CHINA.—The news from China is extremely scanty. Reports had been circulated of Sir H. Pottinger's sickness, but they were regarded as exaggerations. He was said, according to the latest news of the beginning of May, to be waiting for the arrival of the new Imperial Commissioner, Ke-Ying, who was expected at Canton about the beginning of June. The death of Captain Farmer, of Her Majesty's ship Driver, was mentioned. A letter from Hong Kong, dated March 7, states that business was most active to the north. There were seven ships in the Yang-Tze Kiang, selling openly, at Woosung, opium and British goods. They had been warned off by the authorities, but having persisted, they were allowed to continue their sales. The Americans are busy in smuggling. Sir H. Pottinger sought to stop that trade, but in vain. Capt. Hope endeavoured to detain some ships, but they were subsequently released. Opium and British goods are selling at high prices at Shanghai, and British goods are said to be scarce in China; not a piece to be found outside for sale. The French frigate Erigone was going to Nizon, in Cochin China, to demand satisfaction for the persecution of the French missionaries.

NEW ZEALAND.—The New Zealand Company has determined upon the formation of a new settlement upon its lands in New Zealand, to be called New Edinburgh, the site of which will be selected by the Company, subject to the approval of the Governor of the colony. It is intended that the site chosen shall be the best that may be available at the time of the selection being made, and the Company will select in this settlement such a quantity of land as to provide that 121,550 acres shall be of the greatest value in the neighbourhood with respect to fertility and accessibility. The land will be divided into 550 acres for the town, 20,000 for suburban lots, and 100,000 for rural lots. The town-land will be divided into 2,200 lots of a quarter of an acre each; the suburban land into 2,000 lots of 10 acres each; and the rural land into 2,000 lots of 50 acres each. There will be reserved, free of charge, as a property for the future municipal corporation of the town, 200 town-lots. 1 town lot, 1 suburban lot, and 1 rural lot will constitute a single property, and there will be reserved for the company 200 properties. The remaining 1,800 properties are to be offered for sale at the price of 120*l.* for each property. A deposit of 10 per cent. on each property to be paid previous to any application being registered at the Company's house, and the residue of the purchase-money on a day of which public notice will be given. The priority of choice in selecting the lands comprised in each property will be determined by lot, for the Company's and Corporation's reserves, as

well as for the properties belonging to purchasers. The ballot for priority of choice will be so arranged that any party purchasing two or more properties may, with respect to rural lots only, take them in a contiguous block under certain conditions. The purchase-moneys to be received, viz., 216,000*l.* will be disposed of as follows:—54,000*l.* to the Company as the price of the land at 10*s.* per acre; 30,000*l.* for surveys and other expenses of founding the settlement; 81,000*l.* for emigration; 26,000*l.* for roads, bridges, and other improvements; 5,000*l.* as a church building fund; 10,000*l.* as an endowment for ministers; 10,000*l.* as a school-fund for building and masters. The Company undertakes to apply the purchase-moneys, or so much thereof as shall be received in the proportions stated, or as nearly so as may be practicable to these several objects. The whole of the emigration-fund, with the exception of 11,000*l.*, will be expended in conveying from Scotland to the settlement of New Edinburgh, labouring persons eligible according to the regulations established by the Government. The 11,000*l.* will be reserved as a special fund, out of which, and to that extent only, allowances will be made to purchasers, towards the cost of cabin-passages for themselves, their families, and servants, to the settlement. The amount of the allowance will, in no case, exceed 25*l.* per cent. of the purchase-money paid by the colonists; and the fund being limited as above mentioned, preference will be given to the applicants for the allowance, in the order of their respective applications for the same.

Parliament.

HOUSE OF LORDS.

Monday.—Lord CAMPBELL laid on the table a bill, the object of which was to prevent any proceedings being taken to eject from the Scotch Universities such professors or principals as had seceded from the Established Church of Scotland on account of such secession. The bill was read a first time.

Earl FORTESSCUE presented a petition from Lord Oranmore (an Irish Peer) praying that the revenues of the Established Church in Ireland might be appropriated to the religious wants of the Catholic, Presbyterian, and Protestant population. Lord Fortescue expressed his opinion that the Irish Church Establishment is a great grievance to the people of Ireland, and his conviction that, in accordance with the rules of justice and common sense, the appropriation of the funds of the Church to the endowment of the Roman Catholic priesthood should be forthwith decreed. On the motion that the petition of Lord Oranmore be laid on the table, the Duke of WELLINGTON rose, and in a tone of voice much louder than usual, said:—"My Lords, I shall not enter upon the question of the irregularity of presenting such a petition, nor do I intend to enter into the discussion of the important question to which it relates. I wish only to warn your Lordships of one circumstance attending it. The prayer of this petition goes to nothing more nor less than this—whether your Lordships are to repeal or to maintain the laws by which the Reformation has been established in this United Kingdom. That is the question on for your Lordships' consideration in this petition from a Peer of Ireland, though not a member of this House—that is the question which I beg your Lordships to consider well, and to decide whether or not you will listen to arguments in support of such a proposition."—After a few words from the Earl of WICKLOW, Lord BROUGHAM, and the Marquess of CHANCERIE, the petition was ordered to lie on the table.—The Lilet and Detraction Bill, with the amendment on the sixth clause, proposed by Lord BROUGHAM, and rendering it more effectual, was read a third time and passed.

Tuesday.—The Royal Assent was given by commission to the Woollen Manufactures Bill, the Bridges (Ireland) Bill, the Loan Societies Bill, the Infant Orphan Asylum Bill, and several private Bills.—The Duke of WELLINGTON laid on the table the papers relative to the late transactions in Scinde.—The Public Works (Ireland) Bill, the Cathedral Churches (Wales) Bill, the Slave Treaties Bill, the Controverted Elections Bill, the Bills of Exchange Bill, and the Militia Ballot Suspension Bill, were read a third time and passed.

Thursday.—Lord BROUGHAM complained of the publication of a false and malignant libel in the *Examiner*, in charging him with using corrupt means to procure a judicial appointment. He would move to commit the author next session, when imprisonment would be a more severe punishment than at the close of the session.—The Lord Chancellor bore testimony to the fact that Lord Brougham had refused the office of judicial chairman of the Privy Council, when pressed on him.—Lord CAMPBELL remarked on the unusual nature of the proceeding, of giving notice of a breach of privilege for next session, when Lord BROUGHAM said he would set the question at rest, by proceeding against the author by an action at law. On the motion of the Earl of ABERDEEN, a bill for the better government of her Majesty's subjects residing in China was read a third time.

Friday.—The Affidavits in Chancery (Scotland and Ireland) Bill passed through committee.—The Earl of ROSEN gave notice to present a petition on Tuesday next, on the subject of illegal processions in Ireland, and to call attention to an Act of Parliament relating thereto.—The Excise Duties Bill, the Slave-trade (Austria, Portugal, Chili, and Mexican Republic) Bills, and the Stamp Bill, were read a second time.

HOUSE OF COMMONS.

Monday.—The SERGEANT-AT-ARMS announced that he had Samuel Potts in custody.—Mr. CHRISTOPHER moved, in conformity with the resolution of the committee on the first Epworth petition, and in conformity with the precedent of the House, that Samuel Potts be committed to Newgate for a gross breach of privilege, in having forged certain signatures to a petition presented to that House. The motion was agreed to.—In reply to a question from Mr. F. MAULE, Sir J. GRAHAM said that, upon inspection which he had been able to make of the several proposed plans of medical reform, he could not conclude that the charter to the College of Surgeons ought to be renewed. He thought that the new charter should be to make that body a local corporation only.—In answer to a question by Capt. PLUMRIDGE, the CHANCELLOR of the EXCHEQUER said that the Government, having sufficiently remunerated Sir Joseph Douglas for his services in China, while captain of the merchant ship Cambridge, in giving him 2,000*l.* for his personal services, and 850*l.* for his crew, in addition to a knighthood and the regular payment of 700*l.* a month while his vessel was employed, did not intend to comply with his demand of 30,000*l.* for further expenses, considering that they had already met every just demand which he could make.

Sir J. GRAHAM moved the second reading of the Church of Scotland Benefices Bill, sent down from the House of Lords. The Bill, he said, was introduced to remove the doubts which unhappily had arisen upon the question of right as between the Church-goers and the lay patrons. The Presbyterian religion had been first adopted by the lower and middle classes; the gentry and the aristocracy had been later in their adhesion to it; and hence had arisen much dispute. Having first sketched the history of the question down to the Revolution, he came to the act of 1690, which he considered as establishing—1st, that no right was

given to disapprovers, except for reason assigned; 2dly, that the Presbytery are to act judicially, and not ministerially; 3dly, that their judicial discretion is to be exercised upon the identical reasons assigned by the Church-goers. The statute of Anne, which took the patronage from the Bishops and Kirk Session, and restored it to the lay patrons, did not supersede those principles; and upon them was founded the act now presented to the House. The letter which he had addressed to the Moderator in the beginning of this year, though bearing only his own signature, was to be considered as the letter of the Government, and had been written after full consultation with the Lord Advocate and Solicitor-General of Scotland; and he now stated to the House the outline of that letter, with a running commentary. The three general objections to the qualifications of a presentee were to his life, his learning, and his doctrine; and beside these, there were other special objections, as to his fitness for the particular parish to which he was appointed, but much doubt had existed whether these special objections were a ground of legal exception to the presentee's admission. The Government had anxiously considered the subject; disapproving the Veto Act, as one which, in transferring the patronage from the Presbytery to the people, was really transferring it from a responsible to an irresponsible, from an educated to an illiterate, body. The General Assembly, in the present year, after rescinding the Veto Act, had declared their opinion that it was desirable to remove all doubts upon the law, with as little delay as possible; and the resolutions they had passed, which were substantially the adoption of the present bill, had been officially transmitted to the Government. This adoption, he would venture to add, had the general sanction of the Church of Scotland. After some general explanations of the state of the Scotch law respecting ordination and other ecclesiastical points, he concluded, in reference to the objection respecting the lateness of the measure, by expressing his persuasion that, consistently with the dignity of the Legislature, it would have been impossible for Parliament to pass such an act, so long as the Church of Scotland should have continued contumacious.—Mr. WALLACE doubted whether the Queen could assent to this act consistently with her coronation oath; and moved that the bill be read a second time on that day six months.

Mr. RUTHERFORD said, that now, instead of being best with a Church which commanded the affections of her people, Scotland was cursed with a Church which had the attachment only of a minority. Warmly endorsing the conduct of the seceders, who had acted from deep conscientious feeling, as evinced by no less than two hundred licentiates voluntarily abandoning those prospects which constituted the highest object of their ambition; he proceeded, in a lengthened argument, to show that the original limitations on the rights of lay patronage had not been effected by subsequent enactments, as the statute of Queen Anne, and that therefore the right of the people to object generally to a presentee, and of the church courts to sustain the objection, existed in law, of which the Veto Act of the Assembly was an assertion. The bill professed to be "declaratory," but where was the law to be found which it professed to "declare"? Nay, if it were only declaratory, whence the necessity of announcing the consent of the Crown to the introduction of the measure? The bill was, in fact, "enactive;" it changed the constitution of the Church of Scotland, as secured by statute; it interfered with the rights of patrons, and altered the internal government of the Church, by interfering with its judicatories; and in handing over the rights of the patrons to the Church—the priesthood—it vested them in the worst depositories which could be devised, for "presbyter was but priest writ large." The people of Scotland have been long imbued with the sense and determination to have a voice in the choice of their ministers, of which the late great secession was but an exponent. But that popular control over the exercise of patronage which the people asked for, was not given them by this act, it was transferred to the Church, of which the people were as zealous as its most zealous opponents could be. Instead of confirming objections to "life, literature, and doctrine," as laid down by the Aochterarder judgment, with which it affected to conform, the bill gave large latitude as to "ministerial gifts and capabilities," and in endowing the presbyteries with the power of deciding on the nature of the objections, it armed them with power to inquire into the particular characters and habits of the objectors; that is, it invested the church courts with inquisitorial powers over the people. If the bill were fit to be brought forward at all, it should have been introduced before the secession—but in the present temper of the people it would only aggravate all its evils, and drive more of the members of the Establishment from it.

The SOLICITOR-GENERAL differed from Mr. Rutherford, as to the propriety of introducing the bill before the secession. The claims of the non-intrusionists were such as no government could sanction or satisfy, seeing they sought the total abrogation of patronage, and even taught that the church courts could set at defiance the acts of the imperial Legislature. But the present measure, whose object was the removing of doubts, was acceptable to the General Assembly, and those adhering to the Established Church.

Lord J. RUSSELL protested against the doctrine that a difference of opinion between an inferior tribunal and the highest court of appeal was a ground for treating the law as doubtful. It alarmed him to hear that the judgment of the House of Lords was not conclusive of the law. He quoted a protest against this bill, by Lords Cottenham, Campbell, and Langdale, and added that Lord Denman also would have signed that protest but for his absence on circuit. The decision which was now to overturn the judgment of the highest appellate judges was to be the decision, not of other legal authorities, but of a political majority, pronounced, he supposed, by way of compliment to Lord Aberdeen, and as a testimonial to the merits of his administration in the Foreign office. So much for the declaratory part of the bill. Coming now to its new enactments, he particularly condemned the jurisdiction given to the Presbytery. Here was a vague rule by which, in a parish where there were 1,000 heads of families, they might reject a minister disapproved by three or the number, though approved by the other 997, so that they would possess the complete means of giving effect to all their own High Church views. But this bill was to settle the Church! What Church was there now left to settle? Half had seceded; and of the remainder, many were adverse to this bill. But perhaps the greatest evil of the measure was, that you were conceding everything to a party which was disposed to carry High Church principles as far as any Pope had ever pressed them. After some remarks by Sir G. CLECK and Mr. H. JOHNSTON, in support of the Bill, and by Mr. F. MAULE and Mr. A. CAMPBELL in favour of the amendment, Sir R. PEEL objected to many of the arguments used in the debate, as having no bearing on the question before the House, and which he criticised with some verbal minuteness. The offer of the Government to legislate was officially communicated to the last General Assembly, and accepted by that body; and the object of the bill, thus sanctioned, was to do that for which the Assembly was incompetent, to give a legal definition of the rights of patrons, people, and Church Courts. The constitution and spirit of Presbyterianism gave the people the right of objection, and the Presbyteries the right of accession; and this, which was the usage from the earliest times, was the leading feature of the bill. He called on them, therefore, to confirm the principle, by carrying the second reading, leaving details for future discussion. The measure, he believed, was acceptable to the great body of the people of Scotland; and the secession would have been much larger, but for the prospect of its introduction.—After a few words of explanation from Mr. CAMPBELL, the House divided: For the second reading, 98; against it, 80; majority, 18.

The Earl of LINCOLN withdrew for this session the Metropolitan Buildings Bill.—On the order of the day for going into committee on the Episcopal Functions Bill, Mr. S. O'BRIEN opposed the Bill, and Mr. WILLIAMS moved the adjournment of the House.—After a short discussion, the House divided.—For the

amendment, 6; against it, 50: majority, 44. The Bill was committed *pro forma*.

Tuesday.—The House had a morning sitting, the chief business of which consisted in discussing the London Coal-whippers' Bill.—At the afternoon sitting, Colonel RUSSELL moved the issue of a new writ for the borough of Sudbury.—Mr. BLACKSTONE moved, as an amendment, that leave be given to bring in a bill to make an effectual inquiry into the bribery and corrupt practices alleged to exist in the borough of Sudbury. Considerable discussion ensued, but ultimately the House divided, when the amendment was carried by 138 to 25. Leave was then given to bring in the bill to make further inquiry.

Lord JOHN MANNERS then brought on a motion, "That it is inexpedient in the present condition of the country to continue the existing restrictions on the exercise of private charity and munificence." His motion was directed to the propriety and expediency of repealing the laws of Mortmain, the origin and history of which he briefly sketched. Restrictions in Mortmain originated, not in any politico-economical notion, but in jealousy of the exorbitant and accumulating wealth of the monastic establishments. He was not prepared to say that these restrictions were useless; on the contrary, he thought if the monastic establishments had been placed under more stringent regulations we might have escaped the subversion of the Reformation. But what might be expedient in the fifteenth century was absurd and pernicious now, when so great a change had passed over society, and we had six millions of our population beyond the pale of the Church, and out of the reach of that narrowed and stinted charity still existing amongst our habits of intense competition and thirst for wealth. In asking for the repeal of the Mortmain laws, he asked no exclusive benefit for the Church of England; he was prepared to extend it not only to Dissenters, but to the Roman Catholic Church, the professors of which we had now placed on a political equality with ourselves; while the state of Ireland, with its numerous and impoverished peasantry, furnished an additional argument for it. We could not leave land to endow a college or a cathedral, but we could do so for a museum or a menagerie of wild beasts. The law was full of inconsistencies, and he asked them to sweep them away. We wanted more churches and more schools; nay more, we required the establishment of religious houses, and monastic institutions. In proof of the disadvantages to which the restrictions exposed the country, he mentioned the case of an old lady, who has bequeathed 25,000*l.* for the erection of churches in the north of England, and the lawyers are of opinion that the bequest will be void, unless she live over the coming winter. He hoped they would sweep away those cobwebs and meshes of legislation which crippled the efforts of modern times.

Sir J. GRAHAM could not consent, at so late a period of the session, and in so thin a House, to disturb one of the great arrangements of the law of real property. Nor could he agree to the expediency of establishing, in these times, religious houses or monastic institutions. In such a matter, too, it would have been more fitting that the noble Lord should have proposed a bill than a mere abstract resolution. Therefore, with all respect for the motives and intentions of the mover, he must resist this proposition.—Mr. C. BULLER supported the motion. He saw no reason to fear that too profuse a piety would in these days engulf any great amount of land. It was much better for religion to endow a church by private bounty than to make that church unpopular by a public rate.—Sir R. INGLES could not join in the views of the mover, least of all in his wish to revive monastic institutions. Though there were restrictions as to land, personality was unrestricted; and this kind of property had grown in modern times to a bulk undreamt of by the makers of the Mortmain Acts.—Mr. BERNALL recommended it to Lord J. Manners not to press his motion to a division.—Mr. BORTHWICK was favourable to the motion, and Lord EBRINGTON suggested that the testatrix whom Lord J. Manners had mentioned might effect her object by giving the money to a church-building society.—Mr. BROTHERTON wished to remove restrictions on gifts to charity.—Lord J. MANNERS replied, consenting to waive a division, and the motion was thereupon withdrawn.

Mr. WARD then brought on his motion for an address to the Queen, affirming the Church of Ireland to be among the most prominent grievances of her people, and pledging the House to co-operate with her Majesty in a new settlement of the property of that church. He said he could not wonder that when two Governments had sunk under the attempt to arrange this question, the present Ministers were unwilling to grapple with it; but it was one which must be arranged. He had said, some weeks ago, that the whole substance of the Ministerial policy as to Ireland was summed up in the Arms Bill; and he was now convinced, that unless his address were carried, Parliament would separate without having taken any one step toward the relief of Ireland. The man who should vote for his address could not stop at a mere temporality or appropriation measure. Appropriation might have sufficed ten years ago; but it would not do now. It was the old story of the Sybiline books—you would give more, get less, perhaps endanger all. His own principle was simply this—that all which had been done in Ireland for 300 years on the subject of religion had been done wrongly. Every Catholic member, if he would speak in debate as he spoke in private, would say that the existence of the Protestant Church in Ireland was the consequence, the type, and the badge of his degradation. In all other countries the established religion was that of the majority, but in Ireland this rule was reversed, because there the majority was a conquered race. The work of the reformation, in its commencement, had been handed over to the very scum and refuse of the English clergy. He quoted Spenser's testimony against those clergymen, and in favour of the Roman Catholics of that time; and he read an extract from King James's grant of Coleraine to the city of London, containing a condition that the grantees should extirpate the Roman Catholics. Lord Eliot had said that the evils of Ireland were referable to the state of society; but the state of society was traceable to the Statute-book. The settlement of every great question in Ireland had been impeded by the fears of the Protestants for their church. What, then, had that church done for Ireland? Was it the author of that great modern revolution which had reclaimed a whole people to temperance? No: that was the work of a humble Roman Catholic priest. The clear revenue of the Protestant Church was about 552,753*l.*, being at the rate of about 1*s.* a head for each communicant of the establishment; while the *Regium donum* to the Presbyterians made provision only at the rate of about 1*s.* a head; and for the Roman Catholics there was not a farthing. Mr. Ward then went back to the times of Primate Boulter, to show that the church in those days was used, not as a means of religion, but as an engine of State. The same thing was equally true 30 years afterwards. Then what was the pure apostolical period of the Irish Church? Was it the time of the union? He cited instances to show that at that time also the church was converted to grossly secular purposes. He admitted that at the present day there were many churches on the bench who were ornaments to it; but the church had still very great abuses; for instance, some of the unions, containing a number of parishes thrown together, as it should seem, for the purpose of making a rich provision for some favoured incumbent. The existence of such a church was regarded by the Irish not only as an injury, but as an insult. Being men, they must be governed, and they could not be governed thus. You could not thus govern 9,000,000 of people, living in the midst of you, and knit together by the bond of a common injustice. On the Continent, in Austria, and in Prussia, the true principle was well understood; this country alone was ignorant of it. He would propose altogether to break up the present establishment of Bishops and Archbishops in Ireland, and would look only to the working clergy. He would legalise the titles of the Roman Catholic Bishops, and restore the churches which had been anciently taken from Roman Catholic congregations. He would make the clergy, as Mr. Pitt had proposed,

the link between you and the people. Some thought that the best course would be to transfer the whole establishment to the Roman Catholics. That might have been done at the Union; nay, as late as 1825, the Priests were willing to accept remuneration from the State; but this willingness had ceased. Some thought a provision should be made for the Catholic clergy from the consolidated fund; but the objection to that was simply that it would be impossible; the English and Scotch people would never consent to it. As to the funds of the Church, he would place them, subject to existing interests, in the hands of commissioners, and distribute them among the Members of the Establishment, the Presbyterians and the Roman Catholics, according to the numbers of each denomination. Now as to the objections which might be made to his plan. It would be said, we must look to the truth of the religion we establish; but he contended that no party or majority had a right to pronounce upon such a question. If this were justifiable anywhere, it was justifiable everywhere, and Lord Ellenborough in India ought to parade the 39 articles instead of the gates of Somnath. Then the Catholic religion was said to be dangerous. Why, it was the only form in which Christianity had flourished for many centuries; it was the elder type of our own religion. The spirit in which the House should proceed would have a great effect upon the question of union, and he would fain see the two countries made one in a perfect equality, civil and religious.—Mr. CARRW seconded the motion. The do-nothing system could not be maintained much longer in Ireland, nor could the Protestant Church. He had no personal hostility to that Church, but he disapproved the system on which it was planted there.—Lord ELIOT said that certainly this was no vague proposal; it was definite enough! But the question now was not what would have been, *a priori*, the fittest church establishment for Ireland: the existing establishment had been fixed as the condition of the Union; and without that Union, so purchased, Catholic emancipation would never have been peaceably carried. Mr. Ward had admitted that no man who voted for this address could stop there; and it was therefore for gentlemen to consider whether they were prepared to vote for the total destruction of the Protestant Church. The question of a Protestant Establishment was also the question of a Protestant Sovereign; certainly until the throne should be opened to the Catholics, they had not the complete equality demanded on their behalf. In answer to the imputation on the Irish Church, that she had used her influence in past times for political purposes, he would remind Mr. Ward that in those times the same thing was true of every Church in Europe. The total revenue of the Irish Church, which Mr. Ward had put at upwards of 552,000*l.*, was in fact 432,123*l.*; and this sum, when distributed among 1,396 beneficed clergymen and 744 curates, gave an average income of little more than 201*l.* to each. Mr. Ward had made many quotations from Mr. Grattan, Mr. Plunket, and other high authorities; but had omitted to cite their opinions in favour of the inviolability of the Protestant Establishment. Gentlemen talked of the Roman Catholics as if they were the whole people of Ireland—treating the entire body of the Protestant proprietors as no part of that people. Mr. Ward had said that the English and Scotch nations would never consent to tax themselves for the maintenance of the Roman Catholic clergy. Did he suppose those two nations would ever consent to the abolition of the Protestant Church? The language now employed was strangely at variance with the assurances given when the emancipation was carried. Mr. O'Connell now held opinions on the subject different from what he and other leaders expressed when emancipation was granted; and without a distinct compact, not all the influence of the Duke of Wellington and Sir R. Peel would have sufficed to carry that measure.—On the conclusion of Lord Eliot's speech the debate was adjourned.

Wednesday.—The adjourned debate on Ireland was resumed by Mr. TRELAWNEY, who advised the House to take into its deliberate consideration, that they must either abolish the Established Church in Ireland, or submit to the alternative of civil war.—Sir R. INGLES maintained the title of the Church to its endowments. The mover, whatever else might be imputed to him, could not be accused of having deceived the House; he had taken away from Lord J. Russell and his partisans all excuse for voting in favour of the motion. He had broadly proposed to strip from the Church in Ireland all the revenue it possessed except 70,000*l.*—that is, to take away 7-8ths, or 17*s.* 6*d.* in the pound; and yet had gravely added, that this was no unworthy compromise! He had left the Church with scarce a rag to cover her nakedness, and then, putting a halter round her neck, had handed the other end of the rope to her bitterest enemies. The manner of the hon. Member had, indeed, been courteous; but the bowstring was not the less fatal because it might be made of silk. He admitted that in some respects the Church of Ireland had failed of her duty; in particular, the Scriptures ought to have been translated in the language of the people. But he denied the validity of the arguments deduced from former abuses of that Church, and showed the improvements of its ministry in recent times. Mr. Ward, however, grounded his reasoning mainly upon numbers, and was prepared to establish the creed of Braham or of Fo, if it were the creed of the majority. From that principle he dissented; for he was persuaded that it was just as much our public as our private duty to teach and advance what we believed to be the true religion. The question, moreover, was not what religion we should establish; the motion went not to establish a religion, but to destroy one already established; and that, too, by more than any ordinary law, by a compact of two independent Legislatures. The multitudes, therefore, who were collected to destroy that establishment were not entitled to plead that they were seeking only the repeal of a statute. When emancipation was conceded, it was upon the assurances, given by the leading Catholics themselves, that it would not be employed to weaken, but would rather avail to fortify, the Protestant Church. He would maintain that Church, because he believed its doctrine to be the truth, because it was a doctrine established by the treaty of two kingdoms, because he valued it for its works of charity, and because he regarded it as the great bond of connexion between England and Ireland.—The Earl of LISROWEL and Mr. V. STUART spoke in favour of the motion, and Lord BERNARD and Mr. B. COCHRANE opposed it.—Mr. HARDY was proceeding to speak against it, when it was moved that the House be counted: 38 members only having been found present, the motion fell to the ground, and the House adjourned at eight o'clock.

Thursday.—Mr. WARD adverted to the "counting out" of the House on the previous evening. He laid the chief blame on the Opposition, for not supporting him; the Government had treated him fairly, and therefore he could not expect to renew his motion during the present session.—Mr. ESCOTT, who had made the motion for "counting out" the House, explained why he did so; which was, because he considered that no interest was taken in the question by the Opposition, or the House generally.—After some conversation on this point, Mr. SHAW corrected the assertion of Mr. Ward, that the Liturgy had never been printed in Irish. The very first book ever printed in Dublin was a Prayer-book in Irish.—Sir J. GRAHAM postponed the committee on the Scotch Church Bill to Monday, in order to give an opportunity to the Scotch Church to express their opinion of the bill.—The third reading of the Irish Arms Bill was fixed for Monday.—The House went into committee on the Limitations of Actions (Ireland) Bill, and counsel having been heard at the bar, the clauses were all agreed to.—The House went into committee on the Poor Relief (Ireland) Bill, and agreed to the first 15 clauses, after which progress was reported.—The Mandamus Appeals Bill and the Bishops' Relief (Ireland) Bill passed through committee.—The CHANCELLOR of the EXCHEQUER obtained leave to bring in a Bill to Declare and Amend the Law for Auditing and Enrolling the Accounts of the Land Revenue of the Crown.

Friday.—Mr. T. DUNCOMBE's motion for a select committee to inquire into the facts connected with a recent meeting at Hull was negatived by 83 to 29. The House then went into committee

of supply, and Sir G. CLERK moved that the sum of 1,281,211*l.* be granted as compensation to the owners of the opium destroyed in Canton, in March, 1839, being the amount due to them under the treaty of peace with China.—Mr. MANGLES, Mr. LINDSAY, Sir T. WILDE, Mr. ABEL SMITH, Lord PALMERSTON, Mr. HUME, and others objected to the sum as insufficient and demanding further inquiry. The Chancellor of the Exchequer, the Attorney-General, Sir Robert Peel, and Sir R. INGLES supported the resolution, when the House divided affirming the motion by 74 to 47.

CITY.

Money Market, Friday.—Consols for account closed at 93½ to 94; Three per Cent. Reduced, 94½ to 95; Three-and-half per Cents., 102½ to 103; New Three-and-half per Cents. 101½ to 102; Bank Stock, 180½; Exchequer Bills 55*s.* to 57*s.*, and 53*s.* to 55*s.* prem.

Metropolis and its Vicinity.

Visit of the Queen to the New Houses of Parliament.—On Saturday afternoon the Queen and Prince Albert paid a visit to the new houses of Parliament, which are now in a state of rapid progression. The royal party were joined at the gates of the works by the Prince and Princess Augusta of Saxe Coburg Gotha, and his Serene Highness Prince Leopold, who had but just left the exhibition of cartoons. Her Majesty was received in the Speaker's court by Mr. Barry, the architect, and Mr. Grissel, the contractor. The Royal party were first conducted through the Speaker's court to the river terrace, and thence to the sculpture and model rooms, where there were many objects that occupied her Majesty's attention. A model of the new House of Lords was shown to her Majesty, with which she was so much pleased that duplicates of the ornamental parts were directed to be taken in plaster and forwarded to the palace. The Queen also inspected the various descriptions of stone of which the new houses are built. The royal party proceeded from the sculpture and model rooms to the south and north wings, where the statues of the Saxon Kings and Queens, in niches, occupied their attention for a considerable time. From the south wing the Queen and suite were conducted to the Victoria Tower, and thence through the cloisters and crypt of St. Stephen's to the present House of Commons, and the plain appearance of the interior caused her Majesty to remark that it was wholly unbecoming the high purposes to which it was appropriated. The House of Lords was next visited; and then Dr. Reid's Experimental Room. Dr. Reid was in attendance, and minutely explained to the Queen the process proposed to be adopted in the ventilation and warming of the new Houses of Parliament. Her Majesty, previous to leaving the works, expressed her approbation of the present appearance of the new buildings. This was the Queen's first visit to the house, and it occupied about an hour and a half.—In reference to her Majesty's visit to the Tunnel last week, it is stated that the Royal barge on its return was in some danger of being swamped by the "Syren," a Woolwich steamer. The boat was very near the barge, when a naval officer, who was outside the house, between her Majesty and the watermen, stood up on the cushions, waved his hand, and, unmindful of the presence of Royalty, sung out, at the top of his voice, "Halloo, halloo, where are you coming to?" The rudder of the barge was put hard over, and fortunately, the collision was avoided, but some of the royal party were greatly alarmed. Prince Albert looked serious, the Princess Clementine appeared frightened, but the Queen laughed, and did not exhibit the least symptoms of fear.

Death of the Duke of Dorset.—We have to announce the death of this nobleman on Saturday last, at his residence in Harley-street, in his 76th year. His Grace had been for some months in feeble health, and his death was, therefore, not unexpected. He succeeded to the family honours in 1815, on the death of his cousin, Charles Duke of Dorset, who was killed by a fall from his horse in Dublin, whilst on a visit at the vice-regal court, during the lord-lieutenancy of his father-in-law, Earl Whitworth. The late duke was Viscount Sackville previous to his accession to the dukedom, and as he dies without issue, the Dukedom of Dorset, Earldom of Middlesex, Barony of Buckhurst, &c., become extinct. His Grace was a personal favourite of King George IV. and King William IV., to both of which monarchs he was Master of the Horse. By his Grace's death, a vacant ribbon of the Garter is at the disposal of Ministers.

Excise Seizures.—It having come to the knowledge of the Commissioners of Excise, that large quantities of grain, purporting to be high-dried malt, but which was, in fact, but "scorched barley," having never been subjected to the malting process, were to be found upon the market, an investigation was instituted, when the officers discovered that several large maltsters and corn-dealers had in their possession extensive stocks of this description of grain, which was accordingly seized, and deposited in Her Majesty's warehouses, and now amounts in quantity to between 400 and 500 quarters. A considerable portion of it was brought from the neighbourhood of Croydon, where this illegal article had been disposed of for some time. The effect of the sale of this article was to produce beer from it having the high colour and appearance of real stout, without its strength, and to defraud the Crown of a large revenue from legally malted grain.

Custom-house Frauds.—It will be in the recollection of our readers that two landing-waiters, named Homersham and Blake, were deeply implicated in the late Custom-house frauds, and their names have been repeatedly mentioned in the legal proceedings against Messrs. Candy and Deane and other parties. Homersham and Blake were dismissed about six months ago, and the former died shortly after his delinquencies had become

known. Blake, who possesses an estate near Dublin, retired to Ireland after his dismissal, and continued to reside there until within the last few days, when he came over to the metropolis. In the meantime the Commissioners of Customs, with the law-advisers of the Crown, had determined upon proceeding against Blake for the extent to which it had become known he had defrauded the Crown. For this purpose a warrant was issued at the suit of the Attorney-General, for upwards of 20,000*l.*, and another warrant for a much larger sum was issued in the City. Mr. Blake was accordingly apprehended, and is now in the Queen's Prison. A second detainer had been lodged against him at the instance of the Crown, and it is said that the claims against him altogether amount to 80,000*l.*

Public Meetings.—On Saturday evening a meeting was held at the Crown and Anchor, to celebrate the return of Mr. Bright for Durham. The Hon. Mr. Villiers presided, and was supported by Messrs. Cobden, Bright, Crawford, Bowring, Brotherton, Gibson, and Moore, all of whom took a part in the proceedings. Mr. Bright thanked the meeting for the honour conferred upon Durham, and pledged himself to be the unflinching enemy of every species of monopoly to the latest moment of his existence. He hoped that the electors of London would follow the example of the men of Durham and Essex by returning Members opposed to corruption and monopoly. In conclusion, he assured the meeting that the 50,000*l.* collected by the League had not been uselessly lavished, but had been expended on tracts and books in favour of the repeal of the Corn-laws, and in paying Anti-Corn-law missionaries. A resolution of thanks to the 488 electors of Durham who returned Mr. Bright was carried; and, in consequence of the crowded state of the great room at the tavern, another meeting was held contemporaneously with the above in a smaller room.

Temperance Meetings.—On Monday a vast concourse of people assembled in the Commercial-road to hear and see the apostle of temperance, the Rev. Theobald Mathew, who had announced his intention of administering the total abstinence pledge from all intoxicating drinks in the ground lately consecrated by the Roman Catholic Bishop. About 10 o'clock Father Mathew made his appearance before a Metropolitan auditory for the first time. He was received with loud cheers, particularly by his countrymen, who assembled in great numbers. He is about 50 years of age, of mild and expressive features. His unaffected manner and deportment, and the simplicity of his style when addressing his hearers, appeared to make a great impression. Father Mathew opened the proceedings by a short but expressive prayer, and then delivered an address, which was listened to with great attention, on the advantages of total abstinence from all intoxicating drinks, and the evils of intemperance. The first persons who presented themselves was a Roman Catholic fraternity called the Holy Guild, who came in procession to the ground bearing crosses. The brothers and sisters of the fraternity knelt down, and repeated the words of the pledge after Father Mathew, in a loud voice. He then descended from the platform, gave them his blessing, and after touching them all on the forehead, dismissed them. The same ceremony was repeated about 12 or 14 times during the day. At 12 o'clock, Earl Stanhope arrived, and was loudly cheered by the people. At this time there were not less than 30,000 persons assembled, and the Commercial-road was nearly impassable. Earl Stanhope and Father Mathew shook hands, and the noble Lord addressed the multitude for nearly an hour, and said he had been a teetotaler for many years, and invited his hearers to follow his example. He declared his intention of publicly taking the pledge from Father Mathew, and warmly eulogised the Rev. Gentleman for his useful and patriotic exertions in Ireland, and expressed a fervent hope that his mission in England would be attended with similar results. Father Mathew then called upon those who were anxious to take the pledge with Earl Stanhope to come forward and do so. A semicircle was formed, and 300 men and women knelt down and received the pledge. Earl Stanhope, who laboured under considerable agitation, was directly afterwards embraced by Father Mathew, who, in the enthusiasm of the moment, kissed his cheek. The noble Earl smiled, and grasped Father Mathew's hands, exclaiming, "God bless you, Sir." The delivery of speeches and the administering of the pledge proceeded until dusk, when Father Mathew left the ground, having previously announced his intention of attending the same place for the same purpose every day this week. He was treated with great respect by all persons, and appeared nearly exhausted on leaving the ground. About 3,000 persons took the pledge during the day, one half of whom were Irish.—On Tuesday Earl Stanhope again attended, and addressed the meeting in praise of Father Mathew's exertions. In acknowledging the compliment Father Mathew said that "he had no sectarian objects in view. Though a Catholic Priest, he had been received in the most cordial manner by clergymen and lay members of the Established Church, by Wesleyans, Dissenters, Quakers, and even Jews, and he administered the pledge to millions of all sects. He wished to elevate mankind, and to promote the interests of religion, and the good of the community, by that greatest of all blessings, sobriety. The people of Yorkshire, where he had administered the pledge to upwards of 100,000 persons, wished to pay him for his services, and presents were offered to him from persons of wealth and high standing in society, but he refused to accept a farthing. He had expended 300*l.* of his own money since he had been in England, but he did not regret it; and if he had been disposed to favour himself and family, he should not have been a temperance advocate, and converted millions of

his own countrymen from drunkenness to sobriety. A brother he dearly loved was the proprietor of a large distillery in Ireland, the bare walls of which cost 30,000*l.*, and he was compelled to close it, and was almost ruined by the temperance movement in that country. The husband of his only sister, whom he also dearly loved, was a distiller, and became a bankrupt from the same cause. He was sorry to speak of those things, but when he was accused of being instigated to do what he had done to enrich himself, he felt compelled to deny the charge." The proportion of English who took the pledge on Tuesday was greater than on Monday. Upwards of 50,000 persons visited the ground, and many went down by the steamers to Wapping, and by the Blackwall Railway, to witness the proceedings, which appeared to excite great interest, and have continued daily during the week.

The Church Service.—On Wednesday, a vestry meeting of the Parishioners of All Hallows Barking, was held in the parish church, for the purpose of considering the changes which have been recently introduced during the performance of divine service, and to adopt such measures thereupon as might appear expedient. Mr. Howell, the senior churchwarden, was called to the chair, and read the requisition addressed to him by a large number of the resident parishioners, requesting that a meeting might be convened. After some discussion on the custom of preaching in the surplice instead of the academical gown, and on the restoration of the weekly offertory, a series of resolutions was proposed representing to the vicar, the Rev. S. J. Knight, that the recent alterations were regarded with regret by the vestry, and that the inhabitants were desirous of returning to the former mode of conducting divine service. These resolutions were seconded, and carried with only one dissenter.

Wood Pavement.—A number of labourers have been engaged for some days in removing the macadamised stone-paving on that portion of the Great Western road extending from the entrance to Kensington Palace to the western end of Kensington High-street, a distance of nearly a quarter of a mile, preparatory to the whole being laid with wood pavement, by order of the Commissioners of the metropolis roads.

Murder on the High Seas.—Intelligence has been received of the blowing up of the *Diana*, South-Sea whaler, while on her homeward voyage, and the death of her commander, under very suspicious circumstances. The *Diana* has for several years been engaged in the South-Sea fishery. She left London about three years ago, her crew consisting of Captain May (the commander,) chief and second mates, steward, and about 18 seamen and two boys. She was on her voyage from Ascension to St. Helena, when the chief mate and crew on deck were alarmed by the report of fire-arms from the cabin, where the captain was found shot, the pistol lying in one corner of the cabin, about six or seven feet from the body. The second mate was below, but denied that he had been in the cabin. On her arrival at St. Helena, a day was fixed for her departure for England, and a few hours previous to the time appointed for the starting the powder-magazine blew up, causing the almost total destruction of the vessel. Most of the crew at the moment were standing on the after part of the deck, and the steward, who was seated on a chair near the companion-ladder, was killed on the spot. The inquiry instituted by the authorities occupied five days, and excited great interest. It was clearly shown that the explosion had been caused by the wilful firing of the powder-magazine, for on the vessel undergoing an inspection by the officers attached to her Majesty's ship *Grecian*, it was found that a train had been laid from the magazine to the fore-castle, from the latter of which it had been set fire. It was stated that there were several hundred-weight of powder, most of which was packed in barrels lined with copper, clearly showing that the preparation for the explosion must have taken some time, for it had all exploded. The jury returned a verdict of "Wilful murder against some person or persons unknown."

Temple Church.—This unique edifice is again to be closed after to-morrow for two months, during which time it will be thoroughly cleansed from a great quantity of dust which hangs about the grooves of the arches in the ceiling. The marble pillars are to be polished, and the entire wood-work is to be stained dark and polished. The pulpit will also be finished, as well as the new seats for the choristers, and a building attached to the church for the choir. Above 20,000 persons must have visited this building by Benchers' orders since it opened in November last, including the greater part of the Royal Family and Nobility, and for some months hundreds were refused admittance daily, not having orders. The whole cost of the repairs, it is said, exceeds 70,000*l.*, which has been paid out of the funds of the societies.

Female Orphan Asylum.—On Thursday, a ballot took place for the election of Chaplain to this charity, when the numbers at the close were—for the Rev. Mr. Cattley, 418; for the Rev. Mr. Curling, 229;—majority for Mr. Cattley, 119. The Duke of Cambridge, President of the Institution, recorded his votes, forty in number, in favour of the successful candidate. A great deal of angry feeling prevailed in consequence of the Committee having recommended Mr. Cattley to the notice of the Guardians; and a resolution expressing censure and want of confidence in the Committee, was carried by a large majority.

Suicide.—On Thursday evening, Mr. Frederick Ancona, manager of the Patent Elastic Pavement Company, and brother to the well-known architect, committed suicide by throwing himself over Waterloo Bridge. It appears that he had been spending the afternoon with two friends, Mr. Green, jun., son of the aeronaut, and another gentleman, and was returning with them over Waterloo Bridge towards the Middlesex shore, about 9 o'clock, when, on

nearing the third arch from the Surrey side, the deceased suddenly exclaimed that he would throw himself over the parapet, and, darting from his friends, ran towards the next recess. In an instant, before either gentleman could ascertain the reality of his intention, Mr. Ancona had mounted the stone seat in the recess, and precipitated himself into the river. Two ladies and a gentleman were close to deceased when he entered the recess, and, had his manner indicated anything approaching to an intention to commit suicide, nothing would have been easier than to have arrested the attempt. As it was, the occurrence was the work of an instant, and as the tide was running down fast, all attempts to recover the body were fruitless, although several boats put off immediately from the stairs on both sides of the bridge. The agony of his friends when the fate of his death became no longer doubtful was extreme, and it was with the greatest difficulty that Mr. Green could be prevented from throwing himself over the parapet. The body has not yet been found.

High Tide.—On Monday afternoon the tide was more than usually high. The wharfs along Milbank and the opposite side of the river were flooded. A great portion of Battersea Fields was laid under water, as was also the Lammas Land at Chelsea. In the latter village, Cheyne-walk was for a time impassable. At the Waterside, Wandsworth, the Thames flowed into the houses. The Wandle overflowed its banks, and so high was the tide at Putney, that the Thunder steamboat, in attempting to pass through the centre arch of the bridge, had the top of her paddle-boxes carried away by coming in contact with a cross beam at the very top of the arch.

Southwark.—At the vestry meeting on Monday for the parish of St. Saviour's, the Warden of the Great Account moved a rate of 9*d.* in the pound, to meet the expenses of the year. An amendment was moved, that the parishioners should not be trifled with by being called upon to pay such an amount of rate during the present depressed state of trade. After some discussion a division took place, when there were for a rate of 6*d.*, 46; for the larger ditto, 23; giving a majority of one-half the rate-payers present in favour of the smaller rate.

Mortality of the Metropolis.—The following is the number of Deaths registered in the week ending Saturday, July 22:—West districts, 113; North districts, 167; Central districts, 153; East districts, 180; South districts, 177. Total, 790—(398 males, 392 females.) Weekly average for the last five years, 903—(461 males, 442 females,) and for the last five summers, 846.

Provincial News.

Birmingham.—The state of the iron district continues to give rise to great apprehension, and the crisis anticipated in the masters' memorial, which we lately noticed, appears to be fast approaching. The furnaces are daily blown out, the horses drawn out of the pits, the works closed, and the masters going into the *Gazette*, while the men and their wives and children are going to the work-house, or collecting in groups along the roads and fields, and, without leaders or organisation, threatening revenge against all around them. Distress is now reaching all classes. At a place called Lye, 70 rate-payers were summoned for non-payment of poor-rates a few days ago, when they produced their rent-books to show that they could not get a shilling from their tenants, that their property was now useless, and that they themselves were on the verge of pauperism. In Dudley it was found, on the 20th ult., that 200 persons, occupiers of 10*l.* houses, had become disqualified for voting from non-payment of their rates. At Dudley, the bank of Dixon and Dalton is still open, notwithstanding rumours at a distance to the contrary. It is said that they have advanced little short of 300,000*l.* to iron and coal masters, who are unable to meet their engagements.

Carmarthen.—The Rebecca riots are still unchecked. Mr. Maule, solicitor of the Treasury, with Mr. Raven, have arrived at Swansea, and Mr. Vaughan and the other parties who destroyed the Bolgoed gate have been committed for trial. In the course of the inquiry it appeared that a chest of fire-arms had been found in the steam-packet office, addressed to Mr. Vaughan; suspicion being excited as to its contents, it was broken open by the authorities, and twelve new muskets, two new pistols, a quantity of patent ball cartridges, and some powder, were discovered. The Abergwilly-gate, upon the road at the entrance to Abergwilly village, and at about a mile from Swansea, has been demolished. The bar was situated upon the high road leading from Abergwilly to Cwmwilly and Castellpegin. The number of Rebeccaites who attended was large, and their conduct firm and determined. They showed by their proceeding on this occasion that they had no antipathy to the turnpike-gates upon the main lines of road, but only to the private bars; for although the bar which was destroyed immediately adjoined a main gate and its toll-house, they were not injured—the party contenting themselves with the total demolition of the bar. The Rebeccaites, as if in utter defiance of the authorities, have also attacked and destroyed the Sandy-gate, close to the town of Llanelly. It appears that at 12 o'clock at night there had been no symptoms of any attack, but shortly afterwards Rebecca and her daughters arrived, and the gate was speedily destroyed. Penygarn gate, on the Llandilo road, has also been again destroyed. Not a night passes without a gate being destroyed, although a detachment of the 73d Foot is patrolling the roads round Carmarthen nightly. The plans of Rebecca, however, are so well laid, that she and her followers invariably escape being caught in the fact.

Chelmsford.—On Thursday week Mr. Cobden paid a

second visit to this town, for the purpose of propounding his views on the subject of the Corn-laws, and their effect upon the tenant-farmers and farm-labourers. A hustings was erected in a field at the back of the Bell Inn, where the proceedings took place. There were upwards of 1,000 persons present, the great majority of whom were the mechanics and working classes of the town and neighbourhood, but it being market-day a good many farmers were also present. Mr. J. Copeland was called to the chair. Mr. Cobden addressed the meeting at great length in favour of total repeal, and Mr. Holt White spoke on the other side. A resolution in favour of total repeal was then carried by a large majority.

Chester.—On Friday last, the wife of a labourer in the employ of Mr. G. Wilbraham, of Delamere-house, in passing down a lonely lane at Crowton, called Red-hill, discovered the body of a man lying on his face, and bleeding from the back part of his head. She immediately gave an alarm, when the body was recognised as that of Matthias Bailey, the gamekeeper of Mr. Wilbraham. He was quite dead, and was bleeding from a gun-shot wound in the top of the neck. It was evident that he had been shot from behind, and fell suddenly forward without the slightest struggle. Five men were taken into custody on suspicion of being concerned in the murder, but there was no evidence against them, and the jury have returned a verdict of Wilful Murder against some persons unknown.

Durham.—There are only two instances of Quakers having been returned to Parliament, and it is remarkable that one was for the county, and the other for the city, of Durham. Mr. Joseph Pease, of Darlington, represented the southern division of the county after the passing of the Reform Bill, and Mr. John Bright, of Rochdale, has now been returned for the city.

Eton.—The annual celebration of "election" commenced on Saturday, and attracted, as upon all former occasions, a large assemblage of the nobility and gentry of the neighbourhood, and many old Etonians and distinguished dignitaries of the Church from various parts of the kingdom. After the usual ceremonies of the first day, the cloister speech was delivered by Joynes, M.A., K.S., and Captain of the school for the succeeding year. After the delivery of the speeches, the boats left the Brocas for Old Surley, and on their return there was a display of fireworks. On Monday the public delivery of the speeches took place, after which the Provost and the visitors proceeded to the long chamber, which was tastefully ornamented with boughs and evergreens. The "election" festival took place in the College-hall, to which upwards of seventy guests were invited. There are more pupils on the establishment at this "election" than at any former period; a gradual increase having taken place every year since 1836, when the number on the books was 444. The number now is 713—viz., 661 in the Upper and 52 in the Lower School. In 1745 the aggregate number in the two schools was only 248. Since the foundation, in 1141, 2,257 have succeeded to King's. It has been determined that the examination this year for Prince Albert's prize of 50*l.*, is to be in the French and German languages, and that the prize is to be thus divided:—the first prize to consist of 10*l.* in books and 35*l.* in money; to be given to the successful candidate on leaving school; the second prize to consist of books of the value of 5*l.*

Hereford.—Mr. Cobden visited this city last week for the purpose of discussing the question of the Corn-laws with the tenant-farmers of this district. It had been concluded that the interior of the Town-hall would not be large enough to contain the expected assemblage, and a platform was erected in the open square at the east end of the building. The meeting, in a short time, reached in number from two to three thousand. The audience was composed of agriculturists and inhabitants of the city; among the former were many farmers from the neighbourhoods of Ross, Ledbury, Bromyard, Ludlow, Leominster, Kington, and Hay. Sir S. R. Meyrick was unanimously called to the chair. Mr. Cobden, Mr. Baily, M.P. for the county, and Colonel Thompson, addressed the meeting at considerable length, and a resolution in favour of the total repeal of the Corn-laws and all other monopolies was afterwards proposed to the meeting by Mr. Southall, of Leominster, and seconded by Mr. Morgan, the banker at Ross, and when put by the chairman it was carried almost unanimously—a very few hands only being held up in opposition.

Hull.—Since our last report, arrangements have been made for weighing the hull of the Pegasus steamer, and numerous persons have arrived at Bamburgh and Holy Island to make inquiries for the bodies of their lost relatives. A considerable portion of the wreck, and various items of property, have been brought to shore. On Tuesday the quarter-deck of the vessel, having risen to the surface, was towed on shore by the fishing-boats. The cabin staircase and skylight were attached to the deck, as also the cabin floor. Below the deck was a writing desk marked "William Banks, 1836." No bodies have as yet come ashore in addition to those mentioned in our last. The following is a statement of the number of passengers and crew of the Pegasus, according to the latest estimate in the local papers:—Cabin passengers, 18; steerage, 23; crew, including firemen, 14. Total, 55; of whom there were saved 6. Drowned, 49.

Hythe.—It appears that the English vessel mentioned in our last as having been run down by a French Government steamer, did not founder as was supposed, but was discovered on the following morning by a brig belonging to Great Yarmouth, and carried into Dover harbour. The mate, also, who was reported as killed, was found on board the wreck, unhurt.

Liverpool.—John Anderson was again brought before Mr. Rushton on Thursday, on the charge of having had

sums of money in his possession, knowing the same to have been stolen from Mr. Marquis, at the Preston Guild, and Mr. Blakemore, M.P. Mr. Dowling, commissioner of police, produced the gentleman whose pocket had been picked of 1999*l.* at the Preston Guild, which had become necessary in consequence of the evidence given last day by Mr. Jennings, clerk in the Branch Bank, that he had changed the stolen notes for the prisoner at the bank, by substituting for them others of a similar amount. Mr. Marquis accordingly deposed that he lived at Accrington, and when at the Preston Guild in September, 1842, lost 1999*l.* in notes. They consisted of two 500*l.* and nine 100*l.* notes, which he received from Cunliffe and Co., Blackburn. Since the robbery he had ascertained that the numbers were known to the clerk at the bank, from whom he had received them. All the notes were of the Manchester branch of the Bank of England. A woman had been apprehended in London and convicted of stealing the money from him. There was a 100*l.* note produced at her trial, found at Birkenhead the day after the robbery. Mr. Rushton said it would be necessary to have the banker's clerk who paid the notes to Mr. Marquis, and knew the numbers, examined. Two inquiries have since taken place, and the prisoner is still remanded.

Maidstone.—Some particulars connected with the discovery of the body of a young female in the Medway, at Maidstone, under very suspicious circumstances, have appeared in the daily papers. On Friday the inquest took place before the coroner for the borough, and from the rumours circulated in the town the inquiry created considerable interest. The first witness was a boatman, who proved that, while he was waiting upon the river bank, about half-past ten on Wednesday night, he heard a screaming up the water for about two minutes, which appeared to come from a woman's voice. He was about to get into his punt to see what was the matter, when he heard footsteps, and a woman's voice say, "Oh dear, oh dear, what shall we do?" He plainly saw two men and a woman, and one of the men said, "Come along—she's all right," and they all then walked along very fast. He went up to them, and gave them into custody, and afterwards got drags and discovered the body, but life was quite extinct. The surgeons who examined the body after it was taken out of the water found no marks of violence about the deceased. The three persons accused were examined, but nothing was elicited further than that they heard a noise as of a person drowning, and that the woman in their party was greatly frightened. Some other evidence was adduced, and the jury returned a verdict of "Found drowned." The prisoners in custody were afterwards examined before the mayor, but there being no evidence to implicate them in the transaction, they were discharged from custody. The borough police, however, are still pursuing their inquiries into the affair.

Manchester.—On Tuesday last, while workmen were employed in strengthening the curbs to exclude the water from the pits in Mr. Fitzgerald's colliery, at Pendleton, the whole gave way, and the water rushed into the pits with such violence that the entire colliery was destroyed. The loss to Mr. Fitzgerald is stated to be at least 50,000*l.*, and several hundreds of workpeople are thereby thrown out of employment. The pits supplied nearly 1,000 tons of coals daily to the Manchester market.

Rochester.—Last week the bodies of a man called Hendery, and of a young woman called Hannah Sancto, daughter of the innkeeper at Stroud, were found drowned in the Medway, clasped in each other's arms, which were tied together by a piece of tape. It appeared at the inquest that the parties were to have been married, but that some obstacle had been raised by Hendery, who for some days had been in a desponding way. Subsequently the young woman went to meet him, but never returned home again. On Thursday last the bodies were found. After the jury had retired some time to consider their verdict, they reported that seven of the number were for a verdict of "Felo de se," and the remainder for that of "Temporary insanity." The coroner told them he could not assist them, as he could not take a verdict unless agreed upon by twelve of them. The jury were again locked up, each party continuing to uphold their opinion. After some hours they all, with the exception of the foreman, agreed to a verdict of Felo-de-se, and the bodies were buried at night by the Coroner's warrant.

Shields.—The local papers state that upwards of 200 unemployed workmen of South Shields have thrown themselves on the parish, and are now employed breaking stones and covering the churchyard with gravel, at 1*s.* per day, whilst others have gone into the workhouse, where they receive the food of the house, and lodgings.

Stafford.—Another dreadful accident has just happened in the Potteries, and within a short distance of the scene where only a few weeks ago nine persons were killed by an explosion of fire-damp. It occurred on Wednesday morning, as four colliers were descending the shaft of one of a pair of pits belonging to the Broadfield Company, at Fenton, and was caused by the breaking of a spur-wheel connected with the engine used for drawing the coals. When these four men were going down one pit, a corfe of coals was ascending the other, and as soon as the spur-wheel broke, the corfe, which was within 15 yards of the top, and the men within 15 yards of the bottom, caused, by its great weight, the men to be thrown out of the pit with great velocity over the pulley-wheel. The bodies of the men were thrown a considerable height in the air, and nearly 70 yards from the mouth of the pit; they were greatly mutilated, and death must have been instantaneous.

Ware.—A correspondence has taken place between the parishioners of Ware and the Bishop of London on the subject of the services of the church as performed in that parish. The Churchwardens transmitted a memorial to

the bishop, signed by the whole congregation, with the exception of about five or six individuals, calling upon his lordship to recommend the vicar to return to the former mode of celebrating the Service, and abandon certain innovations of recent date. The bishop having requested to know the particular points to which objection is made, the churchwardens in reply, state that the parishioners object—"1st, to the preaching in the surplice instead of the academical gown. 2. To the entire omission of the prayer before the sermon in the morning, and to the use of the long prayer prescribed by the 55th canon, instead of a simple collect, with the Lord's Prayer, before the sermon in the afternoon. 3. To the service being concluded at the communion table with the use of the offertory, instead of dismissing the congregation with the blessing immediately after the sermon."

Wells.—The Dean and Chapter of Wells have just concluded arrangements for the immediate and thorough repair of their cathedral at an expense of about 70,000*l.*

Windsor.—In consequence of the crowded state of the small portion of consecrated ground attached to the Royal Chapel of St. George, which is appropriated for the interment of the dead, the dean and canons have removed three houses opposite the west entrance to the chapel, for the purpose of having extensive vaults excavated, extending to within a few feet of the west door leading into the nave. The catacombs are nearly completed, and will contain between 200 and 300 coffins.

Railways.—The following are the returns for the past week:—London and Birmingham, 18,704*l.* 5*s.* 2*d.*; Great Western, 17,318*l.* 19*s.* 11*d.*; S. Western, 8,426*l.* 0*s.* 10½*d.*; South Eastern, 3,550*l.* 10*s.* 8*d.*; Eastern Counties, 3,311*l.* 6*s.* 8*d.*; North Midland, 4,654*l.* 11*s.* 7*d.*; York and N. Midland, 2,170*l.* 4*s.* 1*d.*; Greenwich, 702*l.* 0*s.* 5*d.*; Croydon, 362*l.* 13*s.* 2½*d.*; Brighton, 4,305*l.* 6*s.* 11*d.*; Blackwall, 1,103*l.* 18*s.* 8*d.*; Hull and Selby, 1,189*l.* 17*s.* 6*d.*; Midland Counties, 2,724*l.* 5*s.* 2*d.*; Grand Junction, 8,349*l.* 19*s.* 1*d.*; Northern and Eastern, 1,817*l.*; Edinburgh and Glasgow, 2,400*l.*; Birmingham and Gloucester, 2,450*l.*; Birmingham and Derby, 1,280*l.*; Great North of England, 1,480*l.*; Liverpool and Manchester, 5,230*l.*; Manchester and Birmingham, 3,280*l.*; Manchester and Leeds, 5,000*l.*—The half-yearly general meeting of the Liverpool and Manchester Company took place last week. The report stated that the receipts for the half-year had amounted to 108,960*l.*, and the disbursement to 51,897*l.*, leaving a net profit of 57,062*l.*, out of which a dividend at the rate of five per cent. for the half-year was declared. While the receipts in the merchandise department had remained steady, there had been a falling off in the coaching department to the extent of 5,000*l.*, which was partly attributable to the completion of the Bolton and Preston Railway. It appears by the report that during the last six months great progress has been made in the construction of the Leeds Junction line, and of the Company's new station at Hutt's-bank.—The Manchester and Bolton Company have declared a dividend of 1*l.* 7*s.* 6*d.* per share, leaving a surplus of 1,935*l.* 1*s.* 2*d.*. The net profit for the half-year's working is stated to have been 9,008*l.* 4*s.* 1½*d.*.—A public dinner was given last week at Northampton to celebrate the passing of the Act recently obtained for the construction of the Northampton and Peterborough Railway, which is intended to join the London and Birmingham line at Blisworth. Mr. Barwell, the mayor, presided, supported by a large number of the principal inhabitants. From the remarks of Mr. Bidder, who, jointly with Mr. R. Stephenson, will act as engineer of the line, it appeared that its length is nearly 48 miles, and that the estimated amount of traffic from passengers, merchandise, and cattle, is about 40,000*l.* per annum. In its route it will form the principal medium of communication between the eastern and western districts, connecting the manufacturing districts of Birmingham and the north on the one side, with the agricultural counties of Lincoln and Norfolk on the other. The line will be worked by the electric telegraph, with one set of rails, and will pass through Thrapston, Oundle, Boston, and Kettering. It was announced that, under the direction of the Birmingham Company, the line would be commenced immediately.—The half-yearly meeting of the Greenwich Company was held on Tuesday. The report announced that the traffic account, as compared with the corresponding period of last year, showed a falling off of 119,000 passengers, and of 2,327*l.* in receipts, and which was attributable, in the opinion of the directors, to the omnibus and steamboat competition. The directors therefore recommended that the fares of the railway be reduced from 6*d.* and 8*d.* to 4*d.* and 6*d.*. The net profit for the half-year amounted to 1,103*l.* of which 1,000*l.* would be appropriated towards the expense incurred in asphaltting the line. The directors regretted the issue of the late Parliamentary contest with the Croydon Company to prevent the construction of the Bricklayers' Arms branch. The adoption of the report having been moved, an amendment was moved and seconded, that a committee be appointed to investigate the affairs of the company, and that they apply themselves more particularly towards effecting an amicable arrangement with the neighbouring lines at London-bridge, report on the great falling off in the traffic returns, and suggest the best means for its speedy restoration. The proposition elicited a long and clamorous discussion, but was ultimately carried.—On Tuesday last a regular communication between London and Boulogne was established by way of Folkestone; two trains being despatched twice a day on the Dover Railway, in connection with steam-vessels between Folkestone and Boulogne, working each way, every tide. The event was celebrated by a public entertainment given at Folkestone by the Mayor and inhabitants of that town to the Mayor and Corporate Officers of Boulogne. About 120 gentlemen

were present, and the band of the national guard of Boulogne played some of the national airs of France and England during the entertainment.—The directors of the Brighton Company have issued their new list, reducing the fares and altering the time table. Six trains will carry third-class passengers to and fro every day; the fare is reduced to 5s., and on Sundays every train will convey third-class passengers.—The up and down morning mail trains on the London and Birmingham Railway have been accelerated this week, the whole distance being accomplished in four hours and a half. For this increased speed, and for the superior accommodation which these trains, composed wholly of first-rate carriages offer, an additional 2s. 6d. per passenger is charged.

IRELAND.

Dublin.—The Commissioners of the Great Seal, in the absence of Sir E. Sugden, have superseded Mr. Geoffrey Martin, from the commission of the peace for Mayo, for having attended a Repeal meeting at Ballinrobe on the 24th ult. The Lords of the Treasury have given notice that all revenue officers who may attend Repeal meetings will be dismissed from her Majesty's Service. The meeting of the Repeal Association took place on Monday, when Mr. O'Connell announced that he had received a letter from M. Ledru-Rollin, for which he felt exceedingly grateful. It was exactly suited to the temper of the times; but the letter was written in French, and he had not had time to have it translated. He would therefore not read it then, but would move that the society adjourn to Friday, for the purpose of reading M. Rollin's letter, and paying it that respectful attention to which it was entitled. This gentleman, he said, had tender claims upon Ireland, as he had married an Irishwoman, who had shown her taste in making so good a choice. He next spoke of the miserable condition of the people amongst whom he had recently travelled. Nothing, he said, could be more dreadful than the increasing fatness of the beasts of the fields, and the increasing leanness of the population. They lived in habitations not fit for swine. The clothing they were ragged—not robbed—in, was disgusting. The brute beast was there everything—and man nothing. The soil was abundantly cultivated, under a better system, to support four times its present population. The rent for the week was announced to be 2,004l. 10s. 8½d. It was ordered that the Association bands should play none but Irish tunes, with the exception of "God save the Queen." Great preparations, it was also stated, were making for an extraordinary and purely Irish meeting on the celebrated hill of Tara, and new Irish harps were making for the occasion.

Mayo.—The Repeal demonstration of the county of Mayo took place at Castlebar, on Monday. Mr. Mark Blake, M.P., in the chair. The local papers estimate the numbers present from 250,000 to 300,000 souls. The meeting presented little novelty, but at the dinner in the evening, at which Mr. D. Browne, M.P., presided, Mr. O'Connell and Dr. M'Hale, titular Archbishop of Tuam, spoke at great length on the affairs of Ireland. Dr. M'Hale called upon the enemies of Ireland seriously to apply themselves to redress her wrongs, to heal her evils, to restore her to equality by the management of her own concerns, and by the enactment, with the consent of the British Sovereign, of her own laws. Then, and never until then, would they see the end of this, or of a similar agitation. It was well for the Government, for England, and for the empire, that the discontent of the people flowed through such legitimate and innocuous channels, and grateful ought they to be to their illustrious guest and the Catholic hierarchy for their lessons of wise forbearance, compassionate sympathy, and active co-operation, in forwarding the only measure which could bring relief to the people on a large national scale. He said that in reply to a petition for an increased grant to Maynooth, the Secretary for Ireland had demanded what *quid pro quo* would the trustees of the college give the Government in return? But he would venture to say that the Catholics of Ireland were not yet prepared, and never would be, to hand over, for an additional grant to Maynooth, to the Secretary of the Castle, any further control over the education of their priesthood. The *quid pro quo* was at the bottom of everything. This it was which Whigs and Tories, for they were all equally Saxons, aimed at in their grants for education, and in all their insidious overtures for pensioning the Catholic clergy; and he was convinced that if the Government did get the control demanded, it would soon happen that their books of instruction and theology would be intrusted to some Saxon prelate whom habitual revilings of the Irish people and their creed happened to place on one of the archiepiscopal thrones of Ireland, recommended by the bigotry of his past life as the fittest instrument silently to work their perversion." The Rev. Prelate then proceeded to consider what would be the result of the present movement, concluding by assuring his auditors that it must end in a repeal of the legislative union.

Tipperary.—Another murder has just been perpetrated in the north division of this county. A respectable farmer, named Rody Donohoe, who lived at Nicane, near Toomavara, was waylaid by four men, who beat his head into a mutilated and shapeless mass, with stones and bludgeons. The resident magistrate, from Nenagh, was at the scene of the outrage at midnight, when he concentrated the police from the adjacent stations, and scoured the surrounding country, but without any success. Some suspicious characters were arrested, but were released after examination. The murderers, who were four in number, were seen by several persons. They were strangers, and armed with sticks only; they had been lying concealed in a pit, and rushed out of it upon their victim.

This murder, like all others in the same county, with one or two exceptions, is attributed to the taking of land, and Rody Donohoe was murdered in mistake for his brother John, who had lately taken some land in the neighbourhood of Toom, from which the Shelleys, relatives of his by marriage, had been ejected. The mistaking of one brother for the other is a further confirmation of the four men being strangers in the locality.

Ahascragh.—The presiding magistrates, after a patient investigation into the cases of the different prisoners, have determined upon a summary conviction of twenty of them. Different judgments were pronounced, varying from 10s. fine (or imprisonment) to 2l. 10s., which was the highest penalty inflicted. Ten of the prisoners have gone to Galway gaol, the other ten paid the fines. Warrants have been issued for the apprehension of ten more of the rioters.

Cork.—In pursuance of orders received by Admiral Bowles from the Admiralty, the entire fleet at present stationed at Cove, is said to have received orders to be in readiness to sail in a day or two. In pursuance of those orders, the *Racer* and the *Tyne* have already sailed.—The arrangements for the meeting of the British Association are nearly completed. The sectional meetings are to be held in the Court Houses and Grand Jury Rooms, the Chamber of Commerce, and Commercial Building Rooms, &c., and it is said that besides the two promenades and soirées given by the association, a ball on an extensive scale, under the direction of the local committee, will take place at the Corn Exchange Rooms, which is to be boarded over for the occasion, and a gallery raised so as to accommodate 1,200 persons. Prince de Canino, nephew of Napoleon, is expected to visit this city during the meeting of the association.—Ballincollig powder-mills, near this city, exploded on Saturday, and two persons were killed.

Monaghan.—As Dr. Coote, of Carn Cottage, was returning home on the 20th ult., after driving a friend in his car to the ferry at Foxshore, Lough Erne, he was fired at when going down a hill by an assassin whom he did not see. After having travelled some distance on the road he got out of the car, and discovered that the ball had perforated the step. The only cause that can be assigned for this outrage is, that Dr. Coote had attended an Anti-Repeal Meeting in his neighbourhood a few days before.

SCOTLAND.

Glasgow.—The local papers announce the death of Mr. Charles Mackintosh, of Dunchattan and Campsie, whose name is known far and wide as the inventor of the Indian-rubber cloth. At an early period of life he distinguished himself as a chemist, and became the friend and correspondent of many of the most celebrated men of his day. His successful practical application of scientific principles to the manufacture of various ingredients used in the processes of dyeing, printing, and bleaching, is known to the whole mercantile world; and the large works which he carried on for these purposes at Hurler, Campsie, and Dunchattan, have long been objects of interest to strangers visiting Glasgow. The discovery of a cloth impervious to wet, with various other ingenious contrivances, for some of which patents were taken, extended his celebrity, and secured his election as a fellow of the Royal Society.

THEATRICALS.

HAYMARKET.—A new comedy, in five acts, called *Moonshine*, from the pen of Lady Emmeline Stuart Wortley, was produced at this theatre on Thursday night. The authoress has laid her scene in Rome, among a party of English fashionables who are staying in that city. An intriguing mother with a brace of marriageable daughters, and a wealthy unmarried nobleman and his younger brother, a titled but penniless French adventurer, and a modern specimen of a member of Parliament, were the chief characters of the piece. There was a good deal of applause at the outset, evidently prompted by something of a feeling of gallantry; but as the play went on it became less frequent and more feeble in its expression. As early as the close of the first act there were some sounds of disapprobation, which were occasionally repeated as the succeeding acts proceeded. At length coughing and sneezing succeeded hissing, and had increased so much before the close of the fourth act that Mr. Webster came forward and entreated the audience to bear the play to the close. This appeal had the effect of restoring silence during the remainder of the performance; but at its conclusion, when Mr. Farren came forward to announce the piece for repetition, he was greeted with such a volley of cries of "off, off," amidst some very pertinacious applause, that he was unable to obtain a hearing. The characters were strongly cast, and Mr. Farren, Mrs. Glover, Madame Vestris, &c., did their best to ensure success.—On Wednesday night, Mr. Webster, the manager, devoted the entire receipts of a crowded house towards the fund now raising for the relief of the orphans of the late Mr. Elton.

THE PATENT THEATRES.—It is stated that M. Benedict has been engaged by Mr. Bunn as conductor of the music in the forthcoming season at Drury-lane Theatre, which will open on the 1st Oct. It is presumed that the new lessee will make opera, ballet, and spectacle, his staple commodities of attraction. Mr. H. Wallack, on the other hand, is making engagements for Covent-Garden Theatre, which lead to the conclusion that he will follow in Mr. Macready's footsteps to uphold the national drama. The theatre will open under his management in September.

Miscellaneous.

New Tank at Windsor Castle.—In consequence of the difficulties which presented themselves in the attempts to

obtain a supply of water on the premises of the New Royal Gardens at Frogmore, (which extend over an area of upwards of twenty acres,) the Commissioners of Woods and Forests determined upon the erection of an enormous tank in the private gardens at Windsor Castle, to communicate by means of iron pipes with Frogmore-house and gardens; the private gardens at Windsor Castle being upwards of 40 feet above the level of Frogmore. This tank which is 100 feet long, 10 feet wide, and 7 feet in depth, has just been completed by Mr. Stacey, bricklayer to Her Majesty. It is composed of brickwork, of a most substantial and durable character, and faced with cement. It will contain 7000 cubic feet of water, or upwards of 42,000 gallons, and will be kept constantly supplied by the Queen's engine from the Thames, in Datchet-lane; the water pumped up by the Royal engine first supplying a large tank on the top of the George IV. Tower, which supplies the fountain and reservoir in the private gardens, and thence it proceeds to the newly-erected bricked tank. Iron pipes, 6 inches in diameter, are laid down across the Home-park from the Castle to Frogmore, with 25 branch pipes from the main carried to various parts of the extensive kitchen-gardens, for the convenient supply of water at every part of them. Branch pipes also from the main will communicate with Frogmore-house, for supplying the whole of the establishment of the Duchess of Kent. Frogmore-house is now but scantily supplied with water from some wells in its immediate vicinity, at considerable uncertainty and inconvenience. The tank in Her Majesty's private gardens will be covered with cast-iron girders and (stone) landings, and will be completely hidden from view. It may be observed, that in attempting to obtain a sufficient supply of water for the new gardens at Frogmore, upon the premises, several borings took place, and some to the depth of upwards of 200 feet; but although plenty of water was obtained, it would not rise in any one instance within 15 or 20 feet of the surface. Under these circumstances it was deemed necessary either to have a steam-engine erected over one of these wells to pump up the water, or to adopt the plan which has now been perfected. The latter will prove in the end by far the least expensive, as not one farthing further outlay of money will be required for a period of many years, and an immense daily supply of water obtained for all the purposes for which it will be required. The whole of the works, which are most substantial and complete, will have been accomplished within a period of five weeks from their commencement.—*Times*.

Egyptian Antiquities.—A letter from Dr. Lepsius, a member of the scientific expedition sent by the King of Prussia to Egypt, has just announced that the ruins of the ancient labyrinth and of the Pyramid of Moeris have been discovered. The account states that former descriptions, particularly of Messrs. Jomard and Coutelle, by no means agree with the real localities, and that the drawing of Mr. Perring Colonel Wyse's clever architect, gives but a poor idea of the existing ruins. There are some hundreds of chambers standing, with walls of from fifteen to twenty feet high, and the name of Moeris has been frequently found amongst the inscriptions. Dr. Lepsius says that the supposition of Manetho that this monarch belonged to the twelfth dynasty is confirmed. The supposition that the ancient Lake of Moeris was at Birke-el-Kernn is found to be incorrect. The immense embankments, 160 feet wide, of the real lake have been discovered by M. Linant, a French architect in the service of the Pacha. Its use was as a reservoir for the waters of the Nile in order to pour them out in times of drought over the plains of Memphis and the provinces bordering on the Delta.—*Times*.

Law.

VICE CHANCELLOR'S COURT.—(Before Vice-Chancellor Wigram.)—*The Corporation of Gloucester v. Wood.*—This was an application on the part of the Corporation of Gloucester, calling on the Court to order the executors of the will of the late James Wood, of Gloucester, to pay the sum of 200,000l. into the funds of the Corporation, that amount having been left to the Corporation by the will of the deceased. The case, which has been before his Honour for several days, closed on Friday. It was expected that the Vice-Chancellor would have given judgment, but he deferred doing so until next term.

Dupuy v. Truman.—(Before Vice-Chancellor Knight Bruce.)—A motion in this case was made to discharge an order made by his Honour on the 22d of June last, suspending the decree pronounced on the 15th of that month, by which Dr. Truman, the physician of the plaintiff, an elderly and infirm lady, was ordered to refund certain sums of money which he was alleged to have applied to his own uses, after they had been intrusted to his care for the purpose of being invested for the benefit of the plaintiff, with whom he was also connected by marriage. In pronouncing that decree, the Vice-Chancellor regretted that he felt himself obliged to pronounce judgment against the defendant, in account of the injury such a result might be presumed to involve, but his Honour expressed his conviction that defendant would lose no time in appealing against the decision if he felt himself aggrieved. The docket of enrolment was presented to the Lord Chancellor on the 30th of June, and the twenty-eight days during which a petition of appeal might be presented had now expired, and the defendant had taken no steps to prosecute one. Mr. Campbell, who appeared for the defendant, said that it had been the intention of the defendant to appeal, and in proof of this, he stated that he had paid the 1000l., and had entered into the other recognisances required on his behalf. The period for an appeal to the Lord Chancellor had expired, and the defendant had no intention of appealing to the House of Lords. He had come to this resolution on account of the great expense which an appeal would entail upon him, from the belief that he could not introduce any new facts which would alter the judgment, and from the consolation which he derived from the fact that he was assured in the opinions of all that knew him, that he was incapable of any dishonest or improper action. In thus bowing to circumstances, he wished it to be clearly understood that nothing like a compromise had been entered into. Mr. Roupell, who appeared in support of the motion, said that not the slightest idea of a compromise had ever been entertained. His Honour made the order. The decree must therefore be executed as if the order for suspending it had not been made. The defendant must pay the costs up to the present time.

COMMISSION OF LUNACY.—On Monday a commission de lunatic inquisition was opened before Mr. Barlow, and a special Jury, to inquire into the state of mind of Mr. David Ochterlony Dyce Sombre, formerly of Sirhind, in the Upper Provinces of Bengal, and now of Hanover Lodge, Regent's-park. The alleged lunatic was formerly elected member for the borough of Sudbury, but was unseated by petition. Mr. Calvert, of the Chancery bar, appeared in support of the commission, which was unopposed. The learned Counsel stated to the Jury that the unfortunate gentleman was a native of Hindostan, and the son of General Sombre and the Begum or Princess Sirhind. At an early age he came over to England, where he remained until the course of education laid down for him was finished, when, at the age of 19, he returned to India, and remained at the residence of the Princess, his mother, until her death, which took place in 1836. Some time before her death she made a will, bequeathing to Mr. Dyce Sombre the whole of her landed and personal property, and this will she soon after confirmed by another document. Upon the will of the Princess becoming known, the East India Company claimed the lands left to Mr. Dyce Sombre, but allowed him to retain the personal property, which was enormous. He came to England in 1838, and in 1840 he became acquainted with Miss Jervis, the daughter of Earl St. Vincent, to whom he paid his addresses, and to whom he was married in September in the same year. It was shortly after his marriage that the first symptoms of mental aberration manifested themselves, and they gradually increased until an inquiry was rendered imperatively necessary. The consent of his friends having been obtained, the present commission was instituted. Sir J. Clark, Lord Marcus Hill, and several witnesses, were examined at great length in the presence of Mr. Dyce Sombre, when the Jury expressed themselves satisfied, and declared him to have been of "unsound mind from the 27th of October, 1842." The room was crowded during the investigation by distinguished personages.

ASSIZE INTELLIGENCE.—MIDLAND CIRCUIT, LEICESTER.—Francis Bailey was charged with having, on the 3d April last, feloniously stolen in the house of the Earl of Wilton, at Melton Mowbray, a gold watch and purse, bank notes to the value of 320*l.*, and other articles, the property of his Lordship. Thomas Smith was charged with being an accessory after the fact. It appeared, from the evidence, that about four o'clock on the morning of the 3d April, the gardener at Egerton House (Lord Wilton's seat at Melton Mowbray) found the back-gate open, when an alarm was given, and shortly after it was discovered that his Lordship's dressing-room had been robbed of the articles above described, and that the thief must have been secreted in the house, and had let himself out. Information was immediately sent to the different police stations in the neighbourhood, and a reward offered for the discovery of the offender, together with a description of such portions of the property as could be identified. On the 10th of April the prisoner Bailey was taken into custody at Kegworth, a little town near Loughborough, at which latter place the other prisoner was arrested. Several of the notes were of the Bank of England, and the remainder of some bank in Grantham; and a person had been seen a few days before, both at Loughborough and in Leicester, exhibiting a large amount of money in notes of the latter bank, and in gold. Bailey had some time before been in the employ of Lord Wilton as cook, and the certainty of the robbery having been committed by some one well acquainted with the premises, together with certain suspicious conduct, led to his apprehension, when all the articles which could be identified were found upon his person, together with 180*l.* in notes. Lord Wilton stated that he had left the whole of the missing property in his dressing-room, which was partially detached from the house, when he retired to rest about twelve o'clock on the night previous to the robbery. His Lordship also identified the articles which were found upon the prisoner. Several witnesses were examined to prove the facts alleged in the indictment, and the jury having found the prisoners guilty, they were sentenced to be transported, Bailey for life, and Smith for 14 years.

NORFOLK CIRCUIT, CAMBRIDGE.—Considerable sensation was created in Cambridge on Friday by a rumour, which turned out to be true, that Henry Burnham, a farmer of Whittlesey, in the Isle of Ely, who was convicted on the preceding day of an assault upon his wife, with intent to murder her, and sentenced to transportation for fifteen years, had put an end to his existence. The prisoner, it appears, was locked up in his cell a little before seven o'clock on Thursday evening, the turnkey, as is usual under the circumstances, removing his outer clothing. Everything was removed from his possession which was likely to afford him an opportunity of doing violence to himself, and he was heard, it is said, by a lad who was in an adjoining cell, moving about so late as two o'clock in the morning. After that hour nothing was heard of him, and when the turnkey went to his cell, at eight o'clock, he found him suspended by the neck from a bar in a small ventilator, which was fixed in the bar just above the door. Immediate recourse was had to medical aid, but without any effect, for, from the state of the body, it was manifest that the fatal act had been consummated for some hours before the visit of the turnkey, while the means by which it was accomplished indicated the most deliberate purpose. It would seem that having tied his stockings together, and made one end fast to the bar in the ventilator, he added to the other his braces, which he placed round his neck. The length of these must have been such as to leave him little or no room to effect his purpose in the ordinary way, for, when discovered, his legs were nearly on the floor, and the lacerated condition of his neck and throat showed that strangulation must have been caused by sheer violence on the part of the deceased. In the course of the day a coroner's inquest sat upon the body, and after an attentive investigation both into the circumstances immediately attendant upon the death, and the whole history of the man's life, a verdict of "Temporary insanity" has been returned, grounded, no doubt, upon the testimony of his relations and friends, who deposed to many acts of violence attempted both on himself and others, of a character closely indicative of a mind disordered at intervals.

HOME CIRCUIT, LEWES.—*Mucintosh v. The Wardens and Fellows of New College, Oxford.*—This was an issue arising under the Tithe Commutation Act, which has been already twice disposed of, and which was now brought forward for the third time. The plaintiff is the holder of a large quantity of land in the neighbourhood of Romford, known as Havering Park, and which was formerly a Royal demesne; and it was contended that, in lieu of tithe in kind, this land was only subject to the rendering of a fat buck and doe, in the proper season, to the vicar of Hornchurch, in which parish the park is situated. The property in question was in the hands of the Crown in the reign of Henry II., and that Monarch leased or granted the right of tithes to the monks of St. Bernard and Montjoie, in Savoy, by whom they were held until, in the reign of Richard II., the property was transferred by a license of the Crown to William of Wickham, the founder of New College, Oxford, and it has ever since been in the hands of that corporation, and they have received the tithes accruing upon it, and have appointed ministers to the parish church of Hornchurch. The case on the part of the plaintiff was, that from time immemorial no tithes in kind had ever been paid for the park, and a variety of ancient documents were put in to support the claim of exemption, and amongst them was a parliamentary survey, made in the time of the Commonwealth, and which, after minutely describing all the land in question, expressly stated that it was entirely exempted from the payment of tithe in kind, and that the only rendering in the shape of tithe was a fat buck and doe, in the proper season, to the parson of Hornchurch. In the course of his address to the Jury, the Solicitor-General complained of the litigation that had been occasioned by the New College authorities, and he said that, after the solemn decision of two Juries, affirming the right of the plaintiff to the exemption from payment of tithe, they had, upon a mere technicality, occasioned the necessity of a third trial, and he added, that he was convinced he should be able to satisfy the

Jury that the College had no legal ground for claiming tithes, and he trusted the Jury would defeat their unjust attempt to increase their revenues at the expense of the plaintiff, who had purchased this land from the Crown as tithe free, and paid for it accordingly, and to whom it would be a great injustice if he were compelled to pay an impost to which he had no idea that he was liable. The various deeds and documents that were produced on the former trials were then again put in evidence, and witnesses were also examined, who proved that within the time of living memory, no tithe in kind had ever been paid for the park, and that a modus of a buck and doe had always been given in lieu of tithe. Sir T. Wilde made a very long address to the Jury on behalf of the authorities of the college, who he denied to have been actuated by any desire for litigation, but who, he said, being placed in the situation of trustees for the benefit of others, were bound to assert those rights to which they considered themselves legally entitled. He then proceeded to comment upon the evidence that had been adduced on behalf of the plaintiff, and contended that it was by no means conclusive of the fact of the existence of the modus that was set up. Mr. Baron Parke having summed up, the Jury, after a short deliberation, returned a verdict for the plaintiff, thus establishing the right of the land to be held tithe free. The cause occupied the Court nearly eleven hours, and it is anticipated that this verdict will set the question for ever at rest.

SPORTING.

GOODWOOD RACES.—FRIDAY.—*Chesterfield Cup*, by subs. of 15 sovs. each. Craven Course. (32 subs.) Lord Milntown's Scalteen, 4 yrs, 7st 10lb, beat Lord Exeter's Wee Pet, 3 yrs, 6st 10lb; Mr. Forth's Policy, 4 yrs, 8st 11lb, and 19 others who started, but were not placed.

Nassau Stakes of 50 sovs. each for three yr old fillies. The New Mile. (16 subs.) Mr. Payne's Maria, 8st 13lb, beat Lord Exeter's Maria Diaz, 8st 7lb; Lord Exeter's Macremma filly, 8st 7lb; Lord Milntown's Birdeen, 8st 7lb, and Lord Eglington's Egidia, 8st 7lb.

First class of the March Stakes of 10 sovs. each, h. ft. Three quarters of a mile. (61 subs.) Seven in each class, 47 paying 5 sovs. for each to the winner of the challenge. Lord G. Bentinck's African, 4 yrs, 10st, (Lord March), beat Lord G. Bentinck's St. Jean d'Acre, (Lord Maidstone); Mr. Gardner's Monopis, 6 yrs, 11st, (Owner); Duke of Richmond's The Currier, aged, (Lord Paget), and Lord Eglington's Jamie Forest, 6 yrs, (Capt. Pettat).

Second class of the March Stakes. Lord G. Bentinck's Misdeal, 4 yrs, (Mr. Gardner), beat Duke of Bedford's Currycomb, 6 yrs, (Capt. Williams); Lord Chesterfield's Rhodanthé, 6 yrs, (Mr. R. Oliver); Mr. Bigg's Eleus, 4 yrs, 11st 7lb, (Gen. Gilbert), and Lord G. Bentinck's Yorkshire Lady, 4 yrs, (Lord March).

Challenge for the March Stakes. Lord G. Bentinck's African, 10st 10lb, (Lord Maidstone), beat Mr. Bigg's Eleus, 10st 7lb, Gen. Gilbert; Lord G. Bentinck's Misdeal, 10st 10lb, (Lord March); Lord Eglington's Jamie Forest, 11st 7lb, (Capt. Pettat); Mr. Gardner's Monopis, 11st, (Mr. Gardner), and Lord G. Bentinck's St. Jean d'Acre, (Capt. Williams).

Matches 300 sovs. h. ft. Old mile. Mr. Theobald's Highlander, 8st 2lb, beat Lord G. Bentinck's Farintosh, 8st 7lb.—300, h. ft; 8st 10lb each. T.Y.C. Col. Peel's c. by Touchstone, out of Vulture, against Mr. Trean's Barricade. Off by consent.

lb., 1s 9d	Urate, per ton, 5 <i>l.</i>
— pulverised,	
ready for use, per cwt., 24s	

MARK LANE, FRIDAY, AUGUST 4.—There were several parcels of Essex Wheat here to-day, which realised an advance of 1*s.* from Monday's quotations; in some instances a trifle more was made of free Foreign, and 1*s.* generally asked; there was also a better demand for free on board Wheat. Barley, Peas, and Beans, are fully as dear. The Oat-trade was very flat.

GAZETTE OF THE WEEK.

BANKRUPTS.—T. Skinner, Dorking, Surrey, butcher.—J. and G. Wilkinson, Leadenhall-street, indigo-brokers.—A. Laing, Halifax, Yorkshire, draper.—H. M. Godwin and C. Lee, Bishopsgate-street, shipowners.—W. Runtz and W. Jeffcoat, East Harding-street, bookbinders.—J. Martin, Boxley-hill, Kent, victualler.—R. Davies, Abercrombie, Monmouthshire, grocer.—T. and W. S. Bate and J. Hollings, Kewbury, Staffordshire, brewers.—N. Neal and B. Solly, Rowley Regis, Staffordshire, iron-masters.—J. Wright, Exeter, builder.—John Thomas Banks, Southminster, Essex, grocer.—James Vincent, Edmonton, Middlesex, schoolmaster.—John Masters, the younger, Witney, Oxfordshire, innkeeper.—John Woolam, St. Alban's, Hertfordshire, silk-throwster.—Philip and Solomon Beyfus, Ilminster, importers of French goods.—Jeremiah Scott, Manchester, innkeeper.—William Blanks, Rochford, Essex, draper.—John Mease, Hutton, Yorkshire, flax-spinner.—Robert Jones, Newborough-house, Carnarvon, draper.—George Hall, Birmingham, leather-seller.—Thomas Southern, Gloucester, grocer.—John and Thomas Harriman, Nottingham, drapers.—Sarah and Timothy Ross, Leicester, hosiers.—Robert Cragbie, Sutton, Cheshire, tea-dealer.—George Allison, Darlington, Durham, scrivener.

SCOTCH SEQUESTRATIONS.—D. B. Macgregor, Leith, auctioneer.—J. C. C. Larnack, messenger-at-arms.—R. Strachan, Kirkliston, maltster.—W. Paterson, New Sauchie, grocer.—A. Aitkenhead, Patrick, victualler.—A. Cousland, Glasgow, wireworker.

BIRTHS.—On the 27th ult., at St. Andrew's, Fifeshire, the wife of Robert Maidstone Smith, M.D., Oxon., of a daughter.—On the 29th ult., at Sandwell, in Staffordshire, the Countess of Dartmouth, of a daughter.—On the 29th ult., at Kempton, Brighton, the lady of C. J. V. Hervey, Esq., of a daughter.
MARRIAGES.—On Saturday, the 29th ult., at Brighton, the Right Hon. Lord Erskine, to Miss Ann Bennet, a daughter of the late John Bennet, Esq., of Lancashire, and first cousin of the late Lady Erskine.—On the 29th ult., at St. Mary's church, Bryanston-square, Seymour Place, Esq., to Catherine, daughter of the Hon. and Lady Catherine Folgers, at St. George's, Hanover-square, Mr. G. Chetwynde, eldest son of Sir G. Chetwynde, to Lady Charlotte Hill, eldest daughter of the Marquis of Downshire.
DIED.—On the 23d inst., on board her Majesty's ship Howe, W. C. Phillett, Esq., Commander.—On the 29th ult., at his house in Harley-street, his Grace the Duke of Dorset, K.G.—On the 31st ult., at Holywell Lodge, Oxford, Charlotte, wife of the Rev. Vaughan Thomas.—On the 2d ult., at his residence, Cheltenham, Sir E. Syngue, Bart., aged 57.—At the seat of Mr. Stewart Kerr, country Antrim, the Dowager Lady Dufferin and Clanebohy, in the 66th year of her age.

AGRICULTURAL EDUCATION.—The Proprietor of a respectable Academy, some distance from town, who is also connected with Farming, has a VACANCY for two Pupils, between the ages of 8 and 15, who will devote a part of the day to Scholastic pursuits, and the other to those of Agriculture, the practice of which is conducted upon the improved system. English, French, Latin, Greek, Drawing, and the Mathematics, are the principal branches of literature that will be taught.—For terms, &c., apply by letter to X. Y., 6, Old Cavendish-street, Oxford-street.

ELECTRO-PLATED and GILT ARTICLES.—ELKINGTON & Co., Patentees, beg to announce that, to meet the increasing demand for this manufacture, they have opened an Establishment at No. 22, REGENT-STREET, (CORNER of JERMYN-STREET), where every variety of articles for the Side-board, Dinner, Dessert, and Breakfast Tables may be inspected.

They have also a similar assortment at their City Establishment, No. 45, MOORGATE-STREET, where they have a MANUFACTORY for PLATING and GILDING, RE-PLATING and RE-GILDING ARTICLES of every description, and of ALL METALS.

With reference to articles of their manufacture, the Patentees beg to state that they differ from all goods hitherto offered as "Plated Goods" or "Substitutes for Silver," being made in the same manner as SOLID SILVER, from which they cannot be known, and being also composed of a hard white metal, strongly coated with silver by the Electro process.

Silver Articles of every kind or pattern exactly copied. Every article made by the Patentees bears their stamp (E. & Co. beneath a Crown.)

CHEAP STATIONERY, CUTLERY, WORK-BOX, WRITING-DESK, and DRESSING-CASE MANUFACTURER.—Sloper's Embossed Postage Envelopes, without Advertisements, 1*s.* per dozen to purchasers of other articles; fine Bath-post, 3*d.* per Quire, 5*s.* per Ream; ditto Note, 2*d.* per Quire, 3*s.* per Ream; Queen's Size (Note), 2*s.* per Ream; very superior Foolscap, 8*d.* per Quire, 12*s.* 6*d.* per Ream; Envelopes, 6*d.* per 100; Copy Books, 4*d.* each, 3*s.* 6*d.* per dozen; good Pens, 1*s.* 6*d.* per 100; Embossed Blotting Books, 6*d.* each; superior Bibles, gilt edges, 1*s.* 10*d.* each; ditto Prayer Books, 1*s.* 6*d.* each; good Pen-knives, 6*d.* each; Rosewood Work-boxes, 2*s.*; Rosewood and Mahogany superior Desks, 7*s.* 6*d.*; superior Pocket-books, 6*d.* each, &c., &c. Goods exchanged, or Money returned if not approved of. A name-plate engraved, and 100 best Cards printed for 4*s.* 6*d.*. Bookbinding, Printing, and Engraving, at the lowest terms; 10 per cent. off new Books and Music. Parcels of 2*l.* value forwarded 100 miles free of carriage; of 10*s.*, 5 miles from London, and any amount in town. Lists of Prices, and samples of Paper, sent on the receipt of two postage-stamps, from SLOPER'S Stationery Warehouse, 20, George-street, Portman-square, London.

SNOWDROPS.—A quantity of Double and Single SNOWDROPS WANTED. Samples, with price, to be sent, carriage or post-free, to A. B., 156, Cheapside, London.

COUNTRY HOUSE WANTED, Unfurnished, for a term of years.—A Gentlemanly Residence, detached, in perfect order, between 30 and 50 miles of London. The situation must be elevated and healthy, free from the neighbourhood of stagnant water or marsh land, on a light or gravelly soil, with southern aspect. The house must contain 3 or 4 best bedrooms, nurseries, 3 servants' rooms; dining and drawing-rooms, not less than 21 ft. by 16 ft.; good morning room, usual domestic offices, well supplied with water; 4-stall stable; good pleasure-grounds, flower and kitchen gardens, with from 14 to 20 acres of meadow land; and within a mile of a church and a village, and 3 or 4 of a good town. The house must stand in its own grounds, and a lodge-entrance for the gardener would be preferred. Full particulars to be addressed to Messrs. HENDER, Land-Agents, 10, New Bond-street, opposite the Clarendon,—at whose offices Cosmographic drawings of properties may be seen.

ROYAL POLYTECHNIC INSTITUTION.—CARTOONS OF RAPHAEL.—The Series of ORIGINAL CRAYON DRAWINGS (by Holloway) which were executed for the well-known ENGRAVINGS of these CARTOONS, are now exhibiting, with other additions to the numerous works, both in Art and Science, in this Institution. The LECTURES of Dr. RYAN, Professor BACHHOFFNER, and Mr. GODDARD, are at Twelve, Two, a Quarter to Three, and Five daily, and at Eight o'clock in the Evenings. In these Lectures, AGRICULTURAL CHEMISTRY, and every recent Scientific Discovery is explained in a popular manner. The COLOSSAL ELECTRICAL MACHINE, NEW MICROSCOPE (by Carey), DISSOLVING VIEWS, DIVER and DIVING-BELL, &c. &c. Open Mornings and Evenings, except Saturday Evening. Admission, 1*s.* Schools, Half-price.

GROWTH OF PLANTS.—HUMPHREYS'S GINODOROUS SOLUBLE COMPOUND, to promote the Growth of Plants. Dissolved in water, this valuable Preparation may be used with great advantage either in the Drawing-Room, or in the Conservatory. A single bottle is equal in fertilizing force to some hundred weight of rich Compost; and by its use, not only common plants are improved by increased brilliancy of flower and deeper verdure, but valuable Exotics are so strengthened as to resist the usual alternations of temperature, and may be preserved without a Greenhouse. Sold in bottles, 1*s.* 6*d.* each, with full Instructions for Use, by FLANAGAN & SON, Mansion-House-street; Hurst & M'ULLEN, Leadenhall-street; Wm. CLARK, Bishopgate-Within; and other leading Seedsman, &c. in town and country. Wholesale Agents, DAVY, MACKMURDO, & Co., 110, Upper Thames-street, London.

WANT PLACES.—All Letters to be post-paid.

AS GARDENER.—A middle-aged, married Man, without incumbrance, who has a thorough knowledge of his business, in Forcing of Fruits and Flowers, the management of Pleasure-ground and Kitchen-garden, and can have a good character from the gentleman he is about to leave.—Direct to R. E., Gunnersbury Lodge, near Acton, Middlesex.

AS GARDENER.—A young Man, 28 years of age. He can be highly recommended for strict integrity and a general knowledge of Gardening in all its various departments, by some of the Noblemen's Gardeners he has lived with.—Direct to C. S., 2, Henry-street, Upper John-street, Liverpool-road, Islington.

AS GARDENER.—A single Man, aged 30, who, from the advantageous circumstances in which he has been placed, in connexion with Horticulture, has enjoyed ample facilities for acquiring a practical knowledge of the various branches of the profession, to which he has ever been much attached; and would, with confidence, refer any lady or gentleman to his present employer for character, whom he is about to leave in consequence of that gentleman's intention to leave England.—Direct to J. S., No. 9, Margaret-street, Stamford Hill, Middlesex.

AS GARDENER.—A middle-aged married Man, without family, who well and practically understands his business. He can have an excellent character. His wife is a good plain Cook, if wanted. He has no objection to in-door or out, or to any part of the country. Address, R. W., at Mr. ANSELL'S, Camden Nursery, Camden Town.

Printed by Messrs. BRADBURY and EVANS, Lombard-street, Fleet-street, in the Precinct of Whitefriars, in the City of London, and Published by them at the Office, 3, CHARLES-STREET, COVENT GARDEN, in the County of Middlesex, where all Advertisements and Communications are to be addressed to the Editor.—Saturday, August 5, 1843.

THE GARDENERS' CHRONICLE.

A STAMPED NEWSPAPER OF RURAL ECONOMY AND GENERAL NEWS.

THE HORTICULTURAL PART EDITED BY PROFESSOR LINDLEY.

No. 32—1843.

SATURDAY, AUGUST 12.

Price 6d.

INDEX OF THE PRINCIPAL HORTICULTURAL SUBJECTS IN THE LAST NUMBER.

Alum, useful in fixing ammonia	541 c	Lupinus, Mr. H. Peggs' experiments with	543 a
Amateurs' Garden, No. XXXI.	540 b	Manures, artificial, Potter's remarks on; experiments with	541 c
Ammonia, its value for horticultural purposes	539 a	Melons, cause of their barrenness	545 a
Aphides, to destroy	545 b	Mohl (Dr.), his review of Liebig's Work	543 c
Bees, remarks on	542 c	Monsters, remarks on	545 a
Bottom-heat for a Cucumber bed	544 c	Moth, small Ermine, to destroy Norman's Carnations and Pico-	545 a
Carnations, select	543 b	tees noticed	543 b
Cereus serpentinus, blooming at Yard House	543 c	Potatoes, nitro-muriatic acid beneficial in checking the spot upon the leaves of	541 c
Cherimoya, to procure plants of	545 a	— seedling, remarks on the awards for	542 c
Chrysanthemums, to layer	541 a	— select	545 a
Clay land, to improve	540 c	Perennials, hardy, list of	544 c
Copied plants, to knock on	545 b	Picotees, select	545 b
Creeper, lady, to strike from cuttings	545 a	Link, select	545 a
Cress, for preserving butchers' meat and fish	543 b	Pit, Dunsford's, described	543 a
Cuttings, their transmission to India	539 c	Pits for Melons, M'Phail's recommended	544 c
— to prepare for sending abroad	544 a	Plants, remarks on their decomposition	543 c
Eldest wine, best work on	545 b	Roses in pots, No. 1	541 a
Exotic plants may be kept too warm	545 a	— best kinds for pot culture	541 b
Fruit, maturation of, although distant from leaves	542 b	Sandy land, to improve	539 b
Fuchsia corymbiflora, its treatment	539 c	Strawberries, benefited by the removal of the leaves in autumn	542 b
— St. Clare, a good variety	545 a	— to prepare for forcing	542 b
Gas-liquor, the manner in which it should be applied	539 a	Comte Lelieur's remarks on	543 c
Holly, remarks on pruning it	544 c	Tall trees, to increase	545 a
Hydrangeas, experiments upon changing their colour	543 a	Veitch's propagating-house, plan of	540 b
Land, barren, to improve	539 b	Watering out-door plants, remarks on	543 a
Larch, cause of its decay	542 c	Watering plants in the Ionian Islands	543 b
Letts, white Versailles, its treatment	545 a		

STONEHENGE.—DAHLIAS.

THE GRAND ANNUAL EXHIBITION on SALISBURY PLAIN will take place this season at STONEHENGE, on WEDNESDAY, August 30th, 1843. Silver Cups, value Ten Guineas, and other Prizes on a large scale, will be given. Full particulars may be had on application to J. KEYNES, Honorary Secretary, Salisbury.—August 8th, 1843.

DUTCH HYACINTHS AND OTHER BULBS.

YOUELL & Co. beg respectfully to inform the readers of the *Gardeners' Chronicle*, that one of their Firm has just returned from Haarlem, having selected a most extensive Stock of the finest HYACINTHS, as well as a general assortment of BULBS for which that city is so justly famed; and flatter themselves, from the facility of communication between Yarmouth and Haarlem, the distance not occupying more than 10 or 12 hours, and from the varieties being chosen for their great beauty and size of flowers during the blooming season, that the List will be found to contain none but the very best sorts, adapted either for glass-houses, forcing, or open border culture. Prices, as follows:

Red, Blue, White, or Yellow } 6s. per doz.
Extra fine Ditto } 9s. to 12s. "
Extra fine, and very superior Ditto } 18s. "
The selection being left to YOUELL & Co.
Also, Narcissus, Early Single and Double Tulips, Jonquils, Gladioli, Iris, Ixias, Ranunculus, Double and Single Anemones, Crocus, &c., Catalogues of which may be had on application. Bulbs added to compensate for long carriage.—Great Yarmouth Nursery, Aug. 10, 1843.

NEW FUCHSIAS.

JOHN SMITH, NURSERYMAN, Dalston, begs leave to call the attention of the lovers of this beautiful tribe of Plants, to his fine new SEEDLINGS of the present year, now in bloom. They only require to be seen to be admired, nothing like them having yet appeared. A large Collection of all the other Varieties may be seen at the same time. Dalston, Aug. 11, 1843.

SPLENDID NEW FUCHSIA, BROWN'S "PRINCE ALBERT."—Strong Plants of this new and superb variety of Fuchsia are now to be had, at 10s. 6d. each, of THOMAS BROWN, Bedford Nursery, Hampstead-road, London.

T. B. begs to inform the admirers of this beautiful genus of plants, that, owing to the very great number of flowers, in combination with the striking colour and size of each flower, "Prince Albert" Fuchsia is allowed to stand pre-eminent to any Fuchsia yet introduced to the public. Plants of it are yet in flower at the above Nursery; also to be seen at Messrs. BECK, HENDERSON, & Co.'s, Seedsmen, 67, Strand; and at W. J. NUTTING'S, Seedsmen, 46, Cheapside.

NEW, BEAUTIFUL, & CURIOUS "PASSIFLORA FIELDII." THIS beautiful PASSIFLORA was raised by Mr. FIELD, NURSERYMAN, Kensal New Town, from P. Loudonii, fertilized with Prince's. Description:—Habit Loudonii; foliage partaking of both; colour of flower deep pink, dotted with carmine; breadth of flowers 3½ inches; rays four circles, chocolate, tipped with white; length of outer rays ½ of an inch. Nectarial fringe deep chocolate, a portion of which is seated above the stamens, forming a beautiful botanical curiosity. Pistil long and crooked; stamens long and crooked, attached to the middle of the pistil; it grows and flowers freely. It was exhibited at the Horticultural Society Rooms, Regent-street, where the Certificate of Merit was awarded. See Dr. LINDLEY'S description in *Gardeners' Chronicle* of July 8th.

Small plants will be sent out early in November at One Guinea each. The seed having been sown but twelve months the stock is scarce. Orders will be supplied as received. Apply to Mr. FIELD, Nurseryman, Kensal New Town.

P.S.—The whole stock may be disposed of.

THE NEW YELLOW AUTUMNAL ROSE, "CLOTH OF GOLD," NOISSETTE.

T. RIVERS, JUN., has the pleasure of offering to his Friends a splendid new YELLOW NOISSETTE ROSE, raised in the West of France from Noisette Lamarque. This fine Rose was purchased by T. RIVERS, jun., last spring, on condition that he might give it an English name; he has therefore named it as above. T. R. visited France in July, 1842, to see it in bloom; he can therefore submit the following description as correct in every respect. Colour, brilliant yellow, of the same shade as Rosa Harrisonii; form, globular, like Noisette Lamarque, flowers of the same size; petals thick and leathery, not liable to fade in the sun; habit extremely robust, as much, or more so than Noisette Jaune Desprez. Owing to the plants being cut in closely for propagation, it has not yet bloomed here, but is in bud, and will bloom shortly. T. R. offers it now, that purchasers may have the opportunity of budding a few plants. Price 21s. each; as the stock is limited, no allowance can be made to the trade. NOISSETTE SOLFATERRE, from the same parents, and of the same robust habit—colour, pale lemon yellow, 7s. 6d. each. Sawbridgeworth, Herts, August 10, 1843.

FASTOLFF RASPBERRY.

PATRONISED BY HER MOST GRACIOUS MAJESTY THE QUEEN, HIS GRACE THE DUKE OF RUTLAND, THE EARL OF HARRINGTON, THE LORD BISHOP OF LONDON, LORD VISCOUNT LORTON, LORD SONDES, &c.; as well as by the HORTICULTURAL SOCIETY OF LONDON.

YOUELL & Co. have much pleasure in announcing they will be enabled to supply, at the latter end of Oct. next, fine Canes of the above highly-valuable and much-esteemed RASPBERRY—unequalled for the extraordinary size of its fruit and richness of flavour. Those to whom Y. & Co. sent it last season have expressed their high admiration of its superiority over all other varieties, and it has been awarded several prizes at various Horticultural exhibitions during the season. As a proof that they have not exaggerated its excellent qualities, Fruit was submitted to Dr. LINDLEY (see *Gardeners' Chronicle* of the 22d July, page 502), whose opinion of it is as follows:—"FASTOLFF RASPBERRY.—We have received from Messrs. YOUELL, of Great Yarmouth, fruit of the Fastolf Raspberry, and we find that it merits all that has been stated in favour of its excellence. The fruit received is very large, obtusely conical, and of rich flavour, far exceeding in this respect some other new and large varieties. The plants bear abundantly and in long succession." They also exhibited it, on the 1st of August, before the London Horticultural Society, 21, Regent-street, and a prize was awarded to them. It would, therefore, be unnecessary for YOUELL & Co. to recommend it more fully, or with greater confidence, to the notice of the public, merely observing that it continues in high perfection throughout the autumnal months, and has maintained its superiority in the most unfavourable soils and situations, and requires no other than the ordinary treatment of the old varieties. Fine Canes will be ready by the latter end of October, and can be sent with safety to any part of the United Kingdom (on the receipt of a Post-office order) upon the following terms:—

	£	s.	d.
Packages containing 100 Canes	2	5	0
" " 50 "	1	5	0
" " 25 "	0	14	0

Packages included. The usual discount to the Trade, when not less than 200 are ordered.

Extensive orders are already received for the above; and to prevent a repetition of the disappointment which many experienced last season, by Y. & Co. not being able to meet the demand, they therefore respectfully solicit early application. Great Yarmouth Nursery, August 10, 1843.

J. YOUNG, NURSERYMAN, Taunton, begs to offer to the lovers of HARDY FERNS collections of 25 varieties of the better British and Hardy American sorts for 11 10s.

J. Y. is now taking up a large collection of IXIAS, which have been grown in the open ground, without protection, during the last winter, and begs to offer to his Friends and the Public collections consisting of 16 or more sorts, at 4s. per dozen, in quantities of not less than six of each; they may be sent by post at a very small expense. He has also a few bulbs of *Calochortus venustus*, splendens, and luteus; a good collection of *Gladioli*, particularly seedlings, which latter he offers at 12s. per dozen, in collections, with many congeners of the *Ixia* family, *Trichonema*, *Sparaxis*, *Tritonia*, &c., &c. at moderate prices. J. Y. will furnish names of Ferns and Ixias, if desired.—August 2, 1843.

WILLIAM BELL, NURSERYMAN, Thirsk, Yorkshire, begs leave to direct the attention of the Public to his SEEDLING FUCHSIAS, and to inform those who have already ordered that they will be sent out after the 28th of August, 1843, in rotation as the orders are received. They were submitted to the Editor of the *Gardeners' Chronicle*, and the following is his decision as to their merits:—

"We have examined your Seedling Fuchsias, and compared them with many of the finest varieties at present in cultivation; your specimens possess more substance in the sepals, and the tubes are higher coloured, than any of the large-blossomed hybrids we have seen."

1. "PRINCE OF WALES, (10s.)—Tube very long, and rich in colour; petals stout, with a slight tinge of purple: very fine variety.
 2. "PRINCESS ROYAL, (10s.)—Resembles Chanderii, with a longer tube; sepals not quite so light, but tipped with green: this is equal, if not superior, to that fine variety.
 3. "ALICE MAUD MARY, (7s. 6d.)—Wants colour. We regard this as a botanical curiosity; the petals are long, separated, quilled, and each is furnished with an anther; there are four perfect stamens also; the style is very long; flower, light rosy vermillion.
 4. "FAIRY QUEEN, (10s.)—Long rough rich-coloured tube and sepals; petals stout, without purple: remarkably fine.
 5. "RUDOLPHUS, (3s. 6d.)—Red purple petals, deep rosy vermillion tube and sepals, stout in substance and rich in colour.
 6. "MAGNIFICENT, (3s. 6d.)—Tube rather longer, and flower higher coloured, than No. 5.
 7. "MAGICIAN, (5s.)—Tube rather longer, and flower higher coloured, than No. 6.
- "These three (5, 6, 7) are remarkably fine, bearing a strong resemblance to each other."—See *Gardeners' Chronicle*, June 17, 1843, p. 417, signature "Mowbray."
- The above seven Seedling Fuchsias will be sent by post for 21. 2s., or if ordered singly at the price attached to each. Parties wishing it may have them in pots delivered in London at 2s. 6d. per set extra.—A remittance will be required from unknown parties.—Thirsk, Aug. 8, 1843.

MAGNIFICENT NEW FUCHSIA, "FUCHSIA EXONIENSIS."

LUCOMBE, PINCE, & Co., beg leave to call the attention of the Public to a very superb New Fuchsia, which has been raised in the Exeter Nursery, and which is decidedly the finest variety ever produced. Flowers of it were submitted to Dr. LINDLEY, who, in the *Gardeners' Chronicle* of the 8th ult., thus expresses himself:—

"Lucombe, Pince, and Co.—The blooms sent of Fuchsia Exoniensis prove it to be a very splendid variety; it is a flower of great substance throughout, seed-vessels dark, tube and sepals of a rich crimson carmine; the sepals are long, they expand freely, and disclose the rich crimson purple corolla, which is very large, and of a peculiar denseness of texture."

The Plant was also exhibited at the last great meeting of the London Horticultural Society on the 12th ult., and obtained the Society's Certificate of Merit.

Strong Plants will be ready for delivery on the 10th inst., at 10s. 6d. each, and will be sent, free of all other charge, by the post, carefully packed in stout tin cases. The usual discount to the trade if six plants are ordered. For a full description, see Advertisement in the *Gardeners' Chronicle* of the 17th June.

N.B.—This Seedling Fuchsia has been fully proved, and will give satisfaction to those who purchase it.

ARAUCARIA IMBRICATA, or SIR JOSEPH BANKS'S PINE. YOUELL & Co., possessing the most extensive stock in the country of the above Splendid Hardy Ornamental Tree, beg to offer them on the following advantageous terms:—Fine robust, 3 year-old plants, 8 to 9 inches high, 10l. per 100, or 30s. per dozen.—Great Yarmouth Nursery, August 10, 1843.

ARAUCARIA IMBRICATA PLANTS.

MESSRS. VEITCH & SON having raised a considerable number of this Splendid Hardy Ornamental Tree, are enabled to offer fine healthy plants, from 4 to 6 inches in height, at the following moderate prices, viz.:—

10l. per 100;—5l. 10s. for 50;—and 30s. per dozen. For the convenience of some purchasers, Messrs. V. & S. have appointed, as their London agent, Messrs. HURST and M'MULLEN, Seedsmen, No. 6, Leadenhall-street. N.B.—A remittance or reference required from unknown correspondents.—Exeter, June 19, 1843.

FUCHSIA ST. CLARE.—This magnificent Fuchsia was exhibited on the 1st inst., before the London Horticultural Society at their room, 21, Regent-street, and was awarded a Prize. YOUELL & Co. are now sending it out post free, with Eleven other finest Show varieties at 21s. the dozen; also the finest show varieties of Chrysanthemums, per post free, at 12s. per dozen.—Great Yarmouth Nursery, Aug. 10, 1843.

NEW SEEDLING PICOTEE.

JOHN JOHNS begs most respectfully to inform his Friends and the Public generally that he will send out in the ensuing autumn his New, Splendid, Purple-edged PICOTEE, named "PRINCE ALBERT." Orders taken for Plants by WARNER and WARNER, Seedsmen, 23, Cornhill, and by Wm. DUNNING, Kensal New Town, Paddington, where blooms are exhibited. For opinion, see "Answers to Correspondents," addressed "W. B." in the *Gardeners' Chronicle* of August 5.

UNRIVALLED NEW FUCHSIA, "LOWRYII."

JOHN HANCOCK AND SON beg to invite the attention of their Friends and the Horticultural World in general to the above SPLENDID NEW FUCHSIA, of which they have purchased the entire Stock, and they can, without doubt, pronounce it the FINEST VARIETY ever introduced.

The habit of the Plant is dwarf and close, possessing all the elegance of the older species, and without the large coarse foliage and dinginess of colour which nearly all the modern varieties have. It is a great bloomer, the flowers hang gracefully on long footstalks, clear of foliage. The flowers are very large and distinct, the tube and sepals are of a bright scarlet crimson, expanding freely, and showing to great advantage the large beautiful blue corolla, decidedly differing from all other Fuchsias. It also blooms freely on a small Plant, which is a great advantage.

J. H. and Son, in bringing this production to public notice, feel assured that it cannot fail to give universal satisfaction. It will be found one of the gems of the year. Strong healthy plants will be ready for delivery on the 15th of September, at 10s. 6d. each, and will be sent by Post, pre-paid, to any part of the Kingdom, carefully packed in tin cases. The usual trade allowance if six Plants are taken.

Agents in London, Messrs. HURST and M'MULLEN, 6, Leadenhall-street, where Plants may be had. Wear Nurseries, Durham, August 5, 1843.

ANAGALLIS BREWERII AND SUPERB BLUE CINERARIA SEED.

MICHAEL BREWER, SEN., NURSERYMAN, &c., London Road, Cambridge, begs to offer strong plants of his Splendid deep blue, full and complete round-petaled Seedling ANAGALLIS (BREWERII), being of a strong green and vigorous habit, and remarkably well-adapted for bedding. It is now ready for sending out, at 5s. per plant, postage free, to any part of the Kingdom. Flowers have been submitted for the inspection of Dr. LINDLEY, of which he gives the following description in the *Notices to Correspondents in the Gardeners' Chronicle*, June 10:—"Anagallis (Brewerii). M. Brewer, Sen.—The flowers of your Anagallis are very large, and of a brilliant deep blue tint. If, as you say, it is of a green and vigorous habit, it will be a very desirable plant." The Messrs. HENDERSON, Nurserymen, &c., Pineapple Place, Edgeware Road, London, with several other eminent Florists, gave orders for it, on the ground of seeing the flower previous. Flowers will be forwarded to any applicant on receipt of two postage stamps.

Also, packets of his Brilliant CINERARIA SEED, comprising every shade of Dark and Light Blue tint; and as the present is the best time for sowing for Winter, and early Spring flowering, he is induced to offer Seed, warranted as newly gathered, in packets at 3s. 6d., 7s., and 10s. Applications, inclosing post-office orders, will be immediately executed.

NEW PLANTS.—The following New and Beautiful

Chilian Plants will be sent out as soon as ready, Schizanthus candidus, Dr. Lindley, 7s. 6d. per plant. Loasa lucida, 7s. 6d. The first is snow-white, somewhat fragrant, and quite distinct from all others; the latter is white, with scarlet centre surrounded by a yellow border, foliage large and glittering; both are hardy. They were exhibited at the Gardens of the Horticultural Society, Chiswick, in July.—JAMES CARTER, Seedsmen and Florist, 238, High Holborn, London.

MORTON'S "WALBURTON ADMIRABLE" PEACH.

This new and splendid variety was raised at Richard Prime's, Esq., Walburton House, Sussex, and has received the highest testimonials from Dr. Lindley, who had specimens sent him in 1841.

This Peach is a seedling from the Noblesse, but its great merit consists in its ripening fully five weeks later; it is a very free grower, the fruit of a full size, of excellent flavour and melting, altogether a very desirable variety, and one which no good garden ought to be without.

From the very limited supply of plants the orders will be executed in rotation at One Guinea per plant, early in the autumn. All orders for the above to be sent to ALEXANDER WEBB, Nurseryman and Seedsmen, Westergate Nursery, near Arundel, Sussex.

GROWTH OF PLANTS.—HUMPHREYS'S

INODOROUS SOLUBLE COMPOUND, to promote the Growth of Plants. Dissolved in water, this valuable Preparation may be used with great advantage, either in the Drawing-Room, or in the Conservatory. A single bottle is equal in fertilizing force to some hundred weight of rich Compost; and by its use, not only common plants are improved by increased brilliancy of flower and deeper verdure, but valuable Exotics are so strengthened as to resist the usual variations of temperature, and may be preserved without a Greenhouse. Sold in bottles, 1s. 9d. each, with full instructions for Use, by FLANAGAN & SON, Mansion-House street; HURST & M'MULLEN, Leadenhall-street; Wm. CLARE, Bishopsgate-Within; and other leading Seedsmen, &c., in town and country. Wholesale Agents, DAVY, MACKMURDO, & Co., 110, Upper Thames-street, London.

MYATT'S NEW SEEDLING STRAWBERRIES.

J. AND W. MYATT intend sending out, by the middle of August, their NEW STRAWBERRY, the DEPTFORD PINE, fruit of which has been exhibited at the London Horticultural Society, and a Banksian Medal awarded. It has also been submitted to Professor LINDLEY, for whose opinion see *Gardeners' Chronicle*, No. 26, p. 447. It is a most prolific bearer, exhibiting at the same time a profusion of fine fruit and bloom on the same truss. Price, Deptford Pine, 2s. 10s.; British Queen, 1s., and Eliza, 1s. 10s. — Manor Farm, Deptford, July 22, 1843.

SEEDS for IMMEDIATE SOWING.—The following seeds, which are proper for Autumn sowing may be had during the present month:—

	s.	d.	s.	d.
Dwarf German Stocks, 12 varieties, 4 0,—smaller packets	2	6		
Branching „ 12 „ 3 6 „ „	2	0		
Wallflower-leaved „ 12 „ 3 6 „ „	2	0		
Autumnal „ 12 „ 4 0 „ „	2	6		
English Ten-week „ 6 „ „ „	1	6		
Blue mixed German Stock „ „ „ „	1	0		
New Scarlet, or Intermediate, extra fine „ „ „ „	0	6		
Schizanthus retusus and Grahami „ „ „ „	0	6		
Ipomopsis elegans and picta „ „ „ „	1	0		
Salpiglossis, beautiful, mixed „ „ „ „	1	0		
Splendid mixed Cineraria, 20 varieties, (Greenhouse) „ „ „ „	1	6		
„ „ „ „ „ „ „ „	1	6		
Chinese Primroses, mixed fringed „ „ „ „	1	0		
Finest mixed Petunia, 6 varieties „ „ „ „	1	0		
Ipomoea rubro cærulea, warr., (Greenhouse Climber) „ „ „ „	2	6		
Lophospermum, 3 varieties „ „ „ „	1	0		
Manrandya, „ „ „ „	1	0		
Thunbergia, „ „ „ „	1	0		
Aquilegia, Delphinium, and Antirrhinum, finest mixed, each „ „ „ „	0	6		
Hollyhock, finest mixed, 1s. per packet; 20 vars., separate, „ „ „ „	3	6		
Pentstemon, 12 fine varieties „ „ „ „	1	0		
Polyanthus, finest mixed „ „ „ „	1	0		
Larkspur, Dwarf German, mixed „ „ „ „	1	6		
30 fine Hardy Annuals, including the Californian „ „ „ „	6	0		
30 „ „ „ „ „ „ „ „	6	0		

The first ten require protection; the next eight (from Cineraria to Thunbergia, inclusive) are Greenhouse plants; the remainder are quite hardy. Any of the above will be forwarded free of all expense. An extensive Catalogue of Dutch and Cape Bulbs is in preparation, and may be had, prepaid, on application to JAMES CARTER, Seedsman and Florist, 238, High Holborn, London, Aug. 12, 1843.

TO NOBLEMEN, GENTLEMEN, AND NURSERYMEN. The Collection of Rare and Valuable EXOTIC PLANTS, the property of THOMAS HARRIS, Esq., of Kingsbury, Middlesex.

MESSRS. J. C. & S. STEVENS respectfully beg to announce they are instructed by Mr. HARRIS (who is leaving Kingsbury for some years) to offer for unreserved sale by auction on the Premises, on WEDNESDAY, 30th August, and two following days, at 12 o'clock, the whole of his Valuable Collection of STOVE AND GREENHOUSE PLANTS, comprising numerous fine specimens of rare ORCHIDACEÆ, CACTI, CAMELLIÆ, AZALÆAS, RHODODENDRONS, ORANGE and LEMON TREES, &c. &c. Catalogues of which are now preparing, and may be had one week prior to the sale of the Auctioneers, 38, King-street, Covent Garden. The collection will be on Public View two days before the sale.

TO NOBLEMEN, GENTLEMEN, NURSERYMEN, FLORISTS, and Others,

MESSRS. PROTHEROE and MORRIS are instructed by the Executrix of the late Mr. JOHN MILNE, to submit to public competition on the premises, Albion-road Nursery, Stoke Newington, on MONDAY, August 21, 1843, and following day, at 12 o'clock each day, the Splendid and Choice STOCKS, GLOMBOS, EXOTIC, and other Plants in pots, consisting of CAMELLIÆ of various sizes, AZALÆA INDICA, RHODODENDRON ARBOREUM and HYBRIDUM, fine SPECIMENS of LANTANA BORBONICA, AZALEA EXCELSA, LONARARIA JUNCUS, LILIAN LANCEOLATUM, &c. A choice assortment of GERANIUMS, NEW FUCHSIAS, CACTUS, ERICAS, EPACRIS, with a selected assortment of CAPE PLANTS. Also a quantity of Hot-water Pipe, Useful Timber, a Capital Set of Chaise Harness, and other effects. May be viewed one week prior to sale. Catalogues may be had on the premises; of the principal Seedsmen; and of the Auctioneers, American Nursery, Leytonstone.

NATIONAL LOAN FUND LIFE ASSURANCE ANNUITY, and DEFERRED ANNUITY SOCIETY, 26, Cornhill, London.

Capital, 500,000l.—Empowered by Parliament.

DIRECTORS.

T. Lamie Murray, Esq., Chairman.
John Elliottson, M.D., F.R.S.
John Griffith Smith, Esq.
H. Gordon, Esq.

John Rawson, Esq.
Clement Tabor, Esq.

Joseph Thompson, Esq.

Auditors.—Professor Wheatstone, F.R.S.

Professor Graves, A.M., F.R.S.

ACTUARY.—W. S. B. Woolhouse, Esq., F.R.A.S.

The superior advantages to those Assured with this Society will be best understood by a comparison of its principles and a reference to the last Annual Bonus declared on Policies of five years' standing, viz.:—

Entry	Policy No.	Age.	Sum.	Annual Premium	Bonus added.	Cash Bonus.	Prem. reduced.
			£	£ s. d.	£ s. d.	£ s. d.	£ s. d.
1837	39	59	1,000	67 8 4	132 14 6	58 19 9	8 19 4
1838	114	55	3,000	175 15 0	296 9 7	123 0 6	16 9 7

Policies now entered upon entitled to participation in next Annual Division. Two-thirds of all premiums paid can be borrowed by the Assured without loss of Policy.

F. FERGUSON CAMROUX, SECRETARY.

HAIL-STORMS.

THE DEVASTATION caused by the late destructive HAIL-STORMS proves the necessity of Persons protecting their property against such losses. Persons desiring to obtain the Rates of Insurance for Crops and Glass may be obtained on application to W. B. W. Esq., at the Hail-Storm Insurance Company, 10, Abchurch-lane, London.

RENDLE'S TANK SYSTEM OF HEATING.

STEPHENSON AND CO., 61, Gracechurch-street, London, Inventors of the IMPROVED CONICAL and DOUBLE CYLINDRICAL BOILERS, having been much engaged in heating buildings upon the above system with Tanks of various materials, solicit the attention of scientific Horticulturists to an Iron Tank now fitting up on their premises, which offers most decided advantages over every other article hitherto employed for the same purpose. These tanks which are ornamental in appearance can be made from 10 to 160 feet long and of any width and depth, and can be connected or disconnected by any working Gardener without the slightest difficulty, thus affording the opportunity to persons in remote districts of employing this much approved method of heating without the assistance of a boiler. The Tanks can be applied to Boilers and Stoves already fixed, and from the present low price of Iron will be found cheaper than of any other material. Mr. RENDLE, of the above firm, has undertaken to receive orders and furnish information to persons in his neighbourhood, and prices for any size will be forwarded upon application to S. and Co.

HOT-WATER APPARATUS FOR HEATING HORTICULTURAL BUILDINGS, DWELLING-HOUSES, CHURCHES, and MANUFACTORIES, upon improved principles, and at very moderate charges, erected by DANIEL and EDWARD BAILEY, 272, HOLBORN.

D. and E. BAILEY having devoted much time to the consideration of this subject, and had much experience in the erection of apparatus for the above-mentioned purposes, have, by improvements suggested in their practice, rendered their mode of heating not only very efficient, but very simple, and have combined durability in the apparatus with economy in the charge. They have erected apparatus in England, Scotland, and Ireland, for many noblemen and gentlemen, and have had the honour to be employed by the Horticultural Society of London, in executing the works of their splendid Conservatory, lately erected at Chiswick.

D. and E. BAILEY also construct in metal all descriptions of Horticultural Buildings and Sashes, and invite noblemen, gentlemen, and the public to an inspection of their various drawings and models, at 272, Holborn, where they have the opportunity of exhibiting, amongst other metal works, an extremely complete and convenient kitchen apparatus, or range, adapted for the continued supply of hot water, and an arrangement of the oven more complete than has hitherto been brought before the public.

D. and E. BAILEY were the first to introduce metallic curvilinear houses to horticulturists, and can refer to the Conservatory attached to the Pantheon as one of their works, besides many others in this country and on the Continent.

D. and E. BAILEY have prepared a quantity of the Galvanic Plant Protectors, which are now ready for immediate delivery; they beg to introduce to public notice a new Trough Pipe, for Orchidaceous or other Houses where vapour is constantly, or at intervals required, and which may be seen at their Manufactory.

NEW AND USEFUL INVENTIONS.

EDWARD WEEKS, Sen., HORTICULTURAL ARCHITECT, Hortulan-place, King's road, Chelsea, original and sole Patentee for HEATING by HOT-WATER, respectfully begs to inform the Nobility, Gentry, and all Patrons of Horticulture—amateur as well as practical—that he has invented and brought to perfection several essentially-necessary improvements in the fitting up and construction of Forcing-frames and Hothouses, Greenhouses, Conservatories of whatever size or construction, namely, 1, a very powerful and effectual BOILER, at present unequalled; instantaneous in action, economical in fuel, and lasting in heat; not possible to corrode or to be out of order; 2d, a very simple STEAMING APPARATUS, by which the body of air in the house is kept in constant motion; and lastly, a very simple contrivance by which fresh air can be admitted or excluded at pleasure, even by the hand of a child, either within or without; either a single or double roof. SUNSHADES also on a very simple principle. E. WEEKS begs further to state that as his inventions have been shamefully pirated and unfairly imitated, by which he has suffered seriously, both in purse and reputation, he is now under the necessity of not allowing the inspection of his new Inventions or his Factory, except by employers or their accredited agents or gardeners.

HOT-WATER APPARATUS.—Buildings of every kind heated in a superior manner. The trade supplied with Boilers, Furnace-doors, Bars, Dampers, Pipes, Cisterns, and every requisite for heating. BENJ. FOWLER, 63, Dorset-st., Fleet-st., London.

HENRY HUNT'S PATENT GARDEN POTS and STANDS, for effecting improved Drainage and draught of Air, of which highly favourable notices have appeared in *Planton's Magazine* for May, *Gardeners' Magazine* for June, *Practical Florist*, No. 23, and *Gardeners' Gazette*, May 6. Sold Wholesale and Retail at HUNT'S China Warehouse, Queen's-row, Pimlico; and No. 17, Great Rider-street, St. James's. N.B.—Nurserymen wanted as Agents for the above in many of the provincial towns.

J. B. LAWES'S PATENT MANURES, composed of Super Phosphate of Lime, Phosphate of Ammonia, Silicate of Potash, &c., are now for sale at his Factory, Deptford-creek, London, price 4s. 6d. per bushel. These substances can be had separately; the Super Phosphate of Lime alone is recommended for fixing the Ammonia of Dung-heaps, Cesspools, Gas Liquor, &c. Price 4s. 6d. per bushel.

GUANO ON SALE, BY THE IMPORTERS, ANTHONY GIBBS & SONS, LONDON; GIBBS, BRIGHT & CO., LIVERPOOL AND BRISTOL.

POTTER'S GUANO.—TURNIPS, MANGEL-WURZEL, &c. By the use of the above Manure, the enormous yield at the rate of 86 tons per acre was obtained of ORANGE GLOBE MANGEL WURZEL, by Mr. A. COTTON, of Hildersham, near Cambridge. On Meadow Land, the Earl of Zetland got an increase of Hay of 18 cwt. 2 qrs. per acre, while by the Foreign Guano the increase was only 8 cwt. 2 qrs. under similar circumstances. These Facts prove the superiority of POTTER'S GUANO.

* * * POTTER'S Portable Farm-yard Manure, at 4l. 15s. per ton; from 6 to 7 cwt. per acre.—Chemical Works, 28, Upper Fore-st., Lambeth.

No. VIII. was published on the 1st of August, and will be continued, at Sixpence a Month, of the

GARDENERS' EDITION OF THE BOTANICAL GARDEN, with numerous Additions and Engravings of Plants. By B. MAUND, F.L.S. It contains Coloured Engravings of the most Ornamental Plants, suited to the open Garden, with Descriptions, Cultivation, &c., for the assistance of Gardeners and Amateurs. Also, a FLORAL REGISTER, with Woodcuts and Descriptions of handsome Plants, newly introduced from Foreign Countries. Also, AN AUCTARIUM, containing Miscellaneous Information on Gardening Affairs. Also, a portion of PROFESSOR HENSLOW'S BOTANICAL DICTIONARY of 5,000 Words, and 200 Cuts, descriptive of the Vegetable World; a complete Book of Reference on subjects connected with the description of Plants.

Thus, it will be seen, that this Work, although sold at so very moderate a price, comprehends a greater variety of Botanical and Gardening Information than any Publication extant.

London: R. GROOMBRIDGE, Paternoster-row.

YARRELL'S BRITISH BIRDS.

A HISTORY OF BRITISH BIRDS. By WILLIAM YARRELL, F.L.S., V.P.Z.S., &c.

This work contains a History and a Picture Portrait, engraved expressly for this work, of each species of the Birds found in Britain. The 3 vols. contain 520 illustrations. Price in demy 8vo. 4l. 10s., Royal 8vo. 9l., or imperial 8vo. 13l. 10s. To suit the convenience of purchasers, the work will still be sold in parts at 2s. 6d. each, or in vols. Vol. I., price 28s. Vol. II., 35s., Vol. III., 30s.

JOHN VAN VOORST, 1, Paternoster-row.

CULTURE OF THE ROSE; by G. GLENNY, F.H.S., Editor of the *Gardeners' Gazette*; with Lists of a few good Varieties in each division, and comprising General Culture, Pruning, Preparation of Stocks, Budding, Grafting, Bud-grafting, Root-grafting, Raising from Seed, &c. &c., will appear in No. LI. of "THE GARDENER AND PRACTICAL FLORIST," price 3d. **CULTURE OF THE DAHLIA**, by G. GLENNY, appears in No. XXIX.; and **SEEDLING DAHLIAS** of 1841 and 1842, in No. VIII. Either of the above Numbers will be sent free to any part of the kingdom, if four Postage-stamps are inclosed to the Publisher, R. GROOMBRIDGE, 5, Paternoster-row, London.

BOTANICAL BOOKS.

THE FOLLOWING WORKS ARE NOW TO BE HAD OF WILLIAM PAMPLIN, BOTANICAL BOOKSELLER, 45, FRITH STREET, SOHO SQUARE, LONDON.

TRANSACTIONS OF THE HORTICULTURAL SOCIETY OF LONDON. Seven Volumes. 4to. That is—the First Series complete, half calf, gilt, 7l. 7s.

TRANSACTIONS OF THE LINNÆAN SOCIETY OF LONDON. Eighteen Volumes. 4to. That is—all that have yet been published. Vols. I. to XII. are neatly half-bound, and the remaining six are in Parts, as published, 17l. 17s.

TRANSACTIONS OF THE HORTICULTURAL SOCIETY OF PRUSSIA. Fourteen Volumes. 4to. A fine Copy, half-calf, gilt. Berlin, 1824-1840. 12l. 12s.

TRANSACTIONS OF THE IMPERIAL ACADEMY OF NATURAL HISTORY OF BONN. 4to. A quantity of separate Volumes, Parts, and Papers from this and several other similar Continental Works can always be supplied.

Of the following Books, copies are always to be found at W. PAMPLIN'S.

DE CANDOLLE.—PRODROMUS SYSTEMATIS REGNI VEGETABILIS. Seven Volumes. The eighth volume of this Work will be published in a few weeks; those persons who wish to receive it on the day of publication are requested to forward their names to the Advertiser at once, in order that they may be supplied without disappointment.

BUEK.—GENERA, SPECIES, ET SYNONYMA CANDOLLEANA, seu INDEX GENERALIS ET SPECIALIS AD DE CANDOLLE PRODRUMUM SYSTEMATIS NATURALIS REGNI VEGETABILIS. Pars I. et II. Berlin, 1842. 18s.

WALPERS.—REPERTORIUM BOTANICES SYSTEMATICÆ. Of this Valuable Work, the 8th Part, or Part III. of the second Volume, has just appeared. Price of each Part, 4s.

ENDLICHER.—GENERA PLANTARUM. Vienna, 1840. 4l.; or handsomely bound in two volumes, half-calf extra, 4l. 8s. 6d.

ENDLICHER.—MANTISSA BOTANICA. Vienna, 1842. 6s.

ENDLICHER.—ICONOGRAPHIA GENERUM PLANTARUM. Handsomely bound, half-calf extra. Vienna, 1838. 3l. 10s.

POEPPIG ET ENDLICHER.—NOVA GENERA AC SPECIES PLANTARUM QUAS IN REGNO CHILENSI PERUVIANO ET IN TERRA AMAZONICA, &c. Two Volumes, fol. Various copies, bound or unbound, from 4l. 14s. 6d. and upwards, according to binding and condition. The Parts of Volume the Third which have appeared, as well as most of the former Parts, can still be had separately.

PERSOON.—SYNOPSIS PLANTARUM. Two Volumes. Various copies, neatly bound or half-bound, from 18s., and upwards.

KUNTH.—ENUMERATIO PLANTARUM OMNIUM HUCUSQUE COGNITARUM, &c. Several of the Volumes may be had separately. 14s. each.

AUGUSTE ST. HILAIRE.—FLORA BRAZILIÆ MERIDIONALIS, ADJUT. JUSSIEU ET CAMBESSEDES. Volumes I. and II., neatly half-bound, and remainder in Parts. Paris, 1824, &c. 7l. 7s.

MIKAN.—DELECTUS FLORÆ ET FAUNÆ BRAZILIENSIS, &c. Several odd Parts of this Magnificent Work, each, 15s.

FLORA.—ODER BOTANISCHE ZEITUNG. Complete from the beginning.

LINNÆA, EIN JOURNAL FÜR DIE BOTANIK. Complete from the beginning.

GERARDE'S HERBAL, or HISTORY OF PLANTS. Various Copies of both the Editions, from 18s. and upwards, according to condition.

PARKINSON'S HERBAL. Various Copies, from 18s. and upwards, according to condition.

LINNÆI SPECIES PLANTARUM CURA WILLDENOW. Various Copies, from One to Three Guineas, according to condition.

LINNÆI SYSTEMA VEGETABILIIUM CURA SPRENGEL. Various Copies, from Two Guineas and a half to Three Guineas.

EKART SYNOPSIS JUNGERMANNIARUM IN GERMANIA, &c. Numerous Plates. 4to. Various Copies from 10s. 6d. to 12s.

WIGHT'S ICONES PLANTARUM INDIE ORIENTALIS, or Figures with Descriptions of East Indian Plants. This is allowed to be the very best and cheapest Work upon Indian Botany. The Third Part of the Second Volume has just been received from Madras; the Price of this Part is 1l. 5s.

WIGHT AND ARNOTT.—PRODROMUS FLORÆ INDIE ORIENTALIS. Volume the First being all that has yet appeared. 16s.

* * * N.B.—W. PAMPLIN has a good collection of British and Foreign Books upon FERNS.

Bound in cloth, price 5s. 6d.,

JOE MILLER'S JEST-BOOK.

A Reprint from the first and genuine edition, such omissions and alterations only having been made as were required by the greater delicacy observed in modern conversation; but, that the volume might have some substance, and be a good table or travelling book, copious additions have been made from other old volumes of Facetiae.

Extract from the Preface.

"Another strange circumstance connected with this work is, that everybody presumes that he himself and everybody else are perfectly familiar with its contents. . . and yet, if the reader will ask his acquaintance, it will appear that not one in five hundred ever set eyes on a copy. It is in consequence of like questions that this edition is published."

London: WHITTAKER and Co.

FAMILIAR ASTRONOMY. By GEORGE DARLEY, A.B., Author of A System of Popular Geometry.—Companion to the Popular Geometry.—A System of Popular Algebra, and a System of Popular Trigonometry. 12mo, with Engravings, 5s. cloth lettered.

"There is a vast deal of astronomical information conveyed in a most winning and unassuming manner in this delightful little volume, which, not less for the novelty of its plan than the extent of its intelligence, reflects infinite credit on the taste and talents of its projector and editor, Mr. Darley."—*Sun*.

TAYLOR and WALTON, Booksellers and Publishers to University College, 28, Upper Gower-street.

HORTICULTURAL SOCIETY OF LONDON.—Fellows of the Society who are desirous of sharing in the seeds just brought from South America by Mr. Hartweg, are requested to apply immediately to the Secretary, 21, Regent street.

The Gardeners' Chronicle.

SATURDAY, AUGUST 12, 1843.

MEETING FOR THE FOLLOWING WEEK.
Tuesday, August 15 . . . Horticultural . . . 3 P.M.

Should Strawberry leaves be mowed off at this season?—We say, no; some of our correspondents say, yes. They appeal to their own practice,—we to general principles, which cannot be neglected with impunity. The opinions of the one are empirical—of the other theoretical. To which is the public to give assent? Let us consider.

The reasons in justification of this practice, assigned by the mowers, are the following, viz.: 1. That they get good crops; 2. That the beds are again covered with leaves before the winter, and are thus well protected at that season; 3. That a very neat appearance is secured; and 4. That the buds for the next year are thereby rendered uncommonly plump.

That good crops may be obtained by mowing is what we will not dispute, for on good Strawberry land we know that the beds will bear ill treatment to a great extent; but in such cases it may be that the crops are obtained in spite of the mowing and not in consequence of it. A man who is lame may walk faster than another who is whole, but no one would say that the fastness of the former is in consequence of his lameness, and the slowness of the other because of his wholeness. The question is not whether good crops can be obtained with mowing, but whether better could not have been had without it.

As to the beds being again well covered with leaves before winter, this is perfectly true; but what then? Rightly considered, this is one of the worst consequences of the mowing; for if we inquire into the history of the formation of these new leaves, we shall find that they are produced at the expense of organizable matter, previously lodged in the roots of the Strawberry plant. That matter was lodged there by the leaves, which the mower destroyed, and was intended by nature for the food of the leaves and fruit of the succeeding year. Being expended in the production of autumn leaves, the store of food for the leaves of the next spring is, by so much, diminished. Doubtless such autumn leaves form a good protection in winter, but it is a protection bought at a great price, and not better, if so good, as would have been furnished by the old leaves had the mower allowed them to remain.

We are far from denying the neat appearance obtained by the mowers, and if Strawberry beds are made for ornament we should approve of this practice. But the Strawberry is grown, we believe, to gratify the palate and not the eye. This is not a question about the manner of making a green edging, but of obtaining a crop of fruit. Nevertheless, we believe, that the whole history of the practice of the mowers is traceable to an inconsiderate anxiety to make their Strawberry beds look pretty.

Finally, we fully admit the fact that when Strawberry beds are mowed at this season, the buds do become very plump and fine looking; and so much the worse; for what is this plumpness, except the indication of an attempt on the part of the plants to throw up their flower-buds in the autumn, instead of reserving their strength till the spring? Surely it cannot be advisable to encourage such an attempt, which can only have the effect of rendering the buds tender and excitable during the winter, when they ought to be perfectly dormant.

Let any one look at the present state of Strawberry beds. He will find them covered with dark green healthy vigorous leaves, not exhibiting a trace of decay, if the beds are in good health. Those leaves are now collecting the organizable matter which is wanted for the crop of next year, and that matter they are slowly depositing in the roots. Up to the present time they have not done much in this way; for at first they were occupied with their own organisation, and then were called upon to feed the fruit. It was only after the fruit was gathered that they began to collect and send down into the roots, in any considerable quantity, the organizable matter, or true sap, wanted for another season. By mowing them off the gardener stops this essential operation; and it is physically impossible for him to do so without detriment to the future crop. The utmost that he can expect is to repair the mischief he has committed: but is that good gardening which commits mischief for the sake of repairing it?

The way in which the evil may be partially remedied is this. When new Strawberry leaves appear, they feed, as we have before said, upon the sap already in the roots, and thus consume a large part of that which was intended by nature for the

maintenance of the fruit of next year. At first their action is entirely one of robbing. But if they grow fast enough, and the season is long enough, they may become organised in sufficient time to restore to the roots a part of that which they have stolen; and in that case the mischief produced by mowing is, perhaps, repaired. This is the utmost that can be said—not in favour, but in palliation—of the bad system we have been considering.

If it were right that the life of a Strawberry leaf should be put an end to at Midsummer, we may rely upon it that Providence would have ordained that it should perish without the assistance of a scythe.

The most obvious mode of increasing the produce of the land is, no doubt, that of bringing waste lands into cultivation, and of improving the fertility of those which are of inferior quality; but there is another, which is of more general application—we mean the more perfect cultivation of every kind of soil, from the richest to the poorest. There was a time when an opinion was universally adopted by agriculturists, that in every soil, according to its natural quality, there was a maximum of production which could never be exceeded;—that if by excessive manuring you attempted to force a crop, you were sure to suffer: the produce of straw would be increased at the expense of the grain, or the weight of the ear would be too great for the straw, and the corn would be laid before harvest.

At one time, five quarters per acre of Wheat were thought a maximum for the best lands, and other grain in proportion: yet we have known eight, and even ten, quarters per acre in the gardens of cottagers; and we observe daily that the crops on the allotments let to labourers, and well managed by them, are much heavier than those of the farmers around, although the land is in general cropped harder in the allotments than in the farmers' fields. No farmer would think of having Potatoes and Wheat alternately for several years. His Potatoes would curl, and his Wheat fail after a few alternations;—nor would we recommend such a practice on the richest alluvial loams. How comes it, then, that the labourer does so, and his crops seem as good as ever? Perhaps one word will account for it—this is, *tillage*. He stirs his land oftener and deeper; he incorporates the manure intimately with the soil. If you observe his crops growing they appear less luxuriant in spring; the plants are not so thick on the ground as they are in a field which was richly dunged in autumn—but pull one up carefully, and you will find that the fibres have struck deeper, and the roots are more numerous: the strength of the plant is gone downwards, a broader foundation is laid, and when the stems rise they are more numerous and much stronger. The deep roots are not much affected by the vicissitudes in the weather; if there is a wet season, there is a greater depth of mellow earth to absorb it; should it be very dry, and the superficial roots lack moisture, the deeper-laid fibres will pump it up. We see how vegetables in a garden which are drooping for want of rain are invigorated and refreshed by merely digging or forking the ground around their roots; the fibres find a readier passage to the moisture of the earth below, and very soon transmit it to the stems and leaves by capillary attraction. In a deeply-pulverised soil, however light in its nature, plants are seldom burnt by the effects of drought; clays, no doubt, retain moisture in their solid clods, but the roots cannot penetrate them until they are pulverised. If plants are kept alive in very stiff clays they make no progress, unless they find a well-pulverised soil below.

Tull, who was a keen observer of nature, saw so many proofs of this in his clay soil, that he began to think that dividing and pulverising the soil was all that the land required for producing great crops; and as he could not deny that manure did some good, he thought it must be by dividing the clay and preventing its uniting in masses—and he was not entirely wrong. When fresh long dung is ploughed into a stiff soil, the undecomposed fibres of the straw interpose between the clods and prevent their being cemented together by the rains; as they decay they leave a residue of a black carbonaceous matter, which is imperfect humus, and which forms excellent channels for the fibres to spread in, while the moisture which this humus retains strongly, independently of its own nourishing quality, greatly promotes the growth of the roots. Tull produced good crops of Wheat for many years in succession by sowing the seed in rows with wide intervals, keeping the plough continually working between the rows; thus he had a fallow and a crop at the same time: and if he had known of the chemical constitution of the grain which he carried off the land, and had found means to restore the required elements to the soil, he might perhaps have realised his vision of a perpetual fertility. If, while he ploughed the intervals, he had manured them judiciously,—we will not say that one species of plant might have been brought to perfection for ever in the same ground, but the symptoms of deficiency in the crop from what farmers call

the land being tired of it, would probably not have appeared so soon. In fact, the cause of this defect is not yet well ascertained. Perhaps one great cause is the increase of those minute insects which are found to infest and live upon particular plants, and which increase so rapidly as at last to check the growth of the plant altogether: another plant, especially of a different natural family, does not afford them the nourishment and protection they require; hence this plant thrives, the insects gradually die off, and the original plant thrives again. We know that the greater the variety of produce raised in succession on the same spot, the more healthy is the growth of each; but if we could find out the real cause of the degeneracy of plants repeatedly raised in the same soil, and also a remedy for it, there seems no reason to doubt but the same crop might succeed on the same spot for ever.

In the present state of our knowledge, experience has taught us, that, by pulverising the soil and exposing it to the influence of the atmosphere, and by varying the crops, restoring, in the shape of manure, those elements which they had extracted from the earth and assimilated to themselves, we can keep up the fertility of the richest soils; and by giving a little more tillage and manuring to those which are inferior, we gradually improve them till they become equally productive with the best. The soil of very old gardens is nearly of the same quality, whatever may have been the original soil. Stiff clays are converted into a black friable mould, and so are light sands; so that, without a very minute analysis, it would be difficult to distinguish them, and as to their fertility, they are quite on a par. The object of the farmer should be, so to crop and manure his land, and so to till and prepare it, that every year it may improve in texture and productive power, until his porous sands become consolidated and retentive of moisture, and his heavy clays mellow and crumbling under the fingers. Then he may hope for increased crops, and reap from the same extent of land as much corn as he would have done had he added to it an equal tract of waste, and brought it into cultivation at a great expense.—M.

CONCLUDING REMARKS ON THE WATERING OF OUT-DOOR PLANTS.

As the remarks I made a fortnight since on the watering of out-door plants were intended chiefly to turn the attention of practical men to the subject, and embody a few leading facts in physics bearing on the process, I would here, with your permission, enter a little more into detail. That the cold produced by the combined influence of evaporation and radiation is considerable, may be tested by direct experiment; it is also obvious from many familiar examples. That given in the experience of the natives of India is quite *apropos*. Placed in a climate which does not naturally produce ice, advantage has been taken of the refrigerating powers of evaporation and radiation in order to procure it. Shallow trenches are dug on the higher lands, where the temperature is lowest; the bottoms of these are covered over with straw, which is moistened; on this straw are placed shallow earthenware vessels with about half an inch of water, and by the agency referred to, the whole or a portion of this water is converted into ice during the night. The object of the shallow trench in this instance is to guard against a frequent renewal of the air as it is cooled down, and of the straw and porous vessels to increase as much as possible the evaporation. When the vessels used are of a dark colour, and the straw or other porous material of like complexion, the effect is greater. Another example of a similar nature here occurs to me, which may be worth while noticing. In many parts of the country, particularly in Scotland, there are many natural basins where marshes erewhile existed; these, by the successive accumulation of vegetable debris, have got filled up with peat-earth, and by drainage and cultivation converted into arable land. On such land it is, however, found that the crops (green crops in particular) suffer much from hoar-frost during the early and latter parts of the season; that the Potato in particular is often cut down by frost, while those growing on the neighbouring acclivities and places more exposed remain unscathed. The reason of this is obvious. The dark porous nature of the soil favours free radiation and evaporation during the cloudless night, by which the temperature is depressed: and the shelter of the surrounding hills and woods, it may be, prevents a free circulation of air, by which that depression may be compensated; the cold in consequence gets so great, that the plants growing there are frequently frozen to death, while others in the vicinity escape.

There being no question whatever about the fact of cold thus produced, let us inquire briefly into attendant circumstances. The amount of cold is greatest when the air is very dry; that is, when the dew-point is farthest removed from the atmospheric temperature, or, more practically, when the wet and dry bulbs of the thermometer indicate the greatest difference of heat; 2d, When the sky is clear and cloudless; 3d, When the atmosphere is still; and 4th, When the surrounding soil is dry and parched. On the two first circumstances it is unnecessary to insist; on the third I may remark that tender plants are generally put out in a sheltered situation, being so protected either by shrubbery or hedges, and that so placed they are thus the more liable to have their temperature depreciated. On the concluding attendant circumstance I would observe, that the surrounding soil and other objects being in a parched state, tend to imbibe moisture given off from any

attainable source, and in so doing render the atmosphere a water-carrier, by which the moisture is brought from the wet place to the dry, and the evaporation and cold consequently increased: to render this more familiar, take a small cup of water, place it in a tray of vitriol or dry muriate of lime, and invert a bell-glass over the whole; you will soon find that the fluid in the cup sinks in temperature sensibly, from the increased evaporation caused by the absorption of its vapour by the vitriol or muriate of lime, both of these substances having a great avidity for moisture, and keeping the air about them constantly dry. The cup of water here is like the wet pot or patch of soil, and the vitriol or lime like the dry objects around in their thirst for moisture. The next subject of inquiry is,—are there no exceptions to the rule attempted to be laid down in preferring the morning to the evening supply of moisture to plants exposed? undoubtedly there are: in the case of Ferns, Alpine plants, and such others as you wish to keep cool during the night, by all means water at night; or, if the sky is cloudy and promises to continue so, then little or no harm can accrue from the evening practice, as no radiation can then take place with its cooling influence; or, in fine, if the hygrometric state of the atmosphere is great, the wet and dry bulbs of the thermometer differing little from each other, then there will also be comparatively less diminution of heat, although evening moisture be given. In other cases when the air is very dry, the neighbouring soil parched, and the sky cloudless, and where you wish your plants protected against excessive night-chill, then be cautious with your evening irrigations. It is clear that the early part of the season, when tender plants are first turned out of doors, is the time when night-cold is apt to be most prejudicial, for it is then that we are apt to have the coldest nights, and then also the susceptibility of the plants to the influence of the cold is greatest. It was from observations made on plants at this season and under these circumstances, that led me to inquire into and draw inferences from the practice adopted, and to arrive at the conclusions which I have offered to your readers in the remarks made. I am, therefore—you will excuse me in observing—no mere theorist, but would rather wish to wed theory and practice, or reason and experience, into indissoluble bonds. I willingly, therefore, leave my hints to the candour and intelligence of practical men.—J. L., Newburgh.

AMATEUR'S GARDEN.—No. XXXII.

ONE of the first things to be attended to now is sowing Mignonette for blooming in pots through the winter and spring. It is a plant rather difficult to manage in low and damp situations, especially if not sown sufficiently early to allow the plants to become strong before the dull weather of winter sets in. To insure success, the pots must be clean, and well drained; the compost used should consist of three parts good mellow sandy loam, to which one part of decomposed leaf-mould may be added. Fill the pots quite full of soil, and make it rather solid, so as not to allow much room for subsiding; for as the young plants are rather impatient of too much moisture, it is as well to have them so placed as not to be susceptible of injury, while very small, from careless watering. The plants must not be allowed to become crowded in the pots; for it is better to thin them several different times, leaving about six plants to bloom in a 48-sized pot, than to take too many out at one time. Through the winter the proper treatment is to secure them against frost—to keep the soil moderately moist, but not wet—and to give them all the air possible at all favourable times, but always to guard them against cold cutting winds or rain. A few small plants, potted now from the open borders, will bloom in November; those sown now will succeed them in January, and a few more pots sown towards the end of the month will give a succession as long as bloom is wanted in pots in the spring.

The plants to which attention is first required in the way of propagation for another season are those of a delicate habit, and which consequently are difficult to keep through the winter. Among these may be noticed the different kinds of Nierembergia, as *N. intermedia*, *calycina*, *gracilis*, and *filiaculis*. The first is the most delicate, and is now rarely to be met with in greenhouses, much less in flower-gardens; but it makes an excellent bed, and those who possess a plant will do well to propagate from it. *N. calycina* is also scarce, but it is not so difficult to manage as the preceding. *Bouvardia triphylla* and *angustifolia* or *splendens*,—for I believe they are both the same,—are plants which make beautiful beds in ordinary seasons, though in the present one they have, by no means, done well. *B. angustifolia* is the best both in constitution and colour of flower, but both will now strike freely in sand in a little heat, and, if gradually dried off before the winter, will make nice plants for turning out next season. Another favourite plant is *Lantana Selowii*, which also requires to be propagated early, so as to get the plants well established in small pots before winter. *Lotus Jacobæus*, with its yellow variety, and the lovely little *L. microphyllus*, with its pale orange flowers, are plants which make excellent beds, but require very kind treatment in the winter; and, as an old plant which is admirably adapted for drooping over the sides of a basket or vase, or even for making an excellent bed late in the season, may be mentioned *Myoporum débile*; it blooms freely in the autumn, and is not readily injured by cold weather. These are all good plants, which hitherto have not been so cultivated as their merits entitle them to.

Of Pelargoniums, a large quantity of the Scarlets should be got out as quickly as possible. The best of these for beds are, *Smith's Emperor*, *The Shrubland*, *Frogmore*, *Brighton Hero*, *Globe Scarlet*, and a prostrate-growing scarlet, which in some places is called the Huntsman, but

which is scarcely known in the neighbourhood of London. *Ingram's* and *Cooper's Scarlets* are two dwarf kinds, of good habit, the latter with a slight tinge of black in the upper petals. These are the cream of the Scarlets at the present time, but there are several seedlings which will probably displace some of them next year. There are, moreover, many pencilled varieties which make good beds, and to which I shall next week allude.—W. P. Ayres, Brooklands.

DESCRIPTION OF THE BOILERS USED AT THE EXETER NURSERY.

THE accompanying sketches, *a b c*, represent different views of the boiler used in heating the Propagating-house described at p. 540. It is called here the cylindrical, horizontal, wrought-iron boiler, and was manufactured and erected by Messrs. Garton and Jarvis, of Exeter. We find it equal, if not superior, in power and economy to any boiler that has come under our notice, both the interior and exterior being presented to the action of the fire. *a* shows the perspective, *b* the end section, and *c* the section. We have also in work a boiler of another shape, and of a very novel description, *d e f*, called the double-drum boiler, also of their invention, which we think equally good, but better adapted for smaller houses; *d* represents the door and frames, *e* the perspective, and *f* the section; *g* is a section of the door and frame.—J. Veitch and Son, Exeter.

THE EXHIBITIONS IN THE GARDEN OF THE HORTICULTURAL SOCIETY.

LET no one who reads the following return complain again of the uncertainty of an English summer, and of its unfitness for out-door meetings. Here we find that out of thirty-four days, fixed four or five months beforehand, only five have been at all rainy, and of those five all but two were fine in the afternoon. Even the worst of them did not deter 2,471 persons, chiefly of the higher classes, from travelling several miles to inspect a Horticultural exhibition. In other respects also this document is remarkable, and deserves to be preserved.

STATE OF THE WEATHER IN THE HORTICULTURAL SOCIETY'S GARDEN ON THE DAYS OF EXHIBITION, WITH THE NUMBER OF VISITORS ON EACH OCCASION.

HOME CORRESPONDENCE.

Prizes for Seedling Pelargoniums.—In reply to your correspondent "F. H. S.," who, at p. 542, finds fault with the decision of the Judges at the last show of the Horticultural Society, I would, in the first instance, beg leave to remark that the objects for which prizes are offered for old and new productions are not similar,—in the one case they are really for the encouragement of individuals, and comparatively little wrong is done, even should the specimens exhibited be not sufficiently good to deserve the award; but in the case of a seedling, the individual should never be considered, and no higher award made than can be justified by the intrinsic value of the production itself; for if to gratify the individual a prize be given disproportionate to that value, the public are misled in their estimation of its merits. I need not add that such is not the case with an old and well-known variety. As regards the prizes offered by the Society for different objects, the judges have nothing to do therewith; although with regard to seedlings they are often placed in some dilemma. Faults may exist which may or may not be permanent, and notwithstanding the desire which may be felt to make some allowances for an uncultivated variety, the opinion of the judges may be compromised by not confining themselves strictly to the facts before them. It is therefore not only the opinion of most judges, but of amateurs and growers generally, that in common with many other flowers, some alteration should be made in the plan of exhibiting seedling Pelargoniums,—that the Large 'Silver Knightian and Silver Banksian Medals' should only be given to seedlings 2 years old; the Prizes offered for those of the current years being only considered probationary and confined to certificates, for it is a well-known fact that flowers which have been very promising in their seedling state, have proved quite worthless the second year. Besides, the plan I have suggested would afford the twofold advantage of ascertaining the true habit of the plant, as well as the permanent properties of the bloom; the judge should also know whether a flower had been submitted to cultivation. Upon the flower mentioned by "F. H. S.," a difference of opinion existed amongst the judges, and upon the very point to which I have alluded, viz., whether the faults apparent in it would be permanent or not; and a certificate of merit was consequently granted, in order that on account of its good properties it might not be disqualified from receiving a medal next year more commensurate with its merits, should the defects prove to have been transient only. I have annexed my notes on the flower for the information of "F. H. S." and of your other readers who take an interest which I would wish to encourage in these matters. "*Psyche*, deep crimson maroon upper petals, with a narrow margin of bright rose; bases of the petals white, feathering, scarcely any; rest of the petal salmony rose-colour, upon which veins are irregularly marked; the top petals rather thin and uneven on the edge." In conclusion, I would take leave to remark, that when a flower of really first-rate properties, viz., *Phæon*, was exhibited by Mr. Forster at the preceding show, the judges took the opportunity of conferring the highest mark of approbation they had the power to bestow, and with the same feeling they withheld it when it could not be consistently awarded.—One of the Judges.

Prizes for Fruit.—I beg to state, in answer to "F. H. S.," p. 542, that in my opinion, there is as much skill required in producing good Cherries as in raising a good seedling Pelargonium. Be that as it may, as one of the judges of fruit at the Horticultural Society's Exhibitions, I can safely assert that everything in that department has been judged with the strictest impartiality and fairness during the season. "F. H. S." seems to consider that the opinion of one of the most experienced growers of seedling Pelargoniums ought to be taken in preference to that of the three judges in that department, or that there was a want of fairness in the judges;—neither of which, well knowing them, can I subscribe to.—F. H. S., of more than 25 years' standing, and equally anxious that the high character of the Society should be maintained.

Effect of Muriate of Ammonia upon Cucumbers.—I have put 3-jointed cuttings of Cucumbers into small phials filled with water, and hung them near the glass of a small house, where they form roots, sometimes in six or eight days, when I pot them off without flagging. A few days since I dissolved one ounce of Muriate of Ammonia in one gallon of water, and filled a small phial with the solution, into which I put three Cucumber cuttings, which in a little time faded and seemed dead; showing that the solution was too strong in that state. I took the cuttings from the phial and placed them in another phial of warm rain-water, in which they recovered and rooted; they are now potted and growing well. I had two Cucumber plants in pots sent me by a friend, as an excellent sort; one plant seemed drooping, and scarcely worth planting; however, as they were a present, I bestowed some pains on them. One plant grew in a frame; the other, in a separate frame, remained stationary for many days, and appeared to be going off. I mixed one part of the above solution with two parts of water, and watered all round the bed; this I continued to do, when required, for about four or six times; the plant recovered, and is now by far the finest and most healthy of the two, with leaves of a beautiful green.—W. S. D.

Wasps.—My method of destroying Wasps is as follows:—Having found a nest, I procure a large glass bottle, and a small portion of turpentine which I put therein, and shake it about until the whole of the inside is wet with it. I then fix the neck of the bottle in the entrance to the nest, and place over it a large flower-pot. By replenishing the bottle with turpentine once or twice, the fumes penetrate into the nest and completely destroy them.

This method I have practised for several years, and never found it fail.—*B. C. K.* [This is a slight variation from the method recommended by Professor Henslow, at p. 637 of last year's *Chronicle*, which is certainly an excellent way to destroy them.]

On Watering Out-door Plants.—On perusing an article at p. 478, on watering out-door plants by "J. L.," I was struck with the novelty of the subject which he therein strenuously advocates. The following week you directed attention to the subject, since which time I have waited the appearance of your last *Chronicle*, to see what practical experience would say on a point of such great interest to gardeners; but there appears to be an apathy on their part to say anything on the subject. I do not object to watering plants in the morning because it is contrary to common practice, but because I conceive it to be unnatural, and in many points retarding instead of accelerating the very processes which "J. L." conceives to be of such paramount importance—heat and moisture; but he, not content with plants receiving the heat which nature intends for them through the day, wishes also to preserve as large an amount as possible during the night, which is certainly contrary to nature. But supposing heat at night to be necessary for out-door plants, night-watering—and not morning—would be the best means of preserving it, for these reasons: all bodies absorb heat during the day, parting with it by radiation at night. Heat is preserved in any body so long as the surrounding atmosphere is at a higher temperature than the body itself; the body increasing its amount of heat in an equal ratio with the surrounding air. Radiation, therefore, cannot take place from any substance till the atmosphere that surrounds that substance is reduced to a temperature lower than the subject itself. Now, radiation takes place much more rapidly under a clear sky than a cloudy one; in a damp atmosphere slower than in a dry one. If the sky be cloudy after a warm summer's day, and the atmosphere consequently damp, the earth, water, &c. will appear to be warmer than if the sky were clear and the air dry, which proves that radiation is retarded by a damp atmosphere; were it not so, bodies in contact with the air would radiate the heat acquired during the day, and quickly correspond in temperature with the surrounding medium. If we water plants in the morning, however damp the atmosphere may be at the moment, it is constantly becoming drier, and before night every vestige of the moisture communicated to the plants is evaporated, leaving the soil dry, and affording every facility for radiation,—the very process intended to be retarded. Whereas, if water were given to plants in the evening, evaporation would go on but slowly, a damp atmosphere would surround the plants, and radiation would be retarded, and not accelerated, as "J. L." conceives would be the case. Night watering, also, is not subjected to so rapid an evaporation as morning watering. As I before observed, the air after sunrise is becoming every moment drier, and, consequently, the moisture intended for the benefit of the plants has scarcely saturated the soil ere it is evaporated, leaving them destitute of the agent by which their nutrition is to be carried on. This, I think, will prove that to preserve by night the heat acquired by the soil during the day, we must create a damp atmosphere around the plants instead of a dry one. Another objection to morning watering is, that the dew renders the surface of the soil damp; we cannot discriminate between those requiring water and those that do not, rendering the performance more tedious, and causing a waste of time which otherwise would have been avoided. But laying aside theory altogether, and appealing to nature for an answer,—are warm nights beneficial to the health of vegetable life or not? I think not. Plants store up at night materials which are to support them under the influence of heat, light, &c. during the day, and nature has so ordered it that a certain period is assigned for each. Now all animals require a period of rest to recruit their bodies, and why not vegetables? And as heat is a principal stimulant to not vegetables? It follows that if, by artificial means, we give vegetable life more than a natural quantity, we shall overwork their organs, and consequently weaken them. By an unnatural stimulant plants may certainly for a time appear to be enjoying good health; but as their organs by such treatment would, in time, become deranged, they would thereby become unable to perform their offices, the plants would be unhealthy, and unless timely steps were taken, death would probably be the result; at all events, a total derangement of their whole system would take place.—*Tyro.*

Improved Garden Pots.—The Improved Garden Pots recommended by Mr. Rendle, at p. 519, have been made by Mr. Croucher, of Clapham, for the last two or three years, and answer remarkably well.—*A Subscriber.*

Fuchsias.—It may, perhaps, be interesting to some persons to know that some varieties of the Fuchsia are more hardy than is generally believed. There is in the Flower-garden of Colonel M'Douall at Logan, Wigtonshire, a Fuchsia about 10 feet high and 40 feet in circumference, forming a compact bush, which is annually in the months of July, &c. richly covered with its elegant flowers, and ripening its seeds in the autumn, from which there are annually raised seedlings without number. Some of these have nearly attained the size of the parent plant, and grow freely in any soil or situation in which they may chance to be placed, even under the shade of trees, where few other shrubs will grow, and on exposed situations without any protection, blooming freely, to the great ornament of the grounds, from July until November. The above parent plant has been said by several individuals, who have visited gardens in many parts of Britain, to be the largest they have seen. But your widely-circulated Paper may possibly be read at some gardens which neither of these

persons have happened to visit, and where there may be Fuchsias as well acclimatised and larger specimens. If so, a statement to that effect would, I presume, be gratifying to many of your readers, as, by bringing them into more general notice as hardy shrubs, they may become more universally cultivated, as they undoubtedly deserve to be. I may also state that there is a considerable variety among the seedlings, as regards the size of the flower, habit of the plant, bardiness, &c.—*G. Williamson, Gardener, Logan.* [It is a pity our correspondent does not say what species of Fuchsia it is that he describes.]

Support for Orchidaceous Plants.—I herewith send you a sketch of a simple and efficient method of supporting

suspended Orchidaceous Plants, whereby they may be introduced into the drawing-room with the same ease as those under pot-culture; and as some of the most curious and desirable of the tribe produce pendulous flower-stems, their beauty cannot thoroughly be displayed without being elevated and subjected to this or some similar mode of treatment. Floral admirers know that to place their subjects in a proper position, so as to catch the eye to most advantage, displays as much art as their superior culture; and in no class of flowers can this be more apparent than in Orchidaceæ; for when so situated, their singular habits, their curious form, and gaudy colours, cannot fail to attract the admiration of those who are least interested in floral beauties; and as many of them can have no rivals as drawing-room flowers, on account of their delightful fragrance and their long duration of bloom in such situations, the following means of making them portable may prove acceptable to those who wish to see them oftener than by visiting the Orchidaceous house:—Make choice of a flower-pot according to the size of the suspender required, and get a piece of strong wire, (say a quarter of an inch in diameter;) place the end of this in the bottom of the pot, and turn it sharp over the rim; then proceed to shape it in the form of the annexed representation. Turn the top down so as to form a loop, bring it close at the shoulder, and form the other side to correspond; this will compose half the frame. Make two more sides of the same shape, with a turn at top to meet close to its neck; make this fast with a piece of wire, then with a bradawl perforate two holes below the rim of the pot, and two at bottom for each side; pass a piece of wire (copper is best) through to the inside, and twist the ends with plyers tightly over the uprights, which will complete the suspender. The pot may be filled with sand to give greater stability to its basis, and as well as the suspender, may be painted green. It may then be placed either in a flower-stand or upon the drawing-room table.—*J. W.*

Artificial Glazing.—As a covering for flowers, &c., nothing can be better than the varnish or solution of caoutchouc, spread with a clean brush upon fine holland—not calico. When the linen is properly strained upon frames, it is as tight as a drum-head, and is no contemptible substitute for glass;—indeed, its chastened light renders it sometimes preferable.—*Proteus.*

Shade and Shelter for Plants.—The following is an account of a contrivance for shading or otherwise protecting various outdoor plants, which answers the purpose so admirably, that I think it worthy of publicity. It is simply half a common garden-pot (the pot being bisected before being submitted to the kiln), twelve inches in diameter, and fourteen inches high (but the dimensions, of course, may vary according to convenience), of the same width from top to bottom. It may be used in various ways, either erect or longitudinally, so as to afford a complete shelter to anything newly planted, from scorching sun, driving winds, or beating rains. In some cases, where required, it will be found advantageous to place two with their mouths together, so as to entirely shut up the plant. Their application is universal, their usefulness endless, and their cost so trifling, that no garden ought to be without them. Whilst I am on this subject, I may mention a simple, but, I believe, effectual, method of protecting tender Roses in masses, as practised at Ash Grove, near Halifax, the residence of E. Rawson, Esq., which came under my notice during my visits there in the winter months. It was done by merely pricking branches of common Whin between the plants, deep enough to prevent the wind from blowing them about; these branches stand very little higher than the Roses, and not so numerous as to crowd them. In this way at that season of the year, the groups presented an improved appearance rather than otherwise. This simple method of protection may be applied with advantage to many other tender plants, after the roots have been covered with decayed leaves, or tanner's bark. Where the Whin is not very plentiful, common Heath or spruce Fir-branches will answer quite as well.—*Joshua Major, Knosthorpe.*

Forcing Pears.—I have tried to bring Pears to bear

forcing, but cannot succeed. The red spider took possession so strongly of the leaves, that for the preservation of the Vines from their ravages, the Pear-plants were taken out of the Vinery.—*W. S. D.*

Mulberries.—I beg to state, in answer to "Anonymous," at p. 545, that I was reading some years ago of an old man who was planting a Mulberry-tree being ridiculed by three young men, who asked him if he thought that he should ever taste the fruit; his reply was, that his tree would live when they were rotten: and they all three died in the same year. Upon turning the subject over in my own mind, I fancied that Mulberries could be reared and brought to perfection much earlier than by the usual way. I therefore obtained a branch from a tree, about the end of December, and laid it on a grass plat, where it was left until early in March following, when I cut from the branch 30 small pieces from 6 to 9 inches in length, and planted them in the garden 8 inches apart. In dry weather I gave a little water, and watched the progress of growth, which was slow. At the following Michaelmas I lifted them, pruned the roots, and planted them again, giving them more space to grow in. At the end of two years I had upwards of 20 small but healthy plants; I selected four of the best, and again pruned the roots, so as to get them into a small pot, and placed them in a Vinery, where they continued to do well all the summer, but did not increase in size. I put them in the open air all winter, and early the next season I returned them again to the Vinery, where they soon showed blossom, and produced a few fruit, which ripened well. The following year the plants grew, and on one of them I had 103 very fine fruit, which ripened by the end of June. I was led into this experiment as well from the story of the old man and his three visitors, as from having some years ago grafted a small seedling Apple-plant only two years old, and put it into a very small pot under glass; the second year from grafting it ripened two Apples, which were excellent.—*W. S. D.*

Ginger.—After the first crop is gathered, which will be in the space of ten or twelve weeks from the time of planting, replace the old sets, and they will produce a crop for seed the following year. I have some now that are very promising.—*W. Brown, Merevale.*

Botanical Destruction.—I was in hopes that the absurd outcry about "radical Botany" had died a natural death; but I observe, at p. 501, that such is not the case. Notwithstanding your correspondent's formidable signature, his letter is devoid of sting, and is in want of those facts which should support his conclusions; indeed it would not require notice, but that well-meaning people who do not investigate for themselves might be misled by it,—I believe that the only authentic case of "extermination" is that of *Menziesia cærulea* (said to have been the work of an Edinburgh nurseryman); as to the Orchidaceæ, although roots of *Orchis fusca* are hawked about London in the spring, I found it abundantly near Cobham this year. *O. hircina*, perhaps, is gone; I do not know of its having been found since the time mentioned by Mr. Peete, in a late Number of the "Phytologist." Now, I, for one, would rather that so rare a plant, as it has always been, should be preserved in the Herbaria of the celebrated Botanist, whom Mr. Peete names as having found it, than that it should be left to the mercy of promiscuous passers-by, who, ignorant of the interest attached to it, would nevertheless be attracted by the singularity of its appearance. *Althæa hirsuta*, about the loss of which so much lament was made last year, is this year as plentiful as ever in the old locality; this is the case also with *Salvia pratensis*. "Nettle" does not appear to understand any distinction between rare and local plants. I consider that, if I have a local plant growing abundantly within my reach, I owe it to my brother Botanists to collect for them as well as for myself, as it is not every one who can make a pilgrimage to the locality. The imputation of greediness must certainly rest with those who think otherwise. "Nettle" says that he has been told that a member of the Botanical Society of London has transmitted plants to head-quarters by the hundred. I must frighten him still more—I know that several have done so. I have even heard of a member of the Edinburgh Society botanizing with a cart. Possibly your correspondent may be a follower of the Botanist(?) who travelled all over Europe with a sandwich-box and a pair of scissors, by means of which he obtained a splendid collection of specimens, each five inches long. For my part, until we can altogether dispense with roots in our specific descriptions, I shall stick to the trowel.—*Dockleaf*

The Cuckoo.—I see, at p. 519, that "A Subscriber" is rather astonished at having heard the cuckoo singing on the last day of June. In this part of Suffolk I have constantly heard him up to the 12th day of July, but never later than that period. "A Subscriber" also states that a friend of his has a young one, which he hopes to keep through the winter, and which I hope he will, as many more of your readers beside myself would like to be acquainted with a method of doing this. Many of my friends, as well as myself, have tried several times to do so, but have never yet succeeded.—*Finbroensis, Stowmarket.*

Birds.—Many gardeners adopt the motto, and act up to it to the very letter, of killing every bird that enters their gardens. Now, leaving humanity out of the question, such a practice cannot be too highly censured; and could they for one moment reflect on the injury they were inflicting on themselves, they would instantly abandon the practice. To induce such a reflection is the only object of this essay; and should it be the means of producing it in but one individual—should it be the means of saving the life of but one innocent bird—I shall be more than amply recompensed. To say that gardeners do not receive extensive injuries from birds, would be to speak

falsely; and we are so apt to be led away by prejudice, that by witnessing the depredations of one or two, we instantly believe them all to be thieves and enemies, and persecute them accordingly, when, if we had but examined their habits, and been less hasty in our decision, we should have saved many a poor bird's life, and benefited ourselves greatly. We should certainly find, if we would take the matter into consideration, that by balancing the accounts of the injuries they inflict against the benefits they confer, the result would stand very widely from what we conceive it to be. The injuries we receive are directly, the benefits indirectly, which certainly leaves us more chance of deciding against the poor birds. Thus, if we have a bed of seed or a crop of fruit mutilated or destroyed, we are immediately sensible of the injury; but when tens of thousands of the larvæ of destructive insects are exterminated, the benefits are indirectly; we are not aware of it, and consequently we cannot appreciate it. We should therefore carefully investigate the habits of the garden-frequenting birds, before we deal death and destruction among them. There are some we are justified in killing; but Man, as lord and master of all inferior animals, of which he is but the superior one, should not recklessly destroy. He has an undoubted right to remove those that are noxious to him, but he should act discriminately; and he that wantonly destroys the most minute of God's creatures, will have more to answer for than he imagines. A providential power is extended to the ant as well as to the most mighty of mankind, and through every grade of animal life; and that man who acts the tyrant over inferior animals—he who, without just reasons for his conduct, can wantonly and cruelly destroy the most trifling animal—is unworthy the name, and is destitute of the best feeling of our nature,—the love of Nature's subjects—

"I would not enter on my list of friends
The man who heedless treads upon a worm."

—Tyro.

PROCEEDINGS OF SOCIETIES.

HORTICULTURAL SOCIETY.

ERRATA.—It should have been stated in our Report of the meeting at Regent Street last week, that Mr. Cuthill was awarded a certificate for *Lisianthus Russellianus*. The same plant also received a prize at the South London Exhibition.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

August 2.—W. Miles, Esq., in the Chair. Five gentlemen were elected Members. Mr. R. Barker presented the Monthly Report of the accounts, from which it appeared that independently of the sums deposited at Messrs. Crompton, Newton, & Co., there was on the 31st July in the hands of Messrs. Drummond, a current cash balance of 2,052l. to meet the amount of prizes awarded at the Derby Meeting. The names of three Governors and twenty Members were ordered to be struck out on account of their unpaid arrears of subscription. Mr. Neale, contractor for the Council Dinner in Derby County Hall, attended to produce his tickets as vouchers for his claim of payment, and to explain the omissions complained of as having occurred at that dinner; although the Council resolved that he had insufficiently executed his contract, they accepted his offer for payment at a reduced rate on the original terms. The Rev. C. Hill was reported as the author of the successful essay on the construction of cottages, for which the Society had awarded their Gold Medal, and Mr. Stanley as the recipient of an additional premium of 100l. The parasitical plant brought to the last meeting by the Rev. D. Gwilt, and referred to Mr. Paxton, was stated by him to be the *Cuscuta Europæa*, or larger European Dodder.

August 4.—A Special Council was held for the purpose of taking into consideration the Report of the Judges of Implements and the arrangements for the Southampton Meeting. Earl Spencer, President, in the Chair. The award of prizes by the Judges of Implements at Derby, and their report of the grounds on which any of the prizes had been withheld, was read and adopted:—Mr. Miles, M.P., on the part of the Stewards of the implement department, stated the case of the implement-makers, who at Derby had appointed Messrs. Ransome and Cottam as their joint representatives in communicating their wishes to the Stewards during the meeting, and that all the implement-makers present were fully prepared for the full trial of the merits of their respective implements, and were greatly disappointed at the result in the arrangements for effecting that trial; for, with the exception of the satisfactory trial of thrashing-machines and chaff-cutters, there was not sufficient time, even had there been proper land, to institute a due trial of the numerous implements for competition. With regard to the regulations applying to the exhibition and trial of implements, there had existed no distinct collection, the instructions referring to them being mixed up with those affecting the general objects of the show. He had therefore drawn up, in conjunction with Mr. Shelley, a code of regulations applying exclusively to implements, and embodying all that they conceived to be most suitable in previous regulations. Mr. T. J. Marshall having sent the model of a stack-covering previously to the Derby meeting, which had become too much injured by the carriage to be exhibited among the models on that occasion, he called attention at the present meeting to the value of the plan proposed for effecting the object in view. The contrivance consists of a framed roofing above the stacks, and the arranging upon this from the eaves to the ridge, in the mode pursued in the slating of a house, successive layers of a flat material, of the substance of hat felting, afterwards coated with coal-tar, &c. Mr. Marshall remarked, "For large farmers who grow a great quantity of corn and hay, I strongly recommend the erection of sheds near every homestead; indeed they will soon save themselves with a person who may grow only for his own consumption. With this impression, I beg to send you a plan and estimate for one I am about to erect; which, upon blocks and felt roofing, will cost about 117l., one twice the size would be less in proportion, say 187l.: either of these properly made at the first will last from 15 to 20 years. When once hay or corn is ready to lead, and safely under such a shed, neither stack-cloths or other protection are required. Against this outlay, place the expense of thatching in the usual way, the same quantity for the same successive number of years, and no more need be said in its favour. The wood-work I find lighter, and the inclination of the roof not so steep by one half as slate or tiles require, and the whole cost consequently less. The frost and snow of last winter, and the late heavy rains, have not made any impression, nor is there any appearance of either damp or wet within. This stack-covering admits of extension or contraction to any extent." Numerous donations to the Library were reported. The Council then adjourned, to meet again on the first Wednesday in November.

WEST LONDON FLORICULTURAL EXHIBITION.

The Annual Flower Show, for the benefit of the Butchers' Charitable Institution, was held at Waltham Green on the 8th and 9th inst., and, combined with other sources of amusement, attracted a large assemblage of spectators. The display of flowers far exceeded our expectations, both in extent and quality. The tents were well filled, and appeared to afford general gratification. The following is the award of the Judges:—**CLASS I.; FLORISTS AND NURSERYMEN.**—*Best Collection of Twelve Pelargoniums*, 1,

(Gold Medal,) Mr. Gaines; 2, (Large Silver Medal,) Mr. Catlough. *Best Collection of Ericas*, not less than Six, 1, (Large Silver Medal,) Mr. Pawley, of Bromley; 2, (Middle Silver Medal,) Mr. Cooper, of Bromley. *Best Collection of Cut Roses*, not less than 40 Bunches, 1, (Middle Silver Medal,) Mr. Paul, of Cheshunt; 2, (Small Silver Medal,) Mr. Halley, of Blackheath. **CLASS II.; GENTLEMEN'S GARDENERS AND AMATEURS.**—*Best Collection of Miscellaneous Plants* (Gold Medal), Mr. Hunt, gr. to Miss Traill, Hayes Place, Kent; 2, (Large Silver Medal), Mr. Redding, gr. to Mrs. Marryatt. *Best Collection of 12 Pelargoniums* (Middle Silver Medal), Mr. Hill; 2, (Small Silver Medal), Mr. Hayes. **CLASS III., OPEN TO ALL.**—*Best 12 Plants* (Large Silver Medal), Messrs. Lane and Pawley, equal. *Best Collection of Fuchsias* (Large Silver Medal), Mr. Gaines; 2, (Middle Silver Medal), Mr. Pawley; 3, (Small Silver Medal), Messrs. F. and A. Smith. *Best Calceolarias*, not less than 12 (Middle Silver Medal), Mr. Gaines. *Best Collection of Cut Flowers* (Middle Silver Medal), Mr. Redding; 2, (Small Silver Medal), Mr. Doran. *Best 12 Hydrangeas* (Middle Silver Medal), Mr. Larcomb, of Pimlico; 2, (Small Silver Medal), Messrs. F. and A. Smith. *Best Collection of Scarlet Pelargoniums* (Middle Silver Medal), Mr. Baile; 2, (Small Silver Medal), Mr. Ricketts; 3, (Second Small Silver Medal), Mr. Gaines. *Best Collection of Cacti* (Middle Silver Medal), Mr. Demoyne, of Walworth; 2, (Small Silver Medal), Mr. Trevers, of Walworth. **EXTRA PRIZES.**—*Six Ericas*, Mr. Hunt, gr. to Miss Traill (Large Silver Medal). *Fifty Miscellaneous Plants*, Mr. Catlough (Large Silver Medal). *Do.*, Messrs. F. and A. Smith, Hackney (Middle Silver Medal). *Collection of Cacti*, Mr. Plant, gr. to—Schroder, Esq., Brixton (Small Silver Medal). *Verbenas*, containing many new varieties, Mr. Ivory, Peckham (Middle Silver Medal). *12 Plants*, Messrs. F. and A. Smith (Small Silver Medal). *Picotees and Carnations*, Mr. Willmer (Middle Silver Medal). *Do.*, Mr. Embleton, gr. to T. Barnard, Esq., Brixton (Small Silver Medal). *Carnations*,—Burrup, Esq. (Small Silver Medal). *Named Cut Flowers*, Mr. Maxwell (Second Small Silver Medal). *Verbenas*, Mr. Gaines (Second Small Silver Medal). *Collection of Heaths*, Mr. Halley (Second Small Silver Medal). *Fruit*, Mr. Larcomb, Pimlico.

COUNTRY SHOWS.

Practical Floral and Horticultural Society of Ireland, July 20.—The above Society held their second Summer Exhibition of Fruits, Plants, and Flowers, in the Round Room of the Rotunda, and on no previous occasion has there been a greater display of finely-cultivated specimens. The contributions from the various Nurseries were much admired for their beautiful and healthy appearance, and also for their rarity and value. Amongst these might be noticed some very fine varieties of Pelargoniums, raised from seed by Mr. M'Laine, and Miscellaneous Collections of plants from the following persons, viz., Messrs. Haggarty, Livingston, and Hodgins. The groups from private contributors displayed evident skill and admirable management in their cultivation. The following is a list of the prizes:—**PRIVATE GARDENS:** *Stove Plants*, Collection of Six, 1, Mr. Humphreys, gr. to the Hon. Col. Wingfield, for Gesnera lateritia, G. hybrid var., Vinca rosea, Barleria flava, Gloxonia seedling var., G. bicolor; 2, Mr. Ellis, gr. to the Under Secretary. *Ericas*, Collection of Six, 1, Mr. Humphreys, for Erica Massoni, E. viridiflora, E. ventricosa superba, E. tricolor, E. reflexa alba, E. inflata. *Dark Pelargoniums*, Collection of Six, 1, J. H. Evans, Esq., for Jehu, Yeatmanianum grandiflorum, Desdemona, Hyder Ali, Black Prince, Negro Boy; 2, Mr. Smith, gr. to Mrs. Putland; *Light Do.*, Collection of Six, 1, Mr. Smith, for M'Laine's Mithridates, Queen, Croesus, Seleucus, Constantine, and Sylph; 2, J. H. Evans, Esq.; *Mixed Do.*, Collection of Six, 1, Mr. B. Kane, gr. to E. Clibborn, Esq., Incomparable, Arabella, Nymph, Lowndes's Perfection, Alexandrina, Fair Maid of Devon; 2, Mr. Smith. *Single Specimen, Stove Plant in flower*, 1 and 2, Mr. Smith. *Single Specimen, Greenhouse Plant in flower*, 1, Mr. Ellis, for Aloe brevifolia. *Fuchsias*, Collection of Six, 1, Mr. Ellis (old varieties, but very large); *Single Specimen*, 1, G. M. Walthew, Esq., for Enchantress; 2, Mr. Humphreys, for a splendid specimen of F. Chandlerii. *Basket of Ornamental Plants*, 1, Mr. Humphreys, for Elchrysom proflerum, Fuchsia fulgens, Gesnera (seedling var.), Tree Picotee—Julius Caesar (6 ft. high, finely bloomed), Vinca rosea and alba, Euphorbia splendens, Sinningia guttata, Amaryllis (seedling), Erica viridiflora, E. ventricosa superba, Indigolera incana; 2, Mr. Smith. *Mimulus*, 3 varieties, 1, J. H. Evans, Esq., for M'Lainianus, Gutbranus, and another. *Hardy Herbaceous Plants*, 4 varieties, 1, P. Pidgeon, Esq.; 2, J. H. Evans, Esq. *Device in Hardy Flowers*, 1, J. H. Evans, Esq.; *Do.*, in Tender Flowers, 1, J. H. Evans, Esq. *Roses*, 24 blooms, 1, Mr. Ellis; 2, Neptune Collier, Esq.; *Do.*, 12 blooms, 1, Mr. Alexander, gr. to the Duke of Leinster; *Dahlias*, 24 blooms, 1, J. H. Evans, Esq. 12 blooms, 1, Geo. M. Walthew, Esq., for Conquering Hero, Pickwick, Daneroff Rival, Ruby, Rosa, Burcham Hero, Argo, Lady Woodhouse, Triumph of Flora, Constantia, Edith Plantagenet, and the Bishop of Winchester. *Pansies*, 24 blooms, 1, Geo. M. Walthew, Esq., for Imogene, Robin Adair, Souter Johnny, Captivation, Glory of Enfield, Jewess, Pilot, Diogenes, Amulet, Duke of Cornwall, Prince Albert, Blue Petre, Coronation, Peter Dick, Charles the Twelfth, Desirable, Queen of Purples, Lady Peel, Earl of Clarendon, Delicata, Giantess, King of Yellows, Mulberry Superb. 1st prize to the same person for 50 blooms, including the above 24 and Eclipse (Thompson's), Paragon, Queen (Mountjoy's), Grand Duke, Eliza, Belzonii, Black Knight, Enfield Glory, Sarpass Imogene, Yellow Defiance, Goldsmith, Rodney (Walthew's), Blue Petre (Walthew's), Dark-eyed Maid (Walthew's), Pride of Norfolk (Walthew's), Blue-eyed Maid (Walthew's), Mulberry, Maid of the Mill (Davey's), Sophia (Henchman's), Success (Henchman's), Agnes (Henchman's), The Bride (Henchman's), Princess Royal (Davey's), Miss Kemble, Miss Stainforth, Sulphurea latea (Stubbs's). *Six Annuals*, J. H. Evans. **PUBLIC GARDENS.**—*Stove Plants*, Collection of Six, 1, Mr. Haggarty, for Euphorbia splendens, Begonia Dreggii, Rondetia speciosa, Gesneria bulbosa, Gloxonia rubra, maxima alba; 2, Mr. D. Livingston. *Greenhouse Plants*, Collection of Six, 1, Mr. Haggarty, for Stactice sinuata, S. mucronata, Burchellia capensis, Angozanthus Manglésii, Syphocampylus betulifolius, Elchrysom proflerum. *Orchidaceæ*, 1, Mr. Haggarty, for Calanthe veratrifolia, and Oncidium flexuosum. *Dark Pelargoniums*, Collection of Six, 1, Mr. Haggarty, for Negro Boy, Mervilleana, Yeatmanianum, Yeatmanianum grandiflorum, Jehu, Prince George. *Light Pelargoniums*, Collection of Six, 1, Mr. Haggarty, for Keefe's Erin go Bragh, Masterpiece, Napoleon, Joan of Arc, Lowndes's Perfection, and Sylph. *Mixed do.*, Collection of Six, 1, Mr. M'Laine, for M'Laine's Constantine, Medora, Queen Elizabeth, Amelia, Desdemona, and Garth's Conservative; 2, Mr. Haggarty; 3, Mr. Livingston. *Mimulus*, three varieties, 1, Mr. Livingston. *Fuchsias*, Collection of Six, 1, Mr. Haggarty, for Venus victrix, Victoria Regina, magnifica, Fulgens multiflora, Rósea elegans, splendissima; 2, Mr. Livingston. *Fuchsia, Single Specimen*, 1, Mr. Robert Hodgins, for Fuchsia Stanwelliana. *Basket of Ornamental Plants*, 1, Mr. Haggarty, for Grevillea sericea, Swainsonia galegifolia, Pavetta caffra, Brownea ciliata, Pimelea linifolia, Ardisia crenulata, Siphocampylus bicolor, Pimelea decussata, Gesneria speciosa, Erica ventricosa breviflora, Fuchsia Greggiana; 2, Mr. Livingston. *Herbaceous Plants*, Collection of Six, 1, Mr. Haggarty, for Delphinium Barlowii, Phlox omniflora, and Brownii; Spirea japonica, Stactice scoparia, Funkia Sieboldi; 2, Mr. J. Gough. *Device in Hardy Flowers*, 1, Mr. J. Gough. *Roses*, 24 blooms, 1, Mr. Livingston. **OPEN COMPETITION.**—*Stove Plants, Seedlings, Three Specimens*, 1, J. C. Humphreys. *Light Seeding Pelargonium*, 1, Mr. M'Laine; 2, J. C. Humphreys. *Three Seeding Pelargoniums*, Silver Medal, J. C. Humphreys. *Six Seeding Do.*, 1, J. C. Humphreys. *Pansies*, Six Seedlings, 1, N. Collier, Esq. *Five Hand-Bouquets of Greenhouse Flowers*, 1, J. C. Humphreys; 2, Mr. Ellis; 3, Mr. Livingston. *Three Hand Bouquets of Stove Flowers*, 1, J. C. Humphreys; 2, Mr. Livingston. *An extra prize* was recommended Mr. B. Kane, for three (greenhouse) Hand

Bouquets. Six varieties of German Stocks, J. Gough. A Seedling Fuchsia, exhibited by Mr. R. Hodgins, was universally admired; its colours were, corolla deep vivid purple and calyx very deep blood colour; form of flower that of Globosa. J. Welsh, Esq., exhibited a Pan of Pinks, (seedlings raised by him,) which were much admired for distinctness of character and clearness of colours. G. M. Walthew, Esq., also exhibited a fine specimen of Fuchsia Enchantress, in good bloom, the first so exhibited in Ireland; and as usual Mrs. Desmond exhibited her inimitable wax imitations of fruit and flowers; one in particular, that of the beautiful and curious Maxillaria tetragona, attracted general admiration. **FRUIT.**—*Melons, Persian or Green-flesh*, 1, Mr. O'Gilvie, gr. to the Earl of Leitrim; 2, Mr. Ellis. *Do., any variety*, 1, Mr. O'Gilvie; 2, Mr. Alexander. *Grapes, black*, 1, Mr. Smith; 2, Mr. Alexander. *Do., white*, 1, Mr. Alexander. *Cherries*, 1, Mr. M. Shaw; 2, Mr. Alexander. *Nectarines*, 1, Mr. Ellis; 2, Mr. Alexander. *Currants, white*, 1, C. S. Spear, Esq. *Do. red*, 1, N. Collier, Esq. *Dish of Peas*, 1, N. Collier, Esq.; 2, Mr. J. C. Humphreys. *Carrots*, 1, Mr. Johnston, gr. to H. Hanbridge, Esq. *Celery*, Mr. J. C. Humphreys. *Onions*, Mr. B. Kane. Two Orchidaceous plants were sent in by Mr. Boyle, gr. to the Chief Baron; but being too late were not entered for competition.

Reigate Cottage Gardeners' Society, July 29.—On Saturday evening, the second anniversary of this Society was held at the Town Hall, for the distribution of premiums for the best cultivated Cottage Gardens, within the parish, when the members with their wives and friends attended, and exhibited a very respectable display of Vegetables, Fruits, and Flowers, the products of their gardens; and a numerous assemblage of ladies and gentlemen, resident in the parish and neighbourhood, honoured the meeting with their presence. W. Price, Esq., having taken the chair, the Treasurer stated, that by the Report of the Inspectors of Gardens, the cultivation and keeping of the Cottage Gardens had been much improved in the course of the past year, in proof of which the superiority of the productions of Gardens then on the table would show; and at the monthly meetings, the Members were frequently bringing proofs of improved cultivation. The subscriptions of the honorary Members were sufficient, not only for the premiums awarded to the ordinary Members; but the Committee felt themselves justified from the surplus balance, to distribute young fruit-trees, chiefly Apples, at the choice of the Members, as additional rewards. The Members having been supplied with a good assortment of books relating strictly to gardening and rural economy, the Committee had recommended the adoption of other books on subjects likely to interest, agreeably, the minds of the Members and their families; and as affording a variety of reading, they had adopted "White's Selborne," "Bloomfield's Farmer's Boy," "The Cottager's Monthly Visitor," and "The Visitor;" to which they will add, as they proceed, other books of an instructive and entertaining nature. A kind friend of the Society, P. Foskett, Esq., being well aware that Members, in the course of their reading, would meet with many words they did not understand, had presented them with several copies of a cheap edition of "Johnson's Dictionary." Mrs. Price had, as last year, presented packets of flower-seeds to the Members' wives. The Treasurer also stated the case of a farm labourer, who, from a fortunate combination of circumstances and great activity of mind, was enabled, in addition to a skilful knowledge of all farming operations, to handle the tools of various trades to excellent purpose; and although few could equal the number and variety of talents this man possessed, all might emulate his activity, ingenuity, and industry. The use of candles made of rushes dipped in melted fat, with a little wax, of home produce, was recommended, as costing nothing; the man collecting the rushes and the wife peeling and preparing them so as to furnish a very good light for all domestic purposes, of which there is a very pleasing description in "White's Selborne," Letter 26th, addressed to Mr. Pennant. From the increasing population of the country, and the circumstance that individuals of small capital finding it a profitable investment for their money to build up tenements, with very insufficient accommodation for the purposes of domestic comfort and decency, with scarcely any garden ground, and in some instances none at all, which from the great demand for human habitations are immediately occupied, the allotment system so strongly recommended by the "Labourers' Friend Society" as furnishing useful and profitable occupation for the labouring man during his spare time, assisted by his wife and children, is found to be attended with the best advantages. The Report of a Select Committee of the House of Commons, appointed to inquire into the results of the allotment system was adverted to, the favourable nature of the evidence pointed out, and the conclusion quoted:—"Your Committee cannot conclude their Report without pressing upon the attention of the House, and of every landowner, this method of fulfilling the duty which they have to perform towards a class less fortunately situated than themselves, whose whole property is in their labour, constantly, though unavoidably, interfered with by improvements in machinery, changes of fashion, alteration of duties, and various other causes producing distress and misery, against which the most prudent cannot guard, but which the possession of a garden allotment, your Committee have abundant evidence to prove, tends most materially to alleviate. They would therefore urge upon such landed proprietors as possess property where allotments could be conveniently provided, to give every facility for the purpose." From a considerable kindness towards his regular workmen, Mr. Pym, a farmer of this parish, has always allowed them the use of small odds and ends of his fields, and waste lands, to plant with Potatoes chiefly. The men have always felt grateful for this favour, of which he has had abundant proof. The fathers and mothers of families present were strongly urged to bring up their children in good courses; to get the best education they could for them, combining, as much as possible, scholastic instruction and industrial occupation. The Rev. G. A. Webb, in expressing himself warmly in favour of the objects of the Society, adverted to the circumstance of the miserable tenements frequently occupied by the poor; that in the course of his ministrations among them, he was well assured that the crowded state of the dwellings tended not only to make the inhabitants uncomfortable in their homes, but also to much moral and physical deterioration. He exhorted all present to a strict observance of religious, moral, and social duties, to a religious education of the children, and to persevere in the objects of the Society. The Chairman then coincided in entire approbation of the objects of the Society, and expressed his cordial good wishes for its successful course: that he should be always most happy to do everything in his power to promote those ends, and the good of all industrious and well-disposed persons. The premiums were then distributed as follows:—J. Kent, 2l.; Jos. Eade, 17. 10s.; H. Stone, 11.; R. Comber, 15s.; C. Charlew, 10s.; W. Peat, 5s.; J. Bryant, a woodman's leathern jacket and gloves; Every other Member, 2s. 6d., and to each two gardening tools, according to choice.

NOTICES OF NEW PLANTS WHICH ARE EITHER USEFUL OR ORNAMENTAL.

HARTWEGIA PURPUREA; var. angustifolia. Purple Hartwegia; narrow-leaved variety. (*Stove Epiphyte*.) Orchidaceæ. Gynandria Monandra.—This plant was gathered in Guatemala, by George Ure Skinner, Esq., and added to Sir Charles Lemon's collection at Carr-Skew, in August, 1841. Although very distinct from the original form of this species in its leaves and flowers, yet the general habit and appearance of the two plants are so very similar, that the present one can only be regarded as a well-defined variety of the other. Its leaves are from three to four inches long, and from half an inch to an inch in breadth, oblong lanceolate acute, very thick and fleshy, hollowed along the middle, and tapering to both ends; of a brownish-green colour, singularly marked with numerous deep brown irregularly-formed spots. The scape is erect, about a foot

long, round and wiry, with many joints, each of which is surrounded by a pale brown-coloured bract, which closely embraces the stem, and covers it half way between the joints. The flowers are terminal, of the same bright pinkish colour as those of the old variety: from which, however, they differ in the form and size of the sepals, which are not obliquely cordate, but ovate oblong, and rather smaller than in the other. The lip is also very different, being much larger in every respect, and having a notch at the point, whereas in the original species it is small, roundish, cordate, and forms a kind of spur where it joins the column. In this variety there is no appearance of a spur, but it is narrowed round the column, and has a singular indentation just opposite its point. The column is curved, and about the same length as the sepals and petals. It is also of a deeper pink, and is rounded on the upper side; beneath, it is two-edged, from being slightly hollowed out along the middle. The anther-case is somewhat reniform, brownish pink, much darker than any other part of the flower.—*Botanical Register.*

GLADIOLUS SPLENDENS. Splendid Corn-flag. (*Frane Perennial*) Iridaceae. Triandria Monogynia.—Mr. Plant's "Mule Anisanth" calls attention to this plant, which was its female parent. There is no difference between the two former, except that the flower of *Canonus* has the tube yellow, the lower lip diminished, and yellow tipped with red, the rest of the flower scarlet, the upper segment being concave and prolonged, the laterals compressed; *splendens* has the like form, the tube and lower lip dull green, the lower edge of the upper laterals pale straw-colour, which is yellow in *Canonus*. On the same stem, in one flower, the two lower laterals are prolonged 5-8ths of an inch, of a pale straw-colour, the two upper laterals also prolonged, and the upper segment shortened to their usual length. Another flower has one of the upper laterals prolonged to the length of the upper segment and entirely red, and one of the lower laterals prolonged 3-16ths of an inch, and straw-coloured, with a little red. Plant's mule has the upper segment scarlet, a little speckled, largest, and concave; upper laterals similar, expanding, and sub-concave; lower lip 7-8ths of an inch shorter, sub erect, and coming, pale straw-colour, marked within with red, having a straw-coloured middle stripe. The expansion of the upper lip and the foliage show that it was bred as Mr. Plant asserts. *G. abbreviatus*, "Bot. Reg." 166, or quadrangularis, "Bot. Mag." 567, has the upper segment large and concave, all the rest abbreviated. All the three natural sorts have the usual seed of the Cape Gladiolus with foliaceous margins. I have had many instances of seedlings amongst the mixed produce from *Cardinalis*, *blandus*, and *tristis*, with the lower lip abbreviated, sometimes only during an unfavourable season. *Canonus* and *splendens*, which are closely akin, and scarcely separable, are both stoloniferous; quadrangularis is not, the latter having precisely the singular leaf of *G. tristis*, with four angles, the midrib being like the blade of the leaf. It is evident that the genera *Anisanthus* and *Petemenes* cannot be supported, their distinctions depending upon features which are variable.—*Hon. and Rev. W. Herbert, in Botanical Register.*

BIFRENNARIA INODORA. Scentless Bifrenaria. (*Stove Epiphyte*.) Orchidaceae. Gynandria Monandria.—This plant was imported from Rio in 1839, and added to Sir C. Lemon's collection at Carlew, where it flowered in April, 1843. In habit and general appearance it approaches so near to *Maxillaria tetragona*, as to have been mistaken for it, but on flowering it proved to be widely different from that species, and much handsomer, although the flowers are destitute of that peculiar fragrance which *M. tetragona* is said to possess. It requires similar treatment, and flourishes in a warm, moist stove, potted in a mixture of rotten wood and other decayed vegetable substances. The pseudo-bulbs are of a dull, brownish green, ovate-oblong, four-angled, a good deal hollowed between them, upwards of three inches long, and nearly the same in circumference at the base, from which they taper to the point, where there is a black-coloured band, indicating the joint at which the leaf is united to the pseudo-bulb. The leaves are solitary, oblong lanceolate acute, on short foot-stalks, spreading and recurved, measuring, when full-grown, a foot in length, and four inches across. They are thin and rigid, of a pale green below, rich deep green above, slightly undulated, or crimped, at the margin, with a prominent vein on either side of the midrib. The flowers are large and spreading, of a brownish green, with a hairy, red labellum; and the scape is ramical, very short, scarcely half the length of the pseudo-bulb, round, and of a pale green, bearing two and sometimes three flowers. The species is much the finest yet known, its flowers being as large as those of *Maxillaria Harrisoniae*.—*Botanical Register.*

MISCELLANEOUS.

On the Nutritive Power of Bread and Flour of different Countries.—It was observed as early as 1742, by Beccaria of Bologna, in Italy, that Flour consisted of two parts, differing essentially in their nature; the starchy part affording principles similar to those of all vegetables, and the glutinous part supplying azotized substances similar to those derived from an animal origin. According to the present views of chemists, those substances which contain azote are alone capable of forming blood, or, in common language, of nourishing the body. It is obvious, therefore, that the determination of the amount of this element present in Flour affords us at once an index of the nutritive power of Flour or Bread; on this principle the following important Table has been constructed by Dr. Robert D. Thomson, of Glasgow. The Naumburg Bread—a town in the south of Prussia, situated in a fine corn country,—the Dresden and Berlin Bread, were obtained in these cities in August, 1842. The Flour was probably, therefore, grown in 1841. The other specimens were procured in the early part of the present year, and are probably of the growth of 1842. The last column gives the relative value; 100 of Naumburg being equivalent to 115½ of Dresden Bread:—

	Azotized Principles.	Per Cent.	Equivalents.
Naumburg Bread	16.49	100.00	
Dresden do.	14.30	115.31	
Berlin do.	14.21	116.04	
Canada Flour	13.81	117.23	
Essex do.	13.59	121.33	
Glasgow unfermented Bread	13.39	123.15	
Lothian Flour	12.30	134.06	
United States Flour	11.37	145.03	
Ditto, by mechanical analysis	10.99	158.00	

The low position of the American Flour, as indicated by the first experiment in the Table, was so startling, that it was repeated by means of the mechanical process. The result of the analysis of three ounces was as follows:—

	Per Cent.
Starch	902.00
Azotized Principles:	68.73
Gluten	130.40
Albumen	14.00
Gum	60.40
Sugar	16.30
Water	189.40
3 oz. = 1312.50	100.00

It is from this analysis that the second result is given in the Table, and it affords a striking confirmation of the accuracy of the first determination. It is only necessary

to add, that all these specimens were dried at the temperature of 212° before being subjected to experiment.

The Rhododendron a good Thermometer.—The following singular statement appears in the *American Agriculturist*. "There are few persons who would see, on first scrutiny, in the Rhododendron maximum a complete thermometer. There have been for the last five years several very large specimens of this shrub close by our dining-room windows, and, by protracted observations by various members of the family, they have been so infallible in showing the temperature of the atmosphere, that the thermometer, which hung without the door, became in some measure useless, unless we wished to ascertain to a degree the state of the air. When the weather is cold, and the thermometer about zero, the leaves are rolled so tightly together that it seems almost impossible for them to again become unrolled, at the same time they are turned nearly black; and the expansion, as the weather moderates, is so gradual, that, by the degrees of their colour and shape, a person is enabled to form a pretty accurate opinion of the weather; and when mild, the leaves assume a light and very rich green."

Botanical Prize-men.—The following gentlemen obtained honours at the recent examination in Botany, in University College, London:—The 1st certificate and gold medal, Mr. C. Prentice, of Kingston-on-Thames; 2nd certificate and silver medal, Mr. W. H. Colborne, of Chippenham; 3rd certificate, Mr. J. R. Pretty, of London, and Mr. A. Haviland, of Bridgewater; 4th ditto, Mr. R. de Champ Ball, of Plymouth; 5th, Mr. Alex. Henry, of Kingsbridge, Devon; 6th, Mr. H. F. Goodridge, of Bath; 7th, Mr. W. R. Randall, of Southampton; 8th, Mr. C. R. Matthew, of Paddington; 9th, Mr. J. H. Elliott, of London.

Cormack's Prince Albert Pea.—This Pea, which has been cultivated in the garden of the Horticultural Society during the present season, produced Peas fit for table ten days earlier than any other variety sown at the same time. It is a seedling from Cormack's Early Kent, but is earlier and more hardy; and it may be recommended as the best early Pea.

THE NATURALIST'S CORNER.—No. XV.

(Continued from page 463.)

55. *Agarics.*—There is this most remarkable fact connected with the qualities of the Agarics, or Mushrooms; a fact which seems to show that their properties depend upon climate and situation and accidental circumstances, rather than upon specific peculiarities. Those kinds which are wholesome in one country are not so in another; thus, in Great Britain, the common Mushroom (*Agaricus campestris*), the Fairy Ring Agaric (*A. pratensis*), and the *A. Georgii*, are the only sorts that it is quite safe to eat; while the Fly Agaric (*A. muscarius*), and *A. virosus* are extremely poisonous. But in other countries of Europe it is different. In France, in Italy, and especially in Russia, a usual aliment is afforded by a great variety of species, which, although very common in this country, it would be extremely dangerous to eat; and, on the other hand, even the dangerous *A. muscarius* is a species of food in Kamtschatka.

56. *Aromatics.*—The impression made on the organs of smell and taste, and the peculiar influence exercised over the digestive powers, by those agents obtained from the vegetable kingdom are very peculiar. Scarcely any one is insensible to the odour of particular flowers, and some are affected by them to an extraordinary degree. The approach to Ceylon can be determined by the fragrance of the air at the distance of many miles; the *Magnolia glauca* diffuses an odour by which it can be recognised at the distance of three miles among the swampy districts in which it grows. This powerfully affects many persons while travelling or hunting; and the *Magnolia tripetala* causes sickness, headache, and an aggravation of fevers or rheumatism, among those near it who are labouring under these complaints. The odour of the Jonquils and other fragrant plants raised in Holland, is so great when brought into a close apartment, as to be quite overpowering. In such countries or places as have a very humid atmosphere, the odour of plants is most readily diffused as well as most potent; of this we may satisfy ourselves by calling to mind the greater fragrance of flowers early in the morning, in the evening, or after a shower. This accounts for the violent action of the plants in the countries just mentioned; but even many plants of Britain affect some individuals, endowed with a peculiar and excessive sensibility to an extreme degree. The sweet-scented Violet has such an effect on certain persons as to occasion headache, convulsions, and apoplexy.

57. *Nelumbium speciosum.*—Of all the vegetable productions of Astrakhan, none is more remarkable than the great Water-lily. Its leaves are nearly 2 ft. in diameter, and float upon the surface of the water; the stalk which bears them rises perpendicularly between six and eight feet from the bed of the water, and from between the leaves issue stout runners, which terminate in a splendid rose-coloured flower of delicious fragrance. The plant is held in deep veneration by the Hindoos and natives of Thibet, from a belief that their divinities reappear after death in the shape of these richly-scented flowers. The nuts, or capsules, of the plant are also in great request among them; and the flowers are distilled at Astrakhan into a water, which has the taste of amber, and, used as a cosmetic, gives softness to the skin.

58. The dried leaves of the *Saxifraga crassifolia* are used in Siberia and other parts of Upper Asia as a substitute for tea. They are chiefly gathered in the valley of the Tsharysh, on a mountain, which, on that account is called by the Russians Tshaynaya Sopka, the Tea Mountain. The leathery spongy leaves of this plant fall off in

the fourth year, when those only are gathered which are quite black. They require no other preparation to be used. The infusion is reddish, and of an astringent taste, similar to that of tea, but the aromatic flavour is wanting.

GARDEN MEMORANDA.

J. Allard, Esq., Stratford Green.—In the Orchidaceous house several varieties of *Gongora maculata*, suspended in baskets over a small reservoir of water, are flowering in great luxuriance; while beneath them the delicate *Nymphæa cærulea*, is expanding its beautiful light-blue starlike flowers. *Passiflora Kermesina* is trained, as a shade, above all, and is hanging in rich crimson festoons from the rafters of the house. A most lovely plant of *Miltonia spectabilis*, with 13 flowers open, and many more unexpanded, makes a rich display; in addition to this, there are in bloom *Stanhopea oculata* and *tigrina*; *Brassia verrucosa*, with singular strap-shaped divisions of the perianth; *Oncidium Baueri*, with spikes at least eight feet long; the highly-coloured *On. lanceanum*; the delicate *Epidendrum leucochilum*; *Cirrheæ viridi-purpurea*, *Zygopetalum rostratum*, and numerous others. The Fernery is exceedingly rich, and contains many highly-interesting species; the larger ones being planned amongst rock-work in the centre of the house, where they seem to thrive with as much luxuriance as in their native country. Several specimens of the *Cyathea arborea*, or Tree Fern, have lately been received from Jamaica, but they do not appear likely to recover from the effects of the voyage. In the greenhouse are excellent plants of *Thunbergia aurantiaca* and *alata alba*; the pale variety of *Lilium punctatum*; a great variety of *Fuchsias*, *magnifica* being the most prolific bloomer, in which respect *Venus victrix* also excels, and, independently of its peculiar colour, is worth cultivating on that account. A small plant of *Fuchsia Eppsii* is flowering freely, although the blooms are small, compared with some which we have seen elsewhere. The rich blue flowers of *Achimenes longiflora* form a pleasing contrast with the more brilliant colours of the *Balsams* and *Fuchsias*. There are to be two distinct varieties of this plant, one with leaves the undersurface of which are light-green, the other having them of a deep red, as is the case with several *Begonias*, and bearing flowers of a darker colour than the former. Upon the lawn we noticed a bed of the *Frogmore* scarlet *Pelargonium*, which is admirably adapted for planting out in this manner, being a free bloomer, and of particularly dwarf habit. Another clump was composed of *Campanula stricta*, which answers admirably in such a wet season as the present, affording a rapid succession of its pale blue flowers for a considerable length of time. The Vineries contain a good crop of Grapes, considering the short time during which the Vines have been established. Some young ones in pots are loaded with ripe fruit, several of them bearing as many as eight or nine bunches each. In these houses are healthy plants of *Achimenes pedunculata*; *Erythrina crista-galli*, in a most vigorous condition; *Portulaca splendens* and *Thellusoni*, flowering profusely, and the beautiful *Ipomœa rubro-cærulea*, twining round one of the supporters of the rafters. To judge from the crops of Melons and Cucumbers obtained by Mr. Crouch, the ridge and furrow system, and at 20s. is well adapted for their growth. The "single shift system" of potting has been practised here upon Heaths, Pimeleas, and other hard-wooded plants, and the healthy state of the specimens under this treatment bear ample testimony to its superiority, after a plant has once become established, over the more ancient plan of a little shift and often.—*R. A. July 26.*

SCIENCE.

Dr. Justus Liebig, in his Relation to Vegetable Physiology. By Dr. Hugo Mohl. (Dr. Justus Liebig's Verhältniss zur Pflanzen-Physiologie.) Tübingen. Fries. 1843.

(Continued from page 544.)

The next part of Dr. Mohl's observations relates to the chapters of Professor Liebig's book, inscribed "The Assimilation of Carbon." The question at issue is, whether the plants owe their carbon to the absorption of organic or inorganic substances, Prof. L. having given his sanction to the latter opinion. The reasons which seem to have weighed most with him are, 1st, Humic acid loses its soluble character by exsiccation as well as by freezing; 2d, Even conceding that all the bases found in the ashes of plants should have been conveyed to their substance in the form of humates, yet the amount of humic acid thus conveyed to plants is not sufficient to explain the amount of carbon they contain; moreover, 3d, Even all the rain which falls on a certain area is not sufficient to explain the large quantity of carbon they contain; but the chief argument against the plants deriving carbon from humus is, 4th, That manured and barren ground will yield nearly the same amount of carbon in the plants growing thereon. It is, in fine, to be observed, that, 5th, Humus and the carbon of plants must have the same origin, as it is impossible that there could have existed any primitive humus, for plants must have existed before humus. Plants receive, therefore, their carbon from the atmosphere, where it exists in sufficient quantity to supply all plants with carbon. Dr. Mohl says, then, that L. has arrived, in these remarks, at one or two results correct in the main; but he also shows that most of it (or at least as much as is true) has been known to Saussure 40 years ago. As the above axiom, however, is one of great importance in botanical physiology, Dr. Mohl proceeds to examine the doctrine of Liebig in detail. The argument stated under No. 1 proves, he says, nothing,—because the combination of humic acid with alkalies, stated under No. 2, is in direct contradiction to it. These parts of the question have been, however, already sifted by Schleiden; and the utmost which can be conceded is, that plants do not obtain all their carbon from the soil.

Liebig concludes one of his remarks relating to humus in the following words:—"As plants grown on an acre of unmanured meadow or forest-land will assimilate an equal amount of carbon to those grown on manured and cultivated fields,—as, moreover, the former soil will not become, by the process of vegetation, poorer in humus, but, on the contrary, richer; there must be a source different from humus or manure, whence plants receive their carbon, and this is the atmosphere." This mistaken argument of Liebig, (says Dr. Mohl) arises out of his confounding the origin of carbon in the whole of vegetation with that in a single plant, as well as on his placing unmanured soil on a par with that when is denuded of humus. A plant might require a certain amount of humus for its nourishment, and still prepare and yield, by the decay of its foliage

or herbage, the same quantity, or even more than it has absorbed, for the growth of subsequent generations.

The next argument of Liebig discussed by Dr. Mohl (relating always to the origin of carbon in plants) is, that in antediluvian times, plants must have existed before humus; and so they do now—witness the Lecanoras and Parmelias growing on the perpendicular cliffs of granitic mountains. This reminds him of the question, whether the egg or the hen existed first; and being aware of the abuse which has of late been made of scientific axioms being derived from mere algebraic calculations, he says that all sorts of results may be ex-calculated (heraus-rechnen) in that way.

To settle the question about the existence of primeval humus, Dr. Mohl makes the following remark on antediluvian vegetation. "What do we know of the incipient vegetation of the primeval world—and why, before the appearance of the highest developed plants, such for instance as Ferns, should not others which can live without humus, such as Mosses and Lichens, have prepared the humus necessary for the higher plants?" This, of course, is the eternal progress of vegetation in all times and in every place of the globe.

(To be continued.)

British Phanogamous Botany; or, Figures and Descriptions of the German and British Flowering Plants. By W. Baxter, F.H.S. 6 Vols., 8vo. Oxford, Parker.

It is not every year that brings a work like this to its conclusion;—begun long since, and continued steadily and uninterruptedly to the end, with perfect good faith towards its subscribers, and so absolutely the same in execution at the beginning and at last, that one would have thought that the whole must have appeared simultaneously. Mr. Baxter deserves great credit for having thus completed his design, with the production of one of the most useful, if not the most useful, help the young student possesses to a knowledge of British Flowering plants. We must all of us have felt in the beginning that the great difficulty which is offered to gaining an acquaintance with plants consists in appreciating correctly the minute characters by which the genera of plants are distinguished. It is very puzzling to an unassisted student to ascertain whether his plant is a Polygonum or a Chenopodium, for instance; but it is less difficult, and we will add less important, to determine what species of Polygonum or Chenopodium he has before him. The former difficulty Mr. Baxter has removed by his well-conducted work, in which a figure of each genus of British plants is given, with such representations of the parts of the flower as it is really necessary to understand; and a full explanation of the differences by which it is known from those to which it is most like.

For those whose means will not permit them to purchase the more expensive books of Natural History, this is particularly well suited, and we can hardly name a more acceptable present to a young person. We only regret that the inevitable cost of a work containing upwards of 500 copper plates should necessarily place it beyond the reach of the multitude.

Chemistry made Easy, for the Use of the Agriculturists of Great Britain and Ireland. By the Rev. J. Topham, M.A. 24mo. Whitaker.

INTO 44 tiny pages, containing about five of our columns of ordinary type, is here compressed all that Mr. Topham considers "necessary for the clear comprehension of the terms (viz., the things they represent) which chemistry uses; to show the manner in which chemical action is performed; the multifarious objects over which its influence extends; and the method by which it explains the qualities and exposes the constituents of the respective objects on which a farmer's attention and capital are usually exercised." We wish that experience would justify our admitting that these important objects are to be accomplished by such means. Nevertheless the little work is worth reading, as an introduction to a serious inquiry into chemical phenomena.

CALENDAR OF OPERATIONS for the ensuing week.

Any time after the middle of this month those hardy annuals that stand our ordinary winters, and that flower from the middle of April to the middle or end of June, may be sown in very light sandy soil, on an east border in the kitchen or reserve-garden—where there is such a convenience—or indeed in any open places in the shrubberies. This is about a month earlier than is generally chosen or recommended for this work; but I am of opinion, and this opinion is grounded on my own experience, that this is the best time, especially in this cold season, as the earth has not been warmed to the usual degree; and if we should have a cold autumn, a month hence will be too late. If, otherwise, this should not be the case, and the plants are found to be too forward by the beginning of October, they could then be easily transplanted, and the check would be so far in their favour in enabling them to stand the winter. When the flower-beds are dug over in February, these annuals could be transplanted in groups, according to their colours, or the fancy of the owner, for I would never impose rules against people's fancies in such matters. At the same time the seeds of other annuals could be sown, so as to have no blanks in the beds; even those beds filled with spring bulbs, such as the dwarf early Tulips, Hyacinths, Narcissus, &c., should be planted or sown with these annuals between the rows of bulbs, and by the time the latter would begin to fade, the annuals would be getting gay, and continue so till the leaves of the bulbs were ripe. As soon as the bloom began to fade, the whole could be dug over, the bulbs taken away to be dried, and the beds planted immediately with strong healthy plants of the half-hardy sorts, now used for summer and autumn display. As by this system there would be no want of flowers during May and June, there need be no hurry in "getting out" the latter class of plants (as at present), till they are sufficiently hardened in turf pits and temporary shelters to stand the change with impunity, and be ready to grow away at once, instead of being watered and otherwise nursed for weeks together. No one who has travelled through the country and seen the haggard appearance of nine-tenths of our best flower-gardens at that season, will dispute that something of this kind is much wanted. *Silene pendula* and *compacta*, with *Nemophila insignis* and *atomaria*, are among the first to flower in spring; and here you have at once pink, scarlet, with true blue and white; *S. compacta*, at that early season, being a deep reddish pink, and pen-

dula being also deeper in colour at that season, rising not higher than the *Nemophila*, while *compacta* is rather higher, say from 12 to 15 inches. Moreover, *Silene pendula*, when sown in April, will flower from June till overtaken by the frost, and yet you can hardly see it anywhere; it forms the best pink edging, as it bears clipping like the sweet Alyssum, the Virginian Stock, and *Sanvitalia procumbens*, all excellent plants for edgings. Indeed, with the exception of the *Leptosiphon densiflorus*, when you catch it in its prime, there is not a plant which makes a neater bed than *Sanvitalia*, which blooms from the 1st of June to the end of November. For yellow colours there are *Calliandroa platyglossa*, *Bartonia aurea*, and *Oxyurachrysanthemoides*, all three differing little in height (1½ foot); they also come into flower by the end of April, and although their foliage is rather weedy, it is well hidden with the profusion of their rich-coloured flowers, which last six weeks. Then for a taller bed of yellow, there is *Erysimum Peroffskianum*, which contrasts beautifully in size and colour with the blue branching *Larkspur*. I have not yet tried if *Sphenogyne speciosa* will stand the winter; I wish some one who would let me know. Whilst it lasts in bloom it is the finest thing we have, to say nothing of the *Clarkias*, *Collinsias*, *Godetias*, &c., which make such a rich appearance in the latter end of April, through May and the greater part of June, or in other words during the dreary season of the English flower-gardens.

I.—KITCHEN-GARDEN AND ORCHARD.

In-door Department.

PINERY.—If you are satisfied that the newly-potted plants are in no danger from bottom-heat, the rest is mere routine, as soon as they begin to show signs of fresh growth let in more air to them, but they require little water till they get good hold in the fresh soil.

VINERY.—If all has gone on well with the late Grapes, some of the black ones will now begin to change colour, and then you may carry them on slowly, with plenty of air, no moisture, and, except on very wet days, without fires throughout the autumn. Some people never think of pushing on late Vines till they see them at a standstill by the end of August; then a course of forcing commences, deranging the economy of nature and leaving traces of bad management for years to come.

PEACH-HOUSE.—By this time our Peach-houses ought to be so far through for this season as to be able to relieve those readers who take little interest in keeping down red spider in such a place, of this heading in the Calendar for the next three months; and I shall contrive to find something to say about flowers, to fill up the space.

MELONS AND CUCUMBERS.—After the present crop—which is nearly ready to cut, is over—few people care much about late Melons, except in great families, where Melons are in request late in autumn; and as, in these places, first-rate gardeners are always kept, I may perhaps be excused if I pass over this head occasionally through the autumn to make room for something else.

Out-door Department.

It appears that a wet, cold season is unfavourable to the mildew, which attacks Peas in this country by the end of summer, for I have not seen any of it this season, and from a good circle of correspondents I hear no complaints about it. Peas of all sorts have borne remarkably well this season, and the individual crops kept longer in succession than I ever remember to have seen before. I had a singular instance of the force of vegetation the other day, in a small way: two beds of the Silver-skinned Onion, which were sown about the middle of May, for pickling, being nearly large enough, the foreman and myself walked step by step all over them, and laid their tops down quite flat. He is a heavier man than myself, and I thought he had crushed his bed, bulbs and all. Soon after this a heavy thunderstorm passed over the garden, and next day all our Onions were upright again. Once more they acted the same part, but the third time settled them, and I have no doubt but they will come in good-sized for pickling.

CABBAGES.—After we plant out from the first-sown beds, which we must do very soon, as the plants are nearly stout enough—and the same from the Lettuce-beds, with other two sowings of Lettuces, and one of Cauliflower and Spinach there will be very little done in the Cabbage way for a long time to come, with the exception of the perennial succession crop, or weekly sowings of small saladings.

CELERY.—This and the Cardoons will want to be earthed up as soon as they are fit; but I think the latter had better remain till they are full-grown, and then be earthed up at once; either way will do well enough.

ORCHARD.—All that I can think of under this head to-day is, that the early summer Apples and Pears ought to be gathered a few days before they are fully ripe, and if they do not ripen fast enough in the fruit-room, to expose a dish of them every day in some of the houses, or in the sun, to bring them up to their right flavour. As to pruning or regulating the wood on wall-trees, &c., stirring the borders, protecting the fruit, and such kind of work, so much has been already said about it that no one will wish me to repeat it over again. However, you had better walk round, and if you see anything that wants doing, let no time be lost till all is put in good order again.

II.—FLOWER-GARDEN AND SHRUBBERY.

In-door Department.

STOVE.—Have you added the *Passiflora fragrans* or *Middletonia* yet to the climbers in this house—or do you prefer an intermediate stove for it? Although its general aspect differs little from the old *cærulea*, it deserves a place in every collection, on account of its fragrance, and if you were to graft it on *cærulea* it would flower in a warm conservatory. *Passiflora racemosa* and *Loudonii* so grafted flower beautifully in our conservatory, and look as green and healthy as those in the stove; but I have not yet succeeded in establishing *P. Kermesina* in the conservatory. Almost all woody stove-plants require to be kept drier in the autumn, after finishing their summer growth, and to have large portions of air given them.

GREENHOUSE.—If those thunder-storms which have passed over this month have really settled the weather at last, we may expect a fine autumn, and then greenhouse plants out-of-doors will grow more than will be useful for them next winter. It is the misfortune of greenhouse plants out-of-doors that they too often are in vigorous growth at the time they are housed for winter; and this is another reason out of many for growing the finer kinds in frames or pits, as their growth can there be regulated according to their own habits or the wishes of the grower. All that can be done in autumn for those out-of-doors is to get them now, or soon, into more exposed situations—to allow them more room, less water, and to be well secured with stakes.

CONSERVATORY.—The early spring cuttings of *Pelargoniums* are now nice sizeable plants, ready to turn into the conservatory for the last successions. If the house is large, four or five of these bushy plants may be put into a large pot, and great bushes thus formed at once, to fill up recesses or vacant corners. The leaves and flowers will soon turn to the light, and by turning the pots round twice a week, you will have fine specimens without a forest of sticks, which, although very necessary to show off plants at exhibitions, are most intolerable in a well-regulated conservatory. As the autumn advances, the conservatory is again kept more or less close, and much less water is given to the plants; those from the stoves now in flower require but very little water, and as they get past their prime they should be removed back to the stoves.

PITS AND FRAMES.—Let not the observations I have made on greenhouse plants out-of-doors deceive you here. Every encouragement should now be given to frame plants to grow to their utmost; the lights during most of the day admitting a portion of air, and, towards the evening, being taken off altogether, to let them have the night-dews, which are always heavy in the autumn, and make plants look so green and healthy at this time. We can always stop the growth when we think fit, by keeping the plants and frames drier, by having the lights off through the day and on at night, or reversing our present system. Is it not curious that plants should grow better in turf pits than in those made with bricks? I suppose bricks heated with the sun absorb too much of the moisture from the plants at night.

FLOWER-GARDEN.—Since the last Calendar I have received a letter from one of my late pupils, in which the following observations occur:—"Our flower garden looks remarkably gay just now—unrivalled about this quarter—but the incessant rains injure its beauty very much. We have some excellently-furnished beds of

scarlet, variegated, and miscellaneous *Pelargoniums*, such as, for instance, *Alexandrina*, *Conservative*, *Sylph*, *Coronation*, *Jewess*, *Joan of Arc*, &c." The italics are mine, to show how much I relish this kind of emulation in young men. I should like very much to have many more of such letters from different parts of the country, naming all the bedding plants that are not commonly used, for the use of this Calendar.—D. Beaton, *Shrubland Park Gardens*.

State of the Weather near London for the week ending Aug. 10, 1843, as observed at the Horticultural Garden, Chiswick.

Aug.		BAROMETER		THERMOMETER			Wind.	Rain.
		Max.	Min.	Max.	Min.	Mean		
Friday	4	29.605	29.527	68	46	5.0	S.W.	.18

Sat.	19	73.3	50.7	62.0	6	0.24	—	1	1	1	1	5	3

The highest temperature during the above period occurred on the 17th, 1834, thermometer 94°; and the lowest on the 13th, 1839—thermometer 32°.

REPORT ON COVENT-GARDEN MARKET,

For the Week ending August 11, 1843.

THE late hot weather has caused an abundant supply of Orchard Fruit to be brought into the market. The quantity of Vegetables is also amply sufficient to meet the demand. Pines are plentiful, and comprise several varieties. Both Black and White Grapes of good quality are abundant, at last week's prices. Foreign Melons continue to be well supplied, but those of home growth are becoming less numerous. The supply of Peaches and Nectarines will be rather limited until those are ripe upon the open walls. Apricots, Greengages, and several kinds of Plum are now generally offered: the best of the former fetching from 2s. to 4s. per doz. A few good Bigarreau Cherries may still be met with; very tolerable Strawberries may also be obtained at a somewhat advanced price. Gooseberries and Currants continue plentiful. Apples are brought in abundance, the Red Quarrenden being added to the dessert ones. Jargonelle Pears are becoming general, from 4s. to 8s. per half-sieve; inferior sorts are offered in great abundance. Filberts have made their appearance, from 1s. to 1s. 6d. per lb. Although the supply of Peas is somewhat limited, yet it is seldom that they are supplied in such quantities at this season. Broad and French Beans are abundant. Artichokes are very inferior. A few Tomatoes have been offered during the week. Field Mushrooms are selling at 6s. per bushel. Flowers in pots consist of Balsams, Fuchsias, *Pelargoniums*, *Hydrangeas*, &c.; amongst the cut ones are *Combretum purpureum*, *Soliva heterophylla*, *Agapanthus umbellatus*, *Jasmin*, beautiful Heaths, Pinks, Picotees, Roses, &c.

PRICES, SATURDAY, August 12, 1843.—FRUITS:—

Pine Apple, per lb., 3s to 6s	Cherries, English, p 12 lbs., 1s 6d to 3s 6d
Grapes, hothouse, per lb., 2s to 6s	— Wall, per lb., 1s to 4s
Peaches, per dozen, 12s to 21s	— Mowell, per 12 lbs., 3s to 12s
Nectarines, per dozen, 12s to 21s	Apples, new, per half-sieve, 1s 6d to 2s 6d
Apricots, per doz., 1s to 4s	Pears, per half sieve, 2s 6d to 3s
Figs, per doz., 6s	Oranges, per dozen, 1s 6d to 2s
Melons, each 2s to 6s	— per 100, 10s to 24s
— Dutch, each, 1s 6d to 3s	Lemons, per doz. 1s to 2s 6d
Plums, per punnet, 1s to 2s	— per 100, 5s to 14s
— violet, per half-sieve, 6s to 7s	Cucumbers, per brace, 6d to 2s
— Gage, per punnet, 2s	Almonds, per peck, 6s
Strawberries, per pottle, 6d to 1s	Sweet Almonds, per pound, 8s
Gooseberries, p half-sieve, 1s 6d to 2s 6d	Nuts, per bushel, —
Currants, per half-sieve, 2s to 3s 6d	— Black, 1s 10s
— Black, per half-sieve, 2s 6d to 3s	— Burlesome, 21s
— Red, for wine, per sieve, 4s to 5s	— Cob, 12s
— for dessert, p half-sieve, 3s to 4s 6d	Filberts, English, p 100 lbs., 100s to 110s
Raspberries, per gallon, 5d to 1s	

VEGETABLES.

Cabbages, per doz., 9d to 1s 3d	Leeks, per doz. bun., 3s to 4s
Cauliflowers, per dozen, 1s to 5s	Onions, Spring, doz. bun., 1s 6d to 2s
Beans, Kidney, per half-sieve, 1s 6d to 3s	— Large, per doz. bun., 2s to 5s
— Scarlet, per half-sieve, 1s 6d to 2s 6d	Garlic, per lb. 6d to 8d
— Windsor, per sieve, 1s to 1s 6d	Chills, per 100, 1s to 2s
Potatoes, New, per ton, 60s to 100s	Peas, per bushel, 1s to 3s
— per cwt, 3s to 5s 6d	— per sack, 2s to 5s
— per bushel, 1s to 3s	Lettuce, Cab., p. score, 9d to 1s
Kidney, p. bush., 2s to 4s 6d	— Cos, per score, 6d to 1s 6d
Artichokes, green, per doz., 1s to 4s	Celery, p. doz., (12 to 15) 9d to 1s 6d
Vegetable Marrows, per doz., 6d to 1s	Small Salad, per punnet, 3d to 6d
Turnips, per doz. bunches, 3s to 8s	Sweet Basil, per doz. bun., 3s to 4s
Red Beet, per dozen, 9d to 1s	Watercress, per doz. sm. bun. 4d to 6d
Horse Radish, per bundle, 1s to 8s	Parsley, per half sieve, 1s
Radish, spring, p. doz. hands, 6d to 1s	Tarragon, per doz. bunches, 2s to 3s
— Turnip, p. doz. bunch, 9d to 1s	Fennel, per doz. bun., 2s to 3s
Carrots, Horn, p. doz. bunches, 3s to 5s	Mint, per doz. bunches, 1s 6d to 2s
— Long, per doz. bunches, 4s to 7s	Marjoram, green, per bunch, 9d to 4d
Shallots, per lb., 1s	Mushrooms, per punnet, 1s to 2s
— green, per bunch, 4d	Walnuts, Green, per bushel, 7s to 9s
Spinach, per sieve, 2s to 2s 6d	

Notices to Correspondents.

AGRICULTURE.—Querist.—The nearest supports for rick-stands are those of cast-iron, placed on a stone or brick foundation. They should have caps 15 ins. in diameter. The shaft should be 18 ins. This will secure the stack from rats. Where free-stone is cheap, that may be more economical. We have a rick-stand all of iron, made by Messrs. Ransome, of Ipswich. The pillars are cast, but the frame, which is circular, is of wrought-iron; we have found these cheaper, and less liable to decay than those made of timber, and supported by cast-iron pillars. M.—A *Leicestershire Farmer*.—When Oats are stacked in a wet state they will come out musty and much deteriorated. When stacked too green they will heat and become dark coloured. In this state they purge and even gripe horses; we never heard this questioned. M.

IMPROVEMENT OF LAND.—A *Subscriber ab initio*.—In the improvement of a gravelly soil much depends on its nature, whether loamy or sandy; the first retains water like clay, and should be under-drained; the second forms a very good sub-soil, with a foot or 18 inches of good soil over it. Your plan of trenching and exposing to the air for a winter is good. The best thing for converting your peaty soil into good earth is horse-dung, well incorporated. Lime may have been previously added, or chalk, but should not be mixed with the dung. As you mean this ground for a garden, you can scarcely incorporate too much good rotten dung with the soil. The first expense will be the least. 20 cart-loads of chalk will not be too much laid on the surface before winter, that the frost may pulverise it, and then dig it in. Unless we know the exact quality of your soil and underlying peat and vegetable mould, we can only give general directions; as a physician cannot prescribe well without seeing the patient. M.

MANURES.—R. D.—You cannot employ a better substance than

Potter's Guano for your little garden. If applied in March, and two or three times more during the early summer, it will convert your desert into a paradise.—*J. W.*—If old tan is thoroughly decomposed it becomes a good soil for plants; it acts like leaf-mould, and is much improved by the addition of some animal manure, or of gas-water. We, however, doubt whether it is decomposed, unless it has been violently heated by being fermented with decaying animal matter. If the tannin is not destroyed, the tan will poison everything.

LIQUID MANURE.—*G.*—A plan of a simple machine for this purpose is given at p. 758 of 1842.

HEATING.—*G.*—Water does not circulate well in very small pipes; you had better use them of inch bore. It is of no consequence how small your boiler is; indeed you need not have one at all, but may make your pipe with a bend at the fire end, and put that in the fire. Arnot's stoves may be used to heat water; but the boiler should be entirely independent of the stove, as you propose; your plan will work. There is no danger in it. We apprehend that if your plumber when he fixed his pipe B to the lowest point of the syphon, had filled it by means of B, and then rendered B air tight, the syphon would have continued to work. Pray be so kind as to give us your experience about Bees, for which we shall be much obliged.

BOTTOM-HEAT.—*An Amateur.*—The greatest heat of water in open gutters in a pit for Cucumbers will be 100°. It is not absolutely indispensable that there should be a flow and return pipe; but it is extremely desirable.

PITS.—*Walthamstow.*—You will see a good system of heating in the garden of the Horticultural Society; and we advise you to inspect it. By and-by we shall publish the necessary details.

CLEMATIS.—*Discipulus.*—*C. Hendersonii* is a pretty single dark blue variety, growing rapidly, and attaining the height of ten or twelve feet.

BERBERIS AQUIFOLIUM.—*W. E.*—Rub the berries in dry sand, so as to separate the pulp, and sow immediately in peat or some light humous soil. If not immediately, keep the seed in sand till February, and sow it then; some of it will be two years coming up.

CAMELIAS.—*R. M.*—There is no means of checking the second growth of your Camellias, but by diminishing their supply of water, and keeping them cool. As you say, however, that they are strong and well-rooted plants, it may perhaps be better to let them continue their growth, as a check now might injure them. If we have a fine autumn they will not be much the worse; and in this case you should do all you can to encourage the ripening of the wood.

HEATHS.—*H. T. S.*—There is but one edition of Macnab's treatise, and that is excellent. We are unacquainted with the diseases that afflict you, but will inquire.

VICTORIA REGIA.—*Chronicles.*—This is a very tender stove-plant, native of the colony of Demerara.

ROSES.—*Slyboots.*—A mixture of finely-sifted leaf-mould and silver-sand is well adapted for striking Roses in. They may be potted off in a compost consisting of equal parts of loam and leaf-mould, with a small portion of dung.

CALCEOLARIAS.—*J. A.*—We recommend you the following twelve Calceolarias, as being distinct and first-rate varieties:—*Stan-dishii*, *Green's Royal Standard*, *Mary*, *Venusta*, *Isabella*, *Miss Antrobus*, and *alba coccinea maxima*; *Barnes's Perfection*, and *Bridesmaid*, *Well's Brenda* and *Modish*, and *Green's Prince Albert*.

PERALONIUMS.—*A Subscriber, Huddersfield.*—We beg to refer you to the list of Peraloniums in our last week's Paper. *—*C.*—We are not aware that unhealthy plants produce fine flowers, and doubt the fact. That the flowers should not be so bad as the leaves is accounted for by the fact that all flowers are a sort of diseased leaf, as our proposed articles on Morphology will show.

FUCHSIAS.—*Amateur.*—An account of a good method of treating *F. corymbiflora* is given in our Number of last week. *—*F. Chandleri* is a male, and like many others of its class, is destitute of good pollen.

FRUIT.—*J. R.*, having a Nectarine tree, trained horizontally in a small house, which regularly sheds its fruit a few days before it ripens, (having done this three years successively, although great attention has been paid to air and watering, and it has not been forced early,) wishes to be informed if any correspondent can assign a reason for it.

CUCUMBERS.—*B.*—The bitterness which you complain of in Cucumbers is no doubt occasioned by cold, and the consequent slowness of their growth.

PACKING FRUIT.—*E. H. L.*—A good method of packing fruit is, first to line the box with cotton-wool, and then to place the fruit, surrounded with tissue-paper, upon it. Let the whole be stuffed up firmly with cotton wool, so that there is no room for the contents to shake about; then place the box within another about three inches larger every way, and fill up all round it with dry moss.

MUSHROOMS.—*Bingo.*—Mushroom spawn may be procured of any nurseryman. Mushroom beds are prepared by collecting a sufficient number of horse-droppings, as free from straw as possible, into a heap, and turning them over repeatedly, previously to the formation of the bed, in order that the violent heat arising from them at first may be dissipated. In making the bed, the droppings are well beaten down and trodden, and when after a few days the temperature of the bed has settled down to about 70°, the spawn may be put in, barely covering it with dung, and afterwards firmly encasing the bed with soil to the depth of 1½ or 2 inches. The whole is then lightly covered with hay several inches thick.

THE FLANDERS' SPINACH.—*A.*—This is smooth-seeded, and if the seedmen sell a prickly-seeded kind for it they don't know it. The Horticultural Society annually import it from Paris, where it is called *Epinard de Flandres*. There is no comparison between it and other kinds of Winter Spinach, unless the "Lettuce-leaved" should prove as good.

CABBAGES.—*Bedhampton.*—The circumstance of a large white Cabbage having grown of a regular form but with fifty compactly cabbaged growths inside, is most probably owing to some accident in the course of cultivation, and not to any constitutional change in the variety. Still it may be worth endeavouring to save seed, pure, from the plant;—a very difficult thing, however, in the case of a single specimen of the Cabbage tribe. You may plant a few of the sprouts in different cottage gardens as you propose, but the more you have in a body the better chance you will have of preserving any characteristic which the variety may possess. It should be inclosed with gauze, kept at some distance from the plant, and the top covered with some close substance. A netting sufficient to prevent the access of bees to the flower is not sufficient to prevent their crossing the variety.

POTATOES.—*Somerset.*—We know nothing of the Potato; but it would require better evidence than the assertion of an advertisement to make us believe that 40 tons an acre have been obtained. In plain English, we don't believe it. The advertisement is very like a puff. We cannot recommend dealers. Apply to the nearest respectable nurseryman.

INSECTS.—*A Young Gardener.*—Your insects are the Mealy Bug, *Coccus aspidiotum*. We know of no better plan of getting rid of such troublesome visitors than gently brushing them off the plants on which they abound, and destroying them; or resorting to the method which has been successfully tried in Holland, of washing the plants well with a mixture of lime, black sulphur, and water, as recommended in the *Gardeners' Chronicle* for 1842, page 131. S.

CRICKETS.—*Verax.*—It is stated that by mixing arsenic with roasted apple or potato, and leaving it upon a sheet of paper during the night, the Crickets will partake of it and be destroyed. Probably, the method recommended at p. 505, for the destruction of Cockroaches, would answer the purpose as well.

BOOKS.—*A Subscriber.*—Mr. Lawrence's pamphlet is out of print. *—*Miss K.*—"Macculloch on Wine" may be had of all book-sellers. *—*J. E. M.*—No book, that we know of, was taken as the absolute basis of the work; but we believe that "Sprengel's Systema Vegetabilium" was a good deal used, and "Willdenow's Species Plantarum." The work was compiled from many books.

GARDEN ALLOTMENTS.—*An Old Surveyor.*—Your idea about an Arboretum is not a bad one, provided you plant only handsome species. Those Arboreta, for popular purposes, in which all manner of things, good, bad, and worse, are planted, are mere absurdities. It is not possible to advise you as to sorts in a short answer, and we have not room for a long one. Better consult some good nurseryman who deals in hardy trees.

EXHIBITIONS.—*Surrey.*—In exhibiting Roses at the meetings of the Horticultural Society next season, gentlemen's gardeners will be classed amongst amateurs.

TAN.—*A Subscriber.*—We are not acquainted with any other method of destroying the fungus which springs up in bark-beds, than that of constantly removing those portions of the bark upon which it makes its appearance.

FLINT PITCHING.—*T. P.* inquires what is the best chemical mixture, or other means, for keeping flint pitching free from weeds. As we do not know what this is, we refer the inquiry to some intelligent correspondent.

BRICK LABELS.—*J. H. B.*—Very much obliged; but your letter is an advertisement.

LARCH ROT.—*C. G. S. M.*—Many thanks. We hope to find room next week.

WINES.—*Miss K.*—We shall be obliged by the receipt for the home-made wines you name.

MISCELLANEOUS.—*C. W.*—*Phallus impudicus.*—*B.*—Both are *Cattleya Loddigesii*, and very beautifully-grown specimens they are. *—*W. C.*—Of the Ceylon plants, one is *Peliosanthus Tetra*; the other, with yellow flowers, is *Microstylis versicolor*.

—*Gwyn.*—No. 1, but like all those publications it is principally useful for the prices of markets. *—*Ipos.*—Certainly not *Convolvulus arvensis*, but apparently a striped variety of *Pharbitis hispida*. *—*Ignia.*—*A. Gleditschia* and *Tamus communis.*—*A Reader.*—1, Everlasting Pea; 2, *Sedum Telephoides*; 3, *Corydalis glauca*. *—*Oswald.*—*Mormodes aromatica*. *—*Insig-nis.*—1, *Veronica*; 2, *V. spicata*; 3, *Sedum oppositifolium*; 4, *S. spurius*; 5, *Potentilla astracantha*; 6, *P. obscura*. *—*O.*—*Escallonia rubra* and *Berberis aquifolium*. *—*A. Morton.*—There is no objection to your publishing the letter about the Walburton Admirable Peach. *—*Veronica.*—1, *Eutoca viscidula*; 2, *Schizanthus pinnatus*; 3, *Campánula speculum*, which are Annuals; 4, *Veronica spicata*; 5, *V. carnea*. *—*Omega.*—*Sophora velutina*. The reason why buds at the extremity of a tree open first is, that they are youngest and most excitable.

If the terminal bud is allowed to grow, it robs those next below it of their food, and they cannot grow. If you pinch out the terminal bud, then the others will sprout. *—*H. E. B.*—The rare *Delphinium vestitum* and a *Thalictrum*, apparently from India, which cannot be determined in the absence of nearly ripe fruit. *—*W. George.*—The snake Cucumber is the *Cucumis flexuosus* of Botanists, an East Indian Plant, not used as food, and probably not safe to meddle with. *—*Thos. M.*—One Latin Dictionary is as good for your purpose as another. You may find one at the bookstalls very cheap; such as schoolboys use, and called Ainsworth's, may be inquired for. *—*A. K.*—For Scaweeds you should study Greville's *Algæ Britannicæ*, a beautiful book, with plates, and Harvey's *Manual of British Algæ*. We are not aware that any other means are employed in drying them than steeping them in fresh water till the salt is extracted, and then floating them over sheets of paper till the parts are all displayed, when the sheets are lifted up carefully with the specimens, and dried in the usual way. No care will preserve the colours of some of them. The best specimens are those gathered from the rocks at low water. *—*M. D.*—*Ptelea trifoliata* is not at all uncommon, and is regularly sold at the great nurseries as a hardy tree; we therefore need not trespass upon your kindness for seeds. We do not know what the flowering Arrow-root plant is. *—*A. E.*—1, *Acinus vulgaris*; 2, *Valeriana officinalis*; 3, *Erythraea centaureum*; 4, *Lysimachia nummularia*; 5, *L. vulgaris*; 6, *Chlora perfoliata*. *—*F. C.*—Your plants are such bad specimens that it is impossible to name them, with the exception of *Epidendrum odoratissimum*. Besides, you have not even numbered them. *—*J. Carter.*—Your *Alstroemeria* is very handsome, and quite new. We will again notice it next week.

SEEDLING FLORISTS' FLOWERS.

FUCHSIAS.—*W. J. Epps.*—To judge from the specimen sent, your seedling (Eppsi) flowers freely enough, producing a pair of blooms from the axil of every leaf. *Monarch* is a flower of good substance, with remarkably stout tube and sepals of a purplish vermilion colour, and petals of crimson purple. The sepals have, however, a roughness which is not agreeable; it is nevertheless a fine globular flower, and seems to bloom even more freely than the preceding. Of your two seedlings (5 and 6), there is nothing remarkable in the former, excepting that some of the stem are partially metamorphosed in petals; in the latter, the flowers are borne upon pedicels above three inches long; the sepals are long and narrow, and with the tube of a purplish vermilion colour; the petals are large, of a deep crimson purple. If a free bloomer, the length of the flowers and footstalk combined will render it an elegant variety. *—*W. T. Peckham.*—Your seedling would be very pretty, were it not for one great fault, and that is the extreme roughness of the tube and sepals, which are of a clear flesh-colour, tipped with green, opening well and showing the bright vermilion corolla. It appears to be a very free bloomer. *—*J. Girling.*—No. 5 is a handsome seedling, with short crimson vermilion tube and sepals of good substance, the latter expanding so as almost to reflex, after the manner of magnificia; petals pale rosy purple, stamens and pistil much exerted. 13, although small, is of pleasing form, having a short, almost globose, tube, with dark vermilion sepals and violet-coloured petals. 12 has dark crimson vermilion tube and sepals, and crimson purple corolla. 14, the sepals are too long and narrow, as well as rough and ill-formed. 11, though a large flower, wants brilliancy of colour. *—*C. B. H., a Subscriber.*—Your seedlings are large and fine varieties; 1, 2, 4, 6, are the best; 2 the most novel, from the depth of its colour and the length of its flowers; 3 and 5 are coarser varieties. There are now so many fine seedlings produced of this beautiful flower, that it is difficult to distinguish them; and many that were thought highly of a few months since, have been equalled and surpassed by more recent varieties, every week producing many fine ones. Your seedlings are large, well-formed, of good substance, with large corollas, and the sepals well expanded; they are as good as most of those we have seen, but not equal to our finest varieties.

PERALONIUMS.—*A young Nurseryman.*—Your seedling is of a very desirable colour, but the upper petals are defective, from the weakness of the blotch and the quantity of feathering; it was badly packed, so that we could not judge of its general form, but the bottom petals are broad and well rounded.

VERBENAS.—*J. Plant.*—Your seedling is of a pretty dark lavender colour, but unless its habit is dwarf it will be of little value, in consequence of the small size of the flowers. The *Pink* is not different from *P. suaveolens*. *—*T. C.*—Your seedling appears to possess the habit of the old *V. Aubletia*, with leaves like those of *Drummondii*, and flowers of a deep purple. The colour is very good, but we are afraid its habit is against it.

PANSIES.—*Clericus.*—*Maria Lister* and *Lu plus Superbe* are both flowers of good form and substance, but both very deficient in the eye; the former variety has very rough edges to the petals. *Milania* and *Blue Beard* are very inferior to the dark flowers already in cultivation. The bloom of *Lady Sale* was curled up; the yellow appears uncertain. *Sir W. Follett* and

Nor are both flowers of good substance: the latter the best in the collection, though rather deficient in its outline, the circle not being well marked at the top. They are none of them beyond second-class flowers. *—*J. R. P.*—*Miranda* (though unquestionably too small in its present state for showing) is one of the most perfect Pansies we have seen: form and substance good, fine eye, good ground-colour, and the side petals meeting well above the eye joins the belting with great precision—we should like to see it again when larger. Neither *Colbert* nor *Portia* are sufficiently good to send out, the former on account of the indistinct ground-colour in the side petals and deficiency in the eye, and the latter from the colours being weak, and having a washed out appearance, it wants substance also. *—*A Lover of Pansies.*—The general failure in your flowers is in the want of substance, and very frequently the smallness of the side petals also, which seldom meet above the eye; several of the blooms were curled up that we could not decide upon the general form. No. 1, good general form, with fine eye; the belting is imperfect but uniform, and the yellow deeper in the bottom than in the side petals, a bright and attractive flower; 2, colour poor; 3, colour weak, edges rough; 4, yellow not uniform; 5, very fine eye, but deficient in substance, marking also irregular; 6, yellow, marking imperfect, petals too thin; 7, run colour; 8, dark rich self, not equal to the best out, and rather deficient in form; 9, fine eye, deficient in form and substance; 10, eye fine, yellow delicate and good, marking imperfect and wants substance; 11, fine eye, very pretty and novel, but rather deficient in substance; 12, eye bad; 13, colour too imperfect; 14, good substance, general form not good; 15, too thin; 16, thin, and eye poor; 17, wants substance, top petals very poor; 18, too thin, and not good in form; 67, imperfect in the marking on the upper petals, notch in the bottom one; the best of these flowers are but second rate, and are surpassed by others in the same way, already out. *
CALCEOLARIAS.—*J. Plant.*—Some of your seedlings are extremely pretty, and very curiously marked; there are, however, two or three that want purity in the ground-colour. *
As usual, a host of letters have arrived too late for answers this week.

NEWS OF THE WEEK.

A TELEGRAPHIC despatch reached town on Monday, announcing that the Spanish Regent had been driven to seek protection on board a British ship of war. The siege of Seville was raised on the 27th ult. The Regent had heard two days before of the surrender of Madrid, and of the march of General Concha to the relief of the besieged. He perceived, therefore, that his last hope was gone, and immediately retired in the direction of Cadiz. The insurgent forces, however, so closely pursued him, that it was impossible to reach Cadiz; and he was compelled, almost at the point of the sword, to embark at a small port on the shores of the bay, and seek protection on board the Malabar. Thus, the power which at one time seemed to bid fair to consolidate the interests of Spain has been overthrown in less than three years after the abdication of Queen Christina, and only 69 days after the commencement of the insurrection. In the meantime, the new Ministers have announced various measures, more in accordance with the character of a military commission than of a Constitutional Government. They have issued a Decree convoking the Cortes for the 15th October, and have broken up the Supreme Court of Law, because the Judges would not recognise their authority as established by the enactments of the Constitution. Great disunion and jealousy are said to exist among the Generals themselves, and some apprehensions are entertained that a reaction will take place before the assembly of the Cortes. *—In France, these changes in the affairs of Spain are received with general satisfaction, and the Spanish party no longer conceal their anxiety to effect a marriage between Queen Isabella and the Duc d'Aumale. The Repeal subscription has ceased to be reported, and it is rumoured that the French Government have given orders for its suppression. *—From Portugal, we learn that the tariff negotiations are on the point of being renewed, the Duke of Palmella having arrived in London, with full powers to bring the convention to a satisfactory conclusion. *—From the United States we have accounts to a recent date, but they contain few topics of interest. The Repeal agitation in the States appears to be entirely at an end, and some of the New York journals describe it as a political farce, got up for electioneering purposes.

At home, in both Houses of Parliament, a great amount of routine business has been despatched during the week. The House of Commons has sat on some days for 13 or 14 hours, and many supplemental votes and matters of detail have been disposed of. On Monday Mr. Ewart's motion in favour of free trade was negatived by 52 to 25, and on Wednesday, after a long debate, the Irish Arms Bill was read a third time and passed by a majority of 70. On Thursday the second reading of the Exportation of Machinery Bill was carried by a majority of 78, and an amendment rejecting the Church of Scotland Benefices Bill was negatived by a majority of 31. Both these Bills were passed last night. In the House of Lords on Monday, the Coroners Bill was thrown out in the second reading, by a majority of 24, and Lord Campbell's Bill relative to the expulsion of the Scotch Professors who have joined the Free Church, was thrown out without a division. On Tuesday a conversation took place on the Repeal agitation in Ireland, in which the Duke of Wellington expressed his conviction that from the measures adopted the Government will be able to resist every attempt against the public peace, and that it would be better to employ no other precautions until they become absolutely necessary.

Home News.

Court.—Her Majesty, Prince Albert, the Prince of Wales, and the Princesses, are at Windsor Castle, and in

excellent health. On Saturday, her Majesty and Prince Albert, with their distinguished visitors, walked through the Home Park, and inspected the new Royal Gardens at Frogmore. On Sunday her Majesty and the Prince, accompanied by the Duke Ferdinand of Saxe Coburg Gotha, attended divine service in the Chapel Royal in the Park, and the Prince Augustus, and the Princess Clementine attended high mass at the Roman Catholic Chapel at Clewer. In the afternoon her Majesty and his Royal Highness, with the whole of their visitors and suite, walked out on the Castle-terrace. The bands of the Guards were in attendance, and the assemblage was very numerous. On Monday morning her Majesty and Prince Albert took their usual walk through the slopes, and in the private enclosures in the Home-park. In the afternoon, her Majesty, accompanied by the Princess Clementine, took a carriage-ride through the Great Park to the vicinity of Virginia Water. Prince Albert, and the Princes Augustus and Leopold of Saxe Coburg, accompanied the Queen on horseback. On Tuesday her Majesty and Prince Albert, accompanied by their visitors, took their departure for town by a special train, on the Great Western Railway. On arriving at Paddington they proceeded to Woolwich, where the Duke Ferdinand, the Prince and Princess Augustus, and Prince Leopold of Saxe Coburg Gotha, embarked for France in the French war-steamer *Pluton*. On their departure, her Majesty and Prince Albert proceeded from Woolwich to Deptford Dockyard, where they went on board the new Royal steam-yacht *Victoria* and Albert. Her Majesty and the Prince on leaving the yacht, returned to town, and in the evening honoured the performance of the Italian Opera with their presence. On Wednesday, the Queen and Prince returned to Windsor Castle by a special train on the Great Western Railway, and in the course of the day, Prince Alexander of the Netherlands arrived at the Castle on a visit to Her Majesty. It is reported that the Queen intends to visit Brighton in the course of a few weeks, and that the Royal yacht will be sent round to the coast, in order that Her Majesty may make excursions in the Channel.—The King of Hanover, accompanied by the Duchess of Gloucester, left town on Saturday by the Birmingham Railway for Stowe, the seat of the Duke of Buckingham, on a visit to His Grace, and returned to town on Monday. On Tuesday, the King honoured the Earl of Cardigan with his company at dinner. On Wednesday His Majesty, as Duke of Cumberland, gave an assembly at St. James's Palace, which was numerously attended, and on Thursday returned to Kew.—The Queen-Dowager left Bushey on Monday by the Birmingham Railway for Whitley Court, Worcestershire, and was received along the whole line of her route with every demonstration of respect.—The Crown Prince of Wurtemberg left town on Saturday, on his return to the Continent.—The Ministerial papers announce that Sir Augustus D'Este has presented a petition to the Queen, claiming to be entitled to the titles of his father, the late Duke of Sussex.

Parliamentary Movements.—Mr. Oswald was elected member for Ayrshire last week without opposition, and has since taken the oaths and his seat.

Orders of Knighthood.—It is understood that the blue ribbon of the Order of the Garter, vacant by the death of the Duke of Dorset, is to be conferred on the Marquess of Abercorn. The Queen has been pleased to appoint Sir John S. Richardson, Bart., to be Secretary to the Order of the Thistle, in the room of Lord Robert Kerr, deceased.

Duchy of Cornwall.—Her Majesty has been pleased to direct letters patent to be passed under the Privy Seal of the Prince of Wales, granting to the Duke of Northumberland the office of constable of the Castle of Launceston, Cornwall.

Church Preferment.—The Queen has been pleased to make the following additional appointments to benefices vacant in consequence of the late secession in the Scotch Church:—The Rev. J. Hope to the church and parish of Dunscore, Dumfries, in the room of the Rev. R. Brydon; the Rev. A. M'Nab to the parish of Kilchoman, Argyll, in the room of the Rev. A. Cameron; the Rev. A. Webster to the church at Quarff, Orkney, in the room of the Rev. J. Gardner; the Rev. H. Beatson to the parish of Small Isles, Inverness, in the room of the Rev. J. Swanson; the Rev. D. M'Callum to the church of Trumisgarry, Uist, in the room of the Rev. N. M'Leod; the Rev. J. Cochran to the parish of Cupar, Fife, in the room of the Rev. A. Cairns; the Rev. T. Mackintosh to the parish of St. Cyrus, Kincardine, in the room of Dr. A. Keith; and the Rev. C. M'Culloch to the parish of Denny, Stirling, in the room of the Rev. J. Dempster.

Exhibition of Cartoons.—The Commissioners have published a declaration respecting a second drawing executed by Mr. Edward Armitage, as a proof that the cartoon representing Cæsar's first invasion of Britain, to which the first prize was awarded, was really his work. The Commissioners express themselves quite satisfied by the second drawing, and the premium of 300*l.* has consequently been paid. The subject of the drawing, which was suggested to the artist by the Commissioners, is that of an ancient Briton defending his wounded son from the attack of a Roman soldier.

Celebration of Marriages.—By a recent Parliamentary return, it appears that the number of places of worship in England registered for the celebration of marriages up to the 30th June, 1842, was 1,922, of which 187 were in Lancashire, 171 in Yorkshire, and 115 in Middlesex. In Cheshire there were 38 places registered. The 187 in this county are thus classified according to their religious denomination:—Presbyterians—8 Church of Scotland; 3 United Secession Church; 13 English Presbyterians and Unitarians; 11 Presbyterians, not otherwise defined. Independents.—52 Independents or Congregationalists.

Baptists.—7 particular or Calvinistic; 1 general or Arminian; 11 Baptists, not otherwise defined. Methodists (Arminian).—Wesleyan, 0; new connexion, 3; Primitive, 0; Association, 4; Independent Methodists, 1. Calvinistic Methodists.—English and Welch, 0; Lady Huntingdon's connexion, 3. Roman Catholics, 63. Foreign Churches, 0. Miscellaneous.—New Jerusalem or Swedenborgian, 5; Christian Israelites, 1; Evangelical Friends, 1. Undescribed or belonging to no specific denomination, 5.—In England and Wales the places classed as Presbyterian are 178; Independent, 798; Baptists, 461; Methodist (Arminian), 135; Methodist (Calvinistic), 42; Roman Catholics, 263; Foreign Churches, 4; and miscellaneous, 41.

Apprehension of Offenders.—An act came into operation on the 28th ult., entitled "An Act for the better Apprehension of certain Offenders." The object of this statute is to convey offenders who have escaped from the colonies back again to be tried, and those who escape from the United Kingdom into any of the British colonies in the same manner to the place where the alleged offence was committed. There are two somewhat similar bills now before the Legislature with respect to France and America. This act states, "That it is expedient to make more effectual provision for the apprehension and trial of offenders against the laws who may be in other parts of her Majesty's dominions than those in which their offences were committed." Offenders may be committed to gaol until they can be sent back to the place where the offence was committed; and in order to prove the charge, copies of the depositions made to obtain the warrant are to be received in evidence of the alleged criminality. If a removal does not take place in two months after the apprehension, the party may be discharged; and after the removal, if an indictment is not preferred within six months, application may be made to be sent back at the expense of the party making the removal. The expense of removal, &c. to be allowed. No warrant for the apprehension of a party is to be endorsed, unless the offence shall be stated, which, to justify such endorsement, must be for treason or some other felony which appears sufficient to warrant the committal of such person for trial. The act came into operation on the day it received the Royal Assent—namely, July 28.

Foreign.

FRANCE.—The Paris season is now completely at an end. The King and all the Royal Family, except the Duke and Duchess de Nemours, and the Duke de Montpensier, took their departure for Eu on Monday. His Majesty, it is believed, intends to remain there until the end of September. The Duke and Duchess de Nemours left St. Lo on Wednesday week, on their return to Caen. Preparations for departure were likewise observable at the hotels of the Ministers of War and Foreign Affairs. Marshal Soult will shortly set out for his chateau of St. Amans, and M. Guizot for Val de Richer. Gen. Bugeaud, the Commander of the Army in Algiers, has been made a Marshal of France. The *National* has ceased publishing its daily list of subscriptions in favour of the Repeal movement in Ireland. The *Globe* states that a report was current that orders had been given by the law officers of the Crown to seize such part of the subscriptions as might be found at the office of the *National*. "It is certain," it says, "that there must be great carelessness on the part of the French Government, and great tolerance on the part of that of England, to allow a subscription to be publicly made for the purpose of aiding and encouraging revolt and civil war in a friendly country; unless the two Governments, indeed, as is probable, have allowed ridicule to do all that is necessary for a piece of buffoonery which some persons, after too good a dinner, took it into their heads to devise." The *France* says:—"A Frenchman lately visited the Hôtel de Bragança, to compliment the Royal occupant on the happy events which have taken place in Spain. Maria Christina replied that she received his congratulations with infinite satisfaction, as she believed that those events would lead at length to the pacification of Spain, particularly if, as she most anxiously desired, the Duc d'Aumale should marry her daughter Isabella. We are able to guarantee this to have been the sense of the words pronounced by the widow of Ferdinand VII." It is stated by some of the journals that M. Salvandy is making preparations to return immediately to Madrid, as Ambassador at the Court of Queen Isabella II.

SPAIN.—A telegraphic despatch reached town on Monday, announcing that the Regent has been driven, at the point of the sword, to seek protection on board a British ship of war. According to the terms of the despatch, he embarked at Cadiz on the 30th ult., at 4 o'clock in the morning, on board the *Malabar*, British ship of war, of 72 guns. General Concha had pursued him with 500 horse up to Sta. Maria, where he took a boat. The Spanish frigate the *Constitucion* and several small vessels, which had gone over to the insurgents, blockaded Cadiz at the time. It appears that the siege of Seville lasted two days longer than was announced by the telegraph, having been raised on the night of the 27th, and not on that of the 25th, as hitherto supposed. The bombardment continued ten days in all, during which time 1,600 projectiles were thrown into the town. The Political Chief, in his report to the Provisional Government at Madrid, writes thus:—"We have great losses to deplore. The streets are filled with ruins, and more than one edifice, which had stood the wear of ages, is now levelled to the ground. But, in the end, we have conquered, and the standard of liberty floats proudly from the top of our magnificent cathedral tower, the *Giralda*." The error in the telegraphic despatch arose, most probably, from

the fact that the Regent took his departure from Seville on the morning of the 26th, with 300 or 400 cavalry. He heard, on the 25th, of the surrender of Madrid, and learning, at the same time, that the main body of Gen. Concha's forces were near at hand (part of them having got into the town on the preceding day), he saw that his last hope was gone, and that no other alternative was left him than to retire. He, therefore, determined on proceeding to Cadiz; and, in order to prevent his march from being molested, ordered the siege to be continued until the evening of the 27th. Gen. Concha immediately pursued him, and after a vain attempt to reach Cadiz, he hurried round the bay towards Sta. Maria to intercept the Regent in that quarter. The two forces met between Puerto Real and Puerto Sta. Maria, and a charge was immediately made by Espartero's troops, which remained devoted to the last. The accounts are not very communicative as to the details of this engagement. It appears, however, that ultimately Gen. Concha's troops had the advantage, and that they succeeded in making a number of prisoners, amongst whom were Gen. Juan Van Halen, brother of the Commander-in-Chief, Generals Alvarez, Osset, Osorio, and others of some rank in the service, though not of such great notoriety. Whilst the troops were thus engaged the Regent made for the sea-side, and embarked at Port-Santa Maria, with Generals Van Halen and Noguera (his minister of war), M. Gomez de la Serra (his minister of the interior), and some other officers, amongst whom is said to be his friend Linage. The accounts state that he took him the Military chest. The boat to which the Regent and his companions had entrusted their safety put out to sea at once, and proceeded straight to the Malabar. Here he was at first refused to be received, the officer in command declaring that he could not admit him on board until he should have consulted the English Consul at Cadiz. The order for his reception soon arrived, and the Regent had no further cause for alarm. Once on board he showed some hesitation as to his future course. His companions were of opinion that he ought to proceed to Cadiz, which still held out for him, and he seemed almost inclined to listen to the suggestion; but in the midst of their deliberation, a loud discharge of cannon and ringing of bells were heard in the town, and it was soon after ascertained that this rejoicing was in celebration of the victory of the other party, and of the installation of the Junta of the *pronunciamento*. The account states that the Regent then wished to proceed to Lisbon, but that he was prevented doing so by illness. At Madrid in the meantime the Provisional Government have adopted the course of a true military despotism. They have issued a decree convoking the General Cortes of the kingdom for the 15th of October next, and directing that the Senate be integrally renewed, contrary to the express letter of the Constitution. Another decree, equally unconstitutional, has been published, dissolving the provincial deputations of Madrid, and appointed other Deputies to replace those whose services were dispensed with. By other decrees the tolls levied at the gates of 31 cities and harbours, and suppressed by M. Mendizabal, have been re-established. Another decree has been issued breaking up the supreme Tribunal de Justicia (the highest court of law in Spain), and dismissing the President, Don Jose Calatrava, and nine other judges and fiscals, because they would not pronounce in favour of the new Government. The judges in council were called together, it appears, to reply to an authoritative communication of Señor Lopez, as the insurgent Minister of Grace and Justice. They refused to recognise the Lopez Ministry, on the ground that it was not regularly exercising the supreme power, and had not been established according to the enactments of the Constitution, or been sanctioned by the majority of the people. The judges, whilst making this protest, expressed their readiness to exercise their functions as usual, if required. To this Señor Lopez replied by dismissing the ten judges who formed the majority out of fourteen who assisted at the council, and replacing them by so many partisans who will not be likely to manifest the same scruples. The councils of the Ministry are also described as showing strong symptoms of disunion among the Generals. They have, however, published a manifesto, addressed to the nation, and signed by all the members of the cabinet. The manifesto contains nothing worthy of notice, except that it promises the faithful fulfilment of the celebrated programme, and adds that "justice and concord between all good Spaniards will assure the confidence and strengthen the bonds which happily unite us." They have also re-established all the taxes as they existed before the abolition by the late Ministry. The Spanish budget for 1843, as is well known, had not been voted, on account of the precipitate dissolution of the Cortes by the Regent, and the taxes had therefore ceased to be legally demandable.

PORTUGAL.—Letters from Lisbon to the 31st ult. announce that the Queen and infant Princess are going on favourably. The Duke of Pa'mella has come to England by the steamer, for the purpose, it is said, of renewing the tariff negotiations. The Duke is said to be invested with full powers, and it is confidently believed in Lisbon, that the convention will be forthwith concluded.

GERMANY.—Great preparations are making all over Germany to celebrate the thousandth anniversary of the treaty or Act of Verdun, signed by Charlemagne, August 6, 843, and by which all Germany east of the Rhine was separated and declared independent from the other Carolingian dominions. The Israelites of Berlin, in order to express their gratitude to the Diet of the Rhenish provinces for the wish manifested by the members of that body to emancipate the Jews of Prussia, have presented to them a sum of 38,000*l.*, to be vested in public securities, the interest to be applied, in equal proportions, to the relief of the indigent Catholics, Protest-

ants, and Israelites of the province. Accounts from Vienna state that the Austrian Government has concluded treaties with three of the small North Italian States, and in which the Sardinian Government has joined, for the purpose of abolishing the many different duties to be paid on merchandise going up or down the Po; and this, it is believed, will be the first step towards the introduction of a uniform tariff all over Italy. The papers contain a letter from Goritz announcing that the health of the Duke d'Angoulême was seriously impaired, by a long-standing intestinal irritation, and that he is now reduced to a state of complete emaciation.

BELGIUM.—Letters from Ostend state that the Louisa Maria schooner, which left Saint Thomas, Guatemala, on the 16th June, has just arrived in that port, bringing intelligence of the death of Mr. Simons, the director of the expedition, which took place at sea on the 15th May. On its arrival at St. Thomas the schooner found the colonists, who had arrived in the Theodore 17 days before, and were living for the present in huts erected at the end of the bay by Caribs, in the service of the directors of the colony. At the time of the departure of the Louisa Maria, the colonists were preparing to quit that low and marshy spot, to settle on the more elevated ground. The Ville de Bruxelles arrived at St. Thomas on the 8th June.

GREECE.—Letters from Athens of the 20th ult. announce that the Government had transmitted 500,000 francs by the last French packet to pay the interest due on the loan. The people were much dissatisfied at so much money leaving the country, particularly as it was not sufficient for the purpose for which it was intended. M. Rizos, Minister for Foreign Affairs, had resigned, but the King had not accepted his resignation.

TURKEY.—The *Augsburg Gazette* publishes a letter from Belgrade of the 22d ult., stating that Baron Lieven has demanded formally from the Senate the expulsion of Wucitsch and Petroniewich, and has also protested against the election of Prince Alexander. The Leipzig papers state from Smyrna, that the Sultan has it in contemplation to confiscate all property belonging to the mosques and other religious institutions, for the benefit of the public Treasury.

UNITED STATES.—The new packet Montezuma arrived at Liverpool on Friday, after one of the quickest voyages for a sailing ship ever known, having been only fifteen days from New York. An immense gang of coiners had been arrested at New York, the chief counterfeiter being a blacksmith of Boston, worth 60,000 dollars. The village of Warrenton, Mississippi, had been destroyed by fire. Mrs. Gillmour, of Scotland, claimed by the British Government, had not succeeded in her insanity plea, as the doctors and commissioners believed her insanity to be feigned. She said she was coerced into a marriage with the unfortunate Gillmour, and denied having murdered him. The Commissioner deferred giving his decision, and stated at the termination of the inquiry that he should require several days to determine whether or not he should accede to the application for the surrender of the prisoner. The Repeal agitation in the United States appears to be entirely at an end. The *New York Journal of Commerce* speaks of the whole movement as a political farce, got up for the purpose of securing a few Irish votes in various districts. The memorial of the Rev. Sydney Smith to Congress, against the repudiation doctrine, was still creating a great sensation in the States. Emigration to the Oregon territory continued to increase. Two expeditions had recently started, the last with 990 persons (male and female) with 121 waggons, 698 oxen, 296 horses, and 973 loose cattle. Sir W. Drummond Stewart's party had been spoken to on the prairies, near the Big Sandy River, all well. Sir William and his friends had protected a party of Pawnee Indians from their bitter foes, the Kansas. The troop ship *Alert* was totally lost on her passage from Halifax to England, having on board part of the 64th Regiment, all of whom, together with the crew, were saved. The *Alert* has since become a total wreck, and the whole of the baggage belonging to the troops is lost. H.M.'s ship *Rose* has been sent to their assistance, and a subscription has been commenced at Halifax to relieve their sufferings. The loss is said to exceed 20,000*l*.

INDIA AND CHINA.—Among the miscellaneous items in the papers received last week, we learn that the Agricultural and Horticultural Society of Calcutta are endeavouring to call the attention of Parliament to the question of the introduction of Indian-grown wheat into British markets on a principle of equality with home produce. A resolution was agreed to at the May meeting of the society, "That a committee be appointed to inquire into the capabilities and advantages of giving encouragement to the export of wheat from this country; and to report upon the expediency of our expressing our gratitude, as an Indian public society, to the Court of Directors for pressing on the home government the important measure of the admission of Indian wheat into British ports, and at the same time expressing our earnest support to the measure, as one calculated to benefit and advance the interests of India."—From China, we learn that the anxiety caused by the vague announcement of the Indian papers, that Lord Saltoun had met with a dangerous accident, had been considerably relieved by the last accounts, stating that Lord Saltoun was considered out of danger and likely to do well. The accident, which took place in the last week of March, occurred at Hong Kong. He was riding in the vicinity of his residence, when his horse took fright and ran down a precipitous hill, and at length succeeded in kicking his lordship off, who fell with so much violence as to fracture his collar-bone and several of his ribs. When the letters came away, six weeks after the accident, the bones had united, and all the symptoms were favourable.

WEST INDIES.—The mail-steamer *Teviot* has arrived

with accounts from Antigua to June 28th; Demerara, July 4th; St. Christopher's and Jamaica to July 8th. The Antigua papers notice a curious circumstance as having resulted from the late earthquake. It appears that the water on the bar of St. John's harbour has deepened to the extent of about three feet, and that at some of the wharfs, indications of a like effect are perceptible. The pilots will now, it is understood, be able to carry over vessels drawing not more than fifteen feet of water. It is considered probable that the accumulations of soil washed from the streets which had been gradually depositing in various parts of the harbour, having been shaken down by the shock, are now distributed more equally over the whole basin; and that, at all events, some benefit has attended the great convulsion. In Demerara, much political dissension continued to exist, and an important Order in Council had been promulgated, authorizing the Court of Policy to effect extensive law reforms. The weather had changed from wet to fair, much to the satisfaction of the planters, some estates having begun to suffer from an excess of moisture. The Jamaica accounts are not of much interest. No change worth noticing, either in commercial or agricultural affairs, had occurred. The weather had proved very sultry, and in some parts of the colony the want of rain was severely felt, as well as the want of labour. Lord Elgin was in good health, though the death of the Countess caused the Governor and his family to remain in a state of melancholy seclusion. The island was exempt from fever and other epidemics.

AUSTRALIA.—Accounts from Port Philip to March 19 have come to hand. The Governor had issued a proclamation, under authority of the Land Sales Acts, dividing the colony of New South Wales into two separate colonies for the purposes of those Acts—the middle, or Sidney district, to be one—and the southern, or Port Philip district, the other. The separation is not a municipal, but merely a territorial separation—the various civil institutions remaining the same, as well as the appropriation of general revenues.—Zephaniah Williams, the Newport Chartist, has been hanged for the murder of an old man, on his own confession. The jury on the inquest had returned a verdict of "Murdered by some person or persons unknown;" but Williams afterwards made a voluntary confession. He said that he was tired of his life, and had determined, on the morning that he absconded, to murder the first man he met.—Western Australia papers to the 8th Feb., and letters to the 12th March, have been received; they give evidence of a considerable increase in the flocks of sheep and horned cattle, and of the steady progress of the colony. An Insolvent Act passed the Legislative Council in October last, but up to the dates of those letters not a single person had petitioned for relief under the act. Many of the principal settlers are turning their attention to the cultivation of the Vine. In the spring of 1842 an association was formed for the purpose of inclosing and planting 20 acres of land as a nursery vineyard, for the accommodation of the colonists. The association have already upwards of 50,000 plants in a thriving condition.

Parliament.

HOUSE OF LORDS.

Monday.—The Marquess of LONDONDERRY asked if it were true that the Regent Espartero had deserted the Government of Spain, and had been taken on board a British man-of-war off Cadiz.—The Earl of ABERDEEN replied, that he had no official information on the subject, but thought it probable that Espartero had taken refuge on board a British ship, and, if so, that so eminent a person had been received with all the distinction he merited.

Lord BROUGHAM moved the second reading of the Coroners' Expenses Bill.—The Marquis of SALISBURY moved that it be read a second time that day six months.—This amendment was seconded by the Marquis of LONDONDERRY, and the House having divided, there were:—Contents, 7; Non-contents, 31: Majority 24.

The Earl of ABERDEEN moved the second reading of the China Bill, which, he said, was simply intended to the legislation of Hong-Kong, to provide for the government and protection of British subjects in China.—After some objections made by Lord CAMPBELL, the Bill was read a second time.—Lord CAMPBELL moved the second reading of the Scotch Universities Professors Bill.—The Earl of HADDINGTON condemned the Bill as an absurd interference with the existing law, as a breach of the Act of Union for no adequate purpose, and as a futile attempt to legislate upon an inexpedient and unacceptable point. He moved the second reading that day six months. The second reading was negatived without a division, and the Bill thrown out.—The Irish Excise Bill was read a third time and passed.—Lord MONTAGUE gave notice on an early day to call their Lordships' attention to the present state of the finances of the country.

Tuesday.—The Slave Trade Treaties (Austria, Chili, Portugal, and Mexican Republic) Bills were read a third time and passed. Lord BROUGHAM laid on the table a bill, containing the unopposed portions of the Coroners' Bill, which was read a first time.—Lord BEAUMONT presented a petition from Mr. Macready, praying for the extension of the license to perform the legitimate drama to other theatres beside the patent ones; or else for the confinement of the right of the patent theatres to the performance of the legitimate drama only.—The Earl of GLENCAIRN declared his readiness to meet all the allegations of the petition, which he described as the greatest compound of vanity, self-sufficiency, and absurdity he had ever heard read.—The Earl of ROXBOROUGH presented a petition, signed by 5,000 Protestants of the county of Down, and complaining, that while processions and meetings of the Roman Catholics for the repeal of the union were tolerated, they had been severely punished for celebrating the anniversary of the battle of the Boyne; and calling upon their Lordships to take into consideration the dangers to which the Irish Protestants were exposed from an agitation which, they feared, would result in civil war. The noble Lord urged the injustice of carrying out the law prohibiting party processions in all its rigour against the few Orangemen who had ventured to transgress it, while immense multitudes, assembling with banners bearing mottoes and emblems of sedition, and marching in array to the sound of military music, were indulged with complete impunity. Let the law either be put in force without distinction or not at all. At any rate let it not be strained to coerce a body of men who, under circumstances of great irritation, had manifested most creditable forbearance. With respect to the danger to which the petitioners believed themselves as Protestants to be exposed, he was convinced that theirs was no unfounded alarm. They were at least justified in such an apprehension when they saw a vast proportion of the population drilled until they rivalled the regularity of veteran troops, and implicitly obeying the commands of their leaders, who openly professed their determination to carry repeal either by fair means or by

force, and promised to their followers deliverance from the yoke of the Saxon. He argued unfavourably, too, from the circumstance that a much smaller number of repeaters than usual had come to this country in search of employment, in the presence of a number of foreigners in Ireland, and from the close connexion of the Roman Catholic hierarchy with the Repeal movement, and expressed the general disapprobation of the Irish Protestants had remarked the absence of activity and energy in the Government to repress this agitation. He acknowledged with gratitude the excellent disposition of military force to meet any sanguinary outbreak, but regretted that no measures had been employed to instil the spirit of all who would associate to preserve tranquillity. The quality of the Government had driven many, who were otherwise well inclined, to swell the repeal ranks, but he trusted that it would now endeavour to retrieve its errors. He approved the conduct of former Viceroy in calling out the yeomanry, and after an earnest appeal for protection to the loyal Protestants of Ireland, concluded by praying, in accordance with the petition, that the law relating to processions might either be repealed or brought into general operation.

The Duke of WELLINGTON confessed, that the evils and inconveniences attending the present state of affairs in Ireland had been by no means exaggerated; but after paying a general compliment upon their loyal forbearance to the Orangemen of the north, proceeded to explain that the act, the operation of which they were called on to extend, had reference only to meetings or processions in commemoration of anniversaries to which either a religious or political character was attached, and could not consequently be held to include those at which the repeal of the union was discussed. It might be asked, "Why not, then, extend its provisions?"—but, although admitting the evils which the present criminal agitation had inflicted, and most anxious to put an end to them—aware, too, of the responsibility of Government for its omissions as well as its acts,—he did not think it desirable to state what were its intentions further than to explain that in his own department everything that could be done had been done to enable it "to preserve the peace of the country, and to meet all misfortunes and consequences which may result from the violence of the passions of those men who unfortunately guide the multitude in Ireland." He disputed neither the extent of the conspiracy, the dangers to be expected from it, nor the assistance it had derived from foreigners; but he was confident that, from the measures adopted, the Government would be able to resist every attempt against the public peace; and he believed it better, therefore, to persevere in its present course, and to employ no other precautions until they should become absolutely necessary.—The Earl of WINCHELSEA censured the Government for not having punished the leader of the agitation, who was guilty of treason and sedition, after they had dismissed magistrates for attending repeal meetings.—The Earl of WICKLOW approved of the conduct of the Government in not calling for new measures of coercion, and recommended the elevation of the character of the Irish priesthood as the best means of preventing agitation in future.—The Marquess of CLANRICARDE suggested a long catalogue of improvements and amendments; and Lord BROUGHAM condemned the agitators and their foreign allies—his opinion being that they were all equally ridiculous, and that the whole affair would quickly blow over.—The Earl of GLENCAIRN insisted on the necessity of taking some effectual measures to put a stop to the agitation. The petition was then ordered to lie on the table.

Thursday.—The royal assent was given by commission to the Excise Duties (Ireland) Bill, the Controverted Elections Bill, the Militia Ballot Suspension Bill, the Stock in Trade Bill, the Bills of Exchange Bill, the Slave Trade Treaties (Austria, Chili, Portugal, and Mexican Republic) Bills, and several private Bills. The Arms (Ireland) Bill, and the West India Relief Bill, were brought up from the Commons, and read a first time.

Lord BROUGHAM moved the first reading of a Bill which will give to the Judges in Ireland a permanent change of venue, in cases of seditions and riotous proceedings, and unlawful meetings, from one county to the next, or to the county of Dublin. It was a Bill, he said, similar to that by which he had succeeded in 1833 in putting an effectual stop to the disturbances of the peace in Ireland, and his reason for now presenting it was that he had seen an atrocious attempt made upon the loyalty of the British Army. Lord Brougham called special attention to the fact, that he had brought forward the same Bill, but the sanction or knowledge of the Government.—A brief discussion arose on the nature of the Bill, which Lord CAMPBELL declared his intention of opposing, on the ground of its interference with the ordinary constitutional right of the subject, and being either unnecessary or unjust.—The Earl of LUCAN raised a discussion respecting his dismissal from the magistracy, by the Lord Chancellor of Ireland, on account of a dispute with Mr. O'Malley, which ended in a *fracas* at the Castibar petty sessions. The production of papers on the subject was moved and agreed to.

Friday.—On a motion of Lord CAMPBELL respecting a Bill regulating the succession to property in Scotland, Lord BROUGHAM attacked with great severity the late proceedings of Government in regard to the Scotch Church, particularly censuring Lord Aberdeen, Sir J. Graham, and the Lord Advocate. Lord Brougham then withdrew his Bill for changing the *venue* in Ireland. The Duke of WELLINGTON indignantly condemned the allusion of Mr. O'Connell to the British army in one of his recent speeches. "To plunder the public, he said, of money in Ireland for the purposes of the rent, or for Repeal contributions, is one thing, and to excite the common people of that country to approach as near as possible to the commission of crime, and so do all the mischief possible to be done to the country, without exposing his own person, is another thing—but to corrupt the army is quite a different thing, which, I hope and trust, I may promise your Lordships will not be fulfilled."

HOUSE OF COMMONS.

Saturday.—The House sat for about six hours, the main subject of discussion being the Customs' Bill, the object of which is to effect certain alterations and amendments of the Customs' laws, relating to different articles. Clause 10, which affected the British Watch-trade, was given up by the Government, and struck out of the Bill. On the 25th clause, which permits the produce of the State of Maine to enjoy the same privileges as if it were still a British Colony, Mr. BANKES objected to the admission of American agricultural produce, through the State of Maine, into this country, on equal terms with the produce of Canada. He proposed the insertion of the words "except the produce of agriculture."—Mr. GLADSTONE defended the clause, because it was conformable to Mr. Webster's proposition to Lord Ashburton; because the permission it gave was a matter of no great consequence one way or the other; because the State of Maine having been a portion of the British territory, was passed under a foreign power, with all its British privileges unimpaired; and because the State of Maine did not grow enough corn for itself.—Sir R. PEEL opposed the amendment because, as the Ashburton treaty had made no distinction between agricultural and other produce, no distinction ought to be made. He thought it extremely reasonable that, when we passed the State of Maine over to America, we secured to the produce of Maine the same privileges as if it had continued to be British produce. He also thought no other country would have the effrontery to ask to be equally favoured with Maine.—Mr. BANKES withdrew his amendment, and the clause was ordered to stand part of the Bill.—The other clauses were agreed to.

Monday.—The House sat from noon till half-past one Tuesday morning, being 13 hours and a half. They went through the Irish Poor-law Amendment Bill in committee, and advanced other measures. On the motion for going into committee of supply, Mr. EWART raised a brief debate on free trade, by moving that it was expedient that the principles advanced in the celebrated Import Duties Committee of 1840 should now be recognised in legislation, and at once applied as a remedy for the depression of commerce and the distress of the people.—Mr.

M. GIBSON seconded the motion.—Mr. GLADSTONE thought it altogether too late in the session to revive the discussion. Any intimation of the intention of Government to touch the duties on important articles during next session would do mischief rather than good.—Mr. HUME blamed the Government, and especially Sir R. Peel, for halting, undecided, and even retrograde policy.—Mr. BRIGHT then made his "maiden speech," supporting the motion, which was negatived by 52 to 25.—The next business was a motion by Mr. BOADEN, respecting the detention of Don Carlos in France; his object being to elicit opinions respecting it.—Mr. COCHRANE seconded it, and informed the House that he was personally assured by Don Carlos himself that he was only allowed £1,200 per annum for his establishment, and he was kept in close restraint.—Sir R. PEEL considered that the treatment of Don Carlos ought to be as lenient as was consistent with the object in view. The British Government had communicated with the French Government, and was assured that it had no disposition to subject Don Carlos to any restraint beyond what was necessary. If he had given any assurance not again to disturb Spain, or had agreed to take up his residence in Austria, he would at once have been liberated.—Dr. BOWRING dwelt on the importance of as little interference with the affairs of Spain as possible.—Lord J. MANNERS defied Sir R. Peel or the French Government to justify the detention of Don Carlos in Spain, or to extract a plea for it, from the most lax interpretation of the quadruple treaty. The cause for which that Prince suffered was the cause of religion, of good order, and of legitimacy. This was proved by the result; Don Carlos had been defeated, and anarchy and infidelity now triumphed over the ancient Church of Spain.—Lord PALMERSTON remarked that both the French and British Governments had agreed as to the inexpediency of permitting Don Carlos to return to Spain. When that Prince was on the point of being captured, he was saved from his Spanish antagonists by British agents. He was then permitted to take up his residence in England, on the condition that he was not to rekindle the flames of insurrection in Spain. In afterwards returning to that country, he was guilty of a breach of faith. He was not surprised at the motion, as it arose no doubt from the feeling that in the present distracted condition of Spain, Don Carlos should have a fair start in the general scramble.—The documents asked for having been considered both by Sir R. Peel and Lord Palmerston as not producible, the motion was negatived without a division.

The House then went into committee of supply, there being various supplemental votes to be added to those of the year already granted. The first was a sum of £21,000, for the expenses of the China war, with several others, one of which was £5,000, for the Calcutta Canal, which raised considerable discussion, and led to a division, in which the Government were supported by 137 to 13.—The next vote was £1,500, to defray the cost of monuments to the memory of the late Sir Sidney Smith, Lord Exmouth, and Admiral De Saumarez.—Dr. BOWRING suggested that in all cases of public statues, models should be sent in, and the work assigned to the ablest modelist.—Sir R. PEEL thought there was great difficulty as far as regarded public competition in such cases. It by no means followed that the person who made the best model could execute the best statue.—Mr. HAWES expressed a hope that the Government would avail themselves of the Royal Commission of Fine Arts for the purpose of ascertaining the best mode of erecting memorials to men distinguished in literature and science. He did not see why the military and naval profession should engross all the national monuments.—Sir R. PEEL thought it very desirable that in the case of very eminent scientific men public monuments should be erected to their memory. He saw no reason why the country should pay that tribute only to distinguished naval and military men; on the contrary, it would be a great incentive to exertion in science if monuments were erected to the most eminent of her sons. He had given a good deal of consideration to this subject since it had been mentioned last year by the hon. member for Lambeth. The first difficulty which struck him was, as to the place where such monuments should be erected. There was very great objection to placing them in ecclesiastical edifices, for unless the public had free access to them, no great public object would be attained. If they did not erect them in any edifice—if they erected them out of doors, it was almost necessary that they should be of bronze; then the expense would be enormous, and a statue in bronze was not always a very great ornament. He always hoped that there might be some portion of that great building which was now erecting for the houses of Parliament that might be appropriated to the statues of eminent men; not merely of men of political character, but of persons distinguished in literature and science; and if he were assured that there could be any part of that edifice so appropriated, he should not have the slightest difficulty in referring the matter to the commission which had been alluded to, and which had discharged its duty with the greatest credit to itself. But it was a commission appointed to consider the proper method of decorating the houses of Parliament; and if its duties were extended beyond the sphere assigned to it, the commission might be made a general roving commission for the encouragement of the fine arts in this country. This was a matter requiring consideration, and he was not prepared at once to say that he was disposed to recommend that the commission should undertake other duties than those which were originally contemplated for it. Therefore, unless he saw reason to believe that there would be some portion of the new edifice erecting for the houses of Parliament in which statues to men of science could be placed, he should wish to reserve to himself the right of judging whether the commission was the body which could be properly consulted on the matter. Under these circumstances, he was afraid he could not say anything definite, excepting that he was not adverse to the principle of the proposition which had been suggested. The site for the statues was the chief difficulty. The hall at Greenwich was appropriated to naval men, and nothing could be more proper than such an appropriation, for it was suitable to the *genius loci*. He did not wish that the subject should be pressed further at present. The Government would be prepared to consider the question of erecting statues to men so eminent as Newton and Davy, but they would wish to be perfectly satisfied as to the place where the statues could be put.—Mr. V. SMITH felt that there was a great deal of weight in the observations which had fallen from the right hon. baronet, but there was one point which he had omitted to notice, and that was whether the right hon. baronet might not refer to the commission to ascertain if there could not be some portion of the building for the new houses of Parliament which might be appropriated for the reception of such statues as had been alluded to. He understood that Westminster-hall was to form an access to the new houses of Parliament, and if that were so, he asked why might not that hall be appropriated to the reception of the statues? Without extending the sphere of the duties of the commission, might not that body be also referred to to ascertain whether there might not be some parts of the new houses themselves in which the statues could be erected? The opinion which had been expressed by the right hon. baronet as to the manner in which the commission had performed its duties, so far as their judgment had been exercised, was, he believed, entertained by all parties.—Mr. COLLETT objected to this vote, on the ground that the house was called upon to vote one sum, when another sum was intended to be expended.—Sir R. PEEL explained that the Government only asked for the particular sum they wanted for the current year. With reference to the suggestion of Mr. V. SMITH, he said he should be sorry to suggest to the commission to go out of the line of their parliamentary duty, but if the matter fairly came within the original design of the building, he should not have the slightest objection to suggest it to the commission.—Mr. HUME trusted that the right hon. baronet would remove the statues of our naval heroes from the prisons in which they were now locked up. He alluded to Westminster Abbey and St. Paul's, where they could not be seen unless the parties

desirous of beholding them first paid money for admission. He thought the country would be prepared to have a proper place fitted up for the reception of all statues for which it voted money. If, instead of throwing 200,000, into the Calcutta Canal, they had taken one-half, or even one-fourth of the money, they might have fitted up an appropriate building for the reception of these statues. For the want of a suitable building, the statue of one of our greatest poets, executed by one of the greatest of modern sculptors, had been lying in the Custom-house for the last ten years.—Mr. M. MILNES thought it was extremely creditable to the hon. Member for Montrose that, with all his economical propensities, he had always shown himself extremely generous with respect to matters of art. He, however, differed from the hon. Member on one point, viz., as to the unwillingness on the part of those who were the guardians of the great public depositories to meet the views entertained by the country. He believed there were great difficulties in the way, and from conversation he had had with those persons, he could state, that they were as anxious to open all to the public, and in every respect to accomplish the wishes which, from time to time, had been expressed. He concurred in thinking that there was a class of monuments much better calculated for other buildings than a Christian church, and he should be glad if the suggestion of Mr. Barry, as to the admission of such into Westminster-hall, should meet with every attention.—Captain PEBELL expressed himself perfectly satisfied with the selection of the naval officers made last year to whom statues were to be erected; but if the list was not closed, he urged, as deserving such an honour, the names of Sir R. Strachan, Sir A. Cochrane, and Sir J. Duckworth.—Mr. HUME, in allusion to what had fallen from Mr. Milne, said he was anxious to hear what objections could be raised against opening the monuments to the public, especially after the Government had declared its opinion that they ought to be so opened. The other votes were then agreed to.

Tuesday.—The House met at noon, and on the bringing up of the report of the committee of supply, Mr. HUME raised a short discussion respecting the Custom-house frauds. He moved for a copy of the evidence taken before the commissioners of inquiry.—The CHANCELLOR of the EXCHEQUER resisted this, on the ground of present inconvenience, promising that the evidence would, however, be forthcoming as early as possible. The House was counted out at half-past four in the afternoon.

Wednesday.—The Coalwhippers Bill, after much opposition and six divisions, passed through committee.—Mr. T. DUNCAN complained of the manner in which the nomination of High Sheriff of Buckinghamshire for the ensuing year had been made by the Privy Council.—Sir J. GRAHAM explained the facts of the case, and stated that the nomination was strictly conformable to law and usage.—Mr. S. CRAWFORD moved the second reading of the Landlord and Tenant (Ireland) Bill.—Sir R. PEEL opposed the principle of this bill, at the same time promising, on the part of Government, to give a fair consideration to the subject. He had already ordered a careful inquiry to be made into the laws of England and Ireland, so far as they referred to the relation between landlord and tenant.—After remarks by M. O'FERRALL, Sir A. BROOKE, Mr. M. J. O'CONNELL, and Sir D. NORREYS, the motion was withdrawn.—The House went into committee of Ways and Means, and 11,000,000, for Exchequer Bills for the year 1843, and 500,000, for the purposes of savings banks were voted.

The third reading of the Irish Arms Bill having been moved, Lord CLEMENTS moved, as an amendment, that it be read a third time that day six months.—Captain BERNALL seconded the amendment.—Mr. M. MILNES supported the bill, but on the understanding that the Government would hereafter bring in large measures of policy towards Ireland.—Mr. B. WALL opposed it, and Mr. D'ISRAELI, Mr. SMYTHE, and Mr. C. BULLER, censured both the bill and the Irish policy of Government.—Mr. SHEIL quoted a sentiment of Sir R. Peel's, when he said that his resistance to the Reform Bill might be unavailing, but would not be fruitless. So would it be with the Arms Bill. He drew a parallel between the condition of Ireland under the Whigs and its present aspect, affirming that the country was now more combined, organized, and excited than even during the agitation for Emancipation. Even while the Whig majority was diminishing to the vanishing point, the Irish Executive had the confidence of the people, and the support of the Catholic priesthood, who were now, to a man, supporting the national movement of the Repeal of the Union. The influence of this priesthood Englishmen seemed incapable of understanding, judging from the style in which they had been spoken of in the House of Lords on the previous evening. He described the sources of their influence, proceeding from thence to the subject of the grant to Maynooth, scandalous to those who received it, but far more ignominious to those who doled it out. He warned the House against the delusion of supposing that the Repeal agitation was an *ignis fatuus*, rising out of the morasses of Derrynane; and defined a parliamentary line, by which the legislation even of an Imperial Parliament might be made acceptable to the Irish people, on all Irish domestic questions, if the votes and feelings of the majority of Irish members be duly considered; on the plan he suggested, the old system of the management of the House must be given up, but with it legislation for Ireland was impossible. He concluded with a warm appeal to Sir R. Peel, to give effect to those "noble aspirations which make ambition virtue," and, throwing aside all party considerations, enter on a bold and decided policy for Ireland.

Sir R. PEEL reminded the House that the Arms Bill had been framed last year, before the present agitation had arisen; and proceeded to show that the peculiar state of Ireland was the justification of this and all preceding Arms Bills. Mr. Sheil's own proposals (made in his speech delivered in a former stage of the bill) for diminishing the evils of Ireland, strikingly evinced the diseased condition of the social state of the country, for, in order to secure convictions at the ordinary assizes, he would resort to the unconstitutional plan of substituting special for ordinary juries, and would provide an asylum in a foreign country for witnesses. After criticising the speeches of Mr. Smythe and Mr. D'Israeli, he passed to a general defence of the whole policy of the Government. Mr. Sheil talked of the "disciplined phalanx" of ecclesiastics combined for the Repeal of the Union. Did he foresee that in 1829? Or would the prospect of what is now taking place in 1843 have then conciliated English support to Catholic emancipation? It was complained that the Government did not endow the Roman Catholic priesthood, and yet Mr. M. O'FERRALL distinctly told them that no *concordat* with the Pope would be accepted by the Roman Catholics, by which they would be subjected to the control of the Crown. Roman Catholics had not only received the benefit of Emancipation, but since that great measure had been passed, they had received other substantial additions to their claims for civil equality, as in admission to municipal corporations. The Government, therefore, were justified in expecting that the present agitation would subside; and they were determined to adopt every alternative but an appeal to arms, and leave nothing undone which would tend to preserve the integrity of the empire.—Mr. M. J. O'CONNELL remarked that Sir R. Peel was much given to "hope," but his expectations of returning tranquillity to Ireland would prove fallacious, without measures of amelioration.—On a division, the third reading was carried by a majority of 125 to 55.

Thursday.—The House met at noon, and after passing the Designs Copyright Bill, entered into consideration of the Municipal Corporations Bill in Committee. It underwent a protracted discussion, but was ultimately carried through this stage.

To a question from Mr. HUME, Lord STANLEY said he had lately received proposals respecting the importation of free labourers from China to the West Indies, but he was not yet prepared with any plan on the subject.—To Mr. HINDLEY, Sir R. PEEL replied, that the Queen of Tahiti, having signed papers which she did not understand, was now dissatisfied with her position in regard to France; but he declined to say further on the matter.—

To a question from Mr. SHEIL, Sir R. PEEL answered, that the question of the Oregon Territory remained *in statu quo*, but expressed his expectation that some negotiation would soon be commenced.

Mr. GLADSTONE moved the second reading of the Exportation of Machinery Bill.—Mr. HINDLEY opposed it as unnecessary, and moved as an amendment that a select committee be appointed to inquire into the subject.—Mr. S. WORTLEY would not oppose the bill, but Mr. LABOUCHERE warmly supported it.—Mr. BROTHERTON, Mr. HUME, Mr. COBDEN, Mr. DUNCAN, and Dr. BOWRING all expressed their satisfaction with the measure; while Mr. ROSS, who had been called upon by his constituents in the flax trade to oppose it, admitted that the arguments of Mr. Gladstone could not be answered.—Mr. WILLIAMS, Mr. DABRY, and Sir R. PEEL, took part in the debate, and the second reading was carried by 96 to 18.—On the result of the division, Mr. HINDLEY declared his determination to unite with Mr. Cobden and Mr. Bright, in seeking for a total repeal of the Corn-laws.

On the motion for going into committee on the Church of Scotland Benefices Bill, Mr. M. P. STEWART moved its commitment that day three months.—After a discussion, in which Mr. HUME, Dr. BOYD, Mr. PRINGLE, Mr. BANNERMAN, Sir J. GRAHAM, and Mr. COLLETT, took part, the House divided, when the amendment was rejected by a majority of 31.

Sir H. HARDINGS moved the second reading of the Chelsea Hospital Out-Pensioners Bill. The bill proposed that when these pensioners were called out to help the civil power, they should be placed under the command of the half-pay officer by whom they were paid, and that, when necessary, they should be equipped with fire-arms. They were only to be called out in cases of emergency, and on the responsibility of the Home Secretary.—Mr. T. DUNCAN moved the second reading that day three months.—The House divided, when the second reading was carried by a majority of 49.

Friday.—The Irish Poor Law Bill was read a third time and passed. The House then went into committee, and the Export of Machinery Bill, the Fisheries Bill, and the Bills for the Apprehension of Offenders in America and France passed through committee. The Customs Bill was read a third time, and the Church of Scotland Benefices Bill was read a third time and passed.—Sir R. PEEL said that Government knew nothing of the Bill introduced by Lord Brougham in the House of Lords, and that they did not consider such a measure necessary, as otherwise they should have introduced it themselves.

CITY.

Money Market, Friday.—Consols for account closed at $94\frac{1}{2}$ to $\frac{1}{2}$; Three per Cent. Reduced, $94\frac{1}{2}$ to 5; Three-and-half per Cents., $102\frac{1}{2}$ to $\frac{1}{2}$; New Three-and-half per Cents., $101\frac{1}{2}$ to $\frac{1}{2}$; Bank Stock, $181\frac{1}{2}$ to $2\frac{1}{2}$; Exchequer Bills, 59s. to 61s.

Metropolis and its Vicinity.

Loss of H.M.'s Steam-ship Lizard.—Accounts have been received of the total loss of her Majesty's steam-ship Lizard, which was run down by the French man-of-war steamer, *Veloce*. It appears that before day-break on Monday, the 24th July, when about 20 miles from Carthage, a light was reported on the larboard bow of the Lizard. The officer of the watch, in obedience to the positive orders of the Admiralty when steamers meet each other, immediately put his helm a-port, but owing to the other vessel putting her helm a-starboard, the Lizard was struck by her on the larboard paddle-box, the shock of which was so violent as to throw the Lizard over on her starboard side and carry away the funnel-stays. The officers and men below immediately rushed on deck, the engineer in charge blew off the steam, and was proceeding to pump out, when the rush of water was so violent, and the Lizard was apparently sinking so rapidly, that the men were ordered to save themselves by climbing up the bowsprit rigging of the other vessel. At the instant the collision took place the Lizard's boats were ordered to be lowered, but the passage aft was obstructed by the bowsprit and bow of the other vessel, so that the only persons on the quarter deck were the quartermaster's man at the wheel, and one or two officers, who had come up from their cabins, and who, seeing that to all appearance all others had left, followed their example. Determined, however, not to abandon the Lizard whilst there was a chance of saving her, the boats of the vessel (which proved to be the French man-of-war steamer *Veloce*, of 1,200 tons and 220 horse power) were lowered, in which some of the officers and men of the Lizard returned, and saved a sick boy and passenger, with some two or three others who had been left behind in the first confusion. It was then discovered that the water had already made so much head as to put out the fires and to float the lower-deck hatches, and continued pouring in with such violence as to render it dangerous to remain on board. The last boat had scarcely left the Lizard when she sunk head foremost. The night was misty, and the lights of the *Veloce*, being placed on her paddle-boxes, could not be seen until she was close on board the Lizard, which carried her lights as usual at the mast head.

Society for the Discouragement of Duelling.—On Friday, the first public meeting of the members and supporters of this institution was held at the British Hotel, Viscount Lilford in the chair, supported by Lord R. Grosvenor, Sir R. H. Inglis, Admiral Oliver, Sir F. Austin, Sir Edward Parry, the Hon. W. Cowper, several officers, both military and naval, and a large number of civilians. The chairman opened the proceedings in a brief address, explanatory of the objects for which the society had been established, and characterising the practice of duelling as barbarous, unchristian, and absurd. His Lordship then drew the attention of the meeting to a memorial, which was read by Capt. Hope, embodying the sentiments of the committee on the subject, for the purpose of being presented to her Majesty, in discountenancing the beseeching her to lend her aid in discountenancing the practice, by the expression of her royal displeasure. Resolutions in furtherance of this object were proposed and seconded by Lord R. Grosvenor, Sir R. H. Inglis, Sir E. Parry, and other speakers; and a deputation was appointed to present the memorial to Sir J. Graham-Capt. Roberts, in proposing a vote of thanks to the chairman, said he hoped that before long a Court of Honour, similar to that established in the reign of Louis XIV.,

would be formed in connexion with the society, by which personal disputes and points of honour would be settled, without an appeal to arms, a measure which he was sure would greatly tend to diminish duelling.

Anti-Puseyite Meeting.—On Tuesday evening a crowded public meeting was held in Marylebone, for the purpose of considering the best means of opposing and counteracting the progress of Puseyism in the established church. The secretary read letters from the Earl of Galloway, Mr. Plumptre, M.P., the Rev. C. Day, the Rev. A. Rose, the Rev. E. Dalton, and other clergymen and gentlemen, apologising for their absence, and expressive of their cordial concurrence with the object of the meeting. Several gentlemen addressed the meeting, and resolutions condemnatory of the Puseyite doctrines were passed.

Temperance Meetings.—On Sunday, after morning service, Father Mathew administered the pledge to a large number of persons who had been prevented attending during the preceding week. Throughout the day there could not have been less than 50,000 to 60,000 visitors, and from 5000 to 6000 received the pledge. On Monday, Tuesday, and Wednesday, Father Mathew administered the pledge on Kennington-common. On Monday he was accompanied by a large number of Temperance Societies, who marched in procession to the Common. On their way some of the people at the end of the line attacked Mr. C. Orme, the distiller in Blackfriars-road, who attempted to pass them in his gig, and severely beat him. They pulled him out of his gig, and tore his clothes from his back. One of the principal assailants was apprehended and fined 10s. for the assault. Father Mathew and his friends were at the head of the procession, and were not aware of what had taken place. In the course of the proceedings on Tuesday, the platform was attended by Mr. Milnes, M.P., Mr. P. H. Howard, M.P., and a large number of ladies and gentlemen, several of whom accepted the pledge. Mr. Milnes and Mr. Howard shook hands with Father Mathew, and expressed themselves highly gratified with his extraordinary exertions. An address was presented by a numerous deputation of the Society of Friends, to Father Mathew from the Protestant Temperance Associations of the south of London, expressive of their gratitude and delight at the success of his labours. On Thursday Father Mathew proceeded to Fulham to administer the pledge in the western suburbs. Some disturbance took place on the ground, and the police refused to interfere, but the business of the day proceeded after Father Mathew had assured the meeting that he had the approbation of her Majesty's Government in holding these meetings. He had received letters from Sir J. Graham and Sir R. Peel, applauding his exertions, and until now, even throughout Ulster, where the most conflicting political and religious opinions prevailed, he had never been refused the aid of the magistrates and police to prevent the proceedings from being interrupted. From 1000 to 1200 persons took the pledge during the day; they were chiefly composed of Irish labourers, employed by the market gardeners of the neighbourhood, to whom a vote of thanks was awarded for having given the men a holiday on the occasion. Yesterday Father Mathew administered the pledge in the Riding School, Albany-street, Regent's Park: he will also attend at the same place this day, and at Cumberland Market to-morrow. The numbers computed to have taken the pledge in London is computed to be upwards of 32,000 persons—viz., about 22,000 at the East End; 5000 on Monday, 3000 on Tuesday, and 1000 on Wednesday, on Kennington Common, and 1200 at Fulham.—On Thursday a meeting of the Tower Hamlets Protestant Association was held for the purpose of opposing Father Mathew's proceedings, on the ground that their object was the spread of Popery. Great uproar took place, and the speakers could hardly obtain a hearing; the police were at length called in, and the meeting broke up in great confusion.

The New Steam-ship Bentinck.—This fine vessel arrived in the river from Southampton last week, and is now moored off Blackwall. The Bentinck was built at Liverpool, and launched in January last. She is 2000 tons burthen, and 520 horse power, has accommodation for 110 passengers, consisting of 20 single cabins, 22 double cabins, 12 family and general cabins. Twelve of the cabins are unusually spacious, being from 12 to 15 feet by 9 feet, and in the cabins throughout every possible contrivance has been adopted to promote the health and comfort of the occupants. Light and ventilation have been particularly attended to; the lower cabins are fitted with Lang's patent ports, and the sides and doors of the cabins throughout are almost entirely Venetians. There are hot, cold, and shower baths on board, and a bath-room on the main deck. The Bentinck is the property of the Peninsular and Oriental Company. She is sister vessel to the Hindostan, and intended to run on the same station, between Suez and Calcutta, affording a direct communication with Madras and Bengal to passengers by the overland route. The Bentinck starts from the river this day, and from Southampton for Calcutta on the 24th August, and from Calcutta on her first trip to Suez on the 15th December. Her average speed on the voyage round to London has been little under 13 miles per hour, and she occasionally ran 14 miles per hour.

Fires.—On Saturday and Sunday last, within the short period of 24 hours, the metropolis was the scene of four destructive fires—three of them occurring almost simultaneously, and each resulting in a great sacrifice of property. The first occurred on the premises of Mr. Mosely, machine-ruler and tool-maker, in New-street, Covent-garden. It broke out on Saturday morning, and ended in the total destruction of his warehouse, with a large quantity of valuable property, and serious injury to several of

the adjoining houses. The next was in Fore-street, Lime-house, where several dwellings on the banks of the river were destroyed, and a great sacrifice of property took place. It occurred at 11 on Saturday night, and was followed about 1 on Sunday morning by a third destructive fire on the premises occupied by Mr. Bird, an extensive contractor to the various Dock Companies, near the bottom of Old Gravel-lane, Shadwell. Mr. Bird's premises consisted of saw-mills, worked by steam, said to be the finest in the kingdom; besides this, on the same plot of ground, he carried on the business of a scum-boiler on a very extensive scale, employing nearly 80 workpeople. With a comparatively trifling exception, the whole of these premises, covering nearly one acre, were levelled with the ground; the whole of which were uninsured, as the stock was considered so dangerous that no office would undertake the risk. While this fire was raging, the reflection of another in the western part of London rendered it necessary to despatch those engines that could be spared in that direction; and it was then found that the fourth outbreak had taken place on the premises occupied by Mr. Villiers, surgeon, in Great George-street, exactly facing Westminster Abbey. Here the fire commenced before 3 o'clock, and burnt with undiminished violence until nearly 6, wholly destroying two houses and seriously injuring several of those adjoining. Fortunately, no loss of life resulted in any case. The total loss has been variously estimated, and it would be impossible to give the amount accurately; it is, however, believed not to exceed 30,000*l.*, a result attributable in a great measure to the efficiency of the Fire-brigade.

Inquests.—An inquest was held on Thursday on the body of Mr. F. S. Ancona, whose death by drowning, off Waterloo-bridge, on the 3d inst., was noticed in our last. The body was found under the second arch of the bridge on Tuesday evening. It appeared from the evidence of Mr. Green and Mr. Rogerson, who were walking with the deceased at the time of the occurrence, that he was partially intoxicated, and jumped on the parapet of the bridge as a feat of daring and agility, and not with any purpose of committing suicide. The jury returned a verdict of Accidental Death.

Thames Tunnel.—The traffic through the Tunnel continues to increase steadily, independently of the visitors who pass through from motives of curiosity. The number of passengers last week was 45,528.

Chiswick.—On Tuesday evening a report was circulated that a young man, named John Blissard, a labourer, residing in William-street, Chiswick New-town, had been killed by his own father, who in a violent fit of passion, had nearly severed his head from his body with a grass-hook. It appears that the father aimed at his head, but the son guarding his head with his left arm, received the weapon just under the elbow-joint, and it inflicted a wound across the arm upwards of four inches in length, extending to the bone, and dividing all the principal arteries. The father was at once taken into custody, and has been committed to Newgate on the capital charge. Another attempt at the same crime was made in the village on Wednesday, by a female, named Isabella Murray, upon her own offspring, an infant only nine weeks old, by poisoning with laudanum, but the measures taken to counteract the poison were effectual, and the child is likely to do well.

Tottenham.—We learn from a correspondent that the Vicar of this parish has placed at the disposal of a Committee of the inhabitant householders seven acres of his glebe, very superior land, near the most populous portion of the village, to be divided by the Committee into plots averaging about 20 square poles each, to be let to such of the industrious labouring classes of the district as may desire to use it as garden ground only.

Mortality of the Metropolis.—The following is the number of Deaths registered in the week ending Saturday, July 29:—West districts, 98; North districts, 129; Central districts, 138; East districts, 182; South districts, 202. Total, 749—(378 males, 371 females) Weekly average for the last five years, 903—(461 males, 442 females,) and for the last five summers, 846.

Provincial News.

The Harvest.—The local papers are filled with reports of the approaching harvest. From the West of England we learn that the harvest has commenced in the neighbourhood of Exeter, where a considerable breadth of wheat and barley has been cut. Wheat has also been cut in good condition near Bath. In Herefordshire, a large breadth of wheat and barley presents a most luxuriant appearance, and although the harvest will be late, still fine weather will insure a full average crop of excellent quality. The hop plantations scarcely ever looked worse. In Hampshire, harvest commenced on the south side of Portsdown Hill last week. In Buckinghamshire, a sack of new barley, from the farm of the Rev. J. B. Reade, of Stone, was exposed for sale in Aylesbury market, on Saturday. In Bedfordshire, the harvest commenced last week. Wheat was to be seen in shock on Wednesday week, about Caldecote and Biggleswade; oats were mown at Girtford, and at Bromham a very large field was in process of reaping. In the neighbourhood of Birmingham the crops look poor and withered, while in the Vale of Worcester the wheat crop is much better, and in many places abundant and fine. In Yorkshire, from the appearance of the crops on the ground, even with fine weather, the harvest will not commence before September, and will not be more than an average one. In Lancashire, Westmoreland, and Cumberland, the oldest individual living does not remember the occurrence of a fall of snow in the month of July. Such, however, is the fact, for, on the 17th ult., the celebrated mountain called the "Old Man," the highest point in Coniston

Fell, was partially covered with snow, which, in the course of a few hours, disappeared. It is feared, that unless the weather takes up, the late heavy rains will have materially injured the hay crops already cut, and that the hay and grain harvests will be very late. Scarcely one half of the hay is secured in the northern counties, but the wheat in Lancashire looks well, and promises an abundant crop if the weather continues fine. In Norfolk and Suffolk, the wheat with scarcely an exception is uncut, and the barley is generally green. The crops are laid to an unusual extent, and in many districts the winds have twisted the stems in every conceivable direction, not merely laying the corn flat, but breaking the straw. The consequence must be, that a great proportion of the grain will not ripen, or if it does, the grain will be small and shrivelled. From Scotland we learn that the markets, particularly for wheat, have advanced considerably within the month, and, until the harvest is secured, will fluctuate with the weather. The chances, however, are, that prices are at their highest, and that they will decline rather than otherwise, unless the harvest is more disastrous than there is at present any reason to anticipate. In the neighbourhood of the metropolis the operations of harvest have commenced. In Surrey several fields of rye and oats, at Peckham and Battersea, have been cut. In the parishes of Tottenham and Edmonton, also, fields of rye and oats have been cleared, the produce appearing in good condition. Should the present warm weather continue the wheat will, in a few days, be ready for the sickle.

Thunder-storms.—On Wednesday, one of the most destructive storms which has occurred for some years was experienced in different parts of the country, extending, as far as we have yet learnt from Kent to the Midland Counties, and from the East coast to Somersetshire and Wilts. At Rochester and Chatham the damage done by the hail is said to be incalculable. The skylights in the Dockyard and public buildings have been demolished, and the loss in every direction to individuals must be very great. Mr. G. Masters, nurseryman, estimates his loss at between 400*l.* and 500*l.* The skylights over the Corn-market at the City Repository are entirely destroyed; several greenhouses in the neighbourhood have hundreds of panes broken, and scarcely a house in the neighbourhood has wholly escaped. Many of the pieces of ice which fell measured an inch and a half in length, and in the marshes, near the Cattle-market, pieces as large as a hen's egg were picked up. At Cheltenham the rain fell in such torrents that the High Street was nearly impassable. At Hungerford, a correspondent states that the hail-stones were 1½ inch in diameter; they demolished the glass in four houses 40 feet long, and swept the fruit from the trees. At Stamford many houses were damaged, and at Cambridge the hail-stones are said to have been as large as pullets' eggs; the University buildings and churches lost a great deal of glass in their windows, and the inhabitants were obliged to pump the water out of their houses. At Worcester, the lightning struck several buildings, and many animals were killed, but no loss of human life occurred.

Bedford.—Sarah Dazeley, who was tried at the last Assizes for the murder of her two husbands and daughter, by administering arsenic to them, and sentenced to death, underwent the last sentence of the law on Saturday in this city, in the presence of an immense concourse of spectators from various parts of the county.

Bury St. Edmunds.—In pursuance of an invitation from the inhabitants of this town, and several agriculturists in the vicinity, Mr. Cobden and Mr. Moore attended a meeting on Monday, for the purpose of addressing the farmers of Suffolk upon free trade and the Corn-laws. On the motion of Lord C. Fitzroy, Colonel Addison was called to the chair. Mr. Cobden in a long speech laid before the farmers the usual arguments against the Corn-laws. The Rev. Mr. Maberley then came forward to expose what he called the well-intentioned delusions of Mr. Cobden. He wished all classes to live, and was of opinion that the man who tilled the soil was, both upon principles of reason and Scripture, entitled before any one else to a subsistence from it. He was proceeding at some length, when the people refused to listen to him. Mr. Hales, a farmer, then came forward, and moved a resolution in favour of free trade. He had had the honour of addressing them about three years ago, at a time when the people were in great distress; that distress now continued with unabated force, and imperatively required some radical remedy. After some remarks from Mr. Moore, the resolution was carried with only two dissentients.

Hull.—It is stated in the local papers that Government is about to institute an inquiry as to the loss of the Pegasus. As the boats belonging to her are saved, proof can be obtained whether they were capable of taking all on board at the time of the accident. It is said that they were unusually large, and with the assistance of the life-buoy, on the quarter-deck, all might have reached the shore, had not these been lowered and swamped by the passengers in the first alarm.—Another of the unfortunate sufferers was picked up by the steamer Vesta, from Newcastle to Leith, on the 4th inst., and put on shore at Holy Island. He was in the fatigue dress of the 96th Regiment, but so disfigured as to render his identification impossible. Mr. Aird, a passenger, has also been found, with a piece of wood across his body, which prevented his rising to the surface; and it is expected that many other bodies will soon be found, the diver's impression being that a number are kept down by the mattresses, &c., which are strewn about the cabin.

Gloucester.—After several years' litigation, the will and codicils of Mr. James Wood, the late wealthy banker and draper of this city, have been proved in Doctors' Com-

mons. He gives to the corporation of Gloucester 60,000*l.*, to Mr. Philo 50,000*l.*, to Mr. Council 10,000*l.*, to Mr. Hobbs 30,000*l.*, to Mrs. Goodlake 20,000*l.*, to Mr. Smith 20,000*l.*, to Mr. Cleveland 14,000*l.*, and to the family of the latter gentleman 6,000*l.*; and the residue of his property, estimated at about 500,000*l.*, to his executors. The property has been sworn under 900,000*l.*, and the probate bears a stamp of 12,000*l.* The executors named are Alderman Wood, John Chadburn, Esq., (who committed suicide some time back under very extraordinary circumstances), Jacob Osborn, Esq., and John Surnam, Esq. The charges of three proctors engaged in the suit relative to the will amount to 17,536*l.* 3*s.* 2*d.*

Edin.—The daily papers in noticing the ill-fortune of the senior King's scholar at Eton last week, who lost his Fellowship at King's, because there was no vacancy when the clock struck two, stated their impression that such an event had never before occurred since the foundation of the college, in 1441. It appears, however, that this instance of ill-luck is not without a precedent. In 1758 the Rev. Witley Heald lost his Fellowship at King's under similar circumstances. This gentleman died in 1786, holding the livings of Northrepps and Buston St. Lawrence, Norfolk. An Eton boy, however, when he leaves Eton for King's, is first a Scholar and then a Fellow, but he may lose his Fellowship by misconduct.

Liverpool.—A meeting of the proprietors of the St. George Steam-packet Company was held last week, for the purpose of considering the propriety of effecting an entire dissolution and winding up the concern. It appears that during the eight years of the company's existence as much as 500,000*l.* have been lost, and that the proprietors on hearing this, unanimously resolved on an immediate dissolution. The English proprietors then agreed to take those of the Company's steam-packets which had not lately been to sea, while the Cork proprietors agreed to take those packets which have for some time past been plying across the Irish Channel. Thus it seems that two companies are to arise from the dissolution of the one. A meeting for the purpose of winding up affairs, and of publishing a final report, will be shortly held.—John Anderson, whose case has been so often mentioned, and who is charged with having received portions of the money stolen at the Preston Guild, and from Mr. Blakemore, M.P., in London, was brought up on Saturday for final examination, when some additional evidence was adduced, with the view of corroborating several parts of that given upon the previous days, and with respect to the different hands through which the stolen and substituted notes passed. At the close the several witnesses were bound over to prosecute, and the prisoner, who refused to make any statement in his defence, was committed for trial at the approaching assizes.

Manchester.—It appears that the damage occasioned to Mr. Fitzgerald's colliery, by the irruption of the water, and the loss likely to be sustained in consequence, are not so extensive as at first anticipated; and that the colliery, so far from being destroyed, is no further injured than by the temporary suspension of its trade, until the water be pumped out, after which the raising of the coal will be resumed.—Another turn-out of mill hands has taken place at Ashton-under-Lyne, commencing with the spinners in Ryecroft Lower mill, but subsequently it extended to the weavers of one or two mills, and has since been carried into effect in every mill in the neighbourhood. It was caused by a notice for the reduction of wages, and appears to have been free from all political character.

Norwich.—Mr. Matteaux, of Swaffham, who died on Saturday week, has bequeathed the whole of his extensive landed property in this county, producing a rental of 20,000*l.* per annum, to the Hon. C. Spencer Cowper, the third son of Lady Palmerston, by the late Earl. He is no relation to the testator, and is now Secretary of Legation at Sweden.

Oxford.—The long-pending case of Macmullen v. the Regius Professor of Divinity was brought forward in the Vice-Chancellor's Court last week, when Dr. Kenyon, the assessor, gave judgment in favour of the admissibility of the plaintiff's libel in its amended form. The two principal exceptions to the libel, taken by Dr. Twiss, counsel for Dr. Hampden, viz., that the libel did not allege that the damages affirmed to be sustained by the plaintiff were consequential, or that the defendant had acted from malice, were overruled by the assessor. The Court reserved the question of costs till a further stage of the proceedings, considering that the question before the Court was in effect the trial of a right, although in form an action for damages. Should no appeal be entered by the defendant's proctor within 15 days, it is supposed that the proof of the plaintiff's allegations will be proceeded with early in the ensuing University term. The case continues to excite intense interest, both from the theological questions involved, and the effect of the ultimate decision of the Court in determining the privileges of the professorship.

Salisbury.—On Wednesday a meeting was held in this city for the purpose of hearing Mr. Cobden and Mr. Bright on the Repeal of the Corn-laws. About 4,000 persons were present, of whom at least 400 were farmers. After several speeches had been delivered it was unanimously resolved "That in the opinion of this meeting, the principles of free trade are founded on justice, and consistent with the revealed designs of the Creator; and therefore every act of legislation which interferes with the freedom of industry, under the pretence of protecting manufactures, agriculture, or the colonies, ought to be forthwith abolished."

Swansea.—The toll-houses and bars in this county (Glamorgan), as well as in Carmarthen, continue to fall

by the hands of the Welsh Guerillas, who, from their local knowledge, the precaution of their spies, and the sympathy of the great body of the people, are still enabled to laugh at the mustering of the military. On Thursday morning the Rebeccaïtes assembled at Ty Coch, within half a mile of Swansea, and in less than a quarter of an hour demolished Ty Coch and two adjoining toll-gates. The Furnace toll-house and gate, together with all the side bars near Llanelly, were also destroyed on the same night, and the wood-work burned. Mr. Maule, of the Treasury, and Mr. Raven, who are present to conduct and watch the proceedings before the magistrates, are said to be convinced of the necessity of some other measures than those previously adopted to put down this career. On Friday, the men employed in the great copper works near this town struck work, in consequence of the intended reduction of wages to the amount of 12½ per cent. They assembled on Saturday to the number of from 1400 to 1500, and proceeded to perambulate the streets, marching four abreast. They were met by the mayor, Mr. Vivian, M.P., and other gentlemen connected with the works. The Mayor informed them that he had instructions from government to prevent large assemblages of persons from marching or congregating in the streets; and he trusted that their good sense would induce them to obey his instructions. Mr. Vivian then addressed them, exhorting them to listen to the advice of those who really wished to guide and direct them for their benefit, assuring them that necessity alone compelled himself and their other employers to make the reduction in their wages; and that when any improvement in the trade and price of copper took place, their wages would be advanced again in proportion. Several of the men attempted to show that by the reduction they would not be able to support themselves and families; but upon being questioned as to the amount of their earnings, they were compelled to admit that at the reduced price it would average above a pound per week, more or less, according to the several branches of their employment. Since this meeting took place several have returned to their work. Mr. Hall, the Commissioner appointed to inquire into the cause of the disturbances, has concluded his inquiry at Carmarthen, after hearing privately the communications of every person who went before him relative to the state of the country. Mr. Ellis the barrister also formed part of the commission, and directed his attention solely to the accounts and management of the turnpike trusts. It is said that he has expressed a strong opinion against the numerous side bars, and that he has drawn a bill, now before Parliament, having for its object the consolidation of the trusts, and the gradual paying off of the tallies. It appears that these outrages, by reducing the incomes of the trusts, will, in many cases, inflict much hardship and suffering in rendering the trustees unable to pay the interest on the tallies, great numbers of the small tally holders being old people, who have invested the little savings of a life in these securities, and are now living on the interest of their investments.

Railways.—The following are the returns for the past week:—Croydon, 405*l.*; Greenwich, 749*l.*; Blackwall, 1,190*l.*; Brighton, 4,926*l.*; Birmingham, 18,402*l.*; South-Eastern, 4,022*l.*; Great Western, 16,050*l.*; South-Western, 9,133*l.*; North Midland, 4,658*l.*; Grand Junction, 8,849*l.*; Birmingham and Gloucester, 2,114*l.*; Manchester and Leeds, 5,074*l.*; Edinburgh and Glasgow, 2,115*l.*; Midland Counties, 2,667*l.*; York and North Midland, 1,983*l.*; Manchester and Birmingham, 2,802*l.*; Birmingham and Derby, 1,298*l.*; Hull and Selby, 1,135*l.*; Liverpool and Manchester, 4,739*l.*; Eastern Counties, 3,092*l.*—The half-yearly meetings of the different companies occupy just now a considerable portion of public attention. The Grand Junction continues to pay a dividend at the rate of 10 per cent., which, however, has been maintained at the expense of the guarantee fund, no provision being made to increase it out of the half-year's return, and also by adding the surplus of the preceding half-year. The traffic has declined, but with rigid economy the expenditure has been proportionately reduced. The sum divided among the shareholders is 110,781*l.*, but the net profits appear to be barely 105,000*l.*—The Leeds and Selby Company have declared a dividend of 2*l.* 10*s.* per share, or at the rate of 5 per cent. on their capital. This line is leased to the York and North Midland Company.—The North Union Company pays a dividend of 2*l.* 5*s.* per share. Retrenchments have been made in several departments, and the interest upon the bonded debt reduced from 5 to 4 per cent.—The Chester and Birkenhead Company's accounts for the last half-year show receipts at 13,007*l.* 15*s.* 3*d.*, and the expenses at 10,170*l.* 14*s.* 1*d.* The directors exhibit a reduction of expenditure, and declare a dividend of 7*s.* 3*d.* on the original 50*l.* shares, and of 3*s.* 7½*d.* on the halves, or 25*l.* shares.—The Manchester, Bolton, and Bury Canal Navigation and Railway Company declare a dividend of 1*l.* 7*s.* 6*d.*, reserving a large surplus to equalize future dividends, should any decline take place in the traffic. The profits were sufficient to pay a dividend of 1*l.* 12*s.*, but the shareholders acquiescing in the views of the directors contained in their report, consented to forego a division of the net returns.—The York and North Midland Company at their recent meeting reported that there had been a falling off in the receipts, during the last half-year, as compared with 1842, of upwards of 2,200*l.* The receipts for merchandise, however, exceeded the corresponding half-year of 1842 by 2682*l.*, and as the working expenses had also been reduced to the extent of upwards of 1000*l.* on the half-year, the dividend of ten per cent. would be maintained. The prospects of a considerable increase of traffic, from the early completion of the Newcastle and Darling-

ton Railway, were represented as extremely encouraging. Resolutions declaring the expediency of undertaking the formation of a railway to Scarborough, thus uniting the York and North Midland with Filey, Bridlington, Whitby, Pickering, &c., were unanimously agreed to, it being stated that the whole of the proposed line would be completed for 260,000*l.*, or about 6000*l.* or 7000*l.* per mile.—At the meeting of the Newcastle and Darlington Company last week, the directors reported that all the land for the line is, with a trifling exception, purchased, and that the works for the whole line are under contract and in active operation, so that no doubt can be entertained that the railway will be completed for opening on the 1st July. With regard to the completion of the railway chain to Scotland, there was no movement on the part of the promoters of the West coast (Lancaster and Carlisle) line at present, and the government commissioners had given a preference to the Eastern (Rugby, Leeds, and Berwick) line, if the Midland railways were continued to Newcastle, which communication the Newcastle and Darlington would effect. Resolutions, authorizing the directors to open negotiations with the Durham Junction, and to ascertain whether it would be practicable to purchase the line, were then agreed to.—At the meeting of the Brighton Company on Tuesday, the report of the directors announced that by a recent valuation of the locomotive stock, that portion of the company's property was found to amount to 99,370*l.* The land and buildings had been disposed of at 21,755*l.*, and the residue of unsold property was estimated at 28,177*l.* A further sum of 11,611*l.* would be required for the purpose of re-ballasting the line, and the total cost of the railway had been ascertained to stand at 2,707,872*l.* The revenue account showed the expenses for the past half-year to have amounted to 38,985*l.*, and the receipts to 74,394*l.*, leaving a deficit of 3,304*l.* The directors would have to raise 120,000*l.* to meet the current demands upon the company. Wharfs were now erecting at Shoreham Harbour for the reception of steam-vessels, and arrangements had been made with the General Steam Navigation Company for enabling passengers to book through from London to Rouen, an advantage which would soon be extended to Paris. A long discussion ensued with reference to the election of a director, when Mr. Joseph Thompson was elected in the room of Mr. Entwistle, resigned.—The North Midland Company met on Wednesday, when the directors reported that considerable progress had been made since the last meeting in reforming the management, and in reducing the expenditure, but the receipts, as compared with the corresponding half-year, were nearly stationary, though there had been a diminution in the working expenses of 11,500*l.* An estimate had been made of the liabilities of the company, their claims, and disposable property, which led the directors to conclude that a surplus would remain after discharging all debts, and paying off the loan notes. The amount received for the conveyance of passengers during the past half-year was 56,511*l.* The total receipts being 98,554*l.*, and the expenses 57,960*l.*, leaving a disposable balance of 44,654*l.* A dividend of 1*l.* 10*s.* per share for the half-year was declared, and resolutions were carried for extending the line to Bradford, and for awarding 600*l.* to the members of the investigation committee as an acknowledgment of their services.

IRELAND.

Dublin.—The Lords Commissioners of the Great Seal have ordered that Christopher Blake, Esq., of the county Meath, be superseded in the commission of the peace. The papers publish a correspondence between Mr. Lucas, Mr. John Bodkin, M.P., and Mr. Sugden, containing the usual questions and answers relative to the attendance of Mr. Bodkin at the Tuam repeal meeting. The replies being deemed unsatisfactory by the Lord-Lieutenant and the Commissioners of the Great Seal, Mr. Bodkin has been informed that he is dismissed from the office of Deputy-Lieutenant and Justice of the Peace. Mr. J. H. Talbot has also had a correspondence with Mr. Lucas, who intimates to the ex-member for New Ross that having attended a repeal banquet at Enniscorthy, he is no longer a Deputy-Lieutenant of the county of Wexford.—Mr. Ross Cox, who was despatched some weeks ago in search of Mr. Finn, the fugitive treasurer of the Corporation, returned to Dublin by the last packet. The ex-treasurer had escaped into Texas, whither it was useless to pursue him, as the southern states of America do not recognise British jurisdiction.—After one or two postponements, owing, it is said, to the inclemency of the weather, Mr. Gypson, the aeronaut, made an ascent in his balloon from the Portobello Gardens on Monday. Although the evening was highly favourable for a more extended excursion, Mr. Gypson descended in a field close to the city. Here the balloon was taken possession of by a party of quay porters, who demanded remuneration by way of salvage; but Mr. Gypson, not feeling inclined to comply with their demands, and, moreover, making some remarks derogatory to Irishmen, the coal porters vented their indignation by closing the vent of the balloon, and having cut the cords, suffered it to proceed on its solitary voyage. The balloon being left thus unincumbered, and shot with inconceivable velocity towards the clouds, and a brisk gale blowing at the time, it was soon lost to sight, with little prospect of its ever more being heard of.—An adjourned meeting of the Repeal Association was held on Saturday, for the purpose of reading the translation of a letter from M. Ledru Rollin, member of the Chamber of Deputies in Paris, received by Mr. O'Connell last week. After reading this letter, Mr. O'Connell said that the hon. gentleman's communication met every view he had at heart, and with him disclaimed any wish to disturb their attachment to the Queen, which he would say it was im-

possible to disturb, as the Repealers were in reality the true friends of the Sovereign; therefore, the object attributed to M. Ledru Rollin was false—that he wished to draw the people of Ireland from their allegiance. He was not surprised that they should speak of the alliance between the Irish troops and French warriors in bygone times, because the violation of the treaty of Limerick alone (independent of any similar case) sent no less than 50,000 men into the French service; and on the record in Paris it was to be seen that 144,000 Irishmen died in the French service, and most of that number on the field of battle. A letter of acknowledgment was then adopted, from which the following is an extract:—"We understand each other perfectly. Your present countenance and sympathy is bestowed upon men who are struggling within the limits of local law and constitutional principle for the rights and liberties of their native land—of men who desire to use no other means than those which are peaceable—means which have no other efficacy than that which arises from their moral force and power. You, indeed, allude to another contingency, in which you may be disposed to be more active in our support. But that is a contingency which we decline to discuss, because we now deem it impossible that it should arise, the British Government having retracted every menace of illegal force and unjust violence, and confining its resistance to our claims—if it shall continue to resist those claims—within the ordinary channels of legalised administration." The week's rent was announced to be 1,354l. 11s. 4d.

Baltinglass.—The Wicklow Repeal demonstration took place in this town on Sunday. Nearly 150,000 persons are said to have been present, collected from the five or six adjoining counties. At the banquet which followed, Mr. O'Connell said, "I trust that before Christmas comes we will have the Preservative Society sitting in Dublin, and drawing up bills which they will call on the British Parliament to pass: if they will refuse, then respectfully call on her Majesty to convene a Parliament in Ireland again. I, therefore, call upon all of you to become apostles of my sect—to promulgate my doctrines far and near—to talk amongst yourselves and to convey amongst your neighbours the plan I propose, which will have the effect of putting an end to absenteeism—to the clearance system—to the extermination of tenants—to the overburdening with taxation—to the miserable limit of our franchises—to the giving to our corporate towns the full dominion of their local affairs, and to Ireland generally the regulation of all that concerns her welfare." The Rev. Mr. Lalor, (parish priest of Baltinglass), said, in acknowledging the toast of the Clergy, "that rumours were abroad of an intention on the part of Government to renew the attempt of pensioning the Irish priesthood on the Crown; but he would tell England, that wealthy though she was, she was too poor to bribe the Catholic clergy of Ireland. There was no project that could find less favour in his eyes than that which was said to be in contemplation, for the history of all countries abounded in evidence to show that the interests of true religion had invariably been impaired in every land where church and state were allied."

SCOTLAND.

Edinburgh.—The local papers state that since the late trial before the High Court of Justiciary, for the sale of blasphemous publications, which was delayed in consequence of a technical flaw in the indictment, a man named Paterson has come down from London, and opened another shop for their sale, with more open defiance to the authorities than before. Our readers may recollect that the conduct of this man in Holywell-street was frequently the subject of legal proceedings before the police magistrates of the metropolis.—It is said that there is no doubt that the Duke of Wellington will visit Scotland in the autumn, and that he will for a few days be the guest of the Duke of Hamilton.

Miscellaneous.

The Duke of Marlborough's Despatches.—A discovery has been recently made, the interest of which it is not possible to overrate, although the extent of its historical value has only hitherto been partially ascertained. In a house in the town of Woodstock there had been lying for many years 18 boxes, supposed to contain deeds and papers appertaining to the Marlborough estates, whose dust nobody had ever thought of disturbing, and the existence of which was probably unknown to Archdeacon Coxe when he had the ransacking of all the documentary stores of Blenheim. These boxes have been lately opened and examined, and they have been found to contain the whole of the correspondence and despatches of the great Duke of Marlborough, during the eventful period of the war of succession. A large portion of them—the letters to Prince Eugene and all the foreign Sovereigns, Princes, and Generals—are in the French language. They form a collection very much resembling the compilation of Colonel Gurwood, and the partial examination which there has been time to bestow on them has been just enough to prove the very great interest of the matter they contain. We understand that these precious and important documents have been confided, by the present Duke of Marlborough, to the custody and inspection of Sir George Murray.—*Times.*

Growth of Wood.—A few days ago, as some workmen were cutting up a log of cedar, at the High Mill, in Thornthwaite, they discovered, nearly in the heart of the log, two pieces of beautiful china. There were several inches of solid wood on all sides of the china, and no defect whatever to be seen in the log in which the two pieces were so closely embedded.—*Cumberland Packet.*

Steam Draining Machine.—On Saturday last, the commissioners for superintending the works for the draining of the Lake of Haarlem laid the first stone of the building of the steam-engine called the "Leeghwater," from Mr. Leeghwater Ryp, mill-builder and engineer, who published, in 1643, his book on the Lake of Haarlem, in which there is a complete plan for draining that great lake. The Leeghwater is the first machine for draining of water by steam instead of wind, and is the greatest attempt at draining in the Netherlands—a work unparalleled among us, and which will do honour as well to the Princes in whose reign it was projected, as to the King under whom it will be completed. The cavity in which the first stone will be placed is about six and a half yards below the lowest of the water; 1,400 piles have been driven into the ground, to serve as the foundation of this heavy building. The result of these preliminary operations has proved that the soil is perfectly good and solid, and there is every reason to hope that the foundation will be fully equal to bear the immense weight.—*Mark Lane Express.*

LAW.

House of Lords.—*The Athlone Peerage.*—A Committee for privileges assembled on Monday to hear the evidence in support of the claim of William, fifth son of the last Earl but one, and uncle to the last Earl, to vote as Earl of Athlone for representative Peers of Ireland. The documentary evidence was not quite satisfactory to their Lordships, who required the originals instead of examined copies of certificates of birth and burial and entombments of peerages, but having been satisfied that such copies had before been admitted as evidence, and having the state of the family and the relationship of the different members clearly proved, the Committee resolved that the claim had been made out.

APPEALS.—*The Queen v. Mills.*—This was one of two cases brought up to the House of Lords on a writ of error, from the Court of Queen's Bench in Ireland, the alleged error being that the Court had held that a marriage not celebrated in any church of the Establishment, but by a Presbyterian minister, was not such a valid marriage as to make a subsequent marriage in the Church of England invalid, and to render the parties contracting the same liable to the penalties of bigamy. The defendant had been convicted of the crime, but the judgment had been arrested by the Court of Queen's Bench in Ireland. On that decision the present writ of error had been brought. The case was argued in March last before several of the English Judges, and in July last, upon the motion of Lord Brougham, they gave an opinion delivered on their behalf by Lord Chief Justice Tindal, to the effect that the judgment of the Court below was correct. The judgment of the House had been postponed, and the Lords now assembled "further to consider" the case. Lord Brougham proceeded to give his opinion on the case, dissenting from the opinion of the Judges, and concluding by moving, that the judgment of their Lordships should be given for the plaintiff in error; but if they did not think proper to take that step now, then he begged them not to give judgment for the defendant in error, but to delay the award of their judgment till they had had the opportunity of obtaining the assistance of the Judges of the Consistorial Courts, to which it was admitted the cognizance of these matters most peculiarly belonged. Lord Abinger upheld the decision of the Judges as delivered by Lord Chief Justice Tindal; but Lord Campbell declared that he was totally unable to concur with that decision. The Lord Chancellor doubted whether the Ecclesiastical Judges could be summoned in any way to assist their Lordships; but perhaps their Lordships might think fit to have the case again argued, but only by the Ecclesiastical Court advocates. The further hearing was postponed.

ROLLS' COURT.—*Hope v. Hope.*—This suit related to a cabinet of jewels which were collected by the late Henry Philip Hope, Esq., and are estimated to be of the value of 100,000l. That gentleman left three nephews, sons of his brother, Thomas Hope—namely, Henry Thomas Hope, Adrian John Hope, and Alexander James Beresford Hope. Adrian John Hope, as one of the residuary legatees of his uncle, instituted one of the three suits now before the Court, for the administration of his uncle's estate and effects. In consequence of this, Alexander J. B. Hope was compelled to institute another suit, asking the Court to declare that he was entitled to the cabinet in question, by virtue of the deeds giving them to him, the one dated the 19th of May, 1832, and the other dated the 10th of April, 1838. This suit was followed by a third, instituted by Henry Thomas Hope, claiming the jewels in question under a deed alleged to have been executed in 1821. No such deed, however, could be found, neither were the contents of the deed, or the property intended to pass, proved. From the case, as stated, it appeared that the late Henry Philip Hope had for many years been collecting the cabinet in question, which now consists of many rare specimens; and in 1821 it was alleged that he executed a deed, by which, after his decease, he gave sixteen of the most valuable, if not all, the jewels in question, together with his gallery of pictures in Duchess-street, to Henry Thomas Hope; no trace, however, of this deed can be found, other than a paper writing, alleged to be a copy, but containing nothing from which it could be ascertained that any deed had been executed. In 1831, Henry Thomas Hope died, and appointed his brother, H. P. Hope, the guardian of his son, Alexander James Beresford Hope, who was then about eleven years of age. On the 19th of May, 1832, Henry P. Hope assigned his collection of diamonds and precious stones, jewels, gems, and minerals, contained in a mahogany cabinet, about 18½ inches long, 12 inches wide, and 12 inches high, with silver cornices and a circular silver plate, engraved with the armorial bearings of the said H. P. Hope, to John Raphael, since deceased, upon trust for him for life, and after his decease upon trust for his nephew, Alexander James Beresford Hope. This deed contained a power to sell or exchange the jewels; so that those disposed of were replaced by others of equal value. It also contained a covenant for further assurance, and a clause indemnifying the trustees in case of any loss. This deed was duly executed and delivered. It subsequently, however, came into the possession of Henry P. Hope. Between the date of this deed and 1838, the cabinet was changed for a larger one, into which the jewels were transferred, partly because the cabinet was too small, and partly because it would not admit of a scientific arrangement. At a time the old cabinet was allowed a space in the lumber-room of the owner, but ultimately it was sold to a gentleman in Sussex, in whose possession it now is. In 1838 Henry Philip Hope, for some purpose, considered it requisite to make another deed of gift of the same jewels to his nephew, Alexander James Beresford Hope, and accordingly he sent the deed of 1832 back to John Raphael, who prepared another deed, to which he, as trustee of the former deed, was no party. By this deed, which was executed on the 10th of April, 1838, H. P. Hope assigned his collection of jewels, by the description in the former deed, to A. J. B. Hope absolutely; this deed was duly executed and delivered, and was afterwards delivered to H. P. Hope. In July, 1838, as H. P. Hope was going to Holland, which he occasionally did, he delivered three sealed parcels to Louisa Viscountess Beresford, the mother of his three nephews, at the same time saying,—"Dear Mamma, I rely upon you, after my death, to deliver these sealed parcels to the parties to whom they are respectively addressed." One of these packets was addressed to herself, one to H. T. Hope,

and the other to Alexander J. B. Hope. H. P. Hope subsequently left England for Holland, but returned in the autumn, and at his request the packets were returned to him unopened. In the following year he again went to Holland, and he then in like manner and with a like request, delivered three similar packets to Lady Beresford; he again returned to England in the autumn, sick and unwell, and took up his last abode at Bexley Park, in the county of Kent, the seat of Lady Beresford. When spoken to respecting the packets, he said he recollects what he had done; he, however, never recollects the date, but died on the 8th December, 1839, leaving by his will appointed H. Thomas Hope, Jeremiah Harman, Edward Harman, Henry Harman, and William Belton Crealock, his executors in England. Three days afterwards Lady Beresford went to Holland, and caused the packet directed to Alex. J. B. Hope to be delivered to him. This upon opening was found to contain the key of the new cabinet, and also the deed of gift dated the 10th of April, 1838. At the meeting of the family this deed was read immediately after the will of the testator, but nothing was said; but shortly afterwards Adrian J. Hope filed his bill in this court for an administration of the estate, upon which the present suit was instituted by A. J. B. Hope, calling upon the executors to give up the cabinet and the collection of jewels, &c. to him. It was argued on behalf of A. J. B. Hope, that there was no doubt of the intention of the donor. He contemplated making a legal gift, and had never swerved from that intention from 1832. A deed had accordingly been prepared, and there was no doubt but that the property passed without its actual delivery. There were some alterations on the face of the deed of 1838, but they were in the handwriting of the donor, and related chiefly to the altered size of the cabinet. These, in the absence of any proof, must be considered to have been made before the deed was executed; but, assuming that the alterations were made afterwards, they could not be considered as of any moment, and did not vitiate the deed, as the collection would pass by that term, notwithstanding the cabinet was misdescribed. This collection was fully identified, and it was submitted passed to A. J. B. Hope, either by the deed of the 10th April, 1838, or that of the 15th of May, 1832. It was contended for Henry Thomas Hope, that the validity of the deeds must be determined by a court of law. The case of H. T. Hope, therefore, must stand over until A. J. B. Hope had established his title under the two deeds; if he succeeded, H. T. Hope would then insist upon the validity of the deed executed in his favour; if he failed, then Mr. H. T. Hope would give up his claim under the deed. On the other side, it was submitted that this court could not decide the question; the validity of the deeds must be substantiated before the court could make any declaration. After some discussion, it was ultimately arranged that the suit should stand over, and that A. J. B. Hope should be at liberty to bring one or more action or actions, with liberty to use the name of Mary Raphael as plaintiff, against the executors, for the recovery of some or one of the articles in the cabinet; and upon the application of the executors, Adrian John Hope was to be at liberty to defend the action or actions in the name of the executors of Henry Philip Hope. Henry Thomas Hope was also to be at liberty to bring an action against the executors of his uncle, in the name of his father, Thomas Hope, who was alleged to have been the trustee in the deed under which he claimed.

ASSIZE INTELLIGENCE.—**MIDLAND CIRCUIT, WARWICK.**—*Jane Smith*, only 13 years of age, was indicted for having, at Leamington Priory, on the 7th July, feloniously set fire to a dwelling-house in the occupation of Martha Wright. It appeared from the evidence that the prisoner was living in the service of Mrs. Wright, and possessed a very sullen temper. Her mistress had scolded her for some offence, and threatened to turn her away. Shortly afterwards, and when the prisoner was alone in the house, one of the upper rooms was discovered to be in a blaze, but by prompt exertions the fire was happily extinguished. The prisoner, when charged with being the cause of it, begged to be at once admitted that she had taken a candle upstairs, and set fire to some clothes in the room. The Jury, without hesitation, found her guilty. Mr. Justice Patteson, in passing sentence, said that he could hardly suppose the prisoner knew that the act she had committed, she had forfeited her life. At the moment she might pass sentence of death upon her, and leave her for execution. He should, however, recommend her Majesty, who alone had the power, to spare her life; but upon what terms he was not prepared to say. He had little doubt, however, that she would be sent out of the country. Whatever her future destiny might be, care would be taken to impress upon her mind the enormity of the offence which she had committed, and to teach her the duty she owed towards God and man. Judgment of death recorded.

NORFOLK CIRCUIT, NORWICH.—*William Sanger* pleaded guilty to two indictments charging him with having forged the name of a customer of the East of England Bank to two checks for the payment of between 2000l. and 3000l., which he received upon presenting such forgeries to the London agents of the bank. The facts of this case did not transpire, but this paper at the time gave a brief account of the circumstances attending the forgery. The prisoner was a clerk in the bank at Lynn. The prosecutors recommended the prisoner to the merciful consideration of the Court, because he had only spent 30l. of the stolen money when he was apprehended. Mr. Baron Alderson said that was no reason whatever for the passing of a lenient sentence upon him. The offence was a very bad one, and if he had not been apprehended he would no doubt have spent the whole of the money. The learned Judge enlarged upon the enormity of his crime, and sentenced him to be transported for life.

Berney, Esq., v. Read, Esq.—This was an action of trespass for stubbing up and cutting down furze and whins, and carrying away gravel, soil, and earth from a close of the plaintiff, called Easton Heath. The defendant justified taking the gravel as the occupier of the manor farm, under a right to take it for the repavement of the roads thereon; and as to the furze and whins, he justified under a right to take them for the purposes of fuel, of unfencing, of making "bottoms to ricks," and of fencing his yards. Issues were joined on these claims, and the plaintiff also "new assigned" that the defendant took more than was necessary, even if he possessed the right; and as to that part the defendant paid 10l. into court. The plaintiff is owner in fee of the heath mentioned in the pleadings (which were of enormous length, measuring between 15 and 20 feet), and the defendant is the occupier of the farm in respect of which he justified the trespasses complained of. The cause lasted from an early hour till nearly 8 o'clock, and, I might say, numerous witnesses being examined on each side. The jury found a verdict for the defendant on all the issues, establishing the rights set up, and adding that the excess he had committed in the exercise of those rights amounted only to the sum of 19s., and that the difference between it and the amount paid into court (10l.) ought to be returned to defendant.

OXFORD CIRCUIT, STAFFORD.—*Charles Higginson* was arraigned for the wilful murder of his son, William Higginson, at Eccles-hall, on the 2d April last. The prisoner pleaded guilty, and begged for mercy; but upon the representation of the judge that, in such a plea he had no other alternative than to leave him for execution, he retracted his plea and pleaded not guilty. The prisoner was a widower, the deceased was his only child, a boy of five years old. Early in the present year, the prisoner, who was then an in-door servant to a gentleman named James, made an agreement with the wife of a cottager named Breeze, of Lipsley-heath, in this county, that she should take care of the child at her cottage for eighteenpence a week. He was in arrears of payment, however, and had received notice to find some other person to take charge of the child. On the 2d April, having borrowed a spade from the cottager, he left with the boy, stating that he was then going to take him to his brother's. Mrs. Breeze, who had dressed the child, handed over the remainder of his clothes to the prisoner, and stated that at that time she observed no peculiarity in the prisoner's manner or appearance. The child was then in good health, with the exception of a slight inflammation in one eye. The prisoner was seen by a

Printed by Messrs. BRADSHAW and EVANS, Lombard-street, Fleet-street, in the Precinct of Whitefriars, in the City of London, and Published by them at the OFFICE, 8, CHARLES-STREET, COVENT GARDEN, in the County of Middlesex, where all Advertisements and Communications are to be addressed to the Editor.—Saturday, August 12, 1842.

THE HORTICULTURAL PART EDITED BY PROFESSOR LINDLEY.

No. 33—1843.

SATURDAY, AUGUST 19.

Price 6d.

INDEX OF THE PRINCIPAL HORTICULTURAL SUBJECTS IN THE LAST NUMBER.

Agarics, qualities of . . .	530 b	Mohl (Dr.), his critique upon . . .	550 c
Agricultural Society's meeting . . .	550 a	Milbetries, treatment of, in pots . . .	557 c
Allard (Mr.), his garden notice . . .	550 c	Muriate of ammonia, its effect . . .	558 c
Amateur's Garden . . .	550 a	Mushroom-beds, to prepare . . .	561 a
Annals, good kinds for autumn-sowing . . .	560 a	Naturalist's Corner . . .	559 b
Aromatic flowers, remarks on the effects produced by . . .	559 b	No. 100—tree, singular in its mode of fruit dropping . . .	561 a
Baxter's Phenomenous Botany, rev. . .	560 a	Oats, apt to be musty when stacked wet . . .	560 c
Berberis aquifolium, to propagate the seed for sowing . . .	561 a	Orchidaceous plants, support for . . .	557 b
Brenaria inodora . . .	550 a	Pea, Cormack's Prince Albert . . .	559 b
Birds, their use . . .	557 c	Pears will not force . . .	557 b
Blossoms at the Exeter nursery described . . .	558 b	Pelargoniums, remarks on the flowers produced by diseased plants . . .	561 a
Botanical destruction . . .	557 c	— seedlings, remarks on prizes for . . .	558 c
Bread and flour, nutritive properties of, in different countries . . .	559 a	Plants, delicate, to prepare cuttings of . . .	559 a
Bugs, mealy, to destroy . . .	561 a	— plan for sheltering them from sun and rain . . .	557 b
Cabbage, singular sport in . . .	561 a	Pots, improved . . .	557 a
Calceolarias, select . . .	561 a	Potter's guano, recommended . . .	560 c
Chrysanthemum, to improve its quality . . .	555 b	Regate Cottagers' Society . . .	558 b
Clematis Hendersonii . . .	561 a	Rhododendron, a good thermometer . . .	559 b
Crickets, to destroy . . .	561 a	Rickstan's, supports for . . .	561 a
Cuckoo, its habits . . .	557 c	Roses, soil for . . .	561 a
Cucumber, cause of bitterness in . . .	561 a	Saxifraga crassifolia, leaves of, used as Tea . . .	559 b
Flint-pitching . . .	561 a	Soil, necessity of pulverising . . .	557 b
Fruit, remarks on prizes for . . .	556 c	Sonach, Flinders . . .	561 a
— to pack . . .	561 a	Stocks, newly-invented covering for . . .	558 a
Fuchsia Chandlerii a mule . . .	561 a	Strawberries, remarks on mowing off their leaves . . .	556 a
— fine specimen of, in the open air . . .	557 a	Tan as a manure . . .	561 a
Garden allotments, remarks on . . .	561 b	Tan fungus, to destroy . . .	561 b
Ginger, to produce a second crop of . . .	557 c	Tillage, remarks on . . .	555 b
Gladiolus splendens . . .	557 c	Topham's Chemistry made Easy, rev. . .	560 a
Glazing, good substitute for . . .	557 b	University College, Botanical garden at . . .	559 b
Gravelly land, to improve . . .	559 c	Victoria regia . . .	561 a
Gravelly, purple . . .	558 c	Wasps, to destroy . . .	559 c
Heat, highest degree obtained in open gutters . . .	561 a	Watering out-door plants . . .	557 a
Heaths, Macnab's Treatise on . . .	561 a	West London exhibition . . .	558 a
Heating, remarks on . . .	561 a		
Horticultural Society's exhibitions, tabular statement of the weather at . . .	556 b		
Ireland, Practical Floral Society of . . .	559 b		
Mignonette, its treatment . . .	559 a		

FASTOLFF RASPBERRY.

PATRONISED BY HER MOST GRACIOUS MAJESTY THE QUEEN, HIS GRACE THE DUKE OF RUTLAND, THE EARL OF HARRINGTON, THE LORD BISHOP OF LONDON, LORD VISCOUNT LORTON, LORD SONDES, &c.; as well as by the HORTICULTURAL SOCIETY OF LONDON.

YOUELL & Co. have much pleasure in announcing they will be enabled to supply, at the latter end of Oct. next, fine Canes of the above highly-valuable and much-esteemed RASPBERRY—unequalled for the extraordinary size of its fruit and richness of flavour. Those to whom Y. & Co. sent it last season have expressed their high admiration of its superiority over all other varieties, and it has been awarded several prizes at various Horticultural exhibitions during the season. As a proof that they have not exaggerated its excellent qualities, Fruit was submitted to Dr. LINDLEY (see *Gardeners' Chronicle* of the 22d July, page 502), whose opinion of it is as follows:—"FASTOLFF RASPBERRY.—We have received from Messrs. YOUELL, of Great Yarmouth, fruit of the Fastolff Raspberry, and we find that it merits all that has been stated in favour of its excellence. The fruit received is very large, obtusely conical, and of rich flavour, far exceeding in this respect some other new and large varieties. The plants bear abundantly and in long succession." They also exhibited it, on the 1st of August, before the London Horticultural Society, 21, Regent-street, and a prize was awarded to them. It would, therefore, be unnecessary for YOUELL & Co. to recommend it more fully, or with greater confidence, to the notice of the public, merely observing that it continues in high perfection throughout the autumnal months, and has maintained its superiority in the most unfavourable soils and situations, and requires no other than the ordinary treatment of the old varieties. Fine Canes will be ready by the latter end of October, and can be sent with safety to any part of the United Kingdom (on the receipt of a Post-office order) upon the following terms:—

Packages containing 100 Canes . . .	£ 2 5 0
" " 50 " . . .	1 5 0
" " 25 " . . .	0 14 0

Packages included. The usual discount to the Trade, when not less than 200 are ordered.

Extensive orders are already received for the above; and to prevent a repetition of the disappointment which many experienced last season, by Y. & Co. not being able to meet the demand, they therefore respectfully solicit early application.

Great Yarmouth Nursery, August 17, 1843.

THE NEW YELLOW AUTUMNAL ROSE, "CLOTH OF GOLD," NOISSETTE.

T. RIVERS, JUN., has the pleasure of offering to his Friends a splendid YELLOW NOISSETTE ROSE, raised in the West of France from Noisette Lamarque. This fine Rose was purchased by T. R. jun., in the spring of 1842, on condition that he might give it an English name; he has therefore named it as above. T. R. visited France in July, 1842, to see it in bloom; he can therefore submit the following description as correct in every respect. Colour, brilliant yellow, of the same shade as Rosa Harrisonii; form, globular, like Noisette Lamarque, flowers of the same size; petals thick and leathery, not liable to fade in the sun; habit extremely robust, as much, or more so than Noisette Jaune Desprez. Owing to the plants being out in closely for propagation, it has not yet bloomed here, but is in bud, and will bloom shortly. T. R. offers it now, that purchasers may have the opportunity of budding a few plants. Price 21s. each, package included, carriage paid to London; as the stock is limited, no allowance can be made to the trade.

NOISSETTE SOLFATERRE, from the same parents, and of the same robust habit—colour, pale lemon yellow, 7s. 6d. each. Sawbridgeworth, Herts, August 17, 1843.

ARAUCHARIA IMBRICATA, or SIR JOSEPH BANKS'S PINE.

YOUELL & Co., possessing the most extensive stock in the country of the above Splendid Hardy Ornamental Tree, beg to offer them on the following advantageous terms:—Fine robust, 3 year-old plants, 8 to 9 inches high, 10l. per 100, or 30s. per dozen.—Great Yarmouth Nursery, August 17, 1843.

MAGNIFICENT NEW FUCHSIA, "FUCHSIA EXONIENSIS."

LUCOMBE, PINCE, & Co., beg leave to call the attention of the Public to a very superb New Fuchsia, which has been raised in the Exeter Nursery, and which is decidedly the finest variety ever produced. Flowers of it were submitted to Dr. LINDLEY, who, in the *Gardeners' Chronicle* of the 8th ult., thus expresses himself:—

"Lucombe, Pince, and Co.—The blooms sent of Fuchsia Exoniensis prove it to be a very splendid variety; it is a flower of great substance throughout, seed-vessels dark, tube and sepals of a rich crimson carmine; the sepals are long, they expand freely, and disclose the rich crimson-purple corolla, which is very large, and of a peculiar denseness of texture."

The Plant was also exhibited at the last great meeting of the London Horticultural Society on the 12th ult., and obtained the Society's Certificate of Merit.

Strong Plants will be ready for delivery on the 10th inst., at 10s. 6d. each, and will be sent, free of all other charge, by the post, carefully packed in stout tin cases. The usual discount to the trade if six plants are ordered. For a full description, see Advertisement in the *Gardeners' Chronicle* of the 17th June.

N.B.—This Seedling Fuchsia has been fully proved, and will give satisfaction to those who purchase it.

FIRST-RATE SEEDLING PANSY, "UNIQUE."

JOHN SCHOFIELD begs respectfully to inform the Public and his Friends that he has Plants in good condition, now ready, at 7s. 6d. each, of the above beautiful PANSY. He would also draw attention to the following opinion of the Editor of the *Gard. Chron.* and others, on the above; see p. 409, No. 25, *Gard. Chron.*, 1842:—"J. Schofield.—No. 10 is a first-rate Pansy; inside white and small, in consequence of the band of deep, rich, bluish purple, which surrounds the lower petals being very broad; the eye is held and rich, the upper petals are mulberry-purple, the flower is large, of fine form, good substance, without crumple." Also, see "Floricultural Cabinet," Notices to Correspondents, Editor's remarks, No. 124 of this year,—"Mr. Schofield's Pansy is a very excellent one, possessing every requisite of a first-rate show-flower." The above was also in the winning stands at the Leeds Horticultural and Floral Society's Show, viz., in 1st 24, 1st 12, and 1st 6 Seedlings. The above tests have stamped the above Pansy as one of the very best in cultivation. A Select List, now ready, may be had on prepaid application; also, a stock of Healthy Young Plants of most of the new FUCHSIAS, VERBENAS, &c. &c., on the lowest terms. Plants and Seed sent per post free of charge. The usual discount when six or more are taken. A remittance or reference required. A few packets of choice Pansy Seed selected from named Flowers, 2s. 6d. and 5s. per packet.

Knowstrop, near Leeds, Yorkshire, Aug. 15, 1843.

NEW PELARGONIUMS.

W. E. RENDLE respectfully informs Amateurs who are in want of a few good Pelargoniums to improve their collections, that he will supply a selection from the following sorts at FIVE POUNDS PER DOZEN:—Lyne's Lord Ebrington, Princess Royal, Cynthia, Hamlet, and Glory of the West; Rendle's Cornish Gem, Fanny, Aurora, Pride of Exe Vale, Circassian, Constellation, Count d'Orsay, Creole, Dido, Fair Maid of Devon, Grand Monarch, Lavinia, Oberon, Queen of the Fairies, Sapphire, Favourite, and Sir Robert Peel, with a Plant of

LYNE'S DUKE OF CORNWALL, or SUNRISE.

Catalogues of Pelargoniums can be obtained—Plants will be delivered in October next—Orders will be executed in strict precedence—Plants will be sent over to compensate for carriage—Reference or remittance required from unknown correspondents.—Union-road Nursery, Plymouth, August 15, 1843.

NEW PLANTS.—The following New and Beautiful

Chilban Plants will be sent out as soon as ready, Schizanthus candidus, Dr. Lindley, 7s. 6d. per plant. Loasa lucida, 7s. 6d.

The first is snow-white, somewhat fragrant, and quite distinct from all others; the latter is white, with scarlet centre surrounded by a yellow border, foliage large and glittering; both are hardy. They were exhibited at the Gardens of the Horticultural Society, Chiswick, in July.—JAMES CARTER, Seedsman and Florist, 239, High Holborn, London.

GROWTH OF PLANTS.—HUMPHREYS'S

INODOROUS SOLUBLE COMPOUND, to promote the Growth of Plants. Dissolved in water, this valuable Preparation may be used with great advantage, either in the Drawing-Room or in the Conservatory. A single bottle is equal in fertilising force to some hundred weight of rich Compost; and by its use, not only common plants are improved by increased brilliancy of flower and deeper verdure, but valuable Exotics are so strengthened as to resist the usual alternations of temperature, and may be preserved without a Greenhouse. Sold in bottles, 1s. 9d. each, with full instructions for use, by FLANAGAN & SON, Mansion House-street; HURST & M'MULLEN, Leadenhall street; Wm. CLARK, Bishopsgate-Within; and other leading Seedsman, &c. in town and country. Wholesale Agents, DAVY, MACK-MURDO, & Co., 110, Upper Thames-street, London.

MORTON'S "WALBURTON ADMIRABLE" PEACH.

This new and splendid variety was raised at Richard Prime's, Esq., Walburton House, Sussex, and has received the highest testimonials from Dr. Lindley, who had specimens sent him in 1841.

This Peach is a seedling from the Noblesse, but its great merit consists in its ripening fully five weeks later; it is a very free grower, the fruit of a full size, of excellent flavour and melting; altogether a very desirable variety, and one which no good garden ought to be without.

From the very limited supply of plants the orders will be executed in rotation at One Guinea per plant, early in the autumn. All orders for the above to be sent to ALEXANDER WYB, Nursery and Seedsman, Westergate Nursery, near Arundel, Sussex.

MYATT'S NEW SEEDLING STRAWBERRIES.

J. AND W. MYATT intend sending out, by the middle of August, their NEW STRAWBERRY, the DEPTFORD PINE, fruit of which has been exhibited at the London Horticultural Society, and a Banksian Medal awarded. It has also been submitted to Professor LINDLEY, for whose opinion see *Gardeners' Chronicle*, No. 26, p. 447. It is a most prolific bearer, exhibiting at the same time a profusion of fine fruit and bloom on the same truss. Price, Deptford Pine, 2l. 10s.; British Queen, 1l., and Eliza, 10s. per 100.—Manor Farm, Deptford, July 22, 1843.

SEEDS for IMMEDIATE SOWING.—The following

Seeds, which are proper for Autumn sowing may be had until September:—	s. d.	s. d.
Dwarf German Stocks, 12 varieties, 4 0—smaller packets 2 6		
Branching " 12 " 3 6		2 0
Wallflower-leaved " 12 " 3 6		2 0
Autumnal " 12 " 4 0		2 6
German Giant, or Brompton Stock, 5 varieties		2 0
English Ten-week " 6		1 6
Fine mixed German Stock		per packet 1 0
New Scarlet, or Intermediate, extra fine		0 6
Schizanthus retusus and Grahami		each 0 6
Ipomopsis elegans and picta		0 6
Salpiglossis, beautiful, mixed		per packet 1 0
Splendid mixed Cineraria, 20 varieties, (Greenhouse)		1 6
" Calceolaria		1 6
Chinese Primrose, mixed fringed		1 0
Finest mixed Petunia, 6 varieties		1 0
Ipomoea rubro-cerulea, warr., (Greenhouse Climber)		2 6
Lophospermum, 3 varieties, mixed		1 0
Maurandya, 4 " " " "		1 0
Thunbergia, 4 " " " "		1 0
Aquilegia, Delphinium, and Antirrhinum, finest mixed, each 0 6		
Hollyhock, finest mixed, 1s. per packet; 20 vars., separate, 3 6		
Pentstemon, 12 fine varieties, mixed		1 0
Polyanthus, finest mixed		1 0
Larkspur, Dwarf German, mixed		per ounce 1 6
30 fine Hardy Annuals, including the Californian		6 0
30 " " Perennials		6 0

The first ten require protection; the next eight (from Cineraria to Thunbergia, inclusive) are Greenhouse plants; the remainder are quite hardy. Any of the above will be forwarded free of all expense.—An extensive Catalogue of Dutch and Cape Bulbs is in preparation, and may be had, prepaid, on application to JAMES CARTER, Seedsman and Florist, 239, High Holborn, London.

Aug. 19, 1843.

SALE OF ORCHIDACEÆ.

MESSRS. J. C. & S. STEVENS beg to announce they have just received Notice of the arrival of Eight Boxes of ORCHIDACEÆ, from St. Marcos and high lands in Central America, which they will sell by Auction, at their Great Room, 38, King-street, Covent-garden, due notice of which will be shortly given. Catalogues will be immediately prepared and forwarded to Collectors.

38, King-street, Covent-garden, Aug. 18, 1843.

TO NOBLEMEN, GENTLEMEN, AND NURSERYMEN.—The Collection of rare and valuable EXOTIC PLANTS, the property of THOMAS HARRIS, Esq., of Kingsbury, Middlesex.

MESSRS. J. C. & S. STEVENS respectfully beg to announce, they are instructed by Mr. Harris (who is leaving Kingsbury for some years) to offer for unreserved Sale by Auction, on the premises, on WEDNESDAY, 30th August, and Two following Days, at 12 o'clock, the whole of his VALUABLE COLLECTION OF STOVE AND GREENHOUSE PLANTS, comprising numerous fine Specimens of rare Orchidaceæ, Cacti, Camellia, Azalea, Rhododendron, Orange and Lemon Trees, &c. &c. Catalogues of which are now preparing, and may be had one week prior to the Sale, of the Auctioneers, 38, King-street, Covent-garden. The Collection will be on view two days before the Sale. Kingsbury is situated about 6½ Miles from London, on the Edgware Road.

WINDSOR AND ETON ROYAL HORTICULTURAL SOCIETY.—The ANNUAL GRAND SHOW of this Society, for the Exhibition of DAHLIAS and other Flowers, Fruits, and Vegetables, will be held at WINDSOR, on TUESDAY, Sept. 12, 1843. Printed Particulars may be had on application to Mr. J. CLEAVE, Windsor.

THE HULL BOTANIC GARDEN.—GRAND ANNUAL FLORICULTURAL AND HORTICULTURAL EXHIBITION.—This great Floral Fête, on the most comprehensive scale, will be held in the Grounds of the Botanic Garden, on WEDNESDAY, the 6th of SEPTEMBER next. The Schedules of Prizes may be had Gratis, at the Gardens, on application to Mr. D. SMITH, the Curator. F. R. HORNER, President.

EXHIBITION OF LILUM LANCIFOLIUM. H. GROOM, Clapham Rise, near London, (removed from Walworth,) by appointment, Florist to Her Majesty, begs to inform the Nobility, Gentry, and the Public, that his Extensive Collection of this most beautiful LILY is in flower, and may be viewed every day from 9 o'clock until 6, Sundays excepted.—Admittance gratis.

NOTICE OF FUCHSIA SHOW.—All the lovers of that beautiful tribe of Plants the FUCHSIA, would be amply rewarded by a visit to PROVIDENCE NURSERY, Ramsgate, where there still may be seen in bloom nearly 200 large and splendid specimens of all the newest varieties.—WILLIAM MILLER, Providence Nursery, Ramsgate.

FUCHSIA ST. CLARE.—This magnificent Fuchsia was exhibited on the 1st inst., before the London Horticultural Society at their room, 21, Regent-street, and was awarded a Prize. YOUELL and Co. are now sending it out post free, with Eleven other finest Show varieties at 21s. the dozen; also the finest show varieties of Chrysanthemums, per post free, at 12s. per dozen. Great Yarmouth Nursery, Aug. 17, 1843.

MR. LYNE'S NEW SEEDLING PELARGONIUM. WILLIAM E. RENDLE has the pleasure of informing the Nobility, Gentry, Amateurs, and the Trade, that he has been successful in procuring the stock of Mr. Lyne's new Pelargoniums, and offers them at the following Prices:—

Lyne's Princess Alice . . .	3l. 3s.	Lyne's Modesty . . .	1l. 1s.
" Celestial . . .	2 2	" Rose-bud . . .	1 1
" Redworth . . .	2 2	" Duke of Cornwall . . .	1 1
" Apollo . . .	2 2	" Sunrise . . .	1 1
" Princeps . . .	1 10		

The above-mentioned sorts can be warranted as first-rate, and have won many Seedling Prizes this season, in London, Exeter, Plymouth, Torquay, Barnstaple, Truro, and Falmouth.

Orders will be executed in strict precedence. The first plants will be ready after the 6th of November.

Printed descriptions and engravings can be obtained at the Union Road Nursery, Plymouth, or of Mr. W. BRISTOW, Seedsman, Knightsbridge; or of Mr. GEORGE CHARLWOOD, Seedsman, Covent-garden; or of Messrs. HURST and M'MULLEN, Seedsman, Leadenhall-street, London.

Lyne's White Perfection, Imogene, Enchantress, Superb, and Sappho, cannot possibly be sent out this season.—Plymouth, August 15, 1843.

DUTCH HYACINTHS AND OTHER BULBS.

YOUELL & Co. beg respectfully to inform the readers of the *Gardeners' Chronicle*, that one of their Firm has just returned from Haarlem, having selected a most extensive Stock of the finest HYACINTHS, as well as a general assortment of BULBS, for which that city is so justly famed; and flatter themselves, from the facility of communication between Yarmouth and Haarlem, the distance not occupying more than 10 or 12 hours, and from the varieties being chosen for their great beauty and size of flowers during the blooming season, that the List will be found to contain none but the very best sorts, adapted either for glasses, forcing, or open border culture. Prices, as follows:

Fine Single or Double Show Hyacinths . . .	6s. per doz.
Red, Blue, White, or Yellow	
Extra fine Ditto . . .	9s. to 12s.
Extra fine, and very superior Ditto . . .	18s.

The selection being left to YOUELL & Co. Also, Narcissus, Early Single and Double Tulips, Jonquils, Gladiolus, Iris, Ixias, Ranunculus, Double and Single Anemones, Crocus, &c., Catalogues of which may be had on application. Bulbs added to compensate for long carriage.—Great Yarmouth Nursery, Aug. 17, 1843.

There is a vast deal of astronomical information contained in a most winning and unassuming manner in this delightful little volume, which, not less for the novelty of its plan than the extent of its intelligence, reflects infinite credit on the taste and talents of its projector and editor, Mr. Darley."—*Sun*.

TAYLOR and WALTON, Booksellers and Publishers to Universities.
 Colliere, 28, Upper Gower-street.

Now ready, price 4s. 6d.,
R U R A L C H E M I S T R Y.
 By EDWARD SOLLY, Esq., Jun. F.R.S.,
 Experimental Chemist to the Horticultural Society of London,
 Hon. Mem. of the Royal Agricultural Society, and Lecturer
 on Chemistry at the Royal Institution.
 London: 3, Charles-street, Covent Garden.

The Gardeners' Chronicle.

SATURDAY, AUGUST 19, 1843.

MEETINGS FOR THE TWO FOLLOWING WEEKS.
 Friday, September 1 . . . Botanical . . . 8 p.m.

COUNTRY SHOW.—August 26 . . . Yorkshire Philosophical.

WHEN the late Sir Alexander Burnes returned from his adventurous visit to Bokhara, he mentioned, as one of the more remarkable products of that country, its magnificent Melons,—large, juicy, and rich, beyond anything he had seen in the East. This fruit appears to have not less attracted attention among those who visited Cabul; and seeds have been sent home in abundance by officers employed in the Affghan expedition. These seeds are now bearing fruit, and delicious they prove: not hard-fleshed, with a thick rind, like Oak bark, forming their larger part, and almost as indigestible as that substance,—but noble fruits, thin-skinned, delicate, and almost wholly eatable. Such a one was produced at a late meeting of the Horticultural Society by Mr. Fleming, the Duke of Sutherland's gardener at Trentham; and we have since seen a specimen of the famous Sirdar kind, grown in the Isle of Wight, which weighed nearly nine pounds, and would not have been inaptly named (as some actually are, in the poetical language of the East) "a mountain of sugar."

Few things more plainly show the great progress that has been silently made in gardening, than the skill with which this delicate fruit has been thus readily brought to perfection in a most unfavourable summer. When Sir Joseph Banks first introduced these Persian Melons into notice, scarcely any one could find that they were better than Gourds; and for a long time the late lamented President of the Horticultural Society stood almost alone in his success in obtaining them of their native excellence. Now, however,—thanks to the admirable precepts of Mr. Knight, and to the general diffusion among gardeners of a knowledge of the principles, as well as practice, of gardening,—nobody seems to find any difficulty in the matter; and nothing would more surely mark a gardener as a bad one, than his clinging to his favourite old Rock Melons, in preference to the delicate varieties of Cabul and Candahar, *because he cannot grow the latter*. In our opinion, a Melon is an infinitely better fruit than a Pine-apple, provided it is like the Ispahan, the Hoosainee, or, above all, the Sirdar; it has the great merit of being much more easily grown, and we strongly recommend everybody who values his dessert, not only in future to procure seeds of the Melons of the East, or of those which have been raised from them, such as the Beechwood, but in future to expel the whole race of Cantaloupes and Rocks as entirely unworthy of a modern garden.

THE reason why the soil of old gardens is so fertile is, that there has been an accumulation of animal and vegetable matter, beyond what was necessary to raise the plants cultivated. The only inconvenience arising from this is, that the soil has too little cohesion for those plants which, like Wheat, require a firm bottom; and hence the produce of these is not in proportion to the richness of the garden mould: besides this, so many insects are bred in this superfluity of organic matter which is undergoing spontaneous decomposition, that many good gardeners, where there is a considerable extent of old garden ground, fallow a portion of it, adding lime or lime-rubbish, and raise green crops, such as Tares, or Lucern, which always grow luxuriantly in such soils. After a year or two, during which all the superfluous animal and vegetable matter is converted into humus, and becomes a constituent part of the soil, it is trenched deep and mixed with the soil below, which is free from insects, and tempers, as it were, the too great richness of the black mould. The vegetables which grow in this renewed soil, if they are not so large, are much more healthy, and have a fresher taste; and if Corn were sown, it would produce a much greater crop, and one less liable to be lodged, than in the richer mould. In a field there is never any danger of there being too much organic matter in the soil—but it may not be regularly diffused and incorporated. There may be a rich layer of manure just under the surface, as the plough has turned it in. The seed, being in contact with this, germinates rapidly, and the shoots spring up vigorously. The roots, finding plenty of food at hand, do not spread downwards, but horizontally. Suppose that there be a dry spring, so as to dry up the soil as far as the manure lies,—this becomes inactive, and, instead of nourishing the roots, dries them up. The whole plant

suffers, and its growth is stopped; and when the ear comes at last out of its sheath and begins to swell, the straw is too weak to bear it, the root has no hold of the ground, and the least wind lays the whole plant prostrate. If the same manure had been well mixed with the soil, and this stirred to a good depth, the fibres of the young roots would have struck downwards and taken a good hold of the ground. No frost could then raise the whole plant out of the ground, nor any length of dry weather parch all the roots. When the seed is forming, and the greatest quantity of nourishment is required, it will be gathered by a much greater extent of root, and nothing will check the formation and swelling of the seed, as is often the case in very dry weather, and where the roots have no depth of soil.

There is another circumstance which materially affects the weight of the crop: this is the distance between the plants. What would some farmers say, if we proposed to hoe out the Wheat plants to ten inches or more apart, as we do Turnips? and yet whoever has examined a crop of Wheat of seven or eight quarters per acre, will have seen that it consisted of tufts of ten or fifteen stems, each proceeding from one coronal root, and that such plants required nearly a square foot of ground to grow in. If they are crowded, the side stems are weak, and bear but small ears; but if they have sufficient room, all the stems are of equal height, and all the ears equally large: this, besides a heavy crop, produces an equal sample, which is more valuable in the market. The practice of dibbling the Wheat, which is found so useful in Norfolk and Suffolk, leaves proper intervals between the plants, which can be hoed; and depositing the seed at a proper depth insures the formation of roots beyond the influence of a hot and dry sun. The great fault of the dibblers is, that they put too many seeds in each dibble hole: if the seed is good, three or four grains, at most, are sufficient; of these, one or two only will take the lead and form the tuft, the others will be overpowered by the more vigorous. When land is well prepared, half a bushel of seed is an ample allowance for an acre, the rows being at nine inches from each other, and the dibble-holes at the same distance in the rows. This allows of perfect stirring and hoeing of the intervals, and the complete destruction of weeds. Whenever a simple and effective machine shall have been invented to make holes and deposit the seed with certainty and expedition; or a perfect drop drill, which will answer the same purpose, and the land shall have been carefully prepared to receive the seed, we may expect to see the average produce of Corn in Great Britain and Ireland so increased, as to supply a continually increasing population; while the mechanic will have his bread at a cheap rate, the farmers and the landlords will be prosperous from the more abundant return of their land. Let all wet lands be well drained, all loose soils clayed or marled, if possible; the first rendered light by repeated stirring and long fresh dung, the latter consolidated by pressure and enriched with well-decomposed animal and vegetable manure. Let the crops be varied as much as possible, alternating the culmiferous and leguminous plants, and always having abundant green crops and roots to feed cattle and sheep in winter, increasing and economising every kind of manure, and blending it intimately with the soil by deep stirring. Whatever may have been the original soil, it will, in time, become fertile; the only difference being, that the rich alluvial soils require much less tillage and manuring to keep up their fertility; but if they are overcropped and neglected, they will soon be deteriorated and produce less than much inferior soils, which are properly managed. With great care and industry good crops may be raised on very indifferent soils, but the additional labour and expense should be fully compensated by the difference of the price or rent. Few men are aware of the value of rich land, which is cultivated at little expense, compared to that of the poorer, until they reckon the expense at which the crops are raised in either; the difference is far greater than is usually made in valuations of rents. It may sometimes be advantageous to buy poor land, but it is seldom so to rent it; and our advice to all young farmers is, to seek for farms in the richest districts, and to exercise their skill and industry in keeping up fertility, rather than in producing it where it did not exist before, although the last is by far the more patriotic plan. Let this be done by rich proprietors, or by those who have accumulated a capital by the cultivation of the soil and have ample experience.—M.

VULGAR errors are, of all things, the most difficult to deal with, not because of any want of argument or evidence to refute them, but because the persons who entertain the errors are incapable of understanding argument or weighing evidence. Accordingly, we find people still maintaining that the Berberry blights their Corn, and that one kind of plant changes into another. We are reminded of this by a correspondent, who

writes thus:—"You will, perhaps, be astonished when I tell you that the majority of agriculturists in the eastern division of Kent assert, and most confidently too, that the plant they call Droke, (to botanists known as *Lolium arvense*), is produced—they do not,—perhaps, *entre nous*, they cannot, tell how and why—from Wheat; that is, to use their own expression, Wheat runs out into Droke. I conclude this would be better expressed by the word "degenerates" into Droke. I was told by a gentleman and his bailiff last week—and they are no mean judges in agricultural affairs—that twenty years' experience had convinced them of the truth of this matter, and that Droke and Wheat had been found both growing on the same root. I could not persuade them that they had sown the Droke with the Wheat, which seems to me self-evident, as this plant rarely appears in any other than a Wheat field. I could not refrain from remarking to the bailiff, that some morning I should hear of his honey Bees being changed into Wasps. Facts are stubborn things, but I often think vulgar prejudice (I do not use the term offensively) equally stubborn. My scanty knowledge of botany and fondness for natural history in general tells me that the All-wise Creator allows of no deviation in his harmonious laws of nature, and that however frequently we may find what is termed *lusus naturæ*, (or a sport of nature,) we do not find, either in the animal or vegetable worlds, that one body or plant, from any cause or effect, can be transformed into another. I therefore assert, Wheat can never turn into Droke, or Droke into Wheat. In the latter opinion my opponents agree."

This strange fancy is as "old as the hills." The ancients, says Linnæus, fancied that Corn *degenerated* by degrees in bad land; that Wheat changed into Rye, Rye into Barley, Barley into Rye-grass, Rye-grass into Brome grass, Brome-grass into Oats, and so on; and they even believed that Brome-grass and Barley might, on the other hand, improve into Rye. It was not so very unnatural that these fancies should be entertained, when people believed that Bees sprung spontaneously out of a dead bullock, or that the varied forms of creation are all the result of chance and accident; but it is astounding that any others than atheists should hold such doctrines now-a-days. They might as well believe that a man degenerates into a monkey, a monkey into a squirrel, a squirrel into a rabbit, a rabbit into a rat, a rat into a bat, a bat into a sparrow, and so on. Such absurdities hardly deserve refutation.

We would here ask these persons to watch the growth of an Acorn; to see how its shell is burst—how the young root grows downwards—how the seed-leaves (cotyledons) hold together—how the little branch comes up, and clothes itself with leaves, not of an Almond or a Fir-tree, but of the Oak; and to try whether, by starving or feeding it, he can persuade it to become anything else. And then, when he is satisfied about that, to consider whether, if he cannot change the nature of the Oak, he can alter that of Wheat or Droke. Should he still remain in doubt, we would refer him to Linnæus's ingenious essay on the Transmutation of Corn (*Transmutatio frumentorum*), written to put an end (as it did) to this sort of folly in Sweden. If he is still proof to all such arguments, we can only conclude him to be one of those "*qui fungum habent pro cerebro*."

SCUTELLARIA SPLENDENS; ITS INTEREST AND NEGLECT.

THIS showy species appears to be receiving far less attention at the hands of cultivators than its real merits deserve. Though less gorgeous than the *Salvia*, and much less capricious in its flowering than the *Leonotis* (Lion's-tail), it is, nevertheless, equally beautiful, and much more subservient to the limited convenience of small collections.

With the exception of the instance of its cultivation in the establishment from whence its published figure is derived, I have not met with any other where its intrinsic value appears to have been equally appreciated. This apparent neglect may probably be traced to its habit of growth, wherein it so much resembles many of our common half-hardy herbaceous plants, and offers one more instance wherein exists a striking disparity between the general habits and the splendid floral developments of mature growth in many of our fine autumnal plants. From this has arisen a partial, and in some instances a total, neglect of the means requisite for renovating their constitutional vigour; thus leaving their latent beauties to "blush unseen," except to the few who have discovered their appropriate treatment. The natural result of this has been, in many instances, an exposure of the plants to a temperature unequal to their required growth; in some cases consigned to the ungenial position of a north aspect, and in others wholly exposed to the open ground, where, in both instances, their stunted and collapsed appearance bore ample testimony to the chilling influences around them.

Scutellaria splendens is a half-shrubby plant, requiring, during its season of growth, a warm greenhouse, or one intermediate with the stove. Its period of flowering is from June to November, but well adapted, by being excited at different times, to bloom earlier or later, at the discretion of the grower, when subjected to a suitable temperature. To attain a maturity of growth it should

be regarded as an herbaceous perennial plant, requiring an annual accumulated excitement, consequently should be kept throughout the winter months in a partial state of rest, until March or April, when, after being again excited by a partial development of its buds, its previous season's growth should be partly cut back, to test its amount of vitality, and when this is proved by a vigorous flow of sap, it may then be disrooted and reshifted back to a pot commensurate in size to the vigour of the plant or to the ability of the cultivator in this department of his profession. When thus established in its first pot or shift the whole of its remaining stems of last season's growth should be removed. Its ultimate vigour and fertility will be proportionate to the accumulated development of its growth from the root or base of the stem. Paxton, in the "Magazine of Botany," speaks of its bloom being increased in ratio to its lateral shoots or branches; but thus treating it as a semi-shrubby plant, either by retaining a portion of its previously-matured growth, or by causing axillary or side-shoots, would result eventually in the production of inferior flower-stems, as the only legitimate substitute for the amplitude and splendour of perfected growth. The principle upon which the practice of obtaining the greatest number of axillary or side-shoots is founded, as the only legitimate mode of obtaining the greatest amount of bloom, is more strictly applicable to plants of a shrubby and branching habit than to those which incline to be perennial and herbaceous, or of luxuriant and spare development; the latter requiring, generally, an accumulated vigour at the root, to insure an ultimate bloom.

The present species, being rigid in its growth, and latent in the foliage of its buds, excepting under the most favourable circumstances, requires a tolerable bottom drainage, and the dried siftings of heath-mould, divested of its strong, fibrous portion, may be advantageously used as a substratum, or intermediate drainage, upon the pots. The most suitable compost is equal portions of yellow loam and dried leaf-mould, adding a sixth part of white sand. The application of heath-mould as a component part of the compost, should, in this, as in most others for plants of soft-wooded growth, be entirely regulated by its open and well-pulverised quality; without such a preparation, heath-mould is generally too retentive of moisture for those plants requiring a rapid circulation. By the foregoing management, *S. splendens* will amply repay the attention bestowed upon it by its terminal spikes of brilliant scarlet flowers, from nine to twelve inches in length, which, whether regarded for their long continuance in bloom or gracefulness of habit, will not fail to recommend it as one of the most elegant and interesting of our autumnal flowering house-plants.—*Surrejanus*.

AMATEUR'S GARDEN.—No. XXXIII.

SINCE I wrote my last week's article, I have seen two other scarlet Pelargoniums, which are very deserving of notice, viz., Pullen's Scarlet and Smith's Superb. The first is rather a shy flowerer, but is very large and of robust habit; and of Smith's Superb it is sufficient to say, it is an improvement upon the same person's Emperor, and therefore perhaps the finest variety in cultivation. The prevailing opinion that these scarlets are too strong for beds is an error, for if they are occasionally pegged down, the height of the plant will not exceed the length of the flower-stem, which is the case with many plants here, and which produce flowers as large as small Hydrangeas. For my own part, could I procure a sufficient stock of the large, I would never grow another plant of the dwarf kinds; and, at any rate, a great majority of them will be discarded by me this season.

Of the finer varieties of Pelargonium (a name awarded to them, by the way, more by courtesy than any superior merit), some very good ones for bedding out were noticed by Mr. Beaton last week; and the truth is, that so many of these kinds flower freely when planted out, that it would be more difficult to name those that are not adapted for bedding out, than those that are. Of the old dwarf kinds, there is a beautiful little variety called Moore's Victory, which makes an elegant bed; and there is also another of the same habit, with a light flower, but which I have not seen for a long time, and which we used to call Fair Ellen; and there are also many more old varieties in this way which I should much like to see again in cultivation for the flower-garden. From France we have some singular and free-flowering kinds—of these *Sidonia* is perhaps the finest, being of a rich velvety texture, and very delicately pencilled. *Diadematum*, and *Diadematum rubescens*, are also good kinds, as is, likewise, a very dark variety called *Mulatto*. *Jehu* is curious, and blooms profusely, and the *Jew* and *Jewess* make beautiful beds. *Oliver Twist* is an orange scarlet, of profuse habit, and *Queen Superb*, may be classed with it. *Gauntlet* is a distinct colour, which is only surpassed by *Rising Sun* and *Sun-rise*; these with *Priony Queen*, would make a lovely group. *Lady Carlisle*, *Emily*, *Firebrand*, *Florence*, *Sylph*, *Vulcan*, *Chef d'œuvre*, *Lady Murfay*, *Lady Denbigh*, *Alexandrina*, *Erectum*, *Matilda*, and *Fosteri Roseum*, are all distinct kinds, which make most excellent beds. The great advantage of bedding these kinds out is the prolongation of the Pelargonium season, as they are just beginning to bloom when the house plants are over. The treatment which these varieties require for turning out, is to store them, four or five plants, in a 48-sized pot through the winter, in poor soil; pot them off into 60s in February or the beginning of March, and take great care to keep them well stopped up to the middle of April, to make them dwarf and bushy, and likewise to prevent them blooming until they are well established after being

planted out. As a general rule, the ground should be rather poor than otherwise for Pelargoniums, and if it is of rather a gravelly nature, it will be all the better.

I am obliged to "Omega" for his hint relative to the pairing of Roses; but I was aware that strong-growing kinds would starve the weaker ones, if budded on the same branch, and it was for that reason that I recommended the weak-growing varieties to be placed in the most elevated positions on the branch, as the difference of elevation places the weak and strong-growing varieties almost on an equilibrium; at least, so I have found it. I am gratified to find that "Omega" is, from experiment, so convinced of the excellency of my plan, that he is about to bud a wall of the *Sempervirens*, 214 feet long, with *Bourbon* and *Noisette* Roses, and I hope next year to hear of his complete success.—*W. P. Ayres, Brooklands*.

RENDLE'S SYSTEM OF TANK-HEATING.

I FIND in reference to the *Chronicle*, that the new system of heating lately brought into notice by myself is attracting the attention of Horticulturists, and it is my firm opinion that as soon as it gets properly understood, it will be universally adopted wherever bottom-heat is required. At p. 501, Mr. Sherwood has written a long letter on the subject, and endeavours to throw cold water on my plan, by stating that "it can never be made available for Horticultural purposes to the extent that I anticipate, nor anything like it;" and his reason for so doing, is because he does not see how the atmosphere is to be heated, irrespective of the bottom-heat. This will be readily explained by the annexed drawing:—

The water enters the tank at A, and by means of plugs or valves (at the apertures B) can be made to circulate round the tank and pipes, or be made to pass through the tank or pipes separately. This is easily explained, and I trust, therefore, that Mr. S. will not be prejudiced against my plan, but will forthwith adopt the "tank system." He may be assured that he will be more than pleased with it in the time and trouble saved, and his employer will be still more pleased in the saving of expense that would be effected. The accompanying drawing represents the section and perspective view of the interior of a propagating-house, heated on the tank system:—

At p. 460 there is a letter from the Rev. J. Huysbe on the "Tank-system," which I should have answered before, but have been too busily engaged. Mr. H. seems, from the tenor of his letter, to claim for himself an improvement on my plan, and, to use his own words, states, that "the most material point in which I differ from Mr. Rendle is in the depth of the tanks; instead of being four inches in depth (as he advises, p. 15), mine are 18 ins. in depth." On referring to my treatise (p. 32), he will find the following advice:—"I would recommend the tank to be at least 12 ins. in depth, so as to contain a very large body of water, for the larger the body of water the larger the continuance of heat." What Mr. H. alludes to at p. 15 is the depth of the tank I erected for the purpose of experiment, and not advice to others. This, "the material point," is explained; the other differences, as to the thickness of the slate, or the exact position in which the boards ought to be placed, do not seem to call for observation, further than to state that I recommend the best articles to be used in the best possible manner. If a superior slate cannot be procured, an inferior quality must be used; but still it must be acknowledged that the firmer the quality of the slate the more capable it is of enduring the heat of the water.—*W. E. Rendle, F.H.S., Plymouth*.

SPRENGEL ON VEGETABLE MANURES.

(Continued from page 500.)

11. *Saw-dust*.—It is known that saw-dust is one of the worst litters, being almost entirely composed of woody fibre. Like the different kinds of straw, sawdust varies in value according to the sorts of timber which produce it. The value of sawdust depends—like all other litter, on its mineral contents and its nitrogen; the amount of the latter is not known; but I have analyzed certain kinds so

as to determine their mineral substances, as will be seen by the following Table:—

100,000 parts of red Beech contain of mineral substances:—	
19 parts of silica	
100 "	lime
24 "	magnesia
91 "	potash
9 "	soda
50 "	iron, manganese, and alumina
26 "	sulphuric acid
25 "	phosphoric acid
6 "	chlorine

350 parts of mineral substances.	
100,000 parts of Oak sawdust contain of mineral substances:—	
56 parts of silica	
36 "	lime
3 "	magnesia
66 "	potash
14 "	soda
17 "	iron, manganese, and alumina
7 "	sulphuric acid
4 "	phosphoric acid
5 "	chlorine

208 parts of mineral Carlin.	
Oak sawdust contains much tannin.	
100,000 parts of Fir sawdust contain of mineral substances:—	
13 parts of silica	
130 "	lime
15 "	magnesia
13 "	potash
12 "	soda
53 "	iron, manganese, and alumina
3 "	sulphuric acid
7 "	phosphoric acid
4 "	chlorine

0,250 parts of mineral substances.	
100,000 parts of Scotch Pine (?) (<i>Kiefern</i>) contain of mineral substances:—	
18 parts of silica	
140 "	lime (carbonate of)
31 "	magnesia (carbonate of)
6 "	potash
7 "	soda
48 "	iron, manganese, and alumina
7 "	sulphuric acid
8 "	phosphoric acid
8 "	chlorine

0,270 parts of mineral substances.	
100,000 parts of Elm sawdust contain of mineral substances:—	
14 parts of silica	
569 "	lime
36 "	magnesia
791 "	potash
370 "	soda
47 "	iron, manganese, and alumina
9 "	sulphuric acid
41 "	phosphoric acid
5 "	chlorine

1,882 parts of mineral substances.	
100,000 parts of Ash sawdust contain of mineral substances:—	
18 parts of silica	
127 "	lime
32 "	magnesia
121 "	potash
189 "	soda
29 "	iron, manganese, and alumina
17 "	sulphuric acid
8 "	phosphoric acid
11 "	chlorine

552 parts of mineral substances. From these facts, it results that if even 5000lbs of sawdust (mixed with excrements) be applied to a Magdeburg acre, the soil will not derive from it more, on an average, than 20lbs. of mineral matter, which is not enough to produce any great effect. Manuring with sawdust can only be beneficial by supplying humic acid; but as the decomposition of sawdust is very slow, art must be brought in aid of that process. It should therefore be left (mixed with excrements) till it is thoroughly rotten, or be, previous to being used as litter, thrown into large heaps, till it is entirely decomposed; this will be accelerated by its being occasionally wetted with liquid manure and stirred up.

It is probable that the sawdust of Oak, Beech, Ash, and Elm, will contain somewhat more nitrogen than that of Pines and Fir, on which account the former is preferable; but in either case its amount is insignificant, and not equal even to that of Rye-straw. Yet, bad as sawdust may be as litter, it is preferable to the refuse of Flax and Hemp, for the latter not only contain less mineral matter, but are altogether destitute of nitrogen.

(To be continued.)

HOME CORRESPONDENCE.

Decay in Larches.—At p. 542, I observed some remarks upon the rot incident to Larches, in the red or heart wood of the tree, and which you attribute to too much moisture in the soil upon which the Larch is grown, while the experience of a correspondent leads to a contrary

opinion, viz., that Larches are most liable to this disease when grown upon a sandy soil. I believe that I am the first person who observed the decay of the red wood in the Larch-tree, now more than thirty years ago; having planted many thousand Larches on the estate of Closeburn, in the county of Dumfries, upon a sandy soil, with a subsoil of gravel or red sandstone, and also upon a slaty rock. I have found a great proportion of the Larch-trees upon the sandy soil begin to decay at the root in the course of ten or twelve years; and at the age of thirty or forty years the decay is found to extend three or four feet up the stem of the tree. The Larch-tree, planted upon the sides of hills composed of Greywacke, or slaty rock, so common in the south of Scotland, I have always found to succeed best, and not at all liable to the disease which affects it when grown upon a sandy soil, which I consider too dry for the healthy state of this tree. The opinion I entertained, that a sandy soil was not congenial to the Larch, was completely confirmed by observations which I made in a tour through Switzerland (the country from which the Larch-tree was imported into Great Britain) about twenty-five years since. In the valleys of Switzerland not a Larch-tree is to be seen; the Spruce Fir is the prevailing tree upon the limestone or sandstone, which are the common subsoils in the lower parts of that country; and it was not until I came to the Slaty mountains that I observed the Larch-tree growing upon the sides of the hills. The Larch is not found to thrive well when grown upon limestone or chalky soils. In a plantation, near Ferrybridge, in Yorkshire, upon a magnesian subsoil, I found the Larch-tree liable to a similar disease in the heart wood of the tree: in this soil the Oak also suffers from premature decay. From my own experience, I should say that Larch-trees, when grown upon sandy soils, should be cut down by the time they have arrived at forty years of age; and though the Larch is found not to arrive to a great age in a healthy thriving state, yet I consider it a profitable tree to plant in a sandy soil, as it becomes useful when 12 or 14 years old for many agricultural purposes, such as the division of fields by a temporary paling, and hurdles for feeding sheep upon turnips; and if allowed to stand till forty years old, it becomes very good timber for roofing and flooring farm-houses, for boat-building, &c. It is known to be a very durable wood for all purposes in which it may be employed, containing much more heart wood than any other Fir grown in this country. I have found the Scotch Fir, at a considerable age, in a much more thriving state in a sandy soil than the Larch-tree, but much worse upon a slaty subsoil; it is much less compact and hard when grown upon a slaty than upon a sandy soil. The wood of the Scotch Fir is made much more durable by soaking it in lime-water, when cut up for boards or the roofing of houses. This I can attest by having employed this plan for more than forty years, and I find the wood of roofs erected with Scotch Fir treated in this way at that period, to be perfectly sound; whereas roofs which had not been subjected to this process, require to be renewed in little more than thirty years. The effect produced by submitting Scotch Fir to a soaking in lime-water, is to destroy the eggs of the worms which destroy the white or sap wood of Scotch Fir by feeding upon the saccharine matter contained in it. This the lime-water is found to neutralize or absorb, and it thus renders our home-grown Fir a valuable substitute for the more expensive Baltic timber.

—C. G. Stuart Monteath.

Rot in Larch.—Seeing in your Paper some remarks on the Larch, where the opinion seemed to incline to the belief that a wet subsoil was the cause of this tree rotting in the heart, I beg to state what I know of the tree in this quarter. 1st. When planted on very dry and very sandy land, it begins to rot after fifteen or twenty years, and to the extent of one half or more of the number. 2nd. When on the sides of steep hills, although wet at some seasons, we rarely find any of them rotten—say one in a hundred. 3d. When growing on low situations, by the sides of rivulets, a rotten one is rare indeed. But if there be any stagnant water it kills them in the course of a very few years. 4th. If we wish the trees to become timber, then we give them as much room as we would give to any hard-wood tree; we allow the branches to luxuriate on every side, just as they please. 5th. If they are wanted for poles, &c., then we plant thickly, never taking out any but those that are killed by their neighbours overtopping them.—Doolly, Stonehaven.

Diseases of Tares.—The crops of Tares in this neighbourhood have suffered much from the united attacks of an insect and a fungus, the latter probably the consequence of a weak and depraved state of the plant induced by the former. You will observe in the specimens which accompany this note, that the development of the shoots has been suddenly arrested, their extremities presenting a mass of abortive flowers and deformed leaves. The petioles of the leaves at the lower part of the mass are thickened and incurved, and in their axillæ you will find a few white grubs, probably belonging to some *Curculio*. On this, however, I am not competent to give an opinion. In most cases, after a time, these masses wither, and are invested with *Botrytis vulgaris*; sometimes, however, one or more shoots are developed, which flower, and are again liable to be attacked, and even if this be not the case, the produce is not only injured by the destruction of the first crop of terminal flowers; but in case the others proceed towards maturity, the pods in the upper part of the plant are immature, while those below are ready for the scythe, which is at least an inconvenience. This is not, however, the whole of the injury, for the portions of the plant below the parts attacked by the grub, not excepting even the pods, are invested with a little red fungus, which is evidently very injurious. I have not at present found speci-

mens of the parasite in a perfect state, so as to enable me to ascertain the species. It is, I believe, a form either of *Ascochyta Viciae* or *Pisi*, of Madam Libert, the latter of which—pointed out to me, many years ago, by Captain Carmichael—in damp seasons destroys many a crop of Peas but without the inspection of the reproductive bodies, it is impossible to ascertain this. The parenchyma beneath the red spots, is gorged with a gummy substance, of a beautiful red or lilac, in which all trace of chlorophyll is lost. The hairs with the coloured bases afford sometimes a pretty object under the microscope. The main strength of vegetation is evidently diverted in great measure from the seeds towards the coloured spots, and I have little doubt that the produce will be very much diminished in consequence, and probably few of the grains will be well developed. It is not unfrequent for parasitic fungi to be imperfectly developed. The red fungus, which is often so conspicuous on the leaves of the Sloe, is abundant in America, but, I believe, never perfect; and this is by no means a solitary instance, and is analogous to the fact, that in certain countries many species of Mosses and Lichens never fructify. I do not find any special mention of the disease either in Wiegman's or Meyen's Work* on the diseases of plants.—*M. J. Berkley.*

Disease in Pansies.—Our Pansies here are dying with almost incalculable rapidity. The disease is by no means uncommon, but having never met with any person who could satisfactorily assign a reason, I purpose to lay the case before your practical readers, in order that they may assist me in finding out the cause. If a reason for their decay cannot be assigned, perhaps some one may be able to name a preventive,—as a remedy is out of the question, because the first symptom of disarrangement is the sudden drooping of the leaves and young shoots, as if from want of moisture. Some of them have completely failed in wet weather, when we daily experienced falls of rain, averaging $\frac{1}{4}$ of an inch for a whole week, so that it is evident it does not proceed from drought. The first appearance of it this season was observable during the dry tract of weather, which preceded the wet months of May and June; at that period weak plants appeared to be the first to suffer, but now weak and strong are alike subject to these ravages. The plants, when examined after death, generally present a mass of dead roots, partly decomposed; but on examination, we find that those parts of the stem below ground are the first attacked. Sometimes (but seldom) the infection attacks the stem immediately above ground, and the happy consequences are, that a fresh supply of young shoots fills up the vacancy; we have only to regret the rare occurrence of the latter circumstance. Our plants have been procured from Cambridge, Edmonton, and elsewhere; some of them propagated hundreds of miles from these places, but all are alike susceptible of the disease. The whole of our plants are already half dead, and only those plants which have been stationary for two years are healthy; that is, the disease is wholly confined to those plants which have been kept in small pots through the winter, and planted out in spring. In all our investigations we can observe no insect, unless in one solitary instance, which turned out to be a small maggot—but was this the cause or effect? It may further be necessary to mention, that we have plants in two separate parts of the ground, growing in different soils, but the disease is alike in both places; when there are two of a sort, if one dies, the other immediately follows. Thus, two plants of Countess of Orkney both died together; of three plants of Major's Bridegroom, two are dead, and the third is sickly; two plants of Ultra Flora Superb, growing at least four yards apart, died during the last fortnight.—*R. L.*

Tropæolum canariense.—In the new long garden-walk in Kensington Gardens the zeal and ingenuity of Mr. George Davidson, one of the gardeners, have prompted him to train five plants of *Tropæolum canariense* or peregrinum upon dead skeleton trees, about seven feet high, the foliage and bloom being equally disposed and distributed in a graceful shape, by twine attached from the extremities of the boughs, the whole being just now literally covered with a profusion of beautiful yellow trusses, emanating from the refreshing pale green of the foliage, doubly agreeable in the autumn, when the leaves of the shrubs and trees assume so dark a hue, as by contrast to display the vivid tints of this valuable creeper to the greatest advantage, reminding the beholder of the Laburnums with which we part with such reluctance in spring, and for which we have now presented to us a very cheap and efficient substitute—six pennyworth of seed being enough to procure 100 artificial trees, covered with flowers of incessant renewal throughout the entire months of July, August, and September. Two plants to each skeleton tree will ensure a most profuse mass of bloom, and the stems at the bottom being trained behind the tree, will diminish the artificial appearance of the treatment of the plant. As the seed ripens freely in the open air, this plan, once commenced, may be annually continued by the poorest cottager free of all expense. The seed also makes an excellent pickle, and I have met one gardener who daily improves his bread and butter at tea-time by the young leaves, which have a very agreeable flavour. Profuse watering has stimulated the plants, which literally surround the lodge of Mr. Sapp, the keeper of the Kensington Gore Gate, Hyde Park.—
James Mangles.

Prizes for Seedling Pelargoniums.—I feel obliged to "One of the Judges" for his courteous reply to the observations I made at page 542 of the *Chronicle*, and for his explanation of the principles upon which the certificate of merit was awarded to the Pelargonium named *Psyche*.

* Die Krankheiten der Pflanzen. Von Dr. A. F. Wiegman
Braunschweig, 1839.
Pflanzen-Pathologie, von F. I. F. Meyen, Berlin, 1841.

That Seedling Pelargonium excite much interest, is proved by the crowded state of the tent in which they are exhibited at Chiswick, and it is for the Horticultural Society to determine whether the public taste shall be gratified by encouraging the exhibition of them. But if they are to be ranked below the common out-door fruits of the season, or if it be necessary to exhibit the same seedling two successive years before a medal can be awarded to it, few gentlemen will, I think, take the trouble of sending their seedlings for competition. To your correspondent "F.H.S. of more than 25 years' standing," I will now offer two or three observations. In the first place, I did not impugn the decision of the judges in the fruit department; they could not be responsible for the awards to flowers. In the next place, my remarks amounted to this: if there be as much merit in raising a good Seedling Pelargonium as in producing a dish of good Cherries, is there not an apparent inconsistency if the Horticultural Society should reward them with different prizes? With regard to the degree of skill required to produce good Cherries, I will observe his admission, that there "is as much skill required" in the production of one as the other, is quite sufficient for my argument. Should, however, his life be spared to the Society another year, and should he cast his eye into the fruiterers' shops in the month of July, he will see such an abundance of fine Cherries, as may make him doubt the correctness of the opinion which the experience of an F.H.S. of more than a quarter of a century has led him to adopt, that the skill necessary for the production of that excellent fruit is such as to require the Horticultural Society to encourage it by giving two silver Knightian and two Banksian medals.—*F.H.S.*—[Now that each party has made its statement, we may be allowed to remark, 1st That the Society *does not offer medals* for Cherries, and that such as have been awarded have been conferred by the judges, by virtue of that authority which enables them "to confer *additional* silver medals *if they think it necessary to do so.*" 2d. That silver Knightian and Banksian medals are *specifically* offered for seedling florists' flowers; and, therefore, if the judges do not award them, it is by virtue of that other authority, which enables them "to diminish the number and value of medals," *if they think it necessary to do so.* It will be obvious to "F.H.S." that the Society has done all that he desires, and that blame, if there is any, lies with the judges. All that the Society can do is to offer prizes; it is impossible for them to control the judges in their decisions. It has been alleged, indeed, that they have done so; but that statement was destitute of the smallest foundation.]

Vines.—In a leading article, at p. 443, you have advanced a doctrine which seems to startle many Grapegrowers, and to many it will be impracticable on account of having Pines growing beneath the Vines. For my part, I think your doctrine is wrong, and my reason for thinking so is this. In the xvth chap. of John, ver. 2, we find, "Every branch in me that beareth not fruit, he taketh away; and every branch that beareth fruit, he purgeth it, that it may bring forth more fruit." This is my system, which I have acted upon for many years; my Grapes are good, and the fruit is full-sized. I take away all barren shoots, and I purge all fruitful branches; that is, I remove all laterals, and stop the shoot at the eye next the fruit, or one above it. Now if the Saviour cultivates his church upon this principle, I don't think we can follow a better example in the cultivation of the Vine, whatever philosophers may say to the contrary.—*A Subscriber.*

Vines.—I have planted my Vinery four years, and have since had three full crops of Grapes. The first year, the plants were turned out of 48-sized pots, in February, and made rods of strong, good wood, 20 feet long. The second year 200 large bunches ripened, and I cut off 150. The third year there was a greater crop. This year there is a still larger quantity, and excellent wood for the next year. I am persuaded this success may always be expected with proper management and a proper situation.—*Verax.* [Will you state your management, for the benefit of those who are less successful?]

Pines.—I have just taken up a quantity of *Pines* from a bark pit and planted them in a bed of virgin soil, with a bottom-heat obtained from a flue (not water). They were in a wretched state when in the bark, but they are now looking well and growing fast. They are planted in the soil, and I expect to have full-grown *Pines* with much less expense and trouble than by the old method, than which I can conceive nothing worse or more unscientific. —*Verax*.

Mulberries.—I am no great gardener, but I will tell you something about a Mulberry plant. I got a top shoot from a Mulberry-tree carried through the bottom hole of a garden-pot, and filled the pot with mould, leaving the shoot a few inches above the surface. This was cut off when it had struck in the pot. It was put in the vinery, and next year bore two fruit :—what became of it afterwards I don't know. Mr. Knight, of Downton, once told me that by striking cuttings or taking plants from the upper instead of the lower branches of the Mulberry, the period of fruiting was hastened seven or eight years.—*Seward.* [We are aware of this practice, which is a very good one.]

The Shaddock.—In the vicinity of Ingleton, Yorkshire, a beautiful specimen of the *Citrus decumana*, or Shaddock, has this year borne flowers. It is only three years since it was raised from seed; it does not usually bloom even in the genial climate of Italy, before the seventh or eighth year. The above-named plant was raised in a sitting-room.—*Facile.*

Treatment of Strawberry Plants for Forcing.—Mr. Murdock's paper, at p. 542, on preparing Strawberries for forcing, is good, and many excellent crops I have seen

grown on the system recommended by him,—but I consider the following to be an improvement on that method. I proceed as follows:—any convenient time from the last week in July to the middle of August, (but the earlier the better,) I take 60-sized pots, and having filled them with good loam and a third well-decomposed manure, I place them along the rows of Strawberries, and lay one of the finest runners in each pot (taking care not to break the wire). I let them remain in that situation for six weeks, and should the weather prove dry, they are carefully watered. I then remove them to a shady situation, and about the beginning of October I shift them into 32s, singly; as I find one plant, thus treated, to produce more and much finer fruit than three, with a certainty that none of them will go blind: and such plants will be found stronger and in a better bearing condition than those of two or three years' standing. The advantages of this system are, in the first place, that the plants make the best roots, and being supported by their parents until they can shift for themselves, or rather until they are shifted by the gardener, who, with Mr. Murdock, I recommend to be gentle in forcing until the fruit is fairly set. Nothing, in my opinion, repays the gardener better for his trouble, or affords greater satisfaction to his employer, than a good dish of Strawberries, from the 1st of February until the 1st of September.—*C. W. T.*

Apples.—In the last Saturday in July, at Preston market, Apples were sold by Mr. H. Hornby, of Catforth-within-Woodplumpton, some of the past and some of the present year's growth. The Apples of 1842 were remarkably fresh and sound, and fetched 2d. per pound.—*Facile.*

New Peas.—A neighbour of mine has grown Cormack's Prince Albert Pea, (sold last spring at 5s. per quart) side by side with the Early May, and he believes them to be the same variety. At any rate, the reputed new sort is not a single day earlier than the old one, nor better in any respect. I have myself proved that the Early May comes into use nearly a week sooner than Farnes's First Early, which also was advertised as a new sort, or at all events with a new name.—*J. B. Whiting.*

Large Mushrooms.—Two prodigious Mushrooms were gathered on the 1st of August last; one in a field near Fort Green Cottage, Garstang, the residence of Mr. Saul, which measured 42 inches in circumference, and had a stem 6 inches long and 2 inches in diameter, the height of the whole being 9 inches. This immense Mushroom must have grown within 24 hours, as I had looked over the ground the previous evening, when there was no such thing to be found. The above was perfect in colour and well formed in all its parts. The other was gathered in Witinton Hall Park, near Kirby Lonsdale, the residence of T. Green, Esq., and measured 23½ inches in circumference; it was well formed, and in a state of growth when gathered.—*Facile.*

Extraordinary Discovery of preserving Vegetables for an unlimited Period.—Our energies and exertions of late years have been directed to the improvement in the growth of fruits and vegetables; but we have never yet been able to discover how to grow them at every season of the year; but, thanks to the talent and research of a French gentleman, we are enabled, by a singular process, to enjoy not only fruits and vegetables, but poultry, game, meat, and even milk, at all times, and all seasons. We would strongly recommend the curious in such matters to pay a visit to the manufactory, 137, Houndsditch, where we have seen the whole process, and where we were treated with the utmost politeness and attention.—*J. R. B.*

Ward's Cases.—I am truly glad to see the Horticultural Society of London have taken Ward's Cases under their fostering protection, as I am convinced they will come more and more into general use, the better their capabilities are developed. The best guide to find out what may be done by them is to know what has already been done, and I am, therefore, induced to send you some account of mine; reserving a more particular description to some future time. I have, at present, in bud and in blossom, *Cattleya Forbesii*, *C. Loddigesii*, *Gloxinia maxima alba*, *G. speciosa* two plants, *Achimenes coccinea*, *A. longiflora*, *Thunbergia alata*, and the white and pink double *Oleanders* (growing freely, but from improper season or being too small, not flowering), *Cattleya crispata*, *Cypripedium insigne*, *Dendrobium cucullatum*, *Leptotes bicolor*, *Brassia lanceana*, *Oncidium flexuosum*, *O. papilio*, *Maxillaria stapelioides*, *Stanhopea grandiflora*, *Coelogyne fimbriata*, *Oncidium viperinum*, *Dendrobium speciosum*, *D. cupreum*, *D. fimbriatum*, *D. pulchellum*, *Maxillaria Harrisoniae*, *Crinum longifolium*, *Gloxinia rubra*, *Gesneria elongata*, *Lælia anceps*, *Stephanotis floribunda*, *Hoya carnosa*, and *Gossypium herbaceum* (alive, but making no progress), *Cypripedium venustum*, *Æceoclades maculata* and a (supposed) *Galeandra*; the latter has never started since its arrival from Rio, last autumn. So congenial does the atmosphere appear to be, that *Brassia*, which, when I received it last winter, consisted of one pseudo bulb, with one arrested shoot upon it, has now not only pushed two other shoots, but vegetation is proceeding in the heart of the arrested shoot, a most unusual occurrence. I believe *Dendrobium speciosum* consisted only of two very shrivelled bulbs, without root, and appearing quite rotten about the rhizoma; it has pushed a very healthy shoot, and is rooting freely. *Cattleya Loddigesii*, *C. crispata*, *Oncidium papilio*, and *O. viperinum*, though small plants, have each two growing shoots; and *Leptotes bicolor*, which arrived with the *Galeandra*, and consisted of five bulbs, has pushed in no fewer than nine points, and is rooting in proportion. *Hymenophyllum Tunbridgensis* (I think, for it is too small as yet for me to be quite certain) has come up spontaneously in some of the Devonshire peat, in which *C. Loddigesii* was potted. *Gloxinia* leaves

take root in three weeks, and form tubers as large as a full-sized Pea in six. *Portulaca Thellusonii*, and *Petunia magna rosea* rooted in a fortnight. You will see by the above list that my box is none of the little elegant drawing-room ornaments, in which a few plants are kept alive, looking like crows in a mist; it stands six feet high, is four feet broad, and two feet wide, has a door at one end, two shelves inside, and as many hooks at top as possible for suspending logs of wood. During the coldest nightlast winter, when the thermometer was at 6° F. in the fields, the thermometer in the box fell to 38° F.; during the summer it has never been below 65°, and two hours' sunshine raises it to 90°. The window in which it stands looks S.S.W. In conclusion, I would recommend boxes to be made two feet and a half wide, with a door at each end, large enough to admit the whole person freely; and if it is wished to grow *Dendrobium* well it should be not less than eight or nine feet high. There is in mine a difference of from three to eight degrees between the thermometer at the top and that at the bottom of the box; but the lower situation answers quite well for *Cattleyas*, *Lælias*, &c. *Allosorus crispus* is growing very luxuriantly.—*H. B. Harris, M.D., Dumfries.*

Cuckoo.—I see in your last Paper that a correspondent appears to think it very difficult to keep a Cuckoo through a winter. I should think warmth was very important to their well-doing. The only bird I ever heard of surviving a winter was one kept in a laundry in a country-house, and I believe that Cuckoo lived two winters; and in the spring, when the family went to London, the bird went too.—*Rural Chemistry.*

Rats.—A drain runs down the centre of my garden, and discharges itself into the sea; and I am surrounded on the one hand by a malt-house, and on the other by a slaughter-house, both affording shelter and food to these destructive vermin; the consequence is that my garden is completely honeycombed, and looking as much like a rabbit-warren as a garden; and to make matters worse, I find to-day that the continual excavations have at last stopped the drain, so that the water now runs about the beds of the garden instead of following its natural channel. What can I do to rid myself of these pests? Poison has been tried, but without any diminution of numbers, as a fresh colony takes possession immediately the former one is destroyed.—*Devoniensis.* [We must refer this case to some clever correspondent; for we cannot suggest a remedy,—unless chlorine gas or sulphuretted hydrogen can be driven into the galleries.]

Fecundity of Bees.—A hive of Bees belonging to Mr. T. Dobson, of Great Plumpton, near Preston, swarmed on the 12th and on the 26th of June, and again on the 1st of July. The young progeny of the 12th of June put forth a large swarm on the 4th of July.—*Facile.*

Refuse of Paper-making.—A paper-maker wishes to be informed of the best manner of disposing of the refuse of the materials used in bleaching his rags. These are salt, sulphuric acid, and manganese. After the distillation of the chlorine gas from these substances, it is supposed that the residue consists of sulphate of soda and oxide or sulphate of manganese,—in what proportions may this saline matter be used, diluted with water, for pasture land, or for arable or growing crops? and would it fix the ammonia in dung, and be more serviceable in that way as a manure for arable land? or, in other words, would it be best to use it as a direct stimulant to vegetation, or as a chemical agent to assist in the decomposition of other materials before it is brought into use? The Paper-maker who asks these questions knows it to be the practice of most of his brethren to empty their retorts into the stream, and he has a strong misgiving that they throw away a very useful manure. Strewed on pavements and paths, the above-mentioned refuse kills the weeds for the entire summer.

PROCEEDINGS OF SOCIETIES.

HORTICULTURAL SOCIETY.

Aug. 15.—R. H. Solly, Esq., in the chair. Sir H. Willoughby, Bart., the Hon. G. F. Hamilton, Gen. Caulfield, Jas. Ackers, Esq., M.P., John Broadhurst, Esq., P. Rolt, Esq., and R. J. T. Tompson, Esq., were elected Fellows. It was announced that the seeds lately brought over by Mr. Hartweg might be obtained by Fellows, upon application being made to the Secretary. Mr. Dean, gr to J. Bateman, Esq., exhibited a collection of handsome Orchidaceous flowers, comprising a superb variety of *Oncidium Lanceanum*; the richly-coloured *Vanda Roxburghii*; a fine spike of *Cycnoches Egertonianum*, which attracted great attention from its having been produced by the selfsame pseudo-bulb which last year bore a spike of *C. ventricosum*; the latter having large pale green flowers, while those of the former are small, and of a dark purplish brown; the same plant this year produced only blooms of *C. Egertonianum*. Cut flowers of *Phaius albus*, and a small species of a *Camarotis*, were also exhibited by Mr. Dean, who received a Banksian Medal for *Oncidium Lanceanum* and *Vanda Roxburghii*. From Mr. Errington, gr to Sir P. G. Egerton, were most beautiful cut specimens of *Cattleya crispata* and *intermedia*, for which, particularly the former, a Certificate was awarded: from the same person were leaves of *Rhododendron ferrugineum*, the undersides of which were covered with galls similar to the Oak-apple, a disease not at all uncommon upon this species, and produced by the puncture of some insect. Mr. J. Robertson, gr to Mrs. Lawrence, brought exceedingly well-grown plants of *Erica Hendersonii*; the curious *Brassia brachiata*; *Peristertia Barkeri*, with a long drooping scape of rich yellow flowers; and *Galeandra Baueri*; both the latter having been received from Oaxaca three months since, at which time the scape of the *Peristertia* was 9 inches long and quite blanched, but by being placed for a time in the shade it arrived at perfection: a Banksian Medal was awarded for the *Brassia* and *Galeandra*. From Mr. Groom, of Clapham Rise, were several exceedingly vigorous plants of the highly beautiful *Lilium lancifolium punctatum*. Mr. Standish, of Bagshot, exhibited four seedling *Fuchsias*, which he stated to have been obtained in the following manner: Having raised in 1842, from *F. formosa elegans*, fertilized with the pollen of *F. corymbiflora*, some pretty seedlings, these again seeded freely without assistance, and gave rise to the present plants, which showed that this tribe, instead of degenerating like *Calceolarias*, and many florists' flowers, if not crossed, improved considerably: the seedlings were named *Attractor* and *Colossus*, which resemble each other in colour, but differ in size and character, having smooth waxy crimson carmine tubes and sepals, with long, large, and

stout corollas, of a purple crimson colour; *President*, with rose-coloured tube and sepals, has a large and stout rich-coloured corolla, with but little blue in it; and *Candidate* has a carmine tube and sepals, with a stout and long corolla of a deep-bluish carmine; the flowers are large, the two latter long, and large also, and the habit of all promises to be good. From Messrs. Lucombe and Pince were blooms of their beautiful *Fuchsia Exoniensis*. From Mr. Epps, of Tunbridge Wells, was a plant of his seedling *Fuchsia*, called *Monarch*, bearing the greatest resemblance in form and habit to the old *globosa* major. Mr. R. Cooper, of Croydon, exhibited a white variety of *Mesembryanthemum tricolor*, the blooms of which would not expand in the shade of the room. Mr. Cuthill, of Camberwell, brought four very fine plants of *Lisianthus Russellianus*, grown in hard earthenware pots; and a specimen of the *Beechwood Melon*. From Mr. Mountjoy, of Ealing, were cut flowers of a new beautiful vermilion and yellow *Gladiolus*, called the *Glory of Ghent*, and apparently raised between *G. cardinalis*, crossed with *psittacinus*; *Gloxinia carnea*, and a sample of "Improved" Taylor's Windsor Beans: a certificate was awarded for the *Gladiolus*. Six well-sweelled Queen Pine-apples, weighing respectively, 3 lbs. 4 oz., 3 lbs. 6 oz., 3 lbs. 7 oz., 3 lbs. 11 oz., 4 lbs., and 4 lbs. 5 oz., were sent by Mr. M. Henderson, gr to Sir G. Beaumont; they were stated to have been cut indiscriminately, as they ripened. From Mr. Eyre, gr to R. W. Barchard, Esq., were two Moscow Queen Pine-apples, weighing 3 lbs. 3 oz. and 3 lbs. 5 oz.; one was particularly well swelled: a certificate awarded. From Mr. C. Barker, gr to the Rev. T. Thurlow, two Candalar Melons, for the larger of which a certificate was awarded; also a large brace of Barker's White Spine Cucumber, from plants grown in pots. From Mr. Wortley, gr to F. Maubert, Esq., an exceedingly fine-looking scarlet netted Cantaloupe Melon. Mr. R. Fish, gr to Col. Sowerby, sent half-a-dozen very fine Peaches, from standard trees, grown in the centre of a house upon the rafters of which vines are trained; one of the specimens had been produced upon the end of a shoot devoid of a terminal bud: a Banksian medal awarded. H. Webb, Esq., 22, Sackville-street, Piccadilly, sent a handsome collection of the dried Ferns of Madeira, beautifully prepared and arranged. From the garden of the Society were fine plants of *Gongora maculata*; *Oncidium microchilum*, a dingy brown species from Guatemala; *Angelonia Gardneriana*, a pretty stove plant from Brazil; *Achimenes multiflora* and *coccinea*, *Sálvia hians*, and *Zephyranthes grandiflora*; with cut flowers of *Gladiolus psittacinus*, *Acanthus mollis*, and a variety of *Verbenas*.

BOTANICAL SOCIETY OF LONDON.

June 2.—J. Reynolds, Esq., Treasurer, in the chair. Mrs. M. Stovin presented specimens of *Anemone ranunculoides*, found wild in a wood near Worsop, Notts. Various donations to the Library, Herbarium, and Museum were announced. The conclusion of a Paper "On the Groups into which the British *Fruticose Rubi* are divisible," by Mr. E. Lees, was read. It was there stated that the barren stems offer the best, if not the only plan, of discrimination in subdividing *Rubi* into groups, especially if the erect or arched mode of growth, and continuance of vitality, be also taken into consideration. And in this view the differences resolve themselves almost entirely into the perfect smoothness, the glaucosity, or greater or less degree of hairiness, and the glandulosity of the barren stems. Commencing then with *R. cæsius*, and ending with *R. idæus*, it will appear that seven groups are easily separable from each other, passing from one into the other in a very natural manner. These, at all events, may be considered the smallest number of species into which our *Rubi* can be classed without confounding really different things. 1. *Cæsius*.—Having the barren stem round, bloomy, covered with unequal prickles, trailing, rooting. *R. cæsius* and its various derivatives. 2. *Glandulose*.—Barren stem angular, hairy and prickly, setose, very glandular, arched or trailing, rooting. *R. radula* of Weihe and Nees, *Koehleri*, *fusco ater*, &c. 3. *Vill-caulis*.—Barren stem angular, very hairy, but without glands, prickly, arched, or decumbent, rooting. *R. villicaulis*, *W. and N.*, *R. leucostachys*, *Smith*, &c. 4. *Fruticose*.—Barren stem angular, glaucous, prickly, arching, rooting. *R. fruticosus* and *discolor*. 5. *Nitidus*.—Barren stem angular, almost smooth, with a few prickles, rooting rarely. *R. affinis*, *nitidus*, *rhaphanifolius*, &c. 6. *Suberecti*.—Barren stem angular, very smooth, nearly erect, not rooting. *R. suberectus*, *Anderson* and *Smith*, *R. plicatus*, *W. and N.*, and *R. fissus*, *Lindley*. 7. *Idæi*.—Barren stem round, downy, covered with innumerable small dilated prickles, erect. *R. idæus* and varieties. The Paper was accompanied by numerous specimens, which are deposited in the Society's Herbarium.

July 7.—J. E. Gray, Esq., President, in the chair. Dr. G. Watson and Mr. R. Kilvington, of Philadelphia, presented a very large collection of North American Plants, comprising numerous Duplicates; and the President presented some plants from Singapore. "Observations on *Dicranum Dillenii*," (M.S.S. Taylor) by Dr. Thomas Taylor, were read.

HIGHLAND AGRICULTURAL SOCIETY.

THE Annual Show of this important Association has lately taken place at Dundee, and is fully reported in the *Dundee Advertiser*, from which we glean a few paragraphs. "There is something extremely curious in the rapid growth of this Association, and in the enthusiasm which has taken possession of many of its noble Members. It was no wonder that farmers, and those in the daily exercise of Agricultural pursuits, should have from the first seen the advantages to be derived from this condensation of experience and discoveries, into a systematic and appreciable form, made patent to every one connected with land interests; but the interest and industry have not been confined to the farmer. Many of the first names among our nobility appear in the exhibition list, and many of the first breeders in England have sent stock, hundreds of miles from their farms and estates, to compete for the prizes of the Highland Society. The whole country for hundreds of miles round seems to have poured out its Agricultural treasures—the mountains of Aberdeenshire and the plains of the Lothians—the pastures of Northumberland and the wild shores of Loch Rannach. And it was a gratifying thing to see noble and peasant, duke, earl, lord, gentleman, and simple farmer, all uniting in one great patriotic object—the improvement of the land and the produce thereof. Nothing was neglected on the part of the Local Committee for the accommodation of Members, and for the exhibition of implements and stock. The great place of interest was, of course, the Show Yard. It was a fine grass-field in the form of an oblong-parallelogram, perfectly sufficient as regards size, and situated in the immediate vicinity of the town. The stalls for containing the different animals ran in parallel lines, with sufficient room in front and rear for the passing and repassing of spectators. In the different lines were arranged the different kinds of stock, each kind forming a separate and distinct family from another: and many a family was there, both of high and low degree—their pedigrees being as keenly scrutinized as those of the human race. The rough West Highland bull, from the hills of Breadalbane, and the sleek Ayrshire and Teeswater from every fat pasture in the country, and in short-horned breed was the finest part of the exhibition, and in the opinion of the Judges, the best that has yet been shown at the Society's Meetings. The work-horses and stallions were also good, and there were in particular some very fine mares. It may show the interest taken in the exhibition, when we mention that the famous breeder, Jonas Webb, sent sheep from Babraham, a distance of four hundred miles, to compete for the Society's prizes. The crowd round the Show Yard was enormous, consisting of all ranks and ages, and many a lady gay had to undergo rather rough treatment in the way of jostling and squeezing for admittance. Great as the crowd was, however, every one had an opportunity of seeing the whole exhibition, which passed off to the full satisfaction of those qualified to judge. The entries of cattle, &c., stood as follows:—Cattle, 326; horses, 74; sheep, 334; pigs, 30;—in all, 764. This was the largest exhibition of cattle ever held by the Society, except that at Glasgow

In 1838. It was not equal to the aggregate exhibition at Edinburgh last year, but that was the most extensive ever held in Europe. There were 29 exhibitors of dairy produce, and a new feature in the Show was some fine poultry, 17 lots in all." Our space prevents our giving a list of the prizes for Cattle, &c., which were extremely numerous.

For Implements, which are more generally interesting to those not present on these occasions, we must find a little room, although they are described as having been less numerous than in former years. Among the more important seem to have been the following: "Thrashing Mill and Steam Engine attached to it, exhibited by Mr. Bridges of North Berwick; the simplicity of the arrangement, and the low price at which it can be furnished, commend it to the agriculturist; and as the principle of connection and method of acquiring speed to the drum are exactly the same as those in our locomotive engines, there can be no doubt of its efficiency. Amongst the Implements exhibited by James Slight and Co., of Edinburgh, was a working model of Ainslie's Patent Drain Tine Machine, which is said to be capable of producing 40 tiles per minute for any length of time each 16 inches long, and from the nature of the process by which the tiles are framed, they are perfect in form and in texture.—Weighing Machines, exhibited by Mr. Craig, of 163, Trongate, Glasgow, attracted considerable notice. They are of foreign invention, on the parallel motion principle, are peculiarly delicate in their indications, and mathematically correct.—A very neat model of a Machine adapted for the double purpose of weighing carts or oxen. It is calculated to stand the roughest usage without injury—the centres or pivots, the great source of inaccuracies of the common machines, being always at rest except in the actual operation of weighing.—A Hydraulic Ram, also exhibited by Mr. Craig, is a self-acting machine, so simply contrived that, by the alternate action of air and water, a continual stream is procured from any distance three hundred feet above the course of any convenient stream or rivulet. This machine is not liable to get disordered; and is said to be an excellent and cheap method for securing water, for house or engine purposes, in situations where the want of it has hitherto prevailed. The Ram was certified by H. J. Burns, Esq., who has had one erected at Cattlehill, which has given entire satisfaction; the water, in this instance, was brought 600 yards and raised 135 feet."

Amongst the various specimens of "Seeds, Roots, Plants, &c., the collection of Messrs. Lawson and Son, of Edinburgh, held a conspicuous place. It consisted of dried specimens and seeds of grasses; several varieties of wheat, barley, and rye—crop, 1843, from Tuscany and France; and a large specimen of Trifolium elegans of the French, and cultivated by them on inferior soils; Schrader's brome grass (Bromus Schraderi), a large rapid-growing species, with soft, sweet, and succulent foliage, was for the first time recommended to be given as food for cattle; also a good specimen of meadow brome grass (Bromus pratensis), cultivated in France, for permanent pasture, on the poorest descriptions of soils. Another collection of useful plants and roots was that of Messrs. Dickson and Co., of Edinburgh. The Committee remarked 24 specimens of hybrid Turnips as very interesting. Some of these in shape and size appeared very fine, particularly that of Skirving's purple top yellow. Messrs. Dickson also exhibited several specimens of Grasses, Bokhara Clover, and Heracleum elegans; also some excellent specimens of Arthur's Alsike Clover, a new variety, which, from its abundant herbage, promises to be desirable for cultivation. Where it has been tried in Scotland, it has thriven well, and ripened seed freely. Some interesting specimens of natural Grasses, from Mr. Bishop, land-steward at Methven Castle, attracted attention, particularly four distinct varieties of the Alopecurus pratensis (Meadow Foxtail Grass), selected from the seeds of hay imported into Dundee from Holland in 1826. These specimens are illustrative of the improvements that may be made in the various species of cultivated Grasses, by a judicious selection of seeds from natural plants. Mr. Bishop had also a specimen of his succedaneum, to be sown in place of tares, and consisting of Italian rye grass, Trifolium incarnatum, a little timothy grass, and red clover. The succedaneum should be sown in April, and makes an excellent substitute for tares. There was a sample of Potatoes, raised from seed by Mr. George Sibbald, gardener, Crescent, Dundee, which promises to be a good addition to early garden varieties, and a specimen of a very early three-grained Oat, in habit similar to the naked oat, exhibited by Mr. John Stewart, Carolina Port, Dundee. There was also a specimen of early Siberian Oats, crop 1843, received from Messrs. Scott, Brothers, at Belfast, who introduced it in that district four years ago, and where it is now held in high estimation, being by far the earliest sort known, while its produce, both in straw and grain, is large in quantity, and the quality first rate. One of the most extraordinary exhibitions in the Catalogue, was that of Mr. James Campbell, of the Dundee Public Seminars. It consists of magnificent plants of Oats and Barley, grown from seed, which had undergone a certain chemical preparation, and without the aid of any manure whatever. Such a mode of culture is at variance with all practical experience; but Mr. Campbell asserted that his prepared seeds, which have produced these strong healthy plants, were sown by him on land which, to his certain knowledge, had no manure of any kind for 11 years; and he declared himself quite ready to verify his statement by experiment, and said that he was willing, at any time, to impregnate with his chemical preparations, the seed which any member of the Society should send to him for that purpose, so as to enable gentlemen to satisfy themselves fully as to the efficacy of this wonderful mode of culture."

NOTICES OF NEW PLANTS WHICH ARE EITHER USEFUL OR ORNAMENTAL.

OXYLOBIVM OBOVATUM. Wedge-leaved Oxylóbium. (*Green-house evergreen Shrub*.) Leguminosae. Decandria Monogynia.—As an addition to the hardy wood Australian shrubs with yellow pea-flowers this is acceptable, for it forms a pretty greenhouse plant, which lasts in blossom for some time. It is best cultivated in a soil which is rather poor, composed of very sandy loam and peat, and should be kept in a cold pit where it is quite secure from frost during winter. The pot must be well drained, and the plant should be seldom shifted after it is once established; when the shifting does take place, it should be a liberal one. Great care must also be taken that the plant never suffers for want of water; if this happens it hardly ever recovers; moreover, it should never be placed out of doors during the summer, but always be kept in a cold pit where the lights can be put on in wet or windy weather. It is increased freely by seeds or by cuttings, put in sand and placed on a gentle heat in the usual way.—*Botanical Register.*

DENDROBIUM CUCUMERINUM. Cucumber Dendrobium.—(*Stove Epiphyte*.) Orchidaceae. Gynandria Monandria.—A native of New Holland, whence it was sent to Messrs. Lindiger, from Mr. Wm. MacLeay. Of the locality for it in that country we are uninformed. It very much resembles a heap of little Cucumbers, whence the name has been derived. Those bodies are apparently leaves, terminating the short articulated stems; but they require further examination, for they may be of the nature of pseudo-bulbs. The flowers appear from the base of the Cucumbers in threes. They are dirty white, with long narrow sepals and petals striped with pink, and a three-lobed lip, whose middle division is crisped very much, with five wavy elevated ridges along its middle.—*Botanical Register.*

MORMODAS LUXATUM. Dislocated Mormodes. (*Stove Epiphyte*.) Orchidaceae. Gynandria Monandria.—The genus Mormodes has so entirely the habit of Catasetum that we have no means of distinguishing those two genera except when in flower. At that time Mormodes presents some peculiarities of so strange a nature that, if they were not found constant in several distinct species, we should be tempted to regard them as monstrosities. In particular, the column, instead of being straight and standing

erect in the centre of the flower, is bent over to one side, just as if it had been subjected to violence. There is also a great irregularity of direction and proportion in the parts that surround the column. Nowhere are these singularities so strongly marked as in the plant now before us, whose sepals and petals, instead of standing in an obviously alternate position with respect to each other, are so completely broken up and twisted out of their places that they can hardly be recognised, and the whole floral apparatus is, as it were, dislocated. For example, of the three sepals, the back one is placed almost opposite one of the petals; the other petal is shifted to one side, so as to stand half behind the first; and the lip, instead of being stationed exactly between the two petals and two lateral sepals, turns its back to the left-hand sepal, and its face to the right-hand petal. And then the column is bent to the left as well as the lip, but not in the same degree, so that even these two organs are not, as they usually are, opposite each other. In mentioning the existence of this singular plant we some time since spoke of it thus:—"When Mr. Ross, the collector to G. Barker, Esq., was in the neighbourhood of Valladolid, in Mexico, there was brought to him some masses of a plant reported to be of great beauty. They arrived safely in England, and one of them has at last flowered, proving to be this species; a most extraordinary plant, of large size, of a stately habit, with a very delicious fragrance, although powerful, but with no brilliant colours to render it what we call handsome. Its flowers are three inches in diameter, pale lemon-colour, fleshy, rather globular, but so distorted by the complete dislocation of all the parts, that it would be difficult to ascertain their real nature, if it were not for the token given by the labellum. The latter has a deep brown streak drawn down its middle, and covers over the column like a hood. The leaves of this plant are about three feet long, narrow, deep green, with a very fine glaucous bloom upon their underside. It is worthy to be associated with even *Sobralia macrantha* in the choicest of all collections of these plants." It is a stove-plant, which should be potted in a compost of turfy heath-mould, mixed with a portion of small potsherds. Water should be liberally given in fine weather, during the summer, and the temperature kept as high as 80° by day, and 70° by night.—*Botanical Register.*

MISCELLANEOUS.

TO THE ROSE DE L'ISLE DE BOURBON.

HATH sorrow paled thy bloom, fair emblem of the mind
Of her whose mourning wreath the Cypress sad hath twined?
Where's fled the brighter glow that sparkled in thy smile,
Before thou bad'st adieu to Bourbon's sunny isle?
We know the rich red tints did mantle o'er thy brow,
As by the Woodbine's arms encircled thou did'st grow,
Beneath the clime that gain'd a fragrance from thy birth,
And double value drew from beauty and from worth;
Then whence this fainter shade, consumption's cheek might wear,
Increasing love by dreams of mingled hope and fear?
Dost fade with vain regret, and for thy birth-place mourn,
Like Afric's bonded sons, from home and kindred torn?
Or dost thou share the grief the widow'd bosom feels?
Is sympathy the pang that from thy lustre steals?
Affection then will cleave with fonder zeal to thee,
If mem'ry thus may clothe thee with her witchery.
Imagination paints the husband's look of love,
As thee he first beheld in Bourbon's spicy grove;
Distinctly as the voice, it tells the thoughts of home,
That clust'ring to his heart, in crowding myriads come.
"The favor'd Rose that forms the virgin's bridal wreath,
Imbibing half its charm from innocence's sweet breath!
I'll covet none beside; fit offering wilt thou prove,
To her who, next to God, ranks husband, home, and love."
Thus, thus, his glance did speak, as thee he homeward bore,
When hasting back to love, from India's fatal shore.
Alas! he ne'er again that dear one e'er beheld,
The visions hope had raised, death's icy hand dispell'd;
His fever'd veins but drank a momentary life,
From balmy airs that seem'd with healthful vigour rife.
He died—but friendly hands this tribute of the heart
In safety bore to her, to dull grief's venom'd dart:
She placed thee where thou stand'st, fit soil for gem like thee,
For what shall beauty prize, if not fidelity?
Upon the grave of him whose heart was virtue's throne,
Thy graceful head reclines beside the sculptured stone,
As though thou fain would'st point to where the world should read,
That "Faith is proved by works," profession by the deed.
W. H. P., Aug. 2, 1843.

NOTE.—The introduction of this Rose into France is ascribed by some writers to the wish of a lady, that her husband, on his return from a long sojourn in the east, should bring her the most beautiful Rose that the journey homeward presented to his observation. Touching at the Isle of Bourbon, he selected this from among the "glittering throng," but lived not to enjoy the presentation. Dying soon after his departure from the Isle, a friend who took charge of them, landed both the Rose and the corpse of his friend in France, when the widow planted the flower upon her husband's grave, a memento of his affection, and her regret.

Pine Apples from the West Indies.—Many thousands of this fruit imported from the West Indies, and as it is said from Nassau in New Providence, have been sold by auction this week, and now crowd the fruiterers' stalls, where they sell from 1s. to 6s. each. They are small, and mostly ill-grown, many not weighing more than half a pound, and none that we have seen exceeding two pounds. Some are in good condition, but many are rotten, and must have heated on the passage. To what variety they belong it is impossible to say, as they are quite unlike the specimens that ripen in this country. It is, however, not improbable that they are small Providences. What we have seen cut had a white flesh, and a tolerable flavour. It is understood that much larger numbers may be expected. English Pine-growers need not, however, be alarmed at present, for unless future importations improve in quality, those accustomed to English Pine Apples would not place them on their tables. They will, however, be acceptable to those who cannot afford the price of home-grown fruit.

GARDEN MEMORANDA.

Horticultural Society's Garden, Turnham Green.—The period at which this garden is seen in the greatest beauty is in the latter months of spring, when the Leguminous plants decorate the conservatory, and the Arboretum is enlivened with Rhododendrons, the numerous species of Crataegus, Philadelphus, &c., and the magnificent *Glycine sinensis*. Although far from being so gay at the present time, there is, nevertheless, much to interest those who may be induced to visit it. Great improvements have been effected within the last twelve months, and many more are contemplated. The tank system of heating has been applied to a range of pits fronting the curvilinear stove, which was formerly taken up with Bulbs and Camellias. This has been effected by raising the walls of the pit about three bricks in height, and by building a small furnace-house at the west end, separated from the curvilinear stove, and partly concealed by a mass of rock-work, which has greatly improved the appearance of the whole. The hot-water gutters, covered with slates, are about seven inches wide and the same in depth, rounded at the bottom, and carried round the pit within a few inches of the exterior walls; the space in the centre being filled with brick-rubbish, upon which a layer

of small cinders is afterwards placed. The pits are at present occupied with South American plants and seeds lately brought over by Mr. Hartweg. The apparatus answers admirably in this case, and another upon a smaller scale has given equal satisfaction in heating a range of Melon pits. In the latter, however, the gutter is carried along and returns down the centre of the pits; the circulation of the water being kept up by one of Stephenson's small cylindrical boilers, which is found very efficient. The experiments with different manures, carried on in front of the Vineries, and briefly alluded to at page 101, are particularly interesting. The subjects of the principal experiments are Wheat, Potatoes, Peas, Turnips, and Beet; and the substances with which they are treated consist of phosphate of ammonia, phosphate of lime, the sulphates of soda, lime, ammonia, magnesia and potash; muriates of ammonia and potash; salt and nitrate of soda; one division in each series of experiments receiving no artificial aid of any kind. Those rows of Potatoes upon which the three compounds of ammonia and nitrate of soda have been applied, are easily distinguishable by the greater vigour and the darkness of their foliage. A few weeks back this difference was even more apparent; but whether their produce will be equally remarkable, remains yet to be proved. Wheat treated with phosphate of ammonia and muriate of potash, appears to be much stronger than the rest; that to which nitrate of soda has been applied is scarcely superior to that which has received nothing, but the most striking difference is observable in that dressed with sulphate of lime, more particularly at the end where silicate of potash has also been applied. A breadth of four feet across the northern ends of all the beds of Wheat was dressed with the latter substance, and it has caused the plants so treated to grow more vigorously, and to produce finer ears. Turnips have succeeded best upon land dressed with the phosphates of ammonia and lime, nitrate of soda, and the sulphates of ammonia and lime; the former and the latter exhibiting a striking superiority. Scarcely any difference is manifest upon the Peas and Beet, but a better judgment may be formed of the latter when taken up. But perhaps none of the experiments have produced a more curious result than a few which have been carried on with the White Paris Cove Cos Lettuce. Each experiment occupied about half a rod of ground, receiving respectively, when the ground was dry, two barrowfuls of rotten dung, four pounds of sulphate of ammonia, and the same quantity of superphosphate of lime. The Lettuces upon the former piece are good, but in many instances rather open in the centre; upon the second they are of a dark green, very open, and promise to be of little value; while those dressed with superphosphate are excellent, regular, and well turned in. This substance has also proved of service to Asparagus; eight worn-out beds having been treated with as many different compounds, and two having been left untouched, 1, to which 20 lbs. of salt were applied at once, is weak and yellow, showing that the dose was too great; 2, the same quantity of nitrate of soda is rather stronger; this substance pulverises the soil, and renders it lighter; 3, 20 lbs. of sulphate of magnesia, is scarcely different from the preceding; 4, watered every week with guano and salt, at the rate of a handful of each to every four gallons of water, is exceedingly strong—showing that weak doses, applied often, produce a much better effect than when a great quantity is given at once; 5, watered once a fortnight with 2 lbs. of sulphate of magnesia, dissolved in water, is very good; 6, with an equal quantity of Potter's guano, dissolved in water, is of a dark green, and particularly vigorous; 7, superphosphate of lime, 2 lbs. applied in the same manner, is strong, but of a much lighter colour; 8, guano, 2 lbs., not so strong as the four preceding; the whole of the beds thus operated upon are, however, far superior to those which received nothing. Onions, with the seed of which charcoal-dust and wood-ashes were sown, do not exhibit any marked difference from the rest, farther than an inclination to grow stronger and later. Some experiments are also going forward upon Celery; but as the manures have only been applied a fortnight, their effect is not yet discernible. Superphosphate of lime appears to suit flowering plants uncommonly well, three Chrysanthemums treated with it growing vigorously, and becoming of a dark green under its application; and a scarlet Pelargonium which had received it exhibiting a great superiority over one to which phosphate of lime had been applied. In the destruction of Aphides, ammoniacal liquor has been of essential service, the Roses being perfectly free from them, and Plum-trees, whose growth had been quite stopped by their numbers for several preceding years, having this season made abundance of wood, by being occasionally syringed with it, diluted in about 10 times its bulk of water. It is of no less use in converting the sweepings of Grass lawns into manure, in the manner recommended at p. 191; it is necessary that the heaps should be small, and that they should be frequently turned; otherwise the exterior of the heap only will decay. The plants in flower in the conservatory consist of the magnificent *Hibiscus splendens*; the beautiful *Tecoma jasminoides*, with light pink corolla and dark purple throat, the sweet-scented *Mandevilla*; *Leschenaultia biloba*, planted out in the border; with a variety of *Fuchsias*, *Hydrangeas*, &c. The Tea-Roses planted in the centre have made vigorous growth, and are now blooming delightfully. The *Araucarias* have advanced rapidly, *A. excelsa* and *Cunninghami* having reached within five or six feet of the top of the house. Alterations are going forward in the house usually known as the "Pine-stove," the roof is to be raised, and the front is to be glazed, instead of being a dead-wall, as at present. The Orchidaceous plants are therefore removed to the greenhouse until these operations are completed. The plants in the curvilinear stove have improved greatly since the late alterations were completed, the curious *Aristolochia gigas*, the various species of *Achimenes*, *Euphorbia splendens*, *Nolana oblonga*, and *Angelica Gardneriana*, are blooming here in full perfection. The aquatic plants exhibit great vigour, particularly *Nelumbium speciosum* and *Caladium esculentum*. In the Orchidaceous house, the singular *Nepenthes distillatoria* is producing its spike of dull brown flowers; the gorgeous *Sobralia macrantha* is making rapid growth; and *Stanhopea Wardii*, var. *Gongora maculata*, *Hemileya violacea*, *Galeandra Baueri*, *Phaius albus*, and the lovely *Peristéria eata*—the Dove or Holy Ghost Plant (so named from the striking resemblance to a dove contained in the interior of the flower), are in bloom. Several species of *Yucca*, in the arboretum, have thrown up flower-stems of great height; those of *Y. recurva* and *cucullata* being 10 feet high. It may, perhaps, be interesting to know that *Fuchsia discolor*, which appears to be either identical with, or differs but very slightly from *F. Riccartonia*—is perfectly hardy; a cutting of it, which was planted last autumn against a north wall, having stood through the winter, forms now a stately bush, four feet high, with its branches bending beneath the weight of their highly beautiful flowers, the colours of which far surpass in richness those of more novel kinds. Three or four new Vines have fruited in the curvilinear Vinery, and amongst them is a particularly fine white Grape, called the Raisin de Calabre; the bunches are long, not unlike those of the White Frontignan, with berries as large as those of a full-sized Sweet-water. The *Orthocentrus* is a small, white Grape, bearing compact bunches, only fit for wine; Rother gulab has large bunches, bearing considerable resemblance to those of the Black Morocco. The Aramon proves to be the White Frontignan. The Zibibo of Sicily—the White Muscat of Alexandria; and the Admiral—the Black Hamburg. Of Melons, a new one called the Pine-apple, with dark green mottled fruit, about the size and shape of a small Green-flesh, is very high-flavoured. Amidst the dearth of Plums, which is so general this season, the Nectarine and Washington promise abundant crops.—The British Queen Pea, sent out last spring by Messrs. Cormack, proves here to be nothing more than Knight's Tall Marrow.—*R. A., August 7.*

Ockham Park, the seat of Lord Lovelace.—At this place, there is a noble specimen of the Douglas Pine, 18 or 20 feet in height, which is producing five or six of its remarkable cones. It is to

be hoped that these will come to perfection, in order that this handsome species may be increased from native seed.

Reviews.

Dr. Justus Liebig, in his Relation to Vegetable Physiology. By Dr. Hugo Mohl. (Dr. Justus Liebig's Verhältniss zur Pflanzen-Physiologie.) Tübingen. Trues. 1843.

(Continued from page 560.)

It is, therefore, clear (continues Dr. M.) that L. has completely failed to prove that plants do not use humus for their food. Besides, the question whether plants feed on organic or inorganic substances, was mooted long before the publication of L.'s work. Although it is certain that the chief portion of plants is formed by the assimilation of inorganic substances, yet, the collateral questions, whether they receive organic as well as inorganic matter; whether all or *only some* plants require organic substances for their existence,—these questions are far from an ultimate and scientifically-corroborated solution. Conclusions, moreover, merely based on uncertain observations, or made merely at random, cannot be of value, and ought to have been replaced by minute and well-devised experiments. In this manner, L. might have become eminently useful to science. He professes (it is true,) to despise minute experiments; nevertheless, the Appendix to his Work contains the reprint of some made by Hartig, which he adduced in corroboration of his doctrine. But it is unworthy of a great chemist (concludes Dr. M.) to mix up experiments of men like Davy or Saussure, with those of a gentleman like Hartig, who, we are sure, does not aim at the distinction to be considered a chemist,—a science foreign to his pursuits.

The experiments which have been hitherto made relating to the question of the organic or inorganic nourishment of plants, may be divided into three classes. 1st, Plants were reared in soil destitute of humus, either with distilled water or such as contained carbonic acid. Under both these circumstances they do not prosper; still, this does not prove the necessity of organic food, because they are here equally deprived of other inorganic substances, which they are in contact with, under common circumstances. 2d, Or, plants have been reared in powdered charcoal. L. says, (p. 58,) that they will attain in this material the most luxuriant growth, flower, and bear fruit; but he merely quotes in evidence the experiments of Lucas, reprinted in his Appendix. But the reasoning of L., under this head, is illusory. Lucas speaks of *vigorous* vegetation of plants reared in a mixture of charcoal powder and decayed leaves; of such as are grown in charcoal powder alone, he merely says that they speedily become rooted. Of their further vegetation he says nothing; and it has been proved by the experiments of Zuccarini that plants will not grow at all, or very badly, in this substratum. The same is stated by Saussure (Bibl. univ. xxxvi., p. 352), who relates, that Peas reared in charcoal did not grow much better than those planted in mere sand. The third class of experiments relates to the question, whether plants will absorb organic substances dissolved in water, and especially humates; and whether they will prosper under these circumstances. The experiments of Saussure, Davy, and Sprengel are affirmative; but L. has reprinted (as stated before) those of Hartig, which are *negative*. The whole question, therefore, is, to say the most of it, one yet undecided. At any rate, it cannot be solved by experiments upon a single species of plants; and it is begging the question to state (p. 122) that, "All plants are the same in the chemical nature of their nutritive process."

Dr. Mohl then proceeds, at some length, to refute this unqualified assertion of Liebig. There is a considerable number, he says, of true parasites, which require for their food the juices of living plants. It cannot be doubted that such plants require substances of a peculiar chemical combination and quality for their food. Many such parasites are not green, and therefore cannot decompose carbonic acid, so that their food must necessarily consist of substances already assimilated by other plants, and stand in the same relation to the mother plant as the flower and fruit of other vegetables to their respective branches. Now this sort of nutrition from substances derived from living plants is also proper to a very large number of parasites (Loranthaceæ) which are quite green, and therefore provided with organs for decomposing carbonic acid. Such plants are entirely similar in structure to those which grow in soil; but they must, of necessity, possess the capacity of feeding on substances already assimilated by other plants. To these *true* parasites are to be added the spurious parasites, which feed on decaying organic matter, amongst which some have green leaves, and others are destitute of that colour. The latter can have no capacity for decomposing carbonic acid, forming organic matter from it and water. The same is also the case with many other plants of a green colour, which, although they decompose carbonic acid, still are proved by their place of abode to be dependent for their food on organic matter in a state of decomposition. From this series of plants there is but a step toward those growing in peat and heath-soil, &c. I do not mean, concludes Dr. Mohl, to prove by these statements that all plants feed on organic substances; my object is rather to explain that the introduction of organic matter into the system of vegetation is not, as Liebig asserts, necessarily detrimental to the economy of plants; and to show that it is by far preferable to have recourse to positive and precise experiments, than to indulge in groundless and general remarks and theories.

(To be continued.)

The Injury and Waste of Corn, from the present Practice of too thick Sowing. By Hewitt Davis, Farmer and Land-agent. London. Waller.

This little Tract treats of a very important point in Agri-

culture, which has been long a subject of discussion among practical farmers, each appealing to experience in support of his own opinion. It is well known that the late Lord Leicester, a very high authority, strongly recommended sowing plenty of seed, and maintained that Wheat should not be allowed to tiller, but that a single strong stem from each seed would produce a more abundant crop and a much more regular sample.

Notwithstanding this, we are inclined to side with Mr. Hewitt Davis. With some exceptions, which may be very good subjects of experiments, where the tillage is perfect, the land clean, and the soil mellow, even less seed than Mr. Davis recommends will produce a plentiful crop; but careful hoeing is essential, just when the Wheat tillers, that the stems may all be equally vigorous. With respect to spring crops, there may still be some doubt, but careful experiments on various soils would soon settle that point. Agriculturists are much indebted to Mr. Davis for drawing their attention to this subject; and we recommend his Tract to their notice, hoping that he will more fully communicate to the public any further information he may obtain, especially the result of experiments made on different soils.—M.

ERRATUM.—In our review of Baxter's British Phanogamous Botany, at p. 560, the continuation of the title should have been—"or Figures and Descriptions of the Genera of British Flowering Plants," and not "of the German and British Flowering Plants."

CALENDAR OF OPERATIONS for the ensuing week.

I AM reminded by the advertisement of "Dutch Hyacinths," in the last *Chronicle*, that to do proper justice to forced Hyacinths, expected to bloom by Christmas, they ought to be potted not later than the middle of August. It is true we manage to flower them as early as Christmas, after potting them as late as the end of September and beginning of October; but this is too much for the bulbs—the flowers are not as fine as from early potting, and it takes two seasons' good nursing to bring them round again, so that they will make their appearance among the early spring bulbs in the beds and borders of the flower-garden. They manage differently in Holland, where they know the nature of the plant so much better than we do, especially as exemplified in our practice. There, from time out of mind, the first crop of forcing Hyacinths is potted about the first week in August. They provide against exciting the foliage till the pots are full of roots, by a thick covering of tan, leaf-mould, or something of the kind. In about six weeks the pots are full of roots; they are then taken to cold frames and kept close to the glass, with plenty of air; and the natural warmth of the latter part of September and the whole of October is sufficient to bring up the foliage and flower-buds very gradually, with the least possible injury to the bulbs; indeed, as compared with our practice, their bulbs can hardly be said to be forced at all; and after one season's nursing, the same bulbs are fit to be again forced or exported in the usual course of business. If one party can procure these bulbs thus early, there is no reason why the whole trade should not be as early in the market, and save themselves and their customers much trouble. There will be no want of *circulars* through the Post-office six weeks after the regular planting season in the open ground is over. It would be better, however, for all parties if they could be issued six weeks in advance of the planting season. Speaking of bulbs, it is high time that the Narcissuses which were taken up last June, to make room for other plants, were now planted where they are to flower next April and May; and as they do not push up till after the present crops are over or killed by frost, they will be no eyesore in that respect. Meantime their roots will push deep into the soil, and be better able to supply the requisite nourishment at the proper time than if left out of the ground till October. Narcissi that are left in the ground from year to year are now making fresh roots actively, though no signs of vegetation are apparent in the bulbs. This tells us plainly enough that we should not put off planting them till the time of planting Tulips.

I.—KITCHEN-GARDEN AND ORCHARD.

In-door Department.

PINEY.—After the August shifting, young Pines generally make more growth in the next three months than during the rest of the year; as soon, therefore, as the pots get full of roots, if the weather is at all fine, give the plants a good dose of liquid manure about once a week, till near the end of September, and let the pits have plenty of air in the morning, shutting them up early in the afternoon, in a moist atmosphere.

VINERY.—If a man had no more to do now than to attend to the Vineries he might make a tour on the Continent, to see their vineyards. Give the ripe and ripening fruit plenty of air as long as the weather is fine; shut up close in dull weather, use a little fire when dampness threatens, and guard against insects, birds, and other animals.

Out-door Department.

I do not recollect anything in particular that requires to be done now in the kitchen-garden, except the usual routine of keeping the ground clean, and trenching vacant pieces as their crops are cleared off. I fear I have done injustice to the Prince Albert Pea, in saying it was not so good as the Warwick, as I see they have found it the best early kind at the Horticultural Society's garden, where they pay more attention to these things than we do in the country. The British Queen Pea, on our light soils, is the best of all kinds, and will drive Knight's Tall Marrow (is it not the same?) out of the garden; it is fully as tall, is in flower when part of the crop is quite ripe for seed, and the Pea is larger and heavier than the Knightian; but who can find stakes for these, or props to keep up the rows after the stakes are covered? The most profitable for a private family is Knight's Dwarf Green Marrow, if the soil suits it, but all Peas are fastidious in this respect.

Cauliflowers.—Before the end of the week sow a bed of these; and at the same time a pinch of Red Cabbage seeds, for planting out a row or two next March.

SPINACH.—Winter Spinach is always sown at the same time as Cauliflowers for spring planting. Onions, Savoy, Red, and two or three sorts of Cabbage, are, or used to be, sown also at the same time.

ORCHARD.—We now wait patiently for the crops, and very little work is now required in the Orchard but watching and preserving the crops. Grafts may still be prepared for exportation to distant parts. I have just prepared some for Bengal, to go in sawdust, *via* the Cape of Good Hope. Intending emigrants to New Zealand, or the Directors of the New Zealand Company, should try this mode also.

II.—FLOWER-GARDEN AND SHRUBBERY.

In-door Department.

STOVE.—There is a large class of stove-plants that might now be propagated from, and the old plants thrown away, after they have done flowering, between this and Christmas; such, for instance, as *Clerodendrons*, *Justicias*, *Roelias*, *Vincas*, &c. Young plants of these might easily be nursed through the winter in 60-sized pots, and as soon as they begin to grow freely in spring, you may pot them into pots one size larger, and as soon as the roots are fairly through the fresh soil, they will be in a condition to stand the one-shift or any other system. This would give more room for woody plants in winter, and the younger the plants of soft-wooded kinds are the better they always flower. If any of these are too small for your ideas of a fine specimen, propagate more of them, and plant half-a-dozen of them in a pot at the final shifting for bloom.

GREENHOUSE.—No two greenhouses are managed alike anywhere in summer. Where Vines are on the rafters the house should now be kept more close, to ripen the fruit early, before the time of housing the plants for winter; and where plants in flower are the chief study, a drier atmosphere, more air, and attention to cleanliness, are requisites to be attended to.

CONSERVATORY.—One of the best autumn-plants for the conservatory is *Lisianthus Russellianus*. Last year's seedlings of it are now in their prime, and will continue in bloom till November. I have known an individual flower of it keep open for 23 days. It does best when treated as a stove biennial, and sown about this time. The varieties of *Thunbergia alata* sown last February are now, and will be for a long time, great beauties trained on trellis-work in this house. The *Vinca rosea* and *alba* make admirable plants for the conservatory in autumn; *Allamanda cathartica*, in a pot, is also well suited for this purpose; but, being of a succulent nature, it should not be kept here late in autumn, but should be removed to the coolest part of the stove. All these plants require now less air and water, and the house is kept somewhat drier.

PITS AND FRAMES.—One might now fill a Calendar under this head, and yet not do justice to the subject. If *Acacias* intended for forcing next January are huddled together in some out-of-the-way corner they will not flower well next spring. Other useful plants would now be better along with them in the open sun. If your old plants of *Coronilla glauca* are planted out in a border, to make them fine specimens, the sooner you take them up and pot them the better, as they go on making young wood till overtaken by frost, without ripening wood for producing bloom. If they are full-grown specimens, cramped in pots, give them plenty of water and expose them to the sun in the open air. See, also, to all plants intended for forcing next winter and spring, and attend to them according to their habits. *Acacia armata* always succeeds best when planted out in a border from May to October, while the plants are young. There is no more room to name individual plants to-day.

FLOWER-GARDEN.—One would have thought that flower gardening was an easy matter in the autumn, the plants having all filled the spaces allotted to them, and needing little or no water, save the passing showers and the heavy dews; but in a large flower-garden, filled with a great variety of plants, there is more delicate work required than at any other time of the year. Taken a bed of *Petunias*, for example; as soon as the plants begin to run over the sides of the bed a man must begin to cut out all the leading shoots just inside the edges of the bed. In three days more the same work must be repeated, and in three weeks the sides of the bed forms a regular bank five or six inches high, while the plants in the middle of the bed are from a foot to 18 inches high, with a surface as even as any part of the surrounding Grass, and yet no one can see that a shoot has ever been touched. Every time the sides of the bed were cut the man had an eye all over the bed, and when a top shoot appeared higher than the rest he cut it off. This brings up the top of every shoot in the bed, equally, to the height you want the bed to be. The bed is kept nearly at that level through the season by close pruning, so that by the autumn you might almost walk over the bed on the top of the stump, and as to the wind or rain beating down the plants, the thing is impossible. Now, how different this is from the old system of cutting the sides of the bed with shears, and allowing the strongest plants to tower here and there all over the bed, which the first heavy rain will perhaps level to the ground. Managed properly, all the *Petunias* make the best of rows for circular beds or along a walk. The following *Pelargoniums* are well suited for autumn beds:—Queen Victoria, light, and a dwarf close habit; Unique, purple, and a rambling habit; Jehu and Yeatmanianum grandiflorum, party-coloured, close growers, standing the rain without injury; Ne plus Ultra, dark scarlet, with a loose, free habit—also a capital forcer; Lord Paget, with tolerably large white flowers; and Prince of Orange, a smaller flower, in the way of Lord Paget; its leaves are lemon-scented; it is the hardiest of the genus, and the best forcer; it flowers all the year round.—D. Benton, Shrubland Park Gardens, Ipswich.

State of the Weather near London for the week ending Aug. 17, 1843, as observed at the Horticultural Garden, Chiswick.

REPORT ON COVENT-GARDEN MARKET.

For the Week ending August 18, 1843.

In consequence of the continued hot weather, late out-door fruit is now becoming more plentiful, and many kinds of vegetables inferior. Pines are excellent and abundant. Amongst the Grapes are very fine bunches of the White Muscat and Black Hamburgh. Peaches and Nectarines from the open wall fetch from 3s. to 8s. per doz. Apricots are plentiful, and sell from 1s. to 4s. per doz. Greengage, Orleans, Violet, and Morocco Plums are abundantly offered. Jargonelle Pears are ripening fast, and fetch from 4s. to 8s. 6d. per half-sieve. Morello Cherries sell from 6d. to 1s. 6d. per lb. Gooseberries and Currants are less plentiful. Filberts are brought in great quantities, and fetch from 40s. to 55s. per 100 lbs. Cucumbers are inferior. The supply of Cauliflowers is sufficient for the demand; but, with Cabbages and Turnips, they begin to show the effects of the hot weather. French Beans are excellent, and Windsor Beans are supplied in abundance. Celery is improving; the solid Red selling at about 18s. per dozen bundles. Onions are exceedingly plentiful. The supply of Peas is becoming limited. Carrots are very fine. Shallots are abundant, and a large quantity of American ones has already been imported. Cut Flowers consist of *Tropaeolum pelerinum*, *Eccremocarpus scaber*, *Bignonia venusta*, yellow and perpetual Roses, Sweet Peas, *Calceolarias*, *Aconites*, *Picotees*, and *Carnations*.

PRICES, SATURDAY, August 19, 1843.—FRUITS.

Pine Apple, per lb., 3s. to 6s.	Raspberries, per gallon, 7d. to 1s.
Grapes, hothouse, per lb., 2s. to 6s.	Cherries, Morello, standards, per hf.-sieve, 6s.
Peaches, per dozen, 12s. to 21s.	— Wall, per lb., 1s. to 2s.
Nectarines, per dozen, 12s. to 21s.	Apples, new, per hf.-sv., 2s. 6d. to 4s. 6d.
Apricots, per doz., 1s. to 4s.	Pears, per half-sieve, 2s. 6d. to 9s.
Figs, per doz., 6s.	Oranges, per dozen, 1s. 6d. to 3s.
Melons, each 2s. to 6s.	— per 100, 10s. to 24s.
— Dutch, each, 1s. 6d. to 3s.	Lemons, per doz., 1s. to 2s. 6d.
Plums, per punnet, 1s. to 2s.	— per 100, 5s. to 14s.
— violet, per hf.-sieve, 2s. 6d. to 3s. 6d.	Cucumbers, per brace, 6d. to 2s.
— Gage, per punnet, 2s.	Gherkins, per 1,000, 7s. to 7s. 6d.
— Gages, Green, per hf.-sv., 10s. to 12s.	Almonds, per peck, 6s.
Gooseberries, p. hf.-sv., 2s. to 3s.	Nuts, per bushel—
Currants, per half-sieve, 3s. to 4s. 6d.	— Brazil, 16s.
— Black, per hf.-sv., 2s. 6d. to 5s.	— Barcelona, 22s.
— Red, for wine, per sv., 4s. 6d. to 5s.	— Cob, 12s.
— for dessert, p. hf.-sv., 4s. to 6s.	Filberts, English, p. 100lbs., 50s. to 70s.

VEGETABLES.

Cabbages, per doz., 9d to 1s 3d	Leeks, per doz. bun., 2s to 4s
Cauliflowers, per dozen, 2s to 4s	Onions, Spring p. doz. bch., 1s 6d to 3s
Beans, Kidney, per doz., 1s to 2s 6d	— Large, per doz. bch., 2s to 5s
— Scarlet, per doz., 1s 6d to 2s 6d	— Spanish, per doz., 1s 6d to 3s
— Windsor, per doz., 1s to 1s 6d	Garlic, per lb., 6d to 8d
Potatoes, New, per ton, 60s to 80s	Chilis, per 100, 1s to 2s
— per cwt., 3s to 4s 6d	Pens, per bushel, 2s to 3s
— Kidney, p. bush., 2s to 4s 6d	— per sack, 3s to 5s
Artichokes, green, per doz., 1s to 4s	Lettuce, Cabb., p. score, 9d to 1s
Vegetable Marrows, per doz., 6d to 1s	— Cos, per score, 6d to 1s 6d
Turnips, per doz. bunches, 3s to 5s	Celery, p. doz., (12 to 15) 9d to 1s 6d
Red Beet, per dozen, 6d to 1s	Small Salads, per punnet, 2d to 3d
Horse Radish, per bundle, 1s to 6s	Sweet Basil, per doz. bunches, 3s to 4s
Radish, spring, p. doz. hands, 6d to 1s	Watercress, per doz. sm. bun. 4d to 6d
Turnip, p. doz. bunches, 9d to 1s	Parsley, per half sieve, 1s
Carrots, Horse, p. doz. bunches, 3s to 6s	Tarragon, per doz. bunches, 2s to 3s
— Long, per doz. bunches, 4s to 7s	Fennel, per doz. bun., 2s to 3s
Shallots, per lb., 1s	Mint, per doz. bunches, 1s 6d to 3s
— green, per bunch, 4d	Marjoram, green, per bunch, 2d to 4d
Spinach, per sieve, 2s to 2s 6d	Mushrooms, per pot, 2s to 4s
	Wallnuts, Green, per bushel, 7s to 9s

Notices to Correspondents.

MANURES.—C. L.—No kind of manure is better adapted for small gardens in which the soil is naturally poor, than Potter's Artificial Guano, applied occasionally in small doses, while the plants are in growth. It may be scattered over the beds until they have the appearance of having received a slight sprinkling of snow. You may apply it now, and again once or twice early in spring. —Googyn.—There is no reason against your watering your manure with vitriol and water, load by load, as you put it on the heap. The quantity to be used is uncertain; about 2 pounds, worth 4d., are enough. But if you can get sulphate of iron cheap, it will be more manageable, because it can be applied in powder without danger to the workman. —Rural Chemistry is answered by the last.

NEW GARDEN.—A Country Vicar.—As FOREST TREES you may take the Common, Turkey, and American Oaks, the Elm, Maple, Beech, Lime, Ash, Birch, Horse and Sweet Chesnuts, Walnut, Allanthus, Pines, and Firs. As FLOWERING TREES or OTHERWISE ORNAMENTAL: Tulip-tree, Deciduous Cypress, the different species of *Esculus*, *Pavia*, and *Crataegus*; *Arbutus*, *Laburnum*, *Robinia*, *Pyrus spectabilis*, *Juniper* and *Thuja*. CHOICE SHRUBS FOR BORDERS OR THE LAWN may consist of *Berberis aquifolium* and *dulcis*; *Spiraea bella*, *ariaefolia*, *tomentosa*, and *flexuosa*; *Magnolia purpurea*, *Deutzia scabra*, *Clethra scabra* and *acuminata*; *Andromeda floribunda*, *Escallonia rubra*, *Ribes speciosum* and *niveum*; *Kalmia latifolia*, *angustifolia*, and *glauca*; *Calycanthus floridus*, *Ledum palustre*, *Rhododendrons* and *Azaleas*. As EVERGREENS AND SHRUBS FOR BACK BORDERS: Common and Portugal Laurels, *Acuba japonica*; *Phillyreas*, *Holies*, *Box*, *Privet*, *Lilacs*, *Ribes aureum* and *sanguineum*; *Philadelphus Gordonianus* and *floribundus*; *Viburnum Oxycoccus*, and *O. pulvis*; *Cornus stricta* and *sanguinea*; *Snowberry*, and Common and Asiatic *Berberis*. As CLIMBERS, you may have *Periploca graeca*, *Clematis Hendersonii*, *flammula*, *florida*, *montana*, and *viticella*; *Bignonia radicans*, *Passiflora cerulea*, *Ampelopsis quinquefolia*, *Aristolochia sipho*, *Jasmines*, *Honeysuckles*, *Glycine sinensis*, and *Climbing Roses*. Lists of fruit-trees for any situation or aspects will be found in last year's volume.

POURING HOUSES.—N. N.—You will find hot-water gutters heated by any of the small boilers, now so much advertised, easily constructed by a country workman, and managed by a fair gardener. In the course of a short time we hope to be able to give other plans of applying this system, concerning which we have lately published good communications from Messrs. Veitch, Rendle, and others. For early forcing you should have a south aspect, because you will never find light enough at the beginning of the year; if, therefore, you must have an eastern aspect, you must employ all available means to render the structure light; and we should advise you to employ iron for the frame-work, provided you are sure of your gardener's skill. Who the agents of Chance and Co. are, you will see by looking over our advertisements. The index for 1842 was published with the first Number for 1843, and not separate. If, therefore, you received the one, the other must have been with it. There are no figures of Horticultural buildings recently published which we can recommend; some of the most useful have been occasionally given in our columns. A few are to be met with in "London's Suburban Horticulturist."

PORTABLE GREENHOUSES.—Dow.—The Horticultural Society has judiciously avoided making any regulations as to the construction or size of the Ward's Cases to be shown next year. We are at present unacquainted with the best mode of either managing or making them; and therefore each exhibitor must exercise his own skill and judgment in the matter. We shall soon take an opportunity of saying something on these points; in the meanwhile we may observe that it is only ignorant people who suppose that these cases should be air-tight (!), and that you will find much information upon the subject in Mr. Ward's pamphlet, "On the Growth of Plants in Closely Glazed Cases." You will also get some information at p. 852, of 1842, and pp. 244 and 796, of 1841.

LABURNUM.—A Dublin Subscriber.—The shoot which you found upon your purple Laburnum is that of *Cytisus purpureus*, between which and the common yellow Laburnum the purple variety originated. Such sportings as you mention are by no means uncommon, as you will find by referring to p. 397, 1842.

MIMULUS.—H. K.—The seedling of a rich orange colour is a fine variety; the blossoms are large and the colour bright and clear. The flower of a rose vermilion colour is also very good, the other variety wants size.*

ERICA.—A Young Nurseryman.—The Erica you sent was too much bruised for us to determine what it was. We cannot undertake to name seedlings.*

LEAVES AND FRUIT.—A. B. C.—On no account remove the leaves of your Musa; read what we have often said before on similar subjects. To cut off the leaves of a plant in order to ripen fruit, is exactly the same as cutting out your own stomach in order to assist your digestion. The fruit when ripe will be yellow, and about four inches long.

STRAWBERRIES.—R. J. C.—The best kind of Strawberry for early forcing is Keen's Seedling. Abundant information respecting the preparation of the plants before subjecting them to heat, will be found in late Numbers of the Chronicle.

MYATT'S PINE STRAWBERRY.—We are obliged to many correspondents for valuable information on this point, for which we shall find room next week.

APRICOTS.—A. B. C.—We cannot account for your Brussels, Orange, and Turkey Apricots dropping off before they are ripe, while those of the Moorpark and Breda continue to ripen well, unless there is some constitutional peculiarity in the two latter kinds, which renders them better able to resist excessive wet.

ASPARAGUS.—A. S.—We have not seen your questions till now; or if we have they were answered. Sea-water is the best of all means of applying salt; because it is a vehicle for other substances, such, for instance, as muriate of magnesia, on which it is probable that the Asparagus feeds. We should water our beds with sea-water during the whole of the season of growth, and also in the spring, just when the shoots are beginning to move. Sea-kale should be treated in the same way. It is better to cut all the shoots as long as the cutting continues; how long that depends on the strength of the plants.

INSECTS.—H. Tansley.—You have sent us *Gastropacha quercifolia*, or the Lappet Moth. —H. C.—The insect which you find infesting your cupboards to such an extent is a minute Ant, nearly allied to the *Myrmica melanoccephala*. It is probably of foreign origin. You will find some difficulty in getting rid of it; however, you may do much by carefully closing all crevices with plaster-of-Paris, so as to prevent the little crea-

tures having hiding-places. You should also expose the interior of your cupboards to the strong gaseous exhalation arising from chloride of lime, which is found to be very destructive to Cockroaches, and will probably be equally obnoxious to Ants. You may also try the plan of poisoning them with arsenic mixed with something sweet, and placed where the Ants most abound. —A Subscriber, Macclesfield.—The insect which you suppose to be a Butterfly is a Moth, belonging to the family Phalaenidae. It is called *Hipparchus Papilio Sárius*, and is of rather uncommon occurrence in this country.

COCKROACHES.—F. H. J.—We can assure you that the plan recommended by Mr. Loddiges does most completely answer the purpose of killing these pests; only you must persevere. By following his advice the hothouses in the Garden of the Horticultural Society have been cleared of them.

BEES.—E. H. L.—You had better consult some neighbour experienced in Bees for his manner of handling them and their comb. You can stupefy them with the fungus which is collected for that purpose. When small portions of honey are often wanted, glasses or movable boxes are usually employed.

BOOKS.—Mr. Lowder.—We are unable to give you any information respecting the pamphlet alluded to.

SEEDS.—A Constant Reader.—The seed of Heaths and Epacris should be sown as soon as ripe in shallow pots or pans, half filled with broken crocks and small lumps of peat, then a layer of somewhat finer peat and silver sand, and lastly, an inch of finely-sifted peat and sand in equal proportions. Mix the seed with sand, and scatter it evenly over the surface, after which a little sand may be sprinkled over it. Water the pans through a very fine rose, and place them on a greenhouse shelf, where the soil will not be liable to be dried up by the sun. When the plants are large enough, pot them off three together into a 60-sized pot. In sowing Ferns, prepare the pots in the same manner, water them previously to sowing through a very fine rose, dust the seed or spores over the surface of the pot, and cover the latter with a hand-glass. Let the pots be placed in a shady part of the greenhouse or stove, according to the temperature of the country of which the plants are natives, and let them remain undisturbed until the spores germinate.

WREDS.—A Correspondent tells us that "flint-pitching" is the paving of stable-yards, and other places with round flint-stones. Grass may be prevented growing in such places by the plentiful use of sulphate of copper, or any other poisonous salt. All such appliances will, however, require renewal.

MILKS.—A Young Gardener.—The subject of cross breeding in plants is far from being fully understood, and we hardly know what is possible. You may, however, be sure that a *Fuchsia* will not mix with a *Pentstemon*. The rule is that plants must be nearly related; the difficulty is to know the degree of relationship, and this can only be determined by experiment. Sow *Fuchsia* seed as soon as ripe in peat, loam, and sand; or if ripened late keep it till the spring, for the seedlings may damp off in winter.

COLOURS OF FLOWERS.—J. B. M. H.—Little is known of the means of changing the colours of flowers artificially. Alum renders the *Hydrangea* blue, and some saline substances, such as phosphate of iron and muriate of ammonia, appear to heighten the tint if red; but there experiment has stopped. If, however, you cause your Balsam to grow in some red infusion, especially that of *Phytolacca*, the *Virginian Poke*, it is not improbable that you may stain the veins purple. If also you grow the cuttings, when in flower, in a weak solution of prussiate of potash, and two days afterwards shift them into a weak solution of sulphate of iron, you will stain the veins blue.

COMPLAINTS.—Omega.—If you will look at the Notices in last week's paper, you will find your questions duly answered.

MISCELLANEOUS.—Horn Box.—*Periploca graeca*. —G. D.—1, *Alonsoa incisifolia*; 2, *Agératum Mexicanum*; 3, a *Cistus*; 4, *Veronica spicata*; 5, *Campánula speculum*; 7, a *Lobelia*; 8, *Helianthemum roseum*; 9, *Lobelia begonioides*; 10, *Genista triquetra*; 11, *Spartium junceum*. —U. R. H.—*Lithospermum purpureo-coccineum*. The creeper is *Wendlandia populifolia*. There is no probability of your perpetuating your monstrous *Fuchsias*. —H. H.—1, *Rubus Koehleri*; 2, *R. corylifolius*; 3, *R. carpinifolius*; 4, *R. rhamnifolius*. —M. L. H.—Messrs. Bailey, Ironmongers, Holborn, will give you the information you desire. —W. H. P.—Thanks. —Sally.—We can form no opinion concerning your blotched *Alonsoa*, for its flowers were crushed to pieces in the post-bags. —A. E.—Strawberry blossoms are blind from one of the following causes:—1, They are naturally barren, as in the *Hautbois*; 2, they are injured by cold when young, as sometimes happens in forced plants; or 3, they are wet when flowering, as occurs in such seasons as the last, or in bad forcing. —E. E.—They are private marks. Myatt's *Victoria Rhubarb* is an excellent early sort. Plant at the end of October. —G. D.—Your Poplars are attacked by a parasitical fungus of the genus *Uredo*. There is no known cure. As the disease only appears now, when the growth of the plant is finished, it is probably unimportant. —Speedwell.—1, apparently *Dracoccephalum speciosum*; 2, *Cytisus nigricans*; 3, *Lysimachia nemorum*. Such wretched morsels are scarcely determinable. —Insignis.—*Veronica exaltata*, *Lupinus polyphyllus*, *Kitabéla vitifolia*, and an Aster of some kind. —A. E.—*Eudomis punctata*. —A. H.—The yellow *Ixia* is apparently *I. bulbifera*; the white is *erecta albiflora*. —J. B. O.—*Stanhopea saccata*. —An Old Subscriber.—Your small green-fleshed Melon, which you say is very prolific, proves to be of rich flavour. It has a thin, but remarkably hard rind. —A Subscriber.—If Messrs. Youell's advertisements do not give you the information, a penny will procure it from them by post. —D. Beaton.—*Leucocoryne ixoides*. —J. S.—*Campanula alliariaefolia*. —John Smith.—*Tournefortia lappacea*, an old and long lost plant. —A Reader.—*Lycium barbarum*. —Scrogie.—1, *Aira cristata*; 2, *Festuca rubra*; 3, *Melica nutans*; 4, *Melilotus officinalis*; 5, *Stellaria uliginosa*; 6, *Juncus bufonius*; 8, *Poa annua*; 9, *Scirpus setaceus*; 10, *Polytrichum alpinum*; 11, *Silene pyrenaica*; 12, *Sisymbrium Sophia*; 13, *Cistopteris dentata*; 14, *C. fragilis*; 15, a *Galium*; 16, apparently a morsel of *Browallia*. —S. G.—1, *Carpinus betulefolius*; 1, some *Desmodium*. —M. W.—Apparently *Erica refuigens*. —Carl.—*Stipa pennata*.

SEEDLING FLORISTS' FLOWERS.

VERBENAS.—J. N.—Your seedlings reached us in such a crippled condition, in consequence of the bad manner in which they were packed, that it is impossible to form any just estimate of their qualities. The *Phlox* is only one of the many varieties of *P. suaveolens*, and is not at all handsome.

DAHLIAS.—W. Deans.—The bloom of your seedling *Duchess of Buccleugh* was rather too much shaken in the journey. The flower appears to be good in form, round, with the crown well up; the petals do not appear to open freely, and the white is not sufficiently pure, it is very regularly tipped of an agreeable lilac. We should like to see another bloom.*

PICTURES.—D. D.—Your flower can only be regarded as a border variety; the petals are too small, jagged at the edges, and the colour is too much distributed over the petals. —Youell & Co.—The bloom now sent is a decided improvement upon the one previously received: the edges of the petals are smoother, the guard leaves are large and well formed, and the next tier are large and good also; but, like Mrs. Barnard, (which flower it somewhat resembles,) it wants two or three more petals to complete the crown; the rose edge is very perfect, neat, and delicate.*

CARNATIONS.—W. Lodge.—Your seedling, *Lodge's True Briton* (scarlet bizarre,) has large guard leaves, of a good form, with very smooth edges, the colours and striping distinct; but the next row of petals, and all the other petals, are disproportionately small—a defect fatal to it as a show flower.*

PANSIES.—A. B.—Among so many specimens of Pansies, there

must of course exist different degrees of merit, altogether, they form a very creditable collection:—the eyes are invariably fine, and generally the substance is good; in some instances the combination of colours is very curious. —J. T.—No. 1 wants substance, and there is a deep notch in the bottom petal; 4, do., and too small; 2 and 3 are deficient in roundness, they are also, in their present state, too small and deficient in substance.*

PRILARGONIUMS.—J. Brock.—None of your seedlings are of any use, they want both form and substance. —G. B., An Amateur Florist.—The upper petals of your flower want substance, particularly at the edge, and they appear too high, but we cannot very well judge of the form, from the petals having fallen, the colour is peculiar; the lower petals, which are broad and well rounded, are of a delicate lavender; the top petals are veiny, with a deep blotch, surrounded by a dull crimson upon a deep lavender ground-colour. The flower is thin for its size, but it is the best of its colour we have seen.*

FUCHSIAS.—An Observer.—The colours of your seedling are not sufficiently brilliant to render it worth cultivation. —G. S.—*Lodowick Rival* is a handsome variety, with dark purplish vermilion tube and sepals, the latter opening so as almost to reflex, showing the large crimson-purple corolla to great advantage. The other is nothing more than the female bloom of *Fuchsia cylindrica*. —R. F.—42-65 is one of your best seedlings, the contrast between the sepals and corolla being very decided; for the same reason we like 86, the dense vermilion corolla of which looks well with the long, delicate tube and sepals tipped with green; 6, 8, 56, 58, 65, 121, 143, for the reason stated above, we should reject—the colours in these varieties are too faint and weak; 2, 36, 81, are but little better; 8-70 is pretty in colour, and forms a good contrast with your *globosa longiflora*; but these, with 1, 50, and 58, are not improvements upon the varieties we daily see. —J. Brock.—Your seedling *Fuchsia* is very pretty in colour, but though a good flower, it is surpassed by many already out. —A. B.—Your seedlings are, most of them, large and showy varieties; we prefer your smaller specimens, as the form of the flowers is more perfect than in the larger sorts, which have the divisions on the corolla narrow and pointed, and when the flowers are fully expanded these divisions separate. The best and the most novel among your seedlings is one entirely of a bright vermilion colour; the other varieties are not equal to the fine sorts in cultivation. Every week produces new and beautiful hybrids. —W. Rogers and Son.—We cannot undertake to name seedlings. In the one sent the tube is stout, with sepals of a rosy carmine, broad, and tipped with green; they expand freely, showing the corolla, which is of a rosy purple. This is a large and bold flower. —Mr. Todd.—Your seedling is not so fine, on account of the extraordinary length of the sepals, which are more than two inches long, and disfigure the flower, by destroying its neat and elegant appearance, and by partially concealing the corolla, which is of a beautiful purple. —W. Deans.—Your seedlings bear rather too much resemblance to each other, and from the deep, rich crimson carmine of the tube and sepals, appear to require more purple in the corolla. *Nobilis* is the best, being the largest and richest-coloured variety; next to this we place *Dansu*. *Semperflorans* is a most prolific bloomer, and appears an excellent variety for outdoor cultivation. *Recurva* is also very pretty. They all appear to be of good habit, and very fine bloomers; the flowers are small, compared to many of the varieties now in cultivation.*

As usual, a host of letters have arrived too late for answers this week.

NEWS OF THE WEEK.

BOTH Houses of Parliament have been actively engaged this week in working up those details of business which are always crowded into the last days of the Session; and from the preparations in progress, it is supposed that the Queen will prorogue Parliament in person in the course of another week. In the Lords, on Monday, Lord Montague brought forward his resolutions on the finances of the country, which led to an animated discussion on the state and prospects of the Revenue; the resolutions were opposed by Government, and negatived without a division. On Tuesday, the second reading of the Irish Arms Bill gave rise to a discussion on the nature of the Roman Catholic Oath, Lord Camoys and the Earl of Shrewsbury contending that the oath was not binding on Catholic Peers in their legislative capacity; while Lords Beaumont, Brougham, and others insisted that it was to be taken in its literal sense, as prohibiting a vote contrary to the interests of the Established Church. After some discussion on this point, the second reading was carried. On Thursday the Bill went through Committee, and was last night read a third time and passed, without alteration. In the Commons, the principal topics of discussion have been the Bill for organising the Chelsea Pensioners as a military force at the disposal of the civil authorities, and Lord Campbell's Bill for altering the law of libel. Considerable opposition was shown to the Chelsea Pensioners Bill, and numerous divisions took place on its several stages, but it ultimately passed through committee after a vain attempt to limit its duration to five years. For the particulars of the debate on the Defamation and Libel Bill, and for the routine business transacted, we must refer to our Parliamentary Report.

From France, we learn that Mr. O'Connell's reply to the offer of assistance from the Republicans of Paris has given no satisfaction to that party. The Conservative press treats the whole affair with ridicule, and the Radical papers declare that Mr. O'Connell does not go far enough, and that French democracy has pitched its tent far beyond the line he has laid down.—In Spain, the new Ministry have adopted the decided course of communicating to Queen Isabella the national wish that she should be declared of age after the meeting of the Cortes. The address embodying this resolution was presented in the presence of the nobility, ambassadors and authorities of Madrid; and the Queen, in reply, signified her assent to the proposal. The adoption of this measure is attributed to the anxiety of the new Government to divest Espartero of all official character, to prevent the Infante Don Francisco from intriguing for the Regency, and, finally, to enable Queen Christina to return to Spain, which can only be effected by declaring the majority of her daughter.

In the meantime, Espartero has published a manifesto declaring that he has not infringed the fundamental law, and showing that he is not disposed to resign his office as chief magistrate. His arrival at Lisbon, of which our Portuguese news has brought advices, was at first supposed to have reference to some ulterior views for the re-establishment of his power; but it is now known that the Portuguese Government have not permitted him to land, and that he is on his way to England.—From the Levant we learn that the two deposed Ministers have at length determined to leave Servia, and take up their residence within the Turkish frontier. This result, it is supposed, will satisfy the demands of Russia, and lead to a final settlement of the Servian question.—From the United States we have accounts of a revival of the Oregon movement by Gen. Cass, late Minister in France, who is avowedly hostile to England. The opinion now expressed is in favour of the seizure of the disputed territory by the United States, without assenting to any negotiation, treaty, or reference.

Home News.

Court.—Her Majesty, Prince Albert, the Prince of Wales, and the Princesses, are quite well, and continue at Windsor Castle. On Saturday, the Queen and Prince took horse exercise in the Great Park. On Sunday, they attended divine service in the Chapel Royal of Cumberland Lodge, and in the afternoon promenaded on the Castle terrace, which was crowded with visitors. On Monday and Tuesday her Majesty and Prince Albert took their early morning walk, and in the afternoon rode out in the Park on horseback. The Prince of Wales, the Princess Royal, and the Princess Alice, were also taken for an airing in the shrubberies and private plantations in the Home Park, attended by the Dowager Lady Lyttelton. Wednesday being the birthday of the Duchess of Kent, her Majesty and Prince Albert dined with her Royal Highness at Frogmore. The Earl of Haddington, First Lord of the Admiralty, and Lord Adolphus Fitzclarence, Commander of the Royal yacht, have visited Windsor this week for the purpose of making all the necessary arrangements connected with the marine excursion of the Queen during the sojourn of the Court in Sussex. Her Majesty is expected to proceed from Windsor to Brighton, on Monday the 28th inst. There is now very little doubt that her Majesty will honour Plymouth, and probably Pembroke, with a visit during the trip. It is likewise expected that the Queen will honour the Earl and Countess Cawdor with a short visit at Stackpoole Court, Pembrokeshire. The Earl of Morton has succeeded Lord Rivers as Lord in Waiting, and Admiral Sir Robert Otway has succeeded Colonel Drummond, as Groom in Waiting on her Majesty. The Duchess of Norfolk has resigned her appointment as Lady of the Bedchamber, and has been succeeded by the Marchioness of Douro.—The Queen Dowager left Witley Hall on Monday morning on a visit to Worcester, returning the same day. Her Majesty was received with every demonstration of respect, but in consequence of the stormy weather the illuminations were postponed to Tuesday.—The King of Hanover came to town from Kew on Saturday, and dined with the Duke of Wellington, returning to Kew in the evening. His Majesty had a dinner-party at Kew on Sunday, on Monday dined with the Marquess of Londonderry at Rosebank, Fulham, and on Tuesday came to town and attended Viscountess Duncannon's evening party. His Majesty dined with the Earl of Lonsdale on Wednesday, and with the Duchess of Gloucester on Thursday.—The Duke and Duchess of Cambridge left town on Monday for Germany.

Post-Office.—The negotiations between the Postmaster-General and the Post-office authorities of Belgium, Holland, Austria, Saxony, Prussia, Sweden and Norway, and Russia, are, it is stated, finally concluded for the transmission of letters and newspapers to and from the above countries, similar to those between England and France, by pre-paying the postage or not, at the option of the parties. The Prussian and Austrian Governments have reduced the postage on letters to a uniform price throughout their territories on the English system. The French Government is making arrangements with the Post-office departments of Switzerland, Turin, Rome, Naples, Sardinia, and the Two Sicilies; so that all letters and journals to and from this country, *via* France, will be placed under the same regulations as the Post-office Convention entered into with this country in June last.

Gazette Announcements.—The Queen has been pleased to grant unto John Townshend, Esq., of Lower Grosvenor-street, and of Chatteris, in the Isle of Ely, formerly known as the Earl of Leicester, and one of the members for Bodmin, her Royal license and authority, that he and his issue may discontinue the surname of Townshend, and henceforth use the surnames and arms of Dunn Gardner. The Queen has also been pleased to grant unto Sir Thomas Gage, Bart., of Hengrave-hall, and of Coldham-hall, Suffolk, her Royal license and authority, that he and his issue, in compliance with the will of his late uncle, John Gage Rokewode, Esq., may use the surname of Rokewode, in addition to and before that of Gage, and bear the arms of Rokewode quarterly with those of Gage.

The Cathedral.—From the Parliamentary returns of the fees charged for admitting individuals to see monuments at Westminster Abbey, it appears that for several years up to Midsummer, 1841, a fee of threepence was paid by each individual for admission to Poet's-corner and the nave, and one shilling more for admission to the transepts and the chapels; but from Midsummer, 1841, up to the present time there has been a free admission to

Poet's-corner, and but sixpence for admission to the remainder of the abbey. From Midsummer, 1841, to the end of the year, upwards of 30,470 persons paid this admission. In the year 1842, 51,444 paid the admission, and from January to Midsummer in the present year about 23,500 paid it. During the year 1842, about 1,290*l.* was received from this source, and during the past half-year 542*l.*, the whole of which, as stated in the return, has been appropriated to the "Ornamental fund," and for cleaning the monuments and tombs. The payment by each person for admission to St. Paul's is twopence, the fees arising from which are received by the four vergers, and which during the year 1842, amounted to 425*l.*; but in consequence of the death of two of these vergers the accurate amount cannot be ascertained.

Foreign Wines and Spirits.—By a Parliamentary return of the quantity of foreign wines and spirits imported into the United Kingdom during the past year, it appears that the total quantity of wine imported from the Cape, Portugal, France, Spain, Madeira, Germany, and other places, was 7,216,113 gallons; the quantity of rum 4,619,804 gallons; the quantity of brandy 1,674,436, with several thousand gallons of spirits, sweetened and not sweetened, mixed, in bond, imported from the before-mentioned countries, America, and other parts.

Window Duty.—The returns of window duty for the twelve towns in England paying the largest amount, and just published by order of the House of Commons, gives the several amounts as follows:—For Bath 21,898*l.*; Birmingham 11,093*l.*; Brighton 15,216*l.*; Bristol 15,056*l.*; Cheltenham 6,755*l.*; Clifton 7,850*l.*; Leeds 7,514*l.*; Liverpool 30,790*l.*; Manchester 19,157*l.*; Newcastle 5,710*l.*; Norwich 7,141*l.*; Plymouth 11,391*l.*

Foreign.

FRANCE.—The domestic news from Paris is of secondary importance: The papers in general refer to Mr. O'Connell's mention of M. Ledru-Rollin's communication relative to the late demonstration of sympathy with the Repealers. The *Débats* sneers at the whole proceeding, and declares that if M. Ledru-Rollin and the Radical journals are satisfied with Mr. O'Connell's letter, they are easily pleased. "It is impossible," it says, "to find a more cutting satire upon the letter of the deputy of the Sarthe, than Mr. O'Connell's answer. Mr. O'Connell is like a polite man who has received a mark of politeness which he did not seek or expect, and which he knows not what to do with. M. Ledru-Rollin says—'Sir, you have perfectly understood our intentions,' and Mr. O'Connell replies—'Sir, we perfectly understand one another.' But how do they understand each other? If the Tory Government, says M. Ledru-Rollin, should profane the sanctuary of the law, France will give you active assistance. Mr. O'Connell reduces to its just value this offer of reinforcement, for he declares it to be useless to discuss this contingency, because it can never happen; and he adds, in his speech, that if France, or America, or any other power should attempt to shake the devoted attachment of the Irish to their Sovereign, such attempts would be repelled with contempt. See, therefore, what the understanding is to which these gentlemen have come! Poor Mr. O'Connell is decidedly incurable! He will never be relieved from that malady with which the *National* the other day reproached him in such burlesque terms—the *Maladie Monarchique*!" The *National* also alludes to the subject, and declares that Mr. O'Connell does not go near far enough for its friends and supporters. "We have not time," it says, "to decide whether his mode of proceeding is best. We receive it as a fact merely, and have to declare that French democracy has pitched its tent far beyond the line thus laid down."—The tour of the Duke and Duchess de Nemours through the western departments had been attended with no striking incident until their arrival at Mans, the chief town of the department of the Sarthe. His Royal Highness was there met at the gates of the city by M. Trouvé Chauvel, the Mayor, who, instead of addressing the usual felicitations to him, recapitulated the grievances of the department against the central Government, spoke of the attachment of the people to the dogma of national sovereignty proclaimed by the revolution of July, of the advantages of conciliation, of the necessity of the Orleans dynasty accepting with sincerity the representative institutions, and upholding abroad the dignity of France; and concluded by reminding the Prince of the cruel trials his family had already undergone, of the vicissitudes of royalty, and of the gratitude of nations for the great citizens who have given glowing proofs of their devotedness to the glory and prosperity of France. The reply of the Prince was remarkable for firmness and dignity; but, although M. Basse, the Deputy of the department, who waited upon him at the head of the *élite* of the population, made up in adulation for the uncourteous harangue of the Mayor, he did not think proper to prolong his stay in the town beyond three hours; and the Mayor, the adjoints, and the librarian, have since been dismissed by a royal ordinance. The tribunal of the first chamber of the Royal Court of Paris pronounced its judgment in the case of the executors of the Marquis of Hertford against Nicholas Suisse at great length last week, and concluded by stating that a donation of 30,000*l.* French rentes, made by the late Marquis to an old servant, was neither out of proportion with his immense fortune, nor unlikely, when the liberal habits of the master were considered. The Court consequently adjudged that the inscriptions should be handed over to Nicholas Suisse, the executors to pay the costs.—The raising of the timbers of the *Télémaque*, at Quillebeuf, is still going on. The new company has saved 42 pieces, besides the caboose stove, and three casks of rancid tallow. Every piece of timber, as it is brought up,

is carefully sounded, in order to ascertain whether it may not have been hollowed out, and made a place of concealment for the diamonds and gold, which some persons persist in saying were embarked in the *Télémaque*. In a few days the whole of the cargo will be landed, and then the hull will be taken up.—Accounts from Algeria of the 29th ult. announce that, early in the morning of the 25th, Abd-el-Kader attacked in person the camp on the Oued-Aman, at the head of 800 cavalry and 200 infantry. This camp, which was intended to protect the works of the bridge in progress of construction on the Mascara-road, was only garrisoned by 250 infantry. The assailants were nevertheless repulsed with the loss of 8 killed. On the side of the French, Colonel Leblond, commander of the camp, and one soldier, were killed, and the surgeon and several others wounded.

SPAIN.—We have accounts from Madrid to the 9th inst. Their contents relate principally to the proceedings at the Palace on the previous day, when the Ministry communicated to her Majesty the wish of the nation that she should be declared of age. This ceremony took place in the presence of the Infante Don Francisco and his family, the whole of the foreign ambassadors, the grandees of Spain, the general officers, and all the authorities of the capital. The manifesto read on this occasion was rather long. After alluding to the termination of the Regency by the flight of Espartero, it proceeds as follows:—"The will and want of the nation are, that your Majesty in person govern it; but your Majesty wishes to hear the national will expressed in the Cortes, which are shortly to meet, and to take before them the oath required by the Constitution, which none but the Cortes can receive from a Constitutional Monarch." To this address, which bore the signatures of all the Ministers, the Queen replied:—"I have heard with the greatest satisfaction the loyal sentiments which the Provisional Government of the nation has just expressed to me; and from the day I shall make oath, before the Cortes, to the Constitution of the State, I shall endeavour to secure the happiness of Spaniards." On the conclusion of the ceremony the troops assembled before the Palace retired, uttering loud *vivas* in honour of Queen Isabella. It appears that the Ministry was induced to adopt this important measure by several considerations. It had been stated by Espartero's friends that he did not renounce all hope of recovering his authority, that he had positively declared that he would not abdicate, and that once in Lisbon, he would concert measures with his partisans in Estramadura and Galicia, to revive the struggle. Although little importance was attached to these menaces, the Ministry deemed it expedient to divest Espartero of all official character. On the other hand, the friends of the ex-Queen Christina were anxious to enable her to return immediately to Spain, and this could only be effected by the declaration of the majority of her daughter. General Narvaez, on being asked by a distinguished foreigner if the ex-Queen intended to visit Madrid shortly, replied, "Certainly; it is but fair that her misfortunes should end with the minority of her daughter." Don Francisco de Paula, or rather Donna Carlota, and their partisans were not idle; the latter loudly talked of investing the Prince with the Regency until the month of October, 1844. Several meetings had already been held for the purpose, under the presidency of Count Pársent. The Ministry, however, was watching their proceedings, and to defeat their plans it resolved at once to proclaim the Queen of age. The *Gazette* publishes several decrees, pronouncing the dissolution of the corps of operation, the staff, and battalions of volunteers, organised during the insurrection, and an address from General Narvaez to the army, exhorting them to union, discipline, and obedience to the laws. Espartero, who arrived at Lisbon on the 7th, has also issued a manifesto to the nation, dated on board the steamer *Betis*, from which the following is an extract:—"I accepted the charge of Regent of the kingdom to give security to the constitution and to the throne of the Queen, after Providence had, by crowning the noble efforts of the people, freed it from despotism. As chief magistrate I swore to maintain the fundamental law—neither to save it did I infringe it. To this blind respect do its enemies owe their triumph. But I am not perjured. There was a time when I witnessed the re-establishment of the laws, and I then hoped that, at the expiration of the term marked by the constitution, I should have been enabled to deliver up to the Queen a monarchy tranquil in its interior and exteriorly respected. A military insurrection, without the slightest pretext, concluded the work commenced by a mere few; and abandoned by those whom I so often had led to victory, I am compelled to seek refuge in a foreign land, fervently desiring the felicity of my beloved country." The Duchess of Victoria had left Madrid to join her husband, escorted by a guard of honour, appointed by the new Ministers. The Junta of Barcelona perseveres in opposing the provisional Government, and had addressed to it a declaration on the necessity of convoking a Supreme National Junta, in imitation of that assembled at Cadiz, in 1812. But the decree for the convocation of the Cortes having arrived at Barcelona, the Junta perceived that their demand was rendered useless.

PORTUGAL.—On Sunday evening, the 6th inst., H.M.S. *Malabar* arrived at Lisbon with the ex-Regent of Spain, and 30 persons, including Gen. Van Halen and some of his late Ministers, who have faithfully adhered to his fallen fortunes, and volunteered to become the companions of his exile. A Council of Ministers was summoned on the following morning, to consider the complication occasioned by the presence of the late Regent, and the probability that he would seek permission to land, and make Lisbon the focus of intrigues for the resumption of his late position in the neighbouring kingdom. The

Council sat for three hours, and resolved to refuse permission. Espartero therefore repaired on board the Prometheus, on his way to London, and touched at Bayonne for the purpose of taking with him the Duchess, if she were still there; but she had already quitted that city for Paris. The Regent did not disembark from the Prometheus, but set sail for England on the 16th. The supposed renewal of the tariff negotiations by the Duke of Palmella, whose arrival in London was announced in our last, has excited much interest in Lisbon, and especially among the fruit-growers. The correspondent of a Morning Paper states that, "The conclusion of the tariff convention will undoubtedly serve, by reducing to a merely nominal rate the duty on Portuguese fruits, &c., to increase and cheapen the early stock of Covent-garden market. The Peninsular Company's packets reach Southampton from this on the fifth day; and thus the epicure, without leaving what Camoens calls "snowy England," will be able to participate in the advantages of this sunny climate, and luxuriate in the choicest fruits and vegetables, long before they could be ripened by his own sluggish sun, and for a fifth of the price of hothouse productions."

BELGIUM.—It appears from the last official returns that the finances of Belgium are not in a flourishing condition; the deficiency between the actual receipts and the budget of expenditure amounting to 4,714,911 francs. The bronze statue of Rubens has at length been placed on its pedestal in the Place Verte at Antwerp. The figure itself is 14 feet high, and weighs 20,000 lbs. The whole monument rises to 30 feet. The inauguration was celebrated with much enthusiasm. M. Lannoy, Belgian Consul in the Philippine Islands, has purchased at Manila, for the Royal Library, a collection of very curious books, which contains, among other works, a general History of the Philippine Islands, in 14 volumes; a Flora of those islands, Chinese works and drawings, a Pampago grammar, a Tagalog and Spanish Dictionary, &c.

GERMANY.—The celebration of the Thousand Years' Jubilee, in commemoration of the settlement by which the German Empire was divided between the three brothers, sons of Philip the Devout, was generally celebrated on the 6th inst., more particularly in the Prussian States. The 6th is said to have been the day of the settlement 1,000 years ago, and as it this year occurred on Sunday, the churches were everywhere crowded. At Berlin, the King, Queen, and all the Royal family, attended the Cathedral, where a sermon suitable to the occasion was preached by Dr. Strauss. The hymn of celebration was executed under the direction of Mendelssohn, and was accompanied by a great variety of instruments. The singing was extremely interesting, and the impression produced was greatly heightened by the firing of cannons at intervals of pauses in the singing. Several of the Prussian papers state that the King intends to pay a visit next month to the Swedish Court. The Duke de Bordeaux arrived at Vienna on the 2d inst., and intends, it is said, to pay a visit to England to study naval tactics.

RUSSIA.—Accounts from St. Petersburg state that the Duchess of Leuchtenberg, the eldest daughter of the Emperor, has been safely delivered of a Prince, who was baptized by the name of Nicholas; and that the Duke of Nassau is betrothed to her Imperial Highness Princess Maria Michaelowna, eldest daughter of the Grand Duke Michael. The *Swabian Mercury* contradicts the statement that Prince Peter Dolgorucki has been exiled to Siberia by the Emperor of Russia, in consequence of his work on the Russian nobility. This journal adds that the Emperor suggested the propriety of his keeping himself for a time at a distance from the nobility, lest he should involve himself in serious disputes, and that the Prince chose Wiatka, where he has estates, as his place of residence.

TURKEY.—Letters from Belgrade in the Austrian papers state that Wutzitch and Petroniewitch have at length determined on quitting Serbia, and that an assembly of three hundred of the principal persons and elders of the country had been convoked at Belgrade for the 8th inst. To that assembly will be submitted, in the presence of Hafiz-Pacha, M. de Lieven, and M. Wanchenko, the reasons which have rendered the departure of those two Primates necessary. On the same day, Wutzitch and Petroniewitch will proceed to Widdin, where the Porte has desired them to fix their residence.—Accounts from Tunis state that the Turkish fleet has not yet made its appearance off the coast, the ships which were seen on the 13th being the Brazilian and Neapolitan squadron, which is conducting the new Empress of Brazil to Rio.

EGYPT.—Letters from Alexandria, of the 26th ult., state that Captain Harris, lately employed on a mission to the Sovereign of Abyssinia, has succeeded in establishing the preliminaries of a commercial treaty, which may eventually lead to a useful commerce with that country, in which there are so many natural resources hitherto totally neglected. Captain Harris has left for England, with presents to the Queen, consisting of a mule of the royal stud, with magnificent accoutrements, and 25 chests of curiosities and objects of natural history. The lock at Atfeh is now finished, and being open to boats of all sizes, affords a direct communication with Cairo, obviating the necessity of changing boats at Atfeh, with the tax upon merchandise and the attendant expenses. The first boats to pass through the lock were those of the Transit Company with the Indian passengers. The Nile has begun to rise early this year, and very favourably; and as the country is now again tolerably well stocked with cattle, there is every reason to look forward to increased agricultural prosperity.

UNITED STATES.—The Royal Mail steam-ship Caledonia, which sailed from Boston on the 1st, and Halifax on the evening of the 3d inst., arrived at Liverpool on Sunday night, after a passage of 12 days. In the absence of other subjects of excitement, the sections of the Protest-

ant Episcopal Church in the United States are in hot controversy respecting the doctrines of Dr. Pusey. With this subject the newspapers have been filled for some time past, and some of the editors declare that their tables are weighed down by correspondence on the topic. They appear generally to agree that there is no resting-place for Dr. Pusey but the bosom of the Roman Catholic church, and they anticipate a large accession of numbers to that body by his influence and example. The Oregon question is once more before the public, having been introduced by General Cass, late Minister to France, and avowedly hostile in his sentiments towards England. He describes England as "boldly aiming at universal dominion," and declares his belief that "a war will not long be avoided, unless prevented by intestine divisions in the British Empire." The opinion entertained by the leaders in the Oregon movement is, that the territory shall be taken possession of by the United States, and that no negotiation, treaty, or reference shall be deemed necessary. These opinions of General Cass attract more than ordinary attention, as he is known to aspire to the Presidency in opposition to Mr. Clay and Mr. Webster, both of whom are mentioned as candidates. The Columbia has been abandoned. A considerable portion of the light machinery has been saved; but the heavy materials, including the engines, it was found impossible to save. The Acadia, which sailed from Liverpool on the 19th, was entering Boston as the Caledonia left. Mrs. Gillmour, charged with murder in Scotland, has been pronounced sane by the court in New York, but her case is adjourned on different pleas, and her counsel is gone to Washington to confer with the Attorney-General. It is very doubtful whether she will be given up.—The last chapters of "Martin Chuzzlewit," by Boz, have given great offence, and even Mr. N. P. Willis, the admirer and advocate of Mr. Dickens, has found it necessary to denounce these chapters. Accounts from Otaheite affirm that the English commander, Sir T. Thompson, has taken the Queen under his protection, that the French commander is exasperated, and that the respective vessels are prepared for action. There is, no doubt, exaggeration in this statement. Another disturbance took place at Kingston, in Canada, on the anniversary of the battle of the Boyne, in which one person was killed. A collision has taken place in Newfoundland between H.M.S. Electra and the French fishermen, who had begun to take bait on British ground in spite of repeated warnings. One man was killed and several wounded, and a French frigate had arrived to demand explanation.

Parliament.

HOUSE OF LORDS.

Saturday.—The House met at 12 o'clock.—The Coroners' Duties Bill was read a third time and passed.—Lord MONTAGUE stated the terms of the resolutions to which he meant to ask their assent on Monday as follows:—"1. That this House observes with much concern and disappointment, that the expectations held out of a surplus revenue, exceeding 500,000l. for the year ending the 5th of April, 1843, have not been realised, but that there has been an actual deficiency of 2,421,000l., notwithstanding the imposition of a tax on property, the application to the public service within the year of 511,400l. obtained from the Government of China, and a receipt exceeding 1,300,000l. as duties upon grain imported. 2. That the charge for the permanent debt has been increased during the last two years, the Exchequer balances have been reduced, and upwards of 1,000,000l. of Exchequer-bills held by the trustees of the Savings-banks converted into stock. 3. That under these circumstances it is most peculiarly the duty of the Legislature and of Her Majesty's Government, to enforce the strictest economy which is consistent with the public service, and to attempt all such measures as may increase the ordinary revenue by insuring to British industry, whether agricultural, manufacturing, or commercial, its widest and freest extension, and its largest reward, thus averting from the country the calamity of the re-enactment of a tax upon property in a time of peace, and promoting the well-being and prosperity of all classes of Her Majesty's subjects."

Monday.—The Admiralty Lands Bill was read a third time and passed.—Lord MONTAGUE brought on his motion relative to the financial condition of the country. The late Ministry had been taunted with a decaying revenue, ruinous wars, and their inability to resuscitate the national finances. The present Ministry had undertaken the task, backed by a Parliamentary confidence almost unbounded and unparalleled. From the imposition of the Property and Income-tax, it was estimated that there would be a surplus of 520,000l., but, instead of this, there was a deficiency of 2,421,000l., which made an error in the estimate of no less than 2,940,000l. and this without reckoning the Chinese money and the 1,300,000l. from the corn duties, which was not calculated on, and which, if added, would present a deficiency in the revenue, as compared with the expenditure, which was perfectly frightful. The Government were entitled to take credit for the unpaid portion of the Property-tax, amounting to upwards of 129,000l., but still the deficiency was to be counted by millions, and was by far the greatest that had ever been known to occur in any former estimate. The deficiency ran through every item—on coals, Irish spirits, &c.; and on timber, an unwise sacrifice had been made of 680,000l., besides inflicting an injury on Sweden, which was entitled to the advantages of the most favoured nation, and had a right to claim being placed in the same position as the United States. In one instance had the expectations of the Government been realised, which was on the article of coffee, in the duties on which they had made the nearest approach to free-trade principles. The loss on coffee had been estimated at 170,000l., and it amounted only to 48,000l., and even that loss was to be attributed to the extraordinary depression of the period. The anticipated income of the present year was 50,150,000l., and a surplus was anticipated of 700,000l. But though the Government had made considerable reductions, he feared that this anticipated surplus would be as illusory as that of the preceding year. Under the circumstances of the country, he had little hope of the repeal of the Income-tax, which the Government had pledged themselves would be taken off in three years, if its produce realised their expectations. This it had more than done, for it was estimated that it would only yield 3,300,000l., while its actual produce was 5,100,000l. A substitute might be discovered for it without much difficulty, which would be found in economy and free trade. It must be admitted that Adam Smith had no more promising pupils than the present Government. They were now removing the restrictions on the exportation of machinery, and they had but to extend the application of the principle involved, in order immensely to benefit the country. After advocating the doctrines of free trade, he concluded by proposing his resolutions.—The Duke of WELLINGTON regretted the absence of the Earl of Ripon, whose illness threw upon him, who was but imperfectly acquainted with financial details, the task of replying. The budget of the past

year had proved defective, from fallacious expectations, a contingency to which all budgets were liable, and to remedy which the Minister of the day must always be under the necessity of applying to Parliament. There was no intention of continuing the Income-tax one day longer than was necessary. Neither the Customs nor the Excise had produced what had been calculated on; but the corn duty was only an equivalent for the loss on the malt duty, and the produce from both was about what might have been received in an average year. The falling off in the duties on wines and spirits was attributable to increased habits of temperance. It was true that a great portion of the Property-tax had been collected between April and July, but it had not been carried to account. All these, and the amounts paid in consequence of the forgery of Exchequer bills, accounted for the difference between the estimates and the result, so as to render the case much more favourable than it had been represented by Lord Montague. The balances in the Exchequer were not diminished, as stated in the noble Lord's resolution, nor had the funded debt been increased. Having every confidence in the future resources of the country, he trusted the House would join him in rejecting the motion.—Lord BROUGHAM and the Marquess of CLANRICARDE followed, in speeches of some length; after which Lord MONTAGUE replied, and offered to withdraw his resolutions, provided the documents were produced which would decide between his figures and those of the Duke of Wellington.—The Duke of WELLINGTON said that the resolutions stated that which was not correct respecting the balances in the Exchequer, and he called on the House to negative them.—Lord BROUGHAM then stated that he had been set free from all allegiance to the party with which he was once connected. He had it under the hand of Lord Melbourne, who admitted that the late Government had no further claim upon him; and he therefore held himself entirely free to support the present one, if he thought proper. The resolutions were then negatived without a division.

Tuesday.—The Theatres Regulation Bill, with an amendment on the 15th clause, was read a third time and passed.

The Duke of WELLINGTON moved the second reading of the Irish Arms Bill, and briefly stated the points in which this bill differed from preceding Arms Bills.—Lord CAMOYS, opposed the Bill, and declared himself almost a Repealer, and entirely an advocate of agitation. He advised the Irish people never to cease agitating until the Established Church was destroyed, and Protestant ascendancy removed.—The Earl of WINCHELSEA reminded Lord CAMOYS of the promise made by Lords and Gentlemen of his persuasion, at the passing of the Emancipation Act, that the Protestant Established Church was to be held strictly inviolate.—The Marquess of LANEDOWN, considering the Bill, as altered and improved by the opposition in the Commons, to be necessary to Government, though not precisely adapted to the present state of Ireland, could not join in opposing it, but he contended that a real independence conferred on the Roman Catholic priesthood would do more than anything else to affirm the Act of Union; but then that provision should not be made at the expense of the Established Church.—Lord BROUGHAM participated in the astonishment with which Lord Winchelsea had heard Lord CAMOYS discuss the subversion of the Irish Protestant Church, and repelled with indignation the charge that the Government of the last 40 years had acted on a policy of irritation. He defended the Coercion Bills of 1833 and 1834, and contrasting the almost tranquillity of those years with the present organised insurrection, with its seditious publications and addresses, demanded whether the modified measure of security now proposed was not at least necessary. He read extracts from the oath prescribed for Roman Catholic Peers, and contended that no subtle distinction which could be devised would avail Lord CAMOYS in reconciling its averments with the opinions he had professed. The Noble Lord's insensibility to the obligation of his oath was but another proof of the evil character of the influence wielded by the Catholic priesthood, and another reason for attending more strictly than hitherto to the nature of the instruction given at Maynooth.—Lord CAMOYS explained that he did not concur in this interpretation of the oath.—The Earl of SHREWSBURY also protested against it, and said that upon such terms he would not have condescended to sit in Parliament. He complained of the depressed position of the Roman Catholic Church, and maintained that if all just grounds of irritation were removed, Arms Bills and all such measures would be unnecessary.—Lord WICKLOW earnestly supported the project for a provision—and a liberal and sufficient one—for the Roman Catholic Clergy.—Lord BEAUMONT emphatically disclaimed the opinions professed both by Lord CAMOYS and Lord Shrewsbury. He understood the oath he had taken in its literal sense, and would feel himself deeply dishonoured and disgraced if he ventured to give a vote contrary to the interests of the Established Church. The progress of the debate, more than anything else, had convinced him of the necessity of some means which would put an instant stop to the present treasonable agitation; and although regretting that the Arms Bill had been accompanied by no remedial measure, he would give it his support.—Lord CAMPBELL quoted Mr. Lynch's opinion to prove that the oath taken by Roman Catholic Members of Parliament, did not affect them in their legislative capacity.—The Marquess of HEADFORD opposed the Bill, because no measures of conciliation went along with it.—The Marquess of LONDONDERRY and the Marquess of CLANRICARDE supported the Bill, which was read a second time.

Thursday.—The Royal Assent was given by commission to the Church of Scotland Benefices Bill, the Ecclesiastical Jurisdiction Bill, the Admiralty Lands Bill, the Court of Exchequer (Ireland) Bill, the Mines and Recoveries (Ireland) Bill, the Liverpool Docks and Harbour Bill, the Glasgow Police Bill, and several other Bills.—Lord BROUGHAM presented a petition from a person of the name of Revelli, who had given evidence before the Athlone Committee, and who in consequence had been denounced from the altar by a Mr. O'Reilly, a Catholic priest. He stated that he had been burned in effigy, and had in fact been driven entirely away from his native town, and he therefore claimed the protection of their Lordships.—Lord WHARFORD laid on the table the papers relative to the dismissal of Lord Lucan and Mr. O'Malley from the magistracy.—After a conference with the Commons, the amendments made by their Lordships in the Theatres Regulation Bill were not insisted on.

On the motion to go into committee on the Irish Arms Bill, Earl Fortescue opposed it, and called on Government to appropriate a part of the ecclesiastical revenues of Ireland to the elevation of the Roman Catholic priests, &c.—After a short defence by Lord BROUGHAM of the late Marquess Wellesley's impartiality in the distribution of patronage in Ireland during his administration in 1834, the House went into committee; and clauses up to 23 (inclusive) were agreed to, and progress reported.—The Holyrood-park Bill and the Designs Copyright Bill were read a third time and passed.

Friday.—The Coalwhippers Bill and the Sudbury Commission Bill were read a third time and passed. The Duke of WELLINGTON moved the committee of the Irish Poor Law Amendment Bill, upon which the Marquis of CLANRICARDE moved an amendment, pledging the House to consider a new and different Poor Law next session. After some discussing the amendment was withdrawn, and the Bill passed through committee. The Irish Arms Bill was read a third time and passed.

HOUSE OF COMMONS.

Saturday.—The House met at noon, and went into committee on the Consolidated Fund Bill. The Sudbury Commission Bill, Attorneys and Solicitors Bill, the Grand Jury Presentments Bill, and the Coal Whippers Bill, were read a third time and passed. Reports on several Bills were then brought up, and various measures were advanced a stage.

Monday.—The House met at noon, and disposed of a large amount of routine business.—On the motion for going into committee on the Charitable Loan Societies (Ireland) Bill, Lord

CLEMENTS made a very long speech, complaining of the inequality of the legislation for the two countries, and objecting in particular to the operation of these Loan Fund Societies in Ireland. No discussion followed, and the bill went through committee, with the exception of two clauses, which were reserved for further consideration.—Lord J. MANNERS presented a petition from members of the United Church of England and Ireland, praying for the establishment of an efficient system of ecclesiastical government, to which he called the attention of the House.—To a question from Sir C. NAPEL, Sir R. PEEL replied, that as the expense of the Chinese war had not yet been fully ascertained, he could not as yet say what the army and navy engaged in that war were entitled to as prize-money.—Mr. COBURN asked if the report was correct that the Duke of Palmella had arrived in this country, in order to renew the negotiations for a commercial treaty with Portugal?—Sir R. PEEL intimated that he was not officially aware of the fact; and, so far as this country was concerned, the negotiations were closed; but he had some reason to believe the report to be correctly founded. On the motion to go into committee on the Chelsea Out-pensioners Bill, Mr. T. DUNCOMBE moved as an amendment that it be committed that day three months, and with great vehemence denounced the Bill as an attempt on the part of Government to establish a military despotism over the people.—Mr. WILLIAMS seconded the motion.—Sir H. HARDING vindicated the army, composed as it was of men as brave as they were incorruptible, and as obedient to the civil power in time of peace, as they were great and energetic in time of war. He repudiated the strong expressions used by Mr. Duncombe, when applied to troops as open to a sense of humanity, as they were ready to perform their duty. The Chelsea pensioners had been repeatedly called out, as in 1830, when a distribution of arms took place, of which a large proportion were sent down to Stockport. But he objected to this mode of arming these men, without the intervention of an Act of Parliament. The metropolitan police force could be accounted and embodied as a military force, at the discretion of the authorities. The Chelsea pensioners were under the control of the executive, and were liable to be deprived of their pensions for disobedience of orders. By the present measure, a portion of them would be organized in a way agreeable to the feelings of the great body; their age and experience would render them more valuable to the civil authorities in any case of disturbance than younger and rawer troops, who, when excited, were apt to act with ferocity; and as the power of the Crown was undoubted, the object of the Bill was at once constitutional and safe.—Mr. E. B. ROCH, Mr. BRIGHT, Mr. HUME, Mr. COBURN, Mr. HAWES, and other Members supported the amendment.—Lord PALMERSTON, Mr. NEWBRIGHT, and Colonel SIBTHORP supported the original motion.—Mr. BROUGHTON would not make up his mind whether to vote for the Bill or not.—The House having divided, there were—For going into committee, 92; against it, 16; majority, 76.—On the question, that the Speaker leave the chair, Mr. HUME moved that he should leave the chair that day six months. On this amendment another division took place. For the Speaker leaving the chair, 92; against it, 13; majority, 79. A course of obstruction, similar to what was pursued in the case of the Irish Arms Bill, followed, the result of which was, that after seven hours' debate, the House went into committee, and reported progress, but without agreeing to the first clause.

Tuesday.—The House met at noon, and disposed of some routine business, but on the motion for going into committee on the Chelsea Out-pensioners Bill, the Opposition was again renewed. After two divisions on questions of adjournment, and four hours' debate, the question that the Speaker leave the chair was left undecided, and consequently no progress was made. The Fisheries Bill, and the Sessions of the Peace (Dublin) Bill, were read a third time and passed.—Lord J. MANNERS called attention to the fact that some boys had been fined by magistrates in Bucks for playing cricket on a Sunday after divine service, and asked the Attorney-General if the laws of England prevented people from practising cricket or any other manly exercise on the Sunday after divine service.—The Attorney-General replied that if the boys were within their own parish they were not violating the law; if they were not he believed that they were acting contrary to an Act of Parliament.—Mr. C. BULLER brought forward his views on colonisation, and, in a long speech, urged the necessity of encouraging a simultaneous emigration of capital and labour to our colonies, especially to Canada. He called on the Government to co-operate during the recess with the Legislature of Canada for the effectual colonisation of that province, and concluded by moving for a copy of an Act passed by the Canadian Parliament, entitled "an Act for the disposal of Public Lands."—Mr. HUME said the difficulties of the Government in the question of general colonisation arose principally from the want of power to carry out an efficient scheme. He assured Mr. Buller that the Government were disposed to treat his plan with the fullest consideration.—The motion was agreed to.

Mr. B. COCHRANE brought the affairs of Greece before the House, and moved for papers relating to our diplomatic intercourse with the kingdom of Greece; among others, for copies of those protocols which are supposed to have been signed since 1833, when the last was communicated to Parliament; also, copies of instructions transmitted to our Minister at Athens, in consequence of those meetings of the representatives of the three Powers, at which, from any particular cause, no protocol was signed; also, copies of those communications from Sir Edmund Lyons which convey any information relating to the financial state of Greece.—Lord PALMERSTON hoped something had been done to impress the Greek Government with the necessity of fulfilling the obligations contracted with the European Governments.—Sir R. PEEL consented to the first part of Mr. Cochrane's motion, but refused those papers relating to arrangements now in progress. With reference to King Otto's conduct personally, the three Powers had offered, very earnestly and pressingly, their advice upon points of great importance, which friendly counsel, he trusted, might be productive of beneficial effects for the people.—Mr. COCHRANE said, in reply, that if these representations were not attended to by the King, it would be the duty of the three Powers to insist more strongly.—The motion was then agreed to.

Lord PALMERSTON moved for copies or extracts of communications between the Government and the ambassadors at Vienna, Paris, St. Petersburg, and Constantinople, and the Consul-General in Serbia, in regard to the transactions connected with the late changes in the Government of Serbia. He contended that the independence of the Turkish empire had been infringed, and that Government here had stood idly by while Russia had compelled the Sultan to accede to unreasonable demands, to the detriment of the balance of power in Europe.—Sir R. PEEL explained the transactions that have taken place in Serbia, at some length. The Russian Government had demanded nothing of the Porte, except that a new election by the authority constituted in Serbia should be made. That new election having been had, Russia would, doubtless, abide by the decision. These transactions being still incomplete, Sir R. Peel did not feel himself justified in granting the papers asked for.—Mr. DISRAELI condemned the policy of Government on this subject, as founded upon an ignorance of which there was no precedent. The House had not devoted any part of the present session to foreign policy; it had confined itself to domestic questions; and yet now, when it was about to separate, no man pretended that the country was left in any other than a most perilous state at home. He would therefore vote for Lord Palmerston's motion.—Mr. MILNES, though he did not altogether approve the course taken by Ministers, was inclined to give them some credit. He was understood to oppose the motion.—Dr. BOWRING lamented the inadequate information of most of our Consuls.—Lord SANDON adopted the views of Sir R. Peel, with some little qualification. He censured Mr. Disraeli for treating Sir R. Peel as the Government with contumely in a speech delivered from behind the Treasury bench.—Mr. DISRAELI denied that he had

used any contumelious expressions.—Lord SANDON referred to the phrases "gross ignorance" and "disgraceful conduct," as having been used by Mr. Disraeli.—Mr. HUME, after defending Mr. Disraeli, inveighed against the ignorance and incompetency of our foreign Consuls. He, however, was favourable to Sir R. Peel's policy of non-interference.—Mr. SMYTHE complained of Lord Sandon's attack.—Mr. CURTIS thought with Mr. Smythe, and was not sorry to see a split in the Tory party.—Lord PALMERSTON replied. He justified the policy of making timely and strong remonstrances in foreign affairs. It was true that war was a great evil to England, but other powers were just as much afraid of war as she could be; and if a nation forbore to interpose in time, she was drawn into hostilities at last with greater disadvantage. As Sir R. Peel had stated that the papers could not be produced without prejudice to the public interest, he would not press his motion.

Wednesday.—The Episcopal Functions Bill passed through committee.—On the motion for going into committee on the Chelsea Hospital Out-Pensioners Bill much opposition was shown to its permanent character. After four divisions and seven hours' discussion, principally on the attempt to limit its duration to five years, or five years and a half, the bill passed through committee, with a protest from Mr. HUME, who declared his opinion of the measure to be unchanged, though he would give no further opposition.

To a question from Mr. EWART, Sir J. GRAHAM stated that it was not the intention of the Government to ask for any additional vote for increasing the existing means of educating the people, as there was already a sum of 40,000*l.* placed at their disposal for that purpose. He assured Mr. Ewart that, though the Education Bill had failed, it was yet the intention of the Government to direct attention to the subject of education, and to afford every assistance that could be given to the Orders in Council found in force when they had succeeded to power. It was also their intention to adhere to the principle of those Orders in Council, not in the letter, but in the spirit.

Some routine business was passed; one portion of which was agreeing to the Lords' amendments on the Theatres Regulation Bill.—Sir J. GRAHAM remarked that the Lords had struck out the clause limiting the representation of the plays of Shakspeare to the patent theatres.—Mr. HUME thought that the Lords had done a very good thing. He was for free trade in theatres as well as everything else.

The Defamation and Libel Bill stood next for consideration in committee. On the question being put, Mr. CHRISTIE gave a sketch of the origin of the bill, and mentioned the high concurring authorities who, in the House of Lords, had examined its nature, and given it their approbation. The bill extended the remedy by civil action from written to spoken defamatory words, thereby removing an inconsistency in the law; it permitted truth to be pleaded in justification, under certain restrictions, as leaving it to the decision of the jury whether or not it was for the public advantage that the alleged libel should be published; and it amended the present state of the law with respect to criminal informations for libel, by the introduction of provisions which were calculated to give protection to the honest and respectable portion of the press, while it reached the worthless individuals who used the press as a means of extorting money.—The Attorney-General was not disposed to bring up the law of slander to the stringency of the law of libel; he was rather disposed to bring down the law of libel to the level of that of slander. In the course of his own long professional experience, he had never advised the bringing of an action for abuse; and he was disposed to consider the law as inoperative. It was undoubtedly the opprobrium of the law that the refusal to serve the office of overseer, and so forth, was placed in the same class as serious crimes, as misprision of treason, procedure by indictment being equally applicable to both. But the bill before them contained objectionable clauses; he was averse to going back to severities of punishment, which have fallen into disuse since public opinion had ameliorated the practical operation of the law; he was unwilling to take cognizance of mere oral slander; and he thought that truth should be alone pleaded in justification, without leaving the validity of the plea to the discretion of a jury. But he cordially approved of all the provisions of the bill which really amended the law, as permitting the plea of truth in cases of criminal information.—After a few observations from Mr. MACAULAY and Mr. BERNAL, who expressed their satisfaction that the Attorney-General had adopted the main principle of the bill, the House went into committee. In its progress, Mr. C. BULLER took the opportunity of speaking generally on the measure, urging its adoption, not on the ground of its perfection, but because it was a decided improvement of the law—was calculated to protect private character from the professional libeller, and drew a broad line between the honest public writer and the mere trading slanderer.—The question of leaving to a jury a discretionary power of judging of the validity of the plea of truth, by reference to considerations of public advantage and private motives, raised a discussion, the Attorney-General thinking it unnecessary to make any change in the law at present in this respect. The clause containing the disputed provision was lost on a division, by 38 to 30.—The bill, having been further discussed and amended, was carried through committee.

The China Government Bill and the Coroners Duties Bill passed through committee. The Charitable Loans Societies (Ireland) Bill was recommitted and all the clauses agreed to, despite the opposition of Lord CLEMENTS, who walked out of the House, saying that there was no use in his attempting to do anything; and he would therefore go home to Ireland and say so.

Thursday.—The China Government Bill, the Court of Exchequer (Ireland) Officers Bill, and the Coroners Duties Bill were read a third time and passed.—The Law of Evidence Bill was read a third time and passed.

In reply to Mr. BANNERMAN, Sir J. GRAHAM said that he had not yet received the opinion of the Law Officers of the Crown with respect to the memorial, as to the inability of Sir David Brewster to discharge his duties as Principal of the College of St. Andrews, in consequence of his secession from the Scottish Church; and no steps had been taken by the Government with respect to that memorial.

Sir J. GRAHAM having stated that he had no confidence in any law for regulating the price of bread, Captain POLHILL gave notice, for next session, to move for a select committee to ascertain the best mode of regulating the price of bread in the metropolis.—Sir R. PEEL, on this notice, remarked that though legislation could not remedy the impositions of the bakers, yet he thought that, if Gentlemen were not ashamed of exerting themselves in that manner, and of dealing with those bakers only who charged a fair price, a check might be put to their exorbitant demands. That was the legitimate mode of putting down the evil; and if his hon. Friend and other Gentlemen would exert themselves in encouraging those tradesmen only who asked a fair price, the public would not be subjected to the injustice.

Mr. WYSE postponed his motion on the subject of legal education in Ireland till next session.

Friday.—The Chelsea Pensioners Bill, the Episcopal Functions Bill, and the Irish Charitable Loan Societies Bill, and the Defamation and Libel Bill were read a third time and passed. On the order of the day for going into committee on the Slave Trade Suppression Bill, Mr. DUNCOMBE, Mr. FORSTER, Lord SANDON, Mr. BRIGHT, and Sir J. MILNAR, strongly condemned it, and severely censured Lord Brougham with whom it originated.—Sir R. PEEL, Sir T. WILDE, and Lord PALMERSTON, supported it.—The House went into committee, and after a long discussion it was agreed that the bill should pass through committee, with the understanding that the discussion upon the amendments to be proposed should take place on Monday.

CITY.

Money Market, Friday.—Consols closed at 94½ to 5; for time and transfer; Three per Cents. Reduced, 95½ to

5; Three-and-half per Cents. reduced, 102½ to 7; New Three-and-half per Cents., 101½ to 2; Exchequer Bills at 1½*d.*, 56*s.* to 58*s.*, and at 1¾*d.*, 58*s.* to 60*s.*

Metropolis and its Vicinity.

Destructive Fire.—A fire of a most destructive character broke out this morning, at a few minutes before 2 A.M., in Cotton's Wharf, close to London-bridge. The flames were discovered by a policeman, but so rapid was their progress, that the entire building in which the fire originated was destroyed before any engines could be got to work. The wharf and warehouses on the east, filled with combustible articles, followed the destruction of Cotton's wharf, in their turn extending the fire to those next eastward, well known as Topping's wharf. This wharf closely adjoins the church of St. Olave's, Tooley-street, the tower of which having first become a prey to the flames, was directly followed by the roof and body of the church, not any portion of which is expected to be saved. The damage on the western side at present extends only to the premises of Mr. Goodchild, these next adjoining being Fenning's Wharf, which have been burnt down on two former occasions. Three schooners lying off Cotton's Wharf are partially burnt, although both of the floating engines were brought to the spot. A large quantity of gunpowder in one of the wharfs exploded shortly before three o'clock. The shock was sensibly felt on the bridge, and at other distant points. The Lord Mayor was on the spot from an early period, directing the labours of the firemen. The deeds of St. Olave's parish were got out shortly before the body of the church took fire. It is impossible to estimate the damage done, but no fire of the like extent has happened in London for many years.

Will of the Duke of Sussex.—The will of his Royal Highness has just passed the seal of the Prerogative Court of Canterbury. The executors named in the will are Lord Dinorben, C.K.; K. Tynte, Esq.; and Mr. Walker (Comptroller of the Duke's household). His Royal Highness directs that a bond held by his daughter for 10,000*l.* be discharged; and that the whole of his property go to his wife, the Duchess of Inverness. He also directs the sale of his plate, jewels, and other articles, which have since realised the sum of 37,713*l.* 9*s.* 11*d.*, and provides that if Government does not purchase his library within a year, it is also to be sold by auction. The will is very short, and written on a small sheet of paper. The property has been sworn under 60,000*l.*

Custom-house Frauds.—The result of the late trials connected with the Custom-house frauds has caused the heads of the various departments to issue circulars to those in a subordinate capacity, with the view of ascertaining if their securities for the faithful performance of their duties are alive and solvent. It is understood that in future similar returns will be made annually by all employed in the Customs department.

Taking the Veil.—On Thursday, four young ladies, named Beauchamp, Pallett, Dawson, and Savage, took the veil at the Roman Catholic Chapel, Bermondsey, preparatory to their becoming "Sisters of Our Lady of Mercy," in the convent of that order attached to the Chapel. The ceremony was performed by Dr. Griffiths.

Temperance Meetings.—On Saturday Father Mathew administered the pledge in Hall's Riding School, Albany-street, Regent's Park. About 15,000 persons visited the building during the day, but out of that number only from 1,200 to 1,400 accepted the pledge. On Sunday he administered it in Cumberland Market, Regent's-park, which presented the appearance of a fair throughout the afternoon. At an early hour, a number of persons decorated with green scarfs and bearing wands with brass crosses, arrived with a banner, which they erected at the back of the platform. It was of very large dimensions, composed of green silk, and bore the words "Somerset's-town Roman Catholic Total Abstinence Association." In the centre were full-length portraits of St. Patrick and Father Mathew, the latter attired in the robes of a Roman Catholic priest, and under them were inscribed the words "The two Apostles of Ireland." On the obverse was "St. Aloysius," the instructor of youth, kneeling to two bleeding hearts, with a cross through them. Father Mathew then addressed the people and said, that in carrying out this work of temperance on a Sunday after attending divine service, he believed he was performing a holy work. These temperance meetings were purely religious ones, and therefore he was committing no desecration of the Sabbath-day. They had assembled to promote the observance of that great cardinal virtue temperance; they had among them all shades of religious and political opinions, and did not interfere with the religion of any man. A gentleman, who was apparently a clergyman, here interrupted him, and pointing to the banner, called on Father Mathew to state why professing as he did, not to interfere with the religious feelings of any man, he should insult Protestants by having that Roman Catholic banner placed above his head? Father Mathew denied that it was his flag, and requested that it might be taken down; some confusion ensued, which ended in the removal of the banner. At the close of the proceedings it was calculated that about 7000 persons had taken the pledge. On Monday Father Mathew administered the pledge in Britannia Fields, Islington, whither he was escorted by a procession of temperance societies. On joining them Father Mathew perceived that the majority of the procession carried wands with crosses, and wore sashes on which were other Catholic emblems, when he at once desired that they should be dispensed with, in order that it should not appear a purely Roman Catholic movement. He said he had no religious or political object in view, and he begged that on the present, and all future occasions, no such distinctions should be made. The emblems

having been removed, the procession proceeded to the place of meeting, where about 2,360 persons received the pledge. On Tuesday he attended at the same place, but the number who took the pledge was not so great as on the previous day. On Wednesday, after breakfasting at the Hon. Mr. Jerningham's, to meet Lord Brougham and other persons of rank, Father Mathew administered the pledge at Paddington to about 2,000 persons. On Thursday he visited Enfield, where about 350 persons took the pledge; and yesterday he commenced his labours in St. Giles's, which he will continue to-day and to-morrow. On Monday next he will administer the pledge at Blackheath, on Wednesday and Thursday at Millbank, and on Friday and Saturday at Bermondsey.

Balloon Ascent.—On Saturday morning Mr. Charles Green, jun., made an ascent in his new balloon, called the Albion, on an experimental trip to the Continent, from the grounds of the commercial gas-works at Stepney, accompanied by Mr. Alfred Bradley. The balloon ascended steadily to a considerable height, where it remained apparently stationary for some minutes. It then crossed the Thames and took a direction towards the Sussex coast, and the wind blowing gently, it was wafted slowly along until lost to view. In the course of the afternoon the wind suddenly shifted, and they were obliged to descend at Cuckfield, Sussex, which they effected in safety, at half-past 3 p.m. of the same day, after a voyage of four hours and a half. On Thursday morning Mr. Green resumed his attempt, and ascended from Brighton, accompanied by Mr. Bradley, as before. It was his intention to make for the French coast; and, in order to avoid the danger arising from the dilation of hydrogen gas when exposed to the sun at a great altitude, measures had been devised for keeping the balloon at a short distance from the water, by means of a rope pendent from the car, and having attached to it, at regular intervals, about a dozen inflated bladders to create a resistance on the surface of the water. The balloon having been filled at Hove, by half-past 8 the voyagers took their seats in the car, and the balloon, at a height of about 30 feet, was conducted by means of a rope to the sea-beach, where the bladders were made fast. The wind at this time was hardly perceptible, but its direction was southward; and the balloon, when detached, glided out to sea at a speed not exceeding two miles an hour, the bladders and rope (120 feet long) answering their purpose effectively, and keeping the car about 90 or 100 feet from the water. Scarcely, however, had the start been made, when the wind gradually veered to the north-east, and the balloon took a direction which must have brought it to the Isle of Wight. A few minutes more, and a further change made it doubtful whether the balloon would not leave the sea before reaching Worthing. The wind still continued rapidly changing till it settled in the south-west, in consequence of which, the balloon having traversed the air in a horse-shoe course, hovered over the Hove Coast Guard station, half a mile from the spot from which it had started. Here the voyagers alighted, and the balloon having been re-conveyed to the gas-works, a fresh supply of gas was taken, and the wind an hour afterwards being nearly south, the balloon again started in the direction of London. Both ascents were viewed by thousands of spectators, who thronged the line of cliff from one extremity of the town to the other. The balloon was inflated with 27,000 cubic feet of carburetted hydrogen gas, which had been diminished in density nearly one-half by being decarbonised, or deprived of its illuminating properties.

Welsh Church.—It is announced that the committee appointed some time since under the presidency of the Earl of Powis, for the purpose of opening a church for Welsh residents in London, have completed their arrangements; and that the chapel in Ely-place, Holborn-hill, has been engaged by them, and will be opened for divine service in the Welsh language at the end of next month.

Mortality of the Metropolis.—The following is the number of Deaths registered in the week ending Saturday, Aug. 5:—West districts, 119; North districts, 146; Central districts, 143; East districts, 201; South districts, 199. Total, 816—(453 males, 363 females.) Weekly average for the last five years, 903—(461 males, 442 females,) and for the last five summers, 845.

Provincial News.

The Late Storm.—The provincial papers are filled with details of the injury done by the thunderstorm of Wednesday week. It appears to have been particularly severe in Kent; the damage done to property in Rochester, Chatham, Strood, and Brompton, is said to be about 6,000*l*. The land between the hills on each side of the Medway is torn up for some distance, and acres of corn are damaged, the ears being cut off by the ice as clean as if done with a pair of scissors. The hop-grounds in the immediate neighbourhood have seriously suffered, the plants being totally destroyed. At Chatham Barracks the water poured down the parade ground from the terrace belonging to the officers in such quantity and with such velocity, that upwards of 100 cartloads of sand were washed down in front of the men's barracks. In the Dockyard no less than 14,000 panes of glass were destroyed. The mail cart, on its way to Rochester from Maidstone with the letters, was overturned, and the driver and horses were severely cut by the ice that fell; the driver's hands, holding the reins, were cut in stripes and covered with blood. The accounts from almost every village in the vale of Berks detail the damage inflicted either by the violent hail or by the electric fluid. In many places the grain crops are described as having been completely beaten down, and the grain thrashed from the ears as cleanly as

if under the ordinary process in the barn. The trees in those places in which the storm descended with its full fury, are said to have been stripped of their leaves, the windows were broken, and the ground in a few moments covered with pieces of ice, measuring, in some instances, from five to six inches in circumference. In Gloucestershire, and particularly in the neighbourhood of the city, the storm raged with destructive fury for two hours and a-half. A correspondent of the *Gloucester Chronicle* says, "The storm visited the neighbourhood of Stow-on-the-Wold, and the adjacent villages, with great violence; the lightning was terrific; the thunder continual, like one constant peal of artillery. The ice fell in large lumps, and proved destructive alike to the crops and the glass windows: pieces of ice were picked up weighing from two to three pounds, pointed and jagged. It commenced about twelve o'clock on Wednesday morning for about an hour, and recommenced with increased fury for three hours in the evening of the same day." On the estate of Upper Upham, in the parish of Aldbourn, Wilts, the property of Mr. Round, M.P. for Maldon, the crops were damaged by the hailstones to the extent of nearly 1,000*l*. 90 acres of wheat, 54 acres of barley, 35 acres of oats, and 20 acres of peas and vetches, were literally thrashed; such a scene of devastation has been rarely witnessed. In Bedfordshire and Cambridgeshire the most serious losses have been sustained in the fertile part of the country, comprised within the Bedford level, and particularly within the neighbourhoods of Wisbeach and Peterborough. In the fens alone upwards of 2,000 acres of hay, valued at 10,000*l*., have been totally destroyed, and the pasturage for 1,000 head of cattle entirely inundated. In consequence of this upwards of 1,000 persons have been thrown out of employment. A letter from Norwich describes the storm as the most extraordinary ever known in that city. The glaziers say that all the glass in the city will not suffice to mend the windows broken; hothouses and greenhouses have been smashed in every direction. The storm commenced at 9 on Wednesday night, and lasted till 3 in the morning. All the cellars and passages were immediately flooded, and it is not yet possible to calculate the damage. Mr. Bell, of Bracondale, the horticulturist, is a great sufferer; almost everything in his establishment was destroyed, to the amount of at least 3,000*l*. Walls were washed down and carried away, and the damage has been equally extensive in the county generally.—In addition to the above, we learn that the midland counties have been visited during the last few days by storms, which, in severity, have not been much less than those of Wednesday week. At Birmingham, on Tuesday night, the lightning was most vivid, and the rain descended for some hours in torrents. Along the Derby line of railway the rivers were much flooded. In most places the wheat was again beaten down, and where it was fit for the sickle was much damaged. Such a succession of storms is said to have been almost unprecedented. On Wednesday morning at 7 o'clock, the metropolis was covered with a dense oppressive atmosphere, threatening thunder and rain, which continued till near 1 o'clock, when a light shower fell, after which the sun shone out. At Richmond, Clapham, Wandsworth, Kensington, and Brompton, at 8 o'clock, the rain came down in torrents, flooding the commons and lowlands, and accompanied with violent peals of thunder and flashes of lightning, passing over to the Surrey hills; whilst in town there was scarcely a breath of air; and at Greenwich and down the river the atmosphere was quite clear with a fine breeze.

Alnwick.—Sufficient funds have been obtained to erect a monument to Grace Darling, the late heroine of the Fern Islands, in the church or churchyard of Bamburgh, where she was buried.—The bodies of the unfortunate passengers in the Pegasus steamer are found daily, floating in the neighbourhood of the wreck, and on the coast of Berwick, Bamburgh, &c. Those of the Rev. Mr. McKenzie, Mr. Brown, painter, Master Flowers, Miss Hopetown, Mr. W. Milne, of Edinburgh, and of several steerage passengers, have been found. It is reported along the coast that the crews of some French fishing-boats in the offing had picked up some bodies, and after stripping them, had recommitted them to the sea. The divers are daily in operation, and have recovered a great deal of property and luggage.

Birmingham.—On Wednesday, in pursuance of a resolution adopted by the Chamber of Commerce on the 2nd inst., in consequence of the declaration of Ministers that the distressed state of the manufacturing districts arises from over-production, and that there are no measures within their power to relieve the present alarming embarrassments, a meeting of the bankers, merchants, manufacturers, and traders of this town and neighbourhood was held, to take into consideration the long-continued difficulties of trade, and to adopt such measures as the present crisis may require. Mr. R. Spooner presided. After a long discussion, it was resolved that a general meeting of the inhabitants be convened for the full consideration of the subject.

Canterbury.—On Saturday Mr. Cobden and Mr. Bright visited this city for the purpose of addressing the farmers on the subject of the Corn Laws. About an hour before the meeting, the East Kent Agricultural Association assembled in order to determine what course should be pursued by the farmers at the Anti-Corn Law Meeting. Sir Brooke Brydges presided. It was then proposed by Mr. Boys, of Waldersham, and seconded by Mr. James, the Novelist, "that the farmers of East Kent do not consider it expedient to enter upon the discussion of the Corn Laws at a meeting called by, or at the request of, any person unconnected with the county." The resolution was carried by a large majority. Shortly afterwards, the meeting in favour of a repeal of the Corn Laws took

place, Sir John Tylden in the chair. Mr. Bright and Mr. Cobden spoke at great length, and resolutions in favour of free trade were unanimously carried.

Carmarthen.—Capt. Andrew Scott has been appointed chief-constable of the new Rural-Police in this county, and it is understood that her Majesty has been pleased to appoint Colonel Love on the staff of the army, and to place under his command the districts of Monmouthshire and South Wales. Mr. Hall, the chief-magistrate of Bow-street, returned to town on Sunday morning from Wales, and shortly afterwards proceeded to the Home-office to submit the evidence and the result of his inquiries to Sir J. Graham. At Swansea, on Friday, the copper-miners had another interview with Mr. Vivian. The men stated that it was absolutely impossible for them to subsist on the reduced wages, in consequence of the physical exertion required in their work being prejudicial to health from excessive perspiration, and their inhaling so much sulphur generated in the furnaces; in consequence of which, they required more and better food than persons employed in other manufactures; and that their expenses were consequently much greater than those of other workmen. Mr. Vivian stated that the mines were worked at a loss, and that the reduction was caused by necessity not by choice, and that unless the men made up their minds to submit, the masters would come to a determination of putting out their furnaces altogether.

Chester.—Through the activity of Mr. Baker, special high-constable of the Tarporley district, a clue has been obtained to the murderers of Matthias Bailey, gamekeeper to Mr. Wilbraham, who was found dead from a gun-shot wound, on the morning of the 28th ult., in a by-lane near Delamere house. The parties accused are John and Samuel Maddocks, both of them notorious poachers. They have both been committed for trial at the next assizes.

Falmouth.—The local papers state that several boats belonging to St. Ives, which have arrived from the Irish coast, shot for pilchards last week, and took from 2,000 to 15,000 per boat, which sold from 1*s*. 6*d*. per hundred of six score. They were taken about two or three leagues from land. The coasting vessels and boats from the Irish coast report that there is abundance of pilchards on the north coast of Cornwall.

Isle of Wight.—A short time since a meeting of the inhabitants of Ventnor was called to consider the propriety of adopting some means to ascertain the practicability of creating a harbour of refuge, and erecting a pier at that place. In consequence of resolutions then entered into, a considerable sum has been raised by public subscription, and a large body of workmen are at this time actively employed, when the tide allows, in clearing away the rocks from the entrance and site of the proposed harbour, and piling them carefully so as to form a breakwater on the south and western sides.

Manchester.—The turn-out at Ashton-under-Line still continues, and every mill is deserted, the men refusing to resume work at the reduced prices. No disturbance has taken place, and neither the police nor military have been called upon to interfere. On Monday and Wednesday meetings were held on Thacker's ground, the usual rendezvous of the turn-outs. Upwards of 10,000 were present, and several persons addressed the meeting in favour of the strike.

Stafford.—The Birmingham papers mention that the iron-trade of South Staffordshire has shown symptoms of improvement during the past week. They state that Mr. Foster, of Stourbridge, has put four puddling furnaces in blast, which had been previously closed, and that an extensive order for castings has been received at Gospel Oak Works.

Stockport.—Some of the power-loom weavers of this town have turned out for an advance of wages; and the hat-dyers of Oldham have also had a partial turn out in consequence of a threatened reduction of wages. The masters allege that this branch of the trade are paid higher rates than any other, as they have suffered no reduction for the last twenty years. The London Relief Committee have refused to send any more money to the aid of the Stockport unemployed manufacturing hands, on the ground that business has improved, and employment is to be had. The local committee have in consequence discharged all the labourers whom they had employed in improving the town for some time past.

Sheffield.—Two cases of great importance to Sheffield manufacturers, and to the cutlery trade throughout the kingdom, came before the magistrates last week for adjudication. It seems that for some time past a practice has prevailed in the trade of putting the marks of superior articles on things of inferior quality. In the cases before the court, the knives, which were made of cast iron, were marked "cast steel" and "sheer steel," in direct violation of the 59th Geo. III., c. 7, passed in 1819, for the purpose of putting a stop to such practices, and to protect manufacturers who marked their articles with the real name of the metal. The charge was fully proved. The magistrates found that the penalty upon Samuel Naylor was 41*l*. 10*s*., and upon William Sanderson 1,395*l*.; and requested the Master Cutler to take the first opportunity of destroying the things forfeited, believing that the trade of the town had been in a great measure destroyed by the practices of the manufacturers.

Windsor.—The early trains from Paddington on Sunday morning brought an immense number of visitors, one train being freighted with not less than between 700 and 800. It is computed that upwards of 4,000 persons from town and the neighbourhood visited Windsor during the day. Her Majesty and Prince Albert attended divine worship in the morning at the Royal Chapel in the Great Park, and long before their arrival the edifice was so crowded with strangers, who had reached Windsor by the early

trains, that the resident families who regularly attend the chapel were unable to find room at the usual hour of service.

Railways.—The following are the receipts for the past week:—Croydon, 561*l.*; Greenwich, 792*l.*; Blackwall, 1,205*l.*; Great North of England, 1,669*l.*; Northern and Eastern, 1,817*l.*; Birmingham and Gloucester, 2,132*l.*; Eastern Counties, 3,038*l.*; South-Eastern and Dover, 4,022*l.*; Manchester and Leeds, 5,074*l.*; North Midland, 5,307*l.*; Brighton, 5,717*l.*; South-Western, 8,124*l.*; Grand Junction, 9,785*l.*; Great Western, 16,670*l.*; Birmingham, 20,193*l.*—The London and Birmingham Company met last week at Birmingham. The report announced the receipts for the half-year as 389,658*l.*; expenses, 165,734*l.*, leaving a net profit of 223,924*l.* The passenger traffic, as compared with the corresponding half-year of 1842, was less by 13,113*l.*, while the goods and cattle traffic was more by 10,019*l.*, making a decrease in traffic of 3,094*l.*, which, with other items, make a total decrease of 3,537*l.* The reduction in expenses, on the other hand, was 8,767*l.*, the total decrease in charge being 20,430*l.* The balance of profit exceeded the amount for the corresponding half-year, by 16,982*l.*; the net profit, with former balances, to be divided being 241,855*l.* The receipts from passengers had been 254,180*l.*, mails, 7,195*l.*, horses and carriages, 15,956*l.*, parcels, 23,125*l.* The number of passengers during the half-year, was 360,784, travelling a distance of 23,395,261 miles, the number of passengers per day amounting to nearly 2000. The works of the Warwick and Leamington line are in active progress, and arrangements had been made for the execution of the proposed Northampton and Peterborough line. For the purpose of constructing these two lines an additional capital of 1,375,000*l.* would be raised, in addition to the existing capital of 5,500,000*l.* The report was adopted, and a dividend at the rate of 10 per cent. was declared.—At the meeting of the Midland Counties Company last week, the directors reported that the receipts for the half-year had amounted to 62,324*l.*; the disbursements to 44,987*l.*, leaving a balance of 17,366*l.* which would have enabled the directors to declare a dividend of 1*l.* 6*s.* for the half-year, but that they had to deduct a balance due to the North Midland Company, amounting to 1,500*l.*, which would leave an available surplus of 15,0*l.* 10*s.* applicable to a dividend at the rate of 1*l.* 4*s.* per share. The competition between the Midland Counties and the Birmingham and Derby Companies still continued unabated. The loss upon passenger-receipts to the former company had been 1,472*l.*, and to the latter, 2,086*l.* A discussion ensued on a proposal to amalgamate the Midland Counties, North Midland, and Birmingham and Derby Companies, which it was contended would increase the joint profits to upwards of 35,000*l.* per annum, reduce the present scale of expenses, and tend to the convenience of the public. Although met by a strenuous opposition on the part of the directors, a resolution was passed for the appointment of a committee to confer with the several companies on the subject, and report the result to a special meeting.—By the proceedings of the York and North Midland meeting, it appears the total receipts for the half-year were 40,020*l.*, and the expenditure 17,562*l.*, the balance of which, with a slight addition from the reserve fund, enabled the directors to declare a dividend of 2*l.* 10*s.* per share on the old shares, and of 1*l.* per share on the half-shares. An extension-line to Scarborough is to be carried out.—The Northern and Eastern Company on its half-year's profits pay a dividend of 12*s.* 6*d.* per share, and the returns present a considerable increase in passenger and goods traffic. A correspondence between the directors of the Eastern Counties and the Northern and Eastern Companies was read at the meeting relative to an offer on the part of the former for leasing the Northern and Eastern line at a rate based on the present receipts and expenditure, to which, however, the latter were not inclined to submit, considering the traffic as yet far from developed, or yielding the reasonable return that might shortly be expected from the sources of revenue with which the line is said to abound. The balance for the dividend was 6,199*l.* 11*s.* 10*d.*—A project is in contemplation for extending the Eastern Counties Railway to Norwich, Harwich, and Bury St. Edmunds, by means of a line to be called the Eastern Union Extension. Plans and sections have been prepared, by which it would appear that the line and branches are well adapted to give Ipswich and Harwich, and the surrounding districts, the benefit of railway communication with the metropolis, as well as with the inland districts. The expected traffic is large, and the earth-works easy; and in furtherance of the object a meeting was held last week at Ipswich, when the High Sheriff, the Mayors of Norwich, Harwich, Bury, Ipswich, and Eye, with influential landowners, were appointed a committee for carrying the project into effect.—An adjourned meeting of the London and Greenwich Company took place on Tuesday, when the committee of investigation made their report on the points referred to for consideration. They recommended that there be three classes of carriages, that the fares be eightpence for the first class, sixpence for the second, and fourpence for the third, and that annual tickets for the first class be 12 guineas, and for the second 10 guineas. After some discussion the report was received, and the committee requested to continue their services with a view to some arrangement with the Croydon and other companies.—At the meeting of the Great North of England Company, at Darlington, the report showed a total receipt for the half-year of 40,179*l.*, leaving, after the payment of expenses, a disposable balance of 13,622*l.*, out of which a dividend, at the rate of 1*l.* 5*s.* for the half-year, was declared. The number of passengers during the half-year was 64,173.—At the annual meeting of the Sheffield and Rotherham Com-

pany, the accounts showed a falling off in the receipts of 900*l.*, which was met by a decrease to the same extent in the cost of the working charges. The local passengers, during the half-year, had amounted to 137,124, and the general passengers to 48,110. A dividend at the rate of 5 per cent. was declared.—The half-yearly meeting of the Great Western Company took place on Thursday at Bristol. The report states that the half-year's income has been 330,847*l.* 19*s.*, of which the separate earnings on the Great Western Railway are 275,306*l.* 1*s.* 7*d.* Compared with the first six months of 1842 there is an increase on the goods of 5,916*l.* 11*s.* 5*d.*, but the passenger receipts have diminished. The Bristol and Exeter railway has been extended twenty miles and a quarter (to Beam Bridge) since June, 1842. The expenses of working the line have been diminished during the past half-year (omitting Government duty, and rates and taxes) by 5,359*l.* 2*s.* 9*d.*, notwithstanding the greater length of line worked. The directors regret that the dividend is less than that of last year, arising from peculiar circumstances, which are thus explained. The balance left undivided in January, 1842, was 18,437*l.* 5*s.* 1*d.*, and in January, 1843, 2,670*l.* 5*s.* 11*d.*, making more than the difference. The interest paid within the last six months exceeds that of 1842, by 13,900*l.* The increased rent of the Bristol and Exeter railway is nearly balanced by the saving of expenditure. The total sum now available is 82,886*l.* 6*s.* 9*d.*, which gives a dividend of two-and-a-half per cent. for the present half-year, amounting to 81,815*l.*, leaving a balance of 1,071*l.* 6*s.* 9*d.* A portion of the permanent way between London and Maidenhead has been reconstructed at a cost, on reference to the accounts, of 17,783*l.* 7*s.* 11*d.* The timber and rails taken up have been made available for the Cheltenham and Oxford lines. The directors conclude by calling the attention of the proprietors to a projected plan for the continuation of the line to Plymouth, or some other western port. The business of the general meeting having been disposed of, a special meeting was held for the purpose of empowering the directors to complete the purchase of the Cheltenham and Great Western Union, the Oxford Junction Line, and to negotiate with the Bristol and Exeter, and the promoters of a projected railway between Exeter and Plymouth, for the purpose of extending the line to that place. The directors were duly empowered to take the necessary steps in these matters.

IRELAND.

Dublin.—The Great Seal of Ireland (in the absence of Sir E. Sugden) has been transferred from the Master of the Rolls to Mr. Justice Burton. The Master of the Rolls is about to visit Germany during the vacation. The Commission have dismissed Mr. C. Nangle from the commission of the peace for Meath, Mr. Pettit from the commission of Wexford county, Mr. V. O'Connor Blake, and Mr. Lynch, of the county Mayo, and Mr. G. Walmsley, of the county Dublin, for having attended repeal meetings. The weekly meeting of the Repeal Association took place on Monday, when Mr. Reilly, a town-councillor, moved that the Irish sculptor, Mr. Hogan, be employed to execute a statue of Mr. O'Connell. In the course of his speech he said, "Though Queen Victoria commands our most steadfast loyalty, yet O'Connell rules our hearts, and is the king of our affections, and never did any sovereign sit on so glorious a throne. I hope he may live long, and see this statue in the Irish House of Commons when he sits there himself as Speaker." The motion was carried by acclamation. The rent for the week was 913*l.* 10*s.* 7*d.*

Cork.—The business of the meeting of the British Association commenced on Monday, when a committee of reception was appointed to attend at the Commercial-buildings in sets, at different hours, in order to be prepared to receive strangers as they arrive. The number of visitors is said to be very great, and a satisfactory meeting is anticipated.

King's County.—The Irish papers state that the Adjutant of the 5th Fusiliers, Lieut. Robertson Mackay, stationed at Birr, King's County, was shot upon parade on the evening of the 11th inst. by one of his men. He fired when about five yards from the unfortunate officer, and the shot passed through his body. He died instantly. The man gave himself up, and there is no reason to suppose that the crime was committed with the knowledge of any other person. A coroner's inquest sat on the body on Saturday, when the jury, after some deliberation, brought in a verdict of "Wilful Murder" against the prisoner, accompanied with the observation, "that discipline had for some time been carried on with unnecessary severity in the 5th Regiment of Fusiliers." The evidence and finding were by order immediately forwarded to the Horse-Guards.

Tara.—The long-expected Repeal demonstration on the hill of Tara took place on Tuesday. About 500,000 persons are said to have been present, and so general was the holiday in Dublin that on Monday, at the commission in Green-street, the counsel for the prosecutions in three cases made application for the postponement of the trials which were fixed for Tuesday, on the ground that public justice would be defeated, as it was impossible by any fear of penalty to prevent the witnesses from attending the meeting. Every description of public conveyance was pressed into the service; and one postmaster, anxious to accommodate his customers, took the roofs off four hearses, and converted them into a sort of omnibus. Mr. O'Connell addressed the meeting on the usual topics, declaring his confident belief that before another year expires he will address an Irish Parliament in College-green. A series of resolutions condemnatory of the Union, and adopting a petition to both Houses of Parliament for its repeal, was then carried, and the immense

multitude quietly dispersed. At the dinner in the evening, Mr. Grattan said that, the Prime Minister speculated upon four contingencies—firstly, upon an outbreak of the Irish people, in which he would be disappointed; secondly, on the demise of Mr. O'Connell; thirdly, on the intention to buy the Catholic clergy; and fourthly, on the attempt to sell the Protestant clergy. Upon this, Dr. Cantwell, titular bishop of Meath, said, "They may, perhaps, sell your clergy, but they never will purchase mine. As to the project of making a state provision for the Catholic clergy, it was a thing to which they would never submit; and he would take upon him to declare, on the part of all the bishops in Ireland, that they would receive such a proposition with horror and indignation."

Clogher.—The Belfast papers state that a singular opening in the ground has taken place at Clogher, which has caused great sensation, and done injury to the market, as the people are really afraid that the town will also sink. The bottom of the pit is hard, yet there is at present about nine feet of water and dirt in it, caused by springs and gravel from the sides of the pit. As yet no cause can be assigned for the chasm.

SCOTLAND.

Edinburgh.—The Commission of the Church of Scotland met last week in the aisle of the High Church, and it being expected that Lord Aberdeen's Bill would be brought under consideration, there was a very full attendance of members. On the motion of Dr. Lee, Principal Macfarlan, Moderator of last Assembly, took the chair. Dr. Cook in a speech of great length moved a resolution, expressing hostility to various clauses of the Bill, "as conferring on Presbyteries an extent of power which no judicatory, bound to decide judicially upon what is brought before it, ought to possess, and as at variance with the professed object of the Bill, and calculated to defeat that object, but nevertheless approving of the general tenor of the Bill." Principal Haldane moved as an amendment, that "The Commission having deliberately considered Lord Aberdeen's Bill, cordially approve of the same, and confidently hope that it will fulfil the patriotic intentions of the Government, by securing the peace and prosperity of the Church." A long discussion ensued which ended in a division, when there appeared—for Dr. Cook's motion, 33; for Principal Haldane's amendment, 61. The amendment was then adopted.

LABOR.

COURT OF QUEEN'S BENCH.—In the course of last term the Duke of Brunswick preferred a series of indictments against Mr. B. Gregory for libellous articles published in the *Satirist*. One of these was removed on writ of *certiorari* into this Court, when the defendant pleaded guilty, and judgment was deferred until Michaelmas term. Subsequently to this other indictments were preferred at the instance of the Duke, and of Mr. Vallance, solicitor to his Serene Highness, which the defendant unsuccessfully attempted to remove by *certiorari*. In order, therefore, to avoid the execution of the warrants issued upon these indictments, the defendant has been for some time keeping himself out of the way. In consequence of this, a reward of 10*l.* was offered for his apprehension. On Saturday last information was received by the police that he was living under a feigned name at South-end, where he was captured on the next day. He was taken before the magistrates, and remanded until he procures the necessary bail.

NORTHERN CIRCUIT, APPEAL.—Brougham-Hall Estates.—Robinson v. Bird and Others.—In this case Mr. Knowles applied to have the case postponed, but it was ultimately decided to proceed with it. Sir T. Wilde, with whom were the Hon. Mr. Stuart Wortley and Mr. Roebuck, stated that the present action was brought to recover compensation for a trespass by the defendants, and an illegal seizure of the goods of the plaintiff. The plaintiff was a tenant to Lord Brougham, of the farm of Weatherriggs in this county, and the seizure was made under an alleged claim for arrears of rent due to the defendants. The defendants had pleaded that they were not guilty of the trespass; and secondly, that the horse in question was seized for arrears of rent due to the defendants. To support the latter plea, it would be necessary for the defendants to establish their title to the property, but this they did not even attempt to do, and independently of the failure of their proof, he would show conclusively that they had no title whatever, and that they could have none, inasmuch as the property in question had been in the possession of the ancestors of Lord Brougham from so early a period that there could not by possibility be any legal title in any other party. He might, indeed, go back as far as the reign of Henry II., and show that it had been in the family of Bergham, Brougham, or Brougham, from which the name of the parish and manor were derived, even from that early period; but it would be necessary to show that the Birds, at least, had no title to this property, all the interest of the James Bird, under whom they claim, having been conveyed to the Brougham family so long ago as 1726. But even if there was any title still existing in the descendants of James Bird, the defendants in the present action were wholly unable to show any relationship to establish a title between themselves and him. There was no reasonable ground whatever for the assumption that they were the representatives of the James Bird in question; but, at all events, it would be shown that the James Bird, who, in 1726, was possessed of the property in question, during a brief alienation from the family of Brougham, left at his death two daughters, who, together with their uncle, sold the hall and demesne to Lord Brougham's ancestor for 5,000*l.* From that time to the present the possession of this property, turned without molestation in the possession of this property, until the present defendants, without any authority, without any proof whatever of a title in them, urged on, probably, by the advice of ignorant or of wicked persons, had ventured to molest and annoy the rightful owner and occupiers. When the distress and annoy the rightful owner and occupiers was made, the regular complaint of in the present action was made, the defendant, Adam Bird, officer I had refused to act, and the defendant, Adam Bird, accompanied by an auctioneer named Irving, had himself made the levy. For that trespass an action was brought, but not being so promptly followed up as the defendants had anticipated, they went, it appeared, in a body to Brougham-hall, and took possession of it, evidently misinterpreting the delay which had taken place in then calling as a witness, and proved the son of the plaintiff was then called as a witness, and proved the seizure at the farm of Weatherriggs, on the 21st March last. Adam Bird, and Irving the auctioneer, were the acting parties. They came, and "tipped" the mare, which they said was sufficient. Before leaving they made a schedule of the property seized, and left it in the house of the plaintiff, stating that unless the mare was replevied within five days, they would return and sell. The schedule was put in, setting forth that a mare had been distrained for 10*l.* arrears of rent due to Thomas Bird, and a notice previously left by Adam Bird, not to pay any rent except to John Bird or his agents. A number of deeds were then put in in evidence to trace the title of Lord Brougham to the property in

question. The first of these was a conveyance by indentures of lease and release, dated the 9th and 10th of November, 1726, whereby Thomas Carleton and Isabella his wife, a daughter of James Brougham, in consideration of 3,150*l.*, and Atkinson Carleton, and Dorothy his wife, and Margaret Bird, granddaughters of James Bird, in consideration of 1,850*l.* to them paid, did convey to John Brougham, of Scaleby, the mansion of Brougham-hall, and other premises, including the farm of Weatheriggs, formerly the property of James Bird, to the use of the said John Brougham, his heirs and assigns, for ever. There were the usual covenants for title and to levy a fine. There was also put in evidence the photograph of a fine levied in pursuance of the former deed, 2d George I., 1727. The next deed was dated 28th November, 1763, and was a conveyance enrolled in the Common Pleas, from Henry Brougham, the elder, son of James Brougham, and Henry Brougham, the younger, to H. Bains, his heirs and assigns, to make a tenant to the *præcipe*, for the purpose of suffering a common recovery of the premises in question, the uses of which were declared to be to Henry Brougham, the elder, for life; remainder to trustees, to preserve contingent remainders, with remainder to the use of Henry Brougham, the younger, and the heirs male of his body, with remainder to the right heirs of Henry Brougham, the elder. There was also an exemplification of a recovery suffered Michaelmas term, 4th George III., pursuant to the deed. There was then a lease and release from Henry Brougham to George Pearson, to make a tenant to the *præcipe* to suffer a recovery, the uses of which were declared to be to Henry Brougham, his heirs and assigns, for ever; and a recovery suffered in pursuance of this deed Trinity term, 23d George III. A number of witnesses were then examined to show the undisturbed possession of Lord Brougham and his predecessors under these deeds, extending back within living memory for nearly 70 years. Mr. Justice Wightman, in summing up, said that the present action had been brought to recover damages for a trespass and illegal distraint. No defence had been set up by the defendants. The plea, so far as it was material, was that the property belonged to the defendants, but no evidence had been given to support that plea, and of course it fell to the ground. It was not, under these circumstances, incumbent on the plaintiff to prove more than the forcible entry and distraint; but he had further gone into his own title, and shown sufficient to satisfy every person that the defendants could have no defence, legal or equitable, to offer. Whatever claims some parties of the name of Bird might have had, they had parted with them in 1726, 117 years ago. It was for the Jury to say whether the trespass was proved to their satisfaction, and if proved, what damages they would award. The action did not appear to have been brought for the sake of damages, but merely to get rid of the danger of annoyance for the future. A very moderate sum would, therefore, probably be sufficient to satisfy the requirements of the case. Verdict for plaintiff—Damages 40*s.*

Thomas Bird, Isaac Bird, Peter Bird, Thomas Bird (nephew of T. Bird, the elder), and **Adam Bird**, stood charged in the Crown Court with having, along with John Bird, on Tuesday, May 23, unlawfully entered the mansion-house of Lord Brougham, called Brougham-hall, in the parish of Brougham, and from the peaceable possession of the same, with force and arms, unlawfully expelled and put him out. The several defendants, who had been admitted to bail, surrendered to take their trial. They had the air of respectable mechanics, and with the exception of Thomas Bird (the nephew) described in the calendar as able to read and write but imperfectly. They all, especially the elder Bird, seemed to be sensible of the difficulty into which they had brought themselves by their illegal conduct. On their being placed at the bar, Mr. Matthews, who appeared for them, stated that, on an examination of the case, he was satisfied that they had no sufficient defence to this indictment, and that by his advice the defendants would plead guilty. Sir J. Wile said that an action had that morning been tried in the other Court, in which a tenant of Lord Brougham sought compensation for a trespass, on the part of the present defendants, arising out of the same claim, which suggested the course of conduct on their part which had given rise to the present indictment; and there had then been laid before the jury a series of evidence which must have satisfied even the present defendants that they had no shadow of title to the property which they claimed. It would, however, be open to them even now to support, by legal means, any claim which they might fancy they possessed; but it was necessary they should be made aware, that it was not to be permitted that parties should take the law into their own hands, and take possession by force and violence of property in the peaceable possession of others, to which they might suppose they had some claim of right. As the defendants, however, seemed to be sensible that their conduct was unjustifiable, he for his part was willing, should it meet his lordship's approbation, that sentence should not be passed, but that the judgment should be postponed, and carried into effect only in case of their being guilty of any further violation of the law. The defendants were then, with some words of admonition from Mr. Justice Cresswell, discharged on their own recognizances to appear to receive judgment when called on.

NORTHAMPTON CIRCUIT, CHESTER.—Worthington v. Grimsditch, M.P.—This was an action brought by Mr. T. Worthington, the administrator of Miss Duncalf, against Mr. Thomas Grimsditch, M.P. for Macclesfield, for the recovery of a sum of 380*l.* upon bonds passed at various times, with the interest. The defendant pleaded payment and the statute of limitations. The facts of the case were few and simple. It appeared that the late Miss Duncalf was the survivor of three sisters, and a member of a wealthy and respectable family, and that the defendant was a distant relation of hers. He had formerly been an articled clerk, and afterwards became the law agent of the Adlington property, on which Miss Duncalf resided. He was appointed collector of her rents, and while acting in this capacity, commenced raising money from her on bond, so far back as 1810. He continued to borrow for years after, until at length it amounted to the considerable sum claimed. Verdict for plaintiff.

Coal Mines, Bagillt—Hammer v. Eyton and Others.—This case excited considerable interest throughout the country, in consequence of the property at stake, the damage being laid at 200,000*l.* The Solicitor-General stated that the plaintiff, Mr. W. Hammer, was the trustee of Sir J. Hammer, under the will of the late Sir Thomas Hammer, who was possessed of considerable estates in the county of Flint including the mine in the parish of Flint, known as the Dee Bank Colliery, and which it was complained had been destroyed by the negligent or wilful wrong acts of the defendants, the Messrs. Eyton, large mining proprietors in the same county. The property borders the river Dee, and consisted of several valuable veins of coal; the dip was from the uplands down towards the river; the veins were the three and five yards, which were very valuable, and dipped under the river. In 1826 it was leased to parties named Howells, for twenty-five years, reserving a royalty of one-seventh. It was since worked by the Dee Bank Colliery Company. Adjacent to this colliery was one worked by the defendants, leased from Dr. Richardson. About 45 years ago the late Mr. Ellis, of Cornist, worked Sir J. Hammer's mines, and several also of the adjacent mines. He worked through two faults, and opened into one, which let in an immense body of water, supposed to be tapped from the river Dee, which filled a large space underground, and formed a sort of subterranean lake, known as the Boot-water, from the Boot Colliery, and which was kept out of the rest of the collieries by a fault. This body of water was well known to all the colliers, and it was also known, that if the fault was disturbed, it would have disastrous effects upon all the adjacent collieries. The defendants began to work their mine at Bagillt about eight or nine years ago, and had nearly exhausted it. It was so situated that water flowed from it into the pits, whose engines had to remove it. About three years since they sink a pit towards the fault which was the barrier against the Boot-water. Notice was given to their agent that they were proceeding in driving levels which would destroy all the collieries, and which notice was repeated. He should prove by their own workmen

that this notice was given, and that they continued to work towards the fault in question. The accident happened on Sunday, the 2d July last, and it was providential that it happened on that day, as 100 lives might have been lost; the Boot-water burst in, and first destroyed defendants' pits, and then plaintiffs' pits. In the first instance defendants offered to pay the expense of draining the plaintiffs' pits; but the learned counsel said he was instructed that that could not be done, but that the colliery was totally destroyed. With respect to the question of damage, he entered into a variety of calculations, by which it appeared that for some years the royalty had averaged annually about 1,547*l.*; and that there were about 91 acres of the three and five yard veins, which gave a gross tonnage of 2,344,427, but, deducting the usual per centage, the net tonnage would be about 1,687,998 tons. It would take 90 years to exhaust these beds. He entered into two calculations founded upon different scales; one came to 20,194*l.*, the other to 30,944*l.* After some further observations, he stated that he should sustain his statements by evidence; and as Sir J. Hanmer had lost his property by the default of the defendants, he was entitled to full compensation at their hands. A number of witnesses were then called to prove the case as stated by the learned counsel, and, at the rising of the Court, there remained two witnesses to examine on behalf of the plaintiff. The trial was resumed on Tuesday, when the additional witnesses were examined, and the case for the plaintiff closed. Mr. Jervis then addressed the jury in favour of the defendants. He said that the enormous damages claimed by the plaintiff would amount to an annuity of 1,500*l.* a year for ever; and that the allegation really was that the defendant had not attended to the idle and gossiping conversation with the people of the neighbourhood respecting the water, called the Boot-water, in his mines, and that he had recklessly destroyed not only his own property, but that of others. He admitted that damage had been done, but he contended that it was caused by the ordinary working of the concern, and that his client, who was a considerable loser thereby, sincerely regretted it. No witnesses having been called for the defence, Baron Gurney charged the jury, who returned a verdict for the plaintiff, damages 6,227*l.*, with power to move for a reduction of damages to 1,600*l.*

WESTERN CIRCUIT, BRISTOL.—Isaac, Thomas, and Robert Watkins, were indicted for burglariously breaking and entering the dwelling-house of Mary Hunt, and stealing divers articles, and for assaulting her with intent to murder her. The prosecutrix was a poor old woman living alone in a house at Brislington, near Bristol, and the circumstances of the outrage attracted considerable attention at the time. Her house was broken into, and the bed was thrown upon her, with a heavy box upon it to prevent her giving an alarm. Two of the prisoners attempted to prove an *alibi*, but the Jury found them all guilty of the burglary and the wounding, but not with intent to murder. Mr. Justice Coleridge ordered judgment of death to be recorded, but told them the only condition upon which their lives would be spared, would be upon that of their being transported for life.

WESTERN CIRCUIT, BAILEY-WATER.—Richard Alvin was indicted for the murder of an illegitimate child, name and sex unknown, by tying a hayband round its neck, and producing suffocation. The case excited the most intense interest. The prisoner is a person of considerable property, residing at the time this offence was said to have been committed, upon his own estate, at Crewkerne, where his father lived, and acquired considerable property as a banker. The particulars of the case having been noticed at the time, it is sufficient to state that the child was the offspring of a servant girl, who swore that her master took the child from the hay-loft in which she was confined, that she never saw it after, and that he also made up a hayband, but she did not see him do anything with it. Other witnesses deposed that the body of a child was found in the prisoner's garden, on the 11th June, with a hayband round it. Mr. Cockburn, for the prisoner, pointed out various inconsistencies in the evidence, and Mr. Justice Coleridge put it to the Jury whether they could see their way clear to find that the prisoner had killed the child by suffocation. There being no evidence whatever that could satisfy them on this particular, the Jury immediately acquitted the prisoner.

OXFORD CIRCUIT, STAFFORD.—The Queen v. Arthur O'Neil.—In this case, the Chartist lecturer was charged with having uttered certain seditious words to a large public meeting of workmen, at Rowley Regis, on the 26th August, 1842, intending to bring the laws and constitution, and the House of Commons into contempt, to obstruct the collection of the revenue, to induce the subjects of this realm to refuse and resist the payment of taxes, and to persuade large bodies of workmen in the coal and iron mines unlawfully to conspire and combine for the purpose of obtaining an increase of their wages, by abstaining from work, and to cause them to hold unlawful assemblies, to create disturbances, break the public peace, and resist the execution of the laws. The Jury found him guilty. The defendant, upon being asked what he had to urge against judgment, said that he had many and weighty reasons to urge. "If," he said, "you value your own cause, and do not desire that my principles should spread, there is no more certain means of so doing than by my imprisonment, by which I shall obtain greater influence than I now possess. Moreover, I am not desirous of leaving all the institutions with which I am connected in Staffordshire—the schools I have formed and taught, the congregations I have preached to, the sick I have visited. Nor do I wish to leave the excited population of Staffordshire without the control I have hitherto been able to exercise over them. But for myself I have not the slightest objection to imprisonment. I shall in gaol have better opportunity of studying the Scriptures diligently, and learning from its pages new lessons against the despotism and evil I have ever struggled against." Mr. Justice Williams, addressing the defendant, said—Arthur O'Neil, you have been convicted of uttering a seditious speech; and when the situation of the country at the time that speech was uttered, and the conduct of the parties to whom it was addressed, suffering, as I fear they were, under great and real distress, are taken into consideration, it seems to me that the Jury could have come to no other conclusion. Having no connexion with the trade of those whom you addressed, though you state you were connected with them or some of them as their minister, you chose to select that particular time of excitement and distress for your visit and address to them. One would have expected that if in that address any other topic than patience and submission to the law had been dwelt on by you, your address would, at least, have been cautious and guarded. Instead of so doing, you exhorted them to throw off allegiance to the Government, and to refuse the payment of taxes. How far you are sincere in the opinions you yesterday at such length expressed, is best known to yourself. How far you can believe that the peaceful millennium which you profess to anticipate as the result of modern enlightenment, and the accomplishment of ancient prophecy, can be brought about without oceans of blood, of which you so strongly express your abhorrence, it is for you to say. No reasonable man can think that the change you deem so much to be desired can be brought about without a fearful burst of the volcano, to which you yesterday referred with so much apparent pleasure. Be that as it may, bear in mind that you are not prosecuted or convicted for your opinions, but for the tendency of the address which you then delivered. Taking into consideration all the circumstances of the case, the sentence of the Court is, that you be imprisoned for twelve calendar months.

Foley v. Botfield.—The questions which gave rise to the present case are of an extremely intricate character, and involve many points of law originating from the construction put upon the clauses of a certain lease made as long ago as the year 1801. That lease operated as a demise for sixty years of an estate of about 100 acres, situated in the centre of the mining district of Tipton, supposed at the time and eventually proving to contain valuable mines of coal and iron, which was then held by different individuals in four undivided shares. The proprietors of these shares concurred in granting to Thomas Botfield a lease of the

land, covenanting at the same time that he should keep the surface as much as possible unbroken, but that he should have free leave to work the mines beneath, to erect such engines, whistles, blast and air furnaces, cupolas, gins, and smelting works, as to him should seem meet, stipulating at the same time that all such buildings and machinery should, on the expiration of the term, be left on the land in good condition and repair. Some years after the date already named, Mr. Botfield made an underlease of the same estate, demising it with all its appurtenances, to Mr. Turton, who afterwards accepted Messrs. Dixon and Co. as his under tenants. The mines were worked to 1837, then on the expiration of the under-lease, Mr. Botfield left the mines unworked till 1842. The original lease being determinable on one year's notice being given by either party, the lessee gave that notice, and thus the lease granted in 1801 expired in consequence on Lady-day, 1842. The main object for which the present action was brought by Mr. Foley was, to recover his proportionate share of the dilapidations alleged to have been caused by the defendants. The covenants of the lease being of a peculiar construction, rendered the determination of this point a matter of no ordinary difficulty, and in all probability the subsequent proceedings will not be brought to a close for a very considerable length of time, as it is scarcely possible, from the nature of the case, that a satisfactory determination of the numerous issues between the parties can be attained by the present trial. The examination of plaintiff's witnesses lasted 54 hours. At the sitting of the Court on Monday, it was again resumed, and concluded at two o'clock, when Mr. Richards addressed the jury on behalf of defendant, and at four o'clock the judge summed up the lengthy evidence with much minuteness. The jury remained some time in deliberation, returning the following special verdict:—We find that the mines were not finished, that they were not left in working condition; and we award accordingly no damages for the broken surface, regarding the whole as still a mining property. But for removing the engines, &c., we give 1,200*l.*; for non-repair of the shafts and levels, 500*l.*; for removing buildings, 250*l.*; for dilapidations of the furnaces, 304*l.*; for basons, bridge, &c., 212*l.* total, 2,526*l.* One-fourth of which will be the share of the plaintiff.

HOME CIRCUIT, CROYDON.—Doe, on the Demise of Angell v. Angell.—The circumstances under which the action was brought are, in many respects, peculiar. Sergeant Shee, in his address to the Jury, said, that the plaintiff was an aged man, a market-gardener, and defendant was a gentleman named John Benedict Angell Angell, whose family name was Brown, but who, in 1785, assumed the name of Angell, under circumstances that would afterwards be detailed. The action was brought to recover about 20 acres of land, in the parish of Stockwell, and the title of plaintiff was founded upon the will of a Mr. John Angell, who died at Stockwell, in 1784. By that will the testator gave to the male heirs of William Angell, the first purchaser of Croyhurst, the father of his great grandfather, and their male heirs for ever, all his lands and estates real and personal in Surrey, Kent, and Sussex; and in default of such male heirs being in existence, then the estates to go to the male heirs of William Angell, of Northamptonshire, who should make themselves out to be Angells, and their heirs for ever, and in default of that branch, to William Brown, who was an Angell. The will also directed that if the party making out his descent of his name should happen not to be Angell, that he should assume the name, and use the Angell arms, or, in default, should be excluded from the enjoyment of the property; and that the estates should only go to the heirs male, and excluded the females altogether. This Mr. John Angell died in 1781, and the present defendant then came into the possession of the whole property under this will, but he should show that at that time the real heir was John Angell, father of plaintiff, who died in 1802, in total ignorance of his rights. The learned Counsel then proceeded to adduce the evidence to make out the pedigree of plaintiff. It consisted of wills, inquisitions, records of the Herald's College, and a variety of other documentary testimony. Mr. Thesiger, for the defendant, proceeded to the facts of the case; after which much evidence was adduced in opposition to the plaintiff's claim. Considerable stress was laid upon certain alterations made in a parish register. The Jury retired, taking all the documents with them, and returned a verdict for plaintiff.

SPORTING.

TATTERSALL'S, THURSDAY.—ST. LEGER.—7 to 4 offered on Mr. Bowes's Cotherstone; 8 to 1 agst Scott's lot, bar Cotherstone; 20 to 1 agst Mr. Yarbrough's Dumping (taken); 20 to 1 agst Lord Exeter's Lucetta colt (taken).

DERBY.—Offers to take 1,000 to 30 each about Voltri and Saddle Bow; 1,000 to 20 agst Mr. Saddler's Johnny Broome (taken).

MARK LANE, FRIDAY, AUGUST 18.—The Wheat Market is very inanimate, a few samples of fine old Wheat have been disposed of at about the rates paid on Monday.—New Wheat has been sold at lower prices, and in Foreign or Bonded scarcely anything doing. Barley is 1*s.* lower. Beans and Peas a dull sale, and Oats are unaltered in value.

GAZETTE OF THE WEEK.

BANKRUPTCY SUPERSEDED.—I. Smallcombe, Bradford, Wiltshire, coal-dealer.

BANKRUPTS.—J. F. Armstrong, Tranquilvale, Blackheath, china-dealer. J. Woolton, Lynn, Norfolk, furnishing-ironmonger. T. Fortune, Lower Whitcross street, cabinet-maker. G. J. Marshall and W. C. Hall, Wood street, City, wooden-ware-warehousemen. J. Johnson, Little Abington, Cambridge-shire, binder. D. Hart, Cambridge, perfumery. R. T. Fletcher, Brentford, Middlesex, money-scrivener. R. Combs, Norwich, draper. J. Hughes, Chesham, Gloucestershire, H. M. Newton, New M. I., Yorkshire, victualler. J. Graham, J. C. Newell, upon Tyne, screw-iron-plant. T. Cooke, Leicester, glove-manufacturer. R. Watson, Yorkshire, silk-mercer. W. Whitfield, Bridge-water, Somersetshire, grocer. J. H. Houghton, Amble, Northumberland, draper. H. Buggins, Preston, Lancashire, alkali-manufacturer. S. Parker, Wokingham, Hampshire, mercer. T. Humble, Ardwick, Lancashire, grocer. George Water, Oldfield, Northamptonshire, grocer. Thomas Meagary, Love-lane, coal-merchant. William Vann, Old street, upholsterer. William Snowball Walker, Pall mall East, pastrycook. Robert Honner, Camden Town, contractor for wood-paving. James Kalfs, Piccadilly, upholsterer. Richard Richard, jun., and William Brown, Prescott, Lancashire, balance-makers. Joshua Horton, Hart's-hill, Dudley, Worcestershire, and Joseph Morton, St. Peter's street, Islington, iron-manufacturers. James Woods, Heathfield, within Saddleworth, Yorkshire, woollen-manufacturer. Joseph Higginbottom, Ashton-under-Lyne, solicitor. Thomas Oldfield Hazard and Henry Bingham, Sheffield, merchants. Gaskill Johnson, Liverpool, merchant.

BIRTHS.—On the 13th inst., the Hon. Mrs. E. P. Bouverie, of a daughter. On the 10th inst., at the Royal Mint, Mrs. Barton, of a daughter. In Curzon-street, Mayfair, the Countess of Mount-Edgumbe, of a daughter. On the 10th inst., at Liverpool, the Hon. Mrs. H. W. Macaulay, of a son. The lady of Sir John Rae Reid, Bart., M.P., of a daughter.

MARRIED.—On Tuesday, at Hatfield House, the Lady Blanche Cecil, daughter of the Marquess of Salisbury, to Mr. J. M. Ballou, M.P., at Edinburgh, on the 4th inst., John Driver, Esq., of Madeira and Liverpool, to Harriett, widow of Dr. J. A. Mason, M.D., of Doncaster.

DIED.—At her residence in Stratford-place, on the 16th inst., the Dowager Lady Ellenborough, in the 75th year of her age. At her residence, Downshire-hill, Hampstead, on the 15th inst., Robert Bakewell, Esq., author of "The Introduction to Geology," aged 76. At the Rectory House, Birmingham, on the 18th inst., the Lady Louisa, wife of the Rev. W. Marsh, D.D., and sister of the Earl Cadogan.

PUBLISHING MONTHLY.
LARGE, 1s. 6d.; SMALL 1s.; GARDENERS' EDITION, 6d. THE
BOTANIC GARDEN; OR, MAGAZINE OF
FLOWERING PLANTS.

WITH MANY IMPORTANT AND USEFUL ADDITIONS.
By B. MAUND, F.L.S.

Each Number contains BEAUTIFULLY-COLOURED FIGURES OF
ORNAMENTAL PLANTS, both herbaceous and shrubby; suitable
for the Flower Garden or Pleasure Ground. With the derivations
of names; classes; orders; height of the plants; time of flower-
ing; native country; history; qualities; most approved modes
of propagation and culture; and other information, interesting to
every lover of a Garden. Annexed to each Number, is the

FLORAL REGISTER,

With Wood-cuts of admired Flowering Plants, mostly such as
have been newly imported into this country; with the necessary
information respecting them. Also,

THE AUCTARIUM,

In which are given, improved methods of cultivation and preserva-
tion of vegetables, fruits, and flowers; new discoveries con-
nected with gardening; and miscellaneous information. Also,
in each Number, till complete, commencing with the new volume,
on the 1st of January, 1843, a portion of Professor Henslow's

BOTANICAL DICTIONARY,

Written expressly for the Author, there being so great a want of
such a Work: thus, the BOTANIC GARDEN contains four distinct
Works, proceeding together, at a trifling cost, once a month.

The Volumes already completed of this Standard Botanical
Work, can be had at the following Prices: LARGE. SMALL.

	£ s. d.	£ s. d.
Hf.-bd., green mor. backs, gilt edges, each	2 2 0	1 10 0
Cloth gilt, beautifully embellished	2 0 0	0 0 0
Drab boards	1 17 0	1 5 0

The Gardeners' Edition at 6d., with partially coloured plates, com-
menced in January, 1843, with No. 1.

The portions of the FLORAL REGISTER and AUCTARIUM, already
published, contain nearly Twelve Hundred Engravings, forming
one handsome volume, which will be delivered GRATIS to the
purchaser of four volumes of the BOTANIC GARDEN.

GROOMBRIDGE, Paternoster-row.

BOTANICAL BOOKS.

THE FOLLOWING WORKS ARE NOW TO BE HAD OF

WILLIAM PAMPLIN,

BOTANICAL BOOKSELLER, 45, FRITH STREET, SOHO
SQUARE, LONDON.

**TRANSACTIONS OF THE HORTICULTURAL
SOCIETY OF LONDON.** Seven Volumes. 4to. That is—
the First Series complete, half calf, gilt, 7l. 7s.

**TRANSACTIONS OF THE LINNEAN SOCIETY
OF LONDON.** Eighteen Volumes. 4to. That is—all that have
yet been published. Vols. I. to XII. are neatly half-bound, and
the remaining six are in Parts, as published, 17l. 17s.

**TRANSACTIONS OF THE HORTICULTURAL
SOCIETY OF PRUSSIA.** Fourteen Volumes. 4to. A fine
Copy, half-calf, gilt. Berlin, 1824-1840. 12l. 12s.

**TRANSACTIONS OF THE IMPERIAL AKA-
DEMY OF NATURAL HISTORY OF BONN.** 4to. A quantity
of separate Volumes, Parts, and Papers from this and several
other similar Continental Works can always be supplied.

Of the following Books, copies are always to be found at
W. PAMPLIN'S.

**DE CANDOLLE.—PRODROMUS SYSTEMATIS
REGNI VEGETABILIS.** Seven Volumes. The eighth volume of
this Work will be published in a few weeks; those persons who
wish to receive it on the day of publication are requested to forward
their names to the Advertiser at once, in order that they may be
supplied without disappointment.

**BUEK.—GENERA, SPECIES, ET SYNONYMA
CANDOLLEANA, seu INDEX GENERALIS ET SPECIALIS
AD DE CANDOLLE PRODROMUM SYSTEMATIS NATU-
RALIS REGNI VEGETABILIS.** Pars I. et II. Berlin, 1842. 18s.

**WALPERS.—REPERTORIUM BOTANICISSYS-
TEMATICÆ.** Of this Valuable Work, the 8th Part, or Part III.
of the second Volume, has just appeared. Price of each Part, 4s.

ENDLICHER.—GENERA PLANTARUM. Vienna,
1840. 4l.; or handsomely bound in two volumes, half-calf extra,
4l. 8s. 6d.

ENDLICHER.—MANTISSA BOTANICA. Vienna.
1842. 6s.

**ENDLICHER.—ICONOGRAPHIA GENERUM
PLANTARUM.** Handsomely bound, half-calf extra. Vienna.
1838. 3l. 10s.

**POEPPIG ET ENDLICHER.—NOVA GENERA
AC SPECIES PLANTARUM QUAS IN REGNO CHILENSI
PERUVIANO ET IN TERRA AMAZONICA, &c.** Two Volumes,
fol. Various copies, bound or unbound, from 4l. 14s. 6d. and up-
wards, according to binding and condition. The Parts of Volume
the Third which have appeared, as well as most of the former
Parts, can still be had separately.

PERSOON.—SYNOPSIS PLANTARUM. Two
Volumes. Various copies, neatly bound or half-bound, from 18s.,
and upwards.

**KUNTH.—ENUMERATIO PLANTARUM OM-
NIUM HUCUSQUE COGNITARUM, &c.** Several of the
Volumes may be had separately. 14s. each.

**AUGUSTE ST. HILAIRE.—FLORA BRAZILIÆ
MERIDIONALIS.—ADJUT. JUSSIEU ET CAMBESSEDES.**
Volumes I. and II., neatly half-bound, and remainder in Parts.
Paris, 1824, &c. 7l. 7s.

**MIKAN.—DELECTUS FLORÆ ET FAUNÆ
BRAZILIENSIS, &c.** Several odd Parts of this Magnificent
Work, each, 15s.

FLORA.—ODER BOTANISCHE ZEITUNG. Com-
plete from the beginning.

LINNEÆ, EIN JOURNAL FÜR DIE BOTANIK.
Complete from the beginning.

**GERARDE'S HERBAL, OR HISTORY OF
PLANTS.** Various Copies of both the Editions, from 18s. and
upwards, according to condition.

PARKINSON'S HERBAL. Various Copies, from
18s. and upwards, according to condition.

**LINNEÆ SPECIES PLANTARUM CURA WILL-
DENOW.** Various Copies, from One to Three Guineas, accord-
ing to condition.

**LINNEÆ SYSTEMA VEGETABILIIUM CURA
SPRENGEL.** Various Copies, from Two Guineas and a half to
Three Guineas.

**EKART SYNOPSIS JUNGERMANNIARUM IN
GERMANIA, &c.** Numerous Plates. 4to. Various Copies from
10s. 6d. to 12s.

**WIGHT'S ICONES PLANTARUM INDICÆ ORI-
ENTALIS, OR FIGURES WITH DESCRIPTIONS OF EAST INDIAN PLANTS.**
This is allowed to be the very best and cheapest Work upon
Indian Botany. The Third Part of the Second Volume has just
been received from Madras; the Price of this Part is 1l. 5s.

**WIGHT AND ARNOTT.—PRODROMUS FLORÆ
INDICÆ ORIENTALIS.** Volume the First being all that has yet
appeared. 16s.

** N.B.—W. PAMPLIN has a good collection of British and
Foreign Books upon FERNS.

TREASURES MORE PRECIOUS THAN GOLD.

DR. ROBERTS'S CELEBRATED OINTMENT,
called the POOR MAN'S FRIEND, is confidently recom-
mended to the public as an unfailing remedy for wounds of every
description, a certain cure for ulcerated sore legs, if of 20 years'
standing, cuts, burns, scalds, bruises, chilblains, scorbutic eruptions
and pimples in the face, sore and inflamed eyes, sore heads,
cancerous humours, &c., and is a specific for those afflicting
eruptions that sometimes follow vaccination. Sold in pots, at
1s. 1½d. and 2s. 9d. each. Also his

PILULÆ ANTISCROPHULÆ,

confirmed by more than 40 years' experience to be, without ex-
ception, one of the best alterative medicines ever compounded
for purifying the blood and assisting nature in all her operations;
hence they are useful in scrofula, scorbutic complaints, glandular
swellings, particularly those of the neck, &c. They are efficacious
also in rheumatism, and form a mild and superior family aperient,
that may be taken at all times without confinement or change of
diet. Sold in boxes, at 1s. 1½d., 2s. 9d., 4s. 6d., 11s., and 22s. each.

To those who cannot take pills, the proprietors would strongly
recommend Dr. Roberts's

ANTISCROBUTIC DROPS,

for the cure of the scurvy, scrofula, leprosy, and all scorbutic com-
plaints; they strengthen the constitution, purify the blood, and pro-
mote a circulation of the fluids; are gentle in their operation, and
do not require cessation from business. In bottles at 2s. 9d. each.

By the late Dr. Roberts's will Messrs. BEACH & BARNICOTT
(who have been confidently entrusted with the preparation of his
medicine for many years past), are left joint proprietors of the
"Poor Man's Friend," "Pilulæ Antiscrophulæ," "Larwell's
Pills," "Medicated Gingerbread Nuts," and "Antiscrobutic
Drops," with the exclusive right, power, and authority to prepare
and vend the same.

The still increasing demand for the above medicines, from all
ranks, is the best and most substantial proof of their utility.

Observe.—No medicine sold under the above names can possibly
be genuine, unless "Beach and Barnicott, late Dr. Roberts, Brid-
port," is engraved and printed on the stamp affixed to each
package.

ALL DISEASES of the KIDNEYS and BLADDER

speedily and effectually cured by DR. YOUNG'S MIXTURE.
—The efficacy of this Medicine in the above Complaints has been
long proved by its unparalleled success in a practice of many
years' standing, and has induced the present proprietor to make
it more generally known.

Sold in Bottles, 2s. 9d. each, by the Proprietor's Agent,
J. SANGER, 150, Oxford-street, London; also by Johnson, 68,
Cornhill; Prout, 229, Strand; Mr. King, 232, Blackfriars Road;
and all Medicine Vendors throughout the country.

CORNS, BUNIONS, &c.

**THE PROPRIETOR of the ANTI-CALLOSITY, or
RUSSIAN CORN AND BUNION PLASTER,** feels great
confidence in recommending it as the most certain cure for all
Callous Swellings on the Feet that has ever yet been invented.
By the use of this Plaster immediate benefit will be found, and in
a short time a Radical Cure will be effected by gradually dis-
persing the Hard or Soft Corn, and entirely removing those
painful throbings so severely felt at every change of weather.

Sold, with full directions for use, in boxes, 1s. 1½d. and 2s., at
SANGER'S Medicine Warehouse, 150, Oxford-street; and all
Medicine Vendors throughout the country.

Remember—"THE RUSSIAN CORN AND BUNION PLASTER."

BRITISH SHEET-GLASS for HORTICULTURAL PURPOSES.

DRAKE & BROMLEY have received Mr. PAXTON'S
kind permission to publish the following extract from his
Letter, dated Chatsworth, July 18, 1843.

"The terrific hailstorm which visited this locality did not injure
a square in the Great Conservatory, but in the Sheffield Botanical
Gardens about 5000 squares were broken, and the houses of a
gentleman near Sheffield were completely riddled, and the plants
in them much injured; but at Queen's Tower, the residence of a
gentleman whose houses were glazed with the Sheet Glass, and
where the storm raged in its utmost fury, only two squares were
broken, and even these were not in the roof, but at the end,
where the hailstones struck them obliquely; this is a most grati-
fying proof of the strength and superiority of the Sheet Glass."

The glazing of the large Conservatory at Chatsworth was begun
by J. DRAKE in June, 1839, and finished in July, 1840; during the
subsequent period no casualty has happened to render necessary
the slightest repair for breakage, and of the superiority of the
Sheet Glass in resisting Hail, no proof more conclusive or satis-
factory could be given, than the above extract affords.

A return to Parliament of the duties and drawbacks on Glass,
from the 5th Jan. 1813, to the 5th Jan. 1843, exhibits the consump-
tion in Great Britain of British Sheet Glass since 1839, in which
year J. DRAKE had the honour to receive the following Letter of
Thanks for its introduction to the notice of the Horticultural
Society of London. "March 20, 1838.

"Sir, I have the honour to return you the thanks of the Hor-
ticultural Society of London, for your exhibition of specimens of
New Sheet Glass, which have been duly received, and exhibited
to the Members who have met this day.

"I am, Sir, your very obedient Servant,
"To Mr. Drake. (Signed) GEORGE BENTHAM, Secretary."

By this return, it appears that the quantity of British Sheet
Glass returned for home use was—

In the year ending Jan. 7, 1838	707 cwt.
" " " 1839	2262 "
" " " 1840	5170 "
" " " 1841	7914 "
" " " 1842	11298 "
" " " 1843	17117 "

An increase so rapid, as sufficiently to manifest that it is fast-
superseding, for all purposes to which it is suitable, every other
kind of Glass.

DRAKE and BROMLEY beg respectfully to add that they shall
be always happy to furnish Lists of Prices of the Glass, or any
other particulars which it may be desirable to obtain, upon appli-
cation by letter, addressed to them at their Warehouse, No. 315,
Oxford-street, London.

GARDEN, FISHING, SHEEP AND RABBIT

NETS.—New Garden Net 1½d. per yard, mended Sea Fish-
ing Nets ½d. per yard, woollen, worsted, and other warp and
Fly Nets. All kinds of Nets for Fishing. Sheepfolding Net 4½d.
per yard, 3½ feet high. Long Hare and Rabbit Net on cords
50, 80, and 100 yards each. Net for Fences against Rabbits,
Cats, Dogs, &c. 2d. per yard. Also on Sale, POLICEMEN'S
CAPES, AND TARPULING COATS, for Gardeners, Game
keepers, Watchers, and Farm Servants; the Capes at 2s. and
2s. 6d. each. Also large Capes like Cloaks. Upwards of 100
New and Second-hand Tents and Marquees for sale. ROBERT
RICHARDSON, Net and Tent maker, No. 21, Tunbridge-place,
New-road, near Euston-square.

TO LET, near Royal Leamington Spa, SIX ACRES

of GARDEN GROUND, with a substantial and roomy
DWELLING-HOUSE, Stabling and Dove house attached. The
ground is in the highest state of cultivation, of which Four Acres
is planted with a variety of Fruit-trees, Two Acres Asparagus and
Seakale. Also, Four and a half Acres of rich Greensward. Pos-
session to be had at Michaelmas or St. Thomas.

For Particulars, inquire of Mr. B. LAW, the Proprietor (who is
retiring from business), Long Itchington, near Southam, and
at Royal Leamington Spa.

**CHEAP STATIONERY, CUTLERY, WORK-
BOX, WRITING-DESK, AND DRESSING-CASE MANU-
FACTURER.**—Sloper's Embossed Postage Envelopes, without
Advertisements, 1s. per dozen to purchasers of other articles; fine
Bath-post, 3d. per Quire, 5s. per Ream; ditto Note, 2d. per Quire,

street, Portman-square, London.

BUTTER MADE IN TEN MINUTES

BY THE NEWLY-INVENTED CHURN.
REGISTERED ACCORDING TO ACT OF PARLIAMENT.
ATTWOOD, WIMBLE, & WARNER, MANUFACTURERS, LEWES,
SUSSEX.

This CHURN being made entirely of Block Tin, the necessary
degree of temperature can be given to the cream, by placing it
in a pan of cold or hot water, which ensures the butter coming
in 10 or 12 minutes. The simplicity of its construction, and the
facility with which it may be cleaned, are no inconsiderable
advantages over those now in common use.

Sizes	No. 1	2	and 3
Churn from	7 to 8 lbs.	13 to 15 lbs.	26 to 28 lbs.
Price, carriage paid } to London.	25s.	35s.	42s.

Metal Pans for Churns to stand in, 4s. 6d., 6s., and 7s. Larger
sizes made to order. N.B.—Thermometers and Butter Prints
supplied. May be obtained through any respectable ironmong-
er in town or country, and from the Manufacturers, Lewes.

To be seen in London, at Wright's Range Warehouse, No. 3,
Arthur-street, near the Monument; RIGBY'S Brush Warehouse,
No. 80, Gracechurch-street; LIVERMORE and SON, Ironmongers,
No. 30, Oxford-street; BENJAMIN, 19, Wigmore-street, Cavendish-
square. Export Agents, BARNES & CO., 109, Fenchurch-street.

SUN-BURNS, FRECKLES, TAN, and other disfigure-

ments of the Skin, are pleasingly eradicated by that unique
preparation ROWLAND'S KALYDOR, a balmy odoriferous
liquid, and now universally admired for its sovereign virtues in
completely removing all cutaneous eruptions, and in rendering the
complexion delicately clear and fair. It is invaluable as a reno-
vating and refreshing wash during travelling, or exposure to the
sun, dust, or harsh winds, and after the heated atmosphere of
crowded assemblies. Gentlemen will find it peculiarly grateful
after shaving, in allaying the smarting pain.

CAUTION.—Much pernicious trash is now offered for sale as
"KALYDOR."—It is therefore imperative on Purchasers to see
that the words "ROWLAND'S KALYDOR" are printed on the
wrapper, and "A. ROWLAND & SON, 20, HATTON-GARDEN,"
engraved on the Government stamp affixed to each bottle. Price
4s. 6d. and 8s. 6d. per bottle, duty included.

Ask for ROWLAND'S KALYDOR.—Sold by them, and by
Chemists and Perfumers.

TO PROPAGATORS.

MESSRS. VEITCH and SON are in want of a
PROPAGATOR who thoroughly understands his Business,
and can bring unexceptionable references as to ability and good
moral character. Letters, with Terms, Reference, &c. to be
addressed to Messrs. VEITCH and SON, Exeter.—Aug. 17, 1843.

WANT PLACES.—All Letters to be post-paid.

AS FOREMAN.—W. WREN, late Foreman to S.
CRAWLEY, Esq., Luton, for 2½ years, and previously to B.
G. KING, Esq., Ware, for 3 years, wishes for a similar Situation.
Direct to W. WREN, care of Mr. Wood, Butcher, Luton, Beds.

A THOROUGH PRACTICAL GARDENER, aged
34, having just left a Nobleman's service, (from whom he
can have a good recommendation) is desirous of obtaining a Situ-
ation in his profession, with any gentleman. He is married:
without family; and his wife would have no objection to fill the
situation of Housekeeper. All Letters addressed as under will
meet with prompt attention:—Mr. Frost, Gardener, Dropmore;
Mr. Brown, Nurseryman, Slough; or to Messrs. MAULE and
Co., Nurserymen, Bristol.

AS GARDENER.—A married Man, aged 40, who
understands the management of Kitchen and Flower-
garden, Greenhouse, Cucumbers, Melons, &c., and has no objec-
tion to make himself useful, for which, as well as other things,
he can be well recommended by his late employer. His Wife
could also officiate as Cook if required.—Direct to J. C., at Mr.
BARRY'S, Charlton, Kent.

AS GARDENER, or GARDENER and BAILIFF.—
A middle-aged married Man, who has a general knowledge
of the Horticultural and Agricultural professions, having passed
the whole of his life in them; can have good testimonials from
his late employer, whom he has just left; satisfactory reasons
can also be given for his leaving.—Direct to A. Z., Woodland-place,
Highgate, Middlesex.

AS GARDENER.—A married Man, 40 years of age,
without family, who has had great practical experience in
the different branches of his business, in Scotland and England.
He understands the management of plantations; and has lived
Head-Gardener with a bishop and other families of distinction.
Direct to H. M., Post-office, Ham Common, near Richmond,
Surrey.

AS GARDENER, an experienced young Man, aged 30,
who can have an unexceptionable character from his last
Situation. He would have no objection to look after a horse,
Situation. He would have no objection to look after a horse,
nor to any part of the country.—Direct to T. H., 5, Gloucester-
street, Hackney-road.

AS GARDENER and BAILIFF.—A steady, middle-
aged Man, without encumbrance, who has had extensive
practice in the above capacities.—Direct to C. D., at Messrs.
FORREST and Co.'s, Kensington Nursery.

TO NURSERYMEN.

A RESPECTABLE young Man, well acquainted with
the Home and Foreign Trade, and able to correspond in
several languages, is desirous of obtaining a responsible Situation
in the Nursery business; he has been employed as Foreman and
Propagator in several respectable establishments in this country,
from all of which highly satisfactory recommendations for ability,
&c. can be obtained.—Direct to A. LORIA, at Messrs. Veitch and
Sons', Nurserymen, Exeter.

Printed by Messrs. BARNUM and EVANS, Lombard-street, Fleet-street, in
the Precinct of Whitechapel, in the City of London, and Published by them
at the Office, 8, CHARLES-STREET, COVENT GARDEN, in the County of Mid-
dlesex, where all Advertisements and Communications are to be addressed
to the Editor.—Saturday, August 19, 1843.

THE GARDENERS' CHRONICLE.

A STAMPED NEWSPAPER OF RURAL ECONOMY AND GENERAL NEWS.

THE HORTICULTURAL PART EDITED BY PROFESSOR LINDLEY.

No. 34—1843.

SATURDAY, AUGUST 26.

PRICE 6d.

INDEX OF THE PRINCIPAL HORTICULTURAL SUBJECTS IN THE LAST NUMBER.

Agricultural remarks	571 a	Pine-apples imported from the West Indies	575 b
Amateur's Garden, No. XXXIII.	572 a	Pine, Douglas, producing cones at Ockham Park	575 c
Apples of 1843, sold at Preston	574 a	Prizes for seedling Pelargoniums	573 b
Asparagus, to apply sea-water to	577 a	Rats, to destroy	574 b
Bees, fecundity of	574 b	Refuse of paper, its use	574 b
Colours of flowers, remarks on changing	577 b	Rendle's tank system, plan of	572 b
Chickoo, account of one surviving two winters in England	574 b	Ruby, sub division of	574 c
Davis's Injury and Waste of Corn, from Thick Sowing, rev.	576 a	Sawdust as manure	572 c
Dendrobium cucurbitum	575 a	Scutellaria splendens, its treatment	571 c
Droes, remarks on	571 c	Seeds of Heath and Epacris, to sow	577 b
Ferns, to sow the seed of	577 b	Shaddock, early blooming of	573 c
Forcing-houses, remarks on	577 a	Soil of old gardens, to cultivate	571 a
Fuchsias, standard's seedlings, described	574 b	Sonnet to the Rose de l'Isle	575 b
Garden, new trees and shrubs for	577 a	Sprengel on Vegetable Manures	572 b
Highland Agricultural Society Hort. Soc. Garden noticed	575 c	Stable-yards, to keep clean	577 b
Hyacinths for forcing, necessity of procuring them early	576 b	Strawberry-plants, to prepare for forcing	573 c
Insects in cupboards, to extirpate	577 a	Sulphate of iron, the best material for fixing ammonia in manure	577 a
Larches, cause of decay in	572 c	Tares, disease of	573 a
Melons, Persian, superiority of Mohl (Dr.), his critique on Liebig's Work, continued	576 a	Tropaeolum peregrinum, its beauty	572 b
Mormones lucidum	575 a	Vegetables, discovery of a way to preserve them	574 a
Mulberry plants, to strike	573 c	Vines, remarks on pruning	573 c
Mules, remarks on	577 b	— great produce of	573 c
Mushrooms, large	574 a	Vulgar errors	571 b
Oxylobium obovatum	575 a	Ward's cases, account of plants grown in	574 a
Pansies, disease in	572 b	— remarks on	571 b
Peas, Gurnack's Prince Albert	574 a	Wheat, to dibble in	571 b
Pelargoniums for bedding out	572 a		

THE UXBRIDGE HORTICULTURAL AND FLORICULTURAL SOCIETY'S GRAND EXHIBITION will take place, by permission, in the Uxbridge Nursery, on **TUESDAY, the 5th SEPTEMBER, 1843**, when, in addition to the Society's Prizes, the Ladies will give a Town Cup, value 5l. 5s., for the best 24 Dahlias, to be competed for by Amateurs and Gentlemen's Gardeners. Further particulars may be had of Mr. JOHN SHACKLE, Hon. Secretary, Uxbridge.

PRIZES for DAHLIAS, open to all England, will be awarded by the **THANET FLORICULTURAL SOCIETY**, on **TUESDAY, SEPTEMBER 12**. Best 24 blooms, 7l.; 2d do., 4l. Entrance, 10s.; the whole of the money so collected will be given as a Third Prize. Place of Exhibition, Ranelagh Gardens, St. Peter's, near Margate. J. G. HODGSON, Secretary. St. Peter's Vicarage, Aug. 23, 1843.

SHOW OF LISIANTHUS RUSSELLIANUS. Splendid Show of LISIANTHUS RUSSELLIANUS ever seen in this country, the largest Plants having many hundred blooms upon them; some of them being four feet high and six feet round. Plants from 2s. 6d. to 2l. each.—JAMES CUTTILL, Florist, Denmark Hill, Camberwell. J. C. will also have the best Melon and Early Cucumber Seeds in cultivation to send out in November.

EXHIBITION OF LILIUM LANCIFOLIUM. H. GROOM, Clapham Rise, near London, (removed from Walworth,) by appointment, Florist to Her Majesty, begs to inform the Nobility, Gentry, and the Public, that his Extensive Collection of this most beautiful LILY is in flower, and may be viewed every day from 9 o'clock until 6, Sundays excepted.—Admittance gratis.

TO GROWERS OF CARNATIONS, PICOTEES, and PINES. YOEULL AND CO. beg respectfully to announce that their extensive stock of the above plants are this season unusually fine, and having spared no expense, by getting in large quantities of every known variety worthy of cultivation and for competition at any Horticultural Exhibition throughout the kingdom, they flatter themselves that they are in a position to execute orders to any extent and upon such advantageous terms as to be satisfactory to those who may favour them with their commands. They would also beg leave to remark that their stock of the above, amounting to upwards of 40,000 pairs of the very best sorts in cultivation, will be a sufficient guarantee that none but strong healthy plants will be sent out, and as every run or degenerated plant is destroyed when in bloom, parties may be fully assured of receiving none but those true to name and colour.

PRICES AS FOLLOWS:—			
12 pairs of good show varieties, 1 pair of each	1	4	0
12 " fine ditto	1	10	0
12 " ditto ditto	1	3	0
12 " Extra fine and very superior ditto	2	10	0
12 " ditto ditto	1	5	0
12 " ditto Pinks	1	0	12
12 " ditto ditto	1	0	0

The selection being left to YOEULL and Co. Catalogues will be shortly ready, and may be had on application.—Great Yarmouth Nursery, Aug. 26, 1843.

MR. LYNE'S NEW SEEDLING PELARGONIUMS. WILLIAM E. RENDLE has the pleasure of informing the Nobility, Gentry, Amateurs, and the Trade, that he has been successful in procuring the stock of Mr. Lyne's new Pelargoniums, and offers them at the following Prices:—

Lyne's Princess Alice	3l. 3s.	Lyne's Modesty	1l. 1s.
" Celestial	2 2	" Rose-bud	1 1
" Redworth	2 2	" Dk. of Cornwall	1 1
" Apollo	2 2	" Sunrise	1 1
" Princess	1 10		

The above-mentioned sorts can be warranted as first-rate, and have won many Seedling Prizes this season, in London, Exeter, Plymouth, Torquay, Barnstaple, Truro, and Falmouth. Orders will be executed in strict precedence. The first plants will be ready after the 6th of November.

Printed descriptions and engravings can be obtained at the Union-road Nursery, Plymouth; of Mr. W. BRISTOW, Seedsman, Knightsbridge; of Mr. GEORGE CHARLWOOD, Seedsman, Covent-garden; or of Messrs. HURST and M'MULLEN, Seedsmen, Leadenhall-street, London.

Lyne's White Perfection, Imogene, Enchantress, Superb, and Sappho, cannot possibly be sent out this season.—Plymouth, August 22, 1843.

T. AND C. LOCKHART AND DUNCAN, FLORISTS and SEEDSMEN, 156, Cheapside, London, have just published their List of Flower-roots for the present season, which they will forward post-free on application. They have purchased of a celebrated Florist at Haarlem, the entire stock of three new and distinct DOUBLE HYACINTHS of great beauty, and suitable for Glasses or Pots. They have named them—

Admiral of the Red	each	2s. 6d.
Admiral of the Blue		2 6
Admiral of the White		2 6

T. and C. L. and D. beg to call particular attention to the various novelties contained in their List, and are happy to add that all the roots have arrived in excellent condition, for which they solicit early orders.

FASTOLFF RASPBERRY.

PATRONISED BY HER MOST GRACIOUS MAJESTY THE QUEEN, HIS GRACE THE DUKE OF RUTLAND, THE EARL OF HARRINGTON, THE LORD BISHOP OF LONDON, LORD VISCOUNT LORTON, LORD SONDES, &c.; as well as by the HORTICULTURAL SOCIETY OF LONDON.

YOEULL & Co. have much pleasure in announcing they will be enabled to supply, at the latter end of Oct. next, fine Canes of the above highly-valuable and much-esteemed **RASPBERRY**—unequalled for the extraordinary size of its fruit and richness of flavour. Those to whom Y. & Co. sent it last season have expressed their high admiration of its superiority over all other varieties, and it has been awarded several prizes at various Horticultural exhibitions during the season. As a proof that they have not exaggerated its excellent qualities, Fruit was submitted to Dr. LINDLEY (see *Gardeners' Chronicle* of the 22d July, page 502), whose opinion of it is as follows:—"FASTOLFF RASPBERRY.—We have received from Messrs. YOEULL, of Great Yarmouth, fruit of the Fastolff Raspberry, and we find that it merits all that has been stated in favour of its excellence. The fruit received is very large, obtusely conical, and of rich flavour, far exceeding in this respect some other new and large varieties. The plants bear abundantly and in long succession." They also exhibited it, on the 1st of August, before the London Horticultural Society, 21, Regent-street, and a prize was awarded to them. It would, therefore, be unnecessary for YOEULL & Co. to recommend it more fully, or with greater confidence, to the notice of the public, merely observing that it continues in high perfection throughout the autumnal months, and has maintained its superiority in the most unfavourable soils and situations, and requires no other than the ordinary treatment of the old varieties. Fine Canes will be ready by the latter end of October, and can be sent with safety to any part of the United Kingdom (on the receipt of a Post-office order) upon the following terms:—

	£	s.	d.
Packages containing 100 Canes	2	5	0
" " 50 "	1	5	0
" " 25 "	0	14	0

Packages included. The usual discount to the Trade, when not less than 200 are ordered.

Extensive orders are already received for the above; and to prevent a repetition of the disappointment which many experienced last season, by Y. & Co. not being able to meet the demand, they therefore respectfully solicit early application. Great Yarmouth Nursery, August 26, 1843.

J. HENCHMAN begs to offer the following fine Green-house Plants, which are peculiarly suitable to be grown as Specimens for Exhibition; and, at the same time, begs to state that he has succeeded in raising 15 species of Banksia, and 12 species of Dryandra, nearly all of which are quite new, or extremely rare, together with many other new and interesting Flowering Plants from the Swan River, which may be purchased on reasonable terms.—*Brachysema villosa*, 21s.; fine foliage and splendid scarlet flowers—one of the finest plants yet introduced; *Hovea illicifolia*, 15s.; *Hovea illicifolia* major, 15s.; *Hovea pungens*, 5s.; *Hovea pungens* major, 7s. 6d.; *Dryandra Fraserii*, beautiful foliage, 21s.

J. HENCHMAN also begs to inform Cultivators of the Pansy that his Collection of Nine Superior Seedling Varieties, price 30s., are now ready for delivery. N.B. A remittance requested from unknown correspondents.—Edmonton, August 26, 1843.

THUNBERGIA FRYERII.

J. FRYER begs to inform his Friends and the Public that the above beautiful and much-admired new variety of **THUNBERGIA** will be sent out on the 30th inst., free by post, at 7s. 6d. each, with allowance to the Trade.

J. F. can, with the greatest confidence, recommend the above, which has been seen and highly approved of by many of the highest authorities; it is noticed by Dr. LINDLEY, in the *Gardeners' Chronicle* of June 17th, where he pronounces it a distinct variety; and Mr. W. P. AYRES, the writer of the "Amateurs' Garden" in this Paper, observes,—"I am favoured with the blooms of your Seedling 'Thunbergia Fryerii,' which I consider a distinct and very beautiful variety, and indispensable in every collection of plants. I shall be glad to have two plants when you send it out."—Blooms will be sent free by post, on application containing two postage-stamps.

N.B.—A Splendid Collection of **PANSIES** can be supplied from a healthy Stock, good sorts, 6s. per doz.; fine show varieties, 12s. per doz.; and new and scarce do., 2s. 6d. to 3s. 6d. each, which will be sent post free.—A remittance or reference required from unknown correspondents. Clarendon Nursery, Camberwell, Aug. 25, 1843.

WOODLANDS NURSERY, Maresfield, near Uckfield, Sussex.

In consequence of the great disappointment experienced with the **NEW CHINA ROSE, "PRINCE OF WALES,"** WILLIAM WOOD & Son consider it their duty to express their most sincere regret to those Friends and Customers who kindly favoured them with orders for it; and thus publicly to assure them that they received the stock from Mons. Miellez, of Lille, accompanied with the strongest assurance of its being decidedly the very best Rose of its class ever introduced; and under this impression W. W. & Son sent it forth to the public; and it is with much pain that they now find themselves to have been grossly deceived, and their customers grievously disappointed. Under these circumstances, they beg leave to give notice that they are quite willing to refund the money to those parties who have purchased it; or they will supply goods to double the value, either in Roses or other Plants.

In consequence of the above vexatious failure, W. W. & Son have come to the determination of never sending out any new Roses in future until they have actually been flowered and proved by themselves.—Woodlands, August 23.

"FUCHSIA EXONIENSIS."

THIS FUCHSIA is admitted to be the finest variety that has yet been sent out; it has three times been exhibited at the Meetings of the London Horticultural Society, and has gained their Certificate of Merit; flowers were also submitted to Dr. LINDLEY, who, in the *Gardeners' Chronicle* of the 8th ult., thus expresses himself:—

"**LUCOMBE, PINCE, and Co.**—The blooms sent of *Fuchsia Exoniensis* prove it to be a very splendid variety, it is a flower of great substance throughout: seed-vessels dark, tube and sepals of a rich crimson carmine; the sepals are long, they expand freely, and disclose the rich crimson purple corolla, which is very large, and of a peculiar denseness of texture."

Strong plants are now ready to be sent by post, at 10s. 6d. each, free of all other charge, carefully packed in stout tin cases, on application to **LUCOMBE, PINCE, and Co.**, Exeter Nursery.

L. P. and Co. beg leave to say that this *Fuchsia* has been fully proved, and will give satisfaction to all who cultivate it.—Exeter Nursery, Aug. 24, 1843.

SPLENDID SEEDLING PELARGONIUMS, AT GREATLY REDUCED PRICES.

LUCOMBE, PINCE, & Co., beg leave to inform the Public that they have obtained the entire stock of those distinct and beautiful **SEEDLING PELARGONIUMS** raised by Mr. E. BECK, of Isleworth, and exhibited by him with such very great success at the Chiswick and Regent's Park Exhibitions. They gained the Gold Banksian Medal (the highest prize awarded to Pelargoniums) twice this summer at Chiswick, and the highest prize at the Royal Botanic Society of London, in June last. Several of them have also gained Silver Medals, Certificates, and other prizes, as Seedlings. These facts will convince the public that a more distinguished lot of Flowers has never before been offered for sale; and L. P. & Co. hope that their having determined upon letting them out at prices reduced greatly below those which Seedling Pelargoniums, of the highest character, have hitherto been let out at, will ensure for them an extensive sale. Strong, healthy Plants will be ready for delivery in October next, at the following prices, viz.:—

	s.	d.		s.	d.
*Leonora	21	0	*Martha	10	6
British Queen	21	0	*Lucy	10	6
*Susanna	21	0	*Geraldine	7	6
*Meteor	21	0	*Evening Star	7	6
*Cleopatra	21	0	*Black Prince	7	6
*Admiral	10	6	Bride	5	0
Stella	10	6	The Purple	5	0

The whole Collection of 14 distinct sorts, package included, for 8l. Those marked thus * all gained prizes at the London Horticultural Society and the Royal Botanic Society of London. Exeter Nursery, Aug. 24, 1843.

DUTCH HYACINTHS AND OTHER BULBS.

YOEULL & Co. beg respectfully to inform the readers of the *Gardeners' Chronicle*, that one of their Firm has just returned from Haarlem, having selected a most extensive Stock of the finest **HYACINTHS**, as well as a general assortment of **BULBS**, for which that city is so justly famed; and, flatter themselves, from the facility of communication between 1st mouth and Haarlem, the distance not occupying more than 10 or 12 hours, and from the varieties being chosen for their great beauty and size of flowers during the blooming season, that the List will be found to contain none but the very best sorts, adapted either for glasses, forcing, or open border culture. Prices, as follows:

Fine Single or Double Show Hyacinths	6s. per doz.
Red, Blue, White, or Yellow	
Extra fine Ditto	9s. to 12s.
Extra fine, and very superior Ditto	18s.

The selection being left to YOEULL & Co.

Also, Narcissus, Early Single and Double Tulips, Jonquils, Gladiolus, Iris, Ixias, Ranunculus, Double and Single Anemones, Crocus, &c., Catalogues of which may be had on application. Bulbs added to compensate for long carriage.—Great Yarmouth Nursery, Aug. 24, 1843.

R. WHITE & CO., NURSERYMEN, Parade, Poole, Dorsetshire.

have to offer strong plants of the following beautiful varieties of Geranium, and confidently recommend the collection as containing the finest sorts in cultivation. Good strong plants in 18-sized pots will be sent free to any part at the price affixed, or smaller plants in tin cases by post at one-third less. Lyne's Sunrise, colour, bright rosy orange; the petals are perfectly round, forming a complete circle. The beautiful brilliancy of the colours of this variety added to its perfect symmetry of form, renders it the best flower in cultivation, 21s. Lyne's "Duke of Cornwall" is well known for its pure and splendid colours.—Ed. Gard. Chronicle, June 24, 1843. It is a bright crimson scarlet, clear in its grain; petals fine and full sized, spot large and black, and a very fine bloomer, 21s. Lyne's Lord Ellington is a very delicate pink, with large black spot, margined with pink, quite round and compact, and a very true bloomer, 10s. 6d. Lyne's Princess Royal is a most attractive flower. The under petals are a delicate rose with a clean white centre; the upper petals are intensely rich, having a bright velvety moroon spot verging off to a delicate pink, 21s. Lyne's Circassian, remarks of the Editor of the *Chronicle*.—"The form of the flower is good, the bottom petals are a bright pink, with a white centre, and an intensely dark spot in the top petals." 10s. Vetch's Fair Maid of Devon, delicate pink under-petals, white centre and bright crimson spot. This is in every respect a first-rate flower, 10s. 6d.

	s.	d.		s.	d.
Barrett's Glory of the West	10	6	Flash	7	6
Queen of the Fairies	7	6	Witch	7	6
Grand Monarch	5	0	Princess Sophia Matilda	7	6

The collection, large plants, 5l., smaller, 63s.; 25 fine sorts of Geranium, 42s.; *Fuchsia Exoniensis*, 10s. 6d.; *Lan. n.*, 2s. 6d.; fine sorts per doz., 10s. 6d., including *Lan. n.* *Verbena Licium*, an exceedingly beautiful variety, 2s. 6d. R. W. & Co. have also ready for delivery new seeds of their own saving of nearly every kind usually sown at this season of the year both of vegetable and flower.

Geranium seed saved from finest kinds, 2s. 6d. per 20 seeds.

Housiana Persian Melon, exhibited by Mr. Fleming, and so much praised in the leading article of the *Gardeners' Chronicle* of the 19th Aug., 5s. per packet of 6 seeds. Black seeded Bath Cos Lettuce, an excellent kind either for summer or winter, 1s. per packet. Prince Albert Strawberry, 21s. per 100, British Queen, do. 21s. per 100.

N.B. Two Newfoundland Dog Pups for sale, at 63s. each; they are of the very finest Breed. The parent stands 2 feet 8 inches high, and measures 4 feet 5 inches from nose to tail.

GROWTH OF PLANTS.—HUMPHREYS'S

INODOROUS SOLUBLE COMPOUND, to promote the Growth of Plants. Dissolved in water, this valuable Preparation may be used with great advantage, either in the Drawing-Room or in the Conservatory. A single bottle is equal in fertilising force to some hundred weight of rich Compost; and by its use, not only common plants are improved by increased brilliancy of flower and deeper verdure, but valuable Exotics are so strengthened as to resist the usual alternations of temperature, and may be preserved without a Greenhouse. Sold in bottles, 1s. 9d. each, with full instructions for Use, by **FLANAGAN & SON**, Mansion House-street; **HURST & M'MULLEN**, Leadenhall street; **Wm. Clark**, Bishopsgate-within; and other leading Seedsman, &c., in town and country. Wholesale Agents, **DAVY, MACK-MURDO, & Co.**, 110, Upper Thames-street, London.

CHOICE CHRYSANTHEMUMS.

STRONG PLANTS, by name, in large pots, carriage paid, and package included in the charge of 13s. 6d. per doz. Messrs. SUTTON and SON'S respectfully recommend the above, as being exceedingly fine Sorts and Fine Plants, which will bloom early this Autumn.

N.B.—Carriage paid to any distance, if by only one conveyance.—Reading Nursery, Berkshire.

MESSRS. BENJAMIN ELY and SONS, FLORISTS and SEEDSMEN, Rothwell Haigh, near Leeds, Yorkshire, beg to inform the Nobility, Florists, and the Public in general, that they will sell out this autumn the following Splendid PICO-TULS, with which they have won Prizes at most of the principal Exhibitions in Yorkshire in 1842 and 1843.

Ely's Favourite, Purple-edged Picotee per pair— 10 0
 Fair Helen, Rose-edged ditto " 5 0
 King of Roses, ditto ditto " 7 0

B. E. and Son have also an extensive collection, consisting of upwards of 2500 pots, including all the best varieties, Catalogues of which are now ready and may be had on application.

N.B.—From unknown correspondents a remittance or reference will be required.

UNRIVALLED NEW FUCHSIA, "LOWRYII."

JOHN HANCOCK and SON beg to invite the attention of their Friends and the Floricultural World in general to the above **SPLENDID NEW FUCHSIA**, of which they have purchased the entire Stock, and they can, without doubt, pronounce it the **FINEST VARIETY** ever introduced.

The habit of the Plant is dwarf and close, possessing all the elegance of the older species, and without the large coarse foliage and dinginess of colour which nearly all the modern varieties have. It is a great bloomer,—the flowers hang gracefully on long footstalks, clear of foliage. The flowers are very large and distinct, the tube and sepals are of a bright scarlet crimson, expanding freely, and showing to great advantage the large beautiful blue corolla, decidedly differing from all other Fuchsias. It also blooms freely on a small Plant, which is a great advantage.

J. H. and Son, in bringing this production to public notice, feel assured that it cannot fail to give universal satisfaction. It will be found one of the gems of the year. Strong healthy plants will be ready for delivery on the 15th of September, at 10s. 6d. each, and will be sent by Post, pre-paid, to any part of the Kingdom, carefully packed in tin cases. The usual trade allowance if six Plants are taken.

J. H. and Son can also supply good Plants of all the New Geraniums, Fuchsias, Verbenas, and Camellias, &c., with other New Plants. Catalogues of which are now published, and may be had on application, by inclosing two postage-stamps. All the varieties are accurately described in the above list.

Agents in London, Messrs. HURST and M'MULLEN, 6, Leadenhall-street, where Plants may be had.

Wear Nurseries, Durham, August 24, 1843.

ALBION ROAD NURSERY, STOKES NEWINGTON, MIDDLESEX.

JOHN BROWN (Late Curator of the Botanic Garden, Colchester), takes this opportunity to inform the Nobility and Public generally, that he has, in partnership with his brother Henry, taken the superior Stock-in-Trade and Nursery, of the late Mr. JOHN MILNE, and hopes by perseverance and attention, to merit the same liberal patronage as was bestowed on their predecessor.

J. and H. B. beg to invite attention to their excellent Collection of Camellias, Fuchsias, Roses, Greenhouse, Herbaceous, and American Plants, new hardy Shrubs, and ornamental Trees of all kinds, of which printed lists may be had on application, at the Nursery. The Seed Business also will be conducted with every attention to new and true Articles.

The splendid new *Lilium punctatum*, *Album speciosum*, &c., are now in flower, Plants of which may be had. Also the new *Achimenes*, *Angelonia grandiflora*, *Viola arborea*, with many other choice Plants, carefully packed, and sent to any part. Allowance made for carriage. Post-office Orders made payable at the General Post-office, St. Martin's-le-Grand, London.

Flower Seeds for present sowing.

ALBION ROAD NURSERY, STOKES NEWINGTON, MIDDLESEX.

MRS. MILNE begs to return her sincere thanks to the numerous Customers and Friends of her late Husband for all past favours, and takes this opportunity of soliciting a continuance of the same patronage and support for Messrs. J. and H. BROWN, who have taken the premises, and purpose carrying on the business of the Albion Nursery, in all its various branches as heretofore.

MORTON'S "WALBURTON ADMIRABLE" PEACH.—This new and splendid variety was raised at Richard Prime's, Esq., Walburton House, Sussex, and has received the highest testimonials from Dr. Lindley, who had specimens sent him in 1841.

This Peach is a seedling from the Noblesse, but its great merit consists in its ripening fully five weeks later; it is a very free grower, the fruit of a full size, of excellent flavour and melting; altogether a very desirable variety, and one which no good garden ought to be without.

From the very limited supply of plants the orders will be executed in rotation at One Guinea per plant, early in the autumn. All orders for the above to be sent to ALEXANDER WEBB, Nursery and Seedsman, Westgate Nursery, near Arundel, Sussex.

MYATT'S NEW SEEDLING STRAWBERRIES.

J. and W. MYATT intend sending out, by the middle of August, their NEW STRAWBERRY, the DEPTFORD PINE, fruit of which has been exhibited at the London Horticultural Society, and a Banksian Medal awarded. It has also been submitted to Professor LINDLEY, for whose opinion see *Gardeners' Chronicle*, No. 26, p. 447. It is a most prolific bearer, exhibiting at the same time a profusion of fine fruit and bloom on the same truss. Price, Deptford Pine, 2l. 10s.; British Queen, 1l., and Eliza, 10s. per 100.—Manor Farm, Deptford, July 22, 1843.

VARIETIES OF AMERICAN ALOES.

FOR SALE, Six Large Specimens of this beautiful Plant, three of which are from 4 to 5 feet high, and from 20 to 25 feet in circumference, and with proper treatment will bloom next year. The smaller ones are 2 feet 6 high, and 4 feet in diameter. They are all in strong oak tubs, in the most robust health, and will be sold a bargain. For particulars and cards to view, apply to Messrs. OSBORNE, Nurserymen, Fulham.

CHOICE PELARGONIUM SEED.

WILLIAM MILLER, having just gathered some Extra Fine Hybridized Pelargonium Seed from the best varieties in cultivation, and having more than he requires, offers it at 10s. 6d. per packet,—a remittance required.—Providence Nursery, Ramsgate.

TO NOBLEMEN, GENTLEMEN, AND NURSERYMEN.—The Collection of rare and valuable EXOTIC PLANTS, the property of THOMAS HARRIS, Esq., of Kingsbury, Middlesex.

MESSRS. J. C. and S. STEVENS respectfully beg to announce, they are instructed by Mr. Harris (who is leaving Kingsbury for some years) to offer for unreserved Sale by Auction, on the premises, on WEDNESDAY, 30th August, and the following Days, at 12 o'clock, the whole of his VALUABLE COLLECTION OF STOVE and GREENHOUSE PLANTS, comprising numerous fine Specimens of rare Orchidaceae, Cacti, Camellias, Azaleas, Rhododendrons, Orange and Lemon Trees, &c. &c., Catalogues of which are now preparing, and may be had one week prior to the Sale, of the Auctioneers, 38, King-street, Covent-garden. The Collection will be on public view two days before the Sale. Kingsbury is situated about 6½ Miles from London, on the Edgware Road.

ARAUCARIA IMBRICATA.

MESSRS. J. C. and S. STEVENS beg to state that after the Sale of Orchidaceae, on the 2d September, they will offer for Sale by Auction, at their Great Room, 38, King-street, Covent-garden, 100 Plants of *ARAUCARIA IMBRICATA*, fine specimens, three years old, from 8 to 10 inches in height; in Lots of One Dozen each. May be viewed the day prior, and morning of sale.

SALE OF ORCHIDACEAE.

MESSRS. J. C. and S. STEVENS beg to announce they will Sell by Auction, at their Great Room, 38, King-street, Covent-Garden, on SATURDAY, Sept. 2, at 12 o'clock, an Importation of ORCHIDACEOUS PLANTS which have just arrived in the finest possible order from St. Marcos and high lands in Central America. It comprises a few new specimens, likewise large and fine masses of *Laelia superbiens*, *Barkeria spectabilis*, *Epidendrum Skinneri*, &c. The attention of growers is particularly invited to this Sale, which will be the last of the present season. Catalogues are now ready, and may be had of the Auctioneers, 38, King-street, Covent-Garden. On View the day prior and morning of Sale.

CROOME, WORCESTERSHIRE.

TO NOBLEMEN, GENTLEMEN, NURSERYMEN, GARDENERS and Others.—Very Important and Unreserved Sale of Stove and Greenhouse Plants, of the Rarest description, the Collection of nearly a Century, at Croome, the seat of the late Right Hon. the Earl of Coventry.

MR. R. C. HERBERT has the honour to announce that he has received instructions from the Executors of the late Right Hon. the Earl of Coventry, to submit to Public Auction at CROOME, on WEDNESDAY and THURSDAY, Aug. 30 and 31 1843, without the least reservation, the whole of the extensive and rare Collection of STOVE and GREENHOUSE PLANTS, in the Conservatories and Greenhouses in the Gardens adjacent to the Mansion.

The Auctioneer respectfully invites the attention of Noblemen and Gentlemen, as well as Nurserymen and others, to this superb Collection of Plants and Exotics, as it will be found that the present will afford them such an opportunity as very seldom occurs of enriching their Conservatories with some of the choicest Plants in the Kingdom. They include East and West Indian Plants, Cape and Botany Bay Plants, Cape Jasmynes, &c., in endless variety, some of which are of an amazing growth, and were selected by the late Earl's Grandfather, more than 80 years since. To enumerate the whole in the compass of an advertisement would be impossible; Catalogues are consequently already prepared, and may be had at the principal Hotels in Cheltenham, Bath, Leamington, Warwick, Birmingham, Hereford, Gloucester, Malvern, and Worcester, or will be forwarded by the Auctioneer to any pre-paid application addressed to him, Foregate-street, Worcester.

The Plants may be viewed on application to Mr. CLARKE, Botanical Gardener, at Croome, two days previous to the Sale.

The Sale will commence on Wednesday at 12 o'clock, and on Thursday at 11 o'clock precisely. Defford Station, on the Birmingham and Gloucester Railway, is within Two Miles of Croome Mansion.

MR. WARREN will sell by AUCTION, at the King's Head Inn, Twickenham, on TUESDAY, Aug. 29, at 2 o'clock, in Twenty-four Lots, TWICKENHAM NEW PARK, in the most delightful part of the county of Middlesex, being a portion of the celebrated POPE'S VILLA ESTATE, comprising upwards of twenty acres of land, of excellent quality, divided into plots of building land, giving votes for the county, most desirably situated, and admirably adapted for the erection of gentlemen's residences, possessing extensive frontages to the high road leading from London and Twickenham to Hampton, Chertsey, &c., and to the new road branching out of the same, and uniting with the road leading to the Southampton Railway at Kingston. Hampton Court, &c. These lots are in the immediate vicinity of the elegant new Church and the river Thames, and within a short distance of Richmond-bridge, Hampton Court, and Bushy Palace, the residence of her Majesty the Queen Dowager, eleven miles of Hyde Park Corner, and three of Hounslow and the Southampton Railway at Kingston. The situation is particularly airy and healthy, and the neighbourhood distinguished for its beautiful scenery and contiguity to the numerous Parks and Grounds of Noblemen and Gentlemen of the first distinction. The quality of the land is excellent, and a portion thereof freehold, and the remainder copyhold, held of his Grace the Duke of Northumberland, as Lord of the Manor of Isleworth Syon, and is equal in value to freehold. A Station upon the proposed Middlesex and Surrey Grand Junction Railway will be erected within a few minutes' walk of these lots. Purchasers may be accommodated with other valuable portions of this Estate, in quantities varying from two acres to 100 acres.

The lots are marked out, and may be viewed upon application to Mr. Pendry, at the Prince Albert Inn, opposite the lots, of whom printed Particulars and Conditions of Sale, with plans, can be obtained any day prior to the Sale; of William Laslett, Esq., Solicitor, Worcester; Messrs. Burgoyne, Thrupp, and Clark, Solicitors, 160, Oxford-street; F. W. Dolman, Esq., Solicitor, 27, Carey-street, Lincoln's-inn-fields; Messrs. Allen and Holmes, Solicitors, Bedford-row; the place of Sale; Greyhound, Richmond; Griffin, Kingston; and of Mr. WARREN, Land and Timber Surveyor, Isleworth.

NATIONAL LOAN FUND LIFE ASSURANCE ANNUITY, and DEFERRED ANNUITY SOCIETY,

26, Cornhill, London.

Capital, 500,000l.—Empowered by Parliament.

DIRECTORS.

T. Lamie Murray, Esq., Chairman.

John Elliottson, M.D., F.R.S.

John Griffith Frith, Esq.

H. Gordon, Esq.

George Lungley, Esq.

John Rawson, Esq.

Clement Tabor, Esq.

Joseph Thompson, Esq.

AUDITORS.—Professor Wheatstone, F.R.S.

Professor Graves, A.M., F.R.S.

ACTUARY.—W. S. B. Woolhouse, Esq., F.R.A.S.

The superior advantages to those Assured with this Society will be best understood by a comparison of its principles and a reference to the last Annual Bonus declared on Policies of five years' standing, viz.:

Entry	Policy No.	Age.	Sum.	Annual Premium.	Bonus added.	Cash Bonus.	Prem. reduced.
1837	39	59	£ 1,000	£ 67 8 4	£ 132 14 6	£ 58 19 9	£ 8 19 4
1838	114	56	£ 3,000	£ 175 15 0	£ 296 9 7	£ 123 0 6	£ 16 9 7

Policies now entered upon entitled to participation in next Annual Division. Two-thirds of all premiums paid can be borrowed by the Assured without loss of Policy.

F. FERGUSON CAMROUX, SECRETARY.

RENDEL'S TANK SYSTEM OF HEATING.

STEPHENSON and CO., 61, Gracechurch-street, London, Inventors of the IMPROVED CONICAL and DOUBLE CYLINDRICAL BOILERS, having been much engaged in heating buildings upon the above system with Tanks of various materials, solicit the attention of scientific Horticulturists to an Iron Tank now fitting up on their premises, which offers most decided advantages over every other article hitherto employed for the same purpose. These tanks which are ornamental in appearance can be made from 10 to 100 feet long and of any width and depth, and can be connected or disconnected by any working Gardener without the slightest difficulty, thus affording the opportunity to persons in remote districts of employing this much approved method of heating without the assistance of Engineers. The Tanks can be applied to Boilers and Pipes already fixed, and from the present low price of Iron will be found cheaper than of any other material. Mr. RENDEL, of Plymouth, has kindly undertaken to receive orders and furnish information to any persons in his neighbourhood, and prices for any size will be forwarded upon application to S. and Co.

THE LATE DREADFUL HAILSTORM.—Some friends of Mr. JOHN BELL, NURSERYMAN, of Norwich, who reside in the neighbourhood of London, being desirous of rendering him assistance in consequence of the severe loss he has sustained, through the destruction of the glass and the utter loss of the crops in his houses, by the late violent Hailstorm which passed over that city, have resolved to do so by commencing a subscription; and they earnestly invite his friends and all who can estimate so dreadful a calamity, to assist them. Mr. BELL's loss is estimated to be above 2000l. The Gentlemen and Tradesmen of Norwich have already commenced a subscription in his favour, and a Committee has been formed to carry out their views. It is intended to transmit all that may be subscribed to this Committee, and as it is desirable that no time be lost in collecting and forwarding the amount subscribed, the subscription will be closed on Saturday the 9th of Sept., and the amount transmitted to Norwich on the Monday following. The following Gentlemen have kindly offered to receive subscriptions:—Mr. W. Catleugh, Florist, Hans-Place, Chelsea; Mr. M. J. Webber, Fruiterer, Centre-row, Covent Garden Market; Messrs. J. A. Henderson and Co., Nurserymen, Pine Apple Place; Mr. G. Charlwood, Seedsman, Tavistock-row, Covent Garden.

The following subscriptions have already been received.
 Mr. W. Catleugh, Nurseryman, Chelsea . . . 5l.
 Mr. M. J. Webber, Fruiterer, Centre-row, Covent Garden . . . 5l.
 Messrs. J. A. Henderson and Co., Nurserymen, Pine Apple Place, Edgeware-road . . . 5l.
 A Friend . . . 5l.
 Mr. G. Charlwood, Seedsman, Tavistock-row, Covent Garden . . . 5l.
 Mr. John Smith, Nurseryman, Dalston . . . 3l.
 A correct List of Subscriptions will be inserted in this Paper.

HOT-WATER APPARATUS.—Buildings of every kind heated in a superior manner. The trade supplied with Boilers, Furnace-doors, Bars, Dampers, Pipes, Cisterns, and every requisite for heating. BENJ. FOWLER, 63, Dorset-st., Fleet-st., London.

COTTAM and HALLEN, ENGINEERS, IRON-FOUNDERS, &c. &c., No. 2, WINSLEY STREET, OXFORD STREET, LONDON, and at CORNWALL ROAD, LAMBETH.

GARDEN ROLLERS 18 inches long, 34s.; 20, 44s.; 22, 50s.; 24 inches, 60s.; 26, 75s.; 28, 84s.; 30, 105s. each.

CAST-IRON RICKSTANDS, 2 feet 6 inches high, 5s. 9d. each. Garden Engines, Mowing Machines, Garden Chairs, Superior Garden Tools of all kinds, Garden Vases and Pedestals in great variety, and every description of Horticultural Articles, Agricultural Implements, and Furnishing Ironmongery; Dr. Arnott's Stoves, Anglo-Belgian Cooking Stoves; Broiling Stoves. The above low prices being on account of the depression in the Iron Trade, are subject to future alterations.

HOTHOUSES, CONSERVATORIES, &c., made upon the most improved principle, either of iron or of iron and wood combined, which can be fixed complete in any part of the Kingdom, at very low prices, in consequence of the present depressed state of the Iron Trade.

HOT-WATER APPARATUS for heating Hothouses, Conservatories, and Greenhouses; Churches, Public, or Private Buildings, &c., with COTTAM'S PATENT, or ROGERS' BOILERS. After 15 years' experience, and having fixed upwards of 1500 Apparatuses for the above-mentioned purposes, and by various improvements which they have made during that time, C. and H. can with confidence undertake the erection of similar Apparatus upon the most extensive scale. For the convenience of those who wish to fix their own Apparatus, they have affixed the following low prices:—

Cottam's Patent Boiler, 24 inch . . . £ 27 0s. 0d.
 (Larger Sizes in proportion.)
 Rogers' Boiler, small size . . . 3 15 0
 do. large do. . . 4 10 0
 Hot-water Pipe, 4 inch diameter, 1s. 3d. per Foot.
STRONG IRON HURDLES, 3 ft. high, out of the ground, 6 ft. long, with five horizontal bars, weighing about 36 lbs., 3s. 6d. each.
 Light Cattle Hurdles, 3 ft. 6 in. high, weighing 42 lbs., at 4s. 0d. each.
 Strong do. do. 45 lbs., at 4 6
 0x Hurdles, 4 feet high, do. 60 lbs., at 5 6
BEST WIRE FOR STRAINED WIRE FENCING at 8s. per bundle of 150 yards each. Uprights for ditto, 7d. each. The Improved continued, and every other kind of Fencing, Fancy Wire-work, &c.
HAND-GLASS FRAMES for Cucumbers, &c., 18 inches square, 3s. 6d.; 20 inches, 4s. 6d.; 22 inches, 5s. 6d. each.
CAST-IRON FLOWER-STAKES 4 feet long out of the ground, 7s.; 4 feet 6, 9s.; 5 feet, 11s.; 6 feet, 13s.; 7 feet, 20s. per dozen.
 Show-Rooms at the Manufactory, No. 2, WINSLEY STREET, where every information may be obtained.

HOT-WATER APPARATUS FOR HEATING HORTICULTURAL BUILDINGS, DWELLING-HOUSES, CHURCHES, and MANUFACTORIES, upon improved principles, and at very moderate charges, erected by DANIEL and EDWARD BAILEY, 272, HOLBORN.

D. and E. BAILEY having devoted much time to the consideration of this subject, and had much experience in the erection of apparatus for the above-mentioned purposes, have, by improvements suggested in their practice, rendered their mode of heating not only very efficient, but very simple, and have combined durability in the apparatus with economy in the charge. They have erected apparatus in England, Scotland, and Ireland, for many noblemen and gentlemen, and have had the honour to be employed by the Horticultural Society of London, in executing the works of their splendid Conservatory, lately erected at Chiswick.

D. and E. BAILEY also construct in metal all descriptions of Horticultural Buildings and Sashes, and invite noblemen, gentlemen, and the public to an inspection of their various drawings and models, at 272, Holborn, an extremely complete and exhibiting, amongst other metal works, an extremely complete and convenient kitchen apparatus, or range, adapted for the continued supply of hot water, and an arrangement of the oven more complete than has hitherto been brought before the public.

D. and E. BAILEY were the first to introduce metallic curvilinear near houses to horticulturists, and can refer to the Conservatory attached to the Pantheon as one of their works, besides many others in this country and on the Continent.

D. and E. BAILEY have prepared a quantity of the Galvanic Plant Protectors, which are now ready for immediate delivery; they beg to introduce to public notice a new Trough Pipe, for Orchidaceous or other Houses where vapour is constantly, or at intervals required, and which may be seen at their Manufactory.

J. B. LAWES'S PATENT MANURES, composed of Super Phosphate of Lime, Phosphate of Ammonia, Silicate of Potash, &c., are now for sale at his Factory, Deptford-creek, London, price 4s. 6d. per bushel. These substances can be had separately; the Super Phosphate of Lime alone is recommended for fixing the Ammonia of Dung-heaps, Cesspools, Gas Liquor, &c. Price 4s. 6d. per bushel.

Now ready, price 4s. 6d.,
RURAL CHEMISTRY.
 By EDWARD SOLLY, Esq., Jun. F.R.S.,
 Experimental Chemist to the Horticultural Society of London,
 Hon. Mem. of the Royal Agricultural Society, and Lecturer
 on Chemistry at the Royal Institution.

 Floricultural . . . 7 P.M.

COUNTRY SHOW.—September 2 . . . Limerick Practical.

In consequence of a statement which we made a few weeks since, directing the attention of our correspondents to the difficulty experienced in the cultivation of Myatt's most excellent Pine Strawberry, we have been favoured with numerous communications upon the subject, the substance of which we now proceed to place before our readers.

Upon this, as upon most other questions of a similar nature, the statements are very conflicting, some persons asserting that the variety is only indifferent, or not superior to the Old Pine,—others contending that it is the most valuable of all kinds; some writers stating that it is a most uncertain, others that it is a most prolific bearer. On one point most of our correspondents seem to agree, and that is, that it delights in a highly manured soil. In a letter from Mr. R. Saunderson, of Ravenswood, is the following statement upon this point:—

"Let the ground be trenched to the depth of two feet, and throw in an abundance of dung during the operation, as this kind of Strawberry can hardly have too much, from the fact that it does not run to leaf, like many other sorts. The plants should be arranged in rows 18 inches apart, in beds four feet wide. A friend of mine has thus obtained them upwards of an ounce in weight. They bear to the amount of twenty or thirty on the bunch, and although we cultivate the Elton, British Queen, and Eliza, which are good kinds, they are not to be compared to Myatt's Pine, one great advantage of which is that it continues bearing till September."

Another correspondent, signing himself "Hibernicus," writes nearly to the same effect. "I choose an open space of ground, which I trench to the depth of eighteen inches or two feet, throwing dung into the bottom of the trench to the thickness of three inches, and afterwards spreading it on the surface four or five inches thick, and digging it in about a spade's depth. Beds four feet wide are then formed, with alleys between them two feet in width, and I take out from the latter the stiff soil to the depth of eight inches, which I throw upon the beds on each side. The manure which I use is rotten dung. If I can get ashes I spread some on the surface of the bed. About the middle of November, a little manure is forked in about the plants, which stand eighteen inches apart between the rows and one foot from plant to plant."

Another writer, under the signature of "J.W.C.Y." is also of opinion that "the chief requisite in the cultivation of Myatt's Pine, and all other large rooting kinds, is free ground, trenched and well manured, so that the roots can penetrate a foot or more in depth before the approach of winter." The latter point we deem well worthy of attention; for if a Strawberry plant is turned out late in autumn, it scarcely forms roots sufficient, before frost occurs, to prevent its being drawn out of the soil, and thus receives so great a check that it either dies or it is late in spring before the plant recovers its energy.

The employment of bog-earth is, by a "Constant Reader," regarded as a cause of success. He says that Myatt's Pine is growing with him magnificently, and bearing abundance of fruit in bog ground; he adds that his kitchen-garden is on a piece of reclaimed bog, and the great luxuriance of every vegetable that grows on it is quite astonishing. The Strawberries in question grow in rows, edging the walks; they bore very fine fruit for more than two months last year, and seem likely to do the same this year. This is a fact well worth attention, without reference to Myatt's Pine; for it shows the high value of bog-land reclaimed by judicious means.

There is one more point upon which several writers concur; which is, that Myatt's Pine Strawberry should never be kept upon the ground after it has borne the second crop. With this statement some of our correspondents of last year (pp. 491 and 525) coincide. We give the remarks of "Hibernicus" upon this subject, as being most to the purpose.

"In consequence of the beds made last August bearing only a moderate crop, and those of 1841 a magnificent one, while those made in 1840 had but a

small one (though last year they bore most abundantly), I am disposed to think that plants of Myatt's Pine will only bear two crops of fine fruit, and that they ought to be destroyed after the second crop. By adopting this kind of biennial treatment, I have cultivated this kind very successfully. My crops last year, as well as those of the present, have been most abundant, and the fruit very large. It will not succeed in a low, damp situation."

Mr. Reid, the intelligent gardener at Noblethorpe, recommends that a fresh bed should be made every season, and the old ones destroyed. After mentioning that he always obtains excellent crops by the method recommended at p. 491 of last year's *Chronicle*, viz., by allowing the runners to strike into an inch or two of rotten manure slightly covered with soil, and making a new bed every season, he continues—"Whoever adopted this plan last autumn will not be able to see the result before next summer, as the runners are only now growing for next year's crop. I am still of opinion that failure is owing more to the treatment than the soil, because if the soil in this garden suited them, why should I not have a crop from them, under the same management as other sorts? This I have never been able to obtain. Being convinced that Myatt's Pine will not produce a crop under the ordinary method of transplanting, I adopted the following plan for moving them: I filled a number of pots (large 60s) with good rich soil, without putting anything over the hole at the bottom, and these I placed round the bed, laying a runner or two on each pot, with a small stone above them to keep them down till they rooted in the soil. I watered them regularly, and in less than three weeks they were fit for removal, which was done carefully by keeping the balls entire. I thus obtained sufficient to plant six rows across a border 12 feet wide, the plants being a foot apart, and four feet between the rows. They grew very strong before winter, and many of them threw out fresh runners. These rows are now producing as heavy a crop as can be desired, and finer fruit than I ever saw before. The runners have nearly covered the four-foot space betwixt each row, and will make complete four-foot beds for next summer's crop. As there is still plenty of time to try this method, I hope many of your readers will do so, as I have no doubt of their success. I ought to mention, that, as soon as the rows have done bearing, or at least some time before winter, I cut them clean out; the space where they grew will serve for alleys for the young beds. The soil in this garden is a very stiff heavy loam, cracking in all directions in dry weather, with strong clay at the bottom."

"Discipulus," another correspondent, states that with him this kind succeeds as well as any other under ordinary treatment. The soil is naturally strong, and he covers down with manure in spring, for the double purpose of keeping the soil moist and rich, and the fruit clean. Last year he parted the old roots, because he could not procure runners in consequence of the ravages of the Crane-fly; and these plants have borne fruit this season as well as the rest. He states, in conclusion, that "as far as his experience goes, he finds Myatt's Pine easy enough to cultivate, and by far the easiest to separate, as there are always an abundance of young roots at the upper part of the old plants, and the offsets thus taken off make very vigorous plants. A rich border, dry in winter, is certainly preferable for it."

It may be as well to observe that the dryness of the beds in winter appears to be of essential consequence; and this may probably be the reason why Myatt's Pine succeeds so well with some persons when grown on a gentle slope. This is particularly observable at Mrs. Marryatt's, of Wimbledon, where it is cultivated in loam, and dressed over in spring with dung, to keep the roots moist.—"D. Z." upon this point, writes thus:—"I, last year, had occasion to make a new bed of this kind, and I selected for the purpose a south-east border, 6 feet wide with a wall 2½ feet high at the back. As my soil is light, I first covered the border about two inches thick with a tender loam, and upon that I laid pigeon's dung, four inches thick. I trenched the border two feet deep, carefully mixing in the dung, and I also took care to have the border elevated towards the back at an angle of seven degrees. On the 26th of October, I planted the border with second runners, a foot apart, and the same distance from row to row. I believe it is rarely that such runners bring any fruit to perfection the following season; but to my surprise they have matured some very good fruit, and at this time, the plants are growing freely." We would therefore suggest that in retentive soils the bottom of the trenches, when the ground is being prepared, should be covered several inches thick with brick rubbish, and that the surface of the beds should slope gently towards the south-east; this would keep the subsoil dry in winter, and partially secure the surface from the parching rays of the mid-day sun in summer.

It may be as well, in conclusion, to mention a remark made by Mr. R. Saunderson, that "in gather-

ing this sort great care is required: if turned red on one side, the fruit is ripe, and if left longer—like its namesake, the Pine-apple—it loses that tart and musky flavour which so distinguishes it."

From the first appearance of the manure called Potter's Guano, we have expressed an opinion that it would necessarily prove one of the most useful of fertilizing agents; and experience proves us to have been right. In addition to the published accounts of last year we are now able to state that on Asparagus and other Kitchen Garden produce its action has been most beneficial during this summer. Little worn-out suburban gardens, where, for obvious reasons, manure cannot be applied, have been restored to fertility by two or three dressings; and have been crowded with flowers where plants could scarcely grow at all before. It has, also, like the superphosphate of lime, the great merit of not doing mischief in unskilful hands. In short, we regard these two substances as the best materials that have yet been provided as substitutes for manure; and we are therefore glad to find that Potter's Guano has experienced such a reduction in price as will induce both farmers and gardeners to avail themselves of it.

When we have got a piece of good loamy land lying on a dry subsoil, or well drained, it is our own fault if we have not good crops, or if the vicissitudes of the seasons affect us to any great extent. The two last years have been trying years for bad farmers; and we may look upon it as a warning to keep our land dry in winter. Whoever has observed the difference between the produce of two fields, both of nearly the same quality, but the one drained and subsoil-ploughed, and the other merely ploughed up in high and narrow stretches, must be fully convinced that the capital laid out in thorough-draining often pays a better interest, without risk, than the most usurious discount of short bills could have the conscience to desire. This year it has been 100 per cent. and more, in some heavy wet soils, now laid dry. Draining, in the best manner, seldom costs more than 6l. per acre, and it can be done effectually for half that sum. Without being drained the cold wet lands which abound in England will not average 16 bushels of Wheat per acre, taking into the account the great many fields which failed entirely. The same soil properly drained, with the same labour and manure, will average 30 bushels, with double the quantity of straw, and more than a bushel per acre of seed may be saved. Here, then, is a difference of 15 bushels per acre, which, at six shillings, amounts to 4l. 10s., and allowing a load of straw more than on the undrained land, worth 1l. 10s., we have just the cost of the draining, or cent. upon cent., on the capital. We have ourselves realised this difference; and we have 10 acres of Wheat in a drained field, and eight acres in another of equal quality, but not drained, of which the first will average by estimate 36 bushels per acre, while we do not expect more than 20 or 22 from the other. The poorer crop has been the most expensive, owing to the constant hoeing and weeding required to keep it clean. After this, can any proprietor or tenant hesitate to have his heavy and wet lands drained? If neither the one nor the other have money to spare, let them borrow it, if they can, at five or six or more per cent. They will soon be enabled to pay off the debt; but every prudent landlord should urge his tenants to drain, and offer to find tiles on receiving 5 per cent. additional rent for the cost of them. He should erect a tile-kiln on his estate, if it is of any extent. Where the land requires draining, there is always brick-earth at hand, or clay, which can be readily tempered. Machines are invented every day by the use of which the expense of tiles is gradually reduced, so that half the sum formerly required to lay a field dry may be saved. For the last Number or half-volume of the "Journal of the Royal Agricultural Society of England," Mr. Pusey has collected a variety of useful information on thorough-draining,—not new plans or theories, but the practice of generations gone by, reaching to 150 years back,—so true is it that in Agriculture there is nothing new, except those things which rest on late discoveries in the arts and sciences; and in these there is not yet that certainty which would produce universal adoption: time alone proves all things. Giving due credit to those who have brought the subject of draining more generally before the farmers, we must not suppose that it is a new discovery. Can any traveller observe the pains taken in warm climates to distribute water over every part of a field, or see the works erected in northern countries to keep the water from the land, without having the advantage of draining suggested to him? It is true, that the first attempts to lay the land dry were by means of ditches and sluices, and by lowering the general level of the waters in a flat country: but ditches take up much ground, and hollow drains will carry off the water equally well. Once arrived at this point, it is only a step to the increase of hollow drains

to any extent. But as the drains increase, they may be made less and less, until a space two inches wide and four inches deep is sufficient to collect the superfluous moisture. Such drains may be made in a retentive subsoil at a trifling expense, and spread over the land—like the veins and arteries of the animal body, increasing in dimensions as they collect more small streams, and ending in a capacious tile-drain, which pours out the water of many acres into the open ditches. We will explain our meaning in the next Paper, and we shall not be surprised if many of our readers have already anticipated our plan.—M.

ON CONSERVATORY CLIMBERS, &c.

At this period, when people are busily engaged in planning out new modes of heating, and re-arranging houses, pits, &c., or in contemplating new ones, let me suggest a simple, cheap, and efficient mode of rendering the conservatory superior and more interesting than anything that has hitherto been done, with the exception of a few instances, which proved highly successful. It is to clothe the rafters with the best stove and half-stove climbers, for seven or eight months in the year, and thus to impart to it all the character and importance of an exotic stove, with the cool, refreshing atmosphere suitable for conservatory plants, where those who cannot endure the broiling heat of the former may enjoy this luxury in a more congenial climate.

Something of this kind seems now to be wanted, seeing that the better and more delicate greenhouse climbers are being encouraged as dwarf plants on trellis-work—a plan very suitable to tender and small flowering-plants, but which does away altogether with our ideas of the bold, unrestrained freedom of a fine climber—and also that the stronger greenhouse climbers are now turned out against conservatory walls, so that we are left in the dilemma of having the same kinds of climbers in the conservatory as against the hot walls in the open air, or we must contrive to grow others in-doors more suitable to our tastes and ideas; or, at all events, more in accordance with the higher branches of gardening.

The plan which I propose for effecting this change is exceedingly simple, and not at all expensive, having had a less economical mode for the same purpose in operation for some years, and I can speak confidently as to the result. This plan is, simply, to build a narrow pit along the back of the conservatory, or along one end of it, if that is not in sight of the main walks; to keep up a constant stove-heat in this pit; to plant out stove-climbers in it, and when they are of sufficient length, to introduce them through holes pierced in the back wall of the conservatory; or, more in detail, to build a pit, six feet wide and four feet high, the whole length or breadth of the conservatory, as the case may be, with glass sashes, in the usual way, at an angle sufficient to leave you head-room along a path next the back wall of the conservatory. This path may be two feet wide, leaving room for a bed four feet wide, excepting the four-inch wall along the path to keep up the soil. This bed is to be made after the manner of a Vine-border, well drained, with a layer of rough bones over the drainage, and a good portion of them mixed with fresh turfy loam and a little peat and leaf-mould, to the depth of three feet. If you wish to try the effect of bottom-heat, nothing is easier than to run a trough under the drainage, with a two-inch pipe, to heat the water after the manner of Mr. Green's pits. Mr. Rendle's plan will not answer this purpose. A common flue may be the mode of heating, if you want to go the cheapest way to work, and the heat may be from 75° to 85° in summer, and from 50° to 55° in winter.

About the end of November prune all the side-shoots from the climbers to one eye, leaving the leading shoots, the first year, their full length, and draw them back to the pit, to be wintered there. For the first few weeks let the temperature of the pit be about what that in the top of the conservatory was for the last month, say 45°; this is to induce the plants to rest, because if the temperature here were kept higher at this time it might cause the plants to make a fresh growth at that dull season, after being so closely pruned, which would derange their economy, and probably defeat your expectations for two or three years. It may appear strange to some that the tops of plants will thus grow in a much lower temperature than that necessary for their roots, but such is the case, and my attention was first drawn to it on seeing it so well explained by the Honourable and Very Rev. the Dean of Manchester, in his work on the Amaryllidaceæ, p. 402; but we have a case far more curious bearing on the point, recorded in vol. i. of the *Chronicle*, p. 150, by Mr. Fox, of Bridport, who states that a shoot of a tender Passion-flower escaped into the open air in summer, "through a small hole in the glass," and remained outside all the hard winter of 1840-41, "without being much injured." Could anyone have believed such a thing possible, unless well authenticated? I am almost satisfied, although I have not yet proved it, that the tops of many of the stove-climbers mentioned below would live well enough in the conservatory all winter, and be the means of making others that are shy flowerers bloom freely.

Where a stove joins a conservatory, this experiment might be tried at once; and in the case of a new conservatory, an intermediate house would suit better for some of the plants chosen for this purpose. If the conservatory stands in an open part of the flower-garden, this is impracticable, without planting screens to hide the pit; and if the conservatory is built with glass all round, like the great Chatsworth conservatory, or the one in the Chiswick gardens, the difficulty might be over-

come by painting the outside of the glass the length and height of the pit. The gardener would find such a pit as useful as any other on the establishment; it would be the best place for many kinds of propagation, for storing away bulbs, &c., for smoking the conservatory plants in, and for cleaning their leaves in wet days; it would also be a good place for many Orchidaceæ: in short, there is no end to the uses to which it might be applied, as well as for furnishing the conservatory with the most gorgeous of the stove climbers.—D. Beaton.

(To be continued.)

ENTOMOLOGY.—No. XLVII.

THE SMALL WHITE-SCALE, or Oleander Shield-bearer, *Aspidiotus Nerii*. (Bouché.)—This insect belongs to the 2d section of Coccoi, in which the scale is not fastened to the animal, but is left sticking to the leaf when the scale is removed; whereas, in the 1st section the animal cannot be removed from it. This group Bouché has distinguished as a genus, under the appellation of *Aspidiotus*, or Shield-bearers; the males differ also from Coccus in having two little processes issuing from the mesothorax, analogous to the balancers in the Diptera.

The small White-scale is a most abundant species upon various hothouse and greenhouse plants, and I have seen it in multitudes upon the Olive and Oleander in conservatories in England. They are generally scattered all over the undersides of the leaves, but first attach themselves to the midrib. The larger ones (Fig. 1) are females, the scales being dirty-whitish or buff-colour, very thin, slightly convex, more or less orbicular, and are very much like Oyster-shells in miniature, even to the impression on the inner surface (Fig. 2, greatly magnified); on removing the scale, a fleshy yellowish animal is disclosed (Fig. 3), which is fastened to the leaf by an exceedingly fine proboscis, that proceeds from a nipple in the breast, about one-third from the anterior margin. I could not discover either legs or horns, but there is often a little cottony substance beneath the scale, especially at the tail of the female, where the eggs and the recently-disclosed young are often grouped together (Fig. 4); the former are oval, and yellow or brownish, and the latter are pale green, oval, with two short antennæ, and six small legs. The lesser scales (Fig. 5), of which there is always an abundance, are perfectly white and generally oval; on lifting these up, a little brown pupa is found beneath, which produces the male insect; this sex differs so astonishingly in all the Coccidæ that have come under my observation from the female, that nothing but a perfect knowledge of the economy of this family could satisfy any one that they were even related to each other; for whilst the females are either horny scales, or fleshy masses concealed beneath a scale, which are constantly drinking deep of the sap, and never move from the spot where they are once located; the males, on the contrary, are little flies, which appear never to require any sustenance, and whose only object is to fulfil the great law of Nature. The male of the small White-scale is infinitely smaller than the female, slender, and reddish brown; the little head has two distinct black eyes, the antennæ are hairy and said to be 8-jointed—they appeared to be only 6-jointed in my specimen, which was dead and injured; the abdomen is furnished with two longish setæ, or bristles, at the apex; the six legs are moderately long and hairy at the extremity; the tarsi apparently consist of one joint only, which is terminated by a single claw: the two wings are dirty-white and iridescent, and are more than twice the length of the animal, rounded, and lying flat on the back in repose (Fig. 6, magnified). With the small White-scales are sometimes found clusters of elliptical white powdery cases (Fig. 7), not adhering very closely to the leaf; they contain a long cylindric greenish pupa, with two black eyes, and a stout process at the tail; these I suppose are the pupæ of the males: but since I have found under the scale, Fig. 5, the male represented, I am now doubtful regarding them, and think they must belong to another species, possibly to the *Aspidiotus Bromeliæ*, (*Gard. Chron.*, vol. i., p. 131, fig. 2); the thoracic scale has two elevated lines forming a cross, the sides of the abdominal margin are raised, and there is a stout elevated ridge down the back (Fig. 8, magnified). *Obs.*: all the small outlines denote the natural sizes of the different objects, as they are shown upon the leaf.

The small White-scale is, I believe, more difficult to eradicate than any of the others. It is supposed to have been introduced from America, and does not require the heat that most of the exotic species do; it is therefore found in myriads on a variety of plants besides the Oleander, as Acacias, Arbutuses, Aloes, Palms, and

similar plants. The Olive, as we have observed, is infested by it: but this is a very different species to the Coccus Oleæ, which inhabits the Olives in their native soils in the South of France, Italy, &c., where those valuable trees suffer considerably from the immense quantities of the Scale-insects which are produced, as many as 2,000 eggs having been found under one female, and as the sap of the Olives is always in circulation, no interruption is offered to their increase, and consequently they are breeding the whole summer, if not in the winter, sometimes spreading to the Myrtles and Phillyreas also. I find that the peasants call them lice, and believe that they are produced by the ants, from those insects traversing the Olive-trees in search of the scales to obtain the sweet fluid secreted by the Coccoi, as already stated in a former communication.—*Ruricola*.

SPRENGEL ON VEGETABLE MANURES.

(Concluded from page 572.)

12. Peat-earth.—Peat is a substance composed of vegetable remains, which are more or less decomposed and deposited in boggy or wet soil. When used as litter it is necessary to throw it in large heaps, that it may lose its superfluous humidity. At times, the vegetable remains of which peat is composed are of a very filmy texture, in which case the heaps must be well cut through several times, else, when placed under cattle, it will not properly mix with the animal excrements. Where, however, peat moors are under cultivation, this is not required; in that case it is sufficient to shovel up the earth from the surface of the fields, which, by burning, ploughing, and harrowing, have already become soft and dry, and this earth may be used at once for litter.

It has been proved by long experience, that peat-earth yields a superior manure, especially if it contain mineral substances, required for the growth of plants. As, however, the different sorts of peat-earth contain different quantities of mineral substances, their manuring value can only be ascertained by the chemical analysis of their ashes. The upper stratum of peaty moor generally consists of half decomposed mosses, which, as has been already stated, possess little value as litter, being deficient in the mineral substances important to vegetation. Hence, it follows that moss-peat cannot be a very good litter, as indeed is proved by experiments on a large scale. The brown fibrous-peat which lies under the moss-peat is much better, because its ashes contain much gypsum, phosphate of lime, magnesia, and common salt; but even this sort of peat does not yield a very superior manure, being (in almost all cases) deficient in potash, and generally in nitrogen also. If, therefore, manure obtained from littering with peat-earth is to supply the crops with all necessary substances, the cattle must be fed with substances containing much potash and nitrogen, so that what is deficient in the litter may be supplied by the animals.

Peat-earth litter will be most advantageous in localities which are very dry and sandy, for the soil will then be supplied with plenty of humus, which (on account of its hygrometrical quality) will keep the soil sufficiently moist. One of the chief advantages of littering with peat-earth, however, is, that not the smallest particle of nitrogen from the animals will be lost, because all the ammonia that is given off from the urine or otherwise, or which the cattle may perspire, will be at once chemically combined with the humic acid of the peat-earth; at the same time that part of the superabundant humic acid which would injure vegetation will be neutralised.

In order that peat may be uniformly mixed with animal matter, and that it may be perfectly rotted, it is better to throw the peat-manure into large heaps, and to leave it for some time (say two or three months), previous to being carted on the land. It is true that in doing so some carbon will be lost in the shape of carbonic acid; but that need not be taken into account, for it will be easily replaced by the layer of peat. The rotting of the peat-manure in large heaps is the more necessary, and must be carried on the longer, in proportion to the undecomposed vegetable remains it contains; for that decomposition will take place in the ground very slowly, especially if the soil be sandy and dry. Peat may be used to advantage for litter with all sorts of cattle, but especially with horses and sheep, as in this case it will fix that great amount of ammonia which these animals furnish. In sheep-folds straw may be strewn over the earth, in order to prevent the wool from being soiled.

In order to show that some sorts of peat-earth are really very valuable on account of their mineral contents, I shall insert here the result of one of my analyses.

100,000 parts of dry peat-earth contain:—	
7,960	parts of silica
760	lime (carbonate of)
160	magnesia (carbonate of)
620	alumina
320	gypsum
40	phosphate of lime
60	common salt
120	oxide of iron and manganese

10,040 parts of mineral substances.

If, therefore, only 33,000 lbs. of peat-earth are brought (in the shape of manure) on one Magdeburg acre of land, they will supply 96 lbs. of gypsum, 228 lbs. carbonate of lime, 48 lbs. of magnesia, 186 lbs. of alumina, 18 lbs. of common salt, and 12 lbs. of phosphate of lime, which will produce a considerable effect on the growth of crops, especially in a sandy soil.

But for the sake of showing that there are also peat-earths, which, on account of the small quantity of mineral substances, possess little value as litter, I subjoin the

result of another analysis of mine, made with another sort of peat-earth.

100,000 parts of dry peat contained:—

313	parts of	silica and quartzose gravel
97	"	alumina
190	"	oxide of iron
33	"	oxide of manganese
141	"	lime (carbonate of)
86	"	magnesia (carbonate of)
102	"	gypsum
10	"	common salt
12	"	sulphate of soda
16	"	phosphate of lime.

1,000 parts.

Now of this sort of peat 33,000 lbs. (in the shape of manure) will furnish a Magdeburg acre with only 30 lbs. of gypsum, 42 lbs. of carbonate of lime, 28 lbs. of magnesia, 30 lbs. of alumina, 3 lbs. of common salt, 4 lbs. of sulphate of soda, and 5 lbs. of phosphate of lime; and this shows clearly that the first sort of peat-earth is far preferable to the latter.

AMATEUR'S GARDEN.—No. XXXIV.

Among flower-garden plants *Calceolarias* deservedly hold a conspicuous place, as being the best flowers we have for forming orange and yellow groups, and there are also some of the dark and ferruginous-coloured hybrids which make good beds. In my estimation *C. viscosissima* is the best for turning out, as the orange colour of the flower is clear and distinct, and it is moreover a most abundant bloomer. *C. rugosa* has a rather paler orange flower, and *C. integrifolia* and its variety *angustifolia* are most excellent yellows. *C. rugosa* and *integrifolia* are confounded in many collections, and by a great number of gardeners the former is not known at all; its leaves are much wrinkled, but their upper surface is perfectly smooth, and the flowers are nearly double the size of those of *C. integrifolia*. It is an excellent one for bedding out,—perhaps, taken altogether, the best we have. There is also another Chilean species which produces dense heads of flowers and which in some collections is called *C. densiflora*. It makes a good specimen for a vase or basket, but does not flower sufficiently profuse to form a good bed. *C. bicolor* is useful in a fine season, but being very brittle is liable to be much damaged by wind in a bad one, unless very securely pegged down. Of the hybrid varieties, with the exception of those first raised, such as *Pluto*, *Indian Chief*, *Harlequin*, *Sultana*, *Cleopatra*, and one or two more, they are generally unfit for beds, as the flowers being large and open in the throat, are soon filled with water, and are consequently washed off the plants by almost every smart shower of rain that falls. In a word, the usefulness of *Calceolarias* is in an inverse ratio to the size of the flowers, for the larger the blooms the less are they adapted for out-door cultivation.

About the middle of August is considered the best time to propagate hard-wooded *Calceolarias* in the generality of seasons; but in this, the first week in September will be quite soon enough, as more depends upon the wood being about half ripe than upon the time at which the cuttings are put in. They strike root freely in a close frame; but it is a bad practice to attempt to stimulate them by heat, at least until the callosity is formed. *C. viscosissima* is scarce in the neighbourhood of London, and therefore, should this meet the eye of any person who has a few score or a few hundred cuttings to spare, I shall be happy to barter with him for them.

The sowing of Californian and other hardy Annuals is an operation which must not be delayed beyond the first week in next month, if you do not wish to have a blank in the flower-garden next May; and some very judicious remarks, with the names of some useful kinds, were offered by Mr. Beaton a fortnight back. As a general rule, it is wrong to have any plant that is at all tender, and which it is desired to preserve through the winter, strong in the autumn; and indeed, for my own part, I have always found small plants much more capable of enduring cold than strong, free-growing ones; and the reason of this probably is, that containing little sap, they are less liable to have their tissue ruptured by sudden thaws, or by being blown about by the wind. A dry situation and poor soil, on a north aspect, well protected from cutting winds by a hedge or shrubs, is the most suitable situation; and if the walks between the four-foot beds are left sufficiently wide to allow of a ridge being thrown up in the winter, it will be very much in favour of the plants.

For the greenhouse next spring, and also for turning out, a general collection of the best tender Annuals should be now sown, such as *Ipomopsis elegans*, *Clintonia pulchella* and *elegans*, *Schizanthus retusus*, *Priestii*, *pin-natas*, *p. humilis*, and several more; and if you can manage a bed of *Lisianthus Russellianus*, it will not be a despicable feature in the flower-garden this time twelve months. *Brachycome iberidifolia* is highly spoken of by several of my correspondents as making an excellent bed; but one bad feature, at least as far as I have seen of it, is its liability to die off suddenly, and without any apparent cause, and thus make gaps in the beds. This, however, I hope is rather the exception than the rule, and at any rate it will be found exceedingly useful in pots in the greenhouse next spring.—W. P. Ayres, Brooklands.

HOME CORRESPONDENCE.

Papermakers' Refuse.—In answer to your correspondent's queries about the utility of the paper-making refuse as a manure, I beg to observe that the same subject has lately occupied my attention. I have been requested to give advice for the establishing a chloride of lime (bleach-

ing-powder) manufactory; and have been brought to consider what might be done most advantageously with the chlorine refuse. This refuse is of the same nature as that from the bleaching of rags, and produced, like it, from salt, manganese oxide, and sulphuric acid (oil of vitriol). The chemical nature of this refuse will depend upon the proportions of the articles used. There is almost always a large excess of manganese, but this is, or should be, separated by washing &c., to be used over again. The salt is generally in excess in relation to the sulphuric acid, it being the cheaper material. Such being the case, and the oxide of manganese almost constantly containing carbonate of lime and oxide of iron, the residuum must consist of the sulphates of manganese, of soda, of lime (Gypsum) and of iron, and a portion of common salt. As all these substances (although in proportion infinitely varied) enter into the composition of almost every plant, there is good reason, *a priori*, to suppose that the judicious application of such a compound can hardly fail to be beneficial, if your reiterated and excellent rules be duly observed,—“little and often.” I do not know, that, with respect to the sulphate of manganese, any exact experiments have been recorded; and it may happen that forming a principal part of the refuse, it might exert a poisonous influence, if used only so strong as to give the other ingredients a chance of acting. Nothing, however, can be easier than to try it, and vary the experiments as to quantity, and, above all, carefully to record the results. There is no doubt about this refuse being most excellent for fixing ammoniacal matters, if the ammonia be in the state of carbonate of hydro-sulphate, (vide my letter in the *Chronicle*, page 117 of this year's vol.) or even if free, should the oil of vitriol have been used in excess. The *modus operandi* will undoubtedly be partly as a stimulant and partly as a conveyer of nutriment, and the probability is, that, being referrible to the class of “Saline Manures,” its best effect will be produced as a top-dressing, and dissolved in water. I hope that your Correspondent will have nerve enough to make the experiments I have mentioned, and philanthropy enough to communicate his results when obtained. Most of the sulphate of manganese might be separated from the other salts by a managed crystallization, and will fetch a good price with the calico-printer.—W. H. Potter.

Peas.—In *Berrow's Worcester Journal*, of the 17th inst., is a receipt for preserving Green-Peas, &c., which runs thus:—“Gather Peas (varieties that are green when ripe) when fit for the table, lay them to dry in the pods over the hothouse flue, or on any place where they can have a continual warmth. When perfectly dry, put them away in a dry drawer till wanted; and whether at Christmas, or even the following spring, if steeped for 24, 30, or 36 hours before boiling, they will be found nearly equal in every respect to Peas fresh gathered.” Now, barring the boiling, the Editor might have added within his editorial brackets,—fine substitute these would make for small shot for the gamekeepers to kill young rabbits with in the garden. This would be better than pirating paragraphs from the *Gardeners' Chronicle*, editorial remarks and all.

—D. B. [We really are surprised that so respectable a paper as *Berrow's Worcester Journal* should thus expose itself to the charge of being a receptacle for stolen property.] *Bees.*—“A Bath Subscriber” replies to “Apis” that he once discovered a swarm of Bees in a Hawthorn-hedge, and their comb contained brood. To some this may appear strange; however, a similar thing sometimes happens. This season I found a weak swarm of Bees in a hedge, having a small comb containing eggs and a little pollen, but no honey. The cold, and shortness of the time they had been in their airy abode, may account for the latter. Such occurrences do not bespeak much for the notion that Bees will not work, I mean construct their cells, except in the dark.—J. W.

Fruit without Leaves.—Should there remain any doubt as to the maturation of fruit without leaves, I beg to state that last year I had a shoot sixteen inches long, which never showed a single leaf, but bloomed and set its fruit well; one of which I allowed to remain as near the middle of the shoot as possible. I, together with two of my young men, determined to watch its progress. The Peach ripened and coloured beautifully, and was as fine as those exhibited before the Horticultural Society. The shoot gradually died back to the fruit, which it reached when the latter was about half swelled; but the disease went no further until the fruit was plucked, when it went on to the main branch, which, I think, fully testifies that the Peach had the power of drawing the matter necessary for its support.—M. Henderson, Coleorton Gardens.

Melons.—I agree with you generally in your remarks, at p. 571, upon the Melon, but not with respect to an unceremonious dismissal of the “whole race of Cantaloupes,” for I think many of the Cantaloupes are good. My object in writing to you is, to mention that I have this year succeeded in growing one of the most magnificent Melons I ever saw; the seed was sent to me from Syria, but I only succeeded in rearing one plant. The fruit was most exquisite, and melted in the mouth like the most delicious Peach; there was not much pulp in it, and the fruit was eatable close to the rind, but this was rather hard,—however, not near so hard as in the old cultivated Melons. The shape was a fine oblong, and it was beautifully covered with net-work, and when ripe was quite golden. It requires a smart bottom-heat, and is inclined to be woody; this season—which, by-the-by, is no criterion—it was shy in fruiting. The finest Melon weighed about seven pounds. I am also growing the Candahar, sent to me by a friend, but from the lateness of the spring when I received the seed, I am afraid I shall not bring the fruit to perfection; for they evidently, like the Syrian, require plenty of sun. The fruit upon the

Candahar is now about the size of a goose's egg. I have also a most delicious Green Flesh, a small fruit, the seed of which came from the Emperor's garden at Constantinople, and is called the “Melon of the Harem.” I am now growing about nine varieties of Melon, and my gardener has no difficulty with any of them. I also keep a good eye on the new ones.—F. P.

Disease in Pansies.—Seeing, at p. 573, an article on “a Disease in Pansies,” I beg to inform you that last year I lost nearly all my best varieties in a similar manner. This year I tried the following plan, which has been perfectly successful, for I have not lost a single plant this season. About the beginning of June I had a barrowful of soil, finely sifted, consisting of loam, rich soil, river sand, and one shovelful of lime: this was well mixed together, about a trowelful was worked in and about the heart of each plant, and the result has been as stated.—W.

Asparagus.—The extent of scientific information which has been elicited through the pages of the *Gardeners' Chronicle* is doing much to amend former practices in the cultivation of Asparagus. It is, however, a matter of considerable doubt if it ever can be produced in Britain equal in size to that grown in Austria. We have a statement in Keyser's Travels, published in 1760, in which he says, that “the goodness of the soil may be inferred from the largeness of the Asparagus that grew last year at Darmstadt, for one head of it weighed half a pound.” He further adds, that the Austrian gardeners generally lay some light sticks over the Asparagus when it appears above the surface; these shelter it from the inclemency of the weather, and cause it to shoot up apace. Besides, by this contrivance it is kept soft, for it is apt to become hard when exposed to cold winds. I should be glad to know, through the medium of the *Chronicle*, whether the Austrian gardeners continue to produce such monstrosities, as to me it appears altogether incredible that one head of Asparagus should weigh half a pound. I have experienced the good result derivable from spring protection, and therefore can bear testimony to its efficacy. In a garden of which I once had the management we were annually, more or less, deprived of an early crop till the adoption of such a procedure. By some it may be argued that Asparagus is as hardy as any other marine plant, which inhabits our sea-coast. To this I readily assent; but when subjected to artificial cultivation, its primitive character is changed by the application of manure, which enlarges the vegetable tissue, and it is consequently less able to resist the effects of cold.—Alexander Cramb, Gardener to H. G. G. Sudlow, Esq., Heywood House, Westbury, Wills.

Strawberries.—The Strawberry deservedly occupies attention in the *Chronicle*, and it is to be hoped that your just remarks at p. 555 will speedily explode that almost worn out system of annually mowing off the leaves, which cannot be too strongly condemned as unnatural and mischievous. My present purpose is to draw the attention of your correspondent “D. Z.” to my method of management, differing as it does from the practice of other gardeners lately recorded in the *Chronicle*. To obtain ripe fruit as early as possible out of doors, I plant Keen's Seedling 18 inches apart, in a row close to the bottom of a south wall, at a point where the perpendicular of the wall forms an angle with the horizontal line of the garden soil, thereby giving the plants the benefit of exposure to the sun during the day. For the general crop, I trench, clean, and well manure the ground; when the whole subsides, I draw the soil with a hoe into ridges six inches high and two feet apart: early in the season, when the first runners are in a fit state, the best plants are planted out on these ridges, two in a patch, 12 or 18 inches apart in the rows, according to the richness of the soil and the vigour of the varieties, Pines requiring more space than Scarlets. By December, I take the opportunity of frosty weather to wheel on a quantity of half-decayed leaves-scrappings from the wood yard, long dung, &c., to fill the space between the ridges; and early in May, the prunings of fruit-trees and other small loppings strewn between the plants, to support the fruit and runners a few inches above the soil; by this method the fruit is large, well flavoured, preserved perfectly clean, and the ground is not impoverished by the growth of useless plants on the runners; the wood-supports prevent this. Early in autumn, I remove all useless growth, fork up the soil between the rows, and repeat the mulching in the winter. By this system of culture, Strawberry plantations may be kept in the highest state of productiveness for several years. To obtain plants for forcing, 48-sized pots, filled with rich mould, are placed in the brambles, between the rows. When the strong runners show signs of rooting, place two apart in each pot, and to secure them, place a few pebbles on the surface, which will also prevent the soil from drying quickly. As soon as the pots are filled with roots, the plants are shifted into the usual size for fruiting. In this way I have never failed to secure in one season healthy vigorous plants for forcing, highly stored with organisable matter, and fit in every respect to answer the purpose.—H. Bowers, Lee's Nursery, Hammersmith.

Bobbin Joans.—Some time since I mooted the question in the *Chronicle*, as to the propriety of using Salt as manure, founded on various allusions in the Sacred Writings, where it is noted as an emblem of sterility and desolation. A correspondent (Mr. Brewer), answered me by a reference to his own successful experience in employing it. I requested him, through the medium of your columns, to state the nature of his soil, and the frequency of the application, the quantity applied to a given space, &c., to which he has never, to my knowledge, replied—a matter which I regret. The notice at p. 427, on disease

COUNTRY SHOWS.

Berwick Horticultural Society, July 15.—The Second Show for the season was held in the Red Lion Assembly Room, when premiums were awarded as follows:—For the best six varieties of *Rose*, 1, Mr. Alex. Aitken, gr to J. S. D. Selby, Esq.; 2, Mr. W. Affleck. Best six varieties of *Pinks*, 1, Mr. W. Affleck; 2, Mr. G. Laidler, gr to R. Forster, Esq. Best twelve varieties of *Calceolarias*, 1, Mr. P. Henderson; 2, Mr. J. Hood, gr to H. Greggson, Esq. Best twelve *Ranunculuses*, 1, Mr. Alex. Aitken; 2, Mr. J. Hood. Best six *Pelargoniums*, 1, Mr. G. Laidler; 2, Mr. J. Hood. Best twelve *Gooseberries* (for weight), 1, Mr. W. Affleck; 2, Mr. J. Hood. Best Dish of *Strawberries*, 1, Mr. M. Smith; 2, Mr. T. M'Dougal, gr to A. Dickson, Esq. Best Dish of *Cherries*, 1, Mr. W. Affleck; 2, Mr. M'Dougal. Best *Brace of Cucumbers*, 1, Mr. Alex. Aitken; 2, Mr. G. Blair, gr to J. C. Renton, Esq. Best two *Cauliflowers*, 1, Mr. T. M'Dougal; 2, Mr. A. Aitken. Best three *Fuchsias*, 1, Mr. P. Henderson; 2, Mr. G. Laidler. Best twenty-four *Gooseberries*, Mr. R. Moffat. Best *Quart of Green Peas* in pod, 1, Mr. J. M'Dougal; 2, Mr. R. Moffat. Best *Bouquet*, 1, Mr. G. Laidler; 2, Mr. G. Blair. Sweepstakes for the greatest variety of *Roses*, Mr. J. Hood. Besides those above, a prize was awarded to Mr. J. Bell, for a collection of *Pansies*, *Mimuluses*, *Roses*, *Trumpet Honeysuckle*, and six *Seedling Pansies* which promise to be superior flowers.—*Kelso Chronicle*.

Cambridgeshire Horticultural Society, July 19.—The following prizes were awarded on this occasion: *Melon for flavour*, Hampton Court, Messrs. Hudson. *Bunch of Black Grapes*, Black Hambro', Mr. Stewart; 2, Mr. Catling. *Bunch of White Grapes*, Frontignan, Mr. Stewart. *Peaches*, 6 best, Noblesse, and Nectarines, 6 best, Mr. Stewart. *Cherries for flavour*, May Duke, Mr. Giddings; 2, Bigarreau, Messrs. Hudson. *Raspberries*, Mr. J. Taylor; 2, Antwerp, Mr. Widnall. *Red Gooseberries*, for weight, 12 to the lb, Mr. Giddings; 2, 13 to the lb, Mr. J. Taylor; *White do.* 13 to the lb, Mr. Giddings; 2, *White Eagle*, 14 to the lb, Mr. Newman; *Yellow do.* 13 to the lb, Mr. Giddings; 2, 15 to the lb, Mr. Newman; *Green do.* 15 to the lb, Mr. Giddings. *Heaviest Gooseberry*, weight 25 dwts 12 grs, Mr. Giddings; 2, weight 24 dwts, 3 grs, Companion, Mr. H. Green. *Gooseberries for flavour*, Champaign, Messrs. Hudson; 2, Mr. H. Green. *Red Currants*, for weight, 23 bunches to the lb, Mr. Wood; 2, 25 bunches to the lb, Mr. Giddings; *White do.* 18 bunches to the lb, Mr. Giddings; 2, 3 bunches to the lb, Mr. H. Green. *Carnations* (Medal), Garratt's Queen of *Roses*, William IV., Wood's Mogul, Willmer's Solander, and Fletcher's Red Rover, Mr. Wood; 2, Wood's William IV., Walmesley's William IV., Lascelles' Queen of *Sheba*, Sir G. Crewe, Prince Albert, Mr. Giddings; 3, Twitchett's Don John, Holmes' Count Paulina, Twitchett's Queen of *Scarlets*, Lowe's Marchioness of Westminster, Mansley's Beauty of Woodhouse, Mr. Twitchett. *Seedling Carnation*, Mr. Wood. *Six Picotees*, John's Prince Albert, Martin's Victoria, Giddens' Diana, Seedling, Wood's Manfred, Mr. Wood; 2, Sharp's Gem, Brinkler's Masterpiece, Giddens' Sir Robt. Peel, Brinkler's Lady Emily, Sharp's Delicate, Sharp's Defender, Mr. Twitchett; 3, Sir R. Peel, Vespasian, and 4 Seedlings, Mr. Giddens. *Seedling Picotee*, Mr. Wood. *Six Dahlias*, Argo, Unique, La Grande Baudine, Beauty of the Plain, Lady Glentworth, Garrick, Messrs. Hudson; 2, Eclipse, Rival Sussex, Pickwick, Ruby, Argo, Wheeler's Maria, Mr. Ready. *Three Balsams*, Mr. H. Green; 2, Messrs. Hudson. *Cockscomb*, Messrs. Hudson; 2, Mr. Newman. *Plant in a pot*, *Achimenes longiflora*, Mr. Widnall; 2, Mr. H. Green. *Best large collection of Plants*, Mr. Widnall; 2, Mr. H. Green. *Best small collection of Plants*, Messrs. Hudson. *Collection of Cut Flowers*, Mr. Ready; 2, Mr. H. Green. *Two Lettuces*, Mr. J. Taylor; 2, Mr. Potter. *EXTRA PRIZES*.—*Basket of Vegetables*, Mr. Newman; *Do.*, Messrs. Hudson. *Strawberries*, Elton Pine, Mr. Newman. *Rhubarb*, Mr. J. Taylor. *Pansies*, Mr. Widnall.—*Cambridge Advertiser*.

Diss Horticultural Society, July 27.—The Third Show was not quite so numerously attended as the last. The display of plants was superior, some beautiful specimens of them being from the gardens of Sir J. Flower, the Rev. B. Penning, and G. St. V. Wilson, Esq. We also observed some fine Grapes and Nectarines shown by the latter gentleman. The following is a list of the prizes awarded:—Best 4 *Cockscombs*, G. St. V. Wilson, Esq. *Best German Stocks*, Rev. T. Frere. *Best tender and Hardy Bouquets*, G. St. V. Wilson, Esq. *Best Paeonies*, Rev. T. Frere. *Best Verbenas*, 1, Mr. Barker; 2, Rev. B. Penning. *Best Petunia*, 1, Rev. C. H. Browne; 2, Mr. Barkway. *Best Greenhouse Plants*, Rev. B. Penning. *Best Thunbergia alata* and *Dracæa*, Sir J. Flower. *Best Fuchsia*, Mr. Barkway. *Best Seedlings*, Mr. Barker. *Second best Greenhouse Plants*, Mr. Ship. *Best mixed Bouquet*, Miss Harrison. 36 *Wild flowers*, 1, Mr. A. Cockell; 2, Rev. C. H. Browne. *Best Grapes*, G. St. V. Wilson, Esq. *Best Gooseberries*, 1, Rev. C. H. Browne; 2, Mr. P. Gould. *Best Cucumber*, 1, Rev. R. Cobbold; 2, Rev. T. Frere. *Best Celery*, 1, Sir J. Flower; 2, Miss Harrison. *Best Nectarine*, *Cherries*, &c., G. St. V. Wilson, Esq. *Best Currants*, Rev. T. Frere. *Best Raspberries*, Mr. Barkway. *Collection of Vegetables*, Sir J. Flower. Upwards of 40 prizes were distributed amongst the cottagers.—*Norfolk Chronicle*.

Felton Florists' Society, July 17.—The florists of Felton and its vicinity held their annual show of *Ranunculuses* and *Pansies*, at Mr. Appleby's, the North Briton Inn, when prizes were awarded to the following gentlemen, viz. —*Ranunculuses* (variegated).—The 1st and 2d to Mr. W. Harrison, with *La Singulière* and *Mélange des Beautés*; 3d, 4th, and 5th, to Mr. A. Gowens, with *scarlet and gold stripe*, *Suprema*, and *Grand Berger*; and 6th, to the Rev. J. Orrell, with *Louis XVI*. *Selves* the 1st, 2d, 3d, and 4th, to Mr. A. Gowens, with *Nabat*, *Brabançon*, *Cleopatra*, and *Variat*; and 5th and 6th, to Mr. R. Richardson, with *Theodine* and *Quaker Lady*. *Pansies*, 1st to Mr. Riddell, with the *best pan of 6 dissimilar Blooms*, consisting of *Black Diamond*, *Grand Vizier*, *Midas*, and three *Seedlings*; 2d, to Mr. J. Jeffrey, with *Wonder of the World*, *Midas*, *Oberon*, *Mulberry*, *Isabella*, and *Pilot*; 3d, to Mr. Riddell, with *Midas*, *Eclipse*, *Wonder*, *Victoria*, *Isabella*, and a *seedling*; 4th, to Mr. Jeffrey, with *Mulberry* and 5 *Seedlings*; 5th, to Mr. Riddell, with *Eclipse*, *Pilot*, *Invincible*, *Hercules*, and two *Seedlings*. The *Seedling prize* was awarded to Mr. J. Jeffrey, for the best single *Seedling Pansy*, which was named Jeffrey's Sampson. A number of beautiful *Stocks* was also exhibited by Mr. Burn, gr to C. W. Bigge, Esq., but as there was no competition, no prize could be awarded, according to the rules. The table of flowers was full and fine; many of the *Ranunculuses* were in fine condition, while the *Pansies* as usual were almost innumerable, and attracted general admiration.

Roarburghshire Horticultural Society, July 12.—This meeting was held within the Spread Eagle Assembly-room, Jedburgh, when prizes were awarded as follows:—For the best six *Pinks*, 1, Mr. A. Hunter; 2, Mr. G. Taylor, gr to G. Broad, Esq. For the best nine varieties of *Garden Rose*, Mr. W. Deans, for Clifton White Moss, Blush Moss, Red Moss Provins, Village Maid, Grand Purple, Red Provins, Champion, Dark Tuscany, and Las Casas; 2, Mr. D. Crichton, gr to the Earl of Minto, for Red Moss Provins, Unique, *Ranunculoides*, Bush Moss, La Belgique, Aragon, Provins, L'Antiope, and York and Lancaster. For the best six *Pelargoniums*, Mr. W. Deans, for Joan of Arc, Garth's Perfection, Climax, Dennis's Perfection, Speculum Mundi, and Deans's William, a seedling of 1842; 2, Mr. T. Weir, gr to W. O. Rutherford, Esq., for Coronation, Masterpiece, Gaiety, Victory, Life Guardsman, Foster's roseum, and Grand Duke. For the best three heads of *Cauliflower*, Mr. G. Taylor. For the best six *Calceolarias*, Mr. Crichton. From the lateness of the season, there was no competition for several of the articles, such as *Strawberries*, *Melons*, &c. There were a number of articles presented to this meeting, the principal of which were by Mr. Crichton, of Minto; some fine blooms of *Cactus*, *Passiflora*

cærulea, and *Clématis Sieboldi*. By Mr. Weir, a large collection of cut *Pelargoniums*, specimens of *Alstrœmeria pelegriana*, *Polygala oppositifolia*, *Swanonia alba* and *purpurea*. By Mr. Deans, 12 *Seedling Pelargoniums*, some of which were very attractive; cut *Roses*, *Seedling Calceolarias*, a card of *Fuchsias*, including *Deansia*, *nobilis*, *La Grande*, *corymbiflora*, *Victoria regina*, *effusa*, *fasciculata*, *recurva*, &c. Also, from the garden of Mr. W. Veitch, two cards of fine *Pinks*.—*Kelso Chronicle*.

Vale of Evesham Horticultural and Floral Society, July 23.—At the Fourth Exhibition the following prizes were awarded:—*CARNATIONS*.—*Scarlet Bizarre*, 1, Walmesley's William IV.; 2, Fletcher's Duke of Devonshire, W. Barnes, Esq.; 3, Hepworth's Leader, Mr. Holmes. *Crimson Bizarre*, 1, Holmes's Count Paulina; 2, Cartwright's Rainbow; 3, Jarrett's Lucretia, W. Barnes, Esq. *Purple Flakes*: 1, Holmes's Mary Ann; 2, Brabbin's Squire Magnell; 3, Elliott's British Queen, Mr. Holmes. *Scarlet Flakes*: 1, Gummery's Brilliant; 2, Orson's Rob Roy, W. Barnes, Esq.; 3, Simpson's Marquess of Granby, Mr. Holmes. *Rose Flakes*: 1, Brown's Duchess of Gloucester, W. Barnes, Esq.; 2, Smith's Coronation, Mr. Holmes; 3, Malpas's Lady Grey, W. Barnes, Esq. *Red Picotees*: 1, Heart's Admiral Southam, Mr. Holmes; 2, Unknown, Mr. Clark; 3, Graham's Duke of Leeds, Mr. Holmes. *Purple Picotees*: 1, Kettland's Queen Victoria, Mr. Holmes; 2, Major Kealy, W. Barnes, Esq.; 3, Unknown, Mr. Clark. *BEST DEVICE IN FLOWERS*, a *Pheasant*, Miss Huntley. *PANSIES*, Rev. J. Marshall. *DAHLIAS*, 1, rosea, Mr. R. Francis; 2, Metella; 3, Egyptian Prince, Mr. Clark; 4, Sussex Rival, Miss Huntley; 5, Seedling, Mr. R. Francis; 6, Phenomenon, Mr. Clark. *BALSAMS*, *Purple Flake*, J. Clarke, Esq.; *Scarlet Flake*, Mr. Clark. *THREE OR GREENHOUSE PLANTS*, 1, 2, and 3, Mr. Clark. *HARDY ANNUALS*, Mr. Moore. *PERENNIALS*, 1, Miss Huntley; 2, Mr. Clark. *COCKSCOMBS*, Miss Huntley. *HEAVILST SIX GOOSEBERRIES*, *Red*, 1 and 2, Mr. Pinnell; *Green*, 1, Mr. Randall; 2, J. B. Haynes, Esq.; *Yellow*, 1 and 2, Mr. Pinnell; *White*, 1, Mrs. Ashwin; 2, R. Ashwin, Esq. *GRAPES*, *Black*, E. Rudge, Esq.; *White*, Mr. Pinnell. *MELON*, E. Rudge, Esq. *CUCUMBERS*, Miss Huntley. *DESERT APPLES*, 1, Mr. Z. Hughes; 2, T. White, Esq. *PEARS*, 1, Mr. H. Drury; 2, Mrs. Ashwin. *RASPBERRIES*, *Red*, Mr. E. Haines; *White*, Mr. H. Drury. *CHERRIES*, *Black*, Miss Huntley; *White*, Rev. W. Digby. *EXTRA PRIZES*.—*Collection of Fuchsias*, Mr. Clark; *Purple Hydrangea*, Mrs. Ashwin; *Dish of Marygold*, Mr. R. Francis; *Peas*, Mr. Randall; *Carnation*, 1, Mr. Holmes; 2, W. Barnes, Esq.; *New White Verbena*, Princess Royal, Mr. Clark.—*Worcester Herald*.

Wexford Horticultural Society, July 29.—The Summer Exhibition took place in the Assembly Rooms. The specimens were beautifully prepared by the Proprietors, and in the arrangements also a refined taste was displayed, a manifest improvement on former exhibitions. The following prizes were awarded:—*FLOWERS*.—*Exotics*, W. Bolton, Esq. *Ericas*, G. LeHunte, Esq. *Hardy Herbaceous Plants*, W. Bolton, Esq. *Calceolarias*, W. Bolton, Esq. *Pelargoniums*, 1, J. Rowe, Esq.; 2, W. Bolton, Esq. *Seedling*, H. Cooper, Esq. *Pansies*, R. Donovan, Esq. *Seedling*, B. Allen, Esq. *Annual Flowers*, W. Bolton, Esq. *Picotees*, J. W. Goff, Esq. *Ornamental Bouquet*, W. Bolton, Esq. *Ornamental Exotic Plant*, G. LeHunte, Esq. *Fuchsias*, G. LeHunte, Esq. *Ornamental Plants*, J. Rowe, Esq. *VEGETABLES*.—*Cauliflowers*, Peas, Kidney Beans, Turnips, Celery, *White and Red*, A. I. Meadows, Esq. *Beans*, J. Nunn, Esq. *Lettuce*, W. Bolton, Esq. *Carrots*, J. W. Goff, Esq. *Cabbage*, J. Rowe, Esq. *FRUITS*.—*Melons* (*Green Flesh*), J. Rowe, Esq. *Ditto* (*Scarlet Flesh*), G. LeHunte, Esq. *Grapes* (*Black*), W. Bolton, Esq. *Peaches*, W. Bolton, Esq. *Nectarines*, W. Bolton, Esq. *Cherries*, W. Bolton, Esq. *Gooseberries* (*Green*), R. Donovan, Esq. *Red*, H. Cooper, Esq. *White*, H. Cooper, Esq. *Currants* (*White*), H. Cooper, Esq. *Red*, J. W. Goff, Esq. *Raspberries*, R. Allen, Esq. *Strawberries*, J. W. Goff, Esq. *Cucumbers*, W. Bolton, Esq. *Second Ditto*, G. LeHunte, Esq. *Exotic Fruit*, G. LeHunte, Esq.—*Wexford Conservative*.

[We hope to be able to make up all our arrears of Country Shows next week.]

NOTICES OF NEW PLANTS WHICH ARE EITHER USEFUL OR ORNAMENTAL.

SCUTELLARIA JAPONICA. Japan Skullcap. (*Frame Herbaceous Plant*). Labiate. Didymia Gymnospermia.—This is one of those pleasing little plants which grow only four or five inches in height, are of a partially trailing character, and bear a profusion of showy blossoms throughout the whole summer. The blossoms are produced in comparatively large spikes, at the end of the principal or lateral branches, and besides being of a handsome blue tint, are prettily spotted in the throat. They are somewhat like those of a delightful little plant which is so common on our hedge-banks, and is therefore scarcely noticed—the Ground Ivy; only they have a much longer tube, and are arranged with greater effect. As its name asserts, it is a Japan plant, and has been in the nursery of Messrs. Rollison, Tooting, for three or four years. It is probably one of the many plants brought to light by Dr. Siebold, during his travels in Japan. From its native country the probability is, that it will be found hardy enough to endure our winters. At Messrs. Rollison's it has been treated as a frame plant, and grown in a pot, amongst Alpines and such-like species, being exposed through the summer months, and merely placed in a cold pit during winter. It is an excellent plant for mixing with a potted collection of Alpines, being of small dimensions, great beauty, a most liberal bloomer, lasting in flower a great length of time, and having blue blossoms, which are not very common in that class. It may also be cultivated with extreme ease, not being at all delicate, and simply requiring the commonest soil. As a border plant, however, it will attain to a higher perfection than in a pot, and may possibly prove useful for planting in beds or patches. These it would cover with bloom throughout the summer. It can be increased by cuttings or by division; or, if a small portion of earth is drawn up around the partially trailing shoots, so as almost or wholly to cover them at the bottom, these will most likely root in the manner of *Verbenas*, and may afterwards be taken off. It will be desirable to test its hardiness by leaving a plant or two exposed in the following winter.—*Paton's Magazine of Botany*.

BIGNONIA PICTA. Streaky-blossomed Trumpet-flower. (*Greenhouse Climber*). Bignoniaceæ. Didymia Angiospermia.—This handsome species has, we find, been in British collections since the year 1823; but, like many of its allies, it is so shy in developing its flowers, that several who have cultivated it for some years have never seen a blossom. Plants at Messrs. Rollison's, however, perfected some blossoms last year in a stove; and the same specimens have flowered again in the present season. The plant is by no means of a rambling habit, for, although its branches extend to a considerable length, it is so well clothed with evergreen foliage as to present, at all times, an agreeable appearance. The flowers seem to come out in pairs, towards the upper ends of the shoots, and are individually of a large size, being almost three inches in breadth. They are of a deep lilac or purplish colour, with a whitish throat, and many streaks of a darker tint throughout. Although, when improperly managed, it is next to impossible to get *B. picta* to bloom; yet if rightly grown, and suffered to reach maturity before it is expected to flower, it blossoms freely enough. Either a warm greenhouse or a cool stove will suit it. Still, it is perhaps the best plan to keep it in an intermediate house, or a kind of close conservatory. In such a situation, it only needs to be placed in soil that is not shaded, or liable to be saturated with moisture, or too far from the glass, or very deep, or imperfectly drained, and it will speedily arrive at a flowering condition. But, when it has grown sufficiently large to be capable of bearing flowers, the great point with it, as with others of the genus, is to refrain from pruning it, and let the branches take their natural course, unless they become too straggling. Under such management it will not fail to flower; and it matters little whether it be planted in a pot or in a bed of earth. The com-

post suitable for it is quite an ordinary one, such as any mixture of peat mould and loam, in which the latter constitutes the main part of the soil. About May or June is the fittest season for propagating it, and it should be raised from cuttings, which will need bottom-heat to start them.—*Paton's Magazine of Botany*.

MISCELLANEOUS.

Mushrooms.—We have lately received the 6th Number of "The Transactions of the Gardeners' and Stewards' Provident and Mutual Instruction Society of Ireland;" from which we extract the following useful remarks by Mr. E. Owens, upon the cultivation of the Mushroom. "I have grown Mushrooms in the open ground, in the following way:—Having opened trenches twelve inches deep and twenty-four wide, and filled them with half rotten dung, previously prepared by frequent turning, I cut from a pasture-field sods four inches deep, and six inches broad, placing the spawn about the size of a walnut, twelve inches by six inches apart in the dung in the trenches, and the sods over the dung on their sides, covering all with maiden mould, about four inches in depth. I had most abundant crops of Mushrooms—at the season they naturally appear in the pasture-fields—and even for this period the plan is well worth a trial. These beds may be made in March and August, and, if dry weather, they should have occasional waterings. In very wet weather I placed hoops over the beds, and covered them with dry litter or mats. If the spawn grows, there will be Mushrooms in about six weeks from the time of planting. From the uncertainty of obtaining good crops of Mushrooms in the open air, I give the preference to house culture, and have found the following mode of cultivating most certain:—stable dung being one of the most necessary agents, should be prepared for that purpose by frequent turning, so as to let off what we term the steam heat, and should never be allowed to get what is termed a burning heat; in fact the frequent turnings prevent and counteract this. An open shed is the most proper place to prepare the dung. The Mushroom-house should be 14 feet wide and 30 feet long, constructed with slide windows, a door at each end, and a boarded passage 4 feet high running along the whole length of the house. The space from the boarded passage to the wall is to contain the prepared dung for the beds, with three divisions in them from the wall to the boards, so that when correctly formed, there will be six beds, three at each side, each 10 feet long and 6 feet wide. The beds are to have a sloping direction, so as to be only 2 feet deep at the walls of the house. The best seasons for forming the beds are spring and autumn, and then in succession every month—not all at the same period. We commence with the first bed, and after the violent heating has subsided, place the Mushroom spawn in it, just under the surface, about the size of a walnut, in rows 1 foot asunder and 6 inches apart; after which, the bed is struck down by the back of a spade, and covered with 3 inches of fresh maiden mould. Dry hay is then placed over all, about 12 inches deep, and left so for one month; at which time the spawn will have sufficiently run through the surface of the bed. We then strip off the hay, and give a copious watering from the fine rose of a water-pot. In a few days after, the Mushrooms will appear in abundance, and should be taken off while young, as, if left, they are liable to be infected by insects. The beds we have been describing will continue to bear from one month from the time the Mushrooms first appear; at which time the second bed will be coming into bearing; and so on for the six beds. As each bed ceases to bear, the earth on the surface should be removed, by which operation the thread-like substances that bore the crop will be cut down to the crowns of the spawn in the dung. When the beds are dry, a layer of the same sort of material that they were originally formed of, should be laid on them four inches deep, and over this maiden mould must be placed as before described. This done, a lining of fresh horse-dung is placed in the passage, so as to cause the plants to grow and the beds again to bear. By this mode of house culture, and from beds so constructed, a constant supply of Mushrooms may be had during the year.

More Orchidaceæ for Sale.—A further sale of Guatemala epiphytes is announced, and we are able to state that it will include some extraordinarily fine specimens of the rarer Guatemala species. In addition to *Barkeria spectabilis*, there are large masses of *Lælia superbiens*, *Odontoglossums*, *Epidendrums*, a *Cattleya*-like plant, and *Oncidium sphacelatum*; all in perfectly good order.

Reviews.

Dr. Justus Liebig, in his Relation to Vegetable Physiology. By Dr. Hugo Mohl. (Dr. Justus Liebig's Verhältniss zur Pflanzen-Physiologie.) Tübingen. Frues. 1843.

(Continued from page 576.)

In the second chapter (*Origin and Nature of Humus*) Liebig states, that vegetable matter is successively changed by decomposition into humus, and that it constantly forms carbonic acid with the oxygen of the atmospheric air; all which forms a constant source of nourishment for plants, which decompose both the carbonic acid taken up by the roots, and that obtained by the leaves from the air. This, says Dr. Mohl, was known long ago. New, however, most certainly, is the argumentation by which L. intends to prove (p. 56) that humus is unnecessary, and that plants derive their food exclusively from the atmosphere. In corroboration thereof, he adduces the antediluvian and tropical vegetation, and says of the former, that its gigantic Palms, Gramineæ (sic!), and Ferns, could dispense altogether with soil, on account of the immense development of their foliage, as they are also distinguished from those of the present world by their scanty roots. L. says further, that in hot climates the succulent plants

scrupulously. Little bits of weeds, shrivelled and broken, crowded together in Post-office covers, and florists' flowers, actually load our table. We have repeatedly declined naming florists' flowers, which are always sold with their names, and the latter should be taken care of.

GUANO.—*Lapis.*—Both the imported and Potter's Guano are excellent manures for meadow-land; but the first can only be employed in wet weather. Why not dress half your land with one and half with the other? There is no great difference in the price. One great advantage of Potter's over Peruvian Guano is that it is of uniform quality, which the latter cannot very well be.

SOOT.—*Herbert.*—This is a very good ingredient for mixing with compost heaps in moderate proportions.

BONE-DUST.—*A Subscriber* will find information by consulting our columns of Advertisements.

HEATING.—*An Inquirer.*—It matters little what the size of a boiler is; the smaller it is the faster the water will heat—the larger it is the longer will the heat be retained when procured. A boiler with two or three gallons of water will be ample for the houses you describe.—*N. N.*—You will find the meaning of hot-water gutters explained in the papers on the tank system of heating. They may be formed of old flues well rendered with cement inside, or of semi-cylindrical draining-tiles, covered with slates or flue tiles, in both cases connected with a boiler. We shall soon explain the matter more fully. Vines succeed perfectly under curvilinear iron roofs.—*G. C.*—The quantity of pipe you will require depends on the size of your room, and other circumstances; about that we cannot very well advise you. Pipes are much used in the form of coils where local circumstances render straight pipes inconvenient. A whole house may be heated by a kitchen fire, if the apparatus is well managed. It is impossible to give prices; everybody must ascertain that for himself. There are plenty of advertisements showing where to apply.—*J. B. H.*—We do not remember to what you allude. Water-gutters for bottom-heat are now making very generally near London, by rendering the inside of old flues, reduced to half their depth, with good cement; and this seems to stand. Perhaps, if you do not find to-day what you want, you will repeat your question early next week.

BOILERS.—*A. B.*—We have no personal experience in the use of the boiler you mention, but we understand it to be a good one, and, in fact, one is about to be applied to some tank heating in the garden of the Horticultural Society.

BRECH-TREES.—*W. R.*—It is very difficult to form an opinion respecting your trees; but if some do well and others do ill in the same ground, there must be some mischief at the roots of those which suffer. We would suggest to you to examine the roots of those which are sickly, and ascertain whether they have not got into some place where water cannot reach them in sufficient quantity. All the symptoms mentioned by you are those of drought.

NELUMBIUM.—*Khan.*—We do not know where seeds of *Nelumbium speciosum* can be procured.

SEEDLING CACTI.—*Gerarde.*—If your Cactus has really the habit of *Jenkinsonii* it must be a good thing; for the flowers are like those of a large and handsome *speciosus*. Much of its value will depend on its habit; so far as the flowers go, they are very fine. We should be thankful for a cutting, addressed to 21, Regent-street, London.

HEATHS.—*H. T. S.* writes that his "Heaths are much infested with the Scab and Mildew; that some of the varieties of *R. ventricosa* and *vestita* are covered with what looks very like grains of sand, and of an adhesive nature, and that his *Epacris*, which had been potted for two months and never suffered to get dry, frequently droop as if they wanted water, which makes his spirits droop, as he expects every time will be their last. For this catalogue of ills he very naturally wishes to know the causes, so that in future he may guard against them." From what can be gleaned from *H. T. S.*'s note, I should say his management of Heaths is radically bad, and the fact of his being guided in his management by Mr. Macnab's treatise confirms me in this opinion, for however excellent the treatment recommended in that work may be for the locality in which it was written or other places similarly situated, it is well known to practical men that for a guide-book in the management of Heaths it is calculated to do more harm than good. I have not time to state the why and wherefore of this assertion at present, but at some more leisure opportunity I may state my reasons in full. Now the preventive for these diseases may be stated in one sentence, viz., keep your plants clean, water regularly and ventilate freely, for diseases in Heaths are more frequently induced by neglecting to do these things properly than by any other cause; as if they are not freely ventilated, they are sure to become mildewed, and if you allow them to be covered with dead flowers, heavy dew and dust, you place them under the most favourable circumstances possible for the generation and propagation of all the insects that plants are subject to. The Scale which *H. T. S.* speaks of is no doubt some species of scale insect, which has been very troublesome in many collections this season, probably owing to the unusually cold spring, diminished light, and slow growth consequent upon it, and the substance which looks like adhesive sand is, I suspect, the young brood of insects before they have formed their covering scale. If the plants are not much infested, they may be cleaned by washing them repeatedly with warm soap-suds, but if they are very bad throw them away, as the probability is you will kill the plants before you clear them of the scale. Mildew is engendered by a damp atmosphere and bad ventilation, and may be eradicated by sprinkling the plants and dusting them with sulphur once a week as long as there is a speck of mildew upon them. You must, however, persevere or you will not conquer. The drooping of *Epacris* under a bright sun, when growing freely, is not an unusual occurrence, and the remedy is a slight shade at those times. *W. P. A.*

ROSES.—*H. W. B.*—Choose your scions in February and graft in March.—*A Subscriber* may bid her white Banksian with the following:—Bennet's Seedling, Laure Davoust, Banksia-flora, Donna Maria, and Rampant.

PELARGONIUMS.—*Herbert.*—It is most advantageous to sow the seed of *Pelargoniums* as soon as it is ripe.

FUCHSIA.—*J. B.*—The flower sent is merely two blooms growing together; it is not unfrequent on the variety called *Majestica*, of which sort your flower is a specimen.

DAHLIAS.—*D. D.*—The following 12 Dahlias, for variety and first-rate properties, will form an excellent stand, if you can manage to have them all in fine condition on the day of exhibition.—*Essex Triumph*, *Mrs. Shelley*, *Maria*, *Dodd's Prince of Wales*, *Bragg's Antagonist*, *Bedford Surprise*, *Hudson's Princess Royal*, *Dowager Lady Cowper*, *Phenomenon*, *Widnall's Queen*, *Springfield Rival*, *Indispensable*, and *Lee's Bloomersbury*.

PROPERTIES OF THE DAHLIA.—*J. B. M. II.*—Have the goodness to refer to p. 87 of the present vol. of the *Gardeners' Chronicle*; you will there find the properties of the Dahlia laid down by Mr. Wildman, and sanctioned by the Floricultural Society of London. Your suggestion will be attended to.

PEACH TREES.—*Rambler.*—You may root-prune your rampant Peach tree now with advantage; taking off the ends of the strong roots which run in a downward direction, where you can reach them, and interfering but little with those which lie near the surface of the ground.

STRAWBERRIES.—*Rambler* would be obliged if any correspondent who has the 2d edition of "Haynes on the Strawberry," &c. would give H.'s plan of growing Currants, as to soil, pruning, time of planting, distance, &c. He has H.'s 1st edition, but has been unable to procure the 2d, to which the Currant is added.—*D. Z.*—One of the first duties of a gardener is civility—of a discussor is to be fair—of a writer is to be intel-

ligible. When you have become aware of the importance of these little regulations we shall be happy to insert your correspondence; but till then you must excuse us.—*J. M. P.*—All runners may fruit in the autumn of the year they are planted, and Alpine Strawberries will fruit the first year they are sown.

FIGS.—*Freston.*—For the back wall of a vinery, you cannot have a better variety than the Brown Turkey. If Fig-trees are kept in a healthy state they will not be subject to red spider. Should this pest, however, commence an attack, it may be subdued by syringing and sponging the foliage, and by frequently diffusing flowers of sulphur with a bellows throughout the air of the house.

POTATOES.—*Rambler.*—The best way of preserving seed Potatoes of early kinds is to store them away in pits surrounded with straw and earth. We think that greening would be no advantage.—*Oudwos.*—If you now plant sets of the Early Manly, or any other good early Potato grown in 1842, and lay a sufficient thickness of litter between the rows before the approach of frost, they will afford you young Potatoes early in winter. You may try a succession of the same sorts from tubers of this year's growth exposed to the sun and air, and planted next month; but your success will greatly depend on the mildness of the season. Were you to plant the sets in pots, you could move the plants under shelter when such is requisite.

LETTUCES.—*T. G. Crediton.*—Now is the time to sow, for standing the winter, the Hardy Hammersmith and Brown Dutch Cabbage Lettuce; also some of the Brown Cos, if good shelter can be afforded.

TOBACCO.—*Herbert.*—There is no law to prevent anyone from growing Tobacco for his own use in England.

INSECTS.—In the last week's *Chronicle*, "Answers to Correspondents—Insects," *Papilio savius* was printed for *Papilionarius*.—*W. H. Rogers, Shirley.*—We are obliged to you for forwarding the moths, the species of which we cannot, however, positively determine, as every specimen was so rubbed that not a scale remained upon the wings. We presume the species is *Tinea vestianella*. The moths deposit their eggs soon after they leave the chrysalis, on substances upon which the larvae feed; and you should do all you can to destroy the insect in the larva or chrysalis state, to prevent a deposit of eggs. If you follow up the suggestions we gave you some time since, we expect you will not be much troubled with these moths another season. The small black beetle which you mention, something the shape and size of a large flea, we suppose to be a *Haltica*. To prevent the injury it causes to the buds of the Peach and Pear trees, when they are just shooting, we recommend you to syringe the trees with a mixture of 1-10th gas-liquor and 9-10ths water. This should be done at the time the attacks take place.

BOOKS.—*R. L.*—The books you inquire about are not translated into English.—*J. M. P.*—The books you name are useful; but *Vegetable Physiology* has advanced a good deal since their publication.

GARDEN WALKS.—*A Subscriber.*—The mode recommended for forming garden-walks, at p. 379 of last year's *Chronicle*, is as follows:—Procure a quantity of road-sand, or similar powdery material; let it be thoroughly dried, so as to feel like dust when handled. Sift out of the cinders from the dwelling-house, or the stove-hole, the finer parts, and let that, too, be made perfectly dry. Then mix the materials carefully, in the proportion of two parts of road-sand to one part of cinder-siftings. Next provide an iron cauldron in which coal-tar can be made boiling hot. In a dry place, on a dry day, spread a quantity of the sand and cinder-ashes on the ground, as a bricklayer spreads his lime, making it hollow in the middle, and into that hollow pour the hot tar; then, with a shovel, incorporate the whole, as in the operation of making mortar. When a stiff paste has been thus formed, let it be spread over the ground with a spade, to the thickness of three or four inches, which must be beaten firm and made as level as possible. Then powder it all over with dry and rather coarse sand, after which a few passages of the roller will press it level, and the work is finished.

PROTECTIONS.—*H. C.*—If your light, six feet by three, with quarter-inch laths, is merely to be used for the purpose of wintering half-hardy things, such as *Fuchsias*, in large pots, *Verbenas*, *Carnations*, &c., and in the summer to be placed in front of a Vine against a south wall, a sufficient slope for the glass to avoid drip in the winter will be 9 inches in front and 18 inches at back, i. e., one deal in front and two at back. The frame will be of use to the hardy Vine, if it is put on in the month of March. You ought to water the ground inside the frame of an evening, so as to raise a dew on the foliage when the plant is leafing; but you should diminish it while the flowers are setting, and discontinue it when the fruit is ripening. Ventilation must be provided by some means of raising the frame from below, so as to admit a free circulation of air.

ICHTHOSE.—*A Subscriber* will find a plan, with directions, at p. 6 of last year's *Chronicle*.—*A Subscriber.*—We are not aware that we can add anything to the information on this subject contained in our volume for 1842. The Index of it will refer you to the passages we mean. If, after looking them through, you will be so good as to say on what point you want further information, we will endeavour to supply it.

WARD'S CASES.—*J. H.*—We must refer you, for the information you seek, to Mr. Ward's pamphlet on this subject, and to previous papers in our columns, especially in 1842. We see no advantage in watering plants with fresh animal gelatine; in that state it will not act; when it becomes putrid it will be useful in the same way as other decaying animal matter.

PICTURE-CLEANING.—*C. C.*—A has a flower-painting which requires cleaning; the following process can be recommended as a perfectly safe one.—Moisten a portion of the surface of your painting, about the size of the palm of the hand, with saliva or tepid water; rub this about with your fingers a short time, then with a piece of fine flannel or wash-leather rub the place till it is quite dry. This process you must repeat while you perceive the flannel or leather gets discoloured by the operation. If it be your intention to varnish the picture, after cleaning its surface as above described, get some whiting, put a portion of it in the palm of your hand, and moisten it well with water; rub it about with your fingers, to ascertain if it be free from particles of grit, that might injure the surface of the picture; when assured of this, apply it to the painting, and cover its entire surface, rubbing it gently about; remove it with a sponge or soft cloth, and let it remain till next day; by this process every particle of a greasy nature will be displaced, and the picture will be in an excellent state for a coat of varnish. This should be done on a dry day, using mastic varnish, with a few drops of drying oil. This is a harmless process, whereas alkalies or other strong liquids, frequently used for the purpose, destroy the integrity of a picture, by removing or injuring the delicate glazings, which can never be restored. *F.*

CHURNS.—*A. B.*—Although we have one of Atwood, Wimble, and Warners' Churns, we have not had sufficient experience of it to give a decided opinion. The principle is good: to heat the cream in winter to 60°, and to cool it in summer to 55°. By the help of a little ice this may be done in the warmest weather; but not having an ice-house we could not get it sufficiently cool this hot weather. They are not expensive, and for a small dairy may probably do well: on the whole, we prefer the old plunge churns, and think the butter comes more readily in them. *M.*

MISCELLANEOUS.—*H. C.*—We cannot assist you with advertisers. It is for those who have articles for sale to make the fact known, and to state their prices; not for us. If they do not they must be content to lose the sale of their commodities. We think what you inquire about has been advertised.—*A Subscriber.*—1, *Lysimachia quadrifolia*; 2, *Melilotus leucantha*.—*J. F.*—*Serissa foetida*.—*Sarah* had better apply for rare

African *Gladioli*, &c. to M. Villet, Nurseryman, Cape Town, Cape of Good Hope.—*H. W. B.*—Any Fellow of the Horticultural Society can give you an order of admission to the Garden.—*The Wife of a Subscriber's* letter is forwarded to our correspondent, "M."—*P. R. W.*—The Botanical name of Chicory is *Cichorium Intybus*.—*J. J. G.*—*Acacia dealbata*.—*Elizabeth.*—1, *Solanum pseudo capsicum*; 2, *Acacia melanoxylon*; 3, *Acacia*, not yet published.—*Hutfield.*—*Diplotaxis tenuifolia* and a *Melissa*, near *M. grandiflora*, but apparently different in its smaller flowers.—*T. B.*—1, *Abroma augustum*; 2, *Pterospermum lanceaefolium*; 3, *Cleome rosea*.—*A Gipsy.*—1, *Statice Limonium*; 2, *S. latifolia*.—*E. S.*—*A. Solanum*, allied to *S. carolinianum*.—*F. M. P.*—*Galeopsis Ladanum*. *Circæa lutea* has white flowers. *Dianthus armeria*. *Hieracium sylvaticum*. *Manettia coccinea* is a Cinchonaceous plant from Brazil.—*Florin.*—No. 4 seems the real *A. vulgaris*, or *Florin*; the others are certainly *A. vulgaris*. None are worth cultivation where better grasses will grow.—*A Striver.*—We are sorry to hear of your ill-success; you had better, the next time, desire your notice to be placed clear of the stamp, when you send it to our publisher. Your plant is *Urtica penduliflora*, or some species nearly allied to it.—*J. M. K.*—1, *Narthecium ossifragum*; 2, *Anagallis tenella*; 3, *Empetrum nigrum*.—*E. J.*—Give your seeds a good bottom-heat.—*Ryall Hill.*—Thanks.

SEEDLING FLORISTS' FLOWERS.

CALCEOLARIAS.—*Robt. Bright.*—Your Seedling is a beautiful variety, of moderate size, good in form, and bright in colour. **FUCHSIAS.**—*T. B.*—The sepals are too narrow in No. 1, and the corolla is not only too short, but the divisions are pointed; 2 appears a disproportioned flower, from the tube being so slender, but it is a good-coloured and rather showy variety; 3, tube and sepals smooth, of a rosy vermillion; the latter turn up and expose the whole of the corolla, which is stout, of a purple crimson—very good variety; 4, tube smooth and stout, corolla rosy purple; this is surpassed by 9, which it resembles, the latter flower having a longer tube, being in better proportion, and altogether larger; 5, tube and sepals light vermillion, the latter short, expanding well, and showing a long, bright, rosy purple corolla; 6 is the best of your Seedlings, tube and sepals smooth, of a bright vermillion, corolla stout, long, of a purple rose-colour, forming a good contrast in colour, texture fine; 8 is a flower of good qualities, but the sepals do not appear to expand sufficiently; 10, smooth tube and sepals, of a rosy vermillion, which expand well, corolla purple crimson; 11, tube red, sepals become rosy, and terminate in a decided green, corolla purple crimson. The best varieties in this collection are Nos. 6, 10, 5, 9, 3, there is rather too much similarity between some of the sorts; they are generally very good in colour, texture, and size.

As usual, a host of letters have arrived too late for answers this week.

NEWS OF THE WEEK.

THE Prorogation of Parliament, after a long and busy session, took place on Thursday with the usual ceremonies. The Queen's speech, delivered by Her Majesty in person, makes but a brief allusion to the subjects which have occupied attention during the recent session. It merely refers to the Bill for making a portion of the church revenues available for the endowment of additional Ministers in populous parishes, and mentions with satisfaction the passing of the Act regulating the jurisdiction of the Church of Scotland. It also contains the usual paragraph, announcing that all Foreign Powers continue to give assurances of their friendly disposition, and of their earnest desire for the maintenance of peace. The speech then alludes to the disturbances in Wales, to the adoption of measures calculated to repress outrage, and to the inquiry instituted into the circumstances which have led to insubordination and violence in a part of the country usually distinguished for good order and willing obedience to the law. It then proceeds to the main topic—the Repeal Agitation in Ireland. The speech declares that it has been, and ever will be, Her Majesty's earnest desire to administer the government of that country in a spirit of strict justice and impartiality, and that from a sincere conviction that the legislative union is essential to the strength and stability of the Empire, it is her firm determination to maintain inviolate that great bond of connexion between the two countries. In conclusion, it states that a demand for additional powers has not been made, from an unwillingness to distrust the efficacy of the ordinary law, and from a belief that those who have influence and authority in Ireland will discourage to the utmost of their power a system of pernicious agitation, which disturbs the industry and retards the improvement of that country.—The business transacted during the week in both Houses of Parliament, prior to the prorogation, was mostly of a routine character. The Chelsea Pensioners Bill, the Customs Bill, the Slave Trade Suppression Bill, and the Bills for the Apprehension of Offenders in France and the United States, have become law, together with many others noticed in our Parliamentary Report. In the Lords, on Tuesday, a petition from Sir Augustus D'Este, claiming the titles of the late Duke of Sussex, was presented to the House by her Majesty's command, and referred to the committee for privileges; so that in the next session the Sussex Dukedom will no doubt become the subject of discussion. In the Commons, on Monday, Sir R. Peel said that the Government of this country regarded Espartero as *de jure* Regent of Spain, and that he would be received with the respect and sympathy due to his high character and unmerited misfortunes. The Regent has since arrived, having landed at Woolwich on Thursday, with his wife and several of his Ministers. The Duke of Wellington, Sir R. Peel, and other Members of the Cabinet, were among his earliest visitors. A Court of Common Council has been summoned by the Lord Mayor, for the purpose of welcoming the Regent to this country.

In France, the Opposition papers have availed them-

selves of some exaggerated accounts of aggressions committed by British ships of war at Newfoundland and Tahiti, to renew their expressions of hostility to England. —In Spain, the proceedings of the new Government have caused a reaction at Barcelona, Valencia, and Cadiz, and the establishment of a Central Junta is loudly demanded by the republicans of Barcelona. The Regent has issued a protest against all the acts of the new Government, and expressing regret that he was compelled to leave the kingdom without the consent of the Cortes, from whom he derived the powers of his Regency.

Home News.

COURT.—Her Majesty and Prince Albert, attended by their suite, arrived in town on Wednesday from Windsor Castle. The Queen held a Privy Council in the afternoon of the same day, at which her Majesty's speech on closing the sessions of Parliament was arranged and agreed upon. After the Council, her Majesty held a Court, and gave audience to several ministers and official personages. On Thursday the Queen prorogued Parliament in person with a speech from the throne, which will be found under our Parliamentary news. The Queen and Prince Albert returned to Windsor in the afternoon. On Monday their Royal Highnesses the Prince de Joinville and the Duc d'Aumale arrived at Windsor Castle from France, on a visit to her Majesty, and accompanied the Queen and Prince Albert on an excursion in the Park. On Tuesday morning her Majesty and Prince Albert took their usual walking exercise, and in the evening visited St. George's Chapel, accompanied by the French Princes. Their Royal Highnesses took leave of her Majesty in the evening, and left the Castle at an early hour on Wednesday morning, on their return to France. Monday next is the day at present fixed upon for her Majesty to leave the Castle, upon the long contemplated marine excursion in the Victoria and Albert yacht. It is not expected that her Majesty and the Prince, with the infant Prince and Princesses, will be absent from Windsor for a longer period than ten days or a fortnight. This, however, will depend, in a great measure, upon the state of the weather during her Majesty's visit to the coast. It is understood that her Majesty will embark at Southampton, and that the Royal infants will remain at Brighton until her Majesty's return. It is also rumoured that the Queen, in this preliminary excursion, will cross over to Eu, near Dieppe, so as either to visit King Louis Philippe or let him visit her Majesty on board the yacht.—The King of Hanover left town on Saturday for Kew, where his Majesty had a dinner party on Sunday, at which the Duchess of Gloucester, Prince George, &c., were present. His Majesty came to town on Tuesday, and was visited by the French Princes at St. James's Palace. In the evening the King dined with Viscount Lowther, and on Thursday returned to Kew.

Church Preferment.—The Queen has made the following appointments to benefices in the Church of Scotland, vacant by the late secession:—The Rev. W. C. Rose to the parish of Cargill, Perth, in the room of the Rev. M. Stirling; the Rev. W. Elder to the parish of Tealling, Forfar, in the room of the Rev. D. B. Mellis; the Rev. J. Mann to the parish of Kiltarn, Ross, in the room of the Rev. D. Campbell; the Rev. P. McKenzie to the parish of Tongue, Sutherland, in the room of the Rev. H. M. McKenzie; the Rev. T. McKie to the parish of Monikie, Forfar, in the room of the Rev. J. Millar; the Rev. T. Davidson to the parish of Abbey St. Bathans, Berwick, in the room of the Rev. J. Wallace; the Rev. A. Hall to the parish of Cromarty, in the room of the Rev. A. Stewart; the Rev. M. J. Bryden to the parish of Kirkaldy, Fife, in the room of the Rev. J. Alexander.—The Queen has also been pleased to nominate the Rev. George Pocock to the perpetual curacy of St. Paul's Chapel, Marylebone, void by the resignation of the Rev. J. H. Caunter.

The Army.—Her Majesty having been pleased to appoint H.R.H. Prince George of Cambridge to the staff in the Ionian Islands, Major-General Brotherton has issued a district order at York, expressing the sense he entertains of the services of His Royal Highness during the time he has been in the north-eastern district. The Major-General states that His Royal Highness was in command of the troops at the breaking out of the disturbances last year, and performed this difficult duty with judgment and discretion. Since that period the Major-General has always found His Royal Highness most zealous and attentive, and he considers it a particular advantage to the service that an officer of the exalted station of His Royal Highness should have shown so laudable an example. The Major-General regrets that His Royal Highness is leaving the district under his command, but states that wherever his services may be required he will be followed by the good wishes of all who have had the honour to serve with him.

Foreign.

FRANCE.—The Paris papers, with few exceptions, have been occupied this week in denouncing the aggressions of England in the affair of Newfoundland, which we noticed briefly in our last, and in another alleged dispute between the English and French ships at Tahiti. The Opposition papers comment in severe terms on the collision with the French fishermen off Newfoundland, in which one of them was killed by the fire of an English vessel. The *Constitutionnel* observes, that even were it true that those fishermen were within English limits, and that warnings had been given and disregarded, the English corvette had other means to enforce respect for her rights than by having

recourse to the argument of fire-arms. He could have seized on the delinquents, and have had them tried instead of firing upon them. According to the first story from Tahiti, the English Captain had enticed Queen Pomare on board, seduced her from French alliance, made her hoist her national flag, saluted it, and when the French threatened to bombard, the English threatened to cannonade the French. A different version has since appeared, which states that "Queen Pomare having hoisted her national flag, the British Commanders saluted it, when the French Captain of the Boussole, a French corvette, placing his vessel between the island and the British frigate, signified to Queen Pomare that she must hoist the flag, or he would fire upon her. The French captain, at the same time, determined to fire on both sides, that is, on the English frigate at the same time, if he was not listened to. But Queen Pomare obeyed the French captain's injunctions, and hoisted the flag." The *Journal des Débats* protests against the needless venom which its brother journalists infuse into these events. "The mission of the press," it says, "is to enlighten the public mind, to correct prejudices, and calm old enmities; on the contrary, it does mostly but revive, foster, and envenom both. We complain of having no sincere allies in the whole world, and how can we obtain any and keep them when our first care is to treat them as enemies, to construe all their acts into insults, and to view every accidental misfortune as a premeditated insult? Let it be well understood; nothing injures us so much in the regard of Europe and of the world as that quarrelsome, discontented, and jealous tone which we seem to assume on every occasion and to seek every opportunity of exhibiting. If the voice of the Radical press were to be taken for the voice of the country, there would henceforth be no possible treaties, alliances, peace, or security."—The Tribunal Correctional of Valenciennes was occupied on the 11th and 12th inst. with the trial of M. Petiaux, the architect of the town, for neglect of duty in not having taken proper measures to prop up the bell-tower, so as to prevent its falling down on the 7th of April, by which accident seven persons were killed. The principal witnesses were four architects, who had been specially appointed to examine the matter as a question of art. They all gave it as their opinion that M. Petiaux ought to have foreseen the fall of the monument, and the Court condemned him to 100f. fine and costs. M. Petiaux immediately lodged an appeal.

SPAIN.—From Madrid we learn that Espartero, besides his manifesto already known, had drawn up, on the 30th ult., on board the Betis, a protest, signed by him and those who accompanied him, against all that had been done and might be done contrary to the constitution, and expressing regret that he could not obtain the permission of the Cortes to leave the kingdom. By a decree of the 16th, the Government declared Don Baldomero Espartero, and those who signed his protest, deprived of their titles, ranks, employments, and decorations. The elections are now the great source of interest. The convocations are already made, and a numerous body will very soon assemble. The Government has sent orders into the provinces that the National Guard should be everywhere and forthwith organised. A grand electoral meeting has been held, at which various political personages inculcated reconciliation and union. A directing committee was appointed, and the representatives of several provinces, such as Alicante, Murcia, Valencia, &c., who happened to be at Madrid, had also assembled for the same purpose. Several public dinners had likewise been given in celebration of the fall of Espartero. The banquet on the 11th, at the Pardo, concluded with a dance, in which General Serrano danced with the young Queen, and General Narvaez with the Infanta, her sister. On the 15th, high mass was celebrated, and a "Te Deum" sung in the Royal Chapel, in honour of the triumph of the "national cause." The Queen sat on the throne which had not been occupied since the days of Isabella the Catholic, no Princess having reigned over Spain since that period. At this solemnity all the high dignitaries of the State, a number of Generals and the *élite* of the society of Madrid, were present. The last accounts from Barcelona represent that city as being still in a very agitated state. Although the Junta had resigned its powers as a supreme Junta, it was still striving to retain much more authority than the Government of Madrid was willing to leave it. It had not, however, succeeded in arming above 200 National Guards. The emigration of the inhabitants is stated to be considerable. General Arbutnot, the new Captain-General, had refused to recognise the Junta, and had shut himself up in the citadel, waiting till the column marching from Madrid to Barcelona should arrive before that town. The *Union*, a democratic paper, founded to overthrow Espartero, has turned its opposition as furiously against the new Chief, Narvaez. On the evening of the 13th, it says, the Liberals mustered on the Rambla, and paraded a banner, to the cry of "Long live the Central Junta, Death to the Moderados, and down with the Queen's majority." The fortress of Monjuich, so long and gallantly held for Espartero, by Brigadier Echaleca, has at length submitted to the new Government, finding it hopeless to hold out further, but it does not appear that the Government troops have yet taken possession. The Junta of Saragossa, following the example of that of Barcelona, have addressed a representation to the Government for the purpose of demanding the re-union of a Central Junta. Some of the Regent's friends have made a demonstration at Cadiz, which has been declared in a state of siege.

PORTUGAL.—The only news from Lisbon relates to the arrival of the Regent of Spain, and to the refusal of the Portuguese Government to allow him to land. No

new facts are stated, except that the Spanish Minister at Lisbon, Señor Aguilar, who owed his elevation to Espartero, protested against his reception by the Portuguese Cabinet. The conduct of the Government is generally condemned at Lisbon as weak and irresolute. On the 10th, the Regent dined on board the Formidable with Commander Sir C. Sullivan. His departure from the one ship, and arrival at the other, were attended with the usual honours from the English ships; but the French brig-of-war, anchored abreast, took no notice. The Bishop of Gibraltar had arrived at Lisbon, on a visit to his diocese, and consecrated the British Chapel of St. George, and the adjoining burial-ground. The Queen is now perfectly restored in health, and drives out daily. The health of the young Princess is proceeding favourably. Her baptism took place on Thursday; the sponsors being the Emperor and Empress of Austria; the former represented by the resident Austrian Minister, the latter by the Infanta Donna Isabel Maria. The name of the Infant Princess is Maria Anna.

GERMANY.—Considerable importance is attached by the German papers to the journey of the agent of Don Carlos at Vienna, to Ischel, for the purpose of conferring with Prince Metternich. M. de Flaber, who, it is said, is his most confidential councillor, has at the same time left Frankfort for Baden Baden, where the Grand Duke Michael of Russia resides at present. A letter from the Italian frontiers asserts also that Don Carlos had sent his abdication to Vienna, on condition that Queen Isabella should be married to either of his sons. Sir R. Gordon, the British ambassador at the court of Vienna, had also proceeded to Ischel, to confer with Prince Metternich on the affairs of Spain, and on the unfavourable condition imposed on British manufactures by the tariff about to be published.—From Berlin we learn that Prince Albert of Prussia returned on the 9th, in perfect health, from his remarkable journey in the East, and that the Princess his wife left Berlin for Italy on the next day. The Minister from the city of Hamburg had arrived for the purpose of presenting to his Majesty the address of thanks, which has been unanimously voted by the Senate of that ancient city for the timely and generous assistance which the King yielded on occasion of the late conflagration. The address, written, or rather painted on parchment in ancient Gothic letters highly coloured with gold, azure, and red, is set in a richly carved, Gothic double, or winged frame, made of the scorched oak timber of the destroyed Town-hall, and ornamented with castings out of the bells of the different churches, which fell a sacrifice to the fire. The Opera-house at Berlin was destroyed by fire, on the 18th, after having stood exactly 100 years.—The commission appointed by the King of Hanover for the purpose of examining the expediency of Hanover joining the Customs Union has unanimously declared against such a step, and at the same time the Bavarian Diet has passed a resolution to petition the King to use his efforts for the purpose of persuading the King of Hanover and the Hanse towns to join the Union.

ITALY.—The Inquisition of Ancona and the neighbouring districts along the shores of the Adriatic, have issued an Edict against the Jews in that portion of the Papal States. The terms of this decree are so severe that they have attracted great attention on the Continent. The following provisions are enjoined under the penalties prescribed in the Edicts of the Supreme Inquisition of Rome:—"1. From the interval of two months after the date of this day (24th June), all Gipsy and Christian domestics, male and female, whether employed by day or by night, must be dismissed from service in the Ghetto (Jewries); and all Jews residing within our jurisdiction are expressly prohibited from employing any Christian nurse, or availing themselves of the service of any Christian in any domestic occupation whatever, under pain of being immediately punished according to the pontifical decrees and constitutions. 2. That all Jews who may possess property, either in town or country, permanent or movable, or rents or interest, or any right involving shares in funded property or leased landed property, must within the term of three months from this day dispose of it by a positive and real, and not by any pretended or factitious, contract. Should this not be done within the time specified, the Holy Office is to sell the same by public auction, on proof of the annual harvest being got in. 3. That no Hebrew nurses, and still less any Hebrew family, shall inhabit the city, or reside in, or remove their property into any town or district where there is no Ghetto (place of residence for Jews); and that such as may actually be there in contumacy to the laws must return to their respective Ghetto within the peremptory period of six months, otherwise they will be proceeded against according to the tenor of the law. 4. That, especially in any city where there is a Ghetto, no Hebrew must presume to associate at table with Christians, either in public-houses or ordinaries, out of the Ghetto. 5. That in a city which has a Ghetto no Hebrew shall sleep out of the Israelite quarter, nor make free to enter into familiar conversation in a Christian house. 6. That no Hebrew shall take the liberty, under any pretext whatever, to induce male Christians, and still less female Christians, to sleep within the boundaries of the Ghetto. 7. That no Hebrew shall hire Christians, even only by the day, to work in their houses in the Ghetto. 8. That no Hebrew, either male or female, shall frequent the houses of Christians, or maintain friendly relations with Christian men and women. 9. That the laws shall remain in force respecting the decorum to be observed by the Hebrews who may absent themselves from their Ghetto, to travel in other parts of the State. 10. That all Hebrews are expressly prohibited from trafficking in sacred ornaments, or books of any kind, and from purchasing, reading, or

keeping possession of prohibited books of any sort, under the penalty of 100 scudi and seven years' imprisonment; and they who have such articles in their possession must surrender them to the Tribunal of the Holy Inquisition; and in case of failing to do so, they will be subject to the above-mentioned penalty. 11. That the Hebrews, in conveying their dead to the place of burial, shall not observe any pomp or ceremony, and must especially abstain from singing psalms, or carrying torches or lighted tapers through the streets without the boundaries of the Ghetto, under pain of forfeiting the torches and tapers, and suffering other punishments, to which the nearest relatives of the deceased will be condemned." It is stated from Rome, that the Pope is determined to put an end to the "nefarious transactions" of his Jewish subjects, and that the Ancona ordinance is only a precursor of more severe measures. There are some fears of political disturbance in South and Central Italy. Neapolitan officers have been recalled to their duties, and the Prince of Palermo has gone on a mission to Paris. Every precaution has been taken at Bologna and along the Po. These, with other circumstances, indicate rather a conspiracy which has failed, than one likely to break forth.

TURKEY AND PERSIA.—Constantinople letters of the 2d inst. state that the conduct of Wuscitsch and Petroniewitsch had caused considerable embarrassment to the Government, as they pretended that their departure would be the signal for disturbances, and that the people would oppose their departure. Baron Lieven proposed to proceed to Krago-jewatz, where preparations were making to convoke an assembly of the people on the 8th inst.—A long statement has appeared in the daily papers containing a narrative of Saaleh Mahomed, one of a family at Herat which has been employed on various services by the British political agents. Saaleh Mahomed states that Major Todd directed him to join Capt. Conolly, and that he accordingly accompanied that officer and Col. Stoddart to Bokhara. After recounting the seizure and confinement of the whole party about December, 1841, he states that he and other servants were led out to execution, that his own life was spared, but that the others were murdered on the 10th June last year. "The next morning," he says, "a secret message came from Capt. Conolly, saying he had heard that I and Allahdad Khan had been killed, and that he was full of anxiety. The same day another message came, ordering me to remain in Bokhara, that an English gentleman (Mr. Thomson) had gone to Khiva, and that he (Capt. Conolly) had contrived to send Hoossein Leng, the Heratier, to Khiva. When I afterwards went to Khiva, I found that Hoossein had actually gone to Khiva, but had arrived after the departure of Mr. Thomson. On Sunday or Monday the Ameer sent to Colonel Stoddart and Capt. Conolly certain letters from Cabul, which had got into the Ameer's possession seven or nine months before, the contents of which the Ameer desired to know. This I heard from Syed Hoossein, the brother of the Topchi Bashi, who had charge of the two officers. The Ameer sent at the same time a message that he would free them in a few days, and told them to be of good heart. On Tuesday, at night, their quarters were entered by several men, who stripped them, and carried them off to prison; but I do not know whether it was to the Black Well, or some other. In stripping Colonel Stoddart a lead pencil was found in the lining of his coat, and some papers in his waist. These were taken to the Ameer, who gave orders that Colonel Stoddart should be beaten with heavy sticks until he disclosed who brought the papers, and to whom he wrote. He was most violently beaten, but he revealed nothing; he was beaten repeatedly for two or three days. On Friday, the 8th or 9th (the 7th) of Jemmedee-oolel (17th of June) the Ameer gave orders that Colonel Stoddart should be killed in the presence of Capt. Conolly, who was to be offered life if he would become a Mahomedan. In the afternoon they were taken outside the prison into the street, which is a kind of small square. Their hands were tied across in front. Many people assembled to behold the spectacle. Their graves were dug before their eyes. Col. Stoddart exclaimed aloud at the cruelty and tyranny of the Ameer. His head was then cut off with a knife. The chief executioner then turned to Capt. Conolly and said—"The Ameer spares your life if you will become a Mussulman." Capt. Conolly answered, "Col. Stoddart has been a Mussulman for three years, and you have killed him. You killed Yoo-soof, too. I will not be a Mussulman, and I am ready to die." Saying which he stretched forth his neck. His head was then cut off. Their bodies were interred in the graves which had been dug, and I myself have seen the spot and the small hillocks which mark the place. One of the executioners gave me the foregoing relation, and, moreover, he offered to bring me the heads, if I chose, that I might take them with me, but I refused this offer." He then concludes with an account of his own escape. To this narrative, Col. Sheil, the British Minister at Teheran, has added the following testimony under his own signature, dated Teheran, Nov. 23, 1842. "Besides the internal evidence of truth contained in the foregoing narrative, I wish to add that the appearance and manners of the Akhondzadeh, who is a most intelligent and prepossessing young man, contribute highly in strengthening the impression in favour of his veracity."

UNITED STATES.—The packet-ship Europe arrived at Liverpool on Tuesday, bringing news from New York one day later than the Caledonia; and the Independence arrived on Wednesday with news 6 days later than the Europe. The commercial accounts are in substance the same as the last arrival, and the papers contain little which was not previously known. The case of Mrs. Gilmour, charged with murdering her husband in Scotland, is still undecided. Mr. Fox, the British Minister, has formally demanded

her from the United States Government. Her counsel repaired to Washington immediately, for the purpose of meeting the demand by objections in the highest quarters; and the result thus far is, that the whole case is referred to the Attorney-General of the United States. No order, therefore, for a delivery of the prisoner to the British authorities will be signed until the Attorney-General gives his opinion in favour of such a course. In Canada, a Mr. Thomas Kinnear, a Scotch gentleman of good family and fortune, had been shot by his servant, M'Dermot, in his own house, about 16 miles from Toronto. The housekeeper was also murdered. The murderer fled, but was captured near the Falls.

Parliament.

HOUSE OF LORDS.

Saturday.—The Chelsea Pensioners Bill and the Irish Charitable Loan Societies Bill were read a second time. The Irish Exchequer Offices Bill the Irish Poor Law and Municipal Corporations Bill were reported; and the Dublin Sessions of the Peace Bill, and the Fisheries Bill, were read a third time and passed.

Monday.—The Marquess of CLANRICARDE withdrew his motion relative to Scinde, promising to draw attention to the subject next session.—Lord BROUGHAM, in making a formal motion relative to the appeal business before the House of Lords, and the Judicial Committee of the Privy Council, took occasion to praise the labours of the Commissioners for inquiring into the criminal law, pointed out the necessity for a complete digest of an index to the criminal law, and expressed his satisfaction with the measures for improving the law which had been passed during the present session.—The LORD CHANCELLOR joined in the eulogium on the Criminal Law Commissioners, and added a compliment to Lord Brougham for his labours on the Judicial Committee of the Privy Council.—Lord CAMPBELL joined his testimony with that of the two preceding speakers, and made some humorous comments on Lord Brougham's "satisfaction" with the amount of the law reforms of the session.—Lord BROUGHAM retorted, vindicated himself from the charge of ignorance brought against him for his Slave Suppression Bill, the authorship of which he assigned to Dr. Lushington, and charged the failure of the Ecclesiastical Courts Bill, the County Courts Bill, and the Factories Bill, mainly on the protracted discussion of the Irish Arms Bill.—Lord CAMPBELL reminded the House that the opposition to the Irish Arms Bill had been the cause of its being very materially amended and improved.—Lord MONTAGUE also remarked that the Factories Bill would have failed if the Arms Bill had never been heard of. The educational clauses fell before the opposition of the masses out of doors.—Lord BROUGHAM said it was the opposition not of masses, but of sects; to which Lord MONTAGUE replied, that there were at least two millions of signatures against them.

Lord WHARNCLEFFE, in laying a pile of papers on the table, part of which related to the case of the Earl of Lucan, gave his opinion that the Lord Chancellor of Ireland had acted perfectly right in dismissing the noble Earl from the commission of the peace.—The LORD CHANCELLOR concurred in this opinion, which he said he had derived from a perusal of the documents.—The Marquess of CLANRICARDE suspected that the Lord Chancellor had been impelled by some other force than a perusal of papers into this tardy vindication of his colleague, the Irish Lord Chancellor.—The Earl of LUCAN complained of the conduct of the Government towards him, and charged Lord Wharncleffe with trickery or evasion in delaying the production of the papers, with the view of defeating the chance of a fair discussion of his case before the session closed.—Lord WHARNCLEFFE indignantly denied the accusation.—The Earl of CHARLEVILLE and Lord BROUGHAM strongly censured the conduct of Lord Chancellor Sugden, which was defended by the Duke of WELLINGTON, and after some general conversation the subject dropped.

The rest of the evening was spent in disposing of the business before the House, various bills being carried through certain stages, or passed. The Customs Bill, which stood for third reading, raised some discussion.—Earl STANHOPE animadverted on the manner in which this Bill had been hurried through Parliament at a late period of the session, and censured those Conservatives who supported measures which they did not approve of. He opposed the grounds on which the unrestricted exportation of machinery was defended, and showed the results that would flow from this free-trade measure, as well as from the admission of the corn of Maine into this country as colonial produce. The noble Earl moved that the Bill be read a third time that day three months.—Lord MONTAGUE supported the exportation of machinery as a measure which gave an additional argument for demanding a free trade in corn. He pointed out the difficulty there will be in refusing to Sweden and other countries, with which we have reciprocity treaties, the same commercial advantages which this Bill gives to the United States through the territory of Maine.—After some remarks from Lord BEAUMONT, the amendment of Lord Stanhope was negatived without a division, and the Bill was read a third time and passed.—The Charitable Loan Societies Bill passed through committee; the Irish Poor Law Bill, the Irish Exchequer and Municipal Corporations Bills, were read a third time and passed.

Tuesday.—The Royal Assent was given by commission to the Customs Duties Bill, the Cathedral Churches (Wales) Bill, West India Islands Relief Bill, Episcopal Functions Bill, Militia Pay Bill, Apprehension of Offenders (France) Bill, the Apprehension of Offenders (America) Bill, China Government Bill, Law of Evidence Bill, Attorneys and Solicitors Bill, Writs of Error Bill, Warrant of Attorneys Bill, Hackney and Stage Carriage Bill, Copyright of Designs Bill, Coroners' Duties Bill, Tonnage Regulation Bill, Turnpike Acts Bill, Coalwhippers Bill, Affidavits, &c., (Scotland and Ireland) Bill, Arms (Ireland) Bill, Grand Jury Presentments (Ireland) Bill, Allotment of Rates (Dublin) Bill, Court of Exchequer (Ireland) Bill, and several private Bills. The Foreign Jurisdiction Bill, the Chelsea Hospital Out-pensioners Bill, the Municipal Corporations Bill, and the British Iron Company Bill, were read a third time and passed.—A petition was read from Sir Augustus d'Este to her Majesty, "claiming to be Duke of Sussex, Earl of Inverness, and Baron of Arklow, and praying that her Majesty will be graciously pleased to order a writ of summons to pass the Great Seal, to summon the petitioner to sit in Parliament, and there to enjoy the rank and privileges to the said titles, dignities, and honours belonging." This petition was presented to their Lordships by her Majesty's command, together with the report of the Attorney-General thereon. It was read and referred to the committee for privileges "to consider and report."

Lord CAMPBELL, in moving that their Lordships agree to the amendments made by the Commons on the Defamation and Libel Bill, while regretting some of those amendments, expressed his hope that the Bill would still have the effect of putting a stop to certain disreputable newspapers which now only existed by publishing, or threatening to publish, libels on individuals. The old maxim of, "the greater the truth the greater the libel," was now put an end to. The truth would now be admitted, and the Jury would have to say whether it was for the public good that the imputation was cast on the plaintiff. If it were proved to be wanton and malicious, the Jury would find in his favour, but if it were proved to be for the public benefit, then they would say that the defendant was not guilty.—The LORD CHANCELLOR supported the Bill, and the Commons' amendments were agreed to.—The Loan Societies (Ireland) Bill was read a third time and passed, after an ineffectual attempt by the Marquess of CLANRICARDE to omit the 47th clause. The Commons' amendments to the Slave Trade Suppression Bill were agreed to.—Lord TAYNHAM moved for returns relating to the operations of the Poor Laws,

and stated his object to be, to suggest whether the Government might not, among themselves, agree to exert their influence in procuring some extension of out-door relief; and next to suggest the propriety of Government calling on the House to grant, next session, a select committee to inquire generally into its operation.—Earl STANHOPE supported the motion, which was agreed to, and their Lordships adjourned until Thursday.

Thursday.—About 2 o'clock this day her Majesty arrived at the House in State to prorogue Parliament. The House was crowded in every part; nearly all the foreign ministers were present. The sound of trumpets indicated her Majesty's arrival, and, preceded by heralds, and surrounded by her court, her Majesty entered the House, led by Prince Albert, and was conducted by him to the throne. The Duke of Buccleugh carried the Crown, the Duke of Wellington bore the sword of state, and Lord Wharncleffe carried the cap of maintenance. The Duchess of Buccleugh and Lady Dunmore attended her Majesty. On her Majesty's entrance, every person rose, and after she had taken her seat even Prince Albert continued standing till her Majesty, in a low voice, bade the lords and gentlemen be seated. Her Majesty looked well. Prince Albert, who was dressed as a field-marshal, also appeared in good health.

The chair of the Prince of Wales was placed on the right of that of her Majesty, and at an equal distance on the left, and on the same platform as the Prince of Wales's chair, but lower than the throne, was the chair of Prince Albert.

The Commons were summoned to attend her Majesty, and in a few minutes the Speaker, accompanied by a considerable number of members, came to the bar. The right honourable gentleman immediately addressed her Majesty on the usual topics of detail and finance. The royal assent was then given in the usual form to the bill for granting 11,132,000*l.* of Exchequer Bills for the service of 1843, and for granting relief to the West Indies; the Appropriation and Consolidated Fund Bill, the Defamation and Libel Law Amendment Bill, the Foreign Jurisdiction Bill, the Bill for more effectually Suppressing the Slave Trade, the Municipal Corporations Bill for England and Wales, the Bill for Appointing Commissioners to inquire into Bribery at Sudbury, the Public Notaries Bill, the Chelsea Pensioners Bill, the Poor Relief (Ireland) Bill, the Charitable Loan Societies (Ireland) Bill, the Municipal Corporation (Ireland) Bill, the Liverpool Fire Bill, the British Iron Company's Bill, and Western's Estate Bill.

Her Majesty then read, in a clear firm voice, the following speech, laying a very marked emphasis on the passages relating to Ireland:—

"My Lords and Gentlemen,

"The state of public business enables me to close this protracted session, and to release you from further attendance on your Parliamentary duties.

"I thank you for the measures you have adopted for enabling me to give full effect to the several treaties which I have concluded with Foreign Powers.

"I have given my cordial assent to the bill which you presented to me for increasing the means of spiritual instruction in populous parishes, by making a portion of the revenues of the church available for the endowment of additional ministers. I confidently trust that the wise and benevolent intentions of the Legislature will be aided by the zeal and liberality of my subjects—and that better provision will thus be made for public worship, and for pastoral superintendence, in many districts of the country.

"I view with satisfaction the passing of the act for removing doubts respecting the jurisdiction of the Church of Scotland in the admission of ministers, and for securing to the people and to the courts of the Church the full exercise of their respective rights. It is my earnest hope that this measure will tend to restore religious peace in Scotland, and to avert the dangers which have threatened a sacred institution of the utmost importance to the happiness and welfare of that part of my dominions.

"I continue to receive from all Foreign Powers assurances of their friendly disposition, and of their earnest desire for the maintenance of peace.

"Gentlemen of the House of Commons,

"I thank you for the readiness and liberality with which you have voted the supplies for the current year. It will be my constant object to combine a strict regard to economy with the consideration which is due to the exigencies of the public service.

"My Lords and Gentlemen,

"In some districts of Wales the public peace has been interrupted by lawless combinations and disturbances, unconnected with political causes. I have adopted the measures which I deemed best calculated for the repression of outrage, and for the detection and punishment of the offenders. I have at the same time directed an inquiry to be made into the circumstances which have led to insubordination and violence in a part of the country usually distinguished for good order and willing obedience to the law.

"I have observed with the deepest concern the persevering efforts which are made to stir up discontent and dissension among my subjects in Ireland, and to excite them to demand a Repeal of the Legislative Union. It has been, and ever will be, my earnest desire to administer the Government of that country in a spirit of strict justice and impartiality, and to co-operate with Parliament in effecting such amendments in the existing laws as may tend to improve the social condition and to develop the natural resources of Ireland. From a deep conviction that the Legislative Union is not less essential to the attainment of these objects than to the strength and stability of the empire, it is my firm determination, with your support, and under the blessing of Divine Providence, to maintain inviolate that great bond of connexion between the two countries. I have foreborne from requiring any additional powers for the counteraction of designs hostile to the concord and welfare of my dominions, as well from my unwillingness to distrust the efficacy of the ordinary law, as from my reliance on the good sense and patriotism of my people, and on the solemn declarations of Parliament in support of the Legislative Union. I feel assured that those of my faithful subjects who have influence and authority in Ireland will discourage, to the utmost of their power, a system of pernicious agitation, which disturbs the industry and retards the improvement of that country, and excites feelings of mutual distrust and animosity between different classes of my people."

At the conclusion of the Speech, the LORD CHANCELLOR, by her Majesty's command, then declared the Parliament prorogued to Thursday, October 19th, to which time it accordingly stands prorogued. The Speaker and the Commons retired, and the ladies and gentlemen who had crowded the House soon separated; and thus concluded the session of 1843.

HOUSE OF COMMONS.

Monday.—A new writ was ordered for the election of a member for Argyllshire, in the room of Mr. A. Campbell, who has accepted the Chiltern Hundreds; and some additional discussion took place on the Slave Trade Suppression Bill. Mr. HINDLEY withdrew his notice for papers relative to the occupation of Tahiti by the French, on an assurance given by Sir R. Peel that a communication was in progress which could not be produced.

In answer to a question put by Mr. BORTHWICK, relative to the reception the Government would give to Espartero, Sir R. PEEL stated that he regarded Espartero as *de jure* Regent of Spain, though he had ceased to exercise the functions of that office *de facto*, and that he should be received in this country with the respect due to his high character, and with the sympathy due to his unmerited misfortune. He would take that opportunity of stating that no disposition whatever had been shown in the transactions between Spain and this country to depart from that high tone which the Spanish Government ought to adopt in its intercourse with other nations. There had been no one single act done by Espartero in conducting the diplomatic relations of Spain with this country at variance with that paramount duty which he owed to his own. He did not believe the reins of power had ever been placed in the hands of one who entertained a more sincere desire for the independence of his country. The accusations against this country of having interfered with the

domestic government of Spain were alike without foundation. The charges and accusations against this country, and against Espartero, had been made use of for the purpose of promoting insurrection in the army, and the infidelity of those military authorities upon whom Espartero had a right to depend for fidelity, was the main cause of the misfortune in which he was at present involved. Having stated that he was *de jure* Regent of Spain, although *de facto* power had passed from his hands, he was sure the honourable gentleman would not call upon him to state what course the Government would consider it proper to take with reference to his reception in this country. —Mr. HINDLEY asked whether it was true that the Government of this country had demanded a conference with the other four Powers relative to the affairs of Spain, and that that conference had been refused? —Sir R. PEEL replied—No.

Tuesday.—After the House returned from the Lords, where they had been summoned to hear the Royal assent given to various bills, Mr. T. DUNCOMBE presented a petition from certain merchants and traders of the City of London, praying for an inquiry into the management of railroads, and the adoption of a uniform rate of charges. —The amendments of the Lords in the Irish Poor-law Bill were read and agreed to, as were also the amendments made by their Lordships in the Irish Municipal Corporations Bill.

Colonel SINTONER asked the Secretary for the Home Department whether he was aware of the proceedings that were going on connected with the importation of an individual into this country under the head of Father Mathew. It appeared to him singular, when there was so great a cry made against Orange processions in Ireland, that this individual should be allowed, in a Protestant country, to carry on his plans through the instrumentality of Popish priests. He therefore asked whether Government was aware of what was going on in this respect, and hoped they would prevent the individual in question from being the precursor of any future steps on the part of those who were disturbing the peace of Ireland.—Sir J. GRAHAM said he certainly was aware that Father Mathew had visited this part of the United Kingdom, and that in several large cities the pledge of temperance had been taken by large numbers of the working classes. This did not in the slightest degree excite his jealousy, as he felt the greatest desire for the observance of such a pledge by every class of society, and nothing had particularly excited his attention except a report of the interchange of a salute in public between Father Mathew and Lord Stanhope.

Sir T. WILDE moved the third reading of the Slave-trade Suppression Bill.—Mr. HAWES said he still viewed the bill with great doubt, and feared it would give encouragement to a traffic in slaves freed from the restrictions imposed upon it by the 5th Geo. IV. He would not obstruct its passing, but, with the apprehensions he entertained respecting its operation, he would not accept it on the part of those who had been the uniform advocates of the abolition of slavery and the slave-trade, and as the amendments made in the original bill by Government gave to the measure its present unsatisfactory character, he protested against those amendments, although without the means of giving effect to his protest further than by throwing upon the Government the entire responsibility for the bill they had thus adopted.—Mr. MILDWAY said, that as he knew that the bill would be injurious to the commerce of this country, he should move that it be read a third time that day three months.—Sir J. R. REID said he should second the amendment with all his heart, and hoped the Government would take time, and reconsider the subject.—Sir T. WILDE contended that sufficient notice had been given of this bill, and therefore it could not be affirmed that the House had been taken by surprise. He did not, he confessed, understand the opposition that was given by those who professed themselves opposed to the slave trade. The object of the bill was to give effect to the second section of the 5th Geo. IV., and to extend the operation of the section to British subjects residing in foreign dominions. The main object was not to encourage the slave-trade, and not to injure British commerce. The main clause would throw impediments in the way of the slave-trade; the other clauses would not affect prejudicially the trade of the country. The bill did not meddle with the property or interests which were not now legal.—Mr. ESCOTT opposed the bill.—The ATTORNEY-GENERAL, in supporting the bill, observed that it recognised the great principle that this country would make every sacrifice that it fairly could to put down slavery. The bill was not a Government bill. It had been introduced into the House of Lords by no member of the Government, and having come down there the Government had endeavoured to give it every fair consideration.—Mr. HINDLEY observed that Government ought not to shrink from supporting this bill. He supported the bill, because it was calculated to put down slavery.—Capt. BERNAL would wish a more perfect measure than the present. As to the author of it, he thought he had been rather unfairly treated; because, however honourable gentlemen might differ on other points, yet they could not forget that for many years of his life the noble Lord had devoted himself to the suppression of slavery.—The bill was then read a third time and passed.—Sir J. GRAHAM said he had intended to introduce a bill on the subject of rates and settlements, grounded on the report just laid before Parliament. He did not, however, think himself justified in doing so at this late period, and merely wished to give notice that he should introduce a bill next session on the subject. He should be happy to receive any suggestions that might be considered useful in framing so important a measure.—Mr. HAWES hoped the report would be printed in an octavo form.—Sir J. GRAHAM acceded to this request, as the authorities were conflicting, and the sum disposed of by local rates very large, amounting to 11,000,000.—Mr. P. BORTHWICK gave notice that he should call the attention of the House to the principle of the Poor-laws next session.—The House then adjourned to Thursday.

Thursday.—In answer to Mr. Cochrane, Sir R. PEEL said that Government had not received any direct official account confirming the report of the murder of Colonel Stoddart and Captain Conolly; they had received no direct positive assurance amounting to complete proof of the fact; but as the hon. gentleman had intimated to him his intention to ask this question, he had gone through the whole of the papers, and he confessed the evidence contained in them was so strong, that he feared there could not be a question that on the 17th June, 1842, the two officers in question were murdered in a barbarous manner by orders of the Ameer of Bokhara. Colonel Sheil, in a despatch of the 12th of November, 1842, sent an account given by a Persian of good character, of the name of Saaleh Mahomed, which bore the evidence of truth; and a letter from St. Petersburg, of the 1st July, stated, that inquiries had been made of the Envoy from Khiva, who informed Count Nesselrode in a report, that accounts had reached Khiva from Bokhara, and entered into details which left no doubt as to the truth of the story. That letter was received on the 16th July, and therefore it confirmed the original statement. He believed all the civilized world, to whom the matter had been communicated, participated in our feelings on the occasion. The Emperor of Russia had behaved in a manner worthy of a Sovereign allied to this country. He had refused to entertain any communication with the Khan of Bokhara, and when an envoy was sent by the Khan to the Russian Government, the Emperor refused to hold any communication with him. The Sultan had acted in the same manner, and, therefore, without reference to the measures that might be taken in consequence of this barbarous murder of British subjects, he could only state that he felt the utmost indignation at so atrocious a crime; and he did not despair that, in some way or other, punishment would reach the Government which had caused it.

Captain FICHELL asked the hon. member for Bedford whether it was his intention, by the motion of which he had given notice for next session, to interfere with the Act of 1836, which did away with the assize of bread.—Captain POLHILL replied that his future proceedings on the subject must depend entirely upon circumstances.—Mr. T. DUNCOMBE stated, in reference to the late charge against the London bakers for keeping up the high price of bread, that the price of bread had risen and fallen with the price of wheat, and by a reference to the weekly averages of the price of wheat, their statement would be found to be borne out.

Mr. HINDLEY asked whether any information had been received of the French Government having acknowledged the present Government of Spain, and also whether the English

Government was inclined to recognise it as a Government *de jure*.—Sir R. PEEL said, that, in declining to answer the question, he would only say he was quite certain it was the duty of the Government of this country—where other Governments were administering the powers of a foreign country—without expressing any opinion—to take care that British interests were not prejudiced.—In reply to Mr. HAWES, in reference to the propriety of decorating the new Houses of Parliament with statues of distinguished persons, Sir ROBERT PEEL said the house would probably recollect that there had been some discussion on the subject a few nights ago, and the hon. gentleman had proposed that commissioners, appointed to the particular duty of inquiring into the best mode of encouraging the arts in connection with the building of the new Houses of Parliament, should be empowered to consider whether it would be advisable that statues, or other records of public gratitude to persons who had distinguished themselves in literature, science, and the arts, should be placed in them. He (Sir R. Peel) rather objected to giving a general power to the commissioners, but said at the time that he had no objection to authorize them to ascertain whether there was any part of the edifice now being constructed for the two Houses of Parliament which could with propriety be appropriated to the reception of such statues or memorials, and if they were of opinion that any part could be so appropriated, that they should have full powers to consider what would be the best mode of attaining the double object of raising a lasting record of public gratitude to distinguished persons, and, at the same time, encourage the arts and he fulfilled his pledge in a few days after it was made, by giving to the commissioners full power to consider the question.—In reply to Mr. EWART, as to any probability of the cathedrals being thrown open to public inspection, Sir R. PEEL said he had no authority in the matter, and could only express his own strong opinion in reference to it. He could only state that, for the purpose of protecting property from any injury which might arise from the admission of the public, the government would lend the assistance of the police, and every aid in their power, to obviate the objections that had been made to the suggestions on the subject; and he should have thought, after the example of throwing open the cartoons without charge, from which not the slightest injury had arisen, it would be considered that free access might be allowed without the apprehension of any mischievous consequences, and that where the admission was unrestricted, the public would themselves act as a police, as was exemplified in the cases of the British Museum and the Cartoons.

The usher of the black rod then appeared at the table and delivered the Queen's command for the immediate attendance of the House in the House of Peers. The Speaker, attended by the members present, forthwith proceeded to the House of Lords, and on their return the right hon. gentleman read at the table, the speech delivered by her Majesty from the throne, immediately after which the members withdrew.

CITY.

Money Market, Friday.—Bank Stock closed at 182; Three per Cent. Reduced, 95; Three per Cent. Consols, 94½; Three-and-half per Cent. Reduced, 102½; New Three-and-half per Cent. 101½; Exchequer Bills, 58s. to 60s. prem.; do. at 1½d., 56s. to 58s. prem.

Metropolis and its Vicinity.

Prorogation of Parliament.—On Thursday, St. James's Park and all the avenues along which the royal procession passed for the prorogation of Parliament, was crowded with persons from an early hour. Her Majesty and suite left the Palace at a ¼ before 2. The *cortège* consisted of five royal carriages and six, which preceded the state carriage, drawn by eight cream-coloured horses. The Queen sat with Prince Albert on her left, having the Duchess of Buccleugh and the Master of the Horse opposite. The escort consisted of Life Guards, under the command of Colonel Reid. Upon the state carriage issuing from the marble arch, the band of the Blues struck up the tune of "God save the Queen," which was responded to by the cheers of the populace. As the procession moved on, this demonstration of loyalty was renewed along the whole line to the House of Lords. Her Majesty on her return was also loudly cheered.

Seizure of a French Merchant Vessel by an English War Steamer.—On Thursday afternoon intelligence was received at Sheerness that the Cyclops war steam-vessel had captured at Cork a French merchantman having a quantity of fire-arms on board, and proceeding to the coast of Ireland.

The late Destructive Fires.—In addition to the destructive fire noticed in our last, several others occurred within the space of a few hours, in the very heart of the metropolis. One of them was attended with the loss of five lives, and altogether there has not been such a series of disastrous calamities for many years. The fire in Tooley-street, briefly mentioned last week, was the most extensive. It broke out in the premises of Messrs. Ward, oilmen, near the entrance to Topping's Wharf. Before the engines could be got into play it had extended to the buildings of the wharf, and to the tower now used as Watson's telegraph. The latter took fire about 3 o'clock, and about the same time the roof of the church of St. Olave's, Southwark, which joined the east end of Topping's Wharf, took fire, at which time the excitement in the neighbourhood was beyond description, all persons being most anxious that the church should, if possible, be preserved. The hose of the County engine was speedily conveyed into the body of the church, which the flames had penetrated near the organ. Other branches of the brigade engines were also taken into the building; but, notwithstanding the exertions of the firemen and the parochial officers, they failed in attaining that object, and in a very short time the fire reached the belfry and clock room, from both of which immense bodies of flame burst forth. By 6 o'clock no portion of the building but the bare walls was left standing, and the attention of the firemen was mainly directed to prevent the flames extending to the adjacent wharfs and warehouses, several of which were in imminent danger; but their efforts were ultimately successful, the ravages of the destructive element being confined within the limits already described. When the fire broke out there were several coasting-vessels lying alongside, some loaded and ready to sail at daybreak; and it was with some difficulty that the crews could be made sensible of the danger in which they and their vessels were placed. Many of them, however, managed to haul their craft into the centre of the river, beyond the reach of the fire; but four were aground, and, it being low water, were

consequently immovable. These were the Fleece, schooner, of Exeter; the schooner Cornwall, of Truro; the Theisa, of Weymouth; and the Dublin Lass, of Dublin. The crews mounted the rigging, and for a length of time prevented, by great exertion, the ships from taking fire; but the flames rapidly increasing soon forced them to quit their situations, the heat being so oppressive that their lives were in jeopardy. Three of the vessels were ultimately towed away, but one, which was lying alongside the wharf, was burnt to the water's edge. By this time the concourse of persons attracted by the extraordinary light in the atmosphere was immense, and the duty the police had to perform in keeping the pressure back was arduous in the extreme. From all the bridges, which were for hours lined with spectators, the whole action of the fire could be distinctly traced. The numerous towers and steeples in the metropolis and the houses and wharfs which lined the river side were perceived with even more distinctness than in the noonday sun; St. Paul's and the Monument had a most beautiful appearance, their summits seemed as if sheathed with the brightest copper. The flames at intervals rose to an immense height, and there was not a portion of the metropolis which was not brightly illuminated, while the whole scene along the Thames, as far as the eye could reach, assumed, from the intensity of the illumination, an appearance brilliant beyond description. The extent of the damage is as follows:—The premises of Messrs. Ward, in Tooley-street, totally destroyed, with the contents, consisting of a stock of oil, turpentine, and other inflammable articles. Insured in the Sun Fire Office. Loss said to amount to 10,000*l*. Messrs. Scovell's premises, Topping's Wharf, totally destroyed. This wharf, which was very extensive, consisted of numerous warehouses, filled from the basement to the roof with valuable property of various descriptions from all parts of the country, no portion of which has been saved. Amongst other property destroyed were 200 tons of paper belonging to a west country manufacturer; and a large quantity of alum and ammonia belonging to Sir R. Dundas, of the Lowestoff alum-works, all of which is burned. Messrs. Scovell estimate their loss at 20,000*l*, a great portion of which is covered by policies in the Sun, Union, and Atlas Fire Offices, in nearly equal proportions. St. Olave's Church is almost totally destroyed, no portion of the edifice remaining but the walls and the pews in the body of the Church, which are all greatly damaged, as well as burned, by the falling of the roof. The interior of the tower has been entirely consumed, and the remains of the bells are now lying in the porch of the church underneath in broken pieces. The church is insured to the extent of 6,000*l*. in the Phoenix Fire Office. All the sacramental plate, and other parochial muniments and records, have been preserved. In addition to the above, the Telegraph Tower, and several other buildings of minor importance are destroyed, which, with the damage done to the shipping, will swell the total amount of damage to nearly 50,000*l*. Among the incidents of the fire it is mentioned that while the galleries were still burning, on Saturday morning, the rite of matrimony was solemnised by the Rev. Mr. Kenney, the vicar, in St. Olave's church, and two couples were married under the cupola of the chancel, which was still standing. The bridegroom, in the first instance, was a gentleman about sixty years of age, and the bride about thirty, while the second couple were both about twenty years of age. After the fire, Mr. Braidwood stated that he thought he might have saved the church, but, at that trying moment, being a public servant, it was a matter of pounds, shillings, and pence with him. If he had attempted to have brought his whole force to save the church, the warehouses and Fenning's-wharf must have been destroyed; he therefore abandoned the church, which is insured for 6,000*l*, for the purpose of saving premises worth at least between 300,000*l*. and 400,000*l*. There were, however, several engines playing on it up to the very last moment, and, under all circumstances, he and his men did all they could to save it from destruction. The property destroyed and damaged is insured, and the amount of insurances are stated to be as follows:—Sun Fire-office, 9,000*l*; Union, 5,000*l*; Phoenix, 6,000*l*; Atlas, 5,000*l*. Total, 25,000*l*.—At about 4 o'clock on Saturday morning, whilst the fire was raging at Topping's Wharf, at its greatest height, another fire, attended with a melancholy loss of life, took place on the premises of Mr. Newberry, Fetter-lane, operative chemist and firework-manufacturer. The first alarm given to the neighbourhood was the report of a loud explosion, and on the police running up the lane they found the shop front and all its contents completely thrown into the street, and flames bursting forth with extreme fury. After the lapse of a few moments they discovered Mr. Newberry getting out of the second-floor window, who cried out to the constables below to render him some assistance, in order to save his life; scarcely, however, had they considered the most available means to do so, before he suddenly precipitated himself into the street, and fell on his back in the road. The police instantly picked up the unfortunate man, when it was found that he had received such severe injuries that he was evidently in his dying moments. He was conveyed to Bartholomew's Hospital; but on his arrival he had ceased to exist. Within a few minutes after Mr. Newberry had jumped from the window, several females made their appearance at the upper part of the house. By this time a large number of persons had assembled, who state that the cries of the females for help were painful in the extreme; but explosions of a destructive character constantly taking place, coupled with fire-works shooting from the burning building in all directions, and other combustibles blazing forth, kept the police from rendering any assistance at this trying moment, at the risk of losing their own lives. A few moments afterwards the poor creatures had dis-

appeared, and were not afterwards seen, the whole of them perishing in the flames. A short time before the engines could be got to the spot a large quantity of gunpowder exploded, and blew the back part of the premises on the houses in Bartlett's passage, occasioning great destruction of property, and throwing the inhabitants into a state of the greatest confusion. The house in Fetter-lane was speedily consumed and the following persons perished:—Mr. Newberry, Mr. and Mrs. Rose, Miss M'Crindell, and Miss Eliza M'Crindell. This party were to have embarked for Ramsgate in the morning, and had made preparations accordingly. Mr. Rose was for many years a clerk in the Law Institution, Chancery-lane; he had from a previous accident suffered amputation. Miss E. M'Crindell left her lodgings in Gough-square, on the previous evening, and slept in Fetter-lane, in order to be in time to see her sister off to Ramsgate, and thus fell a victim to the common calamity. An inquest was held in the evening, but only two of the bodies could be identified. After a long inquiry the jury returned a verdict of "Accidental death," at the same time expressing a hope that the fire ladders in future would be placed in such a situation that they could be more readily brought into operation, it being clearly proved that the fire-escapes could not be made available, as the keys were not to be found. From the evidence at the inquest, there appears to be no doubt that the explosion was caused by the fall of some bottles of fulminating mercury, which are supposed to have been thrown down by the cats in the premises; and it will be recollected, that a fatal accident occurred a short time since at Apothecaries' Hall, from an explosion of the same material.—Whilst the fire was raging in Tooley-street, and the blazing embers were literally falling in showers upon the High-street, a considerable piece of ignited timber fell into the chimney of the house of Mr. Jones, grocer and tea-dealer, High-street. The engines were speedily on the spot, but the flames were not extinguished before considerable damage had been done.—The first fire on Friday night broke out in the rope warehouse of Mr. Seymour, in Pudding-lane, at the rear of the Monument. The damage done was very great, but the flames were prevented from extending to the adjoining houses.—On Saturday night, while an experiment was making with Robinson's night signals for shipping, from a skiff on the river off St. Katharine's-docks, some of the combustible materials of which the signal lights are made, accidentally ignited, and instantly set the skiff in a blaze. The persons in it, to save themselves from the flames, leaped overboard into the water, and were with great difficulty saved from drowning, with the exception of one young lad who was carried away by the tide. The skiff was almost wholly destroyed.—On Sunday night a fire broke out at No. 14, Cambridge-square, a new and unoccupied house filled with planks and flooring. The flames communicated to the adjoining house at the corner of Norfolk-crescent, but were ultimately subdued. There is some suspicion that this fire was not the result of accident, and a reward of 100*l.* is offered for the apprehension of the incendiary.—On Tuesday morning a destructive fire broke out in the oil and varnish manufactory belonging to Messrs. Wentworth, floor-cloth manufacturers, at Old Ford West, within a short distance of Bow. From the inflammable nature of the stock, the flames made rapid progress, and in the space of ten minutes after the discovery, every part of the building, which was composed principally of wood, and about fifty feet long by thirty wide, was one burning mass. The whole was, of course, destroyed, but no lives were lost. On Thursday morning a destructive fire broke out in the extensive warehouses of Mr. Mandeville, hemp and cane merchant, Kent-street, Borough. The warehouses are 130 yards in length, and from the combustible nature of the materials they were almost entirely destroyed. On the same morning a fire broke out in the premises of Mr. Bourne, a cooper, in the Cornwall-road, Lambeth. It spread so rapidly that Mr. Bourne and his wife threw themselves out of the window, and were severely injured. The premises were consumed.

Visit of the French Princes.—On Monday morning the Pluton French war-steamer arrived at Woolwich with the Prince de Joinville, and his brother, the Duc d'Aumale, attended by the Archimede and Napoleon war-steamer in the French service. Their Royal Highnesses, on leaving the Chateau d'Eu, near Dieppe, proceeded in the Pluton to Boulogne on Friday, and the next day sailed for Calais, to review the troops and National Guard. On leaving Calais, they sailed for Dunkirk, and arrived there on Sunday, making but a brief visit. On the departure of their Royal Highnesses from that port, they sailed direct for this country. The Pluton was detained nearly two hours in the Downs before a pilot came on board, and it was determined that the steamers should anchor for the night off Chatham. Their Royal Highnesses consequently remained on board at Chatham until Monday morning, and arrived at Woolwich about 9 o'clock, under a royal salute from the Artillery. The Princes landed shortly afterwards, and were received with the usual honours by the Dock-yard authorities and the officers of the garrison. They left Woolwich immediately for Windsor Castle on a visit to her Majesty, escorted by Lord Hawarden and Capt. Seymour. On Wednesday morning their Royal Highnesses left Windsor Castle and arrived at the terminus of the Great Western Railway, at Paddington, at ten minutes before eight, with their suite. They entered two of the Queen's carriages, which were in readiness at the station, and proceeded to the French Embassy, in Manchester-square. Their Royal Highnesses then visited St. Paul's Cathedral, and afterwards paid a visit to the Duchess of Gloucester, and Prince George of Cambridge. The Princes then proceeded to Buckingham Palace,

where they took leave of Her Majesty and Prince Albert, returning to the residence of the French Embassy, attended by their suite. In the evening their Royal Highnesses dined with the French Chargé d'Affaires. On Thursday at an early hour they left town in one of the Watermen Company's steamers for Woolwich, and breakfasted on board the Pluton. They then landed under a royal salute, and minutely inspected the dock-yard and arsenal. They partook of a luncheon at the house of Sir F. Collier, and embarked about 3 o'clock; soon after which the steamers took their departure for Havre under the customary salutes.

Arrival of the Regent of Spain.—On Wednesday, H.M.'s steamer Prometheus arrived at Woolwich, having on board Gen. Espartero and his suite. Sir F. Collier, Superintendent of the Dock-yard, immediately went on board, and on the part of the Government assured the Regent that every accommodation, both to himself and his suite, would be most gladly rendered. Sir F. Collier also informed his Excellency that carriages for the conveyance of himself and suite to town were in readiness. His Excellency, however, declined the offer, having previously arranged to embark in a small steamer for Hungerford Wharf, where the carriages of the Embassy would be in attendance to receive him. He added, that he wished his visit to be as private as possible. His Excellency conversed in the French language for some time with Sir F. Collier, and took occasion to express in the most unmeasured terms his gratitude for the extreme kindness he had experienced from the British authorities from the moment he placed his foot on board the Malabarship-of-war. The Duchess of Victory and Donna Eledia Espartero, the Regent's niece, also expressed their acknowledgments. Despatches were immediately forwarded to town, announcing the Regent's arrival at Woolwich. Lord Bloomfield, Commandant of the Royal Arsenal, arrived at the dockyard shortly after twelve o'clock, and went off to pay his respects to his Excellency. Shortly before two, a steamer belonging to the Watermen's Company went alongside the Prometheus, for the purpose of receiving his Excellency and suite, and having taken the whole of them on board, proceeded to Hungerford Wharf, where carriages were in waiting to convey the noble exiles to Mivart's hotel. The Prometheus left Lisbon on the 12th for Bayonne, and finding on arrival there that the Duchess had previously left for Havre, the Regent proceeded direct to Falmouth, where he arrived on Saturday, under a royal salute from the Astrea guard-ship in that port. He merely landed for a short time near the Quarantine station at the East-end of the harbour, and expressed his desire of proceeding at once to Havre for the Duchess. Captain Ellice, however, could not grant permission for the Prometheus to go to a port in France, but ordered the Commander to sail for Portsmouth to confer with the Admiral, who at once acceded to the Regent's request. The steamer accordingly embarked the Duchess at Havre, and returned direct to Woolwich. Among the Regent's suite are General Van Halen; General Augustin Noguera, Minister of War; Señor Gomez de la Serra, Minister of the Interior; Brigadier-General Lacarte; several Aides-de-Camps, and Secretaries. Immediately after the arrival of the Regent at Mivart's, on Wednesday, Colonel Wylde, equerry to Prince Albert, had a long interview with his Excellency, and subsequently with the members of the staff who accompanied the Regent to this country. Throughout Thursday the hotel was literally besieged with visitors of all ranks. The Duke of Wellington was among the early calls, and subscribed his name as follows in the visitors' book:—"Field Marshal the Duke of Wellington et Capitaine-General Duque de Ciudad Roderigo." The Earl of Aberdeen and Sir R. Peel also visited the Regent. In the course of the day a deputation of the Common Council presented a requisition to the Lord Mayor requesting him to "convene an early court, to welcome the arrival of General Espartero in this country, on his being driven into exile by the nation to whose services he has devoted his great talents and best energies, and to assure his Excellency (in the words of the Prime Minister of England) 'that he will be received by all classes in this country with that respect which is due to his character, and with the sympathy for his misfortunes which his merits deserve.'" The Lord Mayor appointed Friday next for entertaining the subject.

Temperance Meetings.—On Monday Father Mathew administered the pledge to the inhabitants of Greenwich, at Whitfield's Mount, Blackheath. Some delay in the commencement of the proceedings took place in consequence of his having attended a breakfast given by Colonel Dawson Damer, at which he was to have met the Duke of Wellington, Sir R. Peel, and a large number of nobility and gentry. Neither His Grace nor Sir Robert was present, but the latter sent a letter of apology, expressing regret that the commands of her Majesty detained him at Windsor. There were, however, upwards of seventy of the nobility present to meet Father Mathew, and among them Lord and Lady Palmerston, the Marquess and Marchioness of Clanricarde, Lords Camoys, Clifford, Lovat, &c. Father Mathew, on reaching the Broadway at Deptford, was met by a teetotal procession, headed by horsemen, and accompanied by a temperance band. Father Mathew rode in a carriage and four, and was followed by twelve other carriages, each crowded with temperance advocates. His carriage was preceded by about a hundred and fifty young women and children, carrying a banner, on which was inscribed, "Welcome, Father Mathew, to Greenwich." On his arrival within the barrier, the scene which ensued almost exceeds description. There were at this moment at least from twenty to twenty-five thousand people assembled, and immediately opposite the hustings a publican had erected

a capacious booth, and provided himself with an entire dray, containing not less than ten barrels of ale and porter. Soon after Father Mathew commenced speaking, a large body of persons, who had evidently got intoxicated at the beer booth opposite, aided by a number of Marines, made a desperate rush in the direction of the hustings, knocking down the barrier, and sweeping the people before them with such violence that even the hustings were in danger. The police appeared paralyzed, but subsequently some of the ringleaders were taken into custody. Many of them wore papers in their hats, on which was written, "Member of the Malt and Hops Society," and had pint pots suspended round their necks as a badge of distinction. Father Mathew said it was impossible for him to proceed, and therefore he would at once relinquish the task, and proceed with administering the pledge to all who liked to take it. The Hon. Capt. Jerningham was the first who took the pledge on the platform, and was followed by small batches, including several Greenwich pensioners. As far as the administration of the pledge went the affair was a failure; not more than 500 having received it during the day, but the number who visited the spot is believed to be not less than from 50,000 to 60,000 persons. On Monday Father Mathew breakfasted at the Hon. Mrs. Howard's, where upwards of 50 persons of distinction were assembled to meet him, among whom were Lords Dinorben, Effingham, and Monteagle, the Earl of Arundel and Surrey, Lord and Lady Manners, Lady Stepney, Lady Murray, &c. He then proceeded to administer the pledge at Deptford, but in consequence of the interruptions at Blackheath on the previous day, the meeting took place on a piece of ground which was private property, in order to keep in check not only the members of the "Malt and Hops Society," but any others who might venture to interrupt them. The proceedings were continued throughout the day, and about 200 men belonging to the Deptford dockyard took the pledge. There were several small batches in addition, and all passed off quietly, with the exception of a brief contest between the opposing parties during a heavy shower which had compelled them both to take shelter under the arches of the railway. On Wednesday Father Mathew administered the pledge at Westminster, in the neighbourhood of the Penitentiary, to about 1200 persons. On Thursday he attended at the same place, and soon after his arrival considerable sensation was created amongst the teetotallers by the appearance of the Duke of Wellington, on horseback, in the road facing the hustings, leading to Vauxhall-bridge. The Duke, who was attended by his groom, pulled up for a moment, evidently for the purpose of witnessing the proceedings. He was at once recognised by those on the platform. Father Mathew came forward, and took off his hat to him, and some one having proposed three cheers for his Grace, the call was responded to in a most enthusiastic manner, which the duke acknowledged by taking off his hat and bowing several times. He then proceeded down the road towards the House of Lords, amidst the renewed cheers of the people.

Messrs. Hammersley's Bankruptcy.—It appears that a dividend of 2*s.* 11*d.* on the estate of Messrs. Hammersley is now in course of payment at the office of the Accountant-General in Chancery. The announcement is said to be a relief to the creditors after the long suspense under which they have laboured, but the amount is to most of them a source of disappointment. Nothing is known as to any further dividend to be looked for under the estate.

Balloon Ascent.—In our account of Mr. Green's attempt to cross the Channel last week, it was mentioned that, finding no chance of their being able to reach the Continent, Mr. Green and his companion, Mr. Bradley, determined on taking an excursion inland, and started from Brighton for that purpose on Thursday morning. It appears that they effected their descent in a field at Patcham, a village a short distance from Brighton, on the line of the railway. A number of men, busily employed in reaping, immediately ran to their assistance, and at the same moment the train from London, which reaches Brighton at half-past 12, passed the balloon. The guard, on his arrival at Brighton, reported the circumstance to the superintendent of the line, who despatched an express engine to the assistance of the aeronauts. The gas being emptied from the balloon, it was packed with the apparatus in the car, and with Mr. Green and his companion conveyed to Brighton, where they intend awaiting a change of wind, in the hope of being able to cross the Channel. From an account since published by Mr. Bradley, it appears that in all long voyages hitherto, the greatest difficulty has been occasioned by the loss of gas when the balloon has risen to a considerable altitude. Owing to the atmosphere being there much less dense than at the surface of the earth, the gas expands and rushes from the neck of the balloon, thereby occasioning not only a loss of the sustaining power, but in some cases personal danger to the aeronauts, instances being known where suffocation has nearly resulted in this manner. Mr. Green now uses a line, called a guide-line, of the length of 2,000 feet, which he shortens to any requisite degree, and the end, trailing on the ground, creates a friction, which the levity of the balloon cannot entirely overcome. The balloon is thus kept in the air at a height (within the length of the guide-line), at the pleasure of the voyager, who, when there are currents of air varying both in direction and strength at varying heights, as is generally the case, is enabled to select that current which best suits his object. For effecting the same end when over the sea, about a dozen bladders, partly filled with water, and then inflated with hydrogen gas, are attached to the end of the guide-line; and the ascent at Brighton was for the purpose of trying whether the plan would succeed on the

water equally well as it had proved to do on land. The process of decarbonising the gas also appears to have been successful. By the means adopted at Brighton, the levity of the coal gas approximated to that of pure hydrogen, and some idea may be formed of the great ascending power which the balloon (a small one), containing 24,000 cubic feet, possessed when they left the shore, by stating that the disposable ballast amounted at least to 6 cwt.

New Zealand Company.—A special Court of Directors and members of the New Zealand Company was held on Monday. The Governor, Joseph Soames, Esq., in the chair. After a few words from the Governor, to the effect that the meeting had been convened for the purpose of raising a loan of 50,000% to carry out the establishment of two new colonies; the one to be called New Edinburgh, the other the Church of England Colony, the secretary read the report. From this it would appear that the company desires to increase their capital by way of loan, instead of calling upon the shareholders to pay the remaining moiety of their liabilities. The three distinct settlements already established are going on satisfactorily, and comprise a population of at least 10,000 souls. These settlements have been placed in this position upon a capital of 200,000%, through which the company have acquired a property of about a million of acres of fertile land in favourable portions of a colony in which the minimum price of waste land is fixed by the Legislature at 1% per acre. "While our capital," says the report, "has been only 200,000%, our actual outlay for colonizing purposes has been nearly half a million; the difference, your directors must repeat, was supplied by the confidence of the public." The report concludes by stating that the directors are on the best terms with Government, and that the settlement of New Edinburgh is a favourite one in Scotland. Mr. Soames, and Sir I. L. Goldsmid then expressed their determination to lend the money required at 4½ per cent., should the subscribers and the public fail in making up the amount.

Metropolitan Improvements.—The Marquess of Exeter is about to restore the building once familiar to the public by the title of Exeter 'Change. The erection of a new arcade from the lower end of Catherine-street, in the Strand, to Wellington-street North, is already commenced, from the design of Mr. Sydney Smirke, and will be called "Exeter 'Change." The architecture of the principal entrances is of the Elizabethan style, with red brick and stone, and the interior, having a curvilinear roof of glass, the entire length of the building, will be fitted up with shops, exclusively appropriated to the sale of hardware, as in the former building.

Metropolitan Antiquities.—The portion of London Wall, on Tower Hill, which was surrendered in April last by the Common Council to the Society for building churches, in order that it might be pulled down, and a church erected on its site, is yet to be preserved. The threatened removal of the wall, as one of the few remaining monuments of Roman London, was much regretted by antiquaries, and Sir R. Inglis at length used his influence to save it from destruction. The result is, that the architect has been instructed to re-arrange his plan for the proposed church, so that the wall may be preserved entire.

Mortality of the Metropolis.—The number of Deaths registered in the week ending Saturday, Aug. 12, was as follows:—West districts, 118; North districts, 139; Central districts, 151; East districts, 196; South districts, 197. Total, 801. Weekly average for the last five years, 903—(461 males, 442 females,) and for the last five summers, 845.

Provincial News.

Alnwick.—The Jury, in the case of the two bodies recovered last week from the wreck of the Pegasus steamer, have returned a verdict of "Accidental death, occasioned by the gross carelessness of the Master and those on the look out;" and have added a deodand of 100% against the Company on each body. The divers are still recovering cargo and luggage from the wreck, and several more bodies have come on shore along the coast, the friends of whom have been written to when they could be identified.

Birmingham.—The ceremony of laying the foundation-stone of the Queen's College of Medicine in this town took place on Friday last, in the presence of a numerous assemblage of the inhabitants, professors, and students. The ceremony was opened by the Rev. C. Craven, incumbent of St. Peter's, offering up a prayer for the success of the undertaking, after which the High Bailiff deposited in the cavity of the stone a case containing copies of the charter of incorporation, of the Warneford prize trust-deed, of the various addresses delivered by the Rev. Chancellor Law, Mr. Sands Cox, the Rev. Vaughan Thomas, and Dr. Johnstone; the prospectus of the college, with the list of professors and the laws of the Queen's Hospital, together with coins of her Majesty. The Principal, Dr. Johnstone, then affixed a brass plate, bearing an appropriate inscription, and addressed the assembly at some length upon the benefits of the institution, and announced that a gentleman had placed in the hands of the trustees the sum of 1,000% for the foundation of four scholarships of 10%, to be held for two years, to be conferred upon students who shall have resided in the college twelve months, and have been distinguished for their good conduct, and availed themselves of the moral and religious instruction of the warden.—The local papers state that, from all appearances, Birmingham, at no very distant period, is again likely to be the scene of a great political agitation. The present movement originated with the Chamber of Commerce, which has adopted Mr. Attwood's views on the currency; and that gentleman has been requested to place himself at its head. The whole management of the agitation, it appears, will be transferred to the

leading members of the Political Union of 1829. Ward meetings are held almost every night, at which the burgesses congratulate themselves upon the return of Mr. Attwood to public life, and pledge themselves to use every exertion in their power to support him in any measures he may propose. No public announcement of the mode of procedure has yet taken place, but it may be expected in the course of a short time.

Carmarthen.—A meeting of the parishioners of Llanedy, near Pontardulais, in this county, was held last week, to take into consideration the various grievances which operate prejudicially upon the interests of the country generally, and more especially upon the agricultural interest in Wales. The first subject discussed was the establishment of the police force, when several farmers addressed the meeting, contending that there was no necessity for a rural police, and the sense of the meeting being taken, every hand was held up against it. On the subject of tithes, they were equally unanimous, and it was resolved that the chairman on behalf of the meeting, should sign a letter to the titheowner of the parish, applying for a reduction in tithe. The meeting then discussed the free-trade question, and the effect of the importation of cattle under the new tariff. Several farmers stated that they had been deluded by the notion that the Corn-law was a protection, and that the Corn-laws did them no good whatever, while it did them much injury. If there were free-trade, their Corn could not be lowered much in price, as it was all consumed by themselves, and sold to the neighbouring towns. If they should not have free-trade, the iron-works and copper-works in the neighbourhood would fail, and the farmers would lose their customers. The chairman then took the sense of the meeting on the question of free-trade in Corn and all other articles of food, when all hands were held up in its favour. The new Poor-law was then discussed. It was stated that the amount of Poor-rate for the parish was nearly double what it was under the old law, while the number of poor relieved was less. There are about seven parishes in the Union, and several farmers complained of the unfairness of compelling their small parish to pay towards the support of the poor of the populous parish of Llanedy, which, they contended, was the effect of the new Poor-law. They also complained of the large sums of money paid out of the poor-rate to officials under the new Poor-law, which operated very heavily on their parishes, and deprived the poor of what would otherwise be expended for them. It was then put to the vote, which, in the opinion of the meeting, was the best law for the rate-payers and the poor—the new Poor-law or the old, when the poor of each parish was relieved by the overseers. All hands were held up against the new, and in favour of the old law. A long discussion then ensued upon the gate grievance, when all complained of the great number of gates, bars, &c., so that a man could scarcely go to his own farm without paying toll. They were willing to pay reasonable tolls, but thought that three or four gates within ten or twelve miles was intolerable. They also maintained that landlords and magistrates ought to see the reasonableness of the proposition that lime and all kinds of manure should be exempted from toll. The question of church-rates was also discussed, but they were more objected to from principle, than because of the amount, which they said was very trifling in their parish. After discussing these subjects they agreed to an address to the titheowners and landlords for redress. A similar meeting of the parishioners of Llanon was held on the 9th inst., which was crowded to excess. After several persons had spoken, a series of resolutions were agreed to—copies of which were to be forwarded to the titheowner and landlords of the parish, and which embodied the topics of the Llanedy meeting. They also expressed the regret of the parishioners at the late outrages, but at the same time stated their firm conviction that unless the landlords and tithe proprietors make a reduction in proportion to that in the agricultural market, the depredations will not terminate. The resolutions likewise stated the intention of the parishioners to have a stipendiary overseer to receive and pay all moneys relating to the poor, so that the services of union officers may be dispensed with, "as that would tend materially to restore the country to peace and quietness once more."

Exeter.—The *Western Times* states that Sir W. Follett, the Solicitor-General, netted, in special retainers at the recent assizes, 4,000% in fees.

Isle of Man.—The Isle of Man Joint Stock Bank stopped payment last week. The local papers state that its liabilities amount to about 30,000%, and that many of the shareholders, of whom there are a large number, are persons in moderate circumstances, on whom the loss will fall with peculiar hardship. They also state that so great a shock as that produced by the unexpected stoppage of the bank, has not been experienced in the island within the memory of the oldest inhabitant.

Jersey.—The local papers state that Mr. Aymer, the American vaulter, who became well known in the metropolis a short time since by his performances at the English Opera-house, met his death on Thursday week, at the Circus of Mr. Batty, in this island, where he was fulfilling an engagement. The performance for which Mr. Aymer was announced, concluded with a double summer-set, in throwing which, instead of alighting on his feet, he fell on his neck, and death was the immediate result. Mr. Smith, a well-known trampoline and vaulter, met his death in a similar manner, during the management of Messrs. Ducrow and West, at Astley's, some seasons back.

Liverpool.—On Tuesday evening an attempt of a serious character was made in Dick's Coffee-house in this city, occupied by Mr. Newton. During the temporary absence of the landlady from the bar, some person unknown left upon the table two small parcels, one addressed to Mr. Newton, and the other to a friend of his. The land-

lord was upstairs, the house being full of company, so that he did not open the one for himself; but the gentleman to whom the other was sent proceeded to unwrap it, when a box was seen, from which particles of gunpowder fell. An inspector of police was called in, and having cut the side of the box open, he found it to be full of the finest gunpowder, and a lucifer match wrapped round with sand-paper in the centre of the powder, one end being fastened to the lid of the box with wax, so as to ignite and explode when the lid was moved. The boxes were taken to the magistrate, together with an anonymous letter, which was received the day before, and the affair is now undergoing investigation. The circumstance has caused great excitement in the town, there being at the time nearly 200 persons in the house.

Manchester.—The turn-out at Ashton and Dukinfield may now be considered at an end, and the different establishments have resumed their employment. Some of the mills have availed themselves of the opportunity which the turn-out has afforded to put their engines and machinery in thorough working order.

Oxford.—A correspondence has appeared in the daily papers between Mr. Badeley, of the Temple, and the Vice Chancellor of the University, on the subject of an address respecting the late proceedings in the case of Dr. Pusey. The address was signed by Lord Dungannon, Lord Courtenay, the Right Hon. W. E. Gladstone, Mr. Justice Coleridge, Mr. Acland, and a large number of non-resident members of convocation, who begged respectfully to express their serious regret at the course which Dr. Wynter had adopted with reference to Dr. Pusey's sermon. "We deprecate," they said, "that construction of the statute under which Dr. Pusey has been condemned, which, contrary to the general principles of justice, subjects a person to penalties without affording him the means of explanation or defence; and we think that the interests of the church and of the university require, that when a sermon is adjudged unsound, the points in which its unsoundness consists should be distinctly stated, if the condemnation of it is intended to operate either as a caution to other preachers, or as a check to the reception of doctrines supposed to be erroneous." Mr. Badeley who was commissioned to present this address, was requested by the Vice Chancellor to submit it for his inspection; and ultimately the Vice Chancellor refused to receive it, and returned it by the hands of his bedel. In the letter announcing this decision, the Vice Chancellor says, "In whatever point of view I feel myself at liberty to regard it, whether as addressed to me in my individual or my official capacity, it is deserving of the strongest censure. In the former case, it imputes to me, by implication, that, in a matter wherein every thoughtful man occupying my position would most deeply feel its painful responsibilities, I have acted without due deliberation, and am capable of being influenced by many to concede that which I have already denied to a few. Assuming it to be addressed to me in my public capacity, a graver character attaches to it. If it be not altogether nugatory, then is it an unbecoming and unstatutable attempt to overawe the Resident Governor of the University in the execution of his office. In either case I refuse to receive it, and I hold it to be my duty to admonish those who may have hastily signed it, while I warn others who may have been active in promoting it, to have a more careful regard to the oaths by which they bound themselves upon admission to their several degrees; this act of theirs having a direct tendency to foment, if not create, divisions in the University, to disturb its peace, and interfere with its orderly government." The Oxford journals state that a paper containing the signatures of nearly 1,000 of the clergy, to a protest against Tractarianism, has been withdrawn from circulation, in consequence of the earnest remonstrances of several bishops.

Portsmouth.—The Lords of the Admiralty arrived at this port this week on a tour of inspection, having previously visited Chatham and Sheerness. After transacting the usual business, they will proceed to Plymouth. A court-martial was held on Thursday on board Her Majesty's ship St. Vincent, for the trial of Lieut. R. C. Jenkins, late of the Ferret, on a charge of drunkenness and insubordination. The Court found him guilty, and he was dismissed the service.

Reading.—On Saturday last, Mr. Cobden and Mr. Bright paid a visit to this town for the purpose of addressing the farmers on the repeal of the Corn Laws. Very few agriculturists were present, the Berks Agricultural Association having previously recommended them to take no part in the proceedings, and the number of the meeting is said to have been under 350. Mr. Sleeman took the chair, and Mr. Cobden, Mr. Bright, Mr. Moore, and Dr. Perry, addressed the meeting, and a resolution in favour of free trade was carried unanimously.

Windsor.—On Thursday week Prince Albert visited the Ordnance Survey Office in this town, for the purpose of inspecting the plans which, by command of her Majesty, have been taken of the Home Park, the Castle, and Town of Windsor, including Frogmore and the Royal Gardens. The survey is drawn on a scale of five feet to a mile by a party of Sappers and Miners, under the command of Capt. Tucker. The plan preparing for the office of Woods and Forests, for the improvement of the drainage, is on a large sheet of eleven feet square. In looking over this plan, his Royal Highness suggested various improvements, among which may be mentioned the formation of an ornamental canal in the Lower Park, commencing by the Maestricht Gardens, and terminating at the extremity of the Park, about half-a-mile below Datchet-bridge, the fall of which being six feet, will insure a constant running stream. His Royal Highness gave directions for a reduced copy to be drawn on a scale of two feet to a mile, for the purpose of being placed in the library of the

Castle, and then inspected the Ordnance plans, which are drawn on a similar scale for the office of Woods and Forests. The whole of the work is executed with great minuteness, and when finished will show the contour levels which have been struck out at every four vertical feet above, and two vertical feet below the flood-line of 1841. Several sectional lines have also been executed by the party of Sappers and Miners appointed to assist Sir H. de La Beche in the contemplated drainage of the Castle and town of Windsor, which has long been considered of an infectious character. His Royal Highness expressed his approbation of the progress of the works.

Railways.—The following are the returns for the past week:—London and Birmingham, 19,041*l.*; Great Western, 16,687*l.*; South-Western, 8,428*l.*; South-Eastern, 4,515*l.*; Eastern Counties, 3,085*l.*; North Midland, 5,225*l.*; York and North Midland, 1,980*l.*; Greenwich, 865*l.*; Croydon, 483*l.*; Brighton, 5,251*l.*; Blackwall, 1,408*l.*; Hull and Selby, 1,210*l.*; Midland Counties, 2,865*l.*; Grand Junction, 9,420*l.*—At the annual general meeting of the Canterbury and Whitstable Company the accounts showed a total receipt for the year of 7,785*l.*, and the expenditure of 4,935*l.*, leaving a balance of 2,849*l.* The report stated that great improvements had been effected at the Canterbury station, and that, in addition to the saving that would accrue to the company, the distance between Canterbury and Whitstable might henceforth be performed in the space of thirty minutes. The railway does not yet return sufficient profit for the declaration of a dividend, but the report gives hope of such announcement at the next meeting.—The profits of the Great North of England Company for the last half-year have amounted to 13,622*l.*, from which the Directors have declared a dividend of 1*l.* 5*s.* per share, carrying to a reserve fund the balance of 5,259*l.*; thinking it advisable to apportion this sum to equalize dividends in future. The interest on a greater part of the bonded debt of the company has been reduced from five to four per cent.—The Sheffield and Rotherham Company continues to pay five per cent., the amount declared at the meeting of last week on the half-year's net profit of 3,578*l.*—The half-yearly meeting of the London and Blackwall Company was held on Tuesday, and was well attended. From the report it appeared that the number of passengers carried in the six months ending June, 1842, was 1,063,015, and the amount 20,409*l.* 19*s.* 4*d.*, and those in the corresponding period of 1843 were 999,683, and the amount 17,351*l.* 19*s.* 10*d.*; showing a decrease of 63,332 in the number of passengers, and 3,057*l.* 19*s.* 6*d.* in amount. In the receipts for wharfage there is an increase, and the goods traffic was double that of the last half-year. The total revenue for the half-year was 23,937*l.* 12*s.* 1*d.*, and left a balance of 3,016*l.* 19*s.* 5*d.*, which would be reduced by 1,433*l.* 9*s.* 9*d.*, for repairs of engines. The total capital up to the 30th June was 1,289,080*l.* The committee of investigation had concurred in the recommendation of the directors for extending the steam-boat traffic, as the only means of insuring a dividend. It was stated that if a good Woolwich traffic could be supported, the present prospects of the railway warranted the conclusion that with industry and perseverance a dividend at the rate of 7½ per cent. upon the present prices of the shares might shortly be expected. The whole of the Directors having resigned their seats, five of them who had expressed their willingness to serve again if required, were re-elected, with five other large shareholders, who were members of the late committee, and for their services they are to receive collectively 1000*l.* per annum.—At a meeting lately held at Redruth, subscriptions to the extent of 25,000*l.* were offered for the purpose of constructing the proposed Cornwall Railway, including 5000*l.* from Lady Bassett, and 5000*l.* from Mr. Pendarves, M.P. It was also announced that Lord Wodehouse and others had taken the value of their land in shares.—The half-yearly meeting of the Ponton and South Shields Company took place on Monday. The report showed that, notwithstanding the depression in the coal trade, on which the income of the railway mainly depended, the total receipts for the half-year amounted to 33,264*l.*, the expenditure being 23,047*l.*, leaving a balance of 10,216*l.*, out of which the directors recommended a dividend of 30*s.* per share, being at the rate of five per cent. on the paid-up capital. The total amount of tonnage for the half-year was 324,826, being an increase of 9,000 tons.—A new line is now in contemplation to join the Brighton Railway at Croydon. It is proposed to issue from the Greenwich line, near Deptford, and from thence to pass through Lewisham, Southend, Eltham, Addiscombe, and Bromley, ultimately falling into the Brighton line at its junction with the Croydon. The estimated cost is 300,000*l.*

IRELAND.

Dublin.—The Lord Lieutenant and the Countess de Grey left Corrig-na-Greena, Killiney, where they have been enjoying the sea-breeze during the summer, on Tuesday, for the Vice-regal Lodge, and they were expected to embark yesterday for England.—Circumstances have occurred which have enabled the authorities to place the mysterious murder of Lord Norbury in a train of judicial investigation. It is now about five years since his Lordship was assassinated, in open day, in a plantation on his own demesne, and within view of his house. All that could be ascertained at or subsequent to the inquest was, that the murder was committed by a single individual, who was seen to cross the country after the deed had been perpetrated. An immense reward was offered, but no clue could be discovered to reach the murderer. It appears that a man named Peter Dolan is now in custody, charged, upon sworn informations, as the actual murderer. He was apprehended in England, and is committed to

take his trial at the next assizes for King's County.—The weekly meeting of the Repeal Association took place on Monday, when Mr. J. O'Connell, in consequence of the absence of his father, moved its adjournment to the next day. The rent for the week was announced to be 1,138*l.* 8*s.* 7*d.* At this adjourned meeting, Mr. O'Connell laid before them his "Plan for the renewed action of the Irish Parliament." This document is arranged in nine clauses. 1. The first declares that the people of Ireland recognise, acknowledge, and will maintain the rights of Queen Victoria and her heirs for ever. 2. In this they also acknowledge the privileges of the Peers of Ireland. 3. They insist on the restoration of the Irish House of Commons, consisting of 300 members, and solemnly declare that they will resist the Union by all legal, peaceful, and constitutional means. 4. The plan for the restoration of the Irish Parliament is as follows: The county members to be increased to 173; and 127 members to be returned from cities and towns. The county of Carlow, being the only county in Ireland with less than 100,000 inhabitants, to have an increase of one member; every other county having above 100,000 inhabitants, to have an increase of two members; those above 150,000, an increase of three members; those above 250,000 inhabitants, an increase of four members; Tipperary, having more than 400,000 inhabitants, but less than 500,000, an increase of eight members; and Cork, having more than 700,000 inhabitants, an increase of ten members. 5. With respect to towns and cities, Dublin, having more than 200,000 inhabitants, to have eight members. The University of Dublin, two. Cork, five, having more than 100,000 inhabitants. Limerick and Belfast, four, having more than 500,000 inhabitants. Galway, Waterford, and Kilkenny, three, having more than 200,000 inhabitants. Other towns, having about 7000 inhabitants, to have two members, and 49 other towns, next highest in the ratio of population, one member each. A schedule of the different places to return members to the Irish Parliament is here added, to show their relative population according to the returns of 1831, and the number of members assigned to each. The report then proceeds as follows:—6. The right of voting to be what is called 'household suffrage,' requiring six months' residence in the counties; with the addition in the towns of married men resident for twelve months, whether householders or not. 7. The mode of voting for members of Parliament to be by ballot. 8. The monarch *de facto* of England, at all times hereafter, whoever he may be, to be monarch *de jure* in Ireland. And so in case of a future regency, the Regent *de facto* in England to be Regent *de jure* in Ireland. 9. The connection between Great Britain and Ireland by means of the power, authority, and prerogatives of the Crown, to be perpetual, and incapable of change, or any severance or separation. The foregoing plan to be carried into effect according to recognised law and strict constitutional principle." Mr. O'Connell then proceeded to address the meeting on the subject of the Catholic oath. After animadverting upon the recent speeches of Lords Brougham and Beaumont, in the House of Lords, he concluded by moving that the Repeal Association prepare a petition for the abolition of all oaths affecting Roman Catholics, with the exception of the one specified—the Oath of Allegiance—in the second article of the treaty of Limerick. Mr. O'Neill Daunt seconded the motion, which passed unanimously.

Dalkey.—A preliminary experiment of the principle upon which the atmospheric railway is to act was made on Saturday, and answered in every respect the expectations of the patentees, as well as of all those concerned in the introduction of this important project into Ireland. The experiment was one made solely for the satisfaction of the engineers, the works being as yet in a very crude and imperfect state. Some carriages being placed on the line with the engine, and all the necessary arrangements being made, the train started from Glashule, a little below Kingstown, and proceeded at a very rapid rate, travelling over a mile and a quarter in three minutes and a half. The arrival of this train, the first ever moved upon any regular railway by atmospheric pressure, was hailed by loud cheering at Dalkey. The result of the experiment was considered to establish satisfactorily the success of the atmospheric system. A few data of the line of railway and the machinery may not be uninteresting. When finished there will be in length 9200 feet of open pipe. The close pipe forming the connection with the air-pipe is upwards of 400 yards. The engine is 100 horse-power—to be worked on the expansive condensation principle. The air-pump is double stroke, its diameter 67 inches; the diameter of the tube or open pipe 15 inches. The station at Dalkey is 76 feet higher than that at Kingstown. The elevation varies—one in 57 being the greatest, one in 240 being the least, and the main ascent being one in 115. It is computed that the train will descend from Dalkey by its own gravity, at the rate of from 30 to 35 miles an hour. The sharpest curve is only 547 feet radius. Another trial took place on Tuesday afternoon, in the presence of the Lord-Lieutenant, with still more success than the first experiment. Two carriages ascended at the rate of 25 miles an hour, in three minutes, and returned down the inclined plane, by their own momentum, in five minutes, so that a rate of 50 miles an hour may be easily obtained with perfect safety.

Cork.—The business of the British Association is the chief topic in the Cork papers, and the proceedings are reported at too great length for us to enter into the details. The Earl of Rosse was chosen president of the meeting. The report of the council stated that the Lords of the Treasury had granted 1000*l.* to defray the expenses of the publication of the reduction of the catalogue of stars in the *Histoire Celeste*, and of the catalogue of stars in the

Southern Hemisphere made by Lalande, which had been effected at the expense of the Association. The report of accounts shows that the receipts for last year were 3,271*l.* 4*s.* 4*d.*, and that the expenditure consisted of payments for various grants for scientific purposes, 156*l.* 5*s.* 11½*d.*; printing reports, &c., 446*l.*; salaries, 435*l.*; and expenditure at Manchester, 328*l.* 8*s.* 10*d.*; leaving a balance in hand of 496*l.* 4*s.* 1*d.* The property of the Association consisted of funded property, 5,500*l.*, which, with other assets, made a total of 6,705*l.*—At the meeting on Monday the general committee resolved that the next meeting should be held at York, under the presidency of Dr. Peacock, the Dean of Ely.

Roscommon.—The Repeal demonstration in this town took place on Tuesday, and was attended by as great a number of persons as any previous meeting in the province. The Hon. Mr. Ffrench presided. Mr. O'Connell spoke at great length, and said he "would place the teetotallers in the first rank of the Repealers. Napoleon boasted of his Body-guard—his Imperial Guard—but he boasted of a more than Imperial Guard—he boasted of a guard of Christian teetotallers. He adduced the fact as a precursor to Irish liberty, that they had five millions of pledged teetotallers—for that mighty moral miracle had not emanated from the hands of the Almighty for nothing. It was it that gave them all the security they had in their present movement. How could he have assembled such masses—how could he have brought a million and a half of people together if he were not backed by the teetotallers? They were the first preservers of the liberty of Ireland, and it was for that Father Mathew was sent. Before the expiration of the week he would publish his plan for the restoration of the Irish Parliament. They of course acknowledged Victoria as their Queen, God bless her. And they would maintain all her prerogative. The Irish House of Lords would be acknowledged with all its privileges, and they would insist upon the Irish House of Commons having the number of three hundred members. He would submit to the public the number of counties, and the towns which should have representatives in the Irish Parliament. The machinery of his plan for proceeding for the repeal would be laid before the people, and he had no doubt they would seriously read it. Their success was at hand. He read in the signs of the times and in the actions of men, that the hour was come when Ireland should have her own Parliament, and when her virtuous, faithful, and religious people, would be free, prosperous, and happy." At the dinner in the evening, Mr. O'Connell adverted to the late discussion in the House of Lords on the Catholic oath. He said he had "intended to propose to them a resolution that day, agreeing to petition for the abrogation of the thing called a Catholic oath. If the meeting had been a smaller one, he would have done so, but he promised them that he would let no other meeting pass without proposing a petition to abolish that oath. For it was without example, and it was not to be endured that scoundrels and hypocrites should insult them, and that they should be taunted and insulted every other day by Broughams and Beaumonts. He never would have consented to any arrangement including that oath, if he did not conceive that they would have put the same construction upon it as they did upon the coronation oath. Nothing but the most prejudiced malignity could have dared to attach the imputation of perjury to a body of Christians who were not emancipated for years because they would not consent to perjure themselves. Than be subject to such insults they ought rather not to take the oath any more, and fling the emancipation in their teeth; for that which he had wrung from them before, he could get from them a second time."

11 AM.

CENTRAL CRIMINAL COURT.—*The late Duel.*—At the sitting of the Court yesterday morning, George Gulliver, Surgeon in the Royal Horse Guards Blue, and Holland Leckie Daniel Cuddy, a Lieutenant in the same regiment, surrendered to take their trial on an indictment charging them with being concerned in the death of David Lynar Fawcett. At a few minutes after 10 the Judges (Williams and Rolfe) took their seats upon the bench, and the names of Alexander Thompson Munro, Duncan Trevor Grant, William Holland Leckie Daniel Cuddy, and George Gulliver, were called; only Mr. Cuddy and Mr. Gulliver answered, and they were immediately placed in the dock. The Attorney-General then said that, having carefully perused the depositions in the case of Mr. Gulliver, he was of opinion that the charge against him could not be sustained, and he, therefore, wished to enter a *nolle prosequi* as far as related to that gentleman. Mr. Clarkson expressed his grateful feelings to her Majesty's Attorney-General for the course he had taken, and wished to know whether it was his intention to enter a *nolle prosequi* on the Coroner's inquisition as well as on the indictment? The Attorney-General replied in the affirmative. Mr. Gulliver then left the dock, and Mr. Cuddy was called upon to plead to the indictment and the Coroner's inquisition, to both of which he, in a firm tone of voice, pleaded "Not guilty." Both charged him with the wilful murder of the deceased David Lynar Fawcett. The Attorney-General then stated the case for the prosecution, and recapitulated the facts which are already known to our readers. Mr. Gulliver was called as a witness to the main facts, and the other parties who had already given their evidence before the Coroner, were also brought forward as witnesses; but their evidence was given at such great length that we cannot now give it in detail. Sergeant Shaw addressed the Jury for the prisoner. He said that the only thing that was proved against Lieut. Cuddy was that he was present; but there was no proof that he was thus aiding, assisting, and abetting Lieut. Munro in taking the life of the deceased; and to find him guilty of the offence charged, they must be satisfied that he had gone there to assist him in the murder of Colonel Fawcett. But so far from there being any proof of such being the case, there was everything to show that Mr. Cuddy was, until the very last moment before the fatal shot, doing all in his power to prevent the calamity which took place. Whatever might have been the conduct of the principals in the case, it seemed probable that the seconds had done all in their power to prevent the fatal proceedings. He therefore called upon them seriously to deliberate before they consented to affix the stigma of "Wilful Murder" to the name of this young man in the commencement of his career in life. He left the case with confidence in their hands, and if they could not come to the conclusion that the prisoner had gone out by previous contract, criminally to act in the matter, they could not

THE GARDENERS' CHRONICLE.

A STAMPED NEWSPAPER OF RURAL ECONOMY AND GENERAL NEWS.

THE HORTICULTURAL PART EDITED BY PROFESSOR LINDLEY.

No. 35—1843.

SATURDAY, SEPTEMBER 2.

PRICE 6d.

INDEX OF THE PRINCIPAL HORTICULTURAL SUBJECTS IN THE LAST NUMBER.

Amateur's Garden, No. XXXIV. 589 a	Mulberry-tree, rapid growth of 590 a
Asparagus, superiority of Austrian 589 c	Mushrooms, culture of 591 c
Aspidiotus Nerii, or small white scale, described 588 b	Pansies, cure for disease in 589 c
Beech-trees, disease in 589 a	Paper-makers' refuse as a manure; chemical nature of 589 a
Bees, swarm of, in Hawthorn hedge, their comb containing brood 589 b	Peach-trees, to root-prune 589 a
Bees, remarks on 589 b	Peat-earth as a manure; analysis of 589 c
Bignonia picta 591 b	Pelargoniums, management of 589 b
Bobbin Joints 589 c	Picture-cleaning, directions for 589 b
Churns, Atwood's, &c., noticed 590 a	Potatoes, extraordinary tenacity of life in 589 a
Chimney-Roses, budding of 590 a	— to obtain young ones early in winter 589 b
Conservatory climbers, new mode of treatment suggested 590 a	Potter's guano, good for Asparagus and kitchen-garden crops 590 c
Dahlia, list of 589 a	Potting plants 591 b
Drainage and subsoil-ploughing, remarks on 589 c	Scute-Julia japonica 591 b
Figs, for back wall of Vinery 593 b	Small Black Beetle, to destroy on Peach and Pear-trees 593 b
Fruit, without leaves, maturing of 589 b	Specimens III selected, advertisement respecting 589 c
Garden walks, formation of 589 b	Sprangle on vegetable manures 589 c
Ginger, information regarding its culture requested 589 a	Strawberries, treatment of 589 c
Heaths, scab and mildew on 589 a	— to prepare for forcing 589 c
Heating, remarks on 589 a	Strawberry, Myatt's Pine, remarks on culture of 589 a
Lettuces, kinds to stand the winter, and time of sowing 589 b	Tinea vastatrix, species of moth, to destroy 593 c
Melons, from Syria described 589 b	Truffles 590 c
Mohl (Dr.), his critique on Liebig's Work, continued 591 c	Wrens, their nests noticed 590 b

FLORICULTURAL SOCIETY OF LONDON.

The Evening Meetings will be held every TUESDAY during the month of September for the judgment of Seedling Dahlias. All flowers must be named and forwarded to the Secretary at the Crown and Anchor Tavern, Strand, carriage free. Six blooms are required of Seedlings of 1842, and one of those of the present year.—Aug. 31, 1843. T. C. WILDMAN, Hon. Sec.

WYCOMBE DAHLIA SHOW.—Open to all England

The Autumnal Show of the High Wycombe Horticultural and Floral Society will be held in Mr. LANGSTONE'S garden, on Wednesday the 6th September inst. Open to the admission of the public at One o'clock, by Members' tickets, or by payment of One Shilling. J. G. TATEM and T. WHEELER, Secretaries, Of whom further particulars may be had.

TO GROWERS OF CARNATIONS, PICOTEEs, and PINKs.

YOUELL & CO. beg respectfully to announce that their extensive stock of the above plants are this season unusually fine, and having spared no expense, by getting in large quantities of every known variety worthy of cultivation and for competition at any Horticultural Exhibition throughout the Kingdom, they flatter themselves that they are in a position to execute orders to any extent and upon such advantageous terms as to be satisfactory to those who may favour them with their commands. They would also beg leave to remark that their stock of the above, amounting to upwards of 40,000 pairs of the very best sorts in cultivation, will be a sufficient guarantee that none but strong healthy plants will be sent out, and as every run or degenerated plant is destroyed when in bloom, parties may be fully assured of receiving none but those true to name and colour.

PRICES AS FOLLOWS:—

	£	s.	d.
12 pairs of good show varieties, 1 pair of each	1	4	0
12 " fine ditto ditto	1	10	0
25 " ditto ditto ditto	3	0	0
12 " Extra fine and very superior ditto	2	10	0
25 " ditto ditto ditto	5	0	0
12 " ditto Pinks ditto	0	12	0
25 " ditto ditto ditto	1	0	0

The selection being left to YOUELL and Co.

Catalogues will be shortly ready, and may be had on application.—Great Yarmouth Nursery, Aug. 31, 1843.

SPLENDID SEEDLING PELARGONIUMS, AT GREATLY REDUCED PRICES.

LUCOMBE, PINCE, & Co. beg leave to inform the Public, that they have obtained the entire stock of the following very Splendid PELARGONIUMS, raised by CAPT. THURTELL, R.N., which possess those qualities now indispensably requisite in a first-rate flower—good habit, round shape, and firm petal; and they feel convinced that such novelties cannot fail to please those who purchase them, and will greatly improve all select collections.

Pluto (Thurtell's)	21s	Princess Royal (Thurtell's)	21s
Horatio Nelson	21s	Fairy Queen	21s
Phosphorus	21s	Ceres	21s

The whole collection of six distinct varieties for 5l., package included. A description of "Pluto" is given in the *Gardener's Chronicle* of June 17, 1843. "Horatio Nelson" was exhibited at the Chiswick Show in June last, and was greatly admired. A full descriptive character of all these is contained in L., P., & Co.'s Catalogue of Pelargoniums, which may be had on application. Strong plants will be ready for delivery in October next.

L., P., & Co. beg leave further to say, that, having in this, as in the case of Mr. Beck's Seedlings, determined upon making a great reduction in the prices which Seedling Pelargoniums of the highest character are usually let out at, they hope in consequence to meet with an extensive sale.—Exeter Nursery, Aug. 30, 1843.

DUTCH FLOWER BULBS.

J. CARTER begs leave to inform the Nobility, Gentry, and his Customers in general, that his new CATALOGUE OF GENUINE DUTCH BULBS is now ready. Should any of his correspondents not receive a copy in the course of a few days, he will immediately forward one on application. 238, High Holborn, London.

FINE CAPE ERICAS (HEATHS), EPACRISSES, &c.

J. & J. FAIRBAIRN beg leave most respectfully to solicit the attention of Gentlemen desirous of forming new, or of extending their present Collections of these much-admired tribes of Plants, to their Stock, which are in the finest health and vigour possible, and from its extent they are enabled to offer any quantity upon the following advantageous terms:—

	£	s.	d.
100 fine flowering plants, including 80 Ericas and 20 Epacrisse, of the best and most esteemed kinds	7	0	0
75 do. do., including 60 Ericas and 15 Epacrisse	6	0	0
50 do. do., " 40 Ericas and 10 Epacrisse	5	0	0
25 do. do., " 20 Ericas and 5 Epacrisse	3	0	0
12 do. do., " Choice Ericas	2	0	0

J. & J. F. take leave to acquaint Cultivators of Fuchsias and Verbenas that their collections contain the best and most esteemed varieties. All orders they may be favoured with packed with the greatest care, and delivered free in London.

P.S.—A remittance or reference required from unknown correspondents.—Nurseries, Clapham, near London, August 28, 1843.

HORTICULTURAL SOCIETY OF LONDON.—

LIST OF PRIZES

offered at the Exhibitions in the Gardens, in 1844.

MEDALS AND REWARDS.

The Society distributes the following Medals and Rewards; viz.

	value—£	s.	d.
C. The Certificate	0	10	0
SB. Silver Banksian Medal	1	0	0
SK. Silver Knightian Do.	1	5	0
LS. Large Silver Do.	1	15	0
SG. Large Silver Gilt Do.	4	0	0
GB. Gold Banksian Do.	7	0	0
GK. Gold Knightian Do.	10	0	0
LG. Large Gold Do.	20	0	0

Exhibitors to whom any of these shall be awarded can exchange them one for another, or may receive their value in money, or in plate. In case an Exhibitor shall receive a First Prize in any one Letter, he shall not be entitled to receive any other Medal in the same Letter, except in CC, DD, and EE.

CLASS I.—FLOWERS; for which Nurserymen and Private Growers exhibit independently of each other.

- Pelargoniums, in collections of 12 new and first-rate varieties, cultivated with superior skill, in pots of 24 to a cast. GB—SG—LS—SK.
- Pelargoniums, in collections of 12 varieties, in pots of 12 to a cast. SG—LS—SK.

N.B. Persons exhibiting in B cannot also exhibit in C.

- Pelargoniums, in collections of 6 varieties, in pots of 8 to a cast. LS—SB.

- Rhododendrons, in pots; not fewer than 6 plants in 6 varieties. LS—SK—SB.

- Roses, in pots; Amateurs to show in collections of 12, Nurserymen in collections of 25, distinct varieties. GB—SG—LS.

N.B. It is the wish of the Society in a future season, to require Roses to be shown exclusively in pots; and not to allow cut specimens to be exhibited at all.

- Moss Roses in loose bunches, so as to exhibit, as far as possible, the habit of the variety; in 12 varieties. SK—SB—C.

- Other Roses, exhibited as in the last letter, and in 50 varieties. LS—SK—SB—C.

N.B. No one who exhibits in this letter can also compete for the following.

- Other Roses, exhibited as in the letter F, and in 25 varieties. SK—SB—C.

N.B. Higher medals than those here offered for Roses cannot be given by the Judges. And if Roses are brought for exhibition without attention to the regulations here explained, they will not be allowed to be placed on the tables.

- Cape Heaths, in collections of 20 distinct varieties. GB—SG—LS.

N.B. It is expected that the same plant shall not be exhibited on more than one occasion.

- Cape Heaths, in collections of 6 distinct varieties. SG—LS—SK.

N.B. No person who shows in I will be allowed to exhibit also in K.

- Calceolarias, in sixes; in pots of 12 to the cast. LS—SK—SB.

- Carnations, in pans of 24 distinct varieties. LS—SK—SB.

- Picotees, in pans of 24 distinct varieties. LS—SK—SB.

- Pinks, in pans of 24 distinct varieties. SK—SB.

CLASS II.—FLOWERS; for which all persons are admitted to equal competition.

- Stove or Greenhouse Plants, in collections of 30 plants. GK—GB—SG—LS.

N.B. Heaths, Calceolarias, Fuchsias, Greenhouse Azaleas, Rhododendrons, Orchidaceae, Cacti, and Pelargoniums, to be excluded from P, Q, and R.

- Stove or Greenhouse plants, in collections of 15 plants. GB—SG—LS.

N.B. Persons exhibiting in P not to compete in Q also.

- Stove or Greenhouse plants, in collections of 6 distinct species. SG—LS—SK.

N.B. Persons exhibiting in P or Q will not be allowed to compete in R also.

- Greenhouse Azaleas, in 12 distinct varieties. GB—SG—LS.

- Greenhouse Azaleas, in 6 distinct varieties. SG—LS.

N.B. No one can show in both classes of Azaleas.

- Stove or Greenhouse climbers, in collections of 6 species. SG—SK.

- Exotic Orchidaceae, in collections of not fewer than 20 species. LG—GK—GB.

N.B. Exhibitors cannot show in more than one of the classes, V, W, and X.

- Exotic Orchidaceae, in collections of not fewer than 6 species. GK—GB—SG.

- Exotic Orchidaceae in single specimens. SG—LS—SK.

- Plants in glass cases, grown on Mr. Ward's plan. SG—LS—SK.

N.B. It is highly desirable that these cases be made with a movable door, so as to prevent the condensation of the water on the inner face of the glass during the time of exhibition.

- Distinct varieties of Tall Cacti in flower. GB—SG—LS.

N.B. The GB and SG Medals are not to be given if fewer than six varieties are exhibited.

- Fuchsias in collections of 12 distinct varieties. LS—SK.

- Cinerarias, in pots, in collections of 12 distinct varieties. SK—SB.

- Single Specimens of new or extremely rare ornamental plants. SG—LS—SK—SB—C.

N.B. These Medals will be awarded by the Society's Officers, and not by the usual Judges. Exhibitors will particularly observe that none but new or rare plants can be exhibited under this letter. Nothing will be regarded as new which has been exhibited in the Gardens in a previous season.

- Miscellaneous subjects. SK—SB—C.

N.B. Cockscombs, Heartsseas, Hydrangeas, and cut flowers, are altogether excluded from exhibition. Exhibitors under this head will not be thereby entitled to a pass ticket.

- Seedling Florist's flowers. SK—SB—C.

N.B. Every seedling must be shown singly, and must be marked with the name it is to bear. The same seedling cannot gain a prize more than once in the season. Pelargoniums are to be shown in pots, and not in a cut state. No person will be allowed to exhibit more than five seedlings at each meeting. Exhibitors under this head will not be thereby entitled to a pass ticket.

IN ADDITION to any medals assigned to the classes I, P, Q, and W, the SK and SB medals are offered for the two collections in those classes which shall be best named by the Exhibitor.

N.B. The Society's officers, who will make this award, will be guided in their judgment by a consideration not only of the correctness of the names, but of the accuracy of the spelling, and the neatness of the writing.

CLASS III.—FRUIT; for which Market Gardeners, Fruiterers, or persons in the habit of regularly supply-

ing the market, and private growers, exhibit independently of each other.

N.B. All fruit must be fully ripe and well-coloured; if the contrary it will be disqualified.

FF. Miscellaneous collection of fruit, consisting of at least three different kinds, Peaches and Nectarines being considered as only one kind. GK—GB—LS.

N.B. Cucumbers, Tomatoes, Gourds, and similar Kitchen Garden produce, are excluded from this letter.

GG. Grapes. SG—LS—SK—SB.

HH. Pine-Apples. SG—LS—SK—SB.

II. Peaches or Nectarines, in ashes of six specimens. SK—SB.

KK. Other kinds of fruit. SE—SB—C.

JUDGES.—The Judges have the power of increasing or diminishing the number and value of the Silver Medals offered by the Society for particular objects, and also of conferring Silver Medals or Certificates in cases not contemplated in these regulations, if they think it necessary to do so.

The Judges are also required to bear in mind that the Society's Medals are offered less for new and curious objects, than for fine specimens of Horticultural skill, the design of the Council in instituting these meetings being not so much to encourage the collector as to reward the skilful Gardener; they are also not to make any award in cases where the objects exhibited do not appear worthy of a Medal: otherwise a bad single exhibition might obtain a prize, more, because there is no better exhibition of the same class to oppose it.

Copies of the above list may be obtained at 21, Regent-street, upon application to the Secretary.

FASTOLFF RASPBERRY.

PATRONISED BY HER MOST GRACIOUS MAJESTY THE QUEEN, HIS GRACE THE DUKE OF RUTLAND, THE EARL OF HARRINGTON, THE LORD BISHOP OF LONDON, LORD VISCOUNT LORTON, LORD SONDES, &c.; as well as by the HORTICULTURAL SOCIETY OF LONDON.

YOUELL & Co. have much pleasure in announcing they will be enabled to supply, at the latter end of Oct. next, fine Canes of the above highly-valuable and much-esteemed RASPBERRY—unequalled for the extraordinary size of its fruit and richness of flavour. Those to whom Y. & Co. sent last season have expressed their high admiration of its superiority over all other varieties, and it has been awarded several prizes at various Horticultural exhibitions during the season. As a proof that they have not exaggerated its excellent qualities, Fruit was submitted to Dr. LINDLEY (see *Gardener's Chronicle* of the 22d July. page 502), whose opinion of it is as follows:—"FASTOLFF RASPBERRY.—We have received from Messrs. YOUELL, of Great Yarmouth, fruit of the Fastolff Raspberry, and we find that it merits all that has been stated in favour of its excellence. The fruit received is very large, obtusely conical, and of rich flavour, far exceeding in this respect some other new and large varieties. The plants bear abundantly and in long succession." They also exhibited it, on the 1st of August, before the London Horticultural Society, 21, Regent-street, and a prize was awarded to them. It would, therefore, be unnecessary for YOUELL & Co. to recommend it more fully, or with greater confidence, to the notice of the public, merely observing that it continues in high perfection throughout the autumnal months, and has maintained its superiority in the most unfavourable soils and situations, and requires no other than the ordinary treatment of the old varieties. Fine Canes will be ready by the latter end of October, and can be sent with safety to any part of the United Kingdom (on the receipt of a Post-office order) upon the following terms:—

	£	s.	d.
Packages containing 100 Canes	2	5	0
" " 50 " "	1	5	0
" " 25 " "	0	14	0

Packages included. The usual discount to the Trade, when not less than 200 are ordered.

Extensive orders are already received for the above; and to prevent a repetition of the disappointment which many experienced last season, by Y. & Co. not being able to meet the demand, they therefore respectfully solicit early application.

Myatt's "British Queen" Strawberry, 20s. per 100.

"Eliza" 10s. "

Great Yarmouth Nursery, August 31, 1843.

NEW SEEDLING PICOTEEs.

Raised by the Rev. J. BURROUGHS, of Norwich. Mrs. Beavon, red edge, 10s. 6d.; Miss Jane, fine purple edge, 10s. 6d.; and Miss Osborne, scarlet edge, 7s. 6d.

MESSRS. NORMAN being appointed to send these out, feel confident the first two will give great satisfaction, having grown two pairs of each, and have exhibited them in their winning pans; also first prize for Mrs. Beavon, in class-shewing; they possess beautiful long pods, petals large with a good wire-edged round edge, making a noble back tier flower. The stock being limited, early application will be necessary. They have also fine plants of John's Prince Albert, purple edge, 7s. 6d. per pair. N. & B. NORMAN beg to state that their Catalogues can be had, on prepaid application, of their select and useful Show varieties, with which they have gained 29 prizes at the principal exhibitions near London.—Bull Fields, Woolwich.

TO GROWERS OF FANSIES.

JAMES MAY begs to return his most sincere thanks to his numerous Customers and Friends for all past favours, and at the same time begs to apologise to many for not being able to comply with many orders which he was favoured with last spring, in consequence of being short of plants, his stock having suffered so much by his removal from Edmonton. J. M. is now happy to inform the Public that he is now ready to send out fine healthy plants, consisting of all the best varieties, at moderate prices, a list of which may be had upon a prepaid application. Extra fine Pansy Seed, all warranted collected from the best named varieties, 2s. 6d., 5s. to 10s. per packet.

MAJ'S Crimson Superb Sweet William, plants, 4s. per doz.; seed, 1s. per packet.

Pansy Nursery, Tottenham, near London.

NEW PELARGONIUMS.

W. E. RENDLE respectfully informs Amateurs who are in want of a few good Pelargoniums to improve their collections, that he will supply a selection from the following sorts at FIVE POUNDS PER DOZEN:—Lyne's Lord Ebrington, Princess Royal, Cynthia, Hamlet, and Glory of the West; Rande's Cornish Gem, Fanny, Aurora, Pride of Exe Vale, Circassian, Constellation, Count d'Orsay, Creole, Dido, Fair Maid of Devon, Grand Monarch, Lavinia, Oberon, Queen of the Fairies, Sapphire, Favourite, and Sir Robert Peel; with a Plant of

LYNE'S DUKE OF CORNWALL, OR SUNRISE.

Catalogues of Pelargoniums can be obtained—Plants will be delivered in October next—Orders will be executed in strict precedence—Plants will be added to compensate for carriage—Reference or remittance required from unknown correspondents.—Union-road Nursery, Plymouth, August 31, 1843.

ARRIVAL OF DUTCH HYACINTHS AND OTHER BULBS.
YOUNELL & Co. beg respectfully to inform the readers of the *Gardeners' Chronicle* that one of their Firm has just returned from Haarlem, having elected a most extensive Stock of the finest HYACINTHS, as well as a general assortment of BULBS, for which that city is justly famed; and flatter themselves, from the facility of communication between Yarmouth and Haarlem, the distance not occupying more than 10 or 12 hours, and from the varieties being chosen for their great beauty and size of flowers during the blooming season, that the List will be found to contain none but the very best sorts, adapted either for glasses, forcing, or open border culture. Prices, as follows:

Fine Single or Double Show Hyacinths . . . 6s. per doz.
 Red, Blue, White, or Yellow
 Extra fine Ditto . . . 9s. to 12s. "
 Extra fine, and very superior Ditto . . . 18s. "
 The selection being left to YOUNELL & Co.

Also, Narcissus, Early Single and Double Tulips, Jonquils, Gladiolus, Iris, Ixias, Ranunculus, Double and Single Anemones, Crocus, &c., Catalogues of which may be had on application. Bulbs added to compensate for long carriage. A few plants of Hydrangea japonica, 15s. each.—Great Yarmouth Nursery, Aug. 31, 1843.

SEEDLING VERBENAS.

S. GIRLING, of Danecroft Nursery, Stowmarket, begs to offer the under-mentioned SEEDLINGS, as superior and distinct from any others in cultivation, and refers his Friends, and Purchasers generally, to the opinions given in the *Gardeners' Chronicle* of July 22, and following weeks; independent of which they have been seen by several extensive growers and first-rate judges, professional and amateur, who have ordered them liberally. They will be ready to send out on the 1st of October, and can be had on forwarding a Post-office order for the amount, by unknown correspondents, or some respectable reference.

AMETHYSTINA—A beautiful bright lavender; large pips; forming an immense truss of fragrant flowers. 5s.
BEAUTY—Fine lively cherry-coloured pink; excellent shape and habit; immense bloomer: one of the most distinct and beautiful of all the Verbenas in cultivation. 5s.

BRIDESMAID—A beautiful pale bluish, tinted with blue; very fine. 3s. 6d.

BOULE DE FEU—This is of the most dazzling scarlet, making all other scarlets appear as pink or pale crimson. 3s. 6d.

FORTUNE-TELLER—Blush pink; immense trusser, some of which measure 10 inches in circumference. 3s. 6d.

LONGIFLORA—Violet purple; very large, and remarkable for the length of its tube: fine. 3s. 6d.

RENOUVEAU—rich maroon, fine shape, and very compact, extra fine. 3s. 6d.

MINSTREL BOY—lilac and white, with a bright pink eye, a pleasing and good variety, 3s. 6d.

WHITE PERFECTION—a beautiful pure white, with bright blue centre, excellent shape, and habit fine, 3s. 6d.

N.B.—The above can be had separately, at the prices quoted, or the set of Nine for 25s. A double set for 45s.; or treble, for 3s., inclosed in tin-boxes, where a set are taken, and forwarded, post free, to any part of the kingdom.

S. G. also begs to state that he will have two fine distinct Seedling Fuchsias to send out early next spring, at which time Plants of all the leading kinds in cultivation can be had at moderate prices. To Dahlia Growers, S. G. takes this opportunity of saying, his extensive Collections are nearly in full bloom:—by rail communication from the Eastern Counties' Railway to Colchester, and thence by Criterion coach you reach Stowmarket the same evening, and the same coach leaves Stowmarket every morning (Sundays excepted), quarter before eight, and reaches London by one o'clock the same day; fare from London to Stowmarket, 10s.

UNRIVALLED NEW FUCHSIA, "LOWRYII."

JOHN HANCOCK & SON beg to invite the attention of the Floricultural World to the above **SPLENDID NEW FUCHSIA**, of which they have purchased the entire stock, and can with the greatest confidence pronounce it the best variety yet out. It possesses all the qualities now so much aimed at; it is of large size and substance, peculiarly brilliant in colour, and with that necessary appendage, a beautiful blue corolla and truly elegant habit. It cannot fail to give satisfaction to all who purchase it.

Plants will be ready on the 15th September next, at 10s. 6d. each, and will be sent by post (prepaid) carefully packed in tin cases. For a full description of this Fuchsia see Advertisement in the *Gardeners' Chronicle* and *Gazette* of the 26th ult.

J. H. & Son can supply good plants of all the New Geraniums, Fuchsias, Verbenas, &c., sent out this season, with many other new plants; catalogues of which may now be had on application by inclosing two postage stamps. All the varieties are accurately described in the above list.—Wear Nurseries, Durham, Aug. 30.

WOODLAND'S NURSERY, MARESFIELD, NEAR UCKFIELD, SUSSEX.

WILLIAM WOOD and SON have the pleasure of informing their Friends and the Floricultural Public, that Specimens of their **AUTUMNAL ROSES** are still exhibited at Messrs. **WARNER and WARNER'S**, Seedsmen, 28, Cornhill, and will continue to be shown there during the season. Woodlands, Aug. 31.

H. CORSTEN, FLORIST to Her Majesty the Queen, 19 A, Davies-street, Berkeley-square, has for Sale, Boxes containing the undernamed **DUTCH ROOTS**, at 2s. each box, or half the quantity, at 1s.:—One dozen double Hyacinths, named; one dozen single ditto; one dozen double Duc Van Tholl Tulips, one dozen single ditto; one dozen Tournesol ditto, one dozen Irish Angelica, one dozen ditto Hispanica, one dozen Narcissus, one dozen double Jonquils, one dozen Ranunculus, one dozen Anemones, and 100 Crocus, in all colours.—Remittance required.

SPLENDID SCARLET GERANIUMS.

THE LOVERS of the above general favourite Flower are respectfully invited to visit **CONWAY'S NURSERY**, where they may see Specimens grown upon a new principle, in the open borders and in pots, that will be worthy of their notice.

N.B.—A few fine specimens of the best large growing varieties, well adapted for training against the walls, &c. of Conservatories, to be disposed of; they are from two feet to six feet in height, and bushy in proportion.

CONWAY'S new and handsome Forcing Geranium **LANEII**, unquestionably the best yet raised for that purpose; strong Plants, fit for forcing next winter, at 3s. 6d. each; or 6 plants, 18s. Old Brompton Road, Earl's-court, near the West of London Cemetery.—Sept. 1, 1843.

T. and C. LOCKHART & DUNCAN, FLORISTS and SEEDSMEN, 156, Cheapside, London, have just published their List of Flower-roots for the present season, which they will forward post-free on application. They have purchased of a celebrated Florist at Haarlem, the entire stock of three new and distinct **DOUBLE HYACINTHS** of great beauty, and suitable for Glasses or Pots. They have named them—

Admiral of the Red . . . each 2s. 6d.
 Admiral of the Blue . . . " 2 6
 Admiral of the White . . . " 2 6

T. and C. L. and D. beg to call particular attention to the various novelties contained in their List, and are happy to add that all the roots have arrived in excellent condition, for which they solicit early orders.

DR. HORNER is about to part with his **FINE COLLECTION OF RANUNCULUSES**; hence they are now offered for sale. They consist only of the rarest and finest varieties, being chiefly a selection from the best of Tyso's, Lightbody's, and Weterstone's, with a few others. There are about 1300 or 1400 roots, and nearly 200 sorts; they will be parted with very much below their cost and value. Parties may be referred to who have seen them in bloom.—Hull, Aug. 28, 1843.

MYATT'S NEW SEEDLING STRAWBERRIES.

J. and W. MYATT are now ready to send out their **NEW STRAWBERRY**, the **DEPTFORD PINE**, the fruit of which has been exhibited at the London Horticultural Society, and a Banksian Medal awarded. It has also been submitted to Professor LINDLEY, for whose opinion see *Gardeners' Chronicle*, No. 26, p. 417. It is a most prolific bearer, exhibiting at the same time a profusion of fine fruit and bloom on the same truss. Price, Deptford Pine, 2s. 10s.; British Queen, 1s., and Eliza, 10s. per 100.—Manor Farm, Deptford, July 22, 1843.

THE BRITISH QUEEN AND PRINCE ALBERT PEAS

J. CORMACK & CO., beg to announce to their Friends and the Public that they have harvested the above two New Varieties, and will be obliged by early orders, as the stock is limited. They will be sent out, as last spring, in packages, bearing the name of the firm, price 3s. 6d. per quart. The usual allowance to the trade.

N.B.—"CORMACK'S Early Kent Pea," 14s. per bushel. Newcross, Aug. 30, 1843.

STONE'S SUPERB EARLY CABBAGE SEED.

W. STENT, NURSERY and SEEDSMAN, Stockwith, Gainsborough, begs to inform the trade, that he has about 100lbs. of the above Seed (of this year's growth), which he can recommend as genuine, at 12s. per lb., having received the Stock direct from Mr. STONE's, as his very best kind. Orders, with remittances, will receive immediate attention. Stockwith, Aug. 30, 1843.

GEORGE MILLS having this season saved SEEDS of his **EARLY FORCING CUCUMBER** with great care, offers it with confidence to the public, as the best kind known to him, at 5s. per packet, containing six Seeds, which will be sent free on the receipt of a Post-office order payable at Brentford.

G. M. begs to observe, that however good the kind of Cucumber, good fruit cannot be obtained at an early season unless the seed has good substance and is well organised, a point often unthought of. It is generally supposed that if it will grow it is sufficient; it is not more particularly when sown in the autumn.

Gunnersbury Park, Acton, Middlesex, August 18, 1843.

NATIONAL LOAN FUND LIFE ASSURANCE, ANNUITY, and DEFERRED ANNUITY SOCIETY,

Capital, 500,000l.—Empowered by Parliament.

DIRECTORS.

T. Lamie Murray, Esq., Chairman.
 John Elliotson, M.D., F.R.S. George Langley, Esq.
 John Griffith Frith, Esq. John Rawson, Esq.
 H. Gordon, Esq. Clement Tabor, Esq.

Joseph Thompson, Esq.

AUDITORS.—Professor Wheatstone, F.R.S.

Professor Graves, A.M., F.R.S.

ACTUARY.—W. S. B. Woolhouse, Esq., F.R.A.S.

The superior advantages to those Assured with this Society will be best understood by a comparison of its principles and a reference to the last Annual Bonus declared on Policies of five years' standing, viz.:

Entry	Policy No.	Age.	Sum.	Annual Premium.	Bonus added.	Cash Bonus.	Prem. reduced.
1837	39	59	1,000	£ 7 8 4	£ 132 14 6	£ 58 19 9	£ 8 19 4
1838	114	55	3,000	£ 175 15 0	£ 296 9 7	£ 123 0 6	£ 16 9 7

Policies now entered upon entitled to participation in next Annual Division. Two-thirds of all premiums paid can be borrowed by the Assured without loss of Policy.

F. FERGUSON CAMROUX, SECRETARY.

COTTAM and HALLEN, ENGINEERS, IRON-FOUNDERS, &c. &c., No. 2, WINSLEY STREET, OXFORD STREET, LONDON, and at CORNWALL ROAD, LAMBETH.

GARDEN ROLLERS 18 inches long, 34s.; 20, 44s.; 22, 50s., 24 inches, 60s.; 26, 75s.; 28, 84s.; 30, 105s. each.

CAST-IRON RICKSTANDS, 2 feet 6 inches high, 5s. 9d. each. Garden Engines, Mowing Machines, Garden Chairs, Superior Garden Tools of all kinds, Garden Vases and Pedestals in great variety, and every description of Horticultural Articles, Agricultural Implements, and Furnishing Ironmongery; Dr. Arnott's Stoves, Anglo-Belgian Cooking Stoves; Broiling Stoves. The above low prices being on account of the depression in the Iron Trade, are subject to future alterations.

HOTHOUSES, CONSERVATORIES, &c., made upon the most improved principle, either of iron or of iron and wood combined, which can be fixed complete in any part of the Kingdom, at very low prices, in consequence of the present depressed state of the Iron Trade.

HOT-WATER APPARATUS for heating Hothouses, Conservatories, and Greenhouses; Churches, Public, or Private Buildings, &c., with COTTAM'S PATENT, or ROGERS' BOILERS. After 15 years' experience, and having fixed upwards of 1500 Apparatuses for the above-mentioned purposes, and by various improvements which they have made during that time, C. and H. can with confidence undertake the erection of similar Apparatus upon the most extensive scale. For the convenience of those who wish to fix their own Apparatus, they have affixed the following low prices:—

Cottam's Patent Boiler, 24 inch . . . £7 0s. 0d.

(Larger Sizes in proportion.)

Rogers' Boiler, small size . . . 3 15 0

Do. do. large do. . . 4 10 0

Hot-water Pipe, 4 inch diameter, 1s. 3d. per Foot.

STRONG IRON HURDLES, 3 ft. high, out of the ground, 6 ft. long, with five horizontal bars, weighing about 36 lbs., 3s. 6d. each. Light Cattle Hurdles, 3 ft. 6 in. high, weighing 42 lbs., at 4s. 0d. each.

Strong do. do. do. 45 lbs. at 4 4 "

Ox Hurdles, 4 feet high, do. 60 lbs. at 5 6 "

BEST WIRE FOR STRAINED WIRE FENCING at 8s. per bundle of 150 yards each. Uprights for ditto, 7d. each. The Improved continued, and every other kind of Fencing, Fancy Wire-work, &c.

HAND-GLASS FRAMES for Cucumbers, &c., 18 inches square, 3s. 6d.; 20 inches, 4s. 6d.; 22 inches, 5s. 6d. each. **CAST-IRON FLOWER-STAKES** 4 feet long out of the ground, 7s.; 4 feet 6 in., 5s.; 5 feet, 11s.; 6 feet, 15s.; 7 feet, 20s. per dozen. Show-Rooms at the Manufactory, No. 2, WINSLEY STREET, where every information may be obtained.

RENDLE'S TANK SYSTEM OF HEATING.

STEPHENSON AND CO., 61, Gracechurch-street, London, Inventors of the **IMPROVED CONICAL and DOUBLE CYLINDRICAL BOILERS**, having been much engaged in heating buildings upon the above system with Tanks of various materials, solicit the attention of scientific Horticulturists to an Iron Tank now fitting up on their premises, which offers most decided advantages over every other article hitherto employed for the same purpose. These tanks which are ornamental in appearance can be made from 10 to 100 feet long and of any width and depth, and can be connected or disconnected by any working Gardener without the slightest difficulty, thus affording the opportunity to persons in remote districts of employing this much approved method of heating without the assistance of Engineers. The Tanks can be applied to Boilers and Pipes already fixed, and from the present low price of Iron will be found cheaper than of any other material. Mr. RENDLE, of Plymouth, has kindly undertaken to receive orders and furnish information to any persons in his neighbourhood, and prices for any size will be forwarded upon application to S. and Co.

HORTICULTURAL BUILDING & HEATING by HOT-WATER.

J. WEEKS & Co., ARCHITECTS, &c., Gloucester-place, King's-road, Chelsea, Hot-house-Builders, and Hot-water Apparatus Manufacturers, beg leave to inform the Nobility and Gentry, that their business, which has been extensive throughout the country for many years, is entirely confined to the **BUILDING OF HORTICULTURAL ERECTIONS** of every description, and the **HEATING** of them by **HOT WATER**.

CONICAL and other **BOILERS** of all sizes; their largest consumes but a small quantity of fuel, only requiring attention once in 10 hours, and will heat a range of Forcing-houses 300 feet in length.

Their improved plan of **BOTTOM-HEAT FOR PITS**, by means of an open trough under the bed, is now being universally adopted.

References may be had, and their works seen at most of the Nobility and Gentlemen's seats in the country, nearly the whole of the London Nurseries, and a great variety of Horticultural Erections and Hot-water Apparatus, Models, Plans, Estimates, &c., at their Horticultural Manufactory, Gloucester-place, Chelsea, near Sloane-square.

THE CONICAL HOT-WATER BOILERS, invented by J. ROGERS, Esq., may be obtained of any size from **JOHN SHEWEN**, Ironmonger, &c., Sevenoaks, Kent.

J. SHEWEN having had every opportunity afforded him by an extensive practice to bring this apparatus to perfection, begs to offer it as most efficient and economical; it may be seen at Messrs. Chandler & Sons' Nursery, Vauxhall; Messrs. Loddiges', Hackney; Messrs. Henderson's, Pine Apple-place; Messrs. Veitch and Son's, Exeter; Mr. Pontey's, Plymouth; the Royal Botanical Society's Gardens, Regent's Park; and at the Gardens of the Horticultural Society of London. Considerable improvements have been effected since last season; particulars of which are in course of preparation.

HOT-WATER APPARATUS FOR HEATING

HORTICULTURAL BUILDINGS, DWELLING-HOUSES, CHURCHES, and MANUFACTORIES, upon improved principles, and at very moderate charges, erected by **DANIEL and EDWARD BAILEY**, 272, HOLBORN.

D. and E. BAILEY having devoted much time to the consideration of this subject, and had much experience in the erection of apparatus for the above-mentioned purposes, have, by improvements suggested in their practice, rendered their mode of heating not only very efficient, but very simple, and have combined durability in the apparatus with economy in the charge. They have erected apparatus in England, Scotland, and Ireland, for many noblemen and gentlemen, and have had the honour to be employed by the Horticultural Society of London, in executing the works of their splendid Conservatory, lately erected at Chiswick.

D. and E. BAILEY also construct in metal all descriptions of Horticultural Buildings and Sashes, and invite noblemen, gentlemen, and the public to an inspection of their various drawings and models, at 272, Holborn, where they have the opportunity of exhibiting, amongst other metal works, an extremely complete and convenient kitchen apparatus, or range, adapted for the continued supply of hot water, and an arrangement of the oven more complete than has hitherto been brought before the public.

D. and E. BAILEY were the first to introduce metallic curvilinear houses to horticulturists, and can refer to the Conservatory attached to the Pantheon as one of their works, besides many others in this country and on the Continent.

D. and E. BAILEY have prepared a quantity of the Galvanic Plant Protectors, which are now ready for immediate delivery; they beg to introduce to public notice a new Trough Pipe, for Orchidaceous or other Houses where vapour is constantly, or at intervals required, and which may be seen at their Manufactory.

AGRICULTURAL MACHINE WORKS, BEVERLEY, YORKS.

CROSSKILL'S LIQUID MANURE CART, which received the Honorary Reward of the Roy. Agricul. Society.

The Body of the Cart is made of Cast-Iron, and holds about 200 gallons. A, The Brass Valve Lever. Without stopping the horse, the man pulls the Iron Lever, A, to let out the liquid upon the Spread-Board, C. B, Patent Iron Pump, which cannot possibly choke or get out of order. E, The Flexible Leather Pipe, 7 ft. long, with 3 ft. copper pipe at the end.—Price, delivered in Hull, 25l.

CROSSKILL'S PORTABLE MANURE DRILL, for drilling any quantity of soot, lime, salt, &c.—will contain 8 bushels of manure—price 12l. 12s.

J. B. LAWES'S PATENT MANURES, composed of Super Phosphate of Lime, Phosphate of Ammonia, Silicate of Potash, &c., are now for sale at his Factory, Deptford-creek, London, price 4s. 6d. per bushel. These substances can be had separately; the Super Phosphate of Lime alone is recommended for fixing the Ammonia of Dung-heaps, Cesspools, Gas Liquor, &c. Price 4s. 6d. per bushel.

WHEAT-SOWING.

POTTER'S GUANO.—The superiority of this powerful MANURE being now completely established, it is only necessary to inform the public that a material reduction has been made in the price, and that it may be obtained either at the Works or of Mr. POTTER'S Agents, who have testimonials of its efficacy.—28, Upper Fore-street, Lambeth, London.

* * * Nurserymen required as Agents in all the principal towns.

GUANO ON SALE,
BY THE IMPORTERS,
ANTHONY GIBBS & SONS, LONDON;

MESMERIC SLEEP.

Just published, in small 8vo, price 5s.,
NEURYPNOLOGY; or, The Rationale of Nervous Sleep, considered in relation with Animal Magnetism; Illustrated by numerous Cases of its Successful Application in the Relief and Cure of Disease.

By JAMES BRAID, M.R.C.S. Edin., C.M.W.S., &c.
"Unlimited scepticism is equally the child of imbecility as implicit credulity."—*Dugald Stewart.*

"It deserves to be studied and carefully examined by every member of the medical profession, and by every man having the slightest pretensions to a knowledge of natural science, or the laws by which mind and matter reciprocally act and react on each other. He has conferred an incalculable benefit on the public by explaining so clearly the 'Rationale of Nervous Sleep.'"—*Edinburgh Evening Post.*

"Here is a splendid benefit opened up to the view of mankind. We recommend Mr. Braid's book to the public."—*Scotsman.*
JOHN CHURCHILL, London; A. and C. Black, Edinburgh.

Just published, 8vo, price 2s. 6d.,

CATARACT and its TREATMENT; comprising an easy mode of dividing the Cornea for its extraction, and appropriate means for removing the different forms of that affection. By JOHN SCOTT, Senior Surgeon to the Royal London Ophthalmic Hospital, Surgeon to the London Hospital, &c.
London: JOHN CHURCHILL, Princes-street, Soho.

Just published, 8vo, cloth, price 4s.,

HASTINGS, considered as a RESORT for INVALIDS, with Tables, illustrative of its Temperature, Salubrity, and Climate, showing its suitability in Pulmonary and other Diseases; also Directions for the choice of a Residence, and Hints as to Diet, Regimen, Bathing, &c. By JAMES MACNESS, M.D., Physician to the Hastings Dispensary.
London: JOHN CHURCHILL, Princes-street, Soho.

Just published, 8vo., cloth, price 5s.

OBSERVATIONS on ULCERS of the LEGS and other Parts; showing that the most obstinate Sores may be safely and speedily cured by mild Methods of Treatment. To which are added some Remarks on Scrofulous Disorders. By ARCHIBALD MAXFIELD, Surgeon to the South Hants Infirmary.
London: JOHN CHURCHILL, Princes-street, Soho.

Just published, Third Edition, 8vo., cloth, 5s.
THE ANATOMY of the BLADDER and of the URETHRA, and the Treatment of the Obstructions to which these Passages are liable. By G. J. GUTHRIE, F.R.S., Surgeon to the Westminster Hospital.

By the same Author,
ON INJURIES of the HEAD affecting the BRAIN; 4to. boards, 6s.
London: JOHN CHURCHILL, Princes-street, Soho.

PUBLISHING MONTHLY.

LARGE, 1s. 6d.; SMALL, 1s. GARDENERS' EDITION, 6d. **THE BOTANIC GARDEN; OR, MAGAZINE OF FLOWERING PLANTS.**
WITH MANY IMPORTANT AND USEFUL ADDITIONS.
By B. MAUND, F.L.S.

Each Number contains BEAUTIFULLY-COLOURED FIGURES OF ORNAMENTAL PLANTS, both herbaceous and shrubby; suitable for the Flower Garden or Pleasure Ground. With the derivations of names; classes; orders; height of the plants; time of flowering native country; history; qualities; most approved modes of propagation and culture; and other information, interesting to every lover of a Garden. Annexed to each Number, is the

FLORAL REGISTER.

With Woodcuts of admired Flowering Plants, mostly such as have been newly imported into this country; with the necessary information respecting them. Also,

THE AUCTIONEER.

In which are given, improved methods of cultivation and preservation of vegetables, fruits, and flowers; new discoveries connected with gardening; and miscellaneous information. Also, each Number, till complete, commencing with the new volume, on the 1st of January, 1843, a portion of Professor Henslow's

BOTANICAL DICTIONARY.

Written expressly for the Author, there being so great a want of such a Work. Thus, the BOTANICAL GARDEN contains four distinct parts, proceeding together, at a trifling cost, once a month.

The Volumes already completed of this Standard Botanical Work, can be had at the following Prices.

	LARGE.	SMALL.
Half-bound, green mor. backs, gilt edges, each 2	2 0	1 10
Cloth gilt, beautifully embellished	2 0	0 0
Drab boards	1 17	0 15

The portions of the FLORAL REGISTER and AUCTIONEER, already published, contain nearly Twelve Hundred Engravings, forming a handsome volume, which will be delivered GRATIS to the purchaser of four volumes of the BOTANICAL GARDEN.

GROOMBRIDGE, PATERNOSTER-ROW.

RENDLE'S TANK-SYSTEM OF HEATING.

Second Edition, just published.
A TREATISE (with Engravings), on Mr. RENDLE'S SYSTEM of HEATING HORTICULTURAL BUILDINGS, is now obtained of the Author, or through all Booksellers, at 5s. each copy.
LONGMAN, BROWN, GREEN, and LONGMAN.
Union-road Nurseries, Plymouth, Aug. 22, 1843.

Just published, price Eightpence,
THE FARM-BAILIFF. This work, which forms one of the Series of "Guides to Service," contains an outline of the Practical Duties of Farm Bailiffs, with exemplifications of the most approved methods to be followed in the routine management of a Farm; adapted as well to the use of Farmers generally. Of the "GUIDES TO SERVICE," there have appeared:—The Cowherd—Shepherd—Ploughman—Dairy Maid—Poultry Maid—Groom and Coachman—Servant of All-work—Cook—House Maid—Nursery Maid—Lady's Maid—Clerk—Banker's Clerk. Of the "GUIDES TO TRADE"—The Miller—Baker—Plumber, Painter, and Glazier—Cabinet Maker and Joiner—Cooper—Carver and Gilder—Printer—Tailor—Milliner—Shoemaker—Chemist and Druggist.

London: CHARLES KNIGHT and Co., 22, Ludgate-street.
Just Published, price 6s. cloth,
THE HAND-BOOK OF CHEMISTRY; with a complete Index of Reference. By G. H. CAUNTER, Esq.
London: W. S. ORR & Co.; and W. & R. CHAMBERS, Edinburgh.

RURAL CHEMISTRY.

Now ready, price 4s. 6d.,
By EDWARD SOLLY, Esq., Jun., F.R.S.,
Experimental Chemist to the Horticultural Society of London,
Hon. Mem. of the Royal Agricultural Society, and Lecturer
on Chemistry, at the Royal Institution.
&c. &c. &c.

Extracts from the Introduction.—

"A knowledge of the chemical composition of soils and the various substances employed as manures enables us to comprehend the mode in which the latter act: and a knowledge of the nature of those substances which plants require, points out the best and most economical methods of restoring to the soil, by manures, those substances which plants remove from it."

"If the farmer knows what it is that gives the fertilizing powers to manure, and is aware of the nature of those substances, he will soon learn the best method of preserving and using them: he will then understand how to make the most of the various sources of manure at his disposal, and he will be enabled readily to save much, that, for the want of such knowledge, would otherwise be lost."

Index of Contents.

Acclimatizing Acid, benzoic	Cherry-tree gum	Growth of plants
Acid, carbonic	Chloride of sodium	Guano
Acid, humic	Chlorine	Gum
Acid, lactic	Fider	Gum arabic
Acid, muriatic	Citric acid	Gum, cherry-tree
Acid, nitric	Clay	Gum, resin
Acid, phosphoric	Clay, burnt	Gunpowder
Acid, sulphuric	Climate, effects of	Gypsum
Acid, sulphurous	Clover, analysis of	Hair
Acid, uric	Coal, ashes of	Hard water
Acids	Coal gas	Hartshorn
Acids, organic	Cocoa-nut oil	Heat
Acids, tests for	Cohesion	Heat, latent
Action of plants on the air	Coke	Hoofs
Active principles of plants	Colour	Horns
Affinity	Colour of soil	Humates
Air	Colours, changing of	Humic acid
Air, bad	Colours of plants	Humus
Air, good	Colouring matter	Humus, decay of
Air, inflammable	Combination	Hydrogen gas
Albumen, animal	Combining numbers	Hydrogen, carburetted
Albumen, vegetable	Combining weights	Hydrogen, sulphur-
Ale, bottled	Combustion	ected
Alkali, volatile	Combustion, results of	Ice
Alkalies	Common salt	Inflammable air
Alkalies, vegetable	Composition of bodies	Inflammable gas
Alum	Composition of soils	Inorganic manures
Alumina, sulphate of	Composition of water	Iodides
Ammonia	Compounds, binary	Iodine
Ammonia, fixing	Compounds, all de-	Iron
Ammonia, fixing by acids	nite	Iron, carbonate of
Ammonia, fixing by gypsum	Compounds, saline	Iron, oxide of
Ammonia, fixing by copperas	Compounds, ternary and quaternary	Iron, peroxide of
Ammonia, carbonate of	Contagion	Iron, protoxide of
Ammonia, muriate of	Contagious matters	Iron-stoves
Ammonia, phosphate of	Copperas	Iron, sulphate of
Ammonia, sulphate of	Corn	Iron, sulphuret of
Ammoniacal liquor of the gas-works	Crops, rotation of	Ivory
Animal manures	Cubic nitre	Kelp
Animal principles, proximate	Cultivated lands	Latent heat
Animal substances	Decay	Lead, red
Aquafortis	Decay of humus	Lead, white
Arrow-root	Decomposition	Lead, oxides of
Attraction	Decomposition of stony particles	Leaves
Ashes	Deliquescent	Leaves, use of the
Ashes, wood	Dew	Legumine
Ashes of plants	Diamond	Lettuce
Ashes of coal	Division, mechanical	Light
Ashes of sea-weed	Draining	Light, effects of
Atoms	Dung	Lighting a fire
Bad air	Dutch rushes	Lignin
Barilla	Earths	Lime
Barley	Earthy substances	Lime, carbonate of
Barley, analysis of	Earthy substances in plants	Lime, caustic
Bases	Effervescence	Lime, when useful
Bay salt	Elements	Lime, when not to be used
Beans, analysis of	Embryo	Lime, muriate of
Beet, analysis of	En.bryo of a seed	Lime, nitrate of
Binary compounds	Epsom salts	Lime, phosphate of
Bleaching	Equivalent weights	Lime, quick
Blood	Excrements	Lime, sulphate of
Bone	Excrements of sea-jowl	Limestone
Bones, boiled	Experiments	Limestone, magne-
Bones, green	Following	sian
Bottled ale	Farm-yard manure	Lime-seed
Bran	Fat	Liquid manure
Breathing of Animals	Fatty substances	Lime, large
Brimstone	Fermentation	Loss of manure
Bromides	Fertility	Lucerne, analysis of
Bromine	Fibre, woody	Magnesia
Buckwheat, analysis of	Fibrin	Magnesia, carbonate of
Bubbling, or efferves-	Fire-damp	Magnesia, caustic
cence	Fire, lighting a	Magnesia, muriate of
Burning of plants	Fixed oil	Magnesia, phosphate of
Burnt clay	Fixing ammonia	Magnesia, sulphate of
Carbon	Flax	Magnesia, salts of
Carbon in plants	Flesh of animals	Magnesian limestone
Carbonate of ammo-	Flint	Magnesium
nia	Flowers, use of	Malt
Carbonate of iron	Food of animals	Male acid
Carbonate of lime	Food of plants	Manganese
Carbonate of magne-	Food, too great a sup-	Manganese, oxide of
sia	ply of	Manure
Carbonate of potash	Formation of soils	Manures, animal
Carbonate of soda	Formation of seed	Manures, inorganic
Carbonic acid	Foul smells	Manure, farm-yard
Carbonic oxide	Fruit, ripening of	Manures, green
Carburetted hydro-	Fruit, and seeds	Manure, loss of
gen	Fruit, unripe	Manure, liquid
Carcases	Fungi	Manures, organic
Canot, analysis of	Fumigation	Manures, saline
Casem	Gas	Manures, strong
Castor oil	Gas, inflammable	Manures, vegetable
Caustic lime	Gas-liquor	Marble
Caustic potash	Gas-works	Meat
Caustic substances	Gas-works, ammoni-	Mechanical division
Chalk	acal liquor of	Metallic oxides
Changes, chemical	Gas-works, refuse of	Metals
Charcoal	Gelatine	Minium
Charring	Germination	Mixture
Cheltenham salts	Germination in oxy-	Mould
Chemical changes	gen	Mouldness
	Glass	Mucilage
	Glauber's salts	Muriates
	Glue	Muriatic acid
	Gluten	Muriate of ammonia
	Good air	Muriate of lime
	Grass	Muriate of magnesia
	Green bones	Muriate of soda
	Green manures	Muscle of animals
	Green vitriol	Mustard
		Natural vegetation

Index of Contents—continued.

Nature of the soil	Pruning	Sodium
Nitrates	Putrefaction, results of	Sodium, chloride of
Nitrate of lime	Putrefiable matter	Soft-water
Nitrate of potash	Putrefying animal matter	Soils, analysis of
Nitrate of soda	Putrid urine	Soils, colour of
Nitre	Pyrites	Soils, composition of
Nitre, cubic	Quartz	Soils, formation of
Nitric acid	Quicklime	Soil, nature of
Nitrogen	Rain-water	Soot
Nutrition of plants	Rape	Sorrel
Oats, analysis of	Raw bones	Spirit
Oil	Red Cabbage	Spirit of salt
Oil-cake	Refuse of gas-works	Spirit of wine
Oil, castor	Resins	Spring-water
Oil, Cocoa-nut	Respiration	Starch
Oil, fixed	Results of combus-	Steam

Oil of vitriol	Results of putrefac-	Straw
Oil of Poppy	tion	Strong manures
Oil of Rape	Rhubarb	Subsoil
Oil of Linseed	Ripening of fruit	Subsoil-ploughing
Oil of Mustard	River-water	Substances, in soils
Oil of Lavender	Rock-salt	organic
Oil of Cloves	Rotation of crops	Substances, volatile
Oil of Lemons	Rust	Substratum
Only matters	Rusting	Sugar
Oil-cake	Rye, analysis of	Sulphates
Organic acids	Saccharine matter	Sulphate of alumine
Organic manures	Sago	Sulphate of iron
Organic substances in soils	Saintfoin, analysis of	Sulphate of lime
Organic substances	Sal ammoniac	Sulphate of magnesia
Organised matters	Saline compounds	Sulphate of soda
Oxalic acid	Saline manures	Sulphur
Oxide, carbonic	Salts	Sulphuret of iron
Oxide of manganese	Salt, bay	Sulphuric acid
Oxide of iron	Salt, Cheltenham	Sulphurous acid
Oxides, metallic	Salt, common	Sulphuretted hydro-
Oxygen	Salt, Epsom	gen
Paring	Salt, Glauber's	Sunflower
Parsnep, analysis of	Salt, hartshorn	Tapioca
Pearlash	Salt, magnesie	Tartaric acid
Peas, analysis of	Salt, potash	Teeth
Peat	Salt, sulphate of	Ternary and quater-
Peroxide of iron	Salt, soda	nary compounds
Petre	Salt, iron	The Tropics
Phosphate of ammo-	Salt, metallic	Tobacco
nia	Salt, rock	Treacle
Phosphate of lime	Sand	Turf
Phosphate of mag-	Sawdust	Unripe fruit
nesia	Sea-fowl, excrements of	Urea
Phosphoric acid	Sea-shore	Urine
Phosphorus	Sea-water	Urine, putrid
Pickling	Sea-weed	Use of the leaves
Plants, burning of	Seeds and fruit	Use of plants
Plants, action of on the air	Seed, formation of	Vapour in the air
Plants, death of	Selection by the roots	Vegetable alkalies
Plants, food of	Shells	Vegetable manures
Plants, growth of	Shell-sand	Vinegar
Plants, nutrition of	Silica	Vitriol, green
Plaster-stone	Silicates	Vitriol, oil of
Ploughing, subsoil	Silicate of potash	Volatile alkali
Poppy	Silicic acid	Volatile oil
Potash	Silex	Volatile substances
Potash, carbonate of	Skim	Water
Potash, caustic	Slag	Water, composition of
Potash, nitrate of	Smell	Water, hard
Potash, salts of	Smells, foul	Water, rain
Potash, silicate of	Smelting	Water, river
Potassium	Soap	Water, sea
Potassium, chloride	Soap-making	Water, soft
Potato-flour	Soap-boiling	Water, spring
Potatoes	Soda	Wheat, analysis of
Pottery	Soda, carbonate of	Weeds
Protoxide of iron	Soda, muriate of	Weed-ash
Proximate animal principles	Soda, nitrate of	White of egg
Principles, active	Soda, sulphate of	White lead
Proportions		Wood-ashes
		Woody fibre
		Wool
		Yeast

Price 7s., Illustrated with Woodcuts of Birds, Cages, &c.

A NEW EDITION OF THE

NATURAL HISTORY OF CAGE BIRDS; their Management, Habits, Food, Diseases, Treatment, Breeding, and the Methods of Catching them. By J. M. BUCHSTEIN, M.D.
"A very delightful book of its kind."—*Spectator.*
"It will be welcome to every gentleman's library or drawing-room table. It is superbly got up, with an immense number of vignettes, and, in fact, rivals the beauty of the Annuals."—*Weekly Dispatch.*
London: W. S. ORR and Co.; and W. R. CHAMBERS, Edinburgh.

One Volume, price 7s. 6d.

THE LIFE AND TIMES OF RIENZI.

"Not less interesting than Sir E. Lytton Bulwer's eloquent Romance, and scarcely less romantic, is this historical record of the Conspiracy of Gabrieli."—*Monthly Repository.*
"To all who have read Sir E. Lytton Bulwer's 'Rienzi,' its perusal is, in a measure, a duty."—*Spectator.*
"A curious and pleasing volume, and full of matter of historical character and illustration."—*Literary Gazette.*
"The publication of this work is well timed . . . The Life of Rienzi is to us full of interest."—*Athenaeum.*
"Those that wish to become acquainted with the true history of a man who was, in some sort, the Napoleon of his own age and country, would do well to consult the extraordinary narrative of the 'Life and Times of Rienzi.'"—*Tait's Magazine.*
WHITTAKER and Co., Ave-Maria-lane, London.

ADAPTED FOR SCHOOLS, PRIVATE TEACHERS, AND STUDENTS.

COOLEY'S ELEMENTS of EUCLID,
With Explanatory Appendix and Exercises. Price 4s. 6d. bound.

"The best edition of the Elements which has yet appeared."—*Athenaeum.*

"Cannot be easily surpassed."—*Dublin Univ. Mag.*

COOLEY'S GEOMETRICAL PROPOSITIONS, a Key to the Exercises appended to the Elements. Price 3s. 6d. bound.

COOLEY'S FIGURES of EUCLID, with Enunciations. Price 1s. 6d.

London: WHITTAKER and Co.; sold by all Booksellers.

FAMILIAR ASTRONOMY.

By GEORGE DARLEY, A.B., Author of A System of Popular Geometry, Companion to the Popular Geometry, a System of Popular Algebra, and a System of Popular Trigonometry. 12mo, with Engravings, 5s. cloth lettered.
"There is a vast deal of astronomical information conveyed in a most winning and unassuming manner in this delightful little volume, which, not less for the novelty of its plan than the extent of its intelligence, reflects infinite credit on the taste and talents of its projector and editor, Mr. Darley."—*Sun.*
TAYLOR and WALTON, Booksellers and Publishers to University College, 28, Upper Gower-street.

DARLEY'S SCIENTIFIC LIBRARY, for the Use of Schools, Private Students, Artists, and Mechanics.—It is the purpose of this Work to furnish a Series of Elementary Treatises on Mathematical Science, adapted to the wants of the Public at large. To youth of either sex at public and private schools, to persons whose education has been neglected, or whose attention has not been directed in early life to such studies, and to Artists and Mechanics, these little Works will be found particularly suited. The principles of the various Sciences are rendered as familiar and brought as near to our commonest ideas as possible; the demonstrations of propositions are made plain for the mind, and brief for the memory; and the Elements of each Science are reduced, not only to their simplest, but to their shortest form.

1. A SYSTEM OF POPULAR GEOMETRY. Containing in a few Lessons so much of the Elements of Euclid as is necessary and sufficient for a right understanding of every Art and Science in its leading Truths and general Principles. By GEORGE DARLEY, A.B. Fourth Edition, 4s. 6d. cloth.

2. COMPANION TO THE POPULAR GEOMETRY, in which the Elements of Abstract Science are familiarised, illustrated, and rendered practically useful to the various purposes of Life, with numerous Cuts. (Second Edition.) 4s. 6d. cloth.

3. A SYSTEM OF POPULAR ALGEBRA, with a Section on Proportions and Progressions. Third Edition. 4s. 6d. cloth.

4. A SYSTEM OF POPULAR TRIGONOMETRY, both Plane and Spherical, with Popular Treatises on Logarithms, and the application of Algebra to Geometry. Second Edition, 3s. 6d. cl.

"For students who only seek this limited knowledge of these sciences, there are perhaps no treatises which can be read with more advantage than Darley's Popular Geometry and Algebra."—*Library of Useful Knowledge, Article "Mechanics."*

TAYLOR and WALTON, Booksellers and Publishers to University College, 28, Upper Gower-street.

HAND-BOOKS FOR THE PEOPLE.

THE HAND-BOOK OF GARDENING; expressly intended for Persons possessing and fond of cultivating a Garden of moderate size. Price 2s. cloth, a New and Enlarged Edition.

THE HAND-BOOK OF BOTANY; Or Linnean Lessons on Common Plants, for Field and Garden Practice. Price 2s.

THE HAND-BOOK OF AGRICULTURE; Chiefly for the use of those interested in the Allotment System. Price 1s. 3d.

THE HAND-BOOK OF COOKERY; Intended for the use of the Middle Classes. Price 2s. cloth.

THE HAND-BOOK OF THE TOILETTE; Having in view the union of Bodily Health with Beauty of Person. Price 2s. cloth.

THE HAND-BOOK OF THE LAUNDRY; Expressly intended for those who "wash at home." Price 1s. 9d.

THE HAND-BOOK OF MEDICINE; Forming a Useful Manual in time of Need, when Professional Aid cannot readily be procured. Price 2s. cloth.

THE HAND-BOOK OF NATURAL PHILOSOPHY. Price 1s. 9d.

London: W. S. ORR & Co.; and W. & R. CHAMBERS, Edinburgh.

Bound in cloth, price 5s. 6d.

JOE MILLER'S JEST-BOOK.

A Reprint from the first and genuine edition, such omissions and alterations only having been made as were required by the greater delicacy observed in modern conversation; but, that the volume might have some substance, and be a good table or travelling book, copious additions have been made from other old volumes of Facetiae.

Extract from the Preface.
"Another strange circumstance connected with this work is, that everybody presumes that he himself and everybody else are perfectly familiar with its contents... and yet, if the reader will ask his acquaintance, it will appear that not one in five hundred ever set eyes on a copy. It is in consequence of like questions that this edition is published."
London: WHITTAKER and Co.

Handsomely bound in cloth, with Ninety-three Wood Engravings. Price 6s. 6d.

ILLUSTRATIONS OF THE BIBLE, AND CONFIRMATIONS OF SACRED HISTORY, from the Monuments of Egypt. By W. C. TAYLOR, LL.D.

From the British Magazine.—"This is an elegant and well-executed little book, on a most interesting subject."

From the Birmingham Herald.—"A valuable and indispensable accession to the library of every Biblical student."

From the Rev. Thomas Hartwell Horne's Introduction to the Critical Study of the Scriptures.—"Nearly three hundred texts of Scripture are more or less explained in this elegantly-executed volume, and in a manner equally curious and interesting."

London: BOAG, Fleet-street.

In one small volume, price 15s.

PAXTON'S POCKET BOTANICAL DICTIONARY.

In what may be called an age of Cyclopaedias, when the compression of a great variety of information into one volume, in order to bring it within the means of persons of all ranks, is so universally sought, it is evidently desirable that the Gardener, and those connected with his profession, should be as well accommodated as other classes in this particular. No such work existing, however, prior to the issue of the present publication, its value will be at once apparent; since it combines the more essential features of a Botanical Catalogue, a Horticultural Guide, and a Technical Glossary.

Besides being of this comprehensive description, it is especially adapted for the Amateur and Floriculturist; who may, by carrying it in his pocket, examine all the plants that are at any time submitted to his inspection, and immediately derive every intelligence respecting the peculiarities or affinities of particular species which could reasonably be wished for. This is an advantage that can only be sufficiently estimated by those who have felt the want of such an assistant; and to all such individuals, as well as to every agent or friend of Horticulture, the Pocket Botanical Dictionary is decidedly indispensable.

London: J. ANDREWS, Bond street; S. ORR and Co., Paternoster-row.

CHEAP STATIONERY, CUTLERY, WORK-BOX, WRITING-DESK, AND DRESSING-CASE MANUFACTURER—Sloper's Embossed Postage Envelopes, without

Advertisements, 1s. per dozen to purchasers of other articles; fine Bath-post, 3d. per Quire, 5s. per Ream; ditto Note, 2d. per Quire, 3s. per Ream; Queen's Size (Note), 2s. per Ream; very superior Foolscap, 8d. per Quire, 12s. 6d. per Ream; Envelopes, 6d. per 100; Copy Books, 4d. each, 3s. 6d. per dozen; good Pens, 1s. 6d. per 100; Embossed Blotting Books, 6d. each; superior Bibles, gilt edges, 1s. 10d. each; ditto Prayer Books, 1s. 6d. each; good Pen-knives, 6d. each; Rosewood Work-boxes, 2s.; Rosewood and Mahogany superior Desks, 7s. 6d.; superior Pocket-books, 4d. each, &c., &c. Goods exchanged, or Money returned if not approved of. A nameplate engraved, and 100 best Cards printed for 4s. 6d. Bookbinding, Printing, and Engraving, at the lowest terms; 10 per cent. off new Books and Music. Parcels of 2l. value forwarded 100 miles free of carriage; of 10s., 5 miles from London, and any amount in town. Lists of Prices, and samples of Paper, sent on the receipt of two postage-stamps, from SLOPER'S Stationery Warehouse, 20, George-street, Portman-square, London.

GARDENERS' CHRONICLE and GARDENERS' GAZETTE.—To be Sold, for Six Guineas, the two first volumes of the *Chronicle*, and the first four of the *Gazette*, (three of the latter half bound) commencing in 1837. Apply, post-paid, to A. Z., Post-office, Vauxhall.

THE LATE DREADFUL HAILSTORM.—Some friends of Mr. JOHN BELL, NURSERYMAN, of Norwich, who reside in the neighbourhood of London, being desirous of rendering him assistance in consequence of the severe loss he has sustained, through the destruction of the glass and the utter loss of the crops in his houses, by the late violent Hailstorm which passed over that city, have resolved to do so by commencing a subscription; and they earnestly invite his friends and all who can estimate so dreadful a calamity, to assist them. Mr. BELL's loss is estimated to be above 2000l. The Gentlemen and Tradesmen of Norwich have already commenced a subscription in his favour, and a Committee has been formed to carry out their views. It is intended to transmit all that may be subscribed to this Committee, and as it is desirable that no time be lost in collecting and forwarding the amount subscribed, the subscription will be closed on Saturday the 9th of Sept., and the amount transmitted to Norwich on the Monday following. The following Gentlemen have kindly offered to receive subscriptions:—Mr. W. Catleugh, Florist, Hans-Place, Chelsea; Mr. M. J. Webber, Fruiterer, Centre-row, Covent Garden Market; Messrs. J. A. Henderson and Co., Nurserymen, Pine Apple Place; Mr. G. Charlwood, Seedsman, Tavistock-row, Covent Garden.

The following subscriptions have already been received.

	Amount of subscriptions received to Aug. 26, upwards of	s.	d.
Mr. W. Catleugh, Nurseryman, Chelsea	670	0	0
Mr. M. J. Webber, Fruiterer, Centre-row, Covent Garden	5	0	0
Messrs. J. A. Henderson and Co., Nurserymen, Pine Apple Place, Edgeware-road	5	0	0
A Friend	5	0	0
Mr. G. Charlwood, Seedsman, Tavistock-row, Covent Garden	5	0	0
Proprietors of "GARDENERS' CHRONICLE"	3	0	0
Mr. John Smith, Nurseryman, Dalston	3	0	0
John Hendle, Esq., Stoke Newington	2	0	0
Mr. Prescoe, Seedsman, Brompton	2	2	0

HENRY HUNT'S PATENT GARDEN POTS and STANDS, for effecting improved Drainage and draught of Air, of which highly favourable notices have appeared in *Paxton's Magazine* for May, *Gardeners' Magazine* for June, *Practical Florist*, No. 23, and *Gardeners' Gazette*, May 6. Sold Wholesale and Retail at HUNT'S China Warehouse, Queen's-row, Piccadilly; and No. 17, Great Rider-street, St. James's. N.B.—Nurserymen wanted as Agents for the above in many of the provincial towns.

WIRE-WORK, HOT-WATER APPARATUS, GREEN-HOUSES, &c.

ST. THOMAS BAKER, MANOR-HOUSE, MANOR-PLACE, KING'S-ROAD, CHELSEA, Manufacturer of INVINCIBLE WIRE-FENCE, to resist Grazing Stock, and rendered Rabbit-proof. WIRE-WORK in Trainers, Arches for Walks, Bordering, Flower-stands, Pheasantries, &c. HORTICULTURAL BUILDINGS, Green and Hothouses, Conservatories, &c. The same heated by HOT-WATER APPARATUS, on improved and economical principles.

Parties waited on in Town or Country, and Drawings and Estimates free. Work for the Trade as usual. Ward's Cases, or Domestic Greenhouses.

VALUABLE REMEDIES FOR THE AFFLICTED.

DR. ROBERTS'S CELEBRATED OINTMENT, called the POOR MAN'S FRIEND, is confidently recommended to the public as an unfailing remedy for wounds of every description, a certain cure for ulcerated sore legs, if of 20 years' standing, cuts, burns, scalds, bruises, chilblains, scorbutic eruptions and pimples in the face, sore and inflamed eyes, sore heads, cancerous humours, &c., and is a specific for those afflicting eruptions that sometimes follow vaccination. Sold in pots, at 1s. 1d. and 2s. 9d. each. Also his

PILULÆ ANTISCROPHULÆ,

confirmed by more than 40 years' experience to be, without exception, one of the best alternative medicines ever compounded for purifying the blood and assisting nature in all her operations; hence they are useful in scrofula, scorbutic complaints, glandular swellings, particularly those of the neck, &c. They are efficacious also in rheumatism, and form a mild and superior family aperient, that may be taken at all times without confinement or change of diet. Sold in boxes, at 1s. 1d., 2s. 9d., 4s. 6d., 11s., and 22s. each.

To those who cannot take pills, the proprietors would strongly recommend Dr. Roberts's

ANTISCORBUTIC DROPS,

for the cure of the scurvy, scrofula, leprosy, and all scorbutic complaints; they strengthen the constitution, purify the blood, and promote a circulation of the fluids; are gentle in their operation, and do not require cessation from business. In bottles at 2s. 9d. each.

By the late Dr. Roberts's will Messrs. BEACH & BARNICOTT (who have been confidently entrusted with the preparation of his medicine for many years past), are left joint proprietors of the "Poor Man's Friend," "Pilulæ Antiscrophulæ," "Larwell's Pills," "Medicated Gingerbread Nuts," and "Antiscorbutic Drops," with the exclusive right, power, and authority to prepare and vend the same.

The still increasing demand for the above medicines, from all ranks, is the best and most substantial proof of their utility.

Observe.—No medicine sold under the above names can possibly be genuine, unless "Beach and Barnicott, late Dr. Roberts, Bridport," is engraved and printed on the stamp affixed to each package.

EXCHANGE OF PLANTS.—Amateurs and others having Ericas, New Holland or other Greenhouse or Stove Plants to dispose of in exchange, may see a List, embracing many desirable objects, by addressing a Letter, together with their Catalogue, to A. B., care of the Librarian, Literary Institution, 47, Leicester-square, London.

BUTTER MADE IN TEN MINUTES

BY THE NEWLY-INVENTED CHURN.

REGISTERED ACCORDING TO ACT OF PARLIAMENT.

ATTWOOD, WIMBLE, & WARNER, MANUFACTURERS, LEWES, SUSSEX.

This CHURN being made entirely of Block Tin, the necessary degree of temperature can be given to the cream, by placing it in a pan of cold or hot water, which ensures the butter coming in 10 or 12 minutes. The simplicity of its construction, and the facility with which it may be cleaned, are no inconsiderable advantages over those now in common use.

Sizes	No. 1	2	and 3
Churn from	7 to 8 lbs.	13 to 15 lbs.	26 to 28 lbs.
Price, carriage paid to London.	25s.	35s.	42s.

Metal Pans for Churns to stand in, 4s. 6d., 6s., and 7s. Larger sizes made to order. N.B.—Thermometers and Butter Prints supplied. May be obtained through any respectable Ironmonger in town or country, and from the Manufacturers, LEWES.

To be seen in London, at WRIGHT'S Range Warehouse, No. 3, Arthur-street, near the Monument; RIGBY'S Brush Warehouse, No. 80, Gracechurch-street; LIVERMORE and SON, Ironmongers, No. 30, Oxford-street; BENHAM, 19, Wigmore-street, Cavendish-square. Export Agents, BARNES & Co., 109, Fenchurch-street.

BRITISH SHEET-GLASS for HORTICULTURAL PURPOSES.

DRAKE & BROMLEY have received Mr. PAXTON'S kind permission to publish the following extract from his Letter, dated Chatsworth, July 18, 1843.

"The terrific hailstorm which visited this locality did not injure a square in the Great Conservatory, but in the Sheffield Botanical Gardens about 5,000 squares were broken, and the houses of a gentleman near Sheffield were completely riddled, and the plants in them much injured; but at Queen's Tower, the residence of a gentleman whose houses were glazed with the Sheet Glass, and where the storm raged in its utmost fury, only two squares were broken, and even these were not in the roof, but at the end, where the hailstones struck them obliquely; this is a most gratifying proof of the strength and superiority of the Sheet Glass."

The glazing of the large Conservatory at Chatsworth was begun by J. DRAKE in June, 1839, and finished in July, 1840; during the subsequent period no casualty has happened to render necessary the slightest repair for breakage; and of the superiority of the Sheet Glass in resisting Hail, no proof more conclusive or satisfactory could be given than the above extract affords.

A return to Parliament of the duties and drawbacks on Glass, from the 5th Jan. 1813 to the 5th Jan. 1843, exhibits the consumption in Great Britain of British Sheet Glass since 1838, in which year J. DRAKE had the honour to receive the following Letter of Thanks for its introduction to the notice of the Horticultural Society of London.

"Sir,—I have the honour to return you the thanks of the Horticultural Society of London, for your exhibition of specimens of New Sheet Glass, which have been duly received, and exhibited to the Members who have met this day.

"I am, Sir, your very obedient Servant,

"To Mr. Drake. (Signed) GEORGE BENTHAM, Secretary."

By this return, it appears that the quantity of British Sheet Glass retained for home use was—

In the year ending Jan. 7, 1838		707 cwt.
" " " 1839		2262 "
" " " 1840		5170 "
" " " 1841		7914 "
" " " 1842		11,298 "
" " " 1843		17,117 "

An increase so rapid, as sufficiently to manifest that it is fast superseding, for all purposes to which it is suitable, every other kind of Glass.

DRAKE and BROMLEY beg respectfully to add that they shall be always happy to furnish Lists of Prices of the Glass, or any other particulars which it may be desirable to obtain, upon application by letter, addressed to them at their Warehouse, No. 315, Oxford-street, London.

TO THE PUBLIC.

HEALTH being paramount to all earthly blessings, Mankind are ever anxious to recover it when lost, and to preserve it when restored. The Stomach and Enema Pumps originally invented by J. READ, were sanctioned by the highest Medical Authorities in this Kingdom, as well as on the Continents of Europe, India, and America (vide the Life of Sir Astley Cooper). J. R. begs to inform the Public that he has now made such improvements in the above, which surpass anything of the kind ever offered, inasmuch as they are more simple, profitable, and durable, and are fitted with tubes that will stand the hottest climate, and are not liable to be out of repair. Manufactured only by the Patentee, 35, REGENT CIRCUS, PICCADILLY. N.B.—None are genuine except stamped with the words "READ'S Patent."

GROWTH OF PLANTS.

HUMPHREY'S COMPOUND to Promote the Beauty and Preservation of Plants, may be used either in the Drawing-room or in the Conservatory, and from its condensed fertilizing power a few grains dissolved in water at intervals is effective. Applicable to all Greenhouse plants, to Hyacinths, and other bulbs; and to promote the growth of cuttings, and the germination of seeds. Sold in bottles 11. 9d. each, by FLANAGAN & SON, Mansion-house-street; HURR & McMULLEN, Leadenhall-street; W. CLARK, Bishopsgate-Within; and other leading Seedsman, &c. in town and country. Wholesale Agents, DAVY, MACMURDO & Co., 100, Upper-Thames-street, London.

TO NURSERYMEN, FLORISTS, and Others.

TO BE LET on Lease, a NURSERY-GROUNDS, containing about nine acres of land, a part of which consists of a valuable stock of Plants, Trees, and Shrubs; large Greenhouse, Pits, Frames, &c. Added to which is a convenient Dwelling-house and Seed-shop, Cottage, large Barn, Stable, and spacious underground Tanks, with numerous other additions and improvements.

N.B. Immediate possession may be had on advantageous terms.—Apply personally or by letter to the Office of this Paper.

TO PROPAGATORS.

MESSRS. VEITCH and SON are in want of a PROPAGATOR who thoroughly understands his Business, and can bring unexceptionable references as to ability and good moral character. Letters, with Terms, Reference, &c., to be addressed to Messrs. VEITCH & SON, Exeter.—Aug. 17, 1843.

WANTED IMMEDIATELY, from 5 to 15 Acres of Plantation, Orchard, and Meadow Land, with a good Cottage, of five or six rooms, in or near a market-town, and in a healthy situation.—Direct to I. Z., 21, Upper Market-st., Woolwich, Kent.

PURE ST. VINCENT ARROW-ROOT.—This nutritious article is warranted equal in quality to the best Bermuda Arrow-Root, as certified by Dr. Ure, and being sold at a price considerably under that usually charged, cannot fail to be appreciated by families as a great desideratum for the Nursery, as also for culinary purposes. To be had in tin cases, of 6, 12, and 18 lbs. at 1s. 8d. per lb., of C. W. SOPRESTI, 199, Piccadilly. Sole Agent to the Importer at the West End.

SUN-BURNS, FRECKLES, TAN, and other disfigurements of the Skin, are pleasingly eradicated by that unique preparation ROWLAND'S KALYDOR, a balmy odoriferous liquid, and now universally admired for its sovereign virtues in completely removing all cutaneous eruptions, and in rendering the complexion delicately clear and fair. It is invaluable as a renovating and refreshing wash during traveling, or exposure to the sun, dust, or harsh winds, and after the heated atmosphere of crowded assemblies. Gentlemen will find it peculiarly grateful after shaving, in allaying the smarting pain.

CAUTION.—Much pernicious trash is now offered for sale as "KALYDOR"—it is therefore imperative on Purchasers to see that the words "ROWLAND'S KALYDOR" are printed on the wrapper, and "A. ROWLAND & SON, 20, HATTON-GARDEN," engraved on the Government stamp affixed to each bottle. Price 4s. 6d. and 8s. 6d. per bottle, duty included.

Ask for ROWLAND'S KALYDOR.—Sold by them, and by Chemists and Perfumers.

NURSERY TO BE DISPOSED OF.—Containing between Three and Four Acres of Land, well stocked with Nursery Stock, a good DWELLING-HOUSE and SEED-SHOP, Three Greenhouses, One Forcing-House, Pits and Frames, Sheds, Stable, and every convenience necessary for carrying on the business. A Lease on the Premises—in a good situation for business, about Four Miles from the Royal Exchange. For particulars, apply to Mr. KING, Hackney-road.

WANTED, the following Numbers of the *Gardeners' Chronicle*, for 1841. Nos. 7, 10, 21, 35, 36, 37, 50, and 51; six shillings will be given for the above eight Nos.—Apply at No. 4, Ave Maria-lane, London.

The Gardeners' Chronicle.

— 16 . . . South Spilsby.

FROM the first establishment of this Journal we have thought it a duty to give our support to those who advocate the claims of New Zealand as an agricultural colony, because we have always considered that the evidence in the possession of Botanists as to its climate and products was such as to leave no reasonable doubt as to its fertility and salubrity. We stated long since, that, so far as it was possible to judge from the information that had been received in Europe, New Zealand is the colony where of all others there is most to hope and least to fear; and that, in fact, with the single drawback of the possibility of collisions with the natives, everything gave promise of its being the most advantageous settlement for farmers under the British crown. We were led to do this partly from a desire to point out to agricultural emigrants the place where of all others their energies could be best directed, and partly for the sake of contradicting the false reports, which, invented by the disappointed in New Zealand, and the interested in Australia and Van Diemen's Land, were largely propagated in this country by the daily press. According to those stories, the country is either uncultivable from its ruggedness, or absolutely sterile, or storm-bound, or flooded, or so overrun with bush and fern, as to cost more for clearing than it is worth, or, finally, exposed to the constant inroads of ferocious savages, who refuse to recognise the validity of the sales which they have made, and perpetually threaten to resume by force the land of which they have been deprived by fraud.

Public opinion has now taken a direction so decidedly favourable to New Zealand, and the vast importance of it is at last so fully recognised by the Colonial Government, that it may almost seem superfluous to combat any longer the misrepresentations that have been made upon the subject. But its colonization is still only in the bud,—thousands are still wavering as to the place where their little capital will be best invested, and it is of such vital importance to them to know exactly what they have to expect as emigrants, that we think we cannot do better than direct our readers' attention to a rich supply of facts which have been furnished by the settlers themselves, in collection of their letters which has lately been published.* For here we have no suspicious testimony,—no highly-coloured representations by land agents and speculators, but plain and simple statements from men actually in the islands to their friends at home.

In the first place, it is highly gratifying to see that our fears of quarrels with the natives were groundless, and that their character had either not been at all understood, or that the judicious regulations of the New Zealand Company have effectually removed all cause for serious complaints. Disputes, indeed, have occurred here and there, but so far as we are acquainted with them, they have arisen from causes easily arranged, and with the worst of the natives, whose acts their own countrymen openly discountenance. We may add, too, that where they have led to unpleasant consequences, this has been mainly caused by the cowardice or wrongheadedness of the settlers themselves.

"The New Zealanders are a fine race of people," says a settler at Nelson (p. 78), "stout and well made. Much has been said in England about their fierceness, but a milder, kinder people, I believe, does not exist. Our ladies of the Fifeshire, that almost dreaded the idea of seeing an ugly tattooed New Zealander, would no more be afraid of one of them, or I believe not so much, as they would of one of their country of the lower orders—at least they are perfectly harmless, and I believe that nothing would induce them to meddle with, or injure a white man. Some say they in some cases steal; I believe in no case have they been known or proved to do so; I a little suspected it, but I now believe no such thing; the lost things I have found, and I have trusted them anywhere, and lost nothing by them."—"Some dress in English clothes," says Mr. Gillingham, a yeoman, (p. 154), "the others wear blankets, which is a good article to barter with them. They are a fine race of people. I like them much, and am not afraid to go ten miles inland to live amongst them; they seem to be very harmless and strictly honest; they come into the tents, sit

down, laugh, and are very entertaining with their gibberish."—"The natives," says another witness (p. 158), "are a good-humoured, good-for-nothing set of vagabonds; extremely well-disposed to Europeans; and when inclined to work, which is but seldom, they are of great assistance in constructing houses; at first they took tobacco for every trifling service they rendered; but now nothing will do but clothing or money. There is not much fear of their quarrelling with us; they are too much alive to their interests for that. As long as they continue as well treated as they are at present, there is no chance of any interruption in the amicable intercourse between the two races."

So that, instead of the fierce and bloodthirsty ogres which they have been represented to be, they are really above the average of European peasants. Indeed, it is quite evident that they are amicable and kind-hearted. The greater part of the population in Cook's Straits originally came from Taranaki. This name alone has a magical effect upon them. Whenever Mr. Cook mentioned Taranaki to them, they began to cry like children, and made a thousand inquiries about old friends, old paths, gardens, rivers, &c. &c. (p. 156.) And when a destructive fire broke out at Wellington, destroying fifty-nine of the best houses in the town, the natives actually collected five pounds among themselves for the sufferers (p. 57).

The calumnies relating to the natives being thus disposed of, let us see what the settlers say of the land, which we have been told is all cut up into gullies and precipices, utterly unfit for agricultural purposes, and incapable of improvement by the plough:—

"Here," says Mr. W. Bayly, a yeoman of Devonshire, "are thousands and tens of thousands of acres as level as can be found in England; I would say, when the land is cleared, all that I have seen, that the plough shall go over nineteen acres out of twenty. The soil is very deep in high land as well as low. I believe for climate and soil not better to be found in the known world. I know a man that has tilled the third crop of Potatoes in the same piece of ground, and I am expecting a crop within twelve months."—"There is plenty of land that is fit for agriculture; it is a beautiful soil and a beautiful climate; all kinds of Corn will grow well. You may grow Pease all the year. That small portion of Wheat which I brought with me yielded after the rate of seven quarters to the acre. I saved the whole of the seed, and made myself a hat with the straw, which I believe to be the first that has been made of straw grown in the colony. I have sown the seed on twelve rods of ground, and it is growing beautifully. I have got half an acre of land in cultivation. We sow the Wheat in July, and reap in January. I am sorry to say, there are but few who support cultivation; they seem to be afraid of the bush, which is not half so fierce as it is represented."—*Extract of a Letter from a Producer*, p. 35.—"There is no doubt about its being good, very good; and much superior to any land at home. We can produce two good crops in one year, which can't be done in England: Wheat, averaging sixty bushels an acre, and Potatoes sixteen tons ditto."—*A small Devonshire Farmer*, p. 61.—"The farmer, the labourer, and the independent colonist, have assumed a healthy and vigorous bearing, full of well-grounded hopes, and determination to do their utmost by a soil which barely asks for their powers to clear and cultivate it."—*J. C. Esq.*, p. 67.—"The soil is a black vegetable mould, about four feet or from four to six feet deep; generally speaking, the subsoil is a yellow clay."—*Mr. Charles Palmer*, p. 177.—"New Zealand looks more like an English nobleman's domain;—rich valleys with gentle slopes, and woody knolls, dark groves of Pine, apparently sloped by art, rivers and mountain streams, and every bush filled with songsters,—nay, everything that can charm the eye or captivate the senses."—*From a Settler*, p. 113.—"I can truly say, 'Here one can live in ease, without care or trouble, in one of the most genial and healthy climates in the world, and where it only requires the hand of man to make a Paradise.'"—*Dr. Geo. Rees*, p. 52.—"There is also plenty of clear land suitable for grazing in the immediate neighbourhood, within two hours' sail of the heads. There is a large valley extending for forty miles inland, clear of trees, and covered with the finest grass, capable of maintaining large herds of cattle, if once it was opened up. The country is only becoming known; no sooner is one valley explored and surveyed than another is discovered contiguous to it. They seem mostly to turn up from the sea, and to be sheltered at their entrance by high bare hills from the winds which blow with such violence on the coast, which three-fourths of those who come out here only see, and have no idea of the luxuriant evergreen verdure with which the country in the interior is covered."—*Alexander Perry, Esq.*, p. 20.—"The valley of the Hutt is much more extended, more level, and is, perhaps, one of the most even and the finest districts for agricultural purposes in all New Zealand. In fact, there is plenty of room in this one place for the exertion and capital of at least one hundred thousand Englishmen. At Taranaki, where new Plymouth is situated, there is an opening for at least a million of people; and the country there is open, so that you may have a clear view upon almost any of the rising grounds for at least thirty miles, and in some cases you can see land fifty miles off."—*John Wallace*, p. 12.—"This is the finest Wheat and Barley country that ever was seen, and that you would say if you were to see it."—*S. and W. Curtis*, p. 133.

If from this we turn to the accounts of the produce obtained, the evidence is not only satisfactory, but even beyond all expectation:—

"I don't believe any country in the world will beat this for breeding; sheep, I have little doubt, will breed twice in the year. Some of my goats have kidded three times in less than fifteen months. I landed four females and one male, and in less time considerably than two years, counted 25 in number. Our bush or rich land is too strong for Wheat. I put some into my garden, and had to cut it down twice before I could get it to stand up, so luxuriantly did it grow. I have some Oats growing in my garden, on rich soil, seven feet high; and some of the stems measure one inch in circumference; and a large sort of English Pea growing so high, that I could not reach some of the upper pods. You will think I am romancing, but I give you my honour that I am not. Some Cabbages (the Flat Pole) growing on a piece of bush-land on our farm, measure five feet across, and have only been planted out eight weeks. We have planted 15,000 of the Flat Pole, Jersey Cow, and 100 Headed Cabbage for our milch cows. Cabbage plants are 2s. 6d. per hundred, but I grew all we required, and more. At this present moment my garden is groaning under a profusion of most excellent vegetables; it is most of it bush-land, near an acre in extent, but not all cleared, although fenced in. Some Mangel Wurzel now in seed is seven feet and eight feet high; in fact, I am quite at a loss to say what the land will not produce when under a proper system of cultivation and manured: this arises as much from the climate as the soil. Cattle do remarkably well."—p. 205.—"Wheat is calculated to pay 25l. an acre, which is about the average price here, and not likely to go much lower."—*A Private Letter*, p. 29.—"This is a most splendid country for farming, when the land is cleared. You know I brought some Wheat out with me; it was two quarters. I had a small spot of land, and I sowed it, and I have reaped and thrashed ten gallons from it; mine was the first harvest in the country. I had ten men and boys to cut it for me one evening."—*William Henwood*, p. 149.

Captain Smith has a large garden, with Cabbages 12 feet round, Onions 20 inches round, Roses, Pelargoniums, Sweetbriars, fruit-trees, and all kinds of vegetables.—*H. S. Tiffin, to his father*, p. 11. And another person, (p. 117,) speaks of his Turnip Radishes 16 inches in circumference.

"Mr. Molesworth raised last year at the rate of eighteen tons of Potatoes (Kidneys) to the acre, and ninety bushels of Wheat to the acre.* This is in the Valley of the Hutt, on land newly reclaimed from the forest, and flooded two or three times in the year."—*A Settler*, p. 33.

It should here be remarked that this flooding is one of the evils which people have been told render New Zealand unfit for cultivation. But Mr. Stokes shows most distinctly that the floods of New Zealand are—as those of the Nile—a source of fruitfulness, and not of injury.

"In my last visit to the Hutt, I ascertained a very interesting fact relative to this point. I should state that this winter we have had more rain than in the two previous ones, and the Hutt has several times overflowed its banks. I saw Wheat that had been four times covered with water, and yet was in beautiful order. But the point to which I wished to direct your attention was in the instance of Mr. —'s Barley; that which has been flooded is, I understand, in first-rate order, that which has not been flooded has been attacked by the grub. Now, a flood in New Zealand seems to produce an opposite effect to what it does in England, or a colder climate to ours; it produces a fertilizing effect in the deposit which it leaves, and, as it would appear, a salutary effect in destroying the grub, while the frosts which usually succeed floods in England, and nip the young blade, are unknown here. This is important to be known, because in the district of the Manawatu, more to the north, and still warmer than Port Nicholson, on either side the river there are at least 100,000 acres of good land, easily drained, and still more easily brought under cultivation, but which must be occasionally subject to overflows from the river. Now, if these overflows (as are proved by our experience in the Hutt) are beneficial, they must remove any apprehension or doubt from the mind of the cultivator."

The only well-founded complaint concerning the soil applies to what is called fern land, extensive districts of which have fallen to the lot of some settlers. This is represented to be a strip of land along the coast, about 200 yards wide; behind which is a belt of bush land, as it is called, composed of the most beautiful shrubs from five to twenty feet high, filled up with fern of the same height, which is about three miles wide.

It is said by one person (p. 204) that this sort of soil "will not grow a heavy crop the first year, the land having been run out by the fern; and there is such an immense quantity of fibrous root left, that, after rain, it puffs up, and you walk over it like walking over a Turkey carpet. This lets in the air, the ground dries too quickly, and you require rain every third day to make things grow." And another witness declares that it is all humbug what has been said about fern land being so good (p. 156). But as Mr. Jollie observes (p. 126) the very fact of the fern being so rank shows that the land has in it the power of vigorous production. And such is evidently the fact, for a writer at p. 204, says, that a great

* "Letters from Settlers and Labouring Emigrants in the New Zealand Company's Settlements," 12mo, Smith and Elder, 1843.

* This must be considered an exceptional case; the average production per acre being estimated at 60 bushels for Wheat, and 16 tons for Potatoes.

improvement takes place in its quality after the first year, and that he does not desire to see finer Potatoes than he has on that land. The great question for the settler is how to deal economically with this sort of land. The fern grows 6 and 7 to 15 and 20 feet high, and to clear it is a serious undertaking. No doubt the wiser course is to leave it in the first instance, and to scatter the ashes on the land; by this means the saline matter which the fern has been robbing the land of is all restored, and will immediately give the peaty soil a tendency to decompose and consolidate. That the fern will again spring up is certain; but once down it is easy enough to keep it down. The continual destruction of its young leaves will speedily put an end to the roots; and we are told, what is quite to be expected, that any smothering crop will answer the purpose. The Rev. C. Saxton (p. 105) found that a crop of Vetches killed the fern which grew up among them. And then, when the fern is gone, the settler has the richest land in the colony. There are instances, says Mr. Jollie (p. 126), of prolific crops of nearly everything on land of this description; and in general one may observe over the place, as a pretty certain rule, that the finer the crop the higher had been the fern which previously grew. This must necessarily be the case, and if we were to settle we should be much inclined to try our luck with the unpopular fern land. Let us add, that, to remove the fern, and not to burn it where it grows, will infallibly deteriorate the land excessively.

Can any sensible person, after such evidence as this, say that the reports unfavourable to the land of New Zealand are other than mere calumnies? If we next look to the condition of the agricultural settlers everything bears the face of prosperity.

"At present there is not a single good workman left on the hands of the Company; all but the stupid, lazy, or feeble folk, having been hired by settlers going upon their land, or they are working for themselves. Of absolutely idle people we have none, and the settlement has every appearance of a thriving and industrious community. It will be a beautiful village sort of a country, wherein the population will be principally farmers and well-doing peasants, with a sprinkling of large land-owners, professional men, and shopkeepers."—*Letters received by Thomas Woolcome, Esq.*, p. 188.

No country seems to offer such advantages to the industrious labourer.

"The agriculturist (farm servant), earning 8s. or 8s. 6d. per week at home, out here would save more than he could earn at home. I am persuaded that all classes of honest and industrious persons will do well."—*James Thomas Shaw*, p. 135.—"We can save ourselves about 6l. in a month; our trade is a very good one, I assure you; single men are getting from 2l. to 3l. a week, and they can live and lodge on the best of everything for 20s."—*George Beavan*, p. 28.

Let it not, however, be imagined that New Zealand is a country for the lazy or the apathetic; or that independence is to be gained there by walking about with the hands in one's pockets. Idlers enough have tried the experiment,—of course they have failed; and, attributing their ill-success to anything rather than their own misconduct, have raised the outcry which has found an echo in Europe. Let us see what the settlers say on this head:—

"All the complaints that I have heard, arise only from the drunken, the idle, and worthless portion of the community—fellows who would do good nowhere."—*John George Cook, Esq.*, p. 166.—"It is really lamentable to witness the want of courage and industry in a large number of young men who come here. They arrive with the idea that they are to have no difficulties or discomforts to contend with, yet most of them have fled from home in despair at the dismal prospect they were abandoning. All the prudent and the industrious who have arrived here are well to do. I should not mind landing in this place without a shilling, confident that I could make myself a pursuit in three months."—*A Resident*, p. 23.—"Very many of the young gentlemen which come out, walk the beach and smoke their cigars, and spend their money in the grog-shops, which are very plentiful."—*William Dew*, p. 37.—"I would not go back to England again if I could have a free passage back again, for I know I could not do so well in England as I can here, nor no labouring man besides; but I can tell you a drunken man is not much good here; a good steady man is sure to do well here."—*John and Ann French, working Emigrants*.

But the idle and dissipated are not the only discontented persons. There is another class, who, with good intentions and some means, are equally unsuccessful: these are the gentlemen who, knowing nothing of cultivation at home, undertake the management of land abroad, and, incapable of farming in England, think that the antipodes will teach them. New Zealand is not the country for them. The men who should adventure thither are good farmers with a capital of 1000l., good labourers with no capital, and country gentlemen with abundant wealth. All these may render the country a blessing to themselves, or become themselves a blessing to the country. It is, however, to the first class, more than to any other, that the colony must look; and we trust that the New Zealand Company will take measures to encourage their

emigration beyond all others. A system of cheap cabin passages will be a powerful attraction; and that, we have reason to believe, is already promised.

But we must conclude. Our space is exhausted without even an allusion to the important scheme of establishing a Scotch colony on Banks' Peninsula. That may form the subject of further observations hereafter.

A CORRESPONDENT asks us whether we recommend an open tank as a source of bottom-heat, for he says that many persons are using such a contrivance. We hear this with regret, because the plan is sure to fail. Where an open tank is used three things happen: the steam condenses among the soil and renders it mere mud; the tanks become foul with soil that drains into them; and by degrees the boilers themselves are choked up. All such contrivances as placing hurdles, faggots, or other open materials over tanks have everywhere failed, or will do so. The tanks must be closed with some kind of solid, though porous, material. We prefer soft pan-tiles; but slate answers the purpose very well.

THERE are various systems of draining, according to the circumstances in which the water lies in the ground. However beneficial draining may be in some cases, in others it may do more harm than good to remove the moisture under the soil. In grass land—provided the water does not stagnate in hollows which have no outlet, or remains to soak the ground too near the roots of the grass, so as to rot those of the finer qualities—a moist bottom is an advantage; it is a reservoir for dry weather, when it rises by capillary attraction and refreshes the roots. We read of floating islands in great lakes and rivers, naturally formed by trees and branches, and covered with vegetable earth, which rest entirely on the water, and are covered with the finest verdure.

The first question to be asked, therefore, is, whether the land is too wet? and whether the crops are injured in wet seasons by the water rising and remaining too near the surface?—to what extent the drains should carry off the superfluous water?—whether it is regularly distributed through the soil, or lies directly over an impervious subsoil?—whether the water is merely accumulated by the rains exceeding the evaporation, or rises from springs, or runs down from higher grounds? Each of these circumstances may require a different mode of draining; and whoever should think of applying the same remedies to all cases, must be considered as one of those quacks who, having a nostrum to sell, insists on its curing all disorders, whether dropsy, consumption, or any other.

The following directions on draining are intended for one kind of land only; that is, where a thin stratum of earth, mellowed more or less by the influence of the contact of the atmosphere, and enriched by cultivation and occasional manuring, lies over a stratum, more or less deep, of a compact loam or clay, through which the water cannot percolate; so that, in wet weather, the lower portion of the soil becomes like mud, or, at least, quite saturated with water, and the roots and delicate fibres of plants are injured, if not destroyed, by excessive moisture, unless they be coarse aquatic plants, suited to such a soil. If the surface is nearly level, the whole of the soil, at a certain depth, will be found equally soaked with water; but if it be irregular, with risings and hollows, the water will slowly run over the subsoil, and render the hollows still wetter, so that it may there rise up over the surface, producing temporary pools. The effect of water standing long on one spot is to kill vegetation, and also so to dilute and wash out the soluble portions of the soil as to render it much less capable of bearing a crop, even when the water has been carried off. These circumstances must be well studied by the scientific drainer before he lays down his plan. The straight line, being the shortest, is always to be preferred for carrying off water speedily; but a straight line may not suit the variations in the surface: you may have to go round the foot of a hillock, to collect what filters down between the soil and subsoil; and you may have to go round a hollow, to prevent the water from running into it, and so save the trouble of very deep drains to draw it from the bottom when it is once lodged there.

A section of the land, which can always be obtained by digging holes and boring, is essential to lay down the best plan for the drains. The drains must be sufficient to carry off all the superfluous water; but it is a useless expense to have them larger or deeper than is necessary. They should consist of three distinct sizes at the least: very small, where they merely collect the dripping of the upper soil; somewhat larger, where many smaller drains pour in their contents; and the main drains, which carry all the water of many acres to the ditches where they empty themselves, should be proportioned to the quantity of water. The depth must also be regulated by the size of the drain—the larger it is the deeper it should lie, and better protected from accidents which might choke it. In a

soil where the upper soil is nine or ten inches deep—that is, where the plough has gone to that depth—and the hard impervious subsoil is found a few inches lower, a drain should be dug first so deep as to reach the solid clay, which comes out in spits without any crumbling, as if cut out of soap or cheese; and in this solid mass the main drains and the secondary drains should be cut to the exact width of the tiles to be used, if this be the mode of draining: if they are to be filled up with broken stones, such as are used for macadamising roads—an excellent material—they must be made wider and deeper. On an average, the main drains should be three feet below the surface, if they are five or six inches wide at bottom. They should be filled up with solid clay or loam, rammed down over them; for it must be recollected that they are mere *subterraneous channels*, and do not at all dry the land around them,—they merely carry off the water collected by the secondary drains. The main drains should cross the greatest declivity of the field at the bottom, and have a sufficient fall into a river or deep ditch. In most cases one main drain may suffice; but in fields of great extent several main drains will be found necessary, that they may never be so full as to burst upwards, which would be a continual source of trouble and expense. The secondary drains may run down the declivity of the land; if this be not too steep they may in general be laid in the direction in which the land has been usually ploughed. Two feet six inches will in general be sufficient depth, and this will bring the tiles directly over those in the main drain,—much the most advantageous mode of union. Immediately over the tiles or stones in the secondary drains it may be useful to press down some strong heath, if it can be readily procured, or any porous material which will not rot soon; and the earth thrown over the heath may be a mixture of the soil and subsoil, trod in well, but not quite impervious to water. Thus these secondary drains will act as collectors of water, as well as conductors, and keep the soil dry from 10 to 15 feet on each side. We are well aware that we have hitherto only described the common mode of thorough draining, such as has been so ably advocated by Mr. Smith, of Deanston, and applied with much success by many proprietors and practical farmers. This is the mode we adopted ourselves. The secondary drains, as we now call them, according to the present mode of draining, require to be at no greater distance from each other than 12, or at most 15, feet; the tiles being four or five inches in diameter outside, and two or three inside, with a flat tile to rest on. This is expensive; and by the suggestion of a friend we are about to try an experiment, which, if it appears likely to succeed, may perhaps be also tried by some of our Agricultural readers. It is to have the secondary drains in parallel lines down the declivity, as before, but 50 or 60 feet apart, and convert them into conductors; and to form smaller and shallower drains to collect the water from every spot in the field and pour it into the conductors. We shall explain the plan by a diagram.

The collectors are small drains, about 20 inches deep, made in the solid clay, as is the practice in Suffolk and Essex with a shoulder, as described in the last Number of the "Journal of the Royal Agricultural Society of England," and a sod of grass, or a peat, or any porous substance pressed into it to support the earth thrown over it. These drains are very cheaply executed by men who have the practice. They are only two inches wide at bottom, and a horse happening to step over them, will not have room for his foot to make any serious impression. The subsoil-plough may work to the depth of 14 or 16 inches without fear of injuring them. If one should be choked, it will cause no stoppage in the others, and can readily be repaired; or, which is safer, another may be dug by the side of it. Thus the expensive and regular tile-draining is united with the shoulder-draining, and at a great saving of expense. The collectors may be 25 feet long,—the portion of the drain which carries the water four inches deep and two wide, and the adhesive subsoil will not allow this to fill up. The distance between the collectors must depend on the nature of the climate, and the average quantity of evaporation, but in very wet soils 12 feet will be quite near enough. The conductors can be made and finished by a practised workman for 2d. per pole of 16½ feet. The expense is easily calculated. The main drains will cost altogether 8d. a pole, the

secondaries 6d. We will hereafter give more exact results when we have drained some fields in this way.—M.

THE fearful storm which devastated some of our midland counties the other day has fallen with sad violence upon a most respectable market-gardener at Norwich. The large forcing establishment of Mr. Bell, of Bracondale, has been almost annihilated, his loss being estimated at 3000*l.*, against which it was impossible to insure; at least, the Hailstone Insurance Office, which is now beginning to make itself known, had not become so established in public opinion as to call upon individuals to avail themselves of the security it professes to offer. A calamity of this sort is overwhelming. Mr. Bell, a substantial yeoman, one of that class which forms the main-stay of the country, is ruined—by no errors of his own, but notwithstanding his honest well-directed industry, by a terrible visitation of the elements, unless those who can feel for such disasters will assist him. His friends and neighbours who know him best, have, as the Norwich papers tell us, subscribed already 750*l.* towards the restoration of his establishment. His London friends have also set on foot a subscription, as our advertisements explain; and we hope that the liberality of Norwich will not be greater than that of the country generally.

ON CONSERVATORY CLIMBERS, &c.

(Concluded from page 588.)

The first plant that I would turn out into the bed in this pit would be *Bignonia venusta*, the best of all the old stove climbers. I am aware of the prevalent opinion that this plant requires a strong bottom-heat to flower it; but this opinion is altogether untenable, and a mere delusion. In the hard winter of 1829-30, I had a young one planted out in a front border, and trained up within three inches of the glass. Through a temporary defect in the heating apparatus we could not keep the house warmer than from 40° to 45° for several weeks, and the inside of the glass was often encrusted with ice in the morning. The *Bignonia* did not seem to be much affected by this treatment; it grew away freely next summer, and by the following February every joint of the last year's wood was covered with bloom, and the plant continued to flower annually early in the spring, with no better treatment than being warmer in winter.

The next climber would be *Echites suberecta*, from Jamaica. This lovely climber flowers profusely in the stove on the current year's growth. Like the Vine, it requires a great deal of room, and to be spur-pruned in winter. When in flower, it is a fair representation of that great desideratum, a brilliant yellow *Convolvulus*, or *Iporoea*,—what a beautiful contrast it would make with the *homoea Learii* on the rafters of the conservatory! Then the *Allamanda cathartica*, more hardy than the last, also flowers on the current year's wood from June to October, and requires therefore to be very closely pruned, and kept somewhat dry in winter. After that, *Stephanotis floribunda*, the easiest of all the recent introductions to manage, as sweet as the Cape Jasmine, and, like it, pure white. The delicious fragrance of the old *Pergularia odoratiflora* claims for it a place in this selection. It does not require much room; its flowers are of no beauty, and it should be trained on the same rafter as the *Stephanotis*.

After these comes the *Combretum purpureum*, which flowers from April to November, if the shoots are occasionally stopped through the growing season; and as it blooms on the current year's growth, it requires to be closely pruned in winter. The Honorable and very Reverend the Dean of Manchester, who has adopted this system for some time, leaves the head of the *Combretum* in a conservatory all the winter. By this system only can a beautiful *Beaumontia grandiflora* be successfully lowered. Mr. Brewster, gardener to Mrs. Wray, Cheltenham, is the most successful cultivator of this fine ant, flowering it on the side spurs and on the young wood also. Attempts are now being made in some of the Metropolitan establishments to flower the *Beaumontia* in the stoves, but this will not be. For ten years I tried all conceivable means to bring it to flower in the stove without effect; but by the above system it flowers as freely and regularly as a *Pelargonium*.

Next come the stove and half-stove Passion-flowers, a tribe, of all others, the easiest to manage. One or two of these will be enough to plant permanently in the pit, the less strong kinds may be grafted or inarched on them: *Passiflora quadrangularis*, a magnificent, free blooming plant, on which *kermesina*, *Loudonii*, and *racemosa*, might be worked. *P. alata* also might be tried; in the pit it is a most shy bloomer, very much like the *quadrangularis* in general appearance, but with larger and deeper coloured flowers. These two species are often confounded with each other. I have grown them both for the last 15 years, and the only clue I can give for their identity when not in flower, is the glands on the foot-stalks of the leaves; *quadrangularis* having invariably four greenish uniform glands, while *alata* has only two of a yellowish tint: this will be a sure guide to purchasers. Anyone fond of rich foliage may plant *P. ligularis*, but its flowers are no better than those of the common one. *P. holosericea* is rather pretty, and there are others more curious than ornamental, such as *vespertilio*, with its bat-wing-like leaves; *foetida*, with its curious fringe-work inclosing the flower, &c. The new *Passiflora fragrans*, or *Middletonia*, belongs to the same section as the common blue Passion-flower, which it much resembles; but it is a half-stove plant, and the

flowers are deliciously fragrant, which will give it a place everywhere.

There are many others which might be mentioned, but I have run to too great a length already. I may, however, be allowed a word or two about greenhouse climbers. *Bignonia Cherere* has long been kept in the stove, but it is a true greenhouse plant, and, like all the *Bignonias*, does not bear much pruning, unless indeed you prune them like a Gooseberry bush, without spurring, so that what you take away is cut close to the old wood, and what you leave is trained at full length. *Tacsônia pinnatifida* does not bear the heat of a light greenhouse in summer: the only way to do good with it is to take it out through the front glass and train it outside, where it may remain till Christmas; then it may be closely pruned and wintered inside. This is the way I propose, and have practised with the rest of the conservatory climbers, after introducing the stove ones as above: the principle is the same in both cases. It is true I have not yet flowered all the plants which I recommend for this system, but I am so well acquainted with their habits that I have no fears as to the result.—D. Beaton.

AGRICULTURAL PESTS—DODDER, BROOMRAPE.

I SEND you some specimens in flower of *Cuscuta epilinum*, which appears to have thoroughly established itself in our Flax-fields. Your readers will find a notice of it (by Babington) in the "Journal of the Royal Agricultural Society," Vol. ii., p. 63. I have lately seen it referred to in some journals, as our old *Cuscuta Europæa*; but this is a mistake. I have wrapped up these specimens in the stems of another species of *Cuscuta*, to which I beg to direct the attention of agriculturists. It is now two or three years since I first received a dried bundle of this *Cuscuta*, which had then flowered; it was sent to me from the neighbourhood of Bury St. Edmund's, and described as a pest hitherto unknown to agriculturists, and which was doing considerable injury to the Clover. I observed that it closely resembled our *Cuscuta epithymum*; but not having seen it in its fresh state, I felt uncertain whether it might not be some newly-imported and distinct species. I showed it to Babington, who has noticed it in his lately-published "Flora" as a possible variety of *C. epithymum*, which he has called *B. trifolii*, at the same time expressing a doubt of its identity with this species. About a fortnight or three weeks ago, one of my neighbours invited my attention to what he considered to be a novelty in this parish. Upon accompanying him to a Clover-field, he pointed out to me several circular patches, about two yards in diameter, covered with the stems of this very *Cuscuta*. The appearance was as if a quantity of fine, closely-tangled wet catgut had been carelessly thrown down upon the Clover. The Clover plants below it were either dead or much injured, and it was evidently spreading itself rapidly in all directions. I see no appearance of flowers on it as yet; but I have transplanted some to my own lawn, where it has taken possession, and I hope soon to be able to give a better account of what species it may really be. I find (as might, *a priori*, have been expected) that it attacks Lucerne also. My object in directing the attention of your agricultural readers to this parasite is, to advise them of the propriety of eradicating it as speedily as possible wherever it may happen to make its appearance. It has certainly been introduced into this country with foreign seed; and unless some care be taken to check its progress, we shall soon have it as thoroughly established among our Clover, as the too-much-neglected pest, the *Orobanchè minor*, has already become. A simple means of checking this *Cuscuta* is, to mow the spots where it has attached itself to the Clover, and carry the mown plants entirely away. I see that the farmer in whose field it has here shown itself, has been content with merely raking it off; he has consequently left a considerable number of fragments behind, which are still attached to the Clover, and are again spreading in all directions.

Having alluded to the *Orobanchè minor*, I may mention that this plant has also been slightly noticed in the "Journal of the Royal Agricultural Society," Vol. i., p. 173. Upon finding it in our fields when I first came to reside here, I asked the farmers whether they attempted to keep it under. I found that some of them had never noticed it, whilst others who had observed it were not aware of what it was. As I knew that its seeds are extremely minute and abundant, and that on some parts of the Continent it prevails so much that Clover cannot be grown there, I recommended them always to have it pulled whilst in flower, such a process requiring very little time or trouble. I was glad to find that the neighbour who took me to see the *Cuscuta* had ever since adopted this practice, and no longer allows the *Orobanchè* to perfect its seed in his fields. May I venture to extend my recommendation to all farmers to follow so prudent an example? I would also recommend those who are unacquainted with the singular habits of this description of parasite, to dig up a plant or two which may happen to be attacked by it. They will be able, with a little care, to find the swollen base of the stem of the *Orobanchè* attached to some one of the wiry fibres of the root of the Clover; and if they will allow a Botanist to explain, they will understand that, as the *Orobanchè* has no healthy leaves of its own capable of supplying it with nourishment, it borrows, or rather steals, the proper juice which has been prepared in the leaves and has descended into the roots of the Clover. It is thus that it is enabled to perfect its strange and lurid-looking flowers, to ripen its own seed at the expense of the valuable forage which is destined to fill the stomachs of his cattle, in order that the farmer may afterwards be able to fill his own pockets.

The *Cuscuta* has a like bad habit, only with this difference, that it attacks the stems and not the roots of the Clover. As both plants are readily propagated by seed, they should be watched and never allowed to perfect their seed. It is very possible that their seed may lie dormant in the land for a long period, until a fitting opportunity shall arise for its germinating; and at all events it may be widely disseminated with the seed of the Clover itself wherever the two are housed together.—J. S. Henslow, Hitcham, Suffolk, 25th August, 1843.

THE KILLOGIE;

A SUBSTITUTE FOR FERMENTING MATERIALS IN HOTBEDS, AND FOR PIPES, FLUES, &c. IN HOTHOUSES.

SOME time ago I sent Mr. Loudon a plan for a hotbed adapted to the very poorest class of country cottagers; built without an iron nail or a brick, and calculated to generate "bottom-heat" and "top heat," moist or dry, without pipes, flues, hot-water, or steam—and in the absence, too, of all fermenting materials; by the agency of fire only, and that in its simplest and cheapest form; on the open hearth, a grate or "ingle" in the centre of a chamber, or killogie—or, in other words, by radiant heat, as it hath from time immemorial been used in the parching of corn, &c. The readers of the "Gardeners' Magazine" in general gave Mr. Loudon little praise for this communication, and in the *Gardeners' Chronicle*, Dr. Lindley passed it over by saying "in our simplicity we took it for a hoax." I will now beg leave to trespass on your valuable columns a little, whilst I attempt to show that this system of heating, so far from being a hoax, will be found the simplest, cheapest, and the most efficient, and moreover the oldest; for thousands of reasonable men have borne testimony to its merits for ages past as well as at the present day; and if I were to ask the miller or maltman how it happened that whilst he eagerly adopted every improvement in the machinery connected with the grinding and dressing of the corn, &c., he still continued to dry the grain in the old way on the kiln over an open fire; or, in his own words, over the "ingle" in the "killogie," notwithstanding all the heating apparatus, new and old, approved, improved, and re-proved in hot water and steam, I think the miller or maltman could easily show that the perfect manner in which the ingle and killogie maintain an intense heat at a small expense, leaves little room for improvement in the parching of corn or malt; and where, I would ask, in the whole round of gardening is there required a temperature so high as would be sufficient to parch corn in a few hours? Here, then, is a simple fire-grate in the centre of a cubic room, set up for a few shillings and managed by the man that feeds the miller's swine, or some equally unscientific hand, doing the work of heating the kiln-room or hothouse, and the corn or hotbed to an extent that a hot-water apparatus worth 100 guineas would not be equal to; and I question whether the powers of hot water could in any reasonable space of time prepare grist for the millhopper, and if it could, the intricacy of many hot-water apparatus, and the cost of all, would very likely exclude them from the kiln of the maltman or miller.

Therefore, instead of condemning the miller for not heating his kiln or hothouse by hot water or steam, as gardeners do, let us see whether he has not a better system than they, and if this can be proved we are come to the point, namely, to consider the propriety of borrowing it; for gardening now-a-days embraces such a host of men, so differently situated as regards their means and their wants, and in such various localities, that whilst many will be found glad enough to try a cheap and ready way of obtaining heat for the culture of exotics, others more highly favoured will no doubt say, and that truly, that there is nothing like plenty of strong cast-iron pipes and hot-water for heating all sorts of hothouses; but I could name many very respectable men, who, though they know the better way right well, have a strong reason for not trying it, namely, the want of funds for that purpose, and where this is not the case, short leases prevent many from building permanent structures, in the same way as they pitch a tent where they would not rear a castle. To such the ingle and killogie are well adapted, and for such I write. I am quite surprised that fire for bottom-heat, as well as for top-heat, is not more generally in use wherever heat is wanted. I should first try fire, as the most likely agent to raise it effectually, and whoever has experienced the cleanliness and constancy of that mode of obtaining it for horticultural purposes will not be easily persuaded to return to the litter, with the labour and uncertainty of raising it from fermenting materials—not to speak of the cost, which in most cases is double that of fuel; yet, strange as it is, there seems a general notion that linings of litter and large beds of dung are cheaper and better for hotbeds than flues and fuel; these ideas, however, are fast wearing out, and I hope the day is not far distant when it will be as rare to see a man injuring good manure by making hotbeds and linings of it, as it is now-a-days to see a man winnowing corn between the opposite open doors of the barn, as our fathers did; and though this wind was free of cost in the first instance, yet the process became expensive in labour and loss of time, whilst the supply of wind was always capricious and uncertain, and such is precisely the case in obtaining heat from fermentation; it is equally uncontrollable, and uncertain as the wind.

But mark the change in a few years' experience: artificial wind from the fanner, impelled by machinery, can now be regulated in its duration and force to the greatest nicety; and, moreover, is at command by day or night, within doors; at a moment's notice it begins, and the director of the work can suspend its services by a word. The same may be said of heat, when supplied by fire; kindle

the fire over-night, and your hotbed is warm and sweet in the morning, ready for culture of any kind, and its duration and intensity will be as much under control as the pinions of the fanner; and in our variable climate, where a few hours will raise or depress the thermometer thirty degrees, a perfect control over the supplies of heat is invaluable. On the other hand, observe, in "Mills's Treatise on the Cucumber" (pages 11 and 12),—which, by-the-by, may be taken as a fair, indeed a refined, sample of the system of dung hotbed making; he turns dung eight weeks to sweeten it, and after he allows its body to rest in the bed he shakes the face of it for another fortnight, thus making ten weeks' preparation before the instrument is tuned to play its part, during which time in "Niven's Stove for various purposes," of which everybody has heard, Mr. Niven would, from all accounts, have reared Cucumbers from seed and ripened their seeds to sow again, in less time than Mr. Mills takes to tune his strings. But, mark well, Mr. Mills owns that steam from dung thus prepared is not superior, after all, to the steam obtained from heated bricks for growing Cucumbers; and his improved pit is neither more nor less than a hothouse flued and buried in a dung-heap, the heat being dry as that obtained from hot iron. Surely such statements need no comment to show that heat obtained from sweetened filth comes slowly, and costs foul handling, and heavy unreasonable labour to come at all; witness Mills, shutting his lights to keep the heat in, at three o'clock in the morning of 13th Nov., 1840 (see page 29).

But I should not complain of the filth and labour of fermenting materials so much, if, after all, we could control the heat; but, unfortunately, it is always in the inverse ratio to the out-door cold; for in frosty weather, when, as a matter of course, we want heat most, that is just the time, and in windy weather, when linings are the coldest. See, then, the necessity of trying some simple fire apparatus to generate heat for horticulture just when it is wanted; and here it may be as well to remark, for the sake of those who wish for hot moist air in motion in their hothouses, that it is just as easy for ignited gunpowder to stand still as for heated air to stand still—by whatever system heated; and as for moisture, I should rather prefer heat by itself, and then I could easily add moisture as I might see occasion, for the continual damp or vapour arising from heated water in an open tank or gutter must seriously injure the pollen of flowers, and the colour and flavour of fruits while ripening off. I prefer, therefore, a close apparatus, containing a column of water three or four inches in diameter, with the simple saddle boiler of malleable iron, containing little water and without bricks, forming both sides of the fireplace, such as Fowler, of Temple-bar, and others, have been so successful with, combining strength and simplicity, and such a control over the heat as enables the cultivator to increase or diminish it with the greatest nicety, and make it moist or dry by merely turning a cock. I must, therefore, not be misunderstood as crying up the "killogie," in preference to these inimitable and truly practical systems of heating, which leave nothing to be desired, except that they were cheaper for horticulture. I only wish to throw in my mite towards substituting something in place of the decaying masses of filth for hotbeds in British gardens, and to enable the moorland cotter and the American backwoodsman to nurse, force, and cultivate exotic luxuries with three-light Melon-frames and the use of his own good axe and spade: where he can find fuel, however coarse, there he can always have a good hotbed without dung or any other fermenting material. The walls of the fire-room, or killogie, must be isolated, as it were, from the outer walls of the house, by a cavity, such as is common in Cucumber pits, built after Mills's plan. This cavity admits the heat from the side walls of the fire-room into the atmosphere, where the Vines, Pines, &c. &c. are growing in the hothouse, and as there never can be any difficulty in finding space for a fire-room in any Grape or Pine house, since the killogie will occupy that usually useless space in the body of the house where the tan-bed generally lies, for it is well known that the first four feet immediately under the glass roof is the only atmosphere in which fine fruits can be produced, and the empty space beyond that is highly injurious and wasteful, as it has to be heated to no purpose, and there being no surface near the glass for the reaction of the rays of the sun, the amount of vapour that sun heat would raise is lessened, and all the light that would be reflected is lost. The filling up of this empty space in Vineries, therefore, cannot fail to be beneficial; and in the case of Pines, the killogie will be invaluable as supplying bottom-heat cheaper, and more at command, than any other way that I am acquainted with. The roof of the killogie may be made with iron sleepers and flue tiles; or, instead of tiles, iron castings, the same as for a kiln, only not with holes, as kiln coverers are made. I need not say how many other forms it may take, and of what various materials it may be made, as bricks and mortar in the form of arches, stone or brick walls roofed with flag-stones, either flat like a kiln, or in shelving tiers like an amphitheatre—the force of the ingle or fire being always directed towards the sunny front, to make amends for the sloping rise in the glass, as the higher level will ever be the hottest. The depth of the killogie should be 9 feet; the grate shaped like a punchbowl, with a circular plate of iron, rather larger than the surface of the grate, hung right over the fire, at a distance of 3 feet from the surface of the grate, thus making 3 feet from the ground to the top of the grate, and again 3 feet to the reflector, which will hang 3 feet from the roof. A fire-room 16 feet long, 9 feet wide, and 9 high, will heat a Pine stove or Vinery of the ordinary size, say 25 feet long and 12 wide.—*A. Forsyth, Alton Towers, August 8, 1843.*

(To be continued.)

THE GARDENER'S LAMENT, FOR THE MIDDLE OF AUGUST, 1843.

The chilly west begins to blow again,
His rotten breath infects my garden round,
A thousand mill-leaves follow in his train,
And leaves and blighted fruits bestrew the ground.
The clouds "tuck up their petticoats" * in haste,
And wade and welter through the murky air,
Shower upon shower come pelted thick and fast,
And desolation rules the broad parterre.
My tender Poppies off in whirlwinds fly—
My knots of Tigers, Larkspurs—all are gone;
Headless my noblest Dahlias prostrate lie,
And there—my fairest brightest Pentstemon!
No setting sun pale Enothera cheers,
No merry morn the bright Convolvulus calls;
The much-loved Pansy hides her face in tears,
Oppressed with moisture, too, the Lily falls.
My dwindling Balsams, pranked with many a dye;
My Pelargoniums and my Oaks called Holy,
Begrim'd and prostrate in disorder lie;
Ah! naught remains to soothe my melancholy.
My orchard, too, no better tale relates;
There Apples rot beneath a sunless sky;
The trees themselves a withering fate awaits,
Foliage and fruit alike all black'ning die.
No savoury juice my well-dressed Peaches own,
Nectarines, once luscious, all insipid seem;
Melons are naught, and hard as nether stone,
And Grapes but *nil*, or nothing worth the name.
My bursten Gages drop from off the trees,
The same sad fate awaits my ripe Morelles;
Mildew'd are all my ralh-ripe Cogeees,
And blighted all my best bright Jargonells.
Whip me the fools who prate of western breezes,
Of balmy zephyrs and eternal springs;
Give me the subtle east, tho' oft it freezes,
In summer months it warmth and summer brings.
But still the west and north-west winds prevailing,
Atlantic vapours, rushing to and fro,
O'ercrest our skies, our hard-won sunlight veiling,
Spoil all our year, and work my present woe. P. P.

AMATEUR'S GARDEN.—No. XXXV.

IN my desire to bring the various kinds of Scarlet and other Pelargoniums adapted for bedding out prominently under notice, I find I have forgotten to mention two other classes equally worthy of cultivation, viz., the variegated and Ivy-leaved varieties of the variegated. Captain Mangles' variety,—or what in some parts of the country is called "Pullen's variegated,"—is perhaps the best, as the markings are very distinct and the white particularly good. The flower however is very small, of a pale pink colour, and not profusely produced, so that in grouping a garden I generally regard it more for the colours of the foliage than the flowers. Among the common and golden variegated, there are several kinds with rich scarlet flowers, but as they have no established names the amateur must examine the gardens in his neighbourhood, and choose for himself. There is in cultivation a new variegated variety, with flowers equal to the Shrubland, or Smith's Emperor, but unfortunately it is an exceedingly shy grower, and therefore, being in few hands, is more likely to be lost altogether than extensively disseminated. The Ivy-leaved Pelargoniums being of a trailing habit are plants indispensable for furnishing vases and baskets, or running over Rockwork or Rootwork. Among these, one which has been named in compliment to Captain Mangles, and which has peculiarly wrinkled leaves, is the best, as the white is clear,—indeed, has a silvery appearance. Sometimes whole branches in this variety are produced with leaves entirely white, but variegation being a diseased state of the leaf, it is found impossible to perpetuate these white varieties. There are also several kinds with plain leaves, and others with golden and plain white markings, all of which, as they produce white or pale-pink flowers in large corymbs, are very deserving of cultivation. Both these classes will root freely now in any sandy soil under glass, and if they are placed a dozen or eighteen plants in a 32-sized pot, they may be stored in it until they require to be potted off next March.

Another very interesting tribe of plants which now require to be increased for another season are the Petunias. My spring list contains a tolerable array of names, but now that they are in bloom I do not find many distinct varieties, and among them the following are all I consider worth preserving. Gem, or, as it is called in some places, Triumphans, is the largest flower that I have seen, but it is a shabby grower, and is of a pale rosy purple colour. Rosea alba (Wood's), is nearly or quite as large as the preceding, and of a purplish rose colour, with a dingy white centre. Lady Peel is the darkest variety in cultivation, is of a very dark purple, or rather rich velvety maroon colour; it blooms freely in beds, and is of compact habit. Standishii is synonymous with this variety. Next in colour may be mentioned a variety which originated in the Clapton Nursery, called Duncan's Seedling; the colour is rich crimsonish purple, with a dark centre, and elegans is a smaller flower of the same colour, with a white centre. Medora is a very rich rosy purple, and remarkably beautiful. These are all distinct varieties, and well worth cultivation. Of the pale-flowered kinds Beauty is very properly the most beautiful; the colour is white, with dark centre, and the petals shaded with rosy lilac, very much like Dodd's Mary Dahlia. Erubescens is French-white, tinged with pink, and being a dwarf grower and profuse flowerer, is well adapted for beds. Of white flowers we have not a really good variety; the old Nictaginiflora is dirty, and Climax and Bristol Boy are tinged with rose. All these varieties may be propagated readily by cuttings at the present time, in light sandy compost in a gentle heat, and, like the Pelargoniums before mentioned, may be stored a dozen or a score in a pot through the winter.

The next fortnight is the best time in the whole year

* A familiar expression for the festooning which sometimes shows itself in the cumulus-cloud about to dissolve in nimbus.

for propagating Chinese, Noisette, and Bourbon Roses by cuttings. With a sandy soil, gentle heat, and a close frame, they will strike as freely as Couch-grass. Have you got the "Cloth of Gold Noisette Rose?" is the earnest inquiry of all Rose-fanciers at the present time, and many and loud are the forebodings that it will not come up to the description. Be that as it may, it is a very nice-looking plant, and a good grower.—*W. P. Ayres, Brooklands.*

WEIGHT OF FINE HORTICULTURAL PRODUCTIONS.

PINE-APPLE, *Queen*.—Weight, 5 lbs. 14 oz.; length, 10½ in.; breadth, 6½ in.; number of pips in height, 9. A well-swelled and remarkably handsome fruit, grown by Mr. Spencer, gr. to the Marquess of Lansdowne.
PINE-APPLE, *Queen*.—Weight, 5 lbs. 3 oz.; length, 10 in.; breadth, 5½ in.; number of pips in height 10; crown small. A well-formed fruit, grown by Mr. Spencer, gr. to the Marquess of Lansdowne.
MELON, *Beechwood*.—Weight, 5½ lbs.; grown on a bed of fermented dung and leaves made up in the usual manner, by Mr. Carmichael, gr. to Mrs. Hawkins, Bignor Park, Petworth. Quality, first-rate.

HOME CORRESPONDENCE.

Testa di Quaglia.—No answer having been given to an inquiry made some time ago by a "Constant Reader" from Dorchester, relating to a curious plant called in Malta the Testa di Quaglia, I beg to inform you that the plant has been known in England ever since the year 1738, under the name of Martynia Proboscidea, that it is mentioned by Miller in his "Gardeners' Dictionary," as cultivated under that name in England in 1759, and belongs to the class Didymia Angiospermia. It requires shelter in the winter, but can be raised as other half-hardy plants. Miller recommends sowing the seed in tan bark; but, as he says they frequently failed to vegetate, may not a more hardy treatment suit them better? It was imported to England from the banks of the Ohio, where it still flourishes as well as in the Island of Malta.—*Coturnix.*

Ginger.—Your correspondent "J. M. Dytch," at p. 590, is anxious to gain all the information he can with respect to growing Ginger. My method is as follows:—About the end of March or beginning of April, two good-sized tubers are placed in a 24-sized pot, and plunged into a bark-bed at the hottest end of a Pine-pit, using very rich compost, consisting of half loam and half manure, previously incorporated at least twelve months; the bottom-heat should be 80° or 85°. As soon as the roots will hold the soil together, they are re-potted into a No. 12-sized pot, and plunged again; they now require a powerful heat, and proper attention to watering. By the end of June or the beginning of July the crop is gathered. If the old tubers be replaced in July, they will have plenty of time to mature a second crop before Christmas. They will, however, do best planted out in rich soil, with a good bottom-heat, and gathered as they grow, up to a certain time, similar to plundering an Asparagus-bed. I hope your correspondent will make known his practice for my benefit, as well as for that of others. I must add, that this is my first attempt of planting the tubers twice in one year. Ours have yet to possess that transparency which is conspicuous in that we get from the West India Islands.—*W. Brown, Merevale.*

Standard Roses.—Whoever is desirous of forming lines of these, well-organised under the shortest notice, should bud early in June; cut all away, to force the inserted bud: it will grow a foot and more the same year, and frequently produce a head of flowers. Most sorts (perhaps all of them) will yield to this practice.—*W. Brown, Merevale.*

Maggot in Onions.—The ravages of this pest to the Onion tribe have become very serious. Last year I totally lost a crop by them, and this year I have seen many crops seriously injured, and in some instances quite destroyed; and as I have tried an experiment or two, and have succeeded in obtaining a promising crop, I beg leave, through your pages, to detail the means I have used. A plot of ground intended for Onions was well manured with rotten stable-dung, and thrown up in ridges to be mellowed by the winter frosts. At the proper season for sowing the seed I had the ridges levelled, and the plot divided into three parts: one part was covered with wood-ashes, another with soot, and the third was left as it was. The seed was then sown in drills; it came up very well, and for a time they all appeared to thrive alike; that part sown with soot, however, soon took the lead; the wood-ashes were next; but the part that was dunged only begun to show symptoms of maggots, and is now a failure. There were a few maggots amongst the wood-ashes, but not one amongst the soot. Now as soot can be more easily obtained than wood-ashes, and as I have proved its efficacy, I trust that many of your readers who may have suffered from this insect will be induced to give it a trial.—*T. Appleby.*

Myatt's Pine Strawberry.—After your notice of this Pine Strawberry, the culture appears so clear that I am reluctant to again throw over this variety any mystery as to its cultivation. Deep trenching and manure (with early planting) will go very far to ensure success with any Strawberry, if the plants are not crowded; but as many persons may not have the dry situation recommended for their preservation in winter, I can inform them that the very finest unfailing crops, in my experience, are grown in a marsh that, after heavy rains or floods from an adjoining stream, will scarcely bear the weight of a man, and I have seen them produce their finest crop after lying

under water for days or weeks, during a very wet winter. This occurs in Mr. Sheppard's market-grounds at Deptford, where they grow in the wildest luxuriance, and produce most prolific crops; the plants are renewed annually, and judging from these results I have hitherto deemed a moist bottom to be essential for this variety of my favourite fruit.—*M.*

Hydraulic Cement.—I have a water-work that costs me yearly a large sum. The course is made of ridge tile and brick,—the sides are worked with Roman cement; the Roman cement will not stand the frost;—what I wish is that some of your correspondents would inform me if I could use any other cement for the purpose;—whether the asphalt would answer?—*J. B. H.*

Rust on Grapes.—Having the thinning of Grapes in a late Vinery, and having frequently seen it mentioned in the *Chronicle* that allowing the hair of the head to come in contact with the berries, and unskilful handling in thinning, would cause rust, I beg to say I purposely caused several bunches to come in contact with my hair, and likewise carelessly handled them during the operation of thinning, on all of which there is not a single berry showing symptoms of rust; while on the surrounding bunches, some of the berries are almost totally covered with it; and I should mention that they are now about to change their colour.—*C. R.*

Rendle's Tank System.—I am sorry that my letter on this subject should have been considered by Mr. Rendle as nothing more than an attempt to throw cold water on his plan of heating; if such were the tendency of my remarks, I most earnestly wish those of your readers who have not read Mr. R.'s treatise to understand that those remarks were made on the instruction given in that treatise, and not on what the author now offers, which is entirely supplementary to it. The suggestion, however, at p. 572 of the *Chronicle*, I consider excellent. And if by diverting the current of water in its course from the flow-pipe into other pipes the circulation in the tank is not arrested, I am convinced that a great deal is done towards rendering the plan useful in Pine culture. But there is one thing which should not be overlooked, namely, it does not admit of the pipes being fixed one inch higher in the house than the tank, be that where it may. Whether that is a disadvantage as compared with other tank systems which do, I leave other persons to determine. Respecting the saving of expense that would be effected by the adoption of this plan, I am willing to defer to Mr. R.'s opinion, but I cannot see so clearly as he seems to do, that the saving of fire is attributable to the use of a large body of water; because whether the quantity of water is great or small, it merely transmits the heat given off in the combustion of the fuel to the air in the house. As this air is constantly being cooled, a continual demand of heat is made on the radiating surface to maintain the desired degree of temperature. Now, through whatever medium this heat may be imparted to the house, the quantity of fuel necessary to produce it will always be pretty much the same. If a large body of water yields twice as much heat as a smaller quantity, it is because it has first received twice as much as the other. My opinion is, that the most economical qualities of a heating apparatus consist in its having as much surface of boiler presented to the fire as possible, and the most effectual prevention of loss of heat through flues, &c.; and in its being an equal distribution of heat throughout the house, by means of a quick circulation of water, whether through pipes, gutters, or tanks: these advantages once secured, the question as to quantity of water I regard as one of convenience rather than one of expense. Mr. Rendle tells us that it is his "opinion that as soon as it (his plan of heating) gets properly understood, it will be universally adopted," which implies that it is not properly understood;—in that I quite agree with him, and would go step farther by giving my opinion, that no other plan of heating is properly understood; and the reason is, I don't properly understand what it is that we want; in fact, we are only just beginning to learn. Some well-written letters which have recently appeared in the *Gardeners' Chronicle* on out-door watering, tell us in language not to be misunderstood that we are very far from knowing in what state the elements are most congenial to the growth of plants in our own climate, and it would be strange indeed if our knowledge of every other climate from which we bring plants was more accurate. Now, although the subtlety of the working of nature may forever elude the sagacity of human research, yet it is my humble opinion that the only unerring rule by which we can adapt places to plants, is to be deduced from a greater knowledge than we already possess of the laws which adapt plants to places. When we can duly appreciate the necessity of subjecting a plant, at certain periods of its existence, to a series of changes in the surrounding elements, similar to what the Almighty Creator had determined its vital vicissitudes to effect, in order to its perfect development; I say, when we can do this, it will be with more ease than we have ever yet evinced that we shall make use of a heating apparatus. And, considering the facilities which practical men now enjoy for making known to each other their ideas, and receiving every species of scientific information relative to Horticulture, I regard no longer the idea as Utopian that the opinions of gardeners, which have too long been treated with derision, will not be heard, but that they will become the inventors of everything necessary for carrying on their own operations.—*W. Sherwood.*

Tank System of Heating.—I have put up a small boiler (Rogers') with a wooden tank, under a Melon pit, as an experiment. The result is so entirely satisfactory that I intend to apply it to all the houses. I never saw a crop of Melons, or plants so healthy. I should

say that I added an open gutter, fixed along the front of the pit, which I think an improvement.—*T. P.*

Aromatics.—Under this word, in the *Gardeners' Chronicle* of 12th Aug., 1843, p. 559, middle column, is this passage:—"The approach to Ceylon can be determined by the fragrance of the air, at the distance of many miles." If this has been given by one who has actually perceived the fragrance of Ceylon at the distance of many miles, the writer of this note has nothing farther to say. But if it be little else than what may have been heard or read; I must take the liberty of doubting the statement. I have several times approached Ceylon, and anchored near the island; and having read and heard similar statements, was on the alert to sniff the said fragrance,—but none could be perceived. Many of my shipmates had also heard the like; but neither then nor on earlier occasions, found any confirmation of the rumour; therefore I cannot help setting the notion down as a popular error, believing that the Miltonic authority of "Sabeian odours" being wafted from the spicy shores of Araby the Blest," is mere poetry.—

"Many a league,
Cheered with the grateful smell, old Ocean smiles—" the same. And again, as to the "spicy shores of Araby the Blest," or unblest, it may be set down to the like account—mere poetry. Arabia produces no spice. "The perfumes of Arabia" is a common household phrase, and as erroneous as common. Scores of quotations, poetical and prosaic, might be given in addition to Pope's—

"And all Arabia breathes from yonder box."

But this may suffice.—*Oriental.*

PROCEEDINGS OF SOCIETIES.

BRITISH ASSOCIATION AT CORK.

We are indebted to the columns of the "Athenæum" for the following reports of such part of the proceedings of the Association as relate to Botany or Vegetable Physiology. The most remarkable circumstance is the re-discovery of the very rare *Spiranthes gemmipara*, concerning whose supposed identity with *S. Romanzoviana* we hope now to have some means of deciding.

On the Influence of Light on the Growth of Plants. by Mr. R. Hunt.—The peculiar influence exerted upon the germination of seeds and the growth of the young plants by coloured light, has been for some years the subject of the author's investigations. The results show the surprising powers exerted by the more luminous rays in preventing germination, and in destroying the healthful vigour of the young plant. Plants, when made to grow under the influence of the red rays, bend from the light as something to be avoided; while the blue or chemical rays are efficacious in quickening the growth of plants. Since the publication of the last Report, the author has tried plants of a great variety of kinds, and the same effects have been produced. It has, however, been found, that although blue light accelerates germination, and gives a healthful vigour to the young plant, its stimulating influences are too great to ensure a perfect growth. The strength of the plant appears to be expended in the production of a beautiful deep green foliage; and it is only by checking this tendency, by the substitution of a yellow for a blue light, that the plant can be brought into its flowering and seeding state. The retarding influence of the green rays was observed upon, as well as the power which plants possessed of sending out shoots of a great length in search of that light which is essential to their vigour.

Monstrous Violets.—A paper from Mr. R. Milliken, on a supposed anomaly in the Fructification of the Violet. Mr. Babington said that the author of the paper had described the appearances correctly, but had come to a wrong conclusion. The fact was, that in *Viola* some flowers were later than others in appearing, and that the later ones were generally imperfect, not having any corolla. The later flowers appearing without petals had misled Mr. Milliken to the supposition that these produced their fruit as the result of the flowering of the first flowers.—Prof. E. Forbes stated that the absence of petals was a permanent state of some of the species of the Violet.

On the Decomposition of Carbonic Acid Gas, and the Alkaline Carbonates, by the light of the Sun. By Prof. Draper, New York.—The decomposition of carbonic acid gas, by the leaves of plants under the influence of the light of the sun, is one of the most remarkable facts in chemistry. Dr. Daubeny, in a very able paper in the Transactions of the Royal Society for 1836, came to the conclusion that the decomposition in question was due to the rays of light, a result obtained by the agency of coloured glasses, but which does not appear to have been accepted by later authors, who have attributed it to the chemical rays. There is but one way by which the question can be finally settled, and that is by conducting the experiment in the prismatic spectrum itself. When we consider the feebleness of effect which takes place, by reason of the dispersion of the incident beam through the action of the prism, and the great loss of light through reflection from its surface, it would appear a difficult operation to effect the determination in this way. Encouraged, however, by the purity of the skies in America, I made the trial, and met with complete success. The plan followed was that already described for determining the active ray, in the case of chlorine and hydrogen. A series of tubes, half an inch in diameter and six inches long, were arranged so that the coloured spaces of the spectrum fell on them. In these tubes, water, impregnated with carbonic acid gas, and containing a few green leaves (*Poa annua*), was placed. It was expected, that if the decomposition be due to the radiant heat, the tube occupying the red space, or even the one in the extra-spectral red space, would, at the close of the experiment, contain most gas. If it were the "chemical rays," in the common acceptance of the term, we might look for the effect in the blue, violet, or indigo spaces; but if it were the light, the gas should make its appearance in the yellow, with some in the green, and some in the orange. I made the trial several times, and found it much more easy to accomplish than I had expected. The results were briefly as follows.—In the tube that was in the red space a minute bubble was sometimes found, but sometimes none at all. That in the orange contained a more considerable quantity; in the yellow ray a very large amount, comparatively speaking; in the green a much smaller quantity; in the blue, the indigo, the violet, and the extra-spectral space at that end, not a solitary bubble. From these facts, in connexion with some results obtained by the use of bichromate of potash, as an absorptive medium, I conclude that it is the rays of light which effect the decomposition, and that the rays of heat and the tithonic rays have nothing to do with the phenomenon. The alkaline bicarbonates are easily decomposed by elevation of temperature, yielding a portion of their acid at the boiling point of water. Instead of using a solution of carbonic acid, I endeavoured to effect the decomposition of these salts by leaves in the sunlight, and found that it took place with facility. Nor is the effect limited to the removal and decomposition of the second atom of the acid. It passes on to the first; the neutral carbonate of soda itself decomposing and yielding oxygen gas. In like manner the sesquicarbonate of ammonia may be made to yield a very pure oxygen gas.—Prof. Aljohn made a few remarks on this communication, which announced results so different from our received ideas on this subject, it being generally agreed that the chemical rays were the most active in producing the decomposition of the carbonic acid absorbed by the plant.—Mr. Hunt said, that he had

listened with great surprise to Dr. Draper's paper, as, from his own experiments with coloured glasses and transparent media, carefully analyzed so as to determine what rays were absorbed and what rays passed through them, he had arrived at conclusions diametrically opposed to those now put forth. He acknowledged that he had never tried the experiment with the pure rays of the prismatic spectrum, but he should certainly lose no time in doing so on his return to England. Mr. Hunt then noticed some peculiarities which had been observed in the light of southern climates, to which he was at present inclined to attribute this difference in the result of experiments.

Saxifrages.—Mr. Mackay exhibited specimens of the Irish Saxifrages. He called attention to the species resembling the London Pride (*Saxifraga umbrosa*), and with the specimens of the species he also exhibited several varieties of *S. geum*, *S. hirsuta*, *S. h. polita*, &c.—Mr. Babington remarked, that *Saxifraga* was a difficult genus to study. There were many specimens on the table, which, if they came from different countries, would be naturally described as species, but which, as they were all gathered in Ireland, he had no hesitation in calling varieties. It was no proof that a plant was a species because it remained the same in cultivation for a great length of time, for many varieties did that. He had paid great attention to the Saxifrages, and of those belonging to the London Pride tribe, he believed that only *S. umbrosa elegans*, *geum*, and *hirsuta*, were species. The variety *S. u.* of Mr. Mackay, was not the London Pride of the English Gardens, which was identical with the London Pride of the Pyrenees. Prof. Forbes said, that the difference between botanists with regard to species and varieties, could only be reconciled by ascertaining from each writer an estimate of the value he attached to particular characters. For the want of this there was much confusion even in Botany, but the evil was much greater in Zoology. The vague manner in which the characters of animals were drawn up by British zoologists, was a constant cause of complaint among continental naturalists.

***Spiranthes gemmipara*.**—The Rev. W. Hincks called attention to two living specimens of the *Neottia gemmipara* of Smith. This very rare plant had been discovered by Mr. J. Drummond in a salt marsh near Castleton Bearhaven, in the county of Cork, in 1810. From an imperfect specimen, Sir J. S. Smith had described and figured it, and it had not been seen again till 1841, when it was re-found by Dr. Sharkey. Only one specimen was again obtained, and it was with difficulty identified with the original specimen in the Linnean Herbarium in London. Dr. Wood and Dr. Harvey had, during the past week, both gathered living specimens, which were now on the table. The original plant was not a *Neottia*, as had been supposed by Smith, but was now referred to *Spiranthes*. Mr. Babington stated, that he had carefully examined the plant on the table, and believed that it was a genuine *Spiranthes*. It was a matter of great interest, as probably this plant was one of the rarest in the world. There was no record of its having been found anywhere but in the locality from whence these specimens were brought. Mr. Hincks stated that among some Californian plants received in London had been found what appeared to be a *Spiranthes gemmipara* [not Californian, but *Una aschkan*].

***Linaria Italica*.**—Dr. Allman exhibited specimens of a *Linaria* which he had gathered in Ireland. He believed it to be a new species, and had described it at a meeting of the Royal Irish Academy. It had been supposed to be the *Linaria Italica* of Tievrinus, which had also been found in England, but this plant differed in many respects from *L. Italica*. Mr. Babington thought the plant of Dr. Allman differed from the English *L. Italica*. Should this *Linaria* be a new species, it will probably be new to the European Flora. Dr. Allman stated, that Botanists in London had pronounced his plant a hybrid, and Mr. Mackay concurred with this opinion.

***Trichomanes speciosum*.**—Dr. Allman exhibited specimens of the very rare *Trichomanes speciosum*, and also of one discovered by Mr. Andrews of Dublin, which differed from it in many points, and which might probably turn out a new species. The principal features of difference that this Fern presented were, the possession of bipinnate fronds, long bristles, and the triangular form of its fronds: in all these points it differed from *T. speciosum*. Mr. Mackay had cultivated the plant in question since Mr. Andrews discovered it, and it was his conviction that it was a new species.

Vitality of Seeds.—Mr. H. G. Strickland then read the Report of the Committee appointed to investigate the length of time during which seeds would retain their vitality. Several experiments were making, and the committee still invited the attention of the Members to this subject, as they would be glad to receive from any source, seeds of which the great age could be clearly ascertained.

COUNTRY SHOWS.

Bath Royal United Horticultural Society, August 19.—The fifth show for the season took place in the Horticultural Gardens, Victoria Park. It was distinguished as a *Hollyhock Show*; and was strikingly characterised as such by the introduction of a marquee expressly contrived for the purpose, and erected at the expense of A. Lawrence, Esq., who gave a richly chased silver goblet as a prize for the best cut Hollyhocks. The front entrance of the tent was rendered attractive by an external orbicular embellishment, surmounted by a gold eagle, alternated with Hollyhocks and wreathed Laurel, and bearing an inscription in the inner circle indicative of the purpose of the tent. On the curtain of the tent, behind the stand, was fixed a beautiful Hollyhock star. The principal competitors for the prize were Messrs. Salter, Emerson, and Kitley. It was awarded to the first named. Among the exhibitors were H. Davis, Esq., and A. Lawrence, Esq. **LIST OF PRIZES.**—*Florists' Flowers*, &c.—*Class I.*—*Nurserymen*.—*Dahlias*, 24 varieties, 1, Mr. Maule; 2 and 3, Mr. Walters. *German Stocks*, twenty-four, 1, Mr. Carpenter. *Hollyhocks*, twenty-four, 1, Mr. Kitley; 2, Mr. Salter. *German Asters*, thirty, 1, Mr. E. Tiley; 2, Mr. Wheeler. *German Asters*, thirty-six, in 12 varieties, 1, Mr. Walters; 2, Mr. Wheeler. *Annals or Biennials*, best collection, 1, Mr. Cole; 2, Mr. Carpenter. *Ornamental Collection of Cut Flowers*, 1, Mr. Kitley, jun.; 2, Mr. Leonard. *Collection of Cut Flowers*, 1, Mr. Carpenter; 2, Mr. Kitley. *Class II.*—*Amateurs*.—*Dahlias*, 18 varieties, 1, J. M. Yeates, Esq.; 2, Mr. Nias. *Do.*, best twelve, 1, J. M. Yeates, Esq.; 2, Mr. G. D. Fisher. *German Asters*, twenty-four blooms, in 12 or more varieties, 1, Mr. Reed; 2, Mr. G. D. Fisher. *German Stocks*, eighteen blooms, in 12 or more varieties, 1, J. M. Yeates, Esq. *Hollyhocks*, twenty-four, 1, A. Lawrence, Esq.; 2, T. Emerson, Esq. *Annals or Biennials*, 12 varieties, 1, J. M. Yeates, Esq.; 2, Miss Bayly. *Scabious*, twenty-four, 1, A. Lawrence, Esq. *Roses*, collection, 1, Mr. Bennett; 2, A. Lawrence, Esq. *Ornamental Collection of Cut Flowers*, 1, Mr. Shaw; 2, T. Emerson, Esq. *Flowering Plants in Pots in the growing state*.—*Class I.*—*Nurserymen*.—*Stove Plants*, five, 1, Mr. Drummond. *Greenhouse Plants*, nine, Mr. Salter. *Do.*, six, 1, Mr. Drummond. *Balsams*, eight, 1, Mr. Salter. *Cockscombs*, 1, Mr. Salter. *Fuchsias*, twelve, 1, Mr. Drummond; 2, Mr. Salter. *Collection of Plants*, 1, Mr. Salter; 2, Mr. Carpenter. *Ornamental Basket of Plants*, 1, Mr. Salter; 2, Mr. Carpenter. *Class II.*—*Amateurs*.—*Orchidea*, three, 1, J. Jarrett, Esq. *Single Specimen*, 1, J. Jarrett, Esq. *Stove Plants*, five, 1, J. Jarrett, Esq. *Do.*, three, 1, J. Jarrett, Esq. *Greenhouse Plants*, eight, 1, J. M. Yeates, Esq.; 2, J. Jarrett, Esq. *Cockscombs*, six, 1, J. M. Yeates, Esq.; 2, Y. Sturge, Esq. *Balsams*, 1, J. Jarrett, Esq.; 2, J. M. Yeates, Esq. *Ericas*, three, 1, J. M. Yeates, Esq. *Fuchsias*, nine, 1, J. M. Yeates, Esq. *Ornamental basket of Plants*, 1, Mr. Shaw. *A. Lawrence, Esq.'s Prize (a Silver Goblet) for the best Eighteen Hollyhocks*, Mr. Salter. *Honorary Prize for Wax Flowers*, Mrs. Price. *J. M. Yeates, Esq.'s Prize for the best Collection of Hardy Annals and Biennials*, Rev. C. Paul. **FRUIT.**—*Pine Apples*, Queen's, 1 and 2, Mr. Merry, to the Marquess of Bath. *Grapes*, black, three bunches, 1, Mr. Kitley; 2, Mr. Drummond; 3, W. Miles, Esq., M.P. *Do.*, white, 1, W. Miles, Esq., M.P.; 2, Mr. Kitley; 3, Mr. Targett. *Do.*, any sort, 1, Mr. Kitley. *Melons*,

1, G. Yeates, Esq.; 2, T. Emerson, Esq.; 3, G. C. Tugwell, Esq. Peaches, 1, Mr. Merry; 2 and 3, Mr. J. Cook. Nectarines, 1, Mr. Merry; 2, G. Yeates, Esq. Apricots, 1, Mr. W. eight, 1, Mr. Merry; 2, G. Yeates, Esq. Cherries, 1, Mr. Pyatt; 2, Mr. Shaw. Peas, 1 and 2, Mr. J. Cook. Apples, 1, Mr. Pyatt; 2, Mr. J. Cook. Culinary, 1, Mr. Minty; dessert, 1, Mr. Lidiard; 2, Mr. J. Cook. Currants, 1, Mr. Lidiard. Raspberries, 1, Mr. Lidiard; 2, Mr. Cooper. Gooseberries, 1, Mr. Rogers. Vegetables:—Collection of Tomatoes, Artichokes, Vegetable Marrow, Scarlet Runners, 1, Mr. J. Cook; 2, Rev. C. Paul; 3, G. C. Tugwell, Esq. Collection of Celery, Lettuce, Garden Turnips, Carrots, Onions, 1, Mr. Cooper; 2, Mr. J. Cook. Best Salad, 1, Mr. Cook; 2, Mr. Cooper. EXTRA PRIZES:—Roses, Mr. Cole, Mr. Carpenter. Collection of Verbenas, Mr. Walters. Collection of Cut Flowers, J. M. Yeates, Esq. Collection of Cut Roses, T. Emerson, Esq. Seedling Dahlia, J. M. Yeates, Esq. 12 Dahlias, T. Emerson, Esq. Amaranthus, Mr. Targett. Erica, J. M. Yeates, Esq. Achimenes, Mr. Merry. Six Greenhouse Plants, J. M. Yeates, Esq. Hollyhocks, T. Emerson, Esq. Seedling Fuchsia, Miss Bayly. Statice Puberula, Miss Bayly. Grapes, G. C. Tugwell, Esq., Mr. Minty. Apricots, W. Miles, Esq., M. P. Cauliflowers, Mr. J. Cook. Shallots, Mr. Cooper.—*Bath Herald*.

Cambridge Florists' Society, July 24.—The show of Carnations and Picotees, which was held at the Red Lion Hotel, was much better than might have been anticipated, considering the remarkable coldness of the season. The prize stands of these flowers exhibited respectively an agreeable variety of the choicest sorts, and appeared to give much satisfaction to the connoisseurs in such matters. It will be seen from the list subjoined, that Don John (against which some of the northern florists have been making such an outcry) maintains its position as a first-rate scarlet bazar; it occupied, on this occasion, the dozen places assigned to its class. We must not omit to notice a beautiful seedling Picotee exhibited by Mr. Wood, of Huntingdon, and named Wood's Princess Alice; this flower obtained the first seedling prize, and also took the first prize in its class, beating all the older varieties. CARNATIONS: Mr. R. Haylock, Premier prize, Dalton's Lancashire Lass. Scarlet Bazar: 1, 2, 3, and 4, Mr. Twitcheit, with Twitcheit's Don John; 5, Mr. Rickard; 6, 7, and 8, Mr. Twitcheit; 9, Mr. Marshall; 10, Mr. Rickard; 11, Mr. Haylock, all with Twitcheit's Don John. Crimson Bazar: 1 and 2, Mr. Wood, with Wood's William the Fourth and Ely's Lord Milton; 3, Mr. Twitcheit, Count Paulina; 4, Mr. Wood, Paul Pry; 5, Mr. Ready, Paul Pry; 6, 7, 8, and 9, Mr. Twitcheit, with Puxley's Prince Albert, Paul Pry, Jacques's Gloriana, and Count Paulina; Nos. 10 and 11, not claimed; 12, Mr. Marshall, Hufton's Duke of Wellington. Scarlet Flakes: 1 and 2, Mr. Haylock, Addenbrooke's Lydia, and 3, with Stearn's Dr. Barnes; 4, Mr. Wood, Addenbrooke's Lydia; 5 and 6, Mr. Haylock, with Addenbrooke's Lydia and Dr. Barnes; 7, Mr. Wood, Wilson's William the Fourth; 8 and 9, Mr. Twitcheit, with Marquess of Granby and Lowe's Grand Sultan; 10, Mr. Wood, Addenbrooke's Lydia; 11, Mr. Twitcheit, Marquess of Granby; 12, Mr. Wood, Wilson's William the Fourth. Purple Flakes: 1, Mr. Twitcheit, Mansley's Beauty of Woodhouse; 2, Mr. Ready, Lascelles' Queen of Sheba; 3, Mr. Wood, ditto; 4, Mr. Wood, Millwood's Premier; 5, Mr. Green, Queen of Sheba; 6, Mr. Marshall, Headly's Seedling; 7, Mr. Haylock, Queen of Sheba; 8, Mr. Haylock, Hufton's Bellerophon. Rose Flakes: 1 and 2, Mr. Haylock, Dalton's Lancashire Lass; 3 and 4, Mr. Wood, Sir George Crewe; 5, Mr. Haylock, Duchess of Devonshire; 6, Mr. Rickard, Lancashire Lass; 7, Mr. Dickerson, Duchess of Devonshire; 8, Mr. Twitcheit, Tasker's Princess Royal; 9, Mr. Wood, Yates' Supreme; 10, Mr. Wood, Pullen's Queen of England; 11, Mr. Marshall, Duchess of Devonshire; 12, Mr. Wood, Yates' Supreme. Seedling Carnations: 1, Mr. Twitcheit, not named; 2 and 3, Mr. Wood, ditto. Picotees:—Mr. Twitcheit, Premier Prize, Sharp's Elegante. Red (heavy edged), 1, Mr. Haylock, Sharp's Duke of Wellington; 2, Mr. Wood, do.; 3, Mr. Twitcheit, Brinkler's Masterpiece; 4, Mr. Wood, Wood's Marshal Sout; 5, Mr. Ready, Giddens's Sir R. Peel; 6 and 7, Mr. Haylock, with Sharp's Wellington and Sharp's Hector; 8, Mr. Rickard, Sharp's Wellington; 9, Mr. Ready, Hector; 10, Mr. Haylock, do.; 11, Mr. Wood, Seedling; 12, Mr. Haylock, Sharp's Wellington. Red (light edged), 1, Mr. Twitcheit, Sharp's Gem; 2 and 3, Mr. Rickard, Sharp's Gem; 4, Mr. Wood, Wood's Victoria; 5, Mr. Rickard, Sharp's La Delicate; 6, Mr. Wood, Wood's Lady Paget; 7 and 8, Mr. Dickerson, La Delicate and Sharp's Cleopatra; 9, Mr. J. Taylor, Russell's Incomparable; 10, Mr. Dickerson, Sharp's Cleopatra; 11, Mr. Twitcheit, La Delicate; 12, Mr. Rickard, Sharp's Gem. Purple (heavy edged), 1, Mr. Wood (Seedling), Wood's Princess Alice; 2, Mr. Twitcheit, Sharp's Defender; 3, Mr. J. Taylor, Hufton's Drusilla; 4, Mr. Wood, Seedling; 5, Mr. Marshall, Crask's Queen Victoria; 6, Mr. Ready, Drusilla; 7 and 8, Mr. Wood, Seedling; 9, Mr. Green, Drusilla; 10, Mr. Marshall, Queen of England; 11 and 12, Mr. Twitcheit, Crask's Victoria and Queen of England. Purple (light edged), 1 and 2, Mr. Twitcheit, Sharp's La Elegante; 3, Mr. Ready, Giddens's Vespasian; 4, Mr. Wood, Unknown; 5, Mr. Ready, Vespasian; 6, 7, 8, and 9, Mr. Twitcheit, with Brinkler's Lady Emily, Brinkler's Lady Chesterfield, and Brinkler's Lady Emily; 10, Mr. Wood, Wood's Lord Hinchinbrooke; 11, Mr. Twitcheit, Lady Chesterfield; 12, Mr. Ready, Vespasian. Rose (heavy edged), Mr. Crisp, 5 prizes, with Green's Queen Victoria. Rose (light edged): 1 and 2, Mr. Wood, with Giddens's No. 122 and Favourite; 3 and 4, Mr. Twitcheit, Brinkler's Beauty of Cranfield; 5, Mr. Twitcheit, Purchas's Granta; 6, Mr. Wood, Purchas's Matilda. Yellow Picotees: 1, Mr. Wood, Martin's Victoria; 2, Mr. Haylock, do.; 3, Mr. Marshall, do.; 4 and 5, Mr. Rickard, Howlett's Paragraph; 6, Mr. Wood, Reine de Français. Seedling Picotees: 1 and 2, Mr. Wood, Wood's Princess Alice. Dahlias grown in a pot, 1, Messrs. Hudson, Argo; 2, Messrs. Hudson, Ruby. Balsams, 1 and 2, Mr. Green. Cockcombs, 1 and 2, Messrs. Hudson. Specimen Plant in a pot: 1, Mr. Green, Maurandya Barclayana alba; 2, Messrs. Hudson, Hoya carnosa; 3, Mr. Cumming, Pelargonium (Smith's Emperor). Cut Flowers, 1, Messrs. Hudson; 2, Mr. Ready. Society's Bouquets: 1, Mr. Green, with 5s. added by Mr. J. Crouch; 2, Messrs. Hudson. Amateurs' Bouquets: (Mr. Green's Prizes): 1, Mr. W. Crisp; 2, Mr. J. Edis. EXTRA PRIZES: Mr. Green, Collection of Plants; Messrs. Hudson, do.; Mr. Catling, Ivy-leaf Pelargonium; Mr. J. Sparrow, Hollyhocks; Mr. Ready, Dahlias; Mr. Edis, Pansies.

Cork Horticultural Society, July 26.—The exhibition of Flowers, Fruits, and Vegetables, took place at the Corn Exchange. The varied contributions from the Flower Garden were not so numerous as on former occasions. The Fruits were fine and in great variety, and the Vegetables were never finer. From Sir W. Chatterton's garden there was a collection of Roses, Picotees, and Carnations; a large Bouquet, and a varied collection of Fruits and Vegetables. From Mrs. B. Fitzgerald, a collection of Fruits, comprising Grapes and Melons, and well-grown Greenhouse and Stove Plants; amongst the latter we noticed the beautiful Rondeletia speciosa, and Ixora grandiflora, covered with flower: the Balsams in this collection were remarkably fine. From J. S. Barry, Esq., a large assortment of Stove and Greenhouse Plants, Melons, Grapes, and Cherries, and a collection of Vegetables, amongst which we noticed a brace of immense Cucumbers. From A. Newman, Esq., a collection of Roses, Fuchsias, and Dahlias, and a variety of Vegetables. From the Rev. J. Stopford, a collection of Roses, Pansies, and Herbaceous Plants. From J. Lindsey, Esq., a tastefully-arranged Bouquet and a collection of Fruits and Vegetables; we noticed in this lot some ripe Eve Apples. From Col. Hodder, a collection of Carnations, Picotees, and Dahlias, also some Fruits and Vegetables. From J. M. Travers, Esq., a large collection of Fruits and Vegetables: amongst which were some fine Grapes, Melons, and Peaches. From Sir G. Gould there was also a collection of Fruits and Vegetables. From Mrs. Morrough there was a beautiful collection of Greenhouse and Herbaceous Plants, comprising some Seedling

Fuchsias of rare beauty. From Capt. Hill there was a splendid collection of Pelargoniums, amongst which were some fine Seedlings, also a variety of Fuchsias, Roses, Pinks, and Dahlias. From W. G. Bradford, Esq., there was a beautiful collection of Cape Heaths, Pelargoniums, Calceolarias, Fuchsias, and other Greenhouse Plants. From Miss Lyons there was a collection of Greenhouse Plants, also Picotees and Carnations. From Col. Piper, a large Bouquet, and a collection of Fruits and Vegetables. From M. H. Conway, Esq., a collection of Carnations and Picotees, and a large assortment of Greenhouse Plants, comprising some fine Pelargoniums and Fuchsias. T. H. Hewitt, Esq., sent a splendid specimen of Fuchsia corymbiflora. From W. Beamish, Esq., a collection of Carnations and Picotees, and a variety of Fruits and Vegetables. From W. M. Reeves, Esq., there was a large collection of Pansies, Dahlias, and Annual Flowers; also a collection of Vegetables. From R. J. Coppinger, Esq., a collection of Fruits and Vegetables. W. Parker, Esq., sent a beautiful collection of Pansies. The botanical prize was awarded to D. Sullivan, of Blackrock, for the best "Hortus siccus" of fifty named Native Plants. From Messrs. Haycroft, of the Victoria Nursery, there was, as usual, a brilliant display of Greenhouse Plants, amongst which we noticed many novelties in Pelargoniums and Fuchsias. There were also some beautiful Cape Heaths, Pimeleas, Gloxinias, Petunias, Achimenes, and other Greenhouse Plants, and a large variety of Roses, Picotees, and Carnations.—*Cork Advertiser*.

Cork Horticultural Show, Aug. 22.—The Horticultural Society had a numerous and fashionable attendance in the room of the Corn Exchange. The principal contributor was the Earl of Kingston, in whose collection we noticed Cycas revoluta (the Sago Palm), a large plant of Bromelia; a beautiful assortment of Greenhouse and Stove-plants, amongst which was Clerodendron speciosissimum; there were also Fruits, Pines, Grapes, Melons, Guavas, &c. in great perfection. From Viscount Doneraile's gardens was a plant of Musa Cavendishii, and a beautiful specimen of Cypripedium insigne; also a collection of Dahlias and Greenhouse plants; the Fruits were Grapes, Peaches, and Melons. From Sir W. Chatterton were Fruits, Vegetables, Hollyhocks, Roses, Dahlias, and Annual Flowers. Captain Hill contributed a collection of Fuchsias and other Greenhouse plants, a tastefully-arranged basket of Flowers, and a collection of Vegetables. From W. Beamish, Esq., was a collection of Greenhouse plants, Fruits, and Vegetables. Colonel Hodder contributed a collection of Picotees, Carnations, Dahlias, and German Stocks. From Mrs. Blakeney Fitzgerald was a collection of Fruits, amongst which we noticed some excellent Grapes, also a fine Melon and Pine Apple, a specimen of the curious Pitcher Plant, and a fine variety of Balsams. From J. S. Barry, Esq., were Grapes, Melons, and Cucumbers; and a collection of Greenhouse plants, Dahlias, and other flowers. From Col. Piper was a nicely-arranged large Bouquet, some well-grown Grapes, and a collection of Vegetables. From Mrs. Morrough was a collection of Greenhouse plants; amongst which was Silene laciniata, a variety of Fuchsias, and Herbaceous plants. From W. Crawford, Esq., were well-grown Grapes, Peaches, Melons, and Plums. From A. Newman, Esq., was a collection of Roses, Dahlias, and Greenhouse plants. Miss Lyons contributed some good Picotees and Carnations, a variety of Hollyhocks, German Asters, and Hardy Annual Flowers. From S. Lane, Esq., was a collection of Fruits and Vegetables. From J. Lindsey, Esq., was a Bouquet and a large assortment of Fruits and Vegetables. From J. M. Travers, Esq., was a collection of Fruits and Vegetables; amongst the former we noticed some fine Peaches, Melons, Grapes, and Gooseberries. Counsellor Hewitt contributed beautiful plants of Oleander, the Scarlet Datura and Fuchsia corymbiflora; also a fine specimen of Vallota purpurea. From W. M. Reeves, Esq., were Dahlias and Vegetables. From R. S. Coppinger, Esq., were Vegetables, and a large Melon. From J. Bennett, Esq., was a collection of Dahlias, Roses, Pansies, Vegetables. From Rev. J. Stopford, was a collection of Herbaceous plants and Vegetables. C. Terry, Esq., sent a large specimen of the Oak-leaved Hydrangea. From M. Conway, Esq., was a collection of Picotees, Fuchsias, Pelargoniums, and other Greenhouse plants. From W. Parker, Esq., was a collection of Pansies, Carnations, Picotees, and a variety of Annual Flowers. Dr. Bull contributed some very large Tripoli Onions, weighing on an average about 1½ lb. each. J. Halloran, Esq., exhibited a miscellaneous collection of cut Flowers. From W. G. Bradford, Esq., were some finely-grown Calceolarias, and Cape Heaths; also a collection of Roses, Dahlias, and Pansies. There was a large collection of Native plants contributed by D. Murray and D. Sullivan. The collection from Messrs. Haycroft comprised upwards of one hundred specimens of Greenhouse and Stove-plants in Flower; amongst these the Fuchsias were remarkably beautiful. We also noticed some fine plants of different varieties of Gesneria, Achimenes, Statice, Pimelia, Thunbergia, Chironia, and Cape Heaths; there were also fine plants of Lisianthus Russellianus, and lots of the beautiful Brachycome ibericifolia, Dahlias in great variety, with cut specimens of Herbaceous plants and Roses. Mr. Cutter contributed a collection of Greenhouse plants, and different varieties of Cacti.—*Cork Advertiser*.

Devon and Exeter Botanical and Horticultural Society, July 28.—The 44th Exhibition took place at Congdon's Royal Subscription Rooms in this city, and was surpassingly fine. Foremost among the contributors was Mrs. Wells, who had a quantity of well-grown specimen plants. The Orchidaceae were very good, particularly Cattleya crispa, having 10 flowers open on it; C. Harrisoniae, with 24 flowers; Oncidium Lanceanum, with two spikes, each having 16 flowers on it; Stanhopea insignis, with 9 pendulous flower-spikes; S. Wardii, &c. The Stove or Hothouse Plants were very good; amongst them were Achimenes grandiflora; A. longiflora, an immense mass of blue flowers; Clerodendron squamatum, Golpémia splendens, Gesnera splendens, &c. The Greenhouse Plants consisted of Boronia viminea, Tecoma jasminoides; a very fine specimen of Elichrysum proflerum, Leschenaultia formosa, Siphocampylus betulifolius, &c. The Ericas or Heaths were exceedingly fine. The Fuchsias contained many new and choice sorts well grown. There was also a fine specimen of Lilium lancifolium punctatum. The Carnations and Picotees were very good. On the fruit-table we observed a fine Queen Pine, some good Grapes, and a choice collection of fruit, also exhibited by Mrs. Wells. From J. W. Buller, Esq., Sir T. Acland, Sir J. Kennaway, J. B. Swete, Esq., H. Porter, T. Porter, E. Lousada, Esqrs., and F. Cross, Esq., were collections of plants, flowers, fruit, and vegetables, of the most splendid description. Mr. J. Clark exhibited a beautiful collection of flowers. Mr. R. Webber, a stand of superior Carnations and Picotees; amongst which we noticed in Carnations, Parker's Sophia, Earl Grey, Prince Albert, Festival, Jacques' Georgiana, Queen Bess, &c. Picotees, Heath's Superb, Mary Ann, Giddens's Diana, Webber's Devonian, Duchess of Kent, and Crask's Duke of Wellington. The contributions of the Nurserymen and Florists were as liberal as magnificent; Messrs. Lucombe, Pince, and Co., having beautiful specimens of Achimenes grandiflora, multiflora, pedunculata, rosea and longiflora, Brugmansia floribunda, Ixora grandiflora, &c.; also that beautiful Stove-plant Cyrtoceras reflexa. We likewise noticed a magnificent specimen of Cattleya violacea, with its large rich violet-coloured flowers; Boronia viminea, Siphocampylus betulifolius, Banksia speciosa, &c. Also two fine specimens of Yucca gloriosa, which attracted great attention: but we must particularly notice their new Seedling Fuchsia Exoniensis; this is peculiarly rich and deserving the cultivation of every admirer of the trine. A fine collection of Cape Heaths, and a choice display of named Fuchsias, including all the newest kinds, with cut flowers of Rosa Devonensis, Calceolaria Standishii, &c. Messrs. Veitch & Son had a glorious display, occupying one side of the room, and comprising most valuable and rare Orchidaceous and Stove-plants, Ericas, &c. Messrs. C. Sclater and Son exhibited a fine collection of Stove

and Greenhouse Plants, Carnations, Picotees, Fuchsias, &c.; among which the following were very fine:—Angelonia grandiflora, Gloxinia rubra, Sinningia guttata and violacea, Lophospermum Hendersonii, Stephanotis floribunda, Achimenes longiflora and coccinea; a beautiful Seedling Pelargonium, named Ariel; a quantity of remarkably fine Balsams and Cockcombs. The collection of Fuchsias were of first-rate character, and among other fine kinds, the following were particularly noticed:—Rogersonia, Cormackii, speciosa, Lanei, Towardi, Venus victrix, globosa rosea elegans, Gem, Iveryana, Grenville, Brockmannii, formosa elegans, pulcherrima, and a kind with variegated foliage, namely globosa variegata. The collection of Petunias were beautiful, many of them quite new, and of brilliant colours. There were also a fine box of Verbenas; a Seedling Pentstemon from gentianoides, of distinct character; a fine collection of Carnations and Picotees, in pots; Carnations,—Rainbow, Gem, Prince Albert, Achilles, Coronation, Fire-fly, Lady Morgan, Amato, Endymion, Duke of Devonshire; Picotees,—Queen Victoria (yellow), Mary Anne, Plenipotentiary, Erin-go-bragh, Crask's Victoria, Trude's Victoria; Calceolaria oculata—a Seedling of Messrs. S. and Son of the present year—one of the most unique and beautiful kinds ever seen, dotted with almost black on a light ground, of beautiful form and symmetry; a fine collection of Roses, containing Duc de Trevisse, Emerance, La Fontaine, Madame LaFarge, Micaela, Edward Jesse, Triumphant, Adonis, Charles Duval, Achille, Kean, Felicité Parmentier, Aspasie, La Grandeur, also came from the same. Prizes were awarded as follows:—FRUIT.—Best collection, Silver Medal, 1, H. Porter, Esq.; 2, Sir J. Kennaway, Bart.; best Pine-apple, 1, Mrs. Wells; 2, E. Lousada, Esq.; best dish of mixed Grapes, Sir J. Kennaway, Bart.; best dish of black, Major Toll; best dish of white, Mrs. Wells; best flavoured Melon, 1, Sir J. Kennaway, Bart.; 2, R. T. Head, Esq.; best dish of six Peaches, H. Porter, Esq.; best dish of six Nectarines, J. B. 3; best dish of white Cherries, Sir J. Kennaway, Bart.; best dish of black, Mrs. Long; best dish of red Gooseberries, H. Porter, Esq.; best dish of yellow, Sir T. D. Acland, Bart.; best dish of green, H. Porter, Esq.; best dish of red Currants, F. Cross, Esq.; best dish of white, H. Porter, Esq.; best dish of black, Sir T. D. Acland, Bart.; best dish of Raspberries, red, J. W. Buller, Esq.; best dish of Strawberries, J. W. Buller, Esq.; best dish of ripe dessert Apples, the growth of the present year, F. Cross, Esq. VEGETABLES.—Best collection, Silver Medal, and best brace of Cucumbers, Major Toll; best dish of Peas, J. W. Buller, Esq.; 2, Sir J. Kennaway, Bart.; best dish of dwarf Kidney Beans, and best dish of Scarlet Runners, J. W. Buller, Esq.; best dish of Broad Beans, F. Cross, Esq.; best dish of Artichokes, Sir T. D. Acland, Bart.; best three Cabbages, J. W. Buller, Esq.; best three Cauliflowers, Sir J. Kennaway, Bart.; best six Cos Lettuces, H. Porter, Esq.; best six Cabbage, do., S. T. Kekewich, Esq.; best dish of Spinach, H. Porter, Esq.; best dish of red Potatoes, Sir T. D. Acland, Bart.; best dish of white, Sir J. Kennaway, Bart.; best dish of Kidney, H. Porter, Esq.; best dish of Seedling, raised by the exhibitor, J. W. Buller, Esq.; best dish of Onions, growth of 1843, H. Porter, Esq.; best dish of Shallots, S. T. Kekewich, Esq.; best bunch of twelve Turnips, J. W. Buller, Esq.; best bunch of twelve Carrots, Mrs. Wyatt; 2, best Collection of Vegetables, H. Porter, Esq.; 3, E. Lousada, Esq. EXTRA FRUIT.—Collection of fruit and mixed Grapes, Mrs. Wells; black Grapes, J. New, Esq., and J. B. 3; Pine Apple, E. Lousada, Esq.; Melon, L. Ponsford, Esq.; Apples, 1842, Sir J. Kennaway. EXTRA VEGETABLES.—Collection of Vegetables, P. Cross, Esq.; Beans, Sir J. Kennaway. FLOWERS AND PLANTS.—ORCHIDACEAE.—Best group of six Plants, Mrs. Wells; 2, J. W. Buller, Esq.; newest and best specimen, Mrs. Wells. STOVE PLANTS.—Six best specimens, Silver Medal, J. W. Buller, Esq.; six second best, newest and best do., Mrs. Wells. GREENHOUSE PLANTS.—Best group of twelve plants, (exclusive of Heaths, Pelargoniums, and Fuchsias,) Mrs. Wells; 2, J. W. Buller, Esq.; three newest and best sorts, Mr. J. Clark; twelve best Cape Heaths, Mrs. Wells; six best do., Mr. J. Clark; six best new Fuchsias, J. W. Buller, Esq.; 2, six newest and best Pelargoniums, Mrs. Wells. HERBACEOUS PLANTS.—Best twelve Early Plants, Mrs. Granger; 2, Sir T. D. Acland; newest and best single specimen, and best collection of Phlox, Mr. Jas. Clark; best collection of Verbenas, J. W. Buller, Esq. ROSES.—Best collection of any kind, H. Porter, Esq.; 2, F. Cross, Esq. CARNATIONS AND PICOTEES.—Best twelve Carnations, Mr. Colson; 2nd and best twelve white ground Picotees, Mrs. Wells; 2, Mr. Colson; best six yellow Picotees, Mrs. Wells. HEARTSEASE.—Best eighteen sorts, F. Cross, Esq.; best twelve, Mrs. Granger. TREES AND ANNUALS.—Six best Cockcombs, in pots, H. Porter, Esq.; 2 Sir J. Kennaway; six second best Balsams, H. Porter, Esq. EXTRA FLOWERS AND PLANTS.—Collections of Stove Plants, H. Porter, Esq.; Fuchsias, Mrs. Granger; Ericas, Mrs. Wells; Picotees, W. Kingdon, Esq.; new Annual, Sir T. D. Acland; Design for flower-basket, F. Cross, Esq.; Seedling Pelargonium, J. B. Swete, Esq.

East Norfolk and Suffolk Horticultural Show, Aug. 25.—To the spirit and enterprise of a private individual alone is the town of Yarmouth indebted for the only Horticultural Exhibition in the year with which we have the pleasure to be gratified. Friday broke forth with unclouded brightness, and foreboded a day of unalloyed enjoyment. By 12 o'clock, the hour at which the gardens open, the tables literally groaned beneath their beauteous loads. The exhibition exceeded that of former years, and some of them deserve particular attention. A Peach Tree, belonging to Joseph Bayley, Esq., not less than three feet high, and bearing 20 Peaches of beautiful form, good size, and fully ripe. Some black Hamburg Grapes, exhibited by the Rev. R. Forster, were declared by the judges to be the finest they had seen this year. Lady Lacon's Fuchsias, and the Rev. G. Lucas's Cockcombs, were very fine, while a large collection of Fuchsias, &c. &c., from the nursery grounds of Messrs. W. and H. Youell, exhibited (at for a prize), added greatly to the beauty of the whole. The attendance was altogether the largest and most respectable we ever saw there, while the entertainments provided by the liberality of mine host were far beyond mediocrity. The judges awarded prizes to the amount of nearly 30l.—*Norwich Mercury*.

The East Lothian Horticultural Society, July 27.—The second exhibition for the season was held in the Assembly Rooms, Haddington, when the following prizes were awarded:—Seedling Pelargonium, 1, Mr. Alex. Kinghorn, gr. to Gen. Sir R. Houston; 2, Mr. J. Addison, gr. to the Earl of Wemyss. 3 Seedling Pansies, 1, Mr. M. Dawson; 2, Mr. W. Martin. 6 Pelargoniums, 1, Mr. A. Kinghorn; 2, Mr. Rentoul, gr. to J. Balfour, Esq. 6 Pinks, 1, Mr. Addison; 2, Mr. A. Kinghorn. 6 China Roses, 1, Mr. Thom, gr. to D. Anderson, Esq.; 2, Mr. Street, gr. to Mrs. H. N. Ferguson. 12 British Roses, 1, Mr. Thom; 2, Mr. Street. 24 Pansies, 1, Mr. Martin; 2, Mr. M. Dawson. 3 Petunias, Mr. A. Kinghorn. 6 Verbenas, 1, Mr. A. Kinghorn; 2, Mr. A. Shearer, gr. to the Marquess of Tweeddale. 12 Hardy Herbaceous Plants, 1, Mr. Addison; 2, Mr. Thom. 6 Hardy Annuals, 1, Mr. Street; 2, Mr. Thom. 12 Varieties of Stocks, 1, Mr. W. Henderson, gr. to J. Aitchison, Esq.; 2, Mr. Kinghorn. Balsam, 1, Mr. R. Hamilton, gr. to Sir D. Kinloch, Bart.; 2, Mr. D. Mitchell, gr. to the Right Hon. Lord Elcho. 3 Cape Heaths, Mr. Rentoul; 2, Mr. Addison. 2 Tender Exotics, 1, Mr. Addison; 2, Mr. Rentoul. Bunch of Hamburg Grapes, 1, Mr. C. Anderson, gr. to Sir T. B. Hepburn, Bart.; 2, Mr. W. Henderson, Gardener. Bunch of Grapes, and other variety, 1, Mr. J. White; 2, Mr. C. Anderson. 3 Peaches, 1, Mr. T. Fleming; 2, Mr. W. Rentoul. 3 Nectarines, Mr. D. Mitchell; 2, Mr. T. Fleming. 25 Cherries, 1, Mr. J. Street; 2, Mr. C. Anderson. Melon, Mr. R. Hamilton. Quart of Strawberries, 1, Mr. J. Lawrie, gr. to J. Wedderburn, Esq.; 2, Mr. R. Hamilton. 2 Quarts of Gooseberries, 1 Red and 1 any other colour, 1, Mr. W. Thom; 2, Mr. R. Hamilton. Quart of Raspberries, 1, Mr. W. Thom; 2, Mr. A. Kinghorn. Quart of Red Currants, 1, Mr. J. Addison; 2, Mr. P. Allan; Quart of White, 1, Mr. D. Mitchell; 2, Mr. P. Allan; 50 Black, 1, Mr. C. Anderson.

A. Kinghorn. 6 Early Horn Carrots, 1, Mr. A. Kinghorn; 2, Mr. R. Hamilton. AMATEUR COMPETITION: 3 Pinks, Mr. J. Shaw; 2, Mr. W. Ogilvie. 6 Pansies, 1, Mr. W. Martin; 2, Mr. M. Dawson. Cauliflower, 1, Mr. W. Martin; 2, Mr. W. Ogilvie. Mr. Mitchell sent for exhibition fine specimens of Pelargoniums, Fuchsias, &c., and a great number of Greenhouse Plants.

Lodge; 4, Hoyle's Duke of Leeds, 5, Walmesley's William IV., 6, Hepworth's Leader, Col. Lee; 7, True Briton (Seedling), Mr. W. Lodge; 8, Hufton's Patriarch, Mr. R. J. Kaye. Crimson Bizarres: 1, Wakefield's Paul Pry, Col. Lee; 2, Ely's William Caxton, 3, Ely's Lord Milton, Mr. W. Lodge; 4, Gregory's King Alfred, Mr. R. J. Kaye; 5, Soorne's Bloomsbury, Mr. W. Lodge; 6, Ely's Duke of Bedford, 7, Waile's British Queen, Mr. R. J. Kaye; 8, Cartwright's Rainbow, Mr. J. Holland. Scarlet Flakes: 1, Wilson's William IV., 2, Lowe's Lord Palmerston, 3, Wallis's Beauty of Cradley, Mr. R. J. Kaye; 4, Ely's Bright Venus, Mr. J. Scholes; 5, Chadwick's Brilliant, Mr. R. J. Kaye; 6, Maud's Susannah, Mr. J. Scholes; 7, Potter's Champion, Col. Lee; 8, Festival, Mr. J. Knott. Rose Flakes: 1, Fletcher's Duchess of Devonshire, 2, Lady Scott, Mr. W. Lodge; 3, Elliott's Duchess of Sutherland, Mr. R. J. Kaye; 4, Ely's Lady Ely, Mr. J. Scholes; 5, Ely's Lovely Ann, 6, Lowe's Marchioness of Westminster, 7, Ashworth's Miss Walker, Mr. R. J. Kaye; 8, Ely's Lady Gardner, Mr. J. Holland. Purple Flakes: 1, Hudson's Miss Thornton, 2, Mansley's Beauty of Woodhouse, Mr. R. J. Kaye; 3, Ely's Mango, Col. Lee; 4, Leighton's Bellerophon, Mr. J. Scholes; 5, Ely's Queen Victoria, Mr. R. J. Kaye; 6, Hall's Major Cartwright, Col. Lee; 7, Marsden's Jolly Angler, Mr. W. Lodge; 8, Turner's Princess Charlotte, Col. Lee. PICOTEES.—Purple Edged: 1, Mitchell's Nulli secundus, Mr. W. Lodge; 2, Mitchell's Beauty of Warley, Mr. J. Holland; 3, Kaye's Monarch, Col. Lee; 4, John's Prince Albert, Mr. J. Scholes; 5, Crask's Queen Victoria, Mr. J. Holland; 6, Jackson's Delight, 7, Lee's Miss Jane, Mr. R. J. Kaye; 8, Dickson's Trip to Cambridge, Mr. J. Scholes. Scarlet Edged: 1, Pearson's Nonpareil, 2, Benn's Marc Antony, Mr. J. Scholes; 3, Sharp's Duke of Wellington, Mr. W. Lodge; 4, Ely's Mrs. Horner, Mr. R. J. Kaye; 5, Mrs. Maynall, Mr. J. Holland; 6, Chadwick's William the Conqueror, 7, Wood's Marshal Soult, Mr. R. J. Kaye; 8, Eason's Crispin, Mr. J. Scholes.

Middleton Carnation Show, Aug. 21.—The above annual show was held at the house of Mr. Harrison, the Masons' Arms Inn, Middleton. The following prizes were awarded:—Scarlet Bizarres: 1, Kaye's Omnium Primus, Mr. R. J. Kaye; 2, Hepworth's Leader, Mr. J. Walmesley; 3, Rainforth's Gameboy, Mr. J. Scholes; 4, Ely's Earl of Mexbro, Mr. J. Walmesley; 5, Hepworth's True Briton, Mr. J. Holland; 6, Hoyle's Duke of Leeds, Mr. R. J. Kaye; 7, Prince George, Mr. J. Scholes; 8, Colonel Wainman, Mr. J. Holland. Crimson Bizarres: 1, Cartwright's Rainbow, 2, Cartwright's Travelling Queen, Mr. J. Walmesley; 3, Ely's William Caxton, Mr. J. Heap; 4, Ely's Lord Milton, Mr. J. Holland; 5, Gregory's King Alfred, Mr. J. Scholes; 6, Soorne's Bloomsbury, Mr. J. Walmesley; 7, Wakefield's Paul Pry, Mr. R. J. Kaye; 8, Gressley's Lord Brougham, Mr. J. Holland. Scarlet Flakes: 1, Mansley's Lord Byron, Mr. J. Holland; 2, Chadwick's Brilliant, Mr. R. J. Kaye; 3, Wallis's Beauty of Cradley, Mr. J. Scholes. 4, Simpson's Marquis of Granby, 5, Lowe's Lord Palmerston, Mr. J. Walmesley; 6, Orson's Rob Roy, Mr. R. J. Kaye; 7, Ely's Bright Venus, Mr. J. Scholes; 8, Potter's Belmont, Mr. J. Holland. Rose Flakes: 1, Ely's Lovely Ann, Mr. R. J. Kaye; 2, Ely's Lady Ely, Mr. J. Holland; 3, Maipass's Lady Grey, Mr. J. Holland; 4, Lowe's Marchioness of Westminster, Mr. R. J. Kaye; 5, Barringer's Apollo, 6, Rauden's Luna, Mr. J. Holland; 7, Duchess of Sutherland, Mr. R. J. Kaye; 8, Dobbin's Mountaineer, Mr. J. Taylor. Purple Flakes: 1, Hudson's Miss Thornton, Mr. J. Taylor; 2, Turner's Princess Charlotte, Mr. J. Walmesley; 3, Leighton's Bellerophon, 4, Ely's Queen Victoria, Mr. R. J. Kaye; 5, Henry Hunt, Mr. J. Scholes; 6, Mansley's Beauty of Woodhouse, Mr. R. J. Kaye; 7, Hall's Major Cartwright, Mr. J. Walmesley; 8, Mansley's Euclid, Mr. J. Scholes. PICOTEES.—Purple Heavy Edged: 1, Mitchell's Beauty of Warley, Mr. J. Taylor; 2, Crask's Queen Victoria, Mr. J. Holl; 3, Seedling, Mr. J. Walmesley; 4, Kaye's Monarch, Mr. R. J. Kaye; 5, Dickson's Trip to Cambridge, 6, Hufton's Isabella, Mr. J. Scholes. Purple Light Edged: 1, Mitchell's Nulli Secundus, Mr. J. Scholes; 2, Mrs. Muggleston, 3, John's Prince Albert, Mr. J. Holland; 4, Jackson's Delight, Mr. J. Scholes; 5, Field Marshal, Mr. J. Holland; 6, Lee's Bonny Bet, Mr. R. J.

Kaye. *Scarlet Heavy Edged*.—1, Pearson's Nonpareil, Mr. R. J. Kaye; 2, Marchant's Milkmaid, Mr. J. Scholes; 3, Wollard's Little Wonder, Mr. R. J. Kaye; 4, Eason's Crispin, Mr. J. Scholes; 5, Walmsley's Pilot, Mr. J. Clegg; 6, Prince George, Mr. J. Holland. *Scarlet Light Edged*.—1, Mrs. Maynard, Mr. J. Holland; 2, Benn's Marc Antony, Mr. J. Walmsley; 3, Ely's Mrs. Horner, Mr. J. Holland; 4, Ely's Lady Howden, Mr. J. Scholes; 5, Chadwick's William the Conqueror, Mr. J. Holland; 6, Sharp's Duke of Wellington, Mr. R. J. Kaye.

Morningside Practical Gardeners' Society, August 1.—The third meeting for the season was held in the School-room, Morningside, when the following prizes were awarded:—*Best seedling Pelargonium*, 1, Mr. H. Gibbs, gr to Mrs. Stark; 2, Mr. J. Young, gr to T. Oliver, Esq. *Best seedling Pansy*, 1, Mr. Wm. Denholm, gr to Sir Jas. Forrest, Bart.; 2, Mr. J. Robertson. *Best Roses*, 1, Mr. R. Anderson, gr, Burroughmhead, Madame Hardy, Crested Moss, White Globe Hip, Brennus, Queen of Denmark, La Musque; 2, Mr. Jas. Douglas, gr to Sir T. D. Lauder, Bart. *Best Pinks*, 1, Mr. J. Downie, gr to Gen. Robertson, Duchess of Rutland, Lord Nelson, Low's Tasso, Earl of Roseberry, Miss Brandland, Duchess of Oldenburgh; 2, J. Douglas. *Best Verbenas*, 1, J. Downie, ignea, Princess Royal, incisa coccinea; 2, Mr. Jas. Fergie, gr to Mrs. Gregory. *Best Calceolarias*, 1, J. Downie, for Argo, Lass of Richmond Hill, and a Seedling; 2, H. Gibbs. *Best Salvia*, J. Downie. *Best Picotees*, 1, J. Fergie; 2, J. Young. *Best Hardy Herbaceous Plants*, 1, J. Downie, for Delphinium Barlowi, Phlox omniflora, Chelone barbata, Scarlet Lychnis, Pentstemon gentianoides coccineus, Campanula pyramidalis; 2, J. Douglas. *Best Strawberries*, 1, J. Douglas; 2, J. Fergie. *Best Cherries*, 1, Mr. Archd. Walker, gr, Duncan Street House; 2, J. Douglas. *Best White Currants*, 1, J. Douglas; 2, J. Downie. *Red*, 1, Mr. J. Johnstone, gr to A. Smellie, Esq.; 2, J. Douglas. *Black*, 1, Wm. Denholm; 2, R. Anderson. *Best Raspberries*, 1, J. Douglas; 2, Wm. Denholm. *Best Gooseberries*, 1, Thos. Owens, gr to Alex. Russell, Esq.; 2, J. Downie. *Best Cauliflower*, 1, J. Fergie; 2, J. Douglas. *Best Lettuce*, 1, J. Douglas; 2, H. Gibbs. **AMATEURS' PRIZE, Best Cabbage**, gained by J. Robertson. The Prize offered by Messrs. J. Dickson and Sons, Nurserymen, Inverleith, for the *best six Calceolarias*, was gained, 1, by J. Downie; 2, J. Young. Amongst the various articles for exhibition, particular notice was taken of the following:—from Canaan Bank, a beautiful collection of *Pelargoniums*; from Grange Bank, twenty varieties of *seedling Pansies*, and a brace of very large *Cucumbers*,—also, from Mr. Robertson some pretty *seedling Pansies*, and from Duncan Street House Gardens a basket of fine *Cherries*.

Neepsend Gooseberry Show, near Sheffield, July 31.—This was held at the house of Mr. B. Sykes, Tannery's Arms. The following prizes were awarded:—

PRIZE.	W. Ward's Miss Sarah		14 15
	J. Wilson Dicto		13 16

North British Professional Gardeners' Society, July 12.—The summer meeting took place in the Calton Convening-rooms. Besides the usual prizes given at this period of the year, Messrs. Dickson and Sons placed at the disposal of the Committee one guinea, to be awarded in two prizes for *Pelargoniums* and *Calceolarias*; and Messrs. Eagle and Henderson also contributed half a guinea as a prize for the 12 best *Pansies*; so that the articles sent for competition were both numerous and select. The Judges awarded as follows:—Messrs. Dickson and Sons' Prize of 10s. 6d. for the *six best Pelargoniums*, Mr. J. Young, gr to T. Oliver, Esq.;—*Glory of Jersey*, *Fairy Queen*, *Rising Sun*, *Prince Albert*, *Caroline*, and *Mabel*; 2, Mr. P. Thomson, gr to J. H. Vere, Esq. Messrs. Dickson and Sons' Prize of 10s. 6d. for the *six best Calceolarias*, Mr. J. Young,—*Standishi*, *Lady Constable*, *Lass of Richmond Hill*, *Queen Victoria*, *Enchantress*, and *Kentish Beauty*; 2, Mr. J. Douglas, gr to Sir T. D. Lauder, Bart. Messrs. Eagle and Henderson's Prize of 10s. 6d. for the *twelve best Pansies*, Mr. J. Downie, gr to Gen. Robertson,—*Gipsy*, *Daniel Defoe*, *Black-eyed Susan*, *Flora McDonald*, *Prince Charlie*, *Lass of Brechin*, *Jeannie Deans*, *Duke of Northumberland*, *Meg Merrilies*, *Curion*, *Miss Russell*, and *Jessie*; 2, Mr. J. Gilmore. For the *six best Bulbous Irises*, Mr. G. Stirling, gr to Viscount Melville. 2, Mr. Alex. Forrester, gr to Capt. Falconer. For the *best Seedling Pelargonium*, Mr. J. Thomson, gr to Wm. Keith, Esq., named *Thomson's Lovely Ann*; 2, Mr. J. Addison, gr to the Right Hon. the Earl of Wemyss. For the *six best Pinks*, M. J. Gilmore,—*Countess of Roseberry*, *Earl of Roseberry*, *Queen Victoria* (*Pattison's*), *King* (*Patten's*), *Robert Burns*, and *George IV.*;

2, Mr. W. Cuthbertson, gr to the Right Hon. the Earl of Roseberry. For the *six best China Roses*, Mr. J. Douglas,—*Sweet-scented*, *Yellow China*, *Yellow Noisette*, *Swan-neck*, *Magnificent*, and *La Belle*; 2, Mr. W. Cuthbertson. For the *six best Dutch Roses*, Mr. Alex. Forrester,—*Brutus*, *Perolla*, *Mary Stuart*, *White Bath Moss*, *La Nubienne*, and *Madame Laffay*; 2, Mr. George Stirling, *Meville Castle*. For the *six best Hardy Annuals*, Mr. H. Gibb, gr to Mrs. Stark,—*Phlox Drummondii*, *Schizanthus Hookeri*, *Eutoca viscida*, *Rhodanthe Manglesii*, *Collinsia bicolor*, and *Eutoca Wrangleana*; 2, Mr. J. Goodall, gr to the Marquess of Lothian. For the *best Seedling Pansy*, Mr. D. White, gr at Whitehill; 2, Mr. J. Downie. For the *six best Stocks*, Mr. P. Thomson; 2, Mr. J. Young. For the *six best Hardy Shrubs*, Mr. G. Stirling,—*Lonicera pubescens*, *Rhododendron maximum*, *Kalmia latifolia*, *K. angustifolia*, *Deutzia scabra*, and *Genista sericea*; 2, Mr. Alex. Forrester. For the *six best Hardy Herbaceous Plants*, Mr. Alex. Forrester,—*Cypripedium spectabile*, *Orrhis foliosa*, *Delphinium velutinum*, *Cladifolus byzantinus*, *Pæonia Pottii*, *Dictamnus fraxinella alba*; 2, Mr. J. Addison. For the *best bunch of Hamburgh Grapes*, Mr. J. Goodall; 2, Mr. W. Cuthbertson. For the *best bunch of Grapes of any sort*—*Muscata of Alexandria*—Mr. W. Cuthbertson; 2, Mr. J. Goodall. For the *best Cauliflower*, Mr. J. Goodall; 2, Mr. G. Stirling. For the *best three Carrots*, Mr. J. Downie; 2, Mr. J. Thomson. For the *best quart of Strawberries*, Mr. J. Douglas. The following were sent for exhibition:—From Mr. W. Cuthbertson, several first-rate trusses of *Nerium splendens*. From Messrs. Handasyde, a collection of 24 mixed *Roses* of great beauty, a collection of 30 fine *Pansies*, and a fine plant of *Siphocampylus betulifolius*. From Messrs. Dickson and Sons, a collection of 24 superior *Pelargoniums*. From Messrs. Lawson and Son, a box of 24 distinct varieties of *Pansies*.—The plants and flowers sent for exhibition were superb, and were of course greatly admired, both by professionals and amateurs.

Norwich Horticultural Society, August 3.—The August show was held at the Corn Exchange, and attracted a great many visitors, the spacious hall being, at times, crowded, so that there was scarcely room to move. Although not presenting so many striking features as the July show, held in Mr. Bell's grounds, at Bracondale, this exhibition, nevertheless, offered several points of attraction in the excellence of the fruits, plants, flowers, and vegetables. There were some excellent specimens in every department. The fruits were fine, particularly the Grapes, Currants, Gooseberries and Strawberries. Lord Stafford, H. Cooke, H. N. Burroughes, R. Foster, and C. H. Tompson, Esqrs., exhibited some splendid Grapes. Nothing could be finer than the Currants, the several dishes of which were most seductive objects. Fine Strawberries were exhibited by J. T. Mott, Esq., the Rev. O. Mathias, and Mrs. F. Noverre; a dish of Elton Pine, sent by the latter, were very large, and of exquisite flavour. The Bigarreau and black Tartarian Cherries, and the Gooseberries were also unusually fine. The vegetables were of a superior description. The Rev. J. Burroughes had a number of excellent specimens of plants and flowers in the room; and he was a successful competitor for prizes, as the list shews. The Picotees exhibited by him were beautiful specimens of this charming flower, with its delicate white petals, and their rich dark edging. The Carnations shewn by Mr. Burroughes were also extremely choice ones. There was a considerable variety of Fuchsias from his greenhouse; one of these was the celebrated *St. Clare*, the flowers of which are elegantly formed, and the colour a bright crimson. A large collection of *Roses* were exhibited by Mr. Bircham, from the Hedenham Rosery, but not for a prize. The Picotees and Carnations of the Hon. and Rev. R. Wilson; those of Messrs. Norman, Nurserymen, of Woolwich, (not exhibited for a prize); and of Mr. G. Dover, were much admired. J. N. Waite, Esq.; C. Middleton, Esq.; Mr. J. Barkway; and J. Stracey, Esq., exhibited some excellent specimens of the Fuchsia. A table in the centre of the room excited much attention. It was covered with magnificent specimens of Erica and Greenhouse plants from the Bracondale Nursery, sent by Mr. Bell. On the table were *Erica Juliana*, *Westphalia*, *infundibuliformis*, *Irbiana*, *cubica minor*, *eximia*, *Lawsonia*, *Antonia*, *viridiflora*, *Hartwellii*, and *Boweiana*; the first five being large specimens, the other six smaller ones. Amongst the Greenhouse Plants were *Cytisus racemosus*, *Achimenes longiflora*, two very large plants of *Achimenes coccinea*, *Gloxinia caulescens* and *violacea*, *Cleome purpurea*, a very curious stove plant; 12 Fuchsias, amongst which was a very fine variety, named *Epsil*. Another table possessed equal interest to the admirers of nature. It was covered with a fine collection of Foreign and British Ferns. Every shew exhibits an improvement in the cottagers' specimens. About 50 of this useful class exhibited, and the Onions, Cabbages, Parsneps, Beans, Peas, &c., exhibited by them, were scarcely exceeded by any in the room. There were 1500 visitors during the day; and about 201. were taken at the doors. We subjoin a List of the Prizes.—**MEMBERS' FLOWERS**.—*Picotees*.—*Best Collection* of 30, the Rev. J. Burroughes; *Modest*, *Quiz*, *Joan of Arc*, *Wood's Agrippina*, *Lady of the Lake*, *Sir W. Middleton*, *Constable*, *Country Girl*, *Donna Maria*, *Kirkland's Wellington*, *Mrs. Bevan*, *Lady Doro*, *Miss Osborn*, *Madonna*, *Proserpine*, *Giddens Diana*, *Deborah*, *Hero*, *Zenobia*, *Julia*, *Sylph*, *Unique*, *Emily*, *Jenny Jones*, *Princess Royal*, *Ellen Tree*, *Princess Helen*, *Hebe*, *Rend Rover*, and *Maid of Orleans*. *Best Do.* of 24, the Rev. J. Burroughes; *Do.* of 18, the Hon. and Rev. R. Wilson; *best Seedling*, the Rev. J. Burroughes. *Carnations*, *best Collection* of 18, the Hon. and Rev. R. Wilson; *Do.* of 12, the Rev. J. Burroughes, *Balsams*, Mr. J. Wighton, gr. to Lord Stafford. *Hybrid Fuchsias*, the prize of one guinea, for the *best single specimen*, was awarded to the Rev. J. Burroughes, for *St. Clare*, as was the prize of two guineas for the *best Collection* of 12. Both prizes were given by Messrs. Youell, of Yarmouth. *Fuchsias*, *best Collection* of 18, C. Short, gr. to H. N. Burroughes, Esq.; *Do.* of 12, S. Short, gr. to J. Stracey, Esq.; 2, the Rev. J. Burroughes, and C. Middleton, Esq., were equal; 3, J. N. Waite, jun., Esq. *Calceolarias*, *best Collection*, Rev. J. Burroughes. *Greenhouse Climbers*, *best Collection* of *Thunbergias*, S. Short. *Achimenes*, *Collection* of, C. Middleton, Esq., and C. Short. *Cockscombs*, J. Gordon, Esq. *Picotees in pots*, Mrs. F. Noverre. *Carnations in pots*, Mr. G. Dover. *Achimenes*, C. Short. *Izora coccinea*, Single specimen, C. K. Thompson, Esq. *Dahlias*, *Collection* of 24, C. Short; *Do.* of 12, T. J. Kemp, Esq. *Roses*, large *Collection*, Mr. R. B. Bircham; *Collection* of 49, C. Short. *Gladiolus ramosus*, *Collection* of, C. Middleton, Esq. *German Stocks*, Mr. George Dover; 2, E. Kemp, gr. to J. S. Muskett, Esq. *Cut Flowers*, T. Steward, Esq.; 2, J. N. Waite, jun., Esq. *Annuals and French Marygolds*, J. N. Waite, jun., Esq. *Fuchsias and Calceolarias*, Mr. J. Barkway. *Rochea falcata*, C. Short. *Salpiglossis*, J. N. Waite, jun., Esq. *Floral Device*, Mr. W. Reynolds. **FRUITS**: Grapes, 1, *Black Hamburgh*, Mr. J. Wighton; 2, *Black Prince*, Rev. R. Foster. *Melons*, 1, *Best Egyptian Green Flesh*, Mr. G. Stacey; 2, R. N. Bacon, Esq. *Apricots*, Brussels, Mr. W. Wighton. *Gooseberries*, 1, *Regent*, 2, *New Champagne*, Mr. W. Scarlett. *Red Currants*, Warrington, W. Gale, gr. to H. N. Burroughes, Esq.; 2, *White Dutch*, W. Gale and S. Short were equal; *Black Naples*, C. Aldborough, gr. to G. S. Kett, Esq. *Raspberries*, *Flegg Seedling*, W. Gale. *Cherries*, *Black Tartarian*, Mr. Cockburn, gr. to J. T. Mott, Esq.; *Bigarreau*, C. Aldborough; *Black Tartarian*, Mr. J. Wighton; *Florence*, Mr. Cockburn. *Strawberries*, 1, Elton, Mr. Cockburn; 2, J. Scott, Esq. **VEGETABLES**: *Cucumbers*, *White Turkey*, J. Carter, Esq., and *Edwards' White Spine*, Mr. W. Reynolds, were equal. *Lettuces*, S. Short. *Peas*, *Victoria* and *Auvergne*, S. Short. *Beans*, *Long Pod*, E. Kemp; *Kidney*, Mr. Cockburn and J. Scott, Esq., were equal. *Peas* *Onions*, W. Scarlett, S. Short, and Mr. G. Dover, were equal. *Potatoes*, *King Noble*, S. Short. *Cabbages*, J. T. Kemp, Esq. *Carrots*, *Dutch*, C. Short, and *Altringham*, J. Kitson, Esq., were equal. *Salad*, W. Gale and S. Short were equal.—**Norfolk Chronicle**.

Nottingham Floral and Horticultural Society.—Aug. 2.—The third meeting was held at the Assembly Rooms for the exhibition

of Carnations—*Stove*, *Greenhouse*, and *Herbaceous Plants*, *Ericas* and *Hardy Shrubs*, &c.; and considering the late unpropitious weather, the display of plants and flowers was admirable. The Prizes were as follows:—**CARNATIONS**.—1, Mr. Pearson: *Gameboy*, *Lord Brougham*, *Marquess of Granby*, *Lady Flora*, *Beauty of Woodhouse*, *Mrs. Horner*, *Victoria*, *Nulli Secundus*, *Lady Hinchinbrook*; 2, Mr. U. G. Pickering: *Clark's London*, *Hepworth's Hector*, *Toone's Ringleader*, *Ely's Lady Ely*, *Princess Charlotte*, *Derby Willow*, *Brown's Lovely Ann*, *Jackson's Delight*, *Ely's Grace Darling*; 3, Mr. F. Wood: *Hepworth's Brilliant*, *Puxley's Prince Albert*, *Hutton's Foxhunter*, *Mausley's Euclid*, *Elliott's Duchess of Sutherland*, *Kirkland's Duchess of Gloucester*, *Robinson's Duke of Wellington*, *John's Prince Albert*, *Wilmer's Elizabeth*. *Scarlet Bizarres*, 1, *Martin's Splendid*, *Pickering*; 2, *Ely's Jolly Dragon*, *Taylor*. *Crimson Bizarres*, 1, *Wood's William IV.*, *Taylor*; 2, *Cartwright's Rainbow*, *Pickering*; 3, E. Mundy, Esq., *Pearson*. *Scarlet Flakes*, 1, *Simpson's Marquess of Granby*, *Pickering*; 2, *Rob Roy*, *Taylor*; 3, *Ring-leader*, *Pearson*. *Purple Flakes*, 1, *Mango*, *Taylor*; 2, *Knott's Alfred the Great*, *Pickering*; 3, *Beauty of Woodhouse*, *Pearson*. *Rose Flakes*, 1, *Unknown*, *Taylor*; 2, *Barringer's Apollo*, *Pickering*. *Heavy-edged Red Picotee*, 1, *Derby Willow*, *Pickering*; 2, *Robinson's Will Scarlet*, *Robinson*; 3, *Derby Willow*, *Taylor*. *Light-edged Red Picotee*, 1, *Robinson's Duke of Wellington*, *Robinson*; 2, *Wheeler's Queen Victoria*, *Pickering*; 3, *Sharp's Wellington*, *Pearson*. *Heavy-edged Purple Picotee*, 1, *Boothman's Victoria*, *Taylor*; 2, *Hutton's Nehemiah*, *Pickering*; 3, *Monarch*, *Pearson*. *Light-edged Purple Picotee*, 1, *Nulli Secundus*, *Pearson*; 2, *John's Prince Albert*, *Wood*; 3, *Robinson's Nottingham Hero*, *Robinson*.—*Best collection*, Mr. Pickering; 2, Mr. Pearson. *Seedling* (first-class flower) *Scarlet Bizarre*, Mr. Robinson. *PANSIES*.—1st *Dealer's pan* of 20 blooms, Mr. Pearson, *Milton*, *Elizabeth*, *Zelica*, *Agnes*, *Magraith*, *Aristides*, *Black Prince*, *Sir W. Scott*, *Comet*, *Sobieski* (all Pearson's seedlings), *King's sulphurea elegans*, and nine seedlings. 1st *Amateur's pan* of 20 blooms, Mr. Neville, *Jewess*, *Jehu*, *Miss Stainforth*, *Emily* (*Neville's*), *Cream*, *Rival Yellow*, *Anne*, *Larpen*, *Delicata*, *Dr. Johnson*, *Black Diamond*, and nine seedlings. 1st *do.* 15 blooms, Mr. S. R. P. Shilton, *Black Prince*, and fourteen seedlings. 1st *do.* 10 blooms, A. Lowe, Esq., *Clara*, *Black Prince*, *Milton*, *Mulberry*, *Miss Hoare*, *Lady of the Lake*, *White's Ann*, *Mrs. Walter*, *Yellow Perfection*, *Diana* (*Lowe's*), *Seedlings*, *Yellow-edged*, Mr. Pearson; *White-edged*, Mr. Pearson; *Self* (*puce*, with purple and white eye), Mr. S. R. P. Shilton. *Best Miscellaneous Collection of Cut Flowers*, Mr. Pearson. *Best Collection of Annuals*, Mr. S. R. P. Shilton: *Calliopis Drummondii*, *Hibiscus Richardsonii*, *Kaulfussia amelloides*, *French Marygolds*, *Phlox Drummondii*, *Rhodanthe Manglesii*, *Schizanthus venustus* and *Hookeri*, *Schizopetalon Walkeri*, *Clarkia alba* and *grandiflora*, *Erysimum Peroffskianum*, *Gilia splendens* and *tricolor alba*, *Lupinus nanus*, *Iberis umbellata*, *Platystemon Californicum*. *Best dealer's collection of Roses*, Mr. Pearson. *Best Amateur's do.*, F. Wright, Esq.; 2, G. Walker, Esq. *Best pan* of 20, Mr. S. R. P. Shilton. *Best six Herbaceous blooms*, Mr. S. R. P. Shilton: *Phlox omniflora alba*, *Potentilla Hopwoodiana* and *pedata*, *Pentstemon gentianoides coccinea*, and two seedlings. *Best six Stocks*, Mr. S. R. P. Shilton. *Best collection of Dianthus*, Mr. S. R. P. Shilton. *Best pan of Dahlias*, Mr. Spencer: *Bridesmaid*, *Prince Albert*, *Countess of Pembroke*, *Pickwick*, *Frederick the Great*, *Lewisiam Rival*, *Oriental Pearl*, *Seedling*, *Conservative*, *Beauty of the Plain*, *Westbury Rival*, *Miss Abbot*. **PLANTS**.—*Best Stove Plant*, *Gloriosa superba*, F. Wright, Esq.; 2, *Russelia juncea*, G. Walker, Esq. *Orchidaceous Stove Plant*, *Gongora maculata*, G. Walker, Esq.; 2, *Zygopetalon maxillare*, G. Walker, Esq. *Greenhouse Plant*, *Philibertia grandiflora*, G. Walker, Esq.; 2, *Alstromeria aurea*, F. Wright, Esq. *Cactus speciosissimus*, G. Walker, Esq. *Calceolaria rugosa*, Mr. S. Wright. *Erica eximia*, F. Wright, Esq.; 2, *tricolor*, F. Wright, Esq. *Herbaceous Plants*, F. Wright, Esq.; 2, Mr. Pearson. *Balsam*, *Bizarre*, G. Walker, Esq.; 2, A. Lowe, Esq. *Collection of Verbenas*, Mr. Pearson. *Miscellaneous collection*, Mr. S. Wright; 2, Mr. Spencer. *Collection of Fuchsias*, A. Lowe, Esq.: *Venus victrix*, *tricolor*, *formosa elegans*, *Riccartonia*, *Brewsteri*, *Devonia*, *racemiflora*, *sanguinea*, *grandis*, *mirabilis*, *insignis*, *Yonelli*, *Standishi*, *Chandleri*, *fulgens*, *corymbiflora*, *Money-penny*, *Thomsonia*, *Fuchsia tricolor*, G. Walker, Esq.; 2, *formosa elegans*, A. Lowe, Esq. *Cockscomb*, G. Walker, Esq.; 2, G. Walker, Esq. *Lilium lancifolium punctatum*, Mr. Pearson; 2, *eximium*, Mr. Pearson. *Rhodanthe Manglesii*, G. Walker, Esq. *Clintonia pulchella*, Mr. S. R. P. Shilton. *Orange Tree*, in bearing state, *Myrtle-leaved*, A. Lowe, Esq. *Apple Tree*, in bearing state, Mr. S. Wright. *Globe Amaranthus*, G. Walker, Esq. *Prilongium tricolor*, F. Wright, Esq. *Campanula Barleri*, Mr. Pearson. *Collection of Greenhouse Plants*, A. Lowe, Esq.: *Thunbergia alata*, *speciosa*, and *alba*, *Lantana aculeata*, *Balsam Bizarre* and *double-flaked*, *Achimenes longiflora*, *Rochea falcata*, *Dianthus superbus*, *Verbenas*, *Alicia*, *Queen of May*, *Herne*, and *Firefly*, *Gloxinias alba* and *speciosa*, *Geum speciosum*, and *Swainsonia astragalifolia*. **FRUIT**.—*Pine*, *Queen*, 1, G. Walker, Esq.; 2, J. Milnes, Esq. *Black Grapes*, *Hamburgh*, 1, J. Milnes, Esq.; 2, *Muscata of Alexandria*, *White Grapes*, *Nice*, 1, J. Milnes, Esq.; 2, *Muscata of Alexandria*, G. Mr. T. Groves, Corsair's Squire Clarke; 3, Mr. T. Groves, Elliott's British Queen; 4, Mr. T. Groves, Queen of Sheba; 5, Mr. E. Kelly, Leighton's Bellerophon. *Rose Flakes*, 1, Mr. T. Groves, Lady Peel; 2, Mr. T. Groves, Seeding, 27, Virgo; 3, Mr. T. Groves, Low's Marchioness of Westminster; 4, Mr. T. Groves, Rosina. *Purple Picotees*, 1, Mr. T. Groves, Orson's Rebecca; 2, Mr. T. S. Wood, Mitchell's Beauty of Wharley; 3, Mr. T. Groves, Dixon's Trip to Cambridge; 4, Mr. T. Groves, Crask's Victoria; 5, Mr. T. Groves, Hufton's Drusilla. *Red Picotees*, 1, Mr. T. Groves, Jessop's Sir William Middleton; 2, Mr. T. Groves, Nonsuch; 3, Mr. E. Kelly, Woollard's Little Wonder; 4, Mr. E. Kelly, Seeding; 5, Mr. E. Kelly, Hufton's Will Stukeley. *DAHLIAS*.—*Best Pan of Dahlias*, Mr. T. S. Wood, consisting of the following flowers:—Wood's Seeding, Vanquisher, Grace Darling, Widnall's Argo, Widnall's Eclipse, Essex Rival, and Girling's Indispensable. *Best Self*, (S.P.), Mr. T. S. Wood, Seeding Vanquisher. *Best Trip*, (S.P.), Mr. T. S. Wood, Beauty of the Plain. *Best White*, Mr. E. Kelly, Lewisham Rival. *Best Yellow*, Mr. T. S. Wood, Widnall's Argo. *Best Trip*, Mr. E. Kelly, Phenomenon. *Best Orange*, Mr. T. S. Wood, Bloomsbury. *Best Rose*, Mr. T. S. Wood, Grace Darling. *Best Light Purple*, Mr. T. S. Wood, Girling's Indispensable. *Best Dark Purple*, Mr. Jones, Pickwick, *Best Scarlet*, Mr. T. S. Wood, Tournament. *Best Maroon*, Mr. T. S. Wood, Seeding Vanquisher. **FRUITS AND VEGETABLES**.—*Best Apples*, Mr. Grainger. *Best Gooseberries*, Mr. News. *Best Preserving ditto*, Mr. News. *Best Cucumbers*, D. Crawford, Esq. *Best Kidney Beans*, (runners), Mr. Grainger. *Best ditto*, (dwarf), Mr. T. S. Wood. *Best Cauliflowers*, Mrs. Wood. *Best Cabbage*, Mrs. Wood. *Best Potatoes*, Mr. Grainger. *Best Tripoli Onions*, D. Crawford, Esq. *Best Spring Onions*, Mr. News.—*Eddowes's Journal*.

Solkhull Floral and Horticultural Society, Aug. 15.—The first exhibition was held in the green-room of the George Inn. The following prizes were awarded:—*CARNATIONS.*—*Premier Prize*, Miss Walker, Mr. J. Haines. *Scarlet Bizarre*, 1, Hepworth's Leader, Mr. S. Bunn; 2, Colonel Wainman, Mr. J. Britten; 3, Brown's Prince George, Mr. S. Bunn; 4, Gameboy, Mr. J. Haines. *Crimson Bizarre*, 1, Hugo Meynell, Mr. J. Coudrey; 2, Lord Milton, Mr. J. Haines; 3, Paul Pry, Mr. J. Haines; 4, Gregory's Alfred, Mr. J. Haines. *Scarlet Flakes*, 1, Booth's Conqueror, Mr. J. Fletcher; 2, Beauty of Cradley, Mr. J. Haines; 3, Seedling, Mr. J. Haines; 4, Rob Roy, Mr. J. Fletcher. *Purple Flakes*, 1, Hudson's Miss Thornton, Mr. J. Haines; 2, Mary Ann, Mr. J. Haines; 3, Malpas's Mary Ann, Mr. S. Bunn; 4, Mango, Mr. J. Coudrey. *Rose Flakes*, 1, Lovely Ann, Mr. J. Haines; 2, Lady Ely, Mr. Purcock; 3, Miss Walker, Mr. J. Haines; 4, Easom's Elizabeth, Mr. J. Haines. *PICOTEES.*—*Premier Prize*, Nulli secundus, Mr. J. Haines. *Light-edged Red*, 1, Wood's Queen Victoria, Mr. J. Coudrey; 2, Anacreon, Mr. S. Bunn; 3, Lord Sandes, Mr. J. Coudrey. *Heavy-edged Red*,—1, Mrs. Horner, Mr. S. Bunn; 2, Mrs. Meynell, Mr. H. Pope; 3, Martin's Victoria, Mr. J. Haines. *Light-edged Purple*, 1, Lord Sandes, Mr. J. Haines; 2, Lady St. John, Mr. J. Coudrey; 3, Miss Hancox, Mr. S. Bunn; 4, Mitchell's Miss Fanny, Mr. J. Haines. *Heavy-edged Purple*, 1, Nulli secundus, Mr. S. Bunn; 2, Crask's Queen Victoria, Mr. J. Coudrey; 3, Isabella, Mr. J. Coudrey; 4, Incomparable, Mr. H. Pope. *DAHLIAS.*—*Premier Prize*, Pickwick, Mr. Coudrey. 1, Rouge et Noir, Mr. J. Coudrey; 2, Springfield Rival, Mr. H. Pope; 3, Pickwick, Mr. Purcock; 4, Beauty of the Plain, Mr. J. Coudrey; 5, Lewisham Rival, Mr. H. Pope; 6, Yellow Defiance, Mr. H. Pope. *GOOSEBERRIES.*—*Premier Prize*, London, 23dwts. 12grs., Mr. J. Barton. *Red*, 1, Companion, 23dwts. 1grs., Mr. J. Barton; 2, London, 22dwts. 10grs., Mr. J. Barton; 3, Lion's Provider, 21dwts. 12grs., Mr. J. Fairfield; 4, Guido, 19dwts. 10grs., Mr. W. Betts; 5, Slaughterman, 21dwts. 3grs., Mr. J. Fairfield; 6, Wonderful, 19dwts. 22grs., Mr. F. Stafford; 7, Plum Major, 18dwts. 20grs., Mr. W. Betts; 8, Atlas, 15dwts. 17grs., Mr. W. Baker. *Yellow*, 1, Bird Lime, 23dwts. 10grs., Mr. J. Fairfield; 2, Bunker's Hill, 20dwts. 12grs., Mr. J. Fairfield; 3, Gunner, 20dwts. 10grs., Mr. J. Barton; 4, Leader, 18dwts. 3grs., Mr. W. Betts; 5, Shuttle, 17dwts. 12grs., Mr. J. Barton; 6, Two to One, 16dwts. 10grs., Mr. F. Stafford; 7, Bright Yellow, 16dwts., Mr. W. Betts; 8, Seedling, 16dwts., Mr. J. Britten. *Green*, 1, Thumper, 23dwts. 10grs., Mr. J. Fairfield; 2, Peacock, 20dwts. 10grs., Mr. J. Fairfield; 3, General, 19dwts. 8grs., Mr. W. Betts; 4, Weathercock, 18dwts. 5grs., Mr. J. Barton; 5, Turn Out, 17dwts., Mr. W. Betts; 6, Providence, 16dwts. 16grs., Mr. J. Barton; 7, Angler, 15dwts. 14grs., Mr. W. Baker. *White*, 1, Seedling, 21dwts. 10grs., Mr. J. Fairfield; 2, Freedom, 20dwts. 20grs., Mr. J. Fairfield; 3, Eagle, 19dwts. 17grs., Mr. J. Barton; 4, Tally-Ho, 18dwts., Mr. J. Barton; 5, Competitor, 17dwts., Mr. J. Britten; 6, Ostrich, 16dwts. 23grs., Mr. J. Barton; 7, Audesley Beauty, 15dwts. 12grs., Mr. W. Betts. *Best Collection of Fruit*, Mr. J. Fairfield. *Collections of Vegetables*, 1, Mr. Molineaux; 2, Mr. Baker.

Uttotzer Royal Horticultural and Floral Society, Aug. 15.—The second exhibition for the present year took place at the Red Lion Inn, when the following prizes were awarded:—**CARNATIONS:—***Best Pan of Carnations*, consisting of Colonel Wainman, Bloomsbury, Rob Roy, Seeding (Monarch), Enchantress, Drusilla, and Matilda; Mr. Bagshaw. *Second Pan of Do.*, consisting of Earl Mexborough, Bloomsbury, Rob Roy, Elizabeth, Enchantress, Criterion, and Miss Hunter; Mr. Bagshaw. *Scarlet Bizarres*.—1, Jolly Dragoon, Mr. Holmes; 2, Hepworth's Leader, T. Hart, Esq.; 3, Earl Mexborough, Sir T. C. Sheppard; 4, Jolly Dragoon, T. Hart, Esq.; 5 and 6, Colonel Wainman, Mr. Bagshaw. *Crimson Bizarres*.—1, Lord Milton, T. Hart, Esq.; 2, ditto, Mr. Holmes; 3 and 4, Bloomsbury, Sir T. C. Sheppard; 5, ditto, Mr. Rogers; 6, ditto, Sir T. C. Sheppard. *Scarlet Flakes*, 1, Potter's Champion, 2, Rob Roy, Mr. Holmes; 3, Invincible, T. Hart, Esq.; 4, Madam Mara, Sir T. C. Sheppard; 5, Ringleader, T. Hart, Esq.; 6, Miss Key, T. Hart, Esq. *Rose Flakes*, 1, Lady Scott, Mr. Holmes; 2, Elizabeth, 3, Victoria, Mr. Rogers; 4, Coronation, T. Hart, Esq.; 5, Elizabeth, Mr. Bagshaw; 6, Lovely Ann, Mr. Holmes. *Purple Flakes*, 1, Purple Duchess, 2, Enchantress, Mr. Bagshaw; 3, Ely's Mango, Mr. Holmes; 4, Enchantress, 5, Major (artwright, Mr. Bagshaw; 6, Rev. F. Gisborn, Mr. Holmes. *Red heavy-edged Picotees*, 1 and 2, Matilda, Mr. Bagshaw; 3, Maw's Willow, Mr. Holmes; 4 and 5, Matilda, Mr. Bagshaw; 6, Povey's Glory, T. Hart, Esq. *Red light-edged Picotees*, 1, Sivern's Nonsuch, T. Hart, Esq.; 2, Mrs. Horner, Mr. Holmes; 3, Sivern's Nonsuch, T. Hart, Esq.; 4, Nulli Secundus, Mr. Rogers; 5, Gidding's Marcus, Mr. Holmes; 6, Sivern's Nonsuch, T. Hart, Esq. *Purple heavy edged Picotees*, 1 and 2, Defiance, 3, Bloomsbury, 4, Incomparable, 5, Bloomsbury, 6, Amelia; T. Hart, Esq. *Purple light-edged Picotees*, 1, Crusk's Queen Victoria, Mr. Holmes; 2 and 3, Nulli Secundus, Mr. Rogers; 4, 5, and 6, ditto, T. Hart, Esq. *Seeding Carnations*, 1, Scarlet Bizarre, 2, Rose Flake, 3, Purple Flake, 4, Rose Flake, 5, ditto, 6, ditto, Mr. Bagshaw. *Pansies*, Pan of 12, ditto of 6, Mr. Holmes. *Fuchsias*, Best Plant, Mr. Rogers; Collection of 6 plants, R. Philips, Esq.; ditto, 6, Best Seeding, Mr. Rogers. *Calceolarias*, Best Plant, Mr. Holmes; Best Collection of 6 Plants, Sir T. C. Sheppard; 2d ditto, 6, Best Seeding (Beauty of Heybridge) R. Philips, Esq. **STOVE, GREENHOUSE, AND OTHER PLANTS.**—1, *Stove Plant*, Achimenes uniflora, 2, Achimenes grandiflora, Mr. Rogers; 1, *Greenhouse Plant*, Salvia patens, Plant of Commerce, Lemon Tree, Lord Vernon; Annuals, Sir T. C. Sheppard; Cockcombs, T. Hart, Esq.; Ericas, and Collection of Roses, Sir T. C. Sheppard; Plants of different varieties, Lord Vernon; Pelargonium, Hodges' Violacea, 12 ditto, 2 ditto, 6 ditto, 2 ditto, Sir T. C. Sheppard. **FRUIT AND VEGETABLES.**—*Best Pine*, Lord Vernon; *Black Grapes*, 1, Sir T. C. Sheppard; 2, do., Lord Vernon; *Red do.*, Lord Vernon; *White do.*, 1, Sir T. C. Sheppard; 2, do., Lord Vernon. *Peaches and Nectarines*, Sir T. C. Sheppard. *Apricots and Green Plums*, Lord Vernon. *Red Plums and Blue Gage*, Lord Vernon. *Melon*, Sir T. C. Sheppard. *Raspberries and Strawberries*, Lord Vernon. *Black Cherries*, Sir T. C. Sheppard; *Red do.*, Lord Vernon. *Desert Apples*, Mr. Rogers. *Green Gooseberries*, R. Philips, Esq.; *Red do.*, Sir T. C. Sheppard; *Yellow do.*

R. Phillips, Esq.; *White do.*, Mr. Rogers. *White and Red Currants*, Sir T. C. Sheppard; *Black do.*, R. Phillips, Esq. *Brace of Cucumbers*, Mr. Bagshaw; 2, *do.*, T. Hart, Esq. *Lettuces*, Cabbages, and *Red Cabbages*, Sir T. C. Sheppard. *Cabbage*, Mr. Ashley. *Peas*, 1, T. Hart, Esq.; 2, *do.*, Mr. Foster. *Garden Beans*, 1, Mr. Rogers; 2, *do.*, Mr. Foster. *Kidney Beans*, 1, R. Phillips, Esq.; 2, *do.*, Lord Vernon; *Dwarf do.*, Lord Vernon. *Turnips*, R. Phillips, Esq. *Carrots*, Mr. Foster. *Cauliflowers*, R. Phillips, Esq. *Red Celery*, T. Hart, Esq. *Parsley*, Mr. Rogers. *Autumn and Spring Onions*, Sir T. C. Sheppard. *White and Red Kidney Potatoes*, Mr. Foster; *Round White do.*, Mr. Foster; *Red do.*, R. Phillips, Esq. *Rhubarb*, Mr. Rogers. — **DAHLIAS**:—Best 6, Lord Vernon; 2, *do.*, Mr. Holmes. *Yellow*, 1, 2, 3, Mr. Holmes. *Dark*, 1, Lord Vernon; 2, R. Phillips, Esq.; 3, Mr. Holmes. *Spotted, &c.*, 1, Lord Vernon; 2, Mr. Holmes; 3, Lord Vernon. *Scarlet*, 1, Lord Vernon; 2, R. Phillips, Esq.; 3, Mr. Holmes.

West Kent Floral and Horticultural Society, Aug. 2.—This well-conducted Exhibition took place as usual in the grounds attached to Vanburgh House, Blackheath, and was not so numerously attended as we have seen it. Prizes were awarded as under:—For 24 *Stove and Greenhouse Plants*, 1, Mr. Hunt, gr to Miss Traill, Hayes; 2, Mr. Pawley. For 12 *Stove and Greenhouse Plants*, 1, J. Penn, Esq.; 2, Mr. Basket, gr to H.R.H. Princess Sophia of Gloucester. For 6 *Stove and Greenhouse Plants*, 1, — Brandrom, Esq.; 2, H. Harman, Esq. For 12 *Heaths*, 1, Mr. Hunt, gr to Miss Traill; 2, Mr. Pawley. For 12 *Fuchsias*, 1, Mr. Pawley; 2, — Brandrom, Esq.; 3, H. Harman, Esq. Two EXTRA PRIZES were awarded to Mr. Hally and the Rev. A. Drummond. 12 *Pelargoniums*, 1, Jas. Bruce, Esq.; 2, Mr. Smith. *Carnations*, 1, Mr. Norman; 2, Mr. Hardstone; 3, Mr. Burchett. EXTRA PRIZE, H. Harman, Esq. *Picotees*, 1, Mr. Norman; 2, Mr. Hardstone; 3, Mr. Meade. EXTRA PRIZE to Mr. Neville, for *Seedling Picotees*. EXTRA PRIZES were awarded to the following: 1, Mr. Hunt, for a very fine specimen of *Brugmansia*; 2, Mr. Basket, for a splendid specimen of *Cléthra arborea*; 3, J. Penn, Esq., for a collection of *Cockscombs*; 4, A. Rowland, Esq., for *Cut Roses*; 5, Mr. Randall, for *Seedling Dahlias*. For *Collections of Fruit*, 1, Jas. Bruce, Esq.; 2, H. Stainton, Esq. EXTRA PRIZE to the Rev. R. Greenlaw. *Melons*, Mr. Steadman. *Grapes*, Mr. Hunt. For *Vegetables*, 1, Jas. Bruce, Esq.; 2, — Brandrom, Esq.; 3, H. Stainton, Esq.

MISCELLANEOUS.

Wine from the common Bramble.—Five measures of the ripe fruit with one of honey and six of water, boiled and strained, and left to ferment—then boiled again and put in casks to ferment, are said to produce an excellent Wine. The colour of Wine is often rendered darker by a mixture of Blackberries with the Grapes.—*Loudon's Gardeners' Magazine.*

To make Raisin Wine.—Half Smyrnas and half Malagas are best, seven pounds to the gallon—wine measure. Boil the water and let it stand to get cold; pick out the argest stalks, and wash out the barrel with a little brandy; put the fruit in whole, and let it stand six or seven months, according to the quantity made. If the fruit be good and new it will require rather a large cask to give it room to swell, and should not be stopped down until it has done working, but stir it every two or three days. If it be made all of Malagas, and not high-coloured enough, draw a jugful the night before bottling, mix some burnt sugar in it, and put a little into every bottle,—a cwt. will require a barrel sufficiently large to hold 22 or 23 gallons.—*Anonymous.*

Dock-Mud.—This is probably a most valuable fertiliser. It contains the whole wash of the city; and after a rain-storm, the most valuable portion of the street dirt settles in the docks. Soap-suds, soap-lees, fish-offal, blood, pot-liquor, &c., are the greater portion of them collected in the dock-mud. The very smell from the docks, when foul, or the tide is low, is a pungent proof of its fertilising power. This material should be collected in some convenient spot where it can be landed, put into heaps under open sheds, mixed with lime, plaster, or charcoal, and let lie until a thorough decomposition takes place, and then applied to the land. There can be no doubt that one cart-load from such a compost-heap would be more valuable to the farmer than three loads of the best street-dirt. It has been objected by some that dock-mud contains salt. This, instead of being an objection, will be found to be one of its most valuable properties. The celebrated guano-manure contains more than 30 per cent. of sea-salt, a larger portion probably than would be found in dock-mud. I should consider that a compost made from dock-mud would be very little, if any, inferior to the guano-manure.—*American Agriculturist.* [We trust the Editor is more correct in his other statements than in this concerning the per centage of sea-salt in guano, which contains little more than a trace of it.]

Mushrooms.—Some people assert that the Mushroom, or that part which springs from, or appears above the earth, is the stem, or principal part of the plant, and those parts under the earth, its roots. If this be the case, the rules which regulate vegetable growth are totally departed from; for, as a stem, or principal part, with its appendages, advance from the earth, its roots spread in the earth in proportion and at the same time; but to aver that the roots will extend of themselves in the earth, without the stems, or its buds expanding, or advancing in growth with them, is nothing less than nonsense; and in this case the Mushroom, being the last part produced, after the plant in the earth extends in all directions, and goes through the various stages of growth, is evidently the fruit and flower combined; and as the plant is subterranean, it pushes its fructifying part into the air to perfect its seminal organs, and resembles in this respect aquatic plants at the time of flowering, as they send their flowers above water for the same purpose.—*E. Owens, in the Transactions of the Gardeners' Society of Ireland.* [This is very true, and the observation does credit to the acuteness of Mr. Owens, who does not seem to be aware of the views of modern Botanists on the subject.]

GARDEN MEMORANDA.

Mrs. Sherbourne, Hurst House, near Prescott, Lancashire.—On entering a glazed passage leading to the principal range of stoves, the first object that attracted attention was a noble plant of *Lagerstrœmia indica*, bearing myriads of its pretty pink blossoms. Those who have never seen this plant grown to perfection can have but a very faint idea of its beauty, and as Mr. Durden (the

worthy gardener at Hurst House) succeeds so eminently in its cultivation, I will briefly describe his system of culture, although it may not differ materially from that by which many gardeners are accustomed to grow it. In the autumn, after the plant has done flowering, it is removed first to the greenhouse to harden it a little, then, if there be no fear of frost, it is set out of doors for a time. During winter it is accommodated in a back-shed, where it cannot be injured by frost, nor be excited into growth by too much heat; it is kept entirely without water at this season. Some time in February a great part of the soil is shaken from the roots, and the plant is repotted in light, rich, sandy loam and leaf-mould. The strong shoots are cut back to two or three inches in length; all the small sprays are entirely removed, so that the whole vigour of the plant may be concentrated in the few buds which are left at the base of the last year's shoots; the pot is then plunged in a smart bottom-heat in the stove. The plant grows rapidly for a time, when it appears to receive a sudden check, and remains in a partially dormant state for a few weeks. It is at this time that persons unacquainted with the nature of the plant turn it out into the greenhouse or open air, supposing that there is no chance of its flowering for that year; but if the plant be still kept in the stove it soon commences a second growth, and ultimately flowers in profusion. A white *Maurandya*, called *alba*, falling gracefully over an ornamental vase, looked very pretty, and opposite, in a similar vase, a fine variety of *Pinx* *Drummondii* was blooming beautifully; *Kalosáthes coccinea*, with its bright starry corymbs, showed how beautiful it can be when it receives a little good treatment; a fine old plant of *Plumbago capensis*, profusely producing its beautiful blue flowers; and a noble plant of *Cléthra arborea* are equally worthy of notice. The Orangery, a noble structure, standing in the centre of a long range of stoves, contains the principal collection of the Citrus tribe. The centre of the house is divided into long narrow pits, about two feet in width; between each pit is a path about three feet in width. The Oranges, &c. are planted in the pits, and are trained to perpendicular trellises, and present, as it were, a series of espaliers, the one behind the other; the branches of the trees in front are kept so thin that they do not intercept too much of the light from those behind, thus the greatest possible quantity of fruit is obtained from the space allowed, and the house has at the same time a very neat appearance. The trees are loaded with fruit in every stage of maturation; the large *Shaddocks*, &c. having a beautiful appearance when contrasted with the fine dark-green luxuriant foliage. Several plants of *Passiflora quadrangularis* are trained along wires near the glass, and are producing numerous fine fruit. The beautiful *Mandevilla suaveolens*, planted in a border, and running the whole length of a raft, is growing and flowering as well as if it were in its wild native woods, and the no less beautiful *Petrœa volubilis* is flourishing beautifully in a similar situation; *Jasminum azoricum* and *simplicifolium*, *Beaumontia grandiflora*, *Thunbergia grandiflora*, and several other climbing plants, all contribute to beautify the house. A strong plant of *Bignonia grandiflora* (?) is just putting forth a fine spike of flowers. *Thunbergia Hawtayneana* is in far better health than it is usually seen, though not at present in flower; a handsome plant of *Luculia gratissima*, a plant of *Ardisia crenulata*, about two feet in height, and almost as much in diameter, forms a beautiful object, being loaded with myriads of its little red berries, a handsome plant of the Cinnamon-tree (*Cinnamomum verum* bearing hundreds of spikes of flowers, and another of the same species bearing a quantity of ripe fruit; a pretty *Ipomœacaulis ficifolia*, trained over a barrel-shaped trellis and a neat little plant of *Gardenia amœna*. At one end of the house, and reaching from the floor to the glass, eighteen feet in height, is a very singular-looking plant, from the Organ Mountains in South America, supposed to be a *Lobelia*; its long, naked, slender stem is crowned by a bunch of lanceolate leaves, about two feet in length, which give it a very palm-like appearance. —*J. W. Jones.*

Reviews.

Dr. Justus Liebig, in his Relation to Vegetable Physiology. By Dr. Hugo Mohl. (Dr. Justus Liebig's Verhältniss zur Pflanzen-Physiologie.) Tübingen. Fues. 1843.

(Continued from page 576.)

In a chapter like that "On the Origin and Assimilation of Nitrogen," it was to be presumed that Liebig would have examined the form under which ammonia is conveyed to the plants. As almost all plants grow in black mould, the relation existing between the atmospheric ammonia and the humus was to be examined—a topic interesting not only in a theoretical but practical point of view. But L. treats the matter very slightly, merely stating (p. 83) that humus stands in the same relation to ammonia as powdered charcoal, viz., condensing the ammonia. But we have seen already that humus can not be supplied by charcoal, and although the latter substance absorbs ammonia even more forcibly than humus, yet plants will not prosper in it. This, therefore, does not corroborate L.'s assertion. The province of a true chemist, in this case, instead of being satisfied with the trivial fact that rotten wood absorbs ammonia, would have been rather to inquire whether these two substances will combine, and what combinations they will form. Sprengel and Mulder have lately asserted that humus and ammonia will form combinations soluble in water; Sausure also found, in all sorts of humus, a soluble nitrogenous extract, by which he explains the conveyance of nitrogen to plants. Instead of making experiments, and without even taking notice of those of such men as the above, Liebig despatches the whole question with the assertion that the humic substances contained in black mould (*Damm Erde*) are entirely insoluble in water.

The explanation of the action of gypsum on plants is connected by L. with the existence of carbonate of ammonia in the atmosphere. He assumes that gypsum is decomposed by the carbonate of ammonia of the air; and he considers it, therefore, a means of fixing ammonia, and conveying it to plants; and he adds that—"This is obvious from the evident action of gypsum on the growth of grasses, and by the increased luxuriance and fertility of meadows manured with gypsum." This explanation (replies Dr. Mohl) is only true in a chemical, but not in a physiological point of view; because it is well known that gypsum is most beneficial to leguminous plants. But if its action consisted in fixing ammonia, there is no reason why it should not act beneficially on all plants, especially on Corn. And although L. asserts the latter to be the fact, (*Am. d. Chem. u. Pharm.* xli. p. 369), yet the farmers, who are pretty good judges in these matters, will not agree with the Professor. If L. explains in a farther part of his work the manuring influence of burnt clay and oxyde of iron by their attraction of ammonia,—an influence which, (he says) could not have been previously un-

derstood, it is certainly not to him that the discovery is owing, but to Sprengel, who in his "Doctrine of Manures" has also explained the influence of such substances by their attraction of ammonia.

Of the fifth chapter, headed "The Inorganic Constituents of Plants," Dr. Mohl says, that Liebig justly rejects the prevailing opinion, that the salts absorbed by plants act merely as stimulants, and is right in considering the bases absorbed from the soil as necessary constituents of vegetation. Liebig says, that all plants contain vegetable acids, which become combined with inorganic bases (or organic, formed by the plants themselves) into neutral or acid salts;—that, considering the constant presence of these acids, we have to infer that they serve some vital purpose, and that their formation constitutes some necessary part of the vital process. Hence, Liebig arrives at the conclusion, that several earthy or alkaline bases can be substituted for each other in the vital process, and that the quantity of the saline bases absorbed by plants depends on the saturating capacity of the acids they contain. This, (says Dr. M.), is the second new and important principle contained in L.'s work. Still, it cannot be considered as perfectly evident, for it is only supported by the analysis of two plants. Whether the enigma which still shrouds the absorption of inorganic substances has been thus solved Dr. M. thinks doubtful. This theory, he says, is, in this respect, one-sided,—that it regards only the basal proportion of earth and alkali, and neglects the consideration of the specific proportion, which appertains to such substances in a lesser or greater degree. Many facts shew that the replacing of one base by another is only possible to a certain extent; that, moreover, the same quantity of a certain base, which may be absolutely required for the prosperity of one plant, may act as a poison to another, &c. In this respect, lime more especially is conspicuous, as the flora of the calcareous Alps, compared with that of primitive rocks, clearly proves. In this respect some plants are very fastidious, and will only bear one certain sort of soil, whilst others grow in both. In the species which may be called *fastidious of soil*, the substitution of one base for another cannot be supposed to take place.

In a subsequent part of his book, Dr. Mohl examines what Liebig has stated or retracted in his late work, "Organic Chemistry in its Relation to the Doctrines of Dr. Grubes and Sprengel." Dr. M. considers the explanations of L. in that place only as additional proofs of his inconsistency, and another sample of the uncertain style of his writings, "which leaves the reader, on almost every important topic, in perfect uncertainty what it really is that Liebig means." In only one instance, concludes Dr. M., the author has spoken plainly; viz., in alluding to silica, of which he says that it is the first solid substance that is taken up by plants, and is that, moreover, whence the formation of wood takes its origin: acting, therefore, like one of those particles of a solution on which the first crystals are formed, and that in Equisetum and the Bamboo silica assumes the form and functions of the wood. This theory Dr. M. calls a physiological blunder, (as it certainly is,) proving Prof. Liebig's absolute ignorance of everything connected with the physiology of plants.

Another important point, says Prof. Mohl, (p. 37,) which L.'s theory does not explain, is, that the saline bases absorbed by plants are not only absorbed in the shape of carbonates, (which are easily decomposed by the mere vegetable acids,) but often also in the shape of phosphates, sulphates, &c. According to all experience, these salts are not less essential to vegetation than those bases combined with organic acids. Silica, also, is an ingredient equally essential to the growth of most, if not all, plants. Which part these substances take in the vital process, is (says M.) almost unknown, unless, indeed, we may presume that the sulphates yield plants the sulphur required for some of their organs. Of the phosphates we know still less; we are ignorant why they chiefly occur in young plants, and in their seed; and we are perfectly ignorant of the quantity required for vegetable growth—for analysis shows that the amount of phosphates varies considerably even in the same organ in plants grown on different soils, as is best seen in the different sorts of grain.

(To be continued.)

Anaphytosis; or, the Rejuvenescence of Plants: being a Key to explaining their Growth, Flowering, and Fru-tification, with Practical Application to the Culture of Plants. By Dr. C. H. Schultz. Berlin, 1843. Hirschwald. 8vo, pp. 214. [Die Anaphytose oder Verjüngung der Pflanzen.]

This is the title of a book of Professor Schultz, of Berlin, who, having previously published a work on the Rejuvenescence of Human Life, has applied himself to the regeneration of all nature. It is difficult to bring the ideas of the author into a compass adequate to our space; we will, however, endeavour to state their leading characters.

Dr. S. begins by stating, that "It is often not enough merely to refute scientific error, but a full result of such refutation will be only achieved when, in lieu of error and mistakes, something better and true is proposed." The main object of the author appears from the following passage—"The recent progress of science, however, prompts us strongly to reform the morphological part of Botany in accordance with the laws of nature; for it must be acknowledged that, since the time of Linæus, it has not much progressed beyond the limits of a mechanical terminology, which still forms the whole of our morphological knowledge." This work, in fact, is a new system of Vegetable Physiology, or at least in its leading features. The author, in the subsequent pages of the preface, proceeds to censure the dogmatism of German Botanists, and to complain that the aversion of theoretical

Botanists for practical application has caused a *de facto* separation of theory and practice, theoretical Botany, however, having often "sat upon addled eggs" (11). He recommends therefore that Botanists should earnestly look to horticultural, agricultural, and forest operations; investigate the processes of vegetation in all sorts of plants on a large and comprehensive scale." The remainder of the preface (pp. 20) is a dissertation on the morphological meaning of the different organs of plants,—into which theoretical disquisition we are not inclined to follow Dr. S., but rather refer those interested to the work itself.

The new term, Anaphytosis, is thus explained to be that which lies at the bottom of all vegetation, as well as the foundation of all vegetable metamorphosis; namely, a continual repetition in the development of organs, which, although they are similar to each other, appear always novel, sprouting constantly out of the substance of the individual plant, and repeating in different forms the old type of vegetation. Thence, it follows, that those parts cannot only be divided and dismembered by art (without losing their vitality), but will divide spontaneously, and by the mere impulse of nature, which explains the prodigious increase of plants, especially in the tropics. This may take place by root-spawn, as in the Gramineous, Liliaceous, and Orchidaceous plants, or by branch-spawn, as is the case in the exotic Figs and Mangroves, whose lateral branches again form roots and twigs, by whose continuation, almost *ad infinitum*, a forest of plants is formed out of one plant, which, although yet connected together, still lead each its individual life. This infinite regeneration may take place, moreover, by leaf-spawn, as is the case with Ferns, many Sedums, and Liliaceæ, and more especially with Algæ; or by trunk-spawn, as in Cacteous, Stapeliaceous, and Euphorbiaceous plants. Everywhere we find the same repetition of the same exterior organs of plants, similar to each other, and to the whole from which they are derived; and it is this law of repetition (Wiederholung), which governs all vegetation. In order to give a precise name to these phenomena, the vegetation of individual plants is called "their Anaphytosis;" by which name is meant the living reproduction of the same organs during the growth of plants, as well as their constant regeneration. It is this Anaphytosis which enables a plant to continue itself (sic!), to extend itself, to branch off, and multiply, *ad infinitum*, every part being always equal to that whence it is derived. This, however, takes place with relation to certain partitions, or separations, by which longitudinal growth is divided into articulations, where Anaphytosis continually begins anew. The parts produced from this process of articulation, are called Anaphyta, or vegetative articulations. We have considered it right to attempt an explanation of that idea of the author, which he regards as important enough to be placed on the title of his book; but we must refer again to the work itself for his views concerning what he calls Metanaphytosis, Enanaphytosis, Exanaphytosis, &c.

In a subsequent page Dr. S. dilates on the conditions of flowering. In stating the difference between a mere general growth and the art of flowering, he says:—"On this head a common mistake requires to be rectified, viz., that plants can be forced into flowering and fruiting by being deprived of nourishment, and especially by any such checks to their growth as pruning, transplanting," &c. It was Linnæus who, in his doctrine of Metamorphosis, first introduced this error. A really stunted growth, however, (brought on in any way whatever), can never lead to vigorous fructification or flowering. We know that it is the flowering and fructifying of crops which most exhaust the soil, whilst mere herbage may be grown on worn out ground. Hence it follows, that it is flowering and fructifying which demands the strongest nourishment, and that the known results of pruning trees or exposing bulbs rest on other grounds than those generally received. Even where mere flowering without fructification is desired, land must be well manured, for we find everywhere that the floral organs require quite as much support as the mere individual plants.

The chapter "On the Relation of Chemistry to Botanical Physiology" is one of great importance. The phenomena connected with the transformation of chemical substances into organic forms, lead to some general remarks on the relation of Chemistry to Botanical Physiology, which the author thinks has been hitherto entirely mistaken. The recent improvements in (so called) organic Chemistry, relating to the transformation of substances into the organisation of plants (and animals) has threatened the entire absorption of Vegetable Physiology in chemistry, and seems likely to bring us back to the worst days of the alchemists, when it was thought that even life itself could be analysed by their coarse methods. Physiology, under these circumstances, has done little more than protest against a mere chemical explanation of vital processes.

The physiology of plants has a great practical bearing on medicine, rural economy, and all the practical operations of social life; and this importance is in consequence of the formation of useful substances in the interior of plants. Conceding every importance to chemical explanations of vegetative processes, yet, after all, the grand operations of organic life in plants overrule all chemical phenomena; and although the physician, the agriculturist, and the gardener may constantly refer to the chemical part of Botany, they must always fall back on Physiology, "because the vital principle is the bank where all chemical payment must be ultimately made." The real relation of chemistry to physiology is founded on the contrast between organised form and formless chemical elements. The life of plants with its power manifests itself only in organic form; and mere chemical substances can never

become the exponents of life, without having first acquired organic forms. Vegetable life, in as far as substances enter into its forms, is the vanquishing of the chemical qualities of these very substances, and they obtain their proper forms (their organisation) by the mysterious process of assimilation. This process has never yet been properly understood, and this is the reason of all the mistakes of organic chemistry. Every one conceives the assimilating process of nutrition to consist in a mere chemical change of substances; but, on the contrary, we have to grapple with the entire annihilation of the mere qualities of substances, in their utter transformation into organic forms. If the process of assimilation were one merely chemical, chemistry would have to displace physiology, and the latter would be superfluous, or, at most, but a subordinate chapter of the science of chemistry. But we see, on the contrary, that it is botanical chemistry that has intruded on the province of physiology, and has carried there, like death, its ravages amongst the living, sweeping away with its fatal scythe all traces of sublime organic life.

Dr. Schultz himself answers the question as to assimilation. The very name (he says) is so closely connected with the inmost nature of the process, that we cannot but admire the greatness of the human mind that, by mere instinct, has expressed, in one word, the pure and entire truth. The Latin word (and still more the version of it into German—*verähnlichung*) tells us that we have here to do with the rendering dissimilar substances similar—with the conversion of shapeless nutritive substances into definite forms. It is this changing of chemical matter (*chemismus*) into organic life, which is the culminating point of all assimilation. These considerations, however, still lead us to the fact, that the substances to be assimilated by plants (their food) are of a chemical nature, and that it belongs to chemistry to elucidate their qualities. On the other hand, the organism of plants is, by their death, again resolved into chemical substances, and it is another of the provinces of chemistry to analyse and examine them in that state.

But we have stated enough of the speculative part of Dr. S.'s book, and must devote the remainder of our space to matters of a more tangible and practical character. In the chapter inscribed—"Formation of Substances in Different Parts of the Plant," the author says—"The difference in the formation of different substances in different parts of a plant is dependent, in the main, on a difference in their vital processes." On this account, the parts of a plant above and below ground are often in as different a position as animals living in different climates. Nourishment and water, although they are absorbed by all parts of the plant, still arrive at the interior under different modifications of soil and air; and by an equally different reaction on the part of the organs, different substances are generated. It is, moreover, light to which the above-ground parts owe their peculiar and little oxydised substances, whilst the root and other subterranean parts contain, in many cases, oxydised and sweet ingredients. All the modifications of vegetation are not brought on by a quantitative but by a qualitative difference of the vegetative process, which, again, depends on the condition of the vital sap and the vital vessels; by which, in fine, the condition of the sap formed in the parenchyma of the leaves, stems, tubers, and the roots, is determined, which are again reabsorbed and consumed in the formation of flowers. The concentration and organisation of the substances employed in forming the vital sap go always hand in hand. The sap of the woody fibre usually contains only 2 to 3 parts in a thousand (rarely 2 to 4 per cent.) of solid substances. The vital sap, on the other hand, contains in plants near the period of flowering, 15, 20, nay 40 per cent. of solid substance. The saline contents in the vital sap of a *Mimosa pudica* are so considerable, that a drop placed on a glass plate will instantly crystallise into the finest dendritic forms. This great amount of saline matter in the vital sap is connected with the fact, that the bark (the focus of the vital-sap vessels in most plants) contains a greater amount of ashes than the wood. The tables published by Mr. Werneck show that the amount of ashes in the bark of the Willow is 3.1 per cent., whilst the wood yields only 2.79 per cent.; in *Pinus silvestris* the proportions between bark and wood is 1.9—1.6 per cent. This great amount of saline matter in the sap is, however, only apparent towards the period of flowering, and again decreases during and after that period, when those peculiar substances which are developed at that period are again absorbed. Mollat has observed, that the herbage of Potatoes dried shortly before blossoming, yielded 9.20 per cent. of its weight of ashes, but a month later only 5.12 per cent. The general supply of food is the same for all plants, and will suffice for their mere growth; but flowering and fructifying demand, in different plants, a certain amount of salts, different in each individual case. Thus we find that the toughness and hardness of timber depend on the mineral constituents of the soil. It is well known, that Oak grown in the most fertile humus of American virgin forests is useless for ship-building; whilst that grown on the calcareous soil of Germany is of a superior quality.

"The chief effect, however, which salts would exercise on the flowering of plants, consists in stimulating (Reizung) and contracting the vessels and cellular tissue, so as to increase evaporation and concentrate the sap which unites them. But it is essential that the saline stimuli should be kept in a due proportion to the amount of general food; otherwise the sap will easily be decomposed; and I believe that the brand in wheat and other grain is generally caused by such a disproportion between general food and saline stimuli." The author's remarks upon that subject

occupy considerable space; we can only afford room for the following extracts. Besides the general stimulating and exciting properties of salts, the phosphates and sulphates appear to contribute towards the formation of peculiar substances,—such as albumen and gluten, as is apparent in fruits and seeds; whilst ammoniacal salts cause the development of pollen, which is nitrogenous. Phosphoric and sulphuric acid, and ammonia, may therefore be considered both nourishing and stimulating substances, and equally beneficial in flowering and fruiting. As to other salts, the acid of which they consist seems to exercise less influence than their base, for vegetable acids are apt to be much changed and transformed by the vegetative process. We know that many composite plants, such as Wormwood, Calendula, and *Carduus benedictus*, contain considerable quantities of saltpetre; whence I suspected that the Jerusalem Artichoke, which only flowers about Berlin late, and badly, might be brought to flower early by manuring it with a solution of saltpetre in water. By watering it during several summer months with a weak solution, my Artichoke flowered in August and bore fruit. Further experiments made with beech-ashes gave the same result, and convinced me that it was merely the alkali which acted in this case, the vegetative process of the plant supplying the rest. I believe, therefore, that plants are able to prepare nitric acid from the ammonia of dung and rain, if assisted by the calcareous contents of soil.

Common salt and chloride of lime (continues Dr. S.), seem to be very advantageous in the flowering of most plants, which, however, can only endure a small quantity of them. Salts of lime seem to have so much the same effect as those of potash and soda, that it is only necessary to place lime in their way, provided there is no deficiency of manure in the shape of general food. Lime will, in the main, promote the flowering and fruiting of most plants to an astonishing degree, because calcareous salts promote evaporation and the concentration of the sap. Silica, however, seems to act differently on plants, as in the family of Grasses, which absorb the greatest amount of it, in the form of a soluble silicate, especially that of potash. From a soil composed of sand without potash, even Grasses will absorb no silica; they will always grow badly in it, and it is only from decomposed feldspar that they will absorb the silicate of potash. Soil mixed with the detritus of feldspar is, therefore, the best for Grasses and Grain,—whence the beneficial effect produced by manuring Corn with the sweepings of high roads macadamized with granite. But it is clear that plants can decompose the silicate of potash, and form therefrom silica, as appears from the crystals of silica found in the stems of Grasses. The phosphates, sulphates, nitrates, and ammoniacal salts do not act merely as saline stimuli, but their constituent parts enter into the organic composition of flower and fruit in the shape of food; for the plant assimilates the phosphorus, sulphur, and ammonia of these salts, and uses it in the formation of albumen, gluten, and pollen.

The following observation completes the series of Dr. Schultz's arguments:—"The influence of the above and other salts, as well as of manures in general on vegetation, has been hitherto considered too generally; whilst there is a difference in their influence on growth, and on flowering and fruiting. Hence a great many erroneous notions have originated, for mere growth requires so different a nourishment from flowering, that one sort of food will advance growth but not flowering, and *vice versa*; whilst many circumstances must combine to produce growth, flowering, and fruiting in the most perfect state."

Although we have occupied so much space with a notice of a book whose title cannot fail to excite curiosity, we must confess that we find much less novelty in the matter than in the manner of it.

CALENDAR OF OPERATIONS for the ensuing week.

THAT the autumn is the best time to bud Roses no one who has tried it will dispute. A correspondent writes—"I shall begin to bud my Roses this week (second week in August), and continue to do so occasionally to the end of September, as I find dormant buds are more safe to stand the winter." From some experiments I have been engaged in for the last two years, I am led to infer that the autumn, in many cases, is a better time to graft and bud many kinds of trees and shrubs than the spring or early in summer, especially those trees that are difficult to propagate by these modes. The conclusion at which I have arrived is this: the office of every leaf having a bud at its axil is to prepare proper nourishment for the full development or organisation of that bud; that the leaves of some trees possess the property of furnishing the buds in a few days, that others take some weeks to effect this, while a third will require a month or two to furnish the buds, as independent members of the system. Now, if I bud from a shoot in May whose buds are not fully organised before June, the shield or rind of the bud may unite with the stock; but the eye not yet fully developed dies, and after repeated failures I set down the tree as "difficult to propagate" by budding, whereas my own ignorance of its economy was the true cause. If, on the other hand, I bud from this shoot in July, August, or September, or any time after the maturation of the buds, and find they all live and unite with the stock, am I not warranted in my conclusion that this is the proper explanation? Certain it is that autumn is the safest time to bud those trees and shrubs that are supposed difficult to increase in this way, and that such trees may be grafted in the autumn, and unite in less time, and with greater safety, than at any other season, is a very important point to attend to. During this inquiry I have met with some singular and interesting facts, one of which will be welcome news to many, and with it I shall conclude my remarks this week. The *Rhododendron* in the autumn will bud as freely as the Rose, and graft in the open air as easily as the Apple or Pear. The only precaution that is necessary in this operation is to take prominent buds from the first growth of this season, as many of the family have made a second growth this month. Variegated Hollies may now be grafted and budded with the greatest freedom. The *Rhododendron* being thin rinded it does best by side-grafting, and buds of it also had better be inserted after the manner of side-grafting, with a portion of the soft wood retained behind the bud; all autumn buds may thus be inserted. I scarcely ever used clay in the first instance for excluding the air from these experimental buds and grafts, so that with this useful precaution there will be no fear of success. The following observations may be useful to those little versed in these matters:—Insert autumn-grafts as you would buds, leave about an inch of the graft out, at the top of the incision, and use the firm part of this summer's growth for the

stock. If the bark of the stock be very thin, or if it do not part freely from the wood, you had better put in the grafts and buds as in side-grafting, cutting out a thin slice, and preparing the grafts so as to fit the place, and tie rather gently, as the stock is soft, for fear of bruising the bark. If the graft be put in on the north side of the stock, it will be an additional security from the heat of the sun. The best grafting clay is made by putting a lump of soft clay in the bottom of a small pot, with a little water over it; then stir it with a stick until it is rather thicker than paint, and with a small brush made with stripes of matting tied to a little stick, paint over the tying, and while the paint is wet, dust a little dry sand or mould over it, and when it becomes dry no rain will wash it off, and the sand will keep it from cracking.

I.—KITCHEN-GARDEN AND ORCHARD. In-door Department.

PINES.—After they are firmly rooted, about this time, some good growers whom I know, make up a heap of fresh horse-dung at the outside of the succession-pits, to supply moist top-heat through two or three holes in the end wall. Others leave a space of one light empty, and introduce the dung inside, there to steam away more slowly, and cover it over with a wooden shutter. Any other plant we cultivate except the Pine would soon be destroyed by the rank ammoniacal vapour thus created; but Pines delight in it for three months in the autumn, or at any time when they are growing freely; and this is a better contrivance than letting in the steam from the linings, which is more or less irregular. This is, moreover, the simplest way to clean Pines from scale, bugs, &c.

VINES.—The Black St. Peters should be fully coloured by this time, and Muscats beginning to assume their amber hue, so that the only attention they require is to keep them dry until the frost or very cold nights set in. These Grapes, in a good house, may be kept to February, and so may the White Nice, which is not at all such a bad Grape as it is often represented; but it should never be touched till six weeks after it is fit for table; its flavour will much improve during this time in a dry atmosphere, and there is no Grape in this country that can produce such fine clusters with equal ease; at thinning time any bunch that is not likely to weigh three pounds should be cut out.

FRENCH BEANS.—The thinnings from those sown at the end of July should now be transplanted into turf pits, where they could be covered from early frost, and would succeed the last ones from the open air; others should now be sown in boxes twice or three times during this month, according to the wants of the family, and afterwards transplanted into pots or beds covered with glass.

Out-door Department.

About the beginning of May we planted out a few hundreds of the forced Keen's Seedling Strawberries, and by the time the Eltons were over these were coming in for a second crop, which lasted to the end of August. But a good gardener tells me he gets three full crops off the same plants within twelve months. Thus, those forced last spring and planted out in May, being now done bearing, he will take up and pot in next October, and cut away the main portion of the old roots, as by that time there will be plenty of strong young ones produced immediately under the surface of the ground; these he puts into a cold Vinery, for forcing by the end of January, and a third crop will be gathered by the end of the twelvemonth. Cutting off the leaves of Strawberries at this time is not a worse practice than digging the beds in winter, as you cut off all those fine roots formed late in the autumn near the surface of the ground. The old plan of covering the beds with a rich compost, leaving only the tops of the leaves above it, is the best winter management after all.

ARTICHOKES.—If any of your rows or beds are seven years old, lose no time in cutting them down, and trench the ground as deep as you find it good, while it is yet dry; not but what the plants might go on for another seven years, and still bear well enough, but it is bad management to let ground lie out of rotation so long. Gooseberry, Currant, and Raspberry bushes are often left on the ground until the plants cease producing through sheer exhaustion of the soil.

THYME, SAGE, MINT, and TARRAGON that were cut over last month are now getting quite bushy again, and in fine condition to be taken up for potting, or to be put in boxes for forcing gently in winter.

ORCHARD.—Fruit is scarce in many places this year as I am informed; but here we have abundance on our light soils. Hawthorn and other Codlings for the kitchen should be gathered before they are fully ripe.

II.—FLOWER-GARDEN AND SHRUBBERY. In-door Department.

STOVE.—There will be little variation in the treatment of stove plants for a long time to come; the great point is to get them well ripened before winter, to harden them gradually by exposure to free currents of air, and by giving less water. Another most essential part of their management is to have them perfectly cleared from insects before winter; thousands of plants are ruined by rubbing off insects in the dead of winter.

GREENHOUSE.—The best kinds of greenhouse plants are very impatient of wet and drip in winter; see, therefore, that nothing is wanted about the roof of this house, to render them uncomfortable when they are comparatively crowded.

CONSERVATORY.—No plants look more gay here in the autumn than large specimens of the different varieties of *Thunbergia elata*, or Black-eyed Susan, as we call it. I have seen Mr. Fryer's seedling, with the light eye, and a very pretty contrast it makes with the rest; large specimens of *Galphimia glauca*, a half-stove plant from Mexico, make a gay appearance also at this time, and is one of the easiest to manage. The old *Lagerstromia indica* comes in beautifully at this time, when properly managed.

PITS AND FRAMES.—At this stage of the Calendar I received a catalogue of Dutch bulbs, which contains the following directions, printed at the bottom:—"Hyacinths, when intended to flower early, should be planted the last week in September; and for flowering at a later period, the third week in October." Hyacinths planted the last week in September will flower at their usual time in the spring, if in the open ground; and if intended for flowering early, by forcing the last week in September, is just six weeks too late. These directions of the old catalogues deceive thousands, and nothing but the force of custom can be pleaded in excuse.

FLOWER-GARDEN.—The beds here will require particular attention through the autumn; the fingers and knife must be constantly at work—thinning, pruning, stopping, and regulating plants and the outlines of the beds. Every flower should be cut away which offers to seed as soon as it begins to fade. Dahlias and Hollyhocks, with other tall growers, require to be kept well trimmed, and tied up regularly to stakes. The hybrid Phloxes are particularly gay at this season. *Fuchsia corymbiflora* in rows or single standards will have a fine effect from this time until frost comes. Will "Delta" allow me to publish her criticism?—D. Beaton, *Shrubland Park Gardens, Ipswich*.

State of the Weather near London for the week ending Aug. 31, 1843, as observed at the Horticultural Garden, Chiswick.

Aug.	Barometer.			Thermometer.			Wind.	Rain.
	Max.	Min.	Mean.	Max.	Min.	Mean.		
Friday	30.085	29.835	72	56	40	64.0	S.

The highest temperature during the above period occurred on the 3d, in 1835—thermometer 83°; and the lowest on the 8th, 1838—thermometer 33°.

REPORT ON COVENT-GARDEN MARKET, For the Week ending Sept. 1, 1843.

IN consequence of the steady state of the weather, the market has been well supplied with both fruits and vegetables during the past week, which are offered at nearly the same prices. Pines still continue plentiful, and Grapes are excellent, and quite sufficient to meet the demand. Peaches and Nectarines are very abundant, and are of good quality. Good Apricots bring from 2s. to 4s. per doz. The Green Gage, Orleans, Violet, Muscote, and Morocco Plums, have considerably increased in the market during the past week. Jargonelle Pears bring from 4s. to 9s. per half-sieve. Morello Cherries are selling at from 6d. to 1s. 6d. per lb. Gooseberries are now nearly over for this season; a few, however, are still to be met with in the market; and Currants, likewise, are on the decrease. Filberts are very plentiful, and bring from 30s. to 45s. per 100 lbs. Raspberries are selling at from 9d. to 1s. 6d. per gallon. Cucumbers are offered at from 9d. to 2s. per doz. Cauliflowers are good and plentiful. Cabbages and Turnips, of good quality, are abundant. French and Windsor Beans are exceedingly plentiful. Peas are becoming rather scarce. Tomatoes are from 1s. to 2s. per punnet. Carrots are good, and Shallots very abundant. Cut Flowers consist of *Bigonia venusta*, *Gardenia radicans* and *Florida*, *Erica Aitoniana*, and *retorta*, *Ceropegia tinctoria*, *Plumbago capensis*, *Calceolarias*, *Fuchsias*, *Pelargoniums*, *Verbenas*, and *Pansies*.

PRICES, SATURDAY, September 2, 1843.—FRUITS:—

Pine Apples, per lb., 3s. to 6s.
Grapes, hothouse, per lb., 2s. to 6s.
Peaches, per dozen, 12s. to 21s.
Nectarines, per dozen, 12s. to 21s.
Apricots, per doz., 1s. to 4s.
Figs, per doz., 6s.
Melons, each 2s. 6d. to 7s.
Dutch, each, 1s. to 2s. 6d.
Plums, per punnet, 1s. to 2s.
Violet, per half-sieve, 2s. 6d. to 3s. 6d.
Gage, per punnet, 2s.
Gages, Green, per half-sieve, 10s. to 12s.
Gooseberries, per half-sieve, 2s. to 3s.
Currants, per half-sieve, 3s. to 4s. 6d.
Black, per half-sieve, 3s. 6d. to 5s.
Red, for wine, per ev., 8s. to 4s.
for dessert, per half-sieve, 4s. to 6s.
Raspberries, per gallon, 7d. to 1s.
Cherries, Morello, standards, per hf. sieve, 6s.
Wall, per lb., 1s. to 2s.
Apples, new, per half-sieve, 2s. 6d. to 4s. 6d.
Pears, per half-sieve, 3s. to 7s.
Oranges, per dozen, 1s. 6d. to 2s.
per 100, 10s. to 24s.
Lemons, per doz., 1s. to 2s.
per 100, 6s. to 12s.
Cucumbers, per brace, 6d. to 2s.
Gherkins, per 1,000, 5s. to 7s.
Almonds, per bushel, 6s.
Nuts, per bushel—
Brazil, 16s.
Barcellona, 22s.
Cob, 12s.
Filberts, English, per 100 lbs., 30s. to 45s.
Tomatoes 1s. to 2s. per punnet.

VEGETABLES.

Cabbages, per doz., 9d. to 1s. 6d.
Cauliflowers, per dozen, 2s. to 5s.
Beans, Kidney, per half-sieve, 1s. to 2s. 6d.
Scarlet, per half-sieve, 1s. 6d. to 2s. 6d.
Windsor, per sieve, 1s. to 1s. 6d.
Potatoes, New, per ton, 80s.
per owt., 4s.
per bushel, 2s.
Kidney, per bushel, 2s. to 4s. 6d.
Artichokes, green, per doz., 1s. to 4s.
Vegetable Marrows, per doz., 6d. to 1s.
Turnips, per doz. bunches, 3s. to 5s.
Red Beet, per dozen, 9d. to 1s.
Horse Radish, per bundle, 1s. to 2s.
Radish, spring, per doz. bunches, 6d. to 1s.
Turnip, per doz. bunches, 9d. to 1s.
Carrots, Horn, per doz. bunches, 3s. to 6s.
Long, per doz. bunches, 4s. to 7s.
Shallots, per lb., 1s.
green, per bunch, 4d.
Spinach, per sieve, 2s. to 3s. 6d.
Leeks, per doz. bun., 2s. to 4s.
Onions, Spring, per doz. buch., 1s. 6d. to 3s.
Large, per doz. buch., 2s. to 6s.
Spanish, per doz., 1s. to 3s.
Garlic, per lb., 6d. to 8d.
Chilis, per 100, 1s. to 2s.
Peas, per bushel, 2s. to 3s.
per sack, 3s. to 6s.
Lettuce, Cabb., per score, 9d. to 1s.
Cos, per score, 6d. to 1s. 6d.
Celery, per bd., (12 to 15) 9d. to 1s. 6d.
Small Salads, per punnet, 3d. to 6d.
Sweet Basil, per doz. bunches, 3s. to 4s.
Watercress, per doz. sm. bun., 4d. to 6d.
Parsley, per half sieve, 1s.
Tarragon, per doz. bunches, 2s. to 3s.
Fennel, per doz. bun., 2s. to 3s.
Mint, per doz. bunches, 1s. 6d. to 2s.
Marjoram, green, per bunch, 2d. to 4d.
Mushrooms, per pottle, 2s. to 4s.
Walnuts, Green, per bushel, 7s. to 9s.

Notices to Correspondents.

BACK NUMBERS OF THE GARDENERS' CHRONICLE.—We are so often applied to for particular Numbers of the *Gardeners' Chronicle*, to complete sets, and so many are now out of print, that we think it will save all parties trouble if we publish a list of the Numbers which may still be had. Any subscriber who will forward to our publisher Post-office stamps, equivalent in value to as many Numbers as are required, shall have them sent. Those Subscribers who are very anxious to complete their sets should write at once, as we have very few copies of some of the Numbers.

1841:—1, 6, 8, 13, 14, 15, 16, 17, 18, 20, 22, 23, 24, 26, 27, 28, 29, 30, 31, 32, 34, 49.

1842:—4, 6, 8, 10, 11, 12, 16, 18, 30, 38, 39, 40, 41, 42, 43, 44, 48, 50, 51, 52.

1843:—1, 5, 6, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34.

One shilling each will be given for Nos. 13 and 14, for 1842.

CORRESPONDENTS.—H. W. Humphreys, Lacon, A. G., C. Thomas, and several more, received with thanks.

MANURES.—S. C.—Paper-shavings cannot be used as manure unless they are thoroughly rotted, which is difficult. One way is to throw them into a cesspool, the contents of which are to be employed on your land. Or, which is perhaps quite as well, you may burn them, and take care of their ashes.—C. B.—

Water in which charcoal has been thrown, to keep the water sweet, has no effect either good or bad on plants. ¶ **HEATING.**—J. M.—It is not necessary for the return-pipe to enter the boiler under the flow-pipe. All that is required is that the return-pipe should enter the boiler as near the bottom as possible. We recommend the tank-system to you by all means.

—*Amateur.*—Some of the troughs in the Horticultural Garden are old flues, with the inside rendered water-tight by means of cement; others are composed of hard-burnt semi-cylindrical drain-bricks, covered with flue-tiles. Ashes are thrown on the top of the tiles.—*Ignoramus.*—An Arnott stove may be used for heating so small a house as you speak of. All you have to do is to keep a large open pan of water on it, to moisten the atmosphere, and to wet the ashes before they are raked out, so as to destroy the dust which renders such stoves a nuisance. You may conduct the pipe through the house, but in that case you must see that its joints are quite tight, so that no gas can escape; we however doubt whether it will be necessary in so small a house.

CURVILINEAR ROOFS.—A Subscriber.—The glazing ribs of the large conservatory in the Horticultural Gardens are of rolled iron. The expansion and contraction are so trifling as to cause no breakage. It is glazed with sheet glass. In a conservatory 36 feet long and 16 feet wide, the height of the back wall may be 13 or 14 feet. Of course this is regulated by the height of the front wall.

LAWNS.—An Irish Subscriber's lawn may be laid down with 1 lb. *Avena flavescens*, 5 lbs. *Cynosurus cristatus*, 3 lbs. *Festuca duriuscula*, 2 lbs. *Festuca tenuifolia*, 18 lbs. *Lolium perenne tenue*, 3 lbs. *Poa nemoralis*, 6 lbs. White Clover, 2 lbs. Small Yellow Clover, per acre, if his land is light; if heavy, he must leave out *Avena flavescens*, and increase his *Cynosurus cristatus*. This will give the finest of all turf; to be kept constantly mowed.

PINE-PLANTS.—A Young Pine Grower.—In a bark bed, 26 feet by 8, you may keep up a succession, and fruit 30 Pine-Apple plants, the sorts being chiefly Queens, with some Black Jamaicas. ¶

VINES.—T. M.—That your Vines are bearing very large bunches is owing to that abundance of foliage the look of which you dislike. We should do nothing but stop the shoots till the

fruit is gathered. We, however, send you the answer of a practical Grape-grower, for your better guidance. "All the shoots on the Vines in question should now be stopped; but as there is a good crop of fruit it will not be safe to meddle much with cutting out or shortening the laterals, for by so doing the flow of sap is liable to be deranged, and the bunches, in consequence, either shrivel or colour badly. If the foliage is in any place too much crowded, a little regularity may be effected by means of the knife; but so as not to deprive the Vines of much foliage at any one time or place."

STRAWBERRIES.—W. S. D. asks—"Does the Elton Pine Strawberry covet shade?" and states that he had some runners put in the shade of Apple-trees, about September, 1841, and this year they bear most abundantly; he gathered some measuring two inches and a half, and some two inches and three quarters. Some runners he planted last autumn under a south wall, about four inches apart, and this year they bore a full crop. The Elton Pine grows vigorously, and bears abundantly in almost any situation; but as it contains a good deal of acidity, it is advisable to plant it where it will be fully exposed to the sun. ¶

POMOGA LEAII.—W. C.—This plant will not succeed well in a temperature much lower than 60°. It requires a soil consisting of loam and dung, with the addition of a little peat. It will not flower freely, however, except when planted out in the open border. ¶

ROSES.—W. C.—The following will answer your purpose, viz.—Amie Vibert, Noisette, Corymbiflora, Juan Desprez, Triomphe de Plantier, Madame Desprez, Bourbon Phoenix. We know of no yellow Rose sufficiently hardy. ¶

PELARGONIUMS.—C. E. T.—The bottom leaves of your Pelargoniums, becoming brown and dropping off, seem to indicate an inefficient supply of water; although they may not be allowed to flag, we would advise you to ascertain carefully whether the roots of the plants be thoroughly wet. The spotting of the leaves may be caused from exposure to the sun's rays in a wet state, or from the use of any crude stimulating manure. ¶

PICOTEES.—H. S.—We recommend you to procure the following sorts:—Sharp's Hector, Gidden's Lady Surrey, Ward's Queen Victoria, Agrippina, Barraud's Cornelius and Bride, Dickson's Trip to Cambridge, Sharpe's Duke of Wellington, Hector, and Criterion, Gidden's Teaser, Mrs. Hennell, and Vespasian, Wilson's Pluperfect, Purple perfection, and Fanny Irby; Sykes' Eliza, Gidden's Diana, Wildman's Isabella, Nulli secundus, Green's Queen Victoria, Kirtland's Mrs. Annesley, and Queen Victoria, Orson's Queen Adelaide. ¶

FUCHSIAS.—*Ignoramus* may select for cuttings young shoots containing a sufficient quantity of organisable substance; cut them across immediately below a joint, put them into silver sand, and place them in a shady situation until they strike root. ¶

—D. B.—We are not acquainted with the variety you have sent a bloom of. ¶

VIOLETS.—J. D.—The Neapolitan, Russian, Tree Violet, and Double Blue, with a white variety, are those usually cultivated about London. We are not aware of any other good kinds. ¶

PLANTS.—C. B.—For autumnal Greenhouse Roses, take Boucère, Triomphe de Luxembourg, Noisette Lamarque, Jaune Desprez, Mirande, Caroline. For trailing evergreen plants on rockwork, *Daphne cneorum*, *Berberis empetrifolia*, *Vinca minor*, *Arbutus uva ursi*, *Cotoneaster microphylla*, *Iberis sempervirens*, *Genista triquetra*, *Juniperus prostrata*. For Aquatics in a Greenhouse, *Limnœcharis Humboldtii*, *Apongeton distachyon*, *Caladium bicolor*, *Nymphaea cœrulea*, *Pontederia azurea*. ¶

LETTUCES.—*Ignoramus*.—It is more likely to be the cold wet ground that produces the rot among your Silesian Lettuces than Guano; unless, indeed, the latter has been making them grow too fast, and then any other manure would have produced the same effect.

WEEDS.—S. C.—You may keep down weeds on a gravel walk by strong doses of common salt; but it becomes necessary to repeat the salt from time to time. Much the best remedy, however, is to pick them out as they spring up.

LABOURERS.—A Gardener's Friend.—It is impossible to state what labour any given space of ground or number of hot-houses may require, unless one is acquainted in detail with the quantity and kinds of vegetables required, the number of persons to be supplied, and the time when such supplies are required, whether for the whole year, or only part of it; also, whether the hot-houses are used for growing Pines, Grapes, or for forcing such things as Strawberries and French Beans; what quantity of flowers are required to be forced early in the spring; if the hot-houses are for entirely growing plants, the quantity of wall-trees, &c. All these things must be taken into account before any correct idea can be formed of the exact quantity of labour required. As far as we can make out from your letter, about two men and a boy constantly (besides the gardener), and at very busy times, such as getting in the vegetable crops in spring, some extra assistance would be wanted. The time for meals is half an hour for breakfast, and one hour for dinner; the time for working is from six to six in summer, and from daylight until dark in winter, and generally there is some remuneration given to the person who looks after the fires during the winter-time, at night. ¶ We have answered this question thus fully, in order that people may see how much more is to be considered than they often imagine, when the amount of labour in a garden is to be determined on, and there are still other matters for calculation. We cannot, however, answer further inquiries on this head, because all cases require to be considered singly, and after actual inspection of the place in question.

FARM LABOURERS.—The subject of the letter of the Wife of a Subscriber had not escaped our attention, when we were considering the means of improving the condition of the agricultural labourer. We will take an early opportunity of giving our opinion on early and improvident marriages at some length, in a leading article. M.

INSECTS.—T. P.—Of all the means proposed for killing the scale on Pines, the most effectual is exposing them to steam at a high temperature. The only difficulty is to regulate the heat so as to avoid killing the plants. If steam is applied it is better to invert the plants. If the latter are very foul they are hardly worth keeping.—S. D.—*Scava bastata* is the fly which you find so abundant in the conservatory. It is common everywhere at this season of the year. We cannot recommend you to destroy it, as we never heard that it did any serious mischief in the winged state; and in the larva state it is one of your best friends, being a noted devourer of plant-lice, or aphides. The larva is a green slug-like grub, about three-quarters of an inch long when full grown.—M. B.—The curiously-formed roll of leaves, which you discovered in the wooden frame of a door, is the work of a very interesting Bee, called *Megachile centuncularis*. It cuts small oval pieces out of the leaves of the Rose, or annual Mercury, in a very ingenious manner, and lines its nest with them, dividing it into compartments; each compartment the Bee stores with a substance resembling Bee bread, and into this she lays an egg, which shortly turns into a grub, and feeds upon the good things laid up for it until it is full grown. If you refer to page 59 of a little work called "Insect Architecture," you will find a detailed account of this Bee, which will interest you. We recommend you to leave the Bees in the roof of your Apple-house alone; if you attempt to inclose them in the way you suggest, we should fear you would disturb and do much injury.—Z.—The brown grub which you describe about an inch long and of the thickness of a quill, we suppose to be that of *Tipula cleracea*, the common Daddy-long-legs, which is now so abundant in every direction. If brine (not salt-water of the strength of sea-water, which you have been using) or lime-water have no effect in destroying this destructive grub, we think you may do much towards diminishing the nuisance by turning your soil up as winter comes on, and then by hand-picking secure as many as you can, letting the birds and frost help you also, and they will do much.

Pure gas-liquor would undoubtedly kill these grubs if it reached them in the soil, but at the same time we fear it would kill any plants you might have in the ground. It would not be above a month before you would be able to use the soil again.—*T. P.*—Your grubs are those of the common Cockchafer, about one-third full size. You had better try watering your turf with brine or lime-water, which we expect, as the grubs will not be very deep under the surface, will destroy them. *S.*

Books.—*N. J. S.*—No such work as you inquire about is in course of publication.

EXPORTATION.—*C. W. B.*—In sending your seeds to India, do not use a box at all, but put them as loosely as you can into a canvass bag. You will find the reason for this stated at length some time since in our columns. Take care that they are perfectly dry.

MISCELLANEOUS.—*A Subscriber*.—The tufts of wool on the end of your Cactus are imperfect fruits, which have swelled up after the flowers disappeared.—*A. C.*—*Spiranthes aestivalis*.—*R. Reid*.—The Horticultural Society does award medals at their meetings in Regent-street to non-subscribers.—*Fanny*.—We are sorry to say we do not understand your question.—*C. E. Y.*—Your plants are, 1, *Eupatorium cannabinum*; 2, *Pulicaria dysenterica*; 3, *Pedicularis palustris*; 4, *Epitobium hirsutum*; 5, *Lythrum salicaria*; 6, *Polygonum persicaria*; 7, *Stachys sylvatica*; 8, *Lysimachia vulgaris*; 9, *Chelone glabra*.—*Clericus*.—*Cratægus Crus Galli*.—*Ignoramus*.—1, *Linaria cymbalaria*; 2, *Sedum aurantiacum*; 3, *Sedum spurium*; 4, *Sedum telephium*.—*W. D.*—Send six Post-office labels, and the numbers shall be forwarded to you.—*A Reader, Swansea*.—The plan you have suggested for the lists of Pansies is a very good one; it will be useful to many, and shall be adopted.—*Miles*.—*Lilium lanceolatum speciosum* is not precisely a hardy plant, and will not disqualify a collection of stove and greenhouse plants.—*W. S.*—Your Apple appears to be the Cornish Aromatic, well kept.—*Sarah*.—Mr. Villet has no agent in England; five pounds will buy a great many. An order should be sent direct.—*An Essex Subscriber*.—Your Plum appears to be the Drap d'Or. This sort is earlier than the Green Gage; and it may be further distinguished by having downy shoots. The Green Gage is frequently substituted for the Drap d'Or.—*A Constant Reader*.—"Martin Doyle's Flower Garden," &c.—*J. Wood's* letter is an advertisement.—*R. C.*—*Linaria triphylla*; *Monarda oblongata*.—*An Amateur*.—Striped Pharbitis, nil or hispida; it is a pretty half-hardy annual.—*H.*—You may sow your seed about the end of this month. Milne's Early and Walker's Black Spine do well for early forcing.—*J. D. Parks*.—We have received no Petunias that have not been noticed.—*H. W. B.*—Your Pear from a north wall, ripe and very good, is the English Caillot Rosat; a sort recommendable for such situation. The Apple is the Hawthornden.—*M. D.*—*Lonicera alpigena*; fruit not known to be poisonous.

SEEDLING FLORISTS' FLOWERS.

FUCHSIAS.—*J. Brock*.—Your seedling Fuchsia is unquestionably a double flower, and a very pretty one, the number of stamens, the divisions in the corolla, and the sepals, being doubled in quantity: it is neatly formed, colour good, tube smooth, sepals expanding of a rosy carmine, corolla violet purple.—*T. Jones*.

Your seedlings, if abundant bloomers, will form pretty border-flowers; but they exhibit no improvement upon varieties long since familiar with cultivators.—*J. D. Parks*.—The small variety you sent is like many raised by every one who grows seedlings. The larger sort, which blossoms profusely at the end of the branches, is a much better flower; tube light pink, sepals tipped with green, corolla brilliant vermilion, a very pretty variety.—*T. A.*—Tube and sepals smooth, very stout, of a bright vermilion rose, sepals expand well, showing a stout corolla of a deep vermilion, slightly tinged with purple; the buds are handsome, and the foliage stout, and of a moderate size; it is a bright, handsome, and showy variety.—*W. C.*—Two very large and showy Fuchsias; the light variety has the tube and sepals of a very delicate pink, corolla rosy vermilion; this part of the flower wants stoutness and size, as the divisions are small and puckered; the darker variety has stout tube, and sepals of a bright rose, corolla large, of a rosy purple; the light seedling measures four inches to the end of the pistil; the other is rather larger and longer.

CALCEOLARIAS.—*Y. R. O.*—In packing up your blooms you made the division in the paper through which you passed the head of the flower too large, so that several of them had slipped out; and it is impossible to tell to which names the flowers belonged; there were, *Plato*, *Vesta*, *Gipsy Maid*, *Claudine*, *Donald*, and *Hamilton Hill*; among these was one with a bright brown blotch upon a bright yellow ground; a very attractive flower. With the exception of one called *Cream*, and the *Lass of Richmond*, they are flowers of good form; the former of these is too small, and the latter is too indented at the bottom. *Defiance* and *Negro Boy* are both pretty in colour; *Village Maid*, with the clear yellow margin, and *Mobery Vale* are both good; they are generally flowers of the same character, good in form, with blotches of colour nearly covering the front of the flower, and leaving a narrow margin of ground colour; some are clear, others less distinct; they are deficient in size, being considerably smaller than the Calceolarias cultivated about London.—*Nichols*.—Your seedling is a well-formed and pleasing flower, but it is too like many long since in cultivation.—*[Erratum]*.—The Calceolaria noticed last week was raised by Mr. Spreight, not Bright, as printed.]

PERALCONIUMS.—*Rogers & Son*.—The colour of your seedling is very good, it being of a clear rosy salmon, with a small and decided spot; it is a pleasing flower. The substance, however, is rather delicate, and the upper petals are too pointed.—*T. Jones*.—The petals of your seedling are too crumpled and uneven.—*Andate*.—Your seedling is a bright, clear, and pretty flower, rather undersized; white centre, with bright rose terminations to the lower petals, which are broad and smooth on the edge; in the upper petals the spot is intense, surrounded with rosy crimson colour.

VERBENAS.—*W. G.*—We have examined your collection of seedling Verbenas, and compared them with the sorts cultivated; some of them are inferior, and some equal, to the named varieties. The only one that appeared novel and distinct was No. 7, a dark velvety maroon with small flowers; this appeared darker than any variety we had seen.

PANSIES.—*G. Innes*.—Of your seedlings, No. 1 is deficient in substance, and the ground-colour, which is poor, is not even in the lip: 2 and 3 are very undersized.

As usual, a host of letters have arrived too late for answers this week.

NEWS OF THE WEEK.

THE event of the week is the promised visit of her Majesty to the King of the French at the Château d'Eu. The approaching interview of the two Sovereigns has excited a great sensation on the Continent; and as no British Monarch has visited France since the memorable meeting of Henry VIII. and Francis I., on the Field of the Cloth of Gold, the event is doubtless one of peculiar interest. The French papers are almost exclusively absorbed in discussions on the subject. The Ministerial journals hail the visit of the Queen as a significant compliment to France, and as a symbol of that pacific civilization, which tends every day more and more to the glory of our time and the welfare of nations. The Opposition

papers, with few exceptions, admit the compliment, but regard it as an unforeseen and mysterious episode of British policy, the result of which will probably be a treaty of commerce, or some other consummation intended to undermine the interests of the French manufacturers. The people, however, are represented by all parties as delighted at the prospect of the Queen's visit, and there is no doubt that Her Majesty will meet with a cordial reception from all classes in France. The Queen's speech at the prorogation of Parliament, and the simultaneous manifesto of Mr. O'Connell, are noticed with dissatisfaction by the French papers, which have found a fresh cause of grievance in the hospitable reception given to the Regent of Spain by the British Government.—In Spain, notwithstanding numerous party meetings, the new Government appears to have established its position; and it is rumoured that it has already been acknowledged by the British Cabinet. Barcelona and other provincial cities continue in an excited state, and a Central Junta is still demanded as the only means of pacifying the country.—The reception of the Regent by the Portuguese Government is the chief item of our news from Lisbon, where the conduct of the Executive is generally condemned as unworthy and inhospitable.—From Italy we have particulars of the recent troubles in the Papal States. It appears that a general insurrection had been organised in the States of Central and Southern Italy; but that a premature outbreak in the Bolognese disclosed the nature of the conspiracy, and led to the apprehension or flight of the principal insurgents.—Accounts from the Levant mention that the Servian chiefs have consented to the demands of the Emperor of Russia, and have withdrawn to the Bulgarian territory.—From the United States we learn that the law authorities at Washington have decided on the surrender of Mrs. Gilmour to the British Government, under the 10th article of the Ashburton Treaty, and that she is now on her way to England, to take her trial. This decision recognises the 10th article of the treaty as a subsisting law of the land, and consequently as binding on the judicial authorities of the United States; so that in all future occurrences of the same kind this case will act as a precedent for the guidance of both countries.

Home News.

COURT.—Her Majesty and Prince Albert left Windsor Castle on Monday morning for Southampton, and there embarked on their long-contemplated marine excursion, the details of which will be found in another part of our Paper. On the same day, the Prince of Wales and the Princesses left the Castle for Brighton, under the care of the Dowager Lady Lyttelton. Her Majesty was accompanied by Viscountess Canning (Lady in Waiting), the Hon. Miss Liddell (Maid of Honour), Lord Chas. Wellesley, Colonel Wyld, and Mr. G. E. Anson. The Marquis of Ormonde, Earl Hardwicke, the Hon. C. A. Murray, and Colonel Arbuthnot, are in attendance on the Prince of Wales and the Princesses, at Brighton. On Saturday, being the birthday of Prince Albert, her Majesty gave a fête at Virginia Water in honour of the day. The Royal party dined in the Fishing Temple, at Virginia Water, and afterwards promenaded the grounds, while a display of fireworks was discharged from the frigate the Belvidere, and the pleasure-grounds in front of the lake. The frigate and Royal barges were illuminated with variegated lamps, and the military bands of the Life and Foot Guards were in attendance. The event was also observed in town by the usual illuminations. In the afternoon of the same day his Highness the Duke de la Victoria, Regent of Spain, accompanied by the Earl of Aberdeen and Colonel Gurree, arrived at the Castle, and, after an audience of her Majesty, returned to town. On Sunday morning her Majesty and Prince Albert took their usual walking exercise, and afterwards attended divine service in the chapel of the Castle. The Queen Dowager continues in the enjoyment of improved health, at Witley Court, and daily takes drives in the neighbourhood. The King of Hanover has resided at Kew during the greater part of the week, where the Duchess of Gloucester has been on a visit to his Majesty. The Duchess of Kent left Frogmore Lodge on Monday, for the Watford station of the Birmingham railway, and proceeded thence to Witley Court on a visit to the Queen Dowager. Prince George of Cambridge took his departure on Sunday for Antwerp, on his way to assume the command of the troops in the Ionian Islands. Prince Alexander of the Netherlands is still visiting the Duke and Duchess of Leeds at Mar Lodge, Braemar. His Royal Highness has had excellent sport, and is much pleased with his visit to Scotland.

Parliamentary Business.—A parliamentary return has been published, from which it appears that from the 2d February to the 17th August the House sat 119 days, and three Saturdays; the hours of sittings were 986½, and it sat 105½ after midnight, making the average time of sitting on each occasion 8 hours and 17 minutes. It also appears that the number of petitions for private bills during the past session was 193. Of these 29 originated in the Lords, and 164 in the Commons. Upon these petitions 181 bills were introduced, of which number thirteen were only read a first time, seven a second, six a third, 150 received the Royal assent, and five were withdrawn at various stages during their progress. Of the various purposes for which these bills were applied—fifteen were for the formation and improvement of roads

—13 for harbours—35 for railways—13 for inclosures—13 for improvements in towns and cities—3 for cemeteries—16 for the regulation and improvement of estates; and the remainder consist of bills for peerages, divorces, police, canals, docks, piers, gas and other companies, &c. Upon a comparison with former years, the amount of private business in both houses is shown to be much less during the present session than for some time past.

Church Preferment.—The Queen has been pleased to make the following appointments to benefices in the Scotch Church, void by the late secession:—The Rev. W. Reid to the parish of Marytown, Forfar, in the room of the Rev. A. Ferguson; Rev. J. M'Master to the parish of Barr, Ayr, in the room of the Rev. E. B. Wallace; Rev. A. M. Ferguson to the parish of Muckhart, Perth, in the room of the Rev. J. Thomson; Rev. W. Ritchie to the parish of Longforgan, Perth, in the room of the Rev. R. J. Walker; and the Rev. G. Arklay to the parish of Inverkeilor, Forfar, in the room of the Rev. J. Laird.

The Army.—It is understood that the Rev. Dr. Dakins, Principal Chaplain of the Forces, is about to retire, after a period of more than 33 years' service, and that he is to be succeeded by the Rev. G. R. Gleig, the present chaplain to Chelsea College.

Consular Appointments.—The Queen has been pleased to appoint John Rice Crowe, Esq., late Consul at Hammerfest, to be Consul-General in Norway; William Miller, Esq., to be Consul-General in the Sandwich, Friendly, Society, and other islands in the Pacific Ocean; William Mure, Esq., to be Consul at New Orleans; James Baker, Esq., late Consul at Riga to be Consul at Corunna; and George B. C. Wynyard, Esq., to be Consul at Riga.

Post-Office.—It is stated with reference to Post-offices in rural districts, that the Post-Master-General, with the concurrence of the Treasury, has issued a regulation under which any place whatever within the United Kingdom may have a Post-office, with a free delivery of letters therefrom, provided that one hundred letters weekly may be expected to reach the Post-office; and that when one or more places shall be contiguous, or in the route which a postman would take in his course of delivering letters, these places taken together shall be reckoned as one, if they can amongst them show that one hundred letters weekly may fairly be expected to arrive for the inhabitants of them conjointly. The Postmaster-General having concluded the arrangements that have been pending for some time with the directors of the different Railway Companies, for the transmission of the morning mails by the early trains, the following notice, which came into operation yesterday, will, no doubt, be interesting to the public, being the official list of the different post-towns to which letters and newspapers can be forwarded by the morning mails:—"Abingdon, Accrington, Andover-road, Appleby, Banbury, Bangor, Bath, Basingstoke, Beaumaris, Berwick, Berkhamstead, Birmingham, Bishop's Stortford, Blackburn, Bradford (Yorkshire), Brackley, Brompton, Brough, Bristol, Brighton, Buckingham, Burnley, Burton, Cambridge, Canterbury, Carlisle, Carnarvon, Chatham, Chepstow, Chelmsford, Cheltenham, Chester, Chippenham, Cirencester, Clitheroe, Cockermouth, Colchester, Conway, Coventry, Cowes, Cuckfield, Dartford, Darenty, Dover, Fareham, Fairford, Farrington, Fenny Stratford, Feversham, Folkestone, Gateshead, Godalming, Gloucester, Gosport, Gravesend, Guildford, Halifax, Haydon Bridge, Hemel Hempstead, Hertford, Hexham, Highworth, Hoddesden, Holyhead, Holywell, Huddersfield, Hull, Ipswich, Kendal, Lancaster, Leamington, Lechlade, Leighton Buzzard, Lewes, Liverpool, Maidenhead, Maidstone, Manchester, Margate, Maryport, Milnthorpe, Mold, Monmouth, Newcastle-upon-Tyne, Newport (Isle of Wight), Newport Pagnel, Northampton, North Shields, Oxford, Penkridge, Penrith, Portsmouth, Preston, Preston Brook, Ramsgate, Reading, Rickmansworth, Rochdale, Rochester, Rugby, Ryde, Saffron Walden, Sittingbourne, Shoreham, Slough, South Shields, Salisbury, Southampton, St. Asaph, St. Albans, Stockbridge, Stafford, Stockport, Stone, Stroud, Stoney Stratford, Stratford-on-Avon, Sunderland, Swindon, Towcester, Tring, Ulverstone, Uxbridge, Wallingford, Walsall, Ware, Warrington, Warwick, Watford, Weedon, Whitehaven, Wigan, Wigton, Winchester, Windsor, Wolverhampton, Worthing, Worthing, Yarmouth. All Ireland and Scotland."

Houses in the United Kingdom.—By a parliamentary return just issued, the number of inhabited houses in England is stated to be 2,753,295; the number uninhabited, 162,725; and the number building, 25,882. In Wales the number inhabited is 188,196; uninhabited, 10,133; building, 1,769. In Scotland the number of inhabited houses is put down at 503,451; uninhabited, 24,295; building, 2,763; making a total of about, 3,454,101 inhabited; 198,049 uninhabited; and 30,634 houses building throughout the United Kingdom, Ireland excepted, which is not included in the return.

Fine Arts Commission.—The Commissioners have sent in their second report to her Majesty, stating that the competition of artists at the Cartoon exhibition has satisfied them respecting the attainments of many British artists in the practice of cartoon drawing, and respecting their capacity to attain excellence in those qualities which are essential in historical painting; and that they now propose, in pursuance of the plan before announced, to invite artists to exhibit specimens in fresco-painting of a moderate size, which may enable them to proceed to the selection of artists for the decorations in fresco of certain portions of the Palace. They report their announcement relative to sculpture and decorative arts of various kinds, inviting artists to submit specimens; and state that the order in which the

several branches of art and decoration applicable to the embellishment of the Palace have been considered has been, and must continue to be, determined by the time requisite for the preparation of the works, the study required by the artists in modes of execution which are new to them, and by the progress of particular portions of the building. They conclude by stating, with reference to the architect's report, that they are not yet prepared to lay any specific recommendation before her Majesty, both in consequence of the building not being sufficiently advanced, and because the result of the inquiries and experiments made and making by and under their directions is not sufficiently ascertained to justify them in coming to any final conclusion in this respect. And with reference to that part of the architect's report which relates to local improvements in the neighbourhood of the Palace, the commissioners consider that, however deserving of attention the improvements in question may be, they do not come within the inquiry with which they are entrusted.

Religious Worship.—A Parliamentary return has just been printed, entitled "A return of the amount applied by Parliament during each year since 1800, in aid of the religious worship of the Church of England, of the Church of Scotland, of the Church of Rome, and of the Protestant Dissenters in England, Scotland, and Ireland respectively, whether by way of augmentation of the income of the ministers of each religious persuasion, or for the erection and endowment of churches and chapels, or for any other purposes connected with the religious instruction of each such section of the population of the United Kingdom, with a summary of the whole amount applied during the above period in aid of the religious worship of each of the above classes." The abstract of sums paid to the Established Church shows that the total was 5,207,546*l.*, which is divided in the following manner:—Church of England, 2,935,646*l.*; Church of Scotland, 522,082*l.*; Church of Ireland, 1,749,818*l.* The total sum paid to the Church of Rome is set forth at 365,607*l.* 1*s.* 2*d.*, comprised in the following two items:—Augmentation of incomes (including Maynooth College), 362,893*l.* 8*s.* 1*d.*; erection and repairs of chapels, 2,113*l.* 13*s.* 1*d.* The total sum paid to Protestant Dissenters is 1,019,647*l.* 13*s.* 11*d.* in England and Ireland. The recapitulation shows the following three sums:—Established Church, 5,207,546*l.*; Church of Rome, 365,607*l.*; and Protestant Dissenters, 1,019,647*l.* The sums were advanced from 1800 to 1842.

Foreign.

FRANCE.—The promised visit of Queen Victoria to the French Court, at Eu, excites the attention of the whole French press, and is the theme of many a grave leading article. The ministerial *Journal des Débats* confines itself to the expression of a sincere desire that "so noble a spectacle may be given to Europe," and affirms that the immense majority of the French nation would associate itself on this occasion with the feelings of the King, and would be happy and proud to receive the Sovereign of Great Britain in the territory of France. The *Presse* declares its satisfaction at the event as a compliment to the monarchy, but does not intend to forget the many grievances which the English Navy has inflicted upon France. The *Constitutionnel* adopts the same tone, but accepts the visit as a proof of the good understanding between the two Governments. Another Opposition print, *Le Siècle*, expresses great distrust about the interview between the Queen and Louis Philippe, and dreads its result, because the English Cabinet can authorise such a step only for some interested purpose. The republican *National* declares that when Henry VIII. shook hands with Francis I. on the Field of the Cloth of Gold, he was already meditating that perfidious aggression which so greatly injured France, and that though Queen Victoria is not of the blood of Henry, and Louis Philippe resembles Francis little enough, the character of the English Government is unchanged. Yet it is not a declaration of war that the *National* apprehends; what it dreads most is the possibility that the Queen has a treaty of commerce in her pocket, by which all the cotton-spinners, and iron-founders, and silk-weavers, and artisans of France are to be sacrificed. The French people, however, are delighted at the prospect of the Queen's visit, and even the Paris Bourse has partaken of the general feeling on the occasion. The impression is so strong that her Majesty will also visit Paris, and that the British Embassy is preparing in great haste for her reception, that a number of boxes have been hired at the Grand Opera for several days to come, in hopes of the Queen honouring that theatre with her presence. It is also said that M. Paul Delaroche has been directed to proceed to Eu, to make a drawing of the interview, for the Royal Palace at Versailles.—After this exciting topic the speech of her Majesty on closing the Session of Parliament, and the simultaneous manifesto of Mr. O'Connell, are the principal matters referred to in the Paris journals. Each paper finds great fault with the party which it peculiarly favours. Thus the *Débats* finds Sir R. Peel wanting in decision, whilst the loyalty expressed by Mr. O'Connell for the Queen is an abomination to the *National*. The *Débats* would have the Government adopt measures forthwith against the Irish agitation, and the *National* would have Mr. O'Connell fling off all allegiance at once to a Saxon Queen. The hospitable reception given to the Regent of Spain, and particularly the visit of the Duke of Wellington, who, in addition to the compliment of the call, has committed the grave offence in the eyes of our Paris contemporaries of leaving a card on which one of his Spanish titles was inscribed, has produced a tirade against the English Government,

which they suppose to have no other motive in the kind reception of Espartero than a determination to oppose the new government in Spain, and insult that of France. The visit of Marshal Sebastiani to England is also commented upon with much gravity. All the Opposition journals concur in stating that this visit is of a political character, and of a nature to compromise the dignity of France, but they are not at all agreed as to the precise object of the mission. According to some, he is gone to apologise for the energetic conduct of the Captain of the Boussole, at Otaheite; others say that he is charged to fish out the designs of England as to Spain; and some suppose that his mission has for its object to prevent Sir R. Peel from taking offence at the violent language of French journals respecting the affair at Newfoundland; so that in the midst of these surmises, M. Guizot and his colleagues have again to sustain the imputation of sacrificing the dignity and honour of France to the pleasure of this country.—A serious accident happened to the King and Royal family on Monday. His Majesty, the Queen, the Queen of the Belgians, the Comte de Paris, and other members of the Royal family, left Eu in a *char-à-banc*, drawn by six horses, on an excursion to Tréport by the new road of Mers. On arriving at the bridge of the Look of Assas, at the head of the canal, which goes from thence to the sea, four of the horses, when entering on the bridge, took fright, either at the noise of the cannon, which were firing at the fort of Tréport, or from that of the water rushing into the lock; one of the leaders threw himself on the slender chains which were placed to protect foot-passengers, which instantly broke, and he fell into the canal, dragging with him in his descent two of the other horses. Fortunately the traces snapped, and the postilion who was riding one of the wheelers, with great presence of mind and strength of arm, turned his horses' heads, so as to bring the pole of the carriage against one of the posts at the entrance of the bridge, and thus checked its progress. The King and Queen, and Queen of the Belgians alighted, and their Majesties, having satisfied themselves that no one was hurt, went on foot to Tréport, amidst cries of "Vive le Roi," from the crowd assembled. The alarm of the whole party in such fearful circumstances was very great. The Queen was much affected, and wept bitterly after the danger was over. The King himself acted with great presence of mind; he held the young Count of Paris in his arms, and refused to leave the carriage till every member of his family was safe.

SPAIN.—The Madrid papers have at length published the protest of Espartero, noticed in our last, in which he solemnly protests against all that has been done or should be done by the new Government contrary to the constitution of the monarchy; and also the decree issued not in the Queen's name, but by the new Government in its own name, depriving the Regent of the title of Duke of Victory and of all grades and emoluments. The journals of the 21st ult. state, that a numerous meeting of the friends of Espartero was held in the hall of the Spanish Institute on the previous day. The President, the former deputy, M. Rodriguez Leal, opened the discussion by reading the programme adopted by the committee, which he accompanied by a speech on the present situation of affairs, which the Coalition denounced as most insolent. The basis of the programme was,—1. The faithful execution of the Constitution of 1837; 2. The Queen's minority, until the 10th October, 1844; and, 3. National independence. A letter has been published by the Paymaster-General of the army, completely disproving the assertion that the Regent carried off with him from the Puerto de Santa Maria the military chest of the army. The Members of the Juntas who have arrived at Madrid have come to an understanding with the Government, and it is probable that the submission to the present rulers of the nation will soon be general. The Queen and her sister arrived at Segovia in the morning of the 18th, and were to visit on the next day the citadel, the Mint, and the Alcazar, an old historical edifice, in which Isabel I. was crowned Queen of Castile. It having been reported that the excursion of her Majesty was the commencement of a system adopted by the military party to keep her in their own hands, and that they would eventually carry her to Pampeluna, the Ministry had been obliged to contradict the report in the *Gazette* of the 19th, declaring it calumnious and unfounded. Letters from Barcelona of the 20th and 21st ult., describe that city, and indeed the whole of the province, as in a state of complete anarchy. It would appear that Col. Prim, had, to a certain extent, acquiesced in the wishes of the Supreme Junta, with regard to the formation of a Central Junta, and accepted the post of Captain-General of Catalonia, held by General Arbutnot, in the name of the Madrid Government. The latter had no means of enforcing respect for his authority, and still continued in the citadel with a few battalions, on whose devotedness he could not rely. Brigadier Echalecu had been confirmed in the command of Montjuich by the Junta, which had appointed Gen. Pajol governor of the citadel, and Col. Milans, who had been the first to raise the standard at Reuss with Brigadier Prim, governor of the Attarazanas, which was still occupied by the volunteers. The Captain-General of Seville had issued a decree, appointing Courts-martial at Cadiz, and condemning to death all who should have any relation with the partisans of General Espartero.

PORTUGAL.—The Lisbon papers are filled with discussions on the late conduct of the Portuguese Government towards Espartero. During the stay of the Malabar in the river, the Duke of Terceira sent on board one of his Adjutants to offer his services to the Regent. This act of courtesy was severely censured in Council, and when it was expected that the Duchess of Victory would pass the

frontier in order to arrive at Lisbon, an escort of honour was proposed, but refused, when it is well known that this lady experienced every possible attention and respect from the conquerors of her husband. An extraordinary courier was despatched to Madrid with every particular relative to the impediments placed in the way of the Regent's landing. This express was accompanied with the most positive orders that the Portuguese Minister at that Court should follow precisely the conduct adopted by Mr. Aston. The recognition, therefore, of the Provisional Government has not yet taken place in Lisbon.

GERMANY.—The Berlin papers give long details of the alarming fire which took place on the 19th ult., which reduced the Opera-house to a heap of ashes. It was one of the most magnificent theatres in the world, and one of the greatest ornaments of the Prussian capital, built under Frederick the Great. The two buildings on one side, the invaluable Royal library, and the palace of the Hereditary Prince of Prussia, were alarmingly threatened—so much so that the most valuable manuscripts and works in the library had already been packed up for removal, but through the exertions of the fire brigade, both buildings escaped with only slight injury. The Hereditary Prince has addressed an autograph letter to the magistrates of the city, requesting them to express his gratitude to all the citizens who had assisted in preserving his palace from the threatened conflagration. The investigation into the origin of another fire, which a few months ago reduced to ashes one of the largest and most frequented places of amusement—the Colosseum—has assumed a very serious appearance. The owner of the establishment, who has been known as a very enterprising and wealthy man, has been arrested in consequence of these investigations.—The Duke of Cambridge arrived at Cologne on the 18th ult., and after having inspected the Cathedral, proceeded by land to Coblenz.—The papers announce that the Duke of Bordeaux is on the point of resuming his project of travelling abroad, which he had been obliged to postpone in consequence of the accident that he experienced two years ago. The Prince will travel under the name of Comte de Chambord, and will first visit England and the north of Germany.—Professor Ranke, of Berlin, one of the most celebrated historians of the age, has arrived in London for the purpose of extending his learned researches to the State-Paper Office, and various important archives, for which every facility has been granted him.—According to a circular just published, the new sect of the Jews formed at Frankfort has agreed to the following points:—"We recognise in Mosaism the possibility of an unbounded progressive improvement. The collection called the 'Talmud,' and all Rabbinical writings and assumptions founded on it, have no binding power for us, either dogmatically or practically. A Messiah, who shall conduct the Israelites back to this land, Palestine, is neither expected nor wished for by us; we recognise as our native land that alone to which we belong by birth and civil relations." The members of the reform association are to sign the declaration which expresses those principles. The Universal Gazette of Judaism declares energetically against these proceedings.—A joyful excitement prevails at Baden, among the inhabitants as well as visitors, because the pharao-bank has suffered immense losses, and has actually been broke twice within two days. When it took place the second time a universal "bravo" sounded through the saloon, and the musicians were called from their beds to celebrate the misfortune of the professional gamblers.

ITALY.—We have accounts from the Roman States of the agitation and troubles which have arisen there. It seems that an insurrection was prepared for the month of August, in Sicily and Naples, as well as in the legations. The King of Naples had, however, taken every precaution. He had sent a number of troops to Sicily, and taken steps to fortify Messina and Syracuse. It was on the rumour of some troubles in Naples that the Liberals of Ravenna thought the time was come to make a demonstration. Accordingly an engagement took place on the 15th, at Savigno, between a detachment of carabinieri and the insurgents of Bologna, who had made an irruption into the rural districts. The latter were in number between 40 and 50, the carabinieri and the volunteers were from 25 to 30. The captain of the carabinieri and four of his soldiers were killed; the remainder, having no ammunition, made their escape. The insurgents then entered Savigno and caused the Secretary of the Commune, and two volunteers who were carrying despatches, to be shot. The Cardinal Legate of Bologna adopted precautionary measures, recalled the troops from Ferrara and Romagna, and despatched against the insurgents several detachments, who were familiar with the country about the mountains. Most of those suspected were seized, but many escaped to the coast. It is said that the Austrian garrison of Ferrara has been augmented. The Duke of Modena's Police Minister, Ricci, has not only been dismissed in disgrace, but has thought it necessary to fly and hide himself, as implicated in these troubles.

RUSSIA.—The Paris papers announce that the young Grand Duchess Alexandra, the eldest daughter of the Duke of Leuchtenberg, died a few days since at St. Petersburg, after a long and painful illness. On the 13th August, between five and six in the afternoon, Moscow was visited by a violent storm, with a shower of hail, which did considerable damage. Above 70,000 panes of glass were destroyed, the iron plates on the roofs of sixty houses were torn off, and also many of those on sixty others. Much damage was done to the garden trees, many of which were torn up by the roots. Another storm, with hail, which took place on the 20th June, is remarkable on account of the extent of country which it visited; for its ravages extended over the governments of

St. Petersburg, Moscow, Poltawa, Kiew, &c., that is from the Euxine to the Baltic.

GREECE.—Accounts from Athens of the 10th ult. state that their Majesties have just removed to the new palace, the furnishing of which is now almost entirely completed. This structure is of immense magnitude, built of marble from Pentelicus, after designs by a Bavarian architect, but in the estimation of most people, it is devoid of external grandeur and internal comfort, although the total cost amounts to such an immense sum, that the King has contrived to prevent any exact estimate thereof being made public. The Government had suspended twenty-five Professors of the University, in compliance, it is said, with the desire of the protecting Powers, who insisted on the strictest system of economy being introduced into the finances. The crops had suffered severely in most of the provinces, and the greatest misery pervaded the whole country.

TURKEY.—The Vienna papers announce officially the result of the assembly of the *notables* and people of Servia at Kraguevatz, which is, that the two leaders, Wutsitsch and Petronowitsch had consented to submit to the demands of the Emperor of Russia for their withdrawal, and that the assembly had not made the slightest demonstration against this measure. Later accounts state that they had arrived at Belgrade on the 14th, and were to embark on the day following for Widdin. Accounts from Constantinople of the 7th ult. state that the Turkish fleet still continued to hover about the Dardanelles, followed by a French man-of-war steamer. Large bodies of Turkish troops were concentrated at Adrianople, which, at a period when the Divan professed themselves anxious for retrenchment, caused some surprise. Nothing satisfactory had been concluded by the commissioners appointed to arrange the difficulties between Persia and the Porte.

UNITED STATES.—The Royal mail steam-ship *Acadia* arrived at Liverpool from Boston and Halifax on Tuesday. She left Boston on the 16th, and Halifax on the 18th, and has consequently made the passage in twelve days. The dates from the United States are from the 8th to the 16th ult., inclusive. The authorities at Washington have decided to deliver Mrs. Christina Gilmour to the officer who went in pursuit of her from this country, and a warrant to that effect has accordingly been issued. The counsel of the prisoner had made another attempt to save her, by an application to Judge Betts for a writ of *habeas corpus*, but without success. The Judge, in reply, gave the following as his opinion on the law of the case:—"In the matter of Christina Cochrane, otherwise Gilmour, on application for the allowance of a writ of *habeas corpus*:—I am of opinion that the 10th article of the Treaty of Washington, concluded August 9th, 1842, is, under the 2d subdivision of the 6th article of the Constitution of the United States, in force as a subsisting law of the land, and is accordingly to be observed and executed by the judicial authorities of the country. I am of opinion that a commissioner appointed by a Circuit Court of the United States, pursuant to the acts of Congress in that behalf, is, by force of the act of Congress of August 23, 1842, empowered to perform the functions pointed out by the 10th article of the said treaty. I am of opinion that it is not competent for a Judge of the United States, in vacation, to revise, on *habeas corpus*, the adjudication of such commissioner as to the efficiency of the proof of criminality of a party charged before him. I am of opinion that a writ of *habeas corpus* cannot be rightfully allowed for the purpose of inquiring into the legality of a warrant emanating from the executive branch of the Government, intended to surrender a person duly committed to a marshal of the United States, to the authorities of Great Britain, under the provisions of the 10th article of the said treaty, before the party shall be thereby actually transferred to and detained in such British custody within the United States. I accordingly refuse to allow the *habeas corpus* prayed for in this case." This decision will form a precedent for the guidance of both countries in all similar cases, and is therefore of considerable importance.—Mr. Wickliffe, the Postmaster-General of the United States, had been stabbed, but not mortally, on board a steamer between Portsmouth and Baltimore, by a Mr. Gardiner, who it is stated took this mode of revenging himself on Mr. Wickliffe, because that gentleman refused to interfere to secure him an office. The Philadelphia papers contain accounts of a fearful hurricane which passed over that city and the surrounding country on the 12th ult. Many parts of the city, and some of the adjacent lands were deluged. Several bridges, houses, trees, fences, and hay-stacks were swept away, and 27 lives were lost. A Boston paper states that an American sloop of war brings intelligence respecting the discovery of a beautiful island in the Pacific, extending 40 miles, not laid down in the charts; it is situated in south latitude, 11.05, west latitude, 165.05. It was called Eadie's Island, after the man who first discovered it. Mr. Cushing, the American Ambassador to China, had sailed in a war-steamer for Alexandria, thence to proceed to India by the overland route. On the 19th, off the coast of Newfoundland, the *Acadia* steamer ran down the barque *Merchant*, of Newport, and sustained by the collision the loss of her head and cutwater. The vessel was lost, but the crew were all saved, and brought by the steamer to England. The commissioners upon the demarcation of the boundary line are progressing rapidly in their business, and are making up for their delay in the spring. The survey of the River St. John is nearly completed from the Grand Falls to the mouth of the St. Francis. A party of surveyors is at work near Lake Pohenagunook, and another party has ascended to the head waters of the St. John. Six parties are at work upon the line between the monument and the St. John, amounting in all to about 100

men. Two parties are at the north end of the line, two parties are at the south end, and the other two near Fort Fairfield. The distance is about 78 miles, and all the parties together advance about one mile each day. They clear out a passage 15 feet upon each side of the line, cutting down the trees smooth with the ground. The line-trees are cut upon the spot, and the stumps left standing. It is said that this line is a very crooked one. In one place there is a square offset of about 40 rods. The whole line appears to be a succession of curves, with a general inclination to the westward.

TAHITI.—A copy of the following curious letter, in which Queen Pomare, of Tahiti, solicits the protection of the English Government against France, has been received in the City:—"Tahiti, Jan. 23, 1843.—My dear Friend and Sister Queen Victoria, Queen of Great Britain, —Health and Peace to you, and saved may you be by Jehovah, the foundation of our power as Queens of our respective countries. We dwell in peace from the arrangements made by our predecessors. This is my speech to you, my sister friend. Commiserate me in my affliction, in my helplessness, and in the difficulties in which my nation is involved with France. The existing Protectorate Government of France in my dominions I do not acknowledge. I knew nothing of what my Chiefs and the French Consul had done, before I wrote to you by Captain Jones, I being absent at Raiate. On the arrival of the French Admiral, A Du Petit Thouars, the same chiefs who formerly signed the document requesting French protection assembled, viz., the three governors and Paraita, the person who was left in charge at Papeete (Paraita is the root of this great evil), the French Admiral and the French Consul, after having completed their design in signing the document, sent it over to me at Moorea, through the medium of my messengers, Tairapa and Mr. Simpson, for my signature. Tairapa said to me, 'Pomare, write your name under this document. If you do not write your name, you must pay a fine of 10,000 dollars; 5000 to-morrow, and 5000 the following day; and should the first payment be delayed beyond 2 o'clock the first day, hostilities will be commenced, and your land taken.' On account of this threat, against my will I signed my name. I was compelled to sign it, and because I was afraid, for the British and American subjects residing on my land (in case of hostilities) would have been indiscriminately massacred; no regard would have been paid to parties. This is the way my Government has been taken from me and constituted into a French Government. My Government is taken from me by my enemies, Paraita, Hitate, Tati, and others connected with them; it was they who combined and entered into agreement with the French. They have banished me that I should not be Sovereign of Tahiti; that they should be Kings and also their children. And now, my friend, think of me, have compassion on me, and assist me; let it be powerful, let it be timely and saving, that I may be reinstated in my Government; let it be prompted by the feeling which caused the Messiah to come into our world to save you and me. Have compassion on me in my present trouble, in my affliction, and great helplessness. Do not cast me away, assist me quickly, my friend. I run to you for refuge, to be covered under your great shadow, the same as afforded to my fathers by your fathers, who are now dead, and whose kingdoms have descended to us, the weaker vessels. I renew that agreement; let it be lasting and for ever. Let its continuance extend not only to ourselves and children, but to our children's children. My friend, do not by any means separate our friendship. This is my true wish. I now deliver up to you, my friend, my last effort; my only hope of being restored is in you. Be quick to help me, for I am nearly dead; I am like a captive pursued by a warrior and nearly taken, whose spear is close to me. The time is very nigh when I fear I shall lose my Government and my land. My friend, send quickly a large ship of war to assist me. A French ship of war is daily expected here—speedily send a ship of war to protect me, and I shall be saved. It is my wish that the Admiral may speedily come to Tahiti. If he cannot speedily come, I wish a large ship of war may come just at this present time. Continually send here your ships of war; let not one month pass away without one, until all my present difficulties are over. I have also at this time written a letter to your Admiral on the Spanish coast to come to Tahiti and assist me. Health and peace to you, may you be blessed, my sister friend, Queen of Great Britain, &c.—POMARE, Queen of Tahiti."

CITY.

Money Market, Friday.—Consols closed at 95 for the Account; Three-per-Cents. Reduced, 95½ to 96; Three-and-a-Half per Cents., 102½ to 103; New Three-and-a-Half per Cents. 102½ to 103; Bank Stock, 182½; India Stock, 265½.

Metropolis and its Vicinity.

General Espartero.—The Earl of Aberdeen, as Secretary for Foreign Affairs, wrote to the Regent on Friday evening, to signify her Majesty's pleasure that his Highness should have an audience with the Queen on Saturday afternoon at Windsor Castle. In consequence of this command, the Regent proceeded by a special train to Windsor on Saturday, accompanied by Col. Gurra, his private secretary. The Regent wore the full uniform of a General in the Spanish Army, his left breast being ornamented with various decorations of Knighthood, the Star of the Order of the Bath placed conspicuously in the centre. Colonel Wylde conducted his Highness to the Royal presence, when he was introduced to her Majesty

and Prince Albert by the Earl of Aberdeen. The interview of his Highness with the Queen lasted about half-an-hour. On leaving Windsor the Regent came direct to town. The Duchess of Victory and Donna Eladia went out in an open carriage in the afternoon of the same day, and took airings in the Parks. The Duchess and her niece walked in Kensington-gardens about an hour. On Monday the Earl of Minto, Lord Monteagle, and numerous other visitors, called upon the Regent. Viscount Palmerston also waited upon his Highness, and was engaged some time in conversation with him. The Regent visited the Duke of Wellington and the Earl of Aberdeen, and also called upon Sir R. Peel, but had not an interview, the right hon. Baronet not having then arrived in town from Windsor Castle. The Regent subsequently visited Lord Stanley and the Earl of Clarendon. In the latter part of the afternoon the Regent and Duchess, and Donna Eladia took airings in Hyde-park and Kensington-gardens. On Tuesday the Regent went with the Duchess and Donna Eladia to visit some of the public buildings in the metropolis, and afterwards took a carriage-drive in Hyde-park. His Highness saw several friends at his apartments, and among the calls were the Duke and Duchess of Somerset, Lieut.-Gen. Sir John Macdonald, and several Members of Parliament. In the evening the Regent dined with Lord Palmerston, to meet the Earl of Clarendon, Lords Ponsonby, Monteagle, Glenelg, Seaford, &c. On Wednesday his Highness removed from Mivart's to a villa in the Regent's Park, which he has taken as his residence. Yesterday, according to previous notice, the Lord Mayor, Aldermen, and Common Council, assembled at Guildhall, for the purpose of considering the propriety of welcoming General Espartero's arrival in this country as an exile from Spain. The court was exceedingly crowded, not only with members, but with strangers. After a long and desultory discussion, resolutions were adopted expressing sympathy with his misfortunes and hopes for his speedy recall. The Lord Mayor then announced that he would invite his Highness to meet the Corporation at a banquet at the Mansion-House, where the resolutions should be presented.

Temperance Meetings.—On Sunday Father Mathew administered the pledge in the village of Stratford, Essex. In commencing his address the rev. gentleman said he "had often spoken on the subject of holding a temperance meeting on the Sabbath-day. He believed that a meeting held under the canopy of heaven for the purpose of forwarding the reformation of mankind, was as pleasing to Almighty God as if they were assembled under the roof of a cathedral. If an ox or an ass fell into a pit on the Sabbath, they were commanded by Scripture to pull it out. Was it not, then, incumbent on them to attempt to rescue from the vortex of dissipation, on the same holy day, that being who had a soul to be saved? Why professors and ministers of the church should oppose them he could not understand. If they could not concur in the views of the teetotallers, surely they might leave them alone. The fact of his being a Roman Catholic priest did not at all interfere with his agency in the movement—it could have no effect on the goodness of the cause. He adhered strictly to the tenets of the Roman Catholic Church, and would lay down his life for any one of them; still he allowed the same liberty of opinion to others which he claimed for himself." Several other persons addressed the meeting, and in the course of the day about 600 persons took the pledge. On Monday Father Mathew administered the pledge at Hackney, and on Tuesday at Rag Fair, where about 8000 persons were assembled to welcome him. Father Mathew, on presenting himself, was loudly cheered. He expressed regret at the calumnies which were sought to be heaped upon him, and denied the allegation that his mission to London was a total failure. Considering all the circumstances of opposition, he contended that the total abstinence movement in London had made more progress than in any other part of the United Kingdom. He had given the pledge to upwards of 50,000 persons, and he believed that before he had done as many more would take it. In order to prove he was not mistaken, he called on the people to come forward and follow the example of the people of St. Giles's. This invitation was fully responded to, and before the close of the proceedings, nearly 2,000 persons had taken the pledge. In one of his speeches, Father Mathew alluded to the encouragement given him by the Bishop of Norwich in a recent letter, from which the following is an extract:—"I regret that I cannot attend at Cambridge on the occasion of the Rev. T. Mathew's visit. If, however, he comes to Norwich, I shall think it my duty to sanction a meeting, and pay every respect to an individual to whose zealous exertions in recovering so large a portion of the community from the degrading and ruinous effects of intemperance, men of all religious persuasions and parties owe a debt of gratitude." Father Mathew administered the pledge at Somers Town to about 1000 persons, on Wednesday, and to the same number on Thursday, in the Bunhill-fields burial-ground, in the City. Yesterday he paid a visit to Chelsea. He said that upwards of 60,000 persons in London alone had already taken the pledge at his hands. When circumstances should again permit him to come to England, he hoped he should pledge double the number. It had been his intention to stop a fortnight longer, but having an engagement in Dublin on the 17th, he should be obliged to leave town in the early part of next week. He should, however, before he left England, have the honour of visiting the Bishop of Norwich, and thence he should go to Birmingham and Liverpool, and on to Dublin.

Metropolitan Improvements.—Mr. Barry has completed the internal decorations of the Travellers' Club, the arabesques of which are executed by Herr Sang, a German,

and possess considerable merit. The erection of the new attic gives a very picturesque effect to the exterior, and to the group of clubs in which the Travellers' seemed, until this alteration, to be sunk. The new Conservative Club in St. James's-street is also progressing, and is likely to be a magnificent feature in that neighbourhood. Pater-noster-row is to be invaded by architectural magnificence, the Religious Tract Society having authorized the construction of a new establishment, which is now far advanced, and shows a great array of stone columns and pilasters. Prior to the prorogation of Parliament the select committee appointed to inquire into the means and expediency of preventing the nuisance arising from the smoke of furnaces and fires in the metropolis and elsewhere presented their report to the House of Commons. The committee, consisting of Lord F. Egerton, Viscount Sandon, the Lord Mayor, Sir W. Clay, Capt. Plumridge, Mr. Mackinnon, Mr. Ewart, Mr. Brotherton, Mr. Borthwick, Mr. Hindley, and others, report that, from the evidence received from the most eminent men in chemistry, from practical engineers of high reputation, from leading masters, manufacturers, and proprietors of steam-engines, and from persons who have taken out patents for the prevention of the evil, it appears that smoke, which is the result of imperfect combustion, may in all cases be much diminished, if not entirely prevented, by means of a proper admission of atmospheric air, and other precautions, so as to insure perfect combustion. It appears to them that the expense of putting up the various apparatuses and patents which had been laid before them, and which answered the two-fold purpose, not only of preventing smoke, but of lessening the quantity of fuel required, was not only very trifling, but that the outlay might be repaid within the year by the diminished consumption of fuel. There was no doubt that the prevention of smoke might be accomplished in all steam-vessels by a similar process, and by the use of anthracite and coke, and that the black smoke proceeding from fires in private dwelling-houses might be entirely prevented by the same means, or by the use of stoves or grates formed for the more perfect combustion of coal. The committee looking at the measure as one of a sanitary nature, and as essential to the comfort and well-being of the population, conclude their report by recommending that a bill should be brought into Parliament at an early period in the next session to prohibit the production of smoke from furnaces and steam-engines.

College of Surgeons.—The regulations of the College have just been altered in the following points:—1. Students were formerly required to bring proof "of having studied anatomy and physiology, by attendance on lectures and demonstrations, and by dissections, during three anatomical seasons or sessions, extending from October to April inclusive." The latter part of the rule now runs thus:—"during three winter sessions, of not less than six months each." 2. Each course of the practice of surgery, physic, chemistry, materia medica, and midwifery, was formerly of the obligatory length of 70 lectures; this is now left undefined. A circular has also been sent round to medical teachers, expressing the opinion of the Council that it is highly inexpedient that the pursuits of students should be interrupted by a vacation at Christmas, or at any other period of the winter, and strongly recommending that the vacation hitherto allowed should be discontinued.

Strike of the Type-founders.—On Tuesday, a meeting of journeymen type-founders was held, to resist the reduction of wages proposed by the London firms of Messrs. Figgins, Thorogood, and Caslon. From the statements of the speakers it appeared that in July they reduced the wages 10 to 25 per cent., which they further reduced to 75 per cent., without making any proportionate reduction to printers. It was also stated that Messrs. Sharwood and Wood were resolved to make no reduction, that Mr. Wilson would not reduce the wages beyond the diminution that took place last July, and that Mr. Miller of Glasgow not only continued the old prices, but also allowed his men certain privileges. All the speakers expressed their willingness to submit to the reduction that took place in July, but declared that they would not submit to any further reduction. Resolutions were adopted to that effect. The secretary stated that the funds amounted to 100*l.* only, and that there were 120 men dependent upon it.

British Museum.—On Tuesday, the west end of the centre building of the old Museum was disposed of, for the purpose of being taken down, in consequence of the improvements in progress. The wing is that part of the old building called the Gallery of Antiquities. The site to be cleared will be built upon to form the new frontage. The new west wing, which is several hundred feet beyond the old wing, is in course of erection, and exhibits a solid mass of brickwork. The entire re-erection of the building, it is expected, will not be completed for some years.

River Steamers.—On Sunday there landed from the steamers at Chelsea, 6,421; Putney, 4,863; Kew, 8,709; Richmond, 5,669; Teddington, 3,147, passengers; independent of those who landed at the Red House, Battersea, Wandsworth, Hammersmith, and Brentford.

Fires.—On Thursday night a large unfinished mansion in Westbourne-terrace, Bayswater, was discovered to be on fire. On entering it the police found that a large pile of flooring-boards stacked together in the place were in flames, but by prompt assistance, the fire was confined to that part of the premises in which it commenced. The proprietor, Mr. Ponsford, believes that it was the work of some incendiary, as no light had been on the premises during the day. About a week since, a brother of the same gentleman offered a large reward for the apprehension of the party who fired another unfinished mansion in Cambridge-square, but as yet the incendiary has escaped detection.—Yesterday morning, shortly before

one o'clock, a fire, which was not extinguished until property to the amount of some thousand pounds was consumed, broke out in the spacious premises well known as the Stingo Brewery, in the New-road. The flames were not subdued for some hours, and at one time it was feared that the adjoining Tavern, and also the Lying-in Hospital would be consumed. They were, however, arrested on the south side of the brewery, beyond which they did not spread.

St. Stephen's, Walbrook.—A vestry meeting was held in this parish last week for the purpose of taking into consideration the necessity of cleansing the interior of the parish church, one of the finest designs of Sir Christopher Wren. A long discussion ensued; many parishioners objecting to a rate on the ground that the church was endowed with considerable funds of which they knew nothing, as Alderman Gibbs, the perpetual churchwarden, had long refused to submit any accounts to their notice. The Alderman at length intimated, "that, if not pressed, he might show the accounts demanded." The vestry were not, however, induced by this promise to vote the required sum for repairs, and the meeting was adjourned *sine die*.

Shoreditch.—The churchwardens of this parish have had an interview with the Bishop of London, on the subject of the Puseyite innovations in the mode of performing divine service. The opposition to these forms has become so inveterate, that the parish church, formerly one of the most numerously attended at the east end of the metropolis, has been for some time almost wholly deserted. The circumstances in which the parish is placed are of a singular character. The vicar has been absent upwards of 12 months at Malta, by license of his diocesan, on a plea of mental aberration. The ministerial duties, therefore, devolve on two curates, appointed by the vicar, and who are charged with making those innovations against which the parishioners protest. The Bishop, after reading the memorial, put several questions to the churchwardens as to the way in which the ministerial duties of the church were performed. Upon points of discipline represented to have been either evaded or neglected the Bishop made copious memoranda, and promised that a strict investigation as to these matters should take place. But with regard to the memorial, his Lordship stated that he had no authority to remove the curates upon the grounds set forth by the memorialists. The allegation was much too vague, general, and indefinite, to justify a summary course of procedure. Besides which, the curates were removable only by the vicar, who had originally appointed them. So long as the vicar was the incumbent of the parish, he could not be divested of the right to nominate his assistants. The Bishop then adverted to the great increase of population in the district of Shoreditch, and said it was more than ever essential to keep up a cordial union between ministers and their flocks, more especially those who were charged with official duties appertaining to charity and education. These were matters that should engage the attention of all men, and in which all could safely unite, without violation to conscience.

Richmond.—On Saturday the first stone of a new building for the Mechanics' Institution at Richmond was laid by Mr. Selwyn, Q.C., amidst a numerous assemblage of the gentry of the town and neighbourhood.

Provincial News.

Her Majesty's Marine Excursion.—On Monday morning her Majesty left Windsor Castle on her long-promised excursion in the Channel. The Royal party left the Castle about half-past seven, and joined the South Western Railway at the Farnborough station, where a carriage specially fitted up for the occasion had been provided by the directors. The various stations on the line between Farnborough and Southampton were decorated with flags and laurel, and the inhabitants of the adjacent country and villages were assembled in great numbers to show their loyalty and gratify their curiosity. All of them expressed their gratification by loud cheers, and her Majesty and Prince Albert bowed repeatedly as the train passed at a very rapid rate. Shortly before 11, A.M., the train reached the terminus at Southampton, where every preparation had been made to do honour to the Royal visitors. Unfortunately the morning was not propitious for the occasion. The rain was descending in drizzling showers of sleet, and the wind was blowing cold and comfortless; nevertheless, thousands of people were assembled, both sides of the railroad were crowded, and the platform at the terminus was covered. The Queen on alighting was received by the Duke of Wellington, the Earls of Aberdeen and Liverpool, the chairman, and several directors of the railroad, &c. Her Majesty was loudly cheered as she entered the Royal carriage, which was drawn up close to the platform. The band struck up "God save the Queen," and the cannons thundered forth a Royal salute, whilst from the towers and steeples of the churches the bells rang out peal after peal of welcome. The Duke of Wellington and Lord Liverpool proceeded at once to the pier, whilst the Royal cortege took its course through Marsh-lane, St. Mary-street, into Northam-road, then to Marland-place, down the High-street to the Royal pier. There was hardly a house that was not ornamented with flags; triumphal arches of laurel and flowers were erected across several parts of the road; all the shops were shut, but the windows of every house were filled with spectators, who cheered the Royal visitors incessantly. On reaching the pier the rain had fallen so heavily that the mayor and aldermen spread their cloaks on the ground in order that the Queen might walk dry-footed to the admiral's barge, which conveyed her to the Victoria and Albert yacht; where her Majesty

was received by Lord Haddington, and other Lords of the Admiralty, Admiral Sir C. Rowley, Lord Adolphus Fitz-clarence, Sir H. Pakenham, and other officers. Lords Aberdeen and Liverpool were on board the yacht, and accompanied her Majesty on the excursion. The Duke of Wellington was on the pier, but did not go on board the yacht; his Grace left for London at 1 o'clock by a special train. Immediately on her Majesty ascending the deck of the yacht another Royal salute was fired. Her Majesty did not long remain on deck, the incessant rain compelling her to retreat to the cabin. Shortly after 12 o'clock the yacht got under weigh, and proceeded down Southampton water, amidst the cheers of the thousands who had assembled to witness her departure. The steam-squadron manned their yards as she got under weigh, and followed in her wake. A number of the Royal Yacht Squadron who were lying off also made sail. The Queen's yacht went only at half speed for some time after she left the pier, by which they were able to keep up with her, but as soon as she put a little more steam on they all dropped astern, with the exception of a new iron steamer, the South Western, which, with some difficulty, contrived to keep in her wake. All the others, including even the men-of-war steamers, could not keep up with the yacht, and were left more than two miles astern in little more than half an hour. After passing Calshot Castle the yacht directed her course to Cowes. The Warspite, 50, the Modeste, 18, and the Grecian, 18, were lying in Cowes roads, and as soon as the Royal Standard was descried they each fired a Royal salute and manned their yards. The battery at Cowes Castle, and the Royal Yacht Squadron Club-house also fired. From Cowes the Royal yacht steered towards the Mother-bank and Ryde, and again went at less than half speed, in order to enable the steamers astern to come up with her, and to give the immense fleet of sailing yachts, which were now trying to keep her company, the opportunity of doing so. This was a beautiful sight, and would have been even more splendid had the weather been fine. The Commodore's yacht, the Kestrel, kept alongside the Royal yacht for some time, but at length dropped astern. After passing Ryde the yacht proceeded towards Spithead, and passed round the St. Vincent, 120, which fired a Royal salute and manned her yards. Her Majesty, after leaving Spithead, returned to Ryde, where the Royal yacht was brought to an anchor, and Her Majesty and Prince Albert landed in the admiral's barge at the Ryde pier, and walked to the town, the parties on the pier forming a line on either side to enable her Majesty to pass. Her Majesty and the Prince proceeded in a carriage to St. Clare, formerly the residence of the late Lady Vernon and now the property of Col. Vernon Harcourt. After staying there a short time, the Royal party returned on board the yacht, which immediately got under weigh, and returned with the rest of the squadron to Cowes roads and anchored there. Her Majesty dined and slept on board the yacht, and early on Tuesday morning, accompanied by the Prince, went on board the Earl of Yarborough's yacht the Kestrel, and were conducted by him over the vessel. The Queen and Prince afterwards landed at West Cowes, where the carriage of Earl Delawarr was in waiting to convey them to Norris Castle, where her Majesty formerly resided when Princess Victoria. Upon landing a salute was fired from Cowes Castle, and another from the Royal Yacht Squadron Clubhouse, and the yards of the Modeste were manned. As soon as her Majesty returned on board the yacht from Norris Castle, the vessel immediately got under weigh, and went to the eastward round St. Helens, and to the back of the island. She was accompanied by the Cyclops, Prometheus, Lightning, and other steamers, and by Commodore the Earl of Yarborough, and a numerous fleet of yachts. The royal yacht went at a quarter speed, to enable the sailing vessels to keep up with her, which, however, they could not do; and when off St. Helens they fired a royal salute, and the Victoria and Albert proceeded towards Ventnor, the royal yacht squadron following in the rear. After having visited Ventnor, Shanklin Chine, Blackgang Chine, Freshwater, and other places at the back of the Isle of Wight, her Majesty proceeded to the westward along the coast, and about six in the evening, the yacht anchored in Portland Roads, about 3 miles from Weymouth. The mayor and corporation of that town went off in a boat to receive her Majesty's commands, and to know if it was her pleasure to land. The hopes which had been entertained that the Queen and Prince would go on shore were disappointed, for the intelligence brought by the mayor was, that her Majesty did not intend to land. At six o'clock on Wednesday morning, the yacht and the other steamers got under weigh, and proceeded down the Channel. It was a beautifully fine morning, and notwithstanding the early hour at which the Queen proceeded on her course, numbers of boats had put off from the shore, filled with persons hoping to obtain a glimpse of her Majesty and Prince Albert as they took their departure. About five o'clock in the evening, a signal announcing her Majesty's approach was made from the breakwater at Plymouth, and shortly afterwards, the Caledonia flag-ship anchored in the Sound, and the several men-of-war in the harbour, including the Inconstant, Formidable, and a Neapolitan frigate, fired a Royal salute. The yards were then manned, and the ships decorated with flags of all descriptions. The Royal yacht entered at the eastern channel, and rapidly passed through the Sound to Barnpool, where she was moored. Royal salutes were fired from the men-of-war, the Citadel, Mount Wise, and Mount-Edgcombe, as her Majesty approached. The numerous workmen of the breakwater were drawn up at the eastern end, and cheered as her Majesty passed that great national undertaking. A landing-place had been constructed at Mount-Edge-

cumbe in anticipation of her Majesty's landing there, and another was erected under the Hoe, under the directions of the Town-Council, in the event of the Queen's landing at Plymouth. Shortly after the arrival of the Royal yacht, the other steamers and vessels in attendance and three of the Lords of the Admiralty also arrived. The day was throughout exceedingly fine, and there was scarcely a breath of wind blowing when her Majesty reached the port. On Thursday morning her Majesty landed at Mount Edgecumbe, and walked through its beautiful grounds, while Prince Albert visited the Dockyard, attended by the Lords of the Admiralty. The Prince returned to the yacht about 12. It was expected that her Majesty would then visit the Caledonia, and hold a levée in the course of the afternoon, and after going over the dockyard with the Prince, make a tour through the three towns of Plymouth, Devonport, and Stonehouse. Her Majesty is not expected to arrive at the Château d'Eu, on her promised visit to the King of the French, before Sunday morning.

Brighton.—On Tuesday morning as early as 10 o'clock, a great number of persons assembled at the northern entrance of the Palace-grounds, and for several hours awaited with patience the arrival of the Prince of Wales and the Princesses. Shortly after three o'clock, a salute from the battery announced the approach of the Royal visitors, and a carriage and four, containing the Prince and Princesses, and the Dowager Lady Lyttelton, entered the Palace-grounds, amidst the cheers of the assembled multitude. The Grenadier Guards were drawn up and saluted the Royal visitors, who arrived without any escort. They were followed immediately by two other carriages, containing the Marquess of Ormonde, Lord Hardwicke, and other members of the Royal household.

Bristol.—On Sunday morning the extensive Logwood Mills of Messrs. Lediard and Mortimer, at Chewton Keynsham, about six miles from this city, were destroyed by fire. As the mills are situated at a short distance from the Avon, a plentiful supply of water was obtained, and the engines were enabled to play, after their arrival, without interruption; but they were only enabled to prevent the fire from reaching the house connected with the establishment. The mills were completely destroyed.

Carmarthen.—The proceedings of Rebecca and her daughters assumed last week a more daring character than usual. On Tuesday they proceeded, in three bodies, to Gellywernen, near Llanon, the house of Mr. Edwards, agent to Mr. R. G. Thomas, the lay impropriator of the tithes of the parish. Mr. Edwards was ill in bed at the time, but the Rebeccaites fired into his windows, broke 52 panes of glass, and destroyed the extensive greenhouses and gardens adjoining. Miss Edwards appealed to their humanity, and told them that her father was exceedingly ill, and confined to his bed, but that they might see him on any future day. After letting off a few additional charges they left the house, but attacked and plundered the cottage of the gamekeeper in their retreat. On Thursday evening, information having been received by the magistrates that the Rebeccaites intended besetting Prendergast gate, a messenger was despatched to Narberth for a detachment of cavalry, and another to Pembroke for a company of marines, both of which arrived at Haverfordwest at eleven o'clock. The magistrates determined that the special constables should defend the gate, and in case of need the cavalry and marines should come to their assistance. Very soon after their arrival, Rebecca and her daughters, consisting of about two hundred horse and foot, made their appearance, when the special constables about 25 in number, assisted by several townsmen, attacked Rebecca, who was mounted upon a charger, and carried a double-barrelled percussion-gun, loaded with ball-cartridge, when in the scuffle one of the barrels went off and lodged the contents in the loins of the horse, and the constable succeeded in securing the gun. The second barrel was loaded with ball. Rebecca finding herself disarmed, galloped off, the horse, however, fell dead at the distance of a hundred yards. Unfortunately the rider escaped. In the meantime a fierce contest took place between the constables and the rioters, when two of the latter were captured. Their faces were blackened, and they were otherwise disguised. Finding themselves vigorously attacked by the constabulary, the rioters fled in all directions. On Friday the prisoners captured the previous night were brought before the magistrates. They were both farm-servants. Various witnesses were examined, and the prisoners were fully committed for trial. A large meeting of farmers and operatives was held on Friday on Mynydd-Selen to consider their grievances. From 3,000 to 4,000 persons were present. A petition to her Majesty was adopted, submitting the grievances of the turnpike-gates, the new Poor-law, the tithe-commutation, the increased amount of county-rates, the magisterial costs and fines, &c., and praying her Majesty "to dissolve the present and to convoke a new Parliament, with directions to consider the various grievances of the country, and to ameliorate the same; and also to devise measures to restore the commercial prosperity of the country generally, whereby the demand may be commensurate to the supply—a course which would conduce to the prosperity of the whole country, and the petitioners amongst the number."

Carlisle.—The colliery proprietors of West Cumberland, understanding that a general strike had been agreed upon by their workmen, to take place on the 1st October, last week held a meeting, and came to the resolution not to admit any one into their pits until he had renounced the union. This brought on the strike at once, and at present the pits in the whole district are standing still. Meetings are held daily in different places, and several vessels in the ports along the coast are waiting for coals, but at present there is no prospect of a reconciliation.

Chatham.—On Tuesday afternoon a fine display of siege operations took place at Chatham, under the direction of Lieut.-Col. Sir F. Smith, Commandant of the Engineer department. They included the various manoeuvres incidental to the siege and capture of a fortress, the blowing up of bridges, &c., concluding with a general assault, which carried the enemy's position by storm. A large number of persons assembled to witness them.

Derby.—A singular case has occupied the attention of the magistrates this week, a youth named Growcock, the son of a confectioner at Leicester, who lately removed to Nottingham, having surrendered himself to the police as a murderer. It appears that he had endeavoured to decoy a young child into a cave for the purpose of destroying it, but was interrupted by the father of the child, when he made off, and went to Beeston. He there met with another child, whom he induced to accompany him to Derby, and attempted to murder her on the way. The youth stated that he had an irresistible desire to commit murder, and it is supposed that he is insane.

Farington.—A meeting of farmers and others connected with agriculture took place at Farington last week, for the purpose of considering the propriety of adopting measures for the suppression of the practice of smoking by their labourers on their farms. It was represented to the meeting that a short time ago a hay-rick, at Lodge Farm, in this parish, was entirely consumed, owing to the negligence of a man who was employed to hoe turnips having laid himself down under the hay-rick to take his dinner, and afterwards smoked a pipe of tobacco; several hours after he had returned to his work it was discovered that the tobacco, which was not extinguished in the pipe, had set fire to the man's coat, which communicated it to the rick, and thus the rick was destroyed. Resolutions for the suppression of smoking on the premises were then put, and carried unanimously.

Gravesend.—On Tuesday morning, the vicinity of the seat of Earl Darnley, at Cobham Park, near this town, was thrown into a most painful state of excitement, by the perpetration of an act of parricide, the victim having perished by the hand of his son. The body was found in the park about 30 yards from the road, covered with blood. At first it was surmised that it was a case of suicide; but on attentively examining the corpse, and that part of Cobham-park where it lay, circumstances presented themselves which clearly proved that the unfortunate man had been murdered. There were several severe gashes in the throat, and a large knife 8 inches long covered with blood, was found lying on the grass, between 12 and 14 yards from the corpse. The body was removed to the inn at Cobham, where it was identified as that of Mr. J. Dodd, who had taken tea with his son at the house on the previous evening, and after hiring two beds for the night had gone out for a walk, but had not returned. An inquest was held, and the jury returned a verdict of "Wilful Murder against some person unknown." It has since been ascertained beyond a doubt that the murderer of the unfortunate gentleman was no other than his third son, Richard Dodd, 24 years of age, and that he committed the act whilst labouring under the aberration of intellect. He was an artist, and has gained several prizes at the Royal Academy. A year or two ago he accompanied Sir Thomas Phillips, the late Mayor of Newport, on a tour through Italy, Switzerland, Germany, &c., for the purpose of improving himself in his art. Owing to his arduous studies and exposure to the sun, his brain became affected to such an extent as to produce insanity. He returned to England three months since, and he was visited by several physicians, and only as late as Saturday Dr. Sutherland was called in and recommended the strictest caution in watching his movements, as he did not consider him to be safe at large. A change of scene being considered necessary, Mr. Dodd took his son into Kent, and reached the Ship Tavern at Cobham, on Monday evening. There they had tea, and Mr. Dodd requested that beds should be provided for them both. The son was noticed to behave in a very sullen manner, and took a pint of porter in preference to tea, and at about half-past nine o'clock they left the house, as they stated, for a walk. No intelligence has yet been received as to the flight of the son. The police have scoured the country round for miles, but not the slightest trace of him could be discovered. It is generally supposed that he has destroyed himself.

Leicester.—A young man named James Garner, the son of a small farmer residing at Rearsley, was found murdered last week on the farm of Mr. Messenger, of Gaddesby Lodge, whose service he had entered about 17 weeks previously. It appears that deceased had excited the jealousy of his master, by the partiality shown to him by the housekeeper, and that Messenger had often threatened to "do for him." The young man had been missing for some days, when some Irishmen agreed to reap a field of wheat about 500 yards from the residence of Messenger, and the latter went to show them, but as soon as he got to the corner of the field he turned round by the hedge and went away. The Irishmen then went amongst the wheat, and had not proceeded far before they discovered a human body with the head separated from it, and in a state of decomposition. On the left side was an axe, the handle of which was about two feet and a half long. The body was identified, and the axe was proved to belong to a man in Messenger's employ. At the coroner's inquest the jury returned a verdict of Wilful Murder against some person or persons unknown, but Messenger was immediately apprehended on a magistrate's warrant, and conveyed to Leicester, on the charge of murder.

Marlborough.—The school for the sons of clergymen and others, recently established at this place, was opened on Friday last. The Bishop of Salisbury officiated,

assisted by the Marquess of Aylesbury, the Mayor and Corporation of Marlborough, and a large number of the local clergy and gentry.

Oxford.—The Poor-law Commissioners have sent down their rules for the governance of the Oxford union workhouse, and announced their intention of sending an assistant-commissioner to see them carried out. The board of guardians (who are elected under a local act), have appointed a committee to consider the same, and have expressed their intention of opposing the commissioners by every method in their power.

Stafford.—The execution of Charles Higginson, who has been lying under sentence of death in the county prison, for the murder of his child by burying him alive, took place on Saturday last. He had been, for several days after his condemnation, in a very hardened and incorrigible state of mind; but the chaplain succeeded at length in making some impression upon him. He acknowledged the justice of his sentence, and was sensible of his condition.

Railways.—The traffic for the week has been as follows:—London and Birmingham, 18,648 $\frac{1}{2}$; Northern and Eastern, 1,696 $\frac{1}{2}$; Great Western, 15,992 $\frac{1}{2}$; South Western, 7,920 $\frac{1}{2}$; North Midland, 4,738 $\frac{1}{2}$; Grand Junction, 9,101 $\frac{1}{2}$; Midland Counties, 2,868 $\frac{1}{2}$; Manchester and Leeds, 5,209 $\frac{1}{2}$; York and North Midland, 1,794 $\frac{1}{2}$; Birmingham and Gloucester, 2,050 $\frac{1}{2}$; Birmingham and Derby, 1,368 $\frac{1}{2}$; Great North of England, 1,510 $\frac{1}{2}$; Hull and Selby, 1,151 $\frac{1}{2}$; Liverpool and Manchester, 5,136 $\frac{1}{2}$; Sheffield and Manchester, 528 $\frac{1}{2}$; Eastern Counties, 2,907 $\frac{1}{2}$; London and Brighton, 5,044 $\frac{1}{2}$; Croydon, 447 $\frac{1}{2}$; Blackwall, 1,276 $\frac{1}{2}$; Greenwich, 757 $\frac{1}{2}$.—At the meeting of the Eastern Counties Company last week, a dividend of 5s. per share on the new shares, and a dividend of 4s. per share on the old shares, deducting 1s. per share from the latter in respect of the 2l. per share uncalled, was declared payable, less the income-tax; and the report presented by the directors on the occasion made it appear that the traffic on the line is steadily increasing. The cost of the line throughout is stated to be 2,800,000 $\frac{1}{2}$, and between that date and the 16th August, there has been an additional expenditure of 30,970 $\frac{1}{2}$ 13s. 8d., but against these amounts, 48,833 $\frac{1}{2}$ was received from sales of surplus property. The traffic had much increased since the entire opening of the line, and when the extensions of the line to Harwich, and eastward into Suffolk and Norfolk, are made, a threefold increase was anticipated. Upon the traffic account it was stated that after reserving 1,003 $\frac{1}{2}$ for the depreciation of stock, there remained a balance of net profit amounting to 22,998 $\frac{1}{2}$, out of which the directors made the above dividend, leaving the sum of 881 $\frac{1}{2}$ to be carried to the next account. The application for the branch line, from Stratford to the Thames, was to be renewed in the next session; and the directors sought to be empowered to lease any extension lines at rentals that would pay a moderate interest. The gross receipts for the half-year were 43,182 $\frac{1}{2}$. A long discussion ensued in respect to the litigation with Lord Petre, and the necessity of coming to an arrangement so as to avoid expense, when it was stated that Lord Petre had assented to a station within a quarter of a mile of his residence, but had now objected to one within one mile of it.—The Committee of Investigation, appointed by the Greenwich Company to consider the long-disputed toll question, recommended at the adjourned meeting last week, that the proprietors should adopt a proportionate mileage toll, instead of the now existing toll of 4 $\frac{1}{2}$ d.; but that, should it fall short of 11,500 $\frac{1}{2}$ per annum, the other Companies should make up the deficiency to the Greenwich proprietors. A desultory discussion of nearly four hours' duration ensued upon this proposition. Resolutions and counter resolutions were proposed and withdrawn, till at length the recommendation of the committee was carried in a modified form, the amount of the mileage toll being fixed at 13,500 $\frac{1}{2}$ instead of 11,500 $\frac{1}{2}$. A resolution was then passed, authorizing the committee to offer to the Croydon, Brighton, and Dover Companies, jointly, the sale of that portion of the Greenwich Railway used by them, for the sum of 240,000 $\frac{1}{2}$, or a lease to them of the same at a permanent net rental of 12,500 $\frac{1}{2}$. The committee on Thursday reported to another adjourned meeting that the other Companies had declined this offer, unless the Greenwich Company would give up a certain portion of their land; this condition was at once rejected, and the committee resigned. The old tollage of 4 $\frac{1}{2}$ d. per passenger will therefore continue until the other Companies shall engage to bring, at moderate fares, passengers to London-bridge, when the directors of the Greenwich Company will be prepared to modify the toll, particularly for third-class passengers, and for short distances.—At the Bristol and Exeter and Bristol and Gloucester meetings, the extension of railway communication with Devon and Cornwall was discussed, and so well is the project supported by these companies and the Great Western, that there is apparently every probability of the work being forthwith commenced. The understanding is, so far as present arrangements are concluded, that the Bristol and Exeter Company shall subscribe 200,000 $\frac{1}{2}$, the Great Western Company 150,000 $\frac{1}{2}$, and the Bristol and Gloucester Company 50,000 $\frac{1}{2}$. The dividend declared at the Bristol and Exeter meeting was at the rate of 1 $\frac{1}{2}$ 8s. per share, free of income-tax, payable on the 30th of October. The balance of receipts and expenditure up to the 30th June was 360,004 $\frac{1}{2}$ 6s. 2d.—The report of the Birmingham and Gloucester Company for the last half-year shows that the receipts have been 42,618 $\frac{1}{2}$ 17s. 6d., and the expenditure 25,935 $\frac{1}{2}$ 11s., the difference between which sums, deducting 12,417 $\frac{1}{2}$ 8s. 11d., paid for interest, &c., left a divisible balance of about 5,500 $\frac{1}{2}$, sufficient to declare a dividend of 12s. per share, deducting income-tax. The traffic

both of passengers and goods has slightly increased. After considerable discussion with reference to negotiations with neighbouring lines, upon which a quantity of correspondence was read, a resolution was passed empowering the directors to raise the sum of 41,000*l.*, and three new directors, some of whom had taken a leading part on the recent committee of inquiry, were elected to fill vacancies.—The Pontop and South Shields Company declare a dividend of 30*s.* per share, or at the rate of 5 per cent. on their paid-up capital. The total receipts for the half-year were 33,264*l.* 3*s.* 4*d.*, while the expenditure was 23,047*l.* 13*s.* 4*d.*, leaving a net balance of 10,216*l.* 10*s.* The traffic accounts show a considerable decline in the quantity of coal shipped for foreign destination, owing to the high duty on the export, but a proportionate increase in the delivery for home consumption made up for the deficiency. The Newcastle and Darlington Junction is announced to be steadily progressing to a completion; and the debt of the late Stanhope and Tyne Company has been reduced to 79,700*l.*—The Edinburgh and Glasgow Railway meeting was occupied, in a great measure, with the discussion of the question of Sunday travelling, but Sir A. Agnew was defeated by an enormous majority. The dividend declared was at the rate of 1*l.* 2*s.* 6*d.* per share on the original shares, and 3*s.* 11*d.* per share on the new shares. Of the divisible fund of 25,474*l.* 19*s.* 5*d.*, from which this amount will be paid, there will remain 1,699*l.* 19*s.* 5*d.* to be carried to the reserve fund, now amounting to 7,699*l.* 19*s.* 5*d.* Resolutions were passed to enable the directors to extend the line to North-bridge, Edinburgh, and to take powers to raise an additional sum of 150,000*l.*—In consequence of the facilities afforded by the London and Dover Railway to Folkestone, in three hours from London-bridge, and by the steamers twice a day to Boulogne, in three hours from Folkestone, and *vice versa*, the directors of the Paris diligences are having new light coaches constructed that will run from Paris to Boulogne in 16 hours, instead of 22, as heretofore; so that the whole distance will be performed within 22 hours from Paris to London, which will be nearly as rapid as the Post-office *estafette*.—At the meeting of the South Western Company on Wednesday, the report of the revenue accounts showed a gross increase of 1,893*l.* 2*s.* 11*d.* The branches of expenditure under the directors' control had been considerably reduced; but the increase of parochial rates, and the maintenance of the Gosport line, in a great measure counteracted the beneficial influence of this saving. The directors were, however, enabled to recommend a dividend of 30*s.*, subject to the income-tax. This would require 68,812*l.* 3*s.* 10*d.*, leaving 573*l.* 18*s.* 1*d.* as a balance in hand. The report stated that the docks at Southampton were now open; that Government contemplated removing the mail-packets from Falmouth to the former port; and that the council of the Royal Agricultural Society had selected it as their place of meeting in July next. The report concluded by stating that a new pier had been constructed on the Gosport side of Portsmouth harbour, at which passengers may land and embark at all periods of the tide. The report having been unanimously adopted, the chairman addressed the meeting in a speech of some length, incidentally alluding to the patronage which had recently been bestowed upon the railway by her Majesty, Prince Albert, and the Duke of Wellington, who had expressed their satisfaction at the company's mode of conveyance. A discussion ensued with reference to the establishment of a more efficient system of steam communication in connexion with the railway between Southampton, Havre, and the Channel Islands, and a resolution was passed recommending that application be made to the proprietors for subscriptions in promotion of the measure.—By a Parliamentary return just issued some information is afforded respecting the number of railway bills brought into the House of Commons, with the number of acts which have been passed since the close of the year 1839:—In 1840, the number of bills was 27; in 1841, 24; in 1842, 23; in 1843, 31; total, 105. It appears from the return, that of the bills introduced in 1840, 23 became acts of Parliament; in 1841, 19; in 1842, 21; and in the present sessions, 25. The return further shows that the number of plans deposited for the three last sessions of Parliament at the Private Bill office was 62.

IRELAND.

Dublin.—Lieut.-Gen. Sir E. Blakeney has been sworn in one of the Lords Justices. The Lord Lieutenant sailed for England on Saturday. The Lords Commissioners of the Great Seal have superseded Mr. C. Lynch, of Cong, Galway, and Mr. P. Lynch, of Mayo, for having attended a Repeal meeting at Cong-bridge; and Mr. W. Lalor of Queen's county, for having attended a Repeal meeting at Maryborough.—Twenty-nine of the Irish liberal members of Parliament have published an address to the people of Great Britain on the grievances of Ireland. They state that they have in vain appealed to the Legislature for address, and they accordingly appeal to the higher tribunal of public opinion. They demand the recognition of perfect equality in regard to ecclesiastical and educational arrangements, between the several religious communities into which the population of Ireland is divided; a more ample representation in the Legislature; franchises adequate to give full expression to public opinion; the assimilation of municipal rights in both kingdoms; that Ireland shall participate more largely in the benefits of the public expenditure; that the profession of the Roman Catholic Faith shall no longer be made a ground of virtual, as it has ceased to be one of legal, exclusion from official station; that in the general administration of the affairs of the empire, Irishmen shall be called to take part, in a proportion commensurate with the extent to which Ireland contributes to its greatness;

that the management of local affairs shall be confided as much as possible to those who are identified and acquainted with the interests of the country; and that the principle of self-government, subject to popular control, shall be applied, wherever practicable, in the organization of local institutions. "Should this remonstrance be successful," they say, "we cannot, indeed, promise the restoration of those feelings of attachment which a few years since had begun to expel from the national breast sentiments engendered by centuries of oppression. We can only express our conviction that those who confide in the influence of justice will not have misplaced their trust. It may still be in the power of a government which shall merit the confidence of the Irish people to win back their forfeited affections; but we warn you that every day's delay increases the difficulty of the task, and gives additional strength to those who maintain that there is no hope of good government for Ireland except in the restoration of her national Parliament." The meeting of the Repeal Association took place on Monday. Mr. Steele said, that as it had been determined by a vote of this association to give an order to Mr. Hogan forthwith to execute a statue of O'Connell, "the only question that remained was whether the great father of his country should be represented presiding at Tara, or as he appeared at Mallow, when uttering a fiery defiance at Peel and Wellington in reply to their threat to attack the people of Ireland. The Irish people despised the threats of that puppy Peel, and that old Indian Seapoy—Wellington. Mr. Hogan preferred to execute the statue in the latter attitude, and therefore he would move that this association give its approval to the suggestion. On the base of the statue should be the memorable words uttered by the liberator on that occasion—'They may trample upon me, but it shall not be on my living body, but on my corpse.' " The motion, having been seconded by Mr. Scott, of Edinburgh, passed with acclamation. An allusion having been made to the Queen's speech, Mr. J. O'Connell said that they distinctly recognised the fact that the Queen was in a position of coercion—that the speech in question was her Ministers' and not her own. She was under the constitutional coercion of her ministry, supported by a majority of the present houses of Parliament, and was obliged to make that speech. It was worthy of remark, however, that Peel could not induce her to use any stronger phrase than the milk-and-water one of "deep concern." Mr. O'Connell then gave some further details of his plan for the restoration of the Irish Parliament, and concluded by moving that district repeal wardens should be appointed for the two first towns on his list which are to return members to the Irish Parliament, namely, Arklow and Ardee. This point being disposed of, he informed the meeting that he would postpone his speech in reply to the Queen to Tuesday. All he would say at present was, that the speech attributed to her Majesty was no more hers than it was his. The sentiments were those of her Ministers, and it was daring profligacy on their part to endeavour to make the Irish people believe that the Queen did not possess every claim to their love and affection. The rent for the week was 1,380*l.* 7*s.* 4*d.*—At the adjourned meeting on Tuesday Mr. O'Connell moved, that it be referred to the committee to prepare an address, directed to their fellow-subjects resident in every part of the universe obedient to the British throne, stating the grievances under which the people of Ireland are suffering. He then proceeded to the Queen's speech. He said they might throw Queen's speeches in his teeth—they might taunt him from high places—but they never could drive him from the position he had taken—that of restoring his country to the rank of a nation. He had another bill of indictment against the British Government—the declaration of the Irish members, 30 of whom, and more than two-thirds of them not Repealers, had signed that document—they were the grand jury that found the bill of indictment against the British Government. There was not, he said, a single honest man in Ireland who would not find a verdict of Guilty against the British Government on this indictment. Looking to the enormous grievances described in that declaration, which he had himself a thousand times exhibited, he held it was a sacred duty to be discontented with British misrule, and he would continue discontented so long as his country suffered under such a weight of evil. These 30 Irish gentlemen had published this code of charges against the British Government, unequalled by anything the Christian Greeks could have brought against the Grand Seigneur. At the commencement of the late session of Parliament this was the condition of Ireland. What had been done during that session? Nothing—no, worse than nothing; for all the existing evils had been aggravated. The grievances of the Poor-law had been rendered more intolerable, and they gave Ireland an Arms Bill. But that was not enough, Ministers should close the session with a speech insulting to Ireland. He agreed with the *Morning Chronicle* that the speech was a compound of impudence and stupidity; but, mark, he was not speaking of the Queen. Kings, indeed, condescended to scold him, and Queens also would say something harsh concerning him. Of William the Fourth's speech he had said at once that it was base, brutal, and bloody; of the present he said that it was insolence and stupidity combined. The Tories hold her Majesty in chains. They have the Parliament at their back, and she cannot escape from them. But, oh! he wished she had spoken that speech by commission, and that she had not delivered it in person. He regretted that they made her do this thing herself. This is their worst crime. He entertained for her Majesty a sort of parental feeling. She had the hearts of the Irish people at her command. They would have died for her. Was it not treasonable in

her Ministers to deprive her of such sympathy?—to take that grace from her which is the very surest prop of the throne? But was there anything in this to retard them in their career? No; but something to stimulate them. As to the Tories, he would not think the Queen's life safe in their hands but for her children. They were a security to them against the worst evil that could happen. He next went through the several clauses in her Majesty's speech *seriatim*, and commented at great length and with much vivacity on each. He declared his conviction that if the union were not repealed in his lifetime, the result would be a sanguinary struggle and a perpetual separation. While he lived, he would keep away the danger of despair—he would endeavour to protect the connection, by placing it upon the only just footing on which it could exist. Ministers boasted of not having sought for coercive measures, whereas they had not even tried the ordinary law, because there was no crime to prosecute. Mr. O'Connell concluded a speech of more than two hours' duration by moving that it be referred to the committee to prepare an address to be placed before her Majesty and all her subjects, setting forth the grievances under which Ireland laboured. The motion passed unanimously.

Cork.—The meeting of the British Association terminated on Saturday, when grants of money to the amount of 1,887*l.* were awarded for different scientific purposes.—The Mayor of Cork presided at a meeting on Wednesday, when a committee was appointed, who nominated Prof. M'Neill to prepare the necessary plans and report the best line of railway from the terminus of Cashel to Cork, so as to form a general line of communication from that city to Dublin; and he is required to express his opinion in his report on the application of the atmospheric principle, as well as the locomotive power.

Mayo.—The address to her Majesty from the high sheriff, grand jurors, magistrates, &c., of this county, condemning the Repeal agitation, has been forwarded for presentation. It has been signed by sixty of the gentlemen who form the grand panel of the county, by seventy-nine magistrates, twenty of them being deputy lieutenants, and by twenty of the last grand jury. But four or five of those to whom circulars were sent refused to add their names to the address.

Birr.—Since the late murder of Adjutant Mackay, and the finding of the jury, Major-Gen. Sir Guy Campbell has been here on an official visit. He made a minute and searching inquiry into the state of the corps, its interior economy, its management in the field, and every other circumstance that could in any way throw light on the cause of the recent complaints. He has expressed himself most favourably; states that in his opinion the regiment is in the highest state of discipline, and not overdrilled by the Colonel.

SCOTLAND.

Edinburgh.—The local papers state that the labours of the committee appointed by the public meeting of the inhabitants of Edinburgh, to manage and apply the funds for the relief of the unemployed tradesmen and labourers, have been brought to a close. The last works undertaken by the committee were the walks formed through the Links, which are considered of the most essential service to the inhabitants of Edinburgh; and taken in connection with the Meadow-walks, the public now enjoy a promenade not surpassed by any city in the kingdom. Prince Albert, during the visit of the Court to Scotland last year, having expressed a desire to try the experiment of rearing the Black Cock in the southern parts of the kingdom, several cocks and hens were sent to Windsor last week, as a present to the Prince from the Duke of Hamilton. These birds, which were caught alive with great difficulty, were secured on the estate of the Duke in the Isle of Arran, where they are bred in the highest state of perfection, and are prized for their extraordinary size, many of them weighing from 12 to 14 lbs.

Aberdeen.—The Bishop of Aberdeen, Dr. Skinner, has published a pastoral letter, announcing that the Rev. Sir William Dunbar, Bart., late minister of St. Paul's Chapel in that town, has renounced his canonical obedience, and withdrawn himself from the jurisdiction of the Scottish Episcopal Church, contrary to his ordination vows. The Bishop, therefore, acting under the provisions of Canon XLI., declares that the said Sir W. Dunbar has ceased to be a Presbyter of the Church, and that all his ministerial acts are without authority; and solemnly warns all faithful people to avoid all communion with the said Sir William Dunbar in prayers and sacraments, or in any way giving countenance to him in his present course.

Dalmarnock.—The Glasgow papers state that George Wilson, the steeple-climber, who had acquired some celebrity by his repairs of Carrickfergus steeple in Ireland, and of several tall chimneys in the manufacturing towns, met his death on Thursday week, in the inside of a pipe at the Springfield dye-works, Dalmarnock. The pipe, it appears, which is 18 inches in diameter, had been recently laid down between the works and the river, but previous to bringing it into use, it was necessary to clear it of the mud and rubbish which had gathered within it. Wilson applied to clean it, but his offer was declined, because he was much intoxicated at the time. The unfortunate man, however, entered the pipe when those in charge were temporarily away from its mouth, and for the course of an hour and a half he was heard shouting for help. Every effort was made to get him out, but life was extinct before he could be extricated. He used to make his ascents on chimneys and steeples without scaffolding, by merely fixing amongst the bricks little sharp pieces of wood for the hands and feet, and thus he made a pathway to the summit by which a cat would scarcely venture to ascend.

Inverness.—The number of strangers at present in the Highlands is greater than has been witnessed for many years. Steam-boats, coaches, carriages, and inns are crowded, and every scene and object of interest is daily visited by large parties. Prince Alexander of the Netherlands, the Dukes of Marlborough and Leeds, and numerous visitors, have arrived for the sporting season. The reports from the Moors show that the grouse are plentiful though not equal to last season for numbers or quality. Mr. A. Campbell, M.P., of Monzie, bagged to his own gun on the 12th, 1843, brace of full-grown grouse, 6 mountain hares, and 5 snipes.

THEATRICALS.

HAYMARKET.—At this theatre last week Mr. Planché presented the public with a picturesque and agreeable little piece under the title of *Who's your Friend; or, the Queensberry Fête*. The period is fixed in the year 1728, and the scene of the first act is in the grounds of the Duchess of Queensberry, where a *fête champêtre* is held under the patronage of royalty. Throughout the piece, royalty, nobility, and gentry agree for once to throw off their fine titles and court dresses, and play the parts of shepherds and shepherdesses, millers and milkmaids, under the assumed names of Chloe, Daphnis, Amaryllis, Lubin, &c. The shepherds and shepherdesses, however, do not affect to live in the golden age of the poets, but in the region of Dresden china, recorded to us by the chimney-pieces of our grandmothers, when every shepherd wore his hair nicely frizzed and powdered, played on a gold flute, and wore a waistcoat spotted with gold flowers, while every shepherdess had a hat with a gilt edge, and fondled a lamb with gilt feet. The main feature of the plot is the appearance of a real countryman among this artificial creation, in one *Giles Fairland* (Mr. C. Mathews) who comes raw from Somersetshire in search of some lady to whom he has an introduction, with a view to his obtaining a situation. The opportunity for playing off a practical joke upon his fellow masqueraders is too good to be neglected by a lively baronet who personates a miller; and he at once determines upon introducing *Giles* to the festivities, representing him to be a Russian Baron, with an unpronounceable name, who has created an immense sensation in Paris. The only instructions he gives to *Giles* are to dance and make free with every body, and if any lady should call him "Baron," to kiss her. These instructions he obeys with an alacrity truly astonishing to the weak nerves of the polite assembly. He kisses the Countess, he kisses Lady Bab Blazon (Mrs. Glover), he kisses the Duchess of Queensberry herself; in fact, he kisses all the ladies, young and old, running after them like a wild colt, and knocking down anything in the shape of a man who dares to interpose. But *Giles's* path is not smooth to the end. The Queen is indignant, and constables pursue the delinquent, who is ignorant of the crimes he has been committing, and imagines he has only been carrying on rural jocosities, while he has been embracing Countesses, and pushing Viscounts into the water. The Countess of Rosendale (Madame Vestris) stands his friend, partly because he has saved her dog from drowning in a pond, and partly because, hearing his real name by chance, she finds that he is her foster-brother. She therefore conceals him for a while in a summer-house, where he puts on a court dress (not the pastoral dress) belonging to a Viscount shepherd, and then escapes from the place with the Countess. Of course, there is a good deal of jealousy on the part of *Sir Felix*, the recognised suitor of the Countess, and loud complaints from the Viscount at the loss of his velvet suit, which occasion some amusing scenes, in the course of which the latter are ingeniously returned, and the former appeased; and then all ends merrily as a marriage bell. The part of *Giles* was excellently sustained by Mr. C. Mathews. He gave the country dialect with great effect, and by his heartiness and bluntness really made a "character." The piece was most warmly received, and was announced for repetition every evening by Mr. Mathews, amid loud applause. The two scenes in which the action takes place are remarkable specimens of good taste, fully reviving the best days of the Olympic.

Miscellaneous.

Contagion of Plague.—Letters from Cairo, of the 28th June, state that some very important results have been obtained by the Commissioners who have been sent by the Russian Government to Egypt, in order to make experiments as to the contagion of plague, and the means of arresting the propagation of the virus. One satisfactory conclusion has been already come to, and if nothing more be done, that conclusion must lead to the early modification and final overthrow of the whole quarantine system as at present constituted; for the Commission have come to the unanimous opinion that articles of any sort, after having been subjected to a temperature of from 50 deg. to 60 deg. of Reaumur, cannot communicate the plague. The Commissioners collected a large quantity of garments, of sundry tissues, and of susceptible raw materials, which were thoroughly impregnated with the supposed virus of the plague. These were placed in a chamber heated by a stove to the temperature of from 50 deg. to 60 deg. (Reaumur), some portions loose, some portions tied lightly, others closely pressed together, and others in cases hermetically closed. They were subjected to the action of the heat for forty-eight hours. Sixty-six persons, of all ages and temperaments, including Turks, Egyptians, Syrians, and Negroes, were clad in the garments and put into the closest contact with the articles which had been thus treated. The Board of Health, and the various medical authorities at Cairo, were called in to exercise the necessary control and surveillance over these

very important experiments. The result has been, that not one single person of the sixty-six has been attacked by plague, or his health affected in the slightest degree by the experiments to which he has been subjected. The Commissioners state that the quality of the materials has not been in any way deteriorated by the action of the heat; that the colours of the various manufactured articles have not been dimmed or changed; that the experiments have been attended with scarcely any cost; and that securities may thus be obtained against the communication of plague at an exceedingly small expense.

A Monster Bell.—A few days since an immense bell, the largest ever cast in England, weighing no less than 7 tons 11 cwt. 2 qrs. and 12 lbs., was shipped on board the *Lady Seaton*, lying in the London Dock. This bell, which is intended for the new Catholic cathedral at Montreal, was cast at the foundry of Messrs. Mears and Sons, Whitechapel, and has attracted the attention of a great number of persons. Some idea may be formed of its immense size, from the fact that it required 10 tons of fused metal to form the cast, and the casting itself weighs upwards of 7 tons and a half, that its diameter at the edge is 7 feet three inches, that its clapper weighs upwards of 3 cwt.; the wood work, which is composed of old English oak, one ton; the iron work more than half a ton, and that the bell itself is heavier than the Great Tom of Lincoln by 32 cwt. The bell, it is stated, has been paid for from a fund subscribed by the merchants, artificers, agriculturists, and inhabitants of Montreal, and has cost, with its wood-work, &c., upwards of 1200l.

Statistics of Paris.—The *Courrier Français* states that the number of indigent poor in Paris has varied considerably since the commencement of the present century. In 1804 it was 86,936; in 1805, 90,705; in 1807, 97,914; in 1808, 116,703; in 1809, 118,202; in 1810, 121,801; in 1811, 116,670; in 1812, 93,836; in 1813, 102,806; and at present the number receiving relief amounts to 62,539. The *National* observes, that it is not without interest to consider the sums expended within the last 24 years in the improvement and embellishment of Paris, which have rendered it one of the finest cities in the world. Expended on works relative to the distribution of water, aqueducts, reservoirs, fountains, 30,986,347f.; in flagging and paving, 17,644,061f.; in purchases for enlarging the public avenues, 39,047,708f.; the construction of commercial edifices as well as in objects of art and decoration, 62,984,919f.; in the purchase of ground necessary for those edifices, 17,802,729f.; total, 168,465,764f.

Human Infusoria.—At the last sitting of the Academy of Sciences, a very curious paper was read from M. Mandl, entitled, "Microscopic Investigations as to the Nature of the Tartar and mucus covering of the Tongue and Teeth." If we are to believe M. Mandl's microscope, the human mouth is a perfect cemetery, where millions of infusoria find their catacombs. *Lewenhoeuk* had already told us that the human mouth was peopled with infusory animals, and that the mucous secretions, on its surface served as their ocean; but it remained for M. Mandl to discover that the tartar which covers the teeth is formed of the mountains of the dead of these inhabitants of this ocean. M. Mandl knows not to what cause to attribute the origin of these microscopic animals, but he has ascertained, he says, that they are most numerous in persons who live on spare diet, and are instantly killed by ardent spirits.

Fossil Geology of London.—A few days ago as some workmen were digging a new sewer for the hotel erecting opposite Cadogan-pier, Chelsea, at about 18 feet from the surface, they discovered a great variety of fossil bones, forming the skeletons of various animals, some of which are of enormous magnitude, consisting of the mastodon, the elephant, the ox, the elk, the hyena, the wolf, &c., all of which are in good preservation. Many of the specimens have been selected, and are now in the possession of the Rev. Mr. Kingsley, rector of the parish.

The Comet.—The Canton papers of April 1st. state that the comet which caused so much sensation in Europe had been visible from Manilla and Singapore since the beginning of March, but during almost all that time the weather at Canton had been so unsettled, and the sky so continually overcast, that it was only seen there for the first time on the night of the 28th. The comet itself was barely visible to the naked eye, but its tail was of great extent, about 40 degrees, and quite straight. "At present," it adds, "it sets at about half-past ten in the south-west, and when first seen disappeared soon after nightfall; it is probable, therefore, that it will remain visible a long while. We believe this to be a comet hitherto unknown. As may be supposed, the Chinese are in great consternation about it, believing that it forebodes evil."

The Singing Mouse.—This heading, strange as it appears, is not a fiction, as the incredulous may ascertain to their complete satisfaction by a visit. We give the following account, furnished us by an intelligent correspondent:—I have much pleasure in endeavouring to give you some account of a musical phenomenon which I have just beheld and heard. I will do so in as lucid a manner as I am able. This wonder is in the shape of a "singing mouse!" Let it not raise the smile of incredulity, for sing it does in verity. The little creature is the common house-mouse, of the masculine gender. When I heard him he was in full song—having all the notes of a full-grown canary. The imitation in the *sostenuto* passages and cadences of that bird was perfect. I feel assured that no deception was practised, for by the aid of a powerful glass, which I purposely borrowed, I could observe the tremulousness of the throat; and I asked the proprietor to retire from the room for a moment, which he did, in order that I might convince myself that I was not being made the dupe of ventriloquism. I then placed my ear close to him, and the effect was still the same. No

human being could make his *piano* passages. One circumstance places this beyond doubt; for sometimes parties have to wait a considerable time before he will pipe. An instance of this kind happened recently at the Palace, where he was taken for the little Prince of Wales and the Princesses to hear him. But I was informed that he fully made up for this silence by afterwards singing more lustily than he ever did before. He requires to be attentively observed, and by so doing you catch his variety. When quite still his notes are surpassingly distinct, and have all that peculiarity of the notes of the canary when he is singing himself to sleep. When he was in motion I tried the effect of sound upon him, by vibrating a tuning-fork upon the table. This, although repeated several times, neither deterred him from singing nor in the slightest degree alarmed him. If I may hazard a conjecture, his pitch is more than an octave above that of the bird he imitates. It is very difficult to guess how this faculty got into him; for, supposing that he listened to the canary from his hiding place, the larynx is not formed for such a purpose. However, I must leave the matter to physiologists and modern Daines Barringtons, simply contenting myself with silent wonder, now and then exclaiming "prodigious!" Its history is somewhat interesting. The wife of the man to whom it belongs (they were poor people, but are now on the high road to competence) occupied the second flat of a mean house in Redcross-square, Cripplegate, and, "save the mark," at a tailor's. One night, not being able to sleep for what she conceived the gentle singing of her bird, she removed the cage; but the singing remained, and not coming from the quarter in which the poor innocent Dick was placed, it both puzzled her and excited her curiosity for the rest of the night. The noise was of a flitting kind, like *Hamlet's* ghost, sometimes here, sometimes there. She, however, felt convinced that it came from the wainscot, and she was right. A trap was set, and two nights afterwards the syren was caught, which is likely to prove a golden egg to this knight of the goose.—*Globe*.

Fossil Mammalia of England.—At the recent meeting of the British Association at Cork, Professor Owen read his report on the Fossil Mammalia of England. This was commenced at the request of the Association, and at Manchester he gave an account of those extinct quadrupeds the extremities of which were terminated by hoofs. He gave instances of the fossil remains of a species of monkey, a bat, several species of bears, hyena, badger, weasel, wolf, and a gigantic species of tiger now unknown, with a gigantic beaver three times the size of the present beavers of North America. He first described the fossil remains of the elephant. Many naturalists (and amongst others Cuvier), in endeavouring to prove that these mammalia were natives of the country in which they were found, were reminded of the elephants brought to Rome by Pyrrhus, yet, when they crossed the German Ocean, and found similar fossil remains in Britain, where there is no account of any being brought, with the exception of one by Julius Cæsar, they had ample grounds for supposing that they were formerly natives; and in support of this argument many of them were discovered in Ireland, where Cæsar never put his foot. The remains which had been found differed much from both the Asiatic and the African species, chiefly in the formation of the teeth. In the fossil ivory there were fissures, with a kind of enamel or cement, so that they always retained their character. In the African elephant this character in the formation of the teeth is in the form of a lozenge, but they are in parallel lines in the Asiatic elephant, where the teeth are much broader. The most common fossil teeth found have the ivory and enamel more like the Asiatic elephant than the African, but the streaks are much narrower in the former, and the teeth are much broader in their extent—distinctions which were first discovered by Cuvier in 1796. There were about 3,000 extinct species of mammalia discovered, not one of which could be mistaken for the African elephant, besides which some of the fossil elephants were coated with hair or wool, which had also been discovered in a mammoth found in Siberia. The bone of the fore-leg has in some instances been found 11 feet long, and the fossil remains have been dug up in all parts of England, upwards of 2,000 specimens having within the last 12 years been dredged up on the coast off Yarborough. He next alluded to two species of horse, one of which was about the size of the common mule, and might have belonged to a species of Zebra, and the other about 13 hands high. There was in this class the gigantic elk, commonly called the Irish elk, but that was an erroneous name, as it did not belong to the elk, but to the deer species. The horns were different from those of the elk, being broad at the base and narrow as they approach the top, the species approaching closer to the rein-deer than to any other. There was another species of deer which could not be distinguished from the red deer, but that it was much larger, and the remains of which were found in great abundance in Essex, Norfolk, and Suffolk, as was also a species of roebuck.

Law.

CENTRAL CRIMINAL COURT.—James Trenate, James Huggett, and William Jones, were indicted for a burglary with violence in the dwelling-house of Mr. Alphonso Mackintosh, landlord of the Old Red Lion public-house, Bridge-road, Lambeth, on the night of the 13th ult. The prisoners were detected in the act by a policeman, whom they attacked with great brutality, and cut across his eyes with a knife. Mr. Justice Williams having summed up, the Jury immediately returned a verdict of Guilty. The prisoners Trenate and Huggett were also charged with the capital offence of cutting and wounding the police constable, with intent to murder him. Mr. M. Chambers, who prosecuted on this indictment, said, that as the prisoners were already convicted of a capital offence, it would not be necessary to go into the evidence upon the second indictment. The prisoners were then called up for judgment, and Mr. Justice Williams said, that

THE HORTICULTURAL PART EDITED BY PROFESSOR LINDLEY.

PRICE 6d.

ARRIVAL OF DUTCH HYACINTHS AND OTHER BULBS.

LUCOMBE, PINCE, & Co. beg leave to inform the Public, that they have obtained the entire stock of the following very Splendid PELARGONIUMS, raised by CAPT. TUNNELL, R.N., which possess those qualities now indispensably requisite in a first-rate flower—good habit, round shape, and firm petal, and they feel convinced that such novelties cannot fail to please those who purchase them, and will greatly improve all select collections.

J. T. WILLMER AND SON, King's Road, Chelsea
by Appointment, Florists to Her Majesty, beg to inform
their Friends and the Public, that their stock of **CARNATIONS**
and **PICOTEES** are now ready for delivery, and which they offer
at the following low prices, viz. :—

25 Pairs of Carnations or Picotees, Fine Show Varieties	2
12 Pairs Do.	1
25 Pairs of Pinks	1

Aremittance or reference from unknown Correspondents required.

Leadenhall-street, London.
Lyne's White Perfection, Imogene, Enchantress, Superb, &
Sappho, cannot possibly be sent out this season.—Plymouth.

proved, and will give satisfaction to all who can afford it.
Exeter Nursery, Sept. 8, 1843.

SEEDLING VERBENAS.

S. GIRLING, of Danecroft Nursery, Stowmarket, begs to offer the under mentioned SEEDLINGS, as superior and distinct from any others in cultivation, and refers his Friends, and Purchasers generally, to the opinions given in the *Gardeners' Chronicle* of July 22, and following weeks; independent of which they have been seen by several extensive growers and first-rate judges, professional and amateur, who have ordered them liberally. They will be ready to send out on the 1st of October, and can be had on forwarding a Post-office order for the amount, by unknown correspondents, or some respectable reference.

AMETHYSTINA—A beautiful bright lavender; large pips; forming an immense truss of fragrant flowers. 5s.

BEAUTY—Fine lively cherry coloured pink; excellent shape and habit; immense bloomer: one of the most distinct and beautiful of all the Verbenas in cultivation. 5s.

BRIDESMAID—A beautiful pale blush, tinted with blue; very fine. 3s. 6d.

BOULE DE FEU—This is of the most dazzling scarlet, making all other scarlets appear as pink or pale crimson. 3s. 6d.

FORTUNE-TELLER—Blush pink; immense trusser, some of which measure 10 inches in circumference. 3s. 6d.

LONGFLORE—Violet purple; very large, and remarkable for the length of its tube: fine. 3s. 6d.

RENOUVEAU—rich maroon, fine shape, and very compact, extra fine. 3s. 6d.

MINSTREL BOY—lilac and white, with a bright pink Eye, a pleasing and good variety, 3s. 6d.

WHITE PERFECTION—a beautiful pure white, with bright blue centre, excellent shape, and habit fine, 3s. 6d.

N.B.—The above can be had separately, at the prices quoted, or the set of Nine for 25s. A double set for 45s.; or treble, for 3l., inclosed in tin-boxes, where a set are taken, and forwarded, post free, to any part of the kingdom.

S. G. also begs to state that he will have two fine distinct Seedling Fuchsias to send out early next spring, at which time Plants of all the leading kinds in cultivation can be had at moderate prices. To Dahlia Growers, S. G. takes this opportunity of saying, his extensive Collections are nearly in full bloom:—by rail communication from the Eastern Counties' Railway to Colchester, and thence by Criterion coach you reach Stowmarket the same evening, and the same coach leaves Stowmarket every morning (Sundays excepted), quarter before eight, and reaches London by one o'clock the same day; fare from London to Stowmarket, 10s.

SPLENDID SEEDLING PELARGONIUMS, AT GREATLY REDUCED PRICES.

LUCOMBE, PINCE, and Co., beg leave to inform the Public that they have obtained the entire stock of those distinct and beautiful SEEDLING PELARGONIUMS raised by Mr. E. BECK, of Isleworth, and exhibited by him with such very great success at the Chiswick and Regent's Park Exhibitions. They gained the Gold Banksian Medal (the highest prize awarded to Pelargoniums) twice this summer at Chiswick, and the highest prize at the Royal Botanic Society of London, in June last. Several of them have also gained Silver Medals, Certificates, and other prizes, as Seedlings. The facts will convince the public that a more distinguished lot of Flowers has never before been offered for sale; and L. P. & Co. hope that their having determined upon letting them out at prices reduced greatly below those which Seedling Pelargoniums, of the highest character, have hitherto been let out at, will insure for them an extensive sale. Strong, healthy plants will be ready for delivery on the 20th October next, at the following prices, viz.:

	s. d.		s. d.
*Leonora Beck's	21 0	*Martha Beck's	10 6
British Queen do.	21 0	*Lucy do.	10 6
*Susanna do.	21 0	*Geraldine do.	7 6
*Meteor do.	21 0	*Evening Star do.	7 6
*Cleopatra do.	21 0	*Black Prince do.	7 6
*Admiral do.	10 6	Bride do.	5 0
Stella do.	10 6	The Purple do.	5 0

The whole Collection of 14 distinct sorts, package included, for 8l. Those marked thus * all gained prizes at the London Horticultural Society and the Royal Botanic Society of London.

Exeter Nursery, Sept. 8, 1843.

DUTCH FLOWER ROOTS.—**P. E. ERHARD**, of the Firm of J. D. ZOCHER and VOORHELM SCHNEEVOOGT, of Haarlem, begs most respectfully to return his thanks to the Florists and Amateurs who were kind enough to favour him with the orders last year. He also informs them, and the public generally, that he has just received a very extensive collection of all kinds of Dutch Bulbous roots, of the best quality, and at the most reasonable prices. He trusts from the superior quality of the Bulbs, and by prompt attention to any order which may be confided to him, to deserve the support and recommendation of the discerning public.—359, Strand, corner of Burlington-street.

DUTCH FLOWER ROOTS.—Best named HYACINTHS for glasses 6d. and 1s. each; best do. for pots 4s. per dozen (double and single). Duc Van Thol Tulips 2s. per dozen (double and single). Jonquils (double sweet-scented) 4s. per dozen. Early and late mixed Tulips, Narcissus, Iris, Crocus, Anemones, Ranunculus, &c., at equally moderate prices, at A. Cobbett's, late Mr. Barron's, Italian and Foreign Warehouse, 18, Pall Mall. Lists with prices may be had postage free. Also the true Double Roman and Paper White Narcissus, warranted, 4s. per dozen.

R. WHITE AND CO., NURSERYMEN, Poole, beg to inform the public, that they have just received their ANNUAL SUPPLY OF BULBS, and as they employ an Agent in Haarlem to select for them, they are enabled to offer every variety at very moderate prices; and can safely assure all who favour them with orders, that nothing but the very best of goods will be sent them. Fine Hyacinths, 6s. a dozen; superior, 9s. to 12s.; very finest kinds, 15s. to 18s. a dozen.

Our Autumnal Catalogue of Bulbs and Geraniums, Picotees, Carnations, Roses, &c. &c., is now ready, and will be sent free, on application.

T. AND C. LOCKHART & DUNCAN, FLORISTS and SEEDSMEN, 156, Cheapside, London, have just published their List of Flower-roots for the present season, which they will forward post-free on application. They have purchased of a celebrated Florist at Haarlem, the entire stock of three new and distinct DOUBLE HYACINTHS of great beauty, and suitable for glasses or pots. They have named them—

Admiral of the Red	each	2s. 6d.
Admiral of the Blue	do.	2 6
Admiral of the White	do.	2 6

T. and C. L. and D. beg to call particular attention to the various novelties contained in their List, and are happy to add that all the roots have arrived in excellent condition, for which they solicit early orders.

TO GROWERS OF PANSIES.

JAMES MAY begs to return his most sincere thanks to his numerous Customers and Friends for all past favours, and at the same time begs to apologise to many for not being able to comply with many orders which he was favoured with last spring, in consequence of being short of plants, his stock having suffered so much by his removal from Edmonton. J. M. is now happy to inform the Public that he is now ready to send out fine healthy plants, consisting of all the best varieties, at moderate prices, a list of which may be had upon a prepaid application. Extra fine Pansy Seed, all warranted collected from the best named varieties, 2s. 6d., 5s. to 10s. per packet.

MAY'S Crimson Superb Sweet William, plants, 4s. per doz.; seed, 1s. per packet.—Pansy Nursery, Tottenham, near London.

FINE CAPE ERICAS (HEATHS), EPACRISSES, &c.

J. & J. FAIRBAIRN beg leave most respectfully to solicit the attention of Gentlemen desirous of forming new, or of extending their present Collections of these much-admired tribes of Plants, to their Stock, which are in the finest health and vigour possible, and from its extent they are enabled to offer any quantity upon the following advantageous terms:—

	£	s.	d.
100 fine flowering plants, including 80 Ericas and 20 Epacrisse, of the best and most esteemed kinds	7	0	0
75 do. do., including 60 Ericas and 15 Epacrisse	6	0	0
50 do. do., " 40 Ericas and 10 Epacrisse	5	0	0
25 do. do., " 20 Ericas and 5 Epacrisse	3	0	0
12 do. do., " Choice Ericas	2	2	0

J. & J. F. take leave to acquaint Cultivators of Fuchsias and Verbenas that their collections contain the best and most esteemed varieties. All orders they may be favoured with packed with the greatest care, and delivered free in London.

P.S.—A remittance or reference required from unknown correspondents.—Nurseries, Clapham, near London, Sept. 8, 1843.

MYATT'S NEW SEEDLING STRAWBERRIES.

J. AND W. MYATT are now ready to send out their NEW STRAWBERRY, the DEPTFORD PINE, the fruit of which has been exhibited at the London Horticultural Society, and a Banksian Medal awarded. It has also been submitted to Professor LINDLEY, for whose opinion see *Gardeners' Chronicle*, No. 26, p. 447. It is a most prolific bearer, exhibiting at the same time a profusion of fine fruit and bloom on the same truss. Price, Deptford Pine, 2l. 10s.; British Queen, 1l., and Eliza, 10s. per 100.—Manor Farm, Deptford, Sept. 8, 1843.

THE BRITISH QUEEN AND PRINCE ALBERT PEAS.

W. J. CORMACK & CO., beg to announce to their Friends and the Public that they have harvested the above two New Varieties, and will be obliged by early orders, as the stock is limited. They will be sent out, as last spring, in packages, bearing the name of the firm, price 3s. 6d. per quart. The usual allowance to the trade.

N.B.—"CORMACK'S Early Kent Pea," 14s. per bushel. Newcross, Sept. 8, 1843.

GEORGE MILLS having this season saved SEEDS of his EARLY FORCING CUCUMBER with great care, offers it with confidence to the public, as the best kind known to him, at 6s. per packet, containing six Seeds, which will be sent free on the receipt of a Post-office order payable at Brentford.

G. M. begs to observe, that however good the kind of Cucumber, good fruit cannot be obtained at an early season unless the seed has good substance and is well organised, a point often unthought of. It is generally supposed that if it will grow it is sufficient; it is not more particularly when sown in the autumn. Gunnersbury Park, Acton, Middlesex, Sept. 8, 1843.

THE FARMERS' AND GARDENERS' HAIL-STORM INSURANCE COMPANY (to be empowered by Act of Parliament). Offices, Wellington-street North, Strand, London. Capital, 200,000l., in shares of 10l. each.

HONORARY DIRECTORS.

(Those marked thus * are Members of the Royal Agricultural Society of England.)

The Duke of Rutland, a Trustee of the Royal Agricultural Society; Leicestershire	D. Watts Russell, Esq., M.P., Stafford
The Earl of Stradbroke, a Governor of the Royal Agricultural Society; Suffolk	*Col. Le Couteur, Jersey
The Earl of Coventry; Worcestershire	*Lieut.-Col. North, President of the Banbury Agricultural Association; Oxfordshire
Earl of Ducie, Vice-President of the Royal Agricultural Society; Gloucestershire	*The Rev. Algernon Peyton, Isle of Ely
The Earl of Stamford and Warrington; Cheshire and Staffordshire	The Rev. E. H. G. Williams, a Gov. of the Roy. Agr. Soc. and President of the Llandovery Agr. Soc.; Carmarthenshire
Lord Rayleigh, a Governor of the Royal Agricultural Society; Essex	*The Rev. L. Penoyre, Herefordshire
Viscount Camperdown, a Governor of the Royal Agricultural Society; Rutlandshire	*Adm. Hawker, Ashford Lodge, Hants
Lord Stanley, M.P., a Governor of the Royal Agricultural Society; Lancashire	Col. Olivier, Potterne, Devizes, Wilts
Lord Feversham, a Governor of the Royal Agricultural Society; Yorkshire	J. W. Horlock, Esq., Gloucestershire West
The Hon. H. Fitzroy; Northamptonshire	J. J. Farquharson, Esq., a Gov. of the Roy. Agr. Soc.; Dorsetshire
The Hon. Henry St. John; Wiltshire	F. Pym, Esq., a Gov. and Member of the Council of the Roy. Agr. Soc.; Bedfordshire
Sir Thomas Gooch, Bart., a Vice-President of the Royal Agricultural Society; Wrentham, Suffolk	*Col. Holme Sumner, Chairman of the Agric. Association for the South Western parts of Surrey
Sir T. B. Lethbridge, Bart., Somersetshire West	*J. Spearman, Esq., Durham
*Sir R. Smeaton, Bart., Isle of Wight	*J. S. D. Selby, Esq., Northam and Islandshires, North Durham

DIRECTORS.

Joseph Rogerson, Chairman, a Gov. of the Roy. Agr. Soc. of England.

W. Yonatt, a Gov. of the Roy. Agr. Soc. of England.

JOINT SOLICITORS.—John Rogerson; C. Boydell.

BANKERS.—The London & Westminster Bank, Throgmorton-st.

NOTICE.—All claims upon this Company will be paid in the month of Nov. next, according to the conditions of the Policy. September 2, 1843.

W. SHAW.

NATIONAL LOAN FUND LIFE ASSURANCE, ANNUITY, and DEFERRED ANNUITY SOCIETY,

26, Cornhill, London.
Capital, 500,000l.—Empowered by Parliament.
DIRECTORS.—T. Lamie Murray, Esq., Chairman.
John Elliottson, M.D., F.R.S. George Lungley, Esq.
John Griffith Frith, Esq. John Rawson, Esq.
H. Gordon, Esq. Clement Tabor, Esq.

AUDITORS.—Professor Wheatstone, F.R.S.
Professor Graves, A.M., F.R.S.

ACTUARY.—W. S. B. Woolhouse, Esq., F.R.A.S.

The superior advantages to those Assured with this Society will be best understood by a comparison of its principles and a reference to the last Annual Bonus declared on Policies of five years' standing, viz.:

Entry	Policy No.	Age.	Sum.	Annual Premium.	Bonus added.	Cash Bonus.	Prem. reduced.
1837	39	59	£ 1,000	£ s. d. 67 8 4	£ s. d. 132 14 6	£ s. d. 58 19 9	£ s. d. 8 19 4
1838	114	56	3,000	175 15 0	296 9 7	123 0 6	16 9 7

Policies now entered upon entitled to participation in next Annual Division. Two-thirds of all premiums paid can be borrowed by the Assured without loss of Policy.

F. FERGUSON CAMROUX, SECRETARY.

NEW ZEALAND COMPANY.—COLONY OF NEW EDINBURGH.

Notice is hereby Given, that the Books for the Registration of Applicants for the Purchase of Land in the Colony of NEW EDINBURGH are Now Open.

Intending Purchasers must pay the Deposit of 10 per cent. to the Company's Bankers, Messrs. SMITH, PAYNE, and SMITHS, London, or to the British Linen Company's Bank in Scotland, either of whose receipt must be produced previous to any application being registered at the Company's House.

The allowance for Cabin Passage-Money being limited to the amount of 11,000l. of the Emigration Fund, Purchasers wishing to avail themselves of it, should make an early application, to avoid disappointment.

Further information may be obtained by applying to the Secretary, at the New Zealand House, Broad-street Buildings, London; or, during the months of September and October, to GEORGE RENNIE, Esq., at the New Edinburgh Colonists' Office, 21, South-street, Andrews-street, Edinburgh.

By order of the Court, T. C. HARRINGTON, Secretary.

New Zealand House, Broad-street Buildings, 6th Sept., 1843.

COTTAM AND HALLEN, ENGINEERS, IRON-FOUNDERS, &c. &c., No. 2, WINSLEY STREET, OXFORD STREET, LONDON, and at CORNWALL ROAD, LAMBETH.

GARDEN ROLLERS 18 inches long, 34s.; 20, 44s.; 22, 50s., 24 inches, 60s.; 26, 75s.; 28, 84s.; 30, 105s. each.

CUTTAM'S PATENT RICKSTANDS, 2 feet 6 inches high, 5s. 9d. each. Garden Engines, Mowing Machines, Garden Chairs, Superior Garden Tools of all kinds, Garden Vases and Pedestals in great variety, and every description of Horticultural Articles, Agricultural Implements, and Furnishing Ironmongery; Dr. Arnott's Stoves, Anglo-Belgian Cooking Stoves; Broiling Stoves. The above low prices being on account of the depression in the Iron Trade, are subject to future alterations.

HOTHOUSES, CONSERVATORIES, &c., made upon the most improved principle, either of iron or of iron and wood combined, which can be fixed complete in any part of the Kingdom, at very low prices, in consequence of the present depressed state of the Iron Trade.

HOT-WATER APPARATUS for heating Hothouses, Conservatories, and Greenhouses; Churches, Public, or Private Buildings, &c., with COTTAM'S PATENT, or ROGERS' BOILERS. After 15 years' experience, and having fixed upwards of 1500 Apparatuses for the above-mentioned purposes, and by various improvements which they have made during that time, C. and H. can with confidence undertake the erection of similar Apparatus upon the most extensive scale. For the convenience of those who wish to fix their own Apparatus, they have affixed the following low prices:—

Cuttam's Patent Boiler, 24 inch . . . £7 0s. 0d.

(Larger Sizes in proportion.)

Rogers' Boiler, small size . . . 3 15 0

Do. do. large do. . . 4 10 0

Hot-water Pipe, 4 inch diameter, 1s. 8d. per Foot.

STRONG IRON HURDLES, 3 ft. high, out of the ground, 6 ft. long, with five horizontal bars, weighing about 36 lbs., 3s. 6d. each.

Light Cattle Hurdles, 3 ft. 6 in. high, weighing 42 lbs., at 4s. 0d. each.

Strong do. do. do. 45 lbs. at 4 6 "

Ox Hurdles, 4 feet high, do. 60 lbs. at 5 6 "

BEST WIRE for STRAINED WIRE FENCING at 8s. per bundle of 150 yards each. Uprights for ditto, 7d. each. The Improved continued, and every other kind of Fencing, Fancy Wire-work, &c.,

HAND-GLASS FRAMES for Cucumbers, &c., 18 inches square, 3s. 6d.; 20 inches, 4s. 6d.; 22 inches, 5s. 6d. each.

CAST-IRON FLOWER-STAKES 4 feet long out of the ground, 7s.; 4 feet 6, 9s.; 5 feet, 11s.; 6 feet, 15s.; 7 feet, 20s. per dozen.

Show-Rooms at the Manufactory, No. 2, WINSLEY STREET, where every information may be obtained.

RENDLE'S TANK SYSTEM OF HEATING.

STEPHENSON AND CO., 61, Gracechurch-street, London, Inventors of the IMPROVED CONICAL and DOUBLE CYLINDRICAL BOILERS, having been much engaged in heating buildings upon the above system with Tanks of various materials, solicit the attention of scientific Horticulturists to an Iron Tank now fitting up on their premises, which offers most decided advantages over every other article hitherto employed for the same purpose. These tanks which are ornamental in appearance can be made from 10 to 100 feet long and of any width and depth, and can be connected or disconnected by any working Gardener without the slightest difficulty, thus affording the opportunity to persons in remote districts of employing this much approved method of heating without the assistance of Engineers. The Tanks can be applied to Boilers and Pipes already fixed, and from the present low price of Iron will be found cheaper than of any other material. MR. RENDLE, of Plymouth, has kindly undertaken to receive orders and furnish information to any persons in his neighbourhood, and prices for any size will be forwarded upon application to S. and Co.

J. B. LAWES'S PATENT MANURES, composed

of Super Phosphate of Lime, Phosphate of Ammonia, Silicate of Potash, &c., are now for sale at his Factory, Deptford-creek, London, price 4s. 6d. per bushel. These substances can be had separately; the Super Phosphate of Lime alone is recommended for fixing the Ammonia of Dung-heaps, Cesspools, Gas Liquor, &c. Price 4s. 6d. per bushel.

D.R. LHOTSKY, of the University of Saxe-Weimar, continues to translate, extract, or review Works or Memoirs, on Natural History, Botany, Geology, &c. written in German, French, Italian, or Latin. Charge, for translating an average sheet of text, 2s. Letters, addressed to Mr. Pamplin, Botanical Bookseller, Fritch-street, Soho, will be duly attended to.

The Gardeners' Chronicle.

SATURDAY, SEPTEMBER 9, 1843.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

Wednesday, September 13 Tottenham and Edmonton 1 P.M.

Tuesday, September 19 Horticultural . . . 3 P.M.

COUNTRY SHOWS.—September 12 . . . Royal Hort. Soc., Cornwall.

14 . . . Kingston.
15 . . . South Spilsby.
21 . . . Hoddesdon Cottagers.

PROFESSOR HENSLAW last week called attention to the silent but dangerous progress that is making by a new Agricultural pest, the Clover Dodder, which threatens to destroy the Clover crop altogether in some places. We have been favoured with a communication, which will be found in another column, from Sir James M'Adam upon the same subject; and we understand that the evil is beginning to cause serious alarm among Agriculturists.

There can be no effectual means of opposing the inroads of this new enemy, without knowing what we have to oppose. It may therefore be as well at once to explain its habits, and to offer suggestions for its eradication.

The Didders are a singular race of true parasites, inhabiting all the temperate and warmer parts of the globe, distinguished by Botanists into numerous species, but all having the same manner of growth and multiplication. They are leafless annual plants, allied to the Bindweeds, and, like them, strangling whatever they lay hold of. Their flowers, which are small, appear in balls on the stems, speedily form fruit, and end in producing each four seeds, about the size of a grain of Mustard, within which is coiled up an embryo plant, looking like a miniature snake. As the number of flowers in each ball is, in our common species, on an average, about fifteen, it follows that every ball will furnish about sixty young plants—whence the rapid spread of such pests may be easily understood.

As soon as the seed of the Dodder is ripe, it falls to the ground, and usually seems to lie dormant till the succeeding year; sometimes, however, it is said to germinate immediately. When the spring returns, the embryo sends one end down into the earth to form a root, and with the other it rises upwards, like a small white thread or worm. At this time it is not a parasite, but seems to derive its food from the soil, like ordinary plants. It cannot, however, do so long, but withers and perishes, unless it touches some living branch or stem. If it succeed in doing so, it immediately seizes the live stem by means of a sucker, which is protruded from the point of contact; and then, twining from left to right, and forming more suckers as it twines, it establishes itself on its victim, and ceases to have any further connexion with the soil. From that time forward it is a true parasite, feeding on the juices of the plant it has seized upon. After making a few turns round the branch, and securing itself firmly in its new position, it again lengthens, and catches hold of some other branch, when more suckers are protruded; and thus it goes on—branching, and twining, and sucking, and branching again—until it forms that appearance which Prof. Henslow well describes as resembling "fine, closely-tangled, wet catgut." Now the Dodder has a new and independent seat of life wherever it has twined round a branch; and as it is incessantly twining and separating, and twining again, a single plant is speedily in the condition of a polype—so that if it be cut into a thousand pieces, each piece will immediately go on growing, as if nothing had happened to it. Tearing the Dodder to pieces, then, so far from extirpating it, only multiplies the mischief, instead of arresting it.

This short statement will show that it is a formidable enemy that has been thus unfortunately introduced to our fields; and, as these things are not very nice in their food, it is not impossible that the Clover Dodder may next take a fancy to our Wheat fields, unless we can speedily put an end to its presence. It is of little use to cut it in pieces,—it is of no use whatever to do so, if the fragments are left where they can catch hold of anything else.

As it is only an annual, it would be killed if we could prevent its flowering; but that is difficult, because of its hiding itself among the lower branches of plants, where it cannot well be seen: and a few heads of flowers will soon renew it in a succeeding year. The right plan would be to dig up the Clover where the Dodder appears, so as to form a circle considerably beyond the patch apparently formed by it, and then to burn it in heaps; or, in cases where the entire field is infected by it, to sacrifice the whole crop, and burn it. This may appear a violent remedy, but it is the only one likely to be effectual; and even this will fail, if (which is not yet the case, but soon

will be) the Dodder is allowed to form its seed: for, they will fall on the ground, lie hid in the crevices, and reappear with the next crop,—when all the labour will have to be done over again.

When the ground to be drained is of small extent—as a garden or small paddock—the spade is the best instrument to begin the work with. The main drain having been dug in the lowest part of the ground, with a proper fall into some river or ditch, the conductors as parallel as the ground will allow, and the tiles, with or without soles, laid in firmly and evenly, and covered as we explained before, the collectors are now to be dug: these will be from 24 to 30 inches deep, with a small declivity towards the conductors. The water must run very slowly, and almost continually, in these; for if they get very dry, the moles are apt to work in them, and choke them: this, however, is not likely to happen if the drains are cut in the tough solid clay.

The first thing is to dig a trench, about 18 inches deep, in the direction in which the collectors have been laid out, the bottom of which slopes very gently towards the conductors; this bottom must be carefully cleared out with the shovel, leaving a width of 9 or 10 inches of solid subsoil. Should the top soil be deeper, the trench must be deepened in proportion. This will require the conductors and the main drain to be deeper also, which should have been calculated before they were made.

In this solid clay bottom a very narrow channel, 10 inches deep, is dug, with a spade only 3 inches wide at the insertion of the handle, and 1½ or 2 inches at the end, the length of the blade being 13 inches, leaving 3 inches of solid earth on each side. The annexed cut will give a clearer idea of it. The slit which forms the channel for the water is 10 inches deep, and is cleared out by a hollow scoop, 2 inches wide, made of strong sheet-iron, steeled at the point, and attached to a long handle at an acute angle, as in the annexed cut: this leaves the bottom and sides of the channel quite smooth. When this collecting-drain is finished, it must be covered, first, with tough peat, if this can be got, or sods, with the grass downwards, or with heath pressed in by the feet, so as to fill a third of it, and a few inches of the trench, as is marked by the dotted line. If no heath is to be had, a rope of straw may be twisted

and forced in: this will last a long time, and if it decays, the earth over it will have formed an arch, which will keep the drain open when the straw is rotten. We have seen drains thus made, which ran well after they had been made twenty-five years. The peat, sod, heath, or straw, must be well pressed in with the feet, so as to form a complete plug, leaving 6 inches clear below, for the water to run; over this, some mellow earth from the surface, or small gravel, should be thrown in, till the trench is filled up to the bottom of the top soil. This should be well rammed in, in a dry state, and over it, to fill up to the surface, the common soil may be used. If the surface is in grass, the sods may be laid back from the place out of which they were dug, allowing something for the sinking of the earth.

In a kitchen garden all the drains must lie deeper, to allow for the usual trenching. There the collectors may be 3 feet deep, and the conductors and main drain 3 feet 6 inches and 4 feet respectively. This method, although it is somewhat expensive, will soon be found profitable, by the improvement of the soil and the increase of the produce.

But if the land to be drained is extensive—say fields of from ten to twelve acres—and the soil at top is poor and shallow, the expense must be reduced as much as possible. In this case the plough must do the greater part of the work, to be only finished by manual labour. Expensive draining-ploughs have been invented, but they can only answer on large estates, or where draining is contracted for; a common plough with a sharp coulter and broad fin to the point, will do a great part of the work, if properly managed. Suppose the declivity of the ground to be in the direction *a b*, and that there is a sufficient fall in that of *c d* to carry off the water; then *c d* will be the direction of the main drain, which may be straight or winding, as the lie of the land indicates—*a b* will be the direction of the conductors.

Let a plough make parallel furrows across *a b*, so as to have a very slight deviation from the level, say one inch in 10 feet, more or less. The distance of

these furrows may be from 10 to 15 feet, according as the soil is more or less retentive of moisture. The usual width of 9 inches, with a depth of 6, will do very well. On returning, the plough makes another furrow, leaving a small balk between it and the first. The section of the furrow will then be as under, where *a a* is the slice turned over *b b*, the two furrows. The

plough next splits the balk *d*, taking five or six inches more of the soil and raising it up obliquely, against the sides of the first slices, right and left. Thus a trench is made 10 or 11 inches deep, and 18 wide. The section of the trench will now be somewhat as under, if the mould-board is of a proper concave shape, and the subsoil will probably have been reached. In this trench the draining spade is to be used, digging out a trench 9 inches deep and 9 inches wide. The bottom will now

be 19 inches below the surface, and the narrow spade and scoop finish the narrow drain, the bottom of which will be 27 or 28 inches—quite deep enough for ploughed land to allow of subsoil-ploughing without danger of interfering with the drains. For more minute particulars we must refer to the "Journal of the Royal Agricultural Society of England," vol. iv., p. 28. It must be noted that the plough crosses the conductors, and that only a portion of the trench made by the plough is required for the collectors: but it would be more trouble to have ploughed out short trenches of 20 or 25 feet in length than to go on from one side of the field to the other at once. The ploughman may raise the plough and ease his horses when he goes over the portion which he knows will not be dug out; but at first, before he is quite aware of the plan, it will be best to let him plough to the same depth throughout. The stirring of the soil will do good, even where no drain is wanted, and the whole trench will be filled up by reversing the operation.

If the subsoil is not of a uniform clay, some variation will be required in the operations, which we will next touch upon. The principle, however, will be the same.—*M.*

In our observations last week on New Zealand, is a typographical error which destroys the meaning of the paragraph in which it occurs. Speaking of the mode of clearing fern land we are made to say, "No doubt the wiser course is to leave it (the fern) in the first instance." What should have been printed was—"No doubt the wiser course is to burn it in the first instance," as indeed is obvious from the context. Since we are obliged to correct this error it will be as well to explain why we recommended the fern to be burnt, since it involves a question of general husbandry in other countries as well as New Zealand.

Wherever uncultivated land has been long occupied by a rank vegetation, of whatever nature, it is necessarily rich in what is called humus; viz., that black matter which results from the decay, year after year, of fragments of leaves and branches that fall on the ground;—in other words, it is rich in carbon. To such land it is useless to add more carbon. If the vegetation that overruns it is gathered together and forced to decay, so as to become ordinary manure, and in that condition is restored to the land, that would be to add carbon uselessly to soil already containing it in excess; so that all the time and labour employed in preparing and applying such manure is total loss.

But, on the other hand, it is equally mischievous to carry the wild vegetation off the land, for that would be to incur a large expense, and at the same time to impoverish the land; for this reason: all vegetation, of whatever kind, contains alkaline and other matter taken from the soil in the process of growth, and absolutely necessary to the health of plants. Such matters should never be removed, for soil rarely contains enough of them. Ferns yield as much as 8½ per cent. of such matter, obtained from a great depth beneath the surface. The question is, how to preserve the alkaline and other matters that are important, and to be rid of the carbonaceous substances which are superfluous; the answer is, by fire, which destroys all the latter, and leaves all the other behind in the form of ashes.

But it is not merely the preservation here of substances valuable, and the destruction of matter useless to plants as food that is accomplished by fire. Another most important purpose is thus served. The black mould of such places as the New Zealand fern land, is like our peat mosses, in great part very slowly convertible into vegetable food, because of its insolubility.

Plants growing in it are not unlike animals placed among food of excellent quality, frozen so hard that they cannot bite it. The action of such alkaline matter as is obtained by burning is immediately to render soluble that which was insoluble, and so to convert the vegetable food actually stored in the ground into a form on which plants can freely feed. The true plan of clearing and preparing such land is to fire all the vegetation, standing if possible, in order to save labour, but at all events to fire it and distribute the resulting ashes over the surface of the spongy peat, which forms the soil; the operation being followed by ploughing and such other operations as will suggest themselves to every farmer."

It is known to many farmers, though not to everybody, that skilfully reclaimed peat is among the richest of all soils. Peat, indeed, and wood-ashes, properly mixed, form a manure equal to that from cows. An interesting instance of this effect is mentioned by Dr. Dana, with which these remarks may be concluded:—

"Mr. George Robbins, of Watertown, is an extensive manufacturer of soap and candles and of starch, and still better, a man who employs the refuse of those trades in enriching and gladdening his land. For four years, and it is believed his crops will compare with any of the best cultivators around him; he has not used a spoonful of manure made by any animal, walking either on two legs or on four. He keeps 11 horses, 4 cows, 100 hogs; he uses not a shovelful of their manure, but selling that, he uses peat and swamp muck, mixed with his spent barilla ashes. The proportions are, one part of spent ashes to three of peat, dug up in the fall, mixed in the spring. After shovelling two or three times, it is spread and ploughed in. The effect is immediate, and, so far, lasting. The effects of these spent ashes alone on sandy loam are excellent, it makes the whole quite 'salvy.'"

THE KILLOGIE;

A SUBSTITUTE FOR FERMENTING MATERIALS IN HOT-BEDS, AND FOR PIPES, FLUES, &c. IN HOTHOUSES.

(Concluded from page 608.)

But, connected with the killogie, as applied to heating Vineries, I must say something of the construction of the Grape-house and border, for early forcing especially, but for the finer sample of Grapes at all seasons. Take up any gardening book, and under the head "Grapes" I will guarantee you to find the following prime order:—"Be sure to have the bottom under the Vine-border well drained;" and as some will, no doubt, think this quite unconnected with the killogie, and consequently foreign to the subject in hand, I can only entreat such to have patience a while, and they shall see that this is the principal part, for I mean the killogie to strike at the root of the Vine; and therefore, not contented with having it in the Vinery and under it, I must get it, if possible, under the Vine-border—taking, therefore, the above text, "Be sure to have the bottom well drained." Now, this is all very well in its way, and has done very well in its day; but as I have proved it to be a much better way to drain the top of the Vine-border, I should dispense with any drainage under, and, on the contrary, put a foot thick of clay, grout, or puddle, to keep the moisture in the Vine-border from entering the vaulted chambers under it: by this you will see that I mean the Vine-border to be very high, and regularly celled under, for the following reasons:—When you see a man elevate the glass roof of a Vinery to an angle of about 30° to meet the rays of the sun at nearly right angles, and after securing excellent under-drainage, and some crack compost, you will no doubt think as I have done often, that such a man is doing well. Strange enough, he could clearly see the necessity of the steep roof, yet ever and anon had a mote in his eye in looking at the Vine-border, not to see the imperative necessity of holding its face equally well up to the rays of the sun. Surely there need not be any argument about this, for whoever intends to grow Grapes well, must place the Vine roots in a warm medium, at least perfectly free from chilling and excessive rains, frost, and snow, for these are assuredly fatal to fine Grape-growing; and what more simple method could be devised than raising the Vine-border high and dry to meet the summer sun? and by thatching its steep surface during winter you change the climate entirely; for as far as that compartment is concerned, there is "no winter in the year; for when the winter rain and snow-water, so ruinous to the roots of exotics during their period of rest, are effectually warded off, and when the air under the border in the vaults is increased in temperature by means of fire-grates or ingles, such as plumbers use for out-door soldering, there is such a thorough control over the material for Grape-growing, as renders it almost entirely artificial, and places success nearly altogether dependent upon skill, and not upon seasons; and though it may be no easy task to get prejudiced persons out of the old beaten track, yet I fearlessly assert, and that from extensive observation and experience, that it is impossible to get Grapes, or, indeed, any other fruit, to its proper flavour, if the soil in which they grow is saturated with wet whilst the fruit is colouring. Again, let any one try to keep Grapes late on the Vines long after they are ripe, and I warrant he will learn to his cost that the Vine-border should be dry, for the roots will keep sucking the cold rain that surrounds them till the whole system, fruit and all, becomes affected by it. And in "early forcing," nothing can be done whilst the roots remain in cold wet earth—the roof only can dry it, and nothing else, and the fire, if necessary, which it seldom, if ever, will be, will take

the chill off; it would be perfectly ridiculous to have hot-water pipes under a Vine-border where heat of such coarse quality would do, and where the supply is only trivial, and that but for a short time.

Enormous as the building and labour in erecting such a Vine-house as the above section may appear, I must tell the readers of *Gardeners' Chronicle* that there are vineries in Sir Simon Clarke's gardens containing in their cross sections as much bricklayer's work as this, and nearly as steep Vine-borders, and the crops of Grapes you have reason to know as well as I were first-rate.

But leisure fails me. In conclusion, therefore, I beg leave to say that it will be found an excellent way to warm a bed of earth, to kindle a fire under it in vaults 7 feet high; and to prevent water lodging in the Vine-border, I would give it no quarter there at all, from the time people take up their Potatoes till they begin to plant them again in March, by having wooden shutters 6 feet by 4, supported on rafters, forming a roof perfectly waterproof. No more complaints of cold wet subsoil or bad drainage,—no more talk of your Vines losing root in the winter—the earth, as well as the other elements of fire and water, for Grape-growing, are, or may be, now at your command. If, therefore, the Vines are cold or hot, rich or poor, wet or dry, the media in which they are placed, as regards both branch and root, being now of

your own choosing, the blame or credit arising from the culture has you for its author and its end.—A. Forsyth, *Allon Towers*, 8th August, 1843.

DOUBLE FLOWERS—THEIR ORIGIN.

THE inclosed specimens appear to me curious, as in some degree connected with the origin of double flowers. They consist of plants of the *Gentiana amarella*, found in a wild state, covered with abortive buds, or rather minute double flowers. Each head consists of innumerable small petal-like purplish scales, having in their centre a tuft of still smaller green scales. A plant covered with these little heads not infrequently bears, especially near the top of the stem, one or two more perfect flowers. By examining these, a series can be shown, by which the stamens are seen to become deformed, and gradually to pass into small petals and scales. The pistil also can be traced, becoming more and more foliaceous. The change in the pistil has been effected in several flowers, whilst the stamens have remained nearly perfect. In the same manner I have observed in double Violets and some other garden flowers, that the pistil, contrary to the general rule, is metamorphosed before the stamens. In other semi-perfect flowers of the *Gentiana*, the divisions of the corolla and the number of the stamens, with their filaments flattened, are increased; in others, besides the five ordinary stamens, in an imperfect state, the divisions of the corolla are partially converted into stamen-like bodies: if this conversion had been effected, the flower would have become apetalous. In a Bladder-nut (*Staphylea*) growing in a shady wood, I last summer noticed a similar fact, namely, that the petals showed a tendency to form additional stamens. The plants of the *Gentiana* bearing the little tufts are generally, but not always, dwarfer than the perfect plants; their leaves are less pointed, and the entire plant is much less symmetrical. The much greater number of the imperfect flowers on one plant than are ever produced of the perfect, shows, I presume, that the metamorphic change must be determined early in the plant's life. Except in their small size, less beauty, and in the occasional presence on the same stem of flowers in different stages of monstrosity; these purple tufts seem to be essentially similar in their nature to the double flowers of Horticulturists.

The plants of the *Gentiana* in both states grow mingled together on a very hard, dry, bare chalk bank; but those with the abortive flowers grow on rather the barest spots, where it was surprising that anything could grow. You state in your "Theory of Horticulture," that the origin of double flowers is not well understood. Some have attributed it to excess of food; but the dry chalk bank surely was not too rich a soil; and I may mention that late last autumn, I found on an adjoining field of wretchedly sterile clay, great numbers of the *Ranunculus repens*, producing semi-double flowers, some having three, some additional rows of petals. The partial or entire sterility of double flowers is generally attributed to their doubleness; but is not this putting the effect before the cause? It is well known that plants (and indeed animals, as I could show by a series of facts) when placed out of their natural conditions, become, often from apparently slight and unintelligible causes, sterile. How many American plants fail in producing pollen in this country! the anthers of the Persian and Chinese Lilacs, as I observed this summer, are as destitute of good pollen as if they had been hybrids. Other plants produce good pollen, but are defective, as it appears, in their ovules, as their germen never swells.

Linnaeus has remarked that most Alpine plants, when cultivated in the lowlands, are rendered quite sterile. In most of these cases, we see that sterility is compatible with long life and health. Is it, then, too bold a theory to suppose that all double flowers are first rendered by some change in their natural condition, to a certain degree, sterile; and that their vessels being charged with organizable matter in excess, (which would be greatly formed by high cultivation,) it is converted into petals—the organs which are nearest in their morphological nature and position to those whose functions are checked? Is there any shadow of truth in this theory, or is it an abortive one, as are the buds of the *Gentiana*?—C. Darwin. [We can only say that this is at least as reasonable an hypothesis as any that we have seen; but the greater frequency of double flowers in gardens where soil is rich, than in fields where it is poor, offers some difficulty in the way of Mr. Darwin's speculation.] P.S.—I also send a curious Cabbage-leaf, grown into the form of a perfect funnel, like the fold of paper into which grocers put sugar. It was borne on a long footstalk from the centre of an old stalk, from which a Cabbage had been cut this summer. I remember that De Candolle describes pitchers at the end of the leaves of some Cabbages, which he compares to those of the *Nepenthes*. Is this leaf something of the same kind? [Yes.]

ROSES IN POTS.—No. II.

It is an excellent plan to remove all the Tea-scented, Chinese, and tender varieties of Noisette Roses, to a cold pit in October, or before the autumnal rains set in. This is not only to afford them protection from frost, but many tender varieties, especially those grown on their own roots, are liable to suffer materially from the rains in autumn. Through the winter, the lights or covering should be removed in fine weather, that the plants may have as much air as possible; and being in a state of comparative rest, they will require but little water. Where a cold pit is unattainable, such varieties may be removed to the north side of a wall or fence, and a temporary frame erected; upon this a light covering of Fern or Beech-boughs may be laid in the manner of a thatch, which will throw off the heavy rains, and form no small protection against frost, at comparatively little trouble. The front of this erection may be left open, that air may circulate freely amongst the plants to prevent damp, and the pots should be covered over with Fern or stable-litter.

In selecting plants from the ground to grow in pots, I prefer such as have grown moderately through the summer; they will be more compact, and the wood solid and better ripened than that of those which have grown very vigorously; and it is of great importance to have them potted early in the season. As before mentioned, most of the sorts will bear removing by the middle of September,—certainly the varieties of Tea-scented, Chinese, and Bourbon.

The operation of pruning may be performed at two seasons; in November for early flowering, and in March, or even April, to procure a later bloom. The first season after removal the plants will require to be pruned closer than at subsequent periods; and it is worthy of remembrance, that the flowers should be produced as near home as possible, or, in other words, that the plants may become close and bushy. The Moss, Provins, Gallica, and most of the autumnal Roses, may be pruned in close, to within three or four eyes of the base. With the exception of a few very robust growers, there is little fear of pruning these varieties out of shape or flower. But with the hybrids of Chinese it is far otherwise; they are more disposed to form wood, and should be well thinned out, and the remaining shoots left longer.

In pruning all Roses, where the shoots are crowded or cross each other, it is beneficial to cut some entirely out, that those left for flowering may stand a good distance apart; for if too many be allowed to remain, they will become drawn, and produce weak flowers. It is, in fact, much in favour of a good bloom, to have the shoots thinned during the previous summer, which assists in ripening the wood. And, as a general rule in pruning, weak growers should be cut in close, strong growers left long, and those of intermediate growth pruned in proportion. Soft, unripened wood should be invariably removed.

The hardy varieties (pruned and not pruned) may now (November) be removed to an airy situation in the garden, and plunged in the ground up to the rims of the pots from one to two feet apart, according to the size or habit of the plant. It is well with regard to Roses grown in pots that they be always kept plunged.

To obviate the disadvantages following the plunging of plants in pots, namely, their liability to root through into the ground, and the facility afforded for worms to work into the pots, I have the soil taken out of a sufficient depth, and a seed-pan with the hole enlarged placed at the bottom in an inverted position, upon which the pot is placed. It answers perfectly, and further secures an effectual drainage.

After the plants are plunged, the pots should be covered over with stable-dung, to protect the roots at the top from frost in winter, and to keep the surface of the soil moist through the summer. About March, the tender varieties may be brought from their winter residence, and treated in like manner; and such as were left for late pruning, be pruned. Where the buds push out very numerous, the strongest and those which have a tendency to grow outwards should be selected to remain for flower, and the weak ones rubbed off. The plants should be frequently looked over for the purpose of destroying the grub, which will otherwise eat into the buds, and spoil the bloom; from worked plants all suckers or wild shoots should be cut out as soon as they appear, and in

some instances the backward or side flower-buds be nipped out. As soon as the warm weather appears, it will be well to look after that tiresome pest, the Aphis, or Green-fly. In looking round, you will see one or two tiny ones walking about your plants; you may think they are of no consequence, but rest assured then is the time to attack your enemy, for they are then meditating where to provide for millions of their race. Wash the ends of the shoots, or syringe them, with Tobacco-water. I have also found equal parts of Scotch snuff and sulphur vivum very effectual in destroying them—put on with a barber's puff, or put into a shallow pan and the ends of the shoots dipped in. One thing is important—never allow them to collect their forces.

Great attention should be paid to watering; and, though plunged, the plants will require through the summer months a liberal supply. When they are coming into bloom, such varieties as are of a drooping habit will require the adjustment of a neat stick; we should not, however, be too lavish with these supports, or they render the plants stiff and unsightly. A light shading should now be formed, to protect them from the sun's rays during the middle of the day; this should be constructed to draw up, that the plants may have the advantage of the dews, so beneficial to Roses at this season of the year. Here they may remain till the middle of September, when they should be taken up, turned out of the pots, a good portion of the soil shaken away, and fresh supplied; and such as require it shifted into larger pots.—*W. Paul, Nurseries, Cheshant, Herts.*

AMATEUR'S GARDEN.—No. XXXVI.

AMONG all the various tribes of plants that decorate our flower-gardens, there is not one so beautiful, or which contains within itself so many dazzlingly beautiful flowers, as the Verbena. A very few years back our collection of these plants was limited indeed; but now, thanks to the spirit for collecting and cross-breeding, the varieties are almost innumerable; and though it is to be expected that among so many there should be some indifferent varieties, yet, taking them altogether, there is scarcely a variety that is not worth cultivating in gardens where there is sufficient room for them. However, in conformity with the prevailing fashion for cultivating selections rather than collections, I will endeavour to enumerate those varieties which may be considered, *par excellence*, the most deserving of extensive culture.

First, then, among the throng of beauties may be mentioned Chandler's atrosanguinea, and when I say that the brightest of the Scarlets, as ignea and Melindres latifolia are pale compared with it, the reader may form some idea of the brilliancy of its colour. It is a magnificent variety, and a very free and robust grower. V. ignea is the next in colour, but it is rather difficult to keep through the winter; and Croucher's maxima is nearly as dark, with a better habit of growth. V. Hislop's is a bright scarlet, with something of the breed of Teucrioides in it, and V. melindres, m. latifolia, are kinds known and esteemed by every one. All the varieties of Tweediana are good; but V. T. superba is the best. Of the rose-coloured or pink kinds Barns's is the best, as the old incisa is a very straggling grower, and fades very much under a strong sun. Among the purple kinds, V. Stewart's is the best, but V. Charwoodiana, Henderson's, and Triumphans are so much like it, that it is difficult to distinguish the flowers when off the plants. The two first are probably the best, though all four are worth cultivation. The orange-scarlet varieties are a new class of colours, and of these Kyle's speciosa and Croft's formosa elegans are most worthy of notice. The first has large flowers, with a white centre, and formosa elegans is very appropriately named, for it certainly is elegantly beautiful. V. variegata is a salmon scarlet, and mirabilis is in the same way, but not quite so bright. Of the white varieties V. Teucrioides must be laid aside, as it is very much surpassed by Youell's Princess Royal and the Queen. Princess Royal is a very pure white, more so than the Queen, and a plant of excellent habit. The varieties of V. Teucrioides are very numerous, and most of them sweet scented. V. T. rosea is a purplish rose colour, and Girling's eximia is a flower of the same character, but two or three shades darker. Burleyana might be called variegated, as the flowers open of a deep rose or ruby colour and change to pale rose, so that there are several colours upon a plant at the same time. V. Ingram's is a fine variety, with deep rose-coloured flowers tinged with salmon. V. Taglioni, a very fine, with immense corymbs of flowers of a silvery palish colour, Rosy Queen, and Mortlock's Superb, are of nearly the same colour, and all three very good. V. Iveryana is a rosy purple, very good; and V. Bishop's is a purplish rose-coloured kind, which makes a good bed. Of the lavender-coloured varieties V. Niell's is very good, but of a loose habit, and we have a variety raised at this place, which I have named Brooklandsia, which corresponds admirably with Niell's, and flowers very profusely. V. Hydeana is a pale bluish lilac, very distinct, and V. Vanguard's is of nearly the same colour; V. Lacon's, the blue one that was to be, is a deep bluish lilac, but a very good variety. All the preceding kinds are good and distinct, and worthy of a place in the smallest collections.

While I am writing I have received specimens from Mr. Girling, of Stowmarket, of his nine seedlings, and I must do him the justice of saying they are fine varieties, with large flowers and desirable colours. Boule de Feu is the most dazzling scarlet imaginable, with white centre. Bridesmaid is a pale lovely bluish colour; Fortune Teller and Minstrel Boy are very beautiful; Beauty, Renown, and longiflora, are desirable colours; White Perfection is curious, and Amethystina is a gem,

and very appropriately named. The whole of this collection may be safely added to every garden.—*W. P. Ayres, Brooklands.*

HOME CORRESPONDENCE.

Clover Dodder.—A desire to be useful will, perhaps, be the best apology I can offer for the liberty I have taken to give an account of a most pernicious and destructive plant in a field of Clover, called Seven Acres, on this Farm, which has attracted great attention, and caused much alarm. Its name, if I am correctly informed, is Cuscuta (Dodder) or Indian Grass. It commences in small patches all over the field, and gradually extends itself in circles of from 5 to 7 feet in diameter, destroying in its progress all vegetation, Clover, Weeds, and every thing; it then appears to die off, leaving the whole area black, as if a fire had existed on the spot. Nearly one fourth part of the crop of Clover is already destroyed, and the evil still continues. This Weed has the appearance of a large mass of yellow horse-hair, which shoots up through the Clover upon an average of 9 inches deep, and twines itself around every stalk of it. A portion of it throws out a small white flower at the joints. It is presumed that the seed of this most destructive plant must have been mixed with the seed of the Clover when sown, which was purchased from a general Corn and Seed-dealer in this neighbourhood. I am anxious through the medium of the *Chronicle* to put my brother Agriculturists upon their guard against so fearful an enemy, and I will highly esteem the favour of any information that may be elicited on the subject.—*James M'Adam, Tindon End, near Thaxted, Essex.* [This is the plant mentioned last week by Prof. Henslow as the Cuscuta Trifolii, and the subject of some observations in a leading article of to-day. We have also received specimens from Mr. Stock, from the neighbourhood of Bungay.]

Asparagus.—"Este," respecting Asparagus, begs to say that his beds are 14 yards long and 1 yard wide. He treated all with salt to the amount of 18lbs. each, excepting one, to which he gave 30lbs. The produce was finer and more abundant than ever, in spite of the cold wet season. The salt was applied the first week in March. All the small weeds were killed at first, but they grew afterwards so rapidly that much weeding was necessary. The salt was strewed, and suffered to melt by itself.

Wasps.—Last year, it will be remembered by all persons, that this insect was unusually abundant, and most annoying both in doors and out; all kinds of fruit were attacked, and the poor Bees were engaged in continual warfare. In the spring of the present year, 1843, the Queen Wasps, as they are called, were observed by many persons in Kent, as being exceedingly numerous. I never remember in any spring having seen so many; strange to say, I have seen but one Working Wasp this autumn. What has become of them? I observe, in Dr. Bevan's most useful book on the "Honey Bee," that a similar incident occurred among the Wasps in 1824, 1815, and 1806. On the summer of 1811, Dr. Bevan quotes an author, by name Butler, who noticed a similar circumstance, i.e., an extraordinary number of Wasps in 1811, but none in 1812. The same occurrence is noticed in 1820, but no Wasps in 1821. "It may not be unworthy the attention," says Dr. Bevan, "of the Entomologist, that betwixt the years of scarcity here recorded, there was a lapse of exactly nine years, viz., 1812 to 1821, 1806 to 1815, 1824 to 1833; in the latter case, instead of being preceded, they were succeeded by an abundance." I shall feel obliged to any of your correspondents who have made notes on this subject to forward them to your Paper, *pro bono publico*.—*J. D.*—Last year, in summer and autumn, 35 Wasps' nests were destroyed on my farm, of about 200 acres. Peaches, Nectarines, and other fruits were much injured by them; for the garden swarmed with these intrusive vermin. This year I have seen but one wasp. That was on the 1st of September. In the spring, indeed, several "Queen Wasps," as we call them, were seen. We have a notion that every queen then destroyed prevents a nest. Three or four Hornets have been seen about the garden; but up to this time, no Wasps' or Hornets' nests have been seen by any of the haymakers or harvest men. What I relate is not confined to my premises, near Woodbridge, Suffolk. No Wasps have, I believe, been seen in that neighbourhood this year, while last year they were sad pests. How have your other correspondents fared in this particular?—*E. M.*

Peat-earth.—Until "Moorland Willie" discloses his secret, "Q's" vegetable crops, in the event of dry weather, will derive much benefit by being top-dressed with well-pulverised dry peat-mould: it obstructs evaporation, and being a non-conductor of heat, prevents the roots from being scorched during the day, and chilled at night by radiation. As a proof of the non-conducting properties of dry peat, I may state that, by its application and that of other non-conducting (non-fermenting) materials, we had a daily supply of Seakale last spring, from the 7th of February to 25th of March, very much superior in flavour to Seakale forced under pots with fermenting horse-dung.—*Thomas Cowan, Churchill Garden.*

Bees.—As friendly collision presents the best, as well as the pleasantest mode of eliciting truth, I have been sorry to observe the tone which Mr. Wighton has adopted towards my esteemed friend, Mr. Golding; a tone which is but too well calculated to deprive our apiarian brethren of farther communications from the same intelligent source. Mr. Golding's letter of June last was written in a spirit of friendly disquisition, accompanied by that warm spirit of hospitality which he is ever prompt to evince; and I had hoped that such an apparently auspicious challenge would have led, not only to a courteous reply, but

to a cordial shake of the hand; and have laid the foundation of a friendly intercourse betwixt two gentlemen, who ought to combine those powers which both so eminently possess in the furtherance of science and the eradication of error. Mr. Golding's object in addressing Mr. Wighton was, to induce him to put faith in an avowment of Huber's respecting which Mr. Wighton was sceptical; and as Mr. G. had had ocular demonstration of certain proceedings on the part of his own Bees, which appeared to afford evidence of their throwing out intrenchments of some sort, and which might reasonably be supposed to have been constructed as defences against an apprehended intrusion; he very fairly inferred that in the case mentioned by Huber, the Bees might have done the same, and therefore that the statement of that prince of Apiarians rested upon probable grounds. The fortifications alluded to by Mr. Golding, if Mr. Wighton will allow me to call them by that name, fell under my own observation when I was on a visit to my friend's house, and the representation which I have given of them in the "Honey Bee" is very correct. As respects Mr. G.'s referring Mr. W. to the "Quarterly Review," for the manner in which Bees collect pollen, I think there must be a misconception, though, as I have not the letters before me, being at this time on a visit at Tenby, I cannot speak with certainty. If my memory do not fail me, Mr. G. merely opposed the opinion of the Reviewer upon the whole of the "Honey Bee" to Mr. W.'s criticism upon a single point. Neither Mr. G. nor myself would hesitate for a moment to acknowledge any errors which may have crept into the "Honey Bee;" indeed, to obtain the benefit of their correction, Mr. W. may see, in the first edition, (which I find he possesses,) as well as in the last, that I call for ingenuous criticism: to elicit such criticism from Mr. W., in the most efficient manner, I shall be happy to present him with a copy of the second edition, hoping thereby, should a third be called for, that it may reap the benefit of Mr. W.'s corrections and suggestions.—*Edward Bevan.*

Conservatory Climbers.—Allow me to recommend to the readers of the *Gardeners' Chronicle*, a beautiful plant of the above-named class, which Mr. Beaton has slightly alluded to, in his very interesting paper on the subject,—I mean Bignonia cherere, which is decidedly one of the finest in my conservatory. It was planted in one of the borders, about eight years since, and though it did not bloom for the first three years, has ever since flowered regularly, and been generally admired. It grows very rapidly, and would, if not restrained, cover the whole building, which is between 30 and 40 feet long. Its manner of blooming is, I think, peculiarly valuable, as it does not produce its flowers simultaneously, but continues to develop them from the commencement of June to the end of October, their large size and rich colour rendering them very conspicuous. The plant is decidedly not a Stove-climber, as in the same house the exquisite Bignonia jasminoides thrives and flowers as freely; while in the spring, the Kennedys and Zichyas are equally prodigal of blossoms. Mr. Beaton has assuredly rendered an essential service to Florists, by publishing his valuable remarks on a method of rendering one's conservatories far more attractive than they have hitherto been; but I must dissent from his opinion that he has run to too great a length, as the opinions of a practical gardener like himself are the very things that, among others, tend to make the *Gardeners' Chronicle* so useful. He would confer a boon on me and many others if he would now give us a little information respecting plants that are strictly Conservatory climbers. With Bignonia venusta, planted in the same house, I did not succeed, nor does Ipomoea Learii, though growing luxuriantly, flower well. Mandevilla suaveolens is equally fine, but without blossoms. Canavalia Bonariensis, though possessing handsome foliage and a tolerably free flowerer is, I think, an uninteresting thing; and Duranta Ellisii refuses to gratify me with blossom, though healthy and vigorous. Jasminum heterophyllum I must discard, in spite of its beautiful leaves, as it has never flowered but once in England. Siphocampylus bicolor must give way to something else, though it is an ever-blooming plant, from its being almost hardy in our climate. Bignonia jasminoides I bought from the strong recommendation of a nurseryman, and that too has never produced a single blossom. Will Mr. Beaton kindly aid me in my desire to cover the pillars of my Conservatory with free-flowering plants? With the hope of being possibly enabled to carry out his plan, by erecting a building at the back of my Conservatory for the growth of Stove Climbers, may I also venture to ask,—if, by increasing its size beyond the limits he suggests, it might be made available for the growth of a selection of Stove plants, and for forcing flowers for the Conservatory; its aspect will be west, but the end will receive the sun's rays about 11 o'clock. I conclude that the same heating-apparatus could warm both houses. When will Mr. Beaton favour us with his list of Cape Heaths, which I think promise to give quite a new feature to our flower-gardens—does he purpose sinking the pots, or turning the plants out, into beds of Heath-mould? I had once a bed of Erica cruenta which was very beautiful;—the plants survived one winter, with a slight protection, and the second summer were a mass of bloom; but the next winter proving more than usually rigorous, they all perished.—*A Devonian.*

Cellar for Roots.—One of my neighbours stores his Potatoes every year in a cellar or pit of the following description:—The subsoil is a loose, stony rubble on the upper oolite, and has been excavated to the depth of 5 feet and width of about 8 feet; round the interior is a dry stone wall, which is carried 2 or 3 feet above the level of the surrounding ground. A roof, with about 18 inches in

thickness of thatch "stubble" covers the whole. Outside the wall and up to the eaves earth is laid firm, in a sloping manner; the entrance is by a door at one end. When the Potatoes are stored some loose straw is shaken over them. I have frequently seen the Potatoes taken out in the spring in excellent condition, and I never heard that any were injured by frost. I have also seen similar pits in places where the soil is a stiff clay, but in such cases a sloping bank has been chosen for the purpose of easy drainage. I am induced to send you this short description, from seeing in a late Number of the *Chronicle*, page 285, a communication from "Lusor," who says that many years ago, he stored his Potatoes in a limestone quarry, and although he closed the entrance with a wall of earth, many feet in thickness, and covered the whole with stubble, several yards in thickness, yet his Potatoes were spoiled, and even the wind was not excluded. I cannot help thinking that if "Lusor" had minutely searched for the aperture where the enemy entered, he would have found the covering something less than several yards in thickness. I have never heard of fruit having been kept in such places, but I beg to inform "Totty" (see page 245) that a gentleman lately showed me several sorts of desert Apples which were as hard, and sound, and juicy, as when gathered from the trees. He had kept them in narrow-mouthed large earthenware jars, sealed up until wanted.—*Cultor*.

Roman Cement.—I fear your correspondent "J. B. H." has not had his work properly done, or he would not have occasion to say that "Roman Cement will not stand frost." Supposing his brick-work to be properly executed, with a sufficient bottom to prevent settlement or cracking, and the cement-work done in the following manner, he will find that Roman Cement will stand frost. The brick-work should be well wetted prior to the application of the cement, which should be from a first-rate factory, such as Francis and Sons', and what is technically called No. 2, mixed with one-third clean-washed road-drift, or sharp river-sand (which is better), and should be finished in one coat; a second, or setting coat, as it is called by plasterers, should not be put on, as it almost always scales off after frost. The cement-work should be allowed to become thoroughly dry, and then have two or three coats of boiled oil and turpentine. When this is completely dried the water may be admitted, and if properly done no frost will cause it to split, or scale off. I have no doubt "J. B. H.'s" work has failed either from improper construction of the brick-work, or the cement being dead before it was used, or from being mixed with other material than sharp sand, either of which would render it porous, and therefore liable to be split by the action of frost.—*Semper Idem*. [H. Heylyn, of No. 5, Acre Lane, West Brixton, offers to give information to "J. B. H." on this subject.]

Farnes' Early Pea.—I beg to say that I have some of Farnes' first early Peas, sown by the side of early May and Warwick this season, and the results were decidedly in favour of Farnes', as the latter were fit for use from ten to fourteen days before the others. I merely notice this to show that persons must not be too hasty in drawing conclusions from one communication alone, as we see from Mr. Whiting's account the results are widely different.—*C. Noble*.

Ginger.—I beg to thank Mr. Brown for his ready compliance with my request. His plan, although apparently more tedious than my own, is doubtless very good. That which I call mine is, however, Mr. Markham's, of Hewell, and was published by him in 1831, in the seventh Vol. of the "Gardener's Magazine," page 577, signed "Zingiber;" it runs as follows:—"About the beginning of March I put my Ginger in small 32 or 36 pots, according to the size of the tuber—loam, rotten dung, and leaf mould, in equal parts, by all appearance being their favourite soil. I do not sift it, but break it a little with a spade, or the hand. After filling the pots with this compost I proceed to place the Ginger upon it, but barely covering it, giving a little water to settle the soil, placing it in a hotbed, frame, or some such situation, to start it. If it will push without more water so much the better or safer, as it is very apt to decay if over-watered at that time. The pit in which this practice has so completely answered is about 7 feet wide, with linings on each side; it is prepared a few weeks previously to the planting of the Ginger in the following manner:—about 1½ foot or 2 feet of half decayed tan is placed in the bottom, upon a good drainage of rough pieces of wood and branches, and with the exception of the roughness of the soil placed upon the tan to the depth of about 15 inches or 18 inches deep, it is precisely the same as that in which I first planted my 'sets.' Planted in this compost, at about 15 inches apart, each way allows sufficient room for their growth. Giving them a little water when planted will suffice for some time, as I keep the pit almost close, even in the hottest days in summer, as I find a net thrown over them to preserve them from the burning sun sufficient till they begin their growth, when too much heat and water can scarcely be given them. The pit should be from 5 to 6 feet deep, as in this situation and treatment their growth is almost incredible. By the middle of September the crop will be ready for gathering. I always preserve the oldest part of the tubers for future planting, placing them, after a little drying, in a pan of dry sand, setting them in a cool dry situation, free from frost or damp. With this treatment they ensure a crop of good 'seed' for the following season." It appears Mr. Brown gets two crops in one season; about three lights of the above-mentioned pit produce me from 40 to 50 lbs. of very fine Ginger with scarcely any trouble at all; and this I find an abundance for the consumption of a large family.—*J. M. Dyck*.

Tobacco.—I observe in your "Answers to Correspond-

ents" that "Tobacco may be grown in England by any one for his own use." This I believe to be true, but only to a certain extent. Many years ago (I presume before the union of Ireland with this country) Tobacco was cultivated in the neighbourhood of Kelso, in Scotland; indeed, so successfully, that I believe an act of Parliament was passed prohibiting the growth of it by any person beyond a limited number of plants, I think not exceeding one thousand. Some years after the union with Ireland, it was discovered by some agriculturists that the act was limited to Great Britain; they, therefore, went very largely into the cultivation of this plant, and with no less success than in Scotland. This of course led to the extension of the act to Ireland, and I suppose with the same limitation as to the number of plants. The above I believe to be a correct statement of the case.—*F. H. S.*

Morphology.—As I perceive you are interested in Morphology, I take the liberty of forwarding you a branch of Spruce Fir, in a state of monstrosity, as a specimen from a quantity of plants in the same state, which are growing here in the vicinity of old coal-pits, upon the banks formed of the refuse small coal. It appears the dry weather of last season induced the plants growing upon this porous material (although they are only about three feet high) to form incipient cones in great abundance; and the excessively wet spring of this year has forced them to elongate in their more natural state as branches. I do not know that this is an uncommon circumstance, but I never saw it so abundantly exemplified as in the plantations named, and it appears to me an excellent example, as showing the relationship between fruit and branch, clearly proving them originally one and the same thing, only in a different organic state.—*Joseph Paxton, Chatsworth*.

Larch.—I have examined the Larch in various situations in this part of the country, and find that it thrives well in soil that may be considered light and moist. Some years ago a considerable quantity of Larch was cut that grew on part of the Earl of Dunmore's property. The soil was light, upon a sandstone rock, and most part of the trees were affected with the dry-rot. Neither does it appear to thrive well on soils that have a moist tenacious subsoil. Draining would be an improvement to such soil. Again, in soils that are moist and sandy, with a mixture of peat, the Larch grows well, and produces wood that is healthy and hard. Upwards of twenty years ago I visited the Larch-trees at Monzie, (and it is commonly reported that they are next in size to those at Dunkeld, which are the largest in Scotland); those at Monzie grow in the garden near the edge of a pond, which must have a tendency to keep the soil moist.—*Peter Mackenzie*.

The Chinese Primrose.—In my experiments from time to time in acclimatising plants, it was no small satisfaction to find the purple and white Chinese Primrose able to endure the rigour of our winters, flowering in early beauty with the Crocus, Polyanthus, and its other fair sisters of the spring. This I have effected (even in Middlesex) at more than one place, and in successive seasons, by planting out early in September, strong old plants in front of an elevated shrubbery border, having a west aspect. The soil was a poor light loam on a sandy subsoil. In planting, if I found any part of the border not well drained under the roots of the shrubs, I placed a few brickbats or a flower-pot reversed under each plant; in this situation I had plants which did surprisingly well, without any other protection than the shade of neighbouring Evergreens, from under whose fostering wings many of these interesting flowers peered out in freshness, when there were several inches of snow on the ground; indeed they did not appear to suffer so much from frost or snow, as from the cold March winds—when, as *Stillingfleet* beautifully expresses it,—

"Winter still lingers on the verge of Spring,
Retires reluctant, and from time to time
Looks back, while at his keen and chilling breath
Fair Flora sickens."

Plants in other aspects of the garden planted similarly did not answer; those on the north perished first, east next, and those on the south, though surviving the winter, vanished in March and April by the joint effects of frost and sunshine. In passing, I will observe, if plants of the Chinese Primroses, not excited by fire-heat or allowed to flower during the previous winter and spring, are planted out about the end of May in the flower-garden, on elevated beds in a mixture of loam and leaf-mould, and shaded a few hours from the mid-day sun, they will become very ornamental during the summer, but in this situation they are early destroyed by frost. I have found in various localities early planting to be decidedly unfavourable for acclimatising exotics. In most cases August and September are the best season, for, above all things, luxuriance of growth must be guarded against, as every practical gardener knows that succulent vegetation of any kind is the first to indicate the effects of frost, and a low temperature acts injuriously on plants in pro-

portion to their watery contents; therefore attempts should be unceasingly made, by thinking gardeners, to place exotics in the most favourable situations, so as to increase their numbers, inure them to our climate, and render the flower-garden at all seasons as attractive as possible; for it must be allowed the two great sources of interest in a place are variety and contrast; and the best means by which these can be introduced in the flower-garden is in the selection and diversity of its flowers and shrubs.—*H. Bowers, Hammersmith Nursery*.

Several Species of Rose on one Stock.—In addition to what your correspondent "E. B." has stated respecting this subject, in your valuable paper of August 26, p. 590, I may mention that a gentleman, a very near relative of mine, had a common Rose-stock, on which he budded all the Moss Roses that could be obtained in the county in which he resided. The buds took, and in the following year the tree was quite a picture of beauty, every shoot bringing forth flowers peculiar to its kind. While speaking of this subject, it may probably be interesting to some if I mention that my relative had also a Pear-tree, trained against a wall, on which he had grafted fourteen different kinds of Pears. He selected those Pears which he considered the very best (he being a good pomologist), and he was gratified to find that year after year, each shoot produced fruit true to its kind. Unfortunately, however, for these trees, my friend determined on making great alterations in his garden, and, consequently, the trees were obliged to be removed. This removal, however, had no effect on the Rose, which continued to thrive with great luxuriance; but the Pear-tree did not survive this transmigration, it being about the middle of June when it was taken up.—*Ortolano*.

PROCEEDINGS OF SOCIETIES.

HORTICULTURAL SOCIETY.

Sept. 5.—R. W. Barchard, Esq., in the chair. R. Osborne, Esq., and W. Ellis, Esq., were elected Fellows of the Society. From Messrs. Veitch and Son, of Exeter, were beautiful cut specimens of *Echites splendens*, and a species of *Allamanda*, said to be *grandiflora*, but appearing to be only *cathartica*; also a beautiful little plant of a *Verticordia*, for which a certificate was awarded. Mr. Henderson, of Pine-apple Place, exhibited a plant of *Stanhopea Wardii*, bearing a fine spike of its beautifully spotted flowers; also a new species of *Achimenes*, which sprung spontaneously among the roots of a mass of *Orchidaceae*, which was purchased from Mr. Skinner last year, and having, in its habit of growth and appearance of foliage, a marked resemblance to *A. pedunculata*, but distinctly different in the flower, which is of a violet-rose colour, with a dingy yellow throat, closely dotted with small brown spots; the flowers also are rather larger than those of the last-mentioned variety: although it is not so handsome as some of the others, yet it evidently possesses considerable merit: for this a Silver Knightian was awarded. From Mr. J. Robertson, gr to Mrs. Lawrence, were beautiful plants of *Catasetum Russellianum*, *Oncidium microchilum*, *Maxillaria Deppel*, and *Stanhopea graveolens*, having a remarkably fine spike of its pretty yellow flowers; also splendid plants of *Lilium lancifolium album*, *speciosum*, and *lancifolium rubrum*; the latter about six feet in height, and bearing 15 fully expanded blooms. This plant was stated by Mr. Robertson to have been presented to Mrs. Lawrence some time ago by Baron Hugel, and is perhaps the only plant of the kind in the country: a silver Knightian was awarded for the *Stanhopea* and *L. lancifolium rubrum*. Mr. H. Groom, of Clapham Rise, also exhibited a collection of *Lilium lancifolium album*, and *lancifolium roseum*, particularly well-grown specimens, varying from 5 feet to 5½ feet in height, and producing seven and eight stems from each pot, literally covered with beautiful white and pink flowers. They had been grown in a span-roofed house, about 21 feet long by 18 feet in breadth, on a horizontal stage; a Knightian Medal was awarded for them. From S. Rucker, Esq., was a fine plant of a most beautiful new variety of *Miltonia candida*, and a cut flower of *Govenia* sp., very curious, and rather handsome: a Banksian Medal was awarded for the *Miltonia candida*. Mr. Trenfield, of Lee, sent some seedling *Verbenas* and a hybrid *Gloxinia*, with light pink flowers. Mr. Pawley exhibited cut flowers of two new seedling *Fuchsias*. From Mr. Allee, gr to H. Beaufoy, Esq., were some very fine Peaches, consisting of *Violette hâtive*, *Noblesse*, *Millet's Mignonne*, *Red Magdalen*, *Kensington*, and *Padley's Mignonne*, finely swelled and beautifully coloured: a certificate was awarded for the *Violette hâtive* and *Noblesse*. From the same person were also *Violette hâtive* and *Old Newington Nectarines*, with some good bunches of unnamed Grapes: Mr. M. Henderson, gr to Sir G. Beaumont, sent five fine bunches of the Muscat of Alexandria Grape, weighing respectively 2 lbs. 3 oz., 2 lbs. 2 oz., 2 lbs. 12 oz., 1 lb. 13 oz., and 1 lb. 13 oz. Mr. Elridge, gr to G. W. Ward, Esq., sent a bunch of unnamed Grapes, imported from Paris in the year 1839, resembling in appearance, a good deal, the Black Morocco. From Mr. Trinder, of Forest Hill, was a new variety of Pine-apple, weighing 2½ lbs., and about eight inches in length and four inches in breadth, not so well grown as might have been wished, but well-flavoured, and reported to be very handsome, under favourable circumstances. Mr. Frazer, gr to Sir C. Sullivan, sent two nice looking hybrid Persian Melons, two Citrons, and some well-swelled and beautifully coloured *Noblesse* Peaches, which, independent of their great beauty, were interesting from the circumstance of their having been produced by a tree 16 years of age, which was removed 2 years ago from a south to a west aspect, and never produced previous to its removal such fine fruit as those exhibited. Mr. Frazer is of opinion that all Peach-trees of any size are improved by being occasionally removed and properly transplanted. A Certificate was awarded for the Peaches. From Mr. Jones, gr to Sir M. Disney, were excellent *Noblesse* and *Grosse Mignonne* Peaches. A Certificate was awarded for the former. From the Gardens of the Society were plants of *Peristéria Barkeri*, with its fine pendulous scape of yellow flowers, *Bolbophyllum Careyannum*, *Achimenes coccinea* and *longiflora*, *Babingtonia camphorosma*, an exceedingly pretty plant, bearing on its fine drooping branches a multitude of its small white flowers. This plant was imported a few years ago from Swan River, also *Fuchsia sanguinea*, *Statice mucronata*, and cut flowers of *Lupinus semper-florens*, sent by Mr. Hartweg, particularly remarkable on account of its forming a large bush, densely covered with flowers, during the whole year, in its native country, Peru. From the Gardens of the Society were also sent, the Nectarine Plum, *Imperatrice Nectarine*, and George the Fourth Peach, an American variety, which is found most worthy of cultivation of any from the United States, and possesses the additional advantage of being an excellent forcer.

NOTICES OF NEW PLANTS WHICH ARE EITHER USEFUL OR ORNAMENTAL.

CHOROZEMA SPARTIODES. Broom-like *Chorozema*. (*Green-house Dwarf Shrub*.) Leguminosae. Decandria Monogynia.—This plant grows up with a short stem, and then spreads out its branches horizontally, or in a partly drooping style. These branches are peculiarly irregular and zigzag; but when the plant is nicely cultivated, it forms a low bush, not more than three

inches above the soil, compact, and during the blooming period very showy with its fine yellowish flowers. It was raised from New Holland seeds several years ago, and is a plant that commences blossoming about the month of April, and continues nearly all the summer. This is one of those fine-rooted plants which are easily injured, want frequent attention in their culture, and require to be managed well, or they are never worth growing. It should be potted high in the centre of the pot, in a compost of very fibrous and open heath-mould and loam, with the base of the stem, whence the roots proceed, left a little exposed. The shoots of the young plants must be kept duly shortened, while they are advancing; for it is a species which, if not thus pruned, will straggle, become very weak and slender, and have a displeasing appearance. When the specimens are two years old, however, the pruning may be almost wholly left off, as it is near the extremities of the shoots that the flowers are borne. After this time the plant may be pruned in the winter. It will flourish in any light airy greenhouse. The species is multiplied, somewhat slowly, by cuttings, which should be taken from the branches that do not seem inclined to flower much. If they show any disposition to bloom, even after they have formed roots, the flower buds should be timely taken away. It is extremely injudicious, in all cases, to suffer small plants to flower.

—*Paton's Magazine of Botany.*

EPIDENDRUM SCHOMBURGKII. Mr. Schomburgk's Epidendrum. (Stove Epiphyte.) Orchidaceæ. Gynandria Monandria. —This plant is quite the gem of its class; and, with *E. cinnabarinum*, a very nearly related kind, stands among the more interesting and beautiful of the order. It has far more ample clusters of bloom than the majority of caulescent Epidendras, and the individual flowers are much larger than those of the best species, such as *E. ellipticum*, &c. while their colour is a deep rich red, with a tinge of yellow in the centre. They remain perfect, too, for a considerable time after expansion, being generally open from one to two months. It was introduced by Mr. Schomburgk from British Guiana a few years back, and sent to Messrs. Loddiges, with whom it has been frequently in bloom. It is now, likewise, in most other large nursery establishments. Messrs. Loddiges cultivate it like *E. ellipticum* and other caulescent species, by planting it in a pot filled with rough heath-mould and potsherds. It seems to flourish in a warm, moist house, and succeeds well where it can be suspended over a cistern, or a large body of water from which exhalations are constantly going forward. In the winter it should have a somewhat drier spot, and will require scarcely any water, if kept in a cool house. In potting it and all similar plants, the base of the stem, from which the roots are emitted, should be placed rather high in the pot, and above the general level of the soil. A small pot may be inverted in the one in which it is put, before the soil is introduced. To propagate it, it is only necessary to take away carefully one of the stems, and pot it separately. Or, sometimes the older stems will throw out lateral branches, which form roots at their base; and when the tendency to do this is perceived, a little moss should be wrapped round such parts, which, by being kept moist, will encourage the development of roots, and young plants will speedily be formed, fit for detaching, and treating as separate specimens. —*Paton's Magazine of Botany.*

LYCASTE PLANA. Even-flowered Lycaste. (Stove Epiphyte.) Orchidaceæ. Gynandria Monandria. —A Bolivian plant, imported by Messrs. Loddiges, with whom it flowered in October last. It is conspicuous for the large size of its leaves, and is in fact very near *L. macrophylla*, from which it differs in the petals being quite even, not undulated, and in the lateral sepals being much more exactly oblong. Added to which is a greater degree of bluntness on the tubercle of the lip. The beauty of the flowers of *L. plana* is far greater than in *L. macrophylla*, which wants the rich red-wine colour of the plant before us. Like other species of Lycaste, this requires to be grown in turfy peat; the pot to be half filled with potsherds, and the soil considerably elevated above its brim. Care must be taken not to have its pseudo-bulbs imbedded in the soil, or they will damp off. In summer, after the plant has commenced growing, plenty of water should be given to its roots, and a slight syringing over head once or twice a day as the weather permits. The house should be shaded in sunny days, and the temperature kept about 80° by day, and 70° by night. In winter, for a few weeks, very little water is required, especially in cloudy weather; if the house is kept moist it will be quite sufficient, and the temperature may be allowed to fall as low as 58° by day, and 50° by night. —*Botanical Register.*

PORTULACA SPLENDENS. Garden variety. (Half-hardy annual.) —We presume this to be a mere variety of *Portulaca Neilsonii*; but if so it is one of singular beauty. Its origin is however unknown to us. Seeds of it were purchased of Mr. Charlwood, in Covent Garden, for the Horticultural Society, and in the Chiswick Garden it flowered in the autumn of 1842. It is a charming tender annual, about a foot high, which flowers most abundantly from July to September, if treated in the following manner. The seed should be sown about the middle of March in pots filled with a mixture of sandy loam, old lime-rubbish, and well-decomposed cow-dung in equal portions. The plants should be raised on a hot-bed, and when large enough should be potted off singly into small sixty-pots, filled with the same kind of compost as that in which the seeds were sown. The young plants when potted should be again returned to the hot-bed, and when well established, their pots being well filled with roots, should be potted into upright thirty-twins, draining the pots well, and covering the surface of the soil with a thin covering of fine sand. After this the pots should be placed on the front shelf of a greenhouse, where they are freely exposed to the sun, but guarded from wind and rain, the first of which destroys the flowers, and the latter the plants. Care must also be taken in watering the plants; for on this much depends of the success in their management, for they are very subject to damp off close to the soil. It is also possible to grow this Purslane in the open ground in a fine dry season, if it is planted in a hot situation, where it can be protected from heavy rain and wind, but it will not, under such circumstances, display all its beautiful effects. —*Botanical Register.*

MISCELLANEOUS.

Chalk in Brazil. —It is a general opinion among geologists that no chalk occurs in South America; this was Humboldt's conjecture, and all succeeding geologists have adopted his view. Mr. Gardner has, however, in a paper read before the Philosophical Society of Glasgow, proved that in Brazil there is a very extensive chalk formation, probably extending over the whole of the immense shoulder which forms the most eastern point of the American continent. The country from the coast to the chalk district is very level, and large tracts of it all the way up consist of what are called Vargens by the Brazilians. These are large open spaces destitute of trees or shrubs for the most part, and only covered with herbaceous vegetation, and that sparingly, during the season of the rains. The place where Mr. Gardner found his evidence of chalk is situated in about 80° of south latitude, and 40° of west longitude, or about 300 miles in a straight line from the east coast. The locality forms part of an elevated table-land, which stretches continuously from the sea-coast southward, and forms a natural boundary between the two great provinces of Ceará and Piauhý. It is generally elevated from 500 to 1000 feet above the level of the country to the east of it, but not so much above that to the west; and at

the place from whence specimens were taken is about 2000 feet above the level of the sea. To this range the name of Serra Vermelha is given by the Portuguese, and Ibiapaba by the Indians. Between the 10th and 11th degrees of latitude it takes a westerly direction, and in about 47° of longitude takes a northerly sweep, finally terminating at the mouth of the Amazon, under the Equator, the country which it surrounds forming a vast valley, including the provinces of Piauhý and Maranhão.

Italian Rye-grass. —The following communication from Dr. Blundell respecting the early and abundant produce of Italian Rye-grass, we extract from the *Mark Lane Express*: —It is now more than three weeks since I drew your attention to the fact of my having cut a specimen of Italian Rye-grass on the 12th of June, the seed of which was only sown on the 27th of the previous April, which measured the astonishing length of 18 inches, cut clear from the surface soil! This, from the sowing to the cutting, is little more than six weeks! I make little doubt that many of your readers considered, as I did at the time, this rapidity of growth as surpassing that of any other known kind of grass; but what will they say when I inform them that on the same spot of ground, and from the selfsame plants, I have obtained a second growth of grass, cut on the 1st of July, the average specimen of which measured from 15 to 16 inches! This is only a growth of eighteen days, or very nearly equal to one inch per day. Again, another sample of this Italian grass, sown on a ground which was last year sown with Wheat, and which was also cut on the 1st of this July, measured 5 feet 4½ inches, and was only just then full in seed. Surely these facts are of themselves sufficient to establish the high claims of this grass to the notice of the agricultural public. Since my former letter appeared, a gentleman has written to ask me the question, "Whether Italian Rye-grass will succeed sown after harvest, upon a Barley stubble which is sown with Clover, for sheep feed?" and as this may be a question which may arise in the minds of others, I wish to inform them also that it will so succeed—and in a manner, too, that will surprise and exceed their most sanguine expectations. Again, I may further remark that such is the avidity with which stock of all kinds will eat this grass, that having once tasted it, they will forsake every other part of the field for that on which this grass may, for the sake of trial, chance to be sown and growing.

Great Produce. —We find in a late Number of the *American Agriculturist* the following statement: —"In answer to some inquiries as to the manner of obtaining the large crops, for which premiums were awarded at a meeting of the New York State Agricultural Society." Where the land was not naturally rich, it was made so by a plentiful use of barnyard manure, and some ashes and plaster. The corn was planted in hills two feet apart each way, kept clear of all weeds, and a product of 122 bushels to the acre was obtained. Of oats, five bushels were sown to the acre, on well-manured land, and 102 bushels obtained. In the same field, side by side, without manure, less than 86 bushels on an acre and a half were obtained; thus demonstrating, even on naturally rich land, the benefit of adding fertilising substances to it. The same care was used in the cultivation of all other grain, and also of the root crops; and the products were uncommonly large.

GARDEN MEMORANDA.

[Second Notice.]

Mrs. Sherbourne, Hurst House, near Prescott, Lancashire. —The cultivation of Tropical fruits is carried on here with a spirit too seldom to be met with. The principal collection is contained in two stoves, and perhaps a better or a more varied private collection, considering the short time that has elapsed since the talented proprietress first devoted separate houses for the cultivation of Tropical fruits, cannot be met with in the country. The greater part of the plants are as yet young, and several years, with the best of culture, must elapse before many of them can be expected to make any return for the trouble and care which they now require. At present, the younger plants have a very stimulating heat, with plenty of pot room; they will be kept growing vigorously until they have attained such a size as may be considered large enough for them to bear fruit, when they will be stunted in their growth, and every means used to induce them to bear fruit. The centre of each of the two houses is occupied by a bark-bed, such as is usually appropriated to Pines, but at a greater distance from the glass. Many of the plants are plunged in the tan, but the greater part merely stand upon it. To enumerate all the plants worthy of notice in the collection would take up too much space for the columns of a newspaper; a few of the principal ones will, however, give some idea of the nature and extent of the collection. There are some remarkably fine plants of the Rose Apple (*Jambosa vulgaris*); the Rose-Water Jamba (*J. aquea*); the Malay Apple (*J. Malaccensis*); and *J. macrophylla*. Also some very fine plants of the common Papaw-tree (*Carica Papaya*), the Monococious (*C. monoica*), and two other varieties, —all flowering and fruiting abundantly. A fine plant of Sour-sop (*Annona muricata*), with several other species of the Custard Apple; *Terminalia angustifolia*; the Star Apple (*Chrysophyllum Cainito*); the Alligator Pear (*Persea gratissima*); all fine plants, especially the last; there are, besides, very fine plants of *Annona Barbadosensis*; a noble plant of a Musa, called Steel, resembling *M. Cavendishii*; fine young plants of the Honey-berry (*Meiococca bijuga*); handsome young plants of the Mammee-tree (*Mammea americana*); the silvery leaved Star Apple (*Chrysophyllum argenteum*); the Akee-tree (*Begonia sapida*); the Anchovy Pear (*Grias cauliflora*); the Jacca-tree (*Artocarpus integrifolia*); and another species of Bread-fruit also the Cashew Nut (*Anacardium occidentale*); a noble plant of *Cicca disticha*; another of the Butter-Nut (*Caryocar nuciferum*); the Pistacia lentiscus and terebinthus, and many more remarkable plants. The back wall of one of the stoves is covered with Cattle's Guava (*Psidium Cattleianum*). There are also in these two stoves many fine plants which are cultivated merely for their flowers, the principal of which are *Nelumbium speciosum*, throwing up many fine flowers; *N. luteum*, and a third a white species. *Nymphaea carulea*, rubra, and odorata, and two beautiful plants of *Pentstemon crassipes*; *Ixora coccinea*, or stricta, fine and healthy; *Tabernaemontana grandiflora*; a fine plant of *Bignonia grandifolia*, but not in flower; *Sagittaria sagittifolia*, *Lumocharts*, *Humboldtii*, and several others, all good plants. *Bignonia campanulata*, and a great variety of climbers, trained up the numerous pillars, render these houses gay and interesting. Against the back-wall of a Pine-stove is a very large plant of the Lee-chee (*Euphoria Litchii*); also a large plant of *Jambosa aquea*, and another of the Cherimoyer (*Annona cheri-*

molia); these last three are planted in a border, and cover about 30 square yards of wall; it is hoped from their size that they will soon begin to bear fruit. The Cherimoyer has produced flowers, but did not carry its fruit well; Mr. Durden supposed that this may result from the plant not obtaining a sufficient rest during the winter, as the Pine-stove may be too warm for it at that season. At the back of another Pine-stove is a large plant of the Mango (*Mangifera indica*); an equally fine plant of the Sappodilla Plum (*Achras Sapota*); these, with *Piper nigrum*, cover about 30 square yards of the wall. Against the glazed end of one of the houses is an immense plant of *Ipomoea Learii*, flowering most abundantly; this, and many other of the finest of the climbers noticed here, are planted in the Vine border outside of the house, and the branches pass through a hole in the front wall. To judge by the luxuriance of their appearance the situation agrees with them well, for they have a great superiority over those planted in pots, both in health and in the abundance of their flowers. There will be a difficulty, perhaps, in preserving the roots from frost, but that Mr. Durden hoped to effect by placing shallow boxes, filled with light dry litter, over the place where the principal part of the roots lie. With such plants as *Ipomoea Learii*, it may scarcely be worth the trouble to preserve the old plants over winter, seeing that a young plant will grow quite large enough in one season. There are some good Pines in the pits, and some excellent grapes on the Vines, especially one plant of Mill Hill, which has some excellent bunches on it. In one viney are some fine bunches of the Cannon Hall Muscat Grape, and some fine Figs in another house. The greenhouse, a neat structure, having a dome in the centre and two span-roofed ends, contains, at present, nothing remarkable, the greater part of the plants being out of doors. A clean well-cropped Kitchen Garden and a neat little Flower Garden are both in keeping with the rest of the establishment. —*J. W. Jones.*

At *Roseenth*, in *Dumbarshire*, there are two plants of *Fuchsia discolor*, nearly equal in size, and so rapidly increasing, that two Gooseberry bushes had last year to be moved to give them room, as the Fuchsias were smothering the Gooseberries; and now, to prevent a similar result, a limb of a Standard Apple-tree must be taken off. The largest is in circumference 40 feet, and in height 7 feet 3 inches. I brought a very small plant of it home in April last, from a cutting in a pot, and planted it out, being a few inches in size. It is now in circumference 6 feet 2 inches, and 2 feet high. —*Ryall Hill, Worcestershire.*

Liebig's.

Dr. Justus Liebig, in his Relation to Vegetable Physiology. By Dr. Hugo Mohl. (Dr. Justus Liebig's Verhältniss zur Pflanzen-Physiologie.) Tübingen. Fues. 1843.

(Continued from page 614.)

In that chapter which is devoted to the Culture of Plants, Professor Liebig puts forth a regular theory of vegetable nutrition—as far, namely, (observes Dr. Mohl,) as L.'s unconnected way of writing admits of any systematic arrangement. He again starts from the assumption, that humus cannot be absorbed and used as food by plants; for two reasons—one chemical, and the other physiological. He, in the first instance, denies that the humus of vegetable mould possesses the properties ascribed to it by chemists, it being absolutely insoluble in water, and not combining with earth into soluble salts. The latter, he says, may be seen in calcareous caves, whose stalactites, instead of consisting of humate of lime, do not contain a trace of vegetable matter. Dr. M. says that he does not intend to settle these opinions, for he has no doubt that chemists will take them up in due time. He merely throws out the following remarks: —"It cannot be positively asserted that the humates contained in vegetable mould are insoluble in water, because water will dissolve out of the soil a certain amount of an organic, brownish substance—an experiment which can be made with any garden soil; still coal of humus seems to possess the property of subtracting these substances from a solution passing or filtering through soil, otherwise (as L. has stated) all our springs would contain brown water. It appears, moreover, that besides coal of humus, the inorganic substances of the soil themselves possess (although in a lesser degree) the property of withdrawing from water the substances dissolved in it—a circumstance to which the greater purity of springs coming from a great depth may be ascribed. Still this withdrawal of organic substances is obviously only a partial one, for our spring-water is never free from organic substances—a fact borne out by analysis, as well as by the putrescence to which spring-water is subject. This perfectly agrees with the new experiments of Saussure, who found in all waters an azotised substance soluble in water." All these facts, therefore, give quite another result from that which L. has arrived at, viz., that the water which filters through vegetable mould will always supply plants with some portion of organic matter. How far this substance influences the nutritive process of plants, was the proper question for Liebig to examine, but which he has neglected to enter into. Saussure has, however, made some experiments on the absorption of humate of potash, and the extract of vegetable mould by the roots of plants (*Bibl. Univ.*, vol. xxxvi. p. 340). Although these experiments do not strictly prove that this is really the case, under all circumstances; still they go so far as to prove, that it will be the case as long as the roots are healthy, and do not, by their putrescence, yield humous substances to the water. L., in a subsequent refutation of these experiments, ascribes their telling against him to an error of calculation! In another part of this chapter (p. 109), L. says, that humus, if not properly exposed to the influence of atmospheric air, will form with water a solution of a brown colour; but that no plants can grow in such soil, for the humus will consume all the oxygen contained in the air. It is (says Dr. Mohl), quite inconceivable how a man can write such things, when the inspection of any peat moss will show the fallacy of such assertions.

The second argument which L. brings forth to support his favourite assertion of plants not feeding on humus, is based on physiological grounds. He first announces as a general principle, that, under the appellation of food, such substances only can be included, as being derived from external sources, can maintain all the vital functions, and which the organs of a plant can use for the formation of the substances peculiar to them. This ambiguous

definition includes (says Dr. Mohl), some anomalies, and does not apply to several reputed kinds of food. Starch, for instance, is certainly one of the substances on which man feeds; yet he could not live on it alone. In further explanation of his views, Liebig adduces the example of a grain of Wheat, which contains the necessary ingredients of the germ, and the first fibres of roots; and he adds that we have to suppose that these ingredients are mixed just in the proportion that is required for the development of those organs. If one of the ingredients, say starch or gluten, were superabundant, they would not serve either for the formation of leaves or otherwise. Carbon, also, as well as ammonia and water, are always combined in plants with an azotised matter; and it is for this reason that substances, containing no nitrogen, like gum, sugar, &c., and consequently no humic acid (which stands next to them in a chemical point of view), are not used as food by plants, but would rather impede the vital process and kill the plant. (p. 116.) In analysing this string of assertions, Dr. Mohl observes, in the first instance, that the absorption of azotised compounds as food by plants is a fact doubted by no one; but he doubts whether the quantitative proportion between the absorption and digestion of azotised and unazotised substances, assumed by Liebig, be based on fact. L. says that this proportion must exist in the grains of Wheat. But Hermbstadt's fine experiments on the different sorts of grain show quite the contrary; for one sort of Wheat contains 41 per cent. of starch to 34 per cent. of gluten, whilst another sort shows a proportion of 65 to 9. But this varying proportion of azotised and unazotised substances also occurs in the organs of vegetation themselves, as may be seen in the roots of Beet cultivated on a soil rich in vegetable mould, or in one manured with animal matter. Chemistry, therefore, does not support Liebig's assertions. Indeed, he himself, in some degree, contradicts his own statements, when he says (p. 119) that if plants obtain a greater proportion of carbon than of nitrogen, then the carbon will not be used for forming gluten, or albumen, or wood, nor for any constituent part of an organ, but will be secreted in the form of sugar, starch, oil, wax, resin, mannite, gum, &c.

(To be continued.)

Hooker's Icones Plantarum, Vol. II., New Series; or Vol. VI. of the entire work, has appeared, with a most interesting selection of plants. The figures are executed in the same bold style as those of former volumes, and are remarkable for the vigour and truth of the drawings. Among them are many from the Straits of Magellan, which just now are particularly acceptable. Others are from New Zealand, and will be useful to the more scientific among the settlers in that colony; as, for example, the Miro Tree and the Mai, (two species of *Podocarpus*); a most curious species, thought to be of the same genus, with the habit of *Lycopodium phlegmaria*; *Ourisia macrophylla*, a handsome herbaceous plant of the Fox-glove tribe; *Phyllocladus trichomanoides*, the Tanehaha Tree, one of the finest of the Coniferae; and a fine blue *Lobelia physaloides*, from the woods of Wangaroa. Among Van Diemen's Land novelties are those curious plants called by Don, *Athrotaxis*, which form a very peculiar set of Coniferae, nearly allied to *Cunninghamia*. Containing such illustrations as this the work would be one of the most acceptable of all presents in our southern colonies, and ought, in fact, to be found in every public Colonial Library.

CALENDAR OF OPERATIONS for the ensuing week.

I HAVE had a number of inquiries about the best and cheapest modes of heating hotbeds, by the trough system, &c. &c., some of which I have answered privately; the rest I shall endeavour to answer from time to time, in observations at the head of the Calendar; but as this can only be done in an unconnected form, to suit the different queries, I shall draw up a paper or two on the subject, the first of which will probably be ready for publication soon. What depth of water do you recommend for the troughs? almost every one inquires; and as this seems to be less understood, by the best advocates of the system than it ought to be, I shall answer it first, from my own practice. The heat given out by a body of water in these tanks does not depend on its depth; and this is one of the most important points to be looked to in the construction of new tanks. The breadth of surface determines the heat given off. A certain surface of water heated to 140° or 150° will give off the same quantity of heat whether the water in the tank be half an inch or 20 inches in depth. One correspondent, in June last, almost quarrelled with me on this point, but I have since satisfied myself on the subject by direct experiments with my own troughs, and my attention was first drawn to it by the young men who attend our fires insisting that the less water they put into the troughs the more heat they received: we had eight inches depth of water in the troughs at the time, and the house was kept at about 60°. When we had from 7° to 10° of frost, the heat of the water at the surface was 140°, and as the frost increased we had to increase the heat of the water up to 150°, and a few degrees higher once or twice. This being ascertained, the water in the troughs was reduced from eight inches to two inches in depth; this depth of water kept up the temperature as usual, that is, two inches in depth of water at 140° kept the temperature of the house at 60°, when the frost was 10° out-of-doors. Except in hard weather our troughs were never filled more than two inches deep. Seeing, therefore, that the heat is not in proportion to the depth of water, but to the surface it presents to the bed to be heated, the most economical plan in the end will be to make the tank as wide as the bottom of the bed, or nearly so. A three-light Melon-bed, six or seven feet wide, will probably require the water in the tank to stand three inches in depth, if it be intended for use early in February. This depth is not suitable for increased heat, but as a reservoir of heat, which will hold out 12 or 15 hours. A bed with nine lights, to be used early in May, will only want 1½ inch in depth to retain heat for the same length of time, while a range of 100 feet may safely be worked with a tank one inch in depth. Now, this may not be the exact ratio, but it is near enough for practice; and recollect the calculation refers to Melon and Cucumber beds, where 20 inches or two feet of soil lies over the top of the tank; of course any other kind of plant may be planted in the soil, such as the Pine, &c. Here Mr. "Rendle's system" falls a little short of previous arrangements; he makes no provision for moistening the bottom of such a bed, and a gardener cannot well ascertain the moisture of the soil in the bottom of his Melon beds. In a paragraph of the leading article of last week's *Chronicle* is the following statement:—"Where an open tank is used three things happen: the steam condenses among the soil, and renders it mere mud; the tanks become foul with soil that drains into them, and by degrees are choked." Now, this mere mud is the very best thing that can

be for growing Melons and Cucumbers in, providing you keep a dry atmosphere over it, and the surface of the bed also quite dry, and stirred three or four inches deep. Melons and Cucumbers for the markets of Mexico have been grown on beds of mere mud, floating on the lake of Chalco, near that city, time out of mind, to say nothing of the floating beds of Cashmere, where great quantities of Melons, Cucumbers, and Gourds are grown every year on mud beds two feet deep. Melons could thus be grown in any part of the world where strong, dry heat prevails; and here, in England, we can now imitate this state of things. Dr. Lindley's "Guide to the Orchard," the best book on the subject in our language, has this remark bearing on the subject:—"They (the fine Melons of Persia), are found to require a very high temperature and dry atmosphere, and an extremely humid soil."

I.—KITCHEN-GARDEN AND ORCHARD.

In-door Department.

PINERY.—Now that the beds are settled down to a more temperate bottom-heat, see that they do not lower too much, for want of turning the linings; as they are growing fast, they will stand a brisk bottom-heat of 80° or 85°, as long as the weather keeps fine; they will also stand a good current of air: this will harden their leaves and ripen them, as it were, before the dull days overtake them in a green succulent state. We can never pay too much attention to plants of all sorts, in order to assist and hasten their growth when they are in motion; if we get them well ripened, as the season advances, they are better fitted to stand against our long dull winters; and as Pines do not require so much light for this purpose, we may keep them longer in growth late in the autumn, and fires may, therefore, be applied sooner to them than to other stove plants.

VINERY.—In spring we give most air at the top of the house, in order to keep the tops of the Vines cooler, to induce the plants to break regularly all the way down; but in autumn we reverse this plan with late Vines, to keep the top of the house warmer; this we do to get the younger portion of the shoots well ripened, as these are always more succulent than the bottom shoots, and though they may appear brown on the outside, the inner portion of the wood still requires heat to ripen it; there is nothing like getting all the young wood well ripened throughout while the leaves are yet fresh. Laterals and the tops of long rods may now do more harm than good, if left growing, as all the buds are fully organised; these send down their organised matter, and perhaps hinder the shoots from ripening so fast as they would otherwise do. Whether this be so or not, experience has taught us that these had now better be cut away.

PEACH, APRICOT, CHERRY, or FIG-TREES, in boxes, in these houses, except any of the latter that are in bearing, might now be turned out behind a north wall, and pruned at once. Some of the earliest Strawberries in pots for forcing often throw up flower stems at this time; if there is a good stock on hand these might be encouraged, and would produce a few dishes in October; otherwise the flower-stems should be cut off as they appear.

Out-door Department.

Wheeling in rotten dung, for vacant pieces of ground, and digging or trenching them; looking after the Onions, to get them well dried, tying up Lettuces and Endive occasionally, with the general routine of weeding and keeping the ground clear, is the principal work now in the kitchen-garden.

COMPOSTS.—About this time we mix up a twelvemonth's store of what we call universal compost, and put it under cover while dry; it is made up of exhausted Melon-mould, rotten dung, and leaves, the refuse of the potting-sheds, also last winter's gatherings from hedges, banks, ditches, road-sides, &c., that have been carted to the compost-yard, and exposed to the weather all the season. Not a blade of Grass or a withered flower should be lost. Depend on it, if there be one secret in gardening more than another, it is to keep a sharp eye over the compost-yard.

CABBAGE.—If you have any more left on the seed-beds there is plenty of vacant ground now for them, and they will come in for some purpose by-and-by.

CALIFLOWERS should also be got out in time, where they may be protected, or prepared for planting under hand-glasses and frames.

LETTUCES.—While the weather is fine get in the last sowing for the late spring supply, before the week is out.

CELERY may get a good earthing-up now, when the soil is dry, and so may the Cardoons, as they have now finished the greater part of their growth.

TOMATOES promise well; pinch off all their lateral shoots, and stop the leaders just as you would the Vines; but they like more sun than Grapes, and you may cut off some of their leaves, to let the sun reach them.

ORCHARD.—Any of the weak, useless side-shoots may now be cut away, and many of the shoots stopped on wall-trees. Place Beant-stalks among the Peach-trees, if there be any earwigs, and blow them into a pot of water in the morning; this will soon thin them. See that you know the names of all your Peaches before the fruit season is over; if you paid attention to the size of the flowers, the leaves and fruit will now go a good way to determine their right names. It is important that everything should be correctly named. Mats or canvas over Gooseberry and Currant bushes might now be taken off, and the dead leaves and fruit cleared away; when all is clean and sweet, put on the coverings again. Wasps and flies are not very troublesome this season, and there is a chance of keeping fruit for some time.

II.—FLOWER-GARDEN AND SHRUBBERY.

In-door Department.

STOVE.—After this time the syringe need not be much used, and the watering may be done in the morning; let as little water be thrown about as possible; admit large portions of air, and let the house be shut up, with everything dry and sweet, for the night; all this will prepare the plants gradually to go quietly to rest before the winter. Any more growth this autumn cannot do much good, therefore take care of what is made, and be contented.

GREENHOUSE.—The young stock in the nurseries was never in better condition than it is this season, and the rule of "first come first served" is always adhered to in this business; they also house their young plants sooner than we do in the country, and therefore it is much better to order soon what plants are wanted, so that one may get the cream of the stock, and have time to recover the plants from the effects of carriage, before the winter sets in.

CONSERVATORY.—I have just heard that a new plant for the conservatory has appeared near London, called, or to be called, *Lisianthus nigricans*; and if it proves such an acquisition as L. Russellianus, it will be a welcome guest to many. Might not Mr. Cuthill give us a paper on his treatment of the latter? many people find a difficulty in managing it. Little shade will now be wanted to ward off the sun from this house; the plants will require much less water, and the house should be kept close, and shut up early in the afternoon.

PITS AND FRAMES should be filled with good things for next year. As soon as the cuttings are struck let them have a few weeks out-of-doors, if possible; it will revive them much before winter, and will also enable them to stand the confinement with greater freedom.

FLOWER-GARDEN.—Now those who make use of annuals after the middle of June will begin to have blanks among their beds, while those who despise these temporary plants will have full display till cut off by frost. From the middle of April, therefore, to the middle of June is the proper time for these assistants, while more permanent things are coming forward to take their places.—D. Beaton, *Shrubland Park Gardens, Ipswich*.

State of the Weather at Chiswick during the last 17 years, for the ensuing Week ending September 16, 1843.

Sept. 1. Foggy; very hot throughout for the period of the season; overcast.
2. Heavy dew; slight haze; hot and sultry; clear.
3. Heavy dew with slight haze; hot and dry with bright sun; lightly overcast.
4. Clear; fine with bright sun; clear at night.
5. Heavy dew; cloudless; cool north wind at night.
6. Clear and fine; almost cloudless, and exceedingly fine throughout.
7. Heavy dew with slight haze; cloudless and hot; clear and fine.
Mean temperature of the week 64° above the average.

REPORT ON COVENT-GARDEN MARKET,

For the Week ending Sept. 8, 1843.

THE continued fine weather has improved the quality, and increased the supply, of Fruits and Vegetables of almost every kind; but in consequence of a great number of the nobility having retired to their country seats, the demand has been rather dull. Pines are exceedingly plentiful, and are said to be of excellent quality. Grapes are supplied in very large quantities—particularly Black Hamburgh and Muscat of Alexandria—and are selling at from 2s. to 4s. per lb. Apricots are offered at nearly the same prices as last week. Plums still continue plentiful, particularly the Greengage, Violet, and Muscle; the Orleans are becoming less plentiful. Peaches are very abundant, and bring from 4s. to 6s. per doz. Nectarines bring from 1s. to 4s. per doz. Figs of good quality are offered at from 4s. to 6s. per doz. Good Filberts continue plentiful, and are selling at from 40s. to 55s. per 100 lbs. Melons bring from 1s. to 4s. each; and Cucumbers, per brace, are from 5d. to 1s. Cauliflowers are good and plentiful, and bring from 2s. to 6s. per doz. Cabbages and Turnips are plentiful. Peas are offered at from 3s. to 4s. per half-sieve. French and Windsor Beans bring nearly the same prices as last week. Tomatoes are from 6s. to 7s. per half-sieve. Some good Endive may be got, at from 1s. to 1s. 6d. per score. Carrots and Shallots are plentiful. Among Cut Flowers are Erics, Fuchsias, Pelargoniums, Verbenas, Calceolarias, Stocks, Dahlias, and Pansies.

PRICES, SATURDAY, September 9, 1843.—FRUITS:—

Pine Apple, per lb., 3s. to 5s.	Cherries, Wall, per lb., 1s. to 2s.
Grapes, hothouse, per lb., 3s. to 4s.	Raspberries, per gallon, 7d. to 1s.
Portugal, per lb., 1s.	Damsons, per half-sieve, 3s. to 4s. 6d.
Peaches, per dozen, 5s. to 6s.	Apples, dessert, per bush., 5s. to 6s.
Nectarines, per dozen, 1s. to 2s.	Kitchen, per bush., 2s. 6d. to 3s.
Apricots, per doz., 1s. to 4s.	Pears, per half-sieve, 2s. to 3s.
Figs, per doz., 4s. to 6s.	Oranges, per dozen, 1s. 6d. to 2s.
Melons, each 1s. to 4s.	— per 100, 10s. to 25s.
— Dutch, each, 1s. to 2s. 6d.	Lemons, per doz., 1s. to 2s. 6d.
Pump, per punnet, 1s. to 2s.	— per 100, 7s. to 14s.
— violet, per half-sieve, 2s. 6d. to 3s. 6d.	Cucumbers, per brace, 6d. to 1s.
— Gage, per punnet, 2s.	Gherkins, per 1,000, 6s. to 7s.
— Gages, Green, (Baking) per half-sieve, 3s. 6d. to 7s.	Almonds, per peck, 6s.
— Black, per half-sieve, 3s. 6d. to 5s.	Sweet Almonds, per lb., 2s.
— Red, for wine, per sv., 3s. to 4s.	Nuts, per bushel —
— for dessert, per half-sieve, 4s. to 6s.	— Brazil, 16s.
Cherries, Morello, standards, per half-sieve, 6s.	— Barcelona, 22s. to 24s.
— sieve, 6s.	Filberts, English, p. 100 lbs., 40s. to 55s.
	Tomatoes per half-sieve, 6s. to 7s.

VEGETABLES.

Cabbages, per doz., 9d. to 1s. 3d.	Leeks, per doz. bun., 2s. to 3s.
Cauliflowers, per dozen, 2s. to 3s.	Onions, Spring p. doz. bchs., 1s. 6d. to 2s.
Beans, Kidney, per half-sieve, 1s. to 2s. 6d.	— Large, per doz. bchs., 1s. to 2s.
— Scarlet, per half-sieve, 1s. 6d. to 2s. 6d.	— Spanish, per doz. bchs., 1s. 6d. to 2s.
Windsor, per sieve, 1s. to 1s. 6d.	Garlic, per lb., 6d. to 8d.
Peas, per sv., 2s. to 4s.	Chilis, per 100, 1s. to 2s.
Pointons, New, per ton, 80s. to 90s.	Peas, per bushel, 2s. to 3s.
— per cwt., 1s. 6d. to 4s.	— per sack, 3s. to 6s.
— per bushel, 1s. to 2s. 6d.	Lettuce, Cabb., p. score, 9d. to 1s.
— Kidney, p. bush., 2s. to 4s.	— Cos, per score, 6d. to 1s. 6d.
Artichokes, green, per doz., 1s. to 2s.	Celery, p. bd., (12 to 15) 9d. to 1s. 6d.
Vegetable Marrows, per doz., 6d. to 1s.	Small Salads, per punnet, 2d. to 3d.
Turnips, per doz. bunches, 2s. to 4s.	Sweet Basil, per doz. bunches, 2s. to 4s.
Red Beet, per dozen, 9d. to 1s.	Watercress, per doz. sm. bun., 4d. to 6d.
Horse Radish, per bundle, 1s. to 6s.	Farsley, per half-sieve, 1s.
Radish, spring, p. doz. hands, 6d. to 1s.	Farragon, per doz. bunches, 2s. to 3s.
Turnep, p. doz. bunches, 9d. to 1s.	Fennel, per doz. bun., 2s. to 3s.
Carrots, Horn, p. doz. bunches, 2s. to 6s.	Endive, per score, 1s. to 1s. 6d.
— Long, per doz. bunches, 4s. to 7s.	Mint, per doz. bunches, 1s. 6d. to 3s.
Shallots, per lb., 6d. to 9d.	Marjoram, green, per bunch, 3d. to 4d.
— green, per bunch, 4d.	Mushrooms, per pottle, 1s. 6d. to 2s.
Spinach, per sieve, 1s. 6d. to 2s.	Walnuts, Green, per bushel, 7s. to 9s.

Notices to Correspondents.

MANURES.—B. F.—This is the wrong season for top-dressing Asparagus with Potter's Guano, or any such manures. They should be applied when plants are in full growth, or are just about to grow; the Asparagus is now ceasing to grow. You had better give your bed a good dressing of rotten dung in the end of October or beginning of November, when the Asparagus stem is dead, and then Potter's Guano, at the rate of 2 lbs. to a rod, in April, repeating the dose in June and the beginning of August. Two cwt. an acre of this manure will be found excellent for any field-crop.

GUANO.—A Tulip-Grower inquires whether any of our readers used any Guano in growing their Tulips last season; and if so, what effect it had upon them, and the mode and quantity of Guano used.

FRUIT-TREE BORDERS.—R. E.—Your garden being on a slope affords you the command of drainage; but to drain off the water after it has gone through the substratum of your garden, however promptly this may be effected, is not all that could be desired; for in its continual progress it chills the roots of your trees in proportion to the difference there is between its temperature and that of the rain-water which falls during the growing season. It will, therefore, be advisable to cut off the springs by a deep drain along the outside of your garden at top. With regard to the wall borders, as the subsoil is bad, it will be better not to disturb it; for to break part of it up and mix with the top soil would only deteriorate the latter. A layer of concrete interposed, sloping from the wall, between the bad subsoil and the top portion is the best remedy. The trees should be carefully taken up in autumn, and as the border is prepared, replanted very shallow, covering their roots with rich turfy loam. A drain should be made in front lower than the bed of concrete; but whilst this provision is made against stagnant moisture, a sufficient supply of water should not be withheld. If you trench as near the stems of your standard trees as you can without depriving them of too many roots, they will begin to bear as soon as young roots are struck out in the fresh-stirred soil; or, if your dwarfs are growing vigorously, instead of shortening in winter, have recourse to summer pruning. June 30. We have to apologise for the answer to this letter having been mislaid by our assistant till now. It is, however, still in good time for operations.

HEATING.—R. G. L.—In our opinion it is of no great consequence which of the many boilers now in use is employed. We should be guided in some measure by their price. Most of them answer the purpose very well. As to their size, that, too, is immaterial; the larger they are the longer the fire will be in producing its effect, and the longer the effect will be maintained when the heat is up; and vice versa. When small boilers are wanted, we prefer such as have the fire in the inside; but others prefer the horse-shoes, which, if well set, are exceedingly good. For such houses as yours, where the makers call second-size boilers are perhaps the best.—A Brother Subscriber would be much obliged to Mr. D. Weestove, if, as early as possible, he would inform him through the medium of the *Chronicle*, where such a boiler as that described at page 389 of the vol for 1842 may be obtained; and, if possible, how it must be set, so that the fire-flue may, as stated, pass below, round, through, and over it.

PROTECTIVE PITS.—*Cavanensis* will find these fully described at p. 629 of our volume for 1841. All that is necessary is to keep them dry, and to exclude severe frost; some frost, under such circumstances, will do less harm than fire-heat judiciously applied. If you think some kind of heating apparatus really necessary, use a flue, or, better, hot-water pipes, but do not on any account employ the manure from your stalls, which is almost sure to make your plants damp off.

PITS.—*Tindore.*—Pits covered with canvas are used for protecting plants in winter. They do not obstruct the light too much for such plants as merely require shelter. Pits with peat walls, spoken of about a year ago as being very warm and good, will last for many years, if well made. They merely require to be supported inside by upright stakes here and there, especially at the corners, and to slope at an angle of 45° outside.

MIMULUS.—*H. I.*—The varieties of *Mimulus* you have sent will form excellent border flowers. Seedlings of the same colour we have had sent from other parts, but your flowers are the largest we have seen.*

LOPHOSPERMUM.—*H. I.*—Unless the spotting on your seedling comes more distinct than in the specimens sent, it will not be worth keeping.*

MAURANDIA.—*W. Miller.*—We should like to see some flowers of your crimson seedling.*

WARWICK.—*Yucca.*—Cut the flower-stem off your *Yucca gloriosa* directly it has done flowering, and take away all the suckers except three of the strongest. Then remove a little of the soil round the bottom of the plant, and replace it with a dressing of equal parts of sandy loam and cowdung. ¶

LOBELIA FULGENS.—*Persona.*—This plant will do best planted out in the open border, in a rich light soil, as early in spring as the weather will permit, where it may remain until autumn; when the roots should be taken up and packed closely together into a cold frame, and kept free from frost during winter. †

ROSES.—*A. C. E.*—The following list of 24 Roses comprises good free-flowering kinds for an amateur's garden, which are easily procured, and not expensive:—*Brennus*, carmine red; *Mordant de Launay*, pale bluish; *Crested Moss*, rose; *Blush Moss*, pale bluish; *Double Yellow Sweet-brier*, bright yellow; *White Sweet-scented China*, white; *Village Maid*, striped; *Elm-leaved Provins*, bluish rose; *Unique*, white; *Moss de Meaux*, rose; *Gloire White Hip*, white; *Rose du Roi* (Perpetual), crimson; *Madame Desprez*, rosy purple; *Bizarre de la Chine*, dark crimson; *Madame Campan*, spotted; *Triomphe de Laffay*, white; *Duchesse d'Angoulême*, rose; *Shailer's Provins*, pale rose; *Queen of Denmark*, bluish; *Riego*, rosy lilac; *Parny*, slate; *General Lamarque*, dark crimson; *Jean Hachette*, rosy lilac; *Madam Hardy*, white. ¶

FUCHSIAS.—*A Constant Reader.*—It is very doubtful whether you may succeed in raising plants to produce (as a permanent character) blooms similar to the one you sent. It is a mere sport, a thing not at all uncommon with this species; you may, however, save the seeds for the sake of the colour, which is good. To flower *Fuchsia affinis*, pinch it well in the pot, and give it little water until it shows symptoms of flowering; then give it a good shift, and treat it well. †—*H. L. W.*—A Correspondent under the preceding initials, wishes to ascertain if a seedling *Fuchsia* has been raised with the true *Fulgens* bloom at every leaf, instead of being in clusters at the end of the branches? *

CAMELIAS.—*A. C. E.*—When your *Camellias* have done growing, clear away the soil carefully all round them, and examine the state of their roots, as probably the old ball may be very dry below, or very damp, or probably the soil in which they are planted may not suit them; in either case they will have lost all their small roots. If their roots be found to be in a very bad state, take them up and clear as much of the old soil off as possible, pot them in a mixture of sandy loam and peat, and give them a good watering; afterwards place them in a close house, where the temperature is low and rather moist. If the roots be sound, take away a portion of the old soil, and replace it with a mixture of three parts sandy loam and one part peat, to which may be added a small portion of well-decayed cowdung;—then give them a good watering; and should the old ball be found hard and dry, take an iron rod, pointed at one end, and pierce the old ball in various directions, to admit the water to penetrate. ¶

GOLD OF PLEASURE.—*C. M. L.*—This plant is *Camelina sativa*, formerly called *Myagrum sativum*, a plant allied to Rape, and possessing similar qualities. It is the *sepioides* of Theophrastus, the *myagrus* of Dioscorides, and probably the *Irio* of Pliny. It is found apparently wild in some parts of this country, but may have been introduced with Flax. On the Continent it is cultivated for its seeds, which are crushed for their oil. We are not aware that it furnishes thread.

DOUBLE FLOWERS.—*Timothy.*—Double flowers cannot be fertilized without the assistance of single ones, if they are really double, that is to say, have all their organs of fructification metamorphosed. Nor will single flowers produce double-flowered seedlings, unless in the presence of flowers partially double. If you are right in saying that the double *Ten Weeks'* Stocks in your friend's garden had neither male nor female organs, then they are absolutely sterile. But we suspect you have not examined them with sufficient care.

CREPERS.—*H. C.*—The following are showy and hardy:—*Clématide Hendersdii*, deep blue, flowers from July to September; *Cl. montana*, white, flowers in May; *Cl. azorea*, large blue, flowers in May and June; *Cl. Sieboldi*, white, with purplish centre, flowers in June and July; *Tecoma radicans* major, scarlet, flowers in August and September; *Rose Jeanne Desprez*, buff, very fragrant, in flower all the autumn; *Rose Noisette Lamarque*, white, flowers in May and June. The following are annual or tender:—*Tropæolum pentaphyllum*, green and purple, in flower all the autumn; *T. peregrinum*, pale yellow, in flower all the summer and autumn; *Rhodochiton volubile*, brown, in flower all the autumn; *Lophospermum erubescens*, pink, in flower all the autumn; *L. grandiflorum*, deep crimson, in flower all the autumn. ¶

VINES.—*J. M. G.*—You may as well attempt to multiply a pound of salt by a bushel of feathers, as to graft a Fig on a Vine. To be sure there is an old statement, as old, we believe, as Columella, that the thing may be done, but it is a piece of absurdity, and quite impracticable, as has been experimentally shown by the late Mr. Thonin.

MULBERRIES.—*f. f.*—The Mulberry Tree does not usually fruit at an early age, and when subjected to close pruning and training against a wall, as yours has been, till within the last four years, it is in consequence retarded. But as your climate is rather cold, you must endeavour not to lose the benefit of the wall, which you will do in a great measure by allowing the tree to grow without pruning or training. You must only regulate and thin the branches at the winter pruning; and stop the young shoots in summer when they have made four leaves. ¶

CURRENT-BUSHES.—*Este.*—In answer to "Rambler's" wish of procuring information respecting Current-bushes from Haines's work, will, in a short time, send the requisite extracts from the work to the office of the *Gardeners' Chronicle*.

MELONS.—*J. M. G.*—and very many more correspondents, must inquire for the seeds of the Eastern Melons of their friends or of the nurserymen. We cannot give away such things; our duty is done when we point out their existence.

ASPARAGUS.—*Este.*—There is no permanent difference in your Asparagus; they are both one kind; the difference in colour is only owing to accidental circumstances. †

MILDEW ON PEAS.—*P. A.*—There is little doubt but that this disease is produced from your soil becoming hard and caked about the roots of the plants; stirring it up and keeping it moist might be a preventive, but you will only get thoroughly clear of it by altering the condition of the soil. †

VEGETABLE MARROW.—*Persona.*—There are different kinds of Vegetable Marrow, the sort usually grown by Market Gardeners is a long white variety; but a better is the *Courge à la Moelle* of the French. We never recommend seedsmen. †

MEADOWS.—*C. L.*—The bad state of the herbage on your meadow, having a peaty soil, is owing, probably, to an excess of tannin remaining in the peat. Lime and dung are the best correctives in this case. Any kind of earth laid on the surface will improve the Grass. Sand, marl, or chalk, in sufficient quantity, will produce white Clover, and destroy the coarse tussocks; but if this has been tried without effect there may be some other cause of the growth of poor Grasses, which a careful analysis of the soil may discover. M.

CORN.—*Teodore.*—According to Gorham, Maize contains 2½ per cent. of albumen, and 3 per cent. of gluten; good Wheat, on the contrary, contains, according to chemists, from 12 to 15 per cent. of gluten.

MONSTERS.—*G. Lightbody.*—Your Auricula, forming an offset at the end of its stem, where the flowers rise, and the singular Pear growing out of another Pear, are not very rare, but are highly curious proofs that all the organs of flowers and fruit are formed from conversions of leaves. You will find figures of the latter in the "Theory of Horticulture," p. 59 and 61.

TRUFFLES.—*Persona.*—Is anxious to know whether our kind correspondent the Rev. Mr. Berkley has grown any Truffles, and whether the Tuber moschatum would not be a good sort to make a trial with. Perhaps Mr. B. will favour our readers with some observations on this point.

MOVING PLANTS.—*A Young Lady* may move her Pelargoniums, &c., to a distance of fifty miles, by turning them out of their pots, or digging them out of the ground, and packing them tightly in moss, in a wooden case or basket. If space is an object, the heads may be cut off the Pelargoniums without injury to them.

MOSS ON FRUIT-TREES.—*Ignoramus.*—Scrape off as much of the Moss as you possibly can, and wash the trees with lime-water. Shorten branches in autumn, with a view to the production of young shoots, a sprinkling of which will greatly invigorate the trees. ¶

COUNTRY SHOWS.—*G.*—We perfectly agree with you that the reports of Country Shows are too often interesting to none but the parties concerned; but it is interesting to them that they should be recorded. As we give them at a great expense to ourselves, and at no expense to any one else, for they appear in our double Numbers, we think our correspondents can hardly complain of them in fairness.

INSECTS.—*P. M.*—Your insect, as you suppose, is a *Tenthredo* of old authors, but is now called *Allanthus arcuatus*. It is a common species. —*A. B. C.*—A dark-coloured Thrips appears to be the insect which is doing mischief to your Vines. For its removal we should recommend you to syringe your Vines well with water, so as to give them a good washing, repeating the operation three or four times at intervals of a day or two. Should not this rid you of the nuisance, mix with the water one-tenth of gas-liquor, and proceed as before. —*Phil. Veritas.*—If your Pines are covered with the white scale in the way you describe, we recommend you to destroy your plants as soon as possible, for you never will do any good with them. If, however, you wish to try a remedy the best is the one mentioned in last week's *Gardeners' Chronicle*, No. 35, page 616.

INSECTS.—In the "Answers to Correspondents." This remedy consists in exposing the Pine plants to the action of steam at a high temperature.

MISCELLANEOUS.—*P. Mackenzie.*—The term "factitious" signifies those short characters which are used to characterise genera in the classes where they are placed, without reference to other considerations. Thus, "Corolla tripartita, labio ovato," was the factitious character given by Linnæus to *Monandria Monogynia*; signifying that all *Monandrous Monogynous* plants which have that character belong to *Monandria Monogynia*. —We regret an Old Subscriber should have to complain of the way his *Gardeners' Chronicle* is folded; he should write to the news-agent who supplies him, as it is his fault. —*Rhodod.*—*Cistus* and *Deutzia scabra* will do in peat. Smith's *Queen Victoria*, in our opinion, is a finer variety than *Epsil.* It is usual to prune *Rhododendrons* and other American shrubs early in spring. —*W. Bagshaw.*—*Atingia excelsa* is a Greenhouse plant. —*Z.* can have Nos. 13 and 14 for 1842 if he will send his address and 2s. —*H. O. K.*—The spots on your Grapes appear to have been caused by some insect. —*Copan.*—It is not much to the credit of a nurseryman that he should have sold you the *Crimson Nerine rosea*, a Cape plant, for a new yellow Brazilian *Anaryllis*. —*S. V.*—Your Plum is the *Nectarine Plum*. —*Z.*—The fruit you sent is that of the *Cydonia japonica*. —*Samuel Buckland.*—*Abroma augustum*. —*Chemical Jack.*—It is a *Populus* of some kind, but, without a leaf, it is impossible to say what species. —*Croydon.*—The roundish obovate Pear, red next the sun, and speckled, which you have under the name of *Imperial Swan's Egg*, is the *Beurré de Mons*. The other, under the name of *Aston Town*, is the *Hessel*. —*Gony.*—Send us your address, and we will try to help you with the *Echinops*. —*A. B.*—We are unable to recognise your plants by description. The *Ipomœa* is possibly an *Argyrea*—but it is of little use to conjecture. What is *Hibiscus pinnatus*? The freaks of *Catsetums* are now well known, and most surprising things they are. All sorts of European seeds and roots are useful in New Zealand; what are called Dutch roots would be the very thing for that colony. —*Discipulus.*—There is no good treatise on forcing Pigs; but papers on the subject have been published by many modern gardeners. Perhaps we may get some one to see what can be done to meet your wishes. —*Este.*—Many thanks, but the garden of the Horticultural Society is so overstocked with plants, that it would be inconvenient to have a large plant of *Casuarina*, and small ones are often raised there. The *Solanum* is probably *S. pinnatifidum*. —*A. Z.*—It is illegal for any person to make malt without a license. —*W. K.*—For your seedling to flower at this season is merely accidental, and in all probability it will not continue to do so. —*A. M.*—Your *Lobelia gracilis* can only be preserved by cuttings. There are no green-fleshed *Cantaloupe Melons*. —*Persona.*—We do not think that Mushrooms would succeed in the situation you mention, during winter, as they would require a temperature of from 50° to 55°. —*Myall's Pine.*—The distance between the plants in the row should be about 9 inches. —*Croydon.*—*Mesembryanthemum dilatatum*, *Pyrethrum Parthenium flore pleno*. —*S. W.*—Apparently *Calystegia sepium*, but without a flower cannot be certain. —*Sarah.*—*Liparia hirsuta*, *Pyrethrum Parthenium*, *Mesembryanthemum hispidum*. —*H. S.*—Spread out your Tobacco in a dry airy situation, excluded from the sun's rays. —*Edward Spary.*—Your blooms have not arrived. —*J. W.*—*Tripsacum dactyloides*.

SEEDLING FLORISTS' FLOWERS.

CALCEOLARIAS.—*Messrs. Rogers and Son.*—Your seedling No. 1 is a fine variety, having curiously-formed blotches of a light maroon colour, distributed over the entire front of the flower, upon a light buff-ground; it resembles the singular varieties raised by Mr. Standish; it is a beautiful and desirable flower. No. 2, another variety of the same character, but differing in the colours, having red-brown blotches upon a yellow ground.*

PELARGONIUMS.—*Thor.*—*Master Claude* is no improvement upon some of the old varieties, and falls far short of the beautiful flowers introduced of late years.*

DAHLIAS.—*S. Y., a Constant Subscriber.*—Both the seedling Dahlias promise well, but we want to see better specimens before we can speak with confidence about their properties; the flower with the darkest tip has the better-formed petal, though rather ribby; but both these specimens show the disk. The petals in the lighter variety are rather pointed; and though the centre is well up, there is some confusion in the disposition of the petals. We should like to see them again.*

FUCHSIAS.—*T. B.*—Your seedlings are fine varieties, but there is too great a similarity in the colour, especially in the corollas; a selection of the finer sorts would be the most desirable. No. 20 is a flower of good form, with rosy red tube and sepals,

the latter terminating in a decided green; corolla large and stout, of a crimson purple. This is a fair-sized flower, and though not so large as some of the others, it is the one we should select as the most desirable for a collection. No. 18 is the next in order of merit: this is a flower of fine size and substance; it is 2½ inches long, tube and sepals of a bright red, corolla stout, with rather more purple, forming a good contrast. 15 is also a good flower in form and substance; it, however, wants purple in the corolla, and is surpassed by varieties we have lately seen. 16 is inferior to many we have seen of the same character. 14 and 17 are deficient in the corollas. 13 is no improvement. 19 a good showy flower, but wanting purple in the corolla. 21 is a very pretty flower, but also wants a greater contrast in the colours. —*F. W. O.*—Your seedling is an extremely pretty flower, very like *Devonensis*; the flower is bright and attractive; its habit is fine, throwing out several flowers from each joint, and, as you say, the present year's shoots are more than six feet long, its vigorous growth and freedom of blooming points it out as an excellent ornament for the conservatory or border.* —*Jas. Waldron.*—The small seedling is a pretty, lively-looking flower, and most abundant bloomer; it is very small, and will not suit the present taste, which is directed towards the larger varieties. The larger seedling, blooming in bunches, at the termination of the branches, wants substance, particularly in the corolla, which is thin and not equal to others which are out. —*T. B.*—No. 25 is a large and showy flower; it measures four inches from the commencement of the pod to the termination of the pistil, tube and sepals scarlet, corolla stout, having but a slight tinge of purple in it. 26 is also showy, but the corolla is objectionable, from the divisions separating and forming into ridges. 27, tube and sepals bright red, corolla large and peculiarly bright in colour. 28, tube and sepals rosy vermilion, the latter tipped with green and expanding well, corolla maroon purple; a pretty variety, of a medium size. The two latter flowers we consider the best. —*W. Miller.*—Your hybrid between *fulgens* and *corymbiflora* is a very handsome flower; seed-pod small, tube long and slender, gradually increasing in size till the diameter is a quarter of an inch; the tube is of a delicate pink colour, having sepals of a greenish primrose, forming a strong contrast to the bright red corolla seen between them; the flower altogether is 5½ inches in length, and the buds are very handsome as they approach maturity; it flowers in a large, broad bunch, which is divided into branches, containing altogether 150 flowers. —*H. I.*—The *Fuchsia* is a rich-coloured flower, with sufficient purple in the corolla to form an agreeable contrast; but it is not sufficiently large, nor does it differ from others so much as to make it desirable. —*T. B.*—The sepals of 30 are rather coarse, and appear of a faded colour towards the points; it is large and showy, but it wants more colour in the corolla. 31, large and singular in colour, being of a rich dull crimson; the corolla in this wants the violet purple; the latter is the better flower, as it forms a contrast to the lighter flowers.*

As usual, a host of letters have arrived too late for answers this week.

NEWS OF THE WEEK.

HER MAJESTY'S visit to the King of the French is, as might have been expected, the chief topic of interest both at home and on the Continent. The reception given to her Majesty by the Royal Family and people of France cannot fail to be satisfactory to British feelings; and the French journals, with few exceptions, regard the event as a graceful compliment paid to the nation at large in the person of its Sovereign. In their leading features, the details of the Royal Progress are not less picturesque than those of her Majesty's visit to the Highlands last year, while they surpass them in those incidents of personal and national character which will ensure the meeting at the Château d'Eu a conspicuous place in the history of our time. Notwithstanding the visions of commercial treaties which haunted many of the French papers on the first announcement of the Queen's visit, they now express regret that her Majesty did not extend her excursion to Paris and Versailles. They accept the fact, however, as a proof that the visit to France was not one of curiosity or pleasure, but a mark of friendship towards the reigning dynasty, which is all the more welcome, because associated with no object of merely temporary interest. The Ministerial journals hail the visit of the Queen as a pledge of peace—the most significant, perhaps, which has been given to France for 13 years, and welcome it as a proof that, after all the vicissitudes of their history, the happiness of a King or Queen still excites the sympathies of the French people.

From Spain we learn that a battalion of one of the royal regiments at Madrid demanded their discharge on the evening of the 29th, and were immediately disbanded. The new Government, either from alarm at the movement, or from a desire to declare Madrid in a state of siege, arrested the non-commissioned officers, and ordered them to be shot on the following day, without even the form of a court-martial. Considerable excitement ensued, the military were placed under arms, and all the generals in the capital who were supposed to be favourable to Espartero were summarily compelled to leave the city. In the meantime, Barcelona had manifested an increased opposition to the new Government, and Saragossa and other towns were in a state little short of insurrection. The British and French Ministers, however, had officially recognised the Provisional Government, and the diplomatic relations of the three countries continue as heretofore. —From Switzerland, we learn that the long-pending dispute respecting the Argau convents had been no sooner placed in a fair way of settlement, than a civil war broke out between the French and German inhabitants of the Valais. A conflict has already taken place in the neighbourhood of St. Maurice, and it is feared that the Diet will be compelled to divide the canton into two independent governments. —The insurrection in the Papal States has also assumed a formidable aspect; guerillas have formed not only in the Bolognese, but also in Romagna; and large bodies of troops have been despatched from Rome to the March of Ancona. The armed bands of the Papal

Legations, driven along by the military, have entered Tuscany; and have caused so great an alarm in the Grand-Duchy that all the watering-places are deserted. The Tuscan troops have been put in motion in all directions; and the Austrian reinforcements are ready to cross the Frontier.—The news from the Levant contains some interesting particulars of the massacre of the Nestorian Christians by the Turkish Pacha, and of the renewed disturbances at Jerusalem.—The delay in the arrival of the India Mail, which was expected at Marseilles on Friday last, has excited much surprise. Telegraphic despatches were received by the French Government on Wednesday, announcing that the steamer which usually brings the despatches from Alexandria had returned to Malta, having waited six days at Alexandria without procuring any tidings of the mail. The conclusion drawn from this fact is, that some accident has occurred to the steamer between Bombay and Suez, or that she has been delayed in consequence of a new route having been attempted, and without due regard to the probable state of influence of the winds at the period of crossing to Suez.

Home News.

COURT.—The Queen and Prince Albert, after visiting Plymouth and Falmouth, took their departure for the French coast on Friday, and landed at Tréport, on a visit to the King of the French, on Saturday afternoon. Her Majesty remained at the Château d'Eu until Thursday, when she left France, and landed at Brighton in the afternoon of that day, accompanied by the Prince de Joinville. The Court will remain at Brighton until Monday, when the Queen is expected to embark for Ostend, on a visit to the King of the Belgians. The details of her Majesty's visit and reception by the French Court will be found in the general account of the Marine Excursion, in another part of our Paper. "During her Majesty's absence, the Prince of Wales and the Princesses remained at Brighton.—The King of Hanover left Kew on Saturday to return to his own dominions, after a sojourn of three months in this country, his Majesty having arrived on the 2d of June. His Majesty was loudly cheered on his departure from Kew. The Admiralty barge, having on board Lord Bloomfield, Sir F. Collier, and Admiral Brace, had previously arrived from Woolwich at the Brunswick-pier, Blackwall, to attend his Majesty on his embarkation. His Majesty went on board the Admiralty steam-yacht, Dover, at a quarter-past eleven, and immediately left for Antwerp, under the usual salutes from the field-battery at Woolwich.—The Duchess of Kent has returned from Witley Court, the residence of the Queen Dowager; on Tuesday she accompanied her Majesty on a visit to Malvern, and on Thursday arrived in town on her way to join the Queen at Brighton.

Health of Sir Robert Peel.—The *Dublin Evening Post* gives the following from its London correspondent:—"London, Saturday.—I have learned, with the deepest pain, that the fatigues and anxieties of office have again impaired the health of the Premier. About three years since there had been symptoms of internal disease, which, fortunately, yielded to judicious treatment and a vigorous constitution. Latterly, however, similar symptoms have reappeared, and it is feared that Sir R. Peel, ere long, will find it necessary to relieve himself from the cares and turmoils of public life. There is, I am happy to learn, no cause for serious apprehension at present. The Queen, I understand, had expressed a desire that the Premier should accompany the Royal party to France; but the right honourable gentleman urged the necessity, on account of delicate health, of some relaxation amongst his family circle, and Her Majesty kindly dispensed with his attendance."

Illness of Lord Western.—We regret to state that this venerable nobleman and well-known agriculturist, while looking over some of the improvements which he is making on his estates, was taken suddenly ill a few days ago. The accounts received in town from Felix-hall, Essex, during the week, state that his Lordship is better.

Military Pensions.—The following General Officers have been added by the Commander-in-Chief to the list of those already in receipt of pensions for distinguished services:—Major-Generals Sir Henry Watson, Sir Dudley St. Leger Hill, Sir Richard Armstrong, James Ferguson, Thomas William Brotherton, and Alured Faunce.

Post-office.—Her Majesty's Government having decided that Southampton shall be made the port of arrival and departure for the Peninsular, Mediterranean, Oriental, and West India mails, instead of Falmouth, notice has been issued that the following arrangements will come into operation on and from the 18th inst., on which day the next West India packet will be despatched. The respective mails to be forwarded by the packets from Southampton will be made up in London, and transmitted from London to Southampton by the morning, instead of the evening mail, as at present, upon the undermentioned days:—Peninsular mail, viz., Vigo, Oporto, Lisbon, Cadiz, and Gibraltar, every Thursday. Mediterranean, viz., Malta, Greece, and the Ionian Islands, 1st of the month, and the Thursday nearest the 15th of the month—except the 1st of the month falls on a Sunday, when the Mediterranean and East India mails will be made up in London, and despatched on the previous morning. Egypt and India, 1st of the month. West Indies, 2d and 17th of the month—except the 2d or 17th of the month falls on a Sunday, when the West India mail will be made up and despatched on the following morning. The Brazilian packet will continue to be despatched from Falmouth as

at present. Letters to and from the Mediterranean and the East Indies, &c., intended to be forwarded by the direct packet, instead of *via* Marseilles, should henceforward be addressed *via* Southampton.

Parliamentary Returns.—It is stated as a proof of the expense of these returns that during the last session, one return connected with one of the metropolitan prisons, moved for in the House of Commons, occupied three clerks upwards of thirty days, and contained, amongst other particulars, upwards of 13,000 names. It was also so weighty that it was almost more than a man could carry, and the printing of it cost about 2,000*l*.

National Society.—The subscription in aid of the new movement of the National School Society, in behalf of education in the mining and manufacturing districts, already exceeds 90,000*l*. Of this sum 630 individuals have contributed no less than 70,000*l*.

Church Preferment.—The Queen has been pleased to make the following appointments to benefices in the Church of Scotland, vacant in consequence of the late secession. Rev. R. H. Whyte to the parish of Dryfesdale, Dumfries, in the room of the Rev. D. B. Douie; Rev. J. L. Rose to the parish of Markinch, Fife, in the room of the Rev. J. Sieveright; Rev. R. Stewart to the parish of Lochs, Ross, in the room of the Rev. R. Finlayson; Rev. G. Greig to the parish of Kirkpatrick-Durham, Kirkcudbright, in the room of the Rev. G. J. Duncan; Rev. W. F. Burt to the parish of Ferry-Port on Craig, Fife, in the room of the Rev. W. Nicolson; Rev. G. Addison to the parish of Arbirlot, Forfar, in the room of the Rev. J. Kirke; Rev. W. Hunter to the parish of Baldernock, Stirling, in the room of the Rev. J. Pollock.

Foreign.

FRANCE.—The visit of her Majesty to King Louis Philippe is of course the exclusive topic of the Paris journals. Of the landing of the Queen at Tréport, and her arrival at the Château d'Eu, abundant details will be found in another part of our Paper. The columns of our Parisian contemporaries are chiefly filled with accounts of the visit, and with speculations on its consequences, but they almost unanimously greet the arrival of the Queen with courteousness, though they express regret that the visit has not been extended to Paris and Versailles. The *Journal des Débats*, the Ministerial organ, does not underrate the importance generally bestowed by the French press on her Majesty's visit. "In accepting the King's hospitality," it says, "Queen Victoria has wished to prove her confidence in and her personal attachment to her august ally and his royal family. She has also wished, as Queen of England, to give to the constitutional King of France a pledge of political sympathy and good understanding. It is for this two-fold object, and we thank her for it, that the Queen of England has come to France; and it is as being a pledge of peace, and the most significant one, perhaps, given to our country for thirteen years past, that we salute the arrival on the French shores of this young Queen, who bears with so much gracefulness, and with so serene and charming a brow, the weight of a great nation's destinies." In a subsequent paper it says, "France will not be indifferent to the courteous visit of the Queen of England. Whatever may be said or done to the contrary, public satisfaction is expressed on all sides. Everywhere one meets, on the occasion, but with the most sympathetic dispositions, and the utmost good-will. We are happy for the sake of our country that these feelings are manifested. They prove that, despite of all, and even after the terrible vicissitudes of our history, a King or a Queen is still a great deal with us. The mark of gracious deference given by a Queen—by a woman in all the splendour of youth, beauty, and power—to a Prince subjected to such cruel trials, and at the same time, so visibly protected by Heaven, will not be an indifferent or unperceived occurrence in history. That meeting of the two first crowned heads on the globe must not be viewed by us as a mere vain ceremony. It is more than that; it is a grand act, it is a blessing, because it is another guarantee given to the security of the world. We do not mean to say that the dreams of philanthropists are thus realised, and that universal peace is henceforth established in the world. No, certainly. France and England will continue to follow their various, and often rival fortunes; touching one another at all points of the globe, they are exposed to meeting one another everywhere; they must bear the consequences of their greatness, as they bear the glory of it; but it will still be a great deal to know that, above all those hazards, the good-will of the two Governments and mutual sympathies of the great bulk of the two nations predominate." The other papers, with few exceptions, express themselves on the subject with much politeness; several that are habitually opposed to the Administration evince the utmost courtesy towards our Sovereign, and regard her visit not merely as a compliment, but as an event which will hereafter figure conspicuously in history. The *Commerce*, however, persists in believing that the treaty of commerce is already settled, and that the Queen has had nothing to do but to request the signature of Louis Philippe! Another exception is the *National*, the principal organ of the Republicans, which is unable to drop for a few days the catalogue of grievances it has so long been urging against this country and ungraciously reminds the Queen of England that, amidst the honours and festivities that surround her, national resentment slumbers not for a moment. It bewails the expense to which the brief sojourn of her Majesty may put the nation, and foretells that there will be a chapter in the next budget under the head of "Voyage de la Reine d'Angleterre." Another cause of dissatisfaction to the Republican party is the expression used by her Majesty on meeting M. Guizot—"I am delighted to meet you

again." On this point the *National* contends that M. Guizot has been thus affably noticed solely because he has ever eagerly sacrificed the honour and interests of his country to the will and pleasure of England. A melancholy accident has happened at Villequier, on the banks of the Seine, by which the daughter of M. Victor Hugo and her husband were drowned. They had accompanied their uncle, M. Vacquerie, and his son, to Caudebec, in his boat, which unfortunately upset upon a sand-bank, and all the party perished.

SPAIN.—Accounts from Madrid to the 30th ult., announce that, on the night of the 29th, a battalion of the regiment del Principe revolted in the capital. The men demanded their discharge, which had been promised to them. This battalion was immediately disarmed. Five sergeants, two corporals, and one private were shot on the morning of the 30th, in presence of the garrison, which appeared to be devoted to the Government. It appears that the soldiers made no political demand, but merely asked for the fulfilment of the promises made by Gens. Narvaez and Concha, viz., that every non-commissioned officer who deserted the Regent should be raised a grade, and that the soldier who wished it should, if he had served a certain number of years, be dismissed to his home. The Juntas forced the military chiefs to keep their promises in the provinces; but in Madrid Gens. Narvaez and Serrano refused. A disturbance consequently ensued which terminated, as above stated, in a public execution, without even the forms of a court-martial. The Queen and Infanta returned to Madrid on the evening of the 30th. They were received with the warmest enthusiasm. Madrid was then perfectly tranquil, but the troops were kept under arms, and several generals whose adhesion was suspected had been ordered to leave the city. Mr. Aston, Minister Plenipotentiary of England, announced, on the 28th, to the Minister for Foreign Affairs, at an audience which he had asked for that purpose, that his Government had acknowledged the Provisional Government of Spain, and that the relations of good harmony and friendship which had hitherto prevailed between the two countries would continue as heretofore. The Duke de Glucksberg, the Chargé d'Affaires of France, had also presented his credentials to the Provisional Government. Barcelona was still much agitated on the 29th ult. The lists of electors had been torn off the doors of the provincial deputation, and the arrival of the long-expected troops was anxiously looked for. The fortress of the Atarrazanas was still occupied by the Patulea, who refused to surrender it to the regular troops. General Ametler, who had quitted Saragossa with several battalions for the purpose of reinforcing the Governor of Barcelona, had not advanced further than Lerida, being fearful of an insurrection at Saragossa. The committee instituted at Seville for the purpose of ascertaining the extent of the devastation sustained during Gen. Espartero and Van Halen's bombardment, commenced their labours on the 12th. Above three hundred buildings are stated to have been destroyed, and the loss is estimated at 4,000,000 reals.

PORTUGAL.—Letters from Lisbon of the 28th ult. state that the unfavourable reception which the Duke of Palmella met with from the Earl of Aberdeen has been the subject of a good deal of political speculation and surmise respecting the probable issue of the treaty. Petitions, statements, complaints, and representations have been made to Government, pointing out the impropriety of giving the final blow to the lingering industry of the country. It is generally stated that Lord Aberdeen will not depart from his previous *ultimatum*, and that the Duke of Palmella will be obliged to give way.

GERMANY.—Accounts from Munich mention an interview which has just taken place in the Castle of Aschaffenburg between King Leopold of Belgium and the King of Bavaria. The cause of the visit is said to be the anxiety of the King of the Belgians to have the iron and woollen manufactures of his kingdom allowed more advantageous entrance into the German Union.—From Berlin we learn that his Majesty has already issued a cabinet order for the rebuilding of the Opera-house, for which purpose he has appropriated 800,000 dollars, and that it is to be finished within thirteen months. Their Royal Highnesses the Duke and Duchess of Cambridge have arrived at Rumpenheim, on a visit to the Landgrave. Letters from Cologne state that sentence has been passed on Lieutenant Von Pelzer, of the 28th Foot, who had killed a M. Hein in a duel, and that he is condemned to death, and his second, a Lieutenant in the same regiment, to hard labour in a fortress for ten years. It is expected, however, that his Majesty will commute Lieut. Von Pelzer's sentence, and that the punishment of the second will be abridged. It is remarkable that it cannot be discovered who was the second of M. Hein.—Accounts from Carlsruhe state that a nobleman who shot his servant last week in the neighbourhood of Mannheim, has, notwithstanding all the exertions of the police, not been brought to justice, and it is supposed that he has made his escape to England. Meanwhile, the affair is the topic of the day, and even his best friends do not attempt to speak a word in his defence. The cause of the murder is now ascertained to be that the servant returned a blow which the master inflicted on account of ill-treatment of his horses.—M. de Lindenau, the Prime Minister of Saxony, has resigned his office, on account of ill-health.—From Hamburg we have a report that Gen. Espartero has demanded, through the English Chargé d'Affaires, whether, in the event of his wishing to go there, he would be permitted to reside. The reply of the Senate is not known, but there is little doubt that permission will be granted.—The company of equestrians under the management of Mr. Hillier, who succeeded to the management of the company on the death of the late Mr. Ducrow, after having performed in the various towns

of England, were induced lately to visit Hamburg for a professional experiment. After a few weeks' stay, during which time their performances were miserably attended, the director has been compelled to announce for sale the stud of horses, dresses, property, &c., to satisfy his creditors, and return with his company to England.—A fatal duel has just been fought at Baden. About a month since a ball was given by subscription to the Grand Duchess Helena of Russia, to which M. de Haber, the banker, put his name down as a subscriber. When the list was revised by the directors, M. de Haber's name was objected to by M. de Goler, an officer of artillery in the service of Baden, upon the plea that in the year 1838 he gave M. de Haber blows, which the latter did not resent, and that he was therefore unfit for the society of gentlemen. His name was in consequence erased. Thereupon M. de Haber sent his friend, M. Verifkin, a Russian officer, to M. de Goler, positively denying his statement, and calling upon him for satisfaction for the calumny and injury fastened upon him. M. de Goler, by the advice of his brother officers, refused on any terms to meet M. de Haber, saying that he did so because he could prove that he was not entitled to be treated as a gentleman. M. de Haber then had a letter printed and posted, saying that M. de Goler had calumniated him by false statements, had misled his brother officers, had refused to give him satisfaction, and that he therefore was a liar and a coward. This led to violent language between M. de Goler and M. Verifkin, the friend of M. de Haber, and blows were given by the former to the latter; the consequence was a meeting on Sunday at Carlsruhe, between M. de Goler and M. Verifkin. They fought at six paces with pistols. M. Verifkin was shot dead, and M. de Goler received a ball in his chest. M. de Haber has fled to Switzerland.

SWITZERLAND.—Accounts from Zurich of the 31st ult., state that while the long-pending dispute of North Switzerland is in a fair way of being appeased, by Argau consenting to restore the nunnery of Hermetschyl, the Liberal party of the Valais—the one speaking the French tongue and inhabiting the Lower Valais, the other speaking German and inhabiting the Upper Valais—have resorted to a civil war at and near St. Maurice. The accounts of the conflict in the Swiss papers are as yet confused; but it is to be feared that the Diet, to restore peace, must treat the Valais as it treated Bale, Schwitz, and Appenzel, viz., divide the canton into two independent governments.—M. Thiers, the historian and late premier of France, has arrived at Berne, for the purpose of making himself personally and minutely acquainted with the locality of the theatre of the war of 1798-99, for the purpose of his forthcoming volumes of the "History of the French Revolution." M. Michelet, professor of history at the University of Paris, arrived at Fribourg nearly at the same time, to study on the spot the movements of Charles the Bold, of Burgundy, whose life will be treated in the sixth volume of his "History of France."—A letter from Chamouny states that the ascent of Mont Blanc was made a short time since in a most rapid and successful manner, by Dr. E. Ordinaire, of Besançon, M. E. Tairraz, of Chamouny, and a party of thirteen persons. They left the Prieuré at noon of the 23d; at half-past six in the evening arrived at the rocks of the Grand Mulets, which they again quitted the following day at half-past two in the morning. They were seen ascending by the old road exposed to the avalanches, where the three guides of Dr. Hamel perished in 1820. At half-past ten M. Ordinaire, who was in advance of the other travellers with two of his guides, arrived at the summit, where the rest of the party shortly afterwards joined them. At a quarter past eleven they commenced their descent by the new road, and at seven in the evening arrived at Chamouny.

ITALY.—The Cardinal Legate of Bologna has issued a proclamation which removes all doubt as to the disturbances in the Papal States being of a political nature. The papers also state that the bands which have retired to the mountains of Tuscany have spread alarm throughout the country. According to a letter from Leghorn of the 27th, great agitation was observable in the towns on the coast, and such persons as had come to bathe at Leghorn and Viareggio had hastened to quit the country. As stated in our last, the insurgents are now committing brigandage, although political principles formed the basis of their organization. They have drawn nearer to the duchy of Modena, and several regiments have been marched against them. Tidings of the result are the more anxiously expected, as the insurgents have spread the report of all Italy having risen.—A riot occurred at Naples, in the church of the Annunziata, on the festival of the Assumption. The crowd of people, many of whom it was suspected were drawn thither by other motives than devotion, was so great, that in spite of the spaciousness of the church (the nave of which is supported by 24 Corinthian pillars of white marble), a terrible pressure ensued; thefts were committed, and such a scene of disorder arose, that it was found necessary to call in the aid of the military, and a party of Swiss troops arrived. The people, irritated by the presence of the soldiers, began to attack them with knives and stilettoes. Meanwhile a party of Sicilian troops, on duty at Porta Capuana, arrived, and with the view of awing the mob, discharged some balls from a small cannon, and some blank shots. Order was soon restored, but not without the sacrifice of several lives, and about 20 persons were carried to the hospital, all more or less seriously wounded. The church having been profaned by bloodshed, remains closed until it has been again consecrated by the Archbishop. The Queen having interceded with his Majesty in behalf of the criminals, their sentence of death has been commuted to that of 30 years' banishment to the galleys. Another source of uneasiness

at Naples is the frequent occurrence of injury to females walking in the streets, whose dresses have been burnt by means of some combustible preparations thrown upon them. One young female walking in the street at its most crowded time, was thus attacked, and has died from the injuries received. Amongst other victims to this outrage are the Duchess de Grottoletta and the Princess Canitto. The police have not found any clue to the delinquents.

GREECE.—A letter from Athens, Aug. 10, states that a gang of twenty-six coiners, Greeks, Turks, Italians, and French, have been discovered and arrested in that city, and handed over to justice. They had been occupied in the fabrication of Greek crowns, and French two-franc pieces. Other parties connected with this gang, to the number of upwards of 200, have been since arrested, many of whom by birth and fortune, belong to the higher ranks of society.

TURKEY AND SYRIA.—The Levant mail has brought Constantinople letters of the 17th. The Porte seemed inclined to pursue an Anti-Christian course of policy. The expedition of the Pacha of Mosul against the Nestorians, has been stained, as was to be expected, from the co-operation of his auxiliaries the Khurds, with every sort of atrocity. The houses of the inhabitants were fired, they themselves hunted down like wild beasts and exterminated. Neither sex nor age met with mercy; the mother, brothers, and sisters of the Patriarch, were the objects of peculiar barbarity, the former having been literally sawed in two, and the latter mangled and mutilated. The Patriarch himself succeeded in effecting his escape, and has taken refuge in the house of the British Consular Agent at Mosul. The number of victims who have perished in this massacre is not yet known, and can only be known when that of the fugitives has been ascertained. The population of the mountains amounted to 100,000. Their fate has been truly extraordinary. Surrounded by Mussulman hordes, pent up for ages in their native fortresses, the very existence of these children of the primitive church had remained almost a secret to the rest of Christendom, and their obscurity seems to have been their best protection. No sooner had their country been explored by Missionaries, than this visitation befel them, and the public is called upon to sympathise with them in their destruction, before, perhaps, it had become generally aware of their existence. Letters from Mosul throw much of the odium of this sad affair upon Europeans, and state that it was the imprudent zeal of rival Missionaries that first excited the jealous apprehensions of the Pacha of Mosul, and caused him to attack the Nestorians. It is affirmed even that some of these gentlemen, with a view of prejudicing his mind against the American missionaries, suggested to him that they were assisting the mountaineers to raise forts, whereby they would be hereafter enabled to set the Sultan's authority at defiance.—Letters from Jerusalem state, that an attack, which might have been attended with serious consequences, had been made by the populace upon the French consulate. It appears that the Consul, contrary to the usages established, had insisted upon hoisting the tricolor on his house. A fanatical multitude resented the supposed insult to their holy city, and the flag was torn from the building. Reschid Pacha endeavoured to disperse the people, and was severely wounded on the hand by a stone. On the following morning a fresh attack was made because the pole had not been destroyed, and much difficulty was again experienced in quieting the tumult. Guns were discharged into the windows of the consulate, but fortunately no lives were lost. An assault has also been committed on the person of Dr. McGowan, the English physician attached to the episcopal establishment. After an altercation with a guard, he was dragged from his horse, beaten, and thrown into prison. A Prussian, attached to the Prussian consulate, on demanding the doctor's liberation, was also insulted and ill-treated. The culprits, however, have since been punished, on the demand of the British and Prussian Consuls.—Accounts from Erzerum are far from satisfactory. The negotiations are for the present suspended, and the Persians are believed to be assembling troops on the frontiers. The plague has broken out between Erzerum and Trebizond, and also at Diarbekir.—The annual caravan of pilgrims to Mecca had departed from Scutari, in presence of the Sultan and the great officers of state, with the usual ceremonies.

WEST INDIES AND MEXICO.—The Royal mail-steamer Medway arrived at Falmouth on Sunday with West India, Mexican, and other mails, bringing twenty-five passengers, and on freight 344,478 dollars, 162½ doubloons, 1,270 ounces of silver, 1,533 ounces of gold, and other valuable cargo. Of the dollars thus brought 33,525 are on account of the Mexican dividends and 185,024 are a consignment to the directors of the Real del Monte Mining Company. The Severn brought the Jamaica mails and dates from that island to the 8th of August to St. Thomas's, where they were transhipped to the Thames on the 14th. That vessel brought them to Bermuda, at which island a severe hurricane was experienced on the 18th ult., which did considerable damage to the breakwater, and to several small vessels. In addition to this catastrophe, the fever peculiar to the group was raging with great virulence at St. George's at the time the steamer left, and was considered as severe as the epidemic of 1819. It commenced early in August, and by the 20th of the month, more than half the military had been attacked, and were then in hospital. Of the Sappers and Miners six had died, and at the latest accounts sixty men were ill, including nearly all the non-commissioned officers and officers, with Colonel Barry, commanding officer of Engineers. All kind of labour had been suspended, the civil population having experienced the effects of the fever to a great extent. Lieut.-Colonel Arabin, commanding officer of the artillery, had also died of it. The mails from Demerara come down to the 4th,

and from Barbadoes to the 9th August. The Windward Islands are reported to be generally healthy and the crops looking favourable. On the 4th August the Medway was struck by lightning, which shivered her main topmast. By this arrival accounts are received from Tampico to the 19th July, and from Vera Cruz to the 2d August. The Mexican squadron had returned to the latter port on the 29th July from Campeachy, a treaty of peace having been entered into for six months. The commissioners from Campeachy appointed to settle the differences came up in a Mexican brig of war. The commander of the Mexican forces was imprisoned in the castle of St. Juan d'Ulloa, and a court-martial was about to sit in the city of Mexico, to inquire into the charges brought against him. Advices from Port-au-Prince, dated 7th August, state that an opposition to the present order of things had declared itself at Aux Cayes, headed by a black General Salomons, who had some hundred armed supporters; but it had been effectually put down, the general having taken to the woods.

NEW SOUTH WALES.—A letter in the *Northern Star* from Mrs. Williams, states that the paragraph which has appeared in the papers stating that her husband, Zephaniah Williams, the Chartist colleague of Frost and Jones, had committed murder in New South Wales and been hanged, is wholly unfounded. She says that she has had a letter from the Home-office, in which it is stated that a person of the name of Williams had recently been executed in New South Wales, but not her husband, who is alive.

CITY.

Money Market, Friday.—Consols for money are quoted 95½ to ½; and for the account 95½; Three-and-Half per Cents. Red., 102½; New Three-and-Half per Cents., 102½; Long Annuities, 12 9-16; India Stock, 265½ to 266½; India Bonds, 69; Exchequer Bills, 1½d., 59s. 6½s.; and ditto, 1½d., 61s. to 63s. prem.

Metropolis and its Vicinity.

Return of the South-Sea Expedition.—Captain James Clark Ross has just returned from his voyage of exploration to the South Seas. He transacted business at the Admiralty on Wednesday, having left his ship at Portsmouth. He was in excellent health and spirits, and expressed great satisfaction at the result of his voyage.

General Espartero.—His Highness, with the Duchess and the Donna Elidia, visited the exhibition of Cartoons on Monday afternoon, having previously obtained permission to inspect them on that day. Mr. Barry, the architect of the new Houses of Parliament, and Mr. Eastlake, the secretary to the Commission of Fine Arts, were in attendance to receive his Highness, who spent upwards of an hour in the Hall, and on his departure expressed himself much gratified with the drawings. Mr. Barry afterwards accompanied the Regent over the works of the new Houses of Parliament. On Tuesday His Highness, the Duchess, and Donna Elidia, with their suite, left Paddington by the day mail train to visit Windsor Castle. They first proceeded over the state apartments, and from thence through the private apartments of Her Majesty. They afterwards ascended the Round tower, and remained on the ramparts for a considerable period. The Regent expressed himself greatly pleased at the splendid prospect. They left the Castle about two o'clock, and as they proceeded through the town the Regent returned the greetings of the inhabitants with the greatest courtesy. They then drove down the Long Walk to Virginia Water, where they remained for upwards of an hour, and returned to town in the evening.

The Fate of Col. Stoddart and Capt. Conolly.—On Thursday a public meeting was held at the Crown and Anchor Tavern, for the purpose of opening a subscription to enable Dr. Wolff to proceed to Bokhara, in order to ascertain the fate of Col. Stoddart and Capt. Conolly, and, if still living, to take steps for their deliverance from captivity. Capt. Grover presided, supported by about 100 gentlemen. After referring to the facts already noticed in this Paper, and dwelling at some length on the narrative of the Persian servant, which we published a few weeks back, the chairman said, it was a remarkable fact that three months before the statement appeared in the papers, the friends of Col. Stoddart had received a letter from him, in which he used these words, "I am in high favour with the Ameer, and I pray you not to believe any reports of my death that may reach England." He had made strict inquiries at the Foreign Office for the purpose of ascertaining whether Government had received any official report in confirmation of the statement, but he found nothing, unless some vague intelligence to the effect that Col. Stoddart's head had been cut off, that Capt. Conolly was told his life would be spared on consenting to become a Mussulman—that he replied, "You have murdered Col. Stoddart—I will die a Christian;" upon which he was led out and decapitated. Beyond that there was no document to be found in the Foreign Office that was not a repetition of the Persian's statement, to which he should invite the attention of the meeting, believing, as he did, that it was a fabrication from first to last. The following resolution was then moved by Mr. Buckingham; seconded by Col. Humphrey and carried:—That in the uncertainty which exists respecting the lives of Col. Stoddart and Capt. Conolly, it is desirable to ascertain the real facts of the case. The second resolution was moved by Mr. Walker, President of the Institute of Civil Engineers; and seconded by Dr. Burnes, brother of the late Sir A. Burnes:—That a Committee be formed, to communicate with the British Government on this subject, to send out immediately the Rev. Dr. Wolff to Bokhara, and to take such measures as may be necessary. This having been likewise carried, Capt. Downes, R.N., Lieut. Raper, R.N., Mr. Buckingham,

Col. Humfrey, Capt. Moorsom, and Capt. Grover, were appointed a Committee, with power to add to their number; and a subscription was opened for accomplishing the object. About 100*l.* were subscribed in the room.

The Cartoons.—This exhibition having closed to the public on Saturday, the removal of the cartoons was commenced on Monday. The drawings which were successful in the competition will continue to be exhibited in the Suffolk-street gallery. The unsuccessful competitors are also, it is said, about to get up an exhibition of their subjects, though it is not yet fully arranged where it will take place. A large proportion of the artists are in favour of the Pantechnicon, while a section, with Mr. Haydon at their head, prefer the Pantheon. On Saturday, upwards of 4000 persons were admitted in the course of the day, and it is calculated that upwards of 300,000 visitors of all classes have attended the exhibition. The greatest order and decorum have been observed throughout, and not a single robbery has been brought to the police offices as having taken place in the hall. On some of the days of exhibition the children connected with various schools attended. The fittings will not be removed from the Hall, as the commissioners have another exhibition in contemplation for the ensuing year, which will consist of frescos of moderate size, executed on portable frames.

Middlesex Magistrates.—The Lord Chancellor has appointed the following gentlemen as magistrates for the county:—Mr. Dodd, M.P., Montagu-square; Mr. Pilcher, the late Sheriff, Russell-square; Mr. Walter, of Bearwood, Berks; Mr. Ewin, Park-crescent; Mr. Hooper, Stanmore; Mr. Carter, of Brockley-hill; Mr. Rowe, of Covers House, Laleham; Mr. Platt, Hyde Park-gardens; Mr. A. W. Wood, of Uxbridge; Lieut.-Col. Sydney North, of Arlington-street; Mr. J. R. Mills, of Stamford-hill; Mr. W. Crake, Stanhope-street, Hyde Park-gardens; Mr. F. T. Young, Great Cumberland-place; Mr. T. H. Black, St. Anne's, Limehouse; Mr. E. Stock, Poplar; Mr. R. E. Williams, of Weston-grove, Kingston; Mr. J. W. Marriott, of Sunbury; Mr. J. Bentley, of Highbury-park; and Mr. T. B. Herring, Finchley. Mr. F. J. Perseval, of Ladbroke-terrace, Notting-hill, has also been added to the commission of the peace for the city and liberty of Westminster.

Metropolitan Improvements.—The new street from Shoreditch Church to the St. Katharine and London Docks is making rapid progress. Nearly all the houses on the west side of Rose-lane and Essex-street, Whitechapel, have been taken down, and in a few weeks there will be a direct thoroughfare from Spitalfields' Church, in front of which the new street will pass. In consequence of the progress of the new Royal Exchange, orders have been given to dispose of the houses in Freeman's-court, which adjoin the east end of the structure. The space to be cleared away will be from Cornhill to the Church of St. Benedict, at the corner of Threadneedle-street. In the latter street several houses have been pulled down, facing the Hall of Commerce, for the purpose of widening that thoroughfare. Mr. Barry has received instructions from the Woods and Forests to value the property from Chelsea Old Church to Battersea Bridge, preparatory to its removal for the purpose of constructing the new road along the river side, from Vauxhall to Battersea. The open area surrounding the enclosure in St. James's-park has long been remarkable for its soft and wet state in winter, and for its uneven condition in summer, cutting the shoes of pedestrians with the sharp gravel which forms the surface. A new experiment has just been tried between the York column and Storey's gate, which appears well calculated to obviate these objections. The gravel already used in the park has been taken up, and a stratum of concrete, 6in. thick laid down in its place. The concrete has been covered with the fine material obtained by screening the old gravel, and, in order to produce a good colour, a small quantity of the screenings of yellow gravel has been lightly spread over the surface. The experiment has only terminated a few days, but the part laid down is remarkably solid, and forms an agreeable path, owing to the entire absence of large stones. The Marylebone vestry on Thursday resolved by a majority of 11, to adopt wood-paving in the New-road from King's-cross to St. Pancras' church, a distance of 11,000 yds. The cost for paving with granite would be 4*s.* 6*d.* per yard for three years, and the expense of keeping it in repair 1*s.* 6*d.* per year, whilst the wood would cost 11*s.* per yard, without any expense to the parish for two years, and after that time only 6*d.* per yard per annum. It was stated that in 19 years the parish would save 2,000*l.* by the adoption of wood-paving. The works of the Nelson pillar continue to advance rapidly, and the castings which form the Corinthian capital have been fixed. These castings are of bell-metal, weighing several tons. They are fastened together by immense hooks, and strongly rivetted. Several tons of stone will now be raised to the summit to form the plinth upon which the statue is to be placed. The statue is hewn out of two pieces of Cragleith stone of great hardness, and when joined will stand 17 feet in height.

Temperance Meetings.—On Saturday Father Mathew administered the pledge at the New City Burial Ground, Bunhill Fields. He had previously breakfasted with the Earl of Arundel and Surrey, who accompanied him to the meeting, and publicly took the pledge amidst the cheering of the people. Father Mathew, in the course of his address, congratulated himself on the support of his lordship, and stated that on the previous day he had administered the pledge to the Marchioness of Wellesley. Nearly 1,000 persons took the pledge, making altogether 2,200 in this spot. On Sunday Father Mathew revisited the opening scene of his labours in the metropolis, and again administered the pledge to 2,000 persons in the Roman Catholic Cemetery, Commercial-road. On Monday

he concluded his mission in the metropolis by administering the pledge in Calmel-buildings, Manchester-square, which is looked upon as the St. Giles's of Marylebone. Father Mathew, having performed mass and preached in the Spanish Chapel, breakfasted with the Rev. Dr. Piquot, the minister, in company with the Spanish Ambassador, and a batch of Countess of Clare, who took the pledge at the hands of the rev. gentleman, and a large number of the nobility. The proceedings of the day were commenced by the Hon. Stafford Jerningham, Mr. and Mrs. Buckingham, and a batch of nearly twenty other ladies and gentlemen kneeling and receiving the pledge on the platform. A party of brewers' draymen forced their way into the crowd with a barrel of ale, but they were ultimately expelled, after a violent contest with the Irish teetotallers. The number who took the pledge in the course of the day was 3,000. The result of the rev. gentleman's labours in the metropolis and suburbs are 68,000 who have publicly taken the pledge, and about 6,000 made up of schools and factory workmen, to whom it was administered privately. Immediately after the last batch, Father Mathew came on the platform to take his farewell, and was heartily cheered. The rev. gentleman, in an affecting manner, spoke of the reception with which he, as a stranger in the metropolis of England, had been everywhere received. Since he had been in London not a single word had been uttered against him, personally, which could at all be painful to his feelings, and the public press, of every description of politics, had acted in so kindly a spirit towards him, that he publicly begged to tender the conductors of that great and powerful moral engine his heartfelt gratitude. In conclusion, he urged upon all present the blessings of sobriety as compared with the vice of drunkenness, and expressed a hope that the grace of the Almighty might enable those who had taken the pledge to keep it. Father Mathew has since proceeded to Norwich, to which place he had been invited by Bishop Stanley. Thence he goes to Birmingham and Liverpool, and then to Ireland, having on the 17th to preach, in aid of some public charity, in Dublin.

The Mayoralty.—It is said that a large body of the livery are anxious to re-elect the present Lord Mayor for another year, on account of the satisfactory manner in which he has discharged the duties of the mayoralty, and particularly those connected with the hospitalities of the City. Alderman Lanson has resigned his gown as Alderman of Bread-street ward, in consequence of indisposition. He declined serving the office of Lord Mayor during the present year from the same cause.

Excise Seizures.—A few days since an extensive seizure was made by the officers of Excise, in Anchor-yard, Old-street, St. Luke's, where they found a complete manufactory fitted up for the purpose of drying and colouring old tea leaves. It consisted of two large furnaces, drying-pans and plates, for the final process of drying; colouring matter, drugs, and a quantity of "tea" ready to send out, with some in the process of transformation from green to black. Not a particle of good tea was to be found, although the quantity amounted to nearly a ton in weight. The persons owning it made their escape during the entrance of the officers, as no person was to be found on the premises, but the state of the pan proved that they had been recently at work.

Westminster Abbey.—Some alterations and improvements are in progress in the little cloisters adjoining the Coroner's Office. A small tenement, which has been built about 180 years, a portion of which projected over the east side of the cloisters, and was considered in too dilapidated a state to undergo a repair, has been removed. In the course of removing the front wall, a portion of the original building was discovered, which is supposed to have been erected during the reign of Edward I.—The Dean has given directions that the public shall in future have the privilege of passing, after divine service, from the nave into the choir, from which egress will be obtained through the western entrance, which has for many years been closed, the only entrance still being by the gate at Poet's-corner. The monuments in the choir have undergone a thorough cleansing, and all persons will now have the opportunity of viewing them free of charge.

Old St. Paul's.—During the last few days, in the course of some excavations south of the Cathedral, for the formation of a new sewer from Paul's Chain to London House-yard, several human remains were found. Many of the skulls were quite perfect. They were discovered at various depths, some as low as eighteen feet from the surface. It is supposed that this locality was the burial-ground attached to old St. Paul's, which was destroyed by the great fire in 1666. During the recent excavations in Newgate-market, massive walls, about five feet wide, have been cut through at a depth of twelve feet from the surface, some of which were constructed of such solid materials that the workmen were obliged to employ powder to separate them.

St. Olave's, Southwark.—The largest vestry meeting ever known of the parishioners of St. Olave's took place on Thursday, for the purpose of considering the steps to be taken in consequence of the destruction of the parish church by the late fire. A long discussion arose on the propriety of rebuilding the church on a new site and selling the old one for the purpose of building a new wharf, but on the question being put, it was resolved by a large majority to rebuild it on its present site. A committee, with the Lord Mayor at the head, was then appointed to superintend its erection.

Knightsbridge.—The papers have contained reports of what is called a "military outrage" at Knightsbridge, in which some privates of the Royal Horse Guards are stated to have attacked the passers-by with swords and pistols. The affair, however, which was a drunken brawl, has been greatly exaggerated. Some soldiers were assaulted by the frequenters of one of the low public-houses near the

barrack-gates; their comrades rescued them; in the fray some heads were broken on both sides, and a woman was cut with the glass of a broken window, and this we believe was all that happened. No weapons whatever were used by the soldiery.

Kingston.—On Wednesday morning, at three o'clock, the inhabitants of the little village of Maldon, situated between Kingston and Ewell, were alarmed by an explosion, which shook the cottages to their foundation, and entirely demolished the glass in the windows. It was soon discovered that the two powder-mills at the extremity of the village had exploded and been reduced to ruins. Everything contained in them was destroyed, but no lives were lost. The foreman had only locked up the mills, and left them apparently in perfect safety, ten minutes before the explosion.

Mortality of the Metropolis.—The number of Deaths registered in the week ending Saturday, Aug. 26, was as follows:—West districts, 125; North districts, 139; Central districts, 166; East districts, 199; South districts, 213. Total, 842. Males, 433; females, 409. Weekly average for the last five years, 903—(461 males, 442 females); for the last five summers, 846.

Provincial News.

Her Majesty's Marine Excursion.—The Queen and Prince Albert, as mentioned in our last, held a levee on Thursday at Plymouth, on board the yacht, and afterwards paid a visit to the three towns. Her Majesty landed at the dockyard, and after passing through Devonport and Stonehouse, was met at the boundary of Plymouth by the Mayor and Corporate Officers, who preceded Her Majesty through the streets leading to the Hoe, and returned thence by nearly the same route to the Borough boundary on the Stonehouse Mill Bridge, where the authorities of Plymouth took their leave. The procession then returned through Stoke and Devonport, to the dockyard, where Her Majesty re-embarked and went on board the yacht. Her Majesty and the Prince then went to view the Breakwater, upon which they landed and remained some time, when they returned to the yacht, and dined and slept on board. In the evening the ships of war were illuminated, and bonfires were lit on all the heights around the harbour. On Friday morning the Queen left for Falmouth, amidst the usual salutes. When off the Breakwater the yacht hove to for a few minutes to enable Her Majesty and Prince Albert to view the whole scene before putting out to sea. A few minutes before ten she took her departure, steering towards the Eddystone light-house, which the Royal party were desirous of closely inspecting. From the Eddystone the yacht steered towards Falmouth, which she made about half-past one, and came to an anchor off St. Mawes Castle. Her Majesty did not land at Falmouth, but proceeded from the yacht into the harbour in the barge, accompanied by Prince Albert. Salutes were fired from the forts and shipping, and everywhere as her Majesty passed she was received with the most enthusiastic cheering. The mayors and corporations of Falmouth, Penryn, and Truro, put off in boats to wait upon her Majesty while in the barge, and were most graciously received. After pulling round the harbour, and inspecting all that was worth attention, her Majesty and the Prince returned on board the yacht, which immediately got under weigh, and steered for the coast of France. The yacht passed Cherbourg about half-past 6 on Saturday morning, and was saluted by the batteries of the town and fort with 101 guns. All the ships-of-war were dressed in their colours, and the Prince de Joinville was waiting in the Pluton steamer to escort her Majesty to Tréport. At 4 p.m. the royal yacht came in sight of Tréport, when a cannon was discharged as the signal of her Majesty's approach. At 5 o'clock the royal family, consisting of the King and Queen of the French, the Queen of the Belgians, the Duchess of Orleans, and the Princess Clementine, accompanied by M. Guizot, Marshal Sebastiani, Admiral Mackau, &c., left the Château d'Eu to meet the Queen. The Duc d'Aumale and the Prince Augustus of Saxe Coburg accompanied the procession on horseback. On reaching Tréport, his Majesty entered a state barge and proceeded to meet the royal yacht; while the Queens of the French and of the Belgians, with the Princesses, remained in the tent erected at the landing-place to receive the royal visitors as they stepped ashore. As the King approached the royal yacht, a salute from all the steam-vessels was fired, and this being taken up by each vessel in the roads and by the batteries on shore, a continued volley rolled during the entire ceremony of the first meeting of the Sovereigns. As the state barge approached, the yacht backed water, and the barge wore round her stern, out of sight of the spectators ashore. The King, on reaching the deck, embraced her Majesty, and shook Prince Albert most cordially with both hands. A few minutes afterwards, the Queen and Prince Albert, led by the Prince de Joinville, descended from their yacht, and took their place with King Louis Philippe in the state barge, amidst renewed salvos of artillery. The reception of the Royal visitors by the Queen of the French, the Queen of the Belgians, and the French Princesses, in the tent which covered the landing-place, was of the most graceful and heartfelt kind; and this part of the ceremony was also hailed by the assembled multitude with the most expressive demonstrations of concurrence and of joy. Her Majesty saluted on the cheek the Queen of the French, and afterwards kissed the Queen of the Belgians in the most affectionate manner. Having taken their seats in the first *char-à-banc*, drawn by eight horses, the Royal personages proceeded onwards towards Eu, followed by the respective ladies, ministers, and officers of both nations present. On their arrival the bands of the French

regiments struck up "God save the Queen," and in a few moments King Louis Philippe appeared at the balcony, leading our Queen, whom he presented to the people. The enthusiasm with which her Majesty was received is said to have been extremely fine; even the troops joined in the repeated cheers which burst from the crowd assembled, and the voice of the King of the French himself was heard louder than them all, as he waved his hat and led each round of cheering. The delight visible in the King's countenance was unbounded, and evidently uncontrollable. He became young again, and trod, and spoke, and acted, as though he was the most delighted of the party. At eight o'clock the King led Queen Victoria and the Queen of the Belgians into the banquetting-hall, Prince Albert following with the Queen of the French. Nothing could surpass the magnificence displayed at this truly royal feast. The decorations of the hall, the costly vessels, plateaux, chandeliers, &c., of gold, were disposed in the utmost taste. Queen Victoria sat on the right hand of the King, and, flushed with excitement, and undisguisedly happy, chatted and laughed alternately with his Majesty and the Prince de Joinville, who sat on her right. Prince Albert was seated between the Queen of the French, and the Princess de Joinville. Her Majesty was attired in a dress of crimson silk, with a profusion of diamonds, and wore the insignia of the garter. In the evening the Ville d'Eu was illuminated, and the spire of the ancient collegiate church, adjoining the château, was covered with lights to its summit. On Sunday, Her Majesty and Prince Albert and suite assisted at the Church service, which was read in a chapel prepared for that purpose in the château, by one of her attendants, no chaplain having been appointed to the yacht or to attend the Queen in her excursion. The royal party walked through the grounds of the Palace, but did not make any public appearance or take any other recreation, keeping the Sabbath strictly. On Monday, the Royal Family of France, the Royal visitors, and their respective suites, with the Ministers, guests, and officers, residing at the court, left the château to proceed to the forest, about five miles from the town, extending upwards of twenty miles in length, and having a main breadth of two miles. The "Mont d'Orleans," where the fête was held, is a hill embosomed in the forest. The advance of the royal party consisted of horsemen, the foremost being Prince Albert, having on either side the Prince de Joinville and the Duc d'Aumale, the Duc de Montpensier, the Prince of Saxe Coburg, and the other Princes, all in plain clothes, Prince Albert alone being distinguished by the ribbon of the Garter. Six *chars-à-banc* contained the rest of the company. In the first was seated his Majesty the King of the French, having our Queen at his right. The Queen of the French and the Queen of the Belgians occupied the second seat, and the third seat was filled by the Princess de Joinville and the Duchess d'Orleans, the latter in deep mourning. In the first seat of the second *char-à-banc* M. Guizot sat, between the Earls of Aberdeen and Liverpool. Lord Cowley, and the other lords and official personages, occupied the other vehicles. The young Count de Paris and the Duc de Chartres were conveyed to the Mont d'Orleans by attendants, and by a different direction. Nothing could exceed the enthusiasm of the people as the royal party passed; they hailed the appearance of our Queen and Prince with all the joyousness of the French character, and their own Sovereign seemed enchanted with the reception given everywhere to his guests. His Majesty, in fact, is said to have become twenty years younger since the arrival of our Queen. His own subjects hardly recognised in the light, exhilarated, and enthusiastic *cicerone* of the fair Sovereign of England, the serious, anxious Monarch of the French nation. As the *cortège* proceeded slowly up the hill, an English party approached, and one of them having shouted "God save the Queen," his Majesty waved his hat, and turning round, cried also aloud, with all the fervour of deep sincerity, and in English, "Ah! God bless her." Arrived at the top of the hill, which they did about four o'clock, the royal party entered the tent, and partook of a *déjeuner*. The King then led her Majesty round the green platform, thus exhibiting himself and his royal visitor freely and without restriction to the crowd which circled the enclosure. The two other Queens and all the Princes followed; the band, during the promenade, playing "God save the Queen," and the spectators cheering to the echo. The royal party then entered the reception tent, where a few presentations were made. Her Majesty, during the fête, was remarked to caress the two young Princes, the Comte de Paris, and the Prince de Wirtemberg, the son of the late Princess Marie, most affectionately. The Royal party returned to the château at five o'clock, being cheered again on their route with increased enthusiasm. In the course of the evening a concert was given by the professional persons who had been summoned from Paris for the occasion. At the close of the performance the King requested the musical party to join the general company. On Tuesday morning Prince Albert, attended by the French Princes, reviewed the 1st Regiment of Carabineers, in a plain distant about four miles from Eu, in the direction of Dieppe, and afterwards inspected the infantry barracks. In the afternoon the Royal party visited the ancient collegiate church of Notre Dame, which adjoins the château, and which is dedicated to St. Lawrence of Dublin, its founder. Having inspected the several chapels, the architecture of the interior, and the stained glass windows, they descended into the crypt and examined the monuments of the Counts d'Eu. They then proceeded to Tréport. The King of the French having handed Queen Victoria into the *char-à-banc*, moved to Prince Albert to follow. His Royal Highness said he could not precede his Majesty, the King, with the utmost grace and humour, exclaimed,

laughing, "Ah! there is nothing of 'Majesty' necessary here." "But you will not have room beside the Queen," replied the Prince. "True," said the King, "I am a little stout, but I will sit sideways," and he insisted on placing Prince Albert betwixt himself and her Majesty; and, thus sitting three abreast in the first seat of the *char-à-banc*, they proceeded to Tréport. They were cheered vehemently wherever they went. At Tréport it had been designed to inspect the vessels in the port and road, but the tide being low, and the sea running rather high, the excursion was postponed. The Royal party drove to the jetty of Tréport, and returned to the palace to dinner. In the evening there was a concert of vocal and instrumental music. On Wednesday, the royal diversion consisted of a drive through the forest of Eu, and a cold collation at St. Catherine, distant about twelve miles. Passing along the same road as that which they took on Monday to the fête champêtre, until they got embedded in the forest, they then turned into what is called the Route Madeline, and halted at those points which afforded the best points of view. During the drive, than which few could be chosen more diversified, her Majesty seemed chiefly struck with the aspect of the town of Eu, crowned by its church, palace, college, and other edifices, which are seen to great advantage from the hills leading to the forest. The Queen turned several times to gaze at the several objects that most forcibly struck her, and expressed her pleasure at what she saw to the Queen of the French, who sat beside her. In this excursion the Prince de Joinville, the Duc d'Aumale, the Duc de Montpensier, the Prince Augustus of Saxe Coburg and suite, led the van on horseback, and Prince Albert and the King of the French occupied the first seat of the first *char-à-banc*—the three Queens of Great Britain, France, and Belgium, being seated in the second *banc*. In the first seat of the second *char*, M. Guizot sat, as usual, with Lord Aberdeen on his right, and Lord Liverpool on his left. The remaining carriages—six in all—contained the other guests, strangers, and officers staying at the château. In the evening there was a vaudeville, M. Ancelot, the *directeur*, having arrived to superintend its performance. On Thursday morning, about 8 o'clock, her Majesty and Prince Albert left the château, accompanied by all the members of the Royal family, and proceeded to Tréport, where they were received with the greatest enthusiasm. The King of the French, the Dukes d'Aumale and Montpensier, with M. Guizot, and others, accompanied the Queen on board the yacht; and, on taking leave of her Majesty, were saluted with a Royal salute from all the English ships. The yacht then got under weigh, attended by the St. Vincent and four steamers of war, and escorted by the Pluton, Napoleon, and Archimède, French steamers. The Prince de Joinville accompanied her Majesty in the yacht. The Queen's steamer soon ran all the others out of sight; and arrived at Brighton about half-past 3, exactly 6 hours and 10 minutes after starting (75 miles); she brought to a quarter of a mile off the pier, the water being too low to permit her coming alongside. Her Majesty's barge was lowered, and soon reached the pier; but the time of landing being much later than was expected, the alterations made at the pier to facilitate the landing of her Majesty left the barge much below the lowest point to which the platform could be carried. The Queen became rather nervous at the delay and alterations necessary, and the cheering added to the excitement. Her Majesty waved her hand, and the signal being at once understood, the cheering instantly ceased, and the boats which were crowding round the royal barge kept off. In a short time the arrangements were completed and the whole party landed in safety. On reaching the entrance of the pier her Majesty was loudly cheered by the assembled thousands on the cliffs and beach. Her Majesty acknowledged the hearty greeting of her subjects by repeatedly bowing. The Prince de Joinville was also loudly cheered. Her Majesty and Prince Albert appeared to have borne the voyage without the slightest inconvenience. At the end of the pier esplanade her Majesty and the two Princes got into a close carriage, surrounded by a guard of honour, and drove off to the Pavilion. It is said that her Majesty will remain at Brighton until Monday next, when she will go to Ostend on a visit to the King and Queen of the Belgians, accompanied by the Prince de Joinville. Among the other incidents of her Majesty's visit to France, it is mentioned that M. Paul de la Roche, and other artists were sent for by the King to make sketches of the different scenes for the Royal Gallery at Versailles. The Royal landing at Tréport was confided to M. Jugelat, the landscape and marine painter, who had at the King's command come down from Paris expressly to paint it. This picture is said to be already finished, and is described as a beautiful work of art. The point of view is taken from sea, looking into Tréport, as the Royal barge of the King approaches her Majesty's yacht. The barge having come alongside the yacht on the seaward side, made this necessary, but that very necessity has contributed to render the picture more effective than it could have been, had the point of view being taken from any other quarter. The picture is about 18 ins. long, and a foot high. It has been submitted to the King and French Princes, who have all expressed their approval of it. Among the numberless questions to which her Majesty's visit has given rise, not a few have been mooted respecting the supposed incapacity of the Queen to leave her British dominions without the sanction of an express act of Parliament. Some have maintained that the Prince of Wales, and not Her Majesty, is the person affected by this restriction. It appears, however, that the third clause in the Act of Settlement, which enacted "that no person who shall hereafter come to the possession of this Crown shall go out of the domi-

nions of England, Scotland, or Ireland, without consent of Parliament," was repealed very soon afterwards, in the first year of George I. (1st George I. c. 31), "whose frequent journeys to Hanover," says Mr. Hallam, "were an abuse of the graciousness with which the Parliament consented to annul the restriction." The last instance upon record of a British Monarch leaving England for the Continent, was in 1821, when George IV. visited Hanover. Upon that occasion a commission was issued under the Great Seal, appointing certain official personages "His Majesty's Guardians and Justices of the United Kingdom of Great Britain and Ireland, and his Lieutenants in the same during his Majesty's absence from the said United Kingdom, or till further signification of his Majesty's pleasure;" any four or more of whom were empowered to act for the Sovereign during his absence.

The Harvest.—The favourable and steady change in the weather for the last fortnight has had a beneficial effect upon the crops throughout the United Kingdom, and the harvest has nearly all been housed. The reports received on Wednesday, from the agricultural districts, at Mark-lane, were most cheering, and, on the whole, the harvest has been far beyond the expectations of the agriculturists and factors. Seldom has such weather been known at this season, the temperature during the last week varying from 70° to 75°, and occasionally as high as 87° in the sun; the average state of the barometer has been 75 to 78°, unattended with rain or storm. In Middlesex, Kent, Surrey, Sussex, Wilts, Berks, Bucks, Herts, Bedfordshire, Suffolk, Norfolk, Lincolnshire, Leicestershire, the Home and the Midland counties, the fields are open to the sportsmen. In Yorkshire, Durham, Cumberland, Northumberland, and the whole of Scotland, the harvest will be over by the end of this week or next. In Hampshire, Gloucestershire, and Wales, the crops have been most abundant, and all safely stacked. In Scotland the Barley and Oats are extremely fine and full, and the average is far above what was anticipated, as in the Highlands they expected rather a failure. The accounts from every province of Ireland are most satisfactory, and the greater part of the crops have been housed. The Turnip and Potato crops, both in England and Scotland, which were rather threatening in consequence of the excessive rains, promise to render a good return, as the sudden change in the weather has had a beneficial effect on the fields. From the Hop districts of Kent, Worcestershire, &c., the Bines are reported to be looking extremely fine, and will return more than an average. The duty is now estimated at 150,000*l*. One packet of new Hops sold as high as 8*l*. The speculators and millers in Mark-lane are cautious in not making large purchases. The importations of foreign wheat, in consequence of the duty having fallen to 14*s*., have been rather larger than last week, being 60,432 quarters, barley 7,826, and oats 2,670. English wheat 5,680 quarters, 6,720 sacks of flour; Irish oats 14,300. The prices generally having declined 2*s*. to 3*s*. per quarter on wheat, Kent and Essex is at 36*s*. to 56*s*.; Norfolk, 40*s*. to 54*s*.; Suffolk, 36*s*. to 54*s*.; flour, 40*s*. to 45*s*.; ditto fine, 46*s*. to 52*s*. Notwithstanding the fall in the market, the bakers throughout the metropolis still charge 9*d*. for the first quality and 7*d*. for the second bread, per 4*l*b. The price of bread in Paris is for first quality, 6*d*.; second ditto, 5*d*. per 4*l*b. 8 oz.

Bristol.—Information has been received of the total loss of the Queen steamer, belonging to the Bristol Steam Navigation Company, on Saturday night. She had only been built about four years, of 500 tons burden, and 180 horse-power, and is one of several vessels which the Company have lost within the last three or four years. It appears that in proceeding down the Channel they had the weather fair and clear, until they were abreast of St. Ann's, when there came on suddenly a thick bank of fog; they never saw anything after until they struck on the north-east side of Skokham Island, at 11 P.M. The Captain reversed the engines, and backed off, when they directed their course for Milford, thinking to save the ship. About the distance of one mile from the island they saw a sloop, and called her alongside to assist. At this time there were ten feet water in the hold, and the vessel was fast settling forward, when the Captain put the crew and passengers on board the sloop. In about a quarter of an hour the steamer sunk in 16 fathoms. All the crew and passengers were saved excepting one, but they lost their clothes and luggage, and nothing was saved of the ship's property but the plate, two compasses, and the boats. The ladies were nearly all in their night clothes, and arrived in that state at Milford on Sunday evening; the fog being so dense that the sloop could not find the harbour. It was most fortunate that this little vessel hove in sight before the steamer sunk, as all hands would otherwise have been lost. There were about 20 cabin passengers and rather less than that number on deck. It is remarkable that in all the wrecks of steamers, attended with loss of life, the vessels have been backed off and sunk in deep water; whereas in the case of the Columbia, recently lost on the coast of America, she was allowed to remain on the rocks until all hands and a great portion of her cargo had been saved.

Carlisle.—Mr. Stephenson, the Civil Engineer, was lately engaged by the corporation of Carlisle to give an opinion on the long-disputed question as to the best means of introducing water into that city. He estimates the expense of the works at the large sum of 30,000*l*.

Carmarthen.—A reward of 500*l*. has been offered for the discovery of the persons who, on the night of the 23rd ult., attacked the house of Mr. Edwards, of Gallywern, in the parish of Llanon, in this county, as noticed in this paper at the time.—The *Welshman* newspaper publishes a letter from Rebecca, in which she

gives an account of herself and her proceedings. The following are extracts:—"Rebecca's rights once obtained, we shall be as quiet as mice; there will then be no further strife between the slaves (slaves no longer) and the slave-drivers. It is in vain to employ special constables; the rural police will be of no use; and as to the soldiers, I should think, sir, that English gentlemen and brave dragoons might sure be more suitably employed than by being turned into pike and toll-men; they are, however, of no use in the world, and to their long swords, saddles, bridles, Rebecca sings fol de riddle rol. Rebecca bids defiance to all of them: we don't care a straw for all the soldiers, rural police, and special constables: for Rebecca can bring into the field a better force and a much more numerous one. Rebecca is more than 100,000 strong. The people, the masses, to a man, throughout the three counties of Carmarthen, Cardigan, and Pembroke are with me. Oh yes, they are all my children."—"I blush for my countrymen, and resolve to regenerate them. My children are simple, without information and politics. They shall not always be thus. If God spare the life of Rebecca, she will work out their redemption; and if she dies, Miss Cromwell and a band of brave mountaineers can cut their way through every obstacle. We must be free. I say it. I who command—I, the Rebecca and Regenerator."—"The Government commission sent down to listen to and redress our grievances is English; Rebecca and her children rejoice. For we know that England will do more for oppressed Welshmen than Wales itself with its jobbers and degenerate gentry would ever have done. But it was Rebecca who gave the word of command. It was she who brought down the envoy from the seat of the Imperial Legislature. Once more, sir, farwelwch; Rebecca's heart bleeds for her countrymen; she hath compassion for her countrymen, contempt for cowardice, hatred for oppression, and love for all honest independence. By these presents let all men know REBECCA."—On Wednesday night, a collision took place between the police and the Rebeccaites, near the Pontardulais-gate, between Swansea and Llanon. The rioters attacked the gate in a considerable body, and completely destroyed it. The police then advanced, and commanded them to desist; instead, however, of doing so, the Rebeccaites fired a volley at them. The police were then ordered to fire, which they did twice, wounding several of the Rebeccaites, and shooting the horse of the leader. A regular battle took place for a short time, and the police succeeded in capturing six prisoners, three of whom were wounded, two severely. While they were securing their prisoners, the rioters returned to the attack, with a view of rescuing them; but two of the magistrates having ridden off for the troops, a party of the Dragoons from Swansea, who were out on the road, and some of the 76th Foot, arrived, and the Rebeccaites fled. Three of the prisoners have been sent to Carmarthen, and three to Swansea. They were taken in their disguises, with faces blackened, and bounnets and nightgowns on. Upon the arrival of the Dragoons on the spot, the prisoners were placed in the toll-house, and a sentry placed over them; four Dragoons were stationed at the gate, and the remainder patrolled the country, but could not succeed in capturing any other prisoners.

Chester.—James Ratcliffe, who was convicted before Mr. Baron Rolfe, at the late Assizes of the wilful murder of his wife at Stockport, underwent the extreme sentence of the law in this city, on Saturday. The circumstances under which the murder was committed were of an aggravated character. It appeared that the prisoner, who was a tobacconist by trade, had been constantly in the habit of indulging in the use of intoxicating liquors, and that after having long harboured his intention, he stabbed his wife with a clasp knife. The judge held out no hope of mercy, notwithstanding which petitions in his behalf, praying for a commutation of punishment, were forwarded to the Home-office from Chester and Stockport. They were, however, without effect, the answer of Sir J. Graham being that he could not, consistently with his public duty, comply with their prayers.

Derby.—On Saturday, William Grocock, the youth mentioned in our last as having surrendered himself to the police as a murderer, was brought before the magistrates for examination. The girl whom he had enticed from her home, and then attempted to murder, stated various acts of violence he had committed before he struck her on the head with a hammer. Her evidence was confirmed by the surgeon, and the prisoner was committed to take his trial at the assizes.

Gravesend.—During the whole week, the village of Cobham, perhaps one of the most retired and beautiful in Kent, has been the scene of much excitement. Numerous visitors from London have arrived, attracted by the details of the murder of Mr. Robert Dadd, noticed in our last. The melancholy tragedy has created a feeling of deep gloom among the inhabitants of a district seldom disturbed by deeds of violence. The Earl of Darnley is at present in Scotland; his mother, the Countess, was residing at the hall when the catastrophe occurred. Mr. Dadd was the son of Mr. Stephen Dadd, timber-master of the dockyard at Chatham. He opened business for himself in Chatham as a chemist thirty years ago, and remained there until a few years since, when he took the silver gilding and ormolu business of Messrs. Pincott, of Suffolk-street, Pall-mall East, in which he commanded a great share of Court patronage up to the hour of his death. He was married twice, and was the father of 6 sons and 3 daughters, but has been a widower some years. He was a lecturer on chemistry, mineralogy, and geology; an active member of the Chatham Philosophical Institution, and one of the first presidents and founders of the Mechanics' Institute in that town. A few days before his death he was

earnestly advised to place his son under restraint, but was himself the only member of his family who objected to such a course, expressing at the same time his opinion that retirement for a short time in the country, with kind treatment, would operate beneficially. As stated in our last, the son was an artist. The Cartoon, No. 14 in the late exhibition at Westminster Hall, representing "St. George after the death of the Dragon," was his composition; and it is remarkable that the work was begun immediately on the return of Mr. Dadd from Italy, and occupied only a few hours. It is, of course, little more than an outline, and bears marks of haste in other respects, the composition being generally considered exaggerated. The chief figure, however, that of a female, who is represented leaning on the shoulder of St. George, is considered as being finely drawn. One of this young man's sisters stood for this figure, at his own earnest request. The motto chosen for the drawing is the word "Industria," probably in allusion to the short space of time occupied in its completion. The latest accounts of his movements state that he passed through Calais three days since, en route for Marseilles. The fact of the murder having been committed was then fully known, but the passports being all regular, he was permitted to proceed. The authorities, however, set the telegraph to work, and on his arrival at Marseilles he will no doubt be arrested. He is said to have plenty of money with him.

Hastings.—On Friday last, being the 1st September, the Rev. Henry Pratt, of Worthing, left home in his chaise for the purpose of enjoying a day's partridge-shooting on the estates of his father, the Rev. J. Pratt, at Seddlescomb, and while in the act of removing a fowling-piece from the vehicle, the gun, which was already loaded, went off. The contents of the barrel entered the body of the unfortunate gentleman, and his death was instantaneous. Mr. Pratt had only been married a few months to a daughter of the Rev. Sir I. G. Thomas, Bart., Rector of Bodlam, in that neighbourhood.

Lyme Regis.—A fatal accident occurred in this town during the recent visit of her Majesty. On arriving off the harbour, the yacht shaped her course for the land-slip, towards which point a general movement was made by a large number of persons who had congregated to see her Majesty. Amongst the equestrians was Mr. J. J. de Bruen, who had been residing here with his brother for the season. His horse went at a rapid pace towards the margin of the cliff forming the deepest part of the chasm. On approaching the brink the horse made a sudden stop, and it is supposed that Mr. de Bruen, on perceiving the danger, and in disengaging himself from the horse, rolled over the precipice, a depth of 200 feet. The unfortunate gentleman survived but an hour and a half. He was a wealthy merchant of Holland, and only in his 24th year. A coroner's inquest has been held on the body, when the jury returned a verdict of "Accidental death."

Norwich.—A meeting of the committee for erecting a monument to the late Earl of Leicester took place at Holkham last week, when the unanimous opinion was in favour of the high ground on which the obelisk now stands, had it been unoccupied; but as that ornament was the first structure erected upon the estate by the first Earl of Leicester, the present Earl was averse to remove it. The committee decided upon a column without a statue, of such a height as should be apparent from the sea, so that the monument may be useful as a landmark.

Southampton.—The Lords of the Admiralty have issued orders that from henceforward all the mails from Madeira, the West Indies, Mexico, and the Mediterranean, are to be embarked and landed at Southampton, instead of at Falmouth, by which the steam-ships and their passengers will be allowed to proceed direct to their destinations. At the meeting of the Southampton Dock Company last week, the report announced that the tidal dock was completed, and opened for trade on the 1st July last, and that the directors had commissioned Mr. Hardwick, the architect, to construct warehouses for the northern quay of the tidal-dock, calculated to contain 2,500 tons of merchandise, which would be completed by about the end of the year. The revenue account showed a total receipt from the commencement of the undertaking of 326,788*l.*, and an expenditure of 319,731*l.*, leaving a balance of 7,056*l.*

Tyne.—The local papers state that Mr. Roberts, the barrister, has been retained by the Miners' Association of this and other coal districts as their consulting counsel, to act in their behalf at the signing of bonds, and to give them general advice. He is to have a salary of 1,000*l.* or the first year, and 500*l.* annually thereafter.

Railways.—The following are the returns for the past week:—London and Birmingham, 17,356*l.*; Great Western, 15,402*l.*; South Western, 7,782*l.*; South Eastern, 4,202*l.*; Eastern Counties, 2,881*l.*; North Midland, 5,045*l.*; York and North Midland, 2,011*l.*; Greenwich, 825*l.*; Croydon, 362*l.*; Brighton, 4,990*l.*; Blackwall, 1,234*l.*; Hull and Selby, 1,162*l.*; Midland Counties, 2,753*l.*; Grand Junction, 8,527*l.*—The pressure of the railway meetings has now nearly passed, and few of any importance remain to be recorded. At the meeting of the Manchester and Birmingham Company last week, the report stated that the receipts for the half-year, after the payment of 26,911*l.* to the Grand Junction Company, amounted to 52,118*l.*, and the expenditure to 29,555*l.*, leaving a balance of 22,562*l.*, out of which a dividend was declared at the rate of 15*s.* per share. Compared with the previous half-year, the increase in passengers amounted to 81,567, the increase in goods and tolls to 10,000 tons; surplus profit, 10,801*l.* The conveyance of the mails from Manchester to the South was still under the consideration of the Treasury, but the dispute with the Sheffield Company had been decided by an award against

that Company to pay to the Manchester and Birmingham Railway 3,490*l.* per annum for further station accommodation.—At the meeting of the Hull and Selby Company, the report stated that the receipts for the half-year were 25,736*l.*, expenditure 17,117*l.*, leaving a sum, including the balance of the previous half-year, of 9,910*l.* for the disbursement of a dividend of 20*s.* per share, being at the rate of 4 per cent. per annum on the subscribed capital.—The Birmingham and Derby Company have announced a dividend of 5*s.* per share. The most prominent point of discussion at their meeting was the amalgamation of the Midland lines, for the consideration of which a special meeting of shareholders has been called.—The report of the Yarmouth and Norwich Company at their meeting last week announced that the permanent way would be laid nearly throughout the whole line by the end of November, and the railway completed for public traffic by June, 1844; 49,759*l.* had been received on account of calls up to June last, leaving, after the payment of expenses, 10,686*l.* in the hands of the bankers. The original estimates, however, would be exceeded by about 15,000*l.*, to meet which and other contingencies, the directors were empowered to borrow a further sum of 50,000*l.*—At the half-yearly meeting of the Maryport and Carlisle Company last week, the report stated that the line was now open from Wigton to Carlisle, and that the traffic for the past half-year amounted to 3,675*l.*, being an increase of about 1000*l.* over the average produce of the past five years.—The Glasgow, Paisley, and Kilmarnock Company continue to pay a dividend of 12*s.* 6*d.* per share, receivable on and after the 15th inst. The goods and parcels traffic shows an increase, but the passenger traffic, on the other hand, had slightly declined. The mortgage debt of the Company has been renewed at the lower rate of 4 per cent.—The Dublin and Drogheda meeting took place this week. The report stated that the expectation of completing the undertaking at the rate of 14,000*l.* per mile is still relied on, as well as that of being able to open the entire line next May. It appears that there is a movement in favour of extending railway communication from Drogheda to the north of Ireland, which would much increase the traffic of the Dublin and Drogheda line. The receipts from the portion at present in operation were 102,888*l.*, the expenditure 94,921*l.*, leaving a balance of 7,966*l.* to be carried to the general account.—A new line, to be called the Great North British Railway, has been proposed; to run from Edinburgh to Berwick-upon-Tweed, which will complete the chain of railway communication from London to the North. By its communication with the Edinburgh and Glasgow, and the Great Northern lines, which will be completed to Newcastle in June next, and to Berwick in a short time after, it will form an uninterrupted route, between Edinburgh, Glasgow, and all parts of England. The journey between Edinburgh and London will then be effected in the space of sixteen hours. The cost of construction is estimated at 900,000*l.*, and from the report of the commissioners, who have surveyed the route, it appears that the total traffic from passengers and goods will realize about 110,000*l.* per annum.—A branch railway is now in contemplation to unite the town of Salisbury with the South Western Railway at Bishopstoke. Its construction will take two years.—The branch line connecting the South Eastern Railway with Folkestone Harbour is now rapidly progressing. The harbour is also cleared, and a large hotel is building near the Pavilion, with a frontage to the harbour, capable of containing nearly one hundred sleeping rooms. The number of passengers who left Dover during the week was 742 for Boulogne, 314 for Calais, and 155 for Ostend.—On Tuesday week several hundred inhabitants of the north, from Yorkshire and other places, visited Liverpool on a pleasure tour, by special trains, on the Grand Junction Railway, and returned again by the same route on the following day.—The London and Blackwall Railway cost 326,670*l.* per mile, which is the highest cost of any railway in the kingdom. The Greenwich, which comes next, cost 264,733*l.* The three lines which were executed at the lowest cost per mile are the Arbroath and Forfar, the Aylesbury Junction, and the Hayle Railways, which severally cost 9,130*l.*, 8,710*l.*, and 6,940*l.* per mile. The London and Birmingham cost 53,780*l.* per mile, the Great Western 55,330*l.*, the South Western 27,750*l.*; the Liverpool and Manchester 49,320*l.*, the Manchester and Leeds 59,800*l.*, and the London and Brighton, 64,370*l.*

IRELAND.

Dublin.—Mr. Callaghan, M.P., has offered his services as one of the 300 delegates to form Mr. O'Connell's Repeal Parliament, and a schoolmaster, named Hogan, has already commenced his canvass for the Representation of Nenagh in the same assembly. The Lord Primate, Lord J. G. Beresford, has been sworn in as one of the Lords Justices, to act during the absence of the Lord Lieutenant. The weekly meeting of the Repeal Association took place on Monday. Mr. O'Connell having first announced that he would hold a monster meeting at Clontarf, on the 8th October, when the chair would be taken on the large mound erected over the bodies of the Danes and which remains still a conspicuous object, proceeded to speak of their prospects of success and means of obtaining it. As to the Queen's speech, he said, that paltry trick of her Ministers on the sensitive mind of the Irish people, had only acted as a stimulus to goad them on with him, instead of throwing any damp upon their spirit. Even the Protestants of the North concur now, that there is not the slightest danger from Repeal agitation. More than half the people of Ulster had become Repealers. They had given up their intended meeting on the 7th inst.

which was a cloud happily passed away. Their Repeal meetings would now go on without interference from any quarter. There was, however, one source of apprehension—arising from hired incendiaries and disturbers. On this point, he referred to a letter which appeared in a Dublin paper, from a correspondent of the *Morning Chronicle*, in which the writer insinuates that such persons had been brought over from England to create a riot at the Tara meeting. This, said Mr. O'Connell, was a topic which they must not pass over lightly. By whom were these monsters employed? By the Government? By the police merely, or whom? Was it not terrific to think that underlings should be employed to get up a riot in order that slaughter might be done on the people of Ireland? Such persons had been employed among the Chartists, in England; but the people of Ireland were determined to keep the peace, and would not be ensnared by them. He dwelt on this head with great vehemence for some time, and expressed his determination to hunt the matter up. He next alluded to Mr. Feargus O'Connor's plan for the work-people of England—the observance of a sacred month, in which they should do no work—and said that, for himself he sought no revolution—but a bloodless, stainless one—a return to a former time—such a revolution as that of 1782, or 1829. To be sure the people of Ireland would, if required, leave the harvest uncut—or give up the consumption of exciseable articles. “I throw out this hint to show that we are not deprived of peaceable resources. The harvest is now nearly cut, so that I am for the present like a man speaking the day after the fair, and as to the non-consumption of exciseable articles, we will wait for the emergency.” He next entered into the subject of his statistical inquiries for the basis of the future constituency of Ireland, and repeated nearly all the chapter of last week on the same head. He again dwelt on the great necessity of not being in too great a hurry with their work. He concluded by predicting the downfall of the Irish Church Establishment, and said that there will, shall, and must be agitation in Ireland, never to cease till they have their Parliament in College Green. The rent for the week was announced to be 1097*l.* 6*s.* 8*d.*

Belfast.—A meeting of those noblemen and gentlemen who signed the requisition for a meeting in Belfast, on the 7th inst., for the purpose of expressing their determination to resist the Repeal of the Legislative Union, maintain the integrity of the empire, and take measures for the protection of the lives and properties of the Protestants of Ireland, took place last week, the Marquess of Donegal in the chair. A series of resolutions was passed expressing the satisfaction of the meeting with the Queen's speech, and declaring that “as loyal subjects of her Majesty, determined at all times to support the authority of the Queen, and anxious to comply with the spirit, as well as the letter, of her expressed wishes, they feel it their duty to forego the meeting fixed for the 7th September, lest the Protestants of Ulster should be charged by their enemies, however unjustly, as the cause of continuing political agitation.” They also declared “their full conviction that the Repeal agitation is not only a political, but a religious effort to organise their Roman Catholic fellow subjects, for the purpose of dismembering the British empire, destroying the Protestant religion, overturning the Government of the Queen, and establishing Papal domination in this country.” A declaration to be signed by all the Protestants in Ireland, and presented to her Majesty, was then adopted, expressing their resolution in their several spheres and stations, to maintain the Holy Scriptures as the standard of Christian faith and morals, preserve unshaken loyalty to the Queen, defend the Protestant succession to the Crown, and to stand together to defend, with their properties and lives, the integrity of the empire, as cemented by the Legislative Union.—Mr. Green made a successful ascent in his balloon on Saturday from the Botanic Gardens in this town. He intended, if possible, to cross the Channel to the Cumberland coast, but the wind being very light, he descended near Craigavad House, the residence of Mr. Forbes, and within a few hundred yards of the sea, and returned to Belfast the same evening. The excursion occupied twenty-nine minutes; the distance being about ten miles from the gardens.

Cork.—A curious incident occurred during the ball given at Cork in honour of the British Association, which exemplified the adroitness of the Irish police. A number of the swell mob honoured Cork with a visit for the occasion, some of whom came express from London, and among them several female practitioners. The crowded ball-room afforded ample field for displaying their skill, and thither of course they repaired. An inspector of police, dressed in ball costume, having observed one of these ladies appropriating a gentleman's purse, procured an introduction, and obtained the honour of her hand for the next quadrille. The gentleman, of course, in the pauses of the dance, did the agreeable to the lady, who appeared much pleased with her military-looking admirer. The dance ended, the gentleman's arm was offered for a promenade, and when near the door, he quietly resigned his partner into the hands of a brother officer, about whose appearance there could be no mistake.

SCOTLAND.

Edinburgh.—An annual synodical meeting of the Episcopal clergy of the united diocese of Moray, Ross, and Argyle, was held at Inverness on the 17th ult., at which, in reference to the umbrage taken by certain parties to the occasional use of the old Scotch communion office, it was the unanimous opinion of the Synod that there ought to be no difference between the Episcopal Church in Scotland and the united Churches in England and Ireland, in the administration of the holy communion.

In consequence of this opinion, the Dean was requested to convey the desire of the Synod to the Bishops, that the requisite alteration should be made in the canons, so that the English communion service should henceforth be exclusively used.

Braemar.—The presence of a royal Prince at one of those athletic exhibitions, a “gathering” in the Highlands, is an event so unusual, that the Braemar meeting this year possessed an extraordinary attraction to the “men of the mountains.” His Royal Highness Prince Alexander of the Netherlands being at the Mar-lodge, the shooting quarters of the Duke of Leeds, honoured the annual gathering on Friday week by his presence. The Duke of Leeds, with many of his followers in full highland garb, and many of the gentry, collected at the park-gate, when the Duke received the Prince there on his arrival from Mar-lodge. The highland games then commenced, such as putting the stone, running, throwing the hammer, tossing the bar, leaping, dancing the strathspey and sword dance; and at the conclusion of the amusements prizes were awarded to those competitors who had distinguished themselves in the various games. At the termination of the sports, about 200 persons sat down to a repast at the Castle, General Sir Alex. Duff, president of the society, in the chair, supported by his Royal Highness the Duke of Leeds, Lords Prudhoe, Elcho, Lilford, and a numerous party of visitors.

Miscellaneous.

The Royal Banquet at Eu.—The following extract from a description of this banquet, by the reporter of the *Morning Chronicle*, who was an eye-witness of the scene, will hardly fail to interest our readers:—“In the evening I obtained admission into the Palace, and the rare opportunity of seeing the Royal host and hostess, with their illustrious guests, at dinner. The scene was a very splendid one. When a King of France entertains a Queen of England, whatever of costly or gorgeous can be obtained will not be spared, and certainly upon this occasion the magnificent stores of Louis Philippe were put in requisition. The apartment in which the banquet took place is a large and very richly decorated one, looking on the garden terrace. It is hung round with portraits, set in handsome frames, and the roof is pannelled, richly gilt, and painted with subjects taken from the history of France. The plate, which was all gold or silver gilt, was of the most splendid description, and in the centre was a most magnificent plateau of gold, with large vases of the same costly material, filled with flowers. At 8 o'clock dinner was announced, when his Majesty the King of the French, with her Majesty Queen Victoria at his right, and the Queen of the Belgians at his left, proceeded down the grand staircase to the *salle-à-manger*, which is situated on the ground floor of the château. The King of the French appeared to be in excellent health and spirits, and to enjoy himself vastly on the occasion. He seems to me to bear a striking resemblance to some of the later portraits of George IV. He is a handsome and portly man, and not at all the clumsy, vulgar personage which he is occasionally represented in his portraits. He sat at the centre of the table. On his right hand sat the Queen of England, and on his left the Queen of the Belgians. The effect of her sea voyage has “shown” on Queen Victoria. She looks in excellent health, but the sea and air have given her a more flushed appearance than that with which we are accustomed to see her; nor has the sun been more sparing of her complexion than it would be of that of her fair subjects—in short, she is as brown as a berry. Her Majesty had the Prince of Joinville on her right hand, and carried on a most animated conversation with him during the whole time of dinner. She laughed and talked with as much enjoyment and freedom as if she were totally unconscious that upon her shoulders rested the whole weight of the government of Great Britain. She had on a dress of scarlet silk, and wore upon her arm the Order of the Garter, and across her breast the ribbon of that Order. Her head-dress was very plain, the hair being simply braided, and her jewels were handsome emeralds and diamonds. The Queen of the French sat immediately opposite the King, having Prince Albert on her right, and the Duke d'Aumale on her left. Her Majesty on this occasion was very silent, and the conversation did not appear by any means so animated on this side of the table as on the other. However, her Majesty, though reserved and silent, enjoys the presence of company, and the visit of Queen Victoria and Prince Albert have been peculiarly gratifying to her. On the left of the Queen of the French—of whose dress I can say nothing, but that she wore a very long feather in her cap—sat the Duke d'Aumale, who, if what all the world says be true, may hereafter be the Prince Albert of Spain. He is a good-looking, fair young man, and has appropriated to himself a large proportion of the sense of the family. Next to him sat the Princess of Joinville, an exceedingly handsome and pretty person, with a most superb diamond necklace about her neck. It is said she is eighteen, but she certainly looks two years younger. Her figure is very slight, her complexion rather fair, and her features small, delicate, and beautiful. Where there is so much of beauty it is not very easy to pick, but, upon the whole, I think the Princess of Joinville should have the apple. The Queen of the Belgians sat on the left of her Royal father. She is so often in England that her figure is known to many of your London readers. She is handsome, and of pleasing appearance and demeanor, and is said to be the great favourite of her parents. Of her brother, the Duke of Montpensier, who sat next to her, I can only say that he is a very young man, who is assiduously engaged in the cultivation of a pair of moustachios of great promise. His neighbour was the Princess Clementine, who has been recently married to Prince

Augustus of Saxe Coburg, a cousin of our Prince Albert. She is not quite so handsome as the rest of the family, but that says nothing in a family so distinguished for beauty as that of Orleans. The Duchess of Orleans was not present. She was at the château, but being in weeds, French etiquette does not allow her to dine in public. She was, however, one of those who went to Tréport to welcome the Queen, and I have since learned that Queen Victoria visited the Duchess after dinner, and saw “the young people,” to whom she paid such gratifying attentions, that she speedily became a great favourite with all of them. The only other royal personage whom I have to allude to, is our own Prince Albert. He was looking extremely well, and was much admired by the French ladies. “*Quel bel homme, quel beau garçon!*” is the universal cry. Queen Victoria has also found favour in the eyes of the French gentlemen. There is but one opinion among them as to her beauty, her exceedingly fine bust, especially her neck and shoulders, and her amiable and gay manners. In a conversation I had this morning with an officer high in the household, he expressed himself delighted with her animation during dinner, and the gaiety of her conversation both with the King and the Prince of Joinville. Of the other guests, the most conspicuous from the position I occupied, were M. Guizot and the Earl of Aberdeen, both of whom looked very grave. I have only to add, that, with the exception of the King, who wore a military dress, and of M. Guizot and the Earl of Aberdeen, who were in diplomatic dresses, all the rest of the party were in *musti*. The dinner party broke up at a quarter past ten, after which there was some music. The musicians came from Paris. The number of attendants, liveried and unliveried, was extraordinary, fully equal to the number of guests. The royal livery of France is like our own—scarlet; but the coats are made in a very Louis Quatorze style, loaded with heavy worsted lace, like that used to trim the linings of our carriages, and the effect is heavy. I was rather surprised at the number of unliveried servants on the occasion; but I understand that they are considered the very height of style in France, though to me the effect was a bad one, as it took away uniformity. I have given a very inadequate description of what was, in fact, a most gorgeous scene; but where there is so much to admire, and so much to remember, the whole is apt to become a mass of confusion in the memory. The apartment in which the banquet took place was a very splendid one, and was lighted in the most brilliant style; but I may mention, for the information of those lucky people who may be fitting up handsome dining-rooms, that in the King of France's there are no chandeliers. All the candles were placed upon the table.”

The Château d'Eu.—We are indebted to the same source for the following account of the building which will hereafter hold a remarkable place in the history of our time.—“The Château d'Eu came into the hands of Louis Philippe, not as King of the French, but as heir to his mother, who was the daughter and heiress of the Duke of Penthièvre, and from whom he also inherited the Comte d'Eu and other extensive inheritances. The Château is two miles distant from Tréport, which is on the sea beach. The valley between Tréport and the Château is certainly bare of trees, from its proximity to the sea, but it is otherwise one of great beauty. It has one great attraction, the want of which is felt by our countrymen in almost every other part of the continent of Europe—it has a beautiful sward and green hills. None know but those who have felt the want of these beauties how badly they are compensated by stunted vineyards or indifferent brushwood. Beyond the Château, towards the interior of the country, is a lovely valley. It is well wooded, having a small, but pleasing river running through it, and studded with cottages, orchards, and farmsteads, which remind one strongly of similar scenery in the south of England. In passing through all parts of Normandy, Englishmen are continually struck with the similarity of the objects they see to those they have left at home, and it is impossible to look at the churches, cottages, farms, and villages in this country, without being struck with the fact, that we owe much of the beauty of our home scenery in England to our Norman ancestors, who only imparted to us the taste of the country which they themselves had left. The château was built in 1573 by Henry of Lorraine le Balafre, Duc de Guise, on the site of a castle which had belonged in turn to the Lusignans, the Briennes, the Artois, the Clives, and the Saint Pols, and was burned down by Louis XI. This, probably, is a true account of the succession of its various possessors, and the mere enumeration is no slight evidence of the small dependence to be placed in this country on family greatness. At all events, it is certain that on the breaking out of the Revolution the château was seized upon by the so-called National Representatives, and consigned, with all its valuable effects, to the hammer. How any part of those effects happened to be kept together, the valuable history of ‘Eu and Tréport’ does not clearly explain; but this is certain, that after being shorn of two extensive wings by the revolutionary forces, it was restored, on the return of the Bourbons to France, to the mother of Louis Philippe, who left it to her sons, and in whose possession it has been for several years. Some additions have since been made to the château by Louis Philippe, and it is splendidly fitted up, the walls being clothed with a most valuable collection of historical and family portraits, including those of the Royal Family, and of the various lines of the Counts of Eu, to the number of 1100. The pictorial decorations are such as render it superior to any palace in France, with the exception of Versailles alone; and from the beauty and elegance of the furniture, and the propriety of its other appointments, it is inferior to few residences in any other country, either in splendour or comfort. Its greatest

THE GARDENERS' CHRONICLE.

INDEX OF THE PRINCIPAL HORTICULTURAL SUBJECTS IN THE LAST NUMBER

Amateur's Garden, No. XXXVI.	629 a	Meadows, containing peaty soil, to improve	622 b
Asparagus, application of salt to	633 a	Mohl (Dr.), his critique on Liebig's Work, continued	631 c
Bees, remarks on	629 b	Maize, analysis of	628 b
Cabbage-leaf, curious form of	629 c	Malberry on walls, treatment of, produce fruit	633 a
Camellia sativa, or Gold of Pleasure, described	613 a	New Zealand, remarks on soil of	627 c
Cement, Roman, how to apply	630 a	of clearing Fern, &c., on	638 a
Chorocoma spartioides	630 c	Pear, Parnes' Early, remarks on	630 a
Clover Daddier, its habits described	627 a	— midew on, origin of	633 a
— — — to destroy	627 a	Peat earth, non-conducting properties of	629 b
— — — account of pernicious effects of	629 b	Pelargoniums, to move to a distance	633 b
Conservatory, chimneys (Bignonia cherrie, &c.) described	619 c	Pits, remarks on covering	633 a
Croppers, hardy, list and time of flowering of	643 a	Portulaca splendens	631 a
Double flowers, to fertilize	633 a	Potatoes, to store up, cellar described	629 c
Draining land, directions for	627 b	Potter's guano, season to apply to Asparagus, &c.	622 c
Epidendrum Schomburgkii	631 a	Primrose, Chinese, to stand the winter, treatment of	630 b
Fig, to graft on a Vine, absurd statement concerning	633 a	Roses in pots, treatment of	633 c
Figs, forcing of, directions for	633 a	— different sorts on one stock, remarks on	630 c
Flowers, double, their origin	629 b	— list of good kinds for an amateur's garden	633 a
Fruit-tree borders, to drain, &c.	633 c	Rye grass, Italian, rapidity of growth in	631 b
Fuchsia, moss on, to destroy	633 a	Sherbourne, Mrs., her garden noticed	631 b
Fuchsias, remarks on; affinis, to flower	633 a	Spruce Fir branch, monstrosity of	630 b
Fuchsias discolor, rapid growth of	631 c	Tobacco, number of plants allowed to cultivate in Great Britain and Ireland	630 b
Gentiana amarella, &c. noticed	628 b	Vegetable Marrow, different kinds of	633 a
Ginger, directions for cultivation of	630 a	Wages, observations on	629 b
Heating, boilers, remarks on	632 c	Wheat, gluten contained in	633 b
Icones Plantarum, Hooker's, rev. insects, remarks on	632 a	Yucca gloriosa, treatment of, after flowering	633 a
Kilgill, a substitute for fermenting materials in hotbeds	628 a		
Larch, light moist soil essential to growth of	630 b		
Jobelia fulgens, treatment of	633 a		
Lycaste plana	631 a		

ROYAL SURREY ZOOLOGICAL GARDENS.

THE LAST FLOWER-SHOW OF THE SEASON.
next TUESDAY.—The Royal South London Floricultural Society's Grand DAHLIA SHOW and MISCELLANEOUS HORTICULTURAL EXHIBITION will be held on TUESDAY, 19th SEPT., being the third and last Exhibition at the Gardens for 1843. Upwards of 70 Gold and Silver Medals will be awarded by the Society, with extra Prizes, open to all England, including the first competition for the Ten-pound Prize offered by Mr. Bragg, for the best White Dahlia, and Mr. Groom's Prizes for "Lilium lancifolium." All the unique Entertainments of the Establishment will be combined to aid the attractions of the Flower-show, comprising a Promenade Musicale, Elocution, Wonders, by day and night, concluding with the Festival of Boodha! with splendid new effects and Indian Fireworks extraordinary! prepared for the occasion by the renowned Pyrotechnic Artiste, Southby. ADMISSION ONE SHILLING.
Gates open at 1. Flower-Show from 1 till 7. Firing to commence at 8 precisely.

HAMPSTEAD FLORISTS' SOCIETY.—The Second Exhibition and DAHLIA SHOW of this Society for 1843, will be held at the Holly-bush Tavern, Hampstead, on TUESDAY, SEPT. 19, which, from the number entered for competition, is expected to be superior to any former autumn Exhibition of this Society. The doors will be open to the public at One o'clock. Admission, One Shilling. J. HENDRY, Sec.

MANCHESTER BOTANICAL AND HORTICULTURAL SOCIETY.—The THIRD EXHIBITION for the current year will take place at the Society's Gardens, Old Trafford, on WEDNESDAY, the 20th inst., at Two o'clock, when prizes will be awarded for the best specimens of Dahlias, Fruits, and Vegetables.

By the polite permission of the Commanding Officers of the 12th Royal Lancers and the 8th Infantry, the Bands of these Regiments will be in attendance.
This Meeting will close the Public Promenades for the season. S. E. COTTAM, Secretary.

BRIGHTON FLORAL AND HORTICULTURAL SOCIETY.—The next Exhibition of Flowers, Vegetables, &c. by the above Society, will take place at the TOWN HALL, on THURSDAY, the 21st inst., when there will be a Sweepstakes for DAHLIAS, (open to the public) in three prizes, 17. 10s., 11., and 10s. Each pan must contain 12 dissimilar flowers, seedlings to be accepted. Entrance money, 5s.
N.B.—Specimens must be arranged by 11 o'clock, for the inspection of the Censors. R. COLLING, Secretary.
Windsor Cottage, Church-street.

UNDER THE IMMEDIATE PATRONAGE OF HER MOST GRACIOUS MAJESTY, and H. R. H. PRINCE ALBERT.
THE SALT HILL GRAND DAHLIA SHOW will be held in the Grounds of the Slough Nursery, near to the Railway Station, on FRIDAY, September 23, 1843, on a Scale unequalled at any previous Exhibition.

PRIZES.
First Class . . . Amateurs' . . . 12 blooms 4 Prizes.
Second Class . . . Gentlemen's Gardeners . . . 12 blooms 4 Prizes.
Third Class . . . Nurserymen . . . 24 blooms 4 Prizes.
Fourth Class . . . Seedlings of 1842 . . . 4 blooms } Prizes
Fifth Class . . . Seedlings of 1843 . . . 1 bloom } unlimited.
Entrance to the First, Second, and Third Classes, 10s. 6d. each; to the Fourth and Fifth Classes, 5s. each.
Entrances to be made on or before the 19th of September.
Stands will be provided for the Exhibitors.
Seedlings not to be exhibited in Stands with named flowers.
No Flowers to be removed before 6 o'clock.
As the first train from the West of England, and the 4-past 10 train from London, arrive at Slough before 11 o'clock, advantage may be taken of these trains for the conveyance of the blooms, as the time for staging is extended to 4-past 11 o'clock. Trains arrive at the Slough station every hour throughout the day.
A Military Band will be in attendance. Admission at 1 o'clock. Tickets One Shilling each.
All communications to be addressed to Mr. THOMAS BROWN, Honorary Secretary, Slough.
A PRIZE OF TEN GUINEAS—OPEN TO ALL ENGLAND, FOR TWO BLOOMS OF A WHITE DAHLIA.
It was arranged last year respecting this Prize, that the first competition for it should take place at the South London Exhibition, on the 19th inst., the second at Salt Hill, and the third at the Floricultural, on the 26th inst. The Exhibitor, to be entitled to the Prize, must win at two of these Exhibitions.

FUCHSIA ST. CLARE.—This magnificent Fuchsia has been exhibited before the London Horticultural Society, at their room, 21, Regent-street, and was awarded a Prize. Youell and Co. are now sending it out post free, with Eleven other finest Show varieties, for 21s. Also the finest show varieties of Chrysanthemums, per post free, at 12s. per dozen.—Great Yarmouth Nursery, Sept. 14, 1843.

DUTCH FLOWER-ROOTS.

DICKSONS AND CO., NURSERY SEEDSMEN, and FLORISTS, Waterloo-place, Edinburgh, in returning thanks for the long-continued patronage of their numerous Friends and the Public, respectfully intimate the arrival of their second importation of the season of BULBOUS FLOWER-ROOTS, consisting of a superb collection of Double and Single Hyacinths, of every variety and shade of colour, Polyanthus and other Narcissus, Double and Single Duc Van Thol, New Forcing and Florists' Tulips, Amaryllis, Crown Imperials and Martagon Lilies; Gladiolus, Iris, Ixias, Spiraxis, Scillas, Oxalis, Tigridias, Jonquils, Fritillarias, Snowdrops, Crocuses, Anemones, Ranunculuses, Tuberoses, Alstroemerias, Gesnerias, Gloxinias, Tropaeolums, &c.—all carefully selected, of very superior growth, and moderate in price. They have also received their usual supply of Early Garden Seeds, Winter Tares, &c. for Autumn sowing.

D. and Co. would invite particular attention to their extensive Nurseries, Leith Walk, Pilrig, and Red Braes, where they have a complete stock of Seedlings and Transplanted Trees, Shrubs, Thorns, &c., for Forests, Underwood, and Hedges. Samples, if required, will be forwarded to any part of the United Kingdom.

D. and Co. have for a long series of years made it their particular study to add everything new of merit to their choice Collection of Fruit Trees, Evergreen, and Deciduous Flowering Shrubs, Greenhouse, Stove, and Flower Garden Plants; and they flatter themselves their Stock will, on inspection, be found most extensive, and complete in every department. The following splendid New Calceolarias will be sent out for the first time during autumn, being the entire stock of the finest Seedlings produced this year by Isaac Anderson, Esq., Maryfield, including those for which the Silver Medal was awarded to him by the Caledonian Horticultural Society in July, 1843, and they are considered by the first judges both in Scotland and England to form quite a new class, superior to anything yet offered, viz.:—Duchess of Buccleuch, 10s. 6d.; Mrs. Anderson, 10s. 6d.; Princess Royal, 10s. 6d.; Princess Alice, 10s. 6d.; Prince of Wales, 10s. 6d.; Cobbold, 7s. 6d.; Miss Walker, 7s. 6d.; Mrs. Henry, 7s. 6d.; Splendida, 7s. 6d.; Emeline, 7s. 6d.; Lady Harvey, 5s.; Diana, 5s.; with 12 other new varieties of great beauty, produced from seed this season by D. and Co. and other growers, price 5s. to 10s. 6d. each. Noblemen and Gentlemen may obtain superior Gardeners, Land Stewards, and Foresters, on application. Planting contracted for.—1, Waterloo-place, Edinburgh, Sept., 1843.

ARRIVAL OF DUTCH HYACINTHS AND OTHER BULBS.

YOUELL & Co. beg respectfully to announce they have received from Haarlem their annual importation of the above in most excellent condition, adapted either for Glasses, Forcing, or open-border culture. Prices as follows—

Fine Single or Double Show Hyacinths . . . } 6s. per doz.
Red, Blue, White, or Yellow . . . }
Extra fine Ditto . . . 9s. to 12s. "
Extra fine, and very superior Ditto . . . 18s. "
The selection being left to YOUELL & Co.
Catalogues may be had on application.

FASTOLFF RASPBERRY.—For particulars of which see their Advertisement in last week's Paper.
Great Yarmouth Nursery, Sept. 14, 1843.

SEEDLING RANUNCULUS.

GEORGE LIGHTBODY, Falkirk, begs to inform Growers that he has a few splendid new Sorts that bloomed for the first time in 1841 and 1842. These fine varieties will be a great aid to competitors. Early application will be necessary to prevent disappointment, the Stock being limited. Descriptive Catalogues may be had on application. Ranunculus Seed, in Packets, at 2s. 6d.; also a few Packets of Auricula Seed, warranted to have been saved from the choicest Stage Flowers, at 2s. 6d.

MAJOR'S BRIDEGROOM PANSY.—H. MAJOR has a Stock of fine healthy plants of this most beautiful PANSY, at 3s. each. It is allowed by competent judges to be decidedly one of the best out: it is of large size and good shape, with a fine eye, and has the valuable and rare property of retaining its colours distinctly bright throughout the flowering season. H. M. has always on hand an extensive stock of first-rate sorts. For Amateurs and persons desirous of growing only a small collection, H. M. offers 12 first-rate sorts, including Bridgroom, for 20s., postage free. The best months for planting for a spring bloom are September and October. A few packets of select Pansy-seed, 2s. 6d. and 5s. per packet. From unknown correspondents a remittance is respectfully requested.
Knonthorpe, near Leeds, Sept. 13, 1843.

WILLIAM IVERY, Florist, Peckham, near London, begs most respectfully to inform his Friends and the Public, that he will send out his six superb and distinct Seedling CINERARIAS, after the 26th inst.; they have been successively exhibited at Chiswick Gardens; Botanical Gardens, Regent's Park, and South London Floricultural, where their merits are well known. Ivery's Cineraria, Emperor, fine dark shaded purple . . . 5s.
" " Regina Victoria, pure white beautifully tipped with purple . . . 5s.
" " Pride of Peckham, pure white, blue eye . . . 5s.
" " Triumph, bright crimson . . . 5s.
" " Delicata, delicate lilac shaded pink . . . 5s.
" " Regulata, rosy purple, fine form . . . 5s.

W. I. can particularly recommend the following named varieties:—Webberiana, 2s. 6d.; Smith's Challenger, 2s. 6d.; Gaines's Prince of Wales, 1s. 6d.; Bell's Decora, 3s. 6d.; Henderson's Compact Blue, 2s. 6d.; Ditto Azurea, 2s. 6d.; Ditto Magnet, 1s. 6d.; Ditto Eclipse, 2s. 6d.; Ditto No. 7, 2s. 6d.; Ivery's Rival King, 1s. 6d.; Ditto Imperial Blue, 1s. 6d.; Ditto Royal Blue, 1s. 6d.; Ditto Queen Victoria, 1s. 6d.; Ditto Princess Royal, 2s. 6d.; Youngii, 2s. 6d.; Splendida, 1s. 6d.

NEW PICOTEES.

HEADLY'S NANETTE; purple edge, rather heavy, thick petal, rose edge, good white, and edging well defined, 10s. per pair. Bond's Countess of Winterton, after the style of "Trip to Cambridge," although distinct, 7s. 6d. the pair, and all the others that are coming out. John Dickson's Catalogues for 1843 are now ready, comprising all the best flowers in cultivation. Applications for Catalogues may be made at the Nursery, Acre Lane, Brixton, and WARNER and WARNER's, Cornhill, London.

GROWTH OF PLANTS.

HUMPHREY'S COMPOUND to Promote the Beauty and Preservation of Plants, may be used either in the Drawing Room or in the Conservatory, and from its condensed fertilizing power a few grains dissolved in water at intervals is effective. Applicable to all Greenhouse plants, to Hyacinths, and other bulbs; and to promote the growth of cuttings and the germination of seeds. Sold in bottles 1s. 9d. each, by FLANAGAN & SON, Mansion-house-street; HURST & McMULLEN, Leadenhall-street; W. CLARK, Bishopsgate-Within; and other leading Seedsmen, &c. in town and country. Wholesale Agents, DAVY, MACMURDO, & Co., 100, Upper-Thames-street, London.

TWO NEW SEEDLING PICOTEES,—"LADY ALICE PEEL," 10s. 6d., and "MRS. BENYON," 10s. 6d. per pair.—The two splendid Picotees were raised by the Rev. J. Burroughes, of Lingwood Lodge, Norfolk, and kindly presented by that gentleman to Messrs. YOUELL & Co. They have already obtained prizes at the Norfolk and Norwich Horticultural Exhibition; and Y. & Co. feel assured that no further proof of their superior merits is necessary when they refer to the eminent raiser of them.

"LADY ALICE PEEL" is a large and well-formed flower, guard-leaves and petals throughout of fine form and substance, and of the purest white; the lacing a delicate rose, and entirely confined to the edge. This is considered to be greatly superior to Mrs. Barnard, or any flower of its class, and carries a fine long pod.

"MRS. BENYON" (red edged) also possesses every character for a first-rate show-flower; petals of splendid size, form, and substance, and the bloom expanding so correctly as not to require the aid of dressing, and, like the former, has a beautiful long pod.

The stock being limited, early application will be necessary, to prevent disappointment. Catalogues of their extensive collection may be had on application, and will be found to contain upwards of 800 of the very best varieties in cultivation, and which are sent out upon the following terms:—

	£	s.	d.
12 pairs of good show varieties, 1 pair of each	1	4	0
12 " fine ditto ditto	1	10	0
25 " ditto ditto ditto	3	0	0
12 " Extra fine and very superior ditto	2	10	0
25 " ditto ditto ditto	5	0	0
12 " ditto Pinks ditto	0	12	0
25 " ditto ditto ditto	1	0	0

The selection being left to YOUELL and Co.
Great Yarmouth Nursery, Sept. 14, 1843.

WARNER and WARNER, SEED MERCHANTS, 28, Cornhill, opposite the Royal Exchange, London, beg respectfully to inform the Nobility and Gentry, their importation of DUTCH BULBS have arrived in excellent condition. The HYACINTHS are large and handsome, consisting of several New and Splendid Varieties. Catalogues are now ready, and will be forwarded post free.

TULIPS, RANUNCULUSES, HYACINTHS, &c.

H. GROOM, Clapham Rise, near London (removed from Walworth) by APPOINTMENT FLORIST TO HER MAJESTY, respectfully informs the Nobility and Gentry, that his Bulb Catalogue for this autumn is ready, and will be forwarded by post on application. He begs to state that he has a large stock of the beautiful New Lily (Lilium lancifolium) and a fine collection of Auriculas, which he can supply at very moderate prices.

ROSES.

T. RIVERS, Jun., respectfully informs his friends, that his descriptive Catalogue of ROSES is now ready for delivery; it will be sent as usual, post-paid, as soon as possibly convenient, to all those who have ever honoured him with their commands. Unknown Correspondents wishing for a copy, may have one by application, enclosing a twopenny stamp.

T. RIVERS takes the present opportunity of informing the Public, that his Stock of Plants is of unprecedentedly fine and vigorous growth, and from personal inspection, he can assert that it is unequalled in extent in Europe.

Owing to the increasing taste for Dwarfs and Dwarf Standards, he has paid more than usual attention to their culture; so that fine Dwarfs may be had of many sorts hitherto only grown as Standards. The Dwarfs of the various choice Varieties of Moss Roses in particular are more than usually fine, having made shoots from four to six feet in length, and stout and robust in proportion. Plants of Tea-scented Roses and others in pots of extra size, can be had, for immediate forcing. The "Rose Amateur's Guide," third Edition, is now in the press, and will shortly be published by Messrs. LONGMAN and Co.; in this Edition is given the Propagation of the Rose, Forcing, Cultivation of Roses in Pots for the Greenhouse and for exhibition, and a notice of the leading new Varieties, forming a complete "Rose Fancier's Manual."—Sawbridgeworth, Herts, Sept. 13, 1845.

DOUBLE ROMAN AND PAPER-WHITE NARCISSUS, (warranted true.) The above beautiful and most fragrant of all the Narcissus have just been received in most excellent condition at A. COBBETT's, late Mr. BARRON's, Italian Warehouse, No. 18, Pall-mall; price 4s. per dozen. Also, Dutch Hyacinths for glasses, ditto for pots; Narcissus, Tulips, Jonquils, Iris, Crocus, Anemones, and Ranunculus, of which lists, with reduced prices, may be had free, per post.

MAGNIFICENT NEW FUCHSIA, "CONSTELLATION."

WILLIAM MILLER feels much pleasure in announcing, in answer to the inquiries made to him, that he is the fortunate raiser of that extraordinarily large and distinct Fuchsia noticed by Dr. LINDLEY, in last week's Chronicle (Sept. 9, p. 633), under the signature "W. Miller":—"Your hybrid between fulgens and corymbiflora is a very handsome flower: seed-pod small, tube long and slender, gradually increasing in size till the diameter is a quarter of an inch; the tube is of a delicate pink colour, having sepals of a greenish primrose, forming a strong contrast to the bright red corolla seen between them; the flower altogether is 3½ inches in length, and the buds are very handsome as they approach maturity; it flowers in a large, broad bunch, which is divided into branches, containing altogether 150 flowers."

N.B.—Plants next season at 12s. 6d. each, with the usual allowance to the Trade, when not less than six are taken. Early orders will be necessary, to secure plants, as many nurserymen that have seen it have ordered plants of it.
Providence Nursery, Ramsgate, Sept. 13, 1843.

AURICULAS, POLYANTHUSES, CARNATIONS, PICOTEES, and PINKS.

JOHN HOLLAND, Florist, &c., Market-place, Middleton, near Manchester, Lancashire, begs respectfully to call the attention of Gentlemen, Amateurs, Florists, his Friends, &c. to his extensive stock of the above Flowers, which are this season unusually fine, and are now ready for sending out, comprising the finest Show varieties in cultivation. Gentlemen, Amateurs, &c., purchasing, would find it to their advantage to possess his Catalogues, which are now ready, and will be forwarded gratis on application.—Market-place, Middleton, Sept. 14.

J. T. WILLMER and SON, King's Road, Chelsea, by APPOINTMENT FLORISTS to HER MAJESTY, beg to inform their Friends and the Public that their stock of CARNATIONS and PICOTEES are now ready for delivery, and which they offer at the following low prices, viz.:—

	£	s.	d.
25 Pairs of Carnations or Picotees, Fine Show Varieties	2	2	0
12 Pairs Do. Do.	1	1	1
25 Pairs of Pinks Do. Do.	1	1	1

A remittance or reference from unknown Correspondents required.

SEEDLING VERBENAS.

S. GIRLING, of Danecroft Nursery, Stowmarket, begs to offer the under-mentioned SEEDLINGS, as superior and distinct from any others in cultivation, and refers his Friends, and Purchasers generally, to the opinions given in the *Gardeners' Chronicle* of July 23, and following weeks; independent of which they have been seen by several extensive growers and first-rate judges, professional and amateur, who have ordered them liberally. They will be ready to send out on the 1st of October, and can be had on forwarding a Post-office order for the amount, by unknown correspondents, or some respectable reference.

AMETHYSTINA—A beautiful bright lavender; large pips; forming an immense truss of fragrant flowers. 5s.

BEAUTY—Fine lively cherry-coloured pink; excellent shape and habit; immense bloomer: one of the most distinct and beautiful of all the Verbenas in cultivation. 5s.

BRIDESMAID—A beautiful pale blush, tinted with blue; very fine. 3s. 6d.

BOULE DE FEU—This is of the most dazzling scarlet, making all other scarlets appear as pink or pale crimson. 3s. 6d.

FORTUNE-TELLER—Blush pink; immense trusser, some of which measure 10 inches in circumference. 3s. 6d.

LONGIFLORA—Violet purple; very large, and remarkable for the length of its tube: fine. 3s. 6d.

RENOWN—rich maroon, fine shape, and very compact, extra fine. 3s. 6d.

MINSTREL BOY—lilac and white, with a bright pink Eye, a pleasing and good variety. 3s. 6d.

WHITE PERFECTION—a beautiful pure white, with bright blue centre, excellent shape, and habit fine. 3s. 6d.

N.B.—The above can be had separately, at the prices quoted, or the set of Nine for 25s. A double set for 45s.; or treble, for 51s., inclosed in tin-boxes, where a set are taken, and forwarded, post free, to any part of the kingdom.

S. G. also begs to state that he will have two fine distinct Seedling Fuchsias to send out early next spring, at which time Plants of all the leading kinds in cultivation can be had at moderate prices. To Dahlia Growers, S. G. takes this opportunity of saying, his extensive Collections are nearly in full bloom:—by rail communication from the Eastern Counties' Railway to Colchester, and thence by Criterion coach you reach Stowmarket the same evening, and the same coach leaves Stowmarket every morning (Sundays excepted), quarter before eight, and reaches London by one o'clock the same day; fare from London to Stowmarket, 10s.

NEW PELARGONIUMS.

W. E. RENDLE respectfully informs Amateurs who are in want of a few good Pelargoniums to improve their collections, that he will supply a selection from the following sorts at FIVE POUNDS PER DOZEN:—Lyne's Lord Ebrington, Princess Royal, Cynthia, Hamlet, and Glory of the West; Rendle's Cornish Gem, Fanny, Aurora, Pride of Exe Vale, Circassian, Constellation, Count d'Orsay, Creole, Dido, Fair Maid of Devon, Grand Monarch, Lavinia, Oberon, Queen of the Fairies, Sapphire, Favourite, and Sir Robert Peel; with a Plant of

LYNE'S DUKE OF CORNWALL, OR SUNRISE.

Catalogues of Pelargoniums can be obtained—Plants will be delivered in October next—Orders will be executed in strict precedence—Plants will be added to compensate for carriage—Reference or remittance required from unknown correspondents.—Union-road Nursery, Plymouth, Sept. 15, 1843.

MYATT'S NEW SEEDLING STRAWBERRIES.

J. AND W. MYATT are now ready to send out their NEW STRAWBERRY, the DEPTFORD PINE, the fruit of which has been exhibited at the London Horticultural Society, and a Banksian Medal awarded. It has also been submitted to Professor LINDLEY, for whose opinion see *Gardeners' Chronicle*, No. 26, p. 417. It is a most prolific bearer, exhibiting at the same time a profusion of fine fruit and bloom on the same truss. Price, Deptford Pine, 2l. 10s.; British Queen, 1l., and Eliza, 10s. per 100.—Manor Farm, Deptford, Sept. 15, 1843.

THE BRITISH QUEEN AND PRINCE ALBERT PEAS.

W. J. CORMACK & CO., beg to announce to their Friends and the Public that they have harvested the above two New Varieties, and will be obliged by early orders, as the stock is limited. They will be sent out, as last spring, in packages, bearing the name of the firm, price 3s. 6d. per quart. The usual allowance to the trade.

N.B.—"Cormack's Early Kent Pea," 14s. per bushel. Newcross, Sept. 15, 1843.

EASTERN MELON SEED.

R. WHITE AND CO., NURSERYMEN, Poole, have to offer a few remaining packets of the HORSEANA PERSIAN MELON SEED, from the fruit exhibited by Mr. FLEMING, and which the Editor of the *Gard. Chron.* considers infinitely superior to all other kinds. It has an exceedingly thin rind, a most exquisitely delicious flavour, and is extraordinarily large. Packets of 6 seeds, 5s.

R. W. and CO. beg to inform the public, that they have just received their annual supply of BULBS; and as they employ an Agent in Haarlem to select for them, they are able to offer every variety at very moderate prices; and can safely assure all who favour them with orders, that nothing but the very best of goods will be sent them. Fine Hyacinths, 6s. a dozen; superior, 9s. to 12s.; very finest kinds, 15s. to 18s. a dozen.

Our Autumnal Catalogue of Bulbs and Geraniums, Picotees, Carnations, Roses, &c. &c., is now ready, and will be sent free, on application. Orders amounting to 5l. sent out free of charge; if less than 5l. Bulbs will be sent over to compensate for the cost of carriage.

GEORGE MILLS having this season saved SEEDS of his EARLY FORCING CUCUMBER with great care, offers it with confidence to the public, as the best kind known to him, at 5s. per packet, containing six Seeds, which will be sent free on the receipt of a Post-office order payable at Brentford.

G. M. begs to observe, that however good the kind of Cucumber, good fruit cannot be obtained at an early season unless the seed has good substance and is well organised, a point often unthought of. It is generally supposed that if it will grow it is sufficient; it is not—more particularly when sown in the autumn. Gunnersbury Park, Acton, Middlesex, Sept. 15, 1843.

MUSHROOM SPAWN.

WILLIAM FREEMAN, GARDENER, respectfully informs the Nobility and Gentry that he has now for Sale or Exportation a fine assortment of the best PATENT SPAWN, at 3s. per bushel. A considerable reduction will be made to the Trade. Country orders punctually attended to. Westbourne-green, Paddington.

VICTORIA PARK.

MR. J. KING begs leave to inform Market Gardeners and others that he has received instructions from the Honourable Commissioners of Her Majesty's Woods and Forests to submit to Public Auction the Stock and Growing Crops of several Market Gardeners in Wick Lane, Hackney, of which due notice will be given; the ground being required for the Victoria Park.

TO FRUIT-GROWERS and OTHERS.

TO BE LET, the GARDENS at HAWKHURST FARM, near Petworth, Sussex, with two Vineries, about 50 feet by 16 each, well stocked, and one Pine Pit, 45 feet by 12. The Walls and Gardens are full of thriving young trees. A good House and Land may be had with it. Rendle's Tank System may be easily applied to one of the Vineries and Pine Pit, they being heated by hot water. The Proprietor would have no objection to stock the same with Pine Plants for fruit g.—Apply to JOHN STOVELL, Esq., Stedham House, near Midhurst, Sussex.

TO NURSERYMEN, GARDENERS, and OTHERS.

TO BE SOLD, BY PRIVATE CONTRACT, Desirable Leasehold Premises, consisting of Nursery Grounds, and Stock, situate at Camberwell, Surrey.

The Premises consist of a COTTAGE RESIDENCE, with an Extensive Frontage, well situated for business; and an adjacent NURSERY GROUND, with COTTAGE, containing about Seven Acres. The Stock comprises a choice collection of Ornamental Trees and Shrubs, American Plants, Evergreens, Rose and Jasmine Stools and Layers, Trained Apricots, Peaches, and Nectarines, Trained and Standard Cherries, Dwarf and Standard Apple Trees, Gooseberries, Currants, Raspberries, and Strawberries of the best varieties.

The above offers a valuable opportunity to any party wishing to commence business, as the rent is moderate, the Stock well-selected, of the most available description, and the situation undeniable for business. For further particulars and cards to view, apply to W. A. LORD, Esq., 16, Loughborough-road, North Brixton; or to Messrs. PROTHORP and MORRIS, Leytonstone.

COTTAM and HALLEN, ENGINEERS, IRON-FOUNDERS, &c. &c., No. 2, WINSLEY STREET, OXFORD STREET, LONDON, and at CORNWALL ROAD, LAMBETH.

GARDEN ROLLERS 18 inches long, 34s.; 20, 44s.; 22, 50s.; 24 inches, 60s.; 26, 75s.; 28, 84s.; 30, 105s. each.

CAST-IRON RICKSTANDS, 2 feet 6 inches high, 5s. 9d. each. Garden Engines, Mowing Machines, Garden Chairs, Superior Garden Tools of all kinds, Garden Vases and Pedestals in great variety, and every description of Horticultural Articles, Agricultural Implements, and Furnishing Ironmongery; Dr. Arnott's Stoves, Anglo-Belgian Cooking Stoves; Broiling Stoves. The above low prices being on account of the depression in the Iron Trade, are subject to future alterations.

HOTHOUSES, CONSERVATORIES, &c., made upon the most improved principle, either of iron or of iron and wood combined, which can be fixed complete in any part of the Kingdom, at very low prices, in consequence of the present depressed state of the Iron Trade.

HOT-WATER APPARATUS for heating Hothouses, Conservatories, and Greenhouses; Churches, Public, or Private Buildings, &c., with COTTAM'S PATENT, or ROGERS' BOILERS. After 15 years' experience, and having fixed upwards of 1500 Apparatuses for the above-mentioned purposes, and by various improvements which they have made during that time, C. and H. can with confidence undertake the erection of similar Apparatus upon the most extensive scale. For the convenience of those who wish to fix their own Apparatus, they have affixed the following low prices:—

Cottam's Patent Boiler, 24 inch . . . 27 0s. 0d.

(Larger Sizes in proportion.)

Rogers' Boiler, small size . . . 3 15 0

Do. do. large do. 4 10 0

Hot-water Pipe, 4 inch diameter, 1s. 3d. per Foot.

STRONG IRON HURDLES, 3 ft. high, out of the ground, 6 ft. long, with five horizontal bars, weighing about 36 lbs., 3s. 6d. each. Light Cattle Hurdles, 3 ft. 6 in. high, weighing 42 lbs. at 4s. 0d. each.

Strong do. do. do. 45 lbs. at 4 4 "

Ox Hurdles, 4 feet high, do. 60 lbs. at 5 6 "

BEST WIRE FOR STRAINED WIRE FENCING at 8s. per bundle of 150 yards each. Uprights for ditto, 7d. each. The Improved continued, and every other kind of Fencing, Fancy Wire-work, &c.,

HAND-GLASS FRAMES for Cucumbers, &c., 18 inches square, 3s. 6d.; 20 inches, 4s. 6d.; 22 inches, 5s. 6d. each.

CAST-IRON FLOWER-STAKES 4 feet long out of the ground, 7s.; 4 feet 6, 9s.; 5 feet, 11s.; 6 feet, 15s.; 7 feet, 20s. per dozen.

Show-Rooms at the Manufactory, No. 2, WINSLEY STREET, where every information may be obtained.

HOT-WATER APPARATUS FOR HEATING HORTICULTURAL BUILDINGS, DWELLING-HOUSES, CHURCHES, and MANUFACTORIES, upon improved principles, and at very moderate charges, erected by DANIEL and EDWARD BAILEY, 272, HOLBORN.

D. and E. BAILEY having devoted much time to the consideration of this subject, and had much experience in the erection of apparatus for the above-mentioned purposes, have, by improvements suggested in their practice, rendered their mode of heating not only very efficient, but very simple, and have combined durability in the apparatus with economy in the charge. They have erected apparatus in England, Scotland, and Ireland, for many noblemen and gentlemen, and have had the honour to be employed by the Horticultural Society of London, in executing the works of their splendid Conservatory, lately erected at Chiswick.

D. and E. BAILEY also construct in metal all descriptions of Horticultural Buildings and Sashes, and invite noblemen, gentlemen, and the public to an inspection of their various drawings and models, at 272, Holborn, where they have the opportunity of exhibiting, amongst other metal works, an extremely complete and convenient kitchen apparatus, or range, adapted for the continued supply of hot water, and an arrangement of the oven more complete than has hitherto been brought before the public.

D. and E. BAILEY were the first to introduce metallic curvilinear houses to horticulturists, and can refer to the Conservatory attached to the Pantheon as one of their works, besides many others in this country and on the Continent.

D. and E. BAILEY have prepared a quantity of the Galvanic Plant Protectors, which are now ready for immediate delivery; they beg to introduce to public notice a new Trough Pipe, for Orchidaceous or other Houses where vapour is constantly, or at intervals required, and which may be seen at their Manufactory.

THE CONICAL HOT-WATER BOILERS, invented

by J. ROGERS, Esq., may be obtained of any size from JOHN SHEWEN, Ironmonger, &c., Sevenoaks, Kent.

J. SHEWEN having had every opportunity afforded him by an extensive practice to bring this apparatus to perfection, begs to offer it as most efficient and economical: it may be seen at Messrs. Chandler & Sons' Nursery, Vauxhall; Messrs. Loddiges', Hackney; Messrs. Henderson's, Pine Apple-place; Messrs. Veitch and Son's, Exeter; Mr. Pontey's, Plymouth; the Royal Botanical Society's Gardens, Regent's Park; and at the Gardens of the Horticultural Society of London. Considerable improvements have been effected since last season; particulars of which are in course of preparation.

WIRE-WORK, HOT-WATER APPARATUS, GREEN-HOUSES, &c.

ST. THOMAS BAKER, MANOR-HOUSE, MANOR-PLACE, KING'S-ROAD, CHELSEA, Manufacturer of INVISIBLE WIRE-FENCE, to resist Grazing Stock, and rendered Rabbit-proof. WIRE-WORK in Trainers, Arches for Walks, B rdering, Flower-stands, Pheastries, &c. HORTICULTURAL BUILDINGS, Green and Hothouses, Conservatories, &c. The same heated by HOT-WATER APPARATUS, on improved and economical principles.

Parties waited on in Town or Country, and Drawings and Estimates free. Work for the Trade as usual.

Ward's Cases, or Domestic Greenhouses.

RENDLE'S TANK SYSTEM OF HEATING.

STEPHENSON AND CO., 61, Gracechurch-street, London, Inventors of the IMPROVED CONICAL and DOUBLE CYLINDRICAL BOILERS, having been much engaged in heating buildings upon the above system with Tanks of various materials, solicit the attention of scientific Horticulturists to an Iron Tank now fitting up on their premises, which offers most decided advantages over every other article hitherto employed for the same purpose. These tanks which are ornamental in appearance can be made from 10 to 100 feet long and of any width and depth, and can be connected or disconnected by any working Gardener without the slightest difficulty, thus affording the opportunity to persons in remote districts of employing this much approved method of heating without the assistance of Engineers. The Tanks can be applied to Boilers and Pipes already fixed, and from the present low price of Iron will be found cheaper than of any other material. Mr. RENDLE, of Plymouth, has kindly undertaken to receive orders and furnish information to any persons in his neighbourhood, and prices for any size will be forwarded upon application to S. and Co.

HORTICULTURAL BUILDING & HEATING by HOT-WATER.

J. WEEKS & Co., ARCHITECTS, &c., Gloucester-place, King's-road, Chelsea, Hot-house-Builders, and Hot-water Apparatus Manufacturers, beg leave to inform the Nobility and Gentry, that their business, which has been extensive throughout the country for many years, is entirely confined to the BUILDING OF HORTICULTURAL ERECTIONS of every description, and the HEATING of them by HOT WATER.

CONICAL and other BOILERS of all sizes; their largest consumes but a small quantity of fuel, only requiring attention once in 10 hours, and will heat a range of Forcing-houses 300 feet in length.

Their improved plan of BOTTOM-HEAT FOR PITS, by means of an open trough under the bed, is now being universally adopted.

References may be had, and their works seen at most of the Nobility and Gentlemen's seats in the country, nearly the whole of the London Nurseries, and a great variety of Horticultural Erections and Hot-water Apparatus, Models, Plans, Estimates, &c., at their Horticultural Manufactory, Gloucester-place, Chelsea, near Sloane-square.

HOTHOUSES, CONSERVATORIES, &c., made and fixed complete in all parts of the Kingdom. One, two, and three-light Cucumber and Melon-Boxes and Lights of all sizes kept ready for immediate use, packed and sent to all parts of the Kingdom, warranted best material. Two-light Boxes and Lights complete, from 1l. 8s. Garden-Lights made and glazed from 1s. per foot, at JAS. WATTS, Sash Manufactory, Claremont-place, Old Kent-road.

*** Reference given.

LATE in the season,—therefore offered for the price of a Hand-Syringe only, viz., 3l. 10s.—AN EXCELLENT BARROW GARDEN-ENGINE, holding nearly 18-gallons. Superior in power and principle; will remain in order for years. May be seen at Mr. Smyth's, No. 7, Bray's-buildings, Lower-road, Islington.

HENRY HUNT'S PATENT GARDEN POTS and STANDS, for effecting improved Drainage and draught of Air, of which highly favourable notices have appeared in *Paxton's Magazine* for May, *Gardeners' Magazine* for June, *Practical Florist*, No. 23, and *Gardeners' Gazette*, May 6. Sold Wholesale and Retail at HUNT'S China Warehouse, Queen's-row, Pimlico; and No. 17, Great Rider-street, St. James's. N.B.—Nurserymen wanted as Agents for the above in many of the provincial towns.

G U A N O O N S A L E, BY THE IMPORTERS, ANTHONY GIBBS & SONS, LONDON; GIBBS, BRIGHT, & Co., LIVERPOOL AND BRISTOL.

WHEAT-SOWING.

POTTER'S GUANO.—The superiority of this powerful MANURE being now completely established, it is only necessary to inform the public that a material reduction has been made in the price, and that it may be obtained either at the Works or of Mr. POTTER'S Agents, who have testimonials of its efficacy.—28, Upper Fore-street, Lambeth, London.

Mr. MARK FOTHERGILL, 40, Upper Thames-street, Sole London Agent.

*** Nurserymen required as Agents in all the principal towns.

J. B. LAWES'S PATENT MANURES, composed of Super Phosphate of Lime, Phosphate of Ammonia, Silicate of Potash, &c., are now for sale at his Factory, Deptford-creek, London, price 4s. 6d. per bushel. These substances can be had separately; the Super Phosphate of Lime alone is recommended for fixing the Ammonia of Dung-heaps, Cesspools, Gas Liquor, &c. Price 4s. 6d. per bushel.

HORTICULTURAL ALMANACK.

The STATIONERS' COMPANY will publish, with their usual Almanacks, early in November, price 1s.,

THE GARDENERS' ALMANACK, and CALENDAR and REGISTER of the KITCHEN, FRUIT, FLOWER, and FORCING DEPARTMENTS, for the YEAR 1844.

By GEORGE W. JOHNSTONE, Esq., Fellow of the Agri-Horticultural Society of India; Corresponding Member of the Maryland Horticultural Society; and Author of "A History of English Gardening," "The Kitchen Garden," &c.

*** This Almanack will afford a large supply of matter, interesting not only to the professional, but also to the domestic gardener, as well as the amateur cultivator of flowers and fruits, and general reader. Besides containing calendarial directions and suggestions for every department during the current year, it will also be a register of all discoveries in gardening which have characterised the previous twelve months. The contents will, for the most part, vary every year; and it is recommended that each annual publication be preserved, as an index will be given to bind up with each volume.

To Nurserymen, Seedsmen, Implement-makers, and Publishers of works connected with the cultivation of the soil, this Almanack offers a peculiarly desirable organ for advertisements, as a very large number will at once be circulated through the United Kingdom, and will remain a PERMANENT AND INDEXED RECORD for reference in the hands of those most desirous to be made acquainted with their contents—viz., the Landed Gentry, and Cultivators of Gardens generally.

Just published, in One Volume 8vo., price 3s. 6d. to Fellows of the Society, and 5s. to others, (or postage free, upon receipt of a Post-office order, price 5s. to Fellows of the Society, or 6s. 6d. to others.)

A CATALOGUE OF THE FRUITS CULTIVATED in the GARDEN of the HORTICULTURAL SOCIETY OF LONDON. (Third Edition.) Containing the Names, Synonyms, Colour, Size, Form, Quality, Use, Time of Ripening, and many other particulars concerning all the most important varieties of hardy Fruit cultivated in this country.

Sold at the House of the Society, 21, Regent-street, and also by LONGMAN and Co., Paternoster-row; J. HATCHARD, Piccadilly; RIDGWAY, Piccadilly; RIVINGTONS, Waterloo-place; and by the principal Booksellers in all parts of the Empire.

A few Copies of the Second Edition of this Catalogue may be had at the reduced price of 1s. 6d. each.

The Gardeners' Chronicle.

 . . . Salt Hill.

THE observations on the Tank system of obtaining bottom-heat, made by our valued correspondent, Mr. Beaton, both last week in his Calendar and in a more extended article to-day, will be read with great interest, for they are the remarks of a man of much experience and skill. We are, however, sure that he will excuse us for differing from him on one point upon which he has strongly insisted, namely, the propriety of employing uncovered hot-water gutters, which allow the steam to condense among the soil of which the bed they are to heat is composed.

We have already pointed out what we conceive to be the evils of this plan. It is impossible to prevent impurities in large quantity falling into the tanks or gutters, and it is to be apprehended that they will by degrees choke up the boilers; it is equally impracticable to hinder the conversion of the soil into mud. Mr. Beaton admits the facts; he also recognises the force of the first objection; but he contends that the second is untenable and that *mere mud is the best thing possible for growing Melons and Cucumbers in, provided you keep a dry atmosphere over it* (Calendar, p. 632). Here we are at issue.

That both the Melon and the Cucumber are capable of digesting an unusual quantity of water is most true. There is somewhere an account, we believe by Mr. Towers, of a Melon plant whose roots found their way into a tank of water through some solid masonry, and spread in the fluid in all directions. The practice in some hot countries, of growing these plants on beds floating upon the surface of lakes, is familiar to everybody; and therefore it might be true that open tanks converting soil into mud will suit the Melon and Cucumber, without its at all following that they would be equally advantageous to other plants; in which case pits thus constructed could be employed for nothing else—a serious inconvenience in all except very large gardens, and no advantage in any. But we doubt whether excessive moisture at the roots is advantageous in this country, even to the Melon.

In the *Theory of Horticulture* (p. 121) this question has been gone into; and mention is there made of certain experiments with the Melon made in the garden of the Horticultural Society with reference to this very subject. Those experiments all failed. Persian varieties of the Melon were grown in baskets of earth standing in a tank of water, and they were trained under the glass of a curvilinear iron stove, where they received all the heat and light they can have in this climate. The plants for some time grew vigorously, their roots struck into the water in all directions; but some of them rotted at the ground level, and in those which bore fruit the produce was quite inferior to what would have been obtained under ordinary circumstances. Yet in this case the conditions of the floating gardens of Cashmere were fulfilled, *as far as circumstances permit*,—but they were not all fulfilled, nor can they ever be: the bright light of the East was wanting, and the water was stagnant. In a Persian lake the water is in continual agitation, from many causes; and the intensity of light is such as the eye can scarcely bear, while the heat scorches up the skin. All these conditions are necessarily wanting in this country; and therefore we submit that the practice of Cashmere and Mexico cannot here be imitated with advantage. But if we understand Mr. Beaton rightly, he prefers the muddy state of the bed where Melons are cultivated over open hot-water gutters, because it thus approaches the state of Eastern lake-gardens.

It strikes us that there is another serious objection to obtaining wet—we do not say moisture, but wet—by conveying it from below: it cannot be regulated, nor can the amount of it be ascertained at any time; while, on the contrary, if water is communicated from above, and proper drainage is provided below, no gardener need be ignorant of the state of the

roots of his plants. And this is, in fact, the practice of Persia, whose Melon-grounds are regularly irrigated by water let in from above.

Mr. Beaton attaches importance to the dryness of the atmosphere in which Melons are grown, and we perfectly agree with him that it should not be wet; but if the soil is dry on the surface, and only moistened below by condensed steam, we do not understand how the red-spider is to be kept down. Mr. Knight, the best Melon-grower we ever heard of, found no remedy except sprinkling the leaves frequently and *lightly* with warm water.

For these reasons we adhere to our opinion, that, for all purposes, Melon-growing included, it is advisable that the hot-water gutters used for affording bottom-heat should be closed up with some kind of porous material, either all round or at the sides. And, as far as we are at present aware, it will be found that if the spaces between the gutters are filled with rough materials, such as fragments of bricks and pottery, any quantity of water may be communicated to the beds by the ordinary modes of watering, where excessive moisture is desirable.

WHEN the subsoil in which the drains are to be formed is not a compact clay, but a loamy gravel, the labour in draining is greater. Loamy gravel is quite as impervious to water as clay, but it often lies on a sandy stratum which is porous. In this case pits may be dug, into which the drains may be conducted, and the water will sink down; but if this is not the case, tools must be used fit for picking stones, and if the gravel crumbles, and no clear channel can be dug with the narrow spade, tiles or earthen pipes must be used: some of the latter are now made with a very small bore, and at a low price. They will answer admirably to lay in the narrow drains; and if the sides crumble in, the pipes will always carry off the water. Some of these pipes are manufactured at the low price of 20s. per 1000, 13 inches long. They are not close, but there is a sufficient opening left at the joining of the edges, bent round, to let the water in; and they are not likely to choke up soon. The most troublesome subsoil to meet with is a running sand, full of water, which is frequently the case where the boundaries of a stratum of clay approach to those of sand and gravel. If the loose sand lies in a small compass, some very stiff clay may be first thrown into the trench, so as to make an artificial subsoil for the drain to be cut in; but if it be extensive, the only remedy is to find an outlet for the water accumulated in the sand, after which it will become dry and porous, and no further draining will be required on that spot. But the subsoil, without being a quicksand, may be of loose earth, or a marl, which will crumble when wet, and thus the drains will not stand. In this case pipes are the best remedy, unless you can make a solid gutter of concrete, according to the plan of Lord James Hay, which we have not yet had an opportunity of trying. This, it is said, will traverse a quicksand or bog, and carry the water through any soil.

In many fields of which both soil and subsoil appear light, traces may be seen of water having stagnated in winter. The cause of this can always be traced readily, by digging holes here and there around the wet spots, in spring. If water stands in them for any time after rain, draining is required, but not always complete thorough-draining. The water in this case filters horizontally through the upper soil, and meeting with a bank or obstruction, is accumulated where the subsoil is impervious, and lies in a kind of basin. One large deep drain carried judiciously through this basin and the obstructing bank, will lay the whole surface dry at a trifling expense; or some diverging branches may be required to collect the water from different small basins. The application of the system of thorough-draining on such lands would only be expense misapplied, and perhaps render the land less productive than it was before. But where a loose sand lies on a stiff clay or marl, no cultivation can be successful till the subsoil be laid quite dry in summer and winter. We find, in consequence, that it is in such lands that the system of under-draining has been practised the longest, and been considered as an essential preliminary to all good farming. Practice invariably anticipates theory, and the application of common sense by a sensible practical man leads to much sounder systems than the theories of the most acute philosopher, which very often are logically deduced from uncertain principles. The shrewd, well-informed farmer learns more by walking over a field where the crop has failed from the land being too dry or too wet, than he probably would by reading the most reputed system of Agriculture. We are far from disparaging the labours of those who collect facts and record them, judiciously explaining the principles which these facts establish; but we defy any man to have correct notions on soils and cultivation who has not had long experience, and often corrected opinions hastily adopted by the inspection of his crop in seasons which widely differ—as is so often the case in this

climate. The same may be applied to draining. It is one of the best means of obviating the evils of a moist climate: but in some very dry seasons the undrained land may have the best crops; and in some situations draining may not be necessary, and be a useless expenditure. Before any one begins expensive improvement, it is prudent to consult some experienced practical man, and not allow himself to be led away by the wonderful increase of value of some lands produced by simply draining them. If your land is dropsical, tap it; but do not draw off the moisture which is conducive to health. The same observations apply to subsoil-ploughing or trenching. When the subsoil is porous or well drained, and the top soil is of a good depth and mellow, this last should be stirred to its full depth, and a few inches more, to mix some of the subsoil with the upper soil, and in the course of time the productive soil will be much deepened. In a few years the subsoil or the trenching-plough may go still deeper, and the depth of good soil will be much increased. But suppose you have six inches of a very moderate soil over a stiff yellow or blue clay, however well drained, and you use the subsoil-plough to the depth of 14 or 16 inches at once, (which will require six horses, at least, even in a favourable season;) you will only make a temporary channel in the clay, which will close up by the first rains; and if you examine it the year after, no traces of your subsoiling will remain, and all your labour and expense will be thrown away. This is the consequence of applying a useful principle injudiciously: but if you only move three or four inches of the subsoil, some of the upper soil will be washed into the openings made by the subsoil-plough, and prevent their closing, while the roots will follow the good earth, and be kept moist at that depth. This has a reference to the depth of the drains laid in such a subsoil: in many cases 14 inches is a sufficient depth for the small pipes to be laid, 20 inches for the conductors, and 26 for the main drains. The depth of these last may be as great as the lie of the land will allow, for they have no communication with the surface, except through the conductors; but the nearer the small collectors are to the surface, and to each other, the more perfectly they will dry the land. It must, however, be kept in mind that you may over-drain, and lay your land too dry: on a clay subsoil this is seldom the case.—M.

BOTTOM-HEAT.

AT the moment when Mr. Rendle thought his tank-system had settled the question of bottom-heat, which has been in agitation for the last quarter of a century, it appears he has only formed a link which unites the two ends of a great chain—thus forming a circle. He is satisfied with a steady bottom-heat, which, passing through solid pieces of slate, differs nothing in its properties from that obtained by Mr. Forsyth's primitive *Killologie* system. The *Gardeners' Chronicle* occupies an intermediate station between Mr. Rendle and myself, and recommends the use of porous tiles to cover the tanks, so that the heat should not altogether be deprived of its moisture: while I advocate heat saturated with moisture, with the power of converting it into dry heat at pleasure. Now among these jarring principles, how are the uninitiated to arrive at just conclusions on the subject? I recollect being in this predicament in 1825, between steam and hot water. But let us take a rapid glance at the formation of the chain, whose ends Mr. Rendle has united:—About 1820, the late Mr. Stewart, gardener at Valleyfield, in Fifeshire, one of the best gardeners of the day, began to give bottom-heat to his Pines, from a chamber heated by a flue, and covered close with thin flag-stone—hot water and slate coverings not being then thought of. After three years' trial, the advantages of this system were laid before the London Horticultural Society, and printed in their "Transactions" (vol. v.)

But the gardening world, like the rest of mankind, is slow to adopt improvements, and is sadly put out at any new or startling idea. This innovation of bottom-heat met a host of ridicule and objections on the threshold, and was firmly resisted by the advocates of tan-beds and dung-linings: a proposition for obtaining bottom-heat unaccompanied with moisture, they said, could not well be surpassed in absurdity; and when they were told that a layer of sand—placed under the pots to receive the drainage, or otherwise watered—would supply the necessary moisture, they were panic-struck with the idea;—turning linings for one's life-time was nothing to this trouble. Now we must recollect that Mr. Stewart's plan, thus opposed, differed very little from that of Mr. Rendle; the difference being in the more uniform heat by hot water, and the manual labour of raising vapour instead of having it direct from a tank: and if Mr. Rendle had proposed his system in those days, it would have been sure to have met with strong opposition from gardeners of the old school. However, this opposition did some good, in so far as it paved the way for, or rather gave rise to, a less objectionable mode of obtaining bottom-heat, accompanied with the great desideratum of moisture—this was steam, discharged into chambers filled with stones: steam itself having previously met with a "powerful opposition," (*vide* M'Phail, "Gard. Rem." 2d ed.) But now, the comparison with dry bottom-heat turned the tide in its favour, and it flourished for a time, until the element which gave it birth was found to answer better;

and here a second struggle ensued—between the advocates of steam and hot water (see the first 4 vols. "Gard. Mag.")

No sooner, however, had the advocates of hot water influenced the public mind in its favour, than the most extravagant ideas were formed respecting the efficiency of heat and moisture for all practical purposes;—it even became a question whether laundries could be heated by these pipes, or whether the moisture transmitted through their pores should not damp, rather than dry, linen! Thus it generally is with the public mind: a new proposition for facilitating operations must either be nothing at all, or perfection at once—there is no room or time for intermediate degrees. Experience, however, soon determines the fallacy of these hasty conclusions; and this it did very quickly with our subject of bottom-heat. Then hot-water pipes were placed horizontally, in rows of 6, 10, and even 14, to give bottom-heat: these burnt every plant placed over them. A coat of tan or sawdust placed over the pipes did not mend the matter—the former soon rotted, and the latter, if kept dry to hold out longer, resists heat at the rate of 100° to every inch in depth: thus two inches of perfectly dry sawdust over pipes will resist all heat up to the boiling point—a circumstance taken advantage of in setting conical boilers.

This being ascertained, the next step was taken in 1830, by a clever gardener, Mr. Cameron, at Woburn House, near Beaconsfield, who directed Messrs. Grange, of Uxbridge, to place wooden tanks, lined with lead, under his Melon-beds, heated by a 2-inch leaden pipe, connected with the boiler and pipes that heated the pits; these tanks were covered with pieces of wood placed across them, and at two inches apart, a thin covering of turf over that, and then the soil for Melons. This answered exceedingly well, and Mr. Cameron grew fine crops in these pits (see "Gard. Mag." vi. 616.) In less than two years afterwards Mr. Weeks made a more efficient and less expensive application of this principle, by the use of brick troughs, and by passing an iron instead of a leaden pipe through the water; the covering of the tanks was the same in both cases—rough wood, turf, then mould, &c.; the water could be lowered in both cases, also, and dry heat obtained, when thought fit. These are now called Green's pits, and have been in use ten or eleven years, by scores of gardeners and nurserymen, without a single objection having ever yet been raised against them. But Green's pits are too expensive for general purposes, and Mr. Rendle's tanks have come in as a substitute. These tanks are perfectly complete, and unobjectionable as far as they go, and for stove plants in pots, for propagating-houses, or for all sorts of flower-forcing in winter, nothing can be better.

I have been working upon the very same principle and with porous covers, ever since 1837. The best gardeners and most scientific men in our line in Europe have seen my bed at work—Dr. Lindley, Sir William Hooker, De Candoile, and Mr. Loudon, among the number,—and an account of its management is given in the "Proceedings of the Horticultural Society of London for 1840." I ought, therefore, to know something of the subject; if not, it must be more for the want of brains than of practice. Now, I contend that no gardener can grow Pines out of pots, winter Cucumbers, or early Melons, in these closed tanks with half so much ease and certainty as with the most objectionable modes of the old school, and for this very reason—that the principle is in direct opposition to natural laws. I am aware of the experiments carried on this summer in the Chiswick garden with Melons on the tank system; I went to see them in May, June, and July; the plants and fruit looked exceedingly well, but I have seen as good with Mr. Williams, of Pitmaston, without any heat at all. I cut my earliest Melons here in the same week that these were planted. In three years we shall hear of gardeners—and good gardeners too—having lost their places because they could not grow early Melons and Cucumbers by this system, just as others lost their places through Mr. Penn's apparatus; and is it, therefore, to be wondered at, if one of their number, foreseeing all this, should thus remonstrate against it? Let Mr. Rendle consider these objections, which I offer with the best feelings to all concerned. From actual experience, I find he has already effected a very great improvement, and what I want, and insist on having, may be easily effected.

The objection raised in a late *Chronicle* about the soil draining down into the tank and boiler is a valid one, and must be borne in mind; but that about the vapour turning the soil into mud is not borne out by experience. From last January to August I had beds constantly subjected to strong vapours from below, one of which I turned over about the middle of August, to renew it for late autumn Cucumbers; the soil, for the first few inches on the top, was perfectly dry, as we hardly ever watered these beds after the plants got established; the next foot of soil was in a moist friable state, such as you would choose for ordinary purposes; but the bottom spit, next the turf, was as wet as the surface of an ill-drained field immediately after a fall of rain, and the roots of the Cucumbers formed a net-work over the turf. Now, if my bed were turned upside down, it would nearly represent one placed on pieces of solid slate or porous tiles—for I have tried both; only the first foot below would be like ashes, while the surface was in the middle, if the watering went in that way. My old plan of running an inch of rough cinders between the slate and the turf, and pouring water through holes into its stratum, would save the surface-soil from this;—and to those who prefer solid bottoms, this is the best contrivance for watering their beds. After I hear all that can be said for or against all this, I may perhaps write a paper on the practical part of the subject.—D. Beaton.

IN THE TREFOIL DODDER.

I have just visited the Clover-field in this parish, which is attacked by *Cuscuta*. I find one of the patches, which

I stated to be two yards in diameter three weeks ago, is now six yards in diameter; which gives us a ninefold increase in area. The mere raking which this patch had received appears to have promoted the spread of the *Cuscuta*, possibly by having retarded the development of the flowers and by thus fitting the numerous fragments left upon the Clover for making independent and more vigorous shoots. Another patch is now a perfect mass of cream-white flowers, upon which a number of flies have stationed themselves, in seeming enjoyment of the succulency of the heads of flowers. As you have thrown out a suggestion that this *Cuscuta* may possibly become a future pest in our corn-fields, unless it shall be timely checked, I directed my attention to the plants upon which it is now growing, and I observed it was attached to and evidently attacking the following species—*Geranium dissectum*, *Daucus carota*, *Carduus arvensis*, *Euphorbia exigua*, *Viola tricolor*, *Malva sylvestris*, *Linaria spuria*, *Senecio vulgaris*, *Medicago lupulina*, *Alopecurus arvensis*, and another grass, which seemed to be *Agrostis vulgaris*. Some of these plants do not appear to be much, if at all, injured by it, as they continue vigorous where the Clover is completely dead. I was surprised to find it had so firmly attached itself to grasses, because I was impressed with a notion that no *Phoenogamous* parasite ever attacks an *Endogenous* species. I had imbibed this notion from De Candoile; but upon referring to his *Physiology*, I find that he does not speak quite so positively on the subject as I had imagined he did. He mentions two possible exceptions to the rule—namely, that of an *Orobanché* said to have been found in Sicily on the roots of *Chamærops*, and our very *Cuscuta* which is found twining itself about grasses, though he still doubts its deriving any real nourishment from them. The fact, he says, may be observed in fields where Clover and grasses are intermixed, but is never witnessed in a field composed of grasses only. Of course he includes Corn among grasses. He never succeeded in causing a *Cuscuta* to grow upon an *Endogen*. He names a garden which had become infested with *Cuscuta*, introduced into it by the upsetting of a waggon loaded with infected Clover; in this garden he noticed the *Cuscuta* on plants belonging to thirty different families, but still they were all *Exogens*. He concludes from these observations, that, apparently, *Cuscutæ* can exist only on *Exogens*, or at least much more readily than on *Endogens*. The determination of this question may be worthy of experimental research next year. I certainly do observe that the *Cuscuta* has decidedly attacked the stems of the grasses round which it has twined itself; but very possibly its attacks may bear some analogy to those of animal parasites, which cannot long subsist upon other than one particular species, or at least upon very few species of animals. Thus the dog-flea will sometimes bite ourselves, but will not remain with us; and thus the lice which infest partridges will often annoy the sportsman by crawling about him, but he runs no risk of a colony permanently establishing themselves on any part of his person.—J. S. Henslow.

AMATEUR'S GARDEN.—No. XXXVII.

In the propagation of the *Verbenas* mentioned last week, the compost used should be poor and sandy, as the object is to get the cuttings to make plenty of roots without producing much top; for as in most gardens it is indispensable to store the young plants through the winter in the cutting-pots, it follows that the dwarfier the plants are kept, there will be the less fear of their damping off through being overcrowded. The soil we use here consists of the refuse of the potting-bench, such as peat, leaf-mould, and loam taken from the balls of plants in repotting, to which about one-third of sand is added. In this soil common plants root with great freedom, and by allowing it to become dry before the plants are potted off in the spring, it falls from them so freely that scarcely a root is lost. In making choice of cuttings, we take the short-jointed branches, and we insert from 18 to 24 cuttings in a 48-sized pot; so that on an average we store about six dozen plants on every square foot of a pit or frame, so that a frame six feet square is capable of wintering nearly 2,600 plants.

The various kinds of *Anagallis* and dwarf *Lobelias* make beautiful beds; and of the former, *A. cærulea grandiflora*, *Phillipsii*, and *Monelli*, produce beautiful blue flowers; while *A. grandiflora* makes a good pale orange-red group, *A. Parkii* a bed still paler, and *A. carnea* is of a pale flesh-colour. *A. Brewerii* is highly spoken of by the raiser, but as I have not seen it, I cannot speak of its qualities.

Of the *Lobelias*, *L. azurea* is a lovely colour; also *L. erinus*, *pubescens*, and *erinus grandiflora*, of the Pineapple-place Nursery. *L. bicolor* furnishes a bed with pale blue flowers very quickly; *L. unidentata* is indispensable for vases and baskets; and *L. lutea*, though a straggling grower, yet, being yellow, is a plant that cannot be dispensed with. *L.*, or, as it is generally called, *Isotoma axillaris*, makes a good pale blue group; and *L. ramosa* and *heterophylla* are two strictly annual kinds, of great excellence. The whole of these varieties are very valuable, and ought to be cultivated in every garden.

In the management of greenhouse plants, especially hard-wooded ones, as *Heaths*, *Epacris*, and other Cape and New Holland shrubs, Amateurs frequently commit a great error in permitting them, or too frequently forcing them, to grow late in the autumn; and as the wood does not get ripe before the dull weather sets in, the consequence is, the points of the young growth become mildewed, and damp off in the winter, and the plants do not bloom well, if at all, in the following season. Now it would be quite as reasonable for Wheat cut quite green to produce good Corn, as for unripe wood to produce fine flowers, because maturation, in both cases, depends upon the due elaboration of the sap, by which it becomes

organisable, and fit for the reproduction of its kind; and the first effort of reproduction is the formation of flowers, the object for which decorative plants are cultivated. I am led to make these remarks, because in my rambles I find many persons encouraging their plants to grow at the present time, than which they could not do a more injudicious thing. As, however, the weather is promising, there is yet time to ripen the wood; and to effect this, water must be gradually withheld, and the plants have all the sun and air possible, but if the weather should become dull, a little fire may be used, with air in the daytime to expel the damp from the house. These remarks are applicable to all hard-wooded plants, let them be begrown on whatever system they may, but more especially to plants grown on the one-shift system, as the rate of growth is so rapid on that system, that more than ordinary attention is necessary to get the strong shoots properly ripened. The progress and great improvement which this system of potting is generally effecting in collections of plants is very pleasing; and though a few may traduce the system, because it does not accord with their preconceived notions and prejudices, it is a source of high gratification to me, that no person of acknowledged ability has yet ventured to combat the principles upon which the practice is founded; and, therefore, if the principles are sound, it is the error of their application, and not of the system to which want of success is attributable.—W. P. Ayres, Brooklands.

HOME CORRESPONDENCE.

Encouragement to Planters.—Should you deem the following circumstances worth inserting, I can, from personal investigation, vouch for their authenticity. It may possibly be an incitement to persons to plant who otherwise might not be inclined, holding out a hope to them of seeing timber of their own planting, both ornamental and valuable. The Society for the Encouragement of Arts, Manufactures, and Commerce were pleased to vote, in three different years, their gold medal to Dr. Thackeray, of the city of Chester, for planting the greatest number of forest-trees, amounting altogether to 850 acres, from the year 1804, 400 of which belonged to Mr. Wilson Jones, of Hartsheath Park, Flintshire (late M.P. for the borough of Denbigh) in the counties of Denbigh and Merioneth, and the remainder on his own property in the counties of Denbigh and Flint. The plantations of Mr. W. Jones were, from their being formed, regularly pruned till this gentleman came of age to manage them himself; and those planted from the year 1817 to the present time, upon his own land, have been regularly and annually pruned and thinned under the superintendence of Dr. Thackeray himself. More than 200 bushels of Acorns have either been dibbled in the woods, or sown in the nurseries, for the purpose of filling up all vacancies which may arise. The hedgerows have also been filled with fine young trees taken from the woods, at the distance of four yards asunder; and being judiciously pruned, the tenants have no cause to complain of their land being in any way injured by these ornaments to the country around. It will occur to those experienced in such matters, that the effect of neglect in thinning and pruning is very injurious to plantations; no less so is an unskilful mode of performing this duty; and it is to be hoped, therefore, that a few hints may be useful to such of your readers as are anxious for information on this subject, from one not unaccustomed to the business, and having no personal interest to promote in the suggestions he offers, but a sincere desire to see his country prosper in all things. Many pruners, from an apprehension of injuring the stem of a tree, by cutting the branches too close, leave spurs, over which the bark can with difficulty, if ever, unite. Now, these should undoubtedly be cut close and smooth; and should the bark receive a slight injury it would be of trifling consequence, compared to the leaving a dead stump. From ignorance of the bad effects, or from want of attention, too many pruners cut off a number of branches at once; this, I am of opinion, has been practised to such a ruinous extent as to leave nothing but a broom at the top. Were the proprietors of estates sensible of the mischief they thus do to their plantations, they would no longer withhold an improvement. I would beg leave to call the attention of those who have any plantations to this important truth. Orderly thinning the trees is the next essential to pruning; and for this purpose the following simple method should be adopted:—Take out such trees as are the least thriving and impeding the progress of the neighbouring flourishing trees, &c., and then the pruning of these will be found most beneficial; and the training off judiciously the large side-branches will cause the upright ones to shoot the stronger, and by cutting out the dead and decayed wood, the tree is preserved alive: this simple method will produce clearness from knots, straightness, and length, and will advance the quality nearer to that of foreign timber; for it may be traced that where trees are tall, and clear from boughs or knots, the whole substance of the wood is better and of finer grain; and experience proves that such will always be the case. A considerable additional increase in circumference may certainly be expected, in consequence of the trees having almost double the room in which to extend their branches, not allowing them to whip each other, and for the admission of those powerful agents, sunshine and air. The practice should be decidedly condemned of cutting off large limbs to improve the timber, and lamentable effects of it may every day be seen, as the trees exhibit symptoms of early decay. The scientific pruning of forest-trees is but little understood, though such instructions may be easily had by any intelligent woodman earnestly seeking it, and must prove in every way profitable, and I hope to live to see annual pruning wherever there are any plantations, or hedge-row trees, to the benefit of the proprietors and the ornament of our country. A long and progressive work of thin-

ning and pruning demands a skilful and anxious master, and ought to be begun early: in this they differ from single trees in lawns, &c. &c. One common and great error has been to cut off branches to the height of 14 feet from a tree not above 20 or 30 feet high. When this is done the trees remain stationary, and are often stunted, to such a degree as to assume the appearance of old age. The leading shoot has always been encouraged, and all others checked which have a tendency to compete with it, so as to divide the stem into forks; it being well known that when the leading shoot is destroyed, the growth of the tree is greatly impaired. By increasing the number of leading shoots, the strength of the nutritious principle is in a great measure diminished. To confine to the production of one valuable stem the vegetative power which in a forked tree luxuriates unprofitably in a multiplicity of branches, has been the main object of this gentleman's system for nearly 40 years. In short, from three to five of the largest and strongest side-branches, which would have borne too great a proportion to the leading branch, have been removed, or foreshortened every year, thereby modifying the tree, and directing its energies gradually to the top, preserving at the same time a sufficient quantity of foliage. Trees thus managed will form close and healthy stems, without any exterior blemish, and be trained to any reasonable altitude, according to the soil, subsoil, and situation on which they grow; but if neglected,—such is the propensity of most descriptions of trees, or what may be termed "round-headed trees" in open spaces,—they run into branches, without due attention the foliage of which will become too heavy for the roots, and thus check their loftiness; and thus the formation of useful timber will not ensue, as may be observed in all parts of the country. The only rule to attend to is, to keep the top to taper, preserving the leading shoot clear and free from clefts, the trunk free from all the large branches, leaving those only of the smaller kind that are necessary for the health and support of the trees, and clearing the tree from the bottom of all the branches as it advances in age. But the trunk must be cleared very slowly at first, when the trees are young. Only keep the branches that are left thereon small, by pruning, so as not to injure the tree when it becomes timber. No man can ever plant to profit who does not go through his plantations early and annually, with an axe in his hand, and a cold, calculating heart. Nothing can be more unpleasant than to cut down a thriving tree; but it must be done, or you will have no timber. Plantations should be thinned and pruned on a regular principle, which will prevent the trees choking each other. If they have been neglected for 10 or 12 years, the error should be corrected without loss of time, and if taken early they will want but little trouble and expense. I think from experience we may fairly conclude that, providing proper caution is used in pruning, and that we do not cut very large branches, it is not of material consequence what season is chosen for the operation, for those smaller wounds caused by prudent and gradual pruning, will heal in a reasonable time, and without any damage whatever, at any season of the year. P.S.—It has been suggested by a highly-respectable Scotch gentleman residing near Cupar Angus, that much benefit would result from the encouragement by planters of some experienced and well-qualified pruners and trainers, who should go from estate to estate, to show to young pruners and trainers of young woods a proper system of management in thinning and pruning, extending their pretensions no further. He is certain, and I agree with him, this would answer, could gentlemen be prevailed upon to shake off old prejudices and fancies. An intimate knowledge of the habits of growth of the different species of forest-trees, and of the influence of soil and local climate on their periodical increase of timber, is absolutely required in the business of valuing plantations prospectively. There can be no doubt of the great advantages arising to the country and to individuals from a continuation of the system of planting which has already done so much good for Scotland. The amelioration of the climate, the improvement of the soil and pasture, the convenience to the poorer population, the profit to the richer, the independence and defence of the country; every consideration, in short, only impresses more deeply on every thinking person the conviction that the landholder acts at once a prudent and a patriotic part, when he covers his barren acres with wood. It is one of the few modes by which he can add anything to his income, beyond his mere rent-roll. When an old hedge is planted the labourer should be allowed one penny for every young tree he saves, by which means the estate will soon be covered with fine growing timber, at a very trifling expense.

Admeasurement of Trees planted at Nerquis, in Flintshire, and Llanarmon, in Denbighshire, in 1817, and the following years, by Thomas Roberts, and taken in July, 1843.

—H. W. Humphreys, Vicar's Cross Nursery.

Clover Pests; Clover-Rape, &c.—For the last seven or eight years I have noticed the increase of the *Orobanch* minor in the Clover-fields in this neighbourhood, but never so much as in this summer. In the latter part of the month of July, in passing through Suffolk, I noticed it in almost every field which had been cut for hay, but more particularly on gravelly soils, and in many instances the Clover plants were much injured, so as materially to affect the second crop. If the attention of the farmers be directed to this destructive weed, I believe it might be readily extirpated, as it is a very conspicuous plant, showing itself above the Clover; and in all cases where the Clover is left for seed this should be carefully attended to. The *Orobanch* does not show itself again in the same field till it is again sown with Clover. I can fully corroborate Professor Henslow's remarks upon the "*Cuscuta trifolii*." It is a most destructive parasite; but I have not noticed it till this year: it is now committing great ravages in some fields directly under my notice, being now in full blow and vigour; it destroys everything it comes in contact with. I intend carefully to notice its habits, and shall on future occasions give you the result. I think it could be readily destroyed, as it shows itself in distinct patches, at present only in the Clover.—*Henry Dixon, Witham.*

Transplanting.—"Ortolano" appears to be surprised at the circumstances connected with the removal of his standard Rose and Pear-trees; but I do not see how it could have been expected that a Pear-tree, (which is one of the worst trees to remove, as it is frequently badly rooted,) transplanted in the very worst month in the year, June, when the fruit is just forming and the tree making its growth, should succeed. All gardeners know that to remove it then would be certain death. "Ortolano" does not mention the size of the tree, but from the fact of fourteen sorts being grafted on it, "and each shoot producing fruit true to its kind, year after year," I conclude that it was of no small size. In removing a Rose-tree in June, I have frequently succeeded; but there is a wide difference between a Rose and a Pear-tree. By frequent watering and constant attention, you may save a Rose-tree; but I think it impossible to save a Pear-tree of considerable size at such a season.—*Timothy.*

Wasps.—I find that these insects are very numerous and troublesome both in my house and garden, near Taunton, and a gentleman, not a mile distant, informed me last week, that 14 nests had been destroyed within a hundred yards of his house; and another friend states that they were so numerous in the fields as to have been a hindrance in ploughing, as well as having made a nest in the thatch of his farm-house.—*C. A. Roeford.*—In the vicinity of Bristol, although not so numerous as last year, still they annoy us very much, attacking the fruit, and spoiling it before it is near ripe. The working Wasps did not make their appearance till the middle of August, but there were a great many Queens in the spring.—*Hesperus.*

Potter's Guano.—A neighbour of mine tells me that he received some of this manure a few months ago, and when he had shaken out of the sacks as much as he could, he washed them, and the water produced a very striking effect upon his grass land.—*South Wales.*

Vines.—In looking over the *Chronicle* lately, I was glad to find one of your correspondents, (page 573,) speaking of a leading article that appeared a few weeks since in your Paper, on Vines growing all summer without stopping. He says you startled many Grape-growers in the country. I must acknowledge that I was one of these, and think, with him, that it is altogether wrong. "A Subscriber" has chosen the highest authority—One that "knew all things and spoke as never man spake." I do, in some measure, understand Him when speaking of Himself as a Vine, and believers as branches. I have seen many of these that have brought forth fruit purged, that they might bring forth more fruit. Some, like himself, have suffered poverty,—others He has suffered a wicked world to persecute,—and many have had to pass through deep affliction; but when He has tried them He has brought them forth as gold. I have been endeavouring for some years to understand it on the Grape-vine, but I must confess that I have not yet found out the secret. "A Subscriber" quotes the xvth chapter of John and 2nd verse:—"Every branch in me that beareth not fruit He taketh away, and every branch that beareth fruit He purgeth, that it may bring forth more fruit." And then he says—"this is my system," without telling us what that system is. Are we to understand that those that follow the Spur-system are to take all the branches away, in the spring, that do not show fruit? I am afraid we should have very irregular crops of Grapes, and very unsightly Vines. Whatever system of pruning and training is adopted, what all are striving for seems to be—a regular crop of fruit from the top to the bottom of the rafters. "A Subscriber" cannot mean the Long-rod system, because he says he purges or stops all fruit-bearing branches, that they may bear more fruit. Now, every one that has practised the Long-rod system knows that those branches that have borne much fruit this summer will be cut out in the winter's pruning and cast into the fire, and their places taken up with branches that have brought forth little or no fruit. This cannot be his system. I shall be glad if "A Subscriber" will be so kind as to make known through your columns his way of obtaining good crops and fine fruit.—*A Subscriber from the Beginning.*

Melons.—It is said that pigeon's dung is the best manure for Melons; and that the Persian fruit thence derives its superiority. I am not aware that this manure has had fair, if any, trial in England. In Persia, some nobles and wealthy individuals are said to keep ten, fifteen, twenty thousand pigeons, chiefly for their Melon beds. Not having been in Persia, the writer of this note

cannot speak from actual knowledge; but what is here stated is given on very good authority.—*E. M.* [We understand this to be the fact. It is said that small towers, with a door at the bottom by which the pigeon's dung can be cleaned out, are built in the Melon-fields of Persia. No doubt Guano would have the same effect. But those Melon-grounds are said to be regularly irrigated.]

Amaryllis Josephine.—Some of your readers may feel interested in a short notice of a specimen blown this summer by Edward Rogers, Esq., of Stanage Park, near Ludlow. The stem is 23 inches in height, by two inches in width; flattened, but thickest down the middle, and slightly twisted. From the head of this spring twenty-nine stalks, about 11 inches in length, of which the lower ones are horizontal. Each umbel bears a flower, 4 inches long, from the base of the germen to the extremity of a petal; pale orange-coloured in the tube, dull red at the mouth, but appearing rich and brilliant in a transparent light. The six stamens are of unequal length: the filaments and pointal carmine-coloured, and the pointal is about a ½ of an inch longer than the petals. The germen is triangular and ¾ of an inch in length. The plant is leafless: it is now in full flower, but its beauty is beginning to decline. The soil used is composed of one half loam,—nearly one half vegetable mould—with a little sandy bog-earth. The bulb has been blown in a common pinery.—*J. Smith.*

Grape Wine.—I gathered my Grapes one fine day, threw a bunch into a tub, and pressed out the juice with (rather an uncommon press) an old but well-cleaned cricket-bat. Each bunch was thus pressed as it was thrown into the tub, and the produce was about four gallons of juice. To this was added about fourteen pounds of loaf sugar and about four gallons of pure pond water. I allowed the stalks and seeds to remain during the fermentation (which was very steady for some days); then I strained off the Wine, and allowed it to remain exposed to the air for another day; and finally I put it into an eight-gallon cask, which I did not bung down for three weeks or a month afterwards, when all fermentation had entirely ceased. The wine was bottled off in about ten or eleven months, and has been mistaken by experienced travellers for Moselle. Encouraged by my success, I have since made two more quantities, but I have in both instances put the wine into the cask without waiting for the fermentation: and I put into it a larger quantity of sugar; the consequence is my wine now is like "*Champagne non mousseux*." I may add that the strength of the wine is very considerable; it burns like brandy, particularly that made last year, in which the proportion of juice to water was as three to one. All wine-makers that I have consulted have some nostrum or other to improve the flavour, and almost all have the notion that brandy is indispensable, but I have not used anything of the kind. The Grapes I used were chiefly early white varieties, but I also used Black Hamburgs, which were very far from being ripe. The time was October.—*An Original Subscriber.*

Peas.—I sowed a pint of the Prince Albert Pea early in the spring, and at first felt disappointed at their slow progress. However, they realised my expectations at last by coming in a week earlier than the Early Frame, which were sown six weeks earlier. As soon as the first crop of Prince Albert's had ripened seed, I again sowed a few short rows under a wall exposed to the sun. On the 6th day after they were sown they were generally above ground, on the 21st showed blossom, and on the 28th day from sowing they were in full flower. They are, however, very dwarf, and the pods are not large; nevertheless, I think it is a remarkable instance of rapid growth and perfection in the plant in question.—*An Original Subscriber.*

Double Stocks.—In looking over your "Notices to Correspondents," in last Number, p. 633, what you say to "Timothy" about his double flowers attracted my notice. You observe that double flowers cannot be fertilised without the assistance of single ones, if they are really double. You will pardon my saying that some (I do not say all) double flowers cannot be fertilised at all, of which the Stock, the plant specified is one. I well remember its being a common notion that double and single Stocks should grow in close contact, (I have often seen them tied together, heads intermixed,) with the view of the double impregnating the single, that the progeny from the seed might be double; this was the result of mere ignorance, for if you take a solitary flower from a double Stock and examine it, you will find it possesses no organs of fertilization whatever; but is a mere mass of petals without either stamens or pistil; consequently, impregnation either way is a natural impossibility. Some double flowers, however, bear seed, of which *Delphinium Barlowii* is one instance; and I have known the double-flowering Peach bear fruit, which was spoken of as a "great marvel" at the time. I was then young, and never thought of examining the blossoms. Again, you observe, "Nor will single flowers produce double-flowered seedlings, unless in the presence of flowers partially double." This also I think a mistake, and for the following reason: Some years ago I was very anxious to get double Stocks, and selected and marked flowers with 5, 6, 7, and 8 petals, making sure of success, and yet utterly failed. Whence then, you will say, are we to get double-flowering Stocks? for as "Timothy" describes his friend's Stocks being without male or female organs, they certainly are "absolutely sterile." Double Stocks, then, are mere monsters, the effect of culture; and if you will promise not to tell all the world I will endeavour to instruct you how to produce them: that, however, I shall reserve for another day.—*Querous.* [Of course when flowers are wholly double they cannot be fertilised; but, as our correspondent observes, some which are not entirely mis-

formed will do so. The doubleness of flowers usually arises from a change of stamens into petals, as in the Rose, Ranunculus, Anemone, and Cherry; but it often happens that in such cases the pistil is not transformed, and when that is the case the assistance of flowers either wholly or partially single is required, and will produce the usual effect. As to Stocks, we should like to hear the opinion of Stock-seed growers on that point.]

Hydrangea.—A fact has come to my knowledge which may be useful to the lovers of blue Hydrangea. A lady, a friend of mine, removed some plants that had always showed pink blossoms from a former place of residence, and planted them in a bed of bog-earth. They immediately began to blow blue, and have continued to do so for the last three or four years,—as fine a blue as the plant is capable of. On examining the bog-earth, I find that it is very fully charged with a yellow ochraceous matter, which I suppose to be an oxide or a carbonate of iron (sand, a little clay, and peat, forming the bulk of the mass). The springs which feed the peat-bog from whence the earth was taken are strongly impregnated with sulphuret of iron, from the pyritical iron ore of the country; a smell of sulphuretted hydrogen is sometimes to be perceived about them; and I have seen sulphur sublimed amongst the peat-turf fires of the cottagers, who burn it. In the chemical changes which take place also amongst the bog where the water throws down its iron, I think it not improbable that the sulphuric acid unites itself with a portion of the aluminous matter of the clay, and the plants may thus get alum in its nascent state. But, whether it be the superabundant oxide of iron, the sulphur, or the sulphuric acid, or the aluminous compound, the fact of ferruginous peat-bog being favourable to the bluing of Hydrangeas may be relied on. Perhaps it may be right to mention, that the subsoil of the above-mentioned Hydrangea-beds is of a chalky nature.—P. P.

On the Profitable Management of Bees.—The object of the writer is more particularly to address the Bee master, who may have for years past kept Bees, on what is now called the old system,—and if I can induce such persons, at present averse to any change, to advance just one step, it will, I feel confident, be the means of their advancing many paces by another season, for their own profit. It is not to be expected that the cottager can purchase one of Nutt's hives; even if he has seen and understands the system, he could not make one complete under 40s. He must be shewn a cheap way to arrive at nearly the same end, and if he does not procure within a few pounds weight what might be gained with a collateral hive, still he will perceive that an improvement is to be made, and that on a very simple plan. I commenced keeping Bees when I found it practicable to procure honey without destroying the Bees. From experience of nine years, I have been able, owing to a daily observation of their habits, to gain some little knowledge of the subject; having kept Bees on several plans, and in differently formed hives. I will begin with the most simple, and try and tempt the owner of a stock to prepare a hive for his swarm next season. Let him get a straw hive made the same size as usual, say 16 in. diameter, left with a flat top, about 12 in. diameter, into the centre of which make a hole 2 in.—take the edge off in the inner side to allow more room for the Bees to ascend—fit a bung in moderately tight, and it will then be ready for use; have a smaller hive made to fit on the top without any aperture to allow the Bees to go in and out. Let a swarm be procured in the usual way, which must remain the first season with the bung in, and some covering to protect it from the weather, on a pedestal, but not too near a wall. Should the swarm be a very early one, symptoms such as a Bee-master is acquainted with appear; dress the top hive and withdraw the covering to the 2 in. hole; this will most likely not be required till the following year; when the top hive has been on—say from the 1st of June or middle of May, according to the season, about the first week in August, in order to procure the honey made in the two previous months, take a thin wire, place it round between the two hives, and separate the fastening the Bees have made—draw the top hive upon a clean board or sheet of tin, and carry it 10 yards off; have ready a large garden-pot to stand the hive in, and should the operator have sufficient nerve he may shake nearly all the Bees out into a large dish and replace the hive in the pot, and in 20 minutes all will have left—I have done this frequently without a sting. If when the hive was new it had been weighed and also the stand, and the weight had been on the side of the stand, so as not to be lost—it would enable the owner to ascertain sufficiently correct the amount of honey left for the stock for the winter. A strong stock is always the cheapest to maintain, and less liable to intrusion from other Bees or Wasps. I have known many willing to try the above plan during the winter. When Bees are torpid, cut off the top of the hive and introduce a one-inch deal top, with hole ready prepared, and unite it to the hive with long brads. The owner will perceive he has still his Bees, and those Bees sufficiently provided for the winter, and himself sufficiently repaid for all the trouble he has had. No trouble in saving or looking after a swarm;—no going off again, and days' time lost, and not so numerous a collection of hives, because each stock will be so much stronger than an ordinary cottage hive. This must be the first step, and should success attend it, books on the subject will be read, new plans talked over, in order to find a more improved way beyond this our first step in improved Bee-keeping.—G. C.

Aromatics.—As "Oriental," at p. 609, seems to doubt the power of aromatics—as stated at p. 559, I would beg leave to inform him, that a friend writing to me from Ceylon states, that when four miles off the shore of Colombo, the odour of the Cinnamon was perceived by all on board; the wind at the time blowing off the land.—A. G.

Magnolia fuscata.—I shall be glad to know if any of your correspondents have ever observed if the scent of the flowers of the *Magnolia fuscata* possesses any attraction for blackbirds and thrushes. We have had a fine plant in bloom all the summer in our conservatory, and some time ago I was much surprised, upon going to shut the house up, to find several very large panes of glass broken, and could find no means of accounting for it. They were repaired, and, to my chagrin, I found the same repeated a few days afterwards; but in this instance the cause was apparent, for a blackbird, which had been killed by the violence of the concussion, lay dead amongst the fragments of glass. In order to prevent such an occurrence in future, I fastened a net over the windows necessary to be opened, and this proved sufficient for some time, but yesterday I found that a thrush had effected an entrance, and it could only have been through a broken mesh in one corner of the net, as that was the only aperture I could find, through which a bird of its size could enter. Until then, the thought did not strike me that it might possibly be the scent of the above plant (smelling, as it does, like a very rich Melon, or rather between a Melon and Pine Apple,) that caused their pertinacity in entering, and that they had mistaken it for that of fruit. I do not like to discard the plant on such a supposition, which, after all, may be only thought a ridiculous one; therefore I shall feel obliged by information thereon.—Jno. Cox, Thame Park.

Disease in Pansies.—I agree with "R. L." that the rotting of Pansies is not occasioned by any insect, but as many growers are of opinion that the Millipedes (Juli) are the cause, I shall endeavour to prove that such is not the fact. Let a large plant, just beginning to flag, be carefully taken up, and the roots washed; on examination, the disease will be found to have commenced in one of the principal roots, and to have extended thence upwards to the main stem. The affected part will be brown and decayed, particularly where it was first diseased, and if it has been some time in that condition, the small fibres will have quite rotted away. If this root be traced to the main stem, those roots proceeding from the stem nearest to it will be found to be infected, the disease in this case extending downwards. In no instance in which I have taken up a plant which has just begun to droop have I ever found one of the Millipedes, although, on the contrary, there will be numbers if the plant has been long affected. These insects, as I believe, only attack decayed matter, and never, to my knowledge, undecayed. In this opinion I am borne out by your correspondent, "Ruricola," see vol. i., p. 196, and in confirmation of what he there states, I lately saw *Julus complanatus* with a small fly in its mouth. I am unable to assign the cause of this sudden decay, but as some soils and localities are more subject to it than others, I will give my observations upon it. I have always found Pansies grown in soil which has been longest in cultivation, and therefore containing the greater quantity of humus, to be most liable to it; while, on the contrary, fresh loam, rather stiff than otherwise, is the best suited to them. The real secret, however, I think, for the healthy growth of Pansies, is good air, as smoke and the vicinity of a town are most prejudicial to them. This is the conclusion at which I have arrived, from an examination of most of the metropolitan nurseries, as well as those in the country. In connection with what I recommended in vol. i., p. 147, I beg to state that I now much prefer a dry airy situation to a moist one; and instead of shading plants, whether for exhibition or not, I think it more advisable to keep them as open to the light as possible, from their tendency to draw. When seed is sown, the sowing should never be delayed beyond the autumn, as it makes a great difference in the quality of the seedlings, and these should always be transplanted, to check their too luxuriant growth.—An Amateur.

Hydraulic Cement.—Your correspondent, "J. B. H.," in last week's *Chronicle*, asks if Asphalte will answer better than Roman Cement for Tanks, &c.—I reply, the former material is wholly unsuitable for upright walls or any description of water-work. Roman cement, if properly used, will uniformly succeed; it is applied to a great extent in the reservoirs of water and of gas companies, as well as in docks, &c. The material should not be used too late in the year; the frost will never affect it if the work has had time to dry. In the formation of a tank, the walls should be built with cement and sand, but the inside stuccoed with cement alone, the bricks being first well wetted. If "J. B. H." will adopt these precautions, he will not incur further failure.—Nine Elms.

Wheat-sowing.—In the review of Davis's tract on the "Injury and Waste of Corn from the present practice of too thick Sowing," it is stated that different opinions are held respecting the tillering of Wheat, some maintaining that it should be allowed to tiller, others that it should not. Without entering at all upon the question, I would simply ask if the cause of the tillering of Wheat is ascertained by Agriculturists of the present day? for I find that various opinions were entertained respecting it by farmers forty or fifty years ago. According to Naismith, in his "Elements of Agriculture," published in 1807, "Tillering depends much on the expansion of the soil properly repressed." Dr. Cullen, again, in 1768, gives it as his opinion, that tillering is promoted by resisting the progress of vegetation in the roots, by the adhesion of the soil, and by cropping the leaves. In more recent times, it appears to be the opinion of others that it proceeds from a certain property belonging to the plant. In the description of the variety of Wheat called "Mongas-wells" we are informed that it tillers well, and again, in the Gregarian variety we are told that it tillers sparingly. Perhaps the opinion of Vegetable Physiologists of the present day respecting the cause of the tillering of Wheat

would be interesting to many of the readers of the *Chronicle*, and would oblige your humble servant,—Peter Mackenzie.

PROCEEDINGS OF SOCIETIES.

FLORICULTURAL SOCIETY OF LONDON.

Sept. 5.—Mr. Manger in the chair. Messrs. Orson, Palmer, Smith, Wildman, Mearns, Fox, Dickson, Brown, Cook, Bushell, and several others, were present. It was again announced that the meetings would take place on every Tuesday during the present month. The following seedling Dahlias were sent for opinion, and judged according to the subjoined forms:—

Exhibitor.	Name of Flower.	Year when raised.	No. of Blooms.	Colour.	Form.	Substance.	Arrangement.	Eye.	General Form.	Observations.
Mr. Orson, Kennington	Fox-hunter	1843	1	red	not good	good	bad	tolerable	bad	not worth another trial.
Mr. Smith, Hendon	President	1843	1	crimson	tolerable	good	good	good	rather flat.	deceiving trial.
Do.	Peri	1843	1	with purple	long and quilled	good	tolerable	good	round, but too small.	not worth another trial.
Mr. Brown, Worcester.	Delight	1843	1	yellow	Do.	tolerable	bad	good	small	Do.
Do.	Glory of Worcester	1843	1	blush white.	tolerable	bad	tolerable	good	tolerable, but too small.	Do.
Do.	Beauty of Saint John's	1843	1	dull rose	bad	tolerable	bad	good	bad and small.	Do.
Do.	Mrs. Farley	1843	1	ruby	good	do.	bad	good	not good.	Do.
Do.	Earl of Aberdeen	1843	1	crimson	long and quilly.	do.	bad	tolerable	indifferent and small.	Do.
Do.	Don Carlos	1843	1	blac rose	good	good	good	rather sunk	but circular.	worth trial.
Do.	Matilda	1843	1	ruby	good	good	tolerable	good	small	very promising.
Mr. Bushell, Kennington	Madame Vestris	1843	1	maroon	very quilled	very good	bad	good	good	worth trial; but petals never likely to expand.
Do.	Avenger	1843	1	white, mottled with lilac	circular, but rather inclined to be flat and ribby	good	tolerable	good	good	A very desirable 2d class flower.
Mr. Speer, Denford	Lady Antrabus	1842	6	deep buff	good	good	tolerable	good	circular to a front view, but too flat on the face	2d class.

NEW ZEALAND.

New Zealand Horticultural Society.—This was the first exhibition this year of the Wellington Horticultural Society. The day was exceedingly fine, and the room was thronged with visitors, who appeared to be very much gratified with the number and variety of the articles exhibited, particularly in the class of Vegetables, which for size and excellence could not be surpassed; and an impartial visitor must have left the room fully convinced that the climate and capabilities of the district of Port Nicholson will amply reward the exertions of the Colonists. Where all was so good it may seem almost invidious to particularize; and, in many instances, the disappointed competitor could scarcely regret failure in a contest with so many opponents, when the claims were so nearly balanced. We may be excused, however, in referring to the specimens of Potatoes, which were very excellent, and to the Carrots exhibited by Mr. Molesworth, who obtained both prizes. The two objects which attracted the greatest attention were a Netted Cantaloupe Melon, grown under a frame on Wellington-terrace, by E. Johnson, Esq., measuring 27 ins. in circumference, and weighing 10 lbs.; and two frame Cucumbers, by F. A. Molesworth, Esq., the largest of which measured 23 ins. in length, and 7 ins. in circumference. The Wheat, of which several samples were exhibited by different settlers, was magnificent, and the merits of the two successful competitors were very nearly balanced. In the class of Flowers many interesting specimens were exhibited, and several of the rarer kinds to which extra prizes were awarded, attracted great attention by their beauty, and were satisfactory proofs that the Horticultural spirit is daily gaining ground amongst us. Capt. Rhodes also exhibited some seedling Peach-trees and Oaks, raised in the Colony, which we particularize, as they arrived too late in the room to be submitted to the notice of the Judges. There were also some fine specimens of prepared Flax from Wanganui and Otaki, exhibited by Messrs. Johnson and Moore. There are two interesting facts to which we are anxious to draw the attention of our readers. The first is the SPIRITED COMPETITION OF THE NATIVES for the prizes offered to them. There were twelve candidates in this class. The other fact is the growing interest felt by the cottagers and working classes of the Colony towards the Society. The number of Subscribers from amongst them is daily increasing, and a reference to the list of prizes will show that many of them are among the most active and successful competitors. Another gratifying circumstance must not be lost sight of. Some of the best specimens of flowers and vegetables were sent from gardeners

at Wade's Town. One gardener there (Mr. Scutchings), obtained eight prizes. Another (Mr. White), obtained the prize for Barley, competing against opponents from the district of the Hutt. The prizes for the best Cottage-gardens at Wellington were also awarded to two gardens at Wade's Town. These facts are most honourable to the industry and perseverance of the inhabitants of this suburb, and are the best answer to the statement "that the hills of Port Nicholson are barren," and to Mr. Churton's statement "that the winds are the scourge of the place, and that nothing can withstand them and prosper." Our friends in England may be informed that Wade's Town is situated on the hills (part of the Tinakore range), at the north-western extremity of the town. We suspect that those who have expressed these hasty and incorrect opinions would gladly retract them, were they not recorded in print. On the whole, the exhibition may be considered as the best which has taken place since the formation of the Society. Several additional subscribers' names were received, and Mr. Molesworth has very liberally contributed the sum of 5*l.* for himself and family. His Excellency the Acting Governor, during his stay here, also subscribed to the funds of the Society. The following is a list of the prizes:—**VEGETABLES.**—**FIRST PRIZE:**—12 Potatoes and 12 Pods of Peas, Dr. Featherston. 6 Pods of Beans, C. Phazryn, Esq. 6 Kidney Beans, R. Stokes, Esq. 2 Heads of Cauliflower, F. A. Molesworth, Esq. 4 Cabbages, Mr. James. 4 Lettuces, 6 Carrots, and 4 Turnips, F. A. Molesworth, Esq. 6 Scarlet Runners, H. Knowles, Esq. 6 Onions, J. Watt, Esq. 6 Leeks, Mr. R. Seed. 2 Roots of Beet, Rev. J. M'Farlane. 2 Roots of Mangel Wurzel and Sample of Wheat, F. A. Molesworth, Esq. 6 Stalks of Rhubarb, R. Stokes, Esq. Sample of Oats, R. Barton, Esq. Sample of Barley, Mr. White. Collection of Potherbs (9 different sorts), Mr. Scutchings. **SECOND PRIZE:**—12 Potatoes and 6 Roots of Garlic, Mr. James; 12 Potatoes (extra prize), and 6 Carrots, F. A. Molesworth, Esq.; 12 Pods of Peas, H. St. Hill, Esq.; 6 Pods of Beans and 6 Onions, E. Johnson, Esq.; 2 Heads of Cauliflower, Mr. Wilkinson; 4 Cabbages of two varieties and 2 Roots of Beet, R. Stokes, Esq.; 6 Onions (extra prize), F. V. Martin, Esq.; 4 Turnips of two varieties, Mr. White; Do. (extra prize), Col. Wakefield; 2 Roots of Mangel Wurzel, E. Catchpool, Esq.; Sample of Wheat, Mr. T. Mason. **FRUITS.**—**FIRST PRIZE:**—Melon, E. Johnson, Esq.; Cucumber (grown in a frame), F. A. Molesworth, Esq.; Raspberries, E. Catchpool, Esq. **SECOND PRIZE:**—Melon, F. A. Molesworth, Esq.; Cucumber (grown in the open air), Mr. Scutchings; Cane Gooseberries (extra prize), Col. Wakefield. **FLOWERS.**—**FIRST PRIZE:**—Dahlia, Mr. Brady; Seedling Pansy, 6 Pansies, and Seedling Pelargonium, Mr. Scutchings; 6 Pelargoniums, 3 Balsams, and 6 Devises, Mr. Wilkinson; 12 Annuals, 4 Stocks of varieties, two of each, and Bouquet of two Flowers, E. Johnson, Esq.; Collection of Native Plants, Mr. Hurst. **EXTRA PRIZES:**—Dahlia and Gladiolus, Mr. Wilkinson; Starks, Coreopsis, and Hollyhock, Mr. Scutchings; Tigridia Paronia, Hydrangea, and Pinks, R. Stokes, Esq.; Daphne Neapolitana and Glycine sinensis, C. Clifford, Esq.; Tiger Lily, W. Swanson, Esq.; Russian Violet, — Willes, Esq. **SECOND PRIZE:**—Bouquet of Flowers, R. Stokes, Esq.; Best Collection of Seeds of Native Plants, Mr. Hurst; 2d do., H. Tiffen, Esq. **PRIZES FOR THE NATIVES:**—6 largest Potatoes, Eawa; 6 Second largest do., Pumepe. **COTTON PRIZES:**—Best four varieties of Vegetables, Mr. White; Second best do., Mr. James.—New Zealand Colonist.

COUNTRY SHOWS.—Erratum.—In the Berwick Horticultural Society's Show, p. 591, the name of the person who gained the prize for the best quart of Green Peas, in pod, should have been Mr. T. M'Dougal, instead of J. M'Dougal.

NOTICES OF NEW PLANTS WHICH ARE EITHER USEFUL OR ORNAMENTAL.

CYTISUS WELDEI Nil. Dalmatian Laburnum. (Hardy Shrub.) Leguminosae, § Papilionaceae. Diadelphica Decandria.—This plant is obviously distinguished from the Scotch Laburnum by its flowers growing in short erect racemes, and not in long drooping ones. Although, from its similarity in foliage to the Laburnum, it is liable to be confounded with that plant, yet it is, in fact, nearer *Cytisus sessilifolius*, of which it may be almost regarded as a gigantic form. To what size it will grow is unknown—probably eight or ten feet high; but on its Dalmatian mountains it is said to be a bush. The poisonous quality of the common Laburnum is still more concentrated in this species, as we are told by the German botanists. The General Baron Welde, after whom it is named, assuring us that its very flowers produce headache, and that the goats which feed on it produce poisonous milk. [But how is it, then, that the goats themselves do not die?]—*Bot. Reg.*

RENANTHERA MATUTINA. Morning Renanthera. (Stove Epiphyte.) Orchidaceae. § Vandeeae—Sarcanthideae. Gynandria Monandria.—Although this plant bears no comparison with the magnificent China species on which the genus was founded, yet it is very far from being unworthy of cultivation. Indeed, by the number of its flowers, and the richness, though not brilliancy, of their spots, it makes up in some measure for their want of size. The first mention that is made of it is in Blume's "Bijdragen," where it is referred with doubt to the genus *Aerides*, and said to be found in flower in the month of September, on trees, at the foot of Mount Salak, in Java. Mr. Cunningham afterwards gathered it in the Philippines. It flowered at Chatsworth in December last.—*Botanical Register.*

RONDELETIA LONGIFLORA. Long-flowered Rondeletia. (Green-house Shrub.) Cinchonaceae. Pentandria Monogynia.—This is a shrub of great beauty, introduced by Messrs. Veitch and Son, of Exeter, from South Brazil, and is particularly well suited to greenhouse cultivation, because it does not grow to be a large and unmanageable specimen. In fact, it resembles the old *Bouvardia triphylla* in its habits, and may be managed in the same manner. Nevertheless, we presume that it may be grown to some size if desired, for our wild specimens have the appearance of coming from a large bush.—*Botanical Register.*

ONCIDIUM UNIFLORUM. One-flowered Oncidium. (Stove Epiphyte.) Orchidaceae. § Vandeeae. Gynandria Monandria.—This curious little plant, allied to the rare *Oncidium barbatum*, inhabits trees in the forests of the Organ Mountains of Brazil, where it was found in April, 1841, by Mr. Gardner. For its introduction to gardens we are indebted to Sir C. Lemon, who received it from Brazil in August, 1841, through Lieutenant Turner, of H.M.'s Packet "Ranger," and in whose collection at Carlew it flowered in Nov., 1842. The flowers are large in proportion to the size of the plant and very handsome, continuing a long time in perfection. The sepals are of a dingy brown, slightly spotted, much undulated at the margin, and spreading so as to become recurved. They are all nearly of the same size and form. The two lower ones are undivided, and narrow at the base. The petals are similar in colour to the sepals, but rather shorter, and almost twice as wide, recurved at the point, and undulated at the margin. The plant appears to grow in large masses on the branches of trees, to which it is attached by its numerous round, filiform, ash-coloured roots. It is grown at Carlew in a warm moist stove, suspended from one of the rafters.—*Botanical Register.*

MISCELLANEOUS.

New Kind of Corn.—Mr. R. Clarke, the Senior Assistant Surgeon to the Colony of Sierra Leone, has lately brought into notice a kind of grain called "Fundji," or "Fundungi," (*Paspalum exile Kippist*), cultivated by industrious individuals of the Soosoo, Foulah, Bassa, and Joloff nations, by whom it is called the "Hungry Rice." It is a semi-transparent cordiform grain, about the size of Mignonette-seed; the ear consists of two

conjugate spikes, the grain being arranged on the outer edge of either spike. "The ground," says Mr. Clarke, "is cleared for its reception by burning down the copse-wood and hoeing between the roots and stumps. It is sown in the months of May and June, the ground being slightly opened, and again lightly drawn together over the seeds with a hoe. In August, when it shoots up, it is carefully weeded. It ripens in September, growing to the height of about eighteen inches, and its stems, which are very slender, are then bent to the earth by the mere weight of the grain. The patch of land is then either suffered to lie fallow, or is planted with Yams or Cassada, in rotation. Experienced cultivators of this Lilliputian grain have assured me that manure is unnecessary,—nay, injurious, as it delights in light soils, and it is even raised on rocky situations, which are most frequent in and about Kissay. When cut down, it is tied up in small sheaves and placed in a dry situation within the hut; for if allowed to remain on the ground, and to become wet, the grains become agglutinated to their coverings. The grain is trodden out with the feet, and is then parched or dried in the sun, to allow of the more easy removal of the chaff in the process of pounding, which is performed in wooden mortars. It is afterwards winnowed with a kind of cane fanner on mats. In preparing this delicious grain for food it is first put into boiling water, in which it is assiduously stirred for a few minutes; the water is then poured off, and the Foulahs, Joloffs, &c. add to it palm-oil, butter, or milk; but the Europeans and Negroes connected with the colony prepare it as follows: to the grain cooked as above mentioned, fowl, fish, or mutton, with a small piece of salt pork for the sake of flavour, is added, the whole being then stewed in a close saucepan. This makes a very good dish, and thus prepared, resembles "Kouskous." The grain is sometimes made into puddings, with the usual condiments, and eaten either hot or cold with milk. By the few natives of Scotland in the colony it is dressed as milk-porridge. This grain could be raised in sufficient quantities to become an important article of commerce; and I have no doubt would prove a valuable addition to the list of light farinaceous articles of food in use among the delicate or convalescent." The sample with which Mr. C. has favoured us, is, before preparation, of a clear dull brown colour. When cleaned from the husks, it will resemble, we imagine, very fine millet.

Receipt for making Grape Wine.—Water, 4½ gallons, beer measure; Grapes, 5 gallons, beer measure, crushed and soaked in the water seven days; sugar, 17½ lbs., at 10½*d.* per lb.—the Grapes, perhaps, 5*s.* The cask in which it was made held exactly 6½ gallons, beer measure, and produced 34 bottles of wine clear. A bottle of the above wine kept ten years, and proved very good.—*Loudon's Gardeners' Magazine.*

Improvement in the Cultivation of Hops.—The Rev. Mr. Formby, vicar of Frinsbury, has the credit of suggesting this, which consists in stretching a stout wire along each alley, to which wire the poles are fastened. The advantages are, that poles of much less value than those usually employed may be used; that injury from gales of wind is avoided; and that the alleys being open to the influence of the sun and air, the mould, that fatal disease of the Hop, is prevented. At Halling, near Rochester, a garden of nine acres thus cultivated affords a most pleasing sight.—*Country Paper.*

Dr. Joseph Hooker.—We have great pleasure in announcing the safe return of this excellent Naturalist, after all the perils of the adventurous voyage of discovery in which he was engaged. We understand that his collections in Botany are ample, considering the poverty of the countries he visited. Among other valuable plants which he has already been the means of introducing, are the Tussack grass of the Falklands, with the Winter's Bark and Evergreen Beech of the Straits of Magellan.

GARDEN MEMORANDA.

Windsor.—For the first time in my life, I have been sojourning for a few days in the good and loyal town of Windsor. As I had heard much of the castle and its noble and commanding terrace, I first directed my steps thither. I will not attempt to describe the sensations which I experienced as I traversed the magnificent suite of apartments which distinguish this Royal residence from all others of its class; still less will I seek to give utterance to the intense delight with which I gazed from the castle windows upon the widely extended and richly-wooded landscape which was spread out before me. The castle and the view from its terrace, as well as the splendid old chapel, have been described a hundred times, and if nothing be so "tedious as a twice-told tale," it would be very bad taste in me to launch out upon a topic which has been so often exhausted. Let us turn then to a subject which combines within itself all the charms of novelty, and in which nature and art seem to vie with each other, in their endeavour to excite our admiration and surprise; and such a subject was brought under my notice by a visit to the new Royal Gardens, situated at Frogmore, about a mile from the castle. I had often heard of the great operations which were carrying on within this spacious area; but I confess I was not prepared to expect such a coup-d'œil as greeted my approach to the forcing department of the gardens. Let any one imagine a range of Horticultural buildings, upwards of 900 feet in length, all composed exclusively of metal and glass, and presenting the elegant and fairy-like appearance peculiar to these structures, although united at the same time with real strength and durability. Then let him enter this noble range of forcing-houses by the door at the eastern end, and, looking directly before him, he will command a vista of 400 feet, comprising a greenhouse, two pineries, two peach-houses, and a vinery, each one communicating with the other by means of a glazed corridor or lobby; and all the doors being stationed exactly opposite to the one by which the range is entered, an effect is produced which no words can adequately describe. Then, as the visitor leisurely walks through the range, let him narrowly inspect the details of the buildings, and he will find that the principals, or framework, by which is to be understood the rafters, standards, gutters, and sills, are all composed of cast-iron, whilst the bars or divisions between the panes of glass are of copper, and the rims of the sashes or lights of rolled or wrought iron. But another and more striking peculiarity which he cannot fail to observe is, that the whole range of houses throughout is glazed with British sheet-glass, in panes of from 24 to 30 inches long, and of such a thickness as to obviate

all danger of breakage from ordinary causes, whilst that which arises from the action of frost is effectually prevented by the curved form in which the ends of the panes are cut, and by the insertion of an ingeniously contrived lead-lap between each pane. The particulars which I have thus noticed with reference to the east wing of this range, will equally apply, in all points, to the west, or corresponding wing. The central space between the two wings is occupied by the residence of her Majesty's head-gardener, a neat structure in the Elizabethan style of architecture; and it is in contemplation to erect, on either side, a conservatory or flower-house, which will fill up the spaces at present existing between the dwelling-house and the wings, thus making the entire length of the range 935 feet. It has been my lot, in the course of my annual tours, to see many places which are famed for their Horticultural buildings, but I can truly aver that I have never seen a range of houses at all comparable with that in the Frogmore gardens; and which I would strongly recommend all persons having a taste for Horticultural pursuits to visit, whenever an opportunity may occur.—*C. Thomas, Aug. 24.*

Barton, near Bury St. Edmunds.—Amongst the young trees at this place are some which seem worthy of notice. In none of the books of reference do we find the rapid growth of *Abies Douglasii* noted as having been at all equal to what has been witnessed here. Sir Henry Bunbury received from the Horticultural Society a little plant in a pot, in March, 1839; in the spring of 1841 it was planted out. It is now, as nearly as can be ascertained, 35 feet high: the spread of its branches 13 feet and the girth of its stem, at one foot and a half from the ground, 30 inches. This summer, for the first time, this beautiful tree is bearing cones. Next to the *Douglasii*, P. Coulteri has been the most rapid in its growth. But a young P. insignis is now growing at a prodigious rate. One of the finest trees here is a *Magnolia acuminata*, which was planted in August, 1825. It is about 35½ feet high, feathering to the ground on every side. The girth of its stem at 1 ft. is 28 in., at 4 ft., 24 in., at 5½ ft. 23 in. A *Magnolia auriculata*, planted in November, 1823, is about 24½ feet high. Some persons in the neighbourhood complain that their Levant Oats (grown in a sandy soil) *canker* after twenty years. There is no such symptoms here in those growing on clay with the greatest vigour and beauty. Possibly in the former cases the roots have got down to hard chalk.

Reviews.

Dr. Justus Liebig, in his Relation to Vegetable Physiology. By Dr. Hugo Mohl. (Dr. Justus Liebig's Verhältniss zur Pflanzen-Physiologie.) Tübingen. Fries. 1843.

(Continued from page 632.)

The assumption (continues Dr. Mohl) that the organs of plants consist of gluten, albumen, and wood, and that other constituents, like sugar, starch, &c., are mere secretions, is decidedly wrong in an anatomical point of view, for the solid substance of all organs consists of woody fibre alone, and all the other ingredients are merely preserved in the cellular substance, &c. The same objection may be raised against the opinion, that starch, gum, &c., preserved in the cells, are mere excrements, and not constituent parts of the organ. On the other hand, Dr. Mohl considers Liebig's opinion, that a greater amount of nitrogen is required for forming woody fibre, than sugar, gum, starch, &c., as perfectly true. This is corroborated by the experiments of Payen, who found in all young organs, while in a state of vigorous development, an abundance of nitrogenous juices—which leads to the conclusion that nitrogenous substances are essential to the development of new elementary organs, a position fully borne out by recent microscopical experiments on the formation of the cellular tissue in plants. If this is the case, we may also assume that the formation of substances nearly related to woody fibre, such as sugar, gum, and starch, requires also a certain amount of nitrogen; and that a less amount, although it may suffice for the abundant formation of those substances, will only produce a small amount of woody fibre, is an opinion adopted by Liebig. It may be also assumed, that if such an amount of nitrogen as is sufficient for the formation of a moderate quantity of woody fibre, is to be divided between the formation of gum and other similar substances (composed of carbonic acid and water,) and that of woody fibre—the same amount of nitrogen might suffice for the formation of a greater amount of woody fibre, and therefore, for the more vigorous growth of the plant; in those cases where the plant has already absorbed part of its food in the form of substances, which (being composed of carbonic acid and water) have also attained the first degree of vegetable assimilation.

Liebig believes, that, in this case, the function of the leaves will be impaired. This, however, it is impossible to decide, "as we have not even an idea of the variations which the assimilative process may undergo, according to the difference of the substances on which plants feed. It is also, in most cases, less essential to know whether plants absorb only organic substances and water, than whether it is necessarily in conjunction with inorganic matter, that such absorption takes place; in which case, the digestion (Verarbeitung) of inorganic substances would not be suspended; but, in conjunction with this assimilative process, another and different one would make its appearance." To decide on the existence of these processes, it would be necessary to know the metamorphoses which food undergoes in plants. But this is not the case, as we neither are aware of the manner in which gum or sugar are formed, nor of the further changes of these substances into woody fibre. Chemistry, it is true, can change wood and starch into sugar, but only by the application of strong chemical agencies, which we know are not made use of by plants. To imitate the real process is beyond the reach of chemistry; still, it is to this very process that plants owe their growth. Under such circumstances, all that we can do is to make plants absorb organic substances, and to observe the phenomena which their growth exhibits subsequently. It has been shown already that certain plants live only when they absorb organic substances; our cultivated plants prove the same thing, as well as the detailed experiments of Davy and Saussure, which have not been hitherto disproved. The theory of Liebig, therefore, is untenable, and is equally

unsupported by experiment, or by exact reasoning on the nutritive processes of plants.

Liebig has himself felt that arguments founded on fact are required for the support of his theory, and he has pitched upon Mount Vesuvius to supply it. He dwells, therefore (page 131), on the luxuriant crops in the environs of this mountain, in a "soil, which, according to its origin, does not contain the least trace of organic matter, and still is considered as the very type of fertility." We possess, however, no chemical analysis of this soil, derived as it is from volcanic cinders, neither does L. say anything on the subject, but merely appeals to its general volcanic origin. But it would be a surprising thing (says Dr. Mohl), if a soil, on which, for many centuries past, most extensive farming operations (Dreisch-wirtschaft?) have been carried on, should be destitute of humus. This could be only the case, if, after every few years, it was again covered so deeply with the ashes of constantly new eruptions, that the ancient soil and all its organic matter should be placed beyond the reach of new crops. This, however, we know is not the case, and even such eruptions as do take place at intervals could not effect this. The heaviest fall of ashes (since the destruction of Pompeii) was that of 1822, which amounted on the slope of the mountain to 3 feet, and in the plain from 15 to 18 feet; but this was (according to Humboldt) the treble of any previous fall of ashes. We know, moreover, that even the slightest fall of volcanic cinders kills vegetation over an extensive area, so much so that one crop amongst eight near Mount Vesuvius is always lost through such calamities. It is, therefore, these very falls of ashes which cause the formation of a vegetable stratum on a large scale, and such must contain humus. This corresponds entirely with what Mr. Lyell states ("Princ. of Geol." ii., 148), that he found, near Pompeii, under the volcanic cinders of 1822, a layer of vegetable mould of the thickness of three feet.

(To be continued.)

The Guide to Service. The Farm Bailiff.

Charles Knight and Co.

AMONGST the tracts published by Mr. Chas. Knight under the title of "Guides to Service" there are few in which so much practical matter has been condensed in a very small space. When we say that we have reason to believe that this little work is from the pen of our old friend Martin Doyle, we prepare our readers for finding it full of useful practical information. We have perused it with attention and much pleasure; and we can safely recommend it to be placed in the hands of every young farmer, as well as into those of young bailiffs, for whom it is intended. As a specimen of the style in which it is written, we give the following extract on the subject of fallows:—

"Now, though a [worn-out and tired animal requires rest, as well as nourishing food, to recruit his exhausted powers, this cannot be correctly said of the earth, which is perpetually reproducing, and only fails in yielding her productions from the exhaustion of those properties which constitute the food of plants, and which are only supplied, in an effective degree and quickly, by manures that contain the required principles. The earth, so far from taking advantage of any kind of rest which a farmer may be disposed to give it, will produce something—it will not rest—it will throw up a crop of weeds if left to its own energies; and, therefore, on the same principle that a parent will give his children some useful sources of occupation, to prevent them from doing mischief, which he knows they will commit rather than be idle; or as he will cultivate their minds, and sow the seeds of useful knowledge, lest noxious weeds should spring up in their room, so will the prudent farmer sow something that will produce a profitable return; he will imitate the practice of the gardener, who never dreams of letting his garden rest, because he knows that it will perpetually produce useful plants of one sort or other, and that if he does not cultivate some of them, a rank and luxuriant crop of weeds would be the spontaneous growth of the teeming earth."

We need hardly add, that the most experienced farmer will find something to learn by the perusal of the 125 pages of which this little work consists.—M.

Rivers's Descriptive Catalogue of Roses for 1843-44, has just appeared. Its excellence as a guide to purchasers is so well known that we scarcely need do more than announce it. We must, however, state that, in this edition, Mr. Rivers has done additional service to Rose-fanciers by pointing out the best sorts, by paragraphs, calculated for small or large purchasers, and by marking those that are remarkably sweet-scented.

CALENDAR OF OPERATIONS for the ensuing week.

In all lofty conservatories, where mixed climbers are intended to be brought to the greatest perfection, the roof-sashes should be fixed down, and no air given at the top of the house. All the front and end sashes if the house be detached, should be made to open; and if the back part be a solid wall, there should be ample provision made for giving air along the top of it; or, what is better, let openings be left in the back wall from top to bottom, and fitted up with folding shutters, for the purpose of ventilation. Mr. Paxton has admirable contrivances of this sort at Chatsworth. The air in the body of a house thus arranged can be kept as cool as that out-of-doors; while the top of the house is as hot as a stove, or at least as hot as an intermediate house; and climbers will grow and flower with great freedom in such a temperature. Now this arrangement is nearly the reverse of what you generally see; and the Calendar is not a place for speculating on such points. I may add that our conservatory here is on this plan, and for climbers or other plants we find it to answer very well, and it is very easy to manage. The roof is nearly air-tight, and the panes of glass are 45 inches in length, by six inches in breadth, and are of the best sheet glass. In this house *Ipomoea Learii* and *ficifolia*, *Passiflora racemosa* and *Loudonii*, (both grafted on hardier stocks,) and *Mandevilla suaveolens*, flower as well as you could wish, with others nearly as tender. The grand desideratum for conservatory climbers is, that they should be free bloomers, that they bloom in succession for a long time, and that they are of those kinds that are not very liable to insects; but

if they be judged by this standard their number will become scarce indeed. Here and there one may see a climber flowering in all the gorgeousness of its native dingle, while others in the same house may be under mediocrity, and perhaps only a source of vexation or disappointment. Now, instead of trusting to one person's opinion, as "Devonian" proposes, how much better would it be if others would follow his example, and say what best succeeds with them, and what failed, or what they did not like; we might thus, in a few weeks, be in possession of all that is known on the subject. As a proof of the fallacy of trusting to any one's opinion implicitly, however extensive his practice may have been, I may state that I did not previously know that *Bignonia cherere* flowered from the 1st of June until the end of October, although I believe that I was the first who tried and flowered it in a cool house. The one from which the figure in the "Botanical Register" was taken, flowered in a stove at Dropmore in 1829, and from this plant mine originated in 1830, and flowered in 1833, and for two or three years flowered only from the middle of June to the middle of August. *Canavalia Bonariensis*, like *Thunbergia coccinea*, is too much like the Scarlet-runner Bean to be of much interest. *Duranta Ellisii* I never saw grown as a climber; *Duranta Plumieri* answers better, but *Plumbago capensis*, which grows after the same manner, is better than either, and is really a fine thing; and, like the *Duranta*, is a thirsty plant, requiring a deep, rich border, and plenty of liquid manure; it will cover a pillar 15 or 20 feet high in three years, and flower in profusion from May until October, by shortening some of the strongest branches through the summer. *Jasminum heterophyllum* I flowered three years running; it is only fit for the rubbish-heap. *Bignonia*, or rather *Tecoma jasminoides*, is a grand climber, and one of the very best hardy ones. A friend of mine, at Cheltenham, who is very fond of climbers, thus writes concerning it:—"This plant has been so fine this season that I really do think we have nothing at all so truly beautiful; the young wood of last year was trained at full length along the glass; early in spring I had it taken down and bent in all forms, so as to cover about four square yards; from the middle of July it has been one mass of bloom, having from 400 to 500 blossoms expanded every day." *Siphocampylus* is best treated as a pot plant, for winter flowering, cut down in May, and grown out-of-doors until October. A plant of it against our conservatory wall has scarcely been out of flower for the last two years and a half.

I.—KITCHEN-GARDEN AND ORCHARD.

In-door Department.

PINERY.—The late heavy rains, though partial, have reduced the temperature so far that fires may soon be necessary in some of these houses; at any rate no sudden depression should be allowed yet, indeed, young Pines will be in full growth for two months to come; it is much better to assist them well now than to allow them to grow in winter. See, therefore, that all is comfortable about them for a long time hence.

VINERY.—All young Vines, and those grown on the long-rod system, should have the top sashes now kept up day and night, till the wood is perfectly ripe, and the air necessary for the fruit admitted by the front sashes only. It is an excellent old plan that of growing the Vines horizontally; the Muscats, St. Peter's, Black Damascus, &c., towards the top, and the harder ones at the bottom, of the house; with proper ventilators, we can keep any house up to stove-heat at top, while the bottom may be as low as out-of-doors: few, however, think of this.

Late MELONS, CUCUMBERS, MUSHROOMS, and KIDNEY BEANS, to come in next November, and some other things which are never attempted but by good gardeners, who require no Calendars, I shall be excused if I pass over quietly.

Out-door Department.

On Sunday, the 10th inst., an awful thunder-storm passed over the county of Suffolk, but fortunately not accompanied by hail; yet a vast deal of damage has been done to property. The ground was previously very dry, and could take in the wet but slowly; in less than 10 minutes all the level portions of the kitchen-gardens were covered ankle-deep with water, thus putting a stop to all operations on the soil for some time.

LETTUCE.—The last sowing of brown Dutch Lettuce is generally got in by the middle of September. A correspondent from Essex says he has not lost a plant from this sowing for the last 10 years, because they come up slow and stocky through the cool of the autumn.

SPINACH.—The Winter Spinach, Onions, and Carrots, sown in rows, should have the ground well stirred between the rows, as soon as the surface is dry, after every rain. Recollect, stirrings in this way, at regular intervals, belong to other days.

WATER-CRESSSES.—These will grow just as well on a damp, shaded border in the kitchen-garden as along the brook side, and will be ten times safer for use from such a place than in the natural way, where they are always more or less sown over with the eggs of insects and other creatures frequenting pools or running streams. Now is the best time to plant slips of them.

CAULIFLOWERS.—See that the plants for next year are all right; those still on the seed-bed and those pricked out, and more especially the plants from the last sowing.

ORCHARD.—Except gathering in the early fruit and keeping down insects, which is not difficult this season, there is little to do now in the orchard. Mr. Rivers tells me that his dwarf root-pruned trees are better this year than ever they have been.

II.—FLOWER-GARDEN AND SHRUBBERY.

In-door Department.

STOVE.—Some years ago people used to light fires to ripen off their stove plants about this time; but a better plan prevails now: when the plants have begun growing freely in spring, the heat is increased, and every assistance given to them, to make their growth early, so that by this time no ripening of wood or late growths is needed, and the plants are gradually put to rest by the natural decline of our seasons. Plants thus managed should never receive more than 55° of artificial heat in the dead of winter; yet there is no danger if a warm day rises the temperature up to 80° or 85°, with a little air. Orchid-growers will be glad to hear that the queen of these gems, *Laelia superbens*, is throwing up a strong flower-spike, treated on the cool system, but not with me.

GREENHOUSE.—This house should now be in thorough repair, and in a clean, sweet condition, as many of the more tender plants must soon be removed in-doors. If the weather holds tolerably dry, all the stronger greenhouse plants should be left out as long as possible. This is the time when the advantages of cold pits are most apparent, as the lights can be left off, except in rainy or frosty weather, whereas the greenhouse has no such advantage.

CONSERVATORY.—What a luxury a nice light conservatory is, let it be ever so small, when attached to part of the sitting-rooms! and what a contrast, too, with the heavy, ill-arranged, old-fashioned greenhouses, only fit to winter half-hardy shrubs for planting out in summer! There are scores of such greenhouses all over the country, which should be pulled down and converted into modern conservatories. With a little judgment the expense need not be much, and the enjoyment and luxury which thus may be obtained will pay all the trouble and expense in a very short time. Now that little variation is needed in the management of all plants, I hope I shall be excused for loading the Calendar with these digressions, and I shall always keep within practical points, speculative matters being foreign to this part of the *Chronicle*.

PITS AND FRAMES.—These are the places to winter the Heaths in when the frost overtakes them in the flower-garden. No one need be afraid that I shall lose sight of this subject; but without going farther, I may state that I want more information on the subject myself. I planted out about 100 kinds of Heaths last June, from which I lost half-a-dozen; the rest are looking as well as can be expected. If I can keep the frost from them, I shall leave them until they get too big for the place. But for flower-gardening they must be taken up every year, and they will never answer to be plunged in pots. Next week I shall say how I think they ought to be treated all the year round.

FLOWER-GARDEN.—Having a little spare room, under this head I shall say something about Heaths for the flower-garden next season. The nurserymen put four young Heaths struck this season into a small pot, for the winter, and next May these are separated, with a portion of the soil to each, and planted in single pots; these small pots are now full of roots, and this is the best-sized plant to order

for turning out next May, as they cannot be too young to begin with: you often see advertisements offering 100 of these for 5s. From this time to the end of October is the best time to order them. As soon as you get them home prepare a frame for them, from which you can exclude the frost by putting a layer of rough peat at the bottom, then an inch of sandy peat mixed fine, but not sifted; on this bottom place your little Heaths about 6 or 9 inches apart out of their pots, and fill in between them with the mixed fine peat, pressing it gently round their balls; the tops of the plants should be about 6 inches from the glass; they will soon root into the fresh soil. Keep the glass off every fine day till next May, then take them up with a trowel, and they will carry a good portion of the soil with their roots. You will find this loose open ball far better than if you left them in the pots all winter; besides, the plants are much safer in this way than in pots through the winter; the roots also being in a free open state, a ready to strike away in the prepared bed in the flower garden, where you will plant them thick the first season. When the frost sets in next autumn you may take them up with a trowel, and they will carry large portions of the soil with them, like a young *Rhododendron* plant; some of this soil you can trim away from them, and remove them back to the frame, to be planted as before, only a little wider apart; and recollect, by this system they are never to be put into pots at all, whatever their age or size may be; unless, indeed, such of them as may form very fine specimens; these, perhaps, you may be tempted to put into large pots or boxes, for the conservatory, or perhaps for exhibition, as their luxuriance and the deep rich colour of their foliage and flowers will be sure to attract notice.—D. Beaton, *Shrubland Park Gardens, Ipswich*.

State of the Weather near London for the week ending Sept. 14, 1843, as observed at the Horticultural Garden, Chiswick.

Sept.		BAROMETER.		THERMOMETER.			Wind.	Rain.
		Max.	Min.	Max.	Min.	Mean

The highest temperature during the above period occurred on the 17th, 19th, and 21st, in 1834—thermometer 79°; and the lowest on the 21st, 1839—thermometer 32°.

REPORT ON COVENT-GARDEN MARKET.

For the Week ending Sept. 15, 1843.

An abundance of fruit of every kind has been supplied during the past week; but trade still continues very dull. Pines are very plentiful, particularly the Queen, Back Jamaica, and Providence, and bring nearly the same prices as last week. Among Grapes we noticed some excellent bunches of Black Hamburgh and Muscat of Alexandria, which are selling at from 2s. to 4s. per lb. Apricots are now almost over for this season. Green-gage Plums are becoming very scarce, and bring from 6s. to 8s. per hf. sv. Damsons are plentiful, but not in general of very good quality; they bring from 1s. 6d. to 2s. per hf. sv. Peaches and Nectarines are very fine and abundant, particularly the former, and are considerably reduced in price. Figs are still plentiful, and are offered at from 2s. to 4s. per dozen. Filberts are also very abundant, and have fallen considerably in price since last week. Good English Melons are selling at from 1s. to 3s. each, and are quite sufficient to meet the demand. Cucumbers bring from 6d. to 1s. per brace. Cauliflowers are becoming scarce, and are rather of inferior quality. Cabbages and Turnips are quite plentiful, and continue to bring nearly the same prices as last week. Peas are selling at from 3s. to 4s. per half-sieve. French and Scarlet Runner Beans bring from 1s. to 1s. 6d. per half-sieve. Tomatoes of excellent quality are very abundant, and are very much reduced in price. Endive may be had at from 1s. to 1s. 6d. per score. Shallots bring about the same price as last week. Carrots bring from 1s. 6d. to 5s. per dozen bunches. Cut flowers consist of Erica Bowean, cerinthoides major, and perspicua nana; *Gardénia radicans*, *Gladiolus psittacinus*, *Fuchsias*, *Pelargoniums*, *Pansies*, *China Asters*, and *Sweet Peas*.

PRICES, SATURDAY, September 16, 1843.—FRUITS.

Pine Apple, per lb., 2s. to 5s.	Apples, <i>Kraken</i> , per bush., 2s. 6d. to 4s.
Grapes, hothouse, per lb., 2s. to 4s.	Pears, per half-sieve, 2s. to 3s.
Portugal, per lb., 1s.	Oranges, per dozen, 1s. 6d. to 3s.
Peaches, per dozen, 2s. to 4s.	— per 100, 10s. to 24s.
Nectarines, per dozen, 2s. to 4s.	Lemons, per doz., 1s. to 2s. 6d.
Figs, per doz., 2s. to 4s.	— per 100, 7s. to 14s.
Melons, each, 1s. to 3s.	Cucumbers, per brace, 6d. to 1s.
— Dutch, each, 1s. to 2s. 6d.	Gherkins, per 1000, 5s. to 7s.
Plums, per punnet, 1s. to 2s.	Green Capsicums, per 100, 1s. 6d. to 2s.
— violet, per hf.-sieve, 2s. 6d. to 3s. 6d.	Red — — — — — 4s. to 8s.
— Gage, per punnet, 2s.	Almonds, per peck, 6s.
— Gages, Green, (Baking) per hf.-sv., 6s. to 8s.	Sweet Almonds, per lb., 2s.
Currents, per half-sieve, 3s. to 4s. 6d.	Nuts, per bushel, —
Cherries, Morello, standards, per hf. sieve, 6s.	— Brazil, 16s.
Raspberries, per gallon, 7d. to 1s.	— Barcelona, 9s. to 9d.
Damsons, per hf.-sv., 1s. 6d. to 2s. 6d.	— Coh, 12s.
Apples, dessert, per bush., 5s. to 9s. 6d.	Filberts, English, per 100lbs., 4s. to 5s. 6d.
	Tomatoes, per hf.-sv., 3s. to 4s.

VEGETABLES.

Cabbages, per doz., 6d. to 1s. 6d.	Leeks, per doz. bun., 1s. to 2s.
Cauliflowers, per dozen, 4s. to 6s.	Onions, Spring, per doz. buch., 1s. 6d. to 3s.
Beans, Kidney, per hf.-sieve, 9d. to 1s.	— Large, per doz. buch., 1s. to 2s.
— Scarlet, per hf.-sv., 1s. to 1s. 6d.	— Spanish, per doz., 1s. 6d. to 3s.
Peas, per sv., 3s. to 4s.	Garlic, per lb., 6d. to 8d.
Potatoes, New, per ton, 70s. to 80s.	Chilis, per 100, 1s. to 2s.
— per cwt., 1s. 6d. to 4s.	Lettuce, Cabb., p. score, 9d. to 1s.
— per bushel, 1s. to 2s. 6d.	— Cos, per score, 6d. to 1s. 6d.
— Kidney, p. bush., 2s. to 4s.	Calery, per bun., 6d. to 2s.
Artichokes, green, per doz., 1s. to 3s.	Small Salads, per punnet, 2d. to 3d.
Vegetable Marrows, per doz., 6d. to 1s.	Sweet Basil, per doz. bunches, 2s. to 3s.
Turnips, per doz. bunches, 1s. 6d. to 3s.	Watercress, per doz. am. bun., 4d. to 6d.
Red Beet, per dozen, 9d. to 1s.	Parsley, per half sieve, 1s.
Horseradish, per bundle, 1s. to 6s.	Tarragon, per bun. 9d. to 2d.
Radish, spring, p. doz. hands, 6d. to 1s.	Fennel, per doz. bun., 2s. to 3s.
— Turnip, p. doz. bunch, 9d. to 1s.	Endive, per score, 1s. to 1s. 6d.
Carrots, Horn, p. doz. bun., 1s. 6d. to 2s. 6d.	Mint, per doz. bunches, 1s. to 2s.
— Long, per doz. bun., 2s. 6d. to 5s.	Marjoram, green, per bunch, 2d. to 3d.
Shallots, per lb., 6d. to 8d.	Mushrooms, per pottle, 1s. 6d. to 2s.
— green, per bunch, 4d.	Walnuts, Green, per bushel, 5s. 6d. to 7s.
Spinach, per sieve, 1s. to 1s. 6d.	Cheeril, per punnet, 8d. to 3d.

Notices to Correspondents.

MANURE.—T. B.—The remarks on Potter's Guano which you have quoted are applied to its effects on little suburban exhausted gardens. There is no treatise on its application, except that originally published by Mr. Potter. For garden purposes, 4 cwt. an acre in the course of the season is a sufficient quantity; it may be applied broadcast, and washed or raked in.—A. H.—Animal manure is injurious to Yews, but we are not aware that it is so to Hollies.—Gwyn next week.

SOIL.—An Original Subscriber had better marl his land well, in order to render it more cohesive. Peruvian Guano will prove a good manure; but bones will perhaps answer best. We

should use both, and as much as the expense will justify. There is no fear of such land being overmanured by any ordinary amount of application. The bones had better be half-inch.

WEEDS.—*J. B.*—Weeds may be added to the compost-heap, if you can destroy their seeds, as happens when they are violently fermented; but if this cannot be done, or if Couch-grass, and such weeds, cannot be so killed, it is better to burn them in the usual way, and cast the ashes on the land.

HEATING.—*R. W. B.*—It is very difficult to heat well so small a pit as one 12 feet by 4. The boilers usually constructed would overheat it. You might, however, have a small copper or tin boiler made so as to heat the water in some gutters such as are now using near London for bottom-heat; and by using cinders and such refuse for fuel, you might manage to keep it in good order. In a week or two we shall publish a little plan, which you might advantageously adopt. —*A Young Pine-grower* will find Randle's Treatise frequently advertised in our columns. Other matter next week. —*W. M.*—Your plan will answer, provided the inside of the flue is well rendered with cement, and you make a good joint with the brickwork and flow-pipe. You must, in that case, make the partition with few-tiles.

KITCHEN GARDEN.—*S. C.*—By paring and burning the surface of the portion of lawn which you intend to convert into a Kitchen-garden, you will certainly destroy any grubs that may infest it; but at the same time you destroy likewise that turfy texture so desirable for the purpose of rendering the soil open, and pervious for the roots of plants. It will therefore be better to trench it down; and as you have plenty of lime at command, a moderate quantity will do good. If you commence operations now, you may grow any vegetable next season; but the Potato is the best for mellowing the soil.

HOPS.—*J. H. B.*—These may be cultivated profitably in Wales as well as elsewhere, if the soil is rich and strong enough, and not exposed to heavy gales.

CLIMBERS.—*W. P.*—Consult Mr. Beaton's excellent Paper just published, or the remarks of a "Devonian," at p. 629.

CARNATIONS, &c.—*A Constant Subscriber.*—Picotees, Pinks, and Carnations, will grow in almost any kind of soil; they, however, delight in a rich light mould, consisting of old turf, well-decayed dung, leaf-mould, and sand. You may likewise add a little quick-lime to destroy the wireworm, as, from your statement, we apprehend that the premature decay of your plants has been occasioned by it, or some other insect, more than by the ungenial nature of the soil.

FUCHSIAS.—*G. R. Linden.*—You had better save your Fuchsia-seed until the end of February or beginning of March, when it may be sown with advantage, in pots filled with almost any sort of soil of a light nature and placed in a slight bottom-heat. —*O. P. Q.*—Your specimen was too shrivelled and dried to enable us to ascertain its name.

PELAGONIUM.—*G. R. Linden* may cut these down in autumn. The green insect on the leaves may be destroyed by fumigating the house with Tobacco-smoke.

PINES.—*Atlas.*—The cause of seedling Pines shanking, as it is called, is unknown; but the disease never attacks them when raised in pure loam. The sketch of the Araucaria seed is sent to the wood-engraver. Thanks.

GRAPES.—*A Subscriber.*—Your Vines having diseased leaves, the want of colour in the grapes is accounted for. The cause of the injury which the leaves have sustained cannot be the glass, which ought to improve their good condition. Possibly you have over-pruned; probably you have neglected ventilation; very likely you have kept the leaves much too hot at night; most undoubtedly you have to blame the condition of the leaves for the unhappy state of the fruit. Keep leaves healthy, and the leaves will take care of the bunches, under all ordinary circumstances. —*J. D.*—Inasmuch as the artificial treatment of the Vine differs from a close imitation of those circumstances under which it is known to thrive in its native countries, so will the degree of imperfection become manifest in the fruit. If the roots be well conditioned, and if a healthy foliage be uniformly maintained throughout the growing season, then only will your Vines be prepared to produce a good crop in the following season, with proper management. It should be borne in mind that the very best management will not compensate for the non-fulfilment of these preliminary conditions, nor insure you against the recurrence of your present complaint—berries deficient in colour, and unequal in size. Ample foliage may be produced; and it may continue very healthy for a time; but if the period be of too short duration, the wood of the season will not be perfected, and imperfection of the future produce, under any circumstances, must inevitably result.

VINES.—*E. C.*—By all means improve your border; and with Guano if you like. But be careful to apply it in very wet weather, when the Vines are beginning to swell their buds, and every week afterwards, as long as they are growing. A little and often is the rule for this and all other such substances. —*H. M.*—Your Vines having only been planted last spring, may be tied down almost close to the front wall, a cavity being formed between them and the flue, with thin boards or slates. Were it not for the proximity of the flue, this precaution would be unnecessary in carrying out your intention of employing your small Vinery as a greenhouse during winter; for all the heat that greenhouse plants require will not occasion the premature bursting of the Vines.

ORANGE-TREES.—*H. M.*—In a warm Moss-house, well lighted, your Orange-tree will be safe in winter, if such be not severe; but when the tree is likely to experience a temperature below 40°, you must endeavour to find ways and means so as not to subject it to any lower degree.

FRUIT-TREES.—*A Constant Subscriber.*—If your Pear and Cherry-trees, which blossom abundantly, yet bear no fruit, have not been injured by spring-frosts, it must be concluded they are too weak. Prune them when their leaves have fallen, shortening the branches with a view to obtain a sprinkling of young shoots; and apply fresh compost to their roots. Drainings of the stable will prove beneficial to them, and likewise to the generality of plants, if properly diluted.

PEACHES.—*F. B.*—It will be better to prepare the border afresh, and plant young trained trees, instead of attempting to bud other sorts on those late varieties which you wish to do away with; not that buds may not be successfully inserted even in the old bark of the latter, since you state they are vigorous, but because some of the resulting shoots are apt to become too luxuriant, and consequently subject to gum, a disease which the cutting back of the old branches would also tend to induce.

APPLES AND PEARS.—*H. Y.*—Gather two-thirds of the early Apples and Pears ten days before they are ripe, taking them carefully one by one, and place them in a cool fruit-room; these will succeed those left to ripen on the trees. Look over the fruit-room every morning, and pick out the best fruit for the day's consumption; if they do not ripen fast enough remove a few occasionally to a warmer room or kitchen, where they will soon get mellow enough. Those for Kitchen use should also be gathered before they are quite ripe, and the last of them may be selected for the daily consumption. *D. B.*

MELONS.—*Mr. Thompson.*—The Casawba which you have been so obliging as to send, is a fine specimen of the variety, and very thin skinned. It is very good, and correctly named, but not at all equal in quality to the fruit of the Persian varieties.

HOLLY.—*A Subscriber.*—It is usual to bruise and mix Holly berries with double their bulk of sand, and then to dig a hole about 2 feet in depth, into which the berries are put, about 9 inches thick, and covered with a piece of old mat, to prevent the soil from mixing with them. Then fill up the hole, and cover it with litter, to keep the wet from penetrating. In February or March take the berries out, and sow them in a light sandy soil, in drills, and cover them about 1 inch in depth. If the soil be dry and very light, they may have a gentle pressure with the foot.

VEGETABLE MARROW.—*A. B. C.*—Flowering precedes fruiting;

therefore the fruit of your Vegetable Marrow could not die off before coming to flower. Being trained against a wall, it perhaps may have suffered in the operation; the plants are probably too weak to perfect more than those you mention as having already set. When the latter are taken off, others may succeed. Of course you know how to fertilize the females.

ASPARAGUS.—*A Subscriber.*—No beds of Asparagus will ever succeed well if water stagnates in them. But if your soil must be wet, then Spring is the best time for planting, and your beds must be raised above the level of the surrounding ground.

ONIONS.—*A Subscriber.*—Your Onions having suddenly become unsound, in the first week of August, yet not affected by the maggot, is to be attributed to the cold and wet summer. On a change of temperature taking place at the time mentioned, the tops of the crop, in many instances, were attacked by a sort of mildew, and fell in a few days. Charcoal, powdered and sown in drills along with the Onion-seed, is a good preventive against the grub, and other causes tending to produce disease in the Onion crop.

THEIRS ON CUCUMBERS.—*A Subscriber.*—Dust the leaves of your Cucumbers over with flowers of sulphur, and let it remain for a few days; then give them a good washing with the syringe. **ARROW-ROOT.**—*R. G.*—The Arrow-root advertised by Lopresti as "Pure" has been examined by us with care, and we can assure you that it is perfectly genuine, and of the first quality, although only 20d. a pound. Cheap Arrow-root is generally a vile adulteration of Potato and other starches, and quite unfit for the diet of invalids; but this is free from all impurity. We advise everybody to try it.

GLAZING.—*W. C.*—A good glazier will sort his glass, a bad one will not. British sheet-glass is quite flat; and we fear you have been deceived with common glass. If your glazier does not know that crooked panes ought not to lap over flat panes, you had better look out for a workman with a little more common sense.

COUNTRY SHOWS.—*G.*—If we do not insert the names of plants, but only those of the owners, in many of the reports of Country Shows, it is because we cannot get better information. The local reporters are the persons to be blamed. We regret this as much as you can; but we are helpless. If we thought that a non-insertion of all reports without the names of winning flowers would correct the evil, we certainly would adopt that plan; but at present we doubt whether the result would be what you imagine.

INSECTS.—*G. E.*—The insect you complain of appears to be the Chelifer cancrroides, or common Mock-Scorpion. It is nearly allied to the family of spiders. It seldom occurs in the abundance you speak of, but is not unfrequently met with under the bark of trees, dead leaves, and even, occasionally, in old books within doors. We should expect that a moderate use of gas-liquor and water mixed, in the proportion of 1 of the former to 9 of the latter, would much diminish the numbers of this insect, if you water your Melon-beds with it. —*F. H. S.*—The fleas in your stable, kennel, &c., will probably not trouble you so much in the winter as they do now; but as you wish to know how to get rid of them, we advise you for a time to remove all kinds of litter, furniture, &c., from where they abound, exposing everything which might harbour the fleas to the air for a few days; then whitewash your walls, directing the brush well into all crevices, and wash your floors with a mixture of gas-liquor and 3 water. Cleanliness is the great preventive of fleas and such like vermin, and you cannot pay too great attention to this point. —*M. W.*—We have examined your Vine-leaves, and we can discover no insect on them, except the Mealy Bug, or a species of Coccus scale-blight, in a very young state—so young, indeed, as scarcely to be visible without a magnifying-glass. From what we see, however, of the leaves we have little doubt but that the cause of the evil you speak of to your Vines is a Coccus, and to get rid of it is no easy matter. Still much may be done, and we recommend you to proceed as follows:—When the leaves are fallen, carefully rub off from your Vines all the rough exterior bark, using a stiff brush where required, to get into the angles of the branches, &c. Then wash the Vine with strong soap-suds, or if you do not mind appearances you may cover your Vine with whitewash, which will do as well. This operation will remove the greater part, if not the whole, of the insects, which may remain on your Vines, and when completed, you should whitewash the walls of your vinery, carrying the brush well into all crevices, and the floor you should wash with a mixture of gas-liquor and water, as recommended above to "F. H. S." You must carefully follow the instructions we have given, and not mind trouble if you wish to succeed in getting rid of such a pest as the scale-blight on the Vine. —*E. M.*—The larvae of a variety of insects live in such Fungi as you describe. We cannot attempt to say what those you have observed will turn to, without more particulars. All you tell us is that they are maggots. Your questions of "where they will go," and "what they will do," we must also decline to answer until we can determine what the maggots are. Your other question of "how they came there" is more easy to answer, as the maggots, without doubt, result from eggs laid in the Fungi by some insect. You need not fear that these "devouring reptiles," as you call them, will attack any other plant. —*Este.*—Your Caterpillars were much crushed before they reached us, however we have seen sufficient to make us suppose them to be the larvae of the common Cabbage Moth, *Mamestra Oleracea*. We know of no better method of getting rid of them than by diligent hand-picking, or dusting the plants attacked with quick lime. *S.*

WOODLICE.—*L. J.*—Various methods of destroying Woodlice have been given in our columns; but it is a difficult task to get effectually rid of them; their numbers may, however, be considerably thinned in the following manner:—Put a cold boiled potato into a small pot, and cover it loosely with moss; let two or three of these traps be put along the back wall of your Vinery, where the Woodlice are most numerous. These traps should be examined every morning, and the insects that are collected destroyed. By persevering for some time in this way, they will become much less troublesome. —*Ireland* is also answered in the above.

MISCELLANEOUS.—*C. A. B.*—The Spiraea is apparently quite new, at least to gardens. Send it in flower and we will name and publish it for you. 9, *Colletia spinosa*; 8, *Potentilla insignis*; 3, *Antennaria margaritacea*; 1, *Podolepis jaceoides*; 5, *Some New Holland Heliotropium*. The rest indeterminate. —*Holcus.* —*Rosa tomentosa* and *Hieracium umbellatum*. —*J. F.*—*Marchantia polymorpha*. —*J. Mason.*—It is necessary to have a better specimen, with the leaves, &c., in order to determine your plant. It is very like some species of *Podalyria*, but if it belong to that genus it does not come from the East Indies. —*Δ.*—The Pentstemon is pretty, but we perceive little novel in it. However, it is difficult to say anything of single flowers sent by post, packed in sand! —*A. B.*—Your double white Brugmansia arborea is a fine showy thing. —*A. G.*—*Chimonanthus fragrans* often ripens fruit when the plant is old. —*E. V.*—The Plum you sent is Denyer's Victoria. You will observe that the stone is so tender that, in many instances, it will give way to the pressure of the finger and thumb. —*J. C. L.*—Apparently, *Triteleia uniflora*. The *Pleurothallis* seems new, but cannot be determined without a leaf and its stalk complete. —*D. H.*—We admit no speculation or discussion into the Political part of our Paper, which is a record of facts that have occurred. We therefore cannot comply with your suggestion. —*An old Subscriber.*—The best paint for hothouses on the outside is, beyond all comparison, the black oxide of manganese, prepared by some one at Exeter. If your white paint rubs off your sashes like whitewash, we should advise you to rub the painter off your employment. —*Cummins.*—Paxton's "Magazine of Botany," or Sweet's "Hortus Suburbanus Londinensis." —*A. K.*—Your plant appears to be *Epipactis purpurata*, but it is a mere variety

of *Ep. latifolia*. —*A. B. G.*—Probably the Grape you received under the name of Fox's Grape is some variety of the *Vitis vulpina*, none of which are relished in this country. Many varieties are cultivated in the United States under the name of Fox-Grapes, because they smell like a fox. —*J. K. Fowler.*—It is fully late in the season to bud or layer Roses. Some of them may, however, yet succeed. —*H. D.*—*Achimenes longiflora* and *rosea* die down similar to the old *A. coccinea*, and require nearly the same treatment. Hollyhocks may be planted in the spring. Rhubarb may be put into the ground as soon as its leaves are off. —*A. A.*—There is no periodical work on Kitchen-Gardening which we can recommend. —*A Regular Subscriber.*—*Fumaria spicata.* —*W. G.*—*Govenia liliacea.* —*A Reader.*—*Phlox paniculata*, *Tolpis barbata.* —*P. R. W.*—*Pyrus aria*, *Chlora perfoliata*, *Sedum rupestre.* —*W. C.*—All the plants in the list are hardy, and suitable for rockwork, except the following, which are rather tender, and require a slight protection, viz.:—*Ruscus racemosus*, *Pernettya plesia*, *thymifolia*, and *mucronata*, *Genista (Spartium)*, *sphaerocarpa*. The following are improper names:—*Juniperus repens* is prostrata; *Juniperus alpina* is nana; *Juniperus hibernica* is only a variety of *J. alpina*. —*Inquirer* will find much information respecting greenhouse climbers given at p. 607 of the present year. —*A Lady.*—*Melin-Azedarach*. The other inquiry next week. We know nothing of *Humphreys' Compound*. —*A. H.*—*Epipactis latifolia* has also been called *Serapias latifolia*. It is a local plant; but not very rare. *Juniperus thurifera* is scarcely so hardy as the Cedar of Goa. —*Didymus.*—*Gastidium lundigerum.* —*At. Mitchell.*—Your plant is not *Leonurus Cardiaca*, but is *Stachys densiflora.* —*Hydrophilist.*—Much obliged, but must decline introducing such matter.

SEEDLING FLORISTS' FLOWERS.
CALCEOLARIAS.—*A. G. N.*—Your seedling is a very pretty and well-formed flower; but larger specimens, similar in character, have been raised by other growers.

FUCHSIAS.—*T. B.*—The best of your seedlings is the one marked 42; it is a bright and lively flower, having the sepals well expanded; it appears to differ but slightly from other varieties received under the above initials, and a greater contrast of colour is desirable. The sepals to 41 are coarse, and terminate in a bad colour; the corolla has a ragged appearance, and it partially unfolds; and 40, though a very large flower, the sepals do not expand sufficiently to render it a desirable introduction.

PANSIES.—*R. P.*—Most of the dark selfs now cultivated are better than your 21. No. 3 is a flower of good properties, and would be desirable if size could be added to it: the same may be said of 52, which is novel, both in colour and marking; but this is very small, and will be useless, unless it attain a greater size: 6, primrose; the eye is weak, and it is surpassed by many that are out. —*L. L.*—*Io* is a pretty-coloured seedling, clear and distinct, but wanting a blotch in the lower portion, which forms the eye; the form we could not judge of, from its being curled up. —*R. J. I.*—Your seedling N is a well-formed flower, good eye, ground-colour clear and uniform. There appears to be a defect in the petals, as the substance is not carried out to the edge.

As usual, a host of letters have arrived too late for answers this week.

NEWS OF THE WEEK.

THE announcement of the Queen's return from her visit to the French Court had scarcely reached the remotest parts of the kingdom, when Her Majesty set out on her second marine excursion. The visit to Belgium which we have this week to record may be deficient in the political importance which was inseparable from the excursion to France, but it is nevertheless suggestive of many interesting topics. The visit of the Queen to those fine old cities plentifully scattered over the Belgian territory, and which for centuries have been associated with important events in the history of Europe—the promised visit to Brussels—and, above all, to the plains of Waterloo, cannot fail to be regarded hereafter as remarkable incidents in Her Majesty's reign. The details of the Royal progress, so far as they have yet reached us, are confined to the preliminary ceremonies and receptions, but next week they will doubtless supply matter enough of more general interest, to engage attention.

The accounts from Spain contain the details of another insurrection at Barcelona, which has again made that unhappy city the scene of fresh anarchy and bloodshed. The collision anticipated in our last took place on the 3rd, between the forces of the Government and the troops of the revolutionary Junta, the president of which fell in the first attack. The insurgents made themselves masters of the city, while the citadel and the fortress of Montjuich remained in the hands of the Government troops. On the evening of the 7th, the fortress of Montjuich commenced firing on the town, and with results even more destructive than those which followed the bombardment of Espartero and Van Halen. The Exchange and other public buildings were seriously damaged; upwards of 50,000 inhabitants quitted the city, and the canals which supplied the fountains were cut off. The firing still continued at the date of the last despatches, and a general rising throughout Catalonia was hourly expected. Meanwhile, the proceedings of the new Government at Madrid are said to be impeded by disunion in the Cabinet; an open alliance had taken place between the partisans of Espartero and those of the Infante Don Francisco, and doubts are entertained whether the Administration will be able to hold together until the meeting of the Cortes. The insurrection in Italy also continues to excite alarm; Bologna was proclaimed in a state of siege on the 26th, and the mountains as far as the Neapolitan frontier were overrun by numerous bands of armed men. Several arrests had been made in the northern provinces of Naples, and the king had adopted extraordinary precautions to prevent the movement from extending to the south. No authentic explanation has yet been given of the origin of these disturbances, but they would appear to indicate a more extensive combination than the Italian Governments are willing to admit. No tidings of the Indian mail have yet been received, and there is now

little doubt that the steamer from Bombay has been compelled to put back by the monsoon or by some accident to her machinery.

Home News.

Court.—Her Majesty and Prince Albert left Brighton on Tuesday for Ostend, on a visit to the King and Queen of the Belgians. The particulars of the excursion will be found in another part of our Paper. During her Majesty's absence, the Prince of Wales and the Princesses will remain at the Pavilion. The Duchess of Kent returned from Brighton to Frogmore Lodge on Wednesday. The Prince de Joinville left for Portsmouth on Saturday, and proceeded to France in the steamer Pluton on the same day. Orders have been received at Windsor Castle to prepare for her Majesty's reception on Wednesday next. Should the weather prove fine, it is expected that her Majesty, on her return from Ostend, will land at Brighton; otherwise, the Queen will proceed to Woolwich, and from thence to Windsor.

Parliamentary Movements.—The election of a member for the county of Argyll, in the room of Alex. Campbell, Esq., of Monzie, who has accepted the Chiltern Hundreds, took place at Inverary on Friday, when the Lord Advocate was returned without opposition. It is now understood that there will be no immediate vacancy for Sheffield, and that both Mr. Ward and Mr. Parker will retain their seats.

Health of Sir R. Peel.—In reference to the statements of the Irish journals, noticed in our last, the *Times* and other Ministerial papers declare that there is not the slightest foundation for the gloomy announcements they contained. The Right Hon. Baronet, they state, certainly appeared much harassed by the great physical and mental labour which he must have endured during the late session of Parliament, but beyond that, from which a little relaxation would soon restore him, his health was in no degree affected.

Church Preferment.—The following appointments have been made to benefices in the Church of Scotland, vacant by the late secession:—Rev. R. Fairweather to the parish of Nigg, Kincardine, in the room of the Rev. Alex. Thorn. Rev. W. Simpson, M.A., to the parish of Barry, Forfar, in the room of the Rev. J. Lumsden. The Rev. John Campbell to the parish of Reay, Caithness, in the room of the Rev. Finly Cook.

Foreign.

FRANCE.—The Ministerial journals contain a series of Royal ordinances, granting promotion and decorations to a number of officers of the navy and army who were present at the reception of Queen Victoria at Tréport and Eu. The King intends founding a new picture gallery at Eu, to be called the Victoria Gallery. In it will be placed a series of pictures connected with the proceedings of the Queen's visit. It is at present intended that the number shall be about 30, of which six will be of a large size, 9 feet by 6, and fourteen of smaller dimensions, the remaining ten being portraits. A special building is to be erected at the Château for this collection in the course of the ensuing spring. The King of the French has conferred on Prince Albert the grand cordon of the Legion of Honour. Previously to her departure from France, her Majesty presented to General Baron Athalin, first aide-de-camp of the King, a gold snuff-box, with her Majesty's cipher in brilliants on the cover, and on leaving the Château, her Majesty left 1,000*l.* to be distributed amongst the household. A *Havre* journal states that it is contemplated to erect at Tréport a column commemorative of the landing of Queen Victoria, with two allegorical figures, representing England and France holding each other by the hand. On Saturday evening a steamer, despatched by the Queen from Brighton, brought news of the safe arrival of her Majesty at that port. A letter from her Majesty, addressed to the Queen of the French, was delivered to her Majesty by the Captain of the steamer. The *Patrie* announces that apartments are fitting up in the Palais Royal, for the reception, it was believed, of the King of Naples. The transatlantic steamer *Darien*, of 450 horse power, was launched at Cherbourg on the 3d. She is one of 14 steamers of 1000 tons burden, and 450 horse power, which are now nearly completed. They are fitted up in the most commodious manner for passengers and commerce, and armed with four carronades and two swivels fore and aft. Nantes, Bordeaux, and Marseilles are to be the ports from which they will sail for the French possessions in the West Indies and the foreign ports in the New World.

SPAIN.—Barcelona is again the scene of anarchy and bloodshed. On the evening of the 3d, the Government steamer, which was despatched to Tarragona by General Arbuthnot for reinforcements, arrived at the quay with some companies of the line. The terrace and parapet above the quay was lined with volunteers, who warned the troops that they would fire upon them if an attempt to land was made. Unintimidated by this threat, the commanding officer on board the steamer ordered his men to disembark, which they did under a heavy fire from above. The engagement then became general, and the citadel fired several well-directed rounds of grape and canister into the insurgents. This checked them, and enabled the troops to effect their entrance into the citadel, but not without experiencing a heavy loss. Among the slain was Gen. Baiges, president of the Junta. The firing continued during the whole of the 4th, and at 7 P.M. the artillery of Atarazanas was playing on the soldiers of Col. Prim, who were endeavouring to get up a battery at the Mole. M. Degollada, the new president of the Junta, showed himself everywhere, in order to refute the report of his having left Barcelona. The insurgents had planted a battery at the breach of Cana-

leta, which had compelled the forces of Prim to retrograde. On the 5th, the three battalions of volunteers who were lately at Saragossa, under the command of Brigadier Ametler, were expected from Lerida. The garrison, which consisted only of 2,500 men, occupied the citadel and the harbour. The revolted were in possession of the city; the National Guards remained neutral. Emigration had recommenced, and upwards of 50,000 inhabitants had quitted the city. On the evening of the 7th the fort of Montjuich opened its fire on the Atarazanas, Col. Sayas having superseded Gen. Echaleca in the command of that fortress. A brigade of artillery from Molino del Rey, and 400 militia men of Igualada, had arrived at Gracia, and the militia of Vic, Villafranca, Manresa, and Berga, had marched to support the operations of the Captain-General against the insurgents. On the 8th the state of things at Barcelona was nearly the same. In the evening the fortress of Montjuich recommenced the fire on the Atarazanas. The fire had dismounted the batteries directed on Barcelonetta, and the citadel, and the Capt.-Gen. had caused the canals to be cut which supplied the fountains; but there were a great many wells in Barcelona, which had rendered this measure abortive. Col. Prim had done serious damage with his artillery, and three 24-pound shots had traversed the drawing-room of M. Penleaze, the British Consul. The Exchange had also been much damaged.—Our accounts from Madrid are of the 4th inst. Division among the members of the Lopez Cabinet was becoming daily more serious, and it was doubted whether they would hold together until the meeting of the Cortes. The summary justice done by General Narvaez on the occasion of the mutiny of the Princessa regiment had displeased two of the Ministers; another motive of dissension in the Administration was their political programme, which some would maintain, and others set aside; a third cause of strife was the appointment to places and commands, each wanting to promote his favourites. Although the news of the sanguinary struggle at Barcelona had not reached Madrid, the accounts from Catalonia created great anxiety, and it was said that the Minister of War had determined to act with vigour against the Barcelonense. Much uneasiness was also felt regarding Seville, where the partisans of Espartero and the Infante Don Francisco de Paula have combined with a portion of the Exaltados, in order to excite a movement in favour of the convocation of a Central Junta. The Andalusian prints of the 30th and 31st concur in representing the authorities of Seville as adopting extraordinary precautions. Notwithstanding these causes of alarm, and the many other difficulties that beset the new Government, it was thought that the elections would take place, and that the Cortes would be enabled to meet on the 15th October. The *Gazette* officially announces the recognition of the new Government by the English Cabinet. According to the same journal, the Lopez Ministry had accepted the offer of a loan of 400,000,000 of reals, to be applied to the construction of roads, canals, bridges, lighthouses, and telegraphs, made to it by Don Jose Salamanca. The following are the roads which the contractor will have to execute within the delay of twenty months:—The road called Delas Cabrillas, from Madrid to Valencia. A branch from La Minglanilla to Cuenca, and from thence to Guadalajara, on the roads of Barcelona by Saragossa, and of France by Soria and Lagrono. A road from Madrid to Lugo and Corunna, with various branches. From Madrid to Badajoz, the whole line not yet finished. From Madrid to Barcelona, the line not yet made between Saragossa and Lerida. From Bailen to Mengibar, from Grenada to Malaga, from Cordova and Andujar to Luceda, and from that bridge to Malaga. From Albacete to Murcia and Carthagena. From Madrid to Toledo. These works, if the state of the country allows them to be undertaken, would give employment to 80,000 men.

PORTUGAL.—We have accounts from Lisbon to the 4th inst. The past week has been destitute of any political event, the mission of the Duke of Palmella being the talk of the day. Sir R. Peel having declared in Parliament that the Cabinet of Great Britain had not solicited in the slightest way a renewal of the question regarding the treaty, the issue is anxiously looked for, the united wish of the nation being, with the exception of the Douro wine-growers, that it may again fall to the ground. The Royal Family has returned to Cintra, the palace at Lisbon being about to undergo alterations and improvements; and everything is in a state of perfect tranquillity.

GIBRALTAR.—Accounts have been received of the total loss of the steam frigate, *Missouri*, one of the finest vessels in the United States Navy, which was destroyed by fire in the Bay of Gibraltar, on the 28th ult. She was found to be on fire about 8 P.M., and the discovery was immediately followed by flames issuing from the engineers' store-room, where it is supposed it originated amongst the combustible spirits and oils. The large pumps were put into operation without a moment's delay, but the nature of the ignited articles rendered it impossible to stop the progress of the flames. The moment the fire was discovered, Captain Sir G. Sartorius, of the *Malabar*, 72, then in the bay, afforded assistance under his own immediate superintendence, and the *Locust*, steam-vessel, Lieutenant Lunn, got up her steam, and on coming alongside the *Missouri*, endeavoured to tow her into deeper water, but she had unfortunately already grounded, and could not be moved from her position. Finding it impossible to scuttle the vessel, and great danger and loss of life being apprehended, should the fire, which was making rapid progress all over the vessel, have communicated with the powder magazines, it was resolved to flood them, which was done, and only a trifling explosion took place about 3 o'clock on Sunday morning. Sir R. T. Wilson, the governor of the fort, on the fire breaking out,

proceeded personally to the wharf, and despatched two fire-engines, under the charge of the Sappers and Miners, but their united efforts with others and the crew of the vessel, proved unavailing to check the progress of the flames, and it was only when all hopes were given up of further assistance being useful, that Captain Newton of the *Missouri* could be induced to abandon her, which he did, with his crew, by the assistance of the boats of the *Malabar* and other vessels in the harbour, without saving anything except the clothes they had on. Mr. Cushing, the American Minister, appointed to proceed to Canton, was on board at the time the fire broke out, and fortunately secured his papers, and conveyed them safe on shore. When this was accomplished, he returned to the vessel and united with his countrymen in their exertions to save the vessel. The sight was one which will not soon be forgotten; the dark lines of the masts, spars, and rigging for a long time forming an imposing spectacle amidst the brilliant flames, relieved by the dark sky. The rock was completely illuminated, and surrounding objects were as clear and distinct as at noon-day; a sight of a similar description has not been witnessed since the memorable conflagration of the floating batteries in the celebrated siege of Gibraltar. The whole of the line of wall immediately fronting the bay was crowded, until an early hour on Sunday morning, with spectators, anxiously watching the progress of the flames; but it was not until eleven A.M., that Capt. Newton and his crew left her, burned to the water's-edge and converted into one mass of charred wood and cinders, which sunk soon afterwards in four fathoms water. The *Missouri* was nearly 2000 tons and 600 horse power. She mounted 28 guns, and was pierced for 44.

GERMANY.—It is stated in some of the continental papers that a meeting between the Emperor of Russia, the King of Prussia, and the King of Denmark, at Luneberg, has been arranged for the purpose of conferring on the possibility of exchanging the right of succession of the duchies of Sleswick and Holstein, for the same hereditary rights, to Hesse Cassel. The Emperor arrived at Berlin on the 6th inst., where the Grand Duke Michael, the Duke of Leuchtenberg, and the Grand Duke of Saxe Weimar, had also assembled.—In consequence of the permission granted by the King of Wurtemberg to Prince Napoleon Bonaparte, his nephew, to fight a duel in his dominions, the Prince and Count de Laroche Pouchin met on the morning of the 5th inst. near the village of Dhelboan. After a combat which lasted ten minutes, the seconds separated the combatants; Prince Napoleon received a sword wound in his right arm, which opened a vein, and Count Pouchin two wounds, one through the hand.—The *Frankfort* papers announce that M. de Haber, who was the cause of the fatal duel at Baden (the particulars of which were published in our Paper last week), has been arrested, and an inquiry into the facts instituted by order of the Government. On hearing of the death of the last surviving combatant, M. de Goeler, the populace assembled before the house of M. de Haber at Carlsruhe, and proceeded to break and demolish his furniture, but before the work of destruction was complete a strong body of troops was called out, and the people were dispersed. From the same authority we learn that those opposed to the reform in the Jewish religion, which makes rapid progress in Frankfort, had considered the refusal of the learned Rabbi, Dr. Reisser, to join them as a signal triumph. But now it is understood from the *Jews' Gazette* that he hesitates to join the new sect, merely because, in his opinion, the doctrines of it do not extend so far as to cause a thorough reform, particularly as to circumcision, which he, as a mere Talmud doctrine, wants to have abolished altogether. The Senate of Frankfort has authorized a loan of two millions of florins, at an interest of three per cent. towards the expense of the railroads from the Mein to the Neckar, and from Frankfort to Offenbach.—We mentioned in our last the retirement of M. Von Lindenau, Prime Minister of Saxony, after an official service of forty-five years. This venerable statesman has announced his intention to apply his state pension of 3,083 rix dollars in the following manner:—"The principal and 700 rix dollars annually to purchase a historical picture by a Saxon artist, to remain the public property; 300 dollars to a distinguished pupil of the Technical Institution, who intends to qualify himself as a civil engineer, to enable him to travel for two years; 400 dollars to eight Evangelical clergymen, whose income does not exceed 400 dollars, at the rate of 50 dollars each; 900 dollars to 36 Evangelical schoolmasters, whose income does not exceed 200 dollars, at the rate of 25 dollars to each."—We learn from Hungary that the magnates have now unanimously joined in the representation to his Majesty, requesting that the Diet may be removed from Presburg to Pesth.

ITALY.—According to letters from Leghorn of the 3d inst., the authorities were industriously circulating reports of the overthrow and dispersion of the insurgents in the legation of Bologna. Numerous bands, nevertheless, have traversed the mountains of the country. A great number of persons had been arrested, who were to be tried by a military commission. On the 26th, Cardinal Spinola, the Apostolic Legate, proclaimed Bologna in a state of siege, in virtue of an order from Rome. Notwithstanding the display of numerous forces, some armed bands have again appeared. One was commanded by a priest at Castel-Bolognese, in the district of Ravenna. This state of things does injury to trade and business of every description, and most of the depositors have withdrawn their funds from the savings' banks. A circular has been sent round to all the mayors of the province giving a description of eight persons, for the arrest of each of whom a sum of 300 crowns is offered. They are the Counts Zambecari

and Biancoli, the Marquises Messara and Tanara, and the brothers Muratori, Turri, and Giovanni, landowners. A circular of the 2d gives the description of eight other persons, without, however, offering a price for their arrest. These disturbances appear to have a more extended character than was at first attributed to them. The last accounts from Naples state that a great ferment exists in the kingdom of the Two Sicilies; that bands of armed men have been seen on several points of the Papal states and on the frontiers of the Abruzzi. The King of Naples had commanded several arrests to be made, and had taken measures to prevent the disturbances from extending to the Southern provinces and to Sicily.—From Palermo we learn that for some time past the most audacious robberies have been committed in that city in open day, and the Sicilian police seem, to a certain degree, to be on an understanding with the robbers. On the 16th ult., at the moment when a shop was plundered, the police agents arrived, headed by an inspector. The inspector received a bullet in the stomach, and the agents fled, leaving him on the spot.—The German papers announce that Austria has persuaded the smaller states of Italy to join in a kind of southern Customs' League, but that Sardinia and Naples have refused to do so.—The *Globe* states, upon the authority of letters from Marseilles, that the article published a short time since as a decree of the Inquisition of Ancona against the Jews is a fabrication. The railroad from Venice to Padua is open to the public for a distance of about eight French leagues. The bridge which will cross the Lagunes in order to bring the line into Venice, will be 1700 metres in length, and will not be completed for two years. The distance from Padua to the Lagunes is run in two hours, and the Lagunes are crossed by boats, specially appointed for the service, in half an hour. This railway has cost in construction about 180,000 fr. per kilometre, or 720,000 fr. per league.

HOLLAND.—The first trial on the railroad from Utrecht to Amsterdam took place on the 10th with complete success, on the section from Utrecht to Breda. The project of a railroad from Antwerp to Breda is engaging public attention at the former place, as well as in the Dutch cities. In the event of Belgium carrying the line to Breda, it is understood that the Dutch Government will undertake the continuation of it to Gorcum and Utrecht, a branch being formed from Gorcum to Rotterdam. Some objections to the contemplated measures are offered, but the general feeling seems to be in favour of them, and there is, accordingly, a fair prospect of their being carried into effect.

SWEDEN.—Letters from Stockholm of the 1st state that amongst the foreigners lately arrived in that city are two Quakers (Messrs. Alexander and Wiffens), the former a merchant from London of considerable property, who with great zeal devotes his time to effect the abolition of slavery. For this purpose he visited Stockholm three years ago, to persuade the King to an emancipation of the slaves on the island of St. Barthelmy, but did not succeed in getting an audience. Whether his endeavours this time will be more successful is said to be very questionable, although the object of his mission is popular in Sweden.

TURKEY.—The Levant mail has arrived, with news from Constantinople of the 23d ult. An Armenian renegade, who subsequently recanted and became Christian again, was, notwithstanding the endeavours of Sir S. Canning to obtain a remission of his sentence, publicly executed in the fishmarket of Constantinople on the 22d. It was generally expected that this compliance with the prejudices of the populace would eventually be visited by a severe retribution. The efforts of Sir S. Canning were dictated not only by humanity, but the desire of rescuing the Turkish Government from the odium which such acts must necessarily draw down upon it from all civilized Europe. On the 17th, a Princess was born, who has since received the name of *Jemileh the Beautiful*. The Bosphorus was illuminated for three nights in honour of the event.

EGYPT.—We have advices from Alexandria by the steamer *Polyphemus*, which came to Marseilles without the Indian mail. The *Memnon* steamer, which was to have left Bombay on the 18th July, had not reached Aden on the 14th August; and the Governor of that town, in consequence of the delay, sent on the *Atalanta* to Suez, to bring back the mail from England. The *Memnon*, it is thought, must have put back to Bombay from bad weather. The *Atalanta* reached Suez on the 23d, and was to return to Aden immediately, conveying the London overland mail of the 5th of August. The *Polyphemus* left Malta on the evening of the 2d. It has brought letters from Alexandria of the 29th ult. There are sad complaints not merely on the part of English but of French commercial people, of the Pacha's disposing of the produce of the country by private sales, contrary to his promise. It is said that Mehemet Ali has received intelligence of the discovery of a gold mine in the Soudan, near Dj Doslebel Tull, in 8 degrees 28 minutes south latitude. Achmed Pasha, the Governor of this province, had sent specimens of the ore to Alexandria, where it is expected that a rich produce will be procured. If such expectations be realised, it will be an immense advantage to the commerce of the country.

UNITED STATES.—Great interest has been excited for some days past respecting the voyage of the *Great Western* and the *Hibernia*, the former leaving New York on the 31st ult., the latter leaving Boston on the 1st inst. The betting has been in favour of the *Hibernia*, and she has again beaten her rival. On Tuesday, at midnight, her lights were seen off Liverpool, and at one o'clock she entered the river after another rapid passage of nine days from Halifax, and eleven from Boston. The *Great*

Western did not arrive till Thursday, at 4 A.M., but it appears that justice was not done to her powers this voyage, as she was supplied with coals of such indifferent quality that it was difficult to keep steam up the greater part of the passage. In her outward voyage the *Hibernia* made the trip in 54 hours less than the *Great Western*. This arrival brings news from the United States 16 days later than that received by the packet-ship *Liverpool*. The heaviest rain-storm ever experienced at New York commenced at 9 o'clock on the 21st ult., and continued, though with diminished violence, throughout the following day. The damage done to property in the city and Brooklyn was very great, and the accounts from neighbouring towns and cities contain a long list of disasters. Some alarming cases of yellow fever had taken place at New Orleans, and great apprehension was felt that the disease would prove more fatal this year than usual. One or two cases are reported even to have occurred at the Quarantine at New York. Mrs. Christina Gilmour, alias Cochrane, charged with the murder of her husband, by poison, at Inchinnan, Renfrewshire, arrived at Liverpool on Monday last, on board the *Liverpool*, from New York. She came over in the custody of Mr. M'Key, a police officer from Scotland, and, after having been confined in the Bridewell of Liverpool during the night, sailed for Glasgow on Tuesday, under charge of the same officer.—The officers of the Auburn State prison have recently substituted the effusion of cold water upon the bodies of refractory prisoners instead of scourging. This is an important change in prison discipline, and is likely to be adopted very generally throughout the United States.—By a table in the papers, it appears that the aggregate annual expenditure of the several States, in their executive, judicial, and legislative departments, was—Executive, 198,470 dollars; Legislative, 747,253 dollars; Judiciary, 646,185 dollars—total, 1,591,908 dollars.—The *Caledonia* mail steamer, which left Liverpool last week for Boston and Halifax, took out 85 passengers, amongst whom were Mr. E. Gibbon Wakefield, Mr. Macready, and Judge Haliburton, author of "Sam Slick."

CITY.

Money Market, Friday.—Consols continue rather flat, at 94½ to 5 for Account, and 94½ for present transfer; New Three-and-Half per Cents., 102; Exchequer Bills, at 1½d. per day, 59s. to 61s. prem., and at 1½d. per day, 61s. to 63s. prem.

Metropolis and its Vicinity.

Gen. Espartero.—The Duchess of Victory and Donna Elidia, accompanied by Colonel Guerra, made a hasty inspection of the interior of Westminster Abbey last week, previous to the morning service, at which they were present. Having expressed a wish to hear the service, the Dean's private pew was placed at their command. The Duchess signified that General Espartero and herself would shortly make a more protracted visit, so that they might go over the entire edifice. His Highness has accepted an invitation to dine with the Lord Mayor on the 26th, at the Mansion-house, when a distinguished party will meet the Regent, including Viscount Palmerston, the Earl of Clarendon, and other noblemen. The Regent has hitherto enjoyed a far better state of health in this country than his previous indisposition led him to expect. His Highness, with the Duchess of Victory, and Donna Elidia, almost daily visit some of the principal sights of the Metropolis, but preserve the strictest incognito. On Wednesday they visited Greenwich Hospital, and were conducted over the whole of that establishment by Adm. Sir J. Gordon. General Van Halen's health is considerably improved.

The Murder of Mr. Dadd.—The unfortunate young man whose parricide has excited so great a sensation has been apprehended in France, but not until he had nearly committed another crime by the murder of a fellow-passenger with a razor. It appears from the statement of the French gentleman that, on the night of the 30th ult., he was passing through the forest of Valence, near Montereau, and was seated on the *imperiale* of the diligence, by the side of a young Englishman, whose looks seemed to be wandering, and who had been for above a quarter of an hour amusing himself by lowering the gentleman's cravat and collar. This singular practice provoked the traveller, who desired his neighbour to have done with it; the latter then drew from his pocket an English razor, and set about cutting the throat of the unfortunate Frenchman, who, despite a vigorous resistance, received four rather deep cuts. Notwithstanding his wounds, he succeeded in mastering the young man, who, on being taken before the justice of the peace at Montereau, quietly declared that his name was Richard Dadd, and that he had just arrived from England, where he had murdered his father. He was lodged in the Melun house, and was soon after sent to Fontainebleau. The most surprising circumstance of this strange story is, that the moment he was arrested he hastened to give all he had on him in order that his victim might be taken care of! His apprehension is the first instance of the operation of the new law between France and England, which received the Royal assent last session. In regard to the young man's previous movements, it appears that immediately after the commission of the parricide he proceeded to Rochester, where he took a postchaise and posted to Dover, at which place he arrived about 4 A.M. on Tuesday, the day after the murder. At Dover he went to the Ship Hotel. His dress was torn and disordered, and he stated to persons who remarked on his appearance that he had met with an accident, having fallen from a coach. He had a large sum of money with him, and exhibited a purse, one side of which was filled with notes, and the other

with gold. Shortly after his arrival he engaged an open boat to take him across to Calais, for the hire of which he paid 10l. On landing at Calais he was stopped and taken to the Passport-office. He said he was engaged on business of the utmost importance, and was desirous of proceeding by the shortest route to Marseilles, and his passport being found strictly *en regle*, he was suffered to proceed on his journey. The passport had been obtained by Richard Dadd, in his own name, from the French Ambassador in London, on the Thursday before the commission of the murder. Whilst at Calais he purchased a new suit of clothes. The clothes which he had worn from Dover he left at the inn at Calais, and when they were examined after his departure, it was discovered that they were saturated with blood. At his examination before the French authorities he stated himself to be the son and envoy of God, sent to exterminate the men most possessed with the demon. He relates with the greatest coolness that in the park of Lord Darnley "he was seized, being with him who is said to be his father, with a divine inspiration which commanded him to sacrifice him; he immediately plunged his knife into his breast, and as death did not ensue fast enough, he made deep wounds in his neck with a razor." Dr. Leblanc, who was commissioned to examine him, asked what he thought of such an action, when he replied that he considered it a good one, since he had destroyed an enemy of God. He also considered his attempt on the French gentleman a good action, and is said to have but one thought, which is the extermination of a large part of mankind. The money he has with him is believed to be his own, as it is known that he has recently realised a considerable sum as an artist. He was recommended to Sir Thomas Phillips as a travelling companion by Mr. David Roberts, the academician. Soon after his return from Egypt, Dr. Sutherland, who had been consulted in his case, stated his distinct opinion that he was suffering from such an aberration of intellect that he could not be considered as a responsible agent, and had directed that he should not on any account be permitted to go at large. His father, however, who had in early life practised as an apothecary, paid little attention to this, but said that quiet and retirement was all that the son required; that he would take him down into the country, and he doubted not that his son's health would soon be restored.

Court of Aldermen.—It is supposed that there will be a sharp contest for the Aldermanic gown of Bread-street, vacant by the resignation of Alderman Lainson. Four candidates started at once for the gown:—Mr. Hughes Hughes, barrister, late Member for Oxford, who was returned some years ago in the room of Sir J. Shaw, as Alderman of the ward of Portsoken; Mr. R. L. Wilson, Member of the Common Council for Cripplegate; Mr. B. Lawrence, solicitor, in the ward of Bread-street; and Sheriff Pilcher. Mr. Pilcher retired after a very brief canvass, but the other three are determined to go to the poll.

City of London Registration.—The following are the total claims and objections by Conservatives and Liberals:—Livery objections—Conservative, 610; Liberals, 300; total Livery objections, 1,000. Household objections—Conservative, 724; Liberal, 350; total household objections, 1,074. Livery claims—Conservative, 13; Radical 11; total Livery claims, 24. The above are the only *bond fide* claims, the rest being merely for the alteration of addresses, &c. Household claims—Conservative, 60; Liberal, 41; total household claims, 101.

Street-Sweeping.—Arrangements have been entered into by the City authorities and commissioners of sewers for the daily cleansing of all the principal thoroughfares in the City, with the street-sweeping machines. The whole of the City, which has heretofore been cleansed under five or six different contracts, will now be cleansed under one, and the inconvenience occasioned to the traffic be thereby removed, the machines being capable of passing through the most crowded thoroughfares at the rate of two miles an hour, and without causing obstruction to the traffic.

Accidents and Inquests.—On Friday evening an inquest was held on the body of Mr. John Rogers, aged 47, which was found on the same morning on the shore of the Thames, nearly opposite the Penitentiary, Milbank. From the testimony of the witnesses, it appeared that deceased, who was the well-known nursery seedsman and florist, of Ebury-street, Eaton-square, had lately met with some disappointments in trade, which had to a certain extent affected his mind. On Wednesday morning last, he left home to go to Epsom for some money, but had not since that time been seen or heard of by his friends, until his body was identified at St. Margaret's workhouse, where it had been conveyed after being taken out of the water. A police-constable who was on duty between one and two o'clock on Friday morning, near the Penitentiary, was called by a person named Davis, who said that a man was in the water in the act of drowning, but when he came up he had disappeared near some barges. A bargeman was immediately hailed, and, after a short time, a hat and handkerchief were found, but the body was not discovered until nearly five o'clock. There was no watch or money, but two pocket-books, containing memorandums and cards of address, &c. The coroner summed up, and the jury returned a verdict of "Found drowned."—On Tuesday an inquest was held at St. George's Hospital, on the body of G. Bolton, aged 12 years, a fine youth, son of the head-gardener of Osmond Sampayo, Esq., of Peterborough House, Fulham, who died from the effects of a gun-shot wound which he received under the following circumstances. It appears that on Sunday morning the deceased left his father's home, accompanied by a boy named Buller, for the purpose of attending a place of worship. On their way thither they met two youths, named Bagnard and Whitley,

the former of whom carried a gun with a percussion lock, which he said was loaded, but not capped. Deceased accompanied them to the grounds of Mr. Bagley, the gardener, near Broom-house, where they were joined by a lad named Russell. Bagnard was subsequently in the act of holding the gun while Whitley fixed on a cap, deceased at the time standing in front of it, when Russell cautioned him to move away, but he did not do so, and scarcely had a minute elapsed before the lock went down, and the contents of the gun loaded with powder and small shot entered his left side, and he fell bleeding to the ground. Mr. Bannister, house-surgeon of St. George's Hospital, said that, on deceased being admitted, he was found to be suffering under a gun-shot wound, about an inch in length, on the left side of the abdomen. Deceased died in thirteen hours. Upon a *post mortem* examination, the intestines were found to be ruptured, besides other serious injuries, which had proved mortal. Verdict—Accidental Death; deodand on the gun, 8s.

Shipwrecks.—The particulars of the following shipwrecks have been received in the City this week:—The East India ship *Regular*, Capt. Carter, on her passage from London to Bombay, with a valuable cargo of iron, copper, &c., sprung a leak on the 8th July, in lat. 37° 30' S., long. 36° 80' E. The captain, crew, and passengers, after vainly endeavouring for four days and nights to stop the leak, at last took to the boats, the former not leaving her till her gunwales were under water. They were on the following day taken on board the *Cleopatre*, French frigate, where they received every attention.—The Queen *Victoria*, also an Indiaman, left Bombay for Liverpool on the 11th March, with a cargo of India produce, and, on the 7th April, during a sharp gale, struck on the south-west reef of rocks off Rodrigues, and soon became a total wreck. The captain and some of the crew were saved, but Mr. Serle, first officer, Mr. R. Plunkett, a passenger, and nine seamen were drowned.—The brig *Thomas Rickinson* struck, on the 27th May, on the reef of rocks off Ponte d'Oror, on her passage from the Mauritius to London. The officers and crew got into the boats, and succeeded in reaching the beach in perfect safety.—The *Amelia Thompson*, the property of Sir J. Pirie, Bart., was lost about eighty miles S.E. of Madras, on the 23d May, having been suddenly overtaken by a heavy squall, which completely threw her on her beam-ends. Part of the crew were saved, but Mr. Quarry, chief-mate, Mr. M'Neil, third mate, and five of the crew, were drowned.—The *Princess Augusta*, a schooner, from La Have to Halifax, was lost on the 20th ult., about twenty miles west of Cape Sable, after being thrown on her beam-ends, so that no exertions of her crew could right her. Only one out of the whole crew was saved.—Accounts were received by the last mail from the Brazils of a storm which happened during the 24th and 25th June at Monte Video, and occasioned the most dreadful consequences. H.M.S. *Fantome*, 16, commanded by Capt. Haynes, was totally lost during the violence of the hurricane. All the crew were saved, and are on their way to England to await a Court-Martial.—By accounts from Sydney intelligence has been received of the partial destruction of the schooner *Catherine*, Capt. Bannatyne, in April last, off the Isle of Pines, by the powder magazine being purposely fired, in order to prevent her being captured by a gang of native pirates, some of the crew having been murdered in a conflict with them. The surviving portion of the crew having succeeded in extinguishing the flames and getting the vessel out to sea, they endured severe sufferings for several days, when a vessel hove in sight, which proved to be the *Norwhal*, from London. Her captain bore down upon the distressed vessel, and through his exertions the lives of those on board were preserved. It is feared that three other vessels which are missing, and trade to the islands, have been captured and their crews murdered.

Fires.—On Saturday night a destructive fire broke out in the floor-cloth and table-cover manufactory of Mr. Cleverley, on Walworth-common. The premises occupied a large area of ground, and the fire originated in what is termed the ovens, buildings used for japanning, about one story high. The flames spread with great rapidity, and in a short time the range of buildings, 60 feet long, and about 25 in breadth, were entirely destroyed.—A fire broke out at nearly the same hour on the premises of Mr. Cropper, hatter, New Brentford. It originated at the lower part of the building, and at one time it was expected that the whole house would have fallen a sacrifice to the flames, but they were prevented extending further than the shop. The two adjacent houses were slightly injured.—In the course of Sunday morning the engines of the brigade force in the east end of the metropolis attended three fires which occurred in that part of London, but were of no particular importance.—On Tuesday morning a policeman discovered a fire in the lower part of the newly-built premises of the Religious Tract Society, Paternoster-row. The officer alarmed the inmates of the adjoining houses, and having despatched information to the fire stations, Mr. Braidwood with two engines promptly arrived. Water was soon procured, and an entrance having been effected, the men succeeded in preventing the fire extending beyond the cellar, where it originated, through some unslaked lime having been left by the workmen among the timber on the previous night. To the vigilance of the officer may be attributed the saving of much valuable property belonging to the leading booksellers.

Mortality of the Metropolis.—The number of deaths registered in the week ending Saturday, Sept. 2d, was as follows:—West Districts, 151; North Districts, 169; Central Districts, 160; East Districts, 222; South Districts, 207; total, 909 (males, 489; females, 420). Weekly average for the last 5 years, 903 (461 males, 442 females); and for the last 5 summers, 846.

Provincial News.

Her Majesty's Marine Excursion.—On Saturday the Queen and Prince Albert, accompanied by the Duchess of Kent and the ladies of the suite, took an excursion in the royal steam-yacht to Worthing, and landed at Brighton Pier after an absence of three hours. On Tuesday morning her Majesty and Prince Albert embarked for Ostend, on a visit to the King and Queen of the Belgians, under salutes from the Chain-pier guns, the battery, and the ships-of-war in the offing. All the vessels manned their yards, and were decorated with flags. About 3 o'clock the yacht passed Dover. A royal salute was fired from the guns at the grand redoubt, followed by one from the guns of the Castle. These salutes had hardly died away before the yacht rounded the South Foreland, and in a very short time was out of sight. About half-past 3 the yacht had arrived nearly off Walmer Castle, about a mile and half from the shore, and immediately afterwards the first gun was fired from the Admiral's flag-ship the *St. Vincent*. A royal salute was simultaneously given by the *St. Vincent*, *Caledonia*, and *Camperdown*, as the yacht steamed down the Channel. Twenty-seven galleys put off from Deal on the first intimation that her Majesty was approaching. The men were all dressed alike, and the miniature fleet excited general interest and admiration. On the royal yacht arriving abreast the *St. Vincent*, the yards were manned, and the band struck up "God save the Queen." All the men-of-war were gaily dressed with flags from stem to stern; the whole scene being one of extreme beauty and interest. The yacht proceeded on her course down Channel successively passing inland of the men-of-war, and affording the spectators, who thronged the beach to the number of some thousands, an excellent view of her Majesty and the Prince, who were seated on the deck, near the stern of the vessel. Having passed the *Camperdown*, which was the most easterly ship, the royal yacht was put about, and returned to seaward of the ships-of-war, coming round the flag-ship, which was moored farthest westward, and dropping her anchor immediately between the *St. Vincent* and the *Caledonia*. At this moment a royal salute was fired from the terrace battery in front of Walmer Castle. The *Ariel* mail packet, having on board the Duke of Wellington, had by this time approached the yacht; and his Grace having entered the gig which had put him aboard from the pier, and been towed astern, proceeded alongside. The other vessels of the royal squadron, which had been far outstripped by the yacht in the run from Brighton, now began to arrive. Among the first was the *Lightning* Government steamer, and the *General* Steam Navigation Company's ship *Mercury*, which left Brighton with a large party to proceed on an excursion with the squadron. The *Prometheus* and the *Cyclops* Government steamers, with several packets, soon followed, and by the gaiety of their appearance contributed very much to the beauty of the scene. The Duke of Wellington having proceeded on board the yacht, the Admiral's ship was signalled, and Sir Charles Rowley put off in his barge, to pay his respects to her Majesty. The *Penelope* war frigate arrived off the Castle about half-past 5, and fired a royal salute on joining the squadron. The galleys and sailing-boats remained near the yacht until nearly 6 o'clock, when it having become known that the Duke of Wellington had accepted an invitation to dine with her Majesty on board, they one by one returned to the shore, and the crowd on the beach dispersed. The Duke remained on board upwards of two hours, during which time the wind, which throughout the day had been blowing fresh from the northward and eastward, had considerably increased, and her Majesty, upon the Duke's taking his leave, evinced great anxiety respecting his safe landing. His Grace, however, in thanking her Majesty for the concern she evinced on his account, made light of the matter, and returned on board the *Ariel*, which brought him as near the shore as possible; here he got into the barge and rowed towards the beach. The swell was too great to admit of his landing at the pier from which he started, and the boat was pulled towards the naval yard, where the surf was not so great as at any other part of the shore. Here the Duke landed, but not without a considerable ducking, for no sooner had the bows of the boat touched the shore, than a heavy sea broke over her stern, and completely drenched his Grace, who upon landing, wet as he was, immediately mounted his horse and rode off to Walmer Castle. A numerous assemblage of persons had congregated on the beach where the Duke came on shore, and loudly cheered him. Several of the Government steamers which left Brighton with the Royal yacht, did not arrive until some time after her, and then they came up one by one, according to their several rates of steaming. At nine o'clock the men-of-war and steamers illuminated and manned their yards, each of the men having port-fires in their hands. At Walmer Castle there was also an illumination, and rockets were sent up by the shipping, and also on shore. At an early hour on Wednesday morning the squadron got their steam up, and made preparations for taking their departure. The weather had moderated, and the day was fine. About seven o'clock the Royal yacht got under weigh, and stood out to sea, followed by the other steamers which form the squadron attending her, and also by the *Penelope* steam-frigate, which had been ordered to join the Royal squadron. Her Majesty arrived at Ostend shortly after 2 o'clock, and disembarked immediately, the yacht having made the voyage full two hours earlier than was expected. In consequence of this, many of the preparations for the landing were incomplete, and the workmen were still busily employed at the quay when her Majesty landed. Immediately on the arrival of the yacht, the King and Queen of the Belgians went on board, and were received with every

mark of affection on the part of her Majesty, who was apparently in excellent health, and the highest possible spirits. The Royal party then landed, and entered his Majesty's carriage. The Queen and King Leopold occupied the back seat; the Queen of the Belgians sat opposite them, with Prince Albert. The Minister of Foreign Affairs, the Grand Marshal of the Palace, the Intendant of the Civil List, the Burgomaster of Ostend, with the other dignitaries of the town, together with our own Consul, and a crowd of generals, officers, gentlemen and ladies of rank, were in attendance upon their Majesties. The Royal party immediately drove towards the palace, amidst the enthusiastic cheering of the multitudes who lined the streets along the entire route. Ostend had poured out all its populace, whose numbers were increased by the strangers present in the town. Soon after their arrival, the Royal party dined in the Hotel de Ville, which the King had engaged for this occasion. Sir Hamilton and Lady Seymour, and the Burgomaster, were the only persons invited to join them. In the evening the town was illuminated, and about ten o'clock the Royal party returned to the palace. On Thursday, King Leopold and Prince Albert visited the yacht and afterwards reviewed the infantry. The Queen took a carriage airing, and in the evening the Royal party dined at the Hotel de Ville and afterwards honoured the theatre with their presence. The Royal yacht and the convoy of steamers left in the course of the day for Antwerp. Her Majesty intended to visit Bruges yesterday, and return to Ostend at night; to visit Ghent this day (Saturday); spend the Sunday at Ostend, visit Brussels and its environs on Monday, proceed to Antwerp on Tuesday, and embark for England on Wednesday.

Birmingham.—Father Mathew arrived in this town on Saturday, on his way from Norwich to Dublin. On Sunday the Hon. and Rev. Dr. Spencer arrived from Oscott, and preached at the Catholic church in favour of the temperance movement, and in the evening Father Mathew preached to a crowded congregation. On Monday the rev. gentleman was entertained at a public breakfast by nearly 200 ladies and gentlemen, including many influential inhabitants. Mr. James, the Mayor, presided as chairman, supported by Mr. Beilby and Mr. Clarke, borough magistrates, by Mr. Joseph Sturge, and a large number of dissenting ministers. The pledge was then administered to about 1,000 persons. On Tuesday a public breakfast took place, at which the Right Rev. Dr. Wiseman presided, and advocated the temperance movement at great length. Father Mathew then visited Oscott College, and administered the pledge to several of the students.

Brighton.—On Sunday morning at nine o'clock her Majesty and Prince Albert walked out unattended, and after taking a promenade on the Grand Junction Road, where they escaped recognition for a considerable period, they walked on the Chain Pier. They passed through the turn-stile entrance, and came so unexpectedly upon the toll-collector, that he held out his hand for the usual payment of 2d. a head before he discovered the rank of his visitors. After passing half-an-hour on the Pier, her Majesty and the Prince returned to the Palace. The greater number of persons who witnessed the Royal party leave the Pier contented themselves with bowing, but about 20 or 30 (said to be strangers in the town) pressed closely on their footsteps; and her Majesty and the Prince quickening their pace as they reached the Castle-square, retreated from the annoyance by entering the Palace by the porter's lodge instead of the usual entrance. A private letter in a morning paper states that "it is not at all likely that the public (be they inhabitants of Brighton, or vulgar, uneducated visitors,) will have another opportunity, during the short stay of the Court here, of annoying the Queen in a similarly rude and indecorous manner. Her Majesty, who has more than once expressed her feelings on the subject, is not likely to give them another chance. How different is the case at Windsor, and how extremely different was the behaviour of the public at Walmer, during the Royal visit last autumn. Unless the Brighton people mend their manners, I very much question if the Queen will often honour them with a visit."

Bristol.—A fire broke out at the Castle Inn, in this city, on Wednesday week, attended with loss of life; the landlord, Mr. Worthington, who had been bedridden for the last four months, and a little girl who attended on him, having died from the injuries they sustained. It appears that the fire originated in the bed-room of the landlord. The little girl had been sent up with a basin of gruel, and it is supposed she must have placed the candle too near to the curtains and fallen asleep. There were a number of people in the house at the time; but the fire had so far made head when the alarm was given, that the house and furniture were completely consumed; the property was not insured. By the exertions of the police and firemen the adjoining houses were saved.

Cambridge.—We learn from a correspondent who visited Cambridge on the 8th, to inspect the damage done by the late terrific tempest to the glass in the Botanic Garden, that "no one can have an idea of the extent of the mischief till he has seen the wreck of the houses. Whole sashes are without a single pane of glass left in them, and some have, in fact, little more than the bare woodwork, with small fragments of glass jutting out. They look exactly as if they had been thrashed with iron rods, so completely are they smashed. There is about 4,000 feet of glass to be restored, and of course many of the plants have suffered severely. There is no storm on record that ever happened in this county at all like it."

Carlisle.—The Bishop of Carlisle has just completed his triennial visitation of his diocese. In his charge to the clergy the Bishop remarked that, for the general condition of the Church, there was much cause for thankful-

ness, and referred at some length to Acts of Parliament recently passed, having for their object the welfare of the Church. He then dwelt at great length on the controversies within the Church, and expressed a hope that on all matters of this nature the clergy would so conduct themselves as not to render themselves liable to the charge of using unseemly taunts. In removing the errors of the Church of Rome, the Protestant Church sought only the cause of truth, and they condemned those errors, not for the sake of condemnation only, but for that truth by a regard for which he trusted they would ever be actuated. The Bishop then proceeded to the consideration of the authority of the Church, as Holy, Catholic, and Apostolic, and pointed out the great difference between that claimed by the Church of England and the assumed infallibility of the Church of Rome, noticing in detail several points of doctrine in which the two Churches differed. Much of the discussion, he believed, which had recently taken place, and many of the irregularities which had been complained of, would have been avoided, if the parties had, in the first instance, submitted their doubts to their Ordinary, a practice strongly to be recommended in all cases where changes were contemplated. The Bishop, after some remarks on the daily service, suggested the propriety of a due attention to divine worship, and the ordinances of the Church on Saints' days and other festivals, and proceeded to notice the subject of the dress of the clergy. He did not concur in the opinion that of the whole service should be performed in the surplice, for although there was no canon that treated on the subject expressly, he thought it was to be inferred from what was enjoined—that those parts of the Church service which were purely ministerial, should be performed in the surplice; but during the sermon, which was more to be considered as the opinions of an individual than as the appointed service of the Church, it was not improper that the gown should be used; but in this, as in similar cases, the best plan would be for the clergy to adhere to the common usage, and in all cases where doubts arose, to apply to the Ordinary. His Lordship made some remarks on the educational clauses of the Factories Bill, and the check that their abandonment had given to the education of the people. The remainder of the charge was occupied with the consideration of local matters.

Carmarthen.—Last week the parishioners of Llandeilo parish, about six miles from Carmarthen, met for the purpose of discussing their grievances at a place called Raymond Lodge—a public-house by the road-side. There were present about 60 persons, most of them substantial farmers. The proceedings were chiefly conducted in Welsh, but partly in English. A farmer occupied the chair. Dr. Picton, a relative of General Picton, and possessed of considerable property in the parish, was present, with two or three very substantial yeomen. The reporter of the *Times* obtained permission to attend the meeting, and states that the following resolutions were put to the meeting in Welsh, and agreed to unanimously:—1. The Highway Act ought to be reformed. 2. The gates are too numerous, and the tolls too high. 3. Poor Law. First, the overseer ought to pay the poor. Second, this is to be done under the direction of the guardians. Third, the guardians ought to choose and pay all the officers connected with the workhouse. Fourth, there ought not to be any separation of man and wife. Fifth, the old law was better in cases of bastardy than the new. Sixth, the accounts ought to be passed before justices, as before. Seventh, the chaplain ought to have a salary. 4. Tithes. First, the meeting wish that the tithe should go towards keeping the poor and the Church. Second, the tithe ought to be paid according to the annual value of the land. Third, they ought to be reduced at least 4s. or 5s. in the pound. 5. Church-rates ought to be amended. 6. Church and State. First, they ought to be separated. Second, that the law should defend religion just the same as in Madagascar and Otaheite. 7. County Stock. The meeting thinks the same with regard to this grievance as the Mynydd Selen meeting did. 8. The Corn Law ought to be repealed for a year or two, to try how it can be done without. 9. There ought to be no by-law on the highway, the gates, the poor, the tithes, and income-tax. 10. Every parish to choose its own minister, as in Germany. 11. The Archbishops and Bishops have better work to do than to be in Parliament. 12. No clergymen or preachers are wanted in the workhouse if the guardians do their duty faithfully. 13. The law ought to be amended in many other particulars. 14. Income-tax. It is great foolishness to raise a tax with this name to it. 15. The Dog-tax. The meeting thinks Sir Robert Peel will take off this tax if he is asked to do so. 16. Soldiers are serviceable where they are wanted, but they are not wanted here." It was then determined to adopt a petition relative to the grievances as to tithes.—A daring attack has been made on the farm of Tynywern, belonging to a magistrate, Mr. W. Chambers, of Llanelly, who has rendered himself, it would appear, obnoxious from his efficiency and activity. On Sunday morning, between 1 and 2 o'clock, the barns and out-buildings of this farm were fired, together with the hay and corn stacks, all of which were consumed, and about 300*l.* worth of property destroyed. One of the farm boys was awakened, and on looking out saw the out-buildings on fire, and about 15 men disguised leaving them. The same men were then seen to go across the country to another farm occupied by Mr. Chambers, called Gelbyglnoy, where they set fire to the corn and hay stacks. Three stacks of corn and one of hay, worth about 150*l.*, were entirely consumed. On the same night the rioters set fire to the toll-house at Hendy Gate, on the road from Llanelly to Pontardulais, which was kept by an old woman upwards of 70 years of age, who had received frequent notices that if she did not leave the gate, her house should

be burnt down. The old woman on being awakened ran into the road, and to a neighbouring cottage within twenty yards of the toll-house, shouting to the people who lived in it, to "come out and help her to put out the fire; as there was not much." The occupier of this cottage, a stout able man, was afraid to go out, and begged the old woman to come into his cottage, which she refused, and went back to try and save some of her furniture. It appears her exclamation had been overheard, for the rioters returned, and set fire to the thatch again. The old woman then ran across the road, and shouted out, "She knew them;" when they fired at her and shot her dead. She staggered as far as the neighbouring cottage door, and there sunk down dead. An inquest on the body was held on Monday at Pontardulais, when the surgeon distinctly stated that on a *post mortem* examination he found the lungs considerably congested, with marks of some shots on the surface, two of which were found in the substance of the left lung. Notwithstanding this evidence, the jury returned the following verdict:—That the deceased died from the effusion of blood into the chest, which occasioned suffocation, but from what cause is to this jury unknown.—The Carmarthenshire magistrates in Quarter Sessions, on Tuesday, resolved to defer the question of a rate for a rural police to October next; and the magistrates of Cardiganshire have assented to a reduction of the turnpike tolls.

Dorchester.—The *Dorset Chronicle* publishes a long account of the festivities which took place at Milton Abbey on the 5th inst., to celebrate the coming of age of Mr. Henry Damer. On the first day, beef, bread, and ale were distributed among the people, and the tenantry dined with their young landlord. On the following day a *déjeuner* and ball took place, at which all the principal nobility and gentry of the county were present.

Exeter.—The salutes fired at Plymouth in honour of her Majesty's late visit to that port were distinctly heard on the hills around this city, at Moretonhamstead, Drewsteignton, Black Torrington, &c. In one instance, near this city, the eminence on which the firing was heard cannot be short of 46 miles from Plymouth by the mail-line road.

Harrogate.—It is said that there are at present upwards of 2000 visitors congregated in this town; and all the other watering-places in the north. Scarborough, Seaton, Carew, Redcar, Tynemouth, Shotley-bridge, Gillsland, as well as the Lakes, are full of company.

Hereford.—The Musical Festival, which was held on Tuesday, Wednesday, and Thursday of last week, in All Saints' Church, in consequence of the repairs going on at the Cathedral, was on a much smaller scale than has of late years been usual with the three choirs of Worcester, Gloucester, and Hereford, and the attendances at the various performances were by no means so numerous as had been generally expected. The expenses, however, had been studiously kept down, and it is hoped the receipts may cover them. The collections after the three services amounted to 865*l.*, being 200*l.* less than in 1840, but 50*l.* more than in 1837.

Liverpool.—The local papers mention a rumour that John Anderson, convicted at the Assizes for having knowingly become possessed of the notes stolen at the Preston Guild, has declared that if any hope of a commutation of punishment were held out to him, he would give a clue to the murderer of the late Mr. Bibby. It will be recollected that this gentleman was found dead in the summer of 1840, near Bootle, under circumstances of a mysterious character, which have never since been cleared up.—A Repeal meeting took place in this town on Wednesday, which was attended by Mr. D. O'Connell, jun., and other members of the Dublin Association. About 4000 persons were present. Mr. Fitzgerald moved the first resolution, which set forth that this public demonstration was held, not only as evidence of increasing strength in Liverpool, but with a view to express a fixed resolve to persevere in constitutional agitation till Ireland should obtain her right of self-government. In the course of his address, he stated that a few months ago, the collection of "rent" in Liverpool averaged only 2*l.* or 3*l.* per week; at the present time it had reached 20*l.*, so that the Repealers of this town were now remitting funds to the "National Treasury" in Dublin, at the rate of about 1000*l.* per annum. Mr. O'Connell, jun., then came forward to support the resolution. He spoke at some length, and retired at the close of his address. A riot then ensued, and there appeared an evident determination that the proceedings should be stopped; for fights commenced in different parts, many of the benches were torn up, and an attack was made upon the stage by the anti-repealers in the pit. In the confusion the table at which the reporters were stationed was destroyed, and they had to effect their escape as well as they could. The police secured the assailants, several of whom were seriously hurt; and a few of them having been removed from the building, order was eventually restored, and, with a few trifling exceptions, it was preserved to the end of the proceedings. 41*l.* was then announced as the week's rent for Liverpool, and a petition to Parliament for immediate repeal was adopted.

Leicester.—Mr. Messenger, the master of the man recently murdered at Gaddesby, was fully committed on Wednesday week, on the charge of Wilful Murder. There were several additional witnesses, but the examination, which lasted the whole of the day, being private, the particulars have not transpired.

Norwich.—On Thursday the 7th, the great demonstration to witness the meeting of the Bishop of Norwich and Father Mathew took place in St. Andrew's Hall, which was illuminated for the occasion. The hall, considered one of the finest in the kingdom, and said to be capable of accommodating from 5,000 to 6,000 persons, was crowded

to suffocation. The orchestra, used on the occasion of the musical festival, was appropriated as a platform; and long before the time appointed it was crowded with the ladies and gentry of the city. Father Mathew, accompanied by the Hon. Stafford Jenningham, and the Rev. Mr. Nellyan, rector of Carlton, arrived on the platform shortly after seven, and on making his appearance, the entire assembly rose, and received him with enthusiastic cheering. Mr. J. J. Gurney, on taking the chair, said he felt great pleasure in doing so, as, although he some time since looked upon the principles of total abstinence as a fallacy, he begged now to state that he was a confirmed, absolute, and pledged teetotaler. The total abstinence movement was in harmony with the Christian doctrine of the Gospel, and, therefore, it was a neutral ground, on which they all could meet and join heart and hand without political or religious differences. Upon that understanding he had taken the chair, and he hoped that the proceedings would be carried out in the true principles of Christian charity and love. Shortly after this the Bishop of Norwich, accompanied by several ladies, arrived, and his appearance on the platform was the signal for the most enthusiastic cheers. The entire assembly rose, and the applause which ensued was tremendous for some minutes, which was renewed on his Lordship walking up to Father Mathew and shaking him cordially by the hand. The Bishop then addressed the meeting at great length, stating that he had come there contrary to the advice of many of his friends, but he should have considered himself degraded if he had been induced to remain away by the calumnies circulated against him and the Temperance cause by certain parties in that city. He had watched over the character of Father Mathew, and he would say—and say it publicly—that he sincerely believed that it was embodied in the words in print which he held in his hand. He then read an extract from a printed document, which declared that Father Mathew was a gentleman by birth; that his acts had been publicly known for 25 years; that during his whole life, although possessed of the franchise, he had never given a vote, meddled with politics, or mixed with any agitation; and that he was a meek and spiritual-minded man. The Bishop then proceeded as follows:—"Where did this excellent system commence? Its birth-place was the land of freedom, in America, raised by the descendants of British blood, and it winged its way to this quarter of the world. But where did it alight? Not in England, but in the Protestant town of Belfast, where it began, not with the Catholic, but with the Protestant clergy. It then winged its way to Liverpool, and the manufacturing districts, where I met, and to my shame be it spoken, I opposed it. Yes, three years ago I opposed teetotalism as Eutopian, treated it with ridicule, and as a thing which would pass away as the dew before the sun. I have since, however, looked at both sides of the question. I have followed it from house to house, from cottage to cottage, and conviction was so strongly enforced upon my mind, that instead of being longer its enemy, I became its staunch and enduring friend. I can mention one instructive circumstance in connexion with the religious tendency of temperance societies. I shall never forget visiting the cottage of a man who had been all his life a drunkard, and which was the abode of misery and wretchedness. He became a teetotaler, and in six months after I found his abode the scene of comfort and domestic happiness. This man, with tears in his eyes, placing his hand on a quarto family Bible, said, 'This is the first thing I purchased with the money I saved by giving up drunkenness. It was an alien to my house before, but it has been my daily comfort and companion ever since.' In proportion as temperance has advanced crime has diminished." His Lordship concluded by calling on the meeting to receive Father Mathew in the spirit of honest Christian charity. Father Mathew then came forward and spoke at considerable length. He said it could not be expected that he should reply to the charges made against him, particularly after what had fallen from his Lordship, of whose friendship he had long known the value. He had come to Norwich, previous to going to Ireland, in order to thank his Lordship personally, and if there had been any deviation from the path of rectitude on his part, he would not have dared to show himself. The Rev. gentleman concluded by thanking the meeting for the handsome manner in which they had received him. On Friday, Father Mathew administered the pledge, in St. Andrew's-hall, to several hundreds of persons, and afterwards dined with the Bishop. He left Norwich on Saturday for Birmingham, in order to administer the pledge in that town, under the patronage of Dr. Wiseman, the Roman Catholic bishop.

Oxford.—On Friday the remains of Dr. Bridges, President of Corpus Christi College, arrived here from Ilfracombe, and the interment took place on the next day in the chapel of the College. The funeral of Dr. Grayson, Principal of St. Edmund-hall, took place on Wednesday, in the chapel of that hall. It is a singular coincidence that, in 1823, the Rev. Dr. Cooke, President of Corpus, and the Rev. Dr. Thompson, Principal of St. Edmund-hall, the predecessors of the above gentlemen, also lay dead at the same time.—The daily papers state that it is intended to establish at Littlemore, near Oxford, a college in which young men holding Tractarian principles may be trained for missionary labour; and that the Right Rev. Dr. Coleridge, formerly Bishop of Barbadoes, will be principal of the institution.—The *Standard* announces, on the authority of a letter from Oxford, that Mr. W. Lockhart, B.A., of Exeter College, who for the last twelve months has been an inmate of Mr. Newman's house, at Littlemore, and about four years ago adopted Tractarian principles, has declared himself a convert to the Roman Catholic Church.—On Wednesday Mr. Cobden and Mr.

Bright visited Oxford to address a county meeting, convened by the High Sheriff, on the subject of the Corn-laws. The meeting was attended by the members for the county and city, and several of the landed proprietors, but by very few farmers. Mr. Cooper, Deputy Sheriff, presided. Mr. Cobden spoke at great length, after which Lord Camoys came forward, and concluded a brief address by moving the following resolution:—"That the Agricultural interest being the paramount interest in this country, to depress that interest would be injurious to the entire community—that suddenly to adopt free trade in corn must produce that effect, and that therefore it is the opinion of this meeting that a moderate fixed duty upon the importation of foreign grain is the one best adapted to the present position of the agricultural interest, and the welfare of the country." This resolution was seconded by Mr. Langston, M.P. Mr. Bright then spoke for upwards of an hour in favour of a total repeal, and was followed by Lord Norreys in favour of the existing Corn-laws. The noble Lord said, that while he fully subscribed to the statement that both agriculture and commerce were suffering very great depression at the present time, he at the same time felt that the remedies proposed by the League could only aggravate the distress—which he attributed to a great measure to the enormous over-production by the manufacturers. Considerable interruption was offered to his Lordship while speaking, which induced him to observe that he had attended the meeting because it had been convened by the high sheriff, but he was perfectly aware that it was not a meeting of farmers, for very few of that class were present. Mr. Henley, M.P., followed, and contended that in countries where no Corn-laws exist the variation in price is far greater than in England. He spoke at considerable length, and concluded by expressing his concurrence in the opinion of his colleague, that although some farmers might be present, the great body of that class, utterly repudiating the doctrines of the Anti-Corn-Law League, had purposely absented themselves. Mr. Cobden replied, and an amendment in favour of free trade was carried by a large majority.

Portsmouth.—The Pluton, Archimede, and Napoleon, French war steam-vessels, which joined her Majesty's escort, from Tréport to Brighton, arrived here on Friday morning, and came into harbour for coal, which was immediately supplied from the dock-yard. They were saluted by the flag-ship and the garrison. The Napoleon is propelled by Smith's screw, and is a remarkably handsome vessel. She has on board the models of 12 screws, to test the respective merits of which a committee of engineers were appointed in France, who decided in favour of Smith's screw, and determined that the screw we have adopted in the steamer now fitting therewith is the least efficient of the whole. The Prince de Joinville arrived on Saturday morning, in one of the royal carriages, from Brighton, alighted in the dock-yard, and immediately embarked, under a royal salute from her Majesty's ship Victory, on board the Pluton, French steamer, and hoisted his flag. His Royal Highness soon afterwards landed, and inspected the dock-yard; and at half-past four took his departure for Tréport, followed by the Archimede and Napoleon, under another salute from the Victory, and one from the garrison, as his Royal Highness passed out of harbour. The Pluton immediately afterwards hoisted the British colours and returned the salute.

Plymouth.—On Monday last the fourth story of the Breakwater lighthouse was completed. The air chamber only has now to be put up, when the entire building will be ready for the reception of the lantern which is now making in London. The part now up is 46 feet above the level of high water, and when finished the lighthouse will be 56 feet high without the lantern.

Ramsgate.—A fishing smack, belonging to this port, when about five miles from the North Foreland, discovered a box floating on the water; they picked it up, and on examination it was found to contain about 50 letters, besides a number of newspapers. From the address on the box it appears it had been sent by the General Post office by the ship George, or Royal George, to Sydney, some time last year. It is surmised that the vessel has made the voyage, and returned without delivering the letters, and that in order to avoid discovery and evade the penalty (500*l.*) the box was thrown overboard at the entrance of the Thames, as two 7lb. weights were attached to the box, on purpose, apparently, to sink it. It was delivered to the Customs, for inquiry to be instituted.

Shrewsbury.—The *Shrewsbury Journal* states that a few years ago when the late Earl of Leicester held his agricultural meetings at Holkham, a sheep was sheared in the morning, the wool washed, combed, spun, and wove, the cloth made into a coat, and worn at dinner the same evening, as a proof of the industry and ingenuity of the country. A somewhat similar instance of agricultural effort was accomplished on Saturday last in Salop. Mr. Edward Humphreys, of Walcot, had wheat cut at half-past nine in the morning; at half-past one some of the morning's produce was in loaves, one of which Mr. Davies presented to his landlord, the Earl of Powis, as a sample of the season's production.

Ware.—The churchwardens of Ware, finding that the Bishop of London refused to aid them in their quarrel with the vicar, on account of his introduction of certain changes in the Church Service, determined on appealing to the Archbishop of Canterbury, who declined interference. The parishioners therefore resolved on holding a meeting, which took place on Thursday, when it was resolved unanimously—1, "That the Vicar of this parish having refused to comply with the wishes of his parishioners, in regard to the performance of the church service, under the plea that he is bound by his ordination vow faithfully to observe all the rubrics of the Church, and

notwithstanding which several of them are not so observed—Resolved that the churchwardens be desired to take all proper and legal means to have the rubrics rigidly and strictly adhered to.—2, That it is the opinion of this meeting that the congregation should quit the church immediately after the conclusion of the Nicene Creed."

Windsor.—The embellishments and renovations which have been for some time in progress in St. George's Chapel, having been completed, the edifice was thrown open gratuitously to the public on Tuesday and Wednesday by order of the Dean and Canons. On Tuesday it was visited by upwards of 5000 persons, from all parts of the neighbourhood of Windsor and Eton, and many from the metropolis and the various towns and villages on the line of the Great Western Railway. The whole of the private chapels, which have undergone extensive repairs and embellishments while the works were in progress, and which contain many objects of great interest and high antiquity, were kept closely locked by the attendants, and the public were carefully excluded from every part of the sacred building, with the exception of the nave and choir, and the north and south aisles. It is stated to be the intention of the authorities to permit the public to view the interior two days in every week, when the vergers will be prohibited from receiving any fees. Tuesdays and Fridays are the days mentioned for the chapel to be thus thrown open for the gratuitous admission of the public. At the next chapter held by the Dean and Canons this matter, it is said, will be discussed and determined upon. It is also expected that at the same time a scale of fees to be paid to the vergers (on the other days of the week) will likewise be arranged, so as to do away with the discontent and grumbling which now prevail between the public who pay, and the vergers who receive, fees.

Railways.—The following are the receipts for the past week:—Greenwich, 829*l.*; Brighton, 5753*l.*; Blackwall, 1241*l.*; Eastern Counties, 2872*l.*; Sheffield and Manchester, 486*l.*; Liverpool and Manchester, 5287*l.*; Glasgow and Greenock, 1534*l.*; Hull and Selby, 1111*l.*; Great North of England, 1499*l.*; Birmingham and Derby, 1233*l.*; Birmingham and Gloucester, 2034*l.*; Edinburgh and Glasgow, 2569*l.*; Midland Counties, 2618*l.*; North Midland, 4706*l.*; Grand Junction, 8277*l.*; South-Western, 8227*l.*; Great Western, 15,140*l.*; London and Birmingham, 17,404*l.*; Northern and Eastern, 1574*l.*—The meeting of the Croydon company took place last week. The report showed a balance in favour of the company of 9166*l.*, of which 3043*l.* had been set apart for depreciation of stock, leaving a surplus of 6623*l.*, out of which the directors recommended a dividend of 4*s.* per share. The works for the new line to the Bricklayers' Arms were now in operation, and the directors congratulated the proprietors, that the exertions made by the Greenwich Company to establish a case of hardship and breach of faith on the part of the Croydon Company, had failed, since it had been proved before committees of the House, and the Board of Trade, that the Greenwich Company had undertaken the widening of the line by their own free will, and with the understanding that if the rate of toll should prove obstructive to the traffic of the other parties using the line, that then the other companies might seek another. The directors had canvassed, with the Greenwich committee, and with the directors of the Brighton and Dover companies, the propositions made for an amicable adjustment of the toll question, and had now come to the conclusion that it was not advisable to enter into any further negotiation upon the subject, but that their efforts should be directed to the construction of the Bricklayers' Arms branch, where they had no doubt that the great bulk of the cheap traffic might be satisfactorily conducted. The chairman addressed the proprietors at considerable length on the questions in dispute between the companies, and the report was adopted.—At the meeting of the West London Company, the report stated that the works were rapidly approaching completion, although some delay had arisen from negotiations between the company and the metropolis roads commissioners. The junction of the line with the Birmingham and Great Western Railways would soon be effected, and the whole was expected to be completed before the end of November. The total receipts up to June last were 174,000*l.*, leaving a balance at the bankers' of about 4000*l.* The report having been adopted, Lord Kensington addressed the meeting, and congratulated the shareholders on the improved prospects of the concern. The policy of a paid direction was then discussed, and it was resolved that 600*l.* per annum be allowed the directors from the day when the line is opened.—The Manchester and Leeds Company at their meeting have announced a dividend of 2*½* per cent. on the 100*l.* and 50*l.* shares, and a dividend of 5 per cent. on the 25*l.* shares. The traffic of the line has increased, and the management have turned their attention to the curtailment of expenses. According to the report presented at this meeting, the directors are now occupied with the subject of the extension of railway communication to Liverpool.—A project is in contemplation for uniting Rye, Tenterden, and Hastings with the metropolis, by means of a branch line from the Dover railway at Headcorn. The estimate for a single line of rails is 250,000*l.*, exclusive of land, and it is expected that the line, when completed, will be leased by the South Eastern Company. A meeting, in pursuance of the proposed undertaking, was held at Rye last week, when resolutions were passed for opening a subscription immediately.—The works of the new railway to Oxford have been commenced at the junction with the Great Western Railway at Didcot, and it is expected that in nine months the line will be opened to Oxford.—A new railway from Worcester to Cardiff is proposed, in order to connect the populations of the north of England and the midland

counties with South Wales and Ireland. It will commence at the Taff Vale railway, pass through Wales, cross the Severn, and unite with the Birmingham and Gloucester Railway at Worcester. The cost will be 1,500,000*l.*—The inhabitants of Plymouth, after a conference with Mr. Brunel and Mr. Saunders, of the Great Western Railway, have resolved on adopting the coast line of railway to communicate with their town.

IRELAND.

Dublin.—Mr. J. P. Malony has been superseded by direction of the Lords Justices, for having attended a Repeal meeting at Gort, nearly three months since. The Commissioners of Education have dismissed a schoolmaster named Haydon, the master of the National School at Owing, Wicklow, for having attended the Repeal meeting at Waterford, in opposition to the rule of the Board, which prohibited teachers of National Schools from attending political meetings.—The weekly meeting of the Repeal Association took place on Monday, but nothing of any consequence occurred, Mr. O'Connell being absent on his Western tour. The rent for the week was 735*l.* Two subsequent meetings have been held, and at the last Mr. O'Connell brought forward his address to the nation in reply to the Queen's speech. This document was extremely long; it contained a minute recapitulation of the grievances of Ireland, and concluded by advising the people to continue in constitutional agitation, until they obtained their Parliament in College Green.—At the head office of police on Monday, two Repeal barristers appeared before the magistrates on behalf of Mr. M'Cormick, a bookseller, in reference to Mr. Edward Kelly, who had conducted himself in a very singular manner in Mr. M'Cormick's shop on Friday and Saturday last, using language which appeared to him seditious, and speaking of a weapon which he called a "Repeal gun!" Mr. M'Cormick had made a deposition on this subject on Saturday, from which it appeared that Mr. Kelly went into his shop on Friday, and after having asked for a copy of Mr. O'Callaghan's books, "Letters on the Arms Bill," and "The Irish in the Army and Navy," commenced alluding in strong language to the Repeal question, intimating that physical force must be resorted to for its achievement. Having continued to talk for some time in this strain, he spoke of a "Repeal gun," which he said he had at home, and which he would bring with him, and show to Mr. M'Cormick when he was passing by that way again. On the day following, he called again at the shop, bringing with him the gun, which was made to resemble a walking-stick. He left the gun in the charge of Mrs. M'Cormick, and told her to take care of it till his return. No sooner had he left the shop, than Mr. M'Cormick, acting upon the advice of counsel, apprised the police of the affair, and having lodged information, procured the arrest of Mr. Kelly. Mr. M'Cormick's counsel stated that Mr. Kelly had rendered himself liable to a prosecution on many grounds, either for his having uttered seditious language, or for having violated the provisions of the Arms Bill, by leaving a weapon in the house of an unlicensed person, or else for carrying such a weapon, he being himself unlicensed to do so. The informations having been read over, the magistrates decided on holding Mr. Kelly to bail in the sum of 100*l.*, and two sureties of 50*l.* each, to answer the charge when called upon, and binding over Mr. M'Cormick in a sum of 50*l.* to prosecute. Mr. Kelly, who is a younger son of Mr. Kelly, of Kellyville, Queen's County, is a barrister, and formerly held a situation in the Post-office. He sat on the right hand of Mr. O'Connell at the recent Repeal dinner at Maryborough.—Much conversation has been caused in the military circles of Dublin by a new affair in which Lord Cardigan has become embroiled with a captain of his regiment. The officer, it is said, was placed under arrest under such unusual circumstances, that he referred the matter to Sir E. Blakeney, the chief military authority in Ireland. The result was the immediate and unconditional release of the officer, and a communication to Lord Cardigan, the contents of which have not yet transpired.—On Saturday the engineers engaged on the intended Irish railway completed their survey. The principal station is to be at Harcourt-street, in this city, and the line from thence by Eino, the Curragh of Kildare, to Cashel, where the terminus is to be placed. The survey will be sent off in a few days to Sir R. Peel, for consideration of Government.

Loughrea.—The Repeal meeting in this town, for which extensive arrangements were made, took place on Sunday. Mr. O'Connell arrived on the previous evening at Ballinasloe, about 17 miles from this town. On leaving it in the morning, he was accompanied by a vast concourse of people from the surrounding districts. He was met at the village of Kilreece, where the procession was regularly formed by the traders of Loughrea, Galway, and Ennis, and by people from Athenry, Tuam, Gort, and other places, all of whom were preceded by bands, and carried banners on which Repeal sentiments were inscribed. During the entire proceedings the rain came down in torrents. Resolutions were proposed and carried condemning the Queen's speech, and pledging the meeting not to relax in its efforts to obtain Repeal. At the dinner in the evening, Mr. Bodkin, M.P., presided, supported by Mr. O'Connell on his right hand, and by Dr. M'Hale on his left. Mr. O'Connell said that as he was coming there, at Athlone, a worthy and honest Repealer, with a good deal of anxiety in his countenance, but a happy facility of Irish diction, in his countenance, but a happy facility of Irish diction, asked him this question: "Shall I be afraid of the Queen's speech?" He replied at once he saw no objection to his being afraid, if he were so timid as to be terrified by the ghost of a speech. The Queen's speech was the speech of her Ministers. The people were not

always so ready to make the distinction; but it was his solemn duty to point it out to them, to make them understand it. It was his duty to diminish as much as possible the tendency of the speech to create an unpleasant feeling towards the Sovereign—a result which would be as wrong, constitutionally, as it would be melancholy in point of fact. The Queen was beloved in Ireland. There, indeed, the Queen's name was a tower of strength. Until her accession to the throne, Ireland had received nothing but insult and injustice from sovereigns of the House of Hanover. After the Arms Bill, Ministers had but one arrow left in their quiver, but one stone unflung, one trick untried, and out they brought the Queen. All Europe was to be astonished by her speech against Ireland. Oh, what a trick! It was even worse than a scolding match between two fish-wives in Billingsgate: they were obliged to hear one another in reply; but here the scolding match was all on one side. It was an unfair advantage that Judy took of them. When Ministers talked of beating them, they were ready with their shillelaghs, and if they would give them fair play at scolding, there he was ready for them. Who was afraid of the Queen's speech? No one; but they had cause to rejoice in it. Ministers would not have used so rotten a weapon as that if they had any better. If anything could resist a repeal of the union, it would not be putting a few paltry words into a respectable lady's mouth. Peel supposed that the Irish were a changeable nation, and that they would soon get tired of the repeal agitation; but he was grossly mistaken. So far from shrinking from danger, did not hundreds call out to him, "Sir, when will you let us at them?" These mighty meetings were the safety-valve through which the boiling courage of the people evaporated. After some further observations he announced that he would hold meetings at Connemara on Tuesday; at Lismore on Sunday next; at Mullagah on the 1st October; and Clontarf on the 8th. In this course they would proceed; but their measures were not limited to the mere enumeration of the national will in Ireland. He was making averagements, to have his parliamentary scale complete and ready against accidents; for who could calculate how soon they might have their Parliament? Let England be involved in any awkward dilemma with one of the states of Europe—let any other country on the face of the earth attack her, and in 24 hours they would have their own parliament. Ireland had his plan before it, and he was going on with it. He hoped that every town mentioned in his scheme would furnish two persons to act as repeal wardens for the purpose of enumerating voters. When that was done he would call his protective society of three hundred Irish gentlemen about him. More than one member of Parliament had offered himself as a member of this society already. He would proceed cautiously and deliberately, with an eye to the breakers ahead, and with a full knowledge of the shoal-water, steering the bark of Irish liberty through every danger, till it should reach in safety the port of repeal. He called on the people to rejoice. The day of deliverance was not distant—the day when the country should be a nation again was not distant."

Cavan.—A meeting of the Protestants of Killyshandra, in this county, in favour of the Legislative Union, was held on Saturday week. This is the first out-of-door meeting against Repeal which has been held; and it is mentioned as remarkable, that no party emblem or banner was seen among the thousands assembled on the occasion. The resolutions agreed to bore reference chiefly to details of organisation. Those of most general interest were the following:—"That the Committee be requested to confer with the noblemen, gentlemen, magistrates, and clergymen connected with the district, and in whom they place confidence, in order to appoint from amongst them presidents, vice-presidents, &c. That in compliance with the view taken of her Majesty's speech by the noblemen and gentlemen who signed the requisition for the meeting in Belfast on the 7th September, there shall not be a general meeting of the Killyshandra District Association at present. But that in case the agitation of Repeal continues to be carried on in defiance of the wishes and determination of her Majesty, it shall be left to the Committee to call such meetings as they may think necessary. That in compliance with the existing law, no members of the Association shall parade together or join in procession, wearing, or having amongst them any banner, emblem, flag, or symbol, the display whereof may tend to provoke animosity between her Majesty's subjects of different religious persuasions, or accompanied with music of a like nature or tendency; but that the appropriate music of the Association be 'God save the Queen,' and 'Rule Britannia,' and that its proper flag or banner be the Union Jack."

SCOTLAND.

Edinburgh.—The Special Commission of the General Assembly of the Free Church of Scotland have issued a minute, signed by Dr. Chalmers and Dr. Gordon, calling the attention of landowners in Scotland, and other persons of wealth and influence, to various representations that have been made to them from different parts of the country. They state that they have learned, on undoubted authority, that in some cases proprietors of land have refused sites for building places of worship for the free church; that in other cases servants and dependents have been dismissed from their situations, and thrown on the world, on no other ground but that they have left the Establishment; that the cottagers in some parishes have been warned, at their peril, not to shelter under their roofs the ministers who have left their manses for conscience' sake; and that in one instance an interdict has been applied for to prevent a minister from preaching on a certain estate, or on the sides of the roads and high-

ways that pass through it. The Commission do not dispute the right of the landlords to adopt these measures; but, after recapitulating the grounds of the late secession, they state that any attempt to check the growth of religious opinions by such means must obviously be unsuccessful. "If," they say, "the most unlettered peasant in our land is to be reclaimed from what we regard as error, it must be by an appeal to his understanding and heart. Any other appliances he justly regards as proclaiming the weakness of the cause that needs to be supported by such instruments; and while he will be alienated in affection from any one who can resort to such expedients, he will be more rivetted to the doctrine he has embraced. The history of Scotland has long ago proved, that the mere force of secular power cannot bury a religion, and that every effort to do so always leads to the most fatal results." They proceed to show that even an indirect attempt on the part of the higher classes to interfere with the rights of conscience will surely lead to a dislocation of the different orders of society; and they conclude as follows:—"The inhabitants of Scotland have been long distinguished for their sober, orderly character, and for their attachment to their religious institutions; and no efforts on our part will be wanting to cherish in their hearts feelings of loyalty to their Queen, and due respect for those who occupy the higher walks of life; but if their most sacred rights are in any case disregarded and trampled on, they cannot possibly entertain any feelings of regard to those who do so. It is earnestly hoped that a sense of what they owe to God and their fellow-men, will keep the industrious classes in this country from any of those excesses which have disgraced other parts of the kingdom; but we feel bound to state, that should the measures adopted towards them by some of the higher orders be persevered in, we fear a deep sense of wrong will unavoidably be kindled in their bosoms, and will be transmitted from generation to generation. Such a result every man will surely deprecate, even should it never lead to open outrage, for it will tend to check industry in all its branches, to spread wide a cheerless poverty over the land, and ultimately it may engender a disregard towards all the institutions of religion. We have deemed it our duty to bring these things calmly and earnestly under the notice of the wealthy and powerful among us, and it is our earnest prayer that they may be received in the spirit that has dictated them, and that they may lead to such an issue as will tend to the growth of true religion throughout the land, and to the promotion of that brotherly kindness, peace, and good-will among all classes, which are its genuine fruits."

Glasgow.—We regret to learn that fever has of late progressed to a very alarming extent in Gorbals, in consequence of which a meeting of the magistrates, managers of the poor, and other inhabitants, was held on Friday last, for the purpose of taking measures to alleviate the distress and disease so extensively prevalent. Some details of a painful nature were laid before the meeting, amidst which one place was instanced, where, on the preceding day, no fewer than 71 persons afflicted with fever had been visited by the superintendent. When it is borne in mind, that the barony embraces a population of nearly 60,000, and that fever is not confined to one locality, but to a greater or less extent prevails over all the poorer districts, some idea may be formed of its extent. The parties, it is said, are, for the most part, in utter wretchedness, and some of them lying on bare straw. A committee was appointed by the meeting to receive subscriptions for their relief.

Zetland.—It is stated in *John O'Groat's Journal* that another shoal of whales has been captured in Sandwick, numbering nearly 450, and producing to the parties concerned upwards of 1400*l*.

LABOR.

POLICE.—**MANSION-HOUSE.**—*Capt. William Tune*, commander of the steam-boat *City of Boulogne*, the property of the New Commercial Company, appeared to answer the complaint of the directors of that company, under circumstances of a very serious nature. Mr. Clarkson said, it was with great regret the directors found it necessary to bring forward a charge against Capt. Tune, who had been for several years in their employment, and had uniformly conducted himself in the most irreproachable manner. The facts of the case, as far as the inquiry had hitherto gone, were these:—On the 5th inst. there was delivered to Capt. Tune, at Boulogne, six packages, each containing gold, checks on bankers, bank notes, and bills of exchange, which had been previously booked at the company's office in Boulogne, and paid for according to the rates agreed upon by the company. The Captain admitted that five of these packages were contained in a bag, and the sixth package, together with the bag which contained the others, was delivered into his hands by the clerk to the agent just previously to the starting of the vessel for England. He further stated that, after the vessel had got under weigh, he went down into his own cabin, and shut himself in from observation, and there he opened the bag and counted out the five parcels, which, with the one delivered to him alone, made up the six, and the whole corresponded with the ship's memorandum; that he then put the whole six into a drawer underneath his bed, and went upon deck, having first taken the precaution to lock the cabin-door, and put the key in his pocket; that he remained on deck until the vessel reached the Margate Roads, where the anchor was dropped until the day broke. That after the anchor was dropped he retired to his cabin and went to bed, but did not lock himself in; and after lying about two hours he was called by the second mate, got up, locked the cabin, and went on deck, weighed anchor, and proceeded to London. The Captain's statement further represented that on the ship's arrival at the wharf, and after a portion of the passengers had landed, he went down with the London agent into the cabin to get the packages, but on going to the drawer in which he had deposited them, he found only one of them there. It was due to Capt. Tune to say that he gave an immediate alarm, and caused the vessel and the passengers to be searched, and everything else to be done, which, under such circumstances, would suggest itself to a responsible person wholly unconscious of any knowledge of the disappearance of the property. In vain were the passengers then remaining on deck and their luggage searched; the other passengers who had proceeded to the Custom-house with their luggage were also subjected to examination, but no trace of the missing packages could be found. Police-officers were also called in, and they, with the Custom-

house officers, made an examination of the vessel, but without success. A short time afterwards a third officer belonging to the Customs commenced a minute search of the fore cabin, and on a ledge in a berth adjoining the Captain's cabin, he found one of the missing packages, and as the place in which it was found adjoined an opening between the outside of the vessel and the inside flooring, through which a parcel might have dropped between the timbers, the flooring of the vessel was stripped off, and a close examination was made, but nothing further was found, except a note addressed to the Captain by the agent at Boulogne, on some business relating to the vessel. It was proper to add that the berth just alluded to was not used by any person, and the Captain laid upon the bed in it his blue lights, rockets, and compass, ready for use in case of necessity. These were the remarkable circumstances which he had to detail. Two conjectures at present might be formed to solve the apparent mysterious disappearance of the four missing packages: the one, that if they were delivered on board at all they were taken back again, and that, consequently, there must have been a conspiracy between those who delivered the money, and the party to whom it was delivered. The other assumed that the money was on board, but through the connivance of some of the crew with other persons, passengers on board, it was taken out of the Captain's cabin and disposed of before the passengers who had left the vessel reached the Custom-house. The counsel here remarked upon the singular fact that upon the last examination of the vessel one of the bags, or packages, containing a portion of the large property deposited in the care of the Captain, was found in a place close to the Captain's own cabin, and not before that examination. He likewise submitted the extreme improbability that any person could have entered the cabin without his knowledge while he was resting, and abstracted from drawers, which it was difficult to open at any time, the property confided to his care. It was needless, he said, to state that suspicion pointed very strongly to the Capt., who admitted that he received the six packages, that he counted them in his cabin, that he deposited them in the drawer, that he locked the door of his cabin; that no person, to his knowledge, had access to the cabin while he was on deck, for he found it locked when he went to bed, and he locked it on leaving his bed, after having been called by the mate, and all the circumstances seemed to forbid the supposition that any person entered the cabin while he was asleep. The steward and cook of the vessel, and some of the passengers, would on a future day be in attendance, and prove that the robbery could not have been effected by strangers, without exciting the attention of some parties in the fore cabin. Mr. Wire then requested that Capt. Tune should be remanded for a week, and stated, that the directors being anxious that he should receive as much accommodation as might be consistent with the respectability of his character, and the nature of the difficulty in which he was at present involved, were desirous that bail should be taken for his appearance on the next day of investigation. Alderman Gibbs then required two respectable securities for 500*l*. each, and Capt. Tune to be bound himself in the sum of 1000*l*. The Captain was then remanded for a week. A curious fact came out in the inquiry as to the value of each package. They were all, it appeared, entered and paid for as containing a sum of money much inferior to what each package really contained. The Captain and the whole of the crew, including stewards and waiters, have been discharged, and replaced by others.

QUEEN SQUARE.—*Alfred Wager*, a gardener's labourer, was placed at the bar on Monday, charged with having stolen a number of valuable plants from the nursery-grounds of Messrs. Buck, Keppell-street, Chelsea, and also with having robbed a poor hard-working man of his week's wages. Mr. Buck, jun., stated that the prisoner had formerly been in their employ, but was discharged a long time ago. He had several times of late made a visit to their nursery, and purchased a plant or so at a time, his object clearly being on these occasions to observe where the most valuable collection of flowers was kept, and to become familiar with a large dog that was loosed in the grounds at night. From time to time pots were missed from the greenhouse, and on Friday night last a large number of plants, which, from their particular value, the firm would not have parted with, were stolen. On inquiries, it was ascertained that the prisoner had been frequently seen at night carrying pots of flowers, and as witness had no doubt that the accused was the perpetrator of the robberies, he went to his lodgings in Lower Sumners street, Chelsea, where he found a *Trevirana coccinea*, which had been taken from his nursery. Search was made for the prisoner, and on Sunday evening he was apprehended. Mr. Burrell asked the prosecutor if he could swear positively to the plant produced. Mr. Buck replied most positively; with the same certainty as any mechanic could to any article he had manufactured. Inspector Taylor wished for time in this case, in order, if possible, to find the remainder or some other portion of the stolen property. Mr. Burrell said he would give time, but wished to hear the other charge against the prisoner. James Knight, a bricklayer, said that he slept in the same room as the prisoner and the son of his landlord. On putting on his clothes on Sunday morning, he discovered that his week's earnings, which he had received from his master on Saturday night, and which amounted to 1*l*. 2*s*, had been stolen. Prisoner had got up early that morning and gone out, and, on his return, was given into custody on both charges. Inspector Taylor said that the prisoner had purchased the shirt, waistcoat, and handkerchief which he now wore after the money had been stolen on the Sunday morning, and was found with seven shillings in his possession. Prisoner in defence declared that he bought the plant identified by Mr. Buck of some man whom he did not know, in the street, and asserted that he had never touched the poor man's money. He was remanded until Saturday.

SPORTING.

DONCASTER RACES, MONDAY.—The racing commenced, rather inauspiciously, with a match, in which Blue Bonnet, the winner of the St. Leger last year, showed temper before she had run a quarter of a mile, and got rid of her jockey; her opponent Mania was thus left to canter over, and will thus appear amongst the starters for the St. Leger. The following are the details:—

Match, 300*l*, hf.-ft. St. Leger course. Mr. Payne's *f. Mania*, 3 yrs, 7st 4lbs, beat Lord Eglington's *Blue Bonnet*, 4 yrs. 8st 9lbs. *Her Majesty's Plate* of 100 guineas, for three yrs, 7st 9lbs.; four yrs, 9st; five yrs, 9st 9lbs.; six yrs and aged, 10st. Four miles. Mr. D. Cook's *Trueboy*, 3 yrs, beat Mr. Cuthbert's *Queen of Tyne*, 4 yrs; Lord Exeter's *Wee Pet*, 3 yrs; Mr. Isaac Day's *Portrait*, 5 yrs, and Mr. Hornby's *Champagne*, 6 yrs.

The Champagne Stakes of 50 sovs. each, hf.-ft., for 2-yr-old colts, 8st 7lbs, fillies, 8st 5lbs. The second saved his stake. Red House in. (32 subs.) Mr. Williamson's *The Cure* beat Mr. Osbaldston's *Sis*, to Martingale; Mr. Irwin's *Foig-a-Ballagh*, and seven others who were not placed.

A Plate of 50*l*. for horses, &c., that never won Plate or Sweepstakes; three-yrs-old, 7st 7lbs; four, 8st 5lbs; five and aged, 9st. Heats, St. Leger Course. Lord Exeter's *Revocation*, 4 yrs, beat in both heats, Mr. Mostyn's *Lytham*, 4 yrs, and Mr. St. Paul's *Cheviot*, 3 yrs.

TUESDAY.—*Two year-old Produce Stakes* of 100 sovs. each, hf.-ft., for colts 8st 7lbs; fillies, 8st 5lbs. 2 subs. No race.

Cleveland Handicap, of 20 sovs. each, 10 ft., but 5 only if declared, with 60*l*. added; the second saves his stake. One mile. 13 subs., 5 declared.—Lord Chesterfield's *Knight of the Whistle*, 5 yrs, 8st 12lbs, beat Lord Eglington's *Blue Bonnet*, 4 yrs, 7st 7lbs; Mr. Meiklam's *Philip*, 3 yrs, 6st 9lbs; Mr. Skelton's *Pimley*, 3 yrs, 6st, and Mr. Walker's *Ravensworth*, 3 yrs, 5st 10lbs.

Great St. Leger Stakes, of 50 sovs. each, hf.-ft., for three year-old colts, 8st 7lbs; fillies, 8st 2lbs; the second to receive 200*l*. out of the stake, and the third to save his stake; the winner to pay 30*l*. to the judge. St. Leger Course. (127 subs.)—Mr. S. Wrathe's *Nutwith*, by Tomboy (J. Marson), beat Mr. Bowes's *Cotherstone*, by Touchstone (F. Butler); Lord Chesterfield's *Prizefighter*, by

Gladiator (Holmes); Lord Exeter's c by Beiram, out of Lucetta; Lord Eglington's Aristides, by Bay Middleton; Mr. Payne's Mania, by Muley Moloch; Mr. D. Cooke's Trueboy, by Tomboy; Mr. Bell's Reviewer, by Romulus; and Major Yarbrough's Dumpling, by Muley Moloch. At the third attempt a very good start was accomplished, Prizefighter quitting the crowd in a few strides, and taking up the running at a steady pace, Reviewer following in his wake, Nutwith third, Cotherstone, Lucetta, and Trueboy next, and the others in good places. The speed increased up the hill, and with it Prizefighter's lead, but the order of running continued almost as it commenced to the mile post, where the Lucetta colt was observed to move up, his position in the race on passing the T.Y.C. being next to Reviewer; this horse, however, was already in difficulty, and before he reached the turn had fallen back to the rack; Lucetta colt tired immediately after, and ere he was round was passed by every horse in the race. Up to this time Prizefighter had a strong lead, but it now gradually diminished, and at the bend Nutwith, Cotherstone, Trueboy, and Aristides were lying close up. This lot ran in a body to the distance, where a slight lead was taken by Cotherstone, Nutwith following him, Prizefighter next outside of the latter, Trueboy and Aristides at their quarters. At this point Aristides made an attempt for the lead, and fairly reached the leading horses, but died away in two or three strides, and left the three to finish the race. At the stand Cotherstone's lead was still in advance of Nutwith, Prizefighter lying at the latter's quarters, and in this way the race continued till within a dozen yards of the chair, when Marson made an effort, and landed his horse first by a head, Cotherstone beating Prizefighter for the second prize by a neck. So fine a race with three had never been seen at Doncaster. Trueboy ran in a capital place throughout, and finished at Prizefighter's quarters. Mania was a bad fifth, and Aristides sixth; the others were tailed off. The race was timed at 3 minutes and 20 seconds. Value of the stakes, subject to the usual deductions, 3,100l.

The Selling Stakes, of 10 sovs. each, with 60 added. The winner to be sold for 200l. if demanded. St. Leger Course. (3 subs.)—Mr. Gully's The Era, 3 yrs, 6st 12lbs, beat Mr. Dawson's The Biddy, 4 yrs, 8st, and Mr. Osbaldeston's Martingale, 3 yrs, 6st 12lbs. The Corporation Plate of 60l. Heats, two miles.—Sir C.
