mr. Anderson's notice of my letter, more particularly as he appears to have wrongly understood my remarks, and even goes so far as to say that I have introduced the word precision with something like a sneer. Now I did not write it in a sneering mood, but simply with a desire to elicit some further information, and I made my remarks as short as I could that I might not take up space in your pages when my standing as a gardener or a writer upon gardening did not entitle me to; and thus my letter might carry an appearance of abruptness. First let me notice that I did not impugn Mr. Anderson's own gardening experience, nor did I wish to appear to doubt the facts he gave us, I simply asked for more precision of expression, and being an employer of mechanics, and accustomed to the use of callipers in measuring small diameters, I asked for the measures, as I would have given them had I been asked. I am afraid I am again going to run the risk of being misunderstood, but that I cannot help, further than by disclaiming such intention. D. Falconeri is distinct in many ways, and in one important one is, I think, singular,—the bulbs do not thicken as they grow longer, even if good part of a yard long, and having many fresh points of departure added each year. Each joint in the bulb depends for its size upon the leaf that forms it; if the leaf gets damaged it remains smaller than the others, and perhaps neither forms a flower nor becomes the starting

point of a fresh bulb. Such being the case, any average growing growth is a good sample of the strength of the plant, first, there is the leafless part, then come five or six green joints, with the leaves still on, and so many of them should become points of departure when growing strongly. Dr. Lindley tells us a flower shoot is a stunted growth only. Mr. Anderson says this plant is as green as a Rush, the moisture it has lived in has preserved the leaves, and the leaves have kept that part of the bulb green, and the new growths are wood buds and not flower buds. I have one that has done the same thing, remained green all winter, the three oldest still green joints commencing fresh growths, and I conclude they never will flower or, as far as growing is concerned, the treatment appears identical, but I must still press the question as to the size of the joints, &c. I thank Mr. James Lorimer for his answer, and the temperatures he has given me. I can only express my continued surprise at the tremendous speed at which Orchids are killed. Now this should not be, and though I confess I put as a contrast to Mr. Anderson's cool treatment the highest temperature my house is likely to attain, I gave it no higher than it often has been in July and August. From 70° to 80° is enough for Pines as a rule, and is a heat that I believe Orchids require. Our grand question yet is to flower Falconeri, not to grow it; and I think that if Mr. Lorimer will read my letter again he will see we only differ in the mode of raising the required moisture, the atmosphere in my house is as near saturation as the heat at which it stands will permit. I have not the rule, I wish I had, but I believe it will contain nearly half as much again at 75° than it can at 55°. The paper I mentioned as having written about two years since was not an answer to any one, it was an attempt to start a discussion upon the meteorological requirements of Orchids, as shown by the paper I mentioned in the Journal of the Scottish Meteorological Society. Orchids want the warm rain condensed by the high elevations at which they are found, but they also need the hot sun to ripen the bulbs to the required flowering point, for what plant or tree has this tendency induced by cold?—and when I add that support should be given with the stimulating heat and moisture, I have again gone over all the points I wished to draw attention to in my last letter G. H.

Our Fruit Prospects.—So many friends, both at home and abroad, have written to me on the above subject—the spring having been so peculiar—that I am, with permission, induced to give the result of my observations in your columns; and to be as methodical as possible, I give it alphabetically. For the sake of foreign friends, or perhaps I ought to say colonial friends, some of whom have seen this place, and appear always to take a warm interest in it, and many others who have heard of this corner of Hertfordshire yet are never likely to see it, I may perhaps be allowed to give a short description of site and soil and climate. Saw-bridgeworth, a rural parish on the Great Eastern line of rail, lies about 20 miles in a direct line to the north-east-by-east of London, and at the extreme eastern end of Hertfordshire its climate is cold, sunny, and dry, summer heat 2° or 3° less than that of Chiswick, winter and spring frosts not so severe by 2° or 3°—so that we are cooler in summer and not so cold in winter as that central point of horticultural observations, for instance, on the 1st May last 6° of frost were registered at Chiswick, but here only 3°. With regard to site, we have those pretty undulations peculiar to the county, with its brooks and springs and watercourses, the latter bordered with rich alluvial loams, mixed with alumina and carbonate of lime; these clayey loams, with occasional fields with subsoils of calcareous sand, are disposed over a large district—this parish alone containing 7000 acres,—and are most fertile arable lands, often producing 8 quarters of Wheat per acre, yet, oddly enough, our pastures, unless heavily manured, are not rich, and have but little fattening power even under the highest culture. Apple trees, in the orchards of the farmers, succeed well, and have not that wretched, mossy, scraggy appearance they have in Devonshire, nor are they as luxuriant as they are in the Worcestershire and Herefordshire orchards. The crop this season on standard orchard trees of some 30 to 50 years old is very scanty. Such sorts as Dumelow's Seedling, Rymer, Sturmer Pippin, and others, are almost or quite bare, while, curiously enough, dwarf bushes, or pyramids on Paradise stocks, whether English, French, or Dutch, are crammed with fruit,—little bushes, from 12 to 18 inches high, will require a large portion of their fruit thinned out or they will die under the pressure. I have never thought more highly of these little trees than at present they require no wires or stakes, and but little trouble, merely that required by pinching-in their young shoots during the summer. Too much cannot be said in favour of them for small gardens, as they may be planted 3 feet apart, in rows or squares, and even less. Apricots on standards in the open air are quite bare of fruit, they bore large crops in 1867 and 1868. Trees trained against walls are also bare of fruit, as are the majority of those in orchard-houses the exception here is some tall standard trees in pots in the central border of one of our large orchard-houses, their heads were in a comparatively warm dry atmosphere, and the pollen consequently dry and active. Cherries are a most abundant crop, more so than I have witnessed for many years, boys have been employed for many days in chipping off the fruit from pyramids, more particularly those of the Duke tribe, such as the May Duke and Empress Eugenie—the ground is literally strewn with bushels of fruit, just on the point of colouring, causing some regret that they could not be suffered to ripen their beautiful fruit, but unless removed the rooks destroy

the trees. These trees, some thousands in number, are on the Mahaleb stock (*Cerasus Mahaleb*), which is at home in the calcareous soil. Cherries on standard trees in orchards are equally abundant. Currants and Gooseberries are a most abundant crop. Figs on walls are really loaded with fruit, a rare occurrence here, as the winter generally destroys all the young Figs formed in autumn, even when the trees are protected. I saw the other day in bush-like trees in the open ground weighed down with the quantity of fruit [We can confirm this. Ens.] Grapes never were more abundant bushes in the open borders, vines trained to walls, some under ground vinerias, and in houses where they are planted in the borders of vineyards under glass, all are full of fruit the latter are coming into bloom, these pyramidal vines will one day be popular. I may add that those trained under the roofs in cool vinerias are also showing abundance of fruit. Peaches and Nectarines may be reckoned a total failure. Trees trained to walls in the open air and protected by lights placed against them, and those on the same wall protected with the new-invented glass screens, and those on the same wall unprotected for an experiment, all are bare of fruit. Peaches and Nectarines in unheated orchard-houses are, with few exceptions, as bare of fruit as those on walls; the exceptions here are tall standard trees in pots standing with the Apricots I have mentioned, and some three or four dozen of dwarf bushes in pots which were placed in gentle heat in January, they are full of fruit, which is now ripening. My oldest tree, some 15 years old, and which never before failed to be fruitful. It appears to me that the dull moist weather in March, gaged the pollen to the anthers, so that a soaking tree when it was full of beautiful blossoms, no dust, as usual, flew off, the stigmas were therefore not properly impregnated, the fruit appeared to fall freely, and after a scoring attempt to swell dropped off. Still there are some strange anomalies, as I observe some Peach and Nectarine trees, neither old nor young, and mostly seedlings, standing among those that are fruitless, that are loaded with fruit. Years on standard orchard trees, are for the most part an abundant crop. Williams' Bon Christian, Beurre de Capiaumont, and other hardy kinds, have set large quantities, the fruit is now swelling fast, still they are not yet safe for the old market garden saying occurs to me, that "Fruit is never safe till in the basket." The exception to crops of Pears on standard trees here is the total failure of Marie Louise, my trees are over 30 years old, and they are quite bare of fruit, but only enough, some standard trees of the same sort, double-grafted on trees on the Quince stock, are full of fruit. Pears on Quince stocks are this year a great triumph, bushes and pyramids are for the most part set thick with fruit; cordons near the ground have not done so well. The most gratifying sight I have seen since 1865 is a plantation of I have Bonne Pears, 5000 in number, trees are from 5 to 25 years old, the former planted 3 feet apart, the latter about 6 feet. The old trees set such immense quantities of fruit that we have been compelled to cut off with a sharp knife millions of fruit, and still there are ten times more than we can suffer to remain. The little trees, some only 3 or 4 feet in height, were, like the old ones, masses of blossoms, a most beautiful sight; these, lacking age and strength, have set only moderate quantities, but they are charming objects. Plums are, with some exceptions, a good crop, the exceptions are the Green Gage, Jefferson, and all the Damsons, which, although very twig was full of blossoms, are a total failure. The Diamond Plums—or, to use a Borough Market phrase, the "Black Diamonds"—blossomed abundantly, and set immense quantities of fruit, which has now dropped off, leaving but a "sprinkle." Victoria set the varieties of Greengage Reine Claude de Burg and Oulin's Golden Gage, are bearing fine crops, but the most satisfactory of all Plums in this district is the Early Prolific, the trees of which, many hundreds in number, from 5 to 20 years old, are full of beautiful fruit swelling fast, and apparently quite safe. Prince Englebert (Engelbert of the Dutch property) a great bearer, has partially failed this year, as has the Belgian Purple, a most prolific sort. Plums of all kinds in orchard-houses have set large quantities of fruit, they are now placed out-of-doors and are well-plunged. Cherries in my Cherry-house are most abundant, and the early kinds, such as Gage's Early Prolific and Early Purple Gage are dead ripe, many other kinds are also fully coloured, and approaching to ripeness the house is full of beauty. *Thos. Rivers.* Would any of your correspondents kindly inform me what are the prospects of the Peach and Nectarine crop in orchard-houses this season without the benefit of a failure, owing, I believe, to the cold damp, sunny weather when the trees were in bloom. If and of a winter for it in any other way, as the trees are doing remarkably well. A. H. E. A general complaint.

The St Petersburg Exhibition.—One point on which dissatisfaction seems invariably to arise in the international exhibitions is the arrangements with the railway companies. The managers of the exhibition are naturally anxious to obtain some reduction of the fares for their expected visitors, and of the freight of the plants which they write to be sent to the exhibition, and these have been agreed to by the railway companies, and announced to the public, but when they come to be acted on, it is found that the privilege is so fenced in with stipulations, so encumbered with formalities, so hampered with trouble, that without going the length of charging the railway companies with intentionally breaking the law, the public (a charge which has been made by many of the victims), the practical result is that the exhibitor or visitor has not profited

to the extent promised him, and on the basis of which, it may be, that he undertook the... or sent his plants. It was so in Belgium. I... I was there denied the return privilege on... way back, and to secure it by representation or... insurance would have involved a delay and expense... Something of the same sort took... in Holland, and now again it has been repeated... Peterburg and that in spite of a payment having... made by the exhibition for the conces-... in spite of the special protection and favour... of S. Rogonow, the Minister in charge of the... department in Russia, who, by an arbitrary... of his power, which would probably be... nowhere else, redressed such complaints... under his personal cognisance. It is plain... these experiences that the present system of... with railways for a reduction of prices does not... and I think most people will agree with me, it... would be better that it should be altogether... unless it can be put on some better footing... no insuperable obstacle in the way of doing... The present evils arise chiefly from the arrange-... almost always of an exceptional nature, they... generally a matter of favour. The managers... in their official capacity have no knowledge... favour for horticultural exhibitions. Their... title is, not to promote horticulture, but rail-... roads, and they have no right to sacrifice a... of the interests they might make for any extraneous... however praiseworthy. If they can be con-... that, by reducing the fares or freights, they... an additional source of temporary revenue... may reduce them or if by offering them (as I... was done at St. Petersburg) a money payment... reduction, they may make it. The first, the... traffic brought for a week or two by a horti-... exhibition, is too brief and too trifling to have... weight. The second is the right way, but it will... work so long as the concession is arranged as an... arrangement, for which special instructions... to be given to all the railway officials on all the... lines. It is these special arrangements that... mischief. Before they can be completed, and... properly instructed, the travellers or goods... in the absence of instructions of course... are charged, and the mischief is done. To... work as properly the concession must be... a shape that will not require any new... or the issuing of any fresh instructions to... clerks and guards. Most, we suppose all... companies, have already sufficient machinery... operation (at all events in the summer... which the demands of an international or... exhibition could be easily adjusted. The... excursion tickets or books supply it ready... by previous arrangement the excursions could... suit the routes required by the exhibition, they... of these tickets could be supplied to... at so much per head "on sale or return."... would impose on the managers of the exhibition... of retailing these tickets to their members... at such prices as they might fix—perhaps... prices to the different kinds of members, exhibitors, members, &c. The trouble... not be great, however. Circulars require to... at any rate, and a paragraph adding that... is wanted at the reduced rate, the price... be remitted in advance, would only entail a second... One very great advantage of this plan would... be the routes allowed by the excursion, all the... interesting places in the neighbourhood might be... the journey going and coming might be... and the opportunity might lead many to... for the sake of the cheap excursion and the exhibi-... together, who would not have come for either by... such an arrangement, of course, would not... to the conveyance of plants, and it is not easy to... any general plan could be adopted with regard... On the whole I would suggest that, instead... with the railway companies, the exhibi-... should deal with the exhibitors themselves. Any... attempts at reduction of freight, drawback, or... to be given up, and rather let the exhibition... such a large allowance to the exhibitors, in pro-... of the cost of conveyance of their plants, as... would know. Sure am I that these draw-... and returns only lead to trouble, mystification, and... disappointment. There is another point in the... of these exhibitions wherein some improvement... possible. It is one of some delicacy, and which... with hesitation, and rather with the wish... what others think on the subject than to press... of my own. It will not be disputed that such... as these international exhibitions are, are some-... measure to its having been transplanted last autumn, and also to the great drought of last summer. *Picea nobilis*, 8 feet high, transplanted at the same time as *Webbiana*, has seven cones upon it. *J. Pearson, Range-more Gardens, Burton-on-Trent.*

Variiegated Elm.—I enclose two branches from a Chinese Elm 30 feet high. The green branch is the natural colour, which it produced till within the last five or six years. Now the entire tree is, with the exception of some young shoots from near the ground, variegated as in specimen enclosed. Can this change be accounted for? *H. H.* [We are sorry to have no other answer for you than "we do not know." Eds.]

Cyrtanthus McKenii.—This pretty bulbous plant was discovered at Port Natal, by Mr. Mark J. McKen, and was sent by him to Dr. Hooker, who has named it.

It is described as a semi-aquatic, and seems to be extremely free-flowering; nearly all the bulbs received in the spring of 1868, though very small, having flowered in the autumn. The stronger plants produce from 7 to 8 flowers on a scape. The plant requires to be cultivated like *Imantophyllum*, and, blooming late in autumn, and being very sweet-scented, like *Hyacinth*, it may be recommended to florists. *Haage & Schmidt, Erfurt* [A neat and interesting though not a showy plant, evidently growing and flowering freely. The flowers are white, and are represented of the natural size in the detached figure shown in the margin. Eds.]

Rhododendron Falconeri.—It may perhaps be interesting to some of your readers to know that this beautiful Sikkim Himalayan *Rhododendron* is flowering here in the open ground. It was raised by my employer about 20 years ago from seed which he received from the late Sir *W. Hooker*, and was planted out when very small, the plant is now 7 feet high, and the branches spread 19 feet in circumference. The flowers, which are of great substance, are creamy white, and average about 25 in the truss, of which there are 15 on the plant, its noble foliage and massive branches make it quite a conspicuous object. We have also *R. Dalhousiae* and *Edgeworthii* in flower, but they don't appear to be so hardy. *R. barbatum* has been gay all the winter with its compact brilliant scarlet trusses, and appears to be as hardy as *R. ponticum*; *R. Thomsoni* does remarkably well also, and has flowered profusely through the winter. *W. Johnstone, gr. to W. Shilton, Esq., Tremough House, Penryn.*

Roses.—I hear the *Roses* are in a sad condition in various quarters. Mildew, honeydew, Orange fungus, and black stains in the leaves are the chief causes of the complaints, to which I fear may be added Aphides. I have had to contend with all these foemen. The *Rose* trees here are however in very fair condition, and I hope to gratify "D" of Deal, who promises me a visit on June 22. I have cut out the Orange fungus, and killed the Aphides, the black stained leaves are removed, and now honeydew is very rife both here and elsewhere. To-day (June 7) I have two men employed to wash it off the leaves, and also to water the plants. There are two great errors with regard to honeydew. The first is, that it falls from the skies. If this were the case all trees would be affected alike, and the tops of trees more so than the base. The other error is, that because where honeydew is, insects congregate, the honeydew is occasioned by the insects. Sycamore trees, Hornbeam, and *Roses* are the most liable to it of any trees. It is nothing more than the viscous secretions of the tree after a long continuance of N.E. or E. winds and cold nights. It must be washed off before it is dried on the leaves, the pores of which it will stop. I write this hoping I may be in time to save some of the *Roses* of England. The trees may not die, but if they are seriously affected, they will do nothing more for you this year, and the same remark applies to Orange

fungus. Usually this last evil does not affect the trees observably till August. Once more you must cut it out and burn it! In a few days I will send an account of some of the *Roses* of the last two or three years. *Paul Verdier* is very beautiful here. *W. F. Radcliffe.*

Fruit Prospects in France.—I learn, from the "Revue Horticole," that not only in the centre or north of France new Almonds, Peaches, and Apricots have failed, but a letter from M. Glady of Bordeaux states that a like failure has occurred in the south and the south-west of France, for he says that in his visits to his neighbors he remarks the total absence of Almonds, Apricots, and even of Peaches, a few only of the two latter are to be found here and there in isolated places. Pears are, however, an abundant crop, as are Cherries and Plums, the former having set as many fruit as they showed flowers. Apples at the period when M. Glady wrote (May 5), gave great hopes of an abundant crop, and the Figs were showing, as in this country, a heavy fruit crop; and he adds, that Vines everywhere show such a quantity of bunches as to give hopes of a fabulous crop. It is curious to note the failure of Apricots and Peaches over such a large extent of Europe, and in a climate where, one would have thought a bright sun, so unlike our cloudy spring, would have insured a different result. *T. R.*

Myosotis dissitiflora.—In reply to several inquiries respecting the above, I say the original introducer of this lovely plant (see *Gardener's Chronicle*, pp. 599, 600, 1868), affords me space just to say that I have never found the least difficulty in its culture or propagation. As regards the former, Mr. Fish's directions, I dare say, will succeed very well; but the fact is, it is a plant for everybody, rich and poor alike, much more likely to be nursed and managed to death, than to die of neglect. No doubt it will thrive with moderately generous treatment. It loves a pure air, and an open situation with a free light soil, and if it has these it will thrive anywhere, in sun or in shade (I do not mean directly under the drip of trees) in our cottage gardens it luxuriates beautifully with very little culture. With respect to propagation, it proves in most situations to be a most abundant seeder, indeed so much so that for the last 12 years or more I have never thought it worth while to save seed, but destroy all the plants as soon as the beauty is on the decline, trusting to the numerous seedlings which are sure to spring up in the borders, as it sheds its early seed freely before the beauty is exhausted. As before remarked (*Gardener's Chronicle*, p. 600, 1868).—"It has become quite a weed in the gardens about here," and this from seed. I do know of one or two localities where it does not reproduce itself as abundantly. As regards the many failures spoken of I attribute most of them to the practice of propagating from cuttings, and that sometimes from unhealthy plants, and also endeavouring to save the old plants over after flowering—they are never so good as fresh from seed. That Mr. Fish's plant is identical with mine there can be no reasonable doubt. I sent up specimens from my garden for examination (which are alluded to at p. 600, 1868) about the same time as Mr. Fish, and believe I can trace his plant originally from my stock in a pretty direct line. I take the opportunity of correcting an error or misprint of one locality for it—instead of *Bogelberg* it should have been *Fogelberg* in your former notice. *Jas. Atkins, Painwick.*

Foreign Correspondence.

THE SPRING IN ALGERIA.—Since I wrote from Algiers, I have visited rapidly a considerable portion of Algeria, posting from seven in the morning until six in the evening. This is a favourable mode of progression, inasmuch as it not only gives time for a minute inspection of the main characteristics of the country, geological and botanical, but admits of a stoppage on the road whenever any feature of interest presents itself. The survey I have made may be divided into three sections. firstly, an expedition to the East, to Fort Napoleon, at the base of the granitic or primary mountains of Jurjura, the highest point of Mount Atlas, secondly, an excursion to the entrance of the Desert of Sahara at Teniel el Haad, and to one of the summits of Mount Atlas (5500 feet high), in the middle of the range, where it assumes the form of rocks of transition—mica-schist; thirdly, a journey from Milanah, at the base of this region, to Oran, through a limestone and tertiary range, corresponding to the cretaceous period, and to the Italian tertiary sandstones. Singularly enough, I could find no work on the geology of Algeria at Algiers or Oran, and the various French guide-books do not allude to such a science, nor do they give any account of the nature of the rocks or soils in the different regions they describe. I was told that the only work on the subject is an expensive report of a Government Commission, published in quarto, with map, issued by the School of Mines many years ago, but I could not get a copy. In the catalogues of books on Algeria, published by the various booksellers in Algiers and Paris, there was not the mention of even a pamphlet on the subject—a most singular fact, when we consider the bearing geological formations have on agriculture, and on the botanical aspects of a country. It would seem as if the study of, and the interest in, geology in France, even in its application to agriculture, were confined to the scientific men professionally connected with it. Having no authorities by me, what I state is thus entirely derived from my own observation. I believe, however, that I am right in dividing the Atlas range, from the province of Constantine to the frontiers of Morocco, into three sections. East, granite, Middle transition, mica-schist and sandstone, West, cretaceous, and it will be seen that vegetation follows strictly these geological divisions, as is everywhere the case.

I think it best to mention at once the deductions which I have drawn from this survey of the spring

70 feet from the stems of the Vines, beyond this distance the roots may take the chance. Indeed, if only one-half or a third of the above-named area has been at some time well prepared as a Vine-border, and the whole of the space, after it was found that the roots had taken possession of it, was kept sacred to their use by annually feeding them on the surface with some appropriate sustaining matter, such as half-rotted bones or the Vine manure alluded to in p. 388, if this space has been kept undisturbed, except by having the surface slightly stirred during the summer months to keep down weeds, and to prevent cracking during hot weather, large quantities of rootlets will be annually emitted from the base of the stem and the larger roots, and will in succession take possession of the space allotted, until the whole area becomes one complete mass of roots. A better instance of this cannot be found than at Ilarewood, near Leeds, where a noble Muscat Vine fills a house 60 feet by 20 feet, and annually produces between 400 and 500 bunches of Grapes, which for colour and flavour can scarcely be surpassed, as the fine samples cut from this remarkable Vine and exhibited before the Fruit Committee on the 19th of January last, abundantly proved.

As the cultivation of the Vine is to be one of the principal features of interest at Knowsley, I may be pardoned for wandering so far away from the subject which forms the heading of this paper. My only apology for doing so is my wish to throw in a small ray of light upon Vine growing, and the heating and surface cropping of Vine-borders, so much discussed of late in your pages. I purpose in my next to enumerate the various horticultural structures at Knowsley, stopping only to notice the most prominent and striking objects they contain. *J. Wills, F.R.H.S.*

Garden Operations.

(For the ensuing week)

PLANT HOUSES.

Ferns, both British and exotic, are now making active growth, and according to the way in which they are cared for, so will be the size and quality of individual fronds, and the beauty of the plants. We are very prone, in our anxiety to get fine plants, to coddle them far too much, especially during what should be a period of rest. Take, for instance, the delicate and fragile *Adiantums*, and I here allude especially to *A. cuneatum*, *A. macropodium*, and other kindred species, though few, if any, plants delight in a period of rest more than do these and similar kinds, how very seldom do we meet with specimens in a resting state, if such a period be insured, and the roots be healthy, not a tithe of the warmth, moisture, and forcing routine is necessary that is usually employed. Take, as an example, ordinary British Ferns, and see their robust growth, stimulated as it is by the very moderate amount of heat and moisture of our March and April. So robust a growth under a purely artificial regime is not possible. What a lesson is here indicated. In Fern growing, under artificial circumstances, very much depends on the manner in which they are potted. Few things delight in crude soils more than do Ferns, but it must be so afforded each plant that nothing whatever in the way of sudden matter comes near them. They delight in an open porous soil, as opposed to a close one of small grains, or adhesive texture. And yet they thrive well in soils containing an extraordinary amount of moisture. To secure these necessary conditions it will be requisite, first of all, to obtain and to maintain a perfectly constructed and an efficient drainage. Next, a soil so beaten, and hence divested of its more retentive earthy matter, that the now quickly decaying fibrous material chiefly, or alone remains. Porous crocks, broken up from the softest baked potsherds, portions of soft and moderately burnt red brick, and pieces of charcoal, moderate in size, should be freely mixed with the soil. The whole then should be pressed firmly down, and a portion of smaller particle or more retentive soil should be used for the final surfacing process, with a view to counteract too free evaporation during the drier periods of a summer season. In our treatment of Ferns we are too prone to scouse them too often "over head and ears" with water. This often causes the delicate young fronds of some of the more fragile-leaved varieties to damp or fog off. A nice moisture-laden atmosphere, of moderate warmth, and where no cold chilly draughts are permitted, is alone suited to all ordinary varieties. The old, but most lovely and neglected species, *Didymochloa truncatula*, and its fair ally, *D. pulcherrima*, will be found to thrive remarkably under such a treatment, as indeed will most others. Air, both by night and day, must now be admitted into greenhouses more and more plentifully, until, by a proper gradation, all the quantity possible be admitted without draught. Keep up a nice moisture in the atmosphere surrounding the plants, by damping down all cool surfaces as frequently as necessary. By placing some of the more hardy subjects in the most exposed situations, they may be hardened somewhat preparatory to being turned out. I am an advocate for partially depriving them of their accustomed supply of root moisture, for a week or so previous to turning them out. I consider that, by so doing, the leaf fibre becomes somewhat more hardy, and will the better withstand the very decided effects which attend on full and sudden exposure to light and air. I do not, however, advocate the plan to be carried to such an extent as to cause the plant to flag perceptibly, &c. An actual tax is easily levied on any well-nourished plant, without resorting to such a system of torture as this.

FORCING HOUSES.

Fires may be dispensed with in *Vineres*, the plants in which are now finally ripening their Grapes, except

in instances where haste in ripening is of the first importance. Under such conditions, however, the atmosphere must be kept dry. A good high range of temperature may be afforded by the sun's heat by day, with plenty of air. But the house should not be closed too suddenly or too early, or whilst bright sunshine penetrates directly into it, as it invariably causes moisture to rise in the form of vapour, and this condenses afterwards and settles freely on all around, and does in mischief if the night temperature be low. Those *Vineres* from which the fruit has all been used, should have a plentiful supply of air from this time. In regard to *Pines*, it is a practice followed by some growers at this hot drying period to place a fresh surfacing of tan upon the tan-pit into which the pots are plunged, this for a double purpose. It not only increases the warmth of the mass contained therein, but also, by being placed well up to the rims of the pots and occasionally over the whole ball, tends to keep the balls more moist, and to do away with very frequent waterings, &c. One word about *Melons* before I finish with this department for the present. If there be no decided and obvious change from dull sunless weather to a bright period by the time this appears, I must advise that less water than I have ordinarily suggested be afforded the roots. If the upper crust or soil upon which the vines rest be kept too constantly wet, the plants will not succeed thoroughly. Have resort therefore to tubes, which may be formed of moderate-sized drain tiles or bottomless garden pots, which when sunk in the soil will prove an easy means of affording bottom moisture to the roots without too frequently moistening the whole surface soil. Be particular, once the fruits are set, to elevate them upon some dry surface, in order to insure them against an excess of moisture, which will frequently cause them to rot off if they are permitted to lay in direct communication with the damp soil.

HARDY FLOWER GARDEN.

Those who make a practice of layering *Chrysanthemums* should now peg down the long shoots which have been formed, that they may turn their heads up preparatory to the proper layering process. *Tulips* may now be taken up out of the ground. Lay them carefully on to a cool moderately dry surface, that the fibres which remain attached to the bulbs may ripen off finally. Do not store or pack them away into a close place until this is thoroughly done. *Bedding plants*, which may have had a tolerably good shower of rain upon them, and the beds in which they are planted will now be very quickly benefited by having the surface soil carefully loosened with a hoe. It will be necessary afterwards in some instances to secure such plants as *Verbenas*, *Petunias*, &c., against the ill effects of wind waving, by pegging them down, or other similar means. Finish transplanting all early *Asters* and other similar tender annuals. *Polage plants*, adapted to outdoor work, may also be safely put out now. Where any of the newer varieties of *Clematis* are bedded out or made to furnish hoops &c. they will need constant care and attention in regard to pegging down tying them in, and so on. These are rather averse to any sort of restraint, and being very brittle, need care in the handling. *Roses* in small pots should be shifted into pots a size or two larger, and so be encouraged to make a good summer's growth. *Auriculars* should now receive a slight amount of shading when the sun is at the hottest, about midday, keep them scrupulously clean, and where necessary pot off choice seedlings. Remove all old seed-vessels from *Rhododendrons* immediately the flowers are over, and so aid the young shoot formations in making a good growth.

KITCHEN GARDEN.

The first showery weather should be taken advantage of to transplant out into permanent quarters different varieties of *Broccoli*, *Brussels Sprouts*, and successional batches of *Brussels Sprouts*, all of which will have grown freely, and thus become fitter for the operation during the past warm period. Those who neglect making free use of the hoe during bright weather, will hereafter find to their cost the additional and unnecessary labour which such negligence entails. *W. E.*

TOWN GARDENING.

CHRYSANTHEMUMS, both large-flowered and pompons, now require attention in the matter of staking and tying. The tall-growing sorts should receive this attention at once, unless they are required or preferred dwarf, in which case they should be laid down, but the tops of the shoots should not be taken off. The leading shoots of the Pompons should now be removed, and these, if stuck in the ground in a shady place, will readily make roots, and grow into dwarf bushy pot plants before autumn. Watering is now one of the most important operations in town gardening, and especially during dry weather, the water-pot should therefore be used freely. Instead of using the latter, a more effectual plan for large places is to have the water supplied by a water company to a plug, on which a hose can be attached, as by this means the trees can be readily and beneficially washed, and a good soaking given to the ground at convenience. *J. D.*

STATE OF THE WEATHER AT CHISWICK, During the last 43 years, for the ensuing Week ending June 19 1889.

June	Average Highest Temp.	Average Lowest Temp.	Mean Temp.	No of Years in which it Occurred	Greatest Quantity of Rain	Prevailing Winds.							
						N	NE	E	SE	S	SW	W	NW
Sunday	71.9	47.8	59.8	25	0.58 in	1	5	0	1	2	4	10	9
Mon.	72.8	47.9	60.3	19	0.68	1	8	7	1	7	12	9	8
Tue.	73.8	48.2	60.9	19	0.79	2	7	7	3	5	11	2	6
Wed.	73.8	48.3	60.4	14	1.16	4	5	8	1	10	7	8	3
Thurs	72.9	47.3	60.1	23	0.80	3	5	4	4	7	11	7	7
Friday	73.9	48.1	61.2	21	0.85	1	1	4	6	7	11	1	1
Satur	74.8	49.6	62.2	22	0.95	2	5	7	2	4	10	4	3

The highest temperature during the above period occurred on the 19th, 1846, therm. 83 deg., and the lowest on the 13th, 1850—therm. 30 deg.

STATE OF THE WEATHER AT CHISWICK, NEAR LONDON For the Week ending June 9, 1889, as observed at the Horticultural Gardens.

June	Moon's Age.	TEMPERATURE.						
		Barometer.			Of the Air.			Of the Earth.

Notices to Correspondents.

APPLE SHOOTS INFESTED WITH OIDIUM: A. J. The apple shoots are infested with an Oidium. The malady is common this year. You can either just the trees with sulphur or, what is better, cut all the affected shoots burning them immediately. *M. J. B.*

CALCEOLARIA ALBA FLORIBUNDA: Mrs. Calceolaria is a more or less liable to go off, canker and decay from the bedding-out time, and after as well, in some strange way the causes of which are as yet unknown. In some gardens of late years, they have become so fruitful of mushrooms and so uncertain in their lives, that their culture has almost been abandoned. More injury we believe is done them through over kindness than through neglect. Some varieties also—a particularly that under notice—appear tender in constitution, and are more liable to die than others.

CUCUMBER LEAFY SCALD: S. O. The blotches on the cucumber leaves and cotyledons are evidently scald, but the colour of the leaf sent there seems to be a very vigour, which is, perhaps, constitutional, about the base. Try a pinch of guano on the soil. This has sometimes a wonderful effect when plants are weak. *M. J. B.*

CUNNINGHAMIA MENZIESII: C. D. Undoubtedly the specimen you send from Bletton belongs to the species, as *C. Cunninghamii*.

DRAWING: A young *Passer*. Apply to James Richard Esq. Assistant Secretary, Royal Horticultural Society, 5, Kensington, W.

FERNERIES: W. F. In type.

GOOSEBERRY CATERPILLARS: A. B. One foot radius is quite sufficient for small bushes; larger sized ones, however, should be treated according to the surface area covered by the bush.

GRAPE BUNCHES BEHAVING BEFORE FLOWERING: A. D. Entirely owing to chilly and water resting on them combined with a lessness of temperature at one time and great excitement following. It is very frequent occurrence in late houses with little artificial heat, where the vines are growing vigorously, but more common than usual in season, which is remarkable for cold chilly nights. See answer to C. D., at p. 50.

HERBARIUM: Alpha. Get some coarse paper, lay the plants on a sheet, and arrange them as carefully as possible on a place half-a-dozen more sheets, then more plants at a distance of this half, nailed at a little distance from the sheet by means of a wire. I think you had the paper, as much the better. The pile completed in this way, place a heavy weight on the top. After a day or two remove the damp paper and put dry in its place. The frequency of changing depends on the succulence of the plants, on the state of the atmosphere, and other causes, which experience will teach. When dry the specimens may be carefully packed down with thin glass on to sheets of white paper of the size, and daily labelled and arranged. If brushed over with a solution of corrosive sublimate (poison) in methylated spirits insects will not attack the specimens.

INSECTS: Beta. Your insect is Oribyphidius. Shake the rods at night, placing a cloth under them, and a few nights you will destroy every individual. *M. J. B.*

JUDGING PEACHES: W. F. It is often impossible to determine positively which of the specimens shown in the indefinite class are most entitled to the award. Indefinite classes, which are a great annoyance to exhibitors and jurors, are generally determined by the custom of the neighbourhood, or the views of the market. If, as you put it, A shows 25 distinct equally good plants and B shows 60 plants, including 25 as good as A, and A's, the rest being duplicates and smaller plants, we see how, since B's collection is equal to A's and more, the judges can avoid picking B first as the best collection, unless, indeed, there are such specimens amongst his duplicates as may fairly be regarded as marks against him. This conclusion is in the case of the introduction into a schedule when there is to be competition for prizes. Had the schedule you quote from the collection of 15 distinct sorts, and the uncertainty had been avoided, and A's group would have been comparable with B's, because each must have stage more.

MIMULUS: W. F. A very interesting insect, I think, combining the white spotting of the olive and the rich coppery red of *M. cupreus*. Those which may be seen as much enlarged forms of pupae with prominent are particularly showy, and have most merit.

NAMES OF PLANTS: T. S. P. About Douglas's *M. B.* To make us pay postage, and name plants in the list, much crushed, but sufficient remains to make it possible to do that they are affected with the parasite *Ascomyces deformans*, which is very common on the almond trees. No remedy is known. *M. J. B.*

PEARS ATTACKED BY INSECTS: T. B. Your Pears are in the same state as some which were submitted to the Committee two or three weeks ago. The insects, undoubtedly Dipterous, and identification is promised, but has not at present been received. The flower was transmitted, but in no case can we undertake to name varieties.

SPOT ON PEACHES: Sigma. It is a sort of gumming which attacks fruits are more or less subject to, and is caused through a little unhealthy action of the roots, and possibly your soil is a little sourish—cool, and rather not at all in harmony with the temperature of the house.

STEPHANOTHYS: J. S. We advise you not to try experiments on the fruit. The plant belongs to a bad lot, as far as pests are concerned.

COMMUNICATING: R. F. J. D. G. — J. H. F. — J. S. T. — E. N. — A. J. C. M. H. — T. B. — H. H. — F. M. — W. A. P. — J. J. — I. A. — F. E. — J. A.

The Best Swede in Cultivation is Suttons' Champion.

SUTTONS' CHAMPION PURPLE-TOP SWEDE—
 Of course Champion, price 1s. per lb., much cheaper by the
 bush, carriage free. Lowest price per bushel on application.
 J. C. SUTTON & SONS, Seedsmen to the Queen, Reading, Berks.

The Royal Seedsmen.

J. C. Sutton & Sons
 Seed Growers

27, 28, and 29, HIGH BOLBORN, LONDON, W.C.

SEED FARMS:

JUPES HILL FARM, DEBHAM, ESSEX;
 GOD'S HOUSE FARM, ARLLEIGH, ESSEX,
 EAST HOUSE FARM, DEBHAM, ESSEX,
 THE SLEDD FARM, ST. ASYTH, ESSEX.

CARTER'S GRASS SEEDS,
 as supplied to H. M. G. MAJESTY the QUEEN, and H. R. H.
 the PRINCE OF WALES.

Finest quality, per acre, 2s. to 3s.

For full particulars see CARTER'S FARMER'S CALENDAR
 of 1869 (illustrated). Post free, 6d.; gratis to subscribers.

CARTER'S IMPERIAL HARDY SWEDE,
 The hardiest and best in cultivation. Price 1s. per lb.,
 cheaper per cwt.

EVIDENCE OF QUALITY

C. J. WARD, Esq., Standlands, writes:—"The Swede Turnips (from
 your seeds) were the best in the neighbourhood."

FRAN A. LARKE, Esq., Boxhead:—"Your Imperial Swede is the
 best I have ever seen in this locality."

H. BARROW, Esq., Wouda, says:—"The Swede Turnip (Carter's
 Swede) was very good, I shall certainly have more in the Spring."

CARTER'S PRIZE SWEDE AND TURNIP

	Per lb.	s.	d.
BALL'S WESTHURY SWEDE		0	10
HARTLEY'S SHORT-TOP SWEDE, a large mottled-top		1	0
CARTER'S CHAMPION HYBRID TURNIP, fine quality		1	0
CARTER'S DEVONSHIRE GREYSTONE TURNIP		1	0
CARTER'S EARLY NIMBLE or SIX-WEEK, a very		1	0
quick-growing variety		0	10
POMERANIAN WHITE GLOBE, a handsome variety		0	10
IMPERIAL GREEN GLOBE, a heavy cropper		0	9
LINCOLNSHIRE RED GLOBE (very hardy)		0	10

Cheaper per cwt. or bushel.

For full descriptions of CARTER'S Prize Stocks of Mangel,
 Turnips, Grasses, and other Farm Seeds, harvested on their own
 Seed Farms, see "Carter's Illustrated Farmer's Calendar for 1869."
 Post free, 6d. gratis to pure users.

JAMES CARTER & Co., 27, 28, & 29, High Bolborn, London, W.C.

Wheeler's Imperial Swede.

WHEELERS' IMPERIAL SWEDE—Purple top, very
 hardy, very nutritive, large, handsome, and heavy. 1s. per
 lb., 4s. per bushel. Carriage free excepting small parcels under 20s.
 in value. Five per cent. discount for cash. For five consecutive
 years our Wheeler's Imperial has taken the 1st Prizes—open to all
 England—at the Gloucestershire Root and Grub Society, as the best
 Swede in cultivation. It is a sort especially to be recommended
 for 3 lb. per acre.
 J. C. WHEELER & SONS, Seed Growers, Gloucester, and 150, Mark
 Lane, London, E.C.

Improvement of Grass Lands.

SUTTONS' RENOVATING MIXTURE
 of the GRASSES and CLOVERS
 sown 1 1/2 months after the Hay is carried.

From 6 to 12 lbs. of seed required per acre
 Price 6d. per lb. net per cwt., carriage free

This is the best Mixture to improve the
 quality and yield of Grass, and for
 Pastures destitute of bottom swardage is
 invaluable.

The Agricultural Gazette.

SATURDAY, JUNE 12, 1869.

MEETINGS FOR THE ENSUING WEEK

June 15—Hants and Berks Agricultural at Reading.
 — 16—Essex Agricultural at Colchester.
 — 16—Thorne Agricultural at Thorne, Doncaster.

THE history of every branch of scientific know-
 ledge is marked by an identity of character. Its
 early investigators have always wandered into
 error; for the ray of truth which first enlight-
 ened the mind, instead of being prized as an
 individual principle, has generally been too
 hastily made the foundation-stone of a theory.
 In this manner the original truth has almost
 invariably become intermixed with a mass of
 confused and incorrect ideas, and subsequently,
 when the theory has been rejected because
 proved to be fallacious, we find the truth and
 the error treated with equal contempt. Thus
 has many a truth been hidden for centuries after
 its original discovery. It need not, therefore,
 be a matter of surprise that the science of agri-
 culture should have the same difficulties to
 encounter. There is reason to hope that those
 who are now engaged in promoting it will learn
 wisdom from the past to guide them for the
 future.

It is for this reason that recent scientific in-
 vestigators have avoided in a great measure the
 formation of agricultural theories. Their primary
 object has been to prove, by careful observation,
 certain fixed principles, and from these we learn
 the laws which govern animal and vegetable life.
 As these truths become established and recog-
 nised, the sphere of inquiry widens, and thus
 the discovery of one truth prepares the way for
 its successors. Those who have promoted our
 sciences have been patient and diligent
 searchers after truth—persons who have accumu-
 lated facts, and from the evidence of facts have
 deduced the laws which had been in operation.
 When a number of these laws are discovered
 it is quite possible we may be able to form an

opinion of their combined action, but this can
 never be done with any degree of safety until we
 are fully acquainted with all the primary laws
 which are in operation, and even then caution
 should characterise our proceedings.

It is by no means uncommon to hear of science
 being placed in opposition to practice. Science
 cannot contradict practice; theory may do so,
 and if it be incorrect it must of necessity do so.
 What is science? It is knowledge. A know-
 ledge of the facts of Nature can never be opposed
 to the effects produced by her laws. The
 farmer carries out the tillage of the land, and all
 his operations come under the influence of the
 laws of Nature, and it is these laws which deter-
 mine the result. Hence a knowledge of these
 laws can never oppose the experience of practical
 men; or, in other words, science cannot con-
 tradict practice. If, however, from want of full
 information, we form an imperfect or incorrect
 theory, the experience of practice must prove it
 to be wrong.

The agriculturist in his daily operations is, as
 it were, asking questions of Nature, and she
 replies to them by the measure of success or
 failure which attends his proceedings. If he be
 an observant man he gains after a series of years
 a certain amount of experience, containing much
 truth, intermixed with more or less error.
 Hence we see the folly of those sweeping
 censures which have been passed upon the
 practice of entire districts. Long established
 local customs are always entitled to respect, and
 an entire disregard of them produces failure. It
 is true that in many instances there is much
 that is worthless intermixed with the true prin-
 ciple which is concealed within, and he who would
 improve the farming of any district, whilst he
 may winnow away the chaff from local customs,
 must be sure that in doing so he does not lose the
 corn which is amongst it. As, however, the
 value of all experience must depend upon the
 observer's judgment in connecting effects with
 their causes, so it is evident that he whose mind
 is prepared for its task by a knowledge of the
 laws of Nature, combined with that systematic
 arrangement of his ideas which only a good educa-
 tion can impart, will draw the most correct con-
 clusions, and his experience will give truth in a
 purer form than the observations of another
 destitute of these advantages.

There are few, if any, of the great causes of
 modern times which have not been damaged to
 a greater extent by the indiscretion of their advoca-
 tes than by the opposition of their opponents.
 Amongst these the cause of agricultural improve-
 ment forms no exception. How frequently have
 the failures of theoretical men been brought
 forward as an argument against the advantage of
 science to the farmer. It must, however, be
 admitted that in many instances these results did
 not arise so much from the modified practice
 being incorrect as from the incompetency of
 those carrying them out; they being destitute of
 that practical knowledge, without which even
 approved operations could not succeed. For
 several years past there has been a steady in-
 crease in the number of farmers who possess, not
 only a practical acquaintance with the cultivation
 of the soil, but a knowledge of science which
 enables them to take advantage of improvements
 which are introduced. The time has now come
 when the numbers of such men must be largely
 increased, and the progressive movement which
 has taken place amongst other classes of society
 will spread with equal rapidity throughout the
 agricultural body. "Onward" is the motto of
 the day, and those who mean to maintain an
 honourable position must not content themselves
 by pointing at the failures of others, but rather
 profit by their experience. In ancient times
 seamen were afraid to lose sight of the shore, and
 hence their voyages were long and circuitous;
 but when the mariner's compass came to their
 aid, they soon began to make their voyages in a
 more direct line. This sometimes brought them
 upon "sand banks and hidden rocks," which
 caused loss and decay, but as these became
 known they were recorded on charts as warning
 for other. Science is the farmer's magnetic
 needle, it will lead him to attain the results he
 has in view by a more direct and economical
 course of procedure. The early adventurers
 will, without doubt, sometimes find "sands and
 rocks" in their career, but let them be marked and
 recorded, so that others may derive advantage
 therefrom. Thus even our failures will become
 valuable to ourselves and others, if we gather from
 them the lessons they are calculated to yield.

The duties of the agriculturist bring him in

contact with the operations of Nature, and their agencies are not only beyond his control, but he is subservient to them. It is beyond his power to alter their mode of action according to his will, but it is quite possible for him, by a knowledge of their nature to modify his own operations, so as to enlist their aid, instead of combating with their opposition. If, therefore, the arts of life have been advanced by the aid of science, even where the influence of Nature is less felt, may we not hope for still greater advantages from its more complete association with agriculture. The advantages of a knowledge of chemistry and mechanics are known and appreciated in all the manufactures of the land, and under their aid results have been gained which would appear incredible, did not our every day observation render us so familiar with them that we lose sight of their magnitude. Take as a single instance, that marvel of science, the steam engine. By this agency we produce in England a power far greater than the combined strength of every human being in the world, and yet it represents a force completely under control. Then, again, we see how this power may be multiplied by the aid of machinery, for in some of our factories one man is by this assistance enabled to do as much as 200 or 300 men could do without its aid, and we cannot fail to be struck with wonder at those sciences which enable man to increase his power to such an extraordinary degree, and which has given mind such control over matter.

An art may reach a high state of perfection without any knowledge of principles, but it will be reached slowly, laboriously, and with a vast expenditure of time and money. The application of scientific principles to an art, by indicating the causes of failure and success, and by pointing to new and shorter methods of arriving at the same results, will rapidly raise it to a position which only ages could give it, without such assistance. Indeed, it is a well-known fact that the arts have made more progress during the last century than they ever did before, and this doubtless arises from the sciences being better known and more usefully applied. Agriculture itself yields strong evidence upon this subject. The practice of agriculture, which the Romans introduced into this country 1800 years since was very similar, and in some respects it was superior, to that adopted in some large districts of England a century ago. It is therefore satisfactory to know that the co-operation of men of science has in no small degree contributed to the fact, that more progress has been made in the art of agriculture within the last 50 years, than during the preceding 1800 years.

It is, however, singular that there has generally been great reluctance on the part of those engaged in the arts of life to accept the assistance which science is ever ready to give. Any feeling of this kind which may have existed amongst the agriculturists of this country is now rapidly disappearing, and they are, as a body, preparing themselves for further improvements, which cannot fail to be beneficial. Many are the improvements which have been brought to a high degree of perfection during the last ten years, and operations are now economically performed by machinery which were at that time looked upon as mere speculations. A cordial desire for co-operation exists between men of science and the agricultural community generally, which will without doubt be productive of good results. It is no new principle that knowledge is power. It is as much so to the agriculturist as to any other person. That man who has a reason for all he does must of necessity be in a better position than another who adopts a certain course of procedure as a mere matter of routine. If a person tutors his mind not to do anything without seeking a reason for the same, he will carry out the same habit of thought in watching the plans adopted by others and thus he will extract sweets from many a flower, and store his mind with many truths of Nature which will be valuable to himself and others in after times. The education of the rising generation of farmers should be such as will train their minds to habits of thought and reflection, and if to this is added a knowledge of the sciences they will be put in a position to judge for themselves upon all they see around them, and gather from the book of Nature that instruction which will be of the greatest practical benefit. Nor will this be the only beneficial result, it will make them not only more successful agriculturists but better denizens of the world, for as they ascend the hill of knowledge they will attain higher and purer

views of the work of Nature; and, seeing every arrangement so complete for promoting the happiness and well-being of man, they will become more humble in their own estimation; and goodwill to those around them will characterize all their actions.

[And from all this we infer that the Royal Agricultural Society of England will be acting in direct contravention of all the purposes for which it has been constituted, if, abandoning its efforts for the promotion of professional and scientific education among farmers, it shall divert its education grant to other less important purposes.]

— At Mark Lane the Corn Market has again relapsed into the previous rates, the hot days and the warm nights of the latter part of last week having greatly improved the appearance of both Wheat and spring-sown crops. On Monday the decline was about 2s per quarter, and this fall has been followed throughout the provinces. — Feeding stuffs are much easier now that an abundance of Grass is general. Foreign Beans are obtainable at 30s per quarter, Oats at from 21s to 28s, Linseed cakes at 10s to 12s per ton, according to quality, and Maize at about 28s for 480 lb.

— At the Metropolitan Cattle Market previous high prices brought a large supply of beasts, and prices gave way 4d. a stone on Monday, but a more proportionate supply on Thursday caused a rally to 4s 10d per stone for animals of the first quality. Sheep on Monday were worth 6s 8d, and on Thursday 6s per stone. Lambs have been in excess of the demand, and they have generally been in very fine close-coated condition. Lambs are worth about 6s and calves 5s 1d, only per stone.

— During the meeting of the Bath and Southern Counties' Agricultural Society, held last week at Southampton, an address was given by Mr. W. G. SPOONER, in the Town Hall there, to the Hampshire Chamber of Agriculture, on the very important subject of cattle importation. The Contagious Diseases (Animals) (No. 2) Bill, as introduced by the Government and amended by committee, was described as follows:—It consists of 10 parts and 135 clauses. Part 1 is preliminary, part 2 relates to the local authorities, the inspectors, and officers, part 3 is devoted, with its 15 clauses, to foreign animals, and the rules by which their importation is to be regulated, part 4 refers to the discovery and prevention of disease, part 5 to the slaughter in cattle plague and compensation, part 6 relates to Orders in Council and local authorities, part 7 to the acquisition of land for the purposes of the Act; part 8 to expenses of local authorities, part 9 to offences and legal proceedings; part 10 to Scotland. There are also 10 schedules, which refer to the details by which the Act is carried out. The much-contested subject of the foreign market has resulted in this—that the Corporation are to have a period of three years to provide it, and on their doing so they are to be allowed to increase their charges in Islington market, but being to do so their present money over a radius of seven miles is to be taken away. Foreign cattle are to be allowed to go into Islington market, and to travel by railway, provided they come from countries that have been free from rinderpest for the space of three years, and are not countries of transit from places where the cattle plague has existed. Mr. SPOONER does not think, however, there is any particular magic in the number 3, he believes if it were altered to 1 or 2 it would be equally effectual. "Let us suppose," he says, "this was an exporting instead of an importing country, should we not think it rather hard that, because the rinderpest had existed here within three years, it was therefore to be considered as a suspected country, and subject to various restrictions, when we know that it has been long free from the disease? During a space of twenty-four years not one single diseased beast had ever been imported into Southampton; and would it be right, therefore, to destroy that portion of the trade of the port for a fancied evil, more particularly when scientific authority was directly opposed to it?"

Mr. HEDGER, the dockmaster, said the cattle trade of Southampton was very different from that carried on with London, Hull, and other ports. Those interested in the trade in Southampton sought only to improve what might be termed the natural trade of the port—the importation of fat cattle from Brittany, Normandy, France, Spain, and Portugal, where the disease was unknown. They were landed within a defined area, and under very careful inspection. If intended for the London market, they were loaded, after 12 hours' rest, in railway trucks, and conveyed direct to the metropolitan market, Copenhagen Fields. The ships which brought them over were all well ventilated, roomy, and clean. Cows were under very careful inspection, and under a heavy bond not to have been employed during the previous three months in any other cattle trade. In addition, too, to that bond by the shipowner, the master of the ship had to give a bond to the Customs at the port of landing that he had not called at any other port since he took the cattle on board. The railway trucks that conveyed the cattle to London were cleaned and disinfected after every trip. They could not leave the metropolitan market until they were cleaned and sprinkled with a disinfecting fluid. In the present year, up to May 31, 2718 oxen and 131 cows had been landed at Southampton, out of which 1309 oxen and 51 cows had been sent to the metropolitan market, and 1409 oxen and 77 cows had been taken in Southampton for local consumption. None had been placed in quarantine. — Mr. SPOONER regarded the restriction as to animals coming out of London alive as one of the best securities against the introduction and spread of the

rinderpest, far exceeding in importance the question of foreign cattle markets. He concluded by arriving at the points on which he believed they were agreed:—1st. That with reference to the two principal questions, the grand things to keep them out of the country. 2d. Whilst doing this effectually, we should accommodate our purpose with as little interference as possible with the freedom of trade and the supply of animal food for the people. 3d. That these purposes can be most effectively accomplished by limiting the importation of cattle to the metropolitan area, and to certain specified ports where suitable accommodation can be afforded, not only for the landing, but the housing of imported cattle, and retaining of them in quarantine for several days. 4th. On the indication of any infectious disease, the whole of the animals will, of course, have to be slaughtered on the spot, the place disinfected, and again used for a fortnight at least. 5th. During quarantine any of the animals should be allowed to be sold and slaughtered on the spot, and the remainder after the expiration of the quarantine, and should be submitted to a second examination, and then allowed to travel alive on the railway to the metropolitan market. 6th. No cattle or sheep should be allowed to leave London alive, except calves not exceeding a month in age. — Mr. BLYNDEN could not say with respect to the removal of live cattle from London. They knew very well that the rinderpest was disseminated in this country by the young calves that were allowed to go out of London. — Mr. SPOONER's resolution, with a few unimportant variations, was unanimously adopted.

— The Anniversary Banquet of the Royal Agricultural Benevolent Association was held last Wednesday evening. Lord ROBERT MONTAGU, in the course of his lordship announced the subscription list of the year as having amounted to 8889d. He was of opinion that the Council were wise in investing a considerable portion of their income, and not trusting too unreservedly to the permanence of benevolence. Mr. MARCH gave more according to those who have than to those who want. He added that there are 25000 farmers in Great Britain, and 12 from each would triple or quadruple the Society's income. Mr. MARCH defended the expenditure on the Society's operations. "You should print," he said, "advertisements in every county paper. You should advertise everywhere, and, notwithstanding the expense, you should hold meetings in every part of the country." Many large counties, Mr. MARCH told us, are hardly represented on the subscribers' lists. Even Yorkshire to its shame, is one of them. Mr. CANTRELL desired that no expense should be spared. He sent out the green book of the Society far and wide, every 6d. thus expended had brought him in a guinea. He thought the Society had now sufficient property hoarded, and that the pension list ought to be increased. The thanks of the Society were due to the Secretary, Mr. SHAW, who announced a subscription amounting to about 4000. — Mr. MARCH has sent a memorandum on the expenditure of the past year in connection with the management of the Royal Agricultural Benevolent Society. He says—

"I have made a minute investigation of the balance-sheet and find that the actual total expenditure for working the Institution is barely 12 1/2 per cent on its annual income—£1452:—

9	Salaries and wages	246
44	Books, stationary, and printing	24
14	Rent	2
14	Postages	2
14	Advertising, coals and gas	2
1	Excision and petty expenses	2

18 1/2
I trust that such a statement will be satisfactory to the subscribers. Collecting subscriptions from 1200 persons widely scattered is no easy task, and would be impossible but for the zealous and untiring aid of our honorary (unpaid) local secretaries, to whom we must all feel very much indebted."

— The Central Chamber of Agriculture held its June meeting at the Salisbury Hotel on Tuesday last. The business to be done consisted of four topics. The first was a report of the sub-committee on the subject of local taxation, which Sir MATTHEW LOPES, the chairman, read. In moving this report, Sir MATTHEW LOPES said he desired to impress upon every Chamber the importance of the question. And not only would he do this, but he called upon all local Chambers to subscribe to a special fund for the purpose of thoroughly ventilating this great question. Mr. WHITTAKER, of Worcestershire, seconded the adoption of the report, and in doing so urged the importance of further subscriptions by local Chambers. Mr. CLARKE explained in reply to Mr. WHITTAKER, and as a member of the North Cheshire Chamber that previous annual Chambers had been satisfactory with subscriptions because they had understood that a number of sentencers or missionaries were to be sent about the country for the purpose of agitating the public on this question. Sir MATTHEW LOPES explained the project referred to by the last speaker had been abandoned. The report was then unanimously adopted.

The second subject related to the Contagious Diseases (Animals) Bill. Mr. MANSFELD moved, and Mr. WILSON seconded, the following resolution—

"That this Chamber reaffirms its resolutions of April 1880 as to the present necessity for rendering the Contagious Diseases (Animals) (No. 2) Bill applicable to the whole of the kingdom, and calls attention to the importance of the measure of which Mr. CHAMBERLAIN has given notice should it be carried, the most determined opposition should be given to the Bill."

Upon this Mr. MYAT, of North Cheshire, wished to call the attention of the meeting to Lord Bessborough's

Caution to Gardeners. When you ask for **SAYNOR AND COOK'S WARRANTED PRIZE PRUNING and BUDDING KNIVES**, see that you get them. Observe the mark SAYNOR, and the Corporate Mark, Ours is WARRANTED, without which none are genuine. S. & C. regret having to caution Gardeners and others, but are compelled to do so, in consequence of an imitation of common quality, having been sold for the genuine one, and which has caused many complaints to be made to them of knives which were not of their make, all of which are warranted both by Sellers and Makers. S. & C.'S PRUNING and BUDDING KNIVES are the best and the cheapest in the market. Paxton Works, Sheffield. Established upwards of 125 years.

WOOL YARN—THATCHING CORD. **BROWN'S FLORAL SEEDS** Sold by Nurserymen and Seedsmen. No. 1 3 1/2 inches wide, 25 yards long, at 1/4 per yard. No. 2 3 1/2 " " " 20 " " " 1/4 per yard. No. 3 2 1/2 " " " 15 " " " 1/4 per yard. Samples on application to **CHARLES BROWN, 6, Collyer Quay, London, E.C.**

SHAW'S TIFFANY. For Shading Conservatories and Hot-houses, INDIA-RUBBER HOSE, SYRINGES, GARDEN ENGINES, LAWN MOWERS, &c., at The Garden Repository, 29, James Street, Covent Garden, W.C.

FOWLER'S PATENT STEAM PUMP and CULTIVATOR may be seen at work in the Agricultural County in England. For particulars apply to **JOHN FOWLER & CO., 1, Collyer Quay, E.C., and Steam Plough Works, Leeds.**

SHANKS'S PATENT LAWN MOWERS FOR 1869.

UNDER THE PATRONAGE

OF
**HER MOST GRACIOUS MAJESTY
THE QUEEN,**

AND MOST OF THE
PRINCIPAL NOBILITY
OF
GREAT BRITAIN,

SHANKS'S PATENT LAWN MOWERS

ARE ALL FITTED WITH
**PATENT DOUBLE-EDGED SOLE PLATES, WIND GUARDS, and
SELF-SHARPENING REVOLVING CUTTERS.**

Advantages possessed by no other Lawn Mowers.

The unprecedented Sale of **SHANKS'S LAWN MOWERS** for 1868 forms the convincing testimony of the value and success of the Improvements introduced last year.

HAND MACHINE.

PRICES—INCLUDING CARRIAGE TO ANY RAILWAY STATION OR SHIPPING PORT IN THE KINGDOM.

SHANKS'S NEW PATENT HAND MACHINE.

Machine Size	Price	Operated by
10-inch Machine	£3 10 0	Easily Worked By a Lady

30-inch Machine	15 15 0	30s. "

SHANKS'S NEW PATENT HORSE MACHINE.

Width of Cutter	Price	With Patent Delivering Apparatus
30-inch Machine	£19 0 0	30s. extra.
36-inch Machine	22 0 0	30s. "
42-inch Machine	26 0 0	40s. "
48-inch Machine	28 0 0	40s. "

Boots for Pony, 22s. per set, Ditto for Donkey, 19s. per set. Every Machine warranted to give ample satisfaction, and, if not approved of, can be at once returned without any expense to the buyer.

**ALEXANDER SHANKS AND SON, DENS IRON WORKS, ARBROATH; and
27, LEADENHALL STREET, LONDON, E.C.**

27, Leadenhall Street is the only place in London where intending purchasers of Lawn Mowers can choose from a Stock of from 150 to 200 Machines. All sizes kept there, whether for Horse, Pony, or Hand Power.

S. OWENS & CO., HYDRAULIC ENGINEERS, WHITEFRIARS STREET, LONDON, E.C.

THE IMPROVED SELF-ACTING HYDRAULIC RAM.

This useful Self-acting Apparatus, when works day and night without needing attention, will raise water to any height or distance, without cost for labour or motive power, where a few feet fall can be obtained, and is suited for supplying Public or Private Establishments, Farm buildings, Railway Stations, &c.

- No. 37. DEEP WELL PUMPS for Horse, Hand, Steam, or other Power
 - No. 38. PORTABLE IRRIGATORS with Double or Treble Barrels for Horse or Steam Power
 - No. 40. IMPROVED DOUBLE ACTION PUMPS on BARROW for Watering Gardens, &c.
 - No. 49a. GALVANIZED SWING WATER CARRIERS, for Garden use.
 - No. 50 and 54a. FARM and MANSION FIRE ENGINES of every description.
 - No. 38. PORTABLE LIQUID MANURE PUMPS, on Legs, with Flexible Suction.
 - No. 40. GARDEN ENGINES, of all sizes, in Oak or Galvanized Iron
 - No. 54b. THE CASSIOBURY FIRE EXTINGUISHER, as designed by Right Hon. the Earl of Essex.
 - No. 44. WROUGHT-IRON PORTABLE PUMPS of all sizes.
 - No. 4. CAST-IRON GARDEN, YARD, or STABLE PUMPS.
 - No. 39b. IMPROVED HOSE REELS for Coiling up Long Lengths of Hose for Garden use.
- S. OWENS AND CO. Manufacture and Erect every description of Hydraulic and General Engineers' Work for Mansions, Farms, &c., comprising PUMPS, FIRE ENGINES, WATER WHEELS, WARMING APPARATUS, BATHS, DRYING CLOSETS, GAS WORKS, Apparatus for LIQUID MANURE distribution, FIRE ENGINES, HYDRANTS, HOSE PIPES, &c., &c.
- Particulars taken in any part of the Country. Plans and Estimates furnished. ILLUSTRATED CATALOGUES CAN BE HAD ON APPLICATION.

Weeds Eradicated from Lawns.

WATSON'S LAWN SAND, sprinkled upon Lawns, readily destroys Dandelions, Clovers, Rag-grass, &c., and its fine particles promote the growth of Grass. 2s. per cwt.

May be obtained from any respectable Seedsman, or direct from Mr. WATSON, 7, East Parade, Leeds.

Gratis and Post Free on application.

MEREDITH'S VEGETABLE CIRCULARS of his VEGETABLE FEATHER, and PLANT MANURE. JOS. MEREDITH, The Vineyard, Garston, near Liverpool.

A Boon for Grape Growers.

MEREDITH'S VINE, PINE, PEACH, and PLANT MANURE. MEREDITH'S VINE, The Vineyard, Garston, near Liverpool. Having world-renowned proofs of his excellence in Vine and Grape growing, is now induced to offer to the horticultural world the above MANURE, to the ingredients of which are selected from the most valuable substances which have been used in the cultivation of Grapes in England, Scotland, Paris, &c., &c., and which has been found to be the most valuable aid to both practical and scientific grape growing, but good flavour and high quality of colour, and to plant the greatest help towards vigour and successful cultivation over met with. To be had in sealed bags of 100 lbs., 50 lbs., 25 lbs., 10 lbs., 5 lbs., 2 lbs., with full directions for use. For further particulars see Descriptive Circulars, which had post free on application as above.

The Best and Cheapest Vermin Killer.

"The Gardener's Magazine," conducted by Shirley Hibbard, Esq., F.R.H.S., of August 15, 1868.

MEMBER OF THE HON. BOARD OF CUSTOMS.

THE LONDON GROUND TOBACCO COMPANY, for the Destruction and Prevention of the Grubs and Blights to which the Gardeners are so much exposed by the use of Tobacco.

POWDER DISTRIBUTORS 2s. each. For further particulars see Descriptive Circulars, which had post free on application as above.

TOBACCO, MEALY BUG, &c. This is a very valuable and useful article, and is sold in sealed bags of 100 lbs., 50 lbs., 25 lbs., 10 lbs., 5 lbs., 2 lbs., with full directions for use. For further particulars see Descriptive Circulars, which had post free on application as above.

HER MAJESTY'S GARDENER USES FOWLER'S GARDENERS' INSECTICIDE. Invaluable to Nurserymen, Fruit and Vine Growers.

INSECTS, BLIGHTS, and MILDEWS. Invaluable to Nurserymen, Fruit and Vine Growers.

THE FOLLOWING ARE MOST IMPORTANT. Mr. J. B. Moore, Botanic Gardens, Chelsea, says: "We have used a very favourable opinion of Fowler's Insecticide as a remedy for many of the insect pests of plants. It effectually destroys the Green Fly, Thrips, Red Spider, and the Black Fly, at the same time it does not injure the plants."

30 inches	84 inches	19 10 0

These Rollers possess many advantages over all others; they are made in two parts, and are free to revolve on the axis, affording greater facility for turning, and the outer edges are rounded on, or turned inward, thus avoiding the unsightly marks left by other Rollers. They are manufactured of the best materials, and are got up in a manner surpassing any ever yet brought out. The Rollers 24 by 26 inches, 20 by 22 inches, and 16 by 17 inches, are also made in one part, at a reduced price, and, for Rollers of that size, will be found to answer many requirements, as the handle can be reversed to either side of the Roller at pleasure.

PRICES—24 in. by 26 in., £4; 20 in. by 22 in., £3 2s. 6d; 16 in. by 17 in., £2 10s.

GISHURST COMPOUND

Used by many of the leading Cultivators since 1850, for Red Spider, Meadow Thrip, Green Fly, and other Blight, a solution of from 1 to 2 ounces to the gallon of soft water, and of from 4 to 16 ounces as a Water Dressing for Vines and Fruit Trees, has outlived any preparations intended to supersede it.

Sole Retail by Seedsman, in boxes, 1s., 2s., and 4s. 6d.

Wholesale by PRICES PATENT CANDLE COMPANY (Limited), Rotherhithe, London, S.W.

Health of Horses, Stables, and Dog Kennels.

MASTERS OF HOUNDS

Find the greatest advantage in Filing the Floors of Stables and Kennels with

PERMONT SEYSSSEL ASPHALTE

Thirty years' experience of the durability of this material, has shown and in other parts of the world, its value.

A list of such and other works can be had on application to

J. F. A. BULL, Secretary, 6, Parliament Street, S.W.

CALCEOLARIAS, Bedding, in 12 varieties, including Sparkler, Amplexicaulis, Sultan, Beauty of Herts, Golden Mantle, King of Gardens, at 12s. per 100.

DALLIAS, in 50 choice varieties, at 25s. per 100.

GERANIUMS, Bear's-foot, Zonal, and Nosegay, at 15s. per 100, also Mrs. Longfield, Circle, Bicolor Splendens, Mrs. Milford, Beauty of Oulton, Golden Pheasant, Countess of Warwick, Mrs. Lennox, at 20s. per 100, Bunnet, Italia Unita, Kenilworth, Attraction, Golden Pheasant, Stella variegata, Mrs. Pollock, Gloire de Nancy (double), at 30s. per 100, Sophie Damareque and Triumph (double), at 6s. per dozen.

HELIOTROPES, AGERATUMS, SALVIAS, LOBELIA SPECIOSA, CINFRARIA MARITIMA, GAZANIA, ALYSSUM, VARIEGATA, C. PHEASANT, GYALHALIX LANATUM, NIEREMBERGIA GRACILIS, DAUTYLIS VARIEGATA, at 12s. 6d. per 100, **TROPEOLUM**, double yellow, **LOBELIA FULGENS**, and **SYMPHITICA**, at 3s. per dozen, Package of all the above free. Trade prices on application.

H. and R. STIRZAKER, Skerton Nurseries, Lancaster

Bedding Plants.

ARCHD. HENDERSON'S DESCRIPTIVE and PRICED CATALOGUE OF BEDDING PLANTS is now ready, containing all the novelties of the past two years. The Stock is in fine condition, for extent and vigour unsurpassed.

Purchasers are respectfully invited to inspect the Stock at Slon Nursery, Whitehorse Road, Croydon.

Special offers will be made for large quantities.

Catalogues to be had gratis, and post free on application.

Special Notices.

PRINCE OF WALES GERANIUM (TRICOLOR)

JAMES CARTER AND CO. regret their inability to supply more plants of the above splendid novelty this spring. A fresh stock will be ready for distribution in September, from which orders now received will be executed, in strict rotation.

LILIUM AURATUM.—James Carter & Co. invite an inspection of their fine collection of *Lilium auratum*. Upwards of 1000 plants now coming into bloom at the Nursery.

JAMES CARTER AND CO., 227, 228, & 231, High Holborn, London.

Zonal Pelargoniums.

FOUR THOUSAND ZONAL and NOSEGAY PELARGONIUMS, the new varieties of 1867, all the best ever. —Extra strong autumn-grown plants at 2s. per dozen 1s. 6d. per dozen, 4s. per 100.

The new **SILVER GOLDEN**, and **BONZE TRICOLOR** and **BICOLOR PELARGONIUMS** at very low rates. Also all other Plants for Bedding.

L. S. WOODTHORPE, Munro Nursery, Sible Hadfield, Essex.

DIPLADENIA AMÆNA.

J. W. WIMSETT

HAS GREAT PLEASURE IN ANNOUNCING THAT HE HAS PURCHASED THE WHOLE STOCK OF THE ABOVE BEAUTIFUL PLANT.

Raised by Mr. Tuke, of Bramley, near Leeds, who also raised the lovely *Dipladenia amabilis*. A Figure of the beautiful *D. amœna* is given in the "Florist" for April, 1868. Plants now ready for distribution.

Price 1½ Guinea each. Strong Half Specimens, 5 and 7 Guineas each.

ASHBURNHAM PARK NURSERY, KING'S ROAD, CHELSEA, S.W.

May 1. J. WILLS, F.R.H.S., Manager.

THE ROYAL SEEDSMEN.

GENERAL PLANT CATALOGUE, ILLUSTRATED WITH COLOURED DRAWINGS.

JAMES CARTER & CO.'S

NEW PLANT CATALOGUE IS NOW READY, and will be forwarded on application, ILLUSTRATED with FOUR COLOURED DRAWINGS of **TRICOLOR AND BICOLOR GERANIUMS,** AND CONTAINING FULL DESCRIPTIVE LISTS OF THE NOVELTIES FOR 1869.

ONE MILLION BEDDING AND OTHER PLANTS

Now ready for sending out, of which they invite inspection at their **CRYSTAL PALACE NURSERY, FOREST HILL, S.E.**

LANDSCAPE GARDENING AND ARCHITECTURE.

JAMES CARTER AND CO. having an experienced staff of qualified Men, will be happy to undertake the ALTERATION or IMPROVEMENT of GARDENS, DOMAINS, &c., and to furnish Estimates (after a personal inspection), with Plans or Coloured Plans, as may be desired.

CARTER'S TRICOLOR, BICOLOR, and DOUBLE-FLOWERING GERANIUMS received Five Prizes and Two Certificates at the Royal Horticultural Society's Show at South Kensington, May 22; Two First-Class Certificates at the Royal Botanic Society's Show, May 19 and 20, and Special Prize at the Crystal Palace Show, May 16, 1869.

New Tricolor Coleus, Beauty of Widmore, 5s. each.
Echeveria metallica, 1s. 6d. each; 12s. per dozen.

INDIA-RUBBER HOSE at Manufacturers' Prices. Sixty Feet, with fittings complete, 25s.

JAMES CARTER AND CO., SEED MERCHANTS and NURSERYMEN, 227 and 228, HIGH HOLBORN, LONDON, W.C.; and **CRYSTAL PALACE NURSERY, FOREST HILL, S.E.**

WILLIAM ROLLISSON & SONS

WE RESPECTFULLY TO INFORM THE NOBILITY, GENTRY, AND TRADE THAT THEIR **GENERAL CATALOGUE of PLANTS, SHRUBS, TREES, &c.,** EXTENDING OVER 150 PAGES OF LETTERPRESS, is now Published, and will be forwarded to all applicants on receipt of 8 Postage Stamps, and sent Gratis to Customers.

THE FOLLOWING FORM PART OF THE CONTENTS OF CATALOGUE.—

ACHIMENES	CARNATIONS, Tree or Winter Flowering.	GERANIUMS.	ORCHIDS.
AMARYLLIS	Summer Flowering.	GLOXINIAS.	PAEONIES, Herbaceous.
AMERICAN PLANTS	CYRILLANTHEMUMS	GESNERACEOUS PLANTS.	Tree.
AQUATIC, Stove.	CINFRARIAS	GREENHOUSE PLANTS.	PALMS.
Greenhouse	CLIMBERS, Stove.	HARDY HERBACEOUS and ALPINE PLANTS.	PELARGONIUMS
Hardy.	Greenhouse and Hardy.	SHRUBS, TREES, &c.	PENTSTEMONS.
AZUREA.	CONFESSE	LILIUMS.	PHLOX
AZALEAS, Indian.	ERICAS, Cape.	MISCELLANEOUS SOFT-WOODED PLANTS.	RHODODENDRONS, Hardy
Hardy	Hardy	NEW, or RARE PLANTS.	Stove Plants.
CAMELLIAS.	FUCHSIAS.		SUBTROPICAL PLANTS.
CANNAS.			

W. R. & SONS will also be happy to forward either of the following Catalogues on application.

CATALOGUE of FERNS, classified, comprising nearly every known species and variety. 70 Pages.

CATALOGUE of FRUITS, descriptive and classified, containing the most approved among the old varieties, together with all Novelties of sterling merit. 70 Pages.

CATALOGUE (Spring), containing a great number of very choice soft-wooded Novelties for 1869. 30 Pages.

CATALOGUE of IMPORTED DUTCH and other BULBS, with a very full and Descriptive List of Roses of all kinds added. 58 Pages.

CATALOGUE of CULINARY and FLORICULTURAL SEEDS, priced and classified. 60 Pages.

THE NURSERIES, TOOTING, LONDON, S.W.

Tricolor Pelargoniums.

J. WATSON, New Zealand Nursery, St. Albans, begs to leave to offer his two beautiful **TRICOLOR PELARGONIUMS**, **MISS WATSON** and **MRS. DIX**, unrivalled for freedom of growth and beauty of colouring, in good plants, 6s. each; also, **FRIGESS CLOTILDE**, 5s. each, or the three for 13s. 6d. Miss Watson and Mrs. Dix have received 17 First-class Certificates and First Prize from the leading Horticultural Societies of the Kingdom. Early orders solicited. A liberal allowance to the Trade. Price on application.

Vines for Planting in a Growing State.

JOSEPH MERRILL, the Vineyard, Garden, near Liverpool, has now ready for planting fine extra strong **YOUNG VINES**, with 3 to 4 feet of extra strong Wood at the season's growth. Intending planters of Vines will save a whole year, and prevent disappointment by planting between now and August next. Planting in a Growing State ensures success. Packed to travel any distance with safety.

DESCRIPTIVE CIRCULARS of MERRILL'S VINE MASTER free on application.

Special Offer to the Trade

OF NEW VERBENAS, 1869, and FUCHSIAS, COLEUS, &c., MR. **KNIGHT'S** Six splendid **NEW VERBENAS** for 6s., all gained First-class Certificates.

KEYNES' 12 New Varieties, 8s. **T. R. NEW'S 12 New Varieties, 12** Finest **FUCHSIAS** of 1868, strong plants, 9 to 12 inches, 12 varieties of **COLTUS**, extra strong, 20s. per 100.

ROSES, New and Old, every variety worth growing. For prices see **CATALOGUE.**

W. KNIGHT, Floral Nursery, Hammersmith.

New Verbenas and Golden Coleus.

WILLIAM BADMAN offers **NEW VERBENAS** of 1869, including Perry's, Eckford's, and Henderson's, in 10s. 6d. per dozen.

NEW GOLDEN COLEUS of 1869, in pots, 3s. per dozen.

Six finest **DOUBLE PELARGONIUMS**, including Madame Lamotte for 6s.

Twelve finest **ZONAL PELARGONIUMS**, including Lord Derby, **PELARGONIUM**, Crystal Palace Gem, 3s. per dozen. Package included. Terms cash.

Cemetery Nursery, Gravesend.

Hardy and other Bedding Plants.

ROBERT PARKER begs to offer the under-named, all of which can be supplied in strong, healthy plants.

No. 37—12 Cut Roses, Tea-scented, single blooms, distinct kinds (Amateurs only)—1st prize, £1, 2d, 10s.

No. 38—12 Cut Roses, of any other kinds, single blooms (Amateurs only)—1st prize, £1, 2d, 10s.

Schedules on application to the Honorary Secretary, or J. F. PERKINS, 2, Gold Street, Northampton.

July 19th to 24th, 1869.

THE ROYAL HORTICULTURAL SOCIETY'S GRAND EXHIBITION AT MANCHESTER.

ALL THE PRODUCTS OF AGRICULTURE AND ANIMALS... SILVER CUP... VALUE £21

Prizes to be adjudged according to the... for the several articles produced.

Table with 4 columns: Name of article, 6 marks, 3 marks, 1 mark. Lists various fruits and vegetables like Apples, Peas, French Beans, etc.

The Exhibition amongst Amateurs and Gardeners of private families. The Fruit and Vegetables produced must be of the Exhibitor's own growing.

The Gardeners' Chronicle. SATURDAY, JUNE 19, 1869.

THE BILL for the prevention of the ADULTERATION of SEEDS, to which we have already referred on more than one occasion, was read a second time on Wednesday last, with an understanding that certain clauses should be considered and modified, so as to make the Bill as certain in its operation as possible.

what instructions they have given, or are about to give, to their employes, we imagine Mr BRIGHT's question would be pretty well answered, if it be not already, by the highly interesting document read to the House of Commons by Mr WELBY, wherein, some opposition individual pleads of necessity, because his business is likely to be injuriously affected by the legislation in the question of the adulteration of seeds.

We are compelled to put these questions before the House, because the Bill of the Board of Trade has been already introduced by the representatives of the seed trade, and the Society of Gardeners, whose experiments and tests, though as well enough as far as they go, are nevertheless very defective as pieces of scientific evidence.

We have great pleasure in inserting the following communication from an excellent practical gardener, Mr WILLIAM EARLBY, and we trust that his appeal, on behalf of the aged and enfeebled members of his craft may meet with a satisfactory response both in the matter of fruit and of finance.

that co-operative principle which secures to the subscribers assistance in the time of need in consequence of the forethought and self-reliance exercised by them under previous more favourable circumstances. The Institution is deserving the support of all gardeners and lovers of horticulture.

We are indebted to Mr FORTUNE for the following account read at the last Friday meeting of the Royal Horticultural Society, of the beautiful and hardy species "Mora Japonica" nearly 100 years old.

M. FOURNIER has recently addressed to the French Academie des Sciences a communication respecting the FERNS of MEXICO. Of 605 species considered by M. FOURNIER as forming the Fern flora of Mexico, 178 only are peculiar to that country.

We are informed that the successor to Mr. BARNES at BICTON is Mr. BEGON, late of Castle Martyr, the seat of the lamented Earl of SHANNON, whose tree lore was as great or greater than that of any arboriculturist of the time.

The exact nature of the inflorescence and of the fruits and uses of CONIFERS is a fertile source of controversy. M. VAN TIEBDEM the latest writer on the subject, confirms Mr. BARNES'S views, that the ovules are really not enclosed within any ovary but are formed upon the dorsal surface of a leaf, borne by a branch that is axillary to the branch.

All the world loves a Rose, and the world grows them, some a great therefore of a rose, method of growing them will be sure to be acceptable. There is growing them in the garden of P. PRYOR, Esq., of Digwell, Wexford, which are under the able management of our excellent correspondent, Mr. WILLIAM EARLBY, a Rosarian of about 230 feet long.

standing the heavy showers of rain and hail of the preceding day, presented on Wednesday last a charming mass of bloom. The hedge was originally a row of half standards, of which the crimson Boursoult formed the mass, this row was afterwards trellised over with wire to the height of about 4 feet 6 inches, and 4 feet in width at the bottom. Many of the best of the old and well known sorts were planted in the space. They have all since been grown on what Mr. EARLEY aptly calls the "extension system." Plenty of wood is left in, and this is tied to the trellis, and all vacant spaces are filled by budding. The whole of the row is now completely covered with growth, and literally loaded with blooms in all stages of development. The following varieties, which form the principal mass, seem to be admirably adapted for the purpose.—Charles Lawson, fine flowers and a very free bloomer, Lord Raman, Comtesse de Chabrol, first rate Bant, No. 2, beautiful flower, very free bloomer de Dijon, profusely bloomed Jules Marechal, Grand General Jacquemont, Comtesse de Suseal, Cleopatra, Anna Alexoff, the last rate, the yield of all copper-colored varieties of the latter is very high, and last, though not least, the Manetti, now so much in favour as a stock, and which gives relief and variety to its more showy rivals. That this method of cultivation is a very successful one there can be no doubt, as the result of Mr. EARLEY'S skill amply proves this. As the trellising can be made to any height or width, the plan cannot be too strongly recommended for furnishing tall or dwarf edgings along the walks of either kitchen or flower gardens, or even to form back rows in ribbon borders, and there is no doubt it would succeed equally well on the outskirts of shrubberies, which sometimes present a very rough appearance near the ground.

To complete our account of the honours received by our countrymen at the late INTERNATIONAL HORTICULTURAL EXHIBITION at ST. PETERSBURG, we may say that in addition to the awards made to the Messrs. VEITCH, that have already been announced that firm also took the 1st prize, a gold medal, for three new Orchids, and two large silver medals, for a collection of seeds and an assortment of garden tools. Mr. W. HENDSPATH of Haltwistle, Northumberland, also received a gold and a silver medal, for a collection of ornamental garden pots. Mr. FORD, gardener at Leonardlee, Horsham, sent a splendid collection of Apples and Pears, which, had they not arrived too late, would no doubt have secured the 1st prize.

New Plants.

SARCANTHUS CHRYSOMELAS, sp. n.

Pellis lato loratis spicis inaequalibus; panicula scapula, bracteis triangulis ovaria pedicellata longe non sequentibus; sepalis oblongis, petalis subaequalibus; labelli laciniis lateralibus triangulis aristatis, arista ascendente, lacina media triangulari, lobis subaequalibus; calycis lobis subaequalibus; antheris brevibus; ovulis numerosis; stigma lobato; tubo staminis gracili basi pubescente.

In the way of *Sarcanthus paniculatus* and *racemifer*, with splendid foliage, and a large inflorescence of Saundersian flowers, yellowish, with the disc of the sepals and petals, blackish purple. *Sarcanthus paniculatus* has a trifid anterior lacinia to the lip. *S. racemifer* (*Saccobolium racemiferum*, Lindl., *Sarcanthus pallidus*, Lindl.) has a totally different column, another callus, and different side laciniae to the lip.

Sent by the indefatigable Colonel Benson, from Moulmein, to Messrs. Veitch, who kindly forwarded me a leaf and inflorescence. H. G. Rehb. f.

HOTHOUSE BOILERS.

WHEN a young man I was always anxious to see the processes of manufacture, as carried on in large establishments. In looking over the great Butterley Ironworks near Derby, I remember having been struck with the first reverberatory furnace I came to. Though I knew chemists considered the flame to be the hottest part of a fire, and though I was not ignorant of the effects of the blowpipe, I was still surprised to see the flame alone employed in melting iron. This was a lesson I never forgot.

Having 21 houses, some of them 100 feet long, and 24 to 30 feet wide, I have had a good deal of experience in heating, and have nine different kinds of boilers in use, but I have never been satisfied with any of them, for it has always appeared as if the makers had ignored the power of flame. As I had seen flame melt iron, I could not think it well employed when striking against a brick wall.

Of all the boilers invented, I think the tubular ones are the worst and the most expensive. No doubt the tubes in a locomotive boiler suggested the idea; but because fire carried through tubes surrounded by water is found to heat that water quickly, it does not at all follow that water contained in tubes which enclose a fire should be rapidly made hot. A boiler on this plan can be made of any size, and will hold any amount of fuel, and this I conceive is its only advantage. The flame must pass by and between but few of the tubes into the flue, and the heat will be to a great degree wasted. A tubular boiler must be surrounded by brickwork, and were it fed with small coal and slack, would be choked; it is, therefore, necessary in practice to use large coke, a most expensive fuel. Moreover it requires a very deep hole to stand in, and the Royal Horticultural Society has just paid 80*l.* for setting one. Such a boiler is dear at a gift. Then, again, each tube being caulked into a ring of metal at each end, the large number of joints is fed upon by the fire is sure to give rise to leakage in time, and the unequal expansion of the metal is likely to crack it. I have known so many tubular boilers recently taken out of use that

introduction is so recent, that even if it were a good form of boiler to heat water, and economical in fuel I should hesitate to use one. To put hard water into a hot-water apparatus at all is very bad policy, but it must very quickly destroy a tubular boiler. The water-way is so very small that any incrustation must soon fill it up, and it will in that case soon burn or crack, and I have never heard of any attempts to mend one when once damaged.

My last objection is common to nearly all boilers, namely, that they are necessarily surrounded by brickwork, which must become red hot, the return pipes must pass through such bricks before entering the boiler, and, unless special precautions are taken to prevent it, return currents will be set up, and the circulation will be impeded. These objections do not apply to some of the improved wrought-iron boilers, but wrought-iron boilers rust so rapidly, particularly when not at work that this circumstance alone is a very grave objection to their use.

Impressed with these ideas, I have for years been trying to induce Mr. Foster, who has my leases, to make me a boiler, and at last I have got into work one of which I append sketches. Fig. 1 shows the front of the boiler, the lower door being the ash-pit,

Fig. 1.

the middle door is the fireplace, and the large upper door is for cleaning out the soot. Fig. 2, is a side view, and also shows the back, against which the flame strikes

Fig. 2.

in the first instance, returning through the two holes seen in fig. 1, and again returning under the arched dome to the back of the boiler, and so into the flue or chimney. In fig. 2 is also shown the flow-pipe at the top, and two return pipes at the back, with three of the six bent connections uniting the different sections of the boiler. Fig. 3 shows the four sections

Fig. 3.

of which the boiler is composed. It quite equals my expectations, in fact I have seen nothing like it for quickly heating a large body of water. The boiler is 3 feet 9 inches in length, and as the fire never comes in contact with anything but iron backed by water, and traverses it three times from end to end, it must be most powerful. Supposing such a boiler to be badly used—slated up with lime-water for instance, and in time injured, being made in four sections, the sides next the fire-bars, which would be the parts sure to suffer, could be replaced at a small cost. No bricks are required above the fire-bars; and even if it be convenient to surround it with bricks, such bricks would only become warm, not hot. Every joint being outside, the boiler is safe from the action of fire. The only objection to mine at present is, that having only 800 feet of 4-inch pipe to work, it is too powerful. It is fed with slack and cobbles mixed, costing here about

6*s.* a ton, and yet the ash-pit door has almost always to be closed, and generally a heap of ashes is put against it to stop the draught. I believe if all my boilers were on the same plan, I should save half my coal bill. I hope Mr. Foster will soon advertise his invention, and make it known. Of its value I have no doubt. J. R. Pearson, Chilwell, Notts.

Home Correspondence.

Our Fruit Crops.—We have again arrived at that season of the year when we can form a tolerably correct estimate of our fruit crops. From all I have seen and heard the fruit crop in this part of Yorkshire is, on the whole, a satisfactory one, for though below the average it is very much better than was expected, considering that the crops of fruit of all kinds last year, with the exception of Black Currants, were very heavy. Owing, no doubt, to the hot wet or last summer, so favourable to the ripening of wood, especially on trees on strong soils, there was plenty of blossom on all kinds of fruit trees this spring, and though much, through being weak and imperfect, fell off without setting, especially from trees that were either heavily laden last year, or which suffered from the drought on light soils, a good deal of it set so that there is more fruit of all kinds than was looked for. Apricots are a very irregular crop, though, on the whole, I do not think it will be much below the average in some places thin, in others moderate, and in some instances heavy—even on the same wall they have set irregularly. On two trees here there was sufficient fruit set to make a fair crop for half-a-dozen trees. The trees came into blossom about the beginning of March. There was plenty of blossom, but it was weaker than usual, and much of it fell off without setting. Peaches and Nectarines are in some places a heavy crop, especially on trees on heavy soils, on trees on light soils they are thin—the tree has suffered much last summer from the drought. Here Peaches are a splendid crop, on most of the trees I have had to thin the fruit very freely, and more will have to be taken off yet. The trees were protected at night, what they were in flower but there was no frost to do them any injury, as I had they have set well in other places unprotected. Trees on light soils showed a good deal of blossom, but much of it was weak and imperfect, and fell off without setting. I believe there will be but an average crop, if not more, this season. Cherries are abundant and fine everywhere. Pears are a good crop in most places, both on walls and in the open ground: here there is a good crop. Some standard trees of Aston Town, Williams' Bon Chretien, Beurré d'Espérance, Beurré Diel, &c., are a beautiful sight, being laden with fruit. These trees I planted 18 years ago, and they have regularly borne crops for the last 12 or 13 years, and I believe that this year the crop is above the average. Apples will be rather below the average: here the crop is a fair one, and the fruit will be fine. Some trees are heavily laden, on others there is a fair sprinkling of fruit, and some old trees that bore heavy crops last year, have little or no fruit on them. Plums are a thin crop. There was plenty of blossom, but the fruit is small and weak, which was not caused through the weather, as it was fine and more favourable whilst the trees were in flower than it was last year, and the crop of last year was a very great one. Gooseberries in some places are a thin crop, especially the sorts that come into bloom early, late sorts are better, but the crop will be below an average. Currants are most abundant everywhere, also Raspberries, though they suffered much, especially on light soils, from the drought of last season. Strawberries will be an average crop. Some of the early sorts suffered greatly last summer from the drought, and the plants promised badly, but the fine rains we had during May brought them up wonderfully. Here old beds of Keen's Seedling and British Queen are rather thin but young plantations are so abundant as they were last year. From the foregoing review it will be seen that our fruit prospects this year, in this part of Yorkshire, are so far from being discouraging, very cheering and satisfactory and especially so when we consider the very heavy crops of all kinds of fruit we had last year, and further, when we consider how, owing to the heat and drought of last summer, and the mildness—the autumn and winter, everything was in a very forward state at the commencement of the season, and in consequence exposed to injury from the mildness of the weather. Some people attribute the failure of our fruit to our variable climate but it is wrong to do so. In some seasons, very severe spring frosts may do some injury to the blossoms, but it is very seldom indeed that the whole crop is thus destroyed. Through bad management trees are allowed to get full of wood, full of spurs, full of buds, and full of blossoms, and when there is a crop, it is so excessively heavy that the trees are exhausted in bringing it to maturity and bear only a year's rest to store up what is required for another crop. In orchards this is the case almost everywhere. A tree will attain a certain size and age, and when an attention is paid to pruning or thinning out either the wood or buds they seldom bear heavy crops of fruit two years consecutively. I am convinced, from long practical experience, that our much-abused climate is not the cause of the failure of our fruit crops. When the soil and locality is favourable for fruit growing good management will, in six seasons out of seven, secure favourable returns. Apricots, Peaches, and Nectarines can not be grown without walls, but on these, if properly managed and well protected whilst the trees are in flower, good crops can with great certainty be obtained six seasons out of seven. We occasionally have extraordinary seasons such as the one of 1870, when ripe wood cannot be obtained, and a failure to some extent is sure to follow, but these exceptional seasons only occur occasionally. From what I have seen in this part of the

Scientific Committee.—W. W. Saunders, Esq., F.R.S., in the chair. After the transaction of the formal business of the Committee, a letter was read from Mr. Deavin, gr at Porter's Park, Barnet, relating to some Peach leaves which were perforated with small holes. Shortly after the appearance of the holes gum oozes from the trunk, the leaves and most of the young fruits drop off, often the shoots die also. After this state of things has continued a short interval, and the tree has become where the gum has exuded copiously, and in a short time a shaggy-looking young wood, of which what fruit is left attains a large size. Mr. Berkeley considered the phenomenon thus described to be due to the effect of cold, as explained at former meetings of the Committee. Some specimens of Lime shoots from Mr. Woodford, East-wall Park, were exhibited, showing similar diseased conditions of the leaves (see p. 633). An interesting communication was read from Dr. Ferdinand von Müller, relating to the effect of frost on plants in the vicinity of Melbourne. No doubt this valuable contribution will be printed in full in the Journal of the Society hence we confine ourselves to the statement that on July 12, 1868, the thermometer recorded 37°.4 Fahr. in the air, and 24° on the grass, a degree of cold never before observed in the district. Plants of various kinds more or less affected by the frost, were appended.

The Chairman remarked that he had found the most convenient and efficient mode of protecting trees from frost was to thrust in among their branches masses of Fern or small evergreen boughs, the effect of which, in the effects of frost, was most remarkable.

Mr. Saunders gave some details as to the extraordinary fertility of some English white Oats, observed near Benares. One plant on good soil, and which had been well watered, measured 3 feet 6 inches in height, had 85 stalks, and bore 4180 grains. Other illustrations of a like character were given.

A letter from Mr. Penn, as to the "clubbing" of Potatoes, was read. The substance of this communication has been already given (p. 616). Mr. Penn further remarked that when the Ribston Pippin Apple was grafted on the Blenheim Orange, the flavour of the Ribston was much impaired, but at the same time its value as a culinary fruit.

Dr. Thomson exhibited specimens of Bladder Plums from a hedge in Northamptonshire. The fruit here presents none of its ordinary succulent character, the stone is not formed, and the ovule is more or less atrophied. Sometimes a second carpel is produced. The phenomenon in question is due to a parasitic Fungus, *Ascomyces deformans*. In India a particular form of the Bird Cherry is pretty constantly affected in this way, and the plant has in consequence received the name of *Cornus cornuta*. A species of *Rhus* was also stated to exhibit a similar deformity.

Mr. Moore exhibited a series of plants of various kinds of them of very uncommon occurrence. Some of the good illustrations of particular changes. They consisted of fasciated stem of *Carduus palustris*, from Dr. Moore of Gussowin, double flowers of Apple, looking more like Roses than Apples; the "calyx tube" was not developed so that the carpels were superior, and the petals increased in number and size. Flowers of *Epacris* from Mr. Pennington of Pennington, in which the petals were not its place supplied by a leafy shoot, which thus appeared to be prolonged through the flower; and regular cup-shaped flowers of *Digitalis purpurea*, arising from the fusion of several flowers into one—the axis in this case also was prolonged through the centre, and bore flower-buds.

Mr. Saunders exhibited specimens of a species of *W.*

Mr. or Trevor Clarke showed a specimen of *Palar-* growing in the garden. It was also stated, that a series of experiments as to the effect of manures on the growth of *Palar-* had been made by Messrs. Lawes and Gilbert having been made to provide the requisite manures for the purpose.

Mr. Saunders remarked that in most instances the superposition of various layers of cells, and the red pigment cells which were present in the epidermis were really bronze coloured, and not red.

The Chairman stated that the pink flowered *Crotalaria* was taken from a plant originally a seedling from a white flowered variety, and produced white flowers for several years. It had borne pink flowers, but never grown on well-matured and well-drained clay soil. These Oats produced short stout straw, and a great tendency to develop stolons from the base.

Some stems of *Crepis biennis* were shown which never grew in height, and never produced ears. No conclusion was come to as to the cause of this undesirable peculiarity, which was stated to appear in some seasons and be absent in others.

Some stems of *Crepis biennis* were shown which never grew in height, and never produced ears. No conclusion was come to as to the cause of this undesirable peculiarity, which was stated to appear in some seasons and be absent in others.

Floral Committee. A full and interesting report was made by the Floral Committee, which was a beautiful small-growing plant with slender stem, and close set leaves. Mr. Cripps, of Tunbridge Wells, exhibited a *Clematis* of the lanuginosa variety, and had larger outer or guard sepals, with a tuft of short petaloid bodies occupying the centre in the place of stamens. The inner sepals were violet-purple, the sepals marked with a

a handsome Rose, of the group of pillar or climbing perpe colour, full and symmetrical, and, from samples of the stems exhibited, evidently a free-growing variety. A handsome *Mitella*, probably *foetida*, or a finely-coloured variety of spectabilis, came from Mr. Findlay, Botanic Gardens, Manchester, this has bluish sepals and petals, and the lip marked with bars of deep red. *Adiantum eximium* Leyl, from Mr. Ley, nurseryman, Croydon, is a sport from *A. eximium multifidum*, and is remarkable for its short, close-tufted, and densely cristate habit. Messrs. Rollison & Sons, Tooting, in a very pretty group of flowering plants, showed the true *Epidendrum vitellinum majus*, under the name of *superbum*. *Phyllocactus violaceus*, a cross between *speciosissimus* and *Ackermani*, came from Messrs. F & T Smith, it is a dwarf, free blooming sort, with three winged stems, and large crimson flowers, shot with purple in the

p. 638. A very handsome Ivy-leaved *Pelargonium*, named Gem of the Season, came from Mr. Ford, gr Leonardslace, near Horsham. It has large and abundant salmon-pink blossoms, show the lobed form of the leaves, and are, some green, some with dark green centres, and some almost gold. Mr. Ford must be congratulated on obtaining this plant, which is one of the valuable acquisitions of the year, and was awarded a

Amongst the other subjects brought forward was a curious semi-double *Rhododendron* named Fra Diavolo, from Mr. Noble, a whitish flower with coppery blotch and petaloid filaments; Mr. Noble also sent the beautiful *Spiraea palmata*. A seedling Rose named Earl of Eldon came from Mr. H. Coppin Shirley, Croydon, it was a cross between Cloth of Gold and Gloire de Dijon, and was of a creamy buff tinted with rose, but had the defect of "quartering." Messrs. Veitch & Sons sent an interesting collection of plants, which receive Special Certificate, as did also Messrs. Rollison's collection.

Roses from Mr. Turner and Messrs. Veitch. In a group from Mr. Williams was a noble plant of the *Amalia Sieboldi aureo-marginata*, a fine variety, quite distinct from the common variegated form, *Thrinax grandis*, and *Pandanus glaucophyllus*, with the base of the leaves covered with white powder. Messrs. E. G. Henderson & Son, Wellington Road Nursery, exhibited several grey-leaved plants recommended for bedding purposes, namely, *Gnaphalium tomentosum* and *Achyrocline Sandersoni*, both of compact shrub habit, the latter with something the aspect of a Lavender bush, and with the leaves clothed with a greyish down, and *Cineraria acanthifolia*, with oblong incise-lobes apparently of a neater habit than *C. maritima*. With these were some Golden Variegated Zonal *Pelargoniums* with such unwieldy names as Pleasures of Memory, Love me Long, &c. From Messrs. J. & C. Lee came *Pelargonium Golden Brilliantissimum*, a habit, with yellow-edged leaves, and numerous but small, on coloured flowers. Another collection of Mr. Foster's seedling *Pelargoniums* was staged by

included flower named Admiration, having pink lower petal-veined with and having slight blotches of rose dark blot-

dark slightly runs, and outer edge of pink and a Second dark top petals, very free flowering, the flowers small, but somewhat rough. The others were Rebecca, pink lower petals, slightly veined with rose dark blotch on top petals, with broad margin of pink and edge of pink a pleasing flower, and a third, violet-pink lower petals,

overlaid with dark rosy pink, white tips, with narrow edge of Plantagenet, soft pink, with broad margin of fiery orange, and broad outer edge of pink, a pleasing soft flower, free blooming, and good habit. Flower of the Day lilac-pink lower petals with veins of rose; dark blotch on top petals, with broad margin of pale fiery carmine, and edged with pink; Florence, violet-carmine lower petals, with slight dark veins, dark blotch on top petals, with broad margin of fiery orange, and of pink good habit.

ter, pale pink lower petals, with slight pencillings of

ne instead, the former splendidly coloured, these also are

exhibited a very

ry zone, and golden edges, were well defined; of circular shape and growth—quite a contrast with new kinds staged at the same time, the leaves

of which were so rough as to have the appearance troubled horticultural sea on a small scale. There was a very interesting competition for the special prize on this occasion. The lat prize for the best six double-flowering zonal *Pelargoniums* was taken by Messrs. Gordon & Co., who had

Lemon, white, Pâleur, and

andish & Co. Holo de Nancy, Wilhelm specimens, but not fully in with Victor Lem Inc

For

Mr. Turner who

Mr. James Smith, Bath, was taken by Mr. James, with large specimens Messrs. Dobson & Son, of

plants in was taken by Mr. Wero, of Tottenham, the who had the *Oenothera marginata*, *Silene al* *matronalis purpurea* *alopecurades*, *D* *ans*, *Funckia albo*

market—transferred from the charge of a copy-
 right who are themselves, it seems, helplessly
 liable to be cheated, to that of the farmer who in
 each locality may not take the precautions of the
 wants of a known list of clients and customers
 with whom arrangements had been made during
 the previous season.

Mr. MORRISON'S plan of 'co-operation' is a
 very good one, and in many respects is based upon
 this course. We hope, however, to see with
 Mr. WILKINSON'S Seed Bill, which is supported
 by Mr. G. S. HARRIS M.P., who we have met
 the case which he described. There is a
 marked difference, he said, between the
 case of adulterating seeds and other things—
 feeding stuffs for instance. The farmer
 knows his oilcake is not all louseed, but
 adulterated with bran; that his nitrate of
 soda is mixed with salt, and his ground bones
 with oyster shells, but little harm results in
 these cases beyond that of short measure. The
 case of adulterated seeds is different. In the
 case of a crop may rain a small crop. The rogues
 which exposes, especially the small farmer, to
 such risks as this, is certainly a proper subject
 for vigorous legislation.

If 'catch' or 'snatch' crops did not interfere
 with the main crop of roots, stock farmers would
 no doubt find two green crops instead of one,
 within the year, exceedingly convenient. But
 in this country the climate is slow and inter-
 mittent, spring is cold and variable, and summer is
 generally a long time coming. A farmer who
 grows intermediate crops is often disappointed
 sometimes cold or drought in May starts his
 Trifolium, and it never gets high enough to har-
 row—as it happened last year, or not in at
 weather and a backward spring delay the crop,
 which is consequently being fed off when the
 land ought to be ploughed, and in good order for
 the roots that are to follow. The 'snatch' crop
 itself, though often useful, seldom produces more
 than a fifth the weight of a good crop of Swedes,
 and it is the latter which is the crop which
 is the mainstay of the farmer's system, the
 main crop of roots, the main crop of stock.

It is a pity that the 'snatch' crop has
 been so generally abandoned, and that the
 long run one good crop pays better than two bad
 ones. But the truth is the practice is only
 suited to the warmest, earliest land. In Surrey,
 that southern county, which derives its name
 from being near the south and the sun, we have
 seen it succeed under energetic, clever manage-
 ment, but this was on the warm land of the
 'greenstead,' where the sheep farms are very
 favourably situated for the intermediate forage
 crop, because harvest is early, and the crops
 ready to fold 10 days sooner than in the eastern
 counties—and the root crops may be sown later.
 No precise formula can be laid down for the
 successful management of these crops—it is not a
 lesson that can be learned by rote. The com-
 mon rotation in the district is the four-course,
 the intermediate crops—Trifolium, Tares, Rye,
 Mustard, stubble Turnips, and early Peas—
 are not grown on any formal system. The
 maximum of the Surrey farmers who cultivate the
 sands and loams of Godalming, Bramley, Albury,
 or Abinger, seems to be to keep on sowing
 which they do with a thorough know-
 ledge of all details, and a shrewd calculation
 of what the crops will do in the various seasons. In
 the case of Mangel a foreign crop is sown inter-
 posed through the eye is considerably taken. It is
 the greatest advantage of the four-course system
 and it is at the end of March or May I have
 seen it as high as the hedges, and at that season
 grows starchy and worthless. Italian Rye-grass,
 sown in the spring with Trefal for bottom
 feed, follows immediately after. Trifolium
 blossoms about the third week in May, it is
 useful before Tares, the earliest of which come
 on by about May 20, but food better than either
 of these affords precedes them, for making ewes
 and their young lambs. Turnip-tops and Rape
 are ready to fold before Rye, and generally fit
 to blossom and become worthless between the
 middle of April and the end of May. These two
 crops are by far the most useful for early food,
 and as the autumn-formed bulbs are stored in
 the nutriment which helps to form greens in
 spring, they are less dependent on the soil,
 consequently, we find Turnip-tops and Rape as a
 spring provision for making ewes on almost all
 sheep farms, and even in backward districts on
 soils where Rye and Italian Rye-grass yield but

little food. They are the common spring crops
 on the sheep farms of Cambridgeshire, Hamp-
 shire, &c., and on chalk soils elsewhere which
 are too cold for the other early crops referred to.
 Another forage crop preferred to Rye on the
 colder soils, and following Turnip-tops, is winter
 Barley, after which Trefal and mixtures sown
 in the spring carry on the stock together with
 successive crops of spring Tares. Constant
 shifting of the flock among these several green
 crops, with care, brings the south and west
 county lands to the natural level in the spring
 condition.

'Snatch' crops which have been used to are of
 little service for this reason. Mustard which is
 fit for feeding in eight weeks is little grown,
 because, though a good preparation for Wheat, it
 lasts but a fortnight, and is gone by the time the
 sheep are accustomed to it. Fresh food some-
 times does mischief, we remember a farmer
 defending Mustard from the charge of being but
 poor diet, by declaring that three of his ewes
 had died of it during the week.

On warm soils forage grows fast and so do
 weeds, and in bad harvests we have seen the inter-
 mediate crops fail through the fouling of the
 land, but this was not the fault of the system.
 The following is a record of the number of crops
 grown in a single rotation in one of the parishes
 named above—the seasons were unusually favour-
 able and the crops successful—

- 1864. Wheat sown in the ploughed land at 150 with Rye.
- 1865. Italian Rye-grass, Turnip-tops, and three ploughings.
- 1866. Canadian Oats, at table ploughed once and sown with Turnips.
- 1867. Rye, at table ploughed once and sown with Rye.
- 1868. Wheat, at table ploughed once and sown with Rye.
- 1869. Swedes, Turnips, after one ploughing.

The most certain cause of mischief to the next
 crop arises from the dry harsh state of the land
 when ploughed Swedes are off a lot after Trifolium
 through evaporation. The immense leaf
 surface exhausting the soil, fits in moisture. Tares
 have a similar defect from the same cause, and on
 the heavier soils especially, this crop when fed by
 sheep leaves the land in a state which if
 not restored by the next crop, will be a
 serious loss to the farmer. The system of
 intermediate crops, and the way in which
 the land is restored, is a very important
 feature of the system, and one which is
 not generally understood.

We need not point out the gain in time and
 the other advantages derived from having the
 land in high condition; nowhere has this been
 more striking than at the sewage-farm at
 Barking, where a heavy crop of Rye is
 cut so early that the after-crop is never
 injured by the want of moisture in the soil.
 Practically the system of intermediate crops
 is unsuitable to any but warm early soils, and
 even then only to a part of the fallow break;
 it is entirely unsuited to cold soils. If the agri-
 cultural statistics were collected in January
 instead of June it would be found that the area
 covered by these crops, even in the south of
 England, is not considerable.

At Mark Lane the Wheat trade has recovered
 the fall of last week, the boisterous weather, accom-
 panied with heavy rains and hailstorms, having caused
 some speculative purchases. Other grain and feeding
 stuffs remain unchanged.—A short supply of prime
 British stock has kept both beef and mutton as high
 as 60 per stone, but large numbers of coarse and thin
 fore-quarter animals keep the lowest quotations at 30 and
 40 per stone.—In the seed trade there is but little doing.

On Tuesday last we were riding over high lands
 in the Craven district of the West Riding, through
 some of the most fertile and best of the north and north-
 west hills, and the soil was of a very rich rather than
 of a poor quality, and the soil was very fertile, and
 the weather very dry, and the water of the river of
 the valley of the Craven was very low, and the great
 loss was suffered in the county during the Tuesday
 last. Sheep clipping is going on in the uplands of the
 northern counties, always attended with more or less
 danger, and the northern escarpments of the wolds
 feel the full force of Tuesday's gale, and it is on these
 hills that the great loss has occurred, fat sheep and
 ewes are dying from the cold and exposure. Sheep
 clipped on Tuesday were turned out into the rain and
 cold to be found dead under the hedges next morning.
 The losses from sheep are very heavy, and have been more
 severe than farmers will admit, the farmer alone having
 sent a load of 17 dead sheep to the manure works. In
 some other cases the starved sheep have been housed,
 but many will die.

A conference, called by the local authorities of
 Salford, and attended by the members of Parliament
 for 14 boroughs and the members of Chester and Lan-
 caster, was held at the Westminster Palace Hotel, the
 other day under the presidency of Mr. Cawley, for
 the purpose of considering the provisions of the Con-
 taminated Diseases (Amendment) No. 2 Bill. One of the
 features of the Bill most strongly objected to was that
 it re-enacted those provisions which exempt towns
 having quarter sessions from the county rating-

Discussion of the Seed Adulteration Bill,
 which a report is given on another page, is a
 good illustration of the conservatism and
 of official personages, even when the
 represented by a man of such vigorous
 as Mr. BELSHAM. The difficulties
 the ready advantages of legislation for the
 of an acknowledged evil, were never
 ably stated by an advocate of the
 old time than they were the other

perceptible extent. Nitrate of soda is the best of all dry manures that I have tried to subdue Moss and increase the verdure. I have also found that nitrate of soda in combination with earth, will improve a Mossy sward to a degree that requires to be seen to be fairly satisfied. By the application of manure it is easy for the grass to grow in a sward, but without the aid of a sward, the grass will not grow. I have also found that where charred earth is applied to the surface of the sward, the grass will grow more luxuriantly. I have also found that where charred earth is applied to the surface of the sward, the grass will grow more luxuriantly. I have also found that where charred earth is applied to the surface of the sward, the grass will grow more luxuriantly.

acquainted with soils and the nature of Grasses, must be evident that Grasses, by their growth, gradually exhaust the soil of its most nutrient parts and that these are replaced by the addition of materials of a lasting nature, and which favours the growth of the Grasses. Manure, therefore, is an extreme of after-effects, but the Grasses, however, are unable to do so; they must be re- complete solution before this can be effected. Manures, therefore, can act only by furnishing solid or gaseous matters, capable of being dissolved by water, for such substances as pass off into the atmosphere are soon dissolved and lost.

All my experience and observations lead me to recommend frequent top-dressing, and a chief part earth, to sustain Grass and prevent Moss growing.

Regarding surface manuring on permanent pastures, I would beg to call the attention of the Club to a series of experiments I have been carrying on at the home park of Killybeggs, Co. Londonderry, the results of which are detailed in the report of Mr. James Lawes, and in the report of the Horticultural Society, London, in the year 1851. I have also published a paper on the subject in the Gardeners' Chronicle, and in the Gardeners' Magazine, London, in the year 1851. I have also published a paper on the subject in the Gardeners' Chronicle, and in the Gardeners' Magazine, London, in the year 1851.

the plants on which complex mineral manure is applied—consisting of salts of potash, soda, magnesia, and sulphate and phosphate. The results of these experiments are detailed in the report of Mr. James Lawes, and in the report of the Horticultural Society, London, in the year 1851. I have also published a paper on the subject in the Gardeners' Chronicle, and in the Gardeners' Magazine, London, in the year 1851.

genous manures, the herbage yielded from 70 to 80 per cent of the whole produce; and in the case of the true Grasses, the herbage yielded from 70 to 80 per cent of the whole produce; and in the case of the true Grasses, the herbage yielded from 70 to 80 per cent of the whole produce.

On the other plots it was found that salts of potash and phosphate increased the growth of Clover and greatly increased the weight of leguminous plants.

In calling attention to these invaluable experiments at Killybeggs Park I would beg to say that some of the gentlemen connected with the Killybeggs Farmers' Club will take up the subject and take it to the meadows around Killybeggs, and will be very glad to have the pleasure of consulting a benefactor who has been so kind as to give me the use of his meadows for the purpose of these experiments at any rate I hope the members will be most anxious as a farmers' club we heartily appreciate the valuable service done to agriculture by these experiments by Messrs. Lawes and Gilbert.

The last point I have to consider is the removal of Moss from a pasture when it has taken root on the surface to a considerable depth. The breaking up of such pasture to remedy the evil of Moss is a matter within the scope of this paper, and I will not refer to that plan of improvement.

From what has already been stated regarding the natural character of Mosses, it will be inferred that it is not difficult to destroy Moss for a season when practically gone about, but in eradicating Moss we must aim at more than the mere killing of Moss. It is required to produce a good sward of mixed herbage. In treating land overgrown with Moss I have seen nothing so effectual and so magic-like as the application of a dry time in the month of March, and the rapidity with which the Moss is destroyed. I have also seen the effect of eradicating Moss by the application of a dry time in the month of March, and the rapidity with which the Moss is destroyed.

Quick-lime is often used to destroy the growth of Mosses, but before applying caustic lime the surface should be well broken up by bush harrowing, and this should be completed by top-dressing and sowing Grass seeds on poor land, or where it is inclined to damp when I, there is perhaps no Grass so suitable for this purpose as the rough Cocksfoot Grass, from which as here advised, I have seen splendid results.

Until agriculturists cease to sow what is termed

pastures to the highest standard. I have also seen the effect of eradicating Moss by the application of a dry time in the month of March, and the rapidity with which the Moss is destroyed.

You are all, I am sure, familiar with the superior quality of the herbage produced on a well-managed pasture. I have also seen the effect of eradicating Moss by the application of a dry time in the month of March, and the rapidity with which the Moss is destroyed.

THE SEED ADULTERATION BILL.

The following is an abridgement of the discussion on this Bill, which was read a second time in the House of Commons on Wednesday last.

Mr. MURPHY stated at some length the facts which rendered necessary. The farmer of an arable farm was dependent upon purchased seed, particularly of the sort of which he was most likely to be imposed upon, and of which he had the least knowledge. Constantly in the habit of buying seed, he was in the habit of observing it in the state of its growth, the farmer became a good judge of its quality. It was a pity that the farmer was not more generally so, and that he was almost entirely at the mercy of seedsmen; and this was true of the small farmer very much more than of the large farmer. The farmer of an arable farm was dependent upon purchased seed, particularly of the sort of which he was most likely to be imposed upon, and of which he had the least knowledge.

one-third of the seed sold to farmers was worthless and this was shown indirectly by the fact that a farmer usually sows one-third less of seed which was of his own growth. The farmer of an arable farm was dependent upon purchased seed, particularly of the sort of which he was most likely to be imposed upon, and of which he had the least knowledge.

which were by no means true. The practices were the killing of inferior sorts of seeds, and the doctoring and colouring of the better sorts, simply on the principle that "a good seed is no tale," in order that they might be mixed with the other seeds, and the doctoring and colouring of the better sorts. The practices constituted a separate and distinct trade. He believed that the Bill was well known and recognised in the House of Commons.

advantage on the public. Any change must be compound of universal application and that made the Bill. The farmer of an arable farm was dependent upon purchased seed, particularly of the sort of which he was most likely to be imposed upon, and of which he had the least knowledge.

Mr. COLLINS hoped the Bill would be read a second time. The farmer of an arable farm was dependent upon purchased seed, particularly of the sort of which he was most likely to be imposed upon, and of which he had the least knowledge.

Mr. SHAW LEVEYRE said it was impossible to deny that the evils the hon. member hoped to put an end to were of a very serious character, demanding a lowering of the standard. The farmer of an arable farm was dependent upon purchased seed, particularly of the sort of which he was most likely to be imposed upon, and of which he had the least knowledge.

Mr. HEAD hoped the Bill would be read a second time and would be passed. The farmer of an arable farm was dependent upon purchased seed, particularly of the sort of which he was most likely to be imposed upon, and of which he had the least knowledge.

There was a marked difference between sowing seeds and other things, food, &c. The farmer knew his mistake was not made with bran, that his mistake was not made with bran, that his mistake was not made with bran.

but little harm resulted beyond that of short measure of adulterated seed was different, it might even ruin a small man. With reference to the practice of adulterating seed, the farmer knew his mistake was not made with bran, that his mistake was not made with bran, that his mistake was not made with bran.

which it prevailed, but he doubted whether the remedy it, because of the difficulty of proof. Would it prove that any killed seed had been heated? The farmer of an arable farm was dependent upon purchased seed, particularly of the sort of which he was most likely to be imposed upon, and of which he had the least knowledge.

his best to find a means of overcoming it. Mr. MURPHY said they had some experience to throw light on this question in connection with the Food Act, which they all knew had been passed. The farmer of an arable farm was dependent upon purchased seed, particularly of the sort of which he was most likely to be imposed upon, and of which he had the least knowledge.

would not prove a failure. Then it was a question of the evil. It related only to the purposes of adulteration and the farmer of an arable farm was dependent upon purchased seed, particularly of the sort of which he was most likely to be imposed upon, and of which he had the least knowledge.

much more than he did about this subject, he had informed him a certain farm was than that of another, and that it varied from one to another. The farmer of an arable farm was dependent upon purchased seed, particularly of the sort of which he was most likely to be imposed upon, and of which he had the least knowledge.

no longer in his possession, as him to tell whether the failure in by some peculiarities of the soil. The farmer of an arable farm was dependent upon purchased seed, particularly of the sort of which he was most likely to be imposed upon, and of which he had the least knowledge.

days, to see whether they would on a trial made upon 100 seeds that be good and productive. The simple method mentioned gave these results—25 seeds per acre on the fourth, 18 on the fifth, and 3 on the seventh; making a total of 46 seeds per acre.

unsatisfactory not only to the tradesman. One gentleman wrote to him sued a farmer for 19s., a small debt of the kind and the farmer retaliated by bringing an action with having sold 14l worth of Swedish Turnips. The farmer of an arable farm was dependent upon purchased seed, particularly of the sort of which he was most likely to be imposed upon, and of which he had the least knowledge.

88l., the farmer claimed 100l. damages, which he said was rather more than a half in which the seed was killed in a field. The farmer of an arable farm was dependent upon purchased seed, particularly of the sort of which he was most likely to be imposed upon, and of which he had the least knowledge.

seven years old age to seeds it would be a great advantage to the farmer of an arable farm was dependent upon purchased seed, particularly of the sort of which he was most likely to be imposed upon, and of which he had the least knowledge.

19, 1869.]

the Strand. No one would deny that they were
 They and their predecessors had been in the
 the 200 years, and what they said was this, that one
 did not get a good crop and another almost a failure from
 bulk of seed, it would be, therefore, an intolerable
 that a man should go before a magistrate and say
 had sent him adulterated seed, and throw upon
 of making out their case, which it would be
 seeing that the seed might have come from
 gone through a dozen hands. The result
 could, he hoped, do something. The delay
 would not be very long, and some were very
 that there should be no legislation on the matter
 was not maturely considered. He hoped, therefore, if
 was read a second time—and he should not oppose it
 would be referred to a Select Committee.

He said he was glad, notwithstanding the strong speech
 the President of the Board of Trade had made against
 that he was prepared to support the second reading,
 the ability which the right hon. gentleman had shown
 the measure were applied to improving it, he had
 but they might pass the Bill this session without
 of those affected by it. The right hon.
 had mentioned the different circumstances which
 affect the reproductive character of the seeds, and
 out the difficulties which might arise if all persons
 which did not germinate were liable to a
 process. But this is a most professional and
 failure of which

in which the vendors had no control. The same
 seeds "knowingly" destroyed or coloured, and
 the objections of the right hon. gentleman, though
 plausible, did not really apply to the particular
 of the Bill. He had no doubt that under the third
 would be very little difficulty in looking up the
 to set up for carrying on this fraudulent trade.

He said he was aware of the great difficulties with
 question was surrounded, and it had often struck
 through one of those magnificent
 in agricultural exhibitions how it came to pass that
 of adulteration did not prevail to a much greater
 Any one who walked down through the long rows of
 various kinds of seed displayed in these exhibitions,
 an extremely practised eye to be able to distinguish

Summer Prospects.—In the absence of any
 agricultural statistics of "our summer
 it devolves upon individual observation and
 conductors of the agricultural Press, to
 the best information they can collect of the
 and judgment of those in whom they have
 upon a subject of such high importance
 Agricultural Gazette has hitherto stood promi-
 before the public in obtaining and diffusing
 most valuable information, and as an old contri-
 I venture to give my views upon the present
 prospects. The winter was one of the driest
 ever known, consequently the crops of
 and winter Beans tided through it without
 to any extent, nor did they become "winter
 become too forward in growth. The
 of our country crops passed the winter ordeal
 in a satisfactory state. Farm stock, too,
 well through the winter. The cost was
 to the summer's drought destroying the
 crops, but the casualties were kept at a minimum
 very few exceptions. We then commenced the
 with a good plant of corn and an unusual and
 increased show of farm stock, more particularly
 stock. This was owing to the smaller number
 graziers were enabled to fatten in the winter,
 to wait the summer grazing. The spring sow-
 ing has been all-gather satisfactory. The
 of Peas progress remarkably well,
 here and there look well, but many
 of each kind, e. g. Barley, Oats
 and Beans, look to be in a point, and the May
 prevented their kindly progress. Wheat, too,
 was retarded in growth during the month,
 and crops looked thin and yellow, but all is
 now showing both colour and general appearance,
 they bid fair to produce an average harvest, but
 there is no prospect of an early harvest, or
 to last year's, and taking into account the
 on the days and hot gravels, the chances
 of a fat average yield. The root crops are
 now in a point. Many of the Potato crops are
 planted very backward, and a much less
 than last year. The tubers being
 planted in the ground, both in field and in grave,
 and the progress of plant. Manure is good where
 it is used, but the tubers are very thin and unpro-
 ductive. Turnips are not all sown, but the soil is in
 state to receive the seed, and they are going on
 satisfactorily. There can be no hesitation in pro-
 nouncing our summer prospects in grain to be
 and of roots a fair average. Farm stock being
 graziers have supplied themselves to a
 extent than usual, owing to the unexampled
 of grass during the month of April. The
 of the early part of the season, consequently
 were the best early, and upon the whole the stock
 progressed well, so that the markets are already
 in the spring fed cattle and sheep. Prices still

range high; but as the markets are increasing in
 supplies they must in some measure give way, but to
 no great extent. Figs are unusually dear as stores,
 and pork maintains a high price. Vast numbers have
 been fed from last year's diseased Potatoes, which
 probably causes the scarcity. Wool is making a fair
 start. It is good in quality, being well washed, and
 through the mild winter, and of a beautiful colour.
 The staple is rather short, owing to the drought of last
 summer preventing the sheep's progress.

Law of Hypothec.—It appears to me that Mr
 Cunningham, in his letter on this subject, endorsed by
 the Council, has mistaken the ground on which Lord
 Elibo's views. The matter does not depend on
 the selection of investment being free from compulsion.
 Choice of investment is regulated by the consideration
 of advantages, which weigh very differently with
 different minds. The investment in land at 3 per cent.
 is chosen, amongst other reasons, on account of its
 security—security in one respect; for there are two
 elements of doubtfulness in all purchases. 1. Whether
 the thing purchased is in itself worth the price given.
 2. Whether the returns promised will be realised. It
 is in this first respect alone that land is a subject of
 commercial speculation, and there is seldom much
 room for this cause to operate. As regards the
 second, and taken out of the sphere of com-
 mercial speculation, by a private law, it is a
 of depression, but it is the result of commercial
 speculation. A privilege is a special advantage con-
 ceded by the community, on the ground that in some
 way their existence—upon the whole, beneficial to the
 community. It may be a mistaken view—and opinion
 sets with force against class legislation, and tends to
 restrict and repress private enterprise. It is in consideration
 that in practice the privilege has been and may be
 abused to the perpetration of the grossest iniquity that
 it is fair to call for its modification or abolition.
 Granted that the Law of Hypothec is a privilege which
 ought to be abolished. Let it be so; but in the mean-
 while there is no general infringement of equity in its
 operation, because it is a part of our social compact.
 Rather the present landowners might claim with
 greater show of equity some compensation, if the
 security, on the strength of which they made their
 investments, is abolished, but it would probably be felt
 that the free trade principle, i. e., the operation of a
 natural law, would compensate them sufficiently, for
 most surely other things remaining as they are, if the
 certainty of recovering rent was taken away, rents
 would rise. I. S. I. S.

Clover: Cow.—In Mr. Radclyffe's interesting
 paper, Dr. V. says that the value of Clover root to the subsequent Wheat crop, he
 says, "never feed off your young Clover." Here we think
 it necessary to eat it close down, say through May
 before letting it stand for seed, and on this plan I have
 grown sometimes 4 or 5 tons of Welsh Red Clover seed
 of excellent quality. Does Mr. Radclyffe mean to say
 that the crop will yield more, and ripen as equally
 and earlier, if left to grow in May without being eaten
 down? To make it perfectly level we usually pass the
 scythe over it when the cattle are taken out. Does Mr.
 R. advise its being left entirely alone from harvest to
 harvest?—Allow me to add, as I am writing, that I
 have had a cow, which on the night of Wednesday, the
 2d inst., gave birth to still-born calf; on Thursday
 morning, perhaps eight or nine hours after, to another
 and on Sunday, the 6th, about 10 A.M., a third was
 taken from her. She was much reduced, but doing
 well. All the calves were before their time. Eric.

Societies.

ROYAL AGRICULTURAL OF ENGLAND
SPECIAL COUNCIL. Tuesday, June 15. — Present:
 Lord Walsingham, Vice-President, in the chair, the
 Earl of Powis, Viscount Bridport, Lord Kesteven,
 Lord Tredegar, Sir E. Kerrierson, Bart., Sir A. K. Mac-
 donald, Bart., Mr. Campbell, Mr. Dent, M.P., Mr.
 Drum, Mr. Brandreth Gibbs, Mr. Hornsby, Mr. Wren
 Hoskyns, M.P., Colonel Kingscote, M.P., Mr. Milward,
 Mr. Statter, Mr. Torr, Major Wilson, and Mr. Jacob
 Wilson.

FINANCE.—Major-General Viscount Bridport
 Chairman reported that, with reference to the cases
 of those members against whom legal proceedings have
 been taken, two defended cases, viz., Henry Stanton,
 of Coleman Street, London, and Richard Hodgson of
 Chingford, Essex, were heard in the Western
 County Court on June 3, when the former was dis-
 missed, and the latter the latter being a bankrupt
 until July 1, to enable the Society to produce its original
 charter; and the committee now recommend that the
 Secretary be authorised to produce the same before the
 court, and his agreement as Secretary to the Society,
 as well as such other documents as the Society's solicitor
 may think fit. The committee are happy to state
 that in no less than five cases of defaulting members
 the arrears and costs have been paid; the two remaining
 cases, of the nine authorised by the Council to be
 proceeded against, are at present in abeyance, one
 member being in Canada and the residence of the other
 not yet ascertained.—This report was adopted.

GENERAL, MANCHESTER.—Lord Walsingham re-
 ported that the committee recommended that the sum
 granted for advertising the Manchester meeting be
 increased to 800L, on condition that the local com-
 mittee pay any amount spent in excess of that sum,
 and that the Secretary be instructed to apply for
 double the usual force of London police.—This report
 was adopted.

JUDGES' SELECTION.—Major-General Viscount Brid-
 port presented the report containing the proposed list
 of judges of live stock and implements at Manchester.
 This report was adopted.

On the motion of Mr. Torr, it was resolved that the
 Society's small dynamometer be lent to the Lincolnshire

Agricultural Society, immediately after the Manchester
 meeting, that Society undertaking to pay all expenses.
 On the motion of Mr. Brandreth Gibbs, it was
 resolved that four new exit turnstiles be procured, and
 that the number of entrance turnstiles be increased
 to 16.

The Honorary Director was empowered to make such
 alterations in, and additions to, the showyard plant as
 he may deem necessary.

ESSEX AGRICULTURAL SOCIETY.
Colchester. June 15 and 16.—The meeting has been
 held under the most unusual circumstances of weather.
 On Tuesday it was stormy early in the morning, and
 at intervals during the day heavy hail-storms fell from
 clouds which were driven up so suddenly before gusts
 of wind, that it was hard to run for it from the horse-
 ring to the cattle tents, 50 yards or so distant. Towards
 evening it turned bitterly cold, as the strata of air in
 which the hail was congealed then seemed to have
 descended to the surface; and there seemed no end to
 the variations of climate. Wednesday promised to be
 even worse, and the morning signs were verified up
 till nearly three in the afternoon, for heavy storms,
 with streams of rain, were varied by gusts of wind
 which tried the whole of the shedding in the show-
 yard and made many tents yield to the force of
 the nor-wester. When we arrived in the show-
 yard, about 11 o'clock, the stallions were being led
 about to keep them warm, mares and foals had been
 taken out because their shedding had either given way
 or the cold blast had made their coat stare, and the
 attendants in more favoured spots were standing
 beside their animals "flanking" their hands and
 stamping their feet to prevent the blood from stagnat-
 ing in the extremities.

If the Essex Agricultural Society be intended to be
 a show, that is, a show of doing something, while every-
 one who looks on is to be kept in a happy, or an
 irritated condition of ignorance in regard to the classes
 they bring together, its authorities cannot do better
 than continue their method of making entries, the
 formation of classes, and the arrangement of the
 catalogues, repeating it in time to come in the
 exact form in which all these things were done
 at Colchester. The coolest head and the sharpest wits
 at figures and facts could not comprehend in a week
 the subtleties of two, three, and four different num-
 bers over the head of many animals, and the several
 classes which they formed a part of in the catalogue.

The Horses were placed first in the catalogue, and
 as far as the agricultural classes went they were a
 grand show.

There were 29 stallions, young and aged, in the yard, as
 stock horses for agricultural purposes, and nearly all of
 these were of the Suffolk breed. We will not venture
 to be critical under the conditions which we have
 described. Mr. Wolton, Mr. Ward, Mr. Winch, Mr.
 Wren, Mr. Drum, Mr. P., Mr. Bradham, Mr. Boby,
 Mr. Bot, and other well-known owners and breeders
 of Suffolk horses, were exhibitors in the stallion classes;
 and we need say no more to indicate that the show in
 this department was a good one, and that the competi-
 tion was close and the task of judging arduous.

The geldings, mares, and fillies in this department were
 equally good, the former especially, and particularly
 when they were shown in "teams" of four. There were
 five of these teams—Mr. Winch's, Mr. Hallum's, Mr.
 Frost's, Mr. Green's, and Mr. Badham's. The premium
 was fairly awarded to Mr. Green's four chestnuts, for
 a more magnificent line of strong and active horses,
 with good form and symmetry to make them attractive
 to look at, we never saw. The other four teams were
 scarcely second to them in either appearance or useful-
 ness. This was the best collection of the kind that we
 ever saw at any show.

The entire thoroughbred horses and the hackneys
 and roadsters were more of a character for discussion
 in sporting journals. Too often, however, we might with
 truth have exclaimed, "weedy," "weedy," "weedy," as
 lines of thoroughbreds and not thoroughbreds passed.

We cannot quit this part of the proceedings at
 Colchester without once more condemning the
 "jumping" introduction which has been introduced to
 the horse ring by this and some of the other less
 experienced societies. If there were any use in it, as
 regards testing the stamina of horses, there might not
 be so much to say against it. But to adopt this practice
 as a mere draw—a mere "sawdust" and other
 unbusinesslike and unprofitable—to stake the
 stability of any agricultural association by entering
 into such a contest, and to have a horse-stealer and
 a thief as a witness, is a very unwise and
 well intended, no doubt, for the town committee to
 give a Colchester Town Prize Cup, 10L, for the best
 "jumper," but this is an agricultural association, and
 it is for farmers to say whether they will have these
 business meetings turned into cooped-up fairs, and
 water-jumping tomfoolery. It is unfair to exhibi-
 tors in every other class, as their animals or machines
 are liable to be neglected, and thus the instruction
 which these meetings are intended to impart is almost
 altogether superseded or thrown away.

The Cattle are nearly confined to "pure Short-
 horns" and "Short-horns" with a pedigree. The
 only exceptions are a few Channel Islands cattle.
 The pure Short-horns are a great and good show. Mr.
 Tippler's DICK, by NINE TREE JESSIE, Jam. Duckess, is
 a long and heavy red and white bull with ample muscle
 in his fatry-fed shoulders. Mr. Osier's MONARCH is
 a flat ribbed white of fair size with a good head and
 Mr. Osier's HOWARTH, by MISS BATTLE, Jam. Duckess,
 is a very handsome and well grown straw-
 berry and white bull with a splendid front, his back
 is straight and even, and his whole outline, from a side
 view, is very fine. With the exception of his trust and
 slower rounds he might be described as an animal of
 near perfection as possible. When we add that he was

Genuine Peruvian guano should contain 16 to 19 per cent of ammonia, and 20 to 25 per cent of phosphate of lime. The average quantity of ammonia in the best Peruvian guano is 16 to 18, and of phosphate of lime 20 to 25. It can only be obtained from the English firm, Messrs. J. & C. B. & Co., Ltd.

These quantities of ammonia and phosphate are not more than sufficient for the limited supply of the compound. The limited supply of the compound, which is the best of the kind, is the result of the combined causes of the

The quantities with which the guano is adulterated are very small, and a large quantity of which are sent from our nearest neighbour to Liverpool and other places, and so skilfully are these compounds prepared that the most experienced buyers are often imposed upon; the proportions, of course, depending upon the conscience of the compounder, and on the presumed gullibility of the purchaser. I have met with beautiful-looking samples sold for Peruvian guano which did not contain one particle of real guano, but which were mixed with half a ton of ground limestone, and of no value whatever.

It is unfortunate that there are so many simple-minded farmers who are so easily imposed upon, and who are so ready to believe that they are getting the best of the kind of guano for their money.

An imperial bushel weighs about 69 or 70 lbs. It is a very important fact to know, and one which is often overlooked. With the best of the kind of guano, the results will be greatly improved.

But the only trustworthy method of detecting adulteration is chemical analysis. The farmer should never purchase guano without a guaranteed analysis, and if it turns out in any way inferior, return it to the seller, and compel him to pay all expenses. Farmers have the means of detection in their own hands, they have only to be united, and they will be supported by every responsible dealer who wishes to have his goods sold.

Low of Guano. The use of guano as applied to various crops is a subject which practical farmers widely differ. It should be freely advertised, and it is to be used with any other artificial manure, it should be mixed with an equal bulk of turf mould, or some other material which will give it more easy of application, but it serves to a great measure the same purpose as the other. It is a matter of fact that the use of guano, should be avoided as having the contrary effect. Its utility as a fertilizer is not to be found in the rapid germination of the plants, but in the steady and uniform growth of the plants, and in the large quantity of produce which they yield. It is a matter of fact that the use of guano, and were not it, the results would be greatly improved. It is a matter of fact that the use of guano, and were not it, the results would be greatly improved. It is a matter of fact that the use of guano, and were not it, the results would be greatly improved.

without an exception, but, as a general rule, it is necessary in conjunction with farm

Indeed, the use of guano is a matter of fact, and one which is often overlooked. With the best of the kind of guano, the results will be greatly improved.

Again, on very early stages of the growth of the Turley, the use of guano is much to be desired, and the results will be greatly improved.

The use of guano on grass-land will always be recommended, and the results will be greatly improved.

The use of guano on grass-land will always be recommended, and the results will be greatly improved.

Horticultural Glass Warehouse. THOMAS MITCHELL AND CO., NEW STREET, LONDON, E.C.

Table with columns for dimensions (e.g., 2 ft by 2 ft, 2 ft by 3 ft) and prices per 100 feet.

Table with columns for dimensions (e.g., 12 by 12, 12 by 18) and prices per 100 feet.

The above are given for the sake of stating a quantity of any... that may be required.

SHADE GLASS. In sheets of various sizes, ranging from 6 to 9 feet super.

Table with columns for dimensions and prices for shade glass.

SHADE GLASS is made in the following substances, to wit:

- GREEN PAINT, unshaded. 25s. to 40s.
BLACK PAINT. 24s. to 36s.
RED PAINT. 22s. to 38s.
GROUND BRUSHES.
DUSTERS & WASH TOOLS.
LANTERN BRUSHES.

ERS, 3d. to 4d. per lb. OXFORD COBRE, 3d. to 4d. per lb.

- FINE OIL PUTTY.
FINE OAK VARNISH, 10s. to 12s.
CARRIAGE OIL, 12s. to 16s.
KOPAL.
KNOTTING.
INTERS. (ROUND SIZE).
BLACK JAPAN.
GLAZIERS' DIAMONDS and TRILLS.
MILLED LEAD and PIPES.
OLD LEAD Bought or taken in exchange.

The above are Not for Cash, and as such cannot be booked. Lists of any of the above on application.

Glass for Garden Purposes. JAMES PHILLIPS AND CO. beg to submit their REDUCED PRICES as follows:-

Table for PROPAGATING GLASSES with columns for diameter and price.

Table for BEE GLASSES with columns for diameter and price.

Table for CUCUMBER GLASSES with columns for length and price.

Table for HAND GLASSES WITH OPEN TOPS with columns for length and price.

London Agents for HAMILTON'S IMPROVED PATENT ROUGH PLATE. LINSEED OIL, GENUINE WHITE LEAD, CAULSON'S PAINTS.

GREEN'S PATENT SILENS MESSOR,

OR

NOISELESS LAWN MOWING, ROLLING, and COLLECTING MACHINES.

BY SPECIAL APPOINTMENT,
MANUFACTURER

TO HER MOST GRACIOUS
MAJESTY THE QUEEN.

The Extraordinary Success of GREEN'S PATENT LAWN MOWERS is an established fact. During the last five years the demand has been unprecedented, and is a proof of their superiority over all others. The following are their characteristic features—

- 1st. Simplicity of Construction, every part being free of access.
- 2d. They are worked with far greater ease than any other Lawn Mower.
- 3d. They are the least liable to get out of order.

IMPORTANT NOTICE.

Trial at the London Horticultural Society's Gardens, Chiswick, June 5, 1857; four competitors—First Trial on level ground, Second Trial on uneven ground, Third Trial on intricate places, around trees, &c.—when GREEN'S PATENT was unanimously declared to be the best in each Trial by COLONEL CHALLENGER, Dr. HORTON, and G. McEwen, Esq., the appointed Judges, and on every subsequent Trial to the above have GREEN'S PATENT LAWN MOWERS carried off every Prize that has been given in competition for superiority in every point.

PRIZE MEDALS AWARDED TO GREEN'S PATENT LAWN MOWERS.

FIRST PRIZE MEDAL AT THE INTERNATIONAL EXHIBITION, LONDON, 1862.
FIRST PRIZE MEDAL AT THE INTERNATIONAL EXHIBITION, DUBLIN, 1865.
FIRST PRIZE MEDAL AT THE NAMUR EXHIBITION.
FIRST PRIZE MEDAL AT THE GAND EXHIBITION.

FIRST PRIZE MEDAL AT THE LAKEN EXHIBITION.
FIRST PRIZE MEDAL AT THE LINCOLN EXHIBITION.
FIRST PRIZE MEDAL AT THE BRUSSELS EXHIBITION.
FIRST PRIZE MEDAL AT THE HAMBURG EXHIBITION.

THEY ARE THE ONLY MACHINES IN CONSTANT USE AT

THE DUBLIN BOTANIC GARDENS
THE LIVERPOOL BOTANIC GARDENS
THE LEEDS ROYAL PARK

THE HULL BOTANIC GARDENS
THE BOTANIC GARDENS, BROMLEY
THE SUNDERLAND PARK
THE PRESTON PARK

AND IN MOST OF THE PRINCIPAL PARKS, SQUARES, ETC., IN THE UNITED KINGDOM.

HORSE, PONY, AND DONKEY MACHINE.

GREEN'S PATENT LAWN MOWERS

have proved to be the best, and carried off every Prize that has been given in all cases of competition. Since the first year they were introduced (1856), upwards of 46,000 have been sold, and 25,000 of that number during the last five seasons.

T. GREEN & SON
warrant every Machine to
entire satisfaction, and
approved of can be
unconditionally.

PRICES of HORSE, PONY, and DONKEY MACHINES, including Patent Self-delivery Box, Cross Stay complete, suitable for attaching to ordinary Chain Traces or Gig Harness.

PONY AND DONKEY MACHINES.

To Cut 26 inches	£13 0 0	Leather Boots for Donkey, 18s. Leather Boots for Pony, 22s.
" 28 "	15 0 0	
" 30 "	17 0 0	

HORSE MACHINES.

To Cut 30 inches	£21 0 0	Leather Boots for Horse, 25s.
" 36 "	24 0 0	
" 42 "	27 0 0	
" 48 "	30 0 0	

Both the Horse, Pony, Donkey, and Hand Machines possess (over all other Makers) the advantage of Self-sharpening. The cutters being steel on each side, when they become dull or blunt by running one way round, the cylinder can be reversed again and again, bringing the opposite edge of the cutter against the bottom blade, and the Machine will cut equal to new. Arrangements are made that the cylinder can be reversed, by any inexperienced person, in two or three minutes.

HAND MACHINES.

To Cut 10 inches	£1 10 0	Suitable for a Lady
" 12 "	4 10 0	" "
" 14 "	5 10 0	Suitable for One Person
" 16 "	6 10 0	" "

To Cut 18 inches	£7 10 0	Suitable for One Person
" 20 "	8 0 0	" "
" 22 "	9 10 0	" "
" 24 "	9 0 0	" "

Packing Cases are charged at the following low rates, viz.—For the 10 and 12 inch Machines, 3s., 14 and 16-inch, 4s., 18 and 20-inch, 5s., 22 and 24-inch, 6s. and 8s. respectively. Providing themselves with Lawn Mowers are recommended to purchase the cases in which to stow them away, when not in use, to prevent them from getting damaged. Returned, two-thirds will be allowed for them.

The above MACHINES are made from the best materials, and of superior workmanship, are delivered Carriage Free to all the principal Railway Stations and Shipping Ports in England, Ireland, and Scotland.

HORTICULTURAL and AGRICULTURAL IMPLEMENTS, GARDEN SEATS and CHAIRS, FOUNTAINS, VASES, PLAIN and GALVANISED WIRE NETTING and ORNAMENTAL WIRE WORK of every description.

Having every extensive Premises in London, we are in a position to do all kinds of Repairs there, as well as at our Leeds Establishment.

Having a large quantity of MACHINES in stock at our Leeds and London Establishments, we are in a position to execute Orders on the day they are received.

THOMAS GREEN AND SON, SMITHFIELD IRON WORKS, LEEDS;
and 54 & 55, BLACKFRIARS ROAD, LONDON, S.

July 18th to 24th, 1869.
THE ROYAL HORTICULTURAL SOCIETY'S
GRAND EXHIBITION at MANCHESTER,
 in connection with the
 48th of the ROYAL AGRICULTURAL SOCIETY
 Annual Meeting at Special Place,
 near the Fair, on the 11th of July. **VALUE £21**
 to be offered by the Proprietors of the
THE GARDENERS' CHRONICLE AND AGRICULTURAL GAZETTE
 to be made up as follows.

In awarding the Prize, Marks will be adjudged according to the following scale, for the several subjects produced.

The Prize for the Competition amongst Amateurs and Gardeners for the Fruit and Vegetables produced at the Exhibition is a silver vase, and any articles otherwise marked will be disqualified. It is expected that the exhibition will be neatly and effectively displayed.

The Gardeners' Chronicle.
 SATURDAY, JUNE 26, 1869.

MEETINGS FOR THE ENSUING WEEK.
 Royal Horticultural (Great House Show),
 at the Royal Horticultural Society, 11, St. James's Place, London, W., on Wednesday, June 23rd, 1869.
 Royal Horticultural (Fruit and Vegetable Show),
 at the Royal Horticultural Society, 11, St. James's Place, London, W., on Thursday, June 24th, 1869.

As is the condition of the gardens at Kew, and great as has been the improvement in some of the departments of the gardens, the Orchids in that establishment never be pointed to as illustrations of the best cultivation. With that exception, which prevails all departments of our national garden, the Orchid-house at Kew has been built, forming a portion of a new range of buildings, when completed, will be a valuable addition to the garden. But on looking at the newly erected house, we are disposed to doubt if it be well suited for the growth of Orchids.

There are many reasons why, in a large public establishment, the same amount of success as is obtained in the more important private collections of Orchids, is hardly to be looked for. The continual ingress and egress of visitors, and the continual opening and shutting of doors, and the consequent currents of cold air, are in themselves very disadvantageous circumstances.

With open doors, in addition to the ordinary mode of ventilation, the necessary moisture during the day is leaked up, and the very life blood of the plants is positively stolen away at every opening and crevice. Many of the plants, in spite of the greatest skill, can scarcely recoup themselves by the evaporation and condensation of moisture in the evening and during the night. A liberal mode of ventilation, a certain amount of shade, but a too liberal off-hand mode of ventilation, with them is liable to lead to disastrous consequences. The question arises, what should be done under such circumstances? The British public is so sensitive over national affairs, and public parks and gardens in particular, that to attempt to shut up the Orchid-house might perhaps be the signal for another Hyde Park demonstration in miniature. Moreover the present Government would not care to incur the responsibility of sanctioning what might be considered to be a purely conservative measure, even were it desired by the managers of the garden—a very unlikely thing. We must look in some other direction for a scheme whereby the public will not be denied the privilege of inspection, and one in which the interests of the plants can be studied also.

Two modes seem to us practicable—the one to enclose the existing Orchid-houses, and the other to distribute the plants in what may be called growing and flowering houses.

The first plan is open to this objection—that it is exclusive; for it might well be argued that passing in at either door would be about as satisfactory as walking round a glassed promenade and straining the eyes to catch a glimpse of any floral

treasure within. Moreover the present houses are not adapted for carrying such a plan into effect advantageously; for their width and form would present an almost impenetrable barrier to anything like a satisfactory inspection in the way indicated. If this outer corridor were thought of, all the flowering plants would require to be arranged on the side tables to bring them within sight of those outside, but many of the plants, on account of their stature, could not be so placed. Any arrangements for accommodating the public after this fashion would be well considered before a plan of building was adopted at all; and failing this plan, either a block of new Orchid houses could be built and the present houses utilised for other purposes, or the plan of distributing the plants into growing and flowering houses could be adopted.

Upon the whole this latter plan seems to us by far the best of the two, for it preserves the existing order of things, and only stipulates for auxiliary growing houses with closed doors. The present houses may remain and do duty as show houses, but they are quite unsuited for the permanent growth and well-being of a general collection of Orchids. It is found quite practicable in many private collections to move plants from their growing quarters to cooler houses wherein to display their flowers, but it would be the height of folly to have them exposed to a fluctuating atmosphere in a condition where air currents were uncontrolled. The season of rest of most of the Orchids begins with the wane of the inflorescence, and therefore open doors during the few weeks the plants are in bloom would not be of material consequence; but when the season of growth approaches, every advantage in the shape of proper temperature, duly modulated air currents, and sufficient moisture, must be husbanded else the day of grace passes away, and the life of the plants vanishes along with it. By this separating system both the public and the plants would have justice done them. Moreover it would be far more interesting to a general observer to see the plants together, in flower, removed, as they would probably be by a display in suitable places. It is not well to be told if such an arrangement were carried out, and to the visitor there would be always some novelty to inspect and admire.

As a growing house the new Orchid-house at Kew is much too lofty for the majority of the plants in the collection. As a rule this great family delights in a rather confined atmosphere, and most of its members show special luxuriance in proximity to the glass covering. On that account, and on that alone, many of the plants in the new Orchid-house are not likely to grow and thrive to the best advantage. On the other hand, a limited atmosphere and low roof are injurious to the flowers, for the condensation of moisture destroys many of their beautiful tints. Hence the wisdom of providing a suitable habitation for the plants, both in their growing and flowering state.

The green glass employed seems to us, as far as most Orchids are concerned, to be more a theoretical than a real acquisition. It may be, and evidently is, useful for many plants, such as the economic plants that are ranged in the new buildings near to the Orchids, as obviating the necessity for close shading, but it cannot divert the rays of the sun from acting injuriously upon Orchid life. Shade is requisite and when shading is required, the permanent interposition of any colour to intercept light cannot have any good practical result. During the dark days we want all the light at command and unless at that period the green glass could be exchanged for the clear, translucent glass in everyday use, it appears to us that, instead of securing a benefit we are contracting a loss, and placing our position in point of light and darkness by so much the nearer to the state of affairs at the North Pole.

THE 26th anniversary festival of the GARDENERS' ROYAL BENEVOLENT INSTITUTION was celebrated on Wednesday evening last, at the London Tavern, under the presidency of his Grace the Duke of ARGYLL, K.T. who was supported by JAMES BATEMAN, Esq., F.R.S., G.F. WILSON, Esq., F.R.S., Professor OWEN, R. WRENCH, Esq., A. HELPS, Esq., Mr. Alderman MERRI, and a large number of well-known horticulturists, including Mr. EVLES, Mr. FORBETH, Gunnersbury; Mr. JENNINGS to Lord HILL, Hawkstone, Salop; Mr. BARLEY, jr. to F. PRYOR, Esq., Mr. SMITH, jr. to C. B. PETER, Esq., Norwood, &c. The tables were tastefully decorated with flowers and fruit. Of the former, a very fine Liliac and an equally handsome Armeria Scherzeriana were very conspicuous; while at the back of the chair

was a charming arrangement of flowering plants, tastefully arranged and which were liberally contributed by Messrs. LEE, VEITCH, LUNN, and WILKINS. Some time before the meeting from the gardens of his Royal Highness the PRINCE OF WALES, at Sandringham, from those of Baron ROTHSCHILD, of Gunnersbury; and from those of Mrs. DIXON, of Stanstead Park, Emsworth, and others. After the usual toasts, the noble Chairman proposed the toast of the evening, viz., "Prosperity to the Gardeners' Royal Benevolent Institution," and in so doing referred to the objects of the Institution, which were to provide a pension for the members of the gardening profession in their old age; and said that this Institution the pensioners were allowed to live with their families, which was an advantage not shared by many other similar institutions. Another rule of the Society commented on by his Grace the Chairman is that those who subscribe to the fund for 15 years take precedence over subscribers for shorter periods in obtaining the pension. After alluding to the manner in which the funds of the Institution were raised, the Chairman remarked, that if every gardener would subscribe yearly, the funds could be easily raised without the necessity of being dependent upon the subscriptions of any one individual. As an illustration to the manner in which the funds of the Institution were raised, the Chairman stated that the various London Gardeners, as a body, labour under certain disadvantages, through being scattered in remote districts throughout the country, and that if they were not to be the same amount of co-operation amongst them that existed in their respective localities, but when united, it would be a most powerful force. Nevertheless, he earnestly recommended gardeners to subscribe to the funds of the Institution, and thus to provide for themselves when aged and infirm. The Chairman then expressed his admiration of the manner in which the market-gardeners around London catered for its immense population in the shape of vegetables and fruit, as regards the latter, he stated his belief that this country was better supplied than any other, and that the tables of the EMPEROR of the FRENCH, and a large number of the nobility of France, were supplied with the produce of the English gardeners' skill. As regards flowers, the Chairman referred to the remarks of the vegetation in foreign countries contained in Mr. WATSON'S "Mosses and Ferns," and mentioned very interesting remarks on the skill of the gardeners in producing flowers, and on the science of gardening as carried on in this country. The Chairman afterwards gave "Physiological Science," and coupled with the toast the name of Professor OWEN, who was supported by Mr. HELPS, Mr. WRENCH, Mr. WILSON, Mr. MERRI, Mr. WRENCH, and Mr. WILSON, who read a list of donations amounting to nearly 5000. Mr. Alderman MERRI proposed "The Nursery and Seed Trade," to which Mr. HENNER responded. "The Ladies" were then given by the noble Chairman, after which the proceedings terminated.

We have authority for stating that the Bill for the PREVENTION OF THE ADULTERATION OF SEEDS is to be referred to a Select Committee, for the purpose of collecting evidence as to the facts of the case, and to resist certain clauses of the Bill. The promoters of the measure, we believe, have assumed that the course with a view to any possible objections that might be raised by the breeders of Irish or other parties, if such a plan were not adopted. As the proposed legislation is of somewhat novel character, it perhaps as well that the growers should for themselves have an opportunity of ascertaining the magnitude of the evils. It is considered that sufficient evidence can be brought forward to satisfy the Committee as to the necessity for legislative interference without going into very elaborate details, and without compromising the position of the respectable seed firms.

In a recent number (p. 609) we stated that we understood that the British representatives at the ST. PETERSBURG EXHIBITION did not accept decorations like those awarded to the representatives of other nations, owing to advice given by Dr. HOOKER. We now learn from Dr. HOOKER, and are requested by him to state, that he gave no such advice, that he was never consulted on the subject of giving decorations to jurors or delegates, and that he would naturally have shrunk from doing anything of the kind without consulting his compatriots. As the proceedings at St. Petersburg seem to have been very informal and confused, there is no room for surprise at the misunderstanding on our part.

We understand that the Floral Decorations at Buckingham Palace, on the occasion of the visit of the Viceroy of EGYPT, have been supplied by Mr. WIMBETT, of the Ashburnham Park Nursery, Chelsea.

Those interested in City Gardening will be glad to learn that the new SOUTHWARK PARK was opened to the public on Saturday last by Sir JOHN THWAITES, the Chairman of the Metropolitan Board of Works. The land selected formerly belonged mainly to Sir WILLIAM GOMM, and comprises an area of 63 acres, situated on the south-west of Deptford Lower Road, and reaching in that direction as far as Jamaica Lane, thence to the pleasure ground, and will prove an admirable resort to a portion of the population, at a cost of about 100,000. The ground which has a very flat appearance, has been laid down with grass, large open spaces are left for promenading, and along the sides of the principal paths and other prominent positions large mounds of earth have been thrown up, which are planted with Rhododendrons and various other shrubs.

JUNE 26, 1890.

flowers well at how this year, both in No. 1 house and in the open garden, and our description is taken from the specimens. It resembles most the bicolor variety of Pseudo-Narcissus from which it may be distinguished by its smaller size, bright green leaves, and its flowers not more than half an inch long. Is it a hybrid between Tazetta and some of the varieties of the genus? The N. ... (Pl. Franco, 3, p. 255) corresponds with it, but we have not seen ...

INCOMPARABILIS (Curt. Bot. Mag. t. 121).—Hull oval ... Leaves 3 or 4 to a scape, about a foot long ... A native of the South of France and the ... Marseilles, Avignon, and Nice. We have not seen it in English gardens, but there are excellent figures in the works of Reichenbach and Mogridge, which we have quoted. On the one hand it resembles junceifolius, but the leaves and stem are quite different, and the flowers are a uniform pure white, instead of a bright yellow. On the other hand it comes exceedingly near some of the multiflorous varieties of Tazetta, of which I shall have to treat in my next paper. J. G. Baker

NEW VINE DISEASES.

FROM information which has reached us from various quarters since January 30 last, (when we published our illustrated article on certain Aphidicous insects which had attacked the young roots and also the leaves of the Vine), we regret to learn that the mischief caused thereby is widely spreading both at home and abroad. On March 27 (p. 332) Mr. Berkeley reported that specimens of Vine roots infested by the root insect had been forwarded to him by a correspondent, and that he had recognized in it the insect which we had figured from the leaf-gall; adding, however, that it was possible that a second species belonging to the same genus existed, and that it differed such a great difference from the first as to be distinguished by its eggs. In support of the opinion that the leaf insect is

Fig. 1.—Young of Vine leaf Gall Insect

specifically different from that of the root, although structurally we could discover no specific distinction between them, i.e., between the wingless female state—not having seen the males, which will doubtless be winged and afford better specific characters, we may remark that the French observers of the root species make no mention of the simultaneous attack upon the leaves, and indeed the first notice in England of the appearance of the insect on the Vine leaves in France was recorded in the Standard, and in our own pages of April 17 last, when "a new disease in the Vine, attributed to vermin which are found on the leaves" is mentioned as having broken out in the district of Orange (Vaucluse) where 5000 Vines were destroyed by it on an estate of 25,000 acres. At Sarrians few plants remained in a healthy state; at Roquevaire the loss amounted to one half and the disease was spreading on all sides. Lastly in our issue of May 29 (p. 580), an answer to a correspondent will be found who has sent us a Vine leaf infested with these insects, and from south-east France, to whom we recommend familiarization as a means of eradication. Of course this remedy would be better applied to the insects themselves as in France, but it is very probable that the smoke of a tobacco pipe held to the insects within the galls, as they are on the upper surface of the leaf, and by an essential in destroying them as it is in killing external-feeding Aphides, such as the Rose Aphid or common green-fly. We have had no opportunity of confirming Mr. Berkeley's observation as to the different size of the eggs deposited respectively by the root and leaf-gall females; but we may observe that in both cases the fluids of the Vine are sought after by the insect, whose rostrum is thrust into the young rootlets or the tender leaf; and that it is the vegetable action of the different parts of the plants which are attacked which constitute the great apparent difference of the two insects. Some curious observations on this head have recently been made by two independent observers. Mr. F. Smith of the British Museum, who has devoted the careful attention of many years to the study of hymenopterous insects, has noticed that whilst the root gall in the roots of the Oak, made by the deposition of eggs by the female Cynips aptera, resemble bananas of currants, the galls on the base of the stem of the tree aboveground are consolidated, and form a solid mass (Proc. Ent. Soc., Feb. 1, 1869), in like manner, Mr. Walsh, of Illinois, has just recorded the fact, that he has reared insects which

cannot be distinguished, inter se, from Cynips Quercus spongifica from two different kinds of galls upon two distinct kinds of Oak (Proc. Ent. Soc., May, 1869). In the woodcut (A) at the head of this article we have figured the very minute larva of the leaf-gall specimens soon after leaving the egg. The two dots within the small circle above the insect are about twice the size of the insect at this period, and the upper figure represents its foot, the thickened base of the tarsus evidently representing the distinct basal joint which is observed at a later state of growth, as seen in the lower detached figure, which clearly exhibits also the two terminal hooks or ungues of the feet, thus negating its relationship to the Coccid. The upper detached figure represents the antennae of the young larva, the extremity of the proboscis or sucker of which is seen extending between the first and second legs on the lower side of the body.

From an excellent paper by Dr. Shiner, published in the Proceedings of the Academy of Natural Science of Philadelphia, for January 29, 1887, it appears that the Vine leaves in the United States have been attacked by an insect in a manner so singular to that which takes place with us, that we should have been tempted to consider them as identical, but Dr. Shiner's description and details of structure will not allow such an approximation. He has formed for this insect a new genus, which he terms Plectylophera, from certain globular pedunculated appendages at the extremity of the feet (of which no trace is found in our species). In the accompanying woodcut (B), the lower figure represents one of the legs of D. vitifolia,

Fig. 2.

with two of these appendages (a), and the upper figure (with six of these appendages, a, a) represents one of the legs of a second species, found on the Pig-nut Hickory (Carya glabra). In the fig. 2b represent the terminal ungues. The woodcut (C) represents the winged female of the insect, the same as that which we reserved for our illustration in the "Garden Register" of April 17 last, and which we have figured in our present issue.

and habits of this species, from which we have only space for the following short extract—"The young larva leaves the gall usually soon after being hatched, and resorts to the tender leaf as it is expanding from the bud, fixes its location where it feeds by puncturing the leaf and sucking the juices, this irritation causes an abnormal development of the leaf, and thus produces a cup or bottle-like excrescence or gall, in which the insect now develops to maturity, and where she resides, laying eggs during the remainder of her life. From 50 even up to 5000 eggs may be found with her at once, and one female may be the progenitor of many millions in one season, even 10,000,000,000,000. Sometimes a few of the female larvae, from some cause, appear to remain in the gall until maturity at other times the galls are so closely packed, that two or three are blended into one irregular gall, with as many primary parents. I. O. B.

Home Correspondence.

Oncidium altissimum.—A splendid specimen of this showy Orchid was exhibited a few days ago at the show of the Bitters Horticultural Society, near Southampton, by John Lancaster, Esq., of West End. The plant, which was very healthy and clean, and growing in a tub, must have been nearly a foot in diameter, and had ten large flower spikes, with an aggregate of one thousand expanded flowers besides buds. The plant has been in Mr. Lancaster's possession about six years. Large growers of Orchids may perhaps see nothing of unusual importance in the proportions of this specimen, but forming as it does one of a small collection of plants in Mr. Lancaster's possession cultivated in a mixed house in the most judicious manner, the fine development of this species is very remarkable. R. D.

Gum-tar for Trees.—Better let it alone. If tar is used at all, Stockholm is less injurious, but neither sort is safe. I saw a quantity of nice healthy Poplars killed overnight last winter through being tarred to keep the stock from rubbing against them. As antidotes to game or stock a thick paint of cow-dung, cloacal matter, sulphur, &c., is effectual, and nourishes the trees while protecting its bark. Tar is always injurious. Even patches of it injure every patch of bark they smear, and although the sap can find its way between the patches, all such interference is injurious in proportion to the number and size of the patches. Mr. Scott's peel and paint prescriptions belong to the age of horticultural barbarisms which it was hoped had for ever passed away. Nature does not produce bark to be peeled off and coated over with clay or other emollients. I can hardly conceive of any remedy that would be given more likely to prove disastrous to amateurs and young gardeners than that recorded on p. 413 for the instruction. Mr. I. O. B. He need have no fear to wash his trees, and a remedy will accrue to them by doing so. No remedy. Then Nature has made a mistake and trees may better have their nakedness, than a covering of clay and cow-dung muffled up under a hideous covering of clay and cow-dung. And this, from the times of the boot and the thumb-screw, set forth as serious in the Gardeners' Chronicle for June 5, 1890. Oh! Liar Eye. (The

These are arranged in the following manner:—arrangement, form, colour, number or position, displacement, proliferation, altered sexual organs, &c. Alterations of form include changes from arrest and excess of development, as well as metamorphosis. Changes in number and size are arranged according as they are due to or defective development.

In the principal of the hitherto changes (exclusive of those diseased and amorphous growths resulting from insect attacks) the following are included:—

The following extracts may serve to show in what manner the author has worked. Alluding to the subject on the explanations usually points in the ordinary structure of

done much towards showing the morphological statements that still exist, though their fallacy has been shown. In many cases the views of the author are restricted to the ordinary relation

remarkably they show that the several organs are not so different as they are generally supposed to be. In many cases the identity of the organs, it is impossible to avoid the conclusion that, however distinctly these parts are distinguished, yet morphologically they

many of the subjects treated on are of practical importance to the gardener. The numbers of "sports," "fancies," "improvements," and "monsters" submitted to the Royal Horticultural Society are so numerous that it is impossible to do more than mention a few of the most interesting. To secure as consistent with har-

of teratology deserve the attention of those who are concerned in the embellishment of our gardens. The florist's standard of perfection, and conformity to that model. Whether it be to value all flowers in proportion as they are more or less deviated from the type, or to stop to inquire, suffice it to its broadest sense, the aim is to produce flowers, brightly coloured, the colours must stand out. When all this is done, the flowers become 'monstrous' in the eyes of the more interested to the public on that account. In like manner the

many other products of our kitchen gardens are the estimation in which they are held entirely due to the fact that they are the result of cutting, the formation of adventitious roots, and extension of his plants, are also processes on which the cultivator so greatly relies. Teratology concerns itself. Again, the occasional in getting vines, straw-

when some plants possess a unisexual condition

Florists' Flowers.

So far, the exhibiting of new Large-flowered PELARGONIUMS has been confined to Messrs. Hoyle of Reading, and O. Turner, Slough—the last-named having Mr. Foster's flowers as usual. Some 12 or 15 years ago it used to be thought characteristic of the strains of these two famous raisers, that Mr. Foster should produce but finely-formed and high-coloured flowers; while to Mr. Hoyle appeared to have effected the improvement of the larger flowers, having the more-coloured and pink hues. Of late years, however, the two raisers have to some extent taken each other's ground, and both alike have come to raise not only flowers of the styles named above, but have also struck out new paths, each now appearing to cover the whole area of Pelargonium improvement. The great show at South Kensington on June 2, brought from each of these raisers groups of new flowers illustrative of the position just advanced, though Mr. Foster's seedlings were a little more varied, and generally finer.

Three First-class Certificates going to Mr. Hoyle's, white five Mr. Foster's flowers. Eight First-class Certificates for large-flowered Pelargoniums at one thing remarkable, especially in the descriptions have asserted that the certificates mark a new era, confined to the set-up. The flowers so dark top petals lit up with a slightly running out into it, and flowers very fine, well-proportioned, and smooth excellent, and very free-blooming. Maid of Honour (Foster), a white and showy flower; lower petals small dark blotch; broad margin of salmon-rose lit up to the extreme edge of the lower petals, lower petals like those of Maid of Honour, with less of salmon and more blue, the upper petals having a dense dark blotch margined with fiery carmine, into which the dark runs in the form of faint lines, and extreme edge of pink—a good advance, flowers fine, stout, and bold; the Pretender (Foster), a rich red and white flower, but wanting, as all these more or less do, the s and rose-coloured kinds, pale orange-red lower petals, with a slight dark blotch on each, and lines of the same, five dark top petals, with regular

Warrior (Foster), dark orange-carmine lower petals, irregular dark blotch on top petals, margined with fiery orange, and narrow rose edge, a showy flower, and forming a fine decorative plant; habit spare. Sultana (Foster), lilac lower petals, with small dark blotch on each, and lines of dark; large white centre, dark top petals, and narrow edge of pink, excellent habit, free-blooming. The certificated flowers in Mr. Hoyle's list were Bonnie Charlie, a dark painted flower rose lower petals, dashed with orange, and heavy with dark; dark top petals, rather rough; habit a little more open. He also rose lower petals, with a line of dark; dark top petals, with faint

There are a way of flowers that will go on and on. The following are some of the most interesting:—Herald (Foster), and Harold (Foster), both described at p. 617, the latter under the name of Herald. Plantagenet (Foster), soft pink lower petals, white throat; upper petals of great size, having irregular dark blotch broken into by fiery crimson, and edged with a fine but somewhat rough flower. Velutina (Hoyle), fiery orange lower petals, stained with dark; dark top petals; flowers small, rough and

Hoyle), orange-crimson lower petals, with dark top petals, with violet-rose blotches on top petals; free blooming and Mr. Turner also received First-class Certificates for the following fancy Pelargoniums, viz. Mrs. Wigan, pure white throat; fine and showy habit, and very free-blooming. Mrs. Carrington soft pink, with white throat, and very free and showy, a pretty flower. Mr. Turner also exhibited a group of six fancy Pelargoniums, the following new varieties:—Langbeens, Fanny Gair, Mrs. A. Wigan, Excelstor, and Princess Teck, the last the prettiest and best formed pale flower ever sent out. A First-class Certificate was awarded to Mr. Turner for silver-edged

At the second great exhibition of the Crystal Palace

Mr. Turner had most of the Pelargoniums named, of these the following were awarded First-class Certificates—Heroine, Sultana, Corsair, Warrior, Her Majesty, and Harold, also to fancy Pelargoniums Leola, and Sultana, suffused with violet, the flowers of large size, smooth and of fine substance; to silver-edged variegated Pelargonium Bright Star; and to White Clove The Bride. Second-class Certificates were awarded to Maid of Honour, and to fancy Pelargoniums Lady Carrington and Marmion, all previously described.

The Apiary.

NEWS IN SOUTH DEVON.—A neighbour of mine had a large swarm early in June. In shaking the cluster, about one-half of it fell down on the ground; the bees rose again, and clustered in a Currant bush. The owner had the two clusters in separate straw hives, both of which stand in the garden and work well. He will warrant the issue to have been a first or prime swarm, having watched the bees too closely to have missed the first swarm. Each hive has undoubtedly a queen. It is, I suppose, a delayed swarming, the young queen having come out

time as she did. My bees are swarming this season rather than working. I had a case of regicide the other day. Outside a stock, full of bees, healthy and strong, I noticed a cluster of bees, the rest being wild and excited. I carefully separated the bees in the small cluster, and found their queen closely encased. I offered her carefully to her subjects, but they would not have her, and killed her outright. I searched minutely over the cluster three times, there was no queen, and shortly afterwards a great stir arose among the bees who were looking for the queen they had murdered. Queen cells have been raised since then. Why did the bees thus destroy their queen, not then having any immediate prospect of her place being supplied by a successor?

My hybrid Egyptian queen breeds black bees, and black drones, without a shade of yellow. I have a queen which went back again after being hived. I found the queen on the ground close to the front of the hive. I ought to have killed her then and there, but put her back again. I thought she would not fly, as she had ragged wings. The next day the swarm went off again and pitched high up in a tree, and I had some considerable trouble in getting off the branch and bringing the bees down. They were successfully hived, but at 4 P.M. they again left, and this time clustered in a hedge of brambles and nettles close under the tree. I imagine that the queen could not have been in the hive at all, but when the swarm took wing in the morning, had fallen amongst the brambles, where the bees at last found her out. Why, if this was the case, did they stay so long in the hive, viz. from 10 A.M. till 4 P.M.—did the queen leave and return to the place? I had very difficult work in hiving the bees amongst the nettles, and was dreadfully stung—by the nettles, but not by a single bee, though without having on any protection of veil or gloves. My square glass hive threw off a splendid swarm a few days ago, and is now apparently as crowded as ever. South

I do not think the divided swarm first alluded to in "Hams," in which both divisions have a queen, have been a case of delayed swarming in the same way. It is much more probable that the queen was in the hive at the time of the division, and that the bees which were first hived were impregnated by an Egyptian drone? I do not imagine, this is the case, it would be surprising if she bred any other than black drones, as would upset all the theories of Dzierzon and Von Siedow, now universally accepted by scientific apiculturists. I

hybridised by an English drone, then it is strange she breeds black drones. It is not an unusual circumstance for a queenless swarm to be apparently contented when the bees suddenly rushed off and pitched in a high tree close by. They were a young swarm, and their habitation remained just as before during that day, but left about the same time as the first wing. We had suspected that the queen had been lost, and a search for her was being made, but it was not until the bees were determined to ascertain whether this was the case. The bees were fumigated, and every one passed separately under our observation, but no queen was there. The bees were then united to another stock, and all afterwards went on satisfactorily.

Miscellaneous.

Presentation to Mr. Wilson.—At the recent exhibition at York, the opportunity was taken by those gentlemen who have been interested in the show, as exhibitors and judges, to present to Mr. Wilson, the secretary, a handsome chain and seal, as a mark of their appreciation of his courtesy on all occasions. Mr. Wilson, who has filled the post of secretary for 10 years, has laboured hard in the interests of the exhibition, to raise special prizes. In 1852 he interested himself in getting up a

from a foreign stock not used to these vicissitudes, so that when time, tillage, climate, and seed can all exert such powerful influence the evidence that land is so sick of Clover as to refuse to grow it is by no means to be relied upon.

The next crop we shall advert to was also one of 50 acres, consisting partly of broad Clover alone, and partly of this mixed with perennial Rye-grass. This field was sown down with Barley in 1866. In the following year the Clover or "seed" crop was partly fed off with sheep...

We would now offer a few remarks on the Wheat crop which succeeded the Clover. - The Wheat crop of last year was the best we have had for some time, but had we not read, as well as had some little experience upon the subject, we should hardly have been prepared for the fact that where Clover hay had been taken and followed by a crop of seeded Clover, our Wheat crop, "White Hear," averaged 12 sacks an acre...

Our last year's seed crop consisted of Hye and Rye-grass, and was a very heavy one, this was chosen because in 1863 the field of 32 acres was mostly in Clover, which was seeded. However, by way of experiment, 2 acres were sown with broad Clover and Rye-grass, 10 lb. of the Clover seed to the acre. This, in as far as the Clover was concerned, was a total failure, but as this small quantity of seed was sent for from a neighbouring town, and used, contrary to our usual custom, without examination, much less testing, we are inclined to think it might not have been over good...

was a good crop, cutting over 2 tons of hay to the acre. Our present crop is from a fine bold seed, germinating to the extent of 96 per cent.; the balk was clean, and so free from Plantain that not a specimen, as far as we know, can be found in the 50 acres.

In practice we have found that the mode of sowing Clover seed is important to insure its proper growth. Thus, when the roots have been got off so late that the Barley sowing is done in a hurry, and the ground is rough and in hard knobs, neither the Barley itself nor its accompanying seeds get on well, especially in a dry season. Clover seed, indeed, is as much sown in stony places, and as readily dies away after germination in hard knobs not broken down by wet, as the seed in the parable. In so small a seed care should be taken to roll the soil before sowing as firm and smooth as possible. As a proof of the recognition of this fact we here append a labourer's report on our Barley crop, made April 18 of last year: -

"When the ground is mellow (mellow) and simple sowing it da come altogether suant-like even, but when catty clung and doubly lumpy it aise comes irregular.

We have seen many a crop of roots perilled for want of a fine tith. Curiously enough, if we lose Clover plants under these circumstances we say the land is Clover sick, but one never hears the term Swede sick or Mangel sick. We hence conclude that, as there are so many circumstances affecting the well-being of the Clover crop, the idea conveyed by the term "Clover-sick" land is not only indefinite but doubtful; and long and often as the Clover crop has been a failure, yet observation and experiment are still wanting to determine the cause.

On Saturday last the Rothamsted Experimental Farm was visited by M. DEMAS, the distinguished French chemist, and by a large number of the leading scientific men of this country. Mr. LAWES and Dr. GILBERT accompanied the party round the fields, and explained the treatment which each plot of land had received during many previous years, and the result of this season of the year was a satisfactory answer to the question, as to both the positive and relative effect of the varying manures that had been applied. Our readers already know generally on what a scale and with what intelligence and patience the leading questions in agricultural chemistry have been put to soil and plant and animal at Rothamsted. That which in other countries has been done by Governments or National Societies has in England been even more successfully accomplished by an individual agriculturist and chemist. And upon a more elaborate plan and over a greater area, and with a longer-continued perseverance than has anywhere else been exhibited, Mr. LAWES and Dr. GILBERT have here devoted themselves to the investigation of the whole field of agricultural chemistry. While in the midst of their research a large sum of money, contributed by the agriculturists of this country to express their sense of the professional and national value of their labours, was spent in the erection of a laboratory at Rothamsted, and presented to Mr. LAWES, in the name of a body of subscribers, including all the leading landowners and farmers of the country. In this laboratory the company first assembled last Saturday, and here Dr. GILBERT invited attention, among other things, to a case of specimens illustrating in a very striking way the organic and theoretical botanical composition of a pasture after 14 years of various treatment. The kinds and quantities of the several grasses and other plants contained in a given area of each of the experimental plots was represented by actual portions of each plant in the proper relative quantity. And thus we could see at a glance how the whole produce of a plot had altered in quantity, and how that produce had changed in character as well as quality at the end of 14 years' treatment. It was seen in this collection of dried plants just as it was afterwards more strikingly seen in the field, how ammonia, salts, and mixed manures of various kinds each of them applied year after year to the same plot had at length worked upon the original pasture changes as great as if the several beds had been sown with altogether different mixtures. The changes thus exhibited had been produced, not only by the increased vigour given to the coarser and bulkier Grasses, enabling these to crowd and hustle out the more delicate species, but also, as shown for example by the curious effect produced on the relative

The Agricultural Gazette.

MEETINGS FOR THE ENSUING WEEK. 25th Northamptonshire Agricultural Society, at Northampton. 27th Suffolk Agricultural Society, at Ipswich.

The Clover plant is in itself so valuable as a lawn crop, and affords such a good preparation for the growth of Wheat, that any notes upon its growth can hardly be other than useful. We propose, therefore, to offer a few observations upon the cultivation of common broad Clover on a somewhat extended scale.

In 1864 a 50-acre field of Barley was sown down with Rye-grass and broad Clover. Now, though in that extraordinarily dry summer the hay grasses grew very well, the Clover was entirely destroyed so that in the whole field scarcely a dozen Clover plants survived, and it was accordingly concluded by most people that the land was "Clover sick."

In 1867 the same field was smashed up and sowed with Howard's double engine steam sowing machine, which were very good. These were followed with Barley, sown down with broad Clover and a small admixture of Hop Trefoil Medicago lupulina. This, which was considered a bold experiment by most of our neighbours, is so far justified that at the present moment we have as large and fine a cut of Clover as we have ever grown broad-leaved Clover indeed, inasmuch as the leaflets are not uncommonly over 2 1/2 inches long, and 1 1/2 inch broad.

Now it will be recollect that last summer was almost if not quite, as dry as the summer of 1864, so that we cannot attribute our failure of 1864 altogether to the season, but with regard to the present crop, it may perhaps be reasoned that the extension of time between it and a former crop of Clover, together with steam cultivation, have aided in bringing about the observed difference. But, while admitting that these may have something to do with the matter we can by no means agree in considering the failure due to Clover sickness, as in that year much Clover was smothered out by a good crop of Barley, and more killed by a succeeding cold winter—and perhaps the seed was

a new set of plants may be secured. Some nurseries have given up growing this consequence of not being able to keep the plant, however, is so very pretty worth a trial in every garden, and certainly may surely be found to suit it. The leaves often change in autumn to several shades of brown to deep red.

A very handsome, rather free shrub, bearing a general resemblance to the difference, according to the leaves of the tree, in the autumn. It is said to be of garden origin, and was first introduced in 1807 with it from the neighbourhood of London with a little sand, and is not a species. Figured in 'Floral World' and in the 'Illustration Horticole.'

One of the most beautiful and particularly adapted for pot culture in greenhouses, although well able to endure winter in the open air. For the purpose of experiment I am indebted to Dr. ... for several specimens. ... leaves ... alternate, ... divided spine, ... and remarkably netted, on the other side they are pale green ... The writer hears from Mr Lobb, through Messrs. Veitch, of Exeter, that this species will be found much more tender than the common B. Wallingtoniana, and that a fact it is often killed to the ground. Should this beautiful species be ever reintroduced for general cultivation, it ought certainly to be named B. macrantha without any alias. The venation of this is distinct from all the Berberies I have seen, for the primaries unite with the tertiaries in one confluent mass to one quarter the distance to the margin, and then break up and branch in very bold divisions. In addition to those already noticed, there are a few valuable early specimens that appear to have gone out of ... country, a though they may possibly still exist at Key J. J.

(To be Continued)

WASHINGTON PEAR.

This is a small early Pear, of more than average merit as regards flavour, hardness of constitution, fruitfulness, and general usefulness. For flavour and the texture of its flesh it is altogether first-class. In appearance, however, it is greatly wanting, the fruit generally being small and rather scrubby, the outline here given being that of a fine-sized fruit, while many of them are considerably smaller. It may be thus described:—Fruits below medium size, obovate, regular in outline, surface even. Skin smooth, of a pale green colour, slightly speckled with russet, like the Boyenne Blanc. As the fruits ripen after being gathered, the colour in most cases changes to a uniform pale yellow. Stalks about half an inch long, moderately stout. Eye rather small, with segments erect, open. Flesh white, perfectly melting, very juicy, the juice rich and sweet,

a little musky, very refreshing, and grateful to the palate. Tree hardy, and a prolific bearer as an orchard standard. Season, beginning of September to middle and end of month. The fruits ripen in succession, like the Seckel, as they fall from the tree it is however, better to gather them when they begin to fall, as by that means their season is prolonged, and they are also of better flavour than if allowed to ripen on the tree.

This is a Pear of American origin, as its name implies, and rather an old one too, yet it was somehow or other been strangely neglected, and is at the present time almost unknown, having been passed over for more showy but less worthy varieties. To our knowledge it has never yet been figured or described. We have, however, three manuscript notices of it, beginning with that of Mr Thompson in 1829, all speaking of it in the highest terms. To this we add our own experience of it for several years, and heartily recommend it as a good and useful early Pear. B., in 'Floral World and Pomologist'

COOL TREATMENT OF ORCHIDS

GROWERS of Orchids, and especially of such Orchids as will bear cool treatment, are on the increase it is well, therefore, that there should be a proper understanding what this so-called cool treatment exactly means, and, I opine, not the worst way of arriving at satisfactory data is to have a temperate investigation of the whole question, based, of course, upon practical experience. Looking at the matter as it has been presented to the public in your columns from time to time, and elsewhere, there have been much truth or safe advice propounded, and some error—a good deal of argument based, as the sequel has shown, upon unreportable premises, and consequently the outcome or result is by no means so satisfactory as it, perhaps, appears and deserves to be. Far be it from the writer to claim anything like the mantle, not indeed of an inspired writer, but of seeming perfectness in essaying and debating upon doubtful points, the best of us must be aware of our shortcomings in dealing at all with subjects that are best governed by the natural laws. On the other hand, it would not only be impolitic but improper, in the interests of

horticultural progress, for all, to remain silent when advice, if it were tendered, might be a means of doing good, both directly and indirectly—directly as bearing upon the subject under consideration, and indirectly as having a tendency to stimulate minds to reflection, and carrying the theories further over the individual mind to probably a more practical issue.

The best written and illustrated treatise on the subject that has come under my observation is that of the Messrs. Backhouse, which, so far back as p. 171, 1845, ... and obtained a distinct ... When it is reproduced, under peculiar circumstances, at p. 109, ... exercised a certain effect ... I take exception to a few points, ... that I ask you to give me space to meet them, upon the following grounds.

First, I hold it to be no criterion of cultivation in its widest and broadest sense, that because certain plants can be exposed to a few degrees of frost for a day or two, or even for a week or two, that similar treatment is what should be aimed at under our artificial system of cultivation. Second, I hold that different localities, with corresponding temperatures, and different seasons, different constitution, and that the period of growth and the period of rest start precise difficulties as to a common line of treatment, particularly as regards temperature. Third, the cool-house system of the writer, the remarks under consideration, ... put it nearly in the wrong, ... not exactly essay to 'grasp the oar' with a span, ... his cool-house system to a very large tract of land, ... advised it is not only suitable for some or even for many, but for perhaps most of the Orchids from Brazil, Mexico, Peru, New Grenada, Nepal, Khasya, China, and Australia, ... will bear a temperature close upon the freezing point without injury.

The cultivators of cool Orchids in this and other countries have certainly erred in exposing many a rich and valuable lot to a degree of heat, unaccompanied by sunshine, that was damaging in the extreme to the constitution of the plants. The Messrs. Backhouse, to my thinking, are erring in the opposite direction. Every cultivator knows that Epidendrum velledum will withstand quite as much cold as Oncidium glaucosum, but it is highly prudent to make a practice of an experiment ... for the purpose, but with the expectation that the experiment will be a failure or will produce some result. There some plants under certain circumstances will ... and come out of an ordeal of exposure to cold that under slightly altered management they would succumb to.

'Previous management' has much to do with creating a constitution. Peruvian plants from high altitudes are hardy enough, certainly, but the artificial treatment to which they are subjected ... in this country ... to be in a safe direct one. A little extra warmth may do much good, a little extra cold may do much harm. But it is not solely on the principle of begging the question that I demur to the findings of the writer; I even presume upon higher ground. Take any of the Orchids that have been proved to do best under superlatively cool treatment, and I will guarantee to any grower who has a good rationale of practice that the plants can not only be much more safely managed, but equally if not better cultivated, say at the moderate maximum figure of 45° Fahrenheit. If winters were upon a par with that of 1860-61, then the minimum might be reduced to 35° or 35° rather than have an excess of the best artificial heat producible. It is sufficiently known that Epidendrum rubescens, Lachnolobos, Oncidium, and other species, from a comparative point of view, might be very safely left in an atmosphere oscillating between 35° and 30°, if the pseudobulbs and roots happened to be in the dry order, as we professionally dub it, but I should have great doubts of leaving them in an atmosphere of that kind if their physical condition were of opposite character. I, as an individual, most emphatically aver that mild winter temperatures will in no way diminish the constitution of these plants, but most decidedly warm summer temperatures will do so. There have been more plants sacrificed by the heat of summer plus fire-heat, as applied in one or other of its forms than ever have been killed by moderate winter or resting temperatures. Therefore I hold that it is better to err on the side of the warm side during our winters, than the same number in the cold side. The Messrs. Backhouse, with the additional experience of the last year or two, very lately have seen proper to change their opinion in favour of the moderate cool system, for in one of the last issues of their Catalogue they state that Orchids may be grown in a greenhouse or vinery in cases where the temperature is not allowed to fall much below 45° in winter, for although many have survived several degrees of frost, a lower temperature than that stated has not been found advantageous.

As to the second objection touching upon the physical character of the climate, and its attendant peculiarities upon that portion of Flora on which we are debating, there can scarcely be two opinions. Although the writer has not travelled over the ground, and consequently has been deprived of the pleasure of noting its physical character, it is notorious that similar altitudes in ... considerable variety of climate, and that consequently plant life and health are governed by the peculiarities of such ... the peculiarities of such ... the most peculiar portions of the low ground and along the coasts being scantily supplied with moisture and the lofty plateau between the two makes of the Cordilleras rising to a height of between 10,000 and 14,000 feet above the level of the sea, subject to great fluctuations from a moisture

point of view. Compare and contrast this with that mild, moist, and withal cool region all around Bogota, in the province of New Granada, from which some of the most beautiful Orchids have been taken, and while the mean temperature does not greatly vary, the plants present a very different constitution, and demand treatment in the artificial homes of a corresponding diversity. Take that portion of Mexico whose climate, from a thermometrical point of view, is nearly allied to the hilly regions of Peru and New Granada, and what do we find? Great fluctuations as to drought and moisture—so great, indeed, that many of the plants indigenous to the regions with which it is compared, would not only refuse to grow, but to live. Instances of this kind might be multiplied were it necessary, and did your space permit.

But let us inquire how plants themselves that show a disposition to be of a hardy constitution, capable of standing a fair degree of cold, may be affected under various conditions. Take the Flor de Mari of the Mexicans (*Lichia maxima*), and the Flor de San Joseph (*Lycodendrum crubescens*), and Fox comes it that with impunity they can resist so much cold? The answer, by the practical man, who has never even seen or read of the localities which yield them to us, is simple and at his tongue's-end. Because the plants rest during our winter. Their pseudobulbs are ripened like the mature wood of the Grape-vine, but like it their young growths would no more resist even a stated temperature of 40° than would a Vine shoot in the height of its growth. The same remarks are applicable to the Peruvian *Oncidium macranthum*, the Buenos Ayres *Oncidium bifolium*, the Australian *Dendrobium speciosum*, and the Mexican *Cattleya citrina*. All these names I may not exactly be left out in the cold, but from the finished state of their growths during our dark, dull, resting season, they may be safely treated to a minimum of 40°. Now observe my experience of their fellows from precisely similar localities. The Peruvian *Odontoglossum roseum*, one of the gems among recent introductions, because it is in the habit of maturing its growth during autumn and winter, and yielding its inflorescence at the "turn of the day," was not successful, y res at the amount of cold that its compeer, *Oncidium macranthum*, will. Neither will the Mexican *Lichia silda* and its varieties and allied species, nor the New Grenadan* *Odontoglossum coronarium*, although it revels under cool summer treatment, nor *O. Alexandre*, *O. urvium majus*, nor, in fact, any one of the lot from that locality, because they are all growing in some degree during our winter. It is therefore absurd and inconsiderate advice to tell those who trust for information to the leading journals, that such plants are best cultivated and wintered in houses of low temperature.

There is no rule without exception, however, and I have been a good deal puzzled why the Mexican *Epideodrum vitellinum*, the Guatemalan *Odontoglossum nebulosum*, and the Peruvian *Oncidium nubigenum*, unlike a. their compeers of the respective regions, should grow in England over winter without the slightest symptoms of being affected or distressed by extreme cold. One may have understood plants at rest being all the better fitted for sending forth energies of growth on the return of their spring, but these species have capabilities of endurance beyond the ordinary run of plants living in temperate localities. The young growths seem to revel in the cold, and are invested with a vigour and power of inflorescence which to the Orchidologist and the Orchid culturist must seem equally amazing. Any one might suspect these three particular plants to the lowest temperature that ever epiphytal Orchids were treated to, and come off victorious. Both to the interested and uninterested reader it must seem that the constitution and peculiarities of the Orchid family must be submitted to a crucial test at home before any extreme practice is resorted to.

As to the third and last objection raised, it is too wild to demand anything like a closely reasoned debate. But let it be again fairly put. "There is every reason to believe that many and perhaps most of the Orchids from Brazil, Mexico, Peru, New Granada, Nepal, Khasya, Ceylon, and Australia will bear a temperature close upon the freezing point without injury. Of course it is qualified by the expression that the writer does not recommend it to be tried, but if it was his belief there was no need for promulgating it, more especially as it might have a tendency to mislead a few, probably many, whose efforts at cultivation have been conspicuous by failure, and who gladly catch at any but to get at a successful practice. Besides, and above all these provinces and places enumerated represent nearly all the climates of the earth, from extreme heat to perpetual cold. It would have been, therefore, more convincing and better understood by the novice if particular altitudes, rather than great stretches of country vastly differing in physical configuration, had been referred to. Let any one follow the advice which I not actually give may be understood to be inferred from the article which has called forth the above criticism, and a loss of *Cattleyas* will be in a lamentable plight on the return of summer. But it is not only *Cattleyas*, it is *Miltonias*, *Lycastes*, *Laelas*, *Epideodrams*, *Oncidians*, whatever may be their constitution and character under treatment at home—all that is necessary to vouch, according to the ideas of this writer, is that they have come from one or other of the countries above named, and that consequently they may be placed in cool houses, and treated accordingly, with some few exceptions.

Some Orchids are not difficult to cultivate; it takes a good deal of indifferent practice to kill any of them, but once let them get out of a first-rate healthy condition, and I know nothing in the range of horticultural

subjects that requires more time and patience, and skill if you like, to induce a better state of things. One year's bad management requires three years' good management to get the plants corrected, and up to their former selves again. A wave of cold sustained for any length of time upon a house of even cool Orchids does not take immediate effect, if one were to judge by immediate results, it only becomes apparent weeks, and months possibly, after the infliction. Several people to my certain knowledge have been visited with a mishap of this kind, and did not know the cause, results having tarried so long before manifesting themselves. Is it not, therefore, incumbent upon us all, especially in the interests of those who have recently drifted into Orchid culture, to raise a warning voice, ere it be too late, within hearing of such votaries as have their spurs to win? *J. Anderson, Meadow Bank.*

ABUSES IN HORTICULTURE.

Continued from p. 54.

THIS inquiry was further gone into at another sitting. The Commissioners having taken their seats, an elderly gentleman was seen moving to the front, who turned out to be Mr. Aster Rigidus. He said, Gentlemen, through an infirmity (which I am sorry to say has got hold of so many of my set) I was not in time at your last sitting, but being an old member of a large family, I am deputed to-day to protest against the practice of casting us to the hedges and ditches, where many of us have gone out of the world outright, and all this to satisfy the mania for colour. Take my word for it, gentlemen, these showy things will wear out, I have lived long enough to see many things twisted about. Instead of receiving due attention, so as to improve us, we are ignored, and by-and-by, when again we are wanted—as I believe we shall be—we shall be found to have fallen half a century behind. The C. Have you a remedy to propose?—Mr. A. Yes, two. In order to satisfy the clamour for relief, let large beds be introduced in those fashionable mazes of colour, in which we may be planted, and then we shall relieve the mind as well as the eye, and refresh the senses as well as cool the glare. Otherwise, let us have a garden to ourselves then, as of yore, there shall be a flower when needed, of every shade, the year through—aye, said the old gentleman, with emphasis, and with odour too. Visitors will not then be content to view their bees from the r windows, or, like the painter, go back at a distance to see, but will do as they used to do—come down among us, study our habits, admiring our varied colours and penillings, breathing in our perfume, and we in turn giving back health with pleasure. But, gentlemen, individuality now is nothing it must be a mass, anything or nothing—let there be colour. In conclusion, I wish to say—and I believe I have the whole floral world with me when I say—that in a flower garden, in the place for flowers, nothing should be found but what produces a flower. Gentlemen, as I have said before, things will have a twist.—The old gentleman, who had been by many a most forgotten, was listened to throughout with the attention due to his age, and, receiving the thanks of the Commissioners, sat down.

Mr. Erica Cavendish, who seemed to be the leader of a large number of fellows, was anxious to say a few words. He said, Gentlemen, it has been with some diffculty that I appear before you, and I fear I shall give pain to all those who listen to me, through my extreme height and size: indeed this is the burden of my request, that we be not grown into such monsters. As we grow larger, our admirers grow less. One is put to the trouble of fetching a pair of steps to see just one side of us, and in the attempt has fallen down; another has stretched his neck to get a sight of us that in him we have lost a friend, while both ridicule such spoliation of beauty. Why, gentlemen, should the pleasure which many derive from us, be attained through so much trouble and pain? Let us be grown so that we can be seen as a whole, in pots that can be easily lifted about, and we shall get more admirers, be a credit to horticultural skill, nor seem so much trouble at home or abroad. All present were evidently glad when Mr. E. had retired. Mr. Vine now again made his appearance, though at times perplexed, he made some straightforward remarks. He said, Gentlemen, I question whether and all the queer doctrines laid down, and the quackery practised to make my fruit pleasant to the eye or eatable, even his Majesty the Bramble would consent to thrive. One goes in for steaming the bottom, another for steaming the top; at one place my feet are hot, while my legs are unprotected; at another I have plenty of air at the bottom, while the top is suffocated by heated and poisoned air, which has passed through me again and again, at another place I am forced out of myself at the top, while my feet are freezing, at another my bed is gaily dressed, as if to keep visitors outside. Gentlemen, I must enter my protest against such practice. ("Hear, hear," from Mr. Peach, who, when requested to keep in order, said, with an unusual melancholy look, he wished to enter the same protest with regard to himself.) Mr. V. continuing, Gentlemen, those gaudy dressed rascals are thieves in disguise. Who will tell me they rob no heat? ay, they are worse than robbers, they leave the germs of death behind them in the form of Fungi. I say, keep these rogues away, and people need not—if the other things which I have to say be attended to—linger outside, but rush within to see what they have heard so much about. The C. Well, Mr. V., what have you to say with regard to other matters you have hinted at?—Mr. V. It would be, gentlemen, quite impossible to give advice suitable for all places, and under all circumstances. I can therefore only make a few general remarks. In the first place I would say, whatever I am to do in riper years, begin early to give me attention. Let me not be cramped and distorted, with all my sap channels contracted, by starvation in youth

If wanted to yield my fruit in spring, train me in my youth up. Give me the necessary warmth in autumn and winter, as if nothing was doing out of ordinary course, viz., summer heat at the bottom, and summer heat at the top. Provide the necessary means to keep my roots in as natura, a condition as possible, and no more. Keep my roots as dry as possible from the time my fruit is ripe until the next wanted again. You would be surprised, gentlemen, to know how we like this. I have been with you for months, and none the worse for it, but better sweet bed, gentlemen, and good food—two most important essentials can only be secured by a knowledge of the local circumstances by which we are surrounded. Whatever these circumstances are, we have them, or our owners must have disappeared. If wanted only in the natural way, assist nature as much as possible, but do not make it so troublesome when we are ready not. We want no expensive watering or draining, provide only what will carry off the surface of water, and give all the air and sun possible, keep us out of what we can, and what we like let us have to ourselves. Do not to give air a one, but to take off moisture. V., receiving the thanks of the Commissioners, was listened to with great attention. There was no response to the call of the Commissioners for further evidence, the Commission was declared closed for the present. There were, however, some remarks outside, that the Commission did not include the culture, gardeners' grievances, &c., in its scope. Mr. Aster Rigidus was loudly cheered on leaving the bystanders. *Your Reporter.*

Home Correspondence.

Honeydew.—Mr. Radclyffe's remarks on *Rosa* always read with great interest by lovers of beautiful flowers, as coming *ex cathedra*, but an excellent correspondent has not manifested the acuteness of observation in forming his theory of honeydew. I trust, therefore, that he will pardon for the remarks I am about to make. Various theories have been advanced to account for the phenomenon of the production of honeydew. Pliny called honeydew "the sweat of the heavens," and "the stars," and was inclined to believe that it fell from the atmosphere during the process of its purification. Others have supposed that it is generated in the atmosphere, and that it falls like dew upon the leaves of plants. But this cannot be the case, because always most abundant on the lower leaves, and not overshadowed by the upper ones. It has been supposed to a peculiar haze or mist loaded with minute particles, stimulates the leaves to make a morbid secretion. Neither can this be the case, because it appears perfectly healthy leaves. It has also been supposed an electrical change in the atmosphere, and many theories and absurd notions have been advanced respecting this very simple natural phenomenon, which show how far men may be led astray by theorising without opening their eyes. Some have supposed honeydew to be extravasated sap, caused by great heat of summer, producing an increased flow of the secretory system, and Mr. Radclyffe now says he considers "it is nothing more than the excretion of the tree after a long continuance of E. winds and cold nights." These two theories, which are as opposite as the poles, are as the N. E. to the S. W., are alike unsupported by proof. All the before-mentioned theories are untenable, the question arises, What, then, is the cause of honeydew? I answer, without hesitation, it is assuredly produced by aphides, and by them only. These insects, although individually very minute, are able collectively to produce gigantic effects. They cover all the leaves of all the trees of a forest with their viscid and saccharine secretions, and thus produce an abundance of sweet food for other insects. Honeydew is only to be found where aphides are or have been, for they always precede its formation, which the insects puncture the plants and suck up their substance, and eject the viscid saccharine matter from their bodies, and that with considerable force, as that it may not touch the leaf upon which they are feeding. This residue falls in minute liquid drops upon the leaves or any other object beneath the tree, and becomes honeydew. I have observed on *Rosa* these small round liquid drops as they have fallen, and which soon became more viscid, and assumed a globular appearance as they spread and combined with other drops, and assumed a speckled look. I have noticed also the plants and stones under the trees speckled in the same manner with honeydew. Professor Reuss, by means of a lens, actually saw aphides eject the honeydew drops. He also made an experiment of wiping off the honeydew from *Rosa*, and placing over it a piece of writing-paper, and became in a few hours sprinkled with honeydew, but no more was formed on the paper if it was protected. I have repeated this experiment by placing pieces of paper under the aphides on *Rosa* and *Rose* trees, and with a like result. The paper in one day became sprinkled with honeydew, and round glistening spangles of honeydew were observed also that tree leaves partially covered with leaves resting closely upon them, have had honeydew under the leaves that protected them, but the exposed parts of these partially covered leaves were not abundant. I think, therefore, there can be no doubt of what is the true cause of honeydew. Mr. Radclyffe's theory of honeydew seems to be a mere whim as to the object of ants in haunts of *Rosa* where aphides are abundant. If I remember

* This has been found in other times in Peru, according to Mr. Pearce, at an elevation of 10,000 feet above the sea.

because they are the enemies of aphides, and would destroy them. This, however, is not the case, on the contrary, ants are the friends of aphides, and would not destroy them for the sake of the rich nectar they find on which the ants are remarkably fond. It is not the aphides, the honeydew expelled by them, which I have an opportunity, because they are the robbers of fruit. *A. Thompson, June 29.* [Our correspondent expresses the general belief among gardeners as to this matter. Our readers will be glad to see the statements of Prof. Westwood on this point, and the following letter from Mr. Radcliffe.]

—When the honeydew prevailed here a few days back, there was not an aphid about the plants. The insects which assemble where honeydew is, are the consequence, and not the cause, of the honeydew. Bees are very fond of it. A year in which the honeydew abounds is always a good honey year. It is not heat, with alternations of cold cutting winds, or rain, or insufficiency of water, I believe, which causes it. It always makes its appearance first on the south frontage. The same was the case at Rushton. The sun is the most powerful agent in the world, and the juice from the distillation of the pores of the upper surface of the leaves, which it always disappears. How could it be so if the plants were more or less smeared in one night by the honeydew? When there was not an aphid about the plants, it is right about Geant des Batailles. I saw it up four years ago, on account of its midwintery habits. *W. F. Radcliffe.* [We submitted the following to Professor Westwood, who kindly replies that aphides secrete a saccharine fluid which is sought after by ants is known to everybody, and this fluid is discharged by the aphides, independently of the ants, is equally true, and if there are ants underneath the twig infested by the aphides, the leaves become coated with the fluid, which soon dries, and renders greenhouse plants, not to mention the cleansing action of rain filthy. Within a few days, my young outdoor Rose shoots have been infested by the aphides, and on looking at the leaves it is easy to see many leaves perfectly free from insects, yet coated with the shining sticky fluid; it was only necessary to lift the eye to the shoots immediately above the leaves, to discover from whence the fluid had fallen, the other leaves being quite clean. That the action of the sun upon leaves, which, by-the-by, we have yet had so little this year as scarcely to allow it to be supposed that that had been the cause of honeydew lately observed, I draw out a similar fluid from the pores, I am prepared to deny. Indeed, we know that the sticky sap of Elm trees, for instance, oozes out from the trunk, and attracts wasps, beetles, and flies in great numbers.]

Myosotis dissitiflora. I fully agree with Mr. Fish that it would be folly for any one to depend on the seedlings of *Myosotis dissitiflora* for their plants, where very many are required. I recommended it of its free seedling properties. As regards the appearance and beauty of my plants, grown with no more than ordinary care, I can confidently appeal to the pages of the *Gardeners' Chronicle*, to Dr. Masters, Mr. Fish, and others. Mr. Fish's elaborate directions in growing it appear to have deterred some correspondents from attempting it. I can only repeat, that after years of extensive cultivation, I have always had it of the easiest culture—as hardy as a Dandelion, and if they will follow the plain, simple directions of Mr. May (p. 689), I have no doubt of their success. Trust not to plants from cuttings when you can have seedlings. I regret being unable to furnish very numerous correspondents with seed, not being in the habit of saving more than just sufficient to supply my personal friends. The plant certainly behaves with me than with Mr. Fish, for though I do not recommend such situations, there is now a fine specimen of it in full bloom under the shade of a spreading tree within a few yards of where I am writing, which has annually reproduced itself from seed for several years at least, without the slightest cultivation, so that "sudden death" is not always the consequence of shade. *James Atkins.*—I congratulate Mr. Fish upon his good fortune. The white one will prove valuable, as it has been difficult hitherto to find a plant to match the delicacy and elegance of the white. The Arabis is so different in habit, the white is not suitable, and now we have the prospect of a new colour by its contrast, while the plants in all other respects alike. My fingers itch to try it, and I trust to have one of the first specimens of the white variety. Your correspondent "S. B." seems to have misunderstood me. I cannot now expose upon banks, or previous cultivation, to be called nursing. As to *Imperatrice Elizabeth*, it is not worthy to be named with *dissitiflora*. The only *Myosotis* that can hold the candle to this is the blue or white, and these are generally two distinct varieties. *Dissitiflora* is also hardier than the other. So that "F. N. B." need have no fear of growing it on the flat. But on mounds it is earlier, and I think more beautiful. Finally, I plead not guilty to the charge of versatility made by "F. N. B." I am a wiser man, I may outgrow some opinions; but I am certainly no traitor of my character. When I select my present pet, and run over the common and variable in the muddy ditch after new Forget-Me-Nots, your correspondent indirectly advises, then the charge of versatility may be—not otherwise—nor till that appears. *D. T. Fish.* We bear willing testimony to the appearance and beauty of Mr. Atkins' plants, no less than to those of Mr. Fish. Our own, derived from Mr. Atkins,

have also been very fine, except one plant, which was started in the manner indicated by Mr. Fish. Eps.]

Zinc Edge for Flower-beds on Grass—Gracful curvilinear beds on lawns are often much distorted after a time in consequence of the encroachment of the Grass round their edges, and without much care in cutting it is almost impossible to keep the original design. I have therefore much pleasure in laying before your readers a simple plan to remedy this, and effect a saving of labour. The thought struck me that some kind of metallic lining would answer the purpose, and about 12 months ago I tried the experiment in my home garden, the result of which is very satisfactory. The following are the instructions—Edge round your flower-beds with a perfectly even upright cut in the Grass, 2 inches deep; let into this cut a strip of stout zinc the same depth, bending and fitting it exactly to the shape of the bed on a level with the surrounding grass. To keep the zinc firmly in its place, drive down some small, square, red deal pegs about a foot apart, driving them low enough for the tops to be covered by the soil of the bed. With a little brown paint brush the zinc edge, which should be left 1 inch deep after the soil is replaced. These strips might be painted and sanded on one side before they are put down; they cost about 3d. per foot run, and are cut from 8-foot sheets of zinc, of No. 13 thickness. The mowing machine will eat over this edge, and the stray blades of Grass that escape can be very easily clipped off, so that even a lady gardener with a pair of scissors may keep the edges of her beautiful scroll-work parterres in perfect order. *Henry Curtis, Devon Rosary, Torquay.*

Manure for Transplanted Shrubs.—Will you kindly tell me, in your next Number, whether I could use with advantage highly diluted artificial manure, such as ammonia, or guano, or nitrate of soda, to the roots of large shrubs. About a year ago I removed a number of very large Hollies, Yews, Box, &c., and, though by dint of constant watering, I kept most of them alive through last summer, they still seem very feeble and unable to make a vigorous start again. I infer the cause to be the loss of many of their roots, a loss which even with the greatest care in removing a large shrub, must occur. Some sorts of chemical manures are known to promote the formation of fibres at the roots of plants. I reason, that if I can cause my shrubs to make fibres at root, I shall cause them to make leaves and recover their health. But will you kindly tell me whether I can with safety make the experiment, and which is the best manure to use for this purpose? If you can give me a hint or two, you will greatly oblige *An Old Subscriber.* [We should, under the circumstances you mention, be inclined to put more faith in liberal watering or in mulching the roots with cocoa nut fibre, than in the use of manure. Perhaps superphosphate of lime, 1 to 1 oz., forked into each square foot of soil round the shrubs, might be of service. Eps.]

Large Mushrooms.—Eighteen genuine Mushrooms, some not quite opened, at an average of 8½ inches in diameter, one 10½ inches, were brought to me on the 23d June from the meadows adjoining the Great Western Railway. Have you or any of your correspondents a record of any of similar size? *R. B. Ardington, Wantage.* [Is our correspondent sure that they were genuine Mushrooms, and not *Agaricus arvensis*? Eps.]

Phormium tenax.—The following particulars respecting a plant in my possession may be interesting. In 1836 it became too large to be sheltered in the greenhouse, and therefore was left out in a pot standing on gravel till Jan. 3, 1837, the thermometer the previous night registering 15°. It was then in its frozen state put into an empty cottage, where it remained until May, 1837. Not seeming a bit the worse for its unkind treatment, it was repotted and replaced in its former position on the gravel, where it has remained up to the present time. The pot was broken in December last, and left the roots exposed on one side, but the winter was not severe enough to injure them in the least. The plant was repotted in March last, and has now four flower-stems, 6 feet high, the flowers on which are just expanding. *William Foster, Stroud.*

Abies Morinda.—I am induced to offer a few particulars as to the size of a specimen of this noble Fir, which is growing in the grounds of Mr. Joseph Smith, Shelsley Walsh, Worcestershire, near to the river Teme. It is a graceful and magnificent specimen, developed in all its beauty, and sparkling in the sunshine with hundreds of its vivid green cones, from 6 to 8 inches long. It measures 9 feet in circumference at 1 foot from the ground, 51 feet in diameter in its branches on the ground line, height, 110 feet the bole rises 28 feet without a bough, then branches out with great strength and vigour, giving to the trunk the appearance of a greater girth than above quoted. The branches bend gracefully down and kiss the ground, and on one side dip into the waters of a rill which is constantly running, and flows from the wooded heights behind. The side branchlets hang down to the length of 15 to 20 feet, which gives a very elegant effect. The soil is clay, and of great depth. The situation is sheltered from the north and west, but perfectly exposed to the south-east. This tree is supposed to have been planted for upwards of 300 years. In some situations this tree is subject to have its young shoots destroyed by early spring frosts. Notwithstanding all drawbacks of this sort, I believe there is to be found in every garden in Great Britain a situation suitable where the *Morinda* will be found to do well, and display its great beauty as an ornamental tree. *G. Westland, Witley Court, June 28.*

Gigantic Arum from Nicaragua.—The paragraph, extracted from one of my letters, which you published on the 27th of February last, about the gigantic Aroid discovered by me in the mountains of Nicaragua, has had the good fortune to make the rounds not only of the English and Continental

papers, but also of the American, and been commented upon in many ways, even by your facetious contemporary "Punch." I daresay some thought, when reading of the dimensions of the plant, that I, when penning that paragraph, allowed my imagination to run riot, and was dishing up a mere traveller's tale. But I took the precaution to preserve the flowers in spirit, and to send Mr. William Bull two fine rhizomes of the plant. Both of the latter are now growing, and one of them, received in England only on the 17th of April, is now in a fair way of proving that I rather understated than overestimated the case. It is in a pot of only 11 inches in diameter, and on the 23th of June the petiole of the leaf (the plant has only one leaf at a time) was 7 feet high and 9 inches in circumference. The blade is not yet developed, and I believe that before this communication sees the light the petiole will have attained more than 10 feet, the height it had in Nicaragua. It looks like some huge snake (beautifully mottled) standing bolt upright at the command of some eastern charmer. I may add that the leaf in the present state already exceeds the largest recorded dimensions of all other Aroids with a like habit, and, when fully developed, it will turn out to be what I said, the largest Aroid, both in leaf and flower, of which we have cognisance. The flowers being hermaphrodite, not dichous, the plant in question cannot be referred to *Amorphophallus*, *Conophallus*, or allied genera of the Eastern hemisphere, but will on closer investigation prove to be either a genuine *Dracontium*, or the representative of a closely allied new genus, which "Punch" has asked me to name after Gog and Magog. It would not be the first barbaric name we have in botany, and probably not the last either, and who knows what, after due consultation with the City Corporation, I may do? *Berthold Seemann.*

Foreign Correspondence.

THE SPRING IN ALGERIA (continued from p. 619).—Tenuel is a fortified military outpost and station, occupied by about 3000 men, the settlers who minister to their wants, and a few farmers, or colonists as the French call them. I estimated it to be 4000 feet high with the barometer. From this point the road descends into the desert. Five miles beyond all trees or shrub vegetation ceases, with the exception of a few wild Jujube bushes. This shrub had shown itself all along, even in the Mitidja, as a mass of slender, naked, thorny branches, twined in and in, and lying on the ground like dead brambles here and there. It followed us to the top of the Atlas, and we were told that, along with the Squill, it was the last plant to disappear in the desert. It is clearly the thorn Solomon speaks of that crackles when burnt. It is cut and used by the Arabs as a protection to their camps in this state. Later it throws out leaves, and becomes a pale green bush. A couple of miles to the west of Tenuel there rises a mountain peak, 1400 feet high, the noble flanks of which are occupied by a magnificent Cedar forest, similar in all respects to that which clothes the Mount of Lebanon. A drive of about 13 miles by a haggard road took me and my companions into the midst of this truly mighty forest, and then a climb of 1000 feet brought us to the summit of one of the highest peaks of the Atlas range. A truly glorious sight was there unfolded to our sight. On the north the grand old Cedars covering the mountain's flanks, the two lower ridges we had crossed the day before, the plain of the Chiffell, and the high mountain on the south side of which Milanah is situated, on the north a slope at our feet, covered for a few miles with scrubby, dwarfed Ilex, then gentle undulating green with Grass and corn, then a green flat plain, and then about 15 or 20 miles beyond us the real desert, a flat yellow sea of sand. On the far-off south-east horizon was a ridge of low mountains, several days' journey off in the desert, and inhabited by the wild Touareg Arabs, the conductors or pillagers of the caravans. The abundant winter and spring rains, precipitated by old Atlas, had clothed even the high plains which form the margin of the desert with fugitive grasses and verdure, but no shrub or tree could stand the glare and heat of the summer sun and the breath of the desert lower than about 1000 feet beneath where I was standing. Protection from the south had now become a question of life. If the Date Palm can bear his rays even further south, in the desert itself, it is only on condition of profuse and constant irrigation during the summer. A Date Palm oasis can only exist and thrive if there is an abundant supply of water, sufficient to irrigate constantly every tree. The Cedars are most majestic and venerable. They cover an extent of 6000 acres. Some we found from 24 feet to 30 feet in circumference, or from 8 to 10 feet in diameter. The forest belongs to Government, and many trees are being cut down to make sleepers for the railways, a rather sacrilegious use for massive beams of Cedar wood. The ground underneath was enamelled with flowers—*Hyacinths*, *Narcissus*, *Buttercups*, wild *Roses*, *Daisies*, *Pansies*; whilst the *Honeysuckle* and *Bramble* grew vigorously from cavities in old Cedars. Perhaps the seeds of these plants, the Hawthorn for instance, may have been brought by some bird of passage from the far north, for I recognised the note of birds that regularly visit the Pine forests of Norway during the summer. Snow still filled the ravines, 200 or 300 feet from the summit, whilst the thermometer, even at Tenuel, was 85°. We heard the toucan sing, and saw many jays and crows. There were many deciduous Oaks of considerable size, just beginning to put forth their new leaves. In a word, whilst sitting under the shade of a Cedar tree, and looking into the great desert of Sahara, we were surrounded by the vegetation of an English wood in May, and enjoying the delightful coolness of an English spring. The soil was a deep rich leaf-mould, the result of vegetable decay for thousands of years. On passing

delay and cost equivalent to a law-suit and with most of its characteristics, and pressing in *inverse ratio with the extent* of the transaction,—heaviest upon the smallest;—and what other result could there be than that which is exhibited by every evidence we possess?

The actual number of land owners in England has been estimated at different periods down to the present time from very imperfect data, and with varying results, but one feature in the computation is uniform and unvarying, the decrease, at each successive period, is the one thing most remarkable. The silence, the ir-illiousness of the operation conceals it from the public view. To the mass of the community it is as insensible as the earth's diurnal movement, or the Nutation of the Poles. Freedom of trade, and a reduced Tariff, instead of exposing and bringing it to view, actually help to disguise it, by supplementing to any extent from other lands *inter alia* the deficient produce, both in kind and quantity, of our own: we say deficient because it is not pretended, at least by any one who has studied the capacity of the soil, that the large-scale cultivation gives anything like the same absolute produce with the small.

What is asserted for it is that the acreable return is greater *relatively with the amount of labour employed*: a doctrine and phraseology borrowed—with cruel misapplication, from *Manufactures to the Soil*; which is not a dead machine of human fabric and invention, whose virtue lies in the amount of manual labour it displaces, but a living agent and partner to the hands and brain and motive in league with it * which, like the Cow's udder, gives more the more urgently it is entreated, but dries off to a scantier yield in proportion as the pressure becomes relaxed, or artificial. Or, indeed, we might amonid the simile by contrasting the incomparably more abundant yield which the animal affords to the reiterated importunity of her own offspring, against the daily dolo more rudely withdrawn by the hard hand of the milkman as he hurries through the Dairy-hord. The Earth was made before man, and "was made for all"—we do not say for 'peasant-proprietors,' nor for Norfolk squires and Lincolnshire lords farming their three or four thousand acres,—not for either of these, alone, but for *all* comprised by these two extremes, themselves open perhaps, like all extremes, to some objections not applying to their intermediates.

The truth is that the machinery-doctrine of 'most produce by least labour' is simply, as applied to the soil, the doctrine of starvation and dispossession and instead of belonging to the advance of knowledge and civilisation, is a retrogression towards the time when a 'knight's fee' included a whole Wapentake or Hundred, and a Count was territorial lord over a County. It is this error which underlies the ills of the agricultural Labourer, and in conjunction with our universal system of 'Tenancy,' makes it nobody's interest to find him a cottage that will pay for the building, *that is*, for which his wages will enable him to pay the rent. The farm tenant cannot do so—the land is not his to build it on, nor the permanent interest has, to care to sprinkle the land with dwellings that might furnish hands for a res, *i. e.* those who come after, or even, it may be, for *next year*, for who can tell what a *six months' notice* may bring forth? And the Landlord cannot do it: for what, in fact, has he to do with the matter? He lets his land for the most that another man's capital and skill can make of it, by any means not forbidden in the 'agreement for a year.' It is the Tenant's business, and natural endeavour, to make the most that he can, and in the shortest time and if he could cultivate his farm *entirely* by machinery, without employing a single labourer upon it, it would be worth his while even to sacrifice a further subtractional percentage from the real yield, to purchase a saving so economical to an occupier from whose point of view each cottage is a standing threat upon the *Rates*, subject to which he rents his farm. There is in China a refined method of capital punishment called 'slow mangling,' by which the culprit is gradually flattened out and attenuated between *two hard surfaces*, upper and nether, just as a baker rolls out dough. The head alone is spared, lest the victim's life should be destroyed before he has had full time to

appreciate the whole process. Whether there are any *Iron-Houses* in China for the last polishing-off or 'Finish' we are not accurately informed. There ought to be; to make the parallel complete.

Such is the English Land tenure system, as represented by three *degrees per se*—1. A Tenant-for-life under Settlement, whose *landed ancestry*, for such it is, after meeting every outgoing of the estate (we will not further the text by an attempt to enumerate them), must be devoted to the education and provision for his younger children, who, taking nothing hereafter, are the first claimants for every spare shilling that can be saved from it by the present 'Life-in being.' 2. A yearly Tenant, *farming* the land, for the speediest profit that can be made from it, by the most compendious machinery, with the least outlay in manual labour. 3. A Labourer of whose interest in the soil, or relation to it, or to either of the before-named parts, it is difficult to find words properly descriptive. Perhaps his truest definition, and the shortest, is by negations. He is *not* his landlord's Servant, and he is *not* his employer's Tenant;—*i. e.*, the man who employs, cannot house, and the man who could house, does not employ him. Dependence has its advantages, and Independence its charms: but his lot is cast in a sphere equidistant from either. The proposals to improve his condition by education rather bring to mind that of the Bourbon Princes who wondered why the famishing poor in Paris, if they were short of bread, did not use Pastry. Education, which enhances the sensibility to suffering, also, happily, tends to emancipate the sufferer: and an *educated* Farm-labourer is, in nine cases out of ten, a farm-labourer no longer. When we are considering the problem how to *improve the Nest*, you will hardly help us much by merely showing the birds how to fly out of it. The question as to his cottage accommodation becomes, under such a system, one of those detached problems that fall into the waste basket of 'pure philanthropy.' Whence he comes, in the morning to his work, or whether he goes, in the evening, when he has done it, provided he *has* done it—what is that to his employer? who has no cottage to give him, nor means of building one: and if nothing to *him*, what is it to the landlord? who has no motive for spending the portions of his younger children in making questionable additions to the inheritance of his eldest, by putting up a class of buildings that *don't pay*?

Such is the system; described in the abstract not, of course, as it is modified and ameliorated, in *England*, by land resident landlords, and enterprising Tenants, confident in their holdings under the title of a 'good understanding.' What we have to consider when examining a system, is its *absolute* elements and structure, not the dress it may be made to wear under special and long established circumstances,—a resident proprietary almost partnering their Tenants' interests, a national love of country life, agricultural pursuits, field sports, and 'local self-government.' Taken in conjunction with all this, the system finds plenty of advocates, who think they see in it the ultimatum of 'agricultural prosperity,' men whose view never for one instant has penetrated this outward dress and *filigree*, to the skeleton within the bare and forbidding form that presents itself wherever these consoling adjuncts are altogether absent,—as instanced in a non-resident proprietary, estates of enormous extent—twenty—forty—sixty thousand acres life-owned by a titled absentee, and committed to the vicarious charge of an agent, himself non-resident, and acting for *several* such 'properties' at once,—in a word, all that is comprised in "The Realities of Irish Life."

In vain you tell its defenders that (with the now diminishing exception of Russia,) there is no other country in the world where such a system prevails. They even hear in this a compliment and tell you that is because other countries don't understand Farming as well as we do. In fact, the world's area should, according to them, be laid out on the pattern of a couple-of-thousand-acred Norfolk farm, and those who don't happen to be either large landowners or large Tenants must 'get out of the way.'

"Solitudinem faciunt,—Furtum appellant."

It is not difficult to see that in a prosperous commercial and manufacturing country, where the displaced agricultural population can find employment in the Towns, such a system can go on, and prevail, for a considerable time, without

challenge. The crowding and other evils creates in thousands of narrow streets and the miserable cellars and garrets, reeking with population that ought to be scattered over smiling country districts, are indeed sad to think of, but there is one sadder thought—that of ignorance that cannot, and too often does not, will not see that the cause of all this is to be found in laws which preclude reforms, and which thought unpatriotic to call in question.

THE Contagious Diseases Animals Bill, No. 2, now before the House provides for an important alteration in the present system of regulating the foreign cattle trade. According to the law now in force importations of cattle and other animals, or of substances connected with cattle, can only be prevented by order of the QUEEN IN COUNCIL. The Bill proposes to obviate the inconvenience and delay to which this necessity has sometimes given rise, by conferring the Privy Council the power, "by order, to prohibit landing," "in relation to foreign animals, or to any specified kind or class of foreign animals." With this exception every thing is left very much as it was, and the various clauses of the Bill, divested of their technical phraseology, amount in effect to regulation of the foreign cattle trade in the way which the Privy Council may from time to time deem necessary. It is conceded that a very considerable range of power is desirable to enable the Lordships to meet emergencies, but it does not appear to be generally determined to what extent the power should go. The Bill at once disposes of the whole question by making the power absolute; so that by Order of Council importation of animals from any country may be prohibited or permitted; cattle and sheep of certain countries may be landed and treated as native cattle, and it is for the Privy Council to determine to what classes of animals this privilege shall be extended, and what other classes shall be landed with a defined parts of ports where they be so landed and segregated.

Whether these provisions be effective abortive depends entirely upon the capacity the Privy Council to decide when restrictions are necessary and its energy in enforcing them. One thing is quite certain, the Bill, as at present amended, does not meet the views of the home producers, while its provisions are too stringent to accommodate those who advocate unrestricted trade in foreign stock. The first complaints are directed to the stamping out of infectious diseases when they have already attacked our stock, and that nothing is attempted in the way of protecting us against the introduction of such maladies from abroad. On the other hand, those who represent the consumer contend that the proposed restrictions will be quite sufficient to hamper the trade and keep up the price of supplies. Meanwhile the idea of a 'free market for the sale and slaughter of foreign stock' has undergone a change, the agricultural interest, as represented by the Chamber of Agriculture, formerly required "safety markets for all imported cattle and sheep, now the demand is limited to the establishment of such markets for animals which are brought from 'infected countries,' and the principle of movement for animals which are imported from countries where cattle plague or small-pox have not existed for a certain time, is accepted.

Upon the subject of separate markets for foreign animals the Bill is permissive, and peremptory, "the local authority may, if it shall, establish markets in defined parts of ports, is the language of the clause relating to the material point. At the outports, where foreign animals are landed, the authorities have established markets, and in respect of the matter the Corporation has agreed to construct a separate market for the reception of all foreign stock which is imported from 'non-affected countries.'" So far the 'safety market' question may be considered as settled, but it is infinitely more important question what animals are likely to be sent to it remains to be answered. Knowing something of the details of the foreign cattle trade, we can quite understand that the number of cattle which will be landed in the "defined port" will be extremely limited. With Spain, Normandy, Brittany, and probably Sweden and Denmark free to send cattle without restriction to this country, we may fairly anticipate a considerable falling off in the supply of stock from the "infected or transit countries."

* For thou shalt be in league with the stones of the field.—Job 8: 13

by more judicious purchases, and that fine old bul. GARIBALDI (17,919), of Cambridge Rose blood, was used. The dire effect of the plague in the county in 1865-6 necessitated the greatest vigilance; the cattle were housed until the middle of June, when, tempted by one hot bright day, they were turned out to grass, in the course of a few hours sickness appeared, and in a week or two the larger part of the herd was swept away at a great loss. Old GARIBALDI and a few others survived, and, nothing daunted, as soon as the county was healthy, Mr Davies was again in the market, and the pedigrees of his more recent purchases are before us.

The cattle are arranged in families. At their head stands *Moss Rose*, one of the best known and most public cows in the country, a 100 qrs. purchase at the Killbow sale last year, beside her stands her white heifer, two years old, by 17TH DUKE OF THORNDALE. Then comes *Wellingtonia*, from Haverling Park, a Waterloo, and her roan heifer by 12TH DUKE OF THORNDALE, below these stands *Surmise 14*, six years old, by a Cambridge Rose bull. These pedigrees, given on pages 2 and 3, are of good Bates blood. Turning over we have five *Cleopatra* from Harker, full of Princess blood. A K. platy cow, *Harmony*, from Mr. Cole, succeeds them, and is paired with four *Roses of Thorn* etc., and descendants of Mr. John Wood's *Garibal* or *Rose* family. Pages 4 and 5 are filled with *Constance* & *Duchess*, and her roan cow calf, these are of the old Colling Lady tribe; at their foot pedigrees of two *Charlottes* from Mr. Logan's are placed—a tribe better known for personal merit than for fashionable descent. On turning over we have two of the *Kirkcubright* or *Sockburn* *Blanches*, and two *Leonoras* from Mr. Jolly's that survived the plague. The last pages of females contain three *Princess Royals*, and three *Flattations*, both of short pedigree, but bred originally in the neighbourhood of Thirsk, Yorkshire.

The bulls are headed by 12TH DUKE OF THORNDALE, the imported American bull of 1867, GRAND DUKE OF ESSEX 4TH, a high-priced animal of the Barrington blood at the Haverling Park sale, and *Moss Rose's* young roan son by 10TH GRAND DUKE. These three bulls are, and will be in use, the eight others are of the same families as the heifers, and range from four months to two years old, and are by Bates' bulls, and of various colour, and for which, probably, in sale language, "no reasonable offer will be refused." GARIBALDI and GRAND DUKE OF ESSEX 4TH are the sires of most of the younger animals, and three are accredited to the Thorndale bull. The herd will probably receive many visitors during the great show week, and will no doubt give as much satisfaction as the pedigrees, which not only read well, but are nicely printed on the toned catalogue issued from Langham Place.

PRESENT APPEARANCE OF THE CROPS.

Berkshire.—I am sorry I cannot speak favourably of the growing crops in this neighbourhood. Wheat and Barley especially have been injuriously affected by the large quantity of rain and lowness of temperature we have had during the months of May and June. Oats, Beans, and Peas promise at present to produce the best crops. *James Hulbert, Stroudley, near Reading, June 30*

Devonshire.—The Wheat crop is not so promising as last year, although the late hot weather is improving it much on all weak lands. It is coming into ear very unevenly, and with a small ear. The cold ungenial weather in May was injurious to both Wheat and Barley, and the latter will not be a great crop. Oats are looking very well. Peas are blighted. Beans will be a great crop. Mangel Wurzel does not grow well, and Swedes are only just sown. Grass seed is plentiful, but the hay crop is light. *George Turner, Cudbury, Tiverton, June 28*.—Wheat is again the best cereal, and promises a full yield. Barley short, inferior, suffering from drought. Oats short, rusty, unpromising. Potatoes field crops not looking well, no luxuriance, growth arrested by the very dry weather. The blight has again appeared in the earlier crops. Mangel a good regular braird, and the plants flourishing. Swedes patchy. Hay good crops, and well saved. Orchard Apples one-third of a crop. *P. Cowan, Barnstaple, June 29*.

Dorset.—In reply to your letter of yesterday, respecting the present prospect of our crops in this neighbourhood, on much of the Wheat on the wet, and also on the poor soils, which are not highly maintained, the plant in the early spring ran up very spindly and thin, and where it was not harrowed about and rolled down it did not tiller out, consequently it looks thin, and will be a lighter crop. It is now just out in ear, it looks very uneven, and I am of opinion that, even with a good turn, the yield must be about four sacks less per acre than last year. The Barley and Oat crops look well, and promise for a good crop on most of the good soils, except on very wet land, where it was put in during the time the land was very wet and did not work well. The Mangel plant looks very well, and Turnips and Swedes are taking well. The disease has made its appearance in many places about here in the early Potatoes, which we are now beginning to make use of. *T. H. Saunders*.—Grass is abundant, the hay crop in the meadows over an average, and is being well secured. Clover, average. The appearance of Wheat on clay is much under average. Barley, Oats, and Peas, a prospect of a good crop. Turnips, an excellent plant. Potatoes, a good prospect at present. *W. J. Toss, West Bucknowle, Corfe Castle, June 26*.—The fine weather during the last ten days has raised the spirits of the agriculturists in this locality very much, and has enabled them to secure a large crop of hay, of fine quality, in good condition. The Wheat (much lighter in straw than last year) has improved, and the ears are much more even than I expected they would be ten days ago. We shall not have so large a crop as last year, still I hope there will be very nearly an average one. Of the Barley I cannot speak confidently, as it is not

sufficiently forward. The winter Oats appear to be a most promising crop, although the straw is struck with rust. Flax a heavy crop. Mangel plants regular and promising. Swedish Turnips very hopeful. Potatoes partially affected with disease. On the whole I see no cause for despondency, but opinions vary much. *Symondsbury, June 28*.

HANTS.—The appearance of the crops of corn in this neighbourhood is not very satisfactory. The Wheat crop appears to have suffered very much from the cold wet weather in May and the low temperature prevailing up to this time, especially upon cold heavy land and light soils in low condition, and upon the whole the Wheat crop is not likely to produce an average should the weather prove favourable, and the harvest will be something like three weeks later than last year. Oats and Barley may produce an average, but much will depend on the weather, as a large portion of the crop has suffered from the cold wet weather, but not to the same extent as the Wheat plant. Beans and Peas are generally well spoken of, and bid fair to exceed an average produce. The hay crop has been very abundant, except in those cases where the seeds were deficient, and a third of the crop has been stacked in good condition, the remaining portion is injured by the late rains, but not seriously. The meadows and up and pastures have above an average produce, only requiring favourable weather from this time. All kinds of fodder crops are very abundant, as also Grass in the grazing land. A large breadth of Mangel has been sown under favourable circumstances, and never promised better. Swedes and Turnips have also planted remarkably well, with but little injury from the fly. Potatoes promise well, without any appearance of disease at present. *Joseph Blundell, Land Agent, Southampton, June 25*.—The Wheat crop is bad on wet land and poor thin clays, and far from good on loamy and gravelly soils. It is best on chalk soils, but the ears are not large. Although much will depend on the weather during July, yet in any case the harvest must be backward and under an average. Barley varies, but is about an average, Oats over average. Beans and Peas good, Mangels a good promise; Swedes and Turnips an excellent plant. *W. C. Spooner, Eling, near Southampton, June 28*.

KENT.—I am getting my bustle over with my seeds, and have commenced my usual walks by the footpaths to inspect the crops. There are in this great corn county only a few fields of Wheat that will yield an average crop. On all sands, gravels, chalks, &c., there is not half an average crop, the Wheat not being knee high, and has been as yellow as gold. As to Barley, there is not one good field in fifty, many not 1 foot high, and others not knee high, not half an average crop. Peas are bad, and many not the seed again. Beans a very partial crop. Oats, but few grown. On the whole I cannot see half the crop of corn of last year, nor half the straw. The old Sainfoins are a great crop, those sown last spring are like the Clovers—mostly Wheat and Barley from the shedded corn last harvest. A great crop of hay. A more unproductive crop of corn I have not known for many years. The weather has been, all the spring and summer thus far unheathly. A general blight on all fruits, no wall fruit, and but little other kinds of fruit. The year 1890 was a wet harvest, and I did not finish carting my Wheat till October 2. There is a great breadth of Potatoes, at present not the least appearance of blight, they are selling well, at 8s a bushel. When I have made my annual inspection, and make my report, I shall be able to give you a more correct report. I expect the harvest here one month later than last year. I have seen about 1000 mounds, and upwards of fourscore years, and I still see a deal of harvest, so many of my old friends, staying two or three days with each of them; they drive me about to see every improvement in their localities for instance, the fens of Cambridgeshire, Norfolk, &c.—the greatest improvement in all England—which, when the roads are complete, costing 3002 a mile, will, in the course of time, be studded with farm houses, with resident tenants, which is so much required in most parts of England, thereby making homes for hundreds, increasing the produce of this dependent England, and also doubling and trebling the value of the land. England is not half farmed, with a few things, such as security of tenure, &c., as I have pointed out to several M.P.'s, the produce of England might be doubled. Leases of 14 years are not sufficient; let any man take a beggared farm, it will take him seven years to restore it. He has then only four years to himself, and the remainder to ask himself a few questions as to a fresh lease. *Robt. Malson, Wingham*.—The Wheat crop about here does not look so well as we should like to see it. The cold weather keeps it back. Where it is out in ear the ears are small. Barley is not a good colour, and Oats are in many places much eaten with the wireworm. I consider, under present appearances, our corn crops will be under an average. The Sainfoin has been got up, but not very well, there has been so little sun the cut was light. Mangel Wurzel is thin in plant, there being great complaints that they are eaten either by wireworm or the grub. Turnips are coming nicely, but want warm weather. *Mark Sandford, Martins, near Dover, June 29*.

Lancashire.—Wheat, below average, thin and light of straw, and late. Barley, not much grown, but where grown good. Oats, generally good, occasional fields may have yellowed a little, but upon the whole promise well. Potatoes the principal crop of the district is good, and promises largely; plenty of tubers at the roots, and only requiring warm weather to develop them. Turnips, not grown except after early Potatoes. Eye-grass hay, a fair good crop, deficient in Clover, but will bulk largely. Meadow hay early meadows are good, and an abundant crop, and are even cutting

up better than anticipated, late ones also promise well, but will not bear heavily. Beans this crop is not much cultivated, an occasional field may be seen, some very good and others indifferent. *Northbrook, Leyland, June 25*.

ST. ESSEX.—The weather up to the present time has been very bad for the growing crops, only a week or frost out down the Potatoes and French Beans in particular spots. To-day is better, over half a day of sunshine, the longest day here was more like a December day, very dark and gloomy. The Wheat crop is bad, much of it cannot be, under any circumstances, over half a crop, the early Wheat has had a very hard blooming time.—I trust there is a better time for the late. You see occasionally a good piece of Wheat, but it is quite the exception on this year. The best Wheat in our district is on the early good sandy land, but I fear the cold nights and sunless days will tell badly on them. Barley is very much the same as Wheat, but will no doubt improve very much in the present fine weather continues. Oats promise good, being strong and healthy. Beans good, I fear the winter Beans are blighted. Peas good, some are breadth sown. Mangel coming on very well, Swedes and Turnips doing pretty well, but rather late on account of the wet. Hay, Clover, and the mixed Grasses, under an average crop, and deficient on account of the failure of the seed, considerably damaged by rain. Meadows a good crop, early much damaged by the weather. Pastures bare, cattle and sheep have not done well,—too wet and cold. On the whole, Wheat must be a bad crop, would be very much improved by fine warm weather. Barley may be an average, but like Wheat, needs fine warm weather. Oats, Beans, and Peas promise good. *James Eames, Lynch, Midhurst, June 28*.

WOMEN AND CHILDREN EMPLOYED IN AGRICULTURE.

The following is an abridged report of Mr Fawcett's speech on this subject in the House of Commons last Friday.

MR FAWCETT moved—That, in the opinion of this House, the education of agricultural labourers is in general so unsatisfactory a condition that immediate legislation upon the subject is imperatively demanded. This House, therefore, thinks that the Government ought to legislate upon the subject during the next session of Parliament. The Commission appointed to inquire into the subject had not yet completed their labours, but enough had been done to enable the House to draw some accurate conclusions as to the general condition of the country, and those conclusions were that education was generally most unsatisfactory, that wages were most inadequate, and that the cottages were in a most miserable condition. He believed that little could be done by Parliament directly, but he believed that this House could exercise an important indirect influence in raising wages and improving the condition of agriculture. The educated labourer could produce a larger figure of wealth than the uneducated labourer, and if they gave them that refinement of mental culture, they would refuse to live in the miserable hovels in which the ignorant labourers were contented to dwell. Our schools were a splendid success in the education of the population if the parents were not sufficiently educated, these were, and there was a large demand for juvenile labour. Formerly there was more time for school, now the children were removed at too early an age. The question was how these two evils were to be cured. Some, no doubt, would say that compulsory education was anti-English, and contrary to the free spirit of the nation; but the time for such a plea had passed away, and to the honour of the great Conservative party they destroyed it 26 years ago by enforcing compulsory education in manufactures. They, therefore, could not be surprised when the manufacturers found that the evils they predicted from the system had not been realized, that they should do their best to confer the same blessing on agriculture. They had extended the Factory Acts to every branch of industry except agriculture, and the principle had been laid down that no child be employed until he was eight years of age, and that between eight and 13 years of age every child employed must attend school a certain number of hours daily. If, therefore, they were to have Parliamentary interference, what was the best form for it to assume? Compulsory education had been employed in two forms. In almost every branch of industry, except printworks, the half-time principle had been laid down, but where it had not been adopted the plan was that for every child employed under 13 years of age the attendance at school should be as many hours a year as the half-time system had been a great and extraordinary success, whereas the system adopted under the Factory Act had been a complete and disastrous failure.

The Half-time System.—The child who was at work half-time and at school half-time worked better and learned better than the child who was wholly at work or wholly at school. But if they only enforced a certain number of hours a year for attendance at school and they were gathered into three months and the child worked nine months continuously, the child forgot in the first months what he had learned in the previous three months. The Assistant Commissioners in reply to the half-time system, or any modification of it in agriculture. He would ask the House whether there were not greater advantages associated with any other scheme that could be by any possibility suggested. They must bear in mind the impossibility there was of imposing legislative interference or any particular test without causing some temporary disturbance and hardship. And he thought it would be impossible to impose any scheme upon agriculture without causing some amount of temporary disturbance and hardship. They must, therefore, consider whether the advantages that would be secured therefrom. The scheme that had found most favour in connection with agriculture was the forbidding a child to be employed in that industry until he was 10 years of age, he would time he would have received a sufficient amount of education. He, however, thought the standard education which a child of 10 years of age would have acquired would, when he went to work, be very away, but there was the further difficulty, how were they to get the child to school until he was 10 years of age, because it must be borne in mind that hitherto their legislation had been in reference to those who were at work, and not to those who were not at work. Without, therefore, they took some security that the child should attend school until he was 10 years of age, they would confer greater injury than benefit on him by not permitting him to work under 10 years of age. Without it there would be no guarantee that the child would not be sent to work

I look forward confidently to the day when every root grown in this country shall be converted into a dry feeding substance, and every particle of straw not absolutely required as litter to secure the comfort of stock (and by placing cattle and pigs on boards this may be reduced to a minimum) will be deprived of its feeding value before it is returned to the land as food for vegetable life. Hugh Smith, 21, Westbourne Terrace Road, W., London, in "Mark Lane Express."

STEAM CULTIVATION.

I HAVE seen Mr. Greig's paper, read before the Chamber of Agriculture at Cirencester, the other day, and I beg that you will let me take part in the discussion upon it. Mr Greig says as follows—First, "Take for instance a piece of heavy clay land and Wheat stubble, which is intended for a green crop the following year. My impression is, that in no case should any subsoil be brought to the surface, but that the land should be stirred to the greatest depth possible, and, after being stirred, that it should not be touched again during the autumn,—the manure, of course, being applied before the cultivation, so as to become thoroughly mixed with the soil by the process of stirring. In the spring, I consider that all green crops on this sort of land should be sown entirely on the frosted mould."

I take it that Mr. Greig has not well considered the point, for if we manure and smash up a piece of heavy clay Wheat stubble to lie through the winter, in the spring we find it overrun with self-sown Wheat, if with nothing else, and very frequently with Grasses of various kinds. Professor Wrightson questions the use of the smasher for such an operation on such soils, and goes on, from information that he has received, to infer, "that when the cultivator was used instead of the plough, weeds, such as Coltsfoot, Thistles, and Docks, were rather apt to become a difficulty to the farmer." This inference clearly proves that the learned Professor does not clearly understand the growth of those weeds, for the plough merely cuts off some 5 or 6 inches of the top or strong part of them, and rolls them over to be planted, and grow with the next crop. For instance, a Thistle in a Wheat stubble after Beans thus treated is tenfold stronger than it is in a Wheat stubble after a fallow, and a Dock turned down will be safe to grow again stronger than ever. Mr Smith, of Bibury, goes on to show that "he had seen a piece of land every day that spring, which had been cultivated instead of being turned over, that was as green as a meadow, needing now four times more work than if it had been ploughed in the autumn. That was in Barsley parish. If that had been ploughed in the vegetable matter would have manured the land." Now this is an extreme case, and not worth talking about, for it is a piece of land in a wofully filthy state, and must be costly to clean, whether done by the cultivator or by the plough. What are we to learn by all this? I say that Mr. Greig's deeply stirred land will in the spring be overrun with Wheat, &c., and that when the seed-time comes there will be no "frosted mould" left in which to drill his seeds for a green crop. Professor Wrightson says that he must plough it, or it will be all Coltsfoot, Docks, or Thistles, and Mr. Smith, of Bibury, says plough it. And I now say ridge-plough and subsoil it, laying the land in ridges a yard in width, worked a foot deep, but do not do it until October—until the Wheat fallen out in harvest has grown so that it may be turned under with the dung and buried, and in this way open up the subsoil in the trenches to the action of the sun, frost, air and water, during the winter months. If this land is to be planted with Mangels in the spring, it should be well harrowed to pull down the ridges, and to destroy all the seedling weeds that may have grown during the winter. This harrowing may be done with horses, let Mr Greig say what he may about the tread of their feet on the land in the spring, for my Mangels on land thus treated speak for themselves—that they have received no harm, but look well. If it is intended for Swedes, the ridges should be split and thrown down by a subsoiler worked by horses, and, after lying a time, well harrowed, to kill the seedling weeds that may have grown upon the land during the winter. My Swedes on land thus treated speak for themselves by their healthy appearance.

Secondly—"From what I have observed, I believe the best method of putting in cereal crops is merely to scratch the surface, loosening no more soil on the top than is required to cover the seed; but of course I am supposing that the land has been thoroughly loosened for the previous green crop." We must not take this in the plural number, for what may do for Barley will not do for Wheat, and I have a right to infer that Mr. Greig is pointing only to the former or spring seeding. When roots have been fed on the land by sheep, and the land is in a nice, clean, friable state after a frost or so, all that is needed to make a seed-bed is a mere breaking of the top crust, which is a certain way of procuring a good crop of Barley, but, if we look to Wheat seeding in the autumn, I find it quite another thing, for my combined cultivator and drill did this cracking of the crust most excellently, but then I found that I was trying it too much, for my land showed signs of getting overrun with Knot-grass, &c., so I abandoned it, and now give the public the benefit of my experience.

Thirdly: "The cultivation of clay land is a matter of which we are almost entirely ignorant at present. By forethought and management the deep work can be done in a few weeks in the year, and if the land is never touched when wet, one-fourth of the cultivation at present required will be quite sufficient." This points to the cost of a deep, clean, and cheap seed-bed, and supports my own practice, excepting that I can do my ridging and subsoiling, after we have had some rains in the autumn, better than I can when the land is in a dry hard state. Professor Wrightson ques-

tions the cost as compared with horse-work. He perhaps may have some reasons for doing so, when he compares some operations that he may have seen himself with horse-work, but then this shows that he is one of the slow school, or he must have got my lessons by heart before this. I will give him one over again. A Bean stubble smashed up in the autumn, at a cost of 1s. 9d. an acre, and then cross-cultivated by horses at a cost of 2s. an acre, shakes out all the "Coltsfoot, Thistles, and Docks," at no cost, and makes a capital seed-bed for Wheat, at a total cost of 6s. 9d. an acre. I have at this moment three fields, containing together 33 acres of Wheat on land thus treated, as fine as any to be found in England. The straw is like reeds, nearly as high as my head, higher than I can see over when standing in it, yet the Coltsfoot, Thistles, and Docks on this land are nil. Let Professor Wrightson bring his data as to horse-work, and compare with this if he can. He can do so I know, but he will, I also know, be vastly behind in the race. But I can support my statement by a next crop standing by the side of the Wheat—my Beans. The Wheat stubbles, after a light dressing of manure having been spread over them, were ridge-ploughed and subsoiled last autumn, at a cost of 7s. 0½d. per acre, and the Beans were planted by hand in February last without any other operation, therefore the total cost of seed-bed is only 7s. 0½d. per acre. The Beans are as fine as any to be seen in England, strong in straw, nearly up to my chin, and well bloomed. Take the two crops together, the average cost of seed-bed is 6s. 10½d. an acre. Let the learned Professor bring his evidence against it, if he can; if not, let him learn of me. I speak plain, because Mr. Greig says that "the cultivation of clay land is a matter of which we are entirely ignorant at present." When he says "we" he may be right, for it is clear that neither he nor the learned Professor understand the matter, but I do, for my crops and clean land tell me that I am right, and my 6s. 10½d. an acre must stagger them both.

And lastly "It serves no good purpose to use rollers or clod-crushers in cultivating such land; all must be done by Nature." These are capital words in support of those published in my first pamphlet in 1856—"After Wheat sowing is completed, all the manure that is ready may be drawn out and spread on the land, the trenching and subsoiling-plough may be most efficiently and beneficially applied; the soil will be all broken up, the manure will be covered, and the land trenched up and exposed to the action of the weather during the whole of the winter." My after practice proves that my view upon that point was right, and so says Mr Greig now, when he says that "Nature" is our grand worker.

"This deep stirring breaks up the 'pan' formed by the horse treading." These are significant words in support of mine before the Society of Engineers at Birmingham, in 1857.—"We must take the pitch-plaster from the earth's lungs, the hard horse-trodden pan." The thing will right itself shortly, for my boys are beginning to learn, and Mr Greig appears likely to be one of the foremost of them.

In conclusion I must say a word upon Mr Smith's, of Bibury, stumbling-block. "The pan is on the rock." Limestone rocks are not very extensive, but too much so to be passed unnoticed. The best farmers on them scratch them down as deeply as they can. When thus treated, and manured with light dressings of artificial manure in addition to the manure made on the farm, with a fair supply of cake to the stock, they become very productive, and farmers who thus manage them generally do well upon them: therefore it is quite clear that if we can get implements to scratch them a bit deeper by steam-power, we shall give a good help to the now best-to-do farmer upon them. These are what I call the stout rocks, and they are extensive in Herts, Berks, Hants, Wilts, and other counties. The best farmers on those soils work them as deeply as they can by scratching into the rock whenever they have a chance, and these soils, when thus treated and well manured, become very productive as stock and corn farms. I will bring one witness to bear upon this point—Mr. Child, of Vernham Manor, who farms 800 acres of such land, and well too, for I walked over it all last spring and found it clean from end to end, and worked as deeply as he could work it with horses, but not deep enough to satisfy him, so he obtained a set of steam tackle, supplied under my direction, and some months back he wrote to tell me that the steam cultivator made the stones grumble at it as it passed along, and on June 21 he wrote thus—"I have done more than 90 acres, and am pleased, having driven stones 20 inches deep from the soil, 114 lb. weight, without hindrance—men who happened to be there at the time expressed wonder." You see that men who have farmed deeply heretofore will work deeper now that they have a power to help them, instead of crying out, like Mr Smith, of Bibury, "How would they cultivate that?" His question is answered Scratch it deeper. And then there are the rocks of clay. Many men will tell you, under a plea of great knowledge, that yellow stuff must not be touched, or it will poison your top of 3 or 5 inches, yet for all that I have cut into mine full 10 inches deep, and my crops now upon them tell me that I am right—Wheat and Beans, as fine as any to be found in England, upon these once called poor clays, needing a dead fallow every fourth year to keep them clean and up to the mark for growing not much over half the quantity of corn they do now without any fallow. Last year, taking the Wheat and Beans together, I got 15 bushels more per acre than they grew under horse culture, and this year I shall have more than that. Mr. Smith admits that deep cultivation by steam-power on such soils is good, yet sets the stone rocks up against it as a bugbear. As to costs, let me refer him to what I have said upon that point in this letter, and we shall not

hear much from him again about his two horses and a boy. William Smith, Woolston, Blechley Station, Bucks, June 28.

Home Correspondence.

Agricultural Reflections.—As I muse among the palaces of Pall Mall, Belgravia, and Tyburnia, during "the season," amid the fiery steeds and gorgeous equipages of a noble and fashionable world, my thoughts diverge to the wretched cottage, the dilapidated farmery, the ill-conditioned farm roads, lanes, and fences, and the undrained and half-farmed lands of Britain. I ask, can these be alike the property of one and the same individual? Is agriculture so poor and needy that it languishes for want of means? No, that cannot be for in the bankers' clearing-house, in Lombard Street, 2500 millions of pounds sterling changed hands a year (1863)—nearly four times the amount of our national debt. Well, then, there is no lack of cash, but non-improvement arises from a satisfaction with things as they were, both on the part of the tenant and landowner, and a non-appreciation of the fact that steam-power has changed all our commercial and manufacturing conditions—that it has created gigantic interests, increased wealth, and vastly multiplied population. Agriculture is as yet only on the verge of the stream, but it must soon be hurried on by the impetuous rush of steam-aided advance and improvements. Rents would be higher, land more valuable, tenants more wealthy, were agriculture in its proper condition relatively to other of our industries. Would it be believed that in our forward county of Essex I could point to a farm of 1000 acres where the approach to the farm buildings and residences is through a muddy lane, nearly a mile long, impossible for gig or carriage in the winter? It is even impossible by sheep in wet weather, and the flock is therefore kept in yards. The owner rides on horseback by the hedge side; not much fear of the landlord driving down in winter to inspect the farm. I could multiply such instances of neglect and miscalculation, but they would be merely confirmatory evidence of a comfortable satisfaction with things as they were. It does not appear to occur to the parties that such neglected uncommercial, unprofitable, and unworthy. They have not realised the great fact that we are passing from a pastoral, wooded and wooded age, to one of iron and steel, where the impassable road is made smooth and easy by a bridge of steel rails and a flying engine. Where agriculture is improved, every implement on a farm, from a hurdle to a pig trough, participates in the new iron age. The production of our food is our best managed farms has become almost a manufacture, reapers, mowers, palpers, crushers, steam threshing and steam ploughing machines, mangle, chaff-cutters, and cake-breakers are gradually encroaching on the vast domain of old-fashioned unalterability. The sooner that domain is conquered by these new forces, the better for the country at large. I know that I am looked upon in certain retired nooks as a defender of comfortable agricultural antiquarianisms; but I really am merely endorsing with vigour the bills of indictment that have been abundantly preferred, in the press essays on the farming of our various counties, in the 28 volumes of the Journal of the Royal Agricultural Society of England. Could we but return to earth again in 50 years, what a mighty change and progress would be seen in British Agriculture! J. J. Nash, Tiptree, June 29.

Sources of Pauperism.—The working of the Scotch Poor-laws is just now a subject of inquiry before Committees of both Lords and Commons, but I contend that pauperism is necessarily the normal condition of worn-out rural labourers. Disputing the erroneous inferences of the Rev. Dr Begg in his recent examination, of which a notice appeared in your columns last week, I have sent Mr Crawford, the chairman of the Committee before whom Dr Begg appeared, letters of mine which were published before Dr. Begg gave his evidence, to show him and the Committee the state of matters in the border counties, where there are too many cottage ploughmen. It is easy to prove that worn-out ploughmen are victims of circumstances. I have repeatedly reduced to one the rate of Roxburghshire hinds' wages, as given by Mr Munro, of Farnington in the North British Agriculturist, of July 13, 1864—

£ of cash	24 0 0
18 bushels of Barley, at 11. 4s. 3d per imperial qr.	2 14 0
6 bushels of Peas, at 5s.	1 10 0
100 stone of oatmeal, at 1s. 4d.	6 13 4
Four weeks victuals during harvest	0 16 0
Minimum money substitute for cow's keep	5 0 0
1800 lineal yards of Potato drills, at 6d a score	3 0 0
The cartage of five tons of coals from the nearest station, at half price, a house and garden rent free, and the liberty to feed a pig	22 11 4
5 ranges of bondager to hand	
Say 12 days in harvest, at 1s. 10d., and board	1 14 0
301 days, at 10d.	13 10 10

Aggregate gross total paid to hand for his own wages and the bondager's contract £37 15 4. Fancy the notorious fact that too many farmers had for the year ending May, 1865, the services of two able-bodied labourers for less than 40s. Were you, Mr Editor, a kind, with a family of five or six, and eldest not exceeding, say 12 years of age, and had to pay a hired bondager 12s. a-year for wages of such notoriously small gross total as 40s., where you had scope in 1864 for your supporting four wife, family and bondager, off the remaining 28s., and the liberties of the free house, cartage of coals, and the liberty to feed pigs, and also preventing your aged parents

the birds require abundance of good sharp gravel. But we feel perfectly confident in saying, from our own experience, that it will pay well to cook bran and corn meal as a food for fowls. *Houdan, in "Albany Cultivator."*

SETTING BRAHMA HENS.—My plan of setting is to have a room not accessible by the laying hens. In this room I arrange a row of boxes 12 in high and 11 in square, in which I form a nest by first placing paper over the bottom and put sifted coal ashes on the paper, giving the dish-like form and about 1 inch thick, on the ashes I put about an inch thick of straw or hay—on this place the eggs. At twilight in the evening I take the hens desirous to sit, and handling them gently place them on the nests, by morning if they remain on they will stick; and those I have set so far have done their duty. I set not less than two, or all I wish, at one time when I can, so that in hatching I may place at least 15 to 20 chicks under one hen, the other hens I shut up in a coop for a week by which time they will forget to cluck, and soon commence laying. I find the Brahma a superior mother, and in no instance have they broken the eggs while setting. I allow the chicks to remain 24 to 36 hours under the hen after hatching, and they hatch in 21 days from the time of setting. I always feed the young chicks with cornmeal mixed with boiling water, stirring in a little salt, sufficient to taste it slightly, and mine have not been sick or troubled with pip; last year I lost none until six weeks old, when 1 out of 103 died of disease. My coops for hen and chicks are 20 by 36 inches, tight all round but the front, which is open and covered with lath close enough to keep in the hen. The coops are stationary 12 in one row—standing on the ground with 4 inches of coal ashes for the floor, facing the south-east, and enclosed by a yard 18 by 20 feet square, and pickets 7 feet high to keep off cats and vermin, and placed 1/2 inch apart to keep out rats, with a base board 1 1/2 inches wide, 6 inches of which is in the ground. The ground is dry, and so arranged that in rainy weather the water runs off freely. When necessary, the flooring of ashes is renewed. Wood ashes are equally good. My setting-room and laying and roosting rooms are covered with wood and coal-ashes 6 inches deep, which I remove to the garden when necessary, and replace with fresh ashes. Connected with the setting-room is a small yard, into which the setters can go to stretch and dust themselves. I find the Brahma chicks very hardy. *Albany Cultivator*

Calendar of Operations.

JULY—*Haymaking* in early seasons in the southern counties of England is sometimes finished in June, but it as often extends into the current month; while, in the north, the work is seldom over before August is well through. Generally speaking, therefore, the bulk of the hay crop is secured in July. Town sewage irrigation, farm sewage irrigation, and the other modern plans of liquid manuring grass-land are, however, affording or producing many exceptions to this old rule for several green forage cuttings for sowing are taken, so as to place the cutting for the hay crop immediately before or after corn harvest, according as the weather in the district is the best suited for the operation, or two hay crops may be taken, one before corn harvest and another after it, where there is a full command of town or farm sewage.

Common Turnips are extensively sown during this month in the southern counties, very generally after Vetches, Rye, failing Clover, Italian Rye-grass or other forage crops, and, in a few instances, after old pastures or meadow lands that have been burned. The following of land after Vetches, &c., so as to prepare it for Turnip sowing will depend upon the state the land is in. If clean, a single ploughing with a skim-coulter and a weighted chain for turning down the stubble into the bottom of the furrow, and well turning up the furrow slice over this, with the necessary harrowing and rolling required, may complete the work that is, assuming that the seed is to be drilled in on the flat along with artificial manure, either in a liquid or dry form. In dry weather the liquid manure drill is to be preferred. If the land is clean, and to be manured with farmyard or town manure, it may be skim-ploughed, leaving the stubble on the surface. The manure may then be spread and ploughed in along with the stubble, or a scarifier may precede the plough, if the nature of the land so requires. If, on the other hand, the land is full of Couch and other weeds, "ribbing," or "rafter ploughing," or close ploughing and scarifying, &c., may be the practice. In dry weather one thing has specially to be attended to, viz., to keep the natural moisture in the ground, otherwise it will be difficult to get an equal brard without a plentiful supply of liquid manure. And, besides, in the process of keeping the moisture in the ground the furrow slice is easily broken down, which, if the newly-turned furrow be not at once harrowed and rolled at this season, but allowed to lie and bake in the sun, more work and less certainty of a plant will ensue. Practically speaking, keep the harrowing and rolling close up to the ploughing, and, if the soil can be thus reduced to a suitable condition, then keep the seed-drill close up to the harrows.

Turnips should be horse-hoed as soon as possible, and singled as soon as they will permit the free use of the hand-hoe. No greater mistake can be made than to fall behind in the hoeing of this crop, as the plants not only blanch, but draw each other out of the soil. In the north, sowing being earlier, hoeing is earlier too, so that the second hoeing is very generally over before the beginning of this month; but in late seasons and districts the work will probably not be finished before the middle of July. As soon as the bulbs begin to form, and the leaves to rise off the ground the double

mouldboard-plough follows the horse-hoe, the latter being a day or so in advance of the former.

Mangels, Swedes, and Kohl Rabi will generally require to be gone through a second time with the horse and hand-hoe. In the north few Mangels are grown, and the hoeing of Swedes and Kohl Rabi is generally finished towards the close of the preceding month.

Cabbages planted last month will require horse and hand-hoeing during the current one. The practical rule is to hand-hoe and loosen the earth about the plants as soon as they have fairly started growing, the loose earth being drawn gently up to them. This practice applies also to those grown from the seed—a practice, however, which is seldom advisable. Those planted in April and May, and hoed last month, will generally require going through a second time during this.

Parsnips, Carrots, and Sugar-Beet, and Chicory also, when grown for its roots, should be horse and hand-hoed, the loose earth being kept well up to the roots care being taken at the same time not to injure them with the sharp corners of the hoe. All these crops luxuriate in a finely pulverized and freely aerated soil, so that frequent hoeing, when the land is sufficiently dry for the operation, is greatly in their favour. On the contrary, hoeing in wet weather does harm. When the land is too wet for hoeing, weeds may be kept down with the paring plough, the small ridglets formed in the middle being split with the double mouldboard-plough, if the land continues too wet for the drill harrow. But in such cases, as soon as the weather breaks up, give the land a thorough loosening with the horse and hand-hoes, to let in heat, fresh air, and night dew.

Lucerne, Sainfoin, and Lupine, when grown in drills as forage plants, require to be gone through after every cutting, and all weeds either hoed or pulled out by the hand. The heavy rains which generally fall about the close of June or the beginning of this month, are very liable to raise up weeds, and as the successful growth of these crops depends much upon their being kept clean, every drill should be carefully gone over.

Rape or Cole Seed is sown this month for consumption in autumn, from two to four quarts of seed per acre being used, according to the state of the land and weather at the time of sowing. The crop succeeds well after paring and burning, especially on fen or peat soils, on which it answers better than Turnips both for feeding and fattening sheep and neat cattle. For the former it is consumed on the land as Tares are, for the latter, mown with a scythe and carted to the home-stead or cattle yard. Manure and sow as for Turnips. Where Turnips sown last month fail, many farmers prefer sowing Cole seed to the risk of sowing Turnips a second time. Cole seed sown towards the latter end of June will require a rough hoeing as directed last month, and blanks, if any, may be filled up by transplanting in moist weather.

Rape which was sown towards the close of April or in the beginning of May, will be ready, if it has done well, for feeding off with sheep, so will Vetches sown in early spring. At this season the feeding of sheep on such feed is seldom attended with any difficulty in dry weather. Fresh pots should be folded and fed off daily, so as to eat up the Rape or Vetches clean; but sheep folded on fallows over night should not be turned on to fresh Rape hungry. So also when heavy rains fall, it is often advisable to shift the sheep into grass-land until the weather breaks up. Vetches in such a season form rather a washy diet for fattening sheep; so is Rape, and the same may be said of Clover. It is therefore common to mow such crops a day or some hours before they are given to sheep, and then to feed in low troughs or racks, the sheep, as they advance upon fresh ground, picking up any stubble left better and cleaner than they do when turned in upon the standing crop. But when much cake or corn is consumed along with the Tares or Rape, they may be given shortly after they are mown, and when the green forage does not contain a sufficiency of sap to supply the flock with moisture, water should be supplied in troughs; for although sheep do not require much water to drink, they suffer greatly in the summer time when short of the small quantity they do need. In feeding off Rape, Vetches, Clover, or Lupine, a sufficient breadth is taken in so as to spread the sheep rather thinly over the advancing strip of fresh ground, so as to prevent crowding and trampling, and the troughs for cake, corn, salt and water, should for a similar reason be equally placed along the whole line, and at a suitable distance back in the rear, so as to obviate crossing and trampling the fresh stubble or forage folded on. Sheep thus fed often suffer much for the want of shade in bright summer weather, and straw hurdles should be provided for them to lie under.

Green manuring is perhaps less practised now than it was prior to the introduction and use of artificial manures. Most green crops ploughed into the land, as Rye, Vetches, Buckwheat, Rape, are more profitably fed off by sheep, or otherwise consumed by live stock. But occasionally exceptions occur where green manuring is successfully carried out, and sowing one or more of these plants on heavy land this month, for ploughing in for Wheat, is a cheap and effective practice for increasing the yield. *W. B.*

Notices to Correspondents.

ADDRESS WILL Mr. Forsyth, of Salford, kindly send his address.
POOR MOSSY GRASS ON CHALKY SOIL. B. R. Keep feeding stock on it with hay and Turnips. That must ultimately improve it. Do not mow it for a season or two, and then while apply towards winter 10 to 20 bushels of well rotted bone-dust mixed up (after rotting) with as large a quantity of earthy compost free from weed seeds as you can get. Feeding cattle on the land is the best improvement you can give it, giving them cake along with hay or Turnips in winter and along with the pasture in summer.

FOWLER'S PATENT STEAM and CULTIVATOR may be SEEN at WORK in Agricultural County in England.

For particulars apply to JOHN FOWLER and CO., Ltd., London, E.C., and Steam Plough Works, Leeds.

had of all Ironmongers, and Wholesale only in
Bulling, Ho-born, London, W.C.
GARDEN HOSE and BRANCHES in great variety.

THE HYDROSE
(Robins' Patent) for Gardens, Greenhouses, and
Hotbeds, &c. Unrivalled ease of action, simplicity
and force.

The HYDROSE is a more useful, easy working, water conserving waterer, than any other in the market. It is five sizes, viz. No. 1 with 4 feet of flexible hose, Jet and Rose, 2s. 6d. No. 2, 15s. 6d., No. 3, 21s. 6d., No. 4, 27s. 6d., Extra Hose and Union Joints for sale. Forwarded on receipt of Post Office order. To be obtained of any Ironmonger or Plumber, or of the Proprietors, H. B. BROOK & CO., 27, 28, and 29, Edgware Road, Paddington, W.

"Every Cottage should be provided with a Water Tap and Iron Cisterns."

F. BRADY AND CO. having had many years' experience in the construction of all kinds of Machinery in their English and Foreign Works, are prepared to supply WROUGHT-IRON GALVANISED or PAINTED, of superior quality, at low prices, and at very short notice.

An Illustrated Price List of Galvanized Iron, and other special Machinery, sent on application.
F. BRADY AND CO., Limited, Plumber Works, Ltd., London, or through a respectable Ironmonger.
N.B. Open Tanks of different sizes packed one in each cistern.

Cottam's Iron Hurdles, Fencing, and Gates.

COTTAM'S HURDLES are made in the best manner of superior Wrought Iron, by an improved process. Price Lists on application to **COTTAM AND CO.,** 2, Wansley Street, Oxford Street, London, W.

COTTAM'S PATENT PORTABLE COW FITTINGS.

Their advantages are—pressure, no water work, no dirt, no noise, no vermin, Hay Rack, &c., &c. in all cases, and depth of feeding troughs, water &c., &c. Cover to prevent any pouring water down the side of the trough. It is 1 foot 6 inches deep. It is made of the best material. For particulars apply to **COTTAM AND CO.,** 2, Wansley Street, Oxford Street, London, W. The above are exhibited, together with several other fittings, in the Stable Block, not secured by Patent.

J. PAXTON'S PATENT HOTHOUSES for the
 are cheap, substantial, and easily fixed.

SEED ADULTERATION BILL OF 1869.

It having been intimated to the Promoters of the above Bill that Members of the Seed Trade throughout the country are desirous of assisting in carrying the Bill through Parliament, it is hereby notified that SUBSCRIPTIONS for that purpose may be paid to the Treasurer, THOS. THORNTON, Esq., 2, St. Thomas Street, Borough, S.E., and the EDITORS of the *Gardeners' Chronicle*, who have consented to receive Subscriptions, and by whom their names will be acknowledged in the *Gardeners' Chronicle*.

Inserted by Order of

THE COMMITTEE of PROMOTERS of the BILL.

HAMBURG INTERNATIONAL HORTICULTURAL EXHIBITION.

The English Sub-Committee have the satisfaction to announce that Her MAJESTY the QUEEN has graciously pleased to signify her intention to present

A SILVER CUP AS A PRIZE

FOR THE BEST SPECIMENS OF GRAPES SHOWN AT THE ABOVE EXHIBITION.

The Committee would at the same time call attention to the fact that LIBERAL PRIZES are OFFERED by the HAMBURG COMMITTEE for PINES, GRAPES, PEACHES, MELONS, FIGS, &c., as well as for Collections of APPLES, PEARS, CHERRIES, PLUMS, and other FRUITS. They believe that, owing to liberal terms which have been proposed for the conveyance of objects to and from the Show, they will be forward Packages of Fruit, Free of Cost or Trouble to the Exhibitors, and they trust that this may induce Cultivators to respond liberally to the invitation to exhibit. Prizes of considerable value are also offered for classes of EXOTIC PLANTS, CONIFERAE, &c.; and for GARDEN IMPLEMENTS, MACHINERY, &c.

Intimation of the intention to exhibit should be sent in not later than July 31.

Further particulars, with Prize Schedules, &c., may be had on application to the Secretary

MR. GEORGE EYLES, ROYAL HORTICULTURAL SOCIETY, SOUTH KENSINGTON

invitation to exhibit, more especially in the department of fruits, the transmission of which with entail little or no difficulty, inasmuch as a liberal offer for the conveyance of exhibition articles has been made to the English Committee who will take charge of, and believe they will be able to forward, all English contributions, except implements and machinery, to and from this country to the exhibition, free of cost to the exhibitor. Intending competitors should at once communicate with the secretary, MR. EYLES.

Let us remind young gardeners that the Royal Horticultural Society's MIDSUMMER EXAMINATION takes place on Tuesday next, July 13, commencing at 10 A.M.

We may call the attention of such of our readers as may be interested in the matter, to the fact, that the CELLINI SILVER CUP offered by the Proprietors of this Journal, is open for competition amongst amateurs and gentleman gardeners, for collections of fruits and vegetables staged as indicated in our advertising columns; that is to say, consisting of five kinds of fruits, and eight kinds of vegetables selected from a specified list of subjects, and set up in a neat and tasteful manner. In a district so famous as that around Manchester for horticultural talent, there should be found many competitors for so choice a prize.

The examination of witnesses before the Select Committee appointed to collect evidence relating to the ADULTERATION OF SEEDS has been carried on Monday and Thursday last. Several witnesses were examined, and the inquiry stands adjourned till Monday next. It is to be hoped, on all accounts, that in giving evidence witnesses will reply only to such questions as they can answer from personal knowledge. To expect a seedsman to give satisfactory replies to purely scientific questions is as absurd as for a man of science to give an opinion on the details of trade practices.

A very effective arrangement of Sedums and similar plants is now to be seen at Messrs. VEITCH'S nursery. For terraces, architectural gardens, for town gardens, or any situation where this formal style of bedding is suitable, Messrs. VEITCH'S raised beds with supply valuable hints. Messrs. VEITCH, at our request, have given us the following particulars of the plants, and the way in which they are distributed over the mounds.—There are three distinct arrangements. In No. 1, or the largest slopes, Pyrethrum Golden Feather is used to define the diamond-shaped spaces—each space being filled with different plants. In the centre of each of the three top diamonds there is a large plant of the Echeveria metallica—the centre diamonds being filled in each with Alternanthera amabilis and variegata, and the spaces on either side with Echeveria sanguinea, and Klema repens. The other diamonds are filled with Sempervivum californicum, tabulariforme, tinctorum, anomalum, and montanum. Below a pattern racemosa, gracillima, calciphana, Sedum brevifolium and glaucum, anglicum and phillipoides, corsicum and globiferum; Saxifraga pyramidalis, longifolia, cristata; Sedum tinctorum and arachnoides. In the second arrangement, the slopes in which are smaller, there is an oblong pattern. In the centres are Alternantheras of sorts, followed by Veronica candida, or, for variety, Aubrietia variegata—the groundwork being the Golden Feather Pyrethrum. In one instance the new Iresine Lindeni is being tried, and all the slopes are planted somewhat differently. In the third plan of arrangement the slopes are devoted more exclusively to alpines, &c. The patterns are of oval form, with oval centre of glaucous-foliaged Sempervivums and Sedums, these being surrounded by various kinds of plants to contrast in the foliage. Amongst others are used Thymus lanuginosus, Aubrietia purpurea, Antennaria tomentosa, Bellis minima, Carex colorata, Eriophora prismatica, &c.

Example is better than precept. So thought Major CLARK the other day at the general meeting of the Horticultural Society, when he sliced up the one specimen of GIANT PUFF-BALL, and caused the slices to be cooked and handed round to the company. He assured by the evident looks of satisfaction which beamed on the countenances of the members of the Council, who very properly took the "first bite," the Fellows present partook of the delicacy with it the fear and trembling or prejudiced loathing which usually attends such experiments. The general verdict was satisfactory, though we think the mycophagists (excuse the word) run into extremes in extolling the plant as a comestible. For a figure and full details of this and other edible Fungi, we refer to p. 1004 of our last year's volume.

The ROYAL NURSERY, SLOUGH, which were lately put up to auction, have, we learn, passed by purchase into the hands of the former lessee, now the spirited proprietor, MR. CHARLES TURNER. May his shadow never grow less!

We have just received some curious partly woody and partly fleshy EXCRESCENCES from the sprouting joints of VINES, which are quite new to us, though in all probability they have often been seen before. The excrescences, which are subglobose, resemble externally Truffles, and are more than an inch in diameter, and the resemblance is not confined to the obscurely areolated exterior, for the substance within is mottled very much after the manner of a young Truffle. On a close inspection, the whole pallid substance, which is surrounded by a coarse brown bark, is seen to be divided into several more or less distinctly defined areolae, those towards the centre being more obscure, while the same structure obtains in the bark, though the areolae in that part are much smaller. Under the microscope may be seen in the centre of the areolae large thin-walled cells, some of which are almost globose,

having between them large intercellular spaces, and surrounding these is the ordinary radiating medullary tissue, accompanied by some dotted cells, with large intercellular wedges of woody tissue, and large open intermedullary ducts, with an admixture of vessels with partially undulating and very frequently interrupted spiral structure, so as to present an annular and scalariform structure. The whole mass is evidently formed of a number of confluent adventitious buds, the ends of which are more or less developed, such, at least, is our interpretation of a more horizontal slice off one of the burrs. It is far from an uncommon thing for the base of spurs in Vines to become gouty, and it is probable that the substance before us is a more exaggeration of the more common appearance. If our notion be correct, we should be inclined to consider that the cause is very much the same as that which induces some varieties of Vine to throw out clusters of roots from the stems. We should, however, like to see one or more of the burrs as they are connected with the stem, without which it is perhaps unsafe to pronounce a very decided opinion. M. J. B.

No rule without exceptions. Botanists have, by general consent, divided flowering plants into dicotyledons and monocotyledons, according as the embryo plants have one or two cotyledons, and the distinction holds good in the great majority of instances. But in the same genus it sometimes happens that there are plants with one or two cotyledons respectively. Thus, Professor DICKSON has lately shown that while PINGUICULA LUSITANICA is dicotyledonous, P. vulgaris and P. grandiflora are monocotyledonous. From indications of the presence of five carpels to the ovary, Dr. DICKSON is inclined to put Lentibulariaceae, the family to which Pinguicula belongs, near to Primulaceae, with which it agrees in its free central placentas.

New Plants.

CATTLEYA LABIATA TRIANA (?) LACINA.

Habitat—Cattleya Trianae, petalis cuneatis oblongis acutis grosse serratis, labello cuneato atrinque dente arguto, delto oblongo acuto lobulato.

This is a puzzling plant. It has the habit of Cattleya Trianae and appeared among a collection of these. The flower is white, with a purple hue. The petals have thick teeth. The lip is narrow, cuneate, unguiculate, with a tooth at each side of the base, and a cuneate oblong toothletted lamina. The four pollinia have no caudicles, and look as if they were composed of two, confluent, as in the mule Laelias. Can it be a mule between a Brassavola and Cattleya Trianae? It is most decidedly the strangest Orchid we saw during our last stay in England. We found it with J. Day, Esq., who complained, with a melancholy look, of these, his pets, being so constantly very ugly. We are afraid we shall have to bear a heavy burden of complaints, as, three names having been forbidden the other day at Kensington, we now bring out our odd child with four. H. G. Rehb. fil.

PLANT PORTRAITS.

ANTHURIDIUM LINDENIANUM.—Gartenflora, t. 558. Oronticeae. A stove perennial, with a short stem, long lanceolate acuminate dark green leaves, gradually attenuated at the base, and set on long terete petioles, and linear-lanceolate, reflexed spatulate on terete peduncles, a foot half as long as the leaves. Native of South America. Introduced by M. Linden.

BEGONIA LINDENIANA.—Bot. Mag. t. 5695. Begoniaceae. A dwarf stout stem perennial, with obliquely ovate cordate serrated leaves, and branched panicles of neat white flowers. Introduced from Trinidad to Kew.

CESTROPOGON LUCASII.—Rev. Hort. 1868, 291, with fig. Lobeliaceae. A handsome subshrubby temperate stove plant with oblong lanceolate leaves, and pretty rosy colour. The flowers produce a free, at the ends of short lateral spurs. It flowers in winter. A garden specimen raised from Cestro Pogon fastuosus fertilised with Cestro Pogon betulaefolius, by M. Desfontaines, of Versailles.

DENDROBIUM LINDENIANUM.—Bot. Mag. t. 5180. Orchidaceae. This is the plant shown at South Kensington by Mr. Wentworth Buller as Dendrobium thyriformum. A very distinct and handsome stove climbing orchid, with slender stems, oblong lanceolate leaves, and a terminal raceme of flowers. The flowers are of a pale yellowish green, with a yellowish white lip. Native of Mexico. Introduced by W. W. Buller, Esq.

LEUCANTHEMUM LINDENIANUM.—Bot. Mag. t. 53. Apocynaceae. A very distinct and handsome stove climbing shrub, with slender stems, oblong lanceolate leaves, and a terminal raceme of flowers. The flowers are of a pale yellowish green, with a yellowish white lip. Native of Mexico. Introduced by W. W. Buller, Esq.

LEUCANTHEMUM LINDENIANUM.—Bot. Mag. t. 53. Apocynaceae. A very distinct and handsome stove climbing shrub, with slender stems, oblong lanceolate leaves, and a terminal raceme of flowers. The flowers are of a pale yellowish green, with a yellowish white lip. Native of Mexico. Introduced by W. W. Buller, Esq.

LEUCANTHEMUM LINDENIANUM.—Bot. Mag. t. 53. Apocynaceae. A very distinct and handsome stove climbing shrub, with slender stems, oblong lanceolate leaves, and a terminal raceme of flowers. The flowers are of a pale yellowish green, with a yellowish white lip. Native of Mexico. Introduced by W. W. Buller, Esq.

LEUCANTHEMUM LINDENIANUM.—Bot. Mag. t. 53. Apocynaceae. A very distinct and handsome stove climbing shrub, with slender stems, oblong lanceolate leaves, and a terminal raceme of flowers. The flowers are of a pale yellowish green, with a yellowish white lip. Native of Mexico. Introduced by W. W. Buller, Esq.

LEUCANTHEMUM LINDENIANUM.—Bot. Mag. t. 53. Apocynaceae. A very distinct and handsome stove climbing shrub, with slender stems, oblong lanceolate leaves, and a terminal raceme of flowers. The flowers are of a pale yellowish green, with a yellowish white lip. Native of Mexico. Introduced by W. W. Buller, Esq.

LEUCANTHEMUM LINDENIANUM.—Bot. Mag. t. 53. Apocynaceae. A very distinct and handsome stove climbing shrub, with slender stems, oblong lanceolate leaves, and a terminal raceme of flowers. The flowers are of a pale yellowish green, with a yellowish white lip. Native of Mexico. Introduced by W. W. Buller, Esq.

ODONTOGLOSSUM CONTRAICTUM.—Bot. Mag. t. 5180. Orchidaceae. A very beautiful stove epiphyte, with a short stem, long lanceolate acuminate dark green leaves, gradually attenuated at the base, and set on long terete petioles, and linear-lanceolate, reflexed spatulate on terete peduncles, a foot half as long as the leaves. Native of South America. Introduced by M. Linden.

PASSIFLORA CINCEANATA.—Bot. Mag. t. 5177. Passifloraceae. A beautiful stove climber, with glabrous stems, deeply lobed lanceolate dark green leaves, and bold showy flowers of a deep purple, and having a corona of long and staminate twisted dark violet filia, marked with a narrow white and purple near the base. Native of the West Indies. Introduced from the West Indies to Kew by Mr. P. Frost.

RECHERIA LINDENI.—Bot. Mag. t. 5174. Passifloraceae. A stout stemmed plant, of little horticultural value, with linear-oblong deeply lobed almost pinnatifid leaves, and yellow tubular flowers. Native of the West Indies. Introduced from the West Indies to Kew in July, 1844.

ROSA INTERMEDIA.—Rev. Hort. 1868, 290, fig. 2. Rosaceae. A very curious and interesting species of Rose, with the organic peculiarities of Rosa with the growth and inflorescence of Rubus. It is a climber, with shining bark, imparipinnate leaves with serrated elliptic toothed leaflets, and very numerous small scented pure white single flowers, which form neat heads. Introduced from China and flowered by M. Linden.

STENOCLADUS LINDENI.—Rev. Hort. 1868, 291, with fig. Liliaceae. A pretty dwarf-growing hardy bulb, with linear-oblong flat leaves, and Crocus-like pale yellow flowers produced in early spring and not in autumn, as is the case with S. luteus. Introduced from Karabagh to the Botanic Garden.

TACONIA BENSONIA.—Bot. Mag. t. 5004. Oronticeae. A beautiful stove plant, with a short stem, long lanceolate acuminate dark green leaves, and large showy flowers of a bright rose purple towards the centre, and by deep rich purple towards the base. Native of the West Indies. Introduced from the West Indies to Kew by Mr. P. Frost.

VACCINIUM LINDENI.—Rev. Hort. 1868, 291, with fig. Ericaceae. A slender woody plant, with sparingly branched branches, 1 to 2 feet long, clothed with small lanceolate leaves, and bearing a raceme of deep red flowers. Native of the West Indies. Introduced from the West Indies to Kew by Mr. P. Frost.

LA VERGREEN BERBERIES.

(Continued from p. 711.)

The following species, adverted to in the "Journal of the Horticultural Society" nearly 20 years since:—

B. acifolia (Terra del Fuego).—There are four very different species which have had the name attached to them as an abas, but there is also one distinct species, which was considered by Dr. Hooker to be the handsomest of the genus. The leaves of this shrub are described as being "obovate, petiolate, acute, coriaceous, dark shining green, especially above, pale beneath, the margin coarsely and distinctly serrate, and each serrature armed with a distinct spine." The foliage is said to resemble that of B. Wallichiana, but the inflorescence to be very different. The species is considered to be quite hardy, and it is to be reintroduced for cultivation in the nursery.

B. hypoleuca (Nepal).—The leaves of this species are said to be larger than those of any other species, sometimes measuring 1 inch in length and 1/2 inch in breadth. They are leathery, of a dull dark green above, very white underneath, with coarse spiny teeth. The species does not appear in any of the nursery catalogues, but is probably still existing at Kew, or in the Horticultural Garden at Chiswick.

B. parviflora (S. America).—Described as a wooded evergreen bush, with slender branches and rather fine spines, and bright green leaves. The leaves are about 1 1/2 inch long, by 1/2 inch wide and are exactly the form of a lengthened wedge, whose broad end is almost always divided into three equal rounded lobes. The teeth are other teeth, however, occasionally at the sides. The flowers are unusually small, and are five or six together in nodding clusters. This species was first introduced many years since by Messrs. of Hammersmith, who inform me that the species is a handsome plant, and is quite hardy.

The following, with the exception of those mentioned above, being rather common, and all rather common, will be but briefly noticed.

B. atacamensis (Chili).—A stiff shrub, valued for its great palmate spines, and small green, spiny fasciated leaves. The flowers are clustered, and racemose. It is quite hardy, and in common garden soil.

B. aurantiaca (New Grounds).—Described as "an elegant shrub, with straight, erect branches, bearing leaves of two sorts—the lower coriaceous, enlarged and angular in the sinus, where they are jointed with the petiole, which is very long, and obovate, elliptical, tapering to the base, and very wavy, with a few marginal spiny teeth near the base, and very glaucous beneath. The flowers are in racemes, drooping, and very deep yellow." The specimen very few of the leaves have more than a tooth at the end. It is a hardy plant, and in common garden soil.

B. dealbata (S. America).—A good-looking, with stout brown branches, scarcely spiny, and lanceolate leaves of a bluish green on the upper surface, and almost white beneath. The latter are truncate, with three spray teeth at the end, and three more at the sides, sometimes 2 inches long, and 1 1/2 wide. The flowers appear in short oblong racemes, and are yellow. It is quite hardy, and in common garden soil.

B. empetrifolia (Mazatlan).—This very common well-known species is to be described in the "Journal of the Horticultural Society," vol. 5, part 1, as a trailing bush, with stiff three-part spines, and pungent leaves, not unlike those of Genista.

ONCIDIUM MACRANTHUM.

SINCE the exhibition last summer of Lord Londesborough's fine variety of this plant, the growers of Orchids have been anxious to know more of a species which was then seen to possess so many claims to a prominent position amongst ornamental epiphytes.

Nor are the feelings of admiration which were excited by the plant in question likely to be other than strengthened by the beautiful specimen, with 28 flowers, which we have already noticed as having bloomed this year in the choice collection of E. Salt, Esq., and which was exhibited in all its loveliness at the meeting of the Royal Horticultural Society on Tuesday last...

The imported plants are variable as to colour. Lord Londesborough's has darkish olive-tinted sepals. Mr. Salt's though having the olive tint is somewhat yellower, while one bloomed in the Bishop of Winchester's collection, is said to have these organs of a pure yellow.

Pseudobulbs elongate ovate, compressed, furrowed and transversely wrinkled when old. Leaves oblong, marked with several distinct pallid veins. Stipe from the base of the pseudobulbs, extended into a long climbing panicle, furnished rather sparsely with short lateral flowering branches...

rounded obtuse apex, petals clear yellow, slightly larger than, but of the same shape as, the lateral sepals, attached by a broad short stalk, 1, comparatively small, hastate, the lateral lobes spreading dull purple, the middle lobe approximate yellow, stained with purple at the edge, crest very large and prominent, white, with a few purple spots at the apex, having a central keel extended into a tooth at the top, and furnished with two large reversed teeth on either side. Column wings broad purple.

GLAZING AND GREENHOUSE BUILDING.

At length I have gained sufficient time to go into the calculation of the cost of our new structure for the growth of variegated Pelargoniums, and as it may appear to be out of the usual style of such buildings, I think a short description in aid of the sketch published in the Gardeners' Chronicle (1869), p. 135, may be acceptable to some of your readers.

The whole of the brickwork is 4-inch, or single brick; this is rough cemented inside where covered up, and finished where seen, the cement used is the best Portland. The reasons for this are—first, economy, and, secondly, strength and endurance combined with dryness of the walls. As may be observed, the beds on which the plants stand are filled in nearly 1 foot with ashes. This is more suitable for the plants in all seasons than either boards or slates, as it secures good drainage, with a freely drained yet moist bottom, and is therefore a more natural condition for the well-being of the plants. If the inner side of the pit were not cemented, the outer walls would be damp, and in frosty weather the work would be torn to ruins in a few years. This would occur even if the outer walls were 4 inches thick. Thus I have experienced, whereas a wall well built in mortar of a single brick in thickness, cemented inside to keep it dry, will last a lifetime. I should here observe that the external walls are not cemented. The inner pit has a cross wall every 7 feet, to connect the inner wall of the path with the outer walls, this enables the work to bear the weight of the bed of a bed and the plants without bulging. There is no partition in the centre of this house, the whole length of which is 100 feet, dividing it into equal parts of 50 feet. The height in the centre is 7 feet, the outer walls from the surface of the ground are 2 feet, side ventilators and plates 15 inches, the width is 11 feet 8 inches, the bars 7 feet long, width of opening for ventilation in roof, 8 1/2 inches; angle of house about 40° in slope.

I have estimated the bars or astragals as 2 inches deep and 1 1/2 wide, the double ridge 1 inch thick and 5 inches deep, the cap or ventilator 1 1/2 inch thick by 11 inches wide, brought down at the edges to 1 inch. This should have iron ribs at the ends, and one in the middle (two would be better if 21 feet long), on the upper side, to preserve the work from casting through sun heat. The glass should be 21 oz. free from lenses, and should be a good flat over sample, avoid false economy here. The arches for supporting the roof should be not less than 3/4 or 1 rod iron, and should be turned before drilling; the screws used should be galvanised throughout the whole of the work.

The door-posts are 3 by 4 inches, with oak sides; the doors 1 inch thick, plate 1 by 5 1/2 inches, side ventilators 1 inch thick by 11 inches wide if in one pairs are divided as seen in the figure.

Anyone can take the plan and estimate the cost, and as nearly as I can presently calculate, this building should only cost 150. This sum does not include bands, or any charge for heating apparatus.

I must restate that as the glass does not closely meet, the rain enters and runs down but does not drip, except at the bottom over the plate which should have an outward inclination. Wherever this is the case a little green dirt accumulates in course of a few months, yet is easily cleaned off with a cloth, and then strongly syringed. A lad can clean the whole of our house in a day. Once or twice a year will suffice for this, and a wet day is best for the job, when thus cleaned the house looks as if newly glazed.

Some of my correspondents have been troubled about glass expansion. This is very minute, and may be provided for by making the ridge groove 1/2 inch deep. The glass used only enter 1/2 inch, leaving 1/2 inch play for expansion, which is ample for a wide roof, if preferred, the 1/2 inch might be done with a slip of india-rubber which will prevent the ingress of air.

I shall always feel pleasure in giving any further explanation, in reply to letters addressed to me here, or to receive visitors and show the plan of glazing, &c. F. T. Smith, Lutwick.

Home Correspondence.

Gladiolus insignis. What a gorgeous flower for decorative purposes this is, whether for beds, borders, or pots. Grown in the latter, especially in large sizes, it would be a fine thing to slip into large vases, where, for the time, it would look grand, or even if used to

Lindley, Gen. et Sp. Orchid. Plants, 207

Mountain Ash, Cytisus, Lonicera, &c. or to any mountain vale in England in summer time. In winter, too, as many of the trees—the Fig, the Mulberry, the Apricot, the Pomegranate, the Vine—are deciduous, it must look nearly as naked and desolate as old England. J. Henry Bennet, M.D., Grosvenor Street

Societies.

ROYAL HORTICULTURAL: July 6.—W. W. Saunders, Esq., in the chair. The usual preliminary business of the meeting being concluded, the Rev J. Dix announced the awards of the Floral Committee, and in so doing noticed especially the magnificent Oncidium macranthum from Mr. Salt's collection, and the charming group of out Iris of the English and Spanish breeds, sent by Messrs. Barr & Sugden, which he (Mr. Dix) said were easily grown and deserving of the most extended cultivation, on account of their glowing colour. G. F. Wilson, Esq., then, in noticing the various objects brought before the Fruit Committee, directed attention to a fruit of Monstera deliciosa, sent from the gardens of Lady Ashburton, which was remarkably fine for this season. Major Trevor Clarke (in the unavoidable absence of the Rev M. S. Berkeley) presented a large number of the objects of interest sent to the meeting, and first noticed a Pelargonium named Empress, in Messrs. E. G. Henderson's collection, which, instead of being of the florists' form, had crisped edges to the petals and was altogether quite a ladies' plant. A small dark form of Aralia, in the same collection, was then alluded to, as being one of many kinds of dark-folaged plants which are now coming into fashion. A collection of Satyria and other ground Orchids from the Cape, sent by the same firm, was next brought before the meeting as being worthy of notice, as they were rarely seen in good condition. The most successful cultivator of this interesting class of plants was said to be Sir John Herschel, the great astronomer. The Pinks and Carnations were then referred to as not having received that attention from hybridisers that they deserve, and he (Major Clarke) recommended this class of plants to the attention of hybridists, to see what could be done in developing the flowers and colour. A small specimen of Sturtia pentagyna, which is closely allied to the Cotton plant, was then alluded to, and Major Clarke proceeded to notice the fine specimens of the Giant Puff-Ball (Lycoperdon giganteum), sent to the meeting by Messrs. Carter & Co., of High Holborn. The rapidity of growth and excellent qualities of this giant Fungus were expatiated on, and the company had the opportunity of forming their own opinion as to the latter point, as some cooked slices were handed round, and were found to have a delicate Mushroom flavour. Mr. Wilson's Lilium longiflorum then came under notice, as the name had been questioned, but Major Clarke said there was no doubt but that it was L. longiflorum, as he had a specimen in his own conservatory, like the one here shown, having four or five flowers in the umbel. Asperula odorata was alluded to as being a pretty blue flower, which was said to great advantage when in a mass. A specimen was then presented of the large strain of Antirrhinum that was made in the first cross between a wild form and a large-flowered garden variety.

Mr. Wilson Saunders then referred to the fruit of the Monstera deltoidea, which he had grown and of which he had eaten several times with pleasure; the fruit, if eaten at the proper time, was most delicious, even when pitted against Pines and Grapes. The fruit was ready to eat when the outer scales fell off, and was then of a most delicious flavour. The plant was said to be of easy cultivation. A specimen of a Briar Rose, which he had received through the late Dr. Boyle, from the Himalayas was then noticed, as bearing a profusion of white and delightfully fragrant flowers. Mr. Saunders stated that it would not stand pruning and if left to grow wild, it formed very large thick stems. He (Mr. Saunders) had found it difficult of propagation by cuttings, and it was only last year that he had succeeded in striking it from cuttings of young growing wood.

Mr. Bateman briefly noticed the Monstera, of which he said a new sort had been advertised, as being without prickles, and also Puff-Balls mentioned above. A batch of Potentillas was then said to be in great beauty at Chiswick; and he reminded those who wished to see them in their present state that they had better do so at once, as this class of plants was rapidly passing into the hands of the florists, by whom he had no doubt it would be greatly altered from its present form. Mr. Bateman then alluded to the Orchids, and especially to a new Mormodes, which came from Mr. Wilson Saunders, which was very curious, having the colour of a Cynochas and the lip of a Mormodes, and mentioned that as Colonel Benson was now in England he hoped to be able to induce him at the next meeting to give them some particulars as to the habits of the many splendid species which he had introduced into this country. He then proceeded to give a short lecture on the C. C. C. Mer, as announced in our columns at p. 710, the main facts concerning which have frequently been given in our columns. At the termination of the meeting, specimens of the beautiful Lythospermum petraeum, from Mr. W. Robinson, were shown and commented upon.

Floral Committee. Rev Joshua Dix in the chair. This was a very interesting meeting. Messrs. Veitch & Sons sent a new and beautiful species of Cypripedium, named Parishi, which will shortly be figured and described in our columns. Also Mitella Regnellii purpurea, a beautiful pale rose flower with a purple violet lip, to both of which First-class Certificates were awarded. With these came a collection of Orchids, and other subjects, in which were the graceful drooping Dendrobium filiforme, the pale yellow and purple spotted Staphopsea oculata, Oncidium Papilio-petale, Tubalia Benoniensis with beautiful rosy purple flowers, Dendrobium Bannoniae superbum,

Parishi, and formosum, Epidendrum nemorale; Orthosiphon stamineus, which we hope shortly to notice more fully; Liliom Szovitsianum, and Iresine metallica, a dark bronze variety, &c. A Special Certificate was awarded to Messrs. Rollason & Sons, Tooting, for a nice group of plants, in which were a new Tootling, for a nice group of plants, in which were a new Tootling named Meyerbeer, with a creamy white ground Caladlum named Meyerbeer, with a creamy white ground edged with green, and veined with crimson, which received a First-class Certificate. Amongst other plants sent were beautiful examples of Cattleya superba, the rare Saccolabium Blumei majus, Vanda melleagrif, Cypripedium a. perbiense, and Cattleya Aclandiae, a new English spotted Pelargonium named Marquis of Bute, and Ardisia japonica picta, a prettily variegated species. From Mr. Green gr. to W. W. Saunders, Esq., came a very interesting group of Orchids, amongst which were a new species of Latasetum from Mexico, with flowers of a beautiful green, densely spotted with brown, and the south American Brassavola leucata, with white flowers, to which American First-class Certificates were awarded. With them came the First-class Certificate for Physosiphon Loddigeanii, singular-looking orange-flowered Physosiphon Loddigeanii, Oncidium purulium, Trichopilla turialis, Cattleya Forbesii, Oncidium purulium, Trichopilla turialis, Cattleya Forbesii, a grey-orange coloured Marillaria, near M. crocea, the small greenish yellow flowered Sarcanthus ornatus, Sarcopodium Lobblii, with four beautiful flowers, Epidendrum diurnum, with one nicely flowered spike, a specimen of Arum Draconculum, and a flowering branch of the Rose above mentioned. A Special Certificate was awarded. From G. F. Wilson, Esq., came a fine specimen of the large flowered longiflorum, for which he also received a Special Certificate, and from Mr. Bull came a collection of Palms, Orchids, &c., to which the same award was made. Mr. Noble exhibited the beautiful Spiraea palmata, in splendid condition, and Messrs. Barr & Sugden, a charming collection of British and Spanish Iris, richly and variously coloured. Messrs. E. G. Henderson & Son received a Special Certificate for a large miscellaneous collection of bedding plants, comprising many novelties, already noticed. Mr. T. Cooper H. haecdale Road, Helgate, sent a small but interesting group of Cacti, and to Mr. Edwards, Nurseryman, Natta, Notts, a First-class Certificate was awarded, for Paris serrulata cristata magnifica. From Mr. Lorimer, gr. to R. Salt, Esq., Fernhurst, came the splendid Oncidium macranthum, referred to in another column (p. 739), which is the finest specimen that has yet been shown, and to which a Special Certificate was awarded. As a variety, however, it is scarcely equal to that in the possession of Lord Londesborough. From the Society's gardens, Chiswick, came a box of Aubrieta purpurea variegata, which will be a valuable acquisition, if it retains its present golden colour. It was requested to be sent again. To Mr. B. S. Williams, of H. Lawley, a First-class Certificate was awarded for a nice plant of Agrostis, which was very fine in condition. Several other novelties in the class of flowers were shown. These will be found treated upon in another column.

There was a considerable and very attractive exhibition of Carnations and Picotees, occasioned by the offer of some special prizes for these pretty flowers. The boxes of cut flowers were arranged in front of the raised dais, and attracted as much public attention as their more formidable rivals, the new plants and Orchids. It was like one of the battles of the old florists being fought over again. In the nurseryman's class for 24 Carnations, Mr. C. Turner, Slough, was 1st with 24 blooms of British Queen and Prince Albert, scarlet bizarres, Eclectic, King of Carnations, Premier, Rainbow, Rifleman, and Scintillation, crimson bizarres, Lady of the Lake, pink and purple bizarre, Beauty of Woodhouse, Colonel Wyndham, Dr. Foster, Favourite, Juno, and True Blue, purple flakes, Africana, Christopher Sly, Debutante, Splendour, and William Cowper, scarlet flakes, and James Merryweather, John Root, Merrimac, and Princess Royal, rose flakes. 2d, Mr. Henry Hooper, Bath, who had good blooms of British Hero, p.f., Dr. Hogg, r.f., George Tugwell, r.f., Beautiful, p.f., Mayor of Nottingham, r.f., and Duke of Cambridge, John Root, and Rosina, s.f. 3d, Mr. William Bragg, Slough. In the Carnations class for 12 Carnations, Mr. N. Norman, p.f. 1st, Queen Victoria, Lady of the Lake, and Mayor of Nottingham, p.p.b. 2d, June and Mayor of Nottingham, p.f. 3d, and two seedlings of the same division; and Dr. Hogg, John Root, and Miss Napier, p.f. 2d, Mr. E. F. Kingston, Militia Barracks, Bath, and 3d, Mr. N. Norman. With 6 Carnations, Mr. Norman was also 1st, having Jubal, c.p., John, p.f., Comet, a.f.; Mayor of Nottingham, p.f., John Root, r.f., and Lady of the Lake, p.p.b. 2d, Mr. C. F. Kingston, 3d, Mr. J. Smith, Lyncombe, Bath. With Picotees, Mr. C. Turner was also 1st with 24 blooms, which were of superior quality like his Carnations. The varieties consisted of Ascot Giant, a large heavy-edged flower, Deloch, Mrs. Dodwell, and a seedling, red-edged. Countess, Duke of Devonshire, Exquisite, Lord Nelson, New Colour, a medium bright purple-edged flower, Prince Arthur, and a seedling, purple-edged, Ade 1, Ingelton, Emmeline, Lucy, Miss Sewell, Miss Williams, Miss Wood, and Northern Star, rose and scarlet-edged. 2d, Mr. B. Hooper, 3d, Mr. E. F. Kingston, Bath. With 12 varieties of winter greens, Mr. E. F. Kingston was 1st with flowers not common to districts accepted as authorities, and to varieties, 2d, Mr. J. Smith, 3d, Mr. E. F. Kingston. With 6 Picotees, Mr. N. Norman was 1st with Prince of Wales, and a seedling, red-edged, Eliza, and Mr. May, purple-edged, and Miss Sewell and Miss Wood, rose and scarlet-edged. 2d, Mr. E. F. Kingston. In the nurseryman's class for a collection of 36 Carnations, Picotees, and Cloves, Mr. C. Turner was 1st, and Mr. H. Hooper, 2d. And in a similar collection of 24 blooms from amateurs, Mr. E. F. Kingston was 1st, Mr. J. Smith, 2d; and Mr. Norman, 3d. Mr. Bragg contributed boxes of cut Pinks, and also Fancy Panaisa, Mr. Hooper having some of the latter also.

Fruit Committee. Mr. F. W. Saunders, Esq., F.R.S., in the chair. Messrs. Rivers & Son, of Sawbridgeworth, sent a collection of dwarf Apple trees, grafted on the Nonpareil English Paradise stock, to show their productive habit and suitability for growth in suburban gardens, the specimens were about 2 feet in height, and showed on the average about one dozen and a half fruit on each. The stock which was raised at Sawbridgeworth from seeds of the old Nonpareil Apple, is very productive on the soils in that district, as was fully illustrated by the examples sent. A Special Certificate was awarded. Mr. J. Hopper, gr. to J. W. Hogg, Esq., The Elm, Aylesbury, sent a fine specimen of a new variety of Apple, which was very fine and for two seasons, after which it was very fine, and to which a Special Certificate was awarded. Messrs. Rivers & Co. and Messrs. Rivers & Son, of Sawbridgeworth, sent a fine specimen of a new variety of Apple, which was very fine and for two seasons, after which it was very fine, and to which a Special Certificate was awarded. Messrs. Rivers & Co. and Messrs. Rivers & Son, of Sawbridgeworth, sent a fine specimen of a new variety of Apple, which was very fine and for two seasons, after which it was very fine, and to which a Special Certificate was awarded.

again. From Mr. W. Paul also came examples of the Hardy White Cos Lettuce; and another new sort, called the Hunt Park White Cos, was sent by Mr. J. G. Debonham, Esq., Cleghant Park, High Wycombe, which were offered to be the ordinary variety of White Cos. From the Society's garden came specimens of White Carmes and Atrato Jonette Pears, which are quite a new time before those growing on younger trees. Good, gr. to Lady Ashburton, Metchett Court, near Bath, a fine specimen of the Metchett Court, &c. Mr. Gilbert, gr. to the Marquis of Exeter, L. sent a very fine collection of vegetables, which did not arrive in time to be brought before the meeting. The collection comprised dishes of Monks Fruit, fine fine Globe Artichokes, Early Dwarf Turnips, Early Carrots, Tripoli Onions, four remarkably fine early Dickson's Favourite Peas, good examples of M. Park, Telegraph Cucumbers, and large dishes of Marrow, open air.

ENTOMOLOGICAL. June 7.—Mr. E. W. Doherty, in the chair. A new part of the Society's Transactions was laid on the table. Mr. Pascoe exhibited a singular insect, from Swan River, apparently allied to the genus of Histeridae, as well as a new species of the genus, which he exhibited a remarkable new species of the genus, by M. Millere at Cannes from the Gairia alle, and Paradoxus Ostridellus. It had also been found in Germany, and was distinguished by its large size, and also specimens of Gaebeia atrata, bred from Hyperba, the stem of which it burrows, having previously been case formed of a small piece of the stem of an ornamental plant. Mr. F. Smith exhibited living specimens of the beautiful Physoneta gigantea, from South America, in large numbers in a cage of logwood, from America, and its species, which he exhibited, however, had also a living larva, probably of a Physoneta, from which emits a beautiful green light from the head end of the body, on each side of the body, while the head emits a light, also a bee of the parasitic genus Mitea, which he found struggling in the grass in the neighbourhood of a field covered with the parasitical larvae of Mitea. He also read a letter from the Secretary of the Entomological Society of South Africa, in which he mentioned a young specimen of a seed leaf by a small beetle, Thymus parvulus, and a Turnip flea-beetle. Mr. Druce exhibited some small butterflies from Borneo, including a new species of Gaebelesia. The following papers were read: "Notes on the Eastern Butterflies of the family Eurytomidae and Argynnis," by Mr. A. B. Wallace. "Notes on the characters and description of a new species of Mamestra," by J. Walker. "A Monograph of the Hymenoptera genus Pascoe," containing 43 species, by Mr. F. Smith. "Description of new genera and species of exotic Hymenoptera," by Mr. F. Smith. "Revision of the Nomenclature of the Lixidae and descriptions of some new species," by Major F. Parr. Descriptions of some remarkable forms of Gaebelesia, illustrating the Punctiforme affinities of the singular genus Gaebelesia (Anapestria, King), by Professor Westwood. A note on the Carpenter Beetle of India, made to the Government of that country, was communicated by Mr. G. H. Bates.

Notices of Books.

A Practical Treatise on the Cultivation of the Grape Vine. By William Thomson. 5th edition. pp. 83. Blackwood.

It is not necessary to reiterate our terms of commendation every time a new edition of the well-known book appears. Suffice it to say, that the volume in each succeeding issue keeps abreast of his subject, and hence the reader will find in the present edition reference to the controverted points which have occupied so large a space in our columns recently. To the advantage of bottom-heat for Vines, Mr. Thomson's opinion, "founded on experience, is the subject scarcely admits of discussion, our correspondents seem to have thought very differently as to its advantages. I used to think that it was a disadvantage to have a bottom-heat in the month of May last year I planted a Vine with young Vines, principally from eyes the size of their roots are confined to a border inside the pit 4 1/2 feet wide and 18 inches deep. This border was by two rows of 4-inch pipes under pavement. There are no means of turning off this bottom-heat, one end of the pit there is a tank for collecting water 9 feet long, where there is no bottom-heat. There are two Vines planted in this tank, one is White Frontignan, the other a Royal Marquis. During last summer these two Vines did not make progress the others of the same kind did, and I had bottom-heat. And this year the difference was more remarkable. In consequence of the bottom-heat being used for forcing Strawberries and French Beans the Vines were started at a higher temperature than they ought otherwise to have been. For the heat soon rose to 95, and for a few days it was 100. Those that have bottom-heat broke quicker, and showing far more fruit than those that have no bottom-heat and are now set and ready for the market. The cold border are not in bloom; nor is the fruit much more than half the size of the same kind. Vines where they have the bottom-heat, as far as an example of the good effect, as far as bottom-heat for Vines when applied to so early a stop-valve on the bottom-heat pipes, I will not obtain the heat as compared with what it is." The result have been anticipated on physiological grounds, but we fancy most gardeners would not have a lower degree of bottom-heat. Such an advantage as that mentioned in this instance seems quite disproportionate to the temperature of the border. There is a certain proportion to be observed between the temperature of the border and that of the house. The custom of leaving the roots to be chilled by the coldness of an outside border while the top of the plan of scorching the roots and leaving the roots comparatively cool temperature. Mr. Thomson's

...a gardener to err in either of the ways we have mentioned. We supply a vert to the subject to rest on the ground that it is a healthy and a true relation between the order and that of the cause...

...on Greenhouse Plants con- sidering the number of up to one thousand specimens... By Benjamin S. Williams, F.R.S. Published by the Author, Southampton, Colarod, & Co.

...and Larry volume will supply a real want in horticultural literature that of a reliable modern treatise on the cultivation of the most beautiful flower- ing plants, whether for exhibition, or for the decoration of the stove and greenhouse. We see from the title that it is to be followed by a similar volume on plants with ornamental foliage, and this we can only hope will be equally welcome.

Florists' Flowers.

...at the meeting of the Florist Convention... the English growers were in earnest to compete for the cup... the French raisers on the other hand, and as an important collateral, the breeches- argument that the number of indifferent new roses...

...the development of Roses, and the substance of this flower may be thin from... the variety of this flower may be thin from... the variety of this flower may be thin from... the variety of this flower may be thin from...

Madame Lemoine as to suggest the possibility of this... The same exhibitor had Ascendancy, very like Gion de Nany... Mr W... has said with truth and fitness that the new double Pelargonium should have at least the name of Marie Lemoine and Wilhelm Pflanz...

At the same meeting, a First-class Certificate was awarded to Mr J. George, Putney, for Harry George a very fine hybrid rose-gay Pelargonium, of excellent habit, with faintly zonal foliage, and producing immense globular trusses of bright orange-rose coloured flowers...

Mr Appleby, of Mr Terry Raleigh House, had some pink and blue flowers of forms of bedding Lobelias... of these one named Marie Queen received a First-class Certificate... growth, and free of bloom and having good sized bright blue flowers...

The Apiary.

The following letter was sent to us some weeks ago, but its publication has been unavoidably delayed:— "In answer to yours respecting the hive I wrote about, I find, from a direction since given me, that I made a mistake in calling it the Cory hive. I had been given to understand that Cory was the maker but I find it is King, it is sold only by Cory, so I have no doubt but that you have seen or heard of it before...

Hives with us in the south of England seem this season, so far as we can ascertain, to be more depressed than elsewhere... We generally adopt the plan of cutting out a broad comb, whether of drones or workers, that may be discovered in the supers, returning the mutilated combs to be repaired and filled with honey...

Garden Memoranda.

RED LODGE NURSERY, SOUTHAMPTON. A recent visit to the nursery at Red Lodge, Southampton, and its proprietor, Mr. J. G. ... A more charming situation for a large nursery could hardly be conceived...

The route to the nursery from Southampton is in itself a feature of great beauty. Those of our readers who are familiar with the wood at the Hazue, or the road to Breckenhampton from that town, will best be able to form an idea what the avenue is like. It is to a large extent characterised by the same sylvan and "grassy" beauty as pertains to our own New Forest...

In front of the residence we have a well-kept lawn, edged by masses of glorious Rhododendrons, and dotted over with fine specimens of Conifers such as Araucaria imbricata, Cupressus macrocarpa and Lawsoniana, Pinus Cembra, and others. In the rear of the house the nursery, occupying a succession of slopes and valleys, which covered as they are with many-tinted occupants, would charm the eye of an artist, even were they not backed up by a distant prospect of the hills and glades of the New Forest...

Conifers in general thrive well at Red Lodge. At the time of our visit, early in June, even the smaller plants were particularly noticeable from the infinite variety of tint on the young growths. This was specially manifest on young plants of Picea nobilis, and of course on the various golden-leaved varieties, such as Taxus elegantissima, Retinospora pisifera aurea, Thuja aurea, &c. One plant of the last-named variety can no longer be considered small, as it is at least 5 feet in height, and proportionately large in circumference...

The odd-looking sickly-coloured Umbrella Pine, Sotadopytis, does not appear to grow any more rapidly in proximity to these than it does in a distant little hammock-like plants deserve notice on account of a peculiarity which one of them presents constantly and the other not, Abies Canadensis, which some suppose to have been originally a burr-knot on the common Spruce, and Abies pyramis, which has the same habit. The Canadensis Spruce keeps constant but the pyramis, like the fir, the foliage is constantly showing in some of its branches, the habit is to have the stems of its branches at right angles to the trunk, and the branches at right angles to the stems, and the branches at right angles to the stems, and the branches at right angles to the stems...

spring far better than such lands in ordinary seasons and have been less affected by it. This glorious weather, coming at the blossoming season, is most valuable, and I incline to believe that the Wheat on all strong land will be an average crop, the only probable drawback being that a good deal was broken down, as though sheep had been driven through it, by a wind on the 15th ult., and may not fill. On light lands Wheat cannot reach an average. Barley not an average crop. Peas and spring Beans will be an average crop. Winter Beans, with the greatest bulk of straw ever known, will not produce more than half an average crop of corn. Oats few are sown, the crop not heavy. The hay crop is, without exception, the greatest I have known in 40 years' experience, and secured in perfection. Mangels are very good. Cabbages good. Swedes and Turnips standing well. Pastures abundant. Harvest will probably be a month later than last year—a week later than in ordinary seasons. C. Randell, Chadbury, near Bresham, July 2.

AMERICAN EMIGRATION,

AS AN AID TO THE SKILLED HORTICULTURIST AND AGRICULTURIST WITH SMALL CAPITAL.

HAVING made a professional visit to America to inspect its lands, landscapes, trees, climates, and capability for improved horticulture and agriculture, and its advantages to the skilled English and Scotch horticulturists and agriculturists who have saved a little money, and now find it difficult to obtain suitable situations in this country, I may tell them that to go to America to seek for such things there is, with a few exceptions, not to be recommended. The second hand or foreman, young and willing and ready to take up anything, is more in demand after, and at this time a more useful man in America than here, and should emigrate. Nevertheless there is a fine home for the skilled workman with a little money who desires to own land and cultivate his own farm or garden with one-tenth the amount of capital required in this country. Having worked out this, with the best opportunity of getting information on the spot, it can be relied upon, and what I desire to point out is that men can go and buy lands in Virginia, which has one of the finest climates in America, capable of producing the finest Wheat, corn, Grass lands that have been in cultivation for more than 100 years. The names and titles are English. The owners of the properties having lands for sale will be glad to show kindness to Scotchmen or Englishmen in preference to any other. The reason of the lands being offered for sale is the condition the war with the North has left the South in, at this time without money to cultivate their lands. The slaves being free and uneducated are willing to return to their old masters and make good servants, but if offered lands to work and manage themselves, and return to their owners a third or fourth part of the produce, they will not work, so this is one reason for desiring English agriculturists and horticulturists to come among them. One estate, 1100 acres, I could purchase at 5/ per acre. It is as good land as is to be found in England. The Wheat I saw grown, was equal to 30 to 35 bushels per acre. Clover ready for cutting three loads per acre. The crops of Tobacco, Indian Corn, orchards of standard Peaches, Apples, and Pears, a dwelling house that cost 1800 dollars, with other buildings and plantations of the greatest variety of Virginian deciduous trees. Three other estates, of 1000, 1500, 1800 acres, could be had upon a lease for five years at 1 dollar per annum. Other estates, amounting from 3000 to 25,000, at 1/ 10s per acre, and those owning them will be glad to offer every assistance. I have seen the lands in the north, west, and also the south of the United States; and in travelling for this information, I was with a party, starting from New York, and prospecting for land-buying for aiding emigration. One of this party, a solicitor, the head of the German Emigration Association, told us that this Association had found homes, and added 2,500,000. General J. D. Imboden was the conductor of our party, and you will see by the three letters in print I send you to make any extracts you think well, that we were well posted in our subject. I thought it was worth my trouble to get information for Englishmen of a different class from those who start and land in New York in Castle Gardens without a penny in their pocket, and have to lie for a week, often by hundreds, on the board or floor of the building, without a bed, or any friend to help them, or any one to tell them how to find employment. But, notwithstanding the mistakes yet made in this country in the advice I have heard in London given to poor emigrants, I am able to find good homes, and should be most happy to aid any of your readers. But what I desire to impress upon them is that they should form little bodies or companies of 10 and 20 men with 100/ to 200/. Half the money going to buy land, the other to cultivate and help one another, more could be done to the advantage of a , by working it themselves, than each one going separately. And not only for this class. There is a fine opening for the younger son of the farmer, with 1000/. He could do more in the part of America I here allude to than on any other estate to be bought in our country for 10,000/. But it must be understood that this advantage will not last long in its present state. They rapidly get over the effects of the war, and in three more years the whole state of things must change, and any one settling just now will have the advantage, as the labour question in this country is just now one of the most important. I have thought it proper to bring it first before your readers, for no time is to be lost for those who desire to take advantage of the information, as the month of October or fall, is the season for preparing for the Wheat-growing season, a most important matter for the next years crop. Joseph Newton, 74, Oxford Terrace, Hyde Park

THE ROTHAMSTED FIELD EXPERIMENTS.

MEMORANDA OF THEIR PLAN AND RESULTS.

I. EXPERIMENTS WITH DIFFERENT MANURES ON PERMANENT MEADOW LAND.

THE PARCH.

The land has probably been laid down with Grass for some centuries. No fresh seed has been artificially sown within the last 50 years certainly, nor is there record of any having been sown since the Grass was first laid down. The experiments commenced in 1856, at which time the character of the herbage appeared uniform over all the plots. Excepting as explained in the Table, and in the foot notes, the same description of manure has been applied year after year to the same plot. (Area under experiment, about 5 1/2 acres.)

THE ADULTERATION OF MANURES.

The following discussion of this subject was raised by Lord Elcho last week on motion that the subject be referred to the attention of the Board of Trade.

Lord Elcho called attention to the adulteration of feed-stuffs and manures. His attention was first called to this subject by a letter he received on March 20 last from the Earl of Rosebery, a most eminent agriculturist, who has done more for agriculture than any other man in Scotland. That letter, referring to the greatly increased demand for artificial manures, stated that a corresponding amount of adulteration had arisen. Adulteration was carried on to a most extraordinary extent, and so artfully was it done as almost to escape notice. What he asked was not any protection that would enhance the price of agricultural produce to be marketed, but protection against the fraudulent practices which existed, and were daily increasing, in the manufacture of manures. Last week the Highland Society met, and the report of the committee stated that on no previous occasion had the number of analyses been so large, clearly proving the necessity of care in purchasing these manures. The amount of adulteration detected was small compared with what passed unchallenged. Considering it his duty to get what information he could, he had gone to the Professor of Chemistry to the Royal Agricultural Society of England, and he would state some of the results of his inquiries. Of late years one of the most important manures in this country was guano, of which there were six different descriptions. The best Peruvian sold in the Liverpool market at 12s. 6s., the next description was sold at 7s.; others fetched 6s. 10s., 6s. 15s., 9s., and some sorts as low as 4s. per ton. The best Peruvian contained 10 per cent. of ammonia, but it was very good at 15 per cent. of ammonia, and it contained only 24 and 15 per cent. of phosphoric acid. It was adulterated with chalk, gypsum, and, above all, with lime, and in an island in the Mersey, a Liverpool being the great manufactory of the adulterated article that Messrs. ... yellow sand used for the purpose of adulteration was fetched from 2s. to 2s. 6s., and its appearance was most deceptive. Fifty per cent. of this lime was mixed with guano, and, instead of the price of the genuine article being 12s. per ton, the adulterated article was sold at 8s. There was a kind of British guano which was absolutely worthless. It was sold at 4s. and 5s. per ton. The farmer, pretending to be very knowing, was deceived by finding a lump of guano which he broke, and finding them gone and bought the article eagerly, but those lumps were so strong that they destroyed all vegetation. Then, again, the presence of ammonia being known by a strong smell, something was put in order to create this strong smell. These adulterations could not be detected by the eye—they could only be detected by analysis. Another mode of making spurious goods pass for sound was by inventing wrong names, making up a name of composition and calling it "Swan Island Guano," or some such name, taken from a place which had no existence, and the manufacturer giving out that he was the sole possessor. He called his bones, which in their raw state were worth 1s. per ton, and when crushed from 7s. to 7s. 10s. They were sold for 6s., 7s., or 8s., not in their pure state, but when adulterated with 50 per cent. of gypsum, worth from 1s. to 2s. per ton. They were further adulterated with ... by turnings from factories at Birmingham, which were sold at 2s. 10s. or 3s. per ton, and the only value of which arose from their use in a ... were many manufacturers who bought ...

England he might safely say that the sum expended by farmers upon artificial manures amounted to fully more than their rent.

As to manure now to feed-stuffs. The main feeding stuff was linseed cake, of which there were two descriptions. The pure contained from five to six per cent. of oil, and the best test was to dissolve six grains in a ounce of water, and if the cake was pure it ought to form when shaken a thick jelly. He had said that Liverpool was the headquarters of adulterated manures, but Hull was the headquarters of adulterated food-stuffs. Out of the 40 mills in Hull, only three manufactured pure linseed cake, and, taking the whole United Kingdom together, there was not a mill which made pure cake. Pure cake was a fancy article, and the operative agricultural society had been started to supply it. When asked for Hull it was said it did not exist. Some of these cakes were supposed to be pure, and were analysed with the result to indicate that they were so; but, as he was informed by the eminent chemist to whom he had before referred, analysis showed that it contained from 20 to 30 per cent. of adulteration. The best article was, as a rule, 10 per cent. worse than pure. In fact, the brand of the trader was a security for the quality of Linseed as a whole. Some kinds of adulteration were comparatively harmless—that is to say, they only misled a buyer, but other kinds did positive injury to the cattle. Some of the samples which had been analysed contained 80 per cent. of adulteration, and in certain cases such a quantity of Mustard-seed had been used, that the cake pretending to be oilcake might have been broken up and sold as Mustard. Among the specimens of cake which were analysed as being part of the cake that had killed Mr. Sanderson, and as held in his hand a sample of cake that had killed a cow belonging to an hon. member of that House, another portion of cake he held in his hand was made of mere sweepings of various manufactures, and, although utterly worthless, was sold at the rate of 4s. a ton. The system of adulterating food-stuffs was carried to a great extent in the case of adulterating the food of bipeds had been formerly, and therefore he thought it was Parliament had thought it right to legislate in the latter case, they should take some steps to interfere in the former case also.

Doubtless he should be met by the great argument—that he should be told that the remedy he should look to was not legislation, but an increased intelligence on the part of the farmer. He had, however, thought it was the duty of the Government to protect the people against fraud as well as against violence. It was impossible that the small farmer could bring the requisite chemical knowledge to bear upon the subject to protect himself from robbery of this description. The real question, in his opinion, was whether or not the evil was so generally great to justify legislative interference. He did not know what views were entertained upon this point by the right hon. gentleman, the President of the Board of Trade, who he was sorry not to see in his place upon that occasion, but from a remark which the right hon. gentleman had let fall the other night when speaking to him upon the subject, he was afraid the farmers had not much to hope from him. The right hon. gentleman had said to him on the occasion to which he referred, "Why do you always take up the most ridiculous questions?" He mentioned that circumstance to show that the farmers who looked up to the President of the Board of Trade as their protector—almost their guardian angel—against fraud were not likely to obtain much satisfaction at the hands of the right hon. gentleman. The impression that prevailed among the farmers in Scotland was that the right hon. gentleman was extremely ignorant upon this subject, and required enlightening upon it. The right hon. gentleman had said the other day that if we were to go on inspecting everything, one-half the world would be inspecting the other half;

but if inspection were necessary, steps should be taken to insure the establishment of a proper system, under which it could be carried out advantageously. The principle of inspection had been acted upon with reference to cheese and other adulterations of human food, and there was no reason why the same principle should not be applied to the adulteration of the food of cattle. He felt certain that the Government ought to apply a remedy. What he would suggest was the remedy of publicity—that an analysis should be made, and that the names of fraudulent tradesmen should be published at stated periods in the *London Gazette* or some other publication. Something, at all events, should be done, and he moved that in the opinion of the House it was desirable that the attention of the Board of Trade should be directed to this subject.

Mr. WELBY seconded the proposal of the noble lord, for he was fully convinced of the enormous extent of these frauds and adulterations. He, however, admitted that there were serious practical difficulties in the way of legislation on the matter. Of the two branches of the subject, the adulteration of food-stuffs was the most important, and one difficulty in dealing with this subject arose from the fact that the primary object of the seed crusher was, not the manufacture of oilcake, but the production of oil; and another difficulty was, that chemical analysis frequently failed to detect the adulteration. Some oilcakes contained no Linseed at all, and many were adulterated with pernicious materials. The hon. member here mentioned instances in which cattle, sheep, and horses had been killed by adulterated oilcakes in a few days, and said that matters had gone so far that special machinery had been invented to detect the adulteration. Last year, in consequence of the failure of the green crops, adulteration was carried on to a greater extent than ever. One means of putting some limit to adulteration would be to establish mills, the primary object of which should be to produce oilcake for the farmers. The excuse for these frauds was that the farmer, from ignorance, would only give a certain price for his oilcake or manure, and the dealer must find an article for him at that price, or not sell him any at all. There was a good deal of force in that argument, and it was the case that the farmer might be carried to far in Scotland, and the farmers were so disgusted with the result that they had formed themselves into an association for the purchase of their manures from the manufacturer with a guarantee of quality, and they employed a professional analyst to test their quality. In this way they had already saved a large sum of money, and their next order would probably amount to 10,000 or 15,000 tons. It was in that direction, he thought, that they must in the first instance look for a remedy. At the same time, if a law could be devised that would meet the difficulties of the case, and assist the farmers in their efforts to protect themselves, it would be a very desirable one. He would not say that he would not be extremely small, and he should feel grateful if the House in its wisdom could assist the farmers in protecting themselves against these frauds.

Mr. McLAGAN considered that the farmers had the law in their own hands, by purchasing manures with guaranteed analyses. This plan had been adopted by the farmers forming themselves into a local association in a district where adulteration had been carried on to an immense extent, and after two years there was not found one single article of adulterated manure. In his opinion the farmer should be treated as other traders were, and if other traders did not ask for protection he did not see why the farmer should. He spoke boldly on this point, because he belonged to the agricultural district.

Mr. SHAW LEEVER said that the two hon. members who had spoken before him, while admitting that adulteration existed and also the difficulty of legislation, had not indicated to him what the true remedy was in the hands of the farmer himself. He was glad that this discussion was being carried on so soon after the meeting of the Association of Seed Dealers, because it was possible that the Association would be able to devise a remedy applicable to the present case also. There was another Bill before the House upon a matter of great importance, namely, the adulteration of the food of the human race, and it would be possible to deal with so small a subject as feed-stuffs and manures while the important question of the introduction of inspection into the food of the people was concerned was still undecided. The noble lord had said that the small farmers were unable to protect themselves, but the information he had received pointed to an opposite conclusion. He had received a letter from a gentleman of great experience, who in the last few days pointed out that in various districts of Scotland the farmers were successfully protected by forming an agricultural association among themselves. The assistance was given of a district in which in the beginning much bad seed was sold, but the members of the association ceased to purchase from those who sold bad articles, and one by one the inferior vendors were weeded out. That would show that the farmers had the means of protecting themselves, and even of stamping out adulteration of their food. Let us know that there was an agricultural association within the district and adulteration would cease.

Mr. LEAS said that protection was utterly beyond the reach of small farmers. He did not fancy that the question was ripe for legislation, but he held that the whole question of fraud should be inquired into, and he hoped in a short time they would have a commission to investigate the subject. As to farmers having their protection in their own hands, so had other people, and yet the Government stepped in to protect them. For instance, persons who sent diseased meat to market were liable to fine and imprisonment.

Mr. NORWOOD believed that farmers would be able to obtain plenty of pure oilcake if they would only pay a fair price for it. The motion was then negatived without a division.

is best adapted for every occupation. Farmers must consider if it is adapted to suit their crops. Take the fans and strong loams for instance. It is not every reaping-machine that can cut such crops as are commonly grown upon such soils. In average seasons only they are heavy and laid, and it requires a strong and peculiar machine to cut them satisfactorily. It is so in every district where the crops are heavy and laid. A most any of the modern reaping machines will do satisfactory work upon light standing crops, and it is comparatively immaterial whether it be self-acting or not, or has a side-delivery, sheaf delivery, or manual labour is employed. These are matters for the consideration of farmers in accordance with the soils they cultivate and the crops they grow. If it is requisite to cut the corn down in order that it may lay awhile to wither and dry, as in many Barley crops full of green Clover or seeds, a side self-delivery machine would appear to be most desirable, if all is tied up as it is cut, a sheaf would seem to be best adapted for it, but for heavy crops, laid and thorough grown, the strongest and most effective machine cleared by manual labour would probably prove best. I have frequently seen these machines in competitive trials and otherwise, and I have never seen one yet that could satisfactorily cut and lay a heavy thorough-grown crop in readiness for tying. The manual delivery machines, if strong and properly made, have with this manual assistance made the best work. I hope the crops to be operated upon at Manchester will be above the average in quantity and length, so that the trials may be a real test of capability in every machine. I repeat that almost any machine can cut light crops. Horse rakes—These are scarcely corn-harvest machines, but it is very desirable they should be used after the reapers, and for this purpose care should be taken to observe that they are capable of regulation, so as to cleanly rake up the corn without scraping up the soil or stones. The teeth should have ample scope for raking up in full and satisfactory rows without compressing the rows so as to require subsequent forking out. Carts and Waggon—The question relative to the quickest mode of clearing a cornfield by cart or waggon, is not for decision at Manchester, but it is a question well worth the consideration of every farmer attending the meeting. The competition would appear to be, which is best respectively for harvesting corn, not for general service—this is more especially for the consideration of visitors and farmers who desire to purchase for general service, as well, especially, for harvest work, must be the decision of purchasers, and it is to this point farmers must look. It is a very easy matter to buy or supply the farm with implements, and at a very expensive rate. The great thing is to purchase these only that are of the most generally useful, not an investment for every particular service, as many do and are soon laid aside. A good harvest cart or harvest waggon may be as useful upon the farm, and as serviceable for harvest work, as one constructed more especially for harvest work. Both should be strong, but as light as possible, in accordance with their heavy work as well as the lighter harvest work. The adaptability of the "raves" in carts is of great importance, and not to be lightly thought of in waggons. Fore ladders and hind ladders which are movable are great acquisitions to waggons in harvest work. Handforks and handrakes are highly useful and indispensable implements in harvest work. A competition in the smaller things ought not to be beneath the attention of the Royal Agricultural Society. Stock staves, ladders, bearers for setting down carts, and other little matters connected with harvest work, deserve the encouragement of our great society. O. F.

Emigration—A vast emigration, both of capital and population, is finding its way to countries where there is land to employ both, and where towns are not yet overstocked with either. Here our towns and cities are overstocked with both labour and capital, and so both take to themselves wings and fly to more genial and appropriate climes. Our land does not employ either capital or labour sufficiently, so they are forced upon our cities, where they are not required, and must again move on to the United States, or our own colonies. This is lamentable, in a national point of view. These elements of strength and dignity might still, for a long time, be retained here, were we to do our duty in agriculture. My own experience of 25 years has taught me, that not only does agricultural improvement employ a vast increase of labour and capital, but, by the consequent greater crops, demands permanently much more human aid. Well, then, if we would employ more labour and capital, and grow more food concurrently at home, we should thus shut out, *pro tanto*, the foreign supply, and keep the money circulating profitably among ourselves. So long as Britain is, as at present, only half farmed, so long shall I continue to protest against our present suicidal action. J. J. Mechi, Tiptree, June 29.

The Prejudice against Bothies.—Whoever shall persist in hurling his anathemas at bothies, they will remain indispensable parts of the buildings on well-appointed farms. It is strange that a mere name should draw forth such hostility. I am mistaken if there is not a "young men's room" on the Queen's Home Farms near Windsor. The word bothy is merely a term applied to furnished lodgings. The popular prejudice is so great, that when I republished a tract form a few of my detached essays on the bondager system and its remedy, the local editors took no notice of it. And, notwithstanding that I advertised it 13 times in a *Kelso paper*, Sr. 11d. was my gross receipts for all my trouble and expenditure. About a year ago I was much pleased with a letter by Mr. Willoughby Wood on the contradictory nature of the discussions in agricultural journals; and Mr. Wood referred to

Home Correspondence.

The Harvesting of Crops—The machines and implements for the harvesting of crops are the class of implements to be tested at the Manchester meeting of the Royal Agricultural Society during the next week. They consist of mowing, reaping, and haymaking machines, hay collectors, horse-rakes, carts, and waggons. This gives a fine opportunity for visitors and farmers in particular to ascertain the utility and value of these machines for their respective occupations. It is not because a reaping machine can do admirable work under trial upon an average crop of corn that it

Reviews.

The Quarterly Journal of Science No. XXIII, July, 1869 Longmans & Co. The present number, besides the very full account which gives of the progress of science in all its departments during the past quarter, contains papers on sea-weeds, archaeology, geology, reviews of books, a discussion of the policy of teaching natural science in schools, and several astronomical papers. It is quite up to the usual standard of general interest as well as of strictly scientific information. We extract a passage which the Editor has given, under the head "Agriculture," among his "Chronicles"...

...ual statistical records of the Registrar-General, and the annual agricultural tables issued by the Board of Trade are used in it with great ability to trench upon the leading facts regarding the aborigines in our fields, and their relations to the corresponding facts regarding the labourers in our mines and in our workshops. The main features of agricultural practice and experience in the several English counties are also cleverly marshalled, and explained so as to explain the distribution of the agricultural labourer over the country. The whole is not only discussed in a very well-written essay, but unconsciously well depicted and presented to the eye in diagrams and maps. In one set of curves for example the percentages at the several stages of the whole number of labourers employed on land and on coal and iron respectively are shown, and we see at a glance that a larger proportion of an that are engaged of the male age in the cases of coal and iron than in the case of land. The curves of coal and iron labour stand higher between the ages of 15 and 45, and the curve in the case of land labour stands highest over the early years and over the later years. The explanation is that many of the boys of the farm leave it for the workshop as they become men, and return to it as they approach old age and begin perhaps to look out for a maintenance at the expense of their parish. Other diagrams illustrate the quantity of agricultural labour employed per acre in several counties, and it appears that it is in the case of arable land in a county which determines the quantity of agricultural labour employed per 100 acres, that depends rather on the quantity of live stock which is on the land and especially on the quantity of dairy stock. Lancashire and Middlesex employ more labour than other counties, not that they have a large proportion of grass-land, no doubt because of the great quantity of live stock which their agriculture maintains. There is however a good deal of difference in this particular, as due to the nature of the soil. Light lands are suitable for sheep farming, and sheep require but little care. On heavier soils cattle must be kept, and on arable land they must be kept in yards and stables, and this necessitates much labour. A portion of the essay is devoted to a discussion of the improvements in agriculture which are required in the interests of the labourer. We are not at all disposed to lament the decrease in the number of those employed in fields, which is the leading fact before reviewers of this subject. We may admit that any tendency of this kind is the result of industrial revolution on the part of those engaged in agriculture, which is prompted by the sharpest and most anxious motives of self-interest. If the sons of agricultural labourers are as a rule gradually leaving the soil, we should accept it as a fact, and rather as a lamented and if possible prevented, but rather as a fact which is the result of the industrial revolution, and which is likely to be true in any other, is likely to be true in any other. When it should become the interest of the farmer to employ more labour, and when he shall have been driven by the force of circumstances to pay a higher wage, than the course of events will alter, and we may possibly have hereafter to report that cottages and gardens, and education and wages in country places, are together offering attractions to the labouring man superior to those which are presented in the circumstances of our town population. There can be little doubt that when that happens, we shall have a longer list of labourers upon the whole than we have at present. That is an advantage affecting especially the very young, in which the town labourer is unquestionably at a great disadvantage.

Index to the Transactions of the Highland and Agricultural Society of Scotland. 1799-1863.

A most valuable aid to the agricultural student. Published separately, as that of the English Agricultural Society's Journal ought to be, you have at your command in a compendious and acceptable form the whole contents of one of the most valuable agricultural libraries that have ever been collected.

Farm Memoranda.

LAUGHTON FARM, LINCOLNSHIRE.—In the course of a roundabout route—per Great Northern, Lincolnshire, and Midland railways to Northampton last week, we found ourselves in the Bourne and Fellingham districts of West Lincolnshire with a few hours on our hands. And having paid a flying visit to this neighbourhood in 1866, and having regularly seen for some years at Peterborough fairs the "cream" of flocks which have been reared thereabouts, we resolved to drop down at Laughton to see the conditions under which one of the leading flocks is produced.

West Lincolnshire is as purely and interesting an agricultural district as is now to be found in this country. Taking a line from Stamford to Skeaford, and on the road to Lincoln, before Lincoln Heath is reached, there are throughout the course small hills and valleys in an undulating form, which is pretty to look at, and at the same time not at all inconvenient or difficult for purposes of agriculture. These small hills rise above and lie within a short distance of the vast expanse of flat surface which stretches down to Peterborough, past Spalding to Wisbeach, and beyond Boston to the Wash. On the ridge of these elevations may be seen the smoke belching from factory chimneys at Spalding, 10 miles away, and Boston Church steeple, or "stump," as it is locally called, is conspicuous in the horizon 21 miles distant. These pictures, no features are remote, because, while they add to the pleasures of a tour and the interest of its reflections, they are intimately connected with the practical agriculture of the district to which we are now

especially referring, for most of the large and important breeders and farmers there are enabled to make the mark they do because a few farms are generally held in connection with their occupation on the higher ground.

One fine day last week, then, we spent with Mr. John Henry Casswell at Laughton, a name and farm now well known in Lincolnshire and many other counties from the superiority of the Lincolnshire rams and ewes which have been shown at Royal Agricultural and other meetings, and sold at Peterborough and other fairs. Mr. Casswell has two farms, as referred to, the fen farm being five miles or so away to the east, through Aslackby village and hamlet.

It would take too much space to relate separately and minutely the peculiar features of both these occupancies, but if we work up the two together the salient points of each will present themselves, and at the same time afford all the practical information on which can be imparted in a pen-and-ink description of farming. These upper and lower farms comprise 635 acres, two-thirds of which are arable, and one-third old pasture and permanent grass land. This year 1202 sheep have been clipped. Of these 370 ewes—the animals we felt most interested in seeing—have been lambed down. About 100 shearling ewes are "set" in the flock annually, so that as a rule allowing for casualties, the flock is renewed every four years. Of rams, there are generally produced, for sale and use 100 to 120, most of which are sold as yearlings, a few only being lot, and these are such as are not wanted, according to their descent, for use at home as shearers, although their particular strain and character may be required when the lambs, then growing up, shall have become of a proper age for breeding. This year the stock of rams is small, in consequence of the extraordinary drought and loss of the Turnip crop of last year, meaning, may, compelling Mr. Casswell to dispose of every sheep that was not really of the most promising character. But there are now 75 yearling rams in most excellent form and condition, and some among them are magnificent sheep, there is one in particular, which, we dare to predict, will cause some admiration at the Lincolnshire show this month, and some spirited competition among raw breeders should he be offered for sale or for a season's service. Beyond referring to the fine compact form, the well-marked features, bright complexion, and general pleasing appearance of this sheep, we will defer a full description of him till we see him in person. Besides the shearlings, there are 11 two-shear and other sheep, ranging in age up to seven years.

Now that we have seen the Laughton ewes with their compact, heavy frames, and straight, well-set legs, and their generally good and substantial form, which they necessarily endured last autumn, when they were so severely tried, that the fact of their being so good a figure of a public, and a profitable one to the owner, is beyond the calculation of outsiders, by practical breeders. The reason why the Laughton rams have made the highest averages at Peterborough for some years past is easily understood when the females of this flock have been seen fresh out of their coats with their last crop of lambs by them.

Before entering into the leading details of the system whereby this large and heavy flock is supported, and kept up to the state of perfection for which its owner is so famous, we will simply enumerate the other stock which is usually kept on these farms. The number of cattle is generally about 150, divided into cows, 3-year-olds—which are now going to market off Grass and corn, or cotton-cake,—2-year-olds, yearlings, and calves. About 30 cows are kept, on which, or by the milk of which, the calves are reared, and a finer and more thrifty stock of Shorthorn cattle than there is throughout this part of Lincolnshire where these calves are bred, we have never seen. A great and good bull among the cows is a sufficient indication of the spirit with which this department is also pursued at Laughton.

The methods of cropping these farms are,—on the upper land farm, a four-course system; and on the lower level, or "fen land," a five-course system. The first is fallow and Turnips, Oats or Barley, Clover or Peas or Beans, and Wheat. This high land is naturally a strong and poor one, and if it had not been for the large and expensive dock which Mr. Casswell has kept, this farm could not have been brought to the high condition in which it now is. After saying this, it would seem to be somewhat contradictory to speak in the next sentence of the way in which the Turnip land, the first round of the course, is managed, by the way it is necessary to keep such a dock on it at the autumn and winter season. But it only requires a little explanation to make these apparently paradoxical views perfectly consistent. For, in the first place, Mr. Casswell says:—"After spending 2/ an acre in artificial manure to grow Turnips, and 10s. per acre in hoeing and cleaning, this land is 1/ per acre poorer for growing Barley or Oats than it would be if the inexpensive course of long fallowing had been adopted." Thus, a crop of Turnips cost here, in manure, labour of sowing, seed, cultivation, and injury to the land, above 1/ per acre. This is altogether apart from the cost of preparing the Turnips for the sheep. But this Turnip-cropped and sheep-folded land has to have its reduced fertility restored either for the next cereal crop, or for the following Clover or pulse crop. And it is here where the other points of Mr. Casswell's liberal practice tell, for the sake and care given to the best rams and the other beasts in yards and sheds, places so large a quantity of richly charged straw-manure at its disposal, that the Clover and pulse crops are adequately fertilised, and the heavy crops of them which are grown the result.

Clover is grown only once in two courses, so that on the high land it comes in turn once in eight

GREEN'S PATENT SILENS MESSOR,

OR

NOISELESS LAWN MOWING, ROLLING, and COLLECTING MACHINES.

BY SPECIAL APPOINTMENT,
MANUFACTURER

TO HER MOST GRACIOUS
MAJESTY THE QUEEN.

The Extraordinary Success of GREEN'S PATENT LAWN MOWERS is an established fact. During the last five years the demand has been unprecedented, which alone is a proof of their superiority over all others. The following are their characteristic features—

- 1st. Simplicity of Construction, every part being free of access.
- 2d. They are worked with far greater ease than any other Lawn Mower.
- 3d. They are the least liable to get out of order.

IMPORTANT NOTICE.

Trial at the London Horticultural Society's Gardens, Chiswick, June 5, 1857; four competitors—First Trial on level ground, Second Trial on undulating ground, Third Trial on intricate places, around trees, &c.—when GREEN'S PATENT was unanimously declared to be the best in each Trial by COLONEL CHALLONER, DR. LAYTON, and G. McEWAN, Esq., the appointed Judges, and on every subsequent Trial to the above have GREEN'S PATENT LAWN MOWERS carried off every Prize that has been given in competition for superiority in every point.

PRIZE MEDALS AWARDED TO GREEN'S PATENT LAWN MOWERS.

FIRST PRIZE MEDAL AT THE INTERNATIONAL EXHIBITION, LONDON, 1861.
FIRST PRIZE MEDAL AT THE INTERNATIONAL EXHIBITION, DUBLIN, 1863.
FIRST PRIZE MEDAL AT THE NAMUR EXHIBITION
FIRST PRIZE MEDAL AT THE GAND EXHIBITION

FIRST PRIZE MEDAL AT THE LAAKEN EXHIBITION.
FIRST PRIZE MEDAL AT THE LINDSEY EXHIBITION.
FIRST PRIZE MEDAL AT THE BRUSSELS EXHIBITION, on two occasions.
FIRST PRIZE MEDAL AT THE HAMBURG EXHIBITION.

THEY ARE THE ONLY MACHINES IN CONSTANT USE AT

THE ROYAL HORTICULTURAL SOCIETY'S GARDENS, SOUTH KENSINGTON
THE ROYAL BOTANIC GARDENS, REGENT'S PARK
THE CRYSTAL PALACE COMPANY'S GARDENS, SIDENHAM
BUCKINGHAM PALACE GARDENS
MARLBOROUGH HOUSE

THE HYDE PARK GARDENS
THE WINTER PALACE GARDENS, DUBLIN
THE DUBLIN BOTANIC GARDENS
THE LIVERPOOL BOTANIC GARDENS
THE LEEDS ROYAL PARK

THE HULL BOTANIC GARDENS
THE HORTICULTURAL GARDENS, BRUSSELS
THE SUNDERLAND PARK
THE PRESTON PARK

AND IN MOST OF THE PRINCIPAL PARKS, SQUARES, ETC., IN THE UNITED KINGDOM.

HORSE, PONY, AND DONKEY MACHINE.

GREEN'S PATENT LAWN MOWERS

have proved to be the best, and carried off every Prize that has been given in all cases of competition. Since the first year they were introduced (1847), upwards of 46,600 have been sold, and 25,000 of that number during the last five seasons.

T. GREEN & SON
warrant every Machine to give entire satisfaction, and if not approved of can be returned unconditionally.

PRICES of HORSE, PONY, and DONKEY MACHINES, including Patent Self-delivery Box; Cross Stay complete; suitable for attaching to ordinary Chain Traces or Gig Harness.

PONY AND DONKEY MACHINES.

To Cut 26 inches	£13 0 0	Leather Boots for Donkey, 18s. Leather Boots for Pony, 22s.
" 28 "	15 0 0	
" 30 "	17 0 0	

HORSE MACHINES.

To Cut 30 inches	£21 0 0	Leather Boots for Horse, 3s.
" 36 "	24 0 0	
" 42 "	27 0 0	
" 48 "	30 0 0	

Both the Horse, Pony, Donkey, and Hand Machines possess (over all other Makers) the advantage of Self-sharpening. The cutters being steel on each side, when they become dull or blunt by running one way round, the cylinder can be reversed again and again, bringing the opposite edge of the cutter against the bottom blade, when the Machine will cut equal to new. Arrangements are made that the cylinder can be reversed, by any inexperienced person, in two or three minutes.

HAND MACHINES.

To Cut 10 inches	..	53 10 0	Suitable for a Lady
" 12 "	..	4 10 0	" "
" 14 "	..	5 10 0	Suitable for One Person
" 16 "	..	6 10 0	" "

To Cut 18 inches	..	£7 10 0	Suitable for One Person
" 20 "	..	8 0 0	Suitable for Two Persons
" 22 "	..	8 10 0	" "
" 24 "	..	9 0 0	" "

Packing Cases are charged at the following low rates, viz.:—For the 10 and 12-inch Machines, 3s.; 14 and 16-inch, 4s.; 18 and 20-inch, 5s.; 22 and 24-inch, 6s. Persons providing the machines with Lawn Mowers are recommended to purchase the cases in which to stow them away, when not in use, to prevent them from getting damaged; returned, two-thirds will be allowed for them.

The above MACHINES are made from the best materials, and of superior workmanship; are delivered Carriage Free to all the principal Railway Stations and Shipping Ports in England, Ireland, and Scotland.

HORTICULTURAL and AGRICULTURAL IMPLEMENTS, GARDEN SEATS and CHAIRS, FOUNTAINS, VASES, PLAIN and GALVANISED WIRE NETTING and ORNAMENTAL WIRE WORK of every description.

Having very extensive Premises in London, we are in a position to do all kinds of Repairs there, as well as at our Leeds Establishment.

Having a large quantity of MACHINES in stock at our Leeds and London Establishments, we are in a position to execute Orders on the day they are received.

KENT FIBROUS PEAT, of first-class quality, for all potting purposes, and American Plants, may be obtained on application to Mr. THOMAS JENNIP, Farmington Wood, near Sevenoaks Junction, Kent on (South) side of the Dover Railway, in trucks of 16 yards, for most parts of the Kingdom. It has been extensively used and appreciated in the principal Nurseries and Royal Parks and Gardens.

Rosher's Garden Edging Tiles.

THE above and many other PATTERNS are made in Terra-Metallica Ware, Terra-Cotta, Stoneware, and Redware, and of great durability. The pattern sorts are especially suited for KITCHEN GARDENS, as they harbour no Bugs and insects, take up little room, and once put down incur no further labour and expense, as do "grown" Edgings, consequently being much cheaper. GARDEN VASES, FOUNTAINS, &c., in Art Glass, Stone, of great durability and appearance, and a large variety of design.

F & G Rosner, Manufacturers, Upper Ground Street, Blackfriars, S.E. & Green's Road West, Chelsea, S.W. Catalogue of Tiles, &c., sent free by post. The Trade supplied.

ORNAMENTAL PAVING TILES for Conservatories, Halls, Corridors, Balconies, &c., as cheap and durable as Stone, in blue, red, and buff colours, and capable of forming a variety of designs. Likewise more elaborate designs. Pattern Sheets of Pavements, with prices, forwarded for selection.

WHITE GLAZED TILES, for Lining Walls of Dairies, Larders, Kitchen Ranges, Baths, &c. Grooved and other Stable Paving Bricks of great durability, Dutch and Adamantine Clovers, Wall Copings, Red and Stoneware Drain Pipes, Slates, Cement, &c. To be obtained of F. & G. Rosner, at their premises as above.

SILVER SAND (REIGATE), at the above addresses—14s. per Ton, 1s. 2d. per Bushel; 2s. per Ton extra for delivery within three miles, and to any London Railway or Wharf. Quantities of 4 Tons, 1s. per Ton less. A coarser grained Sand 4s. per Ton more. Samples of Sand by post on receipt of stamp.

PLANTS and BRICK BURELS for Hookeries or Ferneries. KENT PEAT and FLOAM supplied at lowest rates.

F & G Rosner—Addresses see above. Sent by Railway or Water. The Trade supplied.

nine months. The plants were remarkable for compactness and vigour, and the fruit of large size (Cayenne and Black Prince, of 4 lb. to 7 lb. each), considering the plants which produced them.

Illustrative of the practice which we wish to inculcate, we may instance an experiment made more than 30 years ago. At that time some Pines, principally Black Jamaica, Montserrat, Antigua, Brown Sugar-loaf, and Havannah, ripened off their fruit from October to Christmas, and, as was usual at that time, each plant (three years old, threw up a quantity of suckers. As it was late to remove them, it was thought expedient to thin out the smaller ones, retaining two or three of the strongest upon each plant. From these the old leaves were stripped away, so as to expose the base of each sucker, and around these were placed some pieces of turfy loam, a fine growing bottom-heat being maintained by means of steam-pipes under the bed. The suckers soon showed that the arrangements were suitable to their requirements, and they grew accordingly. Early in the following February, a pit having been prepared for their reception, the suckers were taken off, potted into 8-inch pots, plunged, and kept moist. They grew with more than usual luxuriance, and by the end of April some of the most forward began to show fruit, and the others followed in quick succession. As the plants showed fruit they were removed into larger pots, and the result was that, in the September following, 15 fruit were shown at a local show, from those suckers, that averaged nearly 4 1/2 lb each. Nearly the whole of the plants fruited within the year. This, we think, is conclusive evidence of the value of the practice we recommend—a much more simple plan than that generally followed.

RASCALITY is beyond the pale of pity, nor can any right-minded person have a grain of sympathy for those who give way to attacks of kleptomania. Plant-stealing, and cutting-stealing, if we may judge from recent announcements, are deplorably on the increase, and require to be at once vigorously repressed, or they may grow to very serious lengths. It seems that exhibitions are the usual scenes of such depredations, and it certainly behoves the managers of them to have a sharp look-out kept to prevent any outrageous wrong being perpetrated on those who contribute to make up the exhibitions. The following letter speaks for itself, and needs no further comment:—

* There is in your issue of July 3, an advertisement from Mr. Wm. PAUL, respecting the loss of a cutting from one of his variegated Pelargoniums at the late shows in London, and we are sorry to have to record, from our own experience, that such losses are becoming far too common. At the last York show, some five or six of our plants were cut in a most outrageous manner; and at a subsequent show at Northampton, some person cut off the whole of a plant of one of our new varieties, worth about six guineas, leaving nothing but the stump in the pot. There is no disguising the fact that these variegated Pelargoniums appear to be a great temptation to some light-fingered people with dishonest propensities, so much so, that it becomes imperative that something should be done to protect these plants during the time they are in the care of the managers of the show, wherever it may be. The growers of these plants are now becoming very numerous, and all should have a common interest in protecting the plants. Would it not be well for them severally to state their views respecting the best means of securing the object in view? We may here remark that at a recent London show there was exhibited a plant of Jetty Looy, as large as our largest specimen, a variety we sent out in August last, i.e., about nine months ago, and of course it was distributed in small plants. It would have been utterly impossible for any one to have grown so large a specimen as the one shown since that date, indeed it would take some two years or more to accomplish. We lost a cutting of this variety nearly three years ago, when exhibiting at Brighton. This seems to be a curious coincidence; and we should feel greatly obliged if the exhibitor of the plant in question would communicate to us any information relative to the source from whence he obtained his plant, so as to enable us to trace the connection, if any, between the cutting we lost, and the plant exhibited. F. & A. Smith, The Nurseries, West Dulwich, S.E.

OUR readers will learn with satisfaction that the Council of the Royal Horticultural Society, anxious that the PAPERS to be read at the Manchester Meetings should be made public as soon as possible, and having no publication of its own available for that purpose, has decided to place them in our hands. The papers, it will be remembered, were by the terms of the invitation to remain at the Society's disposal. We need not say that, having taken a leading part in organising these meetings, we are glad to be able to render our aid in this extending their usefulness. We shall publish weekly until they are exhausted and at such length as our space will permit an instalment of

the essays, which, we may add, prove to be of a most varied and interesting character.

The following is the PROGRAMME of PAPERS to be read at the Manchester Meetings of the Horticultural Society. The proceedings commence at noon on each day:—

- July 11.—W. WILSON SANDERS, Esq., F.R.S., &c., in the chair.
 1. On the Pruning, &c., of Fruit Trees, as affected by Soil, Climate, Stocks, &c. By Mr. A. F. BARRON, Royal Horticultural Gardens, Chiswick.
 2. What Soil is best suited for the Production of Grapes? By Mr. A. CHAMBERLAIN, to the Earl of Duca, Fortworth Court, Wiltshire.
 3. On the Prospects of Hybridisation. By Major R. TRAYNOR CLARKE, Welton Park, Doncaster.
 4. On the Improvement of Plants by Selection, Hybridisation, and Cross-breeding, having special Reference to the Tulip, and the Rose. By Mr. WILLIAM PAUL, Paul's Nursery, Waltham Cross.
 5. On Foreign Seeds found mixed with Cotton. By R. H. BARRON, Esq., Huddersfield, Lancashire.
 6. On Edible Passion-flowers. By MARY W. MASTERS, M.D.
 7. Critical remarks on Pruning and Training Standard Rose Trees. By Mr. W. EARLEY, to F. FRYOR, Esq., Digwell, Weymouth.
 8. On the result of a few Experiments with Sub-tropical Plants at Battersea Park during the winter of 1886-7. By Mr. J. GIBSON, Superintendent, Battersea Park.
 9. Bottom Heat, its Use and Abuse. By Mr. J. STANISH, Royal Nursery, Ascot.
 10. On the Culture of Chrysanthemums. By Mr. R. FLEMING, to R. BOURGON, Esq., Sandhays, Waterloo, Liverpool.
 11. Nature's Scavengers—Plants as Sanitary Agents. By Mr. D. T. FISH, to Lady GULLON, Hardwicke House, Bury St. Edmund's.
- July 12.—Major R. TRAYNOR CLARKE in the chair.
 1. On covering Walls with Glass for the protection of Fruit Trees. By Mr. W. TILLERY, to the Duke of Portland, Welbeck, Worksop.
 2. On Smoke versus Vegetable Life. By Mr. E. GREEN, to Col. the Right Hon. J. WILSON-PATER, M.P., Bank Hall, Warrington.
 3. Is the Designing of New Works by a Gardener advantageous while continuing to serve as Gardener the same employer? By Mr. G. MACDONALD, to Colonel the Right Hon. W. F. TIGHE, Woodstock Park, Luistigo, Ireland.
 4. On Repeated Grafting of young Fruit Trees. By Mr. J. WILSON, to Lord STAFFORD, Cossey Park, Norwich.
 5. On various Methods of Grafting, with an attempt to inquire into the Influence which the Stock exercises upon the Scion, and vice versa. By Mr. P. GIBSON, to the Rev. E. R. BENYON, Cullford Hall, Bury St. Edmund's.
 6. On Vine-borders their Construction, Heating, &c. By Mr. C. A. PEARSE, to R. E. E. WARRINGTON, Esq., Arley Hall, Northwich.
 7. On Plant Life and its Teachings. By Mr. J. ANDERSON, to T. DAWSON, Esq., Meadon Bank, Uddingston.
 8. Remarks and Experiments on the Application of Water to the Roots of Plants growing under glass. By Mr. T. REED, to Col. E. LOYD, Lillsaden, Staplehurst.
 9. Notes upon Orchids. By Mr. B. E. WILLIAMS, Victoria Nursery, Upper Holloway.
 10. Horticultural Exhibitions their Influence on Gardening. By Mr. T. BAILEY, to H. L. MICHELLS, Esq., Summerfield, Bowdon.
- Horticulture for the People. By Mr. A. MEIKLE, to Mr. J. H. Whalley.

Intending Exhibitors at Manchester will be glad to learn that there is a tolerably good road from the adjacent railway siding into the Horticultural Society's Exhibition ground, and that the railway authorities will draw vans into the show ground. These facilities will, no doubt, be fully appreciated by those who have many plants to move.

We are requested to announce that arrangements have been made by which any horticulturists, who may desire to dine together at Manchester, may participate in the JUDGE'S DINNER, on Monday next. The position of the gentlemen upon whom these censorial duties devolve, and the probable presence of additional representatives of the Floral and Fruit Committees, will impart quite a horticultural character to the little assembly, and will make it a fitting nucleus for the more extended gathering which seems to be desired. Indeed, such a social gathering as this, appears to have many advantages over a more pretentiously-organised dinner. Tickets (3s. each, we believe) will be obtainable on Monday morning, at the Exhibition ground, from the Refreshment Contractor.

We learn officially from Hamburg that the Queen's Silver Cup, mentioned by us at p. 757, is to be given for the best three bunches of Grapes. We have also received information of the following reductions in the freights on the lines of steamers running between Great Britain and Hamburg, and the Custom-House facilities for articles of exhibition:—

- 1. Reduction of Freight. To entitle exhibitors to a reduction of freight on the different steamship lines, they are requested to label the objects to be exhibited as going to the International Exhibition of Horticulture at Hamburg, and to address them to Messrs. W. Grund & Co., in Hamburg. All invoices and declarations must be accompanied by the certificate of admission, which the committee send post free upon receipt of the forms of application for certificates, filled up. A reduction of 50 per cent. on the freight out and home is granted by the General Steam Navigation Company's Messengers (London—Hamburg), the steamers of Messrs. Pearson & Langens trading between London and Hamburg, the steamers of the united companies trading between Hamburg, Hull, Grimsby, and West Hartlepool, the Messrs. H. J. Penhach & Co's steamers (Hull—Hamburg), the Messrs. Grimsby line of steamers Messrs. G. & Co's steamers (Hull—Hamburg), the H. & L. Steam Packet Company; the West Hartlepool Steam Navigation Company. For persons accompanying exhibition articles an abatement in the fares will also be allowed. A freight reduction of 50 per cent. will be made on all perishable articles transmitted to Holland, and for articles not liable to spoil the regular outward freight will be charged, but they will be conveyed back freight free by the Leith, Hull, and the Hamburg, Steam Packet Company, and the Liverpool—Hamburg line of steamers. The term allowed for return tickets is extended to the end of September.
- 2. Customs-House Facilities.—The Exhibitors will be glad to learn that all exhibitors will be allowed to take out duty free. With regard to articles coming from the Zeyher, we would call attention to the following regulations:—A special article has been submitted to a special examination at the Custom House of the place of loading, and have been placed or sealed, will be allowed to be re-entered

duty free on their return at the same Custom-House providing the identification of such articles is indisputable. Agricultural produce, viz., seeds, &c., is excluded from this privilege. B. Articles subject to export duty are allowed to be exported duty free, and need not be re-imported if it is proved that they are actually sent to the Exhibition. C. Every possible facility will be afforded to all articles cleared at the Custom Houses coming or going. The last clause is particularly A refers only to such agricultural produce which is not identified. It must be particularly understood that articles which are liable to duty get changed, and should the official marks of identity become obliterated, will not be allowed to be re-entered free of duty.

In the present issue we have given a translation of extracts from the important memoir of M. PLANCHON on the INSECT which is so DESTRUCTIVE to VINES in France, and which is unhappily widely distributed in this country. We hope in the course of the summer to be able to determine whether the insect on Vine leaves, which is clearly congenic, belongs to the same species, a point which it is highly necessary to determine, as the prompt destruction of every affected leaf might greatly diminish the evil. Our impression is that the species is much larger, but at the present moment we are unable to determine this point. Meanwhile we have made accurate measurements of the insect and eggs, from roots which we have received from the neighbourhood of London, and from Derbyshire. We observed that the ultimate joint in the young active insect is transversely ringed, which we have not found to be the case in the adult. Mr. DUNN, the intelligent gardener of Lord Powis-COURT, in whose domain we had first an opportunity of studying the insect, in 1867, informs us that he succeeded in mastering the plague to a great extent, and has promised later in the season to communicate his plan. The point illustrated by M. PLANCHON of the occurrence of winged females, is one of great importance and importance, and requires fresh confirmatory observations, as it might possibly be some parasite, though the figure, which is not however very satisfactory, and the accompanying observations, militate against the notion. M. CARRIÈRE promises at a future occasion details as to the remedial measures which give the best scope of combating this serious pest. We may also refer to the article and figures of Professor WESTWOOD, published at p. 677 M. J. 2.

The curious little GREENOVIA exhibited by Messrs. E. G. HENDERSON & CO. at the last meeting of the Floral Committee illustrates very well the structure of the Rose flower as explained by M. CASPER DE CANDILLE. In the GREENOVIA the leaves are arranged apparently around and within a hollow cylinder, the bricks of a chimney. This appearance is obviously due to the arrested growth of the true summit of the stem as compared with the lower and outer portions, in consequence of which the real apex of the stem is at the bottom of the cylinder. Now M. DE CASPOLLER'S view as to the structure of the "calyx-tube" in the Rose and similar flowers, is that the organ in question is a ring-like projection from an axis whose further direct development is arrested. The secondary projections, or growing points, correspond to the several fibro-vascular cords of the primary ring, and are ultimately developed into sepals, petals, stamens and ovaries. In the case of the Sempervivum the growing points have developed into leaves, and leaves only.

THE NEW VINE DISEASE.

The following is extracted from the *Revue Horticole* 1887, p. 420:—This disease is caused by an insect, *Phylloxera vastatrix*, J. E. Planchon, 'Comptes Rendus Institut,' 1868, p. 588; Rhizophis vastatrix, J. E. Planchon, *ibid.* p. 33. According to some authors it is to be assigned to the genus Rhizobius. The insect though it has been only known for a short time, already bears several names, and may probably still have others. As it is scarcely sufficiently known at present, the nomenclature, however, is of little consequence in regards our present object. The account given by M. Planchon is as follows:—"I am going to resume, briefly, what a series of observations made on the spot in the course of these short visits, have taught me respecting the insect in concerning its habits, when raised in glass tubes during forty consecutive days. "The most prevalent form is that in which there is a trace of wings. The adult female, in the act of laying its eggs, presents a little oval mass, closely applied to the root by its lower flattened surface, but convex above, and surrounded by a little raised border of the thoracic portion, which consists of five rudimentary segments, obscurely separated from the abdominal portion, which has seven rings (somites). Six or seven little soft tubercles project slightly on the first three segments, and are faintly continued under the marginal ring. The head is always concealed under the exterior projection of the thorax the anterior end of the abdomen is always depressed. The abdomen, therefore, is more or less contracted, is more or less elongated, and the eggs are about to be laid, and by reason of the difference exhibits one or two, more rarely three, eggs a greater or less state of perfection. "The egg is yellow during one, two or even three more days after it has been deposited, but frequently the bright yellow changes to a greyish or dull red. It hatches in from about five to eight days, according to the temperature. "The rapidity and abundance of the deposit depend probably on variable circumstances, the health of the mother, the quantity of nourishment, the temperature, and perhaps other causes. A female which laid 15 or 20 eggs on the 20th of August at 8 o'clock had 15 or 20 on the 21st at 10 o'clock in the evening, that is, nine or ten. The maximum seems to be 40, as appears from an observation of a female between the 19th and 21st of August.

In general the eggs of the same laying are crowded in a mass round the mother, without any apparent order. Nevertheless, she changes sometimes the direction of her abdomen and head, so as to turn quite round, and spread her eggs in every direction. The eggs, which have a very smooth surface, adhere but feebly either to the root or to each other, by means of a slight viscosity.

The young insects escape by means of an irregular hole, which is frequently lateral, and near to one extremity. The shell remains for some time empty and shrunk amongst eggs in different degrees of evolution.

During the first days of their active life (from two to five, according to circumstances), the young move about freely. They wander here and there to find a place to fix themselves; they are more active than when full grown, and appear to apply their antennae to the space which they traverse. The movement of the antennae is generally alternate; one might call them the arms of a balance, or, if the comparison may be pardoned the two sticks of a blind man with which he feels the ground as he advances.

After a variable duration of this wandering life the young plant-lice fix themselves at some determinate point; this is most frequently in a crack in the bark, where their proboscis can easily be plunged into the cells of the young tissue, which is full of juices. If a fresh wound be made on the root by the removal of a piece of bark, it is on the circumference of the wound, and on the section of the medullary rays, that they arrange themselves. When once fixed, we see them apply to the root their soon immovable antennae, which look like two little divergent horns.

At this period of their life, from the third to the fifth day from birth, they are more or less sedentary. Nevertheless they change their place from one time to another, especially if a new wound be made near them which promises succulent nutriment. What is the sense which so surely directs these subterraneous wanderers towards the spot which suits them the best? I cannot be sure, for their eyes are simple pigmentary spots, and their gait is that of the blind. It cannot be smell, since they merely seek a vegetable tissue. It is more probably smell, and we may inquire whether the antennae are not the organs of this function, since locality has been so much controverted.

Amongst the non-adult insects, fixed by their proboscis to the roots, we see here and there some of a somewhat ate size, and generally of a deeper orange, more abdomen, relatively shorter, seems more truncated behind. These individuals seem to move about more than the others, and I have sometimes followed them as possibly being males. Nothing, however, has confirmed this very problematical hypothesis, and as I have seen undoubted females approaching those in which of colour and form, I am inclined to doubt any such distinction.

A double moult precedes the adult state, the first always after birth, the second a little time before depositing the eggs. There is, however, some uncertainty about the number of changes, the empty shells being found mixed in a group of plant-lice of different ages, without its being possible to come to any decision.

On the morbid tuberosities of the deeper roots, or on the rootlets, they are perhaps better nourished, and seem to undergo more rapidly their different transformations. They are also of a paler yellow, passing into pure green, without, however, there being any specific difference.

What, however, may be considered as a distinct species or even genus, is the winged state of Phylloxera. The rare individuals which I have met with all come from individuals nourished on the roots of Vines lately attacked. In the young state (or we may call it the larva), this resembles the wingless type. Presently, however, the thorax is more defined; a distinct constriction separates it from the abdomen, the bases of the wings, under the form of triangular tongues of a grayish colour, appear on the two sides of the thorax, and we at once foresee that the result will be a winged insect.

As soon, in fact, as we see one of these nymphs quit the place where it was more or less fixed, and run over the root or the walls of the vial in which it was reared, we may consider it as the sign of an approaching transformation. Presently, instead of a sort of plant-lice, we see, close to a transparent skin, an elegant little fly, with four horizontally crossed wings, exceeding greatly the length of the body.

It is impossible to have any doubt as to the specific identity of this insect and the form which swarms on the roots. The details of the structure of certain organs, antennae, feet, tarsi, proboscis, &c., establish the identity.

The horizontal carriage of the wings perfectly distinguishes Phylloxera from true aphides, in which the wings are more or less inclined upwards. The two superior wings are obliquely obovate, cuneiform, have for more than the basal half of their outer margin a linear border, slightly dingy, between an interior nerve, which I suppose, to the radial. A single oblique nerve is detached from this last, from about its middle point, and is prolonged to the inner border. These, perhaps, are not nerves, but rather folds, for I have frequently ascertained their absence.

The inferior wings are narrower and shorter, with a median nerve running from their base beyond their middle point, and which is lost in a slight projection which the wing shows at this point, a short radial nerve runs parallel to the first, and disappears before reaching the extremity.

We find it attached in the first instance to young succulent roots, in which they cause a little swelling with a depression on one side, in which the insect with its eggs is lodged, the subjacent tissue soon becoming diseased. M. J. B.

The eyes, relatively, are very large, and of a black colour, they are irregularly globular, with a very strongly marked conical projection; their surface is granulated; a punctiform depression is hollowed out in the centre of each papilla, a circular ocellum is seated in the centre of the forehead.

Amongst the 15 examples of Phylloxera which I have observed, none has presented any sexual difference. Almost all have laid two or three eggs and have died soon afterwards, perhaps in consequence of being confined in the vials. The eggs, like those of the wingless insect, to the number of two or three, fill the entire abdomen of the mother. We see them easily by transparent light if we compress the insect on the stage of the microscope. I know not how long they take to hatch, or whether they always yield winged individuals.

It is probable that these winged specimens serve for spreading the malady to a distance, not indeed that their wings serve for a long or continued flight. They generally remain immovable, and but seldom move their wings by raising them up, but without quitting their plane of position. I suppose, however, that the wind is the principal agent in the dispersal of the Phylloxera, as is sometimes the case with ordinary aphides.

At all events, the knowledge of this winged form and aerial habit easily explains facts which were before matters of perplexity as, for instance the dissemination from centres of invasion in vineyards. As regards nearer dispersion, it may be produced by wingless individuals, which, grouped in great numbers at the foot of plants already affected, would perhaps, send out their swarms to neighbouring healthy vineyards.

We may inquire, in this case, what path the insects take to arrive from one plant to another, and especially to reach at once the extreme rootlets of recently attacked Vines? Do they make their passage through the soil, or, rather, on its surface—during the coolness and obscurity of night, working their way down by the fissures of the bark? This conjecture seems the most probable, and is supported by an experiment which I made in the following manner—

In a case about 40 inches long (one metre) I put some garden soil from Montpellier, free from insects. I placed carefully in this truncheon of Vines infested with wingless Phylloxera. I covered each truncheon with a bell glass, slightly raised on one side, to allow the insects to get out. At about a fourth of an inch (3 millimetres) I placed fragments of sound Vines roots, on which I had made fresh wounds, such as the insects affect. In 1 1/2 hours these insects had migrated to the nearest root, and some days after 20 had reached the same fragment. The other fragments received also a small number. One did not receive any. It must, however, be confessed that there were few individuals on the nearest truncheon capable of moving.

A similar experiment, but in soil already infested, was made at my suggestion by Monsieur T. Leydier. It gave only negative results. One would, however, be glad to learn that the invasion was made only from the surface of the soil, for in this case the smearing the base of the Vine with gas tar might present an insurmountable obstacle, whereas in the other case prevention might be extremely difficult.

THE SUMMER CULTIVATION OF WINTER AND SPRING FLOWERS.

No careful observer can have failed to observe that there are flowers and flowers, and that although the two sets may be the same they are by no means alike. Much depends upon site, soil, and climate, more, possibly, upon skill. Doubtless a horticulturist the latter is one of the weightiest factors in determining the sum total of nett results. Skill at once multiplies and improves our resources, and enables us to dispose of them in the most effective manner, either for use or enjoyment. In the early harvest of winter and spring flowers it is emphatically true, that as a man soweth so shall he reap. He that sows skill shall reap beauty. He that sows ignorantly shall reap springly. He that trusts to chance, and neither dies nor sows, nor cultivates, shall probably not reap at all, or find to his sorrow that Nature, however bountiful at other times, provides no rich chance harvests of beauty amid the shivering blasts of winter. Hence, the foundations of winter and spring beauty must be deeply, broadly laid in the vital energy of the plants during the previous summer. The oblique rays of our wintry suns can create no flowers. It is as much as they can do to liberate and let loose the superabundant of the summer's glory to brighten the bleak earth and lay on skies of frost-bound, snow-wreathed winter. The silver sheen of the Snowdrop, the golden glare of the Crocus, the azure blue of the Forget-Me-Not, are each and all but the carefully treasured fragments that remain.

The summer cultivation of winter flowers consists in the storing up of the products of the summer's rains, air, and sunshine, to become the light and the beauty of darker days. Then the winter sun creeps forth timidly, begeth with a golden key that can unlock the store-house, and reveal the pearl of great price and beauty within. But when no key has been made, no flower formed, while the summer sun shone, then, of course, the house is empty, and no beauty is revealed.

Far be it from me to declare that we can make or not make flowers absolutely and positively at pleasure; yet doubtless, we can determine the course, the destiny, as it were, of vital force to a very great extent, and can guide it into leaf or stem, or concentrate it into blossom by the leadings of our skill. The fault of failure is oftener in ourselves than in the fates or the skies. Vital action compounds the products of plants from a sheathful of sunbeams, a breath of air, a morsel of food, and a drop of water, and it depends largely upon our skill whether these products are to be leaves, stems, flowers, or fruits.

Standing close by the great fountain of vital force, it is ours to direct the current very much at our will, and such direction of energy to predetermined ends we call cultivation, leading, or, if "F. N. B." prefers it, "nursing," not, however, using the term in the sense of rendering tender, but in that of taking proper care of judicious nourishing, and guiding aright. It seems needless to remind your correspondent that this taking care for the present and thought for the future, is as needful for hardy plants as for any others, if their highest development is aimed at, or their most effective setting provided for. Wise culture does not enfeeble but strengthens plants, directs their energy into any given channel, such as root, leaf, or flower, and modifies their power of enduring heat or cold. If not this, and much more than this, be true—and it is—it follows that no plants need more careful cultivation than those appointed to bloom in winter or early spring. And for this reason, plants growing or blossoming at other times may receive some assistance in the shape of new material added to their substance on their journey, but these can derive little or no external assistance. They must start with sufficient vital force, and a large enough stock of organizable matter to carry them over and through the entire stage from dormancy to perfect indifference. Hence the special importance of the most careful preparation. In sending ships out to the arctic regions what a profusion of stores are provided. We should act exactly on the same principle with our winter blooming plants. Let us fix their tissue to rejection with summer sunshine. Every ray of it will be a step little before the winter is over, and the entire flowering stage passed through.

Grow, therefore, the lovely *Myosotis disilliflora* and alba—what a gem this will prove—*Alyssum*, *Aubrietia*, *Arabis*, *Viola*, *Heartsease*, &c., right in the eye of the day, that that eye may sparkle with summer brightness from our wintry flower beds. Thus will the energies of the sun be focussed as it were, and transformed into floral envelopes, to be unfolded in all their beauty to enhance our dreary months. Only by such a skilful husbandry of summer sunbeams can we enjoy to the full a harvest of beauty in winter, and every energy and talent should be bent to increase the store. The primary object, then, in the cultivation of such plants is not an extension of parts but a concentration of all the forces of Nature into the formation and maturation of blossom buds. Having provided a sufficient number, the next object is to constitute each individual plant such a centre. Each must become a candle, to give light in winter. Each flowerless plant is simply a candlestick candleless—a fruitless fruit tree, yielding no centre to the general illumination. But it would be just about as reasonable to expect a candle when the light was gone, as to expect winter flowering plants to form blossoms in the flowering quarters. Candles and flowers alike must be provided beforehand, if the light or full measure of beauty is to be enjoyed in the dark, or in winter.

Is the winter blooming quarter a matter of indifference? By no means. The highest authority has given instruction about the placing of candles, and the same rule holds good in regard to flowers. The question resolves itself mainly into one of where and how they can be best seen. Let their light and glory so shine that all eyes may see them together, and this one condition of effective setting is secured. It is implied of course that the setting will be consistent with it not conducive to health—with this reservation, the base line of our favourites should be adapted to their habits and character. As a rule all such plants as the *Myosotis* best flourish best on irregular mounds. But this is a different thing to the statement that they will only grow or blossom freely in such positions. On the contrary, there is no *Forget-Me-Not* to equal this on the flat, either as rows or in masses though it is still more beautiful and a month or six weeks earlier, on raised banks. But the advantages of irregular base lines are not confined to the exhibition of one or two such families. I make bold to affirm that all herbaceous plants look best on uneven ground, while a garden of early-flowering bulbs so disposed, like irregular waves of flowering beauty, would prove irresistibly charming. Even our usual bedding plants would be infinitely more interesting if the heavy tameness of our flat masses was broken up by an artistic undulating base.

True, the art of culture may be unimpaired by the disposition of our ground lines. But the equally important art of disposing of the products of the best manner is largely dependent upon the configuration of our base. In a garden where the surface for the exhibition of floral beauty is an undulating plain, the footsteps of Nature for a long time have variegated the surface of the world with out-cropping mountains, and scooped out valleys, the better to display the richness and grandeur of her covering robes of beauty and glory; and one of the greatest improvements that could be effected in our gardens would arise from our going and doing likewise.

D. T. Fish, F.R.H.S.

The Golden Champion Grape. — As a member of the Fruit Committee of the Royal Horticultural Society I need not say how deep an interest I take in all new fruits of merit. This must then be my excuse for sending you these few remarks regarding the above noble Grape. On Monday, the 11th inst. I made a hurried call at Stoke Rochford Gardens belonging to Christopher Turner Esq. Here Mr. Turner, an intelligent gardener, had planted a *Vitis* some 11 or 12 feet wide, by 45 to 50 feet in length, with *Golden Vines* in May, 1868, all of which were doing remarkably well, and concerning which I hope, with your permission, to say a few words by-and-by. Amongst the many varieties of Grapes planted thereon, the *Golden Champion*, though planted at a later date than the above, had shown eight very fine bunches. These, as

Home Correspondence.

The Golden Champion Grape. — As a member of the Fruit Committee of the Royal Horticultural Society I need not say how deep an interest I take in all new fruits of merit. This must then be my excuse for sending you these few remarks regarding the above noble Grape. On Monday, the 11th inst. I made a hurried call at Stoke Rochford Gardens belonging to Christopher Turner Esq. Here Mr. Turner, an intelligent gardener, had planted a *Vitis* some 11 or 12 feet wide, by 45 to 50 feet in length, with *Golden Vines* in May, 1868, all of which were doing remarkably well, and concerning which I hope, with your permission, to say a few words by-and-by. Amongst the many varieties of Grapes planted thereon, the *Golden Champion*, though planted at a later date than the above, had shown eight very fine bunches. These, as

they grow so rapidly (the age of the Vines being taken into consideration), were reduced to three bunches, each of which exhibited the true characteristics of the Grape as it has been previously shown. The robustness and vigour of the wood is remarkable—more like, in fact, those of a vigorous Trabbiano than otherwise, some of the leaves measuring at least 12 inches across, and with young wood of the current season's growth up to 2 inches in circumference. At the tips of the young laterals, which were forming upon the young wood, I noticed (in one instance) two fair-sized bunches of flowers. These, though only just perceptible, indicate that this variety is as prolific as any amongst our best older ones. Taking the merits of this variety all in all, as seen here, I am more confirmed in my good opinion of it than ever. *Wm. Earley*

Rats v. Peas.—I have been victimised by rats. As my crops of Peas come to maturity, the rats eat them, so that I have hardly had a dish of Peas this year. We have tried poisoning, shooting, trapping, but all to no purpose. The rats still continue the gardener's master; and, as I am as fond of a dish of green Peas as the rats are, I seek your valuable aid to help me to thwart the persevering marauders. *An Old Subscriber, Co. Meath, Ireland, July 12.* [Try a ferret. Eds.]

Reward of Merit.—I am quite sure the majority of your readers will coincide with the excellent arguments which you bring forward in support of a decoration for those who deserve well of their country, and have, by their skill and example, tended not only to enrich it, but render it the emporium of the civilised world. It is no pecuniary reward that is required, I feel sure this would be considered as an insult, and tending to depreciate, instead of to honour the recipient; let it be simple, but let the donor be regal. Coming even from the Council of the Royal Horticultural Society would not give it sufficient weight; they might advise, but not bestow it. In France how many of the leading horticulturists have the Legion of Honour conferred by the hand of the Emperor himself, and should not skill and industry meet with like reward in this country too? Our fruits, our gardens, our plants, in fact the whole of our horticultural productions, excite the surprise and admiration of all who visit us, and is it just that the "pioneers" of the profession have no decoration which they may exhibit with honest pride, and hand down as an heirloom to their children's children? *William Heale.* [The proposed recognition, whatever form it assumes, should not be so widely distributed as the French "Legion of Honour." It is a question whether those undecorated are not adorned the most in that case. True the Sovereign is the fountain of honour, but in this country, at any rate, the only fountain in the least degree applicable to horticulturists is that of the "Bath." The reward should, in our opinion, come from some society or other body capable of appreciating the worth and achievements of the individual. Where is the honour of being decorated by some one who knows nothing whatever of the merits of the case. Eds.]

Foxgloves.—A few days ago we sent you a small box of Digitalis blooms we now send some flowering spikes. These Foxgloves are now flowering profusely amongst our Rhododendrons (which are now over, and are very striking objects, and really deserving of extended cultivation, taking into consideration the small attention they require in their cultivation. *Stuart & Mein, Kelso.* [Very fine examples. Eds.]

Large Rhododendron at Aigburth.—Herewith I send a photograph of a Rhododendron growing in the grounds of J. A. Tunn, Esq., which has been a fine feature on the lawn this season. It is a hybrid from the old R. ponticum, and is 15 feet 8 inches in height, and 11 feet in diameter. Such plants are a grand and telling feature in pleasure grounds. Are there many such plants to be met with? *G. Forbes, Brinsley, Aigburth.*

A New Fruit Growing Idea. In the *Saturday Review* for July 10, I read that "the stiff, loamy, and wet soils" of England, so hostile to fruit culture, are adapted to the culture of Apples, providing the trees are grafted on the French Paradise stock. This peculiar opinion of the reviewer is perhaps scarcely worthy of notice, because there seems to be a want of horticultural knowledge in the article he has written. Still an erroneous idea may spread and do mischief. It is not therefore asking too much to request some fruit grower or growers to give their experience as to the cultivation in England of Apple trees in swamps. I have a small plantation of fruit trees in a wet loam, which owing to its level cannot be drained; the soil is friable and favourable to look at, but neither Pears or Quince stocks, nor Apples on Paradise stocks, nor Plums, will flourish—their leaves curl, and the trees are always blighted. The trees should be several years old, and growing in one place, as they often grow well for a year or two, and then canker. *Inquirer.*

Walnut Trees.—Can any of your correspondents assist me in the following? I have some fine old Walnut trees, showing strong symptoms of rapid decline during the past two seasons. Three years since, water stood at 7 feet below the surface in this district, the main drainage has now lowered it to 36 feet below. Can this be the cause? It is supposed to be so. Near Melbourne they saved the splendid old Gam trees, which were fast decaying, by digging a deep trench and of ample width, close round the tree, leaving it open for some time, and then refilling with better soil. My trees stand on the edge of a large lawn, having a walk of 5 feet and a thicket of Lilac, &c., beyond. *A. W. Eastwood, Denham Lodge, Hammersmith.*

Cut Herbaceous Flowers.—These are often included in schedules of prizes, but it is only rarely that they are well or tastefully shown. In the schedules of nearly all provincial exhibitions there are classes for these as well as for collections of cut flowers, but seldom is it they are well shown. I have seen the latter staged in a simple and effective manner—a tray of sand, and a stick as many flowers as

he possibly could, through all sorts of monstrosities and ridiculous types, inclusive of what the Rev Mr Hole once happily termed a "floricultural dollop," and culminating in something that would have done for an umbrella stand, or, had it been more durable, served the purpose of a clothes-horse in a children's nursery. The latest development of form was that of a beehive surmounted by a design composed of Grasses, Foxgloves, &c. as if elaborate preparations had been made for a grand display of floricultural fireworks en masse, to be let off towards the close of the exhibition. Unfortunately there is frequently a great deal of vagueness in the wording of schedules, and exhibitors must often be at a great loss to comprehend what it is the promoters really require—on the supposition that they know themselves. At the recent show of the Ipswich Horticultural Society, cut flowers of herbaceous plants were very finely shown, though it was only one of many fine features in a thoroughly good provincial show. There were two classes—one for 18 and one for 12 bunches of cut flowers of this character. Seven stands competed in the two classes, and the worst was better than is generally seen. They were shown in neat bunches, with just enough foliage to relieve them. The flowers consisted of Delphinium formosum and Hendersoni, Spiraea Ulmaria, S. japonica, and S. umbrosa; Alstromerias, in variety, Centranthus ruber, and a pale rose-coloured variety as well, Iris germanica and I. anglica, in varieties, Scilla peruviana, Tangier Peas, several varieties of Dianthus hybridus, Diotamnus Fraxinella, Veronica spicata alba, Stenactis speciosa, Campanulas coronata and persicifolia, both blue and white, Prunella grandiflora, Baptisia australis, Pentstemon, Anthericum Innastrum, Gaillardia Richardsoni, the double red Lychnis, Melittis Melissophyllum, Gladiolus byzantinus and G. Colvilli, Tritonia aurea, Lathyrus Lindleyanus, Stachys coccinea, Borage, Aconitum Napelias, and Canterbury Bells. Without exhausting all the subjects shown on this occasion, the foregoing may be regarded as the very cream of them. The Prunella grandiflora produced on this occasion I take to be identical with that which is to be seen in Mr Barron's capital perennial border at Chiswick, under the name of P. pennsylvanica. This border furnishes a few good things just now in the way of perennials treated for exhibition purposes, such as the beautiful Pentstemon Jaffrayanum, Chelone barbata coccinea, the purple and white double Rocket, N. erenbergia frutescens, and the new Rose Canterbury Bell, both single and double. In addition to these, the different varieties of Anemone japonica should not be overlooked, or the red and white Everlasting Peas, the new spotted Foxgloves, double Pyrethrum, &c. There is, indeed, no lack of fine perennials for exhibition purposes; and if many of the prizes that are given at country shows for, and foolishly wasted on wild flowers, were bestowed on collections of perennials and annuals the result would be a great gain to the effectiveness of the exhibitions, and the clearing away of much rubbish. What is to be done with wild flowers. I may say that at a recent exhibition of the Erith and Belvedere Horticultural Society, in Belvedere Park, there was in the schedule of prizes a class for a "collection of cut wild flowers and grasses, open to the children of a classes residing in the parish of Erith," the sum of two guineas having been ingeniously split up to yield 24 prizes, and the astounding number of 278 exhibitors competed for these prizes. One small tent was completely filled with about 180 of these collections, of all sizes and shapes, while the remainder found a resting-place under the shade of a grand old Oak from the little handful of grasses and flowers gathered by the roadside, and simply tied together with a Rush, to designs (actually the want of design) so utterly incomprehensible and yet so elaborately constructed that one could not but heartily desire so much labour had been more worthily expended. Botanical science has much to be hopeful for in the future if 278 children of the parish of Erith can be induced to explore the locality for collections of wild flowers in the hope of getting one share of two guineas divided into 24 portions, but no one thinks that one in 30 of these collections are obtained or arranged by children. Those who believe otherwise indulge themselves with a pleasant fiction for it is the parents of the children who arrange and exhibit. *Richard Dean, Erith, W.* Nothing can be worse than to encourage the exhibition, and too often at the same time the wanton destruction, of the wild flowers. If teaching is the object, take the children out into the field, and instruct them there. Eds.]

Honeydew.—I am obliged to Mr. Thompson and Professor Westwood for their attempt to correct me on the subject of honeydew; but I regret that I cannot bow to their theory. The learned are, and always have been, at variance on the subject. The only book in my possession to which I can refer on the subject is the "London Encyclopaedia." Under the word "honeydew," I read as follows:—"A term frequently applied to a clammy saccharine substance which is often seen covering leaves and other parts of different trees and plants, at some particular season of the year. It does not appear that the cause of this extraordinary appearance is yet fully understood, as it has not by any means been well ascertained whether it derives its origin from external circumstances or some morbid affection of the vegetables themselves. It is generally supposed, however, to be the production of insects." It then says, "See Aphid." Under this head the same doctrine is propounded, as the opinion of Mr Curtis, as was lately given by Mr Thompson and Prof Westwood, viz, that it is caused by aphides. The only other passage referring to it I find under the head of "Hops" in the same work. It is as follows:—"The Honeydew mostly occurs after the crops have been attacked by these kinds of insects (the green and long-winged fly, and when the weather is close, moist, and foggy. In this

case a sweet, clammy substance is produced upon the leaves of the plants, which has the taste of honey, and which at first present a shining appearance, but afterwards soon become black. It is a disease that mostly happens in the more forward crops, and the chief dependence of the planter for its removal, according to Bannister, is that of heavy thunder-showers. This is all I can find on the subject. I cannot accept or admit that aphides do secrete an analogous saccharine matter—First, I had no aphides when I made the appearance. Secondly, it comes in a single night, other day when it occurred here. The weather was very sultry, so much so that I cut my crop—2 tons per acre—made it, carried it, and tipped, and thatched in four days and a half. Thirdly, because it is impossible that such minute insects could squirt such a mess in one night, the honeydew often being thick enough to be scraped off with a knife. Fourthly, because if it was the work of aphides, I would see it invariably, which is not the case. I only occur in particular seasons. Pliny, with his theory of "sweat of the heavens and saliva of the stars," seems to have held a similar opinion to the poor people, who think it drops from the "elements in a heavy night." This was my servant's opinion till I convinced him by saying, "in that case it would be upon a gate-post or mile-stone, as well as upon Roses and some other plants." It is, in my opinion, an exudation of thickened morbid secretions. It is not true that it generally appears on the lower leaves, or upon unhealthy leaves. It will appear on the very tips of newly formed leaves, as well as upon older leaves. It is also to be seen occasionally on leaves covered by leaves, but not so much as on leaves exposed to torridity. The reason I give that it makes its appearance after a foggy night, is that the fog relaxes the stomata of the leaves, and lets out the morbid secretions which have been caused and pent up by adverse weather. Here I leave the matter. I cannot conclude without thanking Professor Westwood for paying attention to my view, and for admitting the doctrine of exudation. I saw on Sunday a single leaf of Baronne Pelletan de Kinbain in a profuse perspiration! Under any circumstances wash off the honeydew, and give sufficient water to keep the whole of the roots. *W. E. Badelyffe.* Will you be so kind as to give me space for a few words with regard to the origin of honeydew, or blight, by which name every evil, which afflicts the vegetable kingdom is called. My own belief is that there is no such thing as either blight or honeydew without the aid of the aphides, and though I do not believe, with one of your correspondents, that cold or east winds or want of water are the immediate cause of the complaint, they certainly predispose the plants to the attack of the aphid by destroying their vigour. Before I read the remarks in your Paper I had expressed my belief to my gardener that what we had thus been the ruin of some Rose trees (and the leaves of the house, which are now casting their leaves black with the sticky stuff. A very large Oak here is above 100 feet across) has almost every leaf covered with aphides in every stage of growth. The one thing difficult to understand is that whilst the aphides are almost always on the underside of the leaf, their saccharine deposit is on the other. *W. C. Henson, Oatlands, Walton-on-Thames.*—I am very glad that "J. S." has gone a little further than Professor Westwood, and has asserted, what I believe to be strictly the truth, that no honeydew exists except such as is deposited by insects. Mr Radolyffe has decidedly put the cart before the horse, and tries to make the horticultural world believe that honeydew is the secretion from the leaf, caused, as he says, by the contraction of the cold north-easterly winds and the sudden action of the sun afterwards, and that the aphides come to feed on the honeydew. I have never seen in my experience an aphid feeding on the upper side of a leaf that is covered with honeydew, but they will be found instead on the ends of the young shoots, and more especially on the young stem itself; and if a clean piece of glass is placed under a shoot much infested with aphides, it will soon be covered with their secretions, which the action of the sun will melt and spread over the glass, or if a pane of glass be inserted over an infested shoot, it will soon show how far the secretions are ejected as the sides of the shoot be covered. Mr Badelyffe jumps to the conclusion that because he saw no aphides on his Rose trees, that suddenly found them covered with honeydew, that consequently the honeydew must have been caused by cold wind and sun. But is it more extraordinary that the aphides to come rapidly, as they will often do in a single night, than it is for the action of the sun and cold wind to bring on the honeydew? For if cold winds in which Mr Radolyffe describes "no Rose trees would be free this year, whereas I have only one Rose tree infested, and they are against a south wall where no north-east wind can touch them, but they are in close proximity to a Trumpet Honeysuckle which is being killed by aphides; and another Rose which is through the Honeysuckle, and has shoots above it not affected, as far, that is to say, as that part of the tree is concerned which is above the Honeysuckle. That cold winds blowing after warm weather or hot sun are conducive to honeydew is true, because it checks the flow of sap, and produces a state of growth of the young shoots which is more liable to the attack of aphides, but hot sun after cold weather has been dry with the cold winds. And I will venture again to assert that whenever a leaf is found covered with honeydew, no green flies will be found on the upper part of the shoot affected, and that those which may be found will not be feeding on the honeydew.

other insects, as wasps and ants, will do so, but I shall be obliged by your answer.

Blairi No 2.—I have three or four Rose trees of Blairi No. 2, which are very grand, bearing 800 to 900 blossoms each. They are really trees, having been growing for 15 years and they have been left, as advised, about 10 points to each bough, when pruned. The weight is so great when they are in flower that the old boughs cannot sustain the least pressure of wind or moisture. I have had several break off the Briar-stem this season, one with the buds on it, and I feel that I may now be subject to the same annoyance annually. My idea is that I should, after one season, by cutting off all the boughs—making Pollards of them—and so depend upon the new wood. And if so, when should it be done? I should like to know as soon as the present blooms are over—i.e., in autumn. Please to advise me. *J. E. G.* [To the Editor.]

Mr. Badolffe kindly replies:—I can hardly answer this question. You must turn the head, and support the tree with a strong stake. If you head the tree, as you propose, you may do it in November or December, however, Blairi No. 2, more than any other, hates a knife. You had better turn the head, and support the shoots on the remainder.]

Mr. J. E. G. writes: I planted in February half a bushel of the Pride Kidney—most beautiful sets, from Messrs. Jackson, of Chester, and a bushel of Ashleafs, my own sowing, also clean, well harvested, and greened in the open air. Not one in ten of either variety has appeared aboveground, and the few that have made their leaves are very, very weak. There are also numerous small tubers underground, where no appearance has been made above. The Mona's Pride are in every part of the garden, under a wall—fine rich soil, and the Ashleafs are in a stiffer soil, but very clean and friable where they were planted. Now no seed could be seen to appear. My own of the Ashleafs was sown with Early Oxford and Flourball. These latter are somewhat sprouted in the pod, but the Ashleafs are not at all. The Early Oxfords and Flourballs are doing well and every set came up well. Now, to country gardeners the great value and interest attached by your Paper is to learn that other parts of the country are in the same affliction. I shall certainly not have one mess or botany of kidney Potatoes to year, and it is the most unaccountable of all the diseases of the Potato tribe. But the strangest thing is that there are some gardens in this county (Wiltshire) where the kidney Potatoes are as good as in W. M. Rowland. Let some of the haulmless remain in the ground all the winter, protecting them from frost by a little litter, if necessary, and please to know the result next year. The rest will do for me. *Eds.*

Agricultural Clubs. Some time since I recommended the formation of a Horticultural Institution for Great Britain, with a central body and branches ramifying throughout the three kingdoms, in a manner to the Chambers of Agriculture, which have recently been established. But I despaired of the project when I began to count the cost, and so I put the paper aside. The Rev. Reynolds Hole's suggestion is less ambitious, and so far more practicable, as the same difficulties lie in the way, and similar questions meet us on the threshold of his project. Can we afford it?—and are the advantages offered worth the cost? Hitherto the pleasures and profits of club life have been mostly confined to the wealthy, and to the poor where they are densely packed together, or when they have been aided by the benevolence of the better-to-do classes. Now, the members as a body are poor; they are scattered far and wide, and they are above accepting even the benefits of social enjoyment, or the sublimating pleasures of the smoking weed from those who are better than themselves. Better have no club than receive a charity from any body of men. But the question whether we could pay for the moderate enjoyment of club life, can hardly be fairly discussed apart from the advantages that might be reasonably expected from meeting with and enjoying the society of our friends. Doubtless and it is of no use disguising the fact self-interest governs and rules the world as a whole, and notwithstanding all the enthusiasm and poetry of horticulturalists, the same principle of powerful sway in our ranks. We are obliged to appeal to it, depend upon it, in the launching of such projects as these. The question with some, perhaps only one with many, is—Will my subscription prove a profitable investment? What benefits may I fairly expect to reap from it? I must be admitted that the club movement cannot be based upon self interest if it is to succeed, and this is true of all clubs, great or small. Looking at the phase of the question steadily in the face, the question of success or failure must be mainly determined by the measure of probable advantage. The Rev. Reynolds Hole gives prominence to two things—mutual intercourse, and puffing together en masse. Dismissing the latter as of little or no account, it may be well to inquire whether the mere pleasure of meeting larger numbers of the craft in specified numbers would float the club project. I think not. Already, by previous arrangement, we can choose our own society, and few possibly would care to pay a club to choose it for them. Besides, our enjoyment is often, generally perhaps, in the inverse ratio of numbers in our social chit-chats. I submit that a much bolder scheme would be more likely to float than the Rev. Reynolds Hole's proposal of our friend. In my paper, which never saw the light, I suggested that the British Institute of Horticulture should take cognizance of four things—the heads, the

hearts, the trials, and the pockets of gardeners. It should stimulate to the utmost intellectual growth, alike by indicating and providing instruction and rewarding merit. It should culture the heart with social intercourse with the best and purest in our ranks, and thus smooth off our rough sharp angles, and give us the polish of the gent eman. It should succour us in sickness and distress, and guard our pecuniary interests at all times. In one word, such an institute should discharge all the duties of a trades' union for horticulturists while shunning all the evils that have made the very name with many a synonym for all that is evil and wicked. And yet there is no trade nor profession that does not seek to better itself by united action, but that of our own. The Duke of Argyll did noble service to gardeners by directing attention to the weakness engendered by our isolation at the anniversary dinner of the Gardeners' Benevolent Institution. We have so little intercourse with each other, that even this useful society languishes for want of support. Be that as it may, the time seems opportune for inquiry whether a new club or institute could not be floated to provide temporary assistance to members when out of work, or disabled by accident or sickness, as well as the granting pensions to the aged or helplessly infirm. In one word, whether one institution could not be formed embracing all the legitimate duties of a trades' union—a sick and friendly society, an insurance office, a scientific institute, a practical school of gardeners, and a learned body, to which it would be considered an honour to belong, and whose patronage and stamp of merit might become useful aids to promotion, and be looked upon as honours that the best men would be proud to receive. Such an institution would excite in its behalf most of the strongest motives that rule and govern men. I boldly affirm that no club nor institute is worthy of the general support of horticulturists that does not endeavour by all means to redress the grievances and anomalies under which gardeners labour, and to promote the social, moral, and intellectual well-being of its members. We have no unrecorded demands, no dark plans dangerous to society. We only want to have our just claims recognised, and to be levelled up to that fair estate of life to which the faithful discharge of our duties, and the number and nature of our services alike entitle us. Nor are these only nor chiefly gardeners' questions. The things that cut us to the quick will affect and injure our employers, and probably tarnish the fair fame, and arrest the progress, of horticulture to-morrow. Now, if ever, the fortunes of horticulture are in the hands of its living agents. Elevate these, and horticulture will go on to prosper, depress them, and horticulture will go down with them. It is the opinion of many that the tide has begun to turn, from the fact of fewer men, and a consequent lowering of wages, entering our ranks. I give no positive opinion upon the matter. All the probabilities are, however, in favour of its truth. Continuous depression in the wages market must inevitably turn the best skill and talent and character into other channels. And if once the current fairly sets in another direction, it will require all the skill and energy of every horticulturist, from the least to the greatest, and an expenditure of means such as the most liberal have not yet devised, to bring the flood-tide of young life, with the necessary talent, perseverance, and strength, back to horticulture again. *D. T. Fish.*

Cucumber and Vegetable Marrow Judging.—I quite agree with your comments in regard to Vegetable Marrows being out so as to be able to judge by the thick flesh, which no doubt is the principal point in a Vegetable Marrow but I am doubtful whether the size you name would be a suitable size for market purpose, as they are generally liked about 2 lb. or 3 lb. weight. I also beg to differ with you on one point in judging Cucumbers you say that a Cucumber should be evenly swelled up to both ends. I quite hold with the flower end, but for beauty I consider the stalk end should be as thin as can be grown, for 3 inches of the stalk end is seldom eaten, as it is often bitter. I should recommend committees to give prizes as you describe—separate classes for different races of Cucumbers. *H. J.* [Our remark as to the size of Vegetable Marrows had reference to their quality for use, rather than to their suitability for marketing and we maintain that there is no comparison as to quality between a quite young fruit *lightly cooked*, and the older ones of the size "H. J." mentions. The more evenly a Cucumber is swelled throughout, the more symmetrical and proportionate, and consequently the handsomer, it is. We cannot admit that one end being pinched up gives the fruit any additional beauty—quite the reverse. The quality of the stalk end has nothing to do with the question, the fruit is not less beautiful because that part may be bitter, but it is more beautiful when it is well proportioned. *Eds.*]

Foreign Correspondence.

SPRING VEGETATION IN SOUTH-EASTERN SPAIN (continued from p. 742).—Whilst at Valencia I went over the Botanic Garden carefully. It appears to be more viewed and directed as a pleasure garden than as a scientific establishment, but even as such was interesting. The plants in flower (May 6) were the common flowers of our English gardens for May and June, monthly and Bengal Roses, with a few hybrid and Tea Roses, Delphinium, Antirrhinum, Thlaspi, Iris, Stocks, Silene, Jasminum revolutum, Ranunculus, Eschscholtzia, Sweet William, Poppies, Verbena, Spirea, Habrothamnus, Paeonies, Nasturtium, Pinks, Aquilegia, Petunia, Carnations, Collinsia, Viburnum, Convolvulus minor, Tritonia crocata, Oak-leaved Pelargonium, Virginian Stock, Aubrietia, Hydrangea. There was a glasshouse, but a green in which I found the Bougainvilleas, Lantanas, Vincas, Heliotropes,

Pelargoniums, Cinerarias, Coleus, as at Murcia. In this glasshouse were all the Palma Cereaceae which are grown in the open in the Genesee Riviera, with the exception of several. Chamaerops humilis and Latania borbonica, planted out in a very sheltered spot. Thus it contained Corypha australis, Carvota, Dion edulis, Thrinax Cycas revoluta, Cordyline, Dracaena Yucca, Ficus repens, Pereskia, Araha, Philodendron, Russelia lancea, Cyperus alternifolius, Banana. There were Abutilons and Oleanders in the garden, but not in flower. From the above facts I feel authorised to conclude, that the winter cold is greater at Murcia and at Valencia than on the Riviera. If it were not so, why should plants that we can cultivate with ease in the open air be placed in glasshouses, and why also should the open gardens contain little else but what is found in the gardens of more northern European regions? This can be easily understood. The eastward of Spain, favoured as it is in climate, is bounded, north and west, by high mountains and the health towns, Murcia, Alicante, Valencia, are at some distance from the foot of these mountains—that is, from their protection—so that the cold winds fall down upon them. The Genesee Riviera, on the contrary, is at the very foot of the mountain wall that protects it; and the cold winds, passing over, leave it blank in the south sea. At Valencia and in this region generally the Lemon tree is only grown except in very sheltered and warm situations, although in such localities it succeeds thoroughly. Nowhere did I find it grown in large orchards facing the sea, as on the Riviera, between Nice and St. Remo. There were some large timber trees in this garden, which are often met with on the promenades in these regions of Spain. Paeonia imperialis, with elegant blue terminal flowers, Celtis australis, a large beautiful tree, Diospyros Lotus, Crataegus melanocarpa, Gleitschia triacanthos, Sophora japonica, Schinus Molle.

The journey from Valencia to Cordova by rail takes the traveller into the centre of Spain, and of the high table land (New Castile) in a westerly direction, then descends due south, crosses the Sierra Morena, and follows the valley of the Guadalquivir. For many hours, for hundreds of miles, the line crosses the monotonous calcareous plains already described, treeless and houseless, with no cattle to enliven the scene. The entire region seems cultivated, but half or two-thirds was bare of all crops, lying fallow. Thus, it appears, the Spanish system of cultivation as with us ages ago. The land, naturally poor, with a thin soil lying on a calcareous base, very like the chalk downs and hills of Wiltshire, seldom or ever manured, is a bare, treeless soil, and thus to recover itself by the unaided efforts of Nature, and two years out of three. The farmer sows the seed, and he and the tenant divide the crop. So in the years of drought or adversity there is no rent paid or received, tenant and landlord both get on, if they can only manage to keep body and soul together. Moreover they both seem to be quite satisfied if this can be accomplished, and with their abstemious habits and frugal wants very little will do that. The fact, too, of the entire population being aggregated in towns, as in the Middle Ages, when men had to unite for mutual protection, at a distance from the seat of their labours, is a very great drawback, a national one. The men, with their southern fear of moisture, stay from work if it rains, or appears likely to rain, for festivities, for any excuse the women gossip all day, the children play about in the streets. Thus the peasant farmer squanders his own time, and does not get that assistance from his family which he does when they all live in a farmhouse in the centre of the field of labour.

No cattle are seen, and very few are kept on these plains, and I was told that the value of manure is so little known that the peasantry require paying to take it away from the towns. As may be supposed, with such a soil and such views of cultivation, the rising crops of cereals, only from 2 to 4 inches high, were very thin, poor and miserable, offering but little promise for the future. Even at this high elevation, from 2000 to 2500, or 3000 feet, there had been but little rain, and further rain, before the summer heat sets in, was anxiously expected. As to vegetation, we had gone back to early April in England, and the cold was positively bitter and very trying after a month in Algeria and South Eastern Spain. There was not a vestige of a southern climate in the aspect of Nature.

As the railway descending due south approaches the Sierra Morena mountains, the direction of which is due east and west, the geological nature of the soil changes. The calcareous soil and rocks are replaced by a silicious soil, by schistic and sandstone rocks. With this change of soil at once appears a change in vegetation. This change is observed both north and south of the Morena mountains, which are crossed at first through picturesque gorges, and then by a tunnel at an elevation of 2600 feet. The familiar shrubs of the Corsican and Atlas granitic sandstone and schistic ranges reappear. The Cistus or Rock Rose, the Broom—the common European form without spines, and Juniper bushes, the Maritime and Aleppo Pines, Myrtle, Lentiscus, Mountain Lavender, and on the south side, to my surprise, the Chamaerops humilis Palm. The Tamarisk fringes the river sides, and the Oleander is often seen along with it. Thus in Andalusia the vegetation of Northern Africa, of the Atlas ranges and rivers, is reproduced, especially along the course of the Guadalquivir, and more decidedly than in Corsica, where I neither saw the Tamarisk, Oleander, nor Chamaerops. It is singular that the Chamaerops Palm should be described as peculiar to Algeria, for in this part of Andalusia it is as common as Gorse on English commons. I saw thousands of acres covered with this dwarf Palm growing luxuriantly in tufts. Indeed it evidently propagated itself spontaneously wherever the soil in the Guadalquivir valley

is too poor to tempt cultivation. As I had seen it likewise in the basaltic soils near Cartagena and Murcia, I have no doubt that it is to be found all over Southern Spain in stichous soils, just as in Algeria, where it appears the moment the soil becomes calcareous. This is another evidence of the geological unity of Africa and Europe, of former days.

After passing the Sierra Morana the lands rapidly, and soon reaches an elevation of 600 or 700 feet. From this elevation exposure protection from north winds, more rain than on the eastern coast, and a sunny soil, vegetation becomes much more luxuriant than on the elevated central plain that we had just seen. Still I saw nothing to warrant the raptures of poets and travellers when describing the far-famed Guadalquivir valley. It seems to me that these raptures are rather the result of comparison with surrounding nakedness and sterility than of any actual exuberant fertility of the valley itself. For, although there is a good sized river rolling its waters in the midst of a wide and fertile plain, there is no irrigation. This is the first point to note, for the entire region was many centuries ago the basis of the Moors, who are the people who have established the irrigation works of the really exuberant valleys of Murcia, Valencia and Grenada. Indeed Cordova, which is built on the river bank, was the centre, the capital of their dominion. Then it occurred to me that it is of but little use to irrigate a poor sandy soil, as the water must all sink through it, and do no good commensurate with the expense incurred for irrigation. The valleys named above, where such extensive irrigation works have existed for centuries and where they secure exuberant fertility, are all the valleys.

Where the soil is gravelly soil through which we passed was everywhere the crops were thin and poor—indeed withered, and that without the expense of an irrigator. Still the soil with these cultivated regions were wide meadows covered with basm lark, Mountain Lavender, broom, and the Chanarops Palm, which could in former days extended over the entire region and yet, as we have seen, remains on the poorer uncultivated soils just as do Heather and Gorse with us, yet the entire country had a verdant smiling look. In the vicinity of the villages and towns, generally but near the river, in regions where the alluvial soil is deeper, are groves of Olives, Figs, Pomegranates, and as we neared Cordova occasional Palms—the Phoenix dactylifera—were seen. The alluvial soils in the distance were no longer naked, as in the lime regions, but clothed more or less with Lark, Cork Oak, Pines &c. Indeed, poor, sandy, gravelly soils, even when covered with very little vegetable soil, are everywhere, even in dry, warm climates, more verdant, more luxuriant with their peculiar vegetation than lime rocks, hills, or soils under the same conditions. The vegetation that clothes these soils bears drought better than that which lives in rich alluvial soils, especially when they rest on clay. The reason is no doubt that in sandy, gravelly soils the roots of the plants are not so deep, and the soil is not so dry, and the water is not so far from the surface as in the lime regions.

Thus I remember last year (1868) being much struck by the difference between the state of the vegetation of Surrey and Middlesex. In Surrey, where my country residence is situated, and where much of the soil is sand or gravel, the Weymouth Pines, Spruce Firs, Birch, Beech, Oaks (Chestnuts, Heather, &c. were perfectly healthy and green in August, after three months drought. There was no perceptible difference as compared with other years. But when I crossed the river into Middlesex, on the rich alluvial soils lying on clay, I found a total and real state of things. The ground vegetation was parched and reduced to lay, and the trees were losing their leaves as in November. Another reason may possibly be adduced as my gardener suggested. Our Surrey plants are like poor people accustomed to poor fare so when a fairer came they bore privation better than our rich Middlesex neighbours, accustomed to richer and better fare.

Notices of Books.

Chips and Chapters a Book for Amateurs and Young Geologists. By David Page, LL.D. Small 8vo, pp. 808. Blackwood.

A series of chatty, pleasantly-written chapters on things in general, that is, so far as geology is concerned. Amongst other things, we find in the present volume a chapter devoted to soils and subsoils. The author does not tell us much that was not before known, but we are none the less obliged to him for coming at the subject in a manner which has been almost entirely neglected by geologists, at least so far as the wants of agriculturists and gardeners are concerned. "Generally speaking," says Dr. Page "the soils and subsoils of a country receive but scanty consideration from geologists, yet few things are more erroneous in their formation, none so indispensable in the economical purposes they subserve. It is true they are recent and insignificant in mass compared with the rocky crust which forms the great theme of geology, but considering how intimately they are associated with the manifestations of vegetable and animal life as well as with the food supplies of man they are deserving of a closer inquiry, whether as regards their origin, their qualities, or their artificial amelioration." The physical nature and mechanical texture of the soil, and the circumstances influencing them, appear to us to be by no means sufficiently attended to, and yet to practical men the benefits to be derived from an investigation of these matters would be hardly confined to those which have accrued from the labour of the chemist.

Speaking generally, it may be asserted that except in certain special cases where the presence, in large quantities, of a certain ingredient, such as lime, materially modifies the character of the vegetation, the physical character of the soil has more to do with the kinds and condition of the plants that grow there than has its chemical composition. This is well shown in the case of a drained or undrained field. Chemically the same, its physical and hygroscopic characters are altered, and we all know how great the change in the vegetation, whether wild or cultivated. Manures, which are known to exert so strong an influence over plants, even to the extent of causing the disappearance of some plants, as has been proved in the pastures at Rothamsted, owe their powers not solely to their chemical qualities, but to a large extent to the physical changes they bring about in the mechanical texture of the soil. The same remark applies likewise to farm-yard manure. We want a geologist-gardener, like Mr Ingram, of Belvoir, a great fruit grower, like Mr Rivers, whose nursery contains such variety of soil and subject to take up this matter, and give us from the wealth of their knowledge some data, collected from a gardening point of view, as to the qualities of plants in relation to the nature of the soil.

Societies.

Edinburgh Botanical May 13.—Isaac Anderson Henry, Esq., V.P. in the chair. The following communications were read—1. On the Regional and Hypogeic Distribution of the Conifers. By Robert Brown, F.R.S.E. This paper was the result of the author's studies regarding the geographical distribution of Conifers over the globe, and the laws regulating that distribution. The result of his researches among the conifers that he has resolved to divide into seven or eight groups, which he designated provinces, and that these provinces might be divided into smaller geographical groups called regions, these regions, finally being composed of one or several forms which might be called "districts." He distinguished the prevalence of some particular species, not found out of the range of their own by local distribution, and then described these geographical provinces of districts, and gave the provincial limits assigned to them, with lists of the species frequently found, and the altitudinal range of the species contained in them. The cases regarding this distribution were next considered. It was shown that in all probability each species has a range which is widely distributed, and a certain northern or southern limit, in that the range of temperate trees within which it could prosper was not great. The limits of forests in America and the latitude, were stated for example, at 45° N. and 35° S. respectively, and the isothermic line of 50° F. Moisture was, however, the chief limiting cause of forests, and it appears that at least from 14 to 18 inches of annual rainfall during the growing season are necessary to the prosperity of forests in temperate latitudes. The origin of prairies was discussed. Geological formation has also a limiting influence, the great forests of Sequoia sempervirens in California being entirely limited to the metamorphic sandstones of the western slope of the coast range, breaks in the forest occurring where the formation was alternated with limestone tracts. 2. On the Distribution of Forests in North West America, with Notes on the Non-Coniferous Trees and Shrubs. By Robert Brown, F.R.S.E. The author has been in the mountains of the Pacific coast, and has been struck by the very distinct arboreal provinces. The vegetation of the coast of the Cascades was wet, and everywhere except in a few places, chiefly by the banks of rivers, covered with dense, almost trackless forest, chiefly composed of alpine conifers and differing from the corresponding forests on the Atlantic in possessing few deciduous trees, and a dense undergrowth of scrubby ferns. This region, Mr. Brown considered, might be naturally divided into the Klamath district, bounded by forests of Thuja plicata and a series of several trees common in the interior south of it. The next district commenced with the forests of Abies Douglasii in a north latitude of 45° N. and extended to 49° N. The presence of the chief tree of it was called the Douglasii district. It was everywhere a dense forest of alpine conifers and a few deciduous trees. Abies Menziesiana, Picea canadensis, Quercus garryana, Acer macrophyllum, Populus monticola, Alnus incana, and Juglans floridana, were the most characteristic trees. The Linnæa district was characterized by the presence of forests of Quercus fragrans, only found here, L. borealis, Quercus agrifolia, and other species to the east, where there was a break in the coast range, but a few L. borealis, Quercus agrifolia, and other species to the east. The Sierra district was divided into two districts, the district of the coast range, and the country between it and the Pacific, and the coast range between the coast range and the Sierra Nevada. The trees most characteristic of the first district were Pinus insularis, P. muricata, P. tuberculata, P. contorta, Abies bracteata, Torreya californica, Cupressus macroblatta, C. macrocarpa, Arbutus Menziesii, &c., and of the second, Oreodaphne californica, Platane racemosa, Abies edifera, Arotostaphylos glauca, Pinus babiniana, P. lambertiana, P. monophylla (Freemontiana), P. baldouiana, Cupressus lawsoniana, and Wellingtonia (Sequoia) gigantea, Lindl. Among its most characteristic shrubs are the serviceberry (A. nelsoniana), Rhamnus Purshiana, Prunus americana, and the Poison Oak (Ilex diabolica)—the type of a great number of species. The coast range district was characterized by Pinus ponderosa, Pinus contorta, P. insularis, occidentalis, &c. The Colorado district region part of the Mexican province than that north of it was marked by the prevalence of Alnus glandulosa, Stromboscarpa pubescens, cottonwoods (Populus sp.), Fremontia, a Yucca, some Oaks, and the giant Cactus (Cereus giganteus, Engelm.), the Pithaya of the native Californians, and on the fruit of which the Indians subsisted to some extent. Another region, the Montana, was marked by certain trees, chiefly Conifers, which were found only at certain elevations over the whole arboreal provinces of N.W. America, though the regions at the base of the mountains were entirely distinct in their vegetation. These were common to nearly all the mountain ranges, no matter where situated in the province, the hypsometrical range of the species varying slightly with the altitude. Pinus flexilis, P. centricarpa, A. las Latomia, Alnus Williamsii, Newberry, and Bridges, which was Kellogg's Abies Bridgiana, A. las Williamsii, Larix laricina, A. occidentalis, &c. were of an arctic type, and the region was marked by the prevalence of the conifers and shrubs (non-coniferous) of the

province, including those discovered or introduced in the author, were described. Photographs and drawings of the trees and forest scenery described were exhibited. **Notes of an Excursion to Cornwall, April, 1880.** By Professor Robert Brown, F.R.S.E. The author has been in Cornwall, and has been struck by the very distinct arboreal provinces. The vegetation of the coast of the Cornwalls was wet, and everywhere except in a few places, chiefly by the banks of rivers, covered with dense, almost trackless forest, chiefly composed of alpine conifers and differing from the corresponding forests on the Atlantic in possessing few deciduous trees, and a dense undergrowth of scrubby ferns. This region, Mr. Brown considered, might be naturally divided into the Klamath district, bounded by forests of Thuja plicata and a series of several trees common in the interior south of it. The next district commenced with the forests of Abies Douglasii in a north latitude of 45° N. and extended to 49° N. The presence of the chief tree of it was called the Douglasii district. It was everywhere a dense forest of alpine conifers and a few deciduous trees. Abies Menziesiana, Picea canadensis, Quercus garryana, Acer macrophyllum, Populus monticola, Alnus incana, and Juglans floridana, were the most characteristic trees. The Linnæa district was characterized by the presence of forests of Quercus fragrans, only found here, L. borealis, Quercus agrifolia, and other species to the east, where there was a break in the coast range, but a few L. borealis, Quercus agrifolia, and other species to the east. The Sierra district was divided into two districts, the district of the coast range, and the country between it and the Pacific, and the coast range between the coast range and the Sierra Nevada. The trees most characteristic of the first district were Pinus insularis, P. muricata, P. tuberculata, P. contorta, Abies bracteata, Torreya californica, Cupressus macroblatta, C. macrocarpa, Arbutus Menziesii, &c., and of the second, Oreodaphne californica, Platane racemosa, Abies edifera, Arotostaphylos glauca, Pinus babiniana, P. lambertiana, P. monophylla (Freemontiana), P. baldouiana, Cupressus lawsoniana, and Wellingtonia (Sequoia) gigantea, Lindl. Among its most characteristic shrubs are the serviceberry (A. nelsoniana), Rhamnus Purshiana, Prunus americana, and the Poison Oak (Ilex diabolica)—the type of a great number of species. gentlemen of the old school, in regard to a dish of Artichokes. "What be these?"—"Why, they be 'Chokes.'" "Noo, the mun be Pines!"—"Ah, p'raps soo."

Garden Operations.

(For the ensuing week.)

PLANT HOUSES.

Ericas, and especially the more delicate and tender varieties, after having experienced a somewhat dry period, should now be closely inspected, in order to detect any signs of mildew which may exist or be forming thereon. Where Heaths are properly attended to, this is the greatest pest the cultivator has to contend with, as it necessitates constant attention to every branchlet and sprig to detect immediately any symptoms that occur, and to stop its ravages. Flowers of sulphur are a perfect and sure remedy at all times. These should not, however, be scattered too densely upon the plants, the merest dusting, if applied successively for a few days, will effectually destroy it. Stove plants which are intended for early winter flowering may now have a shift into pots a size or two larger, if they have not a sufficiency of pot room. Such a sized pot should be selected as it will be possible for the plant to fill well with roots before the flowering season commences, otherwise no great success in a blooming point of view can be anticipated. These remarks apply especially to Gesneras, Begonias, and many other similar subjects. It should always be borne in mind that those I have specially alluded to will not bear large shifts, the smaller the pots they are grown in the better will the flowers be as a general rule. Some from amongst the earlier batch of Camellias, such as have already set their bloom buds, may now be removed to a sheltered place out-of-doors, where they should be partly shaded from the more direct rays of the mid-day sun. Give Pelargoniums of the scarlet or zonal section, intended for early autumn or winter blooming, their final shift into pots a little larger than those which they now occupy. Do not pinch them back after this date, as it is now becoming full late to make good strong breaks or shoots in time for such a purpose. Others which may not need potting will be much benefited by the occasional use of liquid manure, if not too strong. Should the weather be again cold and ungenial it will be necessary to reduce the amount of artificial heat and moisture in stoves, as the nights are now becoming much longer, the growths which are formed under so cloudy a sky cannot, if allowed to extend too rampantly, be so good as they are when a fair amount of bright sunny weather prevails.

FORCING HOUSES.

In Vinerias generally Grapes will now be making their final swelling preliminary to the ripening process, and a nice brisk warmth must therefore be maintained around them. Keep all internal surfaces as fresh, or sweet and clean as possible, and permit nothing to stand crowded about upon the floor of the house which is likely to impede the freest possible circulation of the air. Moss covered, or stale untraced surface-floors, emit, to say the least, noxious effluvia, which are very unwholesome, and opposed to the requisite sweetness which should at all times prevail. This is not to be wondered at when it is considered that for the want of a simple raking over of the surface, the soil, beaten or trodden down, is incapable of exercising its deodorizing powers. I am not an advocate for excessive waterings, but would rather advise that they should be so effective as to reach the utmost limit of the roots. The opportunity should be taken at such times, to afford a fair quantity of some harmless stimulant to the roots. Perhaps the best plan of affording this aid to the roots is that followed by many of our most successful growers. First, stir the surface of the border over, then add a thick layer of crude cow or sheep-dung, and afterwards surface the latter well over with a layer of good yellow loam. Thus it will be seen that the soil above and below will modify all rankness which may be contained in the manure, absorbing into itself the more unwholesome parts, and turning them to account at a later period. The water poured copiously upon the surface above, will freely wash the nutriment out of this layer down to the roots, and thus material aid will be afforded without a resort to crude manurial drainings alone, which are not always to be relied upon, as food proper for fast growing and hence very delicate sponges. These remarks apply especially to late Vines. Let the back walls and other similar surfaces in these late Vinerias receive another washing with sulphur and freshly slaked lime; and particularly see that none of those bunches which are intended to hang late are so thick as to be likely to impede a tolerably free circulation of air when mid-winter and its dampness and other injurious influences arrive.

Look keenly after those Pine plants which are intended for early winter fruiting, already we may expect to see some symptoms of "showing" in such varieties as Black Jamaica and Montserrat. They require at such a juncture, as I have so frequently suggested, a liberal treatment both in regard to bottom-heat, manure-water, and humidity. Where Pines are very firm, or have made a very fine growth, and have not been so well ripened as they ought to be (and I fear this will be the case in some instances this season, owing to the dull weather we have experienced), it may be that they will not push the bloom very freely. Under these circumstances it will be well to withhold root moisture, in preference to giving a too plentiful supply. This will tend to develop more fully the fibre of the plants, and will act as a slight incentive to fruit production. Shift now into their fruiting-pots such as are intended to show about next May or June, and this is especially applicable to slow root varieties. The night temperature most suited to Pines at this time is between 60 and 70°. That of

the day, by means of artificial heat alone, should rest at a mean as nearly 78° as possible, with an increase of from 10 to 12° by actual sun-heat only. Peaches and from 10 to 12° by actual sun-heat only. Peaches and Nectarines are ripening very generally now. It will be necessary to look over them carefully every day, that they may be gathered immediately they have become sufficiently ripe. If left upon the trees until they fall into the nets, or upon straw, or other similar appliances placed to catch them, they will have become less pleasant to the palate, and somewhat insipid. Keep up a brisk heat in Melon-pits, &c., and thus particularly whilst any are ripening, and afford air freely during bright weather.

HARDY FLOWER GARDEN

Already the flower gardens look more cheerful, and the plants, after an unusually cold and harsh season, are in a very fair way of covering the beds. None have done better during the past inclement weather than Mrs. Pollock, which proves to be the most useful bedder extant. Continue pegging down all subjects requiring such aid. Verbenas have hitherto not required this assistance, so very indifferently have they grown this season. It will aid them much if the beds receive a good soaking of water; the soil should be afterwards loosened with the hoe when sufficiently dry to work without sticking, and then pegging down should be done as required. Continue to increase Pentstemons, Pansies, &c., as required; any young shoots which emanate from around the base of the main stems will do well for this purpose. Plunge specimen pots of Auriculas into cinder-ashes in a moderately sheltered position should a dry period ensue, carefully guarding them against any form of drip, or too full exposure to the direct rays of the mid-day sun. Gather the seeds of choice Polyanthuses, which will now be very generally ripe. Cut away all flower-stalks of any Herbaceous Plants which have done flowering, such as Delphiniums of the perennial sections, &c. Should the weather continue dry give copious waterings, as previously advised, to Phloxes of the decussata breed, and to Tritomas, as neither will flower or flourish effectually without abundance of root moisture.

HARDY FRUIT GARDEN.

Remove all lateral growths which form upon Peach or Nectarine trees, or more especially upon those strong shoots which have already been laid in. In instances where very gross shoots exist, it will be conducive to a more plentiful supply of flowers if the larger leaves which form near the base are cut in two across the middle just about the time at which they are fully grown and have become tolerably well matured. Lay in all the young shoots which form upon any old plants of Cherries or Plums; a good crop is not attainable without their aid. Remove all Strawberry-runners as frequently as they show upon the stools when not needed to form plants, otherwise they will greatly impoverish the main crowns. Where the side shoots upon Currants (red and white) have not yet been removed, this should now be done without further delay. These remarks are equally applicable to Pears and Plums upon walls, or espaliers also.

KITCHEN GARDEN.

Make sowings now of a good stock of Sangster's or Daniel O'Rourke Peas, such as Carter's First Crop or Sutton's Ringleader, and a few Dwarf French Beans for late uses. Plant out upon very rich ground and in well-prepared drill rows the necessary quantity of Leeks. These may be planted some 8 inches apart by 10 in the rows. Make a main sowing of Turnips, and, as previously intimated, get out all the Celery possible at the earliest moment. Sow Cabbage seeds for early winter Collards, also a succession of Spinach. Water the Celery previously planted, if dry weather continues. Keep a sharp look-out for weeds, both on walks and on the cropped ground. W. E.

TOWN GARDENING.

CUTTINGS of Pompon Chrysanthemums that were put in as directed last month will now be well rooted, and should be at once pinched back, in order to make them nice bushy plants. Where it is intended to grow specimen blooms of the larger flowering kinds, all lateral shoots should be removed as fast as they appear, and the plants should be well watered at the roots every evening, and the tops should be syringed at the same time. Pipings of the late-flowering varieties of Pinks may still be put in, as directed at p. 692 and will do well.

The Intermediate Stock does very well in towns if wintered in a cold frame, these should be sown about the 20th of this month, in the following manner - Take out the mould about 6 inches deep, put in an inch of ashes to keep the worms down, then fill in level with fresh mould from the country, giving it a good watering, and the next morning sow the seed, sifting a little fine mould over it, put it down softly, and cover with a glass till the plants appear, when attention must be paid to give plenty of air. The double white Pyrethrum will likewise do well under the same treatment, if sown now. Pelargoniums that have done flowering in the windows should now have the old flowering wood cut down to the next new shoots that are making, and should be placed out so as to get all the air possible. The Balsam makes a charming window plant, and those plants that are now coming into bloom are the best for this purpose, as they have not been sharply forced, and will last a long time if well supplied with water. Reverting to the propagation of the Carnation in last week's article, I forgot to mention that they can likewise be freely propagated from cuttings but this method I should not recommend as a general rule, for they seldom flower the following summer, but if potted and placed in a pot in the autumn, they will flower very early the following spring. J. D.

STATE OF THE WEATHER AT CHISWICK, NEAR LONDON.

For the Week ending July 14, 1892, as observed at the Horticultural Gardens.

Table with columns: Day, Month, Barometer, Air (Max, Min, Mean), Earth (1 foot, 2 feet deep), Wind.

Average July: 80.67, 50.11, 78°, 49°, 63°, 61, 34.9. July 8 - Overcast, fine, cloudy, clear and fine at 6 a.m. 9 - Very fine, cloudy, but fine, cloudy, and air 10 - Very fine, clear and fine, fine, but cloudy 11 - Fine and clear, very fine, but a slight overcast 12 - Very fine, fine, very hot, cloudy but fine rain 13 - Showery, cloudy, drizzly overcast, cold wind 14 - Very fine, clear and very fine, under a cloud. Mean temperature of the week 81.5 deg. above the average.

STATE OF THE WEATHER AT CHISWICK.

During the last 45 years for the ensuing Week, ending July 21, 1892.

Table with columns: Day, Average Highest Temp., Average Lowest Temp., Mean Temp., No. of Years in which it Rained, Greatest Quantity of Rain, Prevailing Wind.

The highest temperature during the above period occurred on the 23d and 24th, 1869 - therm. 93 deg. and the lowest on the 24th, therm. 32 deg.

Notices to Correspondents.

DISEASED CURRANTS. D. D. We have examined your Currant branches closely, and find no insect or Fungus. The quantity of green matter (Chlorococcus) on the leaf, the situation in which they grow is clearly damp. The present season has been so ungenial that vegetation has suffered materially. The ground under Apple trees is a mass of dead leaves as thick as in autumn. Cherries, Plums, and Apples which were perfectly formed have withered and fallen off, and the same may be said of Wines, which promised a short time since a heavy crop. We hope therefore that the bad condition of trees is only temporary and we are the rather inclined to be sure that this is the case, as a black and red Currant are in the same condition. W. J. A.

DISEASE IN ONIONS. S. W. C. T. It is clear that the roots of the Onions have been first affected. There is an attempt to the distorted plants to throw out fresh roots. We believe that the disease is constitutional, and that if any of the plants should seed that the disease may be propagated. At first, such was the case in similar specimens sent to me some years since. In your case, however, it would be important to ascertain whether the seed was of the same origin as that which was raised in the healthy and healthy beds, as this would indicate some other cause. The specimens were much crushed in the post, and arrived in a very unsatisfactory state for examination. M. J. B.

FRENCH PARADISE STOCKS. W. Henderson. Consult the rising columns.

INSECTS. W. C. T. Although carefully examined with a lens, we have not been able to find any insect on your Paradise roots. We can, therefore, only suggest that they have been gnawed by some insect, or by the ground, with a view to kind of N. ter. W.

IRISH GARDENERS REVIEW. Inquirer. Price 2s. Apply to Thomas Edmondson, 9 Dame Street, Dublin.

NAMES OF PLANTS. S. D. Cynoglossum officinale - 7. 1, Claytonia perfoliata 3, Galium, apparently G. palustre 4, Polygala vulgaris, 6, Rhinanthus crista-galli - 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 35, 36, 37, 38, 39, 40, 41, 42, 43, 44, 45, 46, 47, 48, 49, 50, 51, 52, 53, 54, 55, 56, 57, 58, 59, 60, 61, 62, 63, 64, 65, 66, 67, 68, 69, 70, 71, 72, 73, 74, 75, 76, 77, 78, 79, 80, 81, 82, 83, 84, 85, 86, 87, 88, 89, 90, 91, 92, 93, 94, 95, 96, 97, 98, 99, 100.

PELARGONIUM. Mrs. HALLY. Mr. Hally contradicts the statements of R. D., at p. 743. On referring Mr. Hally's letter to our correspondent, he replies as follows - The plants of Mrs. Hally's Pelargonium, exhibited at Mr. Hally's at the meeting of the Floral Committee on the 6th inst., were not by any means in condition as they had a yellowish appearance of the foliage of the plants, which was commented on by many who were present. I can say that I am not surprised at the reputation of what he regards as a thorough Imperialis the reputation of what he regards as a thorough good and distinct thing by sending to the meetings of the Floral Committee indifferently grown and bloomed plants of it, he must not be surprised if the opinions of others of it, from his own. In regard to the similarity of the down of Mrs. Hally with those of several other persons, I can say that in the company of several other persons, I saw that they were nearly alike, and the unanimous vote was that they were very characteristic of habit given to us new variety by Mrs. Hally are exactly those possessed by Marie Lemoine, the real difference (if any, exists solely in the colour of the flower. Mr. Hally may rely on it that the Floral Committee will not exhibit a specimen to his new variety if he has the opinion I express, at p. 744. R. D.

PENITENTIAL P. TEE. F. P. We do not undertake to send everything that may be shown. Look to the list of names issued by the Society.

ROYAL HORTICULTURAL SOCIETY. J. S. Successful candidate receive plants in due time. The gardens are closed from 10 p.m. on the days only. Apply to the secretary.

VINE BORDERS. W. Brokenbrow. We can only recommend you to form an entirely new border, and plant a tree in it. The roots of your Vines must be in very bad condition, I judge from the example I sent you. I would advise you to take into consideration the treatment which I have received first, by the cutting off of the old wood, and the addition of 3 feet of old soil to your border. No Vines could succeed in a border of this sort.

VINE LEAVES. G. H. The little excrescences are very common on vine leaves, and do not seem, as far as our experience goes, to affect the produce so long as the leaves are healthy in other respects, they appear to be sometimes occur on the branches, they appear to be from an imperfect balance between the supply to the vine and the quantity of moisture in the air of the house. I have seen the same on the branches, and add a little of the American blight. Blake a little lime, and add a little of this will stop it. Soft soap may do so. Orange Peppery is difficult to cure. I cut out as much as I dare do of it. I see it. It much abounds. My trees are nearly clear of it. # F. Henderson.

ZERRATUM. In Mr. Smith's article on "Zerratum," p. 746. Oak sides read Oak still.

COMMUNICATIONS RECEIVED. - E. D. - R. D. - C. H. B. - G. G. - Dick Radcliffe & Co. - J. May (thanks) - W. F. R. - C. J. P. - W. H. R.

RAYBIRD, CALDECOTT, BAWTREE, DOWLING, AND COMPANY (Limited),
 Seed, Machine, and General Merchants,
 10, Seed Market, Mark Lane, E.C.; or Basingstoke
 Address, 10, Seed Market, Mark Lane, E.C.; or Basingstoke
 Prize Medal, 1851,
 1852, and 1853 for "Excellent Seed Corn and Seeds."

The Royal Agricultural Society of England.
 MANCHESTER MEETING, JULY 19 to 22.

FRANCIS MORTON and CO., Limited, Liverpool,
 exhibiting at the above Meeting, at their Stand (376),
 the Large Irons appointed for the Exhibition of Traction
 Engines and heavy agricultural Machinery, numerous examples of
 the new system of STAINED WIRE FENCING, including
 the new PATENT ECCENTRIC SELF-
 WINDING STRAINING PILLAR (the most powerful
 and economical yet invented), their
 PATENT SELF-LOOKING WINDING WINCH or
 GREAT ESCAPE MACHINES and drawings of their improved mode of
 ROOFING and BUILDINGS, designed for all
 kinds of buildings, also of their improved construction of IRON
 ROOFING, both permanent and temporary, including examples
 of their PATENT FIRE-PROOF ROOFING, also an example
 of their PATENT IRON THATCH SUBSTITUTE, for Hay
 Ricks, with numerous specimens of Drawn, Annular,
 and Wire Netting, with similar manufactures required for
 the improvement or improvement of Landed Property
 Catalogues, with catalogues, &c. will be given on the ground,
 and may be had on application to the Agents.

FRANCIS MORTON and CO., Limited, Liverpool
 London Branch—15, Parliament Street, Westminster, S.W.
 Glasgow Branch—Bank of Scotland Buildings, George Square.

Fowler's Steam Cultivating Machinery.
 THE AGRICULTURAL SHOW, MANCHESTER.

JOHN FOWLER and CO. will exhibit all kinds of
 STEAM CULTIVATING MACHINERY, varying from
 2-horse power, at STAND No. 163.
 The IMPLEMENTS will be seen AT WORK in the Field
 adjoining the Showyard.

FOWLER'S PATENT STEAM PLOUGH
 and CULTIVATOR may be SEEN at WORK in every
 agricultural County in England.
 For particulars apply to JOHN FOWLER and CO., 71, Cornhill,
 London, E.C., and Steam Plough Works, Leeds.

ROSEBURY HURDLES
 (Silver Medal of the Royal Agricultural Society)
 SHEEP, 3s. 6d., CATTLE, 4s. 6d., OX 5s. 11d.
 Let by post. GATES and FENCING of every description.
 Besant's Iron Work Company, Old St. Pancras Road, London, N.W.

T. ARCHER'S "FRIGI DOMO"
 The Patent for His Majesty the Queen, the Duke of
 Edinburgh and for St. James's Palace, the Duke of
 Devonshire's Park, Chiswick Gardens, Professor Landley for the
 Royal Society, and Sir Joseph Paxton for the Crystal
 Palace. The Zoological Society, Royal Gardens, Kew, &c.

The best Shading is "Frigi Domo" Netting.
 The net is made of prepared Hair and Wool, a perfect non-
 conductor of heat or cold, keeping a fixed temperature where it is
 used. It is adapted for all Horticultural and Floricultural
 purposes.

PROTECTION from the SCORCHING RAYS of the SUN
 "FRIGI DOMO" NETTING, 2 yards wide, 1s. 6d. per yard run.
 "FRIGI DOMO" CANVAS.

Will you be good enough to send the 50 yards of 2 1/2
 yards wide, of your improved make, 1s. 6d. per yard run
 and 100 yards of 3 yards wide, 1s. 6d. per yard run.
 The net is made of prepared Hair and Wool, a perfect non-
 conductor of heat or cold, keeping a fixed temperature where it is
 used. It is adapted for all Horticultural and Floricultural
 purposes.

THE 1 ARCHER, 7, Great Trinity Lane, Cannon Street, E.C.
THOMAS ARCHER, Wholesale and Sole Manufacturer,
 7, Great Trinity Lane, Cannon Street, City, E.C., and of all Nursery-
 and Seedsmen throughout the Kingdom.

WARNER'S SILICATE of IRON PAINT,
 A certain PREVENTION against DAMP WALLS,
 Effectually PRESERVES IRON and WOOD,
 Is unaffected by extreme HEAT and AMMONIA.
 Has great Covering Properties.

All Colours supplied and can be obtained through any
 Paint or Ironmonger of
WARNER and ASHBY, 17, Laurence Pountney Lane, E.C.

**Health of Horses,
 Stables, and Dog Kennels.**
MASTERS OF HOUNDS

Will find the greatest advantage in Paving the Floors of Stables
 and Kennels with
DIRMONT SEYSEL ASPHALTE.

Thirty years experience of the durability of this material,
 for the above and many other purposes, testifies to its value.
 As well as all such other works can be had on application to
J. FARRELL, Secretary, 6, Parliament Street, S.W.

The Improvement of Landed Estates.
THE LAND LOAN and ENFRANCHISEMENT
COMPANY (Incorporated by special Act of Parliament), is
 empowered, subject to the approval of the Inclosure Commissioners
 in England and Wales, to advance Money to the Owners of Settled
 and other Estates, for the Erection of Farm Buildings and
 Drains, and for the Drainage and general Improvement of Landed
 Property in any part of the United Kingdom, the amount borrowed
 being made repayable by annual instalments spread over a period
 not exceeding 25 years.

The expenses incident to the transaction are paid by the Company,
 and added to the amount to be charged on the Estates. No
 mortgage of the landowner's Title is necessary. Terms and
 other particulars may be obtained of Messrs. GUYLER & BIR,
 10, George Street, Edinburgh, Agents for the Company, and
 of Messrs. LAWRENCE & BURNARD, 22, Great George Street,
 Westminster, W. and Salisbury, of Messrs. AUSTIN, MORRIS &
 CO., Solicitors, 6, Old Jewry, London, E.C., and at the Offices of the
 Company.

T. PAIS, Managing Director
EDWIN GARRUD, Secretary
 10, Great George Street, Westminster, S.W.

THE LANDS IMPROVEMENT COMPANY.
 (Incorporated by Special Acts of Parliament.)

Directors:—
 Sir John Lubbock, Bart., 9, Whitehall Place, S.W.
 Frederick L. Ashurst, Esq., 4, King's Bench Walk, E.C.
 Sir John Lubbock, Bart., 9, Whitehall Place, S.W.
 Sir John Lubbock, Bart., 9, Whitehall Place, S.W.

Agents:—
 Messrs. Farquhar, Esq. (Messrs. Barris, Farquhar & Co.), 16, St.
 James's Street, S.W.
 Messrs. J. & F. Howard, Esq., 1, King's Bench Walk, E.C.
 Messrs. B. Ryder, Esq. (Managing Director), 2, Princes Terrace,
 Hyde Park, S.W.
 Messrs. R. H. Somerset, Esq., Q.C., 4, Park Street, Westminster,
 S.W.
 Messrs. W. West, Esq., Q.C., M.P., 10, King's Bench Walk, E.C.

Chairman:—
 Charles Watkin Williams Wynne, Esq., M.P. (Chairman), 2, Lower
 Berkeley Street, Portman Square, W., and Coed-y-Maen,
 Wrexham.

The Company advance money, unlimited in amount, for all pur-
 poses of Agricultural Improvement, including the erection of Cot-
 tages and Farm Buildings, to the Owners of settled and other
 Estates, and to the Clergy in respect of their Glebe Lands.

The whole cost and expenses are defrayed by a rent charge
 on the land, redeeming principal and interest, over 25 years.
 No investigation of Title is required.

For Forms and further information apply to **GRANVILLE R.
 TYLER, Esq., Managing Director, 3, Parliament Street, London.**

THE GENERAL LAND DRAINAGE and IMPROVEMENT COMPANY

Directors:—
 Thomas Chapman, Esq., F.R.S. The Right Hon. Viscount Com-
 Geo. Thomas Clark, Esq. berere.
 John C. Cobbold, Esq. Edward John Hutchings, Esq.
 Henry W. Currie, Esq. William Tite, Esq., M.P.
J. BAILEY DENTON, Principal Engineer.
 Agricultural Improvements of any kind are executed by the Com-
 pany, or the outlay thereon repaid to Landowners who prefer
 executing the work by their own Agents.
 Tenants may also, by arrangement with their Landlords, procure
 the execution of such improvements.
 The outlay, with all official expenses, may be charged on the
 Estate, and paid off by a rent-charge in 31 years, or at the option of
 the Landowners in a shorter term.
 No investigation of Title necessary, and no legal expenses incurred.
 Application to be made to **HORACE BROKE**, the Secretary, at
 the Offices of the Company, 23, Whitehall Place, London, S.W.

THE ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

President:—His Royal Highness the PRINCE OF WALES, K.G.
MANCHESTER MEETING, 19th to 24th JULY, 1869, inclusive.
PROGRAMME.
MONDAY, July 19, to Friday, July 24, inclusive.—Trial of Reaping,
 Mowing and Haymaking Machines, Horse Rakes, &c., in the
 fields adjoining the Show Yard. Admission, 6d. each person.
FRIDAY, July 19, and Saturday, July 20.—The Implantation Yard
 only Open from 8 A.M. to 6 P.M. Admission, 2s. 6d. each person.
MONDAY, July 19, and Tuesday, July 20.—The entire Show Yard.
 Open from 8 A.M. on Monday, when the Judges commence inspect-
 ing the Live Stock and making their awards. Admission, 6s. each
 person.
WEDNESDAY, July 21. Admission, 2s. 6d. each person.
THURSDAY, July 22, Friday, July 23, and Saturday, July 24. Admission, 1s.
 each person.

SPECIAL NOTICES.
SEASON TICKETS.—Non-transferable Tickets, price 10s. 6d. ad-
 mitting the holder, once on each day, to the Show Yard, from July 19
 to 24, inclusive, may be obtained from the Secretary, 15, Hanover
 Square, not later than Saturday, July 10, and afterwards at the
 Secretary's Office, near the entrance to the Show Yard, or at 26, King
 Street, Manchester, from and after June 25.

TRIAL OF HUNTERS.—The Trial of Hunters will take place in
 an enclosed space adjoining the Show Yard at 2.30 daily, commencing
 on Tuesday the 19th. Admission to this ground, 1s. per day
 each person. Admission to the enclosed stands on Tuesday and
 Wednesday, 4s. each person; and on each of the other days, 1s. 6d.
 each person. Season tickets, price 10s. 6d. each, may be had at 26,
 King Street, or at the Local Comm. ticket tent, in the Show Yard.
 Giving the holder admission to the leap ground and the stands
 at any time on any day, from the 19th to the 24th, inclusive. Govern-
 ment and Members of the Society are, however, retained that they
 have not free admission to the Trial of Hunters.

HOUSING SHOW.—An Exhibition of Housings will be held in
 the enclosure for the Trial of Hunters, adjoining the show ground,
 on Wednesday and Thursday, July 21 and 22. Admission, 1s. The
 holders of Season Tickets for the Trial of Hunters have free
 admission to this exhibition.

HORTICULTURAL SHOW.—Arrangements have been made to
 enable persons to pass and repass from the Royal Agricultural Show
 Yard to the Exhibition of the Royal Horticultural Society, after
 separate payment at each.

REFRESHMENTS.—Provision has been made for first and second
 class refreshments upon the ground, at a reasonable charge.

LODGINGS.—Persons at a distance wishing to obtain information
 as to Lodgings, are requested to address Mr. John Duffield, Essex
 Street, King Street, Manchester, at whose office a register of
 part owners and houses is kept, and by whom printed plans will be
 supplied, or inquiries answered on application.

GENERAL NOTICES.
 No person can be admitted to the Show Yard after 7 o'clock on the
 evening.
 The Show Yard will be cleared of visitors each evening at 10 o'clock.
 For admission to the Show Yard, the gates will be open from 8 A.M.
 and of the horses at 12 o'clock at noon, on each day after Monday.
 A Plan of the Show Ground may be purchased at the Printing
 Office, in the Show Yard.
 There are two Entrances to the Trial Fields, one by Seymour Grove,
 and the other by the Military Exercise Ground, both at Old Trafford.
 Access can be had by no other approach.

The Agricultural Gazette.

SATURDAY, JULY 17, 1869.

MEETINGS FOR THE ENSUING WEEK

July 19	Royal Agricultural Society of England, at Manchester—
20	Admission, 6d.
21	Do ditto, Admission, 2s. 6d.
22	Do ditto, Admission, 1s.
23	Do ditto, Admission, 1s.
24	Do ditto, Admission, 1s.

THE Manchester showyard and its contents
 are, we need hardly say, of greater importance
 than any collection of a similar kind which
 has ever been made. As compared with the
 successful Leicester meeting, the following figures
 will show several points of increase:—

	1868.	1869.	Increase.
Stands	337	395	58
Articles	8369	7724	1355

Of the shedding there are 10,500 feet for
 implements, 1250 feet for machinery in motion,
 700 feet for seeds and models, 5000 feet for live
 stock, 406 feet in length of horse-boxes, and
 1300 feet in length of refreshment stands. All
 these are spread over a space of probably 100
 acres; which is exclusive of the large area
 occupied by the ring and "grand stands" in the
 jumping ground.

The trials which were begun on Tuesday are
 likely to be the most prolonged that have
 hitherto occurred under the auspices of the
 Royal Agricultural Society. The mowers and
 reapers that were selected by the two sets of
 judges in this department of the trials numbered
 upwards of 100. Of the 2-horse mowers there
 were 24. Mr. WALTER A. WOOD, Messrs.
 HORNSBY, Messrs. SAMUELSON, Messrs. BUR-
 GESS & KEY, and Messrs. J. & F. HOWARD,
 did some most excellent work in the seven pre-
 liminary trials of half an acre each. Mr. WOOD,
 Messrs. SAMUELSON, and Messrs. HOWARD, cut
 their half acre in about the same time, viz.,
 28 minutes each. This is quick work, when its
 fine quality is also taken into consideration.
 Indeed, nearly all the machines did the work
 well; and, as one of the judges said, the question
 of relative merit is now more one of the cost,
 lightness, and strength of a machine, than of

the quality of its work, and these points will no
 doubt take a leading place in the final decisions.
 At the time we write, the awards have not been
 announced, and it is not likely they will be
 announced before this evening.

The preliminary trials of the reapers and com-
 bined machines are even more numerous and
 tedious than those of the mower alone.

In addition to those already named as exhibiting
 the latter, and who were also among the Rye
 with their reapers, there were several other
 noteworthy competitors. Messrs. BINGHAM &
 BICKERTON did some excellent work with a
 very simply constructed machine. Messrs.
 SAMUELSON have a good new self-raking machine
 at a reduced price. Messrs. HOWARDS' double
 cam self-raker, which carries the gatherers as
 low down, or nearly so, as the rakes, promises
 to take a prominent place for cutting laid corn.
 Messrs. HORNSBY'S "Paragon," a combined
 reaper and mower, did some first-class work
 with the Rye. Mr. OUTHBERT also did some good
 work with an improved Hussey machine.

The judges in these departments possess the
 confidence of both manufacturers and farmers.
 Of mowing and haymaking machines and horse-
 rakes they are—Mr. JOHN HEMSLEY, Shelton,
 Newark, Notts, Mr. J. W. KIMBER, Tubney
 Warren, Abingdon; and Mr. MATTHEW SAVIDGE,
 Sarsden Lodge Farm, Chipping Norton. Of
 reaping, sheaf-binding, and corn-drying ma-
 chines:—Mr. JOHN HICKEN, Dunchurch, Rugby,
 Mr. W. SANDAY, Radcliffe-on-Trent, Notting-
 ham, and Mr. W. SADLER, Ferrygate, Drem,
 N.B. As an instance of the severe test to which
 these machines have been put, fields of Rye-
 grass and Clover are to be rolled down before
 the mowers are put to work, and several acres
 of Rye are to be treated in a similar manner, to
 test the capacity of some of the reapers.

The judges in other departments are as
 follows. Of manure distributors, potato-getters,
 waggons and carts—Mr. JOHN WHEATLEY,
 Newark, Driffield Mr. HENRY CANTRELI, Baylis
 Court, Slough, Bucks, Mr. JOHN GIBSON,
 Woolnot, by Dalketh, N.B. Of miscellaneous
 and lary utensils—Mr. H. B. CALDWELL,
 Monkton Parloagh, Bradford-on-Avon, Mr. F.
 STERBORN, Bolton, Middlesex, Mr. J. K.
 FOSTER, Wulow Bank, Aylesbury. Of plans
 and models—Mr. J. COLEMAN, Escrick Park
 Office, York; Mr. J. BAILEY DENTON, 22,
 Whitehall Place, London, S.W.; Mr. J. E.
 WATSON, Newcastle-on-Tyne.

Among the machinery exhibited there is
 nothing of a very novel character. But there are
 three entries of corn-drying apparatus to
 compete for the Gold Medal offered by the
 Society. These are shown respectively by Mr.
 GIBBS, who was awarded the premium of the
 Society of Arts, Messrs. DAVY, PAXMAN &
 DAVY; and Messrs. ADAMSON & Co.

Among the more ponderous articles, Messrs.
 FOWLER & Co have a traction engine on the
 ground, which they have made for Mr. CAMP-
 BELL, of Buscot Park, the weight of which is
 about 27½ tons.

As to the City in whose suburbs this great
 collection is now gathered—Manchester is rising
 rapidly to a high condition of expectation, in
 anticipation of the visit of their Royal Highnesses
 the PRESIDENT of the SOCIETY and PRINCESS OF
 WALES. Stands are being erected on every
 available spot by which the Royal party pass,
 and windows and houses are being advertised for
 the convenience of seeing the procession down
 the Stretford Road to Old Trafford, where the
 Royal Society's showyard is situated.

If the enormous population in this city and
 neighbourhood be thus thoroughly aroused they
 will, no doubt, follow the Royal party to the
 showyard; and it is evident that nothing but a
 continuance of the fine weather is necessary to
 make our meeting an unprecedented success.

In all essential points the Contagious Diseases
 (Animals) Bill has passed through Committee
 unaltered. The amendments which were intro-
 duced at the sittings of July 9 and 13, although
 important, do not affect the general principle of
 the measure.

Mr. GREGORY'S proposition to substitute two
 months for 10 days, in clause 54, as the period
 which must elapse since the occurrence of a fresh
 case of pleuro-pneumonia before the rules of
 the Act cease to operate in any particular case,
 was modified by the adoption of the words
 "thirty days," and taking the general experience
 in reference to the progress of pleuro-pneumonia
 that time is sufficient; we have known three

months to elapse before the disease has reappeared, although in exceptional instances. On clause 63, relating to the carriage of animals by railways, Mr. FORSTER'S amendment directs that "Every railway company shall make provision for the supply of water and food to animals carried by the company, the same to be supplied on the request in writing of the consignee of any animals at such stations as the Privy Council may direct." This addition to the clause will meet the wishes of agriculturists, and will also be generally acceptable on humanitarian grounds. Mr. FORSTER has also agreed to take into consideration the arrangements for the transit of cattle in steamboats. Details of legislation on these matters is somewhat difficult, as cattle on board ship, like their animal companions of the voyage, are subject to strange modifications of their normal functions, and do not always behave in a strictly correct or usual manner. Spanish cattle, for example, if fed and watered during the first 12 hours of the voyage, suffer considerable inconvenience, which is avoided when they are kept fasting for a longer time. Again, it is well known that some animals will neither eat nor drink at all during a journey. Practical experience is therefore absolutely necessary for the proper arrangement of details, and the whole question must be left open in any Act of Parliament. If the Privy Council undertake to sanction a certain system of conveyance of animals by land or water, it is reasonable to presume that they will obtain all the necessary information to enable them to act consistently.

In brief, as the Bill now stands, the foreign cattle trade will be regulated by "Orders of Council," in respect of the definition of countries from which animals may be imported into Great Britain free, all other classes of imported stock will be landed within a defined part of a port, and there sold and slaughtered.

Referring to some-Lord and other stock in this country, the Bill makes it penal (clause 56) to expose "for sale in a market or fair or other public place, or sale yard, whether public or private," or to send or cause "to be carried on a railway or on a canal, river, or other inland navigation, or in a coasting vessel," or to drive or lead "on a highway or thoroughfare, any horse or animal affected with a contagious disease."

A difficulty of no mean character presents itself in reference to the position of imported stock at the moment of the disease. Legal statutes we know must be construed strictly, and the penalty applies to the owner or "person" who commits the offence, unless he shall show that he did not know, or could not with reasonable diligence have obtained the knowledge, that the animal was so diseased at the time it was exposed for sale or moved by road or river. In the case of an English ox affected with pleuro-pneumonia the probabilities are that the farmer who sends it to market can with reasonable diligence find out whether he has pleuro-pneumonia on his farm or not; but how stands the matter in reference to a Dutch or German ox landed in this country with the undetected disease in his system, passed by a Custom's inspector as a sound animal, and sent to one or two markets before the symptoms of pleuro-pneumonia are detected? Who is guilty of an offence against the Act in such a case?

Again, the more frequent disease, "foot and mouth complaint," is placed in the list of infectious maladies; and it will be penal, when the Bill becomes law, to expose animals affected with that disease in a market, or to move them along the road or river. Hundreds of imported animals are landed in this country, and at the time of inspection give no evidence of disease, but in two days afterwards are undoubtedly affected with the disease, and the responsibility rests in this case? And if proceedings are taken against the importers, what magistrate will convict a man for exposing in the market on Monday a lot of oxen which were passed by the port inspector on the previous Saturday. This part of the measure appears to require correction, and we confess, with a view to the safety of the stock of the country, we should prefer that infectious diseases which may be detected in a market, or on the road, be slaughtered at the nearest convenient place, rather than that the "person" should merely be deemed guilty of an offence against the Act and punished accordingly, while the diseased beast is left alive to do his worst. If the local

authority had power to order "the slaughter of such animals" no great loss would be incurred as the meat in the early stage of both diseases would be sold for food, as it always is, and the danger of propagating the disease be at once effectually averted.

It is very strange how soon accurate remembrance of the weather fades away from the mind unless there has been some very special circumstance to imprint it, and nothing is more common than the exclamation—"We never had such weather as last week" or "last month," as the case may be. Unless we keep a record of instrumental observation we are very apt to be deceived, our feelings perpetually deceive us, and our remembrances still more. For once, however, we have been in accord, instruments, feelings, memories, all agree as to the character of the month of June last past. Recollections must indeed be able to travel half a century to recall such a season as that we have just passed through; but they need only go back a single twelvemonth to call to mind one of the most remarkable contrasts ever presented by our climate, variable as it is.

Last year we had a warm, bright, and dry May as a prelude to a June extraordinary for warmth and drought and, above all, for the clearness of the sky. It was this last feature which by promoting radiation and affording cool nights, served in some degree to moderate the heat—which was nevertheless oppressive, and, combined with extreme drought (not more than half an inch of rain having fallen throughout the month in many places), was very trying to vegetation. This year's June was pre-empted by a May in every way a contrast to that of 1868—cold, dripping, overcast, with biting winds and frequent frosts. The month that followed it has not been remarkable for anything but cold; the temperature in the shade has been about 2° below the average; the absence of rain (not so remarkable certainly as last year, yet such as to constitute it on the whole a dry month, and at its close leaving all crops, except perhaps the wheat, crying out for moisture. But in heat it has produced a most remarkable contrast to the preceding season: instead of the shade of the grove, we have resorted with pleasure to the fireside—while colds and rheumatism have been as much the fashion as in the depth of winter. The days have been cold and dreary, but the nights extremely cold—frosts prevailing in many localities even to the end of the month, whilst the night of the 16th will long be remembered for its wintry severity—the hills in the north covered with snow of great depth, in the south sheep actually perishing with cold.

Now, if it be asked, what has been the reason of this extraordinary cold? the proximate cause may be indicated with certainty, and perhaps the cause lying immediately behind this; though the remoter causes may remain in obscurity.

Observations with a sun thermometer, of which the bulb is fully exposed to all atmospheric influences, rarely show a difference over the temperature of the shade of more than 14° or 15° even in the hottest weather. During the past two months a much larger difference might have been frequently noticed—a difference of 20° to 25°, and on one occasion nearly 30° has occurred. This may be taken as an index that the temperature would have risen to one much more in accordance with our ordinary experience at this season, but for some overmastering influence. That influence has been the translation bodily of masses of cold air from the arctic regions. The prevalence of northerly winds in May and June, 1869, compared with that in the same month in 1868, is nearly as 9 to 3. The same latitudes of this year as the abnormal weather which has obtained in the north of the country, the papers tell us, have been the scene of a larger body of heated air flying off towards the pole, has been a larger quantity forced from the pole southward. What that again depends on it is much more difficult to say; but probably upon some unequal distribution of vapour. A slight departure from the usual course in those natural forces which are the object of study in meteorology has a tendency to increase and propagate itself till, by the natural arrangement, its very excess calls into action a compensating force, which again works out a cycle of variations, and in variable latitudes the merely arithmetical law of combinations is capable of producing almost endless variety. If you take only three degrees of intensity in the ordinary elements of

weather, and calculate the number of combinations which are rendered possible, it will be found that it will take more than a million years to exhaust the series.

WHEAT has risen in price during the month of July nearly 5s a quarter of which is, was due to the Malay market. The price of a good barrel of wheat and dull, the supply exceeding the demand. There is little to report in the agricultural trade.

OUR LIVE STOCK

THORNTON'S Northern Cattle No. 1, in connection with the week, and as a complete month. It opens with the prize Northern, the Royal, Dublin and John and Wm. of England, which it appears that 297 animals of the latter were shown at the former meeting, and 53 of the latter must have been imported, as 121 entries were made in that class. Northern sales eight, four with colour age, and reference pedigrees of 12 animals, as well as the price realised and buyers names together with a summary of the sale and the average price. Notice of the forthcoming sales are also given, likewise a couple of pages of sales that will probably take place during the season, but which are not yet advertised. The season seems to have been good for exporting for about 30 months ago left the country for America, Australia, Germany, Hanover, Holland, Prussia, Russia, and New Zealand, as the progress of the month are given, with the Herd book reference part of the work must be very useful to Continental breeders. About five pages of births is incorporated herds are given, and an account of the private selling and letting of bulls. The sale of some famous animals is a very curious one, with a report of their produce and drawings, the most interesting being the history of the famous bull, THE DUKE OF THORNDALE 1770. The late Mr Benjamin Wilson's is also a broader and more sketchy, the opening phrase, "a neat farm and a good job, being pretty well the keynote of the whole. Very few animals are sold and three on service complete in the morning. The 7th does not mean the apparent care bestowed on the information arranged to be a daily production, and Thornton's breeders should not feel too unsupported.

The second Mr. Park sale of thoroughbred yearlings was not so well attended, still 35 out of the 40 offered were disposed of at an average of 50s each; Mr Cavender purchased for Mr Graham, the two highest prices, 100s each for two splendid fillies many of which were bought for breeding purposes. Mr Dazear bought two very promising ones, a yearling stall for good service horses at 100s and a yearling mare at 100s. He bought a Graduate colt at 100s and a pair of Arab horses for 500s. The best prize animal at the sale is a yearling Arab stallion has also been obtained from the King of Wurtemberg at Stuttgart, these two will be some of the best animals and best blood that have as yet been exported to Australia.

THE ROYAL AGRICULTURAL SOCIETY AT MANCHESTER

The Manchester meeting of the Royal Agricultural Society, judging from the report, is a successful one. The collection of implements, seeds, and roots, comprises a full and complete volume of 500 pages of printed matter. There are 724 entries, making about 100 pages and 1355 entries in excess of last year. The Manchester implement catalogue of last year is well attended. The catalogue of the department is not yet published, but from the information we are given to understand prospects are equally favourable.

The trial of mowing and reaping machines, 1877, was highly attractive to more than the usual public, and witnessing the "The Royal Capital," and the perfection to which the machines have attained, it is too late to report on the exhibit on we have to report, and the interesting receiving, are no more than what was to be expected. Thus, Manchester enters 72 reapers and mowers, 23 combined machines, 51 reapers, and 10 mowers, against a total Manchester 75, 200, 100, and 100, a difference which speaks sufficiently of the progress of the industry.

The trial of the mowing and reaping machines, 1877, was highly attractive to more than the usual public, and witnessing the "The Royal Capital," and the perfection to which the machines have attained, it is too late to report on the exhibit on we have to report, and the interesting receiving, are no more than what was to be expected. Thus, Manchester enters 72 reapers and mowers, 23 combined machines, 51 reapers, and 10 mowers, against a total Manchester 75, 200, 100, and 100, a difference which speaks sufficiently of the progress of the industry.

a good healthy plant, and grows fast, and the same may be said of the Swedes and Turnips, so that the prospects of the present season are a striking contrast to those of the last, as far as the stock-keeper is concerned. The young Grass seeds look exceedingly well. Harvest will probably commence in this district in about a month. *Cookham Dean, Maidenhead, July 8.*

DORSET—Wheat crops in the neighbourhood of Blandford are looking ragged, weak, and thin, and must be under an average crop, they have never recovered the cold wet month of May. A good field of Wheat, I am sorry to say, is a rare thing to be seen in this locality, even on the best cultivated spots. Warm sun is badly wanted to bring it on. It will be August before any of it will be fit for the reaper, which will make the harvest from 12 to 15 days later than last year. Much as yet cannot be said respecting the Barley and Oat crop, being early for it, but it is at present looking healthy and promising, likely to be an average crop. Keep for all kinds of stock is plenty, and the Mangels, Swedes, and Turnip plants are coming on very satisfactorily. I have not seen anything of the Turnip fly this season, or heard any complaint. *John Ford, Kuston, July 12.*

ESSEX—The following is my estimate of the coming crops—Wheat, barely average. Oats, under average, Barley, good average; Beans, above average, Peas, above average, Tares, above average, Mangel, good, but rather late, hay, above average; Clover, plants lost. *Collinson Hall, Princes Gate, Romford, July 9.*

GLOUCESTERSHIRE—In consequence of the very fine weather we have had lately for the blossoming of the Wheat, I am inclined to think we shall get an average crop. Both Barley and Oats are greatly improved, and promise an average. Beans must be 30 per cent. under an average. The quantity and quality of hay secured from the pasture lands were never better, and the prospect of a good crop of roots is at present very encouraging, and Potatoes are doing up a good crop without any disease. *Edmund Ruck, Castle Hill, Cricklade, July 12.*

HEREFORDSHIRE—The Wheat crop in this district must be much under an average, on the stiff and wet soils there is scarcely half a crop, it being very thin, and coming out in the ear very unevenly. The Barley I think will be about an average crop. Oats are looking well. Beans are strong in haulm, but I do not think will be very well podded. The hay crop is a good one, especially on the drier land. There is at present a very good prospect of roots. *D. Edwards, Brinsop Court, July 9.*

LINCOLN—The corn crops in this part cannot be an average. The Wheats vary much, but will take the lead; it must have been a fine time for flowering. The Oats and Barley are very light and backward. Beans have plenty of straw, but not well corned. *H. Dudding, Panton House, July 13.*

NORFOLK—I have great pleasure in sending you what information I can from this part of the country. The Grass hay a very abundant crop, and mostly well secured, the seeds quite a failure last year. Wheat a good average, Barley, little, Oats, little. Beans under a rather more than an average. The root crops are all very good, scarce a spot failing this year and the warmth of the last few days has promoted their growth immensely. This part of the country is very full of Grass keeping. *Hugh Autmer, July 8.*

OXFORDSHIRE—During the last week the Wheat has come out into ear, and looks better than it promised three weeks ago, but it is yet very uneven, and I fear we will not have an average crop, the yield must be much below last year's. Although last summer's drought was most beneficial for the strong lands, the excessive rain during the winter, with a cold wet spring, made spring seeding most difficult. Barley and Oats have also suffered to the same extent upon strong and sour soils. Beans and Peas are generally good, therefore the prospect for a bountiful harvest is far from general. The hay crop is abundant, and a good deal is well saved. Mangel and Swedes are a full plant, and doing well. *Matthew Savidge, Sarsden Lodge Farm, Chipping Norton, July 6.*

SHERBORN—Wheat short in the straw and light, just out in ear, from three to four weeks later than last year. Barley, very light crop, late sown likely to be very bad indeed, first sown just coming out, but comes out very uneven, must be deficient. Oats promising. Beans good. Peas promising. Swedes likely to be the best we have had for years, though later sown. Hay good average, not much harvested yet. *Richard Shirley, Maslow, Church Stratton, July 9.*

STAFFORDSHIRE—There cannot be a doubt that the Wheat crop has generally improved during the last fortnight, and on good well farmed soils will probably prove an average, on cold strong land and on light, musky muck, the case will be different. I am afraid that last night's wind has done no good, for the ground this morning is covered with pollen. I enclose an ear of autumn-sown Talavera, the whole field is similarly affected. Rust I have not observed elsewhere. Barley must be a light crop in this neighbourhood, one hears of its poverty on all sides, and should we get a wet time for harvesting, even last year's yield may make more sound malt. Oats are not grown much about here, but report speaks favourably of them. Beans and Peas promise well, there is a very large breadth sown. Early sown Mangels and Swedes are mostly singled out, and a little more rain would soon make them cover the ground. The hay crop, a very fine one, has been cheaply and capably secured. Pastures are full of Grass, and stock is generally healthy. One hears of that horrid pleuro-pneumonia being among the Derbyshire dairies. *G. A. May, Elford Park, July 8.*

SUFFOLK—The Wheat in this neighbourhood at the present time I should think scarcely up to an average, from the late frost causing the straw to be short and thin, the appearance of the ear is small. The Barley

has very much improved the last fortnight, there is a good quantity of straw, and I think if the weather is at all favourable it will be a good average crop. Peas and Beans very luxuriant, an immense quantity of straw not forward enough to tell about the corn. Oats, none grown. Clover a failure of quite half the number of acres, but heavy crop on the other half, badly secured. Hay an abundant crop, and well secured. Mangel, splendid prospect of a good crop. Turnips, a prospect of an abundant crop. Potatoes very good, but not an average yield. It is said the disease has made its appearance amongst us. *Samuel G. Stearn, Brandeston, July.*

SURREY—I am sorry I cannot give a very flattering account of the crops in this part of "poor Surrey." Wheat, although within the last few days has slightly altered for the better, cannot by any possibility be an average, and I should put it at six bushels per acre less than last year. A very bad feature of the crop is the unevenness of it, and shortness of the ear. Large tracts within a few miles of this will not go more than 20 bushels. The best crops will be on medium soils. Barley on suitable land is pretty thick, but a very short ear, few over 13 a side, on poor soils it is very bad, and will not be half a crop. Oats at present promise to be a full crop. Swedes and Turnips very backward, few being yet been out. Mangels generally look well. Potatoes also look very promising, but reports of the blight are rife, as usual, about this season, but as yet no outward visible sign. Hay a good crop, but very variously saved, with a great many "uncomfortable stacks." *James Arnot, Carshalton, July 7.*

WARWICKSHIRE—It is much to be feared that the effect produced on the crops by this sunless season will form no exception to the generally admitted opinion, that bright and dry weather are required to produce a good crop of Wheat. Present appearances of that grain are very unsatisfactory, on light and thin soils (when much is growing after Barley) it is short and thin, and on the weak clay lands it is a very small crop, being knee broken and scrawled. On deep well cultivated loams there is a better promise, but on such soils even the crop is not altogether satisfactory, having been given about a good deal by the violent wind, and thus its probable yield is seriously lessened. Wheat is now in full blossom, it is generally remarked that the ears are much smaller than usual. Early sown Barley on land suited to it, is long and level, and promises to be a full crop, but there are large breadths to which an opposite description would better apply. Beans, particularly the autumn planted, are very luxuriant, but pods are thinly set, and I doubt whether the yield of corn will be in accordance with present appearances of the haulm. Peas are most promising, a huge crop of straw covered with healthy blossoms, and at present there is no appearance of blight. The early Turnips and Swedes are unusually good. Mangels are a good plant, and since the wind has changed its course from the eastward, and the temperature has risen, they have grown rapidly. A good crop of hay has been secured in several places. Pastures are green, and stock doing well. *J. C. Atkins, Milecot, Stratford-on-Avon, July 8.*

The hay crops in this neighbourhood are decidedly above an average, and have been gathered in of good quality. We have not had real summer weather here—leadens skies and north-east winds, and, unless great patience has been exercised, we may expect to hear of heated haystacks. There are no good crops of Clover this year, owing to the excessive drought of 1863. The Wheat is now generally in full bloom, but I do not think there is a chance of its being a full average crop, being very short on many of the light soils, and on the clay diminutive ears—a higher range of temperature will much improve it. Corn harvest must be quite a fortnight late, if not more, and cannot be ready much before the middle of August. The crops of Barley vary much, and cannot be an average crop. Winter Beans are much grown, and are very long in the straw, but not well covered. Spring Beans full of promise, if we get rain soon. Mangel, which is much grown here, looking well, but wanting rain. Peas most luxuriant, and very full of blossom. Tremendous crops of all kinds of Plums, and good of Pears, Apples not so abundant. The young seeds at present are a good plant. Oats are not so much grown, but those I have seen are splendid. *John Baldwin, Luddington, Stratford-on-Avon.*

I have seen several reports in the papers respecting the present appearance of the crops, but I have met with none from this, my neighbourhood, and I therefore send you a few lines on this subject. The warm, dry weather which we have lately had has been very beneficial to the Wheat crop, but at the same time the cold frosty nights have been very prejudicial to the blossom, and the consequence is that the crop is not at all promising. I have no hesitation in saying that the yield in this neighbourhood will not be so much as last year by two quarters per acre. The ears are very small and are made up of many artificial corns. The Barley crops look better than the Wheat, but are still not so good as we generally see them at this time of the year. Beans are a capital crop here, and the spring sowing promises to be the heaviest we have had for years. The winter Beans, which looked so magnificent a short time ago, are, alas! a perfect failure, with scarcely a corn upon them. Peas again are very variable; some fields a very fine crop, others being so bad that the plough has been put to work in them. The early sown Turnips are good, as also are the Mangel Wurzel, but many fields are very patchy, and not so promising as one could wish. I have only given you a few hasty notes now, as I purpose in another week or two to make a further report. I will now merely add that the crop of hay has been exceedingly heavy, and secured in fine condition. That the quantity of Wheat remaining in the hands of the farmers is very small, and that with present prospects, and under any and all circum-

stances, I feel convinced that the price of Wheat must and will considerably advance. My report will run somewhat differently from that of my friend Mr. Meck, but I am not such an enthusiast as he is. His crows in his county cannot be as black as they are here. At any rate they are not so numerous as they would find to his cost that 1 bushel of Wheat in the acre would not do. *John Ford, Morlox Hall, Warwick, July 8.*

WILTS—Wheat is by no means a full crop or poor on the ground, a full crop is an exception. It was very uneven at head, when it first made its appearance at the time of blossoming, one stack was feet high, and others too many in number, just bursting into ear, and that unless we have weather very warm and forcing the grain will be decidedly of two characters. My opinion has been we should not have an average crop the last week it is much improved, should the weather from this time be of a forcing character, the crop will be more yielding than was once anticipated. Barley promises well, but in many instances received a check from frost. Oats partially good, water beans appear to be a failure for want of pods spring beans not sufficiently forward, seeds in the field in many instances did not fill up, so that the hay crop was so heavy, pasture very good. The season promises well for a good root crop of all kinds. *Geo. Brown, Avebury, Calne, July 9.*

WORCESTERSHIRE—In this neighbourhood the harvest will be about 28 days later than last year, and from present appearances I am of opinion we shall not have an average crop of Wheat or Barley. Peas, Beans, and Oats look more promising, but of course much depends on the weather for the next few weeks, which, if suitable, may set matters right as regards the former. The hay harvest is progressing satisfactorily, crops pretty good, Turnips, Mangels, and Potatoes badly want rain, which has threatened in several days. We have a fair crop of Apples, but unless we get more sun, will be small. Hops are late and badly blighted, and cannot make half a crop, and have more Grass and keep on the ground than we have had for several years. P.S. I commenced cutting Wheat on July 20 last year. *John Rawlins, Stone Tenbury, July 9.*

APPEARANCE OF CROPS AND HARVEST PROSPECTS IN SOME OF OUR WEST MIDLAND COUNTIES—During a recent trip to Oxford the following notes were made on the aspect of agriculture throughout the districts visited. With but few exceptions the Wheat looks thin, the ears are uneven, the crop is stony, drills still visible, and in some cases the colour is too yellow. No doubt the ripening will be irregular and certainly late, and, what is worse, the yield must be from two to three sacks an acre below an average. Just in this immediate locality, on some good highly farmed land, one might walk through 50 acres of Wheat, at least 3 feet in height, and promising at the same time to produce from 45 to 50 bushels to the acre. From whatever cause it arises, the cold spring or absence of frost in winter there is no doubt the Wheat crop has not turned out to any extent this season, the heavy class of soils promise the greatest yield, especially where drainage and deep farming prevails. In a portion of the old forest of Braydon, Wilts, may be seen 30 acres of as fine Wheat as could be desired, upon land which barely three years back was let at 7s per acre. This result has not been produced without considerable effort and outlay at some future period your readers shall have a description of the work of reclaiming and improving 1000 acres of Braydon Forest, and a detailed account of the cost of the undertaking. Returning to our crops, Barley is not so even or promising as it should be, the cold of May checked its growth, and only in sheltered spots is there a hope of an average crop. Oats are likewise most variable, taking the district we are reporting upon generally, this cereal must make good if it is to reach an average. Beans have all over exhibited a luxuriant growth, and no doubt the winter sown ran away too fast to form pods. Spring Beans promise a good yield. Peas are heavy in the haulm and show fairly for podding, the blight was threatening in some localities, should this be arrested they will be a good average crop of Peas, Savoyon, Yellow Trifolium, and most artificial Grasses have produced heavily, fortunately for agriculturists as in the absence of Mangels and Swedes our live stock would have been ill, had the spring been backward and the ground crops a failure. The hay crop is decidedly good in all directions, a great breadth is secured in good order, and the cleared land is a ready establishment abundant feed. Probably there never was a season when roots exhibited such an even true brand as the present, it appears as though every seed had germinated, and in scarcely one instance has a plant fallen victim to the fly. With abundance of keep in the pastures all kinds of stock have done well, the country generally, horned cattle and sheep were perhaps looked better. Store sheep have well maintained their figure, very fair lambs have been bought at remunerative prices, but the trade in fat lambs has revived, as with pigs—stores are fetch a high price. What with a demand for fat meat, business in the cheese trade, and firmness in the wool market, we may hope to register a prosperous year for agriculturists. It is impossible to pass through this neighbourhood at the present time without being made aware of the spirit of enterprise and improvement of landowners and tenantry, it is very much the fashion to denounce both classes for the absence of the qualities, but no observant practised eye could fail to convict the owners and occupiers of indolence and neglect. Improved residences, convenient homesteads, broad, well cultivated fields, superior and improved stock, expensive modern improvements, well paid, well-housed labourers, betokens a condition

July 17, 1889.]

...society much to be desired. That exceptions to these statements exist no one will deny, but the rule... goes far to prove that agriculture, and all... is steadily and assuredly advancing.

ADVANTAGES OF AGRICULTURAL LEASES.

The following paper on this subject was read last month before the Hampshire Chamber of Agriculture by Mr W. WARNER, of Botley—

Security of tenure has been the subject of discussion by many of the farmers' clubs in the kingdom, and in no form of lease can be framed which will... in all cases and in all parts of the country, still... admitted that greater security for... in land (either by long leases... with compensation for unexhausted... should be given, to insure that proper culti-... of the soil to meet the requirements of the... of the country. I know that on some estates... has been granted for generations, and that... and tenants are well satisfied to go on... to the honour of each other.

There are also some estates where no leases are... perhaps, not the same honourable feeling... as in the former case), where the land is let... year to year, with a six months' notice by either... The consequence is that this is a bar to any... of the soil. The occupier, having no... in the land, his object will be to keep it in... condition, employing but little labour, and... little capital, and what he does spend on... taking out as quickly as possible, feeling the... of his position. I will quote a paragraph... appeared in the Agricultural Gazette some... on the... of a yearly tenant—

...other improvements, he was turned out... at six months' notice, without any reason being... for it. Another gentleman, farming on another... who was a yearly tenant, applied for a lease, and... to give an increased rent if it were granted. But the... refused, saying it would be contrary to his custom, and... no reason for changing. So the gentleman (quoting... words) went on putting a little into the land and... a little out, whereas, if the landlord had given him a... for a good term, with liberal covenants, he would have... 20 per cent. more on the land, and paid 20 per cent. more rent.

I name these instances to show the great loss... both individually and nationally, by farming... without a lease. In some parts of the country tenant-... with a two years' notice to quit on either side... advocated as a security for the tenant as well... the landlord; the incoming tenant or landlord... the outgoing tenant for all improvements and... manures. Now this, though better than... to lease at a... is not at all satisfactory. A tenant... cannot feel comfortable in such a position, being likely... any time to be turned out of his farm at a two... notice. He cannot lay out his capital with... same confidence, neither can he feel the same... in those around him as he would with the... of tenure which a long lease would give him.

He may get back in part what he has laid out; but the... for compensation often leads to litigation as to... that are deemed improvements, and also as to the... of unexhausted manures; and it generally ends... the outgoing tenant getting less than he considered... entitled to, and in the landlord allowing more... than he thinks he ought to do. In fact, tenant-right... expresses a great deal, but is very difficult to carry out... in practice to either the landlord or the tenant.

The next, and I believe the only means, by which a... can have real and good security for the invest-... of his capital in land, is by a lease for a term of... 15 or 21 years—if for 21 years the better. A tenant... with a 21 years' lease need not be afraid of laying out... capital, as he will have ample time to receive it... back again, feeling assured that, if laid out judiciously, it... return to him with profit. The late Lord... one of the greatest friends to agriculture... country ever produced, always granted 21 years'... His advice to any new tenant was to lay out... the money he had of his own, borrow as much as he... and lay it all out on the farm the first seven... get it all back the next seven years, and in the... seven years make a fortune for himself. I believe... tenants in the country have prospered more than... of the late Lord Leicester, and no property has... more improved in value. I believe, also, that, by grant-... long leases, landlords would increase their rentals, as no tenant would object to give a greater rent for his... with a long lease than he would by being merely... at a... Long leases would also be a great social... as a person on taking a lease would consider... a measure, fixed for life in a certain locality, would be looking round for acquaintances and... neighbours, and, having an interest in the well-doing of

those around him, he would be enabled to assist in any measure for the general benefit of the neighbourhood. He would also employ more labour, and take a greater interest in the welfare of his workmen than if he were merely a bird of passage. Long leases would also be a great national advantage, as by having a security of tenure it would induce a greater investment of capital in the land, thereby providing a greater amount of food in corn, beef, and mutton for the people of this country. Now, in advocating the system of long leases I do not presume to say what the conditions of that lease should be, as, I think, in the bargain of buying and selling, or letting and taking, the parties immediately interested are best able to judge for themselves, only I would suggest that it should be as free of restrictions as possible, both in cropping and selling the produce, excepting the last four years of the tenancy, when there should be the necessary restrictions to protect the land. A lease should be drawn up on commercial principles as much as possible, as a tenant is supposed to give the full value of the land; and there ought not to be any of those vexatious and unfair covenants which are sometimes inserted, often to the injury of the tenant, and with no real benefit to the landlord. One thing I would just notice. There are some landlords who, in granting leases to their tenants, think it desirable to retain the cottages on the different farms in their own hands. Now this, though well meant, is a mistaken kindness to the labourer, and operates unfairly on the tenants. It prevents an employer getting rid of a bad and dishonest servant, as, having no control over the cottages, he cannot get rid of him to make room for another. A tenant must be as much interested in the welfare of his labourer as a landlord can be, and if he has a good servant there is no fear of his taking an unfair advantage, and if he has a bad one, he ought to be at liberty to get rid of him as soon as he likes, and this he can only do by having control of the cottage in which the labourer lives.

There is another subject in connection with leases which I cannot pass over—that is, the question of game. I know it is a very delicate subject to touch upon and how sensitive many landlords are on the subject. I have heard that there are more disputes on politics and on game than on any other subject you can name. Too much politics, I am satisfied, is not desirable, and I am half inclined to think that too much game on a farm is also not desirable. It would be a general advantage if, in all leases, the right of shooting was enjoyed in common by both landlord and tenant. In that case a landlord would not be debarr'd from his sport, as his tenant, from having an interest in the game, would take care there should always be a sufficient quantity, and would always feel a pleasure in seeing his landlord on his farm. But I am afraid, we are not yet arrived at that happy state of affairs. I am sure that, in all leases, the tenant should be allowed the right of destroying what is called the ground game, viz., hares and rabbits; and unless he has that right he can never reap that advantage in the cultivation of his land and in the employment of his capital which he is fairly entitled to. It is not necessary for me to state the immense amount of damage done where game preserving is carried to an unreasonable excess. That is continually before the public, and as one rides about the different parts of the kingdom he sees sufficient evidence of it. My only object is to point out the advantage it would be to the country, and to agriculture in particular, if these restrictions, which are a bar to all improvement, and a check to investment of capital, could be removed. I now proceed to quote an extract from remarks by the Rev. J. Fraser on the effects of the over-preservation of game. It is given in his report relating to the employment of women and children in agriculture. He says:—

"The extent to which the system of game preserving is carried on in many parts of the county of Norfolk is assuming a serious significance, both in a moral and an economical point of view. The farmer cannot cultivate his land with the proper measure of profit, and there is a tangible loss thereby sustained in the resources of the country, while the way in which, and the extent to which, preserves are stocked to meet the present taste of battle shooting are to satisfy the notion that you have had the sport unless you have slain 'beasts upon beasts' are unchristianlike incentives with the peasant, who loves his life of sport as truly as the gentleman, and whose honest earnings are not sufficient to enable him to overcome the temptation thus thrown in his way to poach and steal."

I give another extract from a speech made by Mr. Edmonds at the Cromer Farmers' Club—

"A large number of my fellow-farmers whose opinions were much respected, and who were all first agriculturalists, was for some years a great game preserver. He had a large quantity of land in his own hands, and, seeing the great damage and mischief caused by the game, he said, 'It is not honest in me to let my farms, and allow my tenants' crops to be spoiled,' and, feeling convinced of that, he at once gave up game-preserving."

of Wheat yearly is rather over 20 millions of quarters, we are dependent on the foreigner for at least three-eighths of that supply. In fact, in the year ending August, 1888, the consumption, including seed, was 20,800,000 quarters, and the foreign importation was 9,300,000. If, from a general bad crop abroad, as well as in this country, or if, unfortunately, a war were to break out, so as to interfere with the importation of corn, we should have bread at famine price. How necessary it is, then, for the general welfare of the country at large, that all restrictions which interfere with the proper cultivation of the land should be removed? I am aware that in granting long leases there are great difficulties in the case, and many prejudices to remove. Many landlords do not like parting with their property for so long a time, and others do not like giving up game-preserving, others are afraid they may get bad tenants, and the land injured. All these things are to be considered. I think some of those objections might be removed if landlords would more generally be induced to view the question in the light of pounds, shillings, and pence. I think they would find by granting long leases with liberal covenants they would not only get an increased rental, but that the land would be better cultivated and improved in value, and also, if at any time they wished to dispose of their property, it would realise a greater amount than before, as it is well known that the value of property is usually computed from its rental. Many of the difficulties would also be got over if all landlords were to employ only practical men as agents, and who had, perhaps, been farmers themselves; and who, while acting for their employer, would not be unmindful of what was due to the tenant. I think they could draw out an agreement by which the landlord would be fully protected, and one which would be fair towards the tenant. With a due deference to the legal profession, I would never recommend the framing of a lease in a lawyer's office. They may understand the legality, but do not understand the practical working of a lease, and it is only by practical men that a lease can be framed so as to give general satisfaction. As I have said before, I do not pretend to go into the minute details of what the covenants of a lease should be so as to apply in all cases, as the customs differ so much in many parts of the country. For instance, in some counties a Mr. haelmas entry is in practice, in others a Lady Day entry. There are also other matters such as draining, liming, chalking, and repairs, which are best left to competent parties to arrange fairly between landlord and tenant. My object is to prove the general advantage both to the owner and occupier, and also to the community at large, which would arise from the system of long leases, more generally in practice in this country. I have endeavoured to the best of my ability to point out the general advantages of long leases. I am aware I have not done justice to the subject, but will leave it in your hands for discussion, trusting you will excuse any omission on my part. There is one thing we should all feel, both landlords and tenants—that in discussing this question it should be done in a considerate spirit, as it is one in which the whole nation is interested. It is one which concerns the food of the people of this country, and if we can by argument and conviction arrive at any conclusion or suggest any means (without injury and without interference with the rights of others) by which the rental of the land can be improved, the security of the tenant be insured, and the produce of the land be increased, we shall be doing a general good, and not have spent our time in vain.

DISCUSSION.

Mr. Spooner believed the country itself, the landlord, and the tenant-farmer would all be benefited by the custom of granting long leases with liberal covenants. If it were objected that the landlord would have a difficulty in disposing of a bad tenant, he would answer that the landlord would be more particular, in the first instance, in inquiring into the character of the person to whom he let his farm, if he came from a distance, and would ascertain whether he had sufficient capital to manage it properly. Then the tenant's sympathies would be evoked, he would expend his money liberally, pay his labourers well, and take care they were provided with good cottages. He would have far greater inducements to cultivate the land properly and look to the welfare of those dependent upon him than when, under other circumstances, he felt that the land would be the property of a distant party, who might be removed to a distant part of the country. Personally, he had experienced the advantages of long leases, having had a long lease. He occupied several farms for many years, during which a change took place in the estate, and the proprietor wished to double his rent, but as he (Mr. Spooner) knew the land was not worth so much, he left at the end of his term, rather than submit to the augmentation. On the excessive preservation of game, taking the great body of farmers he would assert that 99 out of 100 wished sufficient game to be preserved to afford fair sport for the landlords and also for themselves. But what they objected to was the modern innovation, encouraged here and there, of battle shooting. The large majority of landlords desired nothing more than fair sport, which the tenant was always anxious to give. If the ground game belonged to the tenant, there would always be sufficient to afford fair sport to the landlord and his friends, and he ventured to state that opinion, because he believed it would meet with the approval of nine-tenths of those present.

Mr. Edmonds said that no doubt the chief instrument in the hands of a tenant to ensure his cultivating the land in a manner most to his own advantage and to that of his landlord, would be a long lease with liberal covenants. But this and preservation of game were questions entirely of bargain between landlord and tenant, and if a landlord chose to place certain restrictions upon a tenant at the time of taking a farm, it was for the tenant to consider, before accepting the terms proposed, whether having those restrictions upon it would enable him to get an adequate return for the farm for himself. He was aware that there was a very tender subject. Many landlords were not aware that when the landlord reserved the game, the tenant was at a disadvantage, as he would otherwise fetch, and therefore, as this was a consideration at the creation of a tenancy, the tenant had a right to complain of it afterwards. One point touched upon by Mr. Warner was of vast importance—the reservation of cottages by landlords.

THE ROTHAMSTED FIELD EXPERIMENTS

MEMORANDA OF THEIR PLAN AND RESULTS.

(Continued from p. 748.)

III. EXPERIMENTS ON THE GROWTH OF WHEAT YEAR AFTER YEAR ON THE SAME LAND WITHOUT MANURE, AND WITH DIFFERENT KINDS OF MANURE.

BROADBALK FIELD

Previous cropping—1839, Turnips with farmyard manure (1940, Barley; 1641, Peas, 1413, Wheat; 1415, Oats, the last four crops unmanured. First experimental Wheat crop in 1844. Wheat every year since; and, with some exceptions, nearly the same description of manure on the same plots each year—especially during the last 17 years.

(Area under experiment, about 1.3 acres)

PER ACRE

Table with columns: No., Manures, per acre; Twenty-sixth Season—1899-00, Average per annum—1844-1899, and Twenty-fifth Season—1898. Sub-columns include Quantity, Weight per bush, Total Straw, Dressed Corn, and Total.

1 Since 1875, 200 lb. sulphate of potash, 100 lb. sulphate of soda, and 100 lb. sulphate of magnesia; for crop of 1897-8, and 100 lb. sulphate of soda, 200 lb. sulphate of magnesia, and 100 lb. sulphate of soda. 2 Equal parts sulphate and muriate of ammonia of equal weight. 3 50 lb. nitrate of soda is reckoned to contain the same amount of nitrogen as 400 lb. ammonia-salts. 4 For 1844, and probably only 1/2 lime as much. 5 With 1/2 sulphate instead of sulphuric acid. 6 The 10 acres of plots 1 and 18 are, respectively, year by year, as follows:— 7 Average of 17 years' mineral manures, estimated with ammonia-salts. 8 Plots 17 had the ammonia-salts for the crop of 1895. 9 Plots 18 had the mineral manures for the crop of 1899. 10 Average of 10 years, 1832-1867; in 1868, owing to a mistake at the time of carting, the product could not be ascertained. The plots marked (a and b) are divided into equal portions, a and b, respectively, which were sown alike excepting that, for the crops of 1864-6, the manures on plots 5, 6, 7, 8, 9, 16, and 17 for 18, received a mixture of soil the same as in addition to the other manures, and 1/2 bush without any mineral salt, and for the crops of 1868 and 1869, at straw (1) at produce in the previous year, has been applied (instead of slates) on the same plots (1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, and 15, or 18).

IV EXPERIMENTS ON THE GROWTH OF LEGUMINOUS CROPS.

(1) Beans, Peas, and Tares—Experiments on the growth of leguminous corn crops, with different descriptions of manure, were commenced in 1847, about 9 acres being devoted to the purpose. Experiments with Beans were continued for 13 consecutive seasons, to 1859 inclusive; but during the later years, the crop fell off very much, and the land became very hard. In 1860 the land was fallowed. In 1861 a crop of Wheat, without manure, was taken. In 1862 Beans were again sown, but with some manure at once. In 1863 the land was fallowed. In 1864, and since Beans have been grown, with much the same manures on the same plots each year as in 1862. The general result of the experiments with Beans has been that mineral constituents added as manure (more particularly potash and, to some extent, phosphoric acid also) increased the crop very much during the early years, and, to a certain extent, afterwards, whenever the season was favourable for the crop. Ammonia-salts, on the other hand, produced very little effect, notwithstanding that a leguminous crop contains two, three, or more times as much nitrogen as a graminaceous one grown under parallel circumstances. Nitrate of soda, however, has produced very striking effects. But leguminous crops grown too frequently on the same land seem to be peculiarly subject to disease, which no combination of manuring that we have hitherto tried seems to obviate. Experiments with Peas were soon abandoned owing to the difficulty of keeping the land free from weeds, and an alternation of Beans and Wheat was substituted, the Beans being manured much as in the experiments with the same crop above described. In alternating Wheat with Beans, the remarkable result has been obtained that nearly as much Wheat and nearly as much nitrogen, were yielded in eight crops of Wheat in alternation with the highly nitrogenous Beans, as in 16 crops of Wheat grown consecutively without manure in another field, and also nearly as much as were obtained in a third field in eight crops alternated with bare fallow. Experiments with Tares were also soon abandoned, for the same reason, Beans being at first substituted, with some variation in the description of the manures employed, but of late this experiment has likewise been abandoned. (II) Red Clover (Trifolium pratense)—Experiments on the growth of Clover, with different descriptions of manure, were commenced in 1843 and, with the occasional interpositon of a corn crop or fallow, have been continued up to the present time. As with Beans, the result was that mineral constituents applied, as manures (particularly potash, and, more or less, phosphoric acid also) considerably increased the early crops.

To his mind it was the greatest of the evils that the land should thus be left in a state of... Mr. Holaway said... The Chairman said... Mr. Spooner seconded the resolution, which was carried.

...had little or no effect. But in a few years all attempts to grow Clover on this land have failed to give anything like a plant that would stand the usual wear of the ground, notwithstanding that fresh seed was sown again and again. A portion of the land was trenched 2 feet deep, the manure being applied at a depth of one-third at a depth of 3 inches, and the rest on the surface. The result of the experiments is that neither superphosphate of soda, nor organic matter, nor nitrate of soda, nor other constituents, nor

mineral manures, nor a complex mixture, has availed to restore the Clover-yielding capabilities of the land. It is, however, worthy of remark that in 1854 Red Clover was sown in a kitchen garden only a few hundred yards distant from the experiment field, on soil which has been under ordinary garden cultivation for probably two or three centuries, and it has every year since shown very luxuriant growth; and, after re-sowing three times during the period (in 1860, 1865, and 1868), there is at the present time little or no indication of failure. Lastly, in the winter of 1867-8, small portions of the

experimental land were dug, some to the depth of 9 inches, some to the depth of 18, some to the depth of 27, and some to the depth of 36 inches, and sown to the respective depths with different manurial mixtures. From other similarly-sized plots the soil was removed to the depths of 9, 18, and 27 inches respectively, and replaced by soil from the same kitchen garden border, on a portion of which Clover has been successfully grown since 1854, as above referred to. Clover was sown in April, 1868, over the whole of these, and some other portions not so treated, but the plant has for the most part died off during the winter, and Clover has been again sown (April, 1869).

EXPERIMENTS ON AN ACTUAL COURSE OF ROTATION—TURNIPS, BARLEY, LEGUMINOUS CROP (OR FALLOW), AND WHEAT, AGED 11. FIELD.

These experiments were commenced in 1848, so that the present crop (1869) is the 22d experimental one, or the second crop of the sixth course. One third of the land has been continuously manured with superphosphate of lime alone once every four years, that is for the Turnip crop commencing each course; and one-third manured (also for the Turnip crop) with a complex manure, as described in the foot-note, No. 2. In the second, third, fourth, and fifth courses, instead of Clover, half of each plot was sown with the other half left fallow. From half of each of the three plots the whole Turnip crop (roots and leaves) was removed, and on the other half the roots were eaten on the spot, and the uneaten leaves were spread and ploughed in. In the case of all the other crops, the total produce was removed from the land. The abstract of results given in the table is the portions of each plot from which the Turnip crops were entirely removed; and on which, in the later courses, Beans (not fallow) replaced the Clover. (Area under experiment, about 2½ acres.)

DESCRIPTION OF CROP.	PRODUCE PER ACRE.								
	PLOT 1. Unmanured continuously.			PLOT 2. Superphosphate of Lime, alone, for the Turnip Crops only.			PLOT 3. Complex Manure, for the Turnip Crops only.

1st course—100 lb. bone-ash, and 100 lb. sulphuric acid; second course—100 lb. bone-ash, 120 lb. sulphuric acid, 100 lb. muriate of ammonia, and 2000 lb. sulphate of potash; 3rd, 4th, 5th, and 6th courses—200 lb. bone-ash, 100 lb. sulphuric acid, per acre.

ammonia, and 1000 lb. Rape-cake; second course—300 lb. sulphate of potash, 100 lb. sulphate of soda, 100 lb. sulphate of ammonia, 100 lb. bone-ash, 120 lb. sulphuric acid, 100 lb. sulphate of ammonia, 100 lb. muriate of ammonia, and 2000 lb. rape-cake; third, fourth, fifth, and sixth courses—300 lb. sulphate of potash, 200 lb. sulphate of soda, 100 lb. sulphate

of magnesia, 200 lb. bone-ash, 100 lb. sulphuric acid, 100 lb. sulphate of ammonia, 100 lb. muriate of ammonia, and 2000 lb. rape-cake per acre. The quantities given in bushels represent the dressed corn only. The "total produce" of the corn crops includes dressed corn, offal corn, and total straw.

Home Correspondence.

New Zealand Flax in Ireland—In the *Gardeners' Chronicle* (p. 695), there is a most important letter from Mr. J. D. Hill, on the importance of growing *Phormium tenax* in Ireland. Mr. J. D. Hill is of the subject as of "national importance as reproductive employment," with this I agree. So strongly did I feel the importance of growing the New Zealand Flax as a source of great and peculiar industry to Ireland, that I published it in the *Irish Farmers' Gazette*. In the summer of 1863 the great value of *Phormium tenax* in the manufacture of paper was pointed out in the *Times* by Mr. Cameron, of Edinburgh, after that correspondence, I wrote a short notice to the *Irish Farmers' Gazette*, with some views of the growth of the plant here, it may be of interest to quote a paragraph of that notice from the *Irish Farmers' Gazette*, of Sept. 12, 1863: "Three years old will yield from 30 to 40, or ordinary leaves will produce more than 100 of clean fibre; an acre, with plants at 3 feet apart, would yield from 15 to 20 cwt.—a far greater quantity than ever known from Hemp or Flax. The New Zealand Flax deserves the high consideration of landowners in the south and east of Ireland, as a plant singularly adapted for this climate, and one which will only cause a better development of the native industry." Since that time I have had much correspondence about the culture of New Zealand Flax, and with a gentleman who has just returned to Ireland from New Zealand, and who assures me that the plants growing at this place present the same appearance seen when growing in their native country. The gentleman to whom I refer has shown me a simple and expert way in which the native New Zealanders split the leaves and scrape off the vegetable matter, leaving the outside intact, and quickly convert it into mats, &c. The gentleman whom I speak of is a native New Zealander. Can any correspondent help in the manufacture of New Zealand Flax? I have written the letter of Mr. J. D. Hill that in the process of manufacture there is no loss in that now, if this be so it is

a great encouragement to invest in its culture. I have just measured some of the leaves of the growth of last summer, and find them to be about 6 feet long, and 1½ inches broad, and of fine substance. I note that suckers put in soft ground a year ago have six now leaves nearly 4 feet long. Some years ago I had three plants put firm in between large stones, resting on excavated ground, by the side of an overflow from a small pond. When the plants commenced to grow, the roots extended into the water by the foot long, and it is interesting to observe how the spongy leaves increase with increase of temperature. It is noticeable that these plants growing in the water, when cut down, do not break so freely as others planted in earth. I will greatly rejoice to see the *Phormium tenax* cultivated in Ireland for commercial purposes, it will, however, be a mistake to say that it will grow rapidly in unprepared land. Skill and patience will be required to get good crops established; and when once established, it will prove the easiest managed, and the most valuable of green crops. There are specimens growing here in water, on Peat within the influence of water (the largest), on dry ground, and on good garden soil. If Mr. J. D. Hill cares to have specimens of any or all of these, and will tell me how to forward them, I will be glad to send them for trial. Charles J. Donald, Woodstock Park, June 28.

Aggregation of Properties in England—In your leading article of the 3d July it is stated as a certain fact that the number of landowners in England is continually diminishing. It would be interesting to know whether this fact can be proved. My own experience is limited, but it points in a totally different direction. Around me, land societies are purchasing wholesale and selling retail; one landowner disappears, and in his place 20 or 200 spring up. This takes place daily. But let any one attempt to reverse the process, and try to purchase the 20 plots or fields lying next to his own and belonging to 20 different owners. He would hardly succeed after 100 years. It is just like putting a lump of stiff clay on a sandy field in autumn. It cracks down in spring into a powder, which mixes with the sand, and which you can never form into a clay lump again. Perhaps it will be said that the process of disintegration is vigorous only in the vicinity of towns. But the vicinity of towns, when London is one of them, is a vast area, and the owner of a quarter of an acre of

garden ground must certainly be classed as a landowner. I repeat then, where is the proof that the number of landowners is diminishing? The leading article under discussion is, I think, open to criticism on many points, but I confine myself to the above. G. S.

Foreign Correspondence.

PARIS Experiments in the direct Application and the Purification of Sewage in Paris.—During the years 1867 and 1868 a series of important experiments have been made under the direction of M.M. Milne and Darand Clave, engineers of Ponts et Chaussées, and the results are now made public in an elaborate report. These experiments include the direct application of sewage on the ridge-and-furrow system, saturation of the soil during winter, purification of sewage by means of alum, and, lastly, the application of the precipitated manure, as well as of the clear water after purification. The composition of the sewage, and of the results after purification, are given as follows:—

A cubic metre or ton of sewage is found to contain—	
Nitrogen	0.57 kilogrammes
Phosphoric acid	0.115 "
Potash	0.030 "
Soda	0.101 "
Organic matter	0.729 "
Mineral do.	1.802 "
Total	2.904 "

The precipitate consists of:—	
Nitrogen	8.4 kilogrammes
Phosphoric acid	8.50 "
Organic matter	260.76 "
Mineral	717.50 "
Total	1000.00 "

A ton of the water, after the precipitate has been thrown down, contains:—	
Nitrogen	0.021 kilogrammes
Potash	0.11 "
Soda	0.11 "
Organic matter	0.11 "
Mineral	0.987 "

So that a ton of Paris sewage contains nearly 3 kilogrammes, or 6½ lb. of foreign matter, of which one-third is in a state of solution and two-thirds in suspension.

NEW PATENT BB LAWN MOWING MACHINE FOR 1869

PRICES REDUCED AND THE MACHINE PERFECTED.

PATENTERS AND SOLE MANUFACTURERS.

J. B. BROWN & CO.,
LONDON, E.C.

The BB LAWN MOWER (London made) is allowed to be, by practical judges, superior to any other,—being the best designed, also of best material on v, all parts liable to breakage being of malleable or unbreakable iron, every part made to standard gauge, and numbered, and the entire Machine finished in a manner incontestably superior to any other Lawn Mower manufactured. The BB MOWER is also distinguished by its lightness, silence in movement, ease of working, and is so strong as to be literally unbreakable.

Guaranteed to give perfect satisfaction, and if not approved of may be at once returned.

HAND MACHINE.

The BB MOWER was selected at the Paris Exhibition, in preference to all others, by the celebrated Engineer, Mons. Henri Schneider, of Creusot, and President of the French Legislative Assembly, who thus writes to Mr. J. B. BROWN —

"Usines de Creusot.

Guaranteed to give satisfaction, and delivered Free to any Railway Station

The BB NEW PATENT LAWN MOWER.—The Manufacturers find it necessary to inform the Public that there was no trial of Lawn Mowers at the Paris Exhibition, and the award to one machine was the award of an individual juror only in the absence of his colleague, without practically testing the competing machines. Double-edged, Sole Plates, or Wind Guards, or Reversible Cutters may be supplied with the BB Mowers in any case where they are considered to be an advantage, and not a drawback or complication to the machine.

The BB MOWERS perform their work in the most perfect manner, and are well known to be the best-finished and most durable Mowing Machines.

Class O—CABBAGES. Mr. W. Clarke, 10s. Class P—PODS OF PEAS. Mr. W. Clarke, 10s. Class Q—PODS OF BROAD BEANS. Mr. W. Clarke, 10s. Class R—CARPOTS. Mr. W. Clarke, 10s. Class S—TURNIPS. Mr. W. Clarke, 10s. Class T—STALKS OF RHUBARB. Mr. W. Clarke, 10s. Class U—ONIONS. Mr. W. Clarke, 10s. Class V—COLLECTION OF HERBS. Mr. W. Clarke, 10s.

PUIG, ORNAMENTAL ROCK WORKER, 21, GROVE STREET, ST. JOHN'S WOOD, N.W. FERNERIES of all kinds, and artificial designs and executed.

WHEELER'S PATENT FRUIT AND FLOWER GATHERER, Wholesale and Retail of RICK AND LITTLE AND CO. 129, High Holborn, W.C.

WHEELER'S PATENT STEAM PLOUGH AND CULTIVATOR may be SEEN at WORK in every part of the County in England.

RODON HURDLES Silver Medal of the Royal Agricultural Society) SHEEP, CATTLE, &c. GATES and FENCING of every description.

Horticultural Glass Warehouse. ORCHARD-HOUSE GLASS as supplied to Her Majesty, the Queen, and the leading Horticulturists of the United Kingdom.

Table with 4 columns: Size (inches), Price per 100 feet, and other specifications for ORCHARD-HOUSE GLASS.

Table with 4 columns: Size (inches), Price per 100 feet, and other specifications for SMALL SHEET SQUARES.

Table with 4 columns: Size (inches), Price per 100 feet, and other specifications for LARGE SHEET SQUARES.

WHEELER'S IMPROVED ROILED ROUGH PLATE PATENT PLATE GLASS for Windows and Screens.

PAINTS, COLOURS, VARNISHES, &c. ROYAL WHITE LEAD, 2s. per cwt. This Paint adheres firmly to Lead and resists the weather.

WHEELER'S PATENT DRY BRUSHES, 1s. per doz. These brushes are made of the finest hair and are adapted for all kinds of work.

WHEELER'S PATENT RUBBER DOORSTOP, 1s. per doz. These doorstops are made of the finest rubber and are adapted for all kinds of work.

THE "CASSIOBURY." The best and most powerful GARDEN ENGINE. 15 Gallons £1 10s. 24 Gallons .. 45 10s. S. OWENS AND CO., Whitefriars Street, London, E.C.

ANDREW HANDYSIDE AND CO. Britannia Foundry, Derby. The Britannia Iron Works have for the last 40 years been well known for the production of cast iron.

THE HYPER-NETTING. A new and improved method of shading plants, invented by Mr. E. T. Archer.

THE HYPER-NETTING is a new and improved method of shading plants, invented by Mr. E. T. Archer. It is made of the finest netting and is adapted for all kinds of work.

E. T. ARCHER'S "FRIGI DOMO." The best and most powerful GARDEN ENGINE. 15 Gallons £1 10s. 24 Gallons .. 45 10s. S. OWENS AND CO., Whitefriars Street, London, E.C.

FRIGI DOMO NETTING. White or Brown, made of prepared Hair and Wool, a perfect non-conductor of heat or cold, keeping a fixed temperature where it is applied.

Established 1833. HANCOCK'S INDIA-RUBBER HOSE and TUBING. CARBIDE, GIG, & DOG CART APRONS.

JAMES PHILLIPS AND CO. beg to submit the prices as follows: ORCHARD-HOUSE GLASS, 16-oz., in 100 foot boxes, boxes included.

Table with 4 columns: Size (inches), Price per 100 feet, and other specifications for ORCHARD-HOUSE GLASS.

Table with 4 columns: Size (inches), Price per 100 feet, and other specifications for SMALL SHEET SQUARES.

WHEELER'S PATENT RUBBER DOORSTOP, 1s. per doz. These doorstops are made of the finest rubber and are adapted for all kinds of work.

WHEELER'S PATENT RUBBER DOORSTOP, 1s. per doz. These doorstops are made of the finest rubber and are adapted for all kinds of work.

SATURDAY, JULY 24, 1869.

DETAILS of the great SHOW of the ROYAL HORTICULTURAL SOCIETY at MANCHESTER, which has been held during the week, are given in other columns. A few general remarks...

These difficulties surmounted, the locality at length discovered, and arrived at, the visitor was ushered into a field that would have been better had it been treated to a previous course of ploughing and rolling.

Whatever may be the results of the meeting as a whole—and these are not known at the time at which we write—the managers deserve

success. Of the local authorities we cannot speak so favourably. The arrangements, which, as we suppose, it was their duty to carry out, were indifferent or bad.

It will evidently become a question in the future whether the great provincial flower show would not better be separated from its agricultural brother. The latter is on so vast a scale, its attractions are so manifold, that people have not time to visit both, and a flower show, however good, and however excellent its arrangements, looks small and mean by contrast with its bigger brother.

The Congress was a new and very successful feature of the meeting. It was presided over by the Duke of Buccleuch, Mr. SAUNDERS, and Major CLARKE. The papers read were of good sterling quality, some full of information, almost all eminently suggestive. One fault there was, which we mention in the hope that it will be corrected on another occasion: the papers were, as a rule, too long.

We have drifted from the flowers to their lovers, from the beasts of the field to the "lords of creation," we have shown how the sympathy of brother for brother yearns for fuller opportunities of manifesting itself; and so we may be excused for a moment if we stop from off our own ground of horticulture, to advert to a spectacle that no man could look on unmoved—the crowd in the streets.

Wednesday, the day of the visit of the PRINCE and PRINCESS OF WALES to the city, was observed as a holiday—not a shop, or a bank, or warehouse, or factory, was open, not even an evening paper was published; hence the crowd that thronged the thoroughfares. After all, that was the sight of Manchester. The most confirmed misanthropist must have melted at the sight of those dense myriads of happy, fearless, resolute faces.

We shall revert to the exhibition and the lessons to be derived from it on another occasion, when the general results are more fully known than they are at the time at which we write.

— THE well-known establishment of M. AMBROISE VERSCHAFFELT, of Ghent, has passed into the hands of M. LINDEN, under whose superintendence no doubt its well-won reputation will be fully maintained.

— Under the name of the SELBY FLOWER and FRUIT GATHERER, Messrs. DICK, RADCLIFFE & Co., of High Holborn, have introduced a handy and ingenious form of flower-scissors. By means of a spring clamp attached to the cutting blade, no sooner is the stalk of a flower severed than it is caught by the clamp and retained firmly till purposely released.

— According to M. VILLA, the President of the Agricultural Society of Herault, the main obstacle to the more general use of FRENCH WINES lies in the

amount of fiscal duties payable on them. The cost of production can hardly be lessened, but the duties and cost of transport might be diminished. French wines imported into England pay a duty of 27 fr. to 60 fr. a hectolitre about 22 gallons.

— We are glad to call attention to the following letter, and the announcement it conveys, but we can by no means endorse our correspondent's wish to have a grand exhibition at Manchester and a "little go" at Kensington at the same time. The letter refers to the splendid plants of EPIDENDRUM RADIATUM and DENDROBIUM GIBBONII shown at South Kensington on Tuesday last, and the latter of which remains on view.

New Plants.

DENDROBIUM GIBBONII (Stachybotriaceae) Caulis tenuis caespitosus; racemo secundante subrecto brevi plurifloro, bracteis subevanidis, mento obtuso postice bifido, sepalis oblongis acutis, petalis paulo latioribus, labello rhombico, lobis lateralibus rotundatis denticulatis anticis serratis, lobo antico triangulo denticulato, ungue brevi (carina transversa nulla) nudo, ceterum toto labello superae densissime barbato.

This is a very original plant, with copper-coloured flowers, the apex of the lip golden yellow, with one large brownish or purple blotch on each side of the lip. It may be compared with Dendrobium clavatum, Gibsonii, and fasciatum. Dendrobium clavatum has great sheath-like bracts. Dendrobium Gibsonii has a pendulous raceme with distant flowers, and a quite different very broad short lip bearing a transverse callus on its summit. Dendrobium fasciatum appears to stand nearest of all, yet the specimens of that plant, for which we have to thank its discoverer, Dr. Hooker, show its lip to be quite retuse and emarginate. Our plant is one of Colonel Benson's numerous Burmese introductions, and we have to thank Messrs. Veitch for a very satisfactory specimen. H. G. Rehb. fil.

WHAT SOIL IS BEST SUITED FOR THE PRODUCTION OF GRAPES?

[This and the two succeeding articles were read on Wednesday last at the Manchester Congress, elsewhere alluded to. The remaining papers will be published as opportunity offers. Eds.]

A QUESTION continually asked by amateurs and others is, "What kind of soil should I use in making my vine-border?" "Chouse," says the stereotyped reply, "is my loan from a pasture field." So far the answer is correct; but the geological formation is never named, whether calcareous, silicious, or gneous, assuming that quality in this particular requires no consideration.

I admit that there is some difficulty to secure soil in a free state, as the different formations very often pass into each other. For instance, we have the calcareous sandstone soil when the former predominates over the latter, and again the silicious limestone when the finely divided particles preponderate.

However highly some cultivators may estimate the propriety of providing certain descriptions of soil for the growth of certain classes of plants, our everyday experience demonstrates that the different constituents have separate duties to perform in the vegetable economy, whether the action is chemical or mechanical, and further, we cannot overlook the fact that the duration of life in plants, and the quantity of the fruit, are true expressions of the soil on which they grow. Analogy is certainly not an accurate system of reasoning, but in the present case may be of some assistance. Within the area of the builder's clay it has been found that the best race of men is produced, also the best cattle and that the death-rate is lower. If we accept this statement we need not hesitate to admit the validity of the preceding conclusions.

In relation to, and in support of these preliminary

I now pass on to deal with what may be to some a more practical part of the subject...

berries always set freely, and during the first stage when fully ripe their quality would meet the approval...

frequently perceptible, the skin began to shrivel and turn leathery; there was also a deficiency of saccharine matter, and of that peculiar aroma the exclusive property of the Muscat.

How to account for so decided a departure from the ordinary course eluded every attempt, and my conclusions never rose above mere speculation.

Interposition very frequently alters the whole course of the process, which the agent has prepared, and it so happened with me.

foreknew edge of mine, they were purely the result of unforeseen circumstances. I can best describe the quality of the soil by saying that it belonged to the old red sandstone formation, contained not a particle of lime, and was composed of silex, alumina and organic matter derived from decayed herbage.

beginning to improve the quality of the fruit, certainly the improved quality of the fruit began to appear, and the berries were larger and more numerous.

very decided character has been produced. Now the question is, what is the cause? Not a possibility can it be the lime, as there has been no lime added.

I now feel satisfied I cannot evade the conclusion, the fact is forced upon me that the causal property of the lime has worked as the mesh of, and that the nearer it approaches to a state of carbonate, the more fatal the effect.

Having succeeded in my exertions so far, I next applied silicious soil mixed with a third part of manure, for the growth of our grapes. Without entering into details, the results were the property of every gardener, it will be sufficient to notice that the quality of the fruit was equal to that of the factory, and as a guarantee I may note that a vine of the Alicante, one year from a single eye, matured 18 lb. of excellent grapes.

These results encouraged me to proceed further. I had the earth removed a foot deep, the berries made of calcareous soil, and replaced with silicious soil, on the supposition that it might be as an improver. Although the soil was worked as usual, it freely, and have been doing so for some years past, I have not been able to discover that it has produced any advantage.

observed in the selection of silicious soil, and sometimes to a considerable extent, mixed with oxide of iron, which should be avoided. Whatever opinions are held or may be formed by gardeners on this subject, the red sandstone soil with me, for the growth of the Grape Vine, has long become a settled article of belief.

In making this declaration, I do not exclude soil from other geological formations, I only offer a protest against the presence of calcareous matter.

A writer of considerable reputation has strongly recommended soil from igneous rocks, but of this I have had no experience.

Why, submissively wait on Providence to help them. What is generally understood as mere practice has long ago yielded all the sound information it ever had possess.

perpetrate the folly of threshing the same straw over and over again and winnowing the same old chaff? No, by no means, we are to make progress.

perform in nutrition is clearly ascertained. There is no reason why we should continue to be uninformed on this point any more than on the subject of the composition of the living body.

What we do want is a recognised authority to whom we may apply to have our soil analysed at a moderate charge, which will show that so far from exerting more influence than we are entitled to, it is in fact, a hindrance.

To show that so far from exerting more influence than we are entitled to, it is in fact, a hindrance, we will suppose a case, and the supposition is the correct, viz that one, two, three, or more of the best grape growers, persons whose success has been uniform on some particular kind of soil, we may name the purely silicious, were removed to the calcareous districts, it will be found that the quality of their produce will differ widely even although all their circumstances are the same.

It would then suggest, that the soil on which the districts grapes are grown should be analysed, and the result published. This would inform the cultivator of the soil, and be a guide to others, while making it a duty of the State to have the soil analysed, and the result published.

It would be both interesting and exceedingly useful to did the nature of this discussion and the limit assigned me permit to give a description of these trees and plants that require lime for the proper maturation of their fruit, and those to which it is injurious, success and failure have more to do with these points than we are at all times aware of.

The office performed by inorganic nature in the vegetable system has never been clearly ascertained, at least it has never been fully explained, but has given rise to various opinions, that confuse rather than enlighten the mind.

In conclusion, I would state how desirous I am to see the time when science and practice shall mingle together, and not till then can we acquire the right to open the door of legitimate progression.

immutable law reigns, well as inorganic substances. I believe there is no place where its power is not felt, and nothing beyond the reach of its influence.

In the discussion which has taken place on the subject of this paper, Dr Messing's opinion, and whether the physical character of the soil is permeability to water, and the lime, were the more essential points for consideration, and the result of the analysis, than the chemical constitution, which is the point of view, in which the soil is considered.

Mr Messing's opinion, Mr Cramb's opinion, and the influence of magnesian limestone on vines. The Duke of Devonshire has drawn attention to the

different kinds of limestones, and the consequent necessity for caution not to draw hasty inferences. Ultimately it was agreed that samples of soil, and portions of the vines grown in the various districts, should be sent to the Scientific Committee of the Royal Horticultural Society for

THE PRUNING OF FRUIT TREES AS AFFECTED BY SOIL, CLIMATE, &c.

FRUIT trees are, it is to be presumed, mainly cultivated for the sake of their fruit, consequently the chief object of the cultivator should be directed to its production; and much may be accomplished towards this end by a rational system of pruning.

The judicious pruning or non-pruning of fruit trees is an all-important question, far more important than that of training, with which it is frequently confounded. Training is the producing of form—an ornamental part of the business, and is at times necessary to producing fruit. But pruning, which is chiefly performed for the sake of securing fruit.

To prune a fruit tree is a very different thing from pruning any other sort of tree, inasmuch as the production of fruit is much more difficult than that of timber, or merely ornamental form. It is, indeed, easy to grow a tree and prune it so that it may assume any desired form or size. This is merely a question of time, and of the careful adherence to some given rules or pre-arranged plan; but to make that tree produce good fruit in large quantity, and of good quality, requires the exercise of much more skill and knowledge.

To do this, however, is the office of the pruner, and by proceeding judiciously he may lay down any definite rules for guidance in fruit-tree pruning, beyond the broadest general principles, is impossible, for in practice we have so many variations of soil, climate, subjects, and even stocks, to deal with, all exerting considerable influence, that no given rules can be strictly followed.

According to the amount of foliage during a properly developed, the growth of the tree advances, therefore, although the rate of increase of a tree on which leaves are produced may be the rate of increase on the plant generally, yet the removal of the parts left increase more rapidly, and of their leaves being more fully exposed to the influence of light.

Therefore to prune judiciously is not only advantageous, but in fruit culture it is indispensable. To prune a tree is to cut off a portion of its stem, or parts of its branches, and the object to be attained is the regulation of the vegetation of the plant.

The immediate effect (it may be repeated) of pruning, or the cutting off of any portion of a plant, is to cause a greater supply of sap to flow towards the parts which are left. Thus, if a tree is growing vigorously and making strong upright shoots, the effect of pruning a weak branch will be to increase its vigour instead of weakening it.

A special point to be aimed at in fruit culture is equality of growth and thereby uniformity of action throughout all the component parts of the tree. The most fruitful of all trees are those in which one portion is allowed to have a great ascendancy over the others. The stronger portions of these trees tend to be repressed, and the weaker portions encouraged, which will promote uniformity of growth.

Excessive vigour, is, however, undesirable, as trees in that condition bear but a small quantity of fruit; yet it is possible for a tree to be too weak, and to produce too many small fruits, as well as to be too vigorous and unfruitful.

There may be said to be two kinds of pruning, viz., market garden or orchard pruning, and gentleman's garden or trained-tree pruning. The one is a very different thing from the other, and the trees are of a different character. They are pruned almost entirely for fruit, form or appearance being in a great measure ignored.

In the latter, while fruit-bearing is one main object, yet with this is combined the formation or retention of some particular form. Which of the two, then, is the most productive or profitable? which of the two is most to be recommended? Or is it possible to apply the treatment as regards pruning that is necessary for the one to the case of the other, or to produce the same result?

wanting. These remarks apply more especially, yet not exclusively, to formally trained trees. If we take a glance at the natural tree vegetation of the country, we shall find that the trees are of a dwarf standard character, and are very fertile, while in another they are rampant and vigorous. In the one case we have probably poor soil and an exposure, and in the other deep shelter, and a soil of high fertility.

It is not, however, the soil, but the position of the tree, and the influence of the sun, that is the chief cause of the difference. Nature teaching us, and her general laws we must obey, for though we cannot alter the natural character of a tree, it may be regulated by skill in regard to the one to a small

1863.]

of the other. The light soil may be enriched, but it is more than likely to be impoverished, shelter may be procured, but these can only be done in a very limited way. However, something of the sort be done, the trees in the two instances will be very different, and in order to induce an equal amount of fruit, the treatment of the trees as regards manure will require to be very different also.

It is interesting to see the extent to which the produce of Mr. Lawes and Dr. Gilbert at Sawbridgeworth is affected by these manures on different plants, and their tendency to induce a luxuriant growth, and to favour early maturation, &c. It is perhaps something of this way might be accomplished with fruit trees by the application of special manures, which, as in the case of the mineral manures on grasses, would have a tendency towards fruit production than to leaf-growth. It may be a manure for fruit trees, which is of the nature of the existing and necessary portions of the soil, and concentrating all the energies of the plant towards the production of fruit, and if so, how it would be.

Climate greatly influences the growth of trees, and in some respects its effect is similar to that of the soil. In a damp climate, such as that in the south-west of England, counteracts the effect of a dry soil, assuming the results to those afforded by a deep rich soil in a damp climate. In a damp climate trees grow much more luxuriantly as a rule than in a dry one, and as the soil is unfavourable to fruit-bearing, the treatment of the trees must again be modified to the altered conditions. In the orchards of Devon and other parts with damp climates, there is a check which would otherwise be over-luxuriant and stunted, namely, the growth of Mosses and Lichens on trunks and branches, caused, no doubt, by the increased dampness. The presence of these epiphytes, however, in my opinion, as a beneficial check to over-luxuriance, and thereby induces greater vigour than would otherwise be obtained. Here, the nature repressing vigour more effectually than can be done by the employment of any artificial manure. It being then as yet impossible to alter soils to any great extent, we must perforce, for the greatest success be desired, cultivate only those stocks which are most suitable, and that after the manner in accordance with their natural tendency. In a locality where trees naturally grow but dwarf or miniature fruit-tree culture will be most advantageous, and where trees naturally luxuriantly they must be altered to do so, the dwarf, close trained fruit trees are of the most advantage.

It is interesting to see the extent to which the produce of Mr. Lawes and Dr. Gilbert at Sawbridgeworth is affected by these manures on different plants, and their tendency to induce a luxuriant growth, and to favour early maturation, &c. It is perhaps something of this way might be accomplished with fruit trees by the application of special manures, which, as in the case of the mineral manures on grasses, would have a tendency towards fruit production than to leaf-growth. It may be a manure for fruit trees, which is of the nature of the existing and necessary portions of the soil, and concentrating all the energies of the plant towards the production of fruit, and if so, how it would be.

There is the one case—winter pruning—done pruning is necessary to induce greater vigour, and prevent over-fertility and weakness (i.e., assuming the stocks, &c., used in each locality to be the same); and in the other, the object of the pruner is to reduce luxuriance, and this is best effected by non-pruning, or at most, by the throwing out of the shoots and branches where crowded, so as to expose the remaining ones more freely to the influence of light, leaving the strong growing young shoots at almost their entire length, which the next season produce a less vigorous growth, and as a consequence become more fertile, on account of the forces of the plant not being concentrated on a few buds, but being required to spend itself over many. In short, in the one case miniature fruit-tree growing is advantageous and practicable, simply because the trees are not inclined naturally to grow larger, and in the other it is almost impossible, because the trees naturally grow too luxuriantly.

Excessive vigour may, however, be considerably repressed and fruitfulness may be induced by judicious summer pinching of the growing shoots, and also to a great extent by root pruning. The first summer pinching is of paramount importance. It is most easily accomplished on the naturally fertile trees, yet it is most required on the most luxuriant. By constant application rendered absolutely necessary in all formal styles of training, and in the culture of miniature trees. The leaves of a plant are almost its very life, they are its breathing organs. Leaves elaborate the sap which is drawn from the roots and return it into the stem to form woody fibre. If the pruning or cutting away of any portion of its leaves arrests the flow of sap in that direction and directs it towards the parts which are left. Thus, therefore, by stopping the stronger growing portions, those on the upper parts of the tree, which are in advance of the lower or weaker portion, we equalise the flow of the sap, and cause a uniform action throughout. This stopping and checking of the shoot-growing propensities of the tree tends towards the formation of fruit buds, excepting in some cases, namely, in very rich soil, and where it is attempted to confine the energies of the tree within too narrow a limit. Under such circumstances the most important application will be to produce fertility, but will result in the untimely production of watery shoots, and a gradual weakening of the tree. In such cases root pruning may in some instances be resorted to with advantage. Root pruning in miniature fruit-tree culture is almost absolutely necessary, to keep the trees within bounds in many soils. It should, however, only be resorted to as a last resource, after all other means of checking vigour and inducing fertility have failed. Root pruning tends too much to weaken the whole system of the tree, to take away the powers of the plant which are required for the support of what fruit there may be produced. It is not exactly a weakening of the entire system of

the tree which is required but a retention of all its powers, and a direction of those forces towards the production of fruit, instead of that of shoots. In concluding these remarks, I would recommend those who may be commencing fruit culture to take well into consideration the soil and situation of the place, and then to choose, whether for the production of fruit simply, or for fruit combined with the formation of the trees after some particular form. Whatever may be the object, the condition of the soil should be considered, and the trees selected should be suited to the soil, whose requirements can be best supplied by that soil, and by the mode of pruning and general cultivation adopted. A. F. Barron, Royal Horticultural Society, Chiswick.

Major CLARK, in the course of his remarks on the above paper, suggested to stock raisers the desirability of raising stocks from seed, with the especial object of obtaining seedling varieties under different conditions likely to be serviceable. ON THE PROSPECTS OF HYBRIDISATION. THE object of the following remarks is to show how large a field is still open to cultivators in the matter of cross-breeding. In order to see the extent and nature of this I will ask you to withdraw your attention to a considerable degree from the mere in-and-out breeding of a few favourite and already over-bred groups of garden plants, and to turn it to the higher object of originating new forms and qualities, by working with hitherto neglected or unthought-of subjects. Under this head I include—

- General hitherto unattempted
- True species unused, or insufficiently worked out.
- Old garden plants, shrubs, or trees possessing high special qualities.
- Variegated plants of all kinds to be used as the sires or male plants.

Other descriptions might be catalogued, but the above list would give us enough to do. I will not treat these cases separately, for they are much bound up with one another, but will take them as they happen to suit my present purpose, which is to say as much as I can in the shortest space of time. Let us begin with ordinary cultivated things—the old familiar forms of the flower or kitchen garden, and note a few of our shortcomings. Enter genus *Rosa*—the Rose has been said to be coming rapidly to a dead lock, so great has been its cultural improvement. But this improvement has run somewhat in a rut, hundreds and thousands of seedlings are raised annually, and yet we get little more than stunted, dwarfed forms of a few favourite types.

It is interesting to see the extent to which the produce of Mr. Lawes and Dr. Gilbert at Sawbridgeworth is affected by these manures on different plants, and their tendency to induce a luxuriant growth, and to favour early maturation, &c. It is perhaps something of this way might be accomplished with fruit trees by the application of special manures, which, as in the case of the mineral manures on grasses, would have a tendency towards fruit production than to leaf-growth. It may be a manure for fruit trees, which is of the nature of the existing and necessary portions of the soil, and concentrating all the energies of the plant towards the production of fruit, and if so, how it would be.

The promotion of a yellow will be the more of a task. As seed-bearing parents we take the old yellow *Chama*, it is still to be had though very scarce, the yellow *Tea* with the white *China* and old *Sweet Double White*. Cross these with the Austrian and Persian Briars. Also cross together the yellow *Teas* and *Chinas* with the palest and clearest-coloured *Provence* kinds. The *Teas* should be fruited in pots under glass. This will bring them into flower at the same time with the Austrian Briar. Moreover, they set their fruit freely when grown in this manner. For a high-coloured *Tea Rose*, the old crimson *China Semper* would impart a large share of its colour to any of the true *Teas* and the cross might be taken both ways. It will probably take some generations to produce a good rich-coloured *Tea Rose* bearing in one of the *Rose* and *China* seeds, but the *Tea* will produce seedlings of a better colour and frequent flowering habit by a cross with these distinguished kinds, and for an experiment their position is not to be lost. The sluggish-opening *Coupa d'Heur* and *Lu gens*. The sluggish-opening *Tea Noisettes* might be crossed with the old *semi-double yellow China* to produce an intermediate effect. I may here suggest that the noble old *Noisettes Grandiflora* should make a fine seed-bearing parent when

crosses with handsome vigorous Roses of almost any class, but especially the Provence breed.

Again, to create new and hardy races there is sufficient evidence to prove the enormous advance frequently made by a first cross from a wild or natural species with the pollen of a cultivated one. I need not point here to *Paeonia* and *Maria Letitia* raised from two wild single species by the pollen of the double Tea Rose, and the pollen of the same species of the plant should be tried upon every natural species that can be procured.

I fear I have dwelt too long upon the Rose, but it was tempting—the Rose always so tempting. Moreover, it was a good subject for an endeavour to show forth my meaning clearly.

And now we will take a turn in the orchard. A few good Apples and Pears have been raised by definite well considered crosses, but many yet remain to be devised and carried out. One of the first things that will occur to us when once out of the orchard, is that we have scarcely any good summer Apples and Pears, none of any size and none possessing the peculiar and healthy qualities of the autumn and winter kinds. Who has ever raised a seed of *Citron des Carmes*, or reared a brood of young Jargonelles, ennobled by the blood of Marie Louise, or other early autumn Pear? Who has ever collected, selected, and united in wedlock the pleasant but very improvable summer Apples? I think no one, as yet, not even the great Sultan of Sawbridgeworth. Is there any reason why the great size and hardy vigour of the *Catillac* and other culinary Pears should not be imparted to or shared by those sorts whose melting flesh and rich flavour fit them for the dessert table? Mr. Rivers has worked nobly at the stone fruits, and especially as regards the Peach, Nectarine, and Apricot groups, but there is yet a most interesting and important line of work left open to the horticulturist, viz, the

breeding expressly for hardiness. Hardy Peaches and Apricots are known to exist. Let these be searched for, collected, and bred from, let them be sown, reared, and, if possible, fruited away from the sheltering wall. The long frosts of winter, and exposures of male varieties of spring, will of themselves form an effectual selective process. In all crossing experiments hardiness should be kept prominently in view, hardness of constitution generally, and hardness to bear low temperature. It is common enough to hear it said, "Such a fruit is the king of its race, but it is so tender, or it may be such a bad bearer."

Should such things be when the cross breeder has actually the power in his hands to combine given qualities and to impart definite ones? Much attention has been given of late to the Pear, and we possess many fine sorts, but there still remains many a curious and rarely profitable combination to be tried. The pretty and curious Cherry Plum has not yet been used as a parent. The early and prolific *Danson* would certainly produce valuable orchard sorts if crossed with the *Greenage Green Drop*, and other kinds possessing high quality and marked character. The common Bullace is a most promising subject, but it is in itself quaint and pretty as a dessert fruit, and might repay the trouble of crossing with the *Golden Drop*. Even the poor despised Sloe would furnish an importantly instructive experiment in showing to what an extent the austerities of its wild produce would be modified by the influence of a rich and saccharine garden Plum.

I do not think much deliberate crossing has been done with the Cherries. A few subjects of well defined races might be crossed together. The *Morello* produced sterile seedlings when experimented upon by Andrew Knight, yet I cannot help thinking that further trials might meet with success or at any rate verify a result. I need hardly say that to a really scientific mind the

verification of an experiment, or the settling at rest of an old doubt, is a gratification of the highest order.

After the fruit-tree question, of which I fear you must be almost tired, we pass naturally to the shrubs. Are our small fruits incapable of farther improvement? Not when red Currants are sown—and I have pressed myself to an especial audience.—Men of letters, I call upon you to produce an estate of Currants. Red Currants still lastately persons in being and although they were once worked at by the French, but a few generations under the care of the French would undoubtedly improve the *Cocoberry* in favour as well as in size. Your huge *Lawsford* and *Straw* Lians might be made rich with the blood of some of the old rough green, red, and yellow berries, and the "rapid" pachydermatous, prize-taking *Master* might become a *Manilla* for a price.

I had prepared great stores of materials for carrying out far more fully my intention of a treatise of this subject, but I have not yet had time to do so.

So now I will bring my fragment for an performance to a close. I have no better to say abruptly than that I have accumulated an important principle to which to cling out of a rut, and I was all good fortune in a crossing to the bold traveller in untrod ways.—R. T. Clarke, P.S. There is no earthly reason why we should not cross the Pine-apple.

Rev. S. R. HOLE entered a protest against some of Major Clarke's statements, and considered that florists had more reason for congratulation than for despondency.

Major CLARKE, in reply, created some amusement by stating that he entirely agreed with Mr. Hole.

Mr. SANDERS considered that there should be no such thing as resting in horticulture, continued progress must be aimed at.

Mr. D. T. FISH stated that we still wanted a good white and a good yellow Perpetual Rose.

METEOROLOGICAL TABLE FOR THE QUARTER ENDING JUNE 30, 1869.

Observed at Weybridge Heath, Surrey Lat. 51° 21' 18" N long. 0h 1m 46s. W 150 feet above mean sea level, on the Lower Bagshot sand. Soil and subsoil fine sand. By W. P. HARRISON Esq. F.R.S.

Mean pressure of dry air reduced to 32° at sea level.	Highest temperature of the air in the quarter.	Lowest ditto.	Range of temperature in the quarter.	Mean of all highest.	Mean of all lowest.	Mean monthly range of temperature.	Mean daily range of temperature.	Mean temperature of the air.	Mean temperature of the dew point.	Mean reading of thermometer in sun's rays.	Mean ditto in grass.	Mean temperature of the earth.		Mean elastic force of vapour.	Mean weight of vapour in a cubic foot of air.	Mean of historical weight required for saturation.	Mean degree of humidity in absolute saturation at 60°.	Mean weight of a cubic foot of air.	WIND.				Mean amount of rain in the quarter.	Mean amount of rain in the quarter. ON THE TRAINING OF GREENHOUSE AND STOVE SHRUBS FOR EXHIBITION

The architecture of a tree or shrub is a very difficult subject to deal with, for when the various dimensions of the bole, the limbs, and the twigs are accurately measured, the grand Oak, with a luteous bark and bends, will be found to represent a sugar-loaf shaped piece of timber—a perfect cone, tapering from its codar at the ground to its topmost twig, thus a bole of 12 inches diameter would give two limbs of about 2 1/2 inches diameter, and each of these limbs would give two branches of about 5/8 inches each, and so of the spray and twigs.

The area of the section of the bole, say 12x12x 554 = 113.44 square inches.

The area of the section of the two limbs, 8x8x 554 = 56.72 square inches.

The area of the section of four branches, 5x5x 184 = 45.5 square inches.

Whilst the apparent bulk of the branches is greater than that of the bole, the area when accurately calculated proves that they are less, and that the tree is consistent throughout, and not the top-heavy article we might take it to be.

The outlines of trees and shrubs are therefore by no means a random affair, but are regulated by fixed rules. In the lower orders of the vegetable kingdom the same accurate details may be made out, for if you find with a pair of compasses the centre of a Mushroom of only three days' growth, the circumference will be found to coincide with the line drawn by the other leg of the compasses, but besides the semi-globe and the cone, we have among the ever-varying forms of plants such outlines as the ellipse and the spindle. The cone, whose outline would be an equilateral triangle, will always be a pleasing outline, as it is always a perfect one, standing on its base, it is ever of a conical pyramidal shape to bush or tree, with or without bole or trunk, and mounted on its apex it gives a charming picture when open as an ampt theatre—unless the case of a tree or shrub, a chalice-shaped outline with a flat top and a stem more or less elevated. The architect gives reasons for his arch and its key-stone, and for his pedestals, columns, and capitals, but a certain style of light or heavy slender or massive, according to the number of diameters which go to make its height, custom or caprice have nothing to do with these dimensions, they are regulated by fixed rules.

It is the peculiar character of a vast number of trees and shrubs that their flowers sit upon the twig and form tiers, for if you look into a Cedar of Lebanon, its graceful cones will be found all seated as on a carpet of the leveliest green. The Horse Chestnut is perhaps the finest flowering tree which we possess, yet at whatever angle the branch rises from the limb of the tree the flowers, like great trusses of Hyacinths, are all upright, whilst the foliage is never so. The wild Rose in the hedge bank rambling over some stunted Thorn sets a pattern to the

queen of flowers is mounted on the tip of a pretty little spar, with three or four short pinnated leaves by way of carpet, and these are all set and clustered with an eye to beauty, on long slender wands, gracefully bent. With such elegant models every day before our eyes, one feels outraged to see collections of greenhouse Azaleas and the like bound limb and twig to iron stays, to give a stiff outline, such as is never seen in any of Nature's grandest displays, and, what is worse, bearing no family likeness to the distinctive character and outline of any Azalea whatever. Imagine, if you can, a specimen *Fuchsias* with every flower tied up or out, or to the right or to the left—in short, any way, excepting always being allowed to hang down, and you will easily comprehend what an outrage it is upon other plants to have their distinctive characters destroyed, as if the tying up of *Flora's* train would make her look more graceful. Trees and tree-like shrubs have natural supports, and should not depend upon either props or other plants for their stand, viz, or if they must have supports, it will take very clever handling to put them in and avoid defect on. As the poet has said of satire, so we may well say of these—

"Nature should be like a tiger keen,
Would with a touch that scarcely to be seen."

The fact of such a twiner as the Hop coiling itself round its pole, like some serpent embracing the victim it would destroy, tells clearly that Nature meant it to borrow its support from some sapling in the jungle where it was located, but the Hop does its best to hide the prop it leans upon. Plants for exhibition are usually tied to shapes or frames some little time before they come into flower, so that they may make a grand effort to right themselves, and throw up their blossoms in one unbroken sheet. The glare unremoved by the natural foliage, looks just like some red mantle laid on a bush to dry. The leaves of a tree or shrub are things never to be assumed of, for surely it is the combination of light and shade that makes the picture. Take the lock of raven hair from the lovely countenance, and see the loss, and it is this business that I complain of.

Nature usually places the flowers of greenhouse Azaleas, as well as the flowers of other showy greenhouse shrubs, in tiers or stages, or, as before stated, sets them up on their twigs, and the flowers follow one another, rank behind rank, but at our exhibitions I observed that all the flowers are thrust to the front, and stand as if they were poverty-stricken, in single file. In the worst forms of what is termed "facings," splendid specimens were seen growing on their trollees, all flower, without a leaf to be seen, like great red aprons bulging towards the beholder, these, I am happy to say, are fast disappearing.

Our exhibitors of this class of plants will hardly credit the fact that they have got down to the still

clipped style of the Yew and Holly hedge of our forefathers, but the massive character of the hedge, strong in its supports, could bear the insult better than the plants in question. All specimens have a style the Oak is a mushroom-shaped tree, and looks best in that character, and cannot part with its congruity, even its gouty fork, its knotty twisted grain are ornaments, for that is the style of the "British Oak."

In like manner specimens for exhibition should not be taken out of their own nature, shape or style, and put into artificial shapes that do not become them. No one is to blame in this affair, for it has been creeping in upon the exhibitor for the last 50 years. In order to effect a cure the main good sense of the judges will be required to decide a few cases of the best specimens exhibited in the characteristic style of the plant, and if the plant has leaves as well as flowers, let them appear also on the stage. *Alex. Forsyth*, "Hear! Hear!" Consult the genius of the plant in a. —Eos.

Home Correspondence.

Prunella grandiflora. This lovely gem, which is now to be seen in flower in the newly-formed herbaceous border in the Royal Horticultural Society's Gardens at Chiswick, is one of the most charming subjects to be found in the great rut row, almost neglected family of herbaceous plants that cannot be too highly praised, or too much recommended for general cultivation. It was introduced into this country from Pennsylvania about the year 1801, but, as it is now so seldom seen, I fear it is almost lost. It grows freely to the height of 2 or 3 inches, is perfectly hardy, and throws up an abundance of densely spiced heads (about 1 foot in height) of deep blood-purple flowers, and continues to bloom about six weeks. The heads of flowers are about four times the size of those produced by *P. vulgaris* (the common leafy head of the British *sars*), and when seen in a mass—though it be but a small one—they are beautiful and attractive in the extreme. The plant is admirably adapted for front rows, or for massing in mixed borders, and I doubt not but that if it were tried it would prove an invaluable acquisition for the decoration of the flower garden in general. If any of your correspondents have tried it for this purpose I should feel grateful if they will kindly give their experience through your columns, as any information respecting the cultivation of this beautiful plant, or any of its fellows, cannot be too well made known. It is sometimes called *P. Browniana*, *P. pennsylvanica*, and *P. pyrenaica*, but *P. grandiflora* is the correct name. W.

Roses. When "D. of Deal" was here on the 22d of June he highly recommended to me the Duke of Edinburgh, *Elie More*, *Mille Three Let* and *Vicomtesse de Vesons*, the 2d prize seedling at the

and 32 gs., and several realised over 20 gs. apiece. This is one of the earliest sheep lettings in the season, and during this and next month they will be sold over England. The 20th of July seems to be a favourable day, as Mr. Charles Howard's Oxford Downs are let at Biddenham. Mr. J. B. Lytton, sells 100 Shropshire rams and 200 ewes at Longe, H. B. Bingham's from various flocks at Mr. W. Lyson's, Cotswolds are offered at Broadfield, Northampton. Mr. Robert Gurnall's sale of 60 Cotswold shearing rams takes place on the following day at A. Smith, near Northampton, and the Bulbricke ram sale is altered to Wednesday July 25. Mr. Cotner's 31st annual sale of Cotswold rams is to be held the first week in August, Mr. Brown's Norfolk Cotswolds are to be let at Marham Hall on the 5th, and the day previously, the 4th, Mr. J. A. Treadwell's 60 Oxford Down shearing rams, from his prize flock, will be sold by Mr. J. A. Mansford at the Model Farm, Upper Winchenden, Bucks. Mr. W. Goughby Wood's Shropshires are to be sold on the 10th, and Mr. Preece has, as usual, a number of fixtures for the "grand Shropshire."

The Manchester exhibit in this class is better acquainted with three breeds of sheep which had formerly only been known by name to many of us. We refer to the "Limestones," better known amongst their owners as Crag Sheep, the Herdwicks, and the Lonsks. Of these three, the first-named attracted the greater share of attention, and from what we heard direct from the very best local authority, they are well worthy of a wider distribution. The Limestone or Crag Sheep inhabit the barren moors of West Yorkshire, and subsist upon the dry mountain sides during the summer with little water, and during the winter with little artificial help. This suitability for high barren, exposed and dry situations is considered as their strongest point and in this they differ from the Lonsks, which are adapted for land of the worst possible quality, do better on long, moss, and rushy ground. Hence Lancashire and West Yorkshire boast two capital breeds of sheep for poor land, the one adapted for dry and the other for damper situations. Returning to the Limestone Sheep we found them represented by many fine specimens from Mr. Rowland Parker's flock of Moss End, Burton, Westmoreland. They may be thus described. Both sexes horned, face and legs white, wool firm intermedicate in length, and meaning to the character of short rather than long wool. Mr. Parker's flock clip on an average 7 lb. each sheep, and is 3d. has been realised per pound this season. Mr. Parker rears and feeds off his wether lambs entirely on the lower ("in-land") ground, and raises them to from 18 to 22 lb. per quarter at 20 months old. The ewe lambs are kept on the "in-land" until they are one year old, and then go to the "common" or higher ground from May to October. They are again brought down in October, and put to the ram. Mr. Parker assures us of the prolific character of the females. Out of 54 ewes, 11 produce three lambs each, and the entire flock brought in, 100 to weaning time. With such statements before us we cannot doubt the advisability of knowing a little more about the Limestone breed of sheep, and there appears reason to think that they might be advantageously introduced in many of our dry, hilly, and poor districts.

PRESENT APPEARANCE OF THE CROPS.

CAMBRIDGE.—Wheat. On our best lands the wheat is a full crop. A few of the heaviest crops are partially laid, and went down too early, and consequently are liable to be injured seriously should we get adverse weather. These want sunshine and warmth, and may then come to perfection better probably than we at present anticipate. But it is quite the exception for crops laid early to prove productive. The lighter crops are the worst, and present the most unfavourable aspect. Many of them are drooping down, and tumbling about in all directions, not from their being bulky, but from weakness, of these I entertain a very poor opinion, as in my experience I have never known such crops come well to harvest; they generally yield badly, and are of inferior quality. The remainder of our wheats (and these are the larger portion) are full, good crops, and with suitable weather, may easily yield a full average. But our trying time is yet to come. On our fen lands we so frequently suffer from blight and mildew as the corn approaches maturity, and should we have weather to coincide these, we may see the yield reduced from 20 to 25 per cent. below present appearances, and the quality seriously deteriorated. We have known it so in the past, and are therefore anxious to see a continuance of warmth and sunshine, and with these we may have a very good crop. Oats. This crop is irregular. Many fields have suffered severely from the ravages of winter, and although doing well now, are too thin to be a plan to produce a full crop. Where there is a thick plant there is a heavy crop. Barley. This crop has suffered from an excess of moisture, and will be heavier than its competitors at one time indicate, but it may ever now afford a fair, although not a heavy yield. Beans and Peas as far as straw is concerned, are generally pretty good, but I offer no opinion as to the probable yield. Sunflower and warmth, and an absence of rain, is what this county now requires. Alfred S. Ruston, Aylesbury House, Chatteris, July 12.

EAST NORFOLK (Coast District).—It is scarcely possible to give any definite or reliable opinion of the crops at this moment. A fortnight since they presented a very unpromising appearance. I should then have pronounced them decidedly below average, but the last few days of almost tropical heat have produced a marvellous improvement, and should we have a continuation of such weather, may anticipate, at all events, an average harvest. I have examined several

fields of Wheat, some are rather thinly planted, but have shot a good ear, and headed well. The chief defect is weakness in the stem, which is bent from the root to the first joint. I may say somewhat root-fallen. This may be found to be rather general. I lately examined some heads of Wheat in Essex, and noticed the same defect. How this will affect the crop I am unable to say, but must wait, in view of the weather during the next three weeks. The Barley crops, in general, are by no means promising, wheat on good soils well farmed, it is running to a great length of straw, and the first heavy rain will lay thousands of acres flat upon the ground. Oats are good. Peas and Beans promise fairly but I cannot at present say how they are likely to yield. The hay was a very fair crop, but not such a large breadth mown as usual, owing to so many fields being ploughed up in the spring where the seeds perished by last year's drought. The root crop at present being well, and should we get timely showers, will exceed an average. Harvest will be later than usual, and with a continuation of fine weather it cannot be general here before the middle of August, and probably somewhat later. W. Cahill, Bacton Abbey, North Walsham, July 12.

ESSEX.—Wheat under average, a good deal root-fallen or stem-rotten. Barley, average. Oats promising. Beans, over average; winter Beans good where thinly sown, where too thick plenty of straw and few pods, early sown Peas, over average; Mangol, capital; Cabbage and Kohl Rabi, good. No rain for more than a month in our neighbourhood. First-rate hay crop, well gotten, ditto, winter Tares, very little Red Clover. Potatoes want rain. Shall commence harvest August 2, perhaps earlier. J. J. Meek, July 9.

HUNTINGDONSHIRE.—Wheats came out into ear very irregularly, with the ears thin and very far apart. The stems are very tall in some instances 4 feet 6 inches, soft and succulent, and hence thunder-storms, or heavy rains, would be fatal to the crop. The last ten or twelve days have been favourable to the bearing stage as well as to the crop generally, and the ear has thickened, and is much improved. With a continuance of fine weather, and barring accidents, we may possibly reach an average crop of Wheat, but this will be our limit, and at present I think the chances rather against this. Barleys are very light on the strong land, from the excessive rains and cold nights in May and can not possibly be an average crop. Winter Beans are magnificent and Spring Beans, at present, promising. Peas are a very fine crop, generally, but some of the later crops have been struck with the fly, and will now be very deficient. Potatoes the early sorts are very abundant, and the root crops are very promising and well planted. Grass has been one of the largest crops ever known, especially upon the high lands; upon some of the lowest meadows the crop is not so good. With such prospects of food before us, the prices of stock must be well supported. Peter Purves, Brampton, Huntingdon, July 13.

THE WHEAT in this neighbourhood I think about an average crop, perhaps not quite so. The Barley certainly not an average, a quarter or two crops sort of it. The Beans are good. The Winter Beans are a very great crop, though not well podded. The Peas are generally a deficient crop. The Oats an average crop. The hay is a large crop, and secured in a good state. The root crop has every appearance of being good, so that we are likely to have plenty of food for the stock in the winter. Robert Barton, Wigan St. Lees, July 13.

LINCOLNSHIRE. As regards cereals, I am afraid I have nothing very flattering to say. Wheat upon light land and poor clay soil is light, and must be short of an average. Upon well farmed good soils it is much better, and has come out with a good ear. I must say the same of Barley. Oats are bad. Turnips are promising, but rain would do them good. Hay a heavy crop. We shall not have any harvest until fully the middle of August, unless the weather comes very forcing. F. Sowerby, Aylesby, July 13.

NORTHAMPTONSHIRE. Our Wheat crops in this neighbourhood are anything but promising, though they have improved much in the last few days, but even with a continuation of the present splendid weather the yield must be considerably below the average. The same remark will apply to Barley, excepting that on very superior land. Oats promise fairly, and both Beans and Peas look well, and if the fly keeps off will be good crops. Mangels are a good plant, Swedes and Potatoes look well; Vetches were a remarkably heavy crop, and the hay crop more bulky than for many years, the greater part has been secured in first-rate condition, and, as the pastures are full of keep stock of all kinds commands extreme prices. J. Borlase Tibbitts, Ripon Seagrave, Kettering, July 12.

OXFORDSHIRE. My opinion is that the Wheat is not good, being short in the straw and very irregular in ear. The Oats are a fair crop, and are well secured, but it is not to be depended upon. Barley on the best lands is pretty good, but that on the clay is but short in the straw, and very irregular in ear. The Beans are pretty good. Beans later were more promising, particularly the spring varieties, being a moderate length in the straw, and the pods well set. The winter kinds have too much straw, and are not so promising. Peas are good plenty of straw, and well pulled. Hay there is but little Clover, the plant laid last season, and however a great breadth of Trifolium incarnatum made into hay. The upland pastures are good in quantity, and more than an average in quality, the low meadows turn out short in quantity of fair quality. Roots the Mangol plant is rather thin, but they appear to be doing very well, now Swedes, an excellent plant, and a total absence of fly Turnips are very flourishing, in fact we have not had such a prospect for many years. Potatoes free from disease, abundant in quantity, and good in quality. Samuel Druce, Eynsham, Oxford, July 2.

RUTLAND.—The Wheat crop in my neighbourhood on a well-drained and well farmed land is a full average, but on badly drained and early farmed much of it is a bad crop here (the worst we have had for years) and Oats are not so good. Peas and Beans are a very good crop, and Peas do better than below an average. Mangol Wurzel and Swedes very promising and the hay crop a very good one. The greater part secured in good order. The last week the weather has improved the corn crop, and the harvest must be a very late one. George Turner, Junr, Alexton Hall, Tappinham, July 14.

WEST SUFFOLK. The last fortnight has somewhat changed the appearance of the Wheat crop, about that time the prospect was somewhat dreary. A very uneven top threatened a light crop, and great breadths of Wheat looked as if they were about to have the same fate, and about two-thirds of a very late year was all that was estimated upon. But the last fortnight has worked a magical change for the better. Straw and ears seem to have been raised on every acre, and the crop has improved in an extraordinary manner. At this rate the temperature was 95° to-day in the shade—harvest will begin in less than a fortnight. Some of the Wheat is beginning to change, and a field of Rye, very little of which is grown about here unless for seed, or for green food, is changing fast. The Wheat generally seems thinner than usual, but in many fields it looks quite an average, and in all the fields will be much more satisfactory than was expected a fortnight ago. Straw will be plentiful. The Barley is a plentiful crop, nothing could look better at present. Very few Oats are grown, one field I noticed badly sown. The hay harvest is finished, the weather for the past fortnight, with the exception of a partial thunderstorm that passed over a considerable portion of the county last week, being very favourable for the late crops. I was somewhat about the middle of June had the weather though not a great deal of any or straw has been injured. The crops have been very heavy, and there is plenty of Grass in the meadows for sheep and stock. Green crops have come up well, and Sages and Turnips generally look regular and healthy. Mangol and Sugar-Beet will be a regular and generally a heavy crop. But the weight will depend a good deal upon the weather. We had frosts for several nights in June, and this does not encourage a rapid growth in any of the Beets. Still, they are generally healthy, and with growing weather there is plenty of time to have a good return in October. I hope to send further particulars about the Sugar-Beet crop, and its low becoming an important crop in this district. Peas and Beans generally look well, and promise a heavy yield. The plague of green and black fly is very great upon trees, hedge rows, roses, &c., and we have noticed it much on the green crops. One piece of Wheat was noticed very much infected. Is not this a new occurrence? July 13. Splendid rain last night will give vigour to the grain, and size to the root crop, and fill the meadows again with an abundance of food. D. T. P.

THE ROYAL AGRICULTURAL SHOW AT MANCHESTER.

The Manchester meeting has eclipsed all previous experience in the history of the Royal Agricultural Society of England. To this no doubt the Presence of H.R.H. the Prince of Wales has largely contributed, and the magnificent weather of the past fortnight has no doubt immensely increased the number of spectators. But, apart from the mere incidents of the exhibition, its own inherent excellence has placed it in the very highest rank of merit. The cattle-yard, open to the public on Monday, was filled with the very best classes of Short-horn cattle, Leicesters, Southdowns, and Shropshire sheep, that have ever competed for the Society's prizes. The horse classes, more numerous than this Society has heretofore exhibited, were many of them of the highest merit, and the "steep-chase" display within a separate enclosure proved attractive to large numbers of spectators. The implement department, chiefly interesting for the extraordinary competition in mowers and reapers, which occupied the patience and the judgment of laborious judges during a protracted and adjoining day. Steam cultivators, though for the year competing for the prizes of the Society, were full of work and competitive display as ever, and all the various kinds of them were exhibited. Perhaps the showyard was deficient in novelties, but there is no great harm in that. More detailed reference will be made in the following pages to the character of this part of the exhibition. On Monday, July 10, the judges, an admirable large body of men, commenced their examination. The day was a most successful one, and the exhibition was not so long as had been expected, and more purely agricultural than, as a rule, the neighbourhood of the great city, might have been anticipated. Many of the people apparently reserved themselves for the following day, when the Prince and Princess would attend.

On Tuesday their Royal Highnesses the President of the Society and the Princess of Wales visited the showyard, and were most heartily and joyfully received. Their carriage entered the ring set apart for the parade of the cattle, and the winners in the several classes passed before them. At the luncheon tent, after the parade was over, covers had been laid for 600 ladies and gentlemen, and the CHAIRMAN, Earl Sefton, Lord-Lieutenant of the county, proposed the health of the President of the Royal Agricultural Society of England—his Royal Highness the Prince of Wales, coupled with that toast, the name of her Royal Highness the Princess of Wales. He said, "I think that the reception that their Royal Highnesses have met with

upon the relative merits of the two mares, and the spectators seemed to be about equally divided in their allegiance. A last trial, however, was decided upon, and in this the superiority of Mr Casson's mare came out so clearly as to decide the question at once.

The spectators cheered enthusiastically, and Mr Casson was warmly congratulated when the flat of the judges was given in his favour. "Princess" was an excellent second, and the judges were so satisfied with her performances that they awarded her also a silver cup, but of less value than that given to the winner. The winner was ridden up to the royal stand, and the Prince of Wales examined her with interest.

Home Correspondence.

Harvest Dates in Warwick, &c.—I send a statement of the dates of the earing and flowering of the corn on the Holbrook Grange Farm for the last six years. There has been no Barley sown this year. Wheat was very irregular in earing and flowering, and also in length of plant, but the late hot weather has improved it wonderfully. I don't remember ever having seen the straw so long, and if we have any heavy rain I am afraid it will be easily knocked down. There is a larger breadth of Wheat sown than last year, and the prospects are better on the strong than on the light soils, but we can't expect an average crop. Barley and Oats have also much improved of late, but are much below an average. Peas are above average; Beans, the finest plant I remember though not so heavily covered as I have sometimes seen, still they are much above the average. Mangel and Swede Turnips look well. Potatoes have much improved, though some of the sorts, especially Flukes, have come up very irregularly. The hay crop has been the heaviest I can remember, and almost all of it has been got in in first-class condition; but as the store of hay was entirely exhausted in this neighbourhood, there is no chance of this article being very cheap.

Table with 5 columns: Year, Wheat in Ear, Barley, Oats, Wheat in Flower. Rows for years 1884, 1885, 1886, 1887, 1888, 1889.

Charles M. Calvercott, Holbrook Grange, Rugby, July 19.

Paper and Spinning Material from Bog-land in Ireland.—In the Agricultural Gazette of to-day I see an article with the above heading by Mr Hill Dickson, in which he recommends the culture of New Zealand Flax (Phormium tenax) in the swamps and marshes of Connaught, because, forsooth, he had seen the plant with leaves 6 feet long in the garden of the Galway College, and alleges that this plant can only be grown in Kew Gardens under glass. Mr. Dickson also speaks of giving the Spanish Grass (Esparto) a trial on the western coast of Ireland, and hints at giving a trial to the Indian Rheas, which he hears has been grown to perfection in Robert's Park Gardens. What this latter plant may be I am quite at a loss to know; it may be a misprint for Indian Corn (Zea), or "Rheas," a species of Poppy, of which there are many varieties, but all grown for ornament, and not for use, under the names of scarlet, white, or variegated Corn Poppies, but this is mere guesswork, and I honestly confess that the Indian Rheas is nowhere to be found in Loudon's "Hortus Britannicus," nor in any other work that I am acquainted with. Some little information of a practical nature may be of some service, not only to Mr J Hill Dickson but to the Earl of Arran, who seems to have entertained the magnificent idea of converting into sound land, at little or no expense, thousands of acres of swamp and mires of bog so soft that birds only dare set foot on it. And this is to be done by planting rows of New Zealand Flax 8 feet apart, and waiting three or four years until their roots get matted, when surface-rooting plants are to be grown in the spaces, to feed the Connaught man, whilst the Flax clothes him. The writer of this letter has himself grown New Zealand Flax out-of-doors in England, and also under glass. The plant flowered and perfected its seeds, and he raised plenty of plants from the seeds that were saved. The flowers were, however, all impregnated with their own pollen, by using a camel's-hair pencil to insure fertility, as the plant was under glass in a cool conservatory. So grown, it threw up a fine spike of flowers, 9 feet high. In the southern and western counties of England the plant is quite hardy, and is usually grown among Yuccas and the like, to give an exotic appearance to rockwork in flower gardens. One of the finest plants I have met with stood lately in a nursery at Stroud, in Gloucestershire, and I got some of its leaves from the proprietor for comparison with foreign leaves, and with leaves grown under glass, for I must not conceal the fact, that the English and Scotch papermakers have made themselves acquainted with this plant as well as with Esparto. Some 20 or 30 years ago Mr Murray, an author and lecturer on chemistry and botany, gave me a pamphlet written by himself, and printed on paper made from New Zealand Flax. The gist of his argument was in favour of getting paper strong and yellow, as the bleaching process damaged the fibre. "An edition of the Bible," he said, "printed at Oxford on paper whitened with over-doses of chlorine, was found to be quite rotten in the course of a few years." At Dundee a manufacturer showed me New Zealand Flax scutched and dressed for spinning. I saw it also in the hands of a spinner at Bridport, in Dorsetshire, but in neither case had it got to be of any commercial value. What it may be in the hands of Mr J H D who seems to have superior machines for its preparation, I know not, but in

the affair of getting out the flint from straw, and from Esparto Grass, caustic soda seems to be the recognised agent at the present time. If, however he can, as he says he can, get the silex out without using this terrible agent, which has already driven paper-makers off the stream by poisoning the water, he will assuredly be considered a benefactor to society, and well deserving of the encouragement he solicits. The Chester and Holyhead Railway proprietors have made extensive plantations of Bent in the island of Anglesea, in the sand beds, to prevent the sand from being drifted over their line. This Bent is common in Scotland and in England, and I was informed by a papermaker that he had secured some miles of Bent to make his paper from, although, as a general rule, the Bent is strictly preserved to bind the sand hills. I have seen the ruins of the parish church at Forvey, on the Aberdeenshire coast, standing amid sandhills. The tradition of the place is, that the whole parish was sanded up in one night, and utterly ruined. A papermaker showed me a living plant of Esparto in a flower-pot, and when it was compared with a tuft of Bent from the seaside near Dunbar, "the foreign invader" did not at all look likely to displace the "native." There can be no question that the culture of Esparto in the best parts of any of the "three kingdoms" would not yield a profit for some time to come, as it would not be well established in less than one lifetime, while it could always be got from the place where it is indigenous at less cost than it could be cultivated here. I saw the earliest samples of Esparto bleached in Oxfordshire as "half stuff" for paper making; I carried samples of it to paper mills to let my friends see what could be made of it; I also got sheaves of Esparto in the port of Newcastle, and carried the sample to Edinburgh and elsewhere as a curiosity likely to be of "some service," and I saw in the stores of some papermakers bales of New Zealand Flax, disregarded, not as worthless, but as unprofitable in the trade. The following simple fact will set this matter in a clear light. The papermaker prefers rags to any other material for papermaking. Why is he so perverse in clinging to this the oldest and the dirtiest article in the trade? The cost of a pound of good cotton may be set down at 1s. The papermaker does not buy at that price. Cotton at 1s. per lb. is for the spinner, but the papermaker waits for my shirt till it gets into rags, when he buys it at 2d. per lb., the value to him being equal to the raw cotton at 1s. No wonder then that he grumbles at any Government scheme that tampers with his rags or tariffs his paper. The rag is purchased thus at 80 per cent. under its original value. Some years ago a member of the Royal Agricultural Society introduced to that body "the Edoe" and "the Tania" of the West Indies as a substitute for the Potato, and this plant was generously to be extended to Ireland for the benefit of the poor of that ilk; but, when the Edoe and Tania were translated by me into the ordinary botanical name of Caladium esculentum, it became a matter of no doubt, as every plantsman knew at once the exotic character of the plant, which was by no means new to English botanists. The Edoe and Tania scheme consequently fell to the ground. In like manner the New Zealand Flax was made into paper, and that paper printed 20 or 30 years ago, and its merits held up to the world by able hands. The Spanish Grass, too, has run its course, and is now thoroughly understood and duly appreciated. We grow our Esparto as we do our sugar and our cotton just where they grow best, and we manufacture them here, thus following out the true commercial rule of buying in the best and cheapest market. The cultivation of Irish Flax in Ireland is truly an Irish question of national importance, and it is thoroughly understood by many in the north of Ireland. I have seen a buyer tell the qualities of Flax submitted to him with his eyes shut, and the fine soft silky feel of first-rate Flax well easily convince any one that this can be done. I have mentioned this in order to point out to Mr. J. Hill Dickson and others that this is the direction for him to take with improved machines. The staple of Ulster is Irish Flax; the market is good; and the climate of all Ireland being suitable for its cultivation, it is a profitable crop, and gives employment to the natives, men, women, and children. Rain does not damage this crop as it would cereals, or even Potatoes. I should be sorry to say an unkind word to Mr J H Dickson. He is no doubt enthusiastic and ingenious; but he would be a brave man that would face the Atlantic in Connaught, and make a plantation of seedling Phormiums from 4-inch flower pots in an Irish bog, where "the unfeathered biped of Linnaeus" could not set a foot. Galway, the city of the tribes, is beautifully situated, and the mills on Ness' Island are turned by a stream of fresh water that an English inland town would give thousands to possess, and long may the New Zealand Flax specimen flourish in the garden of its college, but let that suffice. Should any loss occur, however, from further experiments, I have given your readers time to warn you. Der Forger Manchester, June 26.

Foreign Correspondence.

BAKER'S ISLAND is situated within a quarter of a mile of the equator, about 2500 miles west from the coast of Peru. It was discovered about the year 1818 by an American sea captain, whose name it bears, and in 1856 it became the property of the American Guano Company. Baker's Island is saucer-shaped, being elevated at the edges, and depressed in the centre. Its greatest elevation above the sea level is about 30 feet, and its extreme length about a mile and a quarter. Standing on the deck of the vessel, as you approach, you see a dazzling crest of gray sand, wreathed in a frostwork of breakers. The low outlines of the island,

with its single framed house, and the flagstaff, upon which you soon see the stars and stripes of the Union, remind you of a rakish monitor with its turret. The air above the island is alive with birds, which swarm like the flies of Egypt's plague; and, as you near the shore, you hear above the sound of the surf their discordant din, which is to echo in your ear day and night as long as you remain upon the island. It is barricaded on all sides by a coral reef, which stretches out into the ocean, and breaks the force of the incoming waves, so that this flat, sand-covered island is swept away by the storms. Outside of the reef, the downward trend of the island under water is so abrupt that an anchor will not grapple, but falls away toward the bottom of the deep ocean. For this reason it has been found necessary to anchor large can-boats on the side the reef, to which the guano ships can moor themselves while receiving their cargoes. Each buoy is made fast by means of two iron cables. One of the cables attaches the buoy to a large sheet anchor, the other passes from the shore along the bottom to another, and prevents it from sliding down the declivity into unfathomable depths. The island itself is of coral formation; it is a low reef, covered with broken shells, and fragments of coral, and has enough soil to support a stunted vegetation. From November to March or April the winds are variable and tempestuous, and the island is almost inaccessible. Proprietors and labourers then sail away together, leaving one or two persons to guard the property until the return of the trade wind, which for several months blows steadily from the south. It allows of a landing with comparative safety on the western or leeward side of the island, and the assumption of labour. The guano deposit covers the central part of Baker's Island, and forms a layer from six inches to three feet thick. It is a grey-brown powder, without smell or any offensive property. In this respect it differs very greatly from the Chincha Island guano, which has a highly ammoniacal odour. This difference in quality is to be explained by the facts—first, that the Chincha guano is deposited in layers of immense depth; and, secondly, that at the islands it rarely or never rains, while at Baker's Island rain falls with considerable regularity at the change of the moon. Thus the free ammonia is thoroughly washed out of the guano of Baker's Island, while it is retained in that of the Chinchas. The slow process of deodorization, however, but slightly affects the fertilizing properties of the guano. Estimates of the amount of guano on Baker's Island differ; the highest is over 2,000,000 tons, the lowest about 500,000 tons, and this is probably a more correct estimate of the larger one. But the American Guano Company, who still actively work this mine of wealth, ship from a hundred to one hundred and fifty tons during about seven months of the year, are fastidious in their method of transferring animal wealth from its native bed to the hold of a ship, as follows—A railway track is laid from the shore inland to some rich farm. Here the guano is shovelled into stout canvas bags, which are then taken on carts by mules, or by the Kanakas, to the landing place at the shore. In its transit over the track the car passes over one of Fairbank's scales, and its weight is accurately ascertained. At the beach each guano weighing about a hundred pounds, is placed on the back of an athletic Kanaka, who bears it to a whale boat, which is drawn up sufficiently far upon the beach to escape the power of the surf. In smooth water each boat will carry about a ton, but when the day is rough the load has to be reduced. While the boat is loading the men stand up to their waists in the water, holding its sides directly toward the surf, which beats furiously upon the beach, and would otherwise strike the side of the boat and swamp it. When a certain quantity has been given the order, each man gives the boat a shove, jumps in, seizes his oar, throws it into the rowlock, and "gives way" with all his might. The deeply laden craft, sunk in the water almost to its gunwales, cuts through the breaking surf which threatens to swamp it, and, to the wonder of the spectators, escapes into the open sea. Arrived at the vessel, the bag is hoisted by appropriate tacking over the side of the vessel, and emptied into the hold. New York Times.

Farm Memoranda.

BUSCOT, LEICHLADE.—An interesting visit was paid recently by the Cirencester Chamber of Agriculture to Mr. Campbell's large farms at Buscot. The first thing inspected was the 50-horse power Poulton wheel, working six eccentric pumps, and throwing some 2000 tons of water per 24 hours to the reservoir at Buscot village. Mr. Campbell will erect a distillery for the production of alcohol from Beetroot, and a new fattening stall capable of holding 400 bullocks, to be fed on the pulp. They next saw the Hop garden. The plants were remarkably healthy, but already ruined by the possession of 8 or 10 feet, were wonderfully free from disease, and seemed to bid fair to give a produce of 6 or 6 six cwt. per acre. There were 34 shearers in one clip, and point out what can be done by having the deeply cultivated and in a good mechanical state. Mr. Campbell has 300 acres of Beetroot, all planted after the 25th of April, and the greater part of the 300 can be irrigated at pleasure. The water, instead of being carted away, will be put into the irrigation pipes and carried by the force of the water some two miles away to the distillery. Some Beetroot seed was obtained from Prussia, and the rest from the North of France. The Beet is drilled on a system adopted by some of the Beetroot growers in France, viz., two rows 8 inches apart, with an intermediate row of 2 feet or 2 feet 6 inches. The reason for this is to allow a deeper cultivation by the horse-hoe.

GREEN'S PATENT SILENS MESSOR,

OR

NOISELESS LAWN MOWING, ROLLING, and COLLECTING MACHINES.

BY SPECIAL APPOINTMENT,
MANUFACTURER

TO HER MOST GRACIOUS
MAJESTY THE QUEEN.

The Extraordinary Success of GREEN'S PATENT LAWN MOWERS is a proof of their superiority over all others. During the last five years the demand has been unprecedented, which is a proof of their superiority over all others. The following are the principal points in their favour:—

- 1st. Simplicity of Construction, every part being free of access.
- 2d. They are worked with far greater ease than any other Lawn Mower.
- 3d. They are the least liable to get out of order.

IMPORTANT NOTICE.

Trial at the London Horticultural Society's Gardens, Chiswick, June 5, 1857, four competitors. — First Trial on level ground, Second Trial on uneven ground, Third Trial on intricate places, around trees, &c.,—when GREEN'S PATENT was unanimously declared to be the best in each Trial by COLONEL CHALLONER, DR. LIVINGSTON, and G. McEWAN, Esq., the appointed Judges, and on every subsequent Trial to the above have GREEN'S PATENT LAWN MOWERS carried off every Prize that has been given in competition for superiority in every point.

PRIZE MEDALS AWARDED TO GREEN'S PATENT LAWN MOWERS.

HORSE, PONY, AND DONKEY MACHINE.

GREEN'S PATENT LAWN MOWERS

have proved to be the best, and carried off every Prize that has been given in all cases of competition. Since the first year they were introduced (1857), upwards of 20,000 have been sold and upwards of 1,000,000 during the last five seasons.

T. GREEN & SON
warrant every Machine to
entire satisfaction, and
approved of can be returned
unconditionally.

PRICES of HORSE, PONY, and DONKEY MACHINES, including Patent Self delivery Box, Cross Stay complete; suitable for attaching to ordinary Chain Traces or Gig Harness.

PONY AND DONKEY MACHINES.

To Cut 26 inches	£13 0 0	} Leather Boots for Donkey, 18s. } Leather Boots for Pony, 22s.
" 28 "	15 0 0	
" 30 "	17 0 0	

HORSE MACHINES.

To Cut 30 inches	£21 0 0	} Leather Boots for Horse, 26s.
" 36 "	24 0 0	
" 42 "	27 0 0	
" 48 "	30 0 0	

Both the Horse, Pony, Donkey, and Hand Machines possess (over all other Makers) the advantage of Self-sharpening. The cutters being steel on each side, when they become dull or blunt by running one way round, the cylinder can be reversed again and again, bringing the opposite edge of the cutter against the bottom blade, when the Machine will cut equal to new. Arrangements are made that the cylinder can be reversed, by any inexperienced person, in two or three minutes.

HAND MACHINES.

To Cut 16 inches	..	£3 10 0	Suitable for a Lady
" 12 "	..	4 10 0	" "
" 14 "	..	5 10 0	Suitable for One Person
" 16 "	..	6 10 0	" "

To Cut 18 inches	..	£7 10 0	Suitable for One Person
" 20 "	..	8 0 0	Suitable for Two Persons
" 22 "	..	8 10 0	" "
" 24 "	..	9 0 0	" "

Packing Cases are charged at the following low rates, viz. For the 12-inch Machine, 3s.; 14-inch, 4s.; 16-inch, 5s.; 18-inch, 6s.; 20-inch, 7s.; 22-inch, 8s.; 24-inch, 9s. Parties providing themselves with Lawn Mowers are recommended to purchase the cases in which to stow them away, when not in use, to prevent them from getting damaged, if returned, two-thirds will be allowed for them.

The above MACHINES are made from the best materials, and of superior workmanship, are delivered Carriage Free to all the principal Railway Stations and Shipping Ports in England, Ireland, and Scotland.

HORTICULTURAL and AGRICULTURAL IMPLEMENTS, GARDEN SEATS and CHAIRS, FOUNTAINS, VASES, PLAIN and GALVANISED WIRE NETTING, and ORNAMENTAL WIRE WORK of every description.

Having very extensive Premises in London, we are in a position to do all kinds of Repairs there, as well as at our Leeds Establishment.

Having a large quantity of MACHINES in our Leeds and London Establishments, we are in a position to execute Orders on the day they are received.

THOMAS GREEN AND SON, SMITHFIELD IRON WORKS, LEEDS;
and 54 & 55, BLACKFRIARS ROAD, LONDON, S.

TEN FACTS WORTH KNOWING.

1. In the year 1843 the Horizontal Tubular Boiler was invented by J. WEEKS AND CO.
2. In the year 1855 WEEKS AND CO. discovered the superiority of the Upright Tubular over every other description of Boiler.
3. WEEKS AND CO.'S No. 6 is the only Boiler capable of warming four miles of 4-inch piping.
4. WEEKS AND CO.'S Cast Upright Tubular is 75 per cent. more durable than any Wrought Iron Tubular or Saddle Boiler that can be manufactured.
5. WEEKS AND CO.'S Upright Tubular Boiler is in constant operation at all leading Horticultural Establishments throughout Great Britain and the Continent.

6. The largest Hot-water Apparatus in the world was erected by WEEKS AND CO., and worked on their One-Boiler System.
7. WEEKS AND CO.'S No. 6 Upright Tubular Boiler (as exhibited at Manchester) has proved itself the most clean, efficient, durable, economical, and powerful Boiler extant.
8. WEEKS AND CO.'S Upright Tubular Boiler, after having undergone the most severe and critical tests for the last 15 years, has in every case proved itself the best for Horticultural purposes.
9. WEEKS AND CO. are daily receiving the most flattering Testimonials as to the satisfactory working of their One-Boiler System.
10. Write for their "ILLUSTRATED CATALOGUE" (12th Edition), post free.

LINDLEY, and G. McEWEN, Esq., the appointed Judges, and on every subsequent Trial to the above have GREEN'S PATENT LAWN MOWERS carried off every Prize that has been given in competition for superiority in every point.

PRIZE MEDALS AWARDED TO GREEN'S PATENT LAWN MOWERS.

FIRST PRIZE MEDAL AT THE INTERNATIONAL EXHIBITION, LONDON, 1882.
FIRST PRIZE MEDAL AT THE INTERNATIONAL EXHIBITION, DUBLIN, 1885.
FIRST PRIZE MEDAL AT THE NAMUR EXHIBITION.
FIRST PRIZE MEDAL AT THE GAND EXHIBITION.

FIRST PRIZE MEDAL AT THE LAEKEN EXHIBITION.
FIRST PRIZE MEDAL AT THE LIESENE EXHIBITION.
FIRST PRIZE MEDAL AT THE BRUSSELS EXHIBITION, on two occasions.
FIRST PRIZE MEDAL AT THE HAMBURG EXHIBITION.

THEY ARE THE ONLY MACHINES IN CONSTANT USE AT

THE ROYAL HORTICULTURAL SOCIETY'S GARDENS, SOUTH KENSINGTON
THE ROYAL BOTANIC GARDENS, REGENT'S PARK
THE CRYSTAL PALACE COMPANY'S GARDENS, SYDENHAM
ROCKHAM PALACE GARDENS
WARLBOROUGH HOUSE

THE HYDE PARK GARDENS
THE WINTER PALACE GARDENS, DUBLIN
THE DUBLIN BOTANIC GARDENS
THE LIVERPOOL BOTANIC GARDENS
THE LEEDS ROYAL PARK

THE HULL BOTANIC GARDENS
THE BOTANIC GARDENS, BRUSSELS
THE SUNDERLAND PARK
THE PRESTON PARK

AND IN MOST OF THE PRINCIPAL PARKS, SQUARES, ETC., IN THE UNITED KINGDOM.

HORSE, PONY, AND DONKEY MACHINE.

GREEN'S PATENT LAWN MOWERS

have proved to be the best and carried off every Prize that has been given in all cases of competition. Since the first year they were introduced (1856), upwards of 46,600 have been sold, and 25,000 of that number during the last five seasons.

T. GREEN & SON

warrant every Machine to give entire satisfaction, and if not approved of can be returned unconditionally.

PRICES of HORSE, PONY, and DONKEY MACHINES, including Patent Self-delivery Box, Cross Stay complete; suitable for attaching to ordinary Chain Traces or Gig Harness.

PONY AND DONKEY MACHINES.

To Cut 26 inches	£18 0 0	} Leather Boots for Donkey, 18s. Leather Boots for Pony, 22s.
" 28 "	15 0 0	
" 30 "	17 0 0	

HORSE MACHINES.

To Cut 30 inches	£21 0 0	} Leather Boots for Horses, 26s.
" 36 "	24 0 0	
" 42 "	27 0 0	
" 48 "	30 0 0	

Both the Horse, Pony, Donkey, and Hand Machines possess (over all other Makers) the advantage of Self-sharpening. The cutters being steel on each side, when they become dull or blunt by running one way round, the cylinder can be reversed again and again, bringing the opposite edge of the sutter against the bottom blade, when the Machine will cut equal to new. Arrangements are made that the cylinder can be reversed, by any inexperienced person, in two or three minutes.

HAND MACHINES.

To Cut 10 inches	..	£3 10 0	Suitable for a Lady
" 12 "	..	4 10 0	" "
" 14 "	..	5 10 0	Suitable for One Person
" 16 "	..	6 10 0	" "

To Cut 18 inches	..	£7 10 0	Suitable for One Person.
" 20 "	..	8 0 0	Suitable for Two Persons
" 22 "	..	8 10 0	" "
" 24 "	..	9 0 0	" "

Packing Cases are charged at the following low rates, viz.—For the 10 and 12-inch Machines, 3s.; 14 and 16-inch, 4s.; 18 and 20-inch, 5s.; 22 and 24-inch, 6s. Parties providing themselves with Lawn Mowers are recommended to purchase the cases in which to stow them away, when not in use, to prevent them from getting damaged; if returned, two-thirds will be allowed for them.

The above MACHINES are made from the best materials, and of superior workmanship; are delivered Carriage Free to all the principal Railway Stations and Shipping Ports in England, Ireland, and Scotland.

HORTICULTURAL and AGRICULTURAL IMPLEMENTS, GARDEN SEATS and CHAIRS, FOUNTAINS, VASES, PLAIN and GALVANISED WIRE NETTING, and ORNAMENTAL WIRE WORK of every description.

Having very extensive Premises in London, we are in a position to do all kinds of Repairs there, as well as at our Leeds Establishment.

Having a large quantity of MACHINES in stock at our Leeds and London Establishments, we are in a position to execute Orders on the day they are received.

THOMAS GREEN AND SON, SMITHFIELD IRON WORKS, LEEDS;
and 54 & 55, BLACKFRIARS ROAD, LONDON, S.

CARTER'S PRIMULA, CALCEOLARIA, and CINERARIA
 J. C. & Co.'s strain of Calceolaria saved from plants that were awarded a 1st Prize at the late International Show. The Cineraria and Primula stocks are also saved from the finest Prize Varieties, and cannot be surpassed.

CALCEOLARIA and CINERARIA	
Per packet—s. d.	Per packet—s. d.
Calceolaria, finest Hybrid 2 0	Calceolaria, Dobson extra fine 2 6

CALCEOLARIA INTERNATIONAL PRIZE. The Seed of this variety cannot be obtained elsewhere. The plants look 1st Prize wherever exhibited. Per pkt., 2s. 6d.

PRIMULA FIMBRIATA New scarlet. This is a decided novelty, being of a deep scarlet colour and cannot fail to be much admired wherever grown. Per packet, 2s. 6d.

INDIA RUBBER HOME at Manufacturer's prices, 60 feet (with complete fittings), &c.

JAMES CARTER AND CO., The Royal Seedsmen, 237 and 238, High Street, London, W.C.

Choice Flower Seeds for Present Sowing.
DOWNE, LAIRD, and LAING have the pleasure of offering the following choice Flower Seeds—

CALCEOLARIA, Hybrid, saved from a superb First Prize Collection, 2s. 6d., 3s. 6d., 6s. per pkt.

CINERARIA extra choice, saved from an unequalled assortment of mixed flowers, 1s. 6d., 2s. 6d., 3s. 6d. per pkt.

MOLLYHOCK, extra fine, saved from our own magnificent collection, in 2 colours, 6s. per collection.

MOLLYHOCK, extra fine, saved from our own magnificent collection, mixed, 1s. 2s., 3s. 6d. per pkt.

BEST Show saved from our unrivalled Exhibition Flowers, 1s. 6d., 2s. 6d., 3s. 6d. per pkt.

BEST Favor saved from a selection of the most beautiful colours, 1s. 6d., 2s. 6d., 3s. 6d. per pkt.

SHRUBS, Fringed (Red and White) saved from the finest strain in cultivation, 2s. 6d., 3s. 6d., 6s. per pkt.

SHRUBS, Fern-leaved (Red and White) saved from the finest strain in cultivation, 2s. 6d., 3s. 6d., 6s. per pkt.

Stamstead Park, Forest Hill, London, S.E., and at Edinburgh.

another excellent gardener—whose opinion, and justly so, is valued in the highest degree among his colleagues—that the immediate effect of pruning is the encouragement of a greater supply of sap to flow towards the parts that are left. The results that follow such an operation are no doubt such as to render this explanation plausible, but is it true? We do not say that it is not, but we ask by whom, and how, this alleged greater flow of sap to an amputated branch has been tested and gauged? Which sap is it that flows to the wounded part? Is it crude sap just pumped up from the roots? Is it elaborated sap?—if so, where does it come from? If you mutilate the top, does not the root suffer in proportion? Till these and a score of similar questions are satisfactorily answered, we must consider such statements in the light of plausible hypotheses, and nothing more. One class of observers see results and have to deal with them, seeing them daily they are naturally inclined to guess at causes for these results, without stopping to inquire whether or no they are correct in their surmises. Another class of observers make it their business to search after causes, and often miss their mark because they are imperfectly acquainted with results, which lie so close under their eyes that they fail to see them.

The following extract from a letter sent from Bangalore last October will be the best proface to the subsequent observations:—

"I am trying an experiment to grow MUSHROOMS from WHITE ANT-NEST SOIL, and will send you a note of the result. Indications of success are apparent. Would you obligingly publish a memorandum on the culture of Mushrooms for a new country where cultivation of them is unknown, but where several useful kinds grow in the month of September (our dampest month). I am making beds for trial, and getting the soil where they grow spontaneously brought in, but one cannot persuade the natives to try a new thing till they see some indication of success. The very simplest elementary rules would be best in a very short article, and we will try to apply Western experience, and the condition of soil and climate here. I believe we shall introduce the culture of Mushrooms in spite of apparent difficulty."

The common Mushroom occurs in almost every part of the world, where the temperature is not so cold as to destroy the spawn; and there are a variety of forms or species in tropical or subtropical countries, many of which are doubtless excellent for food. Some ten or more such forms occur in Ceylon alone, and perhaps if the continent of India had been as carefully investigated as Ceylon has been by Mr. THWAITES, they would be found to be scarcely less numerous there. Cultivation, indeed, has not hitherto been successful with any species except the true *Agaricus campestris*, of which several varieties, however, appear from time to time in our Mushroom beds. Spawn of *Agaricus arvensis* has been carefully collected and packed, but experiments as to its propagation have hitherto failed. We are, therefore, somewhat doubtful as to success in India with other marked forms or species, though the experiment is well worth a trial.

We should recommend in the first place the importation of some good artificial spawn, though we are not certain that it would retain its vegetative powers on transmission. We received many years ago some spawn of a very superior variety from Australia, which was put under the care of Mr. J. HENDERSON, one of the most excellent cultivators we had ever the pleasure of knowing, but its vegetative powers seem to have been lost, as it never made an attempt to run. Spawn, again, taken from the field, is far from being uniformly successful. We should recommend, therefore, in preference, the collection of the dung of horses, placing it in a large heap by itself, under a shady place, and turning it once or twice to prevent it getting sodden. The heavy rains of India might, however, prevent the dung getting into a favourable condition for the development of spawn; it might, therefore, be well to place it under an open shed, in which case it might require occasional watering. When the dung is found to be full of spawn, it may be used exactly like artificial spawn, mixing it well with the proper soil, without breaking it up too much, taking care that the substratum of soil is well drained, and modifying the treatment according to the necessities of the climate.

Experience alone will show whether a cellar or a shed is most conducive to complete development. There should be a thin layer of fine soil over the spawn, and a covering of hay or some other substance would probably in some cases be necessary. Many worse insect plagues would possibly have to be contended against, than in our own country.

It would be necessary to observe whether the Fungi which it is required to propagate spring from horse-dung or from that of other animals. A kind of *Spharia* grows very commonly on elephant's dung, but we are not aware that it yields any esculent Fungus.

As regards ant-nest soil, there is a species of *Podaxon* which grows very commonly upon it, which may possibly be esculent in the young state, when it somewhat resembles young *Coprinus comatus*; but we have no information as to any other Fungus which is developed upon it likely at all to be esculent. We shall be much pleased to know the result of this experiment, and to have specimens if any Fungi appear. M. J. B.

— We are glad to note that the ROYAL HORTICULTURAL SOCIETY'S MANCHESTER SHOW has proved more successful in a financial point of view than was at one time anticipated. The receipts, we are informed, were as follows: July 19 (5s.), 99l.; July 20 (5s.), 240l. 5s.; July 21 (2s. 6d.), 539l. 2s. 6d.; July 22 (1s.), 352l. 11s. 8d.; July 23 (1s.), 286l. 17s.; July 24 (6d.), 128l. 10s.; tickets sold previously, 112l.; refreshment contractor, 100l.; making a total of upwards of 1857l. This amount would probably have been doubled had the Society received that countenance and support from royalty which it was led to expect, and which, indeed, was publicly announced. As it is, considering the overwhelming attractions of the Agricultural Show, the comparative inaccessibility of the flower show, and the roughness of the local arrangements, the financial results of the Royal Horticultural Society's third visit to the provinces are more favourable than could have been expected.

— The Council of the Royal Horticultural Society has conferred on Mr. JOHN SHAW, of Bowdon, a 40 guinea Life Fellowship, in acknowledgment of the services which he had rendered to the Society in connection with the organisation of the Show just terminated at Manchester.

— The 1st prize BOUQUET at Manchester, exhibited by Mr. YATES, was so remarkable for its simple beauty as to call forth the special commendations of the chairman of the general meeting held on the 20th inst. Much of its effectiveness was due to the sparing introduction of single blossoms of a white-flowered *Panicum*, set a little prominent in reference to the other flowers, in which position the narrow recurving perianth segments had a most graceful and charming effect, while the cup was not sufficiently projected to appear obtrusive. This element, combined with the choice character, tasteful arrangement, and well-chosen colours of the other flowers, no doubt won for Mr. YATES' bouquet the position it so worthily occupied in the prize lists.

— Mr. WILLIAMS exhibited at Manchester a new form of *Todea*, which is to bear the garden name of *TODEA INTERMEDIA*, indicative of its appearance, which is exactly intermediate between that of *T. hymenophylloides* (pellucida), and *T. superba*,—sufficiently so to suggest the idea that botanically these plants may form but one species. The plant had been imported amongst others from New Zealand. It has the stalked fronds of *T. hymenophylloides*, while the lamina, instead of being plane, is fringed after the manner of *T. superba*, though in a less degree.

— One of the most interesting exhibitions at the recent Manchester Show, and one but briefly alluded to in our report at p. 741, was a collection of GRAPES, from Dalkouth, Austria, the gift of the application of BOTTOM-HEAT to the roots of the Vines. The collection consisted of White Frontignan, Grizzly Frontignan, Muscat of Alexandria, Reeves' Muscadine, Rivers' Muscadine, Chasselas Napoleon, Black Alicante, and Royal Muscadine. They had all been cut from one house; had all been planted in May, 1868, chiefly from eyes of that year; and had all been subjected to a bottom-heat from piping placed under pavement, varying from 90° to 105°, except in the case of one Vine, a Royal Muscadine, which had had no bottom-heat. Though under equal circumstances this latter variety would have preceded the Muscat in ripening by at least two months, its fruit under the conditions above indicated, was not so much matured when exhibited the other day as was that of the Muscats grown in the same atmosphere but with bottom-heat in addition. This is a striking fact in support of Mr. THOMSON'S views.

— From a schedule now before us of the Royal Society of Horticulture and Agriculture of Tourney, which this year celebrates its second jubilee, or its 50th anniversary, we learn that a great INTERNATIONAL HORTICULTURAL and POMOLOGICAL EXHIBITION is to take place in that town, from the 12th to the 15th of September next. The schedule extends to 143 classes, divided into five sections, viz., pomology (fruits and fruit trees), 61 classes; horticulture (ornamental plants), 61 classes; out flowers (Roses, Dahlias, and bouquets), 20 classes; garden requisites (vases, aquariums, tools, &c.), 10 classes; vegetables and cereals.

The Gardeners' Chronicle.
 SATURDAY, JULY 31, 1869.

MEETINGS FOR THE ENSUING WEEK.
 Monday, Aug 30. Royal Horticultural (Fruit and Floral Committee), at South Kensington, 11 a.m.
 Tuesday, Aug 31. Daily (General Meeting), 2 p.m.

We have often had occasion to comment on the backward state of VEGETABLE PHYSIOLOGY in this country. Other branches of botanical science have their representatives here, but with few exceptions there is scarcely a Botanist who has turned his attention to this department. In the LINDLEY SCHOOL of departments of botanical science, the application of the principles of vegetable physiology, as known at the time at which he wrote, to the details of practical routine, his reputation in the future will assuredly not rest on his personal contributions to vegetable physiology in the restricted sense in which we here use the term. The fact is that so far as its application to practice goes, vegetable physiology is in much the same state as therapeutics are to medicine. The foremost physicians now-a-days have acquired a marvellous insight into the symptoms and consequences of diseased action. They are enabled to ascertain the actual condition of a sick man—to predict the probable course of his malady—to say with something next to certainty what appearances will be presented after death. They know, too, what will in all probability be the immediate effects of the drugs they administer. But when it comes to a question as to how these drugs produce their peculiar effects, or as to what will be the effect of their prolonged administration on the disease, they are for the most part utterly at a loss. They can do much to alleviate, more to prevent disease, but to control it, in the sense in which an excellent practical gardener the other day used the term, is, in the majority of instances, quite beyond their power. The application of what is known in vegetable physiology to practical horticulture is in an equally unsatisfactory condition. Plants are analysed, their composition is ascertained, water is tested, the nature of soils and manures accurately determined, and what then? We have got results valuable enough in a chemical point of view, it is true, but we want something beyond this. We have the plant itself as a machine for action to consider. Let us explain our meaning. An excellent gardener asserts, that lime is injurious to Vines as sand is beneficial. Assuming the fact to be as stated, will any mere chemical analysis of the dead plant (the product of analysis, of course, implies the death of the plant), any investigation of the soil, give the reason for this fact? It may do so, but we venture to think that the probability is that it will not, and this because the experience of other practitioners, under different circumstances, is different from that of Mr. CRAMB. Certainly no one who has seen a French or a German vineyard would infer that lime was injurious to the Vine. We turn to another subject. We are told by

21 classes. The attention paid to fruit-culture, as well as plant-culture in Belgium, is well known, and hence the Tournay meeting may be expected to be one of the most interesting horticultural gatherings of the ensuing autumn.

— We are glad to record that on the occasion of the meeting of the Royal Horticultural Society at Manchester, His Grace the Duke of Devonshire treated the whole of the young gardeners and labourers employed in the gardens at Chatworth to the number of upwards of 60, to Manchester to see the exhibitions, His Grace paying the whole of their expenses.

— In a recent number of the *Bulletin de la Société Botanique de France*, M. ABOLHE TOUQUAINE describes a curious ANOMALY in the STEM of *ALLES PECTINATA*. The trunk of the plant in question had attained a height of between 6 and 7 feet without producing a single lateral bud. The diameter of the trunk (about an inch) is nearly the same at the top as at the base.

Each year's growth is marked by an annular cicatrix, of which there are sixteen. The leaves remain only on the shoots of the year and of the preceding one. This constant suppression of the lateral buds is a very singular phenomenon in such a plant. What excellent hop-poles such trees would make.

Under the name of LOOKER'S PATENT EARTHENWARE PROPAGATING BOXES, we have received a specimen of a box intended for raising or forcing any kinds of seeds, plants, or cuttings. The boxes, or pans, are made of ordinary pottery-ware, of any required shape or size. The top of the boxes is made slightly sloping, with a groove in which a piece of glass is fitted to slide. These boxes will be useful to those who do not possess a greenhouse or forcing-pit, and they will be found serviceable for the separate growth of choice seeds and cuttings within all glass buildings. In principle they seem nearly identical with BENDLE'S Plant Protectors. The value of this invention depends to some extent upon the cost at which they can be retailed, as a common seed-pan with a glass cover would answer the purpose equally well.

New Plants.

ORCIDIUM HYPLEMATIUM, sp. n.

Panicle laxa, sepalis ligulatis scotis margine repandulo-undulatis; petalis subquadrilobis, labello cucinato utriusque angulato, antice reni formi cum apiculo, basi quibusque lamellato, lamellis externis abbreviatis, internis longioribus antice retratis, columnae alis quadratis, buccis semiovatis.

Rhizoma pulv. usculena, radicans. Pseudobulbi rotundi acicipes oblongo ligulati depressi utrinque per discum tricuspidi, monophylli. Folia oblongo lanceolata apice obtuse acuto inaequali, sessili, a foliis duobus vaginatis stipati, cum vagina articulatis, circa vaginam membranaceis, lamina brevioribus. Pseudobulbus junior minus argute costatus. Pedunculus longe exsertus viridia maculis plurimis stragularibus, in divaricatus, vaginula acuminata artia, superne ramulosis, ramuli valde breves racemose in thalamo sessilibus sistentes. Ovaria posticellata labello subaequali, bracteis triangularibus scariose punctata sepalis cucinate oblonga acuta valde undulato-crispa, costata, limbo hinc inde, extra orbem latera et costae, interna curvata disarcinata, petala basi lata sessilibus, latera angulis in disco natis, colorum ex al. labello in basi lata mucronata, utrinque angulato-arteri formi dilatatione antice excisum cum apiculo, superne pulcherrima citrinum, infra purpureo latera in cut. lacinae punctis pallidis sulphureis; carum abscisum lateralis ante postice, media elevata, omnes basi r. d. line. alabastrina anthera obovata, glandula purpurea, alba antea, labello foeml semiovate crenata, fovea oblonga undulata, tubula infrastigmatica utrinque obtusangula.

We named this plant the first for Messrs. Backhouse, of York. It flowered later in Mr. Lunden's nursery. It appeared in October of last year at South Kensington before the arceopage of the Floral Committee, the specimen belonging to W. Wilson Saunders, Esq., and grown by Mr. Green. The beautiful colours won the hearts of the judges, who felt puzzled at the new name (bloody beneath), alluding to the flower being of a blood-red colour on the outside. Sometimes the plant takes the liberty of getting triandrous, thus breaking the ordinary rule. It may come from Western South America, New Granada or Peru, or Ecuador. H. G. Rehb. fil.

CYPRIPEDIUM PARISHI, R. M. F. *Ante Cypripedium glanduliferum, pediculis longissimis apice obtusis.*

circum apiculis in Marbo (2-3 in quovis petalo); staminodii in necto oblongo emarginato basi cornuto.

Cypripedium Parishii, Rehb. fil. MS. in litt. et Rev. C. Parish in Herb. Acad. in Bonn, Jan. 1896. (The Elephant-crushed Lady-slipper.)

Polla latissime ovata apice truncata bifida, reniformi. Pediculus ovatus, apiculis petaloidibus, nectario sessilibus, apice in necto oblongo emarginato basi cornuto. Ovaria posticellata labello subaequali, bracteis triangularibus scariose punctata sepalis cucinate oblonga acuta valde undulato-crispa, costata, limbo hinc inde, extra orbem latera et costae, interna curvata disarcinata, petala basi lata sessilibus, latera angulis in disco natis, colorum ex al. labello in basi lata mucronata, utrinque angulato-arteri formi dilatatione antice excisum cum apiculo, superne pulcherrima citrinum, infra purpureo latera in cut. lacinae punctis pallidis sulphureis; carum abscisum lateralis ante postice, media elevata, omnes basi r. d. line. alabastrina anthera obovata, glandula purpurea, alba antea, labello foeml semiovate crenata, fovea oblonga undulata, tubula infrastigmatica utrinque obtusangula.

Leaves broad, ligulate, 1/2 in. long, hairy, 2 feet long, bearing a 1/2 flowered raceme at its extremity. The bracts are triangular or oblong, blunt, in cl. shorter than the villous stalked ovary. The upper sepal is concave-oblong acute, with one strong

to the most mysterious tales, which were certainly not diminished in oddity by passing from one to another. We are indebted for a story of this kind to Mr. Wentworth W. Buller, but it is a very simple one, and is no doubt true; indeed we have been told much more surprising things than this. The fact is, that the Rev. Mr. Parish put his fingers on this celebrity near the Siamese frontiers as he came from Burmah—we scarcely think he would be anxious to indicate the exact quantity. But now the myth has begun. Mr. Parish was in the company of one, or of two, or of three, or of four, or of a herd of elephants. And whether one, or a herd, all authorities are unanimous that all the elephants had loads of Orchids, lots of new Vandas, Phalaenopsis, Aerides, new genera, numberless Dendrobies, and our *Cypripedium*. On the return to Moulemein the animals got ill-tempered; whether because they did not get a dram, or because they were tired of being in a narrow path in a forest we are not sure, but the latter our just quoted authority declares to have been the case. Now the elephant, or the elephants, throw off their loads and danced, either a pas seul, or a polka, or a quadrille, or a grand ballet dance, on the poor plants. There has seldom occurred such a devastation of the most wonderful materials, and though we have seen many laugh at the funny tale, we may add that it must have been a very melancholy sight for the collector to see the effect of such hard work destroyed, particularly as he is such an ardent lover of good plants. After all, the discoverer, who had spent, as we hear, a very long time during his trip before he found good things, saved but very few plants. We believe we have seen nearly all. The strongest plant was Mr. W. Buller's, who sent it to Messrs. Vortch, a good specimen is at Kew Gardens, one we saw some time ago at Mr. Day's; one at Mr. Sigismund Rucker's, and we believe one is in the Dawsonian collection.

We are indebted for a highly interesting letter on this wonderful plant to Wentworth W. Buller, Esq. We have to thank Messrs. Vortch for a fresh flower and for a very well executed sketch of the whole plant. The novelty was long since expected by us, and yet it came quite a *deus ex machina*. H. G. Rehb. fil.

ON THE IMPROVEMENT OF PLANTS

BY SELECTION, HYBRIDISING AND CROSS-BREEDING, BY DAY AND SO CAL REFERRED TO THE HOLYBROOK AND THE ROSS.

[Read at the Manchester Congress, July 21, 1900.]

THERE are two important methods of procedure open to him who may wish to engage in the modification, or improvement of plants, 1, selection; 2, hybridising and cross-breeding. The first method, "selection" is exceedingly simple, and may be successfully followed by any one who possesses or who may acquire the habit of observing correctly. The second method, "hybridising and cross-breeding," is more complex, and requires, in addition to the habit of observing correctly, an acquaintance with at least some of the laws of vegetable physiology. In adopting the former, we seize upon certain variations or phenomena which we meet with in Nature and endeavour to "fix" or render permanent that which we are accustomed to call accidents; in pursuing the latter, we start with a conception which we labour to convert into a fact. To the mere man of business, selection is usually the more attractive, the method is more suitable to his habits of thought and practice; but to the scientific mind hybridising or cross-breeding are usually more inviting and the results more satisfactory. To both methods are we largely indebted for improvements in the vegetable kingdom, and it would be exceedingly difficult, perhaps impossible, to say how much we owe to the simple process of selection, and how much to the more complex and scientific labours of the hybridist.

It will be my purpose to-day to place before you, as fully and clearly as I can, a few instances of improvements by both processes, drawing, as far as practicable, from my own observations and experiments.

First of selection. It is well known to observers in this field that most plants, and especially cultivated plants, when raised from seed, are prone to vary. The earth was made so various, that the mind of desecrating man, studious of change, and pleased with novelty, might be indulged.

keel on the dorsal surface. The inferior sepal is smaller, and bent under the ovary, so that the two sepals stand very near one another. Both are nanken coloured, with numerous darker veins, which are green outside. The petals are linear-ligulate, undulate at the upper part, blunt and hairy at the apex; the basilar part greenish, with numerous black or brown shining dots, some of them being callous, the superior part port-wine coloured. The lip has the usual channelled ungues, the sac is conical with two projecting angulate arms, and these have at their posterior base a triangular plate descending in the sac. The column is olive-green coloured. The stamens are triangular, bearing a horn at its base, two diverging teeth at its apex, green in the case, white on the margin. The stigma is roundish. The flower is in shape like that of *Cypridium Lowii*, but the petals are diverging, pendulous. The chief feature of the plant lies in its bearing two or three prominences on the sides of the petals, covered with hairs, stars, if you like. Yet it is not the first *Cypridium* with such decorations. The only species that comes near it, *Cypridium glanduliferum*, Bl. in *Magne Bl. olim*, not of Wallich's *Rumphia*, 1791, which has similar stars. Yet our specimen shows that that species has straight leaves, the stem node is acute and the petals are shorter and acute. It came from New Guinea, and may have been discovered by Zippelius, who was a very clever man, whose manuscripts were much used after his death, though not with a authority.

Old celebrities, in the good old times, among the Greeks and the Romans, gave origin to mythical tales. That is the lot of our plant. Its discovery gave origin

[1862]

... handful of seed, and in some cases scarce any of the young plants which arise therefrom, prove identical; there is a difference in size or appearance, in form, colour, or texture. This shows an inherent capacity of progress or development. It is more marked in cultivated than in wild plants, and the tendency increases under cultivation, yet it appears in all states. Among wild plants I have met with no more striking example than that of the Lychnis viscaria, which grows plentifully in the hedge rows surrounding my nurseries at Waltham Cross. The seedlings of some of these self-sown plants are much more than others, some are of a deeper colour, and some of a smoother aspect and more rounded form. The Lychnis, the Dog Rose (Rosa canina) is another case in point. Examples of this fact are, however, plentiful in Nature, and might be adduced almost without limit if required. But it is only by selection and sowing that the most attractive forms of these plants can be fixed and turned to practical use. The advanced Lychnis, if neglected and sown in its native wilds, would probably produce offspring for the most part similar or inferior to itself, except rarely and at long intervals of time. If, however, removed to a superior soil, more highly fertilized, and the seeds sown from the most attractive only, the improvement would probably go on steadily but regularly from generation to generation. To elucidate further the principle and results of selection, let us suppose an intelligent agriculturist sowing in his wheat-fields some individual plants that are more vigorous in growth, or more prolific, or stouter, and fuller in the ear than those by which it is surrounded. He wishes to retain this variety knowing that if he can succeed in so doing he will thereby increase his crop. He sets a mark upon this seed, and sows the seeds separately, selects again the next year from year to year, those most in advance, be they few or many, until the variation first noticed has become constant and fixed, and perhaps even further improved. This process of selection usually requires to be pursued through several generations, some of the individuals from each successive sowing continuing to adhere to the line first indicated, and the whole drawn closer together, till in the end he establishes the identity or constancy of the race. Once established or fixed, the variation will remain an improved race or type, and if the individual plants composing it are not perfectly identical, they are yet sufficiently so for practical purposes. In this instance we have supposed a case of selection for a prolific tendency, but the same principle may be applied to any other desired improvement, as the quality of grain, earliness or lateness of ripening, quantity or quality of straw, or so on. Or, to take another case, suppose a farmer to be desirous of obtaining a larger size of the root and the small size of the top of his Turnips, a root that has stood the frost uninjured, while others surrounding it have been severely damaged; he selects the Mangel with the least of increasing the weight of his crop without drawing too much from his land, the Turnip for the sake of obtaining a harder race of this valuable root, and follows up the process of cultivation already described until he fixes the recognised and coveted variety.

As with the agriculturist so with the market gardener, the superior vegetables are in great part due to the judicious selection of the individual plants from which he saves his seed. Perhaps half-a-dozen of the finest and closest heads of white Broccoli are selected from many acres as the source of the crop for the coming year, and other vegetables and flowers, such as Cabbages, Lettuces, Stocks, &c.—are subjected to the same careful process of selection.

To continue our seed-growers work on the same principle, although in place of leaving a few only of the best, the quantity of seed they require compels them to be just satisfied with eradicating a few of the worst, and the value of their crop of seeds is, or should be, in proportion to the thoroughness of the selection, and the growers term it, the purity of the stock. In the Bill on the adulteration of seeds, now before Parliament, a clause could have been inserted requiring the purity of the stock, I should have considered that by far the most important part of the measure.

I have intentionally given prominence to the above, because I believe the farmer, market gardener, and seed grower, whatever attention they may be giving to cross-breeding now, have in the past derived their improvements chiefly, if not entirely, from selection, whereas, the horticulturist has been for many years past working more or less ardently in both fields. There has, however, I believe, even with him, been recently but little hybridising or cross-breeding, with vegetables, more, perhaps, and for a longer period, with fruits; and most of all, and for the longest period, with flowers.

The vegetables and flowers which I have improved by selection merely are somewhat numerous among the former, Parsley and Brussels Sprouts.

Parsley was the first plant I endeavoured to improve by selecting for seed one or two of the best plants from a large bed, the unusually double or curly leaves of the selected plants having pleased my fancy. The result was striking in the following year that I was encouraged to persevere, and did so from year to year with increasing success, until Paul's Parsley became household words. Brussels Sprouts, the seed of which it was considered necessary in those days to import from the Continent, was the next plant taken in hand, and I proved over a series of years, to my own satisfaction at least, that it was neither the Continental soil nor air, but the practice of a rigorous selection that gave to the Continental seed an acknowledged superiority. The Aster was the next plant taken in hand, and

with the same results. Stocks, Pansies, Roses, Cinerarias, Hollyhocks, Zonal Pelargoniums, Chinese Primulas, and Polyanthus were taken up in due succession, similarly dealt with, and similarly improved.

The Hollyhock would seem to demand at my hands more than a passing word. To the improvement of the flowers of this plant by selection I gave long and close attention from the year 1833 to 1857. Let me submit to your notice some of the results of the sowing of seeds from selected plants, without the intervention of artificial fertilisation. The variety *Gracia Mundi* (yellow) gave *Salpaurea perfecta*, *Argo*, *El Dorado*, *Queen of the Yellow*, and *King of the Yellows*, all yellow flowers, and *Charles Barron*, buff. *El Dorado*, a smooth yellow flower, gave yellow flowers only, a bright in colour, but rough and irregular in form. *Lady Willoughby d'Eresby* (cream colour, gave a lot of rough dirty whites. *Lady Franklin* (deep pink) reproduced itself, and also gave sundry good rose-coloured flowers. *Lady Palmerston* (blush) gave a very fine brood of peach-coloured and pink flowers. *Purple Defiance* (purple) gave a rough lot of purples. *Attraction* (pink) gave a fine brood of pinks. *Prinzess Royala* (cream and chocolate) gave a rough lot of dirty cream and chocolate coloured flowers. *Crasader* (pink) reproduced itself, and also others of similar colour, varying in form. *Celestial* (blush) reproduced itself, and various shades of blush of superb quality. *Mission* (a fine crimson flower) produced regularly some plants bearing crimson, and others bearing purple flowers. *Omar Pacna* (cream edged with white) reproduced itself. A purple seedling of good form and substance gave some purple and some blush-mottled flowers of very indifferent quality. A salmon-coloured seedling of fine quality gave flowers of the same colour, but of indifferent form. A fine dark shining crimson seedling gave flowers, orange, fawn, and buff, of middling quality, but no crimson. A white-edged seedling gave flowers like the parent, but as a rule not so good. A fine rosy peach-coloured seedling gave rubbish. A nankoen-coloured seedling reproduced itself almost without variation. A pure primrose seedling of very high quality gave some primrose-coloured flowers and some primrose with dark base, usually inferior to the parent. A French white-veined seedling gave a lot of prettily and variously veined flowers. An orange-buff seedling gave also some few prettily veined flowers among many very rough ones, of the colour of the parent. A fine purple seedling gave purple, marbled, maroon and lilac flowers, all of superior quality.

Now it might appear at first sight that the above results are in accordance with the theory of improvement by selection, or merely that it is not really so. It must be to it that the above is a record of general results only. In most cases the original variety in some way have been selected, and the result of one year's sowing only, and it certainly proves that a variation cannot always be fixed by a single effort, which we are perfectly free to admit. It shows also the tendency of the mass of seedling plants raised from cultivated or advanced varieties to revert to a less civilised state. It shows further that a variation once obtained, new ground once broken, often proves a fertile source of further variation and advancement. But of this I shall give an example by-and-by. Now I do not think that the variation in colour recorded in some of the above cases was due to fertilisation either by insects or other instrumentality. But it might be so. I merely express an opinion on this point, founded on the fact that the progeny of some varieties varied but slightly throughout successive annual sowings, whereas that of others varied greatly. The inference I should draw would be, that some variations are capable of a more rapid development, some are more sportive, and some more readily fixed than others.

It will be further inferred from the above facts that the finest flowers do not always produce the finest progeny. And I have found this circumstance corroborated in dealing with other plants. Certain individual sorts furnish a fine brood, others, apparently equally good sorts, an indifferent brood. Sometimes a flower or fruit of indifferent quality will produce a high-class progeny, and a high-class flower or fruit an inferior progeny. The whole question, I admit, beset with difficulties, and offers a fine field for observations and experiments. The exceptions to the rule, that the best flowers proceed from the best parents, are numerous. Notwithstanding, unless we possess special knowledge we cannot do better than work upon this rule, for if we reject it we have nothing so good to put in its place.

One word as to the special knowledge just alluded to. Now and then a variation, peculiarly fitted for the work of progress, will arise. Many years ago, a Pansy, named *Queen Victoria*, raised by the late Mr. Thompson, of Iwer, proved of this character; and more recently the *Roses Général Jacqueminot*, *Jules Margottin*, and *Victor Verdier*, may be taken as prominent instances. From these in their day, and for a certain period many more good flowers were raised than from all others of the period put together. Now, if one acquires this special knowledge there is sure ground to work on. But I know of no law by which this quality of a plant can be determined in advance. In the present state of our knowledge, I conceive that it can only be ascertained by observation and experiment.

I have raised many thousands of seedling Hollyhocks, Roses, Zonal Pelargoniums, and other plants, simply on the principle of gathering the seed from the most advanced plants and flowers without any attempt at cross-breeding. My success under this method of proceeding has been greatest with Hollyhocks, as I could claim at one time (about 1857) the finest Hollyhock of almost every colour as of my production. This I account for by the fact that the subject was a good one for experiment. Although a flower long known to us, it had not been long subjected to high culti-

vation, and was fully ripe for improvement. With the Rose the case was somewhat different. It had been experimented on by clever and industrious men in France for a number of years, and doubtless I was here traversing ground which some of them had exhausted long before. However, success here has not been altogether denied me and to which I shall have occasion to allude by-and-by. Of Zonal Pelargoniums, I was fortunate enough to become the possessor of a remnant of stock left by the late Mr. Donald Beaton, and while many of the variations and improvements that have issued from my nurseries are the result of mere selection, others have been carefully and systematically bred. The Polyanthus is a flower with which I am now carrying on experiments, with the view of rendering it more available in spring gardening. Four years ago I selected certain colours from a bed of mixed seedlings, with the view of saving the seeds of each separately, hoping in time to be able to reproduce each colour true from seed. The first sowing produced all colours from each variety, and while subsequent sowings have done the same, yet each successive sowing brings a larger proportion of the colour of the parent, and I do not doubt that ultimately each variety will become fixed, that is, will reproduce itself true in colour from the seed.

With regard to the progress of improvement after selection, it would appear that the greatest progress does not take place when the variation is young. The most marked progress from a cultivator's point of view seems to occur when the variation has been some little time under cultivation, but before it loses the extra vigour not uncommon to selected variations. A case illustrative of this view has recently come under my observation. It is that of a plant of the *Primula sinensis*, which I recent y exhibited before the Royal Horticultural Society, under the name of *Waltham White*. It is a white-flowered variety with red leaf-stalks (the white-flowered variety has commonly greenish white leaf-stalks). The growth is exceedingly vigorous, the plant bearing a huge pyramidal truss of large pure white flowers, of great substance. It is, in fact, a giant among Primulas, and a giant of goodly and fair proportions. Now nothing could have been more unpromising than the original variation from which this grand result has been obtained. It was a coarse weedy-looking plant, bearing rough misshapen flowers, but there were the distinct features of extraordinary vigour, and the red leaf-stalk. The first year's sowing from this plant produced more variation than improvement, the second more improvement than variation, and now, in the fourth year the characters above described seem fixed for all the seedlings raised from a choice pod of seed have blended so nearly alike in colour, size, form and habit that the variation may be fairly pronounced as proved and fixed.

Thus far I have confined my remarks to the variation of plants from seed which appear to arise spontaneously, and are of everyday occurrence. But there are other variations occasionally taking place, which are known to cultivators under the name of "sports." Sports are variations from the leaf-bud rather than from seed, and I class them under "selection" because in their case man does not intentionally step in with the view of giving a turn to the workings of Nature. Cultivation may, and in many cases probably does, induce "sports," but cultivation is not deliberately pursued with that object. As an example of these we may instance the well-known case of the *Nectarine*, which was a sport from the Peach, that is, a branch of a Peach tree produced the smooth-skinned and otherwise different fruit known as the *Nectarine*. My first efforts at improving the Rose were made in 1833, and were induced by discovering a sport. I observed a branch and flower of the *Bourbon Rose Proserpine*, then recently introduced, of extraordinary vigour; the flowers were larger and somewhat lighter in colour than in the original, the leaves were of a lighter green, more obtuse, and destitute of the customary red nerves and red colouring round their circumference. This, which I believe I am right in speaking of as a sport, was nevertheless not a very marked example of this tendency. It was cultivated separately and fixed, but did not depart sufficiently from the original to be thought worthy of a new name, and was consequently sold as a superior variety of the *Rose Proserpine*. About the same time I observed a branch of the *Rose du Roi*, bearing pale flesh-coloured flowers. This branch was propagated, and the new colour fixed. When about to distribute this as a novelty, to my surprise I received it from France under the name of *Celina Dubus*. Now, although I know nothing of the history of *Celina Dubus* as received from France, I yet know that it was identical with my sport, and I think it is reasonable to conclude that it originated in the same way. Also about the same time I observed a branch on the *Rose Dr. Marx*, producing leaves finely striped with gold, and a branch of the *Bourbon Queen*, with leaves beautifully variegated with white. Both of these sports were propagated and fixed. Of *Roses*, the *Moss Rose* group is the most inclined to sport. I have, in days gone by, frequently seen two or three varieties of the *Moss Rose* growing on the same plant. I have seen the *Baronne Prevost*, which is naturally a double rose-coloured flower, produce striped flowers, and others nearly single. I have also seen Mrs. Bonquet, a white Rose, produce a branch bearing red flowers.

But the most notable recent case of this tendency is that of the new double crimson Thorn; and this is remarkable in having been observed in two different places about the same time. It should be told, however, that both these plants had been purchased from the same stock. The particulars of one case are as follows.—A tree of the double pink Thorn had been planted in a garden some 15 or 16 years, when a branch was observed to have started away from the centre of the tree with unusual vigour. It flowered, and the flowers were crimson instead of pink, presenting a

marked contrast to those on the lower part of the tree. The leaves, too, were of larger size, greater substance, and more deeply lobed. Young plants were propagated from this branch by budding and grafting, and the character was fixed.

A few words with regard to the fixing of variations or sports seem desirable here, and with that I shall close this part of my subject. We have seen that variations or sports are, when reproduced from seed, liable to vary greatly in character, with a general tendency to revert to the type. From the first sowing there will probably be but few like the variation, but by successive repetitions of the process of sowing and selecting the variation is at length fixed. It is thus that many of our rare annuals, as *Asters*, *Stocks*, *Clarkias*, *Candytufts*, *Tropaeolums*, and the like, readily propagated otherwise than from seed, have been obtained. But the process of fixing variations or sports from the leaf-bud is almost certain to proceed without interruption. You graft, bud, or make cuttings of the sported branch or plant, and the plants so propagated remain unchangeable. *William Paul, Waltham Cross.*

(To be continued.)

Home Correspondence.

Large Rhododendrons.—Seeing an account of a large Rhododendron at page 764, I send you the measurements of one growing on my lawn here. It is 37 feet 9 inches in diameter, 116 feet in circumference, and 11 feet 8 inches high. It is a mass of bloom every year at least from a great distance. *G. T. Meynell, Meynell Langley, Derby, July 28.*

Climate of Cornwall.—People greatly mistake the climate here it is variable in the most superlative sense. The thermometer to-day (July 20) shows 30° heat, but on the 21st it fell to 18°. Yesterday the thermometer stood at 80° in the shade, last night with a brisk wind. In May and June last we had a lightning wind with frost; nine years ago we had a frost, which killed all our out-of-door plants. The mildness of the extreme point of the county where the early Potatoes are grown is accounted for by the sea air constantly passing over it. The same reason explains why Mr. Smith at the Scilly Isles grows most of the New Zealand plants, *Mesembryanthemums* and *Pearaeums*, into large bushes or shrubs. By the by, an account of this place would be interesting to many of your friends, and would show many evidences of the effect of sea air in warding off Jack Frost. *Henry Miles Esq, Penryn, July 20.*

Humming bird Moth. Yesterday caught a variety of the humming bird hawk moth, which I have not hitherto seen in those places where the more common variety is found. This is more truly a moth, as it flies at dusk, and its wings are of a soberer kind than those of the day one. Its dimensions are extraordinary: spread of the wings, fully 4½ inches; length of body nearly 3 inches, diameter of the body at thickest part, nearly ¼ inch. Its colours are brown on a dusky white ground, suffused with pink, and the body is barred across with brown on a similar ground. It has a proboscis like that of the day variety of the same species, but with a differently shaped wing; and it flies and hums before a plant just like the former. I should be glad to know whether similar moths have been observed by others, and also what its proper name. *Alexander Boyle, Narberth, July 16.* [Surely not a variety of the Humming-bird Moth.]

The Vegetation of New Zealand, though rich and varied, and including many fine timber trees, is, except the so-called New Zealand Flax (*Phormium tenax*), comparatively little known as furnishing articles of British commerce. The country, however, abounds in plants which are in some way or another useful to the natives, and there was more especially the case before the colonisation by Europeans. The genus *Cordylina* was, and is still to be used amongst the economic series: all the species are more or less valued for various economic purposes. The large "Ti," or Cabbage tree (*C. australis*), is, however, the most useful, for its roots, when cooked, furnish a regular article of food; the heart, or young inner leaves, which are blanched by closely growing together, are also eaten both in the raw and cooked states; besides that they are still used to some extent for plaiting into articles of clothing, mats, baskets, &c., as well as for thatching huts, for which purpose they are very durable. From the fibres of the leaves of *C. indivisa*—a handsome large-leaved plant growing on the mountains—very strong and heavy mats, used for clothing, are made, and are highly prized. The following notes on the *Cordylines* occur in a private letter from an old resident in New Zealand. Referring to a species, the name of which I am unacquainted with, he says—"I have cultivated it since 1845, and have now 10 to 15 plants in my garden here (Napier), but it has never flowered. It throws up a thick Cabbage-like stem 4 to 5 feet high, nearly quite straight, with bark much smoother than any of its congeners, producing both suckers and shoots in plenty from root and stem which grow readily when taken off and planted out. I never saw but this one plant, which in 1845 I obtained from an old native cultivator in this neighbourhood, but the old natives generally know it well, and have often when in my garden asked me for it to cook and eat as a *bonne bouche*, with every symptom of mouth-watering over it! I have frequently inquired of them (in former years) respecting it. All knew of it as a thing of the past, like, alas! many other of their natural productions, viz., *Broussonetia*, &c., and I have heard it is still or was to be found at Maungatutu and at Upper Whanganni. I am made sure of its flowering some day. Now that I have several, I shall keep down all the suckers and

shoots, save the terminal one, of one of my best plants, and so try to get it to flower. My original one died long ago; it seems to get to a certain height, 4-6 feet, then throw out suckers, &c., then the parent dies off. I have often had doubts as to its being really indigenous; certainly not I should say in the North Island. All the other *Cordylines* are native to the South Island, and by, or staff of life, in famine, as I have known and proved; but it is terrible labour to dig up its long tap-roots. I think I know of six, if not seven good species, all North Island ones." It will be noted from these remarks that the *Cordylina* is generally applied to all, or most of the species, and not to *C. australis* in particular. We have New Zealand plants under consideration it may be as well to give another quotation from the same letter:—"Here in my garden, without any manure, *Arthropodium* grows in great abundance. It is known to many persons to whom it is scarcely able to recognise. It is a most striking plant, growing like a huge *Tussock*—leaves 18 inches wide and 4½ feet long, panicle and stem 4 to 5 feet, flowers 1½ to 1½ inch diameter, while outside the garden, among the Ferns, its original habitat, it keeps its common size, which, however, is much larger than the Bay of Islands plant. I have a suspicion it may prove a distinct species." *Arthropodium*, like *Cordylina*, is a Liliaceous plant, a few species of which are cultivated in our greenhouses. *John R. Jackson, Kew.*

Honeydew.—A few words of explanation seem to be required from me, in reply to Mr. S. Bevan Fox, who says that he discredits from the opinion I have expressed, that all honeydew is caused solely by aphides. When I have explained my meaning, he will, I think, believe that our opinions do not differ much, our difference arising chiefly from the different senses we attach to the term honeydew. My remarks related only to honeydew proper, that is to say, that saccharine, viscid and vitreous-looking secretion, which has been so abundant this season upon *Rose* and *Currant* bushes with which *Fern*, *Sycamore*, and other trees are at the present time abounding from being so copiously varnished, and with which also the objects under the trees, whether plants, stones, earth or pavement, are spotted and speckled. I did not mean the occasional, and much more rare and limited phenomenon of "exudations from the pores of the leaves" of which Mr. Fox speaks. These exudations are not properly honeydew, although they may sometimes resemble it. They will not be found to have marked the objects under the trees with minute speckles should these fall in drops to the ground; the drops would be large, and very different from those of honeydew. In confirmation of what I have advanced, and by way of answer to Dr. Bevan, I will, with your permission, make a few short quotations from the "Rural Cyclopaedia." "The most strenuous of all the opinions respecting the nature of honeydew assert it to be extravasated sap. All correct physiologists justly regard honeydew as a thing of only one kind, as simply and solely that clear viscid saccharine substance which we described at the beginning of this article, and they naturally enough and quite philosophically, assume it to proceed from only one cause." "Some observers appear to have mistaken the occasional incidental watery exudation of the ordinary sap of plants for real honeydew. Honeydew, unless in quite perverted senses of the word, is entirely the deposit of minute insects." "Aphides, in the opinion of many of the most eminent naturalists are the sole producers of honeydew." "The aphides are when on a leaf, and discharge no more of cement and are provided not only with an anal vent but with two long, hornlike rudiments for ejecting such refuse or portion of their food as is unnecessary for their nourishment." As they may be interesting to your readers, I will also, if you will permit me, make some short extracts from the *History of a Britanica*, from quotations there of the *Abbe Bossuet de Sauvages*, one of the first discoverers of the true nature of honeydew, and one of those who first dispelled the popular delusion that it came from the honeycombs. "The common dew. In speaking of this honeydew he asserts 'that it owes its origin to a small insect called a vine-fretter (or aphid); the excrement ejected with some force by this insect makes the most delicate honey in Nature.' "The juices, at first perhaps hard and crabbled, becomes in the bowels of this insect equal in sweetness to the honey obtained from the flowers and leaves of vegetables." "The form of the drops drew my attention, and led me to the following discovery." "The leaves covered with these drops of honey were situated beneath a swarm of the larger black vine-fretters, and on observing these insects, I observed them from time to time raise their bellies, at the extremity of which there then appeared a small drop of an amber colour which they instantly ejected from their mouths. I saw drops of this nature, of a sweet flavour with what had before fallen on the leaves. I afterwards saw the smaller species of vine-fretters eject their drops in the same manner. This injection is so far from being a matter of indifference to the insects themselves, that it seems to have been wisely instituted to procure cleanliness in each individual, as well as to preserve the whole swarm from destruction, for pressing as they do, one upon another, they would otherwise soon be glued together and rendered incapable of stirring. The drops thus spurted out fall upon the ground, if not interrupted by leaves or branches, and the spots they make on stones remain some time unless washed off by rain." The *Abbe* then, referring to a seat under a Lime tree, which seat shone with honeydew drops, says:—"I was at a loss to conceive how so glutinous a substance could fall from the leaves in such small drops: for I knew that rain could not overcome its natural attraction to

the leaves till it became pretty large drops; but I have since found the Lime is very subject to these vine-fretters." "Bees are not the only insects that feed upon this honey, ants are equally fond of it." "They place themselves near the vine-fretters in order to seize the drop the moment they see it appear on the surface of the leaf." *J. Thompson.*

Grape Soils.—I have read with interest the original remarks of Mr. Cramb, given in his paper read before the Manchester Congress. I only offer a protest against the presence of calcareous matter by which I presume he intended to say that soil, in some cases, for the cultivation of Grapes. Mr. Cramb is a man of long and great experience, and consequently we should attend to his sayings and doings.

Let us, therefore, trust that our great Grape growers will give us a few words as to the soil they employ, and whether they "protest" against calcareous soils. We have seen that Mr. Cramb has been led to regard the calcareous hills as being in high favour with the *vignerons*, and I have heard that in Spain they are in much esteem. In the limestone and calcareous soils of the Grecian Archipelago, and in Palestine and Syria, Grapes are grown in high perfection. In any soil highly charged with calcareous matter, Vines grow in a wild sort of way (without manure), as if they loved it. How is it, then, that Mr. Cramb does not succeed in growing Grapes in a calcareous soil, and even utters a strong protest against it? Mr. Cramb is so honourable and truthful, that we should like to hear more from him as to the reason why. *Muscat.* [And so stand we, Eds.]

Jetty Lacy Pelargonium.—The letter of Mr. John Stevens, of Ealing, opens up one point that is scarcely so clear as I could wish, and probably it has struck other impartial observers in a like manner. I refer to the name of the variegated zonal *Pelargonium* which is in his possession. I think Messrs. F. & A. Smith were quite right in challenging any variegated zonal *Pelargonium* under the name of Jetty Lacy, simply because it is a purely local name, and very unlikely to have been given as an original designation by Mr. Stevens. I believe I am right in stating that the variety in question was raised by Messrs. Wincobank & Kingbury, of Bevois Valley, Southampton, and named by them in honour of Miss Jetty Lacy, the daughter of Major Lacy, of the Ordnance Department, Southampton, Major Lacy having at that time filled the post of Chairman of the committee of the Southampton Horticultural Society. Now it is very unlikely, indeed, that the name of a young lady, in a district so remote as that of Southampton, and who perhaps has never before been heard of outside her own circle, should have been given to a plant by a person who, in all probability, knows nothing of her. This strikes me as "wondrous strange." It is a very unusual name too, to be noted. Any one can understand the name of a well known public character whose name is, as it were, the common property of the people, bestowed on a new plant by two or three raisers. It is well known that there are among variegated zonal *Pelargoniums* one or two named Prince of Wales, as many more Princesses of Wales, and Queen Victorias in all shades. No one wonders at this, and that there should be two Jetty Lacy's, to say the least, a very odd circumstance. I think also, from Mr. Stevens' own showing, that the Jetty Lacy may be as different from Messrs. F. & A. Smith's Jetty Lacy as the latter is from the former, and yet the two may possibly be exactly alike in every respect. I am therefore of two opinions, either the Jetty Lacy raised by Mr. Stevens at the late exhibition at the Regent's Park is Messrs. F. & A. Smith's Jetty Lacy and nothing else, or that Mr. Stevens has taken an advantage by giving the same name to another variety subsequently to the appearance of that of Messrs. Smith. *Southampton.* We observe, Mr. Stevens claims the honour of showing a specimen plant, labelled "Jetty Lacy," at the late Regent's Park Show, and which we thought at the time bore some resemblance to it when in cultivation; and, as so named, the inference was natural, that it was the true variety, particularly as Mr. Stevens' name was not underlined, which would have been the case in a "Jetty Lacy No. 2;" this was a further ground of supposed identity. I have made a second variety under the same name, and I will make a few remarks, just to clear the argument, and issues. Mr. Stevens avers that we named our "Achievement" after his variety of the same name was made public; whereas our variety of that name was shown at the Royal Horticultural Society's Exhibition at Bury, in 1867. We had not at that time seen either Mr. Stevens' or his "Achievement," our knowledge, but our Mr. F. Smith saw it and then at the Botanic Show in 1868, and then called his attention to the case, and requested the favour of Mr. Stevens to rename his plant, which he quietly declined to do. This disposes of any excuse he may offer to set up in justification of his infraction of a well known rule, and we think that the proper name are by right of priority the owners thereof, and this rule is never wisely or usually broken until the old variety becomes old and obsolete, by being beaten in quality. This not being the case in this instance, the public will be curious to learn what motive or reason led any one to adopt the procedure of Mr. Stevens. If his plant was a better variety, vanity or pique might be the inducement; but this was inferior, which alone would deter any sensible person from inviting so close a comparison as to condemn his so-called new sort. Again, how strange that it was never before known under that name, although at the time it was a three-year-old plant, and Mr. Stevens has exhibited on two occasions at least this season previous to this, without producing this Jetty Lacy, and on each of which we suppose a well-done plant would have materially helped him. Possibly Mr.

JULY 31, 1868.]

...has but lately acquired this plant, but he is extremely reserved on this point, we are not certain what has not been shown before under another name, but in either case we must say of his conduct— "It is strange, his passing strange."

The Nurseries, West Dulwich, S.E.
Early Rose Potatoes.—About the 7th of March I had 1 lb of these Potatoes planted, and nearly a fortnight ago the produce was dug up, and the weight was 264 lb.—a very good yield, so we here think it only about one-fourth of what is advertised as being raised from the same weight of seed. They were of medium size, four of the largest weighing about 1 lb.

J. W. Bachelor, Oditham, Hants.—On the 13th I had some tubers of this root taken up, and they were of a delicate kidney shape, and were watery and mealy. On the 26th inst. I had more taken up, and cooked with some of the Royal Ashleaf Potatoes. They were white and flowery, and had improved in texture, but their flavour was far inferior to that of the Ashleaf. The Early Rose Potato is at least three weeks later than the Royal Ashleaf, so that in England it is not to be called early. It is, however, a very good variety; its foliage and habit much like that of the Royal Ashleaf, or Lapstone—the finest-flavoured potato known. In America the Early Rose is grown to an enormous extent, and sold at a price of 10¢ per bushel.

Improvement of Beans.—In bad Bean years the crop is as low as three, or even two quarters per acre, being nearly the average, five a good crop, and as much as seven being occasionally grown. The cause of the low crop is that the plants are not having taken their full complement of flowers in the axil of each leaf, the most fertile being the lowermost bunch being barren. It follows that the barren tops, seen when the plants are not the consequence of the upper part of the stem not having borne flowers, but that they are the abortion of the flowers from deficient vigour. An expedient which would increase the vigour of the growth of the plant would, therefore, it may be expected, materially increase the produce, especially in bad Bean years. From my experiments on Hemp, as described in this Journal, April 3, I believe this may be effected in some degree, if not to a great extent, by selecting a piece for seed, and cutting off the top of each stem, so as to leave only six, eight, or ten bunches of flowers, according to the fertility of the soil, or at least to such an extent as to reduce in a moderate degree the number of pods produced, and to remove any sprouts which might appear at the base of the stalk, which would be very injurious. If in cutting off the tops too few bunches of flowers were left, so that the crop became materially diminished, it is to be feared that sprouting at the base of the stems would take place to such an extent as to render their removal an expensive operation. Experience would teach to what extent the tops should be cut, and it should be done as soon as possible. By this means Beans of increased size would of course be obtained, because overcropped Scarlet Runners, when three or four pods only are left growing, occasionally bear unusually large seeds, and this operation having been repeated for three or four years successively, a more vigorous plant, less liable to abortion of the flowers in unfavourable years, might be hoped for, if any improvement were apparent, it might be expected to go on increasing year after year. What the result would be after 20 years' experimenting it is not possible to conjecture. *B. Clarke, Mount Vernon, Hampstead.*

Planting under Difficulties.—As a somewhat unusual example of this, I may be allowed to direct the attention of your readers around London to some fine-looking Scarlet Runner Beans that are growing in the open cuttings between Sloane Square and Kensington stations on the Metropolitan District Railway. They are planted at the foot of a wall that is quite 20 feet deep; in fact, on the same level as the rails.

New Invasion.—Last Sunday morning I was surprised by the appearance of an old enemy in tremendous force, in a new position. A good deal has been done to perfect our national defences, but little, however, can be accomplished by way of running a gauntlet across the air. And this seems our most vulnerable point. The broad gate of the heavens was opened wide to admit our foes. For six or eight hours on Sunday, without intermission, and more or less throughout the whole day, our enemies, the flies, were marching in, and fighting in dense flying columns into the earth. The whole air was filled with them, and presented the appearance of a rapid fall of the most snowflakes. At first I took the flies to be a shower of wedges holding high matrimonial carnival in the sky, and wondered that the column did not keep past. But no sooner did I venture to look among them than I was thickly coated with a layer of greenfly or aphides. No place was too sacred for them. They clustered and fought with each other over the whole surface of my face, peered into my eyes, crept up my nose, and hovered earnestly for a passage into my mouth. I went over a mile and a half with hands and handkerchiefs I sought them off the most sensitive points, and on my skin and clothes alike many soiled proofs of the severity of the conflict. I am now of opinion that, in addition to their other bad habits, aphides snap pieces out of our bodies. Otherwise it is difficult to account

for the irritating sensation induced by their passage across the skin, giving rise to a positively painful itching, a long way removed from laughter. In addition to this unpleasantness the cloud of flies gave forth a rank green smell, and conveyed the idea of being smothered in haymow without its sweetness. The aphides seem to have extended for many miles. Between 10 and half-past 10 I walked to Bury through them, and I have seen a gentleman to-day from a distance of 10 miles off, and the flies were equally thick with him. Ten square miles or more of aphides, it is enough to make any horticulturist tremble. And then, what shall we say about the height? It is impossible to say anything positive concerning the elevation of the mass. As far as the eye could see the air was aphides, and apparently nothing else. The density of the living mass varied however, in different places. They seemed to me to be arranged, as it were, in huge waves. Now we had to pass through the great crest of a wave, and again we seemed to walk upon, as it were, the trough of the sea. If it were possible to walk at a uniform level over the surface of the sea, of course we must pass through the greatest mass of waters on the crest of the waves. The arrangement of the aphides reminded me of such a mode of passing through water. At times the mass was so dense that it seemed to interrupt one's breathing, and again it became thinner, and so on many times within the mile and half. But on no point was the air clear. There was but little wind, and the aphides seemed falling towards the earth at about the usual angle of snow or rain. Accompanying the aphides there seemed a smaller crowd, either of young ova or sediment of some kind, which produced an irritating action upon the lungs. Towards evening the innumerable hosts of flies disappeared, and on neither Monday, Tuesday, nor Wednesday have any returned. Wednesday, rain has begun to fall, and it is to be hoped a heavy shower may come to batter down these columns of flies from their seats on the trees, corn, flowers, fruits, and green crops. On Monday morning I began to look out for the moving army upon Roses, fruit trees, &c. I found but few of them anywhere, unless upon the young and tender branches of such plants. But late Peas are literally bent down beneath the crushing weight, and not a leaf nor atom of branch can be seen for the flies. I hope tobacco and clean water will kill them or adieu to all late Peas. I fear the Turnips will suffer much if not immediately sprinkled with soot or some other nauseous mixture. After carefully examining the surface of the earth and the plants, I have come to the decision that the fly storm was a sort of perpetual motion while it lasted, or in other words, that the same flies fell and rose again for many times during its continuance. Had it been otherwise, the whole earth must have been loaded many inches deep with aphides. I observed that the aphides were larger and stronger than I ever remember to have seen them. They alighted, and rose again with great rapidity and strength. Their wings were very large, and the whole of the flies were of a vivid green colour, like the choicest, greenest Peas. Could it be that the flies were swarming? The activity, the excitement, the various degrees of density, and probably, from appearances, of light, seemed as if all the aphides in the world had come here to summer. I would be glad to hear the opinion of naturalists upon the whole matter, and also to learn how far the cloud of flies extended, and the best remedial measures to adopt against their wholesale ravages. One gentleman tells me that there was just such a plague of aphides before the cholera year. But this, if it were so, was doubtless merely a coincidence, and by no means the cause of such a disastrous effect. Such an invasion is a plague enough of, and in itself, without being looked upon as the harbinger of anything worse. *D. T. Fish, Hardwicke.*

Dasythron Hartwegianum. In reference to the letter of Mr J. Verschaffelt at p. 789, I beg to inform him that *Dasythron Hartwegianum* flowered in the Royal Gardens, Kew, in 1859, and was figured in the "Botanical Magazine" of that year, tab. 5099. It is there described by the late Sir W. J. Hooker, with full particulars as to whence and when it was obtained. *John Smith.*

Rose "The Marshal."—Will any of your readers oblige me and many others by telling us how to grow the Rose *Marchal Niel*? I remember some two years since a controversy in a contemporary on the subject. One of the controversialists said—"It is very well for a show Rose where a good stock is kept but for any one who can grow but two or three plants of a variety, it is the worst introduction of late years." Further on the same correspondent adds—"This Rose (*Marchal Niel*) requires the cultivation peculiar to that class." What is this cultivation? *A Florist.* [To this question "S. R. H." kindly replies as follows:—"Having grown this magnificent Rose in various situations, soils, and stocks, upon walls, with aspects east and south, and in the open garden, in light loam and in heavy clay, upon the Briar, the Manetti, and *Gloire de Dijon*, and having realised its golden glories in every instance, I cannot understand the complaints which are made from time to time that the *Marchal Niel* is an austere, unapproachable niggard. I believe him, on the contrary, to be as generous as he is handsome; I believe that wherever Roses prosper, *Rose Marchal Niel* may be grown to perfection. With me it is produced most quickly and certainly from the Briar. I have fine flowers now upon stocks which were budded just 12 months ago, and which will be strong large trees in autumn. These will bloom abundantly next season, early and late. The growth of *Marchal Niel* on the Manetti is here much slower than upon the Briar, and it requires a wall to bring it to maturity. When once established, and with this advantage, it blooms profusely. The largest flower of the *Marchal Niel* which I have seen this season was one which I exhibited at Newark. It was grown upon a Briar, budded

in 1867, and transplanted in 1868 to a wall having an east aspect. There is nothing abnormal in the method of culture, except that in pruning the knife must be used very abstemiously, only weak and decayed wood must be removed, the strong ripened shoots being left intact. The *Marchal Niel*, like some other Frenchmen and softly be it spoken, and other Roses, is a gross feeder.

The Manchester Show. Your reporter gave a long report of the Manchester Show, I have received a much shorter one from one who has been one of our chief exhibitors for 30 years. "I have just returned from Manchester, it was simply a big muddle and a big failure." Is it to be wondered at? The Council of the Royal Horticultural Society, with that perversity that so often marks their proceedings, which made them keep aloof from the International Exhibition, refused the co-operation of the Manchester horticulturists? Were they likely to give them aid after that? and have they not found themselves simply in the position of the dog and shadow? It is, moreover, to be remembered that the Manchester people had their special exhibition in the spring, into which they had then thrown their best energies. It seems to me that the Council of the Royal Horticultural Society live in a very elevated atmosphere, and do not really understand the practical working of such matters. Dukes and lords give a favour to the Society, but we want some good practical horticulturists associated with them, and all subservient to the dish. They seem to me to have an entirely ideal view in such things, and their officials work with arms tied. There are two sides to the question which "X" moots, and it seems to be utterly impracticable to bring both parties to the same view. The divergency of opinion and of action consequent on this state of things was, no doubt, greatly to be deplored, and could not have other than a deteriorating influence on the show, which, considering all the circumstances, was not after all so bad as "X's" friend would have us believe. The names of the prize-takers is indeed sufficient evidence of this. *Ebs.*

Orchid Culture.—There are some very good remarks in Mr. Bullen's letter in your number of July 10, and which will bear repeating. He says that it would be a great boon to lovers of Orchids, if growers would publish the result of their experience with any particular plant which they may happen to cultivate to a high state of perfection. I think that this is what is wanted for all kinds of exotics that require any skill at all in their cultivation, and that the smallest fact in their behaviour under cultivation is worth more than pages of theorising as to what they ought to require, considering the climate that they come from. It is a general truth that it is impossible to tell how an exotic will behave under cultivation in England until it has been tried. Of two kinds of trees which constantly grow side by side in their own country, one may be perfectly hardy in any part of England, while the other will be killed down to the ground every winter. Of two epiphytes taken from the same tree, one will grow in almost any house you try to grow it, whilst the other is only induced to live with the greatest difficulty, and by constant care. Of course a knowledge of the climate, &c., in which a plant naturally grows is of use in order to determine the sort of experiments that are likely to succeed in cultivating it, but it cannot be too often repeated that a knowledge of what suits a plant under cultivation comes only from actual experience, and any facts which are the result of experience are always interesting and valuable. The remainder of Mr. Bullen's letter is therefore very interesting, especially his experience of the treatment of *Epiderman bicoloratum*, and it is perfectly true what he says, that because certain Orchids bear frost with impunity in their native country, it is not therefore certain that they will do so in a house in England. Nor, of course, on the other hand is it to be assumed that, because a plant lives in a constant steam-bath in its own country, it will necessarily require the same here. My experience in Orchid growing is but small, but of those that I have tried I find no two kinds alike in what suits them. Shade is commonly prescribed for them, and to many it is absolutely necessary, but some delight in a blazing sun, and many Ferns do so also; and similarly with a dry or moist atmosphere, and with ventilation or its absence. What is wanted is particular information on all these points for each particular plant, and in a great many instances this is not at present to be procured. *C. W. Stocking.*

St John's Wort and St Peter's Wort.—From the remarks of your correspondent, Mr. J. W. Lighton, upon the old English names of plants (p. 789), it would seem that he believes *Hypericum calycinum* to be the only plant referred to under the name of St. John's Wort, and that by the St. Peter's Wort is meant *Symphoricarpos gomerata* (or, as it is now called, *Symphoricarpos vulgaris*). As these views appear to me questionable, I have been turning over some Herbaria and other books to see what I could find, and here is the result. A Herbarium of the date 1633 describes five different kinds of St. John's Wort, all being species of *Hypericum*. In Dodonæus' Herbarium of 1578, in black letter, only two kinds of St. John's Wort are described. Both these works evidently apply the name of St. Peter's Wort to *Hypericum quadrangulare*, which they also figure under the name of "Square St. John's Grass." Another old work, after giving an account of *H. perforatum* as the St. John's Wort, commences its description of *H. quadrangulare* in the following quaint terms—"The St. Peter's Wort groweth higher and stronger than the St. John's Wort, and good reason too, ask the Pope else, for though the Lord would have the saints all equal, the Pope is of other opinion. It hath a square stem," &c. Referring to more modern works I find Mr. Benthams, and also Messrs. Hooker and Arnott, do not apply the name St. Peter's Wort to any English plant, and that the former restricts the name of St. John's Wort to *H. perforatum*, while the

Jan 31, 1869.]

and F. A. Zaro, and if it meets with the necessary support, will appear every two months, each part consisting of about eight sheets of quarto, and two or more lithographic plates. The papers are not confined to the parasites themselves, but cover also the consideration of such diseases as are presumed, either theoretically or demonstrably, to depend on the presence of parasites. It will, of course, be expected that Dr. Haller's views should be a prominent feature in the journal, and however we may differ from him, or object to his mode of investigation, we are still glad to see those views well developed. We would wish, however, that the figures were more satisfactory—a little more, in fact, prepared after the admirable examples of the Messrs. Tulasne.

The original papers contained in this preliminary number consist of—1, Observations on the Dysentery of 1868 in Weimar, by Dr. Pfeuffer, 2, On Sigar-worm sickness in Bahia, by F. M. Drauert, 3, On the Muscularities of the Caterpillar of the Pine Lappet (Gastrophila Pini), by Dr. Haller, 4, On the Exobasidium of Woronin, by H. Karsten, and 5, On the Parasite of Dysentery, by Dr. Haller. These are followed by a number of small communications gathered from different sources, a very useful list of publications on fermentation, formation of yeast, disinfection, general hygiene, &c. notices of publications, and finally information as to one or two matters of interest, viz., a special list put out for the investigation of parasites with a microscope, and a new number of Rubens's collection of dried Fungi, to which valuable work our correspondent Mr. Bromme has so largely contributed.

We have to object to a nomenclature very different from that commonly in use amongst mycologists, and as we think, very unnecessary, and a disposition to draw conclusions without any direct undoubted connection between the several objects figured. Dr. Haller has clearly a foregone theory, with which every phenomenon is made to accord. Nothing can well be more interesting than such investigations, but to command reception from mycologists, we must have something like demonstrable origin of the various forms from a common source, and while we have nothing better than such figures as the ascus of Puzosia salicina, which by some authors is said to have migrated to the leaves of the Fir, we must for the present be excused if we do not without hesitation admit his conclusions. We suppose that his Puzosia salicina is the same with Capnodium salicinum, Montagne, which we should be very surprised to find on Fir leaves. The figure of the contents of the ascus is altogether different from what is figured by Montagne, and is indeed different from anything we have seen in the genus. The perithecia, as figured on Fir leaves, is totally different from that of the parasite on Willow. We have no way to say that a variety of forms may be assumed by the same species under different circumstances, or that varieties may be formed from a common parent, and at the same time we have seen a large female, and a certainty that the objects in question are referred to the true species.

We think it necessary to make these observations because there was a disposition in this country to adopt Haller's conclusions as logical, without due investigation or accurate knowledge of the organisms in question. We have no wish, however, to say a word against the journal in general, which contains a great deal of valuable information, and is a welcome contribution to those who are interested in the subject. We have indeed a guarantee for this in several, but certainly not in all the names which are given as likely to be contributors.

Florists' Flowers.

The new Florists' Flowers that came under the consideration of the Floral Committee at the Great Exhibition of the Royal Horticultural Society at Manchester, though somewhat numerous, contained but few things of special excellence, and these from well-known sources. The Manchester district, that might reasonably have been expected to contribute some new things of this character, was scarcely represented, and by nothing of first-class character. The following First-class Certificates were awarded—To Messrs. Downie Laird & Co. for gold and bronze Pelargonium Imperatrice Eugenie, a fine and distinctly marked variety, having a golden leaf ground, and a broad, well-coloured, reddish-chocolate zone. Like Kentish Hero, this promises to make a fine bedding variety. To Mr. Charles Turner, South, for Proteas Admirabilis and Miss Turner, the former a splendid heavy rosy purple-edged flower, of full substance and fine quality, the petals short and well rounded, the latter a smaller but charming flower, with a medium light rose edge, and of good substance. Mr. Turner also exhibited flowers of these two new varieties, in his stand of 24 Proteas. To show the continuous blooming character of his new perpetual-flowering Proteas, Prince of Orange which was awarded a First-class Certificate

This fine moth is extremely rare in this country. It is bred by Curtis, British Entomology, vol. 1, tab. 1, under the name of P. salicina. It is very common in the name of P. salicina. It is very common in the name of P. salicina. It is very common in the name of P. salicina.

The same observation applies in great measure to the communication on the disease of the Sugar-cane. We can see no necessary connection between the organism which is described in the paper and the disease. It is high time that such publications should be referred to Fungi instead of Agri. A publication of this nature will appear in this Journal, as it is separating in connection with the disease in Sugar-cane, which was brought before the Scientific Committee of the Horticultural Society, and reported on at p. 417.

at a recent meeting of the Floral Committee in London, Mr. Fred Perkins, of Leamington, brought a box of cut blooms of fine quality. It was said that these blooms came from plants exhibited in flower as far back as the beginning of June, and that they are now in full bloom. Higher praise can scarcely be written, or more justly deserved. First-class Certificates were also awarded to Mr. C. J. Perry, Castle Bromwich, Birmingham, for Verbenas Butterfly and Rising Sun, two fine flowers, every way worthy of Mr. Perry's reputation as a raiser of new kinds, the latter has a ground colour of glowing salmon-red, with small white eye encircled by a rich deep maroon ring, pip and truss fine, the former is of a warm flesh ground, and has a showy crimson ring round a pale eye, a distinct and fine variety. Some others were also staged by Mr. Perry, but they will no doubt come before the Floral Committee before long.

The Floral Committee when at Manchester had to contend with a very bad and deceptive light in the fruit tent, in which the new things were staged. This was somewhat strikingly illustrated in the form of a new bedding Lobelia of the Erinus speciosa section, of dwarf growth, named Favourite, and exhibited by Mr. Price, or to F. Taylor, Esq., of Manchester. Under canvas the flowers of this variety had the appearance of being heavily tinted with dark violet, in the full light of day this apparent hue entirely disappeared, and a bright blue was its place. In a group of bedding plants, arranged in one of the tents by Mr. John Kellett, of Heaton Grange, Stockport, was an almost pure white variety of L. Erinus speciosa named White Lady, the flower white, but very faintly tinged with pale blue on the edges. This appears to supply a very good white bedding Lobelia. Some new Petunias were staged by Messrs. Bell & Thorpe, Stratford-on-Avon. Of these the best were Ann Hathaway, pale ground, with large purple centre, veined with dark, flowers stout and of good form, and Novelty, purple, with a flame of crimson in the form of quarters, a flower of fine shape, and somewhat novel. Two new Verbenas were also staged by the same, one, Mr. Thorpe, in the way of Perry's Butterfly, but, as shown, not such a finished flower, and Mrs. Staples, dark cerise, with lemon eye, surrounded by a dark ring—a variety that had scarcely had justice done to it in the way in which it was exhibited.

From Mr. W. Cunningham, Burton-on-Trent, came zonal Pelargonium Admirabilis, a very bright pale orange-scarlet variety, with flowers of fine form but scarcely distinct enough to merit an award, though much fancied, and Grande, a Nosegay variety, of a shade of colour something between Eclat and La Grand Variegated zonal Pelargonium Miss Tomkins, from Mr. Tomkins, of Sparkhill, is a promising variety, the leaf brightly coloured, of good shape, and regularly edged with green. Another of a like character named Howard was also shown in one of the tents, and I mention it because, though I have occasionally met with it before, and in a way as a good and effective exhibition variety, I don't remember having seen it round London on any occasion. R. D.

The Apiary.

£70 A-YEAR—HOW I MAKE IT BY MY BEES; AND HOW A COTTAGER, OR OTHERS, MAY SOON DO THE SAME.—This little book, by J. W. Pagden, Alfriston, Sussex, of which the second edition is now before us, is, we consider, rather unfortunate in its title. The author's calculations as to the natural increase of an apiary, and the profits which must arise from it, are, in our opinion, by far too sanguine, and are not at all likely to be realised by one bee-keeper in a hundred. The author also makes no calculation as to the amount or pecuniary value of the time it would require to attend to 100 or 200 stocks. Few people can spare the time out of their ordinary business or occupation that would be necessary to the management of a number of hives sufficient to ensure the realisation of this large income. There are few districts in England where so many stocks can be kept by one person within a radius of three miles. He states that 300 hives may be kept in the different gardens of any good-sized village. We believe this, as regards most districts, to be an utter mistake. The author imagines that in the ordinary prosecution of their labours, to take a longer flight than is generally supposed, and that a radius of four miles is with an easy range to them. If hives have often to send out their foragers to half this distance, they will not be likely to thrive very well, but will have to struggle hard for a precarious subsistence. Barring these and a few other statements which may be calculated to mislead the over-sanguine novice, the little book is one which we should not hesitate to recommend to the notice of any who may be desirous of keeping bees in a simple manner. The author does not lay claim to originality in his views as regards bee management. He acknowledges that he has borrowed his system from various sources. The hives he recommends seem to vary very little from those known as Payne's hives; and as we have used some of similar construction we can report favourably of them.

The directions given as to the proper aspect and position of hives in a garden are very good, and the mode of ensuring proper protection from sun and rain possesses the recommendation of being both simple and effectual. Mr. Pagden is an advocate for placing the swarm, as soon as it is securely hived, on the stand of the parent stock, which is to be removed to another part of the garden. This we have long proved to be good practice. Mr. Pagden works on the collateral and nodding systems, as well as the more usual one of top supering. We have no great faith in any but the last named for general success. The directions for feeding bees, both as to the manner of administering

the food and the proper times and seasons for so doing, are very judicious. The various instructions contained in the remainder of the pages are also very good.

We have no hesitation in saying that this little book may be advantageously read and followed by cottage bee-keepers who may be desirous of taking a step or two in advance of their fellows, and by those aspirants of a higher class who may still be unable or unwilling to adopt more expensive methods, or more complicated systems of manipulation.

Obituary.

WE have to announce, with regret, the death of CHARLES B. WARNER, Esq., which took place at his residence at Hoddesdon, Herts, on the 27th inst. Formerly, in the days of the Chiswick exhibitions, Mr. Charles Warner was one of the most successful growers and exhibitors of Orchids—Mr. Williams, who has won for himself a high position amongst Orchid-culturists, having been then his gardener, but for some years past Mr. Warner had given up growing for exhibition, and at Stratford, and more recently at Hoddesdon, confined himself to growing a select collection for his private gratification. At the period above alluded to, Mr. Warner was an active Fellow of the Royal Horticultural Society, and for some years occupied a seat at its Council board. His enthusiasm was contagious, as, by his example, he stimulated and induced others to become as fond of horticultural pursuits as he was himself. He was an earnest supporter of cottagers' shows for fruit and vegetables, and in this, and many ways, made his influence such that his loss will be severely felt by those who knew him. The funeral takes place at Hoddesdon this afternoon.

Miscellaneous.

"Snobs at Work."—The mention made in "Snobs at Work," of the destruction ruthlessly dealt by them in the Earl of Stamford's beautiful gardens at Enville, received full confirmation in The Worcester Herald, June 12, 1869. A paragraph there states that Lord Stamford has again granted permission to the public to visit the Enville gardens, and adds, "It is to be hoped that this privilege will be duly appreciated by visitors, and that they will refrain from those silly acts of mischief by which so much injury was done before, and the repetition of which would ensure the closing of the grounds again." An advertisement in the same newspaper, regarding the opening of the gardens, thus concludes—"Visitors found cutting letters on the seats and trees, or doing any damage to property in the gardens and grounds, will be prosecuted and the gardeners immediately used by order of S. TAILIN, gardener to the Royal Horticultural Society, the Earl of Stamford and Warrington. If the Earl could read this, he would be glad to know that the Earl should not take their pleasure so seriously, but bravely and senselessly. Lord Stamford is about to open his gardens at Alton Towers, and is deterred therefrom by the wanton and mischievous. The Enville Gardens are within reach of the Black Country people, who ought to appreciate the boon of being admitted to such lovely scenes. The gardens cover 100 acres of fine upland scenery, naturally varied with hill and valley, diversified with noble foliage, lakes, fountains, conservatories, orangeries, pheasant-tries, eagle-dens, &c. How many miles of ribbon-borders there are, I am afraid to say; but when I last visited the gardens, the bedding-plants required for those ribbon-borders were 150,000 in number, and represented the value of 7000l. But the Snob thinks it fun to switch their blossoms with the stick that ought to be laid soundly on his own shoulders Once a Week.

Shading.—There is a great want of some better material than we yet possess for shading plant structures—a material which shall possess sufficient strength, without being so thick as to cast too deep a gloom over the interior of the house. We are extremely sorry that all attempts to supply the want have up to the present time proved fruitless. The best material we can recommend is canvas, which on one side must be made fast to a strong roller, and on the other must be nailed to a lath fixed lengthwise near the top of the sashes. In mounting the blinds, care must be taken that they are quite equal in breadth throughout, or the roller will not run regular. A narrow covering should be fixed along the ridge of the house, under which the blind may rest when not in use in order to protect it from wet. The blinds and rollers may be taken down during the winter as little or no shade will be required during that period, and if they are looked to after damp weather, and in winter thoroughly dried and stored away in a dry shed, they will last for several years. Some cultivators, however, like to use them as a protection in winter on frosty nights, as recommended in our "Orchid Manual" and when this is done they must be rolled up at day-break, so that no light may be excluded from the plants during the short winter days. Blinds for the sides can be made of canvas or tiffany, we use and prefer the latter. The strips should have rings sewed to them on both edges, to fasten on hooks, fixed in the house at corresponding distances. This fixing is necessary to prevent the wind blowing the blind on one side, and thus exposing any part of the interior to the sun's influence in an unguarded moment. B. S. Williams on Choice Stove and Greenhouse Plants. How to Catch Rats.—A cheap and effective way is to cover a common barrel with stiff, stout paper, tying the edge around the barrel, place a board so that the rats may have easy access to the top, sprinkle creosote-parings or other "feed" for the rats on the paper for several days, until they begin to believe that they have a right to their daily rations from this source; then place in the bottom of the barrel a piece of rock, about 6 inches or 7 inches high, filling with water until only enough of it projects above the water for

Early Spring Feed.
IMPROVED ITALIAN RYE GRASS
 The best and most productive of any kind in the world. It is a fine, early maturing, and very nutritious grass, which will grow in any soil, and is particularly adapted for the use of horses, cattle, and sheep. It is sold in bundles of 100 lbs. each, and is also available in large quantities for exportation. Price per bundle, 10s. 6d. per 100 lbs. net weight. For particulars, apply to the Secretary, Mr. W. M. TOMKINS, Newcastle.

ALL AGRICULTURAL COLLEGE, GARDENERS' CHRONICLE, MONDAY, AUGUST 1, 1869.

WILTSHIRE AGRICULTURAL SOCIETY -
 FORTHY SHOW at TON on TUESDAY, AUGUST 11. Prize offered for the best batch of the year. Open to all competitors. ENTRIES close at 12 o'clock. Full particulars in the programme. The show will be held on the premises of the Secretary, Mr. W. M. TOMKINS, Newcastle.

State of the Crops, 1869.
GARDENERS' CHRONICLE and AGRICULTURAL GAZETTE, SATURDAY, JULY 31, 1869. will contain a TABLE STATEMENT of the STATE of the CROPS in the UNITED KINGDOM. Order of any News Agent, or apply to the Secretary, Mr. W. M. TOMKINS, Newcastle.

Agricultural Gazette.
 SATURDAY, JULY 31, 1869.

MEETING FOR THE ENSUING WEEK.
 August 1st Yorkshire Agricultural, at Beverley.

The history of agricultural production some striking events have occurred in the past in several countries of the world. Here we experienced a revolution, noiseless, and dire little observed. In a paper on the "Production in the Future and Supply of Wheat," a most interesting paper of the Journal of the Royal Agricultural Society, Mr. EVERSHED shows that the average annual imports of corn for the 10 years of this century had ranged from 1,000,000 quarters to 1,300,000, they have subsequently increased rapidly, and have latterly been 14,000,000 quarters.

Increased population, wealth, and trade account for these startling figures. Increase of population during the past years has been about 3,000,000, while the corn in the average year has been 12,000,000 quarters. In 1841, the average annual imports of foreign wheat, at less than 1,000,000 quarters at the period. Since the last census the average of wheat in each year have maintained 10,000 of our population, while for each year the decade closing in 1841 they maintained over 1,000,000. And in these two periods our growth has maintained respectively an average of 19,000,000 and of 24,000,000 in each year. Our average growth facts 5,250,000 less than once did.

These figures refer to the United Kingdom. In regard to Ireland, the Potato famine and the circumstances have driven out three millions of her people. England, examined in a similar manner, would give a much more satisfactory account of her agricultural progress in the last 28 years. We fully admit in the article referred to, that the writer comes to the conclusion that these positions of vast social and political importance connected with the food-supply of a country will probably become subjects of great urgency and of practical discussion. The rapid increase of population, here and on the Continent, and the competition of other countries, will force the country to the production of a self-supporting system of agriculture.

The writer concludes with a pointed reference to agricultural defects and hindrances, and that the want of secure tenure, which prevents the farmer from "burying his capital deep," so as to get the best returns, has become so excessive through the increase of our town population. "The present social system wastes, so far as reproduction is concerned, a large portion both of unimproved and of home-grown food. Against such waste the manures and cattle feed 'staffs' are a very trifling set-off. Agriculture has to contend with a gigantic system of spoliation, and must inevitably suffer from the diminished fertility of the land." This is strong language, and our readers will scarcely think it justified. For ourselves, we think the subject quite worthy of that "discussion" which it mainly has not yet received.

It must be admitted that the soil of this country ought to become richer in the same degree that the soil of exporting countries becomes poorer. Look upon our little island with a large farm, and see how many materials which, at a low rate labour, earn, and manure will "bring on" to our land. The soil ought to get better every year. The subsoil, instead of being broken up for what it may contain, ought to be needed to mix with the fat surface and make it milder. The best farmer sows part of his produce, but our large farm parts with nothing and "brings on" 14,000,000 quarters of feeding corn every year. The land ought to yield heavier crops, and its character ought to alter perceptibly to our senses, instead of which we are not agreed that our average yield of grain has increased in the last quarter of a century. In fact, many people maintain that instead of increasing the richness of our soil, we are living upon its resources, spending our capital instead of living on the interest of that capital.

The present system of town waste is, it must be remembered, entirely modern. It is a thing of yesterday, and we must wait for our experience of its results. It must be a good while we are careful of the manure of all animals but one, and rightly so, for all our agricultural improvements, without manure, would prove ineffective, like a charge of cavalry without infantry to support them? What would be said if we were to send the manure of our 36,000,000 sheep into the rivers? Our human population is almost as numerous and much better fed. It is clear that if the manure of all animals were wasted, English farming would come to a stand before the end of a four-course rotation. But as we only waste a portion of the manure of the country, no such disaster occurs, and the extent of our loss can't easily be measured. We are told that the soil of corn-exporting countries, where no cattle are fed and no manure is made, becomes poorer. Fertile lands in South Russia and America, formerly capable of yielding 40 to 50 bushels of wheat per acre, have been starved down to an average yield of about 15 bushels; and the general average of these countries has been reduced to between 14 and 15 bushels per acre.

Our soil, which is already so poor, is being further impoverished by the waste of manure. How, then, can we retain for the use of our agriculture, the remains of the corn we receive from abroad. The real extent of loss to the land is in exact proportion to the food consumed at present without return.

This waste, we are told in the paper just referred to, must be arrested. "No agricultural improvements can maintain the fertility of the soil under such a drain of plant food. More tilage—even by steam! does not create anything, practically it destroys, if the fruits are thrown into the sea."

We have referred here only to Mr. EVERSHED'S general conclusions at the close of his article, and to the word of warning, without which a paper on the subject of our future supply of corn would have been incomplete.

The subject of thin-sowing seems to be again coming under general discussion. Mr. MARCH writes to insist upon the national importance of saving so many pecks an acre which are now wasted; another correspondent of the Times argues in favour of a still greater reduction, and Mr. CARTWRIGHT, of Newbottle Manor, Brackley, says—

"I not only sow my Wheat, but my Barley also, at 14 bushels per acre and this year I have some Wheat and Barley at 10 pecks per acre. As some of my neighbours were last year very disappointed in the average of their wheat, I have this season sown my side with five 2 pecks the same quantity of land dried at 2 bushels, and the difference in the appearance between the two quantities is most striking. After I have threshed the corn I hope to send you an account of the produce, and I shall be most happy to show my crops to any gentleman who may wish to come and see them."

"I can also corroborate Mr. MARCH'S statement of the usual quantities sown in Scotland. I tried there last year 6 pecks of Barley and 8 pecks of Oats per acre (my land in Scotland is not Wheat land, with such good results that I dried the same quantities this year, and when I saw my crops there last month they showed every sign of producing an equally good yield."

It is plain that the subject is one which experience and not arithmetic must decide, otherwise this gentleman who sows 8 pecks of Oats lays himself almost as open to what may be called destructive criticism as those whom he attacks. Eight pecks of Oats should produce nearly

20 plants on every square foot of ground, which any one who draws a square of that size on a piece of paper must at once see is an outrageous crowd. The condemnation or justification of practice here is, however, not a question for the arithmetician at all. It is a question for the agriculturist. Crops differ from one another, not by pecks but by bushels and sacks per acre, and it is the plan which shall yield the largest crop that must be recommended. If thick sowing proves best during the harvest month, it can withstand the exposure of its folly during all the other eleven months of the year. It must be admitted, however, that the quantity of grain sown per acre is gradually diminishing, and that 4 to 6 pecks per acre are generally considered enough in the Wheat field, where formerly 8 and 10 were sown. But even 6 pecks per acre are close upon 1,000,000 grain, and that is more than a score of plants on every square foot of land; so that the arithmetic of the subject is really almost as extraordinary as ever.

— THE corn trade has been in a quiet state throughout the week, at about previous prices which is somewhat remarkable considering the fine for the weather we have had during the present month. The live stock and meat markets have been somewhat depressed, in consequence of the heat of the weather. The top prices of beef and mutton have come down, respectively, to 5s. 4d. and 5s. 1d. Lambs vary from 3s. 6d. to 5s. 6d. — In seed there is but little doing. — Hops are foul, and but little improvement has occurred.

— The following are the published returns of the Manchester showyard and its visitors — Monday Season tickets, 2345, payment of 5s. each, 2345. Tuesday Season tickets, 2570, payment of 5s. each, 12,850. members, 3500. Wednesday Season tickets, 2317, by payment of 2s. 6d. each, 40,405. Thursday Season tickets, 1190, by payment of 1s. each, 57,120. Friday Season tickets, 1601, by payment of 1s. each, 31,245. Saturday Season tickets, 1578, by payment of 1s. each, 36,392. — The total number of visitors during the week is estimated at 188,516 besides 11,629 season-ticket holders, and the total receipts were over 17,000l. This is the highest sum ever received since the formation of the Society.

— The discussion in the House of Commons of the Game Law grievance and of the law of hypothec is not this session to bear any direct fruit. All the rival bills on both subjects have been withdrawn for the season, and there is some understanding that Government will themselves attempt to legislate next year on both.

In consideration of the small proportion of the elected members on the County Financial Boards, the Government has laid upon the table of the House of Commons a statement of the number of this class whom they think it is "probable" will be upon the County Financial Boards of each shire, as well as the actual number of magistrates upon the county rolls, and the Pall Mall Gazette thus comments upon the return in question — "It is imperfect — we were about to say 'of course,' the genius of slip slop must have watched over its production, for at a time when so many members of the Legislature are anxious to know what would be the numerical force thrown upon the bench of quarter sessions by the Home Office scheme of county financial reform, the paper is published without a single total or summary, though a statesman would probably look first to the general bearing of the statistics before he investigated their local relations. How easily such a summary could have been given we will show by placing one here. The statistics for the first schedule of the Bill represent 39 English counties, excepting from Cambridge, Hertford, and Northampton respectively, the liberties of Ely, St. Alban's, and Peterborough, which come under the second schedule. We have reckoned Lincolnshire only as one county, but each of its three parts for the purposes of the Bill is a county in itself, and in that view the English shires may be called 41. The second schedule consists of the three English counties of Monmouth, Rutland, and Westmoreland, the three liberties just named, and the 12 counties of the Principality. The epitome of the return in fact, we submit, have been appended in some such shape as this —

	Number of Quarter Sessions Jurisdictions.	County Magistrates in 1863.	Number of Elected Members.	Number of Magistrates on the Roll.
First Schedule	41	85,145,000	1571	16,153
Second Schedule	19	7,122,000	236	1,830
Total	60	92,267,000	1807	17,983

The great diversity of representative power, whatever may be the worth of the privilege anywhere, is under this Bill inevitable, because the scheme gives representatives, not according to the number of magistrates at each board, but according to rental. Thus, for example, Cambridgeshire part of, with 1,000,000 rental, is to have only 14 elected members to 157 magistrates, while that part of the county which is a quarter of the county of Ely for half the rental (500,000) is to have 7 representatives to 15 magistrates. Thus the poorer section of the county will send one representative to sway the counsels of 14 magistrates while the poorer section will have far greater chances of influence at quarter-sessions if

1870.]

surprised. Of course no rule can be laid down as to soil climate and mode of farming... a quite certain that great crops cannot be grown on such excessive quantities of seed.

Manchester Meeting.—The Royal Agricultural Society of England have never enjoyed such a satisfactory meeting as the one just concluded at Manchester.

the plants grow so thickly and to such a size as completely to obscure a man on horseback riding amongst them John A. Jackson New July 27

Societies.

THE Society had a very large and successful meeting on Wednesday last, held in the West Meadows, Manchester. While some of the classes of cattle were exhibited and a few sheep were shown...

Mr Bruce's BARONET, bred by the Duke of Buccleuch, and after a long struggle was placed 2d, but not with the public approval: the 1st prize bull being light in the neck, with a harsh wiry coat.

The cows were a shockingly poor show considering how many good ones there are north of the Tweed. Only four were entered. Sir W. Stirling Maxwell's Flower Girl was withdrawn so Mr Currie came 1st with Lord Strathalbyn's Rose of Strathalbyn...

Mr Bruce's BARONET, bred by the Duke of Buccleuch, and after a long struggle was placed 2d, but not with the public approval: the 1st prize bull being light in the neck, with a harsh wiry coat.

Mr Bruce's BARONET, bred by the Duke of Buccleuch, and after a long struggle was placed 2d, but not with the public approval: the 1st prize bull being light in the neck, with a harsh wiry coat.

Mr Bruce's BARONET, bred by the Duke of Buccleuch, and after a long struggle was placed 2d, but not with the public approval: the 1st prize bull being light in the neck, with a harsh wiry coat.

Mr Bruce's BARONET, bred by the Duke of Buccleuch, and after a long struggle was placed 2d, but not with the public approval: the 1st prize bull being light in the neck, with a harsh wiry coat.

hair, stood well out 1st, he was also 3d with "Stalchd Bhoideach" There were some capital specimens of fat oxen, especially some Highlanders, Mr. C. Morrison's Charlie being one of the best 4-year-olds.

As a collection of the best horses we have scarcely ever seen a show better represented. The entries were very numerous and many an empty stall was to be seen. Mr. Martin's "Conqueror" was 1st, and is a very fine brown horse of 5 years 2 months, and was bred near Gorsebridge.

Alex. Buchanan's filly, and in yearlings, Mr. J. N. Fleming was 1st and 2d. The draught horses were shown in harness, and made a very pretty sight, doing a deal of credit to the groomers.

Class 3 comprised a very large show of Border Leicester sheep many of which were scarcely fairly shorn. Mr. Rossie, of Leaton, took the 1st and 2d prizes for aged Leicesters, the only ones shown, and Mr. Torrance was 3d and 4d to Mr. Ford's 1st in shearlings, who was 2nd 1st in yearlings.

Mr. Bruce's BARONET, bred by the Duke of Buccleuch, and after a long struggle was placed 2d, but not with the public approval: the 1st prize bull being light in the neck, with a harsh wiry coat.

Mr. Bruce's BARONET, bred by the Duke of Buccleuch, and after a long struggle was placed 2d, but not with the public approval: the 1st prize bull being light in the neck, with a harsh wiry coat.

Mr. Bruce's BARONET, bred by the Duke of Buccleuch, and after a long struggle was placed 2d, but not with the public approval: the 1st prize bull being light in the neck, with a harsh wiry coat.

Mr. Bruce's BARONET, bred by the Duke of Buccleuch, and after a long struggle was placed 2d, but not with the public approval: the 1st prize bull being light in the neck, with a harsh wiry coat.

Section 5. Heifers calved after 1st January, 1868.—1st, George Robertson Barclay, Keavil, Dumfrieshire, Booth's Scapular 2d, George Robertson Barclay, Keavil, Dumfrieshire, Booth's Lancaster 3d Robert Scott, Manroan, Edin., Nelly Illeg

FOULDED ANGUS OR ABERDEEN.

1st-prize Bulls at former Shows.—Alexander Morrison, Bognie, Montblair, Turf, Ory 2d.

Section 7. Bulls calved before January 1, 1867.—1st, William James Taylor, Huntly, Clackmannan 2d, James Scott, Stonehaven, Tamerlane 3d, D. R. L. Grant, Alford, Paton of Antikerr

Section 8. Bulls calved after January 1, 1867.—1st, the Earl of Dunmore, Striving Main 2d, Alexander Brown, Arbroath, Jim Crow 3d, William James Taylor, Huntly, Elmore

HIGHLAND.

1st-prize Bulls at former Shows.—The Hon. Lady Menzies, Rannoch Lodge, Pitlochrie

Section 25. Bulls calved before January 1, 1866.—1st, the Duke of Athole, K.T. 2d, the Duke of Athole, K.T. 3d, Archibald Clark, Garvie, Glendaruel, Colliestrae

Section 26. Bulls calved after January 1, 1866.—1st, John Malcolm, Poltalloch, Lochgilphead 2d, John Stewart, Portree 3d, the Hon. Lady Menzies, Pitlochrie

Section 27. Bulls calved after January 1, 1867.—1st, John Malcolm, Poltalloch, Lochgilphead 2d, Donald M'Laren, Corrychone, Callander 3d, Robert Peter, Urral, Aberfeldy

1st-prize Cows at former Shows.—The Duke of Athole, K.T.

Section 28. Cows of any age.—1st, the Duke of Athole, K.T. 2d, John Malcolm, Poltalloch, Lochgilphead 3d, A. M. Donald, Strathcathie, King's Hill

Section 29. Heifers calved after January 1, 1867.—1st, Robert Peter, Urral, Aberfeldy 2d, John Malcolm, Poltalloch, Lochgilphead 3d, Robert Peter, Urral

CLASS II.—HORSES.

Jockeys.—Clydesdales, and Extra Draught Horses: John Buchanan, Colliestrae, Drymen, John Dove, Rodes, Newtown, Kelso; Robert Finlay, Springhill, Bilsborrow, Hunters, Carriage, and Extra Sir David Baird, of New Byth, Bart., Princeskirk; Robert Calder, Kelso, Kelso, Kelso.

FOR AGRICULTURAL PURPOSES.

1st-prize Stallions at former Shows.—James Hall, Frederick Street, Aberdeen.

Section 1. Stallions foaled before January 1, 1866.—1st, Murdo Bothnie, Drim, Bowly, "Cossack" 2d, David Bell, "K" wile, Duntocher "Scott" 3d, David Bell, Duntocher, "Yo"

Section 2. Stallions foaled after January 1, 1866.—1st, James Hall, Frederick Street, Aberdeen 2d, James Hall, Frederick Street, Aberdeen 3d, James Hall, Frederick Street, Aberdeen

Section 3. Entire Cows foaled after January 1, 1867.—1st, Robert Weir, Curwen, "A" 2d, James Weir, Curwen, "B" 3d, Thomas Milne, Inch, Aberdeen, "Young Inkerman"

Section 4. Entire Cows foaled after January 1, 1868.—1st, John Robertson, Lochwinnoch 2d, John Robertson, Lochwinnoch 3d, John Robertson, Lochwinnoch

Section 5. Mares (with foal at foot) foaled before January 1, 1866.—1st, Sir William B. Maxwell, of Keir, Bart. 2d, Sir William B. Maxwell, of Keir, Bart. 3d, Allan Snodgrass, of Cross, "Bell"

1st-prize Mares at former Shows.—John Watson, Glencairn Hill, Motherwell

Section 6. Mares (in Foal) foaled before January 1, 1866.—1st, Lawrence Drew, Merryton 2d, Sir William Stirling Maxwell, of Keir, Bart. 3d, Robert M. Buchanan, Mid-Caldor

Section 7. Fillies foaled after January 1, 1866.—1st, John Graham, Mid-Caldor 2d, James Fleming, Carronock 3d, Robert M. Buchanan, Mid-Caldor

Section 8. Fillies foaled after January 1, 1867.—1st, Alexander Buchanan, Carronock Mains, New Kilpatrick 2d, William

Kirkwood, Stanlymuir, Paisley; 3d, James Nicol Fleming, Kield, Campbeltown.

Section 9. Fillies foaled after January 1, 1868.—James Nicol Fleming, Kield, Campbeltown; 3d, James Nicol Fleming; 3d, William Kerr, Mid-Caldor.

EXTRA SECTIONS.

Section 10. Mares or Geldings foaled before January 1, 1865, suitable for field.—1st, Andrew Williamson, 15, Moray Place, Edinburgh; 2d, Earl of Hopetoun; 3d, Allan Gilmore, Eagle sham House, Glasgow.

Section 11. Mares or Geldings foaled between January 1, 1865, and January 1, 1867, suitable for field.—1st, William Forbes, Callendar, Falkirk; 2d, Thomas Cunningham, Callendar; 3d, W. Brodie, Lennox, Upper Keith.

Section 12. Mares or Geldings foaled before January 1, 1865, suitable for carriage.—1st, John H. Macnab, South Arthurie, Barrhead; 2d, Andrew Williamson, Edinburgh; 3d, Earl of Hopetoun.

Section 13. Mares or Geldings in harness.—1st, Thomas Ross, Edinburgh; 2d, James Scott, Edinburgh; 3d, James Scott, Edinburgh

Section 14. Mares or Geldings between 12 or 14 hands high.—1st, William Illeg, West Lauriston Place, Edinburgh; 2d, Robert Scott Stirling, Campbton, Drem; 3d, Thomas Watson, Forport, Gorsebridge.

Section 15. Mares or Geldings under 12 hands high.—1st, James Mack, Upper Keith, Edinburgh; 2d, John Torrance, East Crosscairnway, Fifeburgh; 3d, M. G. Rannie, Edinmonth, Kelso

EXTRA HORSES.—PONIES.

1st-prize Pony Stallions at former Shows.—The Duke of Athole, K.T.

CLASS III.—SHEEP.

Jockeys.—Leicester and Long-wooled: Robert Hardie, Harrietfield, Kelso; George H. Sanday, Holme Pierrepont, North York; Walter Woodhouse, Manor, Morpeth; Cheviot: George Mack, Burnside, Leckie; David Mandell, Heath, Leith; Inverness: John Robson, Brynosa, Otterburn; Blackface: James Craig, Polgahoy, New Cumnock; James James Millan, Fintry; Peter Robertson, Achilty, Dingwall; Southdown and Short-wooled: Charles Randall, Cheddar, Exmouth, Henry Woods, Merton, Thetford.

Section 1.—Tups not above 4-shear.—1st, J. W. Brodie, Leith; 2d, J. W. Brodie.

Section 2.—Dismont or Shearling Tups.—1st, William Ford, Hardengreen, Dalkeith; 2d, George Torrance, Slaterspath, Dunse; 3d, James Fleming, Carmuir, Falkirk.

Section 3.—Tups not above 4-shear.—1st, James Fleming, Hardengreen, Dalkeith; 2d, George Torrance, Slaterspath, Dunse; 3d, James Fleming, Carmuir, Falkirk.

Section 4.—Tups not above 4-shear.—1st, J. W. Brodie, Leith; 2d, J. W. Brodie.

Section 5.—Dismont or Shearling Tups.—1st, William Ford, Hardengreen, Dalkeith; 2d, George Torrance, Slaterspath, Dunse; 3d, James Fleming, Carmuir, Falkirk.

BORDER LEICESTER.

Section 6.—Tups not above 4-shear.—1st, Rev. R. W. Downington, Hook, Alwark, Northumberland; 2d, J. & W. Dinning, Nisbena Ridge, Haydon Bridge; 3d, T. Simson, Hainthill, Laner.

Section 7.—Dismont or Shearling Tups.—1st, T. Simson, Hainthill, Laner; 2d, Adam Smith, Stevenson Mains, Haddington; 3d, J. & W. Dinning.

Section 8.—Tups not above 4-shear.—1st, G. Simpson, Court Hill, Kelso; 2d, J. & G. Imlay, Kelso; 3d, Rev. R. W. Downington, Hook, Alwark.

Section 9.—Dismont or Shearling Tups.—1st, J. W. Dinning, Nisbena Ridge, Haydon Bridge; 2d, T. Simson, Hainthill, Laner.

Section 10.—Tups not above 4-shear.—1st, James Brydon, Kinnehead, Moffat; 2d and 3d, Thomas Elliot, Hardslope, Jedburgh.

Section 11.—Dismont or Shearling Tups.—1st, 2d, and 3d, James Brydon, Kinnehead, Moffat.

Section 12.—Tups not above 4-shear.—1st, James Brydon, Kinnehead, Moffat; 2d, James Archibald, Kelso; 3d, Thomas Elliot, Hardslope, Jedburgh.

THE KWEE.

Section 13.—Tups not above 4-shear.—1st, J. J. Archibald, Cambuslang, Stow; 2d, Thomas Elliot, Hardslope, Jedburgh.

Section 14.—Dismont or Shearling Tups.—1st, John Archibald, Cambuslang, Stow; 2d and 3d, Charles Hawtorn, Dorn, Murray.

Section 15.—Tups not above 4-shear.—1st, John Archibald, Cambuslang, Stow; 2d, Thomas Elliot, Hardslope, Jedburgh; 3d, James Archibald, Kelso; 4th, James Archibald, Kelso; 5th, James Archibald, Kelso; 6th, James Archibald, Kelso; 7th, James Archibald, Kelso; 8th, James Archibald, Kelso; 9th, James Archibald, Kelso; 10th, James Archibald, Kelso; 11th, James Archibald, Kelso; 12th, James Archibald, Kelso; 13th, James Archibald, Kelso; 14th, James Archibald, Kelso; 15th, James Archibald, Kelso; 16th, James Archibald, Kelso; 17th, James Archibald, Kelso; 18th, James Archibald, Kelso; 19th, James Archibald, Kelso; 20th, James Archibald, Kelso; 21st, James Archibald, Kelso; 22nd, James Archibald, Kelso; 23rd, James Archibald, Kelso; 24th, James Archibald, Kelso; 25th, James Archibald, Kelso; 26th, James Archibald, Kelso; 27th, James Archibald, Kelso; 28th, James Archibald, Kelso; 29th, James Archibald, Kelso; 30th, James Archibald, Kelso; 31st, James Archibald, Kelso; 32nd, James Archibald, Kelso; 33rd, James Archibald, Kelso; 34th, James Archibald, Kelso; 35th, James Archibald, Kelso; 36th, James Archibald, Kelso; 37th, James Archibald, Kelso; 38th, James Archibald, Kelso; 39th, James Archibald, Kelso; 40th, James Archibald, Kelso; 41st, James Archibald, Kelso; 42nd, James Archibald, Kelso; 43rd, James Archibald, Kelso; 44th, James Archibald, Kelso; 45th, James Archibald, Kelso; 46th, James Archibald, Kelso; 47th, James Archibald, Kelso; 48th, James Archibald, Kelso; 49th, James Archibald, Kelso; 50th, James Archibald, Kelso; 51st, James Archibald, Kelso; 52nd, James Archibald, Kelso; 53rd, James Archibald, Kelso; 54th, James Archibald, Kelso; 55th, James Archibald, Kelso; 56th, James Archibald, Kelso; 57th, James Archibald, Kelso; 58th, James Archibald, Kelso; 59th, James Archibald, Kelso; 60th, James Archibald, Kelso; 61st, James Archibald, Kelso; 62nd, James Archibald, Kelso; 63rd, James Archibald, Kelso; 64th, James Archibald, Kelso; 65th, James Archibald, Kelso; 66th, James Archibald, Kelso; 67th, James Archibald, Kelso; 68th, James Archibald, Kelso; 69th, James Archibald, Kelso; 70th, James Archibald, Kelso; 71st, James Archibald, Kelso; 72nd, James Archibald, Kelso; 73rd, James Archibald, Kelso; 74th, James Archibald, Kelso; 75th, James Archibald, Kelso; 76th, James Archibald, Kelso; 77th, James Archibald, Kelso; 78th, James Archibald, Kelso; 79th, James Archibald, Kelso; 80th, James Archibald, Kelso; 81st, James Archibald, Kelso; 82nd, James Archibald, Kelso; 83rd, James Archibald, Kelso; 84th, James Archibald, Kelso; 85th, James Archibald, Kelso; 86th, James Archibald, Kelso; 87th, James Archibald, Kelso; 88th, James Archibald, Kelso; 89th, James Archibald, Kelso; 90th, James Archibald, Kelso; 91st, James Archibald, Kelso; 92nd, James Archibald, Kelso; 93rd, James Archibald, Kelso; 94th, James Archibald, Kelso; 95th, James Archibald, Kelso; 96th, James Archibald, Kelso; 97th, James Archibald, Kelso; 98th, James Archibald, Kelso; 99th, James Archibald, Kelso; 100th, James Archibald, Kelso.

Section 16.—Dismont or Shearling Tups.—1st, John Archibald, Cambuslang, Stow; 2d and 3d, Charles Hawtorn, Dorn, Murray.

Section 17.—Tups not above 4-shear.—1st, John Archibald, Cambuslang, Stow; 2d, Thomas Elliot, Hardslope, Jedburgh; 3d, James Archibald, Kelso; 4th, James Archibald, Kelso; 5th, James Archibald, Kelso; 6th, James Archibald, Kelso; 7th, James Archibald, Kelso; 8th, James Archibald, Kelso; 9th, James Archibald, Kelso; 10th, James Archibald, Kelso; 11th, James Archibald, Kelso; 12th, James Archibald, Kelso; 13th, James Archibald, Kelso; 14th, James Archibald, Kelso; 15th, James Archibald, Kelso; 16th, James Archibald, Kelso; 17th, James Archibald, Kelso; 18th, James Archibald, Kelso; 19th, James Archibald, Kelso; 20th, James Archibald, Kelso; 21st, James Archibald, Kelso; 22nd, James Archibald, Kelso; 23rd, James Archibald, Kelso; 24th, James Archibald, Kelso; 25th, James Archibald, Kelso; 26th, James Archibald, Kelso; 27th, James Archibald, Kelso; 28th, James Archibald, Kelso; 29th, James Archibald, Kelso; 30th, James Archibald, Kelso; 31st, James Archibald, Kelso; 32nd, James Archibald, Kelso; 33rd, James Archibald, Kelso; 34th, James Archibald, Kelso; 35th, James Archibald, Kelso; 36th, James Archibald, Kelso; 37th, James Archibald, Kelso; 38th, James Archibald, Kelso; 39th, James Archibald, Kelso; 40th, James Archibald, Kelso; 41st, James Archibald, Kelso; 42nd, James Archibald, Kelso; 43rd, James Archibald, Kelso; 44th, James Archibald, Kelso; 45th, James Archibald, Kelso; 46th, James Archibald, Kelso; 47th, James Archibald, Kelso; 48th, James Archibald, Kelso; 49th, James Archibald, Kelso; 50th, James Archibald, Kelso; 51st, James Archibald, Kelso; 52nd, James Archibald, Kelso; 53rd, James Archibald, Kelso; 54th, James Archibald, Kelso; 55th, James Archibald, Kelso; 56th, James Archibald, Kelso; 57th, James Archibald, Kelso; 58th, James Archibald, Kelso; 59th, James Archibald, Kelso; 60th, James Archibald, Kelso; 61st, James Archibald, Kelso; 62nd, James Archibald, Kelso; 63rd, James Archibald, Kelso; 64th, James Archibald, Kelso; 65th, James Archibald, Kelso; 66th, James Archibald, Kelso; 67th, James Archibald, Kelso; 68th, James Archibald, Kelso; 69th, James Archibald, Kelso; 70th, James Archibald, Kelso; 71st, James Archibald, Kelso; 72nd, James Archibald, Kelso; 73rd, James Archibald, Kelso; 74th, James Archibald, Kelso; 75th, James Archibald, Kelso; 76th, James Archibald, Kelso; 77th, James Archibald, Kelso; 78th, James Archibald, Kelso; 79th, James Archibald, Kelso; 80th, James Archibald, Kelso; 81st, James Archibald, Kelso; 82nd, James Archibald, Kelso; 83rd, James Archibald, Kelso; 84th, James Archibald, Kelso; 85th, James Archibald, Kelso; 86th, James Archibald, Kelso; 87th, James Archibald, Kelso; 88th, James Archibald, Kelso; 89th, James Archibald, Kelso; 90th, James Archibald, Kelso; 91st, James Archibald, Kelso; 92nd, James Archibald, Kelso; 93rd, James Archibald, Kelso; 94th, James Archibald, Kelso; 95th, James Archibald, Kelso; 96th, James Archibald, Kelso; 97th, James Archibald, Kelso; 98th, James Archibald, Kelso; 99th, James Archibald, Kelso; 100th, James Archibald, Kelso.

Section 18.—Tups not above 4-shear.—1st, John Archibald, Cambuslang, Stow; 2d, Thomas Elliot, Hardslope, Jedburgh; 3d, James Archibald, Kelso; 4th, James Archibald, Kelso; 5th, James Archibald, Kelso; 6th, James Archibald, Kelso; 7th, James Archibald, Kelso; 8th, James Archibald, Kelso; 9th, James Archibald, Kelso; 10th, James Archibald, Kelso; 11th, James Archibald, Kelso; 12th, James Archibald, Kelso; 13th, James Archibald, Kelso; 14th, James Archibald, Kelso; 15th, James Archibald, Kelso; 16th, James Archibald, Kelso; 17th, James Archibald, Kelso; 18th, James Archibald, Kelso; 19th, James Archibald, Kelso; 20th, James Archibald, Kelso; 21st, James Archibald, Kelso; 22nd, James Archibald, Kelso; 23rd, James Archibald, Kelso; 24th, James Archibald, Kelso; 25th, James Archibald, Kelso; 26th, James Archibald, Kelso; 27th, James Archibald, Kelso; 28th, James Archibald, Kelso; 29th, James Archibald, Kelso; 30th, James Archibald, Kelso; 31st, James Archibald, Kelso; 32nd, James Archibald, Kelso; 33rd, James Archibald, Kelso; 34th, James Archibald, Kelso; 35th, James Archibald, Kelso; 36th, James Archibald, Kelso; 37th, James Archibald, Kelso; 38th, James Archibald, Kelso; 39th, James Archibald, Kelso; 40th, James Archibald, Kelso; 41st, James Archibald, Kelso; 42nd, James Archibald, Kelso; 43rd, James Archibald, Kelso; 44th, James Archibald, Kelso; 45th, James Archibald, Kelso; 46th, James Archibald, Kelso; 47th, James Archibald, Kelso; 48th, James Archibald, Kelso; 49th, James Archibald, Kelso; 50th, James Archibald, Kelso; 51st, James Archibald, Kelso; 52nd, James Archibald, Kelso; 53rd, James Archibald, Kelso; 54th, James Archibald, Kelso; 55th, James Archibald, Kelso; 56th, James Archibald, Kelso; 57th, James Archibald, Kelso; 58th, James Archibald, Kelso; 59th, James Archibald, Kelso; 60th, James Archibald, Kelso; 61st, James Archibald, Kelso; 62nd, James Archibald, Kelso; 63rd, James Archibald, Kelso; 64th, James Archibald, Kelso; 65th, James Archibald, Kelso; 66th, James Archibald, Kelso; 67th, James Archibald, Kelso; 68th, James Archibald, Kelso; 69th, James Archibald, Kelso; 70th, James Archibald, Kelso; 71st, James Archibald, Kelso; 72nd, James Archibald, Kelso; 73rd, James Archibald, Kelso; 74th, James Archibald, Kelso; 75th, James Archibald, Kelso; 76th, James Archibald, Kelso; 77th, James Archibald, Kelso; 78th, James Archibald, Kelso; 79th, James Archibald, Kelso; 80th, James Archibald, Kelso; 81st, James Archibald, Kelso; 82nd, James Archibald, Kelso; 83rd, James Archibald, Kelso; 84th, James Archibald, Kelso; 85th, James Archibald, Kelso; 86th, James Archibald, Kelso; 87th, James Archibald, Kelso; 88th, James Archibald, Kelso; 89th, James Archibald, Kelso; 90th, James Archibald, Kelso; 91st, James Archibald, Kelso; 92nd, James Archibald, Kelso; 93rd, James Archibald, Kelso; 94th, James Archibald, Kelso; 95th, James Archibald, Kelso; 96th, James Archibald, Kelso; 97th, James Archibald, Kelso; 98th, James Archibald, Kelso; 99th, James Archibald, Kelso; 100th, James Archibald, Kelso.

Section 19.—Tups not above 4-shear.—1st, John Archibald, Cambuslang, Stow; 2d, Thomas Elliot, Hardslope, Jedburgh; 3d, James Archibald, Kelso; 4th, James Archibald, Kelso; 5th, James Archibald, Kelso; 6th, James Archibald, Kelso; 7th, James Archibald, Kelso; 8th, James Archibald, Kelso; 9th, James Archibald, Kelso; 10th, James Archibald, Kelso; 11th, James Archibald, Kelso; 12th, James Archibald, Kelso; 13th, James Archibald, Kelso; 14th, James Archibald, Kelso; 15th, James Archibald, Kelso; 16th, James Archibald, Kelso; 17th, James Archibald, Kelso; 18th, James Archibald, Kelso; 19th, James Archibald, Kelso; 20th, James Archibald, Kelso; 21st, James Archibald, Kelso; 22nd, James Archibald, Kelso; 23rd, James Archibald, Kelso; 24th, James Archibald, Kelso; 25th, James Archibald, Kelso; 26th, James Archibald, Kelso; 27th, James Archibald, Kelso; 28th, James Archibald, Kelso; 29th, James Archibald, Kelso; 30th, James Archibald, Kelso; 31st, James Archibald, Kelso; 32nd, James Archibald, Kelso; 33rd, James Archibald, Kelso; 34th, James Archibald, Kelso; 35th, James Archibald, Kelso; 36th, James Archibald, Kelso; 37th, James Archibald, Kelso; 38th, James Archibald, Kelso; 39th, James Archibald, Kelso; 40th, James Archibald, Kelso; 41st, James Archibald, Kelso; 42nd, James Archibald, Kelso; 43rd, James Archibald, Kelso; 44th, James Archibald, Kelso; 45th, James Archibald, Kelso; 46th, James Archibald, Kelso; 47th, James Archibald, Kelso; 48th, James Archibald, Kelso; 49th, James Archibald, Kelso; 50th, James Archibald, Kelso; 51st, James Archibald, Kelso; 52nd, James Archibald, Kelso; 53rd, James Archibald, Kelso; 54th, James Archibald, Kelso; 55th, James Archibald, Kelso; 56th, James Archibald, Kelso; 57th, James Archibald, Kelso; 58th, James Archibald, Kelso; 59th, James Archibald, Kelso; 60th, James Archibald, Kelso; 61st, James Archibald, Kelso; 62nd, James Archibald, Kelso; 63rd, James Archibald, Kelso; 64th, James Archibald, Kelso; 65th, James Archibald, Kelso; 66th, James Archibald, Kelso; 67th, James Archibald, Kelso; 68th, James Archibald, Kelso; 69th, James Archibald, Kelso; 70th, James Archibald, Kelso; 71st, James Archibald, Kelso; 72nd, James Archibald, Kelso; 73rd, James Archibald, Kelso; 74th, James Archibald, Kelso; 75th, James Archibald, Kelso; 76th, James Archibald, Kelso; 77th, James Archibald, Kelso; 78th, James Archibald, Kelso; 79th, James Archibald, Kelso; 80th, James Archibald, Kelso; 81st, James Archibald, Kelso; 82nd, James Archibald, Kelso; 83rd, James Archibald, Kelso; 84th, James Archibald, Kelso; 85th, James Archibald, Kelso; 86th, James Archibald, Kelso; 87th, James Archibald, Kelso; 88th, James Archibald, Kelso; 89th, James Archibald, Kelso; 90th, James Archibald, Kelso; 91st, James Archibald, Kelso; 92nd, James Archibald, Kelso; 93rd, James Archibald, Kelso; 94th, James Archibald, Kelso; 95th, James Archibald, Kelso; 96th, James Archibald, Kelso; 97th, James Archibald, Kelso; 98th, James Archibald, Kelso; 99th, James Archibald, Kelso; 100th, James Archibald, Kelso.

Section 20.—Tups not above 4-shear.—1st, John Archibald, Cambuslang, Stow; 2d, Thomas Elliot, Hardslope, Jedburgh; 3d, James Archibald, Kelso; 4th, James Archibald, Kelso; 5th, James Archibald, Kelso; 6th, James Archibald, Kelso; 7th, James Archibald, Kelso; 8th, James Archibald, Kelso; 9th, James Archibald, Kelso; 10th, James Archibald, Kelso; 11th, James Archibald, Kelso; 12th, James Archibald, Kelso; 13th, James Archibald, Kelso; 14th, James Archibald, Kelso; 15th, James Archibald, Kelso; 16th, James Archibald, Kelso; 17th, James Archibald, Kelso; 18th, James Archibald, Kelso; 19th, James Archibald, Kelso; 20th, James Archibald, Kelso; 21st, James Archibald, Kelso; 22nd, James Archibald, Kelso; 23rd, James Archibald, Kelso; 24th, James Archibald, Kelso; 25th, James Archibald, Kelso; 26th, James Archibald, Kelso; 27th, James Archibald, Kelso; 28th, James Archibald, Kelso; 29th, James Archibald, Kelso; 30th, James Archibald, Kelso; 31st, James Archibald, Kelso; 32nd, James Archibald, Kelso; 33rd, James Archibald, Kelso; 34th, James Archibald, Kelso; 35th, James Archibald, Kelso; 36th, James Archibald, Kelso; 37th, James Archibald, Kelso; 38th, James Archibald, Kelso; 39th, James Archibald, Kelso; 40th, James Archibald, Kelso; 41st, James Archibald, Kelso; 42nd, James Archibald, Kelso; 43rd, James Archibald, Kelso; 44th, James Archibald, Kelso; 45th, James Archibald, Kelso; 46th, James Archibald, Kelso; 47th, James Archibald, Kelso; 48th, James Archibald, Kelso; 49th, James Archibald, Kelso; 50th, James Archibald, Kelso; 51st, James Archibald, Kelso; 52nd, James Archibald, Kelso; 53rd, James Archibald, Kelso; 54th, James Archibald, Kelso; 55th, James Archibald, Kelso; 56th, James Archibald, Kelso;

is a common word, but never perhaps realised by the hill farmer in the same degree from day to day and month to month. What the effects of a severe winter would have been with the short supplies, it is difficult to conceive of as anything short of starvation, and now that there is an appearance of roughness and keep about, the sense of relief is great, but that relief did not come all at once or suddenly. We had a fine February, cold March, remarkably fine April, and a backward May, and though the corn crops have grown well of late, the harvest can scarcely now be an early one. Turnips promise very differently from last year, there are partial failures, however—the severe and stormy rain we had a month ago having told against the unbraided or newly braided portions, and the flea followed up with a vigorous attack on the battered and slow-growing plants, so that cases of re-sowing are quite general.

Sheep stock had a good deal of lee-way to make up, having been thin in spring, and, from the want of their usual winter and spring supplies, the clip is light. We have had more than the usual death among them, and that chiefly in the autumn. During the drought of last summer the shepherds began to prophesy death when the Grass came; and they were not wrong, for grass-ill, or braxy, made great ravages, in some instances killing as many as three and four in the score. The lambing season was looked forward to with much anxiety, and the short supplies of extra food economised to the utmost. For one lot of ewes (half-breds) we began to lead off Turnips early in January, beginning with the worst-conditioned first; and when the whole lot (12 score) were put on, two cartloads of Turnips per day was their allowance. The rest of their keep they had to hunt for, with the help of a little hay in the hard weather. Although not by any means in the condition we have often seen them, or would like to have them, they were in tolerable lambing condition, and the flush of Grass in April was worth more than any amount of artificials. One small lot of Cheviot ewes, with the run of several Grass fields, had neither Turnips, corn, nor cake, but the offer of some hay, which they refused to eat, choosing rather to pick up a living on the early Grass which they found in burn-sides and sunny spots. The hill Cheviot ewes got corn, and part of them Clover hay, which they made good use of. The hay was laid down to them daily in small handfuls on the heath. We have tried giving the hay in racks with the view of saving waste, but found that there was more waste from the racks than when spread over a new and clean piece of ground each day, or at all events their finding-ground shifted frequently. Those which had corn got from half a pound to a pound per day. There is no question this corn and hay was a great deal better than nothing, but as little question that Turnips would have been better still. After considerable experience in the use of artificial feeding for hill sheep, we have come to see that nothing supplies the place of Turnips either in bringing them through the winter, or as regards their progress on Grass afterwards. Of course this refers to hill and store stock, which have always a good outtake of rough pastura. The case may be different in regard to field stock and with bare pastures, where the question is one of full Turnips, or Turnips and artificial food combined, the pastures supplying little bulk to fill the animal.

With the present promise of a Turnip crop, which mainly influences the lamb markets, we would expect prices to be somewhat nearer par than last year. Of course what par means exactly we do not undertake to determine, but should fancy that, if it has not, it at least ought to have some relation to rents, which, as now generally arranged, seem to date back to the year 1866, when Cheviot ewes with their lambs were selling at 65s. The one or two markets which have been already held show a material rise from last year in the price of lambs, and there was ample room for it, as such a dog-hanging as our great Melrose lamb market was last year we hope never to see again. J. S. B.

AGRICULTURE OF SOMERSETSHIRE.—We cannot complete our article without stating some general conclusions at which as practical farmers, we have arrived during our examinations and explorations in Somersetshire. We would first direct attention to the fact that Somerset is one of the most important among what are termed the "Cider Counties," and there are those who would yield it the palm of superiority on this account. Granting, however, that a thickly-wooded country, dotted here and there with orchards, looks lovely in early spring, and has a rich and promising appearance when autumn bends down the boughs with the weight of the ruddy fruit, yet we cannot help thinking that this very plethora of cider tends, after all, to increase the poverty of the land.

In cider districts the enclosures are always small, and turbar is grown to the greatest possible extent. In such case the farmer pays rent for trees, rent for grass, and rent in timber, besides rent in the shape of about 10 per cent. for hedges and ditches, which are only impediments to anything like open-handed liberal farming.

If asked to propose a remedy, we should say it would be for the special advantage of Somerset to root out half its orchards. If cider is to be produced, let it be made from good sorts of apples, and with something like care and attention. Half the quantity of good cider is worth more than double the quantity of inferior produce.

We believe that this is a matter deeply affecting the landlord and tenant, as well as the nation at large. Larger fields, less wood, and less orcharding in the fine fertile soil of Somerset are desiderata affecting the well-being of all.

The next point to which we would direct attention is the general backwardness in farm operations which prevails among the occupiers of small holdings.

Indeed the small Somerset farmer is always for putting off work, with the observation that it is time enough to sow Wheat or Beans, or otherwise, at some particular fair, whereas the occurrence of foul weather too often precludes the fair opportunity. In late farming there may be some reason for very thick sowing; but even then, in so far as we have observed, at least one-third more seed is employed in Somerset than is beneficial.

The truth is, that dilatory habits and thick sowing to make up for loss of time, are the great evils of small farmers with small fields on strong land. The whole thing wants to be expanded, the fields to be enlarged, steam to aid in cultivation, more labour, good buildings, and, in fact, well-weighted business arrangements carried on with capital, in the place of what in the west is significantly called "nugling." There are, however, many notable exceptions to this remark, and it were easy to point to several agriculturists who occupy a foremost rank among the farmers of England.

Thick sowing is intimately connected with another subject, namely, that of weeds. I recently saw some very fine ears of Wheat, which I was told were a fair sample of the whole field, and my informant requested to know the cause. Our reply was, weeds. On being assured that the land was as "clean as a flower-garden," we told our friend how a French gentleman had authoritatively declared that the worst weed of Wheat is Wheat, and so it proved here, for, being late in sowing, an odd lot of seed had been drilled at the rate of a sack an acre! But, besides this weed-source, there will ever be found wild plants peculiar to certain soils and districts, and these grow in such quantities as to impede the development of the crop. Professor Buckman, in the "Journal of the Bath and West of England Agricultural Society."

The Poultry Yard.

ACCORDING to general opinion and practice our cattle have reached nearly as high a point of perfection as is supposed to be profitable, possible, or desirable. Seeing that the development of our domestic fowls has, in a great measure, been under the auspices of those who have done so much for cattle, the question arises, would they not do something if they gave the same attention to their poultry? Is it likely that the originators of the great herds, and the hard books, where the pedigrees are carried over in numbers that require a Colenso to read them at sight, had any idea as to what their care and attention would lead? It will be universally admitted that the quality of our poultry as general produce is improving, but not in its proper ratio. We have had during the present breeding season the visits of a large number of American poultry breeders, who have ransacked the yards of France, England and Ireland, with fair judgment and more money on purpose to find birds of high excellence in the matter of breed, to put down with the stock they already have. They say they have the pure blood and good type, but the high excellence they must get hence. It seems strange that men, who in the course of a holiday traverse a great portion of the world, although they go through the departments of France, of which the birds they are in want are not yet do not find them of a quality sufficiently high to please them, and they buy here on the return journey.

We may expect in the course of the next year or two to see birds sent us from America of greater size than any of our European breeding, and then we may still more look for improvement. When we consider what has already been accomplished in the improvement of our breeds of poultry, we are encouraged to look still forward, and to remove to a great distance the limit to the size of our birds.

—The taste for aviaries and pheasantries seems to be spreading among us, and we know no pursuit more pleasing. The continued traffic between our ports and distant parts of the world, is the means of bringing many choice and interesting specimens. A visit to our Zoological Gardens, with a view to examine the splendid additions made to the pheasant tribe during the past year or so, will show how much may be done. Of all the new birds none are so likely to do well as the pheasants, and of them, few so well as the splendid Reeves's or Long-tailed.

—From all parts of the kingdom, and from fanesera of all varieties, come letters and inquiries as to the probability of a poultry show in London or, in default, at the Crystal Palace. It is certainly a matter of regret that the home counties, so rich in amateurs and in birds, should be so badly off for shows at which the latter may be exhibited. If there be no place suitable in London, surely at the Palace at Sydenham a poultry show would be as attractive, if not more so, than one of singing birds. We know of no locality in which a larger number of real amateurs would be collected—people who keep and breed poultry for the love of it, and who attain great excellence in its development. In no other place or building does there exist the same command of space and material, and in suggesting the revival of the annual meeting, to be held either in London or at the Palace, we think we are only commencing that which will be heartily followed up and carried out. The prize-list is always a difficulty and the Birmingham, Manchester, Bath and West of England, and the Royal Agricultural Societies have all in their turn received a very fair share of criticism on the compilation of their respective prize-sheets. It is always very much easier to find fault with the performance of others than to excel it, and we feel diffident in offering a few suggestions to those who may have to draw up the prize-lists of future shows. There is much to retain and admire in the programme of the Bingley Hall Society, and as long as poultry prize lists are wanted

that may be taken as the alphabet of their construction.

We have an idea that the pen of cock and two hens is preferable, the birds being kept apart like the congregation in the Temple Church. Certainly for exhibiting the appearance is more effective. We would always offer a first prize of as high a value as the funds admitted. The second and third should be as good in proportion; the commendations, which cost nothing and are consequently now scattered broadcast, should be few. The classes now seem too numerous, good and well-matched hens are split up to furnish a pen more in each class. In Dorkings colour is now recognised sufficiently to make it the mark distinctive classes in a breed, the old amateurs of which can remember the time when it might have been described as a bird without a colour. In simplification of the now lists, say a class for cock and hen, or cock and two hens, coloured Dorkings, and one for white only, silver grey and red speckles to take their chance with their coloured brethren. Brahmas are now universally conceded two classes, and the best birds are made the running. It is doubtful, however, if they can attain the perfect on of the dark birds but where we give two prizes for dark ones we should, for impartiality's sake, do the same for the light. Spaniards always hold their class, and generally fill it.

Game fowls have at present a string of classes allotted to them, and they have a class of admirers whose devotion to them is intense, nevertheless, after you have passed at a good show the classes for the black and brown reds with the duckwing, how many others will they seem only put up to bother the printer, and three or three pens divide the prizes. The game fowl do not suffer by mixed competition. In all probability the finest exhibition of birds ever seen was that at Liverpool a few years since, when Sir Piers Mackenzie won the sweepstakes of 100 gs. against a marvellous collection of game birds of all colours. Crèvecoeur and Houdans are well worthy of a class each, so is the La Plèche, but we have them not in sufficient numbers to fill one. The other French breeds, such as La Bresse, Breda, &c., may worthily fill a class for the destitute—the class for "any other variety" Hamburgs must have four classes, and it is doubtful whether the blacks should not have one to themselves. Out of respect to antiquity, the Malines might still have a class; but the Polish might certainly be massed. Bantams we would divide into four classes—Sebright games, black, white, and foreign bantams. The turkeys, ducks, and geese we will as they are. We are fully aware that the foregoing remarks are open to a great deal of criticism, but shall be quite content if they invite attention to a subject that is, we hope and believe, only latent, and forgotten.

Miscellaneous.

Death of Mr. Edward Carroll.—[We take the following notice of the life and labours of our excellent correspondent, W. E. Carroll, from the columns of the *Dublin Farmers' Gazette*.] We regret to announce the death of Mr. Edward Carroll, which took place on the 21st inst. at his residence, Walnut Grove, Glasnevin. Mr. Carroll, who had attained the ripe age of 70, was for some time prior to May 8, 1888, Editor of the journal, and since that period a frequent contributor to its columns. For some years past Mr. Carroll had in charge of the horticultural department of the Agricultural Training Institution, Glasnevin, and gave lectures on all the branches of horticulture, being a department in which he had much experience. Mr. Carroll has had a long and useful career, which in many ways afforded to the youth a whose training has been engaged at Glasnevin a most valuable, instructive example. From his youth he was most earnest and laborious in the study of agriculture and horticulture. He was a man of great breadth of view and of a wide range of thought. He was one of the most single-minded of men, and carried this quality to a degree that marred his own pecuniary advancement. He entertained strong views on many of the questions on which people differ in this country; but in his advocacy of these views he studiously avoided offending those who differed with him. To the interests of stewards and gardeners he paid much attention, as the readers of his journal are well aware. When he brought his varied knowledge and his warm and sympathetic disposition into the lecture room at Glasnevin, he commanded the respect and admiration of his "young friends," as he used to call them; and in testimony of their appreciation of their friend and teacher, the pupils have themselves borne his remains to that bourne whence no traveller returns. The announcement of Mr. Carroll's death will be received with deep regret by a large circle of friends, by whom he was much esteemed during a long and useful career.

Clover Experiments.—The current number of the "Agricultural Journal" contains reports of several experimental researches, conducted by Dr. Voelcker into the effects of various manures on Clover and Grass. His observations on the Clover under treatment are that nitrate of soda is about as efficient in the production of growth as sulphate of ammonia—that common salt is variable in its effects, in one year producing growth and in another no effect—that the heaviest crop is obtained from a mixture of superphosphate of lime and marlate of potash, that where salts of potash have been used the second cutting of Clover was 2½ more than the second cutting of the unmanured crop, whereas when nitrate of soda has been used the second cutting is inferior. These are the results in the special instances reported; but every agricultural fact is the result of so many circumstances besides those to which the attention of a reporter is especially directed, that it is never safe to give to particular examples the value of a general law. In the case of ordinary grass-land,

Heating by Hot Water. W. J. HOLLANDS, IRON MERCHANT, 11, Bankside, E.C.

Table listing prices for hot-water pipes, elbows, tees, siphons, and throttle valves in various diameters.

Cash remittance with order. N.B. All Goods of first-class manufacture. No second quality kept.

Glass for Garden Purposes. JAMES PHILLIPS AND CO. beg to submit their REDUCED PRICES as follows:-

Table for propagating glasses with diameters ranging from 2 to 11 inches.

Table for BEE GLASSES with diameters from 4 to 11 inches.

Table for CUCUMBER GLASSES with lengths from 24 to 36 inches.

Table for HAND GLASSES with diameters from 12 to 15 inches.

Table for LONDON AGENTS for HARTLEY'S IMPROVED PATENT ROUGH PLATE.

Text listing various products like LINSEED OIL, CARBON'S PAINTS, and SHEET AND ROUGH PLATE GLASS.

Horticultural Glass Warehouse. THOMAS WILKINGTON AND CO., 37, Bishopsgate Street Without, London, E.C.

Table for ORCHARD-HOUSE SIZES with various dimensions and prices.

Table for SMALL SUFFET SQUARES, 15 oz., per 100 feet.

Table for LARGE SHEET SQUARES, 15 oz., per 100 feet.

Text describing the quality and uses of the glass products.

Table for SHEET GLASS in sheets for cutting up.

Text describing HARTLEY'S IMPROVED ROLLED ROUGH PLATE.

Text describing PAINTS, COLOURS, and VARNISHES.

Text describing STUCCO PAINT and WHITE WASH.

Text describing M. ROYAL ANT-RUST and ANTI-CORROSION.

Text listing various materials like GENUINE WHITE LEAD, CARBON'S PAINTS, and GLASS.

Text listing various tools like GROUND BRUSHES, DUSTERS, and NASH TOOLS.

Text providing contact information and a note about the above list.

GREEN'S IMPROVED PATENT ROLLER, FOR LAWNS, DRIVES, BOWLING GREENS, CRICKET FIELDS, and GRAVEL PATHS.

SUITABLE FOR HAND OR HORSE POWER.

PRICES OF HAND ROLLERS.

Table listing prices for hand rollers with diameters from 15 to 30 inches.

PRICES OF ROLLERS FITTED WITH SHAFTS.

Table listing prices for rollers with shafts, suitable for pony or horse power.

Text describing the features and benefits of the rollers.

Text providing prices for different roller sizes.

Text providing contact information for THOMAS GREEN AND SONS.

CUMMING & EDMONDS, HORTICULTURAL BUILDERS and HOT-WATER ENGINEERS.

LILLIE BRIDGE, FULHAM, LONDON, S.W.

Text describing conservatories and horticultural structures.

PATENT TUBULAR SADDLE BOILER, the cheapest and best Boiler constructed.

Table listing specifications and prices for different sizes of saddle boilers.

Text stating that plans and estimates are free of charge.

GRAY'S OVAL TUBULAR BOILER. INTERNATIONAL EXHIBITION, CLASS IX, No. 2119.

Text stating that Mr. Gray begs to call the attention of the Nobility, Gentry, Nurserymen, Gardeners, &c.

NEW OVAL TUBULAR BOILER.

Text describing the boiler as a great improvement on every form of tubular boiler.

Text mentioning the boiler was exhibited at the International Exhibition in 1862.

Text stating that the boilers are made of all sizes and can be had on application.

Text providing contact information for JAMES GRAY, HORTICULTURAL WORKS.

PORTABLE AND FIXED HOT-WATER APPARATUS, FOR HEATING CONSERVATORIES, HOTHOUSES, CHURCHES, PUBLIC BUILDINGS, PRIVATE RESIDENCES, ETC., WITH TRUSS'S PATENT UNIVERSAL FLEXIBLE AND LEAKLESS PIPE-JOINT.

T. S. TRUSS

Text describing the apparatus and its benefits.

Text stating that the apparatus is guaranteed for a long time.

Text providing contact information for T. S. TRUSS.

Table listing prices for two four-inch pipes along one side and one end of a house.

Text providing contact information for T. S. TRUSS.

Text providing contact information for T. S. TRUSS.

Text providing contact information for T. S. TRUSS.

NEW COLEUS, BEAUTY OF WIDMORE.—Distinctly tricolored, leaves beautifully shaped, dark brilliant green, belted with bright rose and green edged with silvery white. 25 distinct varieties, including the above and all other new ones of this season, free by post for 2s.

ALTERNANTHERA AMABILIS. A new variety, far superior to all the other Alternantheras, 4s. per dozen.

HELVETIA METALLICA.—The beautiful Shell Plant, 4s. per dozen.

JAMES CARTER and CO., Seed Merchants and Nurserymen, 21 and 23, High Holborn, W.C., and Crystal Palace Nurseries, First Hill, S.E.

INTERNATIONAL HORTICULTURAL EXHIBITION to be held in HAMBURG from SEPTEMBER 1 to 12. The EXHIBITION will be held in the grounds of the Exhibition, and will be opened on SEPTEMBER 1 at 10 o'clock in the morning. The grounds of the Exhibition are situated on the banks of the Elbe, with an unobstructed view of the Harbour of Hamburg, and will be presented to the Visitor a most perfect picture of everything appertaining to Horticulture. Besides a vast number of Plants and Trees in the open ground, as well as a vast number of Greenhouses, there will be exhibited all the products of Horticulture and Agriculture, and every variety of Machines, Greenhouses, Heating Apparatus, Summer-houses, Fountains, Statues, Bridges, Follies, Terrariums, Aquariums, &c. &c. Under the same programme there is a large number of Extra Prizes, awarded by H.M. the King and H.M. the Queen of Prussia, H.M. the Queen of England, H.R.H. the Grand Duke of Oldenburg, the Senate of the City of Hamburg, the Austrian Ministry, the Prussian Ministry, the Magistrates of the City of Altona, and numerous private individuals. Numerous applications have been received, the participation of the European and the Transatlantic States will be enormous. A separate Committee has been appointed for the purpose of procuring Lodgings. Address, Dr. CARL GOSLFR.

Through Tickets for the entire Exhibition, the Distribution of the Programmes, and the Auction on September 11, can be had at 1s. each after August 20. Prices of admission: First day, 1s.; second day, 6d.; for the second week, 1s.; for the last day and the last days of the Exhibition the admission will be 6d. THE COMMITTEE OF THE INTERNATIONAL HORTICULTURAL EXHIBITION of 1869. Hamburg, July, 1869.

the Great Shows in London, while they concentrate its efforts upon some of its most legitimate horticultural functions. Moreover, by reducing the aggregate number of meetings, not only exhibitors, but also committee men, will be relieved from such repeated attendances as the present arrangements necessitate. We have but mentioned the general features of the scheme, the actual arrangements determined on, with the schedule of prizes to be offered at the several meetings, will be speedily prepared and issued. These matters of detail should be well-considered and thoroughly matured, and that being done, we strongly urge the Society to continue the same arrangements for a series of years without material alteration, except in so far as additions may be found desirable. Moreover the exhibitors should have some assurance that such will be the case. Changes in the nature or limits of the classes upset the calculations of the growers, and do immense injury to exhibitions. Hence, again, though the subjects of the classes may be varied under somewhat novel associations, we trust the classes themselves will be made as nearly as possible to correspond with those of the schedules of recent years.

The arrangements we have thus briefly shadowed forth are intended to fit in with the scheme of International Exhibitions which has been announced by HER MAJESTY'S Commissioners of 1851, to which we have elsewhere referred.

A LETTER from a New Zealand correspondent in our last issue, clears up what had previously been a mystery to us. Readers of SIR CHARLES DILKE'S "Greater Britain," will remember the glowing terms in which he speaks of the ROCKWOOD LILY. In our notice of the work in question (see p. 84), we expressed our regret that neither the name nor the description given were sufficiently technical to enable us to state what the plant really was. HOOKER'S "Flora of New Zealand," wherein the local names are carefully given, contains no Rockwood Lily, nor were we able in any other work relating to New Zealand botany to trace it. Our correspondent, however, has given us the clue, and declares the plant to be a species of Buttercup, *RANUNCULUS LYALLII*. And now, good New Zealand correspondents, fail not to send us seeds of this glorious Buttercup—for glorious it is. Dr. HOOKER, in the "Handbook of the New Zealand Flora," calls the plant, as well he may, the "most noble species of the genus"—"the Water Lily of the shepherds." Indeed even in the dried specimens of which there are many in the Kew herbaria, the resemblance to our common white Water Lily is striking. The plant is stated to grow in moist places in the Southern Alps, the Wurumui mountains, in the glacier regions of the Forbes River, near Otago, and elsewhere in the Middle Island, at heights of from 1000 to 5000 feet above the sea. In habit it seems almost identical with our common marsh Margold, but it is twice or thrice larger. The leaves are circular, 12 to 15 inches in diameter, very like those of the plant last mentioned, but peltate, as in the *Nelumbium*. The flowers are borne in panicles, each flower is of the purest waxy white colour, 3 to 4 inches across, and in shape and aspect is like a Brodiaugian Buttercup. With such a *supplement* we can readily give credence to Mr. FRASER when he says "the whole plant looked ready made." We imagine there would be no great difficulty in growing the plant if we once got it here. To this end we should be disposed, in addition to more ordinary methods of transport, to try several means, such as sowing the seeds in a Wardian case, or placing them in a closed bottle in damp Moss or moistened earth. At any rate, "moist shady gullies" in New Zealand mountains must no longer be suffered to have the monopoly of so grand a plant as this.

good reason either for passing such plants over entirely, or for making them the same sort of award as is bestowed on more showy but more commonplace and intrinsically less interesting objects. And yet under existing circumstances one or other of these two things happens if a plant unknown to the trade, and unappreciated by the florists, makes its appearance before the Committee. To show the absurdity of the matter, let us take an illustration from the garland of poetry. We suppose that where there is one reader of BLOWING there are a hundred of TENNYSON. Shall we, therefore, take the bookseller's view of the case, and award all our praise to the poet whose works sell best? Many admire TUPPER who have no fancy for TENNYSON. Is that a reason why the latter should have no certificate and the former be awarded a "first-class?"

The Floral Committee, on the whole, does its work well, and, we believe, with thorough impartiality. If occasionally deserving plants get passed over, it is because they are such as are not familiar to, or understood by, the generality of the members, or because things are brought into comparison one with another which really present no fair terms of comparison. The adoption of some form of award for non-commercial plants, or for plants of scientific interest, would, we believe, meet the case, and prevent the scandal that must arise if the highest floral tribunal of the kingdom either pass over without comment deserving plants, or insult them by giving them the same award as they would to a "good bedder" or to one which is likely to be a "good thing" for the pockets of the possessor.

— WE have been requested to publish the following particulars relating to the proposed ANNUAL INTERNATIONAL EXHIBITION OF SELECT WORKS OF FINE and INDUSTRIAL ART and SCIENTIFIC INVENTIONS —

A. Her Majesty's Commissioners for the Exhibition of 1871 announce that the first of a series of annual international exhibitions of selected works of fine and industrial art will be opened in London at South Kensington, on Monday, May 1, 1871, and be closed on Saturday, September 30, 1871.

B. The exhibitions will take place in permanent buildings, designed and erected by the Royal Commission.

C. The promoters of the exhibition will be subject to obtaining the certificate of excellence that they are of sufficient excellence to be worthy of exhibition.

D. The objects in the first exhibition will consist of the following classes, for each of which will be appointed a reporter and a separate committee:—

1. FINE ARTS.
 1. Painting of all kinds, in oil, water-colours, enamel, porcelain, &c.
 2. Sculpture in marble, wood, stone, terra cotta, metal, ivory, and other materials.
 3. Engravings, lithography, photography, &c.
 4. Architectural designs and models.
 5. Tapestries, embroideries, &c. shown for their fine art and not as manufactures.
 6. Designs for all kinds of decorative manufactures. Copies of ancient pictures, engravings, reproductions in plaster, electrotypes of ancient works of art, &c.
2. SCIENTIFIC INVENTIONS AND NEW DISCOVERIES of all kinds.
3. MANUFACTURES.
 - a. Pottery of all kinds, including that used in building, viz., earthenware, stoneware, porcelain, Parian, &c., with machinery and processes for the preparation of such manufactures.
 - b. Wool and worsted fabrics, with the raw produce and machinery for manufactures in the same.
 - c. Educational.
 1. School buildings, fittings, furniture, &c.
 2. Books, maps, globes, &c.
 3. Appliances for physical training, including toys and games.
 4. Specimens and illustrations of modes of teaching fine art, natural history, and physical science.

4. International exhibitions of new and rare plants, and of fruits, vegetables, flowers, and plants, showing specialities of cultivation, will be held by the Royal Horticultural Society in conjunction with the above exhibitions.

5. In Classes 2 and 3 producers will be permitted to send and exhibit their own works, and to be accompanied by a detailed rules applicable to each of the above classes, and lists of the separate trades engaged in the production of objects of manufacture will be issued. Special rules for horticultural exhibitions will be issued by the Royal Horticultural Society.

F. The arrangement of the objects will be according to classes, and not nationalities, as in former international exhibitions.

G. One third portion of the whole available space will be assigned absolutely to foreign exhibitors, who must obtain certificates for the admission of their objects from their respective governments. Foreign countries will appoint their own agents. The remaining two thirds of the space will be filled by objects produced either in the United Kingdom, or if produced abroad, sent to the United Kingdom, and approved of by a judge appointed by the British Exhibitors. Objects not accepted for exhibition will be removed according to the notices given, but no objects can be removed until the close of the exhibition.

H. All exhibitors or their agents, must deliver at the building, into the charge of the proper officers, the objects unpacked and ready for immediate exhibition, and free of all charges for carriage, &c.

I. Her Majesty's Commissioners will send large glass cases, etc., to the exhibitors, and except in the case of machinery, carry out the arrangement of the objects by their own officers.

J. Her Majesty's Commissioners will take the greatest possible care of all objects, but they will not hold themselves responsible for loss or damage of any kind.

K. Prizes may be attached to the objects.

The Gardeners' Chronicle.

SATURDAY, AUGUST 7, 1869.

MEETING FOR THE ENSUING WEEK. Friday, August 10—Royal Botanic Anniversary.

The modification in the Royal Horticultural Society's LONDON MEETINGS and SHOWS to be held during 1870, and to which we have on one or two occasions already adverted, has now, we learn, been definitively adopted by the Council, and will be officially announced forthwith. Virtually these changes consist in the strengthening of the fortnightly meetings, which are the most useful and prosperous of the Society's gatherings, by throwing into them the various shows held during the season, and in the abandonment of separate "shows." Moreover, since Wednesday is a more profitable day of the week than Tuesday regards visitors—the next best, indeed, to Saturday, which is objectionable on various grounds—there is to be the slight change of making the meeting day from Tuesday to Wednesday. The latter day is equally convenient to all the parties concerned, while it has the advantage over any other admissible day, at its adoption, so far as past experience enables one to judge, would help to make the winter shows pay.

These Wednesday meetings, to be held in the first or third week, or the first and third week in each month of 1870, will, as we understand, consist of such meetings as the present Tuesday meetings, supplemented by shows, some small and somewhat like the prize meetings of the present season, others larger, like the spring and other exhibitions of ordinary years. All the meetings are to be show days of a major or minor order, and no separate exhibitions are to be held, except the Provincial show, which will take place in the course of the summer. The days fixed on are the third Wednesday in January and in February, the first and third Wednesdays in each month from March to September inclusive, and the first Wednesday in October, in November, and in December. At each meeting or show some characteristic flower and fruit in season will be selected as the special feature of that meeting, and will be made the subject of certain special prizes while other seasonable objects will be grouped around them, sufficient in quantity to make up a larger or a smaller exhibition. The subjects proposed are the following—

- 10.—Forced flowers—Kitchen Apples and Pears.
- 11.—Chinese Pines—Desert Apples and Pears.
- 12.—Hyacinth and Tulips—Early and late Grapes.
- 13.—Cyclamens—Apples and Pears.
- 14.—Camellias—Greenhouses and Forced Salads.
- 15.—Pot Herbs—Forced Vegetables.
- 16.—Aucubas—Blossoms, Fruits.
- 17.—Paeonies—Figs—Strawberries.
- 18.—Rhubarb—Peaches and Nectarines.
- 19.—Orchids—Strawberries.
- 20.—Roses—Pine-apples.
- 21.—Carnations and Pinks—Cherries.
- 22.—Raspberries—Early Peaches and Plums, and Gooseberries.
- 23.—Grapes—Peaches and Nectarines.
- 24.—Dorset—Figs and Apples.
- 25.—Jesters—Early Apples and Pears.
- 26.—Fuchsias—Grapes.
- 27.—Aucubas—Desert Pears.
- 28.—Late Chrysanthemums—Desert Apples and Pears.

The changes proposed by this scheme appear to us to be steps in the right direction, inasmuch as they relieve the Society from the incubus of

operations." These in their turn may, for a similar object, and with lasting benefit, be again reduced somewhat and thinned out. Being only the second season after successful budding and removal, the capabilities of the roots and the requirements of the head are tolerably evenly balanced one with the other. And what is the result? That at this age, namely, from two to three or four years from the bud, far finer and more plentiful blossoms are produced than are ever seen afterwards upon the same trees where extreme use of the knife is resorted to, and no natural extension of the head, commensurate with and contemporaneous with the ever increasing size of the root, is permitted. Whether it be a Rose, an Elder, or any other deciduous tree, it matters not, an unreasonable amount of mutilation during the resting period must force the tree into making robust growth in the effort to right itself, and that at the expense of well-matured wood and fine flowers. The long shoots produced by standard Roses pruned upon the close principle, with inferior Roses at their apex, and the robbers, or side-shoots, which are produced at the same time, and which run away with the aid the flowers require, are patent to all, the latter especially to exhibitors of cut blooms, who know well the injury they cause, but who dare not remove them at the risk of having a dishonoured stand. The presence of suckers, whether from above or below ground, points to the same cause—violated Nature! I distinctly demur to the suggestion that, by cutting Rose-shoots down to the lower eyes, better blooms are likely to follow upon such shoots than if other eyes nearer to the apex were left.

By close observation I have come to the conclusion that those well-plumped eyes upon wood which has had all the benefit of full autumn sunshine, are equal to and, indeed, better than, those below them. Compare the abundant foliage and bloom of a moderately-pruned Madame Bonquet, Charles Lawson, or, indeed, Sénateur Vasse, with that of others close pruned! Why are Roses in the form of dwarfs and grown upon their own roots, superseding the standard on the hardest and readiest rooting stock which the world produces, but for the fact that those on their own roots are treated in a more natural manner? Was ever a standard *Gloire de Dijon*, or a Charles Lawson, or, indeed, a Marechal Niel, grown on the restricted principle, even if only six or eight flowers were produced, so good as the same sorts would be with a hundred flowers each when permitted to grow freely and naturally, and with but a moderate and reasonable amount of restriction? If we are to have standards or half-standards, let them at least be worthy objects of our skill, even if we have fewer in number. There are few who have not actually seen such objects as standard Roses enrobed in all the magnificence which liberal extension tends to develop, who will be able to form any conception of the wonderful profusion of bloom of which they are capable?

I remember reading some time since a very able article by, I believe, that excellent rosarian, Mr. Radclyffe, in which the following passage (or words to that effect) occurs—"Standard Roses should be taken up, and receive a moderate root-pruning about every third or fourth year." Now this coincides in principle with my own views. The means to the end and the effect are, however, widely different. Instead of root-pruning, or reducing the feeding capacity of the roots in proportion to the requirements of a harshly-pruned or greatly mutilated head, I would encourage every root and rootlet to the minutest spongiola! And the head should be so trained upon a suitable support or trellis (umbrella-shaped, or otherwise, according to individual fancy), that the branches, after such an amount of pruning as would tend to equalise their strength, would present to the eye the greatest surface possible, evenly balanced, and so exposed to the sun that each "eye" could push forth freely, and without being overgrown by its surroundings, and display its flowers with distinctness. The general contour would, under such circumstances, be far more beautiful and effective than the examples with which we are now habitually treated—examples which, in fact, need no skill in their production, and afford but poor illustrations of either our skill or ingenuity as experts in the culture of Rose trees. *William Earley, Digswell, Welwyn, Herts.*

FOREIGN SEEDS FOUND MIXED WITH COTTON.

[Read at the Manchester Congress, July 21, 1869.]

It is well known that with many of our imports there are introduced at the same time the seeds of foreign plants, and that some of these have germinated and become common weeds in our country. Cotton as well as other foreign produce, is a medium by which exotic plants find at least a temporary habitation with us.

All the cotton that comes into this country is contaminated more or less with various impurities, which are in some cases introduced fraudulently, and in others accidentally. If in the middle of a bale of cotton we find a number of heavy pebbles, or large lumps of seed denuded of its cotton, or layers of dusty waste, which are evidently the refuse of the cotton gin, we are fairly entitled to call them fraudulent additions to make weight. If we find a man's cap, or his knife, or even a stray box of lucifer matches, we may readily believe that such extraneous matter has found its way into the cotton by accident. Then, though the ginning of cotton, or the separating of the cotton tissue from the seed, is often conducted with great care, there is no description of it which comes to us absolutely free from cotton-seed. Some kinds of cotton are remarkable for the very large quantity of seed which is mixed with them, especially those which have the fibre adhering very firmly to the seed.

To any one interested in the botany of the cotton plant there is much information to be gathered from the investigation of these seeds, which can be found in nearly every bale. It is not, however, of cotton seeds that I am about to treat. There are still other impurities which are unavoidable. Whether by ripe cotton falling on the ground, or by means of the wind, I do not know—probably from both causes, cotton bales contain, mixed up with the fibre, an enormous quantity of seed of various kinds. Some of them are very minute, and can only be distinguished by careful observation, and many probably could not be picked out without the help of a magnifier. Others are so large that they could not have been caught up either by the wind or by the cotton falling on the ground, but must have been introduced during the process of packing, either by accident or design.

The first thing that the cotton-spinner has to do is to get rid of all such impurities as I have mentioned. For the manufacture of the finer classes of fabrics this is done with so great care that a considerable portion of fibre is wasted at the same time, and all cotton fibre is of such value that the refuse from the finer work is used in the manufacture of coarser fabrics. At last, when all available cotton has been used up, there remains a residuum, which, consisting as it does only of cotton and other seeds, soil, sand, broken-up leaves, and cotton capsules, bits of bread, feathers, bits of rag, and various other substances, is good for nothing but to be put on the land for manure. And very good manure I believe it makes, for it is readily sold at half-a-crown for a cartload, and it does not weigh heavy. In such-like refuse may be found a great number of minute seeds such as I have mentioned, and they afford much matter for thought and study to the botanist and horticulturist.

About three years ago, to my great surprise, I suddenly came upon a number of plants, some of which do not belong to our British flora, and others which, though British plants, are found only in the south, and not in this district. These plants had all sprung up from seeds out of cotton refuse which had been laid there, and also many others which are common with us.

It will be necessary for me to describe the kind of place where the refuse was thrown down. It was an odd corner, used for no other purpose than the stowing away of rubbish. The soil is clay; the surface is to some extent covered with cinders, and on that are little heaps of old bricks, slates, flags, and other useless things which are allowed to accumulate until there is a cartload or two, and are then removed. There was no vegetation excepting such as one meets with on the most barren spot, and there was no sheltering hedge-bank, tree, shrub, or bush, to afford sufficient protection for the growth of many of our commonest weeds, neither was there any water but what falls directly as rain. So there were no conditions which might be considered especially favourable to the sprouting up of a number of plants of any kind in this place, excepting the laying down of cotton refuse. Perhaps the expression laying down is not quite sufficiently descriptive. The cotton refuse was taken there in a hand-cart each day and placed in a heap, awaiting only for a few days some farmers' cart to remove it, and the plants were to be met with not so much on the actual spot where it was placed as on the ground over which it had passed, and in corners and other still places where seeds might be blown by the wind or have dropped out of the conveyance. Finding a strange plant I naturally gave the ground a good looking over, and my search was rewarded by many discoveries. One plant which was growing very abundantly was the Black Nightshade (*Solanum nigrum*). Now this, though common enough in many places, is rare in the neighbourhood of Bury, so rare that I have never either seen it or heard of it in the locality excepting now and then as a garden weed. It seems not unlikely that these occasional appearances of the Black Nightshade may be brought about by the same cause, as cotton refuse is much used by cottage gardeners for the packing of hot-beds.

Another plant which I found was the common Vervain (*Verbena officinalis*), which, though a British plant, is not known to occur in this neighbourhood. Bentham tells us that it is found "on roadsides, and in waste places, in central and southern Europe, and Asia, extending northwards into southern Sweden. Frequent in the southern counties of England, rare in the north, and in Ireland, and almost unknown in Scotland."

Another plant which appears is the narrow-leaved Pepperwort (*Lepidium ruderale*). It is a British plant, but is not a native of these parts. I again quote Bentham as to its distribution. It is found "on dry gravelly soils, waste places, on rubbish and old walls, chiefly near the sea nearly all over Europe and Russian Asia, except the extreme north. In Britain along the coast of England, from Bristol round to Norfolk, but scarcely wild inland."

Next there is the round-leaved Goosefoot (*Chenopodium polyspermum*), which has just a similar geographical distribution to the others I have mentioned. It does not grow in our neighbourhood, but is "dispersed all over Europe and Russian Asia, except the extreme north. In Britain limited to southern and central England."

There are also a few labiates, which though they may not be very uncommon within a short distance, undoubtedly sprung up in this instance from imported seeds, such as Black Horehound (*Ballota nigra*), and Pennyroyal (*Mentha Pulegium*). Then there are several composites some of them common, as Flea-bane (*Pucaria dysenterica*), and the common Bur-Marigold (*Bidens tripartita*). I have ventured to say that these plants, though common enough, arose in this instance undoubtedly from imported seed, entirely on my own authority, because the place in which they were found, and the curious way in which these speci-

mens were huddled together in a small space, coupled with the fact that to find any of them—so far as I know the district I should have to travel at least some miles, seems to preclude the probability of any other supposition.

The four plants, *Solanum nigrum*, *Verbena officinalis*, *Lepidium ruderale*, and *Chenopodium polyspermum*, each belonging to a different natural order, seem in some respects to form a little group of these plants from cotton dirt. They are all British plants. The first, *Solanum nigrum*, grows round about us, as in the sandhills at Southport and other places, but not in our own immediate neighbourhood, the other three are not plants of our locality, but have exactly the same geographical range, and probably come from the same source. I cannot say with certainty where they come from, for we have used cotton from all parts of the world, but the Black Nightshade might come from India, or any other cotton-growing country, and most of the others would probably come from India and Egypt.

I have wondered whether it was probable that the distribution of these and such-like plants would be affected by the spreading on the land of enormous quantities of cotton refuse; but it seems not, for this has been going on during several years, and we do not hear of any such additions to our flora, and we have so many observant botanists that they could scarcely have escaped notice.

Such foreign plants which are found, more or less frequently, apparently wild, have to be appropriately divided into two classes—colonists, or those which spread in their new habitat as though they were native plants, and aliens, or those which only reappear when the causes of their introduction recur. To the latter must be referred, I think most plants springing from cotton refuse. There is no species of plant which is peculiar to England, or that does not exist elsewhere. Several species seem to reach their geographical limit in the southern part of England, extending southwards into warmer climates. *R. H. Alcock, Hudear, Bury, Lancashire.*

(To be Continued.)

WEEPING ELMS.

I HAVE the pleasure of looking from my bedroom window on to my lawn, of rather considerable extent, sloping gently to the south-west (well sheltered by my neighbour's plantation of nearly a century's growth), and sprinkled with ornamental trees of my own planting. My attention for two or three weeks past has been drawn to Weeping Elms; their foliage is so abundant, and their habits so varying and graceful.

The most wildly picturesque of this group of trees is the old variety, *Ulmus montana pendula*, the Weeping Scotch Elm; this, with its large deep green leaves is very imposing and effective. Its congener is the Scampston Weeping Elm, a variety of *Ulmus montana*, but much more pendulous than the first-named; its branches, covered with grand foliage, seem to rush downwards perpendicularly, and a tree soon forms a dense circular arbour.

Ulmus rugosa pendula seems to be a hybrid between *U. montana* and *glabra*; its leaves are not so large as those of *U. montana*, but are of the same dark green and rugose nature. This is a very graceful per se tree. My specimen is about 30 years old and 30 feet in height. On the opposite side of the lawn, and some 30 or 40 yards distant, is a very fine specimen of *Ulmus glabra pendula*. This variety I imported from France many years since. My specimen is from 30 to 40 feet in height, and every shoot more or less pendulous. This tree, like the preceding, is very graceful.

My next favourite Weeping Elm is a lady among the Elms, so delicate and graceful is its foliage and habit. It is from America, and was sent over as *U. americana pendula*, although it is said by my American friend not to merit the specific name of *pendula* more than the Elms commonly planted in the New England towns and villages, as they are all pendulous.

My friend, the lamented A. J. Downing, when on a visit here some years ago, aroused my county pride by persisting that the American Elms were more gracefully pendulous than our Hertfordshire Elms (*U. glabra*), even after I had shown him those to the south of the Roydon station, Great Eastern Railway, which are very beautiful trees. It is only with a these few years that I have given way, and I now believe the American Weeping Elm to be the most beautiful and graceful of weeping trees, so different from the lumpy ungraceful nature of the Weeping Sophora or Weeping Ash. My American Weeping Elm is some 15 years old, and rather small of its age (not more than 15 feet high, as it sustained a grievous check in being removed from where it was established to its present quarters in the centre of my lawn. From the size and richness of its leaves one would think it related to *U. montana*, but their colour is such a delicate green—quite *sw generis*, and they hang on the shoots as if they were placed there by a fairy hand, and in a gentle breeze they flutter as if some young lady fairies were exercising their fingers among them. The tree is really charming.

It is very remarkable that the American Elms, or at least the kind I have, will not succeed when grafted on our English Elms. Scions from my tree have been grafted on the Scotch Elm (*U. montana*), the stock usually employed in nurseries, and on the variety of *Ulmus glabra*, called the Huntingdon Elm, to which, to judge by its light green leaves, it has some relationship. Still it will not unite to its cis-Atlantic conspecifics, and even when grafted by approach (worked) on standards of the last-mentioned kind, and suffered to remain from March, when they were grafted, till the spring following, all the scions died when detached.

There is yet another Weeping Elm deserving of mention, *Ulmus microphylla pendula*, its leaves are

rather smaller than those of the Weeping Birch, it is not quite so graceful as that lady-like tree, but, owing to its dark dense foliage, it forms a very distinct picture. My tree is probably the oldest and largest in England, and is now about 15 feet in height.

There is, perhaps, no family of trees that varies to such an extent as the Elm, there are probably but two species, both of them bearing seed freely, viz., *Ulmus montana*, which rarely varies to any great extent, and *Ulmus glabra* [campestris?], the varieties of which are endless. I cannot be present on two very remarkable varieties, one from the last-named species, called *Ulmus pyramicalis*; this has deep glossy green leaves, and grows more closely pyramidal than the Lombardy Poplar, it is of French origin, and very curious. The other is a sort received some 30 odd years ago from a Mr. Smith, a Scotch botanist, who was very industrious in collecting varieties of British plants. He sent this Elm to me under the name of *Ulmus montana pumila*. My tree is, I think, 36 years old, and it is just 36 inches in height. Nothing can show more forcibly than this tree the control of the graft over the stock, for it is growing near my specimen of *Ulmus glabra*, and is grafted on the same kind of stock, *Ulmus montana*. One is in round numbers 36 feet, and the other 36 inches, in height, both are as nearly as possible of the same age.

Diverging from Elms, I cannot pass over one of our most magnificent penitential trees, the Weeping Lime, *Tilia ba pendula*. My tree is about 20 years old, it formerly stood near my house, but its rapid growth and grand foliage encroached too much on the space allotted to it, so about 10 years since it was removed to its present site. It was a great shock, from which it is only just recovering. This kind of Lime blossoms a fortnight after the common Lime, and fills the air with its unique fragrance. *Thos Rivers*. [See an article on Elms, at p. 941, 1868, for other notable kinds. Eds.]

WHAT IS A KITCHEN GARDEN? AND WHAT SHOULD IT BE?

WHAT is a kitchen garden? When the word "kitchen" was first applied to a garden, did it possess the heterogeneous character it now does? Then why the word "kitchen?" Mr. Punch probably would say, "Because in it you would have a chance to get a 'mess.'" In a horticultural sense, then, is there not often found—and that, too, almost unavoidably—a "mess?" What is and has been going on in our kitchen gardens? It is to be feared in too many cases a wholesale destruction of the roots of fruit trees. But how? In preparing for our "kitchen" winter stuff, the Pear cries out against the Cabbage. By-and-by the Cabbage will cry out against the Pear. Does not the practice explain why so many reformers, and here tasteless fruit is about. Ever yearling, the root through which, perhaps more than any other roots, are conducted the fruit and flavour properties—are cut off or mangled, at the time when most wanted. And yet we have heard, with a boast, of something like this being done with impunity! Is there not also a reckless disturbance of the nature of the soil? But, my some, we give plenty of farmyard manure. What is farmyard manure when applied to the roots of fruit trees? Why, poison. And then, in winter the spades dig down again knee-deep, and layers of some strong dung are thrust about the roots, burning and destroying all the tender ones which it comes in contact with. Oh, say some, that is not for the tree, it is for the Cabbages. But the nature of the soil, I maintain, is altered and deteriorated for fruit culture. This sheltering and nursing, too, of Cabbage stuff is quite unnecessary, as may be seen in the comparison of plants grown by a market gardener, and the leggy things seen in gentlemen's gardens. Are we, in the race we have had for local display, to neglect these things?—to put all our energies in one garden, and leave things so uncomfortable in the other? Depend on it, there are many questions to be settled, many disputes to be arranged, in our "kitchen" garden.

Then, we may ask, what should be a "kitchen" garden? The shortest answer is, a garden for the growth of kitchen vegetables, and for vegetables alone, where no trees should interfere with them, nor they interfere with the trees. We have been "setting class against class," we want "reform." Events have taught us that to bring about a general reformation of any long-practised custom, an agitator is necessary among its promoters. We certainly want a new law here, to be passed and come into force at once. Let then, a "hard and fast line" be drawn, between trees and vegetables. Let the wall garden be a fruit garden, and let a vegetable garden be constructed elsewhere. But how are we to get our "things" early when the walls are gone, and we have no trees? Raised banks of earth, with slopes of the size and form and position required, would answer all the purposes of a wall without any of its drawbacks. I say "agitator, agitator." Owners of large kitchen gardens in days gone by, might have saved themselves great expense in building one-half of the ponderous garden walls we now see, if they had heard of wire netting and cheap glass, and also prevented this everlasting digging in and digging up of vegetables among fruit trees. How much better would it be to have fruit bushes or cordons in our borders—to have our quarters of Pears, Apples, &c. When once the soil was prepared and the trees planted, pruning, cleaning, and watching, would then be all they would require for many years. No see-sawer that could be kept under control should be a low wall in the fruit garden, when grown out of that proportion, if it is to live at all, let it be planted so well to divide them into sections—one a fruit section, the other a vegetable section. To those who are about to construct new gardens, I would say, build no more walls than are sufficient to enclose the amount of fruit trees desired, and provide for a vegetable garden, which might, if desired, have dwarf walls

around it for the training and nursing of young wall trees, and use wire netting above that to keep out rabbits, &c. By thus doing we should rid the kitchen garden of many evils, and have better fruit, and better vegetables. A kitchen garden would still be a kitchen garden, a vegetable garden a vegetable garden, and a fruit garden a fruit garden. *Agitator*.

CURRENT BUD DISEASE.

DURING the last five years our attention has been repeatedly directed, chiefly by Scotch correspondents to a disease with which the buds of Black Currants are infested in the spring months. The Currant buds for need of a number of scales which overlap each other, forming a compact mass, and yet within and between the scales of a single bud hundreds, if not thousands of individuals of a minute creature are developed, which derive their nourishment from the fluid matter in the fleshy portion of the scales, causing them to shrivel up, and so preventing the growth of the embryo bunch of flowers. Our woodcut represents, in the left-hand figure, a bud highly magnified, with the outer scales partially opened, showing a few of the parasites which, on an average, are not more than 1/100th of an inch in length, and 1/50th of an inch in width. The centre figure represents one of these little insects very highly magnified as seen when crawling along, and the right-hand figure represents a very young animal when lying on its side in a state of inactivity. It will be seen that the insect is of a very unusual form, being long, convex, and tapering to the extremity of the body, whilst the anterior portion is of a more conical form when the head is protruded in walking. The head is distinct and oval, but I did not succeed in making out the structure of the mouth,

speedily made their way out of the field of view of the microscope, and being so minute they could not easily be detected by the unassisted eye. The young larvae were already to be found in the buds forming for the next year's crop.

This statement is important, as it militates against the observation of "M. J. B." (*Gardener's Chronicle*, March 13, 1869, pp. 276, 322), that the little animals in March are accompanied by eggs, "and if we mistake not we see very frequently within the body of the mite an egg just ready to be protruded, accompanied by one or two others in a state of progression. The eggs are mostly obovate or broadly elliptical, and about 1/500th of an inch in diameter." We are naturally so much inclined to place full reliance on the observations of "M. J. B.," that we would suggest the possibility of the present being one of those cases in which the ordinary proceedings of insect life are departed from. Parthenogenesis has been already observed among the Acaridæ, and we now know that the young larvae of certain Coccidomyæ, or gall midges, are capable of producing fertile eggs, whilst others of the same larvæ are transformed in the usual manner into midges. Is it possible that this is a similar case of larval parthenogenesis? If, on the other hand, the creature produces eggs as a normal condition of its existence, we have now the case of a perfect Acaridæ never assuming more than two pairs of legs, and which would require for its reception not only a distinct generic name, but also a distinct section in the great family of mites.

Messrs. Duges and Turpin many years ago published the description and figure of a minute species which they had detected in the galls of the Lime and Willow trees. (*Annales des Sciences Naturelles*, 2d ser. n., pl. 114.) These have the elongated body, small sucker, with two short thick lateral palpi, and two pairs of legs, which are seven-jointed. These minute animals Duges considered to be larvae, from the paucity of legs, and he noticed their close resemblance to Tetranych, found occasionally in similar galls. He had also observed these larvae become immovable, and change into elongated chrysalids, in which the shortened body of the future Acaridæ might be observed.

Some caution will be necessary to be observed with reference to the possible species of eight-legged Acaridans, of which it might be supposed that these creatures were the young, as we have received two different full-grown Acari found in the old dried Currant buds in the autumn. One of these was a true Acarus, with the body entirely covered with very long setigerous bristles, whilst the other was a species of Koch's genus *Notaris*, with the eight legs, terminated by two very strong bent hooks or claws.

Barely infested trees ought evidently to be very closely pruned in autumn, as suggested by "M. J. B.," but we would recommend, where possible, the picking off of the old dried buds in August or September, as it is evident that the newly formed buds must become infested almost as soon as they are well developed in the early part of the autumn. Possibly a dressing of the shoots at that period with a thick coating of lime and soapuds might either prevent the females from crawling to the young buds, or the hatching of the eggs if laid in the old buds. *I. O. W.*

Home Correspondence.

Hothouse Boilers. The newly-invented boilers exhibited at the recent show of the Royal Horticultural Society held at Manchester appear to me to possess little or no superiority in regard to heating power over other boilers already in use. The vertical act on so much extolled in those of Ormson's cannot have an economical tendency, a point of fuel, but the reverse, as the products of combustion pass through in an upward course only once, then into the chimney, the philosophy of retaining the heat to the greatest possible distance seems to be lost sight of altogether. There is another new form—namely, Foster's Patent, which possesses a much better internal arrangement, carrying, as it does, the products of combustion three times through its entire length horizontally, and giving off the calorific vertically into the water-jacket, but even this design is somewhat anomalous, first from its semi-detached construction, and secondly because it is supposed to be worked without brickwork, thus allowing quite as much heat to be radiated into the stove-house as is transmitted into the pipes. We have also here a form of boiler invented by one of our best practical gardeners, which is somewhat awkward, but instead of the bricks being used as heat-retainers, they are set in such a way as to be conservators of heat, or rather reverberators of heat. The products of combustion in this case have to pass horizontally through the entire length five times, thus extracting the whole of the available heat before passing into the chimney. I have tested this boiler against a common Saddle and a Cannon boiler having the same quantity of 4-inch piping attached, and the difference in favour of the "Conservative Boiler," for it will henceforth be known under that name, is at the rate of 6 to 1 and 8 to 1 in respect of fuel.—the Saddle requiring six and the Cannon eight bushels to one for the Conservative. It is simple in construction, easily set, and will not cost more than the price of the majority of boilers at present in use. *Robert Mearns, Gr. to the Right Hon. Lord John Lubbock, Vale Royal, North Cheshire.*

Saobs at Work.—I saw the following notice some years ago at the Victoria Park, at Bath, which was effectual.—It is hoped that the public will protect what is intended for the public enjoyment." *W. F. Radcliffe.* At Canterbury a notice—"Respect the walk, it is for the public good," is singularly effective. *Eds.*

Leaf-cutting Bee.—I have to notice a nest of the leaf-cutting

which doubtless consists of a central sucker, defended on each side by an articulated palpus or feeler. Neither eyes nor antennæ were observed. Locomotion is effected by means of two pairs only of articulated legs, the penultimate point of which is furnished with a long bristle on its outer edge next to its distal extremity. The body is white and fleshy, and is covered with minute points, closely arranged in very numerous transverse rows, forming striae of granular lines, and the body is terminated on either side by a long bristle. These bristles, together with the structure of the legs, rather than the structure of the head or body, lead us to the knowledge of the tribe to which the animal belongs, namely, the Acaridæ, or mites, and apparently to the neighbourhood of the genus *Tetranych*, which includes the web-spinning species of the Lime, and also the "red spider" of the greenhouse.

A correspondent, "W. T.," writes to us from Blantyre at the beginning of July, sending specimens of the buds infested with the insects, which were sent in their original four-potted condition, and stating that the disease was quite general in that district, and had been known for 30 years, but that it is not so common as it was formerly. He states that he had examined the buds even during the period of frost and snow, and had then observed the young animals hatching from their eggs. From this statement it is evident that this creature (which differs from the great mass of the eight-legged Acaridæ in having only two instead of three pairs of legs when first hatched) retains its juvenile form for a considerable period, but at a later period (as we learn from "T. C." of Glasgow, a good microscopic observer) they acquire six legs, as was seen in specimens from old buds sent to us near the end of October, when some had two well-developed bristles at the tail. These two bristles we believe to be the rudimental fourth pair of legs, whilst another writer, "D. B." in the *West of Scotland Horticultural Magazine* for November, 1867, states that on examining some of the dried-up buds of the same season's growth still remaining on the Black Currant bushes, he had found the insects in a further state of progress. A good many of them then had three pairs of legs, some of them with a pair of stout bristles, others with several stout hairs, and some of them with two projecting appendages at the termination of the abdomen. A few were also seen with four pairs of legs, being probably another species. Both of those having two six legs and the eight legs walked very nimbly, and

and, from its ornamental foliage, the tree is worth extended cultivation. The beautiful *Hæmanthus cuneatus* was next alluded to, Mr Berkeley remarking that it was different from the species of Blood-plants from the Cape, which flowered without leaves. This, however, was said to belong to a different section, of which one, named *carnea*, was figured in the "Botanical Magazine." Mr Berkeley then alluded to several cases of monstrosity, which, had the Scientific Committee been sitting, would have been brought before that body. The first referred to was a spike of the common white Lily, known in gardens as the double white Lily. The true flower is absent, but there is in its place a large number of white bracts. Next came a Balsam, the upper leaves of which were petal-like and crowded into whorls at the end of the stem. A species of *Phlox* was then noticed as having produced a panicle of bracts instead of flowers. An *Allium*, allied to *A. vineale*, sent by Mr Lowe from Madeira, which had produced bulbous bulbs from the head instead of flowers, was then alluded to. The speaker then proceeded to show specimens of shoots from a Walnut tree in his own garden, which fruited well last year; this season the nuts had all dropped off, and the fruit-buds that should have been developed this season to produce a crop next season, have grown out into leafy shoots. The various excrescences from the spur joints of a Vine, referred to at p. 738, then came under notice, Mr Berkeley showing examples and stating that the fleshy was consisted of a much deformed and distorted web, the individual flowers of which were abortive.

Floral Committee.—Rev J Dix in the chair. This was, surprisingly speaking, a small, but none the less interesting meeting. First among the exhibitors who contributed material in a decorative point of view, were Messrs F & A. Smith, of Dulwich, who sent a large and fine collection of plants, consisting of dwarf grown specimens of the double winter of extremely beautiful colour, for which a Special Certificate was voted. The same award was also made to a very fine example of *Allamanda Hendersoni* (syn *Wardleiana*), sent by Messrs Jackson & Son, of Kingston. The specimen remarkably well grown and beautifully flowered. From the same firm also came 6 admirably grown and flowered specimens of *Fuchsia*, consisting of *Diagnastis*, *retorta*, *major*, *minor*, *Waldenii*, *Atkinsonii*, *largiflora*, *parviflora*, *strawberry*, to which a Special Certificate was given. The Messrs. Vetch also chose to exhibit a fine collection of plants, &c., which were *Atropa*, *Dorlandia*, with two very fine flowers; a lovely *Delphinium Bensoni*, *Odonoglossum Lawrencei*, and *Keatoni*, *M. tonia*, *Regnellii*, *purpurea*, and *speciosa*, the beautiful white-flowered *Burlingtonia candida*, a flowering specimen of the new *Lapageria alba*, well mixed examples of *Dracæna nigro-rubra*, and *Macleanii*, & latter a decided acquisition among the darker kinds of fine yellow-coloured specimens of *Croton maximum* and *subulifolius*, both very effective and most beautiful foliage plants. A Special Certificate was awarded. From Mr Green sent to W. W. Saunders, Esq., came a small group of very curious and extremely interesting plants, *Stenandrium*, *Stenandrium faros*, and a large specimen of *Stenandrium faros*, which were all very fine.

... and leaves, which were of a dark green colour, being covered with stiff brown hairs, while the flowers, which are small, and of a violet or brownish colour, with a streak of orange down the lip, are produced on longish, pendulous, zigzag spikes, which give to the plant a very graceful appearance. In the collection was a South African species of *Agapanthus*, remarkable for its small pale blue flowers, which have a darker blue down the middle of the segments, and a whitish-lined species of *Althea*. From Mr Bell came a small group, in which were *Calceolaria intermedia*, a graceful *Palafoxia*, with white foliage and *Geopogon Schleiperianum*, a fine, pale greenish-yellow flowered species. The former was awarded with a first class certificate the latter with a second class certificate. In the collection, was also shown in the group from Mr E.ley, gr to F. Archer, Esq., a fine well-grown specimen of a pretty free-flowering greenhouse *Passiflora*, named *Beroliti*. The splendid specimens of *Epipendrum rufum* and *Deccan-chalum filiforme*, referred to at p. 745, were noticed here in very fine condition. To Mr Laurence a special certificate was awarded for their excellent condition. To Mr Eley, gr to S. Tucker Esq., a first class Certificate was awarded for the beautiful *Passiflora*, which had a beautiful blue and orange colour flowers. Mr W. Carter, from Walden, sent a very fine group of *Holboellia*, to the award of which first class certificates were awarded. Amongst the collection of *Verbenas*, of which Thomas Hyatt, a fine specimen of *Verbenas*, a beautiful *Verbenas*, R. H. Hyatt, a fine dark shaded purple, and the Rev J Dix a fine dark coloured flower, with a deep rose eye, received first class certificates. Messrs Bell and Thorpe sent a good collection of *Stenandrium*, of various colours, one named *Single*, with a fine flower with a pale blue ground colour, the other, radiating blue and eye of purple was awarded a first class Certificate. The same award was also given to a very distinct golden *Stenandrium*, named *Verbenas*, from the same firm. To Mr S. Tucker Esq., a first class Certificate was awarded for a fine specimen of a *Passiflora*, named *Verbenas*, from the same firm. To Mr S. Tucker Esq., a first class Certificate was awarded for a fine specimen of a *Passiflora*, named *Verbenas*, from the same firm. To Mr S. Tucker Esq., a first class Certificate was awarded for a fine specimen of a *Passiflora*, named *Verbenas*, from the same firm.

Fruit Committee.—G. F. Wilson, Esq. F.R.S., in the chair. On this occasion prizes were offered for competition, in (1) Peaches, single dish from pot plants, (2) Peaches, single dish, grown on painted-out trees, under glass, (3) Peaches, single dish, from pot plants, (4) Nectarines, single dish, grown on painted-out trees, under glass, (5) Apples and Nectarines, best collection, named. The fruit exhibited was remarkably fine considering the character of the season. In class 1 the only competitor was Mr. Douglas, gr. to

F. Whitbourn, Esq., Lexford Hall, Wood, who showed a fine dish of Royal George, for which he received the 1st prize. Mr Tildery, gr. to the Duke of Portland, Wiltshire, was 1st in class 2, with very fine Early Grosse Magnonne from a tree painted out under glass. Mr Turner, Slough, was 2d, with good *Violette Hâtive*. Mr Tildery was also placed 1st in class 3 with *Early King*, but 2d in colour. From Mr Douglas came five examples of *Rivers Orange*. Mr W. Isaacs, Kingswood Warren, Epsom, also exhibited. In class 4 there was no competitor. Mr Douglas, who was the only exhibitor in class 5, showed a remarkably fine *Apple*, consisting of *Violette Hâtive*, *Beauregard*, *Royal George*, *Gauche*, and *Grosse Magnonne* Peaches, and of *Nectarines* *Lowton*, *Violette Rouge*, *Hunt's Tawny*, *Early Murray*, and *King of the Market*, all in first class condition, and for which he was awarded the 1st prize. To Messrs T. Rivers & Son, Sawbridge, worth a Special Certificate was awarded for a collection of 12 dwarf *Apple* trees. They carried a splendid crop of fruit, and were said to be only two years old, and grafted on the broad-leaved *English Paradise* stock, which was raised from seed at Sawbridge, worth from Mr G. Lee, of Clevedon near Bristol, came samples of *Lee's Pringle Black Currant*, a very fine variety, that stands shaking well. A first class Certificate was awarded to it. Mr Lamb, gr. to G. T. Davey, Esq., Colston Bassett, Bingham, Nottingham, sent two good bunches of the *Muscat Champion Grape*, fine in flavour, to which a Special Certificate was awarded. To Mr McIndoo, gr. to his Grace the Archbishop of York, a similar award was also made, for two remarkably fine bunches of *Muscat St. Laurent*, a small, round, white Grape, in the way of *Royal Muscadine*, and which was first sent out by Mr Rivers. The bunches were said to have been cut from a plant that produced 16 in a bush. Mr T. Rivers sent a splendid collection of new and other varieties of Potatoes, and very fine *White Flat Tripod* and *Roca* Italian Potatoes. A Special Certificate was awarded. Messrs. Sell & Clarke, Stratford on Avon, also sent a collection of new varieties of Potatoes. From Mr G. Cooling, of Bath, came a new early dessert *Apple*, named *Bathbrook Seedling*, which, however, was unripe. The Chairman showed some fine *Beurré Giffard* Pears, the Messrs. Rivers, good examples of *Late Purple Galko* and other varieties of *Cherries*, and a fine punnet of *Bigarreau Napoleon* *Cherries* came from Mr Turner. From the Society's garden, Chislewick, came a beautiful dish of *Mulberries*, grown in a pot, and fruited in an orchard-house.

Notices of Books.

Echoes in Plant and Flower Life By Leo H. Grindon. London Pitman Small 8vo, pp. 123.

We are somewhat at a loss how best to give the reader an idea of the contents of this little volume. The title, too, is an odd one, but considerable license may be given to the author, since he expressly tells us that his "pages do not profess to consist of anything more than memoranda and observations from a poet's point of view respecting a certain class of botanical facts." These facts the author, "unable to think of a better name," calls echoes. He means by echoes certain general superficial resemblances in habit and structure between plants whose inner organization is widely diverse. Humboldt was one of the first to allude to this subject in his "Aspects of Nature," where, in an essay on the physiognomy of parts he groups together plants under various headings, according to their outward resemblances, wholly independently of their floral organization. Thus the Palm form would include the *Pandanus*; long-leaved *Dracæna* would be placed with the *Grasses*, and so on. Dr Seemann alluded to the subject in a letter in our columns, June 27, 1868, and it is one that strikes everyone who has his eyes open to the peculiarities of plant form. Every gardener is familiar with the close resemblance between some of the succulent *Euphorbias* and the columnar *Cact.* or *Cereus*—a resemblance so close that, in the absence of flowers, it is often difficult to determine to which of the two families a particular plant belongs. If, on puncturing the stem, a milky juice exudes, the plant is a *Spurge*, while the fluid that flows from a similar wound in the *Cactus* is limpid and transparent. In point of fact, almost every large family of plants has its "succulent" representatives. There are succulent *Euphorbias* and *Jatrophas*, succulent *Composites*, fleshy *Asclepiads*, gouty *Vines* and *Pelargoniums*, hypertrophied *Apocynæ* and *Convolvulacæ*, swollen *Petalinæ*, &c. The flat, ribbon-like stem of the *Bauhinias* finds its match in the compressed stem of *Vitis planicumis*. The fleshy-rooted, near-leaved *Ceropegias*, find their parallel in some of the African *Passifloræ*, such as the *Machadon*, discovered by Dr Welwitsch. Another *Passiflorad*, discovered by Dr Welwitsch in the same district (*Bassanthe*), might readily be passed over for a *Violet*. Other South American *Passifloræ* are trees rivaling *Magnolias* in size and in the aspect of their leaves. The leaves of many *Turneræ* are all but indistinguishable from those of *Waltheria* or *Melbania*. The foliage of our British *Cruiser*, *Diploxys*, is almost precisely similar to that of the African *Waltheria*. The flowers of the labiate genus, *Oenothera*, have a striking resemblance to those of *Cerodædron*. It would be easy to multiply instances by the hundred or by the thousand of this close correspondence in superficial aspect. Mr Grindon cites many such, and these are his "echoes."

Of course, in many cases the reason for this correspondence in outward form is obvious enough. The conditions of life being similar, the results are similar. Desert plants of the most opposite families are characterized by the same aspect—the same dry, shrivelled, interlacing, spiny branches—the same sapless foliage, with roots buried at an amazing depth below the surface, burrowing, in fact, anywhere in search of water. Or it may be that the water is stored in the tissues of the plant itself, and then we get the huge gouty stems, the swollen tubers, reservoirs at once of food and water, and to which we have already alluded. Livingstone tells, in one of his books, a curious tale of the natives, in their search for the juicy tubers, thumping on the ground with their clubs to determine by the sound emitted the presence of these subterranean founts, on the same principle as a doctor thumps the chest of his unfortunate patient, to ascertain whether or no there be fluid in his chest.

Take, again, the plants of salt plains, how like they all are in outer characteristics. We see the same thing in the case of the fleshy leaves of our seaside plants, or in the submerged leaves of aquatic plants. All this is read, & understood.

So also in the case of oblique leaves and flexuose or zigzag stems, a little attention will generally show that these arrangements favour the development of the axillary bud. If the stem retained its primitive direction, or the leaf grew equally, there would be no room for the bud to develop. So, too, if the stems be weak, and unable to bear their own weight, we are not surprised to see tendrils even in plants of the most widely different character.

More marvellous still is the way in which the same end is attained by different means—the same outward appearance preserved by most different methods. Take the tendrils for instance, in all cases they are sufficiently alike to come under Mr. Grindon's appellation of "echoes," and yet how different they really are. The *Vine* tendril and that of the *Passiflower* is the altered flower-stalk, in the *Lathyrus* it is the midrib of the leaf—now it is the stipule, at another time it is an abortive branch. Here is food for a post-naturalist—good wholesome food, too, which will induce more satisfactory results than the mere idle wonderment at the resemblance between plant and plant, without the attempt to ascertain on what circumstances the resemblances depend, and how and why they exist. Mr Grindon's book would have gained an interest even for the most desultory of readers had he guided his Pegasus into these attractive pastures, and not contented himself with hovering on the outskirts, listening to the echoes, without attempting to ascertain whence they come, and how they are produced.

We have also to announce the publication of a second edition of Mr. Grieve's *History of Ornamental Foliaged Pelargoniums* (Baikwood). We have already expressed a favourable opinion of this unpretending little volume, which should be in the hands of all who take an interest in this class of plants. The additional matter comprises a list of the best varieties, and a selection from the articles relating to these plants which have appeared in our own columns, or in those of our contemporaries, since the publication of the first edition.

Florists' Flowers.

It is well to pause, as it were, at intervals, and endeavour to gather up for consideration whatever of information can be gained relative to the improvement of any particular flower, especially if it be one constantly receiving additions in the form of assumed new kinds. What, then, can be so gathered up, respecting the somewhat numerous class of *BEEDING TROPÆOLIUMS*? Much, no doubt, for the varieties of the text are co-extensive with their use. Popularly, they are divisible into four groups, and this simply for the purpose of arranging them, and not because the grouping is assumed to be scientifically correct. These four groups are included in two divisions, the one the trailing, the other the dwarf-growing kinds. This is hardly clear enough, as there are some kinds that are midway between the two, so varied are the characters the numerous garden varieties of late years assume. Under the head of trailing kinds are included the varieties of *T. majus*, and what are known as the varieties of *T. Lobbianum*, under the latter, the varieties of *Tom Thumb*, and the last new form in this section, the compactum varieties.

Since the old *Tropæolum minus* came to us from Peru, in 1593, and 100 years after, *T. majus* and its variety, *atrosangineum*, and, later still, *T. Lobbianum* from Columbia, what a most numberless "fair varieties of earth" have sprung from these Peruvian progenitors, while the old types, still among us in name, have in "the presence of perpetual change" become themselves changed into something better through the operation of that law of natural selection which, consciously or unconsciously, has raised to higher forms so many imported species of garden plants.

Perhaps, of all living men at least, Mr W. H. Dunnitt, of Dedham (now a partner in the firm of Messrs. Carter & Co.), has done most of all to improve the dwarf-growing form of the *Tropæolum*. It is supposed, probably with good reason, that what were formerly known as *Cactæus* dwarf *scabret* and dwarf *prison* *Nasturtiums*, were derived from *Tropæolum minus*, or rather from the improved form of it now found in our gardens. From these Mr Dunnitt selected *Tom Thumb*, *scarlet*, *king of Tom Thumbs*, *ruby*, and others not so well known. The three former varieties named are well known, and are of great service in the flower garden during the summer months. The last-named has a rather dwarfer and more compact habit, and produces numerous brilliant crimson flowers, the foliage being of a dark olive-green. It originated in a selection by Mr. Dunnitt from the old *T. Schultzii*, a half trailing variety of the *T. Brilliant* type. As an effective bedding kind, it was awarded a first class Certificate of merit by the Floral Committee of the Royal Horticultural Society during 1863. It comes very true from seed—in fact, all the varieties of dwarf *Nasturtiums* are to be depended on in this respect, though to secure compactness of growth, and the utmost abundance of bloom, many growers prefer to propagate the plants by cuttings in the early spring. *Crystal Palace Gem*, *Beauty*, and *Spotted Tom Thumb*, are all spotted or blotched with crimson and scarlet on a yellow ground and *Pear* has straw white flowers. Neither of these, though novel in the way, and affording a pleasant variety, can rank as effective bedding kinds, being beaten in that respect by some of the varieties of the *Tom Thumb compactum* kind, to which reference will presently be made. *Tom Thumb*

Look to your Grass Lands.
JAMES CARTER AND CO.'S RENOVATING MIXTURE OF GRASSES AND CLOVERS SHOULD NOW BE USED. This Mixture is specially prepared to suit the various soils, and consists of the most desirable kinds to produce a Permanent sward of first class quality on old decayed Pastures and other soils that have suffered through the extreme dryness of the past season.
 3d per lb., or 60s. per cwt.
CARTER'S "PRIZE MEDAL" PASTURE GRASSES for **IMPROVING NEW MEADOWS**, sown to suit Soil, from 2s. to 5s. per acre. Special low quotations for Quantities on application to **JAMES CARTER AND CO., Seed Farmers, 237 and 238, High Street, London, W.C.**

BIRMINGHAM HORSE SHOW, 1869—The **FOURTH GREAT EXHIBITION OF HORSES, PONIES, CARRIAGES, &c.**, will be held at **Empire Hall, Broad Street, Birmingham**, on **TUESDAY, WEDNESDAY, THURSDAY, and FRIDAY, August 17, 18, 19, and 20**. The Horses will be judged on Tuesday and Wednesday. Admission, 1s. to 4s. on Tuesday, 5s. after 4 o'clock, 1s. On Wednesday, 1s. to 2s. 6d., after that hour, 1s. On Thursday and Friday, 1s. For Excursion Trains, see the Companies' Buses and Time Tables.
JOHN H. LYTHAL, Secretary.

The Agricultural Gazette.
SATURDAY, AUGUST 7, 1869.

MEETINGS FOR THE ENSUING WEEK.
 August 10—Northumberland Agricultural, at Hexham.
 11—Royal Dublin (Horse Show).
 11—Richmond Agricultural Society's Show.

The crop reports in other pages are more than usually uncertain, indefinite, and unsatisfactory. It has been much more difficult than usual to speak confidently of our harvest prospects. A mid May and June made it impossible that we should have a good Wheat crop; and, from the dry soils especially of our chief Wheat-growing districts, the reports were very gloomy. During a few hot weeks in July the appearance of the grain crops generally, however, very greatly improved, but the cold and rain which have since fallen on us have done harm. In hardly any year have we had so many second returns sent in correction of the first report, which had been more favourable than subsequent examination would allow. On the whole it will be seen that nearly half our Wheat returns state the crop to be below an average—less than half the returns report an average—and only one-tenth of our correspondents are able to state that the crop in their neighbourhood is over average. The Wheat crop, then, we can hardly doubt, must be considerably below its usual productiveness.

Of the returns of the Great crop, 80 put it as below the average, 72 declared it to be average, and 20 put it beyond an average crop. And barley, too, though our reports of it are not so favourable as those of the other grains, can hardly be pronounced an average crop. Seventy of our correspondents, indeed, do so pronounce it, but of 91 others only 31 put it as being over average, and 60 declare it to be under average. At one time promised to be a great Bean and Pea year, and probably these crops are better than we generally have them, but they have both become covered with aphid during the past few days, and neither of them will yield so well as was at one time expected.

The following is the tabular account of the reports with which our correspondents have favoured us; and we place it alongside the corresponding figures for 1868, that the great contrast, especially in the Wheat crop, may be seen.

	1868.			1869.		
	Over Average.	Average.	Under Average.	Over Average.	Average.	Under Average.
Wheat	126	67	13	18	76	85
Barley	54	145	31	51	135	61
Oats	11	168	22	11	135	50
Beans	11	17	26	80	23	23
Peas	6	79	43	8	58	63

As regards all succulent growth, we believe the country may be congratulated. There is a capital plant of both Mangel Wurzel and Swedes, and recent rains have saved much that seemed ready to die. There has been a great hay crop, and though pastures are somewhat bare just now, there is no such complaint as there was last year. The Potato crop promises to be good and healthy.

The Contagious Diseases (Animals) Bill passed through the House of Lords on Tuesday last without having undergone any change of importance. Some amendments were carried in Committee relating to the transit of cattle and the supply of food and water to them on long journeys. The clause of the Bill having reference to this subject fixed a maximum period of 30 hours as the limit of legal privation; the Bishop of GLOUCESTER endeavoured to obtain a reduction of 10 hours, without success, however,

as his amendment was negatived by a majority of 11 in a house of 69 members. Ultimately the clause was amended by the addition of words giving to the Privy Council power to fix any other maximum period not less than 12 hours. It is not quite so easy to make a practicable arrangement for the feeding and watering of cattle in transit, as persons unacquainted with the details of the subject imagine, nevertheless, it is undeniable that much unnecessary suffering is inflicted upon the unfortunate beasts which are destined to supply us with animal food, and the mitigation of their pain is worthy of the careful consideration of those whose duty it will be to carry into effect the provisions of the Bill. On Friday, July 30, EARL FEVERSHAM made an attempt to introduce a clause similar to the one which Mr. CLARE SEWELL READ failed to carry in the Commons. Lord FEVERSHAM'S proposition was to the effect that all foreign animals should be landed in defined parts of ports, and not be moved therefrom alive, excepting those animals which should be "imported from countries in which, during the previous 12 months, cattle-plague or sheep-pox shall not have existed, and through which animals shall not have passed from countries so affected." Earl DE GREY opposed the amendment, on the ground that it was inconsistent with the principle of the Bill, and on division it was lost by 56 votes against 11. On Monday last the amendments were reported, and on Tuesday the Bill was read a third time and passed, after Lord SALISBURY had made an effort to give railway companies the right to charge for disinfecting cattle trucks; this amendment was not carried.

On Wednesday the Lords' amendments were agreed to in the Commons, and in all essential points, therefore, the provisions of the Bill are determined. We are now in a position to state succinctly what are the regulations which will in future operate for good or ill upon the home and foreign cattle trade.

First, in regard to the foreign trade, which most required regulation, the provisions of the measure are based on the principle that foreign animals are healthy and may be safely imported without restriction into this country. Diseased or infected animals are looked upon as exceptional; and for the reception of animals which shall come from countries where infectious diseases prevail, or may reasonably be suspected to exist, a separate market is to be provided in a defined part of the port of London.

Power is given to the Privy Council to regulate, and if necessary prohibit, importation of certain kinds or classes of foreign animals; and when it is known that one of the largest importers of foreign stock holds the opinion that the supply of animals from Western Europe is nearly exhausted, and that we must look for an increase of trade to Central and Eastern Europe, it will be admitted that the power to prevent the landing in this country of certain kinds of foreign animals is a very necessary provision, otherwise we may in a few years have a regular cattle trade from the western shores of the Caspian Sea, the only obstacle at present being the want of railway communication with that locality.

Animals which are imported from non-infected countries will, after being passed by the Customs inspector, be treated as home stock, as cattle from Normandy, Spain, and Portugal are treated now. So far as we can understand, there is nothing in the Bill to compel the slaughter of animals from non-infected countries, or to prevent the purchaser from keeping them as store stock if he thinks proper to do so.

The principle for which agriculturists of this country have contended has been exactly reversed, they demanded a measure based on the assumption that all foreign animals are normally dangerous commodities; and they have got a measure which practically asserts all foreign stock to be normally safe, and which only provides exceptional accommodation for certain excepted classes which will occupy the position of suspected animals.

Regulations affecting the home trade have been modified, since we last alluded to them, by the introduction of an additional clause in section 57, giving the Privy Council power to make further regulations respecting foot-and-mouth complaint. As the clause originally stood it would have been quite impracticable of execution, as we pointed out, owing to the short period of incubation of the disease, and its eminently contagious nature, which together make it impossible to guarantee an animal against an attack for two days. At present the malady is

extensively prevalent among cows in the metropolis, and in many parts of the country; and cattle so frequently become affected in transit that, taking into account the requirements of the trade in the metropolis, we do not see how it is possible to restrict the movement of the cattle affected with this disease in London, at least so long as the cordon round the metropolitan district is maintained.

In respect of the other infectious diseases of which the Bill takes cognisance—cattle plague, sheep pox, pleuro-pneumonia, scab in sheep, and glanders in horses—there is no fear of animals suddenly being attacked in transit, therefore, the same difficulty does not present itself in legislating for these diseases, and no reasonable objection can be taken to the restriction which the Bill proposes to place upon the movement of animals affected with any of them. As soon as the measure becomes law, there will be a further necessity for Orders of Council defining infected countries, and for the purpose of carrying into effect certain other provisions of the Act, and we shall take an opportunity to comment upon any points which may be interesting to the agricultural community.

— At Mark Lane yesterday English Wheat advanced 1s. per quarter, in consequence of a short supply, and more money having been made in the provinces during the week.—The Metropolitan stock and meat trade is good for prime qualities; good beef makes 8d. per lb. by the carcass, and mutton something over that figure. But a large supply of foreign stock keeps inferior sorts as low as 3½d. to 4d. per lb. —Wool is slightly cheaper.

— Mr. JOHN HUDSON, late of Castle Acre, the veteran Norfolk agriculturist, died on July 26, at the house of his son-in-law, Mr. JOSEPH SEWELL, at Cirencester, Gloucestershire. He had long been known as one of the most successful practical farmers of the day—representing more strikingly, probably, than any of his contemporaries the good policy of the very "highest" farming in the interest of the tenant as well as of the landowner and the labourer. Mr. HUDSON was held in high esteem not only in his native county but throughout the English agricultural world. He served for many years on the Council of the Royal Agricultural Society, and many years ago, when three or four distinguished men were asked to speak on the several branches of English agriculture, on the occasion of Mr. HOSKYN'S paper on Agricultural Progress, read before the late PRINCE CONSORT in the room of the Society of Arts he was selected by the Society as its best living representative, to speak of the actual practice of the farmer in field, farmyard, and fold, and its wonderfully increased productiveness as the food manufacture of the country. Mr. HUDSON was born in 1794. The announcement of his death will be received with great and general regret.

— At the recent meeting of the Agricultural and Horticultural (Co-operative) Association, it was announced that during its first year the number of members had increased from 10 to 174, and the capital from 257l. to 1003l., that the sales amounted to 10,342l., and the profits (gross) to 1335l., that at the end of the second year, ended June, 1869, the members were 255, capital, 3584l., sales, 19,102l., and gross profits, 2007l.

— Mr. GIBBS, of Gilwell Park, reciting the offer of its Gold Medal by the Royal Agricultural Society of England (for the best system for drying corn and hay in wet weather sufficiently economical for practical purposes,—protests that he has already proved his system to be both practical and economical, not alone by 15 minutes of hurried experiment in the showyard, but by practical work carried out with the utmost care and accuracy in the presence of unimpeachable witnesses, and he claims to have fully earned and fairly won the offered medal. He submits that if it be withheld the Society will have forfeited all claim to the future confidence of inventors, and will have broken a public promise. The Times, defending its report of the drying machine, states that Mr. Gibbs' hot-air shed of 12 feet by 12 feet ground-floor, and fitted with 32 sheaf tubes, dried 32 wet sheaves in 15 minutes. A house of 10 times that area (measuring say 60 feet by 24 feet), with 326 sheaf-tubes injecting hot air into as many sheaves under rick-cloths in the open field, would, if drying with the same expedition, prepare for the stack 320 wet sheaves in 15 minutes, or 1280 sheaves per hour. This would be the produce of about 2 to 2½ acres of a good crop of Wheat, and would represent about the rate of performance of two pitchers and loaders working at once. A Wheat-dryer exhibited in operation actually denoting on such a scale would have demonstrated the applicability of Mr. Gibbs' system to large farms. It is to be regretted that the apparatus at Manchester was not, at least, large enough to keep one pitcher and one set of carts going. It would then have proved to everybody that the 'system' is practical. But the judges could hardly be expected to award the important Gold Medal of the Royal Agricultural Society for a process exemplified by the action of a working model that dried at the rate of 128 sheaves per hour, or only 2½ to 3 acres in a day of 12 hours. The farmer's horses and men cannot work both night and day, neither can a man of business think of pottering for five or six weeks over the carting of his corn, and it is because Mr. Gibbs' invention is so promising that we again ask him to show in actual operation a hot-blast drying sheaves as rapidly as a set of carters can bring them to

THE PRESENT APPEARANCE OF THE CROPS.

[FROM OUR OWN CORRESPONDENTS, JULY 31]

COUNTY	WHEAT.	BARLEY.	OATS.	BEANS.	PEAS.	POTATOS.	ROOT CROPS.	GRASS.	WHEN WILL HARVEST BE GENERAL?	NAME AND ADDRESS.
SCOTLAND.										
ANKFF	Good, average	Average	Under average			Fair average	Promising	Short	Middle of September	John Barclay, Brass of Fennie, by Fochabers
ABERDEEN	Fair average	Average	Fair, but light on bare soils			Very promising	Fine	Very poor	End of August	James Hamilton, Forres
	Very good	Good, except in very dry ground	Deficient			Good as yet	Very good	Poor crop	End of August	John Grigor, The Nurseries, Forres
	Average	Below average	Average			Look well	Look well	Much dried	End of August	Fochabers
	Average	Average	About average			Under average	Healthy and well	Very inferior	September 1	A. Cruickshank, Sittlyton
PERTH	Full bulk, autumn sown diseased	Over average	Short in straw	Short in straw		Promising	Full average on easy soils	Scarcely average	August 15 to 20	David Edie, Bridge of Burn, Elliothead
RYE	Rather under average	Full average	Under average	Average, but podding very bad	Average	Full average	Average	Average	End of August	John Morton, Lambie-lotham, St. Andrews
	Scarcely average	Above average	Very much under average			Average	Average	Under average	August 20	John Pitcairn, Kinward, Newburgh
	Average	Above average	Under average	Above average		Average	Average	Under average	Aug. 15 to 20	Robert Russell, Falmuir, Leven
HIRLING	Promises a full average crop	Rather below average	Considerably below average	Slightly under average		Very promising	Very good, but on clay lands almost a failure	Deficient but partially recovering	Middle of August	Wm. Drummond & Sons, Stirling
HADDINGTON	Average	Above average	Under average	Average		Promising	Very promising	Very poor	Aug. 15 to 25	George Hope, Fenton Barns, Drum
KENFREW	Above average	Average	Under average	Good		Strong and healthy	Under average and late	Very much dried up	About the end of August	George Boyd
KIRKCALDIE	Average	Full average	Above average	Full average		Average	Very late, except early sown	Far above average	About Sept. 1	Wm Orr, Seed Merchant, Both
	Scarcely average	Light	Under average	Not average		Early kinds not heavy	In great need of rain	Much burned up	August 20	And. W. Ralston, Lagg, by Ayr
PERKIE	Above average	Scarcely average	Below average			Below average	Turnips now reviving	Much burnt, hay light	Third week of August	James Lyle, Innerleithen
PERKIE & SHIRE	Above average	Above average	Under average	Average		Under average	Very promising	Has suffered from drought	About Aug. 15	John Wilson, Edington Mains, Chirnside
WIGTOWN	Average	Average but very little sown	Fair on good land	Fair		Good	Turnips very good	Very poor	End of August	A. H. McClean, Auchmeal, Stranraer
ENGLAND										
SOUTHAMPTON	Average	Under average	Very poor	Average	Average	Good	Very promising	Hay good	Aug 20 to 25	Thomas P Dods, Anick Grange, Hexham
SOUTHAMPTON	Above average in bulk	Above average	Under average	Various	Few grown	Fair	Very good indeed	Light, well got	August 16	Geo. Laing, Cornhill, Co. Stroud
CUMBERLAND	Average	Average	Much under average	Average		Good	Never more promising	Hay good, pastures burnt	August 26	Thomas Gibbons, Burnfoot, Esk, Longtown
WESTMORELAND	Over average	Under average	Under average			Over average	Turnips over average	Over average	About second week in Aug.	Jonathan Robinson, Warcop, Penrith
DURHAM	Under average	Average	Average	Good	Average	Average	Average	Over average	Last week in August	Robert Bland Dixon, Fern Bank, Darlington
	Average	Average; short breadth	Bad		Few sown	Good	Good	Good average	August 20	George Crofton, Kimblyton
	Much improved, but full one-third below average	Very light upon sandy soils, one-third below average	Short in general, but full average crop	Short in straw, but full average crop	Few sown, but full average	Very good, average crop	Very good, average crop is anticipated	Very good, well secured, one-third over average	First week in September	John G. Wainwright, Laines, Calder
	Scarcely an average	Average	Under average	Short, but well laden	Over average	Promising	Better than for several years	Meadow entirely average crop, but very well got	Last week in August	H. J. Turner, Land Agent, Richmond
	Considerably under average	Average	Under average	Good	Good	Too soon to judge	Promising	Great crops	August 15	John Coleman, Esrick Park
	Under average	Average	Various	Average		Promising	Average; want rain	Average, well got	August 15	Peter Stevenson, Rainston Thirsk
	Below average	Average	Below average	Average	Over average	Average	Promising	Average	September 1	R. Bell Layton Fields, Caldwell, Darlington
	4 bushels per acre below average	3 bushels per acre below average	12 bushels per acre below average	4 bushels per acre below average	Average crop	Light crop	Pretty well planted	Large crop upon old meadows	August 14	John Clark, Hessele, Hull
	Much improved of late, but will not be an average	Fair average	Generally light and deficient	Full average	A heavy and very good crop	Good crop	Early sown Turnips very good, those sown late upon strong lands bad	Great crop	In three weeks or a month	Samuel Wiley, Bransley
	Average	Better than last year	Good where in condition	Average	Good	Promise well, but want rain	Promise well	Has been good, but now wants wet	August 12	Thomas Taylor, Dorrington, near Pontefract
	This, one-third less than last year	Under average	Bad	Good	Good	Moderate	Promise well, if rain comes	Good	Last week in August	Brady Nicholson, Star ton Grange, Leeds
	Under average, but improved amazingly within the last few weeks	Good	Good	Good		Splendid	Want rain	Very good	End of August	William Irvine, Halifax and Lane, Kipling Cotes Farm, Beverley
	Much improved lately, average	Under average, but very much improved	Light poor crop generally	Bulky; straw not well podded	Above average	Few grown, and poor	Looking well, want rain	Very good	August 13	John and Isaac, Kipling Cotes Farm, Beverley
		Fair	Under average and short	A good crop	Good; not many grown	Good short of last year's crop	Sweedes generally healthy	Clovers bad; meadows full average	First week in September	Jas. Wilkinson Wotby,
LANCASHIRE							Mangel good	Pastures very good	May all secured in first week of August	George Storey Claxson, Bury
	Average	Under average	Had a crop			Average	Early sown late sown indifferent	Hay good, pastures suffering	Middle of August	John Claxson, Oldwick, near Claxton
CHEESHIRE	A little under average	Very little grown	About average	Fine promise, but injured	None	Moderate crop, large breadth	Fair promise	Large crop of hay	August 14	W. B. Burnham, Spital, Chester
DERBYSHIRE	Below average	Below average	Below average	Not sufficient grown to justify an opinion	Not sufficient grown to justify an opinion	Good	Suffering from drought	Good and well got	End of August	John Parkin, Idridge-hay, Wirksworth
			Average			Excellent	Very good	Never better	End of August	Benj. Swaffold, Hartington
LINCOLN	Under average	Under average	Bad			Very few grown	Very promising	Heavy	August 16	Francis Sowerby, Aylesbury Great Grimsby
	Under average	Average	Bad	Fair	Almost destroyed by fly		Good on light lands	Very good	August 20	Isaac Sharpley, Boswell, near Louth
	Full crop much damaged by storms	None grown	Full average	Full of fly	Very bad	Poor crop	Single small hold	Hay a great crop	August 16	Thomas Alderson, Decy Farm, N. Lincoln
	Average	Average	Average	Under average	Nearly a failure	Free from disease	Promising	Abundant	August 6	W. Bennett, Wotby, Folkingham
	Very small ear, and much below an average	A bad crop, much worse than last year	Very light and bad	Winter Beans a large bulk of straw, short of grain	A fair crop, but few grown in this part	At present a full crop	Turnips very promising, but in want of the Woad	A good crop, but hay not so bad	August 10	James G. Dixon, Calster
	Very various much root-fallen and storm-broken	Good a full average	Good a full average	Greatly improved, a fair average	Various, many crops attacked with aphid	Not promising many plants decaying for want of rain	Mangels a fair average, Turnips much in want of rain	Good a full average, but in want of rain	About Aug 21	John Clarke, Old Bank House, Long Sutton

* This return is made up 10 days too soon to be depended upon.

* Not so good a yield by one-third as last year.

	Fair; not average	Very light	Generally good, rather short	Short; toler-ably corned	Promising	Generally good, want rain	Good crops of hay, put together too quickly, much damaged and burned	Aug 10 to 13	Henry Smith, Sul-ton Maddock, Sluina
SHROPSHIRE ..	On liberally farmed good	More planted, but a heavy crop quite the exception	Few grown in this district, and apparently very light	Where mode-rately sown, average crop, but where a mass of stalks, indifferently podded	Tolerably good crop, and considerable breadth planted	Poor and want flavour, late ones want a soak of rain sadly	Early planted Swedes blue and unkind in appearance, for want of moisture, Mangel promising	Good crops of hay, put together too quickly, much damaged and burned	Aug 10 to 13	Henry Smith, Sul-ton Maddock, Sluina
	Wheat soils, average crop, a deal thin and bad, and decidedly under average	Average	Average	Average	Under average	Free from disease	Under average	Burning up	August 12	John Rawlings, Stoke, Tenbury
	Light crop of straw small in the ear, must be under average	Early-sown the best, but not good, late-sown very light	Very good	Very good	Blight has injured them very much the last ten days	Likely to be a small crop, for want of more rain	Early-sown very promising, but want rain	Hay secured in fine condition, full average	About middle of August	Richard Shirley, Church Stretton
	Much improved, will be an average	A good average	Very promising above average	Spicid crop of straw, but barely average	Now attacked by the greenfly	Fair crop, tubers small	In all probability very good	Very good	August 23	Evan Davies, Patton, Wenlock
	Very variable; some fields good, crop reduced a third	Promaturely ripened, a bad crop	Under average	Very good	Blighted	Good	Very good	Good	About August 3 or 4	Thomas Mansel, Ercall Park, Wellington
STAFFORDSHIRE	Under average	Generally not good	Short and under average	Few grown	Few grown	Very much	Good	Heavy hay crop	In a fortnight	W D Green, Market Drayton
	Various; in this parish probably average, in others not so	Below average, many fields spotty	Scarcely average	Spring promised well, tall blighted	Early good, late blighted	Pretty good on light soils	Early-sown good	Getting thin at bottom	Second week in August	George A May, Elford Park, Tamworth
	Under average	Two-thirds average	Average	Winter Beans good, spring Beans bad	Half average, blighted	Under average	Average	Good crop; over average	August 12	Thomas Byrd, Mytton Manor, Panbridge
HEREFORD	Much under average	Average	Good	About average	Not quite average	Good	Wanting rain badly	Hay very good	August 10	D. Edwards, Brins-court
	Below average, but improved since he past three weeks	Below average, late planted very bad	Not many grown average crop	Autumn planted an average crop	About average	Very good in quality	Greatly in need of rain	Hay good and well secured	August 0	T Dickbath, Bayshau Court, Ross
	Best land full average, on poor land very inferior, and far below average	Generally a light crop	About average	Plenty of beans, but badly podded	Very partial on some fields good for nothing	Good	Very promising with rain	Heavy hay the Grass now much burnt up	Beginning of August	Philip Turner, The Leen, Penbridge
	Inferior under average	Generally good	Average not many grown	Quite an average crop	Much blighted	Burnt up; want rain	Plenty of plants, want rain	Very good	In a fortnight or three weeks	Thomas Farmer, Frome Bishop, Bromyard
WORCESTER ...	Below average	Average	Average	Average	Average	Average	Mangels good, Swedes want rain	Hay very good, pastures burning	August 10	Charles Randall, Chad-bury, Evesham
	Much improved, but under average	Variable; supposed under average	Good; not much grown here	Winter Beans very good, spring not good	Fair	Ripening too early, but sound	Mangels promising; others wanting rain	Grass short; heavy hay	August 7 to 9	Stiles Rich, Fearnall Heath
	Variable some good, but will not bear com-parison with last year's	Early planted good late planted very indifferent	Good	Winter Beans good, spring Beans weak	On good land productive, cold land very bad	Early good, late planted small, and poor samples	Excellent, much in want of rain	Very good, and well secured	Second week in August	Joseph Matthews, Great Malvern
	Under average	Average	Average	Average	Under average	Improving	Improving, and good	Very little	August 9	Henry Hudson Wick, near Pershore
WARWICKSHIRE	Thin, weak in the straw, and scrawled	Improved by the dry weather	Very few grown	Winter, bulk badly corned, spring, blighted	Blighted, half a crop	Not many grown	Very good	Large crop, well got	August 12	Joseph Smith, Henley-in-Arden
	Some good crops, but, on the whole, light crop of straw, and ears appear small	Generally a light crop	Some good crops, but short in the straw	Not good, and covered with insects	Great many fields very bad, and covered with insects	Doubtful	Now promising	Very plentiful	Second week in August	Upton, near Nun-aton
	Very much im-proved, and the ears well de-veloped, but yield will be below average	Ripening; below average	Harvest has commenced; crop far below average	Healthy, well grown; not well corned; more than average	Good crop of Early White Peas; above average	Looking well, no disease at present	Mangels, flourishing; Swedes, early sown, flourish-ing; late-sown, patchy	Pastures plenti-ful, but were beginning to burn	Oats general this week, Aug. 10 to 20	Charles M. Caldecott, Holbrook Grange, near Rugby
	Much less than an average	Fully an average	A bad crop of corn	Blighted; under average	Good quality, but small	Mangels promising, Tor-ops want rain	Requires rain	August 9	John C Adkins, Milcote, Stratford-on-Avon
	Under average my own average	Not good my own fair	Inferior	Good	Bad	Promises well	Excellent	Much above average	End of August	James Ansd, Newlands, Rugby
	Not an average crop covered with another fly	Fairly planted very good, late not an average	Some very good, others short and thin	Much winter not well corned can not be a great crop	Long, in straw well corned, but smothered by green insect	Promises average crop	Mangels good, want rain.	Very large crops, and well got	Set by the middle of August	John Jackson, Loding-ton, Stratford-on-Avon
	Under average	Under average	Barely average	Average	Many failures		Want rain	Wants rain	Middle of August	J. H. Burbery, The Chase, Kenitworth
NORTHAMPTON	Considerably under average	Average	Under average	Winter good, spring-sown, bad	Early sorts, half a crop; later sorts, total failure	Good	Good plant; want rain	Very good	About August 10	J Borlase Tibbits, Dar-ton Seagrave, Katter-ting
	Good; full average	Light; under average	Much under average	Fair crops, smothered with fly	Full crops, but almost de-stroyed by fly	Light; want rain very much	Mangels bad	Abundant crops	Middle of August	J B Smeaton, Cromwell House, Naseby
	Average	Average	Under average	Above average	Almost failure	Under average	Very good	Extrn abundant	August 8	Peter Love 15, St. Gles Street, Northampton
	Under average	Average	Under average	Winter, aver age spring, under	Much blighted	Good	Good	Hay abundant	August 12	James Bartlett, Whit-field, near Brachley
HUNTINGDON ..	Barely average	Under average	Under average	Under average	Under average	Promising	Very promising	A double crop	August 9	Peter Purves, The Grove, Hampton

THE PRESENT APPEARANCE OF THE CROPS—(Continued).

COUNTY.	WHEAT	BARLEY.	OATS.	BEANS.	PEAS.	POTATOS.	ROOT CROPS.	GRASS.	WHEN WILL HARVEST BE GENERAL?	NAME AND ADDRESS.
ENGLAND.										
WILTSHIRE	A great deal blighted; about average	Various, under an average	Good quality, under an average	Winter Beans, good; spring, bad	Early Peas, fair; late, very bad	Generally good	Good, benefited by rains	The finest crop for many years	August 9	John Wallis, Park Farm, Kimbolton
WILTSHIRE	Not average, the light crops are down the worst	Below average, through wet weather	About average	Winter Beans, above average, spring, average	Below average, spoiled by fly	An inferior crop	Very good	Hay a heavy crop, and well secured	August 7 or 9	Robert Barton, Wigan Farm, St. Ives
WILTSHIRE	Affraid it will not be average	Under average	Bare average	Full average	Not average	A good crop	Good	Abundant	August 10	Samuel Jones, Christhall Grange
WILTSHIRE	Very various, some unkind, other crops heavy, generally average	About average; suffered to some extent	Various; where unharmed by wire-worm, a very full, heavy crop	Average straw, but hurt by fly	Ruined by fly	Average	Various, some crops very good indeed	A heavy crop	August 9	Alfred S. Ruston, Ayies-by House, Chatteris
WILTSHIRE	Not so good by three coombs as last year	Light land ripening unkind; not an average	Average	Average	Under average	Good; want rain very bad	Good, but want rain	Over average	About August 8	Serjeant Wallis, Granchester
WILTSHIRE	Average here, below average generally	Good, and above average	Various	Good	Very indifferent	Good at present	Good; well planted	Good	August 9	Hugh Aylmer, West Dereham Abbey
WILTSHIRE	About average	Good	Good	Average	Various	Good	Very promising	Short	August 20	William Cubitt, Ecton Abbey, North Walsham
WILTSHIRE	Average	Over average, except on inferior land	Good	Average	Early sown good		Good injured by wireworm	Very much scorched	About August 11	Thomas Moore Hudson, Castle Acre
WILTSHIRE	Under average	Fair average	Much under average	Average, but not as expected	Under average	Promising	Will be good	Fine crop, well secured	Middle to 21st August	Thos. Brown, Manor House, Southery, Downham Market
WILTSHIRE	On good mixed soil, where the land has been well farmed, it looks promising; on light soils it is falling	Looks well on land in good condition elsewhere where ripening prematurely	Very variable, but generally not looking well	Suffering from the fly, which has destroyed some of the late flowers	Not looking well generally	Looking well generally, but want rain	Pastures very much burnt up for want of rain	Now	Henry Woods, Morton, Thetford
WILTSHIRE	Good average	Fair average crop on cool soils	Good crop	Fair crop, improved of late	Early sown fair, late sown good for very little	Good, but small in size	Good crop; full average	Abundant crop of hay	Middle of August	W. H. Taylor, Merchant, Wymondham
WILTSHIRE	Badly set, but average	Long ears, not a strong crop	But few grown	A fair crop	A fair crop	Bad crop	Not good, too dry	Very short, and dry	August 16	George Dobbs, Lidgate
WILTSHIRE	Heavy land, above average	Very good on heavy and well-farmed lands	Scarcely any grown	Winter Beans good; spring, affected by lice	Fair crop; injured by lice	Below average	Good	Above average	August 13	T. C. Whiting, Barsham House, Beccles
WILTSHIRE	Poor light land, very bad	Over average	Few grown	Under average	Healthy, but small	Good plant, looks well	Has been plentiful	August 7	W. E. Bury St. Edmund's
WILTSHIRE	Upon the whole, good; improved within the past three weeks	Very fine and regular best maturing Barley in England grown in the district	Winter very fine, late ones suffering	Heavy crop, good sample, more tall than usual from the fly	Not largely grown, healthy and strong as yet	Mangels good, white	A good deal burnt lately	The first week in August	D. T. F., Bury St. Edmund's
WILTSHIRE	Heavy in the straw, but not average, the ears being very deficient	Beyond average plenty of straw	Plenty of straw, but little corn	Abundance of straw, early will hung but late not an average crop	Very good	Beyond average	Abundant, and well secured	About August 14	Saml G. Stearn, Branston, Wickham Market
WILTSHIRE	Average in quantity, but deficient in quality, owing to blight in all unsound spots	Average crop, very much improved on all heavy lands the last month	Not grown to any extent	Winter, average; spring, very much injured by lice	Early sorts, average; late, half a crop	Sound, but very small	Mangel Wurzel very good; Turnips suffering	Good	August 9	Fredk. Nunn, Rougham
WILTSHIRE	Good	Very good	Attacked by lice	Nearly average	No complaint	Turnips want rain	Very good hay	August 15	George Edwards, Framlingham
WILTSHIRE	On good lands, both straw and crop good; on the poor lands the wheat is light	On good lands a large crop; on the lighter soils, moderate	But few grown, not an average	Not many grown in the district	Clovers a failure, the area of Peas grown very large, about an average	But few grown, and moderate	Mangels good prospect of	Hay good, and generally secured well	August 5	G. M. Sexton, Wharstead Hall, Ipswich
WILTSHIRE	Good	Much improved, promising	Not many sown	Suffering from fly, but podded well	Very few grown	Good, and of excellent quality	Turnips good	Pastures now dry, though not bare	Next week	Henry Trethewy, Silsoe, Ampthill
WILTSHIRE	Below average	Considerably below average	Average	Winter, very good, spring, below average	Below average	Good	Good	Very good	August 8 or 10	Henry A. Bottle, Fetteshall, near Kimbolton
WILTSHIRE	Scarcely average	Average	Average	Blighted	Very bad	Good	Good	Heavy	August "	William Lavender, Biddenham
WILTSHIRE	Quite an average crop	Much below average	Scarcely any grown about here	Very good	Well planted, but very small produce	Good	Good, but want rain	Hay abundant	About Aug. 10	T. E. Pawlett, Beeston, Sandy
WILTSHIRE	Barely average	Average	Average	Under average	Under average	Average	August 9	James Ross, The Hoo Park Farm
WILTSHIRE	Probably average	Above average	Above average	Above average	Mangels good, Swedes well planted, want rain	Much above average	August 9	J. B. Lawes, Rothamsted
WILTSHIRE	About average, but some pieces mildewed, which if general must affect the yield	About average	Winter Oats above average, spring Oats under average	Heavy straw, affected with the green fly	Mangels and early Swedes generally good	Natural Grass good; Clover very light	August 7	George Webb, Beaumont Hall, Redbourn
WILTSHIRE	Improved of late, but under average	Barely average	Under average	Over average	Average	Very promising	Could not look better	Large crop; well made	In a week	John Cobban, Whitfield Berkeley
WILTSHIRE	About average; long and strong in the straw	Much improved lately, full average	Thin in many instances, but likely to yield well	Plenty of straw scarcely any corn	Promising, but want rain	Complaints of grub and wireworm	Pastures burnt up	August 9	Edw. Hundy, near Andoversford
WILTSHIRE	Unusually variable quality will be second-rate	Rather under average of past 7 years quality good	Under average, but few planted here	Very variable; full average, and large breadth planted	Under average; large breadth planted	Early planted good crops, late sorts unpromising	A general good plant, but stunted in growth	Hay crop good and well secured	August 9	Wm. Woodward, Ashchurch and Bredon
WILTSHIRE	Average	Average	Average	Under average	Average	Above average	Above average	Above average	August 5	Edmund Buck, Castle Hill, Cricklade
WILTSHIRE	Under average	Average	A little under average	Winter over average	Under average	Early good; late bad	Average, but suffering	Very large crop of hay	August 3	H. Scott Hayward, Procenter Court, Stoneham
WILTSHIRE	Under average	Bad	Under average	Promising	Blighted for want of rain	Good crop	Promising	Good for mowing	Beginning of August	Giles Edmunds, East-leach, Lechlade
WILTSHIRE	Under average	Under average	Under average	Over average	Under average	Very promising	Precarious	Hay abundant	Middle of Aug	Henry Pride, The Cwm, Monmouth
WILTSHIRE	Uneven and bad, excepting on good soils	Very variable, average	Under average	Good average	Average	Good	Very promising, but requires rain	Heavy crops	August 7	L. yuch Fletcher, Hardwick Hill, Chepstow
WILTSHIRE	Many fields short and uneven, scarcely equal to two-thirds of last year	Fair average, but ripening prematurely from drought	Some fields good many much below average	Middling crop, very little corn	Plenty of straw terribly blighted	Uneven crop, suffering from drought	Early sown, good later planted, want rain	Much burnt up, crop well secured	Now	Gen. Garne, Churchill Heath, Clipping Norton

* I have filled up my return for the crops, but I have little confidence in it. I never knew a season in which it was so difficult to estimate the yield. On my own farm, I have some crops as good as I could wish them to be, and some very bad indeed. I believe this is the general state of the crops in the country; and you know how difficult it is to form any estimate under these circumstances. I shall know better when I thresh my experimental crops.

THE PRESENT APPEARANCE OF THE CROPS—(Continued).

COUNTY.	WHEAT.	BARLEY.	OATS.	BEANS.	PEAS.	POTATOS.	ROOT CROPS.	GRASS.	WHEN WILL HARVEST BE GENERAL?	NAME AND ADDRESS.
ENGLAND.										
OXFORD	Under average and some blight	Average, but bad on strong land	Under average	Good	Very bad, much blighted	Sound at present	Full plant, rain wanted	Pastures require rain	August 10	Matt. Savidge, Saraden Lodge Farm, Chipping Norton
	Fair average	Under average	Average	Badly blighted	Very much blighted	Good	Very promising	Good up to the dry weather	August 2	Sam. Drice, Eynham
	Average crop	Below average	Little straw; well corned	Winter Beans, heavy; spring do., very bad	Pleanty of straw, badly blighted	Looking well	Good plant, wanting rain	Parched	Middle of Aug.	John Gillett, Oaklands, Charlbury
BUCKS	Various; not average	Full average	Light crop	Winter-sown good	Many places good	Generally good	Promising	Very good		J. Bryan, Southleigh, Witney
	Slightly below average	Much below average	Average	Above average	Average	Early, abundant	Good	Hay very abundant	August 10	W. G. Duncan, Bradwell
	Over average	Good	Spring-sown, light	Very good	Good. But few grown	Later promising	Very good	Good	In a few days	Edward Evans, Boveney Court, Woodbur
	Over average	Under average	Under average	Average	Average	Average	Under average	Over average	August 12	W. Smith, Woodston, Titchley
	Under average, blighted	Much below average	Much below average	Full straw, ill corned	Very bad	Good	Good plant, but late	A crop and a half of hay	August 9	Alexander Fraser, Claydon, Winslow
	Excellent on the good lands, thin crop on ill drained soils	Fair average	Average	Good	Good	Good	Good plant, but now going off	Large crop of hay, but no aftermath	About August 7	John K. Fowler, Prebendal Farm, Aylesbury
ESSEX	Good, if the fly has not affected it	Very good	Slightly below average	Winter very good, spring affected by fly	Good straw, short of corn	Not many grown	Mangels excellent, early Swedes good	Very heavy crop	About August 9	—, Waddesdon, Upper Winchendon
	Much improved from the spring, but varies very much, cannot be quite an average	Not generally good; it suffered from the cold and wet in the spring; 10 per cent. less than average	Generally good, but rather short	The winter kinds good, over an average the spring kinds affected by insects	The early-sown pretty good, the later ones much blighted	Planted well, but have suffered from the drought, must be a light crop	Mangels, Kohl Rabi, and Swedes well planted, the white kinds short	A great crop of hay, generally well got	August 2 to 9, according to soil	John Claydon, Littlebury, Sadron Walden
	Some very good, but many fields root-fallen and injured	Good, but not a heavy crop	Very good	Very heavy crop of straw, and fair quantity	Very much injured by aphids	Very small, except the early kinds	Very promising	Very short and dry	August 5	William Impoy, Broomfield Place, Chalmersford
	Under average	Under average	Under average	Under average	Under average	Under average	Better plant than for several years	Abundant, and well got up	August 2	Abraham Hardy, sen., Maldon
	Greatly improved since the 5th of this month	Full eared, bulky, and above average	Good average	Average	A third of a crop can only be expected	Free as yet from disease, tubers small	Mangels very promising	A full crop; tolerably well secured	Some cut already (July 30)	Henry Dixon Dorward, Hall, Wilton
	Under average	Average	Winter good, spring middling	Over average; large breadth	Over average; large breadth	Average	Good; over average	Great crop; well got	August 5	J. J. Mechi, Tigtree Hall, Kelvedon
	Average	Under average	Good	Not good	Bad, great complaints	Good; but small	Mangel good; Turnips bad	Abundant crop	About Aug. 8	A. Barfield, Dunmow
	Average	Over average	Average	Over average	Early Peas good crop	Good crop	Want rain; plant good	Over average	August 10	G. D. Badham, The Lawn, Bummer
	Root-fallen, blighted ears; much under average	Not much grown; rather a light crop	About average, but few grown	Winter open better than expected; spring much hurt	Very bad, killed by lice		Mangel pretty good	Good hay; but no after feed	About August 3 or 4	Charles Harvey, Foulness, Southend
Light land	Under average	Average	Under average	Average	Under average	Under average	Average	Good	August 2	S. W. Squier, Hoxton-on-Hill
Heavy land	Full average	Above average	Average	Above average	Under average	Under average	Average	Good	July 23	T. Mitchell, East Hill, Rainham
MIDDLESEX	Average, many blighted ears	Average	Average	Over average	Average	Looking well	Wurzels under average, Swedes planted	Over average	August 6	Thomas Hewitt, Cranford
BERKS	Average nearly	Under average	Average	Above average	Fair	Promising	Mangel	Abundant and well made	Now	E. W. Moore, Colleshill, Highworth
	Average	Much above average	Probably average	Good	Rather over average	Not much grown	Wurzels good	A good crop, carried very well	August 2	Wm. Bulstrode, Mount Farm, Cookham Dean
	An average	Over average	Over average	Average	Average	Very good	Early sown, good	Very short	August 9	J. Adams, Thatcham, near Newbury
	Very variable, many pieces very thin	On well farmed lands promises full average, but signs of blight	About average	About average	A full average	The forward planted very good, but backward very bad	Never promised better	Meadows very good	Next week	Thomas Owen, Clapton, Hungerford
	Under average	Above average	Full average	Generally good, though some light	Very various	Early planted very good, late planted short	Swedes patchy; all others very good	Good Clovers and Grasses, but burning up now	About August 10 or 12	Martin Hope, Saltham, Reading
	About average	Average	Average	Barely average	Average	Fair	Good plant where sown early	First crop pretty good, second indifferent	August 2	William Dawe, Southridge Farm, Pangbourne
	Under average	Scarcely an average	Average	Average	Average	Average, no complaint	Plant good, but requires rain	Clover light; Sainfoin and meadows good	July 28	James Hulbert, Stratford, near Reading
WILTS	Average	Over average	Over average	Average	Average	Good	Mangel good	Average	August 2	James Rawlence, Hungerford, Wilton, Salisbury
	Deficient ear, thin on ground	Good average	Partial, not a good average	Winter Beans not good	Good	Promising for a crop	Fine plant	Promising, but want rain	10 days	George Brown, Calne
	Not average in the county generally	Not average in the county generally	Above average	Above average	Average	Good	Hay crop above average	August 5	Cyrus Combes, Draining and Irrigating Engineer, near, &c., Tisbury
	Various; nearly an average	Average	Various; barely average	About average	Under average	Early ones a fair crop	Early sown promising	Over average, but little aftermath	August 8	Thomas Arkell, Pen Hill, Swindon
	Full average	Early Barleys very fine	Over average	Over average	Average	Very good	Starting afresh	Over average	August 10	J. A. Williams, Baydon
	Greatly improved since the 1st of August	Average	Early sown good others very inferior	Good	Good	Small crop	Have done well, considering the late drought	Wanting rain	Early in August	R. Stratton, Burdett, Swinlon
SOMERSET	Under average	Average	Good, but short			Good	Good plant	Over average	August 10	John B. Collins, Dulverton
	5 bushels per acre under average	Nearly average	A little under average	Average		Fair crop; diseased	Mangel Wurzel good; Swedes wanting rain	Good crop of hay, pastures beginning to burn	August 5	Walter Farthing, Stoney Court, Bridgwater
KENT	Loy Wheats on best lands not one-third of an average; the worst crop of wheat for many years	Very various; some very good may be average	Over average	Great breadth over average	Various; under average	Excellent quality	Excellent plant, want rain	Greatest crop for many years	August 9	Robert Mason, Wingham
	Average in later districts	Various; some good fields	Barely average	None grown	Average crop	Looking well	Generally good, and kindly	Good crop	August 15	Mark Sandford, Martin, near Dover
	Below average	Above average	Above average	Winter Beans good, spring inferior	On the whole an average	Present appearance good	Mangel and Swedes good	The hay crop heavy	About Aug. 8	Wm. Manser, St. Peter's, near Margate
SURREY	Average	Average	Under average	Winter good, spring poor	Early good; late blighted	Diseased in places	Mangel very good; affected by drought	Meadow good; Clover light	August 2	Edw. Hilder, Woking

Paul & Son's Roses Now in Bloom.

PAUL AND SON, The Old Nurseries, Cheshunt, invite inspection of the ROSES, GLADIOLI, HOLLEHOEK, TREES, and other articles...

Choice Seeds for Present Sowing

Table listing various seeds such as WILLIAMS, POLAKIA, and others with prices per bushel.

Direct from the Growers, the most Effectual Means of Preventing Disappointment.

PAUL AND SON'S SEED GROWERS, deliver their best-grown seeds, from the harvest, to all parts of the Kingdom...

included some among what Mr. BRIGHT called 'the most respectable firms.' It is but fair, however, to say that these firms ultimately withdrew their objections...

NATPIN, indeed, says, that it is not only very productive, but is excellent when cooked, provided it be gathered before the envelop of the seeds becomes hard. M. J. B.

A correspondent has been good enough to forward us an AERIAL grown in water in a bottle that has been tightly corked. The effect has been that from the sides of the main root, as also from the stem, a quantity of white root-like processes have been formed...

We have had submitted to our inspection by Messrs. DICK, RAINEY & CO. a specimen of a CHARCOAL FLOWER-POT introduced by them. The theory is that the porous qualities of the charcoal, and its power of absorbing deleterious gases, will be serviceable in the growth of plants.

At the Botanic Garden, Ghent, under the charge of M. VAN HILDEBRANDT, a fine plant of VICTORIA REGIA, in order to ascertain what weight the leaf of the plant would support...

WE learn from Hamburg that the INTERNATIONAL HORTICULTURAL EXHIBITION is so entirely successful as regard entries, as to threaten to overflow the limits which had been assigned to it.

FOREIGN SEEDS FOUND MIXED WITH COTTON.

(Seed of the Manchester Congress, July 21, 1869.) (Continued from p. 840.)

THE three Claytonia—perfoliata, albinoides, and sibirica—seem to be spreading rapidly, having, no doubt, in the first instance escaped from gardens...

In addition to these plants which, though they may be found in the southern parts of England, do not appear in the mainland, to say nothing of the northern counties...

There were many other plants the names of which I was unable to determine. One was a species of Anemone...

These plants, as I have before said, spring from seeds which have come mixed with cotton from all parts of the world, and being scattered indiscriminately on the ground...

One frequent find is the seeds of various Palm trees, and of many Grasses. I think it is not quite certain that it was in Madras...

There appear to be, taking all the seeds or plants I have seen, a great number of species of Cucurbitaceae...

The Gardeners' Chronicle. SATURDAY, AUGUST 14, 1869.

MEETINGS FOR THE ENSUING WEEK. Royal Horticultural Society, Fruit and Flora. Aug. 17. Comm. Trees at South Kensington. Hort. Soc. Meeting. Aug. 17.

LINKS to the courtesy of our correspondents are enabled to present our readers with a report on the condition of the FRUIT CROPS the present season. The large number of acres, and the wide area from which they are gathered, will serve to a very great extent to counterbalance the inevitable shortcomings of a statement. Our report is amply full enough to show the general condition of the crops throughout the country...

are happy to be able to announce that the ADULTERATION BILL received the Royal Assent on Wednesday last. A few amendments were made in the Bill in its passage through the House of Lords, but in principle and in substance the Bill remains in the state in which it passed the Commons. The Bill will not come into operation till May 1, 1870, nevertheless, for the sake of their reputation already put to a considerable strain, we trust that we shall not hear this autumn of the purchase or sale by seed dealers of any more seed "such as you use." It will be remembered that this Bill has been promoted by itself, and much as we may regret that it has not yet been passed, we may at least congratulate them heartily on their present success. Of course there were many who at first objected to the Bill, and did what they could to thwart its progress, and these, too,

CONDITION OF THE FRUIT CROPS—(Continued).

COUNTY.	APRICOTS.	APPLES.	PEARS.	PLUMS.	STRAW-BERRIES.	CHERRIES.	PEACHES AND NECTARINES.	FIGS.	SMALL FRUITS.	NUTS.	NAME AND ADDRESS.
NORTHERN COUNTIES. YORKSHIRE....	Scarcely any, there was a good show of bloom, but small birds picked nearly all off	A fair sprinkling; no Keswicks	Good crop on walls, espaliers, and standards	Good crop of kitchen sorts, none on some trees, mostly owing to birds, late in coming, picking off the flowers	Very abundant crop, and large, rather late in coming in at first	Good crop on walls and standards	Very good crop	Abundant and good of all kinds	Wood and Filberts loaded; Walnuts scarce	William Denning, Grimston Tadcaster
	Good show of bloom, but a poor crop	Scarcely any	About half a crop		Plenty set, but suffered from drought	Very fair crop	Generally speaking, very few	Plenty	Abundance of all kinds, excepting Raspberries	Abundant crop	John Nicholson, Mount St John, Thirsk
	...	Very thin crop, suffered from late frosts	Medium crop on walls, standards below average	Moderate crop suffered from late frosts	Light crop; late, suffered from drought	Thin crop, dropped their fruit before ripe	Moderate crop	Plentiful	Currents plentiful, but small; Gooseberries very partial, Raspberries small	Good crop	Robert C. Kingdon, Brantingham Thorpe, Brough
	Very scarce	A fall crop	Moderate crop	A failure	Abundant on plants which were forced last year	Good crop on young trees	Early fine; late a failure	Good inside	Currents middling; Gooseberries very fine crop	Good crop	J. Simpson, Wortley Hall, Sheffield
LANCASHIRE.	A failure; all the blossom killed with early frosts	A fair crop of some kinds; young wood much injured with fly and mildew	A good crop of most kinds	Scarce; trees much infested with fly and spider	An abundant crop of all kinds, British Queen has done remarkably well here	A good crop of Morellos, other kinds scarce	A complete failure, all the fruit killed by the frosty nights in March	A good crop	Raspberries, Gooseberries, and Currants in great abundance.	Filberts and wood Nuts very plentiful	John Giffon, Bretton Hall, Wakefield
	Half crop	Good crops	Good crops	Less than half crop	Very good	Very good	Less than quarter of crop	None grown out-of-doors	Good crops, all of them	None grown	James Frosting Knowley
	None	Good	Early Pears (good) late middling	Very poor	Sir C. Napier, none. Keens' seedling, fair crop	May Duke and Morello, good; other sorts only middling	None grown outside	..	Abundant crop, especially Black Currants and Gooseberries	Very good	J. R. Pugh, Garden, Mackay Hall, Manchester
	Almost a failure	Very fair crop; in some places heavy, others rather thin	Common hardy varieties, a good crop, tender choice sorts, moderate; in some instances failure	Moderate	Generally good	Moderate; Morellos very good	Moderate in some places, below the average in general	Not grown in the open air	Gooseberries very abundant, Currants moderate, Raspberries below the average		F. Green, Bush Hall Gardens, Warrington
CHESHIRE ...	Next to none	Great crop many trees require thinning	Very good crop	An average crop	Almost a failure	Excellent crop	Almost a failure	Not grown out-of-doors	Very heavy crops	Very heavy, both cultivated and in the hedges	W. Muir, Oaks Park
	A very abundant crop	Very heavy crops generally, a few trees under the average	Good on walls, and plentiful generally on standards	Above an average, Damsons very plentiful	Not very good, either in size or abundance of crop	Ordinary kinds not plentiful, Kentish and Morellos very abundant	Very few on outdoor trees, and less than usual in orchard-houses	Abundant; but Currants, particularly Black, much attacked by aphides	More plentiful than for many years	W. Whitaker, Crook Hall
	Very few	Early kinds, very few, late, about half a crop	Average crop	Good crop	Much bloom killed by late frosts	Average crop		..	Good crop	Abundant	Allen, Withington Hall Gardens
SURREYSHIRE ..	Few	Kitchen, very poor crops; dessert, a few. Ribstone trees very much blighted	Tolerably good, but backward	Very few of any kind except Damsons	Indifferent	No dessert kinds; Morellos are tolerably good	A sprinkling	Thin, and dropping	Not to be complained of	Filberts and common, remarkably good; Walnuts very thin	J. Pearson, Ebbw, Bawley
	Very poor crops	Partial crops crumpled	Fair crop	Damsons, abundant on light soils, Plums, middling	Abundant here, but only partial in the neighbourhood	Fair average many dropped when stoning	Good crops, but they scarcely ever ripen	Gooseberries and Currants abundant, but very much affected with honeydew and insects	Plentiful, Walnuts not so good	D. Judd, Hawkeston
	A good crop here, under a rough plate-glass coping	A good crop on trees on the Paradise stock, very scarce in orchard	Good crop on walls, and dwarf standards on Quince stocks fruit small	Below average	Good in places, not good with us	Good crop generally	A good crop under a coping of rough plate-glass	A good crop, but fruits drop off	Gooseberries, Currants, and Raspberries, abundant	Walnuts all dropped off, Filberts abundant	C. G. Halston, Oswestry
MIDLAND COUNTIES. STAFFORDSHIRE	Fair crop	Scarce	Good crop	Light	Under average	Moderate crop	Failure	Fine crop under glass	Gooseberries and Currants, abundant crop, Raspberries, scarce	Plentiful	J. Ballingall, Drayton Manor, Tamworth
	Almost a total failure	Much below average	Fair crop	Generally below average	Good	Very few dessert varieties Morellos about half crop	Very bad, mildew and aphid has been very troublesome	Not at all satisfactory out-of-doors	Good	Marvellous crops, never seen anything approaching it before	Edwin Simpson, Wrottesley, Warrington
	Too cold a climate for them	Good crops in some situations	Poor crop	Very indifferent, trees bloomed well, but set badly	Very poor crop, from the effects of last dry summer	Poor crop	Only one Nectarine tree grown on south wall, which has a very large crop		Currants very good largest crop of Gooseberries we ever had, Raspberries a moderate crop		John Sherratt, Kerpersley Gardens
	A very thin crop in this neighbourhood	Average crop, the Keswick very much blighted; other varieties look very well	Excellent crop; Williams' Bon Chretien, extraordinary	Very scarce, with the exception of the Wine-sour and Damson	A very good crop and fine quality, nearly over	Average crop; look promising; free from black fly		Very thin; scarcely any	Currants and Gooseberries, an excellent crop; Red and White Currants, blighted a little	Filberts and Cob Nuts are a good crop	Sutton, Collyer
NOTTS	Very scarce owing to the cool weather of March and April	A very good crop, but small	Good average crop	Very good crops	A poor crop here, but better on heavy soils	Very good	A complete failure	Good crops where the trees are protected in winter	Very good crop altho with honey dew	Immense crops	James Tegg, the Gardens, Juxon
	Very thin crop	Fair average crop	A fine crop protected the bloom with the common Brake Fern	Good on wall; scarcely any on standards	Abundant crop, and fine fruit	Good crop	A fine crop, protected from spring frosts by old herring netting	Not grown outside, plentiful under glass	Plentiful	Filberts and Cobs, heavy crop, Walnuts, a thin crop	John Cope, the Gardens, Berry Hill, Mansfield
	Very scarce, flowered well, but will not set	Average crop; many varieties scarcely any	Some varieties heavy crop, others very thin	Plentiful, Damsons very heavy	Good average crop, very late and soon over	Plentiful	A complete failure; trees flowered well, but did not set	Not much grown	Plentiful; Red and White	Very plentiful	William Shank, Hal.
LEICESTERSHIRE	Very few in this district	About half a crop	Some sorts have very heavy crops, while other kinds have none	Very scarce, not the sixth part of a crop	About the fourth part of a crop	A large crop, of fine quality	Complete failure, hardly any	About half a crop	Currants very much blighted A very good crop with the exception of Raspberries, which did not set well	Filberts, the largest crop I ever saw	Montgomery, the Hall, Ashby-de-la-Zouch

MIDLAND COUNTIES.											
LEICESTER SHIRE	Total failure: less from the direct action of frost than from pro-ludged cold and sunless weather	Very thin; trees blighted, favourable exceptions as to fruit are Herefordshire Pearmain, Frogmore Seedling, and Irish Nonpareil	Good crops of Jargonelle, Knight's Monarch, Marie Louise, Beurré d'Espéren, B. Rance, Louise Bonne of Jersey, Williams Bon Chretien, others thin	Abundant crop of the Victoria, medium of Golden Drop this or a failure in the case of most other sorts	Tolerably abundant, but not particularly fine, quality good President, Sir C Napier, Sir J Paxton, Frogmore Pine, good and prolific	May Duke and Morello on walls, a fair crop; standard trees, no crop	Very much blighted and blistered; crop thin	Promise of a large crop	Raspberries and Currants, abundant, Gooseberries, moderately good crop	Great crop	William Ingram, Bevoir Castle, Grantham
NORTHAMPTONSHIRE	Half our trees good crops, the other thin	Very few here or in the county	Good crop, both on walls and standards	Very few here	Good crops, but not so large as usual	Morello, good crop; other sorts not grown much	Half our trees good crop, other half very thin crop	Very few	Good crops	Not grown here	Emanuel Sage, Gos-sail Hall, Atherstone
NOTLAND-SHIRE	Quarter crop	Failure; scarcely any	Half crop on standards; thin on walls	Good half crop	Quarter crop	Abundant, both Morello and dessert kinds	Very few	Good crop	Gooseberries and Currants very plentiful, Raspberries a fair crop	Extraordinary good crop	R. Gilbert, Kitchen Gardens, Burgh-le-Marsh, Stamford
NOTLAND-SHIRE	Very few	Scarce	Average crop on walls, scarcely any on standards	Below average	Not quite an average	Abundant, both Morello and dessert kinds	Very few	Good crop	Gooseberries and Currants very plentiful, Raspberries a fair crop	Abundant	John Brown, Rockingham Castle
NOTLAND-SHIRE	Failure	Failure	Half a crop	Failure	Half a crop	Good crop		Half a crop	Failure in Gooseberries and Currants, Raspberries fair	Walnuts a failure; great crop of others	M. Hull, Ayton Gardens, Uppingham
NOTLAND-SHIRE	Fine crop of Morepark, Royal a complete failure, although all protected with the same protection, but a scarce crop in general in this neighbourhood	Abundant, and the trees healthy	On walls a fine crop, but was protected with hexagon netting, standards only a few left, the nights being so cold	Green-gages abundant on south-west walls east walls none	All sorts excellent crop; but quite a fortnight latter than usual	Fair crop on south walls; Morello most excellent on north walls, and very large	Only a few where well protected; trees looking very healthy at present	Abundant, and I never remember the trees looking so vigorous	All sorts an extremely fine crop, much better than is generally the case	Filberts the largest crop ever known; Walnuts about one-third of a crop, the nights being so extremely cold throughout June	James Stewart, Nuneham Park, Abingdon
NOTLAND-SHIRE	Under average, but very fine	Under average	Very abundant, but small	Very few	Fair average, good late crop	Good	None out-of-doors, trees much blighted	Very few	Abundant and very fine	Never saw such a heavy crop	W. Lee, Henheim, Woodstock
WARWICK SHIRE	Hardly medium	Fair crop; trees much blighted	Very good	Fair crop	Fair crop	Very good	Failure	Too late	Very plentiful	Filberts plentiful, no Walnuts	S. Elworthy, Stoneleigh Abbey, Kenilworth
WARWICK SHIRE	Very thin	Much under average generally	In localities there are some	Very thin	Good, but soon over	Average crop	A failure out-of-doors	There are some	Very plentiful	Plentiful	William Miller, Cosbe Abbey Gardens, near Coventry.
EASTERN COUNTIES											
INCOLNSHIRE	Not all a crop, but very early	Very good crop on pyramids and espallers, light in orchards	Fine crop on pyramids, required much thinning, on walls, average and good	Average on walls, light standards, Damsons good crop	Fine crop of large fruit	Under average	Very good crop some trees required thinning	Under average	Currants, Gooseberries, Raspberries, and all small fruits abundant	Filberts and Cobs very fine crop, Walnuts scarce	George B. Tillyard, The Gardens, Brooklooby Park
INCOLNSHIRE	A good crop where protected, other wise a failure	A very poor crop	A fair crop on most varieties	Standards a failure, a fair crop on walls where protected	A fair crop of some varieties	A poor crop; Morello a fair crop	A complete failure	A fair crop	An abundant crop	An extraordinary crop of Filberts	David Lonsden, Blackholm Hall, Skeaford
SUFFOLK	Very few	Small and partial crop	Average crop of the hardy sorts	Very few	Below average	Plentiful	Very few	Abundant	Very plentiful	Very plentiful	William Carmichael, Sandringham
SUFFOLK	Almost a failure; a few in patches	About one-third of a crop the fruit very small	Good crop on the wall trees	All but a failure	Half a crop	Half a crop	Complete failure, although well protected with nets	Had crop out-of-doors	Currants average crop, Gooseberries, half a crop, Raspberries, fair crop	Filberts most abundant crop, Walnuts very bad	Wm. Smythe, The Gardens, Elmham Hall
ESSEX	Very short crop	About one-third of a crop	Moderate crop, a great many set that did not swell	Very moderate crop, with the exception of Damsons very scarce	Almost a failure I never saw so few	With the exception of Morello a very poor crop	Very few	A good crop	Gooseberries, Currants, and Raspberries good	Filberts and other Nuts very abundant	Geo Young, Audley End, Saffron Walden
ESSEX	Total failure	Partial crop	Below average	Very scarce	A good crop here, but poor in the district	A fair crop, very few grown here	Total failure	Failure	An average crop, Black Currants poor	Very fine crop	Alexander Crauford, Thorndon Gardens, Brentwood
SUFFOLK	Scarcely any; cut off by the May frosts, trees healthy	Average on pyramids and espallers, scanty in orchards	Nearly an average on walls and pyramids	Very thin, generally scarce	Below average, the plants suffered from last year's drought	Average	Total failure from imperfect development of blossom more than spring frosts	Good, later than usual	Gooseberries and Currants plentiful, with the exception of Black, deficient; Raspberries scarcely an average	Extraordinary crop of Filberts; Walnuts below average	D. T. Fish, Hardwick, Bury St Edmunds
SUFFOLK	Fair crop; trees suffering from the excessive heat of last season	Crops small, trees blighted and suffering for want of rain	Very heavy on Pear stock	Fair crop; trees suffering from fly	Good on deep, trenched land plants killed last season on shallow soils	Heavy crop, but trees much infested with black-fly	Poor crop; trees suffered from the scorching sun of last season	Good show, but three parts of crop have fallen off	Most abundant bushes badly infested with aphides	Heavy crop	J. Sheppard, Wol-verstone Park
SUFFOLK	Failure	Fair crop here, a very light crop in this neighbourhood	Average crop trees clean and healthy	A light crop; Damsons plentiful	Not half a crop, and the fruit small	A good crop; Morello abundant	In orchard house and on walls almost a failure	A full crop, both in houses and on walls	Plentiful and good	Most abundant	Thomas Blair, Shrubland Park
SUFFOLK	A somewhat light crop, but the fruit is large, and of fine quality	A light crop, but the fruit promises to be fine	A very good crop, and the fruit promising to be fine	Very light, especially the Green-gage variety	Plentiful, but of short duration on account of the drought	Morello on walls plentiful; other sorts in orchard houses fair crop	A failure on open walls, and also in orchard houses	Promising to be a fair crop	Black, Red, and White Currants plentiful; Raspberries very light crop	All sorts exceedingly abundant	P. Griev, Culford, Bury St Edmunds
SOUTHERN COUNTIES.											
HERFORDSHIRE	Scarce	Under average	Average crop	Scarce	Plenty	Plenty	A failure on the walls	Not many grown	Plenty	Very plentiful	Alexander McKay, Woburn Abbey
HERFORDSHIRE	...	About half a crop	Good average crop	Scarcely any	Under average	Average crop	Very few	Very few	Abundance of each sort	Very great crop	John Cadger, Luton Roo Gardens
HERFORDSHIRE	Complete failure, owing to the cold weather in March	Very good crop on bush trees grafted on Paradise stocks; scarce in orchards	Middling crop	Half a crop	Very fair crop	Early sorts rather scarce, Morello very heavy crop	Failure, owing to the cold rain with high wind while in bloom	Very fair crop	Plentiful	Very good	D. Cunningham, Moor Park Gardens, Rickmansworth
HERFORDSHIRE	Scarcely any	Middling crop	Very good crop fruit likely to be fine	Very poor crop, fruit keep dropping off	Good crop	Very good crop	Very few, scarcely worth naming	Very good crop	Good crop	Very abundant crop	George Sage, Ashridge Gardens, Berkhamstead

HERTS	Partial crop; on Kaisha and Moor Park there is a fair crop	Fair crop on espaliers and dwarf trees, on standards very thin	Average crop, both on walls and pyramids	Good crop of Damsons and Victoria Plums; all other varieties very thin	About half a crop, the severe frosts at the end of May killing all the first bloom	May Duke and Bigarreau thin on all aspects, Morellos good crop and very fine	Generally thin, one or two sorts swelling off a fair crop	..	Currents and Gooseberries abundant and good, Raspberries abundant but small	Walnuts thin, Filberts and Hazel Nuts very plentiful	Richard Buffet, Brockcott Hall, Welwyn
	Very scarce	Plentiful in places, but partial	Generally, but not universally, good and plentiful	Scarce; more on standards and pyramids than on walls	Indifferent; best where watered last year	Abundant	Very scarce	Plentiful	Abundant	Very abundant	William Paul, Waltham Cross
HUCKS	Very thin crop	About half a crop, have fallen off very much lately	Fine crop on walls, but few on standards	Victoria on standards very fine, but few on walls of any sort	Very fine here, but not generally in this neighbourhood	Good crop	Very few, the worst crop I have known here for the last 30 years	Good crop	Very fine and abundant	Great crop	Thomas Bailey, Shardloes Garden, Amersham
	..	Very light crop; in places none	In places none	..	In places very few; on heavy land a fair crop	Thin	..	Very few	Heavy crops, but very small on poor soils	Very plentiful	Phillip Frost, Dropmore
MIDDLESEX	None	Plentiful	Plentiful	Plentiful	Very thin	Thin	Plentiful	Average crop	J. Peel, Carbridge House, Twickenham
	Very scarce	Very partial; most abundant on small trees	Very abundant and fine	Scarce in general, Danyer's Victoria very heavily cropped	Under average; very late, and soon over	Good crop	Total failures	..	Very abundant and good	Enormous crop	A. F. Barron, Chiswick
	..	Not an average crop	Fair average	..	Fair average	None on walls; fair average on standards	..	Not an average crop	Gooseberries not average, Currants plentiful	..	R. Hamerson, Feham Palace
	Complete failure, whether protected or not, all seem to have suffered alike	Fully an average crop, likely to swell off well	More than average, a really good crop; swelling off beautifully	Considerably under average, but enough for the usual consumption	Growing crop of good fruit bearing season shorter than usual, through excessive drought	More than average, fruit good in all respects	Like Apricots, a complete failure out-of-doors	Very fair crop; likely to finish off well	Most abundant crop of good fruit; bushes clean, save with a few exceptions	Truly a most wonderful crop; trees literally loaded, Walnuts a complete failure	John Edlington, Wrotham Park, Barnet
BESKS	Very scarce, the greater portion fed just before coming to maturity	A thin crop generally	Fine crop of all kinds, very healthy, and free from spot	Thin crop, fruit still dropping	Generally a light crop, and fruit small; Sir J. Paxton, J. Powell, and Cockcomb, the best here	Heavy crop, of good quality	Very thin crop	..	Good average crop	Filberts plentiful, and Walnuts in abundance	H. Rose, Royal Gardens, Frogmore, Windsor
	None; trees that were covered in spring and those left exposed all alike	Average crop	Average crop	Very light crop	Light crop, fruit small and deficient in flavour	Average crop	Very few, none on most of those protected, and those left exposed all alike	Very light crop	Gooseberries, partial Red and White Currants, average, Black Currants, very heavy	..	Charles Ross, Welford Park, Newbury
BURBURY	Partial crop	On walls, moderate; on standards, short	Very short	Short; Viscountesse Herbert de Thury produced the best supply	Moderate	Good crops	..	Good Gooseberries, Currants, and Raspberries	Prodigious crops	James Drevett, The Gardens, Denbigh
	None, trees making good wood	Very good	Fair crop	Moderate on walls, none on standards	Very inferior	Very good	Very poor crop	Moderate	Good crop off	Very plentiful	William Whalley, Addington Park
KENT	Almost a total failure	Greatly below a fair average, some few trees are well loaded, but the greatest portion are a failure	Fair average crop, but rather small at present	Great failure, very abundant set of fruit, but nearly all dropped off before reaching the stoning point	Scarcely half a crop, the frost at the end of May killed a good portion of the blossoms	Fair average crop of some sorts, the finer kinds of Bigarreau fall off at the stoning point	Nectarines, total failure, Peaches, almost the same	Abundant	Gooseberries, fair crop, but drop very much, Red Currants and White below the average; Black Currants, good	Abundant	John Cox, Heddesford Gardens, Penshurst
	..	Crop very short, condition good	Crop and condition good, full average	Scarce	..	Medium crop condition middling	Excellent; everywhere abundant	J. Aitken, Sittingbourne
	..	Fourth of a crop	Half a crop	Half a crop	Fourth of a crop	Third under average	Under fourth of a crop	Half a crop	Full average crop	Full average crop	J. H. Bifrons, Canterbury
	..	Very thin about our district, not a quarter of a crop	Very plentiful in some districts	Very short crop, but Damsons are rather better	The crop has been thin and very small in this district	The crop has been middling but very poor	The crop of wall fruit in this district is very bad	..	Middling	Very plentiful	James Chapman, Beering Manor
SUSSEX	Partial	Average, but small	Under average	Under average	Good crops, deficient in flavour	Plentiful	Very few	Plentiful	Gooseberries abundant; Red and White Currants under average, Raspberries good	Fair crop	T. Jack, Battle Abbey Gardens
	Half crop trees very healthy	An average crop, but very irregular	Heavy crop	Good crop on walls, very thin on standards	Not so fine as usual, owing to frost in May and June	Good average crop	Very thin, trees healthy	Wall trees a fair crop, standards very thin	Very plentiful and good	Filberts very thin, common Nuts abundant	John Wilson, Arundel Castle Gardens
HAMPSHIRE	Very few; a failure generally	Fall crop, small	Enormous crop, and promise well	Very good	Average, well flavoured	Generally good, Morellos very large	Almost a complete failure	Medium	Good crop of all kinds	Heavy crop; Walnuts also good	W. Wildsmith, Hookfield Place
WILTSHIRE	None, blossoms all off, although protected	Much under average	Rather plentiful, later varieties the best	Quite a failure	Plentiful, and good in quality	An average crop	Quite a failure both in orchard house and on walls	An average for our situation, which is not good for Figs	Abundance of all kinds, and very good	Very plentiful	A. Johnson, Saversake Forest
	Not half a crop, but fruit fine	Generally bad	Tender varieties bad, hardier sorts good crop	None, with the exception of trees on north walls	Generally pretty good, especially late varieties	Like sorts good	None except when well protected	Plentiful	Abundant	Very abundant	William Scarswood, Bowood
	Failure	Failure	Very good	Scarcely average	Average, but small	Very good	Very scarce	Promising well, but late	Very good	More than average	John Goode, Melchet Court
DORSETSHIRE	Very scarce	Table fruit, and also orchard or cider fruit, very scarce	Much below average fruit dropping after set, from severe cold winds	Very indifferent crop	Good crop with us, but small, many or most places a failure	With us below average	Out-of-doors complete failure, with us in orchard-houses abundant	Fair in orchard-houses	Gooseberries and Currants abundant, Raspberries also plentiful and good	Good crop in hedges, copses, &c.	Henry Munro, Cleavelands, Lynton, Regis
	A good few set, but they fell off afterwards	Thinnest crop seen about here for many years	Thin, but have some good Marie Louise, Passe Colmar Swans Egg, &c.	Wall fruit generally thin, on some standards an average crop	Came in plentifully, but did not last long for want of moisture	Average	Failure all round	Few	Gooseberries Red and White, Currants, average, Black Currants thin, Raspberries plentiful at first	Average	T. C. Elliott, Melbury House Gardens, Dorchester
	..	Very bad crop	Very good	Very bad	First rate	Very fair	Very few	..	Never were better	..	W. F. Radclyffe, Okford Fitzpines

WORCESTER-SHIRE	Under average, partial.	Under average, late sorts beat	Under average, late sorts beat	Under average	Very good average	Scarce	Scarce	Abundant crop	Abundant crop of all kinds	Heavy crops	G Westland, Witley Court
	Very scarce: not more than one-fourth an average crop	Average crop in some orchards very heavy trees generally healthy	Good kinds, a partial crop, perry Pears abundant	Crop light on walls, best on standards	Generally a light crop, and soon over	Very good, Morellos fine and abundant	Almost a complete failure, the fruit drops very much in stoning	Very light; not nearly so good as last year	Fine and abundant, bushes generally very clean	Great crop of copplee Nuts and Filberts. Walnuts a partial crop	Wm Cox, Madresfield Court
	Very light crop	Fair crop on the whole	Best kinds are light, common kinds good	Best kinds on walls are a light crop; Damsons a partial crop. Not many	Fair crop	Fair crop	Very light crop		Abundant crops	Very heavy crop	John Wyke, Shakenhurst Hall Gardens, Bewdley
	Very good	Half crop	Poor crop	Good	Fair crop	None outdoors. In orchard houses a very partial crop; outdoors none	Good on some trees. Fair average crop	Very great crop. Gooseberries abundant; also Currants and Raspberries, but all deficient in size	Extra crop	D. Mackie, Hagley Hall Gardens. William Dodds, Ash-ton Court
HEREFORD-SHIRE	Much below an average, but heavy crops where glass coping is used	In some places very good, others much below the average	Much below average	Poor crop	Much under average	May Dukes and Morellos an average; other sorts poor crop	In orchard houses a very partial crop; outdoors none	Fair average crop	Gooseberries abundant; also Currants and Raspberries, but all deficient in size	W. Ham Hallett, Cossington, Bridgwater
	Not abundant	Scarcely any in some parts	In some places plentiful	Very few	Not abundant on an average	A fair crop	Very scarce	Pentiful in some parts, but near ripe	Currants and Gooseberries very good crops	More than usual	Robert Begbie, Biston
GLoucestershire	Scarce	Average crop in some orchards, garden sorts under average	Standards good, walls not half a crop especially. Here average crop, but very small	Failure	Poor crop; fruit small, soon over	Morellos good crop	Failure; trees much blighted in spring	Good crop out-of-doors, but falling off owing to drought, very good in houses	Gooseberries under average, Red Currants plentiful, but Black and White sorts thin	Very few Walnuts or Filberts	Alexander Aytou, Oxton House, Kenon
	Scarcely any	About half a crop, fruit small	Average crop, fruit also small	Poor crop in general, good on south aspects	Keons Seedling middling, other sorts a failure	Moderate crop	On walls very few indoor Peaches have been good and plentiful. Almost a failure	Under average	Rather under average, fruit small	Excellent crop, and of good size	George Erskine, Lupton, Brixham. Alexander Craib, Tortworth Court, Wotton under Edge
	An abundant blossom crop a complete failure	About one-fourth of a crop, the early kinds are more productive	Nearly a full crop, fruit small sized, and of a stunted growth	An abundant blossom, fruit almost a complete failure	Abundant fruit in all	On walls nearly a failure, the May Duke on standards a full crop	An abundant blossom crop a complete failure	Moderate crop	Gooseberries scarce, Red Currants abundant. Black, moderate Raspberries half a crop	A heavy crop more abundant than for several years past	A. Mc Naughton, Badminton. Samuel Wells, H. J. M. Luy
HEREFORD-SHIRE	A poor crop in a cold house	About half a crop in orchards	Good, standards setting their fruit better than the same sorts on walls	Very few Damsons good	Not a full crop	Not a full crop. Morellos good	Moderate crop	Abundant and good	Large crop	William Browne, South Court Gardens, Loominster
	Fair crop	Good crop	Very scarce	Moderate crop	Plentiful	Moderate crop	Good	Filberts abundant. Walnuts partial	Richard Lynch, Port Edot
	Very good, much fuller of during the dry weather	An abundant crop, walls and capsters	Very few; blossoms destroyed by late spring frost	Heavy crop, and of good quality	Dessert kinds average. Morellos very good	Scarcely any, blossoms cut off by frost	Not an average crop	Raspberries, Gooseberries, and Red and White Currants average; Black do, very heavy crop, fine	Filberts and Walnuts light	H. M. Keys, Penryn
GLoucestershire	Very few grown out-of-doors	Reports vary, but may safely say full average crop, taking the country through	Average crop on walls; standards very thin, except the Chaumontel, which are abundant on the Juice stock Good	A failure; very few in gardens orchards were scarcely ever known to have so few	A very short crop, partly owing to the dry weather we have experienced	Fair crop of all kinds	Peaches in some places quite a failure. Nectarines better, but not a crop of either anywhere	An average crop, but will be late in ripening	Gooseberries much under average, some places a failure; Raspberries plenty, also Currants	The common, on hedgerows and woods, are under average	George Brown, Powis Castle Gardens, Welshpool
	Good	Good	Half a crop	Good	Good	Not fourth of crop	Average	Half a crop	Fourth of a crop	Geo. Browne, Chirk Castle, Chirk
GLoucestershire	Good, requiring much thinning	Above an average on walls; rather under on pyramids	Remarkably abundant on standards, a fair average on walls	Rather under an average, the result of spring frosts	Very good, especially Morellos and Kentish, other varieties under average	Plentiful	A total failure on open walls set well, but all dropped	Below an average	Gooseberries, Currants, and Raspberries most abundant	Enormous crops this season	P. Middleton, Wynnstay, Rhua-bon
GLoucestershire	About a third of a crop	Plentiful	An extra large crop	Very indifferent out crop	Abundant, but small	Plentiful	Very few—in fact, many places none. Complete failure; in some instances a sprinkling	Few grown out-of-doors in this district. Promise fairly	Fair crop	Abundant crop	J. Eliam Bodorgan
	Average analysis of crops in 14, failure, only a sprinkling	Nearly a full average, but small	Good average, but small	Thin, and very variable, Damsons good crop	Fair crop, some instances a failure	Excellent crops	Very few—in fact, many places none. Complete failure; in some instances a sprinkling	Few grown out-of-doors in this district. Promise fairly	Raspberries, Black Currants, Red Currants, Gooseberries, all excellent crops	Trees and bushes are laden, above average	J. Eliam Bodorgan
GLoucestershire	Good crops under glass without fire heat	Plentiful, but fruit mostly small	Generally a light crop	Very few	Very light crop	Average crop of Morellos	Very few	Plentiful, black Currants very fine	Thomas Young, Slebeck Park, Haverfordwest
GLoucestershire	Very scarce	Good crops	Good crops	Good crops on a south wall, but none in other situations	Good late crops such as the Elton Pine	Good crop of Morellos	Very scarce	None grown on the open walls	Good crops of Raspberries, Red and Black Currants, also Gooseberries	Good crops	J. Ticehurst, Dynevor Castle, Llandilo

FOWLER'S PATENT STEAM PLOUGH
and CULTIVATOR may be SEEN at WORK in every
Agricultural County in England
For particulars apply to **JOHN FOWLER and CO.,** 71, Cornhill,
London, E.C., or to **STEAM PLOUGH WORKS,** Leeds.
Every Cultivator should be provided with a Water Tank, *Illustrated.*
Iron Cisterns.

F. BRABY and CO. having laid down more extensive
Stock, and improved Machinery on their Deptford premises (10a
Street) are prepared to supply **WROUGHT IRON TANKS,**
GALVANISED or PAINTED, of superior quality, at reduced
prices, and at very short notice.

An Illustrated Price List of Galvanised Iron, and other of BRABY'S
special Manufactures, sent on application.
F. BRABY and CO., Limited, Filter Works, Easton Road
London, or through all respectable Ironmongers.
S.B. Open Tanks of different sizes packed one in another to save
space.

Cottam's Iron Hurdles, Fencing, and Gates.

COTTAM'S HURDLES are made in the best manner,
of superior Work, and by a new method. Illustrated
Price Lists, &c., may be had of **M. and CO.,** Iron Works,
1, Waterloo Street, Birmingham, or of any of our Agents.

**COTTAM'S PATENT PORTABLE UNITED
IRON FIXINGS.**

...at
...necessary, increased width
...stern, and Patent Drop
...and impervious to
...water, &c.
...Wansley
...Street, London, W., where
...important improve-
...by patent.

**Health of Horses,
Stables, and Dog Kennels**
MANLEY'S PATENT

...the greatest advantage in Paving the Floors of Stables
and Kennels with

PYRIMONT SEYSSSEL ASPHALTE
Thirty years experience of the durability of this material
for the above and many other purposes, testifies to its value.
A list of such and other works can be had on application to
J. FARRELL, Secretary, 5, Parliament Street, S.W.

Rosher's Garden Edging Tiles.

THE above and many other PATTERNS are made in
Terra-Metallic Ware, Terra-Cotta, Stoneware, and Redware, and
of great durability. The plainest sorts are
especially suited for **KITCHEN GARDENS,** as
they harbour no Slugs and Insects, take up
little room, and once put down incur no
further labour and expense, as do "green"
boards, which are very much cheaper.
GARDEN VASES, POT STAINS, &c., in
all the styles, of great durability, and
at very low prices. The above supplied
180 Rosher's Ware ...
Illustrated Price Lists sent on application.

ORNAMENTAL PAVING TILES for Conservatories,
Races, corridors, lawns, &c. As cheap and durable as
stone, and in red, and buff colours, and capable of forming a variety
of designs. Likewise more elaborate designs. Pattern Sheets
sent on application, forwarded for selection.
WHITING'S PATENT TILES, for lining Walls of Dairies, Larders,
Bakeries, Pantries, &c. Grooved and other Stable Paving
Tiles, &c. of the Dutch and Adamantine Clinkers, Wall
Copings, Red and Buff Ware Drain Pipes, Slates, Cement, &c.
To be had of **F. & G. ROSHER,** at their premises as above.

SILVER SAND (REIGATE), at the above addresses—
1 1/2 per Ton, 2 1/2 per Bushel, 3 1/2 per Ton extra for delivery
within three miles, or to any London Railway or Wharf. Quantities
of 100 tons, or more, at a special rate. A finer grained Sand is per ton more
expensive. Samples of Sand sent on receipt of stamp.
FLINTS and GULL BLENDED for Pavements or Ferneries. **KENT
FLINT** and **WILTSHIRE** supplied at special rates.

F. & G. ROSHER.—Addresses see above.
S.B. Orders promptly executed by Rail, way or Vessel.
A liberal discount to the Trade.

**CALVERT'S CARBOLIC Acid Silver Medal Paris,
1867;** Gold and Silver Medals, Havre, 1865, and was, after
repeated and thorough tests, pronounced to be the BEST ILLUMI-
NANT for **CATTLE DISEASES,** and all other Infectious
Diseases, and was specially recommended by the Royal Veterinary
College, London. It is therefore to be promptly used
in all Farms where the present disease is either prevailing or
suspected, and may be obtained through all respectable Wholesalers
and Retail Druggists.

Buttons' Permanent Grass Seeds for All Soils
SUTTON AND SONS are now prepared to execute
Orders for their MIXTURES of PERMANENT PASTURE
GRASSES and CLOVERS. All MNSOWING for pre-
sents, particulars apply to the Secretary, Sutton, Kent.
Sutton to SUTTON and SONS, Seedsmen, The Queen's Head,
Sutton, Kent.

Look to your Grass Lands
**JAMES CARTER and CO'S RENOVATING
MIXTURE** OF GRASSES and CLOVERS SHOULD NOW BE
SOWN. It is a mixture of the most valuable Grasses, and
consists of the most desirable kinds, and produces a permanent
pasture of fine quality, yielding 10 to 12 tons of hay and other
crops that have suffered through the extreme dryness of the past season.
Sown in the autumn or spring.

CARTER'S PRIZE MEDAL PASTURE GRASSES for
FOULING NEW MEADOWS, &c. Sown in the autumn or
spring, 100 lbs. per acre. Special quotations for quantities on application to
JAMES CARTER and CO., Seed Farmers, 237 and 238, High
Holborn, London, W.C.

STAFFORDSHIRE AGRICULTURAL SOCIETY.—
The next SHOW at BURTON NURENT SEPT. 22.
Liberal Prizes offered for horses hatched the year. Open to
general Competition. ENTRIES CLOSE AUGUST 21.
Prize Lists and Forms of Entry are now ready, and may be had on
application to the Secretary, Mr. W.M. TOMKINSON, Newcastle.

BIRMINGHAM HORSE SHOW, 1869.—The
FOURTH GREAT EXHIBITION OF HORSES, PONIES,
CARRIAGES, &c., will be held in Bingley Hall, Broad Street,
Birmingham, on **TUESDAY, WEDNESDAY, THURSDAY,** and
FRIDAY, August 17, 18, 19, and 20.
The Horses will be judged on Tuesday and Wednesday. Admission
from 9 to 4 on Tuesday, 5s.; after 4 o'clock, 1s. On Wednesday,
from 9 to 2, 2s. 6d., after that hour, 1s. On Thursday and Friday, 1s.
For Excursion Trains, see the Circulars in the Times Tables.
JOHN A. TOMKINSON, Secretary.

MEETINGS FOR THE ENSUING WEEK
August 17 } Midland Counties Horse Show at Birmingham.
August 20 }
August 21 }
22—Ragley Agricultural and Poultry Show

As soon as the Royal sign-manual was attached to the Contagious Diseases (Animals) Act, the Lords of the Privy Council were called upon to commence the exercise of the very considerable powers which the measure confers in relation to the importation and regulation of the movement of stock.

The Act, as we explained in our last article, leaves undetermined some very important points. These have been decided by the provisions of two Orders of Council which were gazetted on Wednesday last—one a General Order, the other containing additional and special clauses for the ports. Together with the Act, these two Orders must be read with care, and the effect of the Act is to be ascertained from the Orders. The Orders, which were issued by the Act of 1869 revoked, and at this moment there is practically nothing in force except the Act and the two Orders dated August 10, 1869. The further Orders, which have been republished, defining the ports, are merely repetitions of the former definitions of certain spaces within which cattle may be landed, and do not affect the general laws for the regulation of movement of home and foreign stock.

In our last article we adverted to the fact of the Bill being based on the idea that foreign cattle are normally safe commodities, and that only in exceptional instances and in the case of certain classes are restrictions necessary. On this principle the several Orders of August 10 enumerate certain countries which are to be treated as infected places. In the schedule to the Orders we find the following places, all of which are either countries of transit or localities where cattle plague has a frequent existence—
1. Dominions of the Emperor of Russia, 2. The Austrian Hungarian Empire, 3. States of the North German Confederation; 4. Dominions of the Sultan; 5. Dominions of the King of Italy, 6. The Papal States; 7. Belgium, 8. Netherlands, 9. The Dominions of the King of the Netherlands, 10. Cattle and other animals, imported from Russia, Austria and its provinces, Prussia, Italy, Rome, Belgium, Holland and Greece, must therefore be landed in a defined part of a port, and be slaughtered within 10 days. In the case of the metropolis all these classes of animals will be removed, as at present, by rail from the defined parts of the port of London to the metropolitan market, and be permitted to move within the area of the metropolis, until the proposed foreign market for London is built for their reception, when the cordon round the metropolis will be removed.

From all countries, except those named in the schedule, animals may be imported under the following conditions, which are necessary to prevent contact with any of the infected classes—
The ship in which they are conveyed must not touch during its voyage at any of the interdicted ports, and the owners are required to give proof that for three months previously no animals from the excepted countries have been on board the vessel; the animals must next be landed in a

defined part of a port, and they will not be allowed to depart from the landing place until the Customs inspector has certified that they are not affected with a contagious or infectious disease. These conditions having been complied with, the animals "cease to be deemed foreign animals," that is to say, they may be moved to any part of the country, and otherwise dealt with as home-bred stock. If, however, they are found to be affected with a contagious disease, they are to be dealt with as the Customs may direct. This may be interpreted to mean they will either be slaughtered on the landing place, or sent into a defined part, which will amount to the same thing; and this fate will be shared by all the animals of the cargo in which the disease is detected. Under the operation of this provision, animals brought from France, Spain, Portugal, Denmark, Norway, Sweden, or other non-excepted country, if found on arrival to be healthy, will be free to move in any direction; but, should a single case of mouth-and-foot disease, for example, be discovered, the whole cargo will be condemned.

English breeders will be perhaps disposed to inquire, what is to be done in the not impossible event of foreign animals which have an infectious disease in the incubatory stage, and therefore not apparent to the observation of the inspector? Naturally these animals will be passed, and will "cease to be deemed foreign animals;" and equally certain it is that, if the purchaser, instead of slaughtering, places them upon his farm without previously subjecting them to quarantine, the disease will manifest itself to the injury of the other stock. The imported animals which have "ceased to be deemed foreign animals" will now be under the law which regulates the movement of home stock.

In reference to infectious diseases of animals at home, including glanders in horses, cattle plague, pleuro-pneumonia, mouth-and-foot disease, scab and sheep pox, the General Order provides that "every person having in his possession or under his charge" an animal so affected, shall give notice to a policeman, and the constables required to give notice to the inspector appointed by the local authority. If the inspector find a contagious disease among animals in his district, it is his duty to communicate all information respecting it to the Privy Council week by week, so long as the disease continues. Compulsory slaughter of diseased animals is only provided for in the case of cattle plague; but animals affected with other contagious diseases are not to be sent to fairs or market, or in any way exposed in public places where they may come in contact with other animals, this prohibition is practically an injunction against the removal of them from premises where they are attacked.

The Metropolitan Order makes a single necessary exception in favour of animals becoming affected, as they commonly are, with mouth-and-foot disease, in lairs near the metropolitan market, or in the market, animals so attacked may be moved by licence to a slaughter-house named in the licence, but not elsewhere; for example, cattle which are attacked with mouth-and-foot disease in the lairs at Islington on Sunday cannot be exposed for sale in the market on Monday, but must be sent direct to a slaughter-house. No doubt can be entertained that the enforcement of this law will tend to arrest the progress of mouth-and-foot complaint, which is now so prevalent, but considerable inconvenience will attend the carrying out of the regulations, and we expect to hear some strong expressions of opinion respecting the interference with trade. If, however, the attempt to eradicate infectious diseases of animals is to be anything more than a sham, some amount of hardship must be endured.

Former regulations respecting the movement of animals by railway through the metropolis, and the removal of cattle out of the metropolis, under licence of the Board of Works, are contained in the Metropolitan Order, but the clauses which most concern the agriculturist are those which relate to the importation of animals and the discovery and prevention of infectious and contagious diseases.

The omission of the much desired clause for a general foreign market for all imported stock will not have the effect of prejudicing the farmers of this kingdom against the most complete and effective measure upon the subject of animal diseases which ever passed through the Legislature; if the representatives of the agricul-

tural interest have not gained all they demanded, they have at least achieved all that was of present possible attainment.

No one writes with greater power or influence upon agricultural progress than Mr SMITH, of Woolston. The future of arable farming depends very much upon the increasing use of steam-power for tillage purposes. And no one has done more than he to promote this great agricultural improvement, or to convince farmers by his own experience that it is a practical and profitable thing. His last letter on the subject appeared in the Times the other day, and we reproduce it here. It appears that in his clay country farmers are making money. Mr SMITH himself is buying land, his neighbour Mr WHITWORTH, of Willen, is also buying land. The farm practices of the two is here contrasted and though the cases do not seem exactly parallel, yet it is worth while to read the lesson, which the contrast gives to Mr SMITH, and which he would pass on to us.

"It is a fact," he says, "that I am now harvesting my 14th crop under steam culture.

"It is a fact that Nos. 1 and 4 heavy lands are Beans growing on seed-beds costing only 7s. 3d. an acre, that they are strong in straw well corned, free from fly or blight, and ripening well, unlike many a crop now growing upon shallow horse-worked land, that may be seen to be weak in straw, full of fly, and dying a premature death.

"It is a fact that my Nos. 2 and 3 heavy land are Wheat growing on seed-beds costing only 6s. 6d. an acre that they are strong in straw, full of corn and ripen well, together they are the best I ever had on this land in my life.

"It is a fact that these four fields will give me an average of full 40 bushels per acre and it is a fact that under horse culture (having a good fallow every fourth year) they did not average over 20 bushels per acre, one year with another.

"The next fact to be looked to is, what do our best farmers on such soils get now-a-days under horse culture? Mr. WHITWORTH, of Willen, a mile from here, is a good farmer under horse culture. He occupies three farms—one where he lives, one at Woughton, only a mile from here, and one at Mursley, about six miles from here. To prove that he is a good farmer, let me tell you that he has made money by farming. Two years ago he bought with his own money the Woughton farm for over 1000. He need not say any more upon that point. On his Woughton farm he has six fields of ploughed land exactly in character with my heavy land on the same hill, and within a mile of it. This year three of his fields are Wheat, one Beans, one Vetches, fed on and fallowed for next year, and the other Clover, fed on, and is now being fallowed for next year. The worth of this feed for sheep, after paying all the expenses for seeding and shepherding, is but a mere trifle. I estimate it at 3s. per acre. Now, then, for the produce on the three fields of Wheat and one of Beans it is not over 35 bushels per acre, or from an acre of each added together only 140 bushels. When, divided by six to spread the 140 bushels over the six fields, we find the average to be only 23. bushels per acre, to which must be added 1s. 6d. as a share of the value after payment of expenses, for sheep-keep on the two fields of Vetches and Clover. I do not ask Mr. WHITWORTH'S permission to make this statement, but I state it openly and fearlessly on behalf of steam culture against the best horse culture. Let him or any other man pull me back in the correctness of it, if he can. I know that it is true, and I mean that the world shall know it. Had I taken had farming for my comparison the average would have been less than 20 bushels with 1s. 6d. for sheep-keep to be added per acre against my 40 bushels per acre.

"I ask you to publish these few facts to help me to open the eyes of the landlords and farmers of England as to the use and value of steam-power to culture, and, in addition to what I have stated above, I will state here that my light-land crops are excellent, without troubling you with particulars.

"I might have stated another fact, that this heavy land of mine always needed four good horses to plough it from 5 to 6 inches deep, which cost fully 14s. per acre, whereas by steam power I can now make an average seed-bed for 7s. an acre year after year, and keep my land clean for corn crops every year.

The Woolston and the Woughton facts are worth studying. We have no personal know-

ledge of the latter farm, but the former is no doubt the example farm of England, from the influence it exerts on the progress of steam culture.

— AT Mark Lane the price of Wheat rose again yesterday 2s per quarter at which increase business was ready to jump up both English and foreign samples. A heavy rain during Thursday night, and during the day with rain up to mid day yesterday, had some influence on the market. — The live stock and meat markets are unchanged. Small supplies of prime English and large importations of foreign produce cause prices to range from 3s 3d and 3s 6d down to 3s per 5lb. The seed trade has been at a standstill, which is attributed to the anxiety excited during the passage of the Adulteration of Seeds Bill through the House of Lords.

— The number of foreign animals inspected in the year 1868 by the Custom House Veterinary Inspectors at London and at Leamings Haven was 120,333, of which beasts 17,000 oxen, 208,100 sheep and 2,000 pigs were the whole number were inspected and slaughtered on account of disease or injury—729 beasts, 58 calves, 5072 sheep, 141 pigs. 6031 of these were slaughtered and the meat passed as fit for human food, and 372 were condemned and destroyed—viz., 65 beasts, 35 calves, 127 sheep, 45 pigs. The whole number slaughtered on account of disease or injury in 1868, therefore, was 0.8 per cent of the beasts imported, 0.3 per cent of the calves, 2.4 per cent of the sheep and lambs, 3.8 per cent of the pigs. The proportion of sheep slaughtered is very large owing to the sudden reappearance of sheep-pox in August in a cargo of upwards of 1300 sheep from Holland. A great credit is due to the inspectors for the discovery of this disease, and the consequent seizure of the cargo, which no other means had been received that the disease existed in Holland. The whole cargo was slaughtered at the place of landing, and other cases following quarantine or slaughter of the sheep at the place of landing was ordered. There was no case of cattle plague in 1868. The falling off in the London supply of foreign beasts and pigs from 1867 to 1868 is as follows:—Beasts, 191,545, 139,336, 103,726; cows, 17,626, 17,990, 11, 14 calves, 24,504, 21,013, 21,810; sheep, 77,174, 57,310, 32,317; lambs, 13,796, 7,900, 17,708; pigs, 73,873, 14,079, 33,721 totals, 1,102,192 in 1866, 763,743 in 1867, 511,564 in 1868. The importation this year shows a great recovery, and the total seems likely to be nearer the total of 1866 than of 1868 or 1867.

— A curious illustration of the fitness of arithmetic to agriculture, and of the wonderful results which ensue upon a confident application of the "three first principles," is given by Mr. Smith in a letter to the Editor of the Times, in which he states the conclusion that 16,000,000l. a year would be a moderate compensation for the profits from the milk cows, &c., which should be fed upon—London sewage! The following is his letter:—

"I, Mr. Smith, after a steam cultivation, speaking of the value of the fallow and sheep food, he makes this remark:—

"The worth of this feed for sheep, after paying all the expenses for seeding and shepherding, is but a mere trifle—I estimate it at 3s. per acre."

"Now, as sheep are kept in order to fertilize land on the present alternate green and straw crop system, as well as the curriers and producers of manure for the production of corn, &c., and Mr. Smith if steam power would not be an infinitely better and cheaper carrier!

"In the ordinary way, before Mr. Rawlinson, at Kingston, when the Corporation proposed irrigating the Ham fields, in order to grow corn for utilizing the Kingston sewage, it was estimated that 1000 Indian Ryegrass per acre could be produced in any year, and the following year, without any further manure, 4 quarters of corn could be grown, consequently 4000 lbs. of manure would be produced annually per acre at a cost of 10s. per acre. If steam-power was used to carry the sewage of 1000 acres, the manure, &c., this could be effected in a simple way, and a good result would be obtained. It was estimated that 1000 acres of land would produce annually 1000 tons of manure, which, at 2s. per ton, would be worth 2000l. and 1000 lbs. of Ryegrass, at 2s. per ton, 2000l. I have seen justly, retail all this summer 2s. 10s. a ton for green food for my horses, so that, taking Mr. Smith's estimate for the seed and profit, there would remain 9000l. after all expenses and cultivation, and the production of 40 bushels of Wheat per acre, to pay the seed and profit of the farmer, to prevent the pollution of our rivers, and remove the sewage from our towns.

"The value of the London sewage, taking the inhabitants at 2,000,000 would be 2,000,000l. as a fertilizer and if the sewage was used in the ordinary way, it would be worth 2,000,000l. per annum.

"If Mr. Smith's estimate is correct, the result would be 16,000,000l. per annum, which is a moderate compensation for the profits from the milk cows, &c., which should be fed upon—London sewage! The following is his letter:—

— Mr. MECHER thus calls attention in the Times to the destruction of hay in the rack.

"The crop this year is unusually heavy and I want sufficient manure, or hay making, the terms are 10s. per ton of 1000 lbs. per acre of water, but I do not know the consequence is a generation of rotting hay, &c. &c. The parties concerned in the management of the stock will, in some cases, if the weather is favourable, about three years ago a farmer contracted a simple mode of preparation, which was manufactured by a large mill & Co., and which I at once purchased at a cost of 10s. per ton. It is made by a fine sieve of 1/2 in. holes in the water, and with a fine sieve, the water is washed out. This is taken by a horse and the straw is a very good hay, as suspected the part of rotting

steam finds its way into the pipe, and passes at once out, it is the outside, where an elbow pipe is attached to give it an upward and better draught. When the weather is cool the steam will be condensed, and you will get rid of the water resulting from condensed vapour. No one need have an injured stack, or deteriorated hay, if this simple instrument be used. The pipe may be withdrawn by a horse when no longer required to the stack. By watching the stack at dawn of day, or by the suspicious aroma, one may always have due warning of danger."

We doubt the efficacy of a chimney for putting out a fire. To prevent by patience during haystacks is the only sound advice on this subject.

— Cattle dying from eating Oak foliage is an odd piece of news at first sight; but for a farmer to be successful in bringing an action for damages, is even more singular. The case reported below was heard at the County Court, Monmouth, and as reported in the Hereford Journal, was considered by the judge to be as important in point of law as it was in regard to animal and vegetable physiology, for his Honour remarked that "it would have been well for the public at large had such a case been heard many years ago. The facts were not disputed. About 40 Oak trees were cut down last spring when the "sap was running;" these fell on a "break" in the occupation of the defendant, and four cows and some steers ate the young shoots and twigs of the boughs. The veterinary testimony was as follows:—

Mr. G. Lewis, veterinary surgeon, made a statement of the last autumn that he had seen a cow which had died from having eaten of the young shoots of the oak trees, from the presence of tannin. He advised the defendant to cut down the oak trees, and the defendant did so. The defendant then brought an action for damages, and the plaintiff brought an action for the value of the trees. The judge considered the case as important in point of law, and in regard to animal and vegetable physiology, for his Honour remarked that "it would have been well for the public at large had such a case been heard many years ago. The facts were not disputed. About 40 Oak trees were cut down last spring when the "sap was running;" these fell on a "break" in the occupation of the defendant, and four cows and some steers ate the young shoots and twigs of the boughs. The veterinary testimony was as follows:—

The defendant's case is a very important one. The action was brought against a plaintiff who had bought the trees. The plaintiff said there was no agreement between himself and his landlord, and therefore, there was no reservation. After the usual evidence had been given, the solicitor for the defendant began to address the Court, but his Honour stopped him, and directed attention to the opinion of Mr. Justice Blackburn, as laid down in *Growcott v. Smith*, Exchequer Reports, that, "As a general rule of law a man was bound to use his property so as not to injure his neighbour." It appeared to him that "when a party altered things from their normal condition so as to render them dangerous to any acquired rights, the law cast on him the obligation of fixing the danger, so as not to be injurious to those rights." In the course of further argument his Honour held that it was incumbent on the defendant to have "fenced" the trees, so as to have rendered them innocuous to the acquired rights of the plaintiff. After quoting and carefully considering other cases as applicable to the one before him, his Honour gave judgment for 45l., the full amount claimed.

OUR LIVE STOCK.

MR. GERHARDT'S sale of Shorthorns, at Muswell Hill, near London, was not very successful. The day (Tuesday the 3d inst.) was deplorably wet, and the sale of the ring had to be removed to a sheltered situation. This was neither favourable to the spirits of the buyers or the appearance of the cattle, and no doubt contributed to lower the prices. The highest figure was given by Mr. Johnston for Violet, by 1st year lot which he paid 40s. Mr. Mortons purchased several females and one bull for 100s. The lot of animals realised 10,000s., or an average of 14s. 10d.

— On the 7th inst a number of first-class cattle and two valuable horses, with other domestic animals, were shipped at Liverpool for Canada. They were selected and purchased at a great outlay by Mr. Henson and Mr. Beattie for Mr. Cocurana, of Montreal, and comprised the Suffolk cart station, Duke a thoroughbred, old by Fan Langens, and some back pigs from the late Mr. Crisp's stock. There were three very well bred Shorthorns from Mr. Furr's herd, namely, *Bright Lady* a very fine heifer of the type of PILOT tribe, *Wool Alias*, by LORD BLITHES, sired by *Walden*, by 4TH DUKE OF NORTHUMBERLAND, and more remotely from the Bates' Water family, and a young bull, GENERAL NAPIER, also by LORD BLITHES (2d), and on the mother's side by the *Glitter* by LONDESBOROUGH sired. The remaining Shorthorns we must notice upon a future occasion. These valuable breeding animals are accompanied by 1000 lbs. of manure from the same source. Mr. G. of Liverpool.

We have just received the Duke of Devonshire's new catalogue published in July. Since the last sale, in April, 1868, the herd at Hoker has slightly increased in number. Contrasting the past with the present, we find that the 31 females and nine bulls named in the first catalogue have been increased to 37 females and eight bulls. *Grand Duchess* 5th, by PRINCE IMPERIAL, sired by GLESTER and her daughter *Blanche* by D. S. D. sired by OAKED 2d of the Wolf by the *Grand Duke* sired by 3d and *Welling* sired by the Bates' Water family, all keep their places as matrons of the herd. *Alfred* 10th and *Lady Butter* sired by PRINCE make their appearance for the first time as part of the Hoker stock. It will be remembered that these two cows were purchased at the sale of 1868, and were the first of the first named produced on June 11, a white heifer

authorised inspector to be free from "pleuro," and to have come from a place also certified to be free of diseased stock, and that no certificate should be in force for a longer period than three days.

provided the animal first affected had been bred on the farm, or, if purchased, had been so in a public market, under duly authorised certificates.

trucks only and fitted with spring buffers, and that every truck be washed out after each journey with a solution of chloride of lime or carbolic acid.

THE PRESENT APPEARANCE OF THE CROPS.

[FROM OUR OWN CORRESPONDENTS, JULY 31]

[The following Reports were received too late for last week's publication.]

Table with columns: COUNTY, WHEAT, BARLEY, OATS, BEANS, PEAS, POTATOS, ROOT CROPS, GRASS, WINDMILL, NAME AND ADDRESS. Rows include Scotland (Stirling, Raddington, Midlothian, Roxburgh) and England (Cumbria, Lancashire, Cheshire, Salop, Warwickshire, Cambridge, Suffolk, Essex, Devonshire) and Ireland (Cork).

THE PROPER DEPTH OF DRAINS.

HAVING recently drained a Grass field, it occurs to me to make a few remarks with reference to the controversy which some few years ago was carried on between the advocates of deep and shallow draining.

Throughout the whole work the drains were placed below the rubble, and resting upon the subjacent clay. It so happened that, in order to carry off the water effectually, it was necessary to cut a main drain in some places 1 foot 6 inches deep through an adjoining field, which was also wet on the surface.

which was nearly always wet, although it had been drained by the previous owner, was found to be intersected by 2-inch tiles, placed in drains 12 yards apart, at about a yard deep, each drain leading to the ditch.

the stagnant moisture, that when in Wheat I have seen
 tubers of half an acre completely bare, and when in
 the produce would not repay the expense of the
 culture. On making trial holes in various parts of the
 field I found that at from 18 to 30 inches beneath the
 surface there was usually a certain amount of rubble,
 though not so gravelly in its texture as, and of less depth
 than, in the field which I described in the former part of
 the article. He on this again came to a character
 of soil called as I ever met with, and which
 extended to an indefinite depth. As the cultivation of
 the field caused a heavy annual loss, it was necessary
 to attempt a remedy. I determined to try the effect of
 turning it over again at a depth of 3 feet, at 12 yards
 apart, the new drains being so arranged as to come as
 near as possible about half way between the old ones.
 The ground being very flat I preferred taking the water
 two ways instead of making it all run into the old
 ones. During the course of the work, it became evi-
 dent that the bulk of the wet lay from 2 to 3 feet from
 the surface, in the gravelly stratum, and that, by placing
 the pipes immediately below this porous layer, it would
 easily find its way into them. The result has
 answered my expectations in every way, so that I have
 been able to grow Swedes and Mangel on this
 soil. It is now sowed down with a view to forming
 permanent pasture and will, I have no doubt, become
 useful for young stock. The new drains have
 proved as effective as those of the old ones. I
 will conclude with another instance of the success
 of draining according to routine, which I
 under my own notice some ten years ago. The water
 of a neighbouring property determined to drain a
 well the works being executed by a professional
 contractor. It is necessary to say that the work was at
 all times overseen by a friend of mine, a gentleman of
 high social rank and one whose name would be a
 guarantee for the soundness of his agricultural views.
 Knowing that the drainage operations were being
 carried out with little regard to the nature of the land,
 my friend offered to the superintendent some hints as
 to the most effective mode of removing the super-
 fluous moisture, based on his knowledge of the pecu-
 liarities of the soil. He was, however, met by an
 objection that the information was superfluous as
 the contractor perfectly understood his own busi-
 ness. The drains were accordingly cut 4 feet deep, and
 spaced 12 yards apart, and the result is that the Rubus
 regalis which I sowed the other day one of the
 seeds from which no water was discharging, at a time
 when those from my own land were running freely. To
 drain at uniform depth and distance has sometimes
 been called scientific, if so, it is a science strongly
 resembling quackery. *Widdoughby Wood, Holly Bush,
 & Bell's Messenger.*

and he describes it under the name of *Batata vir-
 giniana*, evidently under the impression that its native
 country was North America. In the reign of James I
 the Potato began to be considered a great deli-
 cacy, very small quantities were used, the price being about
 2s per pound. After a lapse of a few years their value-
 able properties appear to have become more generally
 appreciated, for we find about this time that the
 attention of the Royal Society is drawn to the subject
 of their more general cultivation. Potatoes, however,
 did not seem to be a bait for agriculturists and land-
 owners to bite at, for most writers on agricultural or
 gardening subjects, down even to the commencement
 of the eighteenth century speak disparagingly of the
 Potato. In one work, published in 1718, it is said that
 "the root is very near the nature of the Jerusalem
 Artichoke, although not so good and wholesome, but it
 may prove good for swine."

Somehow or other the plant seems to have been
 taken from Ireland into Lancashire, where it was
 cultivated and used, whence it spread into
 Scotland, where, about 1728, a cottager and day
 labourer succeeded in cultivating good Potatoes on a
 little plot of ground about his cottage. These Potatoes
 were distributed first among the cottagers and then
 among the farmers, and about the year 1760 they had
 become so plentiful as to be grown no longer in
 garden but in open fields. In Lancashire however the
 cultivation made its progress into the course of the
 last century. In 1766 it is said there were in Essex
 some 1700 acres planted with the crop, and in the same
 year in Lancashire there were no less than 107,000 acres under the same cultivation, while
 in Lancashire, it still grows the largest quantity
 of any English county, there were 315,000 acres.

From the foregoing facts it will be seen that the
 Potato, which is now next in importance to Wheat as
 a national food, in its original state is apparently worth-
 less, and that it is only by care and attention to their
 growth that such products can be brought to a condi-
 tion available for use as food in civilized countries. Of
 course we are aware that the quality of the Potato
 depends a great deal on the cooking, and this want of
 knowledge tended in the first place to create a dislike
 for them, for being merely heated, and not cooked
 they adhered to the teeth like glue, and of course had
 at the same time an earthy flavour.

Many substitutes have from time to time been pro-
 posed for the Potato, but we do not think any have
 been sufficiently persevered in for instance, when,
 some years since the failure of the Potato crop was so
 dreaded, a plant known to botanists as *Linnæa tuberosa*,
 was mentioned as being likely to succeed under
 cultivation. Like the Potato it is a native of South
 America and extends over a great part of the
 continent, the Spaniards and Mexicans were
 the first to cultivate it, and it was introduced into
 Europe by Columbus.

It was, however, found to be unsuitable on account of their waxy nature, and
 the presence of a quantity of mucilaginous matter
 of an earthy taste, but these were also the particu-
 lar faults of the Potato on its introduction. Being
 waxy, and not properly cooked, it stuck to the teeth,
 which together with its earthy flavour, made it dis-
 agreeable. The inhabitants of the elevated regions of
 the Andes, where the boiling point of water is not high
 enough to cook the tubers, being obliged to cook them
 in water, prepared them by a system of alternate freezing
 and thawing, so that they become an agreeable
 food. The plant has weak stems, and fleshy heart-
 shaped leaves, which are either prostrate
 along the ground, or raised amongst the surrounding
 vegetation. The leaves are said to have a similar
 flavour to Spinach.

Another genus of tuberous plants, which at one
 time appeared rather promising, but which have since
 been forgotten, is that of the *Conium* and *Opuntia*.
 The first is a native of Persia, and the second of Libya,
 and cultivated in their native countries for the sake of
 their tubers, which are edible. Those of the *Conium*,
 however, are very small, and seldom exceed 2 ounces in
 weight, so that the average product of one plant is not
 more than half a pound; the tubers have an acid
 flavour, but this is dissipated by boiling, when they
 become mealy, but perhaps rather insipid. The ques-
 tion is whether the cultivation of these tubers was
 persevered in long enough to ascertain decisively to
 what size they might have been grown. There are
 specimens in the museum at Kew which were grown
 in the gardens in two or three years. The tubers
 are very small, and of a large size, and of a
 waxy nature, and are not so agreeable as those of the
Conium. The tubers are said to be very mealy, and
 to have a flavour which is removed by heat, so that the
 natives expose them to the sun, which converts the
 acidity into saccharine matter, and the tubers become
 as mealy as Potatoes.

Apios tuberosa is another plant, producing, as its
 name implies, tuberous roots, which are eaten in their
 native country (North America), and are sometimes,
 we believe, sold in the markets in some parts of
 Germany. The tubers are very small, but are very
 farinaceous. Professor Eaton, in his "Manual of
 Botany for North America," remarks that they ought
 to be more generally cultivated. It grows freely in this
 country in ordinary garden soil, and is very easily
 increased by separating and planting the tubers, which
 are produced abundantly. The plant is a climber, and
 belongs to the natural order of Leguminosæ.

Another South American plant is the *Arracacha*, a
 culcitra, which is much cultivated in the cooler and
 mountainous regions of northern South America. The
 roots there form a staple article of food, having, when
 boiled, a flavour somewhat between a Chestnut and a
 Parsnip. The plant, which belongs to the Umbel-
 iferous order, has been introduced into this country.

but the climate is said to be unsuited for it. During
 the past few years some attention has been paid in
 France to the better cultivation of the *Parasiticherni*,
 known to botanists as *Charophyllum bulbosum*, or
Anthriscus bulbosus. This plant is not unknown to
 gardeners, and was introduced into this country in
 1766, but being of easy culture, and growing on almost
 any soil, it has perhaps not commanded so much atten-
 tion as it otherwise would have done. The tubers are
 somewhat the size and shape of a small Dutch Carrot,
 very wholesome, and contain 21 per cent of starch and
 68 per cent of water against 74 per cent in the Potato.

The plants here mentioned are a few of the most
 prominent, and likely to be successful, were proper
 attention and continued perseverance given to their
 culture. Attempts which have been made, as we have
 already acknowledged in glancing through the few plants
 we have mentioned, but it seems to us that those
 attempts have not been followed up by extending them
 over a sufficient length of time. If this were done, a
 Potato famine might cease to be regarded as a national
 calamity. *J. R. Jackson, Kew.*

RECENT AGRICULTURAL HISTORY.

We extract the following description of English Agricultural
 History, and of the above which the late John Grey,
 Esq., of the University of Cambridge, had prepared for
 the use of the Agricultural Society of the University of
 Cambridge, and which was published by Mr. Grey,
 in 1841.

My father's country (Northamptonshire) has indubitably
 been the primitive seat of husbandry common in the
 last century. It is of old a very rich and fertile soil,
 and applied almost exclusively to the growing of Wheat,
 which is a crop exhausting to the soil that after a
 year or two that heavily had to be left to rest for
 several years, and fresh portions of land subjected to
 the same exhausting treatment. It somewhat resem-
 bled the wasteful ways of the cotton-growing slave-
 owners of the Southern States, who were forced by the
 condition of that unnatural engine, slave-labour, to be
 making ever fresh aggressions upon new lands, and to
 leave the old lands a wilderness. In some parts
 of Russia, husbandmen still practise this primitive
 wastefulness. In the stage of agriculture manure is
 not used, but of, except as inconvenient refuse, to be
 got rid of by any means. Thus, on the outskirts of the
 Roman Campagna, not many years ago, might be seen
 wheels full of dung carted out to a distance from the
 city, rolling accumulations from stables and posting-
 houses, spreading pestilence around and on the
 shores of the Tiber, a similar sight. Dung-
 heaps are brought down by the farmers along the
 shores, and are used to the use when the river is
 frozen over and when the winter cold makes it safe
 to step upon the refuse. When spring comes, the thaw
 washes the manure yearly down to the Caspian
 Sea. The large quantities of dung thrown in a smaller
 stream, which the farmers used to make
 their horses drink, was so offensive, that it was
 a great while that the water was not fit to
 be used, and the water was not fit to be used,
 and poisoning the neighbourhood. The sight of such
 thriftless expedients always vexed my father, for he
 knew the worth of that which people were trying to
 get rid of.

The next stage in agriculture was the introduction
 of the simplest form of rotation of crops (a custom,
 however, as old as Virgil's time), and this spring from
 the necessity of growing crops more frequently from the
 soil. Farmers could not afford to let land be
 idle, and it was found that it should be
 restored without loss. The soil must be renewed by
 some equivalent for what had been taken
 out of it. It is as the wants of the soil under the
 pressure of higher cultivation became greater and more
 complicated, chemistry came to the rescue. But of
 that by-and-by. At first it was found that a simple
 rotation of crops was the best. My father said that "the
 introduction of green crops into Northamptonshire
 was the beginning of a new era in the history of
 agriculture" and it was a very marked era, for with
 green crops came in the large increase of cattle as
 agricultural produce. Before this sheep and cows were
 very little cultivated in comparison with Wheat.
 They were generally poor lean beasts left to wander
 at will on the hills and wastes, not used as agents in
 the system of manure, and of course butcher-meat
 was a scarce luxury among the labouring population.
 But many benefits followed the introduction of green
 crops. Cattle were kept in greater numbers, and fed
 on the most nutritious system of upon turn grass.
 The manure of these animals was very valuable, and
 the system of manure was improved. The expert
 husbandman of the present day, however, is not
 content with the simple rotation of crops, but he
 seeks a more extensive and a more varied system
 on bread and pasture. But these animals also manured
 the land, and while feeding upon it enriched it to such
 a degree that more corn would grow upon the same
 extent of surface than before. The farmer now took
 not less but more grain to market than in the days
 when he cultivated Wheat alone. This was profitable
 both to the producer and consumer. Sheep have been
 called "the animals with the golden hoofs," not only
 because of the value of their wool and mutton, but
 because they enrich the soil they are fed upon more
 than anything else does. Much poor dry land was
 thus brought, by means of alternate crops and eating
 off with sheep, to yield constant and good returns.

Green crops produce much manure, but they also
 require manure. The manure of the towns came
 to be used in great quantities, and this opened up new
 fields for the connection between agriculture and
 chemistry. It began to be discovered that that which
 produces pestilence and fever, which shocks our senses

* From the *Edinburgh Review*, but relatively so, to the advanced
 rate of wages required for almost every kind of labour.

THE POTATO.

It is a well known fact that the crops from his land
 by the Wheat harvest, and a healthy crop of
 Potatoes. The interest with which the state of the
 Potato crop is looked forward to is not at all surpris-
 ing, when we consider the importance the tubers have grown
 to be as articles of food, an absolute necessity to a class
 of the population, and the comparative recent date of the
 potato, when it is in its wild state, and how it has
 become to be domesticated. It is not, however, to be
 forgotten that the potato, as we now know it, has
 not been the wild tuber of the mountains, but a
 cultivated tuber, and that it is a very different
 thing from the wild tuber of the mountains, which
 need these very substitutes for the Potato. There
 is, perhaps, not a man in the three kingdoms, least of
 all in Ireland who could deny that he had a part
 in a good Potato, but what has brought the tuber of
 random tubers to the state we now have it?

In its wild state, and when first introduced, the
 Potato was regarded as a vegetable, and it was
 rejected by many as a disgusting and disagreeable
 labour, but the effects of cultivation, together with the
 withdrawal of popular prejudice, has changed all this,
 and made the Potato what it now is. It may not be
 amiss briefly to sketch the history of this valuable
 vegetable, in the hope that I may inspire those who are
 able to make experiments, and to prosecute them in the
 cultivation of some one or other of the plants we
 shall mention, or indeed of any likely plants of
 which they may happen to have a knowledge.
 Though the native country of the Potato has been a
 question of some discussion, it seems pretty certain
 that it originally came from South America, plants
 having been found in a wild state in the Peruvian
 Andes, and on the mountains of Colombia. The
 tubers of these wild plants are said to be of a
 size and shape like a Walnut. It is said to have been
 brought into Europe by the Spaniards in 1492, to
 the 15th century there seems strong evidence for
 believing that its introduction into England is due to
 the colonists sent to North America under the auspices
 of Sir Walter Raleigh, who returned in 1596. The plants
 he brought home were planted in Sir Walter's garden
 in Ireland, and were used as food in that
 country long before they were known in England. So
 many anecdotes are associated with Sir Walter Raleigh's
 name, that it would be strange if one had not been
 recorded connecting him with the introduction of the
 Potato. It is said that when his evidence at his Irish
 estate had succeeded in growing to the full maturity
 of apples, the fruits of the Potato plants which his
 master had given him as a valuable plant from America,
 he brought one to Sir Walter, who, for the first time
 he saw, was very much surprised, and its appear-
 ance, and who thereupon ordered the "weed" to be
 rooted out; and in the course of digging up the plants, the
 man was surprised to find about a bushel of good Potatoes.
 In "Gerard's Herbal," published in 1597, we find the
 plant mentioned as being grown by him in his garden,
