THE Government proceedings against Mr. O'Connell and the other leaders of the Repeal agitation have been met by informations for perjury against Mr. Hughes, the Government reporter, upon whose depositions the parties to be prosecuted were called upon to give bail. It appears that Mr. Hughes has sworn that Mr. Barrett took an active part in a certain meeting, at which, from the testimony of thirteen witnesses, it was impossible that he could have been present. Mr. Hughes has also sworn that Mr. Steele, in a speech at the Repeal Association, made use of a quotation which, according to Mr. O'Connell, was inserted after the meeting was over in a report of the speech, drawn up by Mr. Steele himself for a Dublin paper. The case of Mr. Barrett has been brought before the magistrates at two sittings, but they have decided that it is not within their jurisdiction and refused to receive the informations. It was then expected that bills of indictment would have been sent before the Grand Jury at the Commission which opened on Tuesday, but no proceedings were taken in the matter and it is supposed that the indictment has been abandoned. At the meeting of the Repeal Association on Monday in the New Conciliation Hall, Mr. O'Connell explained his views relating to a federal Parliament and stated that he had been misunderstood. He declared that he would refuse no man's assistance, but he would not give up his agitation for Repeal. There would be no rebellion or collision, but Repeal was certain if the people continued peaceable, and nothing short of an Irish Parliament could satisfy them or afford a remedy for the grievances of the country.—The Special Commission in South Wales, appointed to try the Rebecca rioters, was opened on Thursday with a speech from Baron Gurney on the law as applicable to the late events, which will be found in another part of our Paper. We must also refer to another column for an account of the Queen's visit to the University of Cambridge, and of the loyal welcome with which her Majesty and Prince Albert were received in that celebrated seat of learning.

The Overland Mail has arrived this week with news from India to the end of August and from China to the 26th June. The intelligence now received has in a great measure been anticipated by that brought by the Hindostan. The ratification of the Chinese treaty was not known at Bombay at the departure of the mail, so that we were already in possession of much later news than that thus received. The accounts from India contain no important facts beyond the announcement that India is peaceful throughout, and that the late sickness among the troops in Scinde has subsided.—The Spanish Cortes were opened by Commission on the 15th. The proceedings passed off without any kind of disturbance, and it was expected that the Chambers would be definitively constituted in the course of the ensuing week.—From Italy we learn that the disturbances in the Papal States have broken out with renewed violence. The populace have again had a collision with the troops in the streets of Bologna, and it is rumoured that Count Radetsky, the Austrian Commander, has crossed the frontier at the head of 1000 men, to aid the Papal Government in suppressing the insurrection.

Home News.

COURT.—Her Majesty and Prince Albert, attended by the Countess of Mount Edgcombe as Lady in Waiting, the Hon. Miss Stanley as Maid of Honour, the Lord Chamberlain, the Hon. Colonel Grey and Col. Bouverie, Equerries in Waiting, and Mr. G. E. Anson, Treasurer to

the Prince, left Windsor Castle on Wednesday on a visit to the University of Cambridge, from whence they are expected to return this day. On Saturday the Queen and Prince Albert took their accustomed early walk in the forenoon. The Prince afterwards went shooting in the Royal preserves, accompanied by the Prince of Hohenlohe Langenbourg. On Sunday her Majesty and Prince Albert, the Prince and Princess of Hohenlohe Langenbourg, attended Divine service in the Royal Lodge Chapel in the Great Park. On Monday morning her Majesty and Prince Albert, accompanied by the Prince and Princess of Hohenlohe, walked out for some time in the Royal pleasure-grounds. Prince Albert afterwards went out shooting in the Royal preserves, accompanied by the Prince of Hohenlohe. In the afternoon her Majesty and the Princess Hohenlohe rode out in the Park in a pony carriage, Prince Albert and the Prince of Hohenlohe with the suite following on horseback. On Tuesday morning the Queen and Prince took their usual morning walk, and in the afternoon the Queen and the visitors then staying at the Castle took a drive in the Park. The Prince of Wales and the Princesses have also taken their accustomed airings during the week. The following personages have been staying at the Castle on a visit to the Queen:—The Earl and Countess of Erroll, Lord and Lady Lyttelton, the Earl and Countess of Orkney, the Earl and Countess of Rosslyn, Viscount and Viscountess Palmerston, Lady Grenville, Lord Granville Somerset, Lord Adolphus Fitzclarence, the Hon. Mr. Charles Gray, Sir H. Wheatley, and Captain F. Seymour.—The Duchess of Kent with the Prince and Princess of Hohenlohe left Windsor on Thursday for Witley Court, on a visit to the Queen Dowager. The Duchess of Gloucester returned to town from Witley Court on Tuesday.—The Duke of Cambridge left Rumpenhelm on the 18th, and travelled by way of Frankfurt, Mayence, Aix-la-Chapelle, and Brussels, to Ostend, where his Royal Highness arrived on Saturday, and passed the night, embarking the following morning for Dover. His Royal Highness slept at the Ship Hotel on Sunday night, and arrived in town on Monday in excellent health.

The Queen's Visit to Cambridge.—Her Majesty and Prince Albert left Windsor Castle about half-past seven on Wednesday morning, on a visit to the University of Cambridge. The Royal party and their suite arrived at the Paddington station of the Great Western Railway at half-past eight, and proceeded through the Regent's Park and Camden-town, to the Manor House, Seven Sisters-road, where the first change of horses was made. A large concourse of persons were assembled in the balcony of the Manor House, and on the sides of the road. The Royal party on leaving the Manor House proceeded down the Seven Sisters-road to Tottenham, two of the horse-patrol being in advance to clear the road. In the town of Tottenham flags and banners were flying, and at Tottenham-Cross a large quantity of evergreens were hung, and a triumphal arch, formed in festoons of laurel and other evergreens, was placed across the road. There were several private carriages on the sides of the road, and crowds of persons on the footpaths, by whom the Queen was repeatedly cheered. Over the Angel-bridge, Edmonton, flags were displayed, and the bridge was covered with evergreens. The Royal party reached the New Inn, Waltham Cross, about ten o'clock, where another change of horses took place. In front of the New Inn was the Royal standard, and an arch formed of laurel and other evergreens, sufficiently large to cover the Royal carriage, which remained under it while the horses were changed. On leaving the New Inn, the postboys were directed on passing "Waltham Cross," to go slowly, in order that her Majesty might have a view of that monument, erected to the memory of Queen Eleanor, but owing to this not being placed in an open and exposed spot, the carriage was taken on some distance before it was seen. The postboys twice attempted to turn back, but were impeded by the great body of persons collected, when the *cortège* proceeded on its journey. The Cross was decorated with the Royal Standard and a variety of evergreens. There were other displays of loyalty in the town, and at the turnpike which divides the counties of Hertford and Middlesex were two Royal Standards, and a great number of persons, who expressed their loyalty by loud cheers. At Royston the Queen was met by the Lord-Lieutenant of Cambridgeshire (the Earl of Hardwicke) and the High Sheriff (Mr. Greene, of Hinxton-Hall), together with the regiment of the Whittlesa Yeomanry Cavalry, under the command of Capt. Smith, and a numerous body of the gentry and yeomen of the county, to the number of upwards of 1000. At a few minutes before two o'clock, punctually according to announcement, her Majesty's approach was heralded by the firing of small pieces of artillery and the pealing of the church-bells of Cambridge, which rang out merrily together. At the gate of Brooklands, the seat of Mr. Foster, which stands at the end of the Senior Wrangler's Walk, about half a mile from the entrance of the town, a triumphal arch first met her Majesty's view, to announce that she was approaching the town. Above the arch, which was interwoven with evergreens, the word "Welcome" appeared, in letters composed of white and red roses, surmounted by an Imperial Crown. The road from Trumpington to Brooklands, and from thence to the Conduit Head, was crowded with thousands on either side, and immense numbers followed in the main road on horseback, and in all sorts of vehicles. At the Conduit Head, at the entrance of Trumpington-street, an arch interwoven with laurels, with the name of Victoria in front, surmounted by the crown, met the Royal view. Here the corporation of the borough, headed by the Mayor, received her Majesty with the usual ceremonies. The procession then advanced by Trumpington and Tri-

nity streets to Trinity College. On their arrival the gates were thrown open, the Whittlesa Yeomanry filed off, the corporation fell back, and her Majesty and the Prince proceeded to the Lodge amidst the loud hurrahs of the gowmsmen. When the carriage reached the Lodge her Majesty and the Prince were received by the Vice-Chancellor and the various college dignitaries, and conducted to the Royal apartments. After partaking of refreshment, her Majesty entered the hall of Trinity College. All the forms and tables had been removed, and just where the portrait of Newton is placed, an elevated platform covered with crimson cloth was erected. Under a canopy was placed a single chair for her Majesty, in which, however, the Queen did not sit down. Her Majesty entered the hall from the south-east door, leading from the Master's residence, the floor leading to the throne being covered with crimson cloth. Immediately after her Majesty followed Prince Albert, the Marquess of Exeter, Earl Delawarr, the Chancellor of the Exchequer, Lady Mount Edgcombe, &c. Her Majesty was attired in a pink drawn bonnet and India shawl with a deep gold fringe, and purple satin dress. Prince Albert was dressed in black, with a star on the left breast. The Marquess of Exeter and Earl Delawarr had on the gowns of Doctors of Civil Law. The gallery at the south end was filled with ladies. As soon as her Majesty had entered, the hall doors were thrown open, and the members of the University entered in their order of precedence. The Vice-Chancellor and the Registrar occupying the centre, the Heads of Houses and Doctors formed a circle at some distance from her Majesty, and the Vice-Chancellor immediately commenced reading the address, which being concluded, he advanced to the foot of the throne, and kneeling, handed it to her Majesty. The address to Prince Albert was then presented in the same manner. The Lord Steward, the Bishop of Ely, the heads of houses, and other dignitaries, were then successively presented to her Majesty by the Registrar, and this ceremony ended, the immense mass of gowmsmen began to move outwards. Her Majesty, taking the arm of the Prince, retired and entered her carriage to proceed to King's College Chapel. Her Majesty entered the College by the grand gate, and proceeding across the first court, the Royal carriage drew up at the west entrance, where her Majesty and the Prince were received by the Provost, who with the Esquire Bedells preceded the Royal party up the ante-chapel through a midway passage, railed off for the occasion and covered with crimson cloth. Passing through the screen, her Majesty was conducted to the east end, near the altar, in front of which was erected a dais with a canopy over Queen Elizabeth's chair. The organ now sent forth its pealing notes, and the service commenced. Her Majesty and the Prince seemed greatly pleased with the chaunting of the choir, and on entering and leaving the chapel expressed their admiration of this beautiful structure. The Royal party went back to Trinity, and after a short space visited the College Chapel. An incident occurred on this occasion which is said to have given the Queen much pleasure. It happened at the moment of her Majesty setting forth on foot for the chapel, that there was some deficiency of crimson cloth for her to walk upon. In an instant some of the undergraduates pulled off their gowns and threw them down before her Majesty; the example was quickly followed by others; the way was thickly strewn with gowns of every academic rank, over which her Majesty, smiling most graciously, made her way. Having some little difficulty here and there to pick her steps, in consequence of the abundant hand with which the gowns were flung together, on her passage back the affair was better arranged, the gowns being spread along the way with some regard to neatness and order. The chapel was lighted with wax tapers, carried by undergraduates, the effect of which was extremely good. Whilst the Queen, previously to dinner, took a short rest from the fatigues of the day, his Royal Highness signified his desire to the Master of seeing the library of the College. In a few minutes, his Royal Highness was conducted thither, through a long row of undergraduates, with flambeaux in their hands. His Royal Highness expressed himself much pleased with the library, and examined minutely some of the manuscripts, especially those of Milton. In looking over a Saxon MS., which the Master said was supposed to have been written so far back as the eighth century, his Royal Highness remarked that, in his opinion, the characters were not of that age. The Royal dinner party took place in King Henry the Eighth's drawing-room, at eight o'clock. After dinner her Majesty held a levee, which was attended by the heads of houses, and other principal members of the University. The company assembled in the first instance in the hall, where their names were called in the order of their precedence—the heads of houses first, the doctors, fellows being masters of arts, and all the fellows of Trinity. In this order they walked up to her Majesty's drawing-room, entering at one side, and going out at the other. The illuminations which took place at night reflected very great credit on the town and University—Trinity, King's, and St. John's were especially beautiful. The fireworks, which were exhibited on Parker's Piece, were also of the highest order of merit and gave general satisfaction. The grand feature of this royal visit was the ceremony of conferring the honorary degree of Doctor of Civil Law upon Prince Albert, which took place in the Senate-house on Thursday morning. The preparations in the Senate-house were of the most superb description. Her Majesty was received at the entrance by the Vice-Chancellor, the Lord Steward, and a number of the higher authorities of the University, and walked up the centre of the building arm in arm with the Prince, bowing to all, and smiling with evidently heartfelt pleasure at the very splendid and

spirit-stirring scene which met her view. At the dais the Queen and Prince stood for about a minute and a half, bowing and curtsying in acknowledgment of the vociferous cheering, which was continued with unabated vigour till the Queen and Prince Albert sat down. Even then an attempt to get up a new cheer for the "Prince of Wales" was made, but was immediately suppressed by the proctors. The ceremony of conferring a Doctor's degree on Prince Albert, and robing his Royal Highness in the scarlet gown, then took place. After this had been gone through, the public orator (Mr. Crick, of St. John's College), delivered a Latin oration, addressed especially to her Majesty and the Prince, thanking them, in the name of the University, for the special favour they conferred upon it by their gracious visit, and congratulating the learned body on the auspicious occasion. The oration also dwelt upon the historical recollections of former royal visits to the University, and pointed out the benefits which would accrue from the present one to religion and learning. The oration took half-an-hour in its delivery, during which time his Royal Highness stood almost in front of the Queen, and the public orator in front of his Royal Highness, but below the platform. His Royal Highness bowed frequently, and now and then really blushed at the very eloquent compliments paid him by the speaker. The Senior Bedel then took his Royal Highness by the right hand and conducted him to the Vice-Chancellor, who administered to him the oaths of allegiance and supremacy. The Vice-Chancellor at the conclusion of these bowed to her Majesty; then, taking his Royal Highness' hand, he administered the oath (in Latin) to obey and defend the laws of the University; after which the Vice-Chancellor, addressing his Royal Highness in the usual Latin form, admitted him to the honorary degree of Doctor of Civil Law. His Royal Highness then descended the steps of the dais, and was invested with the scarlet robe of a D.C.L., and took the velvet cap in his hand. A loud burst of cheering, accompanied with waving of caps, went through the hall as his Royal Highness, thus equipped, walked back to his seat beside her Majesty. Amidst the cheering were heard some cries of "Doctor Albert." After this, the business of the day was prolonged by the ceremony of admitting the Rev. R. Phelps to the degree of doctor in divinity, the Regius Professor of Divinity (Dr. Oliphant) officiating in the Vice-Chancellor's seat. This ceremony was rather a tedious one, and the Queen once or twice spoke to Lord Delawarr, apparently inquiring of him an explanation of what was going forward, with which she appeared satisfied and smiled graciously. But she was observed to yawn more than once before the ceremony was concluded. This being at length finished, the Vice-Chancellor dissolved the convocation. The Queen and Prince Albert, attended as before, then moved off to their carriage amidst enthusiastic cheering. Her Majesty wore a rich puce-coloured silk dress, with an amber-coloured china crape shawl with flowered border. The bonnet was a lilac silk covered with Brussels lace. Prince Albert wore a field-marshal's uniform, with the riband and star of the Garter. After leaving the Senate-house, her Majesty and the Prince, attended by their suite, the Vice-Chancellor, and some of the heads of houses, visited the Geological Museum, Professor Sedgwick explaining to her Majesty and the Prince the nature of most of the specimens. The Queen afterwards walked through the public library, and inspected the Fitzwilliam collection, on leaving which her Majesty entered the royal carriage, the path from the library to the gate opposite St. Mary's Church being strewn with gowns gallantly laid down by the undergraduates. The royal party next visited King's College chapel, and thence proceeded to St. John's College, visiting the library, chapel, hall, and master's lodge, where her Majesty partook of refreshment, and then returned to Trinity, visiting the library, and afterwards returning to the lodge. At half-past 1 o'clock Prince Albert, escorted by the Vice-Chancellor, &c., visited Christ's College, and was received at the gates by the Rev. Dr. Graham, Master of the college, the Tutors of the college, the Rev. J. Hilyard (senior Proctor), and the Rev. J. Cartmell. Scarlet cloth was laid down from the gate to the screens, whence his Royal Highness proceeded between a double file of members of the college to the gardens, and the party halting before the celebrated Mulberry-tree planted by Milton, who was a member of this college, the Rev. Master addressed his Royal Highness in a short but appropriate speech. His Royal Highness having afterwards inspected the college-hall and chapel, again entered the carriage amidst enthusiastic cheers, and having visited Sidney Sussex College in like manner, he proceeded to join her Majesty at Trinity. At half-past two her Majesty accompanied by Prince Albert, who wore his Doctor's gown and cap, proceeded in an open carriage, their suite following in two close carriages to visit Catherine Hall, where an immense mass of people had assembled. An accident, however, occurred at this point which might have been attended with serious consequences. A scaffold erected along the front of the college, which was crowded with people, gave way, and they were all precipitated into the street amidst tremendous shrieking. Fortunately no injury was sustained beyond a few bruises and broken bonnets. The royal party on quitting Catherine Hall visited the Pitt Library, proceeding thence to Queen's College, and afterwards visited several other colleges, at all of which they were received with the warmest demonstrations of loyalty. The royal party returned to Trinity College at a little before four o'clock, and at half-past four set out, escorted by a guard of honour of the Scots Greys, for Wimpole, the seat of the Earl of Hardwicke. The procession went along the streets at a walking pace, and the Queen and

Prince Albert bowed most graciously in acknowledgment of the cheering which attended them the whole length of the way. At a distance of about two miles from Wimpole, and about eight from Cambridge, a new road diverges from the main road up to the mansion. At the entrance gate of this road the Earl of Hardwicke was stationed to receive her Majesty, and the Royal carriages, attended by their escort, passed off through the gate and up to the mansion itself. According to the last accounts, her Majesty leaves Wimpole this morning on her return to town, but the hour of departure is not yet named. Her Majesty will not come round by Cambridge again, but travel by the direct route from Wimpole to Royston, avoiding altogether Melbourn, the place where she changed horses on her way down. From Wimpole to Royston her Majesty will be escorted by the Yeomanry, but at the latter place their office ends, and an escort of the Scotch Greys will attend her Majesty towards Buntingford.

The Duke de Bordeaux.—On Saturday, the 14th inst., his Royal Highness honoured Sir T. D. Lauder with his company at Grange House. On Monday, the Prince with his suite visited Leith, and inspected all that was worth seeing in that town. Thence he went to Newhaven and Granton-pier, and on his return to his hotel visited the Botanic and Horticultural Gardens on the grounds of Inverleith, with all which he seemed highly delighted. On Tuesday, his Royal Highness, with his suite, and attended by the Lord Provost and Bailie Richardson, inspected Heriot's Hospital, and entered his name in the visitors' book—"Henri de France." On Wednesday, his Royal Highness left Edinburgh for Winton Castle, the seat of Lord Ruthven, where he lunched, and dined afterwards with the family of the Earl of Wemyss at Gosford-house. On Thursday, the Duke visited Mr. Mitchell Innes, at Phantassie, and honoured Sir John Hope, of Pinkie-house, and Sir David Wedderburn, of Rosebank, with a visit on his return on Friday to the Royal Hotel, Edinburgh. On Saturday, his Royal Highness left Edinburgh for Fordel-house, the seat of Admiral Sir Philip Durham, near Inverkeithing, and returned to Edinburgh in the evening. On Sunday, the Prince attended divine service at the Catholic chapel in Broughton-street. It is said that his Royal Highness intends sojourning in this country longer than was at first contemplated, and that a mansion is about to be furnished at Edinburgh for the residence of his Royal Highness and suite.

The Grand Duke Michael.—His Imperial Highness and suite remained at Buchanan Castle, on a visit to the Duke and Duchess of Montrose, until Wednesday morning, when he proceeded to Edinburgh, and remained several hours there to inspect the different public buildings of that city. His Imperial Highness then proceeded to York, and arrived at Chatsworth, the seat of the Duke of Devonshire, on Thursday night. The Grand Duke on his arrival was received at the grand hall by the Duke of Devonshire, Baron Brunow, Earl and Countess of Granville, and, after remaining a short time with the noble host, His Imperial Highness and his suite retired for the night, being somewhat fatigued with the journey from Edinburgh. On Friday, about noon, the Grand Duke and suite, with the Duke of Devonshire and several guests of his Grace, proceeded to enjoy a promenade in the pleasure-grounds attached to the mansion. His Imperial Highness then viewed the sculpture gallery and the principal apartments of the house, and went to see the fountain recently added to the hydraulic works, and the immense rookery now in progress, and from thence to the grand conservatory. The party then returned to the house to partake of luncheon. They afterwards visited the kitchen-gardens, and remained in them until nearly four o'clock. The Grand Duke, with the Duke of Devonshire and his guests, then proceeded to Edensor. On leaving that place they drove to Blakewell, to see Haddon Hall, the ancient seat of the Manners family, belonging to the Duke of Rutland, but the evening was so far advancing that the Grand Duke was unable to go over that interesting building. They returned to Chatsworth at six o'clock. On Saturday His Imperial Highness, accompanied by the Duke of Devonshire, visited Hardwick Hall, the noble Duke's seat, about seven miles from Chesterfield, where Mary Queen of Scots passed a considerable portion of her captivity. His Imperial Highness and suite took luncheon there previous to their departing by the railroad to Drayton Manor. Shortly before three the Grand Duke arrived at the Chesterfield station, accompanied by the Duke of Devonshire, from Hardwick, and immediately left by the train for Derby. The Duke of Devonshire saw his illustrious visitor to the railway-carriage, and there took leave of his Imperial Highness. The Grand Duke and suite arrived at Tamworth about half-past five. On reaching the station, Sir R. Peel was in waiting, and the Grand Duke immediately entered the Right Hon. Baronet's carriage, and proceeded direct to Drayton Manor. On Sunday morning his Imperial Highness accompanied Sir Robert and Lady Peel to Tamworth, to attend divine service at the ancient church of that town. His Imperial Highness and the visitors at the Manor were confined within doors all the afternoon, in consequence of the exceedingly unfavourable weather that prevailed. On Monday morning his Imperial Highness with his suite left Drayton Manor for Birmingham. After making a brief stay at that town, the Grand Duke and party proceeded by railway to the Droitwich station, from whence his Imperial Highness went to Witley Court to lunch with her Majesty the Queen Dowager. On leaving Witley Court, his Imperial Highness visited Dyctchley, the seat of Viscount Dillon, where he slept. On Tuesday morning Lord Redesdale's hounds met at Dyctchley, the Grand Duke having expressed a wish to partake of that thoroughly English sport, fox-hunting. A numerous field assembled,

and the hounds having drawn a cover near the house, soon found a fox. His Imperial Highness seemed much delighted, and rode well up to the hounds. After a sharp run of 35 minutes, the fox took to a drain, where all attempts to dislodge him were fruitless. One of his Imperial Highness's suite dislocated his shoulder while taking a stiff fence, but medical attendance was speedily procured. At two P.M., his Imperial Highness sat down to luncheon, where he was met by the principal gentry in the vicinity, and at four started for Wilton House, near Salisbury, on a visit to the Countess of Pembroke. The Grand Duke left Wilton on Thursday afternoon, and returned direct to London.

Parliamentary Movements.—A vacancy has occurred in the representation of Salisbury by the death of Mr. Wadham Wyndham, the Conservative member for that city, which has just taken place.—The Hon. Mr. Bouverie, who had come forward as a candidate for the representation of Kendal, has retired, and has been succeeded by Mr. Warburton, late Member for Bridport. Mr. Bentinck, of Remington Lynn, in Norfolk, son of the late Admiral Bentinck, has come forward as a candidate in the Conservative interest.

The Army.—It is stated that an augmentation of the cavalry regiments has just been decided on by Government. Eight men are to be added to the present strength of each troop. This measure is to be carried into effect with the least possible delay.

Foreign.

FRANCE.—There is little news of general interest in the Paris papers, which are occupied chiefly with matters of domestic interest. Cardinal Boral, Archbishop of Lyons, has published a letter on the quarrel between the Church and the University. He declares his determination to respect the University and be contented with lay teachers, but he declares that whenever a professor shall teach pantheism or infidelity, he will call him to order, and appeal at once to the Minister and the public.—The King, accompanied by the Duke de Nemours and the Prince de Joinville, reviewed on Sunday, in the Place du Carrousel, six regiments of infantry, two of cavalry, and two batteries of artillery. His Majesty rode through the ranks, and looked in excellent health. The *Commerce* states, that it would appear from a reply made lately to a contractor by the Minister of Marine, that his Majesty proposes next year to return the visit of her Majesty the Queen of England. The reply was—"We cannot undertake the works you wish to contract for, as in that case we should not have funds to arm the royal yacht which is to transport his Majesty to England next year." Other papers and letters mention a report that the visit will take place even sooner.—The Legitimist prints press for a settlement of the Spanish quarrel by a marriage of Don Carlos' son with Queen Isabella, the latter remaining Queen by her father's will, the former King by virtue of his father's abdication—both being equally Sovereigns, like Ferdinand and Isabella.—By a royal decree of the 22d inst., Admirals Mackau and Hugon, the Prince de Joinville, and several Naval Officers, have been nominated to inquire into the labours of the commission of inquiry into the situation of the five military harbours of France, in connexion with the construction, organisation, and armament of the steamers of the Royal Navy.—Several of the papers contain accounts of certain alleged differences which have taken place at Otabeite, between the Captain of the French ship of war *L'Allier*, and Mr. Pritchard, the missionary and English Consul in that island; but we have no authentic details from any other source. They also devote a large portion of their columns to reports of a trial on a grand scale which commenced on Monday at the Paris Court of Assizes. It is that of a renowned gang of thieves, called the "Bande du Faubourg Saint Germain," because they had long carried on their depredations in that aristocratic quarter of the capital, owing to the co-operation of a locksmith, who had secured the patronage of a number of the rich old nobility residing there. The thieves on their trial are 27 in number, and there are upwards of 60 separate charges against them.—The *National* has produced considerable sensation at Bordeaux, and other wine-growing or wine-manufacturing towns, by its exposure of the modes employed to falsify and fabricate wine. It states that Rouen is famous for this manufacture. A boat-load of spurious wine was the other day seized by the police, and the barrels emptied into the Seine, the contents having been found to be cider mixed with spirits of wine.—The papers state, that such is the penury in the funds of the charitable associations of the capital, that the 12 mayors of Paris have made the most pressing entreaties to the inhabitants of their various districts to assist the 70,000 unfortunate beings who are at this moment destitute of bread, clothing, and fire.—The Count de Montrond, who lived during many years in the intimacy of Prince Talleyrand, and was the confidant of many of his secrets, died on Wednesday at Paris in the 76th year of his age, after a long illness. Marshal Soult, Minister of War, returned to Paris on Wednesday. General Boyer, ex-President of Hayti, and his family, were to leave Paris for Italy in a few days.—The population of France, as shown by the census taken a short time ago, amounts to 34,494,875. The last census, in 1836, gave 33,540,910. The department of the Seine contains upwards of 1,500,000. It would appear that in less than a century and a half the population of France has been nearly doubled, but this augmentation has been very slow indeed as compared with what takes place in Great Britain, Prussia, Austria, and even Russia.

SPAIN.—We have accounts from Madrid to the 17th inst. The Cortes were opened on the 15th by commis-

sion with the most perfect order, the authorities having adopted measures for the preservation of tranquillity. The assembly was presided over by the President of the Senate, and was numerously attended by members of both houses, attired in their official costumes. The public galleries were crowded with spectators. Two French deputies, Messrs. Mauguin and Garnier Pages, occupied seats in the diplomatic tribune. The President of the Council read the decree of convocation, and having declared the session open, the house immediately afterwards broke up. Letters of the 17th state that the Chamber of Deputies was still engaged in preliminary arrangements; 128 Members were already at their posts, but 81 only had as yet been sworn in. The Ministry expected that the House would be definitively constituted in the course of the ensuing week. Señor Onís had been named President of the Senate, and the Duke de Rivas and Count Espeleter Vice-Presidents. Señor Carneiro had been appointed Minister at Lisbon instead of S. Aguilar. On the 12th her Majesty and her sister, the Infanta Louisa, attended for the first time a bull-fight, the proceeds of which were to go towards building a church in the suburbs of Madrid. For this purpose upwards of 12,000 persons of both sexes were present; the Queen is said to have taken great interest in the proceedings, which terminated in the deaths of eight bulls and a dozen horses. The performance lasted three hours, and produced 1,000*l.*—The town of Leon has pronounced, seized, and imprisoned its authorities, the regular troops and National Guard joining in the movement. The Opposition journals state that Palencia, Zamora, Oviedo, Gijon, and the town of Galicia, had pronounced in imitation of Leon. Valladolid was said to have proclaimed the Central Junta; and the troops sent from the capital against Leon were said to have revolted at Rio Seco. On the other hand, the Government declares that Astorga had declared against the Leon movement.—There are accounts from Saragossa to the morning of the 19th. Some families had been allowed by Gen. Concha to quit the town. They represent the battalion of Officers and the National Guard as determined on obstinate resistance. Gen. Concha had not yet opened his batteries. On the 16th no change had taken place in the situation of affairs at Barcelona; hostilities still continued, and the Junta had issued a decree calling on all men between 17 and 60 years of age to take arms, under the penalty of death. The patuleas had committed great excesses, and plundered several provision stores.

BELGIUM.—The Brussels papers contain the details of the ceremonies at Cologne on the five days, on the occasion of opening the railway from the Scheldt to the Rhine, which completes a line of communication between Vienna and Cologne. These details fill 11 columns of the *Moniteur*. The fêtes were favoured by fine weather, and the greatest cordiality and harmony prevailed between the Belgians and Germans present on this remarkable occasion, which promises to consolidate the good understanding between them, and to be of great advantage to both. On the evening of the first day a grand entertainment was given at Cologne, at which a great number of eminent persons of Belgium and Germany were present.

GERMANY.—The papers state that the Austrian Embassy at Turin has refused to sign the passport for the Marquess of Dalmatia, the son of Marshal Soult and French Ambassador at Turin, on the ground that the Emperor of Austria as King of Dalmatia could not possibly recognise the right of any individual to assume the title of Marquess of Dalmatia. It was further added that the Court of Vienna did not recognise any title which had its origin in the taking of any town or province belonging to the Austrian empire. The Marquess was therefore requested to assume some other title, and the Milan papers announce his arrival in that capital as Marquess Soult.—The Hungarian Diet is making progress in the task of obliging the nobles to pay their quota of taxation. On the 5th, it was decided that the nobles residing in towns should pay not only the land-tax of the *comitat*, but also the patent duty of the town. The attempt to establish a common and general house duty failed. The magnates have persisted in their edict to make the Croats learn and plead in the Magyar language.

RUSSIA.—The *Frankfort Journal* states that the report of a shot having been fired at the Emperor of Russia's carriage at Posen was a mere device of the Emperor to cause the expulsion of the Polish refugees from that Grand Duchy. The *Augsburg Gazette* of the 19th states, that according to all probability the Emperor of Russia will protest against the late revolution in Greece.

ITALY.—A letter from Bologna of the 15th inst. states that fresh disturbances had taken place in that city and its neighbourhood. In the evening of the 3d the populace came to blows with the carabinieri and Swiss in the streets of Borgo San Pietro and San Donato. Four soldiers and a workman were dangerously wounded. The Swiss having given way, a troop of dragoons was immediately sent to the assistance of the carabinieri, and soon restored order. On the 8th several military posts were attacked in the lower city. Similar outbreaks were said to have occurred in other parts of the province, and Cardinal Spinola was so much alarmed at the hostile dispositions evinced by the Bolognese that he applied for a leave of absence and quitted the city. On the 10th he was succeeded by Cardinal Vannicelli Casoni. Three physicians and several landowners of the districts traversed in August last by Muratori's band had been arrested. The prisons of Bologna contained seventy political offenders, and fifty more were detained at Pesaro until they could be safely removed to Fort San Leo. It was reported that in a recent congregation of Cardinals held at Rome, to consider the situation of the legations, Cardinal Bernetti recommended that concessions be made to

the people, and a general amnesty granted to all persons implicated in political conspiracies since 1831. This proposition, however, was rejected by the almost unanimous vote of the assembly.—The French papers announce that the Sicilian sulphur question is terminated. The indemnity to the British merchants has been fixed by a special commission at 130,000 Neapolitan ducats. The merchants demanded that this sum, which it was expected would not be paid for several years, should bear an interest of 6 per cent.; but the Neapolitan Government then determined to pay in cash. A letter from Naples states that the Government is now occupied with the establishment of a regular line of steam-boats between Naples and Ancona, which will touch at Messina, Tarento, Gallipoli, Bari, Barletta, and Manfredonia, and correspond with the steamers belonging to the Austrian Lloyd's Company, which leave Trieste. For this purpose, the Neapolitan Government are now constructing three large steam-vessels, and a fourth will shortly be laid down. This line will commence running in January next.

TURKEY.—Accounts from Constantinople in the German papers state that the Turks are somewhat alarmed lest the Greek movement should increase the agitation in Albania and the northern provinces. An affair at Ibraila is represented as serious, being nothing less than part of a conspiracy for the rising of the Christians in Bulgaria. The local authorities had discovered an illegal association, and had arrested a number of suspected persons, natives of Bulgaria. The troops were confined to their barracks, and their bayonets and sabres sharpened, as if they were on the eve of a battle. M. de Colla, the Russian Consul at Galatz, had frequent conferences with the civil and military chiefs, and assisted at the examination of the prisoners. The conspiracy is said to have extensive ramifications throughout Wallachia and Bulgaria.

INDIA AND CHINA.—The Overland Mail from China and which should have arrived in the early part of the present month reached town on Monday. The dates are—Calcutta, 10th, Scinde, 19th, and Bombay, 26th August. From China 26th of June only. The mails were conveyed from Bombay to Suez by the Victoria steamer, which left Bombay on the 26th August, but being driven back by stress of weather, did not finally leave Bombay till 7th September. The mails reached Alexandria on the 4th inst., but her Majesty's steamer Geyser not having arrived, they were sent on to Malta by the French steamer Lycurge, which sailed from Alexandria on the 7th inst., and arrived at Malta on the 15th. The overland portion of the mail has been forwarded by her Majesty's steamer Aleto from Malta to Marseilles, and arrived at the latter port on the afternoon of the 19th inst., whence being despatched immediately, it arrived at Boulogne within 68 hours. The intelligence thus received has been in great measure anticipated by that brought by the Hindostan. India was peaceful throughout. In Scinde nothing of moment had occurred; Shere Mahomed had recrossed the river, and taken shelter with his family in the Murrie Hills. Ali Mahomed followed shortly after, claiming the same protection. Ali Moorad had been unsuccessful in the pursuit of his nephew; and had on his return visited the fort of Shaghur, where he supposed Shere Mahomed and his family to be located, but on his arrival he found it deserted. Sir C. Napier was busied making preparations for another campaign when the nature of the country permitted. A considerable augmentation of the force was expected to be made by that time. The sickness among the troops had much diminished. The affairs of Gwalior were tending to a complete state of anarchy; and Government had issued an order for the immediate assembling of troops in and around Agra—but this has been countermanded in the meantime. Bundelkund, on the other hand, is rapidly improving—the rural police being considered quite capable of holding the disturbers in check. Two of the leaders in the late disturbances in Jeypore have been executed. In Afghanistan affairs were most unsettled. Dost Mahomed had imprisoned Ameer Oolah and Suftur Jung, while Zeman Khan was still bribing the chiefs to join in his own cause. The whole of those who were in any way favourable to us on former occasions have been compelled to flee the country. The Dost is likewise said to be about waging war with the Chief of Bokhara, the ambassador from whom is said to have been expelled. The difference formerly existing in the Punjab between Shere Sing and his powerful Minister, Dhyang Sing, has been made up; but it is not thought likely to last long. The Nizam's country was much in the same condition. The intelligence from the Burmese empire has been somewhat hostile, but the matter at issue will most probably be amicably settled.—Lord Ellenborough is residing at Burrackpore, 10 miles from Calcutta, and has appointed Mr. Bird, late Deputy Governor, Governor of Bengal. Two items among the local news for the month had caused some excitement. First, the discovery of a joint stock company for robbery, plunder, &c., whose average annual income has been between 60,000*l.* and 80,000*l.*, and who have carried on their depredations for about 30 years. The other case was the decision come to by the court-martial held at Poonah, on charges preferred by Colonel Hughes, commander in the garrison, against Major Seton, a case which is likely to occupy the attention of the Horse Guards. It appears that they had a dispute, and soon after which the Colonel offered to make up the quarrel, but was told the whole affair had been sent up in a complaint to the Government. The complaint was referred to a court of inquiry, which decided, after having heard evidence, that there were faults on both sides. The Colonel then sent in a demand for a court-martial on the Major, on the ground of his having wilfully made a false and unfounded statement. The Commander-in-Chief

refused the demand and censured the application as out of place, as the decision of the court of inquiry was then under his consideration. The Colonel reiterated the demand, but no notice was taken of it. Two months afterwards the Colonel had the proceedings, with his own charges and the letters, privately printed and sent to his friends. The pamphlet was shown to the Major, who demanded a court-martial, by which, after the examination of the same witnesses, he was declared honourably acquitted. This verdict, which was supposed to be contrary to the evidence, has been much canvassed, as also the remarks of the Commander-in-Chief, which were severe on the Colonel for not obeying the dictum of the head of the Army. Party-feeling was warm on both sides of the question. The chief witnesses were the principal medical officers of the army-staff, and they conceived the finding of the court-martial to be a censure on their evidence.—The satisfactory news from China informing us of the ratification of the treaty with this country and of the arrangement of the tariff, was not certainly known at Bombay at the date of the departure of the mail, and the papers are therefore in great measure filled by vague rumours and speculations respecting events of which we are already completely informed.

CITY.

Money Market, Friday.—Consols closed at 95½ for money and the Account; Reduced Three per Cents., 94½; New Three-and-Half per Cents., 102½; Bank Stock, 179½; Exchequer Bills, 63s. to 65s., and 62s. to 64s. prem.

Metropolis and its Vicinity.

City Election.—The polling for the two candidates closed on Saturday at 4 o'clock, when the returns of Mr. Baring's committee gave a majority of 145 in favour of Mr. Pattison, while Mr. Pattison's committee made the majority 201. About eleven o'clock Mr. Baring's friends assembled in great force, and from that time to half-past 12 there was a small majority in favour of that gentleman, but this soon declined, and at two o'clock Mr. Pattison was 121 a-head. The official state of the poll was announced by the Sheriffs on Monday, when the numbers were declared to be, for Mr. Pattison, 6532; for Mr. Baring, 6367; leaving a majority for the former of 145. Mr. Pattison was then in the usual form declared duly elected. The following is the proportion of liverymen and householders who voted for the respective candidates:—For Mr. Pattison, liverymen, 2307; householders, 4225; total, 6532. For Mr. Baring, liverymen, 3196; householders, 3171; total, 6367; making the total number of votes 12,899. The Sheriffs alluded to this circumstance at the close of the proceedings, and said that nearly 13,000 votes had been regularly and peaceably recorded in the short space of eight hours, a fact which they wished to hold out for imitation and example to the constituencies of country boroughs. In connection with this subject we may notice the rumoured illness of Mr. George Lyall, one of the other members for the City, respecting whom reports of the most contradictory nature were in circulation on Tuesday. It appears that Mr. Lyall has been seriously indisposed, but not to an extent to excite alarm, and that at present he is nearly recovered.

Mansion House.—On Friday the Lord Mayor gave an entertainment to the clergy, churchwardens, and vestry-clerks of the several parishes in the Borough of Southwark and the Ward of Aldgate, represented by his Lordship in Parliament and in the Corporation. The Lord Mayor elect and several Aldermen were present; 210 persons sat down to dinner.

Anti-Corn-Law League.—The monthly aggregate meeting of the League took place on Thursday evening in Covent Garden Theatre, which was crowded in every part. An address of congratulation to the Citizens of London, on the return of Mr. Pattison to Parliament was adopted, after which the Hon. C. P. Villiers, Dr. Bowring, Mr. Moore, and Mr. Milner Gibson, addressed the meeting. Mr. Gibson adverted to a report published in the *Morning Post*, that the Queen and Queen Dowager had given up their private boxes at the theatre on account of the League Meetings. He said that her Majesty and the Queen Dowager knew nothing of this, but that it was an attack of the Ministers. The meeting did not break up until a very late hour.

Illness of Mrs. Fry.—The numerous friends of this benevolent lady will regret to learn that she has been so seriously indisposed as to admit of faint hopes of recovery. For some months past Mrs. Fry had been suffering under occasional attacks of a pulmonary complaint, which prevented her from the continued exercise of those active charities that have formed the chief business of her useful life, but without creating any serious apprehension for her safety. Within the last week, however, the disease has assumed a more alarming character. Her medical advisers recommended immediate removal to a warmer climate, but her enfeebled state unfits her for the fatigue of a long journey. Her present illness is supposed to be the effect of a severe cold caught in her recent journey to the north of Europe, which brought on inflammation of the lungs, from which she has never thoroughly recovered.

Illness of Mr. Farren.—We regret to state that this popular comedian has been seized with a sudden affliction which threatens, in its consequences, to deprive the stage of one of its greatest ornaments. On Tuesday night, when near the conclusion of Mr. Mark Lemon's new drama of *Old Parr* at the Haymarket, he was observed to exhibit an unusual tremor of manner and sink in the chair used in the scene. The curtain fell at the usual time, and it was discovered that he had been attacked with a fit of apoplexy, and was unable to speak. He was

instantly conveyed to his room, and medical assistance sent for, when it was discovered that his side and arm were completely paralysed. He was conveyed home to Brompton and attended by the most eminent members of the faculty. This is the third attack of the same malady, but the first that has left such consequences, the two previous having only confined him to his room for a few days.

Hellenic Festival.—On Saturday evening a festival took place at the London Tavern, to celebrate the recent events in Greece, when about 100 Greek gentlemen and friends of their cause sat down to dinner. The upper end of the room displayed the flags of England, France, and Greece; and four pillars against the walls bore inscriptions commemorative of the various national assemblies of regenerated Greece, beginning with that of the 25th March, 1825; of the battles won by the Greeks; and of the surviving and deceased heroes who had fought in the Greek cause. Mr. Ralli was in the chair; and among those who supported him were the Hon. Col. Stanhope, Col. Thompson, Mr. B. Cochrane, and Dr. Bowring. The principal speakers were of course the Greek merchants and other natives of Greece resident in London, who addressed the meeting in Romic. The English visitors abovenamed also spoke at some length on the obligations which civilisation at large owes to Greece, and on the interest felt in this country for her prosperity as a nation.

The Nelson Column.—In accordance with a general wish on the part of the public to have permission to see the figure of Lord Nelson prior to its being placed on the column, the public were admitted to Trafalgar-square yesterday, and will be admitted again this day gratuitously to view the statue. In announcing this in the morning papers, Mr. Baily, the sculptor, states that it is done with the hope that the visitors may thereby be induced to aid the subscription for an entertainment to be given to the Greenwich pensioners, in Trafalgar-square, on the anniversary of the battle of Copenhagen, April 2, 1844.

Wood Pavement.—An injunction having been obtained by the Metropolitan Company against the proprietors of Perring's patent, the paving of Cheapside has been suspended for some days past. On Tuesday, however, a deputation of the inhabitants waited upon the Commissioners of Sewers, with a representation of the extreme inconvenience arising from the continued obstruction of this crowded thoroughfare; and after some consideration, the Commissioners determined on giving up their intention of paving the whole of Cheapside with wood, and issued directions for completing that portion already unfinished with Aberdeen granite.

High Tide.—On Wednesday noon the tide again rose to a great height, overflowing all the warehouses round Limehouse, Wapping, Deptford, Bermondsey, and Bankside. The unusual height of the tide is mainly attributable to the storm of Tuesday night. At Wandsworth and Battersea the grounds of many market-gardeners were under water for several hours.

Lotteries.—The prizes in Mr. Boys's "Fine Arts Distribution" were allotted at Exeter Hall on Wednesday. Two young ladies officiated at the wheels of fortune, and Mr. Cooke, a barrister, was in the chair, in the place of Mr. J. S. Buckingham, who was to have replaced Mr. Bond Cabbell. Mr. Cooke spoke at great length upon the encouragement afforded to the fine arts by the present system of lotteries. The number of tickets was 12,000, and there were 601 prizes. After the 601 prizes were drawn, Mr. Boys gave, as a bonus on his originally announced prizes, other prizes, to the amount of 350 guineas, to the next drawn tickets, and also announced his intention of instituting another "Fine Art Distribution" in the course of the forthcoming year.—The daily papers state that the landlady of a tavern at the west-end of the town, conceiving that ladies have as much right to sport their loose cash on sporting events as gentlemen, has determined to form a Derby Club for ladies. A code of rules has been framed, the club to be limited to 30 members, the subscription being 25*s.*; two prizes to be given; the winner of the first to be entitled to 18*l.*, and of the second prize to 9*l.*; 5*l.* to be divided among the drawers of starting horses, and the balance to be appropriated to incidental expenses.

Inquests.—On Monday an inquest was held on the body of Mr. Charles Wooden, the fruit-saksman of Covent-garden market, who resided at 25, Bow-street. On Thursday last, it appeared, he complained of being ill, and shortly afterwards fell down in a fit, striking his head against the stones. He was assisted home, and medical assistance procured, but he died the same evening. A surgeon stated that he saw deceased on Friday afternoon, and found him affected with apoplexy, which had been produced by concussion of the brain and rupture of some blood-vessels. Verdict—Died of apoplexy.

Mortality of the Metropolis.—The number of deaths registered in the week ending Saturday, October 14, was as follows:—West Districts, 147; North Districts, 159; Central Districts, 182; East Districts, 225; South Districts, 237; Total, 950 (males, 509; females, 441). Weekly average for the last five years, 903 (461 males, 442 females); and for the last five autumns 908.

Provincial News.

The late Storms.—The accounts from all parts of the coast contain detailed accounts of numerous shipwrecks, occasioned by the storms of the last fortnight. The principal places which have suffered are situated on the northern and eastern coasts; and in many instances, the wrecks have been attended with loss of life. On the coast of Devon and Cornwall the storm was also felt with great severity, and many casualties are reported. At Margate, the ship *Burhampoote*, almost new vessel, with emi-

grants on board for Port Philip, was wrecked off the harbour, but all hands were saved.

Carmarthen.—The Right Hon. Frankland Lewis, the Chief Commissioner appointed to inquire into the causes of the present outrages in South Wales, arrived here on Tuesday, bringing with him her Majesty's Commission, which was opened on Wednesday with the examination of the clerk to the Main Trust, and of various books and papers relating to it. Not a night now passes but the morning brings an account of some act of incendiarism. On Monday night two large stacks of hay, containing about 15 tons, the property of a person named Evans, near Llanelli, were set on fire and totally destroyed. A party of the London police, in their usual nightly patrol of the country, had passed the spot as late as 8 o'clock, and all was then safe, but when in another part of the country at 9 they perceived the ricks in flames. Mr. Evans had received two threatening letters, stating that if he did not give up carting coals, Rebecca should visit him; he subsequently received a second threatening letter, which he refused to take in or open. On Thursday and Friday last this town was filled with county magistracy, who came to be present at the opening of the quarter sessions, and to take part in the discussion on maintaining a rural police in the county, and defraying the expenses of the Metropolitan Police. Mr. Pugh opened the proceedings in a speech on the present state of the principality; after which the court discussed the propriety of establishing a rural police, and ended in agreeing to a rate for that purpose. There are now at least 150 of the London police in the disturbed parts of Carmarthenshire, Pembrokeshire, and Cardiganshire. They have been stationed, with small companies of foot-soldiers under the command of non-commissioned officers, in all the villages and small towns throughout the country. At the Pembrokeshire quarter sessions, Colonel Owen, Vice-Lieutenant of the county, moved the following resolution, which was seconded by the Earl of Cawdor and carried:—"That the magistrates are of opinion that the police force which the Government has proffered to be put at the disposal of the Vice-Lieutenant of the county is required for the preservation of the peace of the county, and that it be employed accordingly." The expense of this force will be about 50*l.* a week; and it is expected it will obviate the necessity of establishing a rural police in the county, which is greatly objected to. At the same sessions, William Harris, servant of Colonel Colby, R.E., was indicted with unlawfully and maliciously destroying a toll-bar, the property of the trustees of the Whitland trust. It is rumoured that the evidence brought before the grand jury was defective, and that it appeared before them that the breaking down of the bar was an act done for the purpose of trying its legality, it being alleged to be placed within the borough of Narberth, contrary to law. The grand jury ignored the bill, and the prisoner was of course discharged. Six persons, charged on the information of one Richard Williams with being concerned in the destruction of the Porthyrhyd-gate and toll-house on the 7th August last, have been apprehended by a party of the metropolitan police, and lodged in the Carmarthen gaol, where they have undergone an examination before a full bench of magistrates, and been remanded for further inquiry. On the night of Friday week a farmer, named Richards, occupying a farm called Gorse Goch, in the parish of Llanfrynach, between Narberth and Cardigan, and about 12 miles from the latter town, having bailiffs in his house for arrears of rent, had his farm visited by about 100 Rebeccaite with their faces spotted with black. They threshed out all his corn, packed up the straw, and carried all his corn, straw, and stock, off the premises; they then ordered him out of the house, and packed up his furniture, which they took away. Having ordered the bailiffs, who were afraid to interfere, to be off, they carried all away with them, the bailiffs have been unable to discover where. The farmer says he does not know any of them, nor where they have carried his goods.

Chester.—On Saturday week, about 9 A.M., a barn, forming part of the farm buildings adjoining Sutton Hall, the residence of Joseph White, Esq., was found to be on fire. So rapid was the progress of the flames, that before the engines could arrive the whole of the farm buildings, containing a large quantity of Wheat and Oats, were destroyed; the cheese was saved, and the efforts of the Chester police successfully prevented the fire from communicating to the Hall. The engines remained playing upon the buildings till 10 at night, when all fear of further mischief was removed. Nothing is yet known as to the origin of the fire; and the damage is estimated at from 2,000*l.* to 3,000*l.*

Dover.—On Tuesday, the Duke of Wellington, in his capacity of Lord Warden of the Cinque Ports, held a Court of Loadmanage, or Pilot's Court, here for the superannuation of old Cinque Port pilots, and the making of new ones to fill up vacancies. The proceedings commenced with divine service in St. James's Church, where the Master of the pilots, Mr. D. Peake, was elected. The vacancies filled up were about twenty, and there were upwards of one hundred applicants in attendance. The master and wardens are the examiners, and the points of examination are on the knowledge of the candidates of the English Channel. The last Court was in Nov., 1839.

Durham.—The local papers recently announced the death, at an advanced age, of Mr. Buddle, well known in the northern counties as a coal viewer, and as the agent of the Marquess of Londonderry's collieries. He is said to have died worth 150,000*l.*, although he commenced life as a mere pit lad.

Gloucester.—The local papers state that the 800*l.* of which Mr. John Gardner, of Painswick, was some time ago robbed at Boulogne, has been recovered. A 500*l.* note, part of the amount, was lately stopped at the Bank

of England, where it was offered for change by a foreign Jew; and the remaining 300*l.* has since been recovered from the hands of an old washerwoman at Boulogne, who surrendered it on receiving a reward of 30*l.*

Hatfield.—Our readers will probably remember that in July last an account appeared in our columns (p. 494) of a deliberate murder committed at the village of Mount Tabor, near this place. The victim was a man named John Dobson, a weaver, who was shot dead by his own son, Joseph Dobson. The latter and his wife had gone, about a week before the occurrence, to live with the father, and during the week some quarrel took place between the son and his father. The son on the 4th July went about a mile from Mount Tabor, and took a gun from the house of a man he knew, but who was not at home, and having purchased some powder and shot, returned home and deliberately shot his father in the presence of his wife and two or three children. On first presenting the gun it missed fire, but he put on another cap, and before the old man had time to get out of the house, shot him through the heart, and he dropped dead on the spot. The murderer immediately made his escape, and though great search was made for him no traces of him could be discovered. A coroner's jury unanimously returned a verdict of Wilful Murder against the parricide. A Government reward of 100*l.* was offered for his apprehension, but he contrived to elude the officers of justice until Friday last, when he was apprehended by a working man at Huddersfield, in the neighbourhood of which town he has been working for a few weeks as a weaver. He had cut his whiskers off so as to prevent identification, and when apprehended denied that his name was Joseph Dobson, but on being given into the hands of the chief constable, he acknowledged that he was the man, and instead of feeling compunction for his crime, gave utterance to expressions of pleasure that he had taken his father's life. On Saturday he was committed to York on the coroner's warrant for trial at the next assizes.

Isle of Wight.—Mr. Dawes, brother of the Baroness de Feuchères, has purchased the Niton estate, formerly the property of Mr. Kirkpatrick, banker, of Newport, of his assignees, for 21,000*l.* It contains about 700 acres, taking in part of St. Catherine's Down, and some of the finest scenery in the Isle of Wight. The *English Churchman* states that it is able to confirm the report which was mentioned in its columns a few weeks since of the return of Mr. Sibthorp to the English Church. The Rev. gentleman, it states, has after a deliberation of about six months, formally declared his renewed attachment to the English Church.

Manchester.—The adjourned annual general meeting of the shareholders of the Bank of Manchester was held last week in this town. The attendance was numerous, owing to a report that Mr. Burdakin, the runaway manager, would deliver himself up to the directors. This report, however, was without foundation. A long statement of accounts was presented to the meeting, but it will be sufficient to remind our readers that this bank had branches at Birmingham, Liverpool, and other places, and suspended payment in 1840. At the time of its stoppage, statements were sent forth informing the shareholders that a small loss on their shares would be experienced, but that the securities held by the bank were of such a character that little apprehension need be entertained upon the subject. A sum of money was borrowed from the principal shareholders for the purpose of paying off the more pressing claimants on the bank, and to avoid harassing its debtors by prematurely urging upon them the repayment of advances. Each succeeding year showed that the expectations held out were not to be realised, and that the securities had undergone considerable depreciation. At length a final investigation has taken place, for the purpose of ascertaining what arrangement can be made for the reimbursement of loans made under the circumstances stated; and it is now discovered that, in addition to the paid-up capital of five pounds per share, another call of thirty shillings a share is necessary to enable the directors to pay off the present demands upon the bank. After some discussion, the retiring directors were re-elected, and a committee appointed for the purpose of investigating the private accounts of some of the directors and other individuals, and to report to the proprietors.

Oxford.—An Oxford paper announces that the Rev. Charles Seager, M.A., late Fellow of Worcester College, has joined the communion of the Church of Rome.

Southampton.—Official notice was received here on Friday last announcing that Southampton had been made a second-class port, which doubtless will prove of importance to the town, as all descriptions of merchandise, including tobacco, silks, &c., can now be imported direct. The intelligence was welcomed with peals from the church bells, and with a salute from the battery. It is said that arrangements are in progress between the merchants, Dock and Railway Companies, for the reduction of freights, dues, and carriage of goods, which, if carried into effect, will tend greatly to the increase of trade.

Taunton.—The *Bristol Times* states that at the Somersetshire quarter-sessions, last week, the chaplain of the prison said that no less than 360 prisoners had come under his notice during the last three years who were ignorant of the name of the Saviour, and unable to repeat the Lord's Prayer. He did not mean to say they never heard the name of Christ, but knew nothing of its meaning, and only used that sacred name in their profane oaths or conversations. If he asked them who was the Saviour of mankind, they could not tell; if he asked them who was Christ, they did not know. They were in utter darkness and ignorance as to religion; as to moral and religious duties they were just as ignorant as heathens.

Windsor.—Since the Queen has possessed her pack of

beagles, her Majesty, from domestic causes, has been prevented from hunting during a great portion of the regular season. This year, however, her Majesty has signified her intention to hunt with the beagles occasionally in the Great Park. When her Majesty takes the field, bagged hares will always be at hand, in order to insure sport in the event of their not being successful in an early find. The Queen is said to be an excellent horsewoman; indeed, her Majesty upon her favourite hunter takes a ditch and double fence in beautiful style.—It is stated to be the intention of Prince Albert to add to the present extent of the preserves at Swinley, between Ascot and Bagshot Park, by purchasing some portion of the land which lies contiguous to the Crown property. A large quantity of the game, which is bred at considerable expense at Swinley, is brought down and bagged by a number of persons carrying game licences and called "scouts," who make a point of hovering round the extremity of the Royal preserves when the Prince and the visitors to her Majesty are shooting over them. When any bird rises and makes away, if but one yard from off the Royal property, it is popped at by these licensed "scouts" and carried off.—The sale of Prince Albert's stock for this year took place last week at Norfolk farm, and attracted, from the high character and condition of the stock, all the principal salesmen and butchers for many miles round Windsor, and several large buyers from the metropolis. The stock sold consisted of 417 sheep, 33 Welsh oxen, 12 Devon oxen, 8 Hereford oxen, 2 West Highlanders, and 9 fat cows and heifers. The prices realised were high, and the produce of the sale was 1,743*l.*—Mr. Ormsby Gore, groom in waiting to her Majesty, met with an accident on Wednesday week, while hunting with Prince Albert's harriers, but was enabled to leave the Castle on the next morning for his town residence. The meet on that day was at Mr. Mason's farm, at Salt-hill; and during the second run, when the harriers were in full cry, the horse of Mr. Gore, while at full speed, tripped and fell, throwing his rider with considerable force on a heap of hard mould. Mr. Gore fractured his collar-bone, and had several severe bruises, but is now doing well.—A fire was discovered in the spacious corridor at Frogmore-house early on Tuesday morning by one of the domestics, and had it not been for its fortunate detection at the time, there is little doubt that the mansion must have been burned to the ground. It appears that the corridor, over which is the sleeping apartment of the Duchess of Kent, is warmed by flues, which had been overheated on the previous day, and set fire to the carpet and some furniture. Prompt assistance was at hand, and the fire was soon subdued.

Railways.—The following are the returns for the past week:—Birmingham and Derby, 1,401*l.*; Birmingham and Gloucester, 1,987*l.*; Eastern Counties, 2,833*l.*; Edinburgh and Glasgow, 2,594*l.*; Great Western, 15,199*l.*; Grand Junction, 8,314*l.*; Glasgow, Paisley, and Ayr, 1,289*l.*; Great North of England, 1,537*l.*; Hull and Selby, 1,053*l.*; London and Birmingham, 18,097*l.*; South Western, 7,674*l.*; Blackwall, 826*l.*; Greenwich, 693*l.*; Brighton, 4,568*l.*; Croydon, 251*l.*; Liverpool and Manchester, 4,739*l.*; Manchester and Birmingham, 3,716*l.*; Manchester and Leeds, 5,112*l.*; Midland Counties, 3,168*l.*; Northern and Eastern, 1,805*l.*; North Midland, 4,693*l.*; Newcastle and Carlisle, 1,360*l.*; Dover, 4,602*l.*; Sheffield and Manchester, 442*l.*; York and North Midland, 1,900*l.*—The jury at the Coroner's inquests on the bodies of the two men who were killed on the Dover railway last week returned verdicts of Accidental Death in each case.—It is stated that the works of the branch railway from Oxford to Didcot are progressing rapidly, chiefly in the neighbourhood of Radley and Appleford; and there is little doubt that the opening of the line will take place in June, previous to the Commemoration which will take place next year.—It is understood that the Edinburgh and Glasgow Company have instructed their engineer to examine the former plans of a branch railway to connect their line with Stirling, and to make a further survey of the country if necessary.—It is said that Mr. Geo. Hudson, of York, will be appointed chairman of the three amalgamated Midland Railway Companies. Mr. Hudson will then be chairman of no less than six lines—the Midland Counties, Derby Junction, North Midland, York and North Midland, Newcastle and Darlington, and Leeds and Selby.—On Wednesday the proprietors of the Northern and Eastern and Eastern Counties Companies met simultaneously at the Shoreditch station, to take into consideration the propriety of an amalgamation of their lines. There was a large attendance of shareholders from the Eastern Counties and the North. The meeting of the Northern and Eastern Company took place at twelve o'clock, Mr. Marshall, M.P., presiding, when the heads of the proposed amalgamation with the Eastern Counties Company were submitted to the shareholders. The arrangement proposed was that the Eastern Counties Company should take a lease in perpetuity of the Northern and Eastern, at a rent of five per cent. upon the shares and borrowed capital, the sum of 132,500*l.* out of the net profits to be received by the Eastern Counties, and the remaining net profits to be divided in the proportion of two-thirds to the Eastern Counties, and one-third to the Northern and Eastern; the former Company to have the exclusive control over all extensions and the workings of the lines, and to guarantee that the working expenses shall not exceed 40 per cent. of the gross receipts for the first year, 37½ for the second year; and 36 per cent. for all future years, the number of directors of the joint board to consist of 18 in all. After much discussion, in which Mr. Ward, M.P. for Sheffield, Mr. Masterman and others took part, the resolutions ratifying the above propositions were passed with but four dissentients. A resolution was also passed, empowering the Directors to

apply to Parliament to extend the Northern and Eastern Railway from Newport to Cambridge. At the meeting of the Eastern Counties shareholders, the same propositions were submitted and discussed, Mr. H. Bosanquet presiding. Mr. Whittle Harvey spoke for nearly two hours' duration, contending that it would be a pernicious and suicidal act if the Eastern Counties Company were to take a lease of the Northern and Eastern in perpetuity. He entered largely into statistics on the subject, which were replied to by the Company's solicitor. Mr. Salamons, Mr. Tite, and other proprietors, also spoke in favour of the proposed amalgamation, which was ultimately carried, with only six dissentients out of a meeting of upwards of 200, the chairman explaining to the meeting at its close that its adoption would not only have the effect of largely benefiting the public, but of terminating all existing Parliamentary contest and injurious competition for traffic.

IRELAND.

Dublin.—The Lord-Lieutenant presided at a Privy Council last week, when it was agreed that a proclamation shall issue fixing the 13th November as the day whereon the Arms Act shall come into operation.—On Friday informations for perjury were tendered against Mr. Bond Hughes, the Government reporter, upon whose depositions the parties to be prosecuted were called upon to give bail. It appears that this gentleman swore that a Mr. Barrett, proprietor of the *Pilot* newspaper, was present, and took an active part at a certain meeting, while 13 witnesses depose that Mr. Barrett not only was not present, but it was physically impossible he could have been present. The case was brought before the magistrates of College-street Police-office, at two sittings, but they ultimately decided that it was not within their jurisdiction, and refused to receive the informations.—In the Corporation on Friday, Mr. O'Connell brought forward the following resolution:—"That we deem the transmission of the proclamation to the Lord Mayor about the hour of four o'clock on Saturday the 7th of October inst., to prevent a meeting to be held on the next day, too late for the purpose of due caution, and especially too late for him to warn the citizens of Dublin of the impending peril." The Lord Mayor declared that he had never experienced any want of attention on the part of the Administration, and wondered much how Mr. O'Connell could have thought of alleging this matter as a proof to the contrary. On a division, however, the motion was carried by 38 to 9.—The various wards of the city have since held meetings to protest against the recent measures of Government. At the meeting of the Post-office Board, Mr. O'Connell spoke at considerable length. He said that some misapprehension seemed to prevail respecting what had fallen from him on the previous Monday. It had been most erroneously supposed by some persons that he had changed his mind on the subject of Repeal. It was scarcely necessary for him to say that any such impression was totally erroneous. He had merely repeated on Monday what he had often before and long since stated on the subject of a movement then in contemplation respecting the attainment of a federal Parliament. But then, as well as on Monday last, he fully retained his own opinion, that nothing short of Repeal could or ought to satisfy the people of Ireland, and that nothing else would afford an efficient remedy for the manifold grievances of the country. He was still firmly attached to the principle of independent legislation, but having reason to believe that a movement for a federal Parliament would rally a considerable and very influential party, he had expressed himself ready to make the experiment, because he felt conscious that the result would be a still deeper conviction that in Repeal alone the true remedy would be found. He had been promised the support of a very powerful party in England, and he had reason also to calculate upon the adhesion of a very influential party in Ireland. To his English friends he was doubly grateful; but while entertaining and expressing these opinions, he was bound to declare that he was still of opinion that it was only in an Irish House of Commons, and in an Irish House of Lords, that the wrongs of Ireland could be redressed and the rights of Ireland maintained.—On Monday the Repeal Association held their weekly meeting in the New Conciliation Hall, which was opened on the occasion for the first time. The building was densely crowded, and many thousands were unable to obtain admission. A Government reporter was present. Mr. J. A. O'Neill took the chair, and addressed the meeting at great length. Mr. O'Connell then rose and said: I wish that the first sentence which I have to utter in this Conciliation Hall, formed now as it is into an assembly, shall be this truth, that there is but one way to obtain the Repeal of the Union, and that is by strictly peaceable means. My second sentence, and the only one I shall utter before I hand in money, is that the Repeal is certain. Yes, provided you use no other but peaceable and legal means. Give your enemies no advantage over you. I warn the people against giving the Government the least pretence for using force. I warn the people—in the cities, towns, and in the crowded streets, and in the villages—let there be no single act of violence. If violence be attempted by anybody else, the law is still open, unquestionably open, and means will be found to protect those who are unjustly attacked by the strong arm of legal vengeance. He then moved that Mr. Smith O'Brien, M.P. for the county of Limerick, be admitted a member of the association. This announcement was received with loud cheers, after which Mr. O'Connell read a long letter from Mr. O'Brien detailing the reasons which had induced him to join the Repeal movement. "A few years ago," said Mr. O'Connell, "Mr. O'Brien was an anti-Repealer—events had been his teachers, and had shown him that there was

nothing for Ireland but the Repeal; and he had boldly and manfully, as it became him, scorned to be kept in fetters of former opinions, or to be taunted with inconsistency. He was truly consistent—he was honest when he was an anti-Repealer—he was honest now that he was amongst the Repealers. There had a good deal fallen from their chairman of the distinction between federalism and an independent legislature. It was an independent legislature he (Mr. O'Connell) was looking for. By independence he did not mean independent of England—quite the contrary. By independent he did not mean independent of the Crown, quite the contrary; bound to England by the golden link of the Crown, with a mutuality of interest—most firmly attached to the continuance of that connection on fair terms; but insisting that Ireland has a right to the revival of that parliament of which she was deprived by the foulest means. This language might be thought inconsistent with what fell from him on the last day of meeting, it was no such thing. He mentioned then that approaches had been made on the part of the Whigs. The first was that many would join him if he held out the hope of federalism; the second was a letter which he received from a gentleman in England, and he assured the gentleman who wrote to him that the Repealers did not desire separation, and that they would give every guarantee that that was not their object. It was said to him that if he held out these hopes a considerable number of Whigs would join him; recollect that it was on this ground that they were joined by the Right Rev. Dr. Kennedy; it was on this ground that they sought the junction of Mr. S. Crawford, and received the support of Mr. O'Hagan and others. They went far enough for the Repealers to act with him, but he never said that he would rest contented with a smaller quantity, as long as it was possible for him to get a greater. He would be ashamed of being the colleague and companion of the chairman, and the friend of Smith O'Brien if there was the least hesitation about him in saying that the hopes of justice had been total delusions, and that he was looking now for the Repeal. He would reject no man's assistance who went any part of the way with him. Any man that joined him to repeal the 40th of Geo. III., chap. 38, what was called the "Union Statute," was welcome amongst them; he would obtain the best parliament himself after he had been thus assisted on his way. He had every disposition to conciliate—none to compromise. What had occurred might teach the Government, if there be wisdom amongst them, and the statesmen of England, if they be wise, that they might win the Irish heart by kindness, and by conciliatory conduct they might bind Ireland with the link of faithful affection to the British connection. They might keep the Irish people in a state of irritation, discontent, and disgust, but there never would be a rebellion again. There would be no attack on the part of the people. Oppression might be continued, but the people had perseverance enough to suffer patiently, at the same time determined never to abandon the work in which they were engaged until as large an assembly as he then addressed hurried in College-green on the opening of the Irish Parliament. In conclusion, he moved that the marked thanks and gratitude of the people of Ireland be offered to Mr. Smith O'Brien, that his letter be printed, and a copy of it transmitted to every member of both Houses of Parliament. Mr. O'Connell then handed in several large sums of money, among which was 100*l.* from Philadelphia, and 50*l.* more from the same place, transmitted to his daughter, Mrs. Fitzsimon, from the ladies of Philadelphia. He took that occasion of stating, for Mr. Steele, against whom informations had been sworn by Mr. Bond Hughes, that Mr. Steele had been blamed for not having prosecuted Mr. Hughes for perjury, but seeing that informations on the same ground had been refused, he thought there would not be at present any use in commencing a prosecution. It appeared that Mr. Hughes had sworn that Mr. Steele, at a meeting of the Repeal Association, made use of the quotation—"Behemoth, biggest born of earth, upheaved its vastness." Now, Mr. Steele had never used the lines, but he was in the habit of reporting his own speeches, and when writing his speech for the *Freeman's Journal*, he had put them in, and Mr. Hughes had thought proper to make use of them in his informations. After the routine business had been gone through, Mr. O'Connell addressed a few words to the Association, recommending peace and quietness. The repeal cause, he said, had made a progress that had astonished him. He then announced the rent for the week to be 2,284*l.* 5*s.* 5*d.* An adjourned meeting of the Association took place on Tuesday. Soon after its commencement, the Rev. Tresham Gregg begged to be allowed to state that he did not consider himself included in the vote of thanks purporting to come from the Irish people and Mr. Smith O'Brien. Mr. O'Connell then amidst much laughter moved that Mr. Gregg be not considered included in the vote, and begged the people to allow him quietly to leave the Hall, which was done, all manifestation of feeling being checked at the desire of Mr. O'Connell and Mr. Steele. Mr. O'Connell then attacked the *Morning Chronicle*, for inserting two letters on the state of Ireland, signed "Philaethes," which he attributed to Mr. Trevelyan, secretary of the Treasury. He then moved that an "address of conciliation" be prepared by a committee. It would come, he said, very suitably from that hall, which was called "Conciliation Hall." He wished to conciliate every class of his fellow-subjects, but on just and manly grounds. He would not do it to buy off hostility, nor at the expense of principle. They would co-operate with any man that was for repealing the statute 40 Geo. III. c. 38. As to the people of England, he would be glad to conciliate them, but he almost despaired of being able to do so. The Whigs seek to get into power through Ireland, but

the Whigs were a treacherous set—there was no escaping the extent of their calumnies. They had grossly perverted what he had said about the Bourbons; but he deprecated revolutionary violence in any country on the globe. As to the Chartists they made him offers of assistance, but he would have no alliance with them, and put their letters in the fire. Joseph Sturge and the Complete Suffragists were a small party, but he would be glad to assist them; however, his apprehensions exceeded his hopes. As to the wise and judicious people of England, he would wish to conciliate them, and he would tell them in the first place that he had no desire to separate. He insisted, however, that if England could not transfer her Parliament to France, so neither could the Irish Parliament transfer theirs to England. This was the doctrine of such men as Locke, Plunket, and Bushe. He would move that a committee be appointed to draw up a sort of declaration assuring the Protestants that Catholic ascendancy could never happen. That declaration would be the solemn pledge of the Repeal Association and of the people who confided in that association. That declaration would be the shield of every Protestant to resist persecution if it should ever occur, but there was no danger of it. The spirit of persecution was not in the Catholic. Ireland had been stricken down by dissensions amongst her children; but once all the Irish were for Ireland, Ireland would be legislated for by the Irish. He desired, therefore, to proclaim in the Conciliation Hall this truth as the basis of their exertions;—that they placed their exertions for Repeal on the right of freedom of conscience to all men—without ascendancy to any, or political inferiority to any. He concluded by moving that the Committee be appointed, which was agreed to. Mr. O'Connell then said it was most important that they should have as many addresses as possible to the Queen between that period and the sitting of Parliament, in order that her Majesty should be thoroughly informed of the real state of Ireland. Those petitions should complain of the present administration, and pray that her Majesty will appoint other persons more deserving of her confidence. It would be their duty to see that those petitions were properly signed, and they would begin the next session of Parliament with a cartload of petitions. He did not mean that there should be simultaneous meetings, even of any one county, for this purpose, for in the present state of irritation it would be better to have parish meetings, one after the other, before Parliament sat.

Cork.—The Cork papers mention that on Thursday night the hills in the neighbourhood of Donoughmore, in that county, were all lit up, but for what purpose is a mystery. The *Cork Constitution* says, "The lighting commenced about ten o'clock, and soon after acres of fires were seen flaming round the country. What is the object? Are there any ill-advisers urging on the unfortunate people to deeds which they will by-and-by bewail in blood?"

Limerick.—The *Limerick Reporter* of Friday says, "The hills through the counties of Limerick, Clare, and Tipperary were illuminated last night by large fires, which shed their light over a circumference of at least twenty miles. The scene was beautiful and imposing; but what occasioned so unusual an occurrence we cannot even guess at."

Tipperary.—The *Tipperary Constitution* of Friday alludes to the night-fires as follows:—"Last night, between the hours of seven and eight o'clock, the entire country was literally covered with fires. From every eminence throughout the counties of Limerick, Clare, and Tipperary a fire blazed, and all shot into light almost simultaneously. In several instances the fires blazed on the public roads, and torches were to be seen borne along by the people in every direction. It was really wonderful to witness the exactness with which each fire for miles round blazed into light, almost at the same moment. The meaning of those fires we cannot ascertain."

Clare.—In the county of Clare, as well as in Tipperary, Cork, and Limerick, the fire-lighting system was in operation on Thursday night last. The *Clare Journal* contains the following:—"On Thursday evening, as far as the prospect could be commanded, lights were observable on all the hills in the country. We have in vain made inquiry as to the cause—no one knew, or if so, they were not inclined to tell. In our streets there were several large bundles of blazing straw carried round, followed by a crowd of laughing women and screaming children, to the annoyance of the people and very manifest danger of setting fire to those houses covered with straw. Why some one of the authorities or the police did not prevent the dangerous amusement, we are at a loss to account for."

SCOTLAND.

Glasgow.—The Free Church General Assembly met in this city on Tuesday week, and was attended by the Marquess of Breadalbane, Mr. Fox Maule, and several ministers deputed from distant churches, among whom was the Rev. Cæsar Malan from Geneva. Dr. Chalmers preached the sermon, and moved that Dr. Thomas Brown be elected Moderator, which was seconded by Dr. M'Farlan of Greenock, and carried unanimously. At the sitting on Wednesday Dr. Chalmers intimated that he had transmitted the address of the Free Church to Her Majesty to the Home Secretary immediately after the rising of the first assembly, and that he had received the following answer from Sir James Graham:—"I have had the honour of receiving and of laying before Her Majesty the address which bears your signature, and which was transmitted by you to me. I am unwilling needlessly to refer to the late secession of a portion of the ministers from the Established Church of Scotland; but the assurance of your continued loyalty has been graciously received by Her Majesty; and the Queen relies with satisfaction on the declaration which you make on behalf of the ministers and elders of a Church

VICTORIA PARK.—To Market Gardeners and Others.—By order of the Honourable Commissioners of Her Majesty's Woods and Forests.

M. R. J. KING will sell by Public Auction on **THURSDAY, Nov. 2**, and following day, at 11 o'clock each day, on the premises, Wick Lane, Hackney, held by Mr. Fraser. The Stock consists of two strong Draught Horses, two Market Carts, 76 Boxes and Lights, 140 Bell and Hand-glasses, Barrows, Seeds, &c. The Crops comprise a stock of Ralford's Early Rhubarb, Horse radish, Celery, Coleworts, Asparagus, and about two tons of Potatoes, &c. May be viewed, and Catalogues had on the premises, at the White Horse, Covent Garden; Cheshire Cheese, St. Paul's; Old Lion, Borough Market; and of the Auctioneer, Hackney Road.

FRUITING PINE PLANTS FOR SALE.

TO BE SOLD, in the Ground of **Mr. TRINDER**, at Forest Hill, near Sydenham, Kent, about 1000 **STRONG FRUITING PLANTS**, warranted clean, and in good health.—Apply, as above, where the Plants can be seen, price 7s. each.

MONMOUTHSHIRE.—TO GARDENERS and Others.

TO BE SOLD by private Contract, a new **HOUSE AND GARDEN**, containing one Acre, well planted with choice Fruit-trees, well situated for an Inn and Grocer's Shop (there being neither of the two in the parish), within four miles of Aberavenny, where all sorts of Garden Produce is eagerly purchased. Purchase not above 500*l*.—Apply to **Mr. GRIFITHS**, Tudor-street, Aberavenny.

TO NURSERYMEN, GARDENERS, &c.

TO BE DISPOSED OF, and may be entered upon immediately (at a fair valuation) the **BUSINESS AND STOCK IN TRADE OF A NURSERY AND SEEDSMAN**, successfully carried on for the last eight years by the late **Mr. R. BEACH**, of Stourbridge. The Nursery is at present well stocked, and is in a highly improved state of cultivation; and from its situation and advantages it presents to an intelligent person an opportunity for embarking in business rarely to be met with. All accounts are requested to be sent in immediately to **Mrs. BEACH**, High-street, Stourbridge. Application to be made to **Mrs. BEACH**, or to **Mr. HASSALL**, Chemist, Stourbridge.

TO NURSERYMEN, GENTLEMEN'S GARDENERS, &c.
TO BE LET on the Southern Coast, a **DESIRABLE NURSERY GARDEN**, with House, Greenhouse, Hothouse, &c., with immediate benefits attached. Apply at the office of **Mr. WILLIAM BROMLEY**, Solicitor, Gray's Inn Square.

TO LET.—About **SEVEN ACRES OF NURSERY GROUND**, near London; or the Lease (twelve years and a half unexpired) to be sold. For particulars apply to **Messrs. PROTHORPE & MORRIS**, American Nursery, Leyton-stone, Essex.

RENDLE'S TANK SYSTEM OF HEATING.

STEPHENSON AND CO., 61, Gracechurch-street, London, Inventors of the **IMPROVED CONICAL and DOUBLE CYLINDRICAL BOILERS**, having been much engaged in heating buildings upon the above system with Tanks of various materials, solicit the attention of scientific Horticulturists to an Iron Tank now fitting up on their premises, which offers most decided advantages over every other article hitherto employed for the same purpose. These tanks which are ornamental in appearance can be made from 10 to 100 feet long and of any width and depth, and can be connected or disconnected by any working Gardener without the slightest difficulty, thus affording the opportunity to persons in remote districts of employing this much approved method of heating without the assistance of Engineers. The Tanks can be applied to Boilers and Pipes already fixed, and from the present low price of Iron will be found cheaper than of any other material. **Mr. RENDLE**, of Plymouth, has kindly undertaken to receive orders and furnish information to any persons in his neighbourhood, and prices for any size will be forwarded upon application to S. and Co.

THE CONICAL HOT-WATER BOILERS, invented by **J. P. STEPHENSON**, Esq., may be obtained of any size from **JOHN SHILWYN**, Ironmonger, &c., Sevenoaks, Kent.

J. SHILWYN having had every opportunity afforded him by an extensive practice to bring this apparatus to perfection, begs to offer it as most efficient and economical: it may be seen at Messrs. Chandler & Sons' Nursery, Vauxhall; Messrs. Loddiges', Hackney; Messrs. Henderson's, Pine Apple-place; Messrs. Veitch and Son's, Exeter; Mr. Pontey's, Plymouth; the Royal Botanical Society's Gardens, Regent's Park; and at the Gardens of the Horticultural Society of London. Considerable improvements have been effected since last season; particulars of which are in course of preparation.

TO MARKET GARDENERS and FARMERS.

MANURES.—**BOAST AND CO.** are now ready to supply their **PATENT INORGANIC MANURES**, which are separately prepared for each variety of produce, after having ascertained by Chemical analysis what substances are necessary to the growth of each crop; they are therefore *infinitely more certain and efficacious in their effects* than any Manure yet adopted. Separate Manures are prepared for Hops, Grass, Wheat, &c. by the use of which Wheat may be grown every year on the same land, with immense advantage to the Farmer and without injury to the soil, and the other crops be greatly improved. Prospectuses, containing full particulars, may be obtained, or will be forwarded (post free) on application at the Manufactory, Bow, Middlesex.

* * * **GUANO**, superior to the Foreign, at a reduced price.

GUANO MANURE.—Guano, (Peruvian), Potter's Guano, Alexander's, Clarke's, Poittevin's, and Watson's Composts. Also Nitrates, Soda, and Potash and Gypsum may be had of **MARK FOTHERGILL**, 40, Upper Thames-street.

J. B. LAWES'S PATENT MANURES, composed of Super Phosphate of Lime, Phosphate of Ammonia, Silicate of Potash, &c., are now for sale at his Factory, Deptford-creek, London, price 4s. 6d. per bushel. These substances can be had separately; the Super Phosphate of Lime alone is recommended for fixing the Ammonia of Dung-heaps, Cesspools, Gas Liquor, &c. Price 4s. 6d. per bushel.

GUANO ON SALE, BY THE IMPORTERS, **ANTHONY GIBBS & SONS, LONDON**; **GIBBS, BRIGHT, & CO., LIVERPOOL AND BRISTOL**.

WHEAT-SOWING.

POTTER'S GUANO.—The superiority of this powerful **MANURE** being now completely established, it is only necessary to inform the public that a material reduction has been made in the price, and that it may be obtained either at the Works or of **Mr. POTTER'S** Agents, who have testimonials of its efficacy.—28, Upper Fore-street, Lambeth, London.

Mr. MARK FOTHERGILL, 40, Upper Thames-street, Sole London Agent.

* * * Nurserymen required as Agents in all the principal towns.

GUANO ON SALE.—Any Quantity of this valuable Manure can be had from the bonded stores of the Importer either in London or Liverpool, on application to **CORNWORTH, POWELL, and PRYOR**, St. Helen's Place, London; **EDWARDS, DANSON, and Co.**, Liverpool; and **WILLIAM J. MYERS and Co.**, Importers, Liverpool.

LIQUID MANURE.

PUMPS of a Superior Construction, fixed and portable, for Liquid Manure. Garden Pumps, Hydraulic ditto, and Pumps for deep wells. Also Pumps for Ships, Barges, Tanners, Soap Boilers, Brewers, &c. Well-Digging and Boring executed.—**BENJAMIN FOWLER**, (late George Turner), 63, Dorset-street, Fleet-street.

HORTICULTURAL ALMANACK.

The **STATIONERS' COMPANY** will publish, with their usual Almanacks in November, price 1s.

THE GARDENERS' ALMANACK, and **CALENDAR and REGISTER of the KITCHEN, FRUIT, FLOWER, and FORCING DEPARTMENTS**, for the YEAR 1844. By **GEORGE W. JOHNSON**, Esq., Fellow of the Horticultural Society of India, Corresponding Member of Maryland Horticultural Society, and Author of "A History of English Gardening," "The Kitchen Garden," &c.

* * * This Almanack will afford a large supply of matter, interesting not only to the professional, but also to the domestic gardener, as well as to the amateur cultivator of flowers and fruits, and general reader. Besides containing Calendrical directions and suggestions for every department during the current year, it will also be a register of all discoveries in gardening which have characterised the previous twelvemonths. The contents will, for the most part, vary every year; and it is recommended that each annual publication be preserved, as an index will be given to bind up with each volume.

To Nurserymen, Seedsmen, Implement-makers, and Publishers of Works connected with the cultivation of the soil, this Almanack offers a peculiarly desirable organ for Advertisements, as a very large number will at once be circulated through the United Kingdom, and will remain a permanent and indexed record for reference in the hands of those most desirable to be made acquainted with their contents—viz., the Landed Gentry, and Cultivators of Gardens generally.

Now ready, price 1s., more than 200 pp.

JOHNSON and SHAW'S FARMERS' ALMANACK and **CALENDAR** for 1844, containing every information incidental to an Almanack, with engravings and lists of prices of seventy of the most improved agricultural implements from the best makers, manures, &c.

JAMES RIDGWAY, Piccadilly; and every bookseller in every market town in the kingdom.

N.B. To prevent disappointment, order "Johnson and Shaw's Farmers' Almanack."

This day is Published, Part XVI., price 4s., of

THE BOOK OF THE FARM. By **HENRY STEPHENS**, F.R.S.E.

CONTENTS:—Sowing and Diseases of Turnips, and Turnip Drills—Repairing of the Fences of Grass-Fields, and the Principles on which Field-Gates should be Constructed—Weaning of Calves, Management of Bulls, and Grazing and Diseases of Cattle—Mares Foaling, Management of Stallions, and Grazing and Diseases of Horses—Sheep-washing, Sheep-shearing, and Weaning and Marking of Lambs.

With Thirty-three Engravings on Wood.

WILLIAM BLACKWOOD & SONS, 45, George-street, Edinburgh; and 22, Pall-Mall, London.

FOREIGN AGRICULTURE.

This day is published, 8vo, price 3s. 6d.

THE ECONOMY OF FARMING. Translated from the German of Professor **BURGER**, with copious Notes, &c., by **E. G. SMITH**.

London: **WILEY and PUTNAM**, Stationers' Hall-court.

PINE APPLE CULTURE. By **THOMAS TORBRON**.

A concise Treatise, founded on many years' practice in the Culture of this invaluable Fruit, containing every information relative to their growth, starting and maturing their Fruit, and this, too, at any season they may be required. As a proof of the utility of such a Treatise as this, the Author has the satisfaction of announcing that he has already obtained the names of 90 Subscribers.

Published and Sold by **Mr. STARR**, Tichborne-street, Haymarket, London, Price 5s. Non-subscribers, by sending an order and their address, will receive a copy by post.

HUMOROUS COMPANION TO "VALENTINE VOX."

On the First of November will be Published, price 1s., the First Part of

SYLVESTER SOUND THE SOMNAMBULIST.

By the Author of "Valentine Vox the Ventriloquist," "Stanley Thorn," &c. &c. Each Part will be Embellished with Four Highly-finished Illustrations on Steel.

The character of this Work will be essentially humorous; but as the thrilling as well as the laughter-moving scenes a Somnambulist may create are innumerable, the object proposed is to excite alternately the deepest interest and the most joyous mirth, by the portrayal of the extraordinary positions in which a man who acts upon his dreams may be placed, and the highly ridiculous terror he may inspire. To be completed in Twelve Parts. London:—Published by **W. M. CHARR**, 17, Warwick-lane. Orders received by every Bookseller in the Kingdom.

New Edition of M'Intosh's

PRACTICAL GARDENER, in One Volume, containing the latest and most approved Modes of Management of KITCHEN, FRUIT, and FLOWER GARDENS, GREENHOUSE, HOTHOUSE, CONSERVATORY, &c., comprising numerous explanatory Woodcuts and Steel Engravings. In one large 8vo. vol. (976 pages) 21s., cloth lettered; coloured plates, 26s.; and may be had in 10 Parts, at 2s. plain, or 2s. 6d. coloured.

By **CHARLES M'INTOSH**, C.M.C.H.S., Head Gardener to the Duke of Buccleuch, at Dalkeith.

"The labour and experience of a life devoted to the science of Horticulture, we now present to the public."—*Author's Preface.* London: **THOMAS KELLY**, Paternoster-row; **SIMPSON and MARSHALL**; and all Booksellers.

SMOKE PREVENTED and VENTILATION EFFECTED, BY SPONTANEOUS ACTION.

M. R. JEAKES, 51, Great Russell-street, Russell-square, Sole Agent in London for the Sale of **DAY'S PATENT WIND-GUARD**, by the use of which he guarantees to Cure all Chimneys Smoking from Wind, and also to prevent downward currents; it is admirably adapted for the Ventilation of Apartments of every description; also of Ships, Stables, Dairies, and Lard 1s., as it ensures a constant change of air; and all its parts being fixtures, it is free from noise and not liable to decay or rust; it also offers no impediment to sweeping. Price for general use, 3*l*s.; larger size, 4*l*s.; larger sizes, especially adapted for ventilation, 6*l*s. and upwards. To be had at 51, Great Russell-street, where it may be seen in action. The attention of Architects, Builders, and the trade in general, is especially invited.

DRESS COATS, Superfine cloth, 30s. to 40s.; extra quality, 50s.; Frock-coats, silk facings, 3*l*s. to 4*l*s.; ditto, silk velvet collar and silk facings, 50s.; Waterproof Wrappers, 10s. 6d. to 21*l*s.; fashionable York and Chesterfield ditto, 16*l*s. to 25*l*s.; Waistcoats, 5s. to 15*l*s.; Silk, Satin, and Kerseymer, 10*l*s. to 14*l*s.; Trowsers, 8*l*s. 6d. to 12*l*s. 6d.; stout Doeskin and Kerseymer, 1*l*s. to 2*l*s.; Sporting Jackets, 10*l*s. 6d.; Boys' and Youths' Tricé and Hussar Suits, 30*l*s.; a Suit of Superfine Black Cloth, 3*l*s. 3s.; best quality, 5*l*—At **FISHER and Co.**'s, 31, King William-street, City, 10 doors from London-bridge.

TO LADIES.

ROWLAND'S KALYDOR.—Patronized by Her Majesty the **QUEEN**, the Royal Family, and the several Courts of Europe.—Composed of Balsamic Exotics, and utterly pure and free from all mineral or metallic admixture. It exerts the most soothing, gentle, cooling, and purifying action on the skin; and by its agency on the pores and minute secretory vessels, most effectually dissipates all Redness, Tan, Pimples, Blotches, Spots, Freckles, Chilblains, and other Cutaneous Visitations. The radiant bloom it imparts to the Cheek, and the softness and delicacy it induces on the Hands, Arms, and Neck, render it indispensable to every Toilet. Gentlemen will find it peculiarly grateful in allaying the irritation of the Skin after shaving.

CAUTION.—Each genuine bottle has the words "ROWLAND'S KALYDOR" printed on the wrapper.—All others are "SPURIOUS IMITATIONS." * * * To protect the Public from Fraud, *The Hon. Commissioners of Stamps* have authorized the Proprietors' Signature to be engraved on the Government Stamp, thus—"A. ROWLAND and SON, 20, Hatton Garden," which is affixed to each bottle. Price 1*l*s. 6d. and 8*l*s. 6d. per bottle, duty included. Sold by them, and by Chemists and Perfumers.

A FACT.—**MECHI'S MAGIC STROP** is known to have sharpened razors when all other means had failed. Those who doubt it can ask their friends, and if they purchase and are not satisfied may have their money returned. They are cheap—2*l*s. 6d., 3*l*s. 6d., 4*l*s. 6d., and the very large size 5*l*s., 5*l*s. 6d., and 6*l*s. 6d. each; the Magic Paste is 6d. and 1*l*s. per cake. Upwards of 150,000 Strops and 1,500,000 Paste have been sold in the last six years, which is a pretty good proof of their excellence. There is a little fact, however, to notice, which may prevent much disappointment and a good deal of pain,—sundry unprincipled persons desirous of sharing Mechi's good fortune, without being entitled to it, have made up thousands of common strops, calling them "The Magic Strop," "The Double Magic Strop," "The Real Magic Strop," and so on, taking care not to put on—"Mechi's Magic Strop." Now, by noticing the name Mechi on each Strop, with the address, No. 4, Leadenhall-street, London, you are sure to be right, as the law will not allow them to put Mechi's name on the spurious sort. These imitation strops are manufactured in large quantities at Sheffield, and shipped to a considerable extent to America and the colonies; and it is to be feared that, in too many instances, the buyers are not aware they are deceived, although they find them of no use in sharpening, which is a considerable injury to Mechi's good name. Most respectable Perfumers throughout the United Kingdom will supply the genuine Strops as cheap as it purchased at Mechi's. His Manufactory is at No. 4, LEADENHALL-STREET, LONDON, where may be had his famous Bagatelle-Tables, Dressing-cases, Papier Maché Goods; also his approved Razors, Penknives, and Table Cutlery. Catalogues may be had gratis.

PURE ST. VINCENT ARROW-ROOT.—This nutritious article is warranted equal in quality to the best Bermuda Arrow-Root, as certified by Dr. Ure; and being sold at a price considerably under that usually charged, cannot fail to be appreciated by Families as a great desideratum for the Nursery, as also for culinary purposes.

To be had in tin cases of 6, 12, and 18 lbs., at 1*l*s. 8d. per lb., of **SHUTTLEWORTH and STAMPER**, Chemists, 140, Leadenhall-street, or of **C. W. LOPRESTI**, 199, Piccadilly, sole Agents to the Importer.

WANT PLACES.—All Letters to be post-paid.

AS PRINCIPAL GARDENER.—A young Man who has from infancy been engaged in the Profession, and is well acquainted with the leading physiological principles on which the success of Gardening operations depends, he can be well recommended, and would be happy to take charge of an establishment where alterations are contemplated. The Metropolitan counties would be preferred. Wages, liberal; with garden-house, firing, &c.—Direct to E. H., to be left at the Central Post-office, Kentish-town, London. N.B. Travelling expenses will be expected to be allowed.

AS SECOND GARDENER.—A respectable young Man, aged 24, who has been brought up to the business, and has a good knowledge of Forcing of every description, having been engaged as Foreman in his last two situations, he has also lived in some of the principal families in the North, and can be well recommended by the Nobleman's gardener whom he is about to leave.—Direct to J. T., Hornby Castle Gardens, Catterick.

AS GARDENER.—A single Man, aged 28, who has a knowledge of his business in all its branches, having, from early life, been under the tuition of gardeners in large establishments in the north of England; can have a good character from the gentleman whose service he is leaving.—Direct to M. B., care of Mr. C. Chapman, Stationer, High-street, Croydon.

AS GARDENER.—A married Man, aged 30, without encumbrance, who thoroughly understands the management of Pines, Grapes, and Forcing; also the Kitchen and Flower Garden in all their departments. Character, unexceptionable.—Direct to L. N., care of Messrs. Batt and Rutley, Seedsmen, 412, Strand, London.

AS GARDENER.—A single Man, aged 30, who perfectly understands all kinds of Early Forcing, Kitchen, and Flower Garden, Greenhouse, Conservatory, &c.; can have 24 years' good character, and be well recommended from the situation he has just left.—Direct to G. B., *Gardeners' Chronicle* Office, 3, Charles-street, Covent-garden, London.

AS GARDENER.—A married Man, without encumbrance, aged 31, who perfectly understands his Profession in all its branches: can have a good character from the Situation he has just left. His Wife could also take charge of the Poultry if required.—Direct to A. B., care of Mr. Cuthbert, Nurseryman, Southgate, Middlesex.

AS GARDENER.—A respectable young Man, aged 30, in a Nobleman or Gentleman's family, who perfectly understands his Profession in all its various branches, together with Early Forcing of all kinds, Hot-house and Green-house Plants, Pruning Wall-trees, Flower and Kitchen-garden; can take charge of Meadow-land, if required, and can have 5 years' good character from the gentleman he has just left.—Direct to B. B., care of Mr. Hilliam, Thomas-place, South Tottenham.

AS GARDENER and FORESTER.—A middle-aged single Man, who has had considerable experience in every branch of his profession. Would not object to superintend any Farming department, if upon a moderate scale.—Direct to J. P. C., Olive Mount, Wavertree, Liverpool.

AS GARDENER.—A married Man, who perfectly understands the management of Forcing and Kitchen-garden; has had but three services in 24 years, and has lived eight years with the last family, who are gone abroad.—Direct to G. E., at Evans's Livery Stables, St. John-street, Clerkenwell.

Printed by Messrs. DRAYTON and EVANS, Lombard-street, Fleet-street, in the Precinct of Whitefriars, in the City of London, and Published by them at the Office, 3, CHARLES-STREET, COVENT-GARDEN, in the County of Middlesex, where all Advertisements and Communications are to be addressed to the Editor.—Saturday, October 28, 1843.

FINE NAMED TULIPS.—The Subscriber having a large supply of fine bulbs of the above popular flower, begs to offer them upon the following very moderate terms, viz.: 100 sorts by name for 5s.; 50 sorts by name for 2s. 10s., which will comprise portions of Bizarres, Roses, and Byblomens, and will be found worthy the attention of the amateur and practical florist.—**WILLIAM MAY,** Hope Nursery, Leeming-lane, Bedale, Yorkshire, Nov. 3, 1843.

TULIPS, &c.

JOHN SLATER, FLORIST, Chapel-lane, Cheetham Hill, near Manchester, begs to call the attention of Amateurs to his large and well-selected collection of TULIPS, AURICULAS, POLYANTHUSES, CARNATIONS, and PICOTTEES, Catalogues of which may be had on prepaid application.

J. S. requests a comparison of his prices of CARNATIONS and PICOTTEES, &c. with those which have been so highly spoken of by the Editor of a contemporary Publication in one of his Leading Articles, as well as twice in his notices to Correspondents (one not being sufficient), which will be found in many instances from 50 to 250 per cent. less in price, and all of which, at the time of layering, were in colour.

J. S. has published a descriptive Catalogue of TULIPS, price 2s., which may be had of Messrs. ORR and Co., London.

PELAGONIUM.—"BASKET'S EXQUISITE."

J. HALLY, NURSERYMAN and FLORIST, Blackheath, Kent, begs to inform his Friends that he has the above now ready for sale, at 2s. each, with the usual allowance to the Trade. It was raised by Mr. BASKET, Gardener to H.R.H. the Princess Sophia Matilda of Gloucester, and gained the first prize for Seedling Pelargoniums at the West Kent Horticultural Society's June Show, 1843; it was also shown and universally admired at the June Exhibitions both at Chiswick and Regent's Park. The following character is given of the above in the *Gardeners' Chronicle* of July 1, "Notices to Correspondents":—"J. H. B.—The large Seedling is a very showy variety: the flowers are large; it trusses finely, and will form a fine object in the Greenhouse," &c. "The colour is clear; the upper petals are well covered, with but little feathering visible; the under petals are broad and round, and the flower altogether of a good shape."

Also a few plants will be ready by the middle of November of that good and beautiful CINERARIA, "PIPER'S PRINCESS ROYAL," which obtained a Certificate of Merit, although then a miserably small specimen with only two or three blooms expanded, at the June Show at Chiswick; also the first prize for Cinerarias at the Regent's Park Show, on the 28th June.—(See *Gardeners' Chronicle* for June 24 and July 1.) It has a fine full crimson centre, petals broad and well-shaped, pure white broadly tipped with purple, the colours distinctly defined, so as to form a ring on the expanded flower, which is very sweet-scented and possesses the best properties. In consequence of the very limited stock of the above, and the orders already received, the Advertiser will be able this autumn only to supply the trade at 10s. 6d. each.

Also at the same time CINERARIA SUBCERULEA—a delicate white tipped with azure: plant of very fine robust habit, 5s. each.

BRUGMANSIA SPE. NOVA.

THOS. BRIDGFORD and SON, Spa Field Nursery, Ball's Bridge, Dublin, having a fine stock of the above plant, which will prove a valuable addition to the Greenhouse, from its propensity to flower in plants at 12 to 18 inches high. It is perfectly distinct from all of the species. Strong established plants are now ready for sending out at 10s. 6d. each. Thos. B. and Son have also a fine specimen plant of the same, with three flowers now expanded, it is three feet high, well furnished, which they will dispose of. B. Spe.—Plant flowers abundantly on small specimens, flowers about the same length as those of B. suaveolens, with the calyx full half the length of the corolla, both white; flowers highly perfumed, the rim of the corolla is divided into five long points; rim and calyx much reflexed, which, with the long calyx, give the plant a decided character; the throat of the corolla is of a beautiful greenish white colour.

Answer to "J. C. L." *Gardeners' Gazette*, May 28th, 1842:—"If your Brugmansia retains its large spathaceous calyx, it must be new. Florapandia is the name given to B. coccinea. We are not acquainted with the present species. It does retain its large spathaceous calyx.—J. C. L."

A plant having been sent by us to Mr. Low, Clapton, with seven flowers expanded, to be by him exhibited at the Chiswick Horticultural Show in August, 1843, the flowers of which were injured in its transmission, consequently was not exhibited; it has since flowered with Mr. Low, and is noticed in "Paxton's Botanical Magazine" for September, 1843. The seeds of the above species were received by J. C. Lyons, Esq., Ladiston, Westmeath, from Chili, from whom we received our plant.

The Double White Brugmansia, noticed by Dr. LINDLEY in the *Gardeners' Chronicle*, September 16th, 1843. Seeds of which were also received from Chili by "J. C. L.," along with B. Spe. Nova, plants of which T. B. and Son will have ready to send out in May, 1844. 4s. Lower Sackville-street, Dublin.

TO PLANTERS, &c.

FRANCIS and JAMES DIXON, NEWTON and UPTON NURSERIES, CHESTER.

WE beg most respectfully to draw the attention of Noblemen, Gentlemen, and others to our EXTENSIVE and very SUPERIOR STOCK of Seedling and Transplanted FOREST-TREES, now growing at our Nurseries as above, and also at the Newtown Nursery, Montgomeryshire, which comprises all ages and sizes of Larch, Scotch, Spruce, Silver, and Balm of Gilead Firs; Oaks, Alder, Elms, Ash, Beech, Birches, Chesnuts, Hazel, Hornbeam, Sycamore, Poplars, Privet, Thorn, Quicksetts, &c. &c. And as this season has been particularly favourable for the growth of Trees, we may be allowed to state to our Customers and Planters generally that we never were so well prepared to execute all orders committed to our care, with vigorous and carefully grown Trees, on the most reasonable terms.

Having for a series of years devoted considerable attention to the rearing of FRUIT-TREES, we are happy to announce that our present Fruit-tree grounds are thoroughly stocked with fine well-rooted Trees, of every description, suitable for Walls and Orchards, and such as we can with much confidence recommend, being all correctly named—so desirable to Fruit-tree purchasers.

In our ROSE department we cultivate all the most esteemed varieties, annually adding such New Kinds as are considered first-rate, either in their formation, colour, or perfume, and stamped with the approbation of the great Rose acquirers of the South. And in the training of our Standards, Half-Standards, &c. great pains have been taken to graft on carefully-selected and healthy stocks.

The other parts of our Nurseries also abound with full collections of Herbaceous and Alpine Plants, American Evergreen and Flowering Shrubs, Greenhouse and Orchidaceous Plants, Dahlias, Carnations, Pinks, Tulips, Verbenas, Lobelias, Pansies, and every other article connected with the Nursery business.

We have now on Sale at our Warehouse in Chester, Winter Vetches, Winter Oats, and Rye, several Newly-Imported Seed-Wheats, &c.; Italian and Dutch Bolls, this being the proper season to plant Hyacinths, &c. in pots and glasses.

A first supply of Early Garden Seeds daily expected to arrive. LARGE NEW MATS, MUSHROOM SPAWN, &c.

All orders will command our utmost attention, and will much oblige FRANCIS and JAMES DIXON, who have at present on their list a number of experienced Gardeners, Land Stewards, and Wood Foresters, whose characters and abilities may be strictly relied on.—October 24, 1843.

THOMAS BROWN begs to acquaint the Growers of PANSIES that strong Plants of his fine collection are now ready for sending out, including several novelties not before offered for sale; also, an extensive collection of PINES (comprising all the established Show-flowers), CARNATIONS, PICOTTEES, TULIPS, &c., &c.—Slough Nursery, Nov. 3, 1843.

BURBIDGE and HEALY'S NEW PLAN FOR BOILERS AND SETTING, FOR WARMING HOTHOUSES, GREENHOUSES, CHURCHES, AND PUBLIC BUILDINGS, MANSIONS, &c., &c.

Registered under 6 & 7 Vic., c. 65.

"Section of Boiler and Furnace."

Since our Advertisement of October 21, 1843, we have received an immense number of letters from all parts of the United Kingdom, inquiring the particulars of our Apparatus, and many asking in what respects our plan is superior to others. We beg respectfully to inform our Correspondents, and the Horticultural World, without reference to any of the numerous and ingenious Boilers and Apparatus now in general use, that we will endeavour to convey in as few words as possible, what we consider the advantages of our plan. In the first place, it will be observed that the plan of the Boiler and containing furnace is circular; the Boiler being composed of two truncated cones, one inserted one within the other, in such a form as to give the best effect of the fuel upon its sides, and the form is such as to offer a very extensive surface to the action of the fire and heated air, the whole surface being exposed to their joint action, as well also as a considerable portion of the conducting pipes. It will also be observed that the side of the Boiler is ribbed, which vastly increases the surface of it, so that we obtain a very powerful Boiler in an exceedingly small compass. We beg also to call attention to the absence of complicated flues, as the form of the boiler prevents the dust or soot hanging to its sides, and the top is easily got up and cleaned through the door in front elevation C. (p. 732.) In no place is the fuel in contact with the Boiler, as in cases where it does we apprehend great loss of fuel, and effect takes place from the rapid abstraction of the heat causing imperfect combustion of fuel. The value of this form of Apparatus is much increased by the excellence of the fire and ash-pit doors (Sylvester's Patent), which are fitted with great accuracy, allowing of the utmost precision of regulation—of the greatest importance to the skilful Gardener, as it enables him to continue his fire for any required time, without trouble to himself; or he may at any time, by closing up the door, put out the fire. By not allowing a current of air to pass through the furnace, he thereby prevents the heat of the Boiler and brickwork being conveyed away and lost up the chimney. The Pan, marked Z, is a neat and convenient cover for the top of the brickwork, easily removed and replaced by the Gardener for the purpose of cleansing the Boiler. It acts as a reverberator, and may, under ordinary circumstances, be filled with non-conducting material, clean sand, or pebbles, or any other suitable material; and in cases where the Apparatus is fixed within the House, it may be used as a means of rapidly saturating the house with moisture by evaporation. By placing the Furnace within the House to be warmed, we believe the utmost economy of heat is produced, as, from the circular form of the Apparatus and the small space it occupies, it would have a neat appearance. In short, under every circumstance, we believe it to be a perfect arrangement for Horticultural purposes—being simple, economical in first construction, unquestionably durable, and safe; the perfection of economy in fuel, most easily managed; no poking of fuel into small holes, or troublesome extraction of clinkers; adapted with great facility to the circulation of water through pipes, or to the excellent Tank-System of Rendle, or in any way most suitable to the views of the intelligent Horticulturist.—**BURBIDGE and HEALY, 130, Fleet-street, London.**

WM. HEALE and SON, NURSERYMEN, &c., beg most respectfully to acquaint the Public and Trade in general that they have still a large stock, both Standards, Dwarf, and Trained, of their celebrated HYBRID PLUM, raised between the Greengage and Orleans. And as their circular of last season respecting it was limited to their immediate connexion, they now call the attention of the public to the following particulars: colour yellow, inclining to russet next the sun, size of a modern Apricot, possesses the flavour of the Greengage, with the prolific habits of the Orleans, and bears abundantly either as a standard or trained, constituting a most important addition to our hardy fruits, and ought to be grown in all collections. Fine three-year-old trees, 3s. 6d. each; do. trained, 5s. each.

Nurseries, Calne and Devizes, Nov. 3, 1843.

ON SALE, as under, fine healthy well-furnished Plants, twice transplanted, and very suitable for planting as Game Cover, 20,000 EVERGREEN PRIVET, 24 to 36 inches high, at 20s. per 1000. 12,000 COMMON LAUREL, 18 to 24 inches high, at 50s. per 1000—will be delivered at Liverpool or Whitehaven; free of charge.—Apply to **DAVID CRIDIE, Nurseryman, Gatehouse, N.B.**

MYATT'S NEW SEEDLING STRAWBERRY.

J. and W. MYATT are now ready to send out their NEW STRAWBERRY, the DEPTFORD PINE, the fruit of which has been exhibited at the London Horticultural Society, and a Balkan Medal awarded. It has also been submitted to Professor LINDLEY, for whose opinion see *Gardeners' Chronicle*, No. 26, p. 447. It is a most prolific bearer, exhibiting at the same time a profusion of fine fruit and bloom on the same truss. Price, Deptford Pine, 2s. 10s.; British Queen, 1s., and Eliza, 10s. per 100.—Manor Farm, Deptford, Nov. 3, 1843.

THE BRITISH QUEEN AND PRINCE ALBERT PEAS.

W. J. CORMACK and CO. beg to announce to their Friends and the Public that they have harvested the above two New Varieties, and will be obliged by early orders, as the stock is limited. They will be sent out, as last spring, in packages, bearing the name of the firm, price 3s. 6d. per quart. The usual allowance to the trade.

N.B.—"Cormack's Early Kent Peas," 14s. per bushel. Newcross, and Bedford Conservatory, Covent Garden, Nov. 3,

SHILLING'S NEW EARLY GROTTO PEA.

J. and S. SHILLING have succeeded in raising the above Pea. The Early Frame Pea, impregnated with the Grotto or Oyster Marrow, which they with confidence recommend to the Public generally, being quite as early, and nearly double the size of any early Pea in cultivation. Quite hardy, will stand the winter well, and a good Bearer; the Pod large and long. They would particularly recommend it to the attention of Market Gardeners.

Price 3s. per Quart; 10s. per Gallon; 17s. 6d. per Peck; 30s. per Half-bushel; 2l. 10s. per Bushel. They have likewise a few Packets of Calceolaria Standishii Seed, at 5s. per packet; sent free by post, on the receipt of Postage-stamps, or a Post-office Order.

London Agents: Messrs. FIELD and CHILD, Seedsmen, 119, Lower Thames-street, London; Messrs. W. and T. NOBLE, Seedsmen, 152, Fleet-street, London.

J. and S. SHILLING, Nurserymen, Northampton, Odham, Hants, Nov. 3, 1843.

TO NOBLEMEN, GENTLEMEN, NURSERYMEN, DIRECTORS OF PUBLIC CEMETERIES, and other Public Companies engaged in Planting.

MESSRS. PROTHEROE and MORRIS are instructed by the Proprietors to submit to Public Competition, on the premises, the Kensington Home Nursery, fronting the Great West Road, on MONDAY, 6th November, 1843, and following days, at Eleven o'clock each day, the varied and interesting NURSERY STOCK OF ORNAMENTAL TREES AND SHRUBS; well deserves the attention of Gentlemen who intend planting this autumn, and consists of large Magnolias, of sorts including the fine specimen of Magnolia conspicua, Cedar of Lebanon, Fan Yews, Pinus cembra, with a very extensive Collection of Evergreens of every description. This ground is proverbial for the fineness of its specimens and their safe removal, being of a loamy and adhesive nature; but is now required for building purposes. May be viewed a week before the sale, and Catalogues had of all the principal Seedsmen, and of the Auctioneers, Leytonstone.

Messrs. FORREST and Co. take this opportunity of inviting to an inspection of their general Stock in their other Nurseries, in the Gloucester-road, within five minutes' walk of their home-grounds.

PLANTING SEASON.—TO NOBLEMEN, GENTLEMEN, PUBLIC COMPANIES, NURSERYMEN, BUILDERS, AND OTHERS.

MESSRS. PROTHEROE and MORRIS have the honour to announce they have received instructions to submit to Public Auction (without reserve on the premises, at the Cottage Nursery, Gloucester-place, Camberwell New-road, and the Gravel Field Nursery, Brunswick-road, opposite, on MONDAY, NOVEMBER 20, 1843, and following days, at Eleven o'clock each day, a most extensive and varied Stock of ORNAMENTAL TREES, SHRUBS, and EVERGREEN AMERICAN PLANTS, ROSES, &c. STANDARD and DWARF TRAINED FRUIT TREES of the choicest sorts. Messrs. PROTHEROE and MORRIS beg to observe it has seldom been their lot to offer to Public competition so desirable a stock of thriving plants of every description and so well worthy the notice of noblemen and gentlemen who may be planting or making alterations on their estates. The stock will be lotted to suit every description of purchasers, and may be viewed the week previous to Sale, when Catalogues 1s. each, returnable to purchasers, may be had on the premises, of the principal Seedsmen, and at the Auctioneers' American Nursery, Leytonstone.

DERBY.—TO NOBLEMEN, GENTLEMEN, NURSERYMEN, and Others, intending to plant.

MESSRS. WILSON and SADLER beg, through this medium, to communicate that, in consequence of the expiration of the Lease of one of their Nurseries at Christmas next, they will have to offer by Public Auction, on TUESDAY and WEDNESDAY, the 7th and 8th of November next, the following valuable NURSERY STOCK:—

60,000 English Oaks, 1 to 2½ ft	300 Weymouth Pines, 3 ft
1,725 Canada grafted Elms, from 4 to 10 ft	9,000 Privet, from 6 inches to 1 ft
4,331 Canada Elms, this summer budded	150 Ornamental Thorns
21,468 Broad-leaved Common Elms	35 Canada Service Trees
100 Devonshire Elms, 4 to 6 ft	25 Snowy Mespilus
1,100 Mountain Elms, 4 to 6 ft	10,000 Hollies, from 1 to 4 ft, Silver and Gold Striped ditto
511 Elms, various varieties, 4 to 6 ft	20,000 Common Laurels, from 1½ to 3 ft
17,456 Common Beech, from 1½ to 3 ft	2,000 Portugal Laurels
200 Purple Beech, various sizes	1,500 Fine Standard Apples, fine sorts
50 Striped leaved Beech	1,000 Dwarf Apples
5,082 Birch, various sorts, from 2 to 5 ft	600 Standard Pears
2,350 Spanish Chesnuts, from 2 to 6 ft	300 Dwarf ditto, trained and untrained
7,250 Horse Chesnuts, from 2 to 10 ft	1,400 One-year Pears, fine sorts
1,150 Hornbeam, from 2 to 4 ft	100 Plums, Standards
14,968 Mountain Ash, from 2 to 6 ft	200 Dwarf Plums, kinds, fine
32,750 Alders, from 1 to 3½ ft	1,400 Common Plums, budded
1,620 Area Theophrasti, from 1½ to 4 ft	1,500 Mussil Plum budded with Apricots
9,900 Sycamores, from 2 to 10 ft	300 Standard Cherries
27,000 Larch, from 1½ to 4 ft	200 Dwarf ditto
5,000 Poplars, of various sorts, from 5 to 8 ft	300 Damsons
750 Hazels	300 Fruit-bearing Almonds
1,000 Willows, French, Weeping, and others of the newest kinds	400 Dwarf Peaches
21,980 Spruce Firs, from 12 in. to 2 ft	200 Dwarf and Standard Apricots, &c.
12,000 Scotch Firs, from 1 to 3 ft	115,000 Seedling Oaks
2,800 Silver Firs, small, from 4 to 9 inches	24,000 Seedling Crabs

N.B.—All the above are in Lots.

Messrs. W. and S. respectfully invite attention to the valuable Stock above enumerated, which will be put up in lots to suit purchasers, and sold without reserve. The convenience of immediate transit by Railway from the Derby Station close adjoining, will enable Gentlemen or Nurserymen to forward articles to any part of the Kingdom in a few hours. The sale will commence the first day precisely at Eleven. The Stock may be viewed on application to the Foreman at the Nurseries, or at the Seed Warehouse, Cheapside, Derby.

TO BE SOLD.—A BEAUTIFUL AND DIMINUTIVE BULL AND COW, from the Himalaya Mountains; the Cow forward in calf; they are about 35 inches high, in high condition, and perfectly inured to the climate of this country. Apply to **I. L. TEMPLER, Esq., Torhill, Taybridge, Devon.**

TO GENTLEMEN AND GARDENERS.

TO BE SOLD.—A NURSERY STOCK, consisting of Several Hundred of young Oak, Chesnut, Plane, Birch, Beech, Poplar, and other Forest and Choice Fruit Trees; also flowering shrubs; at 30 per cent. lower than the usual price, as the ground must be cleared in a month.—The Nursery in the Wyndham Road, late in the occupation of Buchanan and Co., and now belonging to Mr. SCORE, 4, Priory Place, Camberwell, New Road, where parties may apply.

TULIPS.

H. GROOM, Clapham Rise, near London, (removed from Walworth; by APPOINTMENT, FLORIST TO HER MAJESTY, begs to remind the Nobility, Gentry, and Amateurs, that this is the season for making up their collections of TULIPS preparatory to planting next month. He therefore recommends that an early application be made, as it not unfrequently happens that gentlemen are unable to obtain the kinds they require, from not applying sufficiently early. His Catalogue of Bulbs will be forwarded by post, on application.—Nov. 3, 1843.

The Gardeners' Chronicle.

SATURDAY, NOVEMBER 4, 1843.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

Tuesday, Nov. 7.	Horticultural	3 P.M.
Wednesday, Nov. 8.	Linnean	8 P.M.
Wednesday, Nov. 8.	Society of Arts	8 P.M.
Wednesday, Nov. 15.	Microscopical	8 P.M.
Friday, Nov. 17.	Botanical	8 P.M.

WITH the most sincere regret we announce the death of the Rev. William Lewis Rham, M.A., a Member of the Council of the Royal Agricultural Society, and one of the best Agricultural writers of our day. We need only point to his excellent articles in our own columns under the signature "M." and to his many valuable contributions to the "Penny Cyclopædia," and the "Journal of the Agricultural Society," to show what a serious loss the science of Agriculture has sustained in this kind, good, and amiable man, who died at his living of Winkfield, in Berkshire, on the 31st ult., in the 64th year of his age.

THE attention which Professor Henslow and other writers in this Journal have directed to the new Agricultural pest, called the Clover Dodder, will, we trust, cause it to be destroyed before it can have had time to spread. And it will doubtless be consolatory to the farmers to know that if it can once be driven off there is little or no chance of its return.

Several writers have stated that it appears to have been introduced from Cabul with the Lucerne, of which we have lately had some importations; and we are enabled by the favour of a correspondent to confirm this supposition beyond all question.

"I have witnessed," he says, "in the extreme north-western portion of Northumberland, a fact which seems to confirm the opinion that a species of *Cuscuta* has been introduced into England with the seed of Trefoil from Khelat. A packet of that seed was sown last spring in rows, in soil prepared for a hedge at the edge of a meadow which had meadows also on three sides of it, and no arable land near it. *Cuscuta* is said to have been previously unknown in that district, and has not been seen, as far as I have learnt, this season. It had seized on two or three patches of the Trefoil, when, in consequence of the first notice on the subject in the *Gardeners' Chronicle*, an examination was made, and the infected Trefoil plants, with their enemy, removed and destroyed. As the latter had no flowers the species could not be determined. I have the pleasure of sending you a packet in the state in which it was purchased at a bazaar with that which produced the *Cuscuta* above mentioned. Close examination may possibly detect the seeds of the parasite mixed with those of the Trefoil."

We have carefully examined the seed alluded to in the foregoing letter, and we are able to state that the seed of *Cuscuta trifolii* was in it. Out of a small packet we have picked thirteen seeds, each with its snake-like embryo perfectly alive and fit for growth.

We are also enabled to state something more important; namely, that the Dodder-seed may be readily separated by sifting. Lucerne-seeds are about 2 lines long, and $1\frac{1}{2}$ broad. Clover-seed is much the same; the Dodder-seed is spheroidal, and scarcely a line in diameter. It is of a pale-grey colour, in form like the quarter of an Orange, and looks more like fragments of grey clay than an organised body.

As there has been a little skirmishing in our columns about the priority of some imaginary discoveries relating to the name and so forth of this plant, we may as well take the present opportunity of staying all further expenditure of powder by stating that the discovery of the species probably rests with Dr. Roxburgh, in whose "*Flora Indica*," Vol. i., p. 447, it is described under the name of *Cuscuta sulcata*.

We have seen with great regret some letters in the Daily Papers complaining of the conduct of visitors to Kensington Gardens, where of late so much pains have been taken to render them instructive and interesting by the introduction of named collections of shrubs and flowers. We regret still more to say that the allegations are true.

The first of these malpractices (says a writer in the *Times*) commences in the spring, when a systematic pillaging of all the birds' nests takes place; not a single blackbird or thrush, whose song at this season is so peculiarly attractive, is suffered to escape,—and were it not for the protection afforded (by express command) to these beautiful songsters in the grounds

of Buckingham Palace, and the keeper's island in St. James's Park, not a note would be heard in any of our parks, and these joyous harbingers of spring would, near London, be exterminated. The second nuisance is the plucking of the flowers, and the stealing of roots and plants almost as soon as they are put into the ground. The best of the Dahlias last season were carried off almost immediately they were planted, and the Pinks and Geraniums were all stolen, one after the other, within a few days of their being transplanted. The third nuisance occurs in the autumn, when the very seeds are stolen, and by persons well dressed.

It is a lamentable thing that the excellent intentions of the Commissioners of Woods and Forests should thus be frustrated by the well-dressed, or ill-dressed, scamps who abound in all great cities, and we should be glad to learn that the example of the good people of Frankfort were followed when such people are caught. Mr. Jessie tells us that "The public gardens at Frankfort are only separated from the high-road by a single rail; and yet nothing is injured, although no one is excluded. In these gardens, a nightingale had for many years built its nest on a particular spot, close to one of the walks. It was seen by every one, and yet no one molested it; until, one day, a foreign servant saw and took it. When it became known, the man was hunted by a mob, taken before the city authorities, and, the fact being proved, he was sentenced to have his coat turned, to be drummed out of the city with every mark of disgrace, and never to enter it again."

Without, however, resorting to means of this kind, which suit Germany better than England, we think that a remedy may be easily found in the plan suggested by the writer in the *Times*, from whom we have already quoted; namely, that a few persons should be constantly employed in Kensington Gardens in looking after the borders, and that a very much larger number of notices warning the public against picking and stealing should be posted about the grounds; to which we would add the dispersal of a few policemen in plain clothes among the thievish crowd, with orders to seize the best dressed persons they could see in the act of plunder. A morning at Kensington Police-office would prove a salutary lesson to such gentry. At Hampton Court, at Kew, at the Gardens of the Horticultural and Zoological Societies, no robbing worth talking of takes place; but then these places are always guarded by workmen engaged in their ordinary duty. We would not answer for their security if the well-dressed mob of London had free liberty of amusing themselves without control. We earnestly hope that the Commissioners of Woods and Forests will adopt so simple a plan for preventing plunder. The Long Walk in Kensington Gardens is, we understand, under the special care of no one. Altogether, there is only the occasional attendance of three men for all the work of the pleasure-ground there—a number barely sufficient for the duty, even if constantly employed. If each of the long beds—and there is nearly a mile of them in length—was placed under the constant charge of some one gardener, he would naturally take a pride in them, and there would be some responsible persons who would be ambitious of the credit of keeping the grounds in order, and would on the other hand have the blame and censure, should the beds be slovenly and ill kept.

The desire of Lord Lincoln is evidently to beautify the Gardens for the pleasure of the public. We are sure that his Lordship only requires to be made aware of the evils now complained of, to cause effectual measures to be taken for preserving the flower-beds in the state in which they ought to be; and, above all, for rewarding the gentry who have been thus offending, in the manner best suited to their conduct, and least agreeable to their feelings.

A COMMENTARY ON CERTAIN PASSAGES IN THE PHYSIOLOGICAL WRITINGS OF THE LATE THOMAS ANDREW KNIGHT.

BY W. WOOD.

NO. I.—ON THE ADVANTAGE OF EMPLOYING VEGETABLE MATTER AS MANURE IN A FRESH STATE.—Opinion, founded upon experiments, "that many vegetable substances are best calculated to reassume an organic living state, when they are least changed and decomposed by putrefaction."

First experiment, upon a seedling Plum—The seed placed in a small garden-pot, and nearly filled with living leaves and roots of grasses, mixed with a small portion of mould, placed under glass, without other artificial heat; appeared in April—was removed into a larger pot three times during the summer, each time with same kind of material for potting; end of October occupied about one-third of a square foot, at which period its height was 9 feet 7 inches. Further experiments in manuring Turnips with green fermented Fern and black vegetable mould, and branches of trees in every stage of decomposition—the latter applied four-fold more than the former—the result being greatly in favour of the former; the growth, &c. being much more rapid than the effects from either vegetable mould or stable produce, and distinguishable in the autumn from the rest of the field, by the deeper shade

of their foliage. The above experiments conceived to be satisfactory, in showing that any given (I presume *proportionate*) quantity of vegetable matter can generally be employed in its recent and organised state with much more advantage than when it has been decomposed, and no inconsiderable part of its component parts has been dissipated and lost during the progress of putrefaction and fermentation.—*Hort. Trans.*, vol. xvii.

Remarks.—This interesting fact, though valuable in its results when applied to the cultivation of plants remarkably robust in constitution, or known to be gross feeders, and under the most favourable circumstances, does not appear equally applicable to the general cultivation of exotic plants in pots. Had the experiments been applied to the management of ornamental plants, even in the attainment of a medium growth, I have no doubt that the results would have been less favourable, for the following reason:—The higher we rise in the scale of cultivation, the more powerful are the agencies required to effect our purpose. And in the cultivation of plants intended for superior growth, there are many instances of extreme fluctuations of temperature, to which the amount of counteractive agency is unequal; and hence I infer, from abundant evidence, that the mechanical texture and effect of undecomposed vegetable matter would by no means balance the injurious influence of its absorbent properties. The undefinable variations of vegetable structure and capability of assimilating matter as food, under equal variations of atmospheric and solar agency, would preclude the application of undecomposed vegetable matter in many elaborate processes of cultivation. The accumulative system of culture is negated in the above facts.

NO. II.—ON THE MOST ADVANTAGEOUS FORM OF GARDEN-POTS.—"I have constantly found the growth of trees to be most rapid when the roots and leaves are brought nearest to each other, under similar external circumstances; and the horizontal space necessarily occupied by the leaves and stems of plants will in almost all cases exceed the width of the pots, of the form now recommended; the width of each being as 8, its depth will be as 6, and its smallest width at its base as 5, inside measure."—*Hort. Trans.*, vol. iii., p. 378.

Remarks.—At p. 110 of "*Paxton's Magazine of Botany*," an opinion is offered that "the capability of roots to fulfil their natural functions will be in proportion as modes of cultivation approach Nature so nearly, as to permit their free extension and ramification in search of elementary substances, &c.: and that it will probably be found that the amount of food thus obtained will be commensurate with the dispersion of the roots over a given surface;" which opinion appears strictly to coincide with Mr. K.'s view.

NO. III.—ON THE APPLICATION OF MANURE, IN A LIQUID FORM, TO PLANTS IN POTS.—"A large extent and depth of soil seem, therefore, to be no further requisite to trees than to afford them a regular supply of water, and a sufficient quantity of organizable matter; and the rapid growth of plants of every kind when their roots are confined in a pot to a small quantity of mould, till that becomes exhausted, proves the truth (sufficiently) of this position."—*Hort. Trans.*, vol. ii.

Remarks.—It would appear from the "rapid growth" here spoken of, that Mr. K. believed plants capable of the most rapid growth when confined in small pots and removed to larger, according to the ordinary and restrictive system. But this opinion can be only maintained by showing that a small plant removed in its young and excitable state to a larger quantity of soil, of a texture and quality adapted to its growth, and so mechanically arranged as to enable its tender organs progressively to assimilate its food without being liable to an impeded circulation of moisture,* is, in reality, making a slower progress to maturity than a small plant, "confined to a small quantity of mould." But the real difference I presume would be, that the former, by a judicious adaptation of its organs to the increased amount of agency brought to act upon it, would be attaining an accumulative vigour by a uniform development of its axillary buds, and consequent deposition of a uniform amount of organizable matter, whilst the latter, if allowed to surpass the other by a more rapid growth, could only do so by an attenuated growth, which is invariably connected with abortive or undeveloped leaf-buds. In the former, accumulation is not only progress, but maturation; in the latter, rapid growth is abortion, and loss of functional power, by the repeated intervention of secondary causes, each of which interferes with an ultimate effect. This paper fails to recognise any principle which involves the application of higher agencies in Nature, or any modification of organic matter, to be rendered successively applicable to the different stages of growth.

(To be continued.)

ON THE ATMOSPHERE OF HOTHOUSES.

WHILE the importance of a suitable temperature for plants, and the best means for effecting that object seem to be acknowledged by Horticulturists, as your columns testify, I would beg to use the same vehicle for a few hints of a wider range, and take up the atmosphere of hothouses as a subject of more general and comprehensive import. In considering this subject, it obviously arranges itself under the four heads of heat, light, moisture, and chemical constitution; all of which conditions must be distinctly attended to by the practical gardener in the atmosphere of his hothouses, if he hopes to make their inmates emulate the luxuriance of their natural compeers in wood and wild. As the rays of our unaided sun are inadequate to the production of sufficient

* Paxton, p. 110.

heat for the growth of tropical and many other tender plants, artificial means have been resorted to in order to make up this deficiency. With the more early gardeners, the production of a sufficient heat in forcing seemed their Alpha and Omega, for they were then unacquainted with vegetable physiology, and the conditions requisite for the proper development of plants: hence the heat and smoke of an ordinary fire, conducted through thin walled brick flues around the interior of the building, gave the heat required. This source of heat, however, has been found both unstable and impure: the plants in a house thus heated are liable to be scorched at one time and chilled at another, and subjected at all times to the influence of pernicious vapours, which escape from the flue at the joinings of its brickwork. The most obvious means to remedy the defects of the ordinary flue was to increase the thickness of its walls, and this practice has been adopted and given to the public by several of your correspondents. The body of material heated being considerable, a house so warmed is not liable to the sudden alterations of temperature of one with the common thin flue; neither can hurtful vapours escape readily into the interior. I myself have tried this plan to a small extent and find it much superior to the old flue; and in small houses of a cheap construction I believe it is the cheapest and best which can be adopted. One of your correspondents, if I recollect right, recommended a nine-inch flue surrounded with two feet of brickwork to run through the house. I would prefer and have used a flue of larger calibre, arched over the surface or upper side: this should run through the house longitudinally, and get gradually larger as it recedes from the fire: in this way a pure and equable supply of heat may be obtained at little cost and trouble. As this is a method of heating suitable for amateurs, who however fond of plants, require to husband their means well in following out their fancy, you will pardon me in being a little more particular, even although I should to some extent anticipate my fourth general head in pointing out the method of ventilation. In building the house, small openings like pigeon-holes should be left along the back wall, about the level of the ground, and two feet asunder; from each of these openings, on the inside, a canal, formed of two bricks on edge for the sides, with bricks on flat for soles and covers, should lead across the house, under the flue, to its farther side: the bottom of these canals (which will be about four inches and a half square on the inside) are not to be on a dead level, but to rise inwards, so that by the time they reach the middle of the bottom of the flue their base may be rather higher than their tops are on the outside of the wall. Along the bottom of the flue, (ere it is built, of course,) build another canal of like size with the cross ones, on the same level, and uniting with them at right angles. The heating flue having been now built, and the outlets of the cross canals carried up a few inches on its front side, you possess an apparatus for ventilation which will supply your house at all times with pure and warm air. The reason of the cross canals being made to rise a little in their course, is to insure the escape of the warm air of the longitudinal one under the flue, into the interior of the house, instead of finding its way outwards into the external air. The port-holes may be allowed to remain open at all times, for more cold air cannot enter them than is permitted to escape through the roof and other openings of the house; when a stronger ventilation is required, pull down the sashes more or less, as you wish this to be. If you wish a good draft, the flue should rise a little in its course above the level next the fire. To obtain moisture a ledge of brick can be attached to the upper surface of the flue to confine a few inches of sand, by wetting which, moisture is given off to the air of the house. For an amateur with limited means, a house suitable for the growth of almost any sort of plant may thus be cheaply obtained; and it is on their account I have furnished these remarks. Water and steam are the two means, however, now getting into general use for heating Horticultural and other buildings. For large establishments we believe steam to be the preferable material, as one furnace and boiler will supply the whole. The temperature too of any building is perfectly under command, for with a few extra metal pipes or boxes, communicating with the steam-pipe by stop-cocks, a greater or less extent of heating surface can at any time be obtained, and the heat thus modified according to inclination or the rigour of the weather. Water-tanks for bottom-heat can also be readily put in operation by steam; and any state of dryness or moisture kept up in the atmosphere by suffering more or less of it to escape through properly-distributed minute openings. But while steam is quite suitable for extensive establishments, and in the neighbourhood of machinery where a steam-engine is at work, heated water is a more manageable medium, and much more employed for communicating heat. For this purpose it is made to circulate either through close pipes of cast-iron, or open and covered gutters and tanks. The principle on which this circulation depends is the different densities of warm and cold water, combined with the hydrostatic fact of all fluids finding their level; and any one thoroughly acquainted with these two principles can at any time plan and modify a hot-water apparatus at his will. As a suitable soil-temperature is as necessary for the luxuriant growth of many plants as a suitably warm atmosphere, tanks of hot water are getting into general use for the purpose of communicating the requisite heat to soil or sand placed over them, and into which the plants are rooted or the pots plunged. The elder gardeners and many of the brethren still are fermenting material for the purpose of producing this bottom-heat, and, in some respects, with decided advantage, as I will attempt to prove under the head of Chemical Constitution. When, however, a

steady moderate bottom-heat is required, there can be little dispute about the utility and docility (if I may use the phrase) of the tank system.—J. L. Newhurst.

(To be continued.)

PLAN OF A PINE-PIT ERECTED AT HEWELL, FOR THE HON. R. H. CLIVE, M.P.

By permission of Mr. Clive we are enabled to publish the following plan of a Pine-Pit, whose bottom-heat is supplied by hot water, and the air-heat by a common flue, as it has been constructed by Mr. J. Jones, of Birmingham. When we saw it, a month ago, the plants were in the best possible health; and Mr. Markham informed us that it worked so well, that he hoped it would soon be lengthened.

Its length is 40ft. 6in., its width inside 12ft. 9in., its height in front above the ground 1ft. 6in., and at the back 5ft. 5in. A is an air-pipe, whose orifice is at the ground level, and which passes underground into a hot chamber,

which it enters at D. A plug at A being removed, cold-air rushes down into the chamber, passes through a pigeon-holed wall at F, rises through a cavity to E, whence, loaded with vapour, it is admitted into the house when occasion requires. C C are two zinc open troughs, 12x5in., filled with water, communicating with a saddle-backed boiler, and passing along the house in a chamber

WHEAT ON THE SAME LAND, YEAR AFTER YEAR.

THE accompanying letter from the *Manchester Guardian* appears to me to be of sufficient importance to deserve a place in your columns. I could wish to stimulate other parties to experiment in the same way, and doubt not if the plan is followed up perseveringly in various soils and by different persons very important results will be obtained.

"I was led into these experiments by reading Liebig's book on the Chemistry of Agriculture; for, assuming his theory to be true, it appeared to me to be quite possible to grow Wheat on the same land, year after year; as, according to that theory, the carbon, oxygen, and hydrogen which constitute the great bulk of all cereal crops (both grain and straw), are supplied in abundance from the soil and atmosphere (or perhaps, to speak more correctly, from the latter), and we have only to supply those inorganic substances, which, however numerous, form but a small part of the whole weight of the crop. With the view of testing this theory, and hoping that I might be able to find out what were the elements which built up and cemented the carbon, oxygen, and hydrogen together; or, in other words, which constituted fertility, I began in the autumn of 1841, to experiment on a field which had been exhausted by a succession of crops, and which had just been cleared of one of Oats. I chose an exhausted field in preference to any other, as the only one in which I could test the truth of the theory; it was very foul, being full of Couch-grass and weeds of all kinds; it was ploughed up and hastily picked over, for the season was so unfavourable for cleaning the land (from the great quantity of rain that fell), that I was almost induced to abandon the experiment. Previously to sowing the seed, one-fourth of the field was manured with a compost of night-soil and coal-ashes, at the rate of 40 tons to the customary acre (7,840 yards); the remaining three-fourths having the seed put in without any manure whatever. The winter was very unfavourable for the plants in our cold wet soil; and, in the unmanured part of the field many of them perished, and those that survived made very little progress, from having no stimulus at the roots. Thinking it desirable to apply my experimental manures in moist weather, I waited until the 6th May, when I treated that part of the field which had not been manured (three-fourths of the whole), in the following manner:—I applied guano over one-fourth, at the rate of 2 cwt. to the statute acre; and the same weight of nitrate of soda over another fourth, leaving one-fourth entirely without manure. The Wheat manured with the guano and nitrate of soda grew vigorously, and the ears, more particularly in the part manured with guano, were the finest I had ever seen, but when it came to ripen, it shrivelled in the ear, and the sample was very indifferent; the soil being evidently deficient in some property necessary for perfecting the grain. The crop also suffered much from the depredations of the birds.

"The portion manured with night soil produced to the statute acre... 32 bushels, of 60lbs. each.
Guano ditto.... 27 ditto, ditto.
Nitrate of soda .. ditto.... 27 ditto, ditto.
Unmanured part .. ditto.... 19½ ditto, ditto.

I give these details to show that the land was in an exhausted state previously to the commencement of the experiment I am now about to detail. After the crop of 1842 was reaped, the land was immediately ploughed up, and the season being very favourable it was tolerably well cleaned, and the seed was sown (without any manure) about the first week in October. After the Wheat came up it was manured with a dusting of 1 cwt. of guano over the entire field (about one acre three roods), to keep the plant's alive through the winter. In the spring, being divided into three portions, it was manured with the same number of experimental manures, which were furnished to me by Mr. Blythe, of Church, near Accrington, who also analysed the soil and sub-soil for me. These manures were applied about the 10th of April, and the experiment was still further varied by covering a portion of each division with guano a fortnight afterwards, at the rate of 2 cwt. to the acre; but all the manure applied to the crop, including the hundred weight of guano put on in the autumn, did not exceed 6½ cwt. The crop, which was a very thin one in the

covered with wood, on which the Pine-bed lies. B is a smoke-flue, passing along the front from the fire-place at one end of the pit and discharging itself at the other end into an upright chimney. The shaded line right and left of the section shows the ground line; so that a large part of this pit is sunk in the ground. The other parts of the plan, which is drawn to a scale, speak for themselves.

spring, improved so much by the application of these manures, that, when it came into ear, it was allowed by all who saw it to be the best in the neighbourhood; but the heavy rains of July caused it to lodge in the best part of the field, and there it was attacked by rust, and the sample is very indifferent. In addition to this drawback, there being very little Wheat grown in the neighbourhood of the town, and this being much earlier than any of the other fields, was attacked by the birds as soon as the grain was formed in the ear. Notwithstanding all the efforts made to prevent them, they continued feeding upon it until it was cut; and it is a very moderate estimate of the damage to say, that they destroyed one-fourth of the crop throughout the field. That part of the field covered with manure, No. 1, being the earliest, suffered most. There were patches of several square yards where there did not appear to be a single grain left; and wherever the birds took a grain from the middle of the ear, when in the milky state, the grains on each side of it appeared to grow no more, but shrivelled up in the ear. I have little doubt that in this portion of the field one-third of the crop was destroyed. All this seems to reduce the experiment to little more than guess work; and it will probably be very difficult to persuade those who did not see the field when it was cut, to credit this report of the devastation made by the birds, even when they are told that Clitheroe is a town of 7,000 inhabitants, and probably as many sparrows, and that apparently they were all assembled to feed in this field; and they became so accustomed to the good living they found there, that even when our neighbour's Wheat was fit to eat, they continued to favour this field with their visits in preference to going elsewhere. I estimate the damage on No. 1 at one-third; No. 2 at one-fourth; No. 3 at one-fifth. This was later than the others, and suffered more from rust than birds. The following are the results: From 3,060 yards manured with No. 1, there were obtained 1,042 lbs. of Wheat, or 27½ bushels, of 60lbs. each, to the statute acre; if we add one-half to this, as we assume that one-third was destroyed by the birds, it will give 41½ bushels to the statute acre. The weight of straw from this portion was 188 stone 5 lbs.—14 lbs. to the stone. From 2,856 yards manured with No. 2, 962 lbs. of Wheat were obtained, and 145 stone 9 lbs. of straw. This is equal to 27½ bushels per acre, or with one-third added for estimated damage, it is equal to 36 bushels per statute acre. From 2,610 yards manured with No. 3, there were 1,067 lbs. of Wheat, and 211 stone 7 lbs. of straw, or 33 bushels to the statute acre; to which, if we add one-fourth, according to the estimate of damage, it will be equal to 41½ bushels per acre. It will be observed that this portion yielded a far greater weight of straw per acre than either of the others, and, from the sort of manure applied, it was expected that this would be the case.

No. 1 yielded straw at the rate of 297½ stone per acre.
No. 2 do. do. 246½ do. do.
No. 3 do. do. 392½ do. do.

Many people may feel inclined to say, all these apparent data are mere guesses, and that a crop may be made into anything one likes, if they assume so much for damage; but, fortunately, it is not all guess-work. I have stated previously that I covered a part of each division with guano a fortnight after the application of the manures in April, intending to see what advantage was obtained by the use of it; but, owing to the depredations of the birds, the portions of the first and second divisions manured with guano were not kept separate from those which were left without; but the third, being later, and therefore not so much injured by them, gave me an opportunity of ascertaining the effect. I measured off a land which had been so manured, and reaped and threshed it out separately. From this land of 100 yards long and 10 feet wide (3,000 square feet), there was obtained 220 lbs. of Wheat, or 53 bushels of 60 lbs. per statute acre; and this was far from being the best portion of the field. I do not mean that it was not the best portion of the crop, but I mean that the soil is by no means so good there as it is in other parts of the field; but, as I have before stated, in the best part of the field the crop was spoiled by being lodged by the rain, and subsequently attacked by rust. It is the duty of everyone to promote the advancement of agriculture; and this is my contribution towards it. I have not yet done, for I have sown the same field with Wheat again, and hope, with a favourable season, to reap a still more abundant crop next year.—T. G.

You will observe that no notice is taken of De Candolle's

theory of excrementitious secretion. At the time the above letter was written it did not occur to me; if it had I should have stated that I considered it completely disproved, for the following reasons. I think the difficulty of growing Clover in many soils at less intervals than six or seven years offers an argument against it, for it is unlikely to suppose that vegetable secretions will remain undecomposed in the soil for that length of time, and if they are decomposed, they no doubt return to something similar to what they were before they were taken up by the plant. Again, an intelligent American gentleman told a friend of mine that his father had a farm, (I think in Illinois), where they grew good crops of Wheat for many years in succession; and if this is to be set down as Yankee boasting, (which I don't believe,) there is the fact communicated to me by Dr. Lyon Playfair of lands somewhere in the West of England, (I believe near Bridgewater,) where good crops of Wheat have been grown for twenty years in succession: if the theory of excrementitious secretion is true, and if one crop always poisons the land for a succeeding crop of the same kind, how are we to account for twenty good crops of Wheat from the same soil in as many years? But if the theory which I have assumed in the above experiments is true, that the deterioration of the soil is owing to the abstraction of matters from it, we have only to ascertain what these substances are, and to replace them, to ensure constant fertility. Without assenting entirely to Liebig's opinion, that plants obtain *all* their carbon from the atmosphere, I think there is great reason to suppose that much of it may be derived from that source, and it is a subject well worth investigating by those whose scientific knowledge will enable them to arrive at satisfactory conclusions.—T. G., *Clitheroe*.

AMATEUR'S GARDEN.—No. XLIV.

At this time, when those who intend to extend their collection of Roses will begin to think of giving their orders, it may perhaps not be out of place to offer a few remarks on their management, and also give a list of those kinds which may be considered the most beautiful. In July last I in company with my employer went to Sawbridgeworth, to see Mr. Rivers' collection in bloom, and the list which I subjoin are what we purchased to add to an already tolerably good collection. Our object was not to select a great number of varieties, but rather to choose those which are really excellent, and to take several plants of the best, in preference to having a number of varieties, so that those who select from this list may make certain of having good kinds, if not the most modern varieties; and in Roses, as in almost every other popular tribe of plants, it is to be regretted that the rage for novelties and collections has led to the introduction of many new kinds which are very inferior to our old established favourites. The "Cloth of Gold" Noisette Rose, which I noticed some weeks back, is an exception to the above rule, for a correspondent at Sawbridgeworth who saw it in bloom says: "The Cloth of Gold has flowered, and most beautifully; it is very large, very double; and as yellow as Rosa Harrisonii." This I think will be good news to the Rose Amateurs, at least I consider myself fortunate in being a purchaser.

As a matter of taste Standard Roses are certainly objectionable, and ought never to be admitted into dressed scenery except their naked stems are hidden by some means or other, such as planting dwarf kinds in the front of them, or training the branches pendants, so as to hide the stem and form the heads into fine expansive balloon-like forms. Trained in this manner they are admissible on lawns either in groups or as single specimens, but with tall naked stems they are in my estimation an intolerable deformity. That they should have been tolerated so long is a proof of the bad taste of the age. I am, however, glad to find the demand for them is decreasing, so that after a few years I hope to see them extirpated from garden scenery.

Pillar Roses, that is, dwarf plants trained to iron rods or strong poles, varying from six to twenty feet high, make splendid objects for the lawn, and when three or four dissimilar colours are brought together on one pillar, they are certainly superlatively beautiful. At Sir John Broughton's, at Kingston, the Pillar Roses in July are worth walking 50 miles to see, and I am not aware of any other garden near the Metropolis where they are so well managed. Indeed, by this method of training the best of the Hybrid, China, and French Roses, Mr. Redding has imparted quite a new feature to the Rose-garden, and the Amateur has only to picture to himself a pillar ten feet high, covered with the beautiful flowers of Coupe d'Hebe, Triomphe de Laqueur, or Great Western, to see how much more beautiful they must be than standards of the same varieties.

In Rose culture it is scarcely necessary to offer a remark; for though there are certain soils better suited to their growth than others, they will grow in any well-enriched soil, if it be only removed from clay, and is not too sandy. A deep mellow loam trenched two spades deep, and manured with decomposed hot-bed dung, is the best; but as a general guide, wherever the Wild Briar grows freely, there also will flourish the cultivated varieties. As a manure for established plants, Mr. Rivers recommends night-soil, to be applied twice in the winter, to the extent, when diluted with pond-water, of three gallons to each plant. For top-dressing Bourbon, China, and Tea Roses in beds, Mr. R. uses with great advantage Potter's Guano; and for top-dressing pots, Lance's Carbonated Humus, used with a very sparing hand, is excellent in giving them colour, though when mixed with the soil in potting it destroys the roots. The present is the best month in the year for planting hardy Roses, and it

is a good plan to mulch them with a little strong litter after the operation of planting is completed.

All the Roses in this list are excellent, but those marked with notes of exclamation are the best, and the notes are increased in number in proportion to their superior claims.—W. P. Ayres, *Brooklands*.

HOME CORRESPONDENCE.

Turtle Doves.—A short time since a beautiful pair of Turtle-Doves was given to me. The feathered travellers came in a basket by the railroad on a cold day; to which, I conclude, may be imputed a disease with which the hen has been afflicted, and for which I now seek a cure. I think there can be no doubt it is asthma, as described in Bechstein's Work on Cage-birds; or rather, what in the human species we should designate spasmodic asthma; the poor little sufferer under the attacks, which last about an hour and recur frequently, keeps her beak open and pants audibly; her tongue and throat are nearly black with inflammation; her feathers are ruffled, and she appears dying from exhaustion; but after a time she partially rallies and takes her food. If by means of your paper, I can receive any hints for the diet and treatment of my little pet (whose death will involve the loss of its mate,) they will much oblige. Fright sometimes causes the asthma in birds: that could scarcely be the case with my invalid, who is so familiar as to prefer perching on a finger.—*Maria W.*

John Dory.—I observe it stated in your Naturalist's Corner of last week, that "our common name of John Dory is clearly nothing more than a corrupt pronunciation of the French term for the colour of the lighter parts of the fish, which is yellow with metallic reflections when it is alive, and therefore styled *jaune dorée*, or gold and yellow." As I remember that many years ago I read a very different version of the parentage of the common name of this fish, I turned to the passage, and send you a copy of it, and should be glad if you or any of your readers would be kind enough to decide this point, upon which Doctors thus disagree. The passage occurs in the "Quarterly Review" for July, 1813, and will be found at p. 269 of vol. ix., in an article upon "Tracts on the British Fisheries," and is as follows:—"Haddocks assemble in vast shoals during the winter months in every part of the Northern Ocean, and bend their course generally to the southward, proceeding beyond the limits of the cod and the herring; but it is remarked that they neither enter the Baltic nor the Mediterranean. The two dark spots a little behind its head are supposed to have gained the haddock, in days of superstition, the credit of being the fish which St. Peter caught with the tribute-money in its mouth; in proof of which the impression of the Saint's finger and thumb has been entailed upon the whole race of haddocks ever since. Unfortunately, however, for the tradition, the haddock is not a Mediterranean fish, nor can we suppose it to have belonged to the Lake of Tiberias. The truth is, the Italians consider a very different fish as that which was sanctified by the Apostle, and which after him they honour with the name of *il Ganiatore*, a name which we have converted into *Johnny Dory*, with the same happy ingenuity that has twisted the *girasole*, or turnsol, into a *Jerusalem Artichoke*."—J. B. K. L.

Enormous Egg.—An egg was this week laid by a goose at a farm in Quermore, near Lancaster, whose weight was 10 ounces, its circumference longitudinally was 10½ inches, and it measured 8½ inches round.—*Facile*.

Large Onions.—An average sample of 15 Onions, which weighed upwards of 10 lbs., was grown on a small croft in the fertile village of Longton, near Preston, which had been sown with 5 lbs. of seed from the same ground. It is supposed more than as many tons have been gathered.—*Facile*.

Verbenas.—The scarlet and pink Verbenas survived last winter in a dry situation not far from the southern coast, by being left in a mass where they had grown the previous summer, and being covered with a hand-glass in severe frost. They likewise lived in cutting-pans in the same way.—*H.*

John Dory.—This fish, the Chalcis of the Greeks and

Faber of the Romans, is now known in the Mediterranean, where it is sufficiently common, as the *Pesce di San Pietro*, and Pennant says:—"The Doree is the rival of the Haddock for the honour of having been the fish out of whose mouth St. Peter took the tribute-money, leaving on its side the incontestible proofs of the identity of the fish, the marks of his finger and thumb." I have heard, as well as most of your readers probably, the origin of its English name, John Dory, ascribed to a corruption of Janitor—in the Italian, *Gianitoré*, which is one of the honourable appellations of St. Peter, the keeper of the portals of Heaven—in virtue of which office we always see him represented with his keys—

"The Pilot of the Galilean lake—
Two mighty keys he bore of metal twain,
The golden opes—the iron shuts again."

—*Electra*.

Pine Apples.—Having seen stated in the *Chronicle* at p. 759, an account of Queen Pines which had been grown to the great weight of six pounds some ounces, will the cultivator of these Pines have the goodness to say what sort of Queen's they were—and whether the treatment, which brought them to that state of great perfection, was different from that which is usually practised? By answering these questions, through the *Chronicle*, he will oblige.—*Doumhuil*. [Another correspondent denies that the Pines were of the weight represented.]

Tulip-root in Oats.—In the "Gardeners' Magazine" I find the following paragraph:—"Much of the Corn crops in the Lothians are drilled; but Oats have suffered severely this season by what is there called the 'Tulip-root,' a disease the cause of which is not hitherto properly understood." Will any one be so good as to give *Ruricola* some information upon the subject? particularly the character of the disease, its appearance, and the way in which it affects the Oat-crops; also, if there be any published account of it.—J. C.

Strawberries.—I beg to inform Mr. Godwin that there is nothing new or uncommon in the mode stated at p. 711, for obtaining a crop of Strawberries late in the season, as I have seen it practised by others as well as by myself for upwards of 20 years past with good success. I am now gathering excellent fruit from plants that were forced in spring, and will no doubt continue to do so until the end of next January. These plants were taken out of 32-sized pots, disrooted, and repotted into 24-sized ones. They were then placed in a shady situation, where they remained until the weather caused them to be removed to a Pine-stove.—*Scrutator*.

Standard Pelargoniums.—I have about 40 Standard Pelargoniums; the wet weather last May killed about 20 of the largest and best sorts. I have one three years old, named Prince Regent, the girth of its stem is 5½ inches, and is 30 inches in length; from the top of the stem to the top of its head is 42 inches, and the circumference of the head is 10½ feet. In my opinion these are much more handsome than Standard Roses, when they are, like these, planted out on the lawn. Fuchsia fulgens and other Fuchsias have also a fine appearance when grown as standards.—J. Waldron, *Harrow Weald*.

Apple-trees.—In the garden of Joseph Boulton, Esq., Springfield Hall, Warwickshire, there is a Peach Apple-tree in full bloom; the late frost and snow do not seem to have had any effect on the blossoms.

Seedling Pelargoniums.—In your columns I observe advertisements of Pelargoniums by Mr. Rendle, of Plymouth (all of which appear to have been raised by Mr. Lyne, of that neighbourhood). These, he says, have obtained prizes in London, Exeter, Torquay, Plymouth, Truro, and Falmouth. I as well as many more of your readers would feel obliged to Mr. Rendle if he would explain which sorts got the various prizes at the different places named in his advertisements, when and at what shows, and what the prizes were which each sort won? This information from the advertiser would no doubt give great satisfaction to many of his customers, and to the public generally, and persons disposed to purchase would be enabled to judge better of their respective merits.—*A Friend to Truth*.

Lobelia gracilis.—I beg to state that striking from cuttings is not the only or best way of propagating *Lobelia gracilis*, as stated in a *Chronicle* some time back. The mode I find to succeed best, is to take up the seedlings, quantities of which will be found in the autumn under the old plants. The seedlings may be put into pots as thickly as possible, and then placed in a greenhouse for the winter; in the spring these will be found to be stronger than from cuttings, at least they were so in my case.—A. B.

Potter's Guano.—In the report of Sir R. Peel's speech at the Tamworth Dinner there is an account of an interesting and important experiment made by his direction upon Potatoes, in which Guano, Potter's Manure, and Stable Manure appear in competition. It is said that this experiment was conducted with great care and perfect fairness. That such was the intention of the distinguished experimentalist, I entertain no doubt; but I shall make it appear that an error has been committed, which, as this speech will be circulated through the length and breadth of the land, is calculated to do me very considerable injury. The error I allude to is, that the Guano (a bushel of which was found to weigh 85 lbs.) and my manure are assumed to have the same weight in the same bulk, but this is far from being the case. A 4-bushel sack of my manure, when quite full, contains only 2 cwt.; a bushel therefore weighs 56 lbs. Now as the experiment was made by taking equal measures, not weights, of the two manures, it is evident that for every 85 lbs. of the Guano, only 56 lbs. of my manure were really applied to the crop. If we rectify this mistake by equalising the weights (for both these manures are sold by weight), we shall find, by the

rule of proportion, that Potter's Manure would have produced not 11, but 16½ bushels of Potatoes. Thus I think I have shown that, without the explanation offered, the statement of the experiment as given by Sir Robert is calculated to operate to my disadvantage.—*W. H. Potter.*

Gooseberries.—In the *Chronicle* of last year, at p. 758, are given the weights of the heaviest Gooseberries grown that year. Subjoined is the weight of the heaviest six in each class produced in 1843, so that a comparison may be made with those raised last year; and your readers will find that they have grown larger this year than the last. Some new sorts have also appeared as leading kinds in size and weight; and it is now the season for planting Gooseberries, so that they may strike root in their new situations before the frost sets in, which is very desirable. It has been this year proved that Gooseberries, when grown and trained against a wall, will increase their size, and acquire more the appearance of large and handsome Plums than Gooseberries, and it will also much improve their flavour, and make them a more interesting fruit for the table.

M. Saul.

Weeds in Ponds.—Among the other interesting subjects in the *Gardeners' Chronicle* of the 21st October, is an answer to a query on the means of keeping down weeds in ponds, by Mr. W. P. Ayres, Brooklands. His answer is, that "the most simple thing you can make use of to cut them with is a pair of swans;" and he instances the success of this scheme at Brooklands. I regret to say that so very simple and pleasant a plan will not be found of universal application. In the grounds where I reside is a pond of an irregular oval shape, about 70 yards in length and 30 in breadth, a large proportion of which is occupied by two islands bearing beautiful evergreens and Weeping Willows, thereby materially curtailing the extent of water, which cannot much exceed one rood. Yet on this small extent of water four swans, all adults, are not able to keep down the weeds, apparently, to any sensible degree; for every autumn they accumulate to such a thickness, that a small light boat can hardly pass over them, and they have to be cut over every year. There are a few circumstances which it may be proper to mention, in case they should constitute a difference from Mr. Ayres' case. The pond is from three to four feet deep, and is maintained by a very powerful spring, which keeps the water in it always clear and fresh. The swans are fed every day with a lippie of oats (one-fourth part of a peck) and also with boiled potatoes, as long as that esculent lasts, and in consequence of receiving this food, along with the grass which they consume, they are remarkably large spirited birds, of fine plumage, except when moulting; but I find that the feeding does not prevent them diving their necks in the water in quest of something, which they must obtain, otherwise they would not persevere in it as they do daily; and, besides, the grass margin around the pond is so limited in extent, that it could not support them, except, perhaps, in the height of summer. It is possible that at that season they may neglect the weeds more than in the early part of the summer; but in answer to this suggestion, I would mention, that for once I see them out of the water grazing on the grass, I see them a dozen times in the water, plucking their necks and even pointing up their tails. Bald coots and water-hens also frequent the pond, as well as common ducks, all living in harmony. How fond the wild birds are of the boiled potatoes! If an effectual plan can be suggested for saving the trouble of cutting the dirty weeds every year, I would be thankful.—*H. S., Edinburgh, Oct. 25.*

Cape Iridacea.—I am a great admirer of this beautiful family, which I think is somewhat neglected in England. It is impossible to give any recipe for growing them, because they are of very various constitutions. By far the greater portion of them may, however, be grown to perfection in the open air in the south of England, by making a bed of sandy peat in a sunny situation, and therein planting them, covering the beds during severe frost or very wet weather. I used to grow a great many kinds in Devonshire, in small beds filled to the depth of two feet with a compost of two parts sandy peat, one part fine river sand, and one part rich garden soil, of a loamy nature. The tough roots contained in the peat were laid at the bottom of the bed along with some stones for drainage, and the mixed soil laid loosely upon it. In such beds the plants will require no further care, except in winter. They do not generally suffer from the cold, but from the wet, or from the effects of the sun following a severe frost. They should never be disturbed after their first planting, as many of the species are very apt to rot if removed; it is, therefore, obviously undesirable that any other plants should be placed in the same beds. No stable manure should on any account be applied, as it will certainly kill all the more delicate species. The best method of enriching the soil is to thatch the beds with straw, and let it decompose as it will. No other manure should ever be used; and if the beds are properly formed, the thatch may be made to supply all the purposes of a covering, to keep off the frost and water during the winter. Although the above plan will suffice for the growing of the greater portion of the family, yet it will not do for others: it will not do for any of the species which flower in the spring, and it is unnecessary for the very late and robust ones, such as oppositiflorus and Natalensis. The spring-flowering species cannot be grown in the open air, because their

leaves sprout in autumn, and will not bear any severe frost; they must, therefore, be grown under glass, or not at all. Certain other kinds require a very much more sandy soil, and will not thrive even in a sandy peat; but as these peculiarities can only be discovered by extensive cultivation of the species, I will mention a few of my results derived from the cultivation of upwards of a hundred. The greatest difference in constitution observable among the individuals of any one of the genera is in *Gladiolus*. All the common kinds may be grown as I recommend; but to grow *alatus*, *viperatus*, *roseus*, *debilis*, *versicolor*, and probably some others which I have never possessed, you must have a bed of nearly pure sand from the more barren parts of heaths. In a pure white sand of great depth I have seen *roseus* (which is a variety of *hirsutus*) 5 feet high, with 13 flowers on the stem; while in a soil still very sandy, but which would slightly bind, it would not grow 18 inches, and produced only about 5 flowers. *Watsonia gracilis* and most of the varieties of *G. hirsutus* flower very early in the spring, and therefore cannot be grown in the open air: they also like sand. On the contrary, *Natalensis* will grow well in ordinary rich soil of any kind, and oppositiflorus and its hybrids in a soil of light peat mixed with loam in about equal proportions. In such a soil I have grown the hybrid *Natalensis oppositiflorus* or *Gardinensis* nearly 6 feet high, bearing 22 flowers on the main stem, and having 5 lateral branches. Almost all *Ixias*, *Sparaxis*, *Tritonias*, and *Moræas*, may be grown in the ordinary *Gladiolus* compost; but the *Trichonemas*, *Lapeyrousias*, and *Babianias*, require sand. *Watsonias* and *Antholyzas* are not particular in their soil, but are difficult to cultivate in England, because they either sprout in the autumn or are evergreen; and their leaves will not bear frost, which, although it will not kill the roots, will prevent their flowering by destroying the leaves. I would observe that the sand of which I speak must be the sand from the surface of peaty heaths: it must neither be red nor yellow, nor must it be taken from beneath the surface, but must be a fine sharp white sand, rendered of a greyish colour by the admixture of a very small quantity of peat. I imagine that the oxide of iron, which forms the colouring matter of the red or yellow sands, is very prejudicial to these roots; but if all the poor soils in the neighbourhood of the cultivator should be coloured, let him carefully scrape up the mere loose surface, which will always be much purer than the body of the soil, and will rarely injure any plants.—*J. C. B.*

Blackberry Jelly.—Put the fruit into a jar, tie paper over it, and stew in a saucepan of boiling water, or by putting the jar into the oven; strain off the liquor, and to every pint of stewed fruit add a pound of loaf-sugar: put all into a preserving pan, simmer and skim it. When it will jelly upon a plate, it is fit to be put into jars for use.—*Warwickshire.* [This is very delicate and excellent.]

Prolific Potatoes.—A friend of mine sent me a Potato in April, and mentioned at the same time that it was a very prolific variety. The Potato weighed about 6 oz. I planted it whole, and last week took up the produce, which weighed 29 lbs., and consisted of 66 Potatoes, 26 of the largest weighing 2½ lbs. The above is the largest return I have ever seen.—*Wm. Thomson.*

Circulating Hot-water in Flues.—I beg to state that the system of heating houses by hot-water circulating in brick-flues is, after all, but a modification of the steam-system, with this difference, that steam does not traverse so rapidly as the thin stratum of water used in these flues; for the cold air, not only in the iron-pipes, but that about them, condenses the steam, until the resisting force of the air is overcome. Limited as the quantity of water is, it has another advantage over steam, and that is, that it retains heat longer; and what is wanting in quantity as compared with other systems of heating by hot-water, is made up by the brick-flues retaining their heat for a considerable time after the fire has been withdrawn. The vapour and heat which rise from the surface of the water will be emitted into the house together, both upwards and downwards; the moisture may not always be visible on the plants, unless the covers are in part removed, or have apertures in them. In this case a diminished temperature in the flues will ensue, and consequently less power to resist the cold air. In whatever way the heat may escape from these flues, condensation will take place at the glass, and would do so even lower down in the house, if the temperature was low. I see that this system of heating is carried on very extensively.—*C.*

Water a Non-conductor of Heat.—I beg to state that I never anticipated Mr. Beaton would tell us (as he has done in the *Calendar*, lately) that "water is a powerful non-conductor of heat, and that heated water will glide along on the surface of cold water without communicating any heat to it; in fact, from his statement, we are to consider them as two distinct strata, something similar to what may be seen in the fat of soap in water, when an acid unites with its alkali. But this is not the case, for water is a conductor of heat, and for an exemplification of this we have only to turn our attention to the great ocean when the noonday sun is shining upon it, to be convinced of the fact. Water is a slight conductor, and the omission of the fact that it is so may induce defective ideas on heating. It is on account of this that I have noticed it.—*C.*

Manuring Strawberries.—There appears an undue fear of manuring Strawberries. I have read somewhere that all plants that throw out suckers or runners rapidly deteriorate the soil, and that a power of escape to new ground is given by the runners. If this is correct, it is a reason for the good results I have always seen of manure. How rarely, except where Strawberries are grown for profit, do we see room enough given. Beds of Straw-

berries are objectionable for this reason, and it is this cause rather than manure that leaves are more abundant than fruit. I have tried and proved this. Where Strawberries are grown for profit, (that is, grown at all in the true sense,) they should be planted in rows—the large sorts not less than 30 inches in the row, and 15 inches from plant to plant, and no runners suffered to remain. By these means, with deep trenching and early planting, any sort worth cultivating may be grown large and abundantly.—*W. M.*

COUNTRY SHOWS.

Forres and Nairn Horticultural Society, October 13.—This was the Autumn Exhibition. The display of fruits was very fine, as was also the vegetables. The following prizes were awarded:—20 *Dahlias*, 1, Mr P. Hall, gr to the Hon. Sir W. G. G. Cumming, Bart., for Lee's Bloomsbury, President of the West, Rouge et Noir, Birmingham Premier, Marquess of Lothian, Sperry's Admirable, Emulator, Advancer, Yellow Defiance, Yellow Climax, Burnham Hero, Oscar, Stella, Prince Albert, Westbury Rival, Frederick the Great, Bedford Surprise, Sir Frederick Johnston, Phenomenon, Argo; 2, Mr A. Brander, gr to N. M'Leod, Esq., for Metella, President of the West, Lee's Bloomsbury, Culling's Suffolk Hero, Rlenzi, Ansel's Unique, Cox's Yellow Defiance, Virgin Queen, Argo, Mackenzie's Perfection, Scarlet Eclipse, Le Grand Baudine, Scarlet Defiance, Grace Darling, Indispensable, Maid of Bath, Nicholas Nickleby, Beauty of the Plain, Admirable, Marquess of Lothian. 9 *Hollyhocks*, 1, Mr P. Hall, gr to Sir W. G. G. Cumming, Bart.; 2, Mr J. M'ulloch, gr to Major G. Peterkin. 12 *Carnations*, 1, Mr P. Hall; 2, Mr J. M'Lean, gr to C. St. John, Esq. 6 *Marigolds*, 1, Mr J. M'ulloch; 2, Mr J. Nimmo, gr to Miss Cumming. 6 *Asters*, 1, Mr J. M'ulloch; 2, Mr P. Hall. 6 *Stocks*, 1, Mr J. Hopkirk, gr to Major C. Bruce, M.P.; 2, Mr A. Brander. 12 *Hardy Annuals*, 1, Mr A. Gauld, gr to W. Mackintosh, Esq.; 2, Mr J. Nimmo. 6 *Pelumnias*, 1, Mr P. M'Intosh, gr to J. Dunbar, Esq.; 2, Mr J. Nimmo. 4 *Fuchsias*, 1, Mr P. Hall, for Moneypanni, pulcherrima, Chandlerii, and Dr. Brands's Seedling; 2, Mr J. Hopkirk, for Chandlerii, Standishii, cordata, and corymbiflora. Best-grown *Fuchsia*, 1, Mr A. Brander, for Riccartonii; 2, Mr P. Hall, for Riccartonii. 2 *Cockscombs*, 1, Mr A. Gauld; 2, Mr P. M'Intosh. 6 *Hardy Perennial Herbaceous Plants*, 1, Mr A. Brander; 2, Mr C. Findlay, gr to W. Brodie, Esq. 3 *Gladiolus*, Mr A. Gauld. 6 *Pentstemons*, 1, Mr P. Hall; 2, Mr C. Findlay. *Collection of Roses*, not fewer than 12, 1, Mr C. Findlay, for King of Roses, Prince Albert, Sempervirens Princesse Louise, Sempervirens Floro-pleno, Stadtholder, Pomponne Moss, Blush Moss, Belle de Rosney, Velour's Episcopal, Ne Plus Ultra, Adeline de Bourbon, Unique White, General Riego, Camaire, New, French Yellow Noisette, La Bache, Lee's Perpetual Crimson, Yellow China, Fragrant Climax, Blush China, White China, Duchess of Kent, Madame Trimore, Louis Philippe D'Anger, Fellenberg, Beau Carmine de Luxembourg, Noisette Vibert, Victoire Modeste, Fenelon Luacmore, Bourbon, Nitida Nankin, Eugene Pirole, Grandiflora, Noisette grandiflora, Marie Louise, Noisette multiflora, Crimson China; 2, Mr P. Hall, for Septimium Suxtile Hybrid, Phoenix, Bon Genevieve, Madame Casper, Jaune Desprez, Madame Desprez, Goubalt, Theresa, Pauline Plantier, Victorieuse, Splendens, Yellow China, Bougrec, Fabvier, Ninon de l'Enclos, Marjolin, Cramoie Supérieure, Gardena, Juliette le Sourd, Count de Paris, Pepin, Noisette grandiflora and multiflora, Noisette Common, Moss, Cabbage, &c. *Stove Plant* recently introduced, Mr A. Brander, for *Ixora rosea*. Most tastefully arranged *Bouquet of Flowers of Hardy Plants*, 1, Mr C. Findlay; 2, Mr J. Nimmo. 2 *Bunches of Grapes*, 1, Mr C. Findlay; 2, Mr A. Brander. *Heaviest Bunch of Grapes*, 1, Mr C. Findlay; 2, Mr A. Brander. 6 *Peaches*, 1, Mr A. M'Killigin, gr to Colonel Gordon; 2, Mr P. Hall. 6 *Apricots*, 1, Mr C. Findlay; 2, Mr J. M'Lean. *Melon*, 1, Mr P. M'Intosh; 2, Mr C. Findlay. *Heaviest Melon*, 1, Mr P. M'Intosh; 2, Mr C. Findlay. 12 *Plums*, Mr C. Findlay. *Greengage Plums*, 1, Mr J. M'Lean; 2, Mr A. Gauld. 9 *Summer Pears*, 3 varieties, Mr P. Hall; 2, Mr J. M'ulloch. 6 *Apples*, 2 varieties, 1, Mr P. Hall; 2, Mr W. Milne, gr to A. Campbell, Esq. *Imperial quart of Gooseberries*, 1, Mr J. Nimmo; 2, Mr A. Gossip, gr to Miss Smyth. 6 *Capsicums*, 1, Mr P. M'Intosh; 2, Mr P. Hall. 6 *Carrots*, 1, Mr J. Duncan, gr to G. S. Duff, Esq.; 2, Mr J. Hopkirk. 4 *Onions*, 1, Mr J. Duncan; 2, Mr P. Hall. 4 *Celery*, 1, Mr P. Hall; 2, Mr A. Gauld. 2 *Vegetable Marrows*, 1, Mr C. Findlay; 2, Mr P. M'Intosh. 2 *Red Beet*, 1, Mr W. Milne; 2, Mr J. M'Lean. 6 *Parsnips*, 1, Mr A. Gauld; 2, Mr P. Hall. 6 *Leeks*, 1, Mr A. Gauld; 2, Mr J. Duncan. 3 *Roots Storzomera*, 1, Mr P. Hall; 2, Mr W. Milne. 3 *Roots Subasfy*, 1, Mr J. Duncan; 2, Mr P. Hall. *Vegetable* recently introduced, Mr A. Gauld. *Dahlias*, best bloom of the following classes:—Tipped, Edged, Yellow, White, Scarlet, Purple, Rose, Lilac, Shaded, Crimson, Blush, Orange, Mr A. Brander. *Dahlia Sweepstake* for best 24, Mr P. Hall. *EXTRA* Prizes were awarded to Mr A. Brander, for a well-grown plant of *Echites suberecta*, and to Mr P. Hall, for a large basket of Fruit, Grapes, Nectarines, Apricots, Peaches, Plums, Pears, &c. The following articles were considered deserving of especial notice:—From Altyre were *Gloxinia rubra*, speciosa, and grandiflora, Gesnera Cooperii, Manettia coccinea, Adiantum Teucrium, Achimenes coccinea, Fuchsia Riccartonii, splendens, Chandlerii, Standishii, Cooperii, insignis, Youellii; several cases of *Carnations* and *Stocks*, and a stand of *Dahlias* of 40 blooms. From Dalvey were *Lycopodium denticulatum* and *stoloniferum*, Cattleya Harrisonii, Nepenthes distillatoria, Thunbergia alata, aurantiaca, and leucantha, Achimenes longiflora, Philibertia grandiflora, Cyclamen persicum, Liliun lancifolium, punctatum album, Erica refulgens, Fuchsia stylosa, conspicua, racemiflora, Standishii, conspicua arborea, Chandlerii, Youellii, Dalveyana, grandiflora, Laneii, and Moneypanni; two small *Bouquets* of cut flowers, and a case of *Hollyhocks* and *Dahlias*. Also a Ward's case, containing Erica grandiflora, inflata, ventricosa superba, Achimenes longiflora, Fuchsias, and *Gloxinia speciosa*. From Darnaways was a basket of excellent *Gooseberries* and *Pears*. From Lady Rose, Holm, were beautiful specimens of *Phlox Drummondii* elegantissima and Wood's new Scarlet; Fuchsia St. Clare, and Enchantress; Dianthus splendens; Digitalis lanata; Verbena Prince of Wales, &c. From Geddes was a fine plant of *Pentstemon Murrayanum*, and *Apples* two-years-old, well preserved. From Relugas were several well-grown *Fuchsias*. From Cluny Cottage were *Sollya heterophylla*, Yellow China Rose, *Potentilla Hopwoodiana*, *Agapanthus umbellatus*, *Origanum dictamnus*, &c. Dr. Brands sent some fine *Fuchsias*. From Forres Nurseries was an extensive collection of *Carnations*. From Mr Gillan, Forres, was a stand of wire baskets, filled with *Pelargoniums* and *Fuchsias*, also a beautiful plant of *Fuchsia fulgens*, with numerous trusses of flowers. [This is taken from a printed copy with which we have been supplied; but we give up in despair the correction of the blunders in the names.]

Hampstead Florists' Society, Sept. 19.—This was the last exhibition for this season. The whole of the collections were good, and that which gained the first prize contained plants that evinced both skill and perseverance in their cultivation. Among *Fuchsias* were several beautiful seedlings. The Specimen *Fuchsia* that gained an extra prize was raised from seed of *F. fulgens*, but was quite distinct from the parent plant, and was said to have been in bloom since May—the racemes were above a foot in length. The following prizes were awarded:—*Collection of Plants*, 1, Mr Cockburn, gr to the Earl of Mansfield, for Achimenes pedunculata, A. longiflora, A. rosea, Francisca Hopcana, Brachycome iberidifolia, Sedum Sieboldii, Crassula falcata, Lechenaultia formosa, Rondeletia odorata, Mirbeliaspe, Philibertia grandiflora, Passiflora Kermesina, Lantana Sellowii, L. crocea, Cassia corymbosa, Plumbago capensis, Tweedia carulea, Tropaeolum pentaphyllum, Mahernia pinnata, Chironia frutescens, Vinca

Egertonianum than ventricosum; the next above it, No. 2, is almost wholly ventricosum; that which succeeds, No. 3, is more ventricosum than Egertonianum; and 4 and 5, the last on the spike, are wholly Egertonianum. What with such cases as this, the Dean of Manchester's Narcissi, and the singular hybrids with which botanists are becoming familiar, all ideas of species and stability of structure in the vegetable kingdom are shaken to their foundation.—*Botanical Register.*

GARDEN MEMORANDA.

Milton Lodge, near Woodbridge, Suffolk.—This is the seat of Captain Apin, and is the place alluded to by Mr. Beaton, in the Calendar, "where every lap between the glass was put." It is particularly celebrated for the cultivation of Cucumbers. I have frequently visited this place during the past twelve months, and can bear testimony to the superior mode in which this establishment is conducted. A selection of the best fruits, flowers, and vegetables, is produced in succession, by the aid of hot-water, dung-leaves, &c. The cultivation of Pines, as recommended by Mr. Joseph Hamilton, of Stockport, is now about to be commenced. Two sorts of the best scarlet and green-flesh Melons are in perfection here from May until October. There are two Vineries; one for early forcing, and the other for late. These are planted with the following Vines, viz., Black Hamburgh, Black Prince, Muscats, Sweetwater, and Muscadine. Both houses have produced excellent crops of Grapes, which have won several first prizes at exhibitions during the season. Keen's Seedling, and some of Myatt's best kinds of Strawberries are also cultivated here in great perfection. These, both forced and grown in the open border, produce excellent fruit. It need scarcely be mentioned that there are plenty of Cucumbers all the year round. Kale, Asparagus, French Beans, Potatoes, Rhubarb, and Mushrooms, are all forced early, and in addition to the above, there is a choice collection of Pelargoniums, Puchsias, Calceolarias, with a few good seedlings of each; also a few gigantic Cockscombs, measuring 28 inches by 14 inches; indeed, the whole appearance of the place is characteristic of skill and good management, and reflects much credit on the gardener, Mr. Thomas Latter.—*A Correspondent.*

Reviews.

Familiar Letters on Chemistry, and its Relation to Commerce, Physiology, and Agriculture. By Justus Liebig, M.D. 12mo. Taylor and Walton.

No book from the pen of this Author can be destitute of interest, and least of all a work professing to place his novel and somewhat abstruse doctrines before the reader in a popular form. We have no doubt, therefore, that the present publication will be eagerly and profitably read, and that it will prove a useful introduction to Professor Liebig's larger works. We cannot, however, promise the man of science much novelty in it, except where the Author ventures into that field of Vegetable Physiology which he affects to despise so much, and of which he knows so little. Then, indeed, there is novelty enough—we only wish it were of better quality. It is, indeed, a subject of serious regret to us that an author, otherwise so talented, should be so woefully unacquainted with the very foundation of that chemical physiology by which, notwithstanding, he has so much distinguished himself. As one instance, let us take the following passage:—

"How different are the evergreen plants, the oleaginous plants, the Mosses, the Ferns, and the Pines, from our annual Grasses, the Cerealia and Leguminous vegetables! The former, at every time of the day during winter and summer, obtain carbon through their leaves by absorbing carbonic acid, which is not furnished by the barren soil on which they grow; water is also absorbed and retained by their coriaceous or fleshy leaves with great force. They lose very little by evaporation compared with other plants. On the other hand, how very small is the quantity of mineral substances which they withdraw from the soil during their almost constant growth in one year, in comparison with the quantity which one crop of Wheat of an equal weight receives in three months!"

Here we have almost as many errors as sentences. There is not a shadow of evidence that what we call evergreens are acted on by soil in a manner different from ordinary plants; or if there be, it is in favour of their requiring a larger amount of carbon in the soil than other plants—witness all those races of evergreens that flourish only in peat. In the next place, to say that Mosses receive no carbon from the soil which sustains them, is an assertion in the very teeth of facts; we do not find these plants thriving on white and pure sand, but on the surface of the ground, in bogs, on housetops, and other places where carbon must necessarily abound, as is shown indeed by the dark colour of the soil that bears them. Then Ferns, we are told, retain water by their coriaceous leaves with great force; which is true of one or two species only. On the contrary, they are plants whose evaporating powers are (as is well known) so great, that they can in general exist only in very damp situations. What oleaginous plants may be we do not know. As to cereal plants (Cerealia, as it is always spelt in this book!)—it is true that they withdraw a large quantity of mineral matter from the soil on which they grow; but we cannot comprehend why that circumstance should prove that their functions of respiration are at all different from those of other plants.

We shall take an early opportunity of calling attention to the remarkable change of opinion in chemico-physiological matters which Professor Liebig has undergone within the last two years, especially in diminishing his estimate of the value of ammonia, and increasing the importance of phosphates and sulphates. For the present, we can merely select a striking passage relating to the principles of Agriculture, which will serve as a favourable specimen of the vivid style of this very clever author:—

"Is it possible, after so many decisive investigations into the origin of the elements of animals and vegetables, the use of the alkalies, of lime and the phosphates, any doubt can exist as to the principles upon which a rational Agriculture depends? Can the art of Agriculture be based upon anything but the restitution of a disturbed equilibrium? Can it be imagined that any country, however

rich and fertile, with a flourishing commerce, which for centuries exports its produce in the shape of grain and cattle, will maintain its fertility, if the same commerce does not restore, in some form of manure, those elements which have been removed from the soil, and which cannot be replaced by the atmosphere? Must not the same fate await every such country which has actually befallen the once prolific soil of Virginia, now in many parts no longer able to grow its former staple productions—wheat and tobacco?"

Messrs. Lane and Son having now published their Descriptive Catalogue of Roses, buyers have a further opportunity of making selections, in addition to those afforded by the Catalogues of Mr. Rivers and Mr. Paul, already noticed. This Catalogue occupies 16 closely printed 8vo. pages, and is classified according to the season in which the varieties blow.

CALENDAR OF OPERATIONS for the ensuing week.

When a gardener is writing about the different operations of the week in this Calendar he must necessarily touch on subjects in which he feels little interest, and also on others in which he takes great delight. In the latter case he sometimes finds himself so pressed for room to get in his ideas, that, were it not for this space allowed him for his preliminary observations, he would often be in danger of encroaching on other parts. This space, therefore, was a wise provision, made by Mr. Paxton, when he laid the foundation of this Calendar. In the dull months of winter there is no great scope for "preliminary observations," bearing on the gardener's art. Whatever topic, therefore, seems uppermost in the gardening world at the time forms a legitimate subject for discussion in this place; at least this is the opinion that I have acted on, and the reason why I have introduced at times subjects which might seem out of my province. The new modes of heating by tanks and gutters so much sought after this season, form a subject of as great utility as any other on which I could write. The manner in which Mr. Haycroft has heated the Pinery at Doneraile Gardens as explained in the last *Chronicle*, is the cleverest thing I have yet seen in the way of heating; it combines the tank and gutter systems so effectually as to leave nothing to wish for, except it be that vapour might safely be used for watering the bottom of the bed, instead of doing it through tubes from above, when plants are turned out into the free soil; but as this has not been thought necessary by so experienced a person as Mr. Haycroft, I feel the less confidence in my own opinion on the point, although I would not alter my own practice which I have recommended. One feature in Mr. Haycroft's plan is likely to raise discussion. I mean his returning the smoke-flue along the back of the house. "In all these cases," therefore, where conservatories have been heated partly by a boiler with circulating water, and partly by the flue-heat from the same furnace, no effect is produced by the double operation which might not have been as well or better obtained by water-pipes alone from a well set boiler."—(Vide vol. 1, p. 434.) This bold assertion was made lately by a gentleman who knows the scientific bearings of the question as well, if not better, than any other man living, yet here, when he stooped to practise, he is out of his depth. It is true enough that if theoretical ideas could be carried out in practice, a flue in any shape would be superfluous along with pipes or gutters; but, unfortunately, we have not yet attained this perfection, and we are not likely soon to do so, judging from our very best set boilers. Not one of our boilers will appropriate anything near the quantity of heat generated under them from the most perfect combustion; the remainder must therefore escape by the chimney, unless it is caught into a flue running through the house. There has been a real prejudice, and a just one too, against the use of flues since the introduction of hot water pipes; but now that iron pipes are fast giving way to gutters and tanks, there need be no great objection against flues when properly constructed; nor will the shape of the boiler be thought so much about in a few years as it has been hitherto, as, if it does not take up all the heat, the rest goes to the flue, and is gained that way.

I.—KITCHEN-GARDEN AND ORCHARD.

In-door Department.

PINERY.—I am reminded by Mr. Haycroft's plan of planting out his fruiting Pines last August, of an awkward position I once got into by planting out a bed of succession Pines about the same time; they kept on growing later in the autumn than I wished them, and some of them that were cramped at the roots before they were turned out kept on growing well all the winter, notwithstanding the temperature being kept low and dry, and in the spring, instead of showing fruit like the rest, they made a fresh start, and did not show fruit until the next June, when the house was kept very dry, for the ripe fruit of the others. Pines of any age should now be induced to go gently to rest for the winter.

VINERY.—Except the latest house, the Vineries are now so many greenhouses, full of half-hardy plants, and the dry state in which they have been kept since the fruit began to ripen is now so much in favour of the plants; let every precaution, therefore, be taken to keep them dry this dull weather.

ASPARAGUS, SEA-KALE, and RHUBARB may now be forced according to the demand, and the stock of plants ready for the purpose. A Mushroom-house at work is a capital place for forcing the Sea-kale and Rhubarb, and the Asparagus is cheapest grown in an old Melon-bed; but be careful not to give it a strong bottom-heat, and as soon as it comes up let it have all the light and air you can. Some water the bed at this stage; I do not think watering does much good or harm.

Out-door Department.

Kitchen-garden work, from this time until the trees are nailed early in the spring, depends so much upon circumstances, that a set of rules is really of very little use; the best gardeners lay little stress on the point. In wet weather they do not like to do much digging or trenching either; this and wheeling manure is reserved for frosty weather. On light soils all fruit-trees ought to be planted during this month; but on heavy clay land I believe most people prefer the middle of February for this work.

CAULIFLOWER.—Hand-glasses are awkward things when they are in one piece, and when placed over Cauliflower-plants there should be boards placed between the rows, to walk on when giving air and stirring the soil.

PEAS.—Where there is no convenience for forcing Peas in February, a few rows are generally sown early in this month, and chopped Gorse tops are put in the rows over the Peas to keep away mice; but nine times out of ten those sown in autumn are lost or nearly so by being sown too early; except on very sandy soils and in high situations, the last week in November is time enough to sow these.

LETTUCE and ENDIVE in the open ground, or in frames, require great attention during all this month, for fear they damp off, or are attacked by slugs or snails.

ORCHARD.—Pruning the different trees and bushes, and making new plantations of them, form the principal work here for some time. A constant eye should be kept over the fruit-room until all the autumn fruit is over. Short memorandums should be made of the qualities of the different sorts, as they are fit for table or the kitchen, with such remarks as will suggest themselves at the time; after a few years these may be compared and will be found very useful.

II.—FLOWER-GARDEN AND SHRUBBERY.

In-door Department.

STOVE.—"How should *Peristeria elata* be managed?" asks a Correspondent. Exactly as I said last week about *Cyrtopodiums*; both should be treated as terrestrial Orchidaceae; but this does

not apply to the pendulous-flowering *Peristerias*. The stove plant, *P. elata*, is as gross a feeder as the Vine, and so are the *Cyrtopodiums*; they should never be forced into growth in the spring, but allowed to grow very gradually; and as soon as all their eyes are fairly started, they should have a strong bottom-heat of 90°, and liquid manure occasionally; as soon as their growth is nearly finished they should be narrowly watched at the bottom of the new bulbs, and as long as there is no sign of a fresh growth you may encourage them; but as sure as you allow a fresh growth, so sure will you be disappointed in their flowering next year. If your plant has made fresh shoots since last June, which are not ripe yet, continue to give water until the growth is finished, then let them get quite dry and let them remain so until April. It is not natural for these plants to carry their leaves from year to year, like *Stanhopea*.

GREENHOUSE.—Few of these plants require much water this month. Keep the house dry, and let the lights be down day and night if the weather will allow. The "yellow bulb" received by a Correspondent from Lima, under the name of Peruvian *Daffodil*, which he cannot find in English books, is the *Ismene amancaes*, or the *Pancratium amancaes* of former days; it is a pretty plant, flowering in May and continuing to grow until about this time, if kept in a pot; it will do better planted out in front of the greenhouse all summer, to be taken up now and kept dry until next April. The soil used for it should be more than one half pure white sand, the other half very light sandy loam.

CONSERVATORY.—The winter always begins here on the 1st of November, and slight fires are therefore used to prevent the temperature falling below 40°. Few plants require much water this month, except the *Chrysanthemums*, and they must be regularly and freely watered until the flowers are past their prime. A Correspondent who planted out in this house his *Lagerstroemia indica*, has done well to take it up again; its proper treatment has been given over and over again in the *Chronicle*—prune it now, or as soon as the leaves turn yellow, cutting the weak shoots to the last joint of this season's growth, and the strong ones to one third their length, or according as you want the plant to be large or small; if you want to confine its growth you had better stump it all over, like pruning a White Currant bush; it will do in a shed all winter, and in spring may be forced like a Vine; after it makes its growth it stops for a time, but still keep it in heat and well watered; presently it makes another effort to grow and will then flower all over on the second growth; not, however, if it has been mismanaged formerly. When the first flower expands, place it in the conservatory, and give it no more heat until next growing season.

PITS.—I have no regret for being short of room under this head, as Mr. Errington will soon send detailed accounts of the winter forcing plants in these pits.

FLOWER-GARDEN.—I like Mr. Ayres' plan very much for covering the naked beds in the flower-garden in winter; nothing can be more unsightly than lumps of ill shaped beds, or even bare beds with the most approved shapes. We cover every inch of soil in our beds here as soon as they are cleared of the summer crops, and I shall say how next week.—*D. Beaton, Shrubland Park Gardens, Ipswich.*

State of the Weather near London for the week ending Oct. 26, 1843, as observed at the Horticultural Garden, Chiswick.

Oct.		Barometer.		Thermometer.				Wind.	Rain.
		Max.	Min.	Max.	Min.	Mean.			
Friday	30	59.231	50.104	57	37	47.0	S.W.		.25
Saturday	31	59.045	51.869	56	31	43.5	W.		.01
Sunday	32	59.090	51.57	51	41	52.0	S.W.		.11

Nov. 26	51.6	37.5	44.7	10	0.41	1	2	3	1	3	1	1	1	1	1

The highest temperature during the above period occurred on the 30th, in 1833, thermometer 57°, and the lowest on the 30th, in 1842, thermometer 23°.

REPORT ON COVENT-GARDEN MARKET.

For the Week ending Nov. 4, 1843.

LITTLE variation has taken place in the prices of most articles during the past week, and the Market still continues to be rather dull. Fruit has been plentifully supplied during the week, and has, generally speaking, rather improved in quality. Pines, although not so large and handsome as in the earlier part of the season, are nevertheless good and sufficient to meet the demand. Grapes principally consist of Black Hamburgh, but a few Muscats are still to be seen in market; we also noticed a good bunch or two of the Syrian. Imperatrice Plums are selling at from 1s. to 2s. per punnet. Damsons continue of good quality. Peaches are now almost entirely over for this season. Among Apples are some of the Royal Russet, B. stone Pippin, King of the Pippins, Blenheim Orange, and a few good Nonpareils. Pears chiefly consist of Gansel's Bergamot, Chaumontel, Beurré Diel, Brown Beurré, and Marie Louise. These good kinds are, however, scarcely sufficient to meet the demand. A few good Spanish Melons are still brought to the market, and are selling at from 1s. 6d. to 3s. each. Cucumbers are rather scarce, and are of inferior quality. Vegetables of almost every kind have been abundantly supplied. Cabbages and Turnips are very good and plentiful, and Carrots are sufficient to meet the demand. There has been some excellent Cape Broccoli brought to the market during the week; this is selling at from 1s. to 2s. per bundle. Endive is sufficient to meet the demand, and Shallots are good and plentiful. A few green Peas have made their appearance during the week. Cut Flowers chiefly consist of *Erica gracilis*, *caffa*, a rather fragrant variety, and *acuminata longiflora*, double variety of *Azalea phoenicea*, *Amaryllis guttata*, and *belladonna*, *Lechenaultia formosa*, *Gardenia radicans*, double white *Primula*, *Neapolitan Violets*, *Chrysanthemums*, *Puchsias*, *Pelargoniums*, *Camellias*, *Calceolarias*, *Verbenas*, *China* and *Perpetual Roses*.

PRICES, SATURDAY, November 4, 1843.—FRUITS.—

Pine Apple, per lb., 3d. to 7s.	Cucumbers, per brace, 4d. to 8d.
Grapes, hothouse, per lb., 2s. to 4s.	Gherkins, per 1000, 5s. to 7s.
Portugal, per lb., 3d. to 5d.	Green Capsicums, per 100, 1s. to 2s.
Melons, each, 1s. 6d. to 1s.	Red, 4s. to 5s.
Dutch, each, 1s. to 2s. 6d.	Almonds, per peck, 8s.
Spanish, each, 1s. 6d. to 2s.	Sweet Almonds, per lb., 2s. 6d. to 3s.
Plums, per punnet, 1s. to 2s.	Nuts, per bushel
Imperatrice, per pun., 1s. to 2s.	Brazil, 16s.
Damsons, per sv., 1s. to 4s. 6d.	Hazel, 1s. to 4s.
Apples, dessert, p. bush, 1s. to 10s.	Bitter melon, 2s. to 2 1/2s.
Apples, Kitchen, p. bush, 1s. 6d. to 3s.	Cob, 12s.
Pears, per lb., if sieve, 2s. to 10s.	Chestnuts, per peck, 4s. to 5s.
Oranges, per dozen, 1s. 6d. to 3s.	Berries, in glass, p. 100lbs., 5s. to 60s.
per 100, 10s. to 24s.	Barberries, per hf. sv., 3s. to 4s.
Lemons, per doz. 1s. to 2 1/2s.	Tomatoes, per hf. sv., 3s. to 4s.
per 100, 6s. to 14s.	

VEGETABLES.

Broccoli, per bundle, 1s to 2s
 Brussels' Sprouts, per lb.-sv., 1s to 2s
 Cabbages, per doz., 6d to 1s
 Greens, per doz., 1s 6d to 2s 6d
 Cauliflowers, per dozen, 1s 6d to 2s
 Beans, kidney, per lb.-sieve, 4s to 6s
 — Scarlet, per lb.-sv., 2s to 3s
 Potatoes, per ton, 40s to 75s
 — per cwt., 2s to 4s
 — per bushel, 1s 6d to 2s
 — Kidney, p. bush., 2s to 2s 6d
 Artichokes, green, per doz., 1s 6d to 2s
 Turnips, per doz. bunches, 1s to 2s
 Red Beet, per dozen, 9d to 1s
 Horse Radish, per bundle, 1s to 6s
 Radish, spring, p. doz. bunches, 6d to 1s
 — Turn p. p. doz. bunches, 9d to 1s
 Carrots, p. doz. bunches, 2s to 5s
 Spinach, per sieve, 9d to 1s
 Leeks, per doz. bunches, 1s to 2s
 Garlic, per lb. 6d to 8d

Onions, Spring p. doz. bch., 1s 6d to 3s
 — Large, per bushel, 2s to 3s
 — Spanish, per doz., 1s 6d to 3s
 — Pickling, p. lb.-sv., 3s 6d to 4s 6d
 Shallots, per lb., 6d to 9d
 Chilis, per 100, 1s to 2s
 Lettuce, Cabb., p. score, 9d to 1s
 — Cos, per score, 6d to 1s
 Celery, per bun., 6d to 2s
 Mushrooms, per pottle, 1s 6d to 2s
 Wallnuts, per bushel, shelled, 16s to 28s
 Small 5s ads, per punnet, 2d to 3d
 Watercress, per doz. sm. bun. 3d to 4d
 Parsley, per doz. bunches, 1s 6d to 2s
 Tarragon, per bun. 2d to 3d
 Endive, per score, 1s to 1s 6d
 Mint, per doz. bunches, 1s to 2s
 Majoram, green, p. doz. bun. 1s 6d to 2s
 Chervil, per punnet, 2d to 3d
 Salsafy, per bundle, 1s to 1s 6d
 Scorzoneria, per bundle, 1s to 1s 6d

Notices to Correspondents.

MR. PAXTON'S COTTAGER'S CALENDAR.—At the earnest solicitation of many of our Subscribers, we have determined on again reprinting Mr. Paxton's "Cottager's Calendar," in the form of a small volume, for general distribution, price 3d. each copy. It may be ordered of all booksellers. Gentlemen wishing to distribute copies among their cottage tenantry, may have them delivered in any part of London, by remitting a post-office order to this office, at the rate of 5s. for every 25 copies.

COMMUNICATIONS from the following CORRESPONDENTS are in type, and are only waiting till room can be found for them:—*Bath, Major C., Electric, G. Williamson, South Devon, J. M., A Practical Man, J. F. McElroy, J. Wighton, Atlas, Facile, M. Saul, P. Mackenzie, Tyro, Quercus, Vultur, W. Paul, B. Maund, R. Errington, G. Fleming, and Wm. Thompson.*

ADHESIVE PAPER.—*Botany.*—Excellent paper of this kind is made by dissolving two parts of fine gum arabic and one part of brown sugar, in water, and applying the mixture, of the thickness of cream, to paper, with a painting-brush. Gum arabic alone is sure to crack and become too hard. In laying on the mucilage, the paper should be well dampened and nailed to a board, or it will shrink unequally and pucker. When quite dry it may be taken off the board and laid in a dry place.

BIGNONIA VENUSTA.—*Argo.*—The Vines of *Bignonia venusta* may be shortened back as soon as they have lost their leaves, because after that time no elaboration of sap can take place, and the Vines are maintained at the expense of the root without making any return. Cold and damp are the cause of canker in Melons.

BOOKS.—*P. R. and A Well-wisher.*—The best books on Landscape Gardening are Repton's works and Price on the Picturesque. —*J. P. B.*—The "Revue Horticole" occasionally contains some good matter. "Berleze's Camellias" is not, in our opinion, of much value. The "Bon Jardinier" is one of the most useful books of its size ever published, and is indispensable to all who would gain a knowledge of French Horticulture.

CACTI.—*Fakontensis.*—Your Pope's-head is, as you suppose, *Melocactus communis*. The rose-coloured fleshy bodies which it has produced are its fruit. The flowers blew in Jamaica, and left their young ones lapped in wool to be produced afterwards. You are not very likely to flower it again. All that it ever becomes is now before you. The seeds in the fruit will propagate it. It requires to be kept without any water, and in a greenhouse, till next summer, when it may be placed upon, not in, any light soil, in which a little lime-rubbish has been mixed. Water may then be given by degrees, but the chances are that it will rot.

CALCEOLARIAS.—*G. L. B.*—Standishii, Barnes's Landmark, Green's Prince Albert, Miss Antrobus, Mary, and alba coccinea maxima.*

CANADA.—*Jean Baptiste.*—We certainly recommend you to use double glass for a greenhouse in Canada. If you do not you must have recourse to coverings of mats or straw, which will ruin your plants if they are anything besides Oranges and Myrtles and Oleanders. No mode of heating is equal to hot water. As it will not do for you to risk your plants in a damp winter atmosphere, you must employ iron pipes, and not brick tanks.

DAHLIAS.—*Stultus.*—It is probably true that after the leaves only of the Dahlia have been killed by frost, a portion of the organizable matter of the stem will find its way into the roots, and so contribute to ripen them. But, on the other hand, there is the danger, in so succulent a plant as the Dahlia, of the decay in the stem spreading to the roots, and giving them a greater tendency to rot than they otherwise would have. You see there is probability on one hand, and danger on the other; but certainly, as regards the question you have put, nowhere. Why not determine the point experimentally? In the meanwhile the common practice is the safest.

DESERT GARDENERS.—*An ill-treated Gardener* must not look to us for assistance in his scheme, which is we think chimerical. We fear, from his letter, that he belongs to a race of gardeners whom nothing will satisfy, and who think more of themselves than of their employers. He is maintained by the nurserymen, and yet he abuses them. Is that right? The practice of calling over the labourers in a morning we entirely approve of. Punctuality is one of the first duties of a gardener, and one of the last that some men think of.

FARMING.—*F. A.*—We should be very sorry to lead our old subscriber and worthy correspondent, near Dartmoor, into disappointment and loss, which we might readily do by specific instructions as to the management of his poor, sandy soil. He had better follow the advice of his Cornish ploughman, till he sees what his land will produce. He may take a small portion in hand, and cultivate it with the spade, cleaning it well, growing Carrots and Potatoes, if he can get dung for the latter. Buckwheat will grow without manure, and may be ploughed in when in bloom. Two horses are required for this farm; other stock must be proportioned to the fodder. If there is no hay and straw to be bought at a reasonable price, he had better sell his young stock; the first loss will be the least. When we know more of this land we shall readily give him our advice as to his future proceedings. M.

GREENHOUSES.—*Cavanensis.*—The upper plan, at p. 93 of Mackintosh, is a very good one, of the kind, but the lower is better. Beds will not suit what appear to be your objects. You may have Vines up the rafters if you wish it. Some good information on the Melon will be found in Rogers's Fruit Cultivator. Mr. Youell's *Fuchsia St. Clare* is no doubt genuine.

HEATHS.—*M. P.*—From your statement we presume that your heaths are infected with mildew—a disease which has this season been rather prevalent among this tribe of plants. It generally attacks young wood made late in the season, that has not been thoroughly ripened; therefore the plants should be encouraged as much as possible to make their growth in the early part of the season, and placed in a dry airy situation, in order that the young shoots may be well matured and hardened off. This will enable them the better to withstand the long dull months of winter, and render them less liable to this or any other disease. The mildew may be cured by the application of sulphur to the parts affected; but as this makes the plants appear rather unsightly, it may be better to put sulphur vivum, (which is stronger,) into a small bag, boil this for some time in water, and then with the water, after it has cooled, you may syringe your plants. This will have the same effect as the sulphur, and will produce no unsightly appearance.

INSECTS.—*J. D.*—The insects have been injured by the larvae or maggots of a little moth, which has crept into his boxes from their not fitting well and being air tight. The only remedy is to wash the undersides of the bodies with a weak solution of corrosive sublimate and alcohol, using a small camel's-hair brush. No. 1 is the chrysalis, probably, of the Buff-tip Moth;

2, do.; 3, do. of a Noctua; 4, do.; 5, do. of the White Cabbage Butterfly; 6, *Eyprepia cajo*; 7, *Vanessa io*; 8, *Triphena imuba*; 9, *Callimorpha Jacobea*; 10, *Plusia Gamma*; 11, *Amphipyra tetra*; 12, *Triphena pronuba*. Several of these *J. D.* will find figured and described in the Journal of the Royal Agricultural Society. R.

KEEPING APPLES AND PEARS.—*A new Subscriber.*—The best mode of keeping Apples and Pears is to place them in close drawers made of wood that does not contain turpentine; these being in a room so constructed as to resist as much as possible all sudden changes of the weather, and in a cool but dry situation. *Ligustrum lucidum*.

MANURE.—*A. S. M.*—As gypsum is itself an excellent manure, you need not be particular how much of it you use in fixing ammonia. A valuable compost may be made by mixing gypsum, gas-water, soil, ashes, and any refuse. The fixation of the ammonia is a slow operation, and it is impossible to give any practical direction as to the proportional quantities of gypsum and gas-water. But a small quantity of the former is requisite. —*B. L.*—If you can add gypsum to your land it will improve it much for Wheat. Should gypsum be too expensive, then employ a good dressing of lime or marl. But you had better cart the latter at once on the land, and not mix it first with your compost; for that would be a waste of labour.

MULBERRY.—*A Reader from the Commencement.*—The soil most suitable for the Mulberry is a rich, deep, and rather light loam, not cold and wet. It succeeds best as a standard, in a well-sheltered situation, open to the south. It may be trained against a south wall with advantage, in a cold climate, but requires much space.

NAMING PLANTS.—*Litoralis.*—We should be happy to oblige you, but we really have no time to name collections of dried plants. You are probably not aware of the trouble such tasks give.

ORCHIDACEÆ.—*Argo.*—*Stanhopea insignis* should receive an abundant supply of water at the roots, and be syringed once or twice a day, as the weather may permit during the summer months, but as the season advances water should be gradually withdrawn, and in winter it should only have as much as will keep the pseudo-bulbs from shrivelling. Your *Cattleya Mossia*, which is growing on a block of wood, would thrive better potted in rough peat mixed with potsherds, and raised up to about one-fourth the height of the pot above the brim. This plant should receive little water at all times, but more especially in winter; indeed, *Orchidaceæ* in general ought to be kept rather dry in winter.

PANSIES.—*F. Chase.*—Brown's Curlew, Maid of the Mill, Countess of Orkney, Cook's Mulberry superb, Alicia, King's Exquisite, Sulphurea elegans, Pearson's Black Prince, Major's Bridegroom, Thompson's Eclipse, Miss Stainforth, Corona, Jehu, Princess Royal, Nymph, Regulator, Atila, Cyclops, Venus, Ultraflora, Desirable, Raphael, Lane's Sir J. Sebright, and Lidgard's Jewess. The soil should be rich loam; and should be well manured; in order to insure large and fine blooms, the plants must be young.*

PEARS.—"Este" was answered, with thanks, at p. 736, col. a.

PEARLONIUMS.—*G. L. B.*—Foster's Favourite, Matilda, and Sir R. Peel, Garth's Unit and Queen of the Fairies, Lyne's Duke of Cornwall.*

PETUNIAS.—The *Petunia* from *M. R.*, noticed at p. 774, should not have been described as a new variety; the flower was from the same plant as the one described at p. 721, and the difference arose from the first specimen having been some days expanded, and the latter newly opened. The flower opens with rosy coloured blotches in addition to the blue; these gradually disappear, and leave the flower of a beautiful blue, mottled upon a white ground, and in this state the flower dies.*

PLANTS.—*G. L. D.*—The following plants will do well on a wall 50 yards long by 5 feet high, with a south aspect:—*Wistaria sinensis*, this may be planted in the centre, and trained each way; *Magnolia grandiflora* and *M. conspicua*, *Passiflora cerulea*, *Clematis Sieboldii* and *C. azurea grandiflora*, *Bignonia radicans*, *Chimonanthus fragrans grandiflora*, *Jasminum revolutum*, the yellow and white Banksian Roses, and *Ceanothus azureus*.

RED SPIDER.—*A Young Gardener.*—We are not aware of any other means of destroying Red Spider, than by keeping a damp humid atmosphere, or by the application of the fumes of sulphur.

RHODODENDRONS, &c.—*H. T. S.*—You may plant *Rhododendrons* and other varieties of American shrubs with advantage about this season. —*Tartan truss.*—In preparing a bed for *Rhododendrons* and other American plants, your peat, which is inert and unproductive, will be greatly benefited by adding the one half maiden-loam and about a third of well-decomposed cow-dung.

SEA-KALE.—*A Correspondent.*—Your Sea-kale, which is still in a state of vegetation, must not have its leaves taken away before they have begun to decay, or you will rob the root of a portion of its nourishment. The pots for forcing should be put on about three weeks or a month before you wish to have it ready for table. You cannot do better than cover the crowns with sea-sand, which, offering a slight resistance, will prevent them from shooting up small and weak; you may also cover the pots with sea-weed.

SHELTER.—*F. R.*—What Ilex do you mean—*Ilex aquifolium*, the Holly; or *Quercus Ilex*, the Evergreen Oak? Either afford excellent shelter, but not better than Evergreen Firs, Yews, Arbor Vitæ, or Portugal Laurels.

THE MICROSCOPE.—*A Lady.*—The specimens of skeleton plants which you sometimes see, and to which we presume you allude, are prepared by maceration in water for many weeks, and carefully cleansing afterwards with brushes; aided, it is said, by muriatic acid. There is, however, some secret in the preparation. In preparing portions of tissue for the microscope, it is most usual to slice the plant very thin with a razor, or to boil it and pull it in pieces with needles, or to leave it in water till it is rotten, when the parts readily separate.

MISCELLANEOUS.—*A Kentish Man.*—1, Blenheim Pippin; 2, Scarlet Nonpareil; 7, Court of Wick; 10, London Pippin; 12, Bedfordshire Foundling; 14, Kentish Fill-basket; 16, Hawthornden; 17, Marmalade Pippin. Pears.—1, Uvedale's St. Germain; 3, Marie Louise. —*W. M.*—Your Grape is certainly the Black Prince. —*C. R. D.*—Six kitchen Apples for espaliers may be the Dutch Codlin, Hawthornden, Blenheim Pippin, Dumelow's Seedling, Bedfordshire Foundling, and Alfriston. —*L.*—Your Apples are—2, Bedfordshire Foundling; 5, Gravenstein; 6, King of the Pippins; 8, Alfriston; 9, Court of Wick; 10, Beauty of Kent; 11, Pomme de Nieve; 12, Hughes's Golden Pippin; 13, Blenheim Pippin; 14, Ribstone Pippin. —*J. B. M.*—Substitute the Florence for Knight's late Black, and your selection of Cherries will be good—ordered as you propose. —*Devonian.*—Send your address to the office, and we will forward you the book. —*B. Y.*—A, Colmar; B, Beurré Rance; C, Passe Colmar; D, Napoléon; E, Glout Moreau; G, (decayed); H, Marie Louise; I, Crassane; J, Seckle; O, Doyenné Blanc. —*Crina.*—*Clavaria coralloides.* —*W. F. G. F.*—We are unacquainted with *Phæomeria magnifica*, which is probably some new discovery of M. Bojer. *Patena elastica* is probably *Urceola elastica*, the plant which produces the india-rubber of Penang. —*G. S.*—Your plant is *Acacia melanoxylon*, or some allied species; the other you mention is doubtless some other species. When Zoologists can explain why a fly first comes into the world as a grub, Botanists may be expected to tell why New Holland Acacias when young have two sorts of leaves. Alocs will not bear the open air in winter; but if by that name you mean the *Agave Americana*, it may be kept in a dry cellar, provided it is secured from much frost. —*T. Davis.*—*Panicum miliaceum.* —*Anon.*—Narrow-leaved Myrtles will flower in a greenhouse, if they are fully exposed to sunlight, for many months every year. Your proposed additional due is needless.

Ranunculuses will flower in a greenhouse. If by Arums you mean the *Calla* or *Richardia æthiopica*, that plant will live in the open pond through mild winters, and therefore will of course be safe in a greenhouse under any circumstances. —*A Suffolk Cucumber Grower.*—It is very seldom that prizes are given for Cucumbers by the Horticultural Society, and we do not recommend you to incur the expense of the experiment. The real merit of a Cucumber consists in its good bearing and good flavour, and not in its enormous length; so that it is not well suited for purposes of exhibition, except where prizes are especially offered for it. —*Dumhuill.*—No. 2 is a *Siphocampylus*, and apparently new; but we will examine further. What sort of a plant is No. 1? a shrub?—and have you sent one of its leaves or a leaflet? —*R. R.*—We cannot assist you. It is usual to pay the subscription in advance, if, however, you refuse to do this, but are willing to pay for each Number as you receive it, you ought only to be charged 6d. —*W. Hughes.*—Your Pear-tree, which trained horizontally, covers 107 ft. of wall by 10 ft., is very different from any of the *Bon Chrétien*; it is the *Poire d'Amour*. The Grape is not known. It very much resembles one from Tarascon, called *Blanche* only; but the latter, which ripened in the open border, was much better flavoured. Have these not been affected by frost? —*J. H.*—18, Monk's Codlin; 19, St. Germain Pear; 21, Lamb Abbey Pearmaine; 22 appears to be the *Hollandbury*; 23, Scarlet Crofton; 25, Orme. —*C.*—Three rich dessert Apples that will keep well, may be Pearson's Plate, Golden Harvey, and Court-pendu Plat. Three Kitchen, Dumelow's Seedling, Alfriston, and Bedfordshire Foundling. —*G. Hildyard.*—Your Apple is the Yorkshire Greening, esteemed for Kitchen use. —*A Subscribing Gardener.*—Apply by a letter to the Secretary of the Horticultural Society. —*W. Criggs.*—*Eulophia macrostachya*. —*A Constant Reader.*—*Origanum dictamnus* and *O. Siphylum*. —*E. Franklin.*—*Brunia ericoides*; sow your Portugal Laurel berries in spring. —*J. H.*—It is impossible to say to what species your *Ipomœa* belongs, from the mere inspection of a single leaf. —*D. M. C.*—There is nothing in your seedling *Gloxinia* worth particular notice, different from other flesh-coloured kinds raised this year. —*Z. Y.*—If the front wall of your Vinery is arched, plant the Vines inside. —*A Correspondent* will find directions for destroying Woodlice at p. 649.

SEEDLING FLORISTS' FLOWERS.

FUCHSIAS.—*E. T.*—Your seedlings are rich in colour, and they are well-formed flowers, but there is too great a similarity between these and others sent some time since. No 5 appears to be the best, being more elegant in appearance, and displaying more of the corolla; 6 was too much decayed to judge of its colour, and 7 appears not to expand sufficiently. They all require the corolla to be more intense in colour. *

PETUNIAS.—*M. R.*—There is no novelty in your seedling No. 14, a clouded rose-coloured variety, it is only a dwarf and prolific habit of blooming that will distinguish it from many we have seen. *

As usual, a host of letters has arrived too late for answers this week.

NEWS OF THE WEEK.

ACCOUNTS from Ireland have reached town this morning, announcing that bills of indictment have been sent before the Grand Jury of the City of Dublin, against Mr. O'Connell and his colleagues. Mr. Justice Burton delivered his charge to the Grand Jury on Thursday, and there was no doubt that the Jury would return true bills. It is said to be impossible that the trials can commence before the end of the month—probably between the 22nd and 27th.—In the meantime, the Repeal Association continues to command fresh support from the higher classes of Society, and the titular Archbishop of Cashel has this week announced his adhesion to the movement, on grounds similar to those assigned by Mr. Smith O'Brien. The Repeal rent also continues to increase, and the amount announced on Monday was upwards of 3000*l.* received from Saturday to Saturday.—The trials of the Welch rioters by the Special Commission have terminated in a verdict of Guilty against the only prisoner who went to trial; while all the others pleaded guilty, in the hope that their contrition might be accepted in mitigation of punishment. In the latter cases the Attorney-General, on behalf of the Crown, abstained from prosecuting, and the Judges by the leniency of their sentences showed that they were anxious only to vindicate the authority of the law.

In France the contest between the Clergy and the University has assumed so hostile a character, that the Ministry, it is said, have referred the letter of one of the Bishops to the Council of State, and intend to bring the whole affair before the Chambers during the ensuing Session.—In Spain the Government have presented to the two Chambers an act demanding that the Queen should be declared of age. The Commissioners for examining this declaration have also been appointed, and as they are all adherents of the present Ministry there is no doubt that the Queen's majority will be forthwith declared.—From Greece we learn that an attempt has been made by Gen. Colocotroni, one of the King's Aides-de-camp, to get up a counter-revolution at Athens. The attempt completely failed, and the King immediately assembled the Council of State, together with the principal authorities, disavowed all participation in the design, and declared his determination to abide by the constitutional system established by the recent revolution.

Home News.

COURT.—Her Majesty and Prince Albert arrived in town on Saturday afternoon from Wimpole Hall, the seat of the Earl of Hardwicke, whom they had honoured with a visit on leaving the University of Cambridge. On reaching the Paddington terminus of the Great Western Railway, the Queen and Prince proceeded by a special train to Windsor, and arrived at the Castle shortly before five o'clock. On Sunday, Her Majesty and the Court attended divine service in one of the private apartments of the Castle. On Monday, her Majesty did not leave the Castle.

in consequence of the unfavourable state of the weather. Prince Albert rode into the Park for the purpose of enjoying a few hours' shooting, but after a few shots he found the covers too wet to continue the sport, and returned to the Castle. In the evening the Grand Duke Michel of Russia arrived on a visit to her Majesty. On Tuesday Prince Albert accompanied his Imperial Highness to Eton College, where they inspected the library, schools, chapel, &c., and in the afternoon the Grand Duke took leave of the Queen and returned to town. On Wednesday morning her Majesty and Prince Albert walked for a short time on the terrace, and the Prince afterwards went out shooting in the Royal Preserves in the Great Park. In the afternoon Prince Alexander of the Netherlands, who returned to town on Saturday from Drayton Manor, the seat of Sir R. Peel, arrived at the Castle on a visit to her Majesty. His Royal Highness hunted with the Prince's harriers on Thursday, and afterwards returned to town. His Royal Highness will take his departure for the Hague in a few days, after a sojourn of nearly three months in this country. The visitors to her Majesty this week, in addition to the Princes mentioned above, have been the Saxon, Russian, and Netherlands Ministers, Baroness Gersdorff, Sir J. Graham, the Earl of Jersey, Sir H. Wheatley, and Mr. E. Stanley. Colonel Buckley has succeeded the Hon. Col. Grey as Equerry in Waiting on her Majesty. Colonel Wylde has succeeded Colonel Bouverie as Equerry in Waiting on Prince Albert. Sir F. Stovin has succeeded Mr. Ormsby Gore as Groom in Waiting on her Majesty, and the Hon. Misses Murray and Lister have succeeded the Hon. Misses Hamilton and Stanley as Maids of Honour in Waiting on her Majesty. The Duchess of Kent, accompanied by the Prince and Princess of Hohenlohe Langenbourg, arrived at Frogmore last evening from Witley Court, where they have been on a visit to the Queen Dowager.

The Grand Duke Michael.—After his return from the North, his Imperial Highness visited several of the exhibitions and public establishments in the metropolis; among others may be mentioned St. Paul's, the Colosseum, the Diorama, the United Service Club, the Glaciarium, the Chinese Collection, the establishment of Messrs. Mortimer and Hunt the silversmiths, the Model Prison, the cavalry barracks in Albany-street, and the office for regulating the clothing of the Army. His Imperial Highness also visited the stables of the principal dealers, and made selections from their different studs. On Thursday morning his Imperial Highness embarked in the Black Eagle at Woolwich, under the usual salutes from the batteries, and proceeded to Rotterdam, on his return to Russia.

The Duke de Bordeaux visited the Duke of Hamilton last week at Hamilton Palace. On Friday, H.R.H. visited Glasgow, accompanied by the Duke of Hamilton and Sir Archibald Campbell, of Succoth. After visiting various places of interest in the city, H.R.H. returned to Hamilton Palace. The Prince is expected to arrive in London about the 15th inst., prior to which he will honour the Earl of Shrewsbury with a visit at Alton Towers, where M. Berryer, the celebrated orator and member of the Chamber of Deputies, and other distinguished royalists, have arrived to meet his Royal Highness.

The Colonies.—Intelligence has been received at the Colonial Office of the death of the Governor and Commander-in-Chief of the Gambia, Commander H. Frowd Seagram, R.N., on the 26th August, in the prime of life. The deceased officer was the fourth son of the Rev. Mr. Seagram, rector of Allbourne, Wilts, and had just assumed the government of that settlement.

The Church.—An impression prevails that Archdeacon Lonsdale, Principal of King's College, London, is to succeed to the see of Lichfield. Some confirmation is given to this belief by the fact that a messenger from Sir R. Peel, with a pressing communication to the Archdeacon, arrived at the Savoy Chapel on Sunday afternoon, while the Rev. Gentleman was in the pulpit.—An Order in Council, recently issued, directs that the six minor canons of Westminster Abbey shall each in future receive an annual stipend of 150*l.*—The Queen has presented the following clergymen to benefices in the Church of Scotland, void by the late secession:—Rev. Alexander MacGregor to the church of Iona or Icolmkill, Argyll, in the room of the Rev. Donald M'Vean; Rev. Alex. Mackeller to the churches of Bailechulish and Corran of Ardour, Argyll, in the room of the Rev. J. M'Millan; Rev. Angus Martin to the church and parish of Snizort, in the Isle of Skye, in the room of the Rev. Roderick M'Leod. Her Majesty has also appointed the Rev. J. Campbell to the church at Strontian, Argyll, vacant by the translation of the Rev. A. Mackenzie to the church of South Knapdale.

Pensions.—We copy from the *Athenæum* the following letter from Sir R. Peel to Lady Bell, widow of Sir Charles Bell, the eminent surgeon:—"Madam,—I have had great pleasure in recommending to her Majesty that, in consideration of the high attainments of your lamented husband and the services rendered by him to the cause of science, a pension of one hundred pounds per annum for your life shall be granted to you, from that very limited fund which Parliament has placed at the disposal of the Crown for the reward and encouragement of scientific labours. This pension, small in amount as it necessarily is, will perhaps be acceptable to you as a public acknowledgment, on the part of the Crown, of the distinguished merit of Sir Charles Bell.—I have the honour to be, Madam, your faithful and obedient servant, ROBERT PEEL. —Whitehall, Sept. 2."

Foreign.

FRANCE.—The Paris papers, with few exceptions, comment upon the resistance which the clergy are oppos-

ing to the privileges of the University; and the contention is deriving some importance from the great displeasure expressed by the Government organs, the violent language of the Liberal prints, and the understanding which seems to exist between most of the prelates of France. The Bishop of Langres has just joined the Archbishop of Lyons and the Bishops of Belley, Chartres, and Chalons in disputing the exclusive rights of the University, and asserting those of the clergy to a participation in public instruction. This rising opposition on the part of the French Church is the more remarkable, as 12 of the 15 Archbishops, and 47 of the 65 Bishops of France have been raised to their sees by the Government of the present king.—On Sunday, the Cabinet of which Marshal Soult and M. Guizot are the heads completed the third year of its existence—a very protracted one when compared with the duration of the Administrations that preceded it. The king marked his sense of its services by promoting most of the ministers to the highest rank in the Legion of Honour. It is said that Tuesday, the 26th December, is the day fixed for the meeting of the Chambers, and that the ordinance of convocation will be published on the 15th inst. A rumour had been current that Admiral Baron Roussin, who held the navy department in the Cabinet, and resigned it some months ago, in consequence of ill health, died last week at Montpellier, but the report appears to be altogether without foundation. Baron Capelle, however, formerly Minister of Charles X., and one of the signers of the ordinances of July, 1830, died in that city on the 25th ult.—The Government have concluded a treaty of navigation and commerce with the Government of the Wallis Islands; a settlement in Madagascar is said to be determined on, and there is some talk of an intention to seize one of the ports of St. Domingo.—The *Commerce* announces that the superior committee of the fortifications of Paris, in concert with the War-office, is at this moment preparing a statement which is not without importance; it relates to the effective of the troops which are to compose the garrison, and likewise of the armament necessary for the detached forts of the capital. If this statement be true, it appears that the Parisian citadels will occupy in time of peace an army of 24,800 men, which, united with the garrison of the military establishments of the continuous wall, as well as those of the interior of Paris, will form an effective of more than 60,000 men to guard the city of Paris, and will be armed with 1,262 cannon, composed in part of 80-pounders and mortars, capable of throwing their projectiles into the centre of Paris. In consequence of the increase of troops demanded by the fortifications of Paris, it is also said to be in contemplation to augment the artillery and engineer force, as well as the Municipal Guard.—The journals mention the return to Paris of the young Duke de Montpensier, whom indisposition has prevented from attending the artillery exercises, for which he had repaired to Metz. Some of the papers discuss the probable marriage of the Duke d'Aumale to a Princess of Naples, for which purpose his Royal Highness is said to be now journeying through Italy. The Duke and Duchess de Nemours intend to leave Paris this week for England, on a visit to the Queen.—*Le Journal des Chemins de Fer* announces that the directors of the Rouen and Havre Railroad Company have concluded with Messrs. Mackenzie and Brassey the most important contract ever made in France:—"The principal works on the Havre Railroad are the bridge of Rouen, seven tunnels of an extent of 6,500 yards, and a viaduct of 27 arches in the valley of Barentin, being 33 yards in height from the arch to the centre. These works will cost from 13,000,000*fr.* to 14,000,000*fr.* They are to be entirely completed in May, 1846. The embankment and the tunnels are contracted for at a discount of 20 per cent. on the prices paid the same contractors for the Paris and Rouen Railroad. The cubic yard of embankment to be paid 1*fr.* 25*c.* (1*s.* British), the superficial yard of tunnelling 88*fr.* (nearly 36*l.* British)."—M. Horace Vernet, who had been commissioned by the King to execute a picture representing the capture of the Smala of Abd-el-Kader by the Duke d'Aumale, returned to Marseilles on the 23d, from Algeria, having visited and sketched the site on which that exploit was achieved.

SPAIN.—We have accounts from Madrid to the 26th ult. The Senate sat on the 20th, when the public and diplomatic galleries were crowded, in the expectation that M. Campuzano would put questions to the Cabinet respecting the insurrections of Barcelona and Saragossa, and the circumstances that have led to them. The discussion took place, and M. Lopez, President of the Council, entered into a long vindication of the Government's conduct towards the two rebellious cities. He stated, in substance, that out of the 49 provinces of Spain only nine—Burgos, Salamanca, Toledo, Palencia, Girona, Lerida, Castellon, Barcelona, and Saragossa, had demanded a Central Junta, and that four of these provinces had demanded it previous, and five subsequently to the promulgation of the decree for the convocation of the Cortes. M. Lopez then urged that the will of nine provinces could not be suffered to prevail over that of the 40 others, and he expatiated on the disastrous consequences which the convocation of a Central Junta would have entailed. The passage wherein he referred to the dismissal of his Cabinet and to the insurrection which followed is worth quoting, because it alludes to the original cause of the fall and expulsion of the ex-Regent. "I avail myself of this opportunity (said M. Lopez) to confute another imposture which was at the time propagated in the Saragossa journals. It was alleged that Espartero had dismissed the Administration of the month of May solely because it had proposed measures which he considered contrary to the welfare of the country. This is false—quite false. There was but one question, that of the dismissal of that favourite so

much flattered; and the Administration dissolved on that question, because the nation must have been sacrificed to the power of one man."—The Chamber of Deputies was constituted on the 26th, on which day the Government presented to the two Chambers an act demanding that the Queen should be declared of age. It was remitted at once to the committee for nominating commissioners. On the next day the Senate and the Chamber named the commissioners for examining the declaration of the Queen's majority, all of whom were adherents of the present Government.—From the provinces we learn that the troops continued to fire upon Girona on the 28th; the town of St. John had been destroyed, and the battery buried under its ruins. At Barcelona the batteries of the city having thrown into Gracia a number of projectiles, by which several persons were killed, the Captain-General caused 1000 cannon-balls and grenades to be fired, on the 25th, against the points occupied by the insurgents. The greatest disorder prevailed at Barcelona; the Junta continued to force open and plunder the stores of the cloth-merchants, provision-venders, and coppersmiths.—A letter from Bayonne states that Gen. Concha cannonaded Saragossa on the 23d and 24th; that on the 24th the municipality came out and proceeded to Concha's head-quarters, to arrange, if possible, the conditions of surrender. The terms which the Saragossans demand are, that there be no dissolution of the provincial deputation, the municipality, or the National Guard; and that the officers and soldiers who joined the movement be in no way punished. Gen. Concha has sent these terms up to the Government for consideration.—A letter from Carthage of the 21st, mentions that at 4 A.M. on that day, a tremendous storm of wind and rain came on, and a water-spout burst there, which had done great damage. Seven large vessels had been sunk, some of them with cargoes on board, besides several smaller ones; the bodies of four persons drowned had been taken out. The water-spout burst against the barracks where the galley-slaves were confined, near the sea, and though the edifice was an extremely solid one, great part of the roof was carried away, but the town did not suffer much. Some trees were torn up in the Alameda, and some doors and timbers gave way.—From Cadiz we learn that Messrs. Abbinett and Sons, the divers of Gosport, have been licensed by the Government to recover the treasures of certain plate-ships, amongst which were the galleons sunk by part of Admiral Blake's squadron, on the 19th Sept., 1656, off that port. The impossibility of ascertaining the precise spot where the wrecks were lying, either from documents in the Admiralty of London, or from the archives of Seville, created the necessity of minutely examining the bay, to the extent of ten square leagues—a task requiring much time and labour, the traditional indications of very ignorant fishermen and pilots presenting a tissue of fictions after a lapse of near two centuries. However, guided by such slender materials, Messrs. Abbinett found a galleon wreck, consisting of heavy brass ordnance, in ten to twelve fathoms of water, which they slung with rope, sent up, brought on shore, lodging them safely in the Custom-house, to the great surprise of the natives, who deemed this feat impossible; and the Government speedily received the per centage it had reserved to itself from the appraised value, probably equally surprised as the Spanish public,—this being the first bonus the Crown of Spain ever touched from such a source of novel revenue. Messrs. Abbinett subsequently found a galleon fully laden, but owing to the lateness of the season, they have thought it best to defer further operations till the spring.

PORTUGAL.—We learn from Lisbon that the attempts of the Opposition to get up a revolution during the absence of the Queen and her leading Ministers in Alemtejo had entirely failed, although the Municipal Chamber of Evora had unexpectedly addressed her Majesty, in the presence of Senhor Costa Cabral, praying her to dismiss him and the rest of her Ministers. From a letter received from Dr. Kalley, dated 7th Oct., it appears he was still in gaol, after ten weeks' imprisonment. He gives some account of the attempts made to prevent the circulation of the Scriptures. Bail, it would appear, was still denied him. Some of Dr. Kalley's friends in Madeira deem it almost providential that he is in gaol, as otherwise attempts might have been made to assassinate him.

GERMANY.—We learn by letters from Wiesbaden of the 16th ult., that the Duke of Nassau escaped, about a week before, from great danger. He was himself steering his boat from Rudesheim to Bingen, when the wind rose and upset it. The Prince was in the water, when some boatmen succeeded in saving him. On the 20th ult., two steam-boats on the Rhine, the *König*, going to Thal, and the *Leopold*, going to Berg, came into contact in the dark, and the *Leopold* instantly sunk. No lives were lost, though there were between 70 and 80 passengers on board the *Leopold*; but all the luggage and cargo, including a travelling carriage, were lost.—The *Frankfort Journal* states that the King of Bavaria had authorized subscriptions to be made throughout his kingdom for the benefit of the Germans who had been expelled from Greece.—From Berlin we learn that the Archduke Albrecht, of Austria, is at present in that city on a visit to the King of Prussia. His Imperial Highness and numerous members of the high nobility had been invited to the palace at Potsdam, to witness the performance of Shakspeare's *Midsummer Night's Dream*, which was not alone eminently successful, but created the utmost sensation. It was announced for three succeeding nights—an unexampled event, and for all the three every place was immediately taken. The *Cedipus Coloneus* was to be brought forward, the arrangement of the music being entrusted to Mendelssohn and Bartholdy.

SWITZERLAND.—The Swiss *Helvetie* of the 27th contains a protest, sent by the Executive Council of Berne to

the Council of Lucerne. The latter, though at present the Vorort, or Federal Executive, has, in concert with five other Catholic cantons, Uri, Schwytz, Unterwald, Zug, and Fribourg, declared that the Federal compact is violated by the permission to Argau to abolish its convents, and that it is determined to take measures to counteract this and appeal to arms. The Executive Council of Berne have announced their intention to resist the pretensions of Lucerne, and it is expected that an extraordinary Diet will be convoked forthwith, at Berne or Zurich.

RUSSIA.—Letters from St. Petersburg of the 17th ult. state that the emperor arrived in his capital on that day, from Moscow. The royal commissioners appointed to investigate the notorious attempt upon the life of the emperor have returned to Berlin without making any discoveries whatever, and there is not the slightest doubt that the shot was fired by the servant behind one of the imperial carriages. It is computed that the expenses of the investigation of this affair will amount to upwards of 10,000 dollars.—On the 28th ult. a squadron of seven ships of the line, of from 120 to 80 guns, one frigate, one transport, and one steamer, anchored in the roads of Odessa, coming from Sebastopol. Its destination is not known, and causes a good deal of curiosity.—The town of Uralsk, in the government of Orenburg, suffered severely on the 9th ult. by two fires which broke out on the same day. 105 houses, some of stone, some of wood, were reduced to ashes; the loss is estimated at 103,000 roubles.

GREECE.—By accounts from Athens to the 16th ult., we learn that the apparent tranquillity of that capital had been disturbed by the discovery of an intended attempt at counter-revolution by General Colocotroni, one of the Aides-de-Camp of King Otho, but that his Majesty in order to remove all suspicion of his own participation in the design, assembled his Council of State, together with the chief civil and military authorities, on the 14th, and assured them of his determination to abide by the constitutional system established by the national will. Sir E. Lyons, the British Minister, had despatched a steam-boat to Constantinople to bring Prince Mavrocordato, who had arrived and was expected to assume the office of Minister for Foreign Affairs, as it was considered that Metaxas and his colleagues could not maintain themselves in office. All the British agents throughout Greece had acknowledged the new Government, and the commander of the British frigate Eagle, stationed at Patras, had given a ball on board in honour of the Constitution, to which all the Liberal party were invited. The Ministers had refused to accept any salary under existing circumstances. The report that the late revolution had been contrived by Russian agency is met by the announcement that the Emperor having at Moscow received full and detailed accounts of the insurrection at Athens, has ordered the immediate dismissal of M. Katakasi, the Russian Minister at the Court of Athens.—English travellers in Greece will regret to learn the death of Mr. Henry Robinson, H.M.'s Vice-Consul at Patras, who had been connected with Greece and the Ionian Islands for nearly a quarter of a century.

CAPE OF GOOD HOPE.—Advices from the Cape to Aug. 25 have been received this week, which are more encouraging as respects the condition and prospects of Natal, the accounts from whence state that the Boers, at a meeting held Aug. 7, had agreed to the terms of the Governor's proclamation, and acknowledged the supremacy of the Queen. Advices from Simon's Town notice the arrival of her Majesty's ship Thunderbolt on the 22d Aug. from Port Natal, having during a heavy gale parted from her anchors and blown off the coast, leaving behind the commander and several of the officers and crew.

UNITED STATES AND CANADA.—The Great Western arrived at Liverpool on Wednesday with accounts from New York to the 19th ult. The news is chiefly of a domestic and commercial nature. The recent elections are unexpectedly favourable to the Whig party, giving them additional hopes that Mr. Clay will be elected President, in which case it is believed that Mr. Webster will be Vice-President.—The Park Theatre is crowded to see Mr. Macready. He retains all his popularity, and is making a great deal of money—as much, it is thought, as 400*l.* a week for four nights' performance.—The Canada papers give the speech of the Governor-General on opening the Provincial Parliament, which appears to have given great satisfaction. His Excellency refers in this document to the loan raised in this country under the sanction of Parliament for the service of the colony. He states that great works by the assistance of that fund are in progress, which he believes are calculated to extend the commerce and develop the resources of that country, and increase the public revenue and individual wealth. In the House of Assembly Mr. Baldwin had given notice of his intention to introduce a bill for the purpose of declaring Orange and all other secret societies illegal. Another immense conflagration had occurred at Quebec. It was not got under until 60 houses had been destroyed, together with numerous outbuildings in the vicinity of the New Market-place. 500 chaldrons of coals and 1000 cords of wood, the property of Government, were consumed. No cause has been assigned for the breaking out of this disastrous fire.

CITY.

Money Market, Friday.—Consols closed at 96 to $\frac{1}{2}$ for money and the account; 3 per Cents. Red., 95 $\frac{1}{2}$ to $\frac{3}{4}$; 3 $\frac{1}{2}$ per Cents. Red., 102 $\frac{1}{2}$ to $\frac{3}{4}$; New 3 $\frac{1}{2}$ per Cents., 103 $\frac{1}{2}$ to $\frac{3}{4}$; Exchequer Bills, at 1 $\frac{1}{2}$ d., 62s. prem.; at 1 $\frac{1}{2}$ d., 63s. to 65s. prem.

Metropolis and its Vicinity.

Court of Aldermen.—On Tuesday a Court was held for the purpose of swearing into office Mr. W. Hughes

Hughes, as alderman of Bread-street ward. Dr. Buckland introduced Mr. Hughes, who was sworn in by the town-clerk with the usual formalities.

The New Royal Exchange.—The last stone of the tower of this building was set by the contractor on Tuesday, and all that now remains to be added to the tower will be the supports of the vane and the vane itself, which will be the same grasshopper (the crest of Sir Thomas Gresham) which for a long time adorned the old Exchange, and escaped the fire almost uninjured. It has been determined that the chimes shall be restored upon an improved plan, the Gresham Committee, on the recommendation of Professor Taylor, having directed that the peal of notes be increased from eight to fifteen. The first brick of this structure was laid in January, 1841, and it is stated that it will be finished and open for the use of the merchants by the middle of next summer.

Darkness of the Metropolis Roads.—On Tuesday evening a numerous meeting of the ratepayers of Hammersmith was held for the purpose of considering the expediency of lighting the Great Western-road within that parish. The Churchwarden having been called to the chair, Mr. Millar stated that he had communicated with the gas company at Brentford, whose pipes were already laid down along the road, to ascertain at what price they would reinstate the lamps, and continue to light, repair, cleanse, and put up the lamps; to which they had replied that they would light the road at 5*l.* per annum per lamp, and would waive all other expenses except the removal of lamp-posts, &c., which would cost about 15*s.* each. It was therefore proposed that the same number of lamps formerly lighted along the portion of the road named by the Commissioners of the Metropolis Roads, viz. 56, should be continued, the expense of which would be covered by a rate of 6*d.* in the pound, which would realise about 300*l.* The motion was seconded by Mr. Daley, and carried.

Victoria Park.—Although the Act of Parliament for the formation of this park passed on the 21st June, 1841, and an Act for conferring additional powers on the commissioners received the Royal assent on the 13th May, 1842, the only real steps to its commencement have just taken place. The chief part of the land required for the formation of the park was in the possession of numerous market-gardeners, generally of small capital, who gave up possession of their gardens on the 10th ult., having previously received twelve months' notice. The stock and growing produce has, for the purpose of possession, been valued by two brokers on the part of the Crown, and two on the part of the tenants. The whole was sold on Thursday, by auction, and the difference between the produce and the awards of the valuers will be paid by the commissioners on behalf of the Crown.

Rental of Middlesex.—The total rental of this county, as given at the recent Westminster Sessions, is 7,574,330*l.*, being an increase over that of last year of 1,581,922*l.* In the following parishes there has been an increase:—St. George's, Hanover-square, 600,797*l.*, being an increase over the preceding year of 108,000*l.*; Paddington, 191,154*l.*, increase, 16,290*l.*; St. Mary, Islington, 217,593*l.*, increase 7,734*l.*; St. Leonard's, Shoreditch, 178,692*l.*, increase 5,702*l.*; St. John's, Hackney, 137,442*l.*, increase 2,411*l.*; Mile End Old Town, 109,628*l.*, increase 2,685*l.*; Kensington, 141,392*l.*, increase 5,732*l.*; Ealing, 31,103*l.*, increase 1,773*l.*; Norwood, 8,872*l.*, increase, 1,140*l.*, &c. In the following parishes the decrease has been as follows:—St. Martin's, 240,066*l.*, decrease 1,884*l.*; St. James's, 239,059*l.*, decrease, 564*l.*; St. Pancras, 566,320*l.*, decrease, 720*l.*; St. Marylebone, 816,572*l.*, decrease 9,963*l.*

Scottish Hospital.—In consequence of the removal of the Rev. Dr. Brown to Scotland, the honorary chaplaincy of the Scottish Hospital becomes vacant. For many years it has been the practice of the governors to elect to this office a clergyman of the Established Church of Scotland who has been longest resident in London. The Free Church party, however, have avowed their determination to depart from this custom, and bring forward a candidate upon Free Church principles.

St. Stephen's, Walbrook.—On Friday at Guildhall, Mr. Crosby, a solicitor, applied to the Lord Mayor on the part of Mr. Rock and other parishioners of St. Stephen's, Walbrook, for a summons against Alderman Gibbs, as churchwarden of the parish, for refusing to allow an inspection of the accounts to Mr. Rock, he being a proper person to look at the same.—The Lord Mayor asked upon what act of Parliament the application was grounded?—Mr. Crosby said the 17th Geo. II. c. 38, sec. 1, and stated that they had tendered the amount therein specified but the alderman refused to give them; they had a show-book, but it was not satisfactory to the parishioners.—The Lord Mayor then said that Alderman Gibbs had been with him that morning, and he had signed his accounts for the last 18 years, which he had verified on oath to be correct. If the applicant now went and demanded a copy of the accounts, and if Alderman Gibbs refused them, he would grant a summons. He must now stand or fall by them. If the alderman was correct in his accounts, the Lord Mayor added, he blamed him very much for not producing them.

Fire in a Steamer.—On Sunday morning a fire broke out on board the Ailsa Craig steam-ship, moored off the Leith and Berwick wharf at the Tower. The steamer, which was about 300 tons burden, arrived from Yarmouth on Saturday afternoon, with a heavy cargo of flour, mustard, wool, cotton, and other goods. During her passage she encountered the gale of wind which prevailed on Friday night, and the sea is supposed to have got in among the cotton rags stowed with the cargo in the after-part of the vessel, which ultimately ignited spontaneously. Prompt assistance was at hand, and the brigade floating engines poured water into the hold until all the cargo was

flooded. The damage amounts to about 1000*l.*, and the vessel is so injured that she must go into dock to repair.

Accidents and Inquests.—On Tuesday an inquest was held in the Hampstead Road, on Mr. C. Orpwood, who committed suicide on Saturday. His brother, Mr. W. Orpwood, the engraver, stated that deceased who resided with him had been an invalid and under medical treatment during the last 16 years. He was of no profession, and had lived with witness since he was 12 years of age. On Saturday last witness went to Richmond to visit a cousin, who is a chemist, residing there. On leaving home his brother requested him to bring from his cousin's three drachms of prussic acid. As witness was aware that deceased was in the habit of making up his own medicines from the prescriptions of his medical attendants, and that they frequently contained a portion of that acid, he consented to do so. When he gave it to him on his return deceased requested witness to hand down a box from the shelf to put the bottle in, and while in the act of doing so, deceased drank the poison. Witness instantly ran off for a surgeon, who employed the stomach pump, but death had ensued almost instantaneously. He admitted that he had acted incautiously in procuring the prussic acid, but his brother was so religiously inclined, and was so much in every sense of the word a Christian, that he had no suspicion he would destroy himself. He believed that deceased, labouring under pain and imbecility, took the prussic acid to destroy his life, and that it did not occur by accident. Other evidence having been adduced which clearly shewed that it was deceased's own act, the jury returned the following verdict:—"That deceased destroyed himself by taking prussic acid, but in what state of mind he was at the time there was not sufficient proof."

Mortality of the Metropolis.—The number of deaths registered in the week ending Saturday, October 21, was as follows:—West Districts, 144; North Districts, 187; Central Districts, 215; East Districts, 263; South Districts, 297; Total, 1106 (males, 572; females, 534). Weekly average for the last five years, 903 (461 males, 442 females); and for the last five autumns 908.

Provincial News.

The late Storm.—The provincial papers are generally filled with details of injury done by the gale of Friday night; and Lloyd's Shipping List contains a long list of casualties at sea, the mere enumeration of which would fill, at least, a column of our paper. The vessels wrecked belong chiefly to the smaller class, and many lives have been lost. Several vessels were seen to founder off the coast, and all hands of course perished. At Liverpool, a fleet, of perhaps 40 sail, had left the port on the previous day, and were caught in the storm before they could clear the Channel. The sea at high water washed over portions of the quays; and the steamers from the opposite ferries had some difficulty in landing their passengers, many of whom, both male and female, from farms in the neighbourhood, it being market day, did not venture to return until Sunday morning, when the storm had abated.

Bearstead.—We learn from the *Maidstone Journal* that Tuesday last, having been the rent-day of the allotment-holders of this parish, every sum which was due from them was paid with the utmost cheerfulness and punctuality. The number of industrious men holding portions of land in Bearstead is upwards of 40—their portions varying from 30 perches to half an acre, according to their means or ability to cultivate them. The rent is 40*s.* per acre, whilst the land being of fair average quality, it enables the holders to use it with advantage to themselves and satisfaction to the proprietors. The best cultivated allotment, so far as manual labour was concerned, was one whose occupier could not obtain employment during the greater part of last spring. His spare time was devoted to the better cultivation of his allotment, which amply repaid his exertions by an abundant and excellent crop. The committee of management were much gratified in their various inspections in observing a decided improvement in the allotments compared with former years; and the cottagers begin to feel that by a careful collection and application of manure applied in a liquid form the greatest benefits ensue.

Birmingham.—A singular charge of robbery was brought against a Mr. Lazarus, a respectable member of the Jewish persuasion, at the police-office of this town in August last, which excited some interest from the circumstances attending it. Mr. Lazarus was travelling from London to Birmingham in a second-class carriage in which were several sailors, one of whom, of the name of Cunningham, contrived to steal his companion's purse while he was asleep, and on the loss being discovered he charged Mr. Lazarus with having committed the robbery, and, in fact, gave evidence that he had seen him take the money. By a singular accident, after Mr. Lazarus had been subjected to much annoyance, the real thief was discovered, and Cunningham ultimately confessed that he committed the robbery, and falsely charged an innocent man with the offence. He was accordingly committed, and brought to trial at the recent Sessions, and the jury having found him guilty, he was sentenced to be transported for ten years.

Carmarthen.—The proceedings of the Commission of Inquiry, the opening of which was announced in our last, have excited very general interest in the Principality. The opening address of Mr. Frankland Lewis, the Chief Commissioner, is regarded as a calm and dispassionate statement, abounding in kindly expressions, and displaying the utmost anxiety on the part of the commissioners to enter into the fullest possible inquiry as to every grievance which has been alleged as a cause of the late disturbances. The manner in which Mr. Lewis invited the whole people, without distinction as to class or station, to lay their grievances before the commissioners, is thought likely to be productive of the most beneficial effects in allaying the present unhappy state of the Principality. The right hon.

gentleman said, "In reading her Majesty's commission, you must be struck with the wording as to the definition of its objects, for although her Majesty's Government, who I believe, and in fact know, are firmly resolved to meet with the strong arm of the law all attempts at disturbance, and to do everything to suppress and put down outrages by the persevering exercise of power on their parts; still at the same time they are most anxiously desirous to ascertain whether there be any real causes of grievance existing, in order that by the powers of the Executive Government, or of Parliament, or both combined, a legislative remedy may be effected, for which purpose it is that we are here." He then proceeded to the subject of turnpike roads as one of the alleged grievances, and said that the commissioners would zealously inquire into the subject, with a view to afford redress. "We will hold ourselves open," he said, "to receive every species of information from persons acquainted with the country, come from whom or where it may, in order that it may be shown to us what have been the real causes of the disturbances that have taken place in this country. Be that information what it may, our eyes and ears shall be open to receive it, and it will be subject to a proper and impartial inquiry, in order that a remedy may be found. If the complaints be reasonable, rational, and well-founded, they may be capable of redress; but I cannot help saying that I have heard enough to lead me to believe that there are other circumstances which we cannot hope to remedy, because I have been told from authority which I cannot doubt, that there are persons ill-judging and ill-informed, not knowing the basis upon which society is founded or property secured, who have interfered with individuals in the management and due control of their own property. Let no person shut his eyes to the important command issued by the Almighty Creator—'Thou shalt not steal.' By this command a right of property was recognised by the Deity, and that which was delivered to the Jews was confirmed by our Saviour Christ from his own mouth. If men are not to steal, it is clear that there must be something belonging to another that is not to be taken. Thus, even the Creator himself recognised a right in property; and it is this foundation on which society is built, the object of all Government being to secure to every individual a free and undisturbed control and enjoyment of that property which by his labour and industry—his honest industry—he may be justly entitled to. If deluded men fancy they can interfere with property without doing injury, not to its possessor merely but to society itself, they will soon find their error, for there is no disturbance of the enjoyment of property that does not recoil on society itself as well as upon the individuals. It is in the nature of things that the products required for the consumption of our fellow-creatures cannot be obtained if he who sows is not secure to reap—if he who plants is not entitled to gather. Gentlemen, society itself is so constituted, that the industrious, thrifty, prudent, and careful people, are by the will of God tolerably secure of their reward; whilst, on the other hand, improvidence, violence, wastefulness, and acts of outrage as certainly bring distress and misery, with all the ruinous consequences that follow in their train, on those persons who are unwise enough to perpetrate them. I say, then, looking to the causes of the recent disturbances which may come before us, if in any case we are led to believe that there has been an infringement on property, there can be no hope of legislative remedy: the rights of property must be sustained by the promulgation of these great truths, and those persons must be taught that their acts can tend to nothing but mischief both to those who commit them and to those who suffer them. But even to wrongdoers I will say that this inquiry will be conducted with feelings of compassion and kindness towards all."

Hereford.—Two interesting curiosities have lately been added to the collection at Goodrich Court, in this county. One is an Afghan sword, found on the person of Prince Hyder Khan, son of Dost Mahomed, and brother of Akbar Khan, on being made prisoner. He was governor of Ghuznee, which was surrendered to the British arms in July, 1839, when the gates of Somnauth were brought away. The other is the monumental stone of Sextus Valerius Genalis, a Roman knight, on which he is sculptured in bas-relief in armour on horseback, and trampling on a Briton, whom he is in the act of piercing with his lance. This interesting piece of antiquity was found in Watermore, about a mile from Cirencester, in 1836.

Leeds.—On Monday, Mr. Thomas Walker, attorney-at-law, residing at Dewsbury, near Wakefield, was brought before the magistrates of this town, charged with having twice forged the signature of Mr. M. B. Bere, Commissioner in the District-Court of Bankruptcy. From the evidence of Mr. Geo. Newsome, of Battley-bar, clothier, it appeared that he employed the prisoner in August last to get him through the Court of Bankruptcy for 15*l*. The prisoner got part of this money at the time the agreement was made, and the remainder was to be paid by instalments. He supplied the witness with a protecting order purporting to be signed by the Commissioner, and afterwards gave him a similarly signed document extending the protection to the 29th Nov. Mr. Bere deposed that the signatures were forgeries, and the Deputy-Registrar of the Court proved that no petition had been filed in the Court from the first witness. The prisoner declined to say anything in his defence, and he was held to bail, himself in 100*l*. and a surety in 100*l*., to appear at the next assizes to take his trial.

Leicester.—Messrs. Mitchell, Clarke, Phillips, and Smith, partners of the late Leicestershire bank, appeared last week at the Birmingham Bankruptcy Court for their final examination. It appeared from the balance-sheet that the probable amount of assets wherewith to pay a

dividend, after making all deductions, was 308,849*l*. 4*s*. 8*d*., and that the assignees expected that a dividend of 10*s*. 6*d*. would be realised by the creditors. The assignees produced various articles of jewellery belonging to the wives of the respective partners, which in the case of Mrs. Mitchell were represented as exceeding 1000*l*. in value, but the creditors unanimously resolved that the whole should be returned.

Merthyr.—On Friday the 20th ult., a fire broke out at Dowlais-house, the residence of Sir J. J. Guest, Bart. The prompt assistance rendered by the neighbours and police succeeded in subduing the flames in about two hours, but not before the premises had been completely saturated with water. The fire originated in that portion of the house recently erected, in which large fires were constantly kept for the purpose of drying it. A spark having flown from the grate among some shavings incautiously left by the carpenters, they were ignited, and the fire communicating with some deal boards, the flames spread with great rapidity, and excited apprehensions for the safety of the whole building. The damage done is said to be inconsiderable.

Newcastle.—On Saturday week, according to previous announcement, a meeting of the miners of Northumberland and Durham took place on the Black Fell, about four miles from this town. Long before the hour appointed, an immense concourse had assembled—Black Fell presenting the appearance of one moving mass. Difference of opinion exists as to the numbers at the meeting, the computation varying from 35,000 to 45,000; but the most probable amount was 40,000. The chair was taken by a miner of South Hetton colliery. An address to Mr. T. Duncombe was then adopted, expressive of certain grievances which that gentleman was requested to bring before Parliament. The address was founded on the following resolutions:—"1. That in the opinion of this meeting it is the duty as well as the interest of this association to adhere to the restriction system, as it is essentially necessary to our very existence as an association to keep all our members equally employed. 2. That in the opinion of this meeting a petition should be forwarded to Parliament, praying for a repeal of the export duty on coal. 3. That in the opinion of this meeting a more safe and efficient system of ventilation ought to be established, by sinking a greater number of shafts, and those shafts to be more equally placed; and that we petition Parliament to obtain that object. 4. That in the opinion of this meeting the present machines for weighing are faulty, and weigh very much out of truth. We therefore resolve to petition Parliament to pass a measure compelling the masters of collieries to have machines on the beam-and-scale principle." Mr. Duncombe rose amid enthusiastic cheering, and proceeded to assure them that, unless he had seen for himself, he could not have believed that so vast a multitude could have been assembled; and he was led to conclude that the cause must be very important and serious to bring them together in such numbers. He promised to bring their grievances before Parliament at the earliest opportunity. Mr. Feargus O'Connor then addressed the meeting, which continued for about three hours, after which they quietly dispersed.

Reading.—The New Public Hall, the foundation-stone of which was laid last June by Miss Mitford, the author of "Our Village," was opened last week by Mr. Blandy, the mayor, assisted by Serjeant Talfourd, Mr. Russell, M.P., Mr. Palmer, M.P., Mr. Walter, of Bearwood, and about 400 of the resident gentry of the town and county. The uses to which the building is to be appropriated will be varied, since it will combine the purposes of a mechanics' institution, with museums, class-rooms, reading and news-rooms, with apartments suitable for the assembling of the various benevolent and general associations of the town. The hall, on the occasion of the inaugural dinner, was decorated with paintings, floricultural and other devices.

Oxford.—In the case of Macmullen v. the Regius Professor of Divinity, a protest has been lodged against the admissibility of an appeal on the part of Dr. Hampden, against the decision of the Court below, in favour of the admissibility of a certain libel. Mr. Macmullen's Proctor protests against the admissibility of the appeal, in consequence of its being addressed "To the Delegates in Congregation," instead of "To the House in Congregation," which he contends was the proper form. The Court, after some discussion, appointed the 15th inst. for hearing Counsel on the point, which will have the effect of protracting the proceedings.

Preston.—The local papers state that Father Mathew is expected to leave Ireland in three weeks, and will recommence his labours in this town, and afterwards proceed to fulfil his numerous engagements in other parts of the country.

Railways.—The following are the returns for the past week:—Birmingham and Derby, 1,453*l*.; Birmingham and Gloucester, 2,035*l*.; Eastern Counties, 2,988*l*.; Edinburgh and Glasgow, 2,338*l*.; Great Western, 15,046*l*.; Grand Junction, 8,487*l*.; Glasgow, Paisley, and Ayr, 1,268*l*.; Great North of England, 1,721*l*.; Hull and Selby, 945*l*.; London and Birmingham, 17,565*l*.; London and South Western, 7,000*l*.; London and Blackwall, 754*l*.; London and Greenwich, 752*l*.; London and Brighton, 4,394*l*.; London and Croydon, 249*l*.; Liverpool and Manchester, 4,095*l*.; Manchester and Leeds, 5,040*l*.; Midland Counties, 3,045*l*.; Manchester and Birmingham, 3,054*l*.; Northern and Eastern, 1,832*l*.; North Midland, 4,734*l*.; Newcastle and Carlisle, 1,454*l*.; South-Eastern and Dover, 3,867*l*.; Sheffield and Manchester, 575*l*.; York and North Midland, 1,749*l*.—The railway from the Northern and Eastern line to Ware and Hertford was opened on Tuesday, the line having been officially reported to the Board of Trade as perfectly

consolidated and in a fit state for working, by General Pasley, the Government Inspector, who, in company with Mr. Marshall, M.P., Mr. Ward, M.P., the directors, and several of the shareholders, took an experimental trip along the line on Thursday week. The first train on Tuesday started from the Shoreditch station at eight o'clock, and reached Hertford, a distance of 26 miles, in about an hour.

IRELAND.

Dublin.—A report was current during the latter part of last week, that Government intended to abandon the state prosecutions. It is now, however, announced that the rumour was unfounded, and that the trials are to take place on as early a day as the Crown can have fixed, before a special Jury of the City of Dublin. It is also said that Mr. Steele, who intends to defend himself without counsel, as he did before, has given instructions to his solicitor to wait upon the late Irish Chancellor, Lord Plunkett, to ask his Lordship when it would be convenient to receive a subpoena, as, in case the trials should go on, it is the intention of Mr. Steele to examine his Lordship as his principal witness. Mr. Steele holds that Lord Plunkett as well as the late Chief Justice Bushe, and the late Mr. Saurin, Attorney-General, all declared in the Irish Parliament that the union would be a nullity by reason of the iniquitous means by which it was carried. The other witnesses whom Mr. Steele proposes to examine are, Sir R. Peel, Mr. Bond Hughes, the Government reporter, the Duke of Wellington, Lord Lyndhurst, and Sir James Graham. A rumour, having its origin in Roman Catholic circles in Dublin, is in circulation to the effect that Dr. Higgins, titular Bishop of Ardagh, has been summoned to Rome to answer before the Sovereign Pontiff for the expressions used by him in reference to England at one of the earliest of the Repeal meetings. Mr. J. L. Arabin has been removed from the commission of the peace for the county of Dublin, for having attended the repeal meeting at Mullaghmast, and Mr. M. Sweetman, a Roman Catholic magistrate, has resigned his commission for the same county. One thousand military pensioners have been selected in Dublin, and have received orders to be in readiness for embodiment and service, and numerous bodies of troops have arrived from England during the week. Mr. H. Grattan, M.P. for Meath, has published an address to his constituents, from which it appears that he is rather annoyed at being passed over in the recent State prosecutions, and evidently considers himself aggrieved by the omission. The letter, which bears date Paris, October 18, commences by referring to the late proceedings against the Repeal agitation, which he pledges himself to bring under the notice of Parliament, where he hopes to see the Minister arraigned for this maladministration of Ireland, and turned out of office, "on the unanimous complaint of an indignant people." He concludes by stating that he has "directed 5*l*. to be paid to the Repeal cause, and, if necessary, it shall be doubled again and again." Dr. Slattery, the titular Archbishop of Cashel, has also written a letter to Mr. O'Connell, stating that he has hitherto abstained from politics, but "the events of the last few weeks have determined him to adopt a different course, and publicly to identify himself with those friends of Ireland who are endeavouring to obtain the restoration of her Parliament by the repeal of the legislative union." He inclosed a donation of 3*l*., and requested to be enrolled as a member of the Repeal Association. A meeting of the law-clerks was held last week in the Corn Exchange, for the purpose of petitioning Parliament for a repeal of the union, and expressing the confidence of the body in Mr. O'Connell, who was present himself and spoke to the latter topic at some length. The weekly meeting of the Repeal Association took place on Monday, Mr. Molony, of Crag, an ex-Justice of the peace, in the chair. Mr. O'Connell announced a donation of 100*l*. from Quebec, and the adhesion of Dr. Slattery to their cause. They had already two of their four archbishops declared Repealers, and he was proud to rank Michael of Cashel beside John of Tuam. He then alluded to the new Government Commission under the presidency of the Earl of Devon, to inquire into the tenure of land. He was disposed to give the present Government its due for having issued it,—and this advantage, at all events, would be derived from it, that landlords would see that the question of tenure was about to be inquired into. Sir R. Peel and Lord Stanley had declared there must be some alteration in that tenure, and he thought it would be unwise to throw cold water on the exertions of the commissioners. Mr. O'Connell then said, that he now came to the immediate business of the day, and the first matter to which he would draw the attention of the association was the denial, from an important source, of one of the calumnies contained in the letters of "Philaethes." Mr. Trevelyan in one of these letters said that the north was ready to pour in military array on the south, and that all Ulster was alarmed at the agitation. Now, he would read for them a letter which appeared in the *Banner of Ulster* of Friday last, written by the Rev. J. Godkin, a Presbyterian minister, denying the truth of the statements of "Philaethes" regarding the country, and adducing evidence to show that he was ludicrously misinformed. Having done so, the hon. gentleman proceeded to read an address to the association from Mr. Sturge, who said that the peaceable demeanour of the Irish people was making an impression on the English mind, and that they had a great deal of English sympathy. Mr. O'Connell, on this point said he would ask, had any of the great towns in England, save Birmingham and Preston, made any demonstration for them? Had London done so? Had Manchester, or Liverpool, or Leeds done so? Let not Mr. Sturge blame the people of Ireland because they judged of Englishmen only by their acts, because they could not place confidence

in them. He believed the English people acted more from ignorance than design; but it was his complaint that they would not take the trouble of being rightly informed as to the real state of the people of Ireland. If there were no other topic to urge in favour of Repeal, the fact would be sufficient, that the governing people were radically ignorant and careless of the state of the country governed. As to separation he repudiated it, but he wished to prevent the possibility of it by getting repeal. There should be no rebellion in Ireland, no civil war, or, what was worse, a servile war—a war from cottage to cottage, from town to town. The hon. gentleman proceeded at great length to meet the objections of Mr. Sturge in regard to a separation. He spoke of America, and the offer of reconciliation made when too late by the British Government to the insurgents in that country, as a warning to Government, and advised Mr. Sturge to remember it. He thought it would be politic in English statesmen to ask Ireland what she wanted, and he would answer, that she merely wanted the management of her own affairs, and did not desire to take anything from the Crown prerogatives. Ireland was big enough for them. She was all they required. They would take nothing less. As to war, if Mr. Sturge thought they might wish not to go to war when England did—that was a royal prerogative, and the only thing they could do was to vote against the supplies; he for one would be glad of it, as it diminished the chances of unjust war, and if there were just cause of war there was no fear of the Irish people being backward in supporting it. The hon. gentleman referred to Portugal and other countries friendly to Ireland, which it would be wise policy in Ireland to refuse going to war with on the sole ground that England wished it. Again, making peace was no imperial question—it was an act of the monarch. They wanted a protective, not an invasive parliament. As to the army and navy, that would be a mere question of length of purse. The number of men paid by England should belong to England, and those paid by Ireland should be Ireland's. Thus treaties, dependencies, colonies, the making of war and peace, the army and navy, could not be considered imperial questions. The hon. gentleman then ridiculed the Federalist party, as not knowing what they meant, and derided the support likely to be had from the north or Ulster men, which, he said, would be but small indeed, for on former occasions there had been no substantiality about them. As to religious questions, there was no fear of difference. In regard to Roman Catholic toleration, if any fear were harboured of it, he would, he said, be willing to place on the Irish Parliament a restriction already existing on the American Legislature—namely, that it should be incompetent to them to place any restrictive right or to interfere with any one's conscience. Mr. O'Connell then contrasted the treatment of rebellious Canada and peaceable Ireland. He would not give up one particle of Irish interest, but he would maintain the Crown prerogatives. After a lengthened address the hon. gentleman concluded, amid loud applause, by moving the adoption of the following resolutions:—"1. That the object and purport of the Repeal of the Union consists in the Parliament of Ireland having the entire legislative control of affairs of the Irish nation. 2. That the basis of the Repeal of the Union consists, and shall consist, in the perpetual connexion with Great Britain, through the medium of their common Sovereign, Queen Victoria, and her heirs and successors. 3. That another basis of the Repeal of the Union shall be perfect equality of civil rights and franchises of every description between all Christian sects and persuasions whatsoever, and that no power shall be committed or intrusted to the Irish Parliament to make any law derogatory to the civil rights or franchises of any individual or class by reason of his or their creed or religious persuasion. 4. That the foregoing resolutions be transmitted to Mr. Joseph Sturge, in reply to his communication, and that he be requested to specify what the questions 'involving the interest of the United Kingdom exclusively' are, other than those which come within the range of the royal prerogative." In answer to some observations of Mr. Gordon, a late member of the Conservative body, who advocated the rights of the Roman Catholic clergy to glebe-houses and lands, Mr. O'Connell expressed his disapprobation of State establishments, for at the present day the efforts of every State were directed to suppress true religious feeling in the Church; still he would be in favour of a plan for obtaining glebes for the Catholic clergy, to whom a perpetual right might easily be given by a slight alteration in the existing laws. But these glebes must be purchased by Catholics themselves, and in no other way. Mr. O'Connell then announced the Repeal rent to be 1142*l.* 19*s.*, making upwards of 3000*l.* received from Saturday to Saturday.

Tipperary.—The *Leinster Express*, in reference to the mysterious signal fires on the night of the 19th ult., makes the following remarks:—"On the night of the 19th large fires burst forth in a simultaneous blaze upon all the hills around the country, from Eyre-court and Meelick up to Banagher, and thence to Parsonstown, and along the range of hills towards Borrisokane. Large bodies of the peasantry were assembled in many places, and patrolled through the country, carrying torch-lights, filling with fear and terror the well-disposed and peaceable by their savage yells and shouts of exultation. In several places the people thought that a 'general rising' had taken place, and sought refuge in the fields and ditches; others betook themselves for protection to the adjoining towns. There is no use in concealing the fact that the general body of the peasantry are ripe for revolt, and that both priests and Mr. O'Connell will find it a difficult task to restrain them from deeds of turbulence. The lower orders of the Repealers seem, now that they cannot have their monster meetings, to have adopted the mode of tele-

graphing their feelings and sentiments through the medium of 'bale' or 'signal' fires. These simultaneous fires, which, on the night in question, extended not only along the places above mentioned, but along the hills and mountains of Cork, Limerick, Kerry, Clare, and Tipperary, require the earliest attention of the Government, more especially as they have been, each and all, attended by masses of the peasantry, carrying with them torch-lights, and halloing and yelling like fiends." The same journal contains a long list of outrages of a very serious nature, perpetrated within the last few days on the borders of King's County and Tipperary. Other papers speculate on the cause of the fires, and give the most contradictory versions of it. One states that the fires originated in a supposition on the part of the people that, to use their own words, 'the war is over'—the hostile manifestations made by the Government with respect to the fortifications having been abandoned in certain localities. It is also said that a rumour had been circulated very generally among the people that large concessions were about to be made by Government, and among others, that a domestic Parliament was to be given to Ireland. Another explains them by stating the belief of the peasantry that "Mr. O'Connell had a great triumph over the Lord-Lieutenant for daring to issue the recent proclamation; in fact, that he had his Excellency fined to the amount of 30,000*l.*" This was regarded by the peasantry as a proof that 'monster meetings' could not be suppressed with impunity; and that, however Government might be opposed to Mr. O'Connell and Repeal, the Queen was on his side.

SCOTLAND.

Glasgow.—The Assembly on Monday week took up the Dalkeith case, in which a call has been given by the Free Church congregation there to a licentiate of the Irish Presbyterian Church. The Assembly considered this a most important case, as it involved the whole question of the admission of ministers belonging to other bodies. The Assembly was also of opinion, that it would not be treating respectfully the bodies to which these ministers belonged, to receive them into communion with the Free Church without corresponding with their respective churches on the subject. On the motion of Dr. Candlish, the following motion was unanimously agreed to:—"To delay the cases of application for admission from Ministers of other denominations, and remit the whole subject to a committee for consideration, instructing them to confer with the other churches interested." The Rev. Mr. Sym gave in the report of the colonial committee. Dr. Buchanan, of Glasgow, in connection with this report suggested the propriety of the committee being instructed to keep in view the case of Dr. Kalley, of Madeira, which was agreed to. Dr. Candlish then made an oral report on behalf of the Jewish committee. He stated that all the Jewish missionaries and agents—some of them converted Jews—had adhered to the free church; that the money collected for the Jewish scheme since the disruption amounted to 3,400*l.*; that at the disruption they left 3,500*l.* in the hands of the establishment. The report was approved of. Dr. Duncan, who is on his way home from Pesth to commence his labours as Professor of Hebrew in the College, was appointed convener of the committee till the return of Dr. Keith, the present convener, who is at present on the Continent. In the evening a committee was appointed to consider the relation of the Church in Canada with the Free Church, and to report to next Assembly. Mr. Hamilton read the report of the Building Committee, from which it appears that about seven hundred churches are either built or building, or about to be commenced. On Wednesday some other business having been disposed of, Mr. Dunlop moved that the next meeting of Assembly should be held in Edinburgh, on Thursday the 16th May next. After some remarks on the character of their present meeting, Mr. Dunlop concluded by saying, that the present temper of their ministers was gratifying in the extreme, and that the content with which they received the intimation of the small allowance from the sustentation fund, and with which they must retire to their homes, must have excited the admiration and touched the feelings of them all. He trusted that they the elders and members of the Free Church would feel it their duty to make their sacrifices as disinterestedly and as nobly as they had made theirs; and he hoped that they would soon be able to show that they were worthy to have them for pastors by providing adequate sustentance, and in some degree at least compensating them for the sacrifices they had made. He concluded by moving that the Assembly should meet at Edinburgh on Thursday, the 16th May, 1844. The motion having been seconded, was unanimously agreed to. The Moderator, Dr. Brown, then proceeded to deliver his closing address, which was listened to with anxious attention and interest by the immense assemblage that crowded the hall. The Assembly was then declared to be dissolved.

THEATRICALS.

COVENT-GARDEN.—On Monday night the *third* season of this theatre commenced with a most novel succession of entertainments, in which it would be difficult to say whether the actors or the audience bore the largest share. The manager, finding he could not work with his English company, had engaged a troop of French juveniles, who sing, act, and dance. The audience were dissatisfied with this, no less than with the other entertainments, and the result was one of the most discordant scenes of confusion which has ever been witnessed in a metropolitan theatre. The first piece, a new comediotta, called *Quits, or War versus Law*, was unsuccessful; and the performance of the French children in a dance which followed, seemed to

strike the audience as an exhibition altogether unsuitable to a national theatre. The storm, however, did not come until the production of a ballet pantomime, in which M. Laurengon was the principal performer; and after this had been condemned, a vaudeville in the French language completely exhausted the patience of the audience. The piece was speedily stopped, when Mr. Wallack came forward and made use of language which was ill-judged and offensive, and the uproar increased tenfold. At length the audience, as if to show that no part of their wrath was intended for the poor children, suffered them to proceed with their parts, with scarcely a moment's interruption, to the end. The ballet of *La Fille Mal Gardée* contained some pretty dancing by this infantile *corps de ballet*, which almost restored the house to good humour; and a pretty *Pas de Deux*, between Mlle. Leontine and M. Victor, was applauded as generously as if nothing unpleasant had occurred throughout the evening. Mr. Wallack has since addressed a letter to the daily papers, stating that an organised opposition was got up on Monday night by rival and interested parties, who, by signals and other preconcerted means, gave a determined opposition to every part of the performances. Mr. Wallack, however, in giving this explanation, brings charges of conspiracy against various individuals, including ladies. Mr. Wallack admits that the French company "has not come up to the point of excellence which he was assured it possessed, and also that the public is not so favourable to that nature of performance as he had hoped."

Lab.

CENTRAL CRIMINAL COURT.—Alleged Trafficking in Slaves.—On Friday the trial of M. Pedro de Zulueta, an opulent merchant in the city, on the charge of Slave-trading, came on at this Court, and excited very general interest. The proceedings lasted through out Friday, Saturday, and Monday, and the evidence on both sides was so voluminous, that it is impossible for us to give more than a brief abstract of the statements of Counsel. The prosecutor was Sir George Stephen. The indictment charged the prisoner with having, after the 1st January, 1815, that is to say, on the 1st November, in the fourth year of the reign of her present Majesty, unlawfully equipped, manned, and navigated a certain vessel called the *Augusta*, to trade and deal in slaves. The second count charged the unlawful object to be to purchase slaves. The third charged the object to be to trade and deal in persons intended to be treated as slaves. In three other counts the prisoner was charged with having unlawfully placed merchandise on board the vessel to be used in bartering for, and in furtherance of the unlawful object of dealing in slaves. Mr. Serjeant Bompas stated the case. He said, that in 1819, the *Augusta*, which was then trading under Russian colours, and named the *Volynitchek*, was fully equipped for the Slave-trade, and was captured on the Coast of Africa, by Capt. H.L., R.N., and sent to Sierra Leone. Her captain, at that time, was a Spaniard, named Bernardino, and the crew were all Spaniards. The case came before the Court at Sierra Leone, but as the vessel was sailing under Russian colours, and had Russian papers, the Court doubted whether it had the power to condemn her, but resolved upon sending her to England with her crew, the vessel being at the time fully equipped as a slave. Upon her arrival in this country, the Russian Consul claimed her as a Russian vessel, and she was eventually sold for 600*l.*, and the amount was handed over to the captain, Bernardino. After this, a negotiation for the disposal of the vessel to M. Zulueta took place. In a letter addressed by the prisoner to Jennings, the person who eventually became her captain, and who was included in the present indictment, he expressed his intention not to give more than 500*l.* for her; but a short time after this, M. Zulueta became the purchaser of the vessel, and paid 600*l.* for her. When this vessel was sold at Portsmouth, some of the implements used in this traffic were stowed upon her. The Jury were aware that to carry on this traffic it was necessary that the vessel should carry a large quantity of water, and upon this vessel there were several large tanks or casks, called "leaguers." Of course it was in possible for her to leave this country with such things on board, because the intention of the voyage would be manifest, and accordingly they were all taken to pieces, and in that shape were still in the vessel ready to be put together again when required. Besides this, there were also the means of placing what were called "slave-decks" in the vessel. These decks, as the jury had perhaps heard, were false decks, about 32 inches apart; and in which, of course, the unfortunate beings placed there could neither sit nor stand. A quantity of bolts were on board, and the holes for them remained, so that these decks could have been fitted up in a very short time, when they were required. In addition to these facts, a seaman had been applied to, at Portsmouth, to enter on board the vessel, on a voyage to the coast of Africa; and, as M. Zulueta had admitted before a committee of the House of Commons that he managed all the business in connection with this voyage, it would be for the jury to say whether it was possible for him to be ignorant of its nature or intended object. The learned Serjeant then read a letter, addressed to Jennings by M. Zulueta, in which he complained of his not having asked for sufficient money to enable him to clear the vessel from Portsmouth, and requesting to know, by return of post, what further amount he required, and directing him to proceed as speedily as he could to Liverpool. Although, he said, this letter was written by M. Zulueta, yet, when it came into the possession of Capt. H.L., it appeared that the signature had been cut out. The jury would also see, that, although it was subsequently to appear in his name, that, in point of fact, it was purchased and paid for by M. Zulueta. After this proceeding the vessel sailed to Liverpool, and he should have to direct the particular attention of the jury to what took place there. A charter party was entered into between the captain, Jennings, and Pedro de Martinez, described as a merchant at Havannah, but who was notoriously a dealer in slaves. By this charter-party it appeared that Martinez had advanced a sum of money to Jennings for the purchase of the vessel, and that he was to pay 100*l.* per month for its hire, and pay all port dues and charges; the vessel to be freighted with legal goods, and proceed to the Gallenas, on the coast of Africa, and from thence to any port of the West Indies or the United States that Martinez might direct, and the amount of freight that would accrue was to be held as a lien for the repayment of the sum advanced for the purchase of the vessel; and in the same document Jennings admitted the receipt of the sum of 1,100*l.* from Messrs. Martinez and Co., through Messrs. Zulueta and Co. Although Jennings was the party who nominally chartered the vessel, yet, in point of fact, M. Zulueta was the real and responsible party in the transaction, and who was the party to this agreement. The case for the prosecution, therefore, was that the whole was merely a colourable transaction, and that Jennings was put forward as the man to screen M. Zulueta in the transaction, and that, in point of fact, the latter was the real owner of the vessel, and Jennings was merely the captain. If the transaction had been a *bona fide* one, and the intention of the parties honest, why should there have been all this secret? After this the vessel proceeded to the Gallenas, on the coast of Africa. As he was instructed, this place was entirely devoted to the slave-trade, and no other commerce of any kind was carried on there.

There were five large barracoons, in which the slaves were kept until an opportunity offered of shipping them to Havannah or Cuba. These slaves were mostly purchased by barter for cotton goods from England, and the names of the principal slave-dealers were Rolla, Ximenes, Alvarez, Buren, and Glasse. The cargo of the vessels in question, it appeared, was consigned to the three first-named persons, and he begged the Jury to remember that at this time, as he was instructed, there was no other trade of any kind carried on at this place except in slaves. He should have stated another fact to show the connection of M. Zulucta with this vessel, which was, that shortly after she sailed from England, in consequence of bad weather, it became necessary that she should put into some port for repairs or shelter, but, although she was not more than one day's sail from either Cork or Lameuth, the captain, in spite of the remonstrances of the crew, insisted upon going to Cadiz, where M. Zulucta had an agent, and at that port part of the damaged cargo was sent ashore, and M. Zulucta received the amount of the loss from the insurance office in London. The vessel sailed from Cadiz about the 7th January, and, on her arrival on the coast of Africa, she was captured by Capt. Hill, who was not a little surprised to see the vessel which but a short time before he had caused to be sent to England under the name of the Voluptick return again under English colours and a fresh name. When the captain boarded her he asked Captain Jennings to whom the cargo was consigned, and he at first refused to give any information. The vessel, however, was again taken to Sierra Leone, where she was condemned and eventually sent to England. The chief question for the Jury to decide, therefore, would be whether this vessel was despatched to the Gallenas for the purposes of honest and lawful trade, or whether she did not go there for the objects alleged in the indictment? The learned Sergeant then read the statements made by M. Zulucta in reference to this transaction before a committee of the House of Commons, and called numerous witnesses.—Capt. Hill, who commanded the Saracen on the coast of Africa, deposed that there were barracoons or large store-houses for containing slaves at the Gallenas, but no other trade but the slave-trade was carried on there, and that in 1840 he captured the Voluptick, and found her fitted as a slave; but as she carried Russian colours he sent her to England to be disposed of by the Admiralty. In 1841 he again saw the vessel at the Gallenas, under the name of the Augusta, and after receiving her papers from Jennings, the captain, he resolved on detaining her, and sent her to Sierra Leone, where she was condemned. He did not think she was then equipped as a slave, but he seized her on the ground that she was carrying on an illegal traffic.—Hon. Capt. Denman deposed that the slave-trade was the only trade pursued at the Gallenas, that no produce is ever exported, and that all goods landed there would be ultimately used to be bartered for slaves. There were no actual merchants at Gallenas. They were all agents. There was not a white man there, except those connected with slave-factors, and there was no produce there but slaves. He destroyed several slave-factories there in 1840, for which actions had been brought against him.—Col. Nicholl, governor of Ascension and of Fernando Po, also deposed to the notorious character of the place.—Other witnesses deposed to the fitting out of the vessel at Portsmouth, to the removal of the leaguers and other slave-fittings at that port, and to her calling at Cadiz on her voyage to the coast of Africa. At the close of the case for the prosecution, Mr. Fitzroy Kelly submitted that there was no case to go to the Jury.—Mr. Justice Maule thought there was a case.—Mr. Fitzroy Kelly then submitted that the offence with which the prisoner was charged was not an offence within the meaning of the Act of Parliament. The Court overruled the objection. Mr. Kelly then addressed the Jury on the part of the prisoner. He said that the case was one of the deepest importance to his client, who was a gentleman of undoubted respectability, whose father had been for years an eminent merchant in this country, and who was associated with some of the most distinguished families in Spain. After the evidence had been given on the part of the prosecution, and commented upon it as he proceeded, the prisoner called upon the evidence given by the prisoner himself to the Committee of the House of Commons, and commented upon it after a full investigation into all the circumstances of the case had been instituted by the constituted authorities in this country, who had deposed any further reference in the matter, that the prisoner should be called upon to answer the present charge which had been preferred against him by Sir O. Stephen. He then contended that there was nothing in the evidence on the part of the prosecution which would warrant the Jury in returning a verdict of guilty against the prisoner, and urged that so far from the prisoner, or the highly respectable firm of which he was a member, taking part in or even countenancing or approving of the traffic in slaves, they had, even at a time when the law had not declared such traffic to be illegal, repeatedly expressed their disapprobation of the system. The learned Counsel concluded by imploring the Jury, by returning a verdict of Not Guilty, to restore the prisoner to that respectable station in society which he has hitherto occupied. He then called as witnesses to character Sir John Prie, Mr. S. Ricardo, Baron de Rothschild, the Spanish, Portuguese, and Swedish Consul General, Dr. Arnott, Mr. Gibbs, Mr. Jones Lloyd, Mr. F. Huth, a Director of the Bank of England, Mr. Mocatta, and numerous other gentlemen of high standing in the city, who all gave the strongest testimony in favour of the prisoner, and declared their belief that he was utterly incapable of engaging in such a nefarious traffic as the Slave-trade. Mr. Justice Maule then summed up, and the Jury returned a verdict of Not Guilty, which the Foreman delivered with marked emphasis. The verdict was received with the loudest cheering that was probably ever heard in a Court of Justice; and as soon as the result was known outside, the crowd collected in the street re-echoed the cheering so vociferously, that the proceedings of the Court were actually interrupted by their shouts. Mr. Serjeant Bompas then said there was another indictment against the prisoner for a misdemeanor, but after the verdict which had been just returned, no evidence would be offered in support of it. The Jury having been again sworn, M. de Zulucta was indicted for a misdemeanor. No evidence was offered, and a verdict of Not Guilty upon this indictment also was returned. M. Zulucta was then discharged.

William Haynes, a young man residing at Haggerstone, was indicted for the murder of his wife. The indictment charged that the prisoner, well knowing that sulphate of potass would have the effect of destroying life, unlawfully administered to deceased large doses of that drug to procure abortion, thereby causing death. This case has been already noticed in this Paper, and no new facts were elicited except that deceased was very likely to have died of apoplexy, and that sulphate of potass was regarded generally as harmless. For the defence, it was contended, in the first place, that there was no distinct proof as to the cause of death, and that it would be impossible to find the prisoner guilty of murder after the evidence of the medical witnesses as to the innocent character of the drug. Mr. Justice Wightman summed up, and the Jury, after a short deliberation, returned a verdict of Not Guilty.

William Stulzer was indicted for the murder of Peter Keim, by stabbing him with a knife. This case was also noticed at the time of the occurrence. The prisoner and deceased were both Germans: the former stabbed deceased in Silver-street, Golden-square, with a knife, and afterwards attempted to destroy himself. An effort was made to prove the prisoner insane, but the jury found him guilty, and Mr. Justice Maule passed sentence of death in the usual form.

Thomas Bunn, aged 76, was indicted for feloniously discharging a loaded pistol at Thomas Waller, with intent to murder him. The prisoner was a poor worn-out looking man, apparently much beyond even the advanced age which was placed opposite his name in the calendar. He had been in the service of Mr. Waller, a wine-merchant in the city, who had no further

employment for him. After various endeavours to induce the prosecutor to take him again into his service, he fired a pistol at him. For the defence, it was contended that the prisoner's faculties had yielded to the advance of age, and that he was not a responsible agent. The jury coincided in this view, and acquitted him on the ground of insanity.

The Rev. Isaac Bridgman, minister of a dissenting chapel in West-street, Walworth, and his son, John White Bridgman, a medical student, were indicted for stealing the body of Mr. Tawney from the family vault in the burying-ground of that chapel. The removal of the body was fully proved; but the counsel for the defence called witnesses to prove an alibi on behalf of the elder prisoner, admitting that it was altogether hopeless to contend against the case made out against the son. After a long trial, the Recorder summed up, and said the question with respect to the elder defendant was one entirely for the consideration of the jury, but he thought the evidence with respect to his being a long distance from London on the day in question, was extremely strong, and therefore the probabilities were that the two witnesses for the prosecution who had spoken to his identity, were either mistaken as to his person, or a mistake had been made as to the precise time when the offence was supposed to have been committed; but with respect to the younger defendant, no defence had been set up in his behalf, and he thought, therefore, they would have no hesitation in pronouncing him guilty. The jury, after a deliberation of about ten minutes, said they considered the evidence failed with respect to the elder defendant, but they found the son, John White Bridgman, guilty. The father was therefore acquitted, and the son was sentenced to imprisonment for 12 calendar months.

The case of Mr. Bernard Gregory, which stood for judgment, has been again postponed to the next session, the Judges considering it best that it should stand over until the Court of Queen's Bench has disposed of a conviction of the defendant, which has already taken place in that Court for a libel, forming a portion of a series of libels of which the prosecutors complain. In announcing this decision, the Judges intimated that it is not likely that counsel will be heard on either side.

THE SPECIAL COMMISSION, CARDIFF.—Immediately after the judges took their seats on the bench, on Friday morning, John Hughes was arraigned at the bar for having unlawfully, riotously, and tumultuously assembled with other persons to the disturbance of the public peace, and feloniously, unlawfully, and with force begun to demolish the dwelling-house of one Wm. Lewis, toll-contractor, at the parish of Llandilofalloy. The prisoner, (who appeared at the bar with his arm in a sling), pleaded not guilty. The Attorney-General, the Solicitor-General, Mr. Chilton, Q.C., Mr. J. Evans, Q.C., and Mr. E. V. Williams, appeared for the prosecution, and Mr. M. D. Hill, Q.C., and Mr. W. Chambers for the prisoner. The array of the panel of the grand jury was challenged by the prisoner's counsel, on the ground that it had been chosen partially. To this challenge the Attorney-General demurred; and the Court considering that it was impossible to traverse the general allegations of the challenge, and that the challenge did not state the grounds for alleging that the panel was partially chosen, decided on allowing the demurrer. The Attorney-General stated the case. He said that the disturbed condition in which this and several counties of the Principality had been for some time, rendered it imperatively necessary that at the earliest moment the law should take effect, and the justice of the country be vindicated. Since offences were increasing in numbers and enormity, it was necessary that the law should check them. Having stated the reason, then, why they were thus summoned, it next became his duty to state that the charge against the prisoner was founded upon an Act of Parliament, by which it was enacted that persons tumultuously assembled, proceeding to pull down a house, dwelling-house, or office of any description, should be guilty of a felony. In this instance the mob attacked a toll-bar, and it appeared that some of them were disguised, so as to give them the appearance of women; they were arrayed in female attire; had their faces blackened, and many of them were armed. Shots were fired, and in one instance, when a gun had been taken, it was loaded, and the marks of shots were visible on the toll-house. The mob had implements of destruction of various kinds; sledges, hammers, and pickaxes, were found after them. With these weapons the work of destruction was commenced: all the windows were broken, and the endeavour was made to pull down the house. That work would have been completed, but for the interruption given to it by Capt. Napier. There could be no doubt of the riotous character of this assembly. Then comes the next important question—what has the prisoner to do with this? It would be shown he was not merely present, but was taking an active part in all this. His dress was disguised, his face blackened. When arrested by the police, who had taken measures to prevent the riot from being completed, they proceeded from the Glamorganshire side of Pontardulais-bridge by a route by which they were not likely to be discovered, and arrived near the gate. Capt. Napier, hearing the noise, advanced with his men. It was the object of Capt. Napier, by wounding the horses, to prevent the flight of the parties. He fired at the prisoner's horse, and the prisoner came down, and then came into personal conflict with Capt. Napier, and in that conflict was wounded as you see. A shot was fired by the mob, which was returned by a volley on the part of the police. There was much confusion, and parties fought hand to hand. The prisoner was taken, and recognised by his dress, and taken to the toll-house, where he was searched. There was found upon him a quantity of gunpowder, and two powder-flasks, a shot-belt, with shot in it, some copper caps, and a paper, of which the following is a translation:—"David Jones, come with your armour and covering, and assist me on Wednesday next, or else you shall not have more or further notice;" and signed "Becca." The Attorney-General then proceeded as follows:—"I have every desire that the present trial shall be protected by every right and privilege which the people possess, and I shall go along with my learned friend in any course to produce that result. The case is one of great importance, and my learned friend needed no apology for the course he had taken; but most properly had it been overruled. It will be for you to decide, when the whole of the proceedings have been stated, whether there can be any reasonable doubt that the crime for which the prisoner is indicted was committed, and when you have it shown before you that the prisoner was taken with arms in his hands, it will be for you to say whether he took any part in that riotous assembly. If you find any just ground on which this prisoner is entitled to acquittal, it needs no suggestion of mine to say that you will give him the benefit of it; on the other hand, I am convinced, if you find circumstances proved which implicate the prisoner, there can be no doubt but you will discharge your duty to the country, and find him guilty." Capt. Napier and other witnesses were then examined, who deposed to the various facts stated by the Attorney-General, most of which were noticed in this Paper at the time of their occurrence.—On Saturday morning Baron Gurney, in summing up the evidence, observed that it was no small consolation that they had been called on to fulfil their duties in a place far removed from the scenes where the recent offences had been committed, and where the minds of persons were naturally excited by those transactions. The Jury were thus enabled coolly and dispassionately to consider all the facts that were laid before them. After recapitulating the charges against the prisoner as described in the indictment, and referring to the more prominent circumstances connected with the offence for which he was arraigned, and which had characterised the conduct of the riotous assemblage of which the evidence left not a doubt that the prisoner formed a part, his Lordship detailed the leading points in the evidence of the witnesses, stating that it was for the Jury to say whether the demonstration which had been begun had been intended to be completed, one way to ascertain that being to see whether the riotous mob desisted from the work of destruction of their own accord, or whether they only did so upon being interrupted while engaged in it by the police coming

up. His Lordship referred briefly to the evidence on this point, and then observed that the remaining question for the Jury to consider was, whether the prisoner was one of those who were aiding and assisting in the acts of demolition, countenancing and augmenting the force of the mob, and concurring in its objects. In conclusion, the learned judge, having stated what was the law on the different parts of the case, reminded the Jury that the facts of the case were what they had maturely to weigh and consider. Should they believe the prisoner, after that solemn consideration of the evidence laid before them, to be innocent of the crime with which he was charged, they would acquit him of that charge; but if, on the other hand, they believed him to be guilty, they would find a verdict accordingly. The Jury then retired, and, after little more than half an hour's absence, returned with a verdict of Guilty, recommending the prisoner to mercy on account of his previous good character. The Court then adjourned until Monday. On that day, David Jones and John Hugh were indicted for taking part in the same offence. The prisoners first pleaded Not Guilty; but after a short conversation between their counsel and attorney, they withdrew their plea, and pleaded guilty. The Attorney-General then said, the prisoners having pleaded guilty, he did not mean to press in aggravation of punishment. Mr. Hill said that their Lordships had heard the prisoners at the bar plead guilty. After the long trial which had occupied the Court on Friday and Saturday; after the verdict which had been given, he thought it would be the opinion of their Lordships that the prisoners had not been ill-advised in pleading guilty. Their Lordships would never consider it an imputation upon any man, though guilty, that he had demanded a trial. In so doing, he only demanded his right. The demand for a trial was no new offence, nor any aggravation of the former one. But when prisoners, on mature consideration, and not acting without the advice of their friends and relatives, thought it right to submit themselves to the law without such a trial, perhaps it would not be considered presumptuous in him in venturing to call their Lordships' attention to this fact, as showing their contrite spirit, and doing all that lies in their power to atone for the offence of which they had been guilty. The principal motive weighing on the minds of those men was one which he was sure their Lordships would not receive with indifference. It was their desire to be of such service as they could be to their associate against whom a verdict of guilty had been returned, and in respect to that unhappy person, he might be allowed to call their Lordships' attention to the character he had received, as showing the station and respectability from which he had fallen. The same remark applied to those who now stood at the bar, and he could be verified by witnesses if the Attorney-General required it. They all belonged to respectable families. A few months ago they might hold up their heads with the proudest in the land, because they were innocent—men acting according to what was right, and walking within the bounds of the law. From that state their Lordships saw into what an abyss they had fallen. They were now felons—stigmatised by the name the most reproachful known to the law; their property was forfeited, and more than that, with regard to two of them, they had received already severe punishment in the shape of gun-shot wounds, which it was not to be presumed would be without its weight with the Court, for from that no human power had the means of relieving them. Their Lordships would, he was sure, be glad to have motives for exercising that mercy, the feeling towards which was at that moment working in their minds, and therefore he made no apology for laying these facts before them. John Hughes, who was convicted on Saturday, having been placed with the other prisoners at the bar,—Mr. Baron Gurney addressed the prisoners, and said, they stood severally convicted of a felony—and a felony of a very aggravated description. They had banded and associated themselves with others—they had assembled in large numbers at the dead hour of the night—they had armed themselves with deadly weapons, and had proved that they were not indisposed to use them. This prepared, they had proceeded to the demolition of a turnpike-gate, and then of a turnpike-house. They had assembled themselves in such numbers as to overwhelm all resistance on the part of the owner of the house, or even his neighbours. They were interrupted in their purpose by magistrates and peace-officers, and then they made use of the fire-arms with which they had equipped themselves—thus setting the law at defiance, and disturbing the peace of the country; all these circumstances, he said, were a very great aggravation. Until of late, such crimes were of very unfrequent occurrence in this country. The interruption they had received would, perhaps, prevent the repetition of the crime in this country; but it was impossible for the Court to be ignorant that in neighbouring counties the perpetration of such crimes continued to this day. It was absolutely necessary that the law should be enforced—that the peace of the country should be preserved—that good order should be restored. In the course that had been taken by the Crown undoubtedly everything had been done to give to justice its fullest effect. The prisoners had been tried at a remote part of the county from whence the offence had been committed, where passions were not excited, where cool deliberation and impartial judgment could be given. The Jury, after a long and patient hearing, had found John Hughes guilty, and the prisoners David Jones and John Hugh had pleaded guilty to an indictment of a similar description, and the learned Counsel, in his address to the Court, had very properly impressed upon it the contrition which Jones and Hugh had manifested, and which was intended to recommend them in some measure to the mercy of the Court. This circumstance was not forgotten, but still an example was necessary. They, from the respectability which they had formerly maintained, and the rank of life which they occupied, were persons of whom it was particularly necessary that an example should be made to deter others from a repetition of their crime. They were all liable to be transported beyond the seas for the term of their lives; but considering all that had been stated with respect to David Jones and John Hugh, the Court was of opinion that it was impossible to pass a less sentence than that which he was about to pronounce, which was, that each of them should be transported for the term of seven years. With respect to John Hughes, the Court could not entertain the same view of his case. He appeared to be one in a station of society far above the rest—one not likely to be misled by others, and yet upon the evidence proved to be a leader, if not the leader of this lawless multitude. His conduct at the time, as well as the papers found in his pocket, demonstrated, at least, that he was a leader—that he was active in collecting adherents and associates, and that something like threats had issued from him against those who were not forward in joining his illegal courses. He had been recommended by the Jury to the mercy of the Court. The Court felt extreme difficulty in any degree lessening the punishment which the law awarded to his offence. The law said that he was liable to transportation for life, and, giving all consideration to the recommendation of the Jury, and to all the circumstances which had been so ably stated by the Learned Counsel for the prisoner, the Court was of opinion that he be transported beyond the seas for the term of twenty years. As to any further extension of mercy, the prisoners must recommend themselves to the grace and mercy of the Crown; but that mercy could not be expected if offences of this kind were repeated, and the peace of the country were not fully restored. He had now discharged a most painful duty, and he did trust that the mercy of the Crown, as well as the punishments inflicted by the Court, would have the effect of deterring all who might be disposed to associate themselves together for the purpose of committing offences against the law.—In the case of the other prisoners, the Attorney-General said he would not proceed against Lewis Davies, David Lewis, and the Morgan family, although, as three of the latter had resisted the law, their offence must be marked by some sentence to mark the displeasure of the Court. Mr. Baron Gurney then, addressing the prisoners, said that they had been convicted, on their own confession, of having assaulted a constable in the execution of his duty. It was

most important that officers in the execution of their duty should receive the protection of the Court, and the resistance of them and assault upon them under such circumstances was a very grave offence. In this case it appeared, that in the resistance which had been offered, the life of the officer was in danger, and he had no doubt that, if the officer had not, in his own defence, discharged a pistol, his life would have been sacrificed, and that all the prisoners would have had to answer for the charge of murder, and have ended their days by an ignominious death. He observed that the Attorney-General had forbore to press against them for any indictment charging them with the higher and felonious offence. It was felt, however, that notwithstanding the forbearance of the Attorney-General, an example must be made, particularly when resistance to a peace officer had been offered, and in the manner in which that resistance had been given. His Lordship then sentenced Margaret Morgan to be imprisoned for six months, and Rees and John Morgan for twelve months. The learned Judge further observed that the Court had received information respecting the goodness of their characters previous to these offences, and that that was the only reason why he had not considered it necessary to sentence them to hard labour also.

SPORTING.

NEWMARKET HOUGHTON MEETING.—MONDAY.—Sweepstakes of 10 sovs each, three yrs, 7st 7lbs; four yrs, 8st 3lbs; five yrs and upwards, 8st 8lbs. The winner to be sold for 500l., &c. Criterion course. 5 subs. Lord G. Bentinck's Chatham, 4 yrs, beat by a length Lord Exeter's Fraulein, 3 yrs; Mr. Wreford's Warden, 6 yrs; Mr. Dawson's Our Nell, 4 yrs; and Mr. Braithwaite's Mobarek, 5 yrs.—**Cambridgeshire Stakes** of 25 sovs each, 10 ft, and 5 only if declared, with 100 added. Last mile and a distance straight. 95 subs, 46 of whom declared. Mr. Eddison's Nat, 3 yrs, 6st 9lbs, beat Mr. Crookford's Pine-apple, 3 yrs, 6st 11lbs; Mr. Boyce's Corran, 4 yrs, 8st 7lbs; and 20 others who were not placed.—**Criterion Stakes** of 30 sovs each, 20 ft, for two-yr-olds colts 8st 7lbs; and fillies 8st 5lbs. From the turn of the land in. 37 subs. Mr. Crookford's Rattan by Buzzard, 2lbs extra, beat in a canter, by 4 lengths, Duke of Richmond's Pastoral, 2lbs extra; Mr. Isaac Day's Seaport; and 7 others who were not placed.—**Matches.**—Mr. Payne's Mania, 8st 11lbs, beat by a neck Lord Glasgow's f by Retainer, out of Purity, 6st 7lbs. T.Y.C. 200, h ft.—Lord Exeter's Antidote, 8st 12lbs, beat by a length Lord Glasgow's f, Sister to Give-him-a-Name, 7st 3lbs. T.Y.C. 100, h ft.—Mr. Payne's Sister to Dilbar, 7st 7lbs, beat by a length Lord Glasgow's f by Voltaire, out of Snowball, 7st 8lbs. A.F. 100, h ft.—Colonel Peel's Murat beat by a neck Mr. Bowes's Auld Lang Syne, 8st 10lbs each. Last 3 miles of B.C. 500, 200 ft. Lord Glasgow's f by Give-him-a-Name beat Lord Miltown's Scatlen, 8st 4lbs each. D.I. 200, h ft. Out by consent.—**Duke of Bedford's Curricomb**, 8st 7lbs, received ft from Mr. Greville's Pickwick, 7st 11lbs. T.Y.C. 100, 25 ft.—Colonel Anson's Armytage, 3 yrs, received ft from Sir W. Wynn's Remnant, aged, 8st 7lbs. D.M. 100, h ft.—Col. Anson's Marquise, 3 yrs, 8st, recd. 70 ft from Sir W. Wynn's Era, 2 yrs, 8st 7lbs. T.Y.C. 100.

TUESDAY.—50l. for two-yr-olds, a feather; three, 7st 5lbs; four, 8st 9lbs; five, 9st 3lbs; six and aged, 9st 7lbs. Last three miles of B.C. The winner to be sold for 300 guineas, &c. Duke of Richmond's Pastoral, 2 yrs, beat by a neck Lord Albemarle's Robinia, 2 yrs; Mr. Berrington's Father Mathew, brother to Proof-print, 2 yrs; Sir C. Cockerill's Whitelock, 2 yrs; and 5 others who were not placed. The winner was claimed.—**Sweepstakes** of 10 sovs each, for three yrs, 7st 10lbs; four yrs, 8st 4lbs; five yrs, &c., 8st 8lbs. Last half of Ab.M. Winner to be sold for 50l. 11 subs. Colonel Peel's Cameleon, 5 yrs, beat by a neck Mr. Wreford's b g by Bay Middleton, out of Margellina, 3 yrs; Lord G. Bentinck's Tripoli, 4 yrs; and 7 others who were not placed. The winner claimed.—**Handicap Plate** of 100l., for three yrs and upwards. D.I. Mr. Bradford's Reciprocity, 3 yrs, 8st 7lbs, beat by 10 lengths Mr. Plummer's Alice Hawthorn, 5 yrs, 9st 8lbs; Duke of Rutland's Hyrcanian, 3 yrs, 8st 7lbs; Mr. Newton's Ma Mie, 4 yrs, 8st 6lbs; and 10 others who were not placed.—**Matches.**—T.Y.C. 100; 8st 7lbs each. Duke of Bedford's Oakley beat Colonel Peel's Gaily Owen by two lengths.—**Lord Miltown's Birchen** beat by a length Mr. W. Riddale's Fragrance, T.Y.C.; 8st 7lbs each; 50, h ft.—D.M. 200, h ft. Lord Exeter's Phlegon, 7st 5lbs, beat by half a length Duke of Bedford's Oakley, 8st 11lbs.—**Duke of Beaufort's c** by Liverpool, out of Ketamosa, 7st, received ft from Count Bathany's Cauliflower, 9st 1lb. D.M. 50, h ft.—Lord Exeter's f by Belram, out of Datura, received 80 sovs. ft from Duke of Bedford's f by Liverpool, out of Plaything. T.Y.C. 200, h ft; no weights mentioned.—**The Running-Rein Cnse.**—The disputed T.Y.C. came on this morning, and was decided in favour of Mr. Goodman, the Duke of Rutland's case having entirely failed.—**The Sealed-up Match** for 500l., h ft, to be run on Wednesday, was opened to-day, and Lord Eglington having named Zanoni (dead), Colonel Peel, who named his Sea-kale filly, receives forfeit.

WEDNESDAY.—Handicap Plate of 50l., for three-yr-olds and upwards, A.F.—Mr. Newton's Jenny Jumps, 3 yrs, 6st 7lbs, beat by half a length Duke of Rutland's Cowslip, 3 yrs, 7st 1lb, Mr. Chaplin's Parade, 4 yrs, 7st 2lbs, and five others, who were not placed.—**Sweepstakes** of 10 sovs each; three yrs, 7st 7lbs; four, 8st 2lbs; five, 8st 7lbs. T.Y.C. Winner to be sold for 150l. 7 subs.—Lord G. Bentinck's Chatham, 4 yrs, beat by a neck Mr. Wreford's b g by Bay Middleton, out of Margellina, 3 yrs, and five others who were not placed.—**Subscription Plate** of 50 sovs., for two yrs, 6st 7lbs, and three yrs, 8st 10lbs, T.Y.C. Winner to be sold for 350l., &c.—**Duke of Richmond's Physalis**, 2 yrs, beat by a length Lord E. Russell's Glen Fishie, 2 yrs, and 12 others, who were not placed. The winner claimed.—**Matches.**—T.Y.C. 100, h ft, Duke of Bedford's Espoir, 7st 9lbs, beat Mr. Osbaldeston's Shocking Mamma, 8st 7lbs, by half a length. T.Y.C. 100, h ft.—**Duke of Bedford's Curricomb**, 8st 8lbs, against Mr. Phillimore's Syntaxina, 7st 2lbs. A dead heat. The horses matched again for Saturday, Curricomb giving 1lb less. Mr. Payne's Sister to Dilbar, beat by a length Lord Glasgow's b f, by Velociped, out of Miss Whip, 6st 7lbs each. Last half of R.M. 50. Colonel Anson's Armytage, 8st 7lbs, received forfeit from Duke of Bedford's Epsom, 7st 7lbs. T.Y.C. 100, h ft. Col. Peel's f by Slane, out of Seakale, 8st 5lbs, recd. ft from Ld. Eglington's Zanoni (dead). T.Y.C. 500, h ft.

THURSDAY.—Sweepstakes of 50 sovs each, h ft, for two-yr-olds colts, 8st 7lbs; fillies, 8st 4lbs. Ab.M. 7 subs. Col. Peel's Zenobia walked over.—**Sweepstakes** of 10 sovs each, for three yrs, 7st 4lbs; four, 8st 4lbs; five, &c., 8st 11lbs; mares, &c. allowed 9lbs; winner to be sold for 250, &c. A.F. 6 subs. Sir W. Wynn's Rowland, 3 yrs, beat by a neck Mr. Bradford's Reciprocity, 3 yrs, Lord G. Bentinck's Misdal, 4 yrs, Lord Miltown's Bournia Tomacha, 3 yrs, and Mr. Bowes's Auld Lang Syne, 3 yrs. The winner claimed.—**Sweepstakes** of 10 sovs each, for two-yr-olds, 7st, and three, 8st 12lbs; fillies allowed 2lbs. T.Y.C. The winner to be sold for 80, &c. 7 subs. Mr. Wreford's b g by Bay Middleton, 3 yrs, beat by a length Mr. Collins's f by Voltaire, 2 yrs, and 5 others who were not placed.—**Matches.**—50, h ft, A.F. Sir W. Wynn's Remnant, aged, 9st 2lbs, beat Mr. Shelley's Nizza, 3 yrs, 7st 4lbs, by a length.—200, R.M. Lord G. Bentinck's All-round-my-Hat, 2 yrs, 8st 3lbs, beat Lord Glasgow's Sister to Give-him-a-Name, 2 yrs, 7st 5lbs, by a length.—100, h ft, 7st 5lbs each; last half of Ab.M. Mr. Jaques's Semiseria beat Mr. Ongley's Queen of the Gipsies by a head.—D.I. 200, h ft, Mr. Payne's Mamma, 7st 7lbs, beat Lord Glasgow's Give-him-a-Name, 8st 7lbs, in a canter by four lengths.—Mr. Thornhill's Elixir, 8st, received ft from Lord Chesterfield's Great Heat, 8st 7lbs. D.M. 200, h ft.

FRIDAY.—Sweepstakes of 10 sovs each, for 3 yrs, 7st 9lbs; 4 yrs, 8st 3lbs; 5 yrs, and upwards, 8st 8lbs. First half of Ab.M. Winner to be sold for 400l. 5 subs. Mr. Bell's Blackdrop, 3 yrs, beat Colonel Peel's Garryowen, 6 yrs, General Yates's Canton, 3 yrs, and Mr. Rogers's s to Corran, 3 yrs. Winner claimed.—**Sweepstakes** of 10 sovs each, for 2 yr-old colts, 8st 7lbs, and fillies, 8st 5lbs. First mile of Ab.M. Winner to be sold for 50l. Five subs. Lord G. Bentinck's Vin Ordinaire beat Mr. Shelley's

Omphale, Mr. Collins's f by Voltaire, Mr. Braithwaite's Gaity, and Lord Chesterfield's f by Gladiator. Winner claimed.—**Handicap Sweepstakes** of 20 sovs each, for 3 yr olds, &c. T.Y.C. 10 subs, 3 of whom paid 5 sovs each. Mr. Griffith's Newcourt, 3 yrs, 7st 8lbs, beat Lord Chesterfield's Knight of the Whistle, 5 yrs, 8st 7lbs; Colonel Peel's Image, 6 yrs, 6st 5lbs, and 3 others.—**Handicap Sweepstakes** of 10 sovs each, for 2-yr-olds. T.Y.C. 8 subs. Mr. White's Emma, 8st, beat Lord Exeter's f by Liverpool, 7st 2lbs; Mr. Payne's Andrey, 7st 12lbs; Lord G. Bentinck's Lufra, 7st 2lbs; Mr. Rogers's Amata, 7st 12lbs, and Mr. Dawson's Lightning, 7st 8lbs.—**Sweepstakes** of 10 sovs each, for 3 yr olds, 7st 7lbs; 4 yrs, 8st 2lbs; 5 yrs, &c., 8st 2lbs. D.M. Winner to be sold for 150l., &c. 5 subs. Lord G. Bentinck's Misdal, 4 yrs, beat Duke of Bedford's John o'Gaunt, 5 yrs, Lord W. Powlett's Mallard, 3 yrs, and Mr. J. Day's Morality, 4 yrs.—**The Nursery Stakes** of 25 sovs each, for 2 yr olds. D.M. 10 subs. Lord Verulam's f by Liverpool, 7st 5lbs, beat Mr. Phillimore's Skeleton, 7st 1lb; Mr. Ford's Snap, 7st 3 lbs, and 3 others.—**Matches.**—8st 7lbs each. T.Y.C. 100, h ft. Lord Glasgow's f by Retainer beat Lord Exeter's Dr Hill, 290 sovs, h ft. T.Y.C. The Duke of Bedford's Espoir, 7st 11lbs, received ft. from Mr. Payne's c by Touchstone, 8st 4lbs.—200 sovs, h ft. T.Y.C. Lord Stradbroke's Evenus, 8st 11lbs, received ft from Mr. Gregory's Barricade, 7st 4lbs.—100 sovs, h ft. D.M. The Duke of Bedford's Curricomb, 8st 7lbs, received ft from Sir W. Wynn's Rowland, 7st 5lbs.

SATURDAY.—Sweepstakes of 50 sovs each, h ft; first half of Ab.M. 3 subs. Lord Exeter's Dr Hill, 2 yrs, 7st 4lbs, beat Mr. Shelley's Omphale, 2 yrs, 7st 1lb, and Colonel Anson's Marquess, 3 yrs, 8st 7lbs.—**Houghton Handicap** of 15 sovs each, and only 5, &c., the forfeits to go to the second horse. D.M. 10 subs. Lord Chesterfield's Knight of the Whistle, 5 yrs, 9st 1lb, beat Mr. Shafto's c by Muley Moioch, 4 yrs, 7st, Mr. Meiklam's Philip, 3 yrs, 7st 4lbs, and Mr. Payne's Johnny, 6 yrs, 7st 10lbs.—**Audley-end Stakes** of 30 sovs each. A.E.C. 13 subs, 4 of whom paid 10 sovs ft. Mr. Newton's Ma Mie, 4 yrs, 8st, beat Lord Verulam's Robert de Gorham, 4 yrs, 7st 7lbs; Duke of Rutland's Hyrcanian, 3 yrs, 5st 13lbs; Lord Miltown's Scatlen, 4 yrs, 7st 3lbs, and 5 others.—**Sweepstakes** of 5 sovs each; for two-yr-olds, 6st 7lbs; three, 8st 5lbs; four, 8st 10lbs; five and aged, 8st 12lbs; the winner to be sold for 25, &c. First half of Ab.M. 6 subs. Mr. Wreford's b g by Bay Middleton, 3 yrs, beat Mr. Shelley's Omphale, 2 yrs; Mr. Robinson's f by Achmet, 2 yrs; Captain Daintree's Dona, by Liverpool, 2 yrs; Lord G. Bentinck's Lufra, 2 yrs; and Count Bathany's Rhodius, 2 yrs.—**Sweepstakes** of 10 sovs each, for three yr-olds; colts, 8st 7lbs; fillies, 8st 4lbs. D.M. The winner to be sold for 50, &c. 5 subs. Colonel Peel's Hartshorn beat Lord Miltown's Burden, Mr. Osbaldeston's Martingale (8st 6lbs), Mr. Shelley's Nizza, and Lord Verulam's c by Sir Hercules.—**Handicap Sweepstakes** of 10 sovs each. D.I. 3 subs. Mr. Bowes's Auld Lang Syne, 3 yrs, 7st 10lbs, beat Duke of Rutland's Allumette, 3 yrs, 8st, and Mr. Meiklam's Philip, 3 yrs, 8st 7lbs.—**Matches.**—50, A.F. Mr. Osbaldeston's Devil among the Tailors, 8st 7lbs, beat Mr. Chaplin's Parade, 8st 2lbs.—100, h ft. T.Y.C. Colonel Anson's Armigate, 8st 7lbs, beat Lord E. Russell's Glen Fishie, 6st 12lbs.—100, h ft. T.Y.C. Mr. Phillimore's Syntaxina, 7st 13lbs, beat Duke of Bedford's Curricomb, 8st 8lbs.—100, h ft. R.M. Mr. Newton's Jenny Jumps, 8st 3lbs, beat Duke of Rutland's Cowslip, 8st 7lbs.—100, h ft. T.Y.C. Lord Exeter's Fraulein, 8st 7lbs, beat Colonel Anson's Marquess, 8st.

With this terminated the most brilliant Houghton Meeting on record. The races made for the six days amounted in number to 57, of which 44 were run, making an average of upwards of seven per day, and many of them of great interest.

TO BE DISPOSED OF immediately, 100 FRUITING PINE PLANTS, perfectly clean and healthy, price 3s. each; with 150 Succession, at 1s. 6d.—Apply to J. Toy, Gardener, Pishiobury, Sawbridgeworth, Herts.

TO LET.—About SEVEN ACRES OF NURSERY GROUND, near London; or the Lease (twelve years and a half unexpired) to be sold. For particulars apply to Messrs. PROTHORP & MORRIS, American Nursery, Leytonstone, Essex.

LONDON, EDINBURGH, AND DUBLIN LIFE COMPANY, No. 3, Charlotte-row, Mansion-house, and Chancery-lane, London.

The indisputability of Policies granted by this Company. The obligation to pay the same assured although the debt for which the policy was taken may have been paid before the claim arises.—Whole-world policies not confined to the limits of Europe;—Option of half-premium payment for the first seven years. These form a combination of advantages which can be obtained only from the London, Edinburgh, and Dublin Life Company. ALEX. ROBERTSON, Manager.

COTTAM AND HALLEN, ENGINEERS, IRON-FOUNDERS, &c. &c., No. 2, WINSLEY STREET, OXFORD STREET, LONDON.

HOTHOUSES, CONSERVATORIES, &c., made upon the most improved principle, either of iron or of iron and wood combined, which can be fixed complete in any part of the Kingdom, at very low prices, in consequence of the present depressed state of the Iron Trade.

HOT-WATER APPARATUS for heating Hothouses, Conservatories, and Greenhouses; Churches, Public or Private Buildings, &c., with COTTAM'S PATENT, or ROGERS' BOILERS. After 15 years' experience, and having fixed upwards of 1500 Apparatuses for the above-mentioned purposes, and by various improvements which they have made during that time, C. and H. can with confidence undertake the erection of similar Apparatus upon the most extensive scale. For the convenience of those who wish to fix their own Apparatus, they have affixed the following low prices:—

Cottam's Patent Boiler, 24 inch	£ s. d.
(Larger Sizes in proportion.)	7 0 0
Rogers' Boiler, small size	3 15 0
Do. do. large do.	4 10 0

Hot-water Pipe, Doors, Frames, and Feeding Apparatus for Boilers, &c.

Rendle's Tank System on an improved simple plan. **STRONG IRON HURDLES**, 3 ft. high out of the ground, 6 ft. long, with five horizontal bars, weighing about 36 lbs., 3s. 6d. each. Light Cattle Hurdles, 3 ft. 6 in. high, weighing 42 lbs., at 4 0 "

Strong do. do. 45 lbs., at 4 4 " Ox Hurdles, 4 ft. high, do. 60 lbs., at 5 6 "

BEST WIRE FOR STRAINED WIRE FENCING, at 8s. 6d. per bundle of 150 yards each. Uprights for ditto, at 7d. each. The Improved continued and every other kind of Fencing, Fancy Wire-work, &c.

HAND-GLASS FRAMES for Cucumbers, &c., 18 inches square, 3s. 6d.; 20 inches, 4s. 6d.; 22 inches, 5s. 6d. each.

CAST-IRON FLOWER-STAKES 4 feet long out of the ground, 7s.; 4 feet 6, 9s.; 5 feet, 11s.; 6 feet, 15s.; 7 feet, 20s. per dozen.

GARDEN ROLLERS 18 inches long, 34s.; 20, 44s.; 22, 50s.; 24 inches, 60s.; 26, 75s.; 28, 84s.; 30, 105s. each.

Garden Engines, Mowing Machines, Garden Chairs, Superior Garden Tools of all kinds, Garden Vases and Pedestals in great variety, and every description of Horticultural Articles, Agricultural Implements, and Furnishing Ironmongery; Dr. Arnott's Stoves, Anglo-Belgian Cooking Stoves; Broiling Stoves. The above low prices being on account of the depression in the Iron Trade, are subject to future alterations.

Show-Rooms at the Manufactory, No. 2, Winsley-street, where every information may be obtained. Estimates sent by return of post.

HOT-WATER APPARATUS FOR HEATING HORTICULTURAL BUILDINGS, DWELLING-HOUSES, CHURCHES, and MANUFACTORIES, upon improved principles, and at very moderate charges, erected by DANIEL and EDWARD BAILEY, 272, HOLBORN.

D. and E. BAILEY have devoted much time to the consideration of this subject, and had much experience in the erection of apparatus for the above-mentioned purposes, have, by improvements suggested in their practice, rendered their mode of heating not only very efficient, but very simple, and have combined durability in the apparatus with economy in the charge. They have erected apparatus in England, Scotland, and Ireland, for many noblemen and gentlemen, and have had the honour to be employed by the Horticultural Society of London, in executing the works of their splendid Conservatory, lately erected at Chiswick.

D. and E. BAILEY also construct in metal all descriptions of Horticultural Buildings and Sashes, and invite noblemen, gentlemen, and the public to an inspection of their various drawings and models, at 272, Holborn, where they have the opportunity of exhibiting, amongst other metal works, an extremely complete and convenient kitchen apparatus, or range, adapted for the continued supply of hot water, and an arrangement of the oven more complete than has hitherto been brought before the public.

D. and E. BAILEY were the first to introduce metallic curvilinear houses to horticulturists, and can refer to the Conservatory attached to the Pantheon as one of their works, besides many others in this country and on the Continent.

D. and E. BAILEY have prepared a quantity of the Galvanic Plant Protectors, which are now ready for immediate delivery; they beg to introduce to public notice a new Trough Pipe, for Orchidaceous or other Houses where vapour is constantly, or at intervals required, and which may be seen at their Manufactory.

PENN'S SYSTEM OF HOTHOUSE BUILDING, WARMING, and VENTILATING.—The superiority of the principle first introduced by JOHN PENN, Esq., for obtaining a more complete circulation of the atmosphere in heated apartments, being now fully established, W. HILL respectfully acquaints the public that having, in conjunction with the late Mr. Penn, devoted much time and study to perfect the same, in the construction of Conservatories, Stoves, Greenhouses, Pits, &c., and to heat them with Improved Hot Water Apparatus, either by Pipes or Troughs, he is enabled to carry out Mr. Penn's principle in a manner to guarantee the most complete success and economy. First-rate references. Plain and Ornamental Designs; and any particulars on application to W. HILL, Surveyor and Builder, Lewisham.

ARGUS LIFE ASSURANCE COMPANY, 39,
Throgmorton-street, Bank.
Empowered by special Act of Parliament, 5 & 6 W. IV., c. 76.
Thomas Farncomb, Esq., Alderman, Chairman.
William Leaf, Esq., Deputy Chairman.

William Banbury, Esq. | Rupert Ingleby, Esq.
Edward Bates, Esq. | Thomas Kelly, Esq., Alderman.
Thomas Camplin, Esq. | Jeremiah Pilcher, Esq., Sheriff
James Clift, Esq. | of London and Middlesex.
Rt. Hon. J. Humphrey, M.P., | Lewis Pocock, Esq.
Lord Mayor of London.

Physician—Dr. Jeafferson, 2, Finsbury-square.
Surgeon—W. Coulson, Esq., 2, Frederick's-place, Old Jewry.
Consulting Actuary—Professor Hall, of King's College.
Advantages of the Argus Life Assurance Company.
Low Rates of Premiums.

In addition to the subscribed Capital of 300,000*l.*, the Assured have the security of the Company's Income of nearly 50,000*l.* per annum, yearly increasing, and accumulating Assurance Fund invested in Government and other available Securities, of considerably larger amount than the estimated liabilities of the Company. The Rates of Premium are reduced to the lowest scale compatible with the safety of the Assured and the stability of the Company, thereby, in effect, giving to every Policy-holder an immediate and certain bonus without risk, in lieu of the deferred and frequently delusive prospect of a periodical division of profits.

Age.	For One Year.	For Seven Years.	Whole Term.
20	£0 17 8	£0 19 1	£1 11 10
30	1 1 8	1 2 7	2 0 7
40	1 5 0	1 6 9	2 14 10
50	1 14 1	1 19 10	4 0 11
60	3 2 4	3 17 0	6 0 10

One-third of whole-term Premiums may remain unpaid at 5 per cent. comp. int. as a debt upon the Policy for life, or may be paid off at any time without notice.

In Assurances for advances of money as security for debts, or as a provision for a family, when the least present outlay is desirable, the varied and comprehensive Tables of the Argus office will be found to be particularly favourable to the Assured.

A Board of Directors, with the Medical Officers, attend daily, at a quarter before 2 o'clock.

EDWARD BATES, Resident Director.
A Liberal Commission to Solicitors and Agents.

HORTICULTURAL BUILDING & HEATING by HOT-WATER.

J. WEEKS & Co., ARCHITECTS, &c., Gloucester-
place, King's-road, Chelsea, Hothouse-Builders, and Hot-water Apparatus Manufacturers, beg leave to inform the Nobility and Gentry, that their business, which has been extensive for many years, is entirely confined to the BUILDING OF HORTICULTURAL ERECTIONS of every description, and the HEATING of them by HOT-WATER.

CONICAL and other BOILERS of all sizes; their largest consumes but a small quantity of fuel, only requiring attention once in 10 hours, and will heat a range of Forcing-houses 300 feet in length.

Their improved plan of BOTTOM-HEAT FOR PITS, by means of an open trough under the bed, is now being universally adopted.

References may be had, and their works seen at most of the Nobility and Gentlemen's seats in the country, nearly the whole of the London Nurseries, and a great variety of Horticultural Erections and Hot-water Apparatus, Models, Plans, Estimates, &c., at their Horticultural Manufactory, Gloucester-place, Chelsea, near Sloane-square.

RENDLE'S TANK SYSTEM OF HEATING.

STEPHENSON AND CO., 61, Gracechurch-street,
London, Inventors of the IMPROVED CONICAL and DOUBLE CYLINDRICAL BOILERS, having been much engaged in heating buildings upon the above system with Tanks of various materials, solicit the attention of scientific Horticulturists to an Iron Tank now fitting up on their premises, which offers most decided advantages over every other article hitherto employed for the same purpose. These tanks which are ornamental in appearance can be made from 10 to 100 feet long and of any width and depth, and can be connected or disconnected by any working Gardener without the slightest difficulty, thus affording the opportunity to persons in remote districts of employing this much approved method of heating without the assistance of Engineers. The Tanks can be applied to Boilers and Pipes already fixed, and from the present low price of Iron will be found cheaper than of any other material. Mr. RENDLE, of Plymouth, has kindly undertaken to receive orders and furnish information to any persons in his neighbourhood, and prices for any size will be forwarded upon application to S. and Co.

GUANO ON SALE.—Any Quantity of this valuable Manure can be had from the bonded stores of the Importer either in London or Liverpool, on application to COTESWORTH, POWELL, and Pevon, St. Helen's Place, London; EDWARDS, DANSON, and Co., Liverpool; and WILLIAM J. MYERS and Co., Importers, Liverpool.

GUANO ON SALE,
BY THE IMPORTERS,
ANTHONY GIBBS & SONS, LONDON;
GIBBS, BRIGHT, & Co., LIVERPOOL AND BRISTOL.

Published this Day, fcp. 8vo., with Wood Engravings, 7*s.* cloth.
TAXIDERMY; or, the Art of Collecting, Preparing, and Mounting Objects of Natural History: for the use of Museums and Travellers. By Mr. R. LEE (formerly Mrs. T. E. Bowdich), Author of "Memoirs of Cuvier," &c. Sixth Edition, improved, with an account of a Visit to Walton Hall, and Mr. Watert's method of Preserving Animals.
London: LONGMAN, BROWN, GREEN, and LONGMANS.

ENCYCLOPEDIA BRITANNICA.—Seventh Edition. Edited by PROFESSOR NATIER.

A recent writer in the *Quarterly Review*, in advertising to the pre-eminent value of this Encyclopædia as a Dictionary of Universal Knowledge, observes, that "an Australian or New Zealand Settler, who left his home with no other accomplishment but that of being able to read, write, and count, might, with such a companion beguile his long and weary voyage, and become a well-informed man before he reached his destination."

An Index of 68,000 references, compiled with great industry and judgment, is appended to the work, forming a ready key to its multifarious contents.

ADAM and CHARLES BLACK, Edinburgh; SIMPKIN, MARSHALL, and Co., WHITTAKER and Co., and HAMILTON, ADAMS, and Co., London.

Now ready, price 1*s.*, more than 200 pp.
JOHNSON and SHAW'S FARMERS' ALMANACK
and CALENDAR for 1844, containing every information incidental to an Almanac, with engravings and lists of prices of seventy of the most improved agricultural implements from the best makers, manures, &c.

JAMES RIDGWAY, Piccadilly; and every bookseller in every market town in the kingdom.

N.B. To prevent disappointment, order "Johnson and Shaw's Farmers' Almanack."

LOUDON'S ARBORETUM ET FRUTICETUM
BRITANNICUM. In 8 vols. 8vo.—4 of letterpress and 4 of plates—price 10*l.*

This being the season for planting Trees and Shrubs, planters are reminded that the above work contains by far the most copious history, natural and artificial, of all the Trees and Shrubs which will stand the open air in Britain, that has ever been published; including their description, uses, propagation, culture, diseases, effect in landscape, and every other particular desirable to be known by the planter and landed proprietor.

There are botanical figures of all the species, drawn to one scale; and portraits of the trees, also drawn to a scale, showing the different sizes which the different kinds attain when ten years planted, and also when full grown; an object which was never before attempted in any work on Trees.

"This book is one of solid value, worthy a place in the library of every landed gentleman, as well as of every student of botanical, arboricultural, and horticultural science. . . . The 'Arboretum Britannicum' is complete in its kind, and it must become a standard book of reference on all subjects connected with Trees."—*Quarterly Review*.

Printed for the Author, and sold by Messrs. LONGMAN and Co., 39, Paternoster-row; where may be had,

LOUDON'S EDITION of REPTON'S LAND-
SCAPE GARDENING and GARDEN ARCHITECTURE, illustrated by numerous Plans, Sections, Views, &c. In one vol. 8vo, price 1*l.* 10*s.* plain; coloured, 3*l.* 6*s.*

This is by far the most complete work on laying out grounds that has hitherto been published; and by means of the numerous plans and sections, the whole may be readily comprehended by the working gardener, as well as by the amateur.

By Mr. TURLE, ORGANIST OF WESTMINSTER ABBEY;
and PROFESSOR TAYLOR, GRESHAM COLLEGE.

I. Psalm Tunes. II. Sacred Music. III. Glees, Madrigals, Duets, Songs, &c.

THE PEOPLE'S MUSIC BOOK. A Work intended to meet the growing demand for Music among all classes of the community.—Principally arranged for Four Voices, and, where admissible, with an accompaniment for the Organ or Piano Forte. Each Number contains three separate portions, forming respectively a complete body of the best Music for the Cathedral, the Church, or Chapel; the Family, the Glee Club, and the Madrigal Society.

Published Monthly, in parts, comprising 32 pages super-royal 8vo, price 1*s.*

The 30th Edition of 1000 each.

FLETCHER'S FAMILY DEVOTION; containing the Morning and Evening Service of a Family for every day throughout the year. Embellished with 17 elegant Engravings. Bound in cloth, gilt edges, price 1*l.* 6*s.* Recommended by 25 distinguished Ministers in England, and upwards of 100 Clergymen in the United States of America.

"Our attention has lately been called to an advertisement of a book of 'Family Devotion,' containing the Morning and Evening Service of a Family for every day throughout the year." According to the advertisement, this new Order for Morning and Evening Prayer daily throughout the year is already in its 30th edition of 1000 each. 30,000 copies of a book of Common Prayer for Dissenters, recommended by 25 distinguished ministers, whose names are given, and who include some of the most prominent of the day, cannot be dispersed throughout England without working some considerable change in the minds of probably 200,000 persons."—*The Times*, Sept. 27, 1843.

Just Published,

A PORTRAIT OF THE REV. JOHN CUMMING,
M.A., Minister of the Scottish National Church, Crown-court, Little Russell-street, Covent-garden; engraved by THOMSON, from a Painting by W. BOOTH, Esq., in the Possession of Mr. CUMMING. Large paper, India Proofs, 10*s.*; small paper, plain proofs, 7*s.* 6*d.*

London: GEORGE VIRTUE, 26, Ivy-lane, Paternoster-row.

BUTTER MADE IN TEN MINUTES

BY THE NEWLY-INVENTED CHURN.

REGISTERED ACCORDING TO ACT OF PARLIAMENT.

This Act imposes a penalty of from 5*l.* to 30*l.*, for each imitation, piracy, or selling, recoverable by the proprietors before a magistrate, or by civil action. Half the penalty will be given to any person informing the proprietors of any infringement. The words of the Act are "No person or persons shall copy or alter any design, either by adding to, or subtracting from," &c.

ATTWOOD, WIMBLE, & WARNER, MANUFACTURERS, LEWES, SUSSEX.

This CHURN being made entirely of Block Tin, the necessary degree of temperature can be given to the cream, by placing it in a pan of cold or hot water, which ensures the butter coming in 10 or 12 minutes. The simplicity of its construction, and the facility with which it may be cleaned, are no inconsiderable advantages over those now in common use. The great advantages of this Churn will be found in the winter; but in the heat of summer placing the Churn in cold water will be the means of hardening the Butter.

Sizes	No. 1	2	and 3
Churn from	7 to 8 lbs.	13 to 15 lbs.	26 to 28 lbs.

Price, carriage paid to London. 25*s.* 35*s.* 42*s.*

Metal Pans for Churns to stand in, 4*s.* 6*d.*, 6*s.*, and 7*s.* Larger sizes made to order.

To be seen in London, at Wright's Range Warehouse, No. 3, Arthur-street, near the Monument; RIDGWAY'S Brush Warehouse, No. 30, Gracechurch-street; LIVERMORE and SON, Ironmongers, No. 30, Oxford-street; BENHAM, 19, Wigmore-street, Cavendish-square. Export Agents, BARNES & Co., 109, Fenchurch-street.

SMOKE PREVENTED AND VENTILATION EFFECTED, BY SPONTANEOUS ACTION.

M. R. JEAKES, 51, Great Russell-street, Russell-square,
Sole Agent in London for the Sale of DAY'S PATENT WIND-GUARD, by the use of which he guarantees to Cure all Chimneys Smoking from Wind, and also to prevent downward currents; it is admirably adapted for the Ventilation of Apartments of every description; also of Ships, Stables, Dairies, and Larders, as it ensures a constant change of air; and all its parts being fixtures, it is free from noise and not liable to derangement; it also offers no impediment to sweeping. Price for general use, 30*s.*; larger size, 45*s.*; larger sizes, especially adapted for ventilation, 60*s.* and upwards. To be had at 51, Great Russell-street, where it may be seen in action. The attention of Architects, Builders, and the trade in general, is especially invited.

SLATE WORKS, ISLEWORTH, MIDDLESEX.

EDWARD BECK informs Horticulturists generally, that the Cisterns, Tanks, Shelves, Stages, Conservatory Tubs, Flower-Boxes, Edging for Garden-paths, &c., manufactured by him in Slate, may be seen in use at Worton Cottage, upon application to the Gardener, (Sundays excepted.)

ONLY TO BE KNOWN TO BE VALUED.

DR. ROBERTS'S CELEBRATED OINTMENT,
called the POOR MAN'S FRIEND, is confidently recommended to the public as an unfailing remedy for wounds of every description, a certain cure for ulcerated sore legs, if of 20 years' standing, cuts, burns, scalds, bruises, chilblains, scorbutic eruptions and pimples in the face, sore and inflamed eyes, sore heads, cancerous humours, &c., and is a specific for those afflicting eruptions that sometimes follow vaccination. Sold in pots, at 1*s.* 1*d.* and 2*s.* 9*d.* each. Also his

PILULE ANTISCORPHULE,
confirmed by more than 40 years' experience to be, without exception, one of the best alternative medicines ever compounded for purifying the blood and assisting nature in all her operations; hence they are useful in scrofula, scorbutic complaints, glandular swellings, particularly those of the neck, &c. They are efficacious also in rheumatism, and form a mild and superior family aperient, that may be taken at all times without confinement or change of diet. Sold in boxes, at 1*s.* 1*d.*, 2*s.* 9*d.*, 4*s.* 6*d.*, 11*s.*, and 22*s.* each.

To those who cannot take pills, the proprietors would strongly recommend Dr. Roberts's

ANTISCORBUTIC DROPS,

for the cure of the scurvy, scrofula, leprosy, and all scorbutic complaints; they strengthen the constitution, purify the blood, and promote a circulation of the fluids; are gentle in their operation, and do not require cessation from business. In bottles at 2*s.* 9*d.* each.

By the late Dr. Roberts's will Messrs. BEACH & BARNICOTT (who have been confidently entrusted with the preparation of his medicine for many years past), are left joint proprietors of the "Poor Man's Friend," "Pilule Antiscrophule," "Larwell's Pills," "Medicated Gingerbread Nuts," and "Antiscorbutic Drops," with the exclusive right, power, and authority to prepare and vend the same.

The still increasing demand for the above medicines, from all ranks, is the best and most substantial proof of their utility.

Observe.—No medicine sold under the above names can possibly be genuine, unless "Beach and Barnicott, late Dr. Roberts, Bridport" is engraved and printed on the stamp affixed to each package.

ROWLAND'S ODONTO, or PEARL DENTIFRICE,

specially Patronised by her Majesty the Queen, H.R.H. Prince Albert, the Royal Family, and the several Courts of Europe. A fragrant white powder, prepared from Oriental herbs of inestimable virtue, for strengthening, preserving and cleansing the teeth. It eradicates the factitious formation of tartar, and by the removal of that extraneous substance lends a salutary growth and freshness to the gums. It removes from the surface of the teeth the spots of incipient decay, polishes and preserves the enamel, substituting for discolour and the aspect of impurity, the most pure and pearl-like whiteness; while, from its salubrious and disinfecting qualities, it gives sweetness and perfume to the breath, bestowing at once cleanliness, and the appearance and reality of health. Price 2*s.* 9*d.* per box, duty included.

CAUTION.—To protect the public from fraud, the Hon. Commissioners of her Majesty's Stamps have authorised the Proprietors' Signature to be engraved on the Government Stamp, thus:—A. ROWLAND & SON, 20, HATTON-GARDEN, which is affixed to each box.

Ask for ROWLAND'S ODONTO; sold by them and by Perfumers and Chemists. All others are Spurious Imitations.

WANT PLACES.—All Letters to be post-paid.

AS GARDENER.—A young Man, aged 35, without encumbrance, would prefer a Situation where one or more men are kept; he perfectly understands Forcing; Kitchen, Fruit, and Flower-gardening, and has had good practice in the Propagation and Cultivation of Plants on the latest and most improved principles; also Ground-work, Planting, &c.; has no objection to town or country, and can have 45 years' good character from the gentleman he has just left.—Direct to W. Y., at Mr. Pamplin's Nursery, Hornsey-road, Holloway.

AS COACHMAN or GARDENER.—A single Man, aged 27, understands raising early Cucumbers and Melons, Greenhouse and Plants in general, Kitchen and Flower-garden. Can wait at table. Has an unexceptionable character of two years from the lady he has just left. Direct to J. S., *Gardeners' Chronicle* office, 3, Charles-street, Covent-garden.

Printed by Messrs. BRADBURY and EVANS, Lombard-street, Fleet-street, in the Precinct of Whitefriars, in the City of London, and Published by them at the Office, 3, CHARLES-STREET, COVENT GARDEN, in the County of Middlesex, where all Advertisements, and Communications are to be addressed to the Editor.—Saturday, November 4, 1843.

CONIFERÆ.—The Subscribers have this Season to offer the following:—

	s.	d.
<i>Pinus acapulcensis</i> , 6 in., in pots, each	25	0
adunca, 1 ft., in pots, each	10	6

PETER LAWSON AND SON, EDINBURGH,
Seedsmen and Nurserymen to the Highland and Agricultural
Society of Scotland.
AGENTS,—Messrs. W. and J. NOBLE, Seedsmen, 152, Fleet-
street, London.

ALEX. PONTEY begs to call the attention of the
Public to his splendid PELARGONIUM, WOOD'S COUNT-
ESS OF MORLEY, which, in consequence of the smallness of
his stock, could not be sent out last season; but having again
this season proved it, he can with confidence recommend it as
first-rate, price 21s. each. Also the following—Wood's Royal
Pet, 10s. 6d.; Do. Macbeth, 10s. 6d.; Do. Eros, 10s. 6d.
The Countess obtained the Gold Medal at Plymouth in 1842, and was
exhibited at Chiswick in June following, where it was univers-
ally admired.

A. P. also begs to offer Seeds of a new crimson Convolvulus,
received from Brazil (beautiful); and also Phlox Drummondii,
saved from several splendid varieties, of which he has a large
stock.—Packing will be commenced the first week of December.
Plymouth Nursery, November 8, 1843.

NORLAND NURSERY, NOTTING-HILL, LONDON.
R. E. GOWER takes this opportunity of offering an
assortment of DUTCH BULBS, which are particularly
good. Fine plants of *Araucaria Braziliensis*. Some large plants
of *Camellias*, very full of bloom. 1-year transplanted Beech,
at 4s. per 1000. Flower and Garden Seeds, among which he has a
small quantity of Cormack's Prince Albert Pea, at 2s. 6d. per qrt.

BRUGMANSIA SPE. NOVA.

THOS. BRIDGFORD AND SON, Spa Field Nursery,
Ball's Bridge, Dublin, having a fine stock of the above plant,
which will prove a valuable addition to the Greenhouse, from its
propensity to flower in plants at 12 to 18 inches high. It is per-
fectly distinct from all of the species. Strong established plants
are now ready for sending out at 10s. 6d. each. Thos. B. and Son
have also a fine specimen plant of the same, with three flowers
now expanded; it is three feet high, well furnished, which they
will dispose of. B. Spe.—Plant flowers abundantly on small spe-
cimens; flowers about the same length as those of *B. suaveolens*,
with the calyx full half the length of the corolla, both white;
flowers highly perfumed; the rim of the corolla is divided into
five long points; rim and calyx much reflexed, which, with the
long calyx, give the plant a decided character; the throat of the
corolla is of a beautiful greenish white colour.

Answer to "J. C. L." *Gardeners' Gazette*, May 28th, 1842:—
"If your *Brugmansia* retains its large spathaceous calyx, it must
be new. *Florapandia* is the name given to *B. coccinea*. We are
not acquainted with the present species. It does retain its large
spathaceous calyx.—J. C. L."

A plant having been sent by us to Mr. Low, Clapton, with seven
flowers expanded, to be by him exhibited at the Chiswick Horti-
cultural Show in August, 1843, the flowers of which were injured
in its transmission, consequently was not exhibited; it has since
flowered with Mr. Low, and is noticed in "Paxton's Botanical
Magazine" for September, 1843. The seeds of the above species
were received by J. C. Lyons, Esq., Ladiston, Westmeath, from
Chilli, from whom we received our plant.

The Double White *Brugmansia*, noticed by Dr. LINDLEY in the
Gardeners' Chronicle, September 16th, 1843. Seeds of which were
also received from Chilli by "J. C. L.," along with *B. Spe. Nova*,
plants of which T. B. and Son will have ready to send out in May,
1844. 48, Lower Sackville-street, Dublin.

TO GENTLEMEN PLANTING.

J. AND J. FAIRBAIRN are induced from the uncer-
tainty upon which they hold the Manor-street Nursery
(situated contiguous to the Home Nursery, Clapham Rise, where
attention will be given to all applications), to effect a Sale of the
Stock at as early a period as possible, consequently beg to solicit
the attention of Gentlemen and the trade to the large and re-
markably healthy and well-grown stock, consisting of fine large
Laurels, twice transplanted, of extra growth; Portugal Laurels,
very handsome; Green Hollies, of various sizes; Evergreen
Privets, fine Standard and Dwarf Roses in great variety, fine
standard flowering Thorns, Almonds, *Asculus*, Robinas, and
other Ornamental Trees, and Evergreen and flowering Shrubs,
with a large stock of fine standard and dwarf, trained and un-
trained Peaches, Nectarines, Apples, Pears, Plums, and Cherries,
of the most approved kinds, and of growth rarely equalled; also,
a large assortment of Forest Trees, consisting of Limes, Elms,
Birch, Beech, Hornbeam, Spanish and Horse Chestnuts, Mountain
Ash, Poplars, and Spruce, and Scotch Firs; also a large number
of Gooseberries and Currants, of excellent growth, and of the
best varieties in cultivation, to all of which J. & J. F. respectfully
invite the inspection of Gentlemen and Nurserymen, flattering
themselves that the general character of the Stock is such as to
ensure unqualified satisfaction, and which they are disposed to
offer at very moderate prices for cash.

J. & J. F. respectfully beg to call the attention of Gentlemen
to their advertisement of Heaths, &c., which has appeared in the
Gardeners' Chronicle of the two last weeks.
Nurseries, Clapham, near London, November 10, 1843.

NEW DAHLIAS.—SPARY'S "LADY ANTROBUS" AND "AURANTIA."

E. SPARY begs most respectfully to solicit the atten-
tion of Nurserymen, Florists, and Amateurs, to the above
new and distinct Seedlings, and begs to apprise the trade that he
intends letting them out in dry-roots, and solicits their early
orders, as the stock is limited.

E. S. has no hesitation in asserting "Lady Antrobus" to be
the best edged Seedling of the year: it was acknowledged at
the grand Salt-hill Exhibition to be a decided improvement on
that much esteemed variety "Beauty of the Plain," and will not
only prove a great acquisition as a show-flower to the most
limited grower, but also a very ornamental flower-garden
variety. Height 2ft. 6in., excellent habit, blooms on stiff stems
well above the foliage, constant and profuse Bloomer, great
depth, fine form, and full centre. Colour clear, white ground,
tinged with a beautiful scarlet lake. Received prizes and notices
of the Press as follows:—1st at Salt-hill, 1st at Portsea, 2d at Salis-
bury Plain, held at Stonehenge, at which 30 entries for Seedlings
only, Keynes's "Standard of Perfection," and "Lady Antrobus"
placed; 2d at the London Floricultural Society; 2d at Chippen-
ham; 1st, 2d, and 3d, at Stockwell Surrey Show.—Class showing
with old Varieties: Exhibited at the Surrey Gardens (vide
Gardeners' Gazette, Sept. 23, p. 203); six Blooms sent to Mr.
Glenny (see report in the same Paper, Sept. 2, p. 152); six Blooms
sent to the Editor of the *Gardeners' Chronicle*, Sept. 23, p. 665.
"Lady Antrobus" is a flower of good substance, and good
general form, and will prove a desirable and useful flower; was
also exhibited at Uxbridge on the 5th Sept., with *Aurantia*, not
for competition. The same evening classed by the London Flori-
cultural Society. Per ground-root, price 10s.; Plants 10s. 6d.

"Aurantia," distinct orange-buff, fine form, shell-Petal, good
substance and centre, a fine show-flower, of good habit;
height 3ft. Classed by the London Floricultural Society, at their
grand Exhibition, on the 20th Sept. 1842; 5th Sept., 1843.
Classed by the same Society 8th Sept.; received a first-class
Prize at Chippenham; 19th Sept., nine Blooms sent to the
Editor of the *Gardeners' Chronicle* (see Report, p. 665); 27th Sept.,
1st prize at Stockwell, for the best orange class showing; price per
ground-root, 6s.; Plants, 7s. 6d. A Post-office order will be
required from unknown correspondents.—Denford, Hungerford,
Nov. 1, 1843.

WM. HEALE AND SON, NURSERYMEN, &c., beg
most respectfully to acquaint the Public and Trade in
general that they have still a large stock, both Standards, Dwarf,
and Trained, of their celebrated HYBRID PLUM, raised between
the Greengage and Orleans. And as their circular of last season
respecting it was limited to their immediate connexion, they now
call the attention of the public to the following particulars: colour
yellow, inclining to russet next the sun, size of a modern Apple,
possesses the flavour of the Greengage, with the prolific
habits of the Orleans, and bears abundantly either as a standard
or trained, constituting a most important addition to our hardy
fruits, and ought to be grown in all collections. Fine three-
year-old trees, 3s. 6d. each; do. trained, 5s. each.
Nurseries, Calne and Devizes, Nov. 10, 1843.

MYATT'S NEW SEEDLING STRAWBERRY.
J. AND W. MYATT are now ready to send out their
NEW STRAWBERRY, the DEPTFORD PINE, the fruit
 of which has been exhibited at the London Horticultural
 Society, and a Banksian Medal awarded. It has also been
 submitted to Professor LINDLEY, for whose opinion see *Gardeners'*
Chronicle, No. 26, p. 417. It is a most prolific bearer, exhibiting
 at the same time a profusion of fine fruit and bloom on the same
 truss. Price, Deptford Pine, 2l. 10s.; British Queen, 1l., and
 Eliza, 10s. per 100.—Manor Farm, Deptford, Nov. 10, 1843.

Just published, in One Volume 8vo., price 3s. 6d. to Fellows of
 the Society, and 5s. to others, (or postage free, upon receipt of
 a Post-office order, price 5s. to Fellows of the Society, or 6s. 6d.
 to others.)

A CATALOGUE OF THE FRUITS CULTIVATED
 in the GARDEN of the HORTICULTURAL SOCIETY OF
 LONDON. (Third Edition.) Containing the Names, Synonyms,
 Colour, Size, Form, Quality, Use, Time of Ripening, and many
 other particulars concerning all the most important varieties of
 hardy Fruit cultivated in this country.

Sold at the House of the Society, 21, Regent-street, and also
 by LONGMAN and Co., Paternoster-row; J. HATCHARD, Picca-
 dilly; RIDGWAY, Piccadilly; RIVINGTONS, Waterloo-place; and
 by the principal Booksellers in all parts of the Empire.

A few Copies of the Second Edition of this Catalogue may be
 had at the reduced price of 1s. 6d. each.

The Gardeners' Chronicle.

SATURDAY, NOVEMBER 11, 1843.

MEETINGS FOR THE TWO FOLLOWING WEEKS.
 Wednesday, Nov. 16, Society of Arts 8 P.M.
 Friday, Nov. 17, Microscopical 8 P.M.
 Tuesday, Nov. 21, Linnean 8 P.M.

THERE is not a few good people in this world who
 cannot discover that they form part of a busy restless
 crowd, sometimes advancing, sometimes receding, but
 in general rushing onwards with a force that actually
 leaves many old landmarks behind it and threatens
 in this age of discovery, to vanish altogether from the
 view of the ancient columns and monuments of learn-
 ing. Such persons are gradually jostled out of the
 stream of travellers—dreaming by the wayside, they
 eventually fall into the rear, and, when they awaken
 from their slumbers, are surprised to find themselves
 alone.

Gardeners possess no exemption from this general
 lot of humanity. How many of them do we see sinking
 into neglect, and ending their days in poverty; com-
 plaining of the preference shown to younger men,
 lamenting the good old times, and wondering how it
 comes to pass that they, who once were shining lights
 to their craft, are no longer thought of or esteemed.
 They cannot discover that they have been standing
 still, while the crowd has been rolling on, and that
 although their light is as bright as ever, objects are too
 far distant for it to illuminate them.

Some recent circumstances have brought these
 reflections painfully to mind. Take, for instance, the
 Pine-grower. He was thought something of thirty
 years ago who could make his Queens average 2 lbs.,
 and a 2½ lb. fruit was a prodigy. And all those men
 who continue to follow the same routine of cultivation,
 and obtain the same result, still fondly believe that they
 continue at the head of this branch of their profession.
 Then when they see in the newspapers that heavier
 Pines are procured in this place and that, some of them
 shake their heads and doubt, others flatly contradict
 the statements, while some cry out at the injury they
 occasion them. "Where are these Gardens of Bicton,"
 says one, "in which Queens average above 5½ lbs?" He
 does not give himself the trouble to consult his map,
 which would have told him that they are near Honiton,
 and belong to Lady Rolle; but he demands to know
 where Bicton is. "You must be aware," says
 another, with the high-sounding signature of "Dunel-
 mensis," "that statements of this kind are calculated
 to do serious injury to gardeners, whose employers
 upon reading them become dissatisfied with only seeing
 fruit of between 2 lbs. and 3 lbs. weight, the usual size in
 the best-managed gardens here, and I believe in most
 places. Two years ago I visited some of the best
 Pine-growers in the neighbourhood of London, and of
 many hundreds of Queens I then saw, found only one of
 4 lbs., very few above 3 lbs., and I should say the
 majority not exceeding 2 lbs." And then we are re-
 proached for having allowed ourselves, as is alleged, to
 be hoaxed by certain statements made in 1841 regard-
 ing huge Enville Pines at Thornfield, which "Dunel-
 mensis" was assured—by whom?—by the people at
 Thornfield? not at all, but—by some fruiterer in
 Covent Garden, "was all moonshine, as there was
 never such a production in any part of the world."

These are the persons who lag behind, and are so
 soon lost to view by the crowds who advance with
 the stream of discovery. Instead of endeavouring to
 equal those who are more successful themselves, they
 reproach us public journalists with not suppressing
 the instances of higher cultivation. They would have
 us do injustice to the rising gardener for the sake of him
 who is in the wane. Or at least, they say, we ought in
 all such cases to run down to the places where such pro-
 digies of cultivation are said to exist, before we make
 it known to the public; as if we were bound to doubt
 the word of respectable men who give their names,
 or are known to us, for the sake of obliging those

whose capacity is not equal to the comprehension of
 the means by which great results are accomplished.
 Instead of carping at the success of other men, they
 should strive to imitate it.

But to the facts, which so many old-fashioned Pine-
 growers are pleased to doubt. The statements concern-
 ing Thornfield and Bicton rest on the authority of
 our correspondents: we have not seen them. It is
 not, however, necessary to rake up old single instances
 of heavy Pines, or to go to France and appeal to the
 12lb. Cayennes of Versailles; we have evidence as
 great as can be desired. We will just beg "Dunel-
 mensis" and all doubters to refer to page 738, where
 he will find that on the 17th Oct., 1843, a Queen Pine
 weighing six pounds four ounces avoirdupois, was
 exhibited before the Horticultural Society of London,
 by Mr. Murray, gardener to the Marquess of Bath;
 and to the proceedings of that same Society of Tues-
 day last, where two Queen Pines were again supplied
 from Lord Bath's Gardens, one of which weighed
 five pounds four ounces, and the latter five pounds nine
 ounces. And these were no long-stalked leafy things,
 with a forest of gills, and a crown like the leaves of an
 Artichoke, but clean, well-grown, beautifully swelled
 fruit, with only two or three withered leaves at the
 base, as much stalk as was just sufficient to hold them
 by, and as small a crown as such fruit well could have.

The fact is that the old way of Pine-growing was
 wrong, as we have more than once asserted, and men
 are only now beginning to find out the art of culti-
 vating that fruit, as we hope one day to show.

No subject in Vegetable Physiology is more inter-
 esting, both for theoretical and practical reasons, than
 the power which seeds undoubtedly possess, under
 certain circumstances, of preserving their vitality for
 an apparently indefinite period. It is doubtless true
 that many of the statements on this subject, to be
 found in books, are apocryphal; but certainly some
 are founded in fact, such as the famous case of the
 Raspberry-seed taken along with the coins of the
 Emperor Hadrian from an ancient barrow in Dorset-
 shire, the offspring of which is now to be seen in the
 Gardens of the Horticultural Society. None among
 the so-called instances of this excessive longevity
 have excited more doubt and discussion than what is
 called Mummy-Wheat; that is to say, Corn taken
 from mummies, and therefore of the highest antiquity,
 which has grown when sown. Every year pro-
 duces cases of this sort about the harvest season, and
 even this season at least 20 specimens have been sent us
 of Wheat-ears, purporting to have had a mummial
 —pardon the word—a mummial origin; and strange
 to say, they have all proved to belong to the Egyptian
 Wheat, or *Blé de Miracle*, called by Botanists *Triti-
 cum compositum*. We have never, however, succeeded
 in satisfying ourselves that the Corn from which
 such Wheat is said to have been produced was really
 taken from mummy-cases. There is always some
 defect in the evidence; as was the case with the
 Tynningham Wheat, mentioned in the *Mark Lane
 Express* of Oct. 9, 1842, which had been raised from
 seed said to have been produced in Egypt, from plants
 said to have grown from grains said to have been
 taken from a mummy-case. Now all such statements
 may be true, but there is no proof that they are so;
 and when we are told that Onions taken from similar
 receptacles have also grown, which is impossible, we
 may be pardoned for requiring very decisive evidence
 before we accord our belief in those prodigies. Never-
 theless they may be true; because we have before us
 an instance, in the evidence concerning which we find no
 flaw whatever. We have had it on our table for some
 months, and produce it now, in order to satisfy the
 many inquiries that are made about such things.

The history of this Wheat was given by Mr. Martin
 Farquhar Tupper, a most exact and conscientious man,
 in the *Times* of September, 1840; and to that gentle-
 man we are indebted for the additional facts which
 we are now able to communicate.

Sir Gardiner Wilkinson, when in the Thebaid, opened
 an ancient tomb (which had probably remained
 unvisited by man during the greater part of 3000
 years), and from some alabaster sepulchral vases therein
 took with his own hands a quantity of Wheat and
 Barley that had been there preserved. Portions of
 this grain Sir G. Wilkinson had given to Mr. Pettigrew,
 who presented Mr. Tupper with 12 grains of the
 venerable harvest. In 1840 Mr. Tupper sowed these
 12 grains, and to show the care with which he pre-
 served their identity we shall quote his own account
 of his proceedings thereupon. "I ordered," he says,
 "four gardenpots of well-sifted loam, and, not content
 with my gardener's care in sifting, I emptied each pot
 successively into an open newspaper and put the
 earth back again, morsel by morsel, with my own
 fingers. It is next to impossible that any other seed
 should have been there. I then (on the 7th of March,
 1840), planted my grains, three in each pot, at the
 angles of an equilateral triangle, so as to be sure of
 the spots where the sprouts would probably come up,
 by way of additional security against any chance seed

unseen lurking in the soil. Of the 12 one only ger-
 minated, the blade first becoming visible on April 22;
 the remaining 11, after long patience, I picked
 out again; and found in every instance that they
 were rotting in the earth, being eaten away by a num-
 ber of minute white worms. My interesting plant of
 Wheat remained in the atmosphere of my usual sitting-
 room until change of place and air seemed necessary
 for its health, when I had it carefully transplanted to
 the open flower-bed, where it has prospered ever since.
 The first ear began to be developed on the 5th of July;
 a second ear made its appearance, and both assumed a
 character somewhat different from all our known
 varieties. Their small size and weakness may,
 in one light, be regarded as collateral evidence
 of so great an age, for assuredly the energies of life
 would be but sluggish after having slept so long;
 however, the season of the sowing—spring instead of
 autumn—will furnish another sufficient cause. The
 two ears on separate stalks were respectively 2½ and 3
 inches long, the former being much blighted, and the
 stalk about 3 feet in height.

"If, and I see no reason to disbelieve it," says Mr.
 Tupper, in conclusion, "if this plant of Wheat be
 indeed the product of a grain preserved since the time
 of the Pharaohs, we moderns may, within a little year,
 eat bread made of Corn which Joseph might have
 reasonably thought to store in his granaries, and
 almost literally snatch a meal from the kneading-
 troughs of departing Israel."

Here we have no link lost in the chain of evidence.
 Sir Gardiner Wilkinson himself opened the tomb,
 and with his own hands emptied the alabaster vase;
 of its contents he gave a portion to Mr. Pettigrew,
 who gave it to Mr. Tupper, who himself sowed it,
 watched it, and reared it. What better proof can we
 require? Unless it be alleged that the grains, after
 all, may have been changed somewhere on the road
 between the Thebaid and Mr. Tupper's garden. But,
 upon this point, Mr. Tupper expressly says, in a pas-
 sage that we have not quoted, that the grains which
 he sowed were brown and shrunk; which is a just
 description of some that we too have seen from Sir
 Gardiner Wilkinson, but which would not apply to
 any modern Wheat. They looked, indeed, as if they
 had been scorched.

But there are other proofs, less direct, but equally
 conclusive, as to the antiquity of the seed sown by
 Mr. Tupper. Out of twelve grains one only grew;
 that one produced but two ears—small, blighted at the
 base, and yielding altogether only 27 grains. Mr.
 Tupper has favoured us with a drawing
 of one of them. But in 1841,
 the second year, when the Wheat
 was recovering its constitutional
 vigour, the ears were perfect, and
 averaged 4½ inches each. In 1842,
 the renovation being complete, some
 of the ears measured 7½ inches in
 length. This, as Mr. Tupper ob-
 serves, corroborates the idea of a re-
 awakening from so long a sleep, as
 if the Wheat had been gradually
 returning to its pristine vigour. One
 of these ears of 1842 is now before
 us, and is so like a good sample of
 Colonel Le Couteur's Bellevue Tala-
 vera, that even the experienced eye
 of that gentleman is unable to detect
 a difference. It proved a most
 abundant bearer: 18 grains in Mr.
 Mitchell's Nursery Garden, Brighton,
 having produced 625 ears, which
 Mr. Hallett of Brighton considers to
 have contained on an average 55
 grains. And this (685, multiplied
 by 55, divided by 18) gives a pro-
 ductiveness equal to two thousand
 and ninety-three fold.

But with the quality of this
 Wheat we do not wish to concern
 ourselves just now. The import-
 ant question is, what were the
 circumstances which preserved the
 growing power of Sir Gardiner Wil-
 kinson's Wheat from the days of the
 Pharaohs down to our own time.
 For if that can be ascertained, a light
 will necessarily be thrown upon the
 very important art of preserving
 seeds artificially. To us it appears
 that we must ascribe the result
 entirely to the DRYNESS of the air
 where the Wheat was kept. And we believe that
 dryness will have been the true cause of similar results
 in all other instances. Such is the conclusion at which
 we long since arrived. ("Theory of Horticulture," pp.
 79 and 189). Daily experience confirms our opinion;
 and reasoning, in the absence of experience, would
 almost have led to it. Decomposition, which in seeds
 is the cause of death, can only occur in a damp atmo-
 sphere; therefore to keep off a damp atmosphere is to

Mummy-Wheat in
 the first year of its
 revivification.

prevent decomposition, and consequently to arrest the approach of death. And yet how little is this regarded by persons interested in such matters. In a damp country like England no precaution should be neglected to ventilate, at least seed-rooms, if not seeds themselves. And yet what is the practice? The seedsmen pack them in large sacks or huge casks, in close ill-ventilated granaries; and gardeners place them in drawers or bags in the damp and miserable sheds with which some masters so thoughtlessly provide them; farmers in damp barns or outhouses. What can possibly happen with such management except the speedy destruction of vitality, especially when we know how badly our home-grown seeds are in almost all seasons ripened, and how much free moisture they necessarily contain. What wonder that French seeds, ripened in a dry climate and preserved in dry buildings, should often be found so much better than English seed? Our climate offers so many impediments to the preservation of seeds that we cannot afford to neglect a single precaution; and we trust Mr. Tupper's Pharaonic Wheat will have the effect of turning those whom these observations may concern to wiser and better ways.

A COMMENTARY ON CERTAIN PASSAGES IN THE PHYSIOLOGICAL WRITINGS OF THE LATE ANDREW THOMAS KNIGHT.

BY W. WOOD.

(Concluded from page 771.)

No. IV.—ON THE CULTIVATION OF THE PINE-APPLE.

—“The temperature of the house raised by means of solar heat from 95° to 105°, sometimes to 110°, no air being given till the temperature exceeded 95°. The compost of thin green turf chopped very small, and pressed very closely whilst wet; a circular piece of the same material being inserted to occupy the bottom of each pot: having found this substance most efficacious for draining &c., and subsequently of facilitating the removal of a plant from one pot to another without loss of roots. The pots elevated upon brick piers near the glass.”—*Horticultural Transactions*, vol. iv.

Remarks.—This paper bespeaks an advance in the principles of cultivation, and tends to illustrate the first principles of Horticulture. There is the application of higher agencies, which, in some measure, may be regarded as a new power, subservient to the highest possible effects in cultivation; and, in the “chopped green turf, is given a texture and mechanical arrangement, adapted to the power of the agency applied, and the attainment of a uniform circulation of moisture.” This paper may also be considered a full illustration of the following opinion given at p. 112 of Paxton's Magazine, viz.:—“Atmospheric and solar influence should be so modified as to balance the power of absorption to which plants are exposed, &c.” There are also valuable inferences to be drawn from the use of chopped turf, as a “substratum” or drainage; perhaps a perfect system of cultivation will include the complete subserviency of the mechanical to the assimilative process in the economy of vegetation. The safe “removal of plants from one pot to another, without loss of roots,” appears to be a dim recognition of that “Principle of Horticulture” by which an accumulative system of cultivation must either stand or fall, viz., that “for the maintenance of a plant in health, it is indispensable that the supply of fluid by the roots should be continued and uninterrupted” (Principles, 32). Here it may be observed, that until it can be proved that the removal of plants from one pot to another does, in no wise, affect them injuriously under the same circumstances, the principle now quoted must for ever decide the question of expediency. The removal of plants without loss of roots is certainly desirable; but the question again recurs—Can they be removed at all without sustaining a loss of that functional power, by the continued uniform reciprocal action of which the “supply of fluid by the roots” can alone “be continuous and uninterrupted?” Every hour's experience denies the possibility of this.

No. V.—ON THE CULTIVATION OF THE COCKSCOMB.

—“Treatment similar to the Pine-apple, having a similar object in view. A single flower-stalk of great strength is requisite, the protrusion of which should be retarded as long as possible, consistently with the rapid growth of the plants. Compost, nutritive as possible, and stimulatory; of unfermented horse-dung, fresh, burnt turf, decayed leaves. Two parts green turf, the latter being in lumps of about an inch in diameter, to keep the mass so hollow for escape of water (uniform circulation) and the air to enter. Plants put very young (small) into pots 4 inches diameter and 3 inches deep; as soon as the roots had reached the sides, in no degree matted, they were transferred to pots of a foot in diameter and 9 inches deep. Particular attention paid to the roots, having reason to think that the compression of them in the pot has under all circumstances, a tendency to accelerate the bloom. Under this treatment the plants became large and strong before they manifested a disposition to blossom. Plants placed within a few inches of the glass, and subject to similar heat as the Pine-apple plants.”—*Hort. Trans.*, Nov. 4, 1830.

Remarks.—The above instance of cultivation may be considered a full recognition of a progressive and accumulative system of cultivation, illustrating a rule to be observed in cultivation generally, that maturity of growth should be antecedent to, or contemporaneous with, a development of bloom. It also points out the necessity of a mechanical arrangement of soil being equal to a uniform

circulation. A rejection of the ordinary mode of repeated shifts is here decisive of the applicability of small growth to comparatively large masses of soil, if, in the first instance, adapted to the ultimate object, by arrangement, exposure to intense agency, &c.

The risk attendant upon “a compression” of the roots may be adduced as an additional evidence of the evils connected with repeated shiftings. If a slight “compression” of the roots tend to “interrupt” the circulation of fluid from the roots, what must be the effect of the whole inward resisting medium of smaller on larger pots? If “compression” interferes injuriously with ultimate effect, then all inverted growth must be subversive of the vital energy of plants.

FORCING THE NEAPOLITAN VIOLET.

THE subject will divide itself under the following heads:—Propagation of Plants; Cultivation or Preparation of do.; Preparation of the Frame or Pit; and Subsequent Management.

I.—Propagation of Plants.—Some cultivators obtain their forcing-plants from the old forced plants of the previous season; this is not the best plan, as the plants have become somewhat exhausted, and are apt to produce long-jointed runners. My plan is this:—When I plant my pit or frame for forcing, I plant the remainder which are to spare in a bed of rich soil, with a view to providing runners for the succeeding year. In the end of February, old tan is riddled through them; and on this, by the middle of May, the runners have so luxuriated that they are fit for removing to prepared beds, to undergo the cultivation necessary. I now prepare as many beds as are requisite in an open and warm part of the kitchen-garden; the beds receive a good dressing of equal parts heath-soil, leaf-mould, and strong yellow loam, which is well blended with the bed; no dung is used at this stage of the process, as my object is to obtain an early, stout, and firm plant, but not a gross one. The plants are set out a foot apart each way, and throughout the summer are kept free of weeds and runners, and freely watered through the months of May, June, and July, if necessary. In August I suffer them to become rather dry, which induces a sort of rest, and enables the plant to concentrate its energies for the production of blossom; this temporary cessation of their fitful luxuriance I find of considerable importance, as the plants by this time, if they have taken well to the soil, are generally somewhat rampant, and, as a necessary consequence, spawn forth a superfluity of long-jointed runners; now there is no great harm, so far, if their pride be timely arrested.

If the cultivation above described be systematically pursued, the plants will be fit to remove to their winter-quarters by the middle of September.

The grand desideratum now is a pit or frame with bottom-heat. This last is a prime secret in the affair. Most cultivators think they have done ample justice to this lovely winter-flower when they have planted them on the remains of an old Melon-bed, afterwards depending on a sort of winter-forcing by hot linings; this, however, in my opinion, is mistaking in some degree the habits and capacities of the plant. The plant, it is well known, is impatient of confined damp, and would rather be on an old hedge-back than in the finest pit extant; now, if the plants are grown late, and the ladies require them in bloom by November, there is no alternative but this attempt at forcing them, which I most strenuously repudiate. I merely contend that by an early application of bottom-heat through part of September and October, in conjunction with the cultivation as above, there will be little necessity for hot linings, or, in fact, for any renewal of artificial heat; the only remaining points being to keep out the frost—give air most freely—and shut up warm early when sunshine occurs. However, to the point.

I pretend not here to dictate the mode of acquiring bottom-heat; and I have no doubts whatever on my mind that we are not merely on the eve of a revolution in these things, but actually at the day-spring itself. The bottom-heat I advise is 70 to 80 degs. as near as may be, and if this can be ensured steadily, or rather slowly declining for a month or six weeks, all is right.

The plants should be placed in the pit, or bed, about nine inches apart each way, and should be removed with good balls of earth. My plan of planting is this:—After securing the necessary bottom-heat, I place a layer of old rotten hotbed-manure, three inches thick, on the fermenting matter; the surface of this last is brought to within 10 inches of the lights back and front, and of course nearly parallel to the roof. The balls are placed in the manure, and filled up as the planter proceeds, with the following compost, pressed firmly around the plants:—

Strong maiden yellow loam	4 parts
Old leaf-soil	1
Rotten horse and cow-dung, thoroughly decomposed	2
Sandy heath-soil	3

Immediately they are finished I give them three or four gentle waterings with tepid water, in rapid succession—in fact, all within two days, and I repeat the same process about the middle of October; after which period they never receive a drop until the beginning of February.

The subsequent management now proceeds entirely on the habits of the plant, viz., impatience of frost and humidity of atmosphere, to which I might add an equal impatience of dry heat, as produced by flues or pipes, although I am of opinion that a small hot-water pipe in the pit would be of advantage occasionally, if the fire were worked with much caution and with a continual respect to the habits of the plant.

The routine of business through the winter is to cover up well at night with mats, and in severer weather, hay and straw besides, and to be equally particular to get a

circulation of dry air on every little occasion, never letting an opportunity slip.

The plant is naturally fond of a soil somewhat rich, and for this reason I place the balls immediately in contact with the manures. As, however, manures are, as I suppose, rather absorbent of atmospheric moisture, I use a considerable portion of heath-soil in the frame mixture, and I find that theory and practice perfectly agree as to this material, for when once dry on the surface, it keeps dry, and I believe acts also in some degree as an antiseptic.

Violets are generally much annoyed with slugs, which deface the flowers. When such is the case I sprinkle the bed all over with a good coat of coarse river-sand, in a dry state, and when the plants are perfectly dry: this is with me an infallible preventive. I have grown Violets for 23 years, and every winter I can find some slight room for improvement. Those, however, who strictly follow the principles here laid down, will seldom want Violets from the end of October to the end of April.—Robert Errington, Oulton Park.

ON THE ATMOSPHERE OF HOTHOUSES.

(Continued from page 772.)

ALTHOUGH I may have incidentally verged into the subject of bottom-heat, I may be excused, inasmuch as it is intimately blended with my general topic, in the tank system, for that process is made to affect both soil and atmosphere at once. It would be endless to notice the various modifications under which this process exists, or to settle the claims of contending parties for originality of conception and superiority of detail. Two lessons from the great school of nature will suffice to guide us in the estimate of means brought under our cognizance, and their proper application. First, the temperature of the soil, particularly in warm climates, varies little in uniformity, except at the very surface, by night and day; second, the atmospheric temperature varies considerably, being colder by night than it is by day. If we wish therefore to follow nature, which is undoubtedly our truest guide, our heating apparatus for soil and atmosphere should be separately under our full control. There can be no doubt that this difference of soil and atmospheric temperature may to a certain extent be effected in the ordinary tank system, by confining a portion of the sun's heat by day; but in order to possess full power over the pit and air of a hothouse, another arrangement is necessary. For this purpose, instead of using a simple boiler with one flow and one return-pipe, it is made compound or double, with two pipes of each sort.* One set of these is connected with the tanks in the ordinary way, for bottom-heat; while the other is united with water-pipes to give atmospheric temperature. Both flow-pipes, after leaving the boiler, are furnished with throttle valves, by which means the communication of hot water to both tank and water-pipes can be permitted or withheld at pleasure; by this means a complete control is exercised over both the bottom-heat and atmospheric temperature, so that each can be regulated to the nicety of a degree. This is probably the most complete apparatus for heating a hothouse requiring bottom-heat which can be employed.

Light.—Under this head I shall be very brief. When one considers the intense flow of light many of our tender plants must receive in their native regions, and that the glass covering of our hothouses always, under the most favourable circumstances, throws off a portion of the light reaching its surface, the necessity for constructing these as lightsome as possible must be apparent. MM. Bouguer, Lambert, and others, determined by experiment that the nearer the perpendicular light falls on the surface of glass, the more of that light passes through. The sun alters its position least in the same time when on the meridian, or rather about it, that is, about noon. Moreover plants require most light when in the vigour of their growth. These three facts combined will lead us to the proper slope of a house for plants we are cultivating, giving it an inclination at right angles to the sun's rays at noon at that season of the year we wish for most light. The technical formula will, for this angle, be—

The latitude of the place = sun's declination of same name. Thus, if we take London as an example, whose latitude is 51° 31' N.; and if a slope is required for the greatest light at midsummer, the sun's declination at that time is 23° 29' N., which is subtracted from the latitude 51° 31' N., both being of one name North, and leaves 28° 2' as the angle or slope of the roof with the horizontal, for a midsummer house at the latitude of London. This is rather a flat roof I acknowledge, and not so easily kept tight as a steeper slope; but 30° will do very well when properly executed, as I have the experience of in one of my own. In steeper slopes than the above there are two periods in the year when the greatest amount of light is admitted by them. If we take a slope of 45°—which is, in fact, a very common one for Vineries—the sun's rays enter it equally and with greatest freedom about the 7th of April and 7th of September, periods which may be taken advantage of accordingly. Curvilinear roofs have been constructed for the purpose of opposing at all times a portion of their surface perpendicular to the sun's rays, and at the same time, being of iron, to present as little opaque surface as possible. For conservatories these are unrivalled, both for elegance of appearance, and a regular supply of light at all seasons of the year; but it is evident they cannot give so full a flood of light as straight roofs can do, at a particular season, when that may be desirable; and it is, therefore, unlikely that they will ever supersede the ordinary roof in the common purposes of gardening. Having said thus much on the south slope proper for the

* I perceive I am anticipated in Burbidge and Healy's plan, of date 21st October. See advertisement in *Chronicle*.

admission of the greatest amount of light, another fact must be attended to in the construction of plant-houses, and that is the familiar one of plants always growing towards the strongest light. If the light, therefore, is admitted only in one direction, the plants will infallibly shoot out in that direction, and it is only by a process of continual turning and tying that they can be kept erect. In steep-roofed greenhouses this is particularly the case, but in those more flat it is much less so, for most light being admitted through the glass perpendicularly, the plants advance to meet it perpendicular to the glass. To obviate as much as possible this tendency, there ought to be a north slope as well as a south, and in fact light ought to be admitted from all aspects of the sky. The foregoing remarks all apply to houses for plants which naturally grow exposed to the full influence of the sun: for such as delight in the shade, a habitation should be provided accordingly.—J. L.

(To be continued.)

AMATEUR'S GARDEN.—No. XLV.

A few weeks back, when pointing out some of the greatest defects in garden scenery, I enumerated borders deficient in soil as one of them, and I would now add another defect, viz., indiscriminate mixture of shrubs, trees, and herbaceous plants. There is not the least objection to allowing the Aconite, the Snowdrop, or Crocus to peep from beneath the branches of shrubs, so long as they appear to have sprung up naturally, but there is a great objection to surrounding a noble shrub with dug ground, so as to impart to it an artificial appearance. In the scenery of a pleasure garden the object of the cultivator should be to have everything as well grown as possible, and to allow each plant to assume its most natural form. To attain this the plant must be properly exposed to air and light on all sides in the growing season, and therefore it is not only wrong but positively injurious to shrubs or trees to allow them to be crowded with herbaceous plants. For the first two or three years after the trees are planted, herbaceous plants may be cultivated among them for the sake of covering the ground; but after the shrubs have attained any size, a very different course should be pursued. Then the ground should be turfed up close to the shrubs, and beds for the cultivation of flowering plants be formed in such places along the line of shrubbery as is most suitable for their cultivation.

I offer these remarks at this time from the conviction that the Amateur more frequently fails in the cultivation of his pet plants from this indiscriminate mixture than from any other cause, because the roots of the shrubs rob the other plants of their nutriment, and therefore it is impossible that they can flourish. I would, therefore, earnestly impress upon the Amateur the necessity of thinning out the trees and shrubs where they are at all crowded, so as to allow each plant to become a handsome single specimen, and to turf the ground close up to the shrubs and cultivate his herbaceous plants in beds by themselves. In this manner he can give both classes of plants the treatment most suitable to them, which it is impossible to do when they are mixed in the same bed. Shrubs and trees are also much injured by annually digging among them, but on this subject I shall have some remarks next week.

With greenhouse plants and plants in pits or frames, the principal care for the next two months will be to keep them clean, and as dry as is consistent with their not suffering for the want of water. Nothing is more injurious to plants at this season than to allow them to be infested with insects or decaying leaves, because, as they are in a dormant state, the loss of every leaf is the loss of the life-blood of the plant, and therefore must be attended with injury. Every decayed leaf should be removed directly it is perceived, as should also every speck of mildew or moss that may collect on the plant or soil. Plants of all descriptions will now require very little water, but they cannot have too much air in fine weather.

The bloom of Rhododendrons and Azaleas is likely to be a failure in many places next spring, and therefore, where it is desired to remove large plants, this will be a good season to do so, as they will not sustain so severe a check as if they were covered with bloom.—W. P. Ayres, Brooklands.

HOME CORRESPONDENCE.

Large Pines.—Observing at page 773 a correspondent signing himself "Dumhuil," and another, doubting the accuracy of my statement respecting the weights of four Queen Pine-apples, published correctly at page 759, I regret having omitted sending the dimensions, &c. of each fruit. I now beg to forward it, and at the same time to say that such Queen Pines are no particular novelty here.

No.	Weight.	Length.	Circumference.	Length of Crown.	Length of Stalk.
1	6lb. 2oz.	11 in.	18 inches	2 in.	3 in.
2	5 7	10½	17 "	2 "	3 "
3	5 9	10½	17½ "	3 "	3 "
4	5 0	9	16 "	3 "	4 "

If anonymous correspondents will come out of their hiding-places and furnish their proper names and addresses, I will endeavour to answer their questions and remove their doubts; but I decline altogether replying to anonymous doubters. I have myself been in practice under several cultivators of this King of fruits, both in this country and in the north; have visited many Pine-growing establishments, and have read much concerning Pine culture, but the method here practised is altogether different from anything I have before seen or heard of. The "Gardener's Magazine" announces that the method is there to be published very soon, and I suspect it will cause more consternation among the Pine cultivators,

through its simplicity, and certain success, than the weight of those four little Queens have done.—W. Dawson, Bickton Gardens, 6th Nov., 1843.

Rosa Hardii.—I should be glad to know the real history of this plant. I have for some time been endeavouring to discover if any rule can be found for the estimation of the probable effect of the male parent on the appearance of hybrid plants. In certain tribes the male type is very strongly developed in the progeny, but there are others on which I have been able to form no decided opinions. As soon as I saw the notice of Rosa Hardii in Paxton, for October, I became very desirous to know more of the history of a hybrid in which the type of one of the parents was so remarkably predominant; the statement in Paxton that it was a hybrid between R. berberifolia and R. involucrata, was about as unsatisfactory and indefinite as could well be imagined. In the first place, it took no notice of the relative sexes of the reputed parents; and, in the second, it does not present the smallest resemblance to R. involucrata. I accordingly searched further, and in "Gore's Rose Fanciers' Manual," 1838, I found "Rosa Hardii berberifolia obtained this year, by the accidental impregnation of that remarkable plant, the Rosa simplicifolia, or R. monophylla (Lowe's berberifolia, Lindl.), by R. microphylla growing near it." Now this was a much more probable pedigree for the plant if the leaves only were to be considered, but when I observe that the flower is of quite as deep a colour as berberifolia itself, the question arises, how can this be—how can a mixture of a pink Rose with a yellow one produce another yellow without a trace of pink in it? Besides, there is another difficulty in the way; berberifolia is a single Rose, microphylla a very double one: is it, therefore, likely that the pollen produced by the hundreds of anthers of the flower producing the seed, should have failed to effect that which is reputed to have been done by the scanty pollen of the other? Persons who pay attention to the raising of hybrids well know the great care required to prevent any portion of the pollen of the female plant from touching the stigma, because they have found by experience that in general the contact of the smallest portion of the proper pollen renders all their attempts abortive. All that appears certain about the plant in question is, that it was raised from seed of R. berberifolia; I am, therefore, inclined to think that it is no hybrid at all, but merely a seminal variety; at the same time, I should like to know if there is any other account of it than those I have mentioned, because, hybrid or not, it is doubtless a very remarkable plant.—J. C. B. [We have always understood that one of its parents was R. clinophylla.]

Protection for Plants.—I had raised since the middle of last July, in the open air, on Mr. Catleugh's plan, several hundred Pelargoniums, which were exposed in pots to the severe frosty nights occurring in the middle of October, after much rain. Every leaf, and the surface of the earth in every pot, were stiffly frozen, and in the hollow of many of the leaves were thick globules of ice. The whole were left unshaded from the sunshine which succeeded, and syringing with cold water was not resorted to. On many of the plants several of the leaves perished, and about a dozen of the plants perished altogether. Had the cuttings been struck and reared under glass, probably about a dozen only would, under the above circumstances, have survived. This leads to the notice of an excellent article in "Paxton's Magazine of Botany," for the present month, on "Economy in Floriculture," recommending external coverings for greenhouses, during severe frost, in preference to fire-heat. Nevertheless, so long as the thermometer shall retain the privilege of sinking in midwinter nights in the open air, from 30° nearly to zero, the ready, safe, and easy protection, which fire-heat affords will be commonly employed. Coverings can only retain heat, they cannot supply it; hence the universal adoption of some means affording a source of warmth. Perhaps the natural source found at a few feet below the surface of the earth, could be successfully taken advantage of for the preservation of vegetable life, by means of a platform made to slide up and down in a pit, under a glass frame kept thickly covered in severe nights. This might be effected by proximity to the glass during the day, and security from frost during the night, with exemption from stimulus.—C.

Blackberry Jelly.—In the receipt for Blackberry Jelly, I ought to have said to every pint of juice add 1 lb. of loaf-sugar. The stewed fruit, after the juice is drained off, is to be thrown away; and it is the juice which is reduced to jelly.—G. W., Warwickshire.

Asclepias curassavica.—This plant is now in flower in my garden. It was put out early in the summer, and my place is one of the most exposed in the island. We have had a frost, which affected my Dahlias, and entirely destroyed a magnificent Gourd plant, grown from seed sent by Colonel Stoddart from Bokhara. I write this, in consequence of reading in a late Number of the Chronicle that it is thought the plant cannot grow elsewhere than in a stove. The Mahenia incisa and Gesneria elegans have both flowered in the open ground, besides others usually grown in-doors. I have some young plants from the seed of the Tacsonia pinnatifida, apparently hybridised by the P. Buonapartii; no fruit save those impregnated matured their seed; the foliage at present is peculiar.—T. J., Jersey.

Forest Pruning.—"Quercus," in your Chronicle now before me, states, "My only fear is, and my only reason for writing this, is to caution planters against carrying the practice too far by continuing it after it should be entirely laid aside, for there is a mistaken tendency that way far too prevalent amongst us." Now, Sir, this practice has been continuing uninterruptedly since 1814 by Dr. Thackeray,

—and with what success? Come and examine for yourself, or depute some one on whom you can rely, who will report to you the condition of his woods, and I have no doubt confirm the report of your two correspondents, "Humphreys" and "R. S. L." (Scott Russel of Edinburgh) a man well known in the scientific world. You are also aware that the Doctor managed, from the year 1804, Mr. Wilson Jones's plantations in the same manner till that gentleman came of age. Dr. T. is pursuing the same system at this moment, and will have a number of hands so engaged the greater part of the winter—that is, in pruning hedge-row trees, and in thinning and pruning his plantations. Can "Quercus" point out a single acre of wood thus treated, in any part of the kingdom during a period of 20 years, which has been a failure? Recollect this land only cost the Doctor one pound per acre, and by the falling of the leaves there is a tolerable herbage in many places, and the mountains all around afford only a miserable pasture to the Welch sheep.—Cymro. (Nemo sibi vivat). [If we did not know from the best private authority that Dr. Thackeray's plantations are all that they are described to be, we should believe it, when we have the assertions of so many respectable correspondents in confirmation of it. But we do not attribute their state to the pruning so much as to the care otherwise bestowed on the trees, and to Dr. T.'s general skill. We do not mean to say that this gentleman's pruning has done any harm; probably it has done good; moderate pruning by prudent and skilful persons is useful; but it is because foresters are so often neither the one nor the other that we have urged a discontinuance of the knife and axe. However this matter cannot be discussed in a corner; we shall very soon return to it formally.]

Pruning.—I have observed in several of your late Numbers articles on the old controverted subject of pruning forest-trees. Throughout them all is the erroneous notion that to reduce the head of a tree proportionately augments its stem; and it is this general mistake or error I have endeavoured to combat ever since I took up the subject. The first article I allude to is an outline of "G. Cree's" system of pruning, based on physiological principles, given at p. 691. I cannot enter on a physiological disquisition, but I consider the article to be self-contradictory, as it is argued, "that when the uppermost lateral branches are shortened, &c., the sap has less surface to cover than when allowed to extend to an improper length and thickness." Against this I beg to quote the following statements:—"For the maintenance of a plant in health it is indispensable that the supply of fluid by the roots should be continued and uninterrupted. 2d. The smallest leaf at the extremity of a branch of a lofty tree must assist in setting in action the absorbing power of the roots, at whatever distance from the other organs these roots act. If this reciprocal action is not maintained without interruption, and if anything occurs to check it during the period of vegetation, the plant will suffer in proportion to the amount of interruption."† This I consider to be sounder Physiology than Mr. Cree's. I have argued for uninterrupted reciprocity from the first; pruning forest-trees certainly tends "to protract or suspend the reciprocal action of their organs, and in proportion impairs their vital energy." (Wood.) Mr. Cree in a communication some time since, if I mistake not, recommended, and said he practised, the removal annually of the lowest tier of branches. I am sure no such practice could be deduced from sound physiological principles, if the object sought was an accelerated growth of timber. I shall now advert to the statements of your correspondent "Pro Bono Publico," and beg to assure him that I am quite as much a friend to planting as either himself, W. H. Humphreys, or Dr. Thackeray, and that too for the good of the public and the ornament of the country. But I contend that these objects, however patriotic in themselves, will never be promoted by any system of pruning that I am aware of. It is quite true that the majority of those who plant, plant for posterity; but posterity will have but little reason to thank the pruner for his operations where these have been carried to any extent. "Pro Bono Publico" calls on me to point out plantations of the same age, lico" calls on me to point out plantations of the same age, extent, and elevation as those at Nerquis; but this is not necessary to the argument. I quite believe all that has been reported of their extent, beauty, and elevation; and been reported of their extent, beauty, and elevation; and quite agree with your correspondent in his concluding sentence. At the same time, I cannot concur in the opinion that the health and beauty of these plantations are attributable to any system of pruning, but to other causes. I have before said that I have no objection to a little knife pruning, judiciously applied when trees are quite young, but to carry it further will, in the exact proportion in which it is applied, certainly frustrate the design it is intended to promote. Since antediluvian times no one lives long enough to see the result of a continued system of pruning till the subjects of it attain the stature of giants; but I venture to say that no forest-tree ever yet attained a large size, or had its growth of stem accelerated by curtailment of its branches, no matter by whose system that curtailment was effected. As "Pro Bono Publico" calls on me to point to plantations of certain extent and elevation, &c. to cope with those at Nerquis, may I call on him to point to any extent of plantation, great or small, at any elevation—40 or 50 years old, that has been subjected to any system of pruning, that would not have been better and more valuable without it? All other things are unobjectionable—such as thinning, &c. Plant judiciously; thin judiciously when needful; but beware of pruners, and systems of pruning—they are dangerous playthings.—Quercus.

Advertisements of Boilers.—Is it not odd that scarcely

* Lindley's Principles of Horticulture, p. 22.

† Theory of Horticulture, p. 50.

any of the manufacturers who advertise their Hot Water Apparatus in the *Chronicle*, should (with the exception, I believe, of one,) state the prices of their Boilers? If they did, beginning with the least expensive, and so on, to the highest prices, it might induce many of us country folk to purchase, who are now deterred by supposing such things high priced.—*Amateur*.

Packing Plants for New Zealand.—A correspondent writes that—"Peaches, Nectarines, Apricots, Apples, Pears, Plums, Gooseberries, and Currants, will bear the voyage if packed in cases lined with zinc, so as to be airtight, the roots being well packed with damp moss, and the plants well secured from moving with the same substance; no straw should be used, as it ferments with the moisture to the serious injury of the plants. Thus I have ascertained from experience, as in a collection of fruit trees I received from England, by the *Indemnity*, which were carefully packed with moss only, and were in very good condition; those packed with straw and moss were, from the cause above mentioned, many of them dead, and all more or less injured."

Seedling Pelargoniums.—Most cheerfully do I accede to the wishes of your correspondent in last week's Paper, who styles himself "A Friend to Truth," and will gladly give him information respecting the prizes that have been gained by Lyne's Seedling Pelargoniums this season. Lyne's Princess Alice was exhibited and won a Seedling prize at Chiswick Grand Horticultural Show, June 17; and also another Seedling prize at the meeting of the London Floricultural Society, June 20. Lyne's Celestial received the gold medal at the meeting of the Royal Devon and Cornwall Horticultural Show, May 18; it also received a Seedling prize at Torquay, June 22. Lyne's Princeps was awarded a Seedling prize at the Exeter Horticultural Society's Show, June 8, as well as another at Torquay, June 22. Lyne's Redworth was so nearly equal in merit to Celestial, that the judges said in their report, that they remained undecided as to which they should award the medal. Lyne's White Perfection received the first Seedling prize at the Torbay Horticultural Meeting, June 22, where it was universally admired; so much so that the "Laureate of Devon" particularly noticed it in his poetry on the opening Show of that Society; (see *Chronicle*, p. 740):—

"Lyne's Seedling Geranium extoll'd to the skies,
And soft-soldered the rivals who show'd for the prize."

In my summer Pelargonium Catalogue, is the following paragraph:—"Lyne's Seedlings have been exhibited in London (at the Chiswick and Floricultural Society's Shows), in Plymouth, Exeter, Torquay, Barnstaple, and Truro, and have won prizes at all the Shows (excepting the two latter, where no Seedling prizes are offered); at which Shows they have been universally admired, and held in high reputation by all Florists who have seen them." I might have mentioned Barnstaple and Truro as well as other places, as quantities of medals have been received from all quarters, in the shape of sovereigns and half-sovereigns. If "A Friend to Truth" had examined the *Chronicle* from time to time, he would have seen the Editor's opinion of these Seedlings given at pp. 431, 433, and 446, of this year.—*W. E. Rendle, F.H.S.*

Heating.—In the "Calendar" of last week, Mr. Beaton after describing Mr. Haycroft's mode of combining flue-heat and water-pipes from the same fire in the Doneraile Pinery, proceeds to quote a passage from one of Mr. Ainger's papers condemning that sort of arrangement. Mr. B. then concludes that Mr. Ainger's theory is refuted by Mr. Haycroft's experiment, and he draws some general inferences in disparagement of science as opposed to practice. I do not quite understand the nature of Mr. Beaton's argument, that, because one person has done what another had disapproved, the latter must of necessity be wrong. Mr. Beaton gives both parties an exceedingly high character, one most justly for science, and the other for skill. I am of opinion that the science which is not good in practice is worth very little; and, on the other hand, I have little faith in the first report of experiments which seem to contradict fairly-deduced principles. We have had too many instances of wonderful rumours to place much reliance upon a first, or even a fiftieth, report. About three years ago it will be recollected that Mr. Penn's system of heating was making a great sensation, and was positively stated in numerous quarters to have produced unheard-of results; while that fever was at its highest, I remember that yourself, and, I think, Mr. Ainger also, denounced it, and since that period I believe the scheme has sunk into oblivion. I remember also that Mr. Ainger condemned the use of small pipes, which were at that time generally recommended on account of their becoming quickly heated. Now, instead of small pipes we have tanks—tons of water instead of ounces. Lastly, I think that Mr. Ainger advocated a greater attention to soil-heating; and this seems to be the direction which practice is taking. So far, therefore, it appears to me that general principles are more to be depended on than individual practice;—but however this may be, I regret to see science and experience opposed to each other in an unfriendly manner.—*X.*

[We thank our correspondent for calling attention to this subject. He will be glad to know that it is Mr. Ainger's intention to resume the subject of heating, with reference to some of the modern propositions.]

Logan Fishpond.—The fishpond here has long been an object of considerable attraction; during the summer and autumn months it is visited almost daily by parties from various localities, and scarcely any strangers from a distance, who may have occasion to come within an ordinary drive, but avail themselves of the opportunity of visiting the finny inhabitants of this aquatic prison. A short description of it, I presume, may be interesting to many readers of the *Chronicle*:—It is an artificial salt-water

basin, hewn out of the solid rock, 30 ft. deep by 160 ft. in circumference, reckoning from the original surface to the bottom; it contains a depth of 10 feet of water at low tide, and communicates with the sea by one of those fissures or natural tunnels so common on this bold and precipitous coast; the opening is grated to prevent the escape of the fish. The rock around the basin is surmounted by a substantial stone wall, for the better shelter and protection of the area within. This basin was excavated in 1800—the object of it was to have a supply of the finest fish on the shortest possible notice, and at any state of wind or tide, when no boat dared to venture on the stormy billows. These, being regularly fed, are of a superior quality to those fished from the open sea. Attached to the pond is a neat gothic cottage for the accommodation of the fisherman, who supplies the proprietor with fish in ordinary weather from the sea, and replenishes the pond with those that may be little injured in their capture. The following notice of it is extracted *verbatim* from a note under the article *Logan* in the "Topographical, Statistical, and Historical Gazetteer of Scotland":—"From the inner or back door of the lodge a winding stair-way conducts you to the usual halting-place—a large flat stone projecting into the water, and commanding a view of every part of the aquatic prison. When the tide is out this stone is left completely dry; and here a stranger perceives with surprise a hundred mouths simultaneously opened to greet his arrival. Fish, in fact, hear as well as see; and the moment the fisherman crosses the threshold the pond is agitated by the action of some hundred fins, and otherwise thrown into a state of perfect confusion and anarchy. Darting from this, that, and the other corner, the whole population move, as it were, to a common centre—elevate their snouts—lash their tails—and jostle one another with such violence, that, on a first view, they actually seem to be menacing an attack on the poor fisherman, instead of the creel-full of limpets he carries. Many of the fish are so tame that they will feed greedily from the hand, and bite your fingers into the bargain, if you are foolish enough to allow them. Cod seems to be the prevailing species of fish in this pond, but there are also blochin or glassin, haddocks, flounders, and various other kinds."—*G. Williamson, Logan House, Wigtonshire.*

Fuchsia.—The large Fuchsia in the flower-garden here, of which a report appeared in the *Chronicle* of Aug. 12, is of the *Macrostemon* species, this being then omitted.—*G. Williamson, Logan House, Wigtonshire.*

PROCEEDINGS OF SOCIETIES.

HORTICULTURAL SOCIETY.

Nov. 7.—R. W. Barchard, Esq., in the chair. Mr. J. Bagster and Mr. H. Waterer were elected Fellows. From Mr. Robertson, gr to Mrs. Lawrence, was an exceedingly well-grown plant of *Gesnera zebрина*, having eight spikes richly covered with flowers; a pretty plant of *Epidendrum viscosum*, with curious long green petals and white fringed labellum, and a plant of *Dendrobium denudans*, with spikes of small white blossoms. In the same collection were likewise *Myanthus barbatus*, with fringed greenish-yellow flowers; *Oncidium Pinellianum*, a species from Brazil, quite new to gardens; and a plant of *Mormodes aromaticum*, with brown spotted flowers. There was also a well-grown plant of *Cattleya labiata*, with two spikes of beautiful light pink blossoms; and a fine specimen of *Euphyllium truncatum* violaceum, with pretty purple flowers. This plant was exceedingly handsome, from its pyramidal form; this was effected by grafting it on *Cereus speciosissimus*, inserting the longest scions at the bottom, the shortest ones at the top, and filling up the intermediate space in the form of a regular pyramid; it was nearly three feet high, and the branches were all in bloom, from top to bottom, which rendered it an object of great interest. A Banksian medal was awarded for this, and the *Gesnera zebрина*. C. B. Warner, Esq., sent a plant of *Oncidium crispum*, with a spike of brownish coloured blossoms. From Mr. Bruce, gr to B. Miller, Esq., was *Clerodendrum notans*, with white flowers, having long slender stems, with brown anthers. Messrs. Chandler and Son, of Vauxhall, exhibited a beautiful cut collection of 36 varieties of *Chrysanthemums*. From Mr. Catleugh, of Chelsea, was also a collection of 24 new French varieties of *Chrysanthemums* in pots. Mr. Murray, gr to the Marquess of Bath, sent two Queen Pine-apples, weighing respectively 5lbs. 4oz., and 5lb. 9oz., and measuring each 5 1/2 in. in diameter, and 9 1/2 in. in length; the number of pips were 10. These were exceedingly handsome fruit, and were not produced by mere accident, as those exhibited by Mr. Murray from time to time prove; but were the result of steady successful cultivation and good management. There is little doubt that in a few years the manner of cultivating the Pine will be greatly altered, and that larger and better fruit will be produced than we have hitherto seen. A Banksian Medal was awarded to Mr. Murray for the two Pine-apples. From Mr. Trinder, of Forest-hill, were three Pine-apples, weighing 2lbs. 12oz., 3lbs., and 3lbs. 4oz., and measuring each 5 inches in diameter and 7 inches in length; the number of pips was 8. Mr. Eldridge, gr. to G. H. Ward, Esq., exhibited two bunches of Grapes, weighing 1lb. 4oz. and 1lb. 3oz.; these were said to have been brought from Paris in the year 1840, under the French name of Raisin Monstre; they much resembled the Gros Ribier du Maroc. They, although as ripe as ever they would be, were not so well flavoured as could have been wished; they had had the benefit of all the heat that was given to Muscats, and it was said to have been put on the first week in March: this Grape would require a warmer and better climate than that of Britain to bring it to perfection. From Mr. L. Robson, gr. to W. Gambier, Esq., was a dish of good late Peaches. Mr. H. Kenny, gr. to Viscount Maynard, exhibited a Cassaba, a Pearson's Green-fleshed, and a Nettle Green-fleshed Melon; these were stated to have been from plants from which two crops had been cut. From the gardens of the Society were *Berberis tenuifolia* and ten varieties of *Chrysanthemums*; they were placed under glass about three weeks or a month ago, and from their having had abundance of light and air, which is so necessary for *Chrysanthemums* at this season, their flowers were finely coloured. There was also from the same place a collection of Pears, consisting of *Urbaniste*, *Gansell's Bergamot*, *Doyenné Blanc*, *Doyenné Gris*, and *Marie Louise*; the latter was from a large tree which had been removed from a wall about three or four years ago, but had not suffered from the operation of lifting and transplanting. There were likewise *Duchesse d'Angoulême*, *Beurré Bosc*, *Napoléon*, *Beurré de Capiaumont*, a very great bearer, *D'Amande*, *Figue de Naples*, and *Seckel*—this is a good Pear if taken in time, which is about three or four days after it gets ripe. In the same collection were also the following Apples, viz., *Golden Reinette*, *Margil*, *Loan's Pearmain*, *Birmingham Pippin*, *Mère de Ménége*, *Burns' Seedling*, *Beauty of Kent*, and *Waltham Abbey Seedling*; also *Golden Noble*, *Lucomb's Seedling*, *Tower of Glammis*, an excellent Kitchen Apple, and *Orack Elma*, a Persian Apple, having

a red tinge, which is different from that seen in European Apples; the flavour somewhat resembles that of the French Calville.

LINNEAN SOCIETY.

Nov. 6.—Robert Brown, Esq., in the Chair. Presents of dried fruits were exhibited from Mr. J. Smith, Mr. Sharpe, and others. A paper was read by Mr. Kippist on the discovery of *Backhousia setosa* of De Candolle at Saffron Walden, in Essex, by Mr. Joshua Clarke. This plant had been previously described as *Pieris hieracioides*; but there can be no doubt now of its identity with the *Backhousia setosa* of Europe. A paper was commenced being read from Mr. Griffith, on the sub-class of plants called *Rhizans* there. The author proceeded to examine in detail the characters on which this class was founded; he considered that in each of the characters this class did not differ so much from the other classes as many of the plants undoubtedly referred to it. Their parasitic character differed. Many of the species had a higher vascular development than was supposed. The absence of the embryo in the seed was an inference. There might be an embryo arrested in a stage of development earlier than we are acquainted with in the higher forms of plants. During the reading of this paper the following Members of the Society were elected for non-payment of their subscriptions:—B. H. Barton, Esq., N. Horley, Esq., G. A. Lake, Esq., H. Leggett, Esq., Dr. Paris, Dr. Radmidge, Dr. Sigmund, Dr. Shaw, Dr. Reynolds, and T. H. Smith, Esq. Professor Forbes exhibited some specimens of Orchidaceous flowers which had been electrolysed, and retained their form and character in a remarkable manner. Messrs. Smith and Varley exhibited their microscopes.

BOTANICAL SOCIETY OF LONDON.

Sept. 1.—J. E. Gray, Esq., F.R.S., &c., President, in the chair. Dr. Wood, of Cork, presented a specimen of *Neottia gemmipara*, found in Ireland. Dr. Thomas Taylor presented the following species of *Jungermannia*, new to the British Flora:—*Jungermannia reclusa* (M. S. S. Taylor), *J. fragilifolia* (M. S. S. Taylor), *J. germana* (M. S. S. Taylor), and *J. riparia* (M. S. S. Taylor). Read "Observations on some varieties of *Hypna*, and on a new species of *Lichen*," by Dr. Thomas Taylor. The specimens described were collected in North America by Dr. Gavin Watson, and by him presented to the Society. The new Lichen described was named *Cenomyce foliacea* by Dr. Taylor.

Oct. 6.—John Reynolds, Esq., Treasurer, in the chair. Mr. Adam Gerard exhibited a collection of fruit and seeds from Sierra Leone, containing specimens of the Butter and Tallow-tree (*Pentadesma butyratea*). Read, "Notes of a Botanical Excursion to Tilgate Forest in August last," by the chairman.

Nov. 3.—Hewett C. Watson, Esq., V.P., F.L.S., in the chair. The following papers were read:—"On the Botany of Lichfield," by the Rev. Richard Garnett. "Notes on a Species of *Cuscuta* found at Duxford, Cambridgeshire," by Mr. Frederick Bond, of Kingsbury. The chairman presented a series of specimens of the common Birch, to show that the forms described by different authors under the names of *Betula alba*, *pendula*, *glutinosa*, and *pubescens*, are only varieties of one single species, the original *Betula alba* of Linnæus. Mr. Watson stated that he had repeatedly found, on different branches of the same tree, the various forms of leaf and other characters which were given as the distinctions between these supposed species, and that the leaves of *Betula glutinosa* or *pubescens* were produced usually (if not always) on the seedling plants of *Betula alba* or *pendula*. Specimens of *Primula elatior*, from the Bardfield Station, were presented by Mr. E. Doubleday. These specimens were remarkable for the wide variation in the relative length of the calyx and corolla, and also in the form of the leaves, some specimens resembling the *Primrose* in their tapering leaves, while others had the abruptly-contracted leaves, similar to those of the Cowslip. It was announced that the Herbarium of the Society might be inspected every Friday evening from 7 to 10 o'clock.

NOTICES OF NEW PLANTS WHICH ARE EITHER USEFUL OR ORNAMENTAL.

LEIANTHUS NIGRESCENS. Black-flowered Leianthus. (*Green-house biennial*.) Gentianaceæ. Pentandria Monogynia. This plant is remarkable for the colour of the flower, which approaches more nearly to black than any with which we are at present acquainted. Probably Chamsco and Schlechtendal, in naming it "*nigrescens*," had an idea that it became black only in drying; and Grisebach and Don even speak of the flowers as white, or probably greenish yellow. In the recent state such is not the case; however, they are of as rich a deep blue, or rather purplish blue black, as a flower can well be. But this singularity is not their only recommendation; they are large, graceful in form and inclination, drooping like a *Fuchsia*, so numerous as to form a large panicle, two or three feet high, and a foot and a half broad; a great many are in bloom at once, and they continue in perfection for a very long time, if kept cool, and protected from the too powerful rays of the sun. Indeed, with us, in a shady greenhouse, its flowers have been equally profuse and perfect for a period of four months. We scarcely know a more interesting plant that has for many years been introduced to our collections, even at this age of novelties, than the present. Schiede appears to have been the first to discover it at Papantla, in Mexico. But it had been long known to Mr. Skinner as an inhabitant of Guatemala, and to him I am indebted for the plants which were reared from his seeds in the Royal Gardens at Kew. It bids fair to produce seeds with us, and strikes readily from cuttings. The plant appears to be biennial. It produced an upright stem, scarcely branched for about a foot and a half, but sending out an enormous shoot in the autumn, which terminate in a large, much-branched panicle two or three feet high. The branches, as well as the stem, are rounded. The leaves are most crowded on the stem, and are opposite and lance-shaped. The petals are long and slender, with usually a pair of bractæ or small leaves below the calyx, and it has gracefully drooping flowers, two or three inches long. The corolla is of a deep purplish blue black, and is funnel-shaped, dilated a little upwards. The segments are about half the length of the corolla, and almost recurved. The stamens, five in number, are inserted a little below the middle of the tube, and the filaments are slender and rather longer than the tube.—*Curtis's Botanical Magazine.*

MISCELLANEOUS.

McNab Testimonial.—At a meeting, held in July last, of gentlemen interested in the promotion of botany and horticulture, it was unanimously agreed, that to Mr. William McNab, the distinguished curator of the Edinburgh Royal Botanic Garden, this country is especially indebted for the eminent progress which it has made in the science and practice of gardening. It was therefore proposed that a fund should be raised, by general subscription, with the view of presenting to Mr. McNab such a testimonial of gratitude for his valuable services, and of respect for his very estimable character, as may both cheer himself in his declining years, and excite others to pursue the same honourable path which he has trod. We are no great advocates of this sort of thing; but we must say, that if there is any man to whom such a compliment should be paid, Mr. McNab is that person. We see by the circulars that about 2500. are already subscribed, and among the names we find those of Sir George Mackenzie, Profrs. Traill, Dunbar, Graham, Lindley, Christison, Balfour, Forbes, Jameson, and Fleming; Dr. Neill, Sir Jas. Gibson-Craig, Sir W. Hooker, Mrs. Lawrence, and the Lords Harrington, Wemyss, and Murray, with a crowd of gardeners and journeymen.

ticular circumstances in which the young families are respectively destined to live. Sometimes these habitations are constructed of earth, the particles of which are united by the viscid saliva of the bird, into a tenacious mortar; and they are then commonly built against the sides of a rock or wall. But, in general, they are composed of sticks, straws, and other vegetable substances; and are placed either on the ground, or among the branches of trees. The greater number of them have a somewhat hemispherical form, resembling a little round basket; and their interior is lined with moss and down (Fig. 262).

"But sometimes the arrangement is much more complicated, in order that some particular danger may be avoided, or some special purpose answered. Thus the nest of the Baya, a little Indian bird allied to our Bulfinch, has the form of a bottle; and it is suspended from a twig of such slenderness and flexibility, that neither Monkeys, Serpents, or Squirrels can reach it (Fig. 263). That it may be still more secure against the attacks of its numerous enemies, the bird forms the entrance of the nest on its under side, so that it can itself only reach it by the aid of its wings. This curious habitation is constructed of long grass; and several chambers are found in its interior, of which one serves for the female to sit on her eggs, whilst another is occupied by the male, who solaces his companion with his song, whilst she is occupied in maternal cares. Another curious nest is that of the *Sylvia sutoria*, or Tailor-bird, a little Eastern bird allied to our Linnet; which, by the aid of filaments, of cotton drawn from the Cotton-plant, sews leaves together with its beak and feet, in such a manner as to conceal the nest which they inclose from the observation of its enemies (Fig. 264)."

Fig. 264.—Nest of the Tailor-bird.

The XVIth Number of Stephens' Book of the Farm is executed with all the talent evinced in previous Numbers. It contains good articles on the sowing of Turnips, the Turnip-drill, grazing cattle, horses at grass, sheep-washing and sheep-shearing. We are sure Mr. Stephens will excuse our pointing out to him an error at p. 781, in quoting the *Gardeners' Gazette* instead of the *Gardeners' Chronicle*. We are particularly desirous not to be confounded with such a publication as the former.

CALENDAR OF OPERATIONS for the ensuing week.

A FLOWER GARDEN, after two or three frosty nights, alternating with heavy rains and winds, is no bad representation of a battle-field, for in it, too, have we to recount the loss of a noble race, which filled up the flower-beds that are all gone, and their remains are now being carried to the compost-yard, there to be resolved into old Chaos again; and their elements fixed by caustic applications from the hand of science, are ready to be applied to the use of their descendants and successors next year. The field of desolation now presents a confused scene of cheerless, naked beds, which meet and offend the eye at every turn, and make one almost wish the present style of flower-gardening had never been thought of. I have known gentlemen go so far as to desire their gardeners to turf over their naked flower-beds on the lawn, during winter, to preserve the uniformity of the Grass. But this is an expensive and unnecessary process, which, if carried out, would do away with spring flowers, the finest feature of the garden. Here we partake of the general aversion to seeing the naked soil of our empty flower-beds, and the manner in which we clothe them in winter is worthy of imitation, if only for the simplicity and cheapness of the thing; and if united to Mr. Ayres' plan for the same object, leaves nothing to wish for. As soon as the frost destroys the appearance of a bed the plants are pulled up and the ground smoothed over with a rake; it is then planted with branches of the different evergreen trees and shrubs, trimmed up to the shape of little shrubs, and from one to three feet high, with stems long enough to be firmly fixed in the soil; they will thus keep quite green till March, and no one can tell whether they are not shrubs turned out of pots on purpose. Branches of the Laurestinus will flower all the winter in this way, as well as if left on the parent plant. With these and others of variegated Hollies, with the berries on, also pieces of Arbutus and of different Crataegus, &c., with the fruit on, one might make a gay bed opposite a sitting-room window all the winter. Pinetums might thus be formed in miniature, and this is a good way to try the effects of planting the different kinds of evergreens in a shrubbery or in a winter garden, &c. &c. Early-flowering shrubs may be planted along with these, and also spring bulbs, and the shelter of the green boughs will nurse these things from the cold. Every one of our beds are thus treated in winter, and have been seen by hundreds of people, all of whom liked the idea; but this announcement will prevent us in future from surprising our friends with the immense quantity of young shrubs we keep on hand. "Where, in the name of goodness, do you keep all these pot plants in summer," asked a young scion of a noble Irish family, about this time last year, and when I pulled up one of the "pot plants," he exclaimed in a manner I shall rather let you guess at than describe; and having large gardens of his own, he said his journey from Ireland was well paid in learning this children's play kind of winter-gardening.

I.—KITCHEN-GARDEN AND ORCHARD.

In-door Department.

PINEAPPLE.—The writer of the Calendar will be recording about this time next year the wonders of Rendle's tank system for growing Pines, as, from information in my possession, I find a great number of growers are preparing to begin them this way, and out of pots, too, next spring; but I cannot well comply with requests to write on their culture generally after this manner, for want of experience; meantime, let us go on in the old way, and see that we are safe enough as to bottom-heat to serve us throughout the winter; and if we are right on that score we can easily manage as to surface temperature and watering.

VINERY.—A correspondent has furnished me with a similar case to that I lately described as having taken place many years since. "Circumstances having rendered it necessary that I should have ripe Grapes early last March, I began this time (5th Nov.) last year, two months earlier than usual, by which we made a great sacrifice in the crop, but we gained our point. Although the lights were off all the summer they began to swell

their eyes early in September, and by the end of the month I was obliged to put on the lights, and now I have appearances of a very excellent crop, which should be ripe next February, as they all promise to set well before the very dull weather comes on, and my late ones will carry me through to that time."

FORCING PITS.—If you are forcing Asparagus, Seakale, and Rhubarb, or anything else in that way, you had better keep a slow, steady heat, the best way you can; linings are very troublesome after this time, and should have wooden covers made of "weather-edged" boards sloping over them.

Out-door Department.

It has been so wet lately that little or no work could be done to any advantage here, except, perhaps, planting some trees and bushes where the soil is light; the fruit-room and the store places for Onions, Carrots, and other roots must be well looked after in such weather.

CROPS.—The only things I can think of under this head are to see that all the young Lettuces, Cauliflowers, Endives, &c., are "well provided for" against the winter; and anything else which will occur to yourself, either do it or see that it is properly done for you.

ORCHARD AND WALLS.—Never lose an hour after this time in which nailing can be done, and never think of keeping men at this work in cold weather. I have known people in my younger days so tender-hearted that they would not allow you to shoot a sparrow, and yet would keep men against bare exposed walls in bitter cold weather till they were nearly perished; besides the cruelty of the thing, this was very bad management.

II.—FLOWER-GARDEN AND SHRUBBERY.

In-door Department.

STOVE.—I am indebted to a botanical correspondent for the following memorandum respecting the new Ashantee plant, *Spathodea campanulata*, of which I spoke lately, and about which I had several queries. "It is a tree or shrub, with pointed alternate leaves; nine oblong lanceolate leaflets, tapering to both ends; the flowers are racemose and terminal, with a large, campanulate corolla, of a reddish orange colour, having the segments bordered with yellow. It is found in various parts of Benin, &c., and figured in a French work published in 1805, on the plants of that part, but I cannot find access to a copy." (*Palaisot de Beauvois Flore d'Oware et de Benin*.) We have several accounts of the useful plants of these pestilential regions, but of the merely ornamental our knowledge is limited, and likely to remain so for a long time.

GREENHOUSE.—This has been a critical time for greenhouse plants; just as they were housed the weather turned so wet that the top sashes could not be let down, and in some places fires have been lighted, to dry the leaves of soft-wooded plants, in the middle of the day, while the whole front sashes and doors were left open. In such a state of things there was little use for the watering-pot. To show how little water is needed for such plants in dull weather like this, you have only to cut down some useless plant and let the top remain in a greenhouse or cold pit, and it will keep green and look just as if it were on its own roots for several weeks. If there are Vines in the greenhouse prune them at once, even should their leaves not be quite ripe; and so, also, in any of the Vineries, the leaves of deciduous plants are of little use now, and they may do harm.

CONSERVATORY.—This is, of all the subjects in the Calendar, the part about which I have had most correspondence, and I find that a very judicious system prevails respecting some flower-gardening plants, and more especially the better sorts of scarlet Pelargoniums. "The first wet day in October," says a correspondent, "I lift some of my best specimens of scarlet Pelargoniums, scarlet Salvias, and, indeed, any plant which I think, from its appearance, is likely to flower in the house," &c. Another correspondent says, "The lifted scarlet Pelargoniums are all in a blaze in the conservatory." Another asks where "can seeds of the fringed white and purple Chinese Primrose, which come in so useful at this time, be had true?" Nowhere, to be depended on. When you get fringed, very large-flowered, or very deep-coloured varieties of these, you must perpetuate them by cuttings; they will not come true from seeds. Again—"Our conservatory, more than 140 feet long, is heated by one boiler; but we have retained the flue through the centre of the building. Our fine specimens of Acacia are grand ornaments in February and March. I have Acacia pubescens now 30 feet high, and feathered down to the ground, with its beautiful foliage showing myriads of flower-buds, and A. verticillata and other varieties of them, equally fine." Again—"The object here is to have an abundance of flowers at this season, and up to March. We are now pretty gay with large specimens of Pelargoniums, which I kept the whole summer from flowering, and they now do well for this dull season."

PITS AND FRAMES.—This is trying weather for plants in cold frames; all that can be done for them is to let in a current of air from front to back, by "tilting" the front and back of the lights, and taking them off altogether on fine days, and to pick up every decayed leaf as soon as it appears. This sort of weather reminds one more than ever of the great advantages of cold turf pits, when properly made with ample drainage at the bottom; in such pits here, and out of pots, we have now thousands of plants which look better than those to which more indulgence is given.

FLOWER-GARDEN.—Sweep as much as you will, you cannot clear all up till the leaves are all down. Planting and transplanting trees and shrubs, making and altering walks, and all kinds of alterations and improvements, will now, and for a long while occupy the time that used to be devoted to flowers in this garden; but, amidst all this bustle, do not neglect to make the best use of all the leaves and stems cleared out off this garden, and as much of other refuse as you can gather together, and the rougher materials of prunings, old stakes, &c. burn the first fine frosty morning, and use all these, as has been often pointed out in the *Chronicle*.—D. Beaton, Shrubland Park Gardens, Ipswich.

State of the Weather near London for the week ending Nov. 9, 1843, as observed at the Horticultural Garden, Chiswick.

Nov.		BAROMETER.			THERMOMETER.			Wind.	Rain.

Nov. 3. Foggy; exceedingly fine throughout.
4. Slight haze; fine with light hazy clouds; overcast at night.
5. Fine; cloudy; very slight shower; foggy with slight rain at night.
6. Thickly overcast; rain; cloudy at night.
7. Bitterness with heavy rain in the morning; afternoon fine; clear.
8. Slightly cloudy; clear and fine at 11 a.m.; dense dark clouds with heavy rain at noon; frosty at night.
9. Clear with slight frost; exceedingly fine throughout.
Mean temperature of the week $24\frac{1}{2}^{\circ}$ above the average.

State of the Weather at Chiswick during the last 17 years, for the ensuing Week ending November 18, 1848.

The highest temperature occurred on the 12th, in 1841—thermometer 68° ; and the lowest on the 16th, 1841—thermometer 15° .

REPORT ON COVENT-GARDEN MARKET.

For the Week ending Nov. 10, 1843.

The wet weather during the week has rendered the market rather dull; but the supply has nevertheless been pretty well kept up, and, generally speaking, the prices have not altered much. Pines are more plentiful, and are of better quality than those of last week. Grapes are good, and quite sufficient to meet the demand. Imperatrice Plums are selling at from 1s. to 2s. per punnet. A few Damsons are still to be met with in the market; but the season for these is now nearly over. Among Apples we noticed a few good Ribstone Pippins, and some of the Blenheim Orange. These meet with a ready sale; but there is not much demand for those of inferior quality. Pears for table are chiefly Gansels' Bergamot, Brown Beurre, Beurre Diel, and Marie Louise. Spanish Melons are still supplied at nearly the same prices. Cucumbers are scarce and of bad quality. Vegetables of almost every kind are good and abundant. Cabbages, Turnips, and Broccoli especially. Carrots are likewise good and plentiful, and Leeks and Onions are sufficient to meet the demand. Celery, Lettuce, Endive, and other saladings are abundant; the Celery in particular is good, and in general quite free from the effects of the maggot. Cut Flowers are chiefly composed of Erica ventricosa superba, gracilis, and triceps, Bignonia venusta, Ceanothus azureus, Neapolitan Violets, Gardenia radicans, Double Primulas, Chrysanthemums, Camellias, Pelargoniums, Fuchsias, China and Perpetual Roses.

PRICES, SATURDAY, November 4, 1843.—FRUITS.

Pine Apple, per lb., 3s. 6d. to 7s.	Cucumbers, per brace, 1d. to 3d.
Grapes, hothouse, per lb., 2s. to 4s.	Green Capsicums, per 100, 1s. to 2s.
Portugal, per lb. 3d. to 4d.	Red " " " " 4s. to 5s.
Melons, each, 1s. 6d. to 4s.	Almonds, per peck, 6s.
Dutch, each, 1s. to 2s. 6d.	Sweet Almonds, per lb., 2s. 6d. to 3s.
Spanish, each, 1s. 6d. to 2s.	Nuts, per bushel, —
Plums, Imperatrice, per pun., 1s. to 2s.	— Brazil, 10s.
Apples, dessert, p. bush. 2s. to 10s.	— Hazel, 8s. to 4s.
Apples, Kitchen, p. bush. 2s. 6d. to 6s.	— Barcelona, 2s. to 3s.
Pears, per half-sieve, 2s. to 10s.	— Cob. 12s.
Oranges, per dozen, 1s. 6d. to 3s.	Chesnuts, per peck, 4s. to 8s.
— per 100, 16s. to 24s.	Filberts, English, 100lbs., 55s. to 60s.
Lemons, per doz. 1s. to 2s. 6d.	Barberries, per hf.-sv., 3s. to 4s.
— per 100, 6s. to 14s.	Tomatoes, per hf.-sv., 3s. to 5s.

VEGETABLES.

Broccoli, per bundle, 6d. to 1s. 6d.	Onions, Spanish, per doz., 2s. to 5s.
Brussels' Sprouts, per hf.-sv., 1s. to 2s.	— picking, p. hf.-sv., 3s. 6d. to 4s. 6d.
Cabbages, per doz., 6d. to 1s.	Shallots, per lb., 5d. to 6d.
Greens, per doz. 1s. 6d. to 2s. 6d.	Chilis, per 100, 1s. to 2s.
Cauliflowers, per dozen, 1s. to 4s.	Lettuce, Cabb., p. score, 6d. to 1s.
Potatoes, per ton, 40s. to 7s.	— per acre, 6d. to 1s.
— per cwt., 2s. to 4s.	Celery, per bun., 6d. to 2s.
— per bushel, 1s. 6d. to 2s.	Mushrooms, per pint, 1s. 6d. to 2s.
Kidney, p. bush., 2s. to 2s. 6d.	Wallnuts, per bushel, shelled, 10s. to 20s.
Turnips, p. doz. 1s. to 2s.	Small Salads, per punnet, 2d. to 3d.
Red Beet, per dozen, 9d. to 1s.	Watercress, per doz. sm. bun., 3d. to 6d.
Horrs Radish, per bundle, 1s. to 5s.	Parsley, per doz. bunches, 1s. 6d. to 2s. 6d.
Radish, spring, p. doz. hands, 1s.	Tarragon, per bun., 2d. to 3d.
Carrots, p. doz. bun., 2s. to 5s.	P. dave, per score, 6d. to 1s. 6d.
Spinach, per sieve, 6d. to 1s.	Mint, per doz. bunches, 1s. to 2s.
Leeks, per doz. bun., 1s. to 1s. 6d.	Marjoram, green, p. doz. bun. 1s. 6d. to 2s.
Garlic, per lb., 6d. to 8d.	Chervil, per punnet, 2d. to 3d.
Onions, Spring p. doz. bun., 2s. to 3s.	Salsify, per bundle, 1s. to 1s. 6d.
— Large, per bushel, 2s. to 3s.	Scorzoneria, per bundle, 1s. to 1s. 6d.

Notices to Correspondents.

COMMUNICATIONS from the following CORRESPONDENTS are in type, and are only waiting till room can be found for them:—Totty, P. Neill, O. J. H., J. B. Whittin, J. A., D. Beaton, South Devon, Major C. Bath, Electra, A. Clapham, J. W., A. Brander, Jas. Snow, Facile, J. Wighton, Atlas, M. Saul, J. M., A. Practical Man, J. F. McElroy, P. Mackenzie, Tyro, W. Thomson, W. Paul, and B. Munn.

AGRICULTURE.—B. F. and Others.—In consequence of the decrease of Mr. Rham, we must beg for the indulgence of our agricultural friends until new arrangements shall have been made.

ASPARAGUS.—Zyva.—Your Asparagus-bed, which is still in a green state, must not be cut over until the stems begin to wither. It will be yet too early to begin to force your Seakale that was planted from portions of root in spring.

BEES.—Este will oblige us much by re-writing the name of the Bee-book, which we cannot read. We will procure it forthwith.

BOOKS.—Mr. Murray's re-issue of "Borrow's Bible in Spain," one of the most entertaining of books, will be welcome to everybody who has 5s. to spare. No work with which we are acquainted gives so faithful an account of Portuguese and Spanish manners.—"Martin's Ireland" is full of statistical documents, relating to the state of that country before and after the Union; but it is printed for political purposes, its object being to defend the Union, and we are therefore unable to offer an opinion upon it.—"Sylvester Sound" is rubbish.—"We wish it were in our power to notice such works as "Miss Corner's History of China and India," a very neat-looking and simply-written book, but our limits prevent us, as it contains no Natural History.—"W. T.—We are obliged to repeat that there is not a single very good book on Arboriculture. Mr. Selby's "British Forest-trees" is much the best, but it does not go far enough into details. Billington on Planting is very useful.—"A Working Gardener."—"Paxton's Dictionary of Botany."

BULFINCH.—L. M.—Answered already, at p. 744.

CABBAGES.—J. M.—Conve Tronchuda is a most excellent vegetable. The thick ribs of its leaves are treated exactly like Seakale, or the whole heart may be boiled. Either your cook must be a bad one, or you cannot have bought the true kind, which is so tender that it will not bear frost.

CAMELLIAS.—H. G.—No such Camellia is known to us, and we do not believe in its existence. Your plan of packing flowers may be good, but ours certainly is. The damp Moss or other material does no injury, but much good. It is always best, however, to guard flowers with tissue-paper in addition.

CARNATIONS.—O.—We do not think it at all probable that the vapour of creosote, because it will preserve meat from putrefaction, would prevent the fly producing a mining grub from attacking Carnations. It would be possible to keep some sort of netting round the seedlings without injuring them. A saucer of pure gas-liquor placed near the plants would be dangerous. Whether gas-water reduced would effectually clear Carnations from green-fly will depend upon the power which the Carnation has of bearing the causticity of this agent. Why not try it even now? Tobacco-water five times reduced will do, but it dirties the plants. The fertilisation of Carnations should be performed as soon as the stigmas unfold. The action of pollen is not instantaneous, but slow, and it is necessary that it should adhere. Although it may produce no effect at the time of applying it, yet it will eventually fertilise the seed-vessel if the flower be kept dry. If the seed-vessel grows and yet the seed does not swell, it is because fertilisation has not taken place. It would increase the probability of procuring seed to place the pots near a south wall. It is of no use to cut out the centre petals when the flower is very double.

FRAMES.—Amateur.—We see no occasion to alter the dimensions of Cucumber-sashes to be glazed with sheet glass. It would not be economical to increase the width of the panes beyond 6 inches; and, for the sashes themselves, if they are made much larger than usual they become unwieldy, and break by their own weight when handled.

HAWTHORN-BERRIES.—Zyva.—You will probably have some of your Hawthorn-berries up the first year after sowing, if you mix them with sand now, and sow them in the spring.

HEATHS.—W. T. Duke.—On no account transfer your seedling Heaths or struck cuttings of this tribe from small pots into 12-sized ones at this season of the year; do it in spring. What

is meant by peat at p. 693 is what is called in Ireland bog-mould.

HEATING.—Amateur.—We doubt whether a brick tank will not be too damp for a greenhouse, the fire in which has to be often heated. For occasional fires, if the house is well ventilated, it will do very well. You must make it occupy the whole space beneath your stage, in such a house as you describe; and a bad arrangement it will be, after all. Much better carry a gutter all round your house, if you can. Notwithstanding the plan, that might perhaps be done if there is but one door, by making the boiler work both ways, by means of double-headed pipes. If the boiler is on a level with the tanks it is needless to have it closed, and an old iron sancepan might be used, but if the boiler is to be lower than the gutters or tanks it must be closed tight. — *P. P. P.*—Your copper boiler will do very well. Its size is of little consequence; 4 gallons is enough; but less or more will do. — *A Subscriber from the First.*—Your mode of heating is very uncommon. We never saw it tried. It does not strike us how you are to keep the descending-pipe filled with water; but if you can manage that by converting the leg A B into a syphon, by taking off the pressure on the water in the boiler, then, and only then, your plan will answer. — *S. R.*—We think the plan adopted by Mr. Beck excellent for the purpose to which it is applied. Indeed we do not see how it can be improved.

MANURES.—M. W. K.—The best manure for your light hungry clay is marl and clay. After that stable manure will act, though not so well as cloacine. Of all ways of preparing this, the best is to mix it with charcoal-dust, or soot, or cinder-siftings, in alternate layers, and after leaving it till the smell is gone, mixing it all together.

MICE.—When *Cantab* sends his plan of destroying these animals, we shall be able to judge better of its efficiency. If it is as good as he represents gardeners will be much obliged to him for it.

MYRTLES.—A Subscriber.—You may preserve your Myrtle through the winter by placing it in a dry room or passage free from frost, and where there is a sufficiency of light and air.

NAMES OF FRUITS.—W. D.—1, 13, Passé Colmar; 2, Marie Louise; 4, Beurré Diel; 5, Ne Plus Meuris; 6, Seckel; 7, Glout Moreau; 8, Williams' Bon Chrétien; 9, 12, Chaumontel; 11, Doyenné Blanc; 14, Beurré Rance; 15, Autumn Bergamot; 17, Gansel's Bergamot; 19, Easter Beurré; 21, Doyenné Gris. Apples—1, Court of Wick; 3, Scarlet Crofton; 5, Lemon Pippin; 6, Downton; 7, London Pippin; 8, Margil; 9, Wormsley Pippin; 10, Minchall Crab; 11, King of the Pippins; 12, Keswick Codlin; 15, Kerry Pippin. — *J. G.*—Robinson's Pippin. — *D. Judd.*—Apples: 2, Damelow's Seedling; 3, Court of Wick; 5, Boston Russet; 6, Hollandbury; 7, Minchall Crab; 8, Northern Greening; 10, Herefordshire Pearmain; 11, Woolman's Long or Orley Pears; 1, D'Austrassie; 2, Beurré Knox; 3, Aston Town; 4, 5, appear to be Comte de Lamy. — *Stour-bridge.*—1, Duchesse d'Angoulême; 2, 5, Ambrosia; 3, a variety of Rousselet; 4, Old Colmar; 6, Passé Colmar; 7, (decayed).]

NAMES OF PLANTS.—R. Plant.—Only a pale variety of *Acropera Loddigesii*. — *T. B.*—No. 1, *Scolopendrium officinarum*; 2, *Adiantum capillus Veneris*. — *Domhuil.*—*Siphocampylus bicolor.* — *Anon.*—*Oncidium uniflorum*, *Cyrtopogon Woodfordii*, 3, *Epidendrum phoeniceum*; 1, *Masdevallia cuprea*, sp. nov. — *J. C. L.*—*Epidendrum floribundum*. — *Dido.*—No. 1, a Cassia; 2, Lotus Jacobæus; 3, *Hypericum Egyptiacum*. — *P. N.*—Your *Oncidium* belongs to a race very difficult to name, even with good specimens. From an inspection of the flower we suspect it to be *O. Suttoni*. — *W. Abb.*—We do not like to dissolve a very old subscriber, but we really must decline naming crowds of specimens in future. 1, *Caparis spinosa*; 2, *Luaria alpina*; 3, *Genista ovata*; 4, *Melia Azedarach*; 5, 6, *Staphylea pinnata*; 7, *Vitex Agnus Castus*. — *J. B. W.*—*Ruzia ligularis*. Poor Alexander's death was regrettably announced. — *A Subscriber.*—Double *Datura fastuosa*, as far as we can judge; of no value. — *Apollonius.*—We must refer you to our notice on this subject at p. 744. — *J. Ingram.*—*Tithonia tagetiflora*. — *T. W. O.*—*Cirrhopetalum Mucosæ.* — *E. P.*—Cut-leaved Alder. — *A Subscriber.*—*Maxillaria picta*.

NEW ZEALAND.—It strikes us that our correspondent at Plymouth is reversing the order of things when he invites persons in this country to send cases to New Zealand upon the chance of their being returned well filled with valuable plants of that colony. What we know of the manner in which liberality here is met by gratitude there, does not induce us to become a party to any such recommendation. Nor is it necessary. The Horticultural Society has sent seeds in abundance to New Zealand; so has the New Zealand Company, and so have other persons. We, however, print in another column what our correspondent says as to the way in which plants will go out to New Zealand. Let no one, however, imagine that plants of the three islands can be returned in that way. We are equally unable to agree with our correspondent in his estimate of the person he mentions. He regards him as a very great naturalist, we as a very small one.

PEARS.—Pyrus.—Varieties to come into use between the Jargonelle and Marie Louise may be the Summer Franc-Real, Dunmore, Summer St. Germain, Ambrosia, Fondante d'Automne, and the English Callet Rosat.

PERALGONIUMS.—Alquis.—When these plants lose their lower leaves they are only obeying the dictates of nature, and showing that their wood is, what it ought to be, matured. We can add nothing to the varied directions given in 1841 for the management of these plants. — *A Novice.*—All the treatment which *Peralgonium* for planting out in spring require during winter, is to store them up, four or five plants together, in pots or boxes. They may be planted in almost any kind of soil, and placed under a greenhouse stage, or any other place where they may have a little light and be kept dry and free from frost.

PITS.—R. G.—The peat used for building walls of pits may be cut from a common bog in the same manner as those which are used for burning; but of course considerably larger. In building, the walls should be made to slope outward a little, and should be well filled in behind with solid earth; the inside may then be cut neatly with a sharp instrument, and a most excellent wall will thus be formed. After the walls have been built, all that is necessary is to drive down some strong wooden posts along the back and front, on which the sill and rafters rest, as well as upon the turf wall. If at any time the turf sinks, these support the sill and rafters, and by pushing in a little turf below the former the vacancies will be filled up. Such pits will last for many years, and when covered with good sashes are dry and warm.

POMEGRANATE.—Rusticus.—A heap of finely-sifted ashes put round the stem of your Pomegranate will not be sufficient to preserve it from the severity of the frosts in winter. It must be matted also, and it is certainly desirable that the mat should be put on when the tree is quite dry.

PRUNING.—W. C.—Prune your Cedars and Deodars either now or when they have begun to grow in the spring. But why prune them at all? You had better let them alone.

SOILS.—Oriola.—Quicklime is a good dressing for worn-out garden-soil, much infested with slugs and worms; the sub-soil, a stiff loam, in some parts clay. It should be applied when the ground is being trenched in autumn.

STRAWBERRIES.—Oriola.—If runners are troublesome, remove them with a strong rake, or pare them off with a spade. If the soil wants loosening, do that after the crop is gathered and with a fork. It is not necessary to expose the fruit to the sun in order to ripen it. All that is required is, that the leaves should be so exposed. The fruit will take care of itself.

WIRE FOR WALLS.—Matilda.—Copper wire is more lasting than iron; and iron wire, coppered by the galvanic process, if you can get it, is probably as good. In the absence of either, you must trust to paint.

ZINC LABELS.—G.—Zinc for labels can be procured from the zinc-cutters; ink for these may be prepared as follows:—viz., verdigris in powder, 1 drachm; sal ammoniac ditto, 1 drachm; lamp-black, $\frac{1}{2}$ a drachm; water 10 drachms.

MISCELLANEOUS.—One shilling will be given for No. 20, 1842. — *A. B.*—What Passion-flower? We cannot help you unless your question is more precise. — *T. Sams.*—As far as we can perceive from your letter, the only remedy is to do as you propose; and with regard to the salt getting through the brickwork, there can be no harm in that. — *A Subscriber.*—A list of ornamental hardy Evergreens is given in the *Amateur's Garden*, p. 757, of this year. — *Rusticus.*—The vine-leaved *Anemone* will thrive best in a moist situation; *Berberis dulcis* is quite another species from the old stoneless preserved *Berberis*. — *A. H.*—If you refer again to the description of *Rosa Hardii*, p. 775, you will find nothing there said about its being worked upon a briar, as you have stated. — *Z.*—You will find directions for grafting Vines at p. 744. If the young wood is badly ripened, cut back to one eye above the two year old wood. Figs will be noticed soon. The Winter Nalis Pear is the same as the Bonne Malinaise.

SEEDLING FLORISTS' FLOWERS.

FUCHSIAS.—A. B.—Your seedling is remarkable only from having the sepals so much reflexed as to hide the tube; it is also very small and not good in colour. — *J. J.*—In colour your seedling bears a strong resemblance to some of the earlier sorts raised by Mr. Thompson; it is not equal in beauty of form and colour to his *Formosa elegans*, and it must be of a very fine and prolific habit to make it desirable.

PANSIES.—H. B., Essex.—*Belvidere* is a very pretty seedling, the eye remarkably fine and decided; the belting still wants decision in the side-petals, and there is a deficiency where they should meet above the eye; the flower wants size also. *Moonlight* has a singular eye, but the flower wants substance, and is very deficient in the form of the petals. *Glorious Apollo* is fine in colour and substance, but deficient in size. *Unique*, fine eye and good form, but too small, and the belting of the side-petals is watery and imperfect.

As usual, a host of letters has arrived too late for answers this week.

ERRATA.—In Messrs. BURBIDGE and HEALY's Advertisement, inserted Nov. 4, 11 lines from top, read "The boiler being composed of two truncated cones, one inserted within the other," instead of "one inserted one within the other."—Cape Iridaceæ. In the note on the cultivation of these plants, in last week's *Chronicle*, p. 774, middle column, 19 lines from top, for "*Watsonia gracilis*," read "*Gladiolus Watsonius* and *G. gracilis*."

NEWS OF THE WEEK.

THE Grand Jury of Dublin after several days deliberation have found a true bill against Mr. O'Connell and his fellow-traversers, all of whom appeared upon their recognizances on Wednesday and answered to their names. The trials will commence in a few days, but there is no chance of their being concluded for some weeks.

The Overland Mail from India which left Bombay on the 2d ult. arrived in town on Monday. The news it brings is of great importance. An insurrection has broken out at Lahore, which first manifested itself in the murder of the Sovereign of the Punjab, the Maharajah Shere Singh, with his two sons. The chief conspirator, Dhyani Singh, the Prime Minister, and the Sirdar Ajeet Singh, his accomplice, were themselves assassinated shortly afterwards, and a wholesale sacrifice of the wives and children of the late Rajah took place at the Palace. A child ten years of age was placed on the throne, to become perhaps a victim in his turn. This dreadful tragedy is considered to have given the finishing blow to the great empire founded by Runjeet Singh; and it is generally believed that the fertile territory of the Punjab, with its immense revenues and population, will eventually be annexed to British India. Lord Ellenborough had already, as if in anticipation of the event, concentrated an imposing force on the banks of the Jumna, and British intervention will probably be necessary to suppress the anarchy which now prevails. The rest of India continues tranquil, and Dost Mahomed, who maintains his authority at Cabul, appears to be desirous of keeping on friendly terms with our Government. — From Mexico we learn that the British flag has been insulted in the city of Mexico by the President, Santa Anna, at a ball given by him in that capital. Mr. Doyle, the British Chargé d'Affaires, has suspended all intercourse with the Mexican authorities until he hears from his own Government, and has demanded an immediate apology for this intentional and deliberate insult to our flag. — From Greece we learn that the King has declared his determination to abide by the will of the people as expressed at the late revolution, and to adopt the representative system which formed the basis of the movement. — In Egypt the Pacha has a fresh cause of trouble in the revolt of Achmet Pacha, Governor of Sennaar, who is said to have declared himself independent. Great preparations, however, are making to resist any act of aggression, and the next arrival will probably put us in possession of further details. — From Spain we learn that both Chambers have agreed to the necessity of declaring the Queen of age as the only means of pacifying that country, and a change of Ministry is said to be contingent on the declaration of majority.

Home News.

COURT.—Her Majesty and Prince Albert, the Prince of Wales, and the Princesses continue at Windsor Castle, and are quite well. On Saturday Prince Albert came to town by the Great Western Railway, and proceeded to the office of the Duchy of Cornwall and Buckingham Palace. His Royal Highness inspected the Summer Temple in the Palace Gardens, and viewed the large Chinese bell and other trophies from China, which are placed in the library

of the Palace. The Prince then visited the Polytechnic Institution, and afterwards returned to Windsor by railway. On Sunday morning her Majesty, Prince Albert, the Prince and Princess of Hohenlohe Langenburg, and the whole Court, attended divine service within the Castle. On Monday the Queen and Prince Albert took equestrian exercise in the riding-school, and the Duke of Cambridge arrived on a visit to her Majesty. On Tuesday the Queen and Prince and the visitors to her Majesty took an excursion in the Park. In the afternoon a powerful hydro-oxygen microscope, magnifying objects upwards of 30,000,000 times, was exhibited by Mr. Paine before her Majesty, Prince Albert, the Duchess of Gloucester, and the visitors to her Majesty. On Wednesday, the Queen and Prince Albert took their usual walking exercise in the vicinity of the Castle in the morning and afternoon. In the course of the morning Prince Albert, accompanied by the Duke of Cambridge and his Serene Highness the Prince d'Oettingen Wallenstein, shot over the royal preserves. The Duke of Cambridge afterwards returned to town. On Thursday the birth-day of the Prince of Wales was celebrated at the Castle and in London with the usual honours. Her Majesty gave a banquet in the evening, followed by an evening party. In the morning the 1st Reg. of Life Guards and the third battalion of Grenadier Guards marched from their barracks to the Home-park, with their respective bands, and at 12 o'clock fired a *feu-de-joie*. In London the day was observed with all the honours, and in the evening her Majesty's tradesmen illuminated their houses. The Duke and Duchess de Nemours are expected to arrive this day from Paris, on a visit to her Majesty. Lord Byron has succeeded the Earl of Warwick as the Lord in Waiting, and Colonel Drummond has succeeded Sir F. Stovin as the Groom in Waiting on her Majesty. The visitors to her Majesty this week have been the Duchess of Gloucester, the Duke of Cambridge, his Serene Highness the Prince d'Oettingen Wallenstein, the Marquess and Marchioness of Normanby, Viscount Combermere, the Earl of Aberdeen, the Bavarian Minister, and Mr. Patrick Fraser Tytler, the historian of Scotland. — It is rumoured that her Majesty intends to have a marine villa erected at Cowes, in the Isle of Wight, as an occasional residence during the summer and autumnal months, and that the Woods and Forests have sent an agent to survey some estates at East Cowes, prior to the selection of the site.

The Queen Dowager.—Sir Robert and Lady Peel arrived at Witley Court on Monday, from Drayton Manor, on a visit to the Queen Dowager. Her Majesty continues in the enjoyment of uninterrupted health and spirits. The Countess of Brownlow has succeeded Lady Barrington as Lady in Waiting, and the Hon. Miss Boyle has succeeded Miss Hudson as Maid of Honour to Her Majesty.

The Duc de Bordeaux.—His Royal Highness arrived at Alton Towers, the seat of the Earl of Shrewsbury, on Saturday. His Royal Highness was received by torch-light, and with the highest honours. A great crowd was assembled to witness the arrival of the Prince, who was greeted from the Castle with the air *Vive Henry IV.* The Prince Robecq de Montmorency, the young Duke de Guiche, and the celebrated orator, M. Berryer, had previously arrived at Alton Towers. His Royal Highness had intended to visit London about the 15th inst., but has deferred his journey for some weeks in consequence of the expected arrival of the Duke and Duchess de Nemours. His Royal Highness will take advantage of this circumstance to visit some of our manufacturing towns, making excursions from Alton Towers, which will, for the present, continue his head-quarters. On his way to Alton Towers, from Drumlanrig, the seat of the Duke of Buccleugh, the Prince visited Lancaster and Liverpool, where he inspected the most remarkable buildings in the town, the docks, the Acadia and Great Western steam-ships, the Town Hall, and the Exchange. On Saturday morning his Royal Highness inspected the railway, where he was received by Mr. Wood, and the directors of the company, after which he breakfasted at Edge-lane Hall, with F. Heywood, Esq., who acted as cicerone to the Prince during his sojourn in Liverpool.

Parliamentary Movements.—The Queen held a Court and Privy Council yesterday, at which Parliament was ordered to be further prorogued from Tuesday next to the 19th December. — The Election for Kendal terminated on Wednesday in the return of Mr. Warburton, by a majority of 63. The numbers were—for Mr. Warburton, 182; for Mr. Bentinck, 119.

Prince Alexander of the Netherlands.—On Saturday evening his Royal Highness gave a dinner at Mivart's Hotel to Prince Edward of Saxe Weimar, the Netherlands Minister, &c. On Sunday his Royal Highness left town for Blackwall, and there embarked for Rotterdam, on his return to the Hague, after a sojourn in this country of more than three months, which his Royal Highness chiefly passed in Scotland.

The Church.—The Queen has nominated Archdeacon Lonsdale, of King's College, London, to the vacant bishopric of Lichfield. Some valuable preferment is vacated by the Archdeacon's elevation. His stall in St. Paul's will fall to the treasury of the Ecclesiastical Commissioners, his Archdeaconry to the Bishop of London, and the Presidency of King's College to the Archbishop of Canterbury. The Archdeaconry has been conferred on the Reverend John Sinclair, Secretary of the National Society. The *Gazette* of Tuesday contained an Order in Council, at the suggestion of the Ecclesiastical Commissioners, for vesting the patronage of Barnston Christ Church, and of Chester Christ Church, in the Bishop of Chester; of Colne Christ Church, in the Vicar

of Whalley; of Leighton St. Peter, in the Bishop of Chester; of Shirley St. James, in the Rector of Solihull; and of Wilden St. Matthew, in the Vicar of Bradford—all for the time being. The *Gazette* also contained an Order in Council, constituting an Archdeaconry of Manchester, and authorizing the Bishop of Chester to appoint the Archdeacon; and another Order, separating the Deanery from the Archdeaconry of Llandaff.

Royal Academy.—On Monday a general assembly of academicians was held at the Royal Academy, in Trafalgar-square, when Mr. C. W. Cope and Mr. T. Duncan were elected associates.

The Army.—A War-Office circular and warrant for establishing and regulating regimental savings banks has just been issued, with forms showing the manner in which the deposit books are to be kept, and of a certificate to be signed by the officer commanding, the officer second in command, and the adjutant, and transmitted quarterly to the Secretary-at-War.

National Society.—The special fund in aid of the National Society now amounts to more than 125,000*l*. The Archbishop of Canterbury, as President, has appointed the Rev. W. J. Kennedy, Curate of Kensington, to be Secretary of the Society, in the room of the Rev. J. Sinclair.

Foreign.

FRANCE.—The Paris papers are principally filled with a speech delivered by the Procureur-General of the court, M. Dupin, at the opening of the sittings of the Court of Cassation. The speech would at any time be remarkable on account of the eloquence of the speaker, but the allusions which it makes to the great dispute now existing between the clergy and the University of Paris, on the subject of education, have invested it with more than usual interest. It was previously known that M. Dupin would speak upon this occasion, and a crowded audience assembled to hear him, among whom were Lord Brougham and Mr. Samuel Rogers.—It is stated that at a recent meeting of the French council of ministers, the King insisted upon the fulfilment of the promise formerly made by the Ministry, that they would present to the Chambers a proposition for a dotation for the Duc de Nemours, in his quality of future Regent of the kingdom. There appears to have been some hesitation on the part of Ministers, which led to some negotiation between the Court and M. Thiers, who is said to have promised to vote in favour of the measure.—The editor of *La France* has been cited before the Court of Assizes for an article instituting a comparison between the circumstances under which the Duc de Bordeaux and the Duc de Nemours have come to England. The article is said to be from the pen of M. Chateaubriand, but the approaching trial excites little interest.—The dispute between the clergy and the University appears to be drawing to a crisis. The bishops do not now content themselves with a simple threat of withdrawing the chaplains from the universities—they have actually put their threat into execution. A provincial paper published at Nancy announces that the chaplain of the college of that city has received orders to quit the college, and that he has consequently taken up his quarters in the Episcopal Palace. This step has of course been taken by order of the bishop, but in the meantime and provisionally, the chaplain will continue to exercise his ministerial functions in the proscribed college. The *Journal des Débats* says that this first act of excommunication was resorted to in consequence of a refusal, on the part of the rector, to allow the Abbé Lacordaire, engaged in re-establishing the Dominicans in France, to preach within the college. The dispute is very complicated, and is daily forcing itself more and more upon public attention, and it is impossible to prevent its being one of the most prominent subjects of discussion in the ensuing session of the Chambers. It appears that it was on the 30th ult. that the Bishop of Chalons' letter was referred to the Council of State, and Viscount d'Hausersaert is ordered to make a report upon the affair.—The excitement regarding the fortifications of Paris has extended to the provinces. Several petitions from the large towns have been presented to Government on the subject, and a strong and numerous signed remonstrance has been sent by the City of Lyons.—The Paris papers announce on the authority of letters from Pondicherry, that the Governor of Bourbon has taken possession of the Islands of Amsterdam and St. Paul, and left garrisons in them.—We lately noticed the manufactory of spurious wine discovered at Rouen. It is now stated that on Friday 103 hogsheads of adulterated wine were brought out from the stores at Paris, and their contents spilt into the Seine. "Immediately after this operation," says an eyewitness, "the surface of the river was covered to the distance of 200 yards, with an innumerable quantity of fishes, poisoned by the deleterious liquor."—The floods of the Rhone and Durance have already been very destructive, and threaten to be still more so. The following despatch has been addressed by telegraph to the Minister of Public Works, from the Prefect of the Bouches du Rhone, dated Marseilles, Nov. 4:—"The Rhone broke its banks last night, at a distance of half a league from Arles. It is feared that the disaster of 1840 to the country and the canal of Arles will be renewed. The day before yesterday, the Durance carried away five bridges, viz., those of Mees, Manosque, Mirabeau, Perthuis, and Rognonas. It is feared that the waters will break through by Millaune and Gravezon to the plains of Arles." The inundations have also threatened Dauphiné with severe calamities.

SPAIN.—We have accounts from Madrid to the 31st ult. They contain M. Martinez de la Rosa's report to the Chamber of Deputies, in the name of the committee

upon the Government communication, relative to the declaration of the Queen's majority. This document, the reading of which is stated to have elicited unanimous marks of approbation, says, in substance, that the declaration of the Queen's majority is the only issue to the present situation of affairs; it will destroy the unfounded pretensions of a prince who has presumed to dispute the sceptre; it will cut by the root the hopes that may be entertained in a foreign land by him who provisionally exercised the supreme power, and who knew not how either to conduct himself with wisdom or defend himself with dignity; in short, it will be the means of stifling the clamour of unlawful parties and of re-entering the legal path pointed out by the Constitution. The report adds that the means proposed by the Government has been resorted to by all nations and in all times to avoid the evils inherent to the minority of Sovereigns; that but a few years ago it was adopted, in similar circumstances and with success in two monarchies, and that without going beyond Spain there are not wanting numerous instances of princes who have assumed the reins of the state with the consent of the Cortes, before they had attained the age fixed by law. The committee conclude with the proposal that the Cortes declare "Her Majesty Queen Isabella II. of age." Owing to its being All Saints Day, the Cortes were not to sit on the 1st of November, but they were to assemble next day, when the debate upon the declaration of the Queen's majority was expected to commence. In the Senate on the 31st, after some conversation relative to a petition against the contract entered into with Don J. Salemanca, M. Figueras brought up the report of the committee upon the bill for declaring the Queen of age. This document, which is signed also by the Duke de Frias, M. J. Tarancon, and M. Garelly, forming the majority of the committee, is favourable to the Government proposal; on its being read, M. Campuzano rose and proposed that the Queen be proclaimed of age in the following terms:—"The General Cortes declare that her Majesty Queen Isabella II. shall exercise the Royal authority with the assistance of the Council of State, which shall cease on the day on which the Constitution acknowledges her majority. That Council shall consist of three titular and two supplementary members, who shall be appointed by the Cortes in the very act proclaiming the Queen's majority. The powers of that Council shall be limited to giving advice in writing to the Queen in all cases where her Majesty shall have to exercise the rights which the Constitution confers on the King by its 17th article." Both this proposal and the committee's report were ordered to be printed, and the Senate adjourned after M. Mureo had given notice of his intention to ask Ministers whether they were disposed to issue a complete amnesty on the declaration of the Queen's majority? It is rumoured that as soon as the majority is declared the present Ministers will resign, and Señor Olozaga be made Prime Minister. The Government had received intelligence of Vigo having pronounced in favour of the Central Junta, and that nearly 600 troops there and in the neighbourhood had adhered to the movement. The castle, which contained about 100 troops, still held out for the Government. Brigadier Cotoner, who was at Corunna, was expected to proceed against Vigo; and the Government, it is said, feel little uneasiness about the movement. The capitulation of Saragossa was arranged on the 28th ult., on which day Gen. Concha and his troops entered that city. From Barcelona we learn that the force under Gen. Sanz, recently strengthened by the accession of nearly 1,000 men from Tarragona, amounts to 3,000 men, independently of the troops in the forts of Barcelona. On the 31st, the date of the last advices, discord was increasing among the insurgents. The Junta's soldiers were indulging in every species of excess, and pillaging the shops and houses. The Junta had ineffectually attempted to disarm their auxiliaries, the galley convicts, who acted foremost in these depredations. On the 24th ult., General Sanz threw into the city 824 solid shot, and 527 grenades and shell. In this terrible bombardment he threw more projectiles into the city in a single day than were fired at it during the whole period of Espartero and Van Halen's siege. The firing continued at Gerona throughout the 1st of November. Martell made another sortie from Figueras on the 31st ult., at the head of 400 men; but, on hearing of the approach of the troops stationed by Prim at Bascara, his column dispersed, throwing their arms away, and their commander was glad to find his way back to the fort of Figueras.

GERMANY.—The German papers continue to make the affairs of Greece almost their exclusive topic. The *Augsburg Gazette* announces the arrival of Colocotroni at Munich, where he is treated with great distinction. He has apartments in the palace, and goes out in the royal carriages. According to reports in well-informed circles, some great distinction is intended for him. The *Cologne Gazette* of the 2nd inst. states that the King of Bavaria is about to visit Athens, in order to judge personally of the state of affairs in Greece.—Several of the German princes are imitating Father Mathew in propagating Temperance societies. The King of Bavaria has published a decree, by which all the municipal magistrates are obliged to become the members and heads of a new temperance society, and at the same time they are called upon to engage their fellow-citizens to the same. Letters from Cologne state that a subscription has been opened in that city in aid of the Irish Repeal Association, and that in the course of one week one florin and thirty kreutzers (one shilling and sixpence sterling,) have been collected. The *Frankfort Gazette* announces that the states of Bohemia, to whom the Austrian Government had applied for a sum of money for the use of the military academy at

Neustadt, had granted the sum applied for only as a gift, and denying at the same time the right of the Government to make the demand.

ITALY.—It is announced that the Austrian troops which were said to have entered the Papal territory did not cross the Frontier, but merely assembled at the request of the Duke of Modena, to join his own and the troops of Parma during the late military manoeuvres, and have since returned to their garrisons. Several of the ringleaders in the recent disturbances have sought refuge in Corsica. Among them are the Marquises Righi Lambertini, Melara, and Tenara, Count Biancoli, Doctor Muratori, and his brother, and five other persons, belonging to good families of Bologna. The Court of Rome is stated to have claimed them as being common offenders; but it is probable that the French Government will confine itself to ordering them to quit Corsica. The *Globe* reports that a mass for Mr. O'Connell has been ordered by the Pope. The Duc d'Aumale arrived at Genoa on the 22d ult., whence he was to proceed to Florence, Rome, and subsequently to Naples. We learn from Palermo that the King of Naples has taken formal possession of the Island of Lampedusa, in order to establish his right to it, and has sent thither some persons who are charged with its colonisation. There is also to be a garrison and 24 men. This island was occupied by a Maltese family, who acted as if it were their own property.

GREECE.—Accounts from Athens to the 21st ult. give some further details of the attempt made by General Colocotroni to effect a counter-revolution. It appears that on the failure of his scheme, he decided on embarking in the Austrian packet, which was on the point of sailing for Trieste, but the populace had become so exasperated against him, that on his arriving at the Piræus, they attacked the carriage, and would have probably sacrificed him on the spot, had not the coachman lashed his horses into a gallop, and at full speed returned to the capital. Once more he attempted to reach the harbour with a strong escort of cavalry, but the populace were too determined, and actually forced them back again. Finally, he succeeded in getting on board the Greek Government steamer, by embarking at a distant part of the shore, and reached Syra. Four days afterwards a large body of the people prevented M. Rhalli, the late obnoxious Minister of Justice, from embarking on board the Austrian steamer. On this occasion the military succeeded in dispersing the crowd, without causing bloodshed, and M. Rhalli was saved from popular vengeance by the French Minister, who conveyed him in his own carriage to the harbour, and there placed him in safety on board a French war-steamer, which conveyed him to Andros. On the 14th the King summoned to the Palace the Council of Ministers, the Council of State, the President of the Holy Synod, and the chief officers of the garrison of Athens, in whose presence he made the following declaration:—"After having adopted those representative institutions which I consider to be useful and necessary for the prosperity of our cherished Greece, I ardently desire to see them established in the midst of tranquillity and order. I therefore call upon you, Gentlemen, to communicate this desire of your Sovereign to your subordinates and to all around you, to the end that no one may be ignorant of my Royal will, nor controvert, in word or deed, this new order of things." This declaration is considered likely to produce a beneficial effect on the country, and greatly to strengthen the moral effects of the King's previous declarations. The ministers have published it with two circular letters to the judges, magistrates, and clergy, recommending prompt application of the laws in all matters, both civil and criminal, and a firm but moderate use of all preventive measures. Perfect tranquillity prevails in the provinces. The elections for deputies were expected to be concluded by the 22d ult. There appears to be no doubt that the Emperor of Russia has formally expressed his displeasure at the revolution, and that he has deprived his minister, M. Katakazi, of his situation, and ordered that his conduct, in having manifested too lively a sympathy in the new order of things, be submitted to a court of inquiry.

EGYPT.—We have accounts from Alexandria of the revolt of Achmet Pacha, Governor of Sennaar, against the authority of Mehemet Ali. This event may again embroil the politics of the country, and lead to serious results. It is stated that Mehemet Ali had received a despatch from Constantinople, officially notifying to him that the Sultan had been pleased to take into consideration his advanced age and the necessity of relieving him of a portion of the cares of so extended an empire, and had therefore conferred upon Achmet Pacha the government of the Belled-el-Soudan. It is said the Pacha was very wroth when this despatch reached him, and at first countermanded the despatch of a steam-yacht, which he intended to present to the Sultan. He afterwards modified the order, and the yacht was sent, but without the Sultan's cypher in brilliants and other accessories, valued at 30,000*l*.; the boat and fittings, in the state in which it was sent, being estimated at a similar sum. In the meantime, the council sits daily in Cairo, and Gallice Bey has been sent for from Alexandria to give his opinion as to what stores and materials it were better to send with the expedition, which is to consist of 11,000 men, of which Ibrahim Pacha has consented to take the personal command, accompanied by Suliman Pacha. The excitement of this Sennaar affair and the Ramazan appear to have induced a forgetfulness of the Suez railroad. When the Pacha went to Cairo a month ago, he told Mr. Galloway his first care on arriving there should be to send him his final and definite instructions; but since then nothing further has been done.

INDIA AND CHINA.—The Overland Mail despatched from Bombay on the 2nd ult. reached Marseilles in the

afternoon of the 2nd inst. We have Bombay papers to the date of the departure of the mail; advices from Calcutta to the 19th Sept., and from China to the 3d August. The latter, however, add nothing to the news brought direct from Hong Kong to Suez by the Akbar steamer, last month. The principal item of intelligence from India is an insurrection at Lahore, and the murder of Shere Singh, his son, and all their families, on the 15th September. The Sirdar Ajeet Singh is the perpetrator of this bloody tragedy. The event took place at the north gate of Lahore, about a mile and a half from the palace, at half-past nine o'clock, on the morning of the 15th. The conspiracy was formed by Fakeer Azeez-ood-deen and Dhyen Singh, and it fell to the lot of Sirdar Ajeet Singh to execute it; Sirdars Golab Singh, Lena Singh, and Soochet Singh were also concerned. Dhyen made the arrangement by proposing to the Maharajah to inspect Ajeet's troops, which the Maharajah said he would do the following morning, and orders were accordingly issued. On the Maharajah's arrival at the parade ground he found fault with the appearance and condition of some horsemen purposely placed to attract attention, when Ajeet became saucy, words ran high, and drawing a pistol from his bosom, Ajeet shot Shere Singh through the head, the ball having entered his right temple. General Ventura and his party attacked the murderer, but being opposed by a powerful body of troops, were defeated. Ajeet cut up the Rajah's body, placed his head on a spear, and on entering the town met Prince Purtaub Singh's suwari, which was immediately attacked, and the prince killed. The palace was taken, the treasury thrown open, and the troops paid their arrears of pay; every child and all the wives of Shere Singh and Prince Purtaub were then brought out and murdered, amongst the rest one of Shere Singh's sons only born the previous evening. Troops were sent off to guard all the ghauts, and all the opposite party (except Gen. Ventura, who escaped) were made prisoners. Ajeet after having killed Shere Singh was returning to the fort and met Dhyen; he told him he had done the deed, and asked him to return; he got into Dhyen's carriage, and when they got near the gate of the fort, Ajeet stabbed Dhyen, and sent his body to his brother and his son, who surrounded the city with their troops, while the people inside continued plundering all night. In the morning (16th) Heera Singh having entered the fort, seized Ajeet, Lena, and others, and having avenged the murder of his father by putting them to death, exposed their heads in the plain and threw their bodies into the bazaar. Dhuleep Singh, an alleged son of Kurruck, 10 years of age, is on the throne, and Heera Singh has been appointed Prime Minister; but the greatest possible anarchy prevails, and perhaps the lives of those now in power are not worth much. The revolution is thought likely to lead to British interference in the affairs of the Punjab, and an eventual annexation of that fertile country with 4,000,000 inhabitants, and a revenue of upwards of 2,000,000 sterling, to our dominions. The tragical event proves that the empire founded with so much labour by Runjeet is on the eve of dislocation. Runjeet died in June, 1839; his son Kurruck succeeded. He died, and was followed by Nao Nihal Singh, who was killed at his father's funeral. Shere Singh succeeded, and he has been killed, and a child placed in his room, to become a victim in his turn. As if in anticipation of the events of Lahore, a large army had been ordered by Lord Ellenborough to prepare to assemble on the banks of the Jumna. Orders were also issued to have a body of Bengal troops sent to occupy Scinde, from whence the Bombay troops were to be withdrawn; but doubts are now formed of the feasibility of that movement, as all the Bengal force will be requisite to protect the frontiers against the Sikhs. There are 16,000 men now in Scinde. Sir C. Napier is at Kurrachee; the troops in Scinde are generally healthy, except the newly-arrived ones at Sukkur that have come from Bengal. Shere Mahommed is said to be in the hills near Candahar. Dost Mahommed, who rules at Cabul, seems desirous of being on friendly terms with the British Government. It is thought he will attempt now to retake Peshawur from the Sikhs, and he may therefore come into collision with the British Government, who are bound to protect Runjeet Singh's descendants. In the interior of India tranquillity prevails. Gwalior appears quiet for the moment, although there was great alarm created there when the intention of the Supreme Government to collect troops became known. Bundelkund is also at rest. In the Nizam's territory a change has taken place by the removal of the old Prime Minister Chimdo Lall, who has been succeeded by a relative. The trial of two of the principals and eight of the confederates of the Bunder gang, who have for years been robbing, plundering, smuggling, and, as it is supposed, murdering in the harbour of Bombay, had attracted great interest. The detection of this gang, after it had existed 20 years, is looked upon with great satisfaction by the friends of Indian civilization. Lord Ellenborough remains at Barrackpore, whence he is expected to proceed soon to the north-western provinces. He is still abused by a part of the Indian Press, but another portion supports his policy as tending to produce good results. Sir Hugh Gough has taken the command of the army. The monsoon has been eminently favourable to the agricultural products of the country.

WEST INDIES AND SOUTH AMERICA.—The mail-steamers *Severn* arrived at Falmouth on Monday, with dates from Tampico, 29th Sept.; Vera Cruz, 1st, Havannah, 9th, Nassau 13th, and Bermuda, 22d Oct. She brings important news of the British flag having been insulted in Mexico by the President Santa Anna, at a ball given by him in that city. It appears that a grand ball was given at the Palace on the 11th Sept. in commemoration of a battle fought at Tampico between the Mexicans and the

Spanish expedition headed by General Barradas in 1829, in which the former were victorious, as well as in commemoration of their independence. At this ball our Chargé d'Affaires, Mr. Doyle, and other foreign Ministers, were present. The ball-room was decorated with a number of Texan and other flags, which were displayed as trophies of war taken from the enemy, and among them a St. George's ensign was also exhibited. Mr. Doyle immediately recognised it as a British emblem, pointed it out to the Minister for Foreign Affairs, and requested it might be removed; stating at the same time that as he did not wish to produce any disturbance in the company, he would be satisfied to have it taken down when the ladies retired to supper. The Mexican Minister replied that it must have been put up by some mistake of the room decorator, and that he would speak to the President about it. Santa Anna, however, on being applied to, refused to have it removed. Upon this being communicated to Mr. Doyle by the Mexican Minister, he said he must now consider it as an intentional and deliberate insult offered to the flag, and immediately withdrew from the room, followed by all the English gentlemen present. Mr. Doyle next day wrote an official letter to the Minister upon the subject, which remained unanswered for a week, and the reply, when it did reach his hands, merely stated, that the Mexican Chargé d'Affaires in London would be instructed to communicate with the British Government concerning it; and, as if to demonstrate their determination to insult, the flag was kept up and again displayed on the 27th of the same month, on the occasion of another fête given in honour of the entrance of the army into the city of Mexico after the battle. Mr. Doyle, therefore, has suspended all official intercourse with them until he hears from his own Government, and so the matter rests for the present.—From Jamaica we learn that the island had been visited with seasonable showers, and the crops generally bore a thriving appearance. A slight shock of an earthquake was experienced on the morning of the 5th October, but, fortunately, it was attended with no damage. The health of the colony was good, a few casual instances of fever only occurring to cause alarm. A number of claims for remuneration of losses sustained by the late fire were in the course of presentation to the authorities. The houses destroyed are valued, making, with some other claims, a total of 100,000*l*. The "Puseyite" controversy is carried on with great acrimony in the journals. Agriculture increases in interest, and commands more than ever the general attention, as does also the application of machinery to tillage and manufacture. A new manure has been discovered in a cave at Dry Harbour, consisting of the excrement and reliquæ of bats, covering to a considerable depth a very extensive surface. It has been analyzed, and is likely to prove from the chemical nature of its ingredients a valuable commodity. A trial is about to be made with it, and it is also supposed that other caves, the natural resort of bats, may contain similar deposits.—From Peru we have intelligence that an English vessel, called the *Vitula*, has been seized for stealing guano off the rocks on the coast. We learn also that a treaty has been concluded between the Peruvian Government and certain individuals at Lima for the supply of guano, the particulars of which are as follow:—The contract was entered into in Lima by various mercantile houses there with the Peruvian Government, to whom a very large sum was advanced for the exclusive privilege of exporting the guano for five years by the contractors, who, in conjunction with the Government, consign it for sale to their agents in London and Liverpool. The contract, as soon as it was signed in March, 1842, was published at length in all the Lima newspapers, and particularly in the official *Gazette*, and became a matter of notoriety accordingly. The quantity of guano to be shipped was limited to 120,000 tons during the five years of the duration of the contract. The maximum nominal value of the guano is calculated in the contract at 30 dollars, or, about 6*l*. per ton. Supposing this price to be realised, the contractors are allowed to set off one-half against the advance to the Government and at the end of each year's operations the remaining half is to be paid into the Lima treasury in bonds, a moiety in those of the external, and another in those of the internal debt of Peru, at their representative or nominal value. Thus, were 6*l*. per ton realised on 120,000 tons, one-fourth, or 180,000*l*. of the nominal foreign stock of Peru would have to be paid into the Exchequer in yearly proportions. Since the contract was made, about 8,000 tons of guano have been sold at above 10*l*. per ton; and it is supposed, now the merits of the article are becoming known, that at least 20,000 tons will be required for the supply of next year's demand, particularly as large quantities are shipping for our West India colonies. The committee of Spanish American bondholders in London have held a meeting on the subject, and have resolved on endeavouring to prevent the Peruvian Government from buying up their bonds with money that should be applied to the discharge of the overdue interest.—By advices from the Brazils to the 13th Sept., it appears that the nuptials of the Emperor with the Princess Thereza of Naples were solemnized on the 4th of that month, the Princess having arrived at Rio the day previous. There were great rejoicings on the auspicious event, and the imperial bride and bridegroom were greeted with enthusiasm by thousands of their subjects from all parts of the empire. In the evening a splendid illumination took place, with a grand display of fireworks, amidst the salutes of the English, French, Neapolitan, and national ships of war. A great number of new titles and decorations of the different orders were conferred.

CITY.

Money Market, Friday.—Consols closed at 96½ to 1 for money and the account; 8 per Cents. Red., 95½ to 1;

3½ per Cents. Red., 102½ to 103; New 3½ per Cents., 103½ to 104; Exchequer Bills, 62s. to 63s. prem., and 62s. to 64s. prem.

Metropolis and its Vicinity.

Destitution in the Metropolis.—We lately noticed the number of houseless poor who resort to the parks for shelter during the night, many of whom had begun to make preparations for passing the winter in the gravel-pits and hollows beneath the banks. Since the announcement of the fact first appeared in the daily papers several contributions have been received for the relief of the poor people, and a society is in progress of formation for the purpose of establishing a House of Refuge. The police reports of the daily papers have recently contained numerous accounts of destitution among the needlewomen who work for the slopsellers and outfitters at the east end of London. In many of these cases the women were charged with having pawned the goods entrusted to them by the contractors employed by the slopseller to make up his materials into shirts at a contract price per dozen. These middlewomen again employed the workwomen to make the shirts. According to the evidence 1*d*. a shirt was the profit of the contractor. If the work was what is called "fine work," it was paid higher than ordinary, viz., 6*d*. per shirt per diem, it being part of the agreement that one shirt was to be finished in the day. Three shillings a week was thus the sum total which the needlewomen were to earn, by working 18 or 19 hours per diem, while for an ordinary shirt the contract price was from three-half-pence to 3*d*. The magistrates on learning these facts not only dismissed the charge, but assisted the prisoners with small donations from the poor-box. Public attention has now been directed to the distress of this industrious class, and the following extract from a letter addressed to the *Times* is only one of numerous communications which have been called forth by the recent disclosures. "Perhaps it is not generally known that the proprietors of several establishments at the eastern part of the metropolis, who employ needlewomen to make up slop-work, compel them to attend at four and five o'clock in the morning to receive the materials which are afterwards made up into trousers, waistcoats, and shirts; and that many of these poor creatures are employed at their needle 18 and 19 hours a-day. It is not an unusual circumstance for girls to employ themselves from 6 o'clock in the morning until 12 o'clock at night, then snatch a few hours' sleep, and rise and 'attend shop,' as it is termed, to obtain more work. The earnings of the shirt and trousers-makers are very precarious, and 6*s*. is considered by many of them 'a good week.' A few who do the fine work for respectable houses in the city earn more; but great numbers who are constantly employed for 18 hours a-day do not obtain more than 4*s*. a-week. The squalid appearance of the women in Shadwell, Stepney, and St. George's-in-the-East is remarkable. Sometimes as many as five or six young girls occupy one small room, in which they work and sleep and take their meals in common, plying their needles from morning to night. Pulmonary complaints are common among them, and their close application to this unhealthy occupation in confined apartments produces premature old age. The slopworkers are frequently compelled, by want or sickness, to pawn the materials entrusted to their care; but their employers seldom lose anything by this, as they invariably obtain security to the amount of 3*l*. or 5*l*. the value of the cotton or linen given out to be converted into shirts. A case was recently heard at the Thames-police Court, in which a slopseller in Ratcliffe-highway was the prosecutor. He stated that he had 153 needlewomen in his employ, of whom 28 had turned out defaulters, and their securities in many instances had made good the loss. He also stated that he gave his work out at 4 o'clock in the morning, and that the greatest distress prevailed among the women who were compelled to make up slop-work; but so great was the competition in the trade, that he found it impossible to give so much as he wished to the persons he employed, and that he felt so much for them that when they disposed of his property he seldom or ever prosecuted, and he only came forward on this occasion after a remand, in compliance with the express directions of the magistrate, in consequence of an unfounded attack on his character made by the prisoner on a previous examination. He mentioned one case of great distress:—A poor widow who had lately given birth to a child, and whom he had intrusted with 32 shirts to make up, pawned the whole of them for the purpose of obtaining nourishment for herself and infant during her confinement; and if she had not done so, he believed she must have perished from want. He waited on the pawnbroker, and remonstrated with him on the impropriety of taking in unfinished work from needlewomen. He ascertained that the shirts were pawned for 35*s*., and offered to pay 10*s*. to redeem them if the pawnbroker would bear the remainder of the loss, which he consented to do. He could mention other cases of an equally distressing character, and said the low prices given for slop-work, and the facility offered by pawnbrokers for the disposal of the materials, caused persons to violate the law by illegally pawning the articles intrusted to their care. The shirtmakers, in fact, finding they cannot obtain a subsistence by the wages allowed them, make away with the property, and, being unable to redeem it, are either driven upon the streets, or else become confirmed thieves, and end their days in a penal settlement or a model prison."

Lord Mayor's Day.—The new Lord Mayor, Ald. Magnay, entered upon his office on Thursday with all the state and ceremony belonging to this, the great festival of the City. The usual procession took place in the morning, and the inauguration dinner was given at Guildhall;

several of the ministers, judges, ambassadors, &c. were present. Sir R. Peel returned thanks for the toast of "Her Majesty's Ministers," which was received with great applause. The Lord Chancellor also spoke in the course of the evening. Sir G. Murray returned thanks for the Army, and Chief Justice Tindal for the Judges.

Gresham College.—The ceremony of re-opening Gresham College, in the new building in Basinghall-street, took place last week. This institution, as is generally known, was founded in the reign of Queen Elizabeth by Sir Thomas Gresham, who bequeathed his own mansion in Broad-street, which covered a space as large as that now occupied by the Bank of England, with a suitable endowment, for the purposes of the college. In that building, which escaped the great fire of London, the college rose to great eminence: the most distinguished names in England were numbered among its professors, whose lectures were attended by crowds of the respectable classes. In 1767, the site of the building was selected by Government for the erection of a new Excise-office, and it was accordingly surrendered by the trustees of the college, on consideration of a perpetual annuity of 500*l.*; the trustees agreeing to pay 1,800*l.* towards the expense of pulling down their own building. This extraordinary transaction had the effect of ruining the college. A small room in the Royal Exchange, capable of holding some 25 persons, was allotted to the professors for the delivery of their lectures, and the consequence was, that the lectures ceased to be delivered, and the appointments became sinecures. When the Exchange was burnt a few years since, the preparations for rebuilding it directed attention to the state of Gresham College. A claim was made on its behalf for suitable accommodation in the Royal Exchange; but the matter was settled by the erection of the spacious and handsome building which was opened last week. The lecture-hall, where the ceremonial took place, will conveniently accommodate about 600 persons. The Lord Mayor was present in state, with several of the civic functionaries, the members of the Gresham committee, &c. After prayer by the Rev. Dr. Birch, a hymn was sung by the vocal band assembled for the musical part of the ceremony. The academical business of the college was then commenced by the Rev. J. Pullen, Professor of Astronomy, who delivered a lecture on that science, to which he gave the character of an address to the audience on the occasion which had brought them together. In giving a general and popular view of the progress of modern astronomy, he pointed out the large share which Gresham College had in this progress, from the labours and discoveries of those who had been its professors. After this address a concert was given under the direction of Professor Taylor, in which Mr. Phillips, Miss Rainforth, and other well-known vocalists, took part.

Court of Aldermen.—In consequence of the late proceedings in the parish of St. Stephen's, Walbrook, it is rumoured in the ward that Alderman Gibbs's friends are likely to induce him to resign his gown, and that Messrs. Flight, Travers, and Pilcher will become candidates to succeed him. It is also said to be the intention of the inhabitants to nominate Mr. Rock, of Walbrook, as a Common Councilman.

Reform Club.—On Monday evening a trial was made between the Bude and Faraday Lights, fixed for that purpose in two of the libraries of the Reform Club. There were present several scientific persons, and many gentlemen connected with the club. The result of the experiment was in favour of the Bude Light as to brilliancy of illumination, ventilation, and freedom from heat. The Bude gave a light equal to 30 argands, and lighted the room perfectly at every point. The Faraday Light consisted of 18 lights, and the smoke of the gas was carried off by tubes. The heat increased six degrees after the Faraday was lighted, and it was of a subdued tone, and not so brilliant as the Bude Light.

The Nelson Monument.—Mr. Bailey's statue of Lord Nelson, which was exhibited last week within the inclosure in Trafalgar-square, has at length reached its ultimate destination on the top of the column, erected after the design of Mr. Railton. The statue was taken to pieces in order to facilitate its elevation. The legs and lower part of the trunk were raised on Friday, after six hours' labour, and the upper portion was raised on Saturday. The arm was also in the course of the day united to the body, and the whole completed. At present the scaffolding prevents the spectators in the street from judging of the appearance of the figure; nothing but the cocked hat can be distinctly seen, the whole being surrounded with scaffolding and pieces of timber. The statue faces Charing-cross, and has its back turned towards the National Gallery. The elevation of the statue was conducted in a very quiet manner, and it was hardly known that it was in process of being carried up until it had attained its utmost point. A flag-staff was then erected which reached above the head of the figure, and from it was displayed one of the flags borne by the Victory at the battle of Trafalgar. During the process of elevation, not the slightest vibration was perceptible in the scaffolding, which is itself remarkable as a piece of scientific workmanship. It is 170 feet in height, and is composed of 150 loads, or 7,500 cubic feet of timber.

The Colosseum.—This building has been sold by Mr. Geo. Robins to Mr. Montague, brother of the City Surveyor. The price paid is said to be under 25,000*l.*, although Mr. Braham paid 40,000*l.* for it. Mr. Stanfield, the academician, and Mr. Bradwell, of Covent-garden Theatre, have been employed by the purchaser to produce a pictorial exhibition to succeed the great picture of London, which will occupy Mr. Stanfield's attention for nearly twelve months. The Conservatory and the Swiss Cottage are to undergo an entire change; and it is

said to be the intention of the new proprietor to render the Colosseum one of the most attractive places of amusement in the metropolis.

The Wood Paving in Cheapside.—It will be remembered that the Commissioners of Sewers recently stopped the further progress of wood paving in Cheapside, on account of an injunction obtained from the Vice-Chancellor of England by the Metropolitan Company against the London Wood Paving Company, as the proprietors of Perring's system, on the ground that it was an infringement of the patent of the former company. Since that occurrence it appears that an amicable arrangement has been effected between the companies, and the injunction is ordered to be forthwith dissolved. The result of this arrangement is that the work will be resumed and the whole of Cheapside completed, from Bow-church to St. Paul's, with Perring's patent.

St. Stephen's, Walbrook.—A meeting of the vestry, adjourned from the 26th ult., was held on Wednesday. Mr. Rock was called to the chair, and informed the vestry that he had entered a bill on the file of Chancery on Saturday, and that Alderman Gibbs would be legally bound to give a decisive answer in a month at furthest. After some remarks from Mr. Howitt, relative to the "garbled accounts" furnished by Ald. Gibbs, Mr. Horner demanded his authority for stating that those accounts were garbled. He was a friend of the Alderman, and was sorry that he had not adopted a more straightforward course; but he could assure the meeting that the select vestry was now busily and industriously looking over the accounts of the last eighteen years, and he would pledge his honour that these accounts would be furnished to the parish in a printed form in a week or so. The world would then see that Alderman Gibbs was untarnished, and that he had acted throughout the whole time of his stewardship in a satisfactory and honest manner. He begged that gentlemen who had made that room an arena for the purpose of showing off their talents would dispose themselves to silence. It was then resolved to adjourn for a further period, to give the Alderman an opportunity of making good his promise.

Kensington.—The magistrates for this division of Middlesex assembled in special sessions on Monday, to take into consideration an application from Mr. Morland for a license for the Royal Kent Theatre in High-street. A recommendation was read signed by the churchwardens, overseers, and a number of the inhabitants of the town and neighbourhood, that the theatre should be licensed, together with a petition against the license being granted, signed by the vicar and other clergymen of different denominations resident in the parish, and by a number of the leading and most influential inhabitants. After a long discussion, the magistrates decided on refusing the license.

Mortality of the Metropolis.—The number of deaths registered in the week ending Saturday, October 28, was as follows:—West Districts, 159; North Districts, 174; Central Districts, 223; East Districts, 269; South Districts, 291; Total, 1,116 (males, 567; females, 549). Weekly average for the last five years, 903 (461 males, 442 females); and for the last five autumns 908.

Provincial News.

Birmingham.—Mr. Attwood, formerly M.P. for this town, has published an address to the inhabitants, in which he seems to recommend a sort of revival of the "Birmingham Union," for the purpose of returning to a paper currency. The following gives some intimation of his view of the present state of affairs:—"I have been exceedingly reluctant to interfere again in political affairs. For a long time I have watched, without hope, the extreme sufferings of the people. But a great change has come over the prospects of the country during the last fifteen months. The late great alterations in the corn and provision laws have given a prodigious accession of strength to the public cause; they have at last brought the owners of land nearly into a community of suffering and of feeling with the unhappy owners of labour. Those great alterations have already produced the disturbances in Wales, and the Repeal proceedings in Ireland, and they are at this moment rendering the payment of the rent of land literally impossible much longer in England under our present taxation and our present monetary laws. Either the taxation must give way, or the rent of land must give way, or the monetary laws, which strangle industry, must give way. To use my old phrase, either the burdens must be cut down to a level with the means, or the means must be lifted up to a level with the burdens. I think, therefore, that a great opportunity has now arisen in which all classes may possibly be induced to unite in one common effort to relieve the common suffering and avert the common danger. If not, I much fear that the doom of our country is written above, and not to be arrested by human means." Mr. Attwood thus treats of the effect of wealth in excess:—"In my humble judgment, founded upon long reflection, and the experience of history, all Governments, of whatever kind, or however composed, whether republican, despotic, or limited, have a tendency to use the power of accumulated wealth in oppressing and defrauding productive industry. From this great principle proceeds the decline and fall of nations. The ancient Republics made innumerable efforts to counteract this fatal tendency of things. Such men as Solon and Lycurgus occasionally succeeded, and for a time arrested the moral ruin. But ultimately the power of accumulated wealth prevailed, and dogged those glorious republics to untimely graves." Mr. Attwood says that no man has done more than he has to put the navy of England in fighting order, and he adds:—"Yet I cannot conceal from my mind the truth, that if the English Government had no navy to protect them from foreign aggression, the English people

would have been much better protected from domestic oppression. We should never have heard the odious and delusive words 'over-trading,' 'over-population,' and 'over-production.'" The following is his account of the best governed country in Europe:—"The Government of Prussia is a despotism; but Prussia is probably the best governed nation in Europe. Surrounded by more powerful rival nations, and under the constant apprehension of either French, or Austrian, or Russian aggression, the Government of that country places money in every man's pocket, education in every man's head, and arms in every man's hand! Such a people cannot be oppressed."

Cambridge.—There is a rumour that Prince Albert, on the resignation of the present Chancellor, the Duke of Northumberland, is to be Chancellor of the University. It is not generally known to what circumstance the rumour owes its origin; but it gains credence throughout the University. The Rev. Dr. Hodgson, Master of St. Peter's College, has been elected Vice-Chancellor for the ensuing year. On resigning his office the late Vice-Chancellor, the Rev. Professor Whewell, delivered a Latin oration in the Senate House, congratulatory of the auspicious event which had just taken place, and eulogising the general conduct of the Academic body on the occasion of the Royal visit. The degree of D.D. has been conferred on Archdeacon Lonsdale of King's College, London, now Bishop of Lichfield, by Royal mandate.

Carmarthen.—A rumour is current that another special commission for the trial of the Carmarthenshire prisoners will be sent down after term into this county. It appears to have arisen from the fact of the county gaol being quite full of Rebecca prisoners, and from one of the Treasury solicitor's clerks being in the town arranging the evidence against the prisoners. In many parts of the county the late verdict against the Rebecca prisoner Hughes, at Cardiff, has excited intense animosity against the jury who tried him. It is said that some farmers from the more disturbed districts have affected even to be incredulous that such a verdict was ever returned by a Welch jury. So far as an opinion can be formed at present, however, the severity of the sentence appears to have had a salutary effect, whilst it has, at the same time, excited universal commiseration for the culprit. The prisoners themselves have issued an address calling on others to take warning by their fate, and to stop in their course before they fall into their condemnation. They say, "We are guilty, and doomed to suffer, while hundreds have escaped; let them and every one take care not to be deluded again to attack public or private property and resist the power of the law; for it will overtake them with vengeance and bring them down to destruction. We are only in prison now, but in a week or two shall be banished as rogues, to be slaves to strangers in a strange land. We must go in the prime of life from our dear homes to live and labour with the worst of villains, looked upon as thieves. Friends, neighbours, all, but especially young men, keep from night meetings, fear to do wrong, and dread the terrors of the Judge. Think of what we must, and you may suffer, before you dare to do as we have done. If you will be peaceable and live again like honest men, by the blessing of God you may expect to prosper, and we—poor outcast wretches—may have to thank you for the mercy of the Crown—for on no other terms than your good conduct will any pity be shown to us or others, who may fall into our almost hopeless situation." The western part of Radnorshire is at present in an excited state, and numerous toll-bars in that county have been destroyed. The rioters have also had recourse to incendiary fires, and no less than twelve fires took place in one night last week in the neighbourhood of Ruthin. The Royal commission has been daily occupied since the 25th ult. All its meetings have been conducted in privacy, as far as relates to the press. The following is a succinct account of its proceedings:—A strict and methodical inquiry into the accounts of the various trusts in Carmarthenshire has hitherto been the principal object of the commissioners, but this employment has been almost daily varied by applications or complaints from individuals, or parochial deputations relating to various subjects of alleged grievance, of a local or general nature. As the commissioners had invited information from all parties who could elucidate the causes of the recent outbreak, or who laboured under any grievance which called for redress, they have given audience to persons of all stations, including county magistrates, trustees of tolls, clergy, farmers, guardians of the poor, and others. The same topics have been adverted to by many different parties, as constituting the principal sources of complaint. Among these are—1st. The turnpike system—the number and expensiveness of the gates and bars—the inconvenience caused by the contiguity of several trusts crossing each other and competing for toll, to the great inconvenience of those who reside on the roads near the point of contact. 2. The working of the Poor Law, particularly with reference to the salaries of the medical, relieving, and other officers of unions. The latter objections were urged by a deputation from the parish of Llanarthney, consisting of the Rev. H. Williams and some of the principal parishioners, who had a conference with the commissioners on Tuesday week. An absolute recurrence to the principles of the old system of poor-laws was also advocated by some, though they did not appear willing to adopt all the conditions of the former practice. They thought that the justices had then too much power, but that guardians had now too little. The increase of the burden of tithes by the working of the Commutation Act is another subject on which several representations had been made to the commissioners, who have inquired into the details of some cases mentioned to them. The undue expenditure of the county rate and the

exorbitant charges of magistrates' clerks have been likewise urged as forming a part of the list of grievances, and into these subjects the commissioners have expressed their intention of instituting a careful inquiry. Some other matters upon which they have been appealed to seem to partake too much of a personal and peculiar character to be classed among the "causes of disturbance" which they are charged to investigate. Such, for instance, are the rating to the lighting and paving-rates and borough-rates of Carmarthen of persons living beyond the precincts of that town, and therefore deriving no benefit from the application of such rates—or the recent enforcement of a penal statute which had been for some time practically obsolete, regulating the use of particular casks for packing butter. The time of the commissioners, with the exception of such intervals as have been occupied in the manner described, has been employed in the examination of the accounts of the several trusts. The commissioners have expressed their complete satisfaction so far as their inquiry has hitherto gone with the readiness shown by all parties whom they have examined to afford the fullest information in their power.

Chichester.—The interior of the cathedral of this city is now undergoing restoration. The ancient tombs and their effigies, and the mutilated Purbeck marble columns, which have so many years been suffered to remain in a decayed state, are restoring under the superintendence of Mr. Richardson, who was employed in the restoration of the Temple Church.

Hounslow.—One of the mixing-mills at the gunpowder-works on Hounslow-heath exploded on Saturday morning, by which the boarding and roof were ripped off the building, but no further damage was done, and no one injured.

Liverpool.—A correspondent ("Facile") informs us that Anderson, the convict, the account of whose connection with the Preston Guild and other robberies has been already noticed in this Paper, has attempted to bribe the keepers who were taking him by railway to London previous to his transportation to a penal colony. One of the parties has called upon the *Liverpool Mercury*, and stated that Anderson's first offer was 600*l.* to the contractor and 100*l.* to the keeper—700*l.* in all. This took place at Birmingham. After he saw that there was no hope he offered the same party 250*l.* and 700*l.* to the contractor, and at last he wished a sum to be named, as hundreds were of no consequence to him. There was a party in the train ready to give the money as soon as any bargain was made. The person states that he has no doubt that 5000*l.* or 6000*l.* would have been given for Anderson's liberation.

Leeds.—In our last Number there appeared an account of a charge brought on the previous Monday against Mr. Thomas Walker, attorney, of Dewsbury, of having forged the name of Mr. Bere, a Commissioner in the Leeds District Court of Bankruptcy, to a spurious interim order of protection, and a renewal thereof, to an insolvent. The forgery was distinctly proved, and the prisoner was admitted to bail to take his trial at the next assizes. It having been discovered that there were other charges of a like nature against him, he was apprehended on Friday morning and taken before the Leeds borough magistrates, on a charge of having forged the signature of Mr. West, the other Commissioner at the Leeds Court of Bankruptcy. In this case he had been employed by a man named Burnley, of Batley, to get him through the Court as an insolvent. He gave Burnley an interim order on the 18th July, which extended until the 6th October, on which day he gave him a renewal of the order until the 15th inst. Both the order and the renewal were produced and shown to Mr. West, who stated that the signatures were forgeries. The registrar proved that no petition of an insolvent of the name of Burnley had been filed in the Court, and no fees paid on behalf of any such insolvent. The prisoner made no defence, and was committed to York Castle for trial.

Leicester.—We lately mentioned that Mr. Messenger, the farmer charged with the murder of his servant, had been admitted to bail. The *Leicester Mercury* states that on Sunday he invited his sureties and other friends to a feast to celebrate his release on bail, when they drank ardent spirits to such excess that one Johnstone, of Rothley, died in consequence.

Llandaff.—The Rev. Knight Bruce, Chancellor of Llandaff, has issued an appeal to the clergy for subscriptions for the restoration of the cathedral church of the diocese. The building is in several parts in a dilapidated condition, and many of its principal beauties have been entirely destroyed. The Dean and Chapter have subscribed 1,000*l.*; two laymen have contributed 100*l.* each, and the Queen Dowager has sent a donation of 100 guineas.

Manchester.—A requisition, numerously signed, has been got up by the merchants and traders of Manchester, calling upon each other to make the sacrifice of half a day in the week by closing their places of business at one o'clock on Saturdays, in order to afford time for the recreation and intellectual improvement of their assistants. The measure has the assent and support of some of the leading commercial men of the town.

Nottingham.—On Saturday week, at 2 A.M., the residence of the Rev. Robert Meek, rector of St. Michael's, Sutton Bonnington, was entered by five men in smock frocks, with their faces masked with black crape, who stole therefrom several valuable articles. The burglars effected an entrance by breaking open the front door with a crow-bar. Mr. Meek was awakened by the noise; he looked out of the window, and although the night was dark and stormy, he observed several men in front of the house; the Rev. gentleman then went to his man-servant's room, and requested him to get up, as he suspected thieves were endeavouring to enter the house. The man, however, got out of the window, clambered up a spout to the top of the house, and remained there until the robbers had disappeared. Mr. Meek then discovered that the

thieves had already effected an entrance. He slipped down a flight of back stairs, and went out at a back door to obtain assistance from the village, but when about 120 yards from the house, he was attacked by two men, who struck him on the head with a crow-bar, inflicting three severe and dangerous wounds, and then dragged him to the house. The ruffians then went up stairs and broke open the bedroom door, which Mrs. Meek had locked when her husband went off for assistance; they held a crow-bar over the lady as she lay in bed, and demanded the money that had been received that day for rent, and also the key of an iron chest. Mrs. Meek at once gave them the key, and the thieves commenced a regular search, breaking open the drawers and ransacking every drawer, but they could not succeed in finding the object of their search, which was in a desk concealed from sight. They remained in the house upwards of an hour, and then went off together. The police, however, succeeded in obtaining a clue to the robbers, and three men residing in the village have been apprehended on suspicion.—The local papers state that the workmen employed in pulling down an old dwelling-house at Gotham, in this county, found the probate copy of the will of a man named Burrows, who had resided there many years ago, and owned the property. It was found stuck between two walls in the staircase. This property has been long held by Earl Howe, in consequence of the inability of the parties to make any title to the same; but it is now conceived that his Lordship will, on a pedigree being produced, and the title of the heir-at-law established, readily relinquish the possession.

Oxford.—Dr. Kenyon, Fellow of All Souls, has been appointed Vinerian Professor of Common Law. The *Oxford Chronicle* states that the Rev. Mr. Sibthorp has addressed a letter to the President of Magdalen College, intimating his return to the English establishment, and soliciting re-election to his fellowship.—The Bishop of Oxford has written a letter to Dr. Pusey, entirely exonerating Mr. Newman from the charge of having broken his faith with his Lordship, by suffering a re-publication of Tract 90. The Bishop says, "I lose no time in stating, that when I requested the *Tracts for the Times* might cease, however I might have regretted the original publication of Tract 90, it formed no part of my injunction or request (from well-considered reasons at the time) that there should be no re-publication of that tract. People may feel themselves at liberty to express their opinions as to the policy or propriety of having published more editions of that tract; but the accusation of Mr. Newman's having done so, contrary to promise, is unfounded and unjust. No one, however, who has the slightest knowledge of Mr. Newman will give a moment's credit to such a charge of unfaithfulness in him; and I feel sure it is unnecessary for me to state to Mr. Newman or yourself that nothing which I have said or written can have given the remotest grounds for the accusation."

Portsmouth.—The following is an extract from one of Mr. Brooke's letters received by the overland mail, announcing the safety of her Majesty's ship Samarang, and dated Sarawak, August 13:—"I am happy to add that the Samarang is afloat and getting ready for sea, with little or no injury."

Windsor.—A general meeting of the inhabitants of this town was held on Friday, for the purpose of taking into consideration a proposition made by the Earl of Lincoln, as head of the Woods and Forests, that the town should contribute the sum of 8,000*l.*, being a moiety of the estimated expenses for draining the castle and town of Windsor. After the Mayor, who was in the chair, had briefly addressed the meeting, Mr. Adams, builder, proposed a resolution that the inhabitants decline bearing any share of the expenses, observing that in the event of the passing of a contemplated Act to compel the inhabitants to improve the drainage of the town, it might be effectively done for less than 3,000*l.* Mr. Bedford moved as an amendment that the sum of 5,000*l.* be contributed towards the expenses, and raised by the disfranchisement of the Corporation property, which was negatived, and after considerable discussion the following proposition of Mr. Adam was carried:—"That considering the vast extent of Crown property within this borough, in no way contributing to the parochial rates, and the extensive defalcation in the various ratings arising from the destruction of property with recent improvements of the Castle, and being convinced of the inability of the borough to meet any material addition to its present burthen, resolved, that this meeting feels itself compelled to decline to contribute towards the expenses of executing the extensive and extravagant plan proposed by the Commissioners of her Majesty's Woods and Forests, with a view to the drainage of the Castle and town, the more especially as such plan would appear to be confined almost entirely to the service of the Castle, and that a very considerable proportion of the town and its suburbs are wholly excluded from any contemplated benefit to be derived therefrom."

Railways.—The following are the returns for the past week:—Birmingham and Derby, 1,480*l.*; Birmingham and Gloucester, 1,816*l.*; Eastern Counties, 2,651*l.*; Edinburgh and Glasgow, 2,337*l.*; Great Western, 14,212*l.*; Grand Junction, 7,511*l.*; Glasgow, Paisley, and Ayr, 1,359*l.*; Great North of England, 1,538*l.*; Hull and Selby, 1,014*l.*; London and Birmingham, 16,542*l.*; London and South-Western, 6,207*l.*; London and Blackwall, 665*l.*; London and Greenwich, 708*l.*; London and Brighton, 4,120*l.*; London and Croydon, 228*l.*; Liverpool and Manchester, 4,007*l.*; Manchester and Leeds, 4,846*l.*; Midland Counties, 2,902*l.*; Manchester and Birmingham, 2,845*l.*; Northern and Eastern, 1,778*l.*; North Midland, 4,384*l.*; Newcastle and Carlisle, 1,473*l.*; South-Eastern and Dover, 3,768*l.*; Sheffield and Manchester, 445*l.*; York and North Midland, 1,658*l.*—A public meeting was held at Salisbury last week, to further

the project of a railway communication between that city and London, by means of a branch line, to join the South-Western at Bishopstoke. An estimate prepared by Mr. Locke fixed the cost of the line at less than 250,000*l.*, whereas a former estimate, when a similar project was in contemplation, was given at 400,000*l.* The meeting was unanimous in support of the measure, and a committee was formed, of which the Hon. Sidney Herbert and other influential landowners in the district are members. It appears that the South-Western company engage to raise one-half of the required capital. Surveys of the projected line are already in a forward state, and the necessary measures will be taken in order that an act of Parliament may be obtained in the ensuing sessions.

IRELAND.

Dublin.—The bills of indictment against Mr. O'Connell and his fellow-travellers were sent up to the city of Dublin grand jury on Friday forenoon. They are enormous in extent, covering not less than ninety-five feet of parchment. The indictment was accompanied by an abstract of its contents, prepared by the Crown counsel; but some members of the grand jury having objected to the reading any abstract, when they were sworn to consider the indictment itself, the voluminous document had to be gone through, count by count. The deepest interest was manifested by the crowds in and about the courts respecting the progress of the prosecutions. During the day a number of witnesses for the Crown—36 it is stated—were in attendance, in apartments near the grand jury room, to which the police prevented access; but at four o'clock, on an intimation from the grand jury that there was not the slightest chance of their coming to any decision on that day, the witnesses were directed to go home. On Saturday the deepest interest again prevailed in the courts respecting the prosecutions, and much anxiety was exhibited in all quarters to learn what progress had been made with the indictment. In the afternoon the foreman of the grand jury and other jurors came into court and stated that there appeared to be a clerical error in the fourth count of the indictment, in which the names of two persons were included—Thomas Tierney and Peter James Tierney—whereas this name should have been Peter James Tyrrell. Some of the jury appeared to think that as this was a clerical error, the name of Peter James Tyrrell should be substituted for Peter James Tierney. A desultory discussion ensued, which terminated in the Chief Justice declaring that all the members of the court were of opinion that the alteration could be made, as the document was not properly a bill of indictment in that state. The alteration was then made by the clerk of the crown, and the bill returned to the grand jury. When they adjourned, shortly before five o'clock, they had examined but one witness, namely, Mr. Vernon, the Registrar of the Stamp-office, whose depositions were merely technical, respecting the registry of the proprietors of the *Pilot*, *Freeman's Journal*, and the *Nation*.—Mr. Bond Hughes, the Government reporter, and several other witnesses, were subsequently examined, and on Wednesday afternoon the Grand Jury came into court with a true bill. Mr. O'Gorman, one of the Jury, however, declared that he dissented from that finding. The Attorney-General moved that the traversers be now called upon their recognizances. The Clerk of the Crown then called upon Daniel O'Connell, Esq., John O'Connell, Esq., Thomas Steele, Esq., M. T. Ray, Esq., John Gray, Esq., Charles G. Duffy, Esq., and the Rev. Messrs. Tyrrell and Tierney, all of whom appeared. The Attorney-General then said that he had next to call upon the Court to put a rule upon the parties that they should plead within four days. Mr. Steele objected to be prosecuted by the Attorney-General. The several parties then applied by their Council for copies of the indictment. The Attorney-General said that copies should be furnished them within an hour. A discussion of some length arose as to enlarging the time for pleading; but the Court said the statute was peremptory, and they were bound to go by it. There was a considerable number about the court to hear the event, but the town was perfectly tranquil.—On Monday Mr. M'Donogh applied for a *mandamus*, calling on the Magistrates of College Street Police-office to receive Mr. Barrett's informations charging Mr. Bond Hughes with perjury. The application was opposed by the Attorney-General, and the Lord Chief Justice held that if the grand jury were to receive evidence against the Crown, that would be trying the case, which it was not their province to do. Now, that being the rule, which was as old as the law itself, he asked, how would it be possible, without infringing on that rule, to permit bills of indictment to be sent up against Mr. Hughes until the existing bills were disposed of? When that occurred, it would be competent for the parties to prefer bills of indictment against Mr. Hughes or any other witness; but the court, in the present stage of the proceedings, could not consent to allow the accused parties to become witnesses in their own case.—The weekly meeting of the Repeal Association was held on Monday. After a resolution had been passed pledging the Association to use every effort to promote the general collection of the O'Connell Compensation Fund for 1843, which is fixed for Sunday the 19th inst., Mr. O'Connell handed in 100*l.* as Proclamation Money from the law clerks of Dublin, and moved an address to the people of Ireland, pointing out the objects of the Repeal agitation, showing that they do not desire separation from England or Catholic ascendancy, but freedom of conscience, education, and the press. This address was adopted, together with the draft of another to the Queen, to be presented by each parish in Ireland. Mr. O'Connell said "it might be objected that the address to the people reiterated matter that had been spoken of before—it certainly did, but it was his plan to reiterate his

topics until they were fully impressed upon the public mind. He would move that the committee be directed to warn the people of Ireland against committing any crime—they had come to the great crisis of their great experiment—an experiment to demonstrate that by peaceable means the most beneficial alterations in human institutions could be obtained. If they adhered to perfectly peaceable means, he saw the certainty of carrying the Repeal. The Government might incarcerate him and others within four walls, but there were others to stand in their places. Ireland had an excellent leader in the person of Smith O'Brien, who declared at the dinner given to him in the county of Limerick, that if to wish the liberty of Ireland was a conspiracy, he was a conspirator." At the close of the meeting the rent for the week was announced to be 1303*l.* 16*s.* 5*d.*—The *Cork Reporter* last week published an improbable story respecting a letter said to have been addressed by the Duke of Wellington to the Earl of Glengail, conveying information respecting the army and its service in Ireland, and stating "that almost all the British army, certainly every regiment which could be spared and made available for service, will be concentrated in Ireland; that camps will be formed in different parts of the country, and particularly in the neighbourhood of cities and towns, &c.; and that supplies of arms, ammunition, and subsistence of every description, would be sent into the country from England, for the use of the army, so as to make it independent of, or not dependent upon, the Irish peasantry or people." This statement has gone the round of the Irish papers, but Lord Glengail has published a denial that any such letter was received.

Cork.—A fatal affray took place at the Steam Saw-mills in this city on Saturday night, in which Dr. Quarry, one of the proprietors, was killed. It appears that the other partner, Mr. Wilson, had withheld possession of part of the building from Dr. Quarry, who called at the mills, and was in the act of going up-stairs, when he was met near the top by a workman, Thomas Carroll, who opposed his going up, and a scuffle ensued, when Carroll called out to his brother Denis to bring a blunderbuss, which he presented at Dr. Quarry, but it missed fire; he then caught it by the butt-end, and struck the Doctor on the head and shoulders, by which he was knocked down the flight of stairs. Then Donoghue, one of the assistants of the Doctor, came up, but got a blow from a sharp instrument which knocked him down, and rendered him for a time insensible; when he recovered he saw Carroll striking Dr. Quarry on the head with a "saw-buckle." The rest of the party seeing the Doctor thus used, made an attempt to go up, when Carroll fired down on them, but hit no one. Smith, the apprentice, went down to the office and brought up a large pistol, which he discharged at Carroll without effect, when the fire from the top was quickly returned, but fortunately without effect; and Ryan, the watchman, affirms, that when the Doctor was lying down bathed in his blood, he saw Mr. G. F. Delany, who was keeping possession for Mr. Wilson, kick the Doctor several times in the most brutal manner. Dr. Quarry lingered until Sunday evening when he expired, and the Coroner's Jury have returned a verdict of Murder against all the parties concerned. Mr. Wilson the partner has also been arrested on the charge of being an accessory before the fact.

SCOTLAND.

The Hebrides.—On Tuesday week two islands, named Rasay and Bona, situated in the Hebrides, were sold by auction at the Auction Mart, London. They were for many years the property of the M'Leods, of Rasay, and comprise about 18,000 acres. The net value of the estate, including the mines and the timber, was about 73,000*l.* There were 52 farms, the rent arising from which was about 1200*l.* They were capable of improvement, in consequence of the facilities of communication from them to the metropolis, the journey now being completed in less than 36 hours. The estate was put up at 20,000 guineas, and eventually knocked down at 35,000 guineas.

THEATRICALS.

COVENT GARDEN.—As might have been anticipated from the recent proceedings at this theatre, the establishment is now closed. The actors were assembled on Saturday morning on the stage of the theatre, preparatory to a rehearsal of the pieces announced for Mr. Wallack's benefit on Monday, when a message was received from the manager that there would be no performance, or, in other words, that the theatre would not open again. The French juvenile performers have since appeared at the St. James's Theatre, and the principal actors of the English company have left town on a provincial tour.

Miscellaneous.

American Debt.—The following letter has been addressed by the Reverend Sydney Smith to the Editor of the *Morning Chronicle*. "Sir,—You did me the favour, some time since, to insert in your valuable journal a petition of mine to the American Congress, for the repayment of a loan made by me, in common with many other unwise people, to the State of Pennsylvania. For that petition I have been abused in the grossest manner by many of the American papers. After some weeks' reflection, I see no reason to alter my opinions or to retract my expressions. What I then said was not wild declamation, but measured truth. I repeat again, that no conduct was ever more profligate than that of the State of Pennsylvania. History cannot pattern it: and let no deluded being imagine that they will ever repay a single farthing—their people have tasted the dangerous luxury of dishonesty, and they will never be brought back

to the homely rule of right. The money transactions of the Americans are become a by-word among the nations of Europe. In every grammar-school of the whole world *ad Græcos Calendas* is translated—the American dividends. I am no enemy to America. I loved and admired honest America when she respected the laws of pounds, shillings, and pence; and I thought the United States the most magnificent picture of human happiness. I meddle now in these matters because I hate fraud—because I pity the misery it has occasioned—because I mourn over the hatred it has excited against free institutions. Among the discussions to which the moral lubricities of this insolvent people have given birth, they have arrogated to themselves the right of sitting in judgment upon the property of their creditors—of deciding who among them is rich, and who poor, and who are proper objects of compassionate payment; but, in the name of Mercury, the great god of thieves, did any man ever hear of debtors alleging the wealth of the lender as a reason for eluding the payment of the loan? Is the Stock Exchange a place for the tables of the money-lenders; or is it a school of moralists, who may amerce the rich, exalt the poor, and correct the inequalities of fortune? Is Biddle an instrument in the hand of Providence to exalt the humble and send the rich empty away? Does American Providence work with such instruments as Biddle? But the only good part of this bad morality is not acted upon. The rich are robbed, but the poor are not paid; they growl against the dividends of Dives, and don't lick the sores of Lazarus. They seize with loud acclamations on the money-bags of Jones Loyd, Rothschild, and Baring, but they do not give back the pittance of the widow and the bread of the child. Those knaves of the setting sun may call me rich, for I have a twentieth part of the income of the Archbishop of Canterbury; but the curate of the next parish is a wretched soul, bruised by adversity; and the 300*l.* for his children, which it has taken his life to save, is eaten and drunken by the mean men of Pennsylvania—by men who are always talking of the virtue and honour of the United States—by men who soar above others in what they say, and sink below all nations in what they do—who, after floating on the heaven of declamation, fall down to feed on the offal and garbage of the earth. Persons who are not in the secret are inclined to consider the abominable conduct of the repudiating states to proceed from exhaustion—"they don't pay because they cannot pay;" whereas, from estimates which have just now reached this country, this is the picture of the finances of the insolvent states:—Their debts may be about 200,000,000 dollars, at an interest of 6 per cent.: this makes an annual charge of 12,000,000 dollars, which is little more than 1 per cent. of their income in 1840, and may be presumed to be less than 1 per cent. of their present income; but if they were all to provide funds for the punctual payment of interest, the debt could readily be converted into a four or five per cent. stock, and the excess, converted into a sinking fund, would discharge the debt in less than thirty years. The debt of Pennsylvania, estimated at 40,000,000 dollars, bears, at five per cent., an annual interest of 2,000,000 dollars. The income of this state was, in 1840, 131,000,000 dollars, and is probably at this time not less than 150,000,000 dollars; a net revenue of only 1½ per cent. would produce the 2,000,000 dollars required. So that the price of national character in Pennsylvania is 1½ per cent. on the net income; and if this market price of morals were established here, a gentleman of a thousand a year would deliberately and publicly submit to infamy for 15*l.* per annum; and a poor man, who by laborious industry had saved 100*l.* a year, would incur general disgrace and opprobrium for 30*s.* by the year. There really should be lunatic asylums for nations as well as for individuals. But they begin to feel all this: their tone is changed; they talk with bated breath and whispering apology, and allay with some cold drops of modesty their strippling spirit. They strutted into this miserable history, and begin to think of sneaking out. And then the sordid press of America contends that the English under similar circumstances would act with their own debt in the same manner; but there are many English constituencies where are thousands not worth a shilling, and no such idea has been broached among them, nor has any petition to such effect been presented to the Legislature. But what if they did act in such a manner—would it be a conduct less wicked than that of the Americans? Is there not one immutable law of justice—is it not written in the book? does it not beat in the heart? Are the great guide-marks of life to be concealed by such nonsense as this? I deny the fact on which the reasoning is founded; and if the facts were true, the reasoning would be false. I never meet a Pennsylvanian at a London dinner without feeling a disposition to seize and divide him—to allot his beaver to one sufferer and his coat to another—to appropriate his pocket-handkerchief to the orphan, and to comfort the widow with his silver watch, Broadway rings, and the 'London Guide,' which he always carries in his pockets. How such a man can set himself down at an English table without feeling that he owes 2*l.* or 3*l.* to every man in company, I am at a loss to conceive: he has no more right to eat with honest men than a leper has to eat with clean men. If he has a particle of honour in his composition he should shut himself up and say—"I cannot mingle with you: I belong to a degraded people—I must hide myself; I am a plunderer from Pennsylvania." Figure to yourself a Pennsylvanian receiving foreigners in his own country, walking over the public works with them, and showing them Larcenous Lake, Swindling Swamp, Crafty Canal, and Rogues' Railway, and other dishonest works. 'This swamp we gained (says the patriotic borrower) by the repudiated loan of 1828. Our canal robbery was in 1830; we pocketed your good people's money for the railroad only last year.' All this may

seem very smart to the Americans; but if I had the misfortune to be born amongst such a people, the land of my fathers should not retain me a single moment after the act of repudiation. I would appeal from my fathers to my forefathers. I would fly to Newgate for greater purity of thought, and seek in the prisons of England for better rules of life. This new and vain people can never forgive us for having preceded them 300 years in civilization. They are prepared to enter into the most bloody wars with England, not on account of Oregon, or boundaries, or right of search, but because our clothes and carriages are better made, and because Bond-street beats Broadway. Wise Webster does all he can to convince his people that these are not lawful causes of war: but wars, and long wars, they will one day or another produce; and this, perhaps, is the only advantage of repudiation. The Americans cannot gratify their avarice and ambition at once; they cannot cheat and conquer at the same time. The warlike power of every country depends on their Three per Cents. If Cæsar were to reappear upon earth, Wettenhall's List would be more important than his Commentaries; Rothschild would open and shut the Temple of Janus; Thomas Baring, or Bates, would probably command the Tenth Legion, and the soldiers would march to the battle with loud cries of Scrip and Omnium Reduced, Consols, and Cæsar! Now, the Americans have cut themselves off from all resources of credit. Having been as dishonest as they can be, they are prevented from being as foolish as they wish to be. In the whole habitable globe they cannot borrow a guinea, and they cannot draw the sword, because they have not money to buy it. If I were an American of any of the honest states, I would never rest till I had compelled Pennsylvania to be as honest as myself. The bad faith of that state brings disgrace on all; just as common snakes are killed because vipers are dangerous. I have a general feeling that by that breed of men I have been robbed and ruined, and I shudder and keep aloof. The pecuniary credit of every state is affected by Pennsylvania. Ohio pays; but with such a bold bankruptcy before their eyes, how long will Ohio pay? The truth is, that the eyes of all capitalists are averted from the United States. The finest commercial understandings will have nothing to do with them. Men rigidly just, who penetrate boldly into the dealings of nations, and work with vigour and virtue for honourable wealth—great and high-minded merchants will loathe, and are now loathing, the name of America: it is becoming, since its fall, the common shore of Europe, and the native home of the needy villain. And now, drab-coloured men of Pennsylvania, there is yet a moment left; the eyes of all Europe are anchored upon you—

"Surrexit mundus justis furibus."

start up from that trance of dishonesty into which you are plunged; don't think of the flesh which walls about your life, but of that sin which has hurled you from the heaven of character, which hangs over you like a devouring pestilence, and makes good men sad, and ruffians dance and sing. It is not for Gin Sling alone and Sherry Cobler that man is to live; but for those great principles against which no argument can be listened to—principles which give to every power a double power above their functions and their offices, which are the books, the arts, the academies that teach, lift up, and nourish the world—principles (I am quite serious in what I say) above cash, superior to cotton, higher than currency—principles without which it is better to die than to live, which every servant of God, over every sea, and in all lands, should cherish. *Usque ad abdita spiramenta animæ.*—Yours, &c., SYDNEY SMITH." Since the above, Mr. Smith has sent the following characteristic note, in reference to some errors of typography, to the Editor of the *Morning Chronicle*:—"Sir,—Your table of errata published the 4th, for my letter of the 3d, is a good indication of the modes of English education. I have twice endeavoured to write the word *shipping*—'*stripping* spirit.' Your printer first printed it '*stripling*,' and then altered it into *stripping*. The fault is entirely mine. I was fifteen years at school and college—I know something about the Romans and the Athenians, and have read a good deal about the præterperfect tense—but I cannot do a sum in simple addition, or write a handwriting which anybody can read.—I am, Sir, SYDNEY SMITH. November 4."

Law.

VICE-CHANCELLOR'S COURT.—(Before the Vice-Chancellor of England.)—*Ranger v. The Great Western Railway Company.*—As to the circumstances of this litigation, our readers will remember that Mr. Ranger was under very stringent, but not unusual, contracts with the Company to complete the works in a limited time, under pain of forfeiture of his plant and machinery, and of a reserved portion of the price which was not to be paid till the works were completed; and that the Company, being dissatisfied with the slow progress of the works, had discharging Mr. Ranger and entered for the forfeiture; that Mr. Ranger had filed this bill for relief against the forfeiture, and for an account, alleging that Mr. Brunel had fraudulently given him insufficient certificates of the work done, so that the Company had not made him such payments as he was entitled to; and that the suit was brought to a hearing under a committee of Mr. Ranger's creditors, who looked to his claims against the Company for liquidation of their debts. His Honour now gave judgment, and decided that there must be a decree for an account, inasmuch as the Lord Chancellor had determined that an investigation must take place as to how far the plaintiff had been sufficiently paid under the superintendence of a Court of Equity. As to the prayers of the bill, his Honour observed that no proof of fraud had been given in respect of the strata through which the tunnels and cuttings were to be made. The charge of fraud seemed an after-thought; and his Honour upheld the extent of the discretionary powers given to Mr. Brunel. It was, he said, of the utmost importance to the safety of mankind that railroads should be well constructed, and the public can have no security that they are well constructed without the judgment of some eminent scientific man. The Great Western Railway Act recognises this principle. The objection that Brunel had shares was of no weight; for it was obvious that the character which the engineer has to sustain

FRIENDSHIP'S OFFERING for 1844. This long established Annual now makes its appearance in a new form and a new dress, the size being *greatly enlarged*, and the list of Steel Engravings increased both in beauty and number with the further addition of appropriate Wood Engravings and other embellishments. The volume, thus changed in everything *but the price*, and the genius and distinction of the Contributors is justly styled "*the best and cheapest Annual of the season.*"
London: SMITH, ELDER, and Co., 65, Cornhill.

I. Psalm Tunes. II. Sacred Music. III. Glee, Madrigals, Duets, Songs, &c.

THE PEOPLE'S MUSIC BOOK. A Work intended to meet the growing demand for Music among all classes of the community.—Principally arranged for Four Voices, and, where admissible, with an accompaniment for the Organ or Piano Forte. Each Number contains three separate portions, forming respectively a complete body of the best Music for the Cathedral, the Church, or Chapel; the Family, the Glee Club, and the Madrigal Society.

Published Monthly, in parts, comprising 32 pages super-royal 8vo, price 1s.

The 30th Edition of 1000 each.

FLETCHER'S FAMILY DEVOTION; containing the Morning and Evening Service of a Family for every day throughout the year. Embellished with 17 elegant Engravings. Bound in cloth, gilt edges, price 1s. 6s. Recommended by 25 distinguished Ministers in England, and upwards of 100 Clergymen in the United States of America.

"Our attention has lately been called to an advertisement of a book of 'Family Devotion,' containing the Morning and Evening Service of a Family for every day throughout the year. According to the advertisement, this new Order for Morning and Evening Prayer daily throughout the year is already in its 30th edition of 1000 each. 30,000 copies of a book of Common Prayer for Dissenters, recommended by 25 distinguished ministers, whose names are given, and who include some of the most prominent of the day, cannot be dispersed throughout England without working some considerable change in the minds of probably 200,000 persons."—*The Times*, Sept. 27, 1843.

Just Published,

A PORTRAIT OF THE REV. JOHN CUMMING, M.A., Minister of the Scottish National Church, Crown-court, Little Russell-street, Covent-garden; engraved by Thomson, from a Painting by W. BOOTH, Esq., in the Possession of Mr. CUMMING. Large paper, India Proofs, 10s.; small paper, plain proofs, 7s. 6d.

London: GEORGE VIRTUE, 28, Ivy-lane, Paternoster-row.

LOUDON'S ARBORETUM ET FRUTICETUM BRITANNICUM. In 8 vols. 8vo—4 of letterpress and 4 of plates—price 10l.

This being the season for planting Trees and Shrubs, planters are reminded that the above work contains by far the most copious history, natural and artificial, of all the Trees and Shrubs which will stand the open air in Britain, that has ever been published; including their description, uses, propagation, culture, diseases, effect in landscape, and every other particular desirable to be known by the planter and landed proprietor.

There are botanical figures of all the species, drawn to one scale; and portraits of the trees, also drawn to a scale, showing the different sizes which the different kinds attain when ten years planted, and also when full grown; an object which was never before attempted in any work on Trees.

"This book is one of solid value, worthy a place in the library of every landed gentleman, as well as of every student of botanical, arboricultural, and horticultural science. . . . The 'Arboretum Britannicum' is complete in its kind, and it must become a standard book of reference on all subjects connected with Trees."—*Quarterly Review*.

Printed for the Author, and sold by Messrs. LONGMAN and Co., 39, Paternoster-row; where may be had.

LOUDON'S EDITION OF REPTON'S LANDSCAPE GARDENING AND GARDEN ARCHITECTURE, illustrated by numerous Plans, Sections, Views, &c. In one vol. 8vo, price 1l. 10s. plain; coloured, 3l. 6s.

This is by far the most complete work on laying out grounds that has hitherto been published; and by means of the numerous plans and sections, the whole may be readily comprehended by the working gardener, as well as by the amateur.

Now ready, price 1s., more than 200 pp.

JOHNSON AND SHAW'S FARMERS' ALMANACK and CALENDAR for 1844, containing every information incidental to an Almanac, with engravings and lists of prices of seventy of the most improved agricultural implements from the best makers, manures, &c.

JAMES RIDGWAY, Piccadilly; and every bookseller in every market town in the kingdom.

N.B. To prevent disappointment, order "Johnson and Shaw's Farmers' Almanack."

AWFUL EVENTS IN 1844.—Now ready, price 1s.

ZADKIEL'S ALMANAC for 1844; containing unerring PREDICTIONS of the Wars, and other exciting events, at the eve of the awful period thus foretold by the GREAT NOSTRADAMUS in 1555.

3. THE BEST METHODS OF IMPROVING HEALTH AND INVIGORATING LIFE, by Diet and Regimen: containing the most approved Principles of Longevity. With the Art of Training, &c.

"The most useful and rational work of the kind."—*Atlas*.

"Calculated to increase the comfort and extend the days of all classes."—*Edinburgh Observer*.

SIMPSON and Co., Paternoster Row; and HATCHARDS, 187, Piccadilly. Sold by all Booksellers.

NEW WORK ON GARDENING.

In 1 vol. (pp. 764), illustrated by 383 Engravings, price 16s.

THE SUBURBAN HORTICULTURIST; adapted for the Use of those interested in the Formation and Management of either Large or Small Gardens. By J. C. LOUDON, F.L.S., &c.

No pains have been spared towards rendering this work as complete as possible. It contains full instructions for the formation of gardens and their management, according to the most approved modes of practice. Extensive information will be found respecting the nature of soils and their improvement; the different kinds of manures and their application; the operations of Planting, Sowing, Budding, Grafting, and the various other modes of Propagation; Pruning and Training of Standard, Dwarf, Espalier, and Wall Trees. The formation of borders for Fruit Trees, the construction of Forcing Houses, Pits, and other structures for forcing and protection, and the various modes of Heating by Hot Water and otherwise, are treated of in full detail, as are likewise the Cropping and Particular Management of the Kitchen Garden, Forcing of the Pine Apple, Vine, Peach, Fig, Cucumber, and Melon. Lists and descriptions of the best varieties of Vegetables and Fruits are also included. Those who have a considerable knowledge of Gardening will find in this work much information to which they may advantageously refer; whilst it will enable such as are inexperienced to proceed with every probability of success.

"Mr. Loudon has made a most successful attempt to teach the science of gardening to the uninitiated, &c."—*Paxton's Magazine of Botany*, March, 1843, p. 46.

"The novice in gardening will here find ample instructions in the various branches of labour, such as digging, trenching, mowing, &c., as well as for the propagation of plants by budding, grafting, inarching, and other methods."—*DR. LINDLEY, in Gardeners' Chronicle*, Nov., 1842.

Published by WILLIAM SMITH, 113, Fleet-street.

PLATE.—A. B. SAVORY & SONS, MANUFACTURING SILVERSMITHS, No. 14, Cornhill, London, opposite the Bank of England. The best wrought FIDDLE-PATTERN SILVER SPOONS and FORKS, at 7s. 2d. per ounce. N.B.—A price current, stamped as a newspaper, illustrated by drawings, and containing every information relative to the purchase of silver or Sheffield plate, may be had on application, or will be sent into the country, free of postage, in answer to a paid letter.

BUTTER MADE IN TEN MINUTES

BY THE NEWLY-INVENTED CHURN.

REGISTERED ACCORDING TO ACT OF PARLIAMENT.

This Act imposes a penalty of from 5l. to 30l., for each imitation, piracy, or selling, recoverable by the proprietors before a magistrate, or by civil action. Half the penalty will be given to any person informing the proprietors of any infringement. The words of the Act are "No person or persons shall copy or alter any design, either by adding to, or subtracting from," &c.

ATTWOOD, WIMBLE, & WARNER, MANUFACTURERS, LEWES, SUSSEX.

This CHURN being made entirely of Block Tin, the necessary degree of temperature can be given to the cream, by placing it in a pan of cold or hot water, which ensures the butter coming in 10 or 12 minutes. The simplicity of its construction, and the facility with which it may be cleaned, are no inconsiderable advantages over those now in common use. The great advantages of this Churn will be found in the winter; but in the heat of summer placing the Churn in cold water will be the means of hardening the Butter.

Sizes	No. 1	2	and 3
Churn from	7 to 8 lbs.	13 to 15 lbs.	26 to 28 lbs.
Price, carriage paid to London.	25s.	35s.	42s.

Metal Pans for Churns to stand in, 4s. (d.), 6s., and 7s. Larger sizes made to order.

To be seen in London, at WRIGHT'S Range Warehouse, No. 3, Arthur-street, near the Monument; RIGBY'S Brush Warehouse, No. 80, Gracechurch street; LIVERMORE and SON, Ironmongers, No. 30, Oxford-street; BENHAM, 19, Wigmore street, Cavendish-square. Export Agents, BARNES & Co., 109, Fenchurch-street.

DRESS COATS, Superfine cloth, 30s. to 40s.; extra quality, 50s.; Frock-coats, silk facings, 35s. to 45s.; ditto, silk velvet collar and silk facings, 50s.; Waterproof Wrappers, 10s. 6d. to 21s.; fashionable York and Chesterfield ditto, 10s. to 25s.; Waistcoats, 5s. to 8s. 6d.; Silk, Satin, and Kerseymere, 10s. to 14s.; Trousers, 8s. 6d. to 12s. 6d.; stout Doeskin and Kerseymere, 16s. to 25s.; Shooting Jackets, 10s. 6d.; Boys' and Youths' Tunic and Hussar Suits, 30s.; a Suit of Superfine Black Cloth, 3l. 3s.; best quality, 5l.—At FISHER and Co.'s, 31, King William-street, City, 10 doors from London-bridge.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

PATENT ASPHALTE ROOFING. The above material has been used and highly approved by the Nobility, Gentry, and Agriculturists generally, as a ROOFING and COVERING TO SIDES of Farm Buildings. Its Advantages are—LIGHTNESS, DURABILITY, AND ECONOMY. BEING A NON-CONDUCTOR, IT HAS BEEN PROVED AN EFFICIENT

"PROTECTIVE MATERIAL" TO PLANTS,

And is now in use at the

"ROYAL HORTICULTURAL SOCIETY'S GARDENS, CHISWICK."

THOMAS JOHN CROGON, 8, Ingram-st., Fenchurch-st., London

SMOKE PREVENTED AND VENTILATION EFFECTED, BY SPONTANEOUS ACTION.

MR. JEAKES, 51, Great Russell-street, Russell-square, Sole Agent in London for the Sale of DAY'S PATENT WIND-GUARD, by the use of which he guarantees to Cure all Chimneys Smoking from Wind, and also to prevent downward currents; it is admirably adapted for the Ventilation of Apartments of every description; also of Ships, Stables, Dairies, and Larders, as it ensures a constant change of air; and all its parts being fixtures, it is free from noise and not liable to derangement; it also offers no impediment to sweeping. Price for general use, 30s.; larger size, 45s.; larger sizes, especially adapted for ventilation, 60s. and upwards. To be had at 51, Great Russell-street, where it may be seen in action. The attention of Architects, Builders, and the trade in general, is especially invited.

ROWLAND'S MACASSAR OIL.—Patronised by Her Majesty, H.R.H. Prince Albert, the Royal Family, and the several Courts of Europe.—This elegant, fragrant, and pellucid Oil, in its preservative, restorative, and beautifying qualities, is unequalled over the whole world. It preserves and reproduces the hair, even at a late period of life; prevents it from turning grey; or if so changed, restores it to its original colour; frees it from scurf and impurity, and renders it soft, silky, curly, and glossy, and retains its curl and other decorative form uninjured by the variations of the atmosphere or the effects of the crowded assembly—facts which are abundantly proved by the numerous testimonials which may be seen at the Proprietors'. To Children it is especially recommended as forming the basis of a beautiful head of Hair. Price 3s. 6d., 7s., Family Bottles (equal to four small), 10s. 6d., and double that size, 21s. per bottle.

CAUTION.—Each genuine bottle has the words "ROWLAND'S MACASSAR OIL," engraved in two lines, on the wrapper, and on the back of the wrapper nearly 1,500 times, containing 29,028 letters. Be sure to ask for "Rowland's Macassar Oil."

Sold by the Proprietors, A. ROWLAND and SON, 20, Hatton-garden, London, and by Chemists and Perfumers.

* * * All others are spurious imitations!!!

GLASS SUPERSEDED for HORTICULTURAL PURPOSES by WHITNEY'S CHEMICAL TRANSPARENT WATERPROOF COMPOSITION, rendering Muslin, Calico, or Linen, for the Frames of Greenhouses, Pine, Melon, or Cucumber Stoves, &c., impervious to rain or moisture, admitting light equal to Glass, much warmer, and the plants never burn under it.

The cheapness of this composition, its durability, and equal utility with Glass, render it not only a useful but most important article to Gardeners and Florists, as the expense of a two-light Frame will not be so much as the annual cost for breakage on a Glass one.

Noblemen, Gentlemen, and Gardeners will, by using this composition have the only effective protection for their Fruit-trees during the blooming season; it is a certain defence from frost, sleet, wind, and blight; its transparency admits the general beams of the sun, with abundance of light, which causes the bloom to expand with increased luxuriance, the fruit to set and swell more freely, much earlier, and a crop of fruit to any extent may be warranted. The covering not to be moved by day (except to thin the Fruit, which will be necessary), till the month of June. It is recommended that the Calico be prepared early, so as to be thoroughly dry before using.

Sold in Bottles, with directions for use, pints, 2s. 6d., quarts, 4s. 6d. each. Prepared by GEORGE WHITNEY, Chemist, Shrewsbury. Seedsman, Florists, and Merchants supplied by Mr. W. BAILEY, Chemist, North-street, Wolverhampton. Agents wanted for London and the country.

WANTED, a GARDENER.—Wages, 48l. per annum. A single Man would be preferred, unless with a Wife capable of taking charge of a Laundry, who will be enabled to earn, 3 days in the week, from 8s. to 10s. No one need apply who cannot produce to perfection the commonest vegetables and hardy annuals, and can keep his garden in neat order; no glass to be taken charge of except Cucumber and Melon frames.—Apply to Mr. McLEOD, Brewer, Camberwell.

WANT PLACES.—All Letters to be post-paid.

AS GARDENER.—A respectable single Man, aged 33, who understands Pines, early forcing of Grapes, Melons, and Flowers, Fruit-trees, Kitchen Gardening, and has lived in the most respectable families many years: can have a good character from the situation he has just left.—Direct to B. C., Post-office, Camden Town.

AS GARDENER.—An active married Man, without family, aged 35, of respectable habits, and well experienced in all the superior branches of Gardening; he has a good practical knowledge of Landscape Gardening, and would not object to the superintendence of Woods, or a small Farm. He at present holds, and has always held, a first-rate situation, at the same time his terms will not be found extravagant. For further information apply to RICHARD MILTON, Nurseryman, Pontefract, Yorkshire.

AS GARDENER.—A young Man who perfectly understands his Profession in all its branches; can have a good character from the Situation he is about to leave.—Direct A. E., 90, High-street, Camden Town.

TO NOBLEMEN AND GENTLEMEN.

AS GARDENER, OR GARDENER AND BAILIFF.—A single Man, upwards of 30 years of age, who thoroughly understands the Business in all its branches, having lived in some of the principal places in England, and can be highly recommended from a family of note that he has lately left.—Direct to C. B., Mr. KERNAN'S, Seedsman, &c., Great Russell-street, Covent Garden.

AS JOURNEYMAN GARDENER.—A respectable young Man, who would not object to a single-handed place.—Direct to E. B., Bedwell Park, Essendon, Herts.

AS UNDER-GARDENER.—A respectable young Man, aged 21, who has been brought up in a Nursery, and thoroughly understands all kinds of out-door work; he is sober, honest, perfectly trustworthy, and can be well recommended.—Direct to J. C., at the Exotic Nursery, Canterbury.

Printed by MESSRS BRADLEY and LANE, Lombard-street, Fleet-street, in the Precinct of Whitefriars, in the City of London, and Published by them at the Office, 8, CHARLES-STREET, COVENT GARDEN, in the County of Middlesex, where all Advertisements and Communications are to be addressed to the Editor.—Saturday, November 11, 1843.

ROSES.

WM. WOOD AND SON beg leave to remind their Friends that the present month is best suited to the removal of ROSES; and possessing an immense stock this season, they are enabled to offer them in any quantity, on the following very advantageous terms, the selection of the kinds being left to W. W. and Son.

	per doz.	per 100.
Superior Standard Roses	24s.	£7 10s.
Half-standards	12	— 6 0
Half-standards, very fine	18	— 7 0
Half-standards, very superior	24	— 10 0
Dwarfs, fine budded, or on own roots	6s. to 9	— 2 10
Dwarfs, extra fine	12	— 3 15
Dwarfs, extra fine, and very superior	18	— 5 0
Climbing and Noisette	9s. to 12	— 2 10

The above will be sent of the most approved sorts, and of luxuriant growth. Plants presented gratis, to defray expense of carriage. A few more hundred plants of Myatt's Eliza Strawberry, at 3s. 6d. per 100. Cormack's Prince Albert Pea, at 3s. 6d. per quart. Please address, Woodlands Nursery, Maresfield, near Uckfield, Sussex.—Woodlands, Nov. 17, 1843.

ANEMONES AND HYACINTHS.

	per 100	£ s. d.
Fine Dutch Hyacinths, for beds	do.	2 10 0
Choice sorts of ditto, by name	do.	0 12 0
Ditto, finest known for glasses and pots	per doz.	0 12 0
The new large Dutch Double Anemones, quite hardy—surpassing in size and colours any yet introduced to this country; 50 distinct varieties by name for	1	5 0
Ditto, ditto, in mixture, containing most of the above varieties, and equally large	per doz., 2s. 6d.	per 100 0 18 0
Old sorts Double Anemones, mixed	per 100	0 10 0
Superb Double Scarlet ditto (separate)	per doz.	0 4 0
Early Single Anemones, many colours	per 100	0 7 0
Ranunculuses, fine mixed, hardy	do.	0 3 0
Crocuses, Tulips, &c., in great variety.		

The above are particularly recommended for present planting by J. SUTTON AND SONS, Reading Nursery, Reading, Berks. N.B.—J. S. and Sons deliver all parcels free of expense to Railway and Packet Offices, or to any part of London.

TO GENTLEMEN PLANTING.

J. AND J. FAIRBAIRN are induced from the uncertainty upon which they hold the Manor-street Nursery (situated contiguous to the Home Nursery, Clapham Rise, where attention will be given to all applications), to effect a Sale of the Stock at as early a period as possible, consequently beg to solicit the attention of Gentlemen and the trade to the large and remarkably healthy and well-grown stock, consisting of fine large Laurels, twice transplanted, of extra growth; Portugal Laurels, very handsome, Green Hollies, of various sizes; Evergreen Privets, fine Standard and Dwarf Roses in great variety, fine standard flowering Thorns, Almonds, Æsculus, Robinias, and other Ornamental Trees, and Evergreen and flowering Shrubs, with a large stock of fine standard and dwarf, trained and untrained Peaches, Nectarines, Apples, Pears, Plums, and Cherries, of the most approved kinds, and of growth rarely equalled; also, a large assortment of Forest Trees, consisting of Limes, Elms, Birch, Beech, Hornbeam, Spanish and Horse Chestnuts, Mountain Ash, Poplars, and Spruce, and Scotch Firs; also a large number of Gooseberries and Currants, of excellent growth, and of the best varieties in cultivation, to all of which J. & J. F. respectfully invite the inspection of Gentlemen and Nurserymen, flattering themselves that the general character of the Stock is such as to ensure unequalled satisfaction, and which they are disposed to offer at very moderate prices for cash.

J. & J. F. respectfully beg to call the attention of Gentlemen to their advertisement of Heaths, &c., which has appeared in the *Gardeners' Chronicle* of the two last weeks.

Nurseries, Clapham, near London, November 17, 1843.

NORLAND NURSERY, NOTTING-HILL, LONDON.

R. E. GOWER takes this opportunity of offering an Assortment of DUTCH BULBS, which are particularly good. Fine plants of Araucaria Braziliensis. Some large plants of Camellias, very full of bloom. 1-year transplanted Beech, at 4s. per 1000. Flower and Garden Seeds, among which he has a small quantity of Cormack's Prince Albert Pea, at 2s. 6d. per qrt.

HOLLYHOCKS.

J. KITLEY, Lyncombe Vale Nursery, Bath, begs to inform the Public that he is now ready to send out his much-admired Collection of SEEDLING HOLLYHOCKS, 18 blooms of which won the silver goblet given by A. Lawrence, Esq., and the first of 24 blooms in the Society's prizes at the Victoria Park, and also an extra prize at the Bristol and Clifton Show. The best selected, and named, 11. 1s., the second-best do., 12s., the third do., 6s. per dozen.

J. K. has now ready fine healthy plants of his SEEDLING PANSY, "Lyncombe Vale Rival," at 5s. each; (see this Paper of the 6th May, 1843.) Also his SEEDLING CACTUS (speciosa superba), 10s. 6d. per plant; (see this Paper of 17th June, 1843.) Orders received at Mr. NUTTING'S, Seedsman, 46, Cheapside, London, and at the Nursery, as above. A remittance from unknown correspondents will be expected.

BROMPTON PARK NURSERY.—ESTABLISHED 1681.

GRAY, ADAMS, AND HOGG, respectfully call the attention of their customers to the extensive Stock of DWARF, STANDARD, and TRAINED FRUIT-TREES, FIGS, VINES, &c. &c., articles for which their Nursery has been so long celebrated, and which are this season even finer than they have been for some years past; select new stove and greenhouse Plants, of which Catalogues for this season are now ready and may be had on application. They earnestly invite an inspection of their Stock, assured that what orders their friends may favour them with, will have the greatest care and give the utmost satisfaction.—Kensington-road, London.

UNDER ESPECIAL

THE PATRONAGE

OF HER MOST GRACIOUS MAJESTY, THE QUEEN DOW-AGER, HER ROYAL HIGHNESS THE DUCHESS OF KENT, THE RIGHT HON. LORD COTTENHAM, THE EARL OF ORFORD, THE EARL OF RADNOR, COUNTESS OF ZETLAND, &c. &c.

A Letter, of which the following is a copy, has been received from the Honorable William Ashley, Treasurer to the Queen.

Sir, I am commanded by the Queen to acknowledge the receipt of a basket of Tobolsk Rhubarb, sent by you for her Majesty's acceptance, and to say that its excellent qualities fully justify the high character you had previously given it.

I remain, Sir, your obedient humble Servant, (Signed) WILLIAM ASHLEY.

To Mr. William Youell, Horticultural Establishment, Yarmouth.

YOUELL'S CELEBRATED TOBOLSK RHUBARB.

This highly-esteemed variety will be found to be the earliest of all early sorts, as well as the most hardy.—As a proof of its extraordinary precocity, it has been ready for Tarts, &c., the 20th of February, on the open border, in a very exposed situation, and continued to produce its fine large Stalks till September. It would be useless to eulogise its merits further than the great demand for it, together with the many high testimonials of approbation received, claim for it a decided superiority.

The TOBOLSK RHUBARB may be grown in boxes or pots, in any common garden-mould, or enveloped in Damp Moss, and placed in a Closet, Dark Cellar, the back fire-room of a Hothouse, or forced in the open border, under the same treatment as Sea Kale, and watered occasionally, where it will produce its Stalks of a beautiful transparent delicate pink, containing a rich vinous juicy pulp, exempt from the medicinal flavor objectionable in other sorts; and when cooked, retains its beautiful colour, which renders it an elegant addition, as well as a delicious luxury, to the table, at a season when Fruits are unobtainable. Roots planted the latter part of November will be ready for cutting in January. A fresh box brought in every three weeks will afford a regular supply; and the plants, when done with, may be taken out of the boxes and replanted in the open ground, and may be again cut for use in the summer, and re-placed in the cellar, &c. in Nov.

Fine Roots for forcing this season, 12s. per dozen.

FASTOLFF RASPBERRY.

YOUELL AND CO. have much pleasure in announcing they have now ready for sending to any part of the United Kingdom fine Canes of the above highly valuable and much esteemed RASPBERRY, unequalled for the extraordinary size of its fruit and richness of flavour.

IT IS PATRONISED BY HER MOST GRACIOUS MAJESTY THE QUEEN, HIS GRACE THE DUKE OF RUTLAND, THE EARL OF HARRINGTON, THE EARL OF LIVERPOOL, THE LORD BISHOP OF LONDON, LORD VISCOUNT LORION, LORD SONDES, &c. &c., as well as by the HORT. SOCIETY OF LONDON.

For further particulars they beg to refer to their Advertisement of the 4th inst.: Prices as follows:—

Packages containing 100 Canes	£2 5s. 0d.
" " 50 "	1 5 0
" " 25 "	0 14 0

Package included. The usual discount to the Trade, when not less than 200 are ordered.

TWO NEW SEEDLING PICOTEEES.—"LADY ALICE PEEL," 10s. 6d., and "MRS. BENYON," 10s. 6d. per pair.—These two splendid Picotees were raised by the Rev. J. Burroughes, of Lingwood Lodge, Norfolk, and kindly presented by that gentleman to Messrs. YOUELL AND CO., for Particulars of which, see their Advertisement in this Paper of the 16th of Sept.

FINEST CARNATIONS AND PICOTEEES.

YOUELL AND CO. beg to refer the readers of the *Gardeners' Chronicle* to their Extensive List, with Prices, of the above highly-esteemed Flowers, which appeared on the Advertising pages, 706 and 707, of this Paper, of October the 14th, and will be found to contain every variety worthy of cultivation.

	11 4s 0d
12 pair of good Shew Sorts	1 10 0
12 ditto fine ditto	3 0 0
25 ditto ditto	2 10 0
12 ditto extra fine and very superior ditto	5 0 0
25 ditto ditto ditto	

The selection being left to YOUELL AND CO.

ARRIVAL OF DUTCH HYACINTHS AND OTHER BULBS.

YOUELL AND CO. beg respectfully to announce they have received from Haarlem their annual importation of the above in most excellent condition, adapted either for Glasses, Forcing, or open-border culture. Prices as follows:—

Fine Single or Double Show Hyacinths	6s. per doz.
Red, Blue, White, or Yellow	
Extra fine Ditto	9s. to 12s.
Extra fine, and very superior Ditto	18s. "

The selection being left to YOUELL AND CO.

Catalogues may be had on application.

FUCHSIAS.

1 dozen of the newest and very best sorts	21s.
1 dozen fine do.	12s.
1 dozen good show varieties	8s.

Sent by post, free, to any part of the United Kingdom.

ARAUCARIA IMBRICATA.

YOUELL AND CO., possessing the most extensive stock in the country of the above Splendid Hardy Ornamental Tree, beg to offer them on the following advantageous terms:—Fine robust 4-year old plants, 8 to 9 inches high, 10s. per 100, or 30s. per dozen.—Great Yarmouth Nursery, Nov. 16, 1843.

HYACINTHS AND GROWING STOCK.

HUMPHREYS' COMPOUND, applicable to all Greenhouse Plants, to Hyacinths and other Bulbs, and to promote the germination of Seeds. Sold in bottles 1s. 9d. each, by FLANAGAN & SON, Mansion-house-street; HURST & McMULLEN, Leadenhall-street; W. CLARK, Bishopsgate-within; GORDON, THOMPSON, and BASKETT, Fenchurch-street; GRIMLEY AND CO., Covent Garden; BATT and RUTLEY, 412, Strand; CHARLWOOD, Tavistock-row; W. J. NUTTING, 46, Cheapside; G. LAWRENCE, 18, Piccadilly; JOHN KERNAN, Great Russell-street, Covent Garden; LOCKHART, 150, Cheapside; SHUTTLEWORTH, Pantheon; MINIER, ADAMS, and NASH, 63, Strand; THATCHER and SON, Islington; THOMAS WATKINSON, Market-place, Manchester; PONTREY, Leeds; P. LAWSON and SON, Edinburgh; and other leading SEEDSMEN in town and country. Wholesale Agents, DAVY, MACMURDO, and CO., 100, Upper-Thames-st., London.

SEED-WHEAT.—THE SURREY WHITE WHEAT.

That won the Prize of the Royal Agricultural Society of England, may be had of ROBERT GIBBS, 69, High-street, Guildford, Surrey, at 2s. per sack of four bushels. Sacks 2s. each. Post-office order to be sent with every order.

TO GENTLEMEN PLANTING.—A Gentleman

being about to make alterations in his grounds in the vicinity of London, has the following trees and shrubs to dispose of; viz., Limes from 12 to 16 feet in height; Scarlet and Double White Thorns, from 6 to 12 feet, with fine flowering tops; Birch, Elm, Poplar, Mountain Ash, &c. from 12 to 16 feet; about 50 very fine variegated Box, 6 feet, and branched to the ground. Fine Aucubas, Yews, Chinese Arbor Vitæ, Laurels, Lilacs, Guelder Roses, &c. &c. The above have been removed several times, and will again remove in excellent condition.

Apply to Mr. McARTHUR, Nurseryman, Maida Hill, Edgeware-road, London.

CARNATIONS, PICOTEEES, AND PINKS.

MESSRS. N. AND B. NORMAN'S CATALOGUE of Show varieties, with which they have gained 29 Prizes this season, can be had on pre-paid application.—Bull-fields, Woolwich.

JOSEPH SMITH, Tansley Nursery, near Matlock,

Derbyshire, begs respectfully to draw the attention of Noblemen, Gentlemen, and others, to his NURSERY STOCK, upon 22 Acres of Land, in a very exposed part of Derbyshire. The stock thereon is rendered extremely hardy and suitable for planting upon poor exposed lands. The Stock consists of Forest and Fruit Trees, Flowering Shrubs and Ornamental Trees, Roses, Evergreens, and Hardy American Shrubs.

Priced Catalogues to be had on application.

NEW WHITE-FLOWERING WINTER TARES.

—This variety is much earlier than the common kinds, and grows very much stronger; will also bear sowing late.

May be had of ROBERT GIBBS, 69, High-street, Guildford, Surrey. Price 1s. per bushel, including bag or sack. All orders to be accompanied with Post-office order.

MARNOCK AND MANLEY beg respectfully to in-

form their Friends and the Public that their STOCK OF TRAINED and OTHER FRUIT TREES is exceedingly Fine this Season; warranted true. Also EVERGREENS and FLOWERING SHRUBS.—Nursery, Hackney, Nov. 10, 1843.

MYATT'S NEW SEEDLING STRAWBERRY.

J. AND W. MYATT are now ready to send out their J. NEW STRAWBERRY, the DEPTFORD PINE, the fruit of which has been exhibited at the London Horticultural Society, and a Banksian Medal awarded. It has also been submitted to Professor LINDLEY, for whose opinion see *Gardeners' Chronicle*, No. 26, p. 417. It is a most prolific bearer, exhibiting at the same time a profusion of fine fruit and bloom on the same truss. Price, Deptford Pine, 2s. 10s.; British Queen, 1s., and Eliza, 10s. per 100.—Manor Farm, Deptford, Nov. 17, 1843.

CABOOL MELON, is a noble bearer, and most deli-

cious thin-skinned fruit, almost all eatable, and would not be unaptly named a Mountain of Sugar. It grows freely from 6 to 8 lbs. weight. The Seed is direct from Cabool: a package containing five large healthy Seeds will be sent free to any part of the kingdom on the receipt of 3s., payable at the Naim office, North Britain.—Direct to JOHN ROSS, Gardener, Holme by Cawdor, N.B.

SPLENDID NEW LATE PEACH—MORTON'S WALBERTON

ADMIRABLE.

THIS Splendid Variety was raised at Walberton House, in Sussex, the seat of R. PRIME, Esq., and is a Seedling from the Noblesse, which it much resembles both in size and flavour, it possesses all the fine qualities of its parent, but its great merit consists in its ripening fully five weeks later. A fruit was sent to Dr. LINDLEY in 1841, from whom we have received the highest testimonial. The tree is a fine, free, and hardy grower; the fruit is full size, melting, and of excellent flavour; it is a truly desirable variety, and one which no good garden ought to be without.

Good strong maiden plants can be obtained of ALEX. WEBB, Nurseryman, Westgate Nursery, Arundel, Sussex; of Messrs. HURST and McMULLEN, Seedsman, Leadenhall-street; and of Messrs. HAY, ANDERSON, and SANSTON, Newington Butts, London—at One Guinea per plant.

THE BRITISH QUEEN AND PRINCE ALBERT PEAS.

W. J. CORMACK AND CO. beg to announce to their Friends and the Public that they have harvested the above two New Varieties, and will be obliged by early orders, as the stock is limited. They will be sent out, as last spring, in packages, bearing the name of the firm, price 3s. 6d. per quart. The usual allowance to the trade.

N.B.—"Cormack's Early Kent Peas," 14s. per bushel.

Newcross, and Bedford Conservatory, Covent Garden, Nov. 17.

SHILLING'S NEW EARLY GROTTO PEA.

J. AND S. SHILLING have succeeded in raising the above Pea. The Early Frame Pea, impregnated with the Grotto or Oyster Marrow, which they with confidence recommend to the Public generally, being quite as early, and nearly mend to the size of any early Pea in cultivation. Quite hardy, will stand the winter well, and a good bearer; the Pod large and long. They would particularly recommend it to the attention of Market Gardeners.

Price 3s. per Quart; 10s. per Gallon; 17s. 6d. per Peck; 30s. per Half-bushel; 2s. 10s. per Bushel. They have likewise a few Packets of Calceolaria Standishii Seed, at 5s. per pkt.; sent free by post, on the receipt of Postage-stamps, or a Post-office order. London Agents: Messrs. FIELD and CHILF, Seedsman, 119, Lower Thames-street; Messrs. W. and J. NOBLE, Seedsman, 152, Fleet-street; Messrs. JAMES GRAY, ADAMS, and HOGG, Nurserymen, Kensington; and Mr. KERNAN, Seedsman, 4, Great Russell-street.

J. and S. SHILLING, Nurserymen, Northwamborough, Odham, Hants, Nov. 17, 1843.

WHYTE'S SUPERIOR DARK DELICIOUS

BELT, to be had of the grower, at the Rail's Head, Isleworth, of Mr. KNIGHT, Nurseryman, King's-road, Chelsea; Mr. worth, of Mr. KNIGHT, Nurseryman, Brentford; and Messrs. FLANAGAN and RONALDS, Nurseryman, 9, Mansion House-street, London, in packets of 1 ounce, at 2s. 6d. each.

MESSRS. PROTHEROE AND MORRIS respect-

fully inform the Public that they have received instructions from Mr. WILLIAM CORMACK, SEN., to dispose of by Auction a Portion of his EXTENSIVE NURSERY STOCK at New Cross, situated on the north side of the road leading from London to Dover. The Sale to commence on Monday the 14th of December next. Due notice will appear in this and other Papers when the Catalogues are ready for delivery. Persons in the mercantile have an opportunity of inspecting the Stock and becoming purchasers at considerably reduced prices.

ORCHIDACEOUS PLANTS.

TO BE SOLD, a Choice Collection of SPECIMEN PLANTS, the property of a Gentleman.—For particulars and cards to view direct (post-paid) to X. X., 33, Fleet-street.

PLANTING SEASON.—TO NOBLEMEN, GENTLEMEN, PUBLIC COMPANIES, NURSERYMEN, BUILDERS, & Others. **MESSRS. PROTHOROE AND MORRIS** have the honour to announce they have received instructions to submit to Public Auction (without reserve) on the premises, at the Cottage Nursery, Gloucester-place, Camberwell New-road, and the Gravel Field Nursery, Brunswick-road, opposite, on Monday, November 20, 1843, and following days, at Eleven o'clock each day, a most extensive and varied Stock of ORNAMENTAL TREES, SHRUBS, and EVERGREEN AMERICAN PLANTS, ROSES, &c. STANDARD and DWARF TRAINED FRUIT TREES of the choicest sorts. Messrs. PROTHOROE and MORRIS beg to observe it has seldom been their lot to offer to Public competition so desirable a stock of thriving plants of every description and so well worthy the notice of noblemen and gentlemen who may be planting or making alterations on their estates. The stock will be lotted to suit every description of purchasers, and may be viewed the week previous to Sale, when Catalogues is, each, returnable to purchasers, may be had on the premises, of the principal Seedsmen, and at the Auctioneers' American Nursery, Leytonstone.

TO BE SOLD BY PRIVATE CONTRACT—the Property of an Amateur—78 Rows of TULIPS, 13 Rows of HYACINTHS, (containing 92 Bulbs of this year's importation), 73 pair of PINKS, and 50 Pots of choice AURICULAS; also, Tulip drawers, 3 two-light Frames, 1 one-light ditto, and Auricula Stage. The whole of the above are first-rate varieties, and may be sold separate if required.—For further particulars, direct prepaid, to X. Post-office, Gloucester.

N.B.—This Advertisement will not be repeated.

COTTAM AND HALLEN, ENGINEERS, IRON-FOUNDERS, &c. &c., No. 2, WINSLEY STREET, OXFORD STREET, LONDON.

HOTHOUSES, CONSERVATORIES, &c., made upon the most improved principle, either of iron or of iron and wood combined, which can be fixed complete in any part of the Kingdom, at very low prices, in consequence of the present depressed state of the Iron Trade.

HOT-WATER APPARATUS for heating Hothouses, Conservatories, and Greenhouses; Churches, Public or Private Buildings, &c., with COTTAM'S PATENT, or ROGERS' BOILERS. After 15 years' experience, and having fixed upwards of 1500 Apparatuses for the above-mentioned purposes, and by various improvements which they have made during that time, C. and H. can with confidence undertake the erection of similar Apparatus upon the most extensive scale. For the convenience of those who wish to fix their own Apparatus, they have affixed the following low prices:—

Cottam's Patent Boiler, 24 inch	£ s. d.
(Larger Sizes in proportion.)	7 0 0
Rogers' Boiler, small size	3 15 0
Do. do. large do.	4 10 0

Hot-water Pipe, Doors, Frames, and Feeding Apparatus for Boilers, &c.

RENDLE'S Tank System on an improved simple plan.

STRONG IRON HURDLES, 3 ft. high out of the ground, 6 ft. long, with five horizontal bars, weighing about 36 lbs., 3s. 6d. each. Light Cattle Hurdles, 3 ft. 6 in. high, weighing 42 lbs., at 4 0 "

Strong do. do. do. do. 45 lbs., at 4 0 "

Ox Hurdles, 4 ft. high, do. 60 lbs., at 4 6 "

BEST WIRE FOR STRAINED WIRE FENCING, at 8s. 6d. per bundle of 150 yards each. Uprights for ditto, at 7d. each. The Improved continued and every other kind of Fencing, Fancy Wire-work, &c.

HAND GLASS FRAMES for Cucumbers, &c., 18 inches square, 3s. 6d.; 20 inches, 4s. 6d.; 22 inches, 5s. 6d. each.

CAST-IRON FLOWER-STAKES 4 feet long out of the ground, 7s.; 4 feet 6 in., 9s.; 5 feet, 11s.; 6 feet, 15s.; 7 feet, 20s. per dozen.

GARDEN ROLLERS 18 inches long, 34s.; 20, 44s.; 22, 50s.; 24 inches, 60s.; 26, 75s.; 28, 84s.; 30, 105s. each.

Garden Engines, Mowing Machines, Garden Chairs, Super or Garden Tools of all kinds, Garden Vases and Pedestals in great variety, and every description of Horticultural Articles, Agricultural Implements, and Furnishing Ironmongery; Dr. Arnott's Stoves, Anglo-Belgian Cooking Stoves; Broiling Stoves. The above low prices being on account of the depression in the Iron Trade, are subject to future alterations.

Show-Rooms at the Manufactory, No. 2, Winsley-street, where every information may be obtained.

Estimates sent by return of post.

HORTICULTURAL BUILDING & HEATING by HOT-WATER.

J. WEEKS & Co., ARCHITECTS, &c., Gloucester-water Apparatus Manufacturers, beg leave to inform the Nobility and Gentry, that their business, which has been extensive throughout the country for many years, is entirely confined to the BUILDING OF HORTICULTURAL ERECTIONS of every description, and the HEATING of them by HOT WATER.

CONICAL and other BOILERS of all sizes; their largest consumes but a small quantity of fuel, only requiring attention once in 10 hours, and will heat a range of Forcing-houses 300 feet in length.

Their improved plan of BOTTOM-HEAT FOR PITS, by means of an open trough under the bed, is now being universally adopted.

References may be had, and their works seen at most of the Nobility and Gentlemen's seats in the country, nearly the whole of the London Nurseries, and a great variety of Horticultural Erections and Hot-water Apparatus, Models, Plans, Estimates, &c., at their Horticultural Manufactory, Gloucester-place, Chelsea, near Sloane-square.

BURBIDGE AND HEALY'S NEW PLAN FOR BOILERS AND SETTING, FOR WARMING HOTHOUSES, GREENHOUSES, CHURCHES, AND PUBLIC BUILDINGS, MANSIONS, &c. &c. Registered under 6 & 7 Vic., c. 65.

Section of Boiler and Furnace.

Since our Advertisement of October 21, 1843, we have received an immense number of letters from all parts of the United Kingdom, inquiring the particulars of our Apparatus, and many asking in what respects our plan is superior to others.

We beg respectfully to inform our Correspondents, and the Horticultural World (without reference to any of the numerous and ingenious Boilers and Apparatus now in general use), that we will endeavour to convey in as few words as possible, what we consider the advantages of our plan. In the first place, it will be observed that the plan of the Boiler and containing furnace is circular; the Boiler being composed of two truncated cones, one inserted within the other, in such a form as to give the best effect of the fuel upon its sides, and the form is such as to offer a very extensive surface to the action of the fire and heated air, the whole surface being exposed to their joint action, as well also as a considerable portion of the conducting pipes. It will also be observed that the side of the Boiler is ribbed, which vastly increases the surface of it, so that we obtain a very powerful Boiler in an exceedingly small compass. We beg also to call attention to the absence of complicated flues, as the form of the Boiler prevents the dust or soot hanging to its sides, and the top is easily got at and cleaned through the door in front elevation C., p. 732. In no place is the fuel in contact with the Boiler, as in cases where it does we apprehend great loss of fuel, and effect takes place from the rapid abstraction of the heat causing imperfect combustion of fuel. The value of this form of Apparatus is much increased by the excellence of the fire and ash-pit doors (Sylvester's Patent), which are fitted with great accuracy, allowing of the utmost precision of regulation—the greatest importance to the skilful Gardener, as it enables him to continue his fire for any required time, without trouble to himself; or he may at any time, by closing up the door, put out the fire. By not allowing a current of air to pass through the furnace, he thereby prevents the heat of the Boiler and brickwork being conveyed away and lost up the chimney. The Pan, marked Z, is a neat and convenient cover for the top of the brickwork, easily removed and replaced by the Gardener for the purpose of cleansing the Boiler. It acts as a reverberator, and may, under ordinary circumstances be filled with non-conducting material, clean sand, or pebbles, or any other suitable material; and in cases where the Apparatus is fixed within the House, it may be used as a means of rapidly saturating the House with moisture by evaporation. By placing the furnace within the House to be warmed, we believe the utmost economy of heat is produced, as, from the circular form of the Apparatus, and the small space it occupies, it would have a neat appearance. In short, under every circumstance, we believe it to be a perfect arrangement for Horticultural purposes—being simple, economical in first construction, unquestionably durable, and safe; the perfection of economy in fuel, most easily managed; no poking of fuel into small holes, or troublesome extraction of clinkers; adapted with great facility to the circulation of water through pipes, or to the excellent Tank-system of Rendle, or in any way most suitable to the views of the intelligent Horticulturist.—BURBIDGE AND HEALY, 130, Fleet street, London.

HOT-WATER APPARATUS FOR HEATING HORTICULTURAL BUILDINGS, DWELLING-HOUSES, CHURCHES, and MANUFACTORIES, upon improved principles, and at very moderate charges, erected by DANIEL and EDWARD BAILEY, 272, HOLBORN.

D. and E. BAILEY having devoted much time to the consideration of this subject, and had much experience in the erection of apparatus for the above-mentioned purposes, have, by improvements suggested in their practice, rendered their mode of heating not only very efficient, but very simple, and have combined durability in the apparatus with economy in the charge. They have erected apparatus in England, Scotland, and Ireland, for many noblemen and gentlemen, and have had the honour to be employed by the Horticultural Society of London, in executing the works of their splendid Conservatory, lately erected at Chiswick.

D. and E. BAILEY also construct in metal all descriptions of Horticultural Buildings and Sashes, and invite noblemen, gentlemen, and the public to an inspection of their various drawings and models, at 272, Holborn, where they have the opportunity of exhibiting, amongst other metal works, an extremely complete and convenient kitchen apparatus, or range, adapted for the continued supply of hot water, and an arrangement of the oven more complete than has hitherto been brought before the public.

D. and E. BAILEY were the first to introduce metallic curvilinear houses to horticulturists, and can refer to the Conservatory attached to the Pantheon as one of their works, besides many others in this country and on the Continent.

D. and E. BAILEY have prepared a quantity of the Galvanic Plant Protectors, which are now ready for immediate delivery; they beg to introduce to public notice a new Trough Pipe, for Orchidaceous or other Houses where vapour is constantly, or at intervals required, and which may be seen at their Manufactory.

PENN'S SYSTEM OF HOTHOUSE BUILDING, WARMING, and VENTILATING.—The superiority of the principle first introduced by JOHN PENN, Esq., for obtaining a more complete circulation of the atmosphere in heated apartments, being now fully established, W. HILL respectfully acquaints the public that having, in conjunction with the late Mr. Penn, devoted much time and study to perfect the same, in the construction of Conservatories, Stoves, Greenhouses, Pits, &c., and to heat them with improved Hot Water Apparatus, either by Pipes or Troughs, he is enabled to carry out Mr. Penn's principle in a manner to guarantee the most complete success and economy. First-rate references. Plain and Ornamental Designs; and any particulars on application to W. HILL, Surveyor & Builder, Lewisham.

RENDLE'S TANK SYSTEM OF HEATING.

STEPHENSON AND CO., 61, Gracechurch-street, London, Inventors of the IMPROVED CONICAL and DOUBLE CYLINDRICAL BOILERS, having been much engaged in heating buildings upon the above system with Tanks of various materials, solicit the attention of scientific Horticulturists to an Iron Tank now fitting up on their premises, which offers most decided advantages over every other article hitherto employed for the same purpose. These tanks which are ornamental in appearance can be made from 10 to 100 feet long and of any width and depth, and can be connected or disconnected by any working Gardener without the slightest difficulty, thus affording the opportunity to persons in remote districts of employing this much approved method of heating without the assistance of Engineers. The Tanks can be applied to Boilers and Pipes already fixed, and from the present low price of Iron will be found cheaper than of any other material. Mr. RENDLE, of Plymouth, has kindly undertaken to receive orders and furnish information to any persons in his neighbourhood, and prices for any size will be forwarded upon application to S. and Co.

GUANO ON SALE,

BY THE IMPORTERS, ANTHONY GIBBS & SONS, LONDON; GIBBS, BRIGHT, & Co., LIVERPOOL AND BRISTOL.

GUANO ON SALE.—Any Quantity of this valuable Manure can be had from the bonded stores of the Importer either in London or Liverpool, on application to COLESWORTH, POWELL, and PRYOR, St. Helen's Place, London; EDWARDS, DAWSON, and Co., Liverpool; and WILLIAM J. MYERS and Co., Importers, Liverpool.

In Monthly Numbers, 8vo, price 1s. 6d. each,

THE GARDENERS' MAGAZINE. Forming One Volume annually, illustrated by numerous Engravings.

The Vols. for 1825 to 1834 inclusive, are out of Print.

The Vol. for 1835, price 16s., contains 720 pages of letterpress and 116 engravings: viz., Plans of Gardens, the Grounds of small Villas, Flower-Gardens, and Arboretums, 28; of Garden Structures, 6; of Garden Ornaments, 4; of Gates, 2; of New Instruments and Utensils, 8; of Garden Operations, 1; of New Fruits, 2; of New Plants, 15; of Entire Trees, 4; Miscellaneous Diagrams, 26.

The Vol. for 1836, price 16s., contains 724 pages of letterpress, and 111 engravings: viz., Plans of Gardens, the Grounds of small Villas, Flower-Gardens, and Arboretums, 37; of Garden Structures, 4; of New Instruments, 4; of Diagrams, 12; of Buildings, 2; of Fruits, 1; of Plants, 24; of Entire Trees, 9; of Reptiles, 3; of Insects, 5; Miscellaneous, 4.

The Vol. for 1837, price 16s., contains 624 pages of letterpress, and 128 engravings: viz., Plans of Gardens, the Grounds of small Villas, and Flower-Gardens, 4; of Garden Structures, 23; of New Instruments, 9; of Diagrams, 23; of Buildings, 2; of New Plants, 43; of Entire Trees, 10; of Insects, 15.

The Vol. for 1838, price 16s., contains 640 pages of letterpress, and 102 engravings: viz., Plans of Gardens, the Grounds of small Villas, &c., 52; of Garden Structures, 6; of Instruments, 8; of Diagrams, 22; of New Plants, 8; of Insects, 6.

The Vol. for 1839, price 14s. 6d., contains 730 pages of letterpress, and 177 engravings: viz., Plans of Gardens and Country Residences, 11; Views of Garden Scenery, 27; Cottages and Lodges, 18; Garden Structures, 36; Instruments, Implements, Utensils, and Machines, 37; Diagrams, 24; Operations, 8; Plants, 20; Insects, 2.

The Vol. for 1840, price 17s. 3s., contains 690 pages of letterpress, and 79 engravings: viz., Plans of Gardens and Country Residences, 7; Views of Buildings and Garden Scenery, 9; Garden Structures, 16; Instruments, Implements, Utensils, and Machines, 24; Diagrams, 17; Plants, 6.

The Vol. for 1841, price 17s. 6d., contains 654 pages of letterpress, and 58 engravings: viz., Plans of Gardens and Country Residences, 6; Garden Structures, 25; Instruments, Implements, Utensils, and Machines, 17; Diagrams, 8; Insects, 2.

The Vol. for 1842, price 17s. 2s., contains 672 pages of letterpress, and 77 engravings: viz., Plans of Houses, Gardens, and Grounds, 8; Views of Buildings, and Garden Scenery, 6; Garden Structures, 8; Instruments, Implements, Utensils, and Machines, 31; Diagrams, 24.

The Vol. for 1843, price 17s. 3s. 6d., contains 700 pages of letterpress and 135 engravings: viz., Plans, Views, Elevations, Sections, &c., connected with Cemeteries, Churches, and Churchyards, 60; Plans of Flower-Gardens, Lawns, &c., 17; Suburban Villas, &c., 5; Artificial Lakes, 4; Plans and Elevations of Cottages, 8; Modes of Heating, 3; Instruments, Implements, Utensils, and Machines, 17; Diagrams, 14; Plants, 1; Insects, 2; Phenological Figures, 6.

Every yearly volume of the *Gardeners' Magazine* contains a Register of the Horticultural Discoveries and Improvements that have been made in the course of that year, and these are again noticed in a more concentrated form in an Annual Summary. Thus every gardener or amateur who possesses the *Encyclopædia of Gardening*, and reads the *Gardeners' Magazine*, is certain of keeping up his professional knowledge with the progress of improvement, rapid as that progress continues to be.

LOUDON'S ARBORETUM ET FRUTICETUM BRITANNICUM. In 8 vols. 8vo—4 of letterpress and 4 of plates—price 10l.

This being the season for planting Trees and Shrubs, planters are reminded that the above work contains by far the most copious history, natural and artificial, of all the Trees and Shrubs which will stand the open air in Britain, that has ever been published; including their description, uses, propagation, culture, diseases, effect in landscape, and every other particular desirable to be known by the planter and landed proprietor.

There are botanical figures of all the species, drawn to one scale; and portraits of the trees, also drawn to a scale, showing the different sizes which the different kinds attain when ten years planted, and also when full grown; an object which was never before attempted in any work on Trees.

"This book is one of solid value, worthy a place in the library of every landed gentleman, as well as of every student of botanical, arboricultural, and horticultural science. . . . The 'Arboretum Britannicum' is complete in its kind, and it must become a standard book of reference on all subjects connected with Trees."—*Quarterly Review*.

Printed for the Author, and sold by Messrs. LONGMAN and Co., 39, Paternoster-row; where may be had,

LOUDON'S EDITION OF REPTON'S LANDSCAPE GARDENING and GARDEN ARCHITECTURE, illustrated by numerous Plans, Sections, Views, &c. In one vol. 8vo, price 14s. 10s. plain; coloured, 31s. 6s.

This is by far the most complete work on laying out grounds that has hitherto been published; and by means of the numerous plans and sections, the whole may be readily comprehended by the working gardener, as well as by the amateur.

ELEMENTARY WORKS FOR YOUNG PERSONS,

TULIPS, RANUNCULUSES, HYACINTHS, &c.
II. GROOM, Clapham Rise, near London (removed from Walworth) by APPOINTMENT FLORIST TO HER MAJESTY, respectfully informs the Nobility and Gentry, that his Bulb Catalogue for this autumn is ready, and will be forwarded by post on application. He begs to state that he has a large stock of the beautiful New Lily (*Lilium lancifolium*) and a fine collection of Auriculas, which he can supply at very moderate prices.

THOMAS CRIPPS, NURSERYMAN, Tunbridge Wells, respectfully begs to direct the attention of the patrons of the ROSE to his Advertisements in former Nos. of this Paper, which contain the prices of Collections of that beautiful Flower.

The Gardeners' Chronicle.

SATURDAY, NOVEMBER 18, 1843.

MEETINGS FOR THE TWO FOLLOWING WEEKS.
 Tuesday, Nov. 21, Linnean 8 P.M.
 Wednesday, Nov. 23, Society of Arts 8 P.M.
 Wednesday, Nov. 23, Botanical 8 P.M.

THE approaching winter will put to the test the real capabilities of hot-water gutters or tanks, as a means of heating, and we shall not fail to report all well-authenticated results. In the meanwhile a few observations as to what is *certainly* known of their efficiency will not be unseasonable.

As a means of conveying *bottom-heat*, for which they are best suited, we regard the tanks or gutters formed of bricks and cement as being perfect. It is indispensable that any contrivance for that purpose should permit a small quantity of moisture, and only a small quantity, to pass through the sides. When steam pipes, hot-water iron pipes, or metal apparatus of any kind are employed, the soil is necessarily dried, and there is no remedy for that except by watering over-head. To do so may be unobjectionable where such a material as tan is employed to form a bed in which pots are to be plunged, but it is inadmissible when soil rests on the apparatus, and plants are expected to grow in that soil. The sides of dry metallic troughs will destroy all roots which touch them, and unless the greatest care is taken, a large portion of the other roots will be injuriously affected by the fluctuating humidity of the soil. That cannot occur with cemented brickwork, through which an insensible perspiration is incessantly passing, diffusing itself in the soil, and maintaining an equal humidity. A most instructive proof of this was afforded a few weeks since in the Garden of the Horticultural Society, when it became necessary to pull down part of a pit which had been fitted up in the spring, experimentally, with hot-water gutters. When this pit was filled with mould, the spaces between the gutters were filled, and they were themselves covered, with sticks and trimmings of Vines and White Mulberries, upon which the earth rested. Upon removing these cuttings they were found to have been forming roots in abundance, upon the sides of the gutters. No evidence could be more conclusive as to the genial moisture emitted by the gutters when filled with hot-water, so that the roots of the most tender plants may be safely trusted in contact with them. We regard, then, the fitness of closed brick gutters for communicating bottom-heat to soil to be established satisfactorily; whether they are the best of all contrivances, or whether the arches and voussoirs proposed by Mr. Ainger in our volume for 1841, or some similar contrivance, may not be better is a separate question.

It may, however, and probably will, turn out that some peculiar management is necessary where pits thus warmed are employed for preserving plants in winter; for that transpiration of moisture which is so grateful to growing plants, especially in summer, may not suit torpid plants in winter; and we anticipate many complaints of plants damping off in winter in pits heated with hot-water gutters passing through soil, tan, cinders, or other materials. But this is an inconvenience common to them and the old hotbeds which they are destined to displace, and similar precautions will be wanted in consequence.

The fitness of hot-water brick gutters for giving air-heat in winter is much more open to doubt, in cases where, as in all greenhouses, a dry atmosphere is required. We have never recommended them except for special purposes. Moisture in the form of vapour will certainly pass through their tops, and the quantity will, we presume, be in proportion to the heat employed; so that the hotter a brick-tank-warmed greenhouse may be kept, the damper it will become. It is, however, probable that abundant ventilation will diminish this inconvenience; or if not, that it may be found possible to coat the tanks with some paint-like substance, which will temporarily arrest the emission of vapour. This difficulty, if it should prove one, will not, however, be felt in forcing-houses; where, on the contrary, it will be a positive advantage. We believe that linseed-oil, applied when the tanks are hot, will obstruct the passage of vapour to a very considerable extent.

We mention these things thus early in order to put gardeners on their guard, so that they may not fall into the error of imagining that the management of

houses whose air is warmed with brick-gutters can be prudently managed in the same way as if iron-pipes or smoke-flues were employed.

Now that the subject of Pine-growing has been brought forward, we have many letters attesting the truth of the statements that have been published regarding the excellence of cultivation at Bicton and elsewhere. For ourselves we require no such evidence; but for the purpose of satisfying those who remain unconvinced, notwithstanding the Longleat Pines lately exhibited, and the details furnished last week by Mr. Dawson, we publish in another column the particulars of some Queens grown at Bowood by Mr. Spencer, Lord Lansdowne's gardener; and we here add the testimony of Mr. Amariah Saul, Lord Forester's gardener at Castle-hill. He states that—"Having lately paid a visit to Bicton, he was much struck by the extraordinary fine Queen Pines produced there by Mr. Barnes. He had not, indeed, an opportunity of seeing any of the fruit weighed, but judging of them by other fruit of the same variety, which he had himself weighed, he has no hesitation in affirming that they must have been quite as heavy as has been represented by our correspondents." "If," he continues, "'Dounhuil' would take the trouble of going to see the plants, I think he would no longer doubt the possibility of their producing fruit of the weight stated. Let him picture to himself a *Queen Pine-plant standing about 6ft. high, with leaves 3ins. or 4ins. broad, and the stem in every way proportionate, and then say whether he does not think it possible for such a plant to produce a fruit of 5lbs. or 6lbs. weight. I have seen a great many well-grown Pine-plants, but never any at all equal to those at Bicton.*"

We purposely refrained last week from bringing forward evidence of great weights, formerly obtained by a few select gardeners, because we regarded them either as doubtful, or as exceptions to the general rule, or accidental, rather than the consequence of high cultivation.

A correspondent, "A. C.," reminds us that nearly 40 years ago, Mr. Griffin, a most respectable gardener of that day, effected at Kelham nearly as much as Mr. Barnes at Bicton and Mr. Murray, at Longleat; he having, in 1802, cut 20 Queen Pines, which weighed 87 lbs. 7 oz., and in 1803 one which weighed 5 lbs. 3 oz.; again, in 1805, 22 of the same sort, which together weighed 118 lbs. 3 oz.; "giving an average not far behind the Little Queens of Bicton of the present day."

Now we do not in any way question the accuracy of this statement; but as we have heard of such a thing as troy weight being used for Pine weighing instead of avoirdupois, and as we know that large gills and heavy crowns, and even a foot of handle, have occasionally been added to the weight of Pines, it strikes us that modern instances, which are easy to verify, are more satisfactory than evidence half a century old.

How these large modern Pines have been obtained, we hope in due time to relate.

A COMMENTARY ON CERTAIN PASSAGES IN THE PHYSIOLOGICAL WRITINGS OF THE LATE ANDREW THOMAS KNIGHT.

BY W. WOOD.

(Continued from page 788.)

No. VI.—ON THE CULTIVATION OF THE PINE-APPLE.
 "If the bark-bed could be made to give a steady heat (temperature of about 10 degrees below that of the day temperature of the air in the stove,) I readily admit that the plants would thrive better in a compost of that temperature than in a colder; for the temperature of the day being about 90° or 95°, and that of the night 70°, the mould in the pots will necessarily acquire nearly the intermediate temperature of 80°. It is true that two disturbing causes are in action—the evaporation from the mould and porous surface of the pots, and the radiant heat of the sun; but these causes operate in opposition to each other, and, probably, nearly negative the operation or influence of each other, as far as respects the temperature of the mould in the pots.

"I have never yet seen plants of the same age equally strong, nor any produce fruit better—so well swelled, nor so rich in flavour.

"But I have never taken off nor shortened a root, nor taken any other measure to retard the period of fructification, with the prospect of obtaining larger fruit; and my plants have always shewed fruit when 14 or 15 months old, though propagated from small and young suckers and crowns.

"The compost as before given for Cockscombs is the most stimulative of growth. Pine-plants will, however, grow perfectly well in composts of different kinds, but I have found that they have succeeded best when the materials have been fresh, and retaining their organic form; particularly if the pots be large relatively to the size of the plants, which I think they always ought to be, for the mode of cultivation recommended. I have used with advantage the haulm of Beans, cut into lengths of about an inch each. I found that the plants succeeded best in the warmest part of the house, where the flue first enters, and where the temperature is very high, varying from about 85° to 105°, and the air exceeding dry.

"Of Suckers. When the whole of the suckers are re-

moved at an early period, one or more very strong suckers usually spring out below the level of the soil, and from these, suffering only one to remain attached to the parent stem, and preserving the roots as entire as possible, I have propagated with much advantage and have obtained plants which shewed fruit strongly at seven months, dating from the period at which the sucker appeared like a strong head of Asparagus, at the surface of the soil."—*Hort. Trans.*, vol. iv., p. 543.

Remarks.—The foregoing statement appears to involve, and to a great extent, to illustrate, the principles upon which a progressive and accumulative system of cultivation depends; while speaking of the medium temperature that is most desirable, and of the opposing agencies of absorption by the mould and surface of pots, &c. with the radiant heat of the sun, I think that the balance or "negative" influence of these causes is more or less embodied in a former paragraph (p. 788,) where it is stated that a due exposure (of plants) to atmospheric and solar agency is requisite; that sentence alluding to "a balance of the power of absorption," &c.

The superior growth of the plants and the excellence of the fruit, compared with the age of the plants, is a sufficient proof of the superiority of an accumulative growth over an opposite treatment; and this instance, connected with another cited at the conclusion of the paper, wherein Mr. Knight refers to suckers showing fruit at seven months, may be adduced as an anticipation in practice of what I have advanced in theory (by the light of practice,) relative to the highest test of cultivation; namely, "that which attains the greatest constitutional vigour within a limited period." The very young state in which the suckers were removed further confirms the remark at p. 710, that the vital functions of plants are diminished in force, in proportion as the primary development of their parts is prematurely hardened or matured, whether by deficiency or excess of the elements which sustain them; and again, p. 734, "it is the elementary condition of an organised being which favours the ultimate development of its parts."

Mr. Knight admits not having "taken off, shortened," or otherwise disturbed the roots in the process of culture. I believe I may cite this as fully bearing me out in the principle I have laid down (p. 710.) as to the law or condition which is essential to perfect accumulative growth, namely, that "the accumulative vigour of all plants is exactly in proportion to the progressive agency of the cause to which they are first subjected," &c. &c. Indeed, the whole of this instance of cultivation appears to be in harmony with first principles. In the first place, we have proportions of compost, their texture and qualities, their mechanical structure (in pieces, &c.) and arrangement, so as to prevent impeded circulation—a method which supposes a union of several parts, adapted to a common end, and implies a principle of unity with progression, or, in other words, progressive transition without breach of continuity. This definition is, I conceive, strictly applicable to a system of cultivation which produces a progressive and accumulative effect, and strictly in harmony with the first principles of Horticulture, which affirm that "For the maintenance of a plant in health it is indispensable that the supply of fluid by the roots should be continued and uninterrupted." The only means by which this continued and uninterrupted supply of fluid may be obtained will be by such a combination of materials, of their relative proportions, textures, qualities, arrangements, and exposure to certain agencies, as will be equal to maintain a regular progression of the functions of life, from the first development to maturity of growth. Such is the only law by which a comparatively perfect system of cultivation can be established. Every other process than that which involves unity of parts with progression of growth may be invariably conducive to inferior results, but the laws which govern organic and chemical affinities will never allow it to be productive of the highest possible effects. A disorganization of vegetable structure is attended with a loss of functional power which no process can entirely re-establish.

"A few days after the annexed paper was read, I had the pleasure of observing (being on a visit to the President &c.) the condition and appearance of the Pine Apple plants &c.) the condition and appearance of the Pine Apple plants described by him. The plants, which were then expecting to be shewing fruit in the next month, though young, were remarkable for their vigour and strength. They were grown in pots of much larger size than usual, which were raised so as to bring the upper leaves nearly in contact with the glass; the plants firmly rooted and leaves of peculiar breadth, &c."—*Hort. Trans.*, vol. iv. Note by the Secretary.

Remarks.—The above remarks afford additional evidence in favour of an accumulative system of cultivation, and though it is not stated that the plants were removed or transferred to such large pots in their youngest state, yet it is a close approximation to it, and may be considered illustrative of a paragraph at page 709, viz.—"The leading feature of the former (accumulative) is found in its adaptation to attain a maturity of growth, apart from the aid of intermediate shifts, by removing plants in their youngest state to pots commensurate in size with their ultimate vigour and fertility." It also strongly corroborates the statement at page 734, that "The intensity of atmospheric and solar agency should be in proportion to the amount of material used in the process of potting, &c."

(To be continued.)

ON THE ATMOSPHERE OF HOTHOUSES.

(Continued from page 788.)

Moisture.—It is of especial importance in the management of plants that the atmosphere surrounding them be in a proper hygrometric condition: if too moist, they are

apt to damp off and perish; and if too dry, their growth is checked, and they get exceedingly liable to the attacks of red spider and other insects. Where high temperatures are maintained, either by hot-water pipes or common flues, the latter condition is much more liable to occur than the former; and if no other means are used than the ordinary watering of the plants to supply the air with moisture, it is almost certain to become too dry. The reason of this depends on a property of air, of extensive appliance in the economy of nature, by which its capability of dissolving water increases in a much higher ratio than its temperature. Thus, if we take a certain portion of air at the temperature of 50°, and heat it a fifth part more, thus raising it to 60°, and if we saturate it with moisture in both instances, it will be found to contain much more than a fifth part additional water at 60° than it did at 50°; or, if we take two equal portions of air at 50° and 60°, both holding as much water in solution as they possibly can, and mix them, an instantaneous deposition of moisture occurs, for the resulting mean temperature of 55° renders the air unfit to hold the whole in solution. If it were not for this simple property of air, we could neither have fogs nor rains. One accustomed to the management of hot-houses will be able by his feelings to tell whether the house he enters be moist or dry, particularly if he gets a glance at the thermometer. A moist air always feels warmer than a dry air at the same temperature, because in the latter case a freer exhalation of vapour takes place from the surface of the body, keeping down its temperature. But the feelings are not always to be relied on either in horticulture or other operations; Mason's hygrometer should, therefore, be provided. This is neither more nor less than a couple of thermometers, the bulb of one of them being covered with a bit of rag kept always moist. The dry bulb thermometer measures the temperature of the atmosphere of the house, and the wet bulb one the intensity of evaporation, or its capability of dissolving moisture—hence its dryness. When plants are in active growth the wet thermometer should not be above two or three degrees below its neighbour, and may be often equal with it; but when they are at rest the difference may and ought to be greater. The wet bulb instrument not only indicates the dryness of the atmosphere, but also gives the gardener another important hint; it tells him the temperature of the soil in his pots, at least, if these are duly supplied with water. The same cause, evaporation, which sinks the mercury in his moistened glass, is at work with his pots, cooling them down in like degree; so that, instead of the fostering influence of bottom-heat, he has its stinging antithesis of bottom-cold. A dry atmosphere is thus not only hurtful directly, by its aridity, but indirectly, by its frigorific influence on the roots of plants, unless the pots are exposed to the direct radiation of heat from the flues, which may thus counterbalance the deficit.

The means of keeping up a moist atmosphere are various. Where steam is employed as the heating medium, the necessary quantity permitted to escape will readily effect this object; where warm water is the material, a portion of its surface exposed, proportioned to the heat and size of the house, will be effective. And where only close pipes, tanks, or flues exist, a number of earthenware trays, or basins, filled with water and placed on them, will yield the requisite supply; or, as formerly hinted, a few inches of sand, ledged in and kept moist over the flue, will answer the same end.—*J. L., Newburgh.*

(To be continued.)

ROSES IN POTS, No. III.—FORCING.

Roses required for forcing, in as far as regards soil, time of removal, and potting, may be treated in the same manner as those intended to be grown in pots in the open air. They should be pruned early in November, and it is well if they can be allowed to make their growth, and bloom out of doors, the first season after removal. That plants taken from out of the ground and potted early in autumn will bear forcing and bloom tolerably well the succeeding spring, we know from experience; but from direct observation, it is evident that, having been a year in pots, they become better established, produce a greater quantity of flowers, and form more compact plants. The first week in January is a very good time for conveying the plants into the forcing-house, commencing with a gentle heat, say 40° to 50°. Very soon the buds will become excited, when the temperature may be gradually raised to about 50° at night, and 60° to 75° during the day, and the plants lightly syringed morning and evening. Great care is required in the admission of air. During January, February, and in most seasons March, very little should be admitted, and this only from the top in still mild weather. I have found the plants more liable to suffer from the admission of cold air, even on sunny days, than from a temperature of 100°. Whilst they do not appear to suffer from the latter high temperature, the too free admission of air early in the season will cause the young leaves to curl up, and eventually drop off in numbers. The plants should be kept as near the glass as possible, and if leaves or tan can be procured readily to plunge them in, to secure a gentle bottom-heat, less fire-heat will be necessary, and they will repay the extra trouble. It is difficult to lay down any precise rules for watering; this the judgment must direct: the plants require to be kept tolerably moist, and the water should be carried into the house some time before required for use, both in watering and syringing, that it may become of a milder temperature. The description of plants I prefer, are for the most part those worked on the Dog-rose, from which it is necessary to keep all suckers removed; and as most of these spring from under the soil, I have found that by clasping the tops firmly between the thumb and finger when in a young state, and pulling

them steadily, they may be drawn out from the base, thus effectually removing them as they appear, without disturbing the roots.

The grub which attacks Roses so generally out of doors, frequently finds its way into the forcing-house, and should be carefully sought after and removed by hand. The green-fly, though more under our command here, is not less troublesome; as soon as any are seen, the house should be fumigated with tobacco to destroy them, and this continually repeated through the season as they reappear. The red spider and mildew will sometimes infest the plants, for which sulphur is the generally acknowledged remedy. Dusting it on the leaves after syringing is an easy method of applying it. From the red spider, however, in a house with a moist atmosphere, there is not much to fear; and it is perhaps as well to remove plants inclined to mildew—which some varieties are more than others—as soon as the first spots are seen.

About the middle of March the flower-buds will show colour; syringing should then cease, and a liberal supply of water be given. Should worms work into the pots, they may be occasionally watered with lime-water; and if large flowers be sought after in preference to number, the small backward flower-buds should be removed. A few plants may now be carried to a colder house, which will give the remaining ones more room, and by selecting them of different degrees of forwardness, a continual supply of flowers may be obtained; and further, the temperature being diminished, the flower-buds will have more time to expand, and produce larger flowers approaching nearer to their natural colour. It is the custom with some, as soon as the buds show colour, gradually to lower the temperature of the house; by this method a greater display may be obtained at one time, but the succession of flowers is lost, and the whole retarded. When the flowers begin to expand, it will be found necessary to form a light shading to screen them from the mid-day sun; and at this season a thin canvass will be found sufficient. But to see Roses in perfection in the forcing-house, we should visit them at the same time as we would Roses in the open air—with the rising sun, just as the buds are unfolding, and while they are wet with the dews of morn. Thus have we arrived at the season when the flowers appear, which by their beauty and fragrance redouble the pleasure we have enjoyed during their progress. Among forcing Roses of the classes Hybrid, Perpetual, and Tea-scented, I know not which may claim the precedence. The former beautiful class has the claim of novelty, and has recently improved and increased at such a rapid rate as to threaten the exclusion of many of the Damask Perpetuals. The flowers are for the most part large and double, but there is a similarity in appearance, the flowers being chiefly purple or crimson. They possess the fragrance of the Damask Perpetuals, and are free growers, with fine foliage.

Tea-scented Roses are of opposite colours, being chiefly white, yellow, and rose. They may be considered as a selection from the Chinese on account of their delicious fragrance, and whether for forcing or out-door pot plants, form very handsome Roses. Many of the Bourbons are also admirable forcing Roses, of erect growth, forming pretty compact heads when worked: the flowers are finely shaped, colours clear, and foliage broad and handsome. The Chinese Roses are very abundant bloomers, and there is something striking and handsome in their habit of flowering peculiar to themselves; among them are also some of the most brilliant crimson Roses. The Damask Perpetuals are very sweet, and are probably best worked on the Dog-rose when grown in pots. They appear to derive an additional vigour from this "exalter of the Rose tribe," and being compact growers, form very neat objects. Some of the hybrids of Chinese also force well. In addition to the varieties recommended in the *Gardeners' Chronicle*, p. 541, the following are excellent forcing Roses:—

Blush to Pink:—N. Custalie, T. Bardon, Mossy de Meaux, T. grandiflora, H. C. Blairii, No. 2, Ch. Antheros, Ch. miranda, H. P. Marquisa Boccella, T. Originale, T. Clara, Ch. Virginal.

Sulphur and Bronze Yellow:—Ch. Mieliez, T. Princesse, Helene du Luxembourg, T. Pauline, Plantier, T. Aurore, T. Mansais.

Rose:—T. Hardy, B. Madame Desprez, B. De Neuilly, B. Psyche, B. Henri Plantier, B. Augustine Margat, H. C. Charles Louis, H. C. Daphne, H. P. Lane, Perp. Madame Feurier, Red Moss, T. Bon Silene.

Crimson:—Perp. Triomphe de Montmorency, Prov. Duc d'Angoulême, Lawrenceiana rubra, Ch. Nemesis, B. Josephine Garnier, Ch. Cramoisie superieure.

Purplish Crimson and Purple:—B. Duc d'Aumale, Ch. Triomphe, Ch. Comble de Gloire, B. Crimson Globe, H. C. Plantier, H. P. Julie Dupont, Perp. Louis Philippe, Perp. Warratah, H. P. Prince Albert.

The colours of forced Roses are not quite equal to what they are when produced in the open air, and in this respect I believe there is a greater difference in the light-coloured than the dark varieties. Many of the sorts above enumerated, though of first merit as forcing Roses, do not at all times expand their flowers when grown out of doors; of which we may instance, Ch. Virginal, H. P. Prince Albert, and T. Princesse, Helene du Luxembourg. The colours which may appear wanting in the above list will be found given in the preceding one.

As soon as the plants are out of bloom the surface of the soil should be removed to the depth of half an inch, or an inch, if practicable, without injuring the roots, and the space supplied with well-pulverised manure. The plants which bloom but once in the season may be gradually hardened off when the house will admit more plants, which should be kept in reserve for that purpose. But with regard to what are usually termed Autumnal Roses,

these may be treated so as to produce a good supply of flowers a second time by the middle of May. The weak shoots should be entirely cut out, and the stronger ones shortened back to within two, or at most, three eyes, taking care, however, not to deprive the plants of more leaves than is absolutely necessary in the operation. If, as is sometimes the case, the shoots in autumn-pruning were left long, and the eyes at the top have only shot forth, these may be cut quite off, when the buds near the base will be excited, and fine flowers be produced therefrom. As the season advances, less fire heat will be necessary. Towards April, a fire lighted of an evening and kept in for a few hours will (unless the weather be unusually cold) be found to impart sufficient warmth; and after the buds show colour, even this will not be requisite. The plants having bloomed a second time, air may be gradually admitted for a few days, when they may be taken out and plunged in the open air, there to remain till required for forcing the following year.

Roses will force well for years in succession; but every autumn they should be turned out of the pots, a good portion of the old soil shook away and fresh supplied. Some few will probably require larger pots, of which we must judge by the condition of the plant and roots.—*W. Paul, Nurseries, Cheshunt, Herts.*

STOPS FOR HOT-WATER CIRCULATION.

MANY modes of stopping the circulation of hot-water where it is not wanted will suggest themselves to an ingenious workman. The following, which is employed in regulating the hot-water currents in one of Stephenson's iron tanks, is employed successfully by Mr. Beck, of Isleworth. A single tank, D E F G, is applied to a small greenhouse, divided into two compartments by the partition, B C, which nearly corresponds with the separation of the houses. When the left-hand house is to be heated, the slides B C are inserted in the cross partition, and the slide A is removed; a current is then established from E to A and from A to D; but if both divisions are to be heated, the slide A is inserted, while those at B and C are removed, when the current passes from E to G, from G to F, and from F to D; and thus both compartments will become heated. The wooden slides, which are apt to warp, are prevented from doing so by a piece of iron hooping being driven into the bottom edge.

LISIANTHUS RUSSELIANUS.

THE above plant was introduced to this country about 8 years ago, and is allowed by all who have seen it well cultivated to be one of the most beautiful plants of modern introduction—yet, strange to say, it is rarely to be met with well grown, even at the Metropolitan Horticultural exhibitions. This, some attribute to its being a plant that is very difficult to cultivate; but not having found it such, I beg to offer a few remarks on its culture. The seed should be sown in March, in seed-pans filled with soil composed of three parts of light loam, two parts of well-decomposed leaf-mould, and one part of silver sand, taking care that the drainage of the pans is perfect; the seed should be covered very slightly, the pans placed in a Cucumber-frame, (or any other,) at a temperature of about 75°. The frame should be shaded to intercept the direct rays of the sun, and the shading should not be removed until the young plants have expanded their third or fourth leaf; by this time they will have struck deep root into the soil, and will be able to stand the full rays of the sun. By the middle or end of June the plants will be fit to pot off; they may be potted in 60-sized pots, in the same kind of soil as that recommended for the seed, returned to the frame and shaded again for a week or ten days, and at the end of that time they will be able to stand full exposure to light. They may remain in the frame till the end of September—care being taken to admit more air and give less artificial heat as the season advances. After a time they will become hardened, and may be removed to a warm dry shelf in the greenhouse, where they may remain until the first week of February. While in the greenhouse they should have as much water as will keep them from flagging, but no more—no plant is more susceptible of injury from wet at this season of the year than this is. About the first week of February they may be removed into a Vinery where forcing has commenced, or into the Pine-stove or Cucumber-frame, and with increased heat receive an increase of water. When they have been growing in heat for a week, if you turn one of the plants out of its pot, the roots which were produced in autumn (that have remained comparatively dormant all winter) will be found breaking out into an abundance of young lateral fibres; if this is the case the plants may be shifted, either on the progressive or "one-shift" system. I have grown them successfully both ways: if the latter system be adopted, a 16-sized, or, at the largest, a 12-sized pot

will be large enough; the soil should be the same as that recommended for the first potting, with this difference, that it ought to contain more of the fibry or turfy parts of the loam—this should especially be attended to if the "one-shift" is adopted; the drainage in each case should be perfect. The plants may now be placed in a frame devoted to themselves, and have a temperature, derived either from dung or hot water, of 75°; the pots should be plunged in coal-ashes or charcoal-dust—the latter, being an antiseptic, is preferable in this situation. It will be found sufficient to water them twice a week until May, when they will require it every second day: they may be watered with rain-water and liquid-manure alternately. About the beginning of July they will be in bloom, and may be removed to the stove, the conservatory, the greenhouse, or even the drawing-room: but the stove suits them best at this stage—in it alone does this plant expand its blooms with that cup-shape so essential to its beauty, and if kept in the stove it will ripen abundance of good seed; but, on the contrary, seeds that have been saved from plants that have bloomed in a greenhouse rarely vegetate, and may be known by their being less plump, and of a lighter colour, than those saved from plants in the stove.

By the above method I have grown the *Lisianthus* successfully for five years. In 1839 I had a plant with above 300 blooms expanded at one time, and during this season I have grown more than two dozen plants without a single failure, some of them, between the beginning of July and the end of September, producing from 400 to 600 blooms.—*Wm. Thomson, Wrotham Park, Barnet.*

ENTOMOLOGY.—No. L.

ASPIDIOTUS OSTREIFORMIS (the Pear-tree Oyster-scale).—I lately received some bark of a Pear-tree which was literally covered with scurfy scales that I had never before noticed. Like the Mussel-scales, they were so exactly the colour and texture of the bark that they were not perceptible at a short distance. The scales themselves were mostly orbicular, but a few were oval; they were of a dark ashy-grey, a little convex, slightly wrinkled,—the margin membranous and whitish, and between it and the centre was a raised semi-transparent spot, of an ochreous or rusty colour (Fig. 2): when the scale is removed, a whitish or greyish spot is apparent upon the bark—on this spot the female rests; the inside of the scale is hollow like a shallow cup, at the top of which the yellowish horny spot is very distinct,—the outer margin of the scale is broad, whitish, and formed of the membrane which attaches it to the bark (Fig. 3). It is not known how these scales are formed, but they are undoubtedly produced by the animal; I can, however, distinctly detect the same green particles upon these scales as clothe the bark of the Pear-tree, which is rather puzzling, as the animals have no power, like many Caterpillars, of detaching the substance with their mandibles, and uniting it with their habitations.

The female is somewhat orbicular-heart-shaped, fleshy, fat, shining and yellowish white, with a few short hairs scattered over the sides (Fig. 4); the tail is distinct and quite yellow, with a suture beneath; neither legs nor antennæ were discoverable, but on the underside—between the anterior margin and the middle—was a minute nipple, from which issued the rostrum, of considerable length (Fig. 5), by which it is generally firmly attached to the tree, so that when the scale is removed the animal remains suspended by it, and does not fall down.

Under one of the oval scales I found a brown dead pupa, which from the partially developed members I feel satisfied was that of one of the males of this species,—these are pretty little creatures, of a bright ochreous colour; the head is small, with a black eye on each side, kidney-shaped, and approximating apparently beneath; the antennæ are nearly as long as the animal, hairy, rather stout and 8-jointed, the apex conical; the thorax is large and ovate, the collar distinct, and between the wings is a black transverse stripe, behind this is the large semi-ovate scutellum; the abdomen is shorter than the thorax, somewhat ovate,—the apex is suddenly narrowed, and produces a long, horny style; the six legs are not very short, and but slightly hairy; the tarsi taper, and appear to be triarticulate and terminated by minute claws; the two wings are very ample and rest horizontally on the back in repose,—they are whitish and rounded, with a distinct submarginal nervure, which has a long branch forming a fork towards the middle,—the two halteres, or balancers, are placed one on each side at the base of the scutellum, they are composed of two minute oval joints—the second producing a short curved bristle at the apex (Fig. 6): *Obs.*—The

minute figures by the side of the magnified ones exhibit the natural size of the objects, and Fig. 1 represents a branch of the Pear-tree with the Oyster-formed scales upon the bark. As I cannot find this scale described by any author, I have called it *Aspidiotus Ostreiformis*, from its great similitude to the common Oyster-shell.

After a careful search I could not discover a single egg, or young scale moving about, and most of the females seemed to have died, forming rust-coloured flattened bodies under their shields,—they were smooth and looked like little seeds; whether they had not been fecundated, or whether it is a species that arrives at maturity at a later period, I am unable to determine. Two or three of the males were certainly hovering about, and there were a few very small, shining ferruginous scales scattered over the branches,—these were attached to the larger ones, but they might form a portion of the autumnal brood.

If it be difficult to get rid of the Apple-tree Mussel-scale, it will be still more so to extirpate the Pear-tree Oyster-scale; for they lie so close to the tree, that it appears almost impossible to scrape them off without injuring the bark very materially. If, however, a stiff scrubbing-brush were used with soft soap, whilst the water is tolerably warm, it would I think have a beneficial effect. Gas-tar might also be very serviceable, if applied when the young make their appearance; for even the scales are at first tender, and consequently of little protection to their inhabitants, and this powerful and adhesive liquid if well brushed on would undoubtedly stop the breeding of multitudes of the females, and certainly destroy all the delicate males that might be about.

I shall now leave this subject for a time, but should Gardeners think it sufficiently interesting to be farther pursued, if they will favour me with such species of scales as have not been illustrated and described, I shall have much pleasure in the future investigation of them, and be happy to communicate the results through the medium of this Journal.—*Ruricola.*

AMATEUR'S GARDEN.—No. XLVI.

Among the absurdities which have been transmitted from one generation of gardeners to another, and followed up like many more old practices, just because we have never taken the trouble to ascertain the utility, or rather injury of them, is that of annually digging among, and of a necessity destroying, all the best roots of old trees and shrubs. Within an hour's ride of the metropolis I could point out scores of gardens where this practice has been so pertinaciously persevered in for years, that shrubs which have been planted a quarter of a century might be turned out of the soil with little more ball of earth adhering to them than would be necessary to fill a number of four-sized pots; and yet the roots of these very plants, if allowed to progress properly, would have extended over from 10 to 30 square yards of ground. If you interrogate the gardeners, you will find it has been the annual custom to rake all leaves and rubbish from the borders and then to dig them over, the consequence of which is, the plants are not only deprived of that little nutriment which nature has provided for them, but they are still further robbed by preventing their roots from extending themselves in search of food.

Now the result of such treatment is, the miserably decrepid specimens of trees and shrubs which are to be met with in most pleasure-grounds—plants producing a few stunted branches, and which either cast their leaves or look wretchedly bad after the first week of dry summer weather; and how could it be otherwise! unless the roots were left unmolested, and the ground allowed some little nutriment. The leaves which fall from the huge Oak of the forest are not cast to the wild winds of heaven as things that are useless; they contain the very elements of vegetable existence, and are intended, when decomposition has rendered them soluble, as nutriment for those very trees which gave them being.

Oh! but I shall be told, how bad the borders will look in spring if they are not dug; and so they will if you expose the naked soil, but this is not necessary, as the front part of the borders should either be turfed or planted up, and the back parts hidden from public gaze. At Claremont the undergrowths consist principally of common Laurel, so thickly bedded together by thick planting and pegging down, that it would be impossible to dig among them. At that place it is a rare occurrence to see a bit of dug ground in the pleasure-grounds, and yet it has never been found fault with on that account. But the undergrowths at Claremont do not consist of Laurels only, but also of dense masses of Rhododendrons and other American plants, which bloom profusely, and in the season have a magnificent effect.

At Dullingham House, near Newmarket, the wild Ivy has covered the ground under the trees in the pleasure-grounds; and in spring, when the Aconite, Snowdrop, Crocus, Primrose, and Daffodil stud it with their gay simple flowers it has a delightful appearance.

At this place I intend, as far as possible, to layer the shrubs, and to fill up all vacant spaces with common Laurel, Aucubas, double Furze, and Rhododendrons; also plants of *Berberis aquifolium* and *repens*, blue and white Periwinkle, common and Irish Ivy, or any other dwarf hardy evergreen shrub or trailing plant that may offer itself to notice. These, mixed with Crocuses, Snowdrops, Primroses, and other wild flowering plants, will make the place gay in spring, and appear considerably better than it would do under the old system of dug ground and a smooth raw surface.—*W. P. Ayres, Brooklands.*

HOME CORRESPONDENCE.

Winter Flowering-Plants.—Mr. Errington having invited Amateurs and Gardeners to add to his list of

Winter Flowering-plants, I beg to state that *Brachycome iberidifolia*, *Lophospermum scandens*, and *Kaulfussia amelloides*, are of that number, and have been produced by means of a cold frame only. The first, *B. iberidifolia*, was sown in March, kept dry during the summer, and placed under a north wall. In September it was put in the frame, and is now, and will probably for some time to come, be in full flower. The second, *L. scandens*, was a very small cutting, planted in April; at fifteen inches high it was stopped, and it then threw out lateral shoots. The bottom ones were pinched off, and three nearest the top were allowed to grow about a foot long. Three very slight pieces of lath were then inserted in the pot, and a sort of trellis formed with green worsted; to this the branches were trained, and although the whole plant is but twenty-five inches high, it has flowered beautifully, and has ten buds still unexpanded. The third, *K. amelloides*, I sowed in August, one of its beautiful blue flowers has expanded, and it is covered with buds. I have also a *Cineraria* in full flower, and a purple *Verbena*. I have sent the above in order that persons like myself, unprovided with artificial heat, may know what can be done in such a case.—*E. C.*

Pelargonium, "Queen Victoria."—This elegant plant may justly be considered to stand at the head of its kind in the class of those fancy varieties, which, although their brilliancy of colour or size of blossoms will not satisfy the florists, are nevertheless of great interest for their unrivalled delicacy and symmetry. *Queen Victoria* is distinguished by its dwarf and compact growth, with intermediate sized blossoms of a white ground, the upper petals being bright pink margined with white. The flowers remain upon the plant until their footstalks decay beneath them, thus rendering its beauty of long continuance. A specimen presented to her Majesty on the 23d of June last was from nine to twelve inches high, and two feet in diameter, uniformly covered with nearly 500 blossoms. It was produced by the skill of Mr. Robert Catleugh, and admitted to be one of the most uniform and perfect specimens of cultivation ever produced.—*From a Correspondent.*

Spathodea.—I see that some person corresponding with Mr. Beaton asserts the *Spathodea campanulata* to have nine oblong lanceolate leaflets, and that the segments of the corolla are bordered with yellow. May I ask if this is the true plant, or that of the Niger? I have been so fortunate as to see some few of this noble tree growing in different situations, but never found it with the leaflets always nine in number, but sometimes nearly double that, and at other times below it; and this not only on the same tree, but on the same branch. Again, the yellow bordering was absent in all that I have seen. If growing with an unbranching stem or trunk to the height of 20 or 30 feet before forming a head constitutes a shrub, this plant is one. I cannot but think that a mistake in the species has been made, as in this plant the inflorescence is terminal, somewhat panicled; while the inflorescence of Mr. B.'s plant is racemose.—*John Ansell.* [This plant is figured in the "Flore d'Oware," &c.; and there it is represented with the flowers and leaves mentioned by Mr. Beaton's correspondent. But the inflorescence is a panicle; and the plant is described as a middle-sized tree, having a soft wood smelling like Garlic.]

Tropæolum tuberosum.—A correspondent states that the plant of *Tropæolum tuberosum*, mentioned at p. 759 of last year's *Chronicle*, reached nearly the same height as it did in 1841, when it flowered nailed to the front of Holme-house. He complains that last year not a plant in four flowered, although under very favourable treatment; and that this year not one in six has flowered, although in every respect treated like the plant that flowered. They were planted on the same day, and the tubers were equally strong. Perhaps some of our correspondents will favour him with some information on this subject.

Mummy Wheat.—May I take the liberty of asking whether this be beyond controversy? I am quite aware of Mr. Pettigrew's accuracy, and no suspicion can attach to Sir G. Wilkinson; but these plaguy Arabs will do anything in the world for Bachshish, especially with an Englishman. I believe that, at all events, Mummies have been searched by them, and afterwards so well re-arranged as to be sold for Virgin Mummies. I know, as an additional proof of the vitality of some seeds, that when, early in this century, some parts of Romney Marsh were converted into arable land, some of the ditches were deepened and new ones made; the earth laid at the sides of the ditches, out of ground that had never been disturbed, so far as man knew, was covered with rampant crops of what they called there Wild Mustard.—*Este.* [We think Mr. Tupper's case beyond question. Almost all others appear to us at least apocryphal, as, indeed, we have already mentioned.]

To Keep Mice from Peas.—Having tried a number of plans for preventing Mice from destroying winter-sown Peas, I have found none so effectual as the following:—Steep the Peas a short time in Salad oil, and then dust them all over with rosin ground to a fine powder, then sow them immediately afterwards.—*Aliquis.*

Schizanthus retusus.—Some years ago I observed that a Nurseryman near me lost his plants just as Mr. Wood describes; but when I got plants from him, and planted them in a dry sloping border of poor soil on a rocky sub-soil, they did not die, but flowered, and produced abundance of seed. A lady who had observed this procured plants from the same Nurseryman, and planted them in her highly-manured Flower-garden (on a limestone-rock), and, as she said, she was greatly disappointed, for they did not flower, and looked just like a Parsley-bed.—*O.*

Tame Fish.—In a gentleman's garden in this neigh-

bourhood the Perch in a large pond come to the side for food as soon as the water is struck with the hand.—O.

Guano.—It is suggested in the "Illustrated London News" of last Saturday, that the use of guano is the cause of epidemic among cattle in the north of England. I myself am not able to confute it. Will one of your correspondents take up the matter, as it might be an obstacle to the progress of this valuable manure.—T. T., Derby.

The Clover Dodder.—I can complete the chain of evidence as to the introduction of the Dodder, which is making so much noise just now. The seed your Northumberland correspondent bought at a bazaar, which was held here last year for the benefit of two of our local Societies, was given by me to one of the fair traders on that occasion, and I obtained it from the India-house through the kindness of Dr. Royle. I gave many of my Agricultural friends portions of it, but have not had an opportunity of inquiring whether the Dodder has appeared in their fields. Most probably it will have done so, since on looking at some of the seed I have by me, I recognise plenty of that of the Dodder amongst it.—G. Wailes, Newcastle.

Weeds in Ponds.—If the weed in "H. S.'s" pond is what is called the Pond-weed, (*Potamogeton natans*), I beg to state that I have no doubt a few geese would most completely remove it, as they appear to be so fond of it as to eat it in preference to grass. A pond in this neighbourhood was effectually cleared of this plant a few weeks ago by means of these birds. They were allowed abundance of other food, so that it could not be hunger that made them clear the weed from the pond.—M. Saul.

Pine Apples.—In order to convince those who will not believe that Queen Pine-apples have been grown to the weight of 5½ lbs. or 6 lbs., as stated in the *Chronicle*, and to show that such a thing is by no means a rare occurrence, I send as follows, the weight of 13 Queen Pine-apples that have been cut at different times since the 1st of August, out of a pit at Bowood Gardens, viz. :—

No.	Weight.	No.	Weight.
1	5 lbs. 12 oz.	8	5 lbs. 12 oz.
2	5	9	5
3	5	10	5
4	5	11	5
5	5	12	5
6	5	13	5
7	5		

Of these, No. 1 was exhibited at the meeting of the Horticultural Society on the 1st of August: see *Gardeners' Chronicle*, p. 543. Nos. 2 and 3 were sent to the office of the said Paper, and are noticed at p. 608. I have arranged the weights in the order in which the fruit ripened. If any correspondent should wish to know the reason why none of the others were exhibited, by looking at the weights he will see that No. 2 was the heaviest fruit: the others, having ripened since that time, and none of them exceeding it in weight, Mr. Spencer did not think them worth sending.—M. Saul.

Rats.—Some of your readers would perhaps rather get rid of these pests altogether than attempt to banish them as "Devonian" recommends. I think that they will, after all his scheming, be able to get inside, for I have known them when very hungry to bore down under the foundation of a wall, and up on the other side, not to mention coming in under the doors. I have also known them to effect an entrance over the tops of walls, where trees were growing against them; and I am of opinion that "Devonian's" rats can get in at the top of the drain as easy as at the bottom; and he cannot make a well there without sinking the shore all the way through his garden. I would therefore recommend him or any other person that is troubled with rats to try the following method, which I have tried in three places with perfect success. Take some potatoes; boil and mix them with oatmeal or flour, but oatmeal is best, and then make them into little balls about half the size of a pigeon's egg. Where the rats most frequent, place portions of these pretty near one another—the quantity depends on the number of rats that you have to destroy; but wherever they seem to have been, there put two or three of the balls. The evening is the time to put them down, and in the morning look where the rats have eaten; if they have missed some places put less there on the next evening, and where they have taken it all put more; but renew the whole every evening, and do this for three evenings successively; then miss one, for the rats may have hid some of it, or have got something else beside, and will not be hungry. On the fifth evening, mix with the potatoes and meal, sugar and arsenic, and lay it down in the same way as before, wherever the rats had eaten on the preceding evening. On the following morning look carefully round, take up any of the poison that is left, for there is no use in leaving it there any longer, and put it into one of their holes and stop the hole up. Any one that is troubled with these vermin had better try this method now, for as there is not much at this time of the year for them to eat, there cannot be a better time for their destruction. There is one thing that I would mention, namely, if the night on which the poison is to be laid is likely to be wet, defer the poison until the next night, and feed them for that night. This method will not, however, answer in a gentleman's house, where rats have plenty to eat, and where they are equally troublesome; the plan, therefore, to effectually destroy them there, is to rub the inside of the holes with treacle mixed with arsenic, and when the rat goes in or out he rubs against the treacle; and as there is no animal cleaner than a rat, he licks the treacle off his hair, and by so doing falls a victim to the poison.—*The Knave of Spades.*

Rat-traps.—Your correspondent "Devoniensis" will, I fear, find himself disappointed in his drain-traps, for preventing rats from having further ingress. There are two of those traps in a drain here which leads from a sink in-

side of the house to a cesspool outside, exactly on the same plan as that represented in the *Chronicle* by "Devoniensis." These vermin, however, (being nearly half amphibious,) were not to be debarred by a little water and mud, from trying what was to be found inside of a dwelling-house, and when once they got in they were not easily kept out again. Believing this drain to be the only communication whereby an entrance was obtained, I had lead gratings made, and put at the bottom of each trap; by this means I have at length got clear of them, being the first time for a number of years. I think your correspondent will do well to use the same preventive.—J. W.

Fleas.—One of your correspondents asks—"How a dog may be kept free from fleas." I beg to state that this may be effected by washing the animal occasionally with the water in which Potatoes have been boiled. I have also seen a very bad case of mange cured with this very simple application.—A. Clapham.

Fleas.—The following is a good method for extirpating fleas from dogs:—"To four ounces of Fox-glove leaves (*Digitalis*) pour two quarts of boiling water, and with this, when it has become cold, wash the dog." For pet dogs this operation may be repeated twice in the season, and I would also recommend that there should be in the box or crib in which the favourite sleeps a quantity of Cedar saw-dust, (clean from the saw,) for the bed. This will clear away the insects effectively, and, if the dandy-brush is used now and then, it will keep the hide clean, as well as remove fleas.—T. F.

Great Productiveness.—Charles Barber, Esq., of Wilmslow, sowed four ounces of Onion-seed this year, using guano as manure, and has had the extraordinary quantity of 7 cwt. of Onions from that small quantity of seed. A Cabbage of the common kind was last week cut from the garden of Mr. Johnston, at Saunderson's Bush, in the parish of Arthuret, of the following enormous dimensions:—circumference, 15½ feet; diameter, 5½ feet; and weight, 4½ stones.—*Liverpool Mercury.*

Large Potatoes.—The following have lately been got on the farm of Mr. Wm. Crook, of Inskip:—two, called Pink-eyes, weighed respectively 2 lbs. 6 oz. and 2 lbs. 14 oz.; and a blue one, a sort recently introduced, weighed 2 lbs. 1 oz. On a rod or fall of seven yards the Blues produced 18 score 1 lb., or 1½ load. It may be remarked that all these Potatoes were planted in drills. This kind generally goes by the name of the Liverpool Blues; it is a very productive sort, much cultivated, and is said to be much used by bakers, on account of its being remarkably white when boiled; but it is not a favourite for the table: the skin is a fine blue, and I am informed that it was raised in the neighbourhood of Liverpool a few years ago.—*Facile.*

Large Eel.—On Monday last a young man caught upon Milnthorpe Sands, after the ebbing of the tide, a large eel, which measured nearly five feet in length, and 20 inches in circumference, and weighed 32 lbs. It was exhibited to the public in the King's Arms' yard in the evening, and many availed themselves of a sight of this monstrous fish.—*Facile.*

Peas.—I tried a quart of Farnes' Peas against a quart of Early Frame Peas: the Farnes' were a week later. The soil was strong and wet. I tried almost every kind of Pea last year, and I found the Auvergne and Knight's Dwarf Marrow the best bearers and by far the best flavoured. The Pois sans parchemin is not a good bearer; and as the pod wanted the hard skin inside, it was much more open to the attacks of the Jays and Tom-tits.—*Totty.*

Tropæolum pentaphyllum.—In Loudon's "Hort. Brit.," "Paxton's Botanical Dictionary," and in the *Chronicle*, p. 633, this plant is accounted tender, but here it has proved itself quite hardy. Several tubers of it were planted in two rustic vases, which have stood exposed without the slightest protection for the last two seasons. The plants in both vases having been in flower since August are now in fruit, and still continue uninjured, although the frost on the 17th ult. was so severe as not only to destroy the more tender flower-garden ornaments, such as Heliotropes, Dahlias, Pelargoniums, &c., but also the hardier sorts, such as Fuchsias, Salvias, and the like, and to bring the leaves from the hardy deciduous trees in myriads. On reference to my meteorological memoranda for the last two winters, I found the registering thermometer indicated several times 16 deg. of frost, and as the mean diameter of the vases in which the plants grow is only 2 ft. outside measure, I have no doubt but the entire mass of earth in them was completely frozen through. I consider that the above facts place the hardihood of *Tropæolum pentaphyllum* beyond a question.—A. Brander, Dalrey Gardens.

On Training Gooseberry and Currant Bushes.—As I have not seen any remarks in the *Chronicle* upon the training of Gooseberry and Currant Bushes, I beg to offer the following:—My present situation (Swinton Park, Masham, Yorkshire,) being within a short distance of the moors, is high and bleak, and we consequently suffer from winds, more especially during the equinoctial gales. Many, or indeed most of my Gooseberry and Currant bushes were rendered useless or unsightly from this cause, and to remedy the evil, I procured some stakes, 4 feet in length, and 3 or 3½ inches in circumference. To these, which were disposed after this manner ××××××××, I trained the trees in the fan method, and tied the shoots to the stakes with matting. After a fair trial, I have no hesitation in saying that the experiment has been successful. Independent of being secure from the wind, there are other advantages to be gained by this mode of training; the space taken up is less, the pruning is more easily performed, and the whole surface is regularly exposed to the action of the sun and air. The wood is also equally and properly ripened, and better crops of well-flavoured fruit ensured. By this means the late kinds are likewise

much more easily and more securely protected from the depredations of birds and wasps, and from injury by frost or wet. A single mat thrown over the bushes is sufficient to preserve the fruit until Christmas, or later. And, moreover, by this system the trees, in matting up, are not disfigured or crushed; the wet is more effectually kept off, as it does not fall on the mat and soak through to the fruit; but, from no flat surface being presented, the rain runs off the mat, as it falls; the fruit is kept perfectly dry, and there is little or no injury done to the mat. The stakes never want renewing, as the bushes, when once in a regular shape, support themselves. They have a neat and pretty appearance at all times, and especially when in fruit. The gardens and romantic grounds at this place are, by the kindness of the proprietor, open to the public, and during the last season have been visited by a great number of persons, most of whom particularly remarked a row of about 120 yards trained in the above style, and their observations induced me to send this account of it.—James Snow, Swinton Gardens.

Conducting Powers of Water.—I thank "C." for setting me right on this head. What he says is perfectly true, but the conducting power of water is so feeble as not to affect the question. I put the case in a strong light on purpose to meet objections which reached me against shallow tanks; otherwise I might have been more explicit. But is "C." more to the point when he says, "We have only to turn our attention to the great Ocean when the noon-day sun is shining upon it, to be convinced of the fact?" I beg to say that I have often turned my attention to the Ocean without becoming acquainted with these facts. But, after all, what are these effects but what we see daily in our own circulation of heated water, only on so much a larger scale? The sea is heated at the equator to a great depth, and it is true enough that a circulation from hence is effected; that its influence is felt almost to either pole is also true, and as a natural inference we must suppose an under-current towards the equator to be equally true; but there do not seem to be facts here to prove anything for or against our practice, farther than perhaps that deep pool-like tanks might do well enough without central divisions to divide the currents, and I have no doubt this would answer, were it not for the folly of having deep tanks to try the experiment; and here we have an explanation of a great natural phenomenon, viz., the disposal of the vast quantity of water which flows into the Mediterranean through the Straits of Gibraltar. The idea of an under-current cut through the Straits is only of a comparatively recent date; the daily loss by evaporation being thought sufficient formerly to balance the influx, although the drainage of the "rivers and fountains of water" carried down by the Po itself might be supposed to be equivalent to the loss by evaporation—to say nothing of the Danube, the Nile, and lesser streams which find their way to the Great Sea.—D. Beaton.

Weeds.—I beg to state, that however useful the ammoniacal liquor of the gas works may be as a manure, administered under certain known modifications, yet applied in its crude state, fresh, just as it comes from the retort, it is certain destruction to the vegetable principle—at least I have found it so in several instances in my own garden. My plan is this:—If I have a strong vigorous knot of Couch-grass, Docks, or any of these common pests of our gardens, I get the scythe and mow them off, and having a common watering-pot full of the liquor by me, pour it on while the wounds are fresh. It is marvellous how soon the whole mass is not only dead, but rotten. I would advise agriculturists to treat the Dodder with a dose of this, after cutting off the top. As gas works are now so general, there can be no difficulty in obtaining the liquor, and a common garden-potfull would in most cases be sufficient. The managers, I should think, would give such a trifle as this, and if not, a penny or twopence a gallon is no great object, and it would not be more. I would be glad to know the result.—J. A.

Drainage of Pots.—I have observed very good effects from adopting the following method of draining pots. Rib-bones (of mutton) are crushed with a heavy hammer into pieces, varying from half an inch to two inches in length. The action of the hammer loosens and weakens, without entirely destroying, the fibrous texture of the bones. A layer of these is placed at the bottom of the pot, and over that another is laid crossways; and so on to the height of about an inch, and the earth is then put in. These layers of crushed bone form a reticulated mass, which does not get clogged up, but on the contrary seems to become more porous as the soft gelatinous or animal particles in the substance of the bones decay; and the minute fibres of the roots push in all directions through them, and derive much nourishment from the substratum of bones.—J. H.

Achimenes pedunculata.—The scaly tubers which form so numerous upon the stems of *Achimenes pedunculata*, seem to possess a certain degree of sensitiveness. Some days since I gathered a considerable number of these into a seed-pan, and happening afterwards to stir them about with my hand, a curious worm-like, or grub-like, movement occurred among the tubers, which continued for a second or two after the motion produced by displacing them with the hand had ceased. The same movement followed the shaking of the pan without touching the tubers, therefore the irritability was not induced by the warmth or moisture of the hand.—J. B. Whiting.

New Heating Apparatus.—In the *Aberdeen Herald* lately was the following notice of a "New Heating Apparatus":—"We have been favoured with a sight of a New Heating Apparatus, on an entirely new principle, invented by Mr. Reid, of Queen-street. The plan of this invention is simple, and its effects are obvious at first sight. The apparatus consists of a stove, to which are

attached three cylinders of strong sheet-iron, within each other; the second one of which forms the flue of the stove, and receives the fire and smoke, which pass in a rotatory direction round the other two. Of each of the latter, one end is open, and receives the atmospheric air, which, after being rarefied by the heat within the cylinders, is carried by the draft thus created into a larger cylinder, called the hot-air chamber, from whence it is thrown forth into the apartment intended to be warmed. From the construction of the apparatus, perfect command is given over the regulation both of fire and heat; and the quantity of fuel required for generating a sufficiency of the latter to warm the largest building is incredibly small, not a spark being lost to the purpose of the apparatus. It is in every way as safe as a common stove, and even more so; the flue is confined within the outer passage for the hot air, and both are built round with brick, so that no combustible material can possibly come in contact with it by any means short of absolute design. The apparatus which we have seen was intended for a new church, and we have no hesitation in saying that the excellence of the invention only requires to be known to be appreciated.—*J. M.*

NOTICES OF NEW PLANTS WHICH ARE EITHER USEFUL OR ORNAMENTAL.

LILIUM TESTACEUM. Pale-red flowered Lily. (*Greenhouse Perennial*.) Liliaceæ. Hexandria. Monogynia.—Japan, which has already furnished our gardens most richly with showy flowers, through the medium of Dr. Siebold, is said to be the native country of this fine Lily. In point of ornamental character, it is quite worthy of being associated with the other noble kinds from the same region; and, indeed, comes rather near *L. Thunbergianum* or *aurantiacum*. Nothing, however, is positively known regarding its introduction, though it is believed to be one of the many plants collected by Dr. Siebold. It appears first to have bloomed with Messrs. Rollisson, of Tooting, last season. It has flowered, this year, and exhibited at one of the Horticultural Society's summer shows, by Mr. Mountjoy, Nurseryman, of Ealing, Middlesex. When well cultivated it grows three feet in height and upwards, being of a vigorous nature, and bearing as many as a dozen of its large flowers on the same plant. The blossoms are of a pale orange-red hue, with darker warty dots on the inner petals: they are produced in a drooping manner, and the petals are somewhat curled back. It is really astonishing what a difference variety of treatment makes in this, as well as other Lilies. Properly managed, they are among the noblest flowers we possess; yet good specimens are far from frequent. The principal thing that they require is a rich, but light soil; such as an open fresh loam, with a fair proportion of rotten dung incorporated. The latter both enriches the other earth, and serves to keep it light. They should not be grown more than one or two years in the same soil. For the present species, a low-roofed conservatory, or a cold pit or frame which has a sufficiently high roof, seems to be the best situation, as it flourishes better in a bed or border than in a pot. If kept in a pot it should have a large one. Possibly, like the varieties of *L. speciosum*, it may turn out to be nearly or wholly hardy; and then it will of course succeed most perfectly in a prepared border, that is open to the south, and otherwise unprotected, or sheltered only at the back. In multiplying this and the rest of the species, a single scale, taken from the bulbs, will suffice to produce a young plant; and some clever propagators will even make four or five plants of each scale, by slitting it into so many pieces.—*Paxton's Magazine of Botany.*

DENDROBIUM TAURINUM. Bull-headed flowered Dendrobium. (*Stone Epiphyte*.) Orchidaceæ. Gynandria. Monandria.—This plant was imported from Manila by Messrs. Loddiges, and flowered in the Hackney Nursery, last autumn. Mr. Cuming was its discoverer and introducer. Its aspect approximates greatly to that of the curious *D. undulatum*. But though the stems of *D. taurinum* are quite as tall, and the foliage a little similar, the former are not nearly so much swollen towards the base. The flowers are borne in noble racemes near the top of the stems, and a single raceme will have perfect flowers upon it for a month or six weeks. Indeed, the species blooms most immoderately. The flowers are large, of a yellowish-green or dull cream colour, beautifully margined and tinted with purplish blue. The lip, column, and twisted petals, constitute a figure, which has been correctly likened to a bull's head, and from which the specific name has been derived. It is cultivated, like the larger kinds of Dendrobium, in a moist summer heat, and a drier and cooler winter atmosphere, being potted in a mixture of rough heath-mould and potsherds. Propagation is managed by cutting off one of the stems in the winter, and potting it separately.—*Paxton's Magazine of Botany.*

SILENE SPECIOSA. Showy Catchfly. (*Greenhouse Perennial*.) Silenaceæ. Decandria Trigynia. This very beautiful plant appears at first sight, to be merely a very well-grown specimen of the pretty *S. laciniata*, a species which is now too rarely seen in cultivation, as its numerous flowers look like so many brilliant scarlet stars. When more closely examined, however, it will be seen that *S. speciosa* differs materially in some respects, while its character is altogether better than that of *S. laciniata*, and its flowers have a deeper and more splendid hue. We have noticed it in several of the London nurseries, but especially at Mr. Knight's, King's Road, Chelsea, where the plant has flowered well all the late summer. As the specimens which have come under our observation have not been finely grown, we may remark, with certainty, that *S. speciosa* is a stronger habited plant, has larger leaves, and finer flowers than *S. laciniata*. The latter, too, instead of having the segments cut into four or more lobes of nearly equal length, have them divided regularly into two larger principal segments, each of which has a very small serrature on the outside, near its base. How the plant was brought to this country, or from whence it was originally obtained, we have not been informed. It got into the London nurseries through some of the Continental collections. In respect to culture, it will rank with *S. laciniata* as a tender herbaceous plant, requiring much care to preserve its evergreen foliage from prejudicial dampness throughout the winter. It should be grown in a porous and very fibrous soil, through which water can freely run at any time. Loamy earth is the most appropriate, but a little heath-mould that is full of the small decaying roots of Heath or other woody vegetation, may be added. It is a mistake to put much sand in the soil used for such plants as the present; for fine sand, instead of keeping soil very porous and friable, actually helps to consolidate it, as every cultivator may readily determine. Fragments of broken stone are far more proper ingredients, and should be employed freely. A dry and airy position in a greenhouse will suit this plant extremely well. It will also thrive well in a pit, where it can be planted out, provided it be duly attended to in winter, to keep it from damping off. To bring it to any high degree of perfection, it must have a larger pot than usual, with the soil a little enriched, and the drainage rendered particularly good. It may be increased by division, or by cuttings.—*Paxton's Magazine of Botany.*

ACHIMENES HIRSUTA. Hairy Achimenes. (*Stone Perennial*.) Gesneraceæ. Didynamia Angiosperma.—This pretty plant forms another acceptable addition to the charming genus Achimenes, and will probably become almost as great a favourite as any of them. In habit it bears the nearest resemblance to *A. pedunculata*, and like that beautiful species is disposed to bear little bulbs

in the axils of its leaves and branches. The history of its introduction is an instructive lesson to importers of plants. How often do we find gardeners throwing away the moss, and mould, and fragments that remain after every foreign case of plants is examined, and the principal part of the contents removed; and how often perhaps do they thus reject the most interesting species, for if accident is the fertile mother of new inventions, so is she also of new introductions. *Canna iridiflora* was obtained from seeds accidentally found in an old herbarium; several Orchidaceous plants have been picked off dried specimens; and this Achimenes adds another to the list. It was hidden among a mass of Orchidaceous plants imported from Guatemala, and sold by auction a few months ago; Mr. Henderson, of the Pine Apple Place Nursery, accidentally detected it; and thus a plant, which must have been often sent home with fruitless care on former occasions, was brought to our gardens without any attention whatever. As has been already stated, this species has the habit of *A. pedunculata*, but is nevertheless a very different species. The leaves are covered with coarse hairs; the flowers are much larger, not at all striped, but have a deep rose-coloured border whose lobes are notched. Those who are fond of hybridizing have been attempting to obtain crosses between *A. longiflora* and some of the red species; but the result has been, we understand, a dingy purple, as was to be expected. We would suggest that this would mix readily with *A. pedunculata*, and that the result would be the improvement of the size of the latter, and of the colour of this, whose rose is hardly bright enough to satisfy the eye fastidious in colour.—*Botanical Register.*

MISCELLANEOUS.

The Poisonous Nature of the Yew.—Although doubts have been expressed by several writers respecting the poisonous action of the Yew, yet a case of poisoning which occurred recently sufficiently proves the contrary. A countryman who had brought in a load of turf to town, placed his three horses in the neighbourhood of a Yew tree: two of these horses, which had eaten of the young shoots, died, one in a quarter of an hour, the other on its return home; the third, which had been placed so that it could not eat the Yew, remained in perfect good health. On examination, distinct traces of poisoning were perceptible.—*Archiv. der Pharm., as quoted in the Chemical Gazette.*

The Bay Lily.—Under the name of *Lilium isabellinum* Professor Kunze has published a description of a Lily which he has growing in the Botanical Garden of Leipzig, and which he regards as quite a new species, unless indeed it should be a hybrid between *L. candidum*, and *L. Martagon*. He says its origin is unknown; that the flowers are very fragrant, and three or four inches in diameter. Inside they are of a reddish bay-colour (isabellino-rubella) marked with some red lines and tubercles; externally they are pale. This should seem worth procuring for our gardens.

Gardeners' Associations.—We learn with pleasure that an association of the gardeners, at Stamford Hill, Clapton, and Stoke Newington, has been formed for mutual instruction, the president being R. Hanbury, Esq., and the secretary our intelligent correspondent, Mr. Wm. Sherwood. The yearly subscription is two shillings and sixpence. The meetings are to be held on the evening of Monday, once every fortnight; if between Michaelmas and Lady Day, to commence at seven o'clock, and at eight o'clock between Lady Day and Michaelmas, and never to be continued after ten o'clock.

Climate of the United States, compared with that of England.—The American Horticulturist needs for his guide American works on gardening. Very many errors in practice have been adopted by us in consequence of following instructions derived from English authorities. Their mode of cultivation may, indeed, often be successful in this country; but, in numerous instances, it will be productive only of failure and disappointment. This is owing to the difference of climate. The climate of England, as compared with that of the United States, is one of extreme humidity. The frequent and long-continued obscuration of the sun by clouds and fogs there, retards the ripening of fruits and seeds and the elaboration of wood, and often chills the air to that degree, even in the month of July, as to render it incongenial to the growth of the tender products of the garden. It is a very common practice in England to cover Cucumbers and some other plants, even in midsummer, by 3 or 4 o'clock, p.m. William Cobbett boasted that he could ripen Indian Corn in England. The summer when he tried it was one of remarkable sunshine for England; and he did succeed in maturing a small, early kind of Indian Corn. But it was a rare hit, and we believe he did not venture to try again. The recommendation of the practice of removing evergreens in the summer, just as they are forming a new growth, in June and August, originated in the works of English gardeners. Although it may sometimes succeed here, it will not generally, unless the season or the soil happen to be of uncommon moisture. Spring is the appropriate season for transplanting evergreens. An excellent Horticulturist (the late Judge Buel) recommended their removal during the summer; but his success may be accounted for by the peculiarity of his soil. It is not strange that English works on Horticulture should not suit us, when we contrast our bright skies with their vapory climate. Their summers afford too little sunlight, and abound too much in moisture, to ripen some of the finer fruits. But our summers, on the other hand, are often so dry as to require extensive artificial irrigation; and our droughts occasionally destroy the grass of the field and some of the trees of the forest. Many European trees and shrubs, like the English Hawthorns, so beautiful there, will blast when introduced here, and become unsightly. Our native *Crataegi* are universally preferable to theirs; and we know of but few European trees which flourish as well in our climate as our own. The English Elm is a beautiful tree, but does not flourish here as well as our native kinds. The great clearness of our atmosphere, and the intense heat of our summer sun require a different aspect and slope for our greenhouses, from what prevails in England. It is neither needful nor

desirable with us, as it is with them, that we should construct our greenhouses so as to derive the greatest possible influence from the heat of the sun's rays.—*Hovey's Magazine of Horticulture.*

The Ailanthus.—The beauty of the Ailanthus, when loaded with the seed, which some varieties of it are even upon quite small trees, cannot be judged of by those commonly seen in New York, which are remarkable for seldom producing any seed. These trees, in this city, which are large enough to flower, have been obtained mostly from suckers, and are of one variety. The matured wood of the Ailanthus is said to be useful, having a fine colour, and susceptible of a polish.—*Hovey's Magazine of Horticulture.*

A Mammoth Pine.—On Tuesday, we had exhibited at our office a Pine cut from the Providence plant, weighing 10½ lbs. avoirdupois, 22½ inches round the thickest part, 12½ inches long, with about 10 inches of stalk, and cultivated by Mr. Smith, gr. to H. Marsland, Esq., of Wood Bank. A short time ago, we saw one cut from one of the pits of F. A. Phillips, Esq., of Thornfield, which measured 23½ inches round it, and was 13½ inches long, with scarcely any stalk, weighing 11 lbs.—*Stockport Advertiser.*

Reviews.

Enumeratio Plantarum omnium hucusque cognitarum secundum Familias Naturales disposita. Auctore C. S. Kunth. Vol. IV. 8vo. Williams and Norgate.

In this new volume of a highly important work on systematic botany, which, beginning at the other end of the chain, will in time meet the *Prodromus* of De Candolle, we have as many things of interest in Horticulture as can well be anticipated in a work which is entirely technical. We ought, perhaps, to mention that Prof. Kunth's "Enumeratio" is a Latin classification of plants according to their natural orders, with technical characters of their genera and species, an enumeration of their synonyms, and short memoranda assisting in their distinctions.

It is because this volume contains a complete account of the Melanthaceæ and Liliaceæ orders, so peculiarly Horticultural, that we think it right to introduce the work into our columns, for the sake of pointing out what the changes are in botanical nomenclature which Prof. Kunth has either adopted from others or himself proposed to introduce. The genus *Helonias* is limited to *H. bullata*, and the other species are scattered through various genera; as *H. dioica*, which is a *Chamælorium*, and *H. asphodeloides*, and *tenax*, which stand in *Xerophyllum*. Lindley's genus *Asagrea* is retained as distinct from *Schoenocaulon*, contrary to the opinion of Dr. Asa Gray. The old *Streptopus roseus* is placed in the genus *Hekorrina*, a most barbarous name, which it would have been better to expunge than revive. Nineteen true species of *Tulipa* are recognised, although several have been suppressed. The Crown Imperial is removed from *Fritillaria*, and receives the old Linnæan name of *Petilium imperiale*. *Lilium candidum* is stated, on the authority of C. A. Meyer, to be found wild in the province of Lenkoran, in Caspian Persia. *Hyacinthus corymbosus*, and *Scilla brevifolia*, form a new genus called *Peribœa*. *Bellevalia*, including *Muscari comosum*, *maritimum*, *ciliatum*, and others, is separated from *Muscari*, of which *M. moschatum* is made the type; while the Starch Hyacinth is removed from *Muscari* and forms a new genus, called *Botryanthus*. Our wild Harebell is placed in *Scilla*. *Ornithogalum nutans* is made a *Myogalum*; 179 species of *Allium* are admitted, after separating *A. striatum* and some others, under the name of *Nothoscordum*. *Brodiaea congesta* forms the new genus *Dichelostemma*, and *Tritileia laxa* is called *Seubertia*. On the other hand, all the modern genera that have been separated from *Aloe* (of which there are 171 species) under the names of *Apicra*, *Haworthia*, *Bowiea*, *Pachidendron*, *Rhipidodendron*, and *Gasteria*, are reduced to that genus. The genus *Tritoma* is named *Kniphofia*. Reichenbach's *Asphodeline* is adopted for *Asphodelus luteus*, *tauricus*, &c., and the genus *Hartwegia* of Nees is recognised. Of course we cannot pretend, in a hasty notice of this sort, to criticise such changes, the value of which will have to be determined by long and careful examination. There is no doubt, however, that Prof. Kunth's classification of Liliaceæ is an important step in advance.

The Meteorological Ephemeris for 1844, by Henry Doxat, is one of those attempts to foretell the weather in which some persons have so much enduring faith. The author tells us that he knows little or nothing of astronomy, chemistry, or mathematics, but he is convinced in his own mind that the method of calculation employed will ultimately lead to success. We wish his conviction may prove at the end of 1844 to have been well founded. At all events Mr. Doxat is no quack, and that is something now-a-days.

GARDEN MEMORANDA.

Jackson's Nursery, Kingston.—At this place, among other plants, Heaths are cultivated to great perfection. These, from their fine dark green foliage and luxuriance of growth, indicate perfect health and good management. The soil in which they are potted is rough fibrous peat, mixed with silver sand; and they receive plenty of drainage, which is essentially necessary for the successful cultivation of this tribe. When they are shifted from one pot to another, the crown of the root is elevated a little above the level of the soil, as Heaths are very impatient of moisture about this part. Early in the season, as soon as the weather would permit, the plants are turned out of doors and placed in a dry airy situation, where they remain until late in autumn, when they are again taken into the Heath-house. By this treatment, in favourable seasons, the young wood gets thoroughly ripened, a condition which enables them to bloom more freely, and renders them less liable to disease. From the long continuance of mild autumn weather, many of the late flowering species were already in bloom; these made the Heath-house unusually gay at this season of the year. Among those in flower we particularly

remarked a very large plant of *Erica acuminata longiflora*, measuring fully 3 feet in diameter, and quite covered with beautiful long pink flowers; also *hyemalis*, and a variety of tricolor, with large light pink flowers, and quite distinct from the old *E. tricolor*. There was also in bloom a good plant of *Metulæ-flora*, with dark pink flowers, having a curious bluish shade, and a well-grown plant of *Jacksonii*, with long flesh-coloured blossoms. This plant has been in bloom ever since the month of July. In the same collection were also good plants of *tenella*, *arbuscula*, and *triceps*, the latter covered with delicate small white flowers, having stamens with dark brown anthers, which, protruding, make a fine contrast with the white corolla. Here were likewise blooming freely *E. exurgens coccinea*, with beautiful dark red blossoms; *mutabilis*, remarkable for the length of time it continues to display its fine purple flowers; and a variety of *princeps*, with light pink corolla; also *rupestris*, with greenish-white blossoms and long brown stamens; this species is particularly handsome, from its pretty dark green foliage, and dwarf compact habit of growth. In this house were also *L. grandiosa*, with pretty hail-like blossoms, and *curvisora lutea*, with pretty yellow flowers; also *Lamberti rosea*, a flesh-coloured variety, and *Banksia alba*, having white flowers, and a beautiful dark green foliage. In the stove was a plant of *Bouvardia splendens*, with long scarlet tube, and *Geissomeria longiflora*, with brilliant scarlet petals, edged with yellow; likewise *Lisianthus Russellianus*, and a *Tradescantia*, with light pink corolla, and long stamens, with orange coloured anthers. We also particularly noticed a plant of *Littleria geminiflora*, with fine, healthy, dark-green foliage. This plant was said to have been lately covered with scale, which was effectually cured by mixing some strong loam with water, to the consistency of thick paint; with this the foliage was covered completely over. The plant was then exposed to the sun, and when the paint became dry, it came off in cakes, and brought the scale off along with it. After this the plant got a good syringing, and has kept quite clean ever since. In the east house was a handsome plant of *Altingia excelsa*, about 8 feet high, and having eight whorls of fine dark-green branches. This plant was potted in peat and loam, and has this season made a growth of 14 inches in length. Here was also a plant of *Cereus flagelliformis*, grafted on *C. speciosissimus*, about 6 feet high, and trained over a circular slightly convex trellis. It had somewhat the appearance of a parasol, and had rather an interesting effect. There were likewise plants of *Epacris*, and a fine young stock of *Phenocoma prolifera* just coming into bloom. This plant is very apt to become naked at the bottom, but this may be easily obviated by pinching off the tops of the shoots, so as to induce laterals when the plants are young. In a house near the Heath-house was a remarkably well-grown specimen of *Crowea saligna*, quite covered with beautiful light pink flowers. This plant should be kept constantly in doors, as, when it is exposed to the full action of the weather, the leaves become discoloured and spotted, and thereby interrupt and impede the elaboration of the sap, and consequently the plant gets diseased, and becomes unsightly. Here was also *Lechenaultia formosa*, with its brilliant scarlet flowers, and a good plant of *Statice mucronata*, which is well worthy of cultivation, on account of the length of time it continues in bloom. In the Orchidaceous-house were in flower, *Vanda teretifolia*, a species of *Calogyne* from India, *Oncidium elatum*, and *Odontoglossum elatum*, the latter having a fine spike of flowers, with delicate lilac bellum, and curiously-spotted upper petals. There were also *Oncidium pumilum*, with pretty small yellow flowers, *Dendrobium densiflorum*, and *Brassavola venosa*, with cream-coloured blossoms; also a variety of the beautifully-spotted *Stanhopea oculata*, and two well-grown plants of *Cypripedium insigne*. In the same collection were likewise *Cattleya Skinneri*, just coming into bloom, and a variety of *Epidendrum ciliare*, with greenish-white flowers. This blooms freely, and is not so robust a grower as the old *E. ciliare*. In this house were also a few Ferns; among these was *Nipholobolus sinensis*, which, although very difficult to manage, was growing freely. It had been turned out of a pot, and was hanging from the roof of the house, with a little moss tied round its root. *Aspidium cornaceum* was also growing freely, treated in this way. In a span-roofed house, close to the Orchidaceous-house, were two plants of the new *Statice macrophylla*. This has a fine broad, dark-green foliage, and bears some resemblance to *S. arborea*, but is very superior to that species in habit. These were not in flower, but judging from the appearance of the plants, there is no doubt it will be an acquisition. In what is called the north house, was a beautiful specimen of *Erica repens*, with scarlet and orange blossoms, measuring nearly 4 feet in diameter and about 5 feet in height; also a plant of *E. ventricosa purpurea*, which, although not in bloom, was remarkable for its size. Along with these were many pretty little plants of *E. gracilis*, with small purple blossoms, which made a fine display, and gave the house, in this, the dull month of November, the gay lively appearance of spring. The show-house was filled with many fine *Camellias* and *Heaths*, and the collection in the pits, which were principally *Heaths*, *Azaleas*, and *Pinus*, were in good condition. In a range of houses belonging to Mr. Jackson, detached from the Home Nursery, were excellent large specimen *Azaleas*; some of them measured 4 feet across and 5 feet high. They consist of scarlet, pink, and white kinds, and will make a beautiful appearance when in bloom.

Dropmore, Nov. 14.—Many improvements are going on at this place, in planting out different species of *Pinus*, which, in time, will add much to the beauty of the scenery. *Pinus monticola* has produced a cone this year, and Mr. Frost has raised four young plants from the seed. *Abies Douglasii* is now exactly 40 feet high, and this year has produced a large wheelbarrow full of cones; already from last year's cones nine promising plants are growing. A great change for the better has taken place in some of the *Pinuses*, especially in the finest *Araucaria*, which has grown more than four feet within two years, and is now 26 feet high, or rather more.

THE NATURALIST'S CORNER.—No. XVII.

(Continued from page 760.)

62. "Behold it is very good!" is the declaration of God himself, over everything animate or inanimate within the whole bounds of the creation. Weeds overrun the garden, and choke those artificial plants which man has sown or planted for his use; but they speak to the slug-gard in language more forcible than all the laws which ever were enacted by human legislation; and impress upon man that, if he is to profit by the bounty of the earth, he must be diligent in performing those labours which are necessary for the security of this bounty. Insects of various kinds, and in different stages of their multifarious existence, are particularly annoying to mankind, both within doors and without; but they proclaim, with voices louder than all the heralds upon earth, the necessity of cleanliness and care. In this manner we may go over the whole catalogue both of vegetable and of animal pests, as they are often called, and show that they are all equally deserving of that benediction which was bestowed upon them at the first.

63. *Depredations of the Tipula prevented.*—We are much indebted to the rook and a variety of other birds for keeping within limited bounds the depredations of the *Tipula*, vulgarly called Tommy Longlegs. A family of rooks would consume 3,847 grubs in a day; supposing

the consumption to be continued throughout the year, it would amount to 1,404,155; and supposing a grub to destroy as many Wheat or other plants as might grow on a space of ground equal to nine inches square, a family of rooks would preserve from destruction more than two acres of corn. If we extend our ideas further, and suppose all these grubs to live and propagate their species, it appears more than probable that, if this one species of bird alone were extinct, the labour of the husbandman would be nearly, if not altogether, in vain.

64. "When we contemplate the wonderful works of Nature, and walking about at leisure gaze upon this ample theatre of the world, considering the stately beauty, constant order, and sumptuous furniture thereof; the glorious splendour and uniform motion of the heavens; the pleasant fertility of the earth; the curious figure and fragrant sweetness of plants; the exquisite frame of animals; and all other amazing miracles of Nature, wherein the glorious attributes of God, especially his transcendent goodness, are more conspicuously displayed; so that by them not only large acknowledgments, but even gratulatory hymns, as it were, of praise, have been extorted from the mouths of Aristotle, Pliny, Galen, and such like men, never suspected guilty of an excessive devotion; then should our hearts be affected with thankful sense, and our lips break forth in praise."—Barrow.

65. There is not, perhaps, a more striking phenomenon in Natural History than the fact of plants teeming with moisture, and growing to a large size, in places where no other vegetable can withstand the burning temperature. In the deserts of the East, in Arabia, and those extensive plains where nothing save sand is seen on the ground; where the heat reflected from the earth dissipates the passing cloud, which hastens, as it were, to shed its refreshing moisture on a more grateful spot; where no water ever rises from a spring, or falls from on high, and where the burning soil is intolerable to the foot even of the camel,—the Water-Melon attains the size of a foot and more in diameter; and, while all around is parched, offers in its cold and copious juice, a draught to the traveller, which has often saved him from a lingering and painful death. In a similar, though less efficient manner, the Melon Cactus refreshes the wild herds of the Pampas; and the formidable prickles are not a sure guard against the powerful kick of the wild horse, who has no other mode of getting at its interior, but who is often permanently lamed in this extraordinary contest.

CALENDAR OF OPERATIONS for the ensuing week.

SCARCELY had I seconded Mr. Haycroft's system of using a flue along with the gutters and tank, than a similar plan appeared from Hewell. Mr. Jones stands second to no man in his experience and success in hothouse building and heating; and Mr. Markham, like Mr. Haycroft—all three, by the way, strangers to me—stands deservedly at the head of his calling. These gentlemen, by their works, show that they are of my opinion in respect to the incapacity of boilers to appropriate all the heat generated under them; a fact also well known to every gardener who has used a hot-water apparatus; but it does not follow that we are "opposed to science in an unfriendly manner," as stated by an anonymous writer last week. Nothing was more distant from my mind than what this writer assumes. He cannot but be aware that there is a multitude of flues now in use, along with pipes, all over the country, and the introduction of gutters and tanks is daily adding to the number. This increase will go on until science, or perhaps chance, discovers that desideratum on which so much of both science and practice has already been expended, viz., an apparatus so adjusted as to lose no heat up the chimney. But allow me to return to the Pine-pit at Hewell in order to correct an error I had fallen into when recommending the proper depth for tanks. It will be recollected that for a bed of 50 feet in length, I said two inches deep of water would be necessary, and to increase the depth as the size of the beds diminished; but at Hewell it has been proved that little more than one inch will suffice for a bed 40 feet long. The water used in the two troughs there, supposing they were brimful, would be little more than an inch deep if spread out all under the bed, according to Mr. Rendle's system, which, by the way, would have been a better arrangement if slate coverings were used, and ultimately more economical, although not, perhaps, so cheap in the first instance; but for a bed covered with wood, as at Hewell, open gutters may, perhaps, suit better, because there will be less vapour to pass up between the pieces of wood, and less chance of the soil finding its way to the gutters and boiler; but to those who are not afraid of too much moisture from below in this way, and who use open boilers, Mr. Rendle's plan is certainly the better of the two.

I.—KITCHEN-GARDEN AND ORCHARD.

In-door Department.

PINERY.—Preserve a steady bottom-heat for all your Pines, and more especially for the younger ones in frames wrought by linings; these plants are more liable to injury now than the older ones. Little or no watering is now necessary, except to those plants next the pipes or flue; of all the plants we cultivate the Pine is least injured by flue heat; this will answer several queries this week, and regarding wooden covers I shall say something next week. True enough the covering at Hewell is the cheapest, and when under the management of good gardeners, I think this is as good as any other covering.

VINERY.—A friend of mine about this time last year began to force a Vinery, which used to be forced not sooner than the middle of January, and his account proves what has been said long since against the practice of beginning to force out of season, or much sooner than usual. Another gardener says, "Reluctantly I undertook last year to have ripe Grapes on the 10th of May from a house I planted only two years before. I began on the 1st of December, and was only ten days behind my time, but it was up-hill work." I want as many letters on this subject as my friends can send me; every day proves that we all have a great deal to learn and unlearn on this and other points.

PEACH HOUSE.—As the Peach does not bleed after pruning, like the Vine, you may begin forcing and pruning the same week; but it is not at all a good plan to "let them flower and set, and then prune, retaining what you want for an average crop," the chances being that you would have little to choose from by such management. True enough, the thing "has been done on open walls," but that is a different case altogether from trees forced in the dead of winter.

Out-door Department.

All trees or bushes that are to be planted or removed here on this side of February should now be finished off hand, without delay, as, after the beginning of next month, we shall be in danger of rough or frosty weather, unfavourable for planting. Get the quarters dug or trenched, also, before the winter sets in too hard, if the ground is at all in a fit state; and the more heavy

work of making new borders, walks, &c., may be left for the dead of winter. I have often seen fruit-tree borders partially improved by merely changing part of the surface-soil for some out of the best quarters in the garden; and with a little fresh soil from the fields this may do some good for a time.

PEAS AND BEANS.—From this time to the end of the month you may sow some of these on a warm border, if you have little convenience for forcing the early crops of them in the spring.

CAULIFLOWERS.—This has been a fine autumn for late Broccoli and Cauliflowers; but it is not safe to leave the latter much longer in the open air, as, if a sudden hard frost comes, it will put an end to them.

JERUSALEM ARTICHOKE.—I have often heard it said that pheasants are fond of these, and I think I have read somewhere of people planting their spare tubers of them in the out-sides of plantations. I intend this winter to send some of them to the gamekeepers, in order to ascertain the truth of this statement.

ENDIVE.—I have seen a few of these plants potted at intervals through the winter, and especially early in spring, and put down in a cellar to blanch, and they did exceedingly well, treated in this way.

STORE-HOUSE.—Onions, Carrots, Parsnips, Siccory, and even Potatoes, will require looking over occasionally, and also Dahlia roots, before they are finally put by for the winter. All these roots have been housed in rather a green state this mild autumn, and may therefore require more attention in keeping.

ORCHARD AND FRUIT-ROOM.—Let one or two hammers be kept constantly at work at the nailing every fine day, beginning with Pears, then Plums and Cherries. Apples and Pears for spring use may now, or any time soon, when you are driven in-doors from bad weather, be packed in hampers, boxes, or jars, among thoroughly-dried fern, or kiln-dried straw, and if they are now in a good sound state they will thus keep better than on the shelves of the generality of fruit-rooms.

II.—FLOWER-GARDEN AND SHRUBBERY.

In-door Department.

STOVE.—I never knew the *Combretum purpureum* to flower so long as it has done this season; it has scarcely been a day out of flower with us since last April, and will go on till Christmas to all appearance. Everyone admires the beautiful markings of the *Gesnera zebrina*, one of the easiest to manage of our winter flowers; and *Gesnera longifolia* is by no means to be despised at this late season. Then there is the old *Eranthemum pulchellum*, the best of all the blue-flowering winter plants; while *Justicia speciosa* is a blaze of purple. *Aphelandra cristata* and *Justicia pulcherrima* are two distinct winter flowers, although under one name in some books. There is much more danger in overheating stoves than in their being now too cool.

GREENHOUSE.—Pelargoniums and Cinerarias require the warmest end of this house, unless there is a compartment for them among the frames and pits. Except these, almost all the greenhouse plants require constant air, and the house kept in a sweet and rather dry state.

CONSERVATORY.—Where collections of the fine new Chrysanthemums have been brought in this season, now is the time for making memoranda of their habits, earliness, and lateness, &c. There are a few inferior varieties among them yet, but they are all beautiful, and fill up a blank between summer and forced flowers. See that your *Luculia* does not get too much water—it is very delicate in that respect; it must go into comparative rest as soon as the flowers are gone. What a pity this most lovely plant should be so scarce! Keep up a genial heat of 45° here now.

FORCING PITS. crammed with all sorts of plants to flower in the conservatory and drawing-room, are now the most critical parts of our garden establishments; forced flowers are coming more and more into use every year, and a new branch of trade is fast rising in London in these, which will soon spread into the provinces. The steady bottom-heat from tanks will effect a great change in forced flowers, as many who could not formerly venture on this more difficult branch will now be able to do so with certainty.

FLOWER-GARDEN.—The roller and the broom must ply diligently here until all the leaves are down, which they are loth to do this season.—D. Beaton, Shrubland Park Gardens, Ipswich.

State of the Weather near London for the week ending Nov. 16, 1843, as observed at the Horticultural Garden, Chiswick.

Nov.		BAROMETER.			THERMOMETER.			Wind.	Rain.
		Max.	Min.	Mean.	Max.	Min.	Mean.		
Friday	10	29.720	29.512	46	30	38.0	S.	0.3	
Saturday	11	30.112	29.946	46	26	36.0	E.		
Sunday	12	30.167	30.126	43	21	34.5	E.		
Monday	13	30.227	30.211	44	25	34.5	N.	.05

Sat. 25	45.8	32.7	39.0	7	0.24	2	3	3	1	1	3	2	2		

The highest temperature occurred on the 21st, in 1832—thermometer 59°; and the lowest on the 22d, 1827—thermometer 20°.

REPORT ON COVENT-GARDEN MARKET,

For the Week ending Nov. 17, 1843.

SCARCELY any difference has occurred in the prices of most articles since our last report, and trade still continues dull. There has been a very good supply of both Fruits and Vegetables during the week. Pines are very good, and quite sufficient to meet the demand. Grapes are also good, and plentiful, especially the Black Hamburgh. Plums are now almost over for this season, a few may still be seen in the market, but are not worth quoting. Some excellent Ribstone Pippins have made their appearance during the week, and Apples in general seem to have improved in quality. Among Pears we noticed the Beurré Diel, Brown Beurré, Gansel's Bergamot, Marie Louise, and the Guernsey Chaumontel. Spanish Melons continue to be brought to the market in considerable quantities, and there is also a few English ones, but these are of inferior quality. Cucumbers bring nearly the same prices as last week. Vegetables are, generally speaking, of excellent quality. Cabbages, Turnips, Carrots, and Broccoli, are abundant, and Leeks and Onions are likewise sufficient for the demand. There are also good supplies of Celery, Endive, and other saladings. Among Cut Flowers were *Erica ventricosa*, *superba*, *gracilis*, and *triceps*, Neapolitan Violets, *Gardenia radicans*, *Bignonia venusta*, *Cypripedium insigne*, *Lechenaultia formosa*, Double Primulas, Chrysanthemums, Camellias, Pelargoniums, Fuchsias, Verbenas, China and Perpetual Roses.

PRICES, SATURDAY, November 18, 1843.—FRUITS.—
Pine Apple, per lb., 3s 6d to 7s
Grapes, hothouse, per lb., 2s to 4s
Portugal, per lb. 6d to 1s 6d
Melons, each, 1s 6d to 4s
Dutch, each, 1s to 2s 6d
Spanish, each, 1s 6d to 3s
Apples, dessert, p. bush. 5s to 12s
Kitchen, p. bush. 3s to 7s
Pears, per half-sieve, 3s to 12s
Oranges, per dozen, 9d to 2s
per 100, 5s to 12s
Lemons, per doz. 1s to 2s
per 100, 6s to 12s
Pomegranates, per doz., 3s to 6s

VEGETABLES.

Broccoli, per bundle, 6d to 1s 6d
Brussels' Sprouts, per hf.-sv., 1s to 2s
Cabbages, per doz., 6d to 1s
Greens, per doz. 1s 6d to 2s 6d
Cauliflowers, per dozen, 1s to 4s
Potatoes, per ton, 40s to 75s
per cwt., 2s to 4s
per bushel, 1s 6d to 2s 6d
Kidney, p. bush., 2s to 2d 6d
Turnips, per doz. bunches, 1s to 2s
Red Beet, per dozen, 9d to 1s
Horse Radish, per bundle, 1s to 5s
Radish, spring, p. doz. hands, 1s
Carrots, p. doz. bunches, 2s to 5s
Spinach, p. sieve, 2s to 1s
Lettuce, per doz. bunches, 1s to 1s 6d
Garlic, per lb. 6d to 8d
Onions, Spring, p. doz. beh., 2s to 3s
Large, per bushel, 2s to 3s

Notices to Correspondents.

Mr. PAXTON'S COTTAGER'S CALENDAR.—At the earnest solicitation of many of our Subscribers, we have determined on again reprinting Mr. Paxton's "Cottager's Calendar," in the form of a small volume, for general distribution, price 3d. each copy. It may be ordered of all booksellers. Gentlemen wishing to distribute copies among their cottage tenants, may have them delivered in any part of London, by remitting a post-office order to this office, at the rate of 5s. for every 25 copies.

COMMUNICATIONS from the following CORRESPONDENTS are in type, and are only waiting till room can be found for them:—R. T., J. L., B. Maund, Bromsgrove, South Devon, P. Neill, Tolly, J. Wighton, Atlas, Facile, M. Saul, A Practical Man, J. T. M'Elroy, Peter Mackenzie, and Tyro.

AGRICULTURE.—We must again solicit the patience of our Agricultural querists until we can make arrangements for supplying the loss of Mr. Rham.

ANEMONES.—W. T. S.—A strong, very rich loam is recommended for these; but we have seen excellent beds in the black garden soil of the valley of the Thames. Thorough drainage in winter is most essential.

APPLES.—J. M. K.—Six first-rate dessert varieties in succession may be the Golden Reinette, Claygate Pearmain, Ribstone Pippin, Pearson's Plate, Herefordshire Pearmain, and Sturmer Pippin. —H. Kemp.—The Apple is middle-sized, somewhat conical, with the eye and stalk deeply sunk. The skin is glossy, beautifully streaked with bright and deep red. Flesh tender with a pleasant acidity, whitish, but variously tinged, even to the core, with bright rose-colour. It well deserves notice.

ASH-TREES, &c.—J. Drope.—As you cannot get the Ash-tree removed, cut off the roots in a semicircle between it and the Vine-border, at 10 or 12 feet from the stem, by cutting a trench a little deeper than you find the roots, and 12 to 18 inches wide; chalk in a half moist state rammed hard into the trench would keep back the roots for many years: coarse lime, one part, with six parts rough gravel, will answer the same purpose, and for this the trench need not be so wide, as it will set as hard as rock. You may also leave the trench open below, and cover it with rough pieces of wood, with a little soil or the turf put over. Clean water and a good scrubbing-brush is the best remedy I know for getting rid of the Mealy Bug. Get some bones, by all means, as well as the cloacine and slaughter-house refuse which you are collecting. B.

BICKES' DISCOVERY.—G. L. P.—This has been mentioned at pp. 35 and 70; and very lately at p. 775. You will see that the opinions in Germany are decidedly unfavourable to it.

Books.—"Punch's Pocket-book" is the very thing for those who want a smart medley of wit, good sense, nonsense, and such useful information as Pocket-books usually contain.—Un Jardinier.—One French dictionary is nearly as good as another for all common purposes. One of the best is Boniface's.—E. S.—There is no little book capable of affording much information on Mosses and Lichens. Purton's "Midland Flora" is of some use, but not much. For Mosses you should consult Hooker's Muscologia Britannica; for Lichens, the English Botany.

BULBS.—E. C.—Do not water Crocuses, Hyacinths, &c. for a month after planting: when they begin to grow is soon enough, for soil is always moist. Do nothing to Dahlia-roots before storing them away, except drying them as well as you can by the sun or the air of a dry shed. Calceolarias cannot be named from leaves, and we never undertake to name even the flowers of florists' plants. Who can?

CABBAGES.—A Constant Reader.—Chou de Milan is the French name for Savoy; it is sufficiently hardy to stand any of our English winters, and its seeds may be sown at the same time as those of other winter Greens. The Couve Tronchuda is not hardy; its seeds may be sown with advantage in March; or if sown in August, the plants should be transplanted into a frame in September, and treated during winter like Cauliflower-plants.—G. L.—The Cabbage called the Field or Drumhead Cabbage is what is usually cultivated in the North of England and in Scotland as food for cattle. The seeds may be sown in May.

CARNATIONS.—H. H.—Scarlet Bizarres: Twitchett's Don John, Martin's Splendid, Ely's Lord Pollington, Headley's William Cobbett, Rainforth's Game Boy, and Strong's Duke of York. Crimson Bizarres: Puxley's Prince Albert, Ely's Lord Milton, Cartwright's Rainbow, Mansley's Robert Burns, Ely's Duke of Bedford, Holmes' Count Paulini. Purple Flakes: Mansley's Beauty of Woodhouse, Pollard's First-rate, Ely's John Wright, Nix's Lady Chetwynde. Scarlet Flakes: Jones' Brilliant, Chadwick's Brilliant, Weldon's Earl of Lichfield, Ivan's Marchioness of Westminster. Rose Flakes: Brook's Flora's Garland, Wilson's Harriet, Lowe's Marchioness of Westminster, Ely's Lady Ely.*

CHEMICAL ANALYSIS.—J. T.—It is useless for unchemical persons to attempt to determine whether land contains potash. It is far better to consult a chemist in the habit of going into such investigations. The process, which is long and troublesome, is fully described in Johnson's "Lectures on Agricultural Chemistry."

CURRENTS, &c.—"Este" has left at our office a book for "Ramblers," which he is requested to send for, with his address. ESPALIERS.—An old Subscriber.—Espaliers may be supported by iron rods, if the expense of purchasing and keeping them painted is no object; but they must be kept painted. Bamboos, when they can be had, are better than stakes; but the latter, from their cheapness, will generally be employed in country places.

GARDEN POTS.—C. L.—You will find full information about the sizes of garden-pots at p. 233 of the present year.

GOLD FISH.—J. Crab.—Always give your gold fish sweet pond or river-water, if you can get it. It is evident that your specimens are very near dying, but it is impossible for us to say from what cause.

GRANITE CHIPPINGS.—E. S. asks where he can procure granite chippings, to lay on walks, and the price per ton. This can only be answered by an advertisement.

GRAPES.—A Subscriber.—Most certainly there never was a bunch

of Black Hamburgs weighing 8lbs. We cannot ascertain what is the greatest weight ever exhibited before the Horticultural Society.

HRIBISCUS SURATTENSIS.—A Constant Reader.—No doubt your flowers wither without expanding in consequence of insufficient heat and moisture; or, which is very probable, some check is given to the plant at that time. Read Mr. Wood's excellent remarks on *Schizanthus retusus*, p. 756.

INSECTS.—J. M. R.'s caterpillars are those of the white Cabbage Butterfly (*Papilio Brassicae*); they have been stung by a little Ichneumon, and were consequently full of maggots, which came forth in the box and formed cocoons. Their history and the best means of destroying them are detailed in the Journal of the Royal Agricultural Society, vol. iii. p. 309, and p. E., figs. 10, 11, and 12. R.—J. R.'s larva eating the *Druscia* is the offspring of *Geometra Betularia*, which generally feeds upon the Birch. It is nearly related to the Brindled Beauty-moth, figured and described in the *Gard. Chron.*, vol. ii. p. 787. R.—Mr. J. Frost's Celery-leaves being completely matted together by the pressure of the post, it is difficult to give a decided opinion, but they exhibit every appearance of being inoculated by a minute fungus. We must beg in future that he will favour us with specimens protected in a chip box, that they may arrive in a proper state for examination. R.—G. L. H.—The eggs of some Dipterous fly have been laid in the leaves of the *Senecio elegans*; they have produced mining caterpillars which fed upon the parenchyma of the leaves and changed to pupæ under the cuticle. We regret that the specimens were sent per post unprotected, as, from such materials, we can neither receive the full benefit of instruction nor communicate the information we desire. If our correspondent will transmit us some leaves inclosed in a flat pill-box, we shall have the pleasure of informing him next year what genus his flies may be referred to. R.—J. B. K. L.—The pretty drawing sent represents the nest of a wasp, which very much resembles the common species, and from which it was distinguished by Dr. Leach, and named *Vespa Britannica*. Such nests are not of uncommon occurrence in some seasons, and are occasionally found as large as a man's head.—Vide "Curtis's Brit. Ent." fol. 760. R.—Bees.—In some former Numbers of the *Gardeners' Chronicle* are various remarks by a Bath subscriber, "J. N." &c., regarding the formation of nests in hedges, &c. by the hive bee, which I should not have been so long in noticing had I not been absent from England for several months. Our correspondents may like to be informed that large masses of comb were discovered by the late Earl of Malmesbury in a copse on his estate in Hants; and an account of this singular phenomenon, together with a deduced figure of the suspended comb, will be found in "Curtis's Brit. Ent." fol. and plate 769. R.

KILNS.—Can any subscriber give us a very cheap plan of a kiln in which sawdust, old tan, or similar refuse, can be charred? We should be much indebted to him for it.

LEYCESTERIA FORMOSA.—M. B.—We do not know whether pheasants will eat the berries of *Leycesteria formosa* or not; but the plant is very hardy, and might probably make good underwood. LINE.—W. C.—It is caustic lime alone which has the power of killing worms and slugs. It may be used as a manure either in a quick or mild form, and will be useful to strong loam, which requires opening, especially if it contain a good deal of organic matter.

MANURE.—N. F.—What Murray do you mean? The noble Scotch family of that name consists of high-minded excellent gentlemen; the gardeners whom we know are most respectable; and the great London bookseller cannot be your man. There is one Murray, a wrong-headed, shallow person, who formerly corresponded with this Paper, and whom we are so happy as to be relieved from; but even he can hardly have committed such ineptitudes as you describe. When bones are digested in sulphuric acid their phosphate of lime, which is perfectly insoluble in water, is converted into gypsum, which is slightly soluble, and phosphoric acid, which is entirely so. When Tobacco is burnt, the ashes, in consequence of the saltpetre it contains, are rich in potash, and may be expected to form a good manure. That is the substance of what we said; and if your Mr. Murray, or Mr. anybody else, denies it, we cannot do you, even if a gardener's apprentice, the injustice to suppose you so ignorant as to believe them. But we are wasting our own and our readers' time upon this matter.

MINULUS.—A Clapham.—The following are some of the most distinct varieties of *Minulus*:—*M. cardinalis*, *roseus*, var. *Macleanianus*, *roseus*, variegatus, and *Smithii*.

MUMMY WHEAT.—A Subscriber.—Yours is Egyptian Wheat, or Blé de Miracle, called by botanists *Triticum compositum*. We do not think your evidence about its origin satisfactory; there is too much hearsay.

NAMES OF FRUIT.—A. Z.—Catillac.—P. P.—1, Birmingham Pippin; 2, White Costin; 4, Alexander; 5, appears to be Minchall Crab; 6, Pigeon; 7, Grey Queen; 8, Golden Reinette. —Y. Z.—1, Williams' Bon Chrétien; 2, Gansell's Bergamot; 3, Doyenné Blanc. —Brutus.—1, Beurré Rance; 2, Gansell's Bergamot; 3, Colmar; 4, St. Germain; 5, Bezi de Caissoy; 7, Chaumontel; 8, Crassane; 10, 11, Passe Colmar. —A Savon.—1, Williams' Bon Chrétien; 2, Black Achan; 3, Beurré Rance; 4, Glout Morceau; 5, 6, Beurré Diel; 7, 11, Passe Colmar; 8, Gansell's Bergamot, substituted for the Van Mons—Léon le Clerc, a long-shaped totally different Pear; 9, Beurré de Capiaumont; 10, Marie Louise; 12, Easter Beurré.

NAMES OF PLANTS.—J. F.—Not a Moss at all, but a Lichen called *Lichen cocciferus*.

PANSIES.—O.—The disease in Pansies which causes them suddenly to droop and die from a state of health has never been satisfactorily accounted for. The idea that they are affected with plethoria does not appear to set the question at rest, as, in a whole bed prepared with the same rich compost, not more than one, two, or three may be so affected, and the rest remain in a healthy and flourishing condition.*

PEAS.—J. B. H.—A good early Pea may be the Early Frame or Charlton; they may be sown any time during this month for an early crop, in a light warm soil, and protected from frost by Spruce-branches; but if your soil be stiff and retentive of moisture, it will be better to sow them about the middle of January, as when sown earlier in such a soil they very often become rotten.

PENTSTEMON.—C. S.—The organ which has puzzled you is the fifth stamen in an abortive state, and which in two-lipped flowers is usually absent. Compare *Pentstemon* with *Antirrhinum*, and you will see that the latter has no such part; the fifth stamen being in that genus missing. The name *Pentstemon*, or fifth stamen, alludes to the peculiarity by which that genus is characterised.

PICOTEES.—H. H.—Red-edged, heavy: Sharp's Duke of Wellington, Barraud's Cornelius, Wildman's Isabella, Brinkler's Masterpiece. Light edged: Sharp's Gem and Criterion, Kirtland's Duke of Wellington and Burroughes' Mrs. Bevan. Purple-edged, heavy: Mansley's Nulli Secundus, Sharp's Invincible, Dickson's Trip to Cambridge, and Luft's seedling. Edged purple, light: John's Prince Albert, Brinklow's Purple Perfection, Burroughes' Lady Douro, Gidden's Vespasian. Rose, scarlet-edged. Burroughes' Miss Osborne, Willmer's Princess Royal, Barraud's Mrs. Barnard, Green's Queen Victoria, Barraud's Bride, Twitchett's Fair Rosamond, Wilson's Miss Fanny Irby, and Kirtland's Squire Annesley.*

PINKS.—O.—Pinks with rose grounds are occasionally produced from seed saved from white ones; but if rose-ground flowers are what you wish to obtain, save seed from such flowers as Anne Boleyn or Hogg's grandiflora. Single Pinks and very double ones should be rejected, if your object is to produce fine flowers; make use of semi-double flowers, and be very particular to select such only as have stout well-formed petals with smooth edges, and reject all such as are serrated. The object

Florists have in fertilizing the stigma of one flower with the pollen from another, is to unite the desirable properties existing in different flowers in a new variety—to improve the habit—and to unite with fine form, fine colour, substance, and size. Care must be used in the operation, and judgment is required in the selection of the sorts proper for the purpose.*

PINUS.—W. T.—Spring will be the best time to plant out *Cedrus Deodara*, *Araucaria imbricata*, *Pinus Cembra*, *patula*, *Morinda*, and *excelsa*, and their roots will need no protection.

RHODODENDRONS.—An Amateur.—In order to insure success, August or September is the best time for budding or grafting *Rhododendrons* in the open air. This plant, being thin-rinded, does best by side-grafting, and buds of it had also better be inserted after the manner of side-grafting, with a portion of the soft wood retained behind the bud.

ROSES.—A. H.—You are probably right in considering that gardeners are wrong in supposing that, for a budded plant, it is only necessary to adapt the soil to the nature of the stock on which the variety is worked. It is highly probable that the chemical action of different kinds of peat is essentially different. Nevertheless we conceive that in general it is its mechanical effect that gives fibrous peat a higher value than other sorts. As to *R. Hardii* itself, we do not believe any art capable of making it stand on a briar stock. It is very delicate; its constitution is entirely different from that of our wild Roses, and such being the case it cannot be expected to grow on them. We should endeavour to cultivate it on its own bottom. You are no doubt aware that its parent *Lowea berberifolia* is itself a plant, the true method of managing which is still unknown.

W. P.—Your Bourbon, Tea, and China Roses, which stand the winter, but are injured by the cold changeable weather in spring, and suffer particularly from the frosty winds of March, may be protected as you propose, by woollen nets. Spruce Fir-branches or Ferns, make excellent winter covering, but exclude the light too much when the Roses begin to grow in spring, and consequently the young shoots are rendered weak and tender. The heavy mists which proceed from the river may not actually produce mildew on the Roses, but no doubt their being constantly subjected to damp will predispose them to it.

SEEDLINGS.—J. R.—Your *Pentstemon* may be as handsome as you describe it to be; but we find it nothing more than a dingy brownish red, in favour of which we have not a word to say. The leaf belongs to *Guaiacum officinale*.

SEEDS.—F. B. G.—No room in which human beings can live will be too dry for seeds.

MISCELLANEOUS.—A Constant Subscriber.—White Water Lily roots may be bought of some of the Nurserymen, or may be obtained from the ponds and lakes of almost any part of the country.—J. G.—Either your question is nonsense or we do not understand it.—N. H.—Inadmissible.—*Cecilia Maria*.—There is only one kind of Ribstone Pippin. Young wood may be grafted on old Vine stumps, but there must be a shoot with leaves above the graft.—A Subscriber is answered at p. 116 of this year.—J. Towers.—Care of Messrs. Longman and Co.

SEEDLING FLORISTS' FLOWERS.

FUCHSIAS.—J. H. B.—Your seedling is a pretty variety in the way of *Chandleri*, having the sepals tipped with brighter green; the corolla, however, appears to be rather smaller; the value of it will depend upon its habits of growth; it appears to bloom freely.*

As usual, a host of letters has arrived too late for answers this week.

ERRATUM.—In Mr. Cuthill's Advertisement of 11th November, for "warm valleys of Saxons," read "warm valleys of Texas."

NEWS OF THE WEEK.

THE State prosecutions in Ireland are making but slow and tedious progress. During the last ten days the Court has been occupied with prolonged arguments on technical points for the most part uninteresting to the public. On Tuesday, Mr. O'Connell and the other traversers appeared at the bar and put in a plea of abatement, declaring that the accused were not guilty of the offences charged, and that the indictment ought to be quashed, as the evidence was found on the examination of witnesses who were not sworn in open Court according to law. The Attorney-General objected to the admission of this plea, but after two days' argument the Judges decided on receiving it. The Attorney-General then demurred on behalf of the Crown, and required the traversers to join issue at once; but the Judges on this point also decided in favour of the traversers, and ordered that there should be the usual four days' notice; so that the demurrer will not be argued until next week. If the Court decide in favour of the validity of the plea, the indictment will be quashed as a matter of course. If, on the other hand, the decision be against the plea, it is clear from the time consumed in the settlement of preliminary questions, that the trials cannot come on before next Session. A rumour, however, is current that Government intend to abandon the prosecutions altogether, on the ground that the defeats already sustained by the Attorney-General on minor points afford but little chance of an ultimate conviction.

From France we learn that the Council of State have found the Bishop of Chalons guilty of an abuse in his letter against the Universities. A royal ordinance has been issued announcing this judgment, but leaving it to work its own influence as a public censure without pointing out any mode of punishment. The trial of the royalist journal for an article drawing a contrast between the simultaneous visits of the Duc de Nemours and the Duc de Bordeaux to England, has terminated in its acquittal on all the counts of the indictment. It appears not only from this trial, but from various other circumstances, that the reception which the Duc de Bordeaux has met with in this country has given much alarm to the French Court, and the reports of his proceedings are evidently read with anxious interest on the other side of the Channel.—In Spain, the majority of Queen Isabella II. has been declared, and her Majesty has taken the oaths in the presence of both Chambers. An attempt was made to assassinate General Narvaez while the discussion on the Queen's majority was pending. Seven shots were fired by the conspirators, who escaped undetected in the darkness of the night. General Narvaez was unhurt, but his aide-

de-camp was mortally wounded. The object of this attempt was to excite a counter-revolution by the death of Narvaez, and thus prevent the declaration of the Queen's majority.—From Italy, the accounts received through the French and German papers are extremely contradictory. It appears that no political disturbance of any moment has taken place during the past month, and that the official inquiry into the late events is still in progress, preparatory to the appointment of a Military Commission. It is said also that the Catholic Powers are about to hold a Conference at Rome, to consult on the best modes of remedying the evils with which the Papal States are now afflicted.—From the United States we learn that the Texan and Oregon questions are assuming additional importance, and that their discussion will produce a stormy session in December. In Canada, the removal of the seat of Government still excites great animosity on the part of the British colonists. Advices from Mexico had reached New York, from which we learn that no reconciliation had been effected between the President Santa Anna and the British Minister.

Home News.

COURT.—On Saturday the Queen and Prince Albert took their customary morning walk, after which the Prince shot over the Royal Preserves. In the afternoon the Duc and Duchess de Nemours arrived on a visit to her Majesty. On Sunday the Queen and Prince Albert attended divine service in the private chapel of the Castle, and the Duc and Duchess de Nemours attended divine service in the Roman Catholic chapel at Clewer. In the afternoon her Majesty and Prince Albert, accompanied by the Duc and Duchess de Nemours and suite, walked to Frogmore and visited the Duchess of Kent. On Monday her Majesty, accompanied by the Princess of Hohenlohe Langenbourg, took an early walk in the precincts of the Castle. After breakfast Prince Albert, accompanied by the Duc de Nemours, shot over the Royal Preserves. On Tuesday the Queen and Prince Albert took their usual walk in the grounds about the Castle. Her Majesty and the Prince also took equestrian exercise in the riding-school. The Duc and Duchess de Nemours left the Castle for Buckingham Palace, where they held a levee for the reception of the foreign diplomatic corps. In the afternoon their Royal Highnesses paid a visit to the Duchess of Gloucester and the Duke of Cambridge, and afterwards honoured the French Ambassador with their company at dinner. Their Royal Highnesses slept at Buckingham Palace, and returned to Windsor Castle on Wednesday morning. After luncheon, Prince Albert and the Duc de Nemours shot over the Royal Preserves in the Great Park. Her Majesty, the Duchess de Nemours and the Princess of Hohenlohe, took a carriage airing in the Park in the afternoon. On Thursday, the Prince and Princess of Hohenlohe took their departure for Brussels, on a visit to the King and Queen of the Belgians. Prince Albert and the Duc de Nemours afterwards hunted with his harriers. It is expected that her Majesty and Prince Albert, with the Duke and Duchess de Nemours, will visit the Duke of Devonshire at Chatsworth, on the 25th or 27th inst., and afterwards visit the Duke of Sutherland at Trentham, Sir R. Peel at Drayton Manor, and the Queen Dowager at Witley.—The Duchess of Gloucester has been indisposed, and is attended by Sir H. Halford.—A report has been current this week, that the health of the Prince of Wales requires a removal to Brighton, for the benefit of the sea air; but the statement has been contradicted on authority by the Ministerial papers, which announce the gratifying fact that His Royal Highness is in the enjoyment of perfect health. The visitors to Her Majesty this week have been the Duke of Wellington, the Earls of Aberdeen and Delawarr, the French Ambassador, and the Countess de St. Aulaire, Sir R. Peel, the Dukes of Sutherland and Devonshire, Major-Gen. Sir George Scovell, and Admiral Casy, of the French Navy.

The Duc de Bordeaux.—On Sunday, the 5th, his Royal Highness and suite attended high mass in the private chapel of Alton Towers. Monday, the 6th, being the anniversary of the death of Charles X., a mass of requiem and a dirge were celebrated, at the request of his Royal Highness, by the Right Rev. Dr. Wiseman. On Tuesday the Prince, accompanied by the Countess of Shrewsbury, and a number of the distinguished guests, drove to Chatsworth, the seat of the Duke of Devonshire. His Royal Highness expressed great admiration of the sculpture gallery, the conservatory, and other splendid objects for which Chatsworth is so celebrated. On Wednesday morning his Royal Highness, at the request of the Earl of Shrewsbury, attended by the whole of the guests, and a concourse of respectable persons, planted five young Oaks on different parts of the lawn in front of the mansion; at the planting of each a cannon was fired from the terrace battery, over which floats the ancient banner of the House of Talbot. After this ceremony his Royal Highness drove to Cheshire to see the catholic church now erecting by the Earl of Shrewsbury, and afterwards visited Trentham, the seat of the Duke of Sutherland. On Thursday the Prince being anxious to visit all the seats of our manufactures, drove to the Potteries, accompanied by the Countess of Shrewsbury and a large party, and inspected the establishment of Messrs. Minton and Co. On Friday his Royal Highness went to Manchester to visit some of the principal manufactories in that district. His Royal Highness and suite dined and slept at Sir T. De Trafford's of Trafford Park, and on Saturday returned to Alton Towers. The village of Farley, near Alton, through which

the Prince had to pass on his return from Manchester, was illuminated by the inhabitants, and every honour was shown to his Royal Highness at the different stages of his route. On Sunday his Royal Highness attended divine service in the chapel of the mansion, where high mass was celebrated by the Reverend Doctor Winter. At the conclusion of dinner in the evening Lord Shrewsbury in a short speech in French gave the health of his illustrious guest, the band playing "Vive Henri Quatre." His Royal Highness then rose, and in most feeling terms thanked the Earl and Countess for the splendid manner in which they had received him, and for the magnificent hospitality with which they continued to entertain him, assuring them that their kindness would never be erased from his memory: he concluded by drinking their healths, the band playing "God save the Queen." When the Earl of Shrewsbury was about to rise to propose his health, the Countess, turning to his Royal Highness, said "Nous allons boire à la santé de Monseigneur avec du vin de Bordeaux; to which he immediately replied, in the most touching and naive manner, "Et moi, milady, je boirai aux vôtres avec du vin de Constantine." On Monday his Royal Highness left Alton Towers for Sheffield, where he visited the manufactories of that town, and proceeded from thence to Leeds and the other great manufacturing districts of the North, on his way to Burton Constable, the seat of Sir Clifford Constable, where he arrived yesterday. From Burton Constable his Royal Highness proceeds to Hornby Castle, the seat of the Duke of Leeds, and from thence on a visit to the Duke of Northumberland at Alnwick Castle. M. Berryer returned to London in the middle of the week for the celebration of a service at the Roman Catholic chapel, in George-street, on Thursday, being the anniversary of the death of his wife. The celebrated orator left London yesterday for Burton Constable, near Hull, to rejoin the Duc de Bordeaux. M. Berryer's stay in England will be prolonged until his Royal Highness's arrival in London. Amongst the calls at Mivart's on the distinguished Deputy have been Sir R. Peel, Sir J. Graham, the Lord Chancellor, Lord Strangford, Lord Mahon, &c. The venerable poet Chateaubriand leaves Paris on the 20th inst., to join the Duc de Bordeaux in London.

Parliamentary Movements.—On Tuesday Parliament was prorogued by commission in the usual manner, to the 19th December. The Lords Commissioners were the Lord Chancellor, Earl Aberdeen, and Lord Wharcliffe.

The Church.—It is said that the Rev. Dr. Mill, chaplain to the Archbishop of Canterbury, and Christian Advocate in the University of Cambridge, is to be the President of King's College, London, in the room of Bishop Lonsdale, and that Archdeacon Manning, the Rev. James Anderson, the Rev. J. Randall, Rector of Binfield, and the Rev. W. Harness, Minister of Regent-square Chapel, St. Pancras, have announced their intention of offering themselves as candidates for the Preachership of Lincoln's-inn whenever the vacancy is declared.

Church of Scotland.—The following appointments have taken place in the Church of Scotland, in consequence of the late secession:—Rev. R. Waugh to the church of North Ronaldshay, Orkney, in the room of the Rev. A. White; Rev. J. Boe to the church of Dunblane, Perth, in the room of the Rev. R. J. Johnstone; Rev. R. Stobie to the church of Keiss, Caithness, in the room of the Rev. T. Gunn. The Queen has also been pleased to appoint the Rev. J. Robertson, minister of Ellon, Aberdeen, to be Secretary to her Majesty's Master Printers in Scotland, in the room of Dr. David Welsh, who has vacated that office by joining the Free Church. The appointment of the Rev. J. Campbell to the church of Reay, Caithness, in the room of the Rev. Finlay Cook, has been cancelled, and the Rev. J. Murray appointed in his stead.

Order of the Bath.—The Queen has been pleased to appoint Arthur Aston, Esq., late her Majesty's Minister in Spain, to be a Knight Grand Cross of the Bath.

Diplomatic Movements.—The Queen has been pleased to appoint Richard Pakenham, Esq., now her Majesty's Minister to the Mexican Republic, to be Minister Plenipotentiary to the United States; Henry Lytton Bulwer, Esq., Secretary to her Majesty's Embassy at Paris, to be Minister Plenipotentiary to the Queen of Spain; and Lord William Hervey, formerly Secretary of Legation at Madrid, to be Secretary of Embassy at Paris.

Pensions.—The Government have granted a pension of 200l. a year to Sir William Hamilton, Astronomer Royal in Ireland.

The New Sheriffs.—The Lords of the Privy Council had a meeting on Monday, in the Exchequer Chamber, to settle the roll of Sheriffs for the ensuing year. The Chancellor of the Exchequer presided, and the following gentlemen were nominated by the Judges for the respective counties:—**Beds.**—J. Lee, of Sharnbrooke, Esq.; G. J. Sullivan, of Leegrave, Esq.; W. B. Higgins, of Turvey, Esq. **Berks.**—E. M. Atkins, of Kingstone Lisle, Esq.; C. D. Griffith, of Padworth House, Esq.; J. B. Monk, of Coley Park, Esq. **Bucks.**—J. Barnes, of Chorley Wood, Esq.; E. F. Dayrell, of Lillingstone Dayrell, Esq.; Sir W. R. Clayton, of Harleyford House, Bart. **Cambridge and Huntingdon.**—T. Lewin, of March, Esq.; R. F. Pate, of Wisbeach, Esq.; J. Vipan, of Sutton, Esq. **Cumberland.**—G. Harrison, of Linethwaite, Esq.; J. Featherstonehaugh, of the College, Kirkoswald, Esq.; T. P. Senhouse, of Netherhall, Esq. **Cheshire.**—G. Wilbraham, of Delamere House, Esq.; J. W. Hammond, of Wistaston, Esq.; Sir W. M. Stanley, of Hobton Hall, Bart. **Derby.**—T. Pares, of Hopwell, Esq.; E. D. Sitwell, of Stainsby, Esq.; Sir J. R. B. Cave, of Shetton-on-the-Fields, Bart. **Devon.**—N. V. Lee, of Ilfracombe, Esq.; J. Whyte, of Pilton House, Esq.; J. W. Buller, of Downes, Esq. **Dorset.**—E. Balston, of Radipole, Esq.;

J. Floyer, of West Stafford, Esq.; S. Pretor, of Sherborne, Esq. **Durham.**—H. Witham, of Lartington, Esq.; J. Allan, of Blackwell, Esq.; J. W. Williamson, of Whickham, Esq. **Essex.**—S. B. Bocket, of Spainshall, Esq.; G. Round, of Colchester, Esq.; J. C. Whiteman, of the Grove, Epping, Esq. **Gloucester.**—E. Hopkinson, of Edgeworth House, Esq.; J. Yorke, of Forthampton Court, Esq.; G. Bengough, of Ridge, Esq. **Hants.**—J. T. Waddington, of Twyford Lodge, Winchester, Esq.; Sir R. G. Simeon, of Swainstone, Isle of Wight, Bart.; J. Beardmore, of Fareham, Esq. **Herefordshire.**—T. G. Symons, of Mynde Park, Esq.; J. K. King, of Moreton House, Esq.; J. Salwey, of the Moor, Esq. **Herts.**—F. Cass, of East Barnett, Esq.; Sir H. Meux, of Theobald's Park, Bart.; F. Calvert, of Hunsden House, Esq. **Kent.**—Sir J. H. Hawley, of Leybourne Grange, Bart.; Sir M. Montefiore, of Ramsgate, Knight; J. Deacon, of Mableton, Esq. **Leicester.**—Lord A. H. Algernon St. Mawr, of Burton on the Wolds; W. A. Pochin, of Barkley, Esq.; W. C. Smith, of Bitteswell, Esq. **Lincoln.**—Hon. C. T. Clifford, of Irnham; R. Crocreeft, of Hackthorne, Esq.; T. Coltman, of Hagnaby Priory, Esq. **Monmouth.**—W. Phillips, of Witston House, Esq.; Hon. W. P. Rodney, of Llanvihangel Court; W. Jones, of Clytha House, Esq. **Norfolk.**—Sir J. P. Boileau, of Ketteringham, Bart.; H. D'Esterne Hemsworth, of Shrop-ham, Esq.; T. R. Buckworth, of Cockley Cley, Esq. **Northampton.**—Sir H. E. L. Dryden, of Canons Ashby, Bart.; J. J. Blencowe, of Marston St. Lawrence, Esq.; Hon. R. Watson, of Rockingham Castle. **Northumberland.**—William Cuthbert, of Beaufort, Esq.; E. J. Collingwood, of Chirton House, Esq.; W. H. Cadogan, of Brinkburn Priory, Esq. **Nottingham.**—C. Paget, of Ruddington, Esq.; R. Milward, of Hexgrave Park, Esq.; W. H. Barrow, of Southwell, Esq. **Oxon.**—W. Strickland, of Cokethorpe Park, Esq.; J. S. North, of Wroxton Abbey, Esq.; M. Ricardo, of Kiddington, Esq. **Rutland.**—Viscount Campden, of Flitteris Park; C. Grantham, of Ketton, Esq.; W. E. Freke, of Glaston, Esq. **Salop.**—St. J. C. Charlton, of Apley Castle, Esq.; R. H. Kinchant, of Park Hall, Esq.; J. C. B. Borough, of Chetwynd Park, Esq.; **Somerset.**—J. F. Luttrell, of Dunster Castle, Esq.; J. Lee Lee, of Dillington House, Esq.; R. M. King, of Pyrland Hall, Esq. **Stafford.**—C. S. Forster, of Walsall, Esq.; R. Sneyd, of Keile, Esq.; J. Levett, of Wychnor, Esq. **Suffolk.**—Sir P. Broke, of Nacton, Bart.; H. Wilson, of Stowlangtoft, Esq.; W. Mills, of Great Saxham, Esq. **Surrey.**—W. Strachan, of Ashurst, Esq.; J. Bonsor, of Pollesden, Esq.; C. McNevin, of Perryfield, Esq. **Sussex.**—E. Hussey, of Scotney Castle, Esq.; Sir C. W. Taylor, of Hollycomb Linch, Bart.; W. T. Mitford, of Pitshill, Esq. **Warwick.**—C. T. Warde, of Clepton House, Esq.; Sir F. Shuckburgh, of Shuckburgh, Bart.; J. R. West, of Alscote, Esq. **Wills.**—G. E. Eyre, of Warrens, Esq.; W. H. Ludlow Bruges, of Seend, Esq.; W. Brown, of Monkton Farleigh, Esq. **Worcester.**—F. Rufford, of Prescott, Esq.; J. Richards, of Wassell-grove, Esq.; A. Skey, of Spring-grove, Esq. **Yorkshire.**—Sir W. B. Cooke, of Wheatley, Bart.; T. Wentworth Beaumont, of Bretton-hall, Esq.; T. Hutton, of Clifton Castle, Esq. On the same day the following gentlemen were nominated by the Council of the Prince of Wales for the county of Cornwall:—F. Spry, of Place, Esq.; H. L. Stephens, of Tregenna-Castle, Esq.; F. Rodd, of Trebartha-Hall, Esq.

Foreign.

FRANCE.—The Council of State has decided that in the letter of the Bishop of Chalons, respecting the system of education in the Universities, there was "abuse," within the meaning of the law, and a royal ordinance appears in the *Moniteur* of Thursday, declaring the judgment of the Council of State in that respect. The ordinance declares the following to have been the grounds of this judgment:—"1. That the Bishop of Chalons, acting in that capacity, had thought proper to make allegations injurious to the University of France and the members of the educational body.—2. That the said bishop threatens, eventually, to refuse the holy sacraments to children educated at the establishments connected with and under the control of the University.—3. That these facts constitute in themselves an injury and an attack upon the honour of the University and the whole body of instructors, and are of a nature unnecessarily to alarm the consciences of the children brought up in the establishments, and their families." It is thereupon found that these facts come within the meaning of the law, as respects cases of abuse; and his Majesty, with the advice of his Council of State, finds that there is "abuse" in the declarations issued by the bishop. The Minister of Justice and Public Worship is then ordered to put the ordinance into execution. It will be observed that no mode of punishment is pointed out in this ordinance, and it is understood, in fact, that no further step is to be taken in the matter. A judgment thus given by the Council of State, and published to all Europe in a state document from the Sovereign, is of itself no small punishment, and is felt as a severe censure, not only on the Bishop of Chalons, but on all those members of the clerical body who used such threats to obtain an extension of their power. Another bishop has come forward as a champion for the cause of the clergy against the University. The Bishop of Perpignan has addressed a letter on the question of education, and, in imitation of his brethren of Lyons, Chalons, and Langres, has chosen to publish it in the newspapers. The bishop, without abating any of the pretensions put forth by his brother bishops, expresses himself with so much mildness and absence of asperity, that he has in a great measure disarmed his opponents. They still hope that the declaration

of the Council of State in regard to the letter of the Bishop of Chalons will not be without its effect; and as the Bishop of Perpignan's letter was published before the writer could have known of that declaration, they further hope that the good sense of the clergy will induce them not to continue the contest.—The editor of *La France* appeared before the Paris Court of Assizes on Thursday, to take his trial on the charge founded upon an article respecting the simultaneous journey of the Duc de Bordeaux and the Duc de Nemours to London. The prosecution was conducted by the Avocat-Général, and the defence by M. Fontaine. The editor was acquitted on all the counts of the indictment. In the course of the trial, the Crown-counsel assured the Jury that the Duc de Bordeaux's visit to this country was a very ordinary and trifling occurrence. It would seem, however, from a leading article of the Ministerial *Journal des Débats*, that it is viewed in a different light at St. Cloud. Although the *Débats* declares that adversity is sacred, that the Government it serves is too humane, too wise, too sure of its rights and strength to envy the Duc de Bordeaux the respect due to his birth and misfortunes, and that it exercises hospitality too generously to dispute its neighbour's right to exercising it towards an unfortunate Prince, the friendly reception his Royal Highness has met with here would appear to have excited jealousy and given offence. This the reader will probably perceive in the *Débats'* reference to the festivities at Alton Towers:—"The French Government knows too well that all the efforts of parties to give a political character to the movements of the Duc de Bordeaux will be frustrated by the honesty and firmness of the English Government. It has, in short, not more fear of the grandson of Charles X. in England than in Germany. This is the exact truth. There remain the old castle and fleurs-de-lis of Lord John Talbot. Nothing is less alarming; of this we can assure the Opposition prints. An ardent Catholic and a Jacobite, if any Jacobites could still exist in England, Lord Shrewsbury must naturally warmly sympathise with the French pretender; but, on the other hand, Lord Shrewsbury, notwithstanding his birth, name, and fortune, exercises not the slightest influence in his country." The wrath of the official print just quoted is next levelled against M. Berryer. That eminent orator, whose attachment to the fallen branch of the Bourbons is known throughout France, whose constituents entertain the same political opinions, is almost charged with treason for having visited the Duc de Bordeaux at Alton Towers, because, as a Member of the Chamber of Deputies, he has made oath of fidelity to King Louis Philippe and of obedience to the charter.—The *Courrier Français* gives a report that the Ministry had abandoned the intention of proposing, in the ensuing session of the Chambers, a bill of dotation of the Duc de Nemours as future Regent of the kingdom, and states that the Prince de Joinville is to sail from Toulon with a squadron in January, on a long voyage. Another print mentions the rumour that Lieutenant-General Dode, who has superintended the erection of the Paris fortifications, is to be rewarded with the staff of a Marshal, and that there is speedily to be a new creation of peers, of whom M. Victor Hugo is to be one.—The *Journal des Chemins de Fer* publishes the report of Mr. Cubitt, the engineer, on his survey of a projected line of railroad from Boulogne to Amiens. Mr. Cubitt speaks very favourably of the project, both as regards economy and facility of execution.—Despatches have been received from Algiers to the 30th October, which state that the French had made a successful incursion into the territory of the Djaffras, and had taken 400 prisoners, 300 head of cattle, and 1,000 sheep, besides a large number of horses. A second incursion was made into the same country by the Hararas, a tribe attached to the French, in which 2,000 sheep, 100 camels, and a number of horses and asses have been seized. How many women and children are included in the booty is not mentioned.

SPAIN.—The news from Madrid is of great importance. It announces the declaration of the Queen's majority, an attempt on the life of General Narvaez, and the occupation of Gerona by the Government troops. The debate on the Queen's majority was resumed and closed in the Cortes on the 7th inst. In the Senate, the Duke de Frias, General Narvaez, M. Campuzano, M. Garelli, and M. Marco, successively spoke. The speech of General Narvaez excited deep interest, owing to his recent escape from assassination. He dwelt on his services to his Sovereign and freedom, and urged that the only institution in Spain that had resisted the shock of parties was the Throne, and that the rendering it strong and powerful was now the only means of saving the country from anarchy. In the Chamber of Deputies, the debate derived more interest still from a long and eloquent speech in which Martinez de la Rosa expatiated on the advantages of the monarchical principle, as a remedy to domestic dissensions, especially when a country was so distracted by them as Spain. This oration is stated to have made a deep impression, and almost every sentence of it elicited cheers. The two chambers assembled next day in the hall of the Deputies, the Ministers Lopez, Caballero, Frias, Serrano, and Ayllon being present, and the public and diplomatic galleries being thronged to excess. The Chambers were called over, when 76 Senators and 133 Deputies were found present. On dividing, 193 to 16 voted in favour of the declaration of the Queen's majority. The sitting was then closed amidst cries of "Viva the Queen! Viva the Constitution! Viva General Narvaez!" This last cry is said to have been enthusiastically uttered. On leaving the chamber an immense crowd outside cheered the General, who excited fresh acclamations by a short address to the multitude. At three o'clock the Cortes sat

again in order to appoint a deputation to convey their congratulations to the Queen. It was ultimately resolved that all the Senators and Deputies should join the deputation, after which the President, Olozaga, exclaimed:—"From this day the constitutional system must begin to be a reality in Spain. Ministers shall be informed of what has just been accomplished, in order that they may take her Majesty's commands." The Chambers were then adjourned amidst great apparent satisfaction. On the 10th Queen Isabella II. took her oath in presence of the two Chambers assembled in the hall of the Senate. Her Majesty was received everywhere with the utmost enthusiasm. In the evening all the public edifices and a great number of private houses were illuminated. The bands of the different regiments of the garrison, preceded by torch-bearers, and followed by an immense concourse of people, traversed the city, and serenaded the Queen, the Ministers, and General Narvaez, who, having appeared on his balcony, was loudly cheered. The attempt on his life was made on the evening of the 6th, at about 11 o'clock. The Queen was in the Circus theatre, and the General was proceeding thither when on his carriage passing the Portaceli church seven shots were fired at it by men who were concealed behind the pillars of the church, awaiting its approach. None of the shots, which were simultaneously discharged, touched Gen. Narvaez, but his aide-de-camp, M. Maceti, was mortally wounded. M. Salvador Bermudez de Castro, a young man distinguished in literature, who accompanied the Captain-General, also received a wound in his head, though not a dangerous one. All the troops of the garrison were immediately summoned to arms, and measures were adopted to prevent any disturbance. None of the assassins were apprehended. Narvaez proceeded to the theatre, and remained until the end of the performance in the box of the Queen, who seemed deeply agitated when informed of the occurrence. In Catalonia, Prim and Ametller had an interview on the 3d, in the castle of Monjuich, at which terms of a new convention were agreed to. The conditions, stipulating for the surrender of Gerona, Figueras, and Hostalrich, were to be submitted to the approbation of Captain-General Sanz. They were more advantageous than those granted to the Saragossa insurgents. Prim entered Gerona on the 9th. At Barcelona the situation of affairs was unchanged on the 3d. Valencia was tranquil, but the interruption of the trade with Barcelona was the cause of much misery, and of many robberies in the city. Conspiracies are said to have been detected at Algeiras and Cordoba. General Concha was about to return to Madrid to resume the organization of the army, and General Roncali was to succeed to him in the command of Aragon.

BELGIUM.—The Belgian Chambers were opened on the 14th by a speech from the throne, in which King Leopold alluded to the recent visit of her Majesty to Belgium, as a proof of her lively sympathy with Belgium. He took a general review of the state of the country, and stated that he will be able to establish, with due regard to the public interests, a perfect equilibrium between the wants of the state and the revenues of the treasury; and that this desirable result will be obtained by a diminution of expenses and by some financial improvements.

GERMANY.—Letters from Vienna of the 29th ult. state that Prince Gustavus Wasa, son of the late King of Sweden, Gustavus Adolphus IV. (dethroned in 1809), and who is now a Field Marshal in the Austrian service, has instituted proceedings for a divorce from his consort, Princess Amelia Stephanie of Baden. The reason which has induced the Prince to adopt this step, after having been married 13 years, is not known; but the rumour is afloat that for some time past, the Prince has experienced frequent fits of mental derangement, a disease which is hereditary in his family. As the Prince and Princess are both Lutherans, it is the Consistory Court of the Augsburg Confession at Vienna that will have to decide upon this application.—A marriage is said to be arranged between the Archduke Stephen, eldest son of the Archduke Charles of Austria, and the Grand Duchess Olga, second daughter of the Emperor of Russia. This is said to be the first matrimonial alliance ever concluded between the reigning dynasties of Austria and Russia.—The opening of the railroad from Antwerp to Cologne has induced the inhabitants of the latter to conceive the plan of having a market for sea-fish, which arrive quite fresh by means of this rapid communication.—On the 30th ult., the Directors of the Railway from Berlin to Potsdam celebrated, by a grand entertainment, the day on which it was opened to the public five years ago. Since that time two millions and a half of persons have been conveyed on it in 21,000 journeys, and only two persons have received slight injuries, a proof of the prudence and order with which the service is conducted.—The Senate of Hamburg is at present deliberating upon a law authorising marriages between Christians and Jews. At present, although a law exists which prohibits mixed marriages, it is easily evaded by the parties getting united in another country. This generally takes place at Hull, between which town and Hamburg there are no less than three lines of steamers.

NORWAY.—By the Norwegian law Jews have been hitherto forbidden to enter that kingdom. The interdiction has recently been suspended in favour of such Israelite naturalists as may wish to attend the scientific congress to be held at Christiania during the next summer, and it is supposed that this is an indication of a reform favourable to religious freedom.

ITALY.—A long account has appeared in the French papers of the proceedings of the military commission at Bologna, stating among other things that the evidence received against the prisoners was written, not oral, that no cross examination of witnesses was therefore possible, that no testimony for the defence was admitted, that the

prisoners were silenced when they attempted to protest against the illegality of the proceedings, and that the Court passed judgment without hesitation, condemning five of the accused to death, and the remainder of those tried to imprisonment for 20 years. There is reason, however, to believe that these statements are greatly exaggerated, if not altogether untrue. Letters from Bologna of the 4th inst. state that with the exception of a few pistol shots fired near the public gardens, where some pasquinades against the authorities were posted, nothing particular has happened since the 8th of October. It is true that in several places, especially at Pieve and Galliera, some excesses have been committed by bodies of the people, but they are mere banditti, and have no political character. The examining magistrates are busily occupied in drawing up processes, which will be laid without delay before a military commission. In the meantime the arrests continue to increase. There are already about 100 prisoners in the prisons of Bologna, without counting the 50 who have been sent to Pesaro. Two examining magistrates have been sent to Pesaro, in order to complete the number for carrying on the process relative to the late political events. The people are very indignant with the Tuscan Government for having banished M. Viola, of Bologna, one of the 16 individuals arrested at the suggestion of the Papal Government. The sanguinary disputes among the soldiers of the garrison of Ancona have been repeated at Imola, at Forti, and at Pesaro. It is said that the Pope is about to add 6,000 men to his army. There is a report that a sort of conference is to take place at Rome between the representatives of the great powers, to consult as to the mode of remedying the evils with which the country is afflicted: but it is said that Cardinal Lambruschini, the secretary of state, will not listen to any proposition either of reform or concession.—Prince Borghese is on the eve of departing for Paris, for the purpose of forming a matrimonial connexion with a member of the house of Rochefoucauld. Prince Borghese is a widower, his first wife, the Lady Catherine Gwendoline Talbot, daughter of the Earl and Countess of Shrewsbury, having died about two years since. A subscription has been raised among the English nobility and others resorting to the Italian States, which already amounts to near 3000*l.*, with which it is intended to erect an academy at Rome, to which all English students will be enabled to proceed with their studies throughout the year, and not be compelled to remain inactive for months, without access to the public collections. The establishment is to contain all that is necessary for their use, a large collection of casts from the antique, the chief works of the most celebrated modern sculptors, and an extensive library.—Letters from Naples of the 1st inst., state that an alarming fire broke out in the British Consular residence, at the Palazzo Calabritta, on Sunday night, the 29th ult., which for some time threatened the total destruction of that vast building. The origin of it is at present enveloped in mystery, but there is strong suspicion of its having been the wilful act of one of the inferior domestics. The damage done to the building is considerable, not only in the dwelling of the British Consul, but also in the apartment above inhabited by the French Consul, whose family had a very narrow escape from being burnt in their beds; the flooring of the room having fallen in a few minutes after they escaped from it. Fortunately no lives were lost.—From Sicily we learn that the troops in garrison at Palermo are kept in constant exercise, particularly at night. At such an exercise and sham fight several soldiers had loaded their muskets secretly with ball cartridges, and availed themselves of the darkness of the night to get rid of some of their most unpopular officers. No less than ten officers are mentioned as having become the victims of their men, but it is believed that the full truth will never come to light.

SWITZERLAND.—The Zurich papers state that the Government of Soleure has given notice to the Governments of Berne and Zurich, that it has protested against the resolution taken by the Grand Council of Lucerne in the affair of the convents, of which it takes quite a different view. The Ultra-Catholic party of Lucerne are said to be alarmed at the bold measures they have adopted, and at the consequences with which they threaten them. The British Minister has also addressed a communication to Lucerne, testifying to the President of the Vorort how much England is grieved to see imprudent demonstrations, compromising the domestic tranquillity of the country, in the maintenance of which the powers of Europe were so much interested.

GREECE.—Letters from Athens of the 21st ult. state that the pretended recal of M. Katakasi, the late Russian Minister to the Court of Athens, was a farce, and that, being a Greek, he has entered the service of King Otho. If this account prove to be correct, it certainly forms a very important addition to the mysteries in which the affairs of Greece appear to be involved. The same letters state that the English and French Ministers, Sir E. Lyons and M. Piscatory, have had an interview with the King of Greece, at which they declared, on the part of their respective Governments, their recognition of the Greek Government, as settled by the revolution of September. Proper persons were employed in drawing up a form of constitution, and copies of the constitutions of France, England, the United States, and Belgium, have been laid before them, for the purpose of enabling them to assist their decision. The Belgian constitution is considered the most complete, and will form the foundation of the Grecian constitution. In the island of Eubœa the people had set fire to the woods to revenge themselves on the German foresters.

MALTA AND GIBRALTAR.—The Malta papers contain a pastoral letter published by the Roman Catholic Bishop,

fulminating his censures and excommunication against the Masonic fraternity. The papers state that this is an indirect attempt to excite the people against Protestants in general, for amongst the Maltese Protestants and Freemasons are almost synonymous terms.—The wreck of the American steam-frigate *Missouri*, which was burnt a few weeks since, still remains submerged in Gibraltar Bay, but since the arrival of Mr. Abbinett, of Gosport, the operations have been carried on with great activity. The whole of her guns, chains, anchors, one store-room of provisions, and other things of great weight have been raised, and placed on board a large American bark which is on her passage to New York. The magazine hatch has also been cleared, and the whole of the magazine has been got up, consisting of about 60 costly copper tanks, but the powder was damaged with the salt water.

TURKEY.—The German papers state that the Turkish population at Urania, to the south of Nissa, have risen against the Christians. The Turks pillaged the churches and committed other excesses. The Russian ambassador has demanded satisfaction from the Ottoman Porte. The Frankfort papers give a letter from Constantinople, of the 25th ult., which states that there was every probability of a change in the Turkish Ministry, in consequence of the jealousies existing between Reschid Pacha and Hafiz Pacha. Hafiz is said to be very intolerant, and it was said to be by his advice that the unfortunate Armenian was executed. The Divan has given no answer yet to the note of M. de Bourqueney on this subject, nor have the English and Prussian ambassadors taken any steps regarding it. It is said that a marriage has been arranged between a grandson of Mehemet Ali and the sister of the Sultan. A similar negotiation was on foot last year, but failed.

UNITED STATES AND CANADA.—The mail steam-ship *Hibernia* arrived at Liverpool on Tuesday. She sailed from Boston on the 1st and from Halifax on the 3d inst., and has made the passage in about 12 days and a half. The New York papers are from the 22d to the 31st ult., and from Boston to the 1st inst. The news is not particularly interesting. That from Mexico leaves matters in the same position as did the intelligence which came more direct by the last West India steamer. No reconciliation appears to have been effected between Santa Anna and the British Minister. The United States papers are principally filled with electioneering matters. Mr. Webster is to be the candidate for the Vice-Presidency on the Whig interest. At New Orleans the yellow fever still prevailed, as it did also at Mobile; but the epidemic was much more virulent at the latter place, and the number of deaths is stated to be on the increase. General Bertrand, so devotedly attached to Napoleon, had arrived at New York, and had received from the citizens and the corporation the liveliest marks of respect and attention. Mr. J. Q. Adams, the most venerable of American statesmen, has made a speech to his constituents at Dedham, Massachusetts, in which he opposes the annexation of Texas and the institution of slavery with even more than his wonted power and eloquence. He stated that it would be a leading topic in the next session of Congress, and that he would oppose it with all the vigour that God had given him. What between Texas and the Oregon territory, a stormy session is looked for in December. With reference to the latter subject, a Tyler meeting has been held at Cincinnati, in which, after resolving that the whole north-west coast, from latitude 42 degrees to 54 degrees, belongs of right to the United States, the following resolution was put and carried unanimously:—"Resolved, that we approve of the policy of President Tyler in relation to the just claim of the United States upon the Oregon territory, and we hereby pledge ourselves, if it shall become necessary, to maintain our right with the blood and treasure of the nation." Mr. Fox, the British minister at Washington, has been dangerously ill of bilious fever. His health is now improving. Professor Dwight, of Yale College, had been recently killed by a student named Fassit. The cause was a sudden quarrel, and the student wearing arms.—The Canadian news is uninteresting. The debates in both houses were upon minor subjects. After a long discussion in the House of Assembly, the bonding of foreign cattle clause in the Agricultural Protection Bill had been adopted. Meetings were still held throughout the province respecting the removal of the seat of Government; and the correspondent of the *Quebec Gazette* mentions that it was an open question. Some attributed the sudden change to the receipt of despatches from England, and others to a wish on the part of the Governor-General to have the question considered open. A despatch had been received from Lord Stanley, announcing the intention of the Home Government to introduce Mr. Hill's system of postage into Canada, to charge letters by weight, as in England, to establish penny district posts, and to authorise the reduction of the internal rates on the correspondence of British North America with England to the uniform rate of twopence the half ounce, the charge being progressive with the weight. The last accounts from the wreck of the *Columbia* on Seal Island state that so strong was the ship, that only her rudder and stern had fallen away, although she had been on the rocks more than two months, and exposed to all the vicissitudes of the weather. A trial of speed between the Great Western and the American steamer of war *Princeton* is minutely described in the United States papers. The result was a decided victory by the *Princeton*, though it is said the Great Western steamed faster than on any former occasion.

BRAZILS.—Letters from Rio state that the Prince of Aquila, brother of the new Empress of Brazil and of the King of Naples, has formally demanded in marriage the hand of the Princess Januaria, elder sister of the Emperor and of the Princess de Joinville.

CITY.

Money Market, Friday.—Consols closed at 96½ to 1½ for time and money; Bank Stock, 181; 3 per Cents. Red., 95½ to 1½; 3½ Red., 102½ to 103; New 3½, 103; Exchange Bills, 60s. to 62s. prem.

Metropolis and its Vicinity.

St. Stephen's, Walbrook.—Another meeting, of a stormy and personal character, was held on Wednesday in the vestry-room, Mr. Cunliffe in the chair. Dr. Croly made a long statement respecting Mr. Horner's assertion at the last meeting concerning his custody of the key of the safe in which the accounts were kept. He stated that he had no key which gave him any personal power over the contents of the safe. Mr. Rock said, as the question of these accounts was now in Chancery, it would be useless to continue these meetings. Alderman Gibbs had already appeared to a suite of his, and he should therefore move "That this vestry did cordially approve of the conduct of the Rev. Dr. Croly during the unfortunate contentions in which the parish had been and was at present engaged;" and that having been agreed to, he should then move that the vestry be adjourned until Wednesday, the 3d January. Both these resolutions were subsequently carried, and the vestry adjourned, after a long indulgence in personalities, during which the chairman had to threaten to leave the chair or eject some of the parties concerned, if something like regularity were not observed. It appeared from the statement of Dr. Croly, that Alderman Gibbs states that he has no funds; that, on the contrary, the parish is indebted to him, and there are not coals enough to warm the church on Sunday.

The Polish Ball at Guildhall.—On Thursday the annual ball for the benefit of the Polish refugees took place in Guildhall, which was fitted up for this occasion. The attendance was very numerous, the visitors filling the Hall and Council Chamber. The concert was executed in a superior style, and appeared to give great satisfaction to the guests. The company did not comprise so many fashionables as usual, but there was a plentiful supply of the middling classes and of the citizens of London.

Explosion at King's College.—An exaggerated report has appeared of an explosion in the Theatre of King's College on Thursday. Preparations had been made for a lecture on the Bude light, and three bags containing hydrogen and oxygen gas had been sent to the theatre for the purpose of the lecture, which was to be delivered by Professor Daniel. The bags had been wrongly numbered by the man whose duty it was to attend to the department where the gas was prepared, and on applying the pipe to the bag containing oxygen, an explosion took place. The first account stated that the large windows of the theatre, containing nearly 80 panes of glass, were smashed, and the frames broken to pieces; that some pieces of wood that lay on the floor were driven into the ceiling, together with the furnace and chemical apparatus, which was all destroyed; and that Prof. Daniel with his assistants were in the theatre at the time, and escaped unhurt, though each thought the other had been killed on recovering from the shock. Professor Daniel, however, has given a complete contradiction to this part of the story, stating that the explosion was very slight.

Infant Orphan Asylum.—On Saturday, Mrs. Isabella Bryant, an elegantly-dressed woman, who had up to the previous Monday filled the situation of matron at the Infant Orphan Asylum recently erected on the borders of Epping Forest, was committed for trial at the Central Criminal Court, but allowed to put in bail, on a charge of stealing some linen and articles of apparel belonging to the institution or some of its servants, and which were found in her trunks when she was about to take her departure. The prisoner did not deny that the linen belonged to the institution; indeed, the table-cloths and towels were marked with the initials of the institution. In reply to a question from her legal adviser, whether she did not obtain the situation in preference to 150 others, from the superiority of her testimonials, the Chaplain said that she had not been appointed from those alone, but from her deportment and manner before the gentlemen with whom the selection rested. The prisoner, on taking the situation, represented herself as a widow with only one son, 17 years of age, but it is understood that she has a daughter much younger, and the whole affair is about to undergo investigation by the authorities at the asylum.

The late Duel.—It is stated by the *Brighton Gazette* that it is the intention of Lieut. Munro to surrender and take his trial forthwith, and that Mr. Thesiger is retained for his defence.

Metropolitan Improvements.—According to a writer in the *Builder*, the Government intend to place the statue of George IV., by Chantrey, on the eastern pedestal of Trafalgar-square, facing St. Martin's Church, and to remove the statue of George III., by Wyatt, from its present position in Cockspur-street to the western pedestal, opposite the College of Physicians. The same writer states that St. Margaret's Church, Westminster, is to be removed from its present locality to a more eligible site, that the funds and the site have been provided, and that the work will be commenced during the present year.

Thames Tunnel.—Notwithstanding the bad weather, about 25,000 persons passed through the Tunnel last week, making the total number upwards of 1,640,000 since it has been opened day and night as a thoroughfare.

Wood Pavement.—A new system of wood paving is laying down opposite St. James's Church, in Piccadilly. The principle is that of Cassel's patent, in which the blocks of wood are cemented with an asphaltic composition. The wood pavement of the New Road from King's Cross to St. Pancras Church is proceeding rapidly.

Grand Union Canal.—The half-yearly meeting of this company took place last week, Mr. Twining in the chair. The report showed that the tonnage receipts during the past half-year had amounted to 2,900L, being a decrease of 238L, which was attributed to the depression in the coal trade; and although the unusual cheapness of sea-borne coal acted powerfully on the inland coal market, still it was necessary that further reductions on tonnage should be made in the lower canals, to which the committee would turn their attention. The total receipts for the six months, including a balance of 3,455L, amounted to 6,788L, leaving a balance, after payment of expenses, of 3,291L, out of which a dividend was declared at the rate of 10s. per share. The works of the canal and the banks of the reservoirs were in good order and the supplies of water abundant.

Marylebone Workhouse.—On Saturday a meeting of the directors and guardians of Marylebone took place at the workhouse, for the purpose of considering certain statements recently published in the daily papers as to the comparative diet awarded to the inmates of the New Model Prison and the paupers in Marylebone Workhouse. According to these statements the paupers had complained that their gruel was so thin that they were forced to use the greater portion of the ten ounces of bread allowed them for each day for their breakfast, and that Mr. Timothy, one of the guardians, had made a long speech showing that this complaint was well founded. Both these statements were denied, and Mr. Timothy admitted that the speech had not been wholly delivered, but had been supplied by him to the reporter. After a long discussion Mr. Anderson moved, and Mr. Nisbet seconded, the following resolution—"The attention of the board having been directed to a report which appeared in the morning papers of Saturday last, in reference to the dietary of the inmates of the workhouse, resolved, That Mr. Timothy having regretted that he had furnished the speech as reported in the morning papers of Saturday last, such speech never having been delivered by him, this board repudiates in the strongest terms the report, and regret the erroneous impression made on the public mind as to the treatment of the pauper inmates of this workhouse." This resolution, in the presence of Mr. Timothy, was carried unanimously.

Newgate.—An answer to the memorial forwarded to the Home Secretary on behalf of William Stolzer was received at Newgate on Thursday, ordering a respite for the prisoner during her Majesty's pleasure. The intelligence was at once conveyed to him by the under-sheriff and Alderman Hughes, but the tidings appeared to produce very little effect on him. It is understood that he will be transported for life.

Richmond.—At the visitation of the Archdeacon of Surrey, held at Epsom on Thursday week, the officiating clergymen of the parish of Richmond were presented by the churchwardens of that place for non-observance of the Rubrics. On the rev. gentlemen being called upon by the Archdeacon to answer the charge, they pleaded custom, and the sanction of the bishop of the diocese for their non-observance. It was, however, contended by the churchwardens that custom could not contravene the Acts of Uniformity prefixed to the Book of Common Prayer, and that the bishop had not the power to sanction a deviation from the ritual of the Church of England. The presentment was made in answer to one of the articles of inquiry annually exhibited by the Archdeacon to churchwardens, and being made in "open court," as the Archdeacon termed it, it is supposed that the bishop of the diocese will feel it incumbent upon him to take some notice of it.

Fires.—On Sunday night soon after 8 o'clock a destructive fire broke out on the manufactory of Messrs. Ogleby and Myers, spermaceti refiners and oil merchants, in Paradise-street, Lambeth, and was not subdued before the principal buildings and their contents were totally consumed. The premises destroyed covered an area of at least two acres of ground. The warehouses containing the machinery and presses, the melting-house, stables, &c., were situated around the yard, the open space being filled with casks of sperm oil and other combustible matter. The foreman of the works was on the premises a short time before the outbreak, when everything appeared perfectly safe. The fire broke out in the press-room, or oil warehouse, both of which were under one roof. From this building it extended to the stables and other out-houses, and when the engines were got to work, their chief efforts were directed to save the candle-house on the west and the melting-house adjoining. Both these warehouses were saved, though several times partially on fire, and it is fortunate that they were so, for had the flames once got a secure hold, it is impossible to say where the conflagration would have ended. With the exception of these two buildings, the whole is pronounced a total loss. The property was fully insured. In Norfolk-row the fire was almost equally destructive. There were 16 small houses, 11 of which are consumed, and others are more or less damaged. Many of the inhabitants of Paradise-street commenced removing their furniture, but, as the wind carried the flames in a contrary direction, the houses on that side escaped, with the exception of a few which were scorched by the flames. Mr. Hodge's distillery, which adjoined the oil manufactory, and contained several thousand gallons of gin, brandy, and other spirits, was at one time in great danger, but escaped without injury.

Inquests.—On Wednesday evening an inquest was held on the body of Mr. John David Robertson, aged 43, assistant secretary of the Royal Society at Somerset House. It appeared by the evidence that deceased was found on Tuesday morning lying upon the sofa of his bedroom in a reclining position. His coat was off and doubled up beneath him, and his cravat lay upon the

table, as if he had died in the act of undressing. He had been subject to fits. Several letters were lying open before him. Dr. Bostock stated that he was called in to see deceased, who had apparently been dead about 17 hours. Witness attributed his death to natural causes. The jury returned a verdict of "Natural death by the visitation of God."—On Monday an inquest was held on the body of Mr. R. B. Warren, the well-known blacking-manufacturer, of the Strand, who suddenly dropped down dead on Sunday evening in Bishop's-walk, Lambeth, whilst on his return home from the fire in Paradise-street. The evidence of the surgeon proved that his death was caused by apoplexy, brought on by over-excitement. It appeared that deceased had a lucifer factory in the neighbourhood of the fire, and that he had hastened to it, in order to see if all was safe; and having satisfied himself on that subject, he was returning home, complained of pain in his heart, and staggered, when he fell into the arms of a young man who had accompanied him to the fire, and almost instantly expired. The jury returned a verdict of "Died from Apoplexy."—On Monday an inquest was held on the body of Mr. Charles Knight, aged 63, solicitor, Union-court, Old Broad-street, who dropped dead from his chair while sitting in the house of a friend in Camden-town, on Saturday evening. Verdict, "Natural death."—An inquest was held on Monday, on the body of Mr. Joseph Barlow, of the firm of Barlow and Anderson, soap-manufacturers, of Great Suffolk-street. It appeared that on Saturday morning he was proceeding up-stairs, when as he got into the hall he fell down suddenly. He breathed once deeply, and then expired. A surgeon was called in, and having attempted ineffectually to bleed deceased, stated that death resulted from apoplexy. Verdict accordingly.—On Wednesday Mr. Peake, one of Her Majesty's messengers attached to the Foreign Office, was found dead at the door of his own residence in Lambeth. The deceased gentleman had just attended to his official duties.

Mortality of the Metropolis.—The number of deaths registered in the week ending Saturday, November 4, was as follows:—West Districts, 155; North Districts, 219; Central Districts, 211; East Districts, 229; South Districts, 246; Total, 1060 (males, 525; females, 535). Weekly average for the last five years, 903 (461 males, 442 females); and for the last five autumns 908.

Provincial News.

Appleby.—During last summer the circumstance of John Bird, of Ashton, his five sons and nephew, laying claim to Lord Brougham's property, their taking possession of the same, their forcible ejection, and the trial which took place at the assizes, gave rise to much excitement and interest throughout the country. It appears, however, that Lord Brougham will not long be allowed to remain at rest, but will again be called upon to vindicate his title to Brougham Hall and estates; for one of another family of Birds from Bondgate, near Appleby, has lately been resident at the village of Clifton, near Brougham Hall, searching for copies of registers of births, marriages and deaths of his ancestors, and obtaining other information, in order to perfect their pedigree and case previous to their making a legal claim to the property.

Bristol.—On Wednesday, the 8th inst., a meeting was held at the Public Rooms, Broadmead, to take into consideration the educational necessities of the labouring classes of the city and neighbourhood. The Earl of Ducie presided, and resolutions were adopted for the purpose of increasing the efficiency of the schools already in existence, and of establishing others in situations where they are needed, on the plan of the British and Foreign School Society. The room was densely crowded by individuals connected with various religious denominations.

Bromley.—An inquest was resumed on Wednesday for the third time on the body of a young woman, at Bromley, named Harriet Monkton, aged 23. She bore an exemplary character, and was what is called a very religious person. No suspicion was entertained that she had left Bromley clandestinely, and after making inquiries in every direction at the houses of friends, a diligent search was set on foot by the police, and deceased was discovered seated on the ground in a water-closet, at the back of Bromley Chapel, quite dead and cold. Information was forwarded to the coroner, who empanelled a jury of the inhabitants on the following day, and the identity being proved, the inquiry was adjourned, in order that a *post mortem* examination of the body might be made. The jury again met on Friday the 10th, and Mr. J. Ilett, Jun., of Bromley, to whom the *post mortem* examination was entrusted, having then stated that he had discovered traces of poison in the stomach, the coroner again adjourned the inquest, in order that its contents might be analysed. It was now proved that the stomach contained prussic acid, but no bottle could be discovered in which such poison had been, although one containing smelling-salts was found in the water-closet. It was also found that deceased was pregnant. After a long inquiry the coroner said the evidence of the medical gentleman showed the cause of death very satisfactorily, but then the question arose, did she take it herself, or was it administered by any other party? It was almost impossible that any person could take the quantity of prussic acid which deceased had done and have strength sufficient to destroy or put away the bottle. One phial had been found, but it contained no traces of the poison. Assuming that she died from prussic acid—where did she get it, or by the aid of what assistants? He thought they ought not to come to a conclusion until this was discovered, and he would suggest an adjournment, with a recommendation to the parish authorities to offer a reward for the discovery of whom it was obtained. He suggested an adjournment to afford time to prosecute

further inquiries. The Jury unanimously coinciding with the coroner, the inquest was again formally adjourned.

Cambridge.—The local papers contradict, on authority, the rumour that the Duke of Northumberland is about to resign the Chancellorship of the University and that Prince Albert is to be elected to that office.

Cardiff.—A run-away slave, belonging to an American vessel lying in the Penarth roads last week, was found secreted on board a Waterford brig in the Bute docks, which he had entered some weeks previous as an able seaman. A strong party of the American ship's crew, having ascertained his place of retreat, entered the brig and forcibly bore off the unfortunate slave. Neither remonstrance nor resistance was offered on the occasion, and the American trader having conveyed the poor fellow on board immediately set sail for his destination. The captured slave was an excellent seaman, and bore upon his person many severe marks of the brutality of his taskmasters. In reference to this circumstance the *Globe* observes that "it is a disgrace to the people of Cardiff to have allowed this poor fellow to be recaptured and dragged back from the sanctuary of the British soil."

Carmarthen.—Her Majesty's Commissioners left Carmarthen on Saturday for Haverfordwest, where they are now pursuing their inquiries. They are understood to have expressed an opinion that the generality of the grievances complained of are such that they cannot be grappled with so as to have any remedy applied. According to the reporter of the *Times* the chief root of the various complaints is general and increasing poverty—a poverty so great that the people can with difficulty subsist and pay the demands made upon them; and the depression in trade, with the recent commercial policy of the Government, each tending to lower the prices of agricultural produce, whilst rents are kept up to their former standard and tithes increased, all pressing on the farmer, have tended to make a comfortable subsistence impossible. A good deal of apprehension is beginning to be entertained regarding the collection of the rural police rate and the rate for the payment of the Metropolitan police now in Wales, the farmers very generally expressing a determination not to pay either. The incendiary who perpetrated the late fires in Denbighshire is supposed to be a man called Ellis, who was apprehended near Bala with lucifer matches on his person and committed for trial. It appears that at the July quarter sessions he was tried for stealing fruit from Maesmor, near Conway, and imprisoned two months. Since then he has been lurking about these parts, and some of the farmers who have suffered were on the jury which found him guilty, and others had refused to give him a good character on his trial. He is said to have protested that he would make them suffer for it. Accounts from Fishguard state that one of the leaders of the Rebeccaites who lately demolished the turnpike-gates and toll-houses, having been tempted by the reward offered in her Majesty's proclamations, has turned Queen's evidence, and has sworn informations against 34 of the party, 25 of whom were taken on Monday night and put in charge of the military in the Market-house, to await the coming of the magistrates to adjudicate on the case. The dragoons have been sent to assist the other military and civil power at present stationed at Fishguard, lest a rescue be attempted by the peasantry and inhabitants.

Gloucester.—The corporation of this city have determined to appeal to the House of Lords against the decision of Vice-Chancellor Wigram in the case of Mr. Wood's will, given in our Law Report last week. They have also ordered that a sum of 1,000*l.* be paid towards the expenses of the appeal.

Liverpool.—The leading topic of conversation in Liverpool during the past week has been the intention of the commissioners of Birkenhead to construct a dock on the Cheshire side of the Mersey. At their meeting on Friday they announced that they had obtained the consent of the Admiralty to their inclosing Wallasey Pool, from the bottom of the Woodside Ferry to Seacombe, an area of not less than 340 acres, with tunnel communication with the Birkenhead and Chester Railway, and that all the arrangements would be carried out on the most magnificent scale. The cost of the work was estimated at near 300,000*l.* All the pecuniary advantages to be derived from the dock are to be appropriated to the measure itself, until the dock could be opened free of charge. The requisite notices preparatory to going to Parliament are to be immediately given.—At the election of a Mayor of Liverpool last week, Mr. Sands, of the firm of Sands, Turner, and Co., the only candidate for the office, requested an investigation into certain charges brought against his house by the receiver of the town dues, for having for a period of years called bales "trusses" and cases "boxes," in order to evade the higher duty. Mr. Sands denied the imputation, and demanded an inquiry before he was elected. A committee of the most eminent merchants in the town was accordingly appointed, and on Saturday they agreed to the following resolution:—"After the most careful and minute examination into the charge preferred against Messrs. Sands, Turner, and Co., in the letter addressed to the Mayor on the 6th inst. by Mr. Corrie, receiver of the town dues, it was resolved unanimously,—That in the opinion of this meeting, there is not the slightest ground to justify the imputation which is attempted to be cast upon those gentlemen." The election of Mayor took place on Monday, when Mr. Sands was elected by a majority of 16 over Mr. Lawrence, who had been brought forward to oppose him. Mr. Sands was accordingly declared duly elected, and took the oaths and his seat as Mayor for the ensuing year. Mr. Bushell gave notice of a motion for a special committee of the town-council to inquire into the charge made against the house of Sands, Turner, and Co.; and

eventually the council adjourned to Monday next, to take the motion into consideration.

Luton.—The magnificent mansion of Luton Hoo, the seat of the Marquess of Bute, was almost totally destroyed by fire on Friday morning. About 2 A.M. the inmates were aroused by the cry of fire from the porter. It was then discovered that the roof immediately over the grand hall was on fire. Exertions were immediately made to quell the flames, and a messenger was sent to Luton for the town engines, which shortly arrived; but in consequence of the smallness of the engines, and the difficulty of obtaining water, which was about a quarter of a mile distant from the house, they were of little use, and the flames continued to extend in every direction, spreading rapidly through the grand hall and the right wing. At 7 o'clock the Hitchin engines arrived; but in spite of all exertions the fire continued to rage with extraordinary fury, and was only prevented from extending to the left wing by pulling down the wall between that wing and the centre of the building. From the roof the fire extended to the grand hall, and thence to the library and the right wing, including the chapel, and by 10 o'clock all these parts of the building had fallen a prey to the flames. During the progress of the conflagration, the domestics, assisted by the townspeople of Luton, were actively engaged in removing the furniture, books, paintings, &c., from the buildings; and so great were their efforts, that nearly everything was saved. The paintings, of which the house contained a large collection, were all saved. These are extremely valuable, and their loss would have been irreparable. They comprise several master-pieces by Raphael, Titian, Rubens, the Caracci, Correggio, and a fine collection of historical portraits. The books, too, have been saved, and a number of waggons have been employed in carrying them from the scene of destruction to the residence of one of Lord Bute's friends in the neighbourhood. The stock of the great botanical work of the first Earl of Bute was in jeopardy, but has fortunately been saved. Some valuable manuscripts, rescued in haste from the fire, were blown about by the wind, but they have all been collected and preserved. The furniture has been all saved, with the exception of the bedsteads, some of which were very costly. There was not time to take these down, and they have consequently been lost. The valuable plate has been also saved. The amount of property saved under the peculiar circumstances of the fire, extending as it did through the corridors of the mansion with frightful rapidity, is perfectly extraordinary. Mr. Collinson, the steward who resides upon the estate, was absent in London when the fire occurred. To the intrepidity and presence of mind of Mrs. Partridge, the housekeeper, who, with only four other domestics, slept in the mansion, must be attributed the salvage of nearly the whole collection of pictures, amounting in number to about three hundred subjects. While the flames were raging fiercely in the northern and eastern wings, and before any attempt had been made to stay the progress of the flames, the engines not having at that time arrived, Mrs. Partridge and the gardener, assisted by the other domestics, at imminent risk, passed into the picture gallery, and while one cut the strings by which the paintings were suspended, the others hastily conveyed them through the southern portico to the lawn. In this way it may be readily supposed many of the subjects sustained injury, but the majority were safely preserved. The chapel which was destroyed was rebuilt by Sir R. Smirke. It contained an exceedingly fine Gothic wainscot, enriched with carving, intermingled with Latin sentences of Scripture, in ancient characters, which was first put up at Tyttenhanger, by Sir Thomas Pope, the founder of Trinity College, Oxon, and was removed to Luton in perfect preservation by the family of Napier, to whom this estate formerly belonged. This beautiful carving—which had been drawn and engraved by Mr. Shaw as an example to modern architects—is, we regret to say, utterly destroyed, with the rest of the right wing. The origin of the fire has been attributed to some plumbers, who were at work on the roof over the entrance-hall on Wednesday. These men, however, assert that it was impossible any spark could have communicated with the rafters from the fire they employed. It does not appear that any of the stoves communicating with the flues had been lighted for some days, so that this fruitful source of similar disasters was not the cause in the present instance. The housekeeper says that she never allowed a fire in any of the upper apartments, and as it is quite clear that the flames burnt downwards, the presumption is, that a spark from the plumbers' fire fell through the copper roof among the rafters, and after smouldering from Wednesday until Friday morning, at length burst out. According to the report of the Fire offices, the bulk of the loss will fall on the Sun, Phoenix, and Royal Exchange Offices. The insurance effected is—House and offices in the Sun for 10,000*l.* Household goods in the Sun for 10,000*l.*, and in the Phoenix for 10,000*l.* Pictures and prints in the Sun for 16,500*l.*, and in the Royal Exchange for 9,450*l.* Stables in the Sun for 2,000*l.* China and glass in the Royal Exchange for 1,000*l.* Entire insurance in the Sun, 38,500*l.*; Phoenix, 10,000*l.*; and Royal Exchange, 10,450*l.*; making the total insurance amount to 58,950*l.* Since the destruction of the Armoury by the late fire in the Tower of London, no building of equal extent has met a similar fate. Luton Hoo owed its magnificence to John, third Earl of Bute, who in 1762 purchased the unfinished mansion of Sir Robert Napier, and soon after resolved upon making a grand addition, in which the genius of Adam should have full scope, regardless of expense. The model adopted by the architect was the Palace of Dioclesian, at Spalatro, and it is admitted that his design was worked out in a very masterly manner.

Manchester.—Another meeting of the shareholders in the Bank of Manchester was held last week, at which it appeared that the estate of the Hiltons, of Darnen, and that of Joseph Raleigh, will wind up in a more disastrous way than was anticipated at the last annual meeting. The bank was stated to be involved in these two concerns to the amount of nearly 200,000*l.* As far as can at present be ascertained, Mr. Burdekin decamped with 100,000*l.* A call of 2*l.* per share was deemed essential to bring the affairs of the bank to a close, and which, if paid, will amount to near 100,000*l.* This call, with that previously paid last year, will make the total loss more than one million sterling. The distress which this second call will make among many shareholders is expected to be very great, and the number of defaulters will also be considerable. The liabilities are now reduced to the comparatively small sum of 400,000*l.*—An extraordinary case came before the magistrates for investigation on Friday, in which the accused was a youth, stated to have been a sailor on board her Majesty's steam-ship *Penelope*, who gave his name James Brown; and the informer a man named Hardman, an operative cotton-spinner, who charged the lad with having caused the late incendiary fires in Denbighshire. Both the accused and accuser were placed in the dock—the latter having been detained from a belief that the serious charge he had made would turn out to be unfounded, and that his motive was the prospect of obtaining the large reward offered for the discovery of the incendiary. After a long examination, both prisoners were remanded for a week.—A meeting of the merchants, manufacturers, trades, and others was held in the Town-hall for the purpose of considering the best means of aiding the future operations of the Anti Corn-law League. Upwards of 250 persons were present, among whom were the representatives of about 70 of the principal firms in Manchester and the neighbourhood. Mr. R. H. Gregg presided. On the motion of Mr. H. Ashworth, seconded by Alderman Callender, a resolution was unanimously adopted in favour of free trade. A subscription was then opened in aid of the League fund, which amounted, before the close of the meeting, to no less than 12,606*l.* 6*s.*

Nottingham.—Nine prisoners who had been apprehended on suspicion of being concerned in the late burglary at Sutton Bonnington, noticed in our last, were brought before the magistrates last week, together with the Rev. Mr. Meek's servant man, who was supposed to have been implicated in the transaction. The magistrates remarked that, although there was strong suspicion that two, if not more, of the parties were present when the burglary was committed, it was thought advisable, in the absence of corroborative evidence, to dismiss them with the others; but he wished them distinctly to understand that this dismissal did not exonerate them from suspicion, nor secure them from any future proceedings. The Rev. R. Meek, although still labouring under the effects of the ill-treatment he received, was present, and said that, though he felt convinced one or more of the prisoners were guilty, yet, from the agitating nature of the circumstances, and the particular manner in which the robbers were disguised, he could not help feeling some doubt as to their identity, and he would give them the benefit of that doubt. The prisoners were then discharged.—On Tuesday week, a burglary was committed in the house of Mr. W. Duke, farmer, near Woodborough, in this county, by five men, who had their faces covered with crape. They broke into the house between 2 and 3 in the morning, and secured a servant man and two boys, who were going to take a waggon-load of corn to Nottingham. Mr. W. Duke hearing a noise, got up and went down stairs, where he met the men, by whom he was knocked down and treated in the same manner as his servant. The robbers then proceeded to the room of Mr. Geo. Duke, brother of the master of the house, and beat him as he lay in bed in such a manner that for some days he was in a precarious state. The thieves ransacked the house, and took away some money and other property. Nine men were apprehended the same day on suspicion, and after a protracted examination four of them have been discharged and the other five remanded.

Oxford.—On Wednesday the delegates of appeals in congregation met by adjournment to hear counsel on the objections by Mr. Macmullen's proctor, who protested against the appeal on the ground of informality; but on entering the court he stated that he should not trouble the court with any argument, as he would withdraw his protest. It was then agreed that the next meeting should be held on Wednesday week to proceed on the appeal.

Plymouth.—On Thursday, the 9th inst., the last stone of the Lighthouse Tower, erected on the western extremity of the breakwater, was set by Rear-Admiral Sir Samuel Pym, Superintendent of the Dockyard. The lantern is the only thing now necessary to complete it for service, and it is expected that the lighthouse will be ready to be brought into use early next year, when it will supersede the old light vessel, which has been moored in the Sound since 1813.

Portsmouth.—Lieut. Hutchinson, R.E., with a party of 14 Sappers and Miners, returned to Woolwich last week, from Spithead, having, in consequence of the severity of the weather, ceased operations on the wreck of the Royal George for the season. Notwithstanding the exertions of the divers, about 20 guns are still embedded in the mud. The wreck has, however, been pronounced clear, and its site fit for anchorage; it is, therefore, probable that no further attempts will be made to obtain the missing guns.

Wakefield.—Mr. W. H. Leatham, of Wakefield, banker, and his wife, resigned their connexion with the Society of Friends on Monday last, at the monthly meeting in this town. It is not known what religious body they are

likely to join, but as they have recently attended Kirkthorpe Church, it is supposed they will join the Establishment.

Windsor.—The *Windsor Express* states that the Commissioners of Woods and Forests are so disgusted with the abrupt and uncourteous manner in which their proposition to drain the town in conjunction with the Castle, was met by certain persons at the late public meeting on the subject, that they have abandoned their proposed plan as regards the drainage of the town. Notice of application to Parliament for a bill "for better cleansing, improving, draining, and sewerage of the town and parish of New Windsor, and Clewer, and the extra-parochial precincts of the Castle, and for this purpose to make use of water from the river Thames," has been given by Mr. Bedborough. It appears that this gentleman, who is the proprietor of Upton-park, is about to erect a series of terraces and villas in the hamlet of Upton, and construct a new line of road through a fine avenue of trees from the railway station to Windsor Castle. By this means the long line of streets through Eton and Windsor will be avoided, and a new suspension-bridge will be raised over the Thames.

Wisbeach.—The Nene estuary embankment, the contract for which was taken in August 1842, by Mr. H. Sharp, for 60,000*l.*, is rapidly progressing towards completion, under the direction of Mr. Fulton, resident engineer. This extensive undertaking was designed for the purpose of inclosing from the sea a tract of valuable land, amounting to about 4000 acres, which will, when inclosed, be principally the property of the commissioners of the Nene outfall, under whose auspices the works are carried into effect, assisted by the professional services of Sir John Rennie. The embankment is near 3½ miles in length, and for some distance averages 28 feet in height; at some parts of the line there is a depth at high water of 14 feet; about one mile and three quarters, or one-half of the whole work, is already completed, and from this portion of the work, as a specimen, it is judged by experienced persons that it will be one of the best examples of a sea wall to be found in England. The land, as a maiden soil, it is estimated, will vary in value from 50*l.* to 80*l.* per acre. The Nene outfall commission has already effected great improvements in part of the fens in Cambridgeshire and Lincolnshire, by procuring a natural drainage for the lands in lieu of the inefficient and expensive system of drainage by windmills and other mechanical means; at the same time improving the navigation of the Nene from the sea to Wisbeach to such an extent, that formerly Humber keels of 70 or 80 tons could with difficulty reach that port; whereas, now, vessels of 400 or 500 tons can, without the assistance of a pilot, owing to the straightness of the channel, get up to Wisbeach with ease. This navigation, as an artificial tidal channel, is said to be the finest work of that description in the country. It was designed and executed by the late Mr. Telford, and Sir John Rennie; and so important has been the result of these works, that the trade of Wisbeach, in the course of ten years, has been trebled, and amounted last year to 140,000 tons of shipping, although the shipping trade throughout the country was in a worse state during 1842 than has been known for many years past.

York.—Three massive doors have just been completed in Newcastle for York Minster. They are of the decorated style, and designed by Mr. Sydney Smirke, under whose direction the restoration of the Minster is now drawing to a close. The three doors are alike, and measure sixteen feet in height, and six and a half feet in breadth. The upper part is full of tracery, supported by columns, embellished with Gothic leaves. The tops of the capitals are ornamented with figure-heads, out of which the hood-mouldings spring, and terminate with carved Gothic finials and crockets. In the centre of the arches are three trefoils, with shields, on which coats of arms may be put. The lower part of the door is divided into six portions or arcades, the tops of which are decorated with crockets and finials, and between each compartment are carved pinnacles, springing from the heads of the columns. They have been executed by Mr. James Wallace, builder, and Mr. R. S. Scott, carver, of Newcastle.

Railways.—The following are the returns for the past week:—Birmingham and Derby, 1,365*l.*; Birmingham and Gloucester, 1,771*l.*; Eastern Counties, 2,443*l.*; Edinburgh and Glasgow, 2,246*l.*; Great Western, 13,061*l.*; Grand Junction, 7,861*l.*; Glasgow, Paisley, and Ayr, 1,203*l.*; Great North of England, 1,495*l.*; Hull and Selby, 966*l.*; London and Birmingham, 16,068*l.*; South Western, 5,440*l.*; Blackwall, 613*l.*; Greenwich, 603*l.*; Brighton, 3,880*l.*; Croydon, 204*l.*; Liverpool and Manchester, 3,760*l.*; Manchester and Leeds, 4,902*l.*; Midland Counties, 2,680*l.*; Manchester and Birmingham, 2,680*l.*; Northern and Eastern, 1,445*l.*; North Midland, 4,640*l.*; Newcastle and Carlisle, 1,553*l.*; South-Eastern and Dover, 3,174*l.*; Sheffield and Manchester, 465*l.*; York and North Midland, 1,680*l.*—The usual notices of an intended application to Parliament in the next session, for a bill to authorise the continuation of the Shoreham branch of the London and Brighton Railway to Chichester, by way of Worthing, have been given, and the plans and sections deposited with the clerks of the peace for Sussex and Chichester. The survey for the Branch railway from Lewes to Brighton has also been completed, and everything is ready for the deposit of the plans and sections with the Clerk of the Peace, preparatory to an application for an Act of Parliament.—The Dover papers state that the South-Eastern Railway will be opened to Dover on the 1st January, when an experimental trip will be performed by the directors; and that on the 14th of the same month the entire line will be opened for general traffic.—The Bishop Auckland and Weardale Railway, from the junction with the Stockton and Darlington Rail-

way at Sheldon to Crook, was opened for merchandise on the 8th inst. The directors assembled at the Darlington station of the Stockton and Darlington Railway, and proceeded to Crook, the terminus of the Bishop Auckland and Weardale line, where they were joined by two engines and trains of coal and lime. They then traversed the whole line, passing Witton-le-Wear, Bishop Auckland, South Church, Shildon, Darlington, Yarm, and Stockton, to Middlesbrough, the place of shipment. The waggons containing coal were emptied into the vessels lying in the docks, several of which completed their lading, and proceeded to sea on that day. The trains were upwards of a mile long.

IRELAND.

Dublin.—On Wednesday the 8th the Attorney-General announced in the Court of Queen's Bench that he intended, on Thursday, to send up fresh indictments against four of the traversers already charged. The deepest interest was manifested all day in the courts to ascertain the nature of those new bills. By some it was supposed that the object of the Crown was, by a supplemental indictment, to cure some defect in the one already found in regard to the informations of Mr. Bond Hughes. There were various other rumours, and amongst them was one that Mr. O'Connell and three others were to be charged with high treason. The *Evening Mail* announced that the Government had made a grand "discovery," and this statement helped to give importance to the story about high treason. On Thursday therefore Mr. Vernon, of the Stamp-office, was in attendance lest his evidence might be required; but, notwithstanding the positive announcement of the Attorney-General, no bills were sent up and the grand jury adjourned early. The jury repeated their attendance on Friday, with the same result; and the bills, which were said to contain a charge of treason and to be directed against the existence of the Repeal Association, were stated to be abandoned for the present. Both Whig and Tory journals, in London as well as Dublin, comment with much severity on this proceeding, and on certain infirmities of temper shown by the Attorney-General towards some of the traversers. They condemn his apparent want of decision and the want of discretion, which could have induced him to make at such a crisis as this, and under such circumstances, the declaration of an intention which he was not prepared to carry out. The Court of Queen's Bench have been occupied with long and tedious arguments on technical points, which have little interest for the general reader. An application on the part of Mr. Duffy, praying for a list of the witnesses to be produced in support of the indictment, was argued at some length, but unanimously refused by the Court. An application was then made on behalf of the Rev. Mr. Tyrrell, for a copy of the "writ of caption," a document not yet in actual existence. The Attorney-General opposed the motion on the ground that the caption formed no part of the indictment. After three days' argument, the Lord Chief Justice, Mr. Justice Burton and Mr. Justice Crampton were of opinion that the application ought not to be complied with, while Mr. Justice Perrin was in favour of the application. The majority therefore being against it, the motion was refused. These tedious arguments indicate a prolongation of the state prosecutions to an extent far beyond the expectations of the most curious in such matters. It is said that Mr. O'Connell intends to summon 60,000 witnesses, and that all the Roman Catholic Bishops are to be examined. It is stated that the Lieutenant-General commanding in Ireland Sir E. Blakeney, the police commissioner Colonel Browne, and other functionaries are also to be summoned for the defence. On Monday, in consequence of an announcement made by Mr. Moore, Q. C. in the Queen's Bench, that the traversers were determined to submit a motion on Tuesday for the bill of particulars of the charges in the indictment, copies of that document were forwarded to the agents of the traversers at 11 o'clock at night. The bill of particulars enumerates almost every number of the *Pilot*, *Freeman's Journal* and *Nation* published since the 22d March last, also the various repeal meetings held since that day, all the speeches delivered by Mr. O'Connell at the various country meetings and at the Repeal Association during the same period. In fact, the bill is a sort of index to the life and adventures of Mr. O'Connell since the 22d of March; and it is notified that all those newspapers, speeches, &c. &c. are to be produced at the trial in support of the charges in the indictment. If printed in the ordinary fashion the bill would make a good-sized octavo volume, requiring some hours to be read and understood. It contains eleven counts or separate charges of crime; and the first count alleges forty-four separate overt acts. On Tuesday, being the last day for pleading, Mr. O'Connell and the other traversers appeared at the bar, and put in their pleas. They were pleas of abatement, and declared the traversers not to be guilty of the offences charged; they also stated that the indictment ought to be quashed as the evidence was found on the examination of witnesses who were not sworn in open court, in accordance with the provisions of the act of George III. The Attorney-General objected to the pleas being received. In this stage of the proceedings he did not conceive a plea of abatement would be received. He trusted, however, that the court would not receive those pleas till he had the opportunity of looking into this matter more fully. A discussion ensued upon this point, and at length the Lord Chief Justice ordered the question to stand over, but without prejudice to the traversers. The argument was resumed on Wednesday, and after a most persevering opposition by the Attorney-General, the plea of abatement was received, and placed on the files of

the Court of Queen's Bench. The Attorney-General was also defeated on another point. After the Court decided upon receiving the plea, the Crown demurred, and required the traversers to join issue at once. After another argument, the Court decided, in favour of the traversers, that there should be four days' notice, and consequently the demurrer, or, in other words, the validity of the plea will not be argued until Monday. Some of the ablest men at the bar consider the plea to be a good one. Should the Court rule it to be so, the indictment will be quashed. Should the Court, on the contrary, determine with the Attorney-General, the traversers will plead. But in any case it is considered impossible that the trials could commence before the next term. Probably owing to these failures, rumours are abroad that the prosecutions are to be abandoned, and that Government will take no further proceedings at common law, but wait until the re-assembling of Parliament, to apply for a coercion law. Another rumour is, that fresh bills of indictment are to be sent up; the Grand Jury were specially summoned on Wednesday, but no bills were sent before them. The impression, however, appears general that the prosecutions are to be abandoned.—The weekly meeting of the Repeal Association took place on Monday. A letter was read from Mr. John O'Brien, M.P. for Limerick, inclosing 5*l.*, and requesting to be admitted a member, which was carried on the motion of Mr. O'Connell by acclamation. Mr. O'Connell then read an address to the people of Ireland, requesting them to be peaceable during the approaching trials. The following are extracts:—"Fellow Countrymen,—I never felt half the anxiety which I do at present to be distinctly understood in the advice I give, and to have that advice implicitly obeyed. The reason of this anxiety is, that if my advice be followed the restoration of the Irish Parliament will assuredly be obtained, and obtained in a manner the most honourable to the religious and peaceable people of Ireland. I want the most perfect quiet, peace and tranquillity, until all these trials are over. No matter what the event of the prosecutions may be, I am thoroughly convinced that in any event they will tend to facilitate the obtaining of Repeal; provided only that the people preserve the condition of the most perfect quietude during those trials. It will be easy to preserve tranquillity after those trials shall, as they ought, have terminated successfully for the unjustly accused, or however they may terminate. Nothing could possibly injure our cause before the Court and Jury half so much as any occurrence of tumult, riot, or physical force of any kind whatsoever. If anybody gives you advice contrary to mine, believe me that he is an enemy of mine and of yours. Arrest every such man, and bring him before the police. I cannot conclude without once again adjuring the people everywhere not to be irritated, excited, or provoked by any event whatsoever, or of whatever nature that event may be; but to continue calm, peaceable, tranquil, and loyal, and if this advice be followed, I anticipate, and I think I can promise, that the result of these trials will be eminently useful to the Repeal cause. But—attend to me—if there be, during the trials, the slightest outbreak of violence in any parish, it will be my duty immediately to abandon the Repeal cause, and to forsake a people who, at such a critical period as the present, would not follow the advice I so earnestly give them. I, however, have no fears that my counsel will be disobeyed. I confidently expect that the people will not injure my cause and the cause of Ireland by disregarding my advice. Be therefore calm, quiet, tranquil, peaceful, loyal. Violate no law of man—obey with devout reverence the law of God. You will thus mortify and disappoint your enemies. Those enemies speculate upon provoking you to some act of turbulence. Disappoint them—mortify them by the inflexible observance of quiet, of calmness, of peaceable and legal conduct. Follow my counsel, and you thereby will serve the cause, and gratify the heart of your devoted friend, Daniel O'Connell." Mr. O'Connell said he wished to draw the attention of the Association to a topic of importance. It was in their recollection that Joseph Sturge, one of the heroes of the chivalry of humanity, wrote to them some time ago, stating that the people of England were indisposed to the Repeal of the Union, for two reasons; firstly, lest it might tend to despotism, and, secondly, because they feared it would result in a religious ascendancy. The Association answered that letter and stated that Repeal, instead of tending to a separation, would render the connection more certain, and that the Irish Parliament would have no power to make a law of a bigoted nature. Mr. Sturge wished the arrangement should be of a federal nature. In our letter, said Mr. O'Connell, we endeavoured to show him that there would be no necessity for a federal Parliament, as the questions to which he referred, and which he called imperial questions, were solved by the prerogative of the Crown. Mr. Sturge had written him a letter, calling upon the advocates of Repeal to clearly define who is to advise the Sovereign in the exercise of the Royal prerogative. This letter was referred to a Committee to report upon it at the next meeting. Mr. J. O'Connell next proceeded with his motion, demonstrative of the financial injustice of the Union, and concluded by proposing the following outline of a financial arrangement between Great Britain and Ireland, after the Repeal:—"1. That the principle of the arrangement be that the revenues of Ireland be spent at home. 2. That the first charge upon her revenues be her debt, as it stands at present. 3. That her contribution to the imperial active expenditure be as now, according to the full measure of her ability, as shown by a comparison of the products of equal taxes in both countries, or such other elements of comparison as may be agreed upon. 4. That a revision of the proportions of contribution of either country respectively

do take place at such periods as may be agreed upon; the first to be within five years after the Repeal. 5. That if it be deemed expedient at the time of the Repeal that Ireland should be charged with any debt beyond what appears charged to her in the public accounts, such debt be transferred from the English to the Irish funds. 6. That the various items of imperial expenditure be apportioned between the two countries in such manner as to obviate all necessity for the revenues of one country being spent in the other. 7. That the control and management of the revenues of Ireland, subject to the foregoing rules, be with the Parliament of Ireland; and that nothing herein contained be deemed or assumed to limit the constitutional right of that Parliament to stop or limit the supplies on constitutional cause arising." Mr. O'Connell announced the Repeal rent for the week to be 107*0**l.* 19*s.* 5*d.*

Cork.—The mysterious signal-fires again prevail in some of the southern counties. On Saturday night, says the *Cork Constitution*, the hills were again in a blaze. In Kerry the same signal was seen on every eminence, and Waterford, Tipperary, Limerick, and Clare, were equally alive. No fewer than twenty fires were counted from Lumlay's Well (Cork), and the yelling was heard for miles round.

Derry.—Dr. Ponsonby the Bishop of Derry and Raphoe, and 130 of his clergy have put forward a protest against Tractarianism. Lord E. Chichester, Dean of Raphoe, heads the list of the clergy who have signed an address to the bishop. A protest against that address and the proceedings of the Anti-Puseyite majority has been published. It is signed by the Rev. C. Boyton, vicar-general of Raphoe, the Rev. W. Archer Butler, professor of Moral Philosophy in the University of Dublin, and five other clergymen of the diocese.

Tipperary.—In the following letter, addressed by the Marquess of Waterford "to the Gentlemen of the County of Tipperary," he states his reasons for withdrawing from that county. "Curraghmore, Nov. 8, 1843. Gentlemen,—I have deferred writing to you until some final arrangement as to hunting your county had been made. Mr. Millett has undertaken that office; and I now beg to thank you for the kind attention and support you have shown me during the period I resided amongst you. I think it right to state the causes which induced me to resign. You are aware that in December, 1841, my hounds were poisoned: I treated the matter with contempt. In January, 1843, they were again poisoned: I discovered the offender, and forgave him; but I stated publicly that if a similar outrage was again committed I should give up hunting the county. In 1843 my stables were burnt; and but for the prompt conduct of my servants, the whole establishment would have been consumed. From the threatening notices I had received, and from the sworn evidence of persons on the spot when the fire commenced, the magistrates came to the conclusion that the burning was malicious. I immediately determined to leave Tipperary, feeling that such a system of annoyance more than counterbalanced the pleasures of fox-hunting, for which alone I proposed to reside at Lakefield. I have the honour to be your obedient servant, WATERFORD."—The *Evening Post* contains the following account of another frightful outrage in Tipperary, which surpasses all that has lately occurred even in that unhappy county:—"Accounts have reached town of a most desperate outrage having been perpetrated in the neighbourhood of Borrisokane, in the county of Tipperary. It appears from a letter we have seen that Thomas Waller, Esq., of Finnoe-house, a magistrate of the county, and his family, were just sitting down to dinner on Sunday last, when eight or nine armed men entered the dining-room and attacked them all. The gentlemen of the party, promptly assisted by the ladies, seized the carving and dinner knives and made a most resolute defence. One ruffian levelled a pistol at Mr. Waller, which was struck down by Mr. Vereker, who was present, and after such a scene as it is impossible to describe the assailants were beaten off, but not before the inmates of the house were severely injured. Mr. Waller's arm was broken, and he also received a bad injury in the head, and it is rumoured that Miss Vereker is not expected to survive. The assailants themselves must have fared badly, as the ear of one was left behind, with other relics of the determined nature of the defence. The police were out in search of the delinquents, but nothing more specific has yet reached town upon the subject."

SCOTLAND.

Edinburgh.—It is announced that Lord Meadowbank has resigned his office as one of the senators of the College of Justice, the duties of which he has discharged for the long period of twenty-four years, having been appointed in 1819. Lord Cockburn will succeed his Lordship in the Second Division, and it is understood that David Mure, Esq., advocate, will be the new advocate-depute in room of Adam Urquhart, Esq., appointed to the sheriffship of Wigtown. It is also rumoured that the Lord Advocate is likely to be nominated as Dean of Faculty.—On Thursday, Thomas Patterson, who was convicted in the High Court of Justiciary, on Wednesday, of selling, or exposing for sale, a number of blasphemous publications at various periods during the present year in a shop in West Register-street, Edinburgh, was placed at the bar, and sentenced by the Lord Chief Justice Clerk to fifteen months' imprisonment. On the same day Henry Robinson was placed at the bar, charged with publishing and exposing for sale printed books, pictures, &c. of a blasphemous and obscene tendency. The prisoner was found guilty, and his Lordship concluded by sentencing Robinson to imprisonment for twelve calendar months. It is said that the jury which convicted Patterson of blasphemy were all but unanimous in their verdict, there being only a single jurymen who dissented

from the verdict which the other fourteen returned. Both Patterson and Robinson were removed to gaol on Thursday evening, and in the course of Friday they were subjected to the usual prison regulations, their heads being shaved and the prison dress put on them, after which they were sent to the occupation of breaking stones. It will be remembered that Patterson became notorious some months back for similar conduct in Holywell-street, London.

Aberdeen.—Lord Francis Egerton has been unanimously re-elected Lord Warden of Aberdeen University.

LABO.

ARCHES COURT.—The Office of the Judge promoted by Titmarsh v. The Rev. W. H. Chapman.—Sir H. Jenner Fust gave his opinion on the validity of the protest offered last court day by the Rev. Mr. Chapman. It is a proceeding brought by letters of request from the diocese of Ely against defendant, for having refused to bury the corpse of a child, first, on the 17th February, 1840, and secondly, on the 26th May, 1841, after due notice had been given. The Church Discipline Act, under which the suit was commenced, provides that, after two years have elapsed from the commission of any offence by clergymen, proceedings could not be commenced, and the counsel for the Rev. Mr. Chapman argued that as but one offence had been committed in refusing to bury the same child twice, the first refusal being in February, 1840, the two years had elapsed, and the court was prayed to sustain the protest, thus ending the suit. The Rev. Mr. Chapman is the vicar of the parish of Bassingbourne, in the county of Cambridge.—Sir H. J. Fust, after briefly referring to the leading facts, said he had looked into all the cases cited on both sides in the arguments heard on the protest, and he thought there was nothing in them to induce the court to stop the proceedings *in limine*. He would very shortly state the grounds upon which he had come to such a conclusion. The first occasion the defendant had refused to bury the child was on the 17th of February, 1840, and this was an offence according to the true intent of the Church Discipline Act, and the court had jurisdiction over it; but the question raised was, if the second refusal was not a fresh offence, and the court was so clearly of opinion that it was, that it could not stop the proceedings. The cases cited were principally of a private nature, but here a public offence had been committed, as from all that appeared to the contrary the clergyman had refused to bury the body of this child, and the penalty attached. The court might conjecture that this was a similar case to that of *Mostin v. Escott*, which had attracted much attention some time since. There was a public scandal to be removed; and the court thought the offence was revived by the second refusal, and the charge to be proceeded with was the refusal to bury the child on 26th May, 1841. This was within the two years as provided by the act; to this must the clergyman answer. The court was bound to overrule the protest, and assign the Rev. Mr. Chapman to appear absolutely.

SPORTING.

TATTERSALL'S, THURSDAY.—DERBY.—6 to 1 agst Scott's lot; 7 to 1 agst Mr. Crockford's Rattan (take 15 to 2); 18 to 1 agst Mr. Quin's Loadstone (taken); 20 to 1 agst Colonel Peel's Orlando; 25 to 1 agst Colonel Peel's Louisa; 27 to 1 agst Mr. Bowes's T'Auld Squire; 35 to 1 agst Mr. Lichtwald's Leander; 40 to 1 agst Mr. Payne's Vat colt (take 50 to 1); 50 to 1 agst Mr. Wat's Voltri; 50 to 1 agst Sir G. Heathcote's Campanero (taken); 2000 to 25 agst Lord Normanby's Lorimer (taken).

MARK LANE, FRIDAY, NOVEMBER 17.—There has been very little English Wheat fresh up since Monday, and our currency of that day has been fully maintained. The business doing in Foreign is in retail, and at the same prices; we have still some inquiry for bonded. Barley remains without alteration in value, and the same may be noted of Beans and Peas. Although the same prices are maintained for Oats the sale is very limited.

GAZETTE OF THE WEEK.

INSOLVENT.—J. WARD, Nottingham, tailor.
BANKRUPTCY SUPERSEDED.—W. SMART, Bellinghurst, Sussex, dealer.
BANKRUPT.—T. G. JAMES, River-street, Middleton-square, Middlesex, builder.—J. SEWELL, Charles-street, Paddington, a chandler.—T. THORPE, Chertsey, Surrey, plumber.—R. TOLLS, Westminster-bridge-road, Lambeth, furnishing-houseman.—J. ZILLI, Morning-lane, merchant.—E. SWIFT, Chingford-mills, Essex, miller.—I. T. COVEMAN, High street, Kensington, mill dealer.—J. WILLIAMS, jun., Abingdon, Bucks, carpet-manufacturer.—A. W. LOWMAN, and T. S. LOWMAN, Eastcheap, City, cheesemongers.—G. CHAMBERLAIN, Waverloe, Essex, shipowner.—R. H. FRARY and J. FRARY, Oxford street, carpet-housemen.—J. PIERCE, Bradford, Yorkshire, ironmonger.—L. F. BINGHAM, Bakenell, Derbyshire, bookseller.—T. WITHELL and W. WITHELL, Padstow, Cornwall, slippers.
S. PARRS, Old Jewry, wine-merchant.—T. H. WOOD, Penton-street, Pentonville, draper.—W. HAWARD and J. JENNINGS, Walbrook, commiss.-agents.—T. THORPE, Chertsey, and Woking, Surrey, and Feltham, Middlesex, plumber.—R. COLLIER, Hythe and Folkestone, Kent, draper.—J. G. POST, University-st., St. Pancras, surgeon.—J. PIERCE, Dean-street, Soho, licensed victualler.—T. BAYLY, West Smithfield, licensed victualler.—R. HALL, Margate, bookseller.—R. T. MITCHELL, Burwood place, Edgeware-road, surgeon.—D. COLLINS, Bent's-place, Poland's-row, Bethnal-green, silk manufacturer.—T. BOURNE, Liverpool, corn-factor.—G. WHITTON, Dudley, Worcestershire, clothier.—J. WARD, Nottingham, tailor.—J. CRISP, Liverpool and Lisard, Cheshire, auctioneer.—A. W. WILKINS, West Derby, Lancashire, joiner.—T. BARTON, Sheffield grocer.—J. HUDSON and J. BROADBENT, jun., Gile, Lancashire, and Manchester coach-pr.-liters.—T. SEINK, Hillam, Yorkshire, farmer.

BIRTHS.—On the 7th, at Hanwell, the wife of the Rev. J. A. EMERTON, of a son.—On the 8th, at Dyham Park, the Hon. Mrs. TROTTER, of a son.—On the 12th, at No. 28, Wimpole-street, Mrs. J. MACPARK, of a daughter.—On the 10th, at Hatherleigh Court, the lady of J. WEBSTER, Esq., of a daughter.—On the 9th, at Burton-upon-Trent, Mrs. H. AINSFORD, of a son.

MARRIED.—On the 7th, at St. Mary's, Battersea, Mr. C. GLENNY, to ANNA, youngest daughter of J. UNWIN, Esq., of Battersea.—On the 14th, at St. Margaret's, Westminster, H. M. CLARK, Esq., to ANNA, daughter of D. ROBERTSON, of Great George-street.—On the 19th ult., at St. George's Church, Halifax, Nova Scotia, W. L. MCKINSH, Esq., Captain in the Rifle Brigade, and eldest son of the late Dean of Hereford, to MARGARET ANN, second daughter of the Hon. S. CUNARD, of Halifax.—At the British Embassy, at Vienna, on the 1st, the Earl of SHELBOURNE, to the Hon. EMILY ELPHINSTONE DE FLAURET, eldest daughter of the Comte de FLAURET, French Ambassador at Vienna.

DIED.—At Carlisle, on the 5th, the Hon. R. KENNEDY, second son of ARCHIBALD, Earl of CASSHIRE, and brother of the Marquis of Ailsa, aged 70.—In Portland-place, on the 11th, FRANCES MARY, aged 7 years, youngest daughter of Sir W. BAYNES, Bart.—On the 5th, at Brighton, W. SQUIER, Esq., keeper of the National Gallery.—At Winchester, on Friday, from a fall from his horse, the Rev. J. C. LITTLEDALES, Fellow of New College.—On the 11th, in the 50th year of her age, SARAH, Countess Dowager of Castle-Stuart.

ARGUS LIFE ASSURANCE COMPANY, 39,
Throgmorton-street, Bank.
Empowered by special Act of Parliament, 5 & 6 W. IV., c. 76.
Thomas Farncomb, Esq., Alderman, *Chairman*.
William Leaf, Esq., *Deputy-Chairman*.
William Banbury, Esq.
Edward Bates, Esq.
Thomas Camplin, Esq.
James Clift, Esq.
Rt. Hon. J. Humphrey, M.P.,
Lord Mayor of London.
Physician—Dr. Jeafferson, 2, Finsbury-square.
Surgeon—W. Coulson, Esq., 2, Frederick's-place, Old Jewry.
Consulting Actuary—Professor Hall, of King's College.
Advantages of the Argus Life Assurance Company.
Low Rates of Premiums.

In addition to the subscribed Capital of 300,000*l.*, the Assured have the security of the Company's Income of nearly 60,000*l.* per annum, yearly increasing, and accumulating Assurance Fund invested in Government and other available Securities, of considerably larger amount than the estimated liabilities of the Company. The Rates of Premium are reduced to the lowest scale compatible with the safety of the Assured and the stability of the Company, thereby, in effect, giving to every Policy-holder an immediate and certain bonus without risk, in lieu of the deferred and frequently delusive prospect of a periodical division of profits.

Age.	For One Year.	For Seven Years.	Whole Term.
20	£0 17 8	£0 19 1	£1 11 10
30	1 1 8	1 2 7	2 0 7
40	1 5 0	1 6 9	2 14 10
50	1 14 1	1 19 10	4 0 11
60	3 2 4	3 17 0	6 0 10

One-third of whole-term Premiums may remain unpaid at 5 per cent. comp. int. as a debt upon the Policy for life, or may be paid off at any time without notice.

In Assurances for advances of money as security for debts, or as a provision for a family, when the least present outlay is desirable, the varied and comprehensive Tables of the Argus office will be found to be particularly favourable to the Assured.

A Board of Directors, with the Medical Officers, attend daily, at a quarter before 2 o'clock.

EDWARD BATES, Resident Director.
A Liberal Commission to Solicitors and Agents.

DISEASED AND HEALTHY LIVES ASSURED.

MEDICAL, INVALID, and GENERAL LIFE
OFFICE, 25, Pall Mall, London. Capital, 500,000*l.* This Office is provided with very accurately constructed Tables, by which it can Assure Diseased Lives on Equitable Terms. Increased Annuities granted on *unsound* Lives, the amount varying with the particular disease. Members of Consumptive Families assured at Equitable Rates. Loans granted upon personal security.
E. G. P. NEISON, Actuary.

NEW WORKS PUBLISHED BY A. H. BAILY AND CO.,

THE BATTLES OF THE BRITISH NAVY,
FROM A.D. 1000 to 1840. By JOSEPH ALLEN, Esq., of Greenwich Hospital.

"The best and most complete repository of the triumphs of the British Navy that has issued from the press."—*United Service Gazette*.

Also, in uniform size and type, and may be bound up with the above, 40 pp. 12mo., with Portrait, price 1*s.*

A VINDICATION OF ADMIRAL LORD NELSON'S PROCEEDINGS IN THE BAY OF NAPLES, faithfully related.

BAILY'S SERIES OF WINNERS.

The above Series comprises Portraits of the Winners of the Derby, Oaks, and St. Leger for 1843, to be continued, besides Portraits of BEESWING, CHARLES THE TWELFTH, and CONFIDENCE, the celebrated American trotter, price 1*l.* 1*s.* each. Also in course of publication, a Splendid Portrait of ALICE HAWTHORN.

BAILY'S SPORTING ALMANACK FOR 1844, Price 2*s.* 6*d.*, embellished by Twelve highly-finished Illustrations, amongst which are Portraits of the following celebrated Horses, painted by J. F. HEARING, Sen., BEESWING, COTHERSTONE, and CONFIDENCE. All the Performances of Two-year-olds in 1843. Entries for the Derby, Oaks, and St. Leger for 1844, List of Trainers, &c. And a variety of useful information on Hunting, Fishing, Shooting, &c.

Published this Day, post 8vo. with Plate, 7*s.* 6*d.* cloth.

A TREATISE ON PHOTOGRAPHY; containing the latest Discoveries appertaining to the Daguerreotype. Compiled from Communications by MM. Daguerre and Arago, and other eminent men of science. By N. P. Lerebours, Optician to the Observatory, Paris, &c. Translated by J. Egerton.

"Any intelligent person may, with the precise instructions of M. Lerebours, and with no very heavy outlay of more than patience, proceed to make experiments in this singular mystery with a fair hope of success. The book contains the most minute details as to modes of manipulating through the different processes of the art, suggestions of every kind as to choice and purchase of plates, and other matters of apparatus; and a quantity of information on the methods of preparing the chemical substances employed."—*Examiner*.

TREASURES MORE PRECIOUS THAN GOLD.

DR. ROBERTS'S CELEBRATED OINTMENT, called the POOR MAN'S FRIEND, is confidently recommended to the public as an unfailing remedy for wounds of every description, a certain cure for ulcerated sore legs, if of 20 years' standing, cuts, burns, scalds, bruises, chilblains, scorbutic eruptions and pimples in the face, sore and inflamed eyes, sore heads, cancerous humours, &c., and is a specific for those afflicting eruptions that sometimes follow vaccination. Sold in pots, at 1*s.* 1*d.* and 2*s.* 9*d.* each. Also his

PILULÆ ANTISCROPHULÆ,

confirmed by more than 40 years' experience to be, without exception, one of the best alterative medicines ever compounded for purifying the blood and assisting nature in all her operations; hence they are useful in scrofula, scorbutic complaints, glandular swellings, particularly those of the neck, &c. They are efficacious also in rheumatism, and form a mild and superior family aperient, that may be taken at all times without confinement or change of diet. Sold in boxes, at 1*s.* 1*d.*, 2*s.* 9*d.*, 4*s.* 6*d.*, 1*l.*, and 2*l.* each.

To those who cannot take pills, the proprietors would strongly recommend Dr. Roberts's

ANTISCROBUTIC DROPS,

for the cure of the scurvy, scrofula, leprosy, and all scorbutic complaints; they strengthen the constitution, purify the blood, and promote a circulation of the fluids; are gentle in their operation, and do not require cessation from business. In bottles at 2*s.* 9*d.* each.

By the late Dr. Roberts's will Messrs. BEACH & BARNICOTT (who have been confidently entrusted with the preparation of his medicine for many years past), are left joint proprietors of the "Poor Man's Friend," "Pilulæ Antiscrophulæ," "Larwell's Pills," "Medicated Gingerbread Nuts," and "Antiscrobutic Drops," with the exclusive right, power, and authority to prepare and vend the same.

The still increasing demand for the above medicines, from all ranks, is the best and most substantial proof of their utility.

Observe.—No medicine sold under the above names can possibly be genuine, unless "Beach and Barnicott, late Dr. Roberts, Bridport" is engraved and printed on the stamp affixed to each package.

BUTTER MADE IN TEN MINUTES
BY THE NEWLY-INVENTED CHURN.

REGISTERED ACCORDING TO ACT OF PARLIAMENT.
This Act imposes a penalty of from 5*l.* to 30*l.*, for each imitation, piracy, or selling, recoverable by the proprietors before a magistrate, or by civil action. Half the penalty will be given to any person informing the proprietors of any infringement. The words of the Act are "No person or persons shall copy or alter any design, either by adding to, or subtracting from," &c.
ATTWOOD, WIMBLE, & WARNER, MANUFACTURERS, LEWES, SUSSEX.

This CHURN being made entirely of Block Tin, the necessary degree of temperature can be given to the cream, by placing it in a pan of cold or hot water, which ensures the butter coming in 10 or 12 minutes. The simplicity of its construction, and the facility with which it may be cleaned, are no inconsiderable advantages over those now in common use. The great advantages of this Churn will be found in the winter; but in the heat of summer placing the Churn in cold water will be the means of hardening the Butter.

Sizes	No. 1	2	and 3
Churn from	7 to 8 lbs.	13 to 15 lbs.	26 to 28 lbs.
Price, carriage paid to London.	2 <i>s.</i>	3 <i>s.</i>	4 <i>s.</i>

Metal Pans for Churns to stand in, 4*s.* 6*d.*, 6*s.*, and 7*s.* Larger sizes made to order.

To be seen in London, at WRIGHT'S Range Warehouse, No. 3, Arthur-street, near the Monument; RIGBY'S Brush Warehouse, No. 80, Gracechurch-street; LIVERMORE and SON, Ironmongers, No. 30, Oxford-street; BENHAM, 19, Wigmore-street, Cavendish-square. Export Agents, BARNES & CO., 109, Fenchurch-street.

SOMETHING QUITE NEW IN PAPIER MACHE.

MECHI, 4, Leadenhall-street, London, has just completed some extraordinary specimens of Tea-trays, Work-tables, Dressing-cases, Inkstands, Writing-desks, Envelope-cases, and Work-boxes, in Papier Maché, richly inlaid with pearl landscapes, and ornamented in a most attractive manner. A few elegant Tables, Cabinets, and Jewel Cases of the same material, and a first-rate assortment of Pole Screens, Card-racks, Tea-caddies, Card-cases, Ladies' Companions, Portfolios, Cake and Note-baskets, and every description of Tortoiseshell and Ivory work. A visit to Mech's Establishment will gratify, as exhibiting the most brilliant display of art in fancy manufactures.

DRESS COATS, Superfine cloth, 30*s.* to 40*s.*; extra quality, 50*s.*; Frock-coats, silk facings, 35*s.* to 45*s.*; ditto, silk velvet collar and silk facings, 50*s.*; Waterproof Wrappers, 10*s.* 6*d.* to 21*s.*; fashionable York and Chesterfield ditto, 16*s.* to 25*s.*; Waistcoats, 5*s.* to 8*s.* 6*d.*; Silk, Satin, and Kerseymer, 10*s.* to 14*s.*; Trousers, 8*s.* 6*d.* to 12*s.* 6*d.*; stout Doeskin and Kerseymer, 16*s.* to 25*s.*; Shooting Jackets, 10*s.* 6*d.*; Boys' and Youths' Tunic and Hussar Suits, 30*s.*; a Suit of Superfine Black Cloth, 3*l.* 3*s.*; best quality, 5*l.*—At FISHER and CO.'S, 31, King William-street, City, 10 doors from London-bridge.

TO LADIES.

ROWLAND'S KALYDOR.—Patronized by Her Majesty the QUEEN, the Royal Family, and the several Courts of Europe.—Composed of Balsamic Exotics, and utterly pure and free from all mineral or metallic admixture. It exerts the most soothing, gentle, cooling, and purifying action on the skin; and by its agency on the pores and minute secretory vessels, most effectually dissipates all Redness, Tan, Pimples, Blotches, Spots, Freckles, Chilblains, and other Cutaneous Visitations. The radiant bloom it imparts to the Cheek, and the softness and delicacy it induces on the Hands, Arms, and Neck, render it indispensable to every Toilet. Gentlemen will find it peculiarly grateful in allaying the irritation of the Skin after shaving.

CAUTION.—Each genuine bottle has the words "ROWLAND'S KALYDOR" printed on the wrapper.—All others are "SPURIOUS IMITATIONS." * * * To protect the Public from Fraud, The Hon. Commissioners of Stamps have authorized the Proprietors' Signature to be engraved on the Government Stamp, thus—"A. ROWLAND and SON, 20, Hatton Garden," which is affixed to each bottle. Price 4*s.* 6*d.* and 8*s.* 6*d.* per bottle, duty included. Sold by them, and by Chemists and Perfumers.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

PATENT ASPHALTE ROOFING. The above material has been used and highly approved by the Nobility, Gentry, and Agriculturists generally, as a ROOFING and COVERING TO SIDES of Farm Buildings. Its Advantages are—LIGHTNESS, DURABILITY, AND ECONOMY. BEING A NON-CONDUCTOR, IT HAS BEEN PROVED AN

EFFICIENT

"PROTECTIVE MATERIAL" TO PLANTS,

And is now in use at the

"ROYAL HORTICULTURAL SOCIETY'S

GARDENS, CHISWICK."

THOMAS JOHN CROGSON, 8, Ingram-st., Fenchurch-st., London.

GLASS SUPERSEDED for HORTICULTURAL PURPOSES by **WHITNEY'S CHEMICAL TRANSPARENT WATERPROOF COMPOSITION**, rendering Muslin, Calico, or Linen, for the Frames of Greenhouses, Pine, Melon, or Cucumber Stoves, &c., impervious to rain or moisture, admitting light equal to Glass, much warmer, and the plants never burn under it.

The cheapness of this composition, its durability, and equal utility with Glass, render it not only a useful but most important article to Gardeners and Florists, as the expense of a two-light Frame will not be so much as the annual cost for breakage on a Glass one.

Noblemen, Gentlemen, and Gardeners will, by using this composition have the only effective protection for their Fruit-trees during the blooming season; it is a certain defence from frost, sleet, wind, and blight; its transparency admits the general beams of the sun, with abundance of light, which causes the bloom to expand with increased luxuriance, the fruit to set and swell more freely, much earlier, and a crop of fruit to any extent may be warranted. The covering not to be moved by day (except to thin the Fruit, which will be necessary), till the month of June. It is recommended that the Calico be prepared early, so as to be thoroughly dry before using.

Sold in Bottles, with directions for use, pints, 2*s.* 6*d.*, quarts, 4*s.* 6*d.* each. Prepared by GEORGE WHITNEY, Chemist, Shrewsbury. Seedsmen, Florists, and Merchants supplied by Mr. W. BAILEY, Chemist, North-street, Wolverhampton. Agents wanted for London and the country.

ROYAL POLYTECHNIC INSTITUTION.

BRILLIANT EFFECTS are produced by ARMSTRONG'S HYDRO-ELECTRIC MACHINE at Three o'clock, and at Eight in the Evenings (except Saturday evenings). By LONGBOT-TOM'S OPAQUE MICROSCOPE the singular Optical Illusion of converting a Matrix into the appearance of being a Cast in bold relief is exhibited, with a variety of other curious effects. Particulars of the CHEMICAL and PHILOSOPHICAL LECTURES, which are delivered Daily, are suspended in the Hall of Manufactures. DISSOLVING VIEWS, DIVER and DIVING BELL. Numerous STEAM-ENGINE and other MODELS at work. The original CRAYON DRAWINGS of RAPHAEL'S CARTOONS, &c. &c.—Admission, One Shilling—Schools Half-price. A New Edition of the Catalogue, with Illustrations, 1*s.* each.

EDWARD BECK invites the attention of Horticulturists to the different articles manufactured by him in SLATE. They may be seen in use at WORTON COTTAGE, ISLEWORTHE, upon application to the Gardener—Sundays excepted.

NURSERY FOREMAN.

WANTED immediately, for the out-door department in an extensive Nursery in the neighbourhood of Edinburgh, an active Man who has a perfect knowledge of his business, and whose character will bear the strictest investigation; (a liberal salary will be given). Applicants to apply in their own hand-writing to Messrs. DICKSON and Co., 1, Waterloo-place, Edinburgh.

WANT PLACES.—All Letters to be post-paid.

AS GARDENER.—A single Man, aged 32, who is capable of all kinds of Forcing, both Fruits and Flowers, and every other description of Gardening, having had 17 years' experience as above. A seven years' character as to every particular may be had from the Situation just left. Wages, 40 guineas, and board; 70 guineas and cottage, if out of Mansion.—Direct to A. B., at Messrs. PAUL & SON, Cheshunt, Waltham Cross.

AS GARDENER.—A married Man, aged 30, without family, of respectable habits, and well experienced in all the superior branches of Gardening; he has had good practice in the propagation and cultivation of plants on the latest and most improved principles; has no objection to any part of the country, and can have a good character from the Situation he has just left.—Direct to M. P., at Mr. HICKS'S, Beulah Hill, Norwood, Surrey.

AS GARDENER.—A young Man who perfectly understands his Profession in all its branches; can have a good character from the Situation he is about to leave.—Direct to A. E., 90, High-street, Camden Town.

AS GARDENER.—A most active, industrious, married Man, who is perfect master of every branch of his business—general management of Hot and Greenhouses, early Forcing, Grapes, Pines, &c., and is an excellent Kitchen, Fruit, and Flower-gardener; could take care of Meadow-land and Cattle. His Wife, if required, would manage the Laundry, Poultry, or small Dairy, or the house in the family's absence; both can get most trustworthy characters. No in-door will be accepted.—Direct C. S., Mr. DUNN'S, Cambridge Heath.

AS GARDENER.—An active married Man, without family, aged 35, of respectable habits, and well experienced in all the superior branches of Gardening; he has a good practical knowledge of Landscape Gardening, and would not object to the superintendence of Woods, or a small Farm. He at present holds, and has always held, a first-rate situation, at the same time his terms will not be found extravagant. For further information apply to RICHARD MITTON, Nurseryman, Pontefract, Yorkshire.

AS GARDENER, a married Man, aged 38, without family, who perfectly understands his business, and has no objection to look after a horse or cow. His Wife is a good plain cook, and can look after poultry. They can have good characters from the Situation they have just left. Direct to J. B., 7, Kinaston-street, Gibson-street, Lambeth.

TO GARDENERS AND OTHERS.

AS JOURNEYMAN GARDENER, for the term of two years, a single Man, aged 23, who can be highly recommended. A moderate premium will be given.—Direct to W. G., 20, Manor-place, Walworth-road, Surrey.

Printed by Messrs. BRADBURY and EVANS, Lombard-street, Fleet-street, in the Precinct of Whitefriars, in the City of London, and Published by them at the Office, 8, CHARLES-STREET, COVENT GARDEN, in the County of Middlesex, where all Advertisements and Communications are to be addressed to the Editor.—Saturday, November 18, 1843.

SHILLING'S NEW EARLY GROTTO PEAS.

J. AND S. SHILLING have succeeded in raising the above Peas. The Early Frame Peas, impregnated with the Grotto or Oyster Marrow, which they with confidence recommend to the Public generally, being quite as early, and nearly double the size of any early Peas in cultivation. Quite hardy, will stand the winter well, and a good Bearer; the Pods large and long. They would particularly recommend it to the attention of Market Gardeners.

Price 3s. per Quart; 10s. per Gallon; 17s. 6d. per Peck; 30s. per Half-bushel; 2l. 10s. per Bushel.

London Agents: Messrs. FIELD and CHILP, Seedsmen, 119, Lower Thames-street; Messrs. W. and J. NOBLE, Seedsmen, 152, Fleet-street; Messrs. JAMES GRAY, ADAMS, and HOGG, Nurserymen, Kensington; and Mr. KERNAN, Seedsmen, 4, Great Russell-street.

J. and S. SHILLING, Nurserymen, Northwamborough, Odiham, Hants, Nov. 24, 1843.

THE BRITISH QUEEN AND PRINCE ALBERT PEAS.

W. J. CORMACK AND CO. beg to announce to their Friends and the Public that they have harvested the above two New Varieties, and will be obliged by early orders, as the stock is limited. They will be sent out, as last spring, in packages, bearing the name of the firm, price 3s. 6d. per quart. The usual allowance to the trade.

N.B.—"Cormack's Early Kent Peas," 14s. per bushel. Newcross, and Bedford Conservatory, Covent Garden, Nov. 24.

MESSRS. PROTHEROE AND MORRIS beg to announce that the SALE of the COTTAGE NURSERY, CAMBERWELL NEW ROAD, will terminate on MONDAY, Nov. 27, with a fine assortment of EVERGREENS, AMERICAN PLANTS, &c. Sale to commence at 11 o'clock.

American Nursery, Leytonstone.

MESSRS. PROTHEROE AND MORRIS respectfully inform the Public that they have received instructions from Mr. WILLIAM CORMACK, SEN., to dispose of by Auction a Portion of his EXTENSIVE NURSERY STOCK at New Cross, situate on the north side of the road leading from London to Dover, on MONDAY the 4th of DECEMBER, 1843, and following days at 11 o'clock each day. May be viewed prior to Sale. Catalogues may be had on the Premises; of the principal Seedsmen; and of the Auctioneers, American Nursery, Leytonstone.

TO NOBLEMEN, GENTLEMEN, NURSERYMEN, and Others.

MESSRS. PROTHEROE & MORRIS are instructed to submit to public Auction, on the premises, ENHAM NURSERY, BATTERSEA, on WEDNESDAY, Dec. 13th, 1843, and following days, at 11 o'clock each day, in consequence of Mr. C. RUSSELL being compelled to clear the ground, the whole of the valuable NURSERY STOCK, consisting of several hundred superior hardy Scotch Rhododendrons, with some remarkably large Tulip-trees, which were removed last autumn, and can now be cleared without risk; also some exceedingly fine Yews, rarely to be met with, extra fine specimens of Aucuba japonica, with a large quantity of intermediate and small sizes; fine Standard, Pillar, and Dwarf Roses, in great variety, by name; Gooseberries in 200 named varieties; fruit-bearing Mulberries; splendid hedges of Box-trees; Laurel, Common and Portugal; Specimens of Arbor vitae, Red Cedar, hardy Azaleas, Kalmias, Yucca glaucescens, and other sorts; Pyrus japonica, large, and safe to move; named Paeonias, together with many other choice Shrubs and Roots. Full particulars will be given in Catalogues, which will shortly be ready.—American Nursery, Leytonstone.

TO PINE-GROWERS.

TO BE SOLD, A BARGAIN.—FIFTY FRUITING PINE PLANTS. Price 2s. each. With 100 SUCCESS-ION, at 1s. each. They consist chiefly of Queen's.—Apply to J. Toy, Pishiobury, Sawbridgeworth, Herts.

SEA SIDE.

TO BE LET, Furnished or Unfurnished, a Detached Freehold Family Residence, with large Garden, Coach-house, and Stabling, and with or without a Field adjoining, on the Southern Coast. Apply at the office of Mr. WILLIAM BROMLEY, Gray's Inn Square; or to view the same, at the Library, near the Royal Hotel, Hayling Island, Hants.

DISEASED AND HEALTHY LIVES ASSURED.

MEDICAL, INVALID, and GENERAL LIFE OFFICE, 25, Pall Mall, London. Capital, 500,000l. This Office is provided with very accurately constructed Tables, by which it can Assure Diseased Lives on Equitable Terms. Increased Annuities granted on *unsound* Lives, the amount varying with the particular disease. Members of Consumptive Families assured at Equitable Rates. Loans granted upon personal security. E. G. P. NATION, Actuary.

HOT-WATER APPARATUS FOR HEATING HORTICULTURAL BUILDINGS, DWELLING-HOUSES, CHURCHES, and MANUFACTORIES, upon improved principles, and at very moderate charges, erected by DANIEL and EDWARD BAILEY, 272, HOLBORN.

D. and E. BAILEY have devoted much time to the consideration of this subject, and had much experience in the erection of apparatus for the above-mentioned purposes, have, by improvements suggested in their practice, rendered their mode of heating not only very efficient, but very simple, and have combined durability in the apparatus with economy in the charge. They have erected apparatus in England, Scotland, and Ireland, for many noblemen and gentlemen, and have had the honour to be employed by the Horticultural Society of London, in executing the works of their splendid Conservatory, lately erected at Chiswick.

D. and E. BAILEY also construct in metal all descriptions of Horticultural Buildings and Sashes, and invite noblemen, gentlemen, and the public to an inspection of their various drawings and models, at 272, Holborn, where they have the opportunity of exhibiting, amongst other metal works, an extremely complete and convenient kitchen apparatus, or range, adapted for the continued supply of hot water, and an arrangement of the oven more complete than has hitherto been brought before the public.

D. and E. BAILEY were the first to introduce metallic curvilinear houses to horticulturists, and can refer to the Conservatory attached to the Pantheon as one of their works, besides many others in this country and on the Continent.

D. and E. BAILEY have prepared a quantity of the Galvanic Plant Protectors, which are now ready for immediate delivery; they beg to introduce to public notice a new Trough Pipe, for Orchidaceous or other Houses where vapour is constantly, or at intervals required, and which may be seen at their Manufactory.

PENN'S SYSTEM OF HOTHOUSE BUILDING, WARMING, and VENTILATING.—The superiority of the principle first introduced by JOHN PENN, Esq., for obtaining a more complete circulation of the atmosphere in heated apartments, being now fully established, W. HILL respectfully acquaints the public that having, in conjunction with the late Mr. Penn, devoted much time and study to perfect the same, in the construction of Conservatories, Stoves, Greenhouses, Pits, &c., and to test them with Improved Hot Water Apparatus, either by Pipes or Froughs, he is enabled to carry out Mr. Penn's principle in a manner to guarantee the most complete success and economy. First-rate references. Plain and Ornamental Designs; and any particulars on application to W. HILL, Surveyor & Builder, Lewisham.

COTTAM AND HALLEN, ENGINEERS, IRON-FOUNDERS, &c. &c., No. 2, WINSLEY STREET, OXFORD STREET, LONDON.

HOTHOUSES, CONSERVATORIES, &c., made upon the most improved principle, either of iron or of iron and wood combined, which can be fixed complete in any part of the Kingdom, at very low prices, in consequence of the present depressed state of the Iron Trade.

HOT-WATER APPARATUS for heating Hothouses, Conservatories, and Greenhouses; Churches, Public or Private Buildings, &c., with COTTAM'S PATENT, or ROGERS' BOILERS. After 15 years' experience, and having fixed upwards of 1500 Apparatuses for the above-mentioned purposes, and by various improvements which they have made during that time, C. and H. can with confidence undertake the erection of similar Apparatus upon the most extensive scale. For the convenience of those who wish to fix their own Apparatus, they have affixed the following low prices:—

Cottam's Patent Boiler, 24 inch	£ 8 0 0
(Larger Sizes in proportion.)	
Rogers' Boiler, small size	3 15 0
Do. do. large do.	4 10 0

Hot-water Pipe, Doors, Frames, and Feeding Apparatus for Boilers, &c.

RENDLE'S TANK SYSTEM on an improved simple plan. **STRONG IRON HURDLES**, 3 ft. high out of the ground, 6 ft. long, with five horizontal bars, weighing about 36 lbs., 3s. 6d. each. **Light Cattle Hurdles**, 3 ft. 6 in. high, weighing 42 lbs., at 4 0 "

Strong do. do. 45 lbs., at 4 0 "
Ox Hurdles, 4 ft. high, do. 60 lbs., at 5 6 "

BEST WIRE FOR STRAINED WIRE FENCING, at 2s. 6d. per bundle of 150 yards each. Uprights for ditto, at 7d. each. The Improved continued and every other kind of Fencing, Fancy Wire-work, &c.

HAND-GLASS FRAMES for Cucumbers, &c., 18 inches square, 3s. 6d.; 20 inches, 4s. 6d.; 22 inches, 5s. 6d. each.

CAST-IRON FLOWER-STAKES 4 feet long out of the ground, 7s.; 4 feet 6, 9s.; 5 feet, 11s.; 6 feet, 15s.; 7 feet, 20s. per dozen.

GARDEN ROLLERS 18 inches long, 34s.; 20, 44s.; 22, 50s.; 24 inches, 60s.; 26, 75s.; 28, 84s.; 30, 105s. each.

Garden Engines, Mowing Machines, Garden Chairs, Superior Garden Tools of all kinds, Garden Vases and Pedestals in great variety, and every description of Horticultural Articles, Agricultural Implements, and Furnishing Ironmongery; Dr. Arnott's Stoves, Anglo-Belgian Cooking Stoves; Broiling Stoves. The above low prices being on account of the depression in the Iron Trade, are subject to future alterations.

Show-Rooms at the Manufactory, No. 2, Winsley-street, where every information may be obtained.

Estimates sent by return of post.

RENDLE'S TANK SYSTEM OF HEATING.

STEPHENSON AND CO., 61, Gracechurch-street, London, Inventors of the IMPROVED CONICAL and DOUBLE CYLINDRICAL BOILERS, having been much engaged in heating buildings upon the above system with Tanks of various materials, solicit the attention of scientific Horticulturists to an Iron Tank now fitting up on their premises, which offers most decided advantages over every other article hitherto employed for the same purpose. These tanks which are ornamental in appearance can be made from 10 to 100 feet long and of any width and depth, and can be connected or disconnected by any working Gardener without the slightest difficulty, thus affording the opportunity to persons in remote districts of employing this much approved method of heating without the assistance of Engineers. The Tanks can be applied to Boilers and Pipes already fixed, and from the present low price of Iron will be found cheaper than any other material. Mr. RENDLE of Plymouth, has kindly undertaken to receive orders and furnish information to any persons in his neighbourhood, and prices for any size will be forwarded upon application to S. and Co.

THE CONICAL HOT-WATER BOILERS, invented by J. ROGERS, Esq., may be obtained of any size from JOHN SHEWEN, Ironmonger, &c., Sevenoaks, Kent.

J. SHEWEN having had every opportunity afforded him by an extensive practice to bring this apparatus to perfection, begs to offer it as most efficient and economical: it may be seen at Messrs. Chandler & Sons' Nursery, Vauxhall; Messrs. Loddiges', Hackney; Messrs. Henderson's, Pine Apple-place; Messrs. Veitch and Son's, Exeter; Mr. Pontey's, Plymouth; the Royal Botanical Society's Gardens, Regent's Park; and at the Gardens of the Horticultural Society of London. Considerable improvements have been effected since last season; particulars of which are in course of preparation.

GUANO ON SALE.—Any Quantity of this valuable Manure can be had from the bonded stores of the Importer either in London or Liverpool, on application to CORNWORTH, POWELL, and PRYOR, St. Helen's Place, London; EDWARDS, DANSON, and Co., Liverpool; and WILLIAM J. MYERS and Co., Importers, Liverpool.

GUANO ON SALE, BY THE IMPORTERS, ANTHONY GIBBS & SONS, LONDON; GIBBS, BRIGHT, & Co., LIVERPOOL AND BRISTOL.

LIQUID MANURE.

PUMPS of a Superior Construction, fixed and portable, for Liquid Manure. Garden Pumps, Hydraulic ditto, and Pumps for deep wells. Also Pumps for Ships, Barges, Tanners, Soap Boilers, Brewers, &c. Well-Digging and Boring executed.—BENJAMIN FOWLER, (late George Turner,) 63, Dorset-street, Fleet-street.

NEW CHRISTMAS BOOK, BY MR. DICKENS.

In December will be published, in small 8vo, with four coloured Etchings, and Woodcuts, by LEECH,

A CHRISTMAS CAROL; IN PROSE. BEING A GHOST STORY OF CHRISTMAS. By CHARLES DICKENS.—Price Five Shillings. CHAPMAN and HALL, 186, Strand.

A TREATISE ON THAT INVALUABLE FRUIT, THE PINE-APPLE. By T. TORBON, founded on long practice; by which it will acquire its climax of size and flavour. The Author has been honoured with the names of 120 subscribers. Published at 23, Titchbourne-street, Haymarket. Price 5s. Sent post free to non-subscribers if required.

PUNCH!—PRINCE ALBERT, THE BRITISH FARMER.—See Saturday's Number. Price Threepence, or stamped, Fourpence.

PUNCH'S POCKET-BOOK FOR 1844, containing Ruled Pages for Cash Accounts, and Memoranda for Every Day in the Year; an Almanack; and a variety of useful and valuable information. Price 2s. 6d.

"We really do not remember *Punch* to have been so brilliant as he is in the present work—every date has its joke, every leaf its laugh; it is, indeed, a prime jest book."—*Weekly Chronicle*. PUNCH OFFICE, 194, Strand; and sold by all Booksellers.

In Monthly Numbers, 8vo, price 1s. 6d. each,

THE GARDENERS' MAGAZINE. Forming One

Volume annually, illustrated by numerous Engravings. The Vols. for 1825 to 1834 inclusive, are out of Print. The Vol. for 1835, price 16s., contains 720 pages of letterpress and 116 engravings: viz., Plans of Gardens, the Grounds of small Villas, Flower-Gardens, and Arboretums, 28; of Garden Structures, 6; of Garden Ornaments, 4; of Gates, 2; of New Instruments and Utensils, 8; of Garden Operations, 1; of New Fruits, 2; of New Plants, 15; of Entire Trees, 4; Miscellaneous Diagrams, 26.

The Vol. for 1836, price 16s., contains 724 pages of letterpress, and 111 engravings: viz., Plans of Gardens, the Grounds of small Villas, Flower-Gardens, and Arboretums, 37; of Garden Structures, 4; of New Instruments, 4; of Diagrams, 12; of Buildings, 2; of Fruits, 1; of Plants, 24; of Entire Trees, 9; of Reptiles, 3; of Insects, 5; Miscellaneous, 4.

The Vol. for 1837, price 16s., contains 624 pages of letterpress, and 128 engravings: viz., Plans of Gardens, the Grounds of small Villas, and Flower-Gardens, 4; of Garden Structures, 23; of New Instruments, 9; of Diagrams, 23; of Buildings, 2; of New Plants, 43; of Entire Trees, 10; of Insects, 15.

The Vol. for 1838, price 16s., contains 640 pages of letterpress, and 102 engravings: viz., Plans of Gardens, the Grounds of small Villas, &c., 52; of Garden Structures, 5; of Instruments, 8; of Diagrams, 22; of New Plants, 8; of Insects, 6.

The Vol. for 1839, price 17. 3s. 6d., contains 730 pages of letterpress, and 177 engravings: viz., Plans of Gardens and Country Residences, 11; Views of Garden Scenery, 27; Cottages and Lodges, 18; Garden Structures, 36; Instruments, Implements, Utensils, and Machines, 37; Diagrams, 24; Operations, 8; Plants, 20; Insects, 2.

The Vol. for 1840, price 17. 3s., contains 690 pages of letterpress, and 79 engravings: viz., Plans of Gardens and Country Residences, 7; Views of Buildings and Garden Scenery, 9; Garden Structures, 16; Instruments, Implements, Utensils, and Machines, 24; Diagrams, 17; Plants, 6.

The Vol. for 1841, price 17. 1s. 6d., contains 654 pages of letterpress, and 58 engravings: viz., Plans of Gardens and Country Residences, 6; Garden Structures, 25; Instruments, Implements, Utensils, and Machines, 17; Diagrams, 8; Insects, 2.

The Vol. for 1842, price 17. 2s., contains 672 pages of letterpress, and 77 engravings: viz., Plans of Houses, Gardens, and Grounds, 8; Views of Buildings, and Garden Scenery, 6; Garden Structures, 8; Instruments, Implements, Utensils, and Machines, 31; Diagrams, 24.

The Vol. for 1843, price 17. 3s. 6d., contains 700 pages of letterpress and 135 engravings: viz., Plans, Views, Elevations, Sections, &c., connected with Cemeteries, Churches, and Churchyards, 60; Plans of Flower-Gardens, Lawns, &c., 17; Suburban Villas, &c., 5; Artificial Lakes, 4; Plans and Elevations of Cottages, 8; Modes of Heating, 3; Instruments, Implements, Utensils, and Machines, 17; Diagrams, 14; Plants, 1; Insects, 2; Phenological Figures, 6.

Every yearly volume of the *Gardeners' Magazine* contains a Register of the Horticultural Discoveries and Improvements that have been made in the course of that year, and these are again noticed in a more concentrated form in an Annual Summary. Thus every gardener or amateur who reads the *Gardeners' Magazine*, is certain of keeping up his professional knowledge with the progress of improvement, rapid as that progress continues to be. Every Volume is complete in itself, with contents, index, &c.

In 12mo., price 5s. cloth lettered,

GUIDE TO THE CONSERVATORY; being a concise Treatise on the Management of the Hothouse and Greenhouse; the Forcing of Bulbs, Shrubs, &c.; and the Best Mode of Keeping a Succession of Bloom through every month of the year; exemplified in a select list of the most admirable plants of the present day, under the arrangements both of Jussieu and Linnæus—including their native country, propagation, and the soil adapted to each.

By RICHARD BAINBRIDGE,

Flower-Gardener to the Right Hon. Lord Wenlock. From Notes of the Author's Daily Practice, and Communications furnished by liberal eminent Floriculturists.

** The peculiar characteristic of this work is the means of obtaining a constant and large supply of flowers. It includes a very extensive List of Orchidaceæ, with their cultivation, as pursued by the most eminent practitioners.

London: ROBERT BALDWIN, 47, Paternoster-row.

HERBARIUM.

WILLIAM PAMPLIN'S DESCRIPTIVE CATALOGUE OF DRIED PLANTS, will be forwarded on sending two Postage stamps to 45, Frith-street, Soho-square, London; it contains above Thirty Distinct Collections, including some very interesting Plants from Brazil, New Grenada, and Mexico; from Nubia and Abyssinia; from Arabia, Kourdistan, and the Georgian Caucasus; and from various parts of Europe; which have been recently consigned to W. P. for sale, at very moderate prices.

A New Edition, complete in 2 vols., 8vo, price 21s.

PRACTICAL SERMONS FOR EVERY SUNDAY AND PRINCIPAL HOLYDAY IN THE YEAR. By the Rev. C. BRADLEY, Vicar of Glasbury. Vols. II. and III. of the smaller edition to be had separately, price 8s. each.

London: HAMILTON, ADAMS, & Co.; and HATCHARD & SON. By the same Author, SERMONS PREACHED CHIEFLY AT THE CELEBRATION OF THE LORD'S SUPPER. Second Edition, price 10s. 6d.

Just published, Price 7s. 6d. post 8vo. boards.

EXPERIMENTAL RESEARCHES, CHEMICAL AND AGRICULTURAL. Part I. contains, Carbon, a Compound Body made by Plants, in quantities varying with the circumstances under which they are placed. Part II. Decomposition of Carbon during the Putrefactive Fermentation. By ROBERT RIGG, F.R.S.

LONDON: SMITH, ELDER, and Co., 65, CORNHILL.

HODGSON'S IMPROVED PORTABLE PENS, are manufactured from Quills peculiarly prepared, of different degrees of hardness to suit all hands, price 4s. per packet, containing 100.

HODGSON'S NEW ENGAGEMENT BOOK. Price 2s.
HODGSON'S IMPROVED CELLAR BOOK. Price 2s.
HODGSON'S FAMILY WASHING BOOK. Price 1s. 6d.
HODGSON'S HOUSEKEEPERS' ACCOUNT BOOK. Price 1s.
HODGSON'S POSTAGE ENVELOPES, infinitely superior to the Government ones, at the same price.

London: HODGSON'S, Stationers, &c., Nos. 6 and 9, Great Mary-lebone-street. To be had of all booksellers and stationers in the United Kingdom, or forwarded by post at a small additional cost.

Just published, in One Volume 8vo., price 3s. 6d. to Fellows of the Society, and 5s. to others, (or postage free, upon receipt of a Post-office order, price 5s. to Fellows of the Society, or 6s. 6d. to others.)

A CATALOGUE OF THE FRUITS CULTIVATED in the GARDEN of the HORTICULTURAL SOCIETY OF LONDON. (Third Edition.) Containing the Names, Synonyms, Colour, Size, Form, Quality, Use, Time of Ripening, and many other particulars concerning all the most important varieties of hardy Fruit cultivated in this country.

Sold at the House of the Society, 21, Regent-street, and also by LONGMAN and Co., Paternoster-row; J. HATCHARD, Piccadilly; RIDGWAY, Piccadilly; RIVINGTONS, Waterloo-place; and by the principal Booksellers in all parts of the Empire.

A few Copies of the Second Edition of this Catalogue may be had at the reduced price of 1s. 6d. each.

The Gardeners' Chronicle.

SATURDAY, NOVEMBER 25, 1843.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

Wednesday, Nov. 29	Botanical Society of Arts	8 P.M.
Tuesday, Dec. 5	Horticultural Linnean	8 P.M.

LIGHT is an agent perfectly indispensable to plants in a growing state, and they generally thrive in proportion to the amount of it they receive. It is the stimulus which puts in action all their most powerful and important vital forces. Hence it is a principle in modern gardening to provide houses used for cultivation with the most transparent substance that can be procured for their roofs, and to employ means of diminishing the quantity of light at those seasons when, under the artificial circumstances to which plants are exposed in hothouses, it becomes necessary to do so. For this end glass is universally employed, and it is not likely to be superseded.

But some plants never require bright light; Cucumbers for example. Others need it only during the summer; as many sorts of Greenhouse plants. Others again, can dispense with it at the early period of their growth, though it is indispensable to them afterwards. In all such instances any substance which is cheap, waterproof, and not brittle, although not more transparent than horn, would be invaluable to gardeners; and accordingly various attempts have been made to deprive paper or cotton linen of their opacity by some greasy or resinous preparation which shall repel water. We cannot say that the attempts have been hitherto very successful. In some cases the application of the substance to be employed has been difficult; in others its preparation has proved an obstacle; and sometimes even its cost.

At last the proposed end seems to have been attained by Mr. George Whitney, of Shrewsbury, if we are to judge from the statements that have been made to us, and by the specimens that we have seen. There is now before us a piece of cotton linen, and another of muslin, which are certainly all that can be wished for on the score of transparency and texture, both prepared by some waterproofing substance which Mr. Whitney has contrived.

We understand that this gentleman was led to turn his attention to the subject in consequence of having lost the larger part of his wall-fruit for three or four years consecutively. Early last spring he covered his trees with common calico coated with the composition, when the blossoms were found to expand fully, and a crop of fruit much greater than the trees could support was the result. He did not take the coverings off by day, except to thin the fruit, till the latter end of May. The crop was not only abundant and very fine, but a month earlier than his neighbours'. This success naturally induced him to try a thinner material (muslin) for Cucumbers and Melons, and the fruit grown under them is represented to have been of good quality.

No doubt can be entertained of the plan being successful for many purposes, and we recommend our Amateur friends to put it in practice—on a small scale, however, at first, until they have ascertained the best means of proceeding.

We regret to find it still necessary to repeat the advice we formerly (p. 587, 1842) gave, as to the destruction of perennial weeds. Everybody is troubled with them; all wish to remove them: but many stand looking on helplessly, as if there were no remedy for the mischief. Fields continue to be smothered with Ferns and Thistles and Docks; lawns swarm with Rib-grass and Dandelion; and gardens are overrun with Couch-grass in all parts of the country, except a very few. And yet the means of destruction are simple, the result certain, and the expense no more than is involved in a small exercise of patience, and the wear of a few common tools.

What we formerly said we now repeat, viz.: that it is physically impossible for any plant to exist long if its leaves are perpetually destroyed. It is of no consequence whatever what the plant is, or under what circumstances it grows—perish it must under the constant loss of its foliage. For the reasons why this is so, we can only refer to the place above quoted.

For the proof, we shall call the first person who has steadily set about cutting off the crowns of the Dandelion in his grass-plots. A year ago, some garden-ground was infested with Gout-weed (*Ægopodium podagraria*), a very troublesome plant to eradicate; and in the instance in question circumstances rendered it inconvenient to take up the Ferns and other herbaceous plants which occupied the ground infested with the Gout-weed, which had insinuated itself among them and intermingled its roots in all directions with the plants it was desirable to preserve. A little girl was taught to watch the Goutweed as it sprang up in the spring, and to pinch off its leaves whenever they were four or five inches long. The first pinching produced no effect, the second very little, and the experiment was pronounced a failure. Patience, however, came in aid of the operation, and after the third destruction of the leaves, which was by Midsummer, the Goutweed was evidently much enfeebled. And now the previous perseverance began to tell: the leaves were thin and pale, and grew but slowly. The merciless pinching was continued, and by the end of September leaves ceased to appear. Upon examining the ground the other day, the subterranean stems and roots of the Goutweed were found wholly dead.

Now what was true in that case would be equally true in all others—a fact which cannot be too well remembered, for the losses occasioned by weeds, on a large scale, no one can count. In the last Number of the "Journal of Agriculture" two similar instances are mentioned by Mr. Boyd, of Innerleithen, which deserve to be mentioned in connexion with this subject:—

"An extensive bog on the farm of Gernsleuch, on the estate of Thirlstane, the property of Lord Napier, was surface-drained some years ago at a very considerable expense, and, no doubt, in the confident expectation that it would be rendered highly productive in consequence; but, in place of this being the result, to the astonishment and sad disappointment of Mr. Laidlaw, the tenant, it produced, the first year, a most extensive crop of Thistles—so extensive, indeed, that the tenant at once and for all abandoned the idea of eradicating them. It is, however, consistent with my knowledge, from a recent experiment, conducted upon a scale of considerable extent, that cutting Thistles two consecutive years will destroy them."

Here we have the destruction of leaves carried on with much less zeal than might have been employed, and the consequence was the loss of two years in the attempt to extirpate the Thistles. If cut as fast as they shot up, they would have disappeared in one year.

The other case is that of the common Brake, one of the most difficult of all plants to get rid of without irrigation:—

"From time immemorial, the inhabitants of Innerleithen have been accustomed to collect Ferns annually from the adjoining mountains for the purpose of pitting, or securing their Potatoes during the winter months. For a number of years past, also, many of them have been in the habit of keeping pigs, and, from their having the command of no other material for litter than the Fern, the competition in collecting it has, in consequence, become of late years so very great, that many of the pig-feeders, (unwittingly for themselves,) in place of allowing the Ferns to come to maturity, as usual, before cutting, have mown down large quantities of them while young and succulent. This has had completely the effect of eradicating them from the soil. On some patches, however, a few sickly plants are still left to point out the ground where, five or six years ago, Ferns were produced in the greatest abundance. As an additional proof that repeated cuttings of the Ferns while young and succulent will eradicate them from sheep pasture, I may mention that in the year 1834, Mr. Ballantyne, of Holylee, engaged two experienced mowers, for five weeks, to cut the Ferns on Blackcleuch and Brakenhope, both of which are farms of great extent, many of the patches of Ferns covering five or six acres of land. Although the plants, after a second and third years' cutting, became extremely feeble and sickly looking, still the operation of mowing was found necessary to be repeated in the month of July for five consecutive years before the Ferns were totally extirpated; and in many places, where they were rank, it was the third year after the first cutting before the surface was completely covered with a variety of Grasses and White Clover. Although the extent of ground subjected to the experiment has not been actually measured, it is the opinion of those conversant with measurements, as also of those who have a practical knowledge of the ordinary quantity of Ferns that a mower will cut in a day, that the whole extent of ground from which the Ferns have been extirpated cannot, at the most moderate computation, be less than 100 acres, which are at this moment the richest and most productive portions of sheep pasture on the estate of Holylee. The whole expense of extermina-

* P. 143, Oct., 1843. Blackwood.

tion mounted only to the comparatively trifling outlay of 25*l.* sterling, being at the rate of 5*s.* an acre."

To this we need only add, that more frequent cuttings would also have accelerated the destruction of the Ferns as well as of the Thistles.

A COMMENTARY ON CERTAIN PASSAGES IN THE PHYSIOLOGICAL WRITINGS OF THE LATE ANDREW THOMAS KNIGHT.

BY W. WOOD.

(Continued from page 803.)

No. VII.—ON THE TRANSPLANTATION OF PLANTS WITH SPINDLE-SHAPED ROOTS.—"It is a generally received opinion amongst Gardeners that plants with spindle-shaped roots cannot be advantageously cultivated by transplantation, and it cannot be questioned that the most perfect crops of plants of this habit, both in quantity and quality, will be obtained by permitting them to retain their first situation and position. Fibrous-rooted plants, also, I am inclined to infer, from the grounds above stated, will be found to succeed well under the same mode of treatment, for these would readily emit in great abundance new superficial roots."—*Hort. Trans.*, vol. vi., p. 370, (1826.)

The above evidence affords still further and clearer proofs, that a Progressive and Accumulative system of cultivation is the ultimate result of cultivation; although as previously stated in the instance of the Balsams, in which intermediate shifts were dispensed with, it did not occur to me at that period that such a system could ever be applied to the culture of plants of slow growth, yet a conviction that such a principle does really exist in nature, and would be ultimately successful in the treatment of plants generally, was my decided opinion from that period up to the present; and each successive instance of an approach to it has only served to confirm my expectations—that had the eminent experimentalist whose papers have done so much to illustrate and confirm all subsequent experience, been permitted to continue his valuable labours, I have no doubt but ere this, a clear conviction and practical insight into the ultimate effects of cultivation would have led him to affirm what I sincerely believe to be consistent with the principles of Horticulture, that, *physiologically* considered, *shifting* is but a substitute for a worse evil.

No. VIII.—ON THE CULTIVATION OF THE PINE-APPLE.—"Concluded a long course of experiments upon the cultivation of the Pine-Apple, and in ascertaining the effects of excess of drought and of moisture, and of very high and of very low temperature, I have of course sacrificed many plants in experiments, which I neither found nor expected to find successful; but from these experiments, &c., much valuable information was gained, &c. &c."—*Hort. Trans.*, vol. vii., p. 409 (1828.)

Remarks.—Such is the honourable testimony borne to the valuable results of philosophical research and inquiry, and it would be well if those who are attempting to apply the highest principles of Horticulture to practice, with but a very slender knowledge of the requisite means, would remember that the success of the latter must essentially depend upon the former.

"Very high temperature, if accompanied with a sufficiently humid state of the atmosphere, I found beneficial at all seasons of the year under a curvilinear iron house, for this admitted as much light in the middle of winter as the Pine-Apple plants appeared to require."

"The effects of the excess of humidity in the air of the house were, as might have been anticipated, diametrically opposite to those which had resulted from drought, and the plants grew so rapidly as to become soon too large for the spaces allotted, without indicating at any season of the year a disposition to show fruit."

Remarks.—The above statement appears to imply a difference of treatment in the cultivation of plants which to a certain extent admit of a progressive maturity of growth, as in many of those with a branching habit, and those whose maturity must depend upon a single accumulative development, as the Pine-Apple, Cockscomb, &c.,—the former not admitting of those artificial processes which render the current of sap subservient to fertility, by diverting its exuberant or perpendicular flow to the formation and support of every developed bud.

"I do not entertain the slightest doubt that as large and larger, and even still larger Pine-Apples may be raised without, than with, a hot-bed of any kind. A requisite degree of temperature and humidity of atmosphere may be maintained by intense solar agency, &c. &c. &c."

In reference to the above, I may again cite the instance of the Balsams, which I subjected to intense heat and excessive moisture by syringing, apart from the aid of fermenting material throughout the whole process. Such was the exuberant growth on that occasion from the plants being transferred from 60-sized pots to 12-sized, that I had a repeated intention of again shifting them; but the stimulating material in which they were placed proved capable of imparting a vigour far exceeding the expectations, of all who saw them, and though cultivated in houses whose structure was favourable only to a dry heat, yet the humidity which they were subjected to daily caused the protrusion of roots above the surface of the soil—a sufficient proof of the genial element and intense agency to which they were exposed.

"To obtain fruit of a much larger size, it will be found necessary to restrain the plants from bearing fruit to a greater age than mine have ever been permitted to acquire, and in such cases it will be found beneficial to remove the plants annually into larger pots. The difficulty of thus removing, without danger to the roots, &c."

Remarks.—Here it appears that Mr. Knight supposed it possible to attain a larger fruit by successive stages of growth. But I am strongly inclined to think that he

here lost sight of the principle which he in part carried out, and that if he had then perceived the application of dispensing with all shifts—by the possibility of obtaining a uniform circulation of moisture from a larger amount of material, whether applied in larger pots, tubs, or proportionately-sized pits—he would still have attempted it on a larger scale. It appears that his attempts on a small scale—yet then proportionately larger than others believed possible—were crowned with success. And here I would inquire whether his application of vegetable matter in a fresh or undecomposed state was at all favourable to the highest possible effects—whether its nutritive properties were not to a certain extent pernicious, not as an element capable of being assimilated by the roots, &c., but pernicious or unfavourable as a medium by which the remaining chemical agencies were to derive and impart their force? *Is not the efficiency of every cause to a certain extent modified or regulated in proportion to the fitness of the medium through which it operates?* If not, I am perfectly unable to establish a method in support of those principles of Horticulture upon which all that is true in cultivation depends.

Referring again to the materials used in the cultivation of the Balsams, I am convinced that the application of materials subservient to the highest possible effects of cultivation must answer a twofold purpose, mechanical and nutritive (or assimilative), and that the amount of material subservient to the latter purpose should only be in proportion to the progressively absorbent and digestive functions of each plant. I would even apply these views to the cultivation of such plants as are exposed to the most intense agencies; for this reason, that the amount of material equal to a given effect would be in proportion to the former—the more powerful the agent, the greater the amount of material a plant could operate upon; and the greater the amount of material, the more essential that its qualities, proportions, arrangement, &c., should be rendered subservient to the progressive stages of growth. I think it is by what I venture to call a mechanical medium that the law of gravitation operates, and it is the uniform operation of this law which constitutes the capability and power of uniform agency in all material bodies.

"It will also be necessary when fruit of the largest size is required, to place the plants at all periods of their growth at considerable distances from each other, because the leaves of the Pine-Apple plant act less efficiently in the generation of sap in proportion as they are made to take a perpendicular direction, and the direction they are compelled to take when they are laterally much shaded—for the leaves of this plant, like the stems of Potato-plants, are subjected to the conflicting influence of gravitation and of light—the one labouring to give a perpendicular, and the other a horizontal direction to the leaves; and the comparative power of one agent increasing as that of the other decreases."

Remarks.—The above very instructive observations appear to inculcate the great importance of equalising the great opposing powers in Nature, and serve to afford the last confirmatory evidence in support of an opinion I have given in a previous paper on the essential importance of "a uniform circulation of moisture," as a principal medium by which the highest possible effects in cultivation are to be attained. As this condition will, ere this, have excited some little attention, and in some instances conjecture, as to the causes which operate to produce it, I beg to submit the following proposition to the consideration of cultivators:—

A uniform circulation of the fluids necessary for the highest objects in Horticulture is the result of adapting the arrangement, proportions, textures, and qualities of the materials employed in cultivation, to the organic structure of plants, and the external agencies which operate upon them.—William Wood.

MR. BECK'S TANK-HOUSE.

PERHAPS a description of my Tank-house may be acceptable to the general reader, and may serve to answer the numerous inquiries I have received upon the subject. What I aimed at was, to employ every portion of the space inclosed to the best advantage. Under one roof are the means of obtaining, at pleasure, stove, bottom, moist and dry heat, and likewise ventilation; the arrangements for these are at once simple and effective. The house (if I may be allowed to call a humble wooden erection by the name) is a "lean-to" against a south wall; it is 35 feet long by 7 wide, and is divided in the centre by a glass partition. The tank, which is heated by one of Stephenson's conical boilers, is an iron one, and made by the same company; it is 30 feet long and 3 feet wide, and is 9 inches deep; it is covered with $1\frac{1}{2}$ inch slate, and the depth of the water in it is about 4 inches.

The tank is divided as shown in the *Chronicle*, p. 804. The half of the house nearest the boiler I use as a stove, and the other as a greenhouse. From the edge of the tank, which is 4 feet from the wall, in both divisions rise a series of shelves removable at pleasure. At either end of both places stands a slate cistern for receiving rain-water from the roof, and under the front sashes is placed a shelf, which is easily let down whenever wide path-room is required for bringing in a large plant, &c. The ventilation is effected by small doors near the ground; the top-lights run in the usual manner, and the front sashes are sliding. The two divisions are furnished thus:—In the stove suspended from the roof, and placed upon shelves, are about 70 choice Orchidaceæ, a few stove plants, and some Roses, just coming into full bloom. There are also some Hyacinths and other plants to bloom in succession. The shelf under the window is filled with various cuttings that have been struck, and are to remain there until they become established. Beneath the tank, which is sup-

ported upon small iron columns 2 feet 6 inches from the ground, are planted Rhubarb, Asparagus, and Seakale—the two former promise to be excellent crops, the latter has only been lately planted, and therefore little can be said about it; here are also stowed away Fuchsias and other plants that remain in a dry state through the winter; as are likewise Hyacinths, and other bulbs, for forcing in succession. This space was at first intended for a Mushroom bed, but could not be spared for that purpose. In the second or greenhouse division, some of the shelves are filled with seedling Pelargoniums, and the front one is occupied with seedling Calceolarias.

I should add that, in the stove, one-half of the tank is covered with dry tan, and the other is divided into two water-tight compartments. There is also a similar one of small size near the sluices C and B. In the greenhouse division the slate cover is entirely bare. With respect to the management: suppose it to be eight o'clock, P.M., the glass falling and the night promising, what we have had this season, 12° of frost; suppose, farther, that the stove is at 70° , the water in that division of the tank 120° or 130° ; the sluice-board at A is put down, and those at B and C are pulled up, and in ten minutes the greenhouse division of the tank, previously cold, is radiating heat; in this way it remains for an hour or so, and then the circulation is shut off and confined to the stove. The fire is made up, and the water-divisions in the stove are replenished, in order to supply the necessary moisture. In the morning the foliage will be covered with a dew-like

PLAN OF A POTTING-SHED.

THE accompanying plan is an inside view of a most convenient pottling-shed belonging to Mr. Beck, of Isleworth. This shed is 25 feet long and 12 feet wide (part of the timbers have been left out for the purpose of better showing the other parts). Although it is not a very substantial building, it is remarkable for its neatness and general arrangement, and contains within itself every convenience which the Amateur can desire. The following is a description; A is the pottling bench, B a bench for standing plants on; over this bench are roof-lights, K, which make it a convenient north house, as well as a pottling-shed; C is a large water-tub, running on castors, which may be pushed under the bench, out of the way; at D, though not seen, is a Stephenson's conical boiler—the iron chimney is shown

moisture, and if this is considered to be too heavy, a small plug in the several divisions is pulled up, the water sinks into the tank, and the evaporation ceases. If the tank be too full to allow its escape from the surface, a cock may be turned leading from the bottom of the farther end, and this allows sufficient to run out to accomplish the object. Should the water boil, the safety of the whole is provided for by a small steam-pipe. The first admission of air is through the small doors near the bottom, and this mingles with the warm air before reaching the plants. If we wish to propagate, we take off a lower shelf in the stove, plunge the pots of cuttings in the tan, and cover with a hand-glass.

Now, I dare say many gardeners in large establishments will smile at this elaborate description of a place that would scarcely hold their tools. But I thought it would be acceptable to humble horticulturists like myself. I could not desire for my purpose a better house than one of several divisions. The readers of the *Chronicle* may remember a notice which appeared in its columns, of the first little structure I worked on the tank-system, and which first directed attention to Rendle's plan in this part of the country. I have had no occasion to vary my original arrangements; all I have done is only to enlarge it, and I believe for simplicity, certainty, economy, variety of temperature under one roof, useful occupation of all space, my wooden boxes may serve as a model. For the health and luxuriance of all they contain, abundance of practical men can vouch.

at E; this boiler heats a small greenhouse at the back, and likewise gives out sufficient heat for the shed; F is a fruit-loft, 16 feet long and 4 feet 4 inches wide; G are bins for peat, sand, crocks, &c.; H is a cupboard for paint-pots and other tools which the amateur may require; I is a shelf for plants on the outside. As this building faces the north, and has a roof partly glazed at K, it is found useful as a place in which plants can be temporarily preserved while in flower, in cases where it is desirable that they should not be exposed to too much light. The water-tub, C, is very useful for washing pots in. The row of bins at G enables the gardener to keep all his composts and pottling materials distinct, and always ready, so that there is no time lost in hunting after this or that, and the place never needs to be unneat.

THE FIG.

THERE is, perhaps, no fruit-tree more easily grown than the Fig. It will thrive under a greater variety of circumstance, as regards soil and situation, drought and moisture, than will even the common orchard trees; and it will also bear a wide range of temperature, provided this does not descend much below the freezing point. The tree is not adapted for withstanding any great degree of frost. Although it will ripen its fruit under a summer-heat scarcely sufficient for the Vine, yet the shoots of the latter, when their growth is perfected, will bear in winter a degree of cold that would kill the Fig to the ground. Notwithstanding the amplitude of its foliage, and proportionably rapid growth under favourable circumstances, the Fig may be fruited in very small compass, although limited in its supply of nourishment—a consequence of its tenacity of life.

The mode of bearing is somewhat peculiar, and requires particular attention. On the lower part of the current shoots of the season wood-buds are generally formed in the axils of every leaf. If the shoots are upright and very vigorous, such only are to be found along the shoot—the natural tendency being to form stems and branches, more especially where a considerable extent of these does not already exist; but the ramifications from such usually

exhibit a fruitful appearance. When the tree is in a bearing condition the shoots are generally furnished with wood-buds at the base; then fruit-buds begin to be formed in the axils of the leaves, and continue to be so formed to the very extremity of the shoot. The fruit-buds earliest formed—those lowest on the current year's shoot—are generally developed into fruit of considerable size; but they rarely attain maturity in the open air in this climate; whilst those formed later can never be expected to do so; and none will stand over winter, if advanced so far as to have the appearance of minute Figs. They will wither with the leaves; and although they may hang on the shoots after the leaves have dropped, yet their vegetation is checked, and cannot be resumed in the following spring.

But some fruit-buds at and near the extremity of the shoots will be observed not larger than small Peas;—in fact, still enveloped by their protecting scales at the time when the vegetation of the season ceases. These will continue alive, if protected from frost, and remain stationary, like wood-buds on other parts of the tree, till vegetation becomes active in the following spring. When that period arrives, these autumn-formed fruit-buds burst from the scales which inclosed and protected them during winter; and they acquire perfect maturity in the course

of the summer, unless from various causes the fruit drops prematurely.

It thus appears that the Fig-tree is naturally adapted for bearing a succession of fruit, progressively formed, from near the base of the shoots to their extremities; that the greater part, if not the whole, of the fruits which push beyond their scales in the same season in which they are formed, fail in attaining maturity in this climate, although they constitute the principal crop in warmer climates, and likewise in forcing-houses in this country; and that the crop likely to ripen without the aid of artificial heat is derived from the embryo fruit-buds formed towards the extremities of the shoots. It is, therefore, evident that the latter ought not to be cut off in pruning.

The propagation of the Fig is easily effected, either from suckers, by layering, or from cuttings. Suckers may be taken off at any time when the trees are not in leaf, and planted either in the open ground or in pots. Layering may be performed at any season. Cuttings should be made early in spring, and struck in heat.

In some parts of the south of England the Fig succeeds as standards, bearing large crops in favourable seasons. It then receives little or no pruning. But in general it is found necessary to plant the Fig against walls; and in this case pruning and training become necessary.—R. T.

ON THE ATMOSPHERE OF HOTHOUSES.

(Continued from page 804.)

Chemical Composition.—The last but not least important topic of my discourse is the permanently gaseous material of which the atmosphere is composed. Of the great bulk of this material, Nitrogen*, forming four-fifths of the whole compound, little need be said, as, so far as known, it constitutes a mere diluent of the other gases. Neither will it be necessary to dwell on oxygen, which, although a product of vegetation, and entering into the atmosphere to the extent of one-fifth, or, more correctly, 21 per cent., is not so immediately involved in our inquiry. Suffice it to say, that the proximate proportion of four-fifths nitrogen and one-fifth oxygen, composing the atmosphere, is found exceedingly stable—the analysis of chemists at various times, and from all possible situations, rendering it the same. With carbonic acid gas as an ingredient in the atmosphere, I, however, propose to be somewhat more minute, as it is now an acknowledged fact in vegetable physiology, that plants derive the basis of woody fibre, or carbon, from this source. The result of extensive and careful analysis has proved that the atmosphere contains of carbonic acid gas about 1/1000 of its bulk, and for the proper growth of plants, this exists as a minimum proportion. Heat, light, moisture, and all things else necessary for plants, may be present in the atmosphere surrounding them; but if this minute and apparently unimportant ingredient be wanting, they will then cease to grow.

By examining our coal-fields and other deposits containing vegetable organic remains, we have the evidence of a period when vegetation must have been exceedingly luxuriant. Ferns, Araucariæ, Stigmariæ, Sigillariæ, and other fossil tribes, to a great extent now extinct in species, grew in vigorous profusion in that early world; but having ceased to live were buried, and became those beds of coal so abundantly disinterred at the present day. Although most of these primeval plants differed in configuration from those now extant, there is no reason to imagine their functions were of another sort than that which living plants now perform. They must therefore have inhaled carbonic acid gas from the atmosphere, and obtained their carbon from that source: hence the conclusion is forced upon us, that the then atmosphere was more copiously impregnated with carbonic acid gas, for all the coal of our mines was then suspended in it in that state. But if plants of that era luxuriated in an atmosphere surcharged with carbonic acid, may not plants of the present day do the same? This question has been answered in the affirmative both by experiment and observation; and hence it may be an object in artificial cultivation, where we wish to urge on vegetation as rapidly as possible, to afford an additional supply of this gaseous food to our plants. Gardeners have long been in the habit of doing this both in hot-beds and pit-stoves: for this purpose a quantity of vegetable matter, such as bark, leaves, or litter, is heaped together and allowed to ferment, when not only is there a generation of heat, but a copious formation of carbonic acid gas. There is no doubt that the chief object contemplated in this process is the production of heat; but there can be as little doubt that carbonic acid has been likewise produced, and had its influence in the result—a vigorous vegetation. It is on this account that the old system of obtaining bottom-heat by the fermentation of vegetable matter, will, when properly managed, never be excelled in its effects by the more modern and more manageable means of the warm-water tank. It is not without reason, therefore, that many of our old gardeners adhere to their old plan, preferring leaves or litter to steam or water as a source of heat. Like the Grotto del Cane, they possess, in their fermenting material, a constant fountain of carbonic acid gas, which, diffusing itself through the atmo-

* Nitrogen.—Although this gas is a component of all plants, they do not, according to the present state of our knowledge, obtain it directly from the atmosphere. It is not difficult to see, however, how they may indirectly procure it; during thunderstorms, for instance, the electric fluid can cause its union with oxygen to form nitric acid, which, combining with the ammonia present in the atmosphere, and carried down in rains to the roots of plants as nitrate of ammonia, will form a fertiliser, yielding nitrogen from both acid and base. Again; the presence of some bases in the soil, such as potash, exerts a disposing affinity upon oxygen and nitrogen, so as to induce them to combine in the form of nitric acid. With this the potash unites to form nitre—an acknowledged fertiliser—yielding nitrogen.

sphere of the house, is absorbed and assimilated by the foliage it encompasses.—J. L., Newburgh.

(To be continued.)

ON THE MANAGEMENT OF BEES.

By T. WARD JESTON, Esq., HENLEY-ON-THAMES.

I HAVE found by experience my plan for the management of Bees, and mode of taking their superfluous honey without destroying the parent hive, fully to succeed. In a Bee country it will afford the cottager a very ample return for his trouble, and not require so much watching as the old plan; for the older the hive is, the less chance there will be of swarming, but the greater chance of a larger deposit of honey. I have kept Bees more than 20 years; have tried Huish's, Nutt's, and various other plans, but the one suggested by the industrious insect itself I have found to be the most simple, cheap, and successful, and will not cost the cottager more than 6d. to adopt in addition to his old hives.

Some years ago I placed an empty butter-tub under the board on which the hive rested; the sun cracked the board and the Bees took possession of the tub, and after filling their own hive deposited 26lbs. of honey and comb in the tub. This I took for my own use, leaving their hive full of honey for their winter's consumption. By improving upon this simple plan I have carried off the prizes for honey, at the Henley Horticultural Society for the last four years. A board half an inch in thickness, 18 inches in width, and perforated with two holes, each half an inch in diameter, is placed between the hive and the butter-tub: when the hive of Bees is placed on a stage in a Bee-house, the holes may be bored near the entrance of the hive, but under it without a second board; and the tub placed underneath must be closely cemented to the board, to prevent light or insects intervening. I find Bee-houses do not succeed so well as separate hives resting on tubs. When the tub of honey is taken away in August, my practice is to place the hive over a similar empty tub and board, leaving the holes open, which will save the Bees much labour, as they will deposit all their dead Bees in the tub during the winter months; therefore, the tub requires to be cleaned out in March, not later, as the Bees have a great dislike to any disturbance of their arrangements.

The tub must be securely cemented to the board with putty; any light penetrating the tub will prevent the Bees depositing their store in it; and I have found the common butter firkin, when dry and deprived of its wooden hoops, in the second year of use, not to succeed so well as at first, on account of the light being admitted between the staves. I last year (1841) took upwards of 40lbs. of honey in this way, although the season was so bad, and an ample supply of food was left for the Bees to subsist on during the winter. This plan will prove a good substitute for the "rear" used to enlarge the common hive, with this advantage, that a supply of honey can be obtained from the strong swarms as well as from the old hives. I have never been obliged to feed the Bees from which honey had been taken in the mode described.

There is little or no gorse or heath near Henley, and the character of the country is arable.—Published in the "Transactions of the Royal Agricultural Society" for 1842.

I have tried Mr. Jeston's plan with six hives and boxes, —old ones and swarms. In every tub taken in Sept. this year there was a large mass of comb; in two there had been honey, and in two there were altogether 6lbs. of honey,—these two were swarms, or casts, as late as 28th and 30th June. Of six hives, old and new, the weights on 3d September were from 26lbs. to 34lbs. I bored the two holes just so far within the entrance of the hive, that, when put over the firkin, the holes came just within the firkin. Each firkin was closely cemented with plaister of Paris—better than putty, as not liable to be gnawed by the Bees. I have cut a groove just broad enough to embrace both holes, into which I slip a thin piece of board; when I took the hive off in the morning of the taking, I pushed the piece of board home, and thus cut off the communication. The hives were lifted off with the bottom boards, and the few Bees in the firkins went home very soon. The combs were then taken off. Nothing can be more simple. The firkins have cost fourpence each. This year has been a bad one for Bees. I took the liberty of feeding each swarm for three or four days after it had swarmed,—wax was made immediately, as Huber suggested. I had seven swarms from three stocks, because I did not ventilate as I ought to do. I took the precaution of stopping the mouth of each hive on the taking morning, and when the tub was removed I opened the hive-door. The *Symphoria racemosa* is the greatest source of Bee-food that I ever saw, more so almost than Dutch Clover; the Raspberry is next in the class of shrubs.—Este.

AMATEUR'S GARDEN.—No. XLVII.

This to many will appear a curious time of the year to talk of commencing the growth of any plant, but nevertheless it is the right time, for those who are desirous of producing unusually large specimens of Fuchsias, to go to work. The Fuchsia, unlike most other plants, does not luxuriate under powerful light; on the contrary, it grows with great exuberance in dull weather, but requires the assistance of powerful sun-light to enable it to mature its flowers. Thus if you take a small plant in January or February, and encourage it properly, you may have it from three to six feet high by the 1st of May; but if you take a similar sized plant in May, and nurse it with all the care imaginable, you will experience considerable difficulty in growing it to six feet by the 1st of November, or double the space of time; and why is this? The answer to this question embodies the whole of the secret of Fuchsia management, and here it is:—In the winter and

early spring months the Fuchsia grows vigorously, if properly stimulated by heat and moisture, because it has no disposition to produce flowers; but so soon as the sun has sufficient power to thoroughly elaborate the juices of the plant, then it becomes organisable, growth in a great measure ceases, and the sap is expanded in the production of flowers.

The Fuchsia may be induced to bloom earlier than June, but this can only be effected by unnatural treatment, such as checking its growth, confining it in a small pot, stinting it for water, and keeping it in a dry atmosphere. Old plants not cut down, will generally bloom better than young plants in the early part of the year; but old plants rarely make handsome specimens, unless they are cut down to the surface of the pots; they will then break away with great strength, and form beautiful pyramidal plants. A Fuchsia, to be fit for exhibition, should be at least four feet high, regularly branched from the pot upwards, and forming a cone of verdure and blossom.

Now, to have them of this size, it is only necessary to commence at the present time, either by cutting down old plants or starting young ones. Keep them gently growing through the winter in a little moist heat, and stimulate them as much as possible when the days begin to lengthen. The soil which I generally use is rough turfy peat, with a small quantity of leaf-mould and loam, and a sprinkling of silver-sand. Young plants that are well rooted, may be removed from small 60s into 24-sized pots at this season, and from them into 8, 4, or 2 sized ones, in February; but after the commencement of the new year, they may be put into the large pots at once.

Among the new kinds that are to come out next season, there are, doubtless, some varieties of great beauty; but we must not be surprised if many that have been highly spoken of, from the inspection of single flowers, turn out comparatively worthless. *F. exoniensis*, as exhibited on the plant at Chiswick this season is, in my estimation, objectionable, because the habit is bad; but off the plant it is the finest Fuchsia in existence. Mr. Standish, of Bagshot, exhibited some beautiful kinds at the Horticultural Society's Rooms, in Regent-street, during summer, which were especially remarkable for the large size and excellent colour of the corolla, and for very robust habit. They were called Colossus, Antagonist, and Conductor, and ought to be added to every collection, if only to breed from. Mr. Epps, of Maidstone, has also several good seedlings; one in the way of *formosa elegans*, but of much better habit, and called Kentish Bride, and another called *Espartero*, as large as *F. Eppsi*, with an excellent purple corolla. Mr. E. has also another of the colour of *Chandlerii*, but nearly double the size, and of upright habit. All these kinds I have seen blooming on the plants, and therefore know them to be good; but of those seedlings of which I have only seen the flowers I say nothing.—W. P. Ayres, Brooklands.

HOME CORRESPONDENCE.

Salted Mangel Wurzel Leaves.—I have just met with the following passage in a work which I saw advertised in your columns, "The Economy of Farming," translated from the German of Professor Burger, which seems to explain the process; and I therefore send it, thinking it may interest your Agricultural readers:—"The peasants of Swabia also preserve the leaves of Cabbage, Beet, and of other roots, for feeding their cattle. After throwing them into boiling-water, they heap them up in deep casks five or six feet square, fixed on posts. Every eighth day they add new layers of leaves, which they take care to salt. The whole then becomes sour, and when preserved for winter use it forms excellent food."—Anthony.

Allotments.—Having seen Mr. Trimmer's statements in the "Highland Agricultural Society's Quarterly Journal" for October, 1843, that ten acres is the minimum quantity of land on which a family could support itself, I take the liberty of saying that I have for nearly four years on the side of the south downs in the parish of Willingdon, near Eastbourne, Sussex, supported my wife and four children in comfort on five acres only, with the help of the little boys to whom I teach reading, writing, and accounts, collects and catechism, for three hours before noon, in return for three hours' work on my land in the afternoon five days a week; they average only eight years of age, and if I was able bodied I should not need their help. I here state what a man would want to begin with:—

1st. Two Cows at 9l. per cow	18 0 0
One young sow	1 5 0
Seed-wheat, 6 bushels, at 7s. per bushel	2 2 0
Seed-rye and Tares for one acre to stall-feed the cows	1 10 0
Clover-seed for one acre of Wheat	0 10 0
Seed-potatoes for one acre	1 5 0
Seed-oats for half-acre	0 7 0
Sweet Turnip and Mangel-seed for half-acre	0 2 0
Fifteen pounds for the man to subsist upon till his cows come on	15 0 0
	£40 1 0

—George Cruttenden, Master of the Willingdon School. A Self-supported Agricultural School, of which further particulars are printed in the "Farmer's Almanac" for 1844.

I should feel obliged by your inserting the foregoing letter in your columns, as it is obviously desirable that in different soils it should be ascertained how many acres will maintain a family by spade husbandry, stall-feed of cows, &c. On Beachey Head, in the parish of East Dean, I had let 10 acres each to two tenants; but finding 10 acres were beyond their strength to cultivate well, last year, to serve them, I reduced each allotment to five acres, and one of the tenants, T. French, told Mr. Madge, the paid master of the Forthampton school, last summer, that he would not give up his five acres, for which he pays me 1l. an acre (including rates, tithes, and taxes) a year

Mildew.—In order to show that there are doubts respecting the real cause of Mildew, I offer the following observations:—Supposing six practical gardeners were asked the reason why their Peach-trees were mildewed, they would most probably all assign it to different causes. The 1st is aware that his trees are in a damp situation; hence arises the Mildew. The 2d, that his soil is light and dry, and this he thinks favours the disease. The 3d remarks that Mildew is a parasitical fungus, and that there is no getting clear of it. The 4th, that it proceeds from a fungus on the roots of the trees, and that the only remedy is to renovate the soil. The 5th contends that Mildew is a kind of itch, similar to that in animals, and that sulphur is the only cure for it. The 6th says, hesitatingly, having seen the effects of Mildew on trees in all kinds of soil and situation, that he is at a loss to account for the cause of it, or to prescribe any certain cure. It may be observed that, if what I stated respecting the power of the Barberry to blight Corn be only a mildewed opinion, perhaps some one who knows more of Mildew than myself will explain the reason why that shrub is blamed for having such an evil influence upon Corn.—*J. Wighton.*

A Weasel Sportsman.—A covey of partridges rose, six in number, in a field near Newby Bridge, and when they were about three feet from the ground, a weasel was observed to spring up from the grass and fetch one of them down, and the observer immediately made to the spot, and found this new sportsman in the act of tearing the bird's head off; but being so early detected, retreated in quick time, leaving the dead bird, as a prize to the observer.—*Facile.*

Capture of a Hawk.—A fine specimen of that rare bird, the Merlin (*Falco Esalon*), was caught a few days ago in the river Lune, near Overton, by Richard Thompson, a fisherman, who, on going to examine his nets at low water, found the Hawk entangled in the net. It is supposed that he had been in pursuit of a sand-pipe, which had taken refuge beneath the nets, and, in his haste to pounce upon his prey, overlooked the obstruction between them. His native ferocity continues unabated, he disdains raw flesh or dead birds; but, if a living one be placed within his reach, he darts upon it with unerring aim, kills it by a single blow on the head with his small but powerful beak, and devours it at his leisure. The Merlin is the least of the falcon tribe; it flies with celerity and ease, and although so diminutive as scarcely to exceed a thrush or blackbird in size, is so courageous that it will not hesitate to attack a full-grown quail or partridge, which it kills with a single stroke. In the days of falconry the Merlin was considered the ladies' bird.—*Facile.*

Heating Apparatus.—This construction fully answers the purpose for which it was intended, viz., the forcing of Dahlias, the striking of cuttings, and raising of plants from seed, towards the commencement of April. If you force much earlier than that time, you must deviate from my plan, by making the smoke and hot air to return in the frame, and enter the chimney somewhere near the point of starting; so that less heat may be lost, and a higher temperature gained, than in an erection like mine. I have found the temperature to differ only ten degrees from that of the open air; my walls are not built below the surface of the ground, and I am inclined to think that a building above ground is preferable to one below, both for keeping plants through winter, and preventing the heat from being conducted outside, and consequently lost. The inclosed section is, I think, an improvement on the one given at p. 428. This plan is on the same principle as the hothouse flues are now; and I am rather surprised that the thing should not have been adopted years ago, as it may be done at so trifling an expense. Fig. 1, is the ground plan, showing

Fig. 1.

Fig. 2.

ing the partitions in the inside to retain the heat in the apparatus, as pointed out above; and it also points out that there may be a grate, so that it may be heated either by turf or coal. Fig. 2, is a section showing that the flues rise one above another, which I think is better than all upon one level.—*M. Saul.*

PROCEEDINGS OF SOCIETIES.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

Nov. 15.—A weekly Council was held at the Society's House in Hanover-square.—T. R. Barker, Esq., in the chair. The Earl of Leicester, of Holkham, Norfolk, was elected a Governor, and 46 gentlemen Members of the Society. Mr. Gibbs gave notice, that at the next Monthly or Special Council, he should move the adoption of additional Regulations for the Exhibition of Implements at the Country Meetings of the Society. Mr. Parkes, C.E., Consulting Engineer to the Society, communicated the following account of a Brazilian Grass:—"I send for presentation to the Society a bundle of Brazilian Grass, called 'Pissava' by the Portuguese. I am informed that it is purely an aquatic grass, growing under water or floating on water. I do not know its proper botanic name, but it is sometimes called Pissava Americana; nor do I know whether its habitation is confined to tropical climates. A considerable quantity of this product is annually imported into England; and is, I am informed, solely used at present for making brushes. As a brush, it is amazingly durable, and withstands the alternations of wetness and dryness better than any known substance. It has been selected by Mr. Whitworth as the sweeping medium of his admirable 'Street-cleaning Machine'; and he has informed me that his brushes of this vegetable will stand a year's daily rubbing on pavement and macadamized roads, wearing down to the 'bone' without decay or relaxation of effect. It turned out to be of such importance to the success of the machine, that Mr. Whitworth sent his brother to the Brazils, to collect and import a large quantity for

this special purpose. The strongest bundle is of the quality used for this machine, cut into lengths of about six inches, and fixed in wooden stocks. The bundle of slender grass, of which I beg the Society's acceptance, is such as is usually imported into London. Brushes are made of it chiefly for the use of butchers, no other being found which has equal endurance, or which penetrates and cleans so effectually the cracks and fissures in their blocks and slabs. The selling price in London is 14s. per ton. The commercial name for the article is 'boss,'—so, however, it is called by the brush-makers. Mr. Whitworth informed me that it may be imported and sold to a fair profit at 9s. per ton. The grass grows 30 feet in length. Its being so dry, from its woody fibrous nature, has led to the belief in England that it is kiln-dried, but Mr. Whitworth has informed me that such is not the fact—the tropical sun is a sufficient kiln!" Mr. Alcock presented a specimen of the Hopetoun Oat, grown by Mr. Shurref, on Lord Ducre's land, near Bristol, measuring 6 feet 10 inches in length, and the average of a crop of 70 acres.

LINNEAN SOCIETY.

November 22.—Edward Forster, Esq., in the Chair. D. W. Mitchell, Esq., was elected a Fellow. A specimen of a variety of *Campanula glomerata* was exhibited. Dr. Robert Dickson exhibited several specimens of Hunt's Flower Pots. A continuation of Mr. Griffith's paper on the Rhizanthæ was read. In conclusion the author criticised the position in which Blume and Endlicher had placed this portion of the Vegetable Kingdom. He came to the conclusion that there was not sufficient ground for the separation of these plants as a distinct class. That even as an artificial arrangement it was not warranted by utility, and that such a deviation from the ordinary principles of classification was unphilosophical. As an appendix to the paper, a description was given of a new genus of Rhizanthæ, called *Sabria*, which had been discovered by the author in his recent expedition to Assam. The genus *Sabria* holds a position between the genera *Brugmansia* and *Rafflesia*. The paper was illustrated by beautiful drawings of dissections of the only species of *Sabria*, the *S. Himalayana*. This plant was found parasitic on a species of *Cissus*, which is abundant in the Himalaya. In our last report we stated that some specimens of electrotyped plants were exhibited; we ought to have added that these had been prepared by Mr. Neville, of Birmingham.

NOTICES OF NEW PLANTS WHICH ARE EITHER USEFUL OR ORNAMENTAL.

DENDROBIUM AQUICUM. Watery Dendrobium. (*Orchidaceæ Epi-phyte.*) *Orchidaceæ.* *Gynandria Monandria.*—Among the crowd of Indian species belonging to this large genus, or group of genera, this plant seems to be hitherto unknown to the botanists of India. With the manner of growth of *D. Pierardi*, it is quite pale watery green flowers are destitute of the attractive colours of that gay species, and are entirely different in the structure of the lip, which is furnished with a large cavity, almost a pouch, at the base of the middle lobe. It is also a much stouter plant, with wavy leaves. This species may be grown in the same way as many other Dendrobiums, potted in rough turfy peat, well mixed with pieces of broken pots. For drainage, the pot should be nearly half filled with potsherds, and the soil elevated one-fourth the height of the pot above its brim. Being thus potted, too much water can scarcely be given during the growing season. The house should be slightly shaded in sunny weather, taking care to keep the temperature as near 80° by day as possible, and about 65° by night. In autumn, as the young shoots become matured, water should gradually be withheld, so that in winter the plant may only receive it in fine weather. The temperature may then be allowed to fall as low as 56° or 55°.—*Botanical Register.*

VISCARIA OULATA. Dark-eyed Viscaria. (*Hardy Annual.*) *Sileneacæ.* *Decandria Pentagynia.* This plant is so like the old hardy annual called *Agrostemma Cœli rosa*, that for some time we regarded it as a mere variety. But upon a more minute examination we find marks of difference that seem to belong to a species. In the first place it has a dark eye, which the old kind has not. Then its petals have a short and slightly emarginate appendage, and not a long bifid one. In the form of the calyx there is this difference, that in the plant before us it contracts suddenly about the middle, while in *Cœli rosa* it narrows very gradually. Furthermore, the surface of the seed-vessel here is rough, with fine granulations, but in *Cœli rosa* is smooth. It is, like the *Cœli rosa*, a hardy annual; it was gathered by Mr. Giles Manby on dry hills, thirty miles from Algiers, and given by him to Messrs. Backhouse, Nurserymen, York, to whom our specimens are owing. This pretty annual may be sown in any good rich garden-soil, in the open border, about the end of March, in the usual way. Afterwards the plants should be thinned so as to stand singly, in which state they flower longer and produce much larger and finer blossoms. It may also be sown in the autumn, remain in pots in a cold frame through the winter, and be planted out about April. It flowers a great part of the summer and autumn.—*Botanical Register.*

DUVAU LONGIFOLIA. Long-leaved Duvau. (*Hardy Evergreen Shrub.*) *Anacardiaceæ.* *Polygama Monœcia.*—The Duvau is a race of evergreen shrubs, smelling of turpentine, with small green flowers, a caustic juice, and considerable affinity to Rhus. We have now in our gardens the following species, viz., *D. dependens*, ovata, latifolia, this longifolia, and another or two undescribed and insufficiently examined. They all inhabit the southern temperate regions of South America, and are capable of living with us in the open air through ordinary winters, especially if placed in a north-western exposure. This species differs from *D. dependens* in its leaves not being at all serrated, and decidedly narrowed, not widened, to the base; and also in having very short corymbs of flowers. With the others it is not necessary to compare it. It is much harder than any of the others, having stood against an exposed wall in the hard winter 1837-8, when all the others were either killed down to the ground or entirely destroyed. It grows freely in any good garden-soil; flowers in June or July; and is increased by seeds, or by cuttings of the half-ripe wood taken off about August, and treated in the ordinary way. This plant was presented to the Horticultural Society some years ago by Mr. H. Low, of Clanton, who raised it from seeds received from Buenos Ayres.—*Botanical Register.*

BORONIA FRASERI. Mr. Fraser's Boronia. (*Greenhouse Shrub.*) *Rutaceæ.* *Octandria Monogynia.*—This is the *Boronia anemonefolia* of "Paxton's Magazine," and, as Sir William Hooker observes, is intended for the plant of that name published by Allan Cunningham; although, as is the custom with that work—which, it must be acknowledged, takes away much from its usefulness—no synonym, or reference, is given. The plant, however, is wholly at variance with the *B. anemonefolia* of A. Cunningham; nor does it appear to be a species taken up by any other author, but is unquestionably one of which I find specimens in my herbarium, from the late Mr. Charles Fraser, which that indefatigable botanist collected, and noted as "Boronia: a native of ravines on the banks of the Nepean River; its height three feet; observed in flower in September; rare." With us it grows freely in a common greenhouse, and is readily increased by cuttings; and its deep rose-coloured flowers are produced in the spring months.—*Curtis's Botanical Magazine.*

MISCELLANEOUS.

French Winter Gardens.—We learn that the good people of Paris have proposed to get up a company to raise twenty millions of frames, by shares, for the purpose of constructing a Winter Garden larger than the Palais Royal, which is to be covered in, heated, and decorated with the rarest flowers and plants.

Parchment Labels.—Some nurserymen use these without any preparation, writing on them with ink; others

slightly moisten the surface of the label and write with a black-lead pencil, or with ink; some, as Sir Thomas Frankland (see "Hort. Trans.") write with Indian ink instead of common ink; others again rub a little white paint on them, as is done in writing names on wooden tallies; but the mode at present considered most efficient is to rub the surface of the parchment with white lead mixed with a little red ochre, and write with a black-lead pencil. The writing thus made, Mr. Rivers informs us, is so durable, that he has seen the labels quite readable at the end of the second season, though exposed to the weather the whole of the time.—*Loudon's Gard. Mag.*

Statistics of Agriculture.—(From the "Census of England and Wales," 1843.)—Waste Land.—There are 3,450,000 acres of waste in England, and 530,000 acres in Wales, capable of improvement. Rent of Land.—The following table shows the average annual value of land, per statute acre, in England and Wales:—

ENGLAND.			ENGLAND.

Extraordinary Cabbage.—There was gathered a few days since a Cabbage, grown in the garden of John Lee, mason, at Pound, adjoining the town at Moretonhamstead, which weighed 42lbs.—*Exeter Flying Post.*

Ancient Oaks.—In the court-yard of a modern farmhouse, which stands a league and a half south-west of Saintes, in the department of the lower Charente, grows an Oak which is estimated to be from 1800 to 2000 years old, and is thought likely to stand some hundred years longer. The diameter at the ground is from 24 to 27 feet; at the height of a man, 18 to 21 feet. The expansion of the branches is from 112 to 120 feet; the height of the tree is 60 feet. A room has been built out of the dead wood, from 9 to 12 feet wide, and 9 feet high.—*Annals of the Agricultural Society in Auslande, No. 192.*

German Travellers.—Professor Charles Koch appears, from late intelligence, to have landed safely at Trebisond, with his companion Dr. Rosen, having left Constantinople on the 14th of July. The voyage across the Black Sea was not interrupted by bad weather, but the passengers were one night very near coming in contact with another steam-boat, the passengers in which appeared to be asleep; an accident was, however, prevented by backing the engine. The Pasha of Trebisond showed them much attention when he was informed of their intention of proceeding to Erzeroum. They thought of starting on the 25th of July, by the caravan-road, which is as much frequented as the high road between Frankfort and Leipsic.—*Botanische Zeitung.*

Dr. Bischoff.—Professor L. W. Theodor Bischoff, a talented physiologist, and well known as a botanist by his memoir "De Vasorum Plantarum Spiralem Structura," has been appointed Professor of Physiology in the Institute of Giessen.—*Botanische Zeitung.*

Ripe Strawberries, Apple and Pear Trees in Full Bloom, and Indian Corn.—Irish letters and newspapers speak of some remarkable cases of this sort. Apples in flower in the garden of Mrs. Baylee of West Grove, near Cork, Strawberries ripe, and Jargonelle Pears blooming and fruiting. Mr. Warren, of Warren's Grove, also mentions some fine growth of Indian Corn grown in the demesne garden of Creegh; length of cob nine inches, and containing 12 rows of grains, and 38 grains in each row. Some of the plants grew to the height of eight feet, and one plant had 15 cobs equal to the specimen sent. Mr. Weldon observes, that "The advantages which the Americans derive from this plant are too well known to need comment; and though they have the advantage of a hotter summer, yet to balance that we are enabled to sow the Corn much earlier than they can in the season, as it will not bear the slightest frost. I mean to sow some of the seed saved this year next season. By thus proceeding, if the seed ripens for one or two seasons successively, it might in a short time be acclimated."

Singular Occurrence.—About six o'clock on the morning of Thursday se'nnight it was discovered that one of the largest and oldest Oak trees in Danbury Park, the seat of Mr. J. Round, M.P., was on fire. Assistance was soon afforded, and the tree was saved from total destruction, but the interior touchwood was wholly burnt out. The fire pouring through the various cavities which time had worn in the trunk presented a very curious and interesting appearance. We understand that "the brave old Oak" has not suffered any vital injury, but is likely to be rather benefited by the accident. It is highly valued by Mr. Round for its antiquity and picturesque form. No

positive cause can be assigned for this fire.—*Cambridge Advertiser.*

Guano.—The adulteration of guano is said to be carried on in this country to a dangerous and unwarrantable extent. One amongst the numerous methods by which the efficacy of this valuable manure is materially impaired is the admixture of stone ground into fine powder.—*Morning Paper.*

GARDEN MEMORANDA.

Chandler's Nursery, Vauxhall.—Chrysanthemums are particularly valuable on account of their flowering at this season of the year, when there is little else in bloom; without them the Conservatory or Greenhouse would now be comparatively dull and uninteresting. These within the last few years have made rapid advancement towards that perfection which constitutes a florist's flower, and every succeeding year adds something new to the list. The plants, however, we are sorry to say, are in many places not so well grown as could be wished. They are allowed to grow up tall and straggling, and soon become unsightly; this might be easily prevented, for if the tops of the young shoots were pinched or broken off, the buds below would be forced into growth, and thus the plants would acquire a dwarf bushy habit. If they were not allowed to get up much above 2 feet, or two feet and a half in height, and given plenty of pot room and water in order to prevent them from losing their foliage, they would no doubt continue to increase that interest which they have already excited. A fine bank of them is now in full bloom in a house at Messrs. Chandler and Son's Nursery, Vauxhall. The rich purple, yellow, and white flowers, here and there intermixed with brown and orange, make a gay and imposing effect. Amongst them were many new varieties, of which we shall mention the following: Horace, a rosy purple, with petals pretty regular, but shows the disk when fully expanded. Horatio, a bright rosy purple; the flowers are large and showy, flat, and stand well up, it is one of the best. Aristides, orange and brown, a very distinct variety; the flowers never show the disk, and are large and showy. Julius Cæsar has large dull crimson blossoms, but shows the eye when fully expanded. David is a bright yellow, with a dwarf bushy habit; the flowers are middle-sized; it is one of the best yellows, and a very prolific bloomer. In the same collection were also Malvina, very double, with large flat bright purple flowers. Bion is a fine white, tipped with purple. Bethulia, with very large curly purple blossoms. Abelard, quilled, light pink, and a very distinct variety. Itobata, considerably resembles Flechier, but is darker, and and is very pretty. Incomparable has large buff-coloured flowers, and Solon is a good yellow, something like David. Marechal de Crequi is purple, and flowers up the stem; it is very pretty. Lamarque is much in the way of Gouvan St. Cyr. Duchess de Montebello is a delicate pink, a little incurved, and is worthy of notice. Louis Philippe is purple, with a bluish shade, flat and double. Demosthenes is flat, and of a brown orange-colour. Among the older varieties we particularly noticed a plant of Defiance, covered with clear white incurved blossoms, which made a fine appearance among those of a darker colour. The pits were principally filled with young Camellias, which, from their finely-swelled flower-buds, indicated abundance of bloom. Those in the large Camellia-house were also covered with buds; their foliage was of a deep healthy green, and they will no doubt produce an interesting effect when in bloom.

Reviews.

Florists' Journal, Nos. XLVI., XLVII., XLVIII.
Adlard.

We have frequently thought, in looking over various Numbers of this little periodical, that some of the matters upon which it touches are not so generally useful as they might be, and may, indeed, be considered beyond the range of subjects expected from a publication of its nature. For instance, the space devoted to Orchidaceæ we consider to be so occupied, to the exclusion of subjects that come more immediately home to the greater number of subscribers. The work is, however, well conducted, and the articles sensibly written; the Numbers under review contain useful and interesting papers, supplied by experienced men. The embellishments are good.

Sertum Plantarum; or, Drawings and Descriptions of Rare or Undescribed Plants from the Author's Herbarium. By H. B. Fielding and George Gardner. Part I. 8vo. Baillière.

THIS is a work on the plan of Hooker's *Icones*, and, like that book, consists of black outlines of plants, executed in lithography, and accompanied by descriptive letter-press. It will be very acceptable to systematic Botanists, to whom such books have become indispensable, and we trust it will be continued beyond the four parts now announced. Mr. Fielding has a noble herbarium, and is a man of fortune; he has therefore all the means of rendering himself useful to the great mass of scientific men who are otherwise circumstanced, and we trust he will secure for himself a niche by the side of the Humboldts and Delesserts, who have in the same way so greatly contributed to the solid progress of Botany.

A Treatise on the Culture of the Pine Apple.

By Thomas Torbrun.

WHEN we say that the Author of this pamphlet demands 5s. for as much matter as occupies about two of our columns, the price of which is one farthing; that the book does not contain a single new view of the cultivation of the Pine; and that the directions it does contain are so confused as to be barely intelligible, we have stated quite as much as is called for by such a production.

CALENDAR OF OPERATIONS for the ensuing week.

Is it true that you can kill the White Scale on Pines in one night, as Mr. — tells me? &c. This query is by a good Pine-grower, who is about to add some new sorts to his stock, but is afraid to introduce them unless he is first satisfied that he can clean them, "as they are covered with scale." It will thus appear that some of our best gardeners are not aware of the simple process of cleaning the scale, &c. on the Pine; and I suppose for this reason: that they grow their plants so well that they are never troubled with insects on them; and seeing some of their less successful brethren always at war with these pests, and never altogether free from their attacks, they conclude there must be some difficulty, if not mystery, about the way of getting rid of them. This supposition is a very fruitful source of complicated recipes, and the more mysterious these recipes are made to appear, the more potent they are in the eyes of a certain class of readers. Now, when a good Pine-grower is in the position of my friend, and has to look over authorities for instructions about cleaning his plants, the chances are that he

gets puzzled before he can make a choice. I have already mentioned in this Calendar the most simple method of cleaning the Pine, and the least injurious to the plants. Indeed, the process is highly beneficial to the plants, whether they are affected with insects or not, and many Pine-growers to this day make use of it in the general management of their plants, without being aware of any deleterious agent, as was formerly the case with M'Phail, Balwin, and other practitioners, who made use of fermenting horse-dung to clean their Pines, believing that the strong moist heat from the dung was the agent of destruction. Mr. Knight says he cleaned Pines with clean water heated to 150°; and very likely the insects cannot stand either so much heat or cold as the plant; but this process (hot water) which is otherwise simple enough, involves the trouble of having the whole plant plunged to be effectually cured. There is nothing, however, so simple, or more effectual, than the ammoniacal gas from fermenting horse-dung, and the simplest way to use it is to have a spare place at the end of the pit inside, say the width of one of the sashes, to fill this nearly with the dung in a fermenting state, and to turn it once a day; it is not at all injurious to the Pine, rather the other way, but it is instant death to any other plant in leaf, and to soft-wooded plants also. Nothing is more congenial to the Vine when it is first forced than a medium temperature, kept up by fermenting horse-dung, and no doubt the ammoniacal gas evolved in the process is equally beneficial in killing any insects that may be on the Vine. Sir Humphrey Davy says this gas is instant death to all insects whatever; and this may be true when rightly applied; but that from horse-dung or from short Grass, which is still more oppressive to our feelings, is not the least injurious to the woodlice in the strongest doses we can apply. Tobacco-smoke kills the green-fly, sulphur the red spider, and ammoniacal gas the scale on the Pine-apple; and it is the opinion of scientific men and of practitioners too, that some gas, smoke, or vapour will ultimately be found to be the true and easiest way of getting rid of all insects whatever, and here is a field for the experimental chemist. Frost is also an active agent in the destruction of exotic or tropical insects on half-hardy plants. I once bought a quantity of fine large plants of *Acacia armata* for a mere trifle, because they were so fully covered with a dry white scale that the owner could not trust them among his other plants; they were thus in the best possible state for my experiment. I placed them behind a high wall, and left them till they had two or three nights' frost of from 5° to 7°; the last frost pinched their young wood very much, and I had to cut back some of the young shoots. Every one of the scale insects were destroyed in this experiment, for I had the plants quite clean for some years afterwards. I have also cancelled many others in the same way, and I have found that *Gardena radicans* and *Florida*, with the common Nerium, will stand 7° of frost with impunity, if their wood is ripe, and I have no doubt a great many kinds of greenhouse plants might easily be cleared of these insects at this season by exposing them to similar trials.

I.—KITCHEN-GARDEN AND ORCHARD.

In-door Department.

PINERY.—The recent accounts of heavy Pines have attracted so much notice, and the ready means of procuring a steady bottom-heat for them by the tank-system holds out such a great inducement to new beginners, that we find a general stir all over the country in the direction of Pine-growing, and, as if to meet a sudden demand for information on their culture, we have two forthcoming books advertised for this purpose. A gentleman connected with the fruit-trade tells me that Suffolk was never noted for Pine-growing; but he thinks, from preparations now in progress, we shall some day be as celebrated for our fine Pines as we now are for our success with Cucumbers. He also told me of a successful attempt to put up a tank for Pines after some plan in the *Chronicle*, but could not give me any particulars; will some reader be good enough to give me these particulars, that I may make use of them in this Calendar, without referring to names, of course? Any accounts of this sort will be as suitable for my purpose, and as useful to the public, as anything I can say on Pine culture in winter.

VINERY.—This is about the usual time to begin to force the earliest house; a week or so, however, earlier or later, does not make much difference. Next week I hope to be able to advance some new and very interesting ideas on early forcing Grapes; I only want a link or two, which I expect by every post. If any scale or mealy-bugs have got hold of the Vines this is the best time to get rid of them, by the good old method of steaming the house with fresh horse-dung, to which I have alluded above. At page 74 of the "Gardener's Almanack," for next year, Mr. Johnson very properly cautions his readers against the deleterious effect of the salts of ammonia, "for they are most powerful agents, and capable of being destructive as well as salutary." This new Almanack is by far the most scientific, the most useful, and the cheapest that ever has been published. Regarding late Grapes, all I shall say this week is, that I have planted three reputed varieties of the Black St. Peter, the best of all winter Grapes, and as soon as I prove them I shall make known the difference, if any.

FRUIT-HOUSE.—Where one house only is devoted to forcing Peaches, it is yet too soon to begin to force it, as the crop would be over some time before those on the open wall would be ready for succession, if that is any great object. To have them by the middle of May, it is best to begin them about this time, or next week, as you will have more time to bring them on very gently; of course there need be no fires for the first fortnight, only the house kept close, with air in the middle of the day, if the sun is out strong; but some gardeners keep them quite close till they perceive the buds beginning to swell, and probably this is as good as giving air at this stage. Some sort of covering should be placed over the border to throw off the wet; and those roots inside would be much benefited by tepid water, and to have the surface of the borders stirred up with a fork.

ASPARAGUS, SEAKALE, AND RHUBARB.—The only thing necessary to remind you here is to have beds of these in readiness to succeed those now in use, and never to apply strong heat to them.

Out-door Department.

If you have any more Cauliflowers or Cape Broccoli, if only three or four inches round, turn them into a cold pit, placing their roots in some light rich soil; they will swell off and come in very useful in the dead of winter, and you can always throw some straw or other additional covering over them, in hard frosty weather. How do you preserve your Strawberry plants in pots through the winter? You recollect, of course, what has been said lately in a leading article respecting their roots being so much injured by frost, and rest assured this is the cause of nine-tenths of the failures you read about. If nothing better offers have the pots plunged in a dry border, ready to have straw or some other dry covering laid over them in frosty weather.

FIGS AND VINES IN POTS.—You almost always see some of these lying out in winter, behind walls, &c., quite exposed; but their roots in confinement are easily injured by frost, and so also those of the Oak or Ash would be under the same treatment, but it is impossible to find room in pots for all these things in winter; something, however, may surely be done for them, if only to turn them out of the pots and plunge their balls in rotten tan, peat, or indeed in any light, sandy soil, with some leaves or straw thrown over the whole.

II.—FLOWER-GARDEN AND SHRUBBERY.

In-door Department.

STOVE.—For the next six weeks, at least if the thermometer stands above 55° in the morning, you are safe enough with a general collection of stove plants. Mr. Johnson has some excellent remarks in his Almanack on the subject of night temperature, derived from his own experience in India, which coincide with the views advocated by the *Chronicle*, and very much at variance with ancient practice. Another very great benefit derived from low temperature in the dead of winter is the small quantity of water which will suffice for the plants at this time.

GREENHOUSE.—If the plants are all clean, the work here is mere routine. See that Cape bulbs, as we call the Iridaceæ, are now well supplied with water, if their pots are full of roots. The shoots of the different winter-growing Tropæolums will also require attention to training, otherwise they are very liable to get confused, if not broken altogether. Tropæolum pentaphyllum, as mentioned last week by Mr. Brander, of Dalry, is, indeed, hardly enough for any part of this island; it stood out here the hard winter of 1840-41, without any protection, and we are more exposed here than they are about Forres and the banks of the Firth of Forth; but what is more curious, the *Gesnera Douglasii* has stood out without protection since 1836, at the end of a stove, in a clay subsoil, in Herefordshire.

CONSERVATORY.—As soon as the Chrysanthemums begin to fade cut them down and protect the stools from frost. I hardly hear anything now about that most splendid new conservatory climber, the *Echites splendens*, exhibited by Mr. Veitch, the summer before last, at Chiswick. When I first saw it, at a distance, I mistook it for a gorgeous new Orchidaceæ. I believe these *Echites* will inarch on the Beaumontia, which is a much stronger plant. My experiment promises well as yet, and I expect next year to get that other princely climber the *Clerodendron splendens* to do in our conservatory, having marched it on a strong plant of the old *C. fragrans*, on which it grew three or four yards this autumn, and is now beginning to bloom, with hundreds of flower-buds on it. The *Mandevilla suaveolens* did not flower, after all, against our conservatory wall; but it was too young, it seems, to be as hardy as the old blue Passion-flower, or rather its seedlings.—*D. Beaton, Shrubland Park Gardens, Ipswich.*

State of the Weather near London for the week ending Nov. 23, 1843, as observed at the Horticultural Garden, Chiswick.

Nov.		BAROMETER.		THERMOMETER.				Wind.	Rain.

The highest temperature occurred on the 28th, in 1838—thermometer 68°; and the lowest on the 23rd Nov. and 2d Dec., 1840—thermometer 22°.

REPORT ON COVENT-GARDEN MARKET.

For the Week ending Nov. 24, 1843.

THE supply of both Fruit and Vegetables has been well kept up during the week, but the market continues to be very dull, as is generally the case about this time of the year. Pines are plentiful, and of good quality; these consist of Queens, Black Antigua, Black Jamaica, Providence, and Enville. Among Grapes are some good Black Hamburgs, and there is also a good supply of Foreign Grapes in the market; these are selling at nearly the same prices as last week. Some excellent Ribstone Pippins have been supplied during the week, and likewise a few good specimens of Royal Russet, the latter is selling at from 3s. 6d. to 5s. 6d. per bushel. Good Pears consist chiefly of Beurré d'El, Beurré d'Anremberg, Guernsey (Chamontel), Chapman's Passe Colmar, and a few of the Giant Moreau. English and Dutch Melons have almost disappeared from the market, but Spanish ones are still brought in considerable quantities. We have seen very few Cucumbers in the market during the week. Cabbages and Broccoli of good quality are abundant. Turnips and Carrots are also good and sufficient to meet the demand. Brussels Sprouts are plentiful and good. Leeks and Onions are very abundant and excellent in quality, as are likewise Celery, Endive, and other salad. A few Cardoons have been brought to the market during the week, but are very small; they are selling at from 1s. to 1s. 6d. each. Cut Flowers chiefly consist of *Erica gracilis*, *acuminata longiflora*, *hymalis*, and *caffra*; *Lechea nautia formosa*, *Gardena radicans*, *Cypripedium insignis*, *Pimelea hispida*, *Chrysanthemums*, *Camellias*, *Pelargoniums*, *Primulas*, *Fuchsias*, *China* and *Perpetual Roses*.

PRICES, SATURDAY, November 25, 1843.—FRUITS:—

Pine Apple, per lb., 3s 6d to 4s	Red Capsicums, 4s to 5s
Grapes, per lb., 2s 6d to 3s	Almonds, per peck, 6s
Portugal, per lb., 6d to 1s 6d	Sweet Almonds, per lb., 2s 6d to 3s
Melons, Spanish, each, 1s 6d to 2s	Nuts, Spanish, per bushel, 10s
Apples, dessert, p. bush., 5s to 10s	Almonds, 16s
" Kitchen, p. bush., 3s to 7s	Hazels, 3s to 4s
Pears, per half sieve, 2s to 12s	Barceloneta, 22s to 24s
Oranges, per dozen, 3d to 2s	Cob., 12s
" per 100, 3s to 15s	Chestnuts, per peck, 4s to 7s
Lemons, per doz., 1s to 2s	Filberts, English, p. 100lbs., 55s to 60s
" per 100, 6s to 14s	Barberries, per lb. sv., 2s to 4s
Pomegranates, per doz., 2s to 6s	Tomatoes, per lb. sv., 3s to 5s
Green Capsicums, per 100, 1s to 2s	

VEGETABLES.

Broccoli, per bundle, 6d to 1s 6d	Onions, Spanish, per doz., 1s 6d to 5s
Brussels' Sprouts, per lb. sv., 1s to 2s	" picking, p. lb. sv., 3s 6d to 4s 6d
Cabbages, per doz., 6d to 1s	Shallots, per lb., 5d to 6d
Greens, per doz., 1s 6d to 2s 6d	Chilis, per 100, 1s to 2s
Cauliflowers, per dozen, 1s to 4s	Lettuce, Cabb., p. score, 6d to 1s
Potatoes, per ton, 40s to 75s	" Cos, per score, 6d to 1s
" per cwt., 2s to 4s	Celery, per bun., 6d to 2s
" per bushel, 1s 6d to 2s 6d	Mushrooms, per pottle, 1s 6d to 2s
" Kidney, p. bush., 2s to 6d	Wallnuts, per bushel, shelled, 16s to 24s
Turnips, per doz. bunches, 1s to 2s	Small Salads, per punnet, 2s to 4s
Red Beet, per dozen, 6d to 1s	Watercress, per doz. sm. bun., 3d to 6d
Horae Radish, per bundle, 1s to 2s	Parsley, per doz. bunches, 1s 6d to 2s 6d
Radish, spring, p. doz. hands, 1s	Tarragon, per bun. 2d to 3d
Carrots, p. doz. bun., 2s to 5s	Fennel, per doz. bunches, 1s to 2s
Spinach, per sieve, 6d to 1s	Mint, per doz. bunches, 1s to 2s
Leeks, per doz. bun., 1s to 1s 6d	Margam, green, p. doz. bun. 1s 6d to 2s
Garlic, per lb., 6d to 1s	(herb), per punnet, 2d to 3d
Onions, Spring p. doz. bch., 2s to 3s	Salsify, per lb. ale, 1s to 1s 6d
" Large, per bushel, 2s to 3s	Scorzonera, per bundle, 1s to 1s 6d

Notices to Correspondents.

COMMUNICATIONS from the following CORRESPONDENTS are in type, and are only waiting till room can be found for them:—*B. Maund, Bromsgrove, J. Lh., Totty, P. Neill, J. Wighton, Atlas, A Practical Man, J. F. M'Ehroy, Peter Mackenzie, Tyro, and Facile.*

BOOKS.—*H. T. A. B.*—Parnell's "British Grasses" is the book for you.—*W. H.*—Mr. Selby's "British Forest Trees" is much the best work on Arboriculture, but it does not go far enough into details. "Billington on Planting" is very useful.—*J. Wood.*—Dix's Treatise on "Land Surveying" is cheap, and an excellent book for a beginner.—*B. K.*—We are not aware that there is any work, except Pfeiffer and Otto's, on Cacti, with coloured plates. That work is useful; such a publication would have no sale in this country. *Cereus setaceus* is a white-flowered Brazilian species. *Dyckia rariflora* is a pretty orange-flowered stove Bromeliaceous plant.

CABBAGES.—*W. J.*—Road-scrappings are recommended by some for preventing the clubbing of the roots of Cabbage-plants; but as your soil is of a light sandy nature, the adding any more of that material might prove injurious. A good dressing of marl, if it can be got, is equally effective in preventing the disease, and will at the same time improve your light sandy soil for almost every kind of vegetable. The disease has also been effectually cured by the following mixture, viz., 1 gallon of fresh soot, and 1 lb. of pounded saltpetre; mix them with water to the consistency of coal-tar, and dip the root of every plant in this before planting. "By this simple method," says a subscriber, "I have not got a single club-rooted plant in my garden, although many of them had begun to club in the seed-bed."

CELLARS.—*Villager.*—Cellars, if frost-proof, or capable of being made so, and dry, are very useful for gardening purposes. They will preserve Dahlias, Verbenas, Pelargoniums, and many other half-hardy things. Even Oranges and Myrtles may be kept in them in winter.

CRINUM LONGIFOLIUM.—*W. H. R.*—Your plant of *Crinum longifolium*, which has grown luxuriantly, but not flowered, has probably been too kindly treated. It is quite hardy, and blooms profusely when planted by the sides of ponds or wet ditches.

DECIDUOUS SHRUBS.—*An Amateur.*—The following hardy deciduous shrubs are showy, and form a succession of flowers: 1, *Amygdalus nana*, 2 feet high, deep rose; 2, *Cytisus purpureus*, 2 ft., light purple; 3, *Ceanothus americanus*, 2 to 3 ft., white; 4, *Prunus japonica*, 2 to 3 ft., rose; 5, *Daphne Mezereum* and varieties, 2 to 3 ft., pink and white; 6, *Pyrus japonica* and varieties, 3 to 4 ft., scarlet and blush; 7, *Ribes aureum*, 3 to 5 ft., yellow; 8, *R. sanguineum*, 3 to 5 ft., red; 9, *Spiraea bella*, 3 to 4 ft., crimson; 10, *S. grandiflora*, 3 to 4 ft., pink; 11, *Rhus cotinus*, 4 to 5 ft., greenish white; 12, *Deutzia scabra*, 3 to 5 ft., white; 13, *Hibiscus syriacus* and varieties, 3 to 5 ft., pink, white, &c.; 14, *Calycanthus floridus*, 3 to 4 ft., brown; 15, *Syringa Josikea*, 3 to 5 ft., purple; 16, *Viburnum dentatum*, 4 to 5 ft., white; 17, *Euconymus latifolius*, 4 to 5 ft., green, fruit handsome; *Coronilla Emerus*, 3 to 4 ft., yellow.

EDGING.—*W. H. R.*—The following plants are suitable for edgings to walks, viz., Thrifts, Daisies, Primulas, and Gentians. *Erica cinerea*, *carnea*, and *vulgaris* have also an enlivening effect when in bloom, and with a little dressing and attention may be kept dwarf and neat. The varieties of dwarf Thyme are likewise sometimes used for edgings. Sulphate of ammonia is not suitable for the purpose you mention.

FEEDING PIGS.—*Anthony.*—You ask why meal water fermented is so much more fattening than sweet meal. The process of digestion is in many points similar to that of fermentation; a great portion of the food has to be transformed into other substances before it can enter into the animal system; it is possible that in souping meal for pigs the process of digestion may be considerably facilitated, by the food being brought into a condition more favourable for undergoing the usual transformations effected in the stomach. There are a great many points connected with the philosophy of digestion which are very imperfectly understood. E.

FRUIT-TREES.—*Brighton.*—The following is a good selection for walls. *Peaches*: Acton Scot, Grosse Mignonne, Royal George, Noblesse, Royal Charlotte, Bellegarde, Barrington, and Late Admirable. *Nectarines*: Elrue, Violette Hâtive, Balgown, and Pitmaston Orange. *Plums*: Green Gage, Purple Gage, Royal Hâtive, Kirke's, and Coe's Golden Drop. *Cherries*: May Duke, Knight's Early Black, Elton, and Florence. *Apricots*: Large Early, Royal, and Moorpark. *Pears*: Jargonelle, Dunmore, Gansel's Bergamot, Marie Louise, Beurré Diel, Hacon's Incomparable, Glout Moreau, Passe Colmar, Winter Nelis, Easter Beurré, and Beurré Rance. With the exception of the Jargonelle and Gansel's Bergamot, the above-named Pears will be suitable for espaliers or dwarf standards, and in addition, the Seckel, Louise Bonne (of Jersey), Duchesse d'Angoulême, Thompson's Althorp Crassane, Knight's Mosarch, Beurré Bosc, and Ne Plus Meuris. *Apples* for dwarfs: Wormsley Pippin, Golden Reinette, Court of Wick, Ribstone Pippin, Margil, Reinette du Canada, Herefordshire Pearmain, Pearson's Plate, Scarlet Nonpareil, Boston Russet, Court-pendu Plat, and Sturmer Pippin. These are all first-rate sorts. For further information, see the Advertisement of the Horticultural Society's Catalogue of Fruits. The Sturmer Pippin deserves the character given of it. As your ground is much exposed to wind, espaliers and dwarf standards will be preferable for Plums and Cherries, as well as Apples and Pears. *—Clericus Hibernicus.*—On your south wall you would have too many Peaches ripe at the same time. If you substitute a Bellegarde for the Grosse Mignonne, you have still one of the latter under the name of Kensington. A Violette Hâtive Nectarine may be substituted for the Fotheringham Plum, and a Royal Apricot for the Washington Plum. The Orleans Plums on the west aspect should be replaced by the Royale Hâtive, Reine Claude, Violette, and Kirke's; and the Red Magnum Bonum by the Washington, transferred from south aspect. Throw away the Swan's Egg Pear, and plant Hacon's Incomparable; also some of the latter on the north aspect wall, which may be then filled up with Morello Cherries and a Catillac Pear. Under the name of Blue Gage, you may perhaps have the Purple Gage, or Reine Claude Violette; but you ought to make sure of having the latter.

GLOXINIAS.—*Flora.*—Gloxinias are deciduous herbs, and consequently always die down after flowering; they are stove plants, and require a temperature above 55°. During winter they should be kept pretty dry, but water should not altogether be withheld from them, and when they commence growing in spring this may be liberally supplied.

GRAPES.—*E. D.*—We last week stated that there never was such a thing as a bunch of Black Hamburg Grapes weighing 8 lbs. A correspondent reminds us that Mr. Davis, gr. to Sir S. Clarke, obtained a medal in 1826, for a bunch weighing 8 lbs. 6 oz., exhibited to the Horticultural Society, at Chiswick, on the 9th of July. As far as we remember, that specimen, like one exhibited on a previous occasion by Mr. Dowding, was not, properly speaking, a bunch, but a monstrous cluster of two or three bunches growing from the same bud. It was the subject of discussion among the Judges at the time.

GRASS LAND.—*F. L.*—If the Couch occurs only in patches here and there in the field, it had better be dug out with the fork; if it occurs generally over the field, the only remedy is a thorough cultivation of the land next spring. Salt will have no effect upon Couch that it will not have in equal degree on the valuable Grasses beside it. The plan of "drilling good seed all over the field, and covering with compost, &c." is very well, provided the Couch be got rid of first, and provided the land be dry. The circumstance of a bad crop following the mowing of last season suggests the idea that the land is wet. J. C.

GREEN CROPS.—*Totty.*—Carrots and Mangold Wurtzel will both grow on clay soils, and these two roots are well suited as food for milch cows; they will not give the milk a disagreeable taste. We advise our Correspondent, as he has to provide food for horses as well as cows, to sow Carrots on three fifths of his plot, and Mangold Wurtzel on the remainder. J. C.

GYPNUM.—*Dean H.*—This should be applied in spring, during wet weather, sown broadcast, at the rate of about four bushels of the powder per acre; but it is not suited as a manure for Wheat. Nitrate of potash or soda, at the rate of one cwt. per acre, or soot, at the rate of 20 bushels per acre, would be a better manure for Wheat. Gypsum is applied beneficially in the above manner to Clovers. J. C.

HEATING.—*J. Waldron.*—Your plan is, no doubt, a good one; but it has the serious fault of being far too expensive.

INSECTS.—*Mr. J. Frost.*—Thanks for better specimens of the Celery leaves, which enable us to confirm our former opinion, that the disease is a minute fungus, and not an insect. R.

It is the fungus called *Puccinia Umbelliferarum*.—*B.*—The insects injuring the Dendrobium leaves are the larvae of a Thrips, a genus which has been described and figured in the *Gardeners' Chronicle*, vol. i, p. 228. R.

IRISES.—*Alquis.*—Six bulbous Irises, with different coloured flowers, may be—Apollo, violet and black; Blandina, white; Constance, blue and dark purple; Georgiana, lilac and white; Cassandra, blue and yellow; Daphne, olive and green, spotted. Six fibrous ones, with flowers of different colours, may be—Iris pallida, pale blue (very large); I. florentina, white; I. biflora, pink; I. De Burghii, brown and yellow (very fine); I. amona, purple and white; I. flavissima, bright yellow. ¶

KILNS.—*Semper idem* has our sincere thanks for his plan. **LARGE FRUIT.**—*J. S. G.*—We cannot insert anonymous statements respecting Pine-apples.

MANETTIA CORDIFOLIA.—*Perseverance.*—Your plant is *Manettia cordifolia*; it is a very pretty stove-plant, with brilliant scarlet flowers. It requires a soil consisting of peat, sand, and leaf-mould, or rotten dung, with the addition of a little loam.

MANURE.—*J. A.*—We would employ Potter's guano at the rate of 1 lb. per rod, applied in March, and the same quantity in April, and see the effect. It is an excellent manure for kitchen-garden purposes. Soot is a useful top-dressing for Grassland. *—Villager.*—Old mortar, plaster from internal walls, and plaster from floors, are excellent manure for stiff land; acting both mechanically and chemically.

NAMES OF FRUIT.—*Brighton.*—No. 1 is the Beurré Bosc; 2, Doyenné Gris. ¶ *J. D., Northumberland.*—1, 40, Louis Bonne of Jersey; 2, 27, Nelis d'Hiver; 3, Duchesse d'Angoulême; 4, Napoléon; 5, 13, Glout Moreau; 6, 16, Brown Beurré; 7, Beurré d'Aremberg; 8, 17, 20, 32, 33, 34, 35, 37, 41, Easter Beurré; 9, Doyenné Blanc; 10, 15, Bezi de la Motte; 11, 14, 24, 28, Beurré Diel; 18, Easter Bergamot; 19, Bezi Voet; 22, 25, Crassane; 23, 29, Chaumontel; 26, Passe Colmar; 30, Gansel's Bergamot; 31 appears to be Van Mons-Léon le Clerc; 36, Black Achan; 38, Swan's Egg; 39, Autumn Bergamot; 42, William's Bon Chrétien. No. 40, Louise Bonne (of Jersey), stated to have been grown on a Quince-stock against a south wall, is of deteriorated quality. ¶ *H. T. Croydon.*—Beurré Diel is correct; but Glout Moreau is Napoléon, and likewise your excellent De Coloma. The one named Hacon's Incomparable appears to be Gansel's Bergamot. ¶ *W. G. Urbaniste.*—*A Reader.*—1, Beauty of Kent; 2, Waltham Abbey Seedling; 3, Dumelow's Seedling; 4, Minchall Crab; 5, Winter Pearmain; 9, Alfriston; 10, Rymer; 11, Yorkshire Greening; 12, White Costin; 13, King of the Pippins; 16, Paradise Pippin; 17, Wheeler's Russet; 18, Nonpareil; 20, Red Streak; 21, Golden Reinette. *Pears*—1, Doyenné Blanc; 2, Gansel's Bergamot. ¶

NAMES OF PLANTS.—*J. Wood.*—Such specimens cannot be named without flowers. *—A. C.*—*Polypodium Phymatodes.*—*W. C.*—Fulham Oak. *—W. H. R.*—*Dioscorea bulbifera*, a species of Yam, the small bodies upon it are tubers. The other is some worthless weed with which we are unacquainted in its present state.

OLEANDERS.—*A Subscriber.*—The cause of your Oleander, which has lately been removed from a greenhouse into a drawing-room, having prematurely dropped its expanded blooms and flower-buds, is probably owing to cold or to its not having had a sufficient supply of water.

PAWLOVIA IMPERIALIS.—*J. J. W.*—In Japan this is said to grow to the height of about 30 feet. It appears to be perfectly hardy. At the Garden of Plants, of Paris, it has already produced ripe seeds, and out of 100 which were sown in January, 1843, 75 were up in 10 days afterwards.

PYRUS SPETABILIS.—Take the plant of *Pyrus spectabilis* carefully up, and wash all the soil from its roots, and replant it in fresh soil; it will thrive best on the common Crab-stock. ¶

RHODOENDRONS.—*An Amateur.*—The more recently-raised hybrid Rhododendrons are for the most part known by either letters or numbers, such as C's hybrid, No. 10, or D's hybrid, E's, &c., they being too numerous and too much alike to give names to. The following are very good free bloomers, and are tolerably hardy, and easily procured by name:—1, Russellianum, scarlet; 2, Lowii, pale straw, with brown; 3, tigrinum, pale rose, with dark brown; 4, Nobleman, dark red; 5, Smith's Yellow, pale yellow; 6, Smith's Buff, pale buff; 7, Splendium (Cunningham's), white; 8, Altacrose, scarlet; 9, Multumaculatum, pale rose spotted; 10, Arboreum roscum, bright rose; 11, Victoria, deep red; 12, Venustum, pink; 13, Augustum, pale flesh, spotted; 14, Polcherrimum, scarlet; 15, Grandiflorum (Cunningham's), pale flesh; 16, Macranthum, rose; 17, Knightii, scarlet; 18, Carnarvonianum, bright rose. ¶ Although August or September is a good time for grafting Rhododendrons in the open air, that operation may also be performed with advantage in spring; but if the scions are already taken off the plants, it will be advisable to graft them at once. If the stocks do not much exceed the scions in thickness, wedge-grafting will answer best; but if they are strong, side-grafting may be practised; and after the scions are put on, the plants should be placed in a close frame or pit, and should have a little bottom-heat in order to set the sap in motion.

SEEDLING PELARGONIUMS.—*A Friend of Truth* has had his question answered, and we can admit no further correspondence on the subject. If he wishes for more discussion he must have recourse to our advertising columns.

STALL-FEEDING.—*Lapis.*—There is a useful chapter on the practice of Stall-feeding in Professor Low's work on "Practical Agriculture;" there is also a good article on this subject in Hillyard's "Practical Farming and Grazing," which is a cheaper work. J. C.

SUGAR.—*Veritas.*—Consult the "Penny Cyclopædia," article—Beet.

THE BREAD-FRUIT TREE.—*F. H. S.*—There is not the smallest probability of this plant living even in the mildest part of Great Britain. We do not know what variety of Banana is cultivated in Tenerife. The Retama, or *Cytisus nubiligenus*, may be had of some of the London nurserymen. *Cytisus filipes* is almost the same thing.

TROPEOLUM PENTAPHYLLUM.—*A Subscriber.*—*Tropeolum pentaphyllum* has proved to be sufficiently hardy to stand the winter.

VINE-BORDERS.—*D. G.*—The soil most suitable for a Vine-border is the surface-spit from a field of good loam that has been long in pasture; this should be collected for some time before it is put into the border, and mixed with a good proportion of pure cow-dung, and the whole should then be turned over at intervals, three or four times, and duly exposed to the action of the weather. In preparing the border, the old mould should be cleared away from the whole space, to the depth of about 2 ft. If there has not been previously, a main drain should be cut parallel with the house, at the extremity of the border. This should be somewhat lower than the bottom of the border, which should be laid with concrete (that is previously unslacked lime mixed with rough gravel and water, to the consistency of thick mortar), about four inches deep, and the bottom of the border should have a gentle inclination from the house to the drain. As it is important to remove all superfluous water from the roots, small drains may be formed by placing drain-tiles on the concrete at convenient distances, to run in a slanting direction from the house to the main drain. These will carry off immediately all unnecessary water from above; the concrete will prevent subterranean damp, and thus the bottom of the border will be kept quite dry. A few turves should be laid over the tile-drains with the grassy sides down; the fresh soil may now be filled in, taking care to keep the roughest part nearest the bottom, and the work is finished. The young Vines may be planted in spring, and under favourable treatment shall have reached the top of the house by autumn. The temperature of the house now filled with Pelargoniums and other greenhouse plants need never exceed 45° of heat during winter.

WORMS.—*Capt. S.*—You may get rid of these animals from your lawn by watering it with weak gas-water, or lime-water, or a

weak solution of corrosive sublimate. Nothing kills Moss on gravel better than gas-water, except frequent hoeing.

MISCELLANEOUS.—*A Farmer and Gardener's* kind suggestions have already been anticipated, as he will see by an announcement in a few weeks. *—A Well-wisher.*—The subscription, if paid in advance, is 26s. per annum. *—Persis* will find a list of showy flowering shrubs suitable for filling up a corner in her flower-garden given above. *—A Subscriber* should ask an auctioneer. We, however, have no doubt that the duty is payable; at least, it ought to be. *—Alcombe.*—Thanks for the hint. *—Horticultor* has been deceived by the Nurseryman.

SEEDLING FLORISTS' FLOWERS.

FUCHSIAS.—*H. C.*—Your seedling was so crushed and dried up, that neither form nor colour could be determined; you cannot depend upon their travelling safely in a letter, without the protection of a box. *—J. Jones.*—*Rival*, long rosy tube, with very short and sharp petals, tipped with green, corolla red; the proportion of this flower is not agreeable, and it must be an abundant bloomer to make it acceptable. *—Bellissima* is a delicate and pretty variety of moderate size, tube light, pink sepals tipped with green, and expanding freely, showing a well-formed corolla of a deep rose-colour, which forms a good contrast to the other parts of the flower; it appears to be of a good habit, blooming freely.

PANSIES.—*C. Judd.*—Your seedling is a pretty flower, of good substance, but rather small; the shield in the centre is small and wants clearness; the points of the eye running into the broad margin of mulberry colour, gives it a bluish character, and what little of the ground-colour is perceptible in the lower petals differs too much.

As usual, a host of letters has arrived too late for answers this week.

ERRATUM.—P. 809, column b, line 48, for "deduced figure" read "reduced."

NEWS OF THE WEEK.

AFTER numerous delays the State prosecutions in Ireland are beginning to approach their crisis. On Monday the traversers joined issue to the demurrer of the Attorney-General, and after a long argument, conducted, as the Court admitted, with great ability and moderation on both sides, the Judges unanimously decided that the plea of abatement was insufficient, and that the demurrer should be held good. Another argument then arose on the time to be allowed the traversers to answer to the indictment, the Attorney-General insisting that they were bound to plead immediately, and the traversers endeavouring to obtain a further delay of four days for the purpose. The Court, however, decided in favour of the Crown, in consequence of which all the parties were called upon their recognizances. They all appeared in person and pleaded Not Guilty, and it was arranged that the Court at yesterday's sitting should name a day for the trial.

From France we learn that the visit of the Duc de Bordeaux to this country continues to excite much unassisted in the Court circles, and that the visit of the Duc de Nemours is condemned with equal animosity in the Opposition journals. The quarrel between the Clergy and the University is still the leading subject of discussion, and public attention is excited by the proposed dotation for the Duc de Nemours and by the anticipated debate on the fortifications in the approaching Session of the Chambers. From Spain we have a detailed account of the proceedings which followed the declaration of the Queen's majority. Her Majesty appears to have been received with great enthusiasm and to have manifested a self-possession and a dignity which was scarcely expected from her years. The Cortes have passed a vote of confidence in the Provisional Government, but a change of Ministry is nevertheless resolved upon, and S. Olozaga is said to have undertaken the formation of the new Cabinet. The accounts from Galicia and Catalonia continue favourable; Vigo has made its submission without conditions; Barcelona also has capitulated, and there is no doubt that the insurrection is gradually expiring. The accounts from Italy are by no means satisfactory; fresh arrests have been made in Romagna, and the people are represented as being in a state of great excitement. Disturbances are said to have broken out in Naples and in Calabria, and the sudden despatch of reinforcements to Sicily proves that apprehensions are entertained for the tranquillity of that island. From the United States we learn that the Elections are still the topic of the day, and from Mexico that the insult offered by the President to the British Minister has called forth the marked reprobation of the Home Government, and that Lord Aberdeen intends to despatch a squadron to demand an apology for the affront.

Home News.

COURT.—On Saturday her Majesty and Prince Albert took their accustomed morning walk, and after breakfast proceeded with the Duc and Duchesse de Nemours to Datchet Common, the place of meeting of the Prince's harriers. Her Majesty and the Duchesse de Nemours rode in a pony phaeton. A brace of hares were found and killed after two good runs in the neighbourhood of Horton. The sport was witnessed by her Majesty and the Duchesse de Nemours as they rode in their carriage. On Sunday morning her Majesty and Prince Albert took their usual walking exercise. Her Majesty and his Royal Highness and the whole Court attended divine service within the Castle. The Duc and Duchesse de Nemours attended mass at the Catholic Chapel at Clewer. In the afternoon her Majesty and the Duchesse de Nemours rode out in an open carriage, accompanied by Prince Albert and the Duc de Nemours on horseback. On Monday after her Majesty's usual walk, Prince Albert and the Duc de Nemours shot

over the royal preserves, and in the afternoon the Queen and Prince Albert took a walk on the terrace and in the slopes.—On Tuesday the Queen did not leave the Castle in consequence of the unfavourable state of the weather. Prince Albert and the Duc de Nemours hunted with her Majesty's stag hounds in the morning. The Princess Royal having this day completed her third year, her birthday was celebrated at Windsor with the ringing of bells, firing of cannon and other rejoicings.—On Wednesday morning the Duc de Nemours attended by his suite left the Castle for Melton Mowbray in order to witness fox-hunting in Leicestershire, from which His Royal Highness returned yesterday. Her Majesty and Prince Albert accompanied by the Duchesse de Nemours took their usual morning and afternoon promenade on the terrace and in the slopes and grounds around the Castle. The Princess Royal and the Princess Alice were taken their customary walk in the precincts of the Castle, and the Prince of Wales was taken a carriage airing.—On Thursday her Majesty and Prince Albert, accompanied by the Duchesse de Nemours, took their customary walk in the neighbourhood of the Castle.—The Duc and Duchesse de Nemours are expected to leave Windsor this day for Buckingham Palace, where they will sleep to-night, and embark either to-morrow or on Monday for the Continent. Preparations are now in progress for her Majesty's visit to the Midland Counties. According to the last arrangements, it is said that her Majesty will leave the Castle at 9 o'clock on Tuesday morning, for Slough, and from thence to Uxbridge, where relays of horses will be stationed to proceed onwards through Rickmansworth to Watford. At that station, on the London and Birmingham line of railway a special train will be in readiness to convey her Majesty and the Prince to the Tamworth station, which is within two or three miles of the seat of Sir Robert Peel. The Queen is expected to reach Watford in about two hours from the period of departing from the Castle, the distance being nineteen miles, ten miles to Uxbridge, and nine miles thence to the Watford station. On Friday her Majesty is expected to take her departure from Drayton Manor, and proceed from the Tamworth station, by the Birmingham railway, to Chesterfield, and from thence to Chatsworth, on a visit to the Duke of Devonshire. On Monday, the 4th, the Queen will honour the Duke of Rutland with a visit at Belvoir Castle, and return to Windsor Castle on the 7th. Her Majesty will be accompanied by Prince Albert, and the Queen Dowager has signified to Sir R. Peel her intention of joining the Royal party at Drayton Manor.—The Hon. Miss Liddell and the Hon. Miss Paget have succeeded the Hon. Miss Murray and the Hon. Miss Lister as maids of honour in waiting; Lady Portman has succeeded the Countess of Mount Edgecumbe as the lady in waiting; the Marquess of Ormonde has succeeded Lord Byron as the lord in waiting; and Admiral Sir R. Otway has succeeded Colonel Drummond as the groom in waiting on her Majesty.—The visitors at the Castle this week have been the Dukes of Buccleugh and Richmond, the Marquess of Exeter, Earls Devon, Rosslyn, Jersey, Ripon, and Lincoln, Lady Caroline Lennox, and Admiral Casey of the French navy.

The Duchess of Gloucester continues indisposed, although all her symptoms are better than they were at the close of last week. The last report of the physicians states that her Royal Highness is going on favourably.

The Duc de Bordeaux.—His Royal Highness and suite arrived at Hull on Friday last. From thence he proceeded to Burton Constable, on a visit to Sir Clifford and Lady Constable, where a large party of nobility and gentry were assembled to meet him. His Royal Highness left Burton Constable on Wednesday morning for York, and from thence proceeded to Newcastle. The Prince was expected to arrive at Alnwick yesterday on a visit to the Duke of Northumberland. According to present arrangements, his Royal Highness will be in London about the 27th or 28th. Sir John Shelley's mansion in Belgrave-square (lately in the occupation of the Duke of Marlborough), has been taken for the Prince during his Royal Highness's residence in London. The house, it is said, has been taken for three months certain.—The Vicomte de Chateaubriand and his Secretary the Marquis d'Espenel, with the Vicomte de Tocqueville, arrived in town on Thursday, and are staying at the York Hotel, Albemarle-street, for the present. M. de Chateaubriand is in excellent health.—M. Berryer left town on Wednesday for Oxford, having letters from the most distinguished personages to the heads of that University. M. Berryer returned to Mivart's Hotel on Thursday, and will remain in town until the arrival of his Royal Highness the Duc de Bordeaux.

Parliamentary Movements.—The nomination of candidates for the representation of Salisbury took place on Wednesday. The Hon. Mr. Bouverie and Mr. Campbell were proposed, and the show of hands was declared to be in favour of Mr. Bouverie. A poll was demanded on behalf of Mr. Campbell, which terminated on Thursday in favour of Mr. Campbell; the numbers being for Mr. Bouverie, 270; for Mr. Campbell, 317; majority for Mr. Campbell, 47.—A rumour has been in circulation for the last few days that Mr. Estcourt was about to resign the representation of the University of Oxford; and that Mr. W. E. Gladstone, the President of the Board of Trade, would be brought forward as his successor; but both statements have been contradicted on authority, Mr. Estcourt having neither resigned nor intended to resign.

The Irish Sheriffs.—The following are the names of gentlemen returned by the Judges of Assize to serve the office of High Sheriff for the ensuing year:—*Antrim.*—J. Leslie, J. McGilgowney, J. White, Esqrs. *Armagh.*—J. R. Irvine, M. Cross, T. M. Jones, Esqrs. *Carlow.*—R. La Touche, R. Doyne, jun., Esqrs.; Sir R. Paul, Bart.

Carrickfergus.—W. Burleigh, J. Legg, S. Dunn, Esqrs. *Cavan.*—Hon. S. R. Maxwell; Earl of Beective; Anthony O'Reilly, Esq. *Clare.*—E. Fitzgerald, W. Butler, H. P. Hickman, Esqrs. *Cork.*—Hon. H. St. Leger; J. H. S. Barry, Esq.; Sir E. Synge, Bart. *Cork City.*—E. Morrough, W. Coppinger, W. Rogers, Esqrs. *Donegal.*—G. Young, G. V. Hart, T. Batt, Esqrs. *Down.*—H. Montgomery, W. Keown, J. R. Allen, Esqrs. *Drogheda Town.*—J. Gernon, T. Carty, St. George Smyth, Esqrs. *Dublin.*—Hon. E. Lawless; Hon. E. Preston; W. E. Calbeck, Esq. *City of Dublin.*—J. B. Ball, B. L. Guinness, T. Crosswaite, Esqrs. *Fermanagh.*—J. G. V. Porter, W. H. Daniell, E. Archdall, Esqrs. *Galway.*—Hon. S. Vereker; Hon. A. F. Nugent; M. J. Browne, Esq. *Galway Town.*—C. Blake, P. M. Lynch, L. M'Lachlan, Esqrs. *Kerry.*—J. Coltsman, C. Galway, W. Gun, Esqrs. *Kildare.*—E. H. Cole, O'C. Henchy, W. Palmer, Esqrs. *Kilkenny.*—H. St. George, C. Hely, J. S. Lane, Esqrs. *Kilkenny City.*—J. Power, Esq.; Sir J. Blunden, Bart.; C. Savage, Esq. *King's County.*—Lord Tullamore; T. Hackett, R. Warburton, Esqrs. *Leitrim.*—E. K. Tenison, J. Johnstone, G. Lloyd, Esqrs. *Limerick.*—R. Q. Sleeman, E. C. Villiers, W. Barrington, Esqrs. *Limerick City.*—S. Dickson, M. Gavin, H. Watson, Esqrs. *Londonderry, City and County.*—T. Scott, Esq.; Sir H. Bruce, Bart.; J. B. Beresford, Esq. *Longford.*—T. Hussey, G. Lefroy, F. B. Edgeworth, Esqrs. *Louth.*—Sir R. Robinson, Bart.; J. O'Reilly, F. J. Foster, Esqrs. *Mayo.*—Sir R. Palmer, Bart.; Lieut.-Col. M'Alpine; T. S. Carter, Esq. *Meath.*—Lord Beective, Lord Killeen, J. Waller, Esq. *Monaghan.*—J. Lentaigne, S. R. B. Evatt, A. A. Murray, Esqrs. *Queen's County.*—Hon. H. G. F. Walker; H. P. Pigott, C. Coote, Esqrs. *Roscommon.*—T. J. Wills, J. F. Grace, Esqrs.; The O'Moore. *Sligo.*—E. J. Cooper, A. Crichton, M. Keogh, Esqrs. *Tipperary.*—W. P. Barker, J. Bailey, Esqrs.; Lieut.-Col. Purefoy. *Tyrone.*—J. M. Stronge, W. Sinclair, R. Montgomery, Esqrs. *Waterford.*—J. Palliser, J. B. Gumbleton, J. H. Keane, Esqrs. *Waterford City.*—S. King, J. Penrose, T. Sheppard, Esqrs. *Westmeath.*—Hon. L. H. King Harman; Sir M. L. Chapman, Bart.; Sir F. Hopkins, Bart. *Wexford.*—C. Tottenham, M. F. Beauman, P. W. Redmond, Esqrs. *Wicklow.*—F. Synge, R. A. G. Cunningham, W. W. F. Hume, Esqrs.

The Welsh Sheriffs.—The following is the list of gentlemen nominated as the new Sheriffs for Wales:—*Anglesey.*—T. A. Smith, of Trefarthin; E. E. Meyrick, of Cefncock; J. Williams, of Treffos, Esqrs. *Breconshire.*—H. Gwyn, of Abercrave; T. T. Roberts, of Llwyn-dwr; H. Thomas, of Llwynmadoc, Esqrs. *Cardigan-shire.*—P. J. Miles, of the Priory; J. P. Lloyd, of Mabws, M. Davies, of Tan-y-bwlch, Esqrs. *Carmarthen-shire.*—J. H. Phillips, of Dyffryn Brogyn; W. P. H. Powell, of Maesogwyn; R. A. Mansel, of Llandarrog, Esqrs. *Carnarvonshire.*—J. B. Edward, of Glyn Afon; J. Price, of Garth-y-Glo; J. Huddart, of Brynker, Esqrs. *Denbighshire.*—H. W. Meredith, of Pentrebychan; F. J. Hughes, of Horsley-hall; T. Griffith, of Trevalyn-hall, Esqrs. *Flintshire.*—Sir R. Puleston, of Emral, Bart.; L. F. Lloyd, of Cilcen-hall; A. Jones, of Wepre-hall, Esqrs. *Glamorganshire.*—T. T. Drake, of St. Donat's castle, Esq.; Sir T. D. Aubrey, of Llantrythid-park, Bart.; J. B. Pryce, of Duffry, Esq. *Merionethshire.*—D. W. Griffith, of Sygun; G. A. Huddart, of Plasynpenrhyn; J. Lloyd, of Cwmorthin, Esqrs. *Montgomeryshire.*—J. Owen, of Broadway; J. W. L. Winder, of Vaenor-park; J. G. Mytton, of Penylan, Esqrs. *Pembrokeshire.*—W. C. A. Philipps, of St. Brides's-hill; A. L. Gower, of Castlemalgyn; C. C. Wells, of Tenby, Esqrs. *Radnor-shire.*—Hon. F. G. Hamilton, of Llanbister; D. James, of Presteigne; J. A. Whittaker, of Newcastle-court, Esqrs.

The Church and Universities.—The *Gazette* announces the appointment of the Right Reverend Dr. Spencer, now Bishop of Newfoundland, to be Bishop of the see of Jamaica, and the creation of an Archdeaconry in the Bahama Islands, to be subordinate to the bishopric of Jamaica, and to be styled the Archdeaconry of Bahamas; and her Majesty has been pleased to appoint the Rev. John M'Cameron Trew, D.D., to be Archdeacon thereof. The Rev. W. Knight Bruce will be appointed Dean of Llandaff. A rumour in Oxford is very generally credited, that at the end of the present term, the Rev. Dr. Wynter will resign the Vice-Chancellorship, and at the same time the Presidentship of St. John's College. The indisposition of Mrs. Wynter, who has been recommended to try the effects of change of air, is said to be the cause of this determination.—The Society for the Propagation of the Gospel having requested its president, the Archbishop of Canterbury, to nominate a Professor of Bishop's College Calcutta, in the place of the late Mr. Coles, his Grace has appointed Mr. George Weidman, fellow of Catharine-hall, Cambridge.

The Colonies.—The Queen has been pleased to appoint Commander Edmund Norcott, R.N., to be Governor and Commander-in-Chief in the Gambia; Commander T. C. Sherwin, R.N., to be Emigration Agent General for the colony of British Guiana, and William Henry Butt, Esq., to be Rector of the University of Malta.

National Gallery.—The Queen has been pleased to confer upon Sir Augustus Calcott, R.A., the appointment of Keeper of the Paintings by the Old Masters in the National Gallery, Trafalgar-square, vacant by the decease of Mr. Seguiet. The appointment of the Conservator of the Royal Pictures contained in Windsor Castle and other Palaces has been conferred upon Mr. Eastlake, R.A. and Secretary to the Fine Arts Commission.

Foreign.

FRANCE.—The Paris papers are still filled, as they have been for some time past, with discussions and dis-

putes on the visit of the Duc de Nemours and Bordeaux to England, the fortifications of Paris, and the Bishop of Chalons' quarrel with the University. The Opposition journals, of all shades and parties, declaim against the visit of the Duc de Nemours to the Queen, while the entire press, with the exception of the papers in the interest of the Legitimists, condemn as much the visit of the Duc de Bordeaux, and the demonstration it has called forth on the part of his friends. The clumsy manner in which the prosecution of Mr. O'Connell and his associates has been hitherto conducted is also severely criticised in most of the journals. Rumours of a change in the Ministry are prevalent, and it is believed that M. Martin, M. Duchatel, and M. Lacave Laplagne, will retire forthwith. The principal reasons given for these expected changes are the divisions of opinion in the Cabinet on the subject of the quarrel between the clergy and the University, and on the subject of the Duc de Nemours' dotation. Should the Ministry venture to bring the dotation forward in the Chambers, which is not thought probable, at least at the commencement of the session, a formidable opposition is expected; and some of those who have hitherto been considered staunch supporters of the Ministry are understood to have intimated their intention to oppose it. Public discontent at the completion of the detached forts, or as they are termed bastilles, is said to be on the increase, and the desire of the Government for the termination of those works is becoming greater as the period for the opening of the Chambers approaches. It is said to be the intention of M. Thiers to attack during the debate on the address the extension given to the fortifications, particularly as respects the works in execution at Vincennes and St. Maur.—It appears that the judgment of the Council of State on the Bishop of Chalons' letter, and the royal ordinance issued in consequence, has not had the effect of preventing the publication of more letters in newspapers. The Bishop of Chalons himself has once more published a letter, in which he stoutly maintains that in his former letter he "did not exceed the limits of his attributes and rights," and that the judgment of the Council of State was arrived at "on a fact which was entirely within his competence, and upon which no one has a right to interrogate him or to prescribe rules to him." He asks if it is not within his right and power in his quality of bishop to maintain the faith and to improve the morals of those within his diocese, and taking it for granted that the answer will be in the affirmative, he says that is the whole question, and that so far from excommunicating the children by withdrawing the chaplain from the university, it is his duty to do so as a means to expose the danger to which the Catholic religion was exposed in those universities, and he denies the right of the State to take up his letter. The *Debat's* comments in very severe terms upon his letter, and insinuates that the same spirit of dispute influences the whole of the clergy. It expresses regret that the bishop, instead of receiving with mildness and respect the rebuke inflicted upon him by the Council of State, should persist in his former course, and maintains that by the concordat with the Church, the Minister of Public Worship is fully justified in checking the erratic propensities of the bishops.—M. Lagrenée, the French Ambassador to China, left Paris on Friday for Brest, where he was to embark. Count Mole has denied a statement in the Havre papers that he had arrived in that town, on his way to England. Lord Brougham had arrived at the château de Tholouet, on a visit to the Marquis de Galiffet. His lordship was to proceed thence to Cannes, where he intends to reside for two months. M. de Chateaubriand left Paris for London on Sunday.—The *Courrier Français* announces, on what it considers unquestionable authority, that Baron de Rothschild had accepted the modifications proposed by the Northern Railway Committee, and that the Minister of Public Works had consequently undertaken to submit to the ratification of the Chambers a bill for the adjudication of that railway to Messrs. Rothschild.—For some days back several acts of Vandalism have been committed in the gardens and park of Versailles. On Friday all the fingers of one of the hands of the Venus of the Tapis Vert were broken off, as well as the head and arms of the child held by Hercules.—Accounts from the departments announce that the rivers which were swollen by the late rains are gradually falling. The Rhone has nearly re-entered its banks, and the Durance has altogether done so. Fortunately those inundations have been of short duration, which circumstance lessened the amount of damage, though still the effects of the disaster are very considerable. The road between Arles and Tarascon remains broken up in not less than eleven places. The loss occasioned by the carrying away of the wooden bridge at Arles is estimated at 40,000*fr.* It is said that the bridge of boats at Saint-Gilles has been also carried off. The damage caused in the neighbourhood of Pertuis by the rise of the Durance is incalculable. Several points in the Haute-Pyrenees have also suffered exceedingly. The Larros spread over a vast length of country, covering the fine plain of Oron, and threatening the little town of Tournay with destruction. Happily the waters began to subside just at the moment when the danger appeared most imminent. The handsome bridge of Chelle was carried away when on the point of being completed, for in three days more the last stone would have been put on. Fortunately no lives were lost in the neighbourhood.

SPAIN.—As announced in our last, Queen Isabella II. took the oaths on the 10th inst. before the Cortes, the foreign Ministers, &c. After her Majesty had taken her seat on the throne, the President of the Senate advanced, holding in his hand the Gospels open. The Queen rose, and with her hand on the holy book pronounced, in a

sonorous and mild voice, the following oath:—"I swear before God and on the holy Evangelists that I will observe, and cause to be observed, the Constitution of the Spanish monarchy promulgated at Madrid on the 28th of June, 1837, and that I will respect the laws and cause them to be respected, without having any other view than the national welfare. If I should act contrary to what I have sworn or to any part of it I ought not to be obeyed, and my acts should be null and void. Thus may God assist me, as otherwise I should be accountable to Him for my conduct." Her Majesty concluded amidst the most enthusiastic acclamations. On leaving the Palace, her Majesty reviewed the troops of the garrison on the Prado. At the reception of the deputations of both houses on the 9th the Queen also evinced singular self-possession and dignity of manners. It is expected that one of her Majesty's first acts will be an amnesty for past offences. The Ministry had tendered their resignations to the Queen, but her Majesty, as was expected, had refused to accept them. In the sitting of the Congress on the 11th a decree was read by which the Queen confirmed for the present the existing Ministry. A resolution was then carried unanimously declaring that the Provisional Government had deserved well of their country and enjoyed the confidence of the Chamber, for which M. Lopez returned thanks. A change of Ministry is however certain, and M. Olozaga has undertaken to form the new cabinet. On the 14th General Narvaez proceeded to the palace, and presented to the Queen his resignation of the post of Captain-General of New Castile. The motives for this resolution were not exactly known, but it was rumoured that he had taken offence at the ayuntamiento of Madrid not having uttered a word about the attempt on his life and the death of his aide-de-camp, whilst it had made great noise about an insult offered by an officer of the garrison to a drummer of the National Guard, who was the bearer of some order from that municipal body. It was also believed that he was rather jealous of General Serrano, and felt hurt at some censure passed on his conduct on the 12th, when, after inviting the Officers of the garrison to dine with him, he conducted his guests to the palace, and presented them to the Queen. His friends however were strenuously exerting themselves to persuade him to recall his resignation, and it was believed that they would succeed. Several arrests took place in the evening of the 14th. A coffee-house keeper implicated in the murder of General Quesada, in 1836, was among the individuals against whom arrest warrants had been issued, as compromised in the attempt against the life of General Narvaez. Three writers of the *Eco del Comercio* and the principal editors of the *Espectador* opposition journals, M. Palmo, former commander of a battalion of Luchana, and M. Savita, an officer of the garrison, had also been arrested as participators in the attempt on the life of General Narvaez. The funeral of Commander Baseti, his aide-de-camp, who died of the wounds received in this attack, took place on the 11th amidst an immense concourse of people. Gen. Mazaredo paid a brief tribute to his memory, after which the *cortège* moved to the tomb of Diego Leon, where the Political Chief also mourned over that unfortunate Officer, and the clergy sang a "De profundis."—The Government have received satisfactory accounts from Galicia. In the evening of the 6th General Iriarte, accompanied by a number of Officers and soldiers, entered Portugal, on the side of San Gregorio. On receipt of this intelligence, the Government despatched Colonel Salazar to Portugal, to demand the arrest and extradition of the rebels. A letter from Barcelona, of the 13th, states that the capitulation of that city was signed on that day, and that several detachments of troops were to enter the town in the course of the same evening. The news of the Queen's majority had been received, and the civil governor had taken the opportunity of exhorting the people to peace and order. A suspension of arms took place on the 12th, the day before the capitulation. The few people remaining in the town immediately availed themselves of the change in affairs, and showed themselves in the streets, and they were even allowed to mount the ramparts. The insurgents at Figueras, however, had made the most active preparations for placing that town in a formidable state of defence. General Prim on arriving at Figueras had summoned the castle to surrender, but his demand had been met by a peremptory refusal, and the batteries had opened a fire upon his quarters by way of defiance. The castle was supplied with provisions for 12 months. On the 11th the insurgents of Vigo made their submission without conditions. The submission of that town and the declaration of the Queen's majority have produced the most lively satisfaction at Corunna.

PORTUGAL.—The Queen returned to Lisbon from her tour in the Alemtejo on the 31st. As stated in our Spanish news, General Iriarte and his staff had arrived in the Portuguese territory, which they entered at Melgaço in the province of Minho. The Civil Governor of Viana having been made acquainted with the arrival of these Spanish officers and troops, and with their request that an asylum should be given them, immediately communicated by telegraph with the Government at Lisbon, which assigned Braga, 40 miles north of Oporto, as their residence. At Lisbon all was quiet and the Cortes were opened as the packet left.

GERMANY.—Letters from the Rhine state that orders have been received from Berlin to employ double the present number of workmen on the repairs and improvements of the Royal Palace at Coblenz during the whole winter, so that the works may be completed in the beginning of May next, when his Majesty is expected for the purpose of receiving there and at the Castle of Stolzenfels the promised visit from Queen Victoria and his royal god-

son.—Letters from Hanover state that his Majesty the King intends leaving his capital and country again for the greater part of the winter, and that Berlin, in particular, is to be honoured with a prolonged visit from him.—It would appear by accounts from Vienna that the appointment of his Imperial Highness the Archduke Stephen to the Governorship of Bohemia meets with unforeseen difficulties. The Archduke wishes for very extended powers, which the Aulic Chamber does not feel disposed to grant, as it would materially diminish its own authority over that important part of the empire.—A Berlin letter of the 12th states that Messrs. Clegg and Samuda, inventors of the Atmospheric Railway, have made proposals to the Prussian Government for the construction, upon their system, of the road for Lower Silesia, about to be laid at the expense of the State. But before taking this proposal into consideration the Government resolved on witnessing a trial of the principle, and therefore has engaged Messrs. Clegg and Samuda to form one from Berlin to Charlottenberg, the works for which will be commenced in the spring and be quickly executed, as the ground is very favourable. Letters from Leipsic mention that on the 1st, the subscription for the Saxo-Silesian Railroad was opened at the Bourse. The estimated cost would be 25,000,000 thalers in shares of 100 thalers each.

ITALY.—A letter from Bologna of the 6th inst. states that M. Barretti, of Ravenna, had been arrested for the part he took in the late disturbances. He had been for some time settled at Bologna. A quantity of arms and ammunition were found in his house. A barber who was accused of putting up a treasonable placard at a café was also arrested. The disturbances were still far from being put down, and the people were in a state of great excitement. Several of the insurgents had taken refuge in Malta and Corsica, and it was said that the Italian states had applied to have them removed. It is by no means likely that the English Government will accede to this request, but the French Government has already so far complied with it as to remove all Italians from Corsica to the interior of France. The two brothers Muratori, the Counts Biancoli and Righi, the Marquess of Melara, and several other refugees have been ordered to Chateau Rouge. It was reported in Paris on Saturday that the French Government had received accounts from Naples of a serious nature. Disturbances were said to have broken out in the neighbourhood of Naples and in Calabria. The particulars were not published; but it was known that the Neapolitan Government was making preparations to send reinforcements to Sicily, and that some demonstrations were apprehended in Calabria and the Abruzzi, where the events of Bologna had produced a deep impression. An Italian paper printed in Paris, *La Jeune Italie*, chiefly for circulation among the Italian refugees, states that the late attempt at insurrection in Romagna failed, not because that disaffection was not general throughout the Peninsula, but because the ultra or real Democratic party refused to concur in it. The reason given for this is that the Republicans would not aid in a movement openly said to have been suggested by Russia. Everything was, it seems, prepared for a general Italian insurrection. The movement was to commence in Naples, where it was expected a portion of the army would lead or immediately enter into it. Upon the knowledge of that revolt, Lombardy, Piedmont, and the Romagna would rise, and form an Italian empire, the ruler over which would be the Duke de Leuchtenberg, son of Eugene Beauharnais and son-in-law of the Emperor Nicholas. The Italian democrats would not promote the monarchical views of any man, and consequently the revolt in Italy miscarried. According to the same paper the revolution in Greece was connected with the movement in Italy, and equally instigated by Russia.—A Neapolitan steamer arrived at Toulon on the 12th with despatches from the Court of Naples and the Duc d'Aumale, which were immediately forwarded to St. Cloud by express. It appears that the marriage of the Duke d'Aumale with the sister of the King of Naples, the object of the Prince's journey, had been agreed upon. Letters from Naples of the 6th state that a difference has arisen between the Government and the British cabinet on account of their having taken possession of the island of Lampedusa. The English minister contends that by that act the honour of the British name has been wounded, and he demands reparation. Although the island belongs to Naples the British Government is said to require that it should be evacuated, and that the British flag be restored. The minister has declared that more prompt measures have not been taken merely on account of the friendly relations which previously existed between the two Governments. From Sicily we learn that Mount Etna was at the close of last month throwing out volumes of flames.

MALTA.—It is announced in Tuesday's *Gazette* that the Government have appointed Mr. W. H. Butt to be rector of the University of Malta. It had been previously stated that the office had been conferred on the Rev. F. Mahony, better known as Father Prout, but it now appears from the *Globe* that a layman has been selected on account of the clerical squabbles in the island, which have obliged the Home Government, for the sake of peace, to resort to this step. The new rector is of course a Roman Catholic.

GREECE.—Letters from Athens of the 30th ult. announce the arrival of General Coletti at the Piræus on that day. He received a salute of 175 guns from the different ships of war—Greek, French, British, Russian, and Austrian—in the harbour. At the landing-place, where a vast multitude was assembled, the cries of "Long live Coletti! long live the good patriot!" resounded on all sides. When his carriage drove off it was accompanied

by a number of women and children repeating with enthusiasm similar exclamations. The following is the result of the elections:—of 225 Members of the Assembly there are nearly 90 Napiers, and 135 Constitutionals, of whom 80 acknowledge Coletti as their chief.—The German papers state that the Emperor of Russia is not content with refusing his sanction to the new state of affairs in Greece, but that he proposes to address an energetic protest against the revolution to all the European Powers.

SWEDEN.—The town of Wexöe, which was scarcely yet rebuilt after the dreadful conflagration of 1838, has again been completely destroyed by fire. 1400 families have lost everything and are without shelter. The King, upon being informed of the disaster, had immediately despatched one of his Aides-de-Camp with 30,000 dollars from his private purse and promises of further relief.

TURKEY.—Accounts from Constantinople of the 31st ult. state that the offices of the Porte and most of the public administrations had remained closed during the preceding ten days in consequence of the solemnity of the Bairam. It was believed for a moment that the revolution in Greece might lead to new complications; this anticipation, however, had not been realised. The Porte, after adopting measures commanded by prudence to guard Thessaly and Epirus from all attempt on the part of the Greek revolutionists, had declared that in its relations with the Hellenic Government it would be guided by the conduct of the Powers which protected the new kingdom. The Persian question still remained *in statu quo*. The last letters from Erzeroum, dated the 17th, merely mention that the Turkish and Persian plenipotentiaries having received fresh instructions from their Governments had resumed the negotiations, and that Mr. Curzon, one of the British Commissioners, was dangerously ill. The French Envoy had taken up seriously the affair of the Armenian decapitated for his relapse to Christianity.

EGYPT.—The accounts from Alexandria come down to the 26th ult. They state that Mehemet Ali had abandoned all hope of the return of the Pacha of Soudan to his allegiance, and that he was consequently re-organizing his fleet, and placing his land forces on the war establishment. Lieutenant Agar and Miss Dalzell passengers, with the remainder of the crew of the ill-fated Memnon, arrived safely at Aden on the 9th Sept. A letter from Lieutenant Agar, dated Aden, Sept. 13, after describing their dreadful sufferings from thirst and the burning heat of the sun, &c., states that on the 2d, at noon, the Company's brig of war Tigris was seen rounding the Hulloolla point, with the preconcerted signal flying. About sunset she anchored; the unfortunate sufferers were speedily on board, and in a few days safely landed at Aden.

CAPE OF GOOD HOPE.—Accounts have been received from the Cape to Sept. 23d, and from Natal to the 10th Sept. The latter announce the entire settlement of affairs in that part of the Colony, the leaders of the Boer conspiracy, Prinsep, Rodeloff, Pretorius, and others, having as it was affirmed submitted to her Majesty's authority and to the terms of the late Government proclamation. Accounts from Port Elizabeth dated August 28th give some details of a dreadful storm in that quarter. The ships Delhi, Elizabeth Rowell, Laura, and Sea-gull were driven ashore, and all but the second seemed to have suffered total destruction. Many lives too were unfortunately lost. Including the amount of damage done to the jetty the total loss sustained is estimated at nearly 30,000*l*. Rains had again fallen in copious quantities in the eastern provinces, which had suffered so much from drought, and the rising crops were therefore becoming more promising. There was a rumour at Cape Town of a new Governor being appointed to succeed Sir George Napier, who is about to come to England. The Frontier papers are, as usual, filled with complaints of the ravages of the Caffres.

UNITED STATES AND CANADA.—By the arrival of two sailing packets we have accounts from New York to the 3d inst. The news is not important. The papers contain much speculation on the coming elections. The friends of Mr. Clay had held a meeting in New York, and each party were loud in the praises of their respective candidates.—By an arrival at Charleston of a vessel from Havannah we have news to the 19th. The newly-appointed Governor-General O'Donnell had arrived at Havannah, and was to have been installed the day the vessel sailed.—In Canada the Provincial Parliament was very active. A bill for the suppression of secret societies had passed in committee of the whole house. Another for the prevention of party processions, said to be aimed at the Orange societies, had excited very great discussion. A bill had also been introduced for the regulation of steamboats in the province, which forbids the use of high-pressure engines.

MEXICO.—It is rumoured that Lord Aberdeen has declined to enter into any negotiation with the Mexican minister Mr. Murphy on the subject of the affront lately offered to the British flag, and that he intends sending out a new minister to Mexico in a frigate which will call at Jamaica, whence the minister will take a squadron down with him to the Mexican coast, and require an apology for the affront before landing. By the packet before the last, advice was received that Mr. Doyle had made a remonstrance to the Mexican Government on the subject of a breach of contract between it and a British house in Mexico, in such strong terms that the Government objected to the expressions. Mr. Doyle refused to retract a word, and the consequence was that the Mexican Government sent a special messenger with despatches to Mr. Murphy in London, requesting him to complain to Lord Aberdeen of the language in which it had been addressed. This grievance preceded the affair of the flag, and it seems that Lord Aberdeen will not admit that the Mexican Govern-

ment had any just ground for breaking contract with the house in question. The last accounts confirm the statement which has been current that the Government of that country has issued a decree prohibiting foreigners from engaging in trade in that republic. Naturalized foreigners, foreigners married to Mexican women, and those who reside in the republic with their families are made exceptions to the prohibition.

BRAZILS.—By the Satellite sloop of war we have accounts from Rio to the 4th Oct. The rejoicings consequent upon the marriage of the young Emperor and a Neapolitan Princess had been suddenly changed into a general manifestation of gloom, arising from the subsequent indisposition of His Imperial Majesty, who had been attacked with an intermittent fever, which, according to the latest bulletins, was upon the increase, with renewed symptoms of irritation. The result of this attack was looked for with much anxiety, though, from the youth of the sufferer, not without a strong hope that it might terminate favourably.

CITY.

Money Market, Friday.—Consols closed at 95½ to 96, for time and money; Three per Cents. Red., 95½ to 96; Three-and-a-Half per Cents. Reduced, 102½ to 103; New Three-and-a-Half per Cents., 102½ to 103; Exchequer Bills, 54s. to 56s. prem.

Metropolis and its Vicinity.

The Royal Palaces.—Her Majesty has just caused to be carried into effect a design, emanating entirely from herself and Prince Albert, for the establishment of "Domestic Libraries" in the servants' halls at Buckingham Palace and Windsor Castle. In order to carry this object into effect her Majesty has been pleased to make a donation of 100% for the purchase of books to commence with, and has presented a great variety of works of a useful and instructive character to both libraries. Prince Albert has also presented 50% for the same purpose. The committee appointed by the Queen to superintend the arrangements consist of the following members of the household, each of whom has presented donations and various works of utility:—Sir H. Wheatley, Mr. G. E. Anson, Hon. and Rev. C. L. Courtenay, Hon. C. A. Murray, and Mr. Glover. Mr. Robert Lyons, secretary to the Master of the Household, has been appointed treasurer to the two library funds, with directions to audit the accounts of each once at least in every year.

Destitution in the Metropolis.—On Monday a public meeting was held at the Western Literary Institution, Leicester-square, for the purpose of considering the destitution now existing in the metropolis, and of adopting measures to alleviate the distresses of the houseless poor. The Rev. Mr. Ward, the Rector of St. James's, was called to the chair, supported by Lord Dudley Stuart, Viscount Ranelagh, Sir Joseph Copley, Mr. Robinson chairman of Lloyd's; Mr. Hankey, Mr. B. B. Cabbell, Sir De Lacy Evans, Hon. Stuart Wortley, Mr. Walter, and others. Mr. Arber, the promoter of the measure, briefly explained to the meeting that it was originally proposed to pass a series of resolutions—1. That the Bishop of London with the parochial clergy be requested to become president and vice-presidents of the proposed institution;—2. That a provisional committee be appointed; and—3. That a public subscription be set on foot in behalf of the institution, to be called the Western Refuge for the Destitute. These resolutions, however, were thought by some of the gentlemen on the committee to be hardly comprehensive enough in their nature. Viscount Ranelagh said that he was decidedly of this opinion; he thought that if any measures were taken they ought, to meet adequately the destitution that now existed in the metropolis, to be taken upon a national and comprehensive scale. The house of refuge to be established should be as well known as St. Paul's. Lord Dudley Stuart was most happy to take part in any measure that might tend to obliterate the reproach which all must feel so grievously attached to the wealthier classes of this metropolis, in having neglected so long to provide a refuge for those houseless and shelterless beings who thronged our public thoroughfares and parks. He knew of no one to whom the presidency of such an institution could better be intrusted than to the Bishop of London, but at the same time he would not enter upon the question whether such an institution should be maintained exclusively by members of the Church. He would conclude by moving that it is expedient to establish an institution for the relief of the houseless and destitute poor in the metropolis, and would suggest that the meeting be adjourned to Exeter Hall until some future day, and that the Bishop of London be requested to preside. Mr. Cabbell was in favour of a comprehensive plan, but objected to the word refuge. While the institution should be one that would furnish the wanderer with a night's shelter, inquiry should at the same time be made into the cause of his destitution, so as to prevent its recurrence. He would cordially second the resolution. Sir De Lacy Evans thought that with reference to the question mooted by the Noble Lord, as to whether the care of the institution should or should not be confined to clergymen of the Church, it was a question which had better be avoided. On the other hand, he thought that a national or more comprehensive plan was not practicable, as there were already institutions of the kind in Marylebone and the City. Mr. Ridgway, Mr. Kingscote, Mr. Robinson, and other gentlemen addressed the meeting, and Dr. Lynch suggested that the Fleet Prison might be appropriated as a place of refuge. The meeting, after the appointment of a provisional committee, resolved that Mr. Cabbell be requested to act as treasurer, and Mr. Arber as honorary secretary; and that it be an instruction to the committee to summon a meet-

ing at Exeter-hall, and request the Bishop of London to preside at the same. The thanks of the meeting were then unanimously given to the Rev. Mr. Ward for taking the chair, and to Mr. Arber for his active interest in calling the meeting.

Court of Aldermen.—On Tuesday a court was held for the despatch of business. The Lord Mayor having taken the chair, Alderman Brown moved a vote of thanks to Alderman Humphery for the uniform kindness, impartiality, and good temper which had distinguished him during his mayoralty, and which had secured for him on his retirement the good wishes and esteem of his fellow-citizens. The vote was carried unanimously and with acclamation. Alderman Copeland brought up the report of the Gaol Committee, which recommended the appointment of a superintendent, with a salary of 300% a year and 50% a year for a house. He represented the anxiety with which the committee engaged in a subject of such importance, and stated that they had not yet completed their investigation into the medical department and other matters. The report was referred back to the committee, and the testimonials of the candidates for the office of superintendent of the gaol of Newgate were ordered to be examined, Ald. Copeland stating that the Duke of Wellington had recommended Capt. Kincaid governor of Bridewell as eminently qualified for the discharge of the duties of the situation. After some other unimportant business the Court adjourned.

East India House.—A Special General Court of Proprietors was held at the India House on Friday, pursuant to requisition, for the purpose of considering the following resolutions to be submitted by the requisitionists:—
1st. That from the printed papers recently laid before Parliament on the subject of Scinde, it is the opinion of this Court that the proceedings of the Government of India which ended in the dethronement, exile, and imprisonment of the Ameers, and the seizure of their country, were uncalled for, impolitic and unjust. 2d. That the Court does therefore most earnestly recommend to the Court of Directors the immediate adoption of such steps, by representation to her Majesty's Government or otherwise, as may cause all practicable reparation to be made for the injustice already committed, and enforce the abandonment of a line of policy inconsistent with good faith and subversive of the interests of the British rule in India." Mr. Cotton, the Deputy-chairman, before any discussion took place, stated that the papers relative to the object of these resolutions had not been laid before the proprietors, and that he would therefore move at once that the directors be requested to lay before the Court such papers as may have been communicated to them by the Secret Committee regarding the proceedings which have taken place in Scinde, and that the same be printed for the use of the proprietors, and that this Court of Directors be requested to apply for and lay before the Court all further information upon this important subject, which her Majesty's Government may be able to communicate." A long and desultory discussion ensued on the question whether the chairman had the power to bring forward this motion, and Mr. Hume expressed his belief that the directors wished to "burk" the discussion. It was, however, ultimately resolved to adopt the motion of the chairman, on the understanding that the proprietors should be convened at the earliest possible period after the publication of the papers.

The late Duel.—In reference to the rumour noticed in our last respecting the surrender of Lieut. Munro, it appears from the Scotch papers that Lieut. Munro landed at Hull on Friday last from a Hamburg steamer, and passed through Inverness on the 18th, on a visit to his father at Tain previous to surrendering to take his trial. At the Marylebone Police Court on Friday, Inspector Aggs, who conducted the inquiry relative to the death of Colonel Fawcett, officially informed the sitting magistrate that Lieut. Munro and Lieut. Grant would surrender to take their trials at the next session of the Central Criminal Court, and that the witnesses to be subpoenaed on the trial would be 31 in number.

Metropolis Roads.—Another meeting of the rate-payers of Hammersmith was held last week for the purpose of adopting measures to light the Great Western Road from Hammersmith turnpike to the New Road leading to Oxford-street, being nearly the whole length of the road running through that parish. A meeting for the same purpose was held about a fortnight ago, but in consequence of some irregularity in the proceedings it was deemed advisable to declare the decision then come to null and void, and by making a slight alteration in the notice to call another meeting. Mr. Shackell having been called to the chair, Mr. Millar moved the adoption of the General Lighting Act within that district. Mr. Daley seconded the resolution. Mr. White moved as an amendment, that the meeting be adjourned until that day twelve months. A lengthened and angry discussion then ensued, which was ended by the amendment being negatived. The Chairman then put the original motion, when there appeared, on a division, to be 78 for, and 69 against the lighting. The Chairman declared that as there was not such a majority of those present in favour of the lighting as was required by Act of Parliament, that object could not be carried out for a twelve-month. Mr. Millar and others demanded a poll, which was granted. The meeting was then adjourned for a fortnight, when the result of the poll will be declared.

Hungerford Suspension-Bridge.—It is intended to open this bridge in May next. The abutments on both sides of the Thames and the pier on the Hungerford side are completed. The pier on the Lambeth side is expected to be finished by Christmas. The entire length of the bridge will be 1,440 feet, the breadth in the clear

about 14 feet, and the height from the water level to the footway, 28 feet. The links that compose the supporting chains are made of malleable iron, 700 tons of which will be necessary for the construction of the bridge. The property required for approaches has cost 13,000%, and a contract has been made for the completion of the bridge at a cost of 80,000%. The total cost, including expenses incidental to the progress of the works, the Act of Parliament, &c., will be 106,000%. The proprietors calculate that a net annual income of 8,010% will be derived from tolls, being at the rate of 8 per cent. on the capital.

Kensington.—On Monday, at a meeting of magistrates for this division of Middlesex, a license for this theatre was granted for the ensuing year; Mr. Morland, the proprietor, having entered into a recognizance in the sum of 300%, with two sureties in 70% each, for the payment of penalties in case of any infringement of the law.

Fires.—On Monday morning, shortly before four o'clock, a destructive fire broke out in the extensive premises belonging to Messrs. Bramah and Prestige, engineers and patent lock-makers, Belgrave-place, Pimlico. The manufactory in which it originated was upwards of 180 feet in length, and was one of the finest in Europe. The fire was discovered raging in the north end of the building; and the wind blowing furiously from the south-west, the flames raged with ungovernable fury. In less than half-an-hour the whole of the engine-room, with its valuable machinery, was destroyed, and the entire building rapidly took fire. By this time the alarm was communicated to several stations of the Fire Brigade, and water having been procured the fury of the flames was somewhat subdued, but they subsequently spread to another part of the factory. By five o'clock the whole building was on fire from top to bottom, and the flames continued their fury until there was not one article of a combustible character to feed them. The number of workmen lately employed on the premises amounted to about 120. On Saturday evening they were at work until 8 o'clock casting a heavy shaft, and when they quitted the factory everything appeared safe. On examining the premises after the fire, it was discovered that they had been broken into, and some panes of glass were found stained with blood near the counting-house, through which a forcible entry had been made. This circumstance induced an impression that the fire was the act of an incendiary, and a clue has been discovered which will doubtless lead to his discovery. Mr. Braidwood reports the entire destruction of the engineering and pattern-shops, with their valuable contents. In Belgrave-street South the school of industry of St. George's parish has the roof of the workshops burned and the back part extensively injured. In Upper Ranelagh-street 6 houses have their back premises injured, and one in Eaton-lane is also much damaged. Messrs. Bramah and Robinson are insured, and the loss to the fire-offices will not be far short of 12,000%.

—Early on Saturday morning, a fire broke out on the premises of Messrs. Edgington, the rick-cloth makers in the Old Kent-road. It was first noticed burning with considerable fury in a shed at the rear of the buildings, used for the store of manufactured goods. Assistance being speedily procured, the flames were extinguished with little destruction of property.—On Saturday evening, a fire, involving the destruction of property to the extent of 2,000%, broke out in the timber-yard of Messrs. Salmon and Co., in Macclesfield-street, City-road. The premises consisted of wharf, sheds, and other large buildings, occupying a large frontage on the east side of the street, reaching about 120 feet depth to the edge of the Regent's Canal Basin, the north and south portions adjoined by valuable property. When the fire was got under, nothing remained but the smoking ruins.

Attempted Suicide.—On Monday morning the neighbourhood of Bryanstone-square was alarmed by an attempted suicide at the house of Mr. Jos. Hume, M.P. It appears that Mr. Gubbins, who is about 30 years of age, and son of the late General Gubbins, Governor of Madras, married Mr. Hume's eldest daughter a short time since. During the last few weeks they have been on a visit to the Duke and Duchess of St. Albans, in Lincolnshire. They returned to town from Redburn on Saturday, and were to stay a few days at Mr. Hume's prior to their departure for India. On Monday morning, shortly before 5 o'clock, the screams of Mrs. Gubbins awoke Mr. Hume and his family, and it was then discovered that the unfortunate gentleman had thrown himself on the pavement from his bedroom window on the third floor. He was found lying there in a pool of blood and quite insensible. Dr. Arnott, Mr. Liston, and other medical men, were sent for, when it was discovered that in addition to other serious injuries Mr. Gubbins had sustained a compound fracture of one of his thighs, and that his other leg was broken. The greatest secrecy appears to have been imposed on the domestics in Mr. Hume's service, and all the information that could be obtained on application at the house was that a member of the family had met with a serious accident and was in a dangerous state. Mr. Gubbins was visited two or three times on Tuesday by his medical attendants, and but faint hopes are entertained of his ultimate recovery. In reference to the above, Dr. Arnott has addressed a letter to the daily papers, stating that Mr. Gubbins had been under medical treatment for some days previous to the accident; that "it occurred during a sudden paroxysm of delirium; and that Mr. Gubbins is so far recovered as to be able to give some account of the accident. It appears from this, that during a horrid dream he fancied he was walking on the parapet of a house, from which he was thrown off; but in what manner or by what means he is evidently even yet not distinctly conscious."

Mortality of the Metropolis.—The number of deaths

registered in the week ending Saturday, Nov. 11, was as follows:—West Districts, 126; North Districts, 196; Central Districts, 202; East Districts, 215; South Districts, 277; Total, 1,016 (males, 524; females, 492). Weekly average for the last five years, 903 (461 males, 442 females); and for the last five autumns, 908.

Provincial News.

Bolton.—An address signed by nearly 900 inhabitants of this town and neighbourhood, who are mostly heads of families, has been presented to the Bishop of Chester, expressing satisfaction at the opposition made by his lordship to the doctrines of Tractarianism. The following is an extract from the Bishop's reply:—"You would scarcely have thought it worth your while to encourage me in the course which I have pursued unless personal experience had taught you to value the doctrines which you believe to be endangered by those writings against which I have felt myself bound to warn my clergy. There is much to justify anxiety in the favour which for a while, and in some quarters, those writings have obtained. But there is also matter of consolation in the opportunity which has been afforded of manifesting the soundness of the public mind, and the determined adherence of the country at large to the doctrines of the Reformation. May I not further assume that the same circumstance proves the general faithfulness of the ministry of our church, by which those doctrines have been established and maintained, and which has fixed the opinions of the people on a foundation too firm and solid to be shaken by the occasional storms which only affect what is light and weak and wavering."

Brighton.—On Wednesday morning several hundred tons of earth and chalk slipped into the sea, near Kemp Town, Brighton, and carried with it two men and a boy, one of whom was killed on the spot.—The parish of Aldington, near this town, contains according to the last census but one inhabitant; a solitary turnpike-gate house, kept by a man with a wooden leg, being the only habitation in the place. The desolation of this parish, in which the ruins of the church are still standing, is said to have been brought about by the encroachments of the sea, at the mouth of the river Adur—Shoreham harbour having been originally there, but being now choked up with shingle.

Burton-on-Trent.—The Rev. J. M. Crockett, Incumbent of Tatenhill, near this town, met with a fatal accident on the 14th inst. It appears that he was returning home with a friend, when on passing the house of a widow of the name of Hassell he heard a confused noise of voices, as if in altercation. On pausing a little, he could hear distinctly a man's voice threatening Mrs. Hassell with violence. Mr. Crockett immediately left the arm of his friend and stepped through the wicket, intending to enter the house and prevent any ill usage, when as he passed by the end of the house the covering of an old well which was under the pavement gave way and Mr. Crockett was precipitated to the bottom, a large quantity of earth and stones falling upon him. The alarm was immediately given, but the unfortunate gentleman when rescued was so seriously injured that he expired two hours afterwards.

Bury.—On Tuesday week the large woollen mill at Openshaw Fold, near this town, the property of Messrs. Openshaw, woollen manufacturers, was destroyed by fire, the origin of which is unknown. The loss is said to be covered by insurance. The mill was 16 windows in length and three stories in height, and the amount of the loss is understood to be upwards of 10,000*l*.

Carmarthen.—The Special Commissioners since our last report have visited Haverfordwest, Narberth, and Newcastle Emlyn, on their way to Cardigan and Aberystwith. Three of the rioters who were committed at Fishguard to be tried at the next assizes for destroying the gates and tollhouses at Parkmorfa and that place have been held to bail, themselves in 100*l*. each and two sureties of 50*l*. each. 23 others have also been committed to take their trial for the same offence and have been held to bail in 50*l*. each with two sureties in 25*l*. each. Much excitement prevailed in the town and neighbourhood of Fishguard, and the informers Thomas Williams and wife incurred the displeasure of their countrymen to such an extent as to render it necessary for them to be placed under the protection of the military.

Dover.—During the last week a whale has been visiting this coast in search of herrings. It was distinctly seen on Sunday morning in the Downs sending up its fountains; on Friday it was seen off Dover from the shore, and some men who were in a boat just as it was approaching had a narrow escape of an upset, but they luckily got on board a galliot which was passing at the time and saved themselves. The whale is supposed to be upwards of 60 ft. long.

Ely.—The *Bury Post* states that "there are at the present time in and about the fens around Ely such quantities of rats that their numbers cannot be reckoned. Great efforts have been made to exterminate the vermin; but still they are not sensibly lessened; many acres of wheat must be sown again, and this again may fall a prey to their incursions. Poison is laid in large quantities, which must take effect, as the bait has disappeared by the morning. Mr. W. Harlock has had men employed on his farm for some time past to take these animals, and they have destroyed above 2,000. A man went into Middle Fen last week to fetch a horse, and was quite terrified at the vast numbers, the ground seeming literally to teem with life; nor was he sorry to mount, and leave the obnoxious animals."

Huddersfield.—The agents of Sir J. W. Ramsden at his half-yearly rent-day in this town last week announced his intention to give the munificent sum of 8,000*l*. for the erection of four new churches and schools in the extensive

parish of Huddersfield, with ground for the sites of the same. The patronage of the new churches is to be vested in the young baronet.

Kirkdale.—An affray with poachers took place at Knowsley Park on the 10th inst., in which Richard Kenyon, Lord Derby's gamekeeper, was so severely wounded that he died in a few days. A man named John Shaw, one of a gang of poachers who have long been notorious in the neighbourhood of Liverpool, has been committed to take his trial for the offence.

Manchester.—Since the last report of the meeting in favour of the League Fund, additional subscriptions have been received to the amount of 1,527*l*., making a total to Thursday of 16,000*l*. The subscription already includes the names of many gentlemen who never before subscribed to the funds of the League.—On Saturday, James Brown, the sailor who was last week remanded on a charge of setting fire to a number of corn-stacks near Denbigh, was brought up for further examination. It will be recollected that William Hardman the informer in this case was ordered to be kept in custody by the magistrates, in consequence of his statement implicating himself, while at the same time there were strong grounds for believing that his account was untrue. Hardman was placed in the witness-box, and Joseph Kedger, the prisoner's companion, who stated that he had run away from her Majesty's steamer *Penelope*, and was consequently detained as a deserter, was also brought into Court. The chief superintendent of police stated that since the prisoners had been remanded he had written to various places for the purpose of ascertaining the truth of the statement made by Hardman before the Court on Friday week, and he had found as he had expected, that he had stated that which was untrue. The magistrates after a long hearing decided on again remanding the case.

Newmarket.—The bank of Mr. Bryant, in this town, suspended payment on Friday last, but there is no doubt of the solvency of the concern, although the assets are not immediately available.

Oldham.—A great portion of the mill of Mr. John Lees, Primrose-hill, with a considerable quantity of valuable machinery, were consumed on Thursday week by fire, the cause of which remains at present unknown, but is believed to have been accidental. The property destroyed is estimated at about 5,000*l*.

Windsor.—On the afternoon of Friday, as Capitaine de Reille was leaving Windsor Castle on horseback, in attendance upon the Duke de Nemours, his horse slipped as it was proceeding through the gates of the Home Park, opposite to the Long Walk, and threw the Captain with considerable force upon the gravelled road; but, although considerably bruised, he mounted another horse, and proceeded throughout the ride with his Royal Highness. The Hon. C. A. Murray, while hunting with Prince Albert's harriers on Thursday last, was thrown from his horse, in the vicinity of Chalvey, near Slough, but fortunately without sustaining any serious injury. It appears that while Mr. Murray was in the act of opening a gate with his hunting-whip, his horse rushed over the gate, taking its rider unawares, and thus causing him to be dismounted.

Railways.—The following are the returns for the past week:—Birmingham and Derby, 1,353*l*.; Birmingham and Gloucester, 1,666*l*.; Edinburgh and Glasgow, 2,062*l*.; Great Western, 12,143*l*.; Grand Junction, 6,787*l*.; Glasgow, Paisley, and Ayr, 1,220*l*.; Great North of England, 1,302*l*.; London and Birmingham, 14,213*l*.; South Western, 5,113*l*.; Blackwall, 641*l*.; Greenwich, 658*l*.; Brighton, 3,432*l*.; Croydon, 219*l*.; Liverpool and Manchester, 3,880*l*.; Manchester and Leeds, 4,465*l*.; Midland Counties, 2,409*l*.; Manchester and Birmingham, 2,416*l*.; Northern and Eastern, 1,415*l*.; North Midland, 4,281*l*.; Newcastle and Carlisle, 1,400*l*.; South Eastern and Dover, 3,078*l*.; Sheffield and Manchester, 458*l*.; York and North Midland, 1,603*l*.—The South Eastern and Dover Company held their half-yearly meeting last week. The report announced that the viaduct at Folkestone was now complete, that the hotel on the harbour would be opened this month, and that the trains in a few days would commence running to the permanent station. In reference to the communication with France, the directors hoped that the French Government will forward one or more of the lines of railway by which it is proposed to reduce within the limits of a moderate day's journey the route between Paris and London on the one hand, and Brussels and London on the other. The promise of opening throughout to Dover before the end of the year would, with favourable weather, be fulfilled, and Mr. Stephenson, the engineer, encouraged a hope of the completion of the branch line to Maidstone by September next. A supplemental account had been received from the Brighton Company claiming a further sum of 34,623*l*. The construction account showed a balance of 333,226*l*. The number of passengers carried on the line during the past half-year was 274,000, the receipts from which had increased to 4,700*l*. per week. The total receipts for passenger traffic had amounted to 84,179*l*., leaving, after payment of expenses, a balance of 12,750*l*., applicable to a dividend; but considering the unfinished state of the line, the directors proposed to defer the payment until next year. Resolutions were then passed, enabling the directors to improve the harbour at Folkestone; to adjust the accounts in dispute with the Brighton Company; to establish an efficient steam communication between the railway, France, and Belgium; and to apply to Parliament in the next session for powers to construct a branch line from Ashford to Canterbury, Ramsgate, and Margate. Some discussion relative to the amalgamation of the three lines having a common terminus at London Bridge took place, but the subject was deferred until a future day. In connection with this subject, we quote the follow-

ing from a Brussels paper:—"We learn from good authority that an English company will establish a daily communication between Folkestone and Ostend by steam-boats, which draw so little water that they can enter both ports at low water, so that travellers leaving London in the morning by the railway to Folkestone will arrive at Ostend toward evening. Another English company will open a communication three times a week between Blackwall and Ostend. The steamers will perform the passage in nine or ten hours, and always arrive at Ostend so as to be able to enter the port. They will also leave Ostend in the morning if the tide suits. Thus travellers who arrive in the evening by the railway from Cologne may reach London in the afternoon of the following day."—The directors of the Great Western Railway have given notice of their intention to apply to Parliament next session for an extension act, which will enable them to carry their line into the town of Cheltenham. The new bill embraces three objects:—1. a branch line from Pangbourne station to Newbury, a distance of about 15 miles; 2. the extension of the line through the city of Gloucester; and 3. its extension into the town of Cheltenham. The cutting and embankments from Kennington towards Didcot on the new branch to Oxford, (about two miles in length) are finished and ready for the ballast. The cuttings opposite Nuneham are going on rapidly, and upwards of 2000 yards per week are taken to the long embankment which runs down to the river at the end of Nuneham park. Where the railway crosses the river a bridge made of timber was commenced on Saturday, and will be completed in about five weeks.—A prospectus has been issued of a new railway from Harrogate and Knaresborough, to form a junction with the York and North Midland at Bolton Percy station. Mr. Locke has been engaged to survey the line, and has made a report. The line is proposed to commence at Knaresborough Spa, nearly half way between Harrogate and Knaresborough; and in its course, it is said, will benefit not only those towns but Wetherby, Thorparch, Tadcaster, and even York.

IRELAND.

Dublin.—On Monday, Mr. Ford, one of the attorneys for the traversers, attended in the Court of Queen's Bench, and handed in joinders to the demurrer to the plea in the case of the *Queen v. O'Connell*. The Attorney-General said, he did not wish to put the traversers to any inconvenience, but no parties were authorized to hand in the rejoinders for the traversers, who should do so in person. He would, however, take it that they had done so, and move that the argument on the demurrer be taken on Tuesday morning. Mr. Ford submitted that the Attorney-General had no right to so move the Court. In the case of the *Queen v. Dungarvan and others*, there was a rule of Court, dated Nov. 2, 1842, that the parties having joined issue to the demurrer, the argument should be set down for argument the next term after, and that the paper books should be prepared for the Judges at the expense of the parties. In the present case, therefore, the Attorney-General could not, in the face of that rule, now move that the argument be proceeded with this term. The Attorney-General insisted on his right to proceed, and expressed a hope the Court would not make itself a party to these delays. Mr. Moore and Mr. Hatchell appeared for the traversers, and contended that the case could not be argued until next term. The Chief Justice said that the Court expected that the parties would be prepared in the morning. Mr. Ford complained that the traversers' briefs were not ready. The Chief Justice—That is your own fault. You have had four days, and you have been idling all that time. The Court will call the cases on tomorrow. Accordingly, on Tuesday the plea in abatement or rather the demurrer of the Crown to that plea, was called up for argument. The court was full at an early hour. All the traversers, save Mr. O'Connell, attended in person, and an appearance by attorney was taken for him. The Attorney-General commenced, and was followed in reply by Sir Coleman O'Loughlin and Mr. Moore, Q.C. The reply devolved upon Mr. Solicitor-General Green. The argument was conducted on both sides with calmness, and with scarcely any interruption from the Court. At the conclusion of the Solicitor-General's argument, the Chief Justice said that judgment on the case would be held over until the next morning. In consequence of this intimation the Court on Wednesday was crowded in every part from an early hour and the greatest anxiety was evinced to know the result. At 11 o'clock the Chief Justice entered the Court and was immediately followed by the other Judges. Mr. Steele was the first of the traversers who made his appearance and occupied a seat at the side bar. After the lapse of a few minutes the Attorney-General and Counsel on both sides having taken their places, the Chief Justice proceeded to give judgment at great length, stating that the question at issue had been argued with great ability on both sides, but after considering all the circumstances, he was of opinion that the plea of abatement was insufficient and that the demurrer should be held good. Mr. Justice Crampton, Mr. Justice Perrin, and Mr. Justice Burton followed, expressing their entire concurrence in what had fallen from the Chief Justice. The Attorney-General said it remained then for him to move that the traversers be called on their recognizances to appear and to plead instantly. This was opposed by the counsel for the traversers on the ground that they were entitled to a four-day rule. The arguments on both sides were purely technical, and of no interest to the public. The Chief Justice said that Mr. O'Connell had had a copy of the indictment—he had been charged with the indictment a fortnight ago, and there was no statement that he was not aware of the subject-matter of that indictment or that he did not under-

stand it. He had now to plead not guilty or to enter a general demurrer, whichever course he may be advised to adopt. But while in this application he admitted the discretion of the court, he withheld any case for the exercise of that discretion. It was the unanimous opinion of the Bench that no case had been made out why the justice of the country should be delayed and the Attorney-General be refused the answer he made to the indictment. Mr. O'Connell must therefore plead *instantur*. The Attorney-General then required that the traversers should be called on their recognisances to appear and to plead forthwith. The traversers were then called on by the Clerk of the Crown. They respectively answered to their names. Mr. O'Connell sat at the side bar. His plea was first handed in. The following is a copy:—"In the Queen's Bench, Crown Side.—Daniel O'Connell and others, at the Prosecution of the Queen.—And the said Charles Gavan Duffy, in his own proper person, comes into Court here, and having heard the said indictment read, says that he is Not Guilty of the premises above laid to his charge, or of any of them, or of any part thereof. And of this he puts himself upon the country, and so forth.—Thomas O'Hagan; Peter M. E. Gartlan, attorney." Similar pleas were handed in for all the other traversers. The Attorney-General then said that notices should that evening be served on each of the traversers of his intention to apply to the Court on Friday to fix a day for the trial of this case at bar in this Court in the ensuing vacation, under the statute 4th William IV.—Sunday last was the day appointed for collecting Mr. O'Connell's tribute, and the result proved that the Dublin returns alone amounted to treble the average of the five previous years, the sum collected being no less than 3,577*l.*—The Roman Catholic Archbishops and Bishops of Ireland assembled at their annual conference in this city last week, resolved for the third time within seven years to publish a decided declaration against a state provision for the clergy, in any form whatever. They state that their determination remains the same as in 1837 and 1841, when a similar proposal was brought forward; and that they unanimously pledge themselves to resist by every influence they possess every attempt that may be made to make any state provision for the Catholic clergy, in whatever shape or form it may be offered.—The weekly meeting of the Repeal Association took place on Monday. Mr. O'Connell opened the proceedings by referring to the determination of the Roman Catholic prelates in reference to a State provision, and moved resolutions approving of their conduct, declaring that the laity will support them on the ground "that the control of the Church by the State is calculated only to degrade and contaminate the sacred offices of religion, to diminish the utility of the clergy, and to introduce hirelings into the place of the sainted pastors of faithful flocks,"—and "that all the bribes of England could not purchase off one single Catholic clergyman from the people throughout their entire isle." These resolutions were passed by acclamation. Mr. O'Connell handed in 103*l.* 15*s.* from Providence, Rhode Island; 24*l.* 4*s.* 4*d.* from Canada; 21*l.* from Maine, Portland; and 23*l.* 11*s.* 5*d.* from Mexico, the first remittance. At this stage of the proceedings a messenger from the courts informed Mr. O'Connell and the other traversers who were present that they were wanted in court. Mr. O'Connell immediately left the meeting, stating, amidst much laughter, that he would be back as soon as possible. Mr. D. O'Connell, jun., asked if Mr. Ray would have to go? Mr. O'Connell replied, amidst renewed laughter, "Oh! all the conspirators." Those of the "nine" who were present then left the hall, and proceeded to the Court of Queen's Bench. Mr. O'Connell returned in about an hour, and having addressed the meeting on the subject of a federal Parliament, in reply to an address from Mr. Sturge, announced the weekly rent to be 932*l.* 19*s.* 6*d.*—Archdeacon Bathurst, son of the late Bishop of Norwich, has sent his name to Mr. O'Connell as a Repealer, "so far as a substitute can be found in a federal union," and announcing his willingness to support him in "any lawful measure to effect a simple Repeal."—The Historical Society, conspicuous in the annals of Irish eloquence, and which, after an existence of half a century, was dissolved in 1815, was revived on Friday night. The Provost was in the chair. The opening address was read by Mr. W. C. Magee, ex-scholar and grandson of the late archbishop. The revival of this society, said to be the cradle of the genius of Burke, Grattan, Plunket, Bushe, Curran, Croker, North, Perrin, Doherty, and many others, suggests interesting reflections; and the address of Mr. Magee, when published, will afford ample gratification upon the subject of its history.

Finoe.—The last accounts from the scene of the late outrage at this place state that Mr. Waller is not yet out of danger, and that Miss Vereker died on Tuesday morning. An inquest has been held on the body of the unfortunate lady, at which the following verdict was returned: "Died in consequence of wounds inflicted by some person or persons unknown." Mrs. Waller has recovered, but Mr. Braddell's case is still precarious. A letter from Limerick states that the writer was at Skinrone ten days before the attack, and then heard it reported as an event that had taken place. The writer says, "I heard that Mr. Waller had been attacked, when he and his family were at dinner, and the report went on to say, that when the men fired at Mr. Waller, his servant rushed at him (the man that fired) with a carving knife in his hand and secured him. The cause alleged for the attack was revenge of a servant who had been dismissed. I was afterwards, on Monday week, in the neighbourhood of Finoe, and heard that the report was false; but I think it proves that the attack was planned, and even the very time it was to take place, and also that it was well known through the country."

Limerick.—The *Limerick Reporter* of Friday states that "the hills and mountains of the adjoining counties of Limerick, Kerry, Tipperary, and Clare were again illuminated on Thursday night, and the whole country was a blaze of light, extending over a distance of at least fifty miles. The cause of this wide-spread illumination of hill and mountain and valley is the news which reached here of Mr. O'Connell's plea of abatement being received, and his subsequent triumph over the law officers of the Crown. No sooner does intelligence of good or evil arrive from the metropolis than it spreads to the inhabitants of the mountains, and is communicated instantly nearly throughout the entire province by means of these signal fires."

Kilkenny.—"This county," remarks a local paper, "and we presume the counties adjoining, were studied with bonfires or signal-fires on Thursday night; not only were the hills illuminated, but in numerous places fires were visible along the lowlands. Rumours of various kinds are afloat as to the cause, but it is supposed they were lighted in consequence of the motion for a postponement of O'Connell's trial having succeeded."

Tipperary.—A local paper of Friday states that "The entire country was literally in a blaze last night. On every eminence as far as the eye could reach fires blazed, and the yells of those who surrounded them could be heard, in many instances, in the vicinity of our town. As we remarked upon a similar circumstance before, the most perfect organization was observable in the lighting of those fires. All blazed forth almost at the same minute, and it was stated that the object of the incendiaries was to infuse dread and awe into the minds of the respectable portion of society by an exhibition of their discipline and good understanding. The fires and yells of last night reminded one more of a country of savages than of civilized human beings."

Cavan.—These mysterious but significant fires have at length extended to the north. On Wednesday evening, at about 7 o'clock, the inhabitants of Mount Nugent were thrown into a state of the greatest alarm by a simultaneous appearance upon the hills of fires blazing in immense numbers, forming a circuit of several miles, accompanied by firing of shots and shouting. At Belurbet the town and neighbourhood were thrown into a state of great excitement, in consequence of fires blazing in every direction as far as the eye could reach. They commenced about 9 o'clock, and from that time fire answered fire in quick succession, till the whole surrounding country was illuminated. Shots were heard from hill to hill, and several Protestant families fled into the town for protection. A constable and three policemen went off to the nearest fire, distant nearly two miles, to learn the nature of the movement, and when they came near to it they saw a large party of men whom they desired to disperse; but they refused, and a shot was fired at the party, upon which the constable and his party rushed upon them, when they all retreated. Two of them were captured, and they got upon the ground a pike, a shovel, and a pitchfork about 10 feet long. The police brought their prisoners and their trophies with them into the town. Soon after Mr. Gumley, J.P., took with him out of barracks a company of the 60th Rifles, commanded by Capt. Thomas; but they could not obtain any trace of the former party, and returned.

King's County.—On Thursday night simultaneous fires blazed on the hills around Clara and as far as the eye could reach,—horns sounded and many shots were fired. The shouting and yells within the town were incessant for many hours, and repeated challenges were given "for any Tory to show his face." The fires and other disturbances, which with marching and counter marching continued throughout the night, are openly avowed to have been illuminations and rejoicings for O'Connell's victory over the Government on Wednesday week in the Court of Queen's Bench. The peasantry ridicule the idea of his being forced to a trial at all, but state that even if he be the Government will soon get enough of it, for that O'Connell has the means of protracting it for years.

Meath.—The neighbourhood of Dunsany, Killeen, Kilmissen, Dunshaughlin, and the far-famed Tara, in the county of Meath, exhibited the same demonstration of fires and shoutings as other places on Thursday evening.

SCOTLAND.

Edinburgh.—Lord Meadowbank has resigned his office as one of the Lords of Justiciary and Session. Mr. Alexander Wood has succeeded him as Lord of Justiciary, and Mr. Patrick Robertson has succeeded him as Lord of Session. The situation of Dean of Faculty, vacant by the promotion of the latter gentleman, has been conferred on Mr. Duncan McNeil, the Lord Advocate.—We learn from the *Scotsman* that the working men of Edinburgh have commenced a movement to establish baths on a large scale for their own use in that city. They are to hold a public meeting under the auspices of Lord Dumferline, who with many leading men in Edinburgh have resolved to encourage the project.

Glasgow.—The election of Lord Rector took place last week. The public are aware that although an election to the rectorial chair takes place annually, the Lord Rector is generally allowed to remain in office for two years, his re-election the second year being almost regarded as a matter of course. On the present occasion, however, a large portion of the students resolved, in consequence of Mr. Fox Maule having ceased to be a member of the Church of Scotland, to adopt measures for his expulsion, and for the election of a person entertaining sentiments more in accordance with their own, and the Earl of Eglintoun was accordingly fixed upon as the opposing candidate. The result was Mr. Maule's return by a majority of 59; the numbers being for Lord Eglintoun, 187; for Mr.

Maule, 246.—At a meeting of the Senate of the University, on the 7th inst., resolutions advocating the abrogation (except in the case of divinity professors) of the Act requiring professors to subscribe the Westminster Confession of Faith, and to conform to the worship and discipline of the Church of Scotland were adopted. This Act was passed for the purpose of preventing the possibility of an Episcopalian holding a Professorship in Scotland, and it is one of the peculiarities of the present movement, that it especially refers to the admission of Episcopalians as well as Dissenters. The 14th resolution states "That it is scarcely necessary to remark that the enforcement of a law which would have deprived this University of the services of the many distinguished members of the English Church who have filled these offices here, could produce no beneficial influence on education."

Miscellaneous.

American Repudiation.—Gen. Duff Green, an American officer now in England, published a few days since in the *Times* a reply to the Rev. Sidney Smith's letter on American Repudiation. On that attempt to defend the conduct of the non-paying States the *Times* itself commented with considerable severity; but Mr. Smith has since entered the field with the following characteristic letter:—"To the Editor of the *Morning Chronicle*. Sir,—Having been unwell for some days past, I have had no opportunity of paying my respects to General Duff Green, who (whatever be his other merits) has certainly not shown himself a Washington in defence of his country. The General demands with a beautiful simplicity, 'Whence this morbid hatred of America?' But this question, all affecting as it is, is stolen from Pilpay's fables:—'A fox,' says Pilpay, 'caught by the leg in a trap near the farm-yard, uttered the most piercing cries of distress; forthwith all the birds of the yard gathered round him and seemed to delight in his misfortune; hens chuckled, geese hissed, ducks quacked, and chattering, with shrill cockadoodles, rent the air. 'Whence,' said the fox stepping forward with infinite gravity, 'whence this morbid hatred of the fox? What have I done? Whom have I injured? I am overwhelmed with astonishment at these symptoms of aversion.' 'Oh you old villain,' the poultry exclaimed, 'where are our ducklings? where are our goslings? Did I not see you running away yesterday with my mother in your mouth? did not you eat up all my relations last week? You ought to die the worst of deaths—to be pecked into a thousand pieces.' " Now hence General Green comes the morbid hatred of America as you term it. Because her conduct has been predatory—because she has ruined so many helpless children, so many miserable women, so many aged men—because she has disturbed the order of the world, and rifled those sacred treasures which human virtue had hoarded for human misery. Why is such hatred morbid? Why, is it not just, inevitable, innate? Why, is it not disgraceful to want it? Why, is it not honourable to feel it? Hate America!!! I have loved and honoured America all my life; and in the *Edinburgh Review*, and at all opportunities which my trumpety sphere of action has afforded, I have never ceased to praise and defend the United States; and to every American to whom I have had the good fortune to be introduced, I have proffered all the hospitality in my power. But I cannot shut my eyes to enormous dishonesty; nor, remembering their former state, can I restrain myself from calling on them (though I copy Satan) to spring up from the gulf of infamy in which they are rolling.

"Awake, arise, or be for ever fallen."

I am astonished that the honest States of America do not draw a *cordon sanitaire* round their unpaying brethren; that the truly mercantile New Yorkers, and the thoroughly honest people of Massachusetts, do not in their European visits wear a uniform with "S. S., or Solvent States," worked in gold letters upon the coat, and receipts in full of all demands tambered on the waistcoats, and "our own property" figured on their pantaloons. But the General seems shocked that I should say the Americans cannot go to war without money. But what do I mean by war? Not irruptions into Canada—not the embodying of militia in Oregon, but a long tedious maritime war of four or five years' duration. Is any man so foolish as to suppose that Rothschild has nothing to do with such wars as these? and that a bankrupt State, without the power of borrowing a shilling in the world, may not be crippled in such a contest? We all know that the Americans can fight. Nobody doubts their courage. I see now in my mind's eye a whole army on the plains of Pennsylvania in battle array, immense corps of insolvent light infantry, regiments of heavy horse debtors, battalions of repudiators, brigades of bankrupts, with *Vivre sans payer, ou mourir* on their banners, and *are alieno* on their trumpets; all these desperate debtors would fight to the death for their country, and probably drive into the sea their invading creditors. Of their courage, I repeat again, I have no doubt. I wish I had the same confidence in their wisdom. But I believe they will become intoxicated by the flattery of unprincipled orators; and instead of entering with us into a noble competition in making calico (the great object for which the Anglo-Saxon race appears to have been created), they will waste their happiness and their money (if they can get any) in years of silly, bloody, foolish, and accursed war, to prove to the world that Perkins is a real fine gentleman, and that the carronades of the Washington steamer will carry farther than those of the Britisher Victoria or the Robert Peel vessel of war. I am accused of applying the epithet 'repudiation' to States which have not repudi-

ated. Perhaps so; but then these latter States have not paid. But what is the difference between a man who says "I don't owe you anything, and will not pay you," and another who says "I do owe you a sum," and who having admitted the debt never pays it? There seems in the first to be some slight colour of right, but the second is broad, blazing, refulgent, meridian fraud. It may be very true that rich and educated men in Pennsylvania wish to pay the debt, and that the real objectors are the Dutch and German agriculturists who cannot be made to understand the effect of character upon clover. All this may be very true, but it is a domestic quarrel. Their churchwardens of repudiation must make a private rate of infamy for themselves—we have nothing to do with this rate. The real quarrel is the Unpaid World *versus* the State of Pennsylvania. And now, dear Jonathan, let me beg of you to follow the advice of a real friend, who will say to you what Wat Tyler had not the virtue to say, and what all speakers in the eleven recent Pennsylvania elections have cautiously abstained from saying, "make a great effort; book up at once and pay." You have no conception of the obloquy and contempt to which you are exposing yourselves all over Europe. Bull is naturally disposed to love you; but he loves nobody who does not pay him. His imaginary paradise is some planet of punctual payment, where ready money prevails, and where debt and discount are unknown. As for me, as soon as I hear that the last farthing is paid to the last creditor, I will appear on my knees at the bar of the Pennsylvania Senate, in the plumeopiean robe of American controversy. Each conscript Jonathan shall trickle over me a few drops of tar, and help to decorate me with those penal plumes in which the vanquished reasoner of the Transatlantic world does homage to the physical superiority of his opponents. And now, having eased my soul of its indignation, and sold my stock at 40 per cent. discount, I sulkily retire from the subject, with a fixed intention of lending no more money to free and enlightened republics, but of employing my money henceforth in buying up Abyssinian bonds and purchasing into the Turkish Fours, or the Tunis Three-and-a-Half per Cent. Funds.—SYDNEY SMITH.

Law.

ROLLS COURT.—*The Duke of Brunswick v. The King of Hanover.*—This suit was instituted by the Duke of Brunswick against the King of Hanover, praying that an instrument which had been executed by the *agnati* of the family, appointing the King of Hanover curator of his estates, property, and effects, might be declared void, and to obtain an account of the receipts and payments. Upon receiving the letters missive the defendant applied to the Lord Chancellor to recall them, but the application was refused, upon which his Majesty filed a demurrer to the bill for want of equity, and denying that the court had any jurisdiction. It appeared that in 1830 the plaintiff, who was then Duke of Brunswick, was deprived of his duchy by a revolutionary movement. The Duke of Cambridge was then Viceroy of Hanover. At a convention of the Germanic Diet on the 2d December, 1830, they made a decree inviting the plaintiff's brother William to take upon himself the government provisionally, but the Diet left it to the legitimate *agnati* of the family to provide for the future government of the Duchy. His Majesty William IV., as King of Hanover, was a member of the Diet; and he and the Duke of Cambridge, in 1831, claimed to be the legitimate *agnati* of the family, and caused a declaration to be published deposing the plaintiff, and recognising William, plaintiff's brother, as Duke of Brunswick. On the 14th March, 1833, an instrument was signed by his Majesty William IV., and by William Duke of Brunswick, stating that, yielding to a painful necessity, they thought it necessary to consider what measures the interests might require, that the powers of supreme guardianship over the princes of the empire had, after the dissolution of the German empire, devolved to the heads of Sovereign states. They therefore decreed that, having arrived at the conviction that the Duke was at that time wasting the fortune which he possessed in enterprise alike impossible, and dangerous both to himself and other persons, in seeking to damage the just claims which certain persons interested now and hereafter might legally have upon his property, they therefore considered that the only method of preserving his fortune from ruin was to appoint a guardian over him. They therefore decreed that the Duke should have a guardian over him; and that he should be chosen from amongst the noble male scions of their house. It then appointed the Duke of Cambridge curator, which office he accepted, and took possession of the real estates of the plaintiff in Brunswick, Hanover, France, and England, and of all his private property. Upon the death of his Majesty William IV., in June, 1837, the Duke of Cambridge transferred his office of curator to the Duke of Cumberland, who had become King of Hanover, and accounted to him for the receipts and application of the income which had arisen from the estates of the plaintiff. The defendant after this took possession of the estates and property of plaintiff, but rendered no account, and until his late visit to England had resided out of the jurisdiction of the Court. It was insisted that the appointment of a guardian was void by the laws of Brunswick, Hanover, and Great Britain. The plaintiff was domiciled in England, and both he and the defendant were subjects of the Crown of Great Britain, and asked for relief. Sir C. Wetherell said that some ingenuity had been exerted to bring the defendant within the jurisdiction of this Court, and for that purpose he had been styled Duke of Cumberland and Teviotdale, and Earl of Armagh. The defendant demurred to this bill; he did not think fit to resign the title of King, and accept the bill in the character of a Duke. An application had been made to the Lord Chancellor to recall the letters missive, and the cause appeared to be one in which the Lord Chancellor, who had carried his authority to the utmost, could have stopped the suit *in limine*. The suit was instituted upon a transaction out of the reach of the jurisdiction of the Court, and the suit ought to be stopped upon the grounds of general reasoning and constitutional principles, as the impropriety of the suit was self-evident. Upon the refusal to recall the letters missive the present demurrer was filed. It was a maxim that the King could not be sued, and the present Sovereign could not be detained or sent to gaol; in his person the country he governed was punished; the Sovereign could not be suspended; in fact, the *Homo* and *Reus* could not be separated. He was the physical man and the metaphysical Government. There was a tale, in olden time, of a King of Scotland who did not get back to his country so early as he wished, but this was a solitary case. The statute passed in the time of Queen Anne upon this occasion the Czar had almost put the country under an anathema for daring to violate his person in that of his ambassador. Where was the authority that a sovereign could be sued, and by what authority was he made subject to a Judge's writ? The subject of the suit was not here, but in Brunswick, but the suit was in this court, not upon a transaction in England, but upon a foreign trust. There were some doubts whether upon transactions which were undertaken by virtue of proceedings

in a foreign court the accidental coming to this country of the party gave this court the power of administering that trust. But a sovereign either came or was supposed to come here upon a safe-conduct, and though in effect it was not issued, still it existed in principle, and he was entitled to the benefit of it. There were many forms of such documents upon the register, and both a sovereign and an ambassador could claim to have the document made out. He submitted, therefore, that the demurrer must be allowed. Mr. Pemberton Leigh and Mr. Elmsley followed on the same side. Mr. Turner, for the plaintiff, argued that the appearance of the defendant was an admission that he had been properly brought into court, and he could not afterwards allege that the process which he had obeyed was of no effect. When summonses were served in a foreign country before the act on that subject, the course was not to appear and afterwards to demur, but to enter an appearance conditionally if the Court should be of opinion the service was regular. Unconditional appearance was a waiver of objection, but here the King of Hanover did not appear until he had applied to the Lord Chancellor to discharge the letters missive to him, when he contended that he was not bound to appear; but the Lord Chancellor thought that the process was properly issued. The defendant's course to try whether he was bound by the proceedings, should have been to enter a conditional appearance with the register, and apply to the Court to be relieved. Where there existed a right there also existed a remedy, and upon objection to the jurisdiction of superior courts, the objector must show where the jurisdiction was. There was no right in the defendant to raise by demurrer an objection to his own personal capacity of being sued. Supposing it, however, to be competent for the defendant to raise the question whether he could be sued in equity, the considerations were what the rights and privileges of Sovereigns were, from what principle they arose, and upon what their exercise was founded. The rule was that the Sovereign of this kingdom could only be sued by petition of right. Whether that was always the rule might be doubted in a passage of 16 Vin. 535, title, "Prerogative," where it was said, "that in the time of Henry III., and always before, a man might have sued the King as a common person might be sued; but Edward I. ruled that none should sue the King but only petition him." It, however, was not now important to consider whether at common law the King could or could not have been sued; the Crown could now only be sued by petition of right. The principle was this—It is by command of the Crown that subjects do justice to one another, the writ issuing from the Queen, the fountain of justice, who cannot issue the writ against herself or command herself to do justice to another person. The exemption was founded, not upon personal right, but upon the mode of administering justice upon the technical form. That objection was not applicable to a foreign Sovereign, whose exemption, if he could not be sued, must arise from his personal privilege in his own dominions, or from some difficulty or defect in the mode in which the process must be executed. With reference to his privilege in his own dominions, if a subject of England asserted a right against him, it was said that right could not be maintained in our courts, because of the privilege to which he was entitled by the laws of his own kingdom; that it would be a conflict of jurisdiction between a right existing in British subjects and a right existing in the foreign Sovereign. Upon principles of international law, and on the comity of nations, no country was bound to regard the privileges of other countries so as to interfere with the rights of their own nation. Justice was not to be administered otherwise than in the most decorous manner towards the Sovereigns or subjects of foreign countries, but it was a right to be administered, and a right which every Government yielded to its own subjects in preference. The learned counsel cited Storey's *Conflict of Laws*, and argued at length that there was no personal incapacity founded either upon principle or authority of the defendant to be sued, who if not sued in this country could not be sued anywhere else, and no other jurisdiction was attempted to be shown. He then went through the facts stated in the bill, contending that the deed of curatorship of 1833 was, as stated by the bill, wholly void, was so admitted by the demurrer, and that the suit related not to affairs of state, but to the personal property of the plaintiff, who was entitled to an account. Mr. Heathfield followed on the same side, and argued that the refusal of the Lord Chancellor to recall his letters missive, was a decision that the process was right, and that the Court had jurisdiction over the defendant, who, by taking the oath of allegiance, had submitted himself to the laws of this country. The suit was against the defendant, not as King of Hanover, but as curator of the plaintiff. Neither was the subject-matter of the suit an act of state, but one of forensic jurisdiction for an account, to which the plaintiff was entitled.—Sir C. Wetherell was heard in reply, after which Lord Langdale said the circumstances were extraordinary, and as much learning had been brought to bear upon the case, he should not decide it without full consideration.

BAIL COURT.—*The Queen v. the Judge of the Arches Court.*—Mr. Rogers, Q.C., applied for a rule, calling upon the Judge of the Arches Court of Canterbury to show cause why a writ of prohibition should not issue to stay all further proceedings in a case now pending in that court under the name of "The office of Judge promoted by Titmarsh v. Chapman." The facts of the case were given in our last. The foundation of Mr. Rogers's present application for the prohibition was, that the construction put by the Judge of the Arches Court upon the 20th section of the statute of Victoria was erroneous. The offence of the vicar, as the learned counsel contended, was not the "refusal" to hurry, but the non-burial; and this offence was complete when the vicar did not bury upon the first request. If this view were correct, the statute protected the defendant against the present suit, and the judgment of the ecclesiastical court refusing to admit the defence was erroneous. Mr. Justice Wightman thought that the judgment of the ecclesiastical court proceeded upon the ground either that there was a continuing offence between, and including the first and second refusal, or that the second refusal was in itself, in the circumstances, a distinct offence against the 68th canon. The question was one of ecclesiastical cognizance; and if the judgment of the court was erroneous upon the point, the proper mode of proceeding was by appeal to an ecclesiastical court of a higher nature. Upon this ground his Lordship declined to accede to the application.

COURT OF QUEEN'S BENCH.—*The Queen v. M'Neil.*—The Attorney-General prayed the judgment of the Court on the defendant, for an assault committed on Mr. J. A. Smith, the banker. The particulars of the case have been long before the public, and the arguments on both sides involved so many questions of detail, that it is impossible to give a complete abstract of them. Mr. Smith and Mr. M'Neil had business transactions together, and the latter failed. Mr. Smith called Mr. M'Neil a swindler; and Mr. M'Neil, after writing a letter requesting an explanation, without effect, horsewhipped Mr. Smith in the street. Mr. Kelly, for the defence, said that this question was not now whether the defendant had rendered himself amenable to the law, for that he had confessed by his plea of guilty; but whether the prosecutor had not so far misconducted himself as to have deprived himself of all right to come to this Court and ask for an aggravated punishment upon the defendant. He submitted, with confidence, that the prosecutor had no such right. The provocation given to the defendant was very serious. His character had been wantonly, and without any justification, slandered by the prosecutor. The first idea that the defendant had was to obtain an explanation. To that only was his first letter addressed. Lord Denman—We are perfectly clear that the original letter was written without the slightest idea of provoking a quarrel. We think it right at once to relieve the defendant from that part of the case. Mr. Kelly was most happy to hear the Court express this opinion. He must add, that if the prosecutor sincerely and calmly believed the expressions he had uttered, he knew that, without any quarrel, and quite in accordance with the rules of society, and the customs prevalent among gentlemen, he could have maintained his assertion, and maintained it without danger. The prosecutor could

not have believed the charge, for otherwise he would have stated this at the time that the defendant sought for his certificate. Lord Denman—The commissioner expressly refused to withhold the defendant's certificate, saying that there was nothing in the defendant's conduct which would justify such a course. Mr. Kelly said that it was so. Well, then, there could be no doubt that the prosecutor had improperly met the first request for an explanation by sending the defendant's friend to an attorney. It was said that the defendant ought to have brought an action, but the words spoken did not afford the defendant the means of action. Mr. M. Chambers followed on the same side, and after a long argument Lord Denman said that as this was an unusually complicated case, it would be better to let it stand over, for the Court could hardly be expected to deal with all the affidavits satisfactorily without again looking into them. Judgment would therefore be postponed.

[Sittings in Banco.]—*The Queen v. Gregory.*—Mr. Sergeant Taound showed cause against a rule obtained by Mr. Sergeant Shee on the part of the defendant, the proprietor of the *Saturday*, for a *certiorari* to issue, directed to the commissioners of the Central Criminal Court, commanding them to send up to this Court certain indictments preferred there by Mr. Vallance and the Duke of Brunswick against the defendant for a libel and conviction thereon. After a long argument on technical points, Lord Denman said that there had not been sufficient cause shown to induce the Court to say that the defendant was entitled to the exercise of their Lordships' discretion in his favour. He found that, besides the indictment in this Court, there were two other indictments against the defendant, and he must say that that fact was at the very best a most equivocal reason for granting any indulgence at all to the defendant. In the September sessions of the Central Criminal Court, the Judges there had thought it inexpedient to pass sentence on the defendant, because they were in doubt whether affidavits could be read and counsel heard on the matter. The Judges had afterwards declined to hear counsel there, and there could be no doubt that their Lordships were right in that decision. It was an *invariable* practice, and the criminal justice of the country could not move at all if such a practice was permitted in the criminal courts. In this Court the Judges had opportunities of informing their own minds by affidavits put in after the trial, and by hearing addresses of counsel on those affidavits. In this Court there was an indictment against the defendant, in which the prosecutor was entitled to ask for judgment, and he was entitled to have it with out waiting till those proceedings which were pending in the Central Criminal Court had terminated. Whatever Court should first pass sentence on the defendant, its sentence would be looked at by the Court that next proceeded to pass sentence on him, and due allowance given in the one for the other, so that there would be no difficulty except what was raised by the discussion of some irregular matter. The rule in this case might therefore be discharged, and would be discharged as to the Duke of Brunswick, who had shown cause against it; but as to Mr. Vallance, who being an officer of the Court had submitted to do what the Court might think convenient, it would be made absolute on the conditions proposed by his counsel.—Rule accordingly.

The Queen v. Burnby.—In this case an indictment had been preferred against the defendant for perjury, alleged to have been committed by him in the course of some examinations taken by the Commissioners of Customs under the 3d and 14th William IV. A rule had been obtained calling upon the prosecutor to show cause why this indictment should not be quashed or further proceedings stayed. Mr. Cockburn and Mr. Chambers showed cause against the rule, and the Attorney-General, Mr. Thesiger, and Mr. Jarvis, supported it, on the ground that the indictment must contain an averment that it was preferred by the authority of the Commissioners of Customs. The arguments were purely of a technical character. Lord Denman and the other Judges decided that they ought not to interfere in defendant's favour, and that the rule ought not to be made absolute. The rule was therefore discharged, but without costs.

SPORTING.

TATTERSALL'S, THURSDAY.—PRIZE.—600 to 100 agst Scott's lot (taken); 450 to 50 agst Mr. John Day's The Ugly Duck (taken); 250 to 1 agst Mr. Quinn's Lostone; 500 to 15 agst Mr. Heathcote's Leander; 1250 to 50 agst Sir G. Heathcote's Camphor (taken); 1000 to 25 agst Mr. Irwin's Foig-a-Ballagh (taken); 1000 to 25 agst Mr. Goodnan's Roaming Rein (taken); 1000 to 20 agst Mr. Watt's Voltri (500 to 20 also taken); 500 to 10 agst Mr. Herbert's Delightful colt (taken); 1000 to 15 agst Mr. Onley's King of the Gipsies (taken); 1000 to 15 agst Mr. Maffam's Dr. Phillimore (taken); 1000 to 10 agst Lord Normanby's Lorimer, 5000 to 100 agst Ed. Westminster's Laura colt.

MARK LANE, FRIDAY, NOVEMBER 24.—Since Monday the supplies of English Wheat have been very indifferent, and prices continue as on that day. Foreign is taken off very slowly at the same rates, and although there have been some sales effected, free on board, during the last fortnight, there did not appear to be much doing to-day.

BANKRUPTCY SUPERSEDED.—J. and R. DAVIES, Chiswell-st., drapers. **BANKRUPT.**—J. M. WINTER, Drury-lane, silversmith.—H. W. DIAMOND, Fifth-street, Westminster, surgeon.—R. BURDENS, Alton, Southamptonshire, plumber.—J. BALL, St. George's-place, Hyde Park Corner, tailor.—G. Z. WHITE, Southampton, stonemason.—J. D. HIXMAN, Harley-street, (avoided), square, wine and fruit.—C. D. LEEDER, Billington, Norfolk, cattle-dealer.—E. P. BIER, South-east-hills, City, wine-merchant.—A. A. NEWMAN, High-street, White-chapel, saddler.—S. JONES, Chesapeake, City, jeweller.—J. COULSON and H. PHIPPS, Clement's-lane, City, shipping-innkeepers.—H. H. FISHER, Bury-street, St. James's, tailor.—J. W. BARR, Bristol, carrier.—H. HARRIS, L. GARRAVON, Monmouthshire, shoemaker.—J. MAY, Pickwick, Wiltshire, v. GARRAVON, North Cerney, Gloucestershire, farmer.—C. F. DAWSON, Brimingham, victualler.—M. RAHMAN and A. NATHAN, Kingston-upon-Hull, silversmiths.—E. LOCKER and A. DICKSON MILLS, Lawrence Pountney-hill, and Redditch, Worcestershire, needle-manufacturers.—W. ROYCE, Thetford, Hertfordshire, farmer.—C. LEAF, W. d-street, (avoided), water-hoiser in G. B. CHURCH, Hornsey, china-dealer.—J. SNEY, Marsh-place, Old Kent-road, draper.—C. CHAPMAN, Croydon, stationer.—J. A. HORMES, New Broad-street, merchant.—D. DROB, Lower Clapton, Middlesex, t. m-dealer.—J. BROWN, jun., Fydey Monmouthshire, ironmonger.

BIRTHS.—On the 21st inst., at Stafford-house, the Duchess of Sutherland, of a son.—On the 16th inst., at Pear. Lily, near Southampton, the Hon. Mrs. HARRIS, of a son.—On the 19th inst., in Chesham-place, the Hon. Mrs. ARUNDAL and SURREY, of a daughter.—On the 14th inst., the Lady of the Rev. F. FROST, Pembroke-place, Cambridge, of a son.
MARRIED.—On the 13th inst., at Cheltenham, H. A. SHUCKENBURY, Esq., Captain of the 4th Regiment, Bengal Native Infantry, to SARAH ELIZABETH, daughter of the late W. DWARREN, Esq., of Golden Grove, Jamaica.—On the 7th inst., the Rev. C. R. DAVE, to CATHERINE AUGUSTA, youngest daughter of A. PEARCE, Esq., of Hurdott, Wilts.
DIED.—On the 25th inst., at T. Quay, Sir J. T. LEE, G. C. H., Magistrate and Deputy-Lieutenant for Middlesex, Hants, Devon, &c., aged 50. On the 17th inst., at Hampton, aged 3 years, RICHARD BRYANT, third son of Sir W. FOLLIES, M.P.—On the 20th inst., at 32, Red Lion-square, MARY, wife of S. TUBBS, of Winchmore-hill, Esq., in her 67th year.—On the 19th inst., at Bersted Lodge, Bognor, the Countess of MAXO.

WITH THE APPROVAL OF THE LORDS COMMISSIONERS
OF HER MAJESTY'S TREASURY.

COMPLETION OF THE ZOOLOGY OF THE "BEAGLE."

Just completed, in 5 vols. bound in cloth, or in half morocco or
Russia, at a small addition to the price,

THE ZOOLOGY OF THE VOYAGE OF H.M.S. "BEAGLE,"

UNDER THE COMMAND OF CAPTAIN FITZROY, R.N.,
DURING THE YEARS 1832 to 1836.

Edited and Superintended by CHARLES DARWIN,
M.A., F.R.S., V.P.G.S., Naturalist to the Expedition.

Comprising highly-finished representations of the most
novel and interesting objects in Natural History, col-
lected during the Voyage of the "Beagle," with de-
scriptive Letterpress, and an account of the habits and
ranges.

CONTENTS OF THE VOLUMES.

FOSSIL MAMMALIA, by RICHARD OWEN, Esq., F.R.S.
Plain Plates, 14. 14s.

MAMMALIA, by R. WATERHOUSE, Esq. Coloured, 24. 2s.

BIRDS, by JOHN GOULD, Esq., F.L.S. Coloured, 34.

FISH, by the Rev. LEONARD JENYNS, M.A., F.R.S.
Plain Plates, 14. 18s.

REPTILES, by THOMAS BELL, Esq., F.R.S., F.L.S.
Plain Plates, 14. 2s.

Each Volume is complete in itself, and may be had separately.

GEOLOGICAL OBSERVATIONS

MADE DURING

THE VOYAGE OF THE "BEAGLE."

IN THREE PARTS.

By CHARLES DARWIN, M.A., F.R.S., V.P.G.S.

Just published, in 1 vol. 8vo, price 15s., cloth,

PART I.—ON THE STRUCTURE AND DISTRI-
BUTION OF CORAL REEFS.

Nearly ready,

PART II.—ON THE VOLCANIC ISLANDS OF THE
ATLANTIC AND PACIFIC OCEANS.

(Together with a brief Notice of the Geology of the Cape of
Good Hope and part of Australia.)

PART III.—ON THE GEOLOGY OF SOUTH
AMERICA.

ELEGANT AND APPROPRIATE PRESENTS FOR CHRISTMAS, &c.

Just published, New Edition, beautifully bound, price One Guinea,

STANFIELD'S COAST SCENERY;

A SERIES OF

FORTY PICTURESQUE VIEWS IN THE BRITISH
CHANNEL AND ON THE COAST OF FRANCE,

FROM ORIGINAL DRAWINGS TAKEN EXPRESSLY FOR THE WORK,

By CLARKSON STANFIELD, Esq., R.A.

"It would be a sin against patriotism and good taste not to
possess oneself of a work so peculiarly national, and so exceed-
ingly beautiful."—*Metropolitan*.

In Imperial 8vo, price 21s., elegantly bound,

THE BYRON GALLERY;

A SERIES OF

THIRTY-SIX HISTORICAL EMBELLISHMENTS,
ILLUSTRATING THE WORKS OF LORD BYRON,

Beautifully Engraved from Original Paintings by Sir
Thomas Lawrence, H. Howard, Chalon, Westall, Sto-
thard, and other eminent Artists.

"Adequately to describe the delicate beauty of these splendid
plates, is not in the power of language. There is no other instance
in which excellence in Poetry and the Arts are so admirably
combined."

"THE FAVOURITE ANNUAL OF THE SEASON."

In large 8vo, price 12s., elegantly bound,

FRIENDSHIP'S OFFERING FOR 1844.

This long-established Annual now makes its appearance
in a new form and a new dress, the size being greatly
enlarged, and the list of Steel Engravings increased both
in beauty and number, with the farther addition of appro-
priate Wood Engravings and other embellishments. The
volume, thus changed in everything but the price, and the
genius and distinction of the Contributors, is justly styled
"the best and cheapest Annual of the season."

"We are much pleased with this Annual; it is every way
improved."—*Times*, Nov. 20.

London: SMITH, ELDER, & Co., 65, Cornhill.

HAND-BOOKS FOR THE PEOPLE.

THE HAND-BOOK OF GARDENING; expressly
intended for Persons possessing and fond of cultivating a
Garden of moderate size. Price 2s. cloth, a New and Enlarged
Edition.

THE HAND-BOOK OF BOTANY;
Or Linnæan Lessons on Common Plants, for Field and Garden
Practice. Price 2s.

THE HAND-BOOK OF AGRICULTURE;
Chiefly for the use of those interested in the Allotment System.
Price 1s. 3d.

THE HAND-BOOK OF COOKERY;
Intended for the use of the Middle Classes. Price 2s. cloth.

THE HAND-BOOK OF THE TOILETTE;
Having in view the union of Bodily Health with Beauty of Per-
son. Price 2s. cloth.

THE HAND-BOOK OF THE LAUNDRY;
Expressly intended for those who "wash at home." Price 1s. 9d.

THE HAND-BOOK OF MEDICINE;
Forming a Useful Manual in time of Need, when Professional Aid
cannot readily be procured. Price 2s. cloth.

THE HAND-BOOK OF NATURAL PHILOSOPHY.
Price 1s. 9d.

London: W. S. Orr & Co.: and W. & R. CHAMBERS, Edinburgh.

GLASS SUPERSEDED for HORTICULTURAL PURPOSES by
WHITNEY'S CHEMICAL TRANSPARENT
WATERPROOF COMPOSITION, rendering Muslin,
Calico, or Linen, for the Frames of Greenhouses, Pine, Melon, or
Cucumber Stoves, &c., impervious to rain or moisture, admitting
light equal to Glass, much warmer, and the plants never burn
under it.

The cheapness of this composition, its durability, and equal
utility with Glass, render it not only a useful but most impor-
tant article to Gardeners and Florists, as the expense of a two-
light Frame will not be so much as the annual cost for breakage
on a Glass one.

Noblemen, Gentlemen, and Gardeners will, by using this com-
position have the only effective protection for their Fruit-trees
during the blooming season; it is a certain defence from frost,
sleet, wind, and blight; its transparency admits the general
beams of the sun, with abundance of light, which causes the
bloom to expand with increased luxuriance, the fruit to set and
swell more freely, much earlier, and a crop of fruit to any extent
may be warranted. The covering not to be moved by day
(except to thin the Fruit, which will be necessary), till the month
of June. It is recommended that the Calico be prepared early,
so as to be thoroughly dry before using.

Sold in Bottles, with directions for use, pints, 2s. 6d., quarts,
4s. 6d. each. Prepared by GEORGE WHITNEY, Chemist, Shrews-
bury. Seedsmen, Florists, and Merchants supplied by Mr. W.
BAILLY, Chemist, North-street, Wolverhampton. Agents wanted
for London and the country.

COMFORT IN WET AND COLD.

NOW READY, FOR THE PRESENT SEASON.

BERDOE'S WINTER really WATERPROOF
WRAPPERS, FROCKS, DREADNOUGHTS, SHOOTING
JACKETS, &c., of first-rate character, and in great variety,
guaranteed without confining perspiration, to exclude any de-
scription or continuance of rain whatever, and bidding defiance
to all weathers. Those to whom superiority, cost, and effi-
ciency, are sine qua non, will not regret an inspection now,
(because, justified by the result of five years' extensive trial,) con-
fidently invited, nor subject themselves to disappointment and vexa-
tion. Made only by W. BERDOE, TAILOR, WATERPROOFER,
&c., 69, Cornhill (North side).

DRESS COATS, Superfine cloth, 30s. to 40s.; extra
quality, 50s.; Frock-coats, silk facings, 35s. to 45s.; ditto,
silk velvet collar and silk facings, 50s.; Waterproof Wrappers,
10s. 6d. to 21s.; fashionable York and Chesterfield ditto, 16s. to
25s.; Waistcoats, 5s. to 8s. 6d.; Silk, Satin, and Kerseymer, 10s.
to 14s.; Trousers, 8s. 6d. to 12s. 6d.; stout Doeskin and Kersey-
mere, 16s. to 25s.; Shooting Jackets, 10s. 6d.; Boys' and Youths'
Tunic and Hussar Suits, 30s.; a Suit of Superfine Black Cloth,
34. 3s.; best quality, 54.—At FISHER and Co.'s, 31, King William-
street, City, 10 doors from London-bridge.

ROWLAND'S ODONTO, or PEARL DENTIFRICE,
specially Patronised by Her Majesty the Queen, H. R. H.
Prince Albert, the Royal Family, and the several Courts of
Europe. A fragrant white powder, prepared from Oriental herbs
of inestimable virtue, for strengthening, preserving and cleansing
the teeth. It eradicates the factitious formation of tartar, and by
the removal of that extraneous substance lends a salutary growth
and freshness to the gums. It removes from the surface of the
teeth the spots of incipient decay, polishes and preserves the
enamel, substituting for discolour and the aspect of impurity,
the most pure and pearl-like whiteness; while, from its salu-
brious and disinfecting qualities, it gives sweetness and perfume
to the breath, bestowing at once cleanliness, and the appearance
and reality of health. Price 2s. 6d. per box, duty included.

CAUTION.—To protect the public from fraud, the Hon. Com-
missioners of her Majesty's Stamps have authorised the Pro-
prietors' Signature to be engraved on the Government Stamp,
thus:—A. ROWLAND & SON, 20, HATTON-GARDEN, which is
affixed to each box.

Ask for ROWLAND'S ODONTO; sold by them and by Per-
fumers and Chemists. All others are Spurious Imitations.

VALUABLE REMEDIES FOR THE AFFLICTED.

DR. ROBERTS'S CELEBRATED OINTMENT,
called the POOR MAN'S FRIEND, is confidently recom-
mended to the public as an unfailing remedy for wounds of every
description, a certain cure for ulcerated sore legs, if of 20 years'
standing, cuts, burns, scalds, bruises, chilblains, scorbutic eruptions,
and pimples in the face, sore and inflamed eyes, sore heads,
cancerous humours, &c., and is a specific for those afflicting
eruptions that sometimes follow vaccination. Sold in pots, at
1s. 14d. and 2s. 9d. each. Also his

PILULÆ ANTISCORPHULÆ,
confirmed by more than 40 years' experience to be, without ex-
ception, one of the best alterative medicines ever compounded
for purifying the blood and assisting nature in all her operations;
hence they are useful in scrofula, scorbutic complaints, glandular
swellings, particularly those of the neck, &c. They are efficacious
also in rheumatism, and form a mild and superior family aperient,
that may be taken at all times without confinement or change of
diet. Sold in boxes, at 1s. 14d., 2s. 9d., 4s. 6d., 11s., and 22s. each.

To those who cannot take pills, the proprietors would strongly
recommend Dr. Roberts's

ANTISCORBUTIC DROPS,

for the cure of the scurvy, scrofula, leprosy, and all scorbutic com-
plaints, they strengthen the constitution, purify the blood, and pro-
mote a circulation of the fluids; are gentle in their operation, and
do not require cessation from business. In bottles at 2s. 9d. each.

By the late Dr. Roberts's will Messrs. BEACH & BARNICOTT
(who have been confidentially entrusted with the preparation of his
medicine for many years past), are left joint proprietors of the
"Poor Man's Friend," "Pilulæ Antiscrophulæ," "Larwell's
Pills," "Medicated Gingerbread Nuts," and "Antiscorbutic
Drops," with the exclusive right, power, and authority to prepare
and vend the same.

The still increasing demand for the above medicines, from all
ranks, is the best and most substantial proof of their utility.

Observe.—No medicine sold under the above names can possibly
be genuine, unless "Beach and Barnicott, late Dr. Roberts, Brid-
port" is engraved and printed on the stamp affixed to each package.

MECH'S ELEGANCIES for PRESENTS and
for USE, manufactured on the premises, No. 4, Leaden-
hall-street, near the India-house, London, wholesale, retail, and
for export.—Ladies' and Gentlemen's Dressing-cases, in Leather,
Wood, and Papier-maché, from 100 guineas each down to 25s.;
Writing-desks, 25 guineas down to 12s.; Workboxes, 20 guineas
to 10s.; Ladies' Cabinet and Jewel-cases, assorted; Teacaddies,
the most elegant in the world, 12l. to 6l. each, down to 7s. 6d.;
Ladies' Papier-maché Workboxes, 10l. each down to 3l.; Net-
ting-boxes, 30s. to 23s.; Card-boxes, at 5s. to 11s.; sets of Tea-
trays, 20 guineas to 5l.; Bottle-cases, 30s. each; Companions,
2l. 10s. to 10s. 6d. each; Pole-screens, 9l. the pair; Hand-screens, 50s.
to 20s. the pair; Card-racks, 40s. to 25s. the pair; Note and
Cake baskets, 50s. to 20s. each; Bagatelle-tables, 13l. 10s. to
3l. 10s. each; Leather Writing-cases, containing a complete
Dressing Apparatus, 15l. 10s. to 5l. 10s.; pearl and fancy Card-
cases, 3l. 10s. to 10s. each; ivory Hair-brushes, 4l. to 2l. 10s. the
pair; splendid cases of 7 day Razors, 10l. to 2l. 10s. the set; ivory-
handle and other highly-finished Straps, from 25s. to 3s. each;
Wharfedale Pen-knives, Sporting Knives, and fancy Scissors, 3l.
to 5s. each; splendid cases of agate, pearl, and ivory Dessert-
knives and Table-knives, from 42l. to 4l. 4s. the case; a rich
variety of slate, bronze, gilt, and papier-maché, and Table Ink-
stands, from 6l. to 7s. 6d. each. The quality generally of Mech's
Manufactures, the elegance of their display, and the rare combi-
nation of excellence and economy, with a very extensive choice
of Stock, will amply repay the trouble of visiting this depot, No. 4,
Leadenhall-street.

RABBIT-NETS, SHEEP-NETS, TARPULING
COATS and CAPES, LIFE-PRESERVERS, &c.—Rabbit-
Nets on cords, 50, 80, and 100 yards long; Rabbit Fence Net, 2d.
per yard; Strong tarred Sheep-folding Net, nearly 4 feet high,
44d. per yard. Tarpauling Coats for Keepers, Watchers, &c.,
8s. 6d. each. Above 1000 London Policemen's Capes, 2s. and
2s. 6d. each. Life Waistcoats, three times as buoyant as cork
jackets, 8s. 6d. each, they form a complete shield against floating
spars or rocks, are well adapted for Ladies also, and form the
best and cheapest Life-preservers ever introduced—and, as air
Life-preservers are liable to injury, these are not filled with air.
Bells, 6s. 6d. Casualty Buoys, which pack in 18 in. by 14 in., and
spread when thrown out 14 ft. each way, 20s. each. One Buoy
would support six persons, but twelve or more might be saved
by it—price 20s. each. Fishermen's Buoys for Nets, 2s. 6d. each.
ROBERT RICHARDSON, Net and Tent Maker, 21, Tonbridge-place,
New Road, corner of Judd-street.

SMOKE PREVENTED AND VENTILATION EFFECTED,
BY SPONTANEOUS ACTION.

MR. JEAKES, 51, Great Russell-street, Russell-square,
Sole Agent in London for the Sale of DAY'S PATENT
WIND-GUARD, by the use of which he guarantees to Cure all
Chimneys Smoking from Wind, and also to prevent downward
currents; it is admirably adapted for the Ventilation of Apart-
ments of every description; also of Ships, Stables, Dairies, and
Larders, as it ensures a constant change of air; and all its parts
being fixtures, it is free from noise and not liable to derangement;
it also offers no impediment to sweeping. Price for general use,
30s.; larger size, 45s.; larger sizes, especially adapted for venti-
lation, 60s. and upwards. To be had at 51, Great Russell-street,
where it may be seen in action. The attention of Architects,
Builders, and the Trade in general, is especially invited.

GENTLEMEN who have any Small YEW-TREES,
YEW-BRANCHES, or YEW-ROOTS, may find a Purcha-
ser by applying, post-paid, to Mr. TROTTER, Rustic Chair Manu-
facturer, 12, Alfred terrace, Upper Holloway, London.

WANTED, in a Gentleman's Family, 9 miles north of
London, a respectable, sober, honest, active, industrious
GARDENER, who thoroughly understands his business in all its
branches. (Only a greenhouse.) Must be married, and without
any family, and at least 12 months' personal character will be
required. A very comfortable cottage of 4 rooms on the premises;
milk, one quart per day, and vegetables for himself and wife;
wages, 18s. per week. A man from the north preferred, about 35
years of age.—Apply to Mr. J. CATLING, 108, Fenchurch-st., City.

TO LANDSCAPE GARDENERS, and Others.—
Any clever Man, of liberal education, and good taste, who
is acquainted with the literature and practice of Landscape Gar-
dening, may hear of employment by communicating (by letter
only) with A. B., addressed to the care of Mr. ORANGE, Portsea.

WANT PLACES.—All Letters to be post-paid.

AS GARDENER.—An active married Man, without
family, aged 35, of respectable habits, and well experienced
in all the superior branches of Gardening; he has a good prac-
tical knowledge of Landscape Gardening, and would not object to
the superintendence of Woods, or a small Farm. He at present
holds, and has always held, a first-rate situation, at the same time
his terms will not be found extravagant. For further information
apply to RICHARD MITTON, Nurseryman, Pontefract, Yorkshire.

AS GARDENER.—A Man of good character, aged 34,
who has a thorough knowledge of his business, Grass land,
&c.; also of cattle, pigs, poultry, &c. A single or double-handed
place would be accepted, in or out of the house.—Direct to S. H.,
8, St. Andrew's Road, New Kent Road, Surrey.

AS GARDENER.—A middle-aged Man, who per-
fectly understands his business, and also the Suffolk mode
of Farming. Can have three years' character from the gentle-
man he has left.—Direct to A. B., Mr. KERNAN'S, 4, Great Russell-
street, Covent-garden.

AS GARDENER.—A single Man, aged 30, who tho-
roughly understands all kinds of Early and late Forcing,
the Management of Kitchen and Flower-garden, Greenhouse,
Conservatory, &c.; can have 2 years and 7 months' good charac-
ter, and be well recommended by the gentleman he has just left.
—Direct to A. B., 8, Queen's-buildings, Knightsbridge, London.

AS GARDENER, where one or more men are kept.
—A single Man, aged 35, who perfectly understands his
business, as Forcing, Kitchen, Fruit, and Flower-gardening,
and has had great practice in the cultivation of plants, ground-
work, &c.; can have 44 years' character from his last Situation.
Direct to W. Y., Mr. PAMELIN'S Nursery, Hornsey rd., Islington.

AS GARDENER.—A respectable married Man, aged
35, who can have nearly three years' most unexceptionable
character from his last Employer, whom he has just left, as a
first-rate Pine and Grape Grower, Plants, &c., &c., with the
usual routine of business.—Direct to W. A. B., at Mr. VICKERS'S,
19, Park-side, Knightsbridge.

AS GARDENER, or GARDENER AND KEEPER.
—A married Man, aged 31, without family; could also take
charge of Meadow-land; the Wife is a good Cook, and capable of
taking the management of a Dairy, or stock of Poultry; they can
both have excellent characters, and have no objection to go
abroad.—Direct to M. W., at Mr. BUTLER'S, Eagle Coffee-house,
Old Kent-road.

Printed by Messrs. BRADBURY and EVANS, Lombard-street, Fleet-street, in
the Precinct of Whitefriars, in the City of London, and Published by them
at the Office, 8, CHARLES-STREET, COVENT-GARDEN, in the County of Mid-
dlesex, where all Advertisements and Communications are to be addressed
to the Editor.—Saturday, November 25, 1844.

THE GARDENERS' CHRONICLE.

	Weasel sportsman 819 a
	Weeds, to destroy 819 b
	Whitney's substitute for glass 823 c
	Winter gardening 823 c
	Worms, to destroy 825 b

ROYAL BOTANIC SOCIETY OF LONDON, REGENT'S PARK.—EXHIBITIONS OF 1844. On TUESDAYS, APRIL 30th, JUNE 4th, and JULY 2d.

SCHEDULE OF PRIZES.

To be awarded on		April 30.	June 4.	July 2.
CLASS I.—MISCELLANEOUS COLLECTIONS.		£ s.	£ s.	£ s.
Letters.				
A Stove and Greenhouse plants; collections of 40 plants		15 0	15 0	15 0
B Stove and Greenhouse plants; collections of 20 species or distinct varieties		7 0	7 0	7 0
N.B.—Private growers and Nurserymen compete separately in this letter.		5 0	5 0	5 0
C Stove and Greenhouse plants; collections of 10 species or distinct varieties		4 0	4 0	4 0
N.B.—Persons exhibiting in any one of the letters A, B, or C, cannot also exhibit in either of the other letters.		3 0	3 0	3 0
Not more than one plant of Rhododendron or Fuchsia will be admitted into the collections A, B, and C.		2 0	2 0	2 0
D Stove and Greenhouse Climbers; collections of 6 species or distinct varieties		4 0	4 0	4 0
E Specimen Ornamental plants; being new or rare kinds		2 0	2 0	2 0
F Fuchsias; collections of 12 distinct varieties		1 0	1 0	1 0
G Cinerarias; collections of 12 distinct vars.		0 10	0 10	0 10
H Pelargoniums (scarlet); collections of 6 vars., grown in No. 12 sized pots or upwards		2 0	2 0	2 0
I Pelargoniums (scarlet); best specimen of any kind of large growth, and displaying superior cultivation		1 0	1 0	1 0
J Pelargoniums; collections of 12 new and distinct varieties, grown in No. 24-sized pots		7 0	7 0	7 0
K Pelargoniums; collections of 12 distinct varieties, grown in No. 12-sized pots		5 0	5 0	5 0
N.B.—Private growers and Nurserymen compete separately in J and K.		3 0	3 0	3 0
L Pelargoniums; collections of 8 distinct varieties, grown in No. 24-sized pots		3 0	3 0	3 0
N.B.—Private growers only to compete in this letter, and those who exhibit in J or K cannot exhibit in L also.		2 0	2 0	2 0
M Pelargoniums; single specimens of any kind grown in a No. 8 or any larger-sized pot, and displaying superior cultivation		1 0	1 0	1 0
N Calceolarias; collections of not fewer than 8 varieties, grown in No. 12-sized pots		2 0	2 0	2 0
N.B.—Private growers and Nurserymen compete separately in this letter.		1 0	1 0	1 0
O Roses (cultivated in pots); collections of 20 distinct varieties		7 0	6 0	4 0
P Roses (cultivated in pots); collections of 10 distinct varieties		3 0	3 0	2 0
N.B.—Private growers only to exhibit in this letter.		2 0	2 0	1 0
Q Hyacinths (cultivated in pots); collections of not fewer than 24 varieties		1 10	1 10	1 10
R Herbaceous, hardy and half hardy spring-flowering plants (not bulbous); collections of not fewer than 12 species or varieties		2 0	2 0	2 0
S Alpine plants; collections of not fewer than 24 species		2 0	2 0	2 0
Note.—All the plants exhibited in Class I. are required to be in bloom.		1 0	1 0	1 0
CLASS II.—CUT FLOWERS.				
T Moss Roses; collections of not fewer than 12 varieties, and not more than 3 trusses of bloom of each variety		1 0	1 0	1 0
U Summer-flowering Roses; collections of not more than 100 varieties, exhibited as in T		2 0	2 0	2 0
N.B.—Private growers and Nurserymen compete separately in T and U; the former to exhibit half the number of varieties specified above.		1 10	1 10	1 10
V Verbenas; in stands of 24 varieties		1 10	1 10	1 10
W Carnations; in stands of 24 varieties		1 0	1 0	1 0
X Picotees; in stands of 24 varieties		1 10	1 10	1 10

To be awarded on		April 30.	June 4.	July 2.
Letters.		£ s.	£ s.	£ s.
Y Pinks; in stands of 24 varieties		1 0	1 0	1 0
Z Pansies; in stands of 36 varieties		1 0	1 0	1 0
AA Tulips; in stands of 12 varieties		1 0	1 0	1 0
BB Device executed with cut flowers, representing the grouping of complementary colours, with reference to their practical arrangement in flower gardening		2 0	2 0	2 0
N.B.—The device to occupy not less than 6 feet in length by 3 feet in width.		1 0	1 0	1 0
Note.—Exhibitors of cut flowers to provide their own boxes or stands, which are not to exceed 8 inches in depth at the back, nor 20 inches from front to the back, with covers to remove.		1 0	1 0	1 0
CLASS III.—SEEDLINGS.				
CC Greenhouse Azaleas		2 0	2 0	2 0
DD Pelargoniums		1 0	1 0	1 0
EE Pelargoniums, containing the deepest shade of scarlet		1 0	1 0	1 0
N.B.—This letter is intended to encourage the production of varieties combining the bright colour of those usually known as "Scarlet Pelargoniums" with the habit, foliage, and size of flower of the other "fancy" varieties.		1 0	1 0	1 0
It is the intention of the Society in future seasons to award prizes to those Seedling Pelargoniums only which have been bloomed during the season previous, and are exhibited in No. 24 sized pots, so as to show the habit of the variety under superior cultivation.		1 0	1 0	1 0
FF Scarlet Pelargoniums		0 10	0 10	0 10
GG Calceolarias		1 0	1 0	1 0
HH Heaths		1 0	1 0	1 0
II Fuchsias		1 0	1 0	1 0
JJ Roses		1 0	1 0	1 0
KK Verbenas		1 0	1 0	1 0
Note.—Certificates will be given to such seedlings of merit as have not prizes awarded to them. To be eligible for competition, all the subjects, except those included in JJ and KK, must be exhibited growing in pots, and they must all be distinctly marked with the names they are to bear. No seedlings can have prizes awarded to them unless these conditions are complied with.		1 0	1 0	1 0
CLASS IV.—NATURAL ORDERS.				
LL Camellias; collections of not fewer than 9 plants		5 0	5 0	5 0
MM Tropaeolums; collections of not fewer than 4 species or distinct varieties		2 0	2 0	2 0
NN Rutaceous plants, including Diosma, Crowea, Eriostemon, Boronia, Correa, Zieria, and others; collections of not fewer than 10 species		2 0	2 0	2 0
Leguminaceous Plants.				
OO Papilionaceae; collections of not fewer than 12 greenhouse species		3 0	3 0	3 0
PP Mimoseae; collections of not fewer than 6 species		1 0	1 0	1 0
Cactaceous Plants.				
QQ Myrtaceous plants, including Beaufortia, Calothamnus, Melaleuca, Metrosideros, Eucalyptus, Myrtus, Eugenia, and others; collections of not fewer than 6 species		1 0	1 0	1 0
Cereaceous Plants.				
RR Collections of not fewer than 6 plants of the tall-growing kinds, as Epiphyllum, Cereus, &c.		5 0	5 0	5 0
SS Single specimens of the tall-growing kinds		2 0	2 0	2 0
TT Collections of not fewer than 30 species or distinct varieties of the dwarf-growing kinds, as Mamillaria, Echinocactus, &c.		3 0	3 0	3 0
Rubiaceous Plants.				
UU Rubiaceous plants, including Gardenia, Rondeletia, Manettia, Bouvardia, Ixora, Pavetta, and others; collections of not fewer than 10 species		3 0	3 0	3 0
Composite Plants, restricted to Helichrysum, Aphelexis, Astelma, and Pheonocoma; collections of not fewer than 6 species				
VV Composite plants, restricted to Helichrysum, Aphelexis, Astelma, and Pheonocoma; collections of not fewer than 6 species		1 0	1 0	1 0
Gesneraceous Plants.				
WW Collections of not fewer than 10 species, including Gesneria, Gloxinia, Sinningia, Nipheea, Achimenes, and others		3 0	3 0	3 0
XX Achimenes; collections of not fewer than 4 species or varieties		2 0	2 0	2 0
Ericaceous Plants.				
YY Cape Heaths; collections of 15 distinct kinds		7 0	7 0	7 0
N.B.—Persons exhibiting in YY cannot exhibit in ZZ also.		2 0	2 0	2 0
ZZ Cape Heaths; collections of 6 distinct kinds		4 0	4 0	4 0
N.B.—Private growers and Nurserymen compete separately in YY and ZZ.		1 0	1 0	1 0
AAA Greenhouse Azaleas; collections of 12 plants		10 0	10 0	10 0
N.B.—Preference will be given to those collections which contain the greatest number of distinct kinds, where merit in other respects is equal.		5 0	5 0	5 0
BBB Greenhouse Azaleas; collections of not fewer than 6 varieties		5 0	5 0	5 0
N.B.—Private growers and Nurserymen com-		1 0	1 0	1 0

To be awarded on		April 30.	June 4.	July 2.
Letters.		£ s.	£ s.	£ s.
pete separately in this letter, and those who compete in AAA, cannot compete in BBB also.		1 0	1 0	1 0
CCC Greenhouse Azaleas single specimen plants		1 0	1 0	1 0
DDD Rhododendrons in pots; collections of not fewer than 4 varieties		3 0	3 0	3 0
N.B.—Private growers and Nurserymen compete separately in this letter.		1 0	1 0	1 0
EEE Rhododendrons in pots; single specimen plants		1 0	1 0	1 0
FFF Epacrids; collections of not fewer than 6 species or distinct varieties		2 0	2 0	2 0
GGG Clerodendrons; collections of not fewer than 4 species or distinct varieties		2 0	2 0	2 0
HHH Statice; collections of not fewer than 6 species or distinct varieties		1 0	1 0	1 0
III Proteaceous plants, including Protea, Grevillea, Banksia, Dryandra, and others; collections of not fewer than 10 species		3 0	3 0	3 0
JJJ Coniferous plants (cultivated in pots); collections of not fewer than 12 species, well-grown plants		1 0	1 0	1 0
Orchidaceous Plants.				
KKK Collections of not fewer than 15 distinct exotic kinds		15 0	15 0	15 0
LLL Collections of not fewer than 6 distinct exotic kinds		7 0	7 0	7 0
MMM Single specimens of new and rare kinds		2 0	2 0	2 0
NNN Liliacs; collections of not fewer than 3 species or distinct varieties		2 0	2 0	2 0
OOO British Ferns (cultivated in pots); collections of not fewer than 20 species		2 0	2 0	2 0
Note.—The Exhibitions in this Class are intended to display the effect of natural classification, in representing the habits and affinities of natural orders or of genera. All the plants, with the exception of those in TT, III, JJJ, and OOO, are required to be in bloom.		1 0	1 0	1 0
CLASS V.—MICROSCOPES.				
PPP A generally useful Compound Achromatic Microscope, the price of which shall not exceed 21/; the price to be stated, and the instrument to be sold, if demanded, at such price. It is required that it be constructed to view opaque objects, to bear a higher power than a such object-glass, a fine adjustment, and an achromatic condenser, if not supplied already		5 0	5 0	5 0
REGULATIONS FOR THE OBSERVANCE OF EXHIBITORS.				
Exhibitions.—The Exhibitions will be open to all competitors, whether Fellows of the Society or not.				
Time for the Reception and Entry of Subjects for Exhibition.—In order that the subjects received may be promptly arranged and displayed to advantage, Exhibitors are requested to communicate their intentions in writing to the Secretary previously to the several days of Exhibition, specifying the probable extent of table-room, in square feet or otherwise, when their plants or flowers will require.				
Unless previous notice have been given, the Exhibitors will, on entering the Garden, be requested to sign a book, or deliver a statement in writing specifying in what letter or letters their plants are to be exhibited; they are also to apply to the clerk for labels to attach to their several Exhibitions, and to see that when staged they are marked with the proper letters; and they are particularly requested to bear in mind, that omissions or mistakes arising from neglect or improper entries on the part of Exhibitors cannot be rectified after the awards have been made. No subjects will be eligible for competition unless the entry has been made previously to half-past eight o'clock in the morning, at which time precisely the gates will be closed, and after which no subjects for competition can on any account whatever be received, nor can any person be allowed to open packages containing plants or flowers for competition after that time.				
Exhibitors are requested to bear in mind that the Judges must proceed at ten o'clock to examine the merits of the subjects exhibited, by which hour the placing and arranging of all plants and flowers must be completed. At seven o'clock in the evening the Exhibitions will close, when all plants and flowers will be delivered up to the Exhibitors.				
Admission of Exhibitors.—Assistant gardeners will be admitted with the Exhibitors until half-past eight o'clock in the morning; but no person whose services are not required in that capacity will be allowed to enter with the Exhibitors, nor can any persons remain in the Garden after ten o'clock, except those who are engaged by the Society.				
All persons who supply subjects for competition for which rewards are offered, may obtain pass-tickets at the Office before ten o'clock, and will be re-admitted to the Garden at two o'clock by delivering them at the workmen's gate.				
Subjects for Exhibition.—It is particularly desired that all plants be distinctly labelled with their scientific names, and the places whence introduced where practicable.				
Subjects of decidedly inferior quality cannot be received for competition, and such subjects the Judges are empowered to reject; and in order to uphold the value and importance of the Society's awards, the Judges are authorized either to withhold or to diminish the value of the awards; that is, to grant either first, second, or third prizes at their discretion; the Judges are also invited to recommend to the Council to increase the number or amount of the awards, and to give medals for subjects of extraordinary merit which may be exhibited, although not specified in the schedule.				
Exhibitors who shall obtain a first prize cannot receive any other award in the same letter, except in E and in Class III.				
The Judges will not be appointed from among the Fellows or Members of the Society. Successful competitors are requested to notify the Secretary within one fortnight after the premiums shall be awarded, in what form they are desirous of receiving their prizes, viz., whether in medals, plate, or money.				
By order of the Council, J. D. C. SOWERBY, Secretary.				
Schedules and further particulars may be had by application at the Gardens.				

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.—MEETING AT SOUTHAMPTON.—Principal Day of the Show, THURSDAY, July 25, 1844.—A General Meeting of the Members will be held at Southampton on FRIDAY, July 26, 1844, at 12 o'clock precisely. The Prizes are open to general competition. Forms of Certificate to be procured on application to the Secretary, 12, Hanover-square, London. All Certificates for implements must be returned, filled up, to the Secretary, on or before the 1st May, and all other Certificates by the 1st June; the Council having decided that in no case whatever shall any Certificate be received after those dates respectively.

PRIZES FOR IMPROVING THE BREED OF CATTLE.—1844.
Short-horns.—CLASS 1. To the owner of the best Bull calved previously to the 1st January, 1842, 30*l.*; to the owner of the second-best do. do., 15*l.*—2. To the owner of the best in-calf Heifer, not exceeding two years old, 10*l.*—5. To the owner of the best yearling Heifer, 7*l.*

Cattle of any Breed, or Cross, (not qualified to compete in the foregoing classes).—CLASS 1. To the owner of the best Bull calved previously to the 1st January, 1842, 30*l.*; to the owner of the second-best do., 15*l.*—2. To the owner of the best Bull calved since the 1st January, 1842, and more than one year old, 20*l.*—3. To the owner of the best Cow in milk, 15*l.*—4. To the owner of the best in-calf Heifer, not exceeding three years old, 15*l.*—5. To the owner of the best yearling Heifer, 10*l.*

HORSES.

CLASS 1. To the owner of the best Stallion for agricultural purposes, of four years old and upwards, 30*l.*; to the owner of the second-best do. do., 20*l.*—2. To the owner of the best two years old ditto, foaled since the 1st January, 1842, 15*l.*—3. To the owner of the best Cart Mare and foal, for agricultural purposes, 20*l.*; to the owner of the second-best do., 10*l.*—4. To the owner of the best two years old Filly, 10*l.*—5. To the owner of the best thorough-bred Stallion, which shall have served mares at a price not exceeding three guineas (and with a groom's fee of not more than five shillings,) in the season of 1844, 30*l.*

SHEEP.

Leicesters.—CLASS 1. To the owner of the best Shearling Ram, 30*l.*; to the owner of the second-best ditto, 15*l.*—2. To the owner of the best Ram of any other age, 30*l.*; to the owner of the second-best do., 15*l.*—3. To the owner of the best pen of Five Shearling Ewes, 10*l.*; to the owner of the second-best do. do., 5*l.*

South Down Sheep.—CLASS 1. To the owner of the best Shearling Ram, 30*l.*; to the owner of the second-best do., 15*l.*—2. To the owner of the best Ram of any other age, 30*l.*; to the owner of the second-best do., 15*l.*—3. To the owner of the best pen of Five Shearling Ewes, 10*l.*; to the owner of the second-best do. do., 5*l.*

Long-Woolled Sheep.—(Not qualified to compete as Leicesters).—CLASS 1. To the owner of the best Shearling Ram, 30*l.*; to the owner of the second-best do., 15*l.*—2. To the owner of the best Ram of any other age, 30*l.*; to the owner of the second-best do., 15*l.*—3. To the owner of the best pen of Five Shearling Ewes, 10*l.*; to the owner of the second-best do. do., 5*l.*

Short-Woolled Sheep (not qualified to compete as South Downs).—CLASS 1. To the owner of the best Shearling Ram, 20*l.*—2. To the owner of the best Ram of any other age, 20*l.*—3. To the owner of the best pen of five Shearling Ewes, 10*l.*

PIGS.

CLASS 1.—To the owner of the best Boar of a large breed, 10*l.*; to the owner of the second-best ditto, 5*l.*—2. To the owner of the best Boar of a small breed, 10*l.*; to the owner of the second-best ditto, 5*l.*—3. To the owner of the best breeding Sow of a large breed, 10*l.*—4. To the owner of the best breeding Sow of a small breed, 10*l.*—5. To the owner of the best pen of three breeding Sow Pigs, of the same litter, above four and under nine months old, 10*l.*

AGRICULTURAL IMPLEMENTS.

A Sum not exceeding Three Hundred Sovereigns.

EXTRA STOCK, ROOTS, AND SEEDS.

For extra stock of any kind, not shown for any of the above prizes, and for Roots, Seeds, &c., prizes may be awarded and apportioned by the committee and judges, to an amount not exceeding in the whole 50*l.*

ANY NEW IMPLEMENT.

For the invention of any new Agricultural Implement, such sum as the Society may think proper to award.

SEED-WHEAT AND BARLEY.

I. Fifteen Sovereigns, or a Piece of Plate of that value, will be given to the Exhibitor, at the Meeting at Southampton, of the best 14 bushels of White Wheat, of the harvest of 1843, and grown by himself.

II. Fifteen Sovereigns, or a Piece of Plate of that value, will be given to the Exhibitor, at the Meeting at Southampton, of the best 14 bushels of Red Wheat, of the harvest of 1843, and grown by himself.

III. Ten Sovereigns, or a Piece of Plate of that value, will be given to the Exhibitor, at the Meeting at Southampton, of the best 14 bushels of Spring Wheat, of the harvest of 1843, and grown by himself.

IV. Ten Sovereigns, or a Piece of Plate of that value, will be given to the Exhibitor, at the Meeting at Southampton, of the best 14 bushels of Barley for malting, of the harvest of 1843, and grown by himself.

V. Ten Sovereigns, or a Piece of Plate of that value, will be given to the Exhibitor, at the Meeting at Southampton, of the best 14 bushels of Barley for general purposes, of the harvest of 1843, and grown by himself.

Competitors are requested to send with their Wheat or Barley, specimens, fairly taken, of the same in the ear, with the whole of the straw, in a sheaf not less than one foot in diameter, and with the roots attached.

Twelve bushels of the Wheat or Barley will be sealed up by the stewards, and one of the remaining bushels of each variety will be exhibited as a sample to the public; the other being kept for comparison with the produce of the next year. At the General Meeting in December, 1845, the prizes will be awarded.

The two best samples of each of these three classes of Wheat or Barley, without at that time distinguishing, in any of the cases, between the comparative merits of either sample, will be selected by the judges appointed for the Meeting at Southampton; and will be sown, under the direction of the Society, (the Winter Wheat in the autumn of 1844, and the Spring Wheat not earlier than the 1st of March, 1845, by four farmers, who will make their report, upon which the prizes will be awarded, provided there be sufficient merit in any of the samples. Ten

Sovereigns will be given at the Meeting at Southampton to each Exhibitor whose Wheat has been selected for trial, and Six Sovereigns for Barley.

* * * No variety which has been selected for trial at any previous show shall be qualified to compete.

ESSAYS AND REPORTS ON VARIOUS SUBJECTS.

Prizes for 1844.—PRIZE ESSAYS.

1. **Water Meadows and Upland Pastures.**—Twenty Sovereigns, or a Piece of Plate of that value, will be given for the best Account of the Comparative Value of Water Meadows and Uplands generally for Cattle, Sheep, and Horses, but especially for Milch Cows. Competitors will be required to state the following particulars in reference to the trials instituted for the purpose of obtaining practical results on this subject:—1. The nature of the soil and its state of drainage to be described; and equal portions of upland and water meadow to be selected. 2. Equal numbers of cows of the same age and breed (not less than four in number) to be separately fed in pairs, on each different kind of grass, and to be changed once from one kind of grass to the other; and the quantity, as well as the quality, of the milk from such cows to be ascertained by the lactometer. 3. If made into hay, the quantity of each sort produced on the land, and the quantity, as well as quality, of the milk which has been produced, to be ascertained in a similar manner. 4. The value of spring food and grass, whether in rows or pasture. 5. The same conditions to be applicable to the feeding of sheep-stock; stating the numbers which the same quantity of each land has separately maintained during a certain period; and whether or not subject to the rot by the flooding. 6. In regard to irrigating the land: the primary cost whether of catch-water or flow-meadow, of its formation, and the annual expense of management, including the repair of sluices; together with the former and present rent or value. Competitors are also requested to state, as far as their observation may have extended, the comparative value of the grasses of water-meadows and uplands, when cut into hay, and consumed as fodder.

2. **Influence of Climate.**—Twenty Sovereigns or a Piece of Plate of that value, will be given for the best Essay on the Influence of Climate upon Cultivation within the limits of Great Britain and Ireland. There being good reason to suppose that the discordant practices of farming in different districts may be partly attributed to the influence of climate, competitors for this prize must endeavour to describe those practices, and to trace them to the variation of climate. Under the term climate must be included the degree of cold or heat, moisture or drought, arising whether from latitude, elevation, neighbourhood to or distance from the sea, &c. Variation in practice may be looked for in the management of artificial and natural Grass, the growth of root-crops, the depth of ploughing, the time of sowing, the choice of white crops, &c.

3. **Indications of Fertility or Barrenness.**—Fifty Sovereigns, or a Piece of Plate of that value, will be given for the best Essay on the Indications which are practical guides in judging of the Fertility or Barrenness of the Soil. Many attempts having been made to explain the productiveness of the soil by chemical or physical causes, without any decided result, it appears desirable to assist the researches of natural philosophers by making them acquainted with those obvious signs, whether of colour, consistence, or vegetation, by which surveyors and farmers are enabled to give at once a practical opinion upon the probable nature of land which they inspect.

4. **Agriculture of Norfolk.**—Fifty Sovereigns, or a Piece of Plate of that value, will be given for the best Report on the present state of the Agriculture of the County of Norfolk:—stating the ordinary course of cropping adopted in the different soils of the county; the breeds of Cattle, Sheep, and Pigs most generally bred or fed within it; the state of its drainage; the implements used; the number of Horses or other Cattle employed in the different operations of Husbandry; the tenure on which the Farms are generally held; the wages of labour; the average amount of the Poor's rate; and whether any and what alterations and improvements have been made in the system of Agriculture pursued within it since the Report made to the Board of Agriculture by Arthur Young, which was published in the year 1804, and by Nathaniel Kent, which was published in the year 1790.

5. **Agriculture of Cheshire.**—Fifty Sovereigns, or a Piece of Plate of that value, will be given for the best Report on the present state of the Agriculture of the County of Cheshire:—stating the ordinary course of cropping adopted in the different soils of the county; the breeds of Cattle, Sheep, and Pigs most generally bred or fed within it; the state of its drainage; the implements used; the number of Horses or other Cattle employed in the different operations of Husbandry; the tenure on which the Farms are generally held; the wages of labour; the average amount of the Poor's rate; and whether any and what alterations and improvements have been made in the system of Agriculture pursued within it since the Report made to the Board of Agriculture by Henry Holland, which was published in the year 1808.

6. **Agriculture of Essex.**—Fifty Sovereigns, or a Piece of Plate of that value, will be given for the best Report on the present State of the Agriculture of the County of Essex:—Stating the ordinary course of cropping adopted in the different soils of the county; the breeds of Cattle, Sheep, and Pigs most generally bred or fed within it; the state of its drainage; the implements used; the number of Horses or other Cattle employed in the different operations of Husbandry; the tenure on which the Farms are generally held; the wages of labour; the average amount of the Poor's rate; and whether any and what alterations and improvements have been made in the system of Agriculture pursued within it since the Report made to the Board of Agriculture by Arthur Young, the Secretary to the Board, which was published in the years 1807 and 1813.

7. **Agriculture of Wiltshire.**—Fifty Sovereigns, or a Piece of Plate of that value, will be given for the best Report on the present State of the Agriculture of the County of Wiltshire, stating the ordinary course of cropping adopted in the different soils of the county; the breeds of Cattle, Sheep, and Pigs, most generally bred or fed within it; the state of its drainage; the implements used; the number of Horses or other cattle employed in the different operations of Husbandry; the tenure on which the Farms are generally held; the wages of labour; the average amount of the Poor's rate; and whether any and what alterations and improvements have been made in the system of agriculture pursued within it since the Report made to the Board of Agriculture by Thomas Davis, which was published in the year 1811.

8. **Improvements by Warping, &c.**—Twenty Sovereigns, or a Piece of Plate of that value, will be given for the best account of improvements made by Artificial Deposits of Soil from the Sea or Tide-rivers, and the subsequent Cultivation of the land.

9. **Keeping Farm-Horses.**—Twenty Sovereigns, or a Piece of Plate of that value, will be given for the best account of the way of keeping Farm-Horses in good condition, both in Winter and Summer. Competitors must state—1. The quantity of food given, and the average cost of such food. 2. The work performed by the horses. 3. The length of time they have been kept on the food described. 4. Whether kept in yards, stables, or pastures.

10. **Any Agricultural Subject.**—Twenty Sovereigns, or a Piece of Plate of that value, will be given for the best Essay on any Agricultural subject.—These Essays must be sent to the Secretary, at 12, Hanover Square, London, on or before March 1st, 1844.

Rules of Competition for Prize Essays.—1. That all information contained in Prize Essays shall be founded on experience or observation, and not on simple reference to books, or other sources. 2. That drawings, specimens, or models, shall accompany writings requiring them. 3. That all competitors shall transmit a sealed note, containing their names and addresses, with a motto on it to correspond with the one inscribed on the Essay. 4. That the Society shall have the power to publish the whole or any part of the Essays which gain the prizes; and the other Essays will be returned on the application of the writers. 5. That the Society

is not bound to give an award, unless they consider one of the Essays worthy of a prize. 6. That, in all reports of experiments, the expenses shall be accurately detailed; that only the imperial weights and measures are those by which calculations are to be made; that prizes may be taken either in money or plate, at the option of the successful candidates; and that no prize be given for any Essay which has already appeared in print.

Notice.—It is requested that all communications addressed to the Society, of experiments on land—whether of draining, liming, manuring, or other operation—be accompanied with the cost of such operation, with the value of the land to rent previous and subsequent thereto, and an analysis of the soil upon which such experiments have taken place; or a specimen of the soil to be analysed, by persons employed by the Society; it is also further requested that, in communications relative to experiments on land in foreign countries, the measures be stated in English values. Those members who have tried subsoil-ploughing, whether successfully or otherwise, are requested to communicate the result to the Secretary, in the hope that, by comparison of the statements, some judgment may be arrived at as to the soils and situations which are, or are not suited for this operation.

By order of the Council, JAMES HUDSON, Secretary.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.—The GENERAL MEETING will be held at the Society's House, No. 12, Hanover-square, on SATURDAY the 9th of December, at 12 o'clock precisely; and the Rooms of the Society thrown open as usual for the accommodation of Members on the Wednesday, Thursday, and Friday evenings of that week, from 6 to 10 o'clock.—By order of the Council.

JAMES HUDSON, Secretary.

FASTOLFF RASPBERRY.

YOUELL AND CO. have much pleasure in announcing they have now ready for sending to any part of the United Kingdom fine Cakes of the above highly valuable and much esteemed RASPBERRY, unequalled for the extraordinary size of its fruit and richness of flavour.

IT IS PATRONISED BY HER MOST GRACIOUS MAJESTY THE QUEEN, HIS GRACE THE DUKE OF RUTLAND, THE EARL OF HARRINGTON, THE EARL OF LIVERPOOL, THE LORD BISHOP OF LONDON, LORD VISCOUNT LORTON, LORD SONDES, &c. &c., as well as by the HORT. SOCIETY OF LONDON.

For further particulars they beg to refer to their Advertisement of the 4th inst.: Prices as follows:—

Packages containing 100 Cakes	22	5s. 0d.
" " " 50 "	15	0
" " " 25 "	8	0

Package included. The usual discount to the Trade, when not less than 200 are ordered.

* * CAUTION.—YOUELL AND CO. have appointed no agents in London for the sale of the Fastolff Raspberry.

DUTCH HYACINTHS AND OTHER BULBS. ARAUCARIA IMBRICATA.

For particulars and prices of the above, see their Advertisement of last week.—Great Yarmouth Nursery, Nov. 30, 1843.

FLORIST TO HER MAJESTY THE QUEEN.

MAGNIFICENT NEW FUCHSIA, "CONSTELLATION."

W. MILLER begs to offer this Noble Variety to the public; for full description see Dr. LINDLEY's opinion in *Gardeners' Chronicle*, Sept. 9, p. 693, as follows:—"W. Miller.—Your hybrid between fulgens and corymbiflora is a very handsome flower, seed-pod small, tube long and slender, gradually increasing in size till the diameter is a $\frac{1}{2}$ of an inch; the tube is of a delicate pink colour, having sepals of a greenish primrose, forming a strong contrast to the bright red corolla seen between them; the flower altogether is $\frac{3}{4}$ inches in length, and the buds are very handsome as they approach maturity; it flowers in a large broad bunch, which is divided into branches containing altogether 150 flowers." Plants next season 12s. 6d. each, with the usual allowance to the trade when not less than six plants are ordered at once. Plants ordered for the Royal Gardens, Claremont.

SPLendid SEEDLING VERBENAS,

"BLUE QUEEN," AND "ZEUXES."

"BLUE QUEEN," the best blue Verbena out. See Dr. LINDLEY's opinion in *Gardeners' Chronicle*, July 15, p. 721.—"M. R.—Your sweet-scented seedling, No. 105, is the best we have seen of its colour—bright blue lilac; the flower is large, smooth, glossy, and perfectly free from crumpling. Price, per plant, 5s. "ZEUXES," beautiful novel rosy crimson, with large white eye. See Dr. LINDLEY's opinion in *Gardeners' Chronicle*, Sept. 30, p. 691.—"J. Miller.—Your seedling named Zeuxes is large and very brilliant." Price, per plant, 3s. 6d., with the usual allowance to the trade when three or more are ordered at once. Fine strong plants early in April, in stout tin cases, post free.—Providence Nursery, Ramsgate, Kent.

N.B.—Priced Catalogue to be had on application.

UNDER THE SPECIAL PATRONAGE OF THE QUEEN. KENSINGTON NURSERIES.

RICHARD FORREST AND CO., LATE WILLIAM MALCOLM AND CO., beg leave most respectfully to direct attention to their very extensive and superior collection of Fruit Trees, which were never so fine as this year. Fruit Trees being an entire change of crop to some of the Nursery Grounds now in cultivation connected with this Establishment, the production is most gratifying, and admitted by all intelligent practical observers to be very superior to anything of the kind ever seen in these Grounds, which have long stood unrivalled for their Fruit Tree culture.

Peach Trees, from one to three years, trained, the latter of which covering 6 to 8 and 9 feet of wall at once; all others equally fine, the sorts of which may be rich upon as being true.

The collection of Ornamental Trees and Shrubs are also very fine in these Grounds, and well deserving the attention of the Trade, and also Gentlemen who may intend planting either now or in spring. General Catalogues may be obtained on application. Camellias, Magnolias, Indian Azaleas, Oleas, Tea Trees and other Greenhouse Plants, Rhododendron arboreum, with interesting hybrid Rhododendrons, are extensive in their several collections, with very large well-grown specimens of Statica macrophylla in the stove, with other interesting Plants in this department.

The collection of Coniferæ is also extensive here, and deserving the notice of Gentlemen who admire this interesting section of Arborea culture. A separate list of them may also be had on application.

BUSHELL'S Light Seedling Dahlia, "EMMA."—Ground roots of this Dahlia to be disposed of for 3s. per root, cash. Colour white, tipped with deep cherry, the petal-form and centre good, the largest, constant and free in flowering of any Dahlia yet propagated, and has obtained several prizes. J. B. cut 48 blooms from 14 plants, which were exhibited at one of the Metropolitan Shows, the whole of which Mr. Neville pronounced fit to be placed in a stand of 12. "PET RIVAL."—Colour purple-maroon, fine cupped petal, and free bloomer; ground roots, 2s.; pot do., 1s. J. B. warrants the above Dahlias to give satisfaction, or he will return the purchase-money.—12, Hall-place, Kennington-lane, Nov. 30, 1843.

HYACINTHS AND GROWING STOCK.
HUMPHREYS' COMPOUND, applicable to all Greenhouse Plants, to Hyacinths and other Bulbs, and to promote the germination of Seeds. Sold in bottles 1s. 6d. each, by PLANAGAN & SON, Mansion-house-street; HURST & McMULLEN, Leadenhall-street; W. CLARK, Bishopsgate-within; GORDON, THOMPSON, and BASKETT, Fenchurch-street; GRIMLEY and Co., Covent Garden; BATT and RUTLEY, 412, Strand; CHARLWOOD, Tavistock-row; W. J. NUTTING, 46, Cheapside; G. LAWRENCE, 18, Piccadilly; JOHN KERNAN, Great Russell-street, Covent Garden; LOCKHART, 156, Cheapside; SHUTTLEWORTH, Pantheon; MINIER, ADAMS, and NASH, 63, Strand; THATCHER and SON, Islington; THOMAS WATKINSON, Market-place, Manchester; Messrs. DICKSON, Edinburgh; PONTY, Leeds; P. LAWSON and SON, Edinburgh; and other leading SEEDSMEN in town and country. Wholesale Agents, DAVY, MACMURDO, and Co., 100, Upper-Thames st., London.

J. G. WAITE, WHOLESALE SEEDSMAN, London, begs to acquaint the Trade generally that he has gone to great expense in selecting from the first Stocks in England and on the Continent, which he offers at very reduced prices, and will warrant every article to be of the first quality. Catalogues to be had on application at Nos. 1 and 4, Eyre-street Hill, Hatton Garden.—Dec. 2, 1843.

TO GENTLEMEN PLANTING.
J. AND J. FAIRBAIRN are induced from the uncertainty upon which they hold the Manor-street Nursery (situated contiguous to the Home Nursery, Clapham Rise, where attention will be given to all applications), to effect a Sale of the Stock at as early a period as possible, consequently beg to solicit the attention of Gentlemen and the trade to the large and remarkably healthy and well-grown stock, consisting of fine large Laurels, twice transplanted, of extra growth; Portugal Laurels, very handsome; Green Hollies, of various sizes; Evergreen Privets, fine Standard and Dwarf Roses in great variety, fine standard flowering Thorns, Almonds, Esculus, Robinias, and other Ornamental Trees, and Evergreen and flowering Shrubs, with a large stock of fine standard and dwarf, trained and untrained Peaches, Nectarines, Apples, Pears, Plums, and Cherries, of the most approved kinds, and of growth rarely equalled; also, a large assortment of Forest Trees, consisting of Limes, Elms, Birch, Beech, Hornbeam, Spanish and Horse Chestnuts, Mountain Ash, Poplars, and Spruce, and Scotch Firs; also a large number of Gooseberries and Currants, of excellent growth, and of the best varieties in cultivation, to all of which J. & J. F. respectfully invite the inspection of Gentlemen and Nurserymen, flattering themselves that the general character of the Stock is such as to ensure unqualified satisfaction, and which they are disposed to offer at very moderate prices for cash. J. & J. F. respectfully beg to call the attention of Gentlemen to their advertisement of Heaths, &c., which has appeared in the *Gardeners' Chronicle* of the two last weeks. Nurseries, Clapham, near London, November 24, 1843.

CARNATIONS, PICOTEES, AND PINKS.
MESSRS. N. AND B. NORMAN'S Catalogue of Show varieties, with which they have gained 23 Prizes this season, can be had on pre-paid application.—Bull-fields, Woolwich.

TO GENTLEMEN PLANTING.—A Gentleman being about to make alterations in his grounds in the vicinity of London, has the following trees and shrubs to dispose of: viz., Limes from 12 to 16 feet in height; Scarlet and Double White Thorns, from 6 to 12 feet, with fine flowering tops; Birch, Elm, Poplar, Mountain Ash, &c. from 12 to 16 feet; about 50 very fine variegated Box, 6 feet, and branched to the ground. Fine Aucubas, Yews, Chinese Arbor Vite, Laurels, Lilacs, Guelder Roses, &c. &c. The above have been removed several times, and will again remove in excellent condition. Apply to Mr. McARTHUR, Nurseryman, Maida Hill, Edgeware-road, London.

WILLIAM MAY begs to announce that he will not be enabled to supply any more proved plants of Hollyhocks for the present season. He can supply the following fine year-old Hollyhocks, grown from seeds saved from best double sorts, at 20s. per 100. Herbaceous plants, select and showy, in great variety (see Advertisement for October) in collections of 100 fine sorts for 42s.; 50 ditto for 25s. (a list of which may be had on application). Tulips, fine named show sorts, in collections of 100 varieties, for 5s.; 50 do. for 2s. 10s.; 25 do. for 25s. Gooseberries, 150 fine varieties by name; a list of sorts and prices on application. Currants, May's new large late "Victoria," red, at 15s. per dozen; new large black "Bang-up," at 6s. per dozen. Seeds of Hollyhocks all warranted, saved from best double flowers, in packets of 200 seeds for 2s. 6d., 500 for 5s. Pansy, from best prize flowers, at 2s. 6d. and 5s. each. The seeds will be sent post free by W. M., and may be had of Mr. Watkinson, Seedsman, Market-place, Manchester. A remittance or reference is requested.—Hope Nursery, Leeming Lane, near Bedale, Yorkshire, November 21, 1843.

WRIGHT, SONS, AND WRIGHT, NURSERYMEN, Edinburgh, have growing at their Nurseries a fine Stock of Transplanted LARCH, from 1 to 4 feet high, which will be sold at very reasonable prices. Also all other descriptions of Transplanted and Seedling Forest Trees and Shrubs.

JAMES BARNES begs leave to inform the numerous Gardeners who have written to him requesting an account of his mode of CULTIVATING THE PINE-APPLE, that it will be found in his 26th Letter, in "London's Gardeners' Magazine" for January next. Persons who write to JAMES BARNES respecting his modes of Culture, when they require an answer will please to inclose a postage stamp.—Bicton Gardens, Nov. 25.

SHILLING'S NEW EARLY GROTTO PEA.
J. AND S. SHILLING have succeeded in raising the above Pea. The Early Frame Pea, impregnated with the Grotto or Oyster Marrow, which they with confidence recommend to the Public generally, being quite as early, and nearly double the size of any early Pea in cultivation. Quite hardy, will stand the winter well, and a good Bearer; the Pod large and long. They would particularly recommend it to the attention of Market Gardeners. Price 3s. per Quart; 10s. per Gallon; 17s. 6d. per Peck; 30s. per Half-bushel; 2l. 10s. per Bushel. London Agents: Messrs. FIELD and CHILD, Seedsman, 119, Lower Thames-street; Messrs. W. and J. NOBLE, Seedsman, 152, Fleet-street; Messrs. JAMES GRAY, ADAMS, and HOOD, Nurserymen, Kensington; and Mr. KERNAN, Seedsman, 4, Great Russell-street. J. and S. SHILLING, Nurserymen, Northwamborough, Odham, Hants, Nov. 24, 1843.

TO MELON GROWERS.

SIX superior kinds of MELON SEEDS, comprising the following: Beechwood, true, Hybrid Persian, Hoosainee, Egyptian, Duncans, improved Green-flesh, and an hybrid Cantaloupe, weight from 9lbs. to 15lbs. The above will be warranted true to their names, and will be forwarded immediately on receipt of a Post-office order for 5s. P.S.—Six good seeds of each. E. SRIEVE, Chippenhams Park, near Mildenhall, Suffolk.

SHIRREFF'S TARE.—After having discovered and introduced the Hopetoun Oat and Hopetoun Wheat, which have become the standard grains in some of the best-cultivated districts in North Britain, the Subscriber, in calling attention to this Tare, trusts that it will be deemed superfluous to lengthen an Advertisement with testimonials in favour of the plant. From residing in East Lothian until the present year, no opportunity has been afforded him of testing by field-practice, if this Tare is fitted for winter cultivation; but after seven years' experience, he assures Agriculturists, that it is admirably adapted for spring sowing, and that it will be found a new and valuable addition to the products of the farm. This Tare has grains of a large size, and light-green in colour; the blossom is pure white; while in rapidity of growth, and in luxuriance and succulency of foliage, it is not surpassed by any variety of the species. This Tare can only be obtained of the Subscriber, and he offers it at 10s. a bushel, cash, delivered at Bristol or Gloucester. The seeds will be ready for delivery in January and February next, and in the meantime they may be seen during the approaching Smithfield Shows, at the stand of Messrs. Gibbs and Co.; and samples will be forwarded by post to intending purchasers. PATRICK SHIRREFF, Buckover, Thornbury, Gloucestershire, Nov. 28, 1843. N.B.—Hopetoun Oats from seed direct from Scotland, at 25s. a quarter.

MESSRS. PROTHEROE AND MORRIS respectfully inform the Public that they have received instructions from Mr. WILLIAM CORMACK, SENR., to dispose of by Auction a Portion of his EXTENSIVE NURSERY STOCK at New Cross, situate on the north side of the road leading from London to Dover, on MONDAY the 4th of DECEMBER, 1843, and following days at 11 o'clock each day. May be viewed prior to Sale. Catalogues may be had on the Premises; of the principal Seedsmen; and of the Auctioneers, American Nursery, Leytonstone.

TO NOBLEMEN, GENTLEMEN, NURSERYMEN, and Others.
MESSRS. PROTHEROE AND MORRIS are instructed to submit to Public Auction on the Premises, Enham Nursery, Battersea, on WEDNESDAY, Dec. 13th, 1843, and following days, at 11 o'clock each day (in consequence of Mr. C. Russell being compelled to clear the ground) the whole of the valuable NURSERY STOCK, consisting of several hundred superb hardy Scarlet Rhododendrons, large Tulip Trees, fine Yews, extra fine specimens of Aucuba japonica, Standard and Dwarf Roses, large fruit-bearing Mulberries, American Plants, with many other choice Shrubs and Roots. May be viewed prior to Sale. Catalogues may be had on the premises; of the principal Seedsmen; and of the Auctioneers, American Nursery, Leytonstone.

TO AMATEURS AND FLORISTS.
TO BE SOLD, BY PRIVATE CONTRACT, the fine Stock of CARNATIONS and PICOTEES of an Amateur, who is relinquishing their growth, consisting of about 400 Pair. Amongst the CARNATIONS are the Queen of Hearts, Twitchett's Don John, Martin's Splendid, Colcutt's Brutus, Sharp's Defiance, Doctor Franklin, Puxley's Prince Albert, Queen, Sir R. Peel, Bucknall's Talma and Earl Fitzhardinge, Wilmer's Solander, Christian's Excellent, Beauty of Woodhouse, &c. &c. PICOTEES: John's Prince Albert, Barrard's Coronatus, Fly's Field Marshall, Marchioness Waterford, Mrs. Fenton, Princess Royal, and Grace Darling, Brinkler's Purple Perfection, Duchess, Lady Charles Russell and Lady Payne, Fellows's Purplea elegans, Burrough's Lady Flower, &c. &c.; the whole well-rooted and healthy plants. For particulars apply or address to L. M., at Messrs. WARNER, 28, Cornhill, London.—Nov. 30, 1843.

TO NURSERYMEN, GARDENERS, and Others.
TO BE DISPOSED OF, AN OLD ESTABLISHED NURSERY AND SEED BUSINESS of 60 years' standing, containing seven acres of Nursery ground within a walled fence, well stocked with every kind of Forest and Fruit Trees, Evergreen and Flowering Shrubs, &c., with Greenhouse, Stove, Cape-house, Pits, &c. &c. well stocked; together with Shop, Seed-loft, Store-room, Stable, Sheds, &c., with every convenience for carrying on the business: there is also two good Dwelling-houses on the same. The above is situated in a thriving market town, and in a good neighbourhood. All letters, post paid, with real signatures, directed A. B., care of Mr. Chapple, Postmaster, Commercial-road, Pimlico, London, will have immediate attention.

PENN'S SYSTEM OF HOTHOUSE BUILDING, WARMING, and VENTILATING.—The superiority of the principle first introduced by JOHN PENN, Esq., for obtaining a more complete circulation of the atmosphere in heated apartments, being now fully established, W. HILL respectfully acquaints the public that having, in conjunction with the late Mr. Penn, devoted much time and study to perfect the same, in the construction of Conservatories, Stoves, Greenhouses, Pits, &c., and to heat them with Improved Hot Water Apparatus, either by Pipes or Troughs, he is enabled to carry out Mr. Penn's principle in a manner to guarantee the most complete success and economy. First-rate references. Plain and Ornamental Designs; and any particulars on application to W. HILL, Surveyor & Builder, Lewisham.

HOT-WATER APPARATUS FOR HEATING HORTICULTURAL BUILDINGS, DWELLING-HOUSES, CHURCHES, and MANUFACTORIES, upon improved principles, and at very moderate charges, erected by DANIEL and EDWARD BAILEY, 272, HOLBORN.

D. and E. BAILEY having devoted much time to the consideration of this subject, and had much experience in the erection of apparatus for the above-mentioned purposes, have, by improvements suggested in their practice, rendered their mode of heating not only very efficient, but very simple, and have combined durability in the apparatus with economy in the charge. They have erected apparatus in England, Scotland, and Ireland, for many noblemen and gentlemen, and have had the honour to be employed by the Horticultural Society of London, in executing the works of their splendid Conservatory, lately erected at Chiswick.

D. and E. BAILEY also construct in metal all descriptions of Horticultural Buildings and Sashes, and invite noblemen, gentlemen, and the public to an inspection of their various drawings and models, at 272, Holborn, where they have the opportunity of exhibiting, amongst other metal works, an extremely complete and convenient kitchen apparatus, or range, adapted for the continued supply of hot water, and an arrangement of the oven more complete than has hitherto been brought before the public.

D. and E. BAILEY were the first to introduce metallic curvilinear near houses to horticulturists, and can refer to the Conservatory attached to the Pantheon as one of their works, besides many others in this country and on the Continent.

D. and E. BAILEY have prepared a quantity of the Galvanic Plant Protectors, which are now ready for immediate delivery; they beg to introduce to public notice a new Trough Pipe, for Orchidaceous or other Houses where vapour is constantly, or at intervals required, and which may be seen at their Manufactory.

HORTICULTURAL BUILDING & HEATING by HOT-WATER.

J. WEEKS & Co., ARCHITECTS, &c., Gloucester-place, King's-road, Chelsea, Hothouse-Builders, and Hot-water Apparatus Manufacturers, beg leave to inform the Nobility and Gentry, that their business, which has been extensive throughout the country for many years, is entirely confined to the BUILDING OF HORTICULTURAL ERECTIONS of every description, and the HEATING of them by HOT WATER.

CONICAL and other BOILERS of all sizes, their largest consumes but a small quantity of fuel, only requiring attention once in 10 hours, and will heat a range of Forcing-houses 300 feet in length.

Their improved plan of BOTTOM-HEAT FOR PITS, by means of an open trough under the bed, is now being universally adopted.

References may be had, and their works seen at most of the Nobility and Gentlemen's seats in the country, nearly the whole of the London Nurseries, and a great variety of Horticultural Erections and Hot-water Apparatus, Models, Plans, Estimates, &c., at their Horticultural Manufactory, Gloucester-place, Chelsea, near Sloane-square.

COTTAM AND HALLEN, ENGINEERS, IRON-FOUNDERS, &c. &c., No. 2, WINSLEY STREET, OXFORD STREET, LONDON.

HOTHOUSES, CONSERVATORIES, &c., made upon the most improved principle, either of iron or of iron and wood combined, which can be fixed complete in any part of the Kingdom, at very low prices, in consequence of the present depressed state of the Iron Trade.

HOT-WATER APPARATUS for heating Hothouses, Conservatories, and Greenhouses; Churches, Public or Private Buildings, &c., with COTTAM'S PATENT, or ROGERS' BOILERS. After 15 years' experience, and having fixed upwards of 1500 Apparatuses for the above-mentioned purposes, and by various improvements which they have made during that time, C. and H. can with confidence undertake the erection of similar Apparatus upon the most extensive scale. For the convenience of those who wish to fix their own Apparatus, they have affixed the following low prices.

(Larger Sizes in proportion.)
Rogers' Boiler, small size 3 15 0
Do. do. large do. 4 10 0

Hot-water Pipe, Doors, Frames, and Feeding Apparatus for Boilers, &c.

Rendle's Tank System on an improved simple plan.

STRONG IRON HURDLES, 3 ft. high out of the ground, 6 ft. long, with five horizontal bars, weighing about 36 lbs., 3s. 6d. each.

Light Cattle Hurdles, 3 ft. 6 in. high, weighing 42 lbs., at 4 0 "

Strong do. do. do. 45 lbs., at 4 4 "

Ox Hurdles, 4 ft. high, do. 60 lbs., at 5 6 "

BEST WIRE FOR STRAINED WIRE FENCING, at 8s. 6d. per bundle of 150 yards each. Uprights for ditto, at 7d. each. The Improved continued and every other kind of Fencing, Fancy Wire-work, &c.

HAND-GLASS FRAMES for Cucumbers, &c., 18 inches square 3s. 6d.; 20 inches, 4s. 6d.; 22 inches, 5s. 6d. each.

CAST-IRON FLOWER-STAKES 4 feet long out of the ground, 7s.; 4 feet 6 in., 9s.; 5 feet, 11s.; 6 feet, 15s.; 7 feet, 20s. per dozen.

GARDEN ROLLERS 18 inches long, 34s.; 20, 44s.; 22, 50s.; 24 inches, 60s.; 26, 75s.; 28, 84s.; 30, 105s. each.

Garden Engines, Mowing Machines, Garden Chairs, Superior Garden Tools of all kinds, Garden Vases and Pedestals in great variety, and every description of Horticultural Articles, Agricultural Implements, and Furnishing Ironmongery; Dr. Arnott's Stoves, Anglo-Belgian Cooking Stoves; Broiling Stoves. The above low prices being on account of the depression in the Iron Trade, are subject to future alterations.

Show-Rooms at the Manufactory, No. 2, Winsley-street, where every information may be obtained.

Estimates sent by return of post.

RENDLE'S TANK SYSTEM OF HEATING.

STEPHENSON AND CO., 61, Gracechurch-street, London, Inventors of the IMPROVED CONICAL and DOUBLE CYLINDRICAL BOILERS, having been much engaged in heating buildings upon the above system with Tanks of various materials, solicit the attention of scientific Horticulturists to an Iron Tank now fitting up on their premises, which offers most decided advantages over every other article hitherto employed for the same purpose. These tanks which are ornamental in appearance can be made from 10 to 100 feet long and of any width and depth, and can be connected or disconnected by any working Gardener without the slightest difficulty, thus affording the opportunity to persons in remote districts of employing this much approved method of heating without the assistance of Engineers. The Tanks can be applied to Boilers and Pipes already fixed, and from the present low price of Iron will be found cheaper than of any other material. MR. RENDLE, of Plymouth, has kindly undertaken to receive orders and furnish information to any persons in his neighbourhood, and prices for any size will be forwarded upon application to S. and Co.

GUANO ON SALE.—Any Quantity of this valuable Manure can be had from the bonded stores of the Importer either in London or Liverpool, on application to COTESWORTH, POWELL, and FRYOR, St. Helen's Place, London; EDWARDS, DAWSON, and Co., Liverpool; and WILLIAM J. MYERS and Co., Importers, Liverpool.

ARGUS LIFE ASSURANCE COMPANY, 39,
Throgmorton-street, Bank.
Empowered by special Act of Parliament, 5 & 6 W. IV., c. 76.
Thomas Farncomb, Esq., Alderman, Chairman.
William Leaf, Esq., Deputy-Chairman.
William Banbury, Esq., Rupert Ingleby, Esq.
Edward Bates, Esq., Thomas Kelly, Esq., Alderman.
Thomas Camplin, Esq., Jeremiah Pilcher, Esq., Sheriff
James Clift, Esq., of London and Middlesex.
Rt. Hon. J. Humphrey, M.P., Lewis Pocock, Esq.
Lord Mayor of London.

Physician—Dr. Jeafferson, 2, Finsbury-square.
Surgeon—W. Coulson, Esq., 2, Frederick's-place, Old Jewry.
Consulting Actuary—Professor Hall, of King's College.
Advantages of the Argus Life Assurance Company.

Low Rates of Premiums.
In addition to the subscribed Capital of 300,000*l.*, the Assured have the security of the Company's Income of nearly 60,000*l.* per annum, yearly increasing, and accumulating Assurance Fund invested in Government and other available Securities, of considerably larger amount than the estimated liabilities of the Company. The Rates of Premium are reduced to the lowest scale compatible with the safety of the Assured and the stability of the Company, thereby, in effect, giving to every Policy-holder an immediate and certain bonus without risk, in lieu of the deferred and frequently delusive prospect of a periodical division of profits.

Annual Premium to Assure £100.			
Age.	For One Year.	For Seven Years.	Whole Term.
20	£0 17 8	£0 15 1	£1 11 10
30	1 1 8	1 2 7	2 0 7
40	1 5 0	1 6 9	2 14 10
50	1 14 1	1 19 10	4 0 11
60	3 2 4	3 17 0	6 0 10

One-third of whole-term Premiums may remain unpaid at 5 per cent. comp. int. as a debt upon the Policy for life, or may be paid off at any time without notice.

In Assurances for advances of money as security for debts, or as a provision for a family, when the least present outlay is desirable, the varied and comprehensive Tables of the Argus office will be found to be particularly favourable to the Assured.

A Board of Directors, with the Medical Officers, attend daily, at a quarter before 2 o'clock.

EDWARD BATES, Resident Director.
A Liberal Commission to Solicitors and Agents.

DISEASED AND HEALTHY LIVES ASSURED.
MEDICAL, INVALID, and GENERAL LIFE
OFFICE, 25, Pall Mall, London. Capital, 500,000*l.* This Office is provided with very accurately constructed Tables, by which it can Assure Diseased Lives on Equitable Terms. Increased Annuities granted on *unsound* Lives, the amount varying with the particular disease. Members of Consumptive Families assured at Equitable Rates. Loans granted upon personal security.
E. G. P. NEISON, Actuary.

GUANO ON SALE,
BY THE IMPORTERS,
ANTHONY GIBBS & SONS, LONDON;
GIBBS, BRIGHT, & CO., LIVERPOOL AND BRISTOL.

FORBES'S HISTORY OF BRITISH STARFISHES.
NEWMAN'S FAMILIAR HISTORY OF INSECTS.
Paternoster-row, July, 1843.

THE PICTORIAL SUNDAY-BOOK. To be completed in Thirteen Monthly Parts, at Eightpence each, with Fifteen Hundred Woodcuts, and Twenty Coloured Maps, forming a splendid Folio Volume. Published also in Weekly Numbers at Threepence, with a Monthly Supplement at Sixpence.

There are intervals in the devotional duties of the Lord's Day when sacred subjects may be fitly offered to the mind, and especially to the mind of the young, in an attractive form. "The Pictorial Bible" has thus been recommended by the most zealous ministers of religion as a proper Sunday-Book, calculated to "make the Word of God an interesting study for youth." The publication now submitted to Christian families is intended to present, at the very cheapest rate, a SERIES OF ENGRAVINGS illustrative of the Bible History, the Prophecies, the Psalms, the Life of our Saviour, and the Acts of his Apostles; exhibiting scenes of the great events recorded in Scripture, the customs of the Jews, the natural history of the Holy Land, and the antiquities which throw a light upon the Sacred Writings. With these are united some of the more striking and impressive compositions of the great Painters, and original designs; each illustrating the historical events of the Old and New Testament, and such portions of the New Testament as form the Gospels which the Church Ritual selects for the Sundays, Feasts, and Festivals of the year. These Pictorial Illustrations are connected with a COURSE OF SUNDAY READING, which, avoiding all matters of controversy, endeavours to present, in the most instructive and engaging form, a body of Scriptural Narrative and Explanation, continuing from Number to Number; each Number forming, as it is judged, a fitting portion for a Sunday's leisure. The Publishers have intrusted this important department of the undertaking to a gentleman whose labours in a similar field have attained the highest reputation, and whose responsibility will insure that the work shall be conducted in a spirit of sincere piety, and of anxious diligence, striving at extensive usefulness.

** The FIRST NUMBER will appear on Saturday, the 9th of December, and the FIRST PART on the 30th December.
London: CHARLES KNIGHT and Co., 22, Ludgate-street.

NOW PUBLISHED,
A COMPREHENSIVE VIEW OF THE CULTURE
OF THE VINE UNDER GLASS. By JAMES ROBERTS.

P. Ayres' remarks in this Paper, page 676, of 30th Sept. last.*
LONGMAN & Co., London and all other Booksellers.

LOUDON'S ARBORETUM ET FRUITICETUM
BRITANNICUM. In 8 vols. 8vo.—4 of letterpress and 4 of plates—price 10*l.*

This being the season for planting Trees and Shrubs, planters are reminded that the above work contains by far the most copious history, natural and artificial, of all the Trees and Shrubs which will stand the open air in Britain, that has ever been published; including their description, uses, propagation, culture, diseases, effect in landscape, and every other particular desirable to be known by the planter and landed proprietor.

There are botanical figures of all the species, drawn to one scale; and portraits of the trees, also drawn to a scale, showing the different sizes which the different kinds attain when ten years planted, and also when full grown; an object which was never before attempted in any work on Trees.

"This book is one of solid value, worthy a place in the library of every landed gentleman, as well as of every student of botanical, arboricultural, and horticultural science." . . . The "Arboretum Britannicum" is complete in its kind, and it must become a standard book of reference on all subjects connected with Trees."—*Quarterly Review.*

Printed for the Author, and sold by Messrs. LONGMAN and Co., 39, Paternoster-row; where may be had,

LOUDON'S EDITION OF REPTON'S LANDSCAPE GARDENING and GARDEN ARCHITECTURE, illustrated by numerous Plans, Sections, Views, &c. In one vol. 8vo, price 1*l.* 10*s.* plain; coloured, 3*l.* 6*s.*

This is by far the most complete work on laying out grounds that has hitherto been published; and by means of the numerous plans and sections, the whole may be readily comprehended by the working gardener, as well as by the amateur.

TO ADVERTISERS.
EDINBURGH REVIEW, No. CLIX.—ADVERTISEMENTS for insertion in No. 159 of "The Edinburgh Review," must be sent to the Publishers by Monday, the 11th of December; and BILLS on or before Wednesday, the 13th.—39, Paternoster-row.

Price 7*s.*, illustrated with Woodcuts of Birds, Cages, &c.

A NEW EDITION OF THE
NATURAL HISTORY OF CAGE BIRDS; their Management, Habits, Food, Diseases, Treatment, Breeding, and the Methods of Catching them. By J. M. BECHSTEIN, M.D.
"A very delightful book of its kind."—*Spectator.*
"It will be welcome to every gentleman's library or drawing-room table. It is superbly got up, with an immense number of vignettes, and, in fact, rivals the beauty of the Annuals."—*Weekly Dispatch.*

COMFORT IN WET AND COLD.—NOW READY FOR THE
PRESENT SEASON.

BERDOE'S WINTER really WATERPROOF
WRAPPERS, FROCKS, DREADNOUGHTS, SHOOTING JACKETS, &c., of first-rate character, and in great variety, guaranteed, without confining perspiration, to exclude any description or continuance of rain whatever, and bidding defiance to all weathers. Those to whom SUPERIORITY, COST, and EFFICIENCY, are sine-qua-nons, will not regret an inspection now, (because, justified by the result of five years' extensive trial,) confidently invited, nor subject themselves to disappointment and vexation. Made only by W. BERDOE, TAILOR, WATERPROOFER, &c., 69, Cornhill (North side).

TO THE PUBLIC.—HEALTH being paramount to all earthly blessings, mankind are ever anxious to recover it when lost, and to preserve it when restored. The STOMACH and ENEMA PUMPS, originally invented by J. READ, were sanctioned by the highest medical authorities in this kingdom, as well as on the Continents of Europe, India, and America (vide the Life of Sir Astley Cooper). J. R. begs to inform the public that he has now made such improvements in the above which surpass anything of the kind ever offered, inasmuch as they are more simple, portable, and durable, and are fitted with tubes that will stand the hottest climate, and are not liable to be out of repair. Manufactured only by the Patentee, 35, Regent-circus, Piccadilly.—N.B.—None are genuine except stamped with the words "Read's Patent."

GLASS SUPERSEDED for HORTICULTURAL PURPOSES BY
WHITNEY'S CHEMICAL TRANSPARENT
WATERPROOF COMPOSITION, rendering Muslin, Calico, or Linen, for the Frames of Greenhouses, Pine, Melon, or Cucumber Stoves, &c., impervious to rain or moisture, admitting light equal to Glass, much warmer, and the plants never burn under it.

Noblemen, Gentlemen, and Gardeners will, by using this composition have the only effectual protection for their Fruit-trees during the blooming season; it is a certain defence from frost, sleet, wind, and blight; its transparency admits the general beams of the sun, with abundance of light, which causes the bloom to expand with increased luxuriance, the fruit to set and swell more freely, much earlier, and a crop of fruit to any extent may be warranted. The covering not to be moved by day (except to thin the Fruit, which will be necessary), till the month of June. It is recommended that the Calico be prepared early, so as to be thoroughly dry before using.

Sold in Bottles, with directions for use, pints, 2*s.* 6*d.*, quarts, 4*s.* 6*d.* each. One pint is sufficient to coat four Frames twice over, each Frame to be sft. by 3 ft. 3 in., or thereabouts. Prepared by GEORGE WHITNEY, Chemist, Shrewsbury. Seedsman, Florists, and Merchants supplied by Mr. W. BAILEY, Chemist, North-street, Wolverhampton. Appointed Agents:—Messrs. BUTLER and MUCKLEY, Covent Garden, where a sample of prepared calico may be seen; Mr. WATKINSON, Market-place, Manchester; PAON and SON, Southampton; T. and C. WHALLAN, Nurserymen, Liverpool.—Agents wanted for London and the country.

ROWLAND'S MACASSAR OIL.—Patronised by Her Majesty, H.R.H. Prince Albert, the Royal Family, and the several Courts of Europe.—This elegant, fragrant, and pellucid Oil, in its preservative, restorative, and beautifying qualities, is unequalled over the whole world. It preserves and reproduces the hair, even at a late period of life; prevents it from turning grey; or if so changed, restores it to its original colour; frees it from scurf and impurity, and renders it soft, silky, curly, and glossy, and retains its curl and other decorative form uninjured by the variations of the atmosphere or the effects of the crowded assembly—facts which are abundantly proved by the numerous testimonials which may be seen at the Proprietors'.

Its value is of course enhanced by being used at an early period of life, and to children it is especially recommended as forming the basis of a beautiful head of Hair. Price 3*s.* 6*d.*, 7*s.* Family Bottles, (equal to four small), 10*s.* 6*d.*, and double that size, 21*s.* per bottle.

CAUTION.—Each genuine bottle has the words "ROWLAND'S MACASSAR OIL," engraved in two lines, on the wrapper, and on the back of the wrapper nearly 1,500 times, containing 29,028 letters. Be sure to ask for "Rowland's Macassar Oil."

Sold by the Proprietors, A. ROWLAND and SON, 20, Hatton-garden, London, and by Chemists and Perfumers.

*** All others are spurious imitations!!!

RABBIT-NETS, SHEEP-NETS, TARPULING
COATS and CAPES, LIFE-PRESERVERS, &c.—Rabbit-Nets on cords, 50, 80, and 100 yards long; Rabbit Fence Net, 2*d.* per yard; Strong tarred Sheep-folding Net, nearly 4 feet high, 4*d.* per yard. Tarpauling Coats for Keepers, Watchers, &c., 8*s.* 6*d.* each. Above 1000 London Policemen's Capes, 2*s.* and 3*s.* 6*d.* each. Life Waistcoats, three times as buoyant as cork jackets, 8*s.* 6*d.* each; they form a complete shield against floating spars or rocks, are well adapted for Ladies also, and form the best and cheapest Life-preservers ever introduced—and, as air Life-preservers are liable to injury, these are not filled with air. Belts, 6*s.* 6*d.* Casualty Buoys, which pack in 18 in. by 14 in., and spread when thrown out 14 ft. each way, 20*s.* each: one Buoy would support six persons, but twelve or more might be saved by it—price 20*s.* each. Fishermen's Buoys for Nets, 2*s.* 6*d.* each. ROBERT RICHARDSON, Net and Tent Maker, 21, Tounbridge-place, New Road, corner of Judd-street.

SLATE WORKS, ISLEWORTH, MIDDLESEX.
EDWARD BECK informs Horticulturists generally, that the Cisterns, Tanks, Shelves, Stages, Conservatory Tubs, Flower-Boxes, Edging for Garden-paths, &c., manufactured by him in Slate, may be seen in use at Worton Cottage, upon application to the Gardener, (Sundays excepted.)

MYATT'S NEW SEEDLING STRAWBERRY.

J. AND W. MYATT are now ready to send out their NEW STRAWBERRY, the DEPTFORD PINE, the fruit of which has been exhibited at the London Horticultural Society, and a Banksian Medal awarded. It has also been submitted to Professor LINDLEY, for whose opinion see *Gardeners' Chronicle*, No. 26, p. 447. It is a most prolific bearer, exhibiting at the same time a profusion of fine fruit and bloom on the same truss. Price, Deptford Pine, 2l. 10s.; British Queen, 1l., and Eliza, 10s. per 100.—Manor Farm, Deptford, Nov. 24, 1843.

THE BRITISH QUEEN AND PRINCE ALBERT PEAS.

W. J. CORMACK AND CO. beg to announce to their Friends and the Public that they have harvested the above two New Varieties, and will be obliged by early orders, as the stock is limited. They will be sent out, as last spring, in packages, bearing the name of the firm, price 3s. 6d. per quart. The usual allowance to the trade.

N.B.—"CORMACK'S Early Kent Peas," 14s. per bushel. Newcross, and Bedford Conservatory, Covent Garden, Nov. 24.

The Gardeners' Chronicle.

SATURDAY, DECEMBER 2, 1843.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

TUESDAY, Dec. 5,	Horticultural	2 P.M.
WEDNESDAY, Dec. 6,	Linnæan	8 P.M.
FRIDAY, Dec. 15,	Society of Arts	8 P.M.
	Botanical	8 P.M.

WHEN the GARDENERS' CHRONICLE was established the proprietors did not contemplate the admission of Agriculture into its columns, except to a limited extent. But the different branches of cultivation prove inseparable. Gardening was, in fact, the mother of Farming; and the parent will not be divided from her offspring.

Our correspondence also tells us that a large number of the readers of the GARDENERS' CHRONICLE are greatly interested in Agriculture, and anxious to obtain the same amount of information upon that subject as has been afforded relating to Horticulture; and this has gradually led to occupying a larger space with Agriculture than the demands of Horticulture will permit.

In order to remedy this, and at the same time to meet fully the interests of the Agricultural community, the Proprietors have determined to enlarge their Paper, permanently, to the size of 72 columns; of which the customary space will be occupied with general news, and the remainder will be divided between Horticulture and Agriculture. They do not, however, on this account propose to increase the price; on the contrary, they are happy to show their sense of the favourable reception which their Journal has already met with, by making it one-half larger without further charge.

At the commencement, we undertook that the GARDENERS' CHRONICLE should become a well-conducted channel for the diffusion of sound Horticultural science and practice, and that it should be, at the same time, a field in which all questions connected with the subject could be discussed in a gentlemanly manner. The large sale of the Paper shows that this promise has been kept. The same plan will be followed in the Agricultural department. The science of Agriculture, its practice in all its bearings, and the many details connected with so vast a subject, will form topics of consideration and of temperate discussion. Political questions will be avoided; our field will be the Farm. While other Journals are absorbed in ephemeral disputes concerning matters of human legislation, we hope to be engaged in the investigation and application of those great truths which regulate the actions of plants and animals, and which no change of times or human laws can affect. The discovery of a new truth in Vegetable or Animal Physiology—a new implement—or a new or improved point in Agricultural practice, will be of more permanent interest than the most triumphant settlement of some disputed point in the politics of the day.

It is needless to repeat the hacknied phrases that have become current in speaking of the high station claimed by Agriculture among human affairs. Man acknowledges its paramount importance; the vast interests connected with it speak in a louder voice than the flourishes of oratorical trumpets. But its actual condition, whether we consider it as an art or as a science, is not so well understood. There are those who imagine that a subject which has engaged the attention of mankind from the Creation cannot now require further investigation;—there are others who declare it to be only in its infancy: and certainly, when we look to the mechanical improvements now making in rural implements, and to the large strides that have been lately made towards more correct views in the Chemistry and Physiology of the organic world, the latter would seem to be the more just opinion: this is, however, what our columns will assist in determining.

Let us, however, not be misunderstood. We have no thought of exalting science over practice. We are no advocates of inconsiderate speculation. We fully recognise the impossibility of applying abstract principles to cultivation without an acquaintance with circumstances, often as varying as places. We admit that, upon some points, the opinion of a good ploughman, who has never stirred from his farm, is precisely that which a wise

man would first consult. We condemn the idea of conducting farming operations upon one invariable plan, and while we welcome science as the best auxiliary of practice, we regard crude scientific speculations as the most dangerous of delusions. But, on the other hand, we feel that in Agriculture, as in all other arts, there are great general principles upon which successful farming must necessarily depend; that there are practical errors which no local circumstances can justify; that there is room for improvement even in those branches of husbandry which are best understood; and, in short, that Agriculture offers one of the richest fields in which men of talent may labour.

Of course the Editor of the Horticultural Department does not take upon himself the management of that of Agriculture. His ground is the garden, and to that he will confine himself. The charge of the Agricultural Department will be confided to a gentleman well acquainted with the best kind of farming, in which he is actively engaged, and supported by the communications of our most distinguished farmers. The AGRICULTURAL GAZETTE—for such will be the name of the new part—will therefore, like the GARDENERS' CHRONICLE, not be confined to an exposition of the views of a few individuals, but will become a record of the opinions of all the most distinguished practical and scientific men of the age.

THAT one of the best treatises we have on the Pine-apple is that of Mr. Glendinning,* is well known to gardeners. It will not diminish the reputation of the book when we state that the large Queens lately sent to London from Longleat have been obtained by following its directions in most respects. We shall therefore—without pledging ourselves to defend all Mr. Glendinning's principles, some of which, in fact, we think will not bear strict examination—proceed to explain what we conceive to be the important points in his code of instructions.

The first, and we apprehend the most essential circumstance upon which he relies is the growing his plants slowly at first, and rapidly afterwards. It is a certain law in Vegetable Physiology that plants which grow fast when young never carry good fruit. It is, indeed, impossible that they should: for how can we expect vigour in old age from debility in youth? and rapid growth when young is inevitably attended by debility. Plants grow fast, but acquire no solidity. They are like children who shoot up at once into the stature of manhood, and immediately afterwards perish of consumption; or they may be likened to those Fungi which are formed in a day, and rot in an hour. This truth, which is just as applicable to Melons, Strawberries, Peaches, and Vines, as to Pine-apples, is, as we conceive, the corner-stone of Mr. Glendinning's system.

"If," says Mr. Glendinning, "the Pine-apple in its younger state is supplied with the same amount of heat and moisture as are required in ripening the fruit, the foliage would become drawn and slender, and the whole plant so constitutionally weak, that nothing but puny fruit could be produced." In fact, the succession-house and the fruiting-house are managed upon a very different plan, the temperature of the former being from 11° to 16° below the latter, as is shown in the following Table:—

MONTHLY TABLE OF TEMPERATURE.

	Pit.	Stove.	
January	54	65	× 11°
February	56	68	12
March	57	71	14
April	59	73	14
May	60	75	15
June	61	76	15
July	62	78	16
August	62	78	16
September	60	76	16
October	58	73	15
November	56	69	13
December	54	65	11

Mr. Glendinning regards this as a deviation from the natural habit of the Pine (p. 12); but in that he is mistaken. The Pine grows in the cool season and fruits in the hot season in its native habitation, and there is scarcely less than 16° of difference between these two periods. For instance, at Nassau, where the Providence Pines are found, the difference is from 14° to 15°; and in some parts of India it amounts to as much as 30°. It is true that these variations of season are not applicable when Pines are several seasons before they fruit; but then very fine Pines are always produced on young plants, for the whole of whose growth two seasons—the cool and the hot one—are sufficient. When the vicissitudes of six seasons, or three years, are allowed to operate on Pines, as Mr. Speede says is the case in Calcutta, nothing but bad fruit will be the result. In fact, this writer, with the climate of India at his back, thinks a Pine of six or seven pounds a prodigy!

In the next place, the Pine-houses are provided with the means of obtaining milk-warm water for syringing and watering. This, which is so often neglected, is a capital point in the cultivation of all tropical plants, which are unacquainted with the low temperature of

* Practical Hints on the Culture of the Pine-apple. By R. Glendinning. 12mo. 1839, pp. 55.

northern countries in any shape, and unprovided with the means of resisting its effects. It is of little use to maintain a steady bottom-heat, or a steady air-heat, if the warmth of the soil or of the leaves is to be suddenly lowered six or seven degrees by a deluge of cold water. Tender plants do not like shower-baths.

Steam is admitted to the air when necessary, so as to maintain a due atmospheric moisture. A steady, uninterrupted growth is to be secured at all times. Liquid manure is given abundantly; the dung of sheep or deer, steeped for a long time in water, being used for this purpose. Finally, a stiff turfy loam mixed with sheep or deer dung, is recommended as the soil; but as the Pine-apple grows capitally at Versailles in peat, and at home in sand, it does not appear to us that the soil is a very important consideration, provided it is open.

Such appear to us to be the main features in Mr. Glendinning's practice. There is, however, still a point of perhaps as much importance as the others. At p. 35 we are told that few persons acquainted with the management of Pine plants are ignorant of the injury consequent on any sudden change of treatment, and of the certain destruction that follows unexpected transitions. Again, at p. 47 it is directed that if large fruit is wanted, *plenty of pot room should be allowed*. But then at p. 23 it is said, that the gardener must always *guard against over-potting*, and the system of frequent shifts is there laid down as the rule to be followed. That the first rule is right and the second wrong we have entertained no doubt; but for the sake of being sure that good practice did not contradict good theory we wrote to Mr. Murray, to inquire which of these two methods he followed. His answer is as we expected, that he adopts the *large shift system*, and to a much greater extent than is recommended by Mr. Glendinning, and that he proposes to carry it *still further* next year. We have some reason to believe that this is also the plan at Bicton, and we regard it as the certain precursor of getting rid of potting altogether. At all events, we shall soon know how Mr. Barnes does manage his Pines, for we understand that a full account of his practice may be expected in the "Gardeners' Magazine" of January next.

Our attention has been directed for some time to the experiment of Mr. Archdale Palmer, on transplanting the roots of Wheat after separating them into several plants by splitting. The experiment is by no means new; and the result, in many instances, perfectly astonishing. The increase from one grain sown early in the season, by repeatedly dividing the plants as they throw out tillers, amounts to many thousands; and by this means valuable varieties may be rapidly brought into general cultivation. But all the experiments which have been made have been on a small scale, and in gardens, or at least in very mellow well-prepared soils; and it appears, at first sight, that however great the saving of seed might be, if the practice of splitting the roots were to become general, and supposing that hands could be obtained in sufficient numbers, without raising the fair wages of labour, to extend the plan to considerable farms, the saving of seed-wheat would be sufficient to supply food for a greatly increased population. We have employed experienced practical labourers to calculate the fair value of the additional manual labour required in planting, dividing, and replanting Wheat on an acre of land; but the results differ so widely, ranging from 12s. to 60s., that without actually planting a considerable portion of land with Wheat in this way, and keeping very minute accounts of the expense, it will be impossible to decide whether it could be recommended, generally, as economical.

The only way to ascertain this is to let it be fairly tried by experiment, the details of which must be stated as follows:—

Digging and preparing seed-bed, 1 square perch	£	—	—
Dibbling 484 seeds at 9 inches each way,			
hour's work	—	—	—
August.—Taking up 494 plants, and dividing			
each into 3, and replanting 1482	—	—	—
Dividing 1482 plants into 4 each, and raking the			
ground for transplanting, hours	—	—	—
September.—Transplanting 5808 plants, hours	—	—	—
Dividing each of these into 3	—	—	—
Raking the ground, &c.	—	—	—
Transplanting 17,424 plants	—	—	—

Suppose each plant occupies a square of 9 inches, this number of plants will cover very little more than 32 square perches, just one-fifth of an acre; so that a whole acre, treated in this way, would cost in labour five times the estimated amount.

The farther we go on in the division, the greater the labour and the chance of plants failing. Every time the roots are divided and replanted, the ground should have some stirring, if only a harrowing or raking, which last would be easiest, as a raker could follow the person who divided the roots, and level the holes made by taking up the plants. Compare this tedious operation with dibbling 5 pecks of seed at 8s. per acre, as is done in Suffolk and Norfolk. There

at least a bushel of seed is saved, which pays for the dibbling; for you must allow at least 1s. for broadcast sowing and harrowing, which leaves the cost of dibbling at 7s., the price of a bushel of seed at the average of 56s. per quarter. There is no prospect of any invention to shorten the labour of dividing roots and transplanting them, whereas machines have been invented, and will gradually be perfected and simplified, by which seed may be dibbled as easily as it is now drilled. Instead, therefore, of attempting what appears impracticable on a large scale, and expensive on a small, we had better direct our attention to the more practical operation of dibbling the seed, of which we have many examples, the cost of which is known, and the advantages established by long experience. We would recommend fewer seeds to be deposited in each dibble-hole, and these to be more distant, so as to admit of the operation of the hoe. On loose soils the tread of the dibblers and of the depositors of the seed has an excellent effect; four or five inches is not too deep to deposit the seed in such soils; it will then find moisture, the first roots will take a firm hold, and the frost will not affect the young plants, or throw them out of the ground, as is the case when the roots have little depth. It is only on heavy clays, which will not bear treading when wet, that dibbling does not answer; but when these are well drained they change their nature, so as to become mellow and almost light in a few years after draining, subsoil-ploughing, and ample manuring; changing into a real garden soil, and showing all the fertility of garden-mould.—M.

Such were the opinions of our late lamented friend, Mr. Rham, upon the curious subject of Wheat-splitting. The dibbling machine to which he referred was a most ingenious contrivance of his own, which he believed he had at last brought to perfection, and which Messrs. Ransome the celebrated machine makers were to have executed for him. And nothing can be more just than his opinions, if Mr. Archdale Palmer's practice, as well as his principles, is to be observed.

But while we are disposed to regard the latter with favour, we consider the former wholly inadmissible. The principle of Wheat-splitting is full of promise, but the plan adopted by Mr. Palmer is too complicated for practice; and therefore we see no advantage in repeating his experiments in his way. The true mode of proceeding is that pointed out by a correspondent, No. IV., at p. 735, who suggests one sowing and one splitting; a little seed being wasted, in order to save the excessive amount of labour incurred by Mr. Palmer. Now as this is a gardening question—for the operations required are those of a gardener, and not a farmer, we may be permitted to offer an opinion upon it. That opinion is, that the plan may possibly succeed upon land that is not too stiff; but, to what extent, it is impossible to say without further data. We entertain no doubt about the possibility of country people making fair wages by splitting and planting the Wheat at 4d. per 1000; that is to say, after they have acquired dexterity in such work; for at first they would be awkward and would waste a great deal of time. And if this is so, the cost of planting will be at least one-half less than sowing, provided the Wheat can be placed profitably so far apart as 18 inches.

The distance at which Wheat can be most profitably planted is not, we believe, at all determined. Such experiments as have come to our knowledge were made in gardens, or otherwise in an unsatisfactory way. Experiments in several different places are required to settle that point, and we would advise their being tried on quarter acres of fair Wheat land, thus:—

No. 1, at	6 inches apart.
No. 2, at	9 " "
No. 3, at	12 " "
No. 4, at	15 " "
No. 5, at	18 " "
No. 6, at	20 " "

An acre and a half on a few farms would determine that part of the question, and the expense of the experiment would be inconsiderable. Nor would it at all matter whether the Wheat were dibbled or split for the purpose of such an experiment. Then, when the most profitable distance at which to set Wheat, on fair Wheat land, was determined experimentally, it would be time enough to resume the question of Wheat-splitting.

Where, however, experimentalists are desirous of putting the plan of Wheat-splitting at once to the proof, we strongly advise them to place the operation under the superintendence of an active young gardener who is acquainted with the method of planting seedlings in the Scotch Nurseries, who can do such work himself, and can teach others the readiest way of performing it. Those who have never seen it done would never believe the rapidity with which a skilful workman will get through so apparently tedious an operation.

We certainly think the experiment worth a fair trial on a small scale, because if nothing is saved by it otherwise, we must at least remember that it would

be an immense advantage to find a large means of employing the poor, especially the least able-bodied part of the population, without any additional burthen upon the farmer.

ON THE CULTURE OF TROPICAL ORCHIDACEÆ. (From the "Orchidaceæ of Mexico and Guatemala.")

BY JAMES BATEMAN, ESQ., F.R.S.

OF Orchis-culture the ancients were entirely ignorant, nor does it appear to have made any progress among the moderns until the commencement of the present century. A few species had, it is true, been established at Kew, and in the collection of the Messrs. Loddiges at a somewhat earlier period; but these may be said to have succeeded rather in defiance than in consequence of the barbarous treatment they received. If, however, the gardener was in the dark as to the management of the tribe, the botanist was as much at fault as to their numbers and importance, for even Professor Lindley—the first to entertain enlarged views upon the subject—in an early edition of his "Natural System," estimates the probable extent of the tribe at only two thousand, a number that is exceeded, at the present time, by those actually cultivated in the hothouses of England alone!

But, before we enter upon the details of the prevailing modes of culture, it may not be uninteresting to make brief mention of the parties who, by their zeal and skill, have successively contributed to bring Orchis-growing to its present palmy state; and first on the list must stand the well-known firm of C. Loddiges and Sons. A collection appears to have existed in this establishment for more than half a century, which in the last ten years has increased so rapidly that it now includes more than one thousand eight hundred species. Mr. Cattley, of Barnet, whose memory is embalmed in the splendid genus that bears his name, appears to have been the first successful private grower, and had the merit of introducing many excellent plants.¹ The Horticultural Society had also, from the first establishment of their garden at Chiswick, spared no pains to discover the secret of Epiphyte culture, and their experiments enabled Professor Lindley to compile his memorable paper "Upon the Cultivation of Epiphytes of the Orchis Tribe," which was read May 18, 1830, and from which the science of Orchis-culture may be said to date.² Contemporary with Mr. Cattley, and no doubt prompted by his success, other collectors soon appeared, of whom the most remarkable were the late Mrs. Arnold Harrison, and her brother Mr. Richard Harrison, the Rev. J. T. Huntley, and the late Lord Fitzwilliam.³ Mr. R. Harrison's collection was, for many years, "the leader," and was visited accordingly not by Epiphyte lovers only, but by botanists and men of science from all parts of the world. Aigburgh, in fact, became a sort of Mecca, to which the faithful Orchis-grower made his annual pilgrimage, and never without finding himself abundantly rewarded by the sight of its then unrivalled treasures. What are called "fine specimens" were here seen for the first time, and many were the years of patient care and skill that had been requisite to produce them. Next in order, and second to none of his predecessors in enthusiasm, came the writer of this article, who, impatient of the tardy rate at which new species crossed the seas, determined to expedite matters by despatching a botanical collector to seek them in their native haunts. This service was undertaken by Mr. Colley, who sailed for Demerara in the winter of 1833, and although his success fell short of expectation, it yet was sufficient to encourage other parties to embark in similar adventures. From this period the importation of Orchidaceæ has steadily increased, and although we now reckon the species by thousands, an inexhaustible fund of novelty seems to be in store for us, and collections have multiplied almost as rapidly as the plants. Those of Mr. Barker and Mr. Williams, in the neighbourhood of Birmingham, became celebrated about the year 1834, and the former gentleman, by sending out Mr. Ross to Mexico, added greatly to the number of species in cultivation. The collection of the Rev. John Clowes next came into notice, as did shortly afterwards that of the Duke of Devonshire, at Chatsworth, which was incalculably enriched by the mission of Mr. Gibson to India in 1836. But the *annus mirabilis* of Orchis-importation was 1837. In addition to the spoils brought by Mr. Gibson from the Nipalese-hills, and which reached Chatsworth in this year, Mr. Skinner poured into our stores the richest treasures of the barancas of Guatemala; Mr. Cumming sent a profusion of the choicest Air-plants from the Philippine Islands; Mr. Shomburgk contributed some exquisite species from the interior of Guiana; and M. Deschamps, a Frenchman, arrived with his vessel from Vera Cruz, entirely laden with Mexican Orchidaceæ. In the whole, not less, probably, than 300 species were seen in England for the first time in this memorable year.

Besides the collections already noticed, many others deserve to be enumerated, which, although more recent than some we have named, are not less rich in species, especially those of Mr. Rucker, the Duke of Northumberland, Baron Dimsdale, Mr. Norman, Mr. Allcard, Mr. Cox, and Mrs. Lawrence, all in the neighbourhood of London; Mr. Brocklehurst, at Macclesfield; Mr. Horsfall and Mr. Moss, at Liverpool; and Mr. Wanklyn and

Mr. Bow, at Manchester. There are also good collections at Enville (Lord Stamford); Arley (Lord Mountnorris); at Cardew (Sir Charles Lemon); Penllargar (Mr. Llewelyn); Bicton (Lady Rolle), &c. &c.; in fact, an Epiphyte-house is already considered an almost indispensable adjunct to a place of any consideration.

Although many of the collections above enumerated are nearly on a par as respects the number of species they contain, there is a wide difference in the modes of culture employed, and in the degree of success attained; and therefore a tour among those of greatest note would be of more service to the young Orchis-grower than any code of instructions that might be laid down for his guidance.

The collections which may be studied with the greatest advantage are those of the Duke of Devonshire, at Chatsworth; the Messrs. Loddiges, at Hackney; the Rev. John Clowes, of Broughton-hall, near Manchester; and Mr. Rucker, of West-hill, Wandsworth. The two first are on an immense scale, and are dispersed through several houses, which differ in their temperature and general arrangements, according to the particular section of the tribe that they are intended to accommodate. At Chatsworth, the largest Epiphyte-house is maintained at a moderate temperature, and contains a large number of Nipalese and South American species; while a smaller house, in which a much higher degree of heat prevails, is devoted to plants from such sultry localities as Sierra Leone, the Mauritius, and the East India Isles. At the establishment of the Messrs. Loddiges, a house immensely long, and hot and damp almost to suffocation, contains their principal collection of Orchidaceæ, a smaller house and lower temperature being reserved for the remainder. In the great house are some magnificent specimens, and the general aspect of the plants is vigorous and healthy; but the system tends to produce exhaustion, and the number of plants seen in flower is smaller in proportion than at Chatsworth.⁴

The collections of Mr. Clowes and Mr. Rucker are admirably grown, and the houses in which they are disposed seem so well adapted to serve as models, that, with the permission of the owners, a ground-plan of each is given in a subsequent page. [We have Mr. Bateman's kind permission to transfer these plans to our own columns, and one of them follows this excellent paper.] Mr. Rucker's plants are the most vigorous; but the house of Mr. Clowes is the most enjoyable, and displays Orchidaceæ to greater advantage than any other that we have hitherto seen. The plans will explain themselves.

And now as respects the leading points in cultivation. Supposing the plants established in a suitable house—which is an indispensable preliminary—the following rules will be found to contain all that is most essential for their successful management.

1st. The plants can scarcely have too much light or too little sun.

Light prevents mildew, strengthens the fibre, and checks the disposition to throw up a succession of weakly shoots, which are quite incompatible with the production of flowers. The sun, on the contrary, scorches and turns the leaves yellow, especially when it first begins to shine powerfully upon plants that have just left their winter quarters. In order to secure as much light as possible, many species should be suspended in the air from rafters or chains, some being placed on blocks of wood (Cork-wood is the best), or fragments of Cocoa-nut husks, and others in baskets of wire or wicker-work filled with moss and broken peat, or in pots with pierced sides. The latter answer perfectly for plants (e.g., the *Saccolabiums*), which are of slow growth, and thrust their roots into the air. Baskets answer best for Stanhopeas and the like. To prevent injury from the rays of the sun, shading is of course necessary, but this should be so arranged as to be easily removed, as it ought not to be continued for more than 10 or 12 hours on the very longest summer's day. Exotic climbing plants introduced sparingly are advantageous, and have a good effect.

2d. Take care of the roots.

On the health of the roots everything depends. The winter is with them the most critical season, for if suffered to grow too dry they shrivel up and perish; if too wet they rot. Much, of course, depends upon the mode in which the plants are potted, and which should be such as to admit of their readily parting with all superfluous moisture; and to secure this nothing is better than a plentiful admixture of broken potsherds. High-potting is now so generally practised in good collections, that it is needless to insist upon its importance. Rapidly-growing plants, such as the different species of *Phaius*, *Gongora*, *Peristeria*, *Stanhopea*, &c., require to be broken up and entirely repotted every second or third year; on the other hand, there are some Air-plants, &c. that may remain undisturbed for five or ten years together.

3d. Beware of noxious insects.

Orchidaceæ are more particularly exposed to the attacks of the following insects:—woodlice, crickets, and cockroaches, the thrip, a minute woolly white scale, and a diminutive species of snail; the two last being infinitely the most pernicious. Woodlice are easily kept in check by placing the plants on saucers, or within troughs filled with water, especially if the valuable aid of a few toads be

¹ Mr. Cattley's collection was disposed of to Mr. Knight, of the Exotic Nursery, about the year 1832.

² This paper is published in the "Horticultural Transactions," 2d Series, Part I.: except that it advocates a temperature unnecessarily high, it contains no views that subsequent experience has not amply confirmed.

³ Of these, all except the collection at Wentworth have disappeared. At the death of Mrs. Arnold Harrison, that lady's collection passed, like Mr. Cattley's, into the hands of Mr. Knight; Mr. Huntley's was removed to Chatsworth in 1835, and Mr. R. Harrison's dispersed by the hammer last year.

⁴ An example of perfectly natural treatment will, probably, ere long, be afforded in the great conservatory at Chatsworth, where the Palms and other glories of the tropical forest will soon be ready—at the rate they are now progressing—for the reception of Epiphytes of all denominations.

⁵ Mr. Rucker has kindly sent the following memorandum of the mode of treatment, &c. at West Hill:—"Our average temperature, in winter, is about 65° at the warm end of the house, which usually falls to about 60° at the other end; in summer 75° to 80°. I find that all the plants from temperate climates thrive better at the cool end of this long house than in another where is less moisture and a lower temperature."

called in. The "Oniscamytic Epiphyte-stand" invented by Mr. Lyons is an ingenious and, no doubt, effectual way of accomplishing the same end. It is made by merely fixing a forked branch, or block of wood, to the raised centre of a massive saucer or feeder, which, being kept constantly full of water, forms a sort of foss—impassable to vermin—round the plant it is intended to guard. Crickets and cockroaches are very fond of flower-scapes, and to be dreaded accordingly. Red wafers scattered over and among the pots are to them very tempting baits, and, if swallowed, the red lead they contain acts as a poison, but these pests are best destroyed by the mixture recommended for the white scale. The thrip does not do much mischief, except where plants are either neglected, or grown in too hot and dry a temperature. It usually first appears among the *Catseta*, and is to be removed by careful washing. Small snails abound in some collections, while in others they are unknown; it is difficult to conjecture whence they come, and all but impossible to eradicate them entirely. They batten upon the tenderest roots, such as plants put forth when they are just beginning to grow, and if not kept in check would speedily produce irretrievable mischief. Lettuce-leaves, slices of Potato, Turnip, &c., are very enticing; and while they divert the attention of the enemy from the roots, they also afford an opportunity of capturing him. The collections which are watered exclusively with rain-water are the least infested. But the worst plague of all is the small white scale, which, in its first insidious approaches, appears only as a white speck upon the leaves, then covers them with a soft whitish down, and finally kills them. For this the following remedy will be found efficacious; viz., dissolve half a pound of camphor in a pint of spirits of wine; the result will be an impalpable powder, to which add one pound of Scotch snuff; one ditto, pepper; one ditto, sulphur, and keep in a bottle (carefully stopped). This mixture should be dusted over the infected parts, and repeated whenever or wherever the enemy shows itself. If persisted in for some time, the mixture rarely fails to effect a perfect cure; and it has the further good property of acting as a most deadly poison to cockroaches, &c., which have quite disappeared in the collection at Knypersley since this mixture came into frequent use. Besides the above annoyances, the red spider and the brown scale are frequently injurious, but never except in cases of gross neglect.

4th. Give the plants a season of rest.

Without a season of rest, most plants will not flower at all, and others do so very imperfectly. It is easily accomplished in a variety of ways, either by moving the plants from the warmer to the cooler end of the house; or by diminishing the quantity of water; or by placing them in a cooler house. Even exposure in a hot, dry atmosphere, although it scorches their leaves, not unfrequently throws them into vigorous flower. Plants from the East Indies, and from other climates, where the extremes of drought and wet are not felt so severely as in Brazil or Hindostan, require a season of rest proportionably short, and of a less decided character.

5th. Attend to the condition of the air.

In winter 60° to 65° is a wholesome temperature for most of the species; in the summer it may rise to 70° or 75° , or even higher if derived from the heat of the sun. Where there are two houses, the warmer one should not be lower than 70° even in winter; but, fortunately, there are comparatively few kinds that insist upon so hot a berth. The air should always be soft, and nearly saturated with moisture. The latter should, however, be prevented from dripping upon the plants, as it condenses; and this is easily effected by fixing a small copper-pipe, or piece of channelled wood, under each rafter and sash-bar, to catch and carry off the water.

6th. Do not over-water.

This a beginner is very apt to do, and a grievous fault it is. When plants do not shrivel or flag, it is a sign that they are content with the humidity that the atmosphere of the house supplies. When watering is necessary, it should not be done indiscriminately, but according to the wants of particular plants. It is also of great importance to use rain-water only, which may be collected for the purpose in a tank, as shown in the plan of Mr. Rucker's house, and which should not be applied of a temperature below 60° . Syringing in moderation may be had recourse to in hot weather. Some of the *Sobralias*, together with *Bromheadia palustris*, grow more vigorously if their pots are set in saucers of water during the summer months.

To the foregoing rules the following advice may be added:—"Do not aim at having too large a collection, but rather strive to grow a few good kinds in the best style." With moderate care and in a moderate-sized house, the whole of the plants enumerated in the subjoined "Century," will thrive apace, and bloom freely—and he whom such a brilliant assemblage fails to satisfy must be an ardent collector indeed.

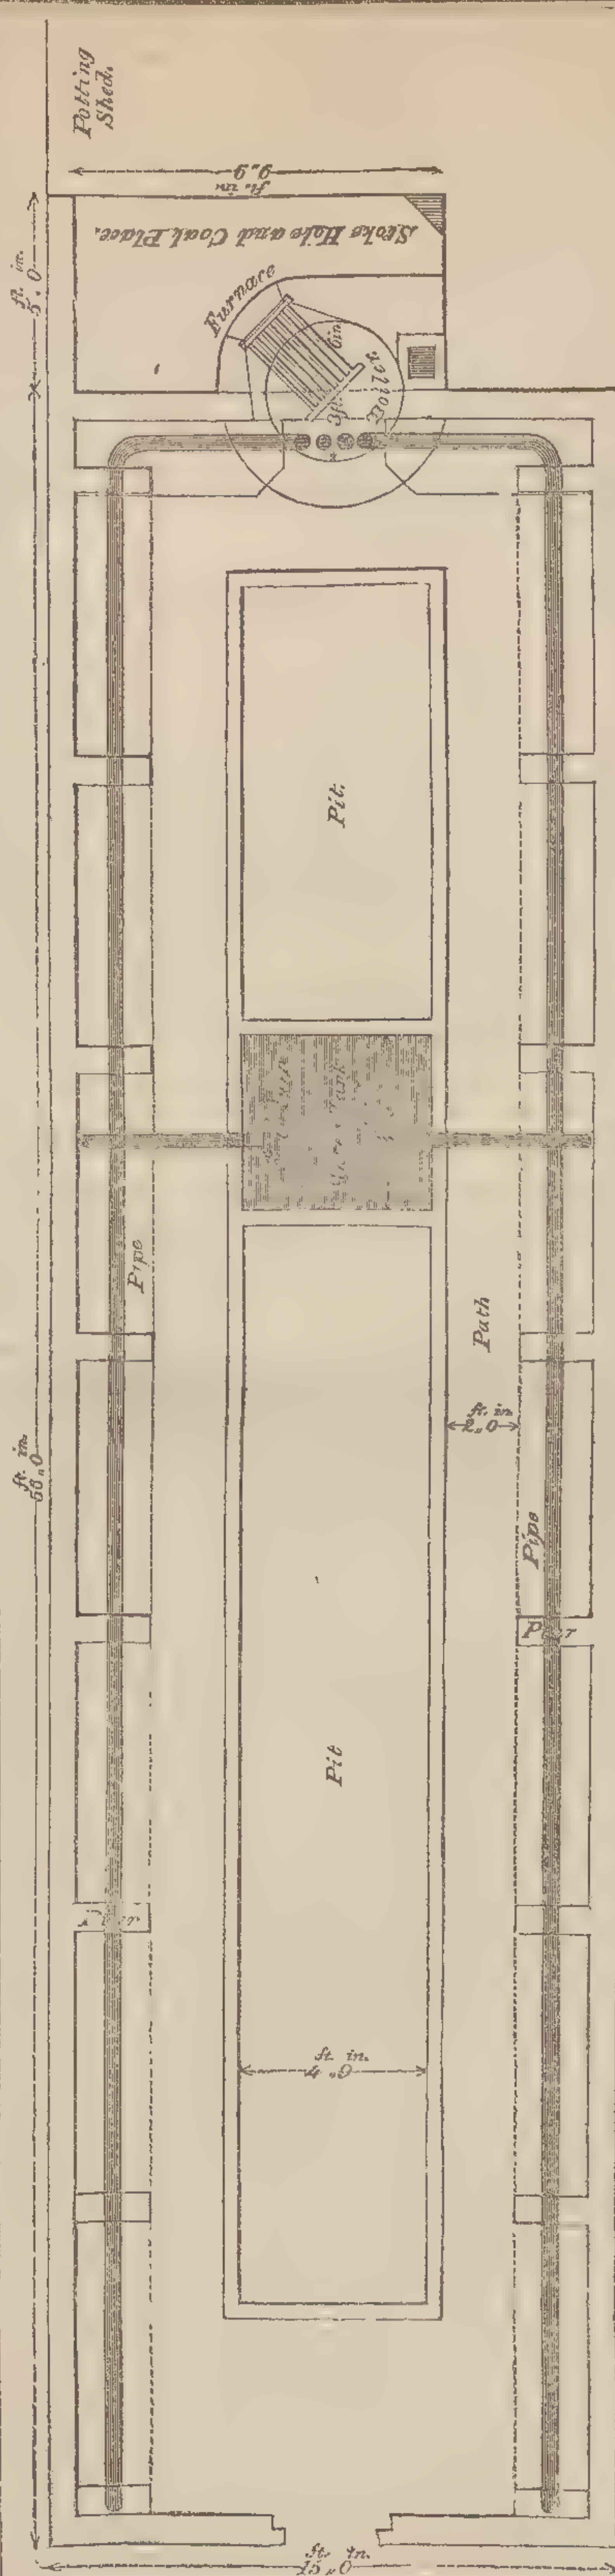

[The following is a ground-plan and section of Mr. Rucker's Orchidaceous house. That of Mr. Clowes will be given on a future occasion.]

ON THE ATMOSPHERE OF HOTHOUSES.

(Continued from page 821.)

It being an admitted fact that all plants require carbonic acid gas in the atmosphere surrounding them, in quantity not less than a thousandth part of its bulk, and that during their growth they are continually abstracting this gaseous nourishment, it is quite clear that, in one way or other, fresh supplies must be afforded. A frequent renewal of the air by ventilation may yield the necessary supply, but the more freely any house is ventilated, there is the greater

⁶ What a pity Mr. Lyons did not invent an easier name for his ingenious device!

expenditure of heat, the external air in forcing being always colder than the interior. It would be therefore wise and economical in all cases to have a source of carbonic acid gas within the house, and thus obviate the necessity of a frequent demand on the external air by rapid ventilation, with its cooling influence. A portion of fermenting material, even where the tank-system is in operation, may be advisable for this end; but nothing can excel the practice I have observed in some instances of

making the hot house also a sort of aviary: while plants absorb carbonic acid gas and give off oxygen, animals absorb oxygen and give off carbonic acid gas, and thus in nature the two great families of organic beings mutually purify or fit the air for each other. If we therefore keep the requisite number of birds or any other animals in a hothouse, it might be made comparatively air-tight, and both kept in health. By keeping animals in hothouses it is clear we supersede the necessity of thorough ventilation, and thus economise heat; it is equally clear, however, that we cannot much increase the natural quantity of carbonic acid gas in our confined atmosphere by this means, for the animals present would then necessarily suffer. A certain increase no doubt may take place with impunity, for animal beings have been found living in an atmosphere charged with two per cent. of carbonic acid gas: it is better, however, in all houses where operations are carried on in their interior not to encourage a great accumulation of this animal poison, lest the health of the attendants should suffer; but in pits, frames, and hotbeds, which are managed from without, such accumulation may with advantage be promoted by particular means; and there can be no doubt when carefully constructed after the old method, with fermenting material, they possess superior powers for fostering vegetation to such as are heated with hot water contained in tanks or gutters.

A fact in vegetable physiology must here be borne in mind, that it is only in the light plants assimilate carbonic acid gas: in the dark or obscure light they cease to appropriate carbon, so that what of this gas has been absorbed or exists in their structure passes off or transudes into the atmosphere again, unchanged. Thus, therefore, in the morning in a close hothouse there may be an accumulation of this aerial compound, but the first rays of the morning sun will give power to the first rays of the rising sun to absorb, make use of it, and in this way cause the redundancy to disappear. Where artificial means are employed to yield this gas, the morning excess in the house will be greater, and the attendant must be on his guard accordingly.—J. L., Newburgh.

ON THE QUALITY AND APPLICATION OF PEAT OR HEATH-MOULD.

A CORRESPONDENT of this Paper, using the signature of "Quæstor," has inquired whether a specimen of that sort of peat "found in moorish bogs, and used in the northern and other parts of the kingdom for fuel," is fit for the growth of plants. It is not in any respect the kind of peat (better called heath-mould) to which I have occasionally adverted. The great differences are these,—the portion sent is the true material, (pure vegetable matter,) but in its raw and unprepared state; in other words, in an incomplete state of decomposition; whilst the peat or heath-mould suitable for the cultivation of plants generally, and of heaths and select greenhouse plants in particular, is the same vegetable matter, after a much higher state of fermentation and decomposition: the former retaining its organic texture, in consequence of having been excluded from the decomposing power of atmospheric and solar agencies; the latter by long exposure to the intense and combined action of air, heat, and water, being so far reduced and decomposed as to enable the roots of plants to re-assimilate its chemical and nutritive properties (the basis of their own). The term "fibrous peat" has been used by men as a mark of distinction rather than of fitness, as a texture of soil embodying the primary elements of vegetable matter by which plants are sustained, in contradistinction to a "sandy-peat," which, to a certain extent, implies the absence of those same elements of vegetable support. From the fact that the best qualities of heath-mould are generally found almost and often altogether exclusive of a sandy ingredient, some eminent cultivators have held an opinion that a perfect system of cultivation will ultimately dispense with all materials incapable of being assimilated generally by the organs of plants. In most barren tracts of heath or moor-land there may be found, on turning the surface up to the depth of two or three

inches, scattered portions of vegetable mould (adhering to the under side) entirely free from the substratum of sandy soil beneath, as well as of the fresh growing portion above. Such, in a higher and more condensed form of decomposition, may be considered as the character of a good material for cultivation. Again, in the entire absence of the true form or substance, take equal portions of thoroughly-fermented woody fibre in a dried state, pure leaf-mould in a half-decomposed state, divested of all earthy matter, charcoal, and disinfected 'night-soil'; these equally pulverised and highly reduced will give a tolerable idea of the texture of true heath-mould, as distinguished from a barren sandy peat. In the adaptation of all soils to the growth of plants, the higher the state of decomposition the more immediate may be their application, and the greater their capability of being appropriated by the organic functions of plants, and *vice versa*. The application of sand to heath-mould and soils generally is not, as is too often supposed, in order to render their texture more open or porous, but on the contrary, to modify and compress the expansive properties of vegetable matter by its gravitating tendency.

Vegetable substances in their various preparations are perhaps the most suitable of all materials for regulating the proportions and enhancing the qualities of other ingredients in the cultivation of plants. Hence their application as a prime material in those instances of culture wherein the higher and intense agencies of nature are applied. The subserviency of organic matter to a progressively mechanical and nutritive effect will be still more effectual in the highest purposes of Horticulture when combined with concentrated forms of animal and other manures.

Perhaps the most common and efficient substitutes for the deficiency of vegetable matter in barren or sandy peat, are pure half-decomposed leaves and woody fibre from the stems of plants, equally pulverised, in a highly reduced and dried state, with a third portion of charcoal, the latter reduced in proportion to the amount of soil used in each process of potting.

The suitability of heath-mould for immediate use in the cultivation of plants in pots, without previous exposure, will generally depend upon its prepared state when obtained from its native bed—that is to say its being in a sufficiently pulverised and friable state. Its application in a very coarse form or texture will mostly depend upon the condition now given, and also upon such an arrangement in the process of potting as will secure under all conditions a uniform circulation of moisture.

It is almost unnecessary to add that the addition of all undecomposed and porous substances, whether vegetable or otherwise, is principally intended to produce a mechanical result, by maintaining the soil in an open state, so that fluid may pass freely among it, and ultimately, by their gradual decomposition, become subservient in the mature stages of growth to a chemical and nutritive effect. This point will be readily understood by stating that the mechanical texture and arrangement of the material should in all cases be in proportion to its amount, it being through the medium of mechanical agency that a chemical or nutritive action both derives and applies its highest force.

Where large quantities of material are wanted for the cultivation of plants requiring heath-mould in open borders, and a sandy peat is the only material at hand, it may be much improved by adding an equal portion of fermented leaves free from earthy matter, in a partially dried and highly-reduced state. In the application of peat in a raw and undecomposed state (such as is generally used for fuel), it will be essentially requisite to reduce its texture until its component parts will admit of a uniform mixture with upwards of one-half thoroughly fermented leaves in a highly-pulverised and reduced condition, with an addition of one-sixth portion of sand.

As the capability of plants to assimilate food from the materials to which they are subjected is in proportion as the mechanical texture of the soil admits of that medium circulation of moisture which ensures its nutritive properties being held in solution for a period equal to the excitability of their organic structure, it may be assumed that the appropriate decomposition and texture of the material will, to a certain extent, determine its elevation in exposed situations, such as clumps. The higher the state of its decomposition, the slower will be the abstraction of its moisture by atmospheric and solar agency, and *vice versa*.

In a wet bottom or subsoil a bottom-drainage is necessary, and the beds may be proportionately elevated, according to their depth or the quantity of material they contain. A dry or solid bottom should, in the first instance, have a heavy substratum of undecomposed sphagnum, or other absorbent material; and the latter, a broken surface, or substratum of broken drainage, regulated by the same conditions as before stated.

A consideration of the importance attached to the texture of soil (essential to a uniform circulation of moisture,) apart from the consideration of its chemical or nutritive properties, appears to involve the following principles, viz.:—

- 1st. All matter, however circumscribed by space, is subject in nature to an universal force of attraction.
- 2d. Attraction is that force in nature whereby the atoms or particles of matter are mutually drawn to each other, and thus tend to form solid masses, or bodies.
- 3d. The effect of attraction, by the cohesion of separate particles of matter to solid masses, is, apart from other counteracting agencies in nature, destructive of the medium by which other elements in nature operate.
- 4th. A modification or construction of matter which counteracts the force of attraction between those particles or substances of which matter consists, may be considered favourable to the operation of other agencies in nature.
- 5th. All attraction is inversely as the squares of the distances between separate bodies; that is, in proportion as the squares of the distances increase, in the same proportion does attraction decrease, and *vice versa*.

6th. The force of attraction increases in proportion as bodies or materials approach each other; and by the same law it must diminish as they recede from each other.

7th. As the attractive force of matter is in proportion to the number of particles which any given body contains, it may be assumed that all materials used in the cultivation of plants may be considered subject to an undue influence of attractive force or cohesion of their parts, in proportion as such materials are reduced beyond a certain limit, and thereby rendered less favourable to the operation of those agencies which are essential to the influence of atmospheric and solar agency upon matter.

8th. As the reduction or division of matter beyond a given proportion is unfavourable to cultivation, by causing an undue cohesion of its parts, it follows that such an arrangement of materials as will tend to increase the distances of its several parts by expansion or porosity, will counteract that undue cohesion of matter which is unfavourable to the action of other agencies.

9th. In accordance with the 5th principle, which states that all attraction is inversely as the distances between separate particles or portions of matter, it may be assumed that such a Mechanical construction of matter (vegetable or otherwise) as shall retain to a certain extent its organic form or texture, will ultimately insure such a condition of the distances between the whole body of which it forms a part as is essential to a uniform operation of the general agencies of nature in the growth of plants.—*W. Wood, Pine-apple Place.*

HORTICULTURAL AND AGRICULTURAL OBSERVATIONS MADE IN SOME OF THE PROVINCES OF TURKEY.

(From the German of Dr. GRISERACH.)

The Gardens of Salonichi.—The gardens of the Franks, which I saw here, although distinguished by fine groups of trees, are of too small a compass, and too much neglected, to deserve any great comment. I had, however, an opportunity of seeing the flower-garden of a rich Turk, who was noted for his love of Floriculture. Were any one to suppose that the ancient fame of the East, with respect to taking the lead in Horticultural matters, had been upheld in Turkey, or at least in Roumelia, where, on the whole, it is at a low ebb, and does not exhibit any striking characters, either in the taste of the designer or in the choice of flowers and plants, he would be deceived. The whole space is for the most part occupied by small beds, shaped into strange figures and designs, having generally a jet of water in the middle, around which these beds are regularly arranged. They are edged with box, and mostly contain a dense mass of Tulips, Marygold, and similar plants; while all variety of form or colour is totally neglected. Still, when compared with what I had previously seen on the shores of the Bosphorus, the garden of the Turk at Salonichi was a pattern of art. Here light open pavilions of pleasing structure were observable, their columned walls covered with garlands of Roses, and the interior enlivened by elegant jets of water. Everywhere springs and fountains were bubbling around the beholder, and the somewhat confined area of the garden was hidden, or rather extended, by the walls having been covered with creepers, and the contiguous places planted with Roses and Oleanders. The paths were kept particularly clean, and sprinkled with water. Notwithstanding all this, the same dearth of plants, and the same attempt at insignificant ornament prevailed. The proprietor himself, dressed in a most costly manner, did not deign to enter into conversation with us, and after a short salutation continued his lonely ramble. A dervise, however, who seemed to have received orders to attend us, walked with us through the grounds, duly extolling the beauty of the garden and the riches of his patron. Contrasted with this well-kept garden, was one which adjoins the monastery of the dancing dervises, which is in a perfectly wild state. It was here that I had an opportunity of observing what kinds of plants will luxuriate in this climate, when the soil is left to itself; they consist, not indeed, of weeds or turf, but of evergreen shrubs. I found here, also, amongst a few Pomegranate and other fruit-trees, a most dense vegetation of Oleander, which had evidently been planted at some former period, but which had increased rapidly, and overgrown everything else, showing, as it were, that there is a natural predisposition in these localities to reproduce (if left to themselves) that evergreen cover of vegetation which, most probably, had clothed these coasts previously to their being subjected to the control and arts of man. Although this had occurred in the garden of these lazy dervises, who passed their time lying about in the halls and near the fountains of the establishment, it could not take place generally in the immediate vicinity of this industrious town, because most of the places which are not cultivated are ill adapted for any plants of a robust character, being for the most part stony and dry slopes, which, on the north side of Salonichi, descend to the shores of the Bay. On one of these hills, which is crowned by the castle of Heptapyrgion, I paid particular attention to the vegetation, as far as the advanced stage of the season, and the heat of the latter days, by which many plants had been parched up, would permit. This inclined ground possesses only a slight depth of soil, which has resulted from the decomposition of the mica schist, large strata of which are visible amongst the soil. With the exception of a few trees, among which I remarked some vigorous specimens of the *Celtis australis*, the soil does not bear any hard-wooded plants, but merely exhibits that scanty herbage, which becomes pulverised by the heat of the summer, piercing with their tenacious roots into the crevices of the rock, and constituting (if we take them either by families or the great variety of this species) the most important constituent of the Mediterranean Flora. It is the very limitation of most of the plants belonging to this group, within a very circumscribed *habitat*, which is the reason why in such localities (amongst forms widely diffused, and common everywhere), some rarities are also to be met with, which characterize the country at present under observation. This phenomenon has struck every botanist who has visited the shores of the Adriatic, and has had an oppor-

tunity of observing on Monte Spaccato, near Trieste, for instance, that abundance of gregarious plants, which is not to be met with in any other locality in Europe north of the Alps. A similar vegetation adorns the schistous hills, near Salonichi. But in the same ratio as the seasons have a greater influence on this than on any other form of vegetation, one single observation can afford but a very incomplete idea of it. In the middle of June, the numerous annual herbs have already disappeared, which, in conjunction with monocotyledonous plants, spread a transient hue of flowers over this country. Still the greatest dearth is apparent at a somewhat later period, when even the most striking objects of this flora—the dicotyledonous shrubs,—have completed their annual growth; when the decaying herbage above their perennial roots has lost its verdure, and a barren rocky solitude has ostensibly usurped the place of what shortly before rather resembled a cultivated garden. In order, therefore, that my assertions on the predominant vegetation of the Heptapyrgion may not assume a too general character, I may remark that the middle, or rather the last—period of vegetable life had then already commenced—that in fact, which I call the season of Compositæ, because it is plants of this group which, amongst the two largest families of European vegetation, are most numerous in perennial as well as in characteristic species; whilst annual leguminous plants are met with most frequently in spring.

On the hills of Salonichi, as far as growth is concerned, may be distinguished two groups of plants, the first of which comprises plants of a stunted form, mostly trailing on the ground, growing intermixed with others, and bearing stiff interwoven branches; the other, those of a more portly growth, possessing equally numerous branches, yet distinguished by growing in tufts, which are divided according to the different species to which they belong. Amongst the former the principal are the *Cynaræ*, *Silenæ*, and *Umbelliferae*; but their abundance is surpassed by the *Teucrium polium*, which grows so extensively over all the south of Europe, the *Proteus* form of which, if I may so call it, creeps about everywhere in the shape of a small-leaved variety. It is this plant also, which, by its woolly appearance, confers another characteristic feature on the vegetation of those southern hills, where the sun, glaring down for months from an unclouded sky, would destroy the unprotected epidermis of the plants, by an evaporation which exceeds the moisture supplied by the soil, if they were not provided with this covering. In the higher gregarious shrubs of the second class, which are still more subject to that influence, because deficient in the enlarged rootstock, which modifies the circulation of the sap, the same protecting organs of vegetable life are to be met with. Whilst a branchy *Marrubium* is wrapped up in a dense silky covering, the *Eryngium*, of pithy, dry structure, resists a superabundant evaporation by its close-skinned epidermis; the *Peganum*, on the other hand, which prevails in many localities, approaches, by the affinity of its natural order, and probably by some internal mechanism which retains the moisture of the atmosphere and the soil in its cellular tissue, to those fleshy-leaved plants which are capable even of resisting the heat and dearth of the African deserts.—*J. Lh.*

THE ANTIQUITIES OF GARDENING.

No. I.—Extracts from Sir Thomas Hanmer's Manuscript on Gardening. (Continued.)

"Of Fruit-trees and Orchards.—Fruit-trees proper for ordinary walls under 9 foote high, are—*Cherries*: the May Cherry, the Duke Cherry; but the walls must be higher for the following: White, Blacke, and Red Hearts, the Blacke is best; the Caroon Cherry, the Orleans Cherry, a new Cherry. *Plums*: the Cherry Plum, the Queen Mother Plum, the Damascene, the Cheston Plum, the Perdigan, the Amber Plum, the Morocco Plum, the Marbled Plum, the Muscle Plum, the Great Holland Plum, a great white new Plum [probably the White Magnum Bonum], Monsieur's Plum [Orleans], Altesse Plum, Mirabelle, Pigeon's Heart Plum, White Damas Plum, Catalonia Plum, the Orleans, alias Lambert's Plum. *Peaches*: the Red and the White Nutmeg Peaches (very early and small), the Newington, the Admirable Peach, the Primordian Peach, the Bellows, the Savoy Peach, the Pan Peach, the Persian Peach, the Rambouillan Peach, the Modena Peach, the Orleans Peach, the Superintendent Peach, the Smyrna Peach, the Laval Peach, the Sion Peach, the Magdalen Peach. *Nectarans*: the Red Roman Nectaran, the Murrey Nectaran, the Green Nectaran, the Elrug or Gules Nectaran, which comes from a stone, and is rare yet, 1667; also the Essex Nectaran and the White Nectaran. *Apricocks*: the Great Apricocke, the Masculine Early Apricocke, the Orange Apricocke. *Pears for walls* are only used to bee with us—the Winter Bon Chrestien, and the Wynter Bergamotts, Monsieur John, and the Beurree Pears, all good Wynter Pears, the other sorts bearing well enough as standards."

"Vines fittest for England are the Parsley Vine, the White Muscadine, the Red Frontinac, and the Yellow Frontinac; the D'Arbois Vine—a white Grape, very good; the Muscat, the Auvergne Printanier."

"Fruit-trees for Hedges or Palisades under ten foote high commonly:—Codling Apples, Pearmaines, any Sommer Apples, Sommer Bergamot Pears, Sommer Bon Chretien Pears, Slip Pears, and almost all other sorts of Pears. Dukes, Flanders, and Carnation Cherries. All sorts of Plums, Quinces, and Vines. The manner of making the Hedges [Espaliers] is either with straight

* *Teucrium polium*, L.; *Scabiosa ncranica*, L.; *Centaurea paniculata*, L. var.; *Carduus nutans*, L.; *Daucus involueratus*, Sibth.; *Bupleurum glumaceum*, Sm.; *Gypsophila cretica*, L.; *Dianthus diffusus*, Sm.; *Nigella arvensis*, L.
† *Marrubium peregrinum*, L.; *Eryngium campestre*, L. var.; *Peganum Harmala*, L.

poles set upright with others across, about a foot asunder, bound together; or with timber and cross ryles. Some make their fruit-trees to spread their boughs by cutting them, and to grow without helpe of ryles or poles."

"*Fruit-trees for an Orchard.*—Wee have many sorts of Apples, some of the sommer season, such as Dovebills, Codlings, Junettings; many of autumn, as Queenings, Darlings, Golden Pippins; some of the beginning of winter, such as the Pearmaine, the Hervey, the Golden Pippin; some that keepe almost the whole year about, such as Pippins, Apple John or Deux Ans, some Russetings, and one kind of Pearmaine. Apples blossom not here till the last weeke of April and first of May [*Old Style*]. *Pears.*—Wee have many sorts of Pears fit for standards; some early, as the Katherine; some middle seasoned, as the Sommer Bergamot, Sommer Bon Chrestien, the Norwich, the Windsor, the Slip Peare, the Binfield, or Dove Peare, Messire John, Roy d'Esté, the Lewys Peare, St. Michel's Peare, St. Lezin Peare, the Beurré Peare, the Long Green Peare. Some of the end of Winter, as the Finor, a French Peare, the Spanish Warden, the Bishop's Peare, the Double Fleur Peare, the Winter Thorn Peare. The best Pears for a wall are the Winter Bon Chrestien, the Winter Bergamot, Bergamot de Bugi, the two sorts of Beurré or Butter Pears, the Greenfield, and all good winter Pears for eating or baking. *Plums.*—Wee have many sorts of Plums for standards. The Marbled Plum and the Turkey are ripe in the end of July, at the farthest, against a wall. The Muscle Plum was ripe in standards with mee the beginning of August. *Cherries.*—Only the Flanders and the Carnation Cherry doe well in England in standards. White Hearts, if they stand warm, and in the Gascoyne Cherry, which bears indifferent well also in standards, if well sheltered from wind. *Quinces.*—Wee have the Portugal Quince, which is the best, and the small round Quince. *Filberts.*—There is the Red kind and the White."

"*Of Colonel Blunt's Vineyard, 1665.*—The Soyle of this Vineyard (which was a part of Blackheath, near Greenwich, in Kent) is extremely barren, (as it seems to be,) of a light whitish sand mixt with small stones, in the earth naturally grows nothing but ling and furze. The situation is on the side of a hill, which lies full facing the south, well defended by the hills from the north and west winds. The parcel of ground was between one and two acres. The earth was in the summer time or autumn digged into shallow trenches and ridges. A little before or after Christmas, the plants were set in the trenches two yards asunder. Between each rank of vines there was a path of four feet wide, to goe betwixt the vines, and dig and prune them. From each root two of the strongest shoots only were allowed to grow up every year, which were tied up to a stake about four feet high, and soe stood till the time vines begin to sprout out, which is in April, and then the tops of each of these two shoots are bound down to a stake stuck between every two roots, and tied archwise to the said stake, one of the two shoots is tied to the right hand stake, and the other to the left hand stake. These two shoots aforesaid, bowed soe down, put forth young branches at the joynts, which will fall and hang down to the very earth, and bear grapes to the ground; the lowest grapes are sweetest, because of the reflection from the earth. The shoots which have once borne fruit are cut back within one joynt of the old stock, which need not be a foot higher than the earth; and two of the strongest shoots produced and tied upright in summer are bent as those of the former year, and soe on."

"Colonel Blunt says that vines cannot stand too dry, nor never need watering, and prosper best in a shallow earth, where the roots cannot run deep, as on rocks or gravel. Springs must be drained away from a vineyard, if there be any; the roots cannot endure wet. The colonel says hee uses no dung nor compost to this barren earth of his vineyard, which is very strange."

"*A List of Fruite-trees and Flowers, with the prices,* sent me from George Ricketts, of Hogsden, London:—*Nectarans*—Murray, Red Roman, Tawny, and Painted, 3s. each. *Peaches*—Newington, two sorts; Mignonne, Savoy, Orleans, Red Nutmeg, Roman, Queen's, Royall, Musk, Arabian, White Nutmeg, 2s. each. *Cherries*—Dukes, Flanders, Moyes, Morillions [Morello], Red, White, Black, and Amber Hearts, Prince Royall, and Carnation; all these at 8d. the tree. *Pears*—Thirty-four are enumerated, at 12d. the tree. *Apples*—Sommer Pepin, Holland Pepin, Russet Pepin, Kentish Pepin, the best supposed in England, Russeting, Gilliflower, Muscadine Queen, John Apple, King Apple, Golden Reinette, the Royal, Hollow-crowned, and Common Pearmaine, Old Wife, Nonsuch, Figg Apple; all these are at 8d. the tree, except the Figg Apple, which is 5s."

AMATEUR'S GARDEN.—No. XLVIII.

The greatest drawback, which we experience in the cultivation of the more tender kinds of Chinese, Teascented, and Bourbon Roses, is the difficulty of preserving them through the winter and early spring months, without being killed to the ground. It is true that if the borders are mulched with short dung, the roots will be preserved, and will break strong shoots again in the spring; but then these shoots will not bloom before midsummer, and therefore during the time the bloom would be the most interesting, the Chinese Rose-garden is comparatively a blank. It is therefore necessary that we should devise some plan of protecting the plants through the winter unscathed, so as to have them in bloom in May and June; and for that purpose I have some experiments in operation which I flatter myself will answer the purpose. The garden for tender Roses here is a mound, the sides of which are sufficiently sloping to throw off a good deal of wet in rainy weather. On this mound beds are formed,

and the branches of the Roses are kept pegged down, so that they are a mass of bloom when the plants are in flower.

Now, with a view to the protection of the plants, I have had them pegged close to the ground, and all the superfluous and young succulent wood cut out. At present they are uninjured; but as soon as severe weather sets in I intend to cover them six inches thick with dry fresh leaves, and to keep them from blowing away I shall cover them with the branches of evergreen trees. Over some of the more delicate kinds I have placed drain-tiles, so as to allow a current of air to pass through them, but to be stopped in severe weather; and one of the beds is so arranged as to allow a current of air to pass between the plants and the covering. If these plans answer, the plants when uncovered next April will be quite sound, and after being regulated and pegged out, will afford me, I expect, a fine bloom in May and June. In pruning the Chinese varieties in the summer, I generally make it a rule to cut the old branches close out to the root as soon as they cease to produce bloom, and replace them with young wood. In this way they bloom with considerable vigour, and it affords an excellent opportunity of manuring or regulating the beds several times in the season.

In America, I believe, they find it necessary to bury all their Roses in the winter season, for the frosts are so severe that the stocks they are worked upon—the Wild Briar of our hedges—are not sufficiently hardy to withstand them. If this is sufficient protection there, I think my plan will be all that we require for tender kinds in this country.

Standard plants of the tender kinds must be protected by dried fern and a waterproof covering, as directed in the early part of the year, with a thick hayband round the stem, and a little mulching dung over the roots.—*W. P. Ayres, Brooklands.*

HOME CORRESPONDENCE.

Peat-draining.—Observations made at the Preston Agricultural Society, Oct. 14, 1843, by Wilson France, Esq., of Rawcliffe Hall, on Peat-draining.—"He had been blamed for saying that turf-draining was the only sort of draining they should attend to; but he had said no such thing. He had said that those situated like himself, on turf-moss, would find turf-draining the best and the cheapest. He quoted from an article by Sir James Graham, in one of the first volumes of the Royal Agricultural Society's Transactions, where he said it had always appeared to him that skill in Agriculture does not so much consist in the discovery of principles of universal application, as in the adaptation of acknowledged principles to local circumstances. If they found turf the best and cheapest, they ought to adopt turf; if they found tile the cheapest, let them adopt tile; or if stone wears the best let them adopt stone. He had said that whenever they found turf the best they should use turf. He had brought that day, and would produce to them, turf that he could prove had been put in a drain fifty-six years since, and they would bear him out in saying, it was now perfectly good and sound. This proved that turf was serviceable, and as a means of draining should not be neglected when it was applicable. He could make them at 2s. 9d. per thousand, and could cart 1,000 with two horses, or even 700 with one horse. They could be inserted as a wedge in the drain; they were not brittle, and in the use of the subsoil-plough, which ought to be used after draining when the substratum was clay, suppose the plough came in contact with the drain, and even cut an inch off his turf, it would not injure the drain, as the turf was spongy, and would give way. If they touched a tile with the plough they knew the effect, the drain was broken into. He cut his drains 11 ins. wide at the top, removing away no more soil than was necessary for the formation of the drain. He made them 30 ins. deep, never less than 30, and the width of the drain tapered, until at the bottom it was only 2 ins. wide. The turf was cut in a certain way, 9 ins. or 10 ins. long, 3 ins. wide at the bottom, and 4½ ins. at the top part. This fits in the drain as a wedge, leaving a channel for the water of 6 ins. deep, and even when the drain was complete, as he had already stated, the subsoil-plough coming in contact with the turf and cutting off an inch would not injure it. There was no question that the longitudinal plan of draining, or down the field, was the best; the general distance of the drains should be 6 yards, or 18 ft. apart, and the ordinary drains run into main drains, which should flow into the ditches. The turf which he produced, 56 years old, was cut so as to rest upon shoulders, and by the pressure of soil had been in some degree bent, but though pressed, the drain had not been spoiled. These drains had been laid across the field, but it was better to drain down. In favour of the superiority of turf-draining he would refer them to the last Number of the Transactions of the Royal Agricultural Society, by the Rev. Copinger Hill, of Stowmarket, near Ipswich. After Mr. Hill had described the several modes of draining in Suffolk, he says, "Better than all peat cut for the purpose in the fens of Cambridgeshire, in length 15 ins. and 3 ins. square; it is pressed gently into the top of the narrow drain, made 10 ins. wide at the top, 2 ins. at the bottom; and 30 ins. deep, and then the earth thrown in upon it. The peat swells speedily, becomes firmly fixed, and is very durable. In peat-draining, when we come to stony or gravel spots, two pieces of peat instead of one are placed in, side by side, and in bad cases the sides of the drain are built with turf as well as the top." Sir H. Davy says, "inert peaty matter remains for years exposed to water and air without undergoing change." This was proved by the turf which had lasted 56 years at Rawcliffe. The size of Mr. Hill's

drains were the same as his, Mr. France's. Peat sells at the rate of 6s. per thousand, and eight score rods of draining to the acre, the rod measuring 5½ yards, takes 2000 feet. This was an important testimony to the advantages of turf, and this was not mere theory, but the experience of a gentleman. He was himself unacquainted with the county of Suffolk, and could not speak of the facilities or difficulties of obtaining tile or stone. The secret of farming, he said, was to produce the greatest possible crop at the least possible expense. Now it was important to notice the expense of these turves, which had lasted 56 years, as he could prove (the old man who laid them was now living on his estate) and were no worse (he did not see why they should not last 556 years). He would put it in this way: it would take about 28 turves to drain a rod of seven yards, which, at the rate of 2s. 9d. per 1000, would cost 1d. He was anxious to pay the wages of his labourers at such a rate that they could earn from 1s. 8d. to 2s. per day, and the price varied for the cutting of these 28 turves from 3d. to 4d.—say 4d. These turves he gave to his tenants free of all charge. He then said they might either pay a per centage for the outlay or join him in the cost; he preferred the latter mode, because it gave the tenant an interest in the work, and being a paymaster as well as himself the tenant could remonstrate if any of the work were not done properly. The marl had to be carted from the drain to the pit, the expense of which would be 1d., making the whole cost only 6d. per rod or 2l. 18s. per statute acre. The results arising from his draining were quite astonishing. He had been highly gratified at seeing fields formerly thick with rushes recently covered with luxuriant green crops. Another field very rushy had borne an excellent crop of Oats, and from which he calculated 7½ to 8 loads of meal per acre. Draining was the first move to good farming; land was grateful, and made ample returns for whatever was bestowed upon it. There were many instances where the expense of this should be shared by the landlord and tenant, and others where the landlord should do all and the tenant pay a per centage; and considering the confidence that ought to exist between landlord and tenant there should be no difficulty in such a matter. He was anxious to have field fences in straight lines; fields when large should be square, and when small should be of an oblong form; in number they should be according to the size of the farm, 8, 12, 16, or 20, so as to suit a proper rotation of crops. The shape of the field had a material influence in the labour of the ploughman; supposing a field of 4180 yards or a statute acre was 10 chains long and 1 broad; the furrow nine inches wide or 88 furrows in the 66 feet: the horses in ploughing this, travel 11 miles exclusive of turning, which make one-tenth, and then the horses travel 12 miles and 176 yards. If the field is shapeless and requires cuts, how much the distance and the time are increased! The loss of time in turning the furrows was not an idle game. He stated it upon first-rate authority, Sir John Sinclair, in the first or second book of whose Treatise on Agriculture they would find it. Yes, there was a loss of one tenth of the time, and in shapeless fields there would be a loss of one fifth. The tenant should have his fields so that he could plough them without any unnecessary loss in turning. It was necessary that these things should be attended to; he did not think produce would be much higher in price, indeed he hardly thought it should: prosperous times, as times of high prices were sometimes called, did not make the best farmers, for if the farmer could pay his way with half a crop, he would make no exertions to have a whole one. The present times hastened improvements; it sharpened their wits, and made them exert themselves to increase their crops. He would again strongly recommend the division of small farms into a regular number of fields, 8, 12, 16, or 20, to have the four-course system of husbandry. He was anxious at all times to give any information on such subjects to those whom it would benefit. He would be glad to see any gentlemen who would come to see his system of draining at Rawcliffe, and if they came they should see the old drain which he was now crossing." Mr. Wilson France then sat down amidst great applause. [In the above we have the history of Peat-draining for the last 56 years, and by referring to the *Gardeners' Chronicle* of the present year, page 737, we have Mr. Fair's account of a further improvement in the Peat-draining in what he calls the tile-turf. The Duke of Hamilton has been for some years adopting the Peat-draining on his estates in Lancashire on the same plan as Mr. France, and there is no doubt but a great quantity of land will be brought into cultivation by these improvements which has remained uncultivated for ages. The Duke has also been adopting what Mr. France has pointed out respecting fields and their fences. Here may be seen some of the Duke's wire-fences, which I suppose are half-a-mile long and quite straight, and the fields made about 17 rods wide, parallel to each other, which gives them a very striking effect when viewed from a distance.]—*Facile.*

Pear Training.—Going over the Pear quarter at the Royal Gardens at Versailles, I found from the head gardener that he considered the tying down the branches a sufficient check to overgrowth, without the assistance of root-pruning, except as regards any very free-growing varieties. Nothing could, to my mind, exceed the neatness and good bearing of the Pear-trees; they were of a conical shape, and all the branches tied down so as to present the appearance of a conical chandelier, and of course much more bearing wood obtained than in the trees which were stunted by root-pruning. I believe Mr. Rivers (whose experience in root-pruning is great) does not agree with me. I have no doubt but that he will, on seeing this, favour us with his views.—*Totty.* [In considering how far French gardening is applicable to England, we must never lose sight of one most important

fact; viz., that their summers are as often hot and dry as ours are cool and moist.]

Autumn Carnations.—How is it that the flower-markets at Paris are throughout the autumn filled with bunches of white and of red crimson Carnations? What is the treatment necessary to make them flower in the autumn? We seem never to succeed in flowering in the autumn the small plants of Catalonian Jasmynes, Pomegranates, and Winter Cherry, which make the Paris flower-markets so gay in the autumn.—*Totty.*

Rot in Larch.—There has lately been some discussion respecting the rot in Larch. Most writers lay the fault to the soil; this supposition is in a great measure correct, if climate be taken in conjunction with it, as I mentioned in Mr. London's *Gardener's Magazine* for 1840, p. 386. Perhaps it may not be out of place to give an extract from it:—"When Larch and Spruce Firs are young, they grow often rapidly, and the wood formed at that period is very porous, both in the trunk and roots. As the trees advance in age, the supply for their growth is less, from the soil being greatly exhausted, and often from the trees not having been thinned out in proper time. The outer case of wood then formed is less porous, and becomes in time too compact to admit air to the early-formed wood within. This latter being of a coarse grain, the dry rot begins to infect it, in the same manner as it attacks wood which has been painted in a green state, the paint excluding the air from the inside wood. 1. The decay in trees goes on more or less rapidly, according to the grain of the wood. It ascends the trunk, and makes its way along the roots: at least those first formed, which have become the conducting tubes to the trunk from the smaller roots and fibres. As the disease advances, the sap collected in the fibres passes with difficulty through the decayed conductors to the trunk, and the trees become sickly, although the smaller roots and fibres, where the sap accumulates, be healthy. As further proof that decay proceeds from too quick a growth, the trees that have grown beside decayed ones, but happened to grow slowly, have been found sound; and it may often be observed, in trees partly decayed, that is, the quick growths in the trunk that are rotten. It is a common observation, that a tree has got down to a soil which it does not like. If the soil were in fault, the wood grown there would be bad, whereas in reality it is the best. The error lies in the supposition that the decay proceeds in age from soil and climate, but its foundation is actually laid in the youth of the tree. In proof of this, it is a well known fact, that trees grown in cold and barren situations are always sound. These growths are small, and the wood in consequence is durable. The best Larch, for instance, in Britain, is grown at Dunkeld. Larches grow there as in their native Alps." What I have said agrees in some measure with the views of Sir C. G. Stuart Monteath, who seems to have paid attention to this important subject. He says, in the *Chronicle*, Aug. 19, "I have found a great proportion of the Larch trees upon the sandy soil began to decay at the root in the course of ten or twelve years." Again, "The Larch tree planted upon the sides of hills composed of Grauwacke or slaty rock, so common in the south of Scotland, I have always found to succeed best, and not at all liable to the disease." After what has been observed, the remedy for the evil requires very little reflection. Let Larches be planted in poor soil, resembling as nearly as possible that of their original native region, and if possible on elevated situations; and let them be properly thinned out when young, to admit air freely around them. The farther they are from the desired soil and situation, the greater attention must be paid to this important point, so that the growth of the trees be not accelerated by too much warmth. If I am wrong in the opinion that the rot proceeds from the exclusion of air from the heart or inside of the tree, by the great closeness of grain of the external wood, there can, at least, be no doubt that the seeds of decay are first sown by too rapid growth. And little do planters think, when admiring the great progress of their young Larch Firs, that growth so rapid is but laying the foundation of worthless timber.—*J. Wighton.*

Florists' Flowers.—A teaspoonful of Humphreys' soluble compound to a gill of rain-water, applied once to an Auricula in a 32-pot, improved the plant. Liquid manure applied to Pinks caused them to grow and bloom better than usual. One sort, which is considered an excellent self, and which I had grown in beds for years, was this season thoroughly laced, growing in a box. I had seen the centre petals partially laced before, but never the guard-leaves. The liquid was prepared by steeping in water some soil which had lain a year or more under a heap of horse-dung, which had received the slop-pails of a house during that period; to this liquid a little soot was added: it was given weak, but often. The plants threw out much Grass, remained long in bloom, and bore seed freely. Some time ago, a Lancashire florist told me that he frequently had seen his neighbours who grew Hyacinths topping their pots with coal-ashes to clear the white. In the "*Floricultural Cabinet*," a writer, who signed "Innovator," some years ago recommended gypsum for the same reason to be mixed among Carnation compost. Perhaps sulphuric acid was to be the agent in both cases. Five years ago I mixed some Carnation compost, to which gypsum, pounded to the size of small peas, was added in the proportion of one-sixteenth of the whole. In the spring of this year the gypsum still remained undissolved, nor could I perceive any difference in the colour of the flowers, but the plants grew well in it. I find that when my Pinks and Carnations are plunged in coal-ashes, the roots run through the pots into the ashes; and I have noticed that when small cinders have been employed as drainage for the Polyanthus, the plant has rooted freely

into them. Possibly these cinders or ashes might be used in the compost with good effect, especially when the Carnation is potted in an 8 or 10 pot, not unusual here.—*O.*

Canker in Auriculas.—What is the cause of this disease? Old florists here say it is infectious; and though excision is sometimes a cure, yet they will often prefer destroying a cankered plant at once, lest it should infect the others. It attacks plants in the open ground, therefore perhaps is not caused by drip nor yet by confinement.—*O., Leeds.* [Perhaps some correspondent will favour us with his opinion on this subject.]

Jointing Earthenware Pipes.—For some time past I have looked for Mr. Hurst's mode of jointing these pipes; but in vain; and as "W. B. H." wishes information on this subject I beg to offer a plan adopted here with success. When the pipes were fitted the end of the one into the other, a quantity of white and red lead was procured and mixed together. That part to which the lead was to be applied, was touched with a brush dipped in oil, a good coating of lead was put on, and in this manner every joint was secured. No water was put into the pipes until the paint became quite hard and dry, which was in about six or eight days after the operation, and they have kept perfectly water-tight ever since. The advice given to gardeners in the leading article at p. 807 is good, and from experience I can state that tanks do not answer for Greenhouse plants in the winter time; neither are they suitable for pits to preserve plants in, on account of emission of vapour, and the earthen pipes are also objectionable for the same reason.—*J. M.* [We are glad to hear that earthenware pipes will do. What we have seen tried have all failed, in consequence of expansion and contraction, which broke them.]

The Coffee Plant.—A Coffee-tree in my bark stove was clothed with fruit in the spring of the year: many were eaten, but many dropped; of the latter a crop sprang up in the old bark below the tree, and at this moment some are about an inch high, with the remains of the dry pulp clasping the seminal leaves; others one inch and a-half, with the round seed-leaves expanded like shillings or half-crowns, and a few have the second leaf developed,—these last being about six months old. We have potted off a dozen or so. I was not before aware of the rapid germination of the Coffee-bean.—*P. Neill.*

Swans and Weeds in Ponds.—In a late *Chronicle* Mr. Ayres said something respecting Swans clearing weeds from ponds that brought forth remarks from an Edinburgh correspondent to the contrary. Having often seen Swans in ponds almost choked up with weeds, I lean to what the latter said. The case, however, may be different when Swans are in very small ponds, and amongst certain kind of weeds. Putting more Swans into larger ponds, though cygnets, would be of little use, for they would not agree. When Swans are in large streams, each pair have their own boundaries, and "woe betide" the weaker that venture beyond their beat. I may mention an instance of this, which came under my observation. During last summer, a pair of young Swans (not cygnets) happened to stray near where their next neighbours' nest was. The old male soon drove the young hen into the field, and a battle commenced between the cocks; and what by the splashing of their wings, biting each others' necks, and hallooing of the boys, there was a fine affray. At last the old cock drove the other to the side, and forced his neck against the bank, and would have soon killed him, if they had not been separated. The intruders took to the field homewards; the other pursued, but was soon left in the distance. Finding this he took to the stream, as if he knew where it was likely they would cross. The retreaters, however, seemed "awake," for they ran across another field and gave their expecting antagonist the slip.—*J. Wighton.*

Manure for Melons.—In the *Chronicle* for the 16th of September, p. 645, I find your correspondent "E. M." mentioning that the Persian Melons derive their superiority from the use of pigeon-dung. Now, some time since, while reading "London's Encyclopædia of Gardening," p. 9, where it treats on this subject, the thought struck me that there might be a similarity between the stimulating properties of hens' dung and pigeons' in promoting the growth of the Melon. I accordingly requested, in the spring of 1842, that the manure from the hen-house should be saved, and after having obtained a heap of it, free from any other mixture, I reserved it by itself, and turned it over two or three times during the winter. In the month of May I erected a temporary 7-light frame, and under each light made a hole for the fermented manure about 18 inches deep. In mixing up the soil I used better than one-fourth part of hens' manure. I turned my plants out into the bed in the third week in May, and planted under each light. These had a space of 4 ft. by (MS. illegible), to grow in, and it was evident soon after they began to grow that the soil agreed with them. From their luxuriant growth I was compelled to use my thumb and finger freely; and in proportion to their growth so was their fruitfulness. There was what was generally considered a good crop of fair-sized fruit. Some bore a second time, and the others would have done so had they been allowed; but it was too late in the season, and it was not convenient to apply a lining. I have also used this soil in the growth of Cockscombs with equal success. I trust these observations will call forth the attention of gardeners who may have a better opportunity of ascertaining its merits, and the means of applying it more successfully.—*J. F. M'Elroy.*

Pine Apples.—Some sensation having been occasioned by a statement lately made in the *Chronicle* about the weight of some Pine-apples recently grown at Bicton varying from 5 to 6 lbs, I beg to state such was by no means a rare occurrence there previous to the present manage-

ment; for from 1834 to 1840 during which time I was foreman under the late gardener Mr. R. Glendinning (now of Chiswick Nursery), fruit was annually produced equal to the weight of those recently noticed. One grown in 1835, I well remember, weighed, when divested of all its under leaves and the stem cut close to the fruit, 6 lbs. 3 oz. Mr. Glendinning some time since published a treatise on the cultivation of this noble fruit, and having practically carried out under his own superintendence the directions therein contained, I can confidently assert that by following his system, Pine-apples of the above weight will be thought no rarity, and scarcely worth recording.—*J. Piller, Exeter.*

Large Pines.—Having for many years felt an interest in the culture of the Pine-apple, will be my apology for troubling you with the following remarks. The readers of the *Gardeners' Chronicle*, as well as those who attend the Chiswick and Regent-street Exhibitions, have abundant testimony of Mr. Spencer's eminent success in the production of this prince of fruits. We require no further statement from him or from Mr. Murray, who has probably in the present day produced the largest Queen Pine-apple in the highest possible state of cultivation. The circumstance of public exhibition has placed these two eminent gardeners in a different position from those whose success rests on the statement of one or two persons, however unquestionable such reports may be. Hundreds and thousands have seen with complete astonishment the distinguished productions of Messrs. Murray and Spencer; and this public exposition of their successful practice has created a desire, as extensive as it is intense, among practical men to become acquainted with the method pursued in attaining such extraordinary results. It may be inferred that it is by other means than those which have resulted in a few fruit of 2 lbs., and some wonderful ones of 3 lbs. It has been insinuated that some of these successful Pine-growers feed their plants on chopped charcoal, just as farmers do their oxen on Turnips; and it is further alleged that the plants consume the one with as much avidity as the oxen do the other.—*Prurient, Nov. 22.*

Pruning.—With reference to the propriety of pruning forest-trees, do your correspondents "*Quercus*" and others, sufficiently consider that the principal object is the growth of valuable timber. An Oak-tree that is left entirely without pruning may, perhaps, produce the largest quantity of actual wood in any given time; but then how much of this is useful as timber? At eight or ten feet from the ground it branches out into a large head, which, with the limbs, except of the largest trees, is fit only for the fire, and this is the case with most trees grown in hedge-rows. If, however, it is regularly pruned from an early age, by taking off the under-branches without too much reducing the head at any one time, it will grow up with a tall trunk, and produce a considerable length of excellent timber, according to the soil in which it grows; and this kind of pruning is, in some measure, naturally performed for the topplings in woods, by the branches of other trees, and the underwood constantly brushing against them, and preventing the growth of the side-shoots. If it is wrong to take away any part of the head of a tree, how is it that the trunks of Pollards (which are entirely beheaded—a horrid practice!) increase in girth more rapidly than spires?—*E. A. C.*

New Hardy Plant.—As considerable interest is evinced on the subject of plants that will stand the winter in this country, and feeling certain that many now considered tender will, with judicious treatment and proper soil, bear the rigour of our climate, thus bringing numerous ornamental specimens within the reach of persons not having greenhouses, and adding greatly to the beauty of our gardens, I beg to mention having seen a beautiful tree growing in this neighbourhood (the *Eucalyptus calophylla*), which, in page 783 of the *Gardeners' Chronicle* for 1841, is called a greenhouse shrub. The plant is now nearly 12 feet high, and has been growing for the last seven years without the least protection in a very exposed situation at Brodwinor, in this county. The specimen has not flowered. Two leaves of the tree are inclosed, as I may be wrong in the name of the plant.—*A. R., Beaminster, Dorset.* [The plant here mentioned by our obliging correspondent is not *Eucalyptus calophylla*, but some species nearly allied to *E. robusta*, if not that plant.]

Planting.—Your Paper of the 11th Nov. was forwarded to me, I suppose because I wish success to planting *en masse* and in hedge-rows. The taste for the former I acquired in visiting mountain districts in Scotland and Wales, where nothing else could be cultivated, and for the latter in the lovely surface of Warwickshire and other districts of England, which (however rich in pasture and grain) would be unadorned indeed, deprived of their hedge-row timber. Happily the subject of planting and pruning is not connected with party-feelings—is one on which we can agree to differ, and if we find ourselves in error we may acknowledge our mistake, and not be ashamed to confess it and declare our determination to correct it. Under this impression I am led to notice a passage in your Paper on the subject of pruning, bearing the signature "*Quercus*." If I recollect right "*Quercus*" was replied to in a former paper by "*Pro Bono Publico*," in which statements are made of the course pursued by Dr. Thackeray, of Chester, in his extensive plantations at Nerkis, in Wales, and particularly in regard to his mode of pruning; this mode "*Quercus*" objects to as injurious to the trees: "*Pro Bono Publico*" challenges investigation for Dr. Thackeray, by a minute examination into the state of his woods. His course is confirmed by no less an authority than that of Mr. Humphreys and Mr. Scott Russel, both of whom, if I mistake not, personally inspected these before they felt authorised to express any opinion about them. Now surely it is not too much to

ask "Quercus" to do the same ere he pronounce judgment against a system so sanctioned, when there is so little difficulty in following the example of Messrs. Humphreys and Scott Russel, and that too in a matter not of momentary importance, but of increasing consequence to ages yet to come, as regards not only ornamental timber, but the very defence of our nation. Our ships, to be good and serviceable, must be made of solid timber; as the old song says,

"Hearts of Oak are our ships,
Jolly tars are our men."

It appears by a note signed "Cymri," in the Paper to which I advert, that this system was pursued by Dr. Thackeray in the woods of Mr. Wilson Jones, commencing in the year 1804; now that period embraces the time in which "Quercus" challenges this inquiry—"whether any system of pruning has proved beneficial to plantations, or whether the woods would not have been more valuable without it." It appears to me the opportunity is afforded to him, by making a personal inspection of the woods of Mr. Jones and of Dr. Thackeray, (which I suppose cannot be far distant from each other,) and having done so, I hope "Quercus" will report the state in which he found these plantations, and his reasons why he shall have changed his mind, as I expect he will, or why he shall retain his opinion upon the benefit of the no-pruning system. I most earnestly request of "Quercus" to avail himself of the advice of "Pro Bono Publico": "Come and examine for yourself, or depute some one on whom you can rely, who will report to you the condition of the woods in question." The subject is one of deep and permanent interest to the public. If Dr. Thackeray's course be wrong, many around him will fall into his mistake; for the apparent success of his plantations has, I am assured, encouraged many gentlemen around to plant and to follow his example in pruning; thus, much evil will follow to the country, but if right much good. Let the subject be seriously taken up under this consideration, and I doubt not the decision will prove beneficial. I have heard a circumstance on the subject of Dr. Thackeray's exertions to cover the mountains with which he is connected, (either Mr. Wilson Jones's or his own,) which I think worth introducing here: it is this—that, when he commenced his plantations he was forced to send to Scotland for his plants, none being to be had in his neighbourhood, and that now there are very extensive nurseries in the district of Chester. If he who has made a blade of grass to grow where it never did previously is entitled to praise, I cannot think he who has covered hundreds of acres with trees in situations that were thought in every way unprofitable, without cause for praise also.—*Consule Planco, Wicklow Mountains, November 22.*

Training Forest Trees.—Having observed several articles on "thinning and pruning forest trees," and "prune not at all," by "Quercus" and others in some late Numbers, allow me to make a few observations. I still find the same chaos of opinions on that subject as formerly; and so it ever will be till there is an Arboricultural Society formed, with experimental plantations, near the metropolis, to show the true principle by practice and example, as I have so often suggested. From the confused ideas about the term pruning, I have substituted for it the word *training* forest-trees. I find "Quercus" still adheres to reciprocity between roots and branches; that all pruning is erroneous, except when very young—how young? and that all plantations however thriving would have been better without any art except thinning. This I maintain is erroneous too; it is as much as to say, Nature and unskilful treatment that we witness the worthless and disgraceful state of our ancient woods, young plantations, and hedge-row timber in general? "Quercus" asserts that all pruning reduces the head, and consequently the timber in the stem and the reciprocity between the roots and branches. Now I distinctly said in a reply to "Quercus" on this subject some time ago, that the system of training forest-trees which I had found out and practised (for I will no longer call it pruning) increases the number of branches on a tree, consequently the increase of timber in the stem, and I presume the reciprocity between roots and branches. If any check is produced by merely breaking out the central bud, or shortening an over-strong young side shoot, in order to produce a greater number of a less size, it must be momentarily as it were; in fact the system is to increase and regulate the number and size of the branches, and establish the "prune-not-at-all" system: but that cannot be accomplished without training. I admit Mr. Cree's practice or system and mine are nearly alike; yet I do not agree with him in taking the lower tier of branches from trees uniformly nor regularly at stated periods, because many trees do not require it, for the longer the branches are left on the more is the stem increased, so long as they do not get too large to injure the timber when they are removed either by art or nature; besides it looks rather formal or artificial. Neither do I agree with Mr. Cree on the increase of timber in trees merely by cambium; but I will say a little more of my ideas on the increase of timber in the stems of trees shortly, if you allow me space in your Paper. I can give credit to what has been said about Dr. Thackeray's plantations; I opine Dr. Thackeray is a "mountaineer," and who lately sent me a printed paper on Arboriculture without a name; if so, and he should see this article, he will know what it refers to.—*W. Billington, Underhill, near Oswestry, Salop.*

Digging Shrubberies.—I perceive that Mr. Ayres, in the "Amateur's Garden," No. 46, condemns the practice of digging shrubberies, and styles it an absurdity of the present age. I beg to inform Mr. Ayres that the practice which he calls an absurdity is an advantage, and shall show that his modern system is not only absurd, but as

regards economy, impracticable; for his system is a waste of time and an expenditure of money to no advantage. He states that the front of the borders should be turved—does he mean every border in a flower-garden? or does he mean only those that surround shrubberies? Taking it to be the latter, such borders generally consist of Herbaceous plants and Annuals, intermixed here and there with ornamental shrubs. Suppose Mr. A. banishes the Annuals and Herbaceous plants, where is the turf to come from to turf the borders? It is very expensive to buy, and very few like to strip their parks for that purpose; but suppose they do this, there is the trouble of mowing it about once a week, and where there are many shrubs this will be greatly augmented; and besides under such trees (for they can scarcely be called shrubs if the roots extend 30 square yards), the turf will need to be annually renewed, and for this trouble and expense there will be little gained. Instead of a fine show of Annuals and Herbaceous plants there will be only a strip of grass about 6ft. wide running along the side of the walk. One half of the year will be occupied in watering and mowing, the other half in renewing it. Shrubs in turfed borders do not thrive so well as those in dug borders or shrubberies; the digging tends to increase their growth instead of retarding it. There is also a want of neatness attending Mr. A.'s plan, for the first windy day or night will cause a portion of the leaves to be blown all over the grass, and this will continue until all the leaves are fallen off the trees. If Mr. A. would look into the Market Gardens he would see Apple, Pear, Plum, Gooseberry, and Currant-trees not only dug between, but also cropped to within a foot of the stem. The branches of these are not stunted, nor will one week of dry weather cause them to lose their leaves; their produce is abundant and of good quality, and the practice there is just the reverse of Mr. A.'s theory; hence if digging benefits fruit-trees, will it not also benefit shrubs? If manure was spread on the surface of the ground, would decomposition take place sooner than if it were dug in? I should think not; but Mr. A. would allow the wind to blow all the leaves away instead of digging them in. I would go further, and say that all the Grass mown off lawns in the summer time should be dug into shrubberies. Mr. A. asserts that he could point out scores of places round the metropolis where the digging of shrubberies has been practised, and that he could take a shrub that has been planted for 25 years, and put it in a 4-sized pot, and that without cutting any of the roots or breaking the ball. I beg to call on Mr. A. to name one place where he could do this, for I do not consider it fair for any one to make such an assertion without being able to prove it.—*The Knave of Spades.*

Pilchard Oil.—A Subscriber would be obliged to any of the readers of the *Gardeners' Chronicle* residing in Cornwall or Devonshire for the following information—"Whether Pilchard Oil is a good and cheap oil for coarse painting,—being told that it is much used in Cornwall for that purpose; if it is so, begs to know the mode of use, and where it could be obtained."

Propagation in Water.—Passing through Buckingham Palace-garden, my attention was called to a rather interesting fact. One of the Artists who are engaged by command of her Majesty in painting the walls of a Summer-temple—in the Fresco style, from designs from Milton's "Comus"—had some weeks ago detached two small branches of *Solanum dulcamara*, probably as aids in forming an outline from Nature, and thus exposed them in water near the front windows, where they have now emitted roots several inches long. My obliging attendant (Mr. Hynes) not having observed them until found in the state now described, could not ascertain the exact period in which the process had taken place. This adaptation of organic structure to a state not common in Nature, adds one more instance to the proofs of a capability to assimilate food to a certain extent from fluid elements apart from those ordinary materials which Nature has designed for its higher and ultimate effects. From the power possessed by water of affording sustenance more immediate and effective than any other agent, it may be inferred that the amount of its influence in the economy of Vegetation is far more extensive than is generally supposed. Whatever the amount of material to which plants are exposed, such an application will invariably be found accompanied by an adaptive process, in which the circulation and appropriation of this single element will be such as to exceed all ordinary calculation, whether viewed merely as a medium by which other agencies operate, or as a part of the permanent circulating fluid of plants throughout their various stages of existence. The above fact recalls a similar instance which occurred 15 or 16 years ago. A small twig of *Stachys fruticosa*, a shrubby greenhouse plant, was placed in a small vial on a plate-rack or case, situated at the side of the room most distant from the light, where in about two weeks it emitted roots, and whence it was eventually transferred to a more favourable position and material for growth.—*W. W.*

To keep Moss Green Twenty Years.—Get it at the right time of the year, wash it clean from the dirt, and set it in the shade out of the sun and out of the wind to dry; and when it is dry, then dip it in spirits of wine, and lay it up in papers, and it will keep good for 20 years.—*Anonymous.*

Leaf-cutter Bee.—Amongst the various insects that adopt singular contrivances to protect their offspring during winter may be mentioned the "Leaf-cutter Bee," which belongs to the genus of Megachile, of which there are eight species indigenous to Britain. These insects must at an early period have attracted the attention of the observer on account of their rolling their cells very curiously in leaves. What Réaumur, Ray, and others have related respecting them is well worthy of attention; but for the

sake of readers who perhaps seldom or never peruse their pages, I shall state what I know respecting the history of one of the most interesting of the species called the "Rose-leaf-cutter Bee," so named from its preferring the green leaf of that shrub as a protection to its cells. A friend gave me some cells of this insect that he had found in the lock of a door, rolled in Rose-leaves in a singular manner, something like little thimbles or balls united together as if they had been shot from a pop-gun. My friend expressed his surprise respecting them, but not so much as did St. Francis Xavier, when he discovered the "Leaf-cutter Bee" moving along in its solemn way, holding up its fore legs as in the act of devotion." I kept the cells until the beginning of the following summer, and was astonished at perceiving a number of small flies emerging from them, instead of, as I expected, a Bee from each cell. On examining some of the cells, I found they contained a number of small chrysalids, but no honey, as stated by Rennie in the "Insect Architecture." I do not see why they should, for honey is the food of the insect in the winged state. The same author says they collect pollen from thistles: this I never could discover; indeed, I doubt it, for such plants are not suitable for that purpose. To account for the intruders puzzled me; however, to clear it up, I sent some of the cells to the Rev. J. Duncan, who wrote to me as follows:—"The cells you have sent have all been pierced by a small four-winged parasitical fly, which consumed the whole substance of the chrysalises. Two of these I found in the box. It is very like the small *Microgaster* which destroys in such numbers the caterpillars and chrysalis of the common Cabbage Butterfly. The Leaf-cutter Bees are not gregarious during summer; the curious cells being constructed by a single pair." It is worthy of remark that the "Rose-leaf Cutter Bee," though not unlike the Honey Bee, may be easily distinguished by the curious circumstance of its collecting pollen under its body between the segments, and not on its legs, like other Bees, (these being admirably adapted for that purpose). Their parasitical enemies may account for their being rather rare, and it would be well if the Butterflies that produce the Cabbage Caterpillars were so. However, this little insect destroys vast numbers of the latter, as noticed by the able Entomologist I have quoted, who has thrown much light on the insects destructive to vegetation.—*J. Wighton.*

PROCEEDINGS OF SOCIETIES.

OXFORDSHIRE HORTICULTURAL SOCIETY.

Nov. 14.—At the annual meeting of the Members of this Society, holden in the Council Chamber, in this city, Mr. A. Browning in the chair, the following report of the Committee was read:—"Your Committee, in submitting to the Members of the Society a statement of their proceedings during the past year, have great pleasure in adverting to the flourishing and improving condition of the Society, and the gradual increase of its Members. The exhibitions of the last season have been well supported by the Members of the Society, and many rare and very superior specimens have been seen upon those occasions. The awarding of prizes to cottagers has been attended with the most beneficial results, since this system has been adopted, the sum of 117^l has been paid to cottagers whose rental is under 9^l. a year. Your Committee, however, cannot close their report without expressing their thanks to the Members of the Society for their assistance and co-operation at all times, but more particularly at the public exhibitions of the past year. At the same time they beg to express a hope that the present Members will not fail to exert themselves to induce others to become subscribers, which would place the funds of the Society in a still more favourable position, and thus enable the Committee to carry out those plans which have been long contemplated."

BALANCE-SHEET FOR THE YEAR.

Arrears due to the Society, 35^l. 14s.—Debts owing by the Society, none.

The rules and bye laws of the Society were read and approved of, after some verbal alterations. It was proposed and carried that a Committee of seven be appointed to take into consideration the re-admission of Mr. Bates, and report thereon to the Society, and such Committee was appointed accordingly. *Committee for the year 1844.*—Rev. J. Baker, Rev. F. Barnes, D.D., Canon of Christ Church, Rev. H. Cary, Dr. Daubney, Professor of Botany, W. H. B. Earle, Esq., Rev. J. Fox, D.D., Provost of Queen's, J. W. Henley, Esq., M.P., M. J. Johnson, Esq., J. H. Langston, Esq., M.P., Rev. A. H. Matthews, Esq., Rev. V. Thomas, Mr. W. Day, Mr. J. Esq., J. Saunders, Esq., Rev. J. Morrell, jun., Esq., C. Peers, Esq., Mr. J. Maltby, Mr. W. Colclutt, C. Dudley, Esq., Mr. J. Stevens, Mr. J. Hastings, jun., Mr. T. Walker, Mr. J. Perkins, Plowman, Mr. J. Birch, Mr. J. Robinson. After some other business the meeting adjourned till the 13th of December.

Ipswich Cucumber Society, Nov. 20.—The General Meeting of this Society was held at the Unicorn Inn, Mr. R. Cole in the chair, when the following business was transacted.—The Right Hon. Lord Rendlesham, M.P., was unanimously elected President, and 8 other gentlemen Vice-Presidents for the forthcoming season. The Shows were fixed for the first week in February and the last in April; when, in addition to a sweepstakes of 1^l. each, 20 prizes will be offered by the Society.

COUNTRY SHOWS.

Hants Horticultural Society, Nov. 14.—This was the anniversary meeting and the last for the season. The favourable state of the weather induced a large attendance. The exhibition contained a good collection of Chrysanthemums, as well as several specimens of Stove and greenhouse plants. The Pears exhibited by Mr. Wilkins, gr. to H. F. K. Holloway, Esq., were remarkably fine, especially the Beurré Diel, three of which weighed respectively 25oz., 26oz., and 27oz. The collections of Apples were also good. The prizes were thus awarded:—*Orchidaceous Plant*, *Zygopetalum Mackaili*, dead silver medal, 1, J. Fleming, Esq.; 2, *Maxillaria picta*, bright silver medal, J. T. Waddington, Esq.; *Stove Plant* (not Orchidaceous), *Gesnera zebra*, dead silver medal, Mr. Wickham. *Collection of ditto* (of any kind), dead silver medal, Rev. Mr. Beadon. *Greenhouse Plant*, *Fuchsia corymbiflora*, dead silver medal, J. T. Waddington, Esq. *Collection of ditto*, dead silver medal, 1, Rev. G. C. Rashleigh, 2, ditto

German silver medal, Rev. Mr. Beadon. Best 12 *Chrysanthemums*, dead silver medal, 1, Rev. the Warden, for Duc de Cornigliano, Vesta, Theresa, Coronet, Grandis, Mirabile, Princess Marie, Formosum, Campastrone, Queen, Minerva, Superb Clustered Yellow; 2, *ditto*, bright silver medal, Dr. Moberly, for Queen, Memnon, Gem, Lucidum, Criterion, Goliath, Formosum, Rosalind, Theresa, Vesta, Tasselled Yellow, Mirabile; 3, *ditto*, German silver medal, Rev. the Warden, for Exquisite, Memnon, Gem, Lucidum, Adventure, Incurved Pink, Changeable Yellow, Gouvion St. Cyr, Marquis, Triumphant, Isabella, Surprise. Best 24 *Chrysanthemums* (in pots not larger than 16), dead silver medal, Mr. W. Barnes, for Vesta, Queen, Minerva, Madame Pompadour, Beauty, Grande, Conqueror, Grand Napoleon, Exquisite, Superb Clustered Yellow, Memnon, Theresa, Formosum, Duc de Cornigliano, Gem, Princess Marie, Gouvion St. Cyr, Coronet, Marquis, Tasselled Yellow, Bijou, Triumphant, Adventure, Mirabile; 2, *ditto*, bright silver medal, C. Deane, Esq. *Collection* (in pots of any size), bright silver medal, Mr. Wickham. *Nosegay*, gilt-rimmed bronze medal, Sir T. Baring, Bart. *Collection of Plants*, bright silver medal, J. T. Waddington, Esq. *EXTRA: 12 Chrysanthemums*, gilt-rimmed bronze medal, Mr. Wickham. *Fruits: Black Grapes*, gilt-rimmed bronze medal, R. Knight, Esq. *Grapes* (out of doors), gilt-rimmed bronze medal, Mr. Stride. *Pine-apple*, gilt-rimmed bronze medal, 1, H. F. K. Holloway, Esq.; 2, *ditto*, bronze medal, H. F. K. Holloway, Esq. *Collection of Apples*, gilt-rimmed bronze medal, 1, Rev. Mr. Beadon; 2, bronze medal, J. White, Esq. *Best Varieties of Table ditto*, gilt-rimmed bronze medal, Mr. W. Barnes. *Best Varieties of Kitchen ditto*, gilt-rimmed bronze medal, Sir T. Baring, Bart. *Collection of Pears*, gilt-rimmed bronze medal, 1, Rev. Mr. Beadon; 2, *ditto*, bronze medal, H. F. K. Holloway, Esq. *Best six Varieties* (now in eating), gilt-rimmed bronze medal, H. F. K. Holloway, Esq. *Medlars*, bronze medal, J. White, Esq. *EXTRA: Grapes*, Sir T. Baring, Bart., and Mr. W. Barnes. *Apples*, Rev. C. S. Bonnett. *VEGETABLES: Celery*, bronze medal, Rev. the Warden. *Onions*, bronze medal, H. F. K. Holloway, Esq.

Morningside Practical Gardeners' Society, Nov. 7.—This was the last meeting for the season. Prizes were awarded as follows. *Six Chrysanthemums*, 1, Mr. J. Young, gr to T. Oliver, Esq., for Lucidum, Cornet, Gem, Marquis, Queen, Venus; 2, Mr. J. Downie, gr to Gen. Robertson. *3 Leeks*, 1, Mr. J. Douglas, gr to Sir Frederick Lauder, Bart.; 2, Mr. A. Walker, gr to Mrs. D. Graham. *German Greens*, 1, Mr. J. Downie; 2, Mr. J. Douglas. *Red Beet*, 1, Mr. J. Douglas; 2, Mr. T. Owens, gr to A. Russell, Esq. *Six Onions*, 1, Mr. R. Anderson, gr, Barroughmuirhead; 2, Mr. J. Douglas. *Red Cabbage*, Mr. A. Walker; 3, Mr. C. Jack, gr, Causewayside. *Broccoli*, 1, Mr. J. Douglas; 2, Mr. J. Furgie, gr to Mrs. Gregory. *Endive*, 1, Mr. H. Gibb, gr to Mrs. Stark; 2, Mr. J. Furgie. *Two heads of Celery*, 1, Mr. J. Gourlay, gr to the Dowager Countess of Glasgow; 2, Mr. J. Douglas. *Brussels Sprouts*, 1, Mr. J. Douglas; 2, Mr. W. Ewing, gr to Mr. J. Adams, Esq. *Two sorts of Pears*, 1, Mr. Douglas; 2, Mr. J. Downie. *Three sorts of Apples*, 1, Mr. J. Furgie; 2, Mr. J. Douglas. *AMATEUR PRIZE: Savoy and Leeks*, Mr. J. Robertson. *Prize given by Messrs. J. Dickson and Sons*: for two heads of *Celery*, 1, Mr. J. Douglas; 2, Mr. J. Gourlay. *Also their prize for the best three sorts of Apples*, 1, Mr. J. Douglas; 2, Mr. J. Gourlay.

NOTICES OF NEW PLANTS WHICH ARE EITHER USEFUL OR ORNAMENTAL.

ELEUTHERINE ANOMALA. Anomalous Eleutherine. (*Stove Perennial*.) Iridaceae. Monadelphina Triandria.—This singular little plant appeared in a flower-pot in the garden of the Horticultural Society in April last, but its origin is unknown. Its similarity to the West Indian *Marica* renders it probable that it had been imported from that part of the world. From *Marica plicata* it differs in its dwarfishness, in the leaves tapering very evidently to the base, while the uppermost have long channelled stalks, and are much longer than the flowers. The great peculiarity, however, consists in the flowers having six stamens instead of three, a circumstance previously, we believe, unobserved in the Iridaceae order. Whether, however, this was an accidental circumstance in the plant now noticed, or is peculiar to the species, is uncertain. The increase in number of stamens is of the same nature as their redundancy in *Vellozia* and *Gethyllis*. If the views of previous botanists, as to the genus in which this should be included, are consulted, we shall find one placing its nearest ally in *Sisyrinchium* (Swartz), another in *Moraea* (Swartz), and a third in *Marica* (Ker), a pretty good indication of its really belonging to one of them. The regular flowers, free stamens, trifid slender-lobed style, ovate corolla, and plated leaves are so peculiar, as to have led the Dean of Manchester to distinguish it under the name of *Eleutherne*, a view we do not hesitate to adopt. It is indeed inconceivable how it could ever have been referred to either *Moraea* or *Marica*, its relation to *Sisyrinchium* is more obvious; the separate stamens, however, distinguish it. The real affinity of the genus is, in Dr. Herbert's opinion, with *Gelasine*.—*Botanical Register*.

CANDOLLEA TETRANTRA. Tetrandrous Candollea. (*Greenhouse Shrub*.) Dileniaceae. Monadelphina Tetrandria. The plant which is called *Candollea cuneiformis* in gardens is a species with leaves and flowers not half the size of the subject of the present plate, and stamens placed from six to nine in a parcel; otherwise it has much the same appearance. This species is manifestly very different. The former comes, or is said to come, from King George's Sound; this has been raised from Swan River seeds. In that country, therefore, they are not very different. Relying upon the traditional application of the name *C. cuneiformis*, I separated the present plant under the name of *C. tetrandria*. But upon looking into prior authorities, I begin to doubt whether this or the small one has the best claim to the former name. De Candolle says nothing about the number of stamens in the phalanges of *C. cuneiformis*; but Sir W. Hooker, in his figure in the "Botanical Magazine," t. 271, of what purports to be that species, represents it with only four stamens; although the figure itself is very characteristic of the small kind, with from six to nine stamens, and not at all of this, which has but four. No doubt, indeed, can be well entertained about the figure being generally intended for the *C. cuneiformis* of the gardens, as seems proved by the shortness of its petals; and it may therefore be presumed that some mistake has been made about the number of the stamens for the figure in question was not made by Sir W. Hooker himself, but by some unknown artist employed by Mr. Aiton. Upon the whole, then, no reason seems to exist why this should be considered otherwise than a new species. It is remarkable for the large size and orange colour of the anthers of its seeds. In a small way this organ is like that of the nutmeg, and will represent the nature of the mace in that spice. This is a greenhouse plant, and will grow freely in almost any sort of soil, but it appears to thrive best in a compost consisting of peat, loam, and sand, in equal proportions. It will bloom freely in a pot, but where it can be accomplished it will do much better planted out in a bed. Whether potted or planted out, the neck of the plant (that portion of the stem immediately above the soil) should be a little elevated, otherwise it is liable to suffer from damp in winter. Water should be liberally given during the summer months, and plenty of air at all times when the weather permits, applying no fire-heat except to keep off frost. It is easily propagated by cuttings under ordinary treatment.—*Botanical Register*.

TETRAMEMA MEXICANUM. (*Tender Greenhouse Perennial*.) Mexican Tetramema. Scrophulariaceae. Didynamia Angiospermia. I have not succeeded in ascertaining where the name *Pentstemon Mexicanus*, under which this species is known in gardens, has been published. It has possibly originated in Belgium, whence the plant seems to have been introduced, as is said, from Mexico. In a wild state it is unknown to us. Mr. Bentham, who has given particular attention to this order of plants, is of opinion that this is certainly a new genus, very near *Pentstemon*, with the same calyx and corolla, but without any trace or very little of the sterile stamen so conspicuous in *Pentstemon*.

It also differs, he says, from *Capraria* and *Russelia*, in its decidedly two-lipped corolla, and is farther removed from other genera in many points. It is a very pretty greenhouse plant, quite peculiar in its appearance, in consequence of its almost stemless habit and the profusion of little corymbs of showy purple and white flowers which rise up from among the leaves on long purple scapes. It is a tender greenhouse plant. It should be top-dressed in autumn and kept rather dry, in an intermediate house between a stove and greenhouse, during winter. In spring it should be re-potted in light free soil, chiefly leaf-mould and sandy-loam, and placed in a greenhouse, where it will remain in bloom the greater part of the summer. It may be propagated from seeds or cuttings, in the usual way.—*Botanical Register*.

MORMODES AROMATICUM. Aromatic Mormodes. (*Stove Epiphyte*.) Orchidaceae. Gynandria Monandria.—On the present occasion we shall only point out in what respect this plant differs from *M. pardinum*, the only species to which it approaches closely. In habit the two are similar, but *M. aromaticum* is the smaller, and has shorter leaves. The spike of *M. pardinum* is much longer, and bears three times as many flowers; the sepals and petals are narrower, and more taper-pointed; their difference in colour is obvious; the labellum of *M. pardinum* has the same form as the sepals, except that it has three sharp-pointed lobes, and a kind of stalk, which *M. aromaticum* wants. This species, although only introduced a few years since from Mexico, is now common, and although of little beauty, is valued for the peculiar fragrance, which is like that of aromatic vinegar.—*Botanical Register*.

ALSTROEMERIA LINEATIFLORA. Lined Alstroemeria. (*Greenhouse Perennial*.) Amaryllidaceae. Hexandria Monogynia.—At last we have the pleasure of publishing the true *Alstroemeria lineatiflora*, from Peruvian roots presented to the Horticultural Society by John Maclean, Esq., of Lima. It is one of the finest of its class, and although, doubtless, very near *A. Ligtu*, peregrina, and pulchra, apparently distinct from either. It will be found that *A. pulchra* has the sepals and petals constantly serrated, which is never the case in the other three, and that the form of their leaves or sepals affords clear marks for further discrimination. In *A. lineatiflora*, the leaves are short, very blunt, and of nearly equal size; in *A. peregrina* they are also of nearly equal size, but very sharp; and in *Ligtu* the upper are very narrow and taper-pointed. Then, as to the sepals; in *A. peregrina* they are deeply obovate, in *Pulchra* narrow, spatulate, and obovate with a little point, in *Ligtu* roundish obovate, with a very small point, and in *lineatiflora* obovately wedge-shaped, with a large point. By these marks it appears that these species may be certainly distinguished; and that being so, we are constrained to regard *A. lineatiflora* as a good species, and not a mere variety of *Ligtu*. It is a greenhouse perennial, and thrives best in a compost consisting of one-half loam, the other peat and sand. This, like many other species of *Alstroemeria*, produces tuberous roots in a horizontal direction, consequently it requires a large pot, which should be nearly half filled with potsherds. In autumn the plant should be set in some airy place, where it will receive very little water, until the beginning of January, when it should be re-potted. While in a growing state, plenty of water should be given, and air at all times when the weather will permit. It may be propagated abundantly from seed.—*Botanical Register*.

MISCELLANEOUS.

Grafting the Grape Vine.—Nothing is more simple than this if the right mode be adopted. Cut off the old Vine below the surface of the earth, after the leaves are fully expanded, and all danger of bleeding is past. Split the stock as in cleft-grafting. Insert the scion, consisting of one-year old wood, and bearing two or three buds, having first cut the end to be inserted in a wedge-like shape. If the stock close firmly on the scion, tying is unnecessary; if it do not close firmly, then it must be bound up tight. Draw the earth up around the whole, leaving the bud mainly depended on, usually the second from the top, just even with the surface, and the work is done. The after-management consists in taking off the sprouts that rise from the stock, those that spring from the scion, all but one, and training that up carefully as it grows. No tree is so easily propagated by grafting as is the Vine in this way. No clay, or wax, or adhesive plaister is wanted. No special care is required to fit bark to bark, as in other cases. I have always put the scion on one side of the stock; and, to insure success, I have usually, when the stock would admit of it, put in two scions, one on each side of the cleft, but never have taken especial care to make bark fit to bark. I have tried wrapping with waxed paper, and then drawing up the earth, as before mentioned, but have found success far more certain when this was omitted. As to the time, I must repeat that it is essential that the operation be performed after the leaves of the stock are fully expanded, and all danger of bleeding is over. I am informed, however, by one who has tried it, that success by this mode is just as certain, if the operation is performed before the sap begins to rise. This I have not tried, except in one or two instances, in which I took up the stock, grafted it as above described, and then planted it where I wanted it. On the 1st of June, of this year, I put a scion of the Gros Maroc in the root of a wild Vine. It had on the 30th June grown about two feet. I have had scions grow, when put on strong roots, fully 15 or 20 feet in one summer, and invariably produce good crops the second year. A white Grape from France, worked on the root of the vigorous-growing Fox-Grape of our woods, produced abundantly the second year, while cuttings of the same Grape, treated as cuttings usually are, grew very slowly, and were five years in coming to a bearing state. The delicate foreign varieties I have invariably found to be wonderfully strengthened by being worked on the roots of our strong native kinds. In propagating by cuttings, I have tried long cuttings, short cuttings, and single eyes; but I find that single eyes succeed with much less certainty than cuttings. I greatly prefer short cuttings, inserted in pots, put on moderate bottom-heat, in January, and planted where they are to remain in April. I have Vines that are now four and a half feet high, from cuttings inserted last January, and managed in this way.—*Hovey's Magazine of Horticulture*.

New Medicine.—Much is said in the United States about a new vegetable medicine. Dr. Mettauer (and after him many other physicians) make use of an infusion of the unripe fruit of *Diospyros virginiana*, also called the Date Plum, whose bark has already been employed as a febrifuge, with surprising success in cases of Cholera infantum, and the worst forms of Mississippi diarrhoea. The particulars as to the manner of applying it are to be found

in Hay's "American Journal of Medical Science," October, 1842.

Cranberries.—The species of Cranberry most commonly found in the United States has been described as an indigenous, low trailing vine, growing wild in bogs and meadows, and bearing a beautiful red berry of an exceedingly sour though agreeable taste, which is much used in domestic economy for tarts and sweetmeats. Mr. Kendrick, of Boston, says the Cranberry is a plant of easy culture, and not a doubt exists that meadows which are now barren wastes or yield nothing but coarse herbage, might be converted into profitable Cranberry fields, with but very little expense. Any meadow, it is said, will answer for their growth. They grow well on sandy bogs after draining. If the bogs are covered with bushes they should be removed; but it is not necessary to remove rushes, as the strong roots of the Cranberry soon overpower them. It would be well, however, if the land could be ploughed previous to planting with Cranberries. Capt. Henry Hall, of Barnstable, who has cultivated the Cranberry more than 20 years, usually spreads beach sand on his bogs, and digs holes four feet distant each way, the same as for Corn, though somewhat deeper. In these holes he plants sods of Cranberry roots, and in the space of three years the whole ground is covered with the vines. The planting is usually performed in autumn, when the bogs are drier and can be better dug or ploughed than at other seasons of the year. A Mr. Hayden, of Lincoln, Mass., is said to raise 400 bushels of Cranberries yearly, which bring him 400 dollars, in the Boston market—sometimes more. An acre of Cranberries, in full bearing, will often produce 200 bushels; and although a moist soil is best suited to the plant, yet with suitable mixtures of bog earth or mud, it will flourish, producing abundant crops, even in a comparatively dry soil.—*Dover (N.H.) Gazette*.

On Fermentation, &c. By Prof. Mitscherlich.—Fermentation is effected by a vegetable, putrefaction by an animal production. In the course of the two last winters the author observed in a large number of putrefying substances only one species of Infusorium to be developed, which consisted of one or of several globules, in the latter case arranged in series; the diameter of such globules was about 0.001 mm, the motion vibratory. According to his observations it would seem probable that the other animalcules which are observed in putrefying substances have been conveyed into them by means of the atmosphere, insects, or some other means. A certain quantity of oxygen is requisite for the development and existence of these Vibriones, and the putrefactive process is dependent, according to the author, on the free access of a certain amount of atmosphere to the decaying substances. The maceration of vegetable substances in water, even when the temperature in the rooms is kept at a summer-heat, appears to depend solely on these Vibriones, when the substances are employed in a clean state. During this process nitrogen is disengaged. These Vibriones are widely diffused in the intestinal canal throughout its entire course, in the cavity of the mouth, and in the stomach, of which it is very easy to be convinced by examining under the microscope the matter which collects or remains on the teeth; sometimes they are even found on the skin, but the author has hitherto not succeeded in detecting them in the blood, in the milk, in the gall, or in other fluids of this kind. When a little sugar is added to the liquid in which these animals are formed, their number augments considerably, and at the same time a vegetable production is generated, viz., ferment. If a larger amount of sugar be added, the production of these animals is suspended or ceases entirely, and a greater quantity of ferment is formed. The author has never observed ferment to be formed in a liquid which contained no sugar. Whether a fungus be the fermentative fungus or another species, may be determined with certainty under the microscope; but also very easily by adding some of it to a solution of sugar, and observing whether any fermentation ensues. In a clear liquid, in which it is possible for ferment to be produced, a turbidness is first perceived, and under the microscope globules of various sizes, from the smallest dimensions hitherto observed, up to a diameter of 0.01 mm. From day to day the small globules increase in size, and many new ones become apparent. In some liquids, as for instance in the juice of the Grape, only a few individual globules are observed, which are generally of an oval form; and sometimes, but rarely, a second is developed at one of the extremities, but this never attains to the size of the primitive globule. Ferment which has been produced for some time by means of other ferment, is otherwise circumstanced: from having been multiplied through a series of years it has acquired a constant character. In the breweries two kinds of ferment may be distinguished with certainty, the bottom ferment and the top ferment. The former multiplies at a temperature which must not exceed 48°, nor go below 32° Fahr.; this is the ferment in Bavarian beer. The most beautifully developed top ferment is that of Berlin white beer, which multiplies at a temperature of about 77°. Bottom ferment consists of single globules of various sizes. The author never observed a small globule to be formed on any part of a large one; the smaller globules are always diffused throughout the liquid. In top ferment scarcely ever could any single small globules be detected, but only large ones, at the extremities of which the smaller globules were developed, thus forming ramifications. These increase therefore by the production of gems; the bottom ferment, on the contrary, by small globules growing isolated in the liquid. The author exhibited drawings of the two species of ferment in the various periods of their development. In the older ferment an envelope and granular contents may be readily distinguished, which becomes, however, more evident on the addition of a drop of

aqueous solution of iodine. By means of a compressorium invented by the author, the granular contents may be easily pressed out under the microscope. The author considers it probable that in the bottom ferment the globules burst and disburthen themselves of their contents, from each granule of which a new globule is developed, so that the bottom ferment would be multiplied by spores. Substances which act as poisons on fungi destroy the action of ferment, for instance corrosive sublimate, and other substances of similar nature; but liquids which act most violently on the animal frame, such as tartar-emetic, in solutions of which fungi very readily develop, do not disturb the process of fermentation. Several fungi which are known as vegetable diseases are similarly circumstanced, as for instance dry-rot to woody fibre; and with these facts a new field is evidently opened, explanatory of the decompositions which the roots of plants are capable of effecting in the soil; and it may be expected that we shall be able to demonstrate by experiment, what general experience has shown, that the roots of plants, when unable to obtain from the atmosphere the substances requisite for their development, take them from the soil; and it is not improbable that the roots themselves effect the necessary decomposition of the substances contained in the soil, just as the greater portion of vegetables obtain the requisite substances for their first development from the seed itself. Although this is difficult to prove in the higher order of plants, it may be proved more definitely in the lower tribes, especially in the fungi, as for instance in the Champignon. The process of fermentation is therefore of considerable interest. One of the most important chemical combinations is decomposed by a contact-substance, which contact-substance is an organized being belonging to the most simple forms, the development of which may be traced in the most easy and certain manner; but its first origin is moreover of great interest, for it is formed in a liquid in which it appears as numerous points so small as to escape observation.—Poggendorff, as quoted in the *Annals of Natural History*.

Agriculture of Ceylon.—"The Kandyian plough is only what may be called a crooked piece of wood, something like an elbow; it merely tears up the ground as unevenly as if it were done by hogs. They then overflow the field with water. They plough twice before they sow; but before they give the first ploughing they let in water upon the land, in order to make it soft and the easier to be worked. After it is once ploughed, they usually make up the banks; for if they were to put off doing so till after the second ploughing, the soil would have become mere mud, totally unfit for banking. These banks are indispensable, not only as paths for the people to walk upon through the fields, who otherwise must go in the mud, but also to keep in and contain the water overflowing the ground. They make these banks as smooth and level as a bricklayer would a wall with his trowel; for in this respect they pay great attention to neatness. These banks at the top are not above a foot in width. But after the land is ploughed, and the banks are finished, it is again laid under water, and remains so till the time for the second ploughing, when it becomes exceedingly muddy, as much from the trampling of the cattle as from the plough; for the more it is stirred up the better. Sometimes they use no plough the second time, but only drive their cattle through and through the field, until the soil is made sufficiently muddy. The land being thus prepared, it is still kept overflowed with water, in order that the weeds and grass may be destroyed. They then soak in water for a night the Corn which they intend for seed. The next day it is taken out and laid in a heap, covered over with green leaves; and thus it remains for five or six days, so as to make it sprout. They then wet it again, and lay it in a heap covered over, as before, with green leaves; and thus it is caused to shoot out its blade and roots: whilst this process is going forward, they have prepared the ground for sowing,—which is thus done: they have a board, as before shown, about four feet long, which they drag over the land by a pair of buffaloes or oxen; not flat-ways, but upon its edge, which is so done that the earth and weeds may be well mixed together; and it also levels and makes the ground so smooth and even, that the water afterwards stands equally over it. It still remains covered with water whilst the seed is growing, and until it is become fit for sowing, which is in about eight days after it was put into water to soak. The seed being ready, they let off the water, and with boards of about a foot in length, fastened to long poles, they dress the land over again; laying it very smooth, and making small furrows in it, that in case rain or other water should come in, it may drain away; for more water now would very likely rot the seed. They then sow, which they do with great evenness, strewing the seed carefully with their hands. The ground now remains without any water, until the grain has grown three or four inches above it. There had been gaps made before in the banks to let out the water; these are now stopped up to keep it in; which is not only to nourish the Corn, but to kill the weeds, for they always keep their fields as clean and neat as a garden. When the grain has grown about nine inches high the women are employed to weed it, and to pull it up where it has grown too thick, so as to transplant it to places where it may be wanted. It then stands overflowed, till the grain is ripe, when they let the water off, in order that it may become dry, and fit for reaping. They never, as I before remarked, use manure of any kind; but their mode of ploughing, trampling, and soaking the ground, apparently obviates the necessity for it. The Kandyans are excellent reapers, and as they had assisted each other in tilling the ground, they do so likewise at harvest. They first reap one man's field, and then go to the next, and so on, until the whole

of the grain is cut; and their custom is that every man, during the time his Corn is reaping, has to find all the rest with food. The women's work is to gather up the Corn after the reapers, and carry it all to one place."—*Col. Campbell's Excursions in Ceylon, as quoted in the Athenæum*.

Experiments with Manures for Turnips.—The result of all experiments with manure is decidedly in favour of Guano as a manure for growing Turnips. So very apparent was its superiority in this respect in most of the fields, that there was no difficulty in pointing out the furrows in which it had been used. The general idea of its value in the commencement of the season, when it was applied, seems to have been that one cwt. of Guano was equal to five yards of farm-yard manure, or six bushels of bones; and it is our impression, from the result of the experiments, that its value as a manure has not been over-estimated. A crop of Turnips, for which the first premium was awarded, was raised on different fields from the following proportions of manure:—

	Dung.	Bones.	Guano.
	yds.	bush.	cwt.
Aberdeen Yellow and White Globe ..	15	7	1½
Swedish, one field ..	10	—	2
Do., another field ..	10	15	2

One furrow in the last field, grown with Guano at the rate of four cwt. per acre, notwithstanding the very heavy manuring which the other part of the field had received, was very considerably a better crop.—*Galloway Courier*.

Presence of Organic Matter in Water.—In the last Number of the "Transactions of the Royal Society of Edinburgh," Prof. Connell has shown that a notable quantity of—apparently nitrogenous—organic matter is present in the purest waters from terrestrial sources, an excellent illustration of which is afforded by the well-known spring of St. Anthony's well, at the foot of Arthur's Seat, near Edinburgh. The water of this well may be considered as a very pure spring-water, as respects inorganic constituents; but the chemical examination of it shows that its proportion of organic matter is considerable. It will readily occur, that if this matter exists in all waters which have filtered through strata below the limits of vegetation, it must necessarily perform a part of considerable importance in the economy of nature. Being in solution in water, it is evidently in that state which is best adapted for being taken up by the roots and fibres of plants, and so contributing to their nourishment, in so far as that nourishment has access by these channels. And Prof. Connell asks, May not a part of the beneficial effects of irrigation be due to such dissolved organic matter? Even as regards the animal economy, we cannot suppose that it will not contribute, in proportion to its amount, to the nourishment of man and other animals partaking of such waters; and this will more particularly be true, if it really be an azotised body.

Swan River Vegetation.—LOBELIACEÆ and its allied orders.—Of this natural order we have many species, but only three of much beauty; these are the *Lobelia heterophylla* and *ramosa*, and *Isotoma Brownii*. The latter is one of our most beautiful plants, it varies with snow white, deep purple, rose-colour, and every possible intermediate shade of colour; it has the extraordinary property of growing and flowering, bringing the seeds to maturity in our hottest and driest weather, without receiving any nourishment from the roots, which are generally dead before the plant begins to flower. This species is extremely acrid, and I long wrongfully suspected it of poisoning the sheep and goats. Of *Stylidæ*, up to this time I have gathered over 60 Swan River, or rather Western Australian species; by far the larger part of these are plants that would be well worth introducing into the greenhouses in England, for independently of the singular irritability of their column, they have in most cases beautiful gaily-coloured flowers, the abundance of which compensates for their smallness, and their tints are by no means confined to pink, which generally has been the colour of the species seen alive in Europe. We have many yellow and purple species, one beautiful climbing species has deep scarlet flowers. The *Stylidium hirsutum* of Brown is the largest-flowered species yet seen in Western Australia, but that with the finest foliage grows on the ironstone hill, to the south of the black-snake creek; I have observed the old seed-vessels on the plant, the flowers are not known. *Stylidium Drummondii* of Lindley, an inhabitant of the rocky pass on the Darling Range, growing eighteen inches or two feet high, with large nearly white flowers, is a very fine species. Of *Goodeniaceæ* our species are numerous, and chiefly blue-flowered, the proportion of yellow species being inconsiderable. The prettiest of the latter is *Vellaya lanceolata*, which grows on the borders of the sandy country to the east of the Toodyay district. I have noticed our beautiful red and yellow *Leschenaultia* in our journey to the south. My celestial blue *Leschenaultia grandiflora* is common near the foot of the Darling Range; my *Leschenaultia sanguinea*, which sports into endless varieties of shades of purple and scarlet, is one of the most beautiful plants our colony can boast of; the *Leschenaultia formosa* is common near King George's Sound, but rare at the Swan. We also have a fine yellow-flowered plant of this order, common about Augusta, and growing five or six feet high. One of our handsomest annuals is a species of *Brunonia*, which grows in large patches in the grassy districts, and forms, with its beautiful sky-blue flowers, a fine contrast, with the beautiful pink and yellow *Everlasting* flowers that surround it.—*Drummond, in the Inquirer*.

African Oil.—The *Carapa Taloucouma*, a meliaceous plant, which furnishes the seeds from which Tallicoona or Kundah oil is procured, is found growing abundantly in the Timneh country, and over the colony of Sierra

Leone. The tree is lofty. The fruit is a large, somewhat globular five-celled capsule; the seeds, of which there are from 18 to 30 in each capsule, vary in size from that of a Chestnut to a hen's egg; they are three-cornered, convex on the dorsal surface, of a brownish or blackish red colour, and rugous. Specimens of the seeds, with the fruit are contained in the Banksian Collection, at the British Museum. The natives manufacture it into oil, which affords a pleasant and good light. The leaves are used by the Kroomen as a thatch to their huts. At the village of Kent, near Cape Schilling, the oil is manufactured as follows:—the seeds are dried in the sun, then hung up in wicker racks or hurdles, and exposed to the smoke of the huts; when exposed for a sufficient time, the seeds are roasted and triturated in large wooden mortars until reduced to a pulp. The mass is then boiled, when the supernatant oil is removed by skimming. Tallicoona oil, medicinally, is both purgative and anthelmintic; its nauseous odour and bitterness render it, however, an unpleasant remedy. It is sometimes liquid, sometimes solid according to the variable quantities of oleine and stearine which it contains; and it owes the bitterness which it possesses to an alkaloid principle. Mr. Redwood, Member of the Pharmaceutical Society, who made a few experiments to determine some of the most prominent characters of the oil, found it to be entirely soluble in ether, and that alcohol separated it into two parts,—a concrete substance, which was dissolved, and an oil fluid at ordinary temperatures, on which the alcohol took no effect. The former contained the bitter principle and the nauseous odour of the oil, the latter was nearly colourless and tasteless. Tallicoona oil is sold in the colony at 2s. a gallon retail, and could be procured in abundance from the coast as an article of commerce. Its medicinal properties are fully detailed in the *Pharmaceutical Journal* for November, 1842.—*Friend of the African*.

The Palmetto Root.—Another important branch of business is likely to do much for the state of Mississippi. The Palmetto-root, which almost covers the country near the sea-shore, is found to contain a large quantity of tannin. These roots lay almost on the top of the ground, three to ten or twelve starting from one common centre, or top root, and frequently growing ten feet long, and from two and a half to four inches diameter, of a spongy fibrous texture, the leaves springing out of the extreme end, which lengthens the main root as the old leaves fall off. The main root is attached firmly to the ground by small fibrous roots growing out, and directly down from the lower side of the main root. This root can be dug up and ground cheaper than oak bark, besides the clearing of the land, which is an important consideration, as taking up these roots has heretofore been considered the most expensive part of our clearing.—*American Agriculturist*.

The Date Tree.—We calculated at Dalaki (in Persia) where very good Dates grow, that every full-grown tree produces 100 pounds weight of fruit, which brings to the possessor from two to three rupees of profit, out of which he must pay a mohammedi (seven kreutzers) as well. Consequently, the annual value of 100 Date trees, in tax-kept gardens, amounts to only 300 rupees.—*Bot. Zeit.*

Experiments with Guano on Potatoes.—In the districts of Dumfriesshire and Galloway, numerous trials on an extensive scale have been made of Guano, with a view accurately to ascertain its comparative qualities; and as it is desirable that the results of these should be made known, we give the following:—Guano, at the rate of 5 cwt. per Scots acre, was sown along the drill before planting the Potatoes, and a variety of drills compared with 30 cubic yards of well-rotted dung. The produce has been:—

	Tons.	Cwt.
White Potatoes, called "Daily Wonders," lately introduced, with Guano, per Scots acre ..	12	7½
With dung, per do. ..	12	12½
Bluffs, with Guano, per do. ..	8	17½
Do., dung, per do. ..	9	11

The seed partially failed, but to an equal extent in both. Guano, at the rate of 3 cwt. per Scots acre, added to 16 yards dung, produced—

	Tons.	Cwt.
Don Potatoes, per Scots acre ..	11	12
Do., with 30 yards dung alone ..	11	7½

The land is fair in point of dryness, it had been cropped for several years, and was in grass before Oats—the soil is not deep. Where Guano alone was used, the shaws from the first, and during the summer, were decidedly stronger and of a darker green colour; but, during September, decayed sooner than where the dung was used. With the mixed manure, the same effects as to strength and colour were produced; but in a less degree, and they remained fresher to the last. From this circumstance, and the result of weight, we would be inclined in future to adopt the mixed manure, varying, of course, the proportion according to circumstances. On some lands in Dumfriesshire this facility of raising productive and profitable crops of Potatoes with the half quantity of farm-yard manure, may lead to the partial adoption of an additional grain and green crop before sowing out, viz.:—First, Oats; next Potatoes, with dung and guano; then Wheat; then Turnips, with dung and bones mixed; then Barley or Oats, with Grass seeds.—*Galloway Courier*.

Constituents of Maize.—Dr. C. T. Jackson made a verbal communication on researches made by himself and Mr. A. A. Hayes, of Roxbury, respecting the saline and other ingredients of Zea mays, and other grains, exhibiting specimens of seeds to which Mr. Hayes' test of sulphate of copper, for the detection of the limits of the phosphates, had been applied. He also exhibited specimens to which tincture of iodine had been applied, which indicated the extent of the starch in each kind of grain and in several other plants. Mr. Hayes' discovery of the limits of a salt of the peroxide of iron was demonstrated by soaking

Indian corn in sulphhydrate of ammonia. The relative proportions of oil in the different varieties of corn was shown by sections of the kernel, also the relative proportions of the zeine of Gorham or the gluten of corn. The causes of the peculiar explosion and evolution of the starch and gluten of corn in parching was explained by the decomposition of the oil in the cells of the transparent portions of the grain. Dr. Jackson had observed, in April, 1840, while analysing the ashes of Indian corn, that after combustion of the corn in a platina capsule, at a high temperature, the platina was rendered brittle, and was in part converted into the phosphuret of that metal. On examining into the cause of this, he discovered phosphoric acid united to some volatile or destructible base, mixed with the phosphates of lime and of magnesia. His subsequent researches satisfied him that the volatile base in question was ammonia, which he separated by the action of potash and lime, at a temperature below that required for charring the grain. By the action of nitric acid he burnt out the carbonaceous matter from the ashes of corn, and procured a considerable quantity of glacial phosphoric acid. In all these experiments, thus far, the whole grain was employed. In May, 1842, Mr. A. A. Hayes, of Roxbury, exhibited to the chemical association some specimens of southern corn, which had been cut in two and soaked in a solution of sulphate of copper; and this test most beautifully marked out the limits of the phosphates in that grain. Profiting by this interesting experiment, and observing that the phosphates were indicated only in the cotyledon of corn, Dr. Jackson dissected out the cotyledons, analysed them separately; and glacial phosphoric acid, phosphate of lime, phosphate of magnesia, and ammonia were obtained. The proportions in the ashes of the whole corn was but 1 per cent. of phosphates of lime, magnesia, and free phosphoric acid, and a little silica. The cotyledons taken separately gave 6.4 per cent. of fusible matter, which ran freely when melted. It consisted of—Phos. lime, 2.4; phos. acid, 3.2; phos. magnesia, 0.8. He also made an extensive series of researches on other seeds, both of the Monocotyledonous and Dicotyledonous plants, which determined the existence of the phosphates exclusively in their cotyledons. The specimens to which Mr. Hayes' test had been applied, and which were exhibited to the society, were Peas and Beans of various kinds, Squash and Pumpkin seeds, Horse-Chesnuts, the common Chesnut, Pea-nut, Barley, Oats, Wheat, Rye, Buckwheat, and Cocoa-nut; also Potato tubers and Turnip bulbs. In all these the existence of phosphates was demonstrated. In Almonds, Walnuts, Butternuts, and most oily seeds, the sulphate of copper fails to demonstrate the presence of phosphates. The application of tincture of iodine proved the presence and limits of starch in the Turnip, and in several other plants which were exhibited. A sample of the hard and transparent portion of Indian corn, from which the oil and zeine had been removed by alcohol and ether, was proved by the iodine test to be starch. It was observed that weak tincture of iodine does not colour this portion of the corn until the oil is removed. If strong tincture of iodine is employed, the alcohol removing the oil causes the freed starch to take the blue colour. Beans and Peas, consisting mostly of legumine, discovered by Braconnot, do not take a blue colour like the starch containing grains, but become dark brown. Specimens of various germinated and growing plants were also tested before the society. In the Potato-sprout the starch was traced up into the plumule about half an inch, where it disappeared, and dextrine was present, the starch having undergone a metamorphosis into that substance. Similar experiments were tried on Indian corn, which had been grown about two inches high, in pure powdered quartz. The changes which the seed had undergone were quite interesting, and it was seen, by the iodine test, that the starch of the albumen had been absorbed, and was changed in the plumule into dextrine and sugar. The portion of the corn, where the oil exists with starch and gluten, had begun to change, and iodine instantly forms a blue compound with the starch. On applying the sulphate of copper the presence of phosphoric acid in the radicle and plumule, and a little around it, was readily proved. On testing germinated English Beans the presence of phosphates was demonstrated in the cotyledons, but iodine did not prove the formation of starch from the legumin. The same experiment was performed with the common Bean, with the same results. It will be interesting to study the changes which legumin (a substance now supposed to be identical with casein), undergoes in the process of germination. As yet we know of no chemical researches on its transformations in the living plant. Dr. J. had observed that Cucurbitaceous plants contained nitrate of potash, and had consequently directed its application around the roots of such Vines. Observations on such plants grown on nitrous ground, where old barns had been removed, proved the value of that salt as a manure for Squashes, Pumpkins, and Melons.—*Proceedings of Boston Society of Natural History.*

Reviews.

Chemistry in its Applications to Agriculture and Physiology. By Justus Liebig, M.D. 8vo. Taylor and Walton. THIRD EDITION.

It is rather more than three years since this remarkable book was laid before the British Association. In the course of that time two Editions have been printed; they have been received on the one hand with most extravagant praise, and on the other with unmeasured censure. The first was attributable to the clearness with which some views that are really new, and others that are thought so, were brought before the public; the second arose from the

manner in which Professor Liebig was so ill-advised as to attack Vegetable Physiologists, of whose science he knows much less than they of Chemistry. The issue of all this has been productive of much good. Had it not been for English trumpets, public attention would never have been so strongly directed to Professor Liebig's excellencies; and we have to thank the German catcalls that his own thoughts have been so advantageously turned to the correction of his deficiencies. The two together have produced a book infinitely superior to its predecessors, and to a very considerable extent unlike them. We hear no more of Starch consisting of concentric layers of wax and amylin; the exaggerations about grand experiments on woods and meadows are omitted, as is the materialism about the unimportance of a vital principle (p. 56, Ed. 2), and the offensive observations upon Physiologists. In the place of these and other subjects that are cancelled we have a very considerable quantity of new matter. A new chapter is devoted to the consideration of "the Formation of Arable Land," another to "Fallows;" that on the "Rotation of Crops" is almost entirely rewritten, and so is the chapter on Manures; while a thirteenth chapter is devoted specially to a general retrospect of the theories included in the previous pages. To these are added supplementary chapters on the sources of ammonia, and on the questions whether Nitric acid is food for plants, and whether the nitrogen of the air takes a part in vegetation. In an Appendix are given at length the important experiments of Wiegmann and Polstorff on the food of plants.

In the former editions ammonia was the great subject of discussion. As chemists seem agreed in considering it improbable that plants should obtain their nitrogen directly from the air, and as all plants contain that element, ammonia seems to be the only source by which it can be supplied; and in all probability this is a just view of the case. Nevertheless it is by no means proved that larger quantities of ammonia than the atmosphere naturally contains are necessary to the most healthy vegetation; and although it is certain that matter rich in ammoniacal salts is among the most powerful of manures, it has by some been supposed that other substances constantly present along with the ammonia may be of equal or even greater importance. Such is sulphuretted hydrogen; such are phosphates. This opinion is now taken up by Professor Liebig, who devotes a whole chapter to its consideration. After stating that animal matter contains invariably the substances named albumen, fibrin, and casein, all three rich in sulphur, he inquires—

"From what source does the animal body derive these three fundamental components? Unquestionably they are obtained from the plants upon which the animals subsist; but in what form, and in what condition, are they contained in plants?"

"Recent investigations of chemists have enabled us to answer these questions with positive certainty. Plants contain, either deposited in their roots or seeds, or dissolved in their juices, variable quantities of compounds containing sulphur. In these nitrogen is an invariable constituent. Two of the compounds containing sulphur exist in the seeds of cereal plants, and in those of leguminous vegetables, such as Peas, Lentils, and Beans. A third is always present in the juices of all plants; and it is found in the greatest abundance in the juices of those which we use for the purposes of the table."

"A very exact inquiry into the properties and composition of these substances has produced a very remarkable result, namely, that the sulphur-compound dissolved in the juice of plants, is, in reality, identical with the ALBUMEN contained in the serum of blood, and in the white of an egg; that the sulphur-compound in the seeds of the cereals possesses the same properties and composition as the FIBRIN of blood; and that the nutritious constituent of Peas, Beans, and Lentils, is actually of the same nature and composition as the CASEIN of milk. Hence it follows that plants, and not animals, generate the constituents of blood containing sulphur. When these are absent from the food given to an animal, its blood cannot be formed. From this it also follows, that vegetable food will be proportionally nutritious and fit to sustain the vital processes of the animal body, according to the amount of these ingredients contained within it."

"There also exist certain families of plants, such as the Cruciferae, which contain peculiar sulphur-compounds much richer in that element than the vegetable constituents of blood. The seeds of Black Mustard, the Horseradish, Garlic, Onions, and Scurvy-grass, are particularly marked in this respect. From all of these plants we obtain, by simple distillation with water, certain volatile oils, differing from all other organic compounds not containing sulphur, by their peculiar, pungent, and disagreeable odour."

"Those compounds containing sulphur are present in the seeds of all plants, as well as in the plants themselves; and as they are particularly abundant in cultivated plants employed for animal nutrition, it is quite obvious that a substance containing sulphur is absolutely essential to the development of such compounds, in order to supply to them their proper proportion of this element."

These are very remarkable statements, and require to be considered with great attention. The opinion, however, that sulphur is beneficial to plants is not originally Prof. Liebig's; he, on the contrary, so lately as 1842, adopted the erroneous views of Christison and Turner, and regarded the "hydrosulphate of ammonia (sulphuret of ammonium) as a deadly poison to vegetables, the properties of which we cannot change by dilution." (Ed. 2, p. 195.) It was, however, proved experimentally by Mr. Edward Solly (*First Report of the Chemical Committee of the Horticultural Society*, p. 9, June, 1842) that this

was a mistake. "I made use of the hydrosulphuret of ammonia, the very compound described by Liebig as being a 'deadly poison;' but in place of killing plants, I found that in small quantity it produced decidedly beneficial effects: in some cases when it was applied to plants in an unhealthy state from the action of other substances, it had the effect of invigorating them, and of restoring their leaves to a healthy, green, and crisp condition. The plants with which these effects were best observed were the garden Lettuce and the common Windsor Bean. The solution of the hydrosulphuret of ammonia employed was prepared by mixing a saturated solution of the compound with fifty times its bulk of water: such a solution had a most nauseous disgusting smell, and contained of course a large quantity of sulphuretted hydrogen. The plants under experiment were selected from many, and were of the same age and size, and as far as possible in the same healthy state of growth. Some were watered with common water, others with a dilute solution of hydrosulphuret of ammonia. At first only a few drops of the solution were given, but finding that this produced little or no effect, the dose was increased, and as much as half an ounce a day, and sometimes even more, was given to each plant; it was found that those thus treated became stronger and sturdier, their leaves were of a bright deep green, the space between the nodes, or the distance from leaf to leaf, was shorter, and the stems were stronger, and the whole plant more flourishing than in those watered in the ordinary way, although all other circumstances were alike, and care was taken to place all under the same condition, by exposing them equally to air and light, and giving them the same quantity of water every day. Plants in a languid state from over-doses of nitrate of potash, or soda, or other saline manures, if not too much injured by their previous treatment, appeared to recover more rapidly when watered with the solution of hydrosulphuret of ammonia, than when merely treated with common water. In some of these latter cases a much stronger solution was employed than that already mentioned, containing two drachms of the saturated solution of hydrosulphuret of ammonia in fifty of water, and of this eight drachms were given daily. For some time after thus watering the plants the earth retained a strong smell of sulphuretted hydrogen, and the water which drained through, when tested by a salt of lead, evidently contained a large quantity of that gas." And then he proceeds to point out the extreme improbability that a substance so constantly evolved from decaying matter as sulphuretted hydrogen should not be the food of plants. "Its presence in manures is well known and readily proved, but its presence in the air, in which it exists in exceedingly minute quantity, is less readily shown. We know, however, that it is constantly being formed on the surface of the earth, and we have evidence of its presence in the air by several effects, such as the tarnishing of some metals, and the blackening of white paint; these effects, which take place gradually and slowly, are principally occasioned by the presence of sulphuretted hydrogen and its compounds, more particularly the hydrosulphuret of ammonia, in the air. Lastly, if the vegetable kingdom is the great means of purifying the air, and retaining it in a fit state for the respiration of men and animals, the absorption and decomposition of sulphuretted hydrogen by plants must constitute not the least important of their functions."

We believe, too, but cannot lay our hands upon the passage, that Dr. Lankester had previously brought forward some evidence to show that sulphuretted hydrogen is not injurious to vegetation.

The source from which sulphur is obtained by plants is not the atmosphere, according to Dr. Liebig, but the soil, whence it is furnished by the decomposition of sulphates. "The air," he says (p. 63), "cannot contain any substances in which sulphur is present, unless, indeed, we except minute and scarcely appreciable traces of sulphuretted hydrogen." We confess our inability to understand this. That ammonia is obtained from the air was one of the author's triumphant proofs, and yet it exists there in as minute and inappreciable a quantity as sulphuretted hydrogen; and we cannot comprehend why the latter should not be thus supplied as well as the former. If not, what, let us ask, becomes of the volumes of this gas continually escaping from the surface of the soil? Are we to suppose that it is all consumed in forming sulphurets? Surely not.

Next to sulphur stand phosphates in their importance to vegetation. This, indeed, is not a new doctrine; on the contrary, their value was pointed out in the former editions; not, however, we think, so strongly as now. We are rejoiced to find Prof. Liebig ranged on this side of the question, for it seems to us that if practical Agriculture points out one thing more strongly than another, it is the great importance of phosphates. Nothing is more remarkable than the action of the superphosphate of lime on plants in gardens; no single agent that we have yet seen employed can be compared to it. This probably arises from garden-soil being rich in all other substances except phosphoric acid, which is always largely carried off, and but sparingly returned in the processes of garden culture. The remarks of Prof. Liebig on this subject are too striking to be omitted:—

"In a former letter I showed you how great a waste of phosphates is unavoidable in England, and referred to the well-known fact that the importation of bones restored in a most admirable manner the fertility of the fields exhausted from this cause. In the year 1827 the importation of bones for manure amounted to 40,000 tons, and Huskisson estimated their value to be from 100,000*l.* to 200,000*l.* sterling. The importation is still greater at present, but it is far from being sufficient to supply the waste."

"Another proof of the efficacy of the phosphates in

restoring fertility to exhausted land is afforded by the use of the *guano*—a manure which, although of recent introduction into England, has found such general and extensive application.

"We believe that the importation of one hundred-weight of *guano* is equivalent to the importation of eight hundred-weight of Wheat—the hundred-weight of *guano* assumes in a time which can be accurately estimated the form of a quantity of food corresponding to eight hundred-weight of Wheat. The same estimate is applicable in the valuation of bones.

"If it were possible to restore to the soil of England and Scotland the phosphates which during the last fifty years have been carried to the sea by the Thames and the Clyde, it would be equivalent to manuring with millions of hundred-weights of bones, and the produce of the land would increase one-third, or perhaps double itself, in 5 or 10 years.

"We cannot doubt that the same result would follow if the price of the *guano* admitted the application of a quantity to the surface of the fields, containing as much of the phosphates as have been withdrawn from them in the same period.

"If a rich and cheap source of phosphate of lime and the alkaline phosphates were open to England, there can be no question that the importation of foreign Corn might be altogether dispensed with after a short time. For these materials England is at present dependent upon foreign countries, and the high price of *guano* and of bones prevents their general application, and in sufficient quantity. Every year the trade in these substances must decrease, or their price will rise as the demand for them increases.

"According to these premises, it cannot be disputed, that the annual expense of Great Britain for the importation of bones and *guano* is equivalent to a duty on Corn: with this difference only, that the amount is paid to foreigners in money.

"To restore the disturbed equilibrium of constitution of the soil,—to fertilise her fields,—England requires an enormous supply of animal excrements, and it must therefore excite considerable interest to learn that she possesses beneath her soil beds of fossil *guano*, strata of animal excrements, in a state which will probably allow of their being employed as a manure at a very small expense. The coprolithes discovered by Dr. Buckland, (a discovery of the highest interest to Geology,) are these excrements; and it seems extremely probable that in these strata England possesses the means of supplying the place of recent bones, and therefore the principal conditions of improving agriculture—of restoring and exalting the fertility of her fields.

"In the autumn of 1842, Dr. Buckland pointed out to me a bed of coprolithes in the neighbourhood of Clifton, from half to one foot thick, inclosed in a limestone formation, extending as a brown stripe in the rocks, for miles along the banks of the Severn. The limestone marl of Lyme Regis consists, for the most part, of one-fourth part of fossil excrements and bones. The same are abundant in the lias of Bath, Eastern and Broadway Hill, near Eversham. Dr. Buckland mentions beds, several miles in extent, the substance of which consists in many places, of a fourth part of coprolithes.

"Pieces of the limestone rock of Clifton, near Bristol, which is rich in coprolithes and organic remains, fragments of bones, teeth, &c., were subjected to analysis, and were found to contain above 18 per cent. of phosphate of lime. If this limestone is burned and brought in that state to the fields, it must be a perfect substitute for bones, the efficacy of which as a manure does not depend, as has been generally but erroneously supposed, upon the nitrogenised matter which they contain, but on their phosphate of lime. The osseous breccia found in many parts of England deserves especial attention, as it is highly probable that in a short time it will become an important article of commerce. What a curious and interesting subject for contemplation! In the remains of an extinct animal world, England is to find the means of increasing her wealth in agricultural produce, as she has already found the great support of her manufacturing industry in fossil fuel,—the preserved matter of primeval forests,—the remains of a vegetable world."

We quote this passage for the sake of showing the vivid style of the author, and not because we quite concur in Prof. Liebig's anticipations concerning coprolithes, whose value is probably exaggerated.

From these we turn to other considerations. It will be remembered that in former editions the author adopted, as a proved fact, the theory of excrementitious deposits by plants, and even went so far as to assert that it was a necessary consequence of their secreting power that excrementitious matters should be formed. We and others have pointed out the objections that must be taken to these views; and upon turning over the pages of this new edition we at first believed that they had been quietly abandoned. We find, however, at p. 75, that the accuracy of Macaire Prinsep's views is still unquestioned, at least in part. In this instance Dr Liebig relies upon the following case:—

"Let us," he says "consider the composition of the ashes of two Fir-trees as analysed by an acute and most accurate chemist. One of these grew in Norway, on a soil of invariable composition, but to which soluble salts and particularly common salt, were conveyed in great quantity by rain-water. How did it happen that its ashes contained no appreciable trace of salt, although we are certain that its roots must have absorbed it after every shower?"

"We can explain the absence of salt in this case by means of the direct and positive observations referred to, which have shown that plants have the power of returning to the soil all substances unnecessary to their existence."

But to our apprehension there must either be some error in these analyses, or the trees never could have

absorbed any salt. For if they had ever taken it up, there must have been some portion remaining at the time when they were felled. It strikes us that this case proves too much.

But if the old theory of vegetable excrements be virtually abandoned, or limited to the extrication of oxygen (p. 170) we have a new one, which is not a little curious. Professor Liebig considers bark a kind of excrement. To avoid the suspicion of misrepresentation we quote his words:—

"These barks are in so far true excrements, that they arise from living plants, and play no further part in their vital functions; they may even be removed from them, without thereby endangering their existence. It is known that certain trees throw off annually their barks: this circumstance, viewed in its proper light, shows that, during the formation of certain products formed by the vital processes, materials arise which are incapable of experiencing a further change.

"There is every reason to believe that this separation takes place over the whole surface; it is observed not only on the stem but also on the smallest twigs; and hence we must conclude that the same excretory process goes on in the roots."

We will not set about seriously refuting this strange hallucination, but content ourselves with asking whether scurfskin, the points of our hairs, the ends of our nails, or the slough of a snake are excrements?

We had hoped that Professor Mohl had put an end to the folly of asserting that dryness of the soil is of no consequence to plants when matured; that is, we suppose, when the fruit is ripened. We are, however, mistaken. Professor Liebig maintains this opinion with as much pertinacity as if there was not a tree or bush within a hundred miles of Giessen:—

"When a plant is quite matured, and when the organs by which it obtains food from the atmosphere are formed, the carbonic acid of the soil is no further required.

"Deficiency of moisture in the soil, or its complete dryness, does not now check the growth of a plant, provided it receives from the dew and from the atmosphere as much as is requisite for the process of assimilation. During the heat of summer it derives its carbon exclusively from the atmosphere."

It seems useless to put him right upon such points, for he does not appear to be acquainted with some of the commonest facts connected with vegetable life. We shall therefore dismiss the subject for the present without further comment, in the hope that with time this learned chemist may become sensible of such errors as this, and his speculations about lactescent plants, which he still maintains have their moisture secured from evaporation by a coating of caoutchouc and wax, which surrounds them by a waterproof envelope!!

The Almanacs of Farming and Gardening.—The approach of another year reminds us of these little productions. Two Gardeners' Almanacs are before us: Johnson's, published by the company of Stationers, is a useful publication of 96 closely-printed pages, filled with all sorts of information relating to Horticulture; Glenny's is a sort of Florists' Calendar, very trashy, very dear, and chiefly intended as a puff of "The Gardener," a book containing a greater mass of ignorance than any work that we are acquainted with. The author tells his readers (p. 20) that "if the ground be hard frozen the seed cannot be sown;" that tender annuals may be planted out at the end of April (p. 27); that *Chrysanthemums* are the most "untidy of all our flowers" (p. 34); that when stone fruit-trees are budded in July the stocks are to be cut down to within a few inches of the ground (p. 34), and so on. Of the Farmers' Almanacs that by Johnson and Shaw contains 100 pages of very closely-printed matter, besides as much more of extremely useful advertisements. We need not say that such a companion is invaluable to a farmer. The British Farmers' Almanac has 96 pages, more loosely printed, and 16 pages of miscellaneous advertisements; it contains two calendars, one for farmers, the other for gardeners, and the usual information concerning fairs, tariff, &c.

Theorie der Gärtnerei, von John Lindley. (Lindley's Theory of Horticulture.) 8vo. Vienna. 1842.

(Continued from page 743.)

Page 131.—If the majority of contrivances for the purpose of warming plant-houses be examined, it will be found that through the warm air they engender during severe and enduring cold, they produce no other effects than are often seen to take place by removing plants after exposure to a severe winter into one of these deficiently-warmed greenhouses. The foliage of such plants is often less interesting than that of the plants in a well-preserved Herbarium.

Page 131.—"Figure B represents a rain-gauge. A copper funnel, *a*, which has an opening below of a quarter of an inch in diameter, is fastened upon a cylindrical tube, *b*. At the side of this a glass-tube, *c*, is placed, which communicates with it below, and has a graduated scale attached. It is evident that any water will stand in the two tubes at the same height, and will be measured by the graduated scale. Enough water is then poured into the funnel to rise above the brass ring which fastens the glass tube just above the cock, and this will form the zero point of the scale. The diameter of the rim of the funnel being

Fig. B.

known, a quantity of water that would occupy the same surface for an inch in height must be poured into the funnel, and the height at which it stands in the glass tube will indicate the height at which an inch of fallen rain would stand in the instrument, and must accordingly be marked off on the scale. The same quantity of water should be added again and again, in order to mark off on the scale several inches. As the diameter of the tube is small compared with that of the funnel, the water rises several inches in the tube, and by this means many subdivisions of the inch may be easily made. When the scale is constructed in this way, it is of little importance what the form of the funnel is, as the relative depth of the rain is measured, and not the actual quantity. This apparatus rests upon a tripod, which should be fastened to the ground, so that the wind may not turn it over. The edge of the funnel should stand horizontal, and the opening of it should be small, in order to prevent a rapid evaporation of the water, as the true quantity of the rain should be ascertained independent of external circumstances. The best way is to measure off the water as soon as convenient after rain, reducing the quantity of it to the point marked zero in the scale before alluded to.

Page 132.—"It is through the wind that the moisture of plants and the earth is constantly borne away, and thus the evaporation of plants is increased, for no still damp air, as is the case in a calm, surrounds plants.

Page 135.—"Shades over plants recently transplanted not only prevent evaporation from the plant, but they also prevent the moisture of the soil being carried away.

Page 141.—"In the case of plants covered with thatched hurdles, it should be borne in mind that the material used for covering absorbs heat during the day, and produces an increased temperature by offering a resistance to the influence of the cold air, by radiating the heat immediately the sun is away. The heat also thus absorbed will be communicated to the covered plant, as there must always be a tendency to a balance of temperature between the covered and covering body.

Page 141.—"We find it very advantageous, during the winter, to surround those plants which grow on grass with leaf-earth (Lauberde) to the extent of about six inches in height and twelve inches in breadth.

Page 142.—"In a climate such as ours, (Vienna,) where frost and rime so often appear before or at the time of the flowering of our fruit-trees, it would be a senseless experiment to endeavour to force the blossoms by blackening the walls. In many parts of the country, branches of the Coniferae are employed as a means of covering against the severe frosts at the beginning of the winter, and are continued till the time of the disappearance of frost and rime. The longer permanent rest and the greater power of the sun's rays soon remove the resulting interruption.

Page 143.—The expression, 30° Fahrenheit, as stated in the original, can only be regarded as an error of the press. (The translator has altered it in the text of the work to 3° Reaumur.)

(To be continued.)

THE NATURALIST'S CORNER.

(Continued from page 808.)

66. *Impurities of Water corrected.*—The use of certain plants and vegetable juices in correcting the bad qualities of water admits of ample illustration. It is understood that the original inducement of the Chinese to the use of tea was for the purpose of correcting the bad qualities of their water; and our early colonists in America infused in the water, for the same purpose, the branches of *Sassafras*. Niebuhr, speaking of the Nile, observes, "The water is always somewhat muddy, but by rubbing with bitter almonds, prepared in a particular manner, the earthen jars in which it is kept, this water is rendered clear, light, and salutary." Roberts, in his "Oriental Illustrations," has some interesting observations concerning the practices of the Hindoos with reference to this subject. He informs us that the brackish water in the neighbourhood of the salt-pans, or of the sea, is often corrected by the natives throwing into it the wood called *Perru-Nelli* (*Phyllanthus emblica*); and should the water be very bad, the well is lined with planks cut out of this tree. He adds—"In swampy grounds, or where there has not been rain for any long time, the water is often muddy and very unwholesome. But Providence has again been bountiful, by giving to the people the *Teatta maram* (*Strychnos potatorum*). All who live in the neighbourhood of such water, or who have to travel where it is, always carry a supply of the nuts of this tree. They grind one or two of them on the side of an earthen vessel; the water is then poured in, and the impurities soon subside."

67. *Darnel.*—The *Lolium temulentum*, or Darnel, is remarkable as being the only well-authenticated instance of a plant belonging to the order of Grasses in which narcotic or even deleterious properties have been found. The grains are said to produce intoxication in man, beasts, and birds, and to bring on fatal convulsions. According to Christison, Darnel, when mixed with flour and made into bread, has been known to produce headache, giddiness, somnolency, delirium, convulsions, paralysis, and even death. Some years ago, the same author tells us almost all the inmates of the Sheffield workhouse were attacked with symptoms supposed to be produced by their Oatmeal having been accidentally adulterated with *Lolium*; and a case is on record of a farmer, near Poitiers, in France, having killed himself by persevering in the use of Darnel flour for making bread. His wife and servant, who discontinued to eat it, escaped, but were violently affected with vomiting and purging.

CALENDAR OF OPERATIONS for the ensuing week.

For some years I have entertained views on early forcing Grapes at variance with common practice, without the oppor-

tunity of putting them to the test. I offer them, therefore, by way of suggestion only. For reasons which I shall mention below, I have come to the conclusion that from the middle of November to Christmas—the usual time to begin to force the early Vinery—is the worst time of the season for that purpose, as, although the mean temperature of our climate during the six weeks preceding Christmas is somewhat higher than for the same period immediately following, the mean excitability of the Vine—if the term be proper—is lowest during the former period, and therefore more difficult to put in action. The solar influence is also less powerful at that time; but the greatest objection will be found in the comparatively short time allowed for the plants to ripen a crop, when Grapes are wanted in March or early in April, and thus compelling the gardener to depart from natural laws, by keeping up a high temperature day and night after the fruit is set. There are those, it is true, who maintain that Grapes will ripen as soon with a low night temperature in winter as when a contrary course is pursued; but this is a delusion, and the question therefore resolves itself thus:—You must either take more time to mature a crop, or violate the first law of nature in respect to vegetable life. In the latter case you obtain your end at a great sacrifice to the Vine, which, although proverbial for its capacity to suit itself to particular circumstances, will some day, under this mismanagement, reach the point where “the last feather breaks the back.” It will be recollected that I lately mentioned a case which occurred many years since, where the Vines of an early Vinery broke into leaf early in September, and also a similar case which took place this autumn, but not quite so early. As far as I recollect, there was a fair crop ripened in the former house in February, and my friend, whose Grapes were all set before the middle of last month, expects equal success. These are the only instances that I recollect where a Vinery has been forced at that early season; but I have little doubt that this is the best time to begin to force Vines that are expected to ripen their fruit any time in April. If I had suggested this course at the proper time—say about the middle of September—would have defeated my object, as some would have been bold enough to have tried the experiment at once, which would have been certain to fail in some measure. Vines must be gradually prepared for this early growth; say, those that have been accustomed to grow about Christmas ought this season to be put in motion now, and after the crop is gathered next May, keep the house close, in order to ripen the wood early; these might be forced again from the beginning of next November; the following season a month earlier, and the third season from the middle of September, which is the period I would suggest as the best to begin for the earliest crop. When the Vines are once brought to this early state, they will afterwards move at the accustomed time with less artificial heat, and with greater certainty, than will those forced at this late dull season; indeed you may calculate, on the average of seasons, to get them into full leaf before the fire is lighted. The border is then warmed throughout by the summer heat, and therefore in a better condition for the roots than it can be at any other period till the following summer. This of itself would be a sufficient reason for the change I anticipate. These are not hasty conclusions taken up to make a paragraph for the Calendar; I submitted them lately to some friends well versed in the subject, and I wish I had room to give their opinions in detail, instead of engrafting them with my own. I should much wish to hear the opinions of old practitioners on the subject.

I.—KITCHEN-GARDEN AND ORCHARD.

In-door Department.

PINERY.—With any of the ordinary means of keeping up the heat there will be no difficulty in managing the surface temperature in Pine-stoves in winter. I wish I could say as much about the bottom-heat. I can at this moment see in my mind's eye long ranges of Pines planted out on prepared beds, over shallow tanks of water, with here and there an old bark-bed, the thermometer placed over the centre of the tanks, and the attendant looking on like an engineer, conscious of his full command over the simple machinery, giving a little more heat here and taking off some there, and regulating the whole with precision. The toils of a long life are nothing to the pleasure of anticipating such a state of things.

VINERY.—A friend writes, in reference to the proposed plan of starting the first Vinery two months earlier than usual, thus:—“I suppose the greatest benefit you expect to derive from this early forcing is the greater length of time the plants would have to ripen the crop;” just so, and this greater length of time will allow you to let down the night temperature, as it does naturally where the Vine is at home, in the warm valleys of Syria, instead of being kept up between 60° and 70°, as I have often seen it. But suppose you were to ripen the fruit in a shorter time, as at present, the fact that the border being about the same temperature as the mean temperature in the Vinery at that time is of itself of equal weight. Then the border would have to be covered earlier with some dry material, which would throw off the wet, and thus render it capable of retaining its heat to a longer period. But let us hear what can be urged on the other side of the question.

PEACH-HOUSE.—The last paragraph reminds me that the outside borders of the Peach-house should now be well covered with dry leaves or litter.

MUSHROOM-HOUSE.—As this house requires stronger fires now, you had better keep it more moist, if you are in a hurry with them, and can keep up the atmosphere to saturation; it is astonishing the heat they will stand. In rearranging some of our buildings here lately, our old Mushroom-house had to be taken down without previous notice, thus cutting off our supply at a time when we most wanted them. A new house was erected forthwith; a bed or two made up and spawned at once, the temperature varying from 70° to 90°, with as much moisture as the air would take up, and in less than six weeks we had no want of Mushrooms; after that the heat was let down to 60°, at which it will be kept through the winter.

Out-door Department.

Among the various operations now going on in the Kitchen-garden we must not overlook our spring Broccoli; they have been growing luxuriantly all along, and although they seldom suffer from frost until after the middle of January, they had better now, or very soon, be laid down—as we call it—with their heads towards the north. Whether it is from the check they thus receive, or from being less exposed, or from both, I know not; but they are much safer this way than left standing. As for digging and trenching, making new beds, borders, or walks, every one will be guided rather by particular circumstances than by a Calendar.

Orchard.—I do not know of anything very particular to mention here; but there is a great deal to be done in this department for all that. I was at Chatsworth about three years since, and I saw among other things that Mr. Paxton had trained up some Currant-trees with clean stems about 4ft. high, and their tops looked like the heads of standard Roses. I thought they looked very pretty, and that I might as well have some too; so when we pruned the bushes about this time, we made short cuttings of the middle part of the shoots, with only two eyes at top, and planted them in a very rich bed in a shaded place, watered them well next summer, and some of them were long enough for standards the first season, and all of them the following one. The reason for discarding the bottom of the shoots is, that many latent eyes are formed there which you cannot see to pick out, but which would push afterwards in the shape of suckers; the two eyes were left in case one should fail, but only the strongest shoot was allowed to grow, and the cutting was made short that the shoot might grow from the surface of the ground, and thus look clean and straight all the way up, which could not be the case if the cutting was long out of the ground, because the young shoot would form a “knee” with the top of the cutting.

II.—FLOWER-GARDEN AND SHRUBBERY.

In-door Department.

STOVE.—A correspondent who is afraid that the heat necessary for his Nepenthes distillatoria will be too much for his other stove-plants, need entertain no such fears; this very curious plant, if at all well established, will do well enough in winter with any degree of heat at night, from 50° to 60°, and not more than 60°, with fire-heat; but when a fine day occurs, the sun-heat may be allowed to raise the temperature to 80°, without doing any harm. “I can, if you think it necessary, place it in the meantime under a hand-glass, and in March give it a good bottom-heat;” no one could do better than this with it. The hand-glass will keep the air more uniform and moist about it; but see that no drops fall on the leaves. The first time you come to London procure admittance to Mr. Rucker's collection, and you will see this plant grown to perfection.

GREENHOUSE.—The late mild damp weather has been a trying time for delicate young plants here, and fires have been in requisition several times for a few hours in the middle of the day. Who would not strain a point to have such command over his heating-apparatus as Mr. Beck has with his close-covered tank under his greenhouse-stage, and here also the depth of water is within a fraction of what I recommended for that sized tank almost at random, and the heat of the water too from 120° to 130°, which keeps his stove to 70°, with a frost of 12°, would surely keep 2ft. of soil up to 80° or 85° if placed over such a tank. Notwithstanding all that has been said on this very simple subject, there are tanks very deep now being put up in Suffolk.

CONSERVATORY.—The double Roman Narcissus of the shops is the first of the forced bulbs to be in bloom for this house; those who potted them and the Hyacinths early last August will in a few days see them in bloom. Cuttings taken off the tops of Gesnera zebrina after the flower-buds were formed, are also now getting forward to succeed the old plants; and like cuttings of the Hydrangea, similarly treated, flower almost as strong as if left on the parent plant, and as they stand dry heat are excellent little ornaments to the sitting-room. Plants of Euphorbia jacquiniiflora, which I cut down last January, are now coming finely into bloom, six weeks earlier than last year; they also stand dry heat, and will do in a sitting-room for two months. I have just pruned others of them which will perhaps flower a month earlier than this next year. Moss Roses will soon be in, the mildness of the last two months was in their favour, as they dislike strong fire-heat; this is the time to test the best stock to graft Roses on for forcing. Dog Roses make slow stocks compared with the old China or Boursault; but of course to begin in January or February to force Roses, they will do well enough on any stock, and with little forcing.—D. Beaton, Shrubland Park Gardens, Ipswich.

State of the Weather near London for the week ending Nov. 30, 1843, as observed at the Horticultural Garden, Chiswick.

The highest temperature occurred on the 5th, in 1827, and 7th, in 1838—therm. 58°; and the lowest on the 3d, in 1840,—thermometer 22°.

REPORT ON COVENT-GARDEN MARKET,

For the Week ending Dec. 1, 1843.

The weather during the week has been very steady, and the market has, in general, been pretty well supplied; but trade continues dull. Pine-apples are good and plentiful, and bring nearly the same prices as last week. The supply of hothouse Grapes is rather short, but good Portuguese ones are abundant. Apples of good quality are scarcer, and the trade for inferior sorts is bad: a few good Blenheim Oranges are to be seen, and are selling at from 4s. to 6s. per bushel; we likewise noticed a few Golden Pippins of good quality, these bring from 7s. to 10s. 6d. per bushel. Pears are selling at nearly the same prices as last week, and consist of the same kinds. Spanish Melons are still brought to the market, and bring from 1s. 6d. to 2s. each. Vegetables of almost every kind are good and plentiful. Cabbages and Broccoli are very fine, and quite sufficient to meet the demand. Brussels Sprouts are plentiful, and Leeks and Onions of good quality are abundant, as are also Celery, Endive, and other salading. Sea-kale and Asparagus have this week made their appearance in the market, but only in small quantities; the former is selling at from 2s. to 3s. 6d. per punnet. A considerable quantity of excellent Horse-radish has been imported from Hamburg and brought to the market during the week. Cardoons are selling at from 1s. to 1s. 6d. each; they are very small. Among Cut Flowers we noticed Erica hyemalis and gracilis, Epiphyllum truncatum, Luculia gratissima, Bignonia venusta, Napolitan Violets, Chrysanthemums, Camellias, Pelargoniums, Primulas, Verbenas, Cinerarias, China and Perpetual Roses.

PRICES, SATURDAY, December 2, 1843.—FRUITS.
Pine Apple, per lb., 3s. 6d. to 7s.
Grapes, hothouse, per lb., 2s. to 4s.
“Portuguese, per lb., 3d. to 4s.
Melons, Spanish, each, 1s. 6d. to 3s.
Apples, dessert, p. bush., 4s. to 10s.
“Kitchen, p. bush., 3s. to 6s.
Pears, per half-sieve, 3s. to 12s.
Oranges, per dozen, 4s. to 2s.
Lemons, per doz., 1s. to 2s.
“per 100, 6s. to 14s.
Pomegranates, per doz., 3s. to 6s.
Green Capsicums, per 100, 1s. to 2s.

VEGETABLES.
Broccoli, per bundle, 6d. to 1s. 6d.
Brussels' Sprouts, per hf. sv., 1s. to 2s.
Cabbages, per doz., 6d. to 1s.
Greens, per doz., 1s. 6d. to 2s. 6d.
Cauliflowers, per dozen, 1s. to 4s.
Potatoes, per ton, 40s. to 75s.
“per cwt., 2s. to 4s.
“per bushel, 1s. 6d. to 2s. 6d.
Kidney, p. bush., 2s. to 3s. 6d.
Turnips, per doz. bunches, 1s. to 2s.
Red Beet, per dozen, 9d. to 1s.
Horse Radish, per bundle, 1s. to 5s.
Radish, spring, p. doz. hands, 1s.
Carrots, p. doz. bunches, 2s. to 5s.
Spinach, per sieve, 9d. to 1s.
Lettuce, per doz. bunches, 1s. to 1s. 6d.
Garlic, per lb., 6d. to 9d.
Onions, Spring p. doz. bunches, 2s. to 3s.
“Large, per bushel, 2s. to 3s.

Notices to Correspondents.

MR. PAXTON'S COTTAGER'S CALENDAR.—At the earnest solicitation of many of our Subscribers, we have determined on again reprinting Mr. Paxton's “Cottager's Calendar,” in the form of a small volume, for general distribution, price 3d. each copy. It may be ordered of all booksellers. Gentlemen wishing to distribute copies among their cottage tenants, may have them delivered in any part of London, by remitting a post-office order to this office, at the rate of 5s. for every 25 copies.

COMMUNICATIONS from the following CORRESPONDENTS are in type, and are only waiting till room can be found for them:—J. L., B. Maund, Bromsgrove; Tyro, Tokky, Peter Mackenzie, O., Quercus, George Bishop, Atlas, W. G. S., C., Facile, G. G. Watson, W. P. Ayres, A Practical Man, Nemo, S. C., E. C., and W. B. Booth.

ASPARAGUS.—M. C.—There cannot be any connection between the salt you have employed and the pools of water you describe. Why not drain off the latter? that certainly ought to be done.

BOOKS.—G. H. B.—There is a new edition of “London's Encyclopædia of Plants,” and a supplement, published a year or two ago. The price, we believe, is five guineas, or thereabouts.

BROCCOLI.—W. Nightingale.—An excellent hardy Broccoli to stand the winter may be Knight's Protecting. The Walcheren Broccoli is like a good large Cauliflower. You have probably been deceived by the Nurserymen.

CARNATIONS.—O.—In addition to the usual soil employ a little superphosphate of lime, which, if you cannot get it at Leeds, you may make by moistening burnt bones with oil of vitriol. This will probably give your seedling Carnations a better start than anything else.

CHRYSANTHEMUMS.—E. A. C.—We will tell you all about these before long.

CLIMATE.—Jean Baptiste.—We have no English books that will assist you. Our authors of course turn their attention to our own climate. It is possible that you may find in Canada what you want. As to protecting plants, there is no possibility of doing so in the absence of fire. Such a pit as is represented at p. 659, substituting hot-water pipes, or smoke flues for the gutters, and having the sides protected by a thick bank of earth, would do very well.

CONSERVATORY PLANTS.—J. R.—No plant will do well with so little as nine inches of soil, if it is to cover a large wall. If you increase the earth sufficiently you may take a Benthamia fragifera, or Luculia gratissima, or Hardenbergia macrophylla.

CUCUMBERS.—D. M. W.—You may give your Cucumbers a bottom-heat of about 80°, and the atmosphere of the pit may be nearly the same.

DRAINS.—A Gardener.—Form a regular drain at bottom—tile if you please; then fill it up with stones, keeping the larger nearest the bottom—those below the surface should not be larger than a pigeon's egg.

FLORISTS' FLOWERS.—Manchester, St. Clare, T. L., Polyphemus, and others.—We really cannot oblige you by inserting your letters. We invariably exclude all correspondence containing personalities. A common slanderer is beneath any man's notice. Follow our example, and treat him with contempt. A scurrilous writer is like a baby beating a drum, who only continues the amusement for the sake of the noise he produces; stop the sound, prevent the drum's replying, and the child blubbers, and is quiet. The Americans are not the only people who cannot understand the connexion “between character and Carnations.” There have always been persons—

“Upon whose tongue continual slanders ride,
The which in every language they pronounce,
Stuffing the ears of men with false reports.”

For “Scandal is a pipe

Blown by surmises, jealousies, conjectures,
And of so easy and so plain a stop
That the blunt monster with uncounted heads,
The still discordant multitude,
Can play upon it.”

It is a trade that requires no capital, and is only followed by those who are not scrupulous how they get on, provided they do succeed, which is not always the case. It is a base coin that only passes current among thimble-riggers, and, like flash notes, is a kind of paper that honest men will not touch.

FRUIT-TREES.—A Subscriber has no cause to fear bad effects from the wash he mentions, if the leaves have fallen from the trees; but it would destroy the foliage.—J. M.—Spirits of Tar will injure the shoots of your trees. Better apply ammoniacal liquor, adding 10 parts of water to 1 of the liquor.

GRAPES.—D. R.—The fruit of your Chasselas Musqué being liable to crack, you must not keep the roots so dry as you have been in the habit of doing; on the contrary, it must have a regular supply of water until the fruit begins to ripen.

GREEN TEA.—A Teetotaller need not make himself unhappy; there is no “death in his pot.” The story of Green Tea being coloured by some preparation of copper is untrue. Its colour is natural to it. Some bad sorts of Tea have had a green appearance given them by means of indigo and other substances, but that kind of fraud will be immediately detected by the colour of the infusion.

GUANO.—B. T.—Guano is an excellent manure, and will no doubt do well to be dug into a border about the roots of Gooseberries and fruit-trees; but it must be well mixed with six or seven times its bulk of ashes or peat, or soil of some kind, as it is of a hot burning nature, and for this reason it should be applied in wet weather, as a top-dressing for grass-land, or it will burn the grass. About 4 cwt. per acre will be sufficient for garden purposes.

INSECTS.—J. W.—Much obliged by your recipe; but what on earth is Sowder Rhododendron?—H. T.—The disease affecting the Azaleas appears to be a resinous exudation, forming pitchy globules upon the pubescence scattered over the leaves, especially the underside. We know of no remedy; may it not arise from the plants being subjected to too high and dry a temperature?—G. L. H.—Thanks for the leaves containing the pupæ of a fly; we hope now to breed some and determine the species. R.—A Young Gardener.—The insect which injures your Vine-leaves is the Thrips adonidum, a very troublesome species in hot-houses; it is described in the Gard. Chron., vol. i., p. 223, where the best mode of extirpation is given.

—D. R.—We could find no insect upon the Pear, and as it was not stated whether it was the flesh or the skin that had been infested, we did not know where to search for the enemy. This variety of Pear has not ripened well anywhere we believe this season. R.—If A Young Millster will do us the favour to send a pill-box full of the infested malt, containing the insects feeding upon it, we shall be better enabled to advise him on the subject. R.

IPOMOPSIS ELEGANS.—Veronica.—This plant is very impatient of cultivation, being apt to die off without apparent cause, about the time of its flowering. It is a perennial, but owing to this cause it seldom survives beyond two years, and hence it has been considered by some to be biennial. It thrives best in a damp soil under a south wall, and it will not live in peat or light soil.

LILIES.—A. K.—Treat your Guernsey Lily like a greenhouse bulb, giving it plenty of light, and cherishing its leaves as long as they are green. Turn the Belladonna out in a warm south border, planting it six inches deep, and protecting it from frost for this season. It will not require protection afterwards.

MANETTIA GLABRA.—M. G.—You had better not cut down your plants of Manettia glabra; they will, in all probability, flower with you if you can by any means check their over-luxuriant growth; whatever does this without injuring the health of the plant will give them a disposition to bloom. Keeping them pretty dry for a time has sometimes that effect. Your straggling plants of Epacris maybe cut down with advantage after they have flowered early in spring, and even after they have

commenced growing the young tops may be pinched off, as this will make them dwarf and bushy. †

MANURE.—A. S.—Your plant is *Zostera marina*. Throw it in heaps with fish, or any other animal sea-refuse, and get them to putrify together. It will then give way, and when rotten, will doubtless prove useful manure. If you cannot do this, burn it and use the ashes.

MELON SEEDS.—D. R.—You will very likely obtain Melon seeds correct from respectable Nurserymen; for such will be careful that their supply is truly saved. †

NAMES OF FRUIT.—An Old Subscriber.—Pears.—1, 5, Beurré Diel; 2, Brown Beurré; 6, Winter Nelis; 7, Chaumontel; 8, 16, Glout Moreau; 9, Easter Beurré; 15, 17, St. Germain; 18, 21, Easter Bergamot; 20, Catillac; the large, long, stewing Pear, and the Uvedale's St. Germain. Apples.—1, 2, New Golden Pippin; 4, 24, Reinette du Canada; 5, Cat's-head; 7, Blenheim Pippin; 9, and one of those marked 19, Beauty of Kent; 11, Hollandbury; 12, Birmingham Pippin; 14, Court of Wick; 16, 17, Golden Russet; 18, Golden Reinette. †—D. R.—1, Frangipane; 2, Beurré Bosc; 3, 5, 9, Beurré Diel; 4, 7, Glout Moreau; 8, Passe Colmar; 10, Winter Nelis; 12, Swan's Egg. †—B. F.—Six good Apples may be Sturmer Pippin, Claygate Pearmain, Alfriston, Golden Reinette, Bedfordshire Foundling, and Reinette du Canada. †

NAMES OF PLANTS.—Exoniensis.—One of the Pittosporums is probably *P. umbellatum*, and the other tenuifolium; the Leptospermum may be rupestre; but it is impossible to say positively without seeing them in flower. †—R. Burley.—The Spruce Fir is *Abies excelsa monstrosa*, Arb. Brit., and the same as a large tree in Lord Spencer's Park at Althorp. †—W. Abb.—Not the least like *Aristotelia Macqui*. †—C. D.—Very good specimens of *Cassia* and *Lupinus* are necessary in naming species of those large and very difficult genera. We believe yours to be *Cassia tomentosa* and *Lupinus semperforens*, but we are not certain. The latter may probably be preserved by putting over it a large flower-pot inverted, and thatching it with straw or fern.

OAKS.—T. R.—The common English Oak is better calculated to stand on a high situation exposed to the south-west wind than the Turkey Oak. †

ORANGES.—A Young Gardener.—An Orange may be preserved for a considerable time in a drawer in a dry place. †

ORCHIDACEÆ.—W. F. G. F.—We will comply with your request in a few weeks. No general rules can be given for the management of plants so very different in their habits. †—B. S.—(attorneys and such plants are not parasites, but epiphytes. The first grow *into* plants, the second grow *upon* them. Mistletoe is a parasite—Moss is an epiphyte.

PELAGONIUMS.—H. D.—From your list we select the following to turn out:—Queen Mab, Prima Donna, Lady Nithsdale, Vandyke, Queen Bess, and Queen Victoria; and add to your collection—Matilda, Erectum, Lynes' Duke of Cornwall, Madelina, Garth's Witch, and Priory Queen. †

PITS.—A Subscriber.—A common slanting roof will be most suitable for the turf pit that you intend to construct for the double purpose of a hotbed in spring, and a cold frame for protecting plants in winter. As the subsoil is gravel it will readily carry off water and render it well adapted for that purpose. The walls may be about three feet high in back, and one foot six inches in front, and the plants should stand above the level of the surrounding ground. The Asphalte boxes answer very well for protecting plants in winter; they are provided with a door hung with hinges, and this is kept open in fine weather to admit light and air. The material advertized by Whitney, of Shrewsbury, as a substitute for glass, is close in texture, very transparent, and will no doubt be valuable for many purposes. It seems to be an excellent material for protecting Wall-trees in spring from cold frosty winds; but like every other new article its real value has to be ascertained by experience. †

POND MUD.—D.—You had better see what Sprengel says at p. 524 of our volume of last year. Gas lime is said to be a good manure, but it must be used cautiously, and your plan seems unobjectionable.

PRUNING.—D. M.—You will not find better rules than are laid down in the late Mr. Lindley's "Guide to the Orchard and Kitchen Garden;" but they are very brief. If you want long instructions you had better consult Loudon's "Suburban Horticulturist."

RASPBERRIES.—J. N.—A good well-flavoured Raspberry may be the Red Antwerp. After they are planted they should be cut down to within 6 inches of the ground, and this will strengthen the canes in the following season. †

SEEDLING CACTI.—R. M.—Your flowers are so much smashed that we can say nothing about them that would be of use to you.

SEEDS.—A Gardener Subscriber.—Your Mammoth Squash, Winter Squash, and Nutmeg Melon seeds should be managed like those of Gourds or Melons. We are not acquainted with the Canadian Cotton and Rattle-Snake weed. †—H. D.—A period of at least three years would elapse between the sowing, next spring, of seeds of *Tigridia Pavonia* and their blooming. †

SEQUELADIAN WORDS.—J. C.—We quite agree with you, and wish most sincerely that our Correspondents would write plain English instead of fine words which nobody can understand. As it is we are obliged to take great liberties with many communications before they see the light. You must not, however, measure gardeners by a literary standard. While the language and ideas of literary men are what command attention, we look only to facts in the communications of plain practical men. We will endeavour to find room for the letter you are so kind as to mention, and may perhaps return to this subject.

SHRUBS.—G. P.—The following hardy flowering shrubs and small trees are suitable for a border. They should be planted at the following distances apart, viz.—Those for the front may be planted about 4 feet apart, and may consist of the following: *Berberis aquifolium* and *duclis*, *Cytisus purpureus* and varieties, *Cotoneaster rotundifolia*, *Daphne cneorum*, *Pyrus floribunda*, *Rhododendrons*, *Kalmias*, and *Azaleas*. The following are for the middle, and may be planted about 8 feet apart: *Magnolia purpurea* and *conspicua*, *Spiræa arifolia*, *Ribes sanguineum* and *aureum*, *Philadelphus Gordonianus*, *Deutzia scabra*, *Persian Lilac*, *Laurustinus*, *Garrya elliptica*, *Arbutus*, Spanish Broom, *Hibiscus syriacus*. Those in the back part of the border may be about 12 or 15 feet apart, and may be—*Laburnum*, *Gueluer Rose*, *Pyrus spectabilis*, *New Scarlet Thorn* (double and single), *Elæagnus fusca*, *Double French Cherry*, *Cornus mascula*, *Cotoneaster frigida*, *Rose Acacia*, and *Common Almond*. †

SOILS.—A Subscriber.—Coal-ashes are not very valuable as a manure. They are applied to stiff clayey soils in order to render them more porous and open. The quantity of tannin Oak leaves contain has led to the opinion, which is not without foundation, that they are injurious to soil; but they soon decompose if fermented with hot dung or charred. †

STALL-FEEDING.—Winkfull.—The subject referred to by our Correspondent is one to which we may probably hereafter return. In the meantime we may safely advise that, where practicable, all milch cows should now be taken wholly under shelter and foddered in stalls or yards. This would be better for the cows, and certainly very much better at this season for the fields, than the plan of putting them into the meadows during the day and taking them in at night. A milch cow will generally consume nearly 2 cwt. of good hay a week, when kept wholly on hay, under shelter; and under the plan of partial stall-feeding suggested by our Correspondent, it would eat from 80 to 100 lbs. of hay in the same time, the actual quantity depending on the condition of the pasture on which she was turned during the day. Mangold Wurtzel must be given with caution at this season, indeed it ought not to be given at all till the spring, when it will have become somewhat less juicy. In the only case we know of in which the experiment has been

tried, the consumption of hay by milch cows was diminished by the substitution of Mangold Wurtzel, in the proportion of 1 lb. of the former for every 5 lbs. of the latter.

TORTOISES.—Clericus.—Will any Correspondent who is a naturalist inform us whether it is necessary to give any protection to a Tortoise which has not yet buried itself, and which seems unable to do so from the hardness of the ground where it has commenced operations, near the matted roots of an old Vine?

VINES.—D. L.—Your Vines that are trained up the rafters of a greenhouse may be pruned with advantage now. If the wood is well ripened it will be firm and hard, but if not there will be little chance of it becoming so now, at this late season. †

B. F.—If the roots of your Vines are deep it will undoubtedly be advisable to raise them nearer the surface; but except you pave the bottom of your border this will be of little service, as the roots will soon begin to seek down, and will again penetrate the bad subsoil. The old loose bark should be peeled off, and the weak spray may be cut out with advantage now. †

WARD'S CASES.—W. F.—Any plants will succeed in these contrivances under good management, provided they do not grow too large. Everything depends on their management and a correct appreciation of their principle. Some ignorant persons fancy they must be air-tight, which is absurd and impossible. You should read Mr. Ward's pamphlet on the subject. Ere long we will give some plans for their construction, and enter fully into the subject. We have seen in these cases *Linnaea borealis*, *Primroses*, *Ferns*, *Geraniums*, *Dentarias*, *Mimulus moschatus*, *Fuchsias*, *Cacti*, *Mosses*, *Camellias*, all sorts of Alpine plants, *Crocuses*, *Hyacinths*, *Azaleas*, *Winter Aconites*, and many more.

WEEDS.—J. B. H.—The weed that infests your field is probably *Allium vineale*. It is a perennial, and is exceedingly difficult to eradicate when once established; but if you continue with patience and perseverance to destroy the foliage whenever it makes its appearance, the result will be certain success. †

MISCELLANEOUS.—A Subscriber.—*Glycine Harrisonii* is the Phæolus caracalla, a beautiful conservatory climber; but it requires room. Nobody knows yet what *G. Backhousiana* is; there is no such plant as *Kennedyia splendens*; *Jasminum azoricum* is worth planting. †—J. C. R.—You must have been cheated by somebody. Scarlet Pelargoniums will not cease to be scarlet when transferred to Italy, neither will double Pinks and Carnations turn to single ones under such circumstances. †—One shilling each will be given for Nos. 9 and 25 for 1841.

ERRATA.—In the account of Mr. Beck's tank-house, p. 820, col. 4, line 15 from top, instead of "it is covered with 1½ inch slate," read "it is covered with ½ inch slate." At p. 822, col. 4, for "from 3 to 9" read "from 3 to 6;" and at p. 823, col. 4, for "twenty millions of frames" read "twenty millions of francs."

NEWS OF THE WEEK.

THE Court of Queen's Bench in Ireland have at length decided that the trial of Mr. O'Connell and his fellow traversers shall commence on the 15th of January. The traversers moved the Court that the trial might be postponed till February, on the ground that such a delay was necessary for the due preparation of the defence, and that the present Jury-list was very imperfect and in process of revision. The Attorney-General regarded as insufficient all the other grounds for postponing the trial, save the imperfection of the Jury-list, but under the circumstances consented to the postponement to the beginning of next Term. The Lord Chief Justice in giving judgment approved of the decision of the Attorney-General, and said the Court were of opinion that the traversers would have abundance of time between this and the 15th January, the day proposed by the Crown for trial, to prepare their defence, and accordingly ordered that day to be appointed for the commencement of the trial.—Her Majesty's progress in the Midland Counties on her visit to Sir R. Peel, the Duke of Devonshire, and the Duke of Rutland is another leading topic of domestic news. The details of the Royal progress will be found in another column and will be read with interest.

From France we learn that the Government have united with England in a determination to abide by the recent revolution in Greece, and to resist the incroachments of Russia in the East. The rumour that Prince Polignac had been ordered to quit Paris is confirmed, and there is no doubt that this summary measure has been suggested by the late remarkable proceedings of the Duc de Bordeaux and his partisans in England.—From Spain we have accounts of the formation of M. Olozaga's Ministry and of the reduction of Barcelona, which took place on the 19th.—The long-pending disputes with Portugal on the subject of the tariff are now finally set at rest by an announcement from the Board of Trade and the Foreign Office that the negotiations were broken off in April last by the Portuguese Government, and have not since been renewed.—The accounts from Italy in the French papers contain a rumour that the Pope is dangerously ill, but as the report has not come direct from Rome it will probably be found to require confirmation.—Advices from Constantinople announce that the President of the Council, Hafz Pacha, has been dismissed, as a satisfaction to England and France for the execution of the unfortunate Armenian, and that Achmet Fethi Pacha, brother-in-law of the Sultan, has been appointed in his stead. From Alexandria we have the important news of the death of Achmet Pacha, the rebellious Governor of Sennaar. Some doubts are entertained as to the cause of his death, but there is no doubt that the event has removed a serious obstacle to the peace of the Ottoman Empire.

Home News.

THE COURT.—The Queen and Prince Albert, accompanied by the Duc and Duchesse de Nemours, arrived at the Paddington terminus of the Great Western Railway by a special train on Saturday morning from Windsor Castle. Prince Albert left the Palace soon after his arrival for the office of the Duchy of Cornwall, in Somer-

set-house, and her Majesty paid a visit to the Duchess of Gloucester. The Duc and Duchesse de Nemours also called on the Duchess, and afterwards went to Cambridge-house to visit the Duke of Cambridge. His Royal Highness also honoured the French Ambassador with a visit. At 3 o'clock the royal party took their departure on their return to Windsor Castle. On Sunday morning the Duc and Duchesse de Nemours, attended by their suite, arrived in town by the Great Western Railway, and went from Paddington to attend mass in the chapel of the French Ambassador. Their Royal Highnesses and suite afterwards left town for Woolwich to embark on board the French steamer *Archimède* for Calais. They were received at Woolwich with the usual honours, and embarked under royal salutes from the batteries and the steamer. The *Archimède* did not leave until 10 o'clock P.M., on account of the state of the tide, and in consequence of the darkness of the night she ran ashore below Gravesend. The French Admiral despatched an officer for the assistance of one of the river steamers, but before she could arrive at the spot the *Archimède* had got off and proceeded on her voyage.—Her Majesty and Prince Albert left Windsor on Tuesday on a visit to the Midland Counties. The particulars of the Royal progress will be found in another column. The Prince of Wales and the Princesses will remain at Windsor Castle during the absence of her Majesty, under the charge of the Dowager Lady Lyttelton. Prior to the departure of the Court Colonel Buckley and Colonel Wyld were succeeded by Major-General Wemyss and Colonel Bouverie, as Equerries in Waiting on her Majesty and the Prince. The Marquess of Ormonde, Sir Robert Otway, the Hon. C. A. Murray, and the Hon. and Rev. C. L. Courtenay, remain at the Castle. It is confidently asserted in the Court circles that her Majesty has expressed her intention of paying a visit to the King of Prussia at Berlin at the end of the approaching London season, and that her Majesty purposes, if circumstances are favourable, to return from Berlin through Paris. The latter event will become still more probable if we may credit the report that King Louis Philippe intends to visit England in two months, and that a steam-yacht is constructing in the French dockyards for the occasion.

Her Majesty's Visit to the Midland Counties.—On Tuesday morning, at 9 o'clock, the Queen and Prince Albert left Windsor Castle for the Watford station of the Birmingham Railway, on their way to Drayton Manor, the seat of Sir R. Peel. The suite consisted of Lady Portman, Lady in Waiting; the Hon. Miss Paget, Maid of Honour; Earl of Jersey, Master of the Horse; Mr. G. E. Anson, Private Secretary to Prince Albert; Major-General Wemyss, her Majesty's Equerry in Waiting; and Colonel Bouverie, Equerry to Prince Albert. The royal party proceeded through Windsor, Eton, and Slough, to Uxbridge, where relays of horses had been stationed, and thence to the Watford station. Her Majesty's punctuality is proverbial, but on the present occasion she arrived nearly half-an-hour before the time appointed. On alighting, her Majesty was received by Mr. Glynn, the chairman of the directors, the deputy-chairman, &c. by whom she was conducted to an elegant apartment appropriately fitted up for the occasion. Her Majesty was looking remarkably well, and wore a satin plaid dress, with black velvet tunic, and an open straw bonnet trimmed with blue. At 20 minutes past 11 all being in readiness, Mr. Bury, the superintendent of the locomotive power, took the direction of the engine, which was gaily decorated, and had a royal standard floating from it. The train then left the station amid the cheering of the crowd, and proceeded at a moderate pace through the tunnel, on emerging from which the speed was increased considerably. Passing King's Langley, Two Waters, and Berkhamstead, in each of which the inhabitants who thronged the road-side vied with each other in the exhibition of their loyalty, the train arrived at the Tring station, where many hundred persons had assembled to greet it. No stoppage however took place, and the royal travellers glided across the beautiful Vale of Aylesbury at the rate of something more than 30 miles an hour. At Leighton the station was decorated with banners bearing appropriate devices, and the line for some distance was crowded with spectators. The train reached Wolverton at half-past twelve, performing the distance of 35 miles in one hour and ten minutes. At this station magnificent preparations had been made, it having been arranged that her Majesty should partake of lunch at this point of the journey. The platform was covered with crimson cloth, and an apartment especially devoted to the use of the Queen was handsomely decorated for the occasion. The directors conducted the Queen and Prince to the apartment, where her Majesty partook of coffee and other refreshments, while a supply of water and coke was taken in. In less than five minutes her Majesty was again seated, having taken occasion in the interval to express to Mr. Glynn her entire approbation of the mode in which the journey had been thus far performed, and remarking upon the perfect ease afforded by the carriage provided for her. The extensive works of the company at Wolverton, which has been entirely colonised since the formation of the railway, were seen by her Majesty to much advantage, and a large number of locomotives with the steam up were ranged along the opposite line. The train left amid the cheering of the assembled crowd. Passing Roade station amid similar marks of loyalty, the train next reached Blisworth, where a company of the 64th Regiment were stationed along the platform. As the train passed the troops presented arms, the band at the same time playing the national anthem. On approaching Weedon, where there is an extensive Military depot, a royal salute was fired from the barrack-ground. The troops were stationed

on either side, and as the train approached the men presented arms, the band playing "God save the Queen." A short stoppage was made at this station, and Prince Albert from the window of the state carriage, entered into conversation with Lieut.-Col. Stretton, the officer commanding the regiment. Various flags and banners were suspended about the station, and an immense crowd of persons were ranged at every point from which a glimpse of the Royal party could be obtained. After the conclusion of the Royal salute the train again proceeded, passing the Crick and Welton station and entering the Kilsby tunnel, shortly after emerging from which the Rugby station was approached. Here also great preparations had been made, but the speed was merely slackened to allow her Majesty the opportunity of seeing the scholars of Rugby-school, who, to the number of 450, under the Rev. Dr. Tait, head master, were stationed on the south platform. The stately spires of Coventry next came in view, and it is no exaggeration to state that at this point 10,000 persons must have been assembled. For upwards of two miles the line on each side was thronged with a multitude of spectators, who testified their loyalty by every possible means as the train glided by. This was the climax of the welcome with which her Majesty was greeted at every point. Proceeding onwards the Royal party reached Hampton station, where the Derby Junction diverges from the Birmingham line, at 20 minutes past 2 P.M., thus performing the distance between Watford and Hampton, 85½ miles, in exactly three hours including stoppages. At this point the directors of the Derby line met her Majesty, and the locomotive belonging to the latter company, supplying the place of that which had brought the train thus far, in less than five minutes the Royal tourists were on their way to Tamworth under the guidance of Mr. Keightley, the resident engineer of the line. This portion of the journey, 15 miles, calls for no remark beyond the fact that the distance was performed in 20 minutes, the Royal carriage being brought to a stand at the Tamworth station at a quarter to 3 o'clock. The station was very tastefully decorated, and covered with crimson cloth, a large number of the resident gentry occupying places on the platform. Sir Robert Peel was in waiting, accompanied by his son, Mr. R. Peel, the Duke of Buccleugh, Lord Talbot, Lord Ingestrie, &c. The ground without the terminus was kept by the Staffordshire Yeomanry Cavalry, under the command of Colonel Monckton, the same regiment lining the road into the town. Upon Her Majesty alighting she was received by Sir R. Peel, with whom she shook hands heartily. Her Majesty also entered into conversation with the Duke of Buccleugh, and resting on Sir R. Peel's arm was conducted down a temporary staircase to the Royal carriage, in waiting for her at the outer entrance. The carriage then proceeded towards the triumphal arch erected at the outskirts of the town, Sir R. Peel, the Duke of Buccleugh and the other noblemen in attendance following on horseback. On reaching the arch alluded to, the mayor of Tamworth Mr. Bremell advanced towards the royal carriage, handing the mace of office to her Majesty. The Queen was pleased to return it with the remark that it could not be in better hands. Loyal addresses on the auspicious occasion of her Majesty's visit to the borough were presented, after which the Royal cortège moved on towards Drayton, passing through the principal streets, all of which were densely crowded with spectators who vociferously cheered her Majesty. No less than four triumphal arches were passed by the Queen in her progress through the town, and on arriving at the Drayton road the royal carriages proceeded at a rapid pace towards the manor-house, where they arrived about half-past three, her Majesty being received by Lady Peel and a circle of distinguished visitors. About half-past five, the eleven o'clock train from London arrived, bringing the Duke of Wellington and the new Bishop of Lichfield, who were invited to join the royal circle at Drayton. The Duke of Wellington travelled the whole distance from town alone in his open britschka, placed on one of the carriage trucks, and also brought his own horses. The same train brought down the Duke of Rutland, who took the Midland Counties line at Rugby, and proceeded to Belvoir Castle to prepare for the reception of the Queen. After dinner, which took place at 8 o'clock, her Majesty inspected Sir R. Peel's valuable collection of statuary and paintings in the library, and retired to rest shortly after 11 o'clock. On Wednesday her Majesty breakfasted at 8 precisely, in her own private apartment. At half-past 9, Prince Albert left on a visit to Birmingham, and at 11, her Majesty went out to walk, accompanied by Lady Peel, the Duchess of Buccleugh, and Miss Paget. Her Majesty walked on the Terrace, and afterwards visited Lady Peel's flower-garden, the farmyard and dairy, and remained in the grounds, apparently much enjoying the fine weather, until nearly 12 o'clock. Prince Albert's visit to Birmingham of course occasioned a general holiday in that town. On arriving at the terminus, the mayor presented an address, after which his Royal Highness inspected the glass manufactory of Messrs. Bacchus, the foundry of Messrs. Muntz, the papier-maché works of Messrs. Gennings and Bettridge, the electro-plating establishment of Messrs. Elkington and Co., the gun and sword-manufactory of Messrs. Sargeant, and the gilt and silver-plated manufactory of Mr. Armfield. His Royal Highness then proceeded to visit the Town-hall and the Free Grammar School, where he had refreshment with the Rev. Mr. Lee. The Prince then inspected the School of Medicine, the Free Grammar School, and the Proof House, where he was received with a discharge of musketry and large guns. His Royal Highness then drove to the railway station, and there met the Queen Dowager, who had come from Witley Court to accompany him to Drayton. The royal party

then started amidst the enthusiastic cheering of the people, who were evidently much delighted with the courtesy of the Prince. The royal party arrived at 3 o'clock, and were received at the Tamworth station by Sir R. Peel, and escorted by the Staffordshire Yeomanry to Drayton Manor. The dinner took place at 8 o'clock, when the Queen, Queen Adelaide, Prince Albert, Prince Edward of Saxe Weimar, and Sir Robert and Lady Peel, with their distinguished visitors, passed from the library and gallery to the dining-room. At the table the Queen sat between Sir R. Peel and the Duke of Buccleugh, Queen Adelaide was on the opposite side of the table, with Prince Albert on her left and the Duke of Wellington on the right. After the healths of her Majesty and Queen Adelaide had been proposed, the company left the dining-room. In accordance with the invariable habits of both Queens, they retired to their private apartments for the night about a quarter-past 11 o'clock. On Thursday the Queen and Prince Albert after breakfasting together took their accustomed walk on the terraces and garden. The Prince, accompanied by Sir Robert Peel, Prince Edward of Saxe Weimar, Duke of Buccleugh, and Mr. Anson, left the Manor shortly after 10 o'clock to shoot over a portion of the demesne, and had very excellent sport. The Prince returned to luncheon about one o'clock. In the course of the morning 2000 poor people sat down to a substantial dinner provided for them at the Town-hall, at which the Mayor presided; and another large party dined at the Castle, with R. Neville, Esq., in the chair. Soon after two o'clock her Majesty and Prince Albert attended by their suites, and accompanied by the Duke of Wellington, Sir R. Peel, and some of the most distinguished guests, left Drayton, for Lichfield. At the different points of the road on the way the country people had collected in numbers, and cheered the Royal party as they passed. Four triumphal arches were erected in different parts of the route through which her Majesty was to pass. The first arch was inscribed, "United for the good of the people," and the houses were very generally decorated with evergreens, festoons, and flags. The Royal party entered Lichfield about 3 o'clock, and were received with the utmost enthusiasm by crowds of people who were assembled to hail their arrival. Her Majesty passed down St. John-street and Bird-street to the Cathedral, where the Dean and the other clerical authorities received her. Her Majesty and the Royal party were then escorted over the Cathedral, and all the most remarkable features were pointed out to her. Her Majesty much admired the celebrated monument by Chantrey, which forms one of the principal objects of interest in the edifice. About a quarter before four the Royal party left Lichfield on their return to Tamworth. Her Majesty, in addition to her escort of the Staffordshire Yeomanry, was attended for some distance by many of the gentlemen of the neighbourhood, on horseback. Her Majesty reached Drayton Manor at a quarter past four o'clock. According to the last arrangements, the Queen and Prince Albert were to leave Tamworth yesterday morning at a quarter-past ten for Chatsworth, and were expected to arrive there to luncheon. The Duke of Wellington, the Duke and Duchess of Buccleugh, and Duke of Rutland, were also to go to Chatsworth to meet her Majesty. The Queen Dowager and Prince Edward of Saxe Weimar also intended to take their departure yesterday for Gopsall Hall, the seat of Earl Howe, near Atherstone, where Her Majesty will remain till Monday morning, and then repair to Belvoir Castle, to meet the Queen and Prince Albert on their arrival at the Duke of Rutland's, from Chatsworth.

The Duchess of Gloucester.—Dr. Hawkins and Mr. Keate are still in attendance on the Duchess. The last report states that her Royal Highness is going on favourably.

The Duc de Bordeaux.—His Royal Highness, after stopping from the 17th to the 22d at Burton Constable, took leave of Sir Clifford and Lady Constable, to pursue his journey to the north. His Royal Highness left Burton on the 22d for Hull, where a special train was in waiting for him. Lord Shrewsbury, Lord Beaumont, Sir Thomas Gage, Sir Clifford and Lady Constable, &c., accompanied the Prince to the station, and took leave of the Royal visitor, who was much cheered by the crowd assembled at the terminus. Shortly after noon his Royal Highness reached York, and inspected the large prison of that town. The Prince, after visiting in succession the remarkable objects in York, left by railroad for Darlington, where his Royal Highness slept. On the 23d he paid a visit to the Duke of Cleveland, at Raby Castle. After spending the day at that ancient edifice, replete with border reminiscences, his Royal Highness went on to Newcastle to pass the night. The greater part of the 24th the Prince passed in inspecting the various glass manufactories. At Mr. Wailes's establishment his Royal Highness was much interested by the specimens of paintings on glass of the middle ages; he then visited in turn the Northumberland Flint Glass Works, those of Mr. Cookson, and the steam sawing apparatus of Messrs. Burnup at the Barras Bridge. On leaving Newcastle the Prince proceeded to Alnwick, the seat of the Duke of Northumberland. The Prince was received at the grand staircase by the Duke of Northumberland, although his Grace was suffering from a recent attack of gout, and confined to his chair. The Duchess of Northumberland was also present at the reception of his Royal Highness, accompanied by the Duke and Duchess of Roxburgh, Lord Strangford, Lord William Graham, Lady Stanley, Lady Walpole, &c. His Royal Highness left Alnwick on Sunday, and reached his residence, 35, Belgrave-square, on Monday evening, and was received on his arrival by M. de Chateaubriand. On Monday upwards of three hundred noblemen, distinguished in France by their rank,

wealth, and social position, assembled to present their respects to the young Prince. His Royal Highness was attended in the grand saloon by the Duc de Levis, the Duc Descars, Admiral Villaret de Joyeuse, M. de Barade, &c. The Hanoverian Minister had the honour of an audience, to deliver a letter from his Sovereign to the Duc de Bordeaux. M. de Chateaubriand first presented all the French in a body, and the Prince Gaston de Montmorency and the Duc de Levis then introduced each gentleman in person to his Royal Highness. M. Berryer presented the deputies who had arrived, namely, the Duc de Valmy, the Marquis de Preigne, and Count Blin de Bourdon. The list of persons presented on this occasion includes some of the most illustrious names in the history of France. The scene is described to have been most affecting. The remembrance of the fate of Louis XVI.—to whom His Royal Highness bears a striking resemblance—the recollection of the death of the Duc de Berry—the circumstances attending the birth of his son—the events of 1830—forced themselves on the attention of all present, and many of them shed tears. On Tuesday and Wednesday numerous noblemen and gentlemen who did not arrive from France in time to do homage to the Prince at his first levee, assembled in Belgrave-square to pay their respects to His Royal Highness.—On Wednesday upwards of three hundred French noblemen assembled at the apartments of M. de Chateaubriand, for the purpose of presenting an address to that venerable author. Having unanimously elected the Duc de Fitzjames as their spokesman, that nobleman addressed M. de Chateaubriand in the following terms:—"Monsieur le Vicomte—After having done homage to the King of France, another duty yet remained for us to perform, and we have now waited upon you to do homage to the royalty of intellect. You have taken your place in the Councils of our Kings, and, alas! you gave them timely advice in the days of their prosperity, and you now come to support by your presence the descendant of Louis the Fourteenth. You have afforded a grand spectacle to mankind. France, which notwithstanding all that has happened is still our country, looks upon your conduct with admiration. She has allowed you to leave her confines, accompanied by the sympathies of her people, because she knows that you had a great duty to perform. In you are centered our fondest hopes. You have lived in bygone times, and will know how to teach us to avoid the rocks and eddies which beset our course, and your genius can pierce through the veil of futurity. Accept the homage of these Frenchmen who have remained through evil report and good report, faithful to their King and country. And I, Sir, the son of your old friend, allow me to express to you the sincere gratification which I feel in having been selected by these gentlemen as their spokesman on this touching occasion." As soon as the Duc de Fitzjames had delivered this address, His Royal Highness the Duc de Bordeaux entered the room. M. de Chateaubriand endeavoured to express his gratitude to the assembled company, but his emotion so thickened his utterance that his remarks were inaudible. The Prince then went up to him and said—"Gentlemen, I heard that you had assembled in the apartments of M. de Chateaubriand, and I was glad to avail myself of this opportunity to return your visit, I feel so supremely happy at finding myself once more in the midst of my countrymen. I love France because it is my native land, and if ever my thoughts have strayed towards the throne of my forefathers it has merely been in the hope that I might be permitted to serve my country with those principles and sentiments which M. de Chateaubriand has so gloriously proclaimed, and which still boasts of so many and such noble defenders in our native land."—A great number of English noblemen and gentlemen have left their names for his Royal Highness during the week. On Friday night the Lord Chancellor and Lady Lyndhurst entertained M. Berryer at dinner. Among those who were present to meet him were the Duke of Wellington, the Earl of Haddington, Lord Wharfedale, Lord Denman, Lord Abinger, the Baron de Maltzahn, the Hanoverian Minister, the Rev. Sydney Smith, &c. M. Berryer left town on Saturday on a visit to Lord Palmerston, but returned to Mivart's on Monday. In passing through Portsmouth M. Berryer went over the Dockyard, every facility having been placed at his command by the Lords of the Admiralty.

Parliamentary Movements.—A rumour has been in circulation for some days that Mr. Emerson Tennent is about to obtain a lucrative appointment in India, and that he will in consequence resign his seat for Belfast.

Diplomatic Appointments.—The Queen has been pleased to appoint Charles Bankhead, Esq., now Secretary of Embassy at Constantinople, to be Minister Plenipotentiary to the Mexican Republic; J. R. Milbanke, Esq., now Secretary of Embassy at Vienna, to be Envoy Extraordinary and Minister Plenipotentiary to the King of Bavaria; the Hon. H. R. C. Wellesley, now Secretary of Legation at Stuttgart, to be Secretary of Embassy at Constantinople; Sir Alex. Malet, Bart., now Secretary of Legation at the Hague, to be Secretary of Embassy at Vienna; D. F. O'Leary, Esq., now Consul at Puerto Cabello, to be Chargé d'Affaires and Consul-General to the Republic of New Granada; and Alexander Macbean, Esq., to be Consul at Leghorn. Her Majesty has also been pleased to direct letters patent to be passed under the Great Seal conferring the honour of Knighthood upon Anthony Perrier, Esq., her Majesty's Consul at Brest.

Colonial Appointments.—The Queen has been pleased to appoint the Rev. F. J. Harrison Rankin to be Chaplain of her Majesty's Settlements in the Gambia.—The appointment of the Chief Judgeship of Wellington, New Zealand, has been conferred upon Mr. H. S. Chapman, of the Inner Temple, who has sailed in company with the new Governor, Captain Fitzroy.—It is the intention of Government to send out to Hong Kong 12

inspectors of police and 12 privates; the general corps to be selected from the natives there. The inspectors are to be allowed 400*l.* per annum.

The Church.—The Bishop of Chichester has presented the Rev. J. Garbett, Professor of Poetry, to a prebendal stall in Chichester Cathedral vacant by the death of the Rev. Dr. Heberden.—It has been reported in certain quarters that the Rev. Dr. Hook, the Vicar of Leeds, recently crossed himself at the altar. Dr. Hook denies the statement in the following letter dated "Vicarage, Leeds, Nov. 15, 1843.—My dear Sir,—You inform me that a report has reached Manchester from a quarter not to be despised that when I was at Leamington the other day I crossed myself at the altar. You will oblige me by having it stated in the quarter referred to, that whoever says I crossed myself at the altar or any other part of the church at Leamington or anywhere else, has told a cool deliberate falsehood. Believe me, &c., W. F. Hook. To the Rev. T. R. Bentley."—The consecration of Dr. Lonsdale as Bishop of Lichfield takes place to-morrow, at Lambeth Palace.

The Scotch Church.—The Queen has been pleased to present the Rev. John Murdoch to the parish of Eyemouth, Berwick, in the room of the Rev. J. Turnbull; the Rev. D. Williamson to the church at Kinloch Likart, Ross, in the room of the Rev. A. Anderson; and the Rev. P. M'Morland to the parish of South Leith, Edinburgh, in the room of the Rev. Dr. Grant, admitted to St. Mary's, Edinburgh.

The Army.—It is stated that the post of Lieutenant-Governor of Chester Castle, vacant by the death of General Sir John Fraser, will not be filled up; and that a portion of the annual emoluments arising from the appointment will be appropriated in aid of the fund set apart for defraying the pensions awarded for distinguished services; the residue reverts to the public. It is also announced that the long-expected rolls for the second dividend of the Burmese prize-money have at length been received at the India House, and that the several claimants will in all probability be paid early in the present month. The long-talked-of new military cap for the infantry, after many "patterns and grotesque shapes," having been presented for the approval of her Majesty and the Duke of Wellington, has at last been decided upon, and will be delivered to the different regiments by next spring. It was submitted on Tuesday and Wednesday for the inspection of leading officers of the army, by Messrs. Lock, the patentees, of Regent-street, and was highly approved of. It is made of felt, is oval instead of circular like the present *chaco*, and is less than 1 lb. in weight. The head-band is three quarters of an inch in width, and the chin-strap one inch. They consist of pattern black leather. The former is fastened behind with a plain black buckle, and when not used curves round the ball, and is similarly secured at the top, being embellished at the side with the rose of England stamped in brass. The plate remains the same as before. The figure of the Crown in front is composed of the same metal, and is surmounted by a small brass ball, upon which rests another of white or green worsted, and red for the Grenadiers, similar to the French infantry. The crown and peaks are also of black pattern leather. The orifices on each side are adapted for causing ventilation for the head, particularly in warm climates, and the hind peak is a protection to the neck against cold, heat, or wet. A new cap for the cavalry is talked of in military circles.

The Navy.—The total number of vessels of every description at present in commission in the British Navy is 227, viz., 11 line-of-battle ships, 29 frigates, 113 sloops and other craft, and 74 steamers. Of these there are 4 line-of-battle ships, 5 frigates, 7 sloops, &c., and 10 steamers in the Mediterranean; 2 line-of-battle ships, 4 frigates, 25 sloops, and 3 steamers in the East Indies; 1 line-of-battle ship, 3 frigates, 13 sloops, and 3 steamers in the West Indies; 4 frigates, 12 sloops, and 3 steamers, Brazils and South America; 3 frigates, 3 sloops, and 2 steamers, Pacific; 1 frigate, 10 sloops, and 3 steamers, Coast of Africa; 4 frigates, 4 sloops, and 1 steamer, at the Cape; 1 line-of-battle ship, 2 frigates, 2 sloops, and 11 steamers, Ireland; 1 frigate, Lisbon; 2 sloops, at Torres Straits; 1 sloop at Falkland Isles; 1 sloop, 2 steamers, Canada; 1 steamer, Azores; and 3 line-of-battle ships, 2 frigates, 33 sloops, &c., and 35 steamers at home, including the Post-office sailing and steam-packets.

The Population of Ireland.—By a Parliamentary paper of last session, it appears that according to the census of 1841 the population of Ireland was 8,175,238, of which number 852,064 were members of the Church of England; 6,427,712 were Roman Catholics; 642,356 Presbyterians; other Protestant Dissenters 21,808; making the total of the abstract 7,943,940. There is no return as to the residue of the population set forth. On a return presented on the same occasion as to the population of England and Wales, it appears, that according to the census of 1841 there were 15,906,750 persons, and 4,896 travelling when the number was ascertained. There were at the same period in England and Wales 7,771,101 males, and 8,135,649 females; and in Scotland 1,241,871 males, and 1,378,336 females.

Winter Assizes.—It has now been arranged that there shall be a winter circuit for the delivery of the gaols of all prisoners charged with offences not triable at the Quarter Sessions. No civil causes, however, will be tried. The following days have already been announced:—*Oxford Circuit*, before Baron Rolfe, Oxford, Saturday, Dec. 9; *Gloucester*, Wednesday, Dec. 13; *Worcester*, Monday, Dec. 18; *Shrewsbury*, Thursday, Dec. 21; *Stafford*, Tuesday, Dec. 26. *Western Circuit*, before Justices Coleridge and Creswell, Winchester, Wednesday, Dec. 20; *Exeter*, Wednesday, Dec. 27. *Midland Circuit*,

before Baron Parke, Warwick, Monday, Dec. 11; *Leicester*, Thursday, Dec. 14; *Nottingham*, Monday, Dec. 18; *Derby*, Wednesday, Dec. 20. *Home Circuit*, before Justice Creswell, Chelmsford, Saturday, Dec. 9; *Maidstone*, Wednesday, Dec. 13; *Lewes*, Saturday, Dec. 16.

Irish Land Commission.—The Queen has been pleased to direct letters-patent to be passed under the Great Seal of the United Kingdom, appointing the Earl of Devon, Sir R. A. Ferguson, Bart., G. A. Hamilton, Esq., T. N. Redington, Esq., and John Wynne, Esq., her Majesty's Commissioners for inquiring into the state of the law and practice in respect to the occupation of land in Ireland.

Post Office.—The report of the Select Committee appointed to inquire into the measures which have been adopted for the general introduction of a general rate of Postage, and for facilitating the conveyance of letters, and the result of such measures, so far as relates to the revenue and expenditure of the Post-office, and the general convenience of the country, has just been published with the minutes of evidence and returns of the gross and net revenue of the Post-office for the three years before and after its adoption. The Report is dated August 14th. The Committee state that they have examined at great length Mr. Rowland Hill, with regard to several proposals which were brought under their notice by him, for extending the facilities of the correspondence of the country, and for improving the management and reducing the expense of the Post-office. They have also examined several of the officers of the Post-office, with regard to the expediency and practicability of adopting these measures. They regret that on account of the late period of the session to which their inquiries were extended, they find it impracticable to report their opinions on these various matters, involving as they do many minute details. They are unable to do more than report the evidence which they have taken and the correspondence in connection therewith between the Treasury and the Post-office, from both of which departments they entertain no doubt these propositions will receive the fullest consideration.—The Ministerial papers announce that by a recent convention arrangements between the Post-office of England and Holland have been established, which secure to both countries a liberal reduction of postage.—Notice has been given that on and after the 5th January next, all letters passing between the United Kingdom and any place in Jamaica when conveyed by packet will be subject to the uniform rate of one shilling and twopence the half ounce, and so on in proportion, in accordance with the scale now in operation in the United Kingdom. Letters however addressed to or posted at Kingston, the packet-station at Jamaica, will only be chargeable with the packet rate of one shilling the half ounce as at present, such letters not being liable to internal colonial postage.

Foreign.

FRANCE.—A royal ordonnance has been published in the *Moniteur* convoking the Chambers of Peers and Deputies for the 27th December. The same official journal contains a paragraph of apparently the most ordinary kind, but which in political circles is deemed of very singular import—namely, that "the King has caused to be purchased for his several private libraries copies of the Marquis de Custine's celebrated work 'Russia in 1839.'" It is said that this patronage of a work which deals so severely with Russia, and which the Emperor has declared to be false, is an intentional affront provoked by repeated insults offered to the King by the Emperor of Russia. An impression is general in Paris that the French and British Governments are perfectly in accord, and determined to act together in respect of Russian intrigue and Russian ambition. Late events in Greece are said to have alarmed both, and to have induced a combined resolve to brave the danger before it become truly formidable.—A dinner took place at the Palace of St. Cloud on Saturday, on the occasion of the 34th anniversary of the marriage of the King and Queen. "The Ministry," says the *Commerce*, "had scarcely announced the recovery of the Count de Paris, when the Count d'Eu, son of the Duc de Nemours, was attacked with the croup. The state of the young Prince inspired uneasiness at one time, and it is even said that the Duc de Nemours has been requested to return to Paris without delay."—The Minister of Marine has addressed a circular to all the maritime prefects, desiring that no workman may in future be employed on Sundays in the Government dock-yards except in cases of absolute necessity. The motives assigned by the Minister for this order are first, that men who do not repose on Sunday do not work with energy on the other days of the week, and consequently that it is not profitable to the State to have labour performed on the Sabbath; and secondly, that it is necessary for the State to promote the religious observance of Sunday amongst the labouring classes.—The *Gazette de France* after stating that the Prince Polignac has been ordered to quit Paris, adds that the French Government has notified to his Royal Highness the Duc de Bordeaux that he must sell all the property he has in France. Prince Polignac, it appears, was ordered to quit Paris in 24 hours, or write to the King for permission to prolong his residence. Marshal Sebastiani immediately proceeded to St. Cloud, and in audience of the King requested that the obnoxious order might be withdrawn. The King positively refused. The Marshal said, "Your Majesty is aware that I would not make a request compliance with which would be in the slightest degree dangerous for your royal person or the State. I will be bail for the Prince," added he in conclusion. The King was still unmoved, but after some time he said, "If the Prince will write to me"—"I would not allow him to do so," said Sebastiani. "Why, Peyronnet wrote to me." "M. Peyronnet is at liberty to do what he pleases," said the

Marshal; "but if Prince Polignac follow his example in that respect, he will cease to be entitled to my esteem. The Prince has not come here to conspire; conspirators do not move about with a train of four children." The only concession he obtained however was an extension of the time to Saturday, when Prince Polignac was to quit Paris, protesting against his forced exile, for inflicting which there is in fact no legal ground, the amnesty having been full and plenary that restored him to civil rights.—Another Bishop has joined his brethren in the crusade against the University of Paris. The Bishop of Rennes has demanded the dismissal of M. Zerort, the professor of moral philosophy in the University of Rennes and has intimated that, in case of refusal, he will remove the chaplain from the University.—Another trial is going on at the Assize Court of the Seine, of another formidable band of 24 thieves, who had selected Paris for the theatre of their operations.—The papers state that the King having been informed that the mother of Alibaud, who was executed for an attempt at assassinating him, has fallen into deep distress has sent to the Mayor of Marseilles a sum of money for the use of the unfortunate woman, with the promise of further assistance.—The long-contested horse-cause between Lord Henry Seymour, Mr. Palmer, and M. Aumont, was decided a few days since by the Cour Royale of Paris, after a hearing which lasted two days. The point at issue was whether a mare sold by M. Aumont to Mr. Palmer for 1000 francs with warrant of her pedigree, as Herodia, bred by Mr. Stirling of Battersea, and subsequently transferred by Mr. Palmer to Lord H. Seymour, was really Herodia as represented. The trial caused great interest in the sporting circles of France. Several witnesses were examined, and their evidence, as might be expected in such a case, was conflicting; the training-groom and other servants of M. Aumont giving a detailed history of Herodia from the time that she was brought from Battersea into France until she was sold to Mr. Palmer; and Mr. Stirling, his grooms, veterinary surgeon, and others swearing that the Herodia produced to them was not the Herodia bred at Battersea, and establishing the marks of difference noticed by Mr. Stirling in his certificate. The Court decided that the mare was a supposititious Herodia, and ordered her to be taken back by M. Aumont, he returning the 1000*l.* paid for her, and a further sum of 1000*l.* to Lord H. Seymour towards the expenses he had been put to, and paying the costs of his Lordship and Mr. Palmer in the suit.—The *National* states some startling facts relative to the thirty political prisoners consigned only four years ago to the dungeons of St. Michel. It quotes official returns to prove that of those thirty prisoners, all of whom are stated to be young men, two had been driven to commit suicide, one has twice attempted to poison himself, four have become madmen, two have fallen into a state of idiocy, and seven have already been attacked with diseases which are likely to adhere to them during the remainder of their lives, and have been removed in consequence to prison-hospitals in different parts of France.

SPAIN.—A conference took place at the Palace on the 20th ult. attended by M. Olozaga and all the Members of the Lopez Cabinet, the result of which was that the termination of the Lopez Administration was formally announced, and a Royal ordonnance issued which was read on the following day in the Cortes officially announcing the nomination of M. Olozaga as President of the Council of Ministers and Minister of Foreign Affairs. The Cabinet was constituted on the 24th by the appointment of the following Ministers: M. Luzuriaga, Grace and Justice; M. Domenecq, Interior; M. Cantero, Finances; M. Serrano, War, and M. Frias, Marine. It was believed that the new President of the Council would submit to the Cortes a project of law for regulating the attributes of the municipal bodies—a delicate question repeatedly discussed but never solved in a satisfactory manner. According to this project the election for municipal officers would hereafter be direct, like that of Members of the Cortes. The Queen's birthday had been celebrated on the 17th with much pomp. Her Majesty had been congratulated by the *corps diplomatique*, *grandses*, &c., and the palace had been crowded on the occasion. The Queen replied to the Minister of Portugal, who addressed her in the name of the Ambassadors—"I have heard with much satisfaction the wishes expressed by the diplomatic body for my personal prosperity and that of my people, and if Providence bless my endeavours I hope that my reign will consolidate the tranquillity of this magnanimous nation, and draw closer the ties of friendship which unite it to the Governments which you represent in so becoming a manner." The Prince de Carini passed through Bayonne on the 23d ult. on his way to Madrid, bearing the recognition by the King of Naples of the Government of Queen Isabella II. The Prince is accredited as Minister Extraordinary at the Spanish Court, and is charged with negotiating the marriage of the Count de Trapani with the Queen. England and France are said to have given their consent to the union.—From Barcelona we learn that the surrender of that city took place on the 19th. During the night of the 17th the greatest confusion reigned in Barcelona, and a deadly struggle took place between the peace party and the Patulea and Republicans, which terminated by the defeat of the latter. In consequence of this victory five delegates had a long interview with General Sanz, and on the 19th the capitulation was signed, and on the 20th 10,000 Government troops took possession of Barcelona. On the evening of the same day the Captain-General was informed by two members of the Junta that some of the most desperate insurgents intended to fire the town at different points, and blow up the Cathedral; in consequence of this timely warning every precaution was taken

to frustrate such a design, and the whole army remained under arms during the night. One of the principal clauses of the capitulation is the disarming of the entire population without exception. The inhabitants are also to restore the streets and houses to their original condition. On the 21st General Sanz issued a *bando*, ordering a general surrender of arms within six hours on pain of death, and by the afternoon some thousands of muskets were deposited in the Atarazanas and the Cathedral. The new municipality have been directed to number and class the inhabitants; and to make a list of the damaged houses, and to whom they belong, including foreigners. By the evening of the 21st all the barricades had disappeared from the streets and most of the trenches were filled up. The Free Corps and National Guard of Barcelona have since delivered at the Atarazanas 500 muskets. Tranquillity is completely restored, the emigrants are returning, and the manufacturers are resuming their business. The Captain-General has gone in person to assume the command of the troops blockading the castle of Figueras, and has taken with him six battalions.—From Cadiz we learn that several British travellers were loud in their complaints of what they characterized as a gross extortion practised on them at the British Consulate in that city. For getting their passports endorsed there to go to Seville for a day they were charged a dollar and a half (6s. 6d.), and the same on their return to Cadiz for the Consul's *visa* to Gibraltar. They thus had to pay the sum of 13s. for absolutely no service whatever, while the charge of the Spanish authorities on both occasions for a real benefit was no more than 3s. This disproportion has long been known and complained of by travellers in Spain, but it has now for the first time attracted the attention of the journals, and some hopes of the interference of the Foreign-office are entertained.

PORTUGAL.—We have accounts from Lisbon to the 22d ult. The greatest tranquillity prevailed and all prospect of its being disturbed had entirely disappeared. The Chambers were occupied with measures to cover the deficit of the current financial year, but the remissness of members caused a frequent failure of Houses. General Iriarte and the Spanish troops who took refuge in Portugal are to be quartered in Oporto. An important communication has been made by the Board of Trade in answer to a recent memorial from the merchants engaged in the Newfoundland trade. It appears that the Duke of Palmella and her British Majesty's Government are at variance as to whether or not the propositions of the latter have been accepted or refused. The Board of Trade states "that the negotiations with Portugal, which were interrupted in April last, have strictly speaking not been revived; that since the arrival of the Duke of Palmella in this country his Excellency has tendered to her Majesty's Government statements intended to show that the British propositions had been previously to the interruption or breaking off of the communications in April last accepted in their substance by the Portuguese Government, and that her Majesty's Government are clearly of opinion, upon an examination of these statements, that the Duke of Palmella is in error in that supposition, and that this conviction has been officially communicated to the Duke of Palmella." Lord Aberdeen has since made a similar communication.

GERMANY.—Letters from Vienna announce that Prince Michael of Serbia was shortly expected to leave that city for Dresden. The Prince has amongst his suite the celebrated writer Dr. Wuk and intends sojourning in that capital a great part of the winter.—The Greek society of Berlin, among whom are the most celebrated authors and artists of Prussia, contemplate giving a representation at their private theatre of the comedy of *The Frogs* of Aristophanes. A new translation has been made of this piece by Professor Franz, and the music arranged by M. Kummer; costumes and decorations are now preparing from designs furnished by the most renowned artists. *The Frogs* was in the first instance intended for performance at the Palace at Potsdam, but the King sent it for review to M. Tieck, who on account of its containing objectionable passages did not advise its production. Dr. Franz has now made several alterations and the first representation is looked for with much curiosity.

ITALY.—It was reported in Paris on Thursday that the Pope was taken suddenly and dangerously ill. In the present disturbed state of Italy, and especially of the states of the church, any change in the holy see is considered important. In the meantime it is said in a letter of the 15th from the Roman states that the disturbances in the neighbourhood of Bologna and Ravenna have been put down.—A grand religious ceremony, the beatification of the nun Maria Francisca of the five wounds, who died in 1814 in a convent at Naples, took place at St. Peter's, at Rome on the 12th inst. The preparations for this ceremony are said to have cost 100,000 Roman crowns, independently of the portraits of the beatified nun, which it is customary to present to the cardinals and the principal churches and convents.—The *Augsburg Gazette* publishes the following letter from Naples of the 2d of November:—"It has been lately remarked that the British Minister has frequent conferences with the Minister of Foreign Affairs and numerous audiences with the King. It was at first thought that these conferences had reference to the treaty of commerce which is now so far settled as only to require the signature of the plenipotentiaries. But as the English flag would get a privilege of ten per cent. over other nations the King wishes as a compensation that the English Government close Malta against the Italian refugees who are now troubling the Peninsula. This is too delicate a matter for the British Cabinet to consent to, but the English Government are willing to keep a strict surveillance over the Italian refugees." In

reference to this subject a Malta paper the *Portafoglio Mallese* states that the disturbances in the Roman dominions are in a great measure owing to the Malta press. The Maltese papers have for the last three or four months tried everything in their power to excite the population of the Papal legations to insurrection and rebellion. The scarcity of public journals in the Papal States is well known, and advantage is taken of this circumstance to furnish intelligence from Malta by way of Ancona to Bologna, Ravenna and other cities in the Papal States.—It is said that the Princess who is about to marry the Duc d'Aumale is not the sister of the King but his cousin, the daughter of the Prince of Salerno.

GREECE.—Accounts from Athens of the 10th ult. state that about 150 Deputies had arrived, and that the National Assembly was to meet in a fortnight, but its legislative labours were likely to be somewhat delayed by about a dozen double elections in the Peloponnese, which must first be decided upon. The Council of Ministers was holding protracted meetings every evening, and the Ministers at the head of the different departments regularly transacted business with the King. The Continental papers state that whatever turn affairs may take in Greece, it is certain that France, Austria and England will oppose any attempt of Russia to overthrow the existing Government, nor will they permit the Emperor to exercise the same influence in Greece which he has established in Servia.

TURKEY AND PERSIA.—Letters from Constantinople announce that the President of the Council of Justice, Hafiz Pacha, had been dismissed on the 8th ult., and replaced by Achmet Fethi Pacha, brother-in-law of the Sultan. The Sultan's object in adopting this resolution was to give satisfaction to England and France for the execution of the unfortunate Armenian. Letters had been received at Constantinople, announcing that serious disturbances had arisen in Albania and in Thessaly, and that an attempt had been made to set fire to Belgrade by the adherents of the dethroned Prince. The Rev. Dr. Wolff arrived on the 3d inst., and was only waiting for the necessary firmans and the arrival of Colonel Napier, who has volunteered to accompany him to prosecute his enterprising expedition to Bokhara.—Letters had arrived from Mosul which state that the remnant of the Mountain Nestorians who had been enabled to resist the Kurdish invaders, joined by their fugitive brethren, have gained a complete victory over their oppressors, and succeeded in regaining much of the territory they had lost.—Letters from Teflis of October 12th announce the important fact that the Emperor of Russia had under pretence of encouraging the commerce between the two countries, established a line of posts guarded by Cossacks from the Caspian Sea to the capital of Persia.

EGYPT.—From Alexandria we have received the very important news of the death of Achmet Pacha, the late rebellious governor of Sennaar. His death is said to be the result of intermittent fever, though many surmise that it has been compassed by other means more in accordance with the Oriental administration of justice. The Pacha by this event is saved an expense and his people a sanguinary civil war. The Porte is said to have been benefited already by large sums remitted by Achmet to Reschid Pacha through Jerusalem in furtherance of his ambitious views. Emir Bey has been appointed his successor. It appears that Gallici Bey did not go to Suez to report again upon the ship canal from Suez to Pelusium, but upon the feasibility of a navigable canal from Boulac to Suez through the desert, the superior altitude of the Nile at Boulac to that of the Red Sea at Suez ensuring a constant supply of fresh water, and possibly the means by irrigation of cultivating a large strip of land on each side where now is a sandy desert.

UNITED STATES.—The packet-ship Patrick Henry reached the Mersey on Sunday after an 18 days' passage, bringing 32 passengers and no less than 100 returned emigrants; her dates are to the 8th ult., four days later than the previous packet. Mr. Horsley Palmer is among her passengers. The Britannia steam-ship has since arrived with dates from New York to the 16th, Boston 17th, and Halifax 19th ult. The Caledonia was seen on her way between Halifax and Boston on the 18th, and the Acadia was spoken by the Britannia on the 26th, out seven days, in lat. 50, 5 N., long. 26, 40 W. The New York and Liverpool liner Sheffield was lost off the former port whilst in charge of a pilot, in very rough weather, on the 11th ult. The passengers were saved by great exertion and presence of mind, and the vessel subsequently got off, but with cargo greatly damaged. The annexation of Texas to the United States appears to be still a favourite scheme, and will it is said form a prominent subject of recommendation in the President's annual message, to be delivered the first week in this month. The papers bring an account of the death of Colonel John Trumbull, at the age of 87. He was an aide-de-camp of Washington in the War of Independence and afterwards became one of the first artists of the United States. The elections for the state and city of New York took place on the 7th, and were in favour of the Whigs. The contest was more than usually exciting from the near approach of the Presidential election, upon which it will probably have a considerable influence.—Mr. O'Connell is rising again into favour in the United States. A meeting to further repeal presided over by Colonel Johnson had been held in the Tabernacle in New York, and another meeting was held of still greater pretensions at the Park when the news arrived out that he had been arrested and was about to be prosecuted.—The yellow fever at New Orleans has been very fatal. The *Herald* of that city publishes the names and addresses of 692 persons, natives of England, Ireland, Scotland, and Germany, who have fallen by its ravages, exclusive of 132 persons

unknown. The Irish and Germans appear to have been the greatest sufferers by its ravages, and after them the Americans. The fever still lingered in the city, but its fierceness had abated. The appearance of frost which usually drives it away was looked for with much anxiety.—The Senate of the State of Tennessee have passed a law to secure to married women the right in and enjoyment of their own property. It provides that a wife shall have the same undisturbed control of her own estate after marriage which she had before, and prevents her property from passing out of her hands on marriage by mere operation of law without her consent. On the other hand the militia law of Rhode Island does not exempt females from performing military duty, and several have been arrested and confined for disobeying the said law.

CANADA.—Our advices from Kingston are to the 3rd, and from Montreal to the 6th ult. The bill to secure the independence of Parliament had passed the Council by a vote of 15 to 12. The Agricultural Protection Bill had also passed the Legislative Council, to go into effect on the 5th January. It had also been decided by a vote of two to one, that Montreal is the only place for the seat of Government. To refer the decision to the Home Government was refused by a vote of 50 to 29. There have been remarkable doings in the Parliament of the province, no less than 13 members of the Legislative Council, with Mr. Morris at their head, having retired. It appears that in the House of Assembly an address to the Queen was adopted by a vote of 51 to 27, concerning the proposition made by Her Majesty to remove the seat of Government to Montreal. When the address came before the Council for their concurrence, a long and angry debate arose, the opponents of the bill contending that the bill could not again come before the Council during the present session without violating all Parliamentary rules, and setting a dangerous precedent, it having once been finally disposed of, it was thought, for the session, and could not be brought before the Council without it was prorogued for a few days. The measure was insisted on, and the further discussion made the special order of the day for the 9th, when the Hon. Mr. Morris rose and said, that in view of their strange proceeding, it became his duty to record his protest, and retire from all further participation in the proceedings of the Council. He then bowed to the Speaker and the House, and retired, followed by Messrs. De Blaquiere, Ferguson, Crooks, Washburn, Sherwood, M'Ray, Dickson, Hamilton, Macanbery, Draper, M'Donald, and A. Fraser. Soon after they retired, the Council adjourned.—The transport Premier with troops on board has been totally lost near Quebec, but the troops and crew were saved.

CITY.

Money Market, Friday.—Consols for the opening closed at 96½; Three per Cents. Red., 95½ to 95½; Three-and-Half per Cents. Red., 102½; New Three-and-Half per Cents., 102½ to 103½; Exchequer Bills, 54s. to 55s.

Metropolis and its Vicinity.

Destitution in the Metropolis.—A meeting of the committee took place on Wednesday which was attended by Lord Dudley Stuart, Viscount Ranelagh, Sir De Lacy Evans, Sir Joseph Copley, Mr. J. A. Smith, M.P., and other gentlemen. Final arrangements were made for a great public meeting in behalf of the destitute poor of the metropolis, and for establishing an institution to be called the Western Refuge for the Destitute. The proposed meeting to be held at Exeter Hall in the course of next week.

Scottish Hospital.—On Thursday being St. Andrew's Day, and the 178th anniversary of the Scottish Hospital, the annual meeting took place in Crane Court, the Duke of Sutherland in the chair, supported by about 200 Members of the Corporation. The Hon. Mr. Fraser opened the proceedings of the Court by tendering his resignation of the appointment which he had held as Treasurer for 21 years, when the meeting, which by this time had become over-crowded, adjourned from the Hall into the Chapel of the Corporation. The Chairman then congratulated the meeting on the numerous attendance of the body, requesting that he might be permitted to resign the chairmanship of the meeting, reserving to himself the pleasure of again presiding at the festival in the evening. The noble Duke then left the Court, accompanied by the Hon. W. Fraser, and was succeeded in the chair by P. M. Stewart, Esq., M.P. It was then proposed by Sir Peter Laurie, seconded by Dr. Webster, and carried by acclamation, that the Duke of Sutherland be re-elected President for the year ensuing, Major Adair the Secretary intimating to the meeting that his Grace had instructed him to state, that although he attended the Society's festival on the present occasion, yet that his medical advisers had forbidden him for the future to attend at public dinners. Dr. Webster then proposed that P. M. Stewart, Esq., M.P., be elected treasurer in the room of the Hon. W. Fraser, to whom a complimentary vote of thanks proposed by Sir Peter Laurie and seconded by Sir C. Forbes was passed, for the able and independent manner in which he had discharged the office for 21 years. After some discussion Lord Blantyre, the Hon. W. Fraser, and Sir C. Forbes were elected to fill the vacancies in the list of vice-presidents. Major Adair then read a letter from the Rev. Dr. Brown, resigning the chaplaincy of the Corporation, caused by the changes in the Church and his translation to a church in Scotland. After a long and turbulent discussion, Dr. Brown's resignation having been accepted, the Rev. Dr. McLeod was reinstated as Senior Chaplain. Sir Peter Laurie then proposed that the Rev. John Cumming be appointed to fill the vacant Chaplaincy. The motion was seconded by Mr. Waugh, and after another stormy discussion was carried without any

apparent opposition. The vacancies in the different committees were then supplied, after which the accounts were read and ordered to be printed. From these it appeared that the total expenditure of the institution for the past year had been 3,505*l*. The annual dinner of the Corporation took place in the evening at the London Tavern, the Duke of Sutherland in the chair. The subscriptions of the evening amounted to upwards of 350*l*. His Grace the Chairman subscribing 50 guineas in addition to his annual subscription.

Anti-Corn-Law League.—On Thursday night the monthly meeting of the League took place in Covent-Garden Theatre which was crowded to excess. Mr. Wilson opened the business by announcing that the League had won London and Kendal and had not won Salisbury, but intended to do better next time. Mr. Cobden then addressed the meeting on the late elections and on the usual topics connected with the Corn Laws. Mr. Lambert Chairman of Mr. Bouverie's Committee at Salisbury, Col. Thompson, and Mr. Bright, next addressed the meeting at very great length. At the close of Mr. Bright's speech the Chairman said he must now close what all present would probably consider to have been not the least interesting of the series of meetings. Mr. Bright had informed them that arrangements had been made for holding during the next month meetings in the principal towns of Yorkshire and Lancashire, for the purpose of promoting subscriptions to the great League fund. When they met again this day month he hoped they would have the pleasure of seeing that their labours for that object had not been unrewarded.

The Model Prison.—Although this prison has been open so short a time, and the prisoners have been carefully selected from the various gaols in point of health, two have become insane this year, and have been transferred to Bethlehem; viz., John Reeve, on the 24th June, and John Hill Stone, on the 17th August. The *Times* observes that it is remarkable that insanity only occurs in the Penitentiary and Model Prison under Government inspectors, and not in magistrates' prisons.

Light Gold.—In consequence of the numerous complaints made by the merchants in the City and the public at the practice of the Bank's issuing light gold, orders have been given by the Governors that no gold shall be issued unless it has been previously weighed and is according to the standard currency. Henceforth all gold presented at the Bank will only be received according to weight, and will be defaced so as to prevent the possibility of a re-issue.

Metropolitan Improvements.—Workmen are pulling down the houses in the vicinity of Buckingham Palace, leading from James-street into the Piccolo-road, to make way for the new improvements. The houses in Tothill-street, York-street, and Castle-lane, Westminster, are also to be pulled down in the spring, as well as Sion College Almshouses, for the new road, which will run across the ground of Elliott's brewery into the Vauxhall road. The Rookery which has been for several centuries the Westminster nuisance is at last coming down, and a square will be built on the spot.

Embankment of the Thames.—At the meeting of the Common Council last week the Lord Mayor laid before the Court a copy of the following letter from Lord Lincoln, together with a plan for carrying out the projected embankment, which he described as a measure of considerable importance to his fellow-citizens:—"1, Whitehall-place, November 8, 1843.—My Lord,—As chairman of the Commissioners appointed by Her Majesty for 'inquiring into and considering the most effectual means of improving the metropolis, and providing increased facilities of communication within the same,' I have the honour to transmit herewith for your lordship's information a plan of the proposed embankment between Westminster and Blackfriars bridges, for the construction of which it is the intention of Her Majesty's Government to submit a bill to Parliament in the course of the ensuing session. It will afford me, as it will I am sure afford the Commissioners, great pleasure to find that the result of these inquiries into the expediency of the course proposed will be acceptable to the Corporation, directed as those inquiries have been to the interests both of the navigation of the river and of the trade carried on upon its shores, and ultimately to the accomplishment, without prejudice to those interests, of a great metropolitan improvement. I have the honour to be, my Lord, Your Lordship's most obedient servant, Lincoln." On the motion of Mr. R. L. Jones, the letter and plan were referred to the Navigation Committee and the London-bridge Approaches Committee for them jointly to report upon. Several members expressed their satisfaction that Government have assumed the responsibility of so great an undertaking.

Westminster Bridge.—Since the carriage-way of this bridge was closed, workmen have been engaged in removing the great body of loose sand and rubble walls which loaded the east pier of the centre arch unnecessarily, and are preparing to substitute brick arches as was done to the sunken pier on the Middlesex side. The lessening of the weight upon each pier by this operation and by the proposed lowering of the roadway will not be less than 1700 tons, and since this lightening began there has not been the smallest movement in any part. Messrs. Walker and Burges have thought it prudent to take the opinion of two other engineers, Messrs. Cubitt and Rendel, who have stated as their opinion that the sinking of the piers is caused by the great load upon the clay foundation, there being no piles under this bridge, and the ground on the Surrey side being of a loose nature.

Shops of London.—The attempt now making to abridge the protracted hours of labour in the shops of the metropolis has received the support of the leading drapers:—

Messrs. Swan and Elgar, Piccadilly; Mr. Redmayne, Bond-street; Messrs. Hitchcock and Rogers, St. Paul's Churchyard; Messrs. Peters and Underwood, Sloane-square; Mr. Owen, Great Coram-street; Mr. Edwards, Soho-square, and others, close their respective establishments at 7 o'clock,—examples which are likely to be soon followed by the trade generally and by other classes of shopkeepers, provided that the public will lend their aid by abstaining from evening purchases.

Roman Remains in the City.—On Thursday in the course of excavations making for a sewer in Bridgewater-square Barbican, the men found the foundation of a Roman wall four feet from the surface, which extended in a direct line across the square from east to west. It was about 18 feet in depth and 4½ in width. Pieces of a Roman pavement were also met with. In one part of the square a workman dug up a square plate of metal one side of which had a polished surface, but was unfortunately broken. A quantity of pottery was also found. During the week, in Tyefoot-lane (a narrow passage leading out of Queenhithe to Fish-street-hill) where a sewer is forming, the men came against three Roman walls about 4 feet from the surface extending in parallel lines, and at about 12 feet distance from each other. They were about five feet in depth. The two external walls were about 4 feet in width and the inner one about 7 feet wide. They appeared to be of a circular form and were so firmly constructed as to be only separated and broken by an iron wedge.

Westminster School.—The "Phormio" of Terence will be performed by the Queen's Scholars on Monday the 11th, Thursday the 14th, and Monday the 18th inst., with a prologue and epilogue on the 14th and 18th.

The Daily Papers.—It is said that the proprietors of the daily papers intend to raise the price of their papers from 5*d*. to 6*d*. Assuming the circulation of the *Times* to be 12,000 a day, this will give to that paper an additional profit of 15,650*l*. a year.

Mortality of the Metropolis.—The number of deaths registered in the week ending Saturday, Nov. 18, was as follows:—West Districts, 183; North Districts, 230; Central Districts, 224; East districts, 285; South Districts, 208; Total, 1,230 (males, 615; females, 615). Weekly average for the last five years, 903 (461 males, 442 females); and for the last five autumns, 908.

Provincial News.

Birmingham.—Mr. Weale, one of the assistant Poor Law Commissioners, commenced an inquiry on Friday last in the workhouse of this town, in consequence of an anonymous letter which the commissioners had received respecting some cruelties practised in that establishment. In September last four young men entered the workhouse as tramps, and were put into the tramp ward. When there they tore up their clothes and were found in that state by the tramp-room keeper. He communicated the circumstance to the governor, who according to the charges in the letter ordered the men to be taken to the black hole in a complete state of nudity. They were put into this vault and there detained eight days and nights, during the whole of which time they had only one rug each to wrap themselves up in by day or night; they were in that state compelled to lie on a bare guard-bed without any straw or bedding, were daily fed on bread and water gruel, there was no fire or hot air or any other means of heating the place, and in this state they were kept until discharged on the 3d of October, but not until one of the men was so ill as to require medical advice. The second charge was that the governor had put a boy into this place of confinement and kept him there until it was necessary to give him a warm bath to ensure his recovery when released. The third charge was that a woman had been put into the tramp-room for punishment; and the fourth was that a sane woman had been put by the governor into an insane ward for punishment. The governor in reply to the charges denied that any punishment had been inflicted. The keeper of the tramp-room however deposed that the four men above named entered the house in September, and that they were in all respects treated in the manner set forth by the commissioner, and detailed other circumstances connected with their confinement of a very revolting nature. The house surgeon deposed that he found one of the tramps ill and ordered medicine for him. The governor's wife swore that the men had each two rugs in the hole, that she had ordered them bread and broth, but she could not swear whether they received it, and that on one Sunday she ordered them meat, but she could not say they got it. The room was not cold, indeed the men complained of the heat, and she directed the keeper to open the door. The Commissioner said they ought to visit the place, and proceeded thither. The sight of it caused an unqualified expression of indignation and abhorrence. It is a low arched vault, into which there is a descent of two steps, six feet wide, nine feet long, with a small iron grating at the top without any guard glass. A bed is raised under this grating, and in this hole situated in a dark passage the men were confined. The Commissioner on returning said he never could have believed that there existed any such place of confinement in any workhouse in England. He certainly never beheld such a place for human beings to be placed in, no matter what might have been their offence. In this expression of disapprobation the whole of the guardians concurred, and declared that they did not know such a place had been used for the purpose. The governor said that the hole had been used most nights for tramps, and that on that very night they would most likely have more tramps than they could accommodate, and would be obliged to put them in that vault. The Commissioner said he should institute a searching inquiry into the entire establishment, and adjourned the inquiry.

Bury.—The *Blackburn Standard* says that singular as it may appear, it is nevertheless true that at noon on Friday the petty sessions were adjourned for half-an-hour, in order to allow the solicitors, county policemen, overseers, and other officials, an opportunity of witnessing the entrance of Van Amburgh with his large collection of wild beasts.

Carmarthen.—The toll-gate between Bettws and the Holyhead road was destroyed last week by the Rebeccaites. The gate-posts were sawed asunder and the gates carried off. A letter in Welch was left under the cottage-door where the toll-taker resides, stating that if the gate is replaced the house will be destroyed.—The Special Commissioners arrived at Cardigan on Wednesday week, and proceeded at once to examine the road-surveyors, and to investigate the trust accounts and the apportionment of tithes in the parish of Pembryn. The Commissioners are understood to have expressed a wish to further any agreement which might be come to between the titheowners and tithepayers to allay the bad feeling which exists, and as far as possible to remedy what seems to be regarded (so far as relates to this parish) as an oppression. The Commissioners make numerous inquiries of intelligent witnesses as to their opinion of the best remedy to remove the grievances complained of, no doubt with the view of extracting some practicable suggestion to embody in their report to Government. They concluded their inquiry at Cardigan on Friday and proceeded thence to Aberystwith.

Gloucester.—A calamitous fire burst out at 3 A.M. on Wednesday the 29th ult., in a large farm-house in the village of Willersey near Broadway in this county, by which the house and furniture were completely destroyed, and the farmer's wife and five young children and a charwoman were burnt to death. The farmer (Mr. Rimell) and three of his sons escaped through a window with much difficulty, but the rooms were so filled with smoke that the rest of the family were soon suffocated, and the mother of the children could not be prevailed upon to fly with her husband and leave the children to perish. It was a heart-rending scene and no assistance could be rendered. The house was fitted up in the old style, with wainscoting, and the divisions between the rooms were all of wood. Had not the engines arrived speedily from Campden and Evegham, the destruction of property might have been very extensive, as the house was close to thatched barns and sheds on two sides, and several stacks of corn were a short distance apart. The consternation in the village may be easily imagined, and the cries of the people of all classes on hearing the loss of life were most distressing. The premises are insured in the Phoenix Fire-office for 800*l*.

Knowsley.—Information has been received in London that a man called Hillingham, another of the party concerned in the late murder of a gamekeeper at Knowsley-park, has been apprehended, and is now in prison.

Kirkdale.—The Privy Council have ordered the plans of the first Industrial School under the new system of education to be published in their forthcoming report. This is to be erected at Kirkdale, near Liverpool, from the designs of Messrs. Lockwood and Allam, and is for the support and education of 1200 children, divided into three classes—infants, boys, and girls. The plans are remarkable for simplicity of arrangement and capabilities for the master's and matron's supervision of the charges to be entrusted to them. Well-ventilated workshops for the teaching of carpentering, tailoring, shoe-making, &c. are found upon the male side; and upon the female side are those of laundry work, straw plaiting, &c. Some notion may be formed of the extent of this edifice by mentioning that the space occupied by the masonry alone will cover upwards of six acres of land. An infirmary detached from the main building is provided. The site is an open ground of considerable altitude, commanding the mouth of the Mersey.

Keswick.—On Monday a meeting was held in the town-hall of this town, for the purpose of carrying into effect a wish very generally expressed that a public testimony of regard and respect to the memory of the late poet-laureate should be placed in the church of Crosthwaite, in which parish he had spent the greatest portion of his life, and in which churchyard his mortal remains were deposited. A committee was then formed, and resolutions entered into for that purpose; one of which was that a white marble tablet, on which is to be a medallion likeness of Dr. Southey, should be executed by some eminent sculptor, and affixed to the wall in a conspicuous part within the church.—Since this announcement appeared Lord John Manners has sent a letter to the *English Churchman*, suggesting that the most appropriate monument to Dr. Southey would be the institution of an establishment of Protestant Sisters of Mercy, and proposing a subscription for that purpose.

Lancaster.—A correspondent ("Facile") informs us that corn still remains unhoused on Nateby and Pilling Moss, in consequence of the wet weather. Since the 10th October there has scarcely been a fine day, while the nights have been cold, leaving a white frost which there was neither wind nor sun to clear off. The farmers are now housing the crops in their wet state. After threshing out the corn they send it to the kilns to be dried, and give the wet straw to the cattle, which seem very fond of it. This step is rendered necessary not only by the advanced state of the season, but by the ravages made upon the outstanding crops by the hares and partridges.

Leeds.—On Thursday, Mr. James Bryam, of Gildersome, shopkeeper, appeared before the magistrates at the court-house to answer to an information preferred against him by the clerk to the Excise at Leeds, for having in his possession and offering for sale 40 lbs. of spent tea-caves, which had been redried and coloured in imitation of black tea. Mr. Rose, grocer, deposed that on or about 11th July

last defendant, whom he knew, called at his shop and asked him if he had a tea-machine; he told him he had not. Defendant said he could talk to him, and he told him that he had an article which he was selling as a substitute for tea. He said he did not grow it, but procured it from Lancashire. He said it was tea-leaves, but before it was used it would require to be ground down and mixed with other tea. The price was 1s. 4d. per lb. He subsequently ordered and received 46lbs. of this spurious tea, the price of which was 3l. 1s. 4d. Mr. Philips, chemist to the Board of Excise in London, said—"The tea is composed of redried tea-leaves, both black and green, and the leaves of other plants not tea. The leaves have been dried with a vegetable red dye, apparently Brazil or logwood, and the dust or small part of the sample contains yellow ochre, both raw and burnt, and sand as well." The bench after a short consultation convicted the defendant in the highest penalty of 5l. for every pound of the composition. The fine therefore is 200l., and 1s. damages.

Melton Mowbray.—On Thursday the 23d ult. the Duc de Nemours, who was on a visit at the Earl of Wilton's at Melton, with his suite, attended the meet of the Quorn hounds at Billesdon Coplow. The field was considerable, considering the early period of the season, including Lord and Lady Seymour, Lords Wilton, Forrester, A. St. Maur, Gardner, and Macdonald; Hon. W. Fitzwilliam, Sir Walter Carew, &c. The weather was unfavourable, but towards the afternoon they had a good run, in which his Royal Highness went remarkably well. The sport has been excellent hitherto, and a good winter is anticipated.

Oxford.—On Wednesday the Court of Delegates of Appeals in congregation met to hear the arguments of Counsel in the appeal from the decree of the assessor of the Vice-Chancellor's Court, in the cause *Macmullen v. the Regius Professor of Divinity*. Mr. Erle in a speech of two hours argued in support of the appeal, adverting to a vast number of legal decisions to prove that the Vice-Chancellor's Court was not the proper tribunal to try the question at issue. He was followed by Dr. Twiss on the same side arguing chiefly from the practice of the University. Mr. Hope then addressed the Court against the appeal, and contended that as the civil law was the only rule for the determination of the question at issue no other course could have been taken than bringing it before the Vice-Chancellor's Court. He supported his opinion by reference to a number of law authorities and statutes. At the close of his speech the Court determined on taking time to consider their decision.

Portsmouth.—The Artesian well at the Royal Hospital, Haslar, sunk by Mr. Docwra, manager of the large Artesian well now in progress for supplying Southampton with water, has resulted in producing an abundant supply of water, which has been analysed by order of the Admiralty and found to be of the purest and softest quality. The water rises through 125 feet of shingle and running sand, which is full of salt water and affected by the tides. The trouble and difficulty in stopping the salt water out has been entirely overcome. The quantity of water that Mr. Docwra guaranteed to obtain was 12,960 gallons per day, but the actual quantity obtained from the spring, 156 feet deep, is 59,328 gallons per day. This quantity can be pumped every day without reducing the water in the well more than about 40 feet from the surface.

Plymouth.—On Sunday evening between 10 and 11 o'clock, Commander Douglas, R.N., fell over the Barbican-quay and was unfortunately drowned. From the marks of a bruise on his chest it is supposed that he first stumbled over a vessel's warp which was fastened to a post, and in endeavouring to get up fell over the quay. Although he did not sink and remained but a short time in the water, life was quite extinct when the body was brought ashore. Commander Douglas had just paid off the *Tweed*, 20, from the North American and West Indian station. He was above 60 years of age, and having spent the greatest part of his life in the service of his country was waiting the arrival of a steamer to convey him to his home near Brighton when this unfortunate event occurred. —Mrs. Hill, a pretended witch charged with imposing upon the credulity of a simple country girl named Charlotte Horn, under circumstances which proved the extraordinary superstition still existing in the lower classes, was brought before the bench of magistrates on Monday for the second time and committed to the House of Correction for three calendar months as a rogue and vagabond, under the 4th section of the 5th George IV.

Teignmouth.—A fire broke out last week at Rowdens, near this town, lately the property of Sir James Nugent, by which the whole building and nearly all the furniture was destroyed.

Railways.—The following are the returns for the past week:—Birmingham and Derby, 1287l.; Birmingham and Gloucester, 1607l.; Eastern Counties, 2289l.; Edinburgh and Glasgow, 2141l.; Great Western, 12,000l.; Grand Junction, 6510l.; Glasgow, Paisley, and Ayr, 1208l.; Great North of England, 1329l.; Hull and Selby, 976l.; London and Birmingham, 13,834l.; South Western, 5023l.; Blackwall, 617l.; Greenwich, 677l.; Brighton, 3108l.; Croydon, 207l.; Liverpool and Manchester, 3659l.; Manchester and Leeds, 4603l.; Midland Counties, 2464l.; Manchester and Birmingham, 2355l.; Northern and Eastern, 1472l.; North Midland, 4,027l.; Newcastle and Carlisle, 1411l.; South Eastern and Dover, 2699l.; Sheffield and Manchester, 479l.; York and North Midland, 1521l.—The York and North Midland Company at their meeting last week empowered the directors to apply to Parliament for the extension of the line to Scarborough, with a branch to Pickering, and also to make arrangements for the purchase of the Leeds and Selby line. It is stated that the extension will cost 260,000l., allowing for all

contingencies, the money to be raised by the issue of 25l. shares, while the revenue is calculated at 10 per cent. No opposition is expected in Parliament. 507,500l. is the purchase-money for the Leeds and Selby Railway, and from the working of the two companies it appears to be considered that a permanent dividend of 10 per cent. will be secured. —The Manchester and Birmingham directors have reported favourably on the subject of the branch to Macclesfield. The money required for this purpose they estimate at 130,000l., and the revenue derivable from it, after paying working expenses is expected to be 13,520l., or rather more than 10 per cent. per annum. The sale of surplus property in the hands of the company will, it is said, be found sufficient to raise the necessary means.—The North Union and the Preston and Bolton companies have united, the division of profits to be made at the rate of 6 per cent. to the former, and of 3 per cent. to the latter, on their respective capitals, after the payment of which any surplus is to be equally distributed. The cessation of competition in consequence of this arrangement will, it is thought, work beneficially for both companies.—The Newcastle and Darlington Company are about to purchase the Durham Junction, and the directors are to apply to Parliament for power to complete the agreement, with a station at Gateshead and other works to carry the railway over the Tyne. —An ingenious invention has just been exhibited, and its powers tried on the Brighton and Croydon railway. It is called a pedomotive machine, and was constructed by Mr. England, the engineer of Hatcham iron-works, Kent-road, for the London and Brighton railway. It weighs about 270 lbs., and is manufactured almost entirely of wrought iron. It carries four or six persons, two of whom propel it by means of treadles applied on a new principle. Its greatest speed for a short distance is 25 miles an hour; its average rate is 15 miles an hour, carrying in both cases four passengers. By means of this machine on a line of railway, one man can convey a message from station to station at a far greater speed than a horse express, and, should there be any fear of its encountering a train, it can be lifted from the tramway with as much ease as a sedan-chair.

IRELAND.

Dublin.—The Court of Queen's Bench on Saturday decided that the 15th of January shall be the day for commencing the O'Connell trial. The matter was discussed at great length, and this arrangement was made by the concession and consent of the Attorney-General, although his notice of application stated that the 11th December was the day which he would ask the Court to name for the above purpose. On proceeding to make his motion on Saturday, he was met by a cross application from the other side. The traversers moved the Court that the trial might be postponed till the 1st February. They applied on the general ground that such a delay was necessary to them in order to be fully prepared; and secondly, on the ground that the present Jury list was very imperfect, and that a new and improved one would be in use at the period they specified. This application was moved by Mr. Henn, Q.C., who read a long affidavit from Mr. Pierce Mahony, which chiefly addressed itself to the imperfections of the existing Jury List. Mr. Henn in the course of his argument said, "There were only 4000 names upon the book altogether, and only 388 names upon the Special Jurors' List, of which there were only twenty-three Roman Catholics. Such was the state of the list; and at the present moment there was a revision going on before the Recorder of Dublin, at which the Recorder several times expressed his satisfaction at the benefit which would accrue to the citizens in obtaining fair Juries. At that revision it was found already, although only one-fourth of the collector's lists were gone through, that there were no less than 500 persons qualified to serve, of which 100 were Roman Catholics; and it was sworn that there were no less than 300 members of that religion qualified; therefore under those circumstances he submitted that a fair and impartial trial could not be had from the present list." The Attorney-General defended himself against several charges which had been made against him, and treated all other grounds put forward for postponing the trial as insufficient, save that last mentioned. Under all circumstances he said he had come to the conclusion that he would best discharge his duty by not objecting to the postponement of the trial to the second day of next Term, to the first Monday in fact in that Term, and he should on no account consent to its being put off to the vacation after Term. Mr. Pigot replied on behalf of the traversers, and contended that considering the importance of the case and the circumstances connected with it, the ends of justice could not be obtained without a postponement of the trial till February. The Solicitor-General was about to respond on the part of the Crown, when he was interrupted by the Chief Justice, who said that he forbore purposely throwing out anything like an expression of opinion of the most remote kind upon the merits of the present case. In the first place—except from popular report, which amounted to nothing—they knew nothing at all about them. In the next place, it would be premature to express a knowledge of what they did happen to know before the case came on for trial, when the accused would have to meet the charge made against them, and be prepared to do so. It was of the utmost regard that proper respect should be paid to the due course of the administration of justice. The Attorney-General had very properly given way to the postponement of this case until everything like an imputation upon the selection of the jury was to be remedied by the process of revision, which it appeared on all hands was now going forward before the Recorder of Dublin. He

knew that there had been affidavits made by the gentlemen who acted as solicitors for the respective defendants, wherein it was represented that they did not think they would be ready before a certain day which they named. Now if what they so stated was a matter of fact within their own knowledge, he would pause before he disregarded what they said; but as that was a mere matter of opinion the court was not called upon to decide it. Under all the circumstances the court were of opinion that the traversers would have plenty of time between this and the 15th January, the day nominated by the Crown for trial, to prepare their defence. His Lordship having observed that it was not mentioned in the affidavits that any of the traversers' witnesses were resident out of Ireland, ordered that the trial should take place on Monday the 15th January next. Mr. Steele (who was sitting in the traversers' bar) rose to address the court. He said—I most respectfully press a proposition that I ought to be heard being, as I am, one of the parties concerned in this case. Chief Justice—This is, perhaps, somewhat irregular. Mr. Steele—I have a profound respect for the court, but—Chief Justice—I should be very sorry to cut you short, Mr. Steele. Mr. Steele—I hope I shall receive the same justice from you, my Lord, as I did from your illustrious brother when I was tried before him. Chief Justice—Go on. Mr. Steele—I most respectfully beg to say that, lest my silence should be considered an acquiescence in what your Lordship has stated in regard to the witnesses that they all resided in Ireland—Chief Justice—I merely stated, Mr. Steele, that the affidavits did not mention that any of the witnesses resided out of Ireland. Mr. Steele—My Lord, what I have to say is this: the only witness whom I shall examine who resides in Ireland is Lord Plunket, and it is with pain I draw him from his present retirement; all the other witnesses reside in England. It was then ordered that Monday, the 15th January, 1844, should be fixed as the day of trial. The court, which was extremely crowded during the day, was soon vacated by the public and the ordinary business of the court proceeded with. The utmost anxiety was manifested by the most respectable citizens, numbers of whom thronged the hall of the court and the avenues to it to learn the result.—On the same day an application was made to the court by Mr. O'Hagan, on the part of Mr. Charles Gavan Duffy, one of the traversers, for a copy of the names of the witnesses on the back of the indictment. He moved upon the affidavit of Mr. J. Coppock, an English attorney, showing what was the practice in England. A motion similar to this had been brought forward, and had been decided against the traverser. But for the present proposition they had special grounds, special affidavits, and special circumstances. The Attorney and Solicitor-General opposed the application, and the Lord Chief Justice said the practice in England was not conclusive. It would, he said, be a different thing to call at the trial a witness whose name was on the indictment, and to make the concession required here, when the consequence might be discussions in newspapers and their characters vilified. There was another danger of witnesses being put out of the way, he did not say by foul means, but by foul means or otherwise. That was a danger which was to be guarded against. He deemed that nothing could be more injurious than a difference of practice in this country and in England; but he protested he was not to be bound by the opinion of Mr. Coppock; and he must say that if he were driven to make a selection between the practice in England and in Ireland, then he must abide by that in Ireland. His opinion therefore was, the rule should be refused. Mr. Justice Burton and Mr. Justice Crampton concurred with the Chief Justice. Mr. Justice Perrin dissented. The rule was consequently refused. At the close of the proceedings Mr. Smyly moved, on the part of the Crown, that their Lordships should direct the proper officer to strike a Special Jury in this case, the rule not to be acted on until the new Jury list should be made out. The order was granted.—The weekly meeting of the Repeal Association took place on Monday. The inspector of police and government reporter were present. After reading several letters from Presbyterians, approving of the late declaration of the Catholic prelates against a state provision, Mr. O'Connell said he "had now to address the association on matters that related to the present state of the repeal question. He was asked, did he feel any species of diffidence as to the ultimate success of that measure? He had been asked whether the prosecution had not impeded its course, and might check its career completely? His answer at once was, those prosecutions had assisted the cause, and made its ultimate success more secure and more complete. more conciliatory, and, at the same time, more complete. That was his thorough conviction. Look at the magnificent tranquillity of the people of Ireland. He always said that they were determined to obtain the repeal by peaceable means. He was told that, if they were interrupted in their career—if the monster meetings, as they were called, were interrupted, the peace would certainly be violated. They were interrupted in the way most dangerous to the peace; they were interrupted by having a short notice given them—they were interrupted in the mode most likely to create tumult, and perhaps even civil war. But what was the result? Perfect tranquillity prevailed; there was not a ripple on the surface of the political ocean, and he was confident that tranquillity would still continue. He would plead guilty to the indictment, if he found in Ireland one single effort to disturb the public peace. What cared he for the result of the prosecution? He could not be deprived of the facts in favour of repeal, and he looked forward to the continuance of that tranquillity, whatever might be the result of the trial. He was sure of the repeal, if the tranquillity assisted him

on the trials and after them, as it did now. Why, they might imprison them, but would they prevent them from writing? Would they prevent the people from looking forward to the day when the period of the traversers' sentence would expire? Oh! they might postpone the repeal cause for a season, but if the tranquillity continued, the day of the revival of the repeal cry would as surely occur as the rising of to-morrow's sun, and it would come the better, because the men of fortune and timid men who were now afraid that the people would engender disturbance, would find that their fears were ill-founded. He next commented on an article in the *Times*, which he charged with anticipating the result of their trial. He bewailed the attack on Mr. Waller, and the dreadful murder of Miss Vereker, and again returned to the *Times*—whose conductors he denounced as "reckless ruffians." He warned England against the encroaching power of Russia, and again made a digression which comprised the year '82 and the independence of Ireland. A letter was read from Mr. Smith O'Brien, accepting office as one of the Committee of the Association. Mr. O'Connell said he wished to state that he was highly honoured by being invited to preside at the banquet to be given to Mr. Smith O'Brien on the 4th inst., and he never performed a public duty with greater pleasure than he would do in presiding at that banquet. He considered Mr. Smith O'Brien one of the greatest acquisitions the repeal cause could have; one who was, in his opinion, in the very highest grade of Irish patriotism. A vote of thanks was passed to Mr. John O'Connell for his financial statement on a former day of meeting. Mr. Steele announced that, in addition to Lord Plunket, he would examine on his trial Sir R. Peel, Sir J. Graham, Lord Lyndhurst, Mr. Bond Hughes, and the Duke of Wellington. The repeal rent for the week was announced to be 636l. 0s. 8d.—Mr. O'Connell has issued another address to the people against Ribbon Societies and midnight fires; the latter of which he condemns as "a foolish and dangerous custom, which can do no good and may do a great deal of harm, even accidentally." The *Fermanagh Reporter* states that "the persons who attended the late repeal meetings throughout Ireland in the character of French emissaries were neither more nor less than officers of the London police, sent over to Ireland for the purpose of watching the proceedings and noting the seditious expressions of the leaders. They were 40 in number, and well acquainted with the continental languages. It is said that they can prove certain offers from the repealers which will substantiate the assertion of the Attorney-General, that he would prove the existence of a wicked and dangerous conspiracy."—Lord Lucan and Mr. St. Clair O'Malley, who had been deprived of the commission of the peace for personal squabbles, have, says the *Pilot*, been both reinstated in all their former honours as magistrates.

Finoc.—A new proclamation has been issued by the Lord-Lieutenant increasing the reward for the apprehension of the persons concerned in the attack on the person of Mr. Waller, from 80l. to 150l., in consequence of the death of Miss Vereker. This proclamation states that the assailants consisted of "a party of three men, armed with pistols." The resident magistrate has also offered a reward of 500l. for the discovery of the offenders. Subsequent accounts received by express yesterday mention the death of Mr. Waller on Wednesday morning between 2 and 3 o'clock. For some days hopes were entertained of his recovery, but on Tuesday his medical attendants felt alarm at the inflammation which was displayed around the wounds on his head. He rallied at night and immediately afterwards fell asleep. About two o'clock he awoke and rung the bell and desired the servant to tell his family to come to him for he had not long to live, and in less than half an hour the ill-fated gentleman expired. Miss Vereker's death was not communicated to Mr. Waller until Monday, and the effect upon him was most prejudicial. The immediate cause of his death arose either from erysipelas or from an abscess forming in his head which broke upon the brain. Mrs. Waller is not expected to survive long. It is rumoured that the police have received information which they expect will lead to the detection of the murderers.

Queen's County.—A labourer named John Gill was apprehended last week in Dublin, and conveyed to Tullamore prison to await his trial at the ensuing assizes on the charge of being concerned in the murder of Lord Norbury.

Claremorris.—An inquest was held on Wednesday the 22nd at Castlemacgarrel, near this town, on the body of the Hon. Henry Browne, son of Lord Oranmore. There were only a few witnesses examined, when the following verdict was returned:—"That the deceased came by his death in consequence of a gunshot wound received on the 21st inst. by the accidental discharge of his own gun while shooting on the lands of Ballykneave."

SCOTLAND.

Sutherland.—The differences which have recently created so much sensation in Scotland between the Duke of Sutherland and the leaders of the Free Church have been satisfactorily settled. The ground on which his Grace declined to grant sites in the county of Sutherland was the reiterated declaration of the Seceders that they looked on the establishment as non-existent as a church, and that their object was to sweep what they were pleased to call the residuary body from the face of Scotland. It has, however, been explained to the Duke by the Free Church that the Seceders are not combined for the overthrow of the institution they left, but that their sole object is to diffuse what they think are sound principles. On this assurance the Duke of Sutherland has felt it his duty to give a favourable consideration to any applications for sites, provided they appear to his Grace to be founded on

such principle, reserving however to himself the power to determine the situation of such sites, and taking care to grant them with due regard to the wants of the people, and to the welfare and security of the Establishment.

Edinburgh.—The Faculty met in their library on Saturday, for the purpose of electing a Dean in the room of Lord Robertson, when Mr. Duncan McNeill the present Lord Advocate was elected.—The musical chair in the University is again vacant. Sir Henry Bishop, who is now in London, has written to the Senatus stating that his health will not permit him to come down and deliver lectures, and that in consequence he resigns the chair.

Aberdeen.—The Senate of King's College and University, Aberdeen, on Saturday last, by the casting vote of the Principal, approved generally of the resolutions of the Senate of the University of Glasgow relative to the abrogation of religious tests in the Scottish Universities.

THEATRICALS.

DRURY-LANE.—On Monday night the lessee of this theatre fairly put forth his strength by the production of a new opera, the work of a native composer. The experiment, although hazardous in the extreme, looking at the fickle taste of English audiences, was most triumphant, and composer, author, and singers, were called for in succession. The *Bohemian Girl* is the title of Mr. Balfe's new opera; the libretto is taken almost entirely from the pantomimic ballet of *La Gypsy*, invented by MM. De St. Georges and Mazilier for Fanny Elssler when she was at the French Opera in 1839, and a version of which has been given at her Majesty's Theatre. Mr. Bunn in arranging the words of the libretto has changed however the locality from Scotland to Hungary. The French story is made to pass in the time of Charles II. The adapter has taken a somewhat corresponding period in Polish history. Thus Thaddeus a proscribed Pole, is to the Emperor of Austria what the Puritans are to the restored Charles. There is little difference consequently in the situations. It is the same history of an exile who joins a band of gipsies to save himself from his pursuers, and who then saves the child of a Count from the anthers of a chased stag. The child afterwards stolen by a gipsy chief out of revenge also joins the tribe, and in due course marries her benefactor. The real rank of the heroine is finally discovered, as also the position of her husband, and the Baron consents to ratify the union. This would seem to end the drama, but there is a jealous queen of the gipsies, and she nearly accomplishes the ruin of the lost child's character by accusation of robbery, and eventually her death, had not the blow been turned against the enraged queen herself. This is the operatic *finale*, for the opera ends fatally. This drama derives its entire interest from its domestic situations; but from the numerous incidents succeeding each other with such rapidity attention is kept alive to the end, and the composer has no ordinary scope for the exercise of his talent. The principal characters were sustained by Miss Rainforth, Mr. Harrison, Mr. Hudson, and Miss Betts. A ballad, "That you loved me still the same," the gipsy girl's dream, was sung twice so charmingly by Miss Rainforth, who is the stolen child arrived at woman's estate, that it was demanded vociferously a third time. At the close of the piece, Mr. Balfe, Mr. Bunn, and the principal singers were called for, and received with such enthusiasm as to leave no doubt that the "*Bohemian Girl*" will have a long career of success.

Law.

COURT OF COMMON PLEAS.—*Registration Appeals; Boroughs of Wenlock, Ludlow, and Birmingham.*—In the two former cases several decisions of the Revising Barrister striking off the list of borough voters persons who qualified in virtue of stables (not being livery stables), in fields, were decided by the court on appeal last week. The judges held that though bridges or walls were not buildings of the same kind as "warehouses," &c., mentioned in the Act, yet stables were so, and therefore were within the meaning of the words, "other buildings." The decision of the Revising Barrister was therefore reversed. In the case of Birmingham the question involved was, whether a leaseholder had a right to claim to vote for a county, he being the lessee for a term originally created for 99 years in the borough, of houses which, separately, were not of the annual value of 10l., but, collectively, were worth more than that sum. The Revising Barrister decided that the claimant was entitled to vote for the county. It was now contended that the decision of the Revising Barrister was not founded on law, and that from the words of the Act of Parliament it was the intention of the Legislature to keep the county voters free from the commixture which would take place if these low houses which did not give a vote for a borough should give a vote for a county. For the respondents it was urged that the language of the 20th section of the Act was so clear, there could be no doubt that voters of this description were contemplated by the Legislature. No inconvenience could arise from property unrepresented in a borough being represented in a county. The Court was of opinion that the Revising Barrister was right in the construction he had put on the words in the Reform Act. It was perfectly clear that the property in question fell within the meaning of the language of the 20th section, and such right of voting was not taken away by the 25th section. And, although a portion of the term may have been parted with by the voter, yet such residue of the term as remained would give him the right to vote. The decision of the Revising Barrister was, therefore, confirmed, and judgment given for the respondents.

Baxter v. Nurse.—Sir T. Wilde, with whom was Mr. Sergeant Bompas, Mr. Sergeant Channell, and Mr. Humphrey stated that this action was brought by the plaintiff, Dr. Baxter, to recover damages from the defendant for services that he had rendered as editor of the *Illustrated Polytechnic Review*, of which journal defendant was proprietor. An introduction took place between Mr. Nurse and plaintiff which ended in the latter being engaged as editor at a salary of three guineas a week. His services, however, were not allowed to continue for a long time, for after the publication of the third number the defendant thought proper to dismiss him. He however did not choose to be treated in that manner, and wrote a letter to defendant stating that the custom in the engagements of editors was that the engagements should be for the year, and therefore he should continue to perform the duties of editor. Witnesses connected with the press were called to prove that in instances such as the present engagements were always annual unless a specific agreement to the contrary was entered into. Among these witnesses were Mr. Dowling, editor of *Bell's Life in London*; Mr. Griffin, sub-editor of the *Tablet*;

Mr. Woods, parliamentary reporter of the *Times*; Mr. Ayckbourn, a barrister and reporter; Mr. O'Brien, a barrister engaged himself sub-editor of the *United Service Gazette*; Mr. Grunelston, foreign editor of the *Morning Post*; Mr. Bousfield, of the *Times*, and others, all of whom stated that an engagement of an editor was always for a year at least according to the usage of the press. For the defence Mr. Sergeant Talfourd contended that whatever might be the nature of the engagements of editors or sub-editors of daily newspapers it could not apply to an engagement on a new publication of this description published at the cheap rate of 4d. The sum of 50l. had been paid in court which the plaintiff had accepted for services rendered before the publication of the journal. But he had thought proper to charge the sum of 534l. odd, being composed of a large sum, at the rate of 3l. 3s. for a twelvemonth, 4l. 4s. a week for the loss he had sustained in not having the perquisites, such as books, prints, &c., generally the property of the editor, which he would have acquired had he continued editor, besides other pecuniary advantages, such as an increase of salary on the sale reaching so many thousands. The publication had, however, been a total failure, and the defendant had made it over to Dr. Sigmund. However, whether such a usage as stated existed or not, the defendant was justified in dismissing the plaintiff, as he had reason to be displeased with the manner in which he conducted the journal. Witnesses were called to prove this dissatisfaction on the part of the plaintiff. Titus Danks, a foreman in the printing house of Mr. Reynell, stated he heard Dr. Baxter and Mr. Nurse on one occasion in very high words. Mr. Nurse had a written paper in his hand, which he showed to Dr. Baxter, stating that he should like it to be inserted. Dr. Baxter said "No; it is conveying an imputation upon me." Mr. Nurse stamped his hand upon the desk, and said it should be inserted, whatever was the consequence. He also alluded to an article about Dr. Playfair, which had been inserted in the first number of the *Review*, and which had previously been printed. Mr. Nurse then went away. Dr. Baxter afterwards came up to the printing-office, and told him not to print the article. It was, however, printed. The article was put in evidence, and was an apology for having taken an article from the *Gardeners' Chronicle*, and inserted it in the *Illustrated Polytechnic Review*. Examination continued: Dr. Baxter did not assist as editor when he came to the printer. He was rather in the way than otherwise. Dr. Lindley, a proprietor of the *Gardeners' Chronicle*, stated that he saw the article in the *Illustrated Polytechnic Review*, copied almost entirely from the former publication. The misprints were included. He complained of such proceeding in the *Gardeners' Chronicle*, because they stated that they had peculiar means of gaining information, and they gave the whole of an article for which he had paid a sum of money. He was not aware of any usage to give an editor a year's engagement. Dr. Potts had looked at the three first numbers of this *Review*, and felt disappointed at the articles which appeared in it. He thought from its name it ought to have treated upon the arts which peculiarly concerned the Polytechnic Institution. He felt so disgusted at the work that he did not read it through. Dr. Potts also thought that the articles were altogether preposterous and belied the title. There were three articles, one on the wind gauge, another on the barometer, and the third on the thermometer, which were copied and utterly incorrect, showing an ignorance of chemical knowledge. The witness also alluded to other inaccuracies, such as printing the name of a French chemist, "Pelouze," as "Pilonge." The three first numbers were sufficient to damn the publication. The articles were preposterous for a *Polytechnic Review*. They would have better suited *Punch*. The Lord Chief Justice summed up and told the jury that the principal questions they had to determine were whether this was an engagement for a year; secondly, whether the defendant had by his plea and the evidence he had given in support of it shown his right to terminate the engagement before the end of the year; and lastly if it should become necessary to what amount of damages the plaintiff was entitled for the inconvenience he had sustained. Now undoubtedly the general rule of law was that when there was nothing to contradict it, if a person engaged another upon a service that was in its nature a lasting and enduring service, the engagement was for a year. That was the general course the law assumed, but the law always looked at the nature of the contract and at the agreement itself, and therefore the plaintiff had called a considerable body of evidence to show that in the cases of editorships of newspapers and other publications of that nature, where an editor was employed and no particular stipulation made, it was always understood by both parties and acted upon, and the general usage was that it was an engagement for the whole year. Undoubtedly when there was a general understanding and a particular course of dealing, and agreements were made without any specific stipulations to vary them from the general course they were held to be included within it. The evidence that had been adduced on that subject was therefore of a nature very proper for them in determining the verdict to take into their consideration. The Jury retired at a quarter past eight o'clock at night, and after having been absent for a considerable time returned with a verdict for the defendant; first issue, that plaintiff was not engaged by the year; second, that defendant had proved his plea.

COURT OF EXCHEQUER.—*Gardner v. Mario and Another.*—This was an action by a market gardener, residing at Ealing, against Signor Mario and his coachman, a person named Albridge, to recover compensation in damages for injuries done to the plaintiff's horse and cart, in consequence of an accident, which was alleged to have been produced by the negligent driving of Signor Mario's servants. Messrs. Jervis, Humphrey, and James appeared for the plaintiff, Messrs. Cockburn and Jones for defendant. It appeared that on the morning of Sunday the 2d of July, at about one o'clock, the plaintiff was driving home to Ealing, in his cart, with one horse, containing a little boy, the plaintiff's son, and some meat and other marketing. Signor Mario's carriage was returning from Notting Hill to town, after depositing the owner upon his return from the Opera-house. The carriage contained the Signor's cook and valet, and by some accident it came in collision with the plaintiff's cart, which was upset, much broken, and the horse so severely injured that he was afterwards killed. The plaintiff's son was thrown out under the cart, in a situation of great peril, but fortunately escaped without much injury. The plaintiff himself was also slightly hurt. As usual in cases of this description the witnesses on either side appeared to have viewed the circumstances in a very different light. The plaintiff's witnesses represented that the cart was going at a slow pace, at the proper side of the road, and that there was abundant room to have passed without a collision, had it not been for the wanton carelessness of the defendant's coachman, who was driving rapidly. On the other side it was alleged that the Signor's carriage was going at a moderate pace, and that the accident was occasioned by the plaintiff keeping the middle of the road. The case lasted up to an advanced hour, and terminated by a verdict for the plaintiff—Damages, 50l.

Solomons v. Isaacs, Executrix.—This was an action by Mr. Solomons, fruiterer in Covent-garden market, to recover from Mrs. Isaacs, the widow and executrix of one Samuel Isaacs, deceased, the amount of an I O U for 200l. with interest, alleged to have been given by the deceased to the plaintiff so far back as the year 1839. Mr. Jervis, with Mr. Miller, appeared for the plaintiff; and Mr. M. Chambers, with Sergeant Bompas, for the defendant. The plaintiff and the deceased, Mr. Isaacs, were intimate friends, and had been partners in trade, and it was suggested that the money, for which the 200l. I O U was given, was borrowed by Mr. Isaacs to advance to a son-in-law, whom he was anxious should not know he could give so much money without borrowing it. A stock-broker, who was in the habit of seeing Mr. Isaacs' will, and other persons acquainted with his handwriting, deposed that the signature to the I O U was that of the deceased. There was also some evidence of the payment of interest. The body of the document was in the handwriting of a clerk of Mr. Solomons, but he could not recollect under what circumstances it was written. On the part of the defendant it

was contended that the IOU was a fabricated document, as it was unlikely that the deceased, who was a very wealthy man, would have borrowed so large a sum of money, and still more unlikely that the plaintiff, from his circumstances, could have afforded to lend so large a sum, or, if lent, to allow it to continue unpaid from 1839 until after Mr. Isaacs' death, which occurred in the early part of the present year. To show the pecuniary incapacity of Mr. Solomon to advance a large sum of money by way of loan, it was stated that in the year 1829 he had applied to a charitable loan society for an advance of 1000l., giving the security of two householders, and had himself given an IOU for 500l. to Mr. Isaacs. It was attempted to explain these facts, however, by evidence in reply, showing that the loan was intended for plaintiff's son, and that the IOU was security for a joint advance for the benefit of a third party. After occupying several hours, the case terminated with a verdict for the plaintiff—Damages 205l.

Custom House Frauds.—*The Attorney-General v. Blake.*—*The Attorney-General v. Candy.*—The first of these cases occupied the Court for two days. It was imputed to defendant that, being an officer of the Customs, and having a place of trust in its management, he had violated that trust, and had assisted in the actual perpetration of frauds, by representing that certain packages consigned to Candy, Dean, and Co., contained a less quantity of manufactured silks, liable to duty, than they actually contained. The jury, after a few minutes' consultation, found a verdict for the Crown, estimating the single value of the goods at 1,450l. In the latter case, the information was filed by the Attorney-General against Charles Candy, for penalties amounting to treble the value of five packages of goods delivered without duty being paid, ex the City of Boulogne, on the 19th of June, 1840. The evidence adduced was precisely similar to that given at length in the preceding cause, both prosecutions originating in the same transaction. The case lasted the whole of Thursday, and was then adjourned for further argument.

CENTRAL CRIMINAL COURT. *William Fowler, alias Benjamin Neek,* was indicted for forging and uttering an order for the delivery of 250 Guernsey frocks, with intent to defraud William Kynaston and another. The prisoner pleaded *Guilty*. The prisoner having been previously convicted for felony, and sentenced to transportation, was retained on board the *Justitia* hulk in this country, on account of the surgeon's report that he was unfit to be sent abroad by reason of a slight lameness with which he was afflicted. While on board the hulks his services were made use of in writing orders and keeping the books, and eventually he obtained a pardon. Immediately upon his release, however, it would appear that he forgot the lesson he had received, and applied the knowledge he had obtained of the mode of doing the business on board the convict ship to effect the offence he was now charged with. There was a second indictment, imputing to the prisoner a similar offence, and to this he also pleaded *Guilty*. The Recorder, in passing sentence, commented in severe terms upon the ingratitude of the prisoner in repaying the kindness of the prosecutor (who was the master of the convict ship), by committing a forgery upon him the moment he obtained his release, and he said he trusted that a similar lameness would not in future operate to prevent the sentence of the law from being fully carried into effect. The prisoner was then sentenced to be transported for life.

The Slave-trading case.—*Thomas Jennings,* captain of the *Augusta*, who stands re-arrested on the charge of navigating her as a slave-vessel, but whose trial cannot take place until evidence shall have been obtained from Sierra Leone, was placed at the bar *pro forma*, when the trial was postponed to the next August session of this court. An application was then made to have the prisoner admitted to bail; but the Court was of opinion that that should be the ground of a future and separate application.

The Seditious case of Mr. B. Gregory.—Mr. M. Chambers submitted an application in this case in reference to irrelevant matter introduced into the affidavits. Mr. Wilkins, for the prosecution, stated that the only object of the present proceeding was to obtain delay, and if they went on in this manner the matter would never come to an end. Mr. Baron Parke said that would not be the case, for the Court had resolved that the defendant should be brought up for judgment on Saturday, and in the meantime affidavits on both sides would be looked into, the Court would decide on all matters contained in them which they considered relevant should be examined.

Forgery.—*Samuel Joseph Smith*, who has long successfully carried on a system of passing by means of false pretences, in connection with a numerous band of accomplices, and who was at length caught in a charge of forging and uttering an instrument described as a promissory note, or a bill of exchange, and of which offence he was convicted at the last August session of this court, was brought up for judgment, in company of *Henry Bush*, one of his accomplices, who appeared as a witness for him at his trial, and swore that he himself had signed the bill in his own proper name, and on behalf of himself and brother. On the conviction of Smith, Baron Parke directed Bush to be taken into custody and indicted for the forgery, which was accordingly done; and at the September session he was tried and convicted also. Judgment was respite on both, in order to have the decision of the judges on a point raised regarding the validity of the indictment, the question being whether the instrument was properly described as a bill of exchange. Mr. Baron Parke, addressing Smith, said that the judges had ruled the description to be correct, and it only remained for him now to pass sentence. Smith said he should move an arrest of judgment; and a long argument took place between him and his counsel, at length he was allowed to be silent, when Baron Parke addressed him and said the learned judge who presided at his trial had informed him of the degree of punishment which he thought should be inflicted upon him. It was that he should be transported for life. Smith, folding up his papers, said he had been very hardly dealt with. He had been convicted by perjury. Henry Bush was then placed at the bar and sentenced to the same punishment.

The late Duel.—The trial of Lieuts. Munro and Grant is arranged to take place at 10 o'clock this day (Saturday), the authorities of the War-office having compelled them to surrender on pain of forfeiting their commissions. Mr. Thesiger, Mr. Bodkin, and Mr. Clarkson, have been retained for the defence; and the Attorney-General, the Solicitor-General, Mr. Adolphus, Mr. Waddington, and Mr. R. Gurney will represent the Crown. The trial appears to excite the most lively interest among the military circles, and several applications have been made to the sheriffs by persons of high rank for tickets of admission to the court. There are 33 witnesses to be examined for the prosecution, and it is currently reported that some extraordinary circumstances will transpire that will throw additional light upon the original cause of quarrel.

Felony.—*Elizabeth Bryant*, the widow of a merchant, and formerly matron of the Wanstead Orphan Asylum, was indicted for stealing on the 3d November, a tablecloth, two napkins, and other articles, the property of the governors and trustees of the Wanstead Orphan Asylum. The particulars have been already noticed in this paper. Another count laid the property as belonging to the Archbishop of Canterbury and others. The prisoner first pleaded *Not Guilty*, but afterwards retracted her plea, and pleaded *Guilty*. Mr. Justice stated that there were many mitigating circumstances in favour of the prisoner. She was the widow of a merchant, who on dying left her the sum of 2,500l., which had since been converted by the trustees to their own use. She had hitherto borne an irreproachable character, and the articles themselves were of trifling value. After some conversation between the counsel and Judge, the sentence upon the prisoner was respite until further inquiries should be made. *Edward Bryant*, charged with the murder of his infant child, by knocking it over the counter of a bar at a public-house, was tried before Lord Denman yesterday. The evidence clearly established the crime. Mr. Wilkins defended the prisoner chiefly on the ground of his previous fondness for the child, the aggravating conduct and desertion of it by its

mother,—the improbable barbarity of the act intentional—and the discrepancy in parts of the evidence. The Jury returned a verdict of "Guilty of committing the act under strong excitement, and therefore recommended the prisoner to mercy." The Lord Chief Justice passed sentence of death to be commuted to transportation for life.

SPORTING.

TATTERSALL'S, THURSDAY.—**THE DERBY.**—200 to 10 agst Loadstone; 1,000 to 30, and 720 to 20, agst Running Rein; 1,000 to 25 agst Voltri; 500 to 10 agst Attaghan; 1,000 to 15 agst Theseus; 1,000 to 15 agst Telemachus; 1,000 to 10 three times agst the Wadestra colt; and 1,000 to 10 agst the Ashstead Pet (half-bred); offers to take 7 to 1 about Rattan, and 15 to 2 about the Ugly Buck. The colt by Elis, out of Nanine, name by the Hon. S. Herbert, is now the property of Lord Palmerston, and one of John Day's Derby lot. Running Rein has joined Smith's stable at Epsom.

Miscellaneous.

A New Comet.—At 1 A.M. on the 22d ult. a comet only visible through a telescope was discovered near the star Gamma of Orion by M. Faye, an astronomer attached to the Royal Observatory at Paris. Notwithstanding the clouds and vapours which impeded the view and rendered the observation uncertain the position of the star was clearly ascertained; the head was so distinct that the observations were made with great facility. From the head slight trains of light were seen diverging nearly opposite to the sun, and this tail was then in length about four minutes of a degree. Since the above announcement Sir James South has published in the *Times* the following account, dated from Kensington Observatory on Thursday morning at half-past 2 A.M.:—"This comet was observed here with the 5-feet equatorial, whose object-glass is 4 $\frac{3}{4}$ inches aperture, about 8 o'clock last evening; with the large achromatic of 11 inches 9-10ths diameter its nucleus, with powers of 250 and 300, seemed not round but elongated in the direction of the tail, which latter after moonset extended about 11 minutes. It does not bear much illumination of the field although it was easily found with an achromatic telescope of 2 $\frac{1}{2}$ inches aperture. At 48 minutes 37 seconds after midnight its right ascension was about 5 hours 21 minutes and 37 seconds and its northern declination about 5 degrees 34 minutes and 32 seconds, and it is very near the star A Orionis."

A Sea Monster.—The following article is copied from a Barbadoes paper:—"On the 22d August the brig *Rowena* was lying in Lagunayra Roads, the weather perfectly calm. I discovered the vessel moving about among the shipping. I could not conceive what could be the matter. I gave orders to heave in and see if the anchor was gone, but it was not; but to my surprise I found a tremendous monster entangled fast to the buoy-rope and moving the anchor slowly along the bottom. I then had the fish towed on shore. It was of a flattish shape something like a devil-fish, but very curious shape, being wider than it was long, and having two tusks one on each side of the mouth, and a very small tail in proportion to the fish and exactly like a bat's tail. The tail can be seen on board the brig *Rowena*. The dimensions of the fish were as follows:—Length from end of the tail to end of the tusks, 18 feet; from wing to wing, 20 feet; the mouth, 4 feet wide; and its weight 3,502lbs.—C. S. Dill."

Extinguishing Fires.—A correspondent ("R. T.") at Daventry, writes that at a fire in that town on Saturday last, it was satisfactorily proved that *Potash* is effectual in extinguishing fire. Mr. Lord, of that town, sent out a large cask of potash and employed a person to put it into the engines, and to this circumstance our correspondent states the safety of that portion of the building which remains is principally attributed.

Colonel Stoddart and Captain Conolly.—Lieut. Vincent Eyre, one of the British Officers who fell into the hands of Akbar Khan, in the retreat from Cabul in 1842, has addressed a letter to the Rev. Joseph Wolff, on the subject of his expedition to Bokhara. It is dated at Meerut on the 17th Sept. last. After expressing his regret that he is prevented by official duties from accompanying Mr. Wolff, he says—"I will now tell you all I have been able to learn about our two captive countrymen. The last authentic intelligence was contained in two letters from Arthur Conolly himself to his brother John, then a hostage at Cabul, in the summer of 1842, in which he drew a melancholy picture of their situation in a prison at Bokhara. For four months they had no change of raiment, their dungeon was in a most filthy and unwholesome state, and teemed with vermin to a degree that rendered life a burden. Stoddart was reduced to a skeleton, and his body was covered with putrid sores. They had with great difficulty prevailed on one of their keepers to represent their wretched condition to the King, and were then awaiting this reply, having committed themselves to God, in the full assurance that unless soon released death must shortly terminate their sufferings. The King was always described to us by the Afghans as a horrid and merciless tyrant, being subject to fits of insanity, during the continuance of which all around him tremble for their lives. This picture of him may be overcharged, but if true it is almost destructive of hope. You have, of course, heard the story derived through Col. Sheil, from a Persian who professed to have actually seen the graves in which Stoddart and Conolly had been buried. This story has, however, been contradicted by two very respectable Jews, both of whom I know intimately, and whom I believe to be honest, upright men. They have received letters from friends at Bokhara mentioning both Officers as still alive; and information has been received from other quarters that the two graves were those of two servants who had offended the King. There was a popular belief at the time of their execution that they were British Officers, and this may have been what misled Colonel Sheil's informant. Since writing the foregoing, I have received a reply to my application from the

Cabul Relief Committee, who regret that they are debarred by the rules of the fund from placing any money at your disposal, but expressing their readiness to assist your undertaking to the utmost of their power."

MARK LANE, FRIDAY, DECEMBER 1.—We had a very bad attendance of buyers at Market this morning, the vessels from Essex have arrived which have been detained a fortnight, and the Wheat comes very badly to hand, several refusals have taken place; good dry samples realize the same prices as on Monday. Foreign continues to sell slowly at the same rates, and there is still some inquiry for bonded. A fresh supply of Barley has created a great dullness in the trade. White and Grey Peas, and Beans of all sorts, are unaltered in value. The Oat trade is rather firm.

GAZETTE OF THE WEEK.

BANKRUPTS.—C. PARSONS, 4d, Blackman-street, Southwark, tailor—W. PARSONS, Chelmsford, Essex, draper—W. and L. DUNNACK, Tooley-street, Southwark, 10mbs—G. BARRAS, Portsea, Hampshire, innkeeper—R. GOODWIN, 8, 10, 12, 14, 16, 18, 20, 22, 24, 26, 28, 30, 32, 34, 36, 38, 40, 42, 44, 46, 48, 50, 52, 54, 56, 58, 60, 62, 64, 66, 68, 70, 72, 74, 76, 78, 80, 82, 84, 86, 88, 90, 92, 94, 96, 98, 100, 102, 104, 106, 108, 110, 112, 114, 116, 118, 120, 122, 124, 126, 128, 130, 132, 134, 136, 138, 140, 142, 144, 146, 148, 150, 152, 154, 156, 158, 160, 162, 164, 166, 168, 170, 172, 174, 176, 178, 180, 182, 184, 186, 188, 190, 192, 194, 196, 198, 200, 202, 204, 206, 208, 210, 212, 214, 216, 218, 220, 222, 224, 226, 228, 230, 232, 234, 236, 238, 240, 242, 244, 246, 248, 250, 252, 254, 256, 258, 260, 262, 264, 266, 268, 270, 272, 274, 276, 278, 280, 282, 284, 286, 288, 290, 292, 294, 296, 298, 300, 302, 304, 306, 308, 310, 312, 314, 316, 318, 320, 322, 324, 326, 328, 330, 332, 334, 336, 338, 340, 342, 344, 346, 348, 350, 352, 354, 356, 358, 360, 362, 364, 366, 368, 370, 372, 374, 376, 378, 380, 382, 384, 386, 388, 390, 392, 394, 396, 398, 400, 402, 404, 406, 408, 410, 412, 414, 416, 418, 420, 422, 424, 426, 428, 430, 432, 434, 436, 438, 440, 442, 444, 446, 448, 450, 452, 454, 456, 458, 460, 462, 464, 466, 468, 470, 472, 474, 476, 478, 480, 482, 484, 486, 488, 490, 492, 494, 496, 498, 500, 502, 504, 506, 508, 510, 512, 514, 516, 518, 520, 522, 524, 526, 528, 530, 532, 534, 536, 538, 540, 542, 544, 546, 548, 550, 552, 554, 556, 558, 560, 562, 564, 566, 568, 570, 572, 574, 576, 578, 580, 582, 584, 586, 588, 590, 592, 594, 596, 598, 600, 602, 604, 606, 608, 610, 612, 614, 616, 618, 620, 622, 624, 626, 628, 630, 632, 634, 636, 638, 640, 642, 644, 646, 648, 650, 652, 654, 656, 658, 660, 662, 664, 666, 668, 670, 672, 674, 676, 678, 680, 682, 684, 686, 688, 690, 692, 694, 696, 698, 700, 702, 704, 706, 708, 710, 712, 714, 716, 718, 720, 722, 724, 726, 728, 730, 732, 734, 736, 738, 740, 742, 744, 746, 748, 750, 752, 754, 756, 758, 760, 762, 764, 766, 768, 770, 772, 774, 776, 778, 780, 782, 784, 786, 788, 790, 792, 794, 796, 798, 800, 802, 804, 806, 808, 810, 812, 814, 816, 818, 820, 822, 824, 826, 828, 830, 832, 834, 836, 838, 840, 842, 844, 846, 848, 850, 852, 854, 856, 858, 860, 862, 864, 866, 868, 870, 872, 874, 876, 878, 880, 882, 884, 886, 888, 890, 892, 894, 896, 898, 900, 902, 904, 906, 908, 910, 912, 914, 916, 918, 920, 922, 924, 926, 928, 930, 932, 934, 936, 938, 940, 942, 944, 946, 948, 950, 952, 954, 956, 958, 960, 962, 964, 966, 968, 970, 972, 974, 976, 978, 980, 982, 984, 986, 988, 990, 992, 994, 996, 998, 1000.

BIRTHS.—On the 25th ult., at Greenwich, the lady of Lieut. G. WALTER, of a son. On the 25th ult., at Portman-square, the Hon. Mrs. ANNALISA, of a daughter. On the 27th ult., at Durham College, Viscountess CHRISTINA, of a daughter. On the 19th ult., Upper Gordon-street, the lady of P. B. MAXWELL, Esq., of a still-born son. On the 27th ult., at Southgate, the wife of A. B. SARGENT, Esq., of a still-born son. On the 25th ult., at Warham Rectory, Norfolk, the lady of the Hon. and Rev. T. K. SARGENT, of a son. On Tuesday, the Earl of MARCH, eldest son of the Duke of Richmond, to Miss Greville, daughter of A. Greville, Esq., Private Secy. to the Duke of Wellington. On the 15th ult., at Farnham, the Rev. J. M. SARGENT, Rector of North Waltham, Hants, to MARY, second daughter of Col. J. SARGENT, Aide-de-Camp to her Majesty, and Viscount of Jersey. (In the Court of St. George's, Bloomsbury, J. KENDALL, Esq., to JANE, youngest daughter of the late Martin Hind, Esq.) On the 1st ult., at Calais, J. P. ROBERTSON, Esq., one of the authors of "Letters on Paraguay." On the 21st ult., FRANCIS GEORGINA, eldest daughter of the Vice-Chancellor of England. On the 25th ult., in Chester terrace, at Regent's park, T. PARKER, Esq., in the 84th year of his age. On the 27th ult., at Fitzwilliam Lodge, Booterstown, near Dublin, the Countess of ROSCOMMON, aged 81. On the 31st ult., at Bushmills-house, Sir F. W. MACLAGHLEN, Bart., in the 81st year of his age.

WANTED, an Experienced Person, of unexceptionable character and good address, to take the management of a respectable Seed Establishment. Also a FOREMAN, capable of taking the general management of a Nursery. Liberal encouragement will be given to individuals properly qualified.—Apply immediately, as the Principal is in town, to C. D., care of W. and J. NOBLE, Seed Merchants, Fleet-street, London. Dec. 1, 1843.

WANTED (IMMEDIATELY) A FOREMAN AND GENERAL SUPERINTENDENT, to conduct the Nursery of an old-established concern in one of the Midland Counties. None need apply who have not filled a similar situation, and thoroughly understand the modern practice of the London Nurseries. A superior address; a married man, of moral habits, with testimonials of some standing, will alone warrant an application. State wages required, and address by letter, post paid, A. Z., Gardeners' Chronicle Office.

WANT PLACES.—All Letters to be post-paid.
AS PRINCIPAL GARDENER.—A respectable and active young Man, whose recommendations will afford the most satisfactory proof of his abilities. Wages, liberal; with garden, house, &c.—Direct to E. H. M., to be left at the Central Post-office, Kentish Town, London.

AS GARDENER.—A respectable married Man, aged 34, who perfectly understands his profession in all its branches, can have three years' character from the gentleman he has just left.—Direct to G. L., at Mr. BAKER'S, Hothouse Builder, Manor House, Manor-place, King's Road, Chelsea.

Printed by M. C. BRADLEY and E. BARNES, Fleet-street, in the City of London, and Published by them at the Office, 3, CHARLES-STREET, COVENT GARDEN, in the County of Middlesex, where all Advertisements and Communications are to be addressed to the Editor.—Saturday, December 2, 1843.

Lilies, treatment of	848 c	— observations on	845 a

REGENT'S PARK GARDENERS' SOCIETY.—In consequence of an arrangement which has been completed with the Proprietor of the "FLORIST'S JOURNAL," the Papers read at the Meetings of the above Society will be published in, and form part of that Work, commencing with the No. for January, 1844.

The Society will in future supply each of its Members with a Copy of the "FLORIST'S JOURNAL" free; and distant Members are hereby requested to make their arrangements for receiving the same, and communicate with the Secretary.

By Order of the Committee. D. MAKER, Secretary.
64, High-street, Marylebone, Dec. 7, 1843.

LUTON HORTICULTURAL SOCIETY.—TO NURSERYMEN.—The lists of this Society for 1844, containing prizes offered to Nurserymen, are now printed, and may be had by applying to the Honorary Secretary, the Rev. HENRY BURKISS, Luton, Beds.

FASTOLFF RASPBERRY.

PATRONISED BY HER MOST GRACIOUS MAJESTY THE QUEEN, HIS GRACE THE DUKE OF RUTLAND, THE EARL OF HARRINGTON, THE EARL OF LIVERPOOL, THE LORD BISHOP OF LONDON, LORD VISCOUNT LORION, LORD SONDES, &c. &c., as well as by the HORT. SOCIETY OF LONDON.

YOUELL AND CO. have much pleasure in announcing they are now enabled to supply fine Canes of the above highly valuable and much esteemed RASPBERRY, unequalled for the extraordinary size of its fruit and richness of flavour.

Those to whom Y. and Co. sent it last season have expressed their high admiration of its superiority over all other varieties, and has been awarded several prizes at various Horticultural Exhibitions during the season. As a proof they have not exaggerated its excellent qualities, Fruit was submitted to Dr. LINDLEY (see *Gardeners' Chronicle* of the 22d July, last page, 502), whose opinion of it is as follows:—

"FASTOLFF RASPBERRY.—We have received from Messrs. YOUELL, of Great Yarmouth, Fruit of the Fastolff Raspberry, and we find it merits all that has been said in favour of its excellence. The Fruit that we have received is very large, oblong conical, and of rich flavour, far exceeding in this respect some other new and large varieties. The plants bear abundantly, and in long succession."

They also exhibited it on the 1st of August, 1843, before the London Hort. Soc., 21, Regent-street, to which a prize was awarded. It would therefore be unnecessary for YOUELL & Co. to recommend it more fully, or with greater confidence, to the notice of the public, merely observing, that it continues in high perfection throughout the autumnal months, and has maintained its superiority in the most unfavourable soils and situations, and requires no other than the ordinary treatment of the old varieties.

Fine Canes are ready for delivery, and can be sent with safety to any part of the United Kingdom, (on the receipt of a Post-office order) upon the following terms:—

Packages containing 100 Canes . . . £2 5s. 0d.
" " 50 " . . . 1 5 0
" " 25 " . . . 0 14 0

Package included. The usual discount to the Trade, when not less than 200 are ordered.

Extensive orders are already received for the above; and to prevent a repetition of the disappointment which many experienced last season, by YOUELL and Co. not being able to meet the demand, they therefore respectfully solicit early application.

** CAUTION.—YOUELL and Co. have appointed no agents in London for the sale of the Fastolff Raspberry.

YOUELL'S TOBOLSK RHUBARB, 12s. per dozen.
—For Particulars of which see their Advertisement of the 18th Nov.

TWO NEW SEEDLING PICOTEEES.—"LADY ALICE PEEL," 10s. 6d., and "MRS. RENVON," 10s. 6d. per pair.

FINEST CARNATIONS AND PICOTEEES.
DUTCH HYACINTHS AND OTHER BULBS.
ARAUCARIA IMBRICATA.

For particulars and prices of the above, see their Advertisement of the 22d Nov.—Great Yarmouth Nursery, Dec. 7, 1843.

NEW HARDY ANNUAL.
VISCARIA Oculata.—DARK-EYED VISCARIA.

T. AND J. BACKHOUSE, NURSERY AND SEEDSMEN, York, have the pleasure of offering to the Public, the above new and beautiful Annual, which is figured at page 53 (No. 10), of the "Botanical Register," for 1843. The blossom is of a bright rose colour, with a deep crimson eye and changing to pale purple. It flowers very abundantly through the greater part of the summer and autumn. It is a native of Algiers, and may be sown either in the open ground in spring, or raised in pots and planted out.

Packets, 2s. 6d. each, will be sent, on the receipt of a Post-office Order, postage free, to any part of the Kingdom.

FLORIST TO HER MAJESTY THE QUEEN.

PETUNIA PUNCTATA.

WILLIAM MILLER, in bringing this extraordinary and beautiful production into public notice, does so without the slightest diffidence, being fully assured of its giving the most entire satisfaction; it is of a dwarf habit, dark green foliage. The reason it was not exhibited at the London shows was, its not flowering till October. It has been submitted three times to Dr. LINDLEY, whose opinions will be found at pages 721, 774, 777, as follows:—"M. R.—Your seedling No. 25 is quite a novelty; it is a beautiful, distinct, and desirable variety; the colour is a soft decided blue, mottled with white and spotted with rose; these gradually disappear, and leave the flower a beautiful blue, mottled with white; in this state the flower dies. It will be an acceptable addition to this beautiful class." It will be figured in "Paxton's Botanical Magazine," and "The Florists' Journal" for February. Plants of it have already been ordered for the Queen's Gardens, Claremont.

Plants in spring at 7s. 6d. each, including case and postage; the usual allowance to the trade, when three or more are taken at once. Orders will be executed in rotation.

W. M. has plants of his "Fireball" Geranium, now ready, at 5s. each, postage included, to any part of the kingdom.

N. B.—A few strong Plants of most of the new Fuchsias can be had. Providence Nursery, Ramsgate, Kent, Dec. 8, 1843.

TO GENTLEMEN PLANTING.

J. AND J. FAIRBAIRN are induced from the uncertainty upon which they hold the Manor-street Nursery (situated contiguous to the Home Nursery, Clapham Rise, where attention will be given to all applications), to effect a Sale of the Stock at as early a period as possible, consequently beg to solicit the attention of Gentlemen and the trade to the large and remarkably healthy and well-grown stock, consisting of fine large Laurels, twice transplanted, of extra growth; Portugal Laurels, very handsome; Green Hollies, of various sizes; Evergreen Privets, fine Standard and Dwarf Roses in great variety, fine standard flowering Thorns, Almonds, Esculus, Robinas, and other Ornamental Trees, and Evergreen and flowering Shrubs, with a large stock of fine standard and dwarf, trained and untrained Peaches, Nectarines, Apples, Pears, Plums, and Cherries, of the most approved kinds, and of growth rarely equalled; also, a large assortment of Forest Trees, consisting of Limes, Elms, Birch, Beech, Hornbeam, Spanish and Horse Chestnuts, Mountain Ash, Poplars, and Spruce, and Scotch Firs; also a large number of Gooseberries and Currants, of excellent growth, and of the best varieties in cultivation, to all of which J. & J. F. respectfully invite the inspection of Gentlemen and Nurserymen, flatter themselves that the general character of the Stock is such as to ensure unqualified satisfaction, and which they are disposed to offer at very moderate prices for cash.

J. & J. F. respectfully beg to call the attention of Gentlemen to their advertisement of Heaths, &c., which has appeared in the *Gardeners' Chronicle* of the two last weeks.

Nursery, Clapham, near London, December 8, 1843.

HYACINTHS AND GROWING STOCK.

HUMPHREYS' COMPOUND, applicable to all Greenhouse Plants, to Hyacinths and other Bulbs, and to promote the germination of Seeds. 100 " " " " " " " " " "	20s.

80 Beautiful Scotch Roses, named

The above are all well grown. The Roses on their own roots; and from the number of First Prizes awarded by the North Riding Horticultural and Floricultural Society, W. J. and Co. have great confidence in recommending them. A few Splendid Prize Hollyhocks, by name, 18s. to 21s. per dozen.

A reference or remittance from unknown correspondents is respectfully solicited.—Cross-Lanes Nursery, near Bedale, Yorkshire, Dec. 8, 1843.

ALBION ROAD NURSERY, STOKE NEWINGTON, LONDON.

MESSRS. BROWN beg to invite attention to their SUPERIOR FRUIT TREES and EVERGREEN SHRUBS; also their extensive collection of American Plants, more especially the New Belgian Azaleas, and that truly beautiful Winter Flowering Shrub the *Andromeda floribunda*, from 3s. 6d. to 42s. per plant.

N.B.—Any person having Box Edging to dispose of may have Shrubs in return. New Grounds designed in the first style and planted on moderate terms in town or country.

TO GENTLEMEN PLANTING.—The subscribers respectfully intimate that they have a large Stock of fine healthy transplanted LARCHES of various sizes, and as they must be removed they will be sold at a low price. Freight paid to London, Hull, Newcastle, or Liverpool. Prices furnished on application to W. URQUHART & SON, Dundee.

DIRECTIONS FOR GROWING LISIANTHUS

RUSSELLIANUS SUCCESSFULLY. By JAMES CUTHILL, Florist, Denmark-hill, Camberwell, London.—The seed of the above plant is now ready, and will be forwarded with the printed directions on the receipt of 2s. 6d. per packet. The Lisianthus must form a link to the Greenhouse and Conservatory, and be as generally grown as the Camellia, the Geranium, and the Chrysanthemum. Fine plants from 2s. to 5s. each. Also CUTHILL'S Early Improved Black Spice Cucumber, at 2s. 6d. per packet.

THE BRITISH QUEEN AND PRINCE ALBERT PEAS.

W. J. CORMACK AND CO. beg to announce to their Friends and the Public that they have harvested the above two New Varieties, and will be obliged by early orders, as the stock is limited. They will be sent out, as last spring, in packages, bearing the name of the firm, price 3s. 6d. per quart. The usual allowance to the trade.

N.B.—"CORMACK'S Early Kent Peas," 14s. per bushel. New Nursery, Clapham, near London, Covent Garden, Dec. 8.

W. HAMILTON has combined with his Treatise on the PINE-APPLE, (which is nearly ready), the VINE; also a very successful method of cultivating the CUCUMBER in pots, &c., &c., all to be grown in one House, which system will shortly be adopted by many subscribers in various localities. The tan bed at Thornfield is about 23 feet by 7, from which J. H. cuts 250 lbs. weight of Pines annually from the same plants, many of which are larger than any on record by this system. Several sorts, particularly the Queen, will produce three fruit in two years, and the weight of each fruit produced at Thornfield is 1½ lb. above the average, and may be obtained by sending a post-office order for 6s., of Mr. T. WILD, 3, Tavern-street, Ipswich; of the Author, at Thornfield, or of any of the persons named in the Prospectus.

BELL'S SUBSCRIPTION.—The Subscribers are informed that the damage at the BRACONDALE HORTICULTURAL ESTABLISHMENT, by the Hailstorm on the 9th August last, has now been carefully investigated, and ascertained at 2275l. 13s. 7d., and the amount of Subscriptions, after payment at 2275l. 13s. 7d., being 1247l. 15s. 3d., the balance this day in for advertisements, has been paid to Mr. JOHN BELL, the Bank of Messrs. GURNEYS, has been paid to Mr. JOHN BELL, by the Trustees. CHAS. S. GILMAN.

Bethel-street, Norwich, December 7, 1843.

JOHN BELL begs to return his sincere thanks to those Nurserymen, Seedsmen, and Friends, who have so very liberally and promptly assisted him after the late awful and destructive Hailstorm, and to assure them their great kindness in the hour of need will ever be gratefully remembered by him.

TO GENTLEMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS will submit to public competition, at the AUCTION MART, Bartholomew Lane, on TUESDAY, Dec. 12th, 1843, at 12 o'clock, about 300 new and Dwarf ROSES, comprising all the leading varieties. Standard and Dwarf BULBS, May be viewed the morning of sale. Catalogues may be had at the Mart, and of the Auctioneers, American Nursery, Leytonstone.

TO NOBLEMEN, GENTLEMEN, NURSERYMEN, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS are instructed to submit to Public Auction on the Premises, Enham Nursery, Battersea, on WEDNESDAY, Dec. 13th, 1843, and following days, at 11 o'clock each day (in consequence of Mr. C. Russell being compelled to clear the ground) the whole of the valuable NURSERY STOCK, consisting of several hundred superb hardy Scarlet Rhododendrons, large Tulip Trees, fine Yews, extra fine specimens of Aucuba japonica, Standard and Dwarf Roses, large fruit-bearing Mulberries, American Plants, Dwarf Roses, large fruit-bearing Shrubs and Roots. May be viewed with many other choice Shrubs and Plants. May be viewed prior to Sale. Catalogues may be had on the premises; of the principal Seedsmen; and of the Auctioneers, American Nursery, Leytonstone.

TO NURSERYMEN, GARDENERS, AND OTHERS.

TO BE DISPOSED OF, AN OLD ESTABLISHED NURSERY AND SEED BUSINESS of 60 years' standing, containing seven acres of Nursery ground within a walled fence, well stocked with every kind of Forest and Fruit Trees, Evergreen and Flowering Shrubs, &c., with Greenhouse, Stove, Cape-glass, &c. &c. well stocked; together with Shop, Seed-house, fits, &c. &c. with every convenience for carrying on the business: there is also two good Dwelling-houses on the same.

The above is situated in a thriving market town, and in a good neighbourhood. All letters, post paid, with real signatures, directed A. B., care of Mr. Chapple, Postmaster, Commercial-road, Pimlico, London, will have immediate attention.

TO NURSERYMEN, FLORISTS, BUILDERS, and Others.
Nursery to Let, Nursery Stock to be disposed of, and Building
Ground for Sale.

TO LET, the WELL-KNOWN and OLD-ESTABLISHED NURSERY near to the town of KELSO, in the County of Roxburgh, at present occupied by Mr. ANDREW LOCKIE, by whom and his Father the Business has been carried on for upwards of 60 years. The Nursery extends to twelve and a half acres, six acres of which belong to Mr. LOCKIE, and six and a half are held on lease. The Ground is in an excellent and convenient situation, is well divided and fenced by walls and hedges; it is well stocked with Trees, Evergreens, and a general assortment of Plants, and the Florist's Department is extensive and well selected. There is a large Greenhouse, Propagating-house, Pits, and Frames, all well filled. There is also a comfortable Cottage with a Stable attached. The Premises will be let with immediate entry, for such number of years as may be agreed on, and the Stock will be disposed of either upon valuation or by private bargain. The Proprietor will reserve power to sell a portion of the Nursery for Building-ground, for which a corresponding reduction of rent will be allowed.

The Proprietor is giving up the above department of his Business, from having engaged in an extensive Farm, which will occupy much of his time. It is proper, however, to intimate to intending offerers, as well as for the information of Mr. LOCKIE's Customers and Friends, that he intends to continue in the Seed Trade, as formerly, at his shop in Kelso. Until the Nursery is let Mr. LOCKIE will carry it on, and supply his customers as usual, the continuance of whose orders will confer on him an important obligation.

BUILDING GROUND.—A portion of the above Nursery will be sold for building Sites conformable to a plan; the eligibility and beauty of the situation for Villas are well known.

Application to be made to the Proprietor, who will conclude a bargain with the first suitable tenant; or to GEORGE MAIN, Writer in Kelso, who is in possession of the plan of the Ground to be sold and the Title Deeds.—Kelso, Nov. 29, 1843.

DISEASED AND HEALTHY LIVES ASSURED.

MEDICAL, INVALID, and GENERAL LIFE OFFICE, 25, Pall Mall, London. Capital, 500,000*l*. This Office is provided with very accurately constructed Tables, by which it can Assure Diseased Lives on Equitable Terms. Increased Annuities granted on *unsound* Lives, the amount varying with the particular disease. Members of Consumptive Families assured at Equitable Rates. Loans granted upon personal security. E. G. P. NEISON, Actuary.

RENDLE'S TANK SYSTEM OF HEATING.

STEPHENSON AND CO., 61, Gracechurch-street, London, Inventors of the IMPROVED CONICAL and DOUBLE CYLINDRICAL BOILERS, having been much engaged in heating buildings upon the above system with Tanks of various materials, solicit the attention of scientific Horticulturists to an Iron Tank now fitting up on their premises, which offers most decided advantages over every other article hitherto employed for the same purpose. These tanks which are ornamental in appearance can be made from 10 to 100 feet long and of any width and depth, and can be connected or disconnected by any working Gardener without the slightest difficulty, thus affording the opportunity to persons in remote districts of employing this much approved method of heating without the assistance of Engineers. The Tanks can be applied to Boilers and Pipes already fixed, and from the present low price of Iron will be found cheaper than of any other material. Mr. RENDLE of Plymouth, has kindly undertaken to receive orders and furnish information to any persons in his neighbourhood, and prices for any size will be forwarded upon application to S. and Co.

COTTAM AND HALLEN, ENGINEERS, IRON-FOUNDERS, &c. &c., No. 2, WINSLEY STREET, OXFORD STREET, LONDON.

HOUSES, CONSERVATORIES, &c., made upon the most improved principle, either of iron or of iron and wood combined, which can be fixed complete in any part of the Kingdom, at very low prices, in consequence of the present depressed state of the Iron Trade.

HOT-WATER APPARATUS for heating Hothouses, Conservatories, and Greenhouses; Churches, Public or Private Buildings, &c., with COTTAM'S PATENT, or ROGERS' BOILERS. After 15 years' experience, and having fixed upwards of 1500 Apparatuses for the above-mentioned purposes, and by various improvements which they have made during that time, C. and H. can with confidence undertake the erection of similar Apparatus upon the most extensive scale. For the convenience of those who wish to fix their own Apparatus, they have affixed the following low prices:—

Cottam's Patent Boiler, 24 inch	7 0 0
(Larger Sizes in proportion.)	
Rogers' Boiler, small size	3 15 0
Do. do. large do.	4 10 0

Hot-water Pipe, Doors, Frames, and Feeding Apparatus for Boilers, &c.
Rendle's Tank System on an improved simple plan.

STRONG IRON HURDLES, 3 ft. high out of the ground, 6 ft. long, with five horizontal bars, weighing about 36 lbs., 3*s*. 6*d*. each.
Light Cattle Hurdles, 3 ft. 6 in. high, weighing 42 lbs., at 4 0 "

Strong do. do. do. 45 lbs., at 4 4 "
Ox Hurdles, 4 ft. high, do. 60 lbs., at 5 6 "

BEST WIRE FOR STRAINED WIRE FENCING, at 8*s*. 6*d*. per bundle of 150 yards each. Uprights for ditto, at 7*d*. each. The improved continued and every other kind of Fencing, Fancy Wire-work, &c.

HAND GLASS FRAMES for Greenhouses, &c., 13 inches square 1*s*. 6*d*. 4*s*. 6*d*. : 22 inches, 5*s*. 6*d*. each.

CAST-IRON FLOWER-STAKES 4 feet long out of the ground, 7*s*. : 4 feet 6 in., 5 feet, 11*s*. : 6 feet, 15*s*. : 7 feet, 20*s*. per dozen.

GARDEN ROLLERS 18 inches long, 34*s*. : 20, 44*s*. : 22, 50*s*. : 24 inches, 60*s*. : 26, 75*s*. : 28, 84*s*. : 30, 105*s*. each.

Garden Engines, Mowing Machines, Garden Chairs, Superior Garden Tools of all kinds, Garden Vases and Pedestals in great variety, and every description of Horticultural Articles, Agricultural Implements, and Furnishing Ironmongery; Dr. Arnott's Stoves, Anglo-Belgian Cooking Stoves; Broiling Stoves. The above low prices being on account of the depression in the Iron Trade, are subject to future alterations.

Show-Rooms at the Manufactory, No. 2, Winsley-street, where every information may be obtained.

Estimates sent by return of post.

CHRISTMAS HOLIDAYS.

PUNCH'S HOLIDAY LETTER.

MY DEAR PUBLIC,—
It is with the most unfeigned satisfaction I now write to inform you that the completion of my FIFTH VOLUME is fixed for Saturday, the 23d instant.

I am happy to inform you that I have again obtained this year the PRIZE for WRITING, and that I have completely beaten MASTER GIBBS in my ARITHMETIC.

The weekly specimens I have sent you of my DRAWING, will, I hope, satisfy you of my proficiency in this branch of my studies. Deeply impressed with the parental care you lavish on me, I feel myself bound (in five volumes) to cultivate assiduously those parts (monthly parts) which you have encouraged me to put forth; and I am preparing to make exertions out of number, which will appear in the numberless numbers that I intend issuing.

Messrs. BRADBURY & EVANS, in whose Establishment I am placed, beg leave to present their compliments (of the season) to you, and to call your attention to the fact, that the whole of my valuable lessons are to be learned for the weekly sum of *Three-pence*, which includes WRITING, DRAWING, MORAL PHILOSOPHY, LAW POETRY, the USE of the GLOBES, the ABUSES of the WORLD, and all the usual BRANCHES—that is to say, SIX ENTIRE LEAVES—OF THE TREE of KNOWLEDGE.

On the 16th instant, it is my intention to present you with a CHRISTMAS PIECE, which I trust will meet your approbation, and hoping that in the ensuing Holidays we shall have much enjoyment in each other's society,

I remain, dear and honoured Public,

Your dutiful and affectionate Servant,

PUNCH.

PUNCH OFFICE, 194, Strand,

December 9.

P.S.—I forgot to tell you that my ALMANACK will be read on the 30th inst., and will be the admiration of the whole World.

On the 6th of January.

A NEW FARMERS' NEWSPAPER.—The time has come when Landlords and Tenants, large Farmers and small, must devote their anxious attention to improved cultivation—when, in the words of Sir Robert Peel, "All must learn how, in the shortest time, and at the least expense, to produce the greatest quantity of food, vegetable or animal, without permanent injury to the land." To accomplish this, no means can be so effectual as that which brings the results of Experience and Science before every man, in a cheap form. For this purpose THE AGRICULTURAL GAZETTE is to be established.

The Proprietors are aware of the difficulties of dealing with the many details of cultivation without an acquaintance with circumstances, often as varying as places. They condemn the idea of conducting farming operations upon one invariable plan; and, while they welcome science as the best auxiliary of practice, they regard crude speculations as the most dangerous of delusions. But, they also feel that in Agriculture, as in all other arts, there are general principles upon which successful farming must depend; that there are practical errors which no local circumstances can justify; in short, that there is room for improvement even in those branches which are best understood. No one man can be competent to deal with the multifarious questions affecting husbandry, and the duty of the Editor of such a Paper as THE AGRICULTURAL GAZETTE is to make known the knowledge of all. It is to practical Farmers that the Proprietors trust for the means of carrying out their views, and not to the talents of any individual. While, therefore, they state that the Editor of THE AGRICULTURAL GAZETTE will be a gentleman well acquainted with the best kind of Farming, in which he is actively engaged, they feel it to be of far more importance to announce the promise of support and assistance received from the landed and farming interest generally, especially of those whose names they are permitted to mention:—

The Right Hon. the Earl Spencer, President of the Royal Agricultural Society of England.

The Right Hon. the Earl of Ducie, Vice-President of the

Royal Agricultural Society of England

Sir J. S. Sebright, Bart.

J. Walbank Childers, Esq., M.P.

J. H. Langston, Esq., M.P.

Rev. Dr. Buckland, Professor of Mineralogy, Oxford

David Low, Esq., Professor of Agriculture, Edinburgh

John Curtis, Esq., F.L.S.

R. D. Drewett, Esq., Burpham, Arundel

W. Parker Hamond, Esq., Pampford Hall, Cambridge

J. Hudson, Esq., Castle Acre, near Swaffham, Norfolk

Curtis Hayward, Esq., Quedgeley, near Gloucester

R. M. Jaques, Esq., Richmond, Yorkshire

W. H. Little, Esq., Lanvair Grange, Abergavenny

E. W. Moore, Esq., Agent to Earl Radnor

S. D. Stirling, Esq., Glenbervie, Falkirk

W. B. Wingate, Esq., Hareby, Bolingbrooke, Lincolnshire

Mr. R. Beman, Stow-on-the-Wold

Mr. J. Clarke, Romney, Hants

Mr. G. Parsons, Agent to Lord Portman

Mr. S. Rigg, Wigton, Cumberland

L. B. Walrod, Esq., Sec. of the Gloucester Farmers' Club

Mr. H. F. Fardon, Sec. of the Broomsgrove Farmers' Club

&c.

&c.

&c.

Lord Worsley, M.P., Vice-President of the Royal Agricultural Society of England

Sir Charles Lemon, Bart., M.P.

William Miles, Esq., M.P.

Rev. J. R. Henslow, Professor of Botany, Cambridge

Dr. Lyon Playfair

Evan David, Esq., President of the Cardiff Farmers' Club

John Gedney, Esq., President of the Harlestone Farmers' Club, Norfolk

C. Herbert, Esq., Powick, near Worcester

W. H. Hyett, Esq., Painswick House

J. B. Lawes, Esq.

D. J. Niblett, Esq., Haresfield

Edward Solly, Esq., Junior, Experimental Chemist to the Horticultural Society of London

Joseph Yorke, Esq., Tewkesbury

Mr. John Brodie, Haddington

Mr. John Morton, Agent to the Earl of Ducie

Mr. Thimbleby, Bolingbrooke

Mr. Hall, Secretary of the Chepstow Farmers' Club

Mr. R. W. Purchas, Secretary of the Monmouth Farmers' Club

&c.

&c.

&c.

With FREE TRADE, FIXED DUTIES, SLIDING SCALE, &c. &c., THE AGRICULTURAL GAZETTE will in no way concern itself—such questions can only be of temporary interest; whereas the AGRICULTURAL GAZETTE will be devoted to the investigation of those great truths which human laws cannot affect.

The Practice of Agriculture—its Science—Animal and Vegetable Physiology—Improvements in Implements—better modes of Husbandry—results of well-conducted experimental Farming—Growth and Rotation of Crops—Stock—Drainage—Irrigation—Forestry—Road-making—Farm-Buildings—Labourers—in short, whatever affects the beneficial employment of capital in land—will form topics of consideration. Reports will be given of the English, Scotch, and Irish Agricultural Societies—London Market Prices of Corn, Hay, and Cattle, and the Weekly Averages. Replies to questions connected with the object of the Paper will also be furnished weekly.

Considering the union which exists between Horticulture and Agriculture, it has been thought advisable to make THE AGRICULTURAL GAZETTE an addition to the GARDENERS' CHRONICLE, edited by Dr. LINDLEY, and so extensively known; but that there may be ample room for discussion, that Paper will be increased one-half in size without additional charge—thus Twenty-four Columns will be occupied, as at present, by Horticulture, and Twenty-four by the General News of the Week, whilst TWENTY-FOUR COLUMNS WILL BE DEVOTED TO AGRICULTURE.

On the 6th of January, therefore, will be published, price 6*d*., Stamped, to go free by post,

THE FIRST NUMBER OF

THE GARDENERS' CHRONICLE AND AGRICULTURAL GAZETTE.

Parties intending to commence the Volume had better give their orders at once to any Bookseller or Newsvender.

HOT-WATER APPARATUS FOR HEATING HORTICULTURAL BUILDINGS, DWELLING-HOUSES, CHURCHES, and MANUFACTORIES, upon improved principles, and at very moderate charges, erected by DANIEL and EDWARD BAILEY, 272, HOLBORN.

D. and E. BAILEY having devoted much time to the consideration of this subject, and had much experience in the erection of apparatus for the above-mentioned purposes, have, by improvements suggested in their practice, rendered their mode of heating not only very efficient, but very simple, and have combined durability in the apparatus with economy in the charge. They have erected apparatus in England, Scotland, and Ireland, for many noblemen and gentlemen, and have had the honour to be employed by the Horticultural Society of London, in executing the works of their splendid Conservatory, lately erected at Chiswick.

D. and E. BAILEY also construct in metal all descriptions of Horticultural Buildings and Sashes, and invite noblemen, gentlemen, and the public to an inspection of their various drawings and models, at 272, Holborn, where they have the opportunity of exhibiting, amongst other metal works, an extremely complete and convenient kitchen apparatus, or range, adapted for the continued supply of hot water, and an arrangement of the oven more complete than has hitherto been brought before the public.

D. and E. BAILEY were the first to introduce metallic curvilinear houses to horticulturists, and can refer to the Conservatory attached to the Pantheon as one of their works, besides many others in this country and on the Continent.

D. and E. BAILEY have prepared a quantity of the Galvanic Plant Protectors, which are now ready for immediate delivery; they beg to introduce to public notice a new Trough Pipe, for Orchidaceous or other Houses where vapour is constantly, or at intervals required, and which may be seen at their Manufactory.

PENN'S SYSTEM OF HOTHOUSE BUILDING, WARMING, and VENTILATING.—The superiority of the principle first introduced by JOHN PENN, Esq., for obtaining a more complete circulation of the atmosphere in heated apartments, being now fully established, W. HILL respectfully acquaints the public that having, in conjunction with the late Mr. Penn, devoted much time and study to perfect the same, in the construction of Conservatories, Stoves, Greenhouses, Pits, &c., and to heat them with Improved Hot Water Apparatus, either by Pipes or Troughs, he is enabled to carry out Mr. Penn's principle in a manner to guarantee the most complete success and economy. First-rate references, Plain and Ornamental Designs; and any particulars on application to W. HILL, Surveyor & Builder, Lewisham.

GENUINE PERUVIAN & BOLIVIAN GUANO ON SALE, BY THE IMPORTERS, ANTONY GIBBS AND SONS, LONDON; GIBBS, BRIGHT, and CO., LIVERPOOL and BRISTOL.

47, Lime-st., Dec. 7, 1843.

THE CONICAL HOT-WATER BOILERS, invented by J. ROGERS, Esq., may be obtained of any size from JOHN SHEWEN, Ironmonger, &c., Sevenoaks, Kent.

J. SHEWEN having had every opportunity afforded him by an extensive practice to bring this apparatus to perfection, begs to offer it as most efficient and economical: it may be seen at Messrs. Chandler & Sons' Nursery, Vauxhall; Messrs. Loddiges', Hackney; Messrs. Henderson's, Pine Apple-place; Messrs. Veitch and Son's, Exeter; Mr. Pontey's, Plymouth; the Royal Botanical Society's Gardens, Regent's Park; and at the Gardens of the Horticultural Society of London. Considerable improvements have been effected since last season; particulars of which are in course of preparation.

GUANO ON SALE.—Any Quantity of this valuable Manure can be had from the bonded stores of the Importer either in London or Liverpool, on application to COTESWORTH, POWELL, and PAVOR, St. Helen's Place, London; EDWARDS, DANSON, and Co., Liverpool; and WILLIAM J. MYERS and Co., Importers, Liverpool.

LIQUID MANURE.

PUMPS of a Superior Construction, fixed and portable, for Liquid Manure. Garden Pumps, Hydraulic ditto, and Pumps for deep wells. Also Pumps for Ships, Barges, Tanners, Soap Boilers, Brewers, &c. Well-Digging and Boring executed.—BENJAMIN FOWLER, (late George Turner,) 63, Dorset-street, Fleet-street.

TO FARMERS AND LANDOWNERS.

CLATER'S EVERY MAN HIS OWN FARRIER; containing the Causes, Symptoms, and most improved Methods of Cure of the Diseases of Horses and Dogs. By FRANCIS CLATER, and his Son, JOHN CLATER. The 28th Edition, Edited, Enlarged, and nearly re-written by the celebrated Author of "The Horse," with the assistance of W. C. SPOONER, Veterinary Surgeon. Price 6*s*. 12 mo., cloth lettered.

CLATER'S EVERY MAN HIS OWN CATTLE DOCTOR; containing the Causes, Symptoms, and Treatment of all the Diseases incident to Oxen, Sheep, Swine, Poultry, and Rabbits. By FRANCIS CLATER. The 9th Edition, in 12 mo., Edited and Revised by the same. Price 6*s*. 12 mo. cloth lettered.

THE COMPLETE GRAZIER; or Farmer's and Cattle Breeder's, and Dealer's Assistant. By a LINCOLNSHIRE GRAZIER. In a thick 8vo. volume of nearly 700 pages, illustrated with numerous Cuts and Plates. The 7th Edition, Edited, Enlarged, and nearly re-written by WILLIAM YOUNG, Esq., Author of "The Horse." Price 17*s*. cloth lettered. London: CRADOCK and Co., SIMPKIN and Co., and HOULSTON and STONEMAN.

Just published, in One Volume 8vo., price 3s. 6d., to Fellows of the Society, and 5s. to others, (or postage free, upon receipt of a Post-office order, price 5s. to Fellows of the Society, or 6s. 6d. to others.)

A CATALOGUE OF THE FRUITS CULTIVATED in the GARDEN of the HORTICULTURAL SOCIETY OF LONDON. (Third Edition.) Containing the Names, Synonyms, Colour, Size, Form, Quality, Use, Time of Ripening, and many other particulars concerning all the most important varieties of hardy Fruit cultivated in this country.

Sold at the House of the Society, 21, Regent-street, and also by LONGMAN and Co., Paternoster-row; J. HATCHARD, Piccadilly; RIDGWAY, Piccadilly; RIVINGTONS, Waterloo-place; and by the principal Booksellers in all parts of the Empire.

A few Copies of the Second Edition of this Catalogue may be had at the reduced price of 1s. 6d. each.

The Gardeners' Chronicle.

THE Queen's visit to Chatsworth is a great event in the history of Gardening. The magnificence of her Majesty's reception was owing more to the Garden-scenery created by the wealth and good taste of the Duke of Devonshire, than even to the splendour of the Palace of the Peak, and all its interior embellishments. The fitness of gardens such as those of Chatsworth for the purposes of Regal entertainment has never been more strikingly illustrated, and they have proved how infinitely superior is Nature, skilfully assisted by art, to mere art however helped in its effect by Nature. There is no architect like HIM who builds up the trees and clothes them with their leafy canopy, and causes them to bring forth flowers and fruit each after its kind.

How this was proved, in what way the Duke of Devonshire wielded the powers which he is so happy as to possess, and by what means the fables of enchantment were realised among Derbyshire-hills, will be learned from the following

REPORT OF HER MAJESTY'S GARDEN RECEPTION AT CHATSWORTH.

(From our own Reporter.)

For a week previous to its being in the slightest degree known to the public that her Majesty intended honouring the Duke of Devonshire with a visit to his Grace's princely seat—Chatsworth, a visible change took place in all the garden proceedings there, and in the other out-door departments under the direction of Mr. Paxton. His Grace had left Chatsworth about the 1st of Nov., and was not expected there again for some months, so that the numerous workmen employed to keep the place in high order during his Grace's residence there, were drafted off to the woods, and to a variety of extensive alterations in the pleasure-grounds and other parts of the park; the great walks were also cleared of their gravel, for the purpose of allowing heavy materials to be carted to the new fountains and great rockery. These extensive works were in progress when a sudden and immediate stop was put to the proceedings; and the men thus employed, and all those from the distant works, were immediately set to work in putting the grounds in the highest state of order.

The weather, it will be remembered, was at this period very boisterous and wet, and it was found impossible to put the old gravel into a fit state to be walked upon; consequently, carts were sent for miles round to the different mines; and in less than a week nearly a thousand tons of beautiful spar-gravel were brought to the spot and spread upon the walks, both of the pleasure-grounds and kitchen-gardens. Every leaf and particle of decayed matter was cleared from the lawns and flower-beds; and before the day of her Majesty's arrival, flowers from the different greenhouses were plunged into the open borders—so that all about the mansion and great conservatory had the appearance of summer. Great efforts were also made to finish off and plant part of the extensive rock-garden, which occupies more than two acres of ground, and which now contains several thousand tons of rocks (some of them weighing nearly twenty tons each,) placed in their natural position. These efforts were successful; and the exertions made to put the grounds and flower-gardens into the highest order were perfect and complete two days before her Majesty's arrival, and this notwithstanding perpetual bad weather for a fortnight.

Three days before the Queen arrived the weather cleared up and became fine, and on the Royal party arriving on Friday, the whole of the gardens presented the appearance of a fine day in the month of September. The park roads, the village of Edensor, and all the conspicuous parts of the domain were equally perfect in their state of high keeping.

Dec. 1.—Her Majesty arrived this day a little before 2 o'clock, and about 20 minutes before 3 o'clock was conducted by his Grace the Duke of Devonshire through the Orangery to the great terrace called "Solomon's Walk," where Mr. Paxton was ready to conduct the royal party to the Great Conservatory through the Rock Garden. The noble visitors invited to meet her Majesty at Chatsworth were in her Majesty's train, to the number of about 50; and altogether the scene, where so much rank and beauty in rich attire mingled with the lovely productions of Nature, presented an appearance more gorgeous than words are capable of describing.

After admiring the Rock Garden the Royal party were

conducted to the upper terrace of the Conservatory gardens, where they came suddenly upon a full view of the Conservatory—the mountain of glass! Her Majesty and the Royal party immediately paused, and expressed their admiration and astonishment at the vastness of the structure. They then descended to the lower terrace of the Conservatory garden, and entered the house at the north end. Here, again, exclamations of wonder and surprise burst forth from the distinguished visitors. The Royal party were conducted through every part of this immense edifice, and Mr. Paxton explained the various objects of beauty, together with the peculiar structure of the house. From thence her Majesty was conducted through the Fern Garden to the great terrace, to the upper bastion south front, where a very commanding view is had of the grounds, and particularly of the last new fountain, which has not been long finished, and which throws water up from five jets, so contrived that each flows in a different way, an arrangement which gives this fountain a most novel appearance. From this bastion his Grace the Duke of Devonshire pointed out to the Queen the spot where her Majesty and the Duchess of Kent had planted two trees 11 years before. Beside this place the ground had been previously prepared for the reception of another tree, should Prince Albert feel disposed to plant one. At his Grace's request, his Royal Highness readily consented to set one beside the Oak previously planted by her Majesty, which is now grown to a considerable height. The Queen then returned part of the way on the terrace, and descended by the summer-stairs to the private terrace, which brought the Royal party to the south end of the Italian Garden, where his Grace pointed to both trees which had been planted by her Majesty and august mother. Mr. Paxton submitted to his Royal Highness several kinds of trees to choose from, when his Royal Highness selected a Sycamore. The Royal party then followed the private terrace of the west front, and descended into the Lower Garden, whence her Majesty proceeded through the "Fragment" Room and the Great Court, to her Majesty's private apartments.

The same evening a grand ball was given to the Queen in the great Banqueting-room. The Orangery and whole line of communication to this room was lighted up by Chinese lamps, and beautifully decorated with plants in flower. They were suspended from the railing of the stairs leading to the ball-room, and at each step hung a beautiful flower in full bloom.

Dec. 2.—Her Majesty and Prince Albert walked out early this morning, and again visited the Conservatory, Arboretum, and Flower-gardens. Mr. Paxton explained to her Majesty and the Prince the nature of the conservative-wall (see an account of this at p. 331 of our vol. for 1842,) with the plants on it, which are protected by linen blinds instead of glass, the heat being supplied by a flue in the centre of the wall.

Illumination of the Conservatory and Waterworks.—This evening the Conservatory and Waterworks were illuminated, although not the slightest appearance of any preparations for doing so were visible when her Majesty visited the grounds; but an immense number of men had been trained to attend to the illumination and to fire the coloured lights according to a certain plan previously devised by Mr. Paxton. About a quarter after 4 o'clock the workmen commenced lighting up the great Conservatory with thousands of variegated lamps. On each rib of the house were suspended 120 lamps, while others hung in festoons between the cast-iron columns supporting the gallery, which was also lighted. The "Robbers' stone," on the summit of the range of hills which back the palace, the waterfall proceeding from near it, the cascade, and all the fountains, were illuminated by Russian lights of different colours, hidden from the house by boards placed in front of them. Many parts of the grounds were also lighted by lamps suspended from the trees, on the opposite side of the river from the house. In short, the whole place was a blaze of fire.

Her Majesty, without being aware of the preparations that had been made for the illuminations, was conducted to the Conservatory at a quarter past 6 o'clock (everything then having been completed,) when the Royal visitors expressed their astonishment at the singular effect produced by so immense a body of light and its reflection on the multitudes of plants. There was something unusually grand in this magnificent scene. To illuminate such an immense mass of building in so short a time was a very bold undertaking, and was most successfully accomplished. The Queen after expressing much delight at the unusual scene, returned to the house, and at half-past seven the public were admitted to see the illuminations by tickets, issued through the liberality of his Grace.

About ten o'clock, on a private signal being given, a rocket was fired, which was a notice to the men placed by the great guns at the "stand." Amidst a roar of artillery, and at the same instant of time, a blaze of coloured fire burst from the Robbers' stone and waterfall, cascades, fountains, and woods, and the whole scene was enveloped in a sheet of flame. The effect baffles description—the visitors were taken by surprise; in whatever direction the eye turned, the coloured lights—crimson, green, and blue, blazed forth to the astonishment of the hundreds who were admitted to the grounds, and of the thousands who were on the opposite bank of the river. The Royal party could be observed at this time passing from window to window of the mansion, and viewing the exciting scene.

Sunday, Dec. 3.—Her Majesty walked out early this morning in the grounds and Conservatory, where not a vestige was to be seen of the materials employed in the previous evening's illumination—everything had been cleared away by an immense number of hands employed

for that purpose. The grounds were as neat and orderly as on the previous morning; and this, too, afforded not a little surprise to many of the distinguished party.

After lunch, her Majesty again visited the grounds and Conservatory, and examined the conservative wall and flower-gardens. The Royal party then walked to the kitchen-gardens, whither they were conducted by his Grace, Mr. Paxton being in attendance at the gates. Her Majesty first entered the Musa-house, where the rich collection of Chrysanthemums elicited much commendation. The Royal party then proceeded to the Greenhouse, where a large Tree Fern greatly excited the admiration of both her Majesty and Prince Albert. His Grace afterwards conducted the Queen, Prince Albert, and others of the Royal party, into Mr. Paxton's house, where they were much pleased with its neatness and order. Mr. Paxton had the honour to present her Majesty with the first nine volumes of his "Magazine of Botany," richly bound, and his "Botanical Dictionary," both which her Majesty was graciously pleased to accept. The Queen also deigned to permit the volume of the "Magazine of Botany" now in course of publication to be dedicated to her Majesty.

After leaving Mr. Paxton's house the Royal party were conducted to the Orchidaceous-house, where they appeared enchanted with the numerous plants in flower in this singular and unique collection. A list of the species which were in bloom when her Majesty visited the Orchidaceous-house is here subjoined.

After going round the gardens, the Queen finally proceeded in an open carriage to the beautiful village of Edensor, where cottages in every possible style of architecture have been designed and executed under the direction of Mr. Paxton.

List of Orchidacea in flower in the Orchidaceous House at the time of Her Majesty's visit:—

Coelogyne Gardneriana	Oncidium flexuosum
" ovalis	" ramiferum
" fimbriata	" ornithorhynchum
Trias racemosa	Epidendrum pastoris
Anectochilus setaceus	" cuspidatum
Zygopetalum maxillare	" latifolium
" Mackayi	" tridactylon
" crinitum	" nocturnum
Maxillaria picta	" fragrans
" chlorantha	" atropurpureum
" pallida	" coriaceum
" pumila	Eria velutina
" cristata	Odontoglossum grande
" lentiginosa	" bickoniense album
" Rolissii	Cattleya labiata
" stenopetala	" Harrisoniae
" atrobens	" intermedia
" rufescens	Cymbidium sinense
" racemosa	" Wallichii
" Warreana	Mitonia Russelliana
Liparis orbicularis	Catasetum tridentatum
" longipes	Pleurothallis lanceolata
Dendrobium denudans	Calanthe sylvatica
Stelis picta	Gongora maculata
Cypripedium venustum	" atropurpurea
" insignis	Brassia cuspidata
Pesomera tetragona	Lycaste macrophylla
Saccolabium deniculatum	Acropera Loddigesii
Oncidium ciliatum	Trichosma s. ovata
" lanceanum	Sacanthus teretifolius
" Taylorii	Bobophyllum coccineum
" triquetrum	" recurvum
" papilio	Ornithidium coccineum

List of other Plants in flower at the same time:—

CONSERVATORY.	
Justicia nodosa	Geissomeria longiflora
" speciosa	Clerodendron splendens
" flavicoma	Carica Papaya (in flower & fruit)
Streptocarpus Reginae	Canna denudata
" ovata	" coccinea
Crinum amabile	" lutea
Pancratium speciosum	Brugmansia suaveolens
Cestrum laurifolium	" bicolor
Salvia splendens	Euphorbia splendens (planted all over the borders)
" fulgens	Amorpha undulata
Linum trigynum	Brunsvigia crispata
Vinca rosea	Abutilon striatum
" alba	Eranthemum pulchellum
Hibiscus rosa sinensis, flore pleno (5 varieties)	Epiphyllum truncatum
" lilacinus	Alpinia nutans
" Barclayanus	Pitcairnia suaveolens
Ixora rosea	Stachytarpheta mutabilis
Cassia corymbosa	Thunbergia alata
Lantana mixta	Saracenia flava
Passiflora alata	" purpurea
" caeruleo-racemosa	Musa Cavendishii
" Princeps	" rosacea

ORANGERY.

The Orange trees covered with a profusion of fruit and flowers.	Tropaeolum majus
Camellias.—Double white and red in great plenty, arranged over the whole house.	Primula sinensis, red and white.
Pelargoniums in great variety	Pentstemon roseus
Cinerarias, many kinds	Persian Tobacco
Fuchsia Chandlerii	Erica hyemalis
Leschenaultia formosa	" Westcottii
	" Bowiana
	" gracilis
	" caffra
	" Sebana

CAMELLIA HOUSE.

The back border filled with	Camellia imbricata
Frogmore Scarlet Pelargoniums, and the trellis and rafters covered with the following plants:—	" double red
Tropaeolum Moritzianum	" double white
Lophospermum Hendersonii	" Gray's Invincible
Tacsonia pinnatifida	" fimbriata
Manettia bicolor	" eclipse
	The outside wall in front covered with various kinds of China Roses and Cydonia Japonica in full flower.

CONSERVATORY WALL.

Malva Creeana	Fuchsia globosa
Melaleuca hypericifolia	" microphylla
Abutilon striatum	" reflexa
Heliotropium peruvianum	Brugmansia sanguinea
Maurandya Barclayana	Passiflora Mayana
Magnolia grandiflora (twelve flowers)	Polygala grandiflora
Rhodochiton volubile	Acacia ornithophora
Jasminum umbellatum	Aristolochia glauca
Garrya elliptica	Clematis azurea grandiflora
	Yellow China Rose

KITCHEN GARDENS.

Show-house for Forced Flowers, &c.

A superb collection of Chrysanthemums arranged in the background
 Linum flavum
 Banksia australis
 Heliotropes
 Primula sinensis, red and white, in great profusion, edging the clumps of plants in flower
 Oxalis floribunda
 Cineraria Greenii
 " pulchella
 " Waterhousiana
 " King
 " Queen
 Verbena Hendersonii
 " Neillii
 " Cliffordiana
 " Tweediana carnea
 " Melindres latifolia
 Abutilon striatum
 Alonsoa incisifolia
 Manettia bicolor
 Gloxinia speciosa, several vars.
 Phlox Drummondii
 Epiphyllum truncatum
 Fuchsia Chandlerii
 " racemiflora

Fuchsia corymbiflora
 " fulgens
 " globosa major
 " formosa elegans
 A large quantity of Mignonette filled the House with the fragrance of its blossoms.
 Calceolarias, many kinds.
 Roses, White China
 " Pauline Plantier
 " Devoniana
 " Duchesse de Palma
 Pelargonium Compactum
 " Jehu
 " Prima Donna
 " Alexandrina
 " Victoria
 " Eliza
 " King
 " Louise
 " Sylph
 " Orange Boven
 " Nosegay
 " Annette
 " Lumsden's Magdalen
 " Masterpiece and many others

LARGE GREENHOUSE.

Erica colorans
 " cruenta
 " cerinthoides
 " intermedia
 " verticillata
 " filamentosa
 " arbuscula
 " exurgens
 " coccinea
 " scabriscula
 " gracilis

 Salvia fulgens
 Passiflora caeruleo-racemosa
 Fuchsia radicans
 " globosa major
 Primula sinensis, double white
 Pimelea decussata
 " hispida
 Sollya linearis
 Leschenaultia formosa
 Chorozema cordata
 Crowea saligna
 Polygala grandiflora
 " cordifolia
 Stenochilus viscosus
 Rhodochiton volubilis
 Quantities of Mignonette.

If any one thing is more likely than another to hasten the cultivation of Pine-apples without pots it is the tank-system of heating. We entertain no doubt of its driving the present plan out of the field, notwithstanding some of the difficulties connected with it. Mr. Rendle, too, to whose zeal in advocating the tank system we are all so much indebted, entertains the same opinion; indeed he goes further, for he authorizes us to make known his willingness to give a prize connected with the subject; and we now announce, on his behalf, that at the June show in the garden of the Horticultural Society in the year 1845, he will give a cup, value five guineas, for the heaviest and handsomest Queen Pine grown on the plan mentioned in his "Treatise on Tank-heating."

ROT IN THE AURICULA.

Your correspondent "O," of Leeds, inquires what is the cause of the rot in his Auriculas. One reason is, because he does not read the *Chronicle* so diligently as he ought to do, especially the essay on the Auricula in vol. i. He should, in the first place, repot his plants annually, taking care to shorten the tap-root (a part peculiarly liable to canker and disease) to within an inch or an inch and a half of the insertion of the leaves. Secondly, he should fill the pot nearly one third with broken crocks. Thirdly, let him stand his pots, in summer and autumn, in a shaded airy part of the garden, and elevated two feet above the ground. And fourthly, let him place them, in winter and spring, in such a frame as is represented in the essay just alluded to: *q. e. d.*—he will have no more rot in his Auriculas.

The disease is not contagious; it is simply the result of mismanagement: what produced it in one plant, produced it in all; yet, because the plants begin to die, or show the ill effects of the same bad treatment about the same time, he resignedly refers his sweeping loss to the mysterious agency of contagion. Want of drainage, old tap-roots, damp, and confinement, are, severally and collectively, the principal causes of rot in the Auricula.—*F. R. Horner, M.D.*

ENTOMOLOGY.—No. LI.

THE ITALIAN FIRE-FLY, OR LUCCIOLA.—Whatever differences of opinion may be entertained concerning the luminous properties of plants, there can be none with regard to insects; yet marvellous as this power is, I am not aware that any one, in this country at least, has taken

the pains to ascertain the exact quality of the matter which gives out the light; philosophers are satisfied with calling it phosphorescent. From the appearances which the bodies of many exotic insects exhibit, there is reason to believe that this power of emitting light is extended to numerous species, but they are all Beetles, excepting the Lantern-flies; one of these, the *Fulgora lanternaria*, is a very handsome and magnificent insect, inhabiting the largest trees of Surinam and Cayenne; the lantern which adorns its head is beautifully painted, and measures in length $1\frac{1}{2}$ inch and $1\frac{1}{2}$ in. in circumference. Madame Merian states that during the night it spreads a light brilliant enough to enable one to read the smallest print, but this has not been confirmed by subsequent travellers; another species is very abundant in China, and as great doubts are entertained regarding their phosphorescent nature, it is to be hoped that this curious and long-disputed point will be settled, now that vast and interesting country is opened to men engaged in scientific pursuits.

The three insects most celebrated for their luminosity, are the Firefly of the West Indies and America (called *Elater noctiluca*); the Glow-worm of the north of Europe (*Lampyrus noctiluca*); and the Firefly of Italy (the *Lampyrus Italica*). All these species the writer has had the gratification of seeing alive. The light of the Elater is the strongest and most constant, affording sufficient to read by, when a single Beetle is carried along the lines; and if a number be confined in a decanter, it will, in a measure, illuminate a room; the second insect, our native Glow-worm, gives a sweet but pale bluish light, resembling that of the moon; whilst the Italian Firefly shines like the planets in the pure atmosphere of a southern sky.

An imported specimen of this insect having been found in a greenhouse in Norfolk, I am induced to give its history, which I am able to do from having often seen it in its native haunts in Italy; the French also claim it as an inhabitant of the South of France, but we can never hope to see it naturalised in England. To describe the magical effect which the Fire-fly produces is impossible—it is a spectacle which far surpasses the imagination—and I shall never forget the delight and astonishment I experienced the first time I beheld the coruscations of this glorious living gem. I was wandering one evening in June in the neighbourhood of Mentone, along the banks of a river whose pebbly bed was dried up, and where the Lemon and Orange groves rendered it, with one exception, the most enchanting spot I have ever seen, when suddenly I saw lights, like electric sparks, emanate from the grass;

as night advanced their numbers and beauty increased, until they swarmed in a plantation, where they seemed to be enjoying the lovely evening, chasing one another and playing about like troops of fairies, alternately hiding and emitting their brilliant lights, until the air sparkled with glittering meteors: it appeared as if the serene and beautiful heavens of Italy were reflected upon the earth, and the stars were dancing for joy. As I returned, the Fire-flies were pursuing each other in the streets of the town, and having caught two in my hat, they were secured in a quill, and thick as the medium was, their light was sufficient to ascertain the hour by my watch during the night. No wonder that poets have sung in praise of the "Lucciola;" and those who have visited Italy without seeing them have missed one of the most beautiful objects to be met with in that interesting country. The Fire-flies are only to be seen in June and July; their light is most brilliant during their vigour, and it becomes extinct with life: they commence their excursions at sunset, and in the middle of a summer's night one cannot set a step in any direction without seeing these little animals darting from one side to the other; their flight appears undulating: they seem to shine by intervals, their luminous effusions being excited by their movements. In the day they rest concealed amongst herbage, and are difficult to find. The Italian Fire-fly differs essentially in form and likewise in its habits from the Glow-worm, as will be shown when we give the history of that insect. The larvæ are considerably alike; but both sexes of the perfect insects of the former species can fly, and are similar in appearance, the male being the smaller.

Linnaeus, who gave the name of *Italica* to the European Fire-fly, describes it as having a black spot upon the thorax; but I have never taken one so marked: this difference, however, led Bonelli to separate them, and he designated the species we have figured *Lampyrus pedemontana*. Charpentier seems to have described the same variety under the name of *L. lusitanica*. Whatever the scientific appellation may be, it is the Lucciola of Italy, and known by our countryman as the Italian Fire-fly, which we will now describe, merely observing, that owing to the structure and other characters above alluded to, it has been separated from the genus *Lampyrus* by modern systematists, and Dejean has included it in his group *Colophotia*.

The Italian Fire-fly varies a little in size: the head is

¹ Zool. Journ. v. iii. p. 379.
² Curtis's Brit. Ent. fol. and pl. 698.

black; the eyes large, hemispherical, and not very remote, especially beneath; the antennæ are eleven-jointed, short, filiform, and black; the basal joint fulvous; the thorax is of an orange colour, transverse, semicircular, the hinder angles lobed; the scutellum is of the same colour; the under side of the thorax and breast are deep ochraceous; the abdomen is blackish: the two last segments are of an opaque cream-colour, and emit the light; the elytra are much longer than the body, elliptical, and black or fuscous; the wings are ample and smoky, longer than the elytra, the tips being folded in repose; the legs are brown, the thighs ochraceous. Fig. 1 is the under side; Fig. 2 is a male flying: the lines denoting the natural sizes.—*Ruricola*.

LOUISE BONNE (OF JERSEY) PEAR.

Synonyms—*Louise Bonne d'Avranches*, *Beurré* or *Bonne Louise d'Araudoré*, *William the Fourth*.

The Pear above designated is widely different from the Louise Bonne described by La Quintinye, Duhamel, and other French authors, and infinitely superior to it. Although the Pear they describe, obtained in France, a good character in the time of Louis XIV., yet, even in that country, subsequent writers describe it as being sometimes but half-melting, and good only in dry soils; whilst in England it is found to be not adapted for bearing as a standard, and unworthy of a wall. La Quintinye enumerates the particulars of its merit, including amongst them, "and above all, that it pleases much his Majesty." It has no red, grown in any climate; in that of this country its flesh is either crisp or scarcely half melting.

The Louise Bonne (of Jersey) is a more recent production. Fruit, probably the first of its kind in this country, was received from General Gordon, from Jersey, and sent to the Horticultural Society by the Marquess of Ailesa, in 1820. Subsequently, in the same season, fruit was also sent to the Society by Major-General Le Couteur, from Jersey; and grafts of the variety were obtained through him for the Society's collection in the following season. It having obtained the name of Louise Bonne in Jersey, and

being found different from the old Louise Bonne of the French, it was considered proper to distinguish it as the Louise Bonne of Jersey. According to some recent accounts, however, the original tree is stated to exist near Avranches.

The accompanying outline represents a fruit of medium size, from a standard. When newly gathered, the shaded side is of a greenish colour; but it becomes paler, acquiring a slight tinge of yellow as it gets fit for use. The flesh is whitish, buttery, melting, exceedingly rich and juicy. In perfection in October. The tree is of vigorous, rather upright growth, and adapted for bearing as a standard. As such, it succeeds in the northern counties better than the Marie Louise. Against a wall with a good aspect the fruit becomes large, handsome, and finely coloured. The shoots are dark olive, with a chestnut tinge next the sun; leaves oblong, oval, slightly acuminate. Worthy of a place in every collection.—*R. T.*

AMATEUR'S GARDEN.—No. XLIX.

In recording the articles which have appeared weekly under this head, it has been a rule with me never to recommend anything which I had not either practised, or from mature consideration and the success of others, was about to practise myself; consequently I am enabled, from experience, to deny the whole of the statements which

appeared at p. 843, relative to my method of managing Shrubbery borders, under the signature of "The Knave of Spades." "The Knave" asks whether I intend every border in a flower-garden to be turved up, or only those that surround the shrubberies? and taking it to be the latter, he says "such borders generally consist of Herbaceous plants and annuals, intermixed here and there with ornamental shrubs." Who ever heard of a Shrubbery of Herbaceous plants and Annuals? for the ornamental shrubs are but a secondary consideration with "The Knave." I have heard such assemblages of plants called an "Herbaceous border," and I have condemned them at p. 789, to which place I refer for my reasons for doing so; but when I spoke of Shrubberies I referred to those broad belts which generally form the boundary line of a suburban pleasure-ground, and which consist of various kinds of trees fronted with deciduous and evergreen flowering shrubs; and in large gardens such Shrubberies are extended to the formation of clumps or borders for dividing walks, breaking unsightly views, &c. It was for Shrubberies of this kind that my directions were intended, and I think there cannot be two opinions among men of taste as to which plan must be the best, viz., a raw dry surface, or one at all times green and luxuriant.

Again: "The Knave" says, "Suppose I banish the Annuals and Herbaceous plants, where is the turf to come from to turf the borders?" This is a matter which he must settle with his employer. Let him first show him that the appearance of his Shrubberies will be much improved, that the plants will grow better, and that the expense of keeping will be decreased after the operation is completed at the rate of one man's wages in every six, and then he will soon discover where the turf is to come from; but, says "The Knave," "it will require to be annually renewed, and instead of a fine show of Annuals and Herbaceous plants there will be a strip of grass six feet wide running along the side of the walk." Where turf would require to be renewed, Herbaceous plants could not exist, except as, which they too generally are in Shrubbery borders, miserable specimens of bad cultivation.

I am referred to the market-gardens, where fruit-trees are both dug and cropped among, as a proof of the beneficial effects of the digging system. But to make this argument of any service "The Knave" must first show that the crops of fruit are better than on ground not dug, and then he will probably find that the annual digging in this instance is an annual "root-pruning," and therefore beneficial from counteracting the luxuriant growth that would otherwise result from the quantity of manure used; hence, though digging under these circumstances may "benefit fruit-trees" it does not follow that it will "also benefit shrubs."—W. P. Ayres, Brooklands.

HOME CORRESPONDENCE.

Pine Apples.—I scarcely expected that the few observations I had written on the culture of the Pine Apple, addressed to a local Horticultural Society five years ago, should have been of such importance at the present day, as to form matter for a Leader in the *Gardeners' Chronicle*. The interest lately created is certainly not less than a fruit of such importance as the Pine Apple deserves. I am glad to learn from the *Chronicle* that my suggestions have been of service. I have also received a number of letters recently, from good Horticulturists, bearing similar testimony. I will hastily venture a remark on one or two particulars on which we appear to differ. Now, were we in the artificial management of this plant strictly to follow the temperature and climate of the tropics, we should of necessity arrive at just what I consider a most fatal error in the culture of this fruit, viz., the production of a great number of Pine Apples at a particular season, and a few or none during the greater part of the year. Hence, by placing the plants under strict artificial management, and producing the hot and cool, the moist and arid atmosphere at one and the same season, you succeed in having a supply of ripe fruit twelve months in the year; which is, if I may be allowed to give an opinion, the *ne plus ultra* of Pine growing. It is this deviation from a tropical climate that is the foundation of our success, and fully accounts for our beating "Mr. Speede with the climate of India at his back." In potting, I believe I used even larger pots than Mr. Murray; but I consider that to secure fruitfulness as well as a vigorous development of leaves, the plant should bear some proportion to the size of the pot: that was my opinion five years since, and subsequent experience has not altered it. I have never found equal success attend popping a little Pine-plant out of a 60 into one of the largest dimensions I used, viz., 18 inches in diameter and nearly the same in depth, and how careful soever one might be in the selection and allocation of the material used. I state this advisedly, as I entertain no prejudice one way or the other. I am, however, not entirely ignorant of what is termed the one-shift system, having subjected during the past season upwards of 1,000 plants of various kinds to this mode of potting, and this you will admit is not a trifling experiment—but more of that by-and-by. I have also planted young Pine-plants out in a prepared bed of soil, there to remain until they matured their fruit. By this system extraordinary growth is secured, and leaves obtained six feet long; but then this is an attainment all good cultivators never wish to accomplish; neither can you by this mode of culture economically secure—if at all—a regular supply. I hold soil in the cultivation of the Pine-apple to be of great consequence; some of those in this country who are fond of novelty have tried peat, but have gladly retraced their steps again; and I have yet to learn that the people of Versailles produce the Queen Pine above 6 lbs., or that the general cultivation is at all equal to our best growers in this country. I shall certainly be satisfied that soil is

of no importance, when I see them produced at our exhibitions, grown either in sand or peat, equal to those of Messrs. Murray and Spencer; and I strongly suspect that if these eminent gardeners were to substitute either sand or peat for the soil they now use, that, instead of gold and silver medals, they may next summer consider themselves well and liberally dealt by at Chiswick if their productions are distinguished by a Certificate of Merit.—R. Glendinning.

Pine-apples.—From experience, I beg to state that the following material may be used with advantage in any soil that is employed for the culture of Pines: viz., one-eighth of soot from coal-fires, to be well mixed with the soil, and the heap to be well saturated with chamber ley five or six times during decomposition. This I have proved to be beneficial to the growth of this excellent fruit.—W. Glendinning.

Pine-apples.—Having read several paragraphs in the *Chronicle* respecting the average weights of large Pines grown at Bicton and other places, I beg to state that the age of these six-foot plants is never mentioned; and as I understand they are cultivated after Mr. Glendinning's practice—with a low temperature and slow growth in their first stages—I conclude that they will require two or three years before they come to the fruiting-house. Suppose the retaining wall of a bark bed in a fruiting-pit to be 23 feet long by 7½ wide, the size of most pits near Manchester: and suppose that there were 33 rows in width and seven plants in the row, which is sufficiently crowded for a pit of the above dimensions; and that the average weights of 20 six-foot plants produced 110 lbs. of fruit, which is about the weight specified in the *Chronicle*: consequently, if my calculations be correct, the cultivators of the six-foot plants will have 110 lbs. of fruit for three years' labour and expense. Now I beg to state that Mr. Hamilton, gardener, Thornfield, with a pit of the above dimensions has raised within the three years 700 lbs. weight of fruit. The majority of his plants consists of the Montserrat, one of the slowest growers and most tardy fruiters. Moreover, to remove the doubts of "Dunelmensis," I herewith hand you the weight of six Envoilles cut at Thornfield:—

Envoilles.		Montserrat.

—R. H. Pope, Heaton Nursery.

Tank-heating.—"C." recommends to your Correspondent "J. M." to try as a covering and material for Rendle's Tanks, sheets of thin metal covered with the porcelain or coarse enamel, in common use for cooking utensils, exposed in every ironmonger's shop. The sheets could be tongued for the purpose of union, and the material would not permit the transmission of water or of moist vapour. Such sheets would be applicable for other purposes in Horticulture besides Rendle's Tanks.—Anonymous.

Pilchard Oil.—I perceive in a late No. an inquiry from "A Subscriber" to be answered by a Cornish or Devonshire reader, viz., if Pilchard Oil is a good and cheap oil for coarse painting. I beg to state that no train or fish oil is proper for painting of any kind; and what is more, the proper oil, linseed, used for painting, is as cheap or cheaper than any other kind of oil, not omitting Pilchard; but if your Correspondent will use the Pilchard or any fish oil to the American blight on his Apple-trees, with a small paint-brush, he will find it destroy this unsightly insect so injurious to the trees, and the oil will be found to nourish them. The trees will require to be locked to two or three times to get free of it.—An Intruder.

Experimental Co-operation.—I am much gratified by the determination expressed of making the *Chronicle* a vehicle for Agricultural, as well as Horticultural, discussion. I shall hope shortly to resume in its pages the subject of Experimental Co-operation, and to report progress since the time which has elapsed when my letters were addressed to the Farmers of Suffolk. I have been favoured with the results of an interesting experiment, undertaken by Mr. Bree at Stowmarket, which I propose to give in the opening Number.—J. S. Henslow.

Pseud-Acacia.—As the qualities of the Pseud-Acacia (Collett's Locust-tree) are not yet generally known, I am induced at this time (being the season for planting) to call the attention of your readers (being practical men) to encourage the growth of them. Twenty years ago I ascertained the good quality of the wood for gate-posts, upon removing one that had stood 20 years without decay, whilst the Oak of the same period failed; that one is now sound, and has consequently been in the ground 40 years. I planted 200 trees (20 years ago) in consequence, and at the same time also upwards of 2000 Oaks; not one of the latter is equal in size to the smallest of the Acacias, which are now useful for many purposes. The wood is nearly all heart. The Acacia of 30 years old may be reckoned as large as an Oak of 100 years; and this circumstance cannot fail to strike every proprietor of land who encourages plantations, of the advantage that will be derived by adopting this tree, whilst the Oak may be allowed to grow for other purposes, particularly ships, although the best tree-rails being part of the head are made of Acacia, and are imported from America specially for that purpose. I am aware that Mr. Withers, of Holt, has published a small work lately upon the usefulness of this tree, but I fear it is not generally known. I cannot, therefore, refrain from calling attention again to the subject. I have lately removed 10 posts put down 15 years ago for a fence, to another place, and not one of them shows any signs of decay; they are only three inches square, and have iron rods through them instead of nails. Many persons complain of the wind having much effect upon them, they being so

brittle—so they are when young, but the wounds heal very soon, and there is no necessity that they should be planted in situations much exposed. They do not require rich soil, and as far as my experience goes they do not thrive well on clay, yet I am told there are some growing well upon it, and of a good size.—A. P., Cheam.

Bees.—"Este" says, in No. 47—"I have had seven swarms from three stocks, because I did not ventilate as I ought to have done." From this and other statements I perceive that "Este" has just commenced that journey which I have accomplished with great loss and disappointment; I would therefore strongly recommend him to pursue a different course, as no system of ventilation—whether applied to collateral living, storifying, or nading, except such as will prevent comb-building—will put a stop to swarming, especially in wet seasons. I have had swarms come off with the thermometer standing below 80° in the middle box of a collateral set, and have frequently had them come off when both side-boxes have been partly filled with combs and honey. I have also found nearly the same results from storifying and nading hiving. In fact, the only way to reap the full benefit of the Beehive is to practise partial deprivation (see "Bevan's Honey-Bee," p. 246) a few days after the departure of a first swarm. By partial deprivation I mean extracting the whole of the combs containing honey only; this will most likely prevent a second issue. A stock so treated will generally be more valuable in the autumn than the swarm which proceeded from it, as it will contain a young queen, and, in all probability, more honey. Nading hiving (or Mr. Jeston's Butter-tub), combined with storifying, without ventilation, I think second to partial deprivation; but any success with nading separately must be more the result of chance than of good management, as it is a well-known fact that Bees have a great disposition to carry their stores upwards, and to keep their brood below. It is no wonder, therefore, that empty combs are found in the tubs in September.—Thomas Buckland, Reigate.

Fertilization of Carnations.—Last spring Mr. Wood published in the *Chronicle* a list of Carnations among which he directed attention to Toone's Ringleader, scarlet flake, as abounding in pollen. I have not found it so, yet Mr. Wood is generally correct. Can you tell me how far the potting might influence the production of pollen? [Not at all.] I believe that pipings mostly produce thinner flowers than Carnations, for which reason I prefer them to layers; besides they are less apt to rot and die when in bloom. However, my plants of Ringleader were layers. I imagine that the layers or pipings should, for seed, be potted in pots not too large—not exceeding 12s, and that the soil should be old turf partially rotted, mixed with half-decayed leaves, and the plants not mutilated for laying nor for piping. Possibly the double pots recently advertised might be very good; or, to avoid watering, the pots might be plunged in a box in ashes, said box being placed on feeders containing lime-water to keep out slugs, and in a great measure earwigs. I was glad to see Mr. Wood's observations on Ringleader, for I have found Florists (commercial ones), in general, unable or unwilling to give such information. I have noticed that Fletcher's Red Rover, scarlet flake, has with me abounded in pollen; the anthers are larger than in any other kind I know, and the flower, I suppose, will in substance and smoothness of petal be considered good, although the white is not first-rate. Will any one kindly inform me what pink Bizarre produces the most pollen.—O., Leeds.

Substitute for Glass.—Having frequently seen mentioned in the *Gardeners' Chronicle* cotton cloth for covering Cucumber-frames, I have inclosed you four different samples:—No. 1 at about 5d.; No. 2 at 6d.; and Nos. 3 and 4 about 8d. or 9d. per yard, 4 wide; the two first are cotton; the others, hemp or flax. I have used them some years, and find them answer very well for frames for covering all sorts of plants that require winter shelter, and will answer, no doubt, for Cucumber-frames. A great quantity of this article is made in this neighbourhood, and used for packing goods in before they are baled up, to keep them from being damaged on board ship, and the water will not penetrate for many days should the vessel sink.—P. W., Hahfax. [The samples sent are less transparent than calico prepared with Mr. Whitney's composition. Both Nos. 1 and 2 will, however, answer the purpose when much light is not required. Nos. 3 and 4 are too opaque, but are strong, and would doubtless prove useful for many purposes. We calculate that calico may be prepared with Mr. Whitney's fluid for about 4½d. a yard, including the price of the materials.]

Shrubberies.—Having read with much pleasure in the "Amateur's Garden," No. 46, Mr. Ayres' ideas of turving up all borders on front of shrubberies, and carrying the turf close up, that the branches of the shrubs may extend over it some little distance, I feel assured this will have a very pleasing effect, and will add much to the natural beauty of the flower-garden and pleasure-grounds; it will also tend materially to diminish the formality of flower-gardens, which at the present time too prominently exists. This idea has long since suggested itself to me, as being far preferable to the present prevailing practice of having a border filled with herbaceous plants in front of shrubberies, bounded with a turf-edging some two or three inches high, which always presents a very unsightly appearance, especially in winter, whether the border is digged or not. If the turf was extended up to the shrubs, the light green colour of the grass (for it never is a very dark-green when it is kept very short) forms a beautiful contrast with the dark green foliage of the shrubs.—William.

Morphology.—Two or three days since I was examining a flower of a Water Lily in a hothouse, in this neighbour-

hood, in company with the Gardener who has the management of the place, and having lately been reading an account of this plant in the "Ladies' Botany," I pointed out the gradual change of petals into stamens as being an excellent illustration of the theory, that all the parts of the flower are but modifications of leaves; when my companion observed, "That is very true, but I should like to know how the Cactus makes his flower without any leaves?" I thought this a shrewd question, and as I am but a Tyro in vegetable Morphology, shall feel obliged if you can find space to answer it in the *Chronicle* next week.—*A Botanical Student*. [It will frequently be found that the leaf-organs of a plant are developed unequally upon different parts. For example, on some Oaks the early shoots have only small scales instead of leaves, and it is only towards the end of the season that true leaves appear. So with the Cactus. Its first leaves are small scale-like points, which soon drop off; when the flower begins to form, these leaves assume a higher development, as is seen at the base of the calyx; then they become larger and larger, as is seen in the calyx itself, &c. &c. As soon as the year is turned we shall give you such reasons for the opinions of Morphologists as we doubt not will satisfy you. In the meanwhile read the "Theory of Horticulture."]

Cocoa Nuts for Manure.—I have lately heard that of the vast quantity of Cocoa Nuts imported into this country, a large proportion turns out rotten and unfit for the purpose of food. Those who buy them of the captains of vessels always require a considerable allowance to be made to meet this casualty; and the nuts which are thus rendered useless are burnt, merely for the sake of getting rid of them, because their stench, in a state of putrefaction, is quite unbearable. I cannot but think that a large mass of nourishment is thus wasted. There is in the Cocoa Nut a great quantity of oleaginous matter; added to which, both the shell and the fibrous mass surrounding it must contain nutritive qualities. Can you or some of your readers tell me whether the value of this article as a manure has ever been tested, and if so what has been the result? In this age of science so much vegetable matter ought not to be wasted.—*Asbestos*. [No doubt the kernel of the Cocoa Nut is rich in nitrogen, and would form excellent manure; the difficulty is to get it out of the shell. As to the fibrous mass, that is probably consumed in the manufacture of door mats. If not, it could not be fit for manure till it turns rotten, which would be so long a time that the cheapest plan would be either to char it or reduce it to ashes. The former we should prefer.]

Temporary Gardens.—Many of the lovers of gardens and evergreens will have thanked Mr. Beaton for instructing them how to improve the appearance of flower-gardens and other places during winter. I have tried his plan in several places, and they appear more cosy and comfortable, and pleasing to the eye, than they were before. Several years ago, when I used to cover tender plants with straw coverings, the straw was also covered with branches of evergreens, and sometimes a top of evergreens was fixed to them, and when neatly done it looked better than the straw, and had some resemblance to the clipped shrubs in old Dutch gardens.—*Peter Mackenzie*.

Italian Fire-Fly.—Let me inquire why, since the Fire-fly has been introduced from Italy, we may not naturalise it, and add to our summer evenings a shower of fire, as well as our own fixed stars of the glow-worm? There can be no reason from our climate that we may fear defeat, and no doubt but it would succeed. During the winter we may introduce the animal either in the chrysalis state or in the egg.—*Questus*. [We fear our climate is much too cold. The creatures could only live in a greenhouse.]

Dodder in Clover.—I send an extract from the "Gardeners' Magazine" of 1828, relative to the Dodder in Clover, which now, unfortunately, occupies so much of the attention of the farmers and others. "The seeds of Dodder, (*Cuscuta europæa*), are not unfrequent among Dutch Clover seed, the plant being a great nuisance to the farmers in that country and Flanders; but the seeds of *Cuscuta* not being above a sixth part of the size of those of Clover, are easily separated from them by sifting."—*Econom. Newigh.*, 1827, No. 12. The daily intercourse we have with both Belgium and Holland would enable any one to procure some of the sieves used by their agriculturists for the above purpose.—*E. C.* [The sieves called Number 17 will probably be found well suited to separating these seeds.]

The Cuckoo and Goat-sucker.—In your Number of the *Gardeners' Chronicle*, dated August 12, one of your correspondents intimates a wish to know if any one has been fortunate enough to preserve a Cuckoo through the winter, and if so the method of doing so. I have much pleasure in stating that mine has consisted in feeding it on raw beef chopped in small pieces about the size of a small horse-bean, and also a mixture of bruised hempseed and boiled bread and milk. By these means I have kept the Cuckoo throughout the winter. The Goat-sucker or Fern Owl I have also kept in the same manner.—*W. Rayner, Usbridge*.

Joining of Pipes.—If "J. M." (at page 842) had added a little cotton-wool to the lead and mixed it well together, he would have found it of great service in preventing the lead from giving way or cracking. This might be used either for joining together earthenware or iron pipes, or for stopping leaks. When pipes have been over-heated, so as to cause leaks, this mixture must be applied to the place, and with small twine or cord it may be secured to the place with very little trouble.—*Facile*.

Fences.—If cottagers wish to renovate their fences on a cheap scale, they should contrive next March, about a week or two before the Hawthorn buds have much

swelled, to obtain young vigorous shoots about the thickness of one's little finger, and about two feet in length; these may be inserted to the depth of six or seven inches, making the base of the cutting flat. The stems of some young trees here were protected with pieces roughly chopped off last year. These have made shoots six or seven inches in length, and are provided with good roots. What chiefly prevents a "dead staked hedge," as it is termed, from growing away in a year or two after it has been put up, is because the Hawthorns are chopped too much with the hand-bill and axe.—*W. Brown, Merevale*.

Fuchsia Exoniensis.—I beg to state that the remarks made by Mr. Ayres upon *Fuchsia Exoniensis*, in a late *Chronicle* (page 821) cannot be allowed to pass without a reply. Although I am sure that these remarks were not made in any spirit of unfairness, yet they are, nevertheless, calculated to make an unfavourable impression in the minds of those who have not had an opportunity of seeing the many fine specimens of this *Fuchsia*, which have been flowering in the Exeter Nursery during the past summer and autumn. These have satisfied all those who have seen them that *Fuchsia Exoniensis* is not only, as Mr. Ayres admits, "off the plant the finest *Fuchsia* in existence," but that it is equally deserving of praise on account of its habit, which is equal to that of the best varieties of this justly-admired tribe. I am sure that when Mr. A. sees this plant next summer in collections, he will admit that he has passed an unmerited censure upon it. As many inferior varieties are sometimes offered to the public, Mr. Ayres certainly cannot be too cautious in what he does recommend, but he should not rashly condemn that which is really first-rate.—*S. Brown, Exeter Nursery*.

Hardy Eucalypti.—Observing the *Eucalyptus* noticed by your Beamster correspondent as flourishing out of doors at Brodwinson, in Dorsetshire, and as having attained in seven years' growth the height of 12 feet, I beg to say that upon the northern side of this island the *Eucalyptus robusta* stands at the height of 28 feet, within four years from its seed. It well endures our winters. I am told by the surgeon of a convict-ship, who has often visited Port Arthur, that he has measured a Gum-tree there, and found the following dimensions, viz.,—Circumference at 4 feet from ground, 40 feet; from ground to first branch, 150 feet; entire height, 381 feet. This statement quite corroborates the report of Dr. Joseph Hooker, who has described in the last October Number of the "Botanical Magazine" the forests of *Eucalypti* with which Van Dieman's Land abounds. The *E. piperita* is a seedling also here, and promises to be hardy; but a small plant of the *E. multiflora*, raised from seed obtained from the Neapolitan Botanist Tenore, already appears to feel the weather we have as yet had, and it seems inclined altogether to refuse our winter.—*G. E. K., Newport, Isle of Wight*.

Vitality of Seeds.—As there are doubts on this subject, I beg to state that about four or five years ago a part of the Birkenhead and Chester line of railway was cut through poor meadow-land, perpendicularly, to the depth of 12 or 14 feet. The work was going on at Christmas, and the subsoil was stiff retentive loam. During the months of May and June following, the slopes on either side of the excavation were densely covered with *Charlock* (*Sinapis arvensis*) in flower; from the regular appearance of the soil, and the absence of any ploughed field near, I concluded that the seed must have lain there since the Deluge. I inquired if any seed had been purposely sown, and was answered in the negative.—*Nemo*.

Larch Insects.—Amongst the admirable papers on insects by your correspondent "Ruricola," I do not remember that he has mentioned that very destructive one which threatens to destroy all the Silver Firs in the country. I suppose it to be an *Eriosoma*. It fixes on the bark, and I know of no instance of a tree once infested by it recovering its vigour. The oldest I have seen attacked was about 40 years old. As there are plenty of them at present, I had all the diseased ones cut down and burnt immediately, to check the spread of the pest; but that system must cease, of course, and rubbing with brushes, &c. can only be applied to a very few ornamental trees or favourites. There is one important question which Mr. Curtis has not alluded to—do these and similar insects, such as the *Scolytus* of the Elms, &c., attack healthy trees, or those only in which the elements of disease are already present? This is worthy of careful investigation, as the ravages of the insect may be the result, and not the cause of the weakness; in which case we must go a step further back, and investigate the very origin of the bad health of the tree. I much wish that "Ruricola" may have leisure to give his opinion upon the subject.—*S. C.*

African Kidney Beans.—Reading lately in "Moffat's Missionary Labours and Scenes in South Africa," I found the following in a foot note:—"Maize I found abundant among the Matabele, where it does not require irrigation; also a fine large species of Kidney Bean, the pods of which grow underground, and are earthed up like Potatoes." The account of the Kidney-Bean rather surprised me. Is any such thing known of, or has it ever before been heard of in this country? Moffat himself was bred a gardener, and I wonder he was not a little more explicit. The part of Africa in which these Matabele were located is known as the Bakone country, themselves a tribe of Zulus. The natural beauty of the country, its richness in woods and metallic ores, as well as fertility—when cultivated—are described by Moffat as extraordinary. Dr. Andrew Smith conducted an expedition through it for the purpose of scientific research. Moffat led him into the country of the Matabele, which is intersected by the Limpopo river. Moselekatshe, the Matabele Sovereign, though a powerful

and savage tyrant, never saw an African ox-waggon till Moffat went to his capital, when he drew back with fear at their approach. He is so friendly to the Missionaries that any one recommended by Moffat would travel safely in his dominions.—*Quercus*. [This underground Kidney Bean is no doubt either the *Voandzeia* or *Arachis*. Both are too tender for this country.]

Material for Potting.—The following material, which is within the reach of most gardeners, will be found highly beneficial to the culture of plants in pots generally, viz., the decayed matter found beneath Fern and Furze. On account of its permitting water speedily to pass through it, it will form a valuable desideratum in the one-shift system; this system, through the perseverance of individuals, is daily progressing. In most professions there are to be found some who will, despite of everything, scoff at modern improvements, and persist in adhering to old practices; and if you ask the reason why they do so, the answer is, simply, Because our forefathers did the same. The above material will be found, in addition to potsherds, to produce a good effect on many *Orchidaceæ*; incorporated with turfy loam and river-sand, *Anemones*, *Ranunculuses*, Dutch bulbs, &c., may also be grown in it to great perfection. It will likewise be found a valuable compost for that beautiful tribe of plants, the *Tropæolums*. The season for planting is at hand, and by coiling the first two or three feet of the stem the tuber may emit, on the surface of the pot, covering it with a little soil, young tubers will be produced by the time the plant has completed its growth. It would be useless for me to enumerate any more genera that are particularly benefited by it; suffice it to say, that I have applied it incorporated with various substances, and its use has far exceeded my most sanguine expectations.—*George Bishop, Buckland*.

Araucaria Seed.—I think one of your correspondents made some inquiry as to the mode of raising the seeds of the *Araucaria*. I lost a great many fine fresh seeds of the *A. imbricata*, from Chili, by imbedding them too deeply in the mould, where they all rotted. I was not aware at the time of a secret, now perhaps generally understood, that these large seeds ought to be merely laid upon the surface of the soil, with, perhaps, a little earth raised round the edges, but not so as to cover them. Treated in this mode, I have now some very healthy young seedlings; and it may not, perhaps, be uninteresting to you to have a sketch of their appearance, as the plants exhibited different stages of germination in July last.—*Atlas*.

Germination of the Seeds of the *Araucaria imbricata*, from Chili, 20th July, 1834.

PROCEEDINGS OF SOCIETIES. HORTICULTURAL SOCIETY.

Dec. 5.—R. W. Barchard, Esq., in the chair. Sir J. W. Lubbock, Bart., and the Earl of Zetland were elected Fellows. A paper was read respecting the cultivation of *Oxalis Deppei*. A specimen of Whitney's (of Shrewsbury) protecting material was also shown to the meeting, with two specimens of a similar kind that might be used for the same purpose from Halifax; the latter, however, were not so transparent as the former, which admits nearly as much light as ground glass, and promises to be very useful in many instances where much light is not required. One great advantage is its cheapness; a sash that would cost 12s. or 13s. to be glazed in the usual way, may be covered with this material for the trifling expense of 9d. or 10d. It is perfectly impervious to water, and will be useful in gardens for many purposes. From the circumstance of its being waterproof, it will also make a good protection for fruit-tree blossoms in spring in damp wet weather, or from cold winds that generally prevail about that season. The material is common calico, painted over with a fluid, the composition of which is not known, but is sold in bottles and may be easily applied by means of a painter's brush. From F. Cox, Esq., of Stockwell, were *Lycaste Skinneri*, a pretty species from Guatemala, with broad light-coloured petals and dark purple labellum; this has, besides being very showy and handsome, the good property of continuing long in bloom; also *Cattleya guttata*, and the old *Cymbidium sinense*, with dark-brown fragrant blossoms; this has been known to keep blooming in a room for the space of six or eight weeks, and during the whole time the house was quite perfumed with its fragrance. In the same collection were likewise *Oncidium bicallosum*, having a fine spike of dark-spotted yellow flowers; this is not very common, and is a good species of that handsome genus. Mr. J. Robertson, gr. to Mrs. Lawrence, sent *Stenorrhynchus speciosus*, having broad dark-green foliage, and 10 spikes of flesh-coloured flowers; also *Odontoglossum grande*, *Dendrobium denudans*, with small white blossoms, and a plant on a block

of the rare *Epidendrum Skinneri*, with fine purple blossoms; this is very difficult to cultivate; according to Mr. Bateman it has been found to succeed well in a Vinery where there was a cool low temperature. From the same collection were likewise *Cypripedium venustum*, *Lycaste Skinneri*, with well-coloured flowers, *Rodriguezia secunda*, and *Epidendrum viscosum*, with greenish yellow petals and white-fringed labellum, also *Laelia albida*, with small sweet-scented white blossoms, *Maxillaria cucullata*, and another species with small dull-brown flowers. There were likewise *Erica Sebania lutea*, and a small specimen of *E. Lamberti rosea*, covered with pretty flesh-coloured blossoms; a Banksian medal was awarded for the first four plants. Mr. Green, gr to Sir E. Antrobus, Bart., exhibited a plant of *Amaryllis alba* with large scarlet flowers; and A. calyptrata, with light-green blossoms. From J. Allnutt, Esq., were *Camellia Donkelaarii*, two plants of *Erica affra*, and two particularly well grown specimens of *E. hymenalis*, having long shoots, densely covered with white and red flowers; this species is valuable, from its producing a profusion of bloom at this dull season of the year, a certificate was awarded for the two specimens of *E. hymenalis*. Mr. W. Brazier, gr to W. H. Story, Esq., sent a hybrid specimen of *Epacris v. virgata*. From Mr. Wright, of Hackney, was a collection of cut flowers of *Chrysanthemums*, among which were some excellent blooms; for these a certificate was awarded. Mr. J. Wilmet, of Isleworth, exhibited three smooth-leaved Cayenne Pine-apples; the first weighed 5 lbs. 11 oz., and measured 8 ins. in length, and 5 ins. in diameter; the number of pips was eight. The second weighed 6 lbs. 3 oz., and measured 7 ins. in length and 6 ins. in diameter; the number of pips was also eight. The third weighed 7 lbs. and measured 8 ins. in length, 6 ins. in diameter, and the number of pips was nine; the latter was exceedingly handsome, and well swelled, with a crown not very large for the size of the fruit. There are two kinds of Cayenne Pines, viz., smooth-leaved and saw-leaved; the smooth-leaved kind is larger and better than the latter, and has been grown to a considerable weight in France, in the King's Gardens at Versailles. From Mr. McOnach, gr. to E. Vine, Esq., of Aversham, were five Queen Pine-apples, the heaviest of which weighed 3 lbs. 14 oz., and measured 6 inches in length and 5 inches in diameter; the number of pips was seven. Mr. T. Moffat, gr to the Duke of Newcastle, sent a Cayenne Pine-apple, weighing 3 lbs. 14 oz., and measuring 7 inches in length and 5 inches in diameter; the number of pips was seven; also bunches of the following Grapes, viz., Muscat, Syrian, Muscadine, St. Peter's, and three good bunches of Black Hamburgh, with a bunch of a black Grape, a variety of the Burgundy. From G. Crawshaw, Esq., of Colney Hatch, Middlesex, were specimens of the Black Hamburgh Grape that had been grown without fire heat in a Vinery; these were good bunches with well swelled berries, but were not so well coloured as could have been wished. There were also from Mr. Crawshaw specimens of large fine-looking Beurré Diel Pears. Mr. J. Moorman exhibited six good specimens of Marie Louise Pear. From Mr. R. Buck was a seedling Pear, No. 15. J. A. Beaumont, Esq., sent good specimens of Renette du Canada and Blenheim Pippin Apples. From W. Rashleigh, Esq., was fruit of *Benthamia fragifera*. This plant was introduced some years ago from the North of India. It is a very handsome evergreen shrub, flowers in profusion during summer, and produces an abundance of large reddish fruit in autumn. It is not lardy, except in the warmest parts of England. The fruit when ripe bears some resemblance to that of an Arbutus. Mr. J. Stewart sent two specimens of Ringleader Cucumber, one of these had been watered with nitrate of soda, and the other had been grown in loam mixed with powdered charcoal, which is a powerful agent in the growth of plants; these, although both the same variety, had a very different appearance; the one was prickly, and the other was nearly smooth, thus showing that a Cucumber may be considerably altered by the use of different manures, although treated in other respects in the usual way as regards soil and heat. From Mrs. Cockburn were two Portuguese specimens of Turb Cap Gourd, with four curious lobes rising in the centre. From its singular appearance it is worthy of cultivation by those who grow these things for ornament. From the garden of the Society was a collection of *Chrysanthemums*; six of these were watered on the 28th of July with superphosphate of lime, in the proportion of a 4 lb. to a gallon of water for each plant. In the course of three weeks after its application the leaves had acquired a very dark green; so apparent was the effect produced on the plants that a stranger could have selected those that had been watered with this from a collection of 150, an one which they were growing, without any other mark or distinction. This substance seems to have a beneficial effect on most plants and, unlike some other artificial manures, it may be applied in different proportions without the least risk of injuring the plants. Had it been given to the *Chrysanthemums* at an earlier period, the result might have been probably still more striking. From the gardens of the Society were likewise a collection of Pears consisting of Beurré Diel, Beurré d'Arenberg, Glout Moreau, Orm-kirk Bergamot, and Passe Colmar; this is an excellent variety and one of the best standard Pears for this part of the country, but it is apt to overbear itself if not properly attended to. There were also the following Apples, viz., Pearson's Plate, Wyker Pippin, Claygate Pearmain, Blenheim Pippin, Walham Abbey Seedling, and Hubbard's Pearmain; the latter is an excellent late Dessert apple, and its merits are not generally known; it is a Norfolk sort, very hardy, and an abundant bearer.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

Dec. 6.—Lord Spencer in the chair. Mr. Brande stated that having been called on at a short notice to deliver two Lectures before the Society, he had fixed upon the subject of Lime and Clay, as being the most important to Agriculturists. Chemistry had now advanced far enough to be of service to Agriculturists, and this had been remarkably the case since the period in which minute analyses of plants had proved the necessity of attending not only to the bulk of materials of which the soil was composed, but to the substances which existed only in minute quantities. The ingredients of the soil may be divided, 1st, into those which form the bulk of the soil, as sand, clay, and lime; and 2dly, those particular substances, which only enter into the composition of some soils, such as some of the salts of lime, soda, potassa, iron, manganese, &c. Lime is a compound of a metal and oxygen, constituting an oxide. The metal is called Calcium, and is very difficult to obtain, but it resembles in its general properties potassium, the metal of the alkali potassa. (Here the lecturer performed the experiment of burning potassium on water.) Like potassium, calcium has a strong affinity for oxygen, and on throwing it on water its oxygen is abstracted, and hydrogen in a state of combustion is set free. Lime has the properties of an alkali, and acts upon test-paper in the same manner as potass and soda. It does not exist pure in a native state, but is always found combined with some acid. The acid with which it is most frequently combined is the carbonic acid, which consists of carbon and oxygen. (Carbon, or charcoal, was here burnt in oxygen to prove the formation of carbonic acid.) Carbonate of lime exists in the greatest abundance in the hills, rocks, and mountains of the globe, and is found in what the geologist calls the primary, secondary, and tertiary rocks. In the first it is found in the form of marble, in the second in the form of limestone and chalk, and in the third in immense beds of shells. One of the properties of carbonate of lime is, that it effervesces with acids and gives off carbonic acid. If a soil containing carbonate of lime be submitted to the action of dilute muriatic or sulphuric acid, and the whole bulk be weighed before and after the experiment, the quantity lost will indicate the quantity of carbonic acid present. Amongst many of the limestones other substances besides carbonate of lime are found. Thus the chalk at Brighton has been found to contain a great number of animalcules, and the consequence of their presence is that phosphate

of lime exists in it also, which is a very important ingredient. The following is an analysis of such chalk:—

Carbonate of lime	98.57
Carbonate of magnesia	0.98
Phosphate of lime	0.11
Oxides of iron and manganese	0.14
Alumina and silica	0.80
	100.00

Chalk with the phosphate might be a valuable manure for chalk without it. In order to get the lime, the carbonic acid must be got rid of. This is effected by heat, as in limekilns. Fifty cwt. of carbonate of lime or chalk yields 28 cwt. of lime, and 22 cwt. of carbonic acid are driven off; lime consisting of 22 parts carbonic acid and 28 parts lime. Chalk should always be burned in a current of air, and the more moisture this contains the better. If lime is exposed to the atmosphere it absorbs water and carbonic acid, forming a hydrate of lime and a carbonate of lime. Such is the affinity of lime for water, that it will dry air exposed to its influence in a confined space. When water is poured on lime it is rapidly absorbed and heat is given out, so that a match may be lighted by it. This is called *slaked lime*. When this lime is exposed to the air it absorbs carbonic acid, which always exists in the air, and parts with its water. Lime is soluble in 700 times its weight of pure water, and in this state becomes the best possible test of the existence of carbonic acid. If shaken in a vessel containing carbonic acid, whether from the combustion of a candle, the respiration of an animal, or the fermenting vat of a brewery the lime-water becomes milky from the presence of carbonate of lime. Carbonic acid may be proved to exist thus even in spring water and in the water of the river Thames. When carbonic acid is in excess in water it dissolves the chalk or carbonate of lime, and whilst under pressure the water holds it in solution, but the moment the carbonic acid is given off then the carbonate of lime falls down, and this is the origin of the stalactites and stalagmites of many of our caverns and springs. The uses of lime in Agriculture are several: 1st, it decomposes vegetable matter, and converts it into what is called *humus*; 2d, it neutralises acids which may collect in the soil; 3d, it decomposes injurious salts of iron, forming an inert oxide of that metal; 4th, it decomposes the various aluminous compounds, setting free their elements; 5th, it decomposes bone manure, and thus produces ammonia, a very valuable constituent in soils. When ammonia comes in contact with potash it becomes converted into nitric acid, and thus are probably formed the large nitre beds of various parts of India; 6th, when it comes in contact with felspar it evolves the potash and the silica of these rocks, and thus produces the best possible soil for the growth of the gramineous plants which are known to require so much silica. One of the best tests for the presence of lime is the oxalate of ammonia, which throws down in lime-water a copious white precipitate, which is oxalate of lime. The presence of carbonate of lime alone may always be ascertained in rocks by its making a clear solution in weak acids, but if there is magnesia or other salts, then the solution becomes turbid. It had been stated that lime is beneficial to plants, as they excrete from their roots an acid which, on coming in contact with the lime, is converted into a soluble salt, which is then taken up into the system of the plant. The sulphate and phosphate of lime are to be treated of in the next lecture. The lecture was illustrated by a number of judiciously-selected and well-performed experiments. The Duke of Richmond, at the conclusion of the lecture, proposed a vote of thanks to Mr. Brande, who had at a short notice, in consequence of the indisposition of Dr. Playfair, the Society's chemist, prepared the admirable lecture they had just listened to. He also proposed a vote of thanks to the Council of the Royal Institution for the use of their lecture-room. This proposition was carried by acclamation. Lord Spencer, having congratulated the Society on the promising aspects of the union of Chemistry and Agriculture, presented Mr. Brande the thanks of the Society.

LINNEAN SOCIETY.

Dec. 5.—Edward Forster, Esq., in the chair. Mr. Westwood exhibited specimens of *Cestrionids* insects, from Professors Zetterstedt and Dehnbach, which proved that the species previously described by Mr. Bracy Clarke in the Transactions of the Society were but the different sexes of the same species. A large collection of dried fruits was presented by Mr. John Smith, of Kew, for the Museum. Mr. N. B. Ward presented a specimen of the Shea Butter, the produce of the Bassia Parkii, which had been collected by Dr. Stanger during the recent Niger expedition. The fruit of this plant was exhibited in Mr. Smith's collection. Several fruits were also presented by Mr. Ralphs. Some further observations were read by the Secretary from Mr. Griffiths, on the family *Cyrtaceae*. A detailed account of the *Thlarea grandiflora*, with observations on its theoretical structure, accompanied with drawings, was also read from the same gentleman. Mr. Solly exhibited several specimens of the preparations of the ovules of *Loranthus globosus*, *Acrostichum dimorphum*, and *Santalum*, which he had received from Mr. Griffiths, illustrating his papers in the Transactions of the Society. Mr. Varley exhibited a microscope with a new movable stage, and specimens of the *Phlodoce roseola*, obtained in the vicinity of London. Mr. Ross exhibited a new object-glass, which he had constructed the one-twelfth of an inch focus, which was highly commended by the microscopists present. A collection of the fruits of *Coniferæ* from Dropmore were exhibited from Lady Grenville. There were excellent specimens of most of the fruits of the genera *Pinus* and *Abies*, and amongst others of the *Pinus Douglasii*.

NOTICES OF NEW PLANTS WHICH ARE EITHER USEFUL OR ORNAMENTAL.

VERONICA SPECIOSA.—Showy-flowered Speedwell. (Half-hardy Greenhouse Shrub.) Scrophulariaceæ. *Diandria Monogynia*. This beautiful species of *Veronica* was first described by Mr. Allan Cunningham in the "Botanical Magazine." And he then took occasion to remark—"Of all the plants of New Zealand with which botanists have made us acquainted, we know of none more to be desired wherewith to enrich our collections, than this very remarkable and beautiful Speedwell, judging both from the first specimens we have received, and from the description given of it on its native hills by its discoverer, Richard Cunningham. Since the country around its locality, at the mouth of the Hokianga river, is now occupied by Europeans, let us hope soon to receive the seeds, which we may reasonably expect will succeed as well as the *Chanthus* has done, in the open borders; the elevated grounds occupied by our *Veronica* being greatly exposed to the prevalent tempests of its weather-beaten coast, in nearly the same degree of southern latitude (about 36°) in which we believe the *Chanthus* has lately been found. Living plants have been brought over by Mr. Edgerly from Hokianga, which were purchased by Mr. Knight, in whose Exotic Nursery they produced their fine spikes of blue purple flowers in the month of September of the present year. It is at present too rare to run the risk of exposing it to an English winter; but it thrives well in a cool greenhouse. The Royal Botanic Garden of Kew is indebted to Mr. Knight for the possession of this scarce plant. In its native country it attains to a height of from three to six feet."—*Curtis's Botanical Magazine*.

BARRINGTONIA SPECIOSA. Showy *Barringtonia*. (Stove Shrub.) *Myrtacæ*. *Monadelphia Polyandria*.—Cultivators will be pleased to find that this noble plant, which is chiefly known in our stoves for its very handsome foliage, and for the alleged difficulty of growing it well, has produced its remarkable inflorescences in the stove of Colonel Baker, at Salisbury. From Mr. Dodds, gardener to Colonel Baker, we have received the following account of the species, kindly furnished by the Rev. J. Greenly:—"It is a stately tree, which grows plentifully towards the coast of many of the islands in the Southern or Pacific Ocean, as well

as in the various parts of India, China, and the Indian Islands. The bark is ash-coloured. The branches are numerous and spreading. The leaves are often more than a foot in length, of a strong and firm texture, with a lucid surface, and of a beautiful bright green. The flowers are numerous, large and white, with a vast number of stamens of a deep sanguineous purple. They are produced from the upper parts of the branches, and blow chiefly in the evening, falling off the next morning, and are followed in succession by others. The tree continues in flower for a considerable time." Mr. Dodds has likewise favoured us with some interesting facts regarding his treatment of the plant. He says:—"We have had it about thirteen years. It is a plant of easy growth, likes plenty of moist heat, abundance of water in the growing season, and a little bottom-heat. Knowing that the species, in its native state, attains a great height, I endeavoured to get age without much height. The plant we have now bloomed was not more than four feet high when it showed flower. It has since made new shoots of more than four feet long. When our first plant was about eight feet high, I cut a foot off the top in March, and struck it. I found it to root freely, and it was ready to pot in five weeks. This young plant was well grown, and about the third year the top again taken off, and treated exactly in the same way as the other. The plant we have now bloomed was four years old last March. It was topped a year ago last March, and kept without a drop of water from November till the middle of March. It was then started into growth. About the beginning of May it had made shoots a foot or more in length, when I turned it out of the pot, shook nearly all the soil away, and cut back the roots. I then potted it into a twelve-inch pot, in a mixture of charcoal, loam, sand, and peat, and on the 4th of the following month (June) it threw up a fine spike of flowers. It is highly fragrant, something like *Cereus grandiflorus*, but more powerful." The remains of the flower-spike sent to us measured twenty-two inches in length. Such is the process by which this splendid plant was induced to bloom. It is rich in instruction. The genus was named *Barringtonia* by Rumphius; this title has since been abandoned for one which commemorates the Hon. Daines Barrington.—*Paxton's Botanical Magazine*.

MISCELLANEOUS.

Analysis of the Raspberry-bush.—Having noticed that the Raspberry-bush sprung up wherever fields had been burnt over, and also by the side of decomposing stone walls, Dr. J. was led to analyse it, with the expectation of finding an unusual amount of potash. The following are the results of the analysis of the *Rubus strigosus*:—1000 grains of the dry Raspberry-bushes were burnt in a platina dish, in a muffle, and the ashes collected in this manner were found to be burnt perfectly free from carbon. The amount of ashes from 1000 grains of the bushes was 16.2 grains, or 1.62 per cent. They were easily melted and flowed in the capsule. The fused ashes, analysed in the usual manner, yielded—

Allotments.—Before reaching the factory of Messrs. Gott of Leeds, we pass by a pair of folding-gates, giving entrance to a large plot of ground presenting a twofold interest, both from the purpose to which it is now applied, and from the improvements which it indicates in the mode of manufacture. This ground was formerly occupied as a tenter-field, where the woollen cloth, in various stages of its manufacture, was suspended by hooks on rails to dry. But the custom became introduced, by degrees, of drying the cloth in close rooms or galleries heated by steam or by hot air; and this has been found in various ways so much more efficacious, that the old system of tenting is no longer acted on in large establishments. The tenter-ground thus set at liberty has been laid out in a series of gardens for the workmen in the factory, and thus presents a most pleasant and healthful boundary to the factory on the eastern side. The extent of ground thus laid out is about eight acres, divided into 142 allotments of nearly equal size. Such of the workmen as take an interest in gardening are allowed to cultivate these little allotments, paying a trifling sum in the form of rent, not as a source of profit to the proprietors, but to give the men an undisputed right to the produce which they may have cultivated. Nearly all the allotments are in a flourishing and healthy condition, each one staked off, separated from the others, and numbered, and each one serving to denote the kind of produce which its cultivator chooses to select. Some contain flowers chiefly; while others (and these more generally) contain such culinary vegetables as Potatoes, Cabbages, Lettuces, Onions, &c. The family of one of the workmen reside in a kind of lodge near the entrance, and to this family the care of the garden is intrusted. Opposite the lodge is a tool-house, where, on hooks and nails properly numbered, hang all the gardening tools, such as spades, hoes, rakes, and so forth, each renter having his own tools. In this tool-house is a board inscribed with the 'Rules and Regulations,' which the proprietors have established for the good management of the garden: such as the hours during which the workmen and their families may have access to the garden, the admission of the friends of the workmen, and other arrangements of a similar character. In a busy town such as Leeds, where houses and factories are necessarily congregated very thickly, the existence of a plot of garden-ground in such a situation is important in respect to the health of those who live near, independent of the good effects likely to result from the maintenance of these kindly relations between masters and workmen.

—Penny Magazine.

Bermuda Coffee.—Coffee was introduced into Bermuda almost as early as into Jamaica. Its cultivation being neglected, it has maintained itself as if it were an indigenous plant, growing wild under the Cedars. The quality of this Coffee is excellent, so that the Bermudians never find any they import to equal it. Mocha lies in a more southern latitude, but the Mocha Coffee is said to grow on

terraced mountains, having a temperature of about 85° or 86°, which is exactly the summer temperature of the Bermudas. The Coffee-tree thus maintaining itself in a wild state in Bermuda is an interesting subject, and in a public address the Governor, Col. Reid, has recently directed attention to it. Some which has been sent us by his Excellency proves of the finest quality, and would doubtless take a very high rank in the European market.

Substitute for Wood.—A singular substance has lately reached this country from Singapore, and promises to become of some importance as a material for the handles of knives, tools, and all instruments which require great strength. It is a pale greyish salmon-coloured material, rather stringy, softening at 150°, and then capable of being moulded into any form. It is hard, compact, and not very unlike horn in texture. We believe it has been found by Mr. Edward Solly to be analogous to India-rubber in its chemical constitution.

Australian Wheat.—Some fine specimens of Australian Wheat have recently arrived in this country. They consist of white Wheat, equal, if not superior, to the finest English. The lot of which we have seen a sample cost 35s. a quarter at Hobart Town, where it was shipped; the freight and expense amounted to from 10s. to 12s. a qr., and the duty to 5s., so that it cost the importers from 50s. to 52s. a qr. in England. As it is worth from 58s. to 60s. a qr. at London or Liverpool, it will leave a fair profit. This is, however, chiefly owing to the very low rates of freight, and the abundance of grain in the Hobart Town market.—*Liverpool Paper.*

The African Guano Islands.—If it is true that between 40 and 50 vessels have gone out to bring guano from the rocky islands on the west coast of Africa, there will be no want of that article next year, even if the West India planters, who have begun to use it freely for their sugar-canes, should require a larger supply than they have yet had. Immense beds of it are known to exist on two of the islands lying on that desert and uninhabited coast, which stretches from the southern point of the Portuguese possessions of Congo, almost to the Great Orange River, the northern boundary of the British possessions at the Cape; and as rain rarely if ever falls along this coast, it is probable that the guano will be found to have been collecting in the same manner, on the whole of the islands along it, for centuries. The first guano searchers who landed on those islands had to fight as fiercely with the birds for their cargoes as Eneas and his companions had to fight with the harpies of old in defence of their dinners.—*Liverpool Times.*

Cider.—In the last Number of the "Pharmaceutical Journal" we find the following useful information on Cider making:—"The usual system is to filter, fine with isinglass, and rack frequently, leaving the bung-hole open until fermentation has ceased. When living in a fruit country, I had placed in my cellar three pipes of cider which had been a day or two previously pressed from the fruit. I added to each cask four ounces of isinglass in solution, and one pound of coarsely-powdered charcoal. I then bunged it down, and introduced a tube through the bung of the shape of a siphon, the contrary end dipping into water for the purpose of excluding the atmospheric air, and at the same time ensuring the safety of the vessel. When it had dropt tolerably fine, I racked it as quickly as possible, adding another quantity of the solution of isinglass and charcoal, stopping it down as before. At the expiration of three weeks fermentation had ceased. I withdrew the tube and stopped the hole in the bung, and found I had a bright, rich, and delicious beverage, which continued in the same state until it was drunk."

New Works on Botany, &c.—Ledbeour's "Flora Rossica," Vol. ii., fasc. 4, containing the orders from Amygdalaceæ to Saxifragaceæ. "Elojo Historico de Don Mariano La Gasca," by Dr. Agustin Yañez y Girona, President of the Academy of Sciences of Barcelona. "De Candolle's Prodromus," Vol. viii., completing the work as far as Asclepiadaceæ, which are from the hand of M. Decaisne.

Extraordinary Produce.—On three acres and a quarter of land on Chatmoss, near Manchester, and only reclaimed some three or four years ago, there has been dug up this season 595 loads of Potatoes, of 252lbs. each, and equal to 67½ tons, and worth fully 54s. per ton. The land is under the superintendence of the guardians of the Manchester Union.—*Country Paper.*

Reviews.

The Rose Amateur's Guide. By T. Rivers, Jun. 12mo. 1843. Longman. 3rd Edition.

WHAT can we say of this, the third edition of Mr. Rivers' "Rose Amateur's Guide," except that it excels its predecessors? No book which we possess gives so good an account of the origin and classification of varieties; no book deals with their management, in a concise way, better; no book has more claim to the approval of the gardening public. We have some remarks to make on its details, but those we shall treat of in another place. The cultivation of Roses in pots for the greenhouse is a new topic, which is treated thus by the author:—

"For this purpose a selection should be made of some of the finer varieties of China and Tea-scented Roses on their own roots; it may also include such Bourbons as the Queen, Acidalie, Crimson Globe, Grand Capitaine, Madame Nerard, Madame Margat, Proserpine and Phoenix, and Noisette's Miss Glegg, Lelieur, Ne Plus Ultra, and Victorieuse. These are all of dwarfish and compact habit, and free bloomers. Presuming these Roses to be procured in the spring or summer, in the usual small pots they are generally grown in by the cultivators for sale,

they should be immediately potted into pots called 32s, (these are generally 7 inches deep, by 6 over at the surface,) in a compost of turfy sandy loam and well-rotted manure, equal quantities, or leaf-mould; if the latter is used, two-thirds to one-third of loam will be as well; this compost must not be sifted, but merely chopped into pieces as large as a walnut: the fine mould, which will, as a matter of course, result from this chopping, must not be separated from the pieces of turf, but all must be well mixed with the manure or leaf-mould. The pots should then be filled about one-third with broken pieces of crockery or potsherds, the plants taken from the small pots, and the balls of earth gently pressed so as to loosen them; place each plant in the centre of the large pot, press the earth well round them, give a soaking of water, and plunge them in the sawdust or tan in some sunny exposed place, where they may have all the sun our fickle climate will give them. They may remain here till early in October, when they should be removed into the greenhouse; but a fortnight before taking them into their winter quarters, lift every pot, and place it on the surface of the bed in which they have been plunged: their roots then become hardened, and bear the dry warm air of the greenhouse without injury: they should at this time also be pruned into any handsome desirable shape, (a compact bush is perhaps the prettiest,) or, if tall plants are required, the long shoots may be fastened to a neat painted stick. Roses thus treated will come into bloom in the greenhouse in April, and continue one of its brightest ornaments till the beginning of June; they should then be repotted into larger pots if large plants are wished for, and again plunged in the open air till the autumn: care must be taken to place the pots on slates, to prevent their roots getting through the bottoms of the pots. If compact and pretty little plants are required the same pots may be used, merely reducing the roots, so that the pot will hold a small quantity of compost for the plant to feed upon. A most excellent compost for potted Roses may be made as follows:—Pare some turf from a loamy pasture; the parings must not be more than one inch in thickness; bake them in an oven about twelve hours, when the temperature is equal to that just after it has been used for baking bread; they must not be burned: this, chopped as before directed, with equal parts of rotten manure, forms one of the very finest of composts. The plants must be looked to carefully in spring, and whenever infested by the aphid, or green-fly, tobacco-smoke must be applied: extraordinary luxuriance of growth may be given by watering them once a week with guano-water."

ERRATUM.—In the review of "Liebig's Agricultural Chemistry," p. 846, we omitted to state that the quotation relating to Phosphates was from his "Letters," a little work noticed at p. 776.

THE NATURALIST'S CORNER.

(Continued from page 847.)

68. Sponges.—There are about fifty different species of this well-known marine production, which has been in use from very early times, and regarding which naturalists were long embarrassed whether to assign it a place in the animal or vegetable kingdom. Most authorities now agree in putting the sponges in the lowest scale of the former. The best are those which come from the Archipelago, where they abound near many of the islands, whose inhabitants may be said to subsist by the sponge-fishery, if it may so be called. At the Cyclades, sponge-diving forms the chief employment of the population. By the old physicians, sponge was regarded as a cure for a long list of maladies: this list is now much abridged, though burnt sponge, in which form only it is used, still has a place in the *Materia Medica*.

CALENDAR OF OPERATIONS for the ensuing week.

THE fact that earthenware pipes have been fitted together so as to hold water, is, indeed, of essential service. In 1834 I saw a complete failure, on a large scale, in an attempt to heat a Pinery with these pipes, jointed with cement; but, from want of perseverance, I thought the experiment had not been fairly tested, and not wishing to prejudge the question when it was proposed to repeat the experiment at Chiswick, I was silent respecting it—besides, I had heard that something of the sort had succeeded in the neighbourhood of Newcastle two or three years since. When one man succeeds in a thing where twenty fail, it shows how essential it is for Gardeners to persevere in experiments, even after repeated trials. Apart from the operations of the garden, we ought thoroughly to understand all the details of building hot-houses, pits, and other structures, the best modes of painting and glazing, and all the minutiae of fitting-up boilers, pipes, flues, and tanks, &c. not, perhaps, that we should practise these things with our own hands, but to be aware if others did so for us in the best and cheapest manner. And this knowledge gives a confidence which is really necessary when we are called upon to conduct these affairs. When alterations or additions are to be made in the present mode of heating hot-houses, &c., whether for the purpose of building a better flue, or for adopting a hot-water apparatus with pipes or tanks, or for all three combined—there are many minor points as necessary to be attended to as first principles. There is a kind of fire-proof mortar which I have used almost every season for the last 15 years, which I do not recollect to have seen noticed in any publication; this I would strongly recommend to be used instead of common mortar for all fire-places, flues, and for building pits—that are always more or less moist with the linings—also for pointing or filling up joints along the tops of old garden walls, &c.; it is made with two thirds of the best limestone and one third of the gritty black dust from a blacksmith's forge, both sifted very fine and well mixed, without any sand: it stands heat equally with fire-bricks, and sets nearly as hard as Roman cement; it requires more time to prepare than common mortar, and more labour to spread it with the trowel—but it may be made softer than common mortar, which removes the difficulty of applying it, and it will dry in half the time the usual mortar would take. I entertained the idea for some time of making a quantity of it with common oil, as we make putty, to try how it would answer for jointing earthenware pipes, first painting the joints as "J.M." mentions in a late *Chronicle*. I may some day try this, but I think "J.M.'s" plan much better. We all know, in glazing, that front putty should not be put on

* I have used, with much success, turf roasted on a sheet of iron (placed in temporary brickwork) under which a moderate fire has been kept: about one hour's roasting is sufficient. This chars the turfy side, and acts most beneficially.

until the slip of glass under it is first painted and dry—putty thus put on never parts with the glass until it perishes, which was the great fault in old-fashioned glazing. Even the simple article putty is seldom made as it ought to be for pits and hot-houses liable to extremes of temperature: whitening, boiled or linseed oil, with a little spirits of turpentine (or "driers," as it is called), are all that is thought necessary for garden purposes; but this soon perishes in some situations, and if you add one tenth white lead it gets so hard that it is difficult to get off when repairs are necessary. The best glaziers now make it thus: 10 lbs. whitening, 1 lb. white lead, and the necessary quantity of boiled oil and driers, and a wine-glassful of the best sweet oil—this last prevents the white lead from hardening, and also preserves the putty for a long time;—all putty ought to be made some time before it is used. Since it has become general to putty laps, or use long panes, it is necessary that the painting should be of a soft tint, to lessen the effects of the reflected rays on the leaves of plants trained near the glass. I have known Vine leaves to be much scorched by incautiously leaving the bars inside with no more paint than the first coat of red, or priming; and I think the cause of the reflected rays from the red bars scorched the leaves was explained to the British Association at Cork last August.

I.—KITCHEN-GARDEN AND ORCHARD.

In-door Department.

PINERY.—I hasten to correct an error into which an Amateur has fallen in the third week of his Pine-growing, in an attempt to kill the white-scale on them. "The stable-litter filled the pit with steam or fog, with the thermometer at 55° in the morning." This was at least 10° too low: the plants are not under a course of culture, but undergoing a process for killing the scale, and ought for a few days to be at from 70° to 100°—for all experience proves the ammoniacal gas to be most destructive at a high temperature. Some of the old gardeners used to finish the process in a few hours; in 1824 I saw about 50 young Pines cleaned completely in two hours and a half, thus:—a bed was made up of fresh dung, and as soon as the heat was at its highest the bed was covered with hurdles, the plants turned out of the pots, and inserted over the hurdles, the glass put on, and covered with a double mat; the suffocating heat was very high, and the plants were completely cleaned in that time, and did not seem to be in any way injured—but I recollect they were shaded from the sun for some weeks afterwards. "You know," says a friend, "when I came here, the Pines were bad with the scale and mealy bug; I disrooted them all in August, gave them a good lining of dung, and kept them well excited until October, and by the next spring they were clean, and I have not seen any of these pests since." This was a more rational mode than the former, and the summer months are preferable for the operation.

VINERY.—Any Vinery that is to be forced on this side of January should be begun forthwith, if only to give more time to the plants to ripen the crop. Begin very gently at first, with no more than 50° of fire-heat, and let the air be saturated with moisture—if from a few barrowfuls of horse-dung or leaves all the better. Let the outside borders be well covered, and those inside stirred, and well watered with tepid water.

PEACH-HOUSE.—The Peach-tree also requires a slow movement at first; and to have the fruit ripe by the middle of May the house should now be closed, with a temperature of 45°. At this low temperature the house does not require so moist an atmosphere as the Vine; yet it is a good practice to syringe the trees night and morning with water at the same, or rather a higher, temperature than that of the house. If insects have been seen on the trees last summer this is a good time to destroy either them or their eggs; indeed, it is a general rule to coat over the trees at this time with paint made of sulphur and soft soap, with a little soot to give a dark colour.

CUCUMBERS.—In Mr. Johnson's very useful Almanac it is said the Cucumber "is more sedulously cultivated in Suffolk than in any other county in England." I am in correspondence with some of the most successful growers, and I learn that the plants are stronger than usual this winter. "We shall have a trial of the most successful cultivation decided next February; not so much as to individual growers as to the systems of growing them with dung and with hot-water." As the best growers in the country have patronised the "Ipswich Cucumber Society," it will, indeed, be interesting to know how far the two systems will maintain the views of their advocates. For these prize Cucumbers a range of 10° is allowed for surface-heat, from 75° to 85°, with a bottom-heat of about 90°, with air every day.

KIDNEY-BEANS and STRAWBERRIES.—Preparations for both should now be made. The top shelves of the Peach-house is the best place to begin the Strawberries, except where pits are devoted to them.

Out-door Department.

Besides the regular work of manuring and digging the ground, there are many things which ought to be seen to in the dead of winter in and around the kitchen-garden; anything which can be done to forward spring work is useful. I have been more than once asked last summer to say something about making borders for fruit-trees. There is hardly anything that can be added on the subject; nothing in the whole range of garden literature is better supplied than this subject. Many years since I broke up an old Vine-border which was well drained with round stones, bricks, and the like, to the depth of 18 inches in some places, but many of the roots found their way through the drainage, and some of them were severely injured, being pressed between the stones by their own growth, showing that rubble drainage, though best for keeping the border dry, is not effectual to keep the roots from the subsoil. I believe a young root would find its way down through a yard deep of such drainage, if the soil below was at all wet. Besides a provision for drainage there ought to be an impervious bottom, to keep back the roots; and the best thing I know for that purpose is chalk broken small, and well rammed when perfectly dry; if it is put together in a wet state it will form a compact mass through which the drainage cannot enter. The bottom of a border made on a bed of chalk is always in a dry state, and well suited for the roots of all plants; the chalk acts like a sponge against the soil, keeping it in a friable, porous state.

II.—FLOWER-GARDEN AND SHRUBBERY.

In-door Department.

STOVE.—I have heard that a new stove climber has been beautifully in bloom for more than two months, and no one thought of sending it to a botanist to be described. Negligence was the sole cause in this case. Stove climbers that have been gradually pruned for the last two months should now be finished off, both for their own sake and to let in more light. Few people think of pruning house-climbers altogether at once. Those climbers which bloom on the young wood, like the Grape-vine, should be closely pruned. To these belong the Passion-flowers, the Ipomæas, and Echites, &c., while those that bloom on last year's wood, as most of the Bignonias do, must be left in long shoots till after flowering time, and then these shoots may be cut off altogether, to make way for another succession, if not wanted to fill up vacant spaces.

GREENHOUSE.—After trying all modes of heating a greenhouse I prefer the old flue after all, but not such flues as were in use in many places 20 years since; it is the least expensive of all the modes that have been tried, and as effectual as any of them; but I allude to a detached house: when a greenhouse is joined to a stove, pipes, or a tank in the way of Mr. Beck's, are more ready and economical, as, by turning a cock, or opening a valve, you get heat at once to meet a sudden change in the weather. The only attention required now among greenhouse plants is to keep them free from damp, by having the house well aired, and all dead leaves removed, the soil stirred occasionally in the pots, and to use as little water as possible.

CONSERVATORY.—"This season has brought out some first-rate Chrysanthemums, new in colour, and so distinct that one

can easily select 12 well-marked varieties," so writes a London nurseryman on whose opinion I can rely. Conservatory climbers may now also be pruned finally. Orange-trees should now, or soon, be well cleaned, especially any dwarf ones that are to be forced, as, when once they begin to grow, you cannot well handle them for this purpose. The finest growth of Orange-trees I ever saw was at Hurst House, near Plescot, in 1832, and Mr. Durden, the successful gardener there, tells me the trees have been loaded with fine fruit ever since, and as he manages them widely different from the usual way, it would be very desirable to have a paper from him on their individual culture, as there is no department of gardening we are less successful in than in the growth of Orange-trees.

PITS AND FRAMES require daily attention, to keep the plants clean and free from damp or decayed leaves, and the forcing pits should be smoked regularly every fortnight. Those flower-bed Pelargoniums that do not strike in summer should now be brought to the forcing-pits, to have young shoots ready for cuttings in January.—D. Beaton, Shrubland Park Gardens, Ipswich.

State of the Weather near London for the week ending Dec. 7, 1843, as observed at the Horticultural Garden, Chiswick.

1. Cloudy; overcast, clear and frosty.
2. Light frosty haze, exceedingly fine; hazy at night.
3. Hazy; cloudy and mild throughout the day and night.
4. Hazy and drizzly; cloudy at night.
5. Drizzly; cloudy and mild; fine.
6. Clear and fine throughout.
7. Thickly overcast; drizzly; fine at night.

Mean temperature of the week 33° above the average.

State of the Weather at Chiswick during the last 17 years, for the ensuing Week ending December 16, 1843.

Dec.		Aver. Temp.		No. of Years in which it has rained.	Greatest quantity of Rain.	Prevailing Winds.							
		Highest.	Lowest.			N.	N.E.	E.	S.E.	S.	S.W.	W.	N.W.

The highest temperature occurred on the 13th, in 1843—thermometer 61°; and the lowest on the 14th, in 1843—thermometer 18°.

REPORT ON COVENT-GARDEN MARKET.

For the Week ending Dec. 8, 1843.

THE mild open weather during the week has rather increased the supply of Vegetables. Fruits are also, generally speaking, abundant; but trade still continues dull. Pide-apples are good and quite sufficient to meet the demand. Hothouse Grapes are scarce, and have rather advanced in price since our last Report; Portugal ones continue to be supplied in large quantities, and are good in quality. The supply of Apples has been pretty well kept up during the week, and Pears are sufficient to meet the demand. Among the latter we noticed some good specimens of Guernsey Chaumontel and Beurré Bosc. Oranges have been pretty largely supplied during the week; a few Seville ones have appeared in the Market. Among Vegetables were some good Broccoli, Cabbages, and Brussels Sprouts; these are selling at last week's prices. Lettuce bring from 6d. to 1s. 6d. per 12 bunches. A few good Savoy's have been brought to the Market during the week, and are selling at from 6d. to 1s. 6d. per dozen. We also noticed a few punnets of Sea-kale and French Beans; the latter are selling from 3s. to 4s. per 100. Celery is good and plentiful. A few New Potatoes have been supplied since our last Report, these are selling at from 3d. to 6d. per lb. Endive and other Salading are abundant. Cut Flowers chiefly consist of Erica hymenalis and gracilis, Roman Narcissus, Poinciana pulcherrima, Bignonia, venusta, Luculia gratissima, Lechenaultia formosa, Heliotropium, Pelargonium, Verbenas, Chrysanthemum, Cinerarias, Camellias, China and Perpetual Roses.

PRICES, SATURDAY, December 9, 1843.—FRUITS.—Pine Apple, per lb., 3d. to 7s. Grapes, per lb., 2s. to 4s. Apples, per lb., 1s. 6d. to 2s. Pears, per lb., 1s. 6d. to 2s. Oranges, per dozen, 9d. to 2s. Lemons, per doz., 1s. to 2s. Pomegranates, per doz., 3s. to 6s. Green Gascapins, per 100, 1s. to 2s.

VEGETABLES.—Onions, Spring p. doz. beh., 2s. to 3s. Large, per bushel, 2s. to 3s. Spanish, per doz., 1s. 6d. to 4s. picking, p. h. sv., 3s. 6d. to 4s. 6d. Shallots, per lb., 5d. to 1s. Chilis, per lb., 1s. to 2s. Lettuce, Cabb., p. doz., 6d. to 1s. Cus., per core, 6d. to 1s. Celery, per bun., 6d. to 2s. Mushrooms, per pottle, 1s. to 1s. 6d. Wallnuts, per bushel, shelled, 1s. to 80s. Small Salads, per punnet, 2d. to 3d. Watercress, per doz. sm. bun., 3d. to 6d. Parsley, per doz. bunches, 1s. 6d. to 2s. 6d. Tarragon, per bun. 2d. to 3d. Endive, per core, 6d. to 1s. Mint, per doz. bunches, 1s. to 2s. Marjoram, green, p. doz. bun., 1s. 6d. to 2s. Chervil, per punnet, 2d. to 3d. Salsify, per bundle, 1s. to 1s. 6d. Scorzonera, per bundle, 1s. to 1s. 6d.

Notices to Correspondents.

TO CORRESPONDENTS.—W. H.—Should be much obliged. COMMUNICATIONS from the following CORRESPONDENTS are in type, and are only waiting till room can be found for them:—B. Maund, Bromsgrove; J. L. O. Leeds, W. Rayner, Uxbridge; J. Wighton, M. Seal, A. B., J. W. Jones, W. P. Ayres, G. G. Watson, A. Practical Man, W. B. Booth, Peter MacKenzie, Tyro, Tolly, W. G. S., C., and Facile. APPLES.—H. B.—None of your seedling Apples which you sent deserve notice, except the Stoke Edith Pippin, which resembles a Golden Pippin in appearance, but is more russeted than is generally the case with the Golden Pippin. The flavour of the Stoke Edith Pippin equals that of the Golden Pippin. ASPARAGUS.—A Cockney.—The stems of your Asparagus plants may be cut off with advantage now, and the beds may be covered with some half-rotten dung, to preserve the crowns of the roots from frost, and this may be allowed to remain on until about March. Seakale may also be treated exactly in the same way. You may plant Myatt's Pine Strawberry in March or April. BEECH-TREES.—H. S. E.—We suspect it to be the dryness of the earth underneath your Beeches, and not anything poisonous in the trees themselves, which prevents the turf from growing. The foliage of the Beech tree is so very dense that rain will hardly pass through it. Try what watering the turf with a weak solution of muriate of lime will do. BOOKS.—R. B.—Neither Liebig nor Mohl's works will do you much good; the latter, indeed, is not translated into English. You had better make yourself master of the "Theory of Horticulture," by Lindley, which you may understand. "Murray's

Encyclopedia of Geography" and "Kollar on Insects" will probably answer your purpose. We never mention the names of publishers or the prices of their books: it is for them to advertise them if they wish to sell them.—Although Knight's "Old England," of which the first part has just appeared, does not at present appear to have any relation to gardening, yet it is so beautiful a book, so wonderfully cheap, and so useful to all who wish to be informed concerning the history of their own country, that we recommend every gardener who has 1s. 6d. a month at command to procure it. Time was when a copy like that of the Druid's Oak would have sold for the price of an entire part of the work.—We can only acknowledge the receipt of "Mr. Redman's Remarks on the Lighthouse System of Great Britain," a pamphlet of 49 pages.—A Constant Subscriber.—Mr. Selby's "British Forest Trees" is the best work on Arboriculture; Dix's "Land Surveying" is cheap and a good book for a beginner; Martin Doyle's "Farmers' Cyclopaedia."—Q. C., Dulwich.—London's "Suburban Gardener." J. M.—Dr. Bevan on the "Honey-Bee."—P.—You must apply to a bookseller, we cannot advertise for them.

BORDERS.—Amicus.—We would certainly advise you, if it can be avoided, not to crop your Peach-tree border lately prepared, that you are anxious to preserve in good heart, not only because cropping would rob the border of its nutriment, for that might be again supplied, but chiefly because it would produce shade, prevent the free action of heat and air, and thereby keep the soil damp and low in temperature; but if you must crop it with Potatoes and Cauliflowers, these should at least be planted four feet from the trees.

CARNATIONS.—O.—You may buy superphosphate of lime at the manufactory of Mr. Lawes, almost weekly advertised in our columns.

ESPALEIRS.—W. D.—Fruit can be brought to better perfection on espaliers than on either dwarf or standard trees. The former likewise occupy comparatively little space, and this is of considerable importance in a small garden. For these, in your northern climate, you may plant the Wormsley Pippin, Ribstone Pippin, Claygate Pearmain, Syke-house Russet, Braddick's Nonpareil, Blenheim Pippin, and Scarlet Nonpareil; Pears—Hacon's Incomparable, Marie Louise, Louise Bonne (of Jersey), Thompson's, Ne plus Meuris, and Knight's Monarch.

EXCREMENTITIOUS MATTER IN VEGETABLES.—J. W.—The passages you quote are in books written four years ago. Since that time the views of physiologists are greatly altered, and the experiments of Macaire have been shown by other observers to be unworthy of credit.

EXHIBITIONS.—A Subscriber.—Roses and Cinerarias may be shown at Chiswick in pots of any size.

FRUIT-TREES.—Surreyensis.—On the northern aspect of the pales inclosing the outside slip of your garden you may plant the Dunmore, Marie Louise, Hacon's Incomparable, and Catillac Pears, Morello Cherries, and Currants. On the eastern aspect, the Glout Moreau, Passe Colmar, Winter Nelis, and Ne plus Meuris Pears.—A Young Subscriber.—Of the kinds of fruit you mention the following will be proper for your small garden:—Strawberries—Keen's Seedling, Downton, Myatt's British Queen, and Elton; Peaches—Royal George, Noble, Bellegarde, and Late Admirable; and the Elrue and Violette Hâtive Nectarines; Apricots—the Royal and Moorpark.

GESNERAS.—A Constant Reader.—Your plant of Gesnera elongata, that has been flowering for nearly two years and does not show any inclination to cease, would die down as Gloxinias do if water was partially withheld, and if the plant was not excited. Another beautiful variety of Gesnera, particularly worthy of cultivation, may be G. zebrina—a very handsome species of this genus.

HEATING.—J. H.—One boiler will do as well as another for such tank heating as you mention. All you have to remember is that if the boiler is open at the top, it must be placed so that the water in it is on the same level as that of the tanks. If it is a close boiler it will be better to let the flow-pipe rise up to the tanks. We think 4 inches enough, but there is no real objection to 8, except the additional expense of tank-work and the necessity of heating so much larger a quantity of water.—A Young Gardener.—Iron pipes and tanks are not so good for holding water with which plants are to be watered as slate; but it is only certain kinds of delicate plants that are affected by water holding minute quantities of iron in solution, and it is not at all worth your while to change your iron cisterns now that you have got them.

HOATHOUSES.—H. W. B.—There is no particular objection to a range of houses, one part being used as a greenhouse and the other as a hothouse, having for their aspect south with a slight inclination to the east; and supposing that the back wall of these houses is 15 feet high, another house may be erected behind this range—but it must be placed so far distant that the shadow of these will not interfere with it.

KITCHEN GARDENING.—O.—Vegetable Marrow is grown exactly like other kinds of Gourd. Hamburgh Parsley is of very little use. Salsify you may grow thus:—Sow the seed in drills about 10 inches apart, in April, in an open part of the garden, and when the plants are three or four inches high they may be thinned out to eight inches' distance from each other in the rows. Oxalis Deppei is a very nice kitchen-garden root, if cultivated in the manner described in vol. i., p. 68. New Zealand Spinach is not so good as the Flanders Spinach, which is the best of all; but it has the merit of standing a hot summer much better than any other vegetable. If Pear-trees are to bear in pots or tubs, the latter must be very large, even if the Pears are grafted on the Quince—it is better to graft them on the Mountain Ash for such a purpose. Apples will bear in pots if grafted on the true French Paradise Stock. Slate boxes are better than wooden ones; they are made of sawn slate, and are sold by Mr. Beck of Isleworth.

LAWNS.—A Cockney.—Autumn is a good time to apply soot to grass lawns; you may apply it now.

MANURES.—A Constant Subscriber.—The refuse lime from the gas-works should be spread out and exposed to the action of the air. If the process which then commences should be completed by the time that the land is ready for the manure, any quantity may be laid on with advantage; but as this is not likely, our correspondent had better make a compost of 1 part of the lime and 6 parts of the Thames' mud, mixing them thoroughly, and he may then apply the compost to the land at the rate of from 12 to 20 cart-loads an acre. J. C.—O.—Guano is the best artificial manure for Wheat. J. C.

MELONS.—W. R.—We can give you no encouragement in your hope that the Melon may be rendered more hardy by grafting on the Gourd.

MICE.—A Cockney.—We are not aware of a better mode of destroying mice than that of poisoning or trapping them.

NAMES OF FRUIT.—H. B.—1, Duchesse d'Angoulême; 2, Bezi de Caissoy; 3, A. Passe Colmar; 5, Hacon's Incomparable; 6, Beurré de Capiaumont; 7, Urbaniste Apples—1, Reinette Blanche d'Espagne; 2, Yorkshire Greening; 3, Dumelow's Seedling; 4, S. N.—1, Doyenné Gris; 2, Bergamot Cadet; 3, Glout Moreau; 4, Easter Beurré; 5, Bezi de Caissoy; 6, Catillac Apples—2, Scarlet Nonpareil; 3, Scarlet Crofton; 4, Blenheim Pippin; 5, Kentish Fil-basket; 6, Reinette Grise.—O. R.—1, Winter Nelis; 5, Beurré Rance; 6, Passe Colmar; 7, Glout Moreau; 8, Bishop's Thumb.—C. Judd.—1, Newbold's Duke of York; 3, Wormsley Pippin; 4, 5, King of the Pippins; 7 appears to be the Court of Wick; 8, probably Cornish Aromatic.—W. S., Kidmaronk.—The Pear No. 1 is not the Hampden's Bergamot; it is probably the true Longueville, introduced from France by the monks; No. 2 appears to be Kidwinning.—H. Girvan.—1, Beurré Bosc, exceedingly large and fine; 2, Beurré Diel.

NAMES OF PLANTS.—Inquisitor.—1, Manettia cordifolia; 2, Ipomoea sanguinea.—Viribus.—Your plant is Bromelia Karatas, or some such plant. It does not produce an eatable fruit.

Start it, and you will soon see its flower, which is rather handsome.—A Country Clergyman.—We do not recognise your leaves; these which are cut seem to belong to a Scizanthus. No doubt they will flower next year.—B. J.—It is very likely that in some Nurseryman's list such a plant as Kenneya splendens may be found, or in some obscure gardening periodical, for splendens is a good name to sell a plant by. It is not, however, a species known to botanists, and is in all probability some well-known plant disguised in a fine dress. Your Vines must be protected with haybands or some such contrivance if the water should be very severe. Otherwise they are safe if the wood is well ripened.—R. Mc.—We cannot name your plant without seeing its flowers.—J. Pope.—Epidendrum phaeum.—Tyro.—Asplenium trichomanes, Scolopendrium vulgare.—A Subscriber.—Your Ferns are all correctly named.—R. Rillott.—Apparently the Turkey Oak.—J. F. G.—Oxalis hirta.

NARCISSE.—N.—If you pot this bulb next August, you may have it in flower by the end of November, without any forcing, as we have had it here this season. B.

PELARGONIUMS.—Q. C., Dulwich.—The Pelargoniums in your greenhouse that are getting very much "drawn," owing to their being so far from the glass, will not be injured by pinching off the tops of the young shoots; on the contrary, it will assist in rendering them dwarf and bushy; this may also be effected by pegging down the shoots horizontally on the surface of the pot.

PINES.—Question.—It would not answer any one's purpose to sell Fruiting Pine-plants. Buyers would not pay a remunerative price, and no good fruit would be obtained from them, because the motion and shocks of a journey would "start" them, and spoil the fruit.

RHODODENDRONS.—A Country Clergyman may prune these like Common Laurels. They are not suited for a hedge, but they form an excellent bank.

RSQUIGUEDALIAN WORDS.—J. C.—What punishment ought to be awarded to an author who writes a book without an index? We have spent an entire evening in hunting through the 4th edition of Otter's life, without finding the letter you mention. Will you be so good as to give us chapter and verse?

SOILS.—A Country Clergyman.—Cow-dung is the best substance you can employ, and if you can add peat so much the better. Potter's Guano may be applied *ad libitum*—about 4 cwt. an acre is usually enough for garden purposes.

STOVES.—Frigid.—Common brick German Stoves are, we believe, unknown in London. Arnett's Stoves are the nearest approach to them, and we use them continually with great satisfaction; but they require careful management, being lined with fire-bricks, they are free from the objections to iron stoves.

WORMS.—F. J. C.—It is true that a solution of corrosive sublimate will kill worms, and not grass. We have employed a very strong solution with impunity. It seems as if the flinty skin of grass guards it till the corrosive sublimate is decomposed and rendered innocuous, although it acts instantly on animal life. Wood-ashes are excellent manure, and will restore grass to many places, and so will soot. Apply them in February or March.

MISCELLANEOUS.—A Moorland Gardener's further contributions will be gladly received.—A. E. Hobby bank.—The concretion you sent, formed in the flue of an Arnett's stove, consists of the ashes of the coals burnt in it, which have been carried up by the draught of the chimney. It consists chiefly of silica, alumina, oxide of iron, and sulphate of iron, cemented together by sulphate of iron. The latter salt has been formed by the action of moisture on the sulphuretted iron, of which it appears your coals contain a large quantity. The best way to prevent such deposits is to have the flues cleaned out from time to time. Good coke will yield a light powdery ash, but not form a solid substance.—Surreyensis.—Thanks.—Cromerster.—We are obliged by the hint, and will see what can be done.—Alpin.—Your list is wrong. Correct sizes of garden-pots are given at p. 133 of this year.—A Subscriber may send his Pears in a box or basket.—H. M. Hall, A Subscriber, A Constant Reader, and G. D.—We never recommend Nurserymen.—An Old Subscriber had better apply to a patent agent.—Esculapian.—Sow Henbane in the beginning of August. The method of making Asphalte patius is fully described in vol. ii., p. 379.

As usual, a host of letters has arrived too late for answers this week.

NEWS OF THE WEEK.

THE Overland Mail has arrived this week with accounts from Bombay to the 1st Nov., from Lahore to the 12th Oct., and from Hong Kong to the 24th August. The tragical events in the Punjab are the chief topic of interest, and that once powerful country is likely to continue the scene of anarchy and tumult. The rumoured murder of Dhyani Singh is confirmed, and a child of six years of age, the reputed son of Runjeet Singh, has been placed upon the throne. It is now ascertained that a great number of principal persons have been murdered in addition to the Maharajah and his family. It is not known whether Lord Ellenborough will interfere, though the assembling of a large army of 30,000 men on the frontier has induced a general belief in India that he will eventually do so. Sawan Mull, the powerful chief of Moultan, was murdered about the time of the first outbreak at Lahore; Holkar, the ruler of Malwa, has died without issue, and has been succeeded by his adopted son, though the numerous claimants who have started for the throne render his tenure of it precarious. Dost Mahomed has become very unpopular and is not likely to retain very long the reins of authority at Cabul. The Eastern Ghilzies and many of his other subjects are in open rebellion, his troops have deserted for want of pay, and an attempt had been made to assassinate him, but without success. The troops in Scinde are suffering severely from sickness, and the events in Lahore will prevent their being relieved so soon as was expected. There is little news from China, the only items of intelligence being the rebuilding of the Bogue forts by the Chinese, and the issuing of several proclamations exhibiting a wish to protect the "foreign barbarians."

In France the proceedings of the Duc de Bordeaux and his followers in London are still the cause of much anxiety in the Court circles; and the conduct of the Deputies who have come over to pay homage to the Prince as King of France is likely to be the subject of discussion in the ensuing Session of the Chambers.—From Spain we have the important news that S. Olozaga, the new Prime Minister, had com-

pelled the young Queen by personal violence to sign a decree for the dissolution of the Cortes. As soon as she was free her Majesty summoned the Presidents and Vice Presidents of both Chambers, and in compliance with their advice, a decree was instantly issued dismissing S. Olozaga from his Ministerial offices. Madrid as might be expected is in a state of great excitement, and the subsequent resignation of all the Ministers renders the formation of another Cabinet inevitable.—From Greece we learn that King Otho opened the National Assembly of that country with a speech from the throne on the 20th ult.—From Italy we have a contradiction of the rumoured death of the Pope, and the important announcement that the ramifications of the late conspiracy are so extensive, that the Papal Government have relinquished the idea of trying the offenders by a military commission.

Home News.

COURT.—Her Majesty and Prince Albert returned to Windsor Castle on Thursday in excellent health. The Prince of Wales and the Princesses who remained at the Castle during her Majesty's absence are quite well. The Duchess of Gloucester is recovering from her recent illness. The Earl of Morton has succeeded the Marquis of Ormonde as the Lord in Waiting, and Sir F. Stovin has succeeded Admiral Sir R. Otway as the Groom in Waiting on her Majesty.

Her Majesty's Visit to the Midland Counties.—The Queen and Prince Albert left Drayton Manor on Friday for Chatsworth, the seat of the Duke of Devonshire. Her Majesty proceeded by railway from Tamworth to Chesterfield, where the Duke of Devonshire was in waiting to receive her. Nothing could surpass the loyalty with which the Queen was welcomed at the different stages of the route, and on arriving at Chatsworth there were no less than 20,000 persons assembled in the Park to do honour to the Royal visitants. Her Majesty was received on alighting by the Duke of Devonshire, who had preceded the Royal carriage, and immediately conducted to the saloon, where a *déjeuner* had been prepared. Among the visitors assembled to meet her Majesty were Lord Melbourne, who was invited at the Queen's especial request, Lord Palmerston, the Marquis of Normanby, Lord Morpeth, the Duke of Bedford, Lords Alvanley, Beaumont, Alfred Paget, Leveson, and Emlin, Sir A. Clifford, &c. &c. The Duke of Wellington, accompanied by the Duke and Duchess of Buccleugh, arrived in the course of the afternoon. About two o'clock her Majesty, led by the Duke of Devonshire, and accompanied by Prince Albert, leading the Duchess of Bedford, and nearly all the Royal suite, left the saloon, and passing through the magnificent orangery walked on the bastion at the west end of the mansion. The spectators who by the kind permission of his Grace were allowed without restriction to approach the vicinity of the house, were here gratified by an excellent view of the Queen and the Royal party. Her Majesty's appearance was the signal for the most enthusiastic cheering from all quarters. After a few minutes the Royal party proceeded towards the garden on the west terrace where the following incident took place. Her Majesty when Princess Victoria in company with the Duchess of Kent visited Chatsworth eleven years since in the month of October. On that occasion the Queen planted an acorn which has since under the care of Mr. Paxton, head gardener to his Grace, become a fine sapling oak. The Duchess of Kent also planted at the same time a sycamore. The walk on Friday was extended to this spot by the express wish of the Queen, and the two trees were pointed out to the observation of Prince Albert without informing him actually which had been planted by the Queen. Four saplings of different kinds were then handed to the Prince with a request that he would select one and plant it near that which he supposed to have been the choice of the Queen; without a moment's hesitation the Prince selected an oak sapling and planted it in a convenient spot near that which had sprung from an acorn set eleven years since by her Majesty. Dinner was ordered for half past 7 in the grand dining banquetting-room, covers being laid for nearly 50. Her Majesty was led into the dining-room by the Duke of Devonshire, the Duchess of Bedford taking the arm of Prince Albert, and the other distinguished visitors following in succession. Her Majesty took her seat on the right hand of the Duke of Devonshire having on her right Lord Melbourne and being faced by the Duke of Wellington. Prince Albert occupied the seat at the left of his noble host, the Duchess of Bedford sitting on the left of the Prince. Her Majesty rose from the table about half past 9 and retired to the drawing-room. A ball to which all the nobility and gentry of the district extending through several counties were invited was given in the banquetting-hall at night. The preparations were on a most extended scale of magnificence. The cascade was lighted up by 500 Venetian lights, and in the conservatory alone no less than 40,000 lamps were exhibited in tasteful devices. Festoons of lamps were extended from tree to tree in the grounds opposite the mansion, and there was a display of fireworks during the evening. The Queen opened the ball with the Duke of Devonshire, Prince Albert dancing in the same quadrille with Lady Louisa Cavendish. In the second quadrille the Queen danced with Lord Morpeth and Prince Albert with the Duchess of Buccleugh. A waltz followed in which her Majesty and Prince Albert waltzed together, and the last dance in which the Queen took part was a country dance, Lord Leveson dancing with her Majesty, and Lady Leveson with Prince Albert. A supper concluded the events of the day, after which her Majesty retired about 1 o'clock. On Saturday morning

the Queen and Prince Albert breakfasted in their private apartment. At half past 12 o'clock Prince Albert, accompanied by Mr. Anson and the Hon. Mr. George Cavendish, left the mansion and proceeded to the Noble Duke's farm on the borders of the park, where his Royal Highness had an opportunity of inspecting the stock of fat cattle belonging to his Grace. His Royal Highness spent more than an hour in examining the excellent arrangements of the farm, and expressed himself much pleased with it, as also with the beautifully neat appearance of the village of Edensor, the whole of which has been designed and rebuilt by the Duke of Devonshire. His Royal Highness returned to the mansion about 1 o'clock. The Duke of Wellington walked through the grounds to the conservatory shortly after daybreak, and spent nearly an hour with Mr. Paxton examining the collection of plants and shrubs. About half-past 2 o'clock the Queen, Prince Albert, and the other visitors proceeded to Haddon Hall, the ancient seat of the Vernon family, now the property of the Duke of Rutland, and on their return drove home through Bakewell, "the Metropolis of the Peak," arriving at Chatsworth in time to visit the conservatory, which was illuminated for the occasion. Her Majesty and Prince Albert drove thither in one of his Grace's chariots. The Earl of Jersey and his Grace seated themselves in the dicky behind the carriage, and followed by two pony phaetons, the party repassed from the entrance-arch into the park, and proceeding up the winding carriage-road leading to the heights, and through the rockery now in progress of formation, entered the building. The military band were stationed on the terrace, and as her Majesty passed into the conservatory the National Anthem was played. At the entrance her Majesty was received by Mr. Paxton, who had the honour of showing to the Queen the collection of tropical, temperate, and aquatic plants contained therein. Her Majesty took great interest in Mr. Paxton's explanation of the peculiarities of some of the remarkable plants contained in the conservatory, and, before the carriage had reached the east end of the shrubbery expressed a wish to alight. Her Majesty accompanied by her suite then minutely inspected the shrubs and plants, and in allusion to the artificial decoration by lamps (which were so arranged as to show most accurately the beautiful architectural design of the building) remarked that "It was indeed a fairy scene, and gave her the highest possible delight." The Duke of Wellington formed one of her Majesty's suite on this occasion, and appeared by the animated conversation which he maintained with her Majesty and Mr. Paxton, to be very much pleased with the effect. The Royal party having returned to the house the remainder of the noble Duke's guests walked through the rockery from the eastern terrace and inspected this beautiful exhibition. Mr. Paxton was again in attendance and rendered most obliging service by answering most readily the questions of the visitors. The dinner was ordered for half past 7 o'clock, covers being laid for 48. Her Majesty sat on the right of her noble host, and the other guests were arranged in the same order as the day before. A second table was laid in an adjoining room for about ten distinguished visitors the magnificent dining saloon not affording sufficient accommodation for the large party assembled. In the evening about 10 o'clock 200 men were simultaneously employed in igniting Russian lights and lamps previously placed in such positions about the grounds as to reflect a bright light upon every part of the cascade which rolls down a height of about 300 yards on the garden-front of the mansion. The various fountains and the magnificent *jets d'eau* throwing up a volume of water about 15 feet square in the centre of the Grand Terrace were also similarly illuminated. This completed, her Majesty and Prince Albert with the Royal suite were conducted to the windows commanding the most perfect view of the whole scene. The park near the mansion was studded with spectators, and about 400 tickets to admit within the gardens were issued through the kindness and liberality of his Grace. A signal rocket was fired at twenty minutes past 10, and immediately answered by a salute from the battery stationed round the "stand" on Hunting Tower. At the same instant from the summit of the cascade to the terrace overhanging the Derwent on the western front of the mansion, a distance of about three quarters of a mile, coloured lights were ignited, which burnt with intense brilliancy for about one minute and a half, each displaying most minutely the beauties observable on every side, even to the marble statues between the trees, half a mile distant from the house. Green, crimson, and white succeeded each other, reflecting their respective tints on mountain, tree, and valley; while their effect on the aquatic portion of the scene may be more easily imagined than described. During the continuance of the illumination the artillery on the heights fired guns in 15 seconds' time, and the whole was concluded by a royal salute in a volley, which appeared almost to shake the foundation of the mansion. Her Majesty who had attentively and with deep interest watched the progress of the scene, at its conclusion came forward to the window, and bowed repeatedly to the spectators on the terrace, who cheered her most enthusiastically. Nothing could exceed the imposing effect of the illuminations, and during their progress the Duke of Wellington said, "I have travelled Europe through and through, and witnessed scenes of surpassing grandeur on many occasions, but never before did I see so magnificent a *coup d'œil* as that now extended before me." On Sunday her Majesty and Prince Albert breakfasted alone shortly after 8 o'clock in the Queen's private apartment, and directly after proceeded through the gardens into the Rockery, and thence to the Conservatory. The Queen and Prince attended the private chapel of his Grace at 9 o'clock, when prayers were read by the Rev. Mr.

Wilmot, chaplain to the Duke. At 12 divine service was performed in the chapel. Her Majesty and Prince Albert attended the service, and sat in his Grace's gallery pew. The Duke of Devonshire, the Duke and Duchess of Buccleugh, Lady Portman, the Earl of Jersey, and the Duke of Wellington, were also in the state pew with her Majesty. The service was performed by the Rev. Mr. Wilmot, assisted by the Rev. Mr. Jebb. Her Majesty afterwards walked across the park to the kitchen gardens, accompanied by the Duke of Devonshire, the Duke of Wellington, the Earl of Jersey, the Duke and Duchess of Buccleugh, Lord and Lady Waterpark, the Marquess and Marchioness of Normanby, Lord Morpeth and Lady Mary Howard, Viscount and Viscountess Emlin, Lord and Lady Leveson, Hon. Charles and Lady Catherine Cavendish, Miss Cavendish, Mr. Frederick and Lady Emlin, Lord and Lady Leveson Gower, Hon. F. Gower, Sir A. Clifford, &c. Her Majesty was attended by Lady Portman and Miss Paget. Mr. Anson and Col. Bouverie were in attendance on Prince Albert. The Queen was attired in a purple velvet dress, with a tunic of crimson velvet. Her Majesty wore an open straw bonnet trimmed with purple velvet. Lord Melbourne was prevented from accompanying the Royal party through slight indisposition. On entering the park from the terrace, through the grand arch, the Royal party were loudly cheered. Her Majesty was engaged in conversation with her noble host nearly the whole period occupied in reaching the gardens. On arriving at the entrance gate her Majesty was received by Mr. Paxton, and conducted to the first greenhouse, which contained the chrysanthemums, roses, and camellias. Her Majesty proceeded from the first greenhouse to a second, containing the New Holland plants and heaths. The various members of the suite wandered through the gardens, while her Majesty and Prince Albert, accompanied by the Duke of Wellington and the Earl of Jersey, honoured Mr. Paxton by visiting his cottage, which is beautifully situated within the grounds. Mr. Paxton had the honour to present his wife and family to her Majesty and the Prince. The Queen was pleased to inspect Mr. Paxton's library, and Mr. Paxton presented her Majesty with a copy of his Magazine of Botany, in 8 vols., splendidly bound in gold and morocco, which her Majesty was pleased to accept. The Duke of Wellington conversed for some time with Mrs. Paxton, and complimented her upon her fine family—not without reason, it may be observed. Passing from the cottage the Queen next proceeded to the greenhouse devoted to Orchidaceous plants. Her Majesty expressed her great admiration of the collection, and admired two plants so much that the Duke immediately ordered that bulbs should be forwarded to Windsor without delay. After inspecting the gardens, &c., her Majesty and Prince Albert, accompanied by the Duke of Devonshire and Lady Louisa Cavendish, entered an open landau and were driven through the grounds. The Duke of Wellington followed the carriage on his chestnut hack, attended by his groom. On leaving the gardens the Royal party were loudly cheered, and the Duke of Wellington was repeatedly and loudly cheered as he rode slowly down the carriage road towards the mansion. On reaching the house Prince Albert alighted, and joined by Mr. Geo. Cavendish and Mr. Anson, walked over the hills to Edensor. Her Majesty and the Duke of Devonshire, with Lady Louisa Cavendish, extended their drive round the pretty village of Edensor, and returned to Chatsworth about half-past 4. Prince Albert and Mr. Cavendish reached the mansion about the same time. The dinner party was much the same as on Saturday. On Monday, at a few minutes after 9, her Majesty was conducted to the entrance-hall, and taking a final leave of the guests there assembled, entered the Royal Carriage. Her Majesty shook hands with Lord Melbourne, Lord Morpeth, and several other noblemen, before taking her departure. The carriage in which her Majesty rode was an open one, and afforded the spectators, who even at this early hour thronged the grounds, an excellent opportunity of seeing the Royal party. Her Majesty arrived at the Chesterfield station about 10, and was handed from the carriage by the Duke of Devonshire, and conducted by the directors to the saloon carriage. The Queen seated herself on the ottoman, and having cordially shaken hands with his Grace and Lady Louisa Cavendish, the train moved onwards towards Derby. A Royal salute was fired from the hills above Chesterfield, opposite the station, as the train left. The Duke of Devonshire accompanied her Majesty in one of the carriages, in his character of Lord Lieutenant of Derbyshire, to present the address of the freeholders of the county at the station near that town, where the necessary preparations had been made. At Derby his Grace presented the address from the county and city of Derby, and then took leave of her Majesty. At this point the Royal train diverged to the Midland Counties line, and after a short delay, the train rapidly passed the Borrowash, Sawley, and Long Eaton stations. At the Nottingham station her Majesty was received by the Earl of Scarborough, Lord Lieutenant of the County, Lord Lincoln, Lord Ranelagh, and the Mayor of Nottingham. The directors of the Midland Counties Company were also in attendance. The Royal party left Nottingham about $\frac{1}{2}$ past 11, and arriving at Birmingham about $\frac{1}{2}$ past 12, changed horses at the Chesterfield Arms, and reached Belvoir Castle, at 35 minutes past 1. The Duke of Rutland attended by the Marquis of Granby, Lord John Manners, Lord Charles Manners, and Lord Forrester met her Majesty at the point where Leicestershire joins Nottinghamshire. The Duke and his relatives were attended by a number of servants in state livery, and followed by about 300 horsemen, among whom were the principal yeomen and gentry of the county, nearly one-half of the

number being his Grace's own tenantry. On reaching the top of Bottesford Old-hill, the cavalcade drew up and awaited the Queen's arrival, a body of the Leicestershire Yeomanry Cavalry forming a guard of honour at the confines of the county. Shortly after one the Royal cortege came in sight, and upon entering the county her Majesty's carriage drew up to allow his Grace, in the character of Lord Lieutenant of the county, to pay his respects to the Queen. The Duke then galloped off towards Belvoir, to be in readiness to receive the Queen on her arrival. All the attendants were stationed at the entrance to receive the Queen, and her Majesty having been handed from her carriage by the Duke of Rutland, was received at the foot of the grand staircase by Lady Adeliza Manners and the members of the family and guests. The keys of the Castle were handed to the Queen by Dr. Staunton upon entering the Castle, and her Majesty was pleased to return them. As her Majesty stepped from the carriage a Royal salute of 21 guns was fired from the bastion of the Castle. The Queen Dowager, attended by Earl Howe, and Lord and Lady Brownlow, arrived at the Castle shortly before 4 o'clock. Her Majesty was received with every mark of respect; Prince Albert accompanied the Marquess of Granby and the other members of the family to the entrance hall, and conducted her Majesty to the grand saloon. Sir Robert and Lady Peel arrived soon afterwards. Dinner was served at 8 o'clock, covers being laid for 48. Her Majesty sat on the right of her noble host, the Duke of Bedford occupying the left of the Queen. The Queen Dowager faced the Duke of Rutland, and Prince Albert sat on the right of her Majesty, the Duke of Wellington occupying the seat at her Majesty's left. Nearly the whole of the guests were attired in the Belvoir uniform, viz., scarlet dress coats with white facings. At half past 9 the healths of the Queen, the Queen Dowager, and Prince Albert having been drunk, the ladies left the table, and her Majesty retired to rest about 11 o'clock. On Tuesday morning the Duke of Wellington was up and walking in the grounds before seven o'clock. Her Majesty and Prince Albert breakfasted together in their private apartment shortly after 8 o'clock, and at a quarter past 9 accompanied by most of the guests in the Castle attended morning prayer in the chapel. The service was read by the Rev. Mr. Thornton. Her Majesty afterwards went to Melton Mowbray to see a hunt with the Belvoir hounds. The Queen and Queen Dowager attended by the Duke of Rutland proceeded to the "meet" in one of his Grace's carriages. Prince Albert looked remarkably well, and even among the followers of the Duke of Rutland's hounds acknowledged on all hands to be one of the first fields in the kingdom, he was the admiration of every beholder. He was dressed in a scarlet hunting coat, with white leather breeches and top-boots, and looked from head to foot a sportsman. The number of horsemen who had by this time joined the cavalcade rendered the due observance of etiquette a matter of some difficulty, but her Majesty and the Queen Dowager who were seated with the Duke of Rutland in the first carriage did not appear at all disconcerted by the near approach of horsemen to the carriage window. On the contrary her Majesty seemed to enjoy the scene very much and laughed heartily at those little accidents of flood and field which are the necessary accompaniments of a gallop to the cover side. In passing through the village of Croxton the throng was so great that the postilions were compelled to walk their horses, and the Royal party were again cheered most vociferously, her Majesty and the Queen Dowager acknowledging most graciously the loyal manifestations of the people. Passing the lake the high ground above Croxton was reached and here the hounds were first seen. On an open plain 50 acres in extent with a fine greenward, the cavalcade assembled for the first time and drew up in double lines extending for an immense distance, while the carriages containing the Royal party drove up the avenue thus formed. The riders closed in, and on the carriages coming to a halt the noble huntsman Lord Forrester brought the hounds under the window of that in which the Queen rode for her Majesty's inspection. At this point the Duke of Wellington left his carriage and mounted his hunter which had been brought to the spot by his groom. The Duke was dressed in a scarlet coat and white leathers. Every eye was turned towards him as he rode up to Lord Jersey with whom he remained in conversation some minutes, and the interest excited by his appearance in the field seemed scarcely second to that occasioned by Royalty. His Grace rode among the thickest of the horsemen and entered into conversation with several gentlemen belonging to the hunt. There was no scarcity of foxes; the hounds gave tongue almost instantly—but a difficulty arose from having too many. The pack were upon three brushes at once, but it was for some time impossible to get either of the foxes away. At length they found at Newman's Gorse, and the fox went away at a good pace through Stonesby Spring leaving Sproxton Thorns to the left. The field were nearly all well up, and numbered about 500, chiefly red-coats. Amongst the first rank were Prince Albert, Earl Jersey, the Marquess of Granby, Lord G. Manners, Mr. Stuart Wortley, Earl Wilton, Lord Forrester, &c. Passing Colston the fox veered to the left and crossed the brook, the Prince going over it in fine style. Leaving Colston cover to the left the fox made its point for Woodle Head, but was headed by a plough-team and turned short round to the right leaving Wymondham village to his left, his point now being Stappleford Park. The pace was now tremendous. The run had lasted nearly half an hour over some of the finest hunting-country in the kingdom. The second horses were called for by scores at Wymondham, and away they went, the Prince still keeping the first rank, with Mr. Anson a little in advance. Clearing the village a cur-dog coursed the fox, turning him round short to the

right and causing a momentary check which gave breathing-time to many a panting horse. The hounds soon tracked again and followed the fox back to Colston village, recrossing the brook, and he was shortly after run to ground at Garthorpe, having afforded a run of about forty minutes, during the greater portion of which time the pace was first-rate. Both the equerry in attendance on his Royal Highness, Colonel Bouverie, and his treasurer, Mr. Anson, had falls during the run. Many of the horses were dreadfully beat, and the hounds have not had a harder run this season. It being nearly 4 when the fox was run to ground, the field dispersed, the Prince and the Duke's party returning to Belvoir Castle. Her Majesty saw very little of the run, and returned to the Castle about half-past 2 with the Queen Dowager and the Duke of Rutland, who although booted and spurred, did not mount. At a few minutes before 8, her Majesty was conducted from her apartments by the Duke of Rutland, preceded by six pages in state liveries, towards the dining saloon. On arriving in the Elizabethan saloon, where the guests were assembled, the Mayor of Leicester presented addresses to her Majesty from the corporation of that borough, from the freemen of that borough, and also from the "Odd Fellows" of the same place. The Mayor of Grantham also had the honour of presenting an address from the corporation of that borough. This ceremony concluded, her Majesty proceeded, resting on the arm of her noble host, to the banquetting-hall, where covers were laid for the same guests who had the honour of dining with the Queen on Monday—with the addition of Lord and Lady Wilton, and the Mayors of Leicester and Grantham. The guests sat exactly as on the preceding day—the Duke of Bedford occupying the left, and the Duke of Rutland the right of the Queen. The Queen Dowager had Prince Albert on her right, and the Duke of Wellington on her left. The dinner was served on gold plate, a magnificent candelabrum presented by the electors of Cambridge to Lord Charles Manners (the Duke's brother) occupying the centre of the table. At half-past 9 o'clock, the healths of the Royal Family having been enthusiastically responded to, the Queen and Queen Dowager rose from table, and retired to the Elizabethan saloon, where they were joined by the Prince and the gentlemen about twenty minutes after. Her Majesty and the Prince played cards together during the evening, several of the guests watching the game with much interest. At 11 refreshments were handed round, and shortly after the Queen and Queen Dowager retired to their apartments. On Wednesday her Majesty rose at an early hour, and took breakfast in her private apartments with Prince Albert. Her Majesty and the Prince walked on the terrace for some time, about half-past 9, and subsequently visited the mausoleum containing the remains of the late Duchess of Rutland, situated in the grounds near the castle. At 10 Prince Albert, accompanied by the Duke of Wellington and the Duke of Bedford, went out to shoot in the preserves near the castle, and had capital sport. At 11 her Majesty, accompanied by the Duke of Rutland, Lady Adeliza Manners, and Lady Portman left the castle for the purpose of seeing the Belvoir hounds throw off. The cavalcade was splendid, and the hounds threw off at Harlaston-wood, about four miles from Belvoir. The fox ran towards Belton Park, where the hounds lost him after a run of an hour and 10 minutes. The dinner took place at half-past 7, but the ball which was expected to follow did not take place. On Thursday her Majesty rose at half-past 6, and took breakfast with Prince Albert in her private apartments. Her Majesty and his Royal Highness took leave of the guests assembled at the Castle at about half-past 7. The Duke of Rutland rode on one side of her Majesty's carriage, and the Marquis of Granby on the other. The escort consisted of a company of the Leicestershire Yeomanry Cavalry, relays being placed along the whole line of road. The Royal party passed through Waltham and Melton Mowbray to Leicester, where her Majesty was received by the Clergy, Magistracy, the troops stationed at Weedon, and the directors of the Railway. Her Majesty and suite then entered the state-carriage on the Birmingham Railway, and proceeded at a rapid rate towards town. The train stopped for a few minutes at Wolverton, where the Duke of Buckingham and the Bucks Yeomanry cavalry were assembled to receive her Majesty, and reached the Watford station about half-past 2. At the station to receive her Majesty were Lord Verulam and Mr. Creed the secretary of the Company. The Herts Yeomanry cavalry under the command of the Marquis of Salisbury in person, were also in attendance to form the escort to her Majesty on the route to Windsor. On entering the carriage her Majesty turned to Mr. Glynn the chairman of the Company, and thanked him for the attention that had been shown by himself and the directors to her conveyance. The Queen said—"I have had a very pleasant journey and I feel that you have done everything possible to secure my comfort and convenience throughout." Her Majesty then entered the carriage and arrived at Windsor about half-past 4. The Castle guard turned out in front of Henry the Eighth's Gateway and presented arms as her Majesty passed. The streets were lined with the inhabitants, who greeted her Majesty with hearty cheers on her return to the Castle, and the bells of the parish and Castle churches rang merrily peals during the evening. Her Majesty was looking remarkably well and experienced no fatigue from her journey.

The Duke de Bordeaux.—The departure of his Royal Highness is fixed for the 15th inst., to continue his tour in England by a visit to the southern and western counties. The Prince on Tuesday visited Doctors'-Commons, attended by Count Albert de Rochefoucauld. His Royal Highness inspected with great interest Napoleon's will,

written with his own hand, and afterwards the original will of Shakspeare, and the copy of Milton's. The Prince and suite visited the Tunnel on Wednesday, and after passing through, inspected the shield with the drawings and models for the intended carriage-way, with all of which his Royal Highness expressed himself much gratified. The Duke of Beaufort has invited the Prince to be present at one of the lawn meets at Badminton, and his Royal Highness has, it is understood, accepted the invitation. In addition to the morning levees of the Prince, his Royal Highness has received every evening since his arrival in Belgrave-square the various persons of note who have arrived from France. Among the recent arrivals have been some deputations from the working classes, who have been sent over by the operatives of the Royalist provinces to pay their respects to the Prince. M. Berryer left town on Saturday, and M. de Chateaubriand will leave in a few days.

Parliamentary Movements.—Mr. P. S. Butler has been elected member for the county of Kilkenny, without opposition. Mr. Emerson Tennent has contradicted the rumour that he is about to resign the representation of Belfast preparatory to accepting an appointment in India.

The Church.—On Sunday morning the Right Rev. Dr. Lonsdale was consecrated to the see of Lichfield, vacant by the decease of Dr. Bowstead. The ceremony was performed by the Archbishop of Canterbury, in the chapel of Lambeth Palace, assisted by the Bishops of London, Chichester and Winchester, in the presence of the Archdeacon of London and the Archdeacon of Middlesex, and a numerous body of the metropolitan clergy.—There are no fewer than 18 candidates in the field for the vacant Preachership of Lincoln's Inn, amongst whom are several clergymen of considerable eminence. A meeting of the Benchers will take place immediately, when a day will be fixed for the election.—It is stated that there is an early probability that a bishopric of the Channel Islands will be created, and that Dr. Jeune, the Dean of Jersey, formerly head master of King Edward's School, Birmingham, is likely to succeed.—The appointment of the Rev. John Sinclair to the Archdeaconry of Middlesex was gazetted last night.—The Lord Primate has addressed a circular to the clergy enclosing the Queen's letter in behalf of the National Society to be read in all churches on some Sunday before the 1st June.

Winter Assizes.—The following days and places have been gazetted since our last:—York, Dec. 16; Haverfordwest, Dec. 18; Carmarthen, Dec. 22; Chester, Dec. 30.

Foreign.

FRANCE.—The leading topic of the Paris papers is the stay of the Duc de Bordeaux in London, the number of friends of his family who have come over to pay their respects to his Royal Highness, and above all the visit paid to the Prince by Viscount de Chateaubriand. The Ministerial paper the *Débats* attacks M. Berryer and the other Deputies who have visited London to salute the Prince as "King of France," in a remarkable article said to have been written by a Royal pen, and charges them with forgetting their oaths of allegiance to the King of 1830. It calls on the Chamber to notice these proceedings, and relies on public opinion for a condemnation of their disloyalty to the expressed will of the nation at large. It also observes "that it will not comment on the conduct of the crowd, titled and untitled, of that aristocracy of all periods who have indulged in the pleasure of a journey to London to salute the *King of France*, and still less of M. de Chateaubriand, whose age, whose tears, and whose regrets form an affecting contrast with the thoughtlessness of the little court, to which nothing is wanting in order to repeat the errors of 1792 but an army of Condé." The *Royalist Gazette*, which insists upon restoring the young Prince in its own fashion, replies to this article and reminds its powerful opponent of the enthusiastic ardour with which the latter recorded the birth of Prince Henri and heaped its blessings on him, when it upheld the Bourbons with as much zeal as it now does the more fortunate branch of that illustrious house.—It is said that Government has abandoned its intention to ask of the Chambers a donation for the Duc de Nemours. The *Gazette de France* mentions that Prince Polignac left Paris on his return to Bavaria on Wednesday week, being unwilling though unwell to avail himself of the indulgence of a few days more which the Government had extended to him. M. de Guernon Rainville, another member of the Prince's Cabinet, is also said to have been desired to quit the capital. The Duc and Duchesse de Nemours, who arrived in Paris on Wednesday, are said to have found the Count d'Eu in a situation which gives great anxiety to all the Royal family.—The *Commerce* has contained several articles on an act of treachery committed by the General Commanding at Constantina in which the caravan of Ben-ganna an ally of France was pillaged. After a long silence the Government papers deny that any report of such an act has been received from Algeria; but notwithstanding this denial the papers affirm that the fact and its details are perfectly known to the Ministers to whom they cause much embarrassment.—The *Journal des Chemins de Fer* announces the formation of a new Anglo-French company which is about to apply for the privilege of constructing a railroad between Paris and Lyons branching from the Corbeil road. M. C. Laffitte of Paris and Mr. Attwood of London appear at the head of this new undertaking.

SPAIN.—Accounts from Madrid announce another complication of affairs which has ended in the dismissal of S. Olozaga the new Prime Minister. It appears that after he had succeeded in getting S. Pidal appointed President of the Cortes, in preference to S. Lopez the late Minister, he demanded the dissolution of the Cortes and compelled the Queen by force to sign the decree.

As soon however as she was free, her Majesty sent for the President and Vice-Presidents of the Congress, and in compliance with their advice the Presidency of the Council of Ministers and Secretaryship of State were withdrawn from M. Olozaga. The decree dismissing him was published on the 29th. All the Ministers subsequently resigned, and the Presidents and Vice-Presidents of Congress were entrusted with the re-construction of the Cabinet. They met at the palace on the 30th, on which day a decree was issued appointing M. Gonzales Bravo Minister of Foreign Affairs. In the capacity of Chancellor, the new Minister presented to the Cortes, in the sitting of the 1st, the Queen's declaration stating that M. Olozaga after having shut up her Majesty in her apartments, had forced her on the night of the 28th by holding her hand to sign the decree of dissolution of the Cortes. A proposal the object of which was to prevent M. Olozaga from sitting in the Congress has been referred to the examination of the committees by a majority of 79 to 75 votes. Madrid, as might be expected, is in a state of the greatest excitement and anxiety. The papers of the 25th ult. state that a soldier seduced by a promise of 60,000 reals had purchased a quantity of corrosive sublimate for the purpose of mixing in the food of General Narvaez, but never having found an opportunity of carrying his designs into execution, he had confessed his crime and named his accomplices. It was still affirmed that General Narvaez insisted on retiring from the post of Captain-General of Madrid. "Some persons add," says the *Castellano*, "that he wishes to quit Spain in the persuasion that order and a regular Government cannot be established here." A conspiracy in favour of Espartero is stated to have been detected at Malaga. The object of it was to assassinate the Commandant-General. The assassins to the number of six are said to have each received about 10*l*. The Political Chief has arrested some 30 persons who are represented as seriously implicated in the plot. It was added at Barcelona, whence this statement comes, that General Van Halen ex-Captain-General of that city, and General Carondelet ex-Commandant of Cadiz, were concealed at Malaga. The Queen by a decree of the 26th confirmed all the promotions, honours, and distinctions conferred by the Government of the ex-Regent down to the 30th of September last, the day on which he embarked in the Bay of Cadiz.—It is said that a Neapolitan diplomatist has been sent to Madrid to negotiate a marriage between a Prince of Naples and Queen Isabella, such an alliance being supported, it is stated, by France and England. According to the *Augsburg Gazette*, the Prince fixed upon to espouse Queen Isabella is her uncle, Prince Louis, Count of Aquila, born in 1824, brother of Queen Christina and of Carlotta the wife of Don Francisco de Paula.

GREECE—The King of Greece opened the National Assembly of that country with the following speech, on the 20th ult.:—"Plenipotentiaries of the Nation,—I appear in the midst of you with the joyful persuasion that this assembly will be productive of good to our beloved Greece. From the very foundation of the monarchy, several liberal institutions were established, with the view of preparing for the introduction of the definitive constitution. Free municipal laws, provincial councils, and trial by Jury, were the precursors of representative Government in Greece. Our task now is to place the crowning stone on this edifice by the introduction and establishment of a constitution. With the support of the Almighty let us now unite our efforts for the establishment of a fundamental law suitable to the real wants and circumstances of the state, and adapted to advance and secure the true interest of all. Yes, let wisdom and justice reign in all strength, and let the tie of mutual affection unite us all. In forming the constitution of our common country, let us not be sparing in mutual concessions, but let the common desire to advance and consolidate the prosperity of the State alone inspire and guide us. You know, gentlemen, my love for the nation, in which I have never failed under any circumstances; and with this feeling I desire neither more nor less power than is necessary for the safety and prosperity of Greece. Let us make a compact with each other, which by its suitability may give assurance of stability and duration. The whole civilised world has its eyes fixed on us, and history will judge of our work by its results. With full confidence in your enlightened patriotism I open this Assembly. May God in his goodness grant that it prove beneficial and advantageous to Greece. The prosperity of Greece is my prayer—is my glory."

GERMANY—The marriage of the Archduke Albrecht of Austria, son of the Archduke Charles, brother of the Emperor, with the Princess Hildegard of Bavaria, is to be solemnised at Munich, in January next. The Archduke Albrecht will leave Vienna for the Bavarian capital next week. Prince Luitpold of Bavaria, who on his return from Florence repaired to Marseilles, has proceeded from thence in the steamer the *Villa de Madrid* to visit some of the Spanish ports. His Royal Highness intends, it is said, to visit Lisbon also. General Colocotroni, who attempted a counter-revolution at Athens on the 9th and 10th of October, left Munich on the 25th ult. by command of the King of Bavaria, and went to Naples, the place assigned him as a residence during his exile. The King of Bavaria, it is said, was not aware of the dangerous attempt Colocotroni had made at Athens, and received him therefore upon his arrival at Munich with that distinction which his former services in Greece seemed to claim, but no sooner was the King informed of the whole extent of the mischief he had contemplated than he was immediately dismissed from the capital.

ITALY—Accounts from Bologna of the 25th ult. state

that the bands of malefactors which recently infested the district of Galliera had been dispersed, and that several of the individuals who composed them were in the hands of justice. Their chief Tintaretto had succeeded in effecting his escape. The judiciary officers sent to examine the political prisoners detained at Pesaro and San Leo had returned to Bologna. The proceedings were conducted with the utmost secrecy. The ramifications of the conspiracy were so extensive that the Papal Government was terrified by its magnitude and was afraid to divulge the truth. The Court of Rome had relinquished the idea of trying the offenders by military commissions, and the tribunal before which they were to appear was to be composed of men of the legal profession.—There was no truth in the reported death of the Pope, but his Holiness had some time previously been ill, which gave rise to the report. The Cardinal Bishop Carlo Maria Pedicini, Bishop of Porto, S. Russino and Civita Vecchia, died a few days ago; he was born at Benevento in 1769, and after having fulfilled various important offices was elevated to the rank of Cardinal in 1823 by Pius VII. He was greatly respected for his learning, benevolent and amiable qualities. Cardinal Pacca dean of the Sacred College is seriously ill and confined to his bed, and Cardinal Micara's health is so affected that instead of proceeding as usual to his diocese he has resolved to pass the winter at Rome.—By the Neapolitan steamer *Francesco I.*, which arrived at Malta Nov. 22, we have an account of the fresh eruption of Mount Etna, announced in this Paper a fortnight since as expected. The mountain had been for some days heavily capped with dense clouds, some rumblings were heard at times resembling distant thunder, and many persons especially on the west side near Bronte imagined they felt at intervals slight shocks of earthquakes or tremblings of the earth. On Saturday the 19th about midnight several violent explosions were heard, and fire was soon seen to ascend from near the mouth of the old crater. The stream of lava gradually increased in extent and took a course towards the town of Bronte, luckily a few hillocks to its left served to turn the direction, which then flowed on towards the post-road to Palermo. On Monday this stream of liquid fire had attained the destructive breadth of upwards of two miles, it still flowed on destroying everything in its path. The road to Palermo was closed up, filled with burning lava. The sight is described as awful, grand, beautiful, yet terrific beyond description, and would well repay the expense of a trip to see it. It is said to bid fair to be the most magnificent eruption of the last century, but fortunately as yet its damages have been confined to a few houses and vineyards.

RUSSIA—A St. Petersburg letter of the 22d ult. says:—"M. Kalergi, brother of the famous Kalergi who played so great a part in the late scenes in Greece, has just received an order from the Emperor Nicholas to leave Russia in 24 hours, although he has been for a great many years a resident in the empire."

TURKEY AND SYRIA—The only Constantinople news, of the 17th, of importance is that Riza Pacha has at last obtained the appointment of Reschid Pacha as envoy to Paris, hoping thereby to get rid of a powerful rival.—Intelligence has been received from the Xanthus Expedition to the 2d November. The *Medea* war-steamer which conveyed the expedition reached Rhodes on the morning of the 20th October. On the 24th Captain Warden and Mr. Fellowes landed at the mouth of the Xanthus and proceeded to the valley, and on the 25th the rest of his followers landed, with carpenters and stone-masons. On the 26th twenty-five men and Mr. Veitch, under the orders of Lieut. Massie, left the ship and encamped themselves at the lower station. On the 27th the lighters were launched and despatched with thirty men under the command of Lieut. Temple, who relieved the first party, which proceeded to the chief station at Xanthus. On the 28th the provisions were all landed and despatched to their destination by camels. On the 29th, although a day of rest, the shore-party remained hard at work, clearing away, building barracks, road-making, &c. On the 30th the remainder of the party were landed to join Lieut. Temple. Even in this out-of-the-way place an Englishman was found, Viscount Eastnor, the eldest son of Lord Somers, travelling with Dr. Mitchell, his medical attendant. Captain Warden communicates daily in person with Mr. Fellowes, and the arrangements by him made bid fair to secure the party from sickness and unnecessary delays. Those who remain on board the *Medea* have got good shooting and fishing to pass their leisure time. As soon as the buildings are erected the *Medea* will run over to Macri for better anchorage.

EGYPT—Accounts from Alexandria of the 22d ult. state that the Pacha left Cairo for Upper Egypt on the 2d. Cairo again enjoyed settled weather. During the first week of November such incessant and heavy rain had fallen there, that between 300 and 400 huts, and about 60 houses in the city and suburbs were washed away. A great many streets were so inundated as to prevent the inhabitants leaving their residences for two days. Selym Pacha, Governor-General of the district of Thebes, discovered a short time since near Syout an ancient quarry of Oriental alabaster. This superb quarry, situated on the right bank of the Nile, has been recently examined by M. Prisse, who has recognised by an hieroglyphical inscription on a rock that the quarry was opened and worked by order of Queen Onkhnas, consort of Amasis, about 560 years before Christ.—A fatal accident happened last month to that accomplished and promising young English traveller Mr. George Lloyd, favourably known to the public by his works on Botany, who had been residing at Thebes for some months. It appears that on the 9th October he went to Médinet-Habou for the purpose of drawing and collecting plants,

when he was insulted by a fellow; in endeavouring to strike him with the butt end of the gun which he constantly carried with him in these excursions, it went off and lodged its contents in his chest. He was conveyed to his residence, but died on the following day, surrounded by such friends as were on the spot.

INDIA AND CHINA—The Indian mail arrived on Monday with accounts from Bombay to the 1st ult., and from China to the 28th Aug. India was throughout peaceful, though this, unfortunately, is not expected to be of any continuance. The state of the Punjab was getting worse and worse. One of the first steps of Heera Sing, the new Prime Minister, was the massacre of the families of Ajeet and Lena Sing, which was perpetrated by a party of soldiers sent by him. Dewan Sewan Mull, governor of Mooltan, has also been poisoned—it is suspected by his brother chiefs. Goolab Sing, the uncle of the former, was a short distance from Lahore, at the head of an army amounting to 25,000 men: his object has not, as yet, been exactly defined. A rumour was current, but was not confirmed, that Heera Sing had been slain, a dispute of a serious nature having arisen between him and his uncle, Soochet Sing. Shere Mahomed was suspected to be in or near Mooltan, and is said to be making himself rather busy in that quarter among the chiefs, who are willing to lend him every assistance, along with the Muhree and Bhoogie tribes for his promised descent, when the cold season opens. The assemblage of the grand army was about to take place on the frontiers commanded by Sir H. Gough in person, but the Sikhs are said to have placed guards at the different fords to prevent the news of what is going on at Lahore from reaching the English. In Scinde sickness prevailed to a great extent, and the country was generally tranquil. Gwalior was much in the same state, but the fact of the assembling of an army in its vicinity was beginning to bring the Khasee to the sense of his predicament. The junction with Bundelkund was progressing favourably under the management of Col. Sleeman. The affairs of the Nizam are in such a state that the Governor-General has felt compelled to make a sweeping retrenchment in its affairs—the Nizam pleading poverty and requesting a loan from the Government has induced his Lordship to adopt these measures. Holkar ruler of Malwa having died without issue, several claimants have started up for the gudgee; but it is thought probable the succession will be left to the choice of the people themselves. Cabool affairs are represented as extremely perplexing to Dost Mahomed—the Ghilziees and the inhabitants of the Loghra district having all but risen against him. An attempt had been twice made to assassinate the Dost, but had proved a failure, and the assassin had escaped. The King of Bokhara is said to have taken possession of the Kolum country, and was on his way to Khooloom on his way to Cabool, but this intelligence requires confirmation. Lord Ellenborough continued at Barrackpore near Calcutta, but it was expected that he would shortly proceed to the north-western provinces. The Madras newspapers state the death of Sir John Norton on board ship while going to Singapore for the benefit of his health. The treasure taken at Hyderabad had been brought to Bombay; it amounts to about 700,000*l*, including the value of the jewels. One of the Ameer family a young and ignorant man had been brought by a steamer to Bombay and sent to join the others at Sapoer near Poonah. Great interest continued to be felt at Bombay in the detection and conviction of the gang of plunderers of all the ships in the harbour to the amount of about 70,000*l* per annum. Immediately previous to the departure of the October mail, ten of the confederates had been convicted and sentenced to be transported—eight for 10 and two for 14 years. This conviction, the first of the kind ever witnessed in Bombay, has been followed by the escheating all the properties of those felon convicts. The seizure and the sale of that property is calculated to spread a salutary terror amongst a portion of the native inhabitants, and to teach them a lesson of morality which a few of them had not practised during the 30 years that the gang has been at work.—The news from China is to the 28th of August. The state of business, with the exception of the coasting trade, does not appear satisfactory at Hong-Kong, so that many of the merchants declined going there. Fever was raging to an alarming extent among the troops, and Mr. Morrison the new Colonial Secretary was very ill of it. Opium was not to be protected by the British and yet the smuggling continued to prosper. The Bogue forts were rebuilt in nearly the same state as before. The Chinese Government had claimed 4,000,000 dollars from the Hong merchants as a contribution on account of the Canton ransom. The Emperor had issued several proclamations, exhibiting a wish to protect "the foreign barbarians," and to punish those officers who had maltreated the sailors that were shipwrecked in the *Nerbudda* and *Anne* in 1842.

UNITED STATES AND CANADA—Two of the most rapid passages ever made from New York to Liverpool have been completed by the *Hottinguer* and *Montezuma*, the former of which made the voyage from land to land in 15 days, and the latter in 15 days and a few hours. By these arrivals we have papers five days later than those by the mail steam-ship *Britannia*. The elections in Massachusetts, Georgia, and several other states, are going on in favour of the Whig candidates. The prospects of permanent protection for American manufactures are thus strengthened. Numerous meetings have been held, at which resolutions were adopted in support of the present tariff. The abolition question is discussed more angrily than ever, and the violence of the opponents of slavery is by some journals represented as threatening the very foundation of the Federal Union. At a late meeting in the state of Rhode Island the following strong resolutions

were adopted:—"That slave-holding is an act so self-evidently and atrociously criminal, that the clergyman who does not denounce it, the Church that does not excommunicate it, the statesman who does not repudiate it, the sect or party that does not assail it, the Government that does not prohibit it, are utterly unworthy of countenance, support, or co-operation. That the only consistent political position that can be taken against slavery in this country is the frank and stern position that the constitution of the United States ought immediately to be abolished and the Union dissolved."—The resolutions respecting the seat of Government in Canada had been adopted in the Legislative Council without debate, the protesting members being absent, and on the 10th both Houses waited on the Governor with the address to the Queen, asking the selection of Montreal, which Sir C. Metcalfe received for transmission to London. A meeting of the citizens was held at Kingston, to take measures for sending delegates to London for the purpose of remonstrating against the removal of the seat of government. Nearly 3000. was subscribed on the spot to defray the expenses. The weather had been very severe. A snow-storm which visited the neighbourhood of Montreal had destroyed many thousand bushels of late grain. Already, in November, the Lachine Canal was closed by ice four inches thick.

WEST INDIES.—We learn with much pleasure, from the *Guiana Herald* of Oct. 23, that Mr. Schomburgk had returned to George Town in safety: having completed the circuit of the Colony from its sea boundary to within forty-two miles of the Equator in the course of nearly three years, during which time notwithstanding the many dangers to which the party had been exposed, not an individual belonging to the expedition lost his life, either by accident or sickness.

CITY.

Money Market, Friday.—Consols for the account left off 93½ buyers; Three per Cents. Red., 95½ to ½; Three-and-Half per Cents. Red., 102½ to ¼; Bank Stock 181½ to 2; Exchequer Bills, 57s. to 59s. prem.

Metropolis and its Vicinity.

Trafalgar Square.—During the past week Sir F. Chantrey's equestrian statue of George IV. has been placed on a pedestal at the N.E. corner of the quadrangle in Trafalgar-square. It was originally commissioned for the triumphal arch in front of Buckingham Palace, but as it is still uncovered the public have as yet had no opportunity of examining its details. Mr. Wyatt's equestrian statue of George III. now in Cockspur-street, will be removed forthwith to the N.W. corner of the square; and that of Charles I. so long the ornament of Charing-cross will be placed more north of its present position. In connexion with these changes, a correspondent of one of the daily papers suggests the propriety of bringing from Whitehall Gardens, a spot where few ever behold it, the fine statue of James II., and of placing it on the vacant pedestal in Pall Mall East, that the passing world may have an opportunity of seeing that London contains at least one fine statue.

School of Design.—The School of Design at Somerset House has established a class for the instruction of females in the art of wood-engraving. It is already well attended, and has added another to the very few and limited sources for the occupation of female industry and talent which exist in this country.

The Darkness of the Metropolis Roads.—An adjourned meeting of householders was held on Friday at Hammer-smith, for the purpose of declaring the result of the poll on the question whether that portion of the Great Western road, which has been in total darkness ever since the commissioners have refused to light them, should be lighted under the provisions of the General Lighting Act. Much excitement has for some time prevailed throughout the parish on the subject, and several attempts have been made to get a rate for the purpose of lighting, but on all occasions the proposition has met with determined opposition. On Mr. Morison being called to the chair, the churchwardens announced the result of the poll to be as follows:—For lighting 162, against it 106, being 56 less than the number required; the Act requiring that there should be a majority of two-thirds in favour of lighting before the act can be adopted, and the subject cannot be again mooted for a twelvemonth. It was stated at the meeting that no fewer than 80 inhabitants having votes were disfranchised in consequence of non-payment of church-rates, arising from the churchwardens refusing to permit the auditors appointed by the vestry to investigate their accounts.

Bank of England.—A batch of 14. notes to the amount of 14000. was paid into the Bank a few days ago on an executor's account, and no doubt constitutes the greater part of those remaining in existence. The interest lost on capital lying dormant in such a shape must have been considerable.

St. George the Martyr, Southwark.—A meeting of the Churchwardens and overseers of this parish took place on Monday relative to the various charity property in which the parish has an interest. It appeared from a statement of the Churchwarden, that by the will of Mr. Dickenson, a city merchant, dated 1631, a sum of money was set apart for apprenticing a poor boy belonging to St. George's and three other parishes alternately, and that the Churchwarden of St. Stephen's Walbrook was appointed by the will to make the necessary arrangements. For some years, however, Alderman Gibbs, as the permanent Churchwarden of that parish, had failed to account for the money and no apprenticeships had been made. On being applied to, Alderman Gibbs stated that the lease of

the premises from which the money is derived will expire in 1845, and that as the Court of Chancery may then be expected to devise an improved scheme he thought it unnecessary to give an account at present. The Board, however, resolved unanimously that Alderman Gibbs be called upon for an immediate settlement, and requested to pay over to the Churchwardens of St. George's all the moneys due from him on account of the charity.

Mortality of the Metropolis.—The number of deaths registered in the week ending Saturday, Nov. 25, was as follows:—West Districts, 177; North Districts, 194; Central Districts, 236; East Districts, 306; South Districts, 275; Total, 1,188 (males, 625; females, 563). Weekly average for the last five years, 903 (461 males, 442 females); and for the last five autumns, 908.

Provincial News.

Provincial Fires.—We regret to state that the local papers contain very sad accounts of the progress of incendiarism throughout the country. The determination of Government to punish with severity the perpetrators of these fires is manifest by the large rewards offered for the apprehension of the chief offenders, and the inducements held out to the less guilty accomplices that may turn Queen's evidence. The following are the last cases which have been communicated to the authorities:—On the 19th ult. a barn and other out-buildings the property of Mrs. Tyrrell of Polstead Hall, in the occupation of Mr. Tabar, together with a quantity of beans and straw, were feloniously set fire to. Government offer 500. reward; C. Tyrrell, Esq., 500.; and the Suffolk Fire Office 500. on conviction, with pardon to any but the person actually firing the premises. On the same night a stack of Barley on the farm of Mr. Gayford of Rymer House, Suffolk, was destroyed; 2500. reward is offered, Government and the Duke of Grafton each offering 500. with pardon to any but the actual incendiary. On the 18th ult. the barns and out-buildings in the occupation of Mr. Buck of Hawstead Lodge farm, Suffolk, were destroyed, with a quantity of corn; 2000. reward is offered, 1000. being given by Government, and pardon to accomplices. On the 18th ult. a stack of Barley on the farm of Mr. Kersey, Fakenham, Suffolk, was destroyed; 2500. reward is offered, 1000. by Government, and 500. by the Duke of Grafton, with pardon to any accomplice. On the 27th ult. a Bean hovel in the rick-yard of Mr. French of Whitfield, Northamptonshire, was fired and destroyed, together with a Wheat rick and two carts. On Tuesday week at St. Columb, Cornwall, an incendiary fire took place at the Red Lion Hotel, which destroyed property to the value of 2000. At Billington, near Leighton, on the same day an extensive barn filled with Wheat, the property of Mr. Garret, was burned down. Damage stated to be 4000. At Arlington on the same day three stacks of Wheat on the farm of Mr. Richards were destroyed. Loss 3000. At Baldock, in Hertfordshire, on Wednesday a barn filled with Corn belonging to Mr. Proyer was fired and destroyed. Damage 4000. A few days before, a fire broke out at Stolfold near Baldock on the farm of Mr. Gibbons, which destroyed property to the amount of 60000. Near Sawbridgeworth in Bedfordshire on the same day a destructive fire happened at the homestead of Mr. C. Bennett in Clay-lane, a few hundred yards from the town. It destroyed in three hours several barns, eight stacks of grain of various descriptions, stables, and all the out-buildings connected with the farm. Loss 20000. At Falmersham, in Hertfordshire, on Thursday a spacious homestead belonging to Mr. Swannell, and two cottages, were destroyed in a few hours. Loss 15000. On Monday last the storehouses full of hay and corn on the farm of Sir J. Lubbock at Farnborough, Kent, occupied by Mr. Stow, a farmer, were destroyed with all their contents.

Bristol.—A case of alleged murder which has caused much excitement in this city was brought before the coroner last week. It appears that in August last Mr. Mountjoy, a master rope-spinner, died from inflammation of the bowels. He was a man of some property, about 36 years of age, and at his death left a young widow of about 24 years, and one child, to whom he bequeathed his property. For the last two years of his life his wife and himself had lived very uncomfortably, but no suspicion having arisen that deceased had been unfairly dealt with, no post mortem examination of the body was made, and it was interred. Last week, however, communications were made to the coroner by the sister of the widow and by other parties, by whom it was alleged that deceased had been poisoned, and the circumstances detailed to the coroner were of sufficient weight to induce him to summon a jury. The body was subsequently exhumed, and the inquest adjourned until Mr. Herapath the chemist has had time to analyze the contents of the stomach.

Crewe.—On the 23d ult. a blacksmith who is the officiating priest of the sect of Mormonites or Latter-day saints at the works of the Grand Junction Railway at this place, with others of that persuasion, assembled at the river at night to baptize into their sect a woman who had been induced to submit to the operation after much entreaty and violence from her husband. The priest and others having made the woman remove nearly all her clothing, immediately plunged her into the stream! The night was cold and dark, and in consequence of the late rains the river was running at a great rate and was much higher than ordinary. The priest having hold of her naked arm, unfortunately let go his grasp, and the current running like a mill-race immediately carried her away, and it being pitch dark she was instantly overwhelmed and drowned. The husband walked home with the greatest deliberation and told his neighbours what had occurred, and after seating himself declared his conviction "that it was the will of God that she should be drowned," adding

"that it was the weakness of her faith that caused it, but that he was now satisfied that she was in glory." Captain Winby of the Crewe station and other parties hearing of the occurrence immediately rushed down to the river, and after some time discovered the body of the unfortunate woman in a bend of the river about 200 yards distant from the spot where she was immersed, but life was extinct. A coroner's inquest has been held upon the body, and the jury having returned a verdict of "Manslaughter," the husband and blacksmith priest have been committed to take their trial.

Foots Cray.—On Tuesday the 28th an inquest was held at Sidcup on the body of Maria Plummer, aged 40, the wife of a gardener in the employment of Lord Bexley, who came to her death under circumstances which implicate both the husband of the deceased and the relieving officer of the Bromley union. From the evidence, which was very voluminous, it appeared that about six years since the deceased summoned her husband before the magistrates at Foots Cray for ill-treatment, on which occasion he agreed to give her half-a-crown a week, which he continued to do with great irregularity, although earning 14s. a week, the result of which was that she was reduced to considerable distress, wandering about from one relation to another, till each in turn, being poor persons, were unable to support her any longer. On Thursday she went to Mr. Pritchard, a surgeon of Foots Cray, who finding her in a deplorable condition gave her a letter to Mr. Banks, the relieving officer, who lives at Chiselhurst. She immediately went over to Mr. Banks whom she saw, and told him that she had slept in a water-closet all night, and wished him to compel her husband to find her a lodging. He promised to do so and called to see her husband, but was unable to meet with him. He however took no steps to relieve her, but told her to apply next day to the board of guardians at St. Mary's Cray, three miles distant; and when he had been spoken to on the subject by Mr. Rogers, a respectable draper of Foots Cray, he replied that if he relieved her without bringing her case before the board of guardians they would immediately reprimand him. The poor woman wandered over to Sidcup and called at the Black Horse, where she asked for a bed; this was at first refused, but afterwards granted to her. Her husband was drinking in the house at the time, and exhibited the utmost indifference to her condition. She retired to bed about half-past nine, being so weak and feeble that she was about half an hour getting up-stairs and fell down in the bed-room. In the night she was attacked with illness, and in the morning when the landlady sent up she was found in the agonies of death. Mr. Pritchard stated that he had made a post mortem examination, and had never seen a human being in so deplorable a condition in his life. The chest was generally healthy. There was a large tumour in the right lobe of the liver; the stomach and intestines exhibited a great deal of inflammation, no doubt produced by the severe diarrhoea to which she had been subjected from want of sufficient bile; the stomach and bowels were perfectly empty; there was not the slightest particle of food or nourishment of any kind to be found therein; and her entire body showed that she had been a victim to neglect, dirt, and improper attention. She was the most wasted and miserably emaciated being he had ever beheld. The relieving officer was called in, and stated he never received Mr. Pritchard's note to him. The jury expressed their opinion that he ought to exercise his own judgment and not wait for the opinions of the board of guardians. The coroner told him that if a verdict of manslaughter was returned, it would be not against the board of guardians but against himself, and therefore he ought to have acted on his own responsibility. The inquest after nearly four hours' duration was adjourned, to enable the jury to discover what had become of Mr. Pritchard's letter. Two subsequent meetings of the jury have been held, but without coming to any conclusion; and one of the jurors having been taken suddenly ill, the inquest has been adjourned for a week.

Gloucester.—An inquest has been held on the bodies of the unfortunate woman, her five children, and servant, who were burnt to death in the fire at Willersey, as noticed in our last. It was clearly proved that no attempt could be made to save them, in consequence of the violence of the flames, and that they must have been suffocated soon after the fire broke out. With respect to the cause of the fire, it appeared that two days previous to the calamity the kitchen-chimney caught fire, and apparently burned itself out, but there was no doubt that one of the bond timbers had ignited, and communicated with the flooring. The house was insured for 8000. The unfortunate servant was the mother of seven fatherless children. The jury after a brief consideration returned a verdict of "Accidental Death" in each case.

Huddersfield.—A movement has been begun in this and other towns of Yorkshire, in favour of the liberation of Mr. Oastler from the Fleet-prison, and for providing an annuity for him and his wife, as an acknowledgment of his services in the agitation for a ten-hour Factory-bill. The clergy have taken an active part in promoting the movement. The Rev. W. Maddon was the first to propose a resolution at the Huddersfield meeting; at Bradford, four clergymen supported the cause by their addresses; at Dewesbury the Vicar occupied the chair, and was supported by the incumbent of Batley. On the 28th ult., there was a meeting at Bingley, Mr. Ferrand, M.P., in the chair, when 24 tradesmen and operatives formed themselves into a committee to canvass the parishioners for subscriptions. Since then meetings have been convened at Dewesbury, Halifax, Sheffield, as well as at Manchester, Liverpool, and other towns in Lancashire. A central committee has been formed in Manchester, and subordinate committees are in course of formation in the principal towns in Lancashire, Cheshire and Derby-

shire for the promotion of the same object. About 2000*l.* it is stated will be sufficient to effect Mr. Oastler's liberation, but it is proposed to raise 8000*l.*, in order that some permanent provision may be made for him.

Ilford.—Our readers are aware that in consequence of certain innovations alleged to have been made by the officiating curate of Ilford Church, some of the congregation opposed to those forms called a meeting of the parishioners at which the subject was discussed with much warmth and a memorial to the Bishop of London was agreed to, calling upon him to interpose his authority to put a stop to the practices complained of, their tendency being to drive from the church its most constant attendants. The Bishop in reply has forwarded to the memorialists a letter expressive of his sentiments upon the facts as detailed in the memorial. His lordship calls attention to the course indicated in his last visitation charge to the clergy of the diocese. In reference to the specific allegation of the introduction of novel forms, set forth in the memorial, his lordship is of opinion that the clergyman is not accountable, provided the service be performed in accordance with the Rubric. In such cases the congregation have no right to object to the introduction of these forms. If, however, the minister goes beyond the Rubric, he is open to censure. The prayer for the church militant, &c. should not be omitted, nor is the congregation entitled to object to it. The memorial averred that the minister had been in the habit of making the sign of the cross which had given great offence to conscientious Protestants; that he usually read the Litany with his face towards the Communion-table, having his back towards the congregation; and that he knelt while placing alms on the table during the offertory-service. These matters call forth the bishop's censure upon the curate by whom they were performed, and the incumbent is condemned for having permitted the continuance of such irregularities unrebuked. In reference to a particular sermon preached in the parish church, which, as the memorialists alleged, maintained the doctrines of transubstantiation, his lordship considers that the sermon referred to does not admit of that construction to the extent which the memorialists had put upon it. The letter, which is of very great length, concludes by enjoining harmony betwixt ministers and their flocks as the surest way to the promotion of piety and sound religion.

Liverpool.—On Friday two females named Scholes and Craig, with Andrew Craig the husband of the latter, and John Neil were brought before the magistrates, charged with being engaged in extensive swindling. They were discovered by means of an application to Lord Newry purporting to be from Caroline Stephens and inclosing a forged certificate from Lord Downshire, which led to the detection of the writer. The police had traced the parties and seized a quantity of books and papers which showed such a system of fraud and deception on the part of the prisoners as has rarely been equalled. From these documents it appeared that the ramifications of the gang extended far and wide, comprising all the principal towns and cities in England, Ireland, and Scotland. Letters and documents bearing the names of the peers, bishops, and of the most wealthy and influential persons in the different localities in which they had practised their frauds, were found amongst these papers, and if but a tithe of the sums there stated were given, it proves that they must have long practised a successful course of villany. Some of the papers seized related to Liverpool, Manchester, and various places in Cheshire. In these towns lists of wealthy individuals, particularly those having the character of being benevolent, were noted down to be called upon and victimised, and circumstances the most minute were pointed out regarding them. Their hours of attendance, the general disposition of the parties applied to—whether liberal or otherwise—were carefully noted. The forged documents seized formed a catalogue unparalleled in fraud, for it appeared by these that they had carried on their depredations in Cheltenham, Birmingham, Leamington, Nottingham, Sheffield, and Newcastle in this country, and had also practised to a great extent in Ireland. In Scotland their operations had extended to most of the counties and towns therein, comprising Berwick, Haddingtonshire, Roxburghshire, Dumfriesshire, Kirkcudbrightshire, Fifeshire, and Forfarshire. In all these districts the prisoners have, according to the papers seized, been carrying on the most perfect system of deception that can well be imagined. The magistrate after hearing the evidence expressed his determination to put down such fraudulent attempts on the public, and remanded the prisoners for further inquiry.

Manchester.—Up to Friday night the total amount subscribed in Manchester to the League Fund was 17,902*l.* In addition to this, 1,665*l.* was subscribed in Rochdale from Tuesday to Thursday evening, making altogether, with the 1,150*l.* contributed by Rochdale at the late Manchester meeting, no less than 2,825*l.* from that town.

Northampton.—At the mayor's dinner in this town on Tuesday week, after several toasts had been given, that of Earl Spencer was proposed and received with such enthusiasm that for full 20 minutes his lordship was upon his legs before quiet was sufficiently restored to enable him to speak. After dwelling on local affairs for some time, his lordship proceeded to express his views of general politics as follows:—"My attention has not been sufficiently called to political questions to enable me to give you any useful explanation of my opinions. I can only say generally with respect to free trade, that neither of your worthy members is a stronger advocate of it than I am. The only time I addressed the House of Lords on the subject what I said was to the same effect. I am anxious not to be misunderstood on this point. I am a

landed proprietor and an occupier of land, and I have no other means of subsistence. If I were to say that I desired a repeal of the Corn-laws, believing at the same time that it would destroy the landed interest, you might say that I was a very honest man, but you would certainly not say I was a wise one. But I believe no such thing. I quite agree with what Mr. Currie has said. I believe that this is a question of the most essential importance to the welfare of the empire at large. But I do not believe that the repeal of the Corn-laws would tend materially to lower the price of corn. I believe it would raise the wages and increase the employment of the people. Thus, although it would not lower the price of corn, it would bring increased means of buying it. I believe, too, that it would be followed by a great increase in the price of corn on the Continent, and the effect of this would be that our manufacturers would be enabled better to compete with the manufacturers on the Continent. With respect to the objection that foreigners will not take our manufactures in exchange, as Mr. Currie has said, if we have their corn they must be paid for it, and if they are to be paid for it I know of only one way of paying them directly or indirectly, and that is by the industry of the people. I set little value on reciprocity treaties. If we take from the foreigner corn, we must pay for it with our manufactures, if not directly, indirectly; and the effect of such a trade must be to raise the continental price of corn to our level, not to reduce ours to theirs." The noble earl concluded by saying that they would well understand why he, declaring himself an advocate of the total repeal of the Corn-laws, was anxious not to be misunderstood. He should be sorry, indeed, if such a change should involve the ruin of those with whom he was now associated, the agriculturists, but he had no such belief. He believed, on the contrary, that it would be for their benefit as well as for the benefit of the country at large. His lordship sat down amidst repeated rounds of the heartiest cheering.

Windsor.—A field of between 100 and 200 were present at the meet on Monday last, which took place at Maidenhead. The celebrated Scotch deer, Highlander, which has heretofore afforded such excellent sport, upon being uncared on Maidenhead Thicket, went away across the thicket to the Great Western Railway, where it ran along the up line towards Reading for upwards of a mile and a half. The hounds followed in hot pursuit, having got upon the railway before the huntsmen and whippers-in had got up to call them off. When between a deep cutting, an up-train, proceeding at the rate of thirty miles an hour, appeared in sight. At this moment the destruction of the whole pack (the hounds still proceeding downwards on the up-line) appeared inevitable. The stag made for the banks of the cutting as soon as it saw the approach of the train, and thus got out of harm's way. Not so, however, the hounds, who still pursued their dangerous career along the line. Fortunately, however, when the train had advanced within less than 100 yards of them, and when every one expected that in another second or two the whole would have been sacrificed, the pack passed over to the down-line of rails, and thus fortunately escaped. The feelings of all who witnessed the danger of the royal pack and their extremely lucky escape, were, as may be imagined, greatly excited. From the railway the deer ran back towards Reading, and after a run of two hours and three-quarters over 30 miles of country was taken in the tap-room of a public-house.

Railways.—The following are the returns for the past week:—Birmingham and Derby, 1265*l.*; Birmingham and Gloucester, 1537*l.*; Eastern Counties, 2118*l.*; Edinburgh and Glasgow, 1923*l.*; Great Western, 11,207*l.*; Grand Junction, 6393*l.*; Glasgow, Paisley, and Ayr, 1201*l.*; Great North of England, 1341*l.*; Hull and Selby, 933*l.*; London and Birmingham, 13,372*l.*; Blackwall, 579*l.*; South Western, 4558*l.*; Greenwich, 677*l.*; Brighton, 3054*l.*; Croydon, 187*l.*; Liverpool and Manchester, 3437*l.*; Manchester and Leeds, 5191*l.*; Midland Counties, 2257*l.*; Manchester and Birmingham, 2304*l.*; Northern and Eastern, 1389*l.*; North Midland, 3907*l.*; Newcastle and Carlisle, 1378*l.*; Sheffield and Manchester, 449*l.*; York and North Midland, 1384*l.*; South Eastern and Dover, 2665*l.*—The works on the Newcastle and Darlington line, which is to connect the Great North of England Railway with Newcastle, are proceeding with a spirit that promises the successful completion of the undertaking at a considerably earlier period than the public had been led to anticipate. The works in the neighbourhood of Durham are in a state of great forwardness, and it is supposed that the whole line will be finished early in the ensuing year.—A fine of 5000*l.* was lately imposed by the Court of Queen's Bench upon Mr. Scott, one of the officers of the Leeds and Manchester Company, for blocking up the highway at Rastrick, near Halifax; but it is understood that this judgment is intended only to quicken the movements of that body, and that if the impediment be removed on or before the 10th day of Easter Term, neither that fine nor the fines of 20*l.* each upon the other defendants will be enforced.—On the North Midland line a large carriage has been fitted up for the accommodation of smokers. It is termed the "divan," and first-class fare is paid for the convenience.—It has been currently stated in the city that the Dover Company have made proposals to the Brighton and Croydon Companies with the view of negotiation for the former company to lease the lines of the last-named companies, the terms to be mutually settled by the respective boards of directors.

IRELAND.

Dublin.—An express appeared in the *Times* of Saturday, announcing an important seizure of arms in this city. It appears that the superintendent of the detective force, having received information that there was a cask on

board the Duchess of Kent steamer which was charged in the manifest as "empty," and only 2*s.* returned on its freight, and that the cask was, in reality, very weighty, proceeded to the vessel, and ordered the cask to be removed to the police-office, where it was broken open, and found to contain 12 pike-heads, upwards of 14 inches long; 12 muskets, 12 cutlasses, 6 horse pistols, and 6 pair of handcuffs. It was immediately rumoured that these arms were connected with the Repeal agitation; but after a long investigation before the Magistrates, it was proved that they were imported by some Conservative merchants for arming a vessel about to proceed to the coast of Africa. They were accordingly given up by command of the Lord Lieutenant.—The usual weekly meeting of the Repeal Association was held on Monday, Mr. T. Steele in the chair; on taking which he observed, that the father of his country had gone to sport with his beagles amongst his native mountains, but that he could not have done so if he did not place the most implicit confidence in the promise of the people of Ireland to be peaceable. He knew they would be true to that promise when they remembered Clontarf, of which he would not now speak, as they all knew his opinions about it; the Americans, too, had their opinions about it. They remembered what had taken place in '98, in the time of Lord Clare and the miscreant Castlereagh, and believed that the same game was intended to be played in 1843. However that might be, O'Connell had declared at the great meeting at the Abbey-street Theatre, that but for his accidental presence in Dublin, Clontarf would have become a scene of havoc and bloodshed which would have spread through Ireland in twenty-four hours. O'Connell's motto was that "whoever committed a crime strengthened the enemy," and those words of the great moral regenerator he, as his head pacificator, now repeated, while he declared that though a poor man he would not change his present position for the brightest diadem in Europe. Her Majesty's Attorney-General in Ireland had attempted to prejudice the minds of the Jury before whom they were to be tried, but whatever might be the effect of such an attempt, should O'Connell even by any human possibility be sent to prison, it would be the duty of the people then to become doubly tranquil, for then would O'Connell be doubly terrible to his enemies—ay, more terrible even than while inhaling the air of his native mountains. O'Connell was the sole though sceptreless monarch who reigned in the hearts of the Irish people; and if he were imprisoned he might say to Earl De Grey in the words of Manfred, "Thou worm whom I obey I scorn." Mr. J. O'Connell addressed the meeting on the subject of the system of Ribandism, which he regretted to say was notwithstanding the repeated denunciations of the Association, still spreading in the neighbourhood of Dundalk. Mr. Barrett of the *Pilot* made some observations on the same subject, and referring to the Finnée murders, expressed his conviction that the real perpetrators of the crime would be found to be neither Roman Catholics nor Repealers. The rent for the week was announced to be 994*l.* 11*s.* 5*d.*—The Earl of Devon arrived in Dublin on Monday, and commenced his duties as chairman of the Landlord and Tenant Commission.—On Friday town-councillor O'Brien was elected Lord Mayor for the ensuing year without opposition. He is a thorough Repealer, and was proposed by Mr. O'Connell and seconded by Mr. M'Clelland.—The Penelope steam-frigate has arrived in Kingstown harbour, loaded almost to the water's edge with large gun-boats. They are intended for the Upper Shannon and the large lakes formed by that river in its progress towards the lower branch. A considerable number of persons were collected on the banks of the canal to see them towed to Portobello from the basin at Ringsend. They are immense boats with great beam, capable of carrying two guns and a large body of men; are doubled banked and each pulled by twelve rowers.—Sir George Back and Capt. Fair, the Commissioners appointed to report on the comparative merits of Holyhead and Port Dynllaen Harbours, have sent in their report to the Admiralty, in which they state their "unqualified opinion that both as to capability and position, Holyhead is unquestionably the most eligible harbour on the coast as a port of communication with Dublin."—The Rev. Peter James Tyrrell, parish-priest of Lusk, and one of the nine persons implicated in the pending state prosecutions, died on Monday night after a short attack of erysipelas. The Rev. Gentleman was it is said greatly beloved by his parishioners, and did not until recently mix himself up with the various political questions which have lately agitated this country. He caught cold during his exertions to prevent the meeting at Clontarf, after the proclamation was issued, and never entirely recovered from the effects.

Tipperary.—At a meeting of the gentry of the North Riding of Tipperary, held on the 29th ult., at Borrisokane, the following resolutions were adopted:—"Resolved—That we contemplate, with feelings of the deepest horror and regret, the savage and unparalleled murder of Miss Vereker and Thomas Waller, Esq., and the brutal and barbarous attack on his family, at Finnée, on the 12th inst.; and we hereby tender the expression of our liveliest sympathy to the members of that family. That the frequency and brutality of such crimes compel us to look with great alarm upon the danger that evidently impends upon us in the present state of the county. That upon the most anxious consideration, we have arrived at the conviction that this outrage is connected with, and a proof of, a widely-extended, secret, and well-organised conspiracy against law, life, and property in this county. That while, on the part of the landlords of this county, we rejoice at the pending commission of inquiry, still we deny emphatically that their conduct has been such as in any manner to palliate or justify the crimes so constantly

occurring in this county. That we are fully persuaded that this lawless and disturbed state of society has been mainly fomented by inflammatory harangues and seditious publications, made and circulated amongst the peasantry. That fully confiding in the wisdom of her Majesty's councils, we deem it our duty most respectfully to express our conviction that the existing laws are inadequate to meet the present disorganised and lawless state of society, and that we pledge ourselves to co-operate with the Government in such measures as they may deem requisite to the restoration and maintenance of peace and order." The last accounts from Finnore fully corroborate the previous statements respecting the precarious condition of Mrs. Waller and the old butler, Larkin; the wounds and contusions of the latter it is said have begun to assume a very unfavourable appearance, while the consequences of the shock produced by the death of her husband on Mrs. Waller's spirit are regarded with serious apprehension. The funeral of Mr. Waller took place on Friday and was attended by all the gentry and clergy of the neighbourhood.

Limerick.—On Monday Mr. Smith O'Brien, M.P., was entertained at a public dinner by the Repealers of this city, to celebrate his accession to their cause. The proceedings excited considerable interest, as Mr. O'Connell presided on the occasion. In proposing the health of the Queen, Mr. O'Connell said, "There is not, I know, in any portion of her dominions an assemblage of persons which more unaffectedly respects her throne, or which is more steady or devoted in its loyalty than the one I am now addressing. As for myself, you may perhaps have seen in the newspapers the heading of 'The Queen v. Daniel O'Connell'—(Laughter)—but I tell you what you are never very likely to see, what it is impossible for you ever to read, and that is, the heading of 'Daniel O'Connell v. the Queen'—(Renewed laughter)—for I believe there is not amongst her subjects one individual labouring more efficaciously than myself to secure the stability of her throne and the possession of it to her descendants." After the other loyal toasts the chairman gave "Repeal of the Union," and then proceeded to the toast of the day, and spoke in terms of great approbation of Mr. Smith O'Brien and his services to Repeal. "He knew not," he said, "how the cause of Ireland might in the ensuing session be retarded by pending circumstances, but if he were incapacitated from aiding it as vigorously as he would wish, there were men to fill his station in that respect. The national mind would have leaders—the national mind had those leaders at present and in prospective, and Ireland would never be deserted as long as William Smith O'Brien lived." Mr. O'Brien returned thanks at great length. After declaring his adhesion to Repeal, he adverted to the State prosecutions, and spoke as follows:—"I consider this is not a prosecution against O'Connell and the other persons who are to be arraigned, but a prosecution against you. In fact it is an indictment against the entire Irish nation. I believe the Government will utterly and signally fail—that the only effect will be to disgrace them and greatly advance the Repeal cause. I cannot believe that a Jury fairly constituted could find a verdict of guilty upon such trumped-up charges; but if it should be otherwise, and if one of the foremost men in Europe should be consigned to a dungeon for having loved his country too well, do you suppose that by those means Ireland will be averted from seeking the Repeal? I know not what would be the result, but I am persuaded that nothing would more dishearten him and those who are involved with him than a tumultuous rising. There was as Mr. O'Connell has said a belief up to a late period that there was one way in which the Repeal question might be silenced, and that was by legislative enactments for the benefit of Ireland. For my part I have not the slightest hope that such will be attained, and therefore it is that I look forward with intense eagerness and certainty to the time when the repeal of the Union will not be treated as a mere chimera. I do not calculate upon that event arising within any given time, within a month or months, or a year, as Mr. O'Connell does; but I believe that the time is coming when Ireland will be banded in one confederation to demand her rights. We know at least that we have the millions with us, and in such a struggle that is no unimportant consequence. And when I look to the other classes of Society, I am not filled with despair. In the first place, the higher circle; with respect to them I give myself no concern whatever, for I am quite sure that whenever our cause shall be a winning cause we shall have their support. Then there is another class—those who believe sincerely that domestic legislation would be an essential benefit to this country, but avoid taking part in support of it, because they deem its attainment impossible. To them I say—you ought to try the experiment. Then there is another party—those who are favourable to federalism, and is it not manifest that they are bound to go along with us so far as repealing the union statute? I am in favour of entire legislative independence as it existed in 1782. I am far from saying we ought to insist on that, for we might find one thing possible and the other impossible, but we are bound to invite and they are bound to come who entertain those opinions. There is another class to whom I did belong, but have no right to accuse of improper motives. I mean those who still hope for justice from the English Parliament. I will only say they are labouring under a dream from which I have myself awakened, and all I ask of them is conscientiously and before their God to lay their hands upon their hearts and ask themselves do they still hope? If they answer in the affirmative I do not blame them, but I think that that class too will soon be in our ranks. There is another class whom I believe to be most influential on this Repeal question—I speak of the sturdy Presbyterians of the north of Ireland, and really

I must say that they in common with their fellow-countrymen are concerned in the prosperity of their native land, for I ask them what class of Irishmen is it that have not such an interest. They have a common interest with us and I cannot but believe that ere long they will be awakened to a sense of that interest. How could I believe otherwise when I recollect that the forefathers of those very men who congregated in Dungannon in 1782 declared that they knew their duty to their Sovereign and were loyal—but that they knew their duty to themselves and were determined to be free. Those were the words of truth, and believe me the spirit of the fathers will animate their sons. Oh if I were instrumental in effecting an union with the Presbyterians of the north, then I would believe I had not lived in vain. I have now to propose to you the health of one whose biography is written in his nation's history—one whose worth and distinguished exertions will be more fully appreciated when his voice is hushed in the grave. I give you, "Daniel O'Connell, the Liberator of Ireland." Mr. O'Connell returned thanks, and said it was a great day for Ireland, and a proof of the wisdom of the prosecution. "The state of the Repeal cause," he said, "is this—at present three-fourths of the Irish people have unanimously declared in favour of it. A portion of the remaining fourth—the Catholic portion of the north at least are also for the Repeal. An immense number of the honest-hearted Presbyterians of Ulster are for the Repeal, and several enlightened members of the Established Church are for it; in short no cause had ever so powerful a support. That is one fact. What is the next? Why 37 monster meetings were held, not including the monster meeting of this day. That more human beings were congregated for peaceable, ay, or even for warlike purposes, than ever assembled in any country before. That there were six millions four hundred thousand as mentioned in the bill of indictment. But what is the fact as was alluded to by Mr. O'Brien? not one breach of the peace was committed at any of the monster meetings. Nay, it is a wonderful fact that not even an accident happened in a throng of so many thousands. Six millions four hundred thousand met together, and observed even the politeness of refined society in their behaviour towards each other, demonstrating their rights to govern their country by the complete manner in which they govern themselves. In regard to the prosecutions, if the Jury be composed of the Orange faction there is little hope for us. I am asked how they can find a verdict on that indictment? They may convict me for being a Popish agitator—but as to conspiracy I loathe the word—the idea of conspiracy never entered my mind. No; I belong to a great national combination, and I am proud to belong to it; and whilst I repudiate the foulness of conspiracy, come weal or woe, I am wedded to that national combination. But I wish to tell the people again how they should be prepared for coming events—if the Jury should be unhappily misinformed, and a verdict be found against us, I am not afraid of any disturbance. I am not afraid of any disturbance from this to that period, nor of any disturbance even then, but there is no harm in repeating my caution to the people. It would indeed break my heart to think that there should be any disturbance. I would abandon the Repeal cause if there was any outbreak. Don't the people see that their enemies are perfectly prepared with troops, artillery and ammunition? Let the people recollect that it was the fomented rebellion of 1798 that carried the Union. Give me but that noble tranquillity which I conjured you to observe, and the repeal is certain. Ireland need have no fear, unless from crime and violence. With that sentiment on my lips—with that conviction on my judgment—with that anxiety in my heart—I call upon you all to abide the coming trials with patience and tranquillity. Let us look forward to peace during the coming crisis. Let no man pity me nor feel that I was a wronged man—that I was an object of compassion after that trial. It is the crime that is disgraceful, and not the scaffold. I have struggled for Ireland—my first speech was against the Union—I have made more speeches since then than any other man, and my private life and public character have been vilified beyond measure; but while I have the confidence of my countrymen I care not for it all. It has been suggested to me that if I consented to abandon the Repeal the prosecutions would be given up; or even if convicted the sentence would not be enforced—that offer was made to me. I said at once there shall be no compromise of the Repeal. I would rot in a dungeon first. No, not while I have breath will I make a compromise. The Repeal! While I live I shall continue to argue Ireland's right to a domestic Parliament, and if I be incarcerated, my pen will enable me to teach my countrymen my sentiments. I rejoice, then, my friends, that we have made this demonstration. Your monster meetings went on until, at the close of them all, they were interrupted by the Government, and it was said that that which was peace before would on the suppression of those meetings be rebellion immediately. It was no such thing. Now we can contradict them. They interfered. He prevented. There was peace still. Peace still is my command—peace still is my entreaty—peace still and Ireland shall be free." Several other toasts were proposed and the meeting did not separate until long after midnight.

Law.

COURT OF COMMON PLEAS.—*Woods v. the Duke of Argyll and Another.*—The action was brought to recover from defendants, the Duke of Argyll and Major-General Sir James Cockburn, the sum of 37l. 6s. for work and labour performed for the defendants, in copying certain maps and making a journey to Gravesend. The Duke of Argyll, it appeared, had been put down by the promoters of the scheme as the President of the British American

Association for Emigration and Colonisation, which had its origin in an association founded for the purpose of securing to the Nova Scotia baronets certain estates in Nova Scotia. The proceedings of the association, the fate of the emigrants who had taken berths in the ship *Barbadoes*, and the bankruptcy of Dr. Rolph, one of the principal promoters of the association, has been made so familiar to the public through the instrumentality of the police and bankruptcy reports, that it will not be necessary to do more than advert to the evidence by which it was sought to fix the defendants with liability for the acts of the association. It appeared that the order to copy the maps, &c., was given by the secretary of the association in August or September, 1842, and that the first meeting which the Duke of Argyll and Sir J. Cockburn attended was held on the 22d April in the same year. They attended another meeting on the 29th April, and another on the 8th June, and after that time there was no evidence to show that they ever interfered in any way, directly or indirectly, with the proceedings of the society, or attended any of their meetings. It appeared that a prospectus was published in which the Duke of Argyll figured as president, and a number of noblemen and gentlemen as vice-presidents, besides a number of baronets, among whom was Sir J. Cockburn, who formed the "consulting council;" but it seemed from the same prospectus that the whole management of the affair was left in the hands of six "commissioners," and that the functions of the president, vice-presidents and consulting council were exclusively confined to the protection of the interests of the shareholders. It was arranged by the very constitution of the association that no peer or baronet who should become a vice-president should be liable as such to the expenses of the association, and it appeared that by one of the resolutions which was adopted on the 8th June, it was determined that nothing should be done by the association till 50,000l. had been subscribed for. Only 7000l. was subscribed for up to December, 1842. There were several minor features in the case, but the above were its leading characteristics. Chief Justice Tindal summed up, and the jury returned a verdict for defendants.

COURT OF QUEEN'S BENCH.—*The Queen v. Strachan.*—In this case Patrick Leith Strachan, a gentleman of fortune, who had formerly served at Sierra Leone, was charged with having committed an assault with a criminal intent at Harrow School. The Jury found the prisoner guilty. At the Central Criminal Court on Saturday, *George Dawson Lovendes*, a barrister of fortune, charged with two similar cases of assault, and who has often been before the police on charges of the same description, was found guilty. The Recorder commenting upon the enormity of his offence, said he was surprised that the prisoner's friends had not taken steps to have him placed in some asylum. He then ordered the prisoner to pay a fine of 100l. upon the first indictment on which he had been convicted, and upon the second he directed that he should be imprisoned in the House of Correction and kept to hard labour for two years, and at the expiration of that period enter into his own recognizance in the sum of 500l. to keep the peace towards all her Majesty's subjects for five years, and that he be farther imprisoned until the fine be paid and the recognizances entered into.

COURT OF EXCHEQUER.—*Custom-house Frauds.*—In the case of the *Attorney-General v. Candy* noticed in our last, the Jury found a verdict for the Crown, estimating the value of the smuggled goods at 1,050l. Another case—the *Attorney-General v. Dean*, being against the partner of the former defendant, was commenced on Monday, but as the same evidence was to be offered as in the former case, counsel on both sides agreed that the evidence should be taken as if given and the same verdict returned. A fourth case, the *Attorney-General v. John Dean*, a silk importer in St. Paul's Churchyard, not connected with Candy and Dean, was then entered upon. The Attorney-General in opening this case begged to inform the Jury that it differed from those which perhaps some of them had heard tried within the last few days, inasmuch as it was not a proceeding for penalties arising out of any charge of fraud, but was simply one for the recovery of certain duties to the extent of 27l. 12s. 10d., which were alleged by the Crown to be due from the defendant, a large silk importer in St. Paul's Churchyard, in respect of two cases of silk goods. That sum was constituted of the difference between the sum actually paid by the defendant on the importation of these two cases and that which, on the part of the Crown, was claimed as the amount properly payable. The defence rested on the admitted negligence of the Custom-house Officers, and on the general mismanagement of that department by which the goods were passed. Lord Abinger summed up, laying it down at the commencement of his charge, that undoubtedly the rules of law as to the proof of defendant's liability were as much to be observed by the Crown in such cases as in ordinary suits between party and party, and certainly as no fraud had been proved against the defendant he was entitled to have doubtful points construed somewhat favourably to himself; especially as the negligence of Custom-house officials had occasioned the loss of evidence, the absence of which surely should occasion no injury to him or impose upon him any additional burden of proof. His Lordship then went carefully through the evidence expressing on most points his opinion that the case of the Crown was substantially established. The jury returned a verdict for the Crown, calculating 137l. 16s. as the amount of deficient duty.

CENTRAL CRIMINAL COURT.—*The late Duel.*—On Saturday, at an early hour, the court was crowded with persons anxious to hear the trial of Mr. Munro. At 10 o'clock the Lord Chief Justice and Mr. Justice Colman entered the court, Lord Denman being accompanied by the celebrated French advocate, M. Berryer. As soon as their Lordships were seated, the Attorney-General stated that he had been led to expect that Mr. Munro, against whom a true bill had been returned by the grand jury at a former session of this court, for the wilful murder of Col. Fawcett, would surrender and take his trial on that charge. At a late hour on the previous night, however, he had received a note from the legal adviser of Mr. Munro, which informed him that Mr. Munro could not surrender or appear to take his trial, having been attacked with illness, and being then suffering from typhus fever. The Attorney-General added that he had only one course to pursue under the circumstances, and that was to ask did their lordships think it right that Mr. Munro should be called on to appear and surrender? Mr. Clark said that Mr. Thesiger and Mr. Bodkin, with himself, had been retained for the defence of Mr. Munro. They had only received the notice of Mr. Munro's illness last night, at too late an hour to countermand the attendance of witnesses. It was too late even to send to the solicitor for the prosecution, but it was not too late to send to the Attorney-General. They accordingly made the communication, which it was quite impossible to have made any earlier. He would beg to add, with respect to the question put by the Attorney-General, that Mr. Munro was not under recognisances. Lord Denman then ordered that the witnesses should be all discharged from further attendance during the present session.

The Saturnist.—*Barnard Gregory* surrendered to receive judgment on the 10th upon the Duke of Brunswick and Mr. Valance, to which he pleaded guilty some sessions back. Mr. Justice Colman, turning to the defendant, who stood on the step of the witness-box, said, Barnard Gregory—Defendant, interrupting him—My lord, before your lordship pronounces judgment upon me, I have to beg your lordships to allow me to make a few observations.—Mr. Justice Colman: We cannot hear you now.—Defendant: It is not possible that justice can be done me if your lordship does not hear me. I have pleaded guilty under peculiar circumstances.—Lord Denman: You have pleaded guilty, and the court cannot now hear you. You have put in your affidavits, and they have been considered.—Defendant: My lord, I was advised by my counsel to plead guilty.—Lord Denman: You really cannot now be heard.—Mr. Justice Colman then proceeded to pass sentence. He said: My brother Parke and myself have looked over the affidavits put in in your case, and

THE GARDENERS' CHRONICLE.

A STAMPED NEWSPAPER OF RURAL ECONOMY AND GENERAL NEWS.
THE HORTICULTURAL PART EDITED BY PROFESSOR LINDLEY.

No. 50.—1843.

SATURDAY, DECEMBER 16.

PRICE 6d.

INDEX OF THE PRINCIPAL HORTICULTURAL SUBJECTS IN THE LAST NUMBER.

African guano islands . . .	861 a	Italian Fire Fly, to naturalise . . .	862 a
— do. Beans . . .	863 b	— do. to apply soot to . . .	865 b
Allotments of land . . .	860 c	Lisianthus Russellianus, Cut- . . .	857 c
Amateur's Garden, No. XLIX. . .	862 c	— do. adv. . .	863 c
Araucaria seed, to sow . . .	860 a	Louise Bonne (of Jersey) . . .	863 c
Asparagus, treatment of . . .	865 a	Manures, refuse lime from gas- . . .	865 b
Auricula, rot in . . .	860 a	works . . .	861 c
Australian Wheat . . .	861 a	Morphology, remarks on . . .	865 b
Barringtonia speciosa . . .	863 b	Narcissus, to force . . .	864 b
Bell's subscription . . .	857 c	Naturalist's Corner . . .	864 b
Bombay Coffee . . .	863 c	Peach-border, to crop . . .	865 b
Bonsai . . .	861 c	Pelargoniums, treatment of . . .	865 b
Botany, works on . . .	857 b	Pilchard-oil to kill blight . . .	861 b
Carnations, Catalogue of, adv. . .	861 c	Pine-apples, culture of . . .	864 a
— do. to fertilise . . .	861 c	Potatoes, great crop of . . .	862 b
Cider, to make . . .	861 a	Potting, material for . . .	861 b
Cover Dodder, seeds of . . .	862 a	Pseud Acacia, durability of . . .	860 a
Cocoa-nuts for manure . . .	862 a	Queen's visit to Chatsworth . . .	863 c
Cuckoo, to keep in winter . . .	862 a	Raspberries, bush, analysis of . . .	863 c
Earthen pipes, to join . . .	862 a	Rhodes, London, to prune . . .	863 c
Eschscholzia for fruit trees . . .	865 b	Rivers, Rose Amateur's Guide, . . .	864 a
Eucalypti, hardy kinds . . .	861 b	3d. edit. . .	862 b
Experiment, co-operation . . .	861 b	Seeds, vitality of . . .	861 c
Fences, to renovate . . .	862 a	Shrub-cities, to dig . . .	861 c
Fruit trees for a north aspect . . .	863 b	Substitute for glass . . .	861 a
Fuchsia Esculenta . . .	863 b	— do. wood . . .	861 a
Gesneras, treatment of . . .	865 b	Tanks, covering for . . .	865 b
Heating, boilers for . . .	865 b	Turf under trees . . .	863 b
— do. covering for tanks . . .	865 b	Veronica speciosa . . .	863 b
Herbaceous plants, Jackson, adv. . .	857 c	Vicaria, water, backhouse, adv. . .	862 a
Hot-water apparatus, Bailey, . . .	857 b	Winter gardening . . .	865 c
Insects on Larch . . .	862 b	Worms, to destroy . . .	865 c
Italian Fire-fly . . .	860 a		

FASTOLFF RASPBERRY.

YOUELL AND CO. have much pleasure in announcing they have now ready for sending to any part of the United Kingdom, fine Canes of the above highly valuable and much esteemed RASPBERRY, unequalled for the extraordinary size of its fruit and richness of flavour.

IT IS PATRONISED BY HER MOST GRACIOUS MAJESTY THE QUEEN, HIS GRACE THE DUKE OF RUTLAND, THE EARL OF HARRINGTON, THE EARL OF LIVERPOOL, THE LORD BISHOP OF LONDON, LORD VISCOUNT LORTON, LORD SONDES, &c. &c., as well as by the HORTICULTURAL SOCIETY OF LONDON.

For further particulars they beg to refer to their Advertisement of the 9th inst. : Prices as follows. —

Packages containing 100 Canes . . .	£2 5s. 0d.
" " 50 " . . .	1 5 0
" " 25 " . . .	0 14 0

Package included. The usual discount to the Trade, when not less than 200 are ordered.

CAUTION.—Y. and Co. beg to call the attention of their Friends and the Public in general to the fact that they have appointed no Agents in London for the sale of the above, and cannot be held responsible for its being genuine unless purchased direct from their Nursery.

YOUELL'S TOBOLSK RHUBARB, 12s. per dozen. — For Particulars of which see their Advertisement of the 18th Nov.

TWO NEW SEEDLING PICOTEES. — "LADY ALICE PEARL," 10s. 6d., and "MRS. BENYON," 10s. 6d. per pair. FINEST CARNATIONS AND PICOTEES.

DUTCH HYACINTHS AND OTHER BULBS. ARAUCARIA IMBRICATA.

For particulars and prices of the above, see their Advertisement of the 22d Nov. — Great Yarmouth Nursery, Dec. 15, 1843.

HYACINTHS AND GROWING STOCK.

Wholesale Agents, DAVY, MACLEOD, and Co., 100, Upper-Thames-st., London.

CHISWICK NURSERY, NEAR LONDON.

R. GLENDINNING, (late of the firm of LUCOMBE, PINCE, and Co., Exeter), most respectfully acquaints Noblemen, Gentlemen, and his Friends generally, that having purchased the Lease and Stock of the above Nursery, he has been for some months engaged in making extensive alterations and additions to it, in order to enable him to carry on the NURSERY BUSINESS in all its various branches, and he begs to assure those who may be pleased to entrust him with their commands, that his utmost endeavours shall be at all times used to execute them with accuracy and punctuality, rendering every article of the best description at a moderate price.

In HOTHOUSE and GREENHOUSE PLANTS, and ORNAMENTAL TREES and SHRUBS, all the best varieties will be cultivated, and every approved novelty added as soon as it appears.

In the FRUIT-TREE DEPARTMENT, those sorts only will be grown which experience has proved to possess good and valuable properties.

In the SEED BUSINESS his arrangements enable him, from his proximity to the best marts, to supply such only as are genuine in quality and true to name.

R. G. flatters himself that from his practical acquaintance with Landscape Gardening and Garden Architecture, he may be safely and usefully consulted in planting Park Scenery, forming Ornamental Water, Constructing and Heating Buildings for Horticultural purposes, upon the most improved and economical principles, Laying out Ground for Flower and Kitchen Gardens, &c. Arboretums designed and systematically planted. — Dec. 11, 1843.

TO GENTLEMEN PLANTING.—The subscribers respectfully intimate that they have a large Stock of fine healthy transplanted LARCHES of various sizes, and as they must be removed they will be sold at a low price. Freight paid to London, Hull, Newcastle, or Liverpool. Prices furnished on application to W. URQUHART & SON, Dundee.

J. G. WAITE, WHOLESALE SEEDSMAN, London, begs to acquaint the trade generally that he has made a selection, at very great expense, from the finest stocks in England and other parts of the world, and can warrant the whole of the seeds genuine, of the first quality, and of the present year's growth. The prices are 30 per cent. lower than any other house in the trade. Catalogues to be had on application at his warehouse, No. 4, Eyre-street-hill, Hatton Garden, London. — Dec. 14, 1843.

TO SEEDSMEN AND OTHERS.

TO BE DISPOSED OF.—TEN TONS OF CARROT-SEED: viz., Five Tons of Large Green Top Altringham, at 52s. per cwt.; and Five Tons of Large Green Top White Belgium, at 32s. per cwt. All warranted of English Growth of 1843, and selected from the finest stocks. To be sold in any quantity not less than 1 cwt. Apply to J. G. WAITE, Nos. 1 and 4, Eyre-street-hill, Hatton Garden, London.

TO MELON GROWERS.

SIX Superior kinds of MELON SEEDS, comprising the following: Beechwood true, Hybrid Persian, Hocsaine, Improved Egyptian, Duncan's Improved Green Flesh, and an Hybrid Cantaloupe, weight from 9 to 15 lbs., and of superior quality; the above will be warranted true to their names, and will be forwarded immediately on receipt of a post-office order for 5s., payable at Mildenhall. P.S.—Six good Seeds of each.—E. SPURDY, Chippenham Park, near Mildenhall, Suffolk.

BRITISH QUEEN STRAWBERRY.—Good Strong Plants of this excellent STRAWBERRY may be had of JOHN COLLING, 2, Park-place, Park-road, Clapham, Surrey, at 6s. per 100, or 2l. 10s. per 1000.

TO NURSERYMEN, FLORISTS, and Others.—Nursery to Let, and Nursery Stock to be disposed of.

TO LET, the WELL-KNOWN and OLD-ESTABLISHED NURSERY near to the town of KILSO, in the County of Roxburgh, presently occupied by Mr. ANDREW LOCKIE, by whom and his Father the Business has been carried on for upwards of 60 years. The Nursery extended to twelve and a half acres, six acres of which belonged to Mr. LOCKIE, and six and a half are held on lease. The Ground is in an excellent and convenient situation, is well divided and fenced by walls and hedges; it is fully stocked with Trees, Evergreens, and a general assortment of Plants, and the Lion's Department is extensive and well selected. There is a large Greenhouse, Propagating-house, Pits, and Frames, all well filled. There is also a comfortable Cottage with a stable attached. The Premises will be let with immediate entry, for such number of years as may be agreed on, and the Stock will be disposed of either upon valuation or by private bargain. The Proprietor has sold about three and a half acres of the Nursery for Building-ground.

The Proprietor is giving up the above department of his Business, from having engaged in an extensive Farm, which will occupy much of his time. It is proper, however, to intimate to intending offerors, as well as for the information of Mr. LOCKIE's Customers and Friends, that he intends to continue in the Seed Trade, as formerly, at his shop in Kelso. Until the Nursery is let Mr. LOCKIE will carry it on, and supply his customers as usual, the continuance of whose orders will confer on him an important obligation.

Application to be made to the Proprietor, or to GEORGE MAIN, Writer, in Kelso.

ARGUS LIFE ASSURANCE COMPANY, 39, Throgmorton-street, Bank.

Empowered by special Act of Parliament, 5 & 6 W. IV., c. 76.

Thomas Farncomb, Esq., Alderman, Chairman.
William Leaf, Esq., Deputy-Chairman.
William Banbury, Esq., Rupert Ingleby, Esq.
Edward Bates, Esq., Thomas Kelly, Esq., Alderman.
Thomas Camplin, Esq., Jeremiah Pilcher, Esq., Sheriff of London and Middlesex.
James Clift, Esq., Lewis Pocock, Esq.
Rt. Hon. J. Humphrey, M.P., Lord Mayor of London.

Physician—Dr. Jeafferson, 2, Finsbury-square.
Surgeon—W. Coulson, Esq., 2, Frederick's-place, Old Jewry.

Consulting Actuary—Professor Hall, of King's College.
Advantages of the Argus Life Assurance Company.

Low Rates of Premiums.
In addition to the subscribed Capital of 300,000l., the Assured have the security of the Company's Income of nearly 65,000l. per annum, yearly increasing, and accumulating Assurance Fund invested in Government and other available Securities, of considerably larger amount than the estimated liabilities of the Company. The Rates of Premium are reduced to the lowest scale compatible with the safety of the Assured and the stability of the Company, thereby, in effect, giving to every Policy-holder an immediate and certain bonus without risk, in lieu of the deferred and frequently delusive prospect of a periodical division of profits.

Annual Premium to Assure £100.			
Age.	For One Year.	For Seven Years.	Whole Term.
20	17 8	19 1	11 10
30	1 1 8	1 2 7	2 0 7
40	1 5 0	1 6 9	2 14 10
50	1 14 1	1 19 10	4 0 11
60	3 2 4	3 17 0	6 0 10

One-third of whole term Premiums may remain unpaid at 5 per cent. comp. int. as a debt upon the Policy for life, or may be paid off at any time without notice.

In Assurances for advances of money as security for debts, or as a provision for a family, when the least present outlay is desirable, the varied and comprehensive Tables of the Argus office will be found to be particularly favourable to the Assured.

A Board of Directors, with the Medical Officers, attend daily, at a quarter before 2 o'clock.

EDWARD BATES, Resident Director.
A Liberal Commission to Solicitors and Agents.

DISEASED AND HEALTHY LIVES ASSURED.
MEDICAL, INVALID, and GENERAL LIFE OFFICE, 25, Pall Mall, London. Capital, 500,000l. This Office is provided with very accurately constructed Tables, by which it can Assure Diseased Lives on Equitable Terms. In which it can Assure Diseased Lives, the amount varying increased Annuities granted on unsound Lives, the amount varying with the particular disease. Members of Consumptive Families assured at Equitable Rates. Loans granted upon personal security.
E. G. P. NEISON, Actuary.

HORTICULTURAL BUILDING & HEATING BY HOT-WATER.

J. WEEKS & Co., ARCHITECTS, &c., Gloucester-place, King's-road, Chelsea, Hothouse-Builders, and Hot-water Apparatus Manufacturers, beg leave to inform the Nobility and Gentry, that their business, which has been extensive throughout the country for many years, is entirely confined to the BUILDING OF HORTICULTURAL ERECTIONS of every description, and the HEATING of them by HOT WATER. CONICAL and other BOILERS of all sizes; their largest construction but a small quantity of fuel, only requiring attention once in 10 hours, and will heat a range of forcing-houses 300 feet in length.

Their improved plan of BOTTOM-HEAT FOR PITS, by means of an open trough under the bed, is now being universally adopted. References may be had, and their works seen at most of the Nobility and Gentlemen's seats in the country, near the whole of the London Nurseries, and a great variety of Horticultural Erections and Hot-water Apparatus, Models, Plans, Estimates, &c., at their Horticultural Manufactory, Gloucester-place, Chelsea, near Sloane-square.

GENUINE PERUVIAN & BOLIVIAN GUANO ON SALE, BY THE IMPORTERS, ANTHONY GIBBS AND SONS, LONDON; GIBBS, BRIGHT, and CO., LIVERPOOL AND BRISTOL. 47, Lime-st., Dec. 7, 1843.

WILLIAM MAY begs to announce that he will not be able to supply any more proved plants of Hollyhocks for the present season. He can supply the following fine year-old Hollyhocks, grown from seeds saved from best double sorts, at 20s. per 100. Herbaceous plants, select and showy, in great variety (see Advertisement for October) in collections of 100 fine sorts for 47s.; 20 ditto for 25s. (a list of which may be had on application). Tulips, fine named show sorts, in collections of 100 varieties, for 5l.; 50 do. for 2l. 10s.; 25 do. for 25s. Gooseberries, 150 fine varieties by name; a list of sorts and prices on application. Currants, May's new large late "Victoria," red, at 15s. per dozen; new large black "Bing-up," at 6s. per dozen. Seeds of Hollyhocks all arranged, saved from best double flowers, in packets of 200 seeds for 2s. 6d., 500 for 5s. Pansy, from best prize flowers, at 2s. 6d. and 5s. each. The seeds will be sent post free by W. M., and may be had of Mr. Watkinson, Seedsman, Market-place, Manchester. A remittance or reference is requested.—Hope Nursery, Leeming Lane, near Bedale, Yorkshire, December 15, 1843.

TO GENTLEMEN PLANTING.

J. AND J. FAIRBAIRN are induced from the uncertainty upon which they hold the Manor-street Nursery (situated contiguous to the Home Nursery, Clapham Rise, where attention will be given to all applications), to effect a Sale of the Stock at as early a period as possible, consequently beg to solicit the attention of Gentlemen and the trade to the large and remarkably healthy and well-grown stock, consisting of fine large Laurels, twice transplanted, of extra growth; Portugal Laurels, very handsome; Green Hollies, of various sizes; Evergreen Privets, fine Standard and Dwarf Roses in great variety, fine standard flowering Thorns, Almonds, Aesculus, Robinias, and other Ornamental Trees, and Evergreen and flowering Shrubs, with a large stock of fine standard and dwarf, trained and untrained Peaches, Nectarines, Apples, Pears, Plums, and Cherries, of the most approved kinds, and of growth rarely equalled; also, of a large assortment of Forest Trees, consisting of Limes, Elms, Birch, Beech, Hornbeam, Spanish and Horse Chestnuts, Mountain Ash, Poplars, and Spruce, and Scotch Firs; also a large number of Gooseberries and Currants, of excellent growth, and of the best varieties in cultivation, to all of which J. & J. F. respectfully invite the inspection of Gentlemen and Nurserymen, flattering themselves that the general character of the Stock is such as to ensure unqualified satisfaction, and which they are disposed to offer at very moderate prices for cash.

J. & J. F. respectfully beg to call the attention of Gentlemen to their advertisement of Heaths, &c., which has lately appeared in the *Gardeners' Chronicle*. (Oct. 21 and 28.) Nurseries, Clapham, near London, December 15, 1843.

CONWAY'S GIANT CACTUS.

PHILIP CONWAY has the pleasure of offering to the Public the above splendid production at the reduced price of One Guinea each. P. C. having been successful in its propagation, can now give the usual discount to the Trade. Also Conway's Pelargonium "LANE" (the best yet raised for forcing), fine plants now showing their blooms, at 5s. each; good plants in 48-sized pots, at 3s. 6d. each. A remittance for reference respectfully requested from unknown Correspondents.—Old Brompton, Dec. 13th, 1843.

BROMPTON PARK NURSERY—ESTABLISHED 1681.

MESSRS. GRAY, ADAMS, and HOGG, introduce to the notice of those engaged in planting Shrubberies, &c., an extensive Stock of fine large EVERGREENS, consisting of Variegated and Green Hollies, common and Portugal Laurels, Hemlock, Spruce, Yews, Arborvitae, Phillyreas, Arbor-vite, Alantus, &c. &c., which they can supply on advantageous terms, and from the well-known nature of their soil being so admirably adapted for the removal of large plants, they with confidence recommend them.

They also take this opportunity of again reminding their customers of their Stock of Dwarf, Standard, and trained Fruit-trees, Figs, Vines, &c. &c., which are this season of a very superior description, and of which Catalogues may be had on application. Seeds and Plants carefully selected and packed for exportation, well deserving the attention of all Emigrants and Colonists.—Kensington-road, December, 1843.

BUSHELL'S Light Seedling Dahlia "EMMA."—Ground roots of this Dahlia to be disposed of for 3l. per root, for cash. Colour, white, tipped with deep cherry, the petal-form and centre good; the largest, most constant and free in flowering of any Dahlia yet propagated, and has obtained several prizes. J. B. cut 48 blooms from 14 plants, which were exhibited at one of the Metropolitan Shows, the whole of which Mr. Neville pronounced fit to be placed in a stand of 12. "PET RIVAL."—Colour purple maroon, fine cupped petal, and free bloomer; ground roots, 2l.; pot do. 1l. J. B. warrants the above Dahlias to give satisfaction, or he will return the purchase-money.—12, Hall-place, Kennington-lane, Dec. 15.

B. SAUNDERS, NURSERYMAN AND FLORIST, Isle of Jersey, respectfully informs the Public and Trade in general that he has a few thousand Maiden PEACHES & NECTARINES to dispose of this season, which are true to name, and comprises all the best varieties in cultivation; and which he will render at moderate prices, with the usual discount to the Trade. N.B.—His collection of Pear-trees are also very fine.—Dec. 8.

HOT-WATER APPARATUS FOR HEATING HORTICULTURAL BUILDINGS, DWELLING-HOUSES, CHURCHES, and MANUFACTORIES, upon improved principles, and at very moderate charges, erected by DANIEL and EDWARD BAILEY, 272, HOLBORN.

D. and E. BAILEY having devoted much time to the consideration of this subject, and had much experience in the erection of apparatus for the above-mentioned purposes, have, by improvements suggested in their practice, rendered their mode of heating not only very efficient, but very simple, and have combined durability in the apparatus with economy in the charge. They have erected apparatus in England, Scotland, and Ireland, for many noblemen and gentlemen, and have had the honour to be employed by the Horticultural Society of London, in executing the works of their splendid Conservatory, lately erected at Chiswick.

D. and E. BAILEY also construct in metal all descriptions of Horticultural Buildings and Sashes, and invite noblemen, gentlemen, and the public to an inspection of their various drawings and models, at 272, Holborn, where they have the opportunity of exhibiting, amongst other metal works, an extremely complete and convenient kitchen apparatus, or range, adapted for the continued supply of hot water, and an arrangement of the oven more complete than has hitherto been brought before the public.

D. and E. BAILEY were the first to introduce metallic curvilinear houses to horticulturists, and can refer to the Conservatory attached to the Pantheon as one of their works, besides many others in this country and on the Continent.

D. and E. BAILEY have prepared a quantity of the Galvanic Plant Protectors, which are now ready for immediate delivery; they beg to introduce to public notice a new Trough Pipe, for Orchidaceous or other Houses where vapour is constantly, or at intervals required, and which may be seen at their Manufactory.

RENDLE'S TANK SYSTEM OF HEATING.
STEPHENSON AND CO., 61, Gracechurch-street, London, Inventors of the IMPROVED CONICAL and DOUBLE CYLINDRICAL BOILERS, having been much engaged in heating buildings upon the above system with Tanks of various materials, solicit the attention of scientific Horticulturists to an Iron Tank now fitting up on their premises, which offers most decided advantages over every other article hitherto employed for the same purpose. These tanks which are ornamental in appearance can be made from 10 to 100 feet long and of any width and depth, and can be connected or disconnected by any working Gardener without the slightest difficulty, thus affording the opportunity to persons in remote districts of employing this much approved method of heating without the assistance of Engineers. The Tanks can be applied to Boilers and Pipes already fixed, and from the present low price of Iron will be found cheaper than of any other material. MR. RENDLE, of Plymouth, has kindly undertaken to receive orders and furnish information to any persons in his neighbourhood, and prices for any size will be forwarded upon application to S. and Co.

ON SALE, in any quantity, PERUVIAN and BOLIVIAN GUANO, genuine as imported.—Apply to CORSEWORTH, POWELL, and PRYOR, London; to EDWARDS, DANKIN, and CO., Liverpool; or WILLIAM J. MYERS and CO., Liverpool, the Importers.

CHRISTMAS AND NEW YEAR'S GIFTS.
On the 20th inst., in patent cloth binding, gilt edges, price 8s. 6d. plain, 12s. coloured.

YOUNG ENGLAND'S LITTLE LIBRARY.—A Collection of original Tales for Children, in prose and verse; contributed by Mrs. S. C. Hall, Mrs. Howitt, Mr. Gaspey, Mr. Albert Smith, the Author of the "New Tale of a Tub," and other Authors of established reputation. Illustrated by Crowquill, Absalon, and Cham.

Also, uniform with the above, price 2s. 6d. plain, 3s. 6d. coloured, bound in patent cloth, gilt edges.
THE BOOK OF CURIOSITIES, Natural and Artificial: descriptive of the most remarkable Natural Phenomena, and the Principal Wonders of Ancient Art.
London: W. S. ORR and Co.

PRACTICAL DIRECTIONS FOR THE CULTIVATION AND GENERAL MANAGEMENT OF COTTAGE ALLOTMENTS, with Plans for laying them out for five years. Also Hints on Keeping Pigs, on Service, &c.; with a form of Rules and Agreements. A Third Edition is being printed by Messrs. MANNING and CO., of Ivy-lane, Newgate street; by whom all orders will be supplied, which may be sent to them before the 1st of January, at 30s. per hundred copies.

Now ready, price 4s. 6d. neatly half-bound with Woodcuts.
THE COTTAGER'S MONTHLY VISITOR, for the Year 1843.

This Work is continued in Numbers, price 4d. each, and forms a Manual of Religious Instruction and Domestic Economy, suited to Family Reading, the Parochial Library, and the Servant's Hall. Its contents include Scriptural Exposition, Instructive Tales, Hints on Gardening and Agriculture, short Extracts from the best Authors, and occasionally from the Public News. The Volumes are included in the List of Books recommended by the Society for Promoting Christian Knowledge.

RIVINGTONS, St. Paul's Church Yard, and Waterloo Place.

Price 10s. sewed, in Two Parts, or 10s. 6d. cloth.

ANIMAL PHYSIOLOGY.

London: W. S. ORR & Co., Paternoster-row.

A NEW FARMERS' NEWSPAPER.

On the 6th of January. The time has come when Landlords and Tenants, large Farmers and small, must devote their anxious attention to improved cultivation—when, in the words of Sir Robert Peel, "All must learn how, in the shortest time, and at the least expense, to produce the greatest quantity of food, vegetable or animal, without permanent injury to the land." To accomplish this, no means can be so effectual as that which brings the results of Experience and Science before every man, in a cheap form. For this purpose THE AGRICULTURAL GAZETTE is to be established.

The Proprietors are aware of the difficulties of dealing with the many details of cultivation without an acquaintance with circumstances, often as varying as places. They condemn the idea of conducting farming operations upon one invariable plan; and, while they welcome science as the best auxiliary of practice, they regard crude speculations as the most dangerous of delusions. But, they also feel that in Agriculture, as in all other arts, there are general principles upon which successful farming must depend; that there are practical errors which no local circumstances can justify; in short, that there is room for improvement even in those branches which are best understood. No one man can be competent to deal with the multifarious questions affecting husbandry, and the duty of the Editor of such a Paper as THE AGRICULTURAL GAZETTE is to make known the knowledge of all. It is to practical Farmers that the Proprietors trust for the means of carrying out their views, and not to the talents of any individual. While, therefore, they state that the Editor of THE AGRICULTURAL GAZETTE will be a gentleman well acquainted with the best kind of Farming, in which he is actively engaged, they feel it to be of far more importance to announce the promise of support and assistance received from the landed and farming interest generally, especially of those whose names they are permitted to mention:—

The Right Hon. the Earl of Ducie, Vice-President of the Royal Agricultural Society of England.	Lord Worsley, M.P., Vice-President of the Royal Agricultural Society of England.
Sir J. S. Sebright, Bart.	Sir Charles Lemon, Bart., M.P.
J. Walbank Childers, Esq., M.P.	William Miles, Esq., M.P.
J. H. Langston, Esq., M.P.	Rev. J. S. Henslow, Professor of Botany, Cambridge
Rev. Dr. Buckland, Professor of Mineralogy, Oxford	Dr. Lyon Playfair
David Low, Esq., Professor of Agriculture, Edinburgh	Evan David, Esq., President of the Cardiff Farmers' Club
John Curtis, Esq., F.L.S.	John Gedney, Esq., President of the Harlestone Farmers' Club, Norfolk
R. D. Drewett, Esq., Burpham, Arundel	C. Herbert, Esq., Powisk, near Worcester
W. Parker Hamond, Esq., Pampisford Hall, Cambridge	W. H. Hyett, Esq., Painswick House
J. Hudson, Esq., Castle Acre, near Swaffham, Norfolk	J. B. Lawes, Esq.
Curtis Hayward, Esq., Quedgeley, near Gloucester	D. J. Niblett, Esq., Haresfield
R. M. Jaques, Esq., Richmond, Yorkshire	Edward Solly, Esq., Junior, Experimental Chemist to the Horticultural Society of London
W. H. Little, Esq., Lanvair Grange, Abergavenny	Joseph Yorke, Esq., Tewkesbury
E. W. Moore, Esq., Agent to Earl Radnor	Mr. John Brodie, Haddington
S. D. Stirling, Esq., Glenbervie, Falkirk	Mr. John Morton, Agent to the Earl of Ducie
W. B. Wingate, Esq., Hareby, Bolingbroke, Lincolnshire	Mr. Thimbleby, Bolingbroke
Mr. R. Beman, Stow-on-the-Wold	Mr. Hall, Secretary of the Chesham Farmers' Club
Mr. J. Clarke, Romney, Hants	Mr. R. W. Purchas, Secretary of the Monmouth Farmers' Club
Mr. G. Parsons, Agent to Lord Portman	
Mr. S. Rigg, Wighton, Cumberland	
J. B. Walrond, Esq., Sec. of the Gloucester Farmers' Club	
Mr. H. F. Fardon, Sec. of the Broomsgrove Farmers' Club	
&c. &c. &c.	&c. &c. &c.

With FREE TRADE, FIXED DUTIES, SLIDING SCALE, &c. &c., THE AGRICULTURAL GAZETTE will in no way concern itself—such questions can only be of temporary interest; whereas the AGRICULTURAL GAZETTE will be devoted to the investigation of those great truths which human laws cannot affect.

The Practice of Agriculture—its Science—Animal and Vegetable Physiology—Improvements in Implements—better modes of Husbandry—results of well-conducted experimental Farming—Growth and Rotation of Crops—Stock—Drainage—Irrigation—Forestry—Road-making—Farm-Buildings—Labourers—in short, whatever affects the beneficial employment of capital in land—will form topics of consideration. Reports will be given of the English, Scotch, and Irish Agricultural Societies—London Market—Prices of Corn, Hay, and Cattle, and the Weekly Averages. Replies to questions connected with the object of the Paper will also be furnished weekly.

Considering the union which exists between Horticulture and Agriculture, it has been thought advisable to make THE AGRICULTURAL GAZETTE an addition to the GARDENERS' CHRONICLE, edited by DR. LINDLEY, and so extensively known; but that there may be ample room for discussion, that Paper will be increased one-half in size without additional charge—thus Twenty-four Columns will be occupied, as at present, by Horticulture, and Twenty-four by the General News of the Week, whilst TWENTY-FOUR COLUMNS WILL BE DEVOTED TO AGRICULTURE.

On the 6th of January, therefore, will be published, price 6d., Stamped, to go free by post.

THE GARDENERS' CHRONICLE AND AGRICULTURAL GAZETTE.

Parties intending to commence the Volume had better give their orders at once to any Bookseller or Newsdealer.

AGRICULTURAL CHEMISTRY.—MR. J. HAYWOOD, having left Workshop, Notts., to superintend the Chemical Department at the Pestalozzian Institution, Grange Hall, near Wakefield, and to take the management of the *Experimental Farm* attached thereto, requests that all letters, Specimens of Soils, &c., for analysis, be in future addressed and sent to him to the above Institution. Terms on application.
Grange Hall, near Wakefield, Dec. 10, 1843.

THE HEALTH OF THE LABOURER.—The Second Edition of this ADDRESS to the WETHERBY AGRICULTURAL ASSOCIATION, with the recent Parliamentary Report on Allotments of Land to the Working Classes, is now published, in deference to the wishes of many friends and correspondents that the subject should be more extensively submitted to public opinion in connexion with all Agricultural Associations. "Attention to the condition of the labourer will do more to raise these institutions in general estimation than any improvement we can make in machinery or stock."—(Sir R. Peel on the Allotment system, Litchfield Agricultural Meeting, October, 1843.) "We recommend every new subscriber to these institutions to read this address."—*The Times*, Oct. 20, 1843. By the Rev. EDWARD DUNCAN, Rector of Newton Kyme, Tadcaster. W. STRANGE, 21, Paternoster-row, London, and all booksellers. Price 3d. each, or 1s. 6d. per dozen.

JOHNSON'S PATENT BEDSTEAD.—The Nobility and Gentry are invited to inspect the NEW PATENT METALLIC FOLDING HINGED BEDSTEADS, Couches, &c., which for cleanliness and elegance of design are worthy the attention of all classes; they are equally adapted for the drawing-room, the chamber, or the nursery; in the daytime they form an elegant piece of drawing-room furniture, and at night may be converted into a bed in a few minutes.—To be had of the Patentee, E. JOHNSON, 45, Jermyn-street, St. James's, opposite the Cavendish Hotel.

SAFETY-INSTANTANEOUS LIGHT, produced by RUSH and Co.'s OXUSOPHUS, which offers superior advantages over any other instantaneous light, being so safe that it may with the most perfect security be placed beneath the pillow; and wherever safety and light are required will be found invaluable.—To be obtained of the Patentees, RUSH and Co., at their Warehouse, 12, Warwick-square, Newgate-street, London; and of all Chemists, Stationers, Ironmongers, Oilmen, and Tobacconists throughout the United Kingdom.

RABBIT-NETS, SHEEP-NETS, TARPULINGS, APRONS, CAPES, &c.—Rabbit-Nets on cords, 50, 80, and 100 yards long; Do. to fence out Rabbits, 2d. per yard; Sheep-Nets, nearly 4 feet high, 4d. per yard. Tarpauling Coats for Keepers, Watchmen, &c., 6s. 6d. Dog-cart and Coach Aprons, lined, and with Straps, 14s. and 16s. each. Above 1000 London Police-men's Capes, for Farm Servants, 2s. and 2s. 6d. each, lined; unlined, 1s. each. Large Driving Capes, 7s. 6d. Garden net (new), 14d. per yard; d. tin second-hand (perfect), 3d. per yard, any length or width. Net to inclose Fowls and Pheasants, 2d. per yard. Horse-cloths 7ft. 6in., and 6ft., 10s. 6d. each. The best Fishing-nets of all kinds. Second-hand Tarpaulings for Pits, Frames, &c., 6d. per square-yard; new do., 1s. to 2s. Horse-loin Cloths. ROBERT RICHARDSON, Net and Tent Maker, 21, Tounbridge-place, corner of Judd-street, New Road, London.
N. B.—Net Hammocks.

GLASS SUPERSEDED FOR HORTICULTURAL PURPOSES BY WHITNEY'S CHEMICAL TRANSPARENT WATERPROOF COMPOSITION, rendering Muslin, Calico, or Linen, for the Frames of Greenhouses, Pine, Melon, or Cucumber Stoves, &c., impervious to rain or moisture, admitting light equal to Glass, much warmer, and the plants never burn under it.

Noblemen, Gentlemen, and Gardeners will, by using this composition have the only effectual protection for their Fruit-trees during the blooming season; it is a certain defence from frost, sleet, wind, and blight; its transparency admits the general beams of the sun, with abundance of light, which causes the bloom to expand with increased luxuriance, the fruit to set and swell more freely, much earlier, and a crop of fruit to any extent may be warranted. The covering not to be moved by day (except to thin the Fruit, which will be necessary), till the month of June. It is recommended that the Calico be prepared early, so as to be thoroughly dry before using.

Sold in Bottles, with directions for use, pints, 2s. 6d., quarts, 4s. 6d. each. One pint is sufficient to coat four frames twice over, each Frame to be 5ft. by 3ft. 3in., or thereabouts. Prepared by GEORGE WHITNEY, Chemist, Shrewsbury. Seedsmen, Florists, and Merchants supplied by Mr. W. BAILEY, Chemist, North-street, Wolverhampton. Appointed Agents:—Messrs. BUTLER and MUCKLEY, Covent Garden, where a sample of prepared calico may be seen; Mr. WATKINSON, Market-place, Manchester, PAGE and SON, Southampton, T. and C. WHALLEY, Nurserymen, Liverpool.

Agents wanted for London and the country.

INDIA.—OUTFITS for CADETS, Assistant-Surgeons, and others appointed to India, comprising shirts, hosiery, gloves, light clothing, military accoutrements, trunks, cabin furniture, &c., are supplied at the wholesale cash prices by THRESHER and GLENNY, next door to Somerset House, Strand, where lists of outfits, both for ship and by the overland route, with prices and every particular, may be had on pre-paid application. N.B. THRESHER's overland trunk can be procured at 152, Strand, but at no other house in London.

THE BRITISH QUEEN AND PRINCE ALBERT PEAS.
J. CORMACK AND CO. beg to announce to their Friends and the Public that they have harvested the above two New Varieties, and will be obliged by early orders, as the stock is limited. They will be sent out, as last spring, in packages, bearing the name of the firm, price 3s. 6d. per quart. The usual allowance to the trade.
 N.B.—"CORMACK'S Early Kent Peas," 14s. per bushel. Newcross, and Bedford Conservatory, Covent Garden, Dec. 15.

EDWARD BECK invites the attention of Horticulturists to the different articles manufactured by him in SLATE. They may be seen in use at WORTON COTTAGE, ISLEWORTH, upon application to the Gardener—Sundays excepted.

The Gardeners' Chronicle.

SATURDAY, DECEMBER 16, 1843.

MEETINGS FOR THE FOLLOWING WEEK.

TUESDAY, Dec. 19, Linnæan : : 8 P.M.
 Wednesday, Dec. 20, Microscopical : : 8 P.M.
 Society of Arts : : 8 P.M.

WE have the painful duty of announcing the decease, at Bayswater, on the 14th inst., of **JOHN CLAUDIUS LONDON, Esq.**, the well-known indefatigable writer on Horticultural subjects and the celebrated Landscape-Gardener, in his 60th year. Whatever differences of opinion there may be as to some of the views which Mr. Loudon advocated, there can be none as to the general value of his literary labours. The esteem which was entertained for them by one who has occasionally been opposed to him, was shown some years ago by the establishment of the genus *Loudonia*—a curious New Holland shrub, whose golden flowers served to typify the value of those labours—Horticultural, Architectural, Œconomical, and Botanical—under which Mr. Loudon at length has sunk.

THE Smithfield Show of fat cattle, implements, &c., which took place last week in Baker-street, viewed as an exhibition of the extent to which feeding can be carried in the fattening of cattle, sheep, and pigs, was considered fully equal to the shows of previous years.

We have not room to give this year's award of the prizes offered by the Smithfield Club, and probably the majority of our readers would not feel much interested in it. Among the many heavy animals exhibited, we noticed particularly the beautifully-formed 4-years and nine months' old short-horned heifer, bred by Sir C. Tempest, Bart., of Broughton-hall, near Skipton, which gained the first prize in her class, and to which gold and silver medals were also awarded.

Prince Albert was among the unsuccessful exhibitors.

The exhibition in the galleries of implements, roots, &c., was full and interesting. These may be considered as the means, whose use results in the extraordinary specimens of ox, sheep, and pig, shewn in the yard below them; and whatever advantage may follow the spirit of emulation, which is, we think, the only useful consequence of a show of fat cattle, there can be no doubt that the exhibition of Agricultural implements, and of the plants used in good farming must be useful in many ways. Some extraordinary Swedish Turnips were exhibited by Mr. Skirving of Liverpool, and Carrots and Mangold Wurzel, by Messrs. Gibbs, of London; but these, though they doubtless displayed the distinguishing marks of their respective varieties carried out to the fullest extent, could not be taken as specimens of what their seed would produce under the ordinary circumstances of field culture. We saw no series of specimens of Agricultural Grasses, or of Wheat, Oats, and Barley; yet these are surely quite worthy of classification, according to their varieties, and they would form to many as interesting an exhibition as that of the fat cattle patronised by the Smithfield Club; and we think that the display of the straw, as well as the seed of such specimens, would not only be useful to the spectator, but profitable also to the exhibitor. We shall, however, next year look to these matters much more narrowly.

THE relation that plants bear to the carbonic acid which surrounds them may, at first sight, appear to be an abstruse question in the Chemistry of Physiology with which Practice has no concern; but a moment's consideration of the nature of plants shows that this would be a very erroneous view, and that, so far from being a mere point of philosophical speculation, it is one intimately connected with the fundamental principles of cultivation.

Plants consist very largely of charcoal (or carbon). This is plain enough, without having recourse to chemical investigation: everybody, indeed, knows that sticks and branches are what become charcoal when properly burned, and that after the operation they are little less bulky, although much lighter than they were before. It is not, however, so generally considered that the most delicate parts of plants are as much composed of charcoal as the wood—yet such is undoubtedly the fact. Take the petal of a Rose—the yet more delicate corolla of a *Convallulus*—or even the tender Fungi which spring up in cellars like tufts of snow, as fragile and as delicate—place them on a piece

of glass, thrust them for a moment between the red-hot coals of a glowing fire, and when they are withdrawn their colour and freshness is gone, but charcoal remains. In short, plants consist principally of charcoal and water.

If it is true that such is the fact—if it is thus evident that plants consist to a large extent of charcoal, it is obviously most important to ascertain the source from which they derive it—for we need not say that they could not have it if cut off from communication with bodies capable of furnishing it. Now all evidence goes to prove that a very large source of charcoal is carbonic acid: a kind of air, compounded of carbon and oxygen, found in the atmosphere, incessantly expelled from the lungs of animals, and produced by the decay of vegetable and animal bodies. On this invisible, untouchable substance plants feed; out of this they help themselves to the charcoal, returning the oxygen to the air. And thus the vast forests of the earth, and all the herbage at their feet, are gradually built up, and fashioned into the beautiful green mantle of our planet.

This great fact being established, some other questions about which Physiologists cannot agree are less important. It practically disposes of the question, whether all the charcoal in plants comes from the atmosphere or not; because the moment it is proved that carbonic acid is their food, we must necessarily admit that plants will take it up by their absorbent surfaces whenever it is presented to their surfaces. And as the power of absorption exists nowhere in plants more powerfully than in their roots, so must we therefore admit that the roots will feed on carbonic acid if the substances surrounding them can furnish it. In all cultivated land it is so furnished, and therefore all cultivated plants must be considered to be so fed. We cannot for a moment admit the truth of those speculations in which the unimportance of carbonic acid at the roots of plants is insisted on. All experience shows the contrary.

If these statements are well founded, as they surely are, one of the most important of all matters connected with cultivation is immediately touched—viz., the management of the soil in which plants grow; for it must be plain that one of the first things to be thought of is the introduction into earth of materials out of which carbonic acid can be steadily produced. The cultivator does this by means of manure—that is, by means of decaying matter capable of producing gaseous compounds of carbon,* one of which is carbonic acid. But although this is practically done universally to a certain extent, it is by no means clear that we employ for this purpose all the available substances at our disposal.

Of late years a great deal has been said of the value of common charcoal in soil. Experiments have been quoted to show that in powdered charcoal alone plants flourish with an extraordinary degree of vigour; charcoal has been recommended as the best of substances in which to strike cuttings (see vol. i., p. 549, and many other places), and by degrees it has gained a reputation which nothing now can shake. It is true that some experiments with it have failed, owing, we believe, to its having been used in too fine a state, or to other accidental causes; nevertheless the opinion of practical men is settling steadily in its favour. Messrs. Lodiges employed it advantageously in the cultivation of Orchidaceous plants, charring the wooden blocks on which they are attached: that practice was introduced beneficially at Chatsworth, and nothing can be more striking than its good effects in the garden of the Horticultural Society, where a few weeks have sufficed to give a dark green healthy colour to the plants attached to the charcoal blocks. By mixing it with the soil of Orange-trees their health was presently increased in a remarkable degree; and we understand that it is used largely as an ingredient in the soil employed by Mr. Barnes for the production of the great Pine-apples at Bicton.

This may be in part ascribed to the mechanical action of charcoal, and to its freedom from insects; or, as chemists maintain, it may be owing to the power possessed by charcoal of *condensing* within its pores carbonic acid and other gaseous substances which are slowly yielded up to plants as they are required. But we are persuaded that charcoal does itself enter into combinations capable of being consumed by plants, either in the form of carbonic acid, or of some other compound. It is true that chemists regard charcoal as one of the most unchangeable bodies in Nature, and altogether incapable of entering into combination with oxygen at common temperatures. But at p. 24 of our volume for 1841, we have pointed out an apparent difficulty in the way of this supposition, and it is always to be recollected that the powers which are assigned to living bodies are far beyond those of the laboratory. Enthusiastic chemists may undervalue

* For the sake of simplicity we here speak of carbonic acid only; nevertheless we by no means exclude carbonic oxide and carburetted hydrogen from the gaseous matters capable of being decomposed by plants.

the vital principle, but the world will hardly go with them in doing so. They cannot decompose the earthy silicates with their most powerful solvents, but the feeble roots of a plant will do so with the utmost ease. We, therefore, regard the inability of man to make charcoal combine with oxygen or hydrogen as no proof whatever that plants cannot do so, and until some experimental evidence is produced to prove that plants cannot feed on charcoal, we shall believe that they can. In the meanwhile we may adduce, in support of our own view of this most important question, a statement just made by Mr. Rigg,* who expressly asserts that charcoal *will* combine with other elements at common temperatures. And this is only reasonable, considering the facility with which some carbonaceous compounds are decomposed; the charcoal being combined by Nature into carbonic oxide and carburetted hydrogen, which rush to the surface of stagnant water when the bottom is disturbed. Let any one push a stake into the mud of a wet ditch, and see what a vast quantity of air-bubbles rises immediately to the surface. Those bubbles are composed almost entirely of compounds of oxygen or hydrogen, obtained by the decomposition of matter, consisting in part of charcoal, and formed among the decaying matter in the mud.

"The opinion of Liebig," says Mr. Rigg, "that the charcoal employed by Lucas (in growing plants) underwent no change, is based upon the indestructibility of this body when prepared from heart-wood of large timbers, which, after having been kept for centuries excluded from the access of the atmosphere, has been found perfectly sound. But it is not so with charcoal made in the ordinary way, from the less valuable parts of timber when kept moist and exposed to the atmosphere. Charcoal of this description undergoes decomposition, and carbonic acid is given off."

"Lucas would lead us to infer that this was the case with those experiments which succeeded best; for he says, 'In order to ascertain the effects of different kinds of charcoal, experiments were also made upon that obtained from the hard woods and peat, and also upon animal charcoal, although I foresaw the probability that none of them would answer so well as that of Pinewood, both on account of its porosity and the ease with which it is decomposed.'"

The following experiment by Mr. Rigg favours the conclusion drawn by Lucas, and disproves the proposition of Liebig:—

"Fifty grains of charcoal, made from Elm branches nearly an inch in diameter was put into a twelve cubic inch bottle whose long neck was graduated into $\frac{1}{100}$ of a cubic inch. To this charcoal was added 400 grains of distilled water: the bottle was tightly corked, sealed, and placed in a greenhouse on May 26th. It remained in this situation, at a temperature varying from 60° to 90°, until the 6th of July, when the cork was drawn, and 1.1 cubic inch of carbonic acid was removed over mercury by caustic potassa.

"The bottle remained open for ten days, when it was corked down and placed in a similar situation, where it stood for 28 days, during which .58 of a cubic inch of carbonic acid had been formed.

"The bottle was again corked, and kept where the temperature varied from 36° to 60°. On drawing the cork, a portion of air made its escape, and there was .64 of a cubic inch of carbonic acid removed by liquor potassæ.

"From these we may conclude, that the charcoal employed by Lucas underwent decomposition, and furnished to the atmosphere carbonic acid; and hence the plants in these experiments might always be in a situation for exercising their influence upon this gas, and for being influenced by it."

Fortunately it matters little in practice whether charcoal acts beneficially on plants by forming gaseous compounds from its own substance, or by seizing them from the atmosphere, locking them in its pores, and then releasing them as plants require them for their food. That it does feed plants, and most abundantly, seems proved by evidence that cannot now be controverted.

Why then should not kilns be erected for converting into charcoal all the rubbish of gardens and all the thousands of loads of tan and sawdust now annually wasted, and thus another agent of fertility be added to the stock with which both gardeners and farmers have to work? But this opens a more extensive question which we cannot at present discuss.

Those who have pits heated by hot-water gutters will find, as we have already stated, that dampness will be a formidable enemy in winter. When *a b* are the gutters, and *c d* the surface of materials placed above them, the air will have no considerable motion, water will lodge on the foliage, and death will result with all soft and tender plants.

But Mr. Donald, the superintendent of the hot-

* Experimental Researches, Chemical and Agricultural, showing Carbon to be a Compound Body made by Plants and decomposed by Putrefaction. 8vo. Smith, Elder, and Co.

house department in the Garden of the Horticultural

Society, has ascertained that the moment the line *cd* is made to slope, as in the next cut, the difficulty is

overcome. By laying bare, or nearly so, the gutter *a*, which is the flow-gutter, and raising the covering materials gradually to *d*, a motion of the colder air takes place from *d* to *c*, while at *c*, the hotter air rises up to the sashes, follows them, and when cooled falls again to *d*, and this kind of circulation going on incessantly, all damping off is effectually prevented.

We have no doubt that this piece of information will prove useful to many persons, even although they may not have pits heated with hot-water gutters; for the principle has a far more general application.

"ONE-SHIFT SYSTEM" versus CENTRADENIA ROSEA.

In a recent Number *Centradenia rosea* is erroneously cited, as an instance of cultivation upon the "one shift" system. As the plant in question was under the writer's care during its early growth, he is well aware that the individual who quoted it could have had no interest in mentioning it as evidence in favour of the system; at the same time it is not to be considered at variance with the principles of that mode of cultivation. What that system produces is not necessarily a larger plant, but a more perfect and uniform growth within a shorter period. The mere size of a plant is no more to be cited in proof of its superior growth, than is any single element of the soils to which it has been subjected as the principal cause of its vigour.

Centradenia rosea is a most remarkable instance of structure being so fully subservient to the purpose of the cultivator as almost to dispense with the ordinary rules which are followed in securing superior growth. In proof of the distinction between this plant and others of comparatively easy culture, let us advert to *Hovea Celsi* and *Oxylobium retusum*, amongst many others, in the greenhouse—plants which, when planted in such materials as Nature has adapted them for, are not of difficult management; yet who has produced fine specimens of them without recourse to the rules of accumulated growth? In the stove we have *Ardisia hymenandra*, *Justicia coccinea*, and *Cerbera fruticosa*, in the style of which none are of greater interest; but where are they found grown in due and uniform proportions? They defy all ordinary modes of cultivation, and yet are proverbial for easy management, and for being capable of assimilating nutritive matter in a gross form. Amongst the commoner forms of vegetation, we have the genera *Lobelia* and *Verbena*—the former never seen in the state to which it is possible to bring it without recourse being had to artificial rules in its early stages of growth; the latter, on account of its pliant and naturally slender growth, capable of being brought into almost every form that nature or art can devise.

The foregoing instances are given in illustration of a structure which is unfavourable to that medium development of parts which is considered essential to fertility, and the attainment of which involves an application of the following principle:

Nature has given plants the power (under favourable circumstances) of producing from the bosom of each leaf, a branch which is capable of being rendered subservient to the formation of bloom; therefore it follows, that the proportion of bloom will, as a general rule, be in proportion to the multiplication of such branches, subject to the condition of their being produced within a given period prior to the season of bloom, and being duly exposed to the agencies which are essential to maturity of growth.

Amongst the occasional instances where a naturally-uniform growth forms an exception to the foregoing principle, *Centradenia rosea* is almost unequalled. Singularly elegant in its habit, it appears adapted to all the modifications of a medium temperature, thriving in a comparatively close frame or greenhouse in summer, and in the coolest part of the stove in winter,—preserving its beauty throughout the year; maintaining its compact and gracefully-expanding growth and deep purplish foliage in summer—covered with innumerable pink blossoms in winter and spring; requiring no artificial support, no process of art to induce uniform growth, no peculiar management above that of exposure to light, no special adaptation of soil, and never subject to the fluctuating condition of those plants in which a slow or rapid circulation of sap requires immediate attention if immediate loss is to be avoided;—this plant is, in fact, a striking adaptation of one of the most interesting forms of vegetation to the limited conveniences of art. The perfection of nature is seen in all its proportions, and, amongst plants, it is one of those best suited to give evidence in favour of any system of cultivation.

Those who have supposed that practice founded upon correct principles can be affected by the distortion of facts may be reminded that truth—though "hewn like

the mangled body of Osiris into a thousand pieces, and scattered to the four winds—shall be gathered limb to limb, and moulded, with every joint and member, into an immortal feature of loveliness and perfection."—*W. Wood, Pine-apple-place.*

EXPERIMENTS WITH MANURES.

THE following details of experiments with various manures, although on a small scale, may assist the readers of the *Chronicle* in forming an opinion of their relative strength. They were conducted under equal circumstances—or, in other words, "it was a fair race." The ground on which the experiments were tried is a deep and light sandy loam, of no adhesiveness, and has carried two or three crops a year for probably half a century.

Nos.	ONIONS.	lbs. oz.
1	Guano, 1oz. to a yard, 6oz. charcoal	7 8
2	" 2oz. " 12oz. " "	6 8
3	" 3oz. " 12oz. " "	8 8
4	" 4oz. " 12oz. sawdust	8 0
5	Nitrate, 1oz. " mixed with soil	8 8
6	" 2oz. " "	8 12
7	Good rotten horsedung, 1 inch	0 0
8	" cowdung, 1 inch	10 8
9	Humus from decayed Strawberry trimmings, 1 inch	9 0
10	" soaked in cows' urine	9 8
11	Cloacine, 1 inch, two parts sand	9 8
12	Fine bone sawings, 2oz. to a yard	10 0
13	" blended with clay soil	10 0
14	Guano, 6oz. to a yard	10 12
15	Nitrate, 6oz. to a yard	9 12
16	Wood-ashes, 1 inch	9 12
17	Guano, in indefinite quantity, probably 8oz. to a yard	11 8

N.B.—The last experiments overpowered the Onions as they came up, and the ground was transplanted over from other parts of the bed; nevertheless, they advanced beyond all competitors, although the transplanting would of necessity throw them behind the rest three weeks.

The next experiment was with Parsnips, and on ground as before, in precisely equal condition. It was as follows:—

Nos.	PARSNIPS.	lbs. oz.
1	Bone-sawings	27 8
2	Nitrate	28 8
3	Charcoal-dust	24 0
4	Pig's blood with sawdust	28 8
5	Cow-dung (old)	25 12
6	Horse-dung (old)	41 0
7	Guano	27 4
8	Cloacine and sawdust	34 0

N.B.—With regard to the proportions employed, they were not, as in the preceding experiments, weighed, but sprinkled in the drills according to their presumed power. This experiment took place under a pressure of business, or it would have received the same attention as the other. It is, of course, by no means conclusive; but may serve, in conjunction with other trials, to assist in forming an estimate of the relative strength of these manures. A kitchen-garden, however, which has carried two or three crops a year for the last half century, and received annual manurings, is by no means the fittest situation to try the effects of these things—full of humus, and *effete* in point of mechanical texture, the result must, of course, be very different from that on "maiden" or rest soils. There are, however, some crops which are termed "gross feeders," which, it would seem, are entirely independent of rest land or leys: such is the Mangel Wurzel, and such also the Drumhead Cabbage, with many others, of which the Mangel may be reckoned the chief. This root, as I have proved, providing it has a deep and free soil, may be produced on the same spot of ground for many years by annual manuring.

Now for growers of green crops it appears to me that composts might be made which would enable them to draw much less on the muck-yard, which in Agricultural matters is frequently wanted for the mowing, &c. To form such a compost, the bottom of old wood-piles, the dubbings or chippings of hedges burnt or smothered into ashes, saw-dust, cloacine which has some time been blended with saw-dust or other matter, and an old heap of manure in the state of humus, if well turned and mixed, and in the last turning some guano or other good and highly-concentrated manure added, would form an economical and highly efficient compost to put in the drills, for green crops in general; it could scarcely be applied wrong. The grand desideratum would be to have it all highly decomposed and well blended.

To return to guano and other concentrated manures: the best way to obtain a conclusive proof of their powers, would, in my opinion, be to try them on soils of three distinct kinds: viz., clays, sandy-loams, and peats; the two first would require four distinct experiments at least, viz., hand-tilled clays destitute of organic matter, and old rest clays, with a good thick sward, and the same with regard to sandy loams. In these it would be seen whether those powerful agents could in any way dispense with the necessity of fallows and rest.

I have been using guano in water rather extensively, after the rate of about half an ounce to a gallon, blended with dung-water, for some months, and I have an idea that it will be a most useful adjunct in gardening, more especially with the new and improved system of potting, so ably and cleverly explained by Mr. Wood in your columns, which are, in my opinion, (without pledging myself to all they contain,) some of the best things that ever appeared in any gardening periodical. Guano, I find by experience, (as might have been expected,) clogs up the interstices of the soil; therefore, if used regularly, the plants should have their soil prepared accordingly. I have a house of Camellias and Chrysanthemums, now in full bloom, with which I might challenge many establishments. These have had many scores of gallons of guano-water.—*Robert Errington, Oulton Park.*

CHINESE CHRYSANTHEMUMS.

THERE are few plants in cultivation more worthy of

attention than the beautiful varieties of *Chrysanthemum*. They adorn our greenhouses and conservatories at this time of the year, when everything else indicates their season of rest. Yet it seems strange that such plants should be neglected. In many gentlemen's gardens they are crowded all the summer in a corner, no matter whether shaded or exposed, if out of sight, and are left without any sort of care; so that in autumn, when they should display their beauty, they must be placed in a thicket of other plants, where their heads only can be seen, and they sometimes even serve for nothing more than a few cut flowers. Still people who treat them thus expect good plants, and wonder by what means others have succeeded so much better. If we do not sow we cannot reap—if we cultivate ill we cannot expect fine flowers. Were gardeners to adopt the following method they would meet with success, and be recompensed for their trouble:—

After the plants have flowered, cut them down to about three inches above the soil, and place them in a cold pit, where they can be protected from frost till spring. During this dormant state no water is required, but as much air in fine weather as possible. In the beginning of April select cuttings, not from the strong shoots that spring from the ground, but those produced on what remains of the old stem; the latter are always preferable, because they are short-jointed and not liable to damp off. When they are prepared pot them in light sandy soil, each cutting in a 60-sized pot, and plunge them in a slight bottom-heat. In the course of a month they will be rooted and ready to repot into 32s. At first give them light rich soil for the roots to run in, and place them in a sheltered situation, where they will be exposed to the sun. When they are established cut them down to within two or three inches of the soil; this will cause them to produce numerous lateral shoots and to become low bushy plants, which will save a great deal of labour in stopping them during summer. When they have recovered this check, repot them into 8-sized pots, where they are to remain fully exposed to the sun for the remainder of the season. The soil best adapted for the last shift is a compost consisting of loam, sandy peat, and rotten dung, in equal proportions and quite rough, and if a few pieces of potsherds are mixed through the whole mass so much the better. During the whole season of growth, watering should be attended to with great care; in fact, where the plants are thus fully exposed to the sun, too much water in dry weather can scarcely be given them.

There are some people, who, for the sake of a few good blooms, only allow one or two flowers to remain on each stem; but where a profusion of flowers is wanted, this system, which sacrifices two-thirds of all the bloom, is inadmissible.—*J. D.*

AMATEUR'S GARDEN.—No. L.

FROM the number of letters which I have received both from gentlemen and gardeners relative to the digging of Shrubbery-borders, and from the diversity of opinion which seems to exist regarding this, I feel disposed to resume the subject again this week. I will now show that as a matter of taste, shrubbery-borders ought not to be dug; neither ought shrubs to be intermixed with Herbaceous plants.

In planting a shrubbery, the object is either to form shady walks among fine trees, to hide unsightly views, or to form screens or shelter against strong winds. Suppose the principal object to be a love of trees, and a desire to possess large and perfect specimens: then it must be wrong to permit them to become so crowded as to destroy each other's form; and it is contrary to nature to dig the ground among them—because in Nature we never find them so situated—and though every pleasure-garden is, or ought to be, avowedly a work of art, we are not so artificial in our ideas as to wish to give every tree in it the appearance of having been placed there by art, as they must have if surrounded by dug ground; but, on the contrary, we wish to make them specimens of Nature in a refined and highly-cultivated state. These, in addition to smooth walks, we surround by smooth velvety turf, which forms a kind of connecting link between tree and tree, and collects them into groups, which, though it may not be exactly the kind of scenery a landscape-painter would make choice of for his pencil, is nevertheless a scene that would not be objected to. Now, although these remarks are offered on the supposition that a love of trees is the great exciting cause of their being planted, they are also equally applicable to the management of screens, shelters, or belts, because by attention at the proper time, it is quite as easy to form a shrub into a fine specimen, as it is to allow it to become an unsightly object.

The greatest objection that can be urged against dug ground, apart from its injurious tendency upon plants, is the disturbing of that repose or quiet, so necessary for the proper enjoyment of sylvan scenery. Herbaceous plants are objectionable, because they do not group or form an harmonious whole with trees or shrubs. Examine the paintings of all the great masters from Claude Lorraine to the present time, and you will scarcely find a flower in any instance—and why? because flowers will not group with trees and shrubs; and therefore their introduction would destroy the harmony of the composition.

My *beau idéal* of fine pleasure-ground scenery is trees perfectly formed, and as large as the maintaining of a proper collection will allow them to become, without being injurious to each other. A Persian Lilac, a Ribes, or Rhododendron, if properly planted and managed, will form a bush of from eight to ten feet high, and the same in diameter, in a period of from six to ten years;—but where do we meet with such plants?—not in crowded and dug shrubberies, but where the great elements of vegetable existence—light, heat, air, and water, can play their

proper parts, which is a clear proof that both crowding and digging are injurious.—*W. P. Ayres, Brooklands.*

HOME CORRESPONDENCE.

* * We trust to be able next week to clear off all arrears of Correspondence. In the meanwhile we must continue to trespass upon the patience of some of our friends.

Pine-Apples.—The large specimens of Pines lately raised by Messrs. Barnes, Murray, and Spencer, and the remarks made in a recent Number of the *Chronicle*, have occasioned a sensation amongst Pine-growers, which is far from being agreeable to those who seldom or never ripen off fruit above two-thirds of the size of those spoken of. In what I am about to say, I beg to state that I have not the slightest intention to detract at all from the merits of the respectable individuals alluded to, who I dare say are deserving the praise bestowed on them. But when we hear of some employers after reading the remarks in the *Gardeners' Chronicle*, expressing themselves dissatisfied with their gardeners who were previously thought to be completely masters of their profession, it behoves some one to say a word or two in defence of the old, and by far the most general, system of growing Pines to a moderate size; and having for a number of years had the management of Pines on a pretty extensive scale, I may, perhaps, be allowed to do so. In the first place, I contend that the production of a large Pine is, without other more direct evidence, no proof of a gardener's skill. A friend of mine in the north of England, who had grown Pines for many years with varied success, at length, some nine or ten years ago, produced a Providence Pine of the great weight of 11 lbs. and upwards (avoirdupois). Such a fruit, as might be expected, caused no small inquiry in the locality, and probably might be inferred as a proof of superior skill; while he, with a magnanimity which did him credit, acknowledged himself an inferior Pine-grower to three-fourths of those who never cut a fruit much above one-half of the weight. Such an assertion may appear singular, but is not the less true, and to those not acquainted with Pine-growing I may observe, that, whenever the plants are induced to continue their growth beyond a given period, and thus attain a large size before they show fruit, a large one may be expected. Such was the case just alluded to: several of his Pines did not fruit the season he expected, or rather wanted them, and the result was, that large fruit was produced—more in spite of his management than as a proof of his skill. From the above example it is obvious that much time and space were sacrificed, which, if more economically applied, might have probably produced double the weight of good useful fruit on half a dozen plants that might have stood in the place of the large one. There were several more large old plants, many of which did not mature fruit above three or four pounds weight, and which had remained twice as long in the fruiting-house as they ought to have done, to the exclusion of a more profitable set of plants. I do not insinuate that the case of Mr. Barnes's Pines is similar, yet if his heavy Pines are produced at a sacrifice of time and space—the two criterions by which I judge of a gardener's merit in Pine-growing—I must object to his system. Few will deny that three fruits of three pounds each are much better than one of five or six; and if his plants are very large, and not of quick growth, they may probably occupy double the time and also double the space of others which may arrive at half this weight. If such be the case, it is obvious, where particular reasons do not call for large fruit, that the smaller are more profitable by a hundred per cent., and perhaps more. But, on the other hand, if Mr. Barnes can produce on a given extent of beds and in the same space of time as many fruit averaging five and six pounds each as another good gardener of the old school can produce under the old way of management, or even if he be able to produce the same weight of fruit collectively, then, and only then, will I admit that his system is an improvement, and will be the first to adopt it. Such are my opinions of skilful Pine-growing, and such are those of the greatest bulk of practical gardeners, who do not grow them exclusively, or nearly so, for showing. I should therefore suggest that all forthcoming treatises on the Pine-apple should state exactly the collective weight of fruit the author has cut within a given period of not less than three years, below a given space of glass, or rather the superficial area of his beds, including nursing and succession pits as well as the fruiting-house. He ought also to be able to prove that no importation of plants has taken place to any extent, and also that the plants remaining at the termination of the stated period are as good as those were at the commencement of it; and he also ought to give some idea of the expense of the materials made use of, as the costliness of any plan is a great drawback in the very many places where economy is the ruling order of the day. If the writer, therefore, be able to answer all these queries satisfactorily, then will his system receive from a discerning public that support which its merits deserve, and be adopted in every place except the few (and I maintain there is but few) in which bigotry and prejudice put an effectual stop to all improvement. But there are many, very many places in which the limited assistance and scanty means within the reach of the gardener put it entirely out of his power to compete with his more fortunate neighbour; with him it is required to make the most of the little he has at command, and if his Pines only reach the weight of two or three lbs. they may perhaps have the recommendation of not costing his employer so much per lb. by 50 or 60 per cent. as those of his neighbours weighing five and six lbs., and he ought to be exempted from the odious character of being bigoted in a system when it is out of his power to alter it. I hope it will not be under-

stood that I mean to uphold an old against a new system; on the contrary, I wish to set both on an equal footing, and would like to hear the opinions of other practical men on the subject. I think there can be no fairer test of their respective merits than to proportion their respective weights collectively of good and useful fruit to the relative area of glass or beds that each occupy, and also the time necessary to bring it to maturity.—*A Practical Gardener, S. N. V.*

Pine-apples.—Mr. R. H. Pope cannot possibly have read the leading article in the *Chronicle*, p. 837, on my system of Pine-growing. If he had, it would at least have saved him all his calculations and erroneous deductions. Every gardener knows that the Pine grows much more rapidly in the autumn months than during the scorching heat of summer; and Dr. Lindley observes, "The Pine grows in the cool season." This fact is so well and universally understood amongst cultivators, that it scarcely requires to be noticed. It nevertheless at once refutes all Mr. R. H. Pope has advanced on this subject. I apprehend, however, that the Montserrat will prove to be the Black Jamaica, as I found in the North of England the former name generally substituted for the latter. This, if it is the case, does not in the least detract from the merits of Mr. Hamilton's productions.—*R. Glendinning.*

Tortoise, to keep in Winter.—Seeing in your last Number a question by "A Clergyman" as to the best way of disposing of a tortoise during winter, I beg to inform him that in every instance within my knowledge of tortoises being allowed to bury themselves either in the open ground or a heap of sand in a greenhouse, the poor animals have fallen a prey to parasitical animals; whereas they have lived many years in perfect health when enveloped in a mass of dry hay, and then sewed up in matting or an old piece of carpeting, or, what is better still, put in a hamper of dry hay in a dry place. If laid on its side, this admits of their crawling out at their pleasure.—*K. W. W.*

Kennedyia splendens.—In your Paper of last week you state there is no such plant as "Kennedyia splendens." I had a remarkably fine specimen a short time back under that name, received from one of the first London nurserymen. It is unfortunately dead. I inclose some of the dried leaves.—*E. R., Dec. 8.* [We can only repeat that this name is unknown to Botanists. The leaves appear to belong to *Zichya inophylla*.]

Van Mons Leon Le Clerc Pear.—This is the most choice of any I have ever tasted. It is superior to most Peaches, but will only last about one month—unless giving the trees different aspects will prolong its duration without destroying its flavour.—*J. Lecouleur, Jersey.*

Guano versus Bones.—In reference to a leading article in a late Number [we do not know what is alluded to by our correspondent] as regards Guano, it should be borne in mind that every ounce which comes to this country is paid for in manufactured goods, and not in gold; in Peru gold and silver are indigenous, (if I may be allowed the expression,) and consequently are not required in payment; but I suspect this is not the case with Bones from the Continent, which are, I fear, paid for in gold. I consider the above facts are of great importance, when our population is so badly employed.—*G. R., Halifax, December 8.*

Prof. Brande's Lectures.—In common with many other Members of the Royal Agricultural Society of England, I have recently had the pleasure of listening to Professor Brande's Lectures on Limes and Clays, and I bear my testimony to the ability with which the lecturer accomplished the task he so kindly undertook. I was especially pleased to observe the profound attention with which the chemical truths announced were received by the audience, and the deep interest they seemed to take in the various scientific statements made by the learned Professor. There was, however, one point in the lecture on clays which I think may perhaps mislead, if not explained—I allude to that very beautiful and striking experiment with the voltaic battery which had for its object the proving whether or no a clay contains alkali, i. e., potassa or soda. This mode, though singularly elegant, and furnishing to those who possess command of voltaic power a speedy and facile mode of arriving at a result, yet is it not so satisfactory, as regards correctness, as could be desired. We all witnessed the reddening effect of potassa and lime upon yellow turmeric paper; we also saw the same effect produced by subjecting a specimen of clay to the voltaic influence. In the latter case it was ascribed to the presence of potassa or soda in the clay—a sort of *experimentum crucis*. Certain precautions were, indeed, taken to prevent delusive inferences; for instance, the clay was thoroughly exhausted by the action of water, which, by dissolving the soluble saline substances, such as common salt, if any were present, would remove one source of fallacy. But supposing—which is very often the case—that the clay contained traces of lime, as carbonate or silicate, then the water would not remove them; and though the clay under examination might not contain an atom of potassa or soda, yet would the reddening effect upon the test-paper be produced. I do not suppose that the Agriculturist, in experimenting upon his soil, will often employ an extensive galvanic battery as a test for alkali; yet it is desirable that Chemists should be very accurate in their assertions and experimental deductions, for many eyes, intelligent and watchful, are upon their movements; and though they may be forgiven many agricultural mistakes, yet an error committed in their own particular department will not so soon be forgotten. This observation comes with more peculiar force just at the present time, when Agriculturists are beginning to feel some degree of confidence in Chemistry and Chemists.—*W. H. Potter.*

Dahlias.—The Dahlias enumerated by "A Subscriber" are some of the most uncertain bloomers in cultivation; and if he succeeded with them in the year 1842, the chances were that he failed in the following season. Sussex Rival I should not advise him to retain in a limited collection: it is seldom good, and is too small. Fanny Keynes never was, even at the best, more than a second-rate flower; it is of a common colour, and totally destitute of style or character. Ruby was a good flower in its time, but is quite gone by; it is too much quilled for the present day; besides, it is thin and wanting in colour. Egyptian King is a good flower when in perfection, but is very uncertain. Scarlet Defiance never was good, although it sometimes promises well early in the season; later, it becomes quilled, flat, and deeply-serrated on the edge of the petal. I noticed, during the year 1842, that every Dahlia, of which the colour had any tendency to scarlet, was deeply notched—indeed to so great an extent, as to give the petal the appearance of a saw; the indentures were, in some instances, more than a quarter of an inch deep. This did not happen to Dahlias of any other colour than red or scarlet; nor did it again occur during the season just past, even in the flowers in which it was most conspicuous during that preceding. I apprehend that any solution of this unusual, and to me inexplicable circumstance, is impossible; but it is clear that the colour of the flower, or whatever gives rise to it, made it susceptible of some influence from which flowers possessing other colours were exempt. Essex Rival is a very uncertain bloomer: it is never really full, and often single or semi-double. Hylas is a flower of good colour, and is firm and clean in petal; I have often regretted that it should be no better than it is, for, notwithstanding its defects, it possesses style. Metella was a good Dahlia, and is even now sometimes seen in good character; but I have seldom known it to be so bad as during the present year: the petal is, however, generally very crumpled. I have seen Conductor occasionally very beautiful, but this is very seldom: it is usually flat, much quilled towards the centre, and too uncertain a bloomer for a small collection. I have not grown the Bishop of Salisbury. The last Dahlia season was altogether the best in my recollection; but no doubt, in consequence of the very dry weather that occurred during the blooming time, in a sandy soil many would fail that might have done well enough in the same soil in a wet season. This would be especially the case with thin flowers, which would, under such circumstances, be thinner in petals than usual, and soon show the disc; whilst very double flowers would, from the same cause, more rapidly expand, and lose their scaly centres. Having now made free with the characters of "A Subscriber's" flowers, I would venture to recommend to him a dozen of which I think he will report favourably—some of them he no doubt possesses, viz., Turvill's Essex Triumph, Trenfield's Admiral Stopford, Smith's Sir R. Sale, Edwards's Mrs. J. Richardson, Thompson's Vivid, Widnall's Queen, Jackson's Lady Cooper, Hudson's Princess Royal, Bragg's Antagonist, Dodd's Prince of Wales, Mitchell's Mrs. Kelly, Keynes' Standard of Perfection. Essex Triumph is the flower that was so successfully exhibited at the meetings of the Floricultural Society of London. It is far from being faultless, but is constant, and one of the most desirable Dahlias grown; it is very globular, and always perfect in the centre; its defects are too great a length of petal, and want of substance in the back ones, which generally become flimsy or die before the bloom is in perfection; another fault is, that notwithstanding its fine dark colour, there is a silvery white hue over the face of the petal, that gives the flower a dull appearance. Adm. Stopford this year was the only rival that could successfully compete with Essex Triumph, and the best blooms I have seen were of the former; but this will not, I imagine, generally be the case, for it is not constant, and in less favourable seasons is not good in the centre; the petal is broad and bold, and the colour, though variable, is very good and glossy. Sir R. Sale is another flower approved by the Floricultural Society, and was proved to be one of the best of the season. Mrs. J. Richardson, a white and purple, was also submitted to the same test, and justified the opinion given of it; it is a very useful flower and one of the best of its class. Vivid, though not by any means a first-rate flower, is an acquisition, and the best scarlet we yet possess. Widnall's Queen is too well known to require comment, it is generally classed as a lilac, but is certainly nearer rose-colour than any other Dahlia at present in cultivation. Lady Cooper and Princess Royal are very beautiful when well grown, but are generally too hard and scaly in the centre. Antagonist, though uncertain, is quite an acquisition; the white is very pure and the petal good; the centre is the point in which it fails. Dodd's Prince of Wales is decidedly one of the best yellows, although the colour is not very pure, and the centre apt to be sunk; but the latter fault does not interfere with the globular form and general outline, and therefore does not detract much from its value. Mrs. Shelley was much exhibited last season, and was, with me, the finest flower in the garden; every bloom came perfect, save a little disposition to quill in the centre, which, increasing towards the end of the season, made the back of the petals too visible. Standard of Perfection is a new Dahlia; it is hazardous, therefore, to offer a very decided opinion upon it; it may, however, safely be stated that it possesses style and character of first-rate order, and although not a large flower was the most successful seedling exhibited in the present year, and was the only Dahlia of 1842 that was placed in the first class by the Floricultural Society.—*T. C. W.*

Picotees.—In some Picotees the stigma appears before the flower expands. Morris's Mary, red Picotee, and Martin's Victoria, yellow Picotee, are examples. The

pollen will adhere to the part protruded, and I have sometimes seen the flowers so treated fade away without ever opening, but no seed was produced; and whether they faded from fertilisation, or owing to the state of the weather at the time, may be doubted.—O., Leeds.

Digging Shrubberies.—I had hoped no one in the present day would have had the hardihood to support the so justly called absurdity of digging Shrubberies to benefit the plants, as a writer, under the signature of "Knave of Spades," has done in p. 843 of a late *Chronicle*. Although hardly worth while to answer the untenable arguments he has brought forward to aid his cause, it shall suffice to say that all practical men have long condemned the practice of digging round any tree, shrub, or herbaceous plant, if the trees, &c. root near the surface, and if you wish them to thrive. The fact of market-gardeners cropping within a foot of their fruit-trees says nothing in favour of the practice, as it is well known an opposite course would be better for their trees, and it reminds me of parties mowing over their Strawberry-beds in the autumn, and then digging between them, a practice justly condemned in this Paper lately. Herbaceous plants and annuals are never grown in perfection amongst shrubs, and are much better in detached groups by themselves; the appearance of shrubs where the turf reaches under their branches is much more natural, (Gardenesque, as Loudon would call it,) than where there is a dug border three or four feet wide in front of them, filled with half-starved perennials and annuals; and from the lack of knowledge the said "Knave of Spades" displays when speaking of the time it takes to lay turf, the expenses thereof, and the annual renewing of the same I would much advise him to see a little operation in that way before he writes again. And as the "Knave," in his inquiries about the decomposition of dung, appears to be retrograding instead of "going a-head," I would say (as a celebrated doctor used to tell his patients,) buy Dr. Lindley's "Theory of Horticulture," and read it.—*Obiter Dictum*.

Vegetable Vagaries.—Under this head you have already published in the *Gardeners' Chronicle* some curious instances of the wonderful freaks of Nature in transforming the flowers of one plant so as to resemble those of another, and I now present you with a sketch of a different kind of

metamorphosis which I conceive to be no less singular than many of the oddities previously recorded. It is that of *Aspasia epidendroides*, of which the accompanying sketch will give you some idea:—where the pseudo-bulb that was made last year after the plant had flowered, elongated into a sort of gouty stem, and formed two other bulbs, very much smaller than the old one but similar in character, with leaves on the crown and at the base of each, and at last terminated by throwing out a flower-stem from between the two leaves on the crown of the latest-formed pseudo-bulb, at the same time as the scape began to show itself at the base of the original one. The flowers on both are now in perfection, and have rather a singular appearance. Were the lower scape removed, it would almost puzzle one acquainted with the mode in which this plant usually flowers, to say what it is; as, although the flowers are those of *Aspasia epidendroides*, still the jointed sort of stem with the terminal scape give it a totally different character,—such as would nearly induce us to look upon it as being a distinct species, or at all events a very different plant from what *Aspasia epidendroides* is described to be.—W. B. Booth.

The Ash-Tree.—In the grounds here is an old timber Ash, which for many years has had one bough of a totally different character to the rest of the tree, or of any other Ash-trees which I have seen; being short-jointed and densely covered with foliage when in leaf. A few years back I directed my father's gardener to graft some of its young shoots upon some young plants in a plantation. The grafts took well, and I now have two of them in a very flourishing condition, strictly corresponding in growth and foliage with the parent bough. This year I grafted some more young Ashes, which have taken well. I think

I may venture to name it, on account of its exclusive character, "*Fraxinus Nectonensis*." I trust it will prove a desirable addition to our ornamental Forest-trees.—W. Mason, Necton, Norfolk. [We shall be much obliged by a plant of this, sent to 21, Regent-street.]

Winter Gardening.—I beg to differ from Mr. Beaton in regard to his remarks on the appearance of flower-beds in winter. I think a well-planned and neatly kept flower-garden will always look well, even though the beds should be empty, since in a well-arranged combination of forms there will ever be something to attract and amuse the eye, though the pleasing variety of colour be wanting. I do not think that flower-beds filled with "fictitious" dwarf shrubs will have a happy effect. I practise a different plan, and one which perhaps many would admire quite as much as though the beds were filled with the little boughs ever so neatly trimmed. I generally allow the summer crops to remain in the beds as late, consistently with neatness, as the season will permit; when these are removed the beds are dug over, raked, and all made tidy. I then refill the centre of them with Poppy Anemones, planted so as to keep the different colours distinct and well contrasted, and surround them with belts or edgings of Crocuses, Snowdrops, Jonquils, *Arabis verna* and *albida*, *Hepaticas*, *Squills*, *Aristea pusilla* [?] &c. The Anemones will bloom through the whole of the dreary winter months, and exhibit almost as gay a variety of colour as their summer brethren; in fact, I have been frequently asked if I had not put artificial flowers in the beds, and I have found it, until after close inspection, sometimes difficult to convince some persons to the contrary. No one can form an idea of the beauty of these charming little flowers, who has not seen them under proper cultivation. They are more particularly desirable for enlivening the cold and gloomy winter, but they will also continue blooming until April, and even when the flowers are cut from them they still keep throwing up fresh flower-stems. I usually take up the tubers in April, dry them and put them away in paper bags. In September, I plant them out in store-beds, and afterwards transplant them thence to the flower-garden when required.—J. L. Snow.

Glasgow Botanical Society.—This Society, which originated in the impulse given to the study of Botany in Glasgow, by the appointment of Dr. John Hutton Balfour to the Botanical chair in the University, and has been in active operation for a year and a half, agreed at its November meeting, to form a junction with the Glasgow Philosophical Society—an old and prosperous institution, of which it now forms the Botanical section, with its own office-bearers and regulations as before. The proposal for union came from the Philosophical Society, and was acceded to on account of the desirableness of concentrating the interest of the friends of science in one society.—Anonymous.

Fuchsia Exoniensis.—In a late notice of *Fuchsia Exoniensis*, the writer who condemns the habit of the plant cannot have seen a good specimen of it, for it is allowed by good judges to be as remarkable for its vigorous and graceful habit as it is conspicuous for the brilliant liveliness and superior size of its flowers. I may perhaps be travelling out of my own province, as an amateur, to mention this; but as I am well acquainted with this noble plant, I venture to say that candour and justice demand it.—A Subscriber, Exeter. [The flowers of this *Fuchsia* are doubtless the finest we have. As to its habit, we apprehend it is good under good management.]

Heating by Brick Flues.—I beg to state that the alterations suggested by "J. L.," at p. 772, respecting Brick Flues, are much opposed to my ideas on this subject. At that part of the house where the flue enters, the heat is always most powerful, and hence the impracticability of keeping up an equable temperature all over the house. "J. L." recommends the flue to be "enlarged as it recedes from the fire." But if this plan was adopted, it would diminish still farther the already reduced temperature, on account of the expansion which the air would suffer in travelling from the fire. "J. L." no doubt, knows that as air becomes expanded, its capacity for heat is increased, and consequently less heat will be evolved from it to the surrounding brickwork. This makes me doubt the utility of "J. L.'s" plan.—C.

Joining Earthenware Pipes.—With reference to the material employed in joining the earthenware pipes alluded to by me at page 693, and also by "W. B. H." and "J. M." at pp. 736 and 842; it consists entirely of good cement, which, with the whole apparatus, continues to afford great satisfaction. Several other gentlemen in this neighbourhood are fitting up pits after this method, and in the event of complete success attending the plan, you may probably hear from me again respecting it.—W. Hunt, Warrington.

Wasps.—In answer to J. Wighton's inquiry respecting the Wasps' nest in the Red-Currant bush, I beg to state that it was of the ordinary colour and texture of Wasps' nests, viz., a greyish-white paper-like substance. There is only one small hole at the bottom at which they enter; the Wasps left it about the end of September, they were the smaller size of the common Wasp.—A Paddy.

Wasps.—There is now (Dec. 4) in a shrubbery belonging to Richard O. Aldworth, Esq., Newmarket-house, county Cork, a Wasps' nest. The Wasps are as active and as busy, passing to and fro, as they would be in the month of July or August. I have been observing them for the last three weeks, and have seen no change in their activity. The nest is on level ground, under trees, and apparently in the rotten stump of a tree.—A. K.

Potter's Guano.—I assert without hesitation, that there were no crops in this neighbourhood equal to those in my kitchen-garden; and the effects upon the flower-beds and borders were perfectly astonishing. Although the season

was unfavourable, scarcely any of my annuals failed, and the number of plants was quite double what could reasonably have been calculated upon. This was owing to the use of Potter's Guano, which I received last Nov. (1842) just as I was making up my Pansy-beds. I used it upon them, and although my flowers were late, they were nearly all much larger than I ever had them before, and remained in full bloom longer than I ever recollect.—John Ritson, Sunderland.

PROCEEDINGS OF SOCIETIES.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

Dec. 7.—Earl Spencer in the chair. There was a much larger attendance this evening than on the previous one. Mr. Brance commenced his lecture by stating that previous to referring to the subject of clay, he should say a few words on the sulphate and phosphate of lime. Sulphate of lime was composed of sulphuric acid and lime; 46 parts of sulphuric acid were equivalent to 22 of carbonic acid, and these were combined with 25 of lime to form the sulphate of lime. Sulphuric acid is composed of sulphur and oxygen, just as carbonic acid is composed of carbon and oxygen, and sulphuric acid may be made by burning sulphur in oxygen. (Here the experiment was performed.) If we add lime-water to the sulphuric acid now made, a sulphate of lime, which is only slightly soluble in water, falls to the bottom of the vessel. Sulphate of lime is found native in the form of gypsum or common sulphate of lime, of anhydrous selenite, &c. It requires about 350 parts of water to dissolve it; but it is very common in the springs and rivers of this country. It is almost always found in blue clay, occurring in the form of crystals. These crystals are composed of 68 parts dry sulphate of lime, and 18 parts of water. Sulphate of lime has a great affinity for water. When the water is driven off, it forms what is called plaster of Paris. It exists in great quantities in the Paris basin; hence this name. When it is present in water, the lime may be detected by means of the oxalate of ammonia, and the sulphuric acid by means of baryta. Sulphate of lime under certain circumstances is decomposed, and some of the oxygen being abstracted, the sulphur unites with hydrogen, and sulphuretted hydrogen is formed. This is said to be the case with the waters of the ocean off the coast of Africa. Now, it is found that many plants require sulphur; such as Horse-radish, Mustard, &c., and seem to owe their acid properties to this principle. The sulphur contained in plants, then, is probably owing to the decomposition of the sulphates in the soil. Sulphate of lime is found in the primary, secondary, and tertiary formations, and is very abundant in the neighbourhood of Paris. The use of sulphate of lime in Agriculture is very considerable. In the first place it decomposes organic matter, but whilst it does this it does not attract moisture from the soil. In many plants it is found to exist in very considerable quantities, especially in Clover, but it does not exist in Wheat and Peas. Plants that contain it will not grow well unless it exists in the soil. Some plants require chloride of sodium or common salt; Wheat requires phosphate of lime. Before plants can appropriate sulphate of lime it must be rendered soluble. If it already exist in a soil, no good will arise from adding more of it. The beneficial effect of peat-ashes on a soil depends on their containing a considerable quantity of sulphate of lime. It also exists in the ashes of common coal, and the value of these ashes as a top-dressing for grasses may be thus explained. A great question about gypsum has arisen—does it fix ammonia? Carbonate of ammonia, which is a very volatile salt of ammonia, when it comes in contact with sulphate of lime in solution, will decompose it, and the consequence will be a carbonate of lime and a sulphate of ammonia, by which means the ammonia exists as a less volatile salt; but we must not infer from this that if we sprinkle dung-hills or the bottom of stables with sulphate of lime that it will fix the ammonia that is constantly escaping from these places. This action may be seen in the following diagram:—

Carbonate of Lime, 50.	
Carbonic acid, 22.	Lime, 28.
Carbonate of Ammonia, 39.	Sulphate of Ammonia, 57.
Ammonia, 17.	Sulphuric Acid, 40.

The next salt is the phosphate of lime. It is obtained chiefly from the bones of animals, but in order for it to exist there it must have come from the Vegetable Kingdom, and vegetables must have it from the soil. The ultimate constituents of this salt are phosphorus, oxygen, and calcium. The phosphorus unites with oxygen just in the same manner as carbon and sulphur to form an acid, and when burned in oxygen exhibits the same phenomenon. (Here phosphoric acid was formed by burning phosphorus in oxygen gas.) 42 parts of lime and 36 of phosphoric acid constitute 78 parts of phosphate of lime. The soil gets its phosphate of lime from artificial manures and from the bones of animals. Bones consist of two parts, an earthy part and an animal part. The earthy part may be dissolved away from the animal by a dilute acid, and the animal part may be driven from the earthy by fire. The earthy part is composed almost entirely of phosphate of lime. Even in fossil bones the animal matter remains, as Dr. Buckland proved by making soap of some Hyena's bones he had found fossilised. When bones are exposed to the air they gradually lose their animal matter. It had been found that the fossilised excrement of animals, which geologists call coprolites, contained phosphate of lime, and these would be probably to a certain extent available for the purposes of Agriculture; but the lecturer could not go the length of Prof. Liebig, in thinking that any amount of these fossilised coprolites that might be found in this country would equal in importance our beds of coal. Guano is a substance that contains phosphate of lime, and it is probably that ingredient which renders it so important as a manure. It exists, to a certain extent, in minerals, and is found in Devonshire associated with the tourmaline. It had also been found in Bohemia, and existed in considerable quantities in Estremadura, in Spain. It is perhaps a question as to whether it would not be worth working in Spain. As was stated in the last lecture, it exists in the Brighton chalk. It also exists with phosphate of alumina in clay-slate, and is present in most slates. Liebig states that phosphate of lime is of more importance in Wheat crops than any other. Bone manure is a ways found beneficial for Wheat. It has been proposed to add sulphuric acid, or, as it is commonly called, oil of vitriol, to bones, before using them as manure. The advantage of this is that the oil of vitriol, not only decomposes the animal matter of the bones, but dissolves the phosphate of lime, and thus enables the plants to take it up more rapidly. There is a considerable quantity of phosphate of lime in hay and Oats, and this will account for its existence in the excrement of horses, which is a valuable manure. The substance called clay is composed of various materials, but all the varieties of this substance contain argil or alumina as their basis. If potash is added to a solution of common alum, a white precipitate falls down, which is alumina, the basis of clay. It is the alumina which gives to clay its plasticity and those other properties which it possesses. Alumina has a great affinity for water, and also for organic matter. It fixes, as it were, organic matter. If a vegetable infusion or dirty water be passed through clay, the alumina arrests the impurities, and clean water passes through. Alumina is also soluble in acids and alkalis. In addition to alumina, clay contains varying quantities of silica. Silica is seen pure in nature in rock crystal, the amethyst, common

flint, the chalcedony, &c. Sand also is composed of silica. It is insoluble in water, and with one exception in acid. When silica and potassa or soda are heated together they form a substance known as glass. These glasses may be of varying kinds, and some are of a nature to be soluble in water. It is in this way that the old "liquor of flints" was made. When silica is thus in solution it may be thrown down by the addition of an acid in various forms, sometimes as a jelly, and at others as hard as flint, according to the quantity of alkali in which it is dissolved. It is by means of this soluble power of the alkalis over the silica that plants are enabled to take this substance into their interior, and to appropriate it to the building up of their whole fabric. Besides silica and alumina, clay contains potassa, soda, limestone, and other substances. Silica mostly preponderates in clays; a clay composed of 60 silica and 40 alumina is called a strong clay. All the varieties of marl, loam, &c., consist of these ingredients, in varying proportions with other substances. The physical properties of soils are very materially affected by the quantity of clay they contain. Salts of soda and potassa exist in all clays, but are somewhat difficult to detect. A solution of the clay may not produce any effect on test papers, but if the clay is submitted to the action of the galvanic current the alkali is soon developed. (This experiment was performed with the aid of the galvanic battery of the Royal Institution.) It is often of importance to add lime to clay, as by this means the alkalis of the clay are developed. It is of importance to mix clay and sand together, as the sand furnishes silica, which, being dissolved by the alkalis of the clay, renders the taking up of that body more easy to the plant. The lecturer apologised at the conclusion of the lecture, on account of its imperfect character. He hoped the time was come when the soil of scientific research, in connexion with Agriculture, which had so long lain fallow, was now about to be cultivated, and would yield an abundant harvest. At the conclusion, P. Pusey, Esq., M.P., proposed a vote of thanks to the lecturer. Every day was demonstrating the importance of Chemistry to Agriculture; at the same time care must be taken that the Farmer was not led away by specious theories, and led to expect much more than could ever be realised. The Duke of Richmond, in seconding the motion, stated that, as one result of a chemical theory applied to the practice of Farming, he had tried on a piece of land of his own the oil of vitriol and bone-dust as recommended by Liebig, and the consequence was, that he had obtained a larger crop of Turnips at a cheaper rate than he had ever done before. He should publish the particulars of this case, and would only state that he had thus spent only 11s. an acre for manure, and had obtained 12 tons of Turnips; whereas in former cases he had spent 3l. per acre on manures, and had got only 11½ tons of Turnips per acre.

Dec. 9.—The Members held their Half-yearly General Meeting at the Society's house in Hanover-square—the Right Hon. Earl Spencer, President, in the chair. The Duke of Richmond, and a number of other gentlemen, were present. "Although," said Lord Spencer, after having opened the proceedings with a few general remarks, "we have received during the past year a large accession of members, I am sorry to say that our financial affairs are not in a favourable state. It should be borne in mind that our annual country meetings, though necessary, are very expensive to us. For instance, the Derby Meeting this year was productive of a loss to the Society, after allowing 1,195l. to be distributed as prizes, of between 1,600l. and 1,700l. This, it is seen, is one great means of our outlay; yet that outlay is unavoidable. The show-yard and dining rooms at Derby cost a large sum, but unfortunately they were not filled. At Southampton, next year, I trust we shall not be in such difficulties. The amount of arrears has, I am glad to say, been very much reduced since last year. As a corporate body, we have now a legal right to sue for all these debts; but really it is due to the Council of this Society to say that they have not proceeded to Council in this matter in any one instance. Still, if these arrears be not paid up, we must take means to have them settled. I have no doubt that, in many instances, these debts may to our funds have arisen from negligence. However that may be, I trust to see more attention in future. I shall not detain you longer, but shall call upon the Secretary to read the Society's Report." A long report was then read, but of this we can only find room for the following more important points to which it adverted. It was stated that the Council and Members of the Society, as well as the implement-makers and public at large, experienced considerable disappointment at the Derby Meeting, that they were deprived of the opportunity of witnessing a trial of implements on lighter soil than that at Rough Heaton, on which the heavy land implements were worked, and the Council have taken every measure which they think best adapted to prevent the recurrence of a similar disappointment. The Council have appointed Mr. Parkes to be the consulting engineer of the Society, to be remunerated, when employed in that capacity, either by the Council, from the funds of the Society, or by individual members, at the usual rate of professional charge. In addition to Mr. Parkes, as the consulting engineer of the Society, the Council have decided that a greater number of judges of implements, including practical farmers, shall be appointed; also that the exhibition of implements on the Tuesday and Wednesday previous to the principal day of the show shall be open at half-a-crown on each of those two days, instead of at five shillings as heretofore. The Finance Committee have also laid before the Council the following statement of the arrears of subscription at the present time, in comparison with their amount at the last December meeting:—

Total amount of arrears in December, 1842	£3705
Do. do. do. in December, 1843	1014
Total amount of arrears paid or discharged during the last 12 months	£2691

The following were stated to be the exact members of the Society—108 Life-Governors, 193 Governors, 434 Life Members, 6115 Members, 13 Hon. Members: total, 6863.

Mr. Cottam said, with the noble chairman's permission, he had a suggestion to make to the meeting, of interest. It was evident, he intimated, that those who had gone through the various show-yards of the Society must have been pleased with the mechanical skill therein observed. The Society had given great support to Agriculture in general, yet he (Mr. Cottam) was firmly convinced, if gentlemen would turn their attention more to implements, the Society would obtain great benefits. He (Mr. Cottam) considered that the machine-makers were not exactly represented at the Council. At Derby several little difficulties arose, but which might have been wholly avoided had the subject been better understood by the Council. What was required was, that the machine-makers be heard "at the bar" of the Council, by some one being called upon to represent them. He hoped he was not asking too much. Doctor Buckland pressed forward the necessity of mechanical science in Agriculture, but the machine-makers had never had a powerful organ to make known their plans. It was evident that more attention should be paid to Mechanics; of their value he required only to refer to what had been accomplished by Mr. Smith, of Deanston, and Earl Ducie (applause). He (Mr. Cottam) was confident that a lecture on Mechanics would be attended with beneficial results. Mr. Pusey then said a few words, and thanks having been voted to the chairman, the meeting concluded.

LUTON HORTICULTURAL SOCIETY.

The Committee of this Society think it due to its patrons and supporters to close the second year of its existence with a Report of their past proceedings; and in doing so they have to perform a task pleasing to the public and themselves, as the career of the Society has been, up to this time, one of uninterrupted prosperity. They have not to leave on record the failure of their attempts, nor the fact that their Institution has led on a languishing existence; on the contrary, the most sanguine wishes of its originators have been more than realised, and the

Committee deliver up their trust in a healthful and flourishing condition. Since the establishment of the Society in the commencement of the year 1842, five exhibitions have been held, which have attracted considerable attention, and conferred a large amount of innocent pleasure on the public. The sum of money received for admission to these exhibitions is 507. 12s. 10d., which, including the free admissions by members' tickets, presents the large number of 2200 visitors. The great interest thus excited has been owing, in part, to the Shows having been held in the gardens of gentlemen, who have on those occasions liberally thrown them open to the Society. This is a feature which the Committee trust the Society will always present, as they think it one admirably adapted to promote its interests. They have much pleasure in knowing that other gentlemen, having attractive gardens, are ready to follow the example so nobly set by those just alluded to; and a guarantee is thus afforded that the attractions of the Shows will not speedily be exhausted. The present opportunity is embraced of thanking F. and C. Burr, Esqrs., for the use of their gardens, and R. Vyse, Esq., for the use of his warehouse for the purposes of the Society. As the direct object of an Institution like this is to forward the general interests of Horticulture, and to encourage cottagers in the culture of their gardens, it will be proper to state to what extent these ends have been secured. The Committee appeal to the exhibitions for proof that energies have been called into play which before were dormant; and that a higher order of Horticultural taste has been elicited; as much, indeed, has been accomplished as could reasonably be expected in the narrow compass of two seasons. With regard to cottagers, the same observations may be justly made. Each successive Show has engaged more attention on the part of labourers in handicraft and husbandry, and in some cases prizes to a considerable amount have been taken. For example, during the present year Samuel Garratt has received 17s., Joseph Fletcher 23s., Joseph Hunt 17s., and Thomas Arnold 12s., besides many smaller prizes. At first, the purposes contemplated by the Society with regard to cottagers were little understood by them, and even now they are but imperfectly comprehended. It has been the wish of the Committee to give every facility for the practice of Horticulture to this interesting class of society, and they voted early in the year 100 copies of "Paxton's Gardener's Calendar" for their use. That valuable little work could not then be obtained, but it is now reprinting, and will be put in circulation as early as possible. It may thus be fairly presumed that the Luton Horticultural Society has answered the direct end contemplated at its formation, and has silently improved the practice of gardening. One result of a collateral character has undoubtedly been obtained, that is, the promotion of kindly feelings among all parties in the town and neighbourhood; who, forgetting among the gentle scenes of nature the differences of public life, have found a pleasure not soon to be forgotten; a pleasure procured without the sacrifice of principle and followed by no regret. The Committee therefore feel they are justified in asking for this Institution the continued support of its patrons; and they conclude by enforcing their appeal by the following elegant tribute to the value of the pursuits they are anxious to encourage:—"The cultivation of flowers, is, of all the amusements of mankind, the one to be selected and approved as the most innocent in itself, and most perfectly devoid of injury or annoyance to others; the employment is not only conducive to health and peace of mind, but probably more good will have arisen and friendships have been founded by the intercourse and communication connected with this pursuit, than from any other whatsoever. The pleasures of the Horticulturist are harmless and pure; a streak, a tint, a shade, becomes his triumph, which, though often obtained by chance, are secured alone by morning care, by evening caution, and by the vigilance of days—an employ which in its various grades, excludes neither the opulent nor the indigent, and, teeming with boundless variety, affords an unceasing excitement to emulation, without contention or ill-will."

cation. The present work is a report by Mr. Cooper of Professor Owen's Lectures on Comparative Anatomy, delivered at the College of Surgeons in London; and to all who know the importance of his labours in the vast field of comparative anatomy, this work will be hailed with delight. The present work treats only of the anatomy of those animals which are called invertebrate, and which are characterised, with many other important structural features, by the absence of a back-bone. To this division of the animal kingdom belong the animalcules, sponges, polypes, star-fishes, snails, worms, insects, spiders, and crabs.

These lectures, although delivered to medical men, contain a vast amount of matter interesting to all who would wish to know something of the wonderful laws which govern the structure and functions of animated beings. We can also recommend them as being admirable examples of the application of the principles of inductive science to the study of organised matter. In the introductory lecture are many just remarks on the classification of animals which apply with equal force to that of plants.

The following remarks in answer to the question "What is the use of animalcules?" are, we think, new and worthy attention.

"Consider their incredible numbers, their universal distribution, their insatiable voracity; and that it is the particles of decaying vegetable and animal bodies which they are appointed to devour and assimilate.

"Surely we must in some degree be indebted to those ever active invisible scavengers for the salubrity of our atmosphere. Nor is this all: they perform a still more important office, in preventing the gradual diminution of the present amount of organised matter upon the earth. For when this matter is dissolved or suspended in water, in that state of comminution and decay which immediately precedes its final decomposition into the elementary gases, and its consequent return from the organic to the inorganic world, these wakeful members of nature's invisible police are everywhere ready to arrest the fugitive organised particles, and turn them back into the ascending stream of animal life. Having converted the dead and decomposing particles into their own living tissues, they themselves become the food of larger Infusoria, as the Rotifera, and of numerous other small animals, which in their turn are devoured by larger animals, as fishes; and thus a pabulum, fit for the nourishment of the highest organised beings, is brought back by a short route, from the extremity of the realms of organic matter.

"There is no elementary and self-subsistent organic matter, as Buffon taught; the inorganic elements into which the particles of organic matter pass by their final decomposition are organically recomposed, and fitted for the sustenance of animals, through the operations of the vegetable kingdom. No animal can subsist on inorganic matter. The vegetable kingdom thus stands, as it were, between animal matter and its ultimate destruction; but in this great office plants must derive most important assistance from the Polygastric Infusoria. These invisible animalcules may be compared, in the great organic world, to the minute capillaries in the microcosm of the animal body, receiving organic matter in its state of minutest subdivision, and when in full career to escape from the organic system, and turning it back by a new route towards the central and highest point of that system."

The lectures on insects are full of interesting matter, especially that part of them which treats of the structure of those pests in our gardens and fields, the plant-lice. By the following figures our readers will at once see the practical importance of destroying these insects as soon as they make their appearance.

"The Aphis lanigera produces each year ten viviparous broods, and one which is oviparous, and each generation averages 100 individuals.

1st generation	1 aphid produces	hundred.
2d	100	ten thousand.
3d	10,000	one million.
4th	1,000,000	hundred millions.
5th	100,000,000	ten billions.
6th	10,000,000,000	one trillion.
7th	1,000,000,000,000	hundred trillions.
8th	100,000,000,000,000	ten quadrillions.
9th	10,000,000,000,000,000	one quintillion.
10th	1,000,000,000,000,000,000	

"If the oviparous generation be added to this you will have a thirty times greater result."

In the remarks on the order Diptera, the importance of the larvæ of the flesh-fly as a consumer of putrid animal matter is alluded to. "Insignificant, indeed," says Prof. Owen, "do these larvæ seem to be in the scale of Nature, yet Linnæus used no exaggeration when he averred that three flesh-flies would devour the carcase of a horse as quickly as would a lion. The assimilative power is so great in the meat-maggot that it will increase its own weight two hundred times in twenty-four hours."

The remarks on the structures and habits of bees and wasps, the silk-worm, and the various kinds of spiders, are interesting, and many of them new.

We cannot conclude this brief notice without referring to the last lecture, containing a discussion on the law of unity of organisation, as well as other general expressions as applied to the animal kingdom, in which the great knowledge of the lecturer is brought to bear in the analysis of those great facts by which our knowledge of the structure and functions of both the vegetable and animal kingdom is so rapidly increasing. The work is copiously illustrated with neat wood-cuts from the diagrams used at the lectures, and the whole has undergone the revision of Professor Owen himself.

Strachan's Agricultural Tables. Simpkin, Marshall, and Co. London.

We have received a neatly-got-up little volume, by Mr.

James Strachan, which is what it professes to be, "A new set of tables for computing the weight of cattle by measurement; the quantity of hay in ricks of different forms; the value of land, &c.; the measurement of drains and dunghills; also a few other practical tables; with rules, examples, and directions for using the tables."

To all farmers who are at all in the habit of making quantitative memoranda of their proceedings, but especially to those who adopt the sensible plan of paying by the piece for work done, not by the day, this little volume will prove a valuable assistant.

THE NATURALIST'S CORNER.

(Continued from page 864.)

69. *Ravages of Wild Boars in Vineyards.*—The Rev. J. Hartley, in his "Researches in Greece and the Levant," has given a very interesting illustration of the passage in the Psalms respecting the ravages of the wild boar in vineyards. He says, "The propriety of the image in the 12th verse of the lxxxth Psalm must be familiar to all who have visited Grape countries; but the force and beauty of the figure derived from a practice connected with the natural history of the wild boar has probably been seldom observed. My friend, the Rev. Mr. Leves, was proceeding in the dusk of the evening from Constantinople to Thessalonica; passing a vineyard, he observed an animal of large size rushing forth from among the Vines. The Greek syrogee, who was riding first, exclaimed, 'Wild boar, wild boar!' and really it proved a wild boar, who was retreating from the vineyards to the woods. 'What has the wild boar to do with the vineyards?' exclaimed Mr. Leves. 'Oh!' said the syrogee, 'tis the custom of the wild boars to frequent the vineyards, and to devour the Grapes.' And it is astonishing what havoc a wild boar is capable of effecting in a single night. What with eating, and what with trampling underfoot, he will destroy an immense quantity of Grapes. With what fatal propriety does this affecting image retain its force, up to the present moment! Still is the Vine of Israel broken down, ravaged, cut down, burnt with fire."

CALENDAR OF OPERATIONS for the ensuing week.

It was about this time three years ago that I first proved the efficiency of brick gutters, and except reducing the depth of water with which I commenced, I have had no reason to make any alteration in them since, and, judging from present appearances, I see no reason why they should not endure as long as bricks and cement used in any other way would. I may also state, as I am writing in answer to inquiries on the subject, that I am not aware of any improvement having been effected in the construction of gutters, with the exception of one arrangement, adopted at the garden of the Horticultural Society, mentioned in a late Number. "A piece of stone pierced with two holes, to which union-screws are secured," has been built "in the end of the water-gutters next the boiler. To these union-screws the flow and return-pipes are afterwards adjusted." This improvement does away with the only difficulty in making these gutters or tanks. Any good bricklayer will put bricks together in any way you direct him, but many persons have failed in making a sound joint where the flow and return-pipes pass into the gutters. If I had to fix these gutters for a greenhouse, or any house to be kept at a low temperature, I would prefer thin slate covers, say half-inch thick, with holes over the return division, to let out vapour when wanted, and the holes to be covered with pieces of the same slate, when dry heat was necessary; heat will pass through these slate covers faster than through tiles, and they are as impervious to moisture as cast-iron pipes; but for Pineries, or any house kept at a high temperature, or where a fire acts in the same house, tile covers are better, as there is some moisture constantly passing through them, counteracting the effects of dry heat. One of the best samples of early Grapes exhibited at the last May show at Chiswick was produced by gutters with tile covers along the front, and with a flue at the back of the house. These Grapes were ripe in April, but for reasons I need not mention they were not entered for competition. The gardener who produced them has obtained first prizes for Grapes and Pines for many years, and he agrees with me that it is extravagant to do away with flues where gutters are introduced. Since the power of erecting tanks and gutters has been placed in the hands of the gardener, I have advised my friends in private to retain flues along with gutters, but owing to the just prejudice—if that be a proper phrase—against flues, I said nothing about them in public until facts could be produced to warrant me to do so, and I am in possession of many such facts. I have two letters complaining that "nothing can be done at present" with gutters recently put up, "owing to the great dampness they create." Where these gutters are made late in the autumn there is always more or less annoyance experienced from them during the first winter, owing to this dampness, until the work becomes hardened. A friend lost a crop of forced Roses last winter with recently-built gutters, but this winter he says, "nothing answers better." I have repeatedly this season recommended parties to make use of a small flue along the front of pits, heated from below by Mr. Rendle's tanks, to afford top-heat; the top of the flue may be level with the top of the tank or with the top of the soil in the bed, leaving a small space open on each side of the flue. The flues might be covered with slabs of Caithness stone, which may be had from stone-cutters in all our great towns nearly as cheap as the old earthen tiles formerly in use. This stone is thus spoken of by an Edinburgh architect in the 1st vol. of the "Architectural Magazine," page 71. "I have heated a portion (of this stone) red hot, and quenched it in water without its cracking or appearing to lose its peculiar tenacity. It is found of all thicknesses, from $\frac{1}{4}$ inch to 3 inches, and is so strong at 2 inches thick that no accident which can occur in ordinary cases could injure a square of 30 inches, or even 3 feet." These are the right covers for flues. I see Mr. Paxton uses stone covers for his flues, but I forgot to ask him where he procured them.

I.—KITCHEN-GARDEN AND ORCHARD.

In-door Department.

PINERY.—The greatest weight of fruit from a given space of house-room is the most profitable, and therefore the best mode of growing Pines, after all. Although Mr. Knight never produced a Pine much above 4 lbs., he packed his plants so close together that he always had a great weight of fruit in a small space. I am indebted to one of the best Pine growers near London for a long memorandum on this subject; he grows his plants with bottom-heat from leaves, and says, "I am persuaded there are more Pines injured by too much bottom heat than by too little of it. I shall never fruit another plant in a pot as long as I can get plenty of leaves; as soon as they show fruit I shall turn them out of pots into beds of half-decayed leaves, supplying their after-wants with stimulating liquids. Last year them out in a two-year-old bed of leaves, and only supplied them with the syringe afterwards; they produced fruit from 2½ to 3 lbs., and by the time the suckers were ready to take off they were

much larger than the mother plants." This is always the best way for young beginners, if only to get into a stock of large healthy suckers, which is "half the battle" in Pine-growing.

VINERY.—Early forced Vinerics require more caution at this season, as regards heat, than when they are begun early in spring. Our earliest house here was shut up three weeks since, with a few barrowfuls of horse-dung introduced to create a moist atmosphere; the heat from the dung is not strong, and we have had no reason to give air since, the thermometer not passing above 60°. We shall go on very slowly with it until the eyes are all broken, and even afterwards we need not force much, as the Grapes. I have seen Grapes ripe early in May from houses shut up on the 1st of January, and even later, but the plan is not to be recommended.

PEACH-HOUSE.—The Peach and Cherry, and probably all the stone fruit, are more susceptible of injury from sudden variations of temperature than other kinds of fruit-trees. If the change should happen to be to a higher temperature so much the worse. Rather let the thermometer fall below 35° at this time than see it above 55°, even with sun heat. A few degrees on either side of 45° will do with fire heat for another week or so. Let the house, or rather the atmosphere, be kept moist, but avoid syringing the trees much if they have been painted over to clean them from insects.

CUCUMBERS.—The plants which are to produce prize fruit should now be encouraged by strong heat, plenty of air, and a rather moist atmosphere, and all flower-buds or fruit should be rubbed off until the end of this month. I believe that the judges at Ipswich are to be very particular this season about having the fruit in a fresh state. It must be cut only a few days before the exhibition, which will take place on the 8th of next February. I see by the circular of this Society that Mr. Mills, Mr. Latter, and some other first-rate growers, are to have a "sweepstakes" on that day, besides the regular competition, and I suppose any grower may join them, but I know little about this kind of competition.

Out-door Department.

In continuation, I shall this week offer a few remarks on Vine-borders. When a border is finished in the best manner, say the proper soil and drainage, with a bottom so hard that no roots can pass through it, young Vines, propagated the same season, or the preceding one, may be planted; the shoots will grow to the top of the house the first season, and the roots will strike downwards almost perpendicularly until they are stopped by the drainage or hard bottom; afterwards they will push horizontally along the bottom to the extremity of the border, and in time these first roots become the great reservoirs for the sap, sending out secondary roots all over the border to collect nourishment. Now how much better would it be, if, instead of lying along the bottom of the border, these large roots were within 6 or 8 inches of the top, and sending down feeders to take back the richness of the border, which is washed down by successive rains. Other fruit-trees garden their roots are spread near the surface, and if they get too luxuriant afterwards they are root-pruned or taken up again, to bring their roots near the surface. Not so, however, with the Vine, and hence the many complaints you hear about it. There are some soils, aided by situation, in which the Vine will grow and produce fine fruit for many years without much preparation or scarcely any drainage. I once knew an Esperino which in any shape for 14 years, and yet produced abundance of fine fruit all that time on an open wall; the fruit of this Vine was often sold at a fashionable watering-place as "the best hothouse Grapes," at from 3s. to 5s. per pound, in October. The shoots were arranged after Speechly's manner—a long arm right and left, from which upright shoots were trained for bearers.

(To be continued.)

II.—FLOWER-GARDEN AND SHRUBBERY.

In-door Department.

STOVE.—It is now fully acknowledged on all hands that a high temperature in winter is injurious to stove plants; and it is no less injurious to have the atmosphere too moist with a low temperature at night—hence the practice of watering early in the day. If you have any stove climber or shrub planted out in beds or borders which you wish to move to another situation to flower next year, this is the best time to begin to prepare such plants for the change. Dig round one side, and get up the half of the roots; place them near the surface, and fill in about them with sand, peat, and leaf-mould; give them a gentle watering, and in six weeks they will have made new roots to feed the plant, then you may take up the other half of the roots and treat them in the same way, and on any rainy day in March or April your plant may be bottled or transplanted anywhere else without sustaining any injury. I have often removed climbers 50 feet long and branched in all directions in this way without diminishing the growth the following season; and I am now repeating the experiment with Passion-flowers, Beaumontia, Allamanda, Echites, &c.

GREENHOUSE.—The best way I know for getting up a stock of pot climbers for exhibition in the shortest time is to plant young plants of them in the borders for a year or two, encourage them to grow as much as possible, and then take them up for potting, as in the above paragraph.

CONSERVATORY.—I am indebted to Mr. Waterer for the following memorandum respecting the "best earliest and second early" Azaleas for forcing for the Conservatory, not including *pontica mutabilis*, and Taylor's red. For succession: *pontica aurantiaca cuprea*, radiata, *monstrosa variabilis*, *aurantia nova*, force better than American plants or are less injured by the ordeal.

PITS AND FRAMES.—Grafting the Luculia in the propagating-pit has given rise to a curious question by a skilful propagator in O, is placed in a consecutive arrangement between N and P, as these letters stand in our alphabet, and refuse to unite with either O not misplaced in such arrangement? I think it is, and also D shall make known what the stock for grafting the Luculia on is in good time.

FLOWER-GARDEN.—I see by Mr. Peter McKenzie's account that I am as far behind with the temporary evergreen winter gardens as I was with budding Rhododendrons in the open ground. Formerly, I used to mix Wallflowers with these branches from the reserve garden, but they exhaust the ground and will flower well enough if removed after the beds are spring-dressed. All the best specimen shrubs or trees planted within the last few years on the grass should now have a circle taken out round the extremities of their roots, and filled with rich compost. Where this is not convenient some stimulating liquid manure will do some good.—D. Beaton, Shrubland Park Gardens, Ipswich.

State of the Weather near London for the week ending Dec. 14, 1848, as observed at the Horticultural Garden, Chiswick.

Day.	Barometer.	Thermometer.		Wind.	Rain.
		Max.	Min.		
Friday 8	30.312	30.153	58	39	44.0
Saturday 9	30.288	30.270	44	31	39.0

The highest temperature occurred on the 17th, in 1832—thermometer 67°; and the lowest on the 18th, in 1841—thermometer 16°.

REPORT ON COVENT-GARDEN MARKET,

For the Week ending Dec. 16, 1843.

Owing to the continuance of fine weather, there has been a plentiful supply of Vegetables during the past week; but that of Fruit has been rather short. Pine-apples, although not very plentiful, are sufficient to meet the demand. Among these we noticed some good Queens and a few of the Black Jamaica. Little alteration has taken place in the price of these since our last Report. Hothouse Grapes have still continued to advance in price during the week; Portugals are selling at from 9d. to 2s. per lb. The supply of Apples has been short, more especially good kitchen ones; some fine specimens of Ribstone Pippin and Blenheim Orange are to be seen in the market—these bring from 6s. to 10s. per bushel. Pears are sufficient to meet the demand; a few Winter Nellis, Crassane, Glout Morceau, and Chaumontel, have appeared in the market during the week. Medlars are selling at from 4s. to 8s. per half-sieve. Oranges are becoming very plentiful. Among Vegetables were some fine Broccoli, Cabbages, and Brussels Sprouts; these are selling at nearly the same prices as last week. Leeks are good and abundant. Savoy has been plentifully supplied during the week; Seakale and French Beans are offered at nearly the same prices as in our last report. New Potatoes continue to be brought to the Market and are selling at the same price as last week. Endive and other Salading are good and abundant. Cut Flowers are chiefly composed of Erica hyemalis and gracilis, Luculia gratissima, Bignonia venusta, Roman Narcissus, Lecheanilla formosa, Verbenas, Pelargoniums, Fuchsias, Chrysanthemums, Cinerarias, Camellias, and Roses.

PRICES, SATURDAY, December 16, 1843.—FRUITS.—
Pine Apple, per lb., 3d to 4d
Grapes, hothouse, per lb., 3d to 4d
Portugals, per lb., 9d to 1s 6d
Apples, dessert, per bush, 5s to 10s
Kitchen, per bush, 3s to 4s
Pears, per half-sieve, 3s to 4s
Oranges, per dozen, 1s to 2s
Lemons, per doz., 1s to 2s
Pomegranates, per doz., 3s to 4s
Green Capsicums, per 100, 1s to 2s

VEGETABLES.—
Broccoli, per bundle, 6d to 1s
Brussels Sprouts, per lb., 1s to 2s
Cabbages, per doz., 6d to 1s
Seakale, per bunch, 2d to 3d
French Beans, 3s to 4s per 100
Autumn Potatoes, 3d to 4d per lb.
Savoy, per doz., 1s to 2s
Greens, per doz., 1s to 2s
Cauliflowers, per dozen, 1s to 4s
Potatoes, per ton, 40s to 50s
— per cwt., 2s to 3s
— per bushel, 1s to 2s
Kidney, per bush, 2s to 3s
Turnips, per doz., 6d to 1s
Horse Radish, per bundle, 1s to 2s
Radish, spring, p. doz., 1s to 2s
Carrots, p. doz., 1s to 2s
Spinach, per sieve, 9d to 1s
Leeks, per doz., 1s to 2s
Garlic, per lb., 6d to 8d

Notices to Correspondents.

MR. PAXTON'S COTTAGER'S CALENDAR.—At the earnest solicitation of many of our Subscribers, we have determined on again reprinting Mr. Paxton's "Cottager's Calendar," in the form of a small volume, for general distribution, price 3d. each copy. It may be ordered of all booksellers. Gentlemen wishing to distribute copies among their cottage tenants, may have them delivered in any part of London, by remitting a post-office order to this office, at the rate of 5s. for every 25 copies.

COMMUNICATIONS from the following CORRESPONDENTS are in type, and are only waiting till room can be found for them:—O, Quercus, M. E. H., Gavin Cree, R. G., J. Wighton, Caution, P. Davies, W. Rayner, Veritas, W. Sherwood, Peter Markenzie, Tyro, Totty, W. G. S., G. G. Watson, M. Saul, A. B., J. W. Jones, A. Perthshire Subscriber, A. Practical Man, J. S. Henslow, A. Subscriber, Peter, A., Este, J. L., B. Maudslayi, and G. Fleming.

ACACIA ARMATA.—J. R.—This plant is easily kept to the height of even six feet; by pruning it is calculated to stand on the southern wall in a conservatory where the height is about 10 feet, and depth of soil about one foot; the heat not falling below about 40°.

ANEMONES.—F. B. C.—Double Anemones may be potted in October, and the soil should be composed as follows:—One-half maiden loam, fresh from the pasture, with one-quarter well-rotted cowdung, and one-quarter fine sand (sea or river-sand if possible). After potting they may be placed in a cold frame or pit, and watered but sparingly until the following spring, when they may be put into a warmer place. They will not stand much forcing by artificial means.

APPLE-TREES.—A. B.—Your farm-bailiff is quite correct; young Apple-trees will not thrive on Grass land with turf laid close up to their stems. They should be kept clear of this about their roots until they are well established. A Subscriber.—Apple and Pear-trees may be pruned in any of the months you mention. They may, however, be pruned now with advantage, as it will allow the borders, &c. to be dug over and laid up rough, to be acted on by the winter frosts.

BEES IN NEW ZEALAND.—It appears that Bees having been transported from Sydney to the settlements of Nelson and Wellington, they are not only thriving there, but there is reason to believe that they have been of essential service in rendering seeds fruitful; for it is remarked by a correspondent in the *New Zealand Journal*, "that since Bees were established at Wellington, Clover seeds all over the settlement, which it did not before." It is asked, "Can any experienced Apiarist explain whether this can be attributed to the Bees?" What says Dr. Bevan? and will any one be so obliging as to inform us whether the Bees in that part of the world are the British or the Italian species. They can hardly be the little black Honey Bee of New Holland, &c.

Books.—Philip Lang.—1, Professor Low's "Elements of Practical Agriculture;" 2, Grisenthwaite's "Theory of Agriculture;" 3, Carpenter's "Vegetable Physiology;" 4, the Lectures now publishing by Professor Johnston, of Durham.—S. W.—Formerly any of the plates of Sowerby's "English Botany" could be had separately, and probably still can be, through the booksellers. That work contains figures of all the species, except Fungi.—Siler.—We cannot recommend any separate work on heating garden buildings. You will find a good deal of information in "London's Suburban Gardener,"—Eden.—"Lindley's Lady's Botany," in 2 vols. 8vo., and Mrs. Loudon's "Gardening for Ladies."

CALCEOLARIAS.—T. M.—We are sorry that we cannot assist you in the selection of your Calceolarias. The list you have sent is not a general one; the greater part is probably selected from the seedlings of a grower, and have never been exhibited: there are very few of them that we do know, and those would not answer your purpose.

CELERY.—A. B. & E. B. G.—The cause of Celery not being crisp is probably owing either to its not having been sufficiently earthed up, or to the severe frosts which occurred so early this autumn; Celery was growing rapidly at the time in consequence of the previously very warm weather. We have had no experience with netting prepared from Cocoa-nut fibre.

GRAFTING THE VINE.—J. J.—You cannot graft Vines except when they are in leaf. At any other time the bleeding prevents a union between the stock and scion. By the time the leaves are fully expanded the glut of sap is over, and the bleeding has ceased. In fact, the leaves have partially emptied the tissue of the excess of fluid.

GRASS-SEEDS.—H. R. Esser.—Plant Wheat or Oats early in spring, and after the plant is up, hoe the Grass-seeds in. You may sow the "Mummy Wheat" now safely. Pour over every four bushels of it a gallon of water in which eight ounces of blue vitriol have been dissolved. It will be dry and ready for sowing in four hours.

GREEN MANURE.—Govyn.—A correspondent asked us, a few months since, where seeds of Echinops banaticus could be had, for sowing for green manure. We now possess some, and shall be happy to give him them, if he will send his address.

ICE.—Calex.—Ice may be kept for a long time in a chest of the dimensions you propose to make it, viz. five feet long and four wide. If a layer of clean straw, or other material that is a non-conductor of heat, is placed along the bottom and up the sides, between the ice and the chest, it will have the effect of preserving the ice much longer than if it was put into the chest without anything of this kind. The ice should be firmly beaten into the chest, which ought to be provided with a close lid, and may be placed in a dark cellar. If it can be covered over with straw so much the better.

INSECTS.—A Constant Reader.—Your insect is a cockroach, called *Blatta Americana*; it is often imported in chests of Oranges, &c., and does mischief similar to the common black-beetle in the warehouses of London. R.—A Young Maltster.—We have to thank him for the Weevils, &c. There are no less than three different sorts of Beetles infesting the Malt. Nothing can effect any benefit but the application of heat, and as we will make these Grain Weevils a subject for illustration, we hope next week to satisfy his inquiries as far as we are able. As Mr. Curtis wishes to attend to the economy of the Corn Weevil, he would be greatly obliged by a pill-box of the living insects and the malt being forwarded to him direct, addressed, 11, Robert-street, Hampstead Road, R.

KILN.—A Constant Reader may be assured that we have not lost sight of the kiln which "Semper idem" was so obliging as to communicate. On the contrary, we have had one built for the purpose of trying it, and as soon as we are satisfied about it we shall report the result and publish the plan.

LARCH INSECTS.—If S. C. will oblige us with a sprig of the Larch infested with the insects complained of when the season arrives for their appearance, we shall have much pleasure in illustrating their history, and at the same time we will endeavour to discuss the difficult question—whether insects are the cause or the effect of disease in trees. R.

LAW OF GARDENS.—F. B.—We believe it is illegal for a tenant to take away, willfully damage, or destroy trees or shrubs in a garden, upon quitting it, without the consent of his landlord, unless he has a special agreement to justify him, or unless he is a market-gardener.—See p. 501 in our volume for 1841. Annuals or flower-roots may be removed.

LUCULIA GRATISSIMA.—Peter.—This plant will bear as low a temperature as 38°, but it is better not to expose it to less than 45°.—J. R.—Either this or *Benthamia* will succeed in the situation you describe.

MANURES.—An Inquirer.—The best manure that you can apply to the piece of ground you intend to convert into a Flower and Vegetable Garden having soil consisting of decomposed old red sandstone and very poor, is a good dressing of half-rotten stable yard dung; and if a few cart-loads of marl can be got it would also be of service to a soil of that nature. t.—A Schoolmaster.—Guano will make a good manure for spring-sown Onions; it should be mixed with six times its bulk of soil and may be applied at the rate of about three lbs. to a rod. t.

MYRTLES.—Majorca.—Your Myrtles growing against a south-west wall, that have spread beyond the limits you can allow them may be cut in with advantage in April or May. t.

NAMES OF FRUIT.—W. Taylor.—1, Easter Beurré; 2, Glout Morceau. M. R.—The Apple is the Beauty of Kent; the Pear is in cultivation in some places under the name of Delices d'Hardenpont—which, however, it is not. J. H. O. P.—1, Marie Louise; 2, d'Austrassie; 4, 6, Gansel's Bergamot; 7, Virgouleuse; 8, Duchesse de Mars; 9, Old Colmar, or d'Aucl; 10, Bezi d'Heri; 11, St. Germain; 12, Hacon's Incomparable. The Apple you sent under the name of Pump Apple, from the original tree having been found near a pump, in Suffolk, is of a handsome form, with a very broad, open, shallow eye. It appears to deserve cultivation.—F. K.—1, St. Germain; 2, Beurré Diel; 3, Parry's Pearmain; 4, Sam Young; 7, King of the Pippins; 8, Fearn's Pippin; 10, Kent's Filbasket; 11, Blenheim Pippin; 12, Hanwell Souring; 13, Norfolk Paradise; 14, Kurke's Lord Nelson; 16, Minchall Crab. The light Apple, broad at the base and streaked, is the Alexander; from this and some others the numbers had become detached. t.

NAMES OF PLANTS.—J. B.—Both are varieties of *Maxillaria picta*.—H. J. W.—*Physalis peruviana*.—A. K.—*Abutilon striatum*; *Orthotrichum crispum*; *Scyphophorus fimbriatus*. §—Inquirendo.—Mr. Loddiges is right; the plant is *Grias caudata*.

PEARS.—The wishes of *Illegitimos* shall be attended to during the season.

PINE-APPLES.—A Subscriber.—We have no faith in Pines being grown without bottom-heat in some shape or other. It is perhaps not indispensable that plants should be plunged, in order to receive the requisite amount of heat; but it is very convenient, and may be found absolutely necessary.

RHUBARB.—Messrs. Youell.—Your sample of forced Tobolsk Rhubarb is very handsome, and of a beautiful pink colour. We have not seen any in Covent Garden Market so good up to the present time.

ROSES.—E. A. C.—The pruning which Roses in borders require in autumn is to cut away all dead wood, small twigs, and unripened points of the remaining shoots. Towards the end of February the young wood on those which have been budded should be cut back within half an inch of the stem, otherwise they soon become unsightly. At the same time those on their own roots should be cut back to within two or three inches of the old wood, leaving a regular supply of young shoots from the bottom every year. Roses are sometimes injured by too much cutting in autumn. The buds become excited in open weather, and are often destroyed by frost in spring.

STALL-FEEDING.—J. Mitchell, jun.—The following is "a proper routine through the whole year" for your in-door cows:—June, July, August, Clover and Grass; September, October, Cabbage and Carrots; November, December, January, February, and March, Carrots and Hay; April and May, Mangold Wurtzel and Vetches. You will derive considerable advantage from giving your cows a little Bean-meal or brewer's grains when they would otherwise be on green food alone.

THE MAPLE.—Phitac.—The quickest way of propagating this is by layers. But raising from seed is better where large quantities are wanted.

TREES AND SHRUBS.—F. B. C.—The following will stand the sea

breeze tolerably well:—*Hippophae rhamnoides*, *Pyrus Aria*, *Pinus pinaster*, *P. pinea*, *P. halepensis*, *P. strobus*, *Abies Deodara*, *Arctostaphylos uva-ursi*, *Lycesteria formosa*, *Quercus Ilex* and varieties, *Q. granatensis*, *Halmidodendron argenteum*, *Magnolia grandiflora*, *M. glauca*, *Saxifraga virens*, *Sambucus racemosa*, *Ribes aureum*, *R. sanguineum*, *Tamarix gallica*, *T. germanica*, *Spiraea arifolia*, *E. ægæus agustifolia*, *Liquidambar styraciflua*, *Hibiscus syriacus* and varieties, *Eucalyptus latifolia*, *Cytisus alpinus*, *Ligustrum lucidum*, *Ononis fruticosa*, *Viburnum lantanoides*, *Phillyrea ilicifolia*, *Ph. latifolia*, *Ulmus rubra*, *U. hispanica*, *Salsola fruticosa*, *Acer pseudoplatanus*, *A. macrophyllum*, *Alnus cordata*, *Celtis occidentalis*, *Cotoneaster frigidus*, *C. macrophylla*, *Amelanchier botryapium*, *Clonanthus maritima*, *Caagana arborescens*, *C. are-naria*, *Crataegus orientalis*, *C. glandulosa*, *C. Douglasii*, and *Cornus mascula*. *Creepers*:—*Ampelopsis quinquefolia*, *Capri-folium gratum*, *Bignonia radicans*, *Clematis montana*, *Cl. azurea*, *Cl. flammula*, *Jasminum revolutum*, *Passiflora caerulea*, *Smilax tancetres*, and *Crataegus pyracantha*.

VINES.—J. L.—We should be afraid of giving forced Vines a dressing of pigeon's dung three inches thick. It would probably kill all the surface roots. If you employ it, do so in mixture with four or five times its bulk of earth, or apply it as liquid manure from the time when the plants are bursting their buds to the period of swelling the berries, and then cease. Half three inches would be abundant, unless your border is in bad heart.

WORMS.—H. W. B.—In using corrosive sublimate you should put a small quantity, say half an ounce, into a bottle, filled up with water. Shake them well together, and in a couple of days the clear liquor will be fit for use. Pour it off so as not to disturb the sediment, and mix it with twice its quantity of fresh water. The corrosive sublimate left in the bottle will go on poisoning more water until it is all dissolved, which will not be very soon. If you want a great deal of the preparation substitute a tub for a bottle.

MISCELLANEOUS.—Mrs. G.—A small packet of Violet seeds will cost about 6d., and may be had from any respectable seed-man.

—J. B.—You have only to apply for your medals in order to receive them.—B. F.—The *Chronicle* is not published, at present, till noon on the Saturday. After this year it will appear earlier. The other matter next week.

As usual, a host of letters has arrived too late for answers this week.

ERRATUM.—P. 860, col. 6, line 7, for "Fulgora lanternaria," read "Fulgora laternaria," a lantern-bearer.

NEWS OF THE WEEK.

The affairs of Spain continue to be the leading topic of our Foreign news, and the recent affair between Queen Isabella and her Prime Minister excites the deepest interest in all parts of Europe. On the 1st the new Minister presented to the Cortes a solemn declaration from the Queen, announcing that M. Olozaga, after bolting the door of her study, had seized her hand and compelled her to sign the decree for the dissolution of the Cortes. On the 3rd the debate was opened on this subject, and after much opposition M. Olozaga entered upon his defence. He denounced the whole affair as the plot of a Camarilla, and eloquently depicted the intrigues and factions which have so long preyed upon the country. As he approached the interview with the Queen, he was almost overcome by his emotions. He protested his innocence and his devotion to Royalty, and repelled the calumnies heaped upon him as the efforts of a Court intrigue, whose designs he had detected and endeavoured to baffle for the sake of Spain. He proceeded at great length and with singular eloquence to vindicate his conduct, and concluded an oration of two days recommending his own impeachment for the offence with which he was charged. This speech is said to have produced an extraordinary sensation, and people had begun to suspect that the young Queen had been made the tool of a party, and that M. Olozaga was really innocent. It has been proposed however in the Cortes to bring the matter to an immediate trial, but it is doubted whether the present Ministers will adopt this course, and risk the chances of a defeat. In France the movements of the Duc de Bordeaux are still regarded with great anxiety, and it is stated as certain that the London demonstration will be made the subject of a motion in the Chambers.—The return of the Duke of Palmella to Portugal without effecting the settlement of the tariff negotiation with England has given rise to much complaint, and the popular feeling is said to be so strong that the Duke has felt it necessary to retire to his country residence.—From the United States we learn that the annexation of Texas and the Oregon territory are still the leading questions of the day, and are to be the prominent topics of discussion in the next Congress. In Canada considerable uncertainty exists in consequence of a misunderstanding between the Governor and his Executive Council. It is announced that his Excellency is about to retire from the Governorship, and that all the members of the Council except the Secretary have retired in a body, in consequence of some dispute respecting their right to be consulted on all appointments to office.—From New Zealand we have accounts of a fatal collision between the native Chiefs and a large party of our countrymen, in which the latter were massacred. The details of this untoward affair will be found in another column.

At home, there is little news of any interest to record except the further prorogation of Parliament to the 1st of February, on which day it will be convened for the despatch of business.

Home News.

COURT.—On Saturday Prince Albert attended by Gen. Wemyss and Col. Bouverie left the Castle about 9 o'clock and proceeded to the Smithfield Cattle Show by the Great Western Railway. After inspecting the fat stock and agricultural implements at the exhibition his Royal High-

ness inspected the progress of the paintings in the new summer temple at Buckingham Palace, and returned to the Castle to luncheon. On Sunday morning, her Majesty, Prince Albert, and the whole Court attended divine service within the Castle. Her Majesty and his Royal Highness took their accustomed walking exercise in the afternoon, but the Prince of Wales and the Princesses did not leave the Castle in consequence of the unfavourable state of the weather. On Monday morning the Queen and Prince Albert took their usual walk in the neighbourhood of the Castle. The Prince of Wales and the Princess Alice were taken a carriage airing attended by the Dowager Lady Lyttelton, and the Princess Royal was taken her customary morning walk on the Castle terrace and in the grounds about the Castle. Prince Albert in the course of the morning shot over the Royal preserves, and in the afternoon her Majesty and his Royal Highness promenaded in the grounds. Capt. Hall, who commanded the *Nemesis* iron steamer during the late war in China, attended at the Castle to present a collection of Chinese guns and swords to her Majesty. On Tuesday morning the Queen and Prince took their usual early walk in the precincts of the Castle, and in the forenoon went to the Riding-school and took equestrian exercise. On Wednesday morning the Queen and Prince Albert took their usual walk in the pleasure-grounds of the Castle. The Royal family were taken for their usual airings during the favourable parts of the day. Prince Albert hunted with his harriers, which threw off at Ankerwyke and had tolerable sport. In the afternoon the Queen held a Court and Privy Council at Windsor Castle. At the Court M. Ribeiro, on a special mission from the Emperor of the Brazils, was presented to the Queen by the Earl of Aberdeen. The Rev. Dr. Lonsdale was presented to her Majesty and did homage upon being appointed Bishop of Lichfield. Mr. Bankhead and Mr. Pakenham were also presented on their return from their diplomatic offices. General Sir Peregrine Maitland, who has been appointed Governor and Commander-in-Chief of the Cape of Good Hope, took the usual oath appointed to be taken by the Governors of her Majesty's plantations, and Mr. Pakenham was sworn in as a Privy Councillor. Some decisions of the judicial committee were approved and confirmed. On Thursday Prince Albert shot over his estate at Rapley accompanied by Sir Robert Peel. The Queen and his Royal Highness afterwards took walking exercise in the pleasure-grounds of the Castle. The visitors to her Majesty this week have been the Earl of Aberdeen, Sir R. Peel, Prince Edward of Saxe Weimar, M. Ribeiro, the Bishop of Lichfield, the Hon. and Rev. E. Keppel, Mr. Pakenham, Mr. Bankhead, Sir H. Wheatley, and Lords Melbourne, Beauvale, and Lincoln.

The Queen Dowager has returned to Witley Court from Gopsall Hall, where her Majesty made a brief sojourn on her return from Belvoir Castle. It is rumoured that her Majesty will take up her residence in the neighbourhood of Bristol during the ensuing summer, and that negotiations for the possession of Ashton Court have been already entered into.

The Duchess of Gloucester has made such favourable progress during the week that the last reports announce her Royal Highness as "nearly well."

The Duc de Bordeaux left town in the beginning of the week for Badminton on a visit to the Duke of Beaufort. His Royal Highness returned to Belgrave-square on Wednesday, and held his 13th levee in the evening of that day, which was attended by all the French Royalists now in London. On Thursday H.R.H. visited the Zoological Gardens. The Prince leaves town on Monday for Wales, and will return to Belgrave-square on the 23d, and remain a fortnight longer in England prior to his departure for the Continent. It is now arranged that his Royal Highness will return on the 23d, in order to spend Christmas-day in London, when his tour will be resumed to view Birmingham and our principal seaports.

Lord Grey.—The local papers state that the indisposition of Earl Grey has increased so much during the last few days as to excite the most serious apprehensions of the family, nearly all the members of which are assembled at Howick. The venerable Earl is confined to his room, and is said to be gradually sinking from exhaustion, arising from decay of nature.

Parliamentary Movements.—At the Council on Wednesday Parliament was ordered to be further prorogued from Tuesday the 19th inst. until Thursday the 1st of February, and a proclamation was ordered to be issued summoning Parliament to meet for the despatch of business on the 1st of February.

Diplomatic Appointments.—James Hudson, Esq., Secretary of Legation at Washington, has been appointed Secretary of Legation at the Hague; John Kennedy, Esq., Secretary of Legation at Naples, has been appointed Secretary of Legation at Washington; George John Robert Gordon, Esq., First Attaché to her Majesty's Legation at Rio de Janeiro, has been appointed Secretary of Legation at Stockholm; and Augustus Craven, Esq., now First Attaché at Brussels, has been appointed Secretary of Legation at Stuttgart.

The Church.—The Queen has been pleased to direct letters patent to be passed under the Great Seal of the United Kingdom, appointing the Bishop of Salisbury to exercise all the functions and powers as well with regard to the temporalities as the spiritualities of the Bishop of Bath and Wells. It is stated that the Rev. R. W. Jelf, D.D., Canon of Christchurch, and Bampton Lecturer for 1844, has been appointed to the headship of King's College, London, vacant by the elevation of the Rev. Dr. Lonsdale to the Bishopric of Lichfield. The Rev. R. Cox Clifton has been elected Canon of Manchester in the room of the Rev. J. Gathff.

Church of Scotland.—The Queen has been pleased to

present the Rev. J. Flowerdew to the parish of Fordoun, Kincardine, vacant by the resignation of Dr. Leslie; the Rev. A. Rutherford to the church at Rothiemurchus, Inverness, vacant by the transportation of the Rev. C. Grant to the parish of Kingussie; the Rev. J. Whyte to the united parishes of Lethnot and Navar, Forfar, vacant by the admission of the Rev. A. Gardner to the second charge in the parish of Brechin; and the Rev. J. Park to the united parishes of St. Martins and Cambus Michael, Perth, vacant by the admission of the Rev. W. Ritchie to the parish of Longforgan.

The Colonies.—The Queen has been pleased to appoint Sir Peregrine Maitland, Knight Commander of the Bath, to be Governor and Commander-in-Chief of the Cape of Good Hope. The Hon. Colonel Bagot, Grenadier Guards, will be Military Secretary to the new Governor, and Viscount Mandeville and Lieut. Maitland, Grenadier Guards, are appointed to his Staff. The Queen has been pleased to appoint Thomas Frederick Elliott, John George Shaw Lefevre, and Charles Alexander Wood, Esqrs., to be Commissioners for superintending the sale and settlement of the Waste Lands of the Crown in the British Colonies and the conveyance of emigrants thither.

Post Office.—The Gazette contains a Treasury warrant, dated 2d inst., authorising an alteration in the rates of postage, to commence on the 1st of January next, between this country and Holland. From and after that date the postage for every letter not exceeding half an oz. from and to Holland will be 8d., to be paid by the sender or receiver, at the option of the party sending. Newspapers will be charged 1d. each. Printed periodical publications, and Parliamentary papers of either country will be charged 1d. for not exceeding two oz.; 6d. for not exceeding three oz.; 8d. for not exceeding four oz.; and 2d. for every additional oz.; publications exceeding 16 oz. will not be forwarded by post. The Belgian Government and the Prussian Government at Cologne are acting in concert to obtain for the British General Post-office the establishment of a regular communication between England, Belgium, Prussia, and the German states on the Rhine, by means of daily packets from Dover to Ostend, which should convey the mails, passengers, and merchandise. The Belgian Government offers on its part an annual contribution of 3,000*l.* sterling, in order to facilitate the arrangement between the post-offices.

Foreign.

FRANCE.—The topics which engage the attention of the Paris papers are more varied than they have been of late. Among them are the movements of the Duc de Bordeaux in London; the affairs of Spain; the elections of the twelve Mayors of Paris and their Deputies, which have terminated more favourably than usual for the Opposition; the fortifications of Paris, and a second letter which M. Arago has addressed to the Opposition papers on that subject. In the first he had shown that the detached forts would avail little against the enemy, but might sooner or later place the liberties and institutions of the country, and the lives of the citizens of Paris, at the mercy of a few "pretorians." In his second letter he demonstrates the necessity of fortifying Paris, but contends that a continuous wall of masonry, with bastions, ought to suffice for the defence of that capital. Vauban and Napoleon (he observes) supply him with the strongest arguments in support of his system, which had, besides its efficacy, the no less valuable advantage of being in no wise dangerous for the liberties of France.—The *Moniteur* contains the report addressed by the French engineer M. Mallet to the Minister of Public Works, respecting the result of his visit to the atmospheric railroad between Kingstown and Dalkey near Dublin. The document speaks in the highest terms of the system invented by Messrs. Jacob Samuda and Clegg, expresses a conviction of its perfect practicability on longer lines, and recommends that a trial of it be made in France.—In regard to the Duc de Bordeaux it is not doubted that the London demonstration will be made the subject of a motion in the Chamber, as it is considered impossible for the Government to pass over in silence such an insult to the reigning dynasty as that of addressing the young prince as "King of France."—Considerable surprise was excited in Paris last week by the announcement that M. Janin the manager of the Italian Opera and his wife had committed suicide. It appears that a young man in the theatre had been apprehended on the charge of fraudulently issuing tickets, and that he had confessed to some of the parties who suffered by the fraud, that M. Janin had instigated him to make false returns, and that although from various considerations an attempt was made by the injured parties to prevent exposure, the effect of the discovery upon the mind of M. Janin, who was much respected and held a situation of 12,000*l.* a year in the theatre, was so great as to deprive him of fortitude to bear up against the disgrace that had fallen upon him. It is said that he committed the act with so much deliberation, that in order to prevent the possibility of setting the room on fire he had removed a marble slab from its place, and put it on the floor to bear the brazier.

SPAIN.—A telegraphic despatch from Bayonne announces that the new Administration was constituted on the 5th inst. M. Gonzales Bravo, First Secretary of State, has been appointed President of the Council; General Mazaredo Minister of War; the Marquess Pena Florida Minister of the Interior; M. Mayans Minister of Justice; M. Portello Minister of the Marine. The Minister of Finances had not then been appointed. The promotion of M. M. Bravo and Mazaredo created vacancies in the Vice-Presidency of both Chambers, which have been filled up by the election of M. Madoz and M. Garnica, both of whom belong to the party of the late Govern-

ment. The recent affair between M. Olozaga and Queen Isabella continued to excite the deepest interest. On the 1st the new Minister Gonzales Bravo presented to the Cortes the following solemn declaration of the Queen:—"On the evening of the 28th of last month Olozaga presented himself to me, and proposed my signing the decree for the dissolution of the Cortes. I answered that I would not sign it; amongst other reasons because those Cortes had declared me of age. Olozaga insisted. I again refused to sign the said decree. I rose and moved towards the door which is at the left of my study; Olozaga advanced before me and closed the bolt (at this passage the public who thronged the galleries of the Chambers seemed indignant). I then moved to that in front, but Olozaga again preceded me and closed the bolt of that door. He seized me by my dress, and compelled me to sit down. He took my hand and compelled me to sign. (Here the public expressed their indignation with extreme warmth.) Olozaga then went away, and I retired to my room. Having read over the above declaration, her Majesty added—'Before he left, Olozaga asked whether I gave him my word that I would utter nothing of what had passed to anybody, when I replied that I did not promise it.' Her Majesty, (said M. Gonzales Bravo,) then requested all present to enter the closet and examine the place where the aforesaid scene had passed; they did so, all entering the closet. I then put the declaration into the hands of the Queen, her Majesty affirming that the declaration was a true and voluntary one. Her Majesty signed it in presence of the above-named witnesses, after I had asked the persons present whether they had well understood its contents, and after their affirmative reply. After this act was terminated, her Majesty ordered the persons present to retire, and the Royal declaration to be deposited in the archives of the Foreign Office." "Gentlemen," added the new Minister, "after reading this solemn declaration made by the Queen before the aforesaid persons, my mission is at an end; its essential object was to convey, as was befitting, the Royal word, which no man of honour can have doubted." On the 3d the public galleries were crowded, all the Deputies were present, and large numbers of persons had gathered around the Oriente Theatre, where the Congress meets. After a discussion of no moment, which ended in its being decided that MM. Olozaga, Cantero and Luzuriaga should undergo a re-election, the President informed the Chamber that the debate was opened upon the verbal process, recording the Royal declaration communicated by the Minister of Foreign affairs. The utmost curiosity and interest were excited by this notification. After some opposition M. Olozaga succeeded in obtaining a hearing, on the motion that an address be presented to the Queen, congratulating her on her safety; the motion for excluding him from the Cortes having been postponed. M. Olozaga declared that he did not rise to oppose an address to the Queen, but that he must and could not avoid speaking when he could do so usefully, and in a way calculated to throw light on the question before the Chamber. His intention was to say as little as possible on the grounds of the question, reserving to himself the liberty of dwelling at greater length on all that had preceded the facts stated in the verbal process. After reminding the Chamber in detail of the various circumstances which preceded his elevation to the station of guardian to the Queen, he declared that during the whole time he was with her Majesty he had never ceased to tell her that, to govern constitutionally Sovereigns must in political affairs listen to none but the constitutional advisers of the Crown. This doctrine roused against him the antipathy of the individuals on duty at the Palace, and that antipathy daily increased. Their aversion and pretensions became boundless when her Majesty's guardian was summoned to the direction of public affairs. Thence had arisen the hidden and open resistance he had experienced in all his efforts to establish a homogeneous Cabinet. Matters had come to such a point that the Prime Minister had found himself under the necessity of declaring that he would expel from the Palace all persons whatsoever who meddled with political affairs, and this threat which had yielded him so much hatred and resentment, he would certainly have followed up. Thus, at the Palace, it was not the Queen but the persons about her that manifested the most hostile dispositions. The very day after his elevation to the Presidency of the Council, he was surprised to hear the Queen tell him that he must immediately form his Cabinet, otherwise somebody else would do so in his stead. That person whom the Queen named not was General Narvaez, who, in order to raise an opposition, awaited not even the composition of the Cabinet, so strong were the prejudices entertained at the Palace against the Administration he was organising. As M. Olozaga detailed what passed between him and the Queen on the 28th November and approached the dénouement, his voice betrayed the utmost emotion and his speech was repeatedly interrupted by his sobs. He called upon Heaven to bear testimony to his innocence, protesting that he was devoted to Royalty, and repelling the calumnies heaped upon his head by his enemies and a camarilla, whose malignity he denounced and whose designs he had detected and wished to baffle for the welfare of Spain. At the moment he protested with the greatest energy against those calumnies the President adjourned the Chamber, declaring that the hour fixed for putting an end to the debate had struck. M. Olozaga's speech is stated to have made a deep impression, and the Chambers listened to it with more composure than had been anticipated, seeing that on entering the hall the ex-Minister had been received with mingled applause, hisses, and cries of "Turn him out!" At the sitting on the 4th M. Olozaga resumed and concluded the vindication of his conduct. He stated

that in the evening of the 28th he repaired from the Ministry of Foreign Affairs to the Palace, bringing a number of decrees which he submitted to the approbation of the Queen and which Her Majesty actually approved and signed. The Queen had treated him with all the marks of kindness that a candid and grateful heart could express, and when he took leave of her she followed him and in presence of bystanders saluted him most graciously, and even gave him a present for his daughter. He then returned direct to the Ministry. Had he been guilty of the attempt imputed to him, his guilt would have been betrayed by his emotion, and he would not have left the Palace without having been arrested. Many hours of the night passed over, and he remained quietly at home in his hotel in conference with several foreign agents. In the morning of the 29th, however, persons attached to the Royal household announced that the decree of dissolution of the Cortes had been signed, and that violence had been offered to the Queen to obtain her signature to the decree. The President of the Chamber, he said, was the first apprized of the circumstance, and those who should have been informed of it first were the last to know it. M. Olozaga then examined the style of the declaration put into the Queen's mouth, and contended that it resembled little the language used by her Majesty, and that it was not accordingly her own. The means besides employed to draw up the Royal act were illegal. He next directed the attention of the Assembly to a conspiracy existing both in Spain and throughout Europe against constitutional governments. He had proofs of its existence and knew for certain that there were agents in Spain labouring to bring about the marriage of the son of Don Carlos with the Queen. This statement was received with cries of "No, no!" and excited a tumult which the President appeased with much difficulty. M. Olozaga however persisted in his declaration, and after attacking the actors in the scene at the Palace who refused to allow him to be present and justify himself, and branding in energetic terms the imprudent courtiers who compromised the throne, he concluded by recommending the adoption of the address to the Queen and his own impeachment for the offence with which he was charged.—The President M. Pidal then left the chair and replied to M. Olozaga, insisting on the veracity of the Queen's declaration, reflecting with great severity on his late conduct, and detailing what share he (M. Pidal) had had in the drawing up of that declaration; and the tears that fell from his eyes when being summoned to the Queen's presence he beheld the candour, innocence, and truth with which she stated the outrage she had been subjected to. The sitting was at a late hour adjourned to the following day.—The debate was then resumed by M. Cortina, who expressed his conviction that the failure of the late attempt to effect a coalition was the chief cause of the late events which they all deplored. He then referred to the declaration of the Queen relative to the occurrences of the evening of the 28th ult., which Her Majesty concluded by a wish that it should be deposited in the archives. M. Gonzales Bravo, he said, had disobeyed the order of the Queen by presenting the document to Congress, which unconstitutional proceeding had compromised both the throne and the legislative power, and thereby incurred the most severe reproaches. That act, in his opinion, was constitutionally much more culpable than that imputed to M. Olozaga, and would justify an impeachment. He then contended that the declaration was divested of all constitutional authenticity, that it was the testimony of Isabel II. respecting a personal fact, and that it should be held in the light of the evidence of a witness deposing in his own cause, or of the declaration of a person denouncing some horrible attempt. M. Cortina was proceeding to describe the legal course the accusation ought to pursue, and was entering on an examination of the consequences that might accrue therefrom, when he was called to order and informed that he had spoken longer than the time allowed by the regulations of Congress, and the Assembly again adjourned.—At its next meeting it was resolved, by a majority of 81 to 66, to take into consideration a proposal for bringing M. Olozaga to trial, and it was referred to the committees to select a commission to report upon it.—In the evening of Sunday the 3d, there were commotions in different parts of the capital. That there was a regular plot is evident, for attempts were not only made in different parts of the city at once, but seditious cries were heard, including even "Death to the Queen." The troops were fired upon with guns and pistols, and several of them were killed and wounded. There have been no disturbances since. In the provinces, at Burgos, Avila and Cuenca the reading of the Queen's declaration excited universal indignation, but the subsequent proceedings of the Chambers and the defence of M. Olozaga were not then known.

PORTUGAL.—We have advices from Lisbon to the 6th inst. The most bitter disappointment was excited by the failure of the tariff negotiations in London. The Duke of Palmella, who arrived by the last packet in Lisbon, had at once retreated to the privacy of domestic retirement to escape the prevalent indignation, as the conviction was universal that his want of candour had again baffled the expectations of both countries. The greatest excitement prevailed in the wine-districts in consequence of his return without accomplishing the object of his mission.

ITALY.—Letters from Rome state that Prince Marcantonio Borghese was married a few days ago to Mlle. Thérèse de la Rochefoucauld, daughter of the Duc d'Estissac. The marriage benediction was bestowed by the Archbishop of Nicea, Apostolic Nuncio in Paris, in the chapel of the Duke's Hotel.—During the year 1842 there

were printed in Italy 3,042 books (the number printed in 1841 was 2,999); of these 3,042, 1769 or about three fifths were published in the Lombardo-Venetian kingdom; of the remainder, 508 appeared in Piedmont; 235 in the Grand Duchy of Tuscany; 216 in the Papal States; 174 in the Kingdom of the Two Sicilies; 19 in the Duchy of Modena, and 11 in the state of Lucca. Of these works a considerable portion were translations.

GREECE.—We have this week the particulars of the opening of the National Assembly on the 20th ult. by King Otho, whose speech on the occasion was given in our last. A Royal salute fired at day-break ushered in the day. The hour appointed by the King for opening the Assembly was two o'clock, some time previous to which the building was densely crowded by the Deputies and the public. Shortly before two the English and French Ministers attended by the Officers of their missions, as also by the Officers of the naval forces of each nation at the Piræus, arrived and occupied the seats allotted to them. The representatives of Austria, Prussia, Spain, Bavaria and Turkey, arrived about the same time; but the Minister of Russia was absent. The Queen next entered accompanied by her ladies in waiting. Her Majesty was dressed in a Greek costume, composed chiefly of crimson and gold, and on her entry the whole assembly stood up and bowed. At the time appointed his Majesty arrived, and was received in the most enthusiastic manner. He took his station on the throne standing, and was surrounded by the Ministers, the Council of State and the highest dignitaries of the Church. His Majesty wore his Greek dress, and having bowed to the Assembly sat down, placing his red cap on his head, and motioning to the Deputies to be seated. The King appeared rather nervous, but was apparently in good health and spirits, and proceeded to read the Royal speech as given in our last. Immediately after the delivery of the speech the King rose and quitted the Assembly amidst enthusiastic cries of "Long live the King!" Everyone then turned towards the Queen and greeted her with "Long live the Queen!" which completely overcame her Majesty and caused her to shed tears abundantly. Everything passed off in the most satisfactory manner, and the whole country continues in the same state of remarkable tranquillity.

RUSSIA.—Letters from St. Petersburg announce the arrival of his Imperial Highness the Grand Duke Michael in that capital on his return from England. The *Augsburg Gazette* of the 7th says that accounts have been received from the Caucasus of a great battle which was fought in the beginning of September between the Avaziz and the Russian troops, in which a vast number were killed on both sides. The Avaziz inhabit the southern part of Lesghistan. The *Frankfort Gazette* adds that the Caucasians had attacked a village friendly to the Russians. Colonel Weselowski, the Russian commander, thereupon went out to oppose them, but found that the enemy consisted of an army of 8,000 or 10,000 men. The Russians were inferior in number and lost 1,000 men, including the Colonel, who is supposed to have fallen on the field of battle, as nothing further was heard of him.

TURKEY.—Advices from Constantinople of the 22d ult. announce the receipt of intelligence from Messoul of another slaughter by the Turks of the Nestorian Christians. Upwards of 200 of the latter were believed to have fallen. Reschid Pasha, the newly-appointed Ambassador of the Porte in France, was to leave Constantinople for Paris on the 7th inst. The Rev. Dr. Wolff was to set out on his mission to Bokhara by the Trebizond steamer on the 24th. He has been provided with two autograph letters from the Sultan, addressed to the Khans of Khiva and Bokhara, one from the Grand Vizier, and three from the Sheikh-ul-Islam. The tenor of the Sultan's letter is that "the British Government being the friend and ally of the Padishah, its subjects were entitled to the protection and favour of his Majesty wherever his influence might extend. The chiefs of Bokhara and Khiva are exhorted therefore to release any British officers that be detained there in captivity, and to receive with kindness and distinction the venerable pastor who should come to claim them." These letters of the Sultan, the descendant of the Caliphs, who is held in great respect by all the followers of the Sunnee sect, are expected to create a very favourable impression for Dr. Wolff at Bokhara.

EGYPT.—Private letters from Egypt mention that the Pasha was seriously contemplating the execution of some great work which should serve to perpetuate his memory to future ages. Three projects, it is stated, were under his consideration—first, a ship canal between the Red Sea and the Nile; second, a canal to join the Red Sea with the Nile; third, a railway across the Desert between Cairo and Suez. Which of the three he might determine on was not known.—The latest accounts from Abyssinia state that Dr. Schimper, the well-known traveller, has obtained possession of a tract of land in that country, over which he exercises sovereign sway. He, however, only intends to remain so long as will be necessary to complete his collections and observations on that important portion of Africa.

CAPE OF GOOD HOPE.—Cape papers to the 15th Oct. have been received which state that several unusually large swarms of locusts had recently made their appearance in the neighbourhood of Bathurst committing great ravages among the standing crops of corn. In the Kat River settlement several swarms had also been discovered in the larva state, and hence fears were entertained for the crops in that locality, which at the date of these advices presented a finer appearance than known for many years. Colonel Hare the Lieutenant-Governor had visited Block-drift with the view of expelling the Chief Tola from the "neutral territory," and having summoned the Chiefs of the Gaika clans had taken their agreement for his good

behaviour in future, giving them however to understand that if either Tola or themselves gave the Government further trouble they would one and all be not only debarred possession of the "neutral territory," but have to cross the Kei. The Cape Government *Gazette* publishes at length the terms upon which trade is to be carried on at Natal. All vessels whether British or foreign excepting those of her Majesty are to pay a port-charge of 3s. per British ton upon their registered burden. In all respects it appears the duties levied are to be the same as those at present in force at the Cape.—The Bentinck steam-ship arrived in Table Bay on the 7th Oct., all well, after a run of 4000 miles from St. Jago without calling at any intermediate port or station for fuel.

WEST INDIES.—The papers received by the Thames steamer give satisfactory accounts of the progress of the several leading islands. The most important feature however is the speech of the Earl of Elgin at the opening of the Legislature at Jamaica. Although it does not give an overcharged account of the capabilities of the soil, or of the immense advantages which future cultivation will secure to those enjoying property in the West Indies, it presents a cheering prospect of what is likely to be effected by better management on the part of the planters, and conciliated feeling on the part of the labouring population. The Governor alludes apparently with satisfaction to the decrease of native fanaticism, as also to the attention of late paid by the agricultural societies to the introduction of implements of husbandry, with the view to decrease the heavy proportion of manual labour. The failure of the scheme of emigration as suggested by the Legislature is the only discouraging topic in the speech; but it appears notwithstanding that encouragement will yet be given to promote the import of labour from the coast of Africa as a means of supplying any deficiency that may arise from other quarters. Bishop Spencer had arrived from Halifax. The weather continued tolerably favourable, although as is usually the case there were complaints from some of the districts of insufficiency of rain. Trade with the South American States had rather fallen off. The news from Demerara, Trinidad and Barbadoes is not very interesting. At the latter island the weather for the crops is described as having been "glorious"—rain one day, sunny and fine the next. Mr. Thomas, the chief clerk of the branch of the Colonial Bank, had been committed for trial on a charge of robbery, to the amount of 41,920 dollars. The supply of labour from the coast of Africa to Demerara had failed. The Superior had only brought over 16 persons from Sierra Leone. At Trinidad prospects were steadily improving, and increased cultivation was attended with success. It is stated that Waddell, who absconded from Demerara after robbing the British Guiana Bank of a considerable sum, had been arrested with almost all the money in his possession. This is probably a mistake, the statement being founded on some vague account said to have been obtained from Scotland.

UNITED STATES AND CANADA.—The packet-ship Roscius, which sailed from New York on the 25th ult., arrived at Liverpool on Tuesday, having made the passage in 16 days and a half. The annexation of Texas and the taking possession of Oregon will be the leading topics of discussion in the next Congress. President Tyler it is said will introduce the question of Texas, and Mr. Bentin will bring forward that of Oregon. These questions are expected to agitate and excite, but it is doubted whether they will form parties or divide the Union. The Rev. Sydney Smith's letter on repudiation had been received and had drawn forth much comment. An English lady, Miss Isabel R. Keats, and niece of the late English poet of that name, had died at Cincinnati from the accidental discharge of a gun which she held in her hands. The United States Customs have decided not to allow the drawback on coals in future to the steamer Great Western: this will make a serious difference to the company. Mr. Macready cleared 8,000 dollars by his first engagement at the Park Theatre, New York; he was also very successful in Philadelphia. Accounts had been received of Sir W. D. Stewart's party on their way across the Rocky Mountains. A few of the party have returned, but a Mr. L. D. Walker of St. Louis had been killed in a quarrel. The packet ship Westminster, which trades between New York and London, has been struck by lightning in a storm. Her commander was knocked down and became for a time insensible, but speedily recovered. The ship did not sustain any considerable damage. The packet ship Sheffield, which was wrecked a short distance from New York, has been towed into port. It was found that the damage which she had sustained was not so great as had been anticipated. The intelligence from Canada is of great importance. It was reported in Kingston on the 17th ult. that Sir Charles Metcalfe had resigned the government of the Canadas and would immediately return home. Severe indisposition arising from an abscess in the face is assigned as one cause for this step. It was also reported that the Government had solicited and obtained the services of several members of the Legislative Council who had thought it their duty to retire. We learn however by the subsequent arrival of the Caledonia mail steam-ship, which reached Liverpool on Tuesday from Halifax, that Sir Charles Metcalfe has not resigned, although his health is by no means good. Another reason for his resignation, if true, may be found in the fact that a schism has occurred between his Excellency and the Executive Council, which has increased to such an extent that all the Members of the Council resigned in a body (with the exception of Mr. Daly, the Provincial Secretary) on the 25th ult., and their resignations were accepted by the Governor-General. This was not known in Kingston till the following day, but it being Sunday the public curiosity

as to the cause would not be gratified till the house met on Monday. The latest letters from Kingston state, as the understood reason of this unexpected change, the desire of the late Council to be consulted upon all appointments to office, a claim which it would appear Sir C. Metcalfe is not inclined to submit to. The names of the retiring Members of the Council are—the Hon. Messrs. Sullivan, Lafontaine, Baldwin, Hincks, Dunn, Small, Morin, Aylwin, and Killaly.—From Texas we learn that an entertainment had been given to General Houston at the place called after himself, where in returning thanks for the compliment, he denied the charges recently brought against him, of being an abolitionist, of conniving at the supremacy of England in Texas, and of vassalage to Mexico. The *New Orleans Bee* states that the British Government through Captain Elliot had presented claims of its subjects to land in Texas amounting to from ten to twenty millions of acres, with a threat that the necessary steps would be taken to enforce the settlement of the claims if they were not speedily conceded. The cotton crop in Texas had been seriously injured by the worm. At Galveston the collector was receiving the exchequer-bills of Texas at a discount of 20 per cent.

BRAZILS.—The Swift packet, with mails from the Brazils, arrived on Monday direct from Rio de Janeiro, having sailed on the 20th of October. She brings 8000% on freight in gold. The rumoured illness of the Emperor was incorrect, but the Princess Januaria, heir presumptive to the throne, has been extremely ill; her life was for some days considered in great danger, but the bulletin of the 19th of October, the day previous to the packet's departure, announces her being convalescent.

NEW ZEALAND.—We regret to state that a disastrous occurrence has taken place in this colony which has led to the murder of Capt. Wakefield and England, Mr. Thompson the magistrate, and several other English settlers. The leading facts were communicated to the *New Zealand Company* by Mr. Kelham in letters dated the 19th and 21st June, but since their arrival the *New Zealand papers* of a later date have been received, which contain more ample particulars, and show that what was at first expected to prove an exaggerated statement is unfortunately too true. The *Auckland Chronicle* of the 15th July gives the annexed account of the origin and progress of the affair:—"The public are aware that the claims of the *New Zealand Company* to land in the colony amount to some millions of acres, partly in this island and partly in the northern part of the southern island; it is also generally known that in many instances these claims have been denied and in some cases openly resisted by the natives, on the ground that the land was never in fact sold by them to the agents of the company. In order to carry out the plan on which the Nelson settlement was founded it became necessary, after putting the settlers into the possession of their town and suburban sections, to resort to the Wairau valley, a fine district in Cloudy Bay about 70 miles from Nelson, for the purpose of finding land to supply the original purchasers with their 150-acre sections of country land. In the month of April last several surveying-parties were despatched on the part of the company to survey the district. Almost immediately on their commencing their work the natives, who it seems dispute the sale of that district, ordered off the surveyors, pulled up their ranging-rods and stakes, and did everything in their power to prevent the survey of the land. Whilst this was being done by some of their people, Rauparaha and Rangiaiaata, two of the most powerful and least civilized chiefs of that part of New Zealand, who are the original native owners of the district, were at Porirua, on the other side of Cook's Straits, urging the Land Claims' Commissioner, Mr. Spain, to hasten over to settle the land claims at Wairau, as they wished the surveyors to be withdrawn. The Commissioner agreed to hear the claims there towards the end of June. In the meantime both the chiefs crossed the Straits to Cloudy Bay—went up the Wairau with their party—found the surveyors still there—collected a number of them together, their tents and provisions, and told them that they intended to send them all off the land together. Previous to this they had set fire to Mr. Cotterell's (one of the surveyors) hut, having first carefully removed all property of value to prevent its destruction. Early in June Mr. Cotterell started for Nelson to inform Captain Wakefield of what had taken place. Mr. Tucket the Company's chief surveyor attempted, but in vain, during Mr. Cotterell's absence to obtain the permission of the chiefs for the survey to proceed. On arriving at Nelson Mr. Cotterell (on the 12th of June) laid an information before the police magistrate Mr. Thompson, who it would seem issued a warrant against Rauparaha and Rangiaiaata for burning Mr. Cotterell's hut. At that time the colonial brig *Victoria* was on the point of sailing for Auckland, being under strict orders to return direct, and on no account to deviate from her course. Captain Richards it seems however was induced to remain until Tuesday the 13th, and to take on board Mr. Thompson the police magistrate; Captain Wakefield the *New Zealand Company's* Agent at Nelson; Mr. Richardson the recently-appointed Crown prosecutor; Captain England late of Her Majesty's 12th Foot; Mr. Howard the company's storekeeper; Mr. Patchett, merchant; Mr. Cotterell, surveyor; Mr. Brooke, who acted as interpreter; the chief-constable of Nelson, three constables, and about 25 other persons, most of them engaged in the company's survey. Before reaching the Wairau they were joined by one of the company's boats, having on board Mr. Tucket and 10 or 12 men who went on board and joined the party. On Thursday evening the brig anchored at the mouth of the Wairau and remained there. At a path at the entrance of the river Mr. Howard the company's storekeeper, served out arms to the men (about 35 in number), con-

sisting of muskets, bayonets, pistols, swords, and cutlasses, and several rounds of ball cartridge. The constables were also armed with guns, muskets, and pistols. One or two of the men were sworn in special constables, some were told they were going to take Rauparaha and Rangiaiaata on a warrant, few it is thought knew that they were upon a hostile service. Many of the party are said to have expressed their intention not to use their arms. In the course of their progress they were joined by Mr. Barnicoat the surveyor and his man. Early on Saturday morning the party who had left their boats when the river became shallow and marched up the banks, came up to the place where they expected to find Rauparaha and Rangiaiaata and their party, they were encamped on the opposite bank of a narrow creek. By the directions of Mr. Thompson and Captain Wakefield the European party was now formed into two bodies under Captain England and Mr. Howard, who gave orders to their men not to interfere until directed. As a means of communication with the other side of the creek where the chiefs were encamped a canoe was placed across the water to serve as a bridge. Mr. Thompson, Captain Wakefield, the chief-constable, Brooke, and some others then crossed over. Mr. Thompson, Captain Wakefield, and Mr. Cotterell walked backwards and forwards for nearly half an hour with the natives, apparently in a friendly manner. Mr. Thompson then showed his warrant, directed the constable to execute it on Rauparaha, and instructed Brooke to explain the meaning of it. Mr. Thompson also stated that he was 'the Queen's representative,' that that (pointing to the warrant) was the Queen's book,—that Rauparaha must go on board the brig with the constable; that it was for burning Mr. Cotterell's house, and had nothing to do with the land question. Rauparaha told them to sit down and talk, and not make a fight, and to wait till Mr. Spain and Mr. Clarke came, and hear what they would say. Mr. Thompson then inquired of Rauparaha, whether he would come or not; to which he replied he would not; but that if Mr. Clarke or Mr. Spain was there he would. Mr. Thompson then said if he would not go he would make him. Rauparaha still refusing, Mr. Thompson, pointing to the Europeans, said, 'There is the armed force, and they shall fire upon you all (or upon you) if you won't go.' Mr. Thompson it appears then became 'exasperated,' and the discussion violent. Rangiaiaata called on him not to fire. 'For God's sake, Thompson, mind what you are about,' shouted Mr. Richardson from the other side. Mr. Thompson then called to the armed party to fix bayonets and advance; Captain Wakefield placing the canoe across the stream for a bridge gave the word, 'Englishmen, forward.' A few of them had entered the canoe, when a shot was fired, whether by accident or design is not clear, neither is it certain on which side; but there is reason to think it was on the side of the Europeans. Upon this the firing immediately became general on both sides, and several fell. Three of their party having fallen, the Maories hesitated whether they should run away; but Rauparaha urged them to pursue. When the firing commenced, Mr. Thompson, Captain Wakefield, and the rest of the party who had been in communication with the chiefs, re-crossed the creek to join their own party, who were now retreating up the hill pursued by the natives. At each step in the ascent, Captain Wakefield again and again attempted to rally the men, and entreated them to make stand, to fix bayonets and charge. An irregular firing was still kept up, but the European party continued retreating. 'For God's sake, come back, men,' cried Mr. Thompson, 'the Maories are coming upon us;' but the greater number made good their retreat. There was running in all directions. Captain Wakefield, finding it impossible to rally the men, then ordered those who remained to lay down their arms and surrender. Brooke, the interpreter, called to the Maories—'Leave off, enough;' but after this some shots were fired by those in retreat who had reached the top of the hill and were too far distant to know what was going on below. When signals of surrender had been made, one or two Maories also threw down their arms and advanced with their arms stretched out in token of reconciliation. It seems that while the surrender was taking place by the gentlemen below and the firing by the stragglers above, Rangiaiaata came up enraged: he had discovered that his wife had been shot—'Rauparaha,' said he, 'remember your daughter.' He then with his own hand it is said destroyed them all. 'Puha, Puha,' cried out the wife of a chief from a distance, 'save some of the chiefs (gentlemen) that you may have it to say you saved some.' But it was then too late. On the European side the number of armed men was about 45, on the Maori side about 40 were engaged—their loss was 4 killed and 5 wounded. On the Wednesday following, Mr. Ironsides the Wesleyan missionary having heard of the fatal conflict hastened to the spot, where he found 19 European bodies. On the Thursday they were buried, Mr. Ironsides reading at the grave the funeral service of the Church of England. On his way to the place, Mr. Ironsides met Rauparaha and Rangiaiaata, and obtained permission from them to go and bury the dead. They told him that they had no intention to fight; that it was the wrath of the Europeans that made them fight; that the Europeans had fired upon them, and one or two of their number had fallen before they began to fight; and that it was not until the wife of Rangiaiaata was shot that 'they began to seek for payment'—(revenge.)" The *New Zealand Colonist* of the 30th June gives the following as the complete list of the persons who have fallen:—"Captains Wakefield and England; Messrs. Thompson, Richardson, Patchett, Howard, Cotterell, John Eroke (interpreter), William Clanzay, Thomas Ratcliffe, William Northam, Thomas Pay, Coster, James McGregor, William Gardner, Ely Cropper, Henry Burn-

forth, Thomas Tyrrell, and Isaac Smith." The missing were—"Malin (Chief Constable), Edward Stokes, Thos. Hannam, and John Burton."

CITY.

Money Market, Friday.—Consols closed at 95½; Three per Cents. Red., 96½ to 1; Three-and-Half per Cents. Red., 102½ to 103; Bank Stock, 182 to 3; Exchequer Bills, 57s. to 59s. prem.; India Bonds, 74 prem.

Metropolis and its Vicinity.

Metropolitan Destitution.—Several meetings have been held at London-house the town residence of the Bishop of London in the course of the last few days, for the purpose of maturing some comprehensive plan for relieving the destitute poor of the metropolis and at the same time improving their moral and social condition. Those meetings have been attended by several noblemen and gentlemen and incumbents of metropolitan parishes, and after much deliberation it has been resolved to form an "Association for the relief of destitution and the improvement of the condition of the poor in the metropolis by means of parochial and district visiting." The Bishop of London will be President of the association, and it is settled that the whole of the funds shall be directly applied to the relief of the indigent after all proper inquiry has been made by gratuitous visitors. The rules and regulations will shortly be announced to the public.—The committee appointed at the meeting held in Leicester-square on the 20th ult., to consider the best method of providing for the relief of the houseless and destitute poor, have decided that the immediate object then proposed, so far as relates to one or more houses of refuge in the western portion of the metropolis, can be most efficiently obtained by a junction with the institution already existing in the City for affording nightly shelter to the houseless, and temporary relief to the destitute. In lieu therefore of establishing a new institution it has been thought advisable by the committee to accept the offer of co-operation made to them by the City Society, who are desirous of extending their operations to the western portion of the metropolis, and who have at the same time the advantage of being assisted by those who have had a successful experience of the working of such an institution for the last 20 years.

Christmas Cattle Show.—Simultaneously with the usual exhibition of prize cattle, the annual general meeting of the members of the Smithfield Cattle Club took place last week at the Horse Bazaar. Earl Spencer, the President of the Club, presided on the occasion. The meeting was very fully attended by noblemen and gentlemen, among whom were the Duke of Richmond, Lord Camden, Lord Western, Sir E. Mostyn, the Hon. Mr. Clifford, &c. The award of the judges was unanimously approved of, and the meeting then proceeded to the election of officers. Earl Spencer was re-elected President, and the Duke of Richmond, the Earl of Scarborough, Lord Western, Lord Aboyne, Sir J. Seabright, and J. M. Cripps, Esq., Vice-Presidents. Mr. H. Gibbs, who has held the office of honorary secretary for seven years, then resigned on account of ill health, and that gentleman's brother, Mr. B. T. B. Gibbs, was elected in his place. Mr. Druce was appointed steward of the beasts, and Mr. Dean of the short-woolled sheep for the ensuing three years. The Cattle Show was opened as early as 7 in the morning, and from that time throughout the week the whole neighbourhood presented the appearance of a fair. The implements of agriculture exhibited in the galleries appeared to excite much admiration. It is computed that upwards of 10,000 persons visited the Bazaar during the first day, and upwards of 20,000 on Thursday. On Friday it was honoured by the presence of Prince Albert, Gen. Espartero, and other distinguished visitors.

Commission of Lunacy.—A commission was sitting during the greater part of last week to inquire into the state of mind of Mrs. Hartley, a lady of fortune residing in Park-street, Grosvenor-square, who imagined herself to be Duchess of Cornwall, Viscountess Rialton, &c., and believed that a conspiracy existed to poison her. The jury found a verdict of Insanity, and were then called upon to enter upon a similar inquiry respecting Mr. W. H. Hartley, the son of the unfortunate lady. The same witnesses as in the former case proved that though the delusions of the son were not altogether the same as those of the mother, yet the case was more urgent, as the insanity of the son was of a dangerous character and required immediate control. The jury returned a verdict that he had been insane since the 13th Sept. last.

The Tower.—The Duke of Wellington as Constable of the Tower a few days since inspected the ruins and ground devastated by the fire on the 30th Oct. 1841, with a view of appropriating the site to new barracks for the soldiers. It will be recollected that the Brick Tower at the eastern end of the Armoury was destroyed in the general conflagration. The outer walls however escaped, and were suffered to remain with the intention it is supposed of preservation, but this will not now be the case, as such a pile would interfere with the new arrangement. The same space will be occupied by the new barracks that was formerly covered by the Armoury, and it is rumoured that the style is to be the military Gothic. It would now appear that the fire only anticipated the destruction of the old Armoury, as extensive cracks had but a short time previously shown themselves throughout the whole of the eastern portion, and great apprehensions were entertained by the Ordnance for its safety. The lower barracks in the Old Mint, on the completion of the proposed erection, will be converted into storehouses. The moat surrounding the Tower has been filled only half its depth; but as the drainage is inefficient and its depth is unfavourable to

the preservation of trees and plants which it is intended to plant in the course of the ensuing summer, some thousand additional loads of mould will be required to raise it to a sufficient height above the level of high water, and thus insure sufficient ventilation.

The New Royal Exchange.—The works of the New Exchange continue to progress very rapidly. On Saturday the Grasshopper, the crest of the founder, Sir Thomas Gresham, formerly so conspicuous an object over the clock-tower of the old building, was placed upon the summit of the tower which forms the principal feature of the east end of the new structure. Several members of the Gresham Committee attended the ceremony, and the completion of the masonry of the building was celebrated by a dinner among the workmen given by the contractors, who have completed their contract within the specified time. The foundation-stone was laid on the 17th Jan., 1842, and the works have been executed to their present state in about 20 months. The building is now slated, all the divisions of rooms are formed, and the greater part of the fire-proof arches over the shops are turned.

Lincoln's Inn.—The appointment of preacher to the Society of Lincoln's Inn having become vacant by the late preacher being appointed Bishop of Lichfield, nineteen clergymen have sent in their applications to the benchers. The following are among the number: Rev. Thomas Robinson, late Archdeacon of Madras; Archdeacon Manning; Rev. Mr. Anderson, of Brighton; Rev. Mr. Garbett, professor of poetry in the University of Oxford; Rev. Mr. Claughton; Rev. Mr. Randall, rector of Binfield, Berks; Rev. Shergold Boone, incumbent of a district church of Marylebone; Rev. Mr. Jelf; Rev. Mr. Vaughan of Brixton; Rev. Dr. Hussey of Hayes; Hon. and Rev. Mr. Best; Hon. and Rev. Mr. Erskine; Rev. Mr. Harness of St. Pancras. The appointment of deputy preacher at Lincoln's Inn is also vacant; it was formerly in the gift of the preacher, but the benchers of Lincoln's Inn have now taken the appointment into their own hands.

Metropolitan Improvements.—A numerous meeting of the parishioners of St. Paul's Covent-garden was held a few days since in the vestry-room of the church, to take into consideration the propriety of petitioning Parliament to pass an act to authorise the formation of a new street from the south-west corner of Long-acre to the north-west corner of King-street, and to determine on the most advisable course to be adopted to secure so desirable a carriage entrance into the parish. Resolutions were agreed to that a committee should wait on the Duke of Bedford to request his co-operation, and also wait upon the various holders of premises in the line to solicit their support; and that a committee should be formed to carry out the object who should report to a future vestry. It was also resolved that a petition should be prepared to be presented to Parliament on the subject.—With the exception of a few houses at the Whitechapel terminus and some smaller tenements near Spitalfields Church, nearly all the houses are down on the site of the new street at the East end of the metropolis. It comprises a district previously inhabited by the poorest classes, and the removal of the houses has been of great benefit to the neighbourhood, as the want of drainage and ventilation and the crowded abodes with which it was covered rendered it a frequent source of disease. It is the intention of the commissioners on the completion of this line of road to carry another oblique street from it to the railways at Shoreditch, by which communication will be opened between the trade of the northern and eastern counties and that of the docks and river-side. The Eastern Counties Railway having taken down many houses in Bethnal-green and Shoreditch, advantage has been taken of their removal to improve the neighbourhood by the erection of new streets and houses.

Lieutenant Munro.—The daily papers state that it is generally believed to be Lieut. Munro's intention to leave the Royal Horse Guards and enter the Prussian Service, with the view of permanently residing abroad. His household furniture, &c. has been sold this week, which appears to confirm the rumour that he does not now intend to surrender to take his trial.

The Rev. Mr. Melvill.—This popular preacher, whose chapel at Camberwell has for many years attracted numerous congregations not only from the inhabitants of the neighbourhood but from different parts of the metropolis, has been appointed Principal of the East India College at Haileybury, and will consequently retire from the chapel with which he has been so long connected. It is not known whether he will vacate his preferment as Chaplain of the Tower.

Freemasonry.—A grand lodge was held at the Freemasons' Hall on Wednesday week, for the nomination of Grand Master of the Order of Free and Accepted Masons of England, rendered vacant by the decease of H. R. H. the Duke of Sussex. The Earl of Zetland, pro-grand Master, and the Marquis of Salisbury, Deputy Grand Master, were both put in nomination. The former was proposed by Brother Peter Thompson, and seconded by Brother James Gibbins; and the latter by the junior Grand Warden, and seconded by one of the past masters. The ballot for the election will take place at the next grand lodge in March next.

Inquests.—On Tuesday an inquest was held on the body of William Wood, a gardener and gate-keeper of St. James's Park: John Jones, gardener, stated that he and deceased were both employed in the enclosure of St. James's Park as gardeners and gate-keepers. On Saturday morning witness and deceased went over to the Horse Guards to sharpen some gardening-tools. Deceased was in the act of sharpening a bill-hook and witness was turning the grindstone, when deceased fell backwards on the ground appa-

rently quite lifeless. Witness raised deceased from the ground and carried him to the Westminster Hospital. He was evidently quite dead. He had never complained of being unwell, and appeared up to the instant of his death to be in excellent health. The house-surgeon said that he was quite dead when brought to the Hospital, and there was no doubt that he had died a natural death. The jury returned a verdict in accordance with this evidence.—An inquest was held on the 8th at the Model Prison at Pentonville on the body of John Bremner, aged 24 years, who was removed into the prison on the 30th May, 1843, from Aberdeen, where he was sentenced on the 27th April previous to 7 years' transportation. The Coroner instituted a minute inquiry into the management of the prison and went with the jury to the cell the deceased had inhabited, and having carefully examined it expressed themselves pleased with its size and appearance, and with the bed and everything else that it contained. Among the witnesses examined were five prisoners, and in order that they should not be selected persons, the men numbered 1, 2, 3, 4, and 5, were produced. Their examination was conducted in the absence of all the officers of the gaol. One of the prisoners was the second who had entered it. The prisoners then, in answer to a variety of questions from the Coroner as to their treatment, all concurred (though examined separately) in bearing testimony to the uniform kindness of the Governor, physician, warders, teachers, and other officers of the prison. They also spoke of the sufficiency of food and of their comfortable location in the cells; but two complained that the cells were too close; one of the two however had a difficulty of breathing. They all appeared very grateful for having been taught trades by which they could support themselves when set at liberty. Some complained of the solitude and silent system, and one added that his annoyance in this respect arose chiefly "from his inability to tell people how grateful he was for the kindness shown to him." From the statement of another prisoner it appeared that they were allowed to see their wives only once in three months. At the close of the examination the coroner requested the attendance of the Governor and Dr. Rees, and informed them that the first prisoner who was a witness had complained that his cell "was sadly too close." That might have seemed so only from his difficulty of breathing, but the last prisoner had also found his cell too warm. He also mentioned the effect of the rope-dust on his lungs. The Governor said that complaint was not common in the prison but the man should be a basket-maker. The Coroner then repeated the statement of a prisoner who had acquired a passion for reading the Bible. The man, he said, had spoken with tears of gratitude of his treatment, but said he felt fagged and weakened, and it was evident from his description and appearance that his brain threatened to become soft; probably by constantly dwelling on what he could not understand. He would advise the Governor to stop that tendency, or the portals of Bethlehem would soon be open to the man. The Governor and Dr. Rees promised to give attention to these suggestions, and the jury having returned a verdict that "John Bremner died a natural death from pulmonary consumption," the court was dissolved, with many expressions of gratification on the part of the jury at the facts elicited as to the kindness and attention bestowed on the prisoners.—An inquest has also been held on the body of Charles Shipley, formerly a clerk to Messrs. Williams and Deacon, bankers, Birchin-lane, who was under sentence of transportation for seven years on a charge of embezzling 402l. 7s. 6d. It was proved that deceased died of an affection of the brain, and that he came out of the infirmary of Newgate straight to the prison. The coroner remarked that such a practice is very unfair to the medical officers of the prison, and was calculated to swell the fatal cases on their sick list in an improper manner. "It is to be regretted," he said, "that no statement that the man had just come out of the infirmary at Newgate was sent here, so as to put you on your guard respecting him. The greater portion of what we have heard to-day has been extremely satisfactory respecting the prisoners; but I believe that if an indication had been made to Dr. Rees on the subject, and he had understood the extent of his power in refusing admission to a sick person, we should not have been sitting here now. There is no doubt that the death was produced by a natural cause, and there our inquiry ends. With regard to the surgeon's certificate from Newgate, his reply to us, if we had him here, would only be that in giving it he fulfilled the condition of the law, and that his official duty as surgeon of the gaol terminated there, as he is only required to certify that the prisoners are not affected by any putrid or contagious disease and are fit to be removed." The jury, without hesitation, returned a verdict that deceased had died "A natural death, caused by an effusion of water on the brain." A relative of the deceased then came forward, and said he should retire from the court to tell the family that the treatment of the deceased in that prison had been perfectly satisfactory, but that he could not say the same with regard to his being sent there from the infirmary at Newgate.—An inquest was held on Saturday on the body of Lieut.-Gen. Sir John Taylor, whose death was announced in our obituary last week, and after a long inquiry a verdict that he "died by the visitation of God" was returned.

Mortality of the Metropolis.—The number of deaths registered in the week ending Saturday, Dec. 2, was as follows:—West Districts, 154; North Districts, 198; Central Districts, 211; East Districts, 257; South Districts, 267; Total, 1,087 (males, 572; females, 515). Weekly average for the last five years, 903 (461 males, 442 females); and for the last five autumns, 908.

Provincial News.

Incendiary Fires.—During the last fortnight the county of Bedford although generally tranquil has been disturbed by repeated nightly fires, and there is evidence to show that they have been the work of incendiaries. It is impossible to assign to the commission of such mischief any distinct or probable motives as the agricultural labourers appear to be generally more contented than in other rural districts of the kingdom. A fire occurred a few days ago in the barn of Alderman Higgins of Bedford, on the Kimbolton-road, by which an old soldier lost his life. Two persons were apprehended on suspicion, but were discharged for defect of evidence.—A large barn and out-houses on the farm of Mr. Eames at Hownes near Amptill were destroyed on Saturday morning, the incendiary has been apprehended and committed for trial on his own confession.—On Sunday night a fire took place at the village of Stockton, Norfolk, on a farm in the occupation of Mr. Grimmer, and in a short space of time a large barn filled with the produce of 20 acres of barley was entirely consumed.—The barn of Mr. Matthews a farmer at Stockcross, Berks, containing a quantity of corn was fired a few evenings since, and with the whole of its contents totally consumed. A poor man named John Grey, living at Burden's Heath near Thatcham, had his little barn and all it contained burnt to the ground. There is little doubt that both these fires were caused by incendiaries.—On Thursday night the 6th inst. a fire was discovered in the farm-buildings of Mr. Kirby of Boxworth, Cambridgeshire. The flames broke out at half-past 11, and notwithstanding every exertion the barns, out-houses, carts, &c., two horses, a cow, 17 pigs, the poultry, and the produce of 500 acres of land, with a cottage, were entirely consumed, leaving only the farm-house standing. There is no doubt that it was the act of an incendiary, as it originated in a barn where no one had been employed for a week.—On Thursday last about five o'clock a fire occurred in a farm-yard belonging to Mr. Fyson of Fen Ditton, about two miles and a half from Cambridge. The yard contained 17 stacks of every description of grain, two large barns, a granary, pigeon-house, cart-hovels, piggeries, and other outbuildings. The fire first broke out in a stack of oat-straw, and in a few minutes from the commencement the whole of the stacks were in a blaze. The labourers manifested little desire to aid in extinguishing the fire. The engines were chiefly worked by members of the University who actively employed themselves in attempting to save the property. There appears to be no doubt that it was the work of an incendiary. Two men have been apprehended, one of whom still remains in custody. The loss cannot be less than 5,000l.—On Monday evening a barn containing unthreshed wheat was fired on the premises of John Hindley, being part of Hurst Hale farm near Chat Moss and on the line of the Liverpool Railway. There seems little doubt that the object of the incendiary was to rob the house, the fire being kindled just opposite the door, and a man called Hayes has been apprehended on suspicion.—On the night of the 5th inst. a farm called Noouses in the parish of Sawbridgeworth, in the occupation of Mrs. Bennett, was fired and almost destroyed together with the outbuildings and their contents. Government have offered a reward of 100l. with a pardon to the accomplices, and a further reward of 100l. has been offered by the Phoenix Fire Office for the apprehension of the incendiaries. The following rewards have also been issued:—For the destruction of barns belonging to Mr. Hindley, of Hurst-hall, Culcheth, and a barn the property of Mr. Blackburn, of Hay Astley, near Manchester. For barns and outbuildings of Mrs. Tyrell, of Polstead-hall, Suffolk, 100l. by Government, and 50l. by the Suffolk Insurance-office. For a stack of barley belonging to Mr. G. Gayford, of Rymer-house, Suffolk, 50l. by Government, 50l. by the Duke of Grafton, and 50l. each by the Norwich Union and Blackburne Association. For the barns and out-houses of Mr. S. Buck, of Hawstead Lodge Farm, Suffolk, 100l. by Government, 500l. by the Suffolk-office, and 50l. by the Essex and Sussex Equitable. For a stack of barley belonging to Mr. Kersey, of Fakenham, Suffolk, 50l. by the Duke of Grafton, 50l. by the Suffolk-office, and 50l. by the Blackburne Association. For the bean-hovel of Mr. French, of Whitfield, two carts and hayrick damaged. For the bean-rick of Mrs. Brown, of Rothwell, Northampton, with wheat-rick barley-rick, and range of beast-hovels, 50l. by Government. For a barley-stack belonging to Mr. Nead, of Easton, 52l. 10s. by the Norwich Union. For the barley-stack of Mr. Gooch, of Honingham, 105l. by the Norwich Union, and 105l. by Mr. Gooch.

Ashton.—The turn-out at this place and Staleybridge has suddenly terminated much sooner than was expected from its extensive ramifications. All the hands resumed their employment on Thursday week and at the old rate of wages. This timely cessation of hostilities has given great comfort to many innocent individuals and families.

Brighton.—Since the late fatal accident by the falling of the cliff at Rottingdean other portions have given way, and on Tuesday night, at Blackrock, close to Arundel-terrace, Kemp-town, several tons of earth fell, completely undermining the carriage-road and threatening its entire destruction. It has been necessary to remove the palings into the middle of the road, leaving only sufficient room for one carriage to pass at a time. Numbers of visitors are daily attracted to the spot to see the destruction made to one of the best roads out of Brighton. Measures are in progress for cutting a new road from Kemp-town to Rottingdean more inland, as no means can be adopted to save the present road.

Brill.—The Annual dinner of the District Conservative Association took place at Brill on Thursday. Mr. J. Stone

of Crendon in the chair. After the usual loyal and local toasts the Duke of Buckingham said the chairman had asked him to give the toast which stood next on the list, a toast which it was at all times grateful to him to propose, and which on the present occasion was doubly gratifying,—"Prosperity to the British Farmer." In that room and in the county of Buckingham they had frequent opportunities of drinking that toast and of hearing speeches upon that most important topic—the state of the agriculture of the country; but if ever there was a time which more than another demanded the steady support of those who had been returned to Parliament by the agriculturists for the express purpose of supporting British agriculture and the British farmer it was the present. And he could heartily say that he wished the speeches which he had heard made by many for whom he had great respect had been carried out to their full extent and that those gentlemen had not detracted from the value of their speeches by contrary votes. To the British farmer this country owed a vast debt of gratitude for the manner in which for many years past he had laboured hard in cultivating the soil of this country and for the indomitable spirit which he had evinced in times of difficulty and danger. It would be presumptuous in him to say more on this subject, inasmuch as he had so often and so repeatedly stated the opinions and feelings which he entertained, and which had never undergone the slightest change. He could but again express his conviction, that if the agriculture of this country was not supported the farmer could not compete with the foreigner, and whenever that occurred they might depend upon it the well-being of the land would be utterly destroyed. Unchanged in those opinions, which he had recorded alike in that country in his former place in the House of Commons, and in his place in the House of Peers, he stood there now only to repeat them word for word, and to call on the members for that county steadily to perform the duty to which they devoted themselves on the hustings. He solemnly called on the representatives of the agricultural interest throughout all parts of the United Kingdom to come forward now and steadily to maintain the opinions which they had broached at the hustings, and by their votes record their firm adherence to the cause of the British farmer. The Noble Duke again repeated the satisfaction which it gave him to propose "The health of the British farmer," whose value and the sterling honesty of whose heart he most fully appreciated. He called on them to rise and drink with hearty cheers "The health of the British Farmer, and may he overcome the difficulties which now threaten him." Mr. Stone, a farmer, returned thanks with much spirit; and several other toasts of local interest were proposed before the close of the meeting.

Bristol.—The local papers state in reference to the death of Mr. Mountjoy of this town, whose body was exhumed last week as stated in our last, that on the *post mortem* examination a corroded pin was found in the part of the body that was diseased, and in the absence of poison the cause of death is attributed to the swallowing of this pin.

Carmarthen.—The Special Commissioners have recently obtained the opinion of the law-officers of the Crown on a practice affecting the administration of the turnpike laws which has prevailed to a considerable extent in Carmarthenshire, and has been the subject of much complaint on the part of the poorer classes of farmers. It frequently occurs that the farmer, having carried his produce to a town or market, and paid toll at the gates, returns on the same day, carrying home in his cart some articles or goods for a friend or neighbour, which he conveys either gratuitously or in consideration of some small payment for his trouble. It has been a common practice with certain toll-collectors to charge carts thus repassing on the same day with a second toll, applying to such cases a clause contained in most local acts, which renders stage carriages and vehicles carrying passengers or goods for pay, hire, or reward, liable to toll for every time of repassing. The Commissioners, considering that the practice in question proceeded upon a misapplication of this clause, and that the additional toll was legally chargeable only on vehicles of the nature of stage-coaches, carriers' carts, and such as regularly ply for hire between certain places, referred the point to the Attorney and Solicitor-General, who have given their opinion that in these cases a second toll cannot be legally demanded.

Derby.—We copy the following paragraph from the *Derby Reporter*:—"There is no part of the princely and munificent generosity of the Duke of Devonshire that will give more general pleasure than his Grace's direction to gratify the public to the utmost extent consistent with the comfort and enjoyment of the Royal party. We have great pleasure in stating that this liberty was not abused, except in one instance. A small brown crystal is missing from the conservatory. We understand it is a rare specimen, and cannot be long concealed if exposed for sale. We trust for the honour of the county that this crystal will be forthwith restored to the place from whence it was taken, and that it may not be said the Noble Duke's munificence is shamefully abused. We hope it is a thoughtless act of some person, who as soon as he knows the value attached to it will restore it immediately."

Footscray.—On Wednesday the coroner and jury impanelled to investigate the death of Maria Plummer, re-assembled for the fourth time at Sidcup to prosecute the inquiry. Our readers will remember that the deceased, who was separated from her husband, a gardener in the service of Lord Bexley, and who agreed to allow her 2s. 6d. per week, had in consequence of his neglect to do so been rendered houseless and destitute. In this state she wandered about, and but two days before her death applied to Mr. Pritchard, surgeon, of Sidcup, for a letter to Mr. Banks, relieving overseer of the Bromley union,

which he gave her. She saw Mr. Banks on the following morning; but instead of his relieving her he went to find her husband, and subsequently left word that deceased was to go before the board on the following Friday, but before that time arrived she died. The inquiry was adjourned to trace if deceased delivered to the relieving officer the letter given her by Mr. Pritchard, in which the necessity for her immediate relief was stated. Various acts of inhumanity were deposed to on the part of the husband, and it having been proved that her death was accelerated by neglect and exposure to cold consequent on the treatment she had received, the question arose whether the responsibility lay with the officer who had not relieved her or the husband who had neglected her. There being no distinct evidence that the relieving officer received the letter alluded to, the responsibility fell upon the husband who was bound to maintain her. After a protracted investigation the jury ultimately returned a verdict of "Manslaughter" against George Plummer the husband, and the coroner made out his committal to Maidstone gaol.

Gravesend.—An inquest has been held here on the body of George Grey, a young man who was killed in a pugilistic fight at Tilbury Fort last week. The Coroner said it was to be regretted that the evidence was not sufficient to throw light on the names of the whole of the parties connected with this disgraceful transaction. The medical testimony went clearly to show that the deceased had died from violence and injuries he had received, and it was also as clearly proved by the witness Davies, who had been admitted as evidence, that such injuries were inflicted a short time previously in a conflict with Henry Ball. The actual origin of the fight was left in mystery, but it was shown that the seconds were fighting men, who although they had escaped for the present could not, inasmuch as they were well known to the police, long evade the law. The Jury returned a verdict against Henry Ball as principal of "Manslaughter" in the first degree, and a verdict of "Manslaughter" in the second degree against John Grady, Tucker Smith, James Knowlton, and other persons to the Jurors unknown, acting as seconds, time-keeper and bottle-holder at the fight. The Coroner then committed Henry Ball to Maidstone Gaol to take his trial. The other parties have not yet been apprehended.

Huddersfield.—The first meeting in Yorkshire, in connexion with the efforts of the Anti-Corn Law League in favour of free trade and the destruction of the Corn-law was held at the Philosophical Hall on Thursday week. Mr. Cobden, Mr. Bright, and Mr. Moore addressed the meeting, and resolutions in favour of free trade were unanimously passed. At the close the chairman announced the total amount of subscriptions to be upwards of 1322*l.*, being nearly double the sum realised last year.

Ilford.—At a meeting of the parishioners last week to consider the correspondence between the Bishop of London and the Vicar, the following resolution was proposed and adopted unanimously:—"That this meeting acquiescing in the opposition which has been raised to the introduction of the weekly offertory and the other changes in the manner of performing Divine service in this parish, do request the churchwardens to represent to the Vicar our sentiments on the subject, and our earnest desire that he will meet the wishes of his parishioners in discontinuing the weekly offertory, and returning to our former simple mode of worship."

Kirkdale.—Five poachers have been committed for trial on the charge of having been concerned in the murder of the Earl of Derby's gamekeeper at Knowsley on the 10th ult. They have been committed on the evidence of an accomplice, who gave a detailed account of the manner in which the five prisoners, himself, and four others who have not yet been arrested, journeyed to Knowsley on the night of the fatal occurrence, and of the way in which the murder was committed.

Lancaster.—On Thursday week a gang of poachers, nearly twenty in number, entered the preserves of Thos. Aspinall, Esq., in Little Mitton Wood, in this county, and were in pursuit of game when they were surprised by the keepers. A struggle ensued, and one of the poachers fired at John Schofield, one of the gamekeepers, and wounded him dangerously. Whilst the gamekeeper lay upon the ground, shot and disabled, he was beaten with bludgeons until he ceased to show signs of life. The poachers afterwards escaped. Mr. Aspinall has offered a reward of 100*l.* for the conviction of the offenders.

Leeds.—A meeting in favour of the Anti-Corn-Law League was held in this town on Wednesday, Mr. H. Stansfield in the chair. About 800 persons were present. The meeting was addressed by Messrs. Cobden, Bright, Moore, Fox, and Ashworth, and the sum of 2,100*l.* was collected for the League Fund.

Leicester.—A meeting was held in this city on the 30th ult., to consider the propriety of establishing a dissenting college in the Midland Counties for the instruction of young men designed both for spiritual and secular purposes, against whom the universities of this country are closed. Another feature is the founding of a class especially designed for the service of Christian missions, to the members of which it is proposed to communicate such a knowledge of medicine and simple surgery as may qualify them to attend to the physical interest of those among whom they may labour, and at the same time to afford such a knowledge of science in general as may enable them to promote the secular and commercial as well as the spiritual interests of the people they may visit. Leicester has been named as the seat of the projected college.

Liverpool.—The subscription in favour of the League Fund is making rapid progress in this town. The total subscriptions up to Saturday night amounted to 5,095*l.* 12*s.* A meeting was held a few days since in the Amphi-

theatre, Mr. Thorneley, M.P., in the chair, for the purpose of raising subscriptions on behalf of the Fund, and of hearing Messrs. Cobden and Bright on the subject of free-trade. At the close of the meeting subscriptions were collected, and no less than 4,100*l.* were raised in the course of the evening, being nearly double the whole amount of last year's subscription, which extended over a month or six weeks. Before the close of the subscription, it is believed that not less than 7,000*l.* will be raised in this town.

Newport.—The last accounts from the penal colonies state that Geach the solicitor and step-son of John Frost, who was about two years since transported for 20 years for forgery, has been after working 20 months upon the roads allowed a "ticket of leave," and hired as a free servant to his wife, who followed him out. Frost, who is released from the penal gang and is in a situation as clerk, has sent a letter to Mrs. Frost and his daughters desiring them to go out also, in the hope that Mrs. Frost will be allowed to hire him as a free servant. The Governor having informed Frost, Williams, and Jones, that the Home Office has finally determined never to allow them to return to their native land, they have resigned themselves to their fate, with a determination to secure to themselves kind treatment by their future good conduct. The letter which Mrs. Frost has received from her husband states that he and Williams have been brought back from the penal settlement whither they had been sent for having attempted to make their escape. Frost is comfortably situated as a clerk. Williams still wears the log on his leg, and Jones continues to hold the situation he obtained shortly after his arrival in the colony.

Oxford.—The Rev. G. W. Hall, D.D., Master of Pembroke College and Prebendary of Gloucester, died at his lodgings at the college on the 10th inst. He had been head of his college 34 years, having been elected in 1809. The members of the university who protested against the validity of the degree conferred upon Mr. Everett the American Minister in June last have submitted all the facts of the case to counsel in order to ascertain the legality of the degree. Mr. Fitzroy Kelly, Q.C., Mr. James R. Hope and Mr. Edward Badeley on perusing this case have given the following opinion:—"We are clearly of opinion that, under the circumstances stated, the grant of the degree in question was invalid. It was the duty of the Vice-Chancellor as the presiding officer of the convocation to take care that the proceedings were conducted with such regularity and order, as would have afforded those persons who were entitled to vote the opportunity of expressing their opinions and giving their votes in the usual manner. The scrutiny which was demanded ought to have been allowed, and if the noise was so great as to prevent the demand from being heard, we think that the Vice-Chancellor should have adjourned the meeting, or have adopted such other measures as were necessary to stop the confusion and enable him to know what was passing. As the irregularity of these proceedings was inconsistent alike with the general rules which are applicable to the meetings of all corporate bodies, and with the statutes and customs of the University which regulate the meetings of Convocation, we are of opinion that the decree is a nullity and that Mr. Everett cannot lawfully assume the rank of Doctor of Civil Law of the University of Oxford."

Portsmouth.—On Monday the 44th Regiment, which is now doing garrison duty at Gosport, was presented with new colours by Lady Pakenham the wife of the Major-General commanding the district. The ceremony of consecrating the colours was performed by Archdeacon Wilberforce, who made an impressive address to the regiment and concluded with an appropriate prayer. Immediately after the consecration of the colours, Lady Pakenham presented them to the Ensigns who had been selected to receive them, addressing the regiment on their late history in Afghanistan. Sir Hercules Pakenham then addressed the troops stating that the attention of the whole army is fixed upon them; that the Commander-in-Chief expects that by the combined action of all ranks they will establish a high regimental character, be distinguished for unanimity in promoting the welfare of the corps, for accuracy in the performance of all duties, and for that general regularity of conduct that reflects credit on and imparts comfort to all well-organised regiments, and that when the service of the country again calls the 44th to the field he was satisfied the Gallant Fours will be found second to none in the career of glory.

Salford.—A young man named Joseph Taylor, 23 years of age, whose mother resides at Prestwich, was brought up last week on a charge of having robbed his mother of 20*l.*; but the theft could not be clearly brought home to him. The prosecutor however, his eldest brother, stated that he had a much more serious charge against him, namely, that of having poisoned his father, a farmer at Prestwich, in April 1840; and with having about six weeks after that time attempted to poison the whole family. Evidence was adduced to prove that the prisoner attempted on several occasions to accomplish this purpose by mixing acetate of lead with the food eaten by the family, and he was ultimately committed to take his trial on the capital charge.

Stockport.—A man named George Fox a bailiff attached to the Stockport Court of Requests has been apprehended and committed to take his trial on a charge of having murdered his wife on Friday week in this town. He had absconded immediately after the death of his wife, but was arrested by the police at Maple Bridge.

Windsor.—One of the severest runs ever known with the Royal Stag Hounds took place on Monday, the fixture having been appointed at Winkfield-row about three or four miles from the kennel at Ascot. The field consisted

of about one hundred. The deer Sulky, who had afforded some splendid runs during the past two seasons, was turned out near Winkfield Church, and went away through Miss Farrand's Park for Farnborough and Elvetham, near Hartford bridge, in Hampshire, into Dogmersfield Park, the seat of Lady Mildmay, where, after going over between thirty and forty miles of heavy country, at a tremendous pace, he was literally dead beat, and died before the pack and the few whose horses managed to continue the chase, had got up. Only fifteen (including Mr. Davis the huntsman, and the whips) were up at the finish. The run occupied a little more than three hours; the distance from point to point was upwards of twenty miles, but from the doublings and divergings the distance gone over could not have been less than forty miles. The hounds from the kennel to the meet during the run and back from Dogmersfield Park to the kennel at Ascot went over upwards of sixty miles of country, a great portion of which was of an extremely heavy character.

Railways.—The following are the returns for the past week:—Birmingham and Derby, 1518*l.*; Birmingham and Gloucester, 1631*l.*; Eastern Counties, 2236*l.*; Edinburgh and Glasgow, 1830*l.*; Great Western, 11,134*l.*; Grand Junction, 6630*l.*; Glasgow, Paisley, and Ayr, 1108*l.*; Great North of England, 1262*l.*; Hull and Selby, 980*l.*; London and Birmingham, 13,371*l.*; South Western, 4879*l.*; Blackwall, 617*l.*; Greenwich, 673*l.*; Brighton, 2943*l.*; Croydon, 201*l.*; Liverpool and Manchester, 3540*l.*; Manchester and Leeds, 4113*l.*; Midland Counties, 2151*l.*; Manchester and Birmingham, 2516*l.*; Northern and Eastern, 1405*l.*; North Midland, 4126*l.*; Newcastle and Carlisle, 1361*l.*; South Eastern and Dover, 2901*l.*; Sheffield and Manchester, 469*l.*; York and North Midland, 1497*l.*—It is said that plans have been made and estimates given for an atmospheric railway between Margate and Ramsgate on the same principle as that between Dublin and Kingstown. This would connect Margate with the proposed branch from the South Eastern to Ramsgate.

IRELAND.

Dublin.—One of the Repeal papers states that on the first day of next term a renewed application will be made by the traversers for a "list of the witnesses" against them, and that the trials will not commence before the 1st of February. The weekly meeting of the Repeal Association took place on Monday, Mr. T. Reynolds in the chair. Mr. J. O'Connell moved two resolutions with reference to the late Rev. P. J. Tyrrell. The first was, that the association recognised as a sacred duty the claim upon them for subsistence during life of the father of the martyr for Ireland—the Rev. Mr. Tyrrell. The second pledged the association that they would immediately erect a suitable monument to record to posterity the virtues and devoted patriotism of the Rev. Mr. Tyrrell, and the sacrifice of his life in the discharge of his duties as a pastor and as an Irishman. He said that these resolutions had been already pledged on behalf of the association by their committee, and he would now call on them to confirm them. He then proceeded to a detailed narration of the circumstances attendant upon the illness and death of the rev. gentleman, whom he described as a martyr to the prosecutions and to his love of old Ireland, and seemed considerably affected at intervals in his address. He spoke of Mr. Tyrrell's poverty—of his homely cottage—of his bereaved and aged father, and called on the association to say if that old man should be left forlorn and helpless. He said, as he looked upon the old man following his son's body to the grave, "The cause of this old man's bereavement is the legislative union." He called on them to confirm the promise the committee had made, to erect to the sainted memory of the martyred Father Tyrrell a monument to commemorate his devotion and death for Ireland. He concluded a lengthened address by moving the resolution amid the loudest demonstrations of applause. Mr. Steele seconded the resolution, which was supported by Dr. Gray and the Rev. Mr. Doran, who said that the last words Mr. Tyrrell uttered were—"The laws, the laws, the laws!" He could speak of nothing but the prosecutions, and after he closed his eyes, in his dreams all the tedious documents he had gone through in the day rose up again before him. The chairman put the resolutions, which were passed unanimously amid loud applause. Some conversation then took place as to the site of the proposed memorial, Mr. J. O'Connell apparently preferring an elevated mound near the chapel of Lusk, as most appropriate. A long letter was then read from Mr. Joseph Sturge, pointing out various objections to Mr. O'Connell's proposed scheme of Repeal, and stating among other things, his belief that there would really be less danger of an hostile cohesion between the two countries if they were entirely and completely separated, than if a merely nominal connexion be maintained through the person of one sovereign, controlled by two independent sets of advisers, each responsible to a different Parliament. Mr. J. O'Connell, after a few remarks in reply to the letter of Mr. Sturge, moved that it be referred for reply to Mr. O'Connell, which was carried. After alluding with regret to the fact that the ribbon system was spreading in some parts of the country, Mr. John O'Connell announced the repeal rent for the week to be 512*l.* 14*s.* 5*d.*—Captain Larcom having declined the office of secretary to the Landlord and Tenant Commission, Mr. Pooler is appointed to discharge the duties for the present. This gentleman was secretary to the Royal Horticultural Society of Ireland for many years.—The last accounts of the State prosecutions state that the agents for the traversers have taken extensive chambers adjacent to the Four Courts, preparatory to the State prosecutions. They are to obtain possession on the 15th of January, the day fixed for the trial. They have engaged those cham-

bers for six months certain from that date, or for twelve months, provided the State prosecutions continue so long. Mr. O'Connell is on a tour in Kerry, and is in the best health and spirits, and indulging in the enjoyment of his mountain sports.

Tipperary.—In reference to the state of this county, the *Nenagh Guardian* denies that the majority of the offences have their origin in anything of a political or sectarian character, and adds, "The only inference which can be drawn from the unceasing and never-ending crime of Tipperary must be the insatiable thirst for land and for its occupancy without payment. One of the primary causes of all these evils was the subdivision of farms into smaller ones, and the man whose station in life should have been that of a labourer thus aspiring to the position of a farmer. The same paper states that Mr. Kempson, its proprietor, has received a significant notice that unless he change his politics, he may calculate on having his brains blown out, and adds that Mr. Kempson has been denounced from the altar of Killeen Chapel, and gives the name of the denouncer.—The local papers mention another murder in this unfortunate county. On Thursday week, a man named Fogarty went from Nenagh accompanied by two bailiffs to execute a civil bill decree on Mr. J. W. Ryan, of Carrigatogher. Having succeeded in the arrest, Fogarty sent one of the bailiffs to Nenagh for a car to take Mr. Ryan to the Marshalsea. While waiting for the vehicle, a party of men entered the house for the purpose without doubt of rescuing Mr. Ryan, but this course Mr. Ryan, who has much influence in that part of the country, dissuaded them against, so they accordingly departed without offering either Fogarty or the remaining bailiff any molestation. Unhappily, the carboy now appeared, approaching the house with the other bailiff. He was in the act of passing by the orchard, when stones were hurled at him. One of them struck him—he jumped off the car, and ran for refuge towards the next house, but before he could reach it he was struck by another stone and knocked down. The poor fellow when taken up was senseless. He was then carried into a cottage where he lingered until about one o'clock on the morning of last Sunday. He had the power of speech about three hours after he had been beaten, and on Friday he was able to tell the names of the persons who pursued and struck him. The murderers are also known by other persons. On Sunday an inquest was held on view of the body and a verdict of Wilful Murder found against the principal. The police are vigilant in their exertions and have already succeeded in making arrests.

Cork.—A report of the Skibbereen petty sessions in the *Cork Examiner* states that Mr. Sandy O'Driscoll, a magistrate of the county of Cork who has taken a leading part in political meetings in that county, has been convicted of a violent assault upon a poor boy whom he flogged unmercifully. The magistrate being found guilty was sentenced to pay a fine of 2*l.*

SCOTLAND.

Glasgow.—Mr. Hamilton the eminent architect died on Tuesday week, in his 76th year. The number of elegant or splendid structures designed by Mr. Hamilton, particularly in the West of Scotland, is very great. Independently of Hamilton Palace, the princely seat of the Duke of Hamilton, he produced the Royal Exchange of Glasgow; the Western Club-house, the British Linen, the Glasgow and Ship, and other banks; Tower Castle, the seat of the late Mr. Kirkman Finlay; Dunlop House, Ayrshire, the seat of Sir John Dunlop, Bart.; Lennox Castle, the residence of John Kincaid, Esq., of Kincaid; and numerous other buildings, remarkable for their taste and effect. Mr. Hamilton was also a competitor for the new houses of Parliament, and although his design was not adopted it was rewarded by a prize of 500*l.*—On Saturday a meeting was held in this city in favour of the fund now raising by the Anti Corn-Law League. Provost Lumsden in the chair, at which the sum of 3000*l.* was collected before the meeting broke up.

Miscellaneous.

Liberality of Her Majesty.—The following interesting anecdote, showing her Majesty's generous sympathy with the distresses of literary men and her judgment in selecting the objects of her bounty has been made known by permission of Mr. Anson, the treasurer of Prince Albert. About two months since Mr. Anson addressed a private communication to Mr. Blewitt, the secretary of the Literary Fund, requesting him to communicate the names of "any persons above 50 years of age whom he might happen to know in the literary world, reduced to poverty, and whose exertions in the cause of literature might give them a claim to a charitable provision for life." In accordance with these instructions the names of several persons of advanced age, who had obtained some eminence in various departments of literature, were submitted to her Majesty, from which two gentlemen, Mr. Moncrieff, the dramatist, and Mr. Davis, the author of the "Post Captain," and of "Travels in America, in 1798-99," were selected for poor Brotherships in the Charter-house. The appointment was offered in the first instance to Mr. William Jones, author of the "History of the Waldenses and Albigenes," and of many works connected with Biblical literature; but he was unable to accept it from being a dissenter. The Queen however with the kindest feeling was graciously pleased to make provision for him in another way which would not interfere with his conscientious scruples, and accordingly placed in Mr. Blewitt's hands the sum of 60*l.* from the Royal "Bounty Fund," to be doled out to Mr. Jones in annual instalments of 20*l.* for the next three years.

Col. Stoddart and Capt. Conolly.—Notwithstanding the many unfavourable reports which have reached this country, there are, according to the accounts received this week from Constantinople, strong grounds for believing that no execution of any Englishmen has taken place at Bokhara, and that the presumption is strong in favour of the belief that Col. Stoddart and Capt. Conolly are yet alive. Sir Stratford Canning, our Ambassador at Constantinople, in a recent letter to the Rev. Dr. Wolff, states that information to this effect has been received by Mr. Layard from a native of Bokhara:—"I rejoice," he adds, "more than language can express to hear that an Englishman named 'Stoddart' was alive at Bokhara five or six months ago, when the individual from whom this information has been obtained left that city."

Antiquarian Researches.—Mr. C. Ade, of Milton-court farm, near Lewes, has recently dug up in his garden a considerable number of silver pennies of the reign of Canute, Harold the First, Hardicanute, and Edward the Confessor. The coins are said to be in an excellent state of preservation. At a meeting of the Numismatic Society, last week, Lord A. Conyngham in the chair, a paper by Mr. Akerman was read on some Merovingian and other gold coins discovered in the parish of Crondall, Hants, near an ancient encampment called "Cæsar's Camp." With the coins were found some jewelled ornaments and a gold chain. The coins belong to the first race of the French kings and their moneyers. Many are capable of being satisfactorily appropriated to a variety of towns, such as Quentovic, Marsal, &c.; others are evident imitations of Roman coins. Many are quite new to the numismatist, and among these are some remarkable ones, having on one side a full-faced beardless head and a cross, and on the other the word "LVNDVNI" with a cross within a circle. It is well known that at the period of the Merovingian dynasty the coinage of England was in silver, but the coins in question seem to be an exception to the rule. Mr. Akerman remarked, that whatever may be their date, it will not be doubted that they are of English origin, and that their place of mintage was London. The possessor of the coins is Mr. C. E. Lefroy, of Ewshot.

Travelling in 1753 and 1843.—The following advertisement appeared in *Felix Farley* on the 7th of March, 1753:—"Bristol Flying Coach to London in two days; will set out from the White Hart Inn, in Broad-street, every Monday, Wednesday, and Friday, at two o'clock in the morning, and continue all the summer months; each passenger to pay 24*s.* and be allowed 20*lbs.* weight." On the 19th of July, 1843, the journey was performed in two hours and forty minutes.

Ancient Wheat.—A letter from Munich states that in effecting some repairs in the old Castle of Burghausen, in Bavaria, a secret chamber has been discovered in which was found a quantity of wheat, placed there, as appears from an inscription lying with it, in 1395. The corn was in a tolerable state, and bread made from the flour was perfectly eatable. Both corn and flour had a blueish tinge.

A New Fire Escape.—A very simple and ingenious invention for preserving persons from being burnt in houses that are on fire has been invented by Mr. Thompson. The contrivance by which they are to be saved from the flames is this:—A rope, the two ends of which are held in the street by policemen or other persons is elevated by means of a pole, consisting of pieces fastened together after the manner of a fishing-rod, to the window of the house from which the inmates are to be rescued; the rope is then to be secured in the room by passing it round a hook or heavy piece of furniture, and the two ends in the street being pulled apart so as to form an angle, a belt, which is secured upon them by strong iron rivets, is forced up to the window, by means of two small iron wheels or sheaves, almost instantaneously. The apparatus will carry a man secured by the belt up to a window at the very top of the house, and will by means of the ends of the ropes being kept tight and asunder at such a distance as the occasion requires, enable any one to descend by means of the belt without any danger from too great rapidity. The machine was tried on Thursday in Sydney's-alley, in Adam-street Adelphi, and in Wellington-street, Strand, when repeated ascents to and descents from windows were made with complete success. The invention is so simple and manageable that any person can avail himself of it.

The Duke of Wellington and the Law.—A gentleman residing at Preston took upon himself last week to inform his Grace that a certain piece of land formerly enjoyed by the writer's family was now in the possession of another party, and as the property had originally belonged to the Crown he felt that he was only doing his duty in pointing out to the noble Duke how the Crown might gain re-possession of it. The answer is characteristic:—"London, Nov. 15, 1843.—The Duke of Wellington has received Mr. ———'s letter of the 11th inst. Mr. ——— should put to counsel learned in the law the question which he has asked of the Duke of Wellington. The Duke is the Commander-in-Chief of the army, not a counsel learned in the law."

Law.

VICK-CHANCELLOR'S COURT.—*Lyon and Jones v. M'Gill and Another.*—Mr. Romilly moved for an injunction to restrain the sale of property which the defendants held as mortgagors. The plaintiffs were the mortgagors, and the sale was advertised for the 5th inst. The real party against whom the motion was directed was Mrs. Anne M'Gill, otherwise Miss Cradock, whose case attracted the attention of the public some time ago, in consequence of the trial of M'Gill for the abduction of Miss Cradock from Liverpool. M'Gill was found guilty at the Lancaster Summer Assizes in 1842, and sentenced to eighteen months' imprisonment in Lancaster Castle. Since that period the plaintiffs had continued paying the interest to Miss Cradock, who acquired the property from her father, until upon an attempted sale an objection was taken to the title from the want of M'Gill's con-

ROYAL BOTANIC SOCIETY, REGENT'S PARK.—

The following days are fixed for the EXHIBITION of PLANTS, FLOWERS, and MICROSCOPES in the Gardens of this Society next season:—

TUESDAY, APRIL 30;

TUESDAY, JUNE 4;

TUESDAY, JULY 2, 1844;

When Prizes exceeding 900l. will be distributed. Tickets for admission may be had, by orders from Fellows or Members only, at the Office in the Gardens; price, on or before April 13th, 4s., after that day, 5s., except on the days of exhibition, when they will be charged 7s. 6d. each. Schedules of Prizes, and further particulars may be had at the Gardens.

RANUNCULUSES, ANEMONES, CARNATIONS, AURICULAS, and LILUM LANCIFOLIUM.

H. GROOM, Clapham-rose, near London (removed from Walworth), by Appointment FLORIST to HER MAJESTY, begs to remind the Nobility, Gentry, and Amateurs, that this is the best season for obtaining collections of the above flowers, and that in consequence of the success he has had in their cultivation this year he can offer them at the following moderate prices:—

100 Ranunculuses, in 100 superb sorts, with names 4 4 0	
100 Do. in 100 very fine sorts, do. 2 10 0	
Superfine mixtures from 7s. to 21s. per 100.	
100 Anemones in 100 superfine sorts, with names 2 10 0	
100 Do. in 50 do. do. do. 2 0 0	
Superfine mixtures 10s. per 100.	
25 pair of Carnations, in 25 superfine sorts, with names 3 10 0	
25 pair of Picotees, in 25 do. do. do. 2 10 0	
25 Auriculas, in 25 superfine sorts, with names 3 13 6	
Lilium lancifolium album, good bulbs, each . . . 0 3 6	
" " " large bulbs, each . . . 0 10 6	
" " " punctatum, good bulbs, each . . . 0 7 6	
" " " large bulbs, each . . . 1 1 0	

Catalogues may be had on application.—December, 1843.

NEW HARDY ANNUAL.

VISCARIA OCULATA—DARK-EYED VISCARIA.

T. MEN, York, have the pleasure of offering to the Public the above new and beautiful Annual, which is figured at page 53, (No. 10), of the "Botanical Register," for 1843. The blossoms are of a bright rose colour, with a deep crimson eye, and change to a pale purple. It flowers very abundantly through the greater part of the summer and autumn. It is a native of Algiers, and may be sown either in the open ground in spring, or raised in pots and planted out.

Packets, 2s. 6d. each, will be sent, on the receipt of a Post-office Order, postage free, to any part of the Kingdom.

SEEDS, NEW AND TRUE.

MESSRS. SUTTON AND SONS respectfully acquaint those readers of the *Gardeners' Chronicle* who have not yet hitherto honoured them with their commands, that their grounds being situated at considerable distances from each other, and of being different soils, they are enabled by strict attention to grow different sorts, and supply Seeds which GARDEN SEEDS true to their kinds, and supply Seeds which they know to be new, thereby preventing disappointment in the crops. A great saving of expense will also be effected, and the named improved sorts insured by purchasing either of the undermentioned collections, which are selected according to Messrs. Sutton's actual knowledge of the comparative merits of each kind.

No. 1.—A complete Collection of new Kitchen-garden Seeds, of very best kinds, being one year's supply for a first-rate establishment . . .	3 3 0
No. 2.—A Collection containing all the kinds as the above, but in smaller quantities . . .	2 2 0
No. 3.—A Complete Collection, in quantities suitable for smaller Families . . .	1 1 0
No. 4.—100 Ranunculuses, in 50 fine varieties, by name . . .	1 5 0
50 ditto in 50 ditto ditto . . .	0 15 0

N.B.—Parcels delivered free of carriage to London, or to any part of the Great Western Railway within 60 miles of London.

For Gardeners and others who would prefer selecting the sorts of seeds themselves, S. & Sons have just published their annual Catalogue of new Kitchen-garden and Flower Seeds, which will be forwarded immediately, post-paid.

* * Where a reference is given payment need not be made for twelve months, which will afford ample opportunity for proving the excellence of the Seeds.—Reading Nursery, Berks, Dec. 21.

B. SAUNDERS, NURSERYMAN AND FLORIST, Isle of Jersey, respectfully informs the Public and Trade in general that he has a few thousand Maiden PEACHES & NECTARINES to dispose of this season, which are true to name, and comprise all the best varieties in cultivation; and which he will render at moderate prices, with the usual discount to the Trade. N.B.—His collection of Pear-trees are also very fine.—Dec. 22.

CONWAY'S GIANT CACTUS.

PHILIP CONWAY has the pleasure of offering to the Public the above splendid production at the reduced price of One Guinea each. P. C. having been successful in its propagation, can now give the usual discount to the Trade. Also CONWAY'S Pelargonium "LANEY" (the best yet raised for forcing), fine plants now showing their blooms, at 5s. each; good plants in 48 sized pots, at 3s. 6d. each. A remittance or reference respectfully requested from unknown Correspondents.—Old Brompton, Dec. 13, 1843.

F A S T O L F F R A S P B E R R Y .

YOUELL'S TOBOLSK RHUBARB.

TWO SEEDLING PICOTEES.

FINEST CARNATIONS AND PICOTEES.

DUTCH HYACINTHS, & other BULBS.

ARAUCARIA IMBRICATA.

Now ready for sending out: for Particulars of which, see Advertisement of the 16th inst.

YOUELL & Co., Great Yarmouth Nursery, Dec. 21, 1843.

CHISWICK NURSERY, NEAR LONDON.

R. GLENDINNING, (late of the firm of LUCOMBE, PINCE, and Co., Exeter), most respectfully acquaints Noblemen, Gentlemen, and his Friends generally, that having purchased the Lease and Stock of the above Nursery, he has been for some months engaged in making extensive alterations and additions to it, in order to enable him to carry on the NURSERY BUSINESS in all its various branches, and he begs to assure those who may be pleased to entrust him with their commands, that his utmost endeavours shall be at all times used to execute them with accuracy and punctuality, rendering every article of the best description at a moderate price.

In HOTHOUSE and GREENHOUSE PLANTS, and ORNAMENTAL TREES and SHRUBS, all the best varieties will be cultivated, and every approved novelty added as soon as it appears. In the FRUIT-TREE DEPARTMENT, those sorts only will be grown which experience has proved to possess good and valuable properties.

In the SEED BUSINESS his arrangements enable him, from his proximity to the best marts, to supply such only as are genuine in quality and true to name.

R. G. flatters himself that from his practical acquaintance with Landscape Gardening and Garden Architecture, he may be safely and usefully consulted in planting Park Scenery, forming Ornamental Water, Constructing and Heating Buildings for Horticultural purposes, upon the most improved and economical principles, Laying out Ground for Flower and Kitchen Gardens, &c. Arboretums designed and systematically planted.—Dec. 22, 1843.

TO GENTLEMEN PLANTING.

J. AND J. FAIRBAIRN are induced from the uncertainty upon which they hold the Manor-street Nursery (situated contiguous to the Home Nursery, Clapham Rise, where attention will be given to all applications), to effect a Sale of the Stock at as early a period as possible, consequently beg to solicit the attention of Gentlemen and the trade to the large and remarkably healthy and well-grown stock, consisting of fine large Laurels, twice transplanted, of extra growth; Portugal Laurels, very handsome; Green Hollies, of various sizes; Evergreen Privets, fine Standard Thorns, Almonds, Aesculus, Robinias, and standard flowering Thorns, Almonds, Aesculus, Robinias, and other Ornamental Trees, and Evergreen and flowering Shrubs, with a large stock of fine standard and dwarf, trained and untrained Peaches, Nectarines, Apples, Pears, Plums, and Cherries, of the most approved kinds, and of growth rarely equalled; also, a large assortment of Forest Trees, consisting of Limes, Elms, Birch, Beech, Hornbeam, Spanish and Horse Chestnuts, Mountain Ash, Poplars, and Spruce, and Scotch Firs; also a large number of Gooseberries and Currants, of excellent growth, and of the best varieties in cultivation, to all of which J. & J. F. respectfully invite the inspection of Gentlemen and Nurserymen, flatter themselves that the general character of the Stock is such as to ensure unqualified satisfaction, and which they are disposed to offer at very moderate prices for cash.

J. & J. F. respectfully beg to call the attention of Gentlemen to their advertisement of Heaths, &c., which has lately appeared in the *Gardeners' Chronicle*. (Oct. 21 and 28.), Nurseries, Clapham, near London, December 22, 1843.

HYACINTHS AND GROWING STOCK.

HUMPHREYS' COMPOUND, applicable to all Greenhouse Plants, to Hyacinths and other Bulbs, and to promote the germination of Seeds. Sold in bottles 1s. 9d. each, by FLANAGAN & SON, Mansion-house-street; WARNER & WARNER, 28, Cornhill; HURST & McMULLEN, Leadenhall-street; W. CLARK, Bishopsgate-Within; SMITH, Islington Nursery; GRIMLEY and Co., Covent Garden; BATT and RUTLEY, 412, Strand; WILLIAM and JOHN NOBLE, Fleet-street; SMITH, Covent-garden; CHARLWOOD, Tavistock-row; W. J. NUTTING, 46, Cheapside; G. LAWRENCE, 18, Piccadilly; JOHN KERNAN, Great Russell-street, Covent Garden; LOCKHART, 156, Cheapside; SHUTTLEWORTH, Pantheon; MINIER, ADAMS, and NASH, 63, Strand; THATCHER and Son, Islington; THOMAS WATKINSON, Market-place, Manchester; W. E. RUNDLE, Plymouth; DICKSON & Co., Edinburgh; PONTREY, Leeds; P. LAWSON and Son, Edinburgh; and other leading SEEDSMEN in town and country. Wholesale Agents, DAVY, MACKMURDO, and Co., 100, Upper-Thames-st., London.

BROMPTON PARK NURSERY—ESTABLISHED 1681.

MESSRS. GRAY, ADAMS, and HOGG, introduce to the notice of those engaged in planting Shrubberies, &c., an extensive Stock of fine large EVERGREENS, consisting of Variegated and Green Hollies, common and Portugal Laurels, Hemlock, Spruce, Yews, Arbutus, Phillyreas, Arbor-vitae, Alaternus, &c. &c., which they can supply on advantageous terms, and from the well-known nature of their soil being so admirably adapted for the removal of large plants, they with confidence recommend them.

They also take this opportunity of again reminding their customers of their Stock of Dwarf, Standard, and trained Fruit-trees, Figs, Vines, &c. &c., which are this season of a very superior description, and of which Catalogues may be had on application. Seeds and Plants carefully selected and packed for exportation, well deserving the attention of all Emigrants and Colonists.—Kensington-road, December, 1843.

TO NOBLEMEN AND GENTLEMEN who are PLANTING and IMPROVING THEIR ESTATES, and to NURSERYMEN.

RICHARD MITTON, NURSERYMAN, Pontefract, Yorkshire, has now growing in his Nurseries (which lay very high and bleak, and from which plants generally thrive) to be disposed of at reduced prices a large stock of Healthy, Well-rooted, and Transplanted Forest Trees, of all sorts and sizes; especially Larches, 2 to 3 and 3 to 4 feet high; Evergreen and Flowering Shrubs, Fruit Trees of all the choicest Sorts, and Ornamental Trees of every description. Prices on application may be had of goods delivered free at those prices at any Railway Station or Canal Warehouse north of Derby or south of Newcastle-on-Tyne.—Pontefract, Dec. 20, 1843.

THE BRITISH QUEEN AND PRINCE ALBERT PEAS.

W. J. CORMACK and CO. beg to announce to their Friends and the Public that they have harvested the above Two New Varieties, and will be obliged by early orders, as the stock is limited. They will be sent out, as last spring, in packages, bearing the name of the firm, price 3s. 6d. per quart. The usual allowance to the trade.

N.B.—"CORMACK'S Early Kent Peas," 14s. per bushel. Newcross, and Bedford Conservatory, Covent Garden, Dec. 22.

HORTICULTURAL SOCIETY OF LONDON.—

The COUNCIL of this Society being desirous of ascertaining the correct addresses of the Corresponding Members resident in Great Britain and Ireland, have directed a List of them to be published, in the hope that all those who see their names in it will immediately inform the Secretary, by letter, 21, Regent-st., whether their addresses are correctly given: or that their friends, in their absence, will do so for them. [It is following persons, concerning whom no intelligence has been received in consequence of the last Advertisement, do not communicate with the Secretary in the course of one month, they will be considered dead, and their names will be erased.]

Affleck, David John Donaldson, Gloucester

J. G. WAITE, WHOLESALE SEEDSMAN, London, begs to acquaint the trade generally that he has made a selection, at very great expense, from the finest stocks in England and other parts of the world, and can warrant the whole of the seeds genuine, of the first quality, and of the present year's growth. The prices are 30 per cent. lower than any other house in the trade. Catalogues to be had on application at his warehouse, No. 4, Eyre-street-hill, Hatton Garden, London.—Dec. 14, 1843.

TO SEEDSMEN AND OTHERS.

TO BE DISPOSED OF.—TEN TONS OF CARROT-SEED: viz., Five Tons of Large Green Top Altringham, at 52s. per cwt.; and Five Tons of Large Green Top White Belgium, at 32s. per cwt. All warranted of *English Growth* of 1843, and selected from the finest stocks. To be sold in any quantity not less than 1 cwt. Apply to J. G. WAITE, Nos. 1 and 4, Eyre-street-hill, Hatton Garden, London.

SHILLING'S NEW EARLY GROTTO PEA.

J. AND S. SHILLING have succeeded in raising the above PEA, the Early Frame Pea, impregnated with the Grotto or Oyster Marrow, which they, with confidence, recommend to the Public generally, being quite as early, and nearly double the size of any other early Pea in cultivation. Quite hardy; will stand the winter well, and a good bearer; the pod large and long. They would particularly recommend it to the attention of Market Gardeners. Price 1s. 6d. per bushel; 17s. 6d. per peck; 30s. per half-bushel; 1s. 10d. per bushel. Agents: Messrs. FIELD & CHILDS, 119, Lower Thames-street, London; Messrs. W. & J. NOBLE, 152, Fleet-street; Mr. KERNAN, 4, Great Russell-street, Covent-Garden; Messrs. HURST & McMULLEN, 61, Leadenhall-street; Messrs. GRAY, ADAMS, & HOGG, Kensington.—Northwarborough Nursery, near Odiham, Hants, December 22, 1843.

TO GARDENERS AND OTHERS.

TO BE LET, near the Sea-coast, in the West of Sussex, Large and Most Productive GARDENS, with a comfortable House and all convenient Buildings. Pine, Melon, Grape, and other Forcing Houses. All in the highest possible state of management and cultivation. For Particulars, apply to Mr. Mason, East-street, Chichester.

DISEASED AND HEALTHY LIVES ASSURED.

MEDICAL, INVALID, and GENERAL LIFE OFFICE, 25, Pall Mall, London. Capital, 500,000l. This Office is provided with very accurately constructed Tables, by which it can Assume Deceased Lives on Equitable Terms. Increased Annuities granted on *assured* Lives the amount varying with the particular disease. Members of Consumptive Families assured at Equitable Rates. Loans granted upon personal security. E. G. P. NELSON, Actuary.

HOT-WATER APPARATUS FOR HEATING HORTICULTURAL BUILDINGS, DWELLING-HOUSES, CHURCHES, and MANUFACTORIES, upon improved principles, and at very moderate charges, erected by DANIEL and EDWARD BAILEY, 272, HOLBORN.

D. and E. BAILEY having devoted much time to the consideration of this subject, and had much experience in the erection of apparatus for the above-mentioned purposes, have, by improvements suggested in their practice, rendered their mode of heating not only very efficient, but very simple, and have combined durability in the apparatus with economy in the charge. They have erected apparatus in England, Scotland, and Ireland, for many noblemen and gentlemen, and have had the honour to be employed by the Horticultural Society of London, in executing the works of their splendid Conservatory, lately erected at Chiswick.

D. and E. BAILEY also construct in metal all descriptions of Horticultural Buildings and Sashes, and invite noblemen, gentlemen, and the public to an inspection of their various drawings and models, at 272, Holborn, where they have the opportunity of exhibiting, amongst other metal works, an extremely complete and convenient kitchen apparatus, or range, adapted for the continued supply of hot water, and an arrangement of the oven more complete than has hitherto been brought before the public.

D. and E. BAILEY were the first to introduce metallic curvilinear houses to horticulturists, and can refer to the Conservatory attached to the Pantheon as one of their works, besides many others in this country and on the Continent.

D. and E. BAILEY have prepared a quantity of the Galvanic Plant Protectors, which are now ready for immediate delivery; they beg to introduce to public notice a new Trough Pipe, for Orchidaceous or other Houses where vapour is constantly, or at intervals required, and which may be seen at their Manufactory.

THE CONICAL HOT-WATER BOILERS, invented by J. ROGERS, Esq., may be obtained of any size from JOHN SHEWEN, Ironmonger, &c., Sevenoaks, Kent.

J. SHEWEN having had every opportunity afforded him by an extensive practice to bring this apparatus to perfection, begs to state it as most efficient and economical: it may be seen at Messrs. Chandler & Sons' Nursery, Vauxhall; Messrs. Loddiges', Hackney; Messrs. Henderson's, Pine Apple-place; Messrs. Veitch and Sons', Exeter; Mr. Pontey's, Plymouth; the Royal Botanical Society's Gardens, Regent's Park; and at the Gardens of the Horticultural Society of London. Considerable improvements have been effected since last season; particulars of which are in course of preparation.

RENDLE'S TANK SYSTEM OF HEATING.

STEPHENSON AND CO., 61, Gracechurch-street, London, Inventors of the IMPROVED CONICAL and DOUBLE CYLINDRICAL BOILERS, having been much engaged in heating buildings upon the above system with Tanks of various materials, solicit the attention of scientific Horticulturists to an Iron Tank now fitting up on their premises, which offers most decided advantages over every other article hitherto used. These tanks which are ornamental in appearance can be made from 10 to 100 feet long and of any width and depth, and can be connected or disconnected by any working Gardener without the slightest difficulty, thus affording the opportunity to persons in remote districts of employing this much approved method of heating without the assistance of Engineers. The Tanks can be applied to Boilers and Pipes already fixed, and from the present low price of Iron will be found cheaper than of any other material. Mr. RENDLE, of Plymouth, has kindly undertaken to receive orders and furnish information to any persons in his neighbourhood, and prices for any size will be forwarded upon application to S. and Co.

GENUINE PERUVIAN & BOLIVIAN GUANO ON SALE, BY THE IMPORTERS, ANTHONY GIBBS AND SONS, LONDON; GIBBS, BRIGHT, AND CO., LIVERPOOL AND BRISTOL. 47, Lime-st., Dec. 22, 1843.

ON SALE, in any quantity, **PERUVIAN and BOLIVIAN GUANO**, genuine as imported.—Apply to CORNWORTH, POWELL, and PRYOR, London; EDWARDS, DANSON, and CO., Liverpool; or WILLIAM J. MYERS and Co., Liverpool, the Importers.

2 vols. 8vo., with 5 coloured plates, 31s. 6d. cloth.

AN INTRODUCTION to ENTOMOLOGY; or, Elements of the Natural History of Insects: comprising an Account of the Noxious and Useful Insects, of their Metamorphoses, Food, Stratagems, Habitations, Societies, Motions, Noises, Hybernation, Instinct, &c. By W. KIRBY, M.A., F.R.S., and L.S., Rectr of Barham; and W. SPENCE, Esq., F.R.S., and L.S. Sixth Edition, corrected and considerably enlarged.

* The first two (or popular) volumes of the "Introduction to Entomology" are now published as a separate work, distinct from the third and fourth volumes; and, though much enlarged, at a considerable reduction in price, in order that the numerous class of readers who confine their study of Insects to that of their manners and economy need not be burdened with the cost of the technical portion of the work, relating to their anatomy, physiology, &c.

"Let no man think he knows how to enjoy the country who has not studied the volumes of Kirby and Spence's delightful 'Introduction.'"—*Quarterly Review*, No. 141, Dec., 1842.

"This Work, the delight of our youth, and the admiration of our mature age, is well known as the most entertaining account of insects ever put into a popular form."—Dr. LINDLEY, in the *Gardeners' Chronicle*.

Lately published, in 2 vols. 8vo., with about 2500 Figures, 24. 7s., cloth.

AN INTRODUCTION to the MODERN CLASSIFICATION of INSECTS. By J. O. WESTWOOD, F.L.S., &c. Intended as a Sequel to Kirby and Spence.

LONDON: LONGMAN, BROWN, GREEN, and LONGMANS.

Nearly ready, in demy 8vo., cloth, price 5s.

FROM A ROSARY. By T. WESTWOOD. Author of "Miscellaneous Poems."

LONDON: SAMUEL CLARKE, 13, Pall Mall East.

NEWSPAPER OFFICE, No. 15, Coventry-street, London. Established upwards of Thirty Years.

UDIE and SONS, General News Agents and Stationers, of the *Gardeners' Chronicle*, and all the other London Newspapers (a Correct List of which may be had on application) with the strictest regularity to all parts of the Kingdom, and to the Colonies, free of postage, and by the Morning Mails if required.

T. M. and Sons beg to state that they print the entire Address of their Customers on the Wrapper, when ordered for six months, or longer.

NEW FARMERS' NEWSPAPER.—The time has come when Landlords and Tenants, large Farmers and small, must devote their anxious attention to improved cultivation—when, in the words of Sir Robert Peel, "All must learn how, in the shortest time, and at the least expense, to produce the greatest quantity of food, vegetable or animal, without permanent injury to the land." To accomplish this, no means can be so effectual as that which brings the results of Experience and Science before every man, in a cheap form. For this purpose THE AGRICULTURAL GAZETTE is to be established.

The Proprietors are aware of the difficulties of dealing with the many details of cultivation without an acquaintance with circumstances, often as varying as places. They condemn the idea of conducting farming operations upon one invariable plan; and, while they welcome science as the best auxiliary of practice, they regard crude speculations as the most dangerous of delusions. But, they also feel that in Agriculture, as in all other arts, there are general principles upon which successful farming must depend; that there are practical errors which no local circumstances can justify; in short, that there is room for improvement even in those branches which are best understood. No one man can be competent to deal with the multifarious questions affecting husbandry, and the duty of the Editor of such a Paper as THE AGRICULTURAL GAZETTE is to make known the knowledge of all. It is to the practical Farmers that the Proprietors trust for the means of carrying out their views, and not to the talents of any individual. While, therefore, they state that the Editor of THE AGRICULTURAL GAZETTE will be a gentleman well acquainted with the best kind of Farming, in which he is actively engaged, they feel it to be of far more importance to announce the promise of support and assistance received from the landed and farming interest generally, especially of those whose names they are permitted to mention:—

The Right Hon. the Earl Spencer, President of the Royal Agricultural Society of England.
The Right Hon. the Earl of Ducie, Vice-President of the Royal Agricultural Society of England
Sir John Saunders Sebright, Bart.
J. Walbanke Childers, Esq., M.P., one of the Council of the Royal Agricultural Society of England
J. H. Langston, Esq., M.P.
Rev. Dr. Buckland, Professor of Mineralogy, Oxford
David Low, Esq., Professor of Agriculture, Edinburgh, one of the Council of the Royal Agricultural Soc. of Scotland
Robert Baker, Esq., Writtle, Essex
J. Bennett, Esq., President of the Leominster Farmers' Club
John Benson, Esq., Agent to the Duke of Bedford
Robert Black, Esq., Loch Alsh, Ross, N.B.
John Curtis, Esq., F.L.S.
R. D. Drewett, Esq., Burpham, Arundel
W. Parker Hamond, Esq., Pampisford Hall, Cambridge
J. Hudson, Esq., Castle Acre, near Swaffham, one of the Council of the Royal Agricultural Society of England
Curtis Hayward, Esq., Queudgeley, near Gloucester
R. M. Jacques, Esq., Richmond, Yorkshire
Samuel Jonas, Esq., Ickleton, Cambridgeshire, one of the Council of the Royal Agricultural Society of England
W. H. Little, Esq., Lanvair Grange, Abergavenny
E. W. Moore, Esq., Agent to Earl Radnor
J. Parkinson, Esq., Leyfields, Ollerton, Notts.
R. Aglionby Stanley, Esq., Walford Manor, Shiffnall, Salop.
S. D. Stirling, Esq., Glenbervie, Falkirk
W. B. Wingate, Esq., Hareby, Bolingbroke, Lincolnshire
Mr. J. Clarke, Romsey, Hants
Mr. G. Parsons, Agent to Lord Portman
Mr. S. Rigg, Wigton, Cumberland
L. B. Walrond, Esq., Sec. of the Gloucester Farmers' Club
Mr. H. F. Fardon, Sec. of the Broomsgrove Farmers' Club
&c. &c. &c.

Lord Worsley, M.P., Vice-President of the Royal Agricultural Society of England
Sir Charles Lemon, Bart., M.P., one of the Council of the Royal Agricultural Society of England
William Miles, Esq., M.P., one of the Council of the Royal Agricultural Society of England
Colonel Le Couteur, Belle Vue, Jersey
Rev. J. S. Henslow, Professor of Botany, Cambridge
Dr. Daubeny, Professor of Botany, Oxford
James F. W. Johnston, Esq., Professor of Chemistry, Durham
Dr. Lyon Playfair, Consulting Chemist to the Royal Agricultural Society of England
Mr. R. Beman, Stow-on-the-Wold
Evan David, Esq., President of the Cardiff Farmers' Club
John Grey, Esq., Dilston, Northumberland
John Gedney, Esq., President of the Harlestone Farmers' Club, Norfolk
A. Hall, Esq., Secretary of the Chepstow Farmers' Club
C. Herbert, Esq., Powick, near Worcester
W. H. Hyett, Esq., Painswick House
J. B. Lawes, Esq., Rothamstead, near St. Albans
G. Legard, Esq., Fargloss, Pocklington, Yorks.
M. M. Milburn, Esq., Sec. of the Yorkshire Agricult. Society
D. J. Niblett, Esq., Haresfield
Edward Solly, Esq., Junior, Experimental Chemist to the Horticultural Society of London
William Torr, Esq., Riby, near Caistor
Joseph Yorke, Esq., Tewkesbury
Mr. John Brodie, Haddington
Mr. John Morton, Agent to the Earl of Ducie
Mr. Thimbleby, Bolingbroke
Mr. R. W. Purchas, Secretary of the Monmouth Farmers' Club
&c. &c. &c.

With FREE TRADE, FIXED DUTIES, SLIDING SCALE, &c. &c., THE AGRICULTURAL GAZETTE will in no way concern itself—such questions can only be of temporary interest; whereas the AGRICULTURAL GAZETTE will be devoted to the investigation of those great truths which human laws cannot affect.

The Practice of Agriculture—its Science—Animal and Vegetable Physiology—Improvements in Implements—better modes of Husbandry—results of well-conducted experimental Farming—Growth and Rotation of Crops—Stock—Drainage—Irrigation—Forestry—Road-making—Farm-Buildings—Labourers—in short, whatever affects the beneficial employment of capital in land—will form topics of consideration. Reports will be given of the English, Scotch, and Irish Agricultural Societies—London Market Prices of Corn, Hay, and Cattle, and the Weekly Averages. Replies to questions connected with the object of the Paper will also be furnished weekly.

Considering the union which exists between Horticulture and Agriculture, it has been thought advisable to make THE AGRICULTURAL GAZETTE an addition to the GARDENERS' CHRONICLE, edited by Dr. LINDLEY, and so extensively known; but that there may be ample room for discussion, that Paper will be increased one-half in size without additional charge—thus Twenty-four Columns will be occupied, as at present, by Horticulture, and Twenty-four by the General News of the Week, whilst TWENTY-FOUR COLUMNS WILL BE DEVOTED TO AGRICULTURE.

On the 6th of January, therefore, will be published, price 6d., Stamped, to go free by post,

THE FIRST NUMBER OF THE GARDENERS' CHRONICLE AND AGRICULTURAL GAZETTE.

Parties intending to commence the Volume had better give their orders at once to any Bookseller or Newsvender.

THE SUPPLEMENT TO ENGLISH BOTANY, and the MINERAL CONCHOLOGY.—These two Works, of which the continuation has been delayed for a long time, will be resumed on the 1st of January next, when No. 57, or No. 2 of the SECOND SERIES of THE SUPPLEMENT TO ENGLISH BOTANY, and No. 110 of the MINERAL CONCHOLOGY will appear. No. 58 of the ENGLISH BOTANY will come out on the 1st of February; after which the two Works will be published on alternate months, by Messrs. SOWERBY and SALTER, at 62, Prattle-street, Camden Town.

HERBARIUM.

WILLIAM PAMPLIN'S DESCRIPTIVE CATALOGUE OF DRIED PLANTS, will be forwarded on sending two Postage stamps to 45, Frith-street, Soho-square, London; it contains above Thirty Distinct Collections, including some very interesting Plants from Brazil, New Grenada, and Mexico; from Nubia and Abyssinia; from Arabia, Kurdistan, and the Georgian Caucasus; and from various parts of Europe; which have been recently consigned to W. P. for sale, at very moderate prices.

PRACTICAL DIRECTIONS FOR THE CULTIVATION AND GENERAL MANAGEMENT OF COTTAGE ALLOTMENTS, with Plans for laying them out for five years. Also, Hints on Keeping Pigs, on Service, &c.; with a form of Rules and Agreements. A Third Edition is being printed by Messrs. MANNING and Co., of Ivy-lane, Newgate-street; by whom all orders will be supplied, which may be sent to them before the 1st of January, at 30s. per hundred copies.

THE COURT CIRCULAR AND FASHIONABLE TRADESMAN'S ADVERTISER, by the original Editor of the *Court Gazette*, dedicated to the Queen and Prince Albert, will appear on January 6th, price 6d. Orders received by THOMPSON, News Agent, Falcon-court, Fleet-street.

THE LIVERPOOL JOURNAL.—Metropolitan Advertisers of all classes, desirous of ensuring extended publicity to their announcements in the most populous and wealthy district of England, are offered unusual advantages by this long-established and highly popular Newspaper,—the largest in Liverpool, and containing, exclusive of ample details of the ordinary occurrences of the week, a far larger amount of original matter,—Political, Literary, and Miscellaneous,—than the rest of the local press put together.

The greatest possible attention is devoted to all subjects connected with Literature and the Arts, several of the writers in the Journal being distinguished contributors to the highest order of Periodicals in this country. Elaborate and dispassionate Reviews of all New Works of the least interest are given immediately on being issued, and in many cases before their appearance in the ordinary course of publication. Being addressed to an educated and intellectual class of readers, no means that experience and ample Capital, added to valuable sources of exclusive information, can afford, are neglected, to render it in all respects a FAMILY NEWSPAPER of the first class; and among other features that distinguish it from its local contemporaries, is the total exclusion of all Advertisements in the slightest degree unfitted to meet the eye of youth of either sex.

The charge for Advertisements will be found exceedingly moderate, especially taking into consideration the great width of the line, and the advantageous manner in which Advertisements are displayed in a very diminutive yet clear and distinct type.

SCALE FOR ADVERTISEMENTS.

Nine Lines 4s. 6d. Every additional Line 3d.

This Series was undertaken with the purpose of supplying a manifest deficiency in the books previously published for the education of the industrial classes. The chief object kept in view is to prepare young persons for the choice of an occupation, by instructing them in the peculiar duties, and, as far as requisite, in the technical details of the various departments of Service or Trade in which they are likely to be engaged as they advance in life. It is, of course, not contemplated here to teach everything that should be known in a Trade, or to point out the whole details of a Service, but to give such a general knowledge of the occupations which the mass of the people are called upon to follow, as may fit the young for the proper discharge of their duties, and systematize much of the practical information which the adult has now, in most cases, to learn without a Guide. These works, collectively, contain a mass of authentic and amusing information on the various departments of industry in this country, which will be useful and interesting to all readers. Explanatory woodcuts are introduced whenever the text requires the aid of such illustrations.

LONDON: CHARLES KNIGHT & Co., 22, Ludgate-street.

CHRISTMAS FESTIVITIES.—The gaiety that reigns supreme at this festive season, when friends and lovers assemble at the social board, or whirl in the giddy mazes of the dance, induces both sexes to be more than usually desirous of shining in personal attraction, and to devote a greater share of attention to the toilet. It is at this particular season that the virtues and singularly happy properties of those auxiliaries of personal beauty, ROWLAND'S KALYDOR, ROWLAND'S MACASSAR OIL, & ROWLAND'S ODONIO, shine pre-eminently in their power; while the white and swan-like neck, the rich luxuriant tress, and the Pearly set of Teeth form admirable trophies of their inestimable qualities! The August Patronage conceded by our Gracious Queen, and the several Sovereigns of Europe, together with the Beauties which adorn the circles of Princely and Regal Magnificence; and the confirmation by experience of the infallible efficacy of these creative renovating Specifics, have characterized them with perfection, and given them a celebrity unparalleled.

Just published, in One Volume 8vo., price 3s. 6d., to Fellows of the Society, and 5s. to others, (or postage free, upon receipt of a Post-office order, price 5s. to Fellows of the Society, or 6s. 6d. to others.)

A CATALOGUE OF THE FRUITS CULTIVATED in the GARDEN of the HORTICULTURAL SOCIETY OF LONDON. (Third Edition.) Containing the Names, Synonyms, Colour, Size, Form, Quality, Use, Time of Ripening, and many other particulars concerning all the most important varieties of hardy Fruit cultivated in this country.

Sold at the House of the Society, 21, Regent-street, and also by LONOMAN and Co., Paternoster-row; J. HATCHARD, Piccadilly; RIDGWAY, Piccadilly; RIVINGTONS, Waterloo-place; and by the principal Booksellers in all parts of the Empire.

A few Copies of the Second Edition of this Catalogue may be had at the reduced price of 1s. 6d. each.

The Gardeners' Chronicle.

SATURDAY, DECEMBER 23, 1843.

MEETING FOR THE TWO FOLLOWING WEEKS.
FRIDAY, Jan. 5 . . . Botanical . . . 8 P.M.

WE are to blame for not taking an earlier opportunity of resuming the question of Timber-pruning; and if some of our recent correspondents have regarded our silence as an acquiescence in the sentiments of others, we cannot say that we have just cause for complaint. We should have taken our side sooner.

Not, indeed, that we have not done so formerly; but it is long ago, and many have probably forgotten by this time what the views are that we actually entertain upon the subject. PRUNE NOT AT ALL having been taken as our motto—if we were to assume a sylvan coat of arms—all the reasoning that was connected with those words has been forgotten, and the qualifying terms, IF YOU CAN HELP IT, have been entirely left out of view. Nevertheless, if those who interest themselves in such considerations will do us the favour to turn to our previous articles, and especially to pages 364 and 523 of our volume for 1842, they will find that what is now sometimes called “the prune-not-at-all system” is not ours, and that there is very little difference between us and some of those who are now with justice regarded as great practical authorities in Forestry. Mr. Billington, indeed, in one place, claimed our views as his own; but, as we then stated, they belong to neither him nor us, but are coeval with the appearance of sound Vegetable Physiology.

The methods employed by Dr. Thackeray and Mr. Gavin Cree in the management of woods, being those which have been most prominently introduced into our pages lately, we will now proceed to examine them, and see how far our views are in opposition to those experienced planters.

Dr. Thackeray's system is explained at pages 644 and 677 of this volume. From the statements there made we collect the following that are its principal features. Instead of attempting to cure injurious growth by the axe and saw, *he takes means to prevent its occurrence*. Instead of sending a crowd of ignorant labourers among his woods at some particular season, he provides a sensible tractable woodman, teaches him his lesson, and *keeps him constantly employed all the year round*. This woodman has a pruning-knife and chisel for his only tools. Large branches are not permitted to grow for years, only to be lopped eventually for the fire-heap or the charcoal-burner, and to ruin timber by the huge scars they leave. But a diligent plan of stopping and preventing is in action every day all the year round. Finally, the woods are “*unmercifully thinned, and health, light, and air, pervade them*.” By this method 500 acres of barren mountainous land in Flintshire are covered with trees whose vigour is attested by their growth. In 26 years Oaks, Larch, and Ash are to be found 20 feet high. The cost of this operation is not stated; but supposing that the Welsh woodman is paid 50l. a year, we have this result attained at the cost of 2s. per annum for each acre: we leave our readers to calculate how far this outlay can be paid by the thinnings of the plantations.

Now it is impossible for any man who understands forestry to doubt that a system like this is precisely what should be adopted in all cases whatsoever. It is this beginning at the beginning in the right way, and an incessant perseverance in doing so, that has produced the results which those who have seen Dr. Thackeray's woods have so much admired. But let us ask in what particular this Flintshire forestry differs from what we have, in ignorance of the existence of the plantations at Nerquis, constantly advocated?

“Prune not at all should be the maxim of a forester. Plant thinly, *thin* constantly, *stop* carefully, and leave the rest to Nature.” These words are to be found at p. 363, and seem to us to state briefly the whole system observed at Nerquis, *with an exception*, to which we shall presently return. But there are some minor points connected with Dr. Thackeray's management, as we learn from the account given by Mr. Humphreys at p. 644. Acorns are dibbled where they are to remain; the advantage of this is most particularly insisted upon at p. 523 of our volume for 1842, in the case of both Oaks and Spanish

Chesnuts. All wounds by the pruning-knife are made close to the main stem, and when the branches are young; this is insisted upon at p. 115 of 1841, and the reasons for it are there shown to be, that, if young shoots are not removed close to the stem, the remaining part dies, and the lips of the wound will not heal till the snag has fallen off, &c. &c.

We have alluded to one point in which we do not appear to agree with Dr. Thackeray. He is represented to be continually trimming his trees up by removing the side branches. We, on the contrary, have advised that the side branches should be merely stopped, and the rest be left to Nature. Who is right? We refer to the magnificent timber of Nature—Dr. T. to his own trees. The question is one which can hardly be answered conclusively in the absence of experiments carefully instituted for the express purpose of deciding the point. Possibly Dr. Thackeray may have made such experiments; in which case, we trust, if this should meet his eye, that he will favour us with them. Our opinion has been founded, in part, upon the well-known method observed in the nurseries, of forming standard fruit-trees. When this is to be done a single vigorous shoot is selected for the stem of the tree, and all the others are removed. The stem that is left grows rapidly, and produces an abundance of laterals, a portion of which form the branches of the head, when the growth of the tree is completed at the end of the season. Now all the laterals are carefully preserved during the growing season, until a few weeks after midsummer, when they are stopped or shortened back a little way, so as to prevent their going on growing any longer. In the autumn, when the leaves have fallen, these laterals are cut off close to the stem, in order to make it look clean; and not till then. Experience shows that a stout standard stem cannot be obtained if the laterals are not allowed to grow. This proves that more timber is obtained in one year by leaving the lateral shoots on an upright vigorous stem than by cutting them off; and if such is the case during one year, we submit that the same thing will go on for any number of years. In other words, if the stem of a tree deprived of laterals produces in one year 10 cubic inches of wood, while the same stem, furnished with laterals, produces 12, it seems to follow that the time which will furnish 100 cubic inches by close pruning will furnish 120 by mere stopping. We admit, however, that this is a doubtful point, upon which evidence is wanted; and the following observations of a correspondent, “A,” are well worth consideration in the absence of such evidence:—

“Although I am strongly opposed to the removal of limbs or branches of trees of advanced growth, I am disposed to think that a needless prejudice exists against pruning or training of trees at an early age. I conceive that the forest-tree, like other branches of the vegetable kingdom, is by nature given to man, with the view that he should by his skill and industry direct and modify its growth to suit the various purposes for which he may design it—whether as a stately ornament of the pleasure-ground with branches extended to the turf, or for the purpose of supplying the dock-yard with a trunk of great length and girth. We are doubtless indebted to nature, unassisted by artificial pruning, for many of the finest timber-trees that have been supplied to our navy—but these trees are pruned by nature, being produced in woods, so close, that for want of sufficient air the lower branches die and gradually disappear. From this circumstance the stems grow to a great height and produce good timber. Young as these branches may be when they die, they must necessarily remain some years in a decayed state before they fall off close to the bole; and during this time, as the trunk advances in thickness, so must they be inclosed in the living stem, and even form dead knots until the bark becomes united and a continuous layer of young wood is formed under it. But if by artificial means the young branches were cut off at once close to the stem, the bark would unite without delay, the wound would heal, and in a short time it would require close investigation to detect the trifling blemish that might remain. If we take a small fruit-tree we are enabled to produce, at our will, either a standard with an erect stem, or a wall-tree with pliant branches, capable of being trained as our fancy may direct. So, likewise, I am persuaded, may we with equal facility and advantage regulate the growth of young forest-trees. If left to nature, under favourable circumstances, many trees, I admit, might become valuable timber; but due attention to pruning at an early period, taking care to remove those shoots that are prejudicial, and to encourage those that are useful, will hasten the growth of the tree; and attention should be directed towards forming a permanent head as early as possible, at such height as may be most advantageous. In this way a beautiful set of tillars (?) may be reared, which, almost without exception, will in due time become fine timber trees. As to the objection frequently raised against pruning—that by reducing the quantity of leaves on a young tree we deprive it, as it were, of its lungs, and thereby check its growth—experience teaches that this is not true. The young plant is endowed with vigorous vital power, and the partial removal of its branches tends to promote even more luxuriant growth, and the trifling deprivation it has sustained is quickly more than compensated by an increased energy.”

In concluding these remarks, we take the oppor-

tunity of setting ourselves right with a correspondent, who reproaches us with putting our *imprimatur* to a letter signed “Quercus” at p. 677. Our words “We quite agree” applied merely to the assertion that “we cannot walk or ride in any direction without being annoyed at seeing crowded or mangled plantations”—a fact about which there surely cannot be two opinions. At the same time we are bound to add that there was no reason why we should have disagreed with the sentiments expressed in the remainder of the letter of “Quercus,” written at a time when the management of the Nerquis plantations had only been described by Mr. Humphreys, and not in the later and much clearer statement of “p. σ. λ.”

On another occasion we shall examine the principles upon which Mr. Gavin Cree's system of forestry is founded.

ON several occasions we have endeavoured to show that the principal, if not the only, cause of the disease in Grapes called “shanking” is to be traced to the border in which the Vines are growing. A better proof of the correctness of this view than is afforded by the following letter could hardly be desired. It relates to a case where Vines, which, prior to the hard winter of 1837-8, had been quite healthy, began to produce shanked Grapes after that season. We conjectured that all the surface-roots had been killed, and that the others had found their way into a cold wet subsoil. Our advice, therefore, was to take up the Vines carefully, drain the border, and replant them with the roots near the surface. The account which Mr. Watson here gives of the result of this experiment is highly interesting.

“The Vines that were replanted here in 1841 have been a complete triumph—so evident is the necessity of placing the roots near the surface. The fruit produced by those Vines on the new border were quite clear from any symptoms of shanking; the Hamburgs were of a jet black, with a blue violet bloom on them; the White Frontignans were of a fine amber colour; the White Sweetwater was also very fine—while those Vines in the old border, under precisely the same treatment, had, as usual, the bunches shanked. As we only renewed rather more than one half of the border, with an intention of renewing the other when the first was in full bearing; the whole of the Vines were in the same house, and subject to the same treatment. The Grapes from the replanted Vines were perfect, no doubt from the roots being placed within the influence of solar heat, and in a border thoroughly drained. Grapes may shank from various causes, yet no doubt exists with me that the coldness of the soil is the great evil—as is proved in a Vinery in this neighbourhood, with a well-prepared border no more than 3 feet deep, when the whole of the Grapes shanked. The surface of the border was most injudiciously planted with Salvias, Fuchsias, Verbenas, &c., and thus a complete shade was produced; the soil was unable to absorb as much heat from the sun as it otherwise would have done; a great quantity of rain fell just at the time when the berries were changing colour, which would still further lower the amount of warmth in the soil; and thus the absorbent points of the roots were rendered inactive, and were in a much colder medium than the leaves and branches. What proves this to be true is, that no plants were ever on the border before, nor were the Grapes ever before this year shanked.”

We most particularly recommend these facts to the consideration of those who would refer “shanking” to other causes than can be found in the border.

EARLY RIPENING OF GRAPES ON OPEN WALLS.

IN this the northern part of Worcestershire, where the ripening of Agricultural and Horticultural produce is from a week to a fortnight later than in some of the warmer parts of the same country, Grapes are frequently destroyed by early autumnal frosts before they arrive at maturity. To remedy disappointment from such cause, some cultivators of the Vine, years ago, inclosed the bunches of fruit singly in glass-tubes; others trained their Vines horizontally near the earth, and placed hand-glasses over them. Some persons have also entirely inclosed their Vines on the walls with glazed frames. Of these several practices we have had no experience; but, doubtless, each one will afford some advantage in respect to the more early maturation of the fruit.

As I prefer the long-rod system of training, so ably advocated by Mr. Hoare, by which the crop of fruit is concentrated into a comparatively small compass, it occurred to me that if the fruiting branches only were inclosed in small glazed frames, the fruit would have the assistance of stimulated foliage, whilst those parts of the tree which were being trained preparatory to their bearing next year's crop would not be interfered with. Having a Vine five years old, which was prepared for bearing fruit the first time, and that on three short perpendicular branches I inclosed the centre one in a small glazed frame, only two feet nine inches long, by thirteen inches wide, with single panes of glass seven inches wide on each side, meeting as a common roof. The fruiting-bunches being developed, the laterals bearing them were shortened above the bunches, and the frame fixed over the whole branch, against the wall. This was done on the 22d of May. Of course the inequalities of a brick-wall did not admit of the frame fitting very closely to it; nor did I think it desirable that it should do so. I would here mention that I think it would have been advantageous to the experi-

ment, had the glazed case been applied three weeks, or even a month earlier. I have at all times kept a thermometer within the case, and another near to it out of the case, and registered their differences at various periods of the day and night, in order to draw some general conclusions from the effects of the glazed frame. The results rather surprised me. It would, however, be useless to detail every particular; to show the effects of the experiment in a practical rather than a philosophical view, it will be sufficient to state the main points.

The temperature within the case was at all times higher than the open atmosphere, but their difference varied greatly according to circumstances. When the sun's rays were powerful, and fell directly on the glass, the thermometer within the case ranged from twenty to twenty-five degrees above the one which was exposed. In the night, when calm, they fell to within one or two degrees of the same point. These form the extremes of variation; and of course the approximation of the two thermometers, either to their greater or less difference, was always in favour of the protected branch of the Vine; inasmuch as the atmosphere within the case, when warm,

cooled more slowly—and when cool, heated more rapidly, than the open air. When I have named one other circumstance, the principal influences of the glazed frame will be clearly appreciated. When sudden cool winds blew for a few minutes in a warm day, and quickly lowered the temperature of the open air several degrees, the air in the case would scarcely be influenced. Ten to fifteen degrees in warm weather was a very common difference of the thermometer during the day.

I will now mention the progress of the Grapes to maturity. The case was put over the branch on the 22d of May. On the 28th of June, the flowers first opened in the case; those without the case, on the 5th of July. On the 20th of July, the berries in the case were well set, and as large as peppercorns; without the case, the flowers had mostly fallen, and the young fruit also was rapidly falling off from cold nights. At this time the advantage of the protection was most evident—the most perfect exposed bunch was left with only eight berries on it, and some with only one. On the 5th of September, the first change of colour of the protected fruit occurred. The same effect did not take place with that out of the case till three weeks afterwards

—the 26th of September, at which time the fruit within the case was tolerably well ripened. Had the glass case been applied three or four weeks earlier in the spring, it is reasonable to believe that its use would have forwarded the ripening a month at the least. In the present instance it seems to decide not only whether Grapes shall be ripened or not ripened in cold districts of England, but also whether any or none shall be produced; for, in this instance, nearly all the berries fell from the exposed bunches whilst flowering. As I am anxious that the method of securing this advantage should be clearly understood, I send the case, with the branch of the Vine and its fruit as it grew, and specimens of the fruit from the exposed wall. I exhibit it only to show the advantage of the protection I have adopted, and which may, I believe, enable the inhabitants of the north of England and Scotland to raise for themselves fine Grapes without artificial heat.—*B. Maund, Bromsgrove.* [This was exhibited to the Horticultural Society on the 3d of October, and was described in our report of the proceedings of that day.]

PLAN OF A MELON PIT.

THIS pit (contrived by Mr. T. Berry, gardener to the Right Hon. C. S. Lefevre) which is usually known as the Heckfield pit, differs from the common pigeon-hole pit in having, instead of that contrivance, a warm air chamber or close flue, which commences at the foundation and is continued all round the pit to the height

of three feet—the depth of the pit below the ground level. In carrying up this flue, a cross brick is occasionally laid in to give stability to the wall. The back and end flues are covered in with a course of brick on bed laid across, which projects one inch beyond the other brickwork on the outside; this projection not only gives a neat finish as a surface line, but serves as a rest for the boarding which conceals the lining. The front flue is covered by one brick laid across and also lengthwise alternately, on the outside course; thus, an opening is left between each cross brick for the ingress and egress of air from the cavity of the flue. In order that the air may take an inward direction, and also to prevent rubbish from falling into the flue, narrow pieces of slate are fixed in the joint

above the cross bricks. In the back flue and under the centre of each light, an opening about a foot long is left, upon which the ventilation passage, in the shape of a thin box, is formed by the back wall and two pieces of slate, placed in such a manner as to discharge the warm air towards the plants, at the distance of six inches below the glass. Below each rafter a nine-inch duct (a a) is sunk in the floor, which communicates with the bottom of the cavity both in the front and back flues, so that a current of air from the ducts supplies the place of the warm air which makes its escape to the surface amongst the plants. This pit, which is simple in construction, and safe and convenient in the application of top and bottom heat, at the same time, and from the same materials, still continues to give great satisfaction in the culture of Cucumbers, Melons, and young Pine plants.—*Proceedings of the Horticultural Society, No. XX.*

AMATEUR'S GARDEN.—No. LI.

In a note on the "One Shift System" of potting plants, in the "Gardeners' Magazine" for November, Mr. Barnes, of Bicton, the writer of it, has offered some remarks on an article of mine at p. 135, and also on those persons who have exhibited plants grown on that system, which if left unnoticed might lead to some misapprehension respecting its merits. Mr. B. says, "This system was no sooner made known than plants were exhibited and said to be grown upon it, although to any experienced man the plants were well known to have been growing for years previously on the old system." This is a bold assertion, and one which, as far I am, or those with whom I am connected, are concerned, is altogether a mistake. Plants grown on this system were exhibited before the Horticultural Society long before my article was written; but it was not until after it had appeared that any were exhibited as the result of that system of management. If Mr. B. imagines this system to be only a wild theory, he is mistaken, for there have been many fine specimens grown upon it for years past; and if he has still any doubts respecting it, he may have them in a great measure removed by calling upon Mr. Glendinning, at the Chiswick Nursery, who will show him some excellent specimens, principally hard-wooded plants, that have been produced since February last. In this there can be no deception, as plants that were bought in at from 17s. to 18s. per dozen are now worth that money per plant. Similar results have been achieved in other nurseries, where the system has been properly understood and carried out.

Mr. B., however, thinks that but "little merit is due to the system," as he hears "on good authority that many valuable plants have been lost through going to the extreme with the one-shift." Did Mr. B. never hear of valuable plants being ruined and lost under the old system of management? I anticipated that many plants would be lost; but delicate plants have been and will be lost under all systems of management.

Again, Mr. B. says, "notwithstanding it is said to be a more natural treatment for plants, I am at present of a different opinion." Will Mr. B. favour us with his reasons for so thinking; he will have some difficulty in doing this without contradicting a considerable part of what he has written in the "Gardener's Magazine." I myself cannot agree with the principle inculcated at p. 693 by Mr. Wood, that "plants the most difficult to rear should be removed at once from the cutting or seed-pot to the largest-sized pot in which they are to be exhibited as specimens;" because on the very same principle that I would put a plant in poor sandy soil to induce a profuse development of roots, so would I have a plant thoroughly established in a small pot before I removed it to a large one. So far as my experience enables me to judge, I should lay this down as a first principle, more especially with very delicate plants; indeed, the principal secret—if there is now any secret in the matter—is to have the plants well rooted and to remove them to the large pot just at the time the young roots are breaking away in the early part of the year.

Whatever injury the one-shift system may have done

where it has not been properly carried out, there can be no doubt that it has effected considerable good, for there never was such a general movement in the direction of specimen plant growing as there has been during the present year. I potted a number of plants in the spring for an amateur gentleman, and on inquiring a short time back how they had progressed, he said he did not like the system, but his objection was a novel one, viz., "that the plants grew so very rapidly that they required more time to regulate and keep them in order, and also more room, than an Amateur could conveniently devote to them."—*W. P. Ayres, Brooklands.*

HOME CORRESPONDENCE.

Peat, or Heath-Mould.—In a late Number of the *Gardeners' Chronicle*, at p. 839, in answer to a correspondent, Mr. Wood states that the peat used for fuel "is not in any respect the kind of peat to which he has occasionally adverted;" namely, the kind used in the cultivation of Heaths, &c. I beg leave to observe that I entertain the same opinion respecting it. But Mr. W. afterwards says that the latter kind "is the same as the first-named after a much higher state of fermentation and decomposition," and goes on to show that the only difference between them in point of quality lies in the one being more decomposed than the other, and accounts for this difference by saying that one has been exposed to heat, air, and moisture, while the other has been excluded from the decomposing power of such agencies. Now, by comparing these assertions with those that follow, it clearly

appears that Mr. W. imagines that one soil is not of the same quality as the other, only because it is not decomposed; and I think that the one is not decomposed, only because it is not of the same quality as that which is. If Mr. Wood was to examine an alluvial stratum of the peat fit for burning in this country, he would find that it is composed chiefly of moss, and therefore very strongly impregnated with tannin; then let him, by exposing a part of it to atmospheric and solar influences, reduce it to a mechanical texture fit for the purposes of potting plants, and I have no doubt that, instead of finding it as he asserts, in quality like heath-mould, he would find it very nearly, if not exactly, like rotten tanners' bark; whereas, if a portion of the peat from Wimbledon-common is subjected to careful analysis, it will be found to contain the ultimate products of various and distinct tribes of plants, all of which are there, as the result of that transcendent wisdom, exemplified in the progressive economy of nature. While the tannin of the Moss has rendered antiseptic the lifeless structures of other plants, and thereby secured a mass of matter containing the primary elements of other and higher tribes which would follow, the Fern has gone far and deep into the substratum and extracted alkalies therefrom; these it imparts to the soil by the annual loss of its leaves, and thus the potash becomes incorporated with the vegetable fibre. This potash is not only essential to the very existence of succeeding tribes as a component part of their structure, but it is the agent by which the dead matter is enabled to absorb oxygen from the atmosphere, to decompose the nutritious properties it contains, to be reorganised in the system of the living plants. When we reflect that this process of decomposition and re-composition has been going on during the thousands of years that have elapsed since a little Moss began to fill up the interstices of a stratum of loose sandy gravel, lying upon the sterile bed of London clay, until we find in the same spot a large mass of earth so fertile that there is scarcely a known shrub that would not luxuriate in it: with such facts as these before our eyes—to say nothing of practical experience—I think I shall not be alone in pleading guilty to the charge of scepticism, when we are told that this soil, which probably contains a greater variety of organic and inorganic substances than is to be found in any other, is in quality the same as that which is composed almost entirely of Moss, only not in form. And I hope Mr. Wood will pardon me for saying that I think, until our conceptions are clearer in relation to the manner in which a plant is enabled to educe its aliment from the reciprocal action of those elements around its absorbing organs, the application of his mixture of woody fibre, leaf-mould, charcoal, and night-soil, as a substitute for heath-mould, will be a very doubtful experiment, to say the best of it.—*W. Sherwood, Stamford-hill.*

Coverings for Frames.—The remarks in the leading article, p. 819, of the *Chronicle*, respecting materials for covering frames, &c., have induced me to direct attention to a note on the subject at page 301, from a correspondent who signs himself "Devoniensis." At the time when that communication appeared I was fitting up a light movable covering for shading some Orchidaceous plants, and was at a loss to know what sort of composition I should apply to it, besides a coating of linseed-oil, that would exclude as little light as possible, and at the same time render it pliant and impervious to water. No sooner had I read the directions given by "Devoniensis," in the note above referred to, for making a waterproof composition, than I determined on giving them a trial. I accordingly procured the materials he recommends in addition to linseed-oil, namely, sugar of lead and white resin; and prepared such a quantity as I thought would be sufficient for my purpose,—using the same proportions of each as specified by "Devoniensis," viz., three pints of old pale linseed-oil, one ounce of sugar of lead, and four ounces of white resin. The sugar of lead was ground with a small quantity of the oil, and added to the remainder. The resin was then put in, and the whole mixed up together. Afterwards it was poured into a large iron pot, placed over a gentle fire, and stirred until the mixture appeared to be thoroughly incorporated. The covering—a cheap thin calico—was now stretched out, and tacked to the floor of a loft, and the composition, while warm, carefully laid over it with a large brush, such as is generally used for tarring with. On the following day it was attached to a roller and fitted in its place, and has ever since given me the greatest satisfaction. Being perfectly transparent, it admits an abundance of clear mellow light, effectually excludes the scorching rays of the sun, and affords an agreeable shade to the plants. I intend preparing a similar sort of covering for my Melon frames next summer. Perhaps the composition may be inferior to that of Mr. Whitney, with which I am perfectly unacquainted; but as it answers the same purpose, and is prepared with very little trouble or expense, I am inclined to think this notice of it may be useful to the Amateur and others who have a desire to prepare such coverings, either for shade or as a substitute for glass.—*M. E. H.*

Digging Shrubberies.—We have received three more letters on the subject of Digging Shrubberies, and we now state that we cannot insert further communications on this subject unless they contain something new. It is probable we may advert to it ourselves on a future occasion. "J. H." states that he entirely agrees with what Mr. Ayres has advanced in the *Amateur's Garden*, No. 46, and calls attention to the state of shrubberies at Elm-grove, Roehampton, which have not been dug for four years past. The shrubs there, "J. H." says, are in a flourishing condition, and, extending over the turf, their long branches covered with dark green foliage have an interesting effect. By having the borders

curved, he says farther, that the shrubs do not require watering in dry summer weather. This is an advantage, as it saves labour at a busy time of the year, besides saving that of digging among them in winter. At this place, he says, are Portugal Laurels, 16 feet high and 90 feet in circumference, that have never had their roots interfered with since they were planted. A second correspondent, "J. C.," is of a different opinion, and says that, although he does not altogether condemn the remarks made by Mr. Ayres, yet they are not applicable to many situations. In most places, he says, of any note, a shrubbery skirts the lawn near the house; and in such a situation what can be more desirable than to have a border planted with a collection of spring flowers, in order that they may display their gay colours at an early season, when few blossoms appear? This should be bounded by an edging, not less than 18 inches or 2 feet wide and half an inch deep, on both sides. Such an arrangement he considers in unison with the flower-garden and lawn. The same correspondent maintains that, where a regular system of shallow digging has been performed for years, it is not at all injurious, but, on the contrary, beneficial, especially in heavy soils, and considers the arboretum or park the only suitable place to put in practice Mr. Ayres' ideas, where turving would be in conformity with the situation.—A third correspondent, "M. K.," writes as follows:—It appears to me that some of Mr. Ayres' remarks apply with more propriety to an arboretum than to a shrubbery: a shrubbery, whether intended for ornament or utility, or both, should be planted so that in a short time the branches and foliage of the shrubs would hide the greater part of the ground. The object is not the rearing of single specimens of a beautiful form, but the production of a picturesque and harmonious whole. If single plants are required, lawns and arboretums are the places to produce them. The production of a "smooth velvety turf" in shrubberies is absolutely impossible, as every gardener knows that grass growing under and near shrubs is always scanty, and that more time and labour is required for mowing and sweeping such a place than would suffice for three times the extent of a lawn. The shrubs are also very liable to accidents from the scythes, &c. Every load of leaves or grass taken from a shrubbery diminishes the fertility of the soil, and, consequently, lessens the power of the plants to grow vigorously; and as the surface is frequently trodden over, the soil becomes hard and tenacious, the free circulation of moisture and atmospheric air through it is impeded, and the power of the roots to penetrate it is also lessened. Shrubberies in a natural state are manured by their own decaying leaves and branches; and as the soil is seldom trodden, it is always kept porous and friable by the roots ramifying through it: in fact, a state of nature is decidedly preferable to the mode of turving the surface, if we regard only the health of the shrubs. The practice of planting Herbaceous and annual plants in the fronts of shrubberies is a paltry and very objectionable one, and can only be tolerated in places of very limited extent, as there are plenty of dwarf shrubs which would appear far more tasteful and appropriate. The old practice of digging is a cheaper way of managing a shrubbery than that recommended by Mr. Ayres; and plants will grow more luxuriantly when manured by their own leaves, &c., in a loose and friable soil, than in a hard and stiff one which is constantly drained of its fertility in the way I have mentioned.

Colours of Carnations.—In some varieties the colours are much firmer than in others. Can any reason be assigned for it? Two scarlet Bizarres, Hephworth's Leader and Hoyle's Duke of Leeds, standing side by side, presented a marked difference after the frost; the first had become a dull red or brick colour, whilst the second was uninjured. I am inclined to think that Duke of Leeds has the finest scarlet, combining brilliance with depth, of any Carnation. Twitchett's Don John, as we see it here, looks heavy in the scarlet, and wants that orange shade which gives life. Walsley's William IV. has a fine Bizarre colour, and this gives the scarlet a value which, when examined separately, it does not possess, being somewhat weak. In Gameboy the white appears very good; the scarlet is not so strong as it seems at first sight, but the white assists it. The sun is trying to Rose Flakes, but not so much as to the Scarlet Flakes and Bizarres, which it perhaps heightens in colour.—*O.*

Chrysanthemums.—Amateurs are not generally aware of the beauty which may be displayed, even at this late season of the year, by a liberal introduction of good Chrysanthemums into their Flower-Gardens. The beds here have been brilliant for the last five weeks by their aid alone; and some late sorts, which are at the same time of the best, are still in great beauty and perfection: of these latter, Casimir—a large crimson flower and a free bloomer—is the best, and as handsome (with a delicate aromatic smell) as any flower which the Garden produces. I will mention a few more purchased last year, which have bloomed both in pots and in the open ground in perfection:—Campestroni, a good form and crimson, but showing a broad disc; Beauty, a late flower, of a delicate lavender, still in bloom; Marshal Augereau, a flat full flower of peculiar growth, a good straw colour; Achmet Bey, a fine maroon, tipped with white; Celestial, a fine full white; Formosum, a very fine white; Golden Lotus, an old and very handsome yellow; Pulcherrimum, a very fine lilac; Sulphureum, &c. The red flowers are in general dull, such as Theresa, Sanguineum, Duc de Colignac, &c.—*A Subscriber, Exeter.*

Prince Albert Pea.—It would appear that in some situations this Pea is no earlier than some of the older varieties. Here the Prince Albert and the New Early May were sown on the 28th of January, side by side, on a south border, so as their merits might be equally tested;

—a dish was gathered from the Prince Albert on the 18th of June, while the Early May was not fit for table until the 25th of the same month; thus giving a difference of seven days in favour of the former.—*G. G. Watson.*

Cucumbers.—In the report of the Horticultural Society's Meeting at Regent-street, on the 5th Dec., there is a notice of a brace of Cucumbers exhibited by Mr. Stewart, of Stradsett Park, and it is stated that, though both the same variety, they had a very different appearance—one being prickly, and the other nearly smooth; and the inference drawn is that the manure used was the cause of the difference. Now, if I recollect right, it was the plant that had been manured with nitrate of soda that produced the smooth fruit, and if so, surely there must have been some mistake, and the smoothness attributed to a wrong cause. On March the 7th, as will be seen by a reference to page 158, Mr. S. exhibited before the Society a leash of fruit of the same kind (Ringleader), which had been watered with a solution of nitrate of soda—in the proportion of 10 ounces to 3 gallons of water, and I perfectly recollect the fruit on that occasion were not smooth; but, on the contrary, were beautifully spined. From those facts, I conclude Mr. S. is labouring under a mistake; and I suspect the real cause of the difference in the appearance of the fruit was the sporting of the variety, and not the manure used; at any rate, there is a contradiction in the statements which requires some explanation before I can believe manure was the cause of the great difference in the appearance of the fruit. Let Mr. S. take a cutting from the smooth kind, and treat it as he does his prickly ones, and then if the fruit it produces becomes prickly, I will believe that manure caused the difference.—*Veritas.*

Orange Trees.—In the *Calendar* lately Mr. Beaton asked for an article on the management of Orange trees, and as their culture is daily becoming of more interest, I trust some of your correspondents will offer a few remarks on this subject.—*A Subscriber, Southampton.*

Preserving Strawberry Plants for Forcing.—Mr. Beaton asks, in a late Number of the *Chronicle*, for an account of the best means of keeping Strawberry plants during winter. The plan I practise is very simple. I lay a row of pots down on their sides on the border of a north wall. I then put some mould to the bottom of the pots, and also over the whole of the pot as far as the rim: when this is done I put another row of pots on the top of these, and cover again in the same manner, and so on for four or five rows. Then I beat the mould on the bottom of the pots, and also that on the top of the last row, firmly with the spade, in order that rain may run off. In this way I proceed until the lot is finished: in frosty weather I cover the whole with fern or straw. This is a better way, in my opinion, than leaving them exposed to rain and severe frosts. If acceptable to you, I will at a future period let you know my plan of forcing them.—*The Knave of Spades.* [We shall be glad to receive this.]

Planting Shrubs.—I beg to offer a few remarks respecting a method which I have proved to be advantageous in planting shrubs under or near ornamental and Forest-trees. Instead of digging holes, as is the common practice, I take as much soil as may be required to the spot I intend to plant; I then place the shrubs on the surface of the ground without disturbing it, and cover over their roots with this soil. By this method I find shrubs to succeed well, and it obviates the labour of digging holes or pits among the roots of trees. The principal advantage gained by this, however, is, that the newly-planted shrubs establish themselves before the roots of the trees deprive the fresh soil of the nourishment that the shrubs require; and when once they are established, there is no great danger of their success. I have found the above method preferable to trenching near large growing trees.—*C. H. N.*

Dutch Clover.—As "R." has appealed pointedly to me respecting the causes which have produced the considerable accession of Dutch Clover which has been observed in Australia, I will reply to him in the best way that I can. I am inclined to think that the increased produce of this valuable pasturage has rather been coincident than correlative to the introduction of Honey-bees to the colony, and that it has arisen from some improvement in the culture of the land, as a change of culture is very well known to be capable of producing such an effect. Dress a pasture-field with soap-maker's waste, or with a compost well imbued with lime, or with lime alone, and you will insure a crop of Dutch Clover where it had never appeared, or but scantily appeared, before. Some physiologists attribute this consequence to your placing the land in a favourable state for the growth of Clover, the seeds of which had lain dormant in the ground, and only awaited the revivifying influence referred to to cause those seeds to germinate. Others, again, regard it as a parallel instance to that which has been afforded by the celebrated Mr. Cross, who by means of electricity has caused the birth of insects previously unknown, and both these phenomena have been viewed by the latter physiologists as militating against the doctrine of "Omnia ab ova." It is a knotty point which I shall not presume to decide; but I hope the remarks I have made will call forth others from some of your intelligent correspondents.—*E. Bevan, Esq. Evan, Newtown, Montgomeryshire.*

Pine Apples.—I planted out several pits of Pines with-out pots in June last, and it is astonishing the progress they have since made. I am so satisfied with the excellence of the plan, that I intend planting out all our Pines in spring in the same way.—*C. Ewing, Bodorgan Hall.*

Pine-apples.—I do not consider that it requires three years to bring a Queen or Montserrat Pine to 5 or 6 lbs. weight, which, according to Mr. Pope's calculation at p. 861, is the case with the large ones lately mentioned in

the *Chronicle*, nor do I think that many of the plants producing these were six feet in height, as I have seen most of them myself. I have cut a considerable quantity of Montserrats within the last two months, and many of them exceeded 6lbs.; two exceeded 6½lbs., and the majority of them weighed from 5 to 6lbs. I have, at the present time, above twenty ripe and ripening. Some of these will fall short of 4lbs., but this is not to be found fault with at Christmas; the whole of the plants producing fruit since October are from 18 to 22 months from the suckers; of course the suckers were good strong ones, which ought always to be the case; all undersized ones I throw away. Now, instead of the plants being six feet high, the longest leaf of these did not exceed four feet; but averaged about three and a-half feet, and were short and broad, and very stiff. Many of my neighbours can bear testimony to the correctness of these statements. I do not find the Montserrat to be a particularly slow grower; it certainly is no longer in perfecting its fruit than the Queen, but it is quite as easy to fruit, and without any check will grow quite as rapidly as it.—*S. Barnes, Apley Park, Bridgenorth.*

Pine-apples.—In reply to a "Practical Gardener" who requests that the collective weights of fruits each writer has cut within a given period of not less than three years should be given, I beg to state that if he will refer to p. 861, he will there find the collective weights of fruits cut during the last three years at Thornfield, together with the dimensions of the retaining wall of the bark-beds in the fruiting-pits; and I beg further to inform him that succession and nursing plants are all grown in one house under the Vines. The bark-bed in this house is 23 feet long and but 7 broad; and moreover no importation of plants has taken place here for ten years back; on the contrary, I have parted with 60 fruiting plants within the last sixteen months. I have entirely dispensed with succession plants in the culture of Pines, and my plants promise to do as well as ever they have done. With regard to expenses: about 12 tons of coals are consumed for fire-heat; this costs about 5*l.*, and one cart-load of bark is used for plunging the plants in; this costs about 8*s.*, making in all 5*l.* 8*s.*; hot water is used for obtaining bottom-heat, of which a full description will be given in my forthcoming Treatise, with suggestions and improvements. I may state that my Cucumbers are also grown in the same pits.—*Joseph Hamilton, Thornfield, Stockport.*

Holly Stealing.—A Correspondent tells us that this offence increases annually with the size of the metropolis. Cart-loads of beautiful evergreens are to be seen entering the principal thoroughfares in the middle of the night, and yet no notice is taken of the stolen property by the police. If a churchwarden or overseer loses his duck or his pig, the robbery is advertised and the thief generally punished; but if a gentleman's grounds are damaged by his evergreens being mutilated and carried away, the thief is encouraged by the persons holding these offices in the metropolitan parishes purchasing the stolen property to perpetuate an old custom, besides throwing away the money which ought to be applied to the relief of the poor. Our correspondent tells us that even to the extent of 30 miles from London gentlemen are put to the annual expense of stripping their bushes of berries, besides the annoyance of lessening their beauty for the remainder of the season. All this might be obviated by a better understanding between the rural and metropolitan police.

Pruning Forest Trees.—In a late Number, there is no fewer than three Correspondents taking me to task about pruning Forest Trees. In reply to "E. A. C.," the first of these, I beg to repeat that my arguments hitherto, if they deserve the name, have all hinged on the mutual action and reaction (or if you please reciprocity) between root and branches, and that the production of timber of best quality in the shortest time is the object in view. I beg to inform "E. A. C." that his distinction between "wood" and "timber" is more fanciful than real; a tree will never make "timber" if it do not make "wood," but will make both faster without pruning than with it; and as to the instance he adduces of Pollards, what he takes for granted is just the reverse of fact. There is now within a mile of where I write, an extensive common with hundreds of Pollard Oaks that have been beheaded a great many times—the last time upwards of 40 years since, as the practice has so long been prohibited. These have fine bushy, and many of them large heads, but yet there is scarcely one among them more than sufficient in size to square into a gate-post. Next comes a correspondent from the "Mountains of Wicklow," who wishes to balance the account between me and "Pro Bono Publico" in regard to Dr. Thackeray's plantations at Nerquis. Now I have said before, I quite believe all that is reported of Dr. T.'s plantations, and am not aware that I should object much to the practice of (Dr. T.'s forester as described by a former correspondent in the *Chronicle*, but I opine that results are attributed to "pruning" in this case which more properly belong to other causes. "Consule Planco" calls on me to go to Nerquis and see the result; this I would gladly do were it convenient—indeed nothing would please me more. I beg to tell all the eulogists of the Nerquis, and all other systems of pruning, that in my younger days I had the management of plantations, which were pruned à la "Pontey," and yet these plantations grew with great vigour. The soil was a strong marly red loam, and was trenched two spades deep, yet to attribute the vigour of these same plantations to the pruning, and place it in favour of "Pontey's" system would be at once an injustice and an absurdity. If any who may be induced to copy Dr. Thackeray's example would first inform them-

selves of the true principles that accelerate the growth of timber in trees, I should have little fear of their counter-acting it by continuing an injurious system of mutilation, vulgarly called pruning, beyond the period of youth. Much as I disapprove of "Pontey's" recommendations, many of his professed followers committed sad havoc in carrying them out in a mistaken manner, and practices which Dr. Thackeray himself would condemn might happen to ensue in attempting to imitate his system. Next comes Mr. Billington, and I am glad to find that our difference, if difference there be, is more about words than things; he says he finds "Quercus" still adheres to reciprocity between roots and branches: "now nobody knows better than Mr. Billington that trees still adhere to this, whether 'Quercus' do or not; and Mr. B. himself adheres to it also, for he subsequently observes—"The system of training forest-trees that I have found out and practised increases the number of branches on a tree, consequently the increase of timber in the stem, and, I presume, the reciprocity between roots and branches." Now here we are as nearly agreed as need be. Although I am quite uninformed on Mr. B.'s system of training, I have a shrewd guess it is near akin to that described and practised by Dr. Thackeray's forester—such as displacing a bud likely to make a wrong shoot, or removing a rival in a young state, or shortening in a limb likely to overshoot his proportions, &c. To all such operations I am decidedly friendly, therefore it is unfair to represent me as opposed to all care about woods and plantations, merely because I disapprove of systems of pruning by which their growth is retarded and their quality deteriorated. I beg to assure all my opponents that I wish every care to be taken of woods and plantations, to promote their growth and beauty; assured, as "Consule Planco" says, "the subject is one of deep and permanent interest to the public." Mr. Billington justly observes there is still a chaos of opinions on this subject; the very terms we use in writing about it may produce different ideas in different men's minds, and therefore there is some little discretionary latitude to be allowed in the use of words and phrases—as there may be in the management of a young tree, according to the circumstances in which it is placed, its kind, and concomitant relationships. Consequently, every man who has the management of woods, &c., should possess knowledge enough to act discreetly with varying subjects under ever-varying circumstances, but never to violate or counteract Nature. Let this answer Mr. B.'s interrogatory—"how young?" Finally, let me recommend all my critics and opponents to procure and study a pamphlet recently published on Arboriculture, read before a scientific society in the West Riding of Yorkshire, and noticed in the *Chronicle*, p. 696, by J. Hamerton, Esq., of Hellifield Peel, near Skipton. Mr. H. shows, among other things, what quacks some writers—who would be reckoned authorities (and are with some) on Arboriculture are. All these serve to show with what wisdom the arboricultural world has been governed. May we all live to see better days and more efficient guides!—*Quercus.*

Forest Trees.—The cause of annual rings being unequal in different parts of the circumference of trees I shall endeavour to explain. A great deal has been written on the increase of timber by consolidation of the sap (*cambium*), and that the sap flows more freely on one side of a tree than on another—on the south side, for instance. But as I am of a different opinion, I beg to state that, when trees are sawn across, it is frequently found that the part which was the original centre of the tree, when young, is out from the centre, from a quarter to three fourths nearer the outside on one side than on another. Why is this? It is not from consolidation of the sap, or from the different aspects, east, west, north, nor even south; but from the descending filaments or woody tissue from the annual leaf or leaf-buds. This has been fully confirmed from observation and admeasurement of trees felled on purpose during this autumn. When trees stand so far apart that the branches are nearly of an equal size, and pretty regular on all sides of the stem, the concentric layers will be of an equal breadth, or nearly so, all round the circumference; but when trees have been crowded on one, two, or three sides, and have lost their branches on those sides, the concentric layers will be broadest on the sides that the branches are on. On the sides where there are no branches the annual layer will be very narrow indeed; and this is the real cause of the inequality in the breadth of the annual layers on different sides of the tree. The same thing occurs when trees are much exposed to strong prevailing winds, and when the branches, in consequence, are forced to one side: from whatever quarter those winds may come, without any regard to aspect, the concentric layer of wood will be broadest on the side to which the branches are inclined. If the branches are strong, numerous, and healthy, the annual layers will be broader than if they were scanty and small; but the grain of the timber will be finer in proportion to the number, health, and smallness of these, and annual layers will be narrower than in more vigorous trees. The following two Larch trees, cut down and measured, will prove what I have stated:—The first was from the south side of a plantation, and the north side of the tree was clad with branches; from the centre to the circumference on that side it measured 8½ inches; the south side of the same tree, with few branches on that side, measured 3½ in.; making a difference of 4½ in. The second, from the north side of a plantation, having branches on the north and north-east sides of the tree, measured from the centre to the circumference, 4½ inches; the south and south-west sides, with few branches, measured, from the centre to the circumference, 2½ inches; this, subtracted from the former, leaves a difference of 2 inches.—*W. Billington.*

On Forest-Tree Pruning.—I have under my care an

acre of young Oaks, from three to six feet high, in a very neglected state as regards pruning, superfluous branches existing in every part. I proceeded to prune the said trees upon what I term scientific principles, viz.:—In the first place, to prune all branches that appear likely to contend in size with the trunk of the tree; and secondly, to prevent more than one leader, my chief object being to abstain from pruning too hard in any one year or succession of years, as in that case I find the trees invariably produce an infinite number of small spray from different parts of its body; caused, I suppose, from the superabundance of sap arising in consequence of a heedless deprivation of its branches. Working this rule I was visited by my employer, who, to my great surprise, told me he had lately been to his estate in Sussex, when his agent then gave it as his opinion that I was decidedly wrong in my application of the pruning-knife—that the young tree never recovered the shock, and should be allowed to stand unmolested, and take its chance as to whether it eventually became a tree worthy of being called the Monarch of the Forest, or to grow like Gooseberry-bushes, useful only for the oven or the charcoal-burner. This is the opinion of a practical man. If any of your readers will favour me with their opinions on this subject, it will oblige *Quercus II.* [We have given our own opinion on this subject in a leader this week. There is no objection to pruning skilfully performed; under some circumstances it is desirable, but it is too often abused.]

Fuchsia Exoniensis.—Without any desire to depreciate the value of this plant, I must persist in what I have stated respecting it. I spoke of it from the plant exhibited at Chiswick, which I have a right to suppose was a fair specimen of cultivation; and in that the branches were irregular, the leaves curled, and the whole aspect spare and meagre. The flowers in colour are everything that can be desired, but like many long-sepalled varieties, they do not expand freely, and are not liberally produced. Like *formosa elegans*, which I should suppose is one of its parents, it will occasionally be caught in fine condition; but, as Dr. Lindley remarked of it when shown at the Horticultural Society's Rooms in the summer, "it, like *St. Clare*, will require good management to have it always in a fine state." A young *Fuchsia* that will grow from six inches to a foot high at this season, without exhibiting any disposition to produce lateral branches, will never come up to my standard of what a prize specimen ought to be. However, I have no prejudice in the matter. I will give it a fair trial, and if it is deserving, will treat it to a ride to Chiswick about the Exhibition time.—*W. P. Ayres.* [We close this question with the present letter and the following observations. *F. exoniensis* has the finest flowers of any variety yet produced, taking them all in all. It is not fair to judge of it from the specimen shown at Chiswick, which had evidently been forced, in order to get it ready. We attach no importance to what is called the *habit* of a *Fuchsia*—a clever gardener can always regulate that. If a variety grows too compactly, force it on; if too loosely, stop it. Adapt the management to the habit, and do not expect the habit to adapt itself to your management. *St. Clare*, a variety with similar growth, and once the finest of its class, though now beaten, is only undervalued by those who cannot grow it.]

Mildness of the Season.—As a proof of the mildness of the season in this district (county Northumberland,) I send you the following list of flowers, gathered from the open borders of the garden on the 14th December, 1843:—China Roses, different sorts; other Roses, *Stenactis*, *Cenotheras*, various kinds; Wallflower, Stocks, German, &c.; Pansies, Phloxes, different sorts; Erics, Violets, *Potentilla nepalensis*, *Escholtzia*, *Mary-golds*, Sweet Peas, *Gilia capitata*, *G. bicolor*, *Malva*, sorts; *Malope trifida*, Chinese *Chrysanthemums*, *Pyrus Japonica*, *Convolvulus minor*, Spanish *Nigella*, *Carnations*, Pinks, *Iberis odorata*, *Aster*, sorts; *Mignonette*, *Branching Larkspur*, *Pentstemon coccineum*, *Verbenas*, &c.—*S. L.*

Bleeding of Grape Vines.—It has occurred to me that the bleeding of the Vine, to which a correspondent adverts, might be prevented by twisting severely the end of the Vine at the point to be separated, in the same manner as surgeons act with arteries by what is called torsion. Is it not worth the trial? Should the end be answered, the dead portion might then be separated without the fear of bleeding.—*W. Rayner, Uxbridge.*

Scale on Pines.—Many applications have been recommended for the destruction of scale on Pine plants. It appears astonishing, when we consider what was known to Mr. Knight and written by him upwards of 20 years since, that fermenting horse-dung, a most destructive and easily-applied agent, is only just beginning to be generally used for the purpose. Being desirous of ascertaining whether a substitute less troublesome and equally efficient could not be found, and to what extent it could be applied without injury to vegetable growth, about two years since I subjected some seedling Orange trees much infected with scale to the fumes arising from ammoniacal liquor, obtained from the gas-works. The trees were kept close in a common-sized Cucumber-frame with glazed top; into this was introduced a pan containing half-a-gallon of the liquor, and in three days the insects were destroyed, but the foliage of the plants presented a scorched and shrivelled appearance. It is probable that the same result would have been obtained in much less time by pouring common sal ammoniac upon quicklime. The subject is well worth consideration, and I hope some one interested in the inquiry will be induced to pursue the experiment further.—*A Subscriber, Southampton.*

Four Crops in a Year.—On the Cottagers' tables at the late exhibition of the Norwich Horticultural Society were four plates of Potatoes, being samples of four crops,

grown by John Digby, of Buxton, on one piece of ground, between March 11 and Oct. 20, this year. Digby himself gives the following account of his crops:—"I have grown, this summer, four crops of Potatoes from the same ground, from March 11 to Oct. 20. The first crop ripe for seed in May; the ground cleared before the next crop was put on. The second crop taken up the fore part of July; the ground was spaded. The third crop was taken up in August; the ground cleared. The fourth crop was taken up Oct. 20. I have a multitude of persons that have witnessed what I have now stated. Four crops of Potatoes were never known to be grown in the memory of man before." This year John Digby has grown three other crops off another piece of ground; the first was Cabbages, which he sold at Norwich and Buxton at a penny each, at the latter end of March. He then planted Onions, for which he obtained a prize at Norwich, for being the largest on the Cottagers' table. He exhibited a peck at Aylsham, grown upon the same ground, which were superior in size and quality to any others shown there, although the others exhibited were not grown after another crop, as Digby's were. He had then another crop of fine Cabbages, some of them beautiful white middles. Digby says, "I have the method of growing new Potatoes in the winter:—Commence digging at Christmas till April, at the rate of two bushels a rod, natural grown; no more trouble than those that are grown in spring, and are superior in quality to those which are grown in spring." The above is cut out of the *Bury Post*. I saw the Potatoes and read the same account at the late Norwich Exhibition. A certificate of the man's respectability was appended by the Rev. Mr. Jarvis, the clergyman at Buxton. —*Rambler*.

Leycesteria formosa.—In reply to "M. B.," p. 809, I beg to state that I find the berries of *Leycesteria formosa* are readily eaten by pheasants and peafowls, and I know of no plant more desirable for shrubberies and plantations, as it seeds freely and is very ornamental.—*N. S. H., Botanic Garden, Bury St. Edmund's*.

Bees.—"J. B." relates at p. 758 something curious respecting Bees being at work in two separate hives. If there was a communication between the "old and new hive," the circumstance of the Bees taking possession of the latter would be similar to Bees at work in an end box in a collateral hive; but if the bustling colonists entered both hives at their common entrances, the case would be different. The like, however, does happen, though rarely. Yet I never knew an instance of a Queen-bee being the head of two separate hives at one time; consequently, there was little chance of "securing a fresh colony by removing the new hive to a distance from the old one," for the Bees would soon return to the one containing the Queen. Supposing that "J. B.'s" friend's two hives were at a distance from each other during the time the Bees were at work in both, the thing would not only have been curious, but have supported what some apiarians advance, viz., when Bees are short of room they search for a place elsewhere to store up their treasure until there is space for it at home. This I believe is founded on a statement of Gelien's; but it cannot be correct. Whoever found Bees in such temporary abodes? indeed it is against their habits to construct cells and work without a Queen, except old hives, which are Queenless for a few days after the old Queen's departure with the first swarm.—*J. Wighton*.

To Bloom Carnations in Winter.—All that is necessary is to take them into a greenhouse, giving as much light as possible, and just excluding frost. In this way I have seen a large collection blooming from Christmas to April. Where piping is practised, they are frequently coming into bloom as strong plants from layers are going out. The colours, however, are always weaker than in the proper season. A common frame raised over a few pots in the angle of a south wall, will preserve the bloom some time, stopping the opening below and covering at night.—*O.*

PROCEEDINGS OF SOCIETIES.

ROYAL SOUTH LONDON FLORICULTURAL SOCIETY.
An unusually numerous meeting of this Society was held at the Horns Tavern, Kennington, on Thursday last. It was the Annual Meeting, for the consideration of the accounts and other matters affecting the Society, as well as for the election of a committee and officers for the year ensuing. The following is the Treasurer's statement:—

Dr.	£ s. d.	Cr.	£ s. d.
To cash paid for Prizes	215 11 0	By Balance from 1842	10 11 11
Printing	47 1 9	Subscriptions	170 0 0
Censors and other expenses at Flower Shows	24 16 4	Amount received from Mr. Cross on account of shows at the Surrey Gardens	120 0 0
Advertisements, Stationery, &c.	33 11 3	Admissions to Shows held at the Horns Tavern	21 8 0
Collector's poundage	16 5 0	Amount received from Members for extra prizes, exclusive of three silver cups	18 7 0
Balance due to the Society	3 6 7		
	£340 11 11		£340 11 11

The following Medals have been awarded during the season:—Gold, 9; Large Silver, 43; Middle Silver, 98; Small Silver, 86; 2d Small Silver, 26; 3d Small Silver, 10. In addition to which four Silver Cups have been presented:—By H. M. the Queen Dowager, for a Collection of Greenhouse Plants; by Mr. James Dickson, for Auriculas; by Mr. Chapman, for Auriculas; by Mr. John Dickson, for Picotees. Besides twelve other prizes by Messrs. Barnard, Denyer, Edmonds, Iliff, Procter, and J. T. Young. The present number of Members is 247; 37 having been elected during the year, and 31 resigned.

Several changes were proposed in the Committee, and, after a spirited contest, the following were elected, viz.:

Amateurs.—Messrs. Barnard, Burnard, Burrup, Chapman, Edmonds, Fox, Jeffs, Schroeder, Seldon, Sangster. *Gentlemen's Gardeners*.—Messrs. Atlee, Bruce, Coutts, Hamp, Payne. *Nurserymen*.—Messrs. James Dickson, R. Chandler, Catleugh, Groom, Denyer.

From the active part taken in the proceedings by many of the members present, it is quite clear that no supineness or partiality

must exist on the part of those in office. Neither, we verily believe, have hitherto existed; and we are happy in having the opportunity of bearing testimony to the high respectability of those who have had to conduct the affairs of the Society. Complaints have no doubt been made, and, in some respects, improvements might perhaps be effected; but we believe that any imputation of unfairness would be totally destitute of foundation.

An occurrence took place in the course of the meeting which will well serve to show the independence and proper feeling of those present. It may be recollected that for the last year or two Mr. John Dickson has offered a five-guinea cup for the best 12 Picotees exhibited by an Amateur. It having been understood that, in offering the cup for the coming season, Mr. George Glenny and Mr. Neville were appointed by Mr. John Dickson to be censors on the occasion, a question was asked as to whether this report was true; which having been ascertained, and upon Mr. John Dickson declining to withdraw a condition so offensive to the Society, it was resolved unanimously "that the Cup be rejected." Mr. Norman, of Woolwich, immediately offered a Cup of equal value, for the same purpose, unconditionally, which was accepted, and the thanks of the meeting were voted to Mr. Norman with acclamation.

LINNEAN SOCIETY.

Dec. 19.—Edward Forster, Esq., in the chair. Dr. Barrett, Dr. Allamy, Dr. Hillier, and S. Hanley, Esq., were elected Fellows. Mr. Henry Denny was elected an Associate. A communication was read from Mr. E. Tradescant Lay, British Consul at Amoy, giving some account of a vegetable production called *Keih Seen-me*, which is used in China as an article of diet. It appears to be a species of *Alga*, belonging to the genus *Nostoc*. A box full of the dried plant was exhibited. Its chief use in China is in making ragouts, and is in much request at Nankin. Messrs. Whitley and Osborn exhibited specimens of *Shepherdia argentea* in full fruit. This is a North American plant, capable of growth in this climate. It produces a red fruit, about the size of a large Currant, and having an agreeable flavour, perfectly innocuous, and used for making jellies, preserves, &c. A paper was read from Dr. Boott, on a new species of *Carex*, a native of Scotland, which had been found in Clova by Dr. Graham, and had been hitherto confounded with the *Carex saxatilis* of Linnæus. It was, however, a distinct species, and Dr. Boott gave it the name of *Carex Grahami*. A paper was read from Maj. Harris, giving an account of the trees producing myrrh and frankincense, and found in those parts of the coast of the Red Sea and Indian Ocean, whence the gums were obtained, in the early history of the world. The myrrh is the production of more than one plant; the best is undoubtedly the production of the shrub bearing the name of *Balsamodendron myrrha*, which is a small shrub. The worst and more liquid kinds of myrrh are the produce of a plant considerably larger than the latter, and of probably a different species. The plants from which the frankincense is obtained, grow from the sides of the steep marble rocks, and seem to require little soil for their growth. The gum may be obtained by bruising the tree during its growth. It is collected by the natives of Abyssinia, and exchanged by them for tobacco, cloth, &c. It has a remarkable bark. The outer layer or epidermis is very thin. The second layer is somewhat thicker, and may be used for the purposes of writing. The third layer of the bark is at least an inch thick. Specimens of the bark were exhibited. A microscope, lately purchased by some of the Fellows and presented to the Society, was exhibited.

MICROSCOPICAL SOCIETY.

Dec. 20.—A paper was read from Mr. Tulke on the discovery of a new parasite, the *Demodex folliculorum* of Owen, on a dog which was suffering from the mange. This animal, which is placed by zoologists in the order *Arachnida*, was first described by Dr. Simon as an *Acarus*, and afterwards by Mr. Wilson as an *Entozoon*. It was first discovered in the human skin, where it exists sometimes in considerable numbers in the mucous follicles. In the instance of its being found in the mange dog it did not appear to be the cause of the disease. Mr. Tulke was not able to discover sufficient difference of structure between the present and the human species to warrant him in giving it a new name. Mr. E. Quckett exhibited specimens of *Cycada septemdecem*, which was remarkable for the ravages it produced in depositing its eggs in the buds, and under the bark of young trees. He also exhibited a diagram, showing the forms of several rare species of infusorial animalcules, which were found in great numbers in a specimen of clay from the tertiary formation near Petersburgh. Mr. Row read a short account of an examination he had made of Daguerreotypes portraits, and which presented the appearance of hexagonal cells, which probably arose from the crystallization of the iodide of silver. A letter was read from the Rev. J. B. Reade, recommending an infusion of nut-galls as one of the best fluids for cleaning glasses used for microscopical purposes. Mr. Bask exhibited an achromatic lens, between glasses of which were evident indications of the growth of a *Conferva* of a simple kind. Mr. R. H. Solly observed that such markings on telescope glasses were very common, and were supposed to arise from some decomposition of the glass. Mr. Ross said he had often seen this same kind of marking, and did not think it could be of a vegetable nature, as the glasses required grinding to get it off. Dr. Lankester thought this inquiry important. Microscopists were often misled, and crystalline markings of a dendritic form in agates, rocks, &c., had been mistaken for vegetables. He was inclined, from the circumstance of these glasses not having been exposed to damp, the branched character of the marking, and the necessity there was of grinding the glass to remove it, to consider it as of crystalline, and not of vegetable origin.

MISCELLANEOUS.

DECEMBER.

By the Author of "Rural Sonnets," "Spartacus," &c.
Crown'd with Chrysanthemums that, on his brow,
Smile loneliness, like Duty tending Age,
December, to fulfil his rigid vow,
O'er moor and mountain toils in pilgrimage.
Lo! with the stinging sleet, or driving blast,
He buffets; or with mist his path is cross'd:
Now, a "white world," bewildering, sets him fast;
The trees all cover'd, and the tracks all lost,
Save where the Peasants keep the farmway's clear,
Or Robins bare the berries to the sight;
Or madcap elves, in holiday career,
Snowball each other to their hearts' delight,
Till driv'n to troop—from ghosts and darkness round—
Where fireside romps and cheer, for Christmas folk, abound!
Inner Temple, Dec. 13, 1843. J. J.

Dublin.—We understand that Dr. Allman is likely to be re-elected Professor of Botany in this University; and that Mr. W. H. Harvey, the well-known zealous and talented author of "British Algae" is a candidate for the Curatorship of the Herbarium, vacant by the death of Dr. Coulter.

New Natural History Society.—Papers have been circulated inviting naturalists to co-operate in the formation of a new Society, to be called "The Ray Club," the objects of which are stated to be the Promotion of Natural History by the printing, and circulation among its members, of original works in Zoology and Botany; of new editions of works of established merit; of rare Tracts and MSS. which throw light on the history of these branches of science; and of translations of such foreign works as tend more directly to illustrate the Zoology and Botany of the British Islands. We confess it appears to us much

better to support the Linnean and Zoological Societies than to form a new one, for which there does not appear to be the smallest necessity.

Pruning Fruit-Trees.—In a garden at Ville d'Avray, near Paris, there is a piece of excellent open ground where fruit-trees, particularly Pears, grow with much vigour, which suggested to M. Milange, the gardener, a mode of pruning suitable to their strength. The branches are all single, that is to say, not forked. He only leaves the strong shoots and the fruit-buds, so that the branches pruned according to their vigour, and at a suitable distance in the height of the trees, allow the sun and air free action upon the fruit to ripen and colour it.—*Rapport à la Société Royale d'Horticulture, par MM. Godefroy, Janin, Pépin*.

Fruiterers' Shops at Christmas.—"Fruiterers were radiant in their glory. There were great, round, pot-bellied baskets of Chesnuts, shaped like the waistcoats of jolly old gentlemen, lolling at the doors, and tumbling out into the street in their apoplectic opulence. There were ruddy, brown-faced, broad-girthed Spanish Onions, shining in the fatness of their growth like Spanish Friars; and winking from their shelves in wanton slyness at the girls as they went by, and glanced demurely at the hung-up Mistletoe. There were Pears and Apples, clustered high in blooming pyramids; there were bunches of Grapes, made, in the shopkeepers' benevolence, to dangle from conspicuous hooks, that people's mouths might water gratis as they passed; there were piles of Filberts, mossy and brown, recalling, in their fragrance, ancient walks among the woods, and pleasant shufflings ankle deep through withered leaves; there were Norfolk Biffins, squab and swarthy, setting off the yellow of the Oranges and Lemons, and, in the great compactness of their juicy persons, urgently entreating and beseeching to be carried home in paper bags and eaten after dinner." —*Dickens' Christmas Carol*.

Portable Hot-bed.—We find in a French periodical the following account of a contrivance which may suit the taste of amateurs, who have a small number of cuttings to strike, or may wish to amuse themselves with gardening experiments. The apparatus consists of three pieces of earthenware (zinc or copper would be better); viz.:

a, the foot, on which stands b, the basin, which is itself surmounted by the plate, c. In the foot, a, is placed a tin or earthenware lamp, d. Three or four inches above the wick is placed a short iron cistern, e, carried by three feet which rest upon the bottom of the basin, b; it is 3 inches deep, 7 inches in diameter, and is fed by a pipe and funnel, f, into which water is poured until it can be seen at the bottom of the funnel, which shows that the cistern is full. The plate c, formed of common red earthenware, consists of two circular trenches g, h, 4 inches broad, and as much deep, filled with sand, in which are placed, in two rows, in the trench, g, 86 little thumbpots, and in the trench, h, 40, which makes room for 120 or 130 cuttings, or more, according to the size of the thumbpots. In the foot, a, is a door, fastening with a button such as is always used in earthenware furnaces; it is removed when the lamp is introduced, and is afterwards replaced. This lamp gets air by eight holes, i, bored in the foot, a, by eight others still smaller at k, and eight or ten at l, in the plate. It is easy to conceive that the cistern, e, is intended to break and regulate the heat, which principally passes through the water, or, when it rises between the cistern and the lower part of the vessel, b, is diffused under the plate, where it circulates, charged with water, in the spaces, n n. The most intense part of the heat strikes m, through a plate of metal pierced with holes. From this arrangement, it results that the centre of the apparatus, that is, the ditch, h, is hotter than the others by some degrees, so that the one will do for stove plants, and the other for greenhouse ones. The whole is covered by the handglass, p. The apparatus is also adapted for bringing up seeds, or trying their germinating powers. The cost of oil for the lamp is said to be at Paris four francs per month.

Scientific Bequests.—The late Mr. Thomas Botfield, of Hopton Court, near Bewdley, has lately bequeathed to the Horticultural, Royal, and Geological Societies, the Royal Institution, and the Society of Arts, the amount of a life subscription to each of those bodies.

GARDEN MEMORANDA.

Bodorgan Hall, Anglesea.—At this place has lately been erected a large ornamental stove which is heated by a flue in connection with open gutters, thus taking advantage of fire-heat in two ways. Round the stove a large flue is constructed 2 feet deep and 20 inches broad, and instead of the common form of flue-tiles it is covered with tiles made of the same material, but having two gutters cast upon them, which serve as a flow and return for the circulation of hot water from a boiler heated by the same fire. The smoke enters the flue near where the pipes from the boiler

are introduced into the gutters, and after travelling all round the house under the gutters it passes under the back path and escapes by a chimney-place behind the back wall near the boiler. Both for economy and utility this plan of heating promises to be all that could be desired. Moisture can either be obtained or dispensed with at pleasure by means of a simple contrivance for drawing off the water from the gutters; and there is a two-fold advantage in having the gutters placed on the top of the flue, as the water returns to the boiler almost as warm as when it left it, consequently there is a very small consumption of fuel. The boiler is provided with a tap at the top for allowing the steam to escape when gutters are not used; and it has also a pipe with a tap attached, inserted near the same for supplying it with water. The house is a semicircle with eight sides, and has the principal entrance in front. The above arrangement has been in operation for some time, and I find it to answer the purpose very well. Many gardeners have also seen it, and all bear testimony to the excellence of the plan.—*C. Ewing.*

Reviews.

Experimental Researches, Chemical and Agricultural, showing Carbon to be a Compound Body, made by Plants, &c. By Robert Rigg, F.R.S. Smith and Elder. 8vo.

A book with this startling title has recently been published, purporting to be the result of many years' study and careful experiment, and containing statements which if borne out by satisfactory evidence would effect a complete revolution in Chemistry generally, more especially in that branch of it which relates to organic matter.

The Author commences by a series of calculations, respecting the amount of carbon in the soil, and shows that the quantity removed from it in the form of crops, amounts in a few years to much more than the soil itself originally contained, or has received in the form of manure. The principal conclusion which he draws from this calculation is doubtless true, viz., that plants cannot derive the whole of their carbon from the soil; but the calculation itself is erroneous, and based on false principles. It is useless to make calculations respecting the composition of a field, in the manner that a chemist speaks of the contents of a bottle, or crucible. In the latter case a known weight of certain substances is heated, or mixed, or acted on in some way, and a definite result is obtained; but in the case of a field there are many circumstances that cannot possibly be taken into account. It is true we know what the farmer adds in the shape of manure, and what he removes in the form of crops of various kinds, but this will not enable us to form conclusions, or to make accurate calculations respecting the changes which have taken place in the composition of the soil.

Mr. Rigg gives several tables, showing the quantity of carbon existing in a given soil, that added in the form of manure, and the amount abstracted by the crops, and then proceeds to strike a balance; but he omits all mention of the roots of the crops each year left in the soil, to add to the store of organic matter which it contains; yet they in some cases amount to very nearly as much as the crop itself. We have taken the pains to ascertain the quantity of organic matter left by a crop of Wheat, and find that, on an average, it is not much less than two tons of dry organic matter per acre. It is quite impossible, in the existing state of knowledge, to form accurate calculations of this kind, and if they are not accurate they are worse than useless. Our Author next inquires into the other sources of carbon, particularly the atmosphere, endeavouring to show by the experiments of others as well as his own, that the carbonic acid of the air is not the chief source of the carbon of plants. In the outset, he states that plants impart carbonic acid to the air; but the experiments by which he endeavours to prove this are by no means satisfactory; at the same time he appears to admit that they have the power of decomposing that gas, although he thinks it questionable whether they abstract more of it than they impart to the air. The statement that plants evolve carbonic acid is in direct opposition to the careful experiments of Mr. Pepys, who never found it given off by healthy plants.

Mr. Rigg next proceeds to examine De Saussure's experiments on the quantity of carbonic acid in the air, and conceives the discovery by that observer that more carbonic acid exists in the air during summer than in winter, to be opposed to the theory that plants decompose it. But these experiments do not in reality prove anything, and cannot be used as arguments against the decomposition of carbonic acid, because we do not know what other circumstances influence the absorption or decomposition of that gas at other times. There are other experiments which show that the quantity of carbonic acid is greater in the night than in the day; these prove that some agent is at work during the day to effect its decomposition, which does not operate during the night; whilst the fact that there is more of it in the summer than in the winter, is no proof that plants do not remove it. During spring and summer, when plants are growing, it may be necessary that there should be a greater supply of carbonic acid to the air than during the autumn, when they have ceased to require it; and on the other hand, at the latter period, various meteorological causes come into play, which may tend to diminish the carbonic acid of the air and keep up the uniformity of its composition. But this, in fact, is mere speculation, and however injurious or plausible such theories may appear, they throw little light on the questions immediately before us. Mr. Rigg is, as a chemist ought to be, sceptical and cautious in believing the theories of others, which, he says, are not based on facts, or are not supported by sufficient evidence; but here his caution ceases, for having thrown aside the theories of others, he advances a new one of his own, and as it appears to us, one far less supported by facts than

the old theories which he discards. Mr. Rigg's experiments are very numerous, and appear to have been carefully performed; but in several instances they want that rigid exactness and minute attention which is essential to experiments of this delicate nature. For example, when he causes plants to grow in water, in confined portions of air under bell-glasses, the edges of which dip into water, it is open to question whether carbonic acid may not pass, through the medium of the water, into the bell-glass.

Mr. Rigg observes, that it appears doubtful whether plants can derive their carbon from the air, and thence seems to pass to the conclusion that therefore they must make it. To establish this point, he relates numerous experiments to prove that plants growing in circumstances where they cannot obtain carbon from any known source, still grow and are subsequently found to have acquired carbon. As has already been said, he does not satisfy us that all necessary precautions were taken to keep out carbonic acid; and secondly, if, as he supposes, the plants in his experiments had made so many grains of carbon, the question arises, out of what did they make it! They could not create matter, and therefore must have formed the carbon out of some matter already existing. He should have proved the disappearance of some substance, as well as the appearance of the carbon. We are believers in the decomposition of carbonic acid by plants, and are therefore predisposed not to adopt Mr. Rigg's theory; but at the same time that we object to his conclusions and doubt his results, we do not altogether deny them.

The opinions of a zealous experimenter are always entitled to respect; and though they may not carry conviction, or may even prove to be erroneous, should be treated with courtesy, and not be ridiculed in the contemptuous manner applied by a great German chemist lately towards a Scotch observer. Such criticisms are unworthy of men of science. We do not pretend to pass judgment on Dr. Brown's experiments, which are purely chemical, but we regret to see a philosopher like Liebig forgetting the dignity of science, and descending to the littleness of personal abuse.

We cannot follow Mr. Rigg through his long series of experiments, which would oblige us to write a commentary on his book, and enter into many chemical inquiries. After carefully reading it through, the impression it leaves is, that he does not establish the theory he has propounded; his experiments are not varied enough, and frequently stop short where further information would be most desirable. At the same time, it is impossible to read his book through, without coming to the conclusion that he is one of the most laborious and industrious chemists in the country. For our own parts, we are disposed to give his experiments the best consideration; for it is never to be forgotten that some years since, when Mr. Rigg announced the fact that nitrogen was always present in all parts of plants, his experiments were questioned and disbelieved; nevertheless, the truth of his statement is now generally admitted, whilst the credit of the discovery is most unfairly given to others.

Table of the Elementary Constituents of Crops.

By James Haywood. A Sheet. Simpkin and Co. This is one of those useful Tables which condense a volume into a page. It shows of what chemical constituents the more important crops consist, how much nitrogen and fixed ingredients are extracted from land by an average crop, according to the evidence of Boussingault and Sprengel. On the other hand, it gives the constituents per ton of all the more valuable manures; so that by comparing the one with the other, it may be seen how to restore to a field the materials of which a crop has robbed it. This Table should hang in every farmer's room.

On the Respiration of the Leaves of Plants. By W. H. Pepys, Esq., F.R.S. From the Philosophical Transactions. 1843, Part II.

It is a universal opinion among Vegetable Physiologists that plants not only decompose carbonic acid, but exhale it. Saussure found that carbonic acid is parted with when plants remain in obscurity; Burnett observed it to be a constant phenomenon; and Liebig roundly asserts that it must be given off with the water of perspiration in which it is dissolved. It certainly does appear to us that when certain plants, such as the Orange Lily, in a state of health, are plunged in lime-water, carbonate of lime is slowly formed on their surface, which can only be owing to the extrication of carbonic acid. All these supposed facts are, however, found in direct opposition to some very careful experiments by Mr. Hasledine Pepys on the Vine and the Fig, from which it appears that, in those instances at least, no carbonic acid whatever is parted with, but that the whole respiratory action of plants is confined to decomposing carbonic acid and liberating oxygen. In no one instance was he able to detect a single trace of carbonic acid in the air surrounding the leaves on which he experimented, although the apparatus was so contrived as to show the existence of a very minute quantity, if it had been present. This is a most unexpected result, to which we trust that experimental Physiologists will direct their attention.

CALENDAR OF OPERATIONS for the ensuing week.

HAVING repeatedly invited criticism on things mentioned in the Calendar, I beg to admit in detail a few remarks that have reached me, as I find I could not well condense and divide them under the different heads with other private correspondence; and now that I am within one week of the end of my series, I again repeat that I shall feel obliged to parties who will send any remarks or fair criticism on what I have advanced in this Calendar; and if I use these remarks in the *Chronicle* I shall not mention names unless it is wished. "I see," says a corre-

spondent, "that you advocate planting out Pines over tanks I have some so planted, and they are doing exceedingly well; but there are many objections to the plan. First, I am afraid there will be some difficulty in starting them without starting all at the same time; secondly, there will be no means of retarding them when in the last stage of swelling without retarding the whole in one pit; and thirdly, we shall be obliged to cut the fruit when they are ripe, being without convenience for removing the plants with the fruit on to a cool place, in the event of having too many fruit ripe at once. Weighing these things against the facility of management by the planting out system, I am disposed to take my plants up in February, and subject them to the one-shift system. This, with the advantages of planting out, offers the preference of managing the fruit as circumstances may render it necessary. As for command of temperature and moisture, the tank-system offers every advantage." Here it will be seen that the "advantages of planting out" are advocated for the plants at an early stage (?) and the convenience of having the plants portable in large pots, for the fruiting process, is also shown: I clearly see the force of this argument. Again, the same writer says, "when you have seen our boiler, &c., you will probably feel disposed to change your opinion as to the necessity of having a flue, in order to take up the waste heat." Although I have pulled down all flues here for the last 15 years, to make way for iron pipes, I am not unfriendly to flues. Mr. Paxton grows better crops of fruit with flues only than many gardeners can grow with hot-water pipes. I only recommend them in connexion with gutters and tanks, except for detached greenhouses. I have some accounts of unsuccessful attempts to get early Grapes in the way I lately suggested; but as the first crop, in 1841, "was the offspring of accident," probably the economy of the Vines might be deranged for some years. Sometimes useful conclusions may be drawn from the result of accident, but they are dangerous guides at best. I have many letters on Horticultural societies and the Gardeners' Benevolent Institution, but cannot make use of them here. I may, however, state that at Chiswick and at the Regent's Park, prizes are offered and given for new plants and specimen plants independently of each other, and by different judges. The individual alluded to was expelled from the Gardeners' Benevolent Institution early in 1839, for defrauding the funds, and there is not the least chance of his getting a footing there again. The funds of this institution are as safe as those of the Bank of England, and are administered by highly-respectable officers. Every gardener who can afford to do so should join this institution. The members and their friends meet, dine, and transact business as usual on the 11th January, but there is not a farthing of the funds of the Society spent at these useful meetings.

I.—KITCHEN-GARDEN AND ORCHARD.

In-door Department.

PINERY.—A good Pine-grower, who favoured me with some letters last autumn, will now see there is plenty of room for treating them in the French manner, &c. I cannot say whether Mr. Knight grew his young plants in dung frames; he often told me he preferred leaving the strongest sucker on the old plant, and he potted this old stool with the sucker, and sometimes with two suckers attached, in deep, upright pots, and earthed them up from time to time, as the roots advanced; but this plan did not, I think, originate with Mr. Knight; it was published in the "Transactions of the Horticultural Society" in 1818 or 1819; however, it is an economical mode of growing Pines which you may safely adopt, even with the tank-system; and if you wish very large fruit, cut off all the suckers as they appear, except the strongest one, leaving the old leaves of the stool as long as they do not interfere with those of the young plant, or, in other words, treat the Pine like the Peach—retain as much of the old wood as is necessary, and keep up a succession of young wood from the bottom for bearing.

VINERY.—This mild season has been more unfavourable to the very late-kept Grapes than when we experience some sharp frosts, as, in a general way, with frosts we have more sun in winter and a drier atmosphere. If the borders outside of the early Vinery are well covered, and the stems, also, if outside, with a moist atmosphere inside of from 50° to 60°, and the plants in good condition, I see nothing more to be wished. If every plant was as easy to manage as the Vine, gardening would, indeed, be a simple process.

PEACH-HOUSE.—The Peach, on the other hand, is like a spoiled child; the least thing will put it out of its way; and you must not only watch it narrowly, but anticipate its wants. Currents of cold air admitted in front is injurious to these trees when they are forced very early.

CUCUMBERS.—Few persons who grow winter Cucumbers need assistance from Calendars, but I find many wish to learn how this branch is going on in this neighbourhood. It would be very difficult for me, however, to convey an idea of the enthusiasm which prevails here on the subject; yet no one makes a secret of his mode of growing them. As far as I can learn, all the growers employ strong heat, and like Mr. Mills, allow large portions of air; but for about three weeks before the day of competition some growers keep their plants "very hot, and give little air," and no more moisture in the atmosphere than will "keep the blossoms from shrivelling."

Out-door Department.

In the first Number of the *Chronicle*, (page 6,) will be seen how Mr. Pontey, of Plymouth, managed to renew Vines which grew "badly upon a close retentive soil." Instead of throwing away his old Vines and planting young ones upon his renovated border, he cut back his old ones and spread their roots all over the border, "and covered them about six inches." Although Mr. Pontey is a large Nurseryman, and has multitudes of young Vines by him, he preferred his old plants, well knowing that young plants would strike down their main roots to the bottom of his new borders and run along them, if not into worse soil, as I said last week. These old Vines having formed all their main roots, will afterwards only form secondary ones to collect nourishment, and after this nourishment is digested by the leaves it is deposited in these large roots within six inches of the surface. Mr. Pontey is a thorough good gardener, and has the best climate in England for his Vines. If he therefore considers it necessary to have his Vine roots near the surface at Plymouth, how much more ought this to be attended to at Inverness, where I first saw the Vine? This way of treating old Vines has been adopted by gardeners for years. Indeed many good gardeners say Grapes never come to their true flavour until after the plants are thus transplanted; and few gardeners in these days will plant young Vines if they can get old ones; but a Vine, like an Oak, at 20 years old is comparatively a young plant. I recollect some 14 years since a good gardener, who had a new Vinery to plant and had plenty of young plants, came to me for some old ones I had out against the wall; he was particular about getting up all their roots, but left their tops behind, saying, "I shall renew them as eagles renew their age," and sure enough he did. I afterwards discovered that he inarched his young plants on them as soon as they grew away freely. Now if you adopt my friend's plan, let me urge you to keep the collar of the old plants well up above the soil; as if any part above the old roots is buried, it will immediately throw out roots, and these, like the roots of a young Vine, will go down at once to the bottom of the border, and being more active than the old roots will in time derange the experiment.

II.—FLOWER-GARDEN AND SHRUBBERY.

In-door Department.

STOVE.—If I could place any confidence in our provincial weather prophets we shall have plenty of time to clean and arrange stove and other house plants; they talk of a "great slaughter" among half-hardy ones by and by; meantime, hear an experiment in which I am interested. An old plant of *Passiflora quadrangulata* used to cover our Orchidaceous house, having grown so large that we were obliged to cut the young wood so often as to prevent its flowering, which it does very freely when allowed room. Six weeks ago we had the half of its roots taken up out

of the border, cut smooth at the ends, and placed near the surface, as I lately stated. This check threw it immediately into flower, and it will probably bloom all the winter. I thought it might fruit also by dusting the pollen in the usual way, but it refused, and about ten days afterwards the rest of its roots were cut all but one, and now it is beginning to set its fruit, and so does also P. kermesina, grafted on it; and if these go on and ripen we shall have a fine cross or two; this is rare, as both are very shy seeders.

GREENHOUSE.—*Tacsonia pinnatifida*, planted inside here and taken out in April or May to be trained outside, is the finest out-door climber we have in the autumn down to this time. I failed to cross this with the *Passion-flowers* nine years running, but at last I have got a seedling which I think is a true cross, and I should like to exchange leaves of it with a late correspondent who also thinks that he has succeeded in this way.

CONSERVATORY.—New *Chrysanthemums* are eagerly sought after. I did not hear the names of the 12 new ones of this season, but I believe the names of all the best new ones will soon be given in the *Chronicle*. An English gentleman saw one in Paris the other day, "nearly scarlet." My experiments this season in crossing the large *Achimenes* do not promise much.

PITS AND FRAMES. This has been a fine season, so far, for frame plants where they have been kept dry and free from dead leaves; this is the main point to be attended to with half-hardy plants in winter. Our young *Heaths* planted out in the open border under a conservatory wall look remarkably well, and a London Nurseryman tells me they never had their young stock of *Heaths* and *Epacris* look better at this time of the year.—*D. Beaton, Shrubland Park Gardens, Ipswich.*

1. State of the Weather near London for the week ending Dec. 21, 1843, as observed at the Horticultural Garden, Chiswick.

Dec.		Barometer			Thermometer			Wind.	Rain.
		Max.	Min.	Mean.	Max.	Min.	Mean.		
Friday	15	30.852	30.818	30.835	54	39	46.5	N.W.	.04
Saturday	16	30.405	30.338	30.372	54	38	46.0	N.W.	.04
Sunday	17	30.453	30.427	30.440	54	40	47.0	N.W.	.04
Monday	18	30.451	30.437	30.444	45	40	42.5	S.	.04
Tuesday	19	30.429	30.422	30.425	47	41	44.0	S.W.	.04
Wednesday	20	30.399	30.397	30.398	49	42	45.0	S.W.	.04
Thursday	21	30.404	30.346	30.375	50	42	46.0	S.W.	.04
Average		30.413	30.380	30.397	50.4	39.8	44.6		.04

Dec. 15. Cloudy and fine throughout.

16. Fine; cloudy; densely overcast; rain at night.

17. Slight haze; clear and exceedingly fine; foggy at night.

18. Foggy; tolerably fine; foggy at night.

19. Foggy; thickly overcast; cloudy.

20. Hazy; densely overcast.

21. Fine; densely and uniformly overcast throughout.

Mean temperature of the week 4° above the average.

State of the Weather at Chiswick during the last 17 years, for the ensuing Week ending December 21, 1843.

Dec.		Aver. Highest Temp.	Aver. Lowest Temp.	Mean Temp.	No. of Years in which it Rained.	Greatest quantity of Rain.	Prevailing Winds.							
							N.	N.E.	E.	S.E.	S.	S.W.	W.	N.W.
Sun.	24	44.0	32.3	38.1	6	0.25 in.	3	1	1	1	1	1	1	3

Wed.	27	42.0	29.3	35.6	6	0.40	1	1	1	2	2	2	4	4
Thurs.	28	41.1	29.6	34.9	6	0.0	2	1	1	2	1	2	1	6
Fri.	29	42.1	34.4	38.2	7	0.15	1	1	1	2	2	2	4	1
Sat.	30	45.6	34.7	40.1	6	0.6	1	2	2	2	2	2	4	1

The highest temperature occurred on the 25th, in 1827—thermometer 50°; and the lowest on the 24th, in 1830—thermometer 10°. The night of the 25th averages a lower temperature than any night in the whole year.

REPORT ON COVENT-GARDEN MARKET, For the Week ending Dec. 22, 1843.

In consequence of the continued fine weather, the market has been well supplied during the week, and trade has been somewhat brisker. Pine-apples of good quality are sufficient to meet the demand, and are selling at from 4s. to 8s. per lb. Hothouse Grapes have rather advanced in price since our last Report; among these we noticed a few good Muscats, which are selling at from 8s. to 7s. per lb.; Portuguese are good and plentiful. Kitchen and dessert Apples have been more abundant during the past week. Pears of good quality are plentiful, and are selling at nearly the same prices as last week; among these we noticed a few good specimens of Glout Moreau and Chaudmont. Oranges are good and plentiful. The demand for Medlars has increased during the week, and they have rather advanced in price. Vegetables are good, and sufficient to meet the demand. Some excellent Broccoli, Cabbages, and Brussels Sprouts have been supplied since our last Report, and are selling at nearly the same prices as last week. Leeks are good and plentiful. French Beans continue to be brought to the market, and are offered at last week's prices. Seakale is becoming more plentiful and is good in quality. New Potatoes, in small quantities, continue to be brought to the Market. Endive is good and plentiful, and is selling at from 6d. to 1s. 6d. per score. Shallots are offered at from 6d. to 9d. per lb. Cut Flowers chiefly consist of *Erica gracilis* and *hyemalis*, *Euphorbia jacquiniiflora*, *Helichrysum prostratum*, *Cypripedium venustum*, *Azalea indica*, *Luculia gratissima*, *Bignonia venusta*, *Roman Narcissus*, *Camellias*, *Cinerarias*, and *Roses*.

PRICES, FRIDAY, Dec. 22, 1843.
Pine Apple, per lb., 4s. to 8s.
Grapes, hothouse, per lb., 3s. to 7s.
Portugal, per lb., 1s. to 7s.
Apples, 4s. to 8s. per bush 4s. to 10s.
Kitchen, p. bus. 3s. to 5s.
Pears, per half-sieve, 3s. to 10s.
Oranges, per dozen, 3s. to 2s.
Lemons, per doz. 1s. to 2s.
Pomegranates, per doz., 3s. to 6s.
Green Capsicums, per 100, 1s. to 2s.

VEGETABLES.
Broccoli, per bundle, 6d. to 1s.
Brussels Sprouts, per lb., 1s. to 2s.
Cabbages, per doz., 6d. to 1s.
Seakale, per bunch, 2s. to 4s. 6d.
French Beans, 3s. to 4s. per 100.
Autumn Potatoes, 3d. to 4d. per lb.
Savoy, per doz. 6d. to 1s. 6d.
Greens, per doz. 1s. 6d. to 2s. 6d.
Cauliflowers, per dozen, 1s. to 4s.
Potatoes, per ton, 40s. to 50s.
per cwt., 2s. to 4s. 6d.
per bushel, 1s. 6d. to 2s. 6d.
Kidney, p. bush., 2s. to 2s. 6d.
Turnips, per doz. bunches, 1s. to 2s.
Red Beet, per dozen, 6d. to 1s.
Horse Radish, per bundle, 1s. to 1s. 6d.
Rush, spring, p. doz. bunches, 1s. to 2s.
Carrots, p. doz. bunches, 2s. to 3s.
Spinach, per bush., 2s. to 3s.
Leeks, per doz. bunches, 1s. to 2s.
Garlic, per lb., 6d. to 8d.

NOTICES TO CORRESPONDENTS.

COMMUNICATIONS from the following CORRESPONDENTS are in type, and are only waiting till room can be found for them:—*A Practical Man*, O., M. Saul, A. B., J. W. Jones, A. Perthshire Subscriber, Gavin Cree, Peter Mackenzie, Tyro, Totty, W. G. S., F. Davies, Caution, Peter, J. S. Henslow, J. Wighton, R. G., Este, W. P. Ayres, C. Babington, R. Gunter, A. Subscriber, G. Fleming, Ruricola, and J. L.

ANEMONES.—A new Subscriber.—Anemones and Ranunculuses may be planted in October or November for early flowering, but unless the soil is light and the situation dry the latter end of January or beginning of February will answer better. The soil should be a rich loam prepared about one foot deep, and the beds should not be much elevated in dry situations. The prepared soil for about five inches deep should be rather light to plant the roots in, as if otherwise, they are apt to rot; the fibres will soon find their way into the rich soil below, &

BOOKS.—*Puck*.—We cannot tell, but should think not.—*F. C.*—Mr. Daniell's address is Twerton, near Bath; his pamphlet was published a year or two ago, but we forget where.—*J. D.*—Children's books are quite out of our way; but "Young England's Little Library," published by Orr and Co., are certainly very superior to books of that kind, with the exception of "Jack Holiday" and "Drolleries;" and considering the way in which they are got up, they are remarkably cheap.

CALCEOLARIAS.—A Subscriber.—The following sorts will afford you an excellent chance. Dobson's Othello, Well's Louis XIVth, Zephyr, Green's Wonder, Queen of Beauties, and Miss Antrobus improved.*

CARBONIC ACID.—W. I. will find his questions answered in part at p. 404 of the vol. for 1842, and in part by a notice under the head of Reviews, in to-day's Paper.

CHARCOAL.—*Aith.*—No doubt a stratum of charcoal at the bottom of your pit for half-hardy plants will be useful; possibly in summer, when moist, by disengaging carbonic acid, and certainly by assisting to keep the place dry during winter. If you have charcoal at command you cannot use a better material. The rot you speak of will only attack the unripened part of the shoots of your Geraniums, and is entirely owing to the pit not being dry enough.

COMPOST.—*Dodona*.—Mould from the rubbish-heap may be used for the garden, if the heap has been turned and well-rotted; a sufficient degree of fermentation having been induced in order to destroy seeds. Any kind of litter will assist in causing fermentation. Ammoniacal liquor will accelerate decomposition.*

DAPHNE ODORA.—*Inquirer*.—When your *Daphne* that has grown up tall and straggling has done flowering, it may be cut down as low as you think proper, as it will break out freely from the old wood. After it has made a few young shoots it may be repotted in a mixture of good turfy loam and peat. It is probably the want of pot-room and water that has occasioned it to lose its leaves.*

DECIDUOUS PLANTS.—*J. H.*—Deciduous plants in pots may be safely kept during winter when they are without leaves, and their functions at rest, in a dark closet, where the temperature averages from 40° to 45°, where they have no light, and where air is admitted only through the crevices at the top and bottom of the door; if they are kept tolerably dry the exclusion from light will not be injurious to them.*

DRODARA.—*M. L.*—Introduced in 1822, according to London; but we suspect some error. The first crop we know of was raised from seed brought in 1831 from India, by the Hon. W. L. Melville. (See p. 731 of our Vol. for 1841.)

DIBBLING MACHINE.—*R. B.*—Newberry's Dibbling-machine may be ordered of Mr. R. Clyburn, engineer to the Earl of Duce's Iron Works at Uley, Gloucestershire. J. C.

FILBERTS.—*W. Bartlett*.—Plants six feet apart, and manage them in the Kentish way, as described at p. 333 of Lindley's "Guide to the Orchard," &c. We hear the wind-guard well spoken of. The other question we cannot answer.

GOOSEBERRIES.—*Dodona*.—Gooseberries will bear very little forcing. You may keep them from 40° to 50° in January; 45° to 55° in April; 50° to 65° in May; and from 55° to 70° in June. The small, rich, old varieties are best adapted for the purpose.*

GRAFTING.—*E. T. B.*—The Cherry will take by grafting on the Laurel, but it does not succeed well, being liable to gum at the junction.*

GUANO.—*B. F.*—The ashes of most vegetable substances contain alkaline salts, such as carbonate of potash or soda, and these salts, when mixed with neutral salts of ammonia, decompose them, and set free the ammonia; hence, when such ashes are mixed with guano, the alkaline salts of the former decompose the fixed salts of ammonia in the guano, and volatile carbonate of ammonia is given off. The ashes of mineral coal are very different from those of wood or vegetable substances, and when mixed with guano do not set free the ammonia. It is probable that the mixture of such ashes as you describe with guano will do more harm than good, and that it would be better to use them elsewhere without guano. E.

HEATING.—*Adolescentulus*.—We regard your plan of heating tanks by a metal box 9 ins. in diameter, to be a great step backwards—in the art of heating. Have you ever considered what it would cost?—*Calorifer*.—To contract the flow-pipe connecting the boiler with the tank from four inches in diameter to two inches, would not diminish the heat in the tank. The larger the body of heated water in the tank the greater will be the heat in the house.*—*J. H. S.*—No heat can be obtained in the manner you propose.

INSECTS.—*J. B. M. H.*—Never having heard before of the *Blue-bug*, we cannot advise you regarding the Apple-trees; but if you will favour us with specimens we will answer your queries. R.

MANDARILLA SUEVENSIS.—A Subscriber.—Your plant of *Mandevilla suaveolens* that has been neglected and allowed to grow as it might, should be cut back to the ripened wood and neatly tied up. It may be planted in a mixture of good turfy loam, peat, and a little rotten dung, and the pot must be well drained. The temperature of a stove containing a general collection of plants, at this season of the year should not be higher than 60° during night, and may be allowed to rise as high as 65° or 70° during the day in fine weather; but 60° is quite high enough in dull weather. If the temperature is kept high at this season it excites the plants, makes them grow up weak, and consequently they will not start away so well in spring.*

MELON PITS.—*Tyro* proposes to build a wall, 12 inches thick all round, surmounted by a 9 inch hollow brick wall to carry the lights, leaving a ledge of 4 inches inside. He intends having his tank made of best Baltic wood, 2 inches thick, 4 or 5 inches deep, divided along its length, and covered by the strong compact slate called "Caithness pavement." He would place the tank on pillars, so that its top should be level with the ledge on what may be called the basement wall, and make it of such size as to leave a vacancy of 4 inches all round the pit, and cover this by kiln tiles. On the tank he would place a frame of wood, or build an inclosure of brick, 12 inches deep in front, to contain the soil; and ventilate by means of an air-drain opening under the tank. He wishes to know—1st, Whether by such an arrangement he is likely to attain his object, of having both atmospheric and ground heat? 2dly, Whether 12 inches be sufficient depth of soil in front for a pit 5 feet wide, with a stone slab under it? and 3dly, What is the best slope for the glass?—he has never used a greater slope than 15°. [We answer, that 15° is slope enough, but 20° better; that wood is a perishable material, and dearer than bricks and cement; that a slate covering for the tank will, in all probability, prove too dry, because no vapour will pass through it, and this will be fatal to Melon-plants growing upon it, that coarse earthen flue-tiles are much better; and that, finally, these objections removed, the plan will answer well enough.]

MUSHROOMS.—A Young Gardener may fail in growing Mushrooms from several causes; but yours probably from the following, viz., the heat in the bed had not sufficiently subsided before it had been spawned, and consequently the spawn was destroyed by heat; or, the dung not having been thoroughly prepared before using, became again over-heated (internally) when covered with the loam, which confined the heat and killed the spawn; at all events, the cause of failure is either from excess of heat or moisture internally.*

NAMES OF FRUIT.—A Subscriber.—1, Marie Louise; 4, 8, 9, 13, Beurré d'Aremberg; 7, 19, Winter Nelis; 3, 10, 12, 17, 21, 24, Beurré Diel; 14, Beurré Bosc; 15, Beurré de Capiaumont; 18, 20, Glout Moreau; 23, Easter Beurré; 25, Easter Bergamot; 26, Ramilies.*—*J. Fish*.—1, Beurré Diel; 2, Bezi Voet.*—*G. Jones*.—1, King of the Pippins; 2, Fearn's Pippin; 3, Downton; 4, Dumelow's Seedling; 6, Rymer; 7, Bedfordshire Foundling; 9, Easter Beurré; 10, Swan's Egg.*

NAMES OF PLANTS.—A. M.—*Euphorbia jacquiniiflora* and *E.*

fulgens, are two names for the same thing. When your Mush room experiment is complete, we shall be glad to learn the result.—*Jas. Mitchinson*.—*Gesneria discolor*, rather new.—*J. W.*—We will inquire and report further about this *Kendya splendens*, since you and another correspondent have put us on its traces. *Schedonorus* derived from *exodon*, near, and *geos*, the end, according to Palisot de Beauvois, who invented the word.—*Sera*.—1, the Yellow *Brugmansia sanguinea*; 2, *Euphorbia splendens*; 3, *Abutilon striatum*.

NURSERYMEN.—We regret to say that complaints of the adulteration of seeds, of the substitution of one kind of tree for another, and of the fraud of selling old and well-known plants under names invented for the mere purposes of trade, are beginning to multiply. One Correspondent begs to know where he can buy Apple-trees true, for he has found that what he has bought for Ribston Pippins are Emperor Alexanders! Another asserts that his seed of *Clintonia pulchella* is uniformly mixed with *Rampion*, and that his Early Charlton Peas were not fit to gather till June, when they were 12 feet high! We had hoped that such practices had wrought their own cure; we know that they totally ruined the credit of certain firms, once flourishing, and we entertain no doubt that they will always end in the same result. At the same time we cannot publish letters relating to such matters. The remedy for these evils lies with purchasers, who should discontinue to deal with houses which countenance such practices, and who refuse to make ample reparation for the loss and vexation produced by the negligence or fraud of their servants. Taken as a body, there is not a more respectable class of men than the Nurserymen and Seedsmen of this country, and they are not to be blamed for the misconduct of a few dishonest people. If buyers are true to themselves, will pay a fair price for what they purchase, and resolve to have no dealing with people who deceive them, the system of adulteration or fraud, if system there be, will fall to pieces of itself.

PEACH-TREES.—*Inquirer*.—The shoots of your young Peach-trees that have been lately planted should be cut back in proportion to their strength, and always pruned to where the wood is firm and well ripened. The strong shoots may be cut back to about two thirds, and the weaker ones to about half their length. The trees should not be allowed to bear fruit the first season. Your young Apricot tree may also be managed in the same manner. The two young shoots on one side that have grown too vigorously for those on the other, should be cut well back, or they will destroy the form of the tree, and injure the other side; for great vigour in one part cannot be maintained without hurting the other; the weaker side may also be nailed a little higher than the stronger one.*

PEARS.—*C. R. D.*—The Bezi de Montigny Pear is well known. It has an unpleasant musky juice, and is unworthy of cultivation.*

PELARGONIUMS.—*Tigridius*.—Your *Pelargoniums* that have been so much injured by cold or frost in a room, that their leaves have become shrivelled and brown, had better be placed in a greenhouse and given a little fire-heat in dull damp weather, but should have air given them at the same time, and must not be too much excited. If they break well they will flower earlier than cuttings put in at this season would do, but the latter would make the most handsome plants.*

POTATOES.—A Gardener.—The black spot in Potatoes is too well known, but its cause is buried in mystery. The most probable explanation seems to be that the soil, or the manure, contains deleterious matter. Next year the subject of vegetable diseases will be taken up, and then perhaps this matter may be discussed.

ROSES.—*An Old Wall*.—A few hardy climbing Roses may be *Amadis*, *Belle Maria*, *Belle Thurette*, *Bonne Genéviève*, *Brennus*, *General Lamarque*, *Gracilis*, *Las Cases*, *Madame de Plantier*, *Phoenix*, *La Chérie*, and *Triomphe de Plantier*.*

RUSSIAN VIOLETS.—A Lady.—Russian Violets were introduced by Mr. Oldaker, probably more than 20 years ago, from St. Petersburg.*

SPINACH.—*Question*.—Riley's New Burdock Spinach is on American production. There is an account of it in Vol. i. p. 815. According to a statement in Hovey's Magazine of Horticulture, "each plant is full the size of half a bushel." The leaves are described as smooth, and the whole plant so hardy as to withstand the severity of an American winter without injury. We cannot inform you where seed can be procured.*

MISCELLANEOUS.—*N. I. H.*—*Phytolacca* is emetic, and probably poisonous in large doses.—*Delta*.—*Physalis Alkekengi* has a flower of no beauty; but its scarlet bladder-like calyxes and fruit are ornamental in winter, and give rise to its name, Winter Cherry. The Winged Pea is an old-fashioned Annual, of little beauty. The Poppy you speak of is the Double French.—*R. Ferguson*.—We have too much respect for ourselves and our readers to bore them with endless talking about ourselves. If you prefer puffing to solid information, you can easily find a gardening newspaper to your taste.—*Empty*.—Many thanks; but the seeds are of no value.—*Economist's* letter is sent to Mr. Paxton.—*Knaue of Spades*.—We can insert no more letters on digging shrubberies, unless they contain some new and useful ideas.—*W. Reischew, H.N.*—We never recommend Nurserymen.—*Cael*.—Whitney's composition has been advertised in our columns, at p. 872.*

IRELAND.—A news-agent ought not to charge 31s. for a year's *Gardener's Chronicle*. Send us a Post-office order, in advance, for 26s., and we will have you supplied by an agent in London.

—*D. I.*—Send a Post-office order for 6s. 6d. or 13s., and the Paper will be forwarded you by our agent. Make your order payable to the Editor.—*B. C.*—Your seeds all belong to stove plants, as far as they are known by the names you give. They may be grown in any common, light, loamy soil.—*H. D.*—We should be happy to answer your inquiry, but we cannot decypher it.—*J. D.*—Diagrams for lecturers are usually prepared by the lecturers themselves, and cannot be procured that we know of.

SEEDLING FLORISTS' FLOWERS.

CINERARIAS.—A Constant Reader.—No. 2 is decidedly the best of your Seedlings, the colour is good, and it is novel in appearance, but deficient in having such narrow petals. No. 1 has the petals too small; 3 is good in colour, but not uncommon.* As usual, a host of letters has arrived too late for answers this week.

NEWS OF THE WEEK.

THE accounts from Spain are of the most melancholy character, and another crisis in the fate of that unhappy country is hourly expected. The debates in the Chambers on the events of the 28th ult. have assumed a tone of personal insult towards the young Queen, which shows that the moral power of the Monarchy has disappeared, and that the throne is shaken to its foundations. The veracity of the Queen is openly discussed as if it were an ordinary incident of the day, and even the late Prime Minister has not hesitated to throw upon her Majesty the imputation of falsehood and intrigue. The Republicans hail the event as a certain blow to the principle of the Monarchy, while the Carlists believe that before the lapse of another year Queen Isabella will have ceased to reign, and the son of Don Carlos will occupy the throne. The position of Señor Olozaga also is hourly becoming more perilous. No

decision has yet been taken in regard to his impeachment, but the Court party are adopting such extensive military preparations that his life is in imminent danger. According to the last accounts it is the general impression in Madrid that another outbreak is inevitable, and that a military dictatorship will be the next scene in this eventful drama.—In France great preparations are making for the opening of the Chambers. The King and Royal Family have arrived at the Tuileries for the commencement of the new Session, and a large number of Deputies are already assembled in Paris. The movements of the Duc de Bordeaux and his followers in London are still the subject of much comment, and are expected to form a leading topic of discussion in the Chambers.—From Holland we have accounts of the death of the Ex-King, the Count of Nassau, who died suddenly at Berlin on the 12th inst. The career of his Majesty was intimately connected with the great events which followed the French Revolution, and he personally bore his share in many of the battles between Napoleon and the Allies.

At home, with the exception of the death of another veteran of the late war, Lord Lynedoch, there is nothing which calls for special notice, except the formal announcement that Parliament will meet on the 1st of February for the despatch of business.

Home News.

Court.—On Sunday her Majesty and Prince Albert and the whole Court attended Divine service in the private chapel of the Castle, which was consecrated on Monday by the Bishop of Oxford. Prince Albert hunted with his harriers on Monday; on Wednesday went out rabbit-shooting in the preserves in the Great Park, and hunted with the stag-hounds on Thursday. Her Majesty and the Prince dined with the Duchess of Kent on Wednesday evening at Frogmore Lodge. The Queen and Prince have taken their usual morning exercise during the week in the grounds about the Castle. On Wednesday a party of Ojibbeway Indians arrived at the Castle conducted by Mr. Catlin, and were presented to her Majesty and Prince Albert, the Duchess of Kent, and the ladies and gentlemen of the suite. The Chief made a speech in which he described the loyalty of his tribe, and the great gratification which he and his countrymen felt in beholding her Majesty. The party then performed several of their national dances, after which they partook of refreshment and returned to town. Their costume was the grotesque dress of their country. The party consisted of seven, four men and three women.—The Marchioness of Douro has succeeded Lady Portman as Lady in Waiting on her Majesty; Lord Rivers has succeeded the Marquess of Ormonde as the Lord in Waiting; and Captain the Honourable Nelson Hood has succeeded Sir Frederick Stovin as the Groom in Waiting on her Majesty. The following personages have been at the Castle this week on a visit to her Majesty:—Lord Portman, the Bishop of Oxford, Sir Henry Wheatley, the Right Hon. Pemberton Leigh, and the Countess of Orkney. It is stated on good authority that her Majesty and Prince Albert will visit Warwick-castle in about six weeks, and that the Queen has determined to take advantage of the opportunity of visiting Birmingham. It is also stated that it is the intention of the Queen to visit the banks of the Rhine next spring and that she will remain some time in that neighbourhood. According to some accounts her Majesty will take up her residence in the Palace of Bruhl, whilst others state that the Palace of Stoltzenfels will be prepared for her reception. It is believed in diplomatic circles that a numerous assemblage of crowned heads will meet on the banks of the Rhine, probably at Coblenz, to receive her Majesty.

The Queen Dowager was in danger of a serious accident last week, in driving from Gopsall-hall to Leicester. When the carriage containing her Majesty was near Newbold-bridge, two of the four horses were thrown upon their knees, and the post-boy was precipitated several yards forward. One of the horses was so much wounded in the shoulder by the pole of the carriage, as to be unfit to proceed; and the post-boy's head was cut so severely that the blood flowed from it in large quantities. Earl Howe was obliged to assist the attendants in their endeavours to set the carriage going. The Queen Dowager was affected to tears on seeing the injury done to the post-boy and the horse, and did not recover from the shock for some hours afterwards.

The Duchess of Gloucester.—Her Royal Highness is so far recovered from her recent indisposition, that no more bulletins of her Royal Highness's health will be issued, her Royal Highness being considered convalescent.

The Duc de Bordeaux.—On Monday his Royal Highness arrived in Birmingham, and was received by Bishop Wiseman and other Catholic priests, who conducted the Prince to Oscott College, where he passed the night. On Tuesday the Prince attended high mass in the chapel of the College, and afterwards visited Birmingham. His Royal Highness was first conducted to the cathedral, which he minutely inspected. On leaving the cathedral, his Royal Highness and suite proceeded to visit the manufactories in the town, and was first conducted to the extensive button-manufactory of Messrs. Hardman and Iliffe, Paradise-street, where he viewed the process from the metal in the raw state to the finished article. He also inspected the pressing of the medals manufactured in the establishment. His Royal Highness then proceeded to the Town Hall, after which he proceeded to inspect the manufactories of Messrs. Phipson and Son, pin-manufac-

turers; Mr. Windfield's brass bedstead manufactory, Mr. Gillot's pen manufactory, Messrs. Elkington, Major, and Co.'s electro-plating establishment in Marshall-street; and Messrs. Serjeant and Co.'s sword manufactory. His Royal Highness then repaired to Dee's Royal Hotel, where he entertained a select party of gentlemen. On Wednesday his Royal Highness visited the rolling mills of Messrs. Muntz, Messrs. Jenners and Bettridge's manufactory, and the proof-house; after which he proceeded to Redditch to visit the needle manufactory. In the afternoon he returned and went to Dudley, where extensive preparations were made to enable him to visit the iron works and other curiosities in the neighbourhood. The Prince then visited Oxford and returned yesterday to Belgrave-square to pass the Christmas in town, after which his Royal Highness will continue his excursions in the west and south of England.

Death of Lord Lynedoch.—The venerable Lord Lynedoch died on Monday night, a few minutes before 11 o'clock, at his town residence in Stratton-street, after several days of severe suffering. This distinguished veteran was descended from a common ancestor with the Dukes of Montrose. He was the son of Thomas Graham, Esq., by Christian, fourth daughter of the first Earl of Hopetoun; was born in 1750, and had consequently reached his 94th year when he died. His Lordship commenced his military career somewhat late in life, having attained his 45th year when he first served at the siege of Toulon as a volunteer in 1794. His future career fully justified the promotion to which through successive grades he rapidly attained, and which he earned by that rare combination of valour and discretion by which he was through life distinguished. During the Peninsular war he was constantly engaged, and having attained the rank of General, was not merely actively employed in, but directed many of its operations. The celebrated victory of Barossa, gained on the 5th of March, 1811, was achieved under his command. He was second in command under Lord Wellington at the siege of Ciudad Rodrigo; and subsequently led the left wing at the hard-fought field of Vittoria, reduced the town and citadel of St. Sebastian, crossed the Bidassoa, and conducted the British army within the French territory. The failure of his health, impaired by incessantly severe service, compelled his return to England; but having recruited his exhausted powers he was again in the field, being appointed to the command of the British army in Holland. Sir Thomas Graham's gallant achievements were in various forms recognized by his sovereign and his country. The thanks of both Houses of Parliament were on several occasions voted to him, in connexion with his companions in arms. In 1814 he was created a peer, as Baron Lynedoch, of Balgowan, Perthshire, with a pension of 2,000*l.* to himself and his heirs. In 1821 he was made a General in the army, in 1826 obtained the colonelcy of the 14th Foot, and in 1829 was made Governor of Dunbarton castle, a post rather honorary than lucrative. In 1774 his Lordship married the Hon. Mary Cathcart, second daughter of the Earl of Cathcart, but he was, by her death, in 1792, left a widower without issue. The title, and the pension which was conferred with the honour, have therefore become extinct by his death. The high estimation for private worth and generous spirit in which Lord Lynedoch was held by all who were his associates in the field or his companions at home has been attested in various gratifying testimonials. Sheridan, speaking of the various excellencies, personal and professional, which adorned his character, said, "I have known him in private life; and never was there seated a loftier spirit in a braver heart." Alluding to his services in the retreat of the British army to Corunna, in which Sir John Moore, the General in command, was killed—he continued, "In the hour of peril, Graham was their best adviser; in the hour of disaster, Graham was their surest consolation." Sir Walter Scott has also made him the subject of eulogium in his "Vision of Don Roderick," the concluding stanzas of which are dedicated to his Lordship's fame.

Parliamentary Movements.—On Tuesday the Lord Chancellor, Lord Haddington, and Lord Aberdeen, as her Majesty's Commissioners, attended in the House of Lords, and prorogued Parliament to Thursday the 1st February. The clerk at the table having read the Royal commission, the Lord Chancellor said: In the name of her Majesty we declare this present Parliament to stand prorogued until Thursday, the 1st day of February next, then to meet for the despatch of divers urgent and important affairs; and this Parliament stands prorogued accordingly until the 1st day of February next.—It is reported that Sir John Rae Reid intends to resign his seat for Dover, and that his acceptance of the Chiltern Hundreds will be announced immediately after the opening of Parliament.

The Church.—It is rumoured that the Rev. Dr. Moore, vicar of St. Pancras, intends resigning his benefice, and that the Rev. Sydney Smith, canon of St. Paul's is likely to be his successor.

Church of Scotland.—The Queen has been pleased to present the Rev. J. MacIver to the parish of Sleate, isle of Sky, vacant by the transportation of the Rev. Alex. MacIver to the parish of Dornoch; and the Rev. Simon Frazer to the parish of Nigg, Ross, vacant by the secession of the Rev. J. Macalister.

The Army.—The Colonelcy of the 13th Light Infantry, vacant by the death of General Morrison, has been presented to Brevet-Colonel Sir Robert Sale by the Commander-in-Chief as a mark of the high sense which his Grace entertains of the services rendered by that distinguished officer whilst serving with this regiment in Afghanistan. With the exception of his Royal Highness

Prince George of Cambridge, this is said to be the only instance of a regiment being bestowed upon any officer under the rank of Major-General.—The Queen has been pleased, on the recommendation of the Commander-in-Chief, to appoint John Blakiston, Esq., late Brevet-Major and Captain on half-pay of the 27th Foot, to be one of her Majesty's Honourable Corps of Gentlemen-at-Arms, vice Shakeshaft, deceased. The Queen has also been pleased, on the nomination of Lord Forester, to appoint John Gregory, Esq., to be one of her Majesty's Honourable Corps of Gentlemen-at-Arms, vice Gray, who retires.

The Navy.—It is understood that the East India Company are about to pay "donation batta" to the officers and men employed in the first expedition to Canton, when Captain Elliot agreed to accept ransom for the city. The allowance to the army has been long since paid. The officers and men employed in the following ships of the Royal navy will be entitled to share—the Algerine, Blenheim, Blonde, Caliope, Columbine, Conway, Cruiser, Druid, Herald, Hyacinth, Larne, Melville, Modeste, Nimrod, Pylades, Samarang, Volage, and Wellesley. The shares to the officers, where they have served 12 months on the coast of China, will be—Captains, about 900*l.*; Commanders, 550*l.*; and Lieutenants, 200*l.*

Law Appointments.—It is reported that Mr. Sergeant Herbert Jones, formerly Solicitor-General of Van Diemen's Land, will be appointed the new Indian Judge.

Post Office.—The following alteration in the Metropolitan offices commences with New Year's Day:—"Letters to pass by the inland mails can be posted at the receiving houses till 5h. 30m., p.m. (being one half-hour later than at present); by the letter-carriers, ringing bells (on payment of one penny with each), from 4h. 30m. to 5h. 30m. p.m.; at the branch post-offices at Charing-cross, Old Cavendish-street, and 108, Blackman-street Borough, till 6 p.m., and with a fee of one penny (which must be paid by a stamp affixed to the letter) until 6h. 45m.; at the branch post-office in Lombard-street till 6 p.m., and till 7 p.m. with a fee paid by means of a penny stamp affixed to the letter; at the General Post-office St. Martin's-le-Grand until 6 p.m., and until 7 p.m. upon payment of a fee of one penny (or an affixed stamp) in addition to the postage which must then be paid in advance, and from 7 till half-past 7 upon payment of a fee of sixpence each."

Foreign.

FRANCE.—The Paris Opposition Papers announced a few days since that the English Government had given a private order to the Duc de Bordeaux to quit England immediately, and some of them even stated that this step was taken at the express request of the French Ministry. The Duc de Levis, however, one of the noblemen in the suite of the Prince, has been authorised to contradict this statement, which he declares to be quite an invention. It was reported in Paris that the Government had some strong measures in contemplation against the Royalists. One of the rumours was that the *Gazette de France* was to be brought before the Chamber of Peers, and another that a motion would be made for the expulsion of M. Berryer and the other deputies who visited the Duc de Bordeaux. The *National* also mentions that M. Deffontaine, one of the Judges of the Tribunals at Lille, was immediately to be summoned before the Supreme Court to account for a journey which he lately made to London, and said to have been for the purpose of visiting the Duc de Bordeaux.—The Deputies were arriving in great numbers in Paris preparatory to the opening of the session. Upwards of 300 had already "reported themselves" at the Chamber of Deputies. The usual precautionary measures for the opening of the Chambers by the King had commenced.—The King and Royal Family arrived at the Tuileries on Tuesday for the winter.—The French mission to China left Brest on the 11th by the Syrene frigate, which had been specially fitted up for the purpose. Several Royal ordonnances have been issued, the object of which had been for some time talked of. The first appoints M. Dumon Minister of Public Works, instead of M. Teste, whom another ordinance raises to the dignity of Peer of France and who is further indemnified with the presidency of a Chamber in the Supreme Court of Cassation. M. Dumon is a Councillor of State, an able member of the Chamber of Deputies and considered an intimate friend of M. Guizot. M. Hippolyte Passy, a member of the Chamber of Deputies, who has held a seat in one of the many Cabinets formed since 1830, is also raised to the dignity of a Peer. The last ordinance introduces various modifications into the provisions of the Royal decree of the 11th November 1835, which regulated the navigation and customs duties in the French North African possessions. As the late minister M. Teste is considered a confidential friend of Marshal Soult, and M. Dumon a confidential friend of M. Guizot, the Opposition prints, which have long supposed the President of the Council and Minister of Foreign Affairs to differ on various political points, generally infer that the Marshal's influence in the Cabinet has declined.—The dispute between the Church and the University has brought forth another champion for the University in the person of the celebrated advocate M. Ledru-Rollin, who publishes in the *National* of Sunday a long letter in answer to M. de Lamartine. A funeral service was celebrated in the Chapel of the Invalids on Friday in commemoration of the Emperor Napoleon, that day being the anniversary of the translation of his remains to Paris. Marshal Oudinot, the Governor; General Petit, the Deputy-Governor; General Gourgand, all the inmates of the Hotel of the Invalids, and a number of military men of the Empire were present, dressed in the uniforms of

the corps in which they served.—M. Casimir Delavigne, the poet and dramatic author, died at Lyons in the night of the 10th inst., in the arms of his wife, and in the presence of his son, who is only in his tenth year. He was on his way to Montpellier for the re-establishment of his health, travelling by short stages. On arriving at Lyons on the 9th he became too weak to proceed. M. Delavigne was born at Havre in 1794. As a private man he was universally esteemed. He was a member of the Académie Française, and librarian at the Palace of Fontainebleau.—The *Courrier Française* states that the crowd was so great on Saturday evening in the Café de la Régence to witness the game of chess then in progress between the English and French amateurs Mr. Staunton and M. St. Amant, that six persons became so ill from the heat that it was deemed prudent to carry them to their homes. A municipal guard was ordered to be stationed at the door of the café, whose duty was to admit only the number of spectators which it could reasonably contain. The last accounts of the game state that Mr. Staunton on Wednesday had gained 11 games, and M. St. Amant six; and that four had been drawn: Mr. Staunton was consequently the victor. The papers add that he won his 11th (the conquering) game in "fine style."—It would appear that horse-racing is losing favour in France. The papers announce that the Minister of Commerce has suppressed the Royal breeding stud at Rosières, and considerably reduced the others by the sale of several horses.

SPAIN.—The sittings of the Congress continue to attract general attention in Madrid, but the debate upon the occurrence of the 28th November advances but slowly. On the 9th sundry incidental motions and counter-motions were supported by the Progresistas and Moderados, the confusion created by which renders an abstract of the discussion a difficult task. At length after many interruptions M. Lopez, the late Prime Minister, moved with extreme warmth that the Chamber should refuse to discuss either M. Murillo's proposal to address the throne or the Queen's message. M. Lopez defended the Progress party and violently attacked their opponents. He was about to discuss the affair at the Palace, which he pronounced a mere intrigue, when the Chamber adjourned. In the sitting of the 10th M. Lopez resumed his speech and addressed the Chamber with as much vehemence as the day before, deriding the superior veracity ascribed to the Queen, inveighing against all that had been done since the alleged occurrence at the Palace, and quoting the line of a Spanish poet, which says, "Do you believe I am silly enough, when I wish to dissemble, to do so without any appearance of truth?" The ex-Premier urged as evidence of the Palace affair having been but an intrigue of the Moderados that he had not been sent for by the Queen, although she had assured him on his retirement from the Cabinet that she would demand his advice whenever any event of magnitude occurred. He concluded by threatening to discharge many more arrows which he had in his quiver, and which would inflict severer wounds than was supposed. His proposal was nevertheless rejected by a majority of 77 to 62. M. Martinez de la Rosa was the next to speak in favour of a proposal that all incidental motions be set aside and the address to the Queen be voted as promptly as possible. He was conciliatory, defending the Moderados and repelling the attacks of their opponents with gentleness; the Chamber adjourned as he was telling the Progress party that they must either believe the Queen's statement, doubt it, or consider it false, and that in the two first cases they must vote the address, and in the last impeach M. Olozaga. On the 11th M. Martinez de la Rosa resumed the arguments in support of his motion for permitting no incidental proposals to be discussed and for hastening the vote on the address in reply to the Queen's message. His oration elicited a violent answer from M. Olozaga, who indulged in bold theories and carried his notions of equality to extremes, but in repeating what he had already said of the circumstances which had preceded his accession to office, and in assailing the Moderados he threw no additional light on the scene at the Palace on the 28th Nov. He insisted that his word was as good as that of the Queen, and thanked those who offered him their assistance to frustrate the "wretched intrigues and infernal machinations of the Court." At the close of his speech M. Martinez de la Rosa's proposal was taken into consideration by a majority of 126 to 2. On the 12th M. Olozaga again addressed the Chamber. He replied principally to those who had imputed to him irreverent conduct at a Royal banquet and to the allegation of his having picked up and pocketed on the evening of the 28th some sugar-plums which the Queen had dropped, and represented them as a gracious *souvenir* sent by her Majesty to his daughter. The ex-Minister of War Serrano next entered into details of what had occurred since the 29th, when he was first informed of the occurrences at the Palace the evening before. His narrative of the affair put it beyond a doubt that the ordinances for the dismissal of Olozaga were drawn up without the knowledge or sanction of any single member of the Cabinet, and that it was entirely the work of the Camarilla. He stated that on his arrival he found no less than four ordinances drawn up—one dismissing Olozaga, one annulling the decree for the dissolution of the Cortes, the third declaring Olozaga incapable of future public employment, and the fourth reciting that in future the Queen should transact business with the whole Cabinet only. He refused to sign any of these decrees, because he had a difference with Olozaga; and it was only after that that Frias, the only Cabinet Minister who signed them, was sent for. General Serrano concluded his speech by a severe attack upon the Government for the military demonstrations they were making on the subject of the Olozaga affair, and also for the dismissals

from the army and civil service. On the 13th the Chamber after authorising the prosecution of two Members, M.M. Mateo and Lorenzo Calvo, who are charged with a participation in the late attempt on the life of the Captain-General Narvaez, resumed the debate on the Queen's message relative to M. Olozaga. The sitting was taken up with another speech of M. Cortina, in which he declared that the laws of Spain formally impose upon the Sovereigns of that country the obligation of telling the truth. On the 14th the debate was resumed, and M. Cortina again spoke at considerable length, inveighing against the Camarilla, and reminding the Moderados of what had taken place in England when, on the Tories recovering office, Sir R. Peel required the dismissal of certain members of the Royal household. He concluded by affirming, that what was passing was but a reaction, the consequences of which would be fatal to the country. M. Posada followed, and next the President of the Council, M. Gonzales Bravo, who, in upholding the Queen's veracity, gave rise to a serious altercation and great uproar. Upon his reminding the Chamber of what he had heard the late Minister of War, General Serrano, confidentially state respecting the occurrence at the Palace, the latter cried, "It is not true." M. Gonzales Bravo then exclaimed, "I regret I am here!" when Serrano said, "Out of doors it would be the same thing." Another scene of confusion was produced by M. Cortina interrupting the Premier with "'Tis false!" Serrano spoke afterwards, and M. Gonzales Bravo replied that he had not questioned the General's loyalty, but that what he now said did not prevent their subsequent meeting and their seeing whether they could not come to some understanding. The Chamber then adjourned in much agitation, as a hostile encounter was expected to follow. Several friends of the Minister and General, such as Generals Narvaez and Concha, and M.M. Eugenio Moreno and Lopez, had hastened to interpose, and it was hoped that through their efforts the meeting would be averted. An impending dissolution of the Cortes was still talked of, and it was also rumoured that M. Olozaga would shortly be arrested. His absence from the two last sittings of the Chamber of Deputies had been remarked, and it had somewhat corroborated a report of a serious nature; three attempts had been made to assassinate him, and he has been compelled to conceal himself. Various other reports were afloat denoting the critical state of affairs. Among others it was said that four armies were about to be formed to act simultaneously, under the command of General Concha, and to be stationed at Guadaluza, in Arragon, Catalonia, and Galicia. A decree is published in the *Gazette* whereby the Queen sanctions the levy of 25,000 men voted in August last. With the above report may be connected the *Espectador's* allegation that the Government were preparing to disarm the whole National Guard on the same day. In regard to the Queen herself, who seems to be lost sight of amidst these melancholy discussions, it was rumoured that insurmountable difficulties have arisen to prevent the marriage of the Count d'Aquila with the young Queen of Spain, and that the Count of Trapani has started as a competitor for the prize. The *Gazette* of the 12th contains a Royal decree, appointing M. Garcia Carrasco Minister of Finance. By another decree, signed by the new Minister, M. Manuel Gonzales Bravo, father to the Premier, was nominated Under-Secretary of the State of the Finance Department. The same official journal publishes a number of other appointments, and amongst them that of Baron de Meer as Captain-General of Catalonia in the room of General Sanz, who was transferred in the same capacity to the seventh military district. The French ambassador, M. de Bresson, has had frequent conferences with the Minister for Foreign Affairs since his arrival at Madrid. Prince de Carini, the Neapolitan envoy, had been present at this last interview, and it had been decided that he should immediately present his credentials to the Queen. Messrs. Donoso Cortes and Ros de Olano left on the 11th for Paris, on a mission to Queen Christina to invite her to return to Madrid. The invitation, however, contained a proviso that she must bring with her 10,000,000*fr.* of the 150,000,000*fr.* still remaining in her coffers,—a condition which is expected to induce her Majesty to decline the invitation.—The *Saragossa* journals of the 14th state that some disturbances took place there on the night of the 12th, and that more were apprehended. The authorities were taking steps to preserve order. All singing in the public streets was forbidden, the laws regarding prohibited arms were put in full force, and the military were kept on the alert. The people in all parts of Spain are said to be in a state of great excitement, in consequence of the recent events at Madrid, and a general outbreak seems inevitable.

PORTUGAL.—We have accounts from Lisbon to the 12th. The Costa Cabral Ministry is surrounded by financial difficulties, which have forced it to the unpopular measure of imposing fresh taxes on the first necessities of life—such as wine, salt, fresh meat, iron, and flax. In addition to this the Government has formidable opponents in the municipal bodies, which carry on opposition by means of bold and almost seditious addresses. The municipalities are dissolved, re-elected, and prosecutions instituted against their members. The unpopularity and doubtful success of this repression renders the position of the Justice Minister as painful as that of the head of finance is rendered by the new imposts; and both are said to meditate resigning.

HOLLAND.—By despatches from Berlin we learn that the ex-King of Holland, his Majesty William Frederick Count of Nassau, died in that capital on the 12th inst. Nothing had given reason to expect so speedy an end of the life of the venerable Prince. He had been engaged in

business that very morning, and was found by his aide-de-camp sitting in his own chair, struck by a fit of apoplexy, and apparently dead. All the attempts which were immediately made to recover his Majesty proved fruitless. The deceased Prince was born in the year 1772, and was therefore at the time of his death in the 71st year of his age. He married a Princess of Prussia, daughter of Frederick William II. The eldest child of this marriage is the present King of Holland, who was born on the 6th December, 1792. When the French republic in 1793 declared war against the Low Countries, his Majesty received the command of the army of Holland, and greatly distinguished himself during the hostilities which ensued. He commanded a division at the battle of Jena, and was at the battle of Wagram, after which event he proceeded to Berlin, and finally visited England, which he did not quit till the year 1813. He was proclaimed King of the Netherlands on the 16th of March, 1815, and as a Sovereign entered Brussels on the 5th of April following. On the return of Bonaparte from Elba, foreseeing that his territories were likely to become the scene of great operations, he lost no time in labelling to put their military positions into the best state of defence that circumstances would permit and to organize his troops with as much expedition as possible. The command of these forces was confided to the present King of Holland, then Prince of Orange, who was wounded at their head in the battle of Waterloo. The late King is said to have been a person of great simplicity of life, very attentive to business and of most economical habits. The Paris papers state that the fortune possessed by the ex-King of Holland amounts to 156,000,000 florins (12,000,000*l.*) The greater part of this immense fortune is vested in the funds of the Belgian General Society. The rupture which separated Holland from Belgium and gave the title of King of Holland merely to the deceased monarch—his abdication in 1840 in favour of his son—his second marriage to the Countess d'Oultremont—his life of retirement as the Count of Nassau—are circumstances of course familiar to every reader.

GERMANY.—From Vienna we learn that there is now no longer any doubt that the Archduke Stephen will be placed at the head of the government of Bohemia, but with what title is not known. The best results for the kingdom of Bohemia are expected from this measure. The Grand Duke Alexander of Russia and his consort, with the Prince Alexander of Hesse, arrived on the 9th at Darmstadt from St. Petersburg at the Grand Duke's Palace, where they intend to make a long stay. The city gave them a very brilliant reception.

ITALY.—The Paris papers state that the French and English papers have been excluded from Rome in consequence of the attacks they have lately contained on the Pope. The excitement in Naples is still very great and the Government are taking further precautionary steps. Much astonishment has been created by a singular event which has recently occurred at Rome, and is the topic of general conversation. Prince Gallitzin, who has resided in that city for many years deriving his income from his estates in Russia, has had his remittances stopped by order of the Russian Government. The cause of this measure has not yet transpired. In consequence of this circumstance the erecting of a splendid palace which Prince Gallitzin was constructing on the Piazza Clementina, after the model of the palace Giraud, the masterpiece of the celebrated architect Bramante, is now discontinued. It is said that the Duke Alessandro Torlonia will become the purchaser of it as it now stands, and have the building finished on the same plan as originally intended by Prince Gallitzin. The Papal Government have been straitened in pecuniary matters owing to the extra expenses occasioned for suppressing the late disturbances; and although they had resolved a short time back not to have recourse to a loan, one for a million of scudi with an eminent London house is said to be nearly concluded.—A letter from Palermo of Nov. 27 states, "We have received at last advices from Catania referring to the eruption of Etna. The fire which had been observed on the top of the mount for some time was not a real stream of lava, but only the reflection of the lava slowly rising within the crater. However, on the 17th November, the mass of lava opened itself an outlet, breaking through on the north side below the crater of 1842, and forming out of the new crater with great force a fresh stream, which in a northerly direction and with great rapidity flowed towards the village of Bronte. The inhabitants of this place very much frightened by the fiery mass fast running towards them, packed up all their movables in order to leave their homes the next day; but on the 18th the lava stream divided itself into two branches, and spared the alarmed inhabitants, who a few hours before thought their former dwellings would be buried under a stream of fire. The eruption did not however pass over without damage; the lava reached many vineyards and fields, which have been changed into barren black heaps of stone. On the 23d the lava was flowing quite slowly."

GREECE.—Accounts from Athens state that the election of President and Vice-Presidents of the National Assembly has taken place with the general approbation of the people, and that it affords an additional proof of the happy unanimity which prevails in the Assembly. Notaros, a man of no party, revered from age, being upwards of 100 years old, and from having presided over several assemblies, is President. The Vice-Presidents are Mavrocordato, Coletti, Metaxos, and Londos, all four ministers—the three first considered to be representatives of the three parties, English, French, and Russian. The rules of the Belgian Chambers have been followed in those laid down for the Assembly.

GIBRALTAR.—H.M.'s steamer *Locust* sailed from

Gibraltar in all haste on the 8th inst. for the coast of Malaga in search of a piratical vessel, of the presence of which certain intelligence has just been received. That a pirate is cruising near Gibraltar in the very tract of vessels bound up and down the Spanish coast within the Straits there is not the slightest doubt; the only difference of opinion is as to the balance of probability in her being a slaver doing a little business as a Corsair, in consequence of being driven off the slaving coast by British cruisers, or the probability of her being the Santa Trinita under Greek colours, which a month since made several captures in the Levant, and whose Captain Theodoraki Spano then murdered six men two women and a girl, among other atrocities.

WEST INDIES.—The Royal mail steamer Teviot has arrived at Southampton with dates from St. Vincent's Nov. 17th; Barbadoes and Demerara 19th; Jamaica 24th; and St. Thomas Dec. 1st. Great dulness prevailed in Jamaica, Barbadoes, and other islands, which is partly ascribed to the slowness with which money returned from the interior into circulation in the commercial towns. The Governor-General of Jamaica had set on foot the General Agricultural Society, by offering two prizes of 100*l.* each, one for the best essay on the manufacture of sugar, the other for a like dissertation on the mode of establishing and conducting industrial schools adapted to the wants and circumstances of the agricultural population. The legislative affairs of the colony were progressing but slowly. In Demerara four fires more or less destructive had occurred, and are placed to the account of incendiaries. The want of an efficient detective police is complained of. Some interest had been excited at Jamaica by the discovery of a new manure, the excrement of the West Indian bat; but it was not found on analysis to be so powerful as the real guano of Peru.

BRAZILS.—The ship Ville de Rouen, which arrived at Havre the 16th inst., brings accounts from Rio to October 26th. The Legislative Chambers closed their sittings on the 24th October. It appears that the Princess Januaria was then in a state of progressive convalescence. The Americans had been buying up coffee in large quantities. The loading of six cargoes was just completed, and prices were expected to give way in some degree consequent thereupon. The slave-trade was carried on with surprising activity throughout the whole line of coast. The papers are far from confirming the hope which had been held out and which was still entertained at Monte Video of the interposition of the Brazilian Government in the struggle between Buenos Ayres and Monte Video. The Government of Brazil had declared that it would not depart from the policy of absolute neutrality, which it had pursued from the commencement of the existing differences between the two republics.

CITY.

Money Market, Friday.—Consols have advanced to 96½ to ¼ for the opening, closing finally at 96½, sellers; Three per Cents. Red., 96½ to ¾; Three-and-Half per Cents. Red., 102½ to ½; Exchequer Bills, 58s. to 60s. prem.

Metropolis and its Vicinity.

Destitution of the Metropolis.—The following are the resolutions adopted by the Association for the relief of the Metropolitan poor at the late meeting at London House:—1. The objects of this Association shall be to relieve destitution, and to improve the condition of the poor in the metropolis, by means of parochial and district visiting under the superintendence and direction of the bishop and clergy. 2. The Association shall consist of the general body of contributors to the fund, the Bishop of London being President. 3. The business of the Association shall be conducted by a Committee of Members belonging to the Church of England: one-third to go out annually, but to be re-eligible. The vacancies to be filled up by election at the annual meeting. 4. The Committee shall have power to defray from the funds of the Association such expenses as they shall deem essential for the efficient management of its concerns, but no part of its funds shall be applied to the payment of district agents or visitors. The attendance of five Members of the Committee shall be necessary for the transaction of business. 5. An annual meeting of the Association shall be held—the President in the chair—to receive the accounts of the preceding year, to appoint auditors for the ensuing year, and to fill up the vacancies in the Committee. The duties of the Committee shall be to form and maintain a fund for the purposes hereinafter specified, by occasional appeals to the public, to receive contributions, and to administer such fund under the following regulations:—1. To obtain from the parochial clergy, and to afford to them information concerning district visiting; for this purpose to enter into immediate communication with the clergy of each metropolitan parish. 2. In such parish where a Visiting Society is in operation, to request information respecting its working and results, and the general condition of the poor. 3. Where a Visiting Society exists, but is confined in its operations by want of funds, to render assistance. 4. Where there is no Society, to submit a plan with the offer of effective co-operation. 5. Where no provision for district visiting exists or seems likely to be made, the case to be submitted to the Bishop. The funds shall be administered to objects deserving of relief, without distinction of religious persuasion:—1. Upon application from any incumbent, or from the curate of any non-resident incumbent, a grant of money may be made, to be employed in the relief of the destitute poor by means of gratuitous district visiting. 2. Such incumbent or curate shall specify in his application the constitution of the

District Visiting Society by which he proposes to dispense the money granted to him by the Committee, and the general objects to which it will be applied. 3. And shall render periodically to the Committee an account of the actual expenditure of the grant. 4. All grants shall be made for one year only, but shall be renewable upon similar application, at the discretion of the Committee. In distributing the funds of the Association care shall be taken not to interfere with the legal administration of relief to the poor.—The Institution formed on the plan of Lord Ranelagh is to be called the "Philanthropic Union for Refuge for the Destitute." The address put forth by its supporters states that "the Committee appointed by the public meeting held in Leicester-square last month have concluded their labours by a portion of the said Committee joining the City Association, which provides shelter and relief for only four months in the year. But that Committee, in so doing, states, 'that during the course of their labours, they have ascertained that the destitution among the poorer classes is so general, and so widely extended, that they feel that a more enlarged scheme for its alleviation is desirable.' The main object of the present Committee is to carry out the above suggestion, by providing permanent houses of refuge. The objects proposed to be effected are—1. To provide nightly shelter for the houseless. 2. To co-operate and advise with other charitable establishments; and, hereafter, to extend the benefits of the Institution as far as funds and increased knowledge as to the wants of the poor may permit."

Court of Common Council.—On Monday a Court was held for the purpose of proceeding in the adjourned debate upon the report from the committee on the Election Act of the 11th George I., delivered on the 7th November, for the introduction of a bill into Parliament for amending the said Act. The Court was crowded from the commencement by Aldermen and Commoners, and the greatest interest was excited. Alderman Brown's amendment, proposed on the last day of meeting, was then read (the original motion being "that this Court do agree with the committee in their report"):—"That it is the bounden duty of this Court to protect the freemen of the City of London in the full enjoyment of their elective franchise as secured to them by law; and that to sanction any measure having for its object the admission of non-freemen to a participation in the franchise without becoming free would be a dereliction of such duty, and an act of great and manifest injustice to our constituents and fellow-citizens; and that in the opinion of this Court it is highly inexpedient to appeal to Parliament for a reform of evils, whether real or supposed, in the municipal institutions of this city, unless it shall hereafter appear that the powers of the corporation are insufficient to effect such reforms as are essentially necessary." In the course of a discussion which ensued, Mr. Ashurst read the following amendment, which it was his intention to submit, should Alderman Brown's stand as the original motion:—"That it be referred to a ward committee to inquire into the power of this corporation to enforce upon all persons whether carrying on business wholesale or retail within this city the obligation of taking up the freedom of this city, and the propriety of enforcing the same upon all traders whomsoever, and particularly upon wholesale dealers, with liberty to the said committee to report any information, matter, or other suggestions to this Court which they may think fit; and that the consideration of the report of the Election Act Committee be adjourned until the said committee now to be appointed shall have reported to this Court." After a very long discussion a division took place, when there appeared for Alderman Brown's amendment, 113; against it, 54—majority, 59. Subsequently Mr. Ashurst's motion, dropping the words after "think fit," was carried by a large majority. The effect of the division was to throw out the report and the bill.

The City Solicitor.—Mr. C. Pearson the City Solicitor has been prominently before the public during the past week, in refutation of an attack made upon the Corporation and himself, in a recent number of the "Westminster Review." Mr. Pearson's speech at the London Tavern, in explanation of these charges, occupied three days in its delivery; and at its close, the meeting adopted the following resolutions:—1. That, in the opinion of this meeting, Mr. Pearson has successfully vindicated his integrity and consistency as a public man from the imputations cast upon him by an article in the "Westminster Review" of May last. 2. That they are, moreover, of opinion that the amount and sources of Mr. Pearson's income and emoluments, stated in that Review, are, as explained by him, at variance with the real facts, and, so far as they are able to judge, do not exceed that fair and proper remuneration which is necessary to maintain the character and position of a gentleman, and a high public officer. 3. That this meeting are indebted to Mr. Pearson for a large amount of information, which, in detailing his long connexion with the Corporation of London, he has communicated; and that his statements have corrected many prevailing errors, as well as proved the great advantages that may be derived from a good system of local government based upon a representative principle."

St. Stephen's, Walbrook.—On Friday, this Church was the scene of another tumult in connexion with Alderman Gibbs's accounts. It appears that, in pursuance of a notice, issued officially by the Alderman, and stating his intention of holding a "select vestry," to make a rate for the poor and other paupers, a large crowd of parishioners assembled round the church door, anxiously waiting to be admitted. At one o'clock the church door still remaining closed against them, the parishioners became clamorous and impatient. At this moment Mr. Alvin, one of the select vestry, arrived at the door which was partially opened to re-

ceive him, when Mr. Rock, Mr. Howett, and others of the parishioners endeavoured to follow him into the church, but were at first repulsed by the beadle and others who had been stationed there by Alderman Gibbs to guard the doorway. After a violent scuffle the beadle and officers were disarmed, the parishioners rushed through the church and presented themselves before the select vestry. Alderman Gibbs commanded Mr. Howett who was amongst the foremost to retire from the vestry as a trespasser, and told him that he should have to answer for his conduct before the Ecclesiastical Court. Mr. Howett refused to retire unless removed in custody, and a scene of indescribable confusion ensued, in the midst of which Alderman Gibbs and the other gentlemen of the select vestry packed up their papers and retired amidst loud manifestations of tumult and displeasure. Mr. Rock was then called to the chair, and proceeded at considerable length to comment upon the conduct of Alderman Gibbs and of the select vestry, reiterating the Alderman's position with reference not only to the parish of Walbrook but in connexion with the Margate Sea-bathing Infirmary, the Sheriffs' Fund, the Cannon-street Ward, St. Benet's Sherehog, and St. George the Martyr. Mr. R. Cunliffe the banker followed, and deprecated the conduct of Alderman Gibbs in having sent a letter to Dr. Croly, stating that with the approbation of the Archdeacon proper persons would be placed at the Church doors to prevent the entrance of any persons other than Dr. Croly, the members of the select vestry and the vestry clerk. Mr. Cunliffe believed that the latter part of this letter contained a falsehood. He therefore moved that a deputation consisting of Mr. Cunliffe, Mr. Flight, and Mr. Rock, do wait on Archdeacon Hale and ascertain if he directed or approved of any particular and what mode of proceeding to effect the exclusion of the parishioners of St. Stephen Walbrook from the Church or the vestry-room on the 15th inst. After some desultory discussion the vestry was adjourned to receive the report of the deputation on the result of the interview with Archdeacon Hale.

East India Company.—The quarterly general court of proprietors was held on Wednesday, Mr. Cotton in the chair. In regard to the motion at the last meeting respecting Scinde, the chairman said that application had been made to the Board of Control, and the Earl of Ripon had replied that "additional papers relating to Scinde will be laid before the Court of Directors at the earliest period at which in the judgment of the Board such a step can be taken without the risk of prejudice to the public interest." The chairman stated the papers already ordered to be printed upon this subject would be ready for delivery to the proprietors on Tuesday, the 26th inst. Mr. Poynder obtained leave to postpone his motion respecting the illegality of the annual payment of 6,000*l.* to the temple of Juggernaut to the March court. A resolution was then passed admitting Capt. John Paterson to an annuity of 200*l.* a year as compensation for maritime services. The chairman said that the death of Sir F. Chantrey had caused some delay in regard to the statue of Lord Wellesley, but measures were in progress to complete the statue forthwith.

Fire in Guildhall.—On Tuesday shortly before midnight an alarm was raised that the Guildhall was on fire. The flames were discovered by one of the watchmen bursting through the ceiling of the Town-clerk's offices, immediately underneath the gallery leading to the ordinance chamber. All hands upon the building were at once assembled, and the powerful engine kept in the hall being well supplied with water the fire was extinguished before any considerable damage was done. The fire originated from the stone slab beneath a patent stove having become red hot, and set fire to the joists of the floor. At the time it was discovered, it was rapidly progressing towards the centre of the building, which but for that circumstance would probably have been destroyed. Many of the valuable papers in the town-clerk's offices are much injured by the water.

National Art Union.—The annual meeting for the distribution of prizes by this lottery was held on Monday at the Freemasons' Tavern. The report stated that the Union consisted of about 2804 members; that the value of the prizes drawn would be upwards of 1430*l.*, and the expenditure had exceeded the receipts by a very considerable sum, the former being 5000*l.*, the latter about 2900*l.* The successful drawers for the highest prizes were—Mr. Norris Best, Bilston, 150 guineas; Messrs. Rowe and Norman, 100 guineas; Mr. Pugh, Parkfield, Wolverhampton, 50 guineas; Mr. D. Yonge, Exeter College, Oxford, 50 guineas. In addition to these there were two prizes of 30 guineas, four of 25 guineas, twenty of 20 guineas, twenty-one of 15 guineas, nineteen of 10 guineas, and one of 6 guineas, besides a print given to each person at the time of subscribing.

King's College.—The Rev. Dr. Jelf, Canon of Christ Church, has been appointed Principal of this College, and Mr. Hullah has been appointed Vocal Professor. The students on Monday presented their late Principal, Bishop Lonsdale, with three elaborate silver salvers as a testimonial of their esteem on his retiring from the college.

Commission of Lunacy.—On Tuesday a commission of lunacy was opened at Kennington before Commissioner Barlow and sixteen freeholders of the county of Surrey, of whom Mr. Puckle, chairman of the Surrey sessions, was the foreman. The subject of the inquiry was Mr. Arthur Legent Pearce, formerly a surgeon at Kensington, but now an inmate of Bechleem Hospital during her Majesty's pleasure, having been acquitted on a plea of insanity by a jury at the Central Criminal Court in November, 1840, when he was tried for having discharged a loaded pistol with felonious intent at his wife, and grievously wounding her. Mr. Pearce was a man of high attainments, eminent in his profession, and the author of several works; and during his confinement he had em-

ployed his time in teaching French to Oxford who was confined for shooting at the Queen. It appeared from the evidence that the Jury at the trial considered him insane and not responsible for his own acts, and the consequence was that he was consigned to prison during her Majesty's pleasure or so long as insanity was found to remain upon him. After his acquittal he was placed under the care of the Messrs. Stillwell, of Moorcroft-house near Hillingdon, and in the course of some months was removed by a warrant from the Home Secretary Lord Normanby to Bethlehem, in which hospital he was received and had since remained as a criminal inmate. He remained the particular object of the care and remarks of the officers of that establishment, whose evidence for a period of two years was called to establish the state of his mind whilst they had him under their notice. After several witnesses had been examined who deposed to various delusions under which he laboured, Mr. Pearce answered several questions put by the Commissioner and Jury, whom he addressed at great length in explanation of the evidence. He persisted in declaring that his bed, sheets, blankets, and shirts had been watered or poisoned through the machinations of Mrs. Pearce and Mr. Pints her father, and he produced a small packet containing some portions of his shirts which he handed to the commissioner and requested they might be analysed. He also exhibited his snuff-box in which he endeavoured to show to the Jury that there were some crystallisations among the snuff of a deleterious character. Mr. Pearce evidently a man of very superior education appealed to the Jury, declaring that he was not insane and imploring them not to confine him for life. Mr. Petersdorff briefly addressed the Jury for Mr. Pearce, and the Commissioner having summed up the Jury returned a verdict dating the unsoundness of mind from the 16th October 1841.

Metropolitan Hospitals.—Much excitement has prevailed for some days past among the professional gentlemen and others connected with St. George's and the Middlesex Hospitals, in consequence of the exceedingly spirited canvassing which has been going on. The vacancy at St. George's was in the office of Assist.-Surgeon, and the candidates were Mr. C. J. Johnson and Mr. H. Hawkins, the latter supported by the medical officers of the hospital. The friends of each candidate had been exerting themselves most strenuously and on Saturday, the day of election, the large board-room in the hospital and passages leading thereto were thronged with noblemen and gentlemen, amongst whom were his Royal Highness the Duke of Cambridge who presided, the Archbishop of Canterbury, the Duke of Sutherland, the Duke of Devonshire, Lord Dudley Stuart, Lord Granville Somerset, Lord Arundel, &c. At the close of the poll the numbers were—For Mr. Johnson 169, for Mr. Hawkins 152. Majority 17 in favour of Mr. Johnson.—A similar contest is now going on for the office of Assistant-Physician at the Middlesex Hospital, the candidates being Dr. Woodfall and Dr. Seth Thompson, the latter supported by the medical officers.

Preachership at Lincoln's Inn.—The following names have been announced as additions to the list of candidates for the appointment of preacher to the Society of Lincoln's Inn:—The Rev. Mr. Page, Principal of the College of Civil Engineers at Putney; the Rev. C. Merivale, Fellow of St. John's College, Cambridge; the Rev. Frank Hewson, incumbent of Southall; the Rev. Mr. Cox, and the Rev. C. E. Wyde. Three gentlemen have declared themselves candidates for the office of assistant-preacher to the Society. The election of both preacher and assistant-preacher will take place on the 12th of January next.

The Westminster Play.—According to annual custom the Christmas holidays at this school were ushered in by the performance of a classical drama. Terence's comedy of *Phormio* was the play selected for this year and the representation went off with credit to the performers and satisfaction to the audience. The cast was as follows:—*Phormio*, F. Cooper; *Demipho*, F. G. A. Williams; *Antipho*, C. J. Fuller; *Gela*, J. G. Smyth; *Dorio*, E. R. Glynn; *Chremes*, J. Rich; *Phedria*, L. A. Cramer; *Davus*, W. L. Smith; *Sophrano*, G. D. Bowles; *Nausistrata*, G. W. Randolph; *Hegio*, G. O. Edwards; *Cratinus*, F. A. Goodenough; *Crito*, E. C. Burton. The comedy had evidently been carefully studied and the effect produced by the scenic representation had a much more striking effect than the drama would have been thought capable of producing from a closet perusal. The plot, intricate as it is, seemed to be well understood and appreciated by the audience, and the acting was marked by great care and discrimination.

Consecration of a New Church.—On Monday the new church in Broadway Westminster was consecrated by the Bishop of London, assisted by the Archdeacon of Middlesex, the Rev. H. H. Milman, and a large number of the Metropolitan clergy. The building is capable of accommodating 1,500 persons, 1,280 of the seats being free and unappropriated, owing to a grant on the part of the Incorporated Society. No organ has yet been erected, and the church is at present without a steeple. The Rev. Cyril W. Page, lately curate of St. Margaret's, has been licensed to the incumbency.

State of the Streets.—The City Police Commissioner, in consequence of the filthy state of the streets, has issued the following order:—"The police constables are ordered to summon every occupier of a house or other tenement within the City who shall not keep sufficiently swept and cleansed all footways and water-courses adjoining to the premises occupied by them. That there may be no excuse from ignorance of the law in this respect the constable is directed to intimate to the person so offending that he is liable to a penalty of 40s. for every such offence, and that for the continuance or repetition thereof he will assuredly

be summoned. The constables will observe that this order is to be enforced every day in the week."

Opening of the Metropolitan Welsh Church.—On Sunday the chapel of St. Etheldreda, in Ely-place, Holborn, was opened for the performance of divine service in the Welsh language. At the morning service the church was crowded to excess, several distinguished natives of the Principality attending. The Rev. J. R. Williams, late curate of Lampeter, has been appointed incumbent.

National Education.—The large subscriptions which members of the Church have entered into for carrying on national education upon Church principles have kindled some corresponding activity on the part of Dissenting bodies. On Tuesday the Conference of the Congregational Dissenters on the subject of general education commenced its sitting at the Congregational Library. There was a very numerous attendance of gentlemen from different parts of the manufacturing districts. Mr. Hindley, M.P., was in the chair. A commencement was made by a list of contributions amounting to upwards of 12,000*l.* Six gentlemen set down their names for 1,000*l.* each, payable in five years; the other 6,000*l.* was contributed in sums varying from 100*l.* to 500*l.* It is expected that a sum of 100,000*l.* will be raised by the congregational body in support of this movement.

The Italian Boys in London.—On Tuesday a meeting was held at the residence of the Rev. Dr. di Menna in furtherance of a plan for establishing an institution for the care and protection of destitute Italian boys. The meeting was numerously attended by Italian and English gentlemen, and several statements were made detailing various acts of cruelty alleged to have been committed upon these poor boys by their masters. A committee was formed, and a resolution was adopted that a deputation should wait on Lords Ashley and Dudley Stuart to solicit their patronage of the institution and their presence at a proposed public meeting.

The late Duel.—We announced last week the intended sale of Lieut. Munro's furniture and effects. On Saturday, shortly before the commencement of the auction, Mr. Wakley, the coroner, made his appearance and served the following notice on Mr. Kirke, the auctioneer:—"Whereas by an inquisition taken before me, Thomas Wakley, one of her Majesty's coroners for the county of Middlesex, on the 3d day of July in the 7th year of the reign of her present Majesty, Alexander Thompson Munro stands charged with the wilful murder of David Lynar Fawcett—this is to give you notice, on behalf of her Majesty, that you will sell any goods or property belonging to the said Alexander Thompson Munro at your peril." The sale of course did not take place and the company dispersed. The circumstances however have been submitted to counsel, who have given it as their opinion that whatever power the coroner might once have had over the property, that power he has lost by not acting upon it immediately after the termination of the inquest on the late Colonel Fawcett.

Acceleration of the India Mails.—On the 19th September it will be recollected a public meeting was held to take into consideration the expediency of accelerating the communication with India, when a committee was named and a day appointed in December to receive their report. The meeting for this purpose was held on Tuesday at the Hall of Commerce, and by the report it appeared that a deputation had waited on the Earl of Ripon, and having explained the great necessity of enabling the merchants not only in London but in the provinces to answer their letters by the outgoing mail, had received the answer of Government that measures should be taken to bring about so desirable an object. This intelligence was communicated by the chairman Mr. J. A. Smith, and received by the meeting with every demonstration of satisfaction.

Accidents and Inquests.—The Hon. Capt. Rous, M.P. for Westminster, met with a serious accident whilst shooting on Lord Rendlesham's preserves, in company with his Lordship on Friday last, at Rendlesham Hall near Woodbridge. Captain Rous's gun either burst or went off accidentally by which he sustained such severe injury that he has been obliged to have one finger amputated, and is likely to lose the sight of one eye.—On Friday Sir Gore Ouseley was returning to his seat Hall Barn Farm near Beaconsfield, from the Railway Station at Slough, when the horses suddenly shied and the carriage was turned over on its side. The coachman having fortunately sufficient command of the horses to prevent them from moving after the carriage was overturned, the Right Hon. Bart. was extricated from his perilous situation having sustained some slight bruises in his neck occasioned by his head striking against the top of the carriage, and compressing his neck between his shoulders.—On Saturday Lord Inverary, eldest son of the Earl of Kintore, met with a melancholy accident, which terminated fatally in a few hours. His Lordship was on a visit to his Grace the Duke of Montrose at Salby-lodge, Northamptonshire. On Saturday last he accompanied the Duke to a meet of the Pytchley hunt. In the heat of the chase his Lordship's horse fell at a very hazardous leap, when its rider was thrown underneath it, and received such severe injuries, that after lingering till Sunday morning he expired. His Lordship was not more than 23 years of age. An inquest was held on the body on Tuesday at Winwick Warren. The surgeon deposed that the internal hemorrhage was very great and sufficient to account for death; but the immediate cause was from pressure upon the brain, caused by extravasation of blood, proceeding from a rupture of one of the vessels of the brain, which rupture in the opinion of witness, was caused by a kick on the head from the foot of the horse, but it might proceed from a violent fall, &c. Deceased was also labouring under concussion of the brain, but that would not produce death in a general way. After a short consultation, the Jury returned a

verdict of "Accidental death, with a deodand of one shilling on the horse."—A serious carriage accident happened on Wednesday evening to the Hon. Mr. Douglas, son of Lord Douglas. The Hon. gentleman, who is on a visit to Mrs. Irvine, near Egham, was returning from a drive in a small barouche, accompanied by one servant. On reaching the top of Parry's-hill, Egham, the horse took fright and dashed at a furious pace down the hill, which is very steep. When half-way down, he commenced plunging, and on reaching Egham Park-gate the reins broke, and the carriage was drawn upon the raised footway and overturned. Mr. Douglas was thrown into the road with great violence. His servant having previously leaped from the vehicle escaped with some slight bruises. Mr. Douglas was immediately removed in a state of insensibility to Colonel Salway's garden lodge, and promptly received the aid of four medical gentlemen. When he recovered a little, it was deemed advisable to remove him to Mr. Irvine's, and two of the surgeons accompanied him thither. Mr. Douglas's face and head were severely contused, and his medical attendants considered he had received concussion of the brain, but it has been since ascertained that the injury to the head is not so great as was at first supposed.

Mortality of the Metropolis.—The number of deaths registered in the week ending Saturday, Dec. 9, was as follows:—West Districts, 153; North Districts, 165; Central Districts, 176; East Districts, 222; South Districts, 271; Total, 987 (males, 512; females, 475). Weekly average for the last five years, 903 (461 males, 442 females); and for the last five autumns, 908.

Provincial News.

Incendiary Fires.—A destructive fire broke out on Sunday evening at Naze Wick Farm, in Foulness Island, Essex, in the occupation of Mr. Charles Harvey, and destroyed a sheep-yard (the walls of which were composed of mustard and caraway straw), 100 ewe sheep in lamb, and a large bean-stack, the produce of 40 acres, adjoining. On the same night a man named J. Rampling was apprehended on suspicion of having caused the conflagration, and after a preliminary examination was committed for trial. The value of the property destroyed is estimated at about 500*l.*—A fire broke out on Thursday week about 5 o'clock in the stackyard of Mr. Rawson, a tenant of Sir Henry Dymoke, at Scrivelsby, near Horncastle, without doubt the work of an incendiary. There were about seven stacks in the yard; the middle one, containing about 40 quarters of wheat, was set on fire and consumed, with a barley-stack about the same size. The fire was stayed in its progress, and extinguished without further destruction of property.—On Saturday morning a fire broke out in the stack-yard of Mr. J. Hall, farmer and corn-dealer, and the whole, consisting of nine large stacks and hovels, two of which were very large, containing upwards of 100 loads each, were destroyed.—Incendiary fires are also mentioned in the local papers at St. Mary's Cray, Kent, where the premises of Mr. Snelling, miller and farmer, were destroyed; at Oakham, where four fires have occurred since the commencement of winter; at various places in the neighbourhood of Norwich; at some farms in Devonshire; and at Pollicott near Brill, Bucks, where a great quantity of property on the farm of Mr. Malin has been destroyed.

Birmingham.—A public meeting of the inhabitants of this town was held on Monday "for the purpose of considering what steps ought to be taken by the friends of civil, religious, and commercial freedom, during the next session of Parliament, to secure the redress by the Legislature of the people's grievances." The Mayor presided. Mr. J. Sturge moved a series of resolutions in favour of universal suffrage and of a full consideration of the people's grievances. These resolutions which were carried unanimously terminated with the following:—"That in the deliberate opinion of this meeting, the representatives of the people in Parliament ought to be called on by their constituents to unite together for the purpose of forcing on the attention of Parliament the grievances of the people before voting the supplies; and that this plan of action be specially recommended to them, because it is perfectly practical, consistent with the functions of the House of Commons, simple in its operation, legal, just, and necessary; has been successfully used in former periods of our history to resist the encroachments of the Crown, and offers to a despairing and disheartened people the power of at once removing abuses and of realising at no distant period the only security to be found against misgovernment, and that full, fair, and free representation in the Commons' House of Parliament to which they are entitled alike by the principles of equity and the British constitution." Resolutions were then passed adopting addresses from the electors to their representatives and to the different constituencies throughout the country in favour of Mr. Sharman Crawford's plan of popular representation. Mr. Muntz, however, and Mr. Scholefield, the two members for the borough, expressed their doubts whether the plan of Mr. Crawford was good in principle or could be carried out to the extent proposed.

Bridgenorth.—A correspondent informs us that the return of Thos. Whitmore, Esq., and family on Thursday week, after an absence of above four months, to Apley Park, near this town, was welcomed with great rejoicings in the neighbourhood. In passing through the villages near his extensive property, the carriage was met by numbers of the inhabitants, carrying torches, laurels, &c. At the north entrance near Stockton Church an arch of evergreens was erected, and along the whole distance from it to the mansion (two miles) large torches were planted at short distances. Numbers of the inhabitants accompanied the carriage in procession on each side bearing torches, and the night although exceedingly dark was

thus rendered as light as day. Several pretty arches of laurel, &c. were erected through the park and the two entrance-gates to the drive were tastefully decorated with shrubs; cannon were fired from the beautiful eminence west of the gardens and from the Castle-hill of Bridgenorth, and bonfires were lighted on the hills. The reflection of the torches and bonfires on the windings of the Severn added not a little to the beauty of the scene.

Bristol.—On Friday morning Mr. William Prichard secretary to the Bristol Union Fire-office committed suicide by taking prussic acid. An inquest was held when evidence was given that deceased had for some days been subject to great depression of spirits and mental alienation. The Jury returned a verdict "That the deceased committed the act whilst labouring under temporary insanity." Mr. Prichard was in his 44th year, and has left a widow and six children.

Carmarthen.—Her Majesty's Special Commissioners have employed the concluding week of their stay in South Wales in investigating the state of the trusts and taking other evidence. They held sittings on Thursday and Friday in last week at Swansea; on Saturday at Bridgend; on Monday and Tuesday at Cardiff; and on Wednesday at Merthyr Tydvil, where their proceedings finally closed. It is understood that the subject to which their attention has been mainly called by complainants is the administration of the turnpike laws.

Chatsworth.—We copy the following article from the *Derbyshire Courier* respecting the missing crystal noticed in our last:—"We are truly happy to learn that the piece of crystal abstracted from the conservatory at Chatsworth during the fête of Saturday evening week has been returned along with a letter bearing the London postmark, of which the following is a copy:—'December 11, 1843.—To Mr. Paxton.—Having observed in a late Derbyshire paper that a small brown crystal was missing from the conservatory at Chatsworth, the same having come accidentally into my possession I herewith return it to you as directed without wishing for the offered reward.' The return of the article so foolishly abstracted is a highly gratifying circumstance. It must be very pleasing to Mr. Paxton, whose generous desire that the public should be gratified had induced him to pledge himself to the Duke of Devonshire for the good behaviour of the parties admitted, to find that the only unpleasant result of his Grace's kind accordance of the request has been obviated. To us and doubtless to all the inhabitants of the district it is not less pleasing to find that the abstraction was not the act of any one residing in the county which has been honoured by the visit of her Majesty. We have the best authority for affirming that the behaviour of the visitors on the occasion to which we refer was in the highest degree creditable and satisfactory. Not a plant nor even a leaf was removed or destroyed, notwithstanding the great concourse of persons who visited the conservatory and gardens."

Chatham.—A court-martial was held in the Royal Marine barracks on the 11th, for the trial of Capt. W. Clindon, on charges preferred by the Admiralty, for irregularities whilst on the recruiting service. The Judge-Advocate read the following charges against the prisoner:—1. For having unlawfully demanded from John Gilby, a recruit, rejected at the head-quarters of the Portsmouth division of Royal Marines on the 9th May, 1842, a sum of money amounting to 17. 11s. 11d. or thereabouts, for expenses attending the rejection of the said John Gilby, he, the said Captain William Clindon, well knowing that he was himself alone liable to the payment of such expenses, in accordance with the tenth article of the Recruiting instructions. 2. For having on the 12th of October, 1843, received from the said John Gilby, by Post-office order, the sum of 19s. 9d. in discharge of the above-named demand, he Captain William Clindon not being lawfully entitled to the same; such conduct being in both instances unbecoming the character of an officer and a gentleman, and tending to bring the corps to which he belongs into disrepute. The prisoner pleaded not guilty to both charges. After the evidence for the prosecution had been heard, the defendant read his statement, in which he alleged that he had erred through misconception, and had derived no personal advantage from the transaction. The finding of the court will not be known until after it shall have been laid before the Admiralty.

Harwich.—It is rumoured that the Board of Ordnance contemplate the removal of their establishment at this place to the opposite shore of Langard Fort; and that the magazine is also to be removed thither, as from its proximity to the town, in the event of a railway being constructed it will no longer be considered eligible. The land on the Harwich side belonging to the Board of Ordnance has been for many years totally abandoned to the ravages of the sea, by which many acres of valuable land have been lost to the Crown.

Liverpool.—Several scenes discreditable to a court of justice have recently taken place in the District Court of Bankruptcy in this town, before Mr. Commissioner Skirrow. Last week a dispute arose between the Commissioner and an attorney, which ended in the latter being given into custody by the Commissioner, though engaged in the literal performance of his professional duties. In consequence of these scenes the profession have to a considerable extent come to a determination to settle every case by compromise or by arbitration, in preference to issuing fiats, under the present composition of the Court. At the same time the principal firms in Liverpool have presented Mr. Charles Phillips with an address, expressing in flattering terms their approbation of his conduct in every respect since he had received the appointment.

Manchester.—Another of the meetings for which Manchester has now become famous in connection with the

Anti-Corn-law movement assembled in the Free-trade Hall on Thursday night, for the purpose of receiving the report of the Great League Fund Committee on the progress of the subscriptions, and to hear addresses from Mr. Bright and Mr. Fox. Both these gentlemen spoke at great length, as did also Mr. Wilson, who presided on the occasion. A list of subscriptions entered into at the meeting was read, which amounted to 20,419l. 6s. 4d.

Moumouth.—A remarkable proof of mistaken identity has just occurred in this county. A man named William Morgan at the last assize was convicted by a jury and sentenced to two years' imprisonment and hard labour for an assault at Dixon on the 24th of April last. He has now however been liberated, as it has been established beyond the possibility of doubt that Morgan was in Usk the whole of the day on which he was said to have committed the offence—that persons who could have proved it refused to attend the trial to give their evidence—and from not having the means to employ a lawyer he knew not how to compel them. On the case being laid before Sir J. Graham the poor man was set at liberty.

Newport, Isle of Wight.—The old Banking Company lately carrying on its business in the names of Sir R. Bassett, Roe and Blachford has declared its inability to meet the demands of its creditors. The event has surprised the island, following so quickly on the bankruptcy of the Kirkpatrick. The firm had for some time ceased to issue promissory notes. When the last bank failed public confidence in private banks was so completely destroyed that Messrs. Roe and Blachford found it impossible to keep a single note afloat, and declined business; a new joint stock company was formed on the premises, and they were appointed directors, so that the losses will be limited to investments and deposits only. The amount of the latter however is said to be immense. It is said by the local papers that the high style of living of the surviving partners was calculated to lull suspicion, although it is believed the concern was insolvent at the death of the late Sir R. Bassett, or even so far back as that of Mr. R. Clarke.

Oxford.—The very Rev. Dr. Jeune, Dean of Jersey, was yesterday elected Master of Pembroke College, by the casting vote of the Vicegerent, the votes for Dr. Jeune and his opponent, the Rev. C. F. Parker, of Ringshall, being equal.—The local papers state that at the recent audit of M. P. W. Boulton, Esq. of Great Tew, the amount of damage sustained by his tenants by the calamitous hailstorm of the 9th August last, which destroyed nearly 30,000l. of property in this county, was returned to them to the amount of nearly 3000l. J. H. Langston, Esq., M.P., acted in the same liberal manner to his tenants, whose losses were little less than 2000l.

Sheffield.—On Wednesday week Messrs. Parker, Shore, Brewin, and Rogers, of the late Sheffield Old Bank, bankers, appeared in the Leeds Court of Bankruptcy for their certificates under the fiat issued against them in January last. The solicitor for the bankrupts produced a letter from the assignees in which they said that the bankrupts had afforded every facility to the winding up of their affairs, and had given a faithful account of the whole of their property which they had yielded up for the benefit of their creditors. Mr. Hill of Leeds, Barrister, on behalf of several of the Sheffield creditors opposed the granting of the certificates on the ground principally that the bankrupts had manifested great carelessness in the way in which they had carried on their business, and had continued to do so for some years after they knew that the bank was in an insolvent state. Mr. Blackburn of Leeds, solicitor, also opposed the granting of certificates to the bankrupts on behalf of a creditor for 500l. The solicitor of the bankrupts contended that although they had committed errors of judgment in some of their business transactions, they had fallen a sacrifice to the pressure of the times, especially from the losses in the American trade, by the manufacturers of Sheffield, the contraction of the trade itself, and by the establishment of joint-stock banks; but they had made all the reparation in their power by yielding up every shilling's worth of property they possessed. Mr. Parker sacrificed 70,000l. besides not getting one sixpence profit from the bank during the last twelve years. The other partners had also made large sacrifices. After a good deal of argument on both sides the Court said it might be considered that the bankrupts had passed their final examination, but adjourned the final decision on the granting of certificates. From some observations however which fell from the Commissioner, it was understood that the adjournment was only formal, and that the certificates were virtually granted.

Windsor.—The ceremony of consecrating the Queen's new private chapel at the Castle by the Bishop of Oxford took place on Tuesday in the presence of her Majesty, Prince Albert, the visitors to the Queen, and the members of the household. The apartment which has now been appropriated for the permanent private chapel of the Sovereign was used occasionally for a devotional purpose in the reigns of George IV. and his late Majesty, but during the reigns of those monarchs and indeed up to a late period it was likewise used as the music-room for her Majesty's private band. Her Majesty's warrant having been read by the registrar, Dr. Phillimore, the ceremony of consecrating and dedicating the chapel was then performed by the Bishop, assisted during the service by Archdeacon Clerke and the Hon. and Rev. C. L. Courtenay. The ceremony occupied upwards of an hour.

Railways.—The following are the returns for the past week:—London and Birmingham, 14,388l.; Great Western, 11,784l.; South Western, 4800l.; South Eastern, 2830l.; Eastern Counties, 2348l.; Northern and Eastern, 1535l.; North Midland, 3983l.; York and North Midland, 1359l.; Greenwich, 688l.; Croydon, 216l.; Brighton, 3254l.; Blackwall, 592l.; Hull and Selby, 908l.;

Midland Counties, 2494l.; Grand Junction, 6431l.—The works of the South Eastern Railway between Folkestone and Dover are progressing rapidly towards completion, and the contractors are under heavy penalties for the permanent station at Dover being shortly ready. The traffic of this line for the past week is 2830l., even though labouring under the disadvantage of being imperfectly opened, and scarcely any one of its resources brought into action. It is intended to put on some steamers of efficiency to maintain the communication with the French ports.—By a communication from Coventry in the *Times* it appears that the manufacturers and traders of that city are making great complaints of the conduct of the Birmingham Railway Company towards them. By this railway there are two kinds of trains by which goods may be conveyed—the passengers' train by which the charge is 9s. 4d. the cwt., and the luggage train by which the charge is 2s. 6d. the cwt. In addition to the morning trains there are now night luggage trains which arrive at London in the morning. These would be of great service to the people of Coventry if they were allowed to avail themselves of them. The weavers bring in their work towards the end of the week, and it is chiefly sold on Saturday, and must be in London on Monday morning. Nevertheless the directors of the company will not allow the night luggage trains to stop at Coventry, and the manufacturers of that city being obliged to send up their goods some way or another are forced to make use of the passengers' train, and consequently pay the company at the rate of 9s. 4d. instead of 2s. 6d. per cwt.—On Wednesday a special general meeting of the Croydon Company was held to consider the propriety of extending the line to Epsom. There was an unusually large attendance, as it was supposed some opposition would be shown to the proceeding suggested by the directors. The chairman stated that the proposal was by no means a new one. It had been suggested by the projectors of the railway in 1836. It had been urged that the amount of traffic did not warrant the Croydon Company in extending their line to Epsom. At the present moment the traffic would yield 49,878l. per annum. Included in this was 23,000l. for goods. Then 26,000l. might fairly be reckoned upon from passengers. The expense would be 170,000l., say 200,000l.; even then an annual profit of 18,500l. would be realised after taking the most reasonable view of affairs. The directors of the South Western Railway were about to petition for powers to extend their line to Epsom, so there would doubtless be a severe parliamentary contest. It was very true that the extension of the Croydon line would cost 170,000l. and that of the South Western only 50,000l., but that was no evidence that it could be worked cheaper when completed. The great question for Parliament to consider would be the accommodation of the public. The Croydon Railway proposed carrying passengers to Epsom for two shillings and it would be impossible for the South Western to carry them for less. The chairman concluded by proposing—"That it is the opinion of this meeting that it would be of great advantage to the shareholders of this company and to the public generally that a railway shall be formed from the London station to the town of Epsom." Mr. Fitch seconded the resolution which, after some discussion, was carried. Another resolution empowering the directors to make application to Parliament and to take whatever measures might appear desirable was also agreed to.

IRELAND.

Dublin.—On Thursday the Landlord and Tenant Commission adjourned for the Christmas holidays, to resume the inquiry on the 3d January. Arrangements are in progress calculated to render the labours of the commission very effective, in the way of a full disclosure of the whole land-tenure system in Ireland. A committee including Sir Colman O'Loughlin, Mr. John O'Connell, M.P., Mr. Moriarty, and other members of the bar, have undertaken the task of receiving communications on the subject of land-tenure, in order to analyse and prepare evidence to be submitted to the commissioners. The preliminary intervention of those gentlemen, totally unconnected as they are with the commission, will greatly abridge the labours of the commissioners. Lord Devon during the short Christmas recess will proceed to Newcastle, his seat in the county of Limerick.—A meeting was held at the Mansion-house last week, to consider the best method of effecting a safe and expeditious communication between London and Dublin. The Duke of Leinster, the Earl of Devon, the Earl of Charleville, and several of the leading gentry were present. Resolutions were adopted expressing the concurrence of the meeting in the views stated in the reports of Sir G. Back and Captain Fair and of Mr. J. Walker civil engineer, recommending that the ports of Dublin and Holyhead should be the ports of arrival and departure for the mails between the two countries, and declaring their opinion that the present untimely evening departures of the two mail-packets to Liverpool is capable of very great improvement as regards the conveyance of both mails and passengers, and that the Council of the Chamber of Commerce be requested to urge in the proper quarter the necessity of an alteration in both these departures.—The usual weekly meeting of the Repeal Association was held on Monday. A letter was read from Mr. O'Connell, suggesting that the sum of 25l. be given by the Association to the butler Larkin who so courageously defended his master's family in the late outrage at Finnoe, and complaining bitterly of the members of the Landlord and Tenant Commission. In connection with the latter subject, Mr. O'Connell suggested that the Association should appoint a working Committee to advertise for information, put themselves in communication with as many of the Clergy as possible, and tender

POLICE.—*Extraordinary Case of Alleged Forgery.*—A few days since, Mr. Barber of the House of Barber and Bircham of New Bridge street, solicitors, was brought before the Lord Mayor in the custody of Daniel Forrester, the officer, upon the charge involved in the following statement as given in the evidence. The prosecution was instituted by the Crown.—In 1829 a sum of 3,500*l.* was transferred in the books of the Bank in the name of Anne Slack, then described as of Smith-street, Chelsea, spinster. The stock was purchased by Mr. Hulme, who was executor of the father of the lady, with part of her share in her father's estate. From an extract of a letter from Mr. Hulme to the brother of Miss Slack, it appeared that the former had purchased Miss Slack 6*6*²/₅ *l* 17*s.* Reduced, and that he had also purchased for her the beforementioned sum of 3,500*l.* Consols. Shortly after the transfer of the stock into her name, Miss Slack granted two separate powers to Mr. Hulme for the receipt of the dividends on both funds, and under these powers that gentleman received the dividends up to the 31st of January, 1832. He did not pay the dividends over regularly, but supplied her with such sums of money as she required. That course of supply continued until Mr. Hulme died in 1832, from which time the dividends on the larger sum of stock were received by Miss Slack, and the residue of the principal sum of 3,500*l.* was lost sight of entirely by her, as she had never attempted to manage her own pecuniary affairs. In that state of things, on the 6th of July, 1842, the dividends having been unreceived for a period of ten years, the stock was on that day by virtue of the Act of Parliament transferred to the commissioners for the reduction of the national debt. About that time, from what cause could not be ascertained, Mr. Barber the prisoner appeared to have got some information concerning the stock which had been transferred to the commissioners, and also of the fact that Captain Foskett, of Abbots Langley, had married one of Miss Slack's sisters, and on the 4th of Oct. he

Printed by Messrs. BRADBURY and EVANS, Lombard-street, Fleet-street, in the Precinct of Whitefriars, in the City of London, and Published by them at the OFFICE, 3, CHARLES-STREET, COVENT GARDEN, in the County of Middlesex, where all Advertisements and Communications are to be addressed to the Editor.—Saturday, December 23, 1843

DIED.—On the 11th inst., the Rev. J. St. V. BOWEN, son of the late Admiral Bowen, of Ilfracombe.—On the 14th inst., at Haslar, Com. G. ALLAN, R.N.—On the 17th inst., at Brighton, in his 71st year, Sir R. F. FLEMING, Bart.—On the 21st inst., aged 53, the Rev. W. J. KENNEDY, Rector of St. Mary, Ashill, and St. Andrew Hubbard, London, and Secretary to the Incorporated Society for building Churches.

THE CHURCH (SIXPENNY) MAGAZINE.—A MONTHLY REMEMBRANCE AND ADVOCATE FOR BRITISH CHURCHMEN.

Vol. V. for 1843, may now be had, price 7s. 6d.; and Cases for binding, price 1s.—No. 61, for January, 1844, will be published December 30.

The principles of the present Conductors are specified in the pages of now nearly two years. We belong to no party but the Church, and to no party in the Church, having no sympathy with those who would unprotestantize or puritanize it. Attached to the Prayer Book, Articles and Homilies, in their literal and obvious teaching, we believe our Church to be Scripturally Evangelical, faithfully Protestant, and happily Reformed; and so primitively Catholic in its constitution, doctrine, and worship, as now established. Such are the Evangelical High Church principles of our little Family Magazine.

THE BOTANY OF THE VOYAGE OF H.M.S.

"SULPHUR." By GEORGE BENTHAM, Esq., F.L.S., &c.

During the widely-extended Voyage of H.M.S. "Sulphur" the

subject of Botany was pursued with much diligence; many

hitherto unexplored localities were visited, and the collections

brought home afford a number of plants of very considerable

interest to science. The Government having sanctioned a

liberal grant towards defraying the expenses of publication, a

series of the most important specimens will be selected for illus-

trations, and be executed in a style befitting such patronage,

and published at a much lower price than would otherwise have

been possible. The determination and description of the new

species have been kindly undertaken by GEORGE BENTHAM, Esq.,

and notices of the climate and seasons, together with the general

features of the localities and vegetation will be furnished by

R. B. HINDS, Esq., Surgeon attached to the Expedition.

Plan of Publication.—I. It is calculated, upon a careful esti-

mate, that the whole will be comprised in Six Parts, each con-

taining Three Sheets of Letterpress and Ten Plates. II. The

Parts will appear Quarterly, price 10s. each.

London: SMITH, ELDER, & Co., 65, Cornhill.

NEWSPAPER OFFICE, No. 15, Coventry-street, Haymarket,

London. Established upwards of 30 years.

T. MUDIE AND SONS, Agents for the supply of the

London: W. S. ORR & Co.; and W. & R. CHAMBERS, Edinburgh.

DARLEY'S SCIENTIFIC LIBRARY, for the Use

of Schools, Private Students, Artists, and Mechanics.—It is

the purpose of this Work to furnish a Series of Elementary

Treatises on Mathematical Science, adapted to the wants of the

Public at large. It is a series of six at public and private

schools, to persons whose education has been neglected, or

whose attention has not been directed in early life to such

studies, and to Artists and Mechanics, these little Works will

be found particularly suited. The principles of the various

Sciences are rendered as familiar and brought as near to our

commonest ideas as possible; the demonstrations of proposi-

tions are made plain for the mind, and brief for the memory;

and the Elements of each Science are reduced, not only to their

simplest, but to their shortest form.

1. A SYSTEM OF POPULAR GEOMETRY. Containing in

a few Lessons so much of the Elements of Euclid as is necessary

and sufficient for a right understanding of every Art and Science

in its leading Truths and general Principles. By GEORGE DAR-

LEY, A.B. Fourth Edition, 4s. 6d. cloth.

2. COMPANION TO THE POPULAR GEOMETRY, in which

the Elements of Abstract Science are familiarised, illustrated,

and rendered practically useful to the various purposes of Life,

with numerous Cuts. (Second Edition.) 4s. 6d. cloth.

3. A SYSTEM OF POPULAR ALGEBRA, with a Section on

Proportions and Progressions. Third Edition. 4s. 6d. cloth.

4. A SYSTEM OF POPULAR TRIGONOMETRY, both Plane

and Spherical, with Popular Treatises on Logarithms, and the

application of Algebra to Geometry. Second Edition, 3s. 6d. cl.

"For students who only seek this limited knowledge of these

sciences, there are perhaps no treatises which can be read with

more advantage than Darley's Popular Geometry and Algebra."

—*Library of Useful Knowledge, Article "Mechanics."*

TAYLOR and WALTON, Booksellers and Publishers to University

College, 28, Upper Gower-street.

Bound in cloth, price 5s. 6d.,

JOE MILLER'S JEST-BOOK.

A Reprint from the first and genuine edition, such omissions

and alterations only having been made as were required by the

greater delicacy observed in modern conversation; but, that the

volume might have some substance, and be a good table or

travelling book, copious additions have been made from other

old volumes of Facetiae.

Extract from the Preface.

"Another strange circumstance connected with this work is,

that everybody presumes that he himself and everybody else

are perfectly familiar with its contents. . . . and yet, if the reader will

ask his acquaintance, it will appear that not one in five hundred

ever set eyes on a copy. It is in consequence of like questions

that this edition is published."

London: WHITTAKER and Co.

Price 7s., Illustrated with Wood-cuts of Birds, Cages, &c.

A NEW EDITION OF THE

NATURAL HISTORY OF CAGE BIRDS; their

Management, Habits, Food, Diseases, Treatment, Breeding,

and the Methods of Catching them. By J. M. BECHSTEIN, M.D.

"A very delightful book of its kind. It seems to us

an indispensable book for the bird-fancier."—*Spectator.*

The Gardeners' Chronicle.

SATURDAY, DECEMBER 30, 1843.

MEETINGS FOR THE TWO FOLLOWING WEEKS.
FRIDAY, JAN. 5. Botanical 8 P.M.
WEDNESDAY, JAN. 10. Society of Arts 8 P.M.

THE conclusion of another year of uninterrupted success leaves the Editor of the *Gardeners' Chronicle* little to do, except to express his grateful sense of the valuable contributions which the friends of Horticulture continue to supply from all parts of the United Kingdom. It seems, however, due to those who so greatly interest themselves in the prosperity of this Paper to mention what preparations have been made for maintaining an abundant variety of information for the year to come.

The intention of adding 24 weekly columns of Agriculture without further charge has already been announced. At the same time, a small increase in the size of the paper itself will be made, so as to give a somewhat wider margin, and this will render the *Gardeners' Chronicle* and *Agricultural Gazette* as large as the utmost limits permitted by Act of Parliament. It has, indeed, become necessary to construct a new printing-machine, of the largest size known in London, on purpose for the delivery of the paper. Connected with these changes will be some alterations in the arrangement of the matter, so that it will be folded upon a new and better plan than heretofore.

Among the new matter provided for the year is a complete set of instructions for the Rose Gardener, illustrated by numerous woodcuts; a series of leading articles on Heating, with reference to the new methods of applying hot water; special articles on Florists' flowers; a lengthened inquiry into the Diseases of plants; an account of the Weeds of Farms and Gardens; and a new dissertation on Bee-management. Letters from Paris are also in type relating to the French method of growing Pine-apples without pots. It is, moreover, hoped that it may be possible to procure some good matter relating to landscape-gardening; that the articles on Familiar Botany, so long interrupted, will be renewed with some sort of regularity, and materially extended; that a still larger supply of Entomological articles will be received from Mr. Curtis; and that the important subjects of Planting will be taken into more special consideration.

In the Calendar of Operations, too, a great change is contemplated. Instead of throwing the responsibility of directing all the varied occupations of the Gardener upon any one individual, it is intended to entrust the duty to six or seven of the most eminent cultivators that can be found, each of whom will take his own department. In this way it is hoped that full instructions will be secured for every branch of Gardening, from Ducal Conservatories and Forcing-houses down to the flower-beds of the Florist, and the little allotments of a Cottager.

Of course, in addition to these important subjects, there will be the usual supply of miscellaneous matter upon all possible branches of Gardening. But for these and other matters we would refer our readers to acts rather than to intentions.

A FORTNIGHT ago we called attention to the increasing evidence as to the value of CHARCOAL, as an agent of cultivation, and we alluded to the employment of it in the Pine-growing at Bicton. We have since received a letter from Mr. Barnes, in which he entirely confirms the statement we then made. "Charcoal," he says, "is the most astonishing article to make use of for all purposes of cultivation, and especially for plants under artificial treatment. I judge from many years' experience in its use. What you say respecting my employing it largely among my Pine-soil is true. It consists of nothing but charcoal and loam, without a particle of manure of any sort. Every plant under my care has some charcoal used about it. I never yet saw the plant that did not delight in it, and to Heaths it is most especially acceptable." It seems to us that opinions thus strongly expressed by one of the best Gardeners in the country, must carry conviction to the most sceptical. However, we may as well mention a few other facts before we leave the question to the experimental proof to which it is now certain to be subjected all over the country.

The other day Mr. Stewart, Gardener at Stradsett Hall, exhibited to the Horticultural Society, some Cucumbers grown in equal parts of loam and charcoal,

without any manure. No stimulant could have given better fruit, so far as health was concerned.

The author of the "Rural Economy of the Midland Counties" states, that the fragments of charcoal left by the charcoal-burners have been found of great benefit to land. He reports them to be, in his time, in esteem as a manure for Turnips, and for fining grass-land.

The well-known operation of paring and burning has been supposed to prove so beneficial in consequence of its removing insects and destroying the cohesiveness of stiff clays. The latter is, no doubt, its effect in part; but we entertain no doubt that the charcoal formed from the roots of grass and other plants, is also of much importance in the operation. Try, for example, brick-dust—which is burnt clay without charcoal—and the burnt clods of the fields, containing charcoal, against each other, and the distinction will soon be seen; yet, so far as mechanical alteration of the texture of the soil is of value, they are not in a very different state.

Then listen to what is stated by Mr. Rivers, in the last edition of his "Rose Amateurs' Guide." "I have used," he says, "with much success (for Roses in pots) turf roasted on a sheet of iron placed in temporary brickwork, under which a moderate fire has been kept; about one hour's roasting is sufficient. This chars the under side, and acts most beneficially" (p. 192). We have reason to know that this is a most important fact in the management of Roses in pots; and let the reader only consider how entirely it confirms all that we have said on the subject.

When we last mentioned this matter we quoted the experiments of Mr. Rigg, against the assertions of other chemists, to prove that charcoal will form carbonic acid with the oxygen of the atmosphere, under ordinary circumstances. We have since met with a passage in De Candolle's "Physiology," which shows that we do not stand alone in our belief that charcoal does, even in the air, form gaseous combinations of some sort or other, and so furnishes food to plants, independently of the matters it may be able to condense within its pores. "Count Rumford," says M. De Candolle, "has proved by direct experiment that charcoal, so long regarded as one of the most fixed of known substances, is capable of combining with oxygen, and forming with it carbonic acid, at a temperature very far below that at which it burns perceptibly. This slow combination of charcoal with oxygen explains why those places in the woods where the charcoal-burners have been at work, although at first sterile, become fertile, in proportion as the charcoal combines with the oxygen of the atmosphere to form carbonic acid, which dissolves in the surrounding water."

We may add that the quality of charcoal is much improved by steeping it in liquid manure; and that the lighter and more spongy it is, the better for the purposes of the cultivator.

ENTOMOLOGY.—No. LII.

CALANDRA GRANARIA (the Grain or Corn Weevil).—Farmers and gardeners not only suffer from the inroads of insects in the field, but after their Corn and seeds are safely stored they not unfrequently fall a sacrifice to the attacks of little insects which breed in granaries and rooms excluded from light and air. We have already described two of these pests,¹ and will now treat of others, which are often complained of and are equally formidable. One of these, called the Grain Weevil, does as much mischief as the *Tinea sarcitella*; it feeds alike upon Wheat and Barley, committing tremendous ravages in many malting establishments, where sometimes two-thirds of the grain are reduced to the outward shells. This small beetle is an imported species, which attacks the Maize in warmer latitudes; and in such climates as Madeira, where the beetles breed in the open field, there is little doubt that the female deposits her eggs amongst the blossoms of the Corn, or upon the incipient and tender germ; in all probability they are soon hatched, and penetrate the young grain, the skin of which closes over them, and they thus feed and undergo their transformations in such security that it has been remarked, when the pupa has actually been inclosed within a grain of Indian Corn, not the most minute puncture or any other sign of an inmate could be discovered upon the skin.

Mr. Mills, who prosecuted these remarks, found that the Corn Weevils were hatched by a heat amounting to 110° Fahrenheit.² England not being hot enough, fortunately, to naturalize them in the open air, they can only gain a settlement and multiply under shelter, and consequently they are found in our granaries, whither they have been imported from abroad with foreign Corn, and eventually they become, if not regular inhabitants of our land, at least the tenants of our buildings. In storehouses they deposit their eggs at one end of a grain, which the little maggot enters to feed upon the flour it contains. There can be no doubt that the perfect insects also subsist upon the same substance, for which purpose they are furnished with strong, although minute, jaws, at the tip of the rostrum. On opening the husks, which are frequently perforated on the side (fig. 4) one generally finds a Weevil concealed there, sometimes dead; in other instances they appear to have escaped at the open extremities, the skin being imperforated, but entirely cleared out.

¹ Gard. Chron., v. iii. pp. 156, 188. ² Trans. Ent. Soc., v. i. p. 241.

Abundant as these insects are, and frequently as I have met with them, I have never been successful in finding either the maggots or the pupæ: they are, I doubt not, very similar to those of the Nut Weevil³, but of course much smaller; I must therefore confine myself to a description of the perfect insect, which was named by Linnaeus, *Curculio granarius*, but it has been separated from that immense group by Clairville, who called it *Calandra granaria* (fig. 1): some are chestnut-coloured, others are tawny; they are depressed and shining: the proboscis is stoutish, slightly curved, not so long as the thorax, and the antennæ are inserted on each side near the base; the thorax is large, oval, and truncated behind, coarsely punctured with long excavations, leaving a ridge down the back: elytra, not much longer and scarcely broader than the thorax, beautifully and firmly striated, the interstices punctured: wings, none: legs, short and stout, the tibiae terminated by a curved claw: the tarsi 4-jointed, the penultimate joint bilobed, the fourth furnished with minute claws: fig. 2 represents the head and thorax in profile.

The other beetle figured (3) which assists in the destruction of the grain, and generally accompanies the Corn Weevil, is the *Silvanus Surinamensis*, Linn.,⁴ called also by Fabricius *Anobium frumentarium*: it is narrow, flat, rusty brown, and thickly punctured: the head is large and subtrigonal, the margin reflexed: thorax oval, with three elevated longitudinal lines, the sides toothed: elytra long and narrow, with four slightly elevated lines on each, and rows of punctures between them: wings ample: legs short: tarsi 5-jointed, the fourth joint exceedingly minute, fifth terminated by two claws. The natural sizes of the beetles are shown by the lines. A third species which accompanies the above is the *Ptinus ovatus*, a little brown beetle, with a nearly globose abdomen; this, however lives in the worm-eaten floors, and probably may not attack the stored grain.

The seasons suited to the propagation of the Corn-insects appear to be uninterrupted, for I have seen them in extensive flour-mills in Norfolk in the spring; in June and July they were abundant in the sweepings of a malt-house in Norwich; in September and the three following months in granaries, and in the winter they attacked and ate up some pearl Barley in the possession of a scientific friend. There are many remedies which might be employed to destroy the eggs, and likewise the larvæ and pupæ, as sudden transitions of temperature, friction, &c.; but such mild applications could have little effect upon the hard beetles, which, secure in their horny coats of mail, defy both heat and cold to an extraordinary degree; and as there seem to be no periods of the year when they are not actively engaged in infected localities, we must have recourse in bad cases to the most efficient means, such as heating the Corn artificially: this mode has been adopted by a gentleman in Madeira who suffered exceedingly from the attacks of Weevils, and has been attended with complete success. He has a room capable of containing 800 bags of Corn, which can be heated by hot water conveyed through pipes; the Corn is thus subjected to a temperature of 135° of Fahrenheit, by which means the Wheat is freed from the living insects, and after being sifted, is said to make as good and sound bread as at first.⁵ In the West Indies, Rice in store is kept free from the inroads of a similar Weevil merely by exposing the grain to the sun, and by frequently winnowing it.—*Ruricola*.

AMATEUR'S GARDEN.—No. LII.

NEXT to the skill requisite for the production of large and perfect specimens of fine-foliaged hard-wooded plants, comes the difficulty of keeping them in a perfect and healthy state after they have arrived at their maximum growth. It is no difficult matter at the present time to meet with large plants (of Heaths, for example); but it is a rare thing to meet with a plant that is perfect in every respect, and which carries its foliage down to the base of its oldest branches—and why is this? In nature we generally find healthy plants clothed with branches and foliage to their very base; but our large specimens of pot-culture too frequently either cast their foliage, or allow it to become diseased after they have attained such a size as to render it inconvenient to remove them to a larger-sized pot. Now, the difference between the plants is;—in a natural state the roots are always in an equable state as to moisture, while under pot-culture they are so frequently fluctuating between drought and moisture, that though they may not be, to appearance, actually suffering for the want of water, yet at times have not so much of it as is necessary to the healthy circulation of the juices of the plant; and the consequence is, the leaves become diseased, and after a time either fall off or are removed by hand as unsightly objects.

In the management of our Heaths, I am not quite sure that our best cultivators are not in error in admitting such strong currents of air at all times, without paying suffi-

³ Gard. Chron., v. ii. p. 108. ⁴ Curtis's Guide, Gen., 247, 2. ⁵ Trans. Ent. Soc., v. i. p. 241.

of great thickness, one of which I measured. The lower part below the excrescence is about two-thirds less in circumference than the part above, which is all of a piece round the stem of the tree; in the others the excrescences are in detached parts. Now, it appears that the timber in all such trees is shaky, or beginning to decay, and consequently of little value. From all the information I can obtain from those who have worked up such timber, the grain, before the excrescences begin to form is straight in the usual way, but after that it is curled; owing, I believe, to the young shoots growing apparently on the dead or decaying timber, which curliness of the wood must be produced by the matter from the annual buds of the young shoots being obstructed in its descent. A specimen of the excrescence with the annual shoots on, showing the cause of the curliness in the after-formed wood, I send with this paper. It appears that these excrescences seldom, if ever, appear, until the heart begins to decay, or till decay has been produced from some cause or other, as by wounds from injuries previously received. I never observed so many infested trees together as in Parkington Park. The disease is, however, frequent in old Pollards, or decapitated trees, in hedgerows and fields. There were scarcely any of this kind in the forest of Dean; query, can it be the soil? Can any of the numerous readers of the *Gardeners' Chronicle* throw more light on this subject?—*W. Billington*.

—I may state, in addition, that many of the above-mentioned trees are almost covered with excrescences, both on the stem and the larger branches; they appear of great age, are from two to three feet in diameter, and are growing on two mounds in the centre of the park. There are few trees of like appearance in the vicinity. Their Welch name signifies "Scabby Coppice." Many of them have no external appearance of being hollow. Mr. Ormsby Gore has had a few cut into veneers, the grain of which is most beautiful. I should attribute the appearance to something connected with the soil.—*B. B. Billington*.

[These excrescences are produced by the growth of myriads of what are called "embryo buds," which are generated in the inside of the bark. The cause of their formation is unknown. The knobs on Cedars of Lebanon, Elms, Beech-trees, &c., have a similar origin. Birdseye Maple is said to be the timber cut from Maple-trees thus affected. The Brusum of the Romans, so much prized by their cabinet-makers, was the wood of the common Maple, twisted into singular forms in consequence of the appearance of such excrescences.]

Bees.—I beg to thank Mr. Buckland for noticing my remarks on Ventilation of Hives, and for his advice. I believe that Mr. B. is quite right in his remarks, both on the ventilation and on the position of the brood. Still I attribute the empty state of my comb to the fact, that the season did not allow the Bees to fill the combs they had made with honey. I added these few remarks to show that Mr. Jeston's plan will answer, and that it is well suited for cottagers, on account of its cheapness and simplicity; the great object being to enable a greater number of persons to manage their Bees profitably. After all that has been written on the subject for the last 150 years, it is remarkable that all the great improvements were confined to a very few persons, who have a fondness for Bees and the requisite patience and leisure. They are not practised by cottagers. Writers on the subject of Bees have refined too much. When the great principle of conservation of the Bees is admitted (which may be practised by any one) the shapes and positions of hives and boxes are of secondary importance. The keeping of Bees cannot be reduced to a system, at least, not in this country; the seasons will control us. In my humble opinion, the less Bees are interfered with the better, when proper space has been allowed to them. It should be borne in mind, that no purely agricultural country is suited for Bees, for the Clover, &c. are cut before they blossom fully; in one word, this is the worst country in Europe, always excepting the north, for the production of honey.—*Este*.

Bees.—I, in answer to "R.'s" inquiries, in a late *Chronicle*, whether in Sydney the Bees are British, beg to inform him that in the autumn of the year 1830, Dr. T. B. Wilson, M.D., who was about to leave England in charge of a convict-ship to Sydney, wished to take out a hive of Bees, and consulted me where he could procure them, and as to the most efficient manner of effecting the same, as several persons had tried and failed. In the early part of the year one of my hives swarming, the gardener, not being provided with a new hive, cut a circular piece out of the centre of the top of the hive, and placed an old one over it, into which the Bees swarmed, and in the autumn it was particularly well furnished. I informed him I would, with pleasure, present the colony with the Bees, and directed a circular hive-covering to be made, which encircled the two hives, leaving about five or six inches in all parts for the Bees to take the air, with conveniences for feeding and removing the dead, and I saw them safely fixed on board the ship at Woolwich. I had the pleasure of learning they arrived safe and in a healthy state, and were placed in the Government gardens, at Sydney, where, for a season, they constituted the general attraction, and were the lion of the day. Their fecundity was so great that I am afraid I should not be credited if I stated how many times they swarmed the first year.—*Robert Gunter, Old Brompton*.

Bees.—Although "Este" adopted the plan of letting his Bees descend into empty butter firkins, as suggested by Mr. Jeston, (page 821,) still, he was not so successful as that gentleman, whose Bees were prosperous even in a bad season. That might be owing to "Este's" stocks being weakened by swarming. He observes, "I had seven swarms from three old stocks, because I did not ventilate as I ought to do." When convenient, will

"Este" have the goodness to let us know in what way he neglected ventilation, also the quantity of combs in the tubs at the time the swarms issued, and the age of his stocks? Mr. Jeston seems to prefer old stocks; he says, "the older the hives, the less chance there will be of swarming, but the greater chance of a larger deposit of honey." At present I will not comment on that strange statement, but merely observe, that the plan of putting common hives upon empty firkins is very simple, and similar to the common way of eking, or nadir living. Honey may be obtained by boring a hole in the floor of a hive, and placing an inverted bell-glass close to it, covered with an empty hive. Mr. Hart, of Billingsford, Norfolk, who is not only a good apiarian, but takes much interest in rural affairs in general, showed me a glass of honey he obtained in that way. The Bees descended into the glass rather late in the season, I mean after the drones were slaughtered, and strange to say, it contained a brood of them. Perhaps some one acquainted with the natural history of the Honey Bee will explain this strange phenomenon. I believe there is something connected with it unfavourable to Mr. Newport's opinion, viz., "That the Honey-Bee, like the *Bombus terrestris* (Humble-Bee), has bags of fat, or nutriment, stored up within its own systems, which alone enables it to pass some portion of the winter in a state of repose." This, of course, is founded on the fact, that some kinds of quadrupeds are enabled to do so; bears, for instance, are said to live on their own fat while in a torpid state. How far the analogy is correct I cannot determine, but I doubt Mr. Newport's opinion in this respect regarding the Humble-Bee and the Honey-Bee, for the latter was not originally destined to pass the winter in repose.—*J. Wighton*.

Wasps and Rats.—Several correspondents have told you of the absence of wasps—in some places total, in others comparative—in their respective localities during the last wasp season. I beg to state that in the region between Ipswich and Woodbridge, in Suffolk, on my farm of two or three hundred acres, I scarcely saw five wasps last season, and not one nest was found. Last year I was pestered, and caused upwards of thirty nests to be destroyed. On my farm a rat was seldom seen until this year. Since harvest, more than a hundred rats have been destroyed, old and young, &c. The neighbouring farmers have likewise been much annoyed by these vermin. I do not presume to say, nor do I think that there is any direct connexion between wasps and rats in any way, but it may still be curious if in future years the rarity of wasps should be found by observers to be the precursor of an abundance of rats. It will be a curious coincidence, and may lead to useful precautions.—*A. B.*

Rats.—Having seen in the *Chronicle* correspondence on the best method of destroying Rats, I venture to recommend a very simple plan, which, though it may sound absurd, I have tried with much success. It is this:—Fasten a red-herring firmly by a string to any place where the Rats usually make their run; and either from their great dislike to the smell, or from some cause I do not profess to understand, they will soon disappear. This may sound improbable, but it is worth trying. The herring must be fastened very strongly, or the Rats will run away with it, and the experiment will fail.—*O.*

Gardeners' Associations.—It is gratifying to learn that Gardeners around the metropolis are instituting Mutual Instruction Societies, in order to promote their own improvement and the progress of Horticulture; and it is surprising that those around Edinburgh are doing so little towards improving themselves or those under their care. Perhaps a word or two on the subject may have a beneficial effect. There is one evil which head-gardeners on the north side of the Tweed ought seriously to consider. I allude to apprenticeships. Numbers of apprentices that have only half acquired the elements of their profession are every year ushered into the gardening world. Some of them are sent out as journeymen, even before they can perform the ordinary operations of the garden with any sort of neatness; and these would-be gardeners fill situations to the exclusion of those that have been regularly trained to the business; but gardeners have themselves, in a great measure, to blame; for if they would form themselves into societies, (and I am sure they would get the support of their employers, for ultimately they alone would receive the benefit,) and see that none should pass but those that had served a proper time to the trade, and paid a proper premium, I have no doubt a complete alteration for the better would speedily follow.—*Peter*.

Cocoa-Nuts.—Your remarks at p. 862, upon the difficulty of getting the flesh of a Cocoa-nut out of its shell, makes me suspect that you are ignorant of a simple method of cracking one. Perhaps the subject is hardly worth a notice, but as I have enlightened at least a dozen dealers, besides other persons on the matter, some of your readers may not object to see this account in your pages. Instead of the common laborious and clumsy method of sawing the nut, let it lie horizontally on the palm of your left hand, and then with a hammer or a poker, hit it smartly in any direction in which you wish it to open. Continue turning the nut round in the hand, and striking with the hammer along the line you have chosen, and when it has been completely round two or three times, it will crack along this line, and may then be separated with ease. Every one is aware that the milk may be drawn off by tapping one of the three eye-like scars at the large end; but comparatively few are acquainted with the fact, that the embryo lies beneath that particular scar which can be pierced; and if a penknife is used carefully to scoop out the flesh, by passing it round the scar as close to the shell as possible, this body will be found in the centre of the plug thus extracted. If the shell should be split longitudinally, by hammering along a line which crosses the

soft scar, the embryo will then be displayed nestling in a little cavity in the flesh. It is an interesting object, and its detection well worth the price of a Cocoa-nut; which, moreover, eats none the worse for having previously administered to our amusement, by this little Botanical exhibition of a good example of a monocotyledonous embryo.—*J. S. Henslow*.

***Eranthemum pulchellum*.**—For the encouragement of those who are desirous of having this beautiful stove-plant in bloom in their sitting-rooms at this season, but who are deceived by the idea that it requires the heat common to other stove-plants, I can assure them that it requires to be only protected from frost till it is wished that it should bloom. Throughout the summer before last I kept a plant of it in my greenhouse, where it grew vigorously, and it was treated precisely the same as my greenhouse plants when they were housed for the winter, the temperature being on no occasion raised above 40° by fire-heat, and that but seldom applied. In the last week of December following it was removed to the window of my sitting-room, where it developed its flowers in abundance for several weeks. I have no doubt that a common frame and light, with external coverings, would afford all the protection required. In an early Number of this year's *Chronicle*, Mr. Beaton mentioned a few other plants equally beautiful, that would bloom freely in a temperature of 45°, viz., *Aphelandra cristata*, *Ardisia crenulata*, *Euphorbia jacquiniiflora* and *splendens*, *Justicia speciosa* and *coccinea*, *Poinciana pulcherrima*, &c. It is not improbable that these, if subjected to similar treatment, would repay the trouble of the experiment.—*A Subscriber, Southampton*.

The Clover Dodder.—When in London last week, I examined the specimens of *Cuscuta sulcata* in Wallich's Herbarium, at the Linnean Society (No. 1320. 2. 3 of his Catalogue,) and found that they all have capitate stigmas, and do not grow upon Leguminous plants. Since my return, I have looked at my own specimens of *C. trifolii* from Essex, Suffolk, and Devon, and find that they all have filiform stigmas. Is not this sufficient to show that the pest in our fields is not the *C. sulcata* of Roxburgh? I suppose that the plant which you last received is different from that of the Eastern Counties, where, (near Bungay) I have the authority of a competent botanist, Mr. D. Stock, for saying that it has occurred for at least 16 years.—*Charles C. Babington, St. John's College, Cambridge*. [Khelet Lucern was introduced for the first time about the year 1824.]

Large Potato.—A Potato weighing seven pounds was dug up lately in ground belonging to S. L. Behrens, Esq., of Catterall, near Garstang.—*Facile*.

Hydrangeas.—In an early Number of "Harrison's Cabinet" was a paper on altering the colour of Hydrangeas by sulphuric acid. Two plants were turned out of pots, and an ounce of oil of vitriol procured, in which a feather was dipped, and the balls of the root touched over with it; afterwards the remainder of the acid was mixed in the proper quantity of soil for repotting,—this caused them to bloom blue. The writer held a respectable situation. If this be correct, could it apply to the China Rose, or to the Carnation?—*O.* [We should think not.]

Late-flowering Carnations.—Can any reason be given why some sorts flower so much later than others, and can anything be done beyond early layering and piping to hasten their bloom? If bloomed in a cool greenhouse, might seed be expected?—*O., Leeds*. [Possibly.]

List of Carnations in which the pollen has been pretty abundant in 1842 and 1843:—*Scarlet Bizarre*—Merchant's Don John, Walmsley's William IV., Hoyle's Duke of Leeds. *Rose Flake*—Chadwick's Lucetta, Dobbing's Mountaineer, Plant's Lady Hood. *Purple Flake*—Hudson's Miss Thornton, Brabbin's Squire Meynell, Leighton's Bellerophon. Seedlings from Walmsley's William IV. seem generally to resemble the parent, as out of seven plants five were Scarlet Bizarre—but two of them single. Four of five seedlings from Duke of Leeds were run Bizarres.—*O., Leeds*.

Orchidaceæ.—The "Spread-eagle," a plant which Mr. Bateman mentions as being in the collection of Mr. Horsfall, of Liverpool, is, I regret to say, defunct. It is said to have had much of the appearance of a *Lælia*.—*J. W. Jones, Knowsley*.

Extraordinary Cabbage.—Under this head in a late *Chronicle* is the following statement taken from the *Exeter Flying Post*, viz.: that John Lee, a mason, at Pound, near Moretonhampstead, had grown a Cabbage to the great weight of 42lbs. I should like to know what sort of a Cabbage it was; if an early one it was very good, but if a late Cabbage I think it nothing extraordinary, as I have repeatedly grown the common Drumhead Cabbage to the weight of 80lbs., when cut off level with the ground, including all the leaves; and in October, 1842, I cut one weighing 47lbs., when stripped of every loose leaf.—*A Perthshire Subscriber*.

Gourds.—As the Courge courcelle was recommended I grew it from seeds obtained from Paris; but although the plants were raised in a hotbed, and were planted out in a small bed of dung and mould, it grew so vigorously that very few fruit were obtained, and those very late. It proved excellent; the flavour very delicate, and somewhat like a Jerusalem Artichoke. What is the experience of your Correspondents as to the growing this plant? Those who are acquainted with the merits of Potage à la Cressi will grow a good stock of the true Potiron jaune. How is it that in the northern parts of France they grow this to such a large size and so much better ripened than those grown in England? Is there a sufficient difference in the climate to account for this? [Yes.] At Versailles, in the kitchen-garden, I found that the Potiron gris d'Hollande was grown in preference to the Potiron jaune for the Royal table, as being much the best.—*Totty*.

Mr. Loudon.—As an amateur gardener, I have long been an enthusiastic admirer of the late Mr. Loudon, and deeply regret, in common with other friends, that the widow should be left in a destitute state. It appears that there are 350 copies of the "Arboretum et Fruticetum Britannicum" on hand, and that a sale amounting to 2,400*l.* would release all other works from the publishers for the benefit of the widow. This is a large number to dispose of, particularly of an expensive work that has already had a great sale. I therefore take the liberty of suggesting to you the following plan, subject to any improvement you may think desirable, and at the same time offering my services gratuitously for carrying it out. A lottery of 14,000 tickets, at 5*s.* each; the 350 copies of the "Arboretum," &c. to be the prizes. This would realise 3,500*l.*, less the sum paid for advertisements, leaving a few hundreds surplus for the widow. Without any uncharitable feeling for my fellow-creatures, I believe there are hundreds who would pay five shillings for a chance of gain, however remote, who would not give the same sum out of pure charity. The low price of the tickets would enable many to take them who could not afford a larger sum.—**Amicus.**—In a late Number of the *Chronicle* is an announcement of the death of John Claudius Loudon, Esq.; and in the last Number of his Magazine is a modest, but painful and distressing, statement of the position of his affairs. The debt owing to the late lamented author by every Gardener I am sure will be willingly paid. Among the friends in and about London, the matter can be easily arranged for England; and so, also, in and about Edinburgh, for Scotland; and as to Ireland, I can safely vouch that many are ready, and will be willing, in and about Dublin, to unite in organising a subscription on this side the Channel. As an individual, I shall be glad to afford all the aid in my power for the furtherance of this object; and I hope that what I have thus explicitly suggested will meet with approbation and powerful assistance. In the meantime, I shall be making every exertion amongst those who are interested here; and will be happy to have any suggestions that may be likely to promote the object in view.—**N. Niven, Richmond-hill, Dublin.** [We insert these two letters; but the columns of a newspaper are not the proper place for discussing such questions. No one wishes better to the survivors of Mr. Loudon than ourselves, but the task of organizing such measures as may be considered desirable must rest with persons of leisure. When any public demonstration takes place we shall be ready to report it.]

Heating.—A good deal having been written in your Journal recently regarding different modes of heating, I take the liberty of sending you my plan of heating my greenhouse, which, although published elsewhere some time ago, has probably not been seen by some of your readers, who may improve on my plan. I should be most happy to receive any suggestions on the subject. Its superiority according to my idea consists in its being perfectly free from brickwork; the whole heat is given out in the house;

A, ash-pan
B, Horizontal pipe to feed the fire, 5 ins. diameter.
C, copper-pipes 4 ins. diameter.
D, lid that opens to let out steam.

E, joint to light the fire
F, Damper to regulate it.
G, Side of the house through which the chimney projects 1 foot.

it keeps my house of a very agreeable temperature, and ripens Grapes well; the chimney takes off at E, through which some straw and a few sticks are put down, and on them some coals. B opens like the cover of a saucepan, through which you can arrange your fire. At A, a lighted candle is introduced, and the fuel burns quickly. After it burns up I feed it with what in Wales they call balls, which are thus made:—Take 3 barrows of dust-coal, 1 barrow of clay, mix them well to the consistence of mortar, make them into round lumps about the size of cricket-balls, put them in at the damper, F, say three or four, and you will find that they will burn many hours. My greenhouse has been heated by them these three years, and it answers admirably. Open D, and your house is soon full of steam; shut it, and none escapes; the whole is made of copper, excepting the chimney from E to F, and the legs. I went expensively to work, as I had no pattern, the whole being an idea of my own; it was made by a brazier in this town, and cost me altogether about 10*l.* A cast-iron one would last for ever without any repairing.—**F. Davies, Pershore.**

Guano.—I have much pleasure in telling you that I tried Guano upon part of a field sown with Turnips, the whole of which had been already manured with ashes. The produce of the part on which Guano, mixed with half ashes, was added to the former dressing is nearly double in weight and height of plant to any other part of the field; the colour of the plant is a much darker green, and the size of the Turnips immense.—**G. O.**

Effects of Gas-tar on Stems of Fruit-trees.—Some time since one of your Subscribers recommended the use of gas or coal-tar for dressing the stems of Fruit-trees; I beg to state that a more injurious ingredient could not be

used. About 12 years ago the person who had the orchard I now possess, being afraid that sheep and pigs would injure the bark of the trees, had them dressed about three or four feet up from the ground with gas-tar, which answered in every respect the intention—to preserve them from cattle; but they suffered in a way equally bad. The Apple-trees, from effects of the gas-tar, gradually began to fail, and some died altogether in about five years after its application. The bark of others close to the ground became rotten, and even up to this time its deleterious effects on the trees are perceptible. Its application to Plum and Pear-trees caused the stem to overgrow immediately above where the tar had been put on; several of these trees became loose in the ground, and did not thrive for a long time afterwards. The gas-tar might, however, be tried in a diluted state for the sake of experiment, and then only on trees that are cankered and of little consequence, in the proportion of one part gas-tar to three of train-oil, well mixed together, with the addition of fifteen parts of cow-dung and two of water. If the stems of trees were covered with this, no cattle of any kind would touch them, and the diluted tar might act in some respects as a manure.—**Caution.**

For Covering a New Wall with Ivy.—This has been effected very rapidly by mixing ripe Ivy seed with the mortar; also by the insertion of suitable slips of Ivy throughout the wall whilst building. These take root in the fresh mortar, and the wall is green almost as soon as completed. Lord Devon's agent in the North of Ireland is authority for the perfect success of both these experiments.—**M. A. M.** [We fear the Ivy will soon throw down the wall under these circumstances, for it must break all the joints of the brickwork if it continues to grow.]

Meteors.—There is and has been a singular luminous appearance visible in the heavens at this place, commencing about 6 o'clock in the evening, about half-way betwixt north and south. It is generally of a circular form, but assumes various shapes every moment, still however keeping in a body. It is like a light cloud, not the dazzling brightness of the northern lights. For any information concerning this phenomenon I shall feel greatly obliged.—**J. Rogers, Woolwich, Dec. 22.**

The Wren's Nest.—I have been induced to direct my attention to this subject on account of what has been said in the *Chronicle* of the present year, at pages 139, 429, and 590. A Wren's nest, usually termed the "cock's nest," was built this year just above my bedroom window, so that I had an opportunity of seeing it built. After it was finished I observed that only one of the birds made use of it until after the other one had brought forth her young, and then I found the other bird and the young ones appeared also at the nest above my window. At first I supposed it to be intended for part of the young to sit in, as I fancied one nest was not sufficient for the whole family, but I soon found this not to be the case, as they only appeared about this nest for ten days, as I imagine for the purpose of being fed by the old birds; the young were not allowed to enter the nest, but were driven away from the place to find for themselves. I observed that the object of the cock's nest is for its winter residence. I have examined it at different hours of the night and have found the bird in; I have also seen him go in and out during the day, when stormy and wet, down to the present time; where the other bird sits I have not been able to find out, but frequently see two of them during the daytime together.—**M. Saul.**

Cape Bulbs.—In the *Gardeners' Chronicle* of Sept. 24, 1842, at p. 638, you did me the favour to insert some remarks I had made respecting Cape Bulbs. I now beg to inform you that early in September last I took up all that were to be found of the twelve bulbs I had planted in the open ground: the four at eighteen inches, and one of those at twelve inches were perfectly sound and throwing out roots, though they had never appeared above ground since I first planted them three years before. I found another of those at twelve inches, but it was in a bad state. I planted it in a pot, but it shortly perished. Of the others I could discover not even a vestige. I should not have taken them up at that early period of the year, but that I thought at the moment I had a good opportunity of disposing of my property here, and I did not wish to leave them without ascertaining their fate. I shall certainly repeat the experiment whenever I have another opportunity, and have no doubt of its succeeding in a dry sandy soil, especially if forced by a handglass in the summer.—**R. G.**

Swans and Weeds in Ponds.—Some Correspondents dispute my statement respecting swans clearing ponds of weeds. I am sorry it is not in my power to state what weeds the ponds at this place were choked with, as they were all exterminated before I came to reside here; but certain it is the ponds at the present time are as clear as could be desired. Whether our swans are more herbivorous than other people's, or are not so well fed, I will not pretend to say, but most assuredly they destroy everything in the form of aquatic vegetation that comes in their way. Even the Water Lily, (*Nymphaea alba*), and the common Flag, (*Iris pseudacorus*), do not escape their ravages; and where these plants have been planted for ornament, we are obliged to watch them pretty closely in the spring, to prevent the swans from destroying them; but after the plants get well established they do not afterwards interfere with them until the following season.—**W. P. Ayres.**

Pruning Forest Trees.—In Number 45 of the *Chronicle*, "Quercus" advises foresters to abstain from what he calls the "dangerous plaything" of pruning. Had his objections been confined only to certain systems, he might have led us along with him, as much mischief

has undoubtedly been incurred by the mismanagement of unskilful pruners. But this is not the case; he aims at nothing less than the complete suppression of every method of pruning, all being, in his opinion, hurtful to the growth of trees. He and I differ widely in our opinions on this point. I have often given reasons for disagreeing with those who regret any interference with the branches of trees, but have not always been successful in bringing them to my way of thinking. "Quercus," on quoting a sentence of mine, places after it some remarks of Professor Lindley, as if they were opposed to it. My observation is, "When the lateral branches are shortened, the sap has less surface to cover than when they are allowed to extend to an improper length and thickness." This fact is obvious enough. The query of "Quercus," however, may be—"Is the sap as abundant proportionally to the surface in the shortened as in the unshortened tree?" I answer in the affirmative. It is even more abundant, which I account for quite consistently with the remarks of Dr. Lindley. He says, "the supply of fluid by the roots should be continued and uninterrupted. The smallest leaf at the extremity of a branch of a lofty tree must assist in setting in action the absorbing power of the roots, at whatever distance from the organ these roots act. If this reciprocal action is not maintained without interruption, and if anything occurs to check it during the period of vegetation, the plant will suffer to the amount of interruption." To this I subscribe most cordially; and one especial benefit derived from shortening branches is, that it aids in rendering the reciprocity between the leaves and roots more ample and beneficial. The smallness of the branches, and the closeness and breadth of the leaves, give a plentiful supply of sap, and render the circulation rapid. Much of the misunderstanding on the subject proceeds, I think, from the idea that there is an irreparable loss of leaves sustained by the application of the pruning-knife. In the act of cutting, we, of course, take away wood which would produce leaves, and there may be a deficiency in the supply till the young shoots grow on the cut branches, but no longer. On the contrary, there is a greater supply of nourishment from the leaves on the young shoots; they, being broader and fresher, draw more nutriment from the atmosphere than is imbibed by the leaves of uncut branches. All gardeners know that fruit-trees and many kinds of shrubs must be cut over annually, in order to make them blossom and bear with full vigour. In like manner forest-trees by shortening, acquire a vigour and luxuriance from the concentration of the sap that does not belong to uncut trees. It is easy to prove that the shortening I recommend secures much more timber for the trunk than any different method, and as it is the desire of planters generally to have rapid growth in the trunk, I doubt not that the system will be more extensively applied than it has been. Those who are anxious to have wide-spreading branches may get them by desisting from pruning when the trunk has gained the desired height, and the branches will spread out and be more elegant and luxuriant from the previous training. Dr. Thackeray's management of forest-trees I have reason to believe is similar to my own. In a letter I had from him he stated "that he annually pursued my system in his plantations in the counties of Denbigh, Flint, and Merioneth, amounting to 850 acres, since the autumn of 1804." Such decided success in the case of Dr. Thackeray might, I think, have a tendency to convince the sceptical.—**Gavin Cree, Biggar.**

PROCEEDINGS OF SOCIETIES.

ROYAL CALEDONIAN HORTICULTURAL SOCIETY.

Dec. 7.—This was the Winter General Meeting of this Society, and it was held in the Hall, in the Experimental Garden; the Hon. Lord Murray, V.P., in the chair. On the centre table were displayed the Chinese Chrysanthemums, and the various parcels of Grapes, Pears, and Apples, which had been sent for competition, those which had gained prizes being distinguished by cards. At one end of the Hall was exhibited, in large pots, single specimens of the rich collection of *Coniferae* belonging to the Society; and other parts of the room were decorated with choice plants. Prizes were awarded as follows:—For excellent retarded Grapes, the Silver Medal to Mr. P. Crockett, gr. to Colonel Ferguson, of Raith, the kind being White Muscat of Alexandria; 2, Mr. J. Young, gr. to Mrs. Hamilton Nisbett Ferguson, of Archerfield; 3, Mr. J. Robertson, gr. to Lord Gray, Kinfauns. No fewer than eleven competitors came forward with *Dessert Pears*, each producing six sorts, and the fruit being in general of good quality. The Silver Medal was voted to Mr. Young, Archerfield, for Marie Louise, Louise Bonne (of Jersey), Precel, Easter Beurre, Gansell's Bergamot, and Swiss Bergamot; 2d premium to Mr. J. Lyall, gr. to Sir J. Hope, Bart., of Pinkie, for Glout Morceau, Colmar, Marie Louise, Gansell's Bergamot, Crassane, and Precel. For table Apples, six kinds, 1, Mr. Young, Archerfield, for Golden Pippin, Ribston Pippin, Old Nonpareil, Bon-dorrier, Hollow-eyed Pippin, and Blenheim Pippin; 2, Mr. J. Murray, gr. to Andrew Fletcher, Esq., of Saltoun, for Ross Nonpareil, Common Nonpareil, Golden Mundi, Golden Pippin, Paradise, and Ribston. The display of Chinese Chrysanthemums was brilliant, there being six competitors, each exhibiting 12 named varieties, single clusters of each flower. The silver medal was assigned to Mr. J. Young, gr. to T. Oliver, Esq., Newington Lodge, for Queen, Comet, Adventurer, Conjuror, Victory, Invincible, Superb clustered Yellow, Norfolk Rival, Venus, Gem, Tasselled Yellow, and Marquis; 2, Mr. Young, Archerfield, for Queen, Vesta, Marquis, Princess Maria, Superb clustered Yellow, Triumphant, Defiance, Champion, Goliath, Spectable, Imperial, and Minerva; and 3d, Mr. J. Addison, gr. to the Earl of Wemyss, Gosford, for Princess Maria, Queen, Beauty, Vesta, Minerva, Clustered Yellow, Virginia, Gem, Lucidum, Memnon, Formosum, and Adventurer. For a handsome plant of the broad-leaved variety of *Epiphyllum truncatum* in flower, a premium was awarded to Mr. Addison, Gosford. In the culinary department the show of *Celery* was extensive, there being eight competitors, each producing six stalks, three red and three white. The silver medal was awarded to Mr. Addison; 2, a premium to Mr. J. Goodall, gr. to the Marquis of Lothian; and 3, to Mr. J. Gourlay, gr. to the Dowager-Countess of Glasgow. The *Onions* produced were of excellent quality. Three sorts were required, and four specimens of each, with a notice of the mode of treatment. A first prize was voted to Mr. Goodall, for Portugal, Strathburgh, and Red—the Portugal having been spring sown and transplanted, the others under no particular management; and 2, a premium to Mr. J. Thomson, gr. to W. Keith, Esq., Corstorphine-hill, for Blood-red, James's

Keeping, and Strasburgh—all of these having been sown in the last week of August 1842, and transplanted in the second week of March, 1843, into rows nine inches apart, and at the distance of three inches from each other in the row. A premium of two guineas having been offered by Messrs. P. Lawson and S. M., through the medium of the Society, to the journeyman gardener who should produce the most extensive and correct, named *Hortus siccus* of hardy arboreous and fruticose plants, either species or marked varieties, the growth of season 1843.—a report by Messrs. W. and J. M'Nab was read, recommending that the premium should be assigned to Mr. A. Connon, a journeyman gardener, at Archerfield; which report was unanimously approved of. The herbarium was laid on the table, containing upwards of 500 specimens, with names and localities. Among *extra articles*, or those for which no premium was offered, there was this day produced a basket of the tuberous roots of *Otites Duperi*, from Mr. R. Foulis, gr. at Fouldel, where these roots are considered as forming a desirable addition to the winter vegetables; a dish of *Sweet Brussels*, nearly ripe, from a west aspect, was in Kilmains garden; and specimens of the Fry's *Pippin*, of crop 1842, in a good state of preservation, from Mr. A. Calder, gr. at Sea Cliff. From the Inverleith Nurseries, Messrs. J. Dickson and Sons, there were sent for exhibition a well-grown plant of *Erica hyemalis*, in flower, and the beautiful and rather rare *Manettia bicolor*, also in flower, for which a small premium was voted to Mr. J. Kelly, cultivator at the nurseries; from the garden at Wemyss Castle, a hamper filled with cut flowers of many fine varieties of *Chrysanthemum sinense*, for which a similar award was made to Mr. J. Simpson, gr. to Captain Wemyss; and from the garden at Gosford House, a collection of twenty-four named *Chrysanthemum* blooms, neatly laid down on paper by Mr. Addison. Dr. Neill, Secretary, read to the meeting the following communications:—1. A report by Mr. J. M'Nab, Curator of the Experimental Garden, as to a collection of detached or extracted seeds (not cones) of Himalayan Conifers, presented by the Highland and Agricultural Society in April last, and which had been carefully tried in the Society's Garden. The seeds of *Abies Morinda* and *Pinus excelsa* had grown freely; but none of the *Pinus Gerardiana* or *Cedrus Deodara* had germinated. 2. A report, also by the Curator, relative to the Coal-Orleans Plum, which had for several years been cultivated in the Experimental Garden, and was now recommended as an early fruit on standard trees, of high flavour, and likely to prove a valuable market Plum. 3. A third report by the Curator, as to the Normandy Early White Trump, seeds of which had been presented by Sir G. S. Mackenzie. It proved a novelty, being early, of a cylindrical form, nearly flat at top and bottom, and in quality closely resembling the Early White Dutch. On the motion of Lord Murray, the thanks of the meeting were voted to Sir G. S. Mackenzie, Bart., for his zeal and attention in making such interesting and useful communications to the Society. 4. An account of a substitute for glass for covering Melon-frames, &c., consisting of calico or book-muslin, overlaid with a transparent gummy liquid which resists the entrance of rain, prepared by Mr. Whitney, chemist, Shrewsbury. 5. A communication on protecting stone-fruit walls by means of hay-netting, and on the utility of brick-tiles placed on the border in promoting, by radiation, the ripening of the wood and fruit of such trees; by Mr. Barron, gr. to the Earl of Harrington, at Elvaston Castle. 6. The Journal of Mr. James M'Nab's Horticultural tour in England, in July last, when he visited the Arboretum at Derby, and the Botanical collections at Chatsworth, Elvaston, Woburn, Frogmore, Ealing Park, Chiswick, Hackney, Clapton, &c.

BOTANICAL SOCIETY OF EDINBURGH.

Nov. 30.—This was the first meeting for the season.—Dr. Neill in the chair. The following gentlemen were elected, viz.,—Drs. N. Buckley, Rochdale, Lancashire, and C. Kingford Vacy, Launceston, Cornwall; and Messrs. J. E. Errington, M. Inst. C. E., and T. Eccleston, as non-resident Fellows; and W. Brown, Esq., R.N., as a resident Fellow. Numerous donations since last meeting, both for the library and museum, were announced. Professor Graham read an account of a Botanical excursion, undertaken by some of his pupils in August last to North Wales, the principal feature of which was the extreme paucity of the Alpine vegetation as compared with that in the Grampian ranges; and the great interest of the products in the Welsh valleys when contrasted with the vegetation of low levels among the Scottish mountains. Dr. Graham also read a notice by Dr. Bell Salter, of some recent additions to the Flora of the Isle of Wight, and of the many species or varieties of *Rubi* occurring in that island, one of which, considered by Dr. Salter to be *Rubus suberectus*, was particularly interesting from its size, almost reaching that of a small tree, and with leaves above six inches in length. Mr. Brand read a communication from Dr. W. H. Campbell, respecting the Eta Palm-wood of British Guiana, which is of extreme lightness, and is used in the colony, among other things, for sharpening razors, &c., probably owing to its containing much silex. Dr. Campbell also mentioned several other kinds of wood, equally remarkable for their solidity and weight, for their great beauty, and for the high prices they bring in this country for veneering and other ornamental cabinet work.

NOTICES OF NEW PLANTS WHICH ARE EITHER USEFUL OR ORNAMENTAL.

CIRRHOPELALUM AURATUM. Gold-edged *Cirrhopetalum*. (*Stove Epiphyte*.) Orchidaceæ. Gynandria Monandria.—Among the singular species of this genus the present is one of the most interesting. It hangs down from the branch of a tree, or a piece of charred wood, which it soon overruns with its delicate green roots and egg-shaped, furrowed pseudo-bulbs. The leaves are very thick, deep green above, and convex; stained with purple beneath. The flower-stem is as slender as a small thread, and too weak to bear the weight of flowers, which therefore hang down gracefully, and are balanced in the air. The umbels, as in many others of this genus, are so arranged that the flowers are all on one plane, and diverging equally from the centre form a circle, whose interior is occupied by the lower part of the flowers, and whose circumference is formed by the long, flat, strap-shaped lateral sepals, which look like so many partly coloured ribbons collected into a balloon. The flowers themselves have a yellowish ground, striped and mottled with crimson. The upper sepal and two petals are fringed with golden hairs, and tapered into a fine point. The lateral sepals are quite destitute of lameness, and only faintly stained with purple. It differs from *C. picturatum* in its partly coloured, not purple, flowers, in its petals being far less taper pointed, and not villous, and in the lip not having a central ridge, which is asped in *C. picturatum*. It is a native of Manilla, whence it was received by Messrs. Led. It may be potted in turfy peat, mild, mixed with pieces of small potsherds; or it may be suspended on a block of wood, with a little sphagnum about its roots to retain moisture. Like many species of *Pleurothallis*, *Stelis*, &c., this requires a humid atmosphere in winter as well as in summer; but it should always be remembered that the more light and heat, the more water is required. During the warm summer months, when the temperature of the house (although shaded) can scarcely be kept below 80°, the water required will be twice as much as is necessary in winter, when the temperature should never be raised above 50° or 55° by artificial means.—*Botanical Register*.

ERIVILUM RUSSELLIANUM. Duke of Bedford's Epiphyllum. (*Stove Shrub*.) Cactaceæ. Icosandria Monogynia.—There is a near resemblance between this beautiful species and *E. truncatum*, with its variety *violaceum*. The latter of all three is very similar, and the appearance of the leaves, or foliaceous branches, is likewise of a related character. Still these are much more slender in *E. russellianum* and more decidedly chain-like, or having the parts between the joints more regular and less flattened. Our present species, has, moreover, a tendency to produce longer shoots, which, from their greater tenuity, are more

drooping. It is therefore a very fit associate for *E. truncatum*, and a good acquisition to any collection of the tribe. But its principal merit is in the hue of its flowers, which is most peculiar and exquisite. It exceeds that of almost all Cactæ, and even of the majority of *Oreantheæ*. It is like that of *E. truncatum*, and also of its variety *violaceum*, yet different from both. We can only describe it by saying that the violaceous tint is not upon the crimsony scarlet as in other flowers. It is not spread over part of the surface of another colour, merging into it in places. It is really mixed with the crimson in the texture of the flower, so as to produce one uniform colour. Unlike *E. truncatum*, it so as to produce one uniform colour. Unlike *E. truncatum*, it blossoms at various seasons under the same treatment, and is commonly seen in flower from October till May. It will succeed very well if reared from a cutting and grown upon its own roots, and in this state makes a capital plant for placing on the outside of a high shelf, or for hanging up to the roof of the stove. But it will thrive favourably too, and have an extremely characteristic appearance if grafted on a standard *Pereskia aculeata*, about 3 ft. in height, or on a single-stemmed *Cereus speciosissimus* or any of the strong-growing kinds of *Cereus*. Its flexible branches will then have an opportunity of showing their true character. To obtain young specimens from cuttings it is only necessary to keep a little damp moss round any of the branches, at a joint, and there will speedily be roots formed at that place. Indeed, the plant roots freely at its joints, in a moist atmosphere, without any such external application. It was found by Mr. Gardner on the Organ Mountains of Brazil, and named after the late Duke of Bedford.—*Paton's Botanical Magazine*.

HIBBERTIA PIRPOTATA. Thorough-wax Hibbertia. (*Greenhouse Shrub*.) Jilleanæ. Polyandria Di-Pentagynia.—This is really a beautiful Swan River shrub, particularly well adapted to pot-culture, on account of the neatness of its appearance at all seasons. According to Baron Hugel it has a tendency to climb, but that has not been observed in our gardens. When it first flowered it was of one uniform glaucous hue, almost as much so as the fruit of the Plum when ripe and covered with bloom; but that appearance has gone off, and the foliage is now of a deep rich glossy green. While the beautiful yellow flowers are as large and showy as in the old *Hibbertia volubilis*, they are quite free from the offensive smell of that species. In the garden of the Horticultural Society it proves to be a greenhouse shrub, requiring the same treatment as many other New Holland plants. It grows freely if potted in a compost consisting of peat, loam, and sand in equal proportions. The pot should be well drained, and a few pieces of potsherds mixed through the soil. Plenty of air and water must be given in summer, and shade in sunny days. In winter the plant should be placed in some airy place free from frost, and be watered in fine weather. It may be propagated by cuttings in the usual way.—*Botanical Register*.

MISCELLANEOUS.

New Hardy Oak.—This Oak, the *Quercus glabra*, was sent to Paris from Leyden, in 1836, and has perfectly succeeded there; for it is now 4½ feet high. It is little known, in consequence of its resemblance to a Laurel more than to an Oak. It takes very well from cuttings, placed in bottom-heat under a bell-glass; a plant propagated in this manner four years ago, and in the open ground for three years, is doing very well. It was protected by a hand-glass in the winter for the two first years; the third year it was destined to undergo all the severity of that winter, if there had been any. I should think that under a hand-glass it has sustained at least eight centigrade degrees; this makes me believe that we could cultivate it, if not under the climate of Paris, yet, certainly, under that of Anger, where acclimating becomes every day more easy, and where the soil suits so well the trees and plants of Japan. From what M. Siebold says in his Work, it appears that this tree has all that is desirable as an object of propagation. This Oak, he says, is a large upright tree, branching out at the top, its leaves are tough, of a bright green underneath, perfectly entire, and remain three years upon the tree. Since I have had it at home, I have not discovered that it has shed its leaves. The catkins are very numerous and upright; the acorns ripen the following year, like those of other evergreen Oaks. In Japan they eat the fruit, which tastes like Chesnuts. There are some varieties of this. The wood is hard and heavy, and is used in making agricultural implements, and different utensils for other purposes. It is propagated by seeds and by grafting. This beautiful Oak was introduced to Leyden in 1830, by seeds which germinated on the passage from Japan to Holland. I tried to graft it on a common Oak, but did not succeed. I should think that if it were grafted upon our evergreen species, we should have better success.—*Neumann, in Rev. Hort.*

Zinc Labels, to write on with a common Pencil.—Slightly rub with pumice-stone the part of the label upon which you wish to write, then write upon it with a common lead pencil, and when the letters have been exposed to the air for two or three days, they are indelible. If you wish to efface the writing, you must rub the label with the pumice-stone, and if the labels become covered over with earth or oxide, rub your finger, slightly wetted, over them, and they will reappear. Old zinc is preferable to new for this purpose. M. Paul Manoury, gardener in the Garden of Plants, of Caen, made this discovery several years ago.—*Rev. Hort.*

Action of Roots on Glass.—Dr. Jackson stated that he had noticed the fact that glasses in which Hyacinth bulbs had been grown, were corroded. He had also noticed the same effects on bottle glass, which had lain in garden mould. He supposed that the plants had the power of decomposing glass as well as the felpar of granite, and of appropriating to their use the potash contained in it, and that this was the source of the potash contained in the ashes of plants.—*Proceedings of Boston Society.*

Application of Dr. Boucherie's Method for Improving the Appearance and Quality of Wood, by the Injection of various Fluids.—We learn from the *Revue Horticole* that Dr. Boucherie has obtained permission to make trial of his method on some trees in the Forest of Compiègne. Two modes of effecting the penetration of the wood are adopted. When the trees are in leaf, the natural suction is sufficient to cause the ascent of the foreign fluid from the bottom of the tree to the extremity of the leaves. But when the leaves have fallen, the trees require to be cut and laid in a horizontal position; and by pressure the fluid is then forced into the tissue, the sap, which offers but little resistance, being at the same time expelled. The

rapidity with which the foreign fluid is substituted for the natural sap of the tree surpasses conception. As an instance, the trunk of a Beech, 52½ feet in length, and 2 feet 9½ inches of mean diameter, and consequently containing 328 cubic feet, had 186,743 cubic inches, or 673½ gallons of sap expelled in 25 hours; and in the same period 195,897 cubic inches, or 706½ gallons of pyroligneous acid were injected. From this experiment, which was very carefully conducted, it may be inferred, in the first place, that the wood of the Beech is solid to the extent of about two-thirds of its volume; hence one-third remains as space destined for the circulation of sap. Secondly, that in its natural state a tree of advanced age contains vacuities into which the sap no longer penetrates, since as above 706½ gallons of fluid were injected, and only 673½ expelled; this may be attributed to the diseased state of certain portions of tissue not permeable to the sap by natural propulsion, but which are capable of being filled with the acid when the latter is injected with sufficient force. M. Boucherie has thus been able to introduce preservative acids into the pores of trees, expelling at the same time the sap, an active agent of corruption; thereby insuring for wood work an incalculable duration. By the same procedure, calcareous substances in solution are introduced; these render the wood much harder, stronger, and almost incombustible; qualities valuable for constructions generally, and particularly for ship-building. By this and certain chemical processes, the colouring of wood is also effected; and tints of blue, green, red, yellow, and violet, are communicated—not a dull uniform tinge, but beautiful variegations according to the windings of the cellular tissue.†

New Botanical and Horticultural Books.—Endlicher's "Genera Plantarum," 3d Supplement; Schleiden's "Grundzüge der Botanik," vols. i. and ii.; De Candolle's "Théorie Élémentaire de la Botanique," 3d Edition; Lindley's "Théorie der Gartenkunde," translated into German by Professor Trevisanus.

Vegetable Irritability.—*Gentiana sedifolia*, a native of the Cordilleras of Guayaquil, at the height of 9000 feet, possesses, in a striking manner, the property of instantly closing its blossoms on being slightly touched by the finger; and so completely is this effected, that one hardly recognises the same plant which, a few moments before, was expanding its deep azure flowers to the sun's rays. It is a curious circumstance, that cold, or probably some other cause connected with atmospheric rarefaction, should, in this instance, excite vegetable irritability. The reverse happens with respect to the *Mimosa*, many of which are natives of the temperate mountain region; yet none of these contract their leaves on being touched; while other species of the same family, abundantly distributed on the sultry savannah that borders the coast, manifest that property in a very remarkable degree.—*Jameson, in Hooker's Journal of Botany.*

Climate of Quito; its Orchidaceæ.—The western side of Pichincha, fronting the Pacific, is frequently obscured by dense fogs, sweeping across the face of the paramo, occasioned by ascending aerial currents, charged with moisture, intermingling with the cool mountain atmosphere; while that of the table land of Quito, unless when disturbed by the transient effect of a thunderstorm, is remarkably dry and transparent. This may be one reason why no trees are found on the plain of Quito, excepting such as have been planted round the "haciendas." At Pichincha, 12,986 feet, where the western descent commences, we have, instead of shrubs, large forest-trees clothing the precipice to the height of nearly 14,000 feet, associated with a few Alpine forms, as *Lychnis* (No. 115), *Cerastium* (No. 108), a gigantic *Draba* (No. 77), and a stinging *Loasa*, with a flower of the colour and size of an Orange. From this point down to the level of about 8,000 feet, the forests frequently break into clumps or patches with vacant spaces of soft green pasture, very much resembling English park scenery. Nothing can exceed the richness and variety of the flora of this region. The gorges, or wooded defiles, are resplendent with *Fuchsias*, *Thibaudias*, and *Begonias*, entwined with *Tacsonias* and *Alstroemerias*; nor can I conceive anything finer than the curious genus *Loranthus*, vegetating on the large forest-trees, and displaying aloft a profusion of splendid blossoms. One species, in particular, produces a large cluster of pendant flowers, each measuring about 10 inches in length, and resembling the finest coral. From their peculiar mode of growth, none of these shrubs have been hitherto introduced in a living state, and consequently no idea can be formed of their extreme beauty from the mere inspection of a dried specimen. Amid the multitude of fine flowers that embellish these tropical forests, those of the Orchidaceæ deserve particular notice. Perhaps no class of plants displays so much diversity in the construction of the corolla, while the whole group is at once distinguished as constituting an extremely natural assemblage. The resemblance which some of the flowers bear to certain animals has not escaped the observation of these people, little inclined as they are to investigate the natural productions of their magnificent country. The fine genus *Anguloa*, a native of the province of Loxa, produces a flower which, from some fancied resemblance to a bull's head, has received the name of "el Torito." *Cyrtocilium pardinum* is a native of the alpine forests of Cuenca and Loxa. The cattle farm of Suruccho, verging on the paramo, over which is traced the main road to Naranjal, presents a greater number of the more minute species than any other locality with which I am acquainted. We have a description of these from the able pen of Professor Lindley; and though important for the advancement of botanical science, I doubt much whether they will be ever seen in a living state. The genus *Stelis*, of which there is a vast number of species, is less affected by cold than the generality of plants

belonging to this tribe; some of them vegetating on the perpendicular cliffs of Pichincha, as high as 12,000 feet. On the western side of the Andes they accompany the forest-trees to a more considerable elevation. Two zones seem particularly well suited for the production of Orchidaceæ. The first, and most extensive, is that just described, from 10,000 to 8,000 feet. The other is the forest land skirting the coast, and extending upwards to nearly 1,000 feet. In the alluvial country of Guayaquil there are many fine plants belonging to this family. From the elevation of 6000 feet downwards to within a few leagues of the coast, the country is a vast unbroken forest, forming overhead a dense leafy canopy, through which a transient sunbeam scarcely ever penetrates. The soil, perpetually deluged with rain, is strewed with leaves and timber in a state of decay, exhaling a peculiar vegetable odour, and, as in Choco, infested with venomous reptiles. Rare and beautiful Cryptogamia (*Trichomanes* and *Hymenophyllum*, Mosses, and *Jungermannia*) clothe with a mantle of lively green the trunks of these gigantic trees, forming a strange contrast with the naked soil underneath. There is, in fact, no space for the growth of herbaceous plants. The excessive moisture, with a perpetual diurnal twilight, are circumstances perhaps opposed to their development; they would be suffocated by the luxuriant vegetation of the forest. A few plants only of *Vijao* (*Heliconia Bijai*) spring from the humid surface, and to the benighted traveller are of the most essential service, as forming a useful material to cover his temporary "rancho," the construction of which would be otherwise a matter of difficulty. Nothing can be more impressive than the silence that reigns throughout these vast primeval forests. I have, on several occasions, traversed a space of 30 miles, in four successive days, without meeting with a single animated being—not even a bird. The traveller's progress is indeed remarkably slow; not so much owing to the miry state of the ground as to the vast number of fallen trees he is compelled to climb over. At the same time he must be careful not to lose the path, the slightest deviation from which might be attended with serious consequences, in a country where it is hardly possible to procure a glimpse of the sun or stars. At night he is frequently startled by the crash of falling trees, which may, perhaps, have existed for centuries, but are finally prostrated by the hand of time.—*Jameson, in Hooker's Journal of Botany.*

Reviews.

Theorie der Gärtnerei, von John Lindley. (Lindley's Theory of Horticulture.) 8vo. Vienna. 1842.

(Concluded from page 847.)

Page 147.—From the observations in the text it would appear that the surface of the glass in the plant-houses of England is not usually covered in winter; and hence we may see how great a difference there is between the climate there and with us, as well as an explanation of the difference between the cultivation of the English and our own.

Page 148.—We cannot let pass this opportunity of remarking on the injury to which plants are exposed by the practice of heating houses to a high temperature during the night. There is not a more unnatural practice in all Horticulture than this. To maintain a temperature during the night as great as that which prevails in the day is perfect madness, and shows the greatest ignorance of the life of vegetables. During a great degree of cold, it is much better to increase the temperature of the house during the day, whilst the light is upon it, than to increase it at night.

Page 151.—Plants also during growth require carbonic acid as well as moisture, and it is through the medium of damp atmosphere that they are enabled, by means of their leaves and green parts, to appropriate this gas.

Page 152.—Every gardener will find it of the greatest use accurately to study the peculiarities of the locality in which he cultivates his plants. Every glass-house possesses some important differences in relation to moisture, dryness, and heat. These differences should be studied in relation to the requirements of the various species which are cultivated.

Page 153.—It seems that there is something like the mania for ventilating plants in England, to which gardeners in this country attach so much importance. Although these good people very often meet with accidents from such a practice, yet they still continue to repeat their error; they seek an explanation of the injurious results, not in the draught of air carrying away the moisture, not in the meeting of two currents of air of very different temperature, but they ascribe it to the locality, to the weather, to anything but the current of air, which they say is necessary for the plants; and many of them do not know at all that a current of air is in the highest degree injurious for many plants.

Page 156.—A small quantity of ammoniacal vapour in the atmosphere does not act injuriously on plants.

Page 156.—"We can bear testimony to the injuriousness of the presence of certain kinds of gas upon plants. We have seen a considerable number of flower-buds drop off in consequence of the gases given off from hot-air pipes. We cannot insist too strongly on these pipes being kept perfectly clean, they should be washed over at least once a year with white-wash, and this is more especially needed in houses where Camellias are grown."

Page 158.—"It is very true that Fungi will live best in a damp atmosphere with a low temperature. But they are only produced when portions of decomposing organic matter, either animal or vegetable, or even inorganic substances, are allowed to accumulate upon the leaves and other parts of the plants. When plants are kept quite

free from such matters, and no dead or dying parts are allowed to remain upon them, they will always remain free from the attacks of Fungi. Hundred-fold experiments have taught us this, and we are of opinion that it is much better to seek the cause from whence an evil springs than to seek to attempt to remove the evil when it has occurred. But when plants are affected with mould, the thick leathery ones should be washed and dried between folds of linen, and the soft and hairy ones should be strewed with powdered chalk (Kreide), and in this way its progress will be stopped."

Page 164.—There are seeds among the Cerealia which require only the $\frac{1}{1000}$ of their weight of water to cause them to germinate.

Page 166.—In a great number of seeds, we may see by their weight that when sown under natural circumstances, they can only have a small covering of earth over them. In other seeds again their form prevents them when they drop naturally from their parent plant, from sinking deep into the ground. Seeds are very often covered naturally with the leaves which fall in autumn, and which by the time germination takes place are formed into humus, thus affording the young plant an abundant supply of carbonic acid, and the peculiar salts which it requires for its growth. We believe that seeds require to be buried less deep in the ground, in proportion to the near approach of the time at which they begin to germinate.

Page 170.—If any one casts a glance at the elements of the seeds of leguminous plants, it will be at once evident how it is that they can bear so high a degree of moist heat, whilst other seeds would have their vitality entirely destroyed by a temperature like that of boiling water.

Page 170.—The seeds of the *Phytolacca decandra*, as well as those of the Raspberry, have been known to germinate after being exposed to the heat of boiling syrup.

Page 171.—Seeds which possess resinous and viscous coverings prevent the access of the air and water to their interior, and as it is by these agents that oxygen is introduced to the carbon of which seeds are principally composed, such seeds do not so easily permit of the formation of carbonic acid.

Page 174.—It is well known that the seeds of Roses have the peculiarity of laying a long time in the soil before they germinate, and in Botanical works they are described as the last to germinate. It is a curious fact that, if these seeds be allowed to remain on the tree till they have experienced a temperature below the freezing point, they will produce twice and three times the quantity of young plants they would have done, had they been gathered before the frost.

Page 176.—The failure of the seeds of cultivated plants may also be ascribed to other causes besides that here mentioned. In a state of nature a plant ceases to exist when all the circumstances are not present which are essential to its existence and reproduction. Cultivated plants suffer generally from the attention of the cultivator, and they are only supplied with the kind of soil which enables them to put forth green parts and leaves, which is looked upon as the normal condition of the plant, and from this cause seeds are not unfrequently imperfectly developed. Again, cuttings of plants are cultivated and only placed in a soil in which they will readily root, and although they grow up and produce no seeds, inquiry is not made as to the reason. The fact is, plants require particular kinds of ingredients in the soil with which to perfect their seeds; and unless these matters are present, the seeds are not matured, and this is undoubtedly the reason why cultivated plants do not oftener bear fertile seeds.

Page 206.—Cuttings of the roots of *Berberis aquifolium*, all *Pelargoniums*, and the *Monsonia*, will propagate the plant with great certainty, provided those portions are selected which contain upon them adventitious buds.

Page 206.—We have seen a *Cerasus Lauro-cerasus*, whose branches grew in the direction of a damp wall, put forth roots in the air. This also frequently occurs in all the shrubby *Calceolarias*, and many other plants, where they are grown in a damp atmosphere, but only on those branches which are not fully exposed to the day-light.

221.—The earth in which we usually plant cuttings cannot be said to be inorganic, as it not only consists of inorganic elements, but also of elements arising from the presence of organic matter.

Page 222.—We have grafted the flower-buds and often the branches with half ripe fruits of the Rose, with perfect success. Herr Foordy, of Mähren, cultivates small *Rhododendrons*, not more than six inches high, by planting branches, promising flower-buds, in little pots.

Pages 227.—It is too true that the common crown-grafting is still in use on the Continent. Yet there are many other good methods adopted, some of which surpass the whip-grafting; and there is now generally a neatness in these operations in German gardens, that was formerly entirely unknown.

Page 234.—In the year 1841, an experiment was performed under the direction of the Royal Horticultural Society of Berlin, in which a branch of the *Cosmea bipinnata* was grafted upon the root of a *Dahlia*, and it not only grew well, but it also brought forth blossoms and ripe seed.

Page 246.—One of the cheapest kinds of grafting clay consists of three parts of common clay, two parts of cow-dung, and one of barley beads (*Gerstenkranen*), which must be thoroughly well kneaded together.

Page 251.—In the case of the *Camellia* branch placed in water, the water is only a means of maintaining the existence of the plant, and not a means of nourishing the plant in the same manner as it would be if the roots were placed in natural circumstances. How long plants would vegetate, and how much they would grow on water alone, need hardly be brought to any one's recollection.

Page 269.—The planting trees against a wall is an operation requiring great care, and the circumstances of climate, &c. should be taken into consideration. There is frequently a very barbarous practice adopted in our gardens; the trees are planted so close to the walls that the roots can obtain only half the nutriment they ought. Such a position can only be remedied by planting the trees further from the wall, and not allowing the roots to penetrate the earth parallel with the stem.

THE NATURALIST'S CORNER.

(Continued from page 880.)

70. *Pleasures and Advantages of Rural Labour.*—The ancient Romans were greatly addicted to husbandry, and are known to have held that art in the greatest esteem. Cato mentions, as an instance of this, that they thought they could not bestow a greater praise on any good man, than by calling him a good husbandman. Cicero, in his oration for Sextus Roscius, observes that their ancestors, by diligently following Agriculture, brought the commonwealth to the flourishing condition in which it then was. Columella observes that Quintus Cincinnatus, who was called from the plough to the dictatorship, laid down his ensigns of authority with greater joy than he took them up, and returned to his bullocks and little hereditary farm of four acres; that C. Fabricius and Curius Dentatus—of whom one had driven Pyrrhus out of Italy and the other had subdued the Sabines—cultivated the seven acres which they shared with the rest of the people, with a diligence equal to the valour by which they had obtained them; that the true offspring of Romulus were hardened by rural labour, to bear the fatigues of war when their country called for their aid; and that they chose their soldiers out of the country rather than out of the city. Pliny observes that Italy produced a greater quantity of corn in former ages, which he ascribes to the land being cultivated by the hand of generals, and of ploughmen who had triumphed.

71. *A true Epicure.*—No man's memory has been more traduced than that of Epicurus. He has been represented as a person wholly given up to luxury and intemperance. His name is become a proverb, to express a voluptuous person, whose whole pleasure was in eating and drinking. And yet it is certain that he was a great pattern of temperance, and recommended it to his followers. Epicurus himself, in his epistle to Menæceus, says, that when he speaks of pleasure, he does not mean the pleasures of the voluptuous and intemperate, as some have misinterpreted him; but tranquillity of mind, and a body void of pain. Hear what the poet Cowley calls being a true epicure:—

"When Epicurus to the world had taught,
That pleasure was the chiefest good—
And was perhaps i' th' right, if rightly understood—
His life he to his doctrine brought,
And in a garden's shade that sovereign pleasure sought:
Whoever a true epicure would be,
May there find cheap and virtuous luxury."

72. *Wise Saying.*—You may admire, says the Latin poet, the splendour of a large vineyard, but you had better cultivate a small one:—

"laudato ingentia rura,
Exiguum colito."

The labour of cultivating Vines is so great, that the master cannot extend his care over a very large spot of ground. Columella relates a story from Græcinus, in confirmation of this. A man had two daughters, and a large vineyard, of which he gave a third part with the eldest daughter in marriage; and yet he gathered as much fruit as he did before. Afterwards he married the younger daughter, with another third for her portion; and still he found that his remaining third part produced as much as the whole had done, which could arise from no other cause than that he was able to cultivate a third part better than the whole vineyard before it was divided. The same author mentions this precept of the poet with great commendation, and says it was taken from a saying of one of the seven wise men, and that it was a proverb of the Carthaginians, that "a field ought to be weaker than the husbandman."

CALENDAR OF OPERATIONS for the ensuing week.

HAVING now "rounded the revolving year," and brought the third annual series of these weekly Calendars to a close, I beg to thank those Correspondents who assisted me with their letters. If I had to do the Calendar over again I might keep more to the point, but I could not write it more earnestly or perhaps make it more generally useful—hence the advantage of changing the writers annually. The change I have taken the liberty of making in the introductions to the Calendar will enable the reader to take a part in the discussions of the day, if he is so inclined, and thus render more interesting a naturally dry subject. Another advantage which arises from this plan, is, that young gardeners on their first attempts at writing are often afraid to send their letters to literary men, but will do so with confidence to a gardener. I have made use of many letters of this kind during the season; and gardeners sometimes would wish to say a word or two on the topic of the day, but will not do so, because they think short communications give more trouble than the matter is worth. I had many useful hints from this source, and I think the subject is worth following out. The only apology I shall give for these remarks, is, that I was among the first gardeners who urged the proprietors to establish a respectable weekly journal, at a time when our garden literature was a disgrace to us as a body, especially in the eyes of foreigners. In reply to the difficulties and dangers pointed out to me in the way of establishing such a work, I said that if you do but stem the flood of personal discussion, founded on mere abuse, thus held out to the young gardener as a *sine qua non* in his writings, depend upon it the great bulk of the gardening world will go along with you; and the sequel proved more than I anticipated. I have to thank more than one friend for a copy of an obscure low publication, in which a writer not favourable to the interest of gardeners is vainly endeavouring to injure the stability of the Gardeners' Benevolent Institution, by attempts at sowing discord among the more zealous of its advocates; but there is not the slightest cause for apprehension from this proceeding. The Committee of 1839, consisting of the principal London nurserymen and gardeners, placed this Institution on a firm basis by expelling improper persons, and effectually closing up the avenues against them.—See the Report of the Proceedings of the London Floricultural Society in last week's *Chronicle*.—The most respectable gardeners

in the country have subscribed to the Institution since then, and many valuable contributions have been sent by some of the great patrons of gardening. This has enabled the Committee to place some more pensioners on their list this season.

I.—KITCHEN-GARDEN AND ORCHARD.

In-door Department.

PINERY.—If the bottom-heat does not fall below 80° at the bottom of the pots when a little more additional tan would be necessary to revive it, the usual routine of air, little water, and a look out after drips is all that is necessary. A friend of mine bought "from 30 to 40 good Pine-apples" last August in Penang, all for 2s., and he says that this island and the opposite Malay Peninsula are better supplied with the finer tropical fruits than any part in the world.

VINERY.—The late fine weather has been much in favour of early forced Vines, as very little fire has been necessary. But if it should suddenly change to frost the fires must be increased; this may perhaps cause the top eyes to break too soon, or before those lower down are ready to follow them; and it is therefore a good plan to bend down the shoots horizontally, and to set their points near the glass: this will render the growth more uniform, which should never be lost sight of in early forcing.

PEACH-HOUSE.—A steady low temperature of from 45° to 50°, and a moist atmosphere, are the chief points now to be attended to.

CUCUMBERS.—I am sorry I cannot oblige some correspondents who ask for seeds of our fancy varieties. When I get a good serviceable sort I prefer continuing it by cuttings or layers; and as these fancy sorts are often seen to degenerate from seeds, why should dealers not increase them by cuttings, and sell young plants instead of seeds?

Out-door Department.

The "Knave of Spades" manages his Strawberry pots better than his shrubby borders, and his communication reminds me that I am indebted to another gardener for his way of protecting Strawberries in pots from frost. My friend lays down a row of pots on their sides, with a stake fixed in the border at each end of the row; the next row is placed in a contrary direction, leaving the pots "bottom to bottom;" two more stakes are used, as before; the vacancies among the pots are then filled up with soil, &c., and other rows are continued in the same way until all the pots are up; the stakes are strong enough to keep the pots up, and the whole operation is afterwards managed as by the "Knave of Spades." The weather has been so unusually fine lately that out-door operations are more forward now than I can remember for many years. Without tasking the reader's patience too much with a repetition of my last Calendar, let us hasten to see if all the plants are in a right condition in the stove, &c.

II.—FLOWER-GARDEN AND SHRUBBERY.

In-door Department.

STOVE.—More than one correspondent is "desirous to know what the new stove climber is I lately mentioned." It is a *Bignonia*, with long, drooping racemes, and keeps in bloom more than two months, and may perhaps do so longer when the plant gets older. Also "What is that *Amlersta nobilis*, which papers tell us cost the Duke of Devonshire so much money?" Dr. Wallich, who named it after the Countess Amherst, says it is a stately tree, "not surpassed in magnificence and elegance in any part of the world," and Dr. Royle says it is "the most splendid of the many magnificent objects in the vegetable kingdom." The plant of it at Chatsworth was brought over by Mr. Gibson, and is the only one in Europe; the flowers are of the Cassia section of the Leguminosae, are large, of a vermilion colour, and produced on pendulous racemes. It is propagated possibly by grafting the tops of the ripened shoots on pieces of its own roots.

CONSERVATORY.—Little air need be given now to this house, as the forced flowers are brought in. I was asked this curious question lately—"How would it answer to keep a greenhouse closely shut all winter, like a Ward's case?" Perhaps just as well, it not better for many plants, than the present mode; you had better try the experiment. The *Echites splendens*, which we suppose will do in a warm conservatory, is now offered for sale in some of the principal nurseries. I have seen blossoms of it, and a lovely plant it is.

PITS AND FRAMES.—We have this week taken up a few dozens of the young Heaths from the open border; they carried large balls of earth, and we stored them, without pots, into a cold pit, lying in between the balls with peat. They will remain here until next April, when they will be moved to the flower-garden. Young plants of the different Chinese Azaleas, treated in this way, will soon make fine specimens.

In conclusion, there is a letter addressed "A. B. C." in the Plymouth Post-office, for a correspondent who wrote about heating a stove heath house, and one more division, but I could not decipher his address.—D. Beaton, Shrubland Park Gardens, Ipswich.

1. State of the Weather near London for the week ending Dec. 28, 1843, as observed at the Horticultural Garden, Chiswick.

Dec.	BAROMETER.			THERMOMETER.			Wind.	Rain.
	Max.	Min.	Mean.	Max.	Min.	Mean.		
Friday 22	30.400	30.306	30.353	53	43	47.0	S.	—
Saturday 23	30.364	30.355	30.359	56	48	52.0	S.W.	.01
Sunday 24	30.468	30.416	30.442	55	46	50.5	S.W.	—
Monday 25	30.468	30.396	30.432	52	35	43.5	S.	.01
Tuesday 26	30.468	30.336	30.402	46	41	43.5	S.E.	—
Wednesday 27	30.438	30.412	30.425	45	33	39.0	W.	.03
Thursday 28	30.438	30.476	30.457	49	42	45.5	W.	—
Average	30.431	30.385	30.408	50.7	41.0	45.8	—	.05

Dec. 22. Very fine; thickly overcast; cloudy.
23. Overcast and remarkably mild for the season.
24. Clear; exceedingly fine with sun; hazy at night.
25. Hazy; overcast and mild; densely clouded; drizzly.
26. Drizzly; foggy; thickly overcast.
27. Hazy throughout the day; suddenly clear in the evening, and again hazy.
28. Cloudy and fine; hazy; densely overcast.
Mean temperature of the week 7° above the average.

State of the Weather at Chiswick during the last 17—18 years, for the ensuing Week ending January 6, 1844.

Dec. 1 and Jan.	Aver. Highest Temp.	Aver. Lowest Temp.	Mean Temp.	No. of Years in which it Rained.	Greatest quantity of Rain.	Prevailing Winds.							
						N.	N.E.	E.	S.E.	S.	S.W.	W.	N.W.

Sat. 6	39.6	29.4	34.5	7	0.33	1	1	1	1	3	3	3	3

The highest temperature occurred on the 31st, 1834, and 6th, 1839—thermometer 53°; and the lowest on the 3d, 1827, and 1st, 1837—thermometer 12°.

REPORT ON COVENT-GARDEN MARKET,

For the Week ending Dec. 29.

From the unusual mildness of the weather at this season the market has been well supplied during the week with vegetables of almost every kind. Fruit has also been sufficient to meet the demand, and is, generally speaking, of good quality. Pine apples, although small, are good in quality, and plentiful. Grapes are offered at nearly the same prices as last week. Among Apples we noticed a few good specimens of Nonpareils, Court of Wick, Golden Pippin, and the American Newtown Pippin. Pears are good and sufficient to meet the demand; they consist of the same kinds as were lately mentioned in our report, with the addition of a few good specimens of *Ne plus Meuris*, which have been brought to the market during the week. Oranges are plentiful. Lemons are selling at from 1s. to 2s. per dozen. Among vegetables Broccoli has rather advanced in price since our last report; it is offered at from 9d. to 4s. per bundle. Cabbages are good and plentiful, and Brussel Sprouts are sufficient to meet the demand,

but are rather small. Seakale is offered at from 1s. to 3s. per punnet, and is good and plentiful. Cauliflowers have advanced a little in price during the week. Rhubarb is selling at from 1s. to 1s. 6d. per bundle. Asparagus is offered at from 2s. to 8s. per 100. Parsley and Endive have been on demand during the week, and have advanced a little in price. Shallots are sufficient for the demand, and are selling at nearly the same prices as last week. Cut Flowers chiefly consist of *Erica hyemalis* and *gracilis*, *Lechenaultia formosa*, *Poinciana pulcherrima*, *Bignonia venusta*, *Cypripedium insigne*, *Euphorbia jacquiniiflora*, *Pelargonium*, *Verbenas*, *Fuchsias*, *Chrysanthemums*, *Camellias*, and *Roses*.

PRICES, Friday, Dec. 29, 1843.—Fruits.
Pine Apple, per lb. 4s to 7s
Grapes, hothouse, per lb. 3s to 7s
Portugal, per lb. 1s to 2s
Apples, dessert, p. bush. 4s to 10s
— Kitchen, p. bush. 3s to 10s
Pears, per half-sieve, 4s to 10s
Oranges, per dozen, 9d to 12s
— per 100, 4s to 12s
Lemons, per doz. 1s to 2s
— per 100, 5s to 12s
Pomegranates, per doz., 3s to 6s
Green Capsicums, per 100, 1s to 2s

VEGETABLES.
Rhubarb, per bundle, 1s to 1s 6d
Broad coll., per bundle, 9d to 1s
Brussels' sprouts, per hf. sv., 1s to 2s
Cabbages, per doz., 6d to 1s
Asparagus, per 100, 2s to 10s
Seakale, per punnet, 1s to 3s
French Beans, 3s to 4s per 100
Autumn Potatoes, 3d to 6d per lb.
Savoy, per doz. 6d to 1s 6d
Greens, per doz. 2s to 4s
Cauliflowers, per dozen, 2s to 6s
Potatoes, per ton, 40s to 80s
— per cwt., 2s to 4s 6d
— per bushel, 1s 6d to 2s 6d
Kidney, p. bush., 2s to 3s 6d
Turnips, per doz. bunches, 1s 6d to 2s 6d
Red Beet, per dozen, 6d to 1s
Horse Radish, per bundle, 1s to 1s 6d
Radish, spring, p. doz. hands, 1s
Carrots, p. doz. bun., 2s 6d to 5s
Spinach, per sieve, 9d to 1s
Leeks, per doz. bun., 9d to 1s 6d

NOTICES TO CORRESPONDENTS.

MR. PAXTON'S COTTAGER'S CALENDAR.—At the earnest solicitation of many of our Subscribers, we have determined on again reprinting Mr. Paxton's "Cottager's Calendar," in the form of a small volume, for general distribution, price 3d. each copy. It may be ordered of all booksellers. Gentlemen wishing to distribute copies among their cottage tenantry, may have them delivered in any part of London, by remitting a post-office order to this office, at the rate of 5s. for every 25 copies.

COMMUNICATIONS from the following CORRESPONDENTS are in type, and are only waiting till room can be found for them:—G. Fleming, J. L., Peter Mackenzie, and Tyro.

BEECH TREES.—*Cathrick*.—This tree retains its leaves when dead, because they are killed by frost before their growth is completed, and therefore the usual separation between them and the twigs does not take place. You will not find the leaves hanging on strong well-ripened wood, but only on the weak spray.

BOOKS.—*Stephen Bell*.—For Vine cultivation in the open air we recommend Hoare's Treatise—for forcing, that of Roberts.—*Viola*.—The cheap edition of "English Botany" and "Baxter's British Flowering Plants."—*Die Kleine* must go to others for information about casting on and casting off, pearling, ribbing, and ribstitching. We never knitted anything in our lives—except our brows, when we read her questions. However, we will not be uncivil, but refer her for the mysteries of the noble art of knitting broches, muffetees, and all the nice warm things for which Berlin wool was invented, to Miss Lambert's famous knitting-book, which she may buy for 1s. 6d.

CACTI.—*Milton*.—*Cereus speciosissimus* will do well on the one-shaft system; only give it a little bottom-heat, and pot it in coarse loamy turf, with one-third charcoal.

CHARCOAL.—*A Forcer*.—Mix it, in coarse fragments, with your soil, to the extent of one-third; and use larger pieces for drainage. No proportions can be given for a hothouse without knowing all particulars. Let the roof form an angle of 40° or 45°.

CUCUMBERS.—*J. W. M.*—If your Cucumbers are, as we presume from your statement, three feet from the glass, that will no doubt have an injurious effect on the plants, and in part account for the failure. The pit also being heated by a plain brick-flue, will not be very favourable to them, if they are not well attended to in other respects; and it is probable the disease may have arisen from one or both these causes; at all events we would advise you to raise your plants nearer the glass if possible, and by good treatment in other respects, they may, perhaps, do better.

GARDENS IN TOWNS.—*S. S. C.*—You will find your case gone into very fully in several articles in the year 1841, beginning at p. 499. We will advert to your note when the year is turned.

HEATING.—*Devoniensis*.—It is very difficult to advise you, in the absence of a plan; but as far as we can understand your description, it appears to us that your gutter may be taken either from the boiler or iron tank, and perhaps the latter would be most convenient. Wood is a good material enough, if you are not anxious for long durability. A foot wide is enough, two feet are better. Your proposed stage is very good. Cannot you manage to make some part of your apparatus warm the water with which your Orchidaceae are to be watered; that is most important.—*A Subscriber*.—The larger the body of heated water in a house the longer the heat will be retained. If, therefore, the four-inch pipes you now have are exchanged for an iron tank you will gain that object. But for so small a house as yours a couple of iron pipes ought to be ample. Probably your boiler is in fault. Before advising you further it will be better to send a plan of the house and heating apparatus.

HOUSES.—*Ignoramus*.—It is of no great consequence whether the stove faces S.E. or S.W. Backsashes are always desirable. Why can't you make the house with a roof sloping both ways? It is a thousand times better than the bad and ugly lean-to. Certainly it is desirable by means of a hard bottom or some such plan to prevent Vines rooting too deep.

INSECTS.—*W.*—Against Red Spider use flowers of sulphur and lime; against Aphides a good syringing or washing with gas water.—*A Subscriber*'s insect which caused so much alarm cannot sting, and would not bite unprovoked. It is the *Staphylinus pubescens*, and is related to the Devil's Coach-horses, figured and described last year in the *Gardeners' Chronicle*, p. 740. R.—Mr. Curtis begs to thank Mr. J. Bransby, of Lynn, for the ample supply of *Calandra granaria*, which arrived safe.

MAHOGANY.—*Mary*.—This wood is said to have been introduced to use in 1724.

MANURES.—*An Original Subscriber*.—The description you give of your soil is not sufficiently particular to guide us in recommending the application of manure; but on a clay soil, "such as tiles are made of," "pure lime" (after the rate of 200 bushels per acre) would act more beneficially than "blue marl," and would probably be equally permanent in its effects. J. C.

MR. TORBRON'S PINE-BOOK (Reviewed at p. 824).—Although we cannot for one moment admit any right on the part of persons who become authors to claim permission to answer the observations that may be made on their works; yet as Mr. Torbron is very anxious to give some explanation of the history of his book we are unwilling to refuse him permission to do so, irregular as it is. The following, then, is the substance of a long letter which we have received from him:—"I wish to stand right with the public. But what new views are heaven knows, and the allusion of two columns for a

farthing appears to me altogether irrelevant: a Gooseberry Treatise at 4d. might obviously pay better than a Guinea one on the Pine Apple. But what I trust you will do in justice to me is to peruse all that has been published in this country relative to the culture of the Pine Apple and compare all the details with mine say from page 11 to 17 and I think you will arrive at a very different conclusion from what you have recorded in finding that my details are most essential to be given. I had long seen that nothing like system effectively had been published either individually or collectively by the various authors. And I have made it my study in services wether I was growing for the supply of my employers or my own experiments to arrive at something conclusive on the subject so that I might be enabled to publish or give instructions as the case might be. I said little about the cultivation with leaves or fermenting materials from the stables &c. because in those things circumstances are the chief guide. An illness prevented me (my Doctor advising a change of air) from carrying out Mr. Knight's design for the culture of the Pine Apple without fermenting materials or I have every reason to think it would have been done effectively from my own experiments since made and I regret it on his account as well as my own as Mr. Knight conceded to me in conservation that my mode of ventilation was the best. Some of my subscribers had become impatient for the pamphlet, and I had to traverse roads from all points 20 and 30 miles from London first for obtaining subscribers and then delivering them in person over those bounds by moonlight or any way along dismal roads."

NAMES OF FRUIT.—*W. B. Z. Y.*—Your Pear is the *Beurré D'Yelle*, different from *Beurré Diel*.—*Anonymous*.—Unknown; sweet without briskness, therefore unfit for either table or kitchen use.

NAMES OF PLANTS.—*Holcus*.—*Nidularia striata*, a kind of Fungus; the lens-like bodies are what it is multiplied by.—*J. Rap.*—It is useless to send such fragments. No one can name them. *Thunbergia coccinea* is right.—*B. E.*—1, No flower; 2, *Malpighia glabra*; 3, *Goldfussia anisophylla*.—*Derwent's* leaf is not recognised.—*A Rector*.—*Catsetum cornutum*.—*Capt. W.*—Your *Adenocarpus* is *Genista linifolia*.

PANSIES.—*R. H. C.* begs that Mr. J. Ritson will have the goodness to state what quantity of Potter's Guano he uses, and what soil he considers best for the Pansy.

PEARS.—*Non sum qualis eram*.—The following are six varieties from amongst which you may select one for planting against a lofty gable facing the south:—*Glout Morceau*, ripens Nov., Jan.; *Passe Colmar*, Dec., Jan.; *Beurré Rance*, March, May; *Winter Nellis*, Dec., Jan.; *Hacon's Incomparable*, Nov.; *Easter Beurré*, Jan., March. The above, or whichever of them may be selected, should be on Pear stocks, because the surface of wall to be covered is of large extent. You will find them described in the "Guide to the Orchard."—*J. B. M. H.*—Two varieties to come in before the Jargonelle may be the *Muscot Robert*, and *Citron des Carmes*.

POTATOES.—*Ignoramus*.—Road-dust, and lime in moderate quantity, will be properly applied, as you propose, between the rows of trees in your orchard, in order to improve the quality of Potatoes you there intend to cultivate. The reason of their being more watery this season than formerly may be partly ascribed to the wet and cold summer, and partly to successive planting in the same spot. If you must again do so, endeavour to procure sets from a different soil; plant shallow, and this renders it necessary that the rows be widely apart, in order to admit of plentiful earthing up. Your present stock of Potatoes will be meliorated by exposure to dry air, but not to light, it should be always borne in mind, for, most undoubtedly, exposure to light renders the tubers unwholesome.

PINE TREES.—*Eboracensis*.—*Pinus excelsa* grows very fast, and will probably justify its name; but the specimens are yet very young. The fastest-growing Pine is *P. Laricio*, and next to it *P. macrocarpa*.

PINNATED BERBERIES.—*Capt. W.*—Sow their seed when ripe in pans of peat and loam, and keep them in a frame where they will be preserved from dryness. They will sometimes not come up till the second year; and in all probability there will be a second crop, at all events.

SEEDS.—*Proteus* must sow his seeds in February, in a hotbed. None are annuals; some may flower in two years, but probably few will do so in less than three. They are tolerably good things—of course greenhouse plants.

SOOT.—*Constant Reader*.—Apply it now. You are quite right.

SOUTH LONDON FLORICULTURAL SOCIETY.—We have received a letter from Mr. John Dickson, begging us to contradict the statement made in our last week's *Chronicle*, that a cup offered by him for Picotees was rejected unanimously by this Society. He says that no vote upon the subject was put, and that he withdrew his cup voluntarily. We can only say that the report was furnished by a person who was present; and that if the Society was not unanimous upon the occasion, it ought to have been so, upon Mr. John Dickson's own showing.

THISTLES.—*Arm. Fil.*—There is no known means of destroying Thistles except rooting them up, or continually destroying their leaves. Either the seeds were left in the ground when it was drained, &c., or, which is very probable, your neighbours have made you a present of them. If you cannot root them up, you must persevere in destroying the foliage. Try a small patch with undiluted gas-water, applied with a watering-pot, as soon as the scythe has passed over the lawn. It will not kill the Grass, but it may destroy the Thistles; we will not, however, answer for it.

MISCELLANEOUS.—*Radix*.—The *Pancratium* are both hardy, and will grow in any warm, dry, light border. *Amaryllis longifolia* likes wet, but is hardy when it is sheltered a little. *Marianthus caeruleo-punctatus* is a greenhouse plant, requiring no particular attention except for ventilation in winter. *Manettia bicolor* is a stove climber, or rather trailer. *Bridgesia spicata* is a greenhouse shrub, concerning whose treatment we have no information.—*A Young Gardener*.—If you are a gardener, and want such information as you ask for, you have still a great deal to learn. The question, moreover, in the way it is put, is so loose that nobody can answer it in less than a page. Read our previous columns, and you will find all you want, or nearly so.—*C. A. L.*—A paper on the management of *Campanula pyramidalis* will be given in our columns soon. Guano may be applied to grass-land at the rate of about 4 cwt. to an acre.—*J. S. C.*—Working plans shall be sent as soon as they can be prepared.—*S. R.*—We have not a complete set of this year's Numbers, but you can have the volume with Index in a week, price 29s.—*Holspur*.—*Stephanotis floribunda* is a very handsome white flowered stove climber, of the *Asclepiadaceae* order.—*H. B.* may obtain stocks for fruit-trees in the nearest good nursery. t.—*A Constant Reader*.—Your *Cineraria* leaf is infested with a species of *Uredo*; but how to get rid of it we cannot say.—*A Constant Reader*.—The Jerusalem Artichoke, is a native of Brazil, and appears to have been introduced in the year 1617.—One shilling will be given for No. 49 of the present year.—*E. H.*—There is very little chance of your procuring the Number.

NEWS OF THE WEEK.

By an intermediate Overland Mail we have news from Calcutta to the 19th ult. and from China to the 12th Oct. The revolution in the Punjab does not appear to have been quite so sanguinary as was at first reported; two of the Chiefs who were said to have been murdered are still alive and wield joint sway at Lahore; but no settled form of government has yet been attempted, and

the prospect of collecting a revenue for the payment of the troops is extremely uncertain. The Governor-General has announced his intention to visit the north-western provinces, but his future policy in regard to the disturbed states is altogether unknown. It was rumoured that Dost Mahommed had been murdered at Cabul by order of the Khan of Bokhara, but there are no means at present of ascertaining the truth of the report. In China the trade has been regularly opened with the four new ports, and with great success. Sickness still prevails to an alarming extent at Hong Kong, and the official residents, as well as the troops, have suffered severely.

From France we have accounts of the opening of the Chambers on Wednesday last by the King in person. His Majesty and the Royal family were received with every demonstration of loyalty by the Chambers, but the people were kept at so great a distance from the Royal carriages by the enormous number of troops which lined the streets that they had no opportunity of evincing their feelings. The Speech adverted with satisfaction to the financial condition of the country, and to its pacific and friendly relations with foreign Powers. It dwelt with marked emphasis on the sincere friendship which unites his Majesty to the Queen of Great Britain, and to the cordial understanding existing between the two Governments on the affairs of Spain and Greece. The commercial relations of France with various countries, the marriage of the Prince de Joinville, the progress of the National Arms in Algeria, and the extension of railways and other public works are next adverted to, and the speech concludes with an expression of gratitude for the state of honourable peace and of increasing prosperity which the country enjoys.—From Spain we learn that the Chambers have adopted the proposed address to the Queen on the events of the 28th ult. and that S. Olozaga has thought it necessary to consult his safety by flight.—From the United States we have the President's Message on the opening of Congress. In this document, which may be regarded as the last official exposition of Mr. Tyler's principles prior to his retiring from the Presidency, he advises the occupation of the Oregon territory by military posts, and the annexation of Texas to the Union. For the terms in which he discusses these important points we must refer our readers to the speech itself, premising however that the views of the President are condemned by many of the New York papers which have hitherto supported his own party, while those of opposite principles attach but little importance to his opinions, and regard him as the least influential personage whom the United States have yet elevated to the position of Chief Magistrate.

Home News.

COURT.—On Sunday her Majesty and Prince Albert attended divine service in the private chapel of the Palace. On Christmas-day her Majesty and suite also attended divine service in the private chapel. Her Majesty and Prince Albert enjoyed their usual early walk in the precincts of the Castle. In the afternoon her Majesty and his Royal Highness took an airing in a pony-phæton, the Prince driving. On Tuesday, in consequence of the unfavourable state of the weather, neither her Majesty nor the Royal Family left the Castle. Prince Albert went in the morning to enjoy the sport of shooting in the Royal preserves. On Wednesday morning the harriers belonging to his Royal Highness met at Mr. Nash's, of Langley-green. Her Majesty, attended by the Marchioness of Douro, was present at the meet. Prince Albert, accompanied by the Duke of Wellington, was also present. After good runs, the sport finished in the neighbourhood of Horton. On Thursday the Queen and Prince took their usual early walk, after which the Prince shot over the Royal preserves. In the afternoon her Majesty took an airing in a pony-phæton. The Prince of Wales and the Princesses are quite well, and have been taking their usual airings during the week. It is expected that her Majesty and Prince Albert will visit Claremont shortly after New Year's-Day, where the Court will probably remain for four or five days for the purpose of enabling the Prince to enjoy the sport of shooting over the well-stocked preserves of the King of the Belgians. The rumour of her Majesty's intended visit to Warwick Castle has been contradicted. The visitors to the Queen this week have been Baron Brunow, the Russian Minister, Count Nesselrode, the Duke of Wellington, Lord Bloomfield, Lord Aberdeen, and the Bishop of London. The Court went into mourning on Sunday for the ex-King of Holland, to change the mourning to-morrow the 31st; and go out of mourning on Thursday the 4th January.

The Duc de Bordeaux.—His Royal Highness quitted Birmingham on the 22d inst., highly delighted with all that he had seen of the interesting and instructive works in that manufacturing town. The Prince then went by the Birmingham railway to Tring and then travelled post to Hartwell, which was once the abode of Louis XVIII. On the evening of the 22d His Royal Highness continued his tour by a visit to Oxford where he passed the night. On the 23d His Royal Highness inspected the colleges and public establishments, the museums, library, and collections of art at that seat of learning. The Prince reached Belgrave-square for dinner that evening. On his arrival he found numerous additional arrivals from France to render him homage. Upwards of 100 persons were presented, among whom were several manufacturers,

traders, and operative deputations. His Royal Highness entertained the Earl and Countess of Shrewsbury at dinner on Sunday, and attended mass at the Catholic chapel on Christmas-day. On Tuesday he visited the Earl of Shrewsbury at the Clarendon, and on Wednesday left town by the Great-Western railway for the West of England. His Royal Highness arrived at Bath in the evening and visited the residence of Mr. Beckford and the Lansdowne Tower. His Royal Highness subsequently went to the New Park and then went over the different public buildings. On Thursday morning the Prince departed for Bristol and Clifton. From thence he will proceed to Exeter and Chudleigh on a visit to Lord Clifford of Ughbrook, and will afterwards visit Plymouth and probably Wales. His Royal Highness is expected to return to town in about a fortnight.

Parliamentary Movements.—The local papers announce that Mr. Ward and Mr. Parker the members for Sheffield, who were expected to resign at the opening of Parliament, have announced their intention to retain their seats.—It is rumoured that Mr. Metcalf intends to resign the representation of Tynemouth on the score of ill-health, and that the Marquess of Douro will contest the county of Roxburgh at the next vacancy in the Conservative interest.—It is also announced that Col. Thompson will be a candidate for Sunderland on the Liberal interest, and that Mr. J. J. Wright will be a candidate for the same borough on the Conservative interest at the next vacancy.

The Church.—The Rev. Charles Kemble, Assistant-Minister of Stockwell, is spoken of as the probable successor of the Rev. Henry Melvill at Camden Chapel, Camberwell, whose appointment to the Principalship of the East India College at Haileybury we announced last week.

The Army.—It is rumoured in military circles that the Colonelcy of the 1st Royals, vacant by the death of Lord Lynedoch, will be given to General Sir George Murray Master-General of the Ordnance.

Death of Sir Edward Bruce.—The daily papers announce the death of Sir Edward Bruce Commander-in-Chief at Sheerness. Sir E. Bruce was a vice-admiral of the white and succeeded Sir H. Digby as commander-in-chief at the Nore on the promotion of that officer in honour of the birth of the Prince of Wales. The appointment which has become vacant by his decease is worth 2,555*l.* per annum with an official residence.

The National Society.—At a recent meeting of this Society, it was resolved to accede to a proposal made by Mr. Kay Shuttleworth and Mr. Tuffnell, to transfer the Training Establishment at Battersea to the care of the National Society, so that henceforth the charge of that establishment will devolve upon that Society, to be conducted according to its principles, and for the advancement of its end and designs. The Training Establishment at Battersea has been for some time under the patronage of Prince Albert, who will continue patron of the institution.

Foreign.

FRANCE.—On Wednesday the French Chambers were opened by the King in person. No less than 20,000 troops were under arms. The whole way to the Chamber was lined on either side by troops of the line and National Guards, and the ground was kept clear by the Municipal Guard, who mustered in considerable numbers. The public were kept even at a greater distance than on previous occasions. Her Majesty, attended by other members of the royal family, left the palace before the King. During the whole line his Majesty was received with warm demonstrations of loyalty from the troops assembled; the public were precluded from the possibility of evincing their feelings from the great distance at which they were kept. On the arrival of the Royal family being announced in the Chamber a deep silence took place, which was only broken by loud cries of "Vive la Reine!" "Vive la Duchesse d'Orléans!" "Vive le Comte de Paris!" as they severally took their seats. The Queen looked uncommonly well and gratified at the warmth of her reception. She led the Comte de Paris forward to the front of the tribune, when a fresh burst of acclamation arose. The Duchess of Orléans was in mourning. His Majesty ascended the steps leading to the royal seat with a firm tread. He was dressed in the uniform of a colonel of the National Guards, and it was the subject of general remark that he has rarely appeared in more robust health. The moment his Majesty appeared on the estrade, loud and prolonged cries of "Vive le Roi!" arose. He bowed repeatedly to the Chamber in acknowledgment of his reception, and on proceeding to take his seat, fresh bursts of acclamation were raised. The Duc de Nemours in a general's uniform took his seat on the right of the King, the Duc de Montpensier being next his brother. The Prince de Joinville sat on the left and wore a naval uniform. The King after a moment's pause signified to the Chamber to be seated, and then read the following speech in a firm voice:—"Gentlemen of the Chamber of Peers and Deputies,—The good harmony between the powers of the state and the loyal support you have afforded to my Government have yielded their fruit. Amidst the order maintained without effort and under the sway of the laws France displays with confidence her fertile activity. The situation of all classes of citizens is improving and advancing. The effects of this prosperity will enable us to restore between the expenses and the revenue of the state, in the law of finance which will be shortly presented to you, a justly desired equilibrium. We can enjoy with security these blessings of peace, for it never was better secured. Our relations with all Powers are pacific and friendly. Serious events have occurred in Spain and in Greece. Queen Isabella II. summoned so young to the cares of state, is at this moment the object

of all my solicitude and of my most affectionate interest. I hope that the issue of these events will be most favourable to two nations friendly to France, and that in Greece as well as in Spain monarchy will strengthen itself by the mutual respect for the rights of the throne and the public liberties. The sincere friendship which unites me to the Queen of Great Britain, and the cordial understanding existing between my Government and hers, confirm me in that confidence. I have concluded with the King of Sardinia and the Republics of the Equator and Venezuela treaties of commerce, and I am pursuing with other States in several parts of the world negotiations which whilst maintaining our national labour in the security which it is entitled to, will open new paths to its intelligence and activity. I have the satisfaction of seeing the circle of my family enlarged by the marriage of my son the Prince de Joinville with the Princess Francesca, the sister of the Emperor of Brazil and of the Queen of Portugal. This union, by ensuring the happiness of my son, adds one consolation more to those which God has reserved to me. Our domination in Algeria will soon be universal and tranquil. Under the command of experienced leaders, among whom I am proud to reckon one of my sons, our brave soldiers unite with admirable constancy the fatigues of war and the labours of peace. The necessary measures for the execution of the general system of railroads, and for various enterprises of national utility will be submitted to your deliberations. A bill relative to secondary instruction will satisfy the wish of the charter for the freedom of instruction by maintaining the authority and action of the state over public education. I behold, Gentlemen, with deep gratitude to Providence the state of honourable peace and of increasing prosperity which our country enjoys. Always guided by our devotedness and our fidelity to France, I and mine have never had any other ambition than that of serving her well. It is the assurance of accomplishing that duty which has given me strength through the trials of my life, and which will, to its end, be my consolation and my firmest support." The interruptions on particular passages were exceedingly slight. A murmur arose at the phrase "justly desired equilibrium." A louder sign of approval greeted the passage alluding to the state of Spain, and the desire that the monarchy of that country should gain strength. The most marked approbation of the day was given to the phrase relative to the friendship existing between his Majesty and the Queen of England; but still nothing like the warmth of enthusiasm could be observed. When speaking of the marriage of the Prince de Joinville, the King turned round towards his son and inclined slightly. At the conclusion loud cheers and cries of "Vive le Roi!" arose from all parts of the Chamber. The King rose immediately, and repeatedly acknowledged the manner in which the Chambers greeted him. When the acclamations which followed the reading of the royal speech had subsided, M. Martin (du Nord) by the King's directions administered the oath to the Prince de Joinville, as Peer of France. His Royal Highness rose when the Minister had concluded the words, and signified his assent by stretching forth his hand towards the King, who bowed in return. M. Duchatel then swore in about half a dozen members who had been elected or re-elected since the last session. M. Martin (du Nord), Minister of Justice, then announced in the usual form, that the session of the year 1843 was opened. The King and the Princes then rose to retire, amidst fresh cries of "Vive le Roi!"—The Government has commenced the threatened campaign against the Legitimists by dismissing several mayors of provincial towns, who have chosen to brave the authorities by going to London to pay their respects to the Duc de Bordeaux. A Royal ordinance has been published in the official papers relieving eight of them of their functions. The *Courrier Français* announces that the friends of Messrs. Guizot and Duchatel are determined to direct an attack in the Chambers against the five deputies who went to London to pay their respects to the Duc de Bordeaux. General Jacqueminot had claimed as superior commander of the National Guard the honour of commencing the attack. M. Pasquier the President of the Chamber of Peers intended likewise to address a remonstrance to M. de Richelieu, who had been guilty of the same offence. The Lyons papers state that the Legitimist party had succeeded in exciting such a feeling in favour of the Duc de Bordeaux among the population of several districts in the South of France, that between Avignon and Orange, the inscription of "Henry V., or Death!" was written on many of the houses of the villages situate along the road.—A circumstance has occurred at Paris which has excited great surprise. The Prince of Moskowa, the son of Marshal Ney, and the son-in-law of M. Lafitte, has resigned his commission in the French army. The Prince has been for the last six years a field-officer. Marshal Soult appointed him a lieutenant-colonel, and presented the commission to the King for his Majesty's signature, but the King positively refused, and stated as his reason that the Prince being in the Opposition had no right to expect favour, and the Prince immediately resigned his commission in the army. The Prince belongs to the party of M. Thiers, with whom he is on the most intimate terms of private friendship. This circumstance has created an immense sensation among that party and is no doubt very impolitic at the present moment, as many of them had intimated their intention of supporting the Duc de Nemours' dotation.

SPAIN.—Accounts from Madrid of the 17th inst. announce that the Congress on that day adopted the proposed message to the Queen. The discussion on the message was resumed by Count de las Navas, General Serrano, M. Roca de Togores, Cortina, and Churruarín. M. Roca de Togores having appealed to General Serrano for some explanations respecting the events of the evening

of the 28th ult., the General replied to the first question, that "the Queen had related to him the fact with ingenuousness and candour, but in terms different from those used in her declaration." To the second, that "her Majesty had told him that previous to her sitting down to transact business with M. Olozaga she had dropped a *bonbon*, but that her Majesty could not recollect whether she gave it to him or whether Olozaga had asked it from her Majesty." To the third question, that "he (General Serrano) accompanied that evening her Majesty to the theatre, and that neither that night nor the next morning had he perceived anything in her Majesty's manner to warrant the belief that she had suffered any outrage at the hands of M. Olozaga." The discussion having closed, M. Sanchez de la Fuente moved the omission in the address of a paragraph tending to criminate M. Olozaga, but this proposition was rejected by 88 against 63, and the address was afterwards voted by 101 against 48. The Chamber next appointed a deputation which waited on her Majesty with the address on the 20th, headed by M. Martinez de la Rosa. M. Olozaga had not appeared in Congress since the 12th. It was reported that he had fled from Madrid on his way to Portugal escorted by a party of smugglers, but others affirmed that he was concealed in that capital. The Moderados were most anxious that he should have adopted the former course, as it would enable them to forego a prosecution, which would be the occasion of more irritating and scandalous debates than those which had already taken place. There was a chance besides that M. Olozaga would not be convicted, and his acquittal might have serious consequences for the *prestige* with which Royalty is still surrounded in Spain. It was said that M. Olozaga had in his possession a letter in the hand-writing of the Marchioness de Santa Cruz addressed to General Narvaez, in which the whole scheme for overthrowing his power at Court and in the country was described. Accounts from Perpignan of the 18th inst. state that hostilities still continued on the frontiers of Catalonia, and that Baron de Meer, the new Captain-General, who had reached Barcelona, was shortly expected to take the command of Gen. Prim's troops engaged in the blockade of Figueras.

GERMANY.—Letters from Berlin of the 23d state that on the previous evening at seven o'clock divine service was performed in the Royal Palace on the mortal remains of the late King of Holland, Count of Nassau, in the presence of the King and Queen, of the Prince and Princess of the Netherlands and their daughters, of the Royal Family, the officers of the Household, and principal civil and military authorities. The principal chaplain to the Court, Dr. Ehrenberg, delivered an appropriate discourse on the melancholy occasion, in which he gave a sketch of the life of the King. Speaking of the deceased Monarch's deep religious feeling, and his entire reliance on the Saviour of Mankind, he mentioned that on the table at which he had been sitting when the fatal stroke seized him, the celebrated work on the "Imitation of Christ" was found open at the chapter on the Contemplation of Death. After 10 o'clock the body was removed in silence, all honours and testimonies of respect usual on such occasions being declined by Prince Frederick of the Netherlands. The military escort was commanded by Prince Augustus of Wurtemberg. The hearse was drawn by eight of his Majesty's horses, immediately behind which was the King of Prussia, Prince Frederick of the Netherlands, and Prince Albert as chief mourners; and then the other princes of the Royal family in their carriages. When the coffin was placed in the hearse all the troops paid military honours. The procession proceeded in the above order to the place where the body was embarked to be conveyed to Hamburg and thence to Holland.—Another fatal duel has been fought at Mayence. It took place between M. de Haber and M. Sacharaga, the seconds in the late affair between Baron de Goeler and M. de Verefskin, and it has terminated in the death of M. Sacharaga. The challenge was sent by the latter to M. de Haber when in prison for his share in the former duel. The meeting took place in Rhenish Bavaria. M. Sacharaga fired twice, and missed his adversary. M. de Haber did not advance though he was entitled to do so. His ball passed through M. Sacharaga's chest and killed him instantaneously. The *Frankfurter Journal* in allusion to this matter states that the Bavarian authorities ordered the body to be buried privately at Manheim, where it had been taken after the duel. They were afraid of disturbance, should any attempt be made to lay the body by the side of his friend M. de Goeler. This order was complied with on the 17th, in the presence of a few officers of the garrison and a friend of the deceased, who came on purpose from Carlsruhe. Several other officers, friends of the deceased, were prevented from attending by being ordered to keep their barracks. M. de Haber has taken refuge in France.—The German papers confirm the report that Prince Gustavus, son of the late King of Sweden, has applied for a divorce from his wife Princess Stephaniea of Baden, after thirteen years of marriage.

ITALY.—A rupture has taken place between Sardinia and Tunis which is likely to lead to hostilities, the Sardinian Government having sent a squadron to blockade Tunis. Letters from Constantinople of the 29th ult. state that the Sardinian Minister had presented to the Divan a note from his Government, informing it of the differences that had arisen with the Bey of Tunis, who, in violation of treaties, had impeded the trade of the Sardinian merchants and prevented them from exporting goods and merchandise which they had purchased in the Regency, and on which duties had been levied by the Tunisian Government. The Envoy added that an *ultimatum* had been forwarded to the Bey, and that if he did not accede to it the King of Sardinia would be under the necessity of sending a fleet to blockade the harbour of Tunis. The

Porte replied that it had no knowledge of the treaty of commerce concluded between the King of Sardinia and the Bey of Tunis, that the Bey had acted of his own accord in the affair, and that the Ottoman Government could not decide who was right or who was wrong.—Letters from Naples are filled with accounts of the success of a musical prodigy called Favante who has lately made her appearance there under extraordinary circumstances of enthusiasm. She is said to be extremely beautiful, and it is reported that she possesses a voice one of the most extensive ever known, enabling her to sing the parts of the contralto, the mezzo-soprano and soprano with equal ease. Her voice which is not only powerful but sweet has been brought to perfection under the guidance of Lablache. It is said that nothing can exceed the excitement prevailing respecting her; she fills the theatre nightly with an overflowing audience at raised prices, whilst all the other houses are deserted.—The celebrated Madame Catalani who for twenty-two years held with so much *eclat* the sceptre of song has just died, after a short illness at the age of fifty-nine, at her villa near Sinigaglia in the Papal States, where she was born in 1784. She made her *débüt* on the stage at Venice when only fifteen and retired in 1831. She married a Frenchman, M. de Valabrigue, a native of Burgundy, who died in 1828, and by whom she had three children. Madame Catalani has left a fortune estimated at about £332,000.—The naturalist Gemmellari has published a letter in the *Naples Journal*, descriptive of some of the effects of the eruption of Etna: "Of the hundred known eruptions of Vesuvius," he says, "eighty have been in November and December. On the 13th of November a crevice opened on the west side of Etna, 400 yards long and 40 wide. I could only get within a mile of it. A stream of lava about six miles long ran at my feet, with a rapidity that I calculated at a yard in a second. The stream was $2\frac{1}{2}$ miles wide when it reached Monte Egitto. It followed the lava stream of 1832, and in four days menaced the village of Bronte; but it turned off towards Aderno, and threatened to turn into the river Simeto. A crowd of curious gathered to watch the effect of the lava stream running into a little lake of water. Fatal curiosity! It produced an explosion like a powder mine. Out of 30 of them 25 were severely wounded. The lava stream stopped short of the river Simeto, having run about fourteen miles in all, ten of them in four days." A curious circumstance took place at Catania the night before the eruption. A fine rain fell which changed the colour of the silk in the umbrellas, and burnt it. A professor of chemistry having analysed this rain, found that it contained a large quantity of muriatic acid.

GREECE.—It is stated by the Ministerial papers that Count Nesselrode, who arrived at Windsor a few days since, is the bearer of the ratification of the Emperor Nicholas to all the proposals which were suggested by Prince Wallerstein during his mission here, respecting the final settlement of the affairs of Greece. It is said that the Emperor not only consents but is anxious that a constitution upon the most liberal principles should be secured to the Greeks.

TURKEY, &c.—Accounts from Constantinople of the 7th state that intelligence had reached that city of the safe arrival of Dr. Wolff at Trebizond, where he had been very courteously received by the English Consul Mr. Stevens and other English gentlemen, who made a very handsome subscription to facilitate the objects of the expedition. Sir S. Canning who has been unremitting in his exertions on behalf of the persecuted Nestorians, has at length prevailed on the Porte to send a commissioner to Mosul with orders to put an immediate stop to the savage warfare of the Kurds. The individual appointed is Kemal Effendi, a Kiatib of the Porte, a man of respectable character, who it is hoped will do his duty impartially. The Pacha of Mosul strongly denies having instigated the Kurds to attack the Nestorians; but the affair is involved in much mystery, and there is reason to believe not only that the Pacha but the Porte also was accessory to the massacre. The disputes of rival missionaries who mutually accused each other of promoting political intrigues under the cloak of religion, had excited the fears and the suspicions of the Pacha of Mosul, who began to imagine that the independence of the Nestorians might become a very dangerous element of foreign encroachment.—From the Danube we learn that the Servian Government has determined on forming four great lines of Post-office roads, of which Belgrade is of course the starting point. The first is the easterly line which runs parallel to the right bank of the Danube by Semendria and Passarowitz, where the famous treaty was concluded, and terminates at Negatin within a few hours' journey of Widdin. The second is the south-easterly line, which follows the high road to Constantinople as far as Alexinitza, which is 126 miles from Belgrade. This is the most frequented route in Servia, for it is in immediate connexion with Sophia, Philippopoli, and Adrianople. The first spare funds that the Government can dispose of are to be applied to the construction of a complete macadamised road along this line, for as it goes through the rich valley of the Morana, it will infallibly develop the resources of the best agricultural district in Servia. The third is the south-westerly line, which after passing by Kragojewatz, the official capital of Servia, in the time of Milosch, goes to Uschitza and the Mocragora, and thus communicates with Montenegro and Herzegowina. Uschitza has, next to Belgrade, the largest Turkish population, and is the only place in the interior where they are allowed to reside. The fourth is the westerly line, and goes up the right bank of the Save to Shafatz and Louvitz, on the frontier of Bosnia, and thus establishes the connexion with this exten-

sive province. The English plan of uniformity of postage has been adopted for all distances, great and small. Letters of 3 drachms and under to pay a piastre, or 2d.

EGYPT.—Letters from Alexandria of the 12th state that the Pacha is still in Upper Egypt. One of his Highness's last extraordinary feats is the carrying up the first cataract of the Nile a small steamer by the sheer manual force of some 2,000 men, which was successfully accomplished, and this vessel has thus been enabled to navigate as far as the second cataract. It is intended to keep her in that division of the Nile for the present; thus materially facilitating the communication with Dongola and Senaar. It is considered probable that the real motive of the Viceroy's always proceeding to Cairo and Upper Egypt in the winter is to enjoy its beautiful climate at this season, while on the sea-coast, including Alexandria, a disagreeable damp and cold atmosphere prevails throughout the winter. On the 28th ult. a destructive conflagration took place at Cairo. The fire broke out in the Khamzaoui Bazaar, of which one-third was burnt, and the loss is estimated at two millions of Turkish piastres.

INDIA AND CHINA.—An extra India mail, direct from Calcutta to Suez, has brought dates from India and China considerably later than those of the last regular Bombay mail. Those from Calcutta come down to the 19th ult., and yet give little news from that quarter, except the extreme abundance of the indigo crop. The news from the Punjab is important as contradicting the reports of Heera Singh's murder. Lena Singh also survives; and both these chiefs, though previously opposed to each other, are reconciled for the moment, and wield joint sway over the 10,000 men collected in the vicinity of Lahore. To keep these men in obedience would, however, require a certain revenue from the provinces and their chiefs, of which there seemed little prospect. Goolab Singh preserved his hostile attitude. The forces left in guard of Peshawur had deserted it. Except the distribution of ammunition to the army of observation and the announced purpose of the Governor-General to visit the north-western provinces, there are no tidings of the intentions of the Indian Government. At Gwalior, the Khasgee has been seized by the troops without bloodshed, and his reign is at an end. It is supposed that this event will render the advance of an army unnecessary. The accounts from Sukkur are more distressing than ever. It appears that of the troops there 1,371 are in hospital, and only 153 well. Every officer but one in each corps is inefficient from illness. It was currently reported that Dost Mahomed had been shot dead at Cabul by order of the Khan of Bokhara. It is said that the Khan sent several papers, with his own seal, to Cabul, stating that whoever should kill the Dost would go to heaven. This event will probably lead to a suspension of any effort on the part of the Afghans to occupy Peshawur.—The *Madras Examiner* contains the report of a temperance meeting which had been held by a society called "Father Mathew's Society," at Secunderabad. Tea was served up at a new temperance hall to about 150 persons, and much good is anticipated from the introduction of those habits of sobriety enjoined by the rules of the fraternity.—The journals of Victoria, Hong Kong, are to the 12th October. The sickness in that island had been such as to induce the officers of the Government to remove for a time to Macao. Mr. Secretary Morrison, Mr. Mercer and Mr. Scott have died of the fever, and the troops have suffered severely. A Committee of Public Health has been appointed, and it remains to be seen whether the cause of the unhealthiness of the colony can be removed by human means. Some parts of the town of Victoria are by experience known to be less healthy than others, and most of the cases of sickness have occurred at both the western and eastern extremities of the town, although they have by no means been confined to them. The trade had been opened with the ports of Foochowfoo, Amoy, Ningpo, and Shanghai, Messrs. Gribble, Thom and Balfour being appointed consuls to the three latter ports. Notwithstanding the previous confinement of the trade to the military stations, it had been carried on to a great extent since the signature of the treaty. More than a million and a half of dollars' worth of India and Straits produce, exclusive of opium, were disposed of at Chusan and Amoy, and other towns of the east coast. The raw cotton imported from India to China amounts alone to more than the previous annual export of British manufactures to China, whilst the opium trade surpasses calculation. Some inconvenience was felt at Canton at first in consequence of there being no responsible persons like the Hong merchants to deal with. Sir H. Pottinger declares the answer of the Chinese commissioners when applied to on the subject as most satisfactory.

UNITED STATES.—The New York packet-ship Independence, so well known for making quick passages and being annually the bearer of the American President's Message on the opening of Congress, arrived at Liverpool on Wednesday, with papers to the 8th inst. her day of sailing. Congress opened on the 4th and the Message was delivered on the 5th. The following is the passage relating to this country in connection with the Oregon territory:—"Since the last adjournment of Congress the executive has relaxed no effort to render indestructible the relations of amity which so happily exist between the United States and other countries. The treaty lately concluded with Great Britain has tended greatly to increase the good understanding which a reciprocity of interest is calculated to encourage, and it is most ardently to be hoped that nothing may transpire to interrupt the relations of amity which it is so obviously the policy of both nations to cultivate. A question of much importance still remains to be adjusted between them. The territorial limits of the two countries in relation to what is

commonly known as the Oregon territory still remain in dispute. The United States would be at all times indisposed to aggrandise themselves at the expense of any other nation; but while they would be restrained by principles of honour, which should govern the conduct of nations as well as that of individuals, from setting up a demand for territory which does not belong to them, they would as unwillingly consent to a surrender of their rights. After the most rigid and as far as practicable unbiassed examination of the subject, the United States have always contended that their rights appertain to the entire region of country lying on the Pacific, and embraced within the forty-second and fifty-fourth degrees 40 m. of north latitude. This claim being controverted by Great Britain, those who have preceded the present Executive, actuated, no doubt, by an earnest desire to adjust the matter upon terms mutually satisfactory to both countries, have caused to be submitted to the British Government propositions for settlement and final adjustment, which however have not proved heretofore acceptable to it. Our Minister at London has under instructions again brought the subject to the consideration of that Government, and while nothing will be done to compromise the rights or honour of the United States, every proper expedient will be resorted to in order to bring the negotiation now in the progress of resumption to a speedy and happy termination. In the meantime, it is proper to remark that many of our citizens are either already established in the territory or are on their way thither for the purpose of forming permanent settlements, while others are preparing to follow—and in view of these facts, I must repeat the recommendation contained in previous messages for the establishment of military posts, at such places on the line of travel as will furnish security and protection to our hardy adventurers against hostile tribes of Indians inhabiting those extensive regions. Our laws should also follow them, so modified as the circumstances of the case may seem to require. Under the influence of our free system of government new republics are destined to spring up at no distant day on the shores of the Pacific, similar in policy and in feeling to those existing on this side of the Rocky Mountains, and giving a wider and more extensive spread to the principles of civil and religious liberty." With respect to the detention of American vessels, the President informs the House that in several cases of vessels detained as slavers by British cruisers off the coast of Africa reparation has been promised, in a few that full satisfaction has been allowed. The President takes a threatening tone in adverting to the continued war between Mexico and her insurgent province of Texas. He goes so far as to intimate that somehow or other the war must cease, for that the interests of the whole continent demand its cessation. He counsels a revision of the tariff, to be conducted on the principles of moderation in scale and permanency and stability in legislation, but disappoints those who had hoped to hear him speak for a very near approach to free trade. He expresses warm congratulations on the general prosperity of the country and on the peaceful aspect of the intercourse with most foreign nations. He also expresses high hopes from the negotiation of a commercial treaty with the States included in the German Customs Union, which seems to offer terms most advantageous to American trade. These, with a budget of local, fiscal and political matter, and the information that if an increase of revenue do not flow in from some quarter a deficit of 4,000,000 dollars may be expected at the close of 1845, form the chief points of interest in the message.

CITY.

Money Market, Friday.—Consols closed at 96½ for the opening; Three per Cents. Red., 97½ to 98; Three-and-Half per Cents., 102½; New Three-and-Half per Cents. Red., 101½ to 102; Bank Stock 183½ to 184.

Metropolis and its Vicinity.

The Christmas Holidays.—Tuesday being the general holiday in consequence of Christmas-day falling on a Monday, all the exhibitions were crowded with visitors. At the British Museum the number of visitors was 18,377. They exhibited the utmost decorum notwithstanding the crowded state of the rooms; there was no single case of robbery, no damage committed, and no person was refused admission on the ground of intoxication. The number of visitors this Boxing-day was nearly 10,000 less than last year, when they exceeded 28,000. The National Gallery was visited by about 10,000 persons. As a striking contrast to these returns of free public exhibitions, the visitors to Westminster Abbey on Tuesday were only 300, while at St. Paul's they only amounted to 25. The Chinese Collection on Tuesday was visited by upwards of 4000 persons; the United Service Institution by upwards of 100; and the Tunnel by many thousands who crowded to the spot by every available conveyance until evening. The Polytechnic Institution and the Adelaide Gallery were also visited by large numbers, and showed that both exhibitions still retain their popularity.

New Royal Exchange.—On the 20th inst. Mr. Tite sent to the Gresham Committee his report on the state of the New Exchange. It appears from this document that very little now remains to be done in the decorative portion, the roof is nearly completed, and the tower is completed to the cleaning down of the stone work, which will be done whilst the scaffold is removing. With regard to the sculpture Mr. Tite reports that every figure has been transferred from the model to the stone, and that a month's labour will complete the work, so that it will be ready for

hoisting within that period. When the sculpture shall have reached its position the finishing touches will be given to it by Mr. Westmacott. Judging from its present advanced state the architect entertains no hesitation in assuring the committee that if necessary it could all be in its place and completely finished within two months from this date. The dials and hands of the clock have been prepared, and will be placed as soon as the scaffold has been sufficiently removed to enable the men to place them with safety. The machinery of the clock is very nearly completed and the only thing remaining unsettled is the arrangement with respect to the actual tunes of the chimes. Upon that subject Mr. Tite had consulted Professor Taylor, the Gresham lecturer on music, and hoped that before the next meeting of the committee he should be prepared to report the result. The moulds for some of the bells have been prepared, and in the course of a month several of them will be cast. Mr. Tite concludes with congratulating the committee at the close of the third year of the work, on the favourable state of the seasons throughout the whole period. The mildness of last winter and the unusually fine spring which followed were greatly in favour of building operations, and though the early part of the summer was wet, yet since August up to the present time scarcely a day had been lost by interruption from the weather. He states that he can see nothing at present, unless some unusually severe weather should occur after Christmas to prevent the realisation of his hopes that the contract will be completed in the time originally agreed upon.

City Statues.—The bronze equestrian statue of the Duke of Wellington, to be placed opposite the entrance to the new Royal Exchange, is proceeding rapidly towards completion under the direction of Mr. Weeks. The statue of William IV., from the design of Mr. Nixon, to be placed at the junction of Gracechurch-street and King William-street, will be shortly raised upon its pedestal. The figure is colossal, being upwards of fourteen feet in height. It is executed in Devonshire granite, and will cost when complete 2,200l., which sum was voted by the corporation for that purpose. His Majesty is represented in the costume of a high admiral. Upon the round pedestal is sculptured a wreath of laurel, in the centre of which an appropriate inscription will be engraved. It is worthy of remark that the spot upon which this statue will be erected, is the exact site of the famous Boar's Head of Eastcheap; a sign rendered so memorable by Shakspeare. A statue by Mr. Nixon is likewise in a forward state, of John Carpenter, the town clerk in the reign of Henry VI., founder of the City of London Schools, and executor to the celebrated Whittington. This statue is six feet high, and will be executed in Rock Abbey stone, similar to that used for the friezes and pediments in front of Buckingham Palace. It is to be placed upon the first landing of the staircase of the City of London schools, opposite the principal entrance. Mr. Nixon has also, in preparation, a statue of Sir John Crosby, to be placed in Crosby Hall, Bishopsgate-street. The model exhibits the knight in the "winged" armour of the period, examples of which may be met with in the Tower &c., and at the tomb of the knight himself in St. Helen's church.

St. Stephen's, Walbrook.—Another attempt was made on Friday to convene a select vestry in this parish, which was successful in consequence of the precautions taken to exclude the ratepayers. Roe and Forester, the Mansion-House officers, were stationed at the entrance of the church, and prevented any persons but the members of the select vestry from entering the building. Mr. Rock, one of the parishioners, determined to try the right of the officers to exclude him, and pushed the door as if to force it open, whereupon the officers immediately laid their hands upon Mr. Rock, who immediately went to the Mansion-House and stated the whole matter to the Lord Mayor. After hearing the circumstances, the Lord Mayor assured the parishioners that he had not sent the officers to exclude them. It was then stated that they had been sent by Alderman Humphrey, but this has since been denied by the Alderman himself. Upon returning to Walbrook more knocks were given at the church-door, and amongst them the churchwardens of St. Benet's Sherehog demanded admittance, but without effect. A great crowd remained in the street opposite to the entrance of the church until some time past three o'clock, when—at apparently a signal from within—the officers relinquished their post at the church-doors. It was then given out that the members of the select vestry had left the church by some back entrance; and upon hearing this the populace quietly dispersed. It is understood that at the vestry Alderman Gibbs submitted his book of accounts, upon which the vestry resolved that they be printed and published. It was also resolved that a rate of 1s. in the pound be levied for the relief of the poor for the year ensuing.

The Gas Companies.—A meeting of the inhabitants of St. Martin's-in-the-Fields, convened by the churchwardens, was held at the vestry-room last week, to take into consideration the present mode of supplying the public with gas, and to devise some means of establishing a standard of purity and of measure for the same. Mr. Jones said that public experiments made in the early part of the present year in the presence of the gas-metre makers themselves, proved that the metres in general use now, while they afford ample protection to the gas companies, register from 3, 4, and even 5 per cent. at the level line to 32 per cent. against the consumer. A metre made by one of the best makers in London was tested under the superintendence of the maker himself, when it could not by any contrivance be made to work against the gas companies, though it was easily worked to the amount of 22 per cent. to the prejudice of the consumer. With

respect to the quality of the gas at present supplied, it was stated that if the gas companies paid proper attention to the illuminating power of their gas and not to the greatest amount of coke they could produce, they would be able to increase the light twofold. This was proved by the fact that the gas in Edinburgh produced from Cannel coal, where there was no desire to obtain a large amount of coke, had double the illuminating power of the gas supplied by the London gas or rather the London coke companies. To show how exorbitant the charges of the gas companies were, Mr. Jones mentioned that one of them charged the proprietors of Vauxhall Gardens upwards of 900l. for inflating the Nassau balloon fourteen times and a lesser one four times, whereas afterwards the proprietors, from gas made by themselves, inflated the balloon the same number of times at a saving of more than 700l. He thought these facts made it imperative on the meeting to appeal to the Legislature for interference with the gas monopolies, in order to secure to the public a fair standard of measure and quality in the matter of gas. Several gentlemen bore testimony to the above statements, and it was ultimately determined to adjourn the meeting to the 4th January, when a committee would be appointed to wait upon Sir J. Graham and on the directors of the different metropolitan gas companies.

Lincoln's Inn.—Mr. C. P. Cooper, Queen's Counsel, has recently presented to the Hon. Society of Lincoln's Inn his valuable collection of works on foreign and civil law. The Benchers in acknowledging the gift have expressed their intention of preserving the collection together, and of having it catalogued under a title commemorative of the munificence of the donor. The collection, in addition to civil law, consists of the works of the most eminent jurists of France, Spain, Portugal, Italy, Russia, Austria, Bavaria, Poland, Prussia, Holland, Denmark, Sweden, Norway, and America.

Mr. Burford's Panorama.—A new panorama has been opened in Leicester-square, representing the landing of her Majesty at Tréport, and her reception by the King of the French, and the members of the French Royal Family present on that occasion. The town, the coast, and the entrance to the harbour have been faithfully depicted by the artist, who had the advantage of being an eye-witness of what he has painted, and of having taken his sketches on the spot at the time most propitious to obtain correct views. The principal group is the Royal Family, who have just landed from the state barge of the King's yacht the Reine Amelie. The Royal party are moving towards the Pavilion; they consist of Queen Victoria, the Queen of the French, Madame Adelaide, the Queen of the Belgians, the Princess of Saxe Cobourg, the Princess de Joinville, and the Duchess of Orleans, the King of the French, Prince Albert, the Prince of Saxe Cobourg, the Prince de Joinville, the Dukes de Montpensier and d'Aumale, Lord Aberdeen, and Lord Liverpool, &c. This part of the picture is perfect, and those who were not present at Tréport will obtain by seeing it a perfect notion of the event. The French troops form a conspicuous portion of the panorama, and together with the boats and marine objects help to make a very effective scene.

St. Leonard's, Shoreditch.—A meeting of the ratepayers of this parish was held on Tuesday for the purpose of making a rate for the relief of the poor, and a stormy discussion took place. A rate of 11d. in the pound was proposed, but it was stated that at the last vestry a ninepenny rate only would be demanded, and a resolution condemnatory of the former rate, and of the trustees of the poor for proposing it was directed by the senior churchwarden to be entered on the minute-book, but he refused to put it to the vote. A long discussion then took place on the practice adopted in the burial of paupers, the undertaker's bill showing that the parish paid only 7½d. each for the coffins of pauper children, and that 5s. 5d. was the highest price paid for the adult poor. It was stated that these coffins were not fit to put a dog in, but the object was that the bodies should decompose quickly, as the pauper burial-ground was so crowded as to become a perfect nuisance. The Churchwarden admitted that there was too much reason to complain of the interment of paupers. It was ultimately resolved that the subject be brought forward at the next vestry, and that the curate be requested to attend. The proceedings were at length closed by the adoption of a rate of 8d.

St. Pancras Workhouse.—An inquest was recently held on the body of a female pauper who died in this workhouse named Ann Humphreys, at which statements were made by the witnesses as to the employment of the female paupers in making shirts for one farthing each, that they stewed up each other's tea-leaves and were compelled to sleep four in one bed. In consequence of the publication of these statements in the papers, the Poor Law Commissioners thought proper to call upon the Guardians for an explanation. At the last weekly meeting of the Board the answer of the Guardians was read, from which it appears that "in conformity with the Local Act 59 G. III. the poor in St. Pancras Workhouse are allowed a portion of their earnings not exceeding one-sixth by way of encouragement, to expend it as they think proper, provided they do not violate the rules of the house. The lowest price at which work is taken at the workhouse is 2s. a dozen for the coarsest slop-shirts, no alteration in price having been made for the last twelve years. Some are taken at 3s. 6d. per dozen, and at intermediate rates. With respect to the statements as to the number of persons sleeping in one bed, the directors inform the Poor Law Commissioners that those statements are not correct, adding that they have reason to believe that no such statements were made, and that no reporter was present at the inquest. They state that there are some extra large beds in the women's wards, a few of which are occu-

pied by three persons when such accommodation is required, but generally only two sleep together; and never was such a thing known in St. Pancras Workhouse as four in a bed or any person sleeping on the floor."

Middlesex Hospital.—On Thursday a general court of the governors of this hospital was held in the board-room of the institution, Mr. Fielder in the chair, for the purpose of electing an assistant-physician to the hospital, vacant by the resignation of Dr. Watson. The candidates for the vacant office were Dr. Seth Thompson and Dr. Woodfall. After a spirited contest, which lasted during the day, the numbers at the close of the poll were announced as follows:—For Dr. Thompson, 369 votes; for Dr. Woodfall, 242; majority for Dr. Thompson, 127. Amongst the governors present were H.R.H. the Duke of Cambridge, the Duke of Sutherland, Lord Radstock, Lord Teignmouth, Lord Calthorpe, Sir Robert Inglis, Sir George Duckett, &c.

Westminster Bridge.—On Saturday the carriage-road of Westminster-bridge was thrown open to the public. The improvement is considerable, the height of the centre having been materially reduced and rendering the acclivity much less. The lowering of the carriage-way has left the foot-way considerably above, but in order to protect the foot-passengers a number of strong posts have been erected, intersected by an iron bar. A thick coating of broken granite has been laid on the road-way.

Mortality of the Metropolis.—The number of deaths registered in the week ending Saturday, Dec. 16, was as follows:—West Districts, 126; North Districts, 165; Central Districts, 205; East Districts, 235; South Districts, 236; Total, 967 (males, 491; females, 476). Weekly average for the last five years, 903 (461 males, 442 females); and for the last five autumns, 908.

Provincial News.

Incendiary Fires.—The following are a few of the more important fires reported in the local papers this week:—At Navenly on Friday on the farm of Mr. Clark Hales, wheatstacks containing 10 quarters and a stack containing 30 quarters of barley destroyed.—At Eakring on the 12th in the stackyard of Mr. R. Storey, two stacks destroyed.—At Binbrook on the 16th on the farm of Mr. Johnson, a large barleystack destroyed.—At Corfe Castle on the farm of Mr. Waters of Rollington on Saturday a wheat rick containing 12 or 13 loads of sheaves destroyed.—At Speen, Berks, on the farm of Mr. Price on Tuesday night a pea-rick and on the following morning a hay-rick destroyed.—At Campion's Farm, near Harlow, on Monday night an outbuilding and farming implements destroyed.—At Eaton Socon on the farm of Mr. Hall on the 16th nine large stacks and hovels, containing about 100 loads each, destroyed.—At Necton, Norfolk, on the 15th on the premises of a small occupier of but a few acres of land, the produce of three acres of wheat, two of barley and six of hay, destroyed.—At Repps near Acle, in the same county, on the farm of Mr. Moore, on Friday week, the premises fired and partially consumed.—At Watisford, Suffolk, on Wednesday week, two stacks and outbuildings on the farm of Mr. Nunn, destroyed, and on Friday at Thurston, in the same county, the farm-buildings and a stackyard belonging to Mr. Jennings destroyed.—Near High Roothing Essex, on Friday last the outhouses on the farm of Mr. Speller, consisting of two bays of wheat, two of barley, a quantity of beans and other corn, all the farming implements on the premises, the brew-house, wash-house and their contents, a sow and nine pigs, and 100 head of poultry destroyed.—At Little Waltham on the farm of Mr. Bird, on Sunday afternoon, a barn containing only loose straw and sawn timber, a barleystack, the produce of 12 acres, a wheatstack the produce of eight acres, a haystack containing 10 loads, about 12 loads of tare hay and a waggon consumed.—At Morton's-field, in Great Moor-lane, Stockport, on the 20th a haystack the property of Mr. Oldham destroyed.—At Pollicott, Bucks, on the 18th, on the farm of Mr. Malins, a hay-rick destroyed.—At Wigmore Hall near Luton, Beds, on the 14th on the farm of Mr. Gutteridge, every barn, shed, stable and sty on the premises and some cattle destroyed.

Bath.—Mr. Roebuck, M.P. for this city, has published a letter denying the truth of the rumour of his having been appointed to an Indian judgeship. Mr. Roebuck says:—"It may possibly save the expectants of a vacancy in the representation of Bath some trouble for me to state, emphatically, that I never, either from the present or any preceding administration, solicited for myself any place; and that no place, either in or out of England, will be sought by me, or accepted if offered, from or by those now in power."

Birmingham.—On Thursday week Mr. Commissioner Balguy delivered his judgment, on the application of Mr. Phillips, one of the partners in the Leicester Bank, for his certificate. His Honour said, that when the bankrupt last came before him, on the 21st November, with Messrs. Mitchell and Clarke, he held the opinion which he still entertained, that he was not entitled to his certificate; but for his own sake, and that of the individual now before him, he felt it right, before he delivered his judgment, to consider most fully, maturely, and deliberately all the facts of the case. The Chief Commissioner went over, at considerable length and with great minuteness the facts connected with the bankrupt's share in the history of the bank, and the circumstances under which he had seceded from Mansfield and Co.'s bank and established the Leicestershire Company. On reviewing these proceedings, he found that, with a nominal capital of 20,000*l.* only, Mr. Phillips permitted five parties—speculators and adventurers many of them—to get into debt to the concern to the amount of 300,000*l.*, or there-

abouts. His Honour then referred to the manner in which the accounts of the bank were kept, from which it was impossible for any person of ordinary acquaintance with business to ascertain its actual state, and said it was clear to him that Mr. Phillips must have known the insolvent state of the bank when the new partnership was formed, and when Mr. Mitchell was induced to embark his money in the concern. Under all these circumstances, painful as it was to him to perform the duty—for he could perfectly well estimate the feelings of Mr. Phillips, who from the sphere of life in which he moved must be keenly alive to the impression made on his character—painful as it was, he felt bound to come to the determination of refusing his certificate.

Bristol.—The underwriters at Lloyd's through the directors of the Great Western Steam Ship Company have presented Captain Hosken, of the Great Western, with the sum of 100*l.*, in testimony of their high opinion of his nautical skill in having successfully accomplished 64 passages to and from America.

Bury.—"We mentioned," says the *Bury Post*, "a few weeks ago the extraordinary visitation of rats in this neighbourhood. On the farm of Mr. Harlock, of this city, no fewer than 4,736 were destroyed by two men, with six ferrets and three dogs, between the 4th November and the 8th December. Mr. Harlock estimates his loss this year from the rats, on his growing crops of wheat alone (about three hundred acres) at upwards of 200*l.* Other farmers are sufferers to a proportionate extent; indeed, the increase of these vermin this year is universally observed, the land in many places being completely undermined by them."

Cambridge.—At Earl Hardwicke's annual rent audit held last week in this town, his Lordship is reported to have made the following declaration:—"After alluding to the late incendiary fires, he urged upon the farmers the advantages of adopting an improved system of cultivation, by which they might grow a double quantity of corn. He then observed that there had lately been a great deal of agitation on the subject of the corn-laws. For himself, he in common with Sir R. Peel and the Duke of Buckingham was opposed to free trade, but he thought that ultimately free-trade principles must prevail. But he conceived the result would not be so disastrous as had been anticipated."

Carmarthen.—Considerable excitement has been caused in this county by the discovery of the body of Mr. Thomas of Pantycerrig, in the river Brechfaedd near Brechfa. It appears that some time since Mr. Thomas gave information against some neighbouring farmers' sons for a riot and assault upon him while under the guise of Rebeccaites. On that occasion he attended Carmarthen in order to give his evidence, and on his return home he found it in a blaze. On Tuesday week Mr. Thomas's corpse was found in the Brechfaedd, which is a small stream having a rocky bed. From the previous occurrences that had taken place suspicion was excited that foul play had been used, and that he came to his death by unfair means. It was proved however that near the spot where he was found the trunk of an Ash-tree is thrown across the stream at a height of about seven feet from its bed. Across this Mr. Thomas must have passed, and he might have fallen from it as he had been walking over a muddy soil, and the tree was a round one and extremely difficult to walk upon. The Jury under these circumstances returned a verdict of Found Dead.—The Rev. Mr. James, a magistrate who has taken an active part in the committal of the Rebecca rioters, was fired at on Monday week while in his dressing-room preparing to go to bed. Two shots were fired at him, one a ball penetrated his right arm and passed through the muscular part between the elbow and shoulder and was found in the room. The other charge was small shot which took effect upon the shutters only, and at the same instant a third charge of small shot was fired into the front bedroom where Mrs. James was, providentially without doing any other injury than smashing the glass.

Chatham.—The following is the finding and sentence of the Court-Martial on the charges brought against Captain Clendon of unlawfully receiving money of a recruit while stationed at Chelmsford:—"The Court after maturely deliberating on the evidence against Captain Clendon, are of opinion that he is not guilty of ungentlemanly or unofficer-like conduct, tending to bring the corps to which he belongs into disrepute, or of receiving the money with wilful intent, but having received it from an error in judgment and without due consideration, sentence him to be reprimanded."

Farnborough.—On Friday an inquest was held at Keston, near this town, on the body of Miss Charlotte Chapman, the daughter of Mr. Chapman, schoolmaster of that place, who was found in one of the ponds at the source of the Ravensbourne, on Keaton-common. The father of the young lady said, that he believed it had been purely her own act during a fit of temporary derangement brought on by witchcraft. He could not account for her state of mind. Had often spoken to her, but she was always silent. Since her death he had been told by the family that about 15 months ago she went with a party to Greenwich, and was induced against her will to have her fortune told, and that the witch told her "she would not die a natural death." The jury returned a verdict that deceased committed suicide during a fit of temporary insanity.

Huddersfield.—After the close of the distribution of the prizes to the successful students of the Huddersfield College last week, a banquet was given to Lord Morpeth, in the College Hall, which was fitted up for the occasion. In acknowledging the toast of his health, Lord Morpeth said:—"Since the period when we last met together I have been, as you are probably aware, at a considerable

distance, not only from the riding, but from my native country; but go where I would I still found myself within reach of Yorkshiremen. I remember I had scarcely landed in the New World when, having to ascertain the nearest way to the house which I wished to reach, I asked the first person I met with to show me the path, when pointing in a particular direction, he said 'You will find that the gainest way.' I said, 'I am sure that is not an American word,' and a good honest Yorkshireman he turned out to be. Again when I was travelling that region of the country that is called the Prairies, which are vast tracts of rich grass land, generally in an unreclaimed state, but fitted from their natural fertility for the production of crops of every description, I came to a town round which all the farms seemed to me to be in a particularly promising and favourable condition. I inquired about the circumstances of the neighbourhood, and I was told that about that place—the town of Jacksonville—a colony almost entirely of Yorkshiremen had planted themselves; and hence I was glad enough, I assure you, to infer the flourishing state of the crops and farming in the neighbourhood. I had the pleasure of paying a visit to one of the most eminent statesmen in America at his country residence. I mean Mr. Clay, and he praised to me the fidelity and long and able services of his female servant, who turned out to be a Yorkshireman. Yorkshirewoman I mean. That will remind you that I have been in Ireland as well as America. The only lesson I wish she had inculcated on her master, who is a supporter of the American tariff is, that she had made him a better friend to free trade all over the world. (The meeting here rose and cheered most enthusiastically for some time.) I will only trouble you with one more of my Yorkshire-American associations, which is this.—I found several old Yorkshiremen in the great city of New York, who from old recollections were kind enough to entertain me at a public dinner, and I there was told that the state of New York goes by the name of the Empire State of the Union; and all the company who assembled at that dinner were perfectly agreed as to the propriety of our christening the old county of York the Empire County of Old England."

Launceston.—The following paragraph appears in the *Falmouth Packet*:—"Last week, a poor woman of the parish of North Tamerton, supposed not to be in a sound state of mind, deliberately walked into the Tamer, and was drowned; the circumstance was soon discovered, and the river dragged without her being found. A consultation then took place, and an elderly person said he remembered a great many years ago they threw penny loaves into the water on such an occasion, and where the loaves stopped the body was found. This plan was adopted, after riding three miles or more for six penny loaves, which were thrown into the water, and floated down the stream for some distance, until by a circling eddy they were gathered to one place, where they remained. It was then concluded the body was under, or at the bottom; the spot was dragged, and it was found."

Leicester.—The following paragraph appears in the *Leicester Chronicle* under the head of "Mormonism":—"A correspondent informs us that this strange sect has obtained a footing in this town, and meets on Sundays and Tuesdays, near St. Nicholas's Church, when the initiated members speak in the 'unknown tongues.' After one has thus spoken, another brother interprets the mysterious language. Upwards of one hundred persons are said to have already joined the 'latter day saints.' They 'take the sacrament' in common with other sects, baptize, lay on hands, and believe the Book of Mormon to be equal in importance to the Mosaic Writings, or the New Testament."

Liverpool.—A most destructive fire broke out on Wednesday morning on the premises of Messrs. Brancker and Co., in Matthew-street, which comprise one of the most extensive sugar-refining establishments in the kingdom. The fire broke out in the warehouse department, and rapidly extended, so that in a few hours the whole was enveloped in flames. In the falling of one of the warehouses, a number of workmen who were employed in trying to save the property were buried in the ruins, and seriously injured. It is impossible at present to estimate the amount of damage, but it is said that there was not less than 50,000*l.* or 60,000*l.* worth of sugar on the premises.—On Wednesday afternoon a large East Indian, called the Meg of Meldon, which only arrived from Calcutta a few days since with a cargo of saltpetre, hemp, &c., took fire in the Waterloo-dock, and was scuttled in order to prevent further mischief. The damage is estimated at 10,000*l.*

Manchester.—It is stated that Lord Francis Egerton has purchased the Old Quay Company's extensive carrying concern between Manchester and Runcorn and Liverpool, with all their warehouse, as well as their entire other property in those places, for 400,000*l.* The Old Quay Company's property was held by a small proprietary in about 500 shares, so that his Lordship, if the gross sum above named be a correct one, has paid 800*l.* per share, or more than double the sum quoted of late in the best authenticated Share Lists. Lord F. Egerton will thus have the entire control of the water conveyance between Manchester and Liverpool, and even in the most populous parts of the West Riding of Yorkshire.

Newcastle.—The local papers state that an ingenious plan has been suggested of crossing the Tyne by passing through a tunnel under the river, on the principle of the centrifugal railway. The carriages would descend by their own gravity into the tunnel from one side, and rise up on the other by the momentum acquired in the descent. It is proposed to construct the tunnel of metallic tubing, and lay it, just within the bed of the river, so as not to

form an obstacle to the navigation; the tunnel to be constructed of such a bore as to obviate the possibility of the carriages getting misplaced in their passage. Railway carriages and vehicles of all kinds, as well as passengers, would thus be safely and rapidly transferred from one side to the other. It is considered that with the present low price of iron, three tunnels might be cheaply constructed, all starting from the station of the Brandling Junction Railway, one proceeding in the direction of Neville-street, the other in that of the Castle-garth, and the third going towards the station of the Newcastle and North Shields Railway.

Norwich.—A competition is at present going on among artists for the commission to perpetuate the memory of the late Earl of Leicester, and to commemorate the improvements in agriculture which were fostered under his patronage during the greater portion of his life. The memorial is to be a column of about 120 feet high, with emblematical devices. The subscription consists of 4,000*l.*, which the erection of the column is to cost, exclusive of the stone, which has been presented by Lord Hastings from his quarries at Seaton Delavel. The monument is likewise intended to serve as a landmark to the eastern coast of England. It will be erected at Holkham, near the seat of the late Earl.

Railways.—The following are the returns for the past week:—Birmingham and Derby, 1,300*l.*; Birmingham and Gloucester, 1,594*l.*; Eastern Counties, 2,348*l.*; Edinburgh and Glasgow, 1,735*l.*; Great Western, 12,939*l.*; Grand Junction, 6,580*l.*; Glasgow, Paisley, and Ayr, 1,090*l.*; Great North of England, 1,320*l.*; Hull and Selby, 870*l.*; London and Birmingham, 14,264*l.*; South Western, 4,840*l.*; Blackwall, 572*l.*; Greenwich, 689*l.*; Brighton, 3,422*l.*; Croydon, 191*l.*; Liverpool and Manchester, 5,505*l.*; Manchester and Leeds, 4,305*l.*; Midland Counties, 2,332*l.*; Northern and Eastern, 1,481*l.*; North Midland, 4,001*l.*; Newcastle and Carlisle, 1,345*l.*; South Eastern and Dover, 2,806*l.*; Sheffield and Manchester, 470*l.*; York and North Midland, 1,540*l.*—A project called the Middlesex and Surrey Grand Junction Railway is now occupying some attention; and as it is proposed by the parties connected with the plan to commence their operations from the Harrow station, on the Birmingham line, through Epsom to Mersham on the Brighton line, crossing the Great Western and South Western railways, it is likely to come in strong competition with other projects now in the field. This line, it is said, will form a connecting link of all the railways from Scotland to the West and South of England.—On Wednesday week a numerous meeting of the shareholders in the Exeter and Plymouth Railway was held at Bristol, to take into consideration the propriety of completing the line from Exeter to Plymouth. The proposition of the directors was that the Bristol and Exeter Companies should advance 600,000*l.* for that purpose, being one-half of the capital required. After a long discussion the proposal of the directors was negatived by the proprietors by a majority of five votes, and was accordingly withdrawn.—A general idea of the extent of fluctuation which has occurred in the value of railway property during the present year may be gathered from a circular just published by Mr. Greaves of Liverpool. It appears from this that the Chester and Birkenhead have been as high as 26, and as low as 16; Eastern Counties as high as 10½, and as low as 7½; Edinburgh and Glasgow as high as 55½, and as low as 45½; Glasgow and Greenock as high as 15½, and as low as 10; Grand Junction as high as 219, and as low as 192; Great Western as high as 96½, and as low as 85¼; Lancaster and Preston as high as 33½, and as low as 29; Liverpool and Manchester as high as 214, and as low as 190; Birmingham as high as 226, and as low as 202; South-Western as high as 70½, and as low as 62; Brighton as high as 42½, and as low as 32; Manchester, Bolton, and Bury, as high as 86½, and as low as 50; Manchester and Birmingham as high as 36½, and as low as 20; Manchester and Leeds as high as 97½, and as low as 60; Midland Counties as high as 86, and as low as 60; North Midland as high as 90, and as low as 63½; North Union as high as 84½, and as low as 70; Paris and Rouen as high as 32½, and as low as 22¼; Rouen and Havre as high as 10½, and as low as 5½; South-Eastern as high as 34½, and as low as 22¼; Sheffield and Manchester as high as 60, and as low as 43½; and York and North Midland as high as 132½, and as low as 93.

IRELAND.

Dublin.—A notice has been issued from the Court of Queen's Bench, announcing that Monday the 15th January is appointed for the state trials, and another notice to the same effect has been sent by the Crown solicitor to all the traversers and their attorneys. The Landlord and Tenant Commission will reassemble in Dublin on the 3d January, and continue their sittings for a month, after which they will adjourn their inquiries to Cork, Limerick, Belfast, Waterford, Galway, &c., for the convenience of witnesses. The revised jury list arranged in alphabetical order, has been transmitted to Mr. Shaw, the recorder, who is now in England, for his final inspection, previous to its delivery into the hands of the high sheriff, Mr. Latouche. The new sheriff, Mr. Bail, may not be sworn in before the commencement of the trials on the 15th January. In that case it will become the duty of Mr. Latouche to make out from the general list of jurors a special jury panel. In the general list there are about eight or ten thousand names, comprising all classes of jurors, but placed according to rank and property. The sheriff is to make his selection from the general list; but he is bound to place upon the special panel all persons marked or qualified to act as special jurors. The special panel will probably contain seven or eight hundred names, including about two hundred Roman Catholics. About Monday, the 8th January, the high sheriff will be required

by the Attorney-General to attend the Court of Queen's Bench, in order that a special jury should be struck for the trial of the traversers in the state prosecutions. Numbers corresponding with all the names in the special panel will be placed in a box, and in the presence of the solicitors at both sides forty-eight names will be drawn by ballot. The Crown solicitor and a solicitor acting in the name of the traversers will then strike off twelve names each. On the day of trial the first twelve of the remaining twenty-four answering to their names will constitute the special jury in the state prosecutions.—The usual weekly meeting of the Repeal Association was held on Monday, Mr. Magennis in the chair. Mr. J. O'Connell said he had to commence the business of the meeting by announcing the death of the Member for Tipperary, Valentine Maher, Esq., who died suddenly on Christmas-day. In the course of a warm eulogy on the character of the deceased gentleman he said he was not a Repealer, but he had no doubt the people of Tipperary would fill the vacancy by electing a thorough Repealer. Mr. John O'Connell read a correspondence between himself and Lord Devon in regard to the publication of evidence taken before the Commission. On this point, his Lordship declined pledging himself or his colleagues. Mr. J. O'Connell commented at some length on the vagueness of Lord Devon's letter, and designated the Commission as a mockery. Mr. O'Neill, of Bunowen Castle and Mr. O'Neil Daunt addressed the meeting. The week's rent was upwards of 470*l.*—Mr. O'Connell is still enjoying his favourite field sports in the country, and is to be entertained at a public dinner in Tipperary on the 4th January.

Finnoe.—A man named John Cahill has been committed for examination on suspicion of being concerned in the murders of the late Mr. Waller and Miss Vereker. Mrs. Waller continues in very delicate health at Finnore House, and is unable to be removed to Kyle Park, the seat of her son-in-law, Mr. Stoney.

SCOTLAND.

Edinburgh.—Several candidates are in the field for the musical professorship vacated by Sir Henry Bishop; but the chances of success are now entirely between two persons,—Mr. Donaldson who ran so close a race with the ex-professor at the last election, and Dr. Gauntlett. Mr. Donaldson was formerly a music-teacher at Glasgow, but marrying a lady of fortune, studied at the bar and became a barrister. He is not known by his works on music, but is the popular candidate in Edinburgh. Dr. Gauntlett has been distinguished as a musical lecturer and by his improvements in organ-building. He is a practical musician, but has little local influence, being a resident in London.—The Lords of the Session on Saturday unanimously passed a bill of suspension and interdict against the recent resolution of the council prohibiting any of their body from officially attending divine service. Immediately after this decision was announced a meeting of the town-council took place, the Lord Provost in the chair, when it was resolved to resume the old practice of going to church in municipal state, leaving it as before optional with the members to be present or not as they felt inclined.

THEATRICALS.

DRURY-LANE.—On Tuesday night after the Opera of *Der Freischütz* the management of this theatre, according to good old custom, presented the public with a new Pantomime entitled *Harlequin and King Pepin, or Valentine and Orson*. Messrs. Howell, T. Ridgway and Blanchard appeared in their well-known parts of *Harlequin, Clown and Pantaloon*, and sustained their reputation by their performances. A new *Columbine* appeared in Miss Carson who was very favourably received. The pantomimic scenes alluded as usual to the passing events and trifles of the day. The Queen's visit to France, the new Regulation Hat, the Derby Sweeps, &c., were all the subjects of a passing joke, and the performance closed with a moving representation of the victory of Trafalgar, terminating with the "Nelson Memorial," in Trafalgar-square, amidst a concourse of water-deities, and a blaze of variegated lights.

HAYMARKET.—After Mr. Knowles's *Love Chase* and the gymnastic performances of Mr. Risley and his son, the novelty of the season at this theatre was a new burlesque fairy tale by Mr. Planché called *The Fair One with the Golden Locks*, a clever drollery full of apt allusions to the events and opinions of the day. The piece was well got up and received with a great deal of applause.

PRINCESS'S.—On Tuesday after the performance of *Don Pasquale* and *Twice Killed*, there was produced a musical burlesque spectacle called the *Magic Mirror, or the Hall of Statues*. The subject is the adventures of *Sing Song, Prince of China*, and as the play-bill has it, *Own Brother of the Sun*, in search of a wife. The piece contains the usual amount of allusions to the affairs of the day, which told well with the audience: and being seconded by the attractions of agreeable music and scenery, and the acting of Mr. Bedford in *Pooh Pooh* the Emperor's Prime Minister, as well as Mrs. Grattan's personation of the Prince, the piece was completely successful. It was dressed and got up on a scale of splendour rarely seen in a minor theatre.

ADELPHI.—This theatre was crowded on boxing night by holiday folks attracted by the pantomime of *Blue Beard*, whose history seems to have lost none of its attractions for a Christmas audience. It was well brought out and is likely to have a run.

Miscellaneous.

Captain Conolly and Colonel Stoddart.—We copy the following paragraph from the *Delhi Gazette* of the 28th

Oct., received by the Overland Mail this week:—"On the 6th of September last a messenger named Luteef, from Colonel Stoddart, arrived at Hyderabad (in Scinde) where he made himself known to a British officer late in political employ, having left Bokhara 80 days previous. He travelled by the Candahar route, in hopes of finding some British officer there to whom he might deliver his letters, some of which were addressed to Major Todd by certain chiefs in Turkistan, others being from Colonel Stoddart himself. He was most unfortunately robbed of all these papers in the Pisheen valley by Meer Dil Khan, by whom he was beaten, but suffered to proceed on his way. He states that he left the Colonel alive and well, though a prisoner in the citadel of Bokhara. It seems, further, that on Captain Conolly's arrival in Bokhara from Kokan, Colonel Stoddart and he lived together, first in the house of Summund Khan and afterwards in a house supplied by the king in the city. About 60 days after Conolly's arrival came the news of the Cabul disasters, when both officers were immediately seized and imprisoned in the citadel. Their servants were at the same time confined in the common prison. One of these was considered an European, and was called Yousoof Khan. After two months the latter were released, but Yousoof Khan being discovered intriguing to convey letters to his master, he and three others were put to death by order of the Ameer. The latter now waged war with the Khan of Kokan, of which country he possessed himself for a time, but was eventually defeated. The Khan of Khiva availing himself of this circumstance overran a portion of the Ameer's country and defeated his army in action. Returning after this to his capital, the Ameer put Captain Conolly to death, but was induced to spare Stoddart's life by the earnest expostulations of that officer. This happened about six months after the death of Yousoof Khan and the rest. The story of Luteef is corroborated by a letter received by Colonel Sheil from Abdool Summund, the Topchi Bashi at Bokhara, in whose house Stoddart and Conolly were living previous to the seizure, and who claims 3000 tillas which he had lent the latter, as a voucher for which Colonel Stoddart had supplied him with a leaf out of Conolly's journal; this was safely delivered to Colonel Sheil. Stoddart would hardly have done this had Conolly been alive at the time. Abdool Summund's letter did not actually mention his death, but referred Colonel Sheil to the messenger, Mirza Rujub Ali, for full information on all points. Colonel Sheil, however, seems to have received the letter by some other hand, so we have yet to learn the Mirza's *vivd voce* news. The Ameer of Bokhara was apparently actuated partly by revengeful and partly by political motives in putting Captain Conolly to death so immediately after his own defeat by the Khan of Khiva, who was well known to be Conolly's staunch friend, and he may have suspected the two of being in league together against him. Luteef visited Herat on his way to Scinde, and confirms the murder of Kamram by Yar Mahomed, which was perpetrated at Ghorian. We trust soon to have further particulars to add."

Mildness of the Season.—The *Hampshire Advertiser* says, "On Saturday last, as a gentleman was journeying from Portsmouth to Arundel, he was forcibly struck with the unprecedented sight of a quantity of swallows playfully disporting themselves in the beautiful valley at the entrance to Arundel, a circumstance never before remembered at this season of the year. As an additional proof of the summerly mildness of the weather, the same gentleman informs us that fresh-gathered violets from the open ground perfumed his breakfast-table at Arundel." The *Bath Journal* states that "On the morning of the longest day in the present year many ponds of water in the eastern part of the kingdom were covered with ice; on the morning of the shortest day the thermometer stood at 50, or nearly 24 degrees higher, and primroses are now in full blossom in many places. The Rev. Dr. Godfrey, Grosvenor-place, has crocuses in an advanced state." The *Falmouth Packet* also says, "The genial mildness of the season in this neighbourhood surpasses anything in the memory of the oldest persons. Roses, violets, geraniums, pinks, auriculas, fuchsias, &c. abound in our gardens, and in a garden in Berkeley Vale we observed on Thursday last more than 20 ripe strawberries. The fields and birds give every indication of advanced spring. Our fish-market is not only abundantly supplied with the finest fish, but those peculiar in summer, such as the sur mullet, John Dory, whiting, &c. are frequent."

Law.

COURT OF QUEEN'S BENCH.—*The Queen v. Peter Townshend.*—This was an indictment charging the defendant with having been guilty of wilful and corrupt perjury. Mr. Sergeant Talfourd, in stating the case to the jury, observed that most persons well knew that such frequent attacks had been made in the *Times* paper against the Duke of Brunswick, that at length it had been ascertained to proceed against the characters of that nobleman. The Duke had been kindly received in a family of the highest respectability, and the name of the lady of that family had been occasionally mentioned in the papers to which he referred. The Duke having determined to move for a criminal information against the *Times*, it became necessary to find certain affidavits; but as the Duke would not suffer the name of the lady to appear in the affidavits, counsel's opinion was taken as to the necessity of introducing the name, and counsel advised that it was absolutely requisite that the name should be inserted in the affidavits, but that it need not transpire in Court, and upon this understanding the Duke consented to the name appearing. The affidavits were then prepared. The name was inserted in one affidavit in an interpolation, and in another in a blank which had been left for it, and the affidavit was then sworn before Mr. Justice Patteson, at his house in Bedford-square, and the initials of the Learned Judge were put in the margin opposite to the different interpolations. Townshend at the time of the preparation of this affidavit was in the employ of Mr. Vallance, but left him shortly afterwards, and then applied to the Court of Queen's Bench to strike Mr. Vallance off the rolls of the Court as an attorney, upon the ground that this name in question was inserted

after the affidavit had been sworn, and that the initials of the Learned Judge appearing in the affidavit had been forged. There was not the slightest ground for this imputation, and it was a charge calculated so to injure Mr. Vallance, that he had thought it right to have recourse to the present proceeding—to indict the defendant for perjury. Witnesses were examined at length on both sides; and Mr. Erle addressed the Jury for defendant, at first objecting that the Judge's chambers were not in Middlesex which was over-ruled, and next endeavouring to prove that the initials were in the handwriting of the defendant himself. The clerk of Mr. Justice Patteson; Mr. Arthur Parsey, a writer in perspective, who is a friend of Mr. Barnard Gregory, and had been his bail at Southend when he was arrested, and other friends of defendant were examined to support this argument. Lord Denman, in summing up, observed that in his opinion the mode in which the affidavit was sworn rendered a party liable to an indictment. It was for the Jury to say whether they considered the chambers of Mr. Justice Williams were in the county of Middlesex; because, if they were not, the defendant was entitled to an acquittal. He must say that the charge imputed to Mr. Vallance was a most serious one, as he was an officer of this Court. The whole case was for their consideration, and they would say whether the defendant was guilty or not. During the latter part of the summing up the defendant, who had been in Court all day instructing his counsel, took his hat and walked out of Court. The Jury returned a verdict of *Guilty*. The defendant was then called, but did not answer. Mr. Sergeant Talford then prayed for judgment. Mr. Erle said there were objections to the indictment. Lord Denman—I shall pass judgment at once. When such a case is proved to the entire satisfaction of the Judge, who finds that the power of the Court has been sought to be abused by the conduct which the defendant has pursued, no doubt ought to be left upon the public mind as to the impression which the case has created on the mind of the Judge. There is not the slightest shadow or pretence for any material defence; there is not the smallest question upon the probability of every step in the case, or of the motives by which all the parties have been actuated. I think the offence of which the defendant has been found guilty is one of the highest character against the administration of justice. In the absence of the defendant I abstain from all comment upon his individual conduct towards the prosecutor, further than to say that it does not afford any motive whatever to take off, in the least degree, the amount of the punishment. It is of the very worst description; one cannot hear it without feeling extreme indignation and sorrow. The sentence of the Court is, that he be transported for seven years.

of the Courts, is, that he be transported for seven years:—*COURT OF COMMON PLEAS.*—*Lord W. Paget v. the Earl of Cardigan.*—This case, which has excited much interest in the higher circles, was fixed for Friday morning, and a few minutes after 9 o'clock Sir T. Wilde, with Mr. Serjeant Talfourd and Mr. Wordsworth, who had been retained for the plaintiff, entered the Court. He was soon followed by the Solicitor-General, with Mr. Serjeant Channell and Mr. Peacock, who were engaged for the defence. The learned counsel had not taken their seats five minutes, when the officer of the Court announced that the special jury who had been summoned to try this cause need not wait any longer, as the record was withdrawn. The announcement came unexpectedly on all present, and seemed to excite greater astonishment among the counsel engaged in the cause than among the remainder of the audience. In reference to this case Lord W. Paget has addressed a letter to Lord Cardigan, imputing to the defendant, upon the authority of the plaintiff's attorney, "the wicked and infamous crime of having bought and sent out of the way" the principal witness in Lord W. Paget's behalf, who was with his solicitor at the opening of the Court. The letter was sent to the daily papers, which considered the terms in which it was written so offensive that they refused to publish it. Lord Cardigan, however, has announced by himself and his solicitors in the strongest possible language that the charge is utterly unfounded, and that legal measures will be taken forthwith against Lord W. Paget for the libel. Lord W. Paget, in acknowledging this communication, expresses his satisfaction that the affair is about to become the subject of legal proceedings, as the real facts of the case will thus become thoroughly investigated.

WINTER ASSIZES, MIDLAND CIRCUIT.—DERBY.—*John Winfield Grocock*, aged seventeen, was charged with having, on the 25th August last, assaulted *Eliza Ann Allwood*, a girl aged eleven years, with intent to kill and murder her. There was also a count for cutting and maiming, and a third count, which charged him with an intent to do her some grievous bodily harm. The particulars of this case were noticed in this paper at the time. The prisoner enticed the girl from her home, promising to take her to Derby, and on their way he crammed a stocking into her mouth, assaulted her, and beat her head with a hammer until she became senseless. The offence was fully proved. The defence relied upon was that the prisoner at times laboured under an aberration of reason, so as not to be accountable for his actions when in that state, and witnesses were called who deposed to his manner being at times strange and wild. The father also deposed to the strangeness of his manner, and that it had been the cause of much sorrow and uneasiness to himself and wife; he also proved that his brother had been in confinement at Leicester, as a lunatic, for eighteen years. The Judge summed up. There were two questions; first, was the act which had been committed the act and deed of the prisoner? and if it was, then was the prisoner in such a state of mind at the time as to make him responsible for the consequences of his act? The burden of proving he was not lay upon the prisoner. To be labouring under a slight delusion would not be sufficient. Was he, in fact, at the time the act was committed, capable of knowing he was doing what was wrong. For that purpose they would look at the evidence in the case, and especially to the prisoner's subsequent conduct. The Jury returned a verdict of Guilty of the intent to do some grievous bodily harm and damage, but acquitted the prisoner of the intent to murder. The Judge sentenced him to transportation for life.

MIDLAND CIRCUIT, LEICESTER.—Our readers will recollect the case of Mr. Messenger, a farmer at Gaddesby, who was apprehended on suspicion of having murdered one of his labourers. The man had been at work, but not returning at breakfast time some surprise was excited, nor was he ever heard of until thirteen weeks from the time he was last seen alive, when he was found by some reapers in one of Messenger's fields. Certain circumstances caused considerable suspicion to attach to the prisoner, who was committed for trial, but was admitted to bail on an application being made to Mr. Justice Erskine. The Grand Jury, however, have not thought the evidence before them sufficient to send him upon his trial, and consequently no true bill was returned.

MIDLAND CIRCUIT, NOTTINGHAM.—*William Kettleband*, labourer, was charged with the wilful murder of his son, Isaac Kettleband, a lad about 10 years of age. This case was purely one of circumstantial evidence, deposed to by many different witnesses. The prisoner is a labourer, and at the time of the alleged murder was waggoner to Mr. Hebb, a farmer, at Wysall. His son was ploughboy; besides which there were three or four other persons upon the farm, acting in different capacities. Upon the farm there is a barn, and near the barn is a pond fenced about on all sides, except where a place is left open for the horses and cattle to get access to it. The pond was about 41 feet long, the average width was 22 feet 9, and averaging about four feet deep in water, which had a mud bottom. Hebb was suddenly missing, and prisoner made many statements as to places where he had called to make inquiries for his son, and had also given accounts of what information had been given to him, all of which were proved to be false. Prisoner had been repeatedly asked to search the pond, but always evaded doing so on one pretence or another. On the Tuesday following the day the child was missed, the prisoner being pressed to search the pond took a rake, and his manner of using it excited so many suspicions in the minds of those who witnessed it, that shortly after Kettle-

band had gone away the pond was again searched in the precise spot the prisoner had pretended to rake, and the poor boy was instantly brought to the surface. When informed the lad had been discovered, Kettlebrand betrayed great agitation, and said to his wife, " It's a pretty job ; " to which she replied, " Ay, it is ; I always thought it would come to that." He then asked if any bruises had been discovered, and added, " If there are any, the horses have been often in the pond so far as he lay ; " when a witness said, " Why, how can you know where he lay, as you have not been to the pond ? " The prisoner was silent for some time, and then said he should not wonder he got in by playing with a rat. An inquest was held on the body the day it was found, when a verdict was returned, Found Drowned. The neighbours, however, were not satisfied. A second inquest was held, and a *post mortem* examination had, and then it was found the neck of the child was broken evidently by violence before it was put into the pond. The learned Judge went very minutely through the evidence, and the Jury after a long consultation returned a verdict of Guilty of Manslaughter. The prisoner was sentenced to be transported for life.

OXFORD CIRCUIT. — *SURREYSBURY.*—*Thomas Skitt* and *James Harris* were jointly indicted for wounding *John Eales* and *Wm. Mansell*, on the 3rd November last. The prisoners it appeared were labourers from *Daisley-green*, and were out for the purpose of poaching with two other persons who have not yet been apprehended, on the night of the 2d November. On the same night the prosecutor *John Eales*, who is head gamekeeper to *Thomas Whitmore, Esq.*, of *Apley Park*, was out with two of his master's under keepers, *Mansell* and *Brian*, for the purpose of protecting the game. The moon was up, but owing to a slight fog the light was not very strong. The three keepers were watching in a field adjoining one of *Mr. Whitmore's* preserves called *Birch's Coppice*, and about half-past one o'clock they observed four men accompanied by two dogs coming through the gateway adjoining the highway leading from *Wellington* to the *New Inn*, and advancing towards them. *Eales* and his companions immediately went to meet them, and when within a short distance *Eales* observed, "Here they are;" to which one of the poachers replied, "We be in the road." *Mansell* answered "It is no road," and almost at the same moment a large stone was thrown at the keepers, which struck *Eales* upon the forehead between the eyes, dividing the skin and laying bare the skull. He fell from the violence of the blow, but rose again directly and ran up towards his antagonists, when he distinctly recognised the prisoner *Skitt*, who stepped back and threw another stone, which struck *Eales* in the face and cut a gash of such a depth that the cartilage of the nose was divided, the upper jaw fractured, and the roof of the mouth driven in; the unfortunate man was rendered insensible, but distinctly swore to the fellow who inflicted upon him the above injuries. *Brian* and *Mansell* were also much bruised with stones by the prisoners, whom they pursued but were not able to capture. A witness of the name of *Cooper* went to the spot where the contest occurred soon after, on the same morning, and found there a bag containing a dead hare and rabbit, both of which had been snared, and also two round smooth stones, polished nearly bright, one of a different nature from any to be found in that part of the country. *Baron Rolfe* summed up in a clear and impartial manner, and the Jury immediately found them both guilty. The Court sentenced them to imprisonment with hard labour for 18 months. This case appeared to excite considerable interest, the bench being crowded during the trial with magistrates and county gentlemen.

Francis Purget, William Dix, Thomas Luckcock, and James Smith, were arraigned upon a charge of having unlawfully entered certain inclosed woodlands in the occupation of Joseph Edmonds, on the 1st inst., for the purpose of destroying game. From the testimony of Oakley, Mr. Gatteker's head-keeper, it appeared that he was out on the night in question, with nine underkeepers, or watchers, for the purpose of protecting his master's property from poachers, whose depredations have been carried on in that part of the country to a very great extent. While thus engaged his attention was drawn to a coppice called "The Bowell's Dingle," forming one of Mr. Gatteker's principal pheasant preserves, in which he heard the report of a gun; he immediately stationed his men silently round the cover, so as to prevent if possible the escape of those who were at work within. Scarcely had he thus disposed his forces when he observed five men issue from the dingle; the moment they observed him they bore down rapidly towards him, evidently concluding that he was alone and with the intention of attacking and overpowering him. Oakley, although a powerful man, was not anxious to enter singly into a contest with so many at once, stepped back about 20 yards and summoned his assistants to his aid; the five poachers meanwhile closed upon him; the moment however that they perceived Oakley's reinforcement they took to their heels, all flying in different directions. All of them however were secured but one, with the assistance of a well-trained mastiff. On behalf of the prisoners some remarks were offered by Mr. Phillimore, deprecating the means which had been used to secure them, as all the facts requisite to establish the charge were too clearly and satisfactorily proved to admit of refutation or doubt. Baron Rolfe summed up, and the Jury without hesitation pronounced all the men guilty. The Learned Baron in passing sentence observed, "These nocturnal depredations are calculated to lead to crimes of greater enormity and of a deeper dye. A number of men go out for the avowed purpose of robbing and plundering the property of their neighbours, for I can describe their conduct in no lighter terms, and they are frequently led to enter into frays of a most desperate and sanguinary character. The crime of which you have been convicted is one to which the law annexes the punishment of transportation for a very long term of years; I am glad, however, to observe in the present case some circumstances which tend slightly to mitigate your offence, and I am always desirous to show comparative leniency to those who in any affray, having arms in their hands, refrain from using them. It may be that in this instance you offered no resistance because it would have been hopeless; be that however as it may, I shall take that fact into consideration now, and instead of directing you to be removed from the country, the sentence which I pass upon you is that you be severally imprisoned and kept to hard labour for twelve calendar months.

NORTHERN CIRCUIT, LIVERPOOL.—*John Roberts, James Hunt, Thomas Jacques, Joseph Rimmer, and Henry Fillingham*, were indicted for the wilful murder of Richard Kenyon at Knowsley, by shooting him. A man named Tyrer, one of Lord Derby's watchers at Knowsley, stated that on the morning of the 10th November he heard a gun go off in the neighbourhood of one of Lord Derby's covers in the direction of what is called the Forest-house Knowsley. He had with him at the time three keepers, and they all went to the lodge of Richard Kenyon, one of the head keepers to call him up. They then with Kenyon went in the direction in which they had heard the shot, towards the new school. The party laid down under a hedge and remained there a few minutes when they heard footsteps, and immediately afterwards found that a party of men numbering from ten to fifteen were close upon them. The keepers sprang over the fence and rushed into the cover. The poachers had guns and sticks and called to the keepers to keep off. There was then a silence among the men for a second or two, but they immediately after began calling out "Go into them—shoot them—kill them," and other expressions of that sort. They then fired a gun. Witness did not see the effect of it but cried out to Kenyon to shoot. Kenyon fired both barrels immediately. There was afterwards a fourth shot fired by the poachers, and the keepers finding they were likely to be overwhelmed by numbers endeavoured to make their escape. The poachers shouted "hurrah" repeatedly when the keepers began to retreat. On the way home it was found that Kenyon was severely wounded, from the effects of which he died on the 14th. The main facts of the case were confirmed by the testimony of Naaman Shaw an approver, whose evidence was confirmed in minute points by other witnesses. It appeared how-

ever that John Shaw the father of the approver had on the statement of the watchers that he was one of the party, been committed on the Coroner's inquest, and that it was after that time and on the reward of 100*l*. being advertised, that Naaman Shaw came forward to make the statement which he repeated at the trial. The case for the prosecution having closed Mr. James addressed the Jury for the defence, contending that there was nothing in the evidence adduced which could properly be looked on as a corroboration of the testimony of the accomplice, who had the very strongest motives which could operate on such a mind (the desire to save his father and to obtain the reward) to induce him to throw the blame on other than the real criminals. Mr. Justice Wightman having summed up, the Jury retired for about an hour, and returned into Court with a verdict of guilty against all the prisoners recommending them strongly to mercy. His Lordship then passed sentence of death in a brief and impressive address, which was repeatedly interrupted by the lamentations of the numerous relatives of the prisoners in Court.

POLICE.—**MANSION HOUSE.**—On Thursday Messrs. *Barber and Fletcher*, were brought before the Lord Mayor on the charge of forging the will of Miss Emma Slack, the particulars of which were given in this Paper last week. Mr. Clarkson on behalf of the Crown called Mr. Chappell, Supervising Registrar of Births and Deaths of the Belgrave District, who produced the original register containing the registration of the death of Anne Slack on the 25th Feb. 1843. He then called Mr. Price Jordan the district registrar, but he did not appear. Mr. Clarkson then entered on another case against the prisoners with reference to another will which had been forged under circumstances similar to those detailed on the former occasion. That will purported to be signed by Mary Hunt, of Queen square, Bristol, and the parties who were entitled to the property had never received the money, but found that it had been deposited in the hands of the Commissioners for the Reduction of the National Debt, that the dividends had been received up to 1830; and that no dividends having been applied for subsequently, the money, amounting to 1210*l.* had been handed over to the Commissioners in 1841, so that the amount became, with the interest for the ten years, something like 1,700*l.* Daniel Forrester had found in the possession of the prisoner Fletcher a book containing an entry in which the name of Mary Hunt, the amount of money handed over to the Commissioners as unclaimed, and the name of the solicitor and other particulars were entered. It appeared that the prisoner Barber went, accompanied by a person who called himself Thomas Hunt, to Doctors' Commons, and obtained probate of the will, the said Thomas Hunt having pretended to be executor to Mary Hunt, and afterwards having received the amount mentioned in the will, together with the interest upon that sum for ten years. Mary Hunt had died in the year 1806, although the will proved by Barber stated that she died as lately as the year 1829. Upon the representation made with the necessary forms to the Commissioners, Barber received the whole amount of the capital and interest for his client Thomas Hunt, the pretended executor. The notes had been changed at the Bank for gold, and about one half of the sum had been entered in Fletcher's name in the Westminster Bank, where that person kept an account. After some remarks from counsel upon both sides, the Lord Mayor said he should not exercise a sound discretion if he admitted either of the prisoners to bail. There were extensive forgeries involved in these cases, and the parties were mixed up, and exhibited so much apparent dexterity that an extreme degree of caution was necessary to be observed. He considered it due to all that every facility should be rendered for inquiry, and he should therefore remand the prisoners till Tuesday week.

CLERKENWELL.—On Thursday a young man named Edward Armstrong, described as a gardener, was charged upon his own confession with being of unsound mind, and with using expressions with reference to the Queen. It appeared from the statement of the inspector that the prisoner came to the station house in George-street, St. Giles's, to surrender himself as being a person unfit to be at large, as he had strong fits that he might do injury to the Queen, by shooting her. In the course of a medical examination it was stated that the prisoner had been sent to the Maudslayi Hospital by the police, but the medical gentlemen who examined him there could not pronounce him insane. He was ultimately sent to the House of Correction for safe custody until further information could be obtained.

MARK LANE, FRIDAY, DECEMBER 29.—On Wednesday the English Wheat was pretty well cleared off, and the demand for free Foreign improved towards the close of the Market. This morning we have a small attendance of buyers, and the trade has ruled exceedingly heavy, with very little business doing, although prices demanded are the same. Barley commands fully late prices, and is in demand. Peas and Beans remain as on Wednesday. The Oat-trade is flat with a fair supply. The duty on Wheat and Peas has advanced 1s. per Quarter.

GAZETTE OF THE WEEK

ANNULLED.—J. PHILLIPS, Pinners' Hall-court, Old
Barnet-street, tailor.—D. COLLINS, Bennett's-place, Pollard's-row, Bethnal-
green, sign-maker.
BANKRUPTS. A. WELLS, of Wickford, Essex, surgeon.—J. DORSON, of Old
Barnet, Ratcliffe-highway, ship-carpreter.—T. HANCOCK, of Canterbury,
10, St. W CHAMBERLAIN, of Peckham, Surrey, linen-draper.—T. MORRIS,
of Badajos-cottages and Salamanca place, Hertford-road and Mortimer-road,
Beaufort-square, Hackney, builder.—R. THOMPSON, of Strood, Kent, com-
missioner.—C. WEBB, of Oxford, apothecary.—W. BERRKLEY, of Uxbridge,
Leicestershire, coal-merchant.—J. HOLDEN, of Morn, Leicestershire,
Hertford-road, builder.—R. EVERIST, of Fulbourn, Sussex, iron-founder.—
J. JENKINS, of 11, Symonds-street, Chelsea, carpenter.—H. GOSNELL,
of 20, Gloucestershire, baker.—J. NEWELL, of 8, Newgate-street, London,
bookseller.—THOMAS M. HALL, of Stoke Newington, Leicestershire, farmer.—J. CORNISH, of
Hampton, Dorsetshire, painter.—W. FRINGLE, of Morphet, Northumberland,
cabinet-maker.—W. VINCE, Fearless-row, City-road, builder.—W. C. CARTER, Ash-
ford, Kent, druggist.—J. and W. WOOLF, of Exeter and Powderham, Devon-
shire, ironmongers.—G. POWELL, Coventry, watch manufacturer.—S. COOK, Dudley,
Worcestershire, draper.—T. KIRKPATRICK, Bourne, Lincolnshire, saddler.—E. PUGH,
Exeter, iron-founder.—L. V. L. OF W. THOMPSON, Newcastle-upon-Tyne, merchant.

BIRTHS.—On the 17th inst., at Eglington Castle, the Countess of 1, of a daughter—On the 24th, at 3, Sussex Gardens, Lady Mary Hope, of a son—On the 28d inst., at 1, Cambridge-square, Hyde-Park, the wife of GEORGE 17th, Esq., of a son

MARRIED.—On the 24th inst., at St. George's, Hanover-square, J. ARCHER, Esq., of Stoke-sub-Hamden, Somerset, to ANN, daughter of W. J. HAY, Esq.—On the 27th inst., at St. Mary's, Chelsea, J. ARCHER, Esq., R.N., to FRANCES, daughter of the late J. HAY, Esq.

DIED.—On the 24th inst., at Letterfourie house, Banffshire, Scotland, GEORGE
GORDONSTOUN, Bart. — On the 26th inst., at the Victoria House, Newcastle,
Lieut.-Admiral Sir EDWARD BRACE, K.C.B., commanding-in-chief at the Nile,
his 75th year.

NEW FARMERS' NEWSPAPER.

THE time has come when Landlords and Tenants, large Farmers and small, must devote their anxious attention to improved cultivation—when, in the words of Sir Robert Peel, “*All must learn how, in the shortest time, and at the least expense, to produce the greatest quantity of food, vegetable or animal, without permanent injury to the land.*” To accomplish this, no means can be so effectual as that which brings the results of Experience and Science before every man, in a cheap form. For this purpose THE AGRICULTURAL GAZETTE is to be established.

The Proprietors are aware of the difficulties of dealing with the many details of cultivation without an acquaintance with circumstances, often as varying as places. They condemn the idea of conducting farming operations upon one invariable plan; and, while they welcome science as the best auxiliary of practice, they regard crude speculations as the most dangerous of delusions. But, they also feel that in Agriculture, as in all other arts, there are general principles upon which successful farming must depend; that there are practical errors which no local circumstances can justify; in short, that there is room for improvement even in those branches which are best understood. No one man can be competent to deal with the multifarious questions affecting husbandry, and the duty of the Editor of such a Paper as THE AGRICULTURAL GAZETTE is to make known the knowledge of all. It is to practical Farmers that the Proprietors trust for the means of carrying out their views, and not to the talents of any individual. While, therefore, they state that the Editor of THE AGRICULTURAL GAZETTE will be a gentleman well acquainted with the best kind of Farming, in which he is actively engaged, they feel it to be of far more importance to announce the promise of assistance received from the landed and farming interest generally, especially of those whose names they are permitted to mention:—

The Right. Hon. the Earl Spencer, President of the Royal Agricultural Society of England.

The Right Hon. the Earl of Ducie, Vice-President of the Royal Agricultural Society of England
Sir Charles Lemon, Bart., M.P., one of the Council of the Royal Agricultural Society of England
J. H. Langston, Esq., M.P.
Dr. Daubeny, Professor of Botany, Oxford
James F. W. Johnston, Esq., Professor of Chemistry, Durham
Robert Black, Esq., Loch Aish, Ross, N.B.
John M. Bryde, Esq., Balker, Ayrshire
T. Caird, Esq., Baldoon, near Wigton

W. H. Little, Esq., Lanvair Grange, Abergavenny
J. Mathews, Esq., Secretary of Hereford Farmers' Club
D. J. Niblett, Esq., Haresfield
R. Parkinson, Esq., Babworth, Retford
W. Price, Esq., Secretary of the Ross Farmers' Club
R. Aglionby Slaney, Esq., Walford Manor, Shiffhall, Salop.
S. D. Stirling, Esq., Glenbervie, Falkirk
W. B. Wingate, Esq., Hareby, Bolingbrooke, Lincolnshire
Mr. T. Beadel, Secretary of the Braintree Farmers' Club
Mr. John Brodie, Haddington
Mr. G. Hope, Fenton Rams, East Lothian.
Mr. John Morton, Agent to the Earl of Ducie
Mr. Shoosmith, Folkington, Sussex
&c. &c. &c.

The Practice of Agriculture—its Science—Animal and Vegetable Physiology—Improvements in Implements—better modes of Husbandry—results of well-conducted experimental Farming—Growth and Rotation of Crops—Stock—Drainage—Irrigation—Road-making—Farm-Buildings—Labourers—in short, whatever affects the beneficial employment of capital in land—will form topics of consideration. Reports will be given of the English, Scotch, and Irish Agricultural Societies—London Market Prices of Corn, Hay, and Cattle, and the Weekly Averages. Replies to questions connected with the object of the Paper will also be furnished weekly.

Considering the union which exists between Horticulture and Agriculture, it has been thought advisable to make THE AGRICULTURAL GAZETTE an addition to the GARDENERS' CHRONICLE, edited by DR. LINDLEY, and so extensively known; but that there may be ample room for discussion, that Paper will be increased one-half in size without additional charge—thus Twenty-four Columns will be occupied, as at present, by Horticulture, and Twenty-four by the General News of the Week, whilst

Twenty-four Columns will be devoted to Agriculture:

On Saturday next, therefore, January 6th, will be published, price SIXPENCE, stamped to go free by post,

THE FIRST NUMBER OF

THE GARDENERS' CHRONICLE AND AGRICULTURAL GAZETTE:

A Weekly Record of Rural Economy and General News.

THE HORTICULTURAL PART EDITED BY PROFESSOR LINDLEY,

THE principle on which the Gardening part of this Paper has been conducted has been to make it a weekly record of everything that bears upon Horticulture, Floriculture, Arboriculture, or Garden Botany, and such Natural History as has a relation to Gardening, with Notices and Criticisms of all works on such subjects. Connected with this part are WEEKLY CALENDARS OF GARDENING OPERATIONS, given in detail, and adapted to the objects of persons in every station of life: so that the Cottager with a few rods of ground before his door, the Amateur who has only a greenhouse, and the Manager of extensive gardens, are alike informed of the routine of operations which the varying seasons render necessary. It moreover contains reports of Horticultural Exhibitions and Proceedings—Notices of Novelties and Improvements—in short, everything that can tend to advance the profession, benefit the condition of the workman, or conduce to the pleasure of his employer; accompanied with Woodcuts, whenever the matter treated of requires that mode of illustration.

To this Farming, as explained above, will now be added.

Lastly, that description of domestic and political News is introduced which is usually found in a Weekly Newspaper. It is unnecessary to dwell on this head further than to say, that the Proprietors do not range themselves under the banners of any party; their earnest endeavours have been to make THE GARDENERS' CHRONICLE a full and comprehensive Record of Facts only—a Newspaper in the true sense of the word—leaving the reader to form his own opinions; their object being elucidation of the laws of Nature, not of man. The reader is thus furnished, in ADDITION TO THE PECULIAR FEATURES OF THE JOURNAL, with such information concerning the events of the day as supersedes the necessity of his providing himself with any other Weekly Paper.

The Proprietors are happy to announce that the following distinguished Botanists, Florists, and Practical Gardeners have already enriched the GARDENERS' CHRONICLE by their communications:—

The Hon. and Very Rev. W. Herbert, Dean of Manchester
The Hon. and Rev. Charles Bathurst
Hon. W. Fox Strangways
Sir Oswald Mosley, Bart.
Sir W. J. Hooker, Royal Gardens, Kew
Dr. Horner, Hull
Dr. Lankester, F.L.S.
Rev. J. M. Berkeley
J. Bateman, Esq., Knypersley
Mr. W. Billington, Oswestry
Mr. Ingram, Gardener to Her Majesty
Mr. Paxton, Gardener to the Duke of Devonshire
Mr. Alexander, Gardener to the Duke of Leinster
Mr. Ferguson, Gardener to the Duke of Buckingham
Mr. Spencer, Gardener to the Marquis of Lansdowne
Mr. Elliott, Gardener to the Earl of Tyreconnell

The Hon. and Rev. L. Vernon Harcourt
Hon. Algernon Herbert
Sir George Mackenzie, Bart.
Sir Charles Wolesey, Bart.
Dr. Bevan, Llanferrry
Dr. Gregory, Aberdeen
Dr. Ingram, President of Trinity College, Oxford
Rev. J. B. Reade
Mr. Henderson, Gardener to the Earl Fitzwilliam
Mr. Frost, Gardener to Lady Grenville
Mr. Haythorn, Gardener to Lord Middleton
Mr. Halliday, late Gardener to Lord Sondes
Mr. Brown, Gardener to Lord Southampton
Mr. Errington, Gardener to Sir P. Egerton, Bart.
Mr. Fortune, Hothouse Dept., Hort. Gardens, Chiswick
Mr. Thompson, Fruit Dept., Hort. Gardens, Chiswick

G. Bentham, Esq., late Secretary of the Horticultural Society
L. W. Dillwyn, Esq., Sketty Hall
J. D. Llewelyn, Esq., Penllergare
Mr. Bailey, Gardener to the Archbishop of York
Mr. Mackintosh, Gardener to the Duke of Buccleuch
Mr. Moffatt, Gardener to the Duke of Newcastle
Mr. Tillery, Gardener to the Duke of Portland
Mr. Cooper, Gardener to the Earl Fitzwilliam
Mr. Bowers, Gardener to the Earl of Lucan
Mr. Forsyth, Gardener to the Earl of Shrewsbury
Mr. Buchan, Gardener to Lord Bagot
Mr. Beaton, Gardener to Sir W. Middleton, Bart.
Mr. Booth, Gardener to Sir C. Lemon, Bart.
Mr. Whiting, Gardener to H. T. Hope, Esq., M.P.
Mr. James Drummond, Gardener, Blair Drummond
Mr. Gordon, Hardy Dept., Horticultural Gardens, Chiswick.

OFFICE FOR ADVERTISEMENTS AND COMMUNICATIONS, 3, CHARLES-STREET, COVENT-GARDEN, LONDON.

Orders received by all Booksellers and News-venders.
